The higher mortality of males which prevails before birth continues throughout life. In the United States the mortality ratio for infants less than one year of age averages about 133 males to 100 females. At the ages of 13 to 19 years the two sexes are approximately equal in numbers and thereafter there are more women than men. Hence the life expectancy of males is always less than that of females. As a consequence of this differential mortality the ratio of males to females in the total population of a country will often be less than parity except as it may be influenced by migration. In the United States the sex ratio of the total population in 1940 was 100.6 males to 100 females; for the white race it was 101.2 to 100. Aside from the greater industrial and social hazards to which the males are commonly exposed in civilized life, this differential mortality must be ascribed to some fundamental physiological difference between the two sexes, since the same condition is found in some of the lower vertebrates and in many invertebrates.

The fact that males have a higher basal metabolism than females may make the former more susceptible to unfavourable conditions. Consequently any condition, such as impaired vitality of the mother, which tends to increase the prenatal mortality, tends to decrease the proportion of boy babies. And conversely the ratio of boys will be higher from reasonably early marriages, since prenatal deaths are relatively less frequent with young mothers than with women more than 30 years of age. For the same reason the first-born children have a slightly greater chance of being boys than those born later in the same families, but there seems to be no satisfactory praof that either the absolute age or the relative age of the father influences the sex ratio. The question as to whether there is a significant increase in the ratio of male births as a consequence of prolonged wars or other social upheavals has not yet been satisfactorily answered. Statistics indicate that a slight increase did follow World War I in all the belligerent and most of the neutral nations of Europe, but not in the United States (see section on Influence of War). It is not improbable that where an increase occurred it may have been due to conditions favourable to early marriage and the resulting low prenatal mortality.

The proportion of prenatal deaths is usually somewhat lower in rural communities than in cities, and the ratio of living male births slightly higher. The union of different racial stocks sometimes results in a high male ratio, either as the influence of hybrid vigour or the suppression of defective genes. In other hybrids the reverse is true. In certain mammals inheritable divergence in sex ratios has been demonstrated and selection for high and low sex ratios has established family lines with the corresponding characteristics. It is not improbable that human families may have similar traits.

In reptiles, fishes and many invertebrates, including insects, crustaceans and molluscs, males are usually smaller than females as well as shorter lived. In some of these a selection of either the largest or the oldest individuals in the population will contain few if any males, although there may have been equality in the primary sex ratio. In many species, including even some of those in which the male is homozygous, males throughout life are more susceptible to adverse conditions, such as deficiency of oxygen, abnormal temperature, poisons and various diseases and succumb more readily than females. In various species of reptiles and fishes there are generally about equal numbers of males and females or an excess of males when young but the proportion of males decreases with increasing age until there may be only 20 to 30, or even fewer, males to 100 females. In some species of molluscs in which each individual retains the same sex throughout life, the males die when relatively young and the population of old and large individuals consists exclusively of females.

These sexual differences in susceptibility and mortality may also be due in part to the influence of sex-linked lethal or semi. lethal genes which would affect principally the heterozygous (heterogametic) sex (See HEREDITY.) Such genes are known to be operative in both animals and plants. Families or races having few or none of these genes would be expected to have a high ratio of males. Colour blindness and defective blood-clotting (haemophilia) are the two best-known sex-linked defects in man.

A good example of the influence of such lethal genes may be found in the fly *Drosophila* melanogaster. In this fly, which has a normal sex ratio of about 98 males to 100 females, certain genetic strains have been obtained whereby it is possible to arrange matings which will produce $66\frac{2}{3}\%$, $87\frac{1}{2}\%$ or 100% female progeny, since one-half, three-fourths or all the males die before or soon after hatching. In other stocks the ratios may be highly variable. Another strain carries a sex-limited lethal gene and produces only males.

In a considerable number of invertebrates, in a few fishes and in certain plants, the sexuality changes during the individual's lifetime. Such individuals are usually, but not invariably, protandric, functioning as male when young and later changing to the opposite phase of sexuality. In any such populations the ratio of male-phase to female-phase individuals will depend entirely upon the proportion of young as compared with older individuals. In some other species each individual experiences several alternations of male and female phases.

EXPERIMENTAL

It seems safe to assert that not one of the many methods which have yet been proposed for obtaining the desired sex in prospective human offspring has been proved to have any merit whatever. Nevertheless the sex ratio can be changed slightly by conditions which tend to increase or decrease the prenatal mortality. It is also theoretically possible to increase the chances of male or female offspring by choosing a mate from a family stock, if such there be, with the desired hereditary characteristics. (See Livestock.) In man, and in many animals and plants, maleness or femaleness is so definitely determined in the fertilized egg that no known external influence can completely reverse it. In others, on the contrary, the male-determining and female-determining factors are so nearly balanced that the sex can be controlled by relatively slight changes in the environmental conditions. In a few species of animals and plants such environmental, or phenotypic, sex control operates regularly in nature.

The environmental conditions, which in certain organisms may influence the sexuality of the individual, and hence the sex ratio of the population, may be grouped in eight categories, namely: mutilation (removal of portion of body), nutrition, chemical alteration, temperature, sunlight, delayed fertilization, association and hybridization. Not infrequently any one of several of these may have the same effect or several may operate conjointly but it is not to be assumed that any of them, except as specially noted, are applicable to man.

The annelid worm *Ophryotrocha puerilis,* found along the seacoasts of both Europe and North America, may be mentioned as an example of this sexual instability. All the young of this species normally function as males but, on reaching a certain age and size, change to the female phase. Under favourable conditions the female phase may continue through life; but when the worm in the female phase has her posterior segments removed, or lacks sufficient food or oxygen, or is subjected to abnormal temperatures or to slightly poisonous substances, she returns to the juvenile male phase. If favourable conditions are then restored, the female phase is again resumed, but is retained only as long as such conditions continue. There are other cases in which the removal of a part of the body reverses the sexuality, both in animals and plants. Extirpation of the left gonad of the young female chicken may cause the prospective hen to develop into a cock by stimulating the otherwise rudimentary right gonad to form a testis.

Nutrition.—Both the quantity and quality of the food, as well as chemical and temperature changes, influence the sexuality of rotifers and cladoceran crustacea. Unfavourable conditions lead to the production of males from cultures of parthenogenetic females, as is also true of aphids. There is some evidence that deficient or faulty nutrition in pregnant women may be a contributing cause of abortion and thus lead to a slight decrease in the normal ratio of male births, since, as has been mentioned, the proportion of prenatal deaths, including stillbirths, is greater for males than for females.

Chemical Alterations.—Male production in cladocerans and rotifers may be elicited from their own excretions. Chemical changes in the sea water, such as the addition of a small amount of a copper or potassium salt or a trace of acid, as well as a decrease in the normal amount of magnesium, may determine whether certain worms (*e.g., Bonellia*) shall develop into males or females. Sex hormones administered to certain fishes and amphibia may likewise reverse the prospective sexuality more or less completely. In some of the amphibia such partial sex reversal may be effected by the surgical union, or parabiosis, of pairs of larvae with opposite sexuality so intimately that sex-differentiating substances may pass from one individual to the other. Grafts of heterosexual gonads may be equally effective.

Temperature may be a potent factor in sex differentiation in both animals and plants. Highly aberrant sex ratios result from temperature changes applied to the eggs of moths and other animals. If certain races of frogs are reared at a relatively high temperature, all or nearly all of the genetic females may transform into males (E. Witschi, 1942). The high temperature activates the male portion of the primary ambisexual gonad and inhibits the female portion.

Sunlight may influence the sexuality of certain plants, since improved nutrition has a tendency to initiate female development in hermaphroditic individuals.

Delayed fertilization may be influential in changing the prospective sexuality of certain amphibians and fishes. When fertilization is delayed until the eggs have become overripe, the majority or all of the resulting embryos usually develop into males.

Association in overcrowded conditions leads to male production in cladocerans. A period of attachment to the proboscis of an adult female usually causes the young, sexually undifferentiated, *Bonellia* worms to develop into males by inhibiting female development in individuals with genetic tendencies toward consecutive sexuality. In snails of the genus *Crepidula* opportunity for mating causes the accentuation and retention of the male phase in an individual which would otherwise have transformed to the female phase.

Hybridization of diverse races or species frequently results in highly aberrant sex ratios, owing in some cases to the abnormal development and death of the heterozygous sex and in other cases to the partial or complete reversal of the initial sex during development. Aberrations which may take place during the formation of the gametes may lead to the production of only one, or predominantly one, of the normally two sexual types of gametes by the heterozygous sex.

LIVESTOCK

The proportions of the two sexes at birth (secondary sex ratios) in the various farm animals approximate equality, as is the case in man and other mammals and in birds. Significant deviations from equality may be characteristic of the different species, but similar deviations may occur within the same species when different breeds, strains or families are considered. The stated ratio for any form, therefore, depends to some extent on the proportions in which these different elements enter into the tabulation. Combined and weighted sex ratios (expressed as per cent males) from various authors for some of the principal farm animals are:

Cattle	51.2	Goat	50.1	Rabbit	51.1	Turkey	49.2
Horse	49.7	Sheep	49.2	Dog	52.4	Pigeon	51.5
Mule	44.3	Pig	51.2	Chicken	49.4		

The secondary sex ratio is the result of the primary or initial sex ratio and any differential mortality with respect to sex in the interval to birth. The primary sex ratios are unknown, but, as in man, there is evidence, at least in cattle and swine, that the early prenatal ratios are higher than those at birth. If this trend is continued back to conception, primary sex ratios of 60% or even higher would he indicated. On the other hand, some results in mice and chickens, where every egg produced was accounted for, suggest an initial equality of sexes. The question must be considered still open.

The tertiary sex ratio. that is the ratio at any period after birth, has little biological meaning in domestic animals, since it is for the most part determined arbitrarily by the husbandman But even when there is no artificial adjustment, there is usually a differential survival rate with respect to sex. Thus F. A. E. Crew reported in swine a sex ratio of 51.2 at birth, which at weaning had dropped to 49.3, indicating a higher mortality of male pigs during this early life period.

For particular purposes the breeder often desires animals all of one sex, or at least to have one or the other sex greatly in excess. In polygamous animals fewer males than females are needed, hence in breeding groups the ratio of males is kept much lower. The number of males to breeding females maintained is ordinarily only 1 male to 10 or 20 females, or even more. With the advent and increasing use of artificial insemination, it may be anticipated that the ratio of males maintained will be considerably lower. The producer of dairy cattle places a premium on heifer calves and the chicken farmer who supplies an egg market prefers pullet chicks. He therefore adjusts the proportions of the sexes in his herds or flocks to meet his economic needs. In some instances this adjustment occurs very early, in other cases at a later age. The excess male calves are usually eliminated from the dairy herd as vealers at a very few weeks of age. In intensive poultry production the male and female hatchery-produced chicks are separated immediately after hatching, the latter going into egg-production flocks, while the former, except such as may be saved for reproduction, are raised for meat purposes as fryers, broilers or roasters.

In the farm mammals sex is recognizable at birth, making selective elimination an easy matter. Such is not ordinarily the case in the birds, however, and here special methods have to be employed. There are differences in the rudimentary sex organs of the newly hatched chick which may be distinguished by a skilled worker. This is known as the Japanese method of sexing chicks and is employed rather extensively. An accuracy of 85% or greater is claimed. Advantage may also be taken of sex-linked characters which occur in certain breeds. By making appropriate crosses, crossbred chicks will be produced in which the males have one colour of down and the females another, and the two sexes may be easily separated. This method involves the disadvantage that the parental breeds have to be maintained separately in order to make the crosses. More recently certain so-called *autosexing* breeds have been established in which the male and female chicks regularly differ with respect to a sex-linked character, thus obviating the necessity of crossbreeding to obtain 100% accuracy in sex-recognition. Such are the Cambar and Legbar in England and the Oklabar in the United States. This method is also being used to some extent with pigeons.

In hybrids between species there is commonly a considerable disparity in the secondary sex ratio, which is ordinarily greater the less closely the parent species are related. Usually females are in excess in mammals and males in birds. The only species hybrid of great economic importance is the mule, from mating of the ass and horse, with a resulting male ratio of 44.3. Certain wide crosses in pigeons produce almost 100% males, presumably due to the death of the female embryos at an early embryonic stage. The almost complete infertility of species hybrids precludes using them for further breeding.

The breeder has always been interested in the possibility of controlling the sex of the offspring before birth and innumerable means of doing this have been suggested, none of which has proven reliable. Recently much publicity has been given to a method of predetermining the sex of the offspring, particularly of farm animals, by controlling the acidity of the vagina at time of mating. An alkaline reaction was supposed to result in more males and an acid condition in more females. Careful experiments on rats, rabbits and swine have failed to substantiate these claims.

HUMAN, AT BIRTH AND DEATH

There is a very extensive and somewhat conflicting literature on the sex ratio at birth. One thing is definite, that in most populations males are born in excess of females in a ratio somewhere around 1,050 to 1,000. Comparative data which have been quoted for different races must be viewed with some reservation, since these ratios are easily disturbed by any inaccuracies, incompleteness or variations in methods of registration. Indeed, some very high figures occasionally cited may be fallacious, being coloured in part by a tendency among certain peoples to hold females in low esteem. With due allowance for these facts, the following reported figures may be cited as examples. In the congeries of peoples making up the former empire of Austria were to be found political divisions inhabited by populations of which the majority had more or less clearly differentiated racial characteristics. An investigation into the births for the three years 1904, 1907 and 1910 showed that among the Jews inhabiting the whole of the empire there were 1.091 males born to 1,000 females. In Dalmatia, with a preponderating Serbo-Croat population the male plurality was only 1,037. Bohemia and Moravia (Czechs) had a ratio of 1,056; Galicia (Poles) one of 1,060 and the coastlands (Italians) one of 1,065. The figures thus quoted relate to racial rather than political divisions, and to populations living under strictly comparable conditions. Going farther afield. data from the different provinces of India and from different parts of the Japanese empire show similar and sometimes extreme variations in the sex ratio at birth seemingly attributable to racial differences, though the statistics in these cases may be very unreliable.

Urbanization.— The general impression, gained from studies by a variety of authors in different countries, is that the sex ratio is somewhat higher in rural than in urban districts. This also appears for most items in Table I. The United States, however, in recent years forms an exception, and for the period 1930–34, the figures for the urban and rural ratios were 1055 9 and 1053.9 respectively, so that here the rural ratio was actually below the urban.

TABLE I —*Births by Sex—Urban and Rural Areas*

Country	Period	Number of births	Males to 1,000 females	
			Urban	Rural
England and Wales	1911–15	4,300,000	1,038	1,043
England and Wales	1936	605,292	1,053	1,058
Ireland	1906–14	600,000	1,048	1,052
Austria	1904–7–10	2,800,000	1,057	1,062
Setherlands	1911–15	850,000	1,045	1,055
U.S.A.	1915	2,800,000	1,054	1,058
U.S.A.	1925–29	13,417,000	1,058	1,058
U.S.A.	1930–34	12,077,000	1,056	1,054
Uruguay	1912–16	170,000	1,044	1,068
South Africa (Wh.)	1912–16	200,000	1,037	1,075
Cape Colony (Bl.)	1906–08	100,000	1,023	1,033

Order of Birth.— There seems little doubt that the sex ratio is higher among the first born than in subsequent births. In the United States in 1925–29, the sex ratio among the first born was 1063.2; for the fourth child 1053.3 and for the fifth and higher children 1051.0. Related to this phenomenon is the fact that there seems to be a tendency for a relatively high sex ratio among the children of very young mothers. So, in the United States 1917–24, the following were the sex ratios observed among the children born of mothers of successive ages.

Age of mother	Sex ratio
Under 15 years	1.229
1; to 34 years	1.060
35 to 54 years	1.055

Influence of War.—There is a popular belief that the proportion of males to females born increases after wars. The question has been much debated. The figures shown in Table II seem to indicate that World War I was indeed followed by an increase in the ratio of male to female births in Great Britain, Belgium, France, Germany, and in the two nonbelligerent countries most closely affected, namely the Netherlands and Switzerland, both of which had large bodies of troops under arms. Finland was less affected by the war in every way, and Italy is the only other belligerent showing no increase. For World War II, figures for the United States show practically no appreciable increase in masculinity, the figures for the years 1939–43 running as follows: 1054; 1055; 1054; 1058; 1055. Thus the only year to show possible evidence of a slight increase is 1942. The figures for England and Wales, on the other hand, do show a definite increase during the progress of the war. The figures for 1939–44, inclusive, are as follows: 1050; 1059; 1054; 1060; 1065; 1062.

TABLE 11.—*Sex Ratio at Birth*

Period	England and Wales	Scotland	Belgium	Bulgaria	Finland	France
1876–1905	1,035	1,050	1,045	1,075	1,053	1,044
1906–14	1,039	1,042	1,042	1,054	1,061	1,045
1915–20	1,048	1,053	1,054	1,072	1,061	1,054
1921–25	1,047	1,051	1,049	1,062	1,063	1,049

Period	Germany	Italy	Netherlands	Norway	Sweden	Switzerland
1876–1905	1,053	1,059	1,053	1,060	1,055	1,048
1906–14	1,055	1,056	1,051	1,060	1,061	1,036
1915–20	1,068	1,056*	1,059	1,059	1,058	1,049
1921–25	1,068	1,053	1,056	1,055	1,059	1,048

*1916–19.

Other Factors.— Many other factors have been alleged to affect the influence of masculinity at birth, among them being crossbreeding and illegitimacy. As to crossbreeding, in British Guiana, the masculinity of children of mixed parentage for the decade 1903–12 was lower than that of the East Indians or blacks, while in Rio de Janeiro from 1910–15, the ratio was whites 1049, mulattoes 979 and blacks 999. It is very probable that the effects of crossbreeding are determined by the nature of the cross. So, for instance, Ciocco, in studying conditions in the United States, found that when one parent was of foreign birth and the other native born, the sex ratio of the children tended to be greater or less than that among purely native born, according as the foreign-born parent belonged to a nationality with greater or less masculinity than the native-born U.S. population. For illegitimacy, the evidence is conflicting, though in the majority of countries illegitimate births show a preponderance of males. The figure for the United States as a whole is misleading, because it is strongly influenced by illegitimate births among the coloured people, where illegitimacy is much higher than among the white. When the illegitimate white births are segregated, it is found that the sex ratio among these was 1056 4 in 1926–29, and 1060.1 in 1930–34. It may be remarked that, to be of real value, figures on masculinity in illegitimate births should relate, not to numbers born out of wedlock, but to those resulting from casual unions. A certain proportion of the births classified as illegitimate is the result of unions which, though not recognized by the law or the church are, from the physiological point of view, marriages.

Sex Ratio at Death.— In speaking of the sex ratio at birth, it is unnecessary to specify the age, since this is necessarily zero. But in discussing the sex ratio at death the age is an important factor and must be specifically taken into account. To speak merely of the sex ratio of all deaths in a population is rather meaningless, since this ratio depends on the prevailing age distribution, and this in turn depends on the past history of the population, on the sex ratio at birth and on other factors.

A comparison of the sex ratio at death for males and females at every tenth year of life is shown in Table III for England and Wales and for the United States (white population). Practically throughout life the mortality of the male exceeds that of the female, and this is true even at the ages where women are exposed to special risks related to childbearing. The advantage in favour of females is undoubtedly due primarily to an underlying physiological superiority, as is clear from the fact that this advantage shows itself even in infancy. In the most productive period of life men, on the other hand, are exposed to greater risks than women in special occupational hazards, and the final picture is the composite of these various tendencies.

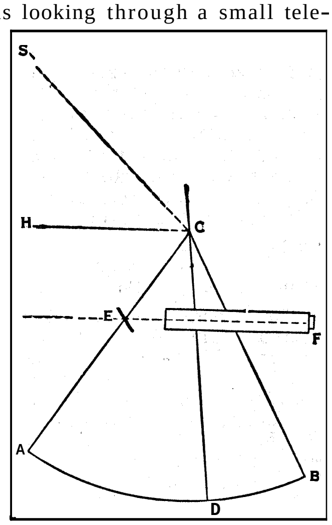
TABLE III —*Mortality Rates and Sex Ratio of the Same at Decennial Ages, United States, 1943, and England and Wales, 1930–32*

Age	United States, 1943			England and Wales, 1930–32		
	Mortality rate per 1,000		Ratio: White males to white females	Mortality rate per 1,000		Ratio: Males to females
	White males	White females		Males	Females	
0	42.30	32.91	1.29	71.86	54.55	1.32
10	.89	.61	1.46	1.46	1.34	1.09
20	2.62	1.23	2.13	3.16	2.68	1.18
30	2.77	1.91	1.45	3.40	3.19	1.07
40	4.96	3.41	1.45	5.62	4.40	1.28
50	11.59	7.26	1.60	11.28	8.16	1.38
60	25.67	16.55	1.55	24.15	17.70	1.36
70	55.30	41.54	1.33	60.35	44.51	1.36
80	126.95	108.95	1.17	145.00	118.58	1.22

BIBLIOGRAPHY.—An extensive bibliography will be found in A. Ciocco, "Variation in the Sex Ratio at Birth in the United States," *Human Biology*, p. 36 (Feb. 1938); see also R. M. Jenss, "An Inquiry into Methods of Studying the Sex Ratio at Birth for the United States during War and Post-War Years," *Human* Biology, p. 255 (Sept. 1943); H. H. Strandskov, "On the Variance of Human Live Birth Sex Ratios," *Human* Biology, p. 85 (Feb. 1942). (A. J. LO.)

SEXTANT, a sixth part of a circle. The name is applied especially to an optical instrument for measuring angular distances, invented by John Hadley in 1731. Hadley's original instrument was, strictly, an octant, employing a graduated arc of one-eighth of a circle. The arc was enlarged to one-sixth, to meet the needs of navigation, by Capt. Campbell in 1757.

The instrument is mainly used at sea, and the angle that is measured is the altitude of the sun (or a star) above the horizon (*see* NAVIGATION). A familiar sight on an ocean steamer is the officer on the bridge "shooting the sun" at noon, in order to determine his latitude. The officer is looking through a small telescope straight at the sea horizon; but he sees also an image of the sun (dimmed by an interposed dark glass) which has been reflected into his field of view by an arrangement of mirrors described below. He is slowly moving an arm which turns one of the mirrors until the solar image appears just to touch the sea-horizon.



The figure shows the construction of the sextant. ABC is a light framework of brass in the shape of a sector of 60°, the limb AB having a graduated arc of silver inlaid. It is held in the hand by a small handle at the back, either vertically in a position in front of the eye to measure the altitude of an object, or in the plane passing through two objects the angular distance of which is to be found. It may also be mounted on a stand. CD is a radius movable round C, where a small plane mirror of silvered plate-glass (called the "index glass") is fixed perpendicular to the plane of the sextant and in the line CD. At D is a vernier read through a microscope, also a clamp and a tangent screw for giving the arm CD a slow motion. At E is another mirror "the horizon glass," also perpendicular to the plane of the sextant and parallel to CB. F is a small telescope fixed across CB, and pointed to the mirror E. As only the loaer half of E is silvered, the observer can see the horizon in the telescope through the unsilvered half, while the light from the sun or a star S may be reflected from the index glass C to the silvered half of E and thence through F to the observer's eye. If CD has been moved so as to make the image of a star or of the limb of the sun coincide with that of the horizon, it is seen that the angle SCH (the altitude of the star or solar limb) equals twice the angle BCD. The limb AB is graduated so as to avoid the necessity of doubling the measured angle, a space marked as a degree on AB being in reality only 30'.

If the sextant is used on land an "artificial horizon" is required instead of the sea horizon. This consists of a trough containing a shallow layer of mercury, which gives a truly horizontal reflecting surface. The telescope F is now pointed downwards so as to view the sun's image reflected in the mercury trough; an image of the sun reflected by the sextant mirrors appears as before, and the two images are made to touch. The reading now gives the angle between the sun and its image in the mercury trough, which is double the angle between the sun and the horizon. In the air, however, the visible horizon is of no use, since its "dip" (below the truly horizontal direction) is large and unknown. The mercury trough is obviously unsuitable for use in an aeroplane. Hence some form of "bubble sextant" (see NAVIGATION) is used, in which a spirit level is reflected into the field of view in such a way that the centre of the bubble indicates the true horizon.

SEXUAL BEHAVIOUR. Definitions and Points of View.—Sexual behaviour could be discussed in terms of its ethical, sociological and biological aspects, but to consider the subject from every possible point of view would involve much more space than is available here. The sociological angle of approach presumably would deal on a descriptive level with the sexual mores and practices found in various human cultures; but, valuable as such data undoubtedly are, they are limited in the sense that they apply only to one of the thousands of species that inhabit the earth. Treatment of the ethical features of this subject would be extremely difficult and of questionable value, for moral standards change from generation to generation and vary widely from one society or culture to another. The biology of sexual behaviour, in contrast, is a basic part of natural science which can be considered objectively, without reference to moral values; and the zoological approach permits description of the behaviour of any animal, including man, in strictly factual terms.

The following discussion will deal with the sexual behaviour of many different kinds of organisms, and activities of the human animal will be treated in the same fashion as those of any other species. The mating responses of insects and other invertebrates are worthy of study, but because of space limitations only vertebrate animals can be considered here. The term "mating" will be applied exclusively to bodily activities directly associated with fertilization of the eggs. "Mating" thus becomes synonymous with "coition" when used in reference to those species which copulate, and, as applied to other organisms, it signifies behaviour accompanying release of eggs by the female and ejaculation of sperm by the male.

Behaviour Preceding Mating.—In many vertebrates the act of mating is preceded by various types and amounts of behavioural interaction between the male and female. Naturalists have lumped such activities together under the heading of "courtship" (see COURTSHIP, ANIMAL), and we shall follow this precedent although the term is poorly chosen, for it implies too close a similarity to human courtship. Generally speaking, the courtship of men and women involves highly complex patterns of social behaviour whereby mutual favour is established and emotional bonds are strengthened, and the eventual goal is the establishment of a marital relationship in which sexual activities represent only one of several equally important elements. Whether or not human courtship includes any behaviour which is sexual in the biological sense depends to a large degree upon the cultural setting in which it occurs, but certainly many patterns of courtship are removed from the biological plane. In other animals, ho ever, the actions belonging under this rubric serve several very important physiological functions.

(1) The attainment of a completely fertile condition in some animals depends upon courtship. Some sea birds nest in very large colonies of several hundred or many more individuals and indulge in mass displays and courting reactions for several days or even weeks before pairs are established. It appears that stimuli derived from the group courtship produce physiological changes in every bird in the colony. One important alteration is a gradual increase in the hormones of the pituitary gland which are essential to reproduction; but, if the colony is so small that communal courtship is markedly restricted, a high proportion of individuals fail to reach fertility.

(2) In many seasonally-breeding species males and females are fertile when the sexes congregate. but even in such cases courtship frequently is essential to reproduction. Many female fishes lay their eggs in previously prepared nests, and sperm are released directly above the fresh spawn by the male who follows close behind his mate. If a species is to be perpetuated by this type of mating, it is necessary that the behavioural responses of both partners occur at the proper place and in exact sequence; and in many species the essential behavioural integrations are brought about by a protracted courtship which leads gradually to the act of spawning. The synchronizing function of premating courtship is further illustrated in the sexual behaviour of certain salamanders which reproduce without laying eggs and without copulating. Walking slowly ahead of the female, the male deposits "spermatophores," small stump-shaped structures of jelly, each surmounted by a cap of sperm. The female straddles over each spermatophore, securing the sperm with the lips of her cloaca (sexual opening), and the eggs are then fertilized within her body. In salamandrian species with this mating pattern, integration of the behaviour of the male and female appears to depend upon the prolonged courtship activities which always precede a successful mating.

(3) Certain types of premating behaviour contribute to the establishment of oppositely-sexed pairs and decrease the likelihood that males will attempt to mate with males and females with females. When they attain breeding condition, male fishes, birds and reptiles of several species establish "sexual territories," and any intruder is vigorously attacked by the resident individual. If the newcomer is another male and does not withdraw before the advances of the resident animal, a fight ensues and the winner drives the loser out of the territory (see BIRD: Reproduction: Territory and Breeding Habits). Invading females are at first attacked as if they were males, and any female that does not have ovaries with maturing eggs beats a quick retreat. A female that is ready to breed does not retaliate as would a male nor attempt to escape in the manner of a nonreceptive female, and her passive toleration of the male's aggression results in a decrease in the frequency and intensity of his attacks. Gradually, as the male's fighting responses are replaced by courtship activities, the pair is established and mating follows.

(4) In addition to inducing physiological preparedness or fertility, facilitating the integration of separate responses into a biologically effective pattern and assisting in the establishment of heterosexual pairs, the courtship of animals appears in many instances to serve yet another function—namely, the generation of a temporary state of intense excitement which is essential, in some species at least, to the occurrence of a complete mating. To the uninitiated observer copulation by a pair of minks resembles a fight, for the female periodically resists her mate, and in his efforts to achieve intromission the male makes full use of his superior size and strength. This is, however, not an example of rape, for it is physically impossible for the most powerful male

to achieve sexual union with a nonreceptive female; in fact, the violent physical exertions of both animals are essential to fertile mating. Males often refuse to mate with a female that submits too easily, and the release of ripe eggs from the female's ovaries to the Fallopian tubes where fertilization takes place depends upon stimulation derived from her struggles with the male. Egg release may occur in the female after a protracted sexual chase or fight, even though copulation does not occur, and, in contrast, matings which take place with very little activity usually are infertile.

The forms of physical contact which engender sexual excitement differ from species to species. An important element in the courtship of the common pigeon is the act of "billing," during which the female inserts her bill within that of the male (or vice versa) and the birds bob their heads up and down in a pumping motion. Copulation usually occurs directly after a sequence of billings, and coition rarely takes place in the absence of this preparatory behaviour. Direct investigation and stimulation of the external genital organs forms a fundamental segment in the premating behaviour of many fishes, amphibians, birds and mammals. The characteristic licking and nibbling with which male mammals of many domestic species investigate the genital region of the female in heat is well known, and the resulting sensations seem in many cases to serve an important function. Just before mating, the male skunk scratches at the female's vulva with his claws, and in response the female assumes the coital posture which is essential to successful copulation. The female cat in heat is induced to display the sexual crouch when the male grips the loose skin of her neck in his teeth and probes her external genitalia with the erect phallus.

The coition of all primates, including man, tends to be preceded by various forms of stimulation which serve to evoke or intensify sexual excitement. Female monkeys and apes invite the male's advances by executing the "sexual presentation," which consists of bending forward sharply at the hips and exposing the buttocks and genitalia. A very similar behaviour pattern occurs in a few human cultures in which open sexual solicitation by women is countenanced. The investigatory responses with which the female chimpanzee greets the male sometimes include handling of the penis and scrotum, and the resultant sexual excitement often culminates in coition. Almost every region of the partner's body is explored and stimulated in the course of the precopulatory activities of apes, but the male's attention is focused particularly upon the female's genitalia. The female's vagina is thoroughly investigated with the male's fingers and often with his tongue and lips, and the excitatory value of such stimulation is revealed by the fact that it often produces erection and pulsation of the clitoris.

The sexually-exciting function of certain forms of stimulation in humans is indicated by the almost universal occurrence of particular types of bodily contact before coition. The complexity and duration of precopulatory behaviour may be influenced by the mores of the social group, but in the absence of cultural prohibitions the premating activities of the human species resemble in many respects those of other primates. Mutual masturbation and mouth-genital contact appear regularly in the sexual behaviour of some cultures, and the stimulation of specific erotic zones such as the female breast is practised in many societies. The similarity of the precoital activities of humans and other primates suggests the existence of an underlying biological pattern common to the order, and the belief that such widely distributed responses as mouth-genital contact are "abnormal" or "perverted" is probably incorrect from the strictly zoological point of view.

Behaviour During Mating. — For descriptive purposes the types of mating shown by different vertebrates can be divided into two major classes, depending upon whether fertilization is external or internal. If the eggs are fertilized after they leave the female's body, mating can occur — and in many species does occur — without any union of male and female sexual organs. In fact, the bodies of the pair may never come in contact during the emission of eggs by the female and of sperm by the male. This type of mating is characteristic of those species of fishes in which the female deposits the eggs and the male releases sperm as he swims behind her.

In other species which reproduce by external fertilization, the eggs and sperm are released simultaneously and the meeting of male and female germ cells depends upon the fact that the sexual openings of the pair are in close proximity at the moment of emission. The mating of some fishes occurs as the male and female swim side by side with their bodies pressed tightly together in such a way that the genital pore of the male is held very near to that of his mate while the eggs and sperm are being released. Approximation of the genitalia is achieved in a different fashion during the mating of frogs and toads, which also depend upon external fertilization. The male swims or climbs upon the back of the female, clasping his forelimbs about her body in the region of the chest; and the male's sexual ejaculations are timed to coincide with the abdominal contractions by means of which the female expels her eggs. When oviposition is completed, the mating clasp is relaxed and the pair separates.

The eggs of many vertebrates are fertilized within the female's reproductive tract, and the mating pattern associated with internal fertilization nearly always culminates in direct contact between the sexual organs of the pair. This is not true in a few species like the salamanders described above, but such exceptions are relatively rare. Transfer of sperm from male to female is achieved through one of two types of genital union: simple contact of the male and female cloacae suffices for species in which the male lacks an intromittent organ; and in all other vertebrates the male's copulatory organ is inserted within the female's cloaca or vagina.

The copulation of most birds involves only cloacal contact. Having been prepared for mating by the preceding courtship, the sexually receptive female stoops or squats, holding her body more or less parallel to the substrate, and the male stands upon her back, maintaining an upright position by vigorous wing flapping. The female's tail feathers are diverted and copulation occurs as the male lowers his rump, pressing his genital opening tightly against that of the female. Sperm transfer is effected in a matter of seconds and the male dismounts with relatively little delay.

Sexual intromission occurs in the mating of some fishes, reptiles and birds and in all mammals. In the male fish of many viviparous species the anal fin is transformed into a movable "gonopod" which may be inserted in the female's genital pore at the moment of sperm release. The masculine sexual organ of most reptiles consists of a bifurcated, saclike structure which is retained within the body cavity save during the time of mating. The copulation of snakes is achieved while the bodies of the male and female are closely intertwined and the sexual parts are in contact or juxtaposition. The male lizard usually grips the neck of the receptive female in his jaws and straddles her body with his legs. Bending the hind parts of his body to one side and downward, he gradually inverts his tail until its under surface is brought against the under side of the female. In this position the male's hemipenis is everted and enters the female's cloaca. The duration of intromission may vary from several minutes to an hour or more.

A few male birds, notably ganders, drakes and others of the order Anseriformes, possess an erectile copulatory organ similar in several respects to the mammalian penis. In such species the outward form of the mating pattern is like that of other members of the class, but the male's organ is inserted within that of the female prior to the emission of sperm.

The copulatory actions characteristic of quadrupedal mammals are relatively stereotyped and well known. The essential elements in the female's pattern consist of standing still, flattening or depressing the back and exposing the elevated genital region. The male always mounts from the rear with his forelimbs resting upon the female's back or encircling her sides. Anecdotal reports of species which copulate with the female in a reclining position and facing the male almost certainly are in error and seem to be based upon pure speculation or upon ignorance of the true nature of the behaviour under observation.

The copulation of monkeys takes place while the standing female bends sharply forward at the hips and the male achieves intromission from the rear, holding himself erect by grasping the hips or waist of his mate. The coital pattern of apes is similar to that of lower primates, and adult pairs apparently do not copulate in a face-to-face position, although this variation may occur occasionally in the sexual play of very young chimpanzees. The possibility of successful "ventro-ventro" copulation would seem to be limited to species, like man, in which structural modifications accompanying the assumption of an upright posture have brought the vaginal opening to the front of the body. Even among humans, however, preferred coital positions vary from society to society, and the bodily relationship common to European cultures (reclining posture, face-to-face, male usually uppermost) is far from universal.

Females of most mammalian species display relatively little activity during copulation, although in a few cases the hindquarters may be moved from side to side or pushed steadily against the male. The coital response of the male involves a variable number of pelvic thrusts which assist in insertion of the penis or serve to move the male organ back and forth within the vagina, producing stimulation which contributes to the occurrence of ejaculation. Ejaculation in most human males is accompanied by a release of tension and may be followed by a period of relative impotence. The subjective aspects of this phenomenon can not be studied in lower animals, but behavioural criteria suggest that something similar to orgasm occurs in at least a few species. The male rabbit, for example, utters a sharp cry and falls off the female just after ejaculation; and in the male rat the emission of sperm is accompanied by mild convulsive reactions followed by a period of lowered sexual responsiveness. Whether or not female animals below the human level experience any orgasmic sensations during intercourse is not known.

Self-Stimulation. — Different human cultures impose varying degrees of social restraint upon the exercise of autoerotic behaviour, but it can hardly be doubted that in every culture at least some men and women practise various methods of self-stimulation leading to intense degrees of sexual arousal The moral or sociological implications of such behaviour are irrelevant from the biological point of view, but studies of other primates indicate that autoerotic responses may be regarded as a common element in the sexual pattern of the entire order.

Male apes and monkeys use the hands and the mouth to stimulate their own sexual organs and ejaculation frequently is produced by either means. This response has been observed not only in caged animals but in wild monkeys living with females under natural conditions, and therefore it can not be regarded as "abnormal" behaviour produced by the artificial conditions of captivity. Autoerotic activities appear less frequently in the behaviour of female primates, but female chimpanzees occasionally stimulate their own genitalia, using their fingers, foreign objects such as twigs, or projections of larger objects such as the corner of a box or the spigot of a water faucet.

Animals belonging below the primates upon the evolutionary scale show little behaviour which can definitely be described as autoerotic but it may be noted that in many mammalian species copulation is preceded or followed by vigorous licking of the genitals in both sexes.

Sex **Play** Before Adulthood. — In many vertebrates certain elements of the adult mating pattern tend to occur long before reproductive maturity is attained. For example, young rats which have just been weaned indulge in mock fighting and wrestling in the course of which mounting with pelvic thrusts occasionally appears; and similar responses have been observed in the behaviour of other rodents. The sexual play of immature primates is more varied than that of lower mammals and resembles more closely the mating of adult animals. Both heterosexual and autoerotic responses occur quite early in the life of monkeys and apes. Male monkeys practise masturbation and employ rubber playthings in a sexual fashion as early as two years after birth. Although chimpanzees are not capable of reproduction until the eighth year or later, male and female infants two years of age indulge in highly complex sexual play which sometimes progresses as far as the achievement of intromission and the execution of pelvic thrusts.

With such a biological background it is not surprising that members of the human species exhibit sexual activity during childhood. The restraints and inhibitions imposed upon this type of behaviour in most societies probably reduce its frequency to some extent; but it is doubtful that sex play is ever totally prevented, although in the presence of strong social taboos it is very difficult to reach any completely satisfactory estimate of the form and frequency of such activity. More reliable information is obtainable in cultural settings which do not restrict sexual activities during childhood, and under such conditions nearly every element in the adult sexual pattern appears several years before puberty.

Effects of Experience. — The widespread occurrence of sex play in juvenile members of many mammalian species naturally raises the question as to whether sexual experience gained during infancy and adolescence has any effect upon mating behaviour in adulthood. Reliable data bearing on this question are not numerous, but it is clear that the answer varies for different species.

No previous sexual experience is necessary for completely normal mating in most of the lower mammals. Males and females which are reared to adulthood in total isolation from all others of their species, and then put together at a time when the female is in heat. mate promptly in a manner indistinguishable from that of experienced breeders.

The situation is somewhat different in primates. Reproductively mature male monkeys which have never mated sometimes experience difficulty in making the essential coital adjustments during initial contacts with a receptive female. No such inadequacy is apparent in the performance of the sexually inexperienced female. Adult male chimpanzees completely lacking in copulatory experience rarely succeed in achieving sexual union with the female, no matter how co-operative she may be.

Erotic arousal is easily evoked in the naïve male ape. but a great deal of experience and practice must take place before this generalized sexual excitement leads smoothly into a well-integrated and complete copulatory pattern.

The mating responses of most sexually inexperienced female chimpanzees stand in striking contrast to those of the unsophisticated male. If she is placed with an experienced consort, the receptive young female often assumes her proper role with very little awkwardness or hesitation, and intercourse is accomplished without difficulty or delay. If both the male and female are inexperienced, the female not only performs all of the responses necessary for her part of the act, but she may even try to assist the male in the execution of his responsibilities.

We have no direct knowledge concerning the importance of learning in human sexual behaviour. Vicarious experience made possible through language might well replace at least part of the trial-and-error behaviour which seems necessary in the, case of subhuman primates. However, the zoological evidence makes it appear probable that in the absence of such vicarious experience, and perhaps even when it is present, a considerable amount of preliminary experimentation and practice is essential to biologically effective sexual intercourse in adult human beings.

It appears that in the course of mammalian evolution, particularly during the appearance and specialization of the higher primates. the mating behaviour of the male (and possibly in humans that of the female as well) has come to be more and more dependent upon individual experience and learning. This implies, of course, a complementary decrease in the adequacy of the purely instinctive elements of the pattern.

"Bisexual" **Behaviour.**—Under certain conditions male and female animals display mating responses which are typical of the opposite sex. Thus, sexually-receptive females of several mammalian species respond to other females which are in heat by mounting them in masculine fashion and executing pelvic movements suggestive of the male's copulatory thrusts. This display of malelike reactions is not "abnormal" in the biological sense; instead, in several species such as cattle, pigs, guinea pigs and rabbits, these responses constitute a regular element in the female's mating pattern, and their appearance is a reliable sign that she is in heat and ready to receive the male. Since nearly all normal females of such species show the complete feminine pattern in addition to portions of the masculine pattern, their behaviour is best described as "bisexual"; and it should be noted that, when a choice is offered, the female mates with the male instead of executing masculine responses toward another female.

Male mammals which are sexually excited sometimes mount other males, treating them as though they were females. Behaviour of this type probably arises from failure to discriminate the sex of the partner under conditions of high excitement and should not be regarded as indication of a preference for sexual relations with members of the same sex.

Support for the first interpretation is seen in the fact that, when both males and females are available, females are always selected as the mate. Occasionally a male that is mounted by other males responds with the temporary display of feminine mating reactions. Such individuals are rare, but their behaviour should probably be regarded as "bisexual," for they inevitably respond in typical masculine fashion to receptive females.

The behaviour of male and female animals thus reveals that the inherited neuro-muscular constitution of both sexes includes mechanisms capable of mediating many of the responses which make up the mating pattern of the opposite sex. However, we do not find any convincing examples of true "homosexuality" among subhuman forms.

The individual incapable of responding to any member of the opposite sex, but experiencing full arousal and satisfaction in contacts with his or her own sex, appears to be primarily if not exclusively a product of human society.

Effects of **Sex** Hormones on Mating **Behaviour.**—In addition to producing sperm or eggs, the male and female gonads (sex glands) manufacture and secrete into the blood stream testicular and ovarian hormones—complex organic compounds which have been analyzed and synthesized in the laboratory.

The fact that gonadal hormones control the mating behaviour of some species is revealed by observations of the reproductive cycle in animals which breed only once each year. With the approach of the breeding season the ovaries and testes increase markedly in size and begin to release the sex hormones which are primarily responsible for the obvious behavioural changes that characterize animals during the rut.

If seasonal recrudescence of the gonads fails to occur, the behavioural changes do not appear. In some species, growth of the sex glands can be experimentally induced at any time of year; and artificially produced activity of the gonads is accompanied by the unseasonal appearance of courtship and mating behaviour.

Males of some mammalian species are sexually active throughout most of the year, while the female becomes fertile and is "in heat" at regular intervals unless pregnancy intervenes. Under such circumstances, the ovaries secrete large amounts of the hormone or hormones responsible for the female's mating behaviour, just at the time that ripe eggs are ready to leave the ovary and pass into the oviduct, where fertilization will occur if mating takes place. The effective hormone concentrations thus are present to produce sexual receptivity only during the limited period that fertile mating, and therefore perpetuation of the species, is possible; and during all other stages of the female's reproductive cycle she is infertile and will not permit mating.

This generalization holds true for nearly all mammals which stand below the primates on the evolutionary scale, but it is not applicable to monkeys, apes or humans. The sex glands of female primates show a periodicity of function resembling in all essential details the ovarian rhythm of lower mammals. Eggs mature and are extruded from the ovaries at fairly regular intervals, and the secretion of sex hormones rises and falls in close relationship with the resultant fluctuations in fertility.

The sexual behaviour of the female primate is not, however, entirely restricted to any single phase of the gonadal cycle. Wild female monkeys have been caught in the jungle immediately after they were observed in copulation, and examination of the ovaries and uterus has shown that, although nearly all matings are restricted to the fertile period, coition does occasionally occur when the ovaries are not secreting large amounts of the hormones ordinarily associated with sexual receptivity.

The mating behaviour of female apes shows a much greater degree of emancipation from control by sex hormones. Chimpanzees may indulge in sexual intercourse during any stage of the female's reproductive cycle, although her eagerness to copulate is most obvious and intense near the time of ovulation. Social factors often take precedence over physiological condition. For example, during their infertile periods females sometimes divert an impending attack by the male by inviting and permitting copulation. In the course of various psychological experiments female apes have been observed to obtain food from the male by proffering sexual services and then seizing and devouring the choice morsel while the male's attention was diverted.

The relaxation of hormonal control over sexual excitability reaches its apex in the human female. Most of the published attempts to identify a cycle of sexual desire in women indicate one or two peaks of erotic responsiveness which come either immediately before or after menstruation in different individuals and at both times in others. It is significant that very few investigators have reported maximal responsiveness during the midmenstrual period when concentrations of the "heat-producing" hormones are highest and most women are fertile.

These observations suggest the interesting hypothesis that within the zoological class Mammalia, advancing evolutionary status is accompanied by progressive reduction of hormonal dominance over the female's sexual behaviour. This interpretation is supported by comparisons of the effects of removal of the ovaries in various species. Spayed females of lower mammalian species never come into heat or show any willingness to receive the male. However, if such animals are injected with ovarian hormones, mating behaviour appears promptly. although of course pregnancy does not occur since there are no eggs to be fertilized. Loss of the sex glands usually eliminates all mating behaviour in female monkeys, but upon rare occasions a few weak signs of receptivity may appear. Administration of ovarian hormones induces full sexual activity in the spayed monkey.

Some female chimpanzees continue to cohabit with the sexually active male despite removal of the ovaries. It is nevertheless obvious that hormonal effects are important in this species, for when ovariectomized apes are injected with the appropriate ovarian secretions their sexual behaviour becomes much more vigorous and frequent. Loss of the ovaries does not necessarily produce a change in the human female's capacity for sexual performance. Scientifically admissible evidence is so scanty that generalizations must be made with extreme caution, but there are many reasons to believe that if general health is not impaired and if the mental attitude is favourable, loss of the woman's sex glands need not interfere with mutually satisfactory intercourse. Differences between individuals are pronounced, however, and in some instances ovarian removal is followed by a definite reduction in sexual responsiveness. The effectiveness of administering sex hormones to such cases is at present subject to controversy; but it is quite clear that the results are less consistent and predictable than they are in the case of other primates. This fact further substantiates the conclusion that the sex life of the human female is not influenced by gonadal hormones to the same degree as is that of lower species.

Males of constantly-breeding mammalian species do not exhibit sex cycles, and therefore our knowledge of the role of testicular hormone in the male's mating behaviour is based chiefly upon the effects of castration and subsequent hormone administration. If the testes are removed before adolescence, males of most of the lower mammalian species show very little sexual behaviour when they reach adulthood; but normal mating performance can be elicited by the administration of testicular hormone. Castration in adulthood usually is followed by gradual loss of sexual responsiveness and ability to mate; and these changes can be prevented or reversed by the proper hormone treatment.

There are indications that castration during infancy does not prevent male chimpanzees from showing some copulatory behaviour in adulthood. Despite such operation, some chimpanzees may perform coitus frequently, although ejaculation does not occur. Administration of testicular hormone evokes the appearance of this final element in the normal male's mating pattern.

The effects of removal of the testes in young boys are variable, but in the majority of individuals the sexual development which normally occurs at the time of puberty never takes place, and the capacity for intercourse in adult life is extremely limited. In many cases of this sort, treatment with testicular hormone during adulthood has induced delayed puberty and produced significant increases in sexual ability.

Loss of the testes after the attainment of maturity seems to have very little effect upon some men and to cause pronounced changes in others. Some patients have reported undiminished sexual desire and capacity continuing for as long as 30 years after complete castration; but most individuals experience a reduction in erotic excitability and coital ability which becomes apparent from several months to a few years after operation and proceeds gradually to a point where intercourse is possible only at infrequent intervals. If testicular hormone is administered to castrated men, it usually restores the capacity for normal sexual behaviour.

Although the data are too few to justify any final conclusions, it may be suggested that while the sexual behaviour of all male mammals is clearly influenced by testicular hormone. the degree of dependence may be somewhat less marked in primates than in lower species, and in at least some humans considerable sexual activity is possible in complete absence of testis secretions. See also references under "Sexual Behaviour" in the Index volume.

SEXUAL DEVIATIONS are ways of sexual behaviour which replace normal copulation. This article will be confined to certain practices which either do not terminate in normal intercourse or involve some degree of physical injury. Normal sexual desire has (1) as its object a person of the opposite sex of more or less the same age as the person feeling the desire; and (2) as its mode of expression the loveplay and intercourse necessary for the fertilization of the female. In the sexual deviations, the object may be unbiological (for instance a person of the same sex, a child or an animal) or the mode of expression only may be at fault.

Deviated conduct occurs in animals as well as in human beings; it is apparent sometimes in the immature, but more often in animals deprived of a normal outlet for their instincts. Conditioning may have a great deal to do with causing it, although much arises spontaneously. In human beings it may be regarded as caused either by some biological residue (apes appear to pass through a stage of undefined sexual activity) or. according to Sigmund Freud, by a fixation of the individual libido resulting from a traumatic experience during an early stage of development. Environment, however, appears to be important as a possible cause.

Sexual deviations may lead to unhappiness in marriage, either because they often result in impotence or because of the very nature of the deviation. They are also a major factor in the demand for prostitution and may further lead to crime. Medically, however, they are regarded as psychosexual diseases, and the law is becoming more and more willing to allow deviant offenders to be treated rather than punished. Some deviations are definitely curable; some can be alleviated. Since glandular and other physical conditions play only a slight part in causation, treatment must be mainly by psychotherapy. This may be easy or take a long time, according to the nature of the cause. Patients should not be encouraged to marry until there is strong evidence of cure. Those who cannot be cured should avoid drinking alcohol, as it may release deviant behaviour and lead to criminal charges. Treatment by conditioning has been tried but not proved satisfactory. In this the patient is shown objects associated with his perversion and given an emetic such as apomorphine at the same time. More useful is the prescription of stilbestrol or estrogens which suppress the libido in males, simultaneously causing atrophy of the genitalia. This treatment should be used in patients unsuitable for psychotherapy or in whom it has failed.

Homosexuality. — Homosexuality (*q.v.*), the female form of which is known as lesbianism (*q.v.*), is the most important sexual deviation. In it the object of desire is unbiological, so that the mode of expression is perforce at fault.

Sodomy.—This expression may be understood in a number of senses: (1) as denoting any homosexual practices between men, in allusion to the story of Sodom, in Gen. xviii–xix; (2) as denoting anal intercourse; (3) as synonymous with bestiality (see below); and (4) as comprehending a number of activities ranging from hand-genital contacts with minors to mouth-genital contacts between persons of the opposite sex. In this article it is understood in the second sense.

Anal intercourse has been observed in apes and is often accepted as normal between men and boys in preliterate societies, notably during initiation rites. In civilized communities it occurs between male homosexuals (though far less frequently than is commonly supposed) and also between men and women. Between men the passive partner as well as the active one may experience pleasure, but if the act is committed by force he may suffer painful injuries. The man who plays the active role with one partner may assume the passive with another.

The desire for anal intercourse has been explained (1) as arising from lack of opportunity for vaginal intercourse, an explanation which cannot be maintained in view of men's committing it on women; (2) as caused by Pavlovian conditioning, which may be of some importance in the case of boys habituated to the passive role; (3) as caused by fixation of the libido at the stage where sexual interest, after being centred on the mouth, is centred on the anus, from which it would normally, but for the fixation, proceed to the genitalia; and (4) as a dominance phenomenon, a view which receives some support from the behaviour of apes (when a weaker one turns to be mounted sexually if a stronger one threatens to steal its food) but does not account for human behaviour in all its aspects.

"The abominable crime of buggery," meaning either anal penetration or intercourse with animals, was punishable by death in England under a 16th-century act (25 Henry VIII c.6). The Offences Against the Person act (1861) reduced the penalty to penal servitude for life or for a term not less than ten years. Attempts are punishable under section 62 of the same act by imprisonment for between three and ten years.

Bestiality. — Intercourse between human beings and animals (Lat. bestiae) is tolerated and even approved by some primitive societies, but many races condemn it and some even punish it with death. In some parts of the United States it was estimated by A. C. Kinsey that between 40% and 50% of boys brought up on farms have some sexual relation with an animal, vaginal intercourse being commoner than anal. The cause of the desire for it is not known for certain; sometimes, however, there may be some inhibition against relations with another human being, or the animal may symbolize a loved human in the deviant's subconscious mind.

Sadism. — Named after the marquis D. A. F. de Sade (*q.v.*), sadism is the obtaining of sexual pleasure from acts of cruelty. Sometimes sadism and masochism (see below) are regarded as correlative aspects of a single deviant tendency, sado-masochism. Sadism appears to shade off into nonsexual cruelty and may be classified in degrees as (1) cruel or destructive acts performed with pleasure but not appreciated as sexual in nature, including certain sports, arson and lynching; (2) cruel acts without erection or ejaculation but with some sexual satisfaction; and (3) acts of outrage accompanied by full sexual satisfaction and associated with erection and ejaculation, including necrophilia (intercourse with the dead) and rape.

Sadism is the association of the aggressive instincts with sexual arousal. Freud (Psychoanalyse, 1917) suggested that this was caused by the fixation of the libido at some early stage when aggression was manifested by biting, scratching, soiling or some such act. L. Bender and F. J. Curran suggested that rivalry was important, deprivation of love and parental aggression being other factors. The sadist uses hate as the emotional currency where the normal man uses love. He injures the parts of the woman a normal man wishes to caress. There is often an obsessional element present, and B. Karpman (*The* Sexual Offender and His Offenses, 1954) states, "The abnormal expression of sadism represents inner tension and anxiety for which the act is attempted relief. He relieves fear by doing to another what he fears might be done to him."

Sadism is most dangerous when the sadist is also a psychopath and therefore has no inhibitions against antisocial conduct. Murders and violent assaults are then done repeatedly until the sadist is caught. Characteristic of the sadistic murder are (1) periodicity; (2) cutting, stabbing and sometimes biting, sucking the blood and even eating the flesh; (3) concomitant sexual excitement; (4) the occasional revisiting of the scene of the crime; and (5) normal behaviour until the next occasion.

There is no separate legislation against sadists, but they may offend against the laws covering assault if the victim does not die, or those covering murder if death results. Their mental abnormality in most cases does not amount to insanity and is no excuse for their crimes, but when sadism shades off into schizophrenia the individual may be regarded as irresponsible.

Masochism. — Masochism. the converse of sadism in the sadomasochistic deviation, is named after the Austrian novelist Leopold von Sacher-Masoch (1835–95), whose writings are centred on it. It is the seeking of what would normally be painful to oneself to induce sexual pleasure. Often associated with fetishisms, it may take the form of a desire to be dominated, humiliated, degraded, enslaved, bound and even castrated and may also appear unrelated to sexual pleasure, as in the practice of religious flagellation.

Masochism appears to be the impulse to hurt others reversed onto oneself. Freud suggested that it was a manifestation of being beaten in infancy. He also believed that the girl's discovery that she had no penis was a strong factor in feminine masochism. K. Horney suggests conditioning as the cause.

Masochism is less important than sadism socially. It does not inspire murders or assaults, but sometimes the masochist is injured so severely as to need medical care or even to die. Thus anyone co-operating with a masochist may lay himself open to charges of assault, manslaughter or murder.

Voyeurism. — Voyeurism, or scoptophilia, is the reverse of exhibitionism (see below), just as masochism is the reverse of sadism. Thus it is often called scoptophilio-exhibitionism. It is the obtaining of pleasure by watching other people undress or by watching sexual intercourse. Voyeurs who are not satisfied by vaudeville acts such as strip tease may go to immense trouble to spy on other people and have been known to fall from buildings and trains in doing so.

Voyeurism appears to be derived from the infantile desire to look. Young monkeys. for instance, are absorbed by the sight of their mother's genitals, and children are intensely curious about sexual matters. Psychoanalysts believe that the voyeur has repressed experiences of the primal scene (*i.e.*, observation of parental intercourse) and is trying to overcome a fear of castration. In normal men the wish to look is a sign of sexual attraction and preliminary to further advances, but in voyeurism all the sexual pleasure comes from looking at nakedness or intercourse. Probably those who watch mating couples show considerable empathy, or imaginative involvement in the act. A. C. Kinsey and his associates pointed out that voyeurism and exhibitionism form an important part of preadolescent sex play. This suggests that, like all deviations, it stems from immaturity.

Voyeurs are called "Peeping Toms." from the legend of Godiva (*q.v.*) and are prosecuted for behaviour contrary to common law and, in England. to the Justices of the Peace act of 1361.

Exhibitionism. — Exhibitionism, or sexual exposure. is exposing the genitalia to obtain sexual pleasure. It usually occurs in males. In exhibitionism the mere showing of the genitals is not sufficient. some emotional reaction is sought from the person to whom exposure is made, viz., disgust or horror. Ejaculation may occur at or after exposure, or the patient may masturbate.

The psychoanalyst believes that exhibitionism is the denial of castration and that the shocked reaction of the onlooker proves to the exhibitionist that his own unconscious fears are unfounded. This explanation is not altogether satisfactory. Psychoanalysts also believe that the castration shock is greater in women than in man, and if this is so one would expect women to be more sexually exhibitionistic than men. Men with castration fears are not necessarily exhibitionistic. Biologically, exhibitionism is the seeking of love. It can be seen in the love dances of many animals, including apes, and in the sexual dances of primitive tribes. Clinically it is often seen, as N. K. Rickles suggested, in men who live in a female-dominated environment. Where a man is subservient to an assertive wife or mother he sometimes goes to some place where he exhibits himself as a means of proving his virility. This desire to assert his masculinity may be uncontrollable.

Exhibitionism (indecent exposure) is an offense under common law and under the Vagrancy act of 1924 and Town Police Clauses act of 1847.

SEXUAL SELECTION: see SELECTION: Sexual Selection.

SEYCHELLES, an archipelago in the Indian ocean, including islands and islets, between 4° and 10° S. latitude and 46° and 57" E. longitude. With the Amirante Isles, Cosmoledo group, Aldabra Islands and other islands they form the British colony of Seychelles. The outlying islands lie southwest of the Seychelles group and between that archipelago and Madagascar. The 92 islands under the Seychelles government have a total area of 156 sq.mi. There are in addition 40,000 to 50,000 sq.mi. of coral banks within the bounds of the colony.

The Seychelles lie, with two exceptions, toward the centre of a large submarine bank and are all within the 50-fathom line. Mahé, the largest island, is 600 mi. from Madagascar, 934 mi. from Mauritius and 970 mi. from Mombasa. The other chief islands form two principal groups: (1) Praslin, with La Digue, Félicité, East Sister, West Sister, Curieuse and Aride; (2) Silhouette and North Island. The most easterly island is Frigate, the most southerly Platte; on the northern edge of the reef are Bird and Denis islands.

Mahé Island, 16 mi. long and 4 mi. wide, has an area of 55 sq.mi. There are small areas of lowlands, chiefly at the mouths of the rivers, but most of the island is mountainous and in general the hills rise abruptly from the sea. The highest peaks are Morne Seychellois, 3.008 ft., and Trois Frères, 2,510 ft. The main ridge runs north and south and from the heights descend many torrents, the whole island being well watered. The capital and principal port, Victoria, is on the northeast coast and is approached by a deep channel through the coral reef which fringes the entire eastern side of the island. Of the small islands close to Mahé, the chief are St. Anne and Cerf, off the east, and Conception and Thérèse off the west coast.

Praslin Island is 8 mi. long and from 1 to 3 mi. wide, and its highest point is 1,260 ft.; La Digue covers 3.9 sq.mi., and its greatest height is 1,175 ft.; Silhouette, roughly circular, covers 8 sq mi and culminates in Mon Plaisir, 2,473 ft. Aldabra, the outlying island farthest from the main group, is 630 mi. from Mahé.

Geology.—Most of the islands are of granite (hornblende or hornblende-biotite variety), in places fringed by coral reefs; Silhouette and Long islands are of typical syenite, while there are dikes and sheets of a younger vogesite, dolerite, porphyrite suite. Bird and Denis islands are of coral limestones, while the basement rocks are represented by clay slates on Silhouette Island and hornstones on Stag's Island. The group is probably a detached and partially submerged portion of Gondwanaland. Inland cliffs indicate a recent uplift of about 200 ft.

Climate. — The climate is equable, and the temperature varies on the coast from about 68" to 88° F., falling at night in the higher regions to 60° or 55° F. The mean coast temperature exceeds 79° F. The southeast monsoon blows from May to October. which is the dry season, and the west-northwest monsoon from December to March During April and November the winds are variable. The average annual rainfall on the coast is 90 in.; it increases to about 120 in at a height of 600 ft., and at heights exceeding 2,000 ft. is about 150 in. The Seychelles lie outside the track of the hurricanes which occasionally devastate Réunion and Mauritius The public health is good.

Vegetation and Animal Life.—Both flora and fauna include species and genera peculiar to the Seychelles. Of these the best knoan is the *Lodoicea sechellarum,* a palm tree indigenous only in Praslin Island, but introduced into Curieuse—noted for its fruit, the so-called Maldive double coconut or *coco de mer*. Another tree found only in the islands is the capucin *(Northea sechellarum)*, ravaged badly by an introduced green beetle. Characteristic of the forests of the coastal belt are the mangrove and *Pandanus,* and. a little inland, the banyan *(Ficus), Pisonia* and *Hernandia.* The coconut is a characteristic feature of the coast. The forests of the granitic land have the characteristics of a tropical moist region, palms. shrubs, climbing and tree ferns growing luxuriantly, the trees on the mountain sides, such as the *Pandanus sechellarum,* sending down roots over the rocks and boulders from 70 to 100 ft. Of timber trees the bois gayac has disappeared, but bois de fer *(Stadtmannia sideroxylon)* and bois de natte *(Mnbn sechellarum)* still flourish on Silhouette Island. Besides cutting for building, the jungle was largely cleared for the planting of vanilla; a multitude of other tropical plants have been introduced. The most important of the trees introduced since 1900 are various kinds of rubber, including Para *(Hevea brasiliensis),* which grows well. *See* also *Agriculture and Industries,* below.

The indigenous fauna resembles that of Madagascar. The only varieties of mammals are the rat and bat. The dugong. which formerly frequented the waters of the islands, does so no longer. The reptiles include certain lizards and snakes; the crocodile, once common, has been exterminated. Land tortoises have also disappeared; a fresh-water tortoise *(Sternothaerus sinuatus)* is still found The giant tortoise. *Testudo elephantina,* is found only in the Xldabra Islands; and the adjacent seas contain many turtles. Three coecilians, three batrachians (including a mountain-frequenting frog) and three fresh-water crustaceans are also indigenous. and there are about 26 species of land shells. The islands are the home of a large number of birds, including terns, gannets and white egrets.

Dependencies.—The outlying islands forming part of the colony of Seychelles consist of several uidely scattered groups. The Amirante Isles are situated on a submarine bank west and southwest of the Seychelles, the nearest island being about 120 mi. from Mahé. The archipelago consists of a number of coral islets and atolls comprising the African Islands (4). the St. Joseph group (8), the Poivre Islands (9) and the Alphonse group *(3)*. Farther south and uithin 170 mi. of Madagascar is the Providence group (3) formed by the piling up of sand on a surface reef which is of crescent shape. The Farquhar group lies to the south of these. The Cosmoledo group, 12 in number, lies about 210 mi W. of Providence Island, while 70 mi. farther west are the Aldabra Islands *(q.v.)*. Assumption Island lies to the south of the Aldabra. The chief island in the Cosmoledo group is 9 mi. long by 6 mi. broad. South of this group of islands lies Astove. Coetivy (transferred from Mauritius to the Seychelles in 1908) lies about 100 mi. S.S.E. of Platte. The majority of the outlying islands are extremely fertile, coconut trees and maize growing luxuriantly. Several of the islands contain valuable deposits of guano and phosphate of lime, and their waters are frequented by edible and shell turtle. Like the Amirantes, all the other islands named are of coral formation.

History and Government.—The Seychelles are marked on Portuguese charts dated 1502. The first recorded visit to the islands was made in 1609 by an English ship. The second recorded visit, in 1742, was made by Capt. Lazare Picault, who, returning in 1743, formally annexed the islands to France. Picault, uho acted as agent of Mahé de La Bourdonnais, governor of Mauritius, named the principal island Mahé and the group Îles de La Bourdonnais, a style changed in 1756, when the islands were renamed after Moreau de Séchelles, at that time *contrôleur général des finances* under Louis XV. The first permanent settlement was made in 1768. Soon afterward Pierre Poivre. intendant of fle de France, seeing the freedom of the Seychelles archipelago from hurricanes, set up spice plantations there. with the object of wresting from the Dutch the monopoly of the spice trade they then enjoyed. The existence of these plantations was kept secret, and it was with that object that they were destroyed by fire by the French on the appearance in the harbour in 1780 of a vessel flying the British flag. The ship. however, proved to be a French slaver which had hoisted the Union Jack fearing to find the British in possession. The islands were occupied in 1810 by the British. to whom they were ceded by the treaty of Paris in 1814. J. B. Quéau de Quincy (1748–1827), governor under the monarchy, the republic and the empire. was appointed agent-civil by the British. He governed the islands for 38 years until his death in 1827. Mauritius and Seychelles were administered as a single colony until 1872 when a board of civil commissioners was appointed and the finances of Seychelles were separated from those of Mauritius. In 1889 the post of administrator was created with a nominated executive and legislative council. In 1897 the administrator was given full powers as governor and in 1903 Seychelles was constituted a separate colony.

The executive council consists of the governor as president with three ex officio and three unofficial members, and the legislative council has six ex officio, two nominated unofficial and four elected members. The electorate comprises about 10% of the population. The civil law is based on the French *code civil* and *code de commerce* as modified by local enactment. The only bank is the government savings bank. In order to facilitate trade, the government treasury purchases and sells drafts and undertakes the collection of documentary bills for London and foreign banks. The monetary unit is the Indian silver rupee of 100 cents (Seychelles) ; currency notes are issued by the government of Seychelles.

Population.—The Seychelles were uninhabited when first visited by Europeans and the islands were colonized by Mauritian and Bourbon Creoles. The first planters introduced slaves from Mauritius, and the African element was increased by the introduction of freed slaves from east Africa. There has also been an immigration of Chinese and, in larger numbers, of Indians (mainly from the Malabar coast). The bulk of the retail trade is in the hands of the Indians and Chinese. A Creole patois, based on French but with a large admixture of Indian. Bantu and English words, is in general use. The Seychellois are excellent sailors. The population was 41,425 in 1960. Of the 92 islands, 33 are inhabited, but 81% of the total population lives on Mahé. Nearly 90% of the population are Roman Catholics. Malarial fever is unknown in the Seychelles, but hookworm is common. There is a leper settlement on Curieuse Island. The only town of any size is the capital, Victoria, on Mahé, picturesquely situated at the head of an excellent harbour 3 mi. wide. Many of the houses are built of massive coral, *Porites gamardi,* hewn into square building blocks, which at a distance glisten like white marble. About one-third of the total population lives in Victoria, the rest being scattered in hamlets which lie along the seashore or in estates on the hills. Education is free but not compulsory.

Communications.—Principal steamer connection is with Mombasa and Bombay. There are no air services. Seychelles is an important cable station. A radio telephone provides communication between Praslin and Mahé and, in conjunction with the Cable and Wireless company, a regular broadcasting service is maintained, which also serves as a means of communication with outlying islands. There are about 75 mi. of motor roads on Mahé.

Agriculture and Industries.—Unproductive lands which cover about one-third of the acreage of the colony comprise outcrops of granite following erosion, and coral reefs still in their position of growth. More than 3,500 ac. of land are under forest, about one-fourth being commercial timber. About a third of the adult population is engaged in agriculture. Copra is the most important export and essential oils, of which cinnamon leaf oil is the most important, are next in value. Breadfruit is the staple food and the tree flourishes on all the granitic islands. Quantities of cassava, yams, sweet potatoes and plantains are also grown. Salted fish is exported, also tortoise shell, green turtle shell and tripangs. There are no exploitable minerals in the colony except phosphatic guano, and no manufactures. There is a small and flourishing production of straw mats, hats and baskets. tortoise-shell cigarette cases, brooches and toilet sets for sale to tourists.

The chief imports are cotton goods! kerosene and petrol, rice, maize, sugar and flour. Imports come principally from the Cnited Kingdom and India. Two-thirds of the exports go to the Cnited Kingdom and most of the remainder to India and the United States.

SEYDLITZ, FRIEDRICH WILHELM, FREIHERR VOK (1721–1773), Prussian soldier, one of the greatest cavalry generals of history, was born on Feb. 3. 1721, at Kalkar. in the duchy of Cleve. At the age of 13 he went as a page to the court of the margrave of Schwedt, who had been his father's colonel. There he acquired a superb mastery of horsemanship, and many stories are told of his feats, the best known of which was his riding between the sails of a windmill in full swing. In 1740 he was commissioned a cornet in the margrave's regiment of Prussian cuirassiers. He served through the first and second Silesian Wars. and in 1753 became lieutenant colonel of the 8th cuirassiers. Under his hands this regiment soon became a pattern to the rest of the army. The Seven Years' War gave Seydlitz his opportunity In 1757, regardless of the custom of keeping back the heavy cavalry in reserve, he took his regiment to join the advanced guard; at Prague he nearly lost his life in attempting to ride through a marshy pool, and at Kolin. at the head of a cavalry brigade, he distinguished himself in checking the Austrian pursuit by a brilliant charge. Two days later the king made him major general and gave him the order pour le *mérite*. In reply to Zieten's congratulations he said: "It was high time, Excellency, if they wanted more work out of me. 1 am already thirty-six " Four times in the dismal neeks that followed the disaster of Kolin. Seydlitz asserted his energy and spirit in cavalry encounters, and on the morning of Rossbach, Frederick, superseding two senior generals. placed Seydlitz in command of the whole of his cavalry. The result of the battle was the complete rout and disorganization of the enemy, and in achieving that result only seven battalions of Frederick's army had fired a shot. The rest was the work of Seydlitz and his 38 squadrons. The same night the king gave him the order of the black eagle, and promoted him lieutenant general. Seydlitz was wounded, but rejoined the king in 1758, and at the battle of Zorndorf his cavalry again won the victory. At Hochkirch with 108 squadrons he covered the Prussian retreat, and in the great disaster of Kunersdorf he was severely mounded in a hopeless attempt to storm a hill held by the Russians. During his convalescence he married Countess Albertine Hacke. In 1761 he reappeared at the front. He now commanded a wing of Prince Henry's army, composed of troops of all arms. and many doubts were expressed as to his fitness for this command, as his service had hitherto been with the cavalry exclusively. But he answered his critics by his conduct at the battle of Freiburg (Oct. 29. 1762), in which, leading his infantry and his cavalry in turn. he decided the day.

After the peace of Hubertusburg he was made inspector general of the cavalry in Silesia, where 11 regiments were permanently stationed and whither Frederick sent all his most promising officers to be trained by him. In 1767 he was made a general of cavalry. But his later years were clouded by domestic unhappiness. His wife was unfaithful to him. and his two daughters, each several times married. were both divorced, the elder once and the younger twice. His formerly close friendship with the king was brought to an end by some misunderstanding, and it was only a few weeks before his death that they met again. Seydlitz died at Ohlau on Aug. 27, 1773.

SEYMOUR or ST. MAUR, the name of an English family in which several titles of nobility have from time to time been created. and of which the duke of Somerset is the head. See HERTFORD. EARLS AKD MARQUESSES OF; and SOMERSET: EARLS AND DUKES OF.

SEYMOUR, HORATIO (1810–1886), U.S. statesman, was born in Pompey, Onondaga county, N.Y., on May 31. 1810. He studied at Geneva academy (afterward Hobart college) and at a military school in Middletown, Conn., and was admitted to the bar in 1832. He was military secretary to Gov. W. L. Marcy in 1833–39, was a member of the New York assembly in 1842, 1844 and 1845. and was speaker in 1845, mayor of Utica in 1843, and in 1852 was elected governor of New York state. He vetoed in 1854 a bill prohibiting the sale of intoxicating liquors, which was declared unconstitutional almost immediately after its re-enactment in 1855. and in consequence he was defeated in 1854 for re-election as governor. Seymour was a conservative on national issues, and supported the administrations of Pierce and Buchanan; he advocated compromise to avoid secession in 1860–61; but when war started he supported the Union. In 1863–65 he was again governor of New York state.

His opposition to President Lincoln's policy was mainly in respect to emancipation. military arrests and conscription. Although he responded immediately to the call for militia in June, he thought the Conscription act unnecessary and unconstitutional and urged the president to postpone the draft until its legality could be tested. During the draft riots in July he proclaimed the city and county of New York in a state of insurrection. but in a speech to the rioters adopted a tone of conciliation—a political error which injured his career. He was defeated as Democratic candidate for governor in 1864. In 1868 he was nominated presidential candidate by the Democratic national convention, but carried only eight states (including New York, New Jersey and Oregon), and received only 80 electoral votes to 214 for Grant. He died on Feb. 12, 1886, in Utica.

The Public Record of Horatio Seymour (1868) includes his speeches and official papers between 1856 and 1868.

SEYMOUR OF SUDELEY, THOMAS SEYMOUR, BARON (*c.* 1508–1549), lord high admiral of England. was fourth son of Sir John Seymour of Wolf hall. Wiltshire. and younger brother of the protector Edward Seymour. 1st duke of Somerset. His sister Jane Seymour became the third wife of Henry VIII in 1536 and another sister, Elizabeth, married Thomas Cromwell's son. Seymour was employed in the royal household and on diplomatic missions abroad. For a short time in 1544 he commanded the English army in the Netherlands. In the same year he received the post of master of the ordnance for life. becoming admiral of the fleet a few months later. in which capacity he was charged with guarding the channel against French invasion. In 1547 he was created Baron Seymour of Sudeley and appointed lord high admiral. From this time forward he mas mainly occupied in intrigue against his brother the protector; and he aimed at procuring for himseli the position of guardian of the young king, Edward VI. The lord high admiral tried to secure the princess (afterward queen) Elizabeth in marriage; and when this project was frustrated he secretly married the late king's widow, Catherine Parr (1547). He ingratiated himself with Edward, and proposed a marriage between the king and Lady Jane Grey. He entered into relations with pirates on the western coasts, whom it was his duty as lord high admiral to suppress, with a view to securing their support; and when the protector invaded Scotland in the summer of 1547 Seymour fomented opposition to his authority in his absence. On the death of his wife in September of the next year he made renewed attempts to marry the princess Elizabeth. Somerset strove ineffectually to save his brother from ruin, and in Jan. 1549 Seymour was arrested and sent to the Tower. He was convicted of treason, and executed on March 20, 1549.

SFAX, a city of Tunisia, 78 mi. due south of Sousse, on the Gulf of Gabès (Syrtis Minor) opposite the Kerkenna Islands, in

34° 43' N., 10° 46' E. It consists of a European quarter, with streets regularly laid out and fine houses, and the Arab town, with its kasbah or citadel, and tower-flanked walls pierced by three gates. Many of the private houses, mosques and *zawias* are good specimens of native art of the 17th and 18th centuries. Sfax is the market for the phosphates of the Gafsa region. with which it is connected by a railway; other railways and good roads link it also with Sousse and Tunis on the one hand and with Gabès on the other. Olive oil is manufactured, and the fisheries are important, notably those of sponges and of octopuses. The prosperity of the town is largely due to the export trade in phosphates. esparto grass. oil, almonds, pistachio nuts, sponges, wool, etc. There is. in the Gulf of Gabès, a rise and fall of 5 ft. at spring tides, which is rare in the Mediterranean. A harbour. to which a channel 1.8 mi. long and of varying width gives access, was built in 1895–97, and has since been deepened at different times. The harbour, which was an important axis base from Nov. 1942, was almost entirely destroyed by Allied air raids. It was captured April 10, 1943, by the British 8th army after covering 75 mi. from Wadi Akarit in four days. The 1956 municipal population was 65,635, of whom 52,707 were Moslems, 3,168 Jews and 9,760 Europeans (8,168 French and 1,1j8 Italians). About 50,000 Moslems live in the outskirts and in the gardens in the neighbourhood of Sfax. Sfax is on the site of a Roman settlement called Taparura, of which few traces remain. The Sicilians under Roger the Norman took it in the 12th century, and in the 16th century the Spaniards occupied it for a brief period. The bombardment of Sfax in 1881 was one of the principal events of the French conquest of Tunisia.

SFORZA, the name of a famous Italian dynasty, descended from the Attendoli of Cotignola (Romagna), a wealthy and war-like family.

MUZIO ATTENDOLO (1369–1424), nicknamed "Sforza" for his strength, became a distinguished mercenary captain in the wars of Italy. Like other *condottieri,* he served many masters and aspired to the possession of a patrimony if not a principality. He was most prominent in the wars of the Neapolitan succession at the time of Joanna II (*q.v.*) in which finally he lost his life.

Muzio was certainly successful in acquiring lands and titles, in Romagna and in Naples! but it was reserved to two of his sons, FRANCESCO (1401–66) and ALESSANDRO (1409–73), likewise *condottieri,* to achieve the status of princes. In 1445 Alessandro acquired possession of Pesaro, in the papal states, where he was subsequently made vicar by the pope; his descendants retained the city until 1512, when Pope Julius II expelled them. Francesco had to wait longer and strive harder before winning himself a state. His first attempt, directed likewise against the states of the church, where for 14 years (1433–47) he held the March of Ancona, ended in failure and dispossession; and success, when it came, lay in the north of Italy in the duchy of Milan. which had long been one of the greatest Italian states. After his father's death, Francesco had. entered the service of the last Visconti duke, Filippo Maria, a morose, suspicious and unpredictable prince, and for more than 20 years had fought now with him, now against him. During the periods of uneasy harmony Franceaco had succeeded in getting himself betrothed (1433) and then married (1441) to Filippo Maria's illegitimate daughter. Bianca Maria, receiving as dowry Pontremoli and Cremona; and he had attained also some promise of succession in the duchy itself. But Filippo Maria did not nominate Francesco as his successor when he died (1447), and it was primarily by right of conquest that Francesco triumphantly entered Milan in March 1450, overthrowing the unstable republic that had been proclaimed at Filippo Maria's death. For 16 years Francesco ruled as duke in Milan, though without the formal recognition of the emperor Frederick III, whose price (in money) for a "legitimate" title was too high. His government, which in the March of Ancona had been burdensome because of the expense of perpetual war, seems in Milan to have been enlightened though despotic. He himself was frugal, retaining the manners of a soldier, but his court conformed to the lavish fashion of the time and his children were raised under leading men of letters in the humanist education then coming into fashion.

Francesco left several sons, among them ASCANIO (1455–1505), who became a cardinal, worldly, magnificent and lettered, and Galeazzo Maria and Ludovico il Moro, who in turn ruled the duchy.

GALEAZZO MARIA (1444–76), who married Bona of Savoy, sister to Queen Charlotte of France, in 1468 and who desired the emperor to raise his duchy to a kingdom, was in many ways a capable ruler (for example, he introduced the cultivation of rice into the territory); he was also an active patron of letters and the arts. But the character traditionally given him was very different from his father's, showing him vain, extravagant, dissolute and often cruel. He was murdered on Dec. 26, 1476, by three citizens of Milan, who hoped thereby to free their city from despotism; but no popular rising followed to endorse their deed, and the duke was rather mourned in his dominions, which in the past had several times stirred against his harsh taxation. Even so the murder did prepare the way for the end of Sforza rule by raising the problems and divisions of a regency. Galeazzo Maria's son GIAN GALEAZZO (1469–94), who in 1476 was only seven years old, never proved himself strong in mind or body, and after a period of conspiracy and violence, effective power passed (1479–80) to his uncle, LUDOVICO IL MORO (1451–1508), whose main concern thereafter was to retain control of the duchy. Ludovico il Moro, who in 1491 married Beatrice d'Este, a brilliant personality and no less ambitious than himself, is both celebrated and ill-famed in Italian history: celebrated for his court and for his patronage of such men as Leonardo da Vinci; ill-famed, though perhaps unjustly, for having encouraged Charles VIII of France to invade Italy and so begin a series of devastating wars. This was the effect of his design to rule perpetually in Milan and to displace Gian Galeazzo for good; in 1489 Gian Galeazzo had married Isabella of Aragon, granddaughter of Ferdinand I of Naples, and it was to conquer Naples that Charles VIII entered Italy, with Ludovico's reluctant connivance. In Sept. 1494 Ludovico was secretly invested with the duchy of Milan by the emperor Maximilian I, to whom he married his niece Bianca; and in October, after the timely death of Gian Galeazzo, he was chosen duke by the Milanese. His triumph, however, lasted only until 1499, when he was driven from power by Louis XII of France. Reinstated for a short time by the Swiss, he was eventually delivered by them to the French (April 1500) and died a prisoner in the castle of Loches.

The two sons of Ludovico, MASSIMILIANO (1493–1530) and FRANCESCO MARIA (1495–1535), took refuge in Germany; the former was restored to Milan by the Swiss in 1512 but, after the overwhelming defeat of his allies at Marignano (1515), surrendered his rights to Francis I and died in Paris; the latter was put in possession of Milan after the defeat of the French at La Bicocca in 1522. His death (Oct. 24, 1535) marked the extinction of the ducal male line of the Sforza. The duchy went to the emperor Charles V.

The dukes Sforza-Cesarini (Rome) are descended from Bosio, a younger brother of Francesco, the first duke of Milan; the counts Sforza (Lunigiana) from Sforza Secondo, one of Francesco's younger sons. Gian Galeazzo's daughter Bona married Sigismund I of Poland.

(P. J. J.)

SFORZA, COUNT CARLO (1873–1952), Italian statesman. born at Montignoso di Lunigiana on Sept. 25, 1873. Having entered the diplomatic service in 1896, Sforza mas minister to China (1911–15) and to Serbia (1916–18) and high commissioner in Turkey (1918) before becoming a senator and undersecretary of state for foreign affairs (1919) and then foreign minister (1920–21); he negotiated the treaty of Rapallo with Yugoslavia (Nov. 1920). Appointed ambassador to France in Feb. 1922, he resigned two months later, refusing to serve the Fascist government.

He then became a leader of democratic opposition in Italy. In voluntary exile after 1928, he went to the United States in 1940, still making anti-Fascist propaganda. He was named leader of the Free Italian movement at the Montevideo conference (Aug. 1942), returned to Italy (1943), served as minister without portfolio under Pietro Badoglio and Ivanoe Bonomi (1944), became president of the consultative assembly (Sept. 1945–May 1946) and was elected to the constituent assembly as a Republican (Sept. 1946). Appointed foreign minister under Alcide de Gasperi (Feb. 1947), he was largely responsible for Italy's ratification of the peace treaty and adherence to the North Atlantic treaty but resigned because of ill-health in July 1951. He died in Rome on Sept. 4, 1952. English translations of his works include Makers of *Modern Europe* (London. 1930), *Fifty Years* of *War* and Diplomacy in *the* Balkans (New York, 1940), Contemporary Italy (New York, 1944) and Italy and the Italians (London, 1918).

SGAMBATI, GIOVANNI (1841–1914), Italian pianist, conductor and composer. was born in Rome on May 28, 1841. After studying music in Naples, he settled in 1860 in Rome. where he became famous for his recitals of works by German composers, who had previously been neglected in Italy. In 1866 he founded an orchestra and conducted the first Italian performance of such works as Beethoven's *Eroica* symphony and Emperor concerto and Liszt's *Dante* symphony. Meanwhile his own compositions began to attract attention and when Wagner visited Rome in 1876 he was so impressed with two piano quintets and some songs that he helped to get them published. Of Sgambati's other works, the most important are the Symphony in D (1881), the Quartet for Strings in D flat (1883) and *Messa* da *Requiem* (1896). He is best remembered, however, as a teacher. He died on Dec. 14, 1914.

SHACKLETON, SIR ERNEST HENRY (1874–1922), British explorer who led two Antarctic expeditions, was born in Kilkee, Ire., on Feb. 15, 1874. Educated at Dulwich college, he entered the mercantile marine service. He joined Capt. R. F. Scott's British National Antarctic ("Discovery") expedition (1901–04) as third lieutenant and took part, with Scott and Edward Wilson. in the sledge journey over the Ross Ice shelf when latitude 82" 16' 33" S. was reached. His health suffered and he was invalided out on the supply ship "Morning" in March 1903. In Jan. 1908 he returned to Antarctica as leader of the British Antarctic ("Nimrod") expedition (1907–09). The expedition, prevented by ice from reaching the intended base site in Edward VII peninsula, wintered on Ross Island, McMurdo sound. A sledging party, led by Shackleton, reached within 97 mi. of the south pole. and another! under T. W. Edgeworth David! reached the area of the south magnetic pole. Victoria Land plateau was claimed for the British crown. On his return Shackleton was knighted and was made a companion of the royal Victorian order. In 'larch 1914 the British Imperial Trans-Antarctic expedition (1914–16) left England under his leadership. He planned to cross Antarctica from a base on the Weddell sea to McMurdo sound. via the south pole, but the expedition ship "Endurance" was beset off Caird coast and drifted for 10 months before being crushed in the pack ice. The expedition then drifted on ice floes for a further five months and finally escaped in boats to Elephant Island in the South Shetland Islands. Shackleton and five others sailed 800 mi. to South Georgia in a whale boat, and then made the first crossing of the island, to seek aid. We led four relief expeditions before succeeding in rescuing his men from Elephant Island. A supporting party, the Ross Sea party led by A. E. Mackintosh, sailed in "Aurora" and laid depots as far as latitude 83° 30' S. for the use of the Trans-Antarctic party; three of this party died on the return journey. Shackleton died on Jan. 5. 1922, at Grytviken, South Georgia, at the outset of the Shackleton-Rowett Antarctic expedition in "Quest"; his exertions in raising funds to finance his expeditions, and the immense strain of the expeditions themselves, wore out his strength. He was ambitious both for himself and for the honour of his country, but his outstanding characteristic was leadership. Courage, optimism and endurance, coloured by a streak of romanticism, earned him the trust and devotion of all his men under the most difficult circumstances.

Shackleton's publications are *The* Heart of the Antarctic (1909), and South (1919).

SHAD, common name of fishes of the genus Alosa, belonging to the herring family, with the upper jaw notched in front. found in the Mediterranean and on both sides of the North Atlantic. They enter rivers to breed, generally from April to June. and the fry live for a year or two in fresh water. The Allis shad. A. alosa, of the coasts of Europe has numerous long, slender gill rakers; it attains a length of 30 in. and a weight of 8 lb. The twaite shad (A. *finta)* is smaller, and has fewer and shorter gill rakers; the Mediterranean form *(A. f.* nilotica) is distinct, and the species also includes some well-marked forms permanently resident in fresh water, one from Killarney, two from lakes in northern Italy. The American shad (A. *sapidissima)* is a valued food fish. and has been successfully introduced on the Pacific coast. The shad of the Black and Caspian seas (*Caspialosa*) have teeth on the vomer, like the herring. Another important related genus of anadromous fishes is Hilsa, with six species, ranging from east Africa to China.

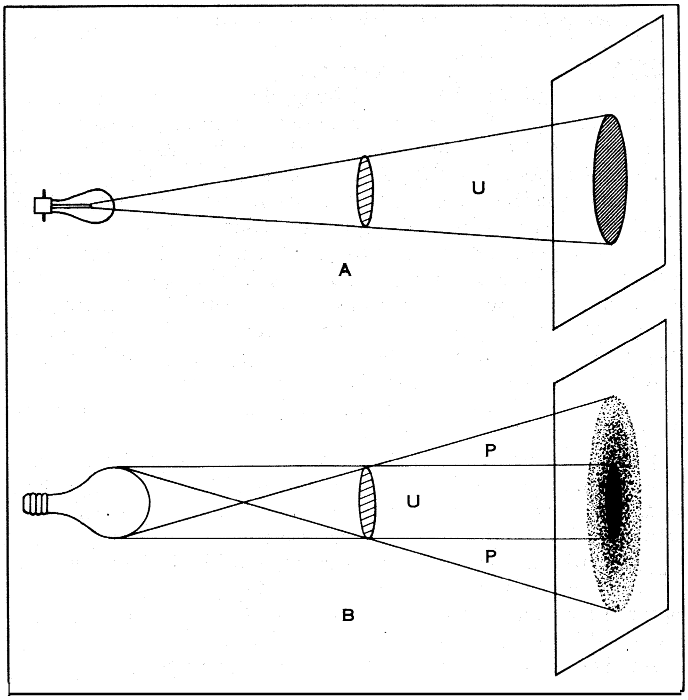
SHADDOCK, or pummelo (Citrus grandis), a tree. 20 to 40 ft. in height, allied to the orange and the lemon, presumably native to the Malay and Polynesian islands. The leaves are like those of the orange, but have broadly winged petioles and are downy on the undersurface, as are also the young shoots. The flowers are large and white, and are succeeded by very large subglobose or subpyriform fruits: closely resembling grapefruit, lemon yellow in colour, and with a pungent, subacid but agreeable flavour. The pulp segments are either pallid or red, and shell out easily. The fruit is highly prized in the orient. The name "shaddock" is asserted to be that of a captain who introduced the tree to the West Indies. The shaddock is considered the parent type from which the grapefruit probably originated. See GRAPEFRUIT.
(L. D. B.)

SHADOW, a term usually meaning that region of an illuminated surface from which the oncoming light rays are shielded by an opaque object. More generally, it can refer to any local changes in the intensity of radiation caused by placing some form of matter in the path of the rays. There are many interesting examples of the latter type, some of which will be mentioned below. First, however, let us consider the characteristics of the simpler kinds of shadow.

If the source of light is small as, for example, the filament of an automobile headlight lamp illustrated in part (A) of the figure, the rays effectively emanate from a point and the shadow has a sharp boundary between light and darkness. Its shape evidently will he that of the object producing it. If, on the other hand, the source has an appreciable size, as in part (B) of the figure, there is a region, U, of the total darkness called the umbra and also another, P. called the penumbra, in which there is a gradual transition from dark to light in going from the inner boundary to the outer. When one looks toward the source from the region of the penumbra, he sees only part of it, the rest being covered by the obstacle.

Pronounced shadows are not formed if there is more than one light source, except when one of these is much brighter than any other, as in sunlight. Shadows cast by the sun are not sharply bounded because there is always a perceptible penumbra. This is relatively unimportant for shadows cast at small distances: it is possible to read a sundial with fair accuracy. The umbra and penumbra assume vast proportions. however, for the shadows of the moon and of the earth. During an eclipse of the sun, the moon's shadow falls on the earth, and the penumbra covers the wide area n-here the eclipse is partial. An eclipse of the moon. on the other hand, occurs when the moon moves into the earth's shadow. The shadow of the moon on its own surface may render a good part of its sphere invisible, so that it appears. to us as a crescent. Another type of shadow occurs when sunlight penetrates to the ground through very small spaces between the leaves of a tree, or to the wall of a room through a hole in a window shade. One observes small circular or elliptical patches of light. which are actual images of the sun's disk. They are caused by the fact that from each part of this disk essentially only one ray can pass through the hole to the shadow. The faithfulness of this image becomes apparent during a partial eclipse of the sun, when the patches of light become crescent shaped.

The nature of a shadow may be modified when the rays are deflected from their straight line paths by the process called refraction. Thus, when the moon lies in the umbra of the earth's shadow



PERSPECTIVE DRAWINGS OF THE SHADOW CAST BY AN OPAQUE DISK USING (A) A SMALL LIGHT SOURCE. AND (B) AN EXTENDED SOURCE SUCH AS A FROSTED LIGHT BULB

during a total lunar eclipse, it is still visible by a faint copper-coloured light. This is light which has been bent inward by refraction as it traverses the mantle of air surrounding the earth. The light has a hue similar to that of a sunset because in both cases the light traverses a great thickness of air. Refraction by the atmosphere also has the effect of delaying the time of sunset, that is, the time when the shadowing effect of the horizon is complete. As a result of the downward deflection of its rays, the sun appears to be higher than it actually is by an amount almost equal to its own diameter. Thus, if it were not for refraction, the sun would have completely disappeared at about the time when we see it first touch the horizon.

It is possible for shadows to form even without the presence of any object to screen off the rays. A transparent substance may, by reflection or refraction, concentrate the light in certain places and deflect it away from others. The commonest example occurs when sunlight is reflected onto the ceiling by a liquid whose surface is disturbed. The shifting patterns of light and shade are caused by the irregularities in the surface contour acting like curved mirrors to focus the light to a greater or less degree. Similar effects caused by refraction may be seen on the bottom of a clear pond when the sun shines through the waves. The air itself, when it contains turbulent regions and irregularities of temperature, can act in the same way. Here the deflections of the rays are so slight that the effects are only apparent when the source of light is a bright one of very small dimensions. For example. at the instant before a solar eclipse becomes total, darker areas called shadow bands are observed rushing across the landscape, an effect which is attributed to refractive effects of the upper atmosphere. On a laboratory scale. the same principle has been put to highly practical use in studying the flow of air around objects in wind tunnels by what is known as the Schlieren method.

One occasionally speaks of shadows formed by radiations other than light. X-ray photographs are shadowgrams caused by absorption of the rays coming from a tiny spot in the X-ray tube *(see* X-RAYS). Sounds, especially those of high pitch, may be almost completely screened off by large obstacles. Even when the source has small dimensions, the resultant acoustical shadows do not have sharp boundaries. The reason lies in an effect called diffraction, exhibited by all types of waves. It becomes more pronounced for longer waves, but exists even for the minute waves of light, where the crest-to-crest distance is only about $\frac{1}{20,000}$ cm.

If we examine the edge of an apparently sharp shadow with a magnifier, the transition from dark to light is found not to be abrupt, and bordering the edge there are several faint bands. These "diffraction fringes" are completely explained as a wave phenomenon, as are some other curious effects such as the existence of a minute bright spot at the centre of the shadow of a circular disk.

A spectacular observation of diffraction fringes has been made when the edge of the moon passes in front of a star. The fringes sweep across the observing telescope at a rate corresponding to the frequency of audible sound, and may be recorded photoelectrically. From the clearness of these records, it is possible to deduce the diameter of the star's disk, provided it is greater than the apparent size of a one-cent piece at a distance of 750 km.

SHADOW PLAY or SHADOW SHOW is drama performed by flat, articulated puppets on a translucent paper or cloth screen illuminated from behind.

Shadow plays originated in the Orient. In India, subjects were drawn from the Hindu national epics *Mahabharata* and *Ramayana (see* SANSKRIT LANGUAGE AND LITERATURE). These passed to Java where they developed into a popular theatre which performed for all ceremonial occasions. Themes from Javanese legendary history and new ones introduced in the 15th century when Java became Moslem were also used. The figures, made-from buffalo hide. were highly ,stylized, perforated and painted. The narrator *(dalang)* operated the puppets (usually by thin bamboo rods). spoke their lines and directed the orchestra. Bali received the shadow play from Java, gave the figures a characteristic stylization, and preserved the Indian themes. In Siam similar stories were presented, and the shadow theatre was also found in Malaya, Burma and Cambodia.

The shadow play in China, for which a legendary origin in the Han dynasty is claimed, became a favourite entertainment for court ladies. The figures were made from thin donkey skin, dyed to cast brilliant colours on the screen.

Shadow plays spread westward by way of Persia to Turkey. where the witty and vulgar characters Karagöz and his companion Hadjivad became the heroes of a popular theatre. The puppets were made of camel hide. perforated and coloured to present types such as the opium addict and the idiot. as well as regional characters including the Persian, the Albanian and the Jew. These plays became popular in Greece. where such showmen as Xntonios Mollas gave them a Greek interpretation. Shadow plays were also found in various forms in the Moslem countries of north Africa.

In the 17th century the shadow theatre was known in Italy; from there it spread to other western European countries. The French called them *ombres chinoises,* although they were black silhouettes, instead of coloured like those of the Chinese. Dominique Séraphin opened a shadow show in Versailles in 1774, later moved it to the Palais Royal in Paris. Until 1859 his descendants presented especially written plays. such as *The Broken Bridge.* Sophisticated plays were produced by a group of artists. musicians and writers who regularly met at the Chat Noir cabaret in Montmartre. Paris. Other cabarets imitated them: and shows were given until 1923.

Shadows were popular in America during the 18th century, declined toward its end and were revived around 1850. At the Chicago world's fair in 1893. Léon-Charles Marot presented the *Théâtre des Ombres Parisiennes,* similar to the performances of the Chat Noir. Greek emigrants brought the Karagoz plays to the U.S. where they were seen in Chicago and Detroit coffeehouses.

In modern times Pauline Benton produced shows in the U.S. with authentic Chinese shadows. After World War I, Lotte Reiniger developed in Germany a number of films in stop motion, using black silhouettes against backgrounds of varying tones of gray. Although showmen in Europe and the U.S. occasionally used them, shadow plays were less popular in mid-20th century than in the past. *See* also PUPPETS AND MARIONETTES.

(M. B. McP.)

SHADWELL, THOMAS (c. 1642–1692), English playwright and miscellaneous writer, was born about 1642, at Santon hall, Norfolk, according to his son's account. He was educated at Bury St. Edmund's school and at Caius college, Cambridge, where he was entered in 1656. He then joined the Middle Temple. Shadwell's best plays are *Epsom Wells* (1672), for which Sir Charles Sedley wrote a prologue, and the *Squire of Alsatia* (1688). For 14 years from the production of his first comedy to his memorable encounter with Dryden, Shadwell produced a play nearly every year. These productions display a genuine hatred of shams and a rough but honest moral purpose. They are disfigured by indecencies, but present a vivid picture of contemporary manners.

Shadwell is chiefly remembered—rather unjustly—as the unfortunate MacFlecknoe of Dryden's satire, the "last great prophet of tautology," and the literary son and heir of Richard Flecknoe:

> The rest to some faint meaning make pretence,
> But Shadwell never deviates into sense.

Dryden had furnished Shadwell with a prologue to his *True Widow* (1679), and in spite of momentary differences, the two had been apparently on friendly terms. But when Dryden joined the court party and produced *Absalom and Achitophel* and *The Medall,* Shadwell became the champion of the true-blue Protestants and made a scurrilous attack on the poet in *The Medal of John Bayes: a Satire Against Folly and Knavery* (1682). Dryden immediately retorted in *MacFlecknoe, or a Satire on the True Blue Protestant Poet, T.S.* (1682), in which Shadwell's personalities were returned with interest. A month later he contributed to Nahum Tate's continuation of *Absalom and Achitophel* satirical portraits of Elkanah Settle as Doeg and of Shadwell as Og. In 1687 Shadwell attempted to answer these attacks in a version of the tenth satire of Juvenal. At the Whig triumph in 1688 he superseded his enemy as poet laureate and historiographer royal. He died at Chelsea on Nov. 19, 1692.

SHAFI'I, AL- (ABU ABDALLAH MOHAMMED IBN IDRIS AL-SHAFI'I) (767–820), one of the greatest jurists of Islam and the founder of the Shafi'i school of canon law, was born in A.H. 150 (A.D. 767) at Gaza or Ascalon, and was brought up by his mother in poor circumstances at Mecca. There, and especially in intercourse with the desert tribe of Hudhail, he gained a knowledge of classical Arabic and old Arabian poetry for which he was afterward famous. About 170 he went to Medina and studied canon law under Malik ibn Anas.

After the death of Malik in A.H. 179 legend takes al-Shafi'i to Yemen, where he is involved in an 'Alid conspiracy: carried prisoner to Baghdad, but pardoned by Harun al-Rashid. He was certainly pursuing his studies, and he seems to have gone to Baghdad in some such way as this and then to have studied under Hanafi teachers. He had not yet formulated his own system. After a journey to Egypt, however, he is reported in Baghdad again, as a teacher, between A.H. 195 and 198. There he had great success and turned the tide against the Hanafi school. In 198 he went to Egypt in the train of a new governor, and this time was received as the leading orthodox authority in law of his time. There he developed and somewhat changed the details of his system, and died in A.H. 204 (A.D. 820). He was buried to the southeast of what is now Cairo, and a great dome (erected c. A.D. 1211–12) is conspicuous over his tomb.

The "classical" theory of Islamic law, by which is meant the view that the law is based upon four sources (Koran, *sunna, ijma, qiyas*), was, according to Joseph Schacht in his *Origins of Muhammadan Jurisprudence* (1950), the creation of Shafi'i. The classical theory does not fully explain the facts as unearthed by modern research. Whether the opinion of Schacht, in its full import, is correct has yet to be proved; but his researches are worthy of the most serious consideration, and give an insight into the system developed by a master jurist. Imam Shafi'i was the founder of one of the "four" schools of Sunnite law, the others being Hanafi, Maliki and Hanbali. *See* also ISLAMIC LAW.

See *Shorter Encyclopaedia of Islam,* pp. 512–515 (1953).

(A. A.-A. F.)

SHAFT (IN ARCHITECTURE): *see* ORDER.

SHAFT, DRIVING. A driving shaft is a cylindrical, rotating member which transmits motion or power, usually both, from one point to another. The shaft may be made of any material strong enough for the purpose, but nearly all shafts are made of metal, especially steel. Motors, engines and machines of all kinds have shafts, often of a specialized kind, such as the camshaft and crankshaft in an automotive engine. In general, the input to or the output from a shaft may be through a shaft coupling, of which there are various kinds, or through belt-driven pulleys, chain drives! gears, etc. The crankshaft of an automotive engine receives power from the work done by the expanding gases in the cylinder; the camshaft is driven from the crankshaft by gears or a chain and delivers power through the cams that operate the valves.

A line shaft drives more than one machine and is itself driven by a prime mover, the power being taken off via belts or chains, usually at several points along the shaft. Shafts intermediate between a line shaft and a driven machine are variously called countershafts, jackshafts or headshafts. In highly industrialized areas where electricity is readily available the use of individual motor drives for each machine is generally favoured over line shafts. It is common practice to speak of short shafts on machines as spindles, especially shafts that carry cutting tools on metal-working machines. The word axle strictly refers to a stationary member carrying rotating wheels, pulleys, etc.. as the axle on a wagon or wheelbarrow; but the drive shafts to the rear wheels of an automobile are also called axles, no doubt a carry-over from horse-and-buggy days.

A shaft is designed to carry without failure or without excessive deformation the forces which act upon it. These forces may cause the shaft to bend. inducing what are called bending stresses within the material, or cause the shaft to twist, inducing twisting or torsional stresses; more often than not, shafts are subject to both bending and twisting forces. Sometimes a force acting in the axial direction causes a tensile or compressive stress. In accordance with theory, these stresses combine and if the resultant combination is too large, the strength of the material will be exceeded and the shaft mill fail. Most shafts break because the resultant of the combination of stresses at some point repeatedly exceeds the fatigue strength of the material. The stress at a point is increased by discontinuities such as fillets; etc.

It is quite likely that the breaking strength of a shaft is not the significant criterion. In a large percentage of situations, it is a matter of keeping the deflection of the shaft at a specified minimum. For example, in machine tools, rigidity or resistance to deflection is most important if the machine is to cut metal to close tolerances. This is often true even if the amount of deflection involved is much too small for the unaided eye to perceive. The torsional deflection of most machinery shafts will be less than 0.1° per foot of length. The transverse or bending deflection may be from a few ten-thousandths of an inch, depending upon the requirements. If the transverse deflection is large enough, a shaft may tend to bind in its bearings.

Any rotating shaft has a critical speed at which the shaft vibrates noticeably, perhaps violently. It might be said that at the critical speed the shaft is undecided whether to rotate about its geometric axis or about the axis through its centre of mass and it attempts to do both. This speed can be fairly accurately computed for a given situation; in any case, the shaft must be designed to run either well above or well below the critical speed.

Flexible shafts will bend around obstructions, as a cable bends, or will transmit small amounts of power in a curved form. They are used in dentists' grinding tools, portable drilling and polishing machines, etc.

Shafts are manufactured by cold-rolling or cold-drawing, processes which leave a relatively hard, strong, smooth surface on steel.. Because of the residual stresses left within the metal after cold-working, cold-finished shafts will warp when a keyway is cut and must later be straightened. Larger shafts are made from hot-rolled steel, turned on a lathe and polished or ground.

(V. M. F.)

SHAFTESBURY, ANTHONY ASHLEY COOPER, 1ST EARL OF (1621–1683), English politician who was one of the most prominent and skillful opponents of Charles II's pro-Catholic policy, was born at Wimborne St. Giles, Dorset, on July 22, 1621, and succeeded his father, Sir John Cooper, as 2nd baronet on March 23. 1631. Largely through his mother, Anne, daughter and heiress of Sir Anthony Ashley, who herself died on July 20, 1628, he inherited great estates in the southwest of England, and although much was lost during his long minority he always remained a wealthy man. Educated partly by tutors, partly at Exeter college, Oxford, and partly at Lincoln's Inn, he early showed evidence of a restless and acute intelligence, which led to his return to the Short parliament of 1640 as member for Tewkesbury and to the succeeding Long parliament as member for Downton. As he was still under age, however, and as his election to the Long parliament was the subject of a dispute which was not determined until 1660, it may be doubted whether he played any effective part in either of these assemblies.

By his first marriage, on Feb. 25, 1639, to Margaret, daughter of Thomas, 1st Baron Coventry, the lord keeper of England, he formed a close association with the lord keeper's sons: Henry and William, and confirmed his natural inclination to take, like them, the royalist side in the Civil War serving the king as captain of a troop of horse, colonel of a regiment of foot, governor of Weymouth and high sheriff of Dorset. Early in 1644, however, he went over to the side of parliament, was given command of all the parliamentary forces in Dorset and took an active part on their behalf in the concluding stages of the war in the southwest. Thereafter he devoted himself mainly to the problems of local government until appointed a member of the Barebones parliament in 1653 and returned for Wiltshire to its more legitimate successors in 1654, 1656 and 1659.

Appointed a member of the council of state on July 14, 1653, and of its successor, the lord protector's council, on Dec. 16 of the same year. he acted for some time as a supporter of Oliver Cromwell and in opposition to the more extreme reformers. At the very end of 1654. however, alienated by the protector's increasing neglect of parliament, he broke away from him, and in consequence was one of the members denied the certificate from the 'council without which they could not take their seats in the parliament of 1656. Against this exclusion he. along with others. strongly protested, and the certificates were soon afterward abolished; but even then he was not elevated. as in other circumstances he probably would have been, to the new "house of lords" created in 1657. When his criticisms of that house and of the protector's autocratic methods proved unavailing, he continued his opposition, not merely for the remainder of Oliver Cromwell's life but under Richard Cromwell as well.

After the fall of Richard and the restoration of the Rump of the Long parliament he was reappointed to the council of state and came under increasing suspicion of being in the interest of the exiled king. Against the power of the army he supported the authority of parliament; but it was a genuine parliament that he had in mind, and in consequence he lent all his weight to secure first his own right to sit in virtue of his election in 1640. then the readmission of the members excluded by Pride's Purge in 1648 and finally the dissolution of the Long parliament and the election of a new one. To that new parliament or convention he was again returned as member for Wiltshire on March 27, 1660, and in it he exerted himself to the utmost to secure the recall of Charles II. On May 7 he was appointed one of the 12 commissioners directed by the commons to go over to Breda and invite Charles to return, and after the landing of the king at Dover on May 25 he waited on him at Canterbury and was well received.

Offices and titles were immediately conferred upon him. Admitted to the privy council on May 27 and to the committee for plantations on July 4, 1660, he was created Baron Ashley of Wimborne St Giles on April 20, 1661, and appointed chancellor of the exchequer on May 13 of the same year. In the general settlement which followed the return of the king he advocated a policy of moderation, urging lenity as regards the former king's judges, opposing the more extravagant provisions of the Corporation act, the Act of Uniformity and the Five Mile act and supporting Charles II's declaration of 1662 in favour of toleration This naturally commended him to Charles. who was also impressed by his industry and ability, and on the death of the earl of Southampton, the lord treasurer, in May 1667 he was appointed one of the commission which took his place, becoming in a short time its most influential member.

During these early years he developed to a high degree that interest in the problems of commerce and colonization which was to be one of his leading characteristics as a statesman. Part owner of a plantation in Barbados, and member of several committees dealing with colonial affairs under the Commonwealth, he had served a long apprenticeship in the colonial field even before the Restoration, and was regularly included thereafter in the various committees to which such affairs were entrusted. On March 24, 1663, he was given a grant, along with seven others, of the vast province of Carolina, and found in it an ideal field for experimentation. Making the acquaintance, three years later, of the philosopher John Locke, he entrusted him with the task of drawing up a constitution for the province based upon aristocratic predominance, religious toleration and other principles which he would have liked to see recognized in England. In Oct. 1673 he secured for Locke the position of secretary to the recently established council of trade and foreign plantations. of which he himself had been appointed president.

Meanwhile Ashley's position at court had first improved and then suddenly declined. On the dismissal and impeachment of the earl of Clarendon in 1667 he had chosen to attach himself, among the ministers who rose to prominence in Clarendon's place, to the duke of Buckingham, with whom he had a common interest in the support of religious toleration; as early as 1670 he became so impressed by the danger of the Catholic duke of York's succeeding to the throne as to give his support to schemes for securing a divorce for the king or legitimizing his bastard son, the duke of Monmouth. In these circumstances he was naturally excluded from the secret of the real treaty of Dover, which aimed at the reconversion of England to the Roman Catholic faith, but he approved of the sham treaty, which provided only for an Anglo-French alliance to reduce the commercial supremacy of the Dutch, and readily signed it, along with other members of the so-called Cabal, on Dec. 21, 1670. He also gave his support to the Declaration of Indulgence which the king issued on March 15, 1672, but disapproved of the Stop of the Exchequer, by which an attempt was made to secure the necessary funds for the whole design.

As a reward he was appointed lord lieutenant of Dorset on Jan. 20. 1672. created earl of Shaftesbury on April 23, and appointed lord chancellor on Nov. 17. As chancellor he was, by general admission. a success; but in his capacity of adviser to the king he nas now in a false position, for he was advocating a policy half of which was concealed from him. When parliament assembled in Feb. 1673 he delivered his famous "*Delenda est Carthago*" speech, justifying the attack on the Dutch as the commercial rivals of England; but as he watched the rising tide of opposition to the king's policy, and began to suspect that there was more in that policy than he had been given to understand. his attitude inevitably changed. Later in the same year he supported the first Test act, designed to exclude Roman Catholics from office under the crown. and did his best in parliament to put obstacles in the way of the duke of York's marriage with the Catholic Mary of Modena On Nov. 9 he was summarily dismissed from the chancellorship and went into opposition. On May 19, 1674, he was also dismissed from the privy council and from his local offices.

It is as a leader of opposition to the court that Shaftesbury is chiefly remembered. but real leadership of the malcontent elements in parliament and the country long evaded his grasp. His frequent changes of policy and his inclination toward extreme courses. increasing rather than diminishing with age. were regarded with disfavour by responsible men, and even among his own associates some preferred the leadership of Lord Holles. Successful in obstructing Lord Danby's nonresisting test bill in the spring of 1675, he failed in the autumn of the same year, even with the assistance of the duke of York, to carry in the lords an address in favour of a dissolution of the Cavalier parliament. He then sought supporters among discontented elements in the City of London, elaborated an argument that in accordance with a statute of Edward III's reign requiring annual parliaments a prorogation for 15 months pronounced on Nov. 22, 1675, was in effect a dissolution, and advanced this contention in the lords when the houses reassembled on Feb. 15, 1677. He was immediately sent to the Tower by the lords themselves for his reflections on parliament, and was not released until Feb. 26, 1678.

The event which gave him his real chance was the appearance of Titus Oates in the autumn of the same year with his story of a vast Jesuit conspiracy against the king and government. Shaftesbury was in no sense the originator of the tale told by Oates, and indeed began by regarding it with suspicion as a fable inspired by government supporters with the object of rallying the nation round the king; but at an early stage he realized what a useful weapon it might prove in his hands: and thereafter he supported it to the utmost. In the midst of the nationwide panic which it engendered, moderate leaders and counsels were forgotten and he was able to secure widespread acceptance as the only man with the courage and skill to ride the storm. By developing an elaborate party organization, based on the famous Green Ribbon club. he exercised great control over elections, built up a large following both in the lords and in the commons and in three successive parliaments endeavoured to secure the exclusion of the duke of York from the succession to the throne. To his efforts at this time was largely due the passing of the Habeas Corpus act, perhaps his greatest and most creditable achievement.

With the object of silencing him by office Charles on April 21, 1679, remodeled the privy council, admitted many of the leading members of the opposition to it and appointed Shaftesbury president; but the failure of the king to follow the advice of his new council soon led Shaftesbury to withdraw his support, and on Oct. 15 of the same year he was dismissed. On Nov. 15, 1680, the Exclusion bill, which had passed without a division in the commons, was rejected, in spite of some brilliant speeches on his part, by the lords; but this only inspired him to more violent courses than he had yet contemplated, and to the succeeding parliament, which met at Oxford on March 21, 1681, he and his associates rode up with an armed following. confident that the king, in his need of money, could not withstand the pressure of the house of commons any longer. Charles, however, who had just strengthened his financial position by an agreement for a subsidy from the king of France, dissolved parliament within a week, and Shaftesbury suddenly found himself practically helpless. Cnfortunately for him the policy by which he had secured his acceptance as the oracle of the nation had almost inevitably been marked by extravagance rather than by statesmanship. and as the panic caused by the "popish" plot declined his credit had correspondingly diminished. Complete exclusion of the duke of York was a hazardous device which could have been accepted, if at all, only during a moment of panic. The substitution of the duke of Monmouth. at which he aimed, probably could not have been accepted at any time. and was only too obviously inspired by his desire to have an the throne a mere puppet of his own. On the unexpected dissolution of the third Exclusion parliament, accordingly. his following simply disintegrated. and he himself came into a position of considerable danger.

For the short remainder of his life his chief efforts were directed toward providing for his own safety. On July 2. 1681, he was seized, committed to the Tower and kept there for four months while every effort was made to find or suborn evidence on which to base a charge of high treason against him. So gloomy did his prospects appear that he offered. if released, to retire to Carolina. When he was brought to trial on Nov. 24, however, the Whig grand jury selected by the Whig sheriffs of London rejected the indictment, and on Dec. 1 he had to be admitted to bail, from which in turn he was released on Feb. 13, 1682. But in spite of the jubilation with which the failure of the prosecution was received, the court was now in the ascendant, and at the midsummer election contrived to secure the return of two Tory sheriffs for London. Thus deprived of all prospect of protection from a favourable jury at a future trial. Shaftesbury made desperate efforts to organize a rising against the government, and when these proved vain left the country on Nov. 28. Reaching Amsterdam early in December he was granted asylum there and admitted a burgher; but imprisonment and privations had aggravated the diseases from which he had long suffered. and after a short final illness he died on Jan. 21, 1683. His body was brought back to England, and was buried at Wimborne St. Giles.

Shaftesbury was undoubtedly a very clever man, and particularly adept at turning to his own advantage the weaknesses of others; but he failed to realize that in English politics cleverness alone is not enough, and that men are not composed exclusively of weaknesses. He has been credited with few genuine principles beyond a sincere belief in parliament and in the desirability of toleration in religious matters. His methods are difficult to defend, involving as they usually did not merely an assumption that the end justifies the means but also a reckless disregard of future consequences in the prospect of immediate gain. Especially toward the close of his life he repeatedly embarked on courses which men much less acute than he was could see were bound to lead to disaster. It is typical of his whole career that he ended his life under the protection of the Dutch, the nation which he had done his best, when at the height of his power, to ruin.

BIBLIOGRAPHY.—The Shaftesbury Papers in the Public Record Office, consisting of autobiographical fragments, letters, speeches and documents connected with Shaitesbury's colonial ventures, have been extensively used by historians, but have not proved as illuminating as might have been expected. Many of them are printed in W. D. Christie, *A Life oj Anthony Ashley Cooper, First Earl of Shaftesbury*, 2 vol. (1871), which is still the standard biography. H. D. Traill, *Shaftesbury* (1886), and O. Airy's article in the *Dictionary* of *National Biography* are useful sketches, one unfavourable and the other favourable in its interpretation of Shaitesbury's conduct. Louise Fargo Brown, *The First Earl of Shaftesbury* (1933), devotes attention to his connection with commercial and colonial developments. (A. Bg.)

SHAFTESBURY, ANTHONY ASHLEY COOPER, 3RD EARL OF (1671–1713), English politician and philosophical writer. was born on Feb. 26. 1671, at Exeter house, London. the residence of his grandfather. the famous 1st earl of Charles II's reign. His early education was directed by the philosopher John Locke; but in Nov. 1683 he was sent to Winchester college. and in 1686 embarked under the care of a tutor on a tour of France, Italy and Germany, from which he did not return until shortly after the English revolution. On May 21, 1695, he was returned to parliament at a by-election for the borough of Poole, and on Nov. 4 of the same year he was re-elected at the general election for the same constituency; but his health. never robust, broke down under the strain imposed by the house of commons, and after the dissolution of 1698 he did not stand again.

During his second period of service in the commons he was the central figure in a well-known incident which has done almost as much as his writings to perpetuate his memory. Having carefully prepared a speech in favour of a bill the main object of which was to allow the assistance of counsel to those accused of high treason. he found himself, when the time arrived, too overcome by the importance of the occasion to be able to recollect the points he had intended to advance, and yet contrived to make out of his own confusion a powerful argument in support of the bill. "If I." he declared, "who rise only to speak my opinion on the bill now depending, am so confounded that I am unable to express the least of what I proposed to say. what must the condition of the man be who is pleading for his life without any assistance. and under apprehensions of being deprived of it?" The bill passed, and became the famous Trials for Treason act of 1696.

On Nov. 2. 1699. occurred the death of his father, the 2nd earl, which enabled him to take his seat in the house of lords on Jan. 19. 1700; and in the quieter atmosphere of that house he found it possible to attend with regularity for the short remainder of William III's reign. In neither house, however. did he make himself quite at home, for he insisted on pursuing a completely independent policy. supporting such measures as he considered to be for the general welfare rather than those dictated by the party situation of the moment. Yet his general outlook, as might have been expected from his ancestry. was that of an advanced Whig, and at elections he did not hesitate to exert all his very considerable influence on behalf of Whig candidates. Under William he was more than once ofiered high office, but doubtful health combined with his love of independence to prevent him from accepting. On the accession of Anne, and the rise of the Tories to power, he was deprived of the vice-admiralty of Dorset, the only official position he held, and this slight was instrumental in inducing him to retire altogether from public affairs. and then to seek quiet and the opportunity for the studies he loved on the continent.

As early as 1699 he had spent nearly the whole of the year in Holland. where the climate suited him better than that of any other place. Now he embarked on a further visit, and from Aug. 1703 to Aug. 1704 resided mainly at Rotterdam. But the improved health with which he returned to England soon gave way before advancing consumption, and for the remainder of his life he was a confirmed invalid. Nevertheless. on Xug. 29, 1709, he married Jane. daughter of Thomas Ewer of Bushey hall, Hertfordshire, and with the birth of a son on Feb. 9, 1711, could feel that he had duly provided for the future of his family. In July of the same year declining health once again forced him to go abroad, and on Feb. 14, 1713, he died at Naples.

During his lifetime his fame was comparatively slight; for he lived much in seclusion and published scarcely anything before 1708. The next few years. however. were years of great literary activity on his part. and his *Characteristics of Men, Manners, Opinions and Times*, in which all his chief works were gathered together, appeared in a first edition in 1711 and in a second edition, enlarged and corrected under his own directions, in 1714. The effect was immediate. and was felt not merely in England but also on the continent, where French and German speculations were deeply influenced by his writings.

This was largely the result of the fidelity with which he reflected the spirit of the age in which he lived. The enthusiasms and conflicts of the 17th century were over: and a sober rationalism or even scepticism was taking their place in church and state. Shaftesbury was strongly opposed to fanaticism, which he maintained was best counteracted, not by argument. but by raillery and good humour. Though never an atheist he was highly critical of revealed religion. The capacity to distinguish between right and wrong was. he believed, due to a "moral sense." inborn in human nature, and was thus independent of theology, custom and law in much the same way as is the capacity to distinguish between what is beautiful and what is ugly. This idea was later developed by Shaftesbury's disciple. Francis Hutcheson (*q.v.*), and became a characteristic feature of the Scottish school of philosophy which derived from him.

BIBLIOGRAPHY.—A large and varied collection of documents connected with Shaftesbury is to be found among the Shaftesbury Papers in the Public Record Office. The best edition of his *Characteristics* is that by John M. Robertson, 2 vol. (London, iqoo). Supplementary material, written mainly in 1712 and concerning art, is contained in *Serond Characteristics, or thr Language of Form*, edited by Benjamin Rand (Cambridge. 1914). An account of his life written by his son. the 4th earl. has been printed in *The Lifr, Unpublished Lrttrrs and Philosophiral Regimen of Shaftesbury*, also edited by Benjamin Rand (London, 1900). The bcst modern lives are those by Thomas Fowler in *Shaftesbury and Hutcheson* (London, 1882) and by Leslie Stephen in the *Dictionary of National Biography*. (A. BG.)

SHAFTESBURY, ANTHONY ASHLEY COOPER, 7TH EARL OF (1801–1885), son of Cropley, 6th earl (a younger brother of the 5th earl; succeeded 1811), and Anne. daughter of the 3rd duke of Marlborough, was born on April 28. 1801. Be was educated at Harrow and Christ Church. Oxford, and entered parliament in 1826. Hc succeeded his father as earl in 1851. Although giving a general support to the Conservatives, his parliamentary conduct was greatly modified by his intense interest in the improvement of the social condition of the working classes. his efforts in behalf of whom have made his name a household word. He opposed the Reform hill of 1832, but was a supporter of Catholic emancipation. and his objection to the continuance of resistance to the abolition of the corn laws led him to resign his seat for Dorset in 1846. In parliament his name. more than any other. is associated with the new factory legislation. He was a lord of the admiralty under Sir Robert Peel (1834–35), but on heing invited to join Peel's administration in 1841 refused. having been unable to obtain Peel's support for the Ten Hours' bill. Chiefly by his persistent efforts a Ten Hours' bill was carried in 1847, but its operation was impeded by legal difficulties. which were only removed by successive acts, instigated chiefly by him, until the law was consolidated by the Factory act of 1874.

The part which Shaftesbury took in the legislation bearing on coal mines was equally prominent. In 1846. after the resignation of his seat for Dorset, he explored the slums of the metropolis, and not only gave a new impulse to the movement for the establishment of ragged schools, but was able to make it more widely beneficial. For 40 years he was president of the Ragged School union. He was also one of the principal founders of reformatory and refuge unions, Young Men's Christian associations and workingmen's institutes. He took an interest in foreign missions, and was president of several philanthropic and religious societies of London. He died on Oct. 1. 1885. By his marriage (1830) to Lady Emily (d. 1872), daughter of the jth Earl Cowper, he left a large family, and was succeeded by his eldest son Anthony, who committed suicide in 1886.

See J. L. and B. Hammond, *Lord Shaftesbury* (1923); and J. W. Bready, *Lord Shaftesbury and Industrial Progress* (1926).

SHAFTESBURY, a market town and municipal borough in the North Dorset parliamentary division of Dorsetshire, Eng., 20 mi. W.S.W. from Salisbury by road. Pop. (1961) 3.366. Area 1.7 sq.mi. It lies high on a hill, on the edge of Cranborne Chase. above a rich agricultural district. Although traces of British and Roman occupation occur in the neighbourhood, the site of Shaftesbury (Caer Palladur, Caer Septon. Seaftonia, Sceafstesbyrig. Shafton) was probably first occupied in Saxon times. Matthew Paris speaks of its foundation by the mythical king Rudhudibras, while Asser ascribes it to Alfred. who made his daughter Ethelgeofu the first abbess. It is probable that a small religious house had existed there before the time of Alfred, and that it and the town were destroyed by the Danes, both being rebuilt about 888. The foundations of the Saxon abbey and nunnery have been laid bare. In 980 Dunstan took St. Edward's hody there from Wareham for burial, and there Canute died in 1035. The relics of St. Edrr-ard were discovered in 1931 during excavation.

In 1252 the burgesses received their first charter from Henry III. There is no evidence that Elizabeth granted Shaftesbury a charter as has been asserted. but she confiscated the common lands in 1585, the town only recovering them by purchase. This probably led to the granting of a new charter by James I in 1604. Yet another charter was granted to the town in 1684. Shaftesbury returned two members to parliament from 1294 to 1832, when the representation was reduced to one. and it was lost in 1885.

SHAFT SINKING. A shaft is a throatlike excavation which has been so formed as to penetrate downward into the earth's crust, either in a vertical or somewhat inclined manner. Although shafts sometimes may be used as intermediate accessways along the courses of railway and vehicular tunnels, or for making deep footings of large buildings and dams and for establishing bridge piers, subways and similar structures, by far the greater number are sunk for underground mining of mineral deposits. The process of shaft sinking has been pursued in one way or another ever since man first began to do underground mining.

Subsurface mineral deposits are notably distinctive and often peculiarly unique so far as their mode of occurrence is concerned (*see* ORE DEPOSITS) and these characteristics frequently introduce important modifying elements in the nature and type of shaft that is made for their exploitation. That is, the shaft may prove to be the limiting "bottleneck" of a given mining operation if it has not been properly designed as to shape, size, depth and inclination to meet the particular environmental conditions that affect the ore body in question. Such situations often transpire because it is through the more or less constricted shaft opening that not only must the ore be moved but, also. all supplies. men and mining equipment must be transported. Shafts may range in general type from the most crude warrenlike openings to highly specialized and well-constructed excavations, and the several ways of shaft sinking may be of various degrees of complexity and engineering refinement.

The basic cycle of the shaft-sinking operation is similar to that which obtains to most mining ventures, namely: (1) drilling and blasting (breaking); (2) loading (mucking); (3) placing of timbers or other types of wall-support materials; and (4) hoisting.

These activities are interrelated in their application and, to be followed efficiently, they require the energy of co-ordinated mining crews. The several individuals forming a crew must have the faculty of working in close and safety-conscious co-operation, not only with each other but also with supporting associates whose function is to give service to the endeavour as a whole. The physical effort that must be expended ordinarily is great and the space within which the work must be performed is constricted. It often is very wet and of rather high temperature.

A typical total labour unit (exclusive of supervisory and engineering personnel) employed for shaft sinking commonly is composed as follows: a sinking crew of 12 miners; 3 or 4 cagers; 3 hoistmen; 1 mechanic; and 2 or more surface labourers.

At about the beginning of the 20th century, the "breaking" stage of the mining cycle was marked by the progressive perfection and adoption of rock-drilling machines (see DRILLING MACHINERY) and this trend, accompanied as it was by the development of better explosives. contributed appreciable progress to the practice of shaft sinking. Most drilling machines are motivated by compressed air and during operation they either are hand-held or more commonly are mounted on a frame known as a "jumbo."

A typical drill hole pattern usually is composed of numerous downward directed holes. The explosives that are employed for blasting generally are water-repellant varieties of high-strength dynamites.

The arduous and expensive procedures of hand-loading and of "mucking off the rough" were practised for many years after the advent of air-driven drilling machines and therefore the operational cycle of shaft sinking in reality showed but little refinement of consequence until about the time of World War II. That is, from the time when man first began to burrow extensively into the earth until the late 1930s, shafts to be used for mining purposes were sunk almost wholly by hand-labour methods or by a borehole drill rig of some form. In fact, sinking by borehole drilling was not used to noteworthy degree until about 1925.

However: mechanized mucking procedures have been pronouncedly advanced and few shafts are sunk without employing some type of mechanical means of loading. The more widely used and generally accepted types of equipment would fit into the following classification: scraper with 2- or 3-drum hoist (inclined shafts); reverse-action bucket or scoop on sliding boom (inclined shafts) (fig. 1); positive-action power shovel (fig. 2); overshot loader or "rocker shovel!' (fig. 3); free-moving clamshell or orange-peel bucket loader; positive-action clamshell unit; and positive-action "backhoe" loader.

Most loading devices discharge into a pan or directly into a car or sinking-bucket sometimes called a "can" and the broken rock thus may be moved at will from the shaft chamber. Except for a few cases, shafts are lined with wood timbering (fig. 2) or with steel or concrete or masonry bricking. The shaft linings are so placed as to serve as protective walls to inhibit the infall of rock from the sides of the excavation and, also, they tend to reduce or to control the inflow of water. In addition, they afford means whereby running guides for the cages can be affixed and aligned.

In giving consideration to the adoption of a shaft-sinking process there are a number of factors that require analysis. First is the question of whether the shaft is to serve chiefly as a means of

FIG. 1.— SCHEMATIC DRAWING OF MUCKING MACHINE

(A) As extended boom is drawn back, bucket loads itself by digging into broken rock. (B) After digging lip of bucket has closed against steel blade, machine is ready to be hoisted. (C) Detail of digging head shown in (B) exploration and prospecting or is to be a large excavation dug so that a major ore body can be mined. Other factors which may bear consequential influence are: (1) availability and degree of skill of man power; (2) location, such as accessibility to sources of power and other supplies; (3) character of surface-plant site, especially with regard to the disposal of muck and the installation of the hoisting engine; and (4) prevailing geologic features and other conditions of the rock environment. This latter factor is particularly pertinent with reference to the shape and general attitude of the body to be exploited. Also, it is related to the existence of possible structures and other ground conditions which, by their influence on rock stability, may tend to induce problems bearing directly on the actual sinking operation.

There are usually other more incidental elements that must be analyzed. For example, if abnormally heavy water flows are encountered, they often will require the installing of exceptional pumping units or, at least, the building of eavelike ducts called "water rings" at intervals within the shaft. In addition, if the temperature gradient of the earth is steep, it is frequently necessary to furnish cooling and ventilating in a manner and to a degree that otherwise would not be needed.

Where the rock material to be penetrated is loose soil or gravel it may be grouted (cemented) or even frozen before sinking is begun.

In some cases, it is necessary to progress downward by lowering steel caissons or to push or drive wooden planks. called "spiles" or "forepoles," into the rock mass ahead of and beyond the actual excavation. These several practices have the general effect of inhibiting sloughing when the shaft is being made and, also, they usually serve to reduce the lateral percolation and undesirable inflow of subsurface water.

When hard rocks are being excavated, the normal or downward sinking cycle of drilling, blasting, mucking and hoisting ordinarily is followed. However, as before noted, the development of some shafts by various means of borehole drilling or, in some special cases! by "raising," which is a mining process carried upward from below, has proved to be outstandingly economic and efficient.

The operational plant unit needed to accomplish the shaft-sinking work usually is comprised of a hoisting engine and headframe, several buckets or skips, one or more sinking pumps, a satisfactory complement of drilling machines, ventilating fans, a selected loading machine and other accessory items of equipment and structure

such as a change house and warehouse.

Shaft-sinking costs may run to several hundred dollars a foot. An example of the items involved in costs in a typical U.S. case is given in the listing below.

Labour	Insurance expense
Bits and rods	Shop and payroll expense (on outside labour)
Compressed air	Taxes—social security
Drill repair	Workmen's compensation
Explosives	Electric power
Hoisting	
Pumping	
Shaft mucking machine—maintenance royalty	Shaft-sinking equipment (purchased)
Ventilation—maintenance	Blasting mat
Shait sets—complete	Drill machines
Surface	Sinking cage
Engineering and surveying	Portable blower
General expense	Shait mucher

SHAGREEN. A species of untanned leather with a roughened. granular surface. The word is the English form; *cf.* Ger. *Schagrin*, Fr. *chagrin*, Ital. *zagrin, zigrino;* these are usually referred to Turkish and Persian *saghri*, "the back of a horse," and so applied to leather made from this part. The skin of the wild ass aas especially used. The method of preparing the skins to secure the rough. granular surface is as follows: The seeds of a plant, usually some species of *Chinopodium*, are embedded in the skin while soft; the surface is then shaved down and soaked in water, when the edges of the indentations swell up. The leather is then dyed, green being a favourite colour. Shagreen is now commonly made of the skins of sharks and rays; the placoid scales of the shark skin giving the necessary roughened surface. Shagreen is used as an ornamental leather for making pocketbooks, small cases and the like, and for the handles of swords, daggers, etc.

SHAHABAD, a district of Bihar, India. Area 4.404 sq.mi. Pop. (1951) 2,688,440. To the north is an alluvial flat constituting about three-fourths of the district, closely cultivated and thickly populated. The southern part is occupied by the Kaimur hills, a branch of the great Vindhyan range. These hills consist of an undulating plateau largely covered with jungle, about 800 sq.mi. in area; at Rohtasgarh they attain a height of 1,490 ft. above sea level. The chief rivers are the Ganges and the Son, which unite in the northeastern corner of Shahabad, and the Karamnasa, which divides it from Uttar Pradesh. The chief crops are rice, millets, wheat, pulses, oilseeds and sugar cane. The northern part of Shahabad is known as Bhojpur, which has given its name to a dialect of the Bihari language. Its inhabitants, the

Bhojpuri, were formerly notorious for turbulence and predatory habits. Before 1857 many were recruited for the army, but during the mutiny they broke out into a rebellion which was not put down till the end of 1858. The district's administrative headquarters are at Arrah, 31 mi. W. of Patna. Pop. (1951) 64,205. The town contains one of the undergraduate colleges of Bihar university. Sixty miles southwest of Arrah is Sasaram, with the domed tomb of the emperor Sher Shah (1540–45) and that of his father.

SHAH ALAM (1728–1806), Mogul emperor of Delhi, son of Alamgir II, was born on June 15, 1728, and was originally known as the Shahzada Ali Gohar. Being proclaimed a rebel by his father, he fled to Shuja-ud-Dowlah, wazir of Oudh, and on the death of his father in 1759 assumed the name of Shah Alam. He joined Shuja-ud-Dowlah against the British, but after his defeat at the battle of Buxar he sought British protection. In 1765 he granted the diwani (superintendence of the revenue) of Bengal to Lord Clive for the East India company in return for a payment of 26 lakhs a year.

In 1771 he fell into the power of the Marathas, was installed emperor of Delhi and lost the British subsidy. In 1788 the Rohilla chief Ghulam Kadir seized Delhi and put out Shah Alam's eyes. Sindhia restored him to the throne, and after the Maratha War of 1803 he was again taken under British protection. He died on Nov. 10, 1806.

See also INDIA: *History*.

See W. Francklin, *History of the Reign of Shah-Aulum* (1798).

SHAH JAHAN (fl. 1627–1658), Mogul emperor of Delhi, the fifth of the dynasty. After revolting against his father, Jahangir, as the latter had revolted against Akbar, Shah Jahan succeeded to the throne on his father's death in 1627. It was during his reign that the splendour of the Mogul court reached its zenith.

The chief events of his reign were the destruction of the kingdom of Ahmadnagar (1636), the loss of Kandahar to the Persians (1653) and a second war against the Deccan princes (1655). Shah Jahan fell ill in 1658 and was confined by his son Aurangzeb in the citadel of Agra until his death in 1666. The period of his reign was the golden age of Indian architecture. Shah Jahan erected many splendid monuments. the most famous of which is the Taj Mahal at Agra, built as a tomb for his wife Mumtaz Mahal; while the Pearl mosque at Agra and the palace and great mosque at Delhi also commemorate him. The celebrated Peacock throne, said to have been worth £6,000,000, also dates from his reign. For his city of Shahjahanabad, *see* DELHI.

See B. P. Saksena, *History of Shahjahan of Dihli (1932).*

SHAHJAHANPUR, a city, with *tehsil* (administrative subdivision) and a district of Uttar Pradesh, India. The city is on the left bank of the Deoha river, 95 mi. N.W. of Lucknow and is a military cantonment. Pop. (1951): city 104,835; municipal 98,949; cantonment 5,886; *tehsil* (395 sq.mi.) 307,735. The city was founded in 1647 during the reign of Shah Jahan by Nawab Bahadur Khan, a Pathan. His mosque is the only building of antiquarian interest. One of the colleges of Agra university is in the city.

SHAHJAHANPUR DISTRICT has an area of 1,762 sq.mi. It consists of a long, narrow tract running up from the Ganges toward the Himalayas, and is for the most part level. The principal rivers are the Gumti, Khanaut, Garai and Ramganga. To the northeast waste and forest preponderate. Between the Gumti and the Khanaut the country varies from a rather wild and unhealthful northern region to a densely inhabited tract in the south, cultivated with sugar cane and other crops.

From the Ramganga to the Ganges in the south is a continuous low country of marshy patches, alternating with a hard clayey soil that requires much irrigation in parts. In 1951 the population was 1,004,378. Shahjahanpur was ceded to the English by the nawab of Oudh in 1801.

SHAHPUR, a small city with *tehsil* (administrative subdivision) and a district in the Rawalpindi division of West Pakistan. The town is near the left bank of the Jhelum river. 48 mi. S.S.W. of Rawalpindi. Pop. (1951): city 5,330; *tehsil* 175,397.

SHAHPUR DISTRICT (4,788 sq.mi.) is bounded by the Salt range in the north. The Jhelum flows through the middle of the district, the eastern half of which, in the Chaj Doab, is well irrigated by the Lower Jhelum canal. There also is the district headquarters, Sargodha: pop. (1951) 78,447. West of the Jhelum are undulating sand hills, part of the Thal desert. The submontane strip has however been reclaimed. New townships and villages have grown up. In 1951 the population was 1,162,988. The chief commercial centre is Bhera (16,644). Shahpur passed into English hands. with the rest of the Punjab, in 1849. The climate is hot and dry but healthy. Wheat, gram, cotton and bajra are the chief crops. (K. S. AD.)

SHAKER HEIGHTS, a city of Ohio, U.S., is an attractive residential suburb of Cleveland (*q.v.*). Planned and developed by the Van Sweringen brothers after 1900 in an area once held by the North Union Shaker community, Shaker Heights was incorporated as a village in 1912 and as a city in 1931. After 1920 it was accessible to downtown Cleveland by rapid transit railroad. now city owned. Population increase, after the initial rush of the 1920s, was due to large apartment developments. In the 1960s little vacant land remained and building codes were rigid. There are no industries in the community. Shaker Heights has a top-ranking public-school system. excellent private schools, a public library and a Shaker historical museum. Shaker lakes, once the site of the Shaker community grist and woolen mills, furnish a distinctive setting for the suburb. For comparative population figures *see* table in *OHIO*. Population. (V. B. S.)

SHAKERS, an American celibate and communistic sect, known as the "United Society of Believers in Christ's Second Appearing" and as the "Millennial Church." Some of the leaders prefer the name "Alethians," for they consider themselves children of the truth. The society had its beginning in a Quaker revival in England (1747) which resulted in the organization of a sect of which Jane and James Wardley were the leaders. They were succeeded by Ann Lee. The distinctive merit of celibacy became an original tenet of the Shakers in England. They did not prohibit marriage but refused to accept it as a Christian institution and considered it less perfect than the celibate state.

Under stress of persecution and in response to a revelation, "Mother" Ann led a band of six men and two women to America. They arrived in New York city on Aug. 6, 1774, and after two years' stay there, settled in the woods of Watervliet, not far from Albany, N.Y. In 1780 there was a religious revival in New Lebanon, N.T., and some of the converts became disciples of Ann Lee. At this place, in 1787. the first Shaker society in the United States was organized; the society at Watervliet was organized immediately afterward. Ann Lee went from place to place preaching her new doctrine and became known as a faith healer. At the time of her death (1784) she had disciples in New York, Massachusetts and Connecticut. A group of Shakers came out of the Kentucky revival of 1800–02. The community at Mount Lebanon, N.Y., sent three of their number to Kentucky to bear witness to the people.

Though at first bitterly opposed, these Shaker preachers made a sufficient number of converts to found five societies, "two in Ohio, two in Kentucky and one in Indiana." In 1894 the Mount Lebanon society founded a colony at h'arcoosee, Fla., called the Union Village society. In 1910 it went into the hands of a receiver.

The Shakers held that God was both male and female, that Adam, having been created in the image of God, had in him the nature of both sexes, that even angels and spirits are both male and female. Christ, they believed, was one of the superior spirits and appeared in Jesus, the son of a Jewish carpenter, representing the male principle. In Mother Ann, daughter of an English blacksmith, the female principle in Christ was manifested, and in her the promise of the Second Coming was fulfilled. Christ's kingdom on earth began with the establishment of the Shaker Church.

The practical ideals of the community were the common possession of property, a life of celibacy, confession of sin, without which no one could become a member of the community, power over physical disease and separation from the world. Disease they regarded as a sin against God. Their separateness from the world was indicated by their manner of living in families of 30 to

90 individuals. Each family had its own house, the stories being divided between the men and women. They made no room for adornments in the way of pictures or other works of art. In their prescribed mode of dress for men and women, they also protested against the fashions of a vain world. For a time they made their own clothing and wove their own cloth. They made leather in New York for several years; but were more successful in selling herbs and garden seeds, and in making apple sauce, weaving linen and knitting underwear. Many of them, however, considered it a mistake to have left agriculture and entered into manufacturing.

In 1874 there were 58 Shaker communities with 2,415 members, owning 100,000 ac. of land; in 1905 the membership was reduced to about 1,000. By mid-20th century there were fewer than 100 members in five surviving communities.

SHAKESPEARE, WILLIAM (1564–1616), English poet, player and playwright, was baptized in the parish church of Stratford-on-Avon (*q.v.*) in Warwickshire on April 26, 1564. The exact date of his birth is not known. Two 18th-century antiquaries, William Oldys and Joseph Greene, gave it as April 23, but without quoting authority for their statements, and the fact that April 23 was the day of Shakespeare's death in 1616 suggests a possible source of error. In any case his birthday cannot have been later than April 23, since the inscription upon his monument is evidence that on April 23, 1616, he had already begun his 53rd year.

Family and Youth.—His father, John Shakespeare, was a burgess of the recently constituted corporation of Stratford (it received its charter in 1553), and had already filled certain minor municipal offices. From 1561 to 1563 he had been one of the two chamberlains to whom the finance of the town was entrusted. John Aubrey (1681) called him a butcher and Nicholas Rowe (1709) a wool dealer, but it is clear from formal documents that by occupation he was a "whittawez," or glover, although he appears to have dealt from time to time in various kinds of agricultural produce, such as barley, timber and wool. He is also described as a yeoman, and it is possible that he combined a certain amount of farming with the practice of his trade. He was living in Stratford as early as April 1552, when he was fined for having a dunghill in Henley street, but he does not appear to have been a native of the town, in whose records the name is not found before his time; and he may reasonably be identified with a John Shakespeare of Snitterfield, who administered the goods of his father, Richard Shakespeare, in 1561. Snitterfield is a village in the immediate neighbourhood of Stratford, and there Richard Shakespeare had been settled as a farmer since 1529. He may have come from Hampton Corley in Budbrooke, where a Richard Shakespeare is on the subsidy roll for 1525. It is probable that John Shakespeare carried on the farm for some time after his father's death, and possible that by 1570 he had acquired a small holding called Ingon in Hampton Lucy. But the Snitterfield farm seems to have passed subsequently to his brother Henry, who was buried there in 1596. There were also at Snitterfield a Thomas Shakespeare and an Anthony Shakespeare, who seems to have moved to Hampton Corley; and these may have been of the same family. A John Shakespeare, who dwelt at Clifford Chambers, another village close to Stratford, is clearly distinct. Strenuous efforts have been made to trace Shakespeare's genealogy beyond Richard of Snitterfield, but so far without success. Certain drafts of heraldic grants of the Shakespeare arms speak, in one case of John Shakespeare's grandfather, in another of his great-grandfather, as having been rewarded with lands and tenements in Warwickshire for service to Henry VII. No such grants have been traced; statements about "antiquity and service" in heraldic preambles were, even in the 16th century, looked upon with suspicion.

The name Shakespeare is extremely widespread, and is spelled in an astonishing variety of ways. Competent paleographers hold that Shakespeare himself, in the extant examples of his signature, generally wrote "Shakspere" in full or in an abbreviated form, but possibly, in the main signature to his will, "Shakspeare." In the printed signatures to the dedications of his poems, on the title pages of nearly all the contemporary editions of his plays that bear his name and in many formal documents it appears as Shakespeare or Shake-speare. This may be in part due to the martial derivation which the poet's literary contemporaries were fond of assigning to his name, and which is acknowledged in the arms that he bore. Certain forms often used at Stratford, however, such as Shaxpere and Schackspere, suggest a short pronunciation of the first syllable, and thus tend to support Henry Bradley's derivation from the Anglo-Saxon personal name, Seaxberht. It is interesting to record that in 1487 Hugh Shakspere of Merton college, Oxford, changed his name to Sawndare, because his former name *vile reputatum est* ("was basely regarded"). The earliest record of a Shakespeare that has yet been traced is in 1248 at Clapton in Gloucestershire. The name also occurs during the 13th century in Kent, Essex and Surrey, and during the 14th in Cumberland, Yorkshire, Cheshire, Nottinghamshire, Essex, Warwickshire and as far away as Youghal in Ireland. Thereafter it is found in London and most of the English counties, particularly those of the midlands; and nowhere more freely than in Warwickshire. There were Shakespeares in Warwick and in Coventry, as well as around Stratford; the clan appears to have been numerous in a group of villages about 12 mi. N. of Stratford, which includes Baddesley Clinton, Wroxall, Rowington, Haseley, Hatton, Lapworth, Packwood, Balsall and Knowle. William was in common use as a personal name, and Williams from more than one other family have from time to time been confounded with the dramatist. Many Shakespeares are upon the register of the guild of St. Anne at Knowle from about 1457 to about 1526. Among these were Isabella Shakespeare,

Believed to have been executed by Gerard Johnson (Gheerart Janssen, Flemish) before 1623; centre, the Droeshout print prefixed to the First Folio edition of Shakespeare's plays in 1623; right, the Chandos portrait attributed to Richard Burbage (*c.* 1567–1619)

prioress of the Benedictine convent of Wroxall, and Jane Shakespeare, a nun of the same convent. Shakespeares are also found as tenants on the manors belonging to the convent, and at the time of the Dissolution in 1534 one Richard Shakespeare was its bailiff and collector of rents. Attempts have been made to connect the ancestors of this Richard Shakespeare with a family of the same name which held land by military tenure at Baddesley Clinton in the 14th and 15th centuries, and to identify him with the poet's grandfather, Richard Shakespeare of Snitterfield. But Shakespeares are to be traced at Wroxall nearly as far back as at Baddesley Clinton, and Richard the bailiff seems to have retired to a farm at Haseley, which he had held since 1523. Probably he died there about 1558 It is not likely that he had also been farming land at Snitterfield since 1529

With the breaking of this link, the hope of giving Shakespeare anything more than a grandfather on the father's side must be laid aside. On the mother's side he nas connected with a family of some distinction. At least part of Richard Shakespeare's land at Snitterfield was held from Robert Arden of Wilmcote in the adjoining parish of Aston Cantlow, probably a younger son of the Ardens of Parkhall, who counted among the leading gentry of Warwickshire. Robert Arden married his second wife. Agnes Hill, formerly Webbe. in 1548, when he was already the father of eight daughters by his first wife. To the youngest. Mary Arden he left in 1556 a freehold in Aston Cantlow. a farm of about 50 or 60 ac.. knonn as Asbies. He had possibly already settled other property in Wilmcote upon her. Mary Arden. at some date later than Nov. 1556, probably before the end of 1j57, married John Shakespeare. John Shakespeare had, in Oct 1556. bought two freehold houses; one in Greenhill street. the other in Henley street The latter. known as the wool shop, was the easternmost of the two houses now combined in the so-called Shakespeare's birthplace The western house, locally regarded as the birthplace proper, may already have been in John Shakespeare's hands, as he seems to have been living in Henley street in 1552. It has sometimes been thought to have been one of two houses purchased in 1575, but there is no evidence that these were in Henley street at all.

William Shakespeare was not the first child A Joan was baptized in 1558 and a Margaret in 1562. Margaret was buried in 1563 and Joan must have died young. though her burial is not recorded, as a second Joan was baptized in 1569. A Gilbert nas baptized in 1j66, an Anne in 1571, a Richard in 1574 and an Edmund in 1580 Anne died in 1579; Edmund (who. like his brother, became an actor) in 1607; Gilbert in 1612; Richard in 1613 Tradition has it that a relative of Shakespeare used to visit London in the 17th century as quite an old man. One form of this tradition makes him a brother, which is impossible

During the years after his marriage, John Shakespeare became prominent in Stratford life, In 1565 he was chosen as an alderman, and in 1568 he held the chief municipal office, that of high bailiff. This carried with it the dignity of justice of the peace. John Shakespeare seems to have contemplated the assumption of arms, and usually appears in corporation documents as "Master" Shakespeare, whereby he may be distinguished from another John Shakespeare, a "corviser" or shoemaker, uho dwelt in Stratford about 1586–92 In 1571 as a former bailiff he began another year of office as chief alderman.

Shakespeare in his boyhood, therefore, may be thought of as the son of a leading citizen of an important market town. Stratford had its own vigorous life, probably not much unlike the life of a similar town today, despite dunghills; the stately buildings formerly belonging to its college and its guild, both suppressed at the Reformation, were reminders of its past. The town stands in agricultural country throughout which, in those days, enclosed orchards and meadows alternated with open arable fields; not far distant was the wilder wooded district of the forest of Arden. Among Stratford's medieval heritages was a free grammar school, and here it is natural to suppose that William Shakespeare obtained a sound enough education, with a working knowledge of "Mantuan" and Ovid in the original, even though to such a thorough scholar as Ben Jonson it might seem no more than "small Latin and less Greek." In 1577, when Shakespeare was about 13, his father's fortunes began to take a turn for the worse. He became irregular in his contributions to town levies. and had to give a mortgage on property of his wife at Wilmcote as security for a loan from her brother-in-law. Edmund Lambert. Money was raised to pay this off. partly by the sale of a small interest in land at Snitterfield which had come to Mary Shakespeare from her sisters. partly perhaps by that of the Greenhill street house and other property in Stratford outside Henley street, none of which seems to have ever come into William Shakespeare's hands. Lambert, however. on the plea of older debts, refused to surrender the mortgage, and an attempt to recover the Wilmcote property by litigation proved ineffectual. John Shakespeare's difficulties increased. He had long ceased to attend the meetings of the corporation, and as a consequence he uas removed in 1586 from the list of aldermen. In this state of domestic affairs it is not likely that Shakespeare's school life was unduly prolonged. The chances are that he was apprenticed to some local trade.

Marriage.--Whatever his circumstances, they did not deter him at 18 from the adventure of marriage. Rowe recorded the name of Shakespeare's wife as Hathanay. and Joseph Greene succeeded in tracing her to a family of that name dwelling in Shottery, one of the hamlets of Stratford. Her monument gives her first name as Anne. and her age as 67 in 1623. She must. therefore, have been about eight years older than Shakespeare. Various small trains of evidence point to her identification nith the daughter Agnes mentioned in the will of a Richard Hathaway of Shottery, who died in 1581, being then in possession of the farmhouse known as "Anne Hathaway's cottage."

Agnes was legally a distinct name from Anne, but there can be no doubt that ordinary custom treated them as identical. The principal record of the marriage is a bond dated Nov. 28, 1582, and executed by Fulk Sandells and John Richardson, two yeomen of Strstford who also figure in Richard Hathaway's will. as a security to the bishop for the issue of a licence for the marriage of William Shakespeare and "Anne Hathwey of Stratford." upon the consent of her friends. with one asking of the banns. There is no reason to suppose, as has been suggested, that the procedure adopted was due to dislike of the marriage on the part of John Shakespeare, since, the bridegroom being a minor. it would not have been in accordance with the practice of the bishop's officials to issue the licence nithout evidence of the father's consent. The explanation probably lies in the fact that Anne was already pregnant. and in the nearness of Advent, nithin which marriages were prohibited, so that the ordinary procedure by banns would have entailed a delay until after Christmas A kindly sentiment has suggested that some form of civil marriage, or at least contract of marriage, had already taken place, so that a canonical marriage was really required only in order to enable Anne to secure the legacy left her by her father "at the day of her marriage." But such a theory is not rigidly required by the facts It is remarkable that, on the day before that on which the bond was executed. an entry was made in the bishop's register of the issue of a licence for a marriage between William Shakespeare and "Annam Whateley de Temple Grafton." Of this it can only be said that the bond, as an original document, is infinitely the better authority, and that a mistake of "Whateley" for "Hathaway" is a possible solution. Temple Grafton may have been indicated in the licence as the place of marriage, although Worcester licences usually named the place of residence of the bride. There are no contemporary registers for Temple Grafton. and there is no entry of the marriage in those for Stratford-on-Avon. Such a record seems to have been seen during the 19th century in the registers for Luddington, a chapelry within the parish, which are now destroyed. Shakespeare's first child, Susanna, was baptized on May 26. 1583, and was followed on Feb. 2, 1585, by twins, Hamnet and Judith.

Departure From Stratford.— In or after 1584 Shakespeare left Stratford. An 18th-century story of a drinking bout in a neighbouring village is of little importance. There is a stronger tradition that he got into trouble through poaching on the estates of a considerable Warwickshire magnate, Sir Thomas Lucy, and found it necessary to leave Stratford in order to escape punishment. It is added that he afterward took his revenge on Lucy by satirizing him as the Justice Shallow of *The Merry Wives of Windsor.* From this event until he emerges as an actor and rising playwright in 1592 his history is a blank. and it is impossible to say what experience may not have helped to fill it. Much might indeed be done in eight years of cronded Elizabethan life Conjecture has not been idle and has assigned him in turn to the occupations of a scrivener. an apothecary. a dyer, a printer a soldier and the like The suggestion that he saw military service rests largely on a confusion with another William Shakespeare of Rowington. Aubrey had heard that "he had been in his younger years a schoolmaster in the country." The mention in *Henry 11'* of certain obscure yeomen families. Visor of Woncote and Perkes of Stinchcombe Hill. near Dursley in Gloucestershire. has been thought to suggest a sojourn in that district. where indeed Shakespeares were to be found from an early date. Ultimately of course, he drifted to London and the theatre. where. according to the stage tradition he found employment in a menial capacity. perhaps even as a holder of horses at the doors, before he was admitted into a company as an actor and so found his nay to his true vocation as a writer of plays. Edmund Malone thought that he might have left Stratford with one of the traveling companies of players which visited the town Later biographers have fixed upon Leicester's men. who were at Stratford in 1586–87. and have held that Shakespeare remained to the end in the same company. passing with it on Leicester's death in 1588 under the patronage of Ferdinando, Lord Strange and afterward earl of Derby. and on Derby's death in 1594 under that of the lord chamberlain. Henry Carey. Lord Hunsdon This theory hardly takes account of the shifting combinations and recombinations of actors, especially during the disastrous plague years of 1592 to 1594. It is not possible to establish a contmuity betneen Strange's company and Leicester's, and nhile the names of many members of Strange's company in and about 1593 are on record, Shakespeare's is not among them It is at least possible. as will be seen later. that he was in contact with the earl of Pembroke's men about this time. or with the earl of Sussex' men, or with both.

Earliest **Writings.**—What is clear is that by the summer of 1592, when he nas 28, he had begun to emerge as a playnright and had evoked the jealousy of at least one of the group of scholar poets who in recent years had claimed a monopoly of the stage This was Robert Greene, nho, in an Invective on behalf of the playmakers against the play actors which forms part of his *Groats-worth of Wit*, speaks of "an upstart Crow, beautified with our feathers, that with his *Tygers heart wrapt in a Players hide,* supposes he is as well able to bumbast out a blank verse as the best of you. and being an absolute *Iohannes fac totum,* is in his owne conceit the onely Shake-scene in a countrie" The play upon Shakespeare's name and the parody of a line from *Henry VI* make the reference unmistakable. The London theatres were closed, first through riots and then through plague from June 1592 to April 1594. with the exception of about a month at each Christmas during that period, and the companies were dissolved or driven to the provinces Even if Shakespeare had been connected with Strange's men during their London seasons of 1592 and 1593, it does not seem that he traveled with them. Other activities may have been sufficient to occupy the interval. The most important of these was probably an attempt to win a reputation as a nondramatic poet. *Venus and Adonts* was published about April 1593. and *Lucrece* about May 1594. These books were printed by Richard Field, who had come to London from Stratford. Each has a dedication to Henry Wriothesley. earl of Southampton. a brilliant and accomplished favourite of the court. who was not yet of age. A possibly supersubtle criticism discerns an mcreased warmth in the tone of the second dedication, which is supposed to argue a marked growth of intimacy. The fact of this intimacy is vouched for by the story handed down from Sir William Davenant to Roue (uho published in 1709 the first regular biography of Shakespeare) that Southampton gave Shakespeare £1,000 "to enable him to go through with a purchase which he heard he had a mind to" The date of this generosity is not specified, and there is no known purchase by Shakespeare which can have cost anything like the sum named. The mention of Southampton leads naturally to the most difficult problem which a biographer has to handle, that of the *Sonnets*. But this will be more conveniently taken up at a later point. and it is necessary here only to record the probability that the earliest of the sonnets belong to this period. There is a surmise. not too implausible and supported by much ingenious argument, that Shakespeare's enforced leisure enabled him to make of 1j93 a *Wanderjahr*, and in particular that the traces of a visit to northern Italy may be seen in the local colouring of *Lucrece* as compared with *Venus and Adonis,* and in that of the group of plays nhich may be dated in or about 1594 and 1595 as compared with those that preceded. It must, honever. be kept in mind that. while Shakespeare may perfectly well. at this or at some earlier time have voyaged to Italy. and possibly Denmark and even Germany as well. there is no direct evidence to rely upon. and that inference from internal evidence is a dangerous guide when a writer of so assimilative a temperament is concerned

Connection With the Chamberlain's Company of Actors.—From the reopening of the theatres in the summer of 1594 onward. Shakespeare's status is in many ways clearer. He had certainly become a leading member of the Chamberlain's company by the following winter. when his name appears for the first and only time in the accounts of the treasurer of the chamber as one of the recipients of payment for their performances at court: there is every reason to suppose that he continued to act with and write for the same associates to the close of his career. The history of the company may be briefly told. At the death of the lord chamberlain on July 22, 1596, it passed under the protection of George, 2nd Lord Hunsdon, and once more became "the Lord Chamberlain's men" when he was appointed to that office on March 17, 1597. James I on his accession took this company under his patronage as grooms of the chamber. and during the remainder of Shakespeare's connection with the stage they were "the King's men." The records of performances at court show that they were by far the most favoured of the companies, their nearest rivals being the company known during the reign of Elizabeth I as "the Admiral's," and afterward as "Prince Henry's men." From the summer of 1594 to March 1603 they appear to have played almost continuously in London. although they undertook a provincial tour during autumn. 1597. when the London theatres were closed because of the interference of some of the players in politics. They traveled again during 1603 when the plague was in London. and during. at any rate, portions of the summers or autumns of most years thereafter. In 1594 they were playing at Newington Butts, and probably afterward at the Cross Keys in the city. It is natural to suppose that in later years they used the Theatre in Shoreditch. since this was the property of James Burbage, the father of their principal actor, Richard Burbage. The Theatre was pulled down in 1598; after a short interval during which the company may have played at the Curtain (also in Shoreditch). Richard Burbage and his brother Cuthbert rehoused them in the Globe on Bankside, built partly out of the materials of the Theatre. There the profits of the enterprise were divided between the members of the company as such and the owners of the building as "housekeepers," and shares in the "house" were held by Shakespeare and some of his leading "fellows." About 1608 another playhouse became available for the company in the "private" or winter house of the Blackfriars. This was also the property of the Burbages, but had previously been leased to a company of boy players. A somewhat similar arrangement with profits was made.

Shakespeare is reported by Aubrey to have been a good actor, but Adam in *As You Like It* and the Ghost in *Hamlet* indicate the type of part he played. As a dramatist, however, he was the mainstay of the company for at least 15 years. during which Jonson, Dekker, Beaumont and Fletcher, and Cyril Tourneur also contributed to their repertory. On an average he must have written about two plays a year for them, although he seems to have been most productive during the opening years of the period. He occasionally took his plots from earlier plays, but theories which represent him as largely a "patcher" of the work of other men, or of his own, seem to be generally abandoned. Similarly, while the texts of his plays contain some theatrical interpolations. there is no reason to suppose that they were substantially revised by other hands before the Restoration. Occasionally he may have entered into collaboration. as, for example. at the end of his career. with Fletcher.

Stratford Affairs. — In a worldly sense he clearly flourished, and about 1596. if not earlier he was able to resume relations as a moneyed man n-ith Stratford-on-Avon. There is no evidence to show whether he had visited the town in the interval. or whether he had brought his wife and family to London. His son Hamnet died in 1596. During the last ten years John Shakespeare's affairs had remained unprosperous. He incurred debts. partly through becoming surety for his brother Henry. and in 1592 his name was included in a list of recusants dwelling at or near Stratford. with a note by the commissioners that in his case the cause was believed to be the fear of process for debt. There is no reason to doubt this explanation or to seek a religious motive in John Shakespeare's abstinence from church. William Shakespeare's purse must have made a considerable difference. The prosecutions for debt ceased. and in 1597 a fresh action was brought in chancery for the recovery of the Wilmcote property from the Lamberts. It seems to have been without result. Another step was taken to secure the dignity of the family by an application in 1596 to the heralds for the confirmation of a coat of arms said to have been granted to John Shakespeare while he was bailiff of Stratford. The bearings were *or* (gold)on a bend *sable* (black) a spear *or* steeled *argent* (silver), the crest a falcon. his wings displayed *argent* supporting a spear *or* steeled *argent*, and the motto *Non sanz droict* ("Not without right"). The grant was made. and in 1599 there was a further application for leave to impale the arms of Arden. in right of Shakespeare's mother. No use, hon-ever. of the Arden arms by the Shakespeares can be traced. In 1597 Shakespeare made an important purchase for £60 of the house and gardens of New Place in Chapel street. This was one of the largest houses in Stratford. Presumably John Shakespeare ended his days in peace. A visitor to his shop remembered him as "a merry-cheekt old man" always ready to crack a jest with his son. He died in 1601. and his wife in 1608, and the Henley street houses passed to William. Aubrey records that William paid annual visits to Stratford, and there is evidence that he kept in touch with the life of the place. The correspondence of his neighbours. the Quineys, in 1598 contains an application to him for a loan to Richard Quiney upon a visit to London.. and a discussion of possible investments for' him in the neighbourhood of Stratford. In 1602 he took, at a rent of 2s. 6d. a year, a copyhold cottage in Chapel lane. perhaps for his gardener. In the same year he invested £320 in the purchase of an estate of 107 ac. in the open fields of Old Stratford. together with 20 ac. of pasture and common rights: in 1605 he spent another £440 in the outstanding term of a lease of certain tithes in Stratford parish. which brought in an income of about £60 a year.

London Associations. — He continued meanwhile to live near the theatres. There is evidence that in 1 j96 he was living in Southwark. Payments of subsidy were due from him in 1597 and 1599 in the parish of St. Helen's. Bishopsgate. and an arrear was ultimately collected in the liberty of the Clink. He had no doubt migrated from Bishopsgate when the Globe upon Bankside was opened by the Chamberlain's men. There is evidence that about 1604 he "lay," temporarily or permanently, in the house of Christopher Mountjoy, a tiremaker of French extraction. at the corner of Silver street and Monkwell street in Cripplegate. A note by Aubrey, if it really refers to Shakespeare (which is almost certain), is of value as thron-ing light not only upon his abode, but upon his personality. Aubrey seems to have derived it from William Beeston the actor. It is as follows: "The more to be admired q[uod] he was not a company keeper. lived in Shoreditch, wouldn't be debauched. & if invited to court; he was in paine." Against this evidence of the correctness of Shakespeare's morals are to be placed an anecdote of a tiring-house amour picked up by a Middle Temple student in 1602 and a Restoration scandal which made him the father, by the hostess of the Cron-n tavern at Oxford where he stayed en route to Stratford. of Sir William Davenant. who was born in Feb. 1606. His credit at court is implied by Jonson's references to his flights "that so did take Eliza and our James." and by stories of the origin of *The Merry Wives of Windsor* in Elizabeth I's desire to see Falstaff in love, and of an autograph letter written to honour him by King James. It was noticed by Henry Chettle that his "honied muse" dropped no "sable tear" to celebrate the death of the queen. Southampton's patronage may have introduced him to the brilliant circle around the earl of Essex. but there is no reason to suppose that he or his company were held responsible for the performance of *Richard II* at the command of some of the followers of Essex as a prelude to the disastrous rising of Feb. 1601. The editors of the First Folio speak also of favours received by the author in his lifetime from William Herbert. earl of Pembroke. and his brother Philip Herbert, earl of Montgomery.

He appears to have been on cordial terms with his fellows of the stage. One of them. Augustine Phillips. left him a small legacy in 1605, and in his own will he paid a similar compliment to Richard Burbage. and to John Heming and Henry Condell, nho afterward edited his plays. His relations with Jonson, whom he is said by Rowe to have introduced to the world as a playwright! have been much discussed. Jests are preserved which, even if apocryphal, indicate considerable intimacy between the two. This is not inconsistent with occasional passages of arms. The anonymous author of *The Return From Parnassus* (2nd part: 1602), for example. makes William Rempe, the actor, allude to a "purge" which Shakespeare gave Jonson, in return for his attack on some of his rivals in *The Poetaster*.[1] It has been conjectured that this purge was the description of Ajax and his humours in *Troilus and Cressida*. Jonson, on the other hand, who was criticism incarnate, did not spare Shakespeare either in his prologues or in his private conversation. He told William Drummond of Hawthornden that "Shaksperr wanted arte." But the verses which he contributed to the First Folio are generous enough to make all amends, and in his *Discoveries* (1623–37), while regretting Shakespeare's excessive facility and the fact that he often "fell into those things, could not escape laughter." he declares him to have been "honest and of an open. and free nature." and says that, for his own part. "I lov'd the man and do honour his memory (on this side idolatryj as much as any." According to a memorandum book (1661–63) of the Rev. John Ward (who became vicar of Stratford in 1662), Jonson and Michael Drayton, himself a Warwickshire poet. had been drinking with Shakespeare when he caught the fever of which he died: and Thomas Fuller (1608–61), whose *Worthies* was published in 1662, gives an imaginative description of the wit combats which took place between the two.

Contemporary Reputation. — Of Shakespeare's literary reputation during his lifetime there is ample evidence. He is probably neither the "Willy" of Edmund Spenser's *Tears of the Muses,* nor the "Aetion" of his *Colin Clout's Come Home Againe.* But from the time of the publication of *Venus and Adonis* and *Lucrece* allusions in praise of his work both as poet and dramatist, and often to himself by name, come thick and fast from writers of every kind and degree. Perhaps the most interesting of these from the biographical point of view are contained in the *Palladis Tamia,* a kind of literary handbook published by Francis Meres in 1598, for Meres not only wrote of him as "the most excellent in both kinds (*i.e.*, comedy and tragedy) for the state," and one of "the most passionate among us to bewaile and bemoane the perplexities of Love." but also took the trouble to give a list of 12 plays already written, which serves as a starting point for all modern attempts at a chronological arrangement of his work. It is, moreover, from Meres that we first hear of "his sugred sonnets among his private friends." Two of these sonnets were printed in 1599 in a volume of miscellaneous verse called *The Passionate Pilgrim.* This was ascribed upon the title page to Shakespeare, but probably, so far as most of its contents were concerned, without justification. The bulk of Shakespeare's sonnets remained unpublished until 1609.

[1]Kempe (speaking to Burbage), "Few of the university men pen plays well. They smell too much of that writer Ovid and that writer (sic) Metamorphosis, and talk too much of Proserpina and Jupiter. Why here's our fellow Shakespeare puts them all down; aye, and Ben Jonson too. O that Ben Jonson is a pestilent fellow. He brought up Horace giving the Poets a pill, but our fellow Shakespeare hath given him a purge that made him beray his credit."

About 1610 Shakespeare seems to have left London, and to have finally settled in his house at New Place. Stratford. There he lived the life of a retired gentleman. on friendly if satirical terms with the richest of his neighbours. the Combes. and interested in local affairs. such as a bill for the improvement of the highways in 1611. or a proposed enclosure of the open fields at Welcombe in 1614. which might affect his income or his comfort. He had his garden with its mulberry tree, and his farm in the immediate neighbourhood. His brothers Gilbert and Richard were still alive. His sister Joan had married William Hart, a hatter, and in 1616 was dwelling in one of his houses in Henley street. In 1607 his eldest daughter. Susanna. had married John Hall (d. 1635), a physician of some reputation. They lived in Stratford and had one child. Elizabeth, born in 1608. The younger daughter. Judith, married Thomas Quiney, a vintner, also of Stratford, two months before her father's death. The last few of the plays may have been written at Stratford. but it is reasonable to suppose that Shakespeare's connection with the King's company ended when the Globe was burned down during a performance of *Henry VIII* on June 29, 1613. Certainly his retirement did not imply an absolute break with London life. In 1613 he devised an *impresa,* or emblem. to be painted by Richard Burbage, and worn in the tilt on .Accession day by the earl of Rutland, who had been one of the old circle of Southampton and Essex. In the same year he purchased for £140 a freehold house in the Blackfriars. near the Wardrobe, once a gatehouse to the lodging of the prior of Blackfriars. This was conveyed to trustees, apparently in order to bar the right which his widow would otherwise have had to dower. In 161j this purchase involved Shakespeare in a lawsuit to obtain the surrender of the title deeds. Richard Davis. a Gloucestershire clergyman of the late 17th century, reports that the poet "died a papist." There is little to corroborate this; the alleged "spiritual testament" of John Shakespeare: an 18th-century discovery, cannot in fact be confidently connected with the poet's father at all. and Davis' own words suggest a late conversion rather than a hereditary faith. On the other hand. there is little to refute it beyond an entry in the accounts of Stratford corporation for drink given in 1614 to "a preacher at the Newe Place."

Will and Death. — Shakespeare made his will on March 25, 1616. apparently in some haste. as the executed deed is a draft with many erasures and interlineations. There were legacies to his daughter Judith Quiney and his sister Joan Hart, and remembrances to friends both in Warwickshire and in London; but the property was left to his daughter Susanna Hall under a strict entail which points to a desire on the part of the testator to found a family. Shakespeare's wife. who had of course dower in most of the property. is mentioned only in an interlineation. by which the "second best bed with the furniture" was beaueathed to her. Much nonsense has been written about this. but it seems quite natural. The best bed was an important chattel. which would go with the house. The estate was after all not a large one. Aubrey's estimate of its annual value as £200 or £300 a year sounds reasonable enough, and John Ward s statement that Shakespeare spent £1.000 a year must surely be an exaggeration The sum total of his known investmepts amounts to £960 Sir Sidney Lee's calculation that his theatrical income must have reached £600 a vear is a considerable overestimate; it can hardly have been more than about £200. It must be remembered that the purchasing value of money in the 17th century was many times greater than at present. Shakespeare's interest in the "houses" of the Globe and Blackfriars probably ended on or before his death.

A month after his will was signed Shakespeare died, on April 23 (old style: May 3. new style), 1616. and as a tithe owner was buried in the chancel of the parish church. Some doggerel upon the stone that covers the grave has been assigned by local tradition to his onn pen A more elaborate monument with a bust by the sculptor Gerard Johnson was in due course set up on the chancel wall Anne Shakespeare followed her husband on hug 6. 1623 The family was never founded Shakespeare s granddaughter, Elizabeth Hall made tno childless marriages the first nith Thomas Nash of Stratford the second nith John (afternard Sir John) Barnard of Abington Manor, Northamptonshire His daughter Judith Quiney had three sons! all of whom had died unmarried by 1639. There were, therefore, no direct descendants of Shakespeare in existence after Lady Barnard's death in 1670. Those of his sister, Joan Hart. could, however, still be traced in 1864. On Lady Barnard's death the Henley street houses passed to the Harts, in whose family they remained until 1806. They were then sold, and in 1847 were bought for the public. They are now held with Anne Hathaway's cottage at Shottery as the Birthplace trust. Lady Barnard had disposed of the Blackfriars house. The rest of the property was sold under the terms of her will, and New Place passed. first to the Cloptons, who rebuilt it, then to the Rev. Francis Gastrell, who pulled it down in 1759. The grounds of the site are now open to the public, and nearby is the Shakespeare Memorial theatre (burned, but rebuilt and opened in 1932) in which performances of Shakespeare's plays are given annually. Both the Memorial theatre and the Birthplace contain museums, in which books. documents and portraits of Shakespearean interest, together n-ith relics of greater or less authenticity, are stored.

No letter or other writing in Shakespeare's hand can be proved to exist, with the exception of three signatures upon his will, one upon a deposition (May 11. 1612) in a lawsuit with which he was remotely concerned. and two upon deeds (March 10 and 11, 1613) in connection with the purchase of his Blackfriars house. Aubrey records that he was "a handsome, well-shap't man." and the lameness attributed to him by some writers has its origin only in a too literal interpretation of certain references to spiritual disabilities in the *Sonnets*.

THE PLAYS

Editions.—A collection of *Mr. William Shakespeare's Comedies, Histories and Tragedies* was printed at the press of William and Isaac Jaggard. and issued by a group of booksellers in 1623. This volume is known as the First Folio. It has dedications to the earls of Pembroke and Montgomery, and to "the great Variety of Readers." both of which are signed by two of Shakespeare's "fellows" at the Globe. John Heming and Henry Condell, and commendatory verses by Ben Jonson. Hugh Holland. Leonard Digges and an unidentified I.M. The Droeshout engraving forms part of the title page. The contents include, with the exception of *Pericles,* all of the 37 plays now ordinarily printed in editions of Shakespeare's works. Of these 18 were published for the first time. The other 18 had already appeared in one or more separate editions. known as the quartos.

The following list gives the date of the First Quarto of each such play, and also that of any later quarto which differs materially from the first.

The Quarto Editions

Titus Andronicus (1594)
2 *Henry VI* (1594)
3 *Henry VI* (1595)
Richard II (1597, 1608)
Richard III (1597)
Romeo and Juliet (1597, 1599)
Love's Labour's Lost (1598)
1 *Henry IV* (1598)
2 *Henry IV* (1600)
Henry V (1600)
A Midsummer Night's Dream (1600)
The Merchant of Venice (1600)
Much Ado About Nothing (1600)
The Merry Wives of Windsor (1602)
Hanzlet (1603, 1604)
King Lear (1608)
Troilus aad Cressida (1609)
Othello (1622)

Entries in the *Register* of copyrights kept by the Company of Stationers indicate that editions of *As You Like It* and *Antony and Cleopatra* were contemplated but not published in 1600 and 1608 respectively.

The quartos vary much in quality. Some of them contain texts which are practically identical with those of the First Folio; others show variations so material as to suggest that some alteration, generally by way of shortening for stage purposes, took place. A group of First Quartos. including 2 *Henry VI*, 3 *Henry VI*, *Romeo and Juliet*, *Henry V*, *The Merry Wives* of *Windsor* and *Hamlet,* are labeled "bad quartos"; it is practically certain that *Richard III* and *King Lear* should be added to this list, and it is highly probable that there was a (no longer extant) bad quarto of *Love's Labour's Lost.* The bad quartos tend to shortness; they are textually corrupt and are generally believed to have a surreptitious origin in "memorial reconstruction" by an actor or actors, or a prompter.

Theories formerly held that they represent "early versions" of the plays or that they derive from shorthand reports of performances in the theatre no longer appear to find supporters. Most of them must have been printed without the consent of the theatrical companies which owned the plays. and the phenomenon is to be observed also in connection with plays by authors other than Shakespeare. Shakespeare's name or initials were printed on the title pages of *Locrine* (1595), *Sir John Oldcastle* (1600), *Thomas Lord Cromwell* (1602). *The London Prodigal* (1605), *The Puritan* (1607). *A Yorkshire Tragedy* (1608) and *Pericles* (1609). It is not likely that, with the exception of *Pericles,* he wrote any part of these plays, some of which were not even produced by his company. They were not included in the First Folio of 1623, or in a reprint of it in 1632, known as the Second Folio; but all seven were appended to the second issue (1664) of the Third Folio (1663) and to the Fourth Folio of 1685. Shakespeare is named as joint author with John Fletcher on the title page of *The Two Noble Kinsmen* (1634), and with William Rowley on that of *The Birth of Merlin* (1662); there is no reason for rejecting the former ascription or for accepting the latter. Late entries in the Stationers' *Register* assign to him *Cardenio* (with Fletcher). *Henry I* and *Henry II* (both with Robert Davenport), *King Stephen, Duke Humphrey* and *Iphis and Ianthe;* none of these plays is extant. Conjecture has attempted to trace his hand in other plays. of which *Arden of Feversham* (1592), *Edward III* (1596), *Mucedorus* (1598) and *The Merry Devil of Edmonton* (1608) are the most important; he may possibly have had a share in *Edward III.* A play on *Sir Thomas More,* which has been handed down in manuscript. contains passages interpolated in various handwritings. and a theory that one is in that of Shakespeare, and gives indications of his orthography and methods of composition, would appear to have won general acceptance.

An attempt to publish a collected edition of the plays seems to have been made in 1619. It was apparently planned to bring out ten plays—The *Merchant of Venice* and *A Midsummer Night's Dream,* the bad quarto versions of the *Henry VI* plays. *Merry Wives, King Lear* and *Henry V,* two of the spuriously attributed plays, and *Pericles.* There is a possibility that undated quartos of *Romeo and Juliet* and *Hamlet* (not in bad quarto versions) were connected with the venture. Official intervention hampered the enterprise and the first ten plays came. separately, surreptitiously and, some of them. with false dates and imprints, from the press of William Jaggard. later the printer of the First Folio; the other two were printed without dates by William Stansby for the owner of the copyright, John Smethwick, later a First Folio shareholder.

Chronology.—The First Folio, unfortunately, does not give the dates at which the plays in it were written or produced; the endeavour to supply this deficiency has been one of the main preoccupations of Shakespearean scholarship: since Edmund Malone's *An Attempt to Ascertain the Order in Which the Plays of Shakespeare Were Written* (1778). The investigation is not a mere piece of barren antiquarianism, for on it depends the possibility of appreciating the work of the world's greatest poet. not as if it were an articulated whole like a philosophical system, but in its true aspect as the reflex of a vital and constantly developing personality. A starting point is afforded by the dates of the quartos and the entries in the Stationers' *Register* which refer to them. and by the list of plays already in existence in 1598 which is inserted by Francis Meres in his *Palladis Tamia* of that year. and which, while not necessarily exhaustive of Shakespeare's pre-1598 writing. includes *The Two Gentlemen of Verona, The Comedy of Errors, Love's Labour's Lost, A Midsummer Night's Dream, The Merchant of Venice, Richard II, Richard III, Henry IV, King John, Titus Andronicus* and *Romeo and Juliet,* as well as a mysterious *Love's Labour's Won,* which must be considered to be a play once printed in quarto and now no longer surviving in a single copy. There is a mass of supplementary evidence, drawn partly from definite notices in other writings or in diaries, letters. account books and similar records, partly from allusions to contemporary persons and events in the plays themselves, partly from parallels of thought and expression between each play and those near to it in point of time, and partly from considerations of style: including the so-called metrical tests, which depend upon an analysis of Shakespeare's varying feeling for rhythm at different stages of his career. The total result is certainly not a demonstration, but in the logical sense a hypothesis which serves to colligate the facts and is consistent with itself and with the known events of Shakespeare's external life.

The following list is an attempt to arrange the original dates of production of the plays according to the theatrical seasons. from autumn to autumn, in which they may have fallen. It is framed on the assumption that. as indeed John Ward tells us was the case. Shakespeare ordinarily wrote two plays a year; but some slackening of production in the later years seems probable.

This chronology is taken from Sir Edmund Chambers' *William Shakespeare.* It will be understood that neither the order in which the plays are given nor the distribution of them over the years lays claim to more than approximate accuracy. Later scholarship has found a tendency to push back the dates of the earlier plays. to date 1 *Henry VI* before the second and third parts, and to argue for numerous minor alterations. As, however. Chambers' book remains the standard scholarly life of Shakespeare, it is convenient to retain his order and chronology.

Chronology of the Plays

1590–91
(1, 2) 2, 3 *Henry VI*

1591–92
(3) 1 *Henry VI*

1592–93
(4) *Richard III*
(5) *Comedy of Errors*

1593–94
(6) *Titus Andronicus*
(7) *Taming of the Shrew*

1594–95
(8) *Two Gentlemen of Verona*
(9) *Love's Labour's Lost*
(10) *Romeo and Juliet*

1595–96
(11) *Richard II*
(12) *Midsummer Night's Dream*

1596–97
(13) *King John*
(14) *Merchant of Venice*

1597–98
(15, 16) 1, 2 *Henry IV*

1598–99
(17) *Much Ado About Nothing*
(18) *Henry V*

1599–1600
(19) *Julius Caesar*
(20) *As You Like It*
(21) *Twelfth Night*

1600–01
(22) *Hamlet*
(23) *Merry Wives of Windsor*

1601–02
(24) *Troilus and Cressida*

1602–03
(25) *All's Well That Ends Well*

1604–05
(26) *Measure for Measure*
(27) *Othello*

1605–06
(28) *King Lear*
(29) *Macbeth*

1606–07
(30) *Antony and Cleopatra*

1607–08
(31) *Coriolanus*
(32) *Timon of Athens*

1608–09
(33) *Pericles*

1609–10
(34) *Cymbeline*

1610–11
(35) *Winter's Tale*

1611–12
(36) *Tempest*

1612–13
(37) *Henry VIII*
(38) *Two Noble Kinsmen*

Composition and **Sources.**—A more detailed account of the individual plays may now be attempted. The figures here prefixed correspond to those listed in the chronology.

1, 2. The relation of *The Contention of York and Lancaster* to 2, 3 *Henry VI* and the extent of Shakespeare's responsibility for either or both works have long been subjects of controversy. The extremes of critical opinion are to be found in a theory which regards Shakespeare as the sole author of 2. 3 *Henry VI* and *The Contention* as a shortened and surreptitious version of the original plays. and in a theory which regards *The Contention* as written in collaboration by Christopher Marlowe. Robert Greene and possibly George Peele, and 2. 3 *Henry VI* as a revision of *The Contention* written, also in collaboration, by Marlowe and Shakespeare. A comparison of the two texts leaves it hardly possible to doubt that the differences between them are to be explained by reporting rather than by revision; scholarly opinion has tended more and more to regard the plays as coming from the unaided pen of Shakespeare. Greene's parody. in the "Shake-scene" passage of his *Groats-worth of Wit* (1592). of a line which occurs both in

The Contention and in 3 *Henry VI,* while it clearly suggests Shakespeare's connection with the plays, is evidence neither for nor against the participation of other men, and no sufficient criterion exists for distinguishing between Shakespeare's earliest writing and that of possible collaborators on grounds of style. But the blank verse style of 2. 3 *Henry 1'1* may quite well be an earlier stage of that found more fully developed in *Richard III*, and it is difficult to assign to anyone except Shakespeare the humour of the Jack Cade scenes. Views which exclude Shakespeare altogether may be left out of account. *Henry VI* is not in Meres's list of his plays, but its inclusion in the First Folio is an almost certain ground for assigning to him some share in the work.

3. It has been argued that such variety and poor quality of style are found in I *Henry VI* that it is difficult to regard Shakespeare as its sole author, even at the earliest stage of his development. It is assuredly unlikely that the text of the First Folio represents that of its original performances. The Temple Gardens scene (ii, 4), which is that most obviously Shakespeare's, was probably a later addition. Thomas Nashe refers to the representation of Talbot on the stage in his *Pierce Penilesse, His Supplication to the Divell* (1592), and it is probable that I *Henry I'1* is to be identified with the "Harey the vj" recorded in Philip Henslowe's *Diary* as having been acted on March 3, 1592, by Lord Strange's men, probably at the Rose theatre.

4. The *Henry VI* series leads directly up to *Richard 111,* and this relationship, together with its style as compared with that of the plays of 1594–96, suggests the short winter season of 1592–93 as the most likely time for the production of *Richard III*. There is a difficulty in that it is not included in Henslowe's list of the plays acted by Lord Strange's men during that season. But it may quite n-ell have been produced by the only other company which appeared at court during the Christmas festivities. Lord Pembroke's. The mere fact that Shakespeare wrote a play. or more than one play, for Lord Strange's men during 1592–94 does not prove that he never wrote for any other company during the same period; and indeed there is plenty of room ior guesswork as to the relations between Strange's and Pembroke's men. The latter are not known to have existed before the latter part of 1592, and many difficulties would be solved by the assumption that they originated out of a division of Strange's. who had amalgamated with the Admiral's. and may have found their numbers too much inflated to enable them to undertake as a whole the autumn tour of that year. If so, Pembroke's probably took over the *Henry VI* series of plays, since part of *The Contention,* under the name of the *True Tragedy of Richard Duke of York,* was published as performed by them, and completed it with *Richard 111* at Christmas. It will be necessary to return to this theory in connection with the discussion of *Titus Andronicus* and *The Taming of the Shrew*. The principal historical source for *Henry VI* was Edward Hall's *The Union of the Noble and Illustre Families of Lancaster and York* (1542), and for *Richard III,* as for most of Shakespeare's later historical plays, the second edition (1587) of Raphael Holinshed's *Chronicles of England, Scotland and Ireland* (1577). An earlier play, *The True Tragedy of Richard the Third* (1594), seems to have contributed little if anything to *Richard III*.

5. To the winter of 1592–93 may also be assigned with fair probability Shakespeare's first experimental comedy. *The Comedy of Errors,* and if his writing at one and the same time for Pembroke's and for another company is not regarded as beyond the bounds of conjecture, it becomes tempting to identify this with "the gelyous comodey" produced. probably by Strange's men, for Henslowe as a new play on Jan. j, 1593. The play contains a reference to the wars of succession in France which would fit any date from 1589 to 1594. The plot is taken from the *Menaechmi* and to a smaller extent from the *Amphitruo* of Plautus. William Warner's translation of the *Menaechmi* was entered in the Stationers' *Register* on June 10. 1594. A performance of *The Comedy of Errors* by "a company of base and common fellows" (including Shakespeare?) is recorded in the *Gesta Grayorum* as taking place in Gray's Inn hall on Dec. 28. 1j94

6. Many scholars have been loath to see the hand of Shakespeare in *Titus Andronicus;* the double testimony of its inclusion in Meres's list and in the First Folio makes its total rejection hazardous. A stage tradition was recorded by Edward Ravenscroft, a late 17th-century adapter of the play, that Shakespeare did no more than give a few "master touches" to the work of a "private author." The share of a collaborator has, however, been much whittled down in accordance with the general departure from "disintegrationist'; theories and many authorities are prepared to regard the play as Shakespeare's throughout. It remains. however, extremely difficult to produce a convincing and coherent hypothesis about its early stage history. The play was entered in the Stationers' *Register* on Feb. 6. 1594, and was published in the same year with a title page setting out that it had been acted by the companies of Lords Derby (*i.e.,* Strange, who had succeeded to his father's title on Sept. 25, 1593), Pembroke and Sussex. It is natural to take this list as indicating the order in which the three companies named were concerned with it. Henslowe records the production by Sussex' company of *Titus Andronicus* as a new play on Jan. 23, 1594, only a few days before the theatres were closed by plague. For the purposes of Henslowe's financial arrangements with the company a rewritten play may have been classed as new. Two years earlier he had appended the same description to a play of *Tittus and Vespacia* (as used in Henslowe's *Diary;* more generally *Titus and Vespasian*), produced by Strange's men on April 11 1592. At first sight the title suggests a piece founded on the lives of the emperors Titus and Vespasian, but there are some grounds. although far from conclusive. for supposing the play to have been an early version of *Titus Andronicus*. It is difficult to explain the company names on the title page unless there had been some version earlier than that of 1594. Pembroke's men are known from a letter of Henslowe's to have been ruined by Aug. 1j93. and it is to be suspected that Sussex'. who appeared in London for the first time at Christmas 1593, acquired their stock of plays and transferred these to the Chamberlain's men when the companies were again reconstituted in the summer of 1594. The Chamberlain's men were apparently playing *Andronicus* in June. The stock of Pembroke's men probably included. as well as *Titus and Vespasian,* both *Henry VI* and *Richard 111,* which also thus passed to the Chamberlain's company. The source of the plot is unknown; there are only slight hints for it in Byzantine chronicles. The relationship between the play and a chapbook version of the story. extant only in an 18th-century printing, remains obscure. It is not impossible that the chapbook represents Shakespeare's source material.

7. A play of *The Taming of a Shrew,* which can be traced back as far as 1589, was published in 1594 as acted by Pembroke's men. In June 1594 it was being acted by the Chamberlain's. There is little agreement among scholars concerning the relationship between *a Shrew* and Shakespeare's *The Shrew.* There are considerable differences between the two texts. One doctrine is that Shakespeare's play is his adaptation of the other; another is that *A Shrew* is a bad quarto of *The Shrew* (it shows all the signs of being a bad quarto of something); supporters of the latter view are forced to date *The Shrew* extremely early. It has been suggested in the past that the hands of two authors are to be seen in *The Shrew;* the evidence for this is not notably cogent. The origins of the play, which is to be classed as a farce rather than a comedy, are to be found ultimately in widely distributed folk tales, and more immediately in Ariosto's *I Suppositi* (1509) as translated in George Gascoigne's *The Supposes* (1566). Those who regard *The Shrew* as an adaptation of *A Shrew* suggest that it may have been Shakespeare's first task for the newly established Chamberlain's company of 1594 to refurbish the old farce. Thenceforward there is no reason to think that he ever wrote for any other company.

8. No very definite evidence exists for the date of *The Two Gentlemen of Verona,* other than the mention of it in *Palladis Tamia.* It is evidently a more rudimentary essay in the genre of romantic comedy than *The Merchant of Venice,* with which it has other affinities in its Italian colouring and its use of the interrelations of love and friendship as a theme; and it may be roughly assigned to the winter of 1594–95. The plot is drawn from various examples of contemporary fiction, especially from the story

of the shepherdess Filismena in Jorge de Montemayor's *Diana* (1559). A play of *Felix and Philiomena* had already been given at court in 1585.

9. *Lose's Labour's Lost* used to be regarded as the first of Shakespeare's plays. and has sometimes been placed as early as 1589. So early a date is extremely improbable. The characters of *Love's Labour's Lost* are evidently suggested by Henry of Navarre, his follon-ers Biron, Longueville and D'Aumont. who has probably been confused with the Catholic league leader, the duc de Maine. These personages would have been familiar at any time from 1591 onward, but Navarrese history of 1578 has also been drawn upon. and the channel of transmission to Shakespeare is unknown. The absence of the play from the lists in Henslowe's *Diary* does not leave it impossible that it should have preceded the formation of the Chamberlain's company. but certainly renders this less likely; and its lyric character perhaps justifies its being grouped with the other lyric plays of 1594–96. No entry of the play is found in the Stationers' *Register;* it is most likely that the present First Quarto of 1598 was not really the first edition, but replaces a lost bad quarto edition. The title page professes to give the play as "corrected and augmented" and as given at the Christmas of 1597. It was again revived for that of 1604 No literary source is known for its incidents.

10. Romeo and Juliet, which was published in 1597 as played by Lord Hunsdon's men, was probably produced somewhat before *A Midsummer Night's Dream,* as its incidents seem to have suggested the parody of the Pyramus and Thisbe interlude. An attempt to date it in 1591 is hardly justified by the Nurse's reference to an earthquake 11 years before and the fact that there was a real earthquake in London in 1580. The text of the First Quarto is surreptitious, and was "corrected, augmented and amended" in the Second Quarto of 1599. There had been an earlier play on the subject, but the immediate source was Arthur Brooke's narrative poem *Romeus and Juliet* (1562).

11. Richard II can be dated with some accuracy by a comparison of the two editions of Samuel Daniel's narrative poem on *The Civil Wars Between the Two Houses of Lancaster and York,* both of which bear the date of 1j gj and were therefore issued between March 25, 1595, and March 24. 1jg6 (new style). It is possible that a performance was given before Sir Robert Cecil in Dec. 1595. The second edition. but not the first: contains some close parallels to the play. From the first three quartos of *Richard II,* one published in 1597 and two in 1598, the deposition scene was omitted, although it was clearly part of the original structure of the play, and its removal leaves an obvious mutilation in the text. There is some reason to suppose that this was due to a popular tendency to draw seditious parallels between Richard and Elizabeth, and it became one of the charges against the earl of Essex and his fellow conspirators in the abortive outbreak of Feb. 1601 that they had procured a performance of a play on Richard's fate to stimulate their followers. As the actors were the Lord Chamberlain's men, this play can hardly have been other than Shakespeare's. The deposition scene was not printed until after Elizabeth's death, in the Third Quarto of 1608.

12. *A Midsummer Sight's Dream,* with its masquelike fairy scenes and the epithalamium at its close. has all the air of having been written less for the public stage than for some courtly wedding. and the compliment paid by Oberon to the "fair vestal throned by the west" makes it possible that it was a wedding at which Elizabeth was present. Many more or less plausible occasions have been suggested. The wedding of Mary, countess of Southampton. with Sir Thomas Heneage on hlay 2, 1594, would fit the setting of the plot; but a widowed countess hardly answers to the "little western flower" of the allegory, and there are allusions to later events and in particular to the rainy weather of 1594–95. The wedding of William Stanley, earl of Derby. brother of the Lord Strange for whose players Shakespeare had written?and Elizabeth Vere, daughter of the earl of Oxford. which took place at Greenwich on Jan. 26. 1595, would meet the conditions. But that of Thomas Berkeley and Elizabeth Carey, granddaughter of the company's patron Lord Hunsdon, on Feb. 19, 1596, is at least as likely. It has been fancied that Shakespeare was present when "certain stars shot madly from their spheres" in the Kenilworth fireworks of 1575, but if he had any particular recorded entertainment in mind it is more likely to have been the more recent one given to Elizabeth by the earl of Hertford at Elvetham in 1591. There appears to be no special source for the play beyond Chaucer's *Knight's Tale* and the fairy lore of western Europe.

13. *King John* has no very clear indications of date, but 1596 seems likely because of the style. in spite of the a priori improbability of a play on an independent subject drawn from English history being interpolated in the middle of the Lancastrian series. It would seem that Shakespeare had before him an old play of the Queen's men. called *The Troublesome Reign of King John.* This was published in 1591 and again. with "W. Sh." on the title page. in 1611. For copyright purposes *King John* appears to have been regarded as a revision of *The Troublesome Reign,* and in fact the succession of incidents in the two plays is much the same. Shakespeare'~dialogue. however, owes little or nothing to that of his predecessor. The early-date supporters argue for *The Troublesome Reign* as being some kind of bad quarto version of a Shakespeare *King John* which must be earlier than 1591. Their case cannot be regarded, in the present state of knowledge. as convincing.

14. The Merchant of Venice, certainly earlier than July 22. 1598, when it was entered in the Stationers' *Register,* and perhaps inspired by the alleged poison plots of Roderigo Lopez. Queen Elizabeth I's Jewish physician who was executed in 1594, shows considerable advance in comic and melodramatic pon-er over any of the earlier plays. and is assigned by a majority of scholars to about 1596. The various stories of which its plot is compounded are based upon common themes of folk tales and Italian *novelle.* It has been suggested that Shakespeare had before him a play called *The Jew,* of which there are traces as early as 1579, and in which motives illustrating "the greedinesse of worldly chusers" and the "bloody mindes of usurers" appear to have been already combined. Marlowe's *Tite Jew of Malta* may also have contributed something to the play.

15, 16. The first part of *Henry IV* was published in 1598, the second not until 1600. but both parts must have been in existence beiore the entry of the first part in the Stationers' *Register* on Feb. 25, 1598, since Falstaff is named in this entry. and a slip in a speech-prefix of the second part. which was not entered in the *Register* until Xug. 23, 1600, betrays that it was written when the character still bore the name of Sir John Oldcastle. Richard James, in his dedication to *The Legend of Sir John Oldcastle* about 1625, and Rowe in 1709 both bear witness to the substitution of the one ,personage for the other; Rowe ascribes this to the intervention of Elizabeth, and James to that of some descendants of Oldcastle, one of whom was probably Lord Cobham. There is an allusion to the incident and an acknowledgment of the wrong done to the famous Lollard martyr in the epilogue to 2 *Henry IV* itself. Probably Shakespeare found Oldcastle. with very little else that was of service to him, in an old play called *The Famous I'ictories of Henry the Fifth,* which is said to have been acted by Tarlton and the Queen's men at least as far back as 1588, and of which an edition was printed in 1598. Falstaff himself is a somewhat libelous portrait of the 15th-century leader Sir John Fastolf. who had already figured in *Henry VI;* but presumably Fastolf had no titled descendants alive in 1598.

17. A note in the Stationers' *Register* during Xug. 1600 shows that *Much Ado About Nothing* was in existence, although its publication was then directed to be "stayed." It may plausibly be regarded as the earliest play not included in Meres's list. In 1613 it was revived before James I under the alternative title of *Benedick and Beatrice.* Dogberry is said by Aubrey to have been taken from a constable at Grendon in Buckinghamshire. There is no very definite literary source for the play. although some of its incidents are to be found in Xriosto's *Orlando Furioso* and Bandello's *novelle,* and attempts have been made to establish relationships between it and two early.German plays. Jacob Ayrer's *Die Schöne Phänicia* and the *Vincentius Ladiszlaus* of Duke Henry Julius of Brunswick.

18. The completion of the Lancastrian series of histories by

Henry V can be placed in or about 1599, since there is an allusion in one of the choruses to the military operations in Ireland of the earl of Essex, who crossed on March 27 and returned on Sept. 28. 1599. The First Quarto, which, in spite of the fact that the play was "stayed" with *Much Ado About Nothing*, was published in 1600, is a surreptitious text, and does not include the choruses. A genuine version was first published in the First Folio.

19. That *Julius Caesar* also belongs to 1599 is shown, not only by its links with *Henry V*, but also by an allusion to it in John Weever's *Mirror of Martyrs*, a work written two years before its publication in 1601, and by a notice of a performance on Sept. 21, 1599, by Thomas Platter of Basel in an account of a visit to London. This was the first of Shakespeare's Roman plays, and, like those that followed, was based upon Plutarch's *Lives* as published by Sir Thomas North in 1580.

20. *As You Like It* was one of the plays "stayed" from publication in 1600, and cannot therefore be later than that year. Some trifling evidence suggests that it is not earlier than 1599. The plot is based on Thomas Lodge's romance of *Rosalynde* (1590), and this in part on the pseudo-Chaucerian *Tale of Gamelyn*.

21. *Twelfth Night* may be placed about 1600–01, since it quotes part of a song included in Robert Jones's *First Book of Songs and Airs* (1600), and is recorded by John Manningham to have been seen by him at a feast in the Middle Temple hall on Feb. 2, 1602. The principal source of the plot was Barnab Rich's "History of Apolonius and Silla" in his *Farewell to Military Profession* (1581).

22. A play of *Hamlet* was performed. probably by the Chamberlain's men, for Henslowe at Newington Butts on June 9, 1594. There are other references to it as a revenge play, and it seems to have been in existence in some shape as early as 1589. It was doubtless on the basis of this that Shakespeare constructed his tragedy. There is an allusion in *Hamlet* to the rivalry between the ordinary stages and the private plays given by boy actors, which points to a date not earlier than the revival of the plays at Paul's. probably in 1599; and another to an inhibition of plays because of a "late innovation" may also be explained by the revival rather than by the Essex rising of 1601, since the play is mentioned in a manuscript note by Gabriel Harvey, probably written before the death of Essex. The play was entered in the Stationers' *Register* on July 26, 1602. The First Quarto was printed in 1603 and the Second Quarto in 1604. These editions contain texts whose differences from each other and from that of the First Folio constitute one of the most difficult of Shakespearean problems. The First Quarto is certainly surreptitious. Its title page records performances in the universities of Oxford and Cambridge and elsewhere, as well as in London. The source of the plot is to be found in Scandinavian legends preserved in the *Historia Danica* of Saxo Grammaticus and transmitted to Shakespeare or his predecessor through the *Histoires Tragiques* (1570) of François de Belleforest (*see* HAMLET).

23. It is reported by John Dennis! in the preface to *The Comical Gallant* (1702), that *The Merry Wives of Windsor* was written at the express desire of Elizabeth, who wished to see Falstaff in love, and was finished by Shakespeare in the space of a fortnight. A date at the end of 1599 or the beginning of 1600, shortly after the completion of the historical Falstaff plays. would be the most natural one for this enterprise, and with such a date the evidence of style agrees. The play was entered in the Stationers' *Register* on Jan. 18 1602. The First Quarto of the same year gives a surreptitious text. which was replaced by that of the First Folio. The Windsor setting makes it possible that *The Merry Wives* was produced within the castle. and perhaps with the assistance of the children of Windsor chapel in the fairy parts. The plot has its analogies to various incidents in Italian *novelle* and in English adaptations of these.

24. Few of the plays present so many difficulties as *Troilus and Cressida*, and it cannot be said that its literary history has as yet been thoroughly worked out. A play of the name. "as yt is acted by my Lord Chamberlens men." was entered in the Stationers' *Register* on Feb. 7, 1603, with a note that "sufficient authority" must be got by the publisher, James Roberts! before he printed it. This can hardly be any other than Shakespeare's play but it must have been "stayed," for the First Quarto did not appear until 1609, and on Jan. 28 of that year a fresh entry had been made in the *Register* by another publisher. The text of the quarto differs in certain respects from that of the folio, but not to a greater extent than the use of different copies of the original manuscript might explain. Two alternative title pages are found in copies of the quarto. On the earlier is a statement that the play was printed "as it was acted by the Kings Maiesties seruants at the Globe"; from the other these words are omitted; and a preface is appended which hints that the "grand possessors" of the play had made difficulties about its publication, and describes it as "never staled with the stage." Attempts have been made, mainly on grounds of style. to find another hand than Shakespeare's in the closing scenes and the prologue, and even to assign widely different dates to various parts of what is ascribed to Shakespeare. But the evidence does not really bear out these theories, and the style of the whole must be regarded as quite consistent with a date in 1602. It has been thought that the description of Ajax and his humours in the second scene of the first act is Shakespeare's "purge" to Jonson in reply to the *Poetaster* (1601), alluded to, as already mentioned, in the *Return From Parnassus*, a Cambridge play acted probably at Christmas 1601–02. It is tempting to conjecture that *Troilus and Cressida* may have been played, like *Hamlet*, by the Chamberlain's men at Cambridge, but may never have been taken to London, and in this sense "never staled with the stage." The only difficulty of a date in 1601 is that a parody of a play on Troilus and Cressida is introduced into *Histriomastix* (*c.* 1599, but not printed until 1610), and that in this Troilus "shakes his furious speare." But Henslowe had produced another play on the subject, by Dekker and Chettle, in 1599, and probably, therefore, no allusion to Shakespeare is intended. The material for *Troilus and Cressida* was taken by Shakespeare from Chaucer's *Troilus and Criseyde*, Caxton's *Recuyell of the Historyes of Troye* and Chapman's Homer.

25. Stylistic arguments have led to the dating of *All's Well That Ends Well* in 1602–03. It has been urged, as in the case of *Troilus and Cressida* (and with little justification), that parts of the play are of a considerably earlier date. The story is derived from Boccaccio's *Decameron* through the medium of William Paynter's *Palace of Pleasure* (1566).

26. *Measure for Measure* was played at court on Dec. 26, 1604. The evidence for this is a list of plays in one of the account books of the office of the revels. This was formerly thought to have been forged, but is now satisfactorily rehabilitated. The play was probably produced when the theatres were reopened after the plague in 1604. The plot is taken from a story already used by George Whetstone. both in his play of *Promos and Cassandra* (1578) and in his prose *Heptemeron of Civil Discourses* (1582), and borrowed by him from Giraldi Cinthio's *Hecatommithi* (1566).

27. A performance at court of *Othello* on Nov. 1, 1604, is noted in the same list as that recording *Measure for Measure*, and the play may be reasonably assigned to the same year. An alleged performance of Harefield in 1602 certainly rests upon a forgery. The play was revived in 1610 and seen by Prince Louis of Württemberg at the Globe on April 30 of that year. It was entered in the Stationers' *Register* on Oct. 6. 1621, and a First Quarto was published in 1622. The text of this is less satisfactory than that of the First Folio, and omits a good many lines found therein and almost certainly belonging to the play as written. It also contains profane expressions which have been modified in the folio, and thereby points to a date for the original production earlier than the Act to Restrain Abuses of Players in spring 1606. The plot, like that of *Measure for Measure*, comes from the *Hecatommithi* (1566) of Giraldi Cinthio.

28. The entry of *King Lear* in the Stationers' *Register* on Nov. 26. 1607, records its performance at court on Dec. 26, 1606. This suggests 1605 or 1606 as the date of production, and this is confirmed by the publication in 1605 of the older play, *The True Chronicle History of King Leir*, which Shakespeare used as his source. Two quartos of *King Lear* were published in 1608, and contain a text rather longer, but in other respects less accurate, than that of the First Folio. The material of the play consists of fragments of Celtic myth which found their way into history through Geoffrey of Monmouth. It was accessible to Shakespeare in Holinshed and in Spenser's *Faerie Queene*, as well as in the old play.

29. *Macbeth* cannot. in view of its obvious allusions to James I, be of earlier date than 1603. The style and some trifling allusions point to about 1605 or 1606. and a hint for the theme may have been given by Matthew Gwynne's entertainment of the *Tres Sibyllae*, n-ith which James was welcomed to Oxford on Aug. 27. 1605. The play was revived in 1610 and Simon Forman saw it at the Globe on April 20. The only extant text. that of the First Folio. bears traces of shortening and has been interpolated with additional rhymed dialogues for the witches. possibly by the hand of Thomas Middleton. But the extent of Middleton's contribution has been exaggerated. A ballad of *Macdobeth* is mentioned in the Stationers' records during 1596, but is not known. It is not likely that Shakespeare had consulted any Scottish history other than that included in Raphael Holinshed's *Chronicle;* he may have gathered witch lore from Reginald Scot's *Discoverie of Witchcraft* (1584) or King James's own *Demonologie* (1599).

30. It is not quite clear whether *Antony and Cleopatra* was the play of that name entered in the Stationers' *Register* on May 20. 1608. for no quarto is extant. and a fresh entry was made in the *Register* before the issue of the First Folio. Apart from this entry there is little external evidence to fix the date of the play. but it is in Shakespeare's later. although not his last. manner and may very well belong to 1607. It is possible that it guided some changes introduced by Samuel Daniel into a new edition of his *Cleopatra* issued in 1607.

31. In the case of *Coriolanus* the external evidence available is even scantier, and all that can be said is that its closest affinities are to *dntony and Cleopatra*, which in all probability it directly followed in order of composition. Both plays, like *Julius Caesar*, are based upon North's *Plutarch*.

32. There is no external evidence as to the date of *Timon of Athens*, but it may safely be grouped on the strength of its internal characteristics with the plays just named. and there is a clear guli between it and those that follow. It may be placed provisionally in 1607, although some critics put it next after *Lear*. The estraordinary incoherencies of its action and inequalities of its style have prevented modern scholars from accepting it as a finished production oi Shakespeare, but there agreement ceases. It is sometimes and perhaps most reasonably regarded as an incomplete draft for an intended play; sometimes as a Shakespearean fragment worked over by a second hand either for the stage or for printing in the First Folio; sometimes, but not very plausibly, as an old play by an inferior writer which Shakespeare had partly remodeled. It seems to have no relation to an extant academic play oi *Timon* which remained in manuscript until 1842. The sources are partly in Plutarch's *Life of Marcus Antonius*, partly in Lucian's dialogue of *Timon or Misanthropos* and partly in William Paynter's *Palace of Pleasure* (1566).

33. Similar difficulties, equally unsolved, cling to *Pericles.* It was entered in the Stationers' *Register* on May 20, 1608. and published in 1609 as "the late and much admired play" acted by the King's men at the Globe. The title page bears Shakespeare's name, but the play was not included in the First Folio and was added to Shakespeare's collected works only in the Third Folio. in company with others which, although they also had been printed under his name or initials in quarto iorm, are certainly not his. In 1608 was published a prose story, *The Painful Adventures of Pericles Prince of Tyre*. This claims to be the history of the play as it was presented by the king's players, and is described in a dedication by George Wilkins as "a poore infant of my braine." The production of the play is therefore to be put in 1608 or a little earlier. It can hardly be doubted on internal evidence that Shakespeare is the author of the verse scenes in the last three acts. with the possible exception of the doggerel choruses. It is probable. although it has been doubted, that he was also the author of the prose scenes in those acts. The poverty of the first two acts has been fairly convincingly accounted for by the theory that the play is a bad quarto, a memorial reconstruction by two reporters, the reporter of the last three acts having an efficiency greater than that of his colleague. It seems reasonable to allow R'ilkins some connection with the play: other dramatic work by him was produced about 1607. The writing oi the play cannot much have preceded publication. for the close resemblances of the style to that of Shakespeare's latest plays argue for its lateness. Unless there was an earlier Shakespearean version now lost. Dryden's statement that .'Shakespeare's own Muse her Pericles first bore" must be held to be an error. The story is an ancient one which exists in many versions. In all of these except the play, the name of the hero is Apollonius of Tyre. The play is directly based upon a version in Gower's *Confessio Amantis*, and the use of. Gower as a "presenter" is thereby explained. But another version in Laurence Twine's *Patterne of Painefull Adventures* (*c.* 1576), of which a new edition appeared in 1607, may also have been consulted.

34. *Cymbeline* shows a further development than *Pericles* in the direction of Shakespeare's final style. and can hardly have come earlier. A description of it is in a notebook of Simon Forman. who died in Sept. 1611; other plays seen by him in 1610 and 1611 are described in the same book. But these were not necessarily new plays. and *Cymbeline* may perhaps be assigned conjecturally to 1609. The masquelike dream in act v, sc. 4 has been thought to be an interpolation by another hand. This play also is based upon a widespread story. probably known to Shakespeare in Boccaccio's *Decameron* (day 2, novel 9), and possibly also in an English book of tales called *Westward for Smelts*. The historical part is, as usual. from Holinshed.

35. *The R'inter's Tale* was seen by Forman on May 15, 1611, and as it clearly belongs to the latest group of plays it may well have been produced in that or the preceding year. A document among the revels accounts, also now cleared of the imputation of forgery, gives Nov. j. 1611, as the date of a performance at court. The play is recorded to have been licensed by Sir George Buck, who began to license plays in 1607. The plot is from Robert Greene's *Pandosto, the Triumph of Time, or Dorastus end Fawnia* (1588).

36. The wedding masque in act iv oi *The Tempest* has suggested the possibility that it may have been composed to celebrate the marriage of the princess Elizabeth and Frederick V, the elector palatine, on Feb. 14. 1613. But the document among the revels accounts gives the precise date of Nov. 1, 1611, for a performance at court. Sylvester Jourdan's *A Discovery of the Bermudas*, containing an account of the shipwreck of Sir George Somers in 1609, was published about Oct. 1610. and this or some other contemporary 'narrative of Virginian colonization probably furnished the hint oi the plot.

37. Critical opinion has veered away from the doctrine that *Henry VIII* shows the hand of an author other than Shakespeare. John Fletcher had been named as the collaborator; some scholars had gone so far as to exclude Shakespeare entirely and allot the authorship to Fletcher and Philip Massinger. The inclusion of the play in the First Folio provides strong argument for Shakespeare's having some share in the writing. He was considered to be responsible for no more than act i, sc. 1, 2; act ii, sc. 3, 4; act iii, sc. 2. lines 1–203; and act v, sc. 1. Now that scholarly opinion is turning against the theory of disintegration. it is thought that, in the Fletcherian passages, Shakespeare was writing merely in the Fletcherian style. The play was probably produced in 1613, and originally bore the alternative title of *All Is True*. It was being performed in the Globe on June 29. 1613. when the thatch caught fire and the theatre was burned. The principal source was Holinshed, but Hall's *Union of Lancaster and York*, Foxe's *Acts and Monuments of the Church* and perhaps Samuel Rowley's play of *When You See Me, You Know Me* (1605) appear also to have contributed.

38. The tale of the First Folio dramas is now complete, but an analysis of *The Two Noble Kinsmen* leaves no reason to doubt the accuracy of its ascription on the title page of the First Quarto of 1634 to Shakespeare and John Fletcher. This appears to have been a case of ordinary collaboration. There is sufficient resemblance between the styles of the two writers to render the division of the play between them a matter of some difficulty; but the parts that may probably be assigned to Shakespeare are act i. sc. 1–4; act ii. sc. 1: act iii, sc. 1, 2: act v. sc. 1. 3. 4. Fletcher's morris dance in act iii. sc. 5 is borrowed from that in Beaumont's *Mask of the Inner Temple and Gray's Inn,* given on Feb. 20, 1613. and the play may perhaps be dated in 1613. It is based on Chaucer's *Knight's Tale.*

THE POEMS

Shakespeare's writings outside the field of drama are not numerous. The narrative poem of *Venus and Adonis* was entered in the Stationers' *Register* on April 18. 1593. and at least 17 editions. dating from 1593 to 1675, are known. The *Rape of Lucrece* was entered on May 9, 1594, and the nine extant editions range from 1594 to 1655. Each poem is prefaced by a dedicatory epistle from the author to Henry Wriothesley, earl of Southampton. The subjects. taken respectively from the *Metamorphoses* and the *Fasti* of Ovid. were frequent in Renaissance literature. It was once supposed that Shakespeare came from Stratford with *Venus and Adonis* in his pocket; but it is more likely that both poems owe their origin to the comparative leisure afforded to playwrights and actors by the plague period of 1592–94. In 1599 the stationer William Jaggard published a volume of miscellaneous verse which he called *The Passionate Pilgrint,* and placed Shakespeare's name on the title page. Only two of the pieces included herein are certainly Shakespeare's. and although others may quite possibly be his. the authority of the volume is destroyed by the fact that some of its contents are without doubt the work of Marlowe, Sir Walter Raleigh. Richard Barnfield and Bartholomew Griffin. In 1601 Shakespeare contributed *The Phoenix and the Turtle,* an elegy on an unknown pair of wedded lovers, to a volume called *Love's Martyr, or Rosalin's Complaint,* collected. and mainly written by Robert Chester.

The Sonnets. — The interest of all these poems sinks into insignificance beside that of one remaining volume. The sonnets were entered in the *Register* on May 20, 1609, by the stationer Thomas Thorpe. and published by him under the title *Shakespeares Sonnets, Never Before Imprinted* in the same year. In addition to 154 sonnets the volume, contains the elegiac poem *A Lover's Complaint.* If this is Shakespeare's. which is very doubtful. it probably dates from the *Venus and Adonis* period. In 1640 the sonnets. together with other poems from *The Passionate Pilgrim* and elsewhere. many of them not Shakespeare's. were republished by John Benson in *Poems Written* by *Wil. Shakespeare, Gent.* Here the sonnets are arranged in an altogether different order from that of 1609 and are declared by the publisher to "appeare of the same purity, the Xuthour himselfe then living avouched." No other Shakespearean controversy has received so much attention as that concerning itself with the date. character and literary history of the sonnets. This is intelligible enough. since upon the issues raised depends the question whether these poems do or do not give a glimpse into the intimate depths of a personality which otherwise is at most only imperfectly revealed through the plays. On the whole, the balance of authority is in favour of regarding them as in a very considerable measure autobiographical. This view has undergone the fires of much destructive argument. The authenticity of the order in which the sonnets were printed in 1609 and even Shakespeare's authorship of some of them have been doubted; and their subject matter has been variously explained as being of the nature of a philosophical allegory, of an effort of the dramatic imagination or of a heartless exercise in the forms of the Petrarchan convention. This last theory rests upon the false psychological assumption. which is disproved by the whole history of poetry and in particular of Petrarchan poetry, that the use of conventions is inconsistent with the expression of unfeigned emotions; and it is hardly to be set against the direct conviction which the sonnets carry of the strength and sincerity of the spiritual experience out of which they were wrought. This conviction makes due allowance for the inevitable heightening of emotion itself in the act of poetic composition; and it certainly does not carry with it a belief that all the external events which underlie the emotional development are capable at this distance of time of inferential reconstruction. But it does accept the sonnets as reflecting a part of Shakespeare's life during the years in which they were written. and as revealing at least the outlines of a drama which played itself out. for once, not in his imagination but in his actual conduct in the world of men and women.

There is no advantage to be gained by rearranging the order of the 1609 volume. even if there were any basis other than that of individual whim on which to do so. Many of the sonnets are obviously linked to those which follow or precede them; and although a few may conceivably be misplaced, the order as a whole does not jar against the sense of emotional continuity, which is the only possible test that can be applied. The last two sonnets. however, are merely alternative versions of a Greek epigram, and it is a hazardous assumption that all of the rest have a common subject matter. On this assumption. however, they have generally been interpreted somewhat as follows. There are two series. which are more probably parallel than successive. The shorter of these (cxxvii–clii) appears to be the record of the poet's relations with a mistress. a dark woman with raven brows and mourning eyes. In the earlier sonnets he undertakes the half-playful defense of black beauty against the blond Elizabethan ideal; but the greater number are in a more serious vein, and are filled with a deep consciousness of the bitterness of lustful passion and of the slavery of the soul to the body. The woman is a wanton. She has broken her bed vow for Shakespeare, who on his side is forsworn in loving her; and she is doubly forsworn in proving faithless to him with other men. His reason condemns her, but his heart has not the power to throw off her tyranny. Her particular offense is that she. "a woman coloured ill." has cast her snares not only upon him. but upon his friend, "a man right fair." who is his "better angel." and that thus his loss is double. in love and friendship. The longer series (i–cxxvi) is written to a man. appears to extend over a considerable period of time and covers a wide range of sentiment. The person addressed is younger than Shakespeare, and of higher rank. He is lovely, and the son of a lovely mother. and has hair like the auburn buds of marjoram. The series falls into a number of groups, which are rarely separated by any sharp lines of demarcation. Perhaps the first group (i–xvii) is the most distinct. These sonnets are a prolonged exhortation by Shakespeare to his friend to marry and beget children. The friend is now at the peak of his youth. and should make haste, before the rose of beauty dies. to secure himself in his descendants against devouring time. In the next group (xviii–xxv) a much more personal note is struck. and the writer assumes the attitudes. at once of the poet whose genius is to be devoted to making the beauty and the honour of his patron eternal, and of the friend whose absorbing affection is always on the point of assuming an emotional colour indistinguishable from that of love. The consciousness of advancing years and that of a fortune which bars the triumph of public honour alike find their consolation in this affection. A period of absence (xxvi–xxxii) follows. in which the thought of friendship comes to remedy the daily labour of travel and the sorrow of a life that is "in disgrace with fortune and men's eyes" and filled with melancholy broodings over the past. Then (xxxiii–xlii) comes an estrangement. The friend has committed a sensual fault, which is at the same time a sin against friendship. He has been wooed by a woman loved by the poet, who deeply resents the treachery but in the end forgives it and bids the friend take all his loves, since all are included in the love that has been freely given him. It is difficult to escape the suggestion that this episode of the conflict between love and friendship is the same as that which inspired some of the "dark woman" sonnets. Another journey (xliii–lii) is again filled with thoughts of the friend, and its record is followed by a group of sonnets (liii–lv) in which the friend's beauty and the immortality which this will find in the poet's verse are especially dwelt upon. Once more there is a parting (lvi–lxi) and the poet awaits as patiently as may be his friend's return to him. Again (lxii–lxv) he looks to his verse to give the friend immortality. He is tired of the world, but his friend redeems it (lxvi–lxviii). Then rumours of some scandal against his friend (lxix–lxx) reach him, and he falls (lxxi–lxxiv) into gloomy thoughts of coming death. The friend, however, is still (lxxv–lxxvii) his argument; and he is perturbed (lxxviii–lxxxvi) by the appearance of a rival poet, who claims to be taught by spirits to write "above a mortal pitch," and with "the proud full sail of his great verse" has already found favour with Shakespeare's patron. There is another estrangement (lxxxvii–xc), and the poet, already crossed with the spite of fortune, is ready not only to acquiesce in the loss of friendship. but to find the fault in himself. The friend returns to him. but the relation is still clouded by doubts of his fidelity (xci–xciii) and by public rumours of his wantonness (xciv–xcvij. For a third time the poet is absent (xcvii–xcix) in summer and spring. Then comes an apparent interval: after which a love already three years old is renewed jc–civ) with even richer praises (cv–cviii). It is now the poet's turn to offer apologies (cix–cxii) for offenses against friendship and for some brand upon his name apparently due to the conditions of his profession. He is again absent (cxiii) and again renews his protestations of the imperishability of love (cxiv–cxvi) and of his own unworthiness (cxvii–cxxi). for which his only excuse is in the fact that. the friend was once unkind. If the friend has suffered as Shakespeare suffered. he has "passed a hell of time." The series closes with a group (cxxii–cxxv) in which love is pitted against time: and an *envoi* warns the "lovely boy" that in the end nature must render up her treasure.

Mystery of "Mr. W. H."—Such an analysis can give no adequate idea of the qualities in these sonnets. whereby the appeal of universal poetry is built up on a basis of intimate self-revelation. The human document is so legible. and at the same time so incomplete. that it is easy to understand the strenuous efforts which have been made to throw further light upon it by tracing the identities of those other personalities, the man and the woman, through his relations to whom the poet was brought to so fiery an ordeal of soul, and even to the borders of self-abasement. It must be added that the search has, as a rule, been conducted with more ingenuity than judgment. It has generally started from the terms of a somewhat mysterious dedication prefixed by the publisher Thomas Thorpe to the volume of 1609. This runs as follows: "To the onlie begetter of these insuing sonnets Mr. W. H. all happinesse and that eternitie promised by our ever-living poet wisheth the well-wishing adventurer in setting forth T. T." The natural interpretation of this is that the inspirer or "begetter" of the sonnets bore the initials W. H.; and contemporary history has accordingly been ransacked to find a W. H. whose age and circumstances might conceivably fit the ccnditions of the problem which the sonnets present. It is perhaps a want of historical perspective which has led to the centring of controversy around two names belonging to the highest ranks of the Elizabethan nobility, those of Henry Wriothesley, earl of Southampton. and William Herbert, earl of Pembroke. There is some evidence to connect Shakespeare with both of these. To Southampton he dedicated *Venus and Adonis* in 1593 and *The Rape of Lucrece* in 1594, and the story that he received a gift of no less than £1,000 from the earl is recorded by Rowe. His acquaintance with Pembroke can only be inferred from the statement of Heming and Condell, in their preface to the First. Folio of the plays. that Pembroke and his brother Montgomery had "prosequuted both them and their Xuthour living, with so much favour." The personal beauty of the rival claimants and of their mothers, their amours and the attempts of their families to persuade them to marry, their relations to poets and actors and all other points in their biographies which do or do not fit in with the indications of the sonnets have been canvassed with great spirit and some erudition: but with no very conclusive result. It is in Pembroke's favour that his initials were in fact W. H., whereas Southampton's can be turned into W. H. only by a process of metathesis; and his champions have certainly been more successful than Southampton's in producing a woman, a certain Mary Fitton, who was a mistress of Pembroke's and was in consequence dismissed in disgrace from her post of maid of honour to Elizabeth. Unfortunately, the balance of evidence is in favour of her having been blond and not "black." Moreover, a careful investigation of the sonnets, as regards their style and their relation to the plays, renders it almost impossible on chronological grounds that Pembroke can have been their subject. He was born on April 9, 1580, and was therefore much younger than Southampton, who was born on Oct. 6, 1573. The earliest sonnets postulate a marriageable youth. certainly not younger than 18. an age which Southampton reached in the autumn of 1591 and Pembroke in the spring of 1598. The writing of the sonnets may have extended over many years. but it is impossible to doubt that as a whole it is to the years 1593–98 rather than to the years 1598–1603 that they belong. There is not. indeed, much external evidence available. Francis Meres in his *Palladis Tamia* of 1598 mentions Shakespeare's "sugred sonnets among his private friends," but this allusion might come as well near the beginning as at the end of the series; and the fact that two, not of the latest, sonnets are in *The Passionate Pilgrim* of 1599 is equally inconclusive.

The only reference to an external event in the sonnets themselves which might at first sight seem useful is in the following lines (cvii):

> The mortal moon hath her eclipse endured,
> And the sad augurs mock their own presage;
> Incertainties now crown themselves assured,
> And peace proclaims olives of endless age.

This has been variously interpreted as referring to the death of Elizabeth and accession of James in 1603. to the relief caused by the death of Philip II of Spain in 1598 and to the illness of Elizabeth and the threatened Spanish invasion in 1596. The "mortal moon" is generally considered to be Queen Elizabeth, but though "eclipse" may well mean "death." it is not clear whether to "endure eclipse" is to die or to escape death. Recent arguments that the "mortal moon" was the hostile battle array of the Spanish Armada in 1588, and that all the sonnets are to be dated before 1590, have found slight acceptance among critics.

Allusions to the rival poet do not help much. "The proud full sail of his great verse" would fit, on critical grounds, with Spenser, Marlowe, Chapman and possibly Peele, Daniel or Drayton; and the "affable familiar ghost." from whom the rival is said to obtain assistance by night, might conceivably be an echo of a passage in one of Chapman's dedications. Daniel inscribed a poem to Southampton in 1603, but with this exception none of the poets named is known to have written either for Southampton or for Pembroke. or for any other W. H. or H. W., during any year which can possibly be covered by the sonnets. Two very minor poets. Barnabe Barnes and Gervase Markham, addressed sonnets to Southampton in 1593 and 1595 respectively. and Thomas Nashe composed improper verses for his delectation.

But even if external guidance fails, the internal evidence for 1593–98 as approximately the .sonnet period in Shakespeare's life is very strong indeed. It has been worked out in detail by two German scholars. Hermann Isaac (Conrad) in the *Shakespeare-Jahrbuch* for 1884, and Gregor Sarrazin in *William Shakespeares Lehrjakre* (1897) and *Aus Shakespeares Meisterwerkstatt* (1906). Conrad's work, in particular, has hardly received enough attention from English scholars, probably because he makes the mistakes of taking the sonnets in Bodenstedt's order instead of Shakespeare's, and of beginning his whole chronology several years too early in order to gratify a fantastic identification of W. H. with the earl of Essex. This, however, does not affect the main force of 'an argument by which the affinities of the great bulk of the sonnets are shown, on the ground of stylistic similarities, parallelisms of expression and parallelisms of theme, to be far closer to the poems and the range of plays from *Love's Labour's Lost* to *Henry IV* than to any earlier or later section of Shakespeare's work. This dating has the further advantage of putting Shakespeare's sonnets in the full tide of Elizabethan sonnet production, which began with the publication of Sidney's *Astrophel and Stella* in 1591 and Daniel's *Delia* and Constable's *Diana* in 1592, rather than during years for which this particular kind of poetry had already ceased to be modish. It is to the three volumes named that the influence upon Shakespeare of his predecessors can most clearly be traced; while he seems in 'his turn to have served as a model for Drayton, whose sonnets to Idea were published in a series of volumes in 1594, 1599, 1602, 160j and 1619. It does not of course follow that because the sonnets belong to 1593–98 W. H. is to be identified with Southampton. It is, in fact, extremely unlikely that the publisher of the sonnets would be so careless as to address a great earl as a mere "master!'; and W. H., even if above Shakespeare's own rank, is likely to have been a young man not to be numbered among the noblest families.

There is a possibility that there is an allusion to Shakespeare's romance in a poem called "Willobie His Avisa," published in 1594 as from the pen of one Henry Willoughby, apparently of West Knoyle in Wiltshire. In this Willoughby, enamoured of an innkeeper's wife, apparently at Sherborne, takes counsel with "his familiar friend W. S. who not long before had tryed the curtesy of the like passion, and was now newly recovered of the like infection,." But there is nothing outside the poem to connect Shakespeare with a family of Willoughbys or with the neighbourhood of West Knoyle or Sherborne. Various other identifications of W. H. have been suggested, which rarely rest upon anything except a similarity of initials. There is every reason for the rejection of the theory. broached by Sir Sidney Lee. that W. H. was not the friend of the sonnets at all, but a certain William Hall, who was himself a printer, and might, it is conjectured, have obtained the "copy" of the sonnets for Thorpe. Somewhat more plausible is Sir William Harvey, the third husband of Southampton's mother. But, although it is just possible that "begetter" might mean not "inspirer" but "procurer for the press," the interpretation is shipwrecked on the obvious identity of the person to whom Thorpe "wishes" eternity with the person to whom the poet "promised" that eternity. The external history of the sonnets must still be regarded as an unsolved problem; the most that can be said is that their subject may just possibly be Southampton, cannot possibly be Pembroke and will probably never be convincingly identified. (E. K. C.; J. Cw.)

SHAKESPEAREAN STUDIES

Literary Criticism.—Attempts to interpret Shakespeare's work have, in important ways. controlled and modified English literary criticism in general. The plays have continued to be enjoyed whether whole: cut or adapted, and the peculiar response of each age has governed its major criticism.

Ben Jonson first had to account for his own and his generation's appreciation of Shakespeare, and for his critical impatience. Both he and, later, Dryden spoke with two voices, and for much the same reason, so that their neoclassicism was checked and scrutinized. Jonson saw bombast and lack of art in the dramatist and qualified the honour he did (in *Discoveries)* to the memory of Shakespeare "on this side idolatry"; whereas he could (in his verses for the First Folio) idolatrously put him above the Greeks and Romans, not only, in Milton's words, as a warbler of "native woodnotes wild," but as an artist.

This half line from Milton's "L'Allegro," with its implication that nature had guided the unscholarly pen of the poet. dogged criticism for two centuries. So the anonymous author of the prologue to *Julius Caesar* in *Covent Garden Drolery* (1672) wrote:

> His Excellencies came and were not sought,
> His words like casual Atoms made a thought:
> Drew up themselves in Rank and File, and writ,
> He wondring how the Devil it were such wit.

This may or may not be Dryden's verse, but it does express one of his opinions:

> All the Images of Nature were still present to him, and he drew them not laboriously, but luckily . . . Those who accuse him to have wanted learning, give him the greater commendation: he was naturally learn'd; he needed not the spectacles of Books to read Nature; he looked inwards, and found her there.
> (Dryden, Of *Dramatick Poesie, An Essay,* 1668.)

Like Jonson, and annoyed by the same elements in Shakespeare, Dryden recognized the "largest and most comprehensive soul" among "all Modern, and perhaps Ancient Poets," and Pope's preface to his edition of the plays in 1725 follows him. The easily accepted Platonic notion of a poet possessed by the muse continued to militate against a recognition of Shakespeare's conscious artistry, and a succession of works on his education, beginning with Richard Farmer's *Essay on the Learning of Shakespeare* (1767) and extending to T. W. Baldwin's *William Shakespere's "Small Latine and Lesse Greeke"* (1944), speak for the liveliness of this interest. So, inferentially, do the Baconian and other theories.

Meanwhile, 18th-century editors and critics accumulated information on the writers of Shakespeare's time and his sources, stimulated by Farmer's essay, which had used these for its own purposes. They wrote about the unities, decorum. quibbles, indecencies and anachronisms; blemishes were indicated and beauties marked. Samuel Johnson's *Preface* to his 1765 edition, a commanding work surveying the plays and summing up and transcending the issues of the age while "placing" Shakespeare securely, decided the controversy about the unities. said wise things about the relation of the tragic to the comic. but still balked at the Shakespearean quibble. "A quibble was to him the fatal Cleopatra for which he lost the world, and was content to lose it." The "world" that is lost is fidelity to nature. and the approbation of an age which recognized in Shakespeare this fidelity above all else. The tone of the *Preface* is still judicial.

Walter Whiter defended the quibble in a clever book, *A Specimen Shakspeare . . .* (1794), which was unappreciated in its day but recognized as important in the 1930s, when his points had been unwittingly made all over again. Stressing the unconscious and associative origin of many puns, he touched on Shakespeare's creative processes, isolated image clusters and hinted at an awareness of what Caroline Spurgeon came to call iterative imagery. Shakespeare is, however, no more an artist for being exhibited as a slave of the associative process, and Whiter's apologetic tone is true to his period which, important as it is for its scholarly work, is more concerned with adjudication than interpretation. In surveying it as a whole one sees chiefly promise and prophecy; a clearing of the way.

One work must, however, be excepted: Maurice Morgann's *An Essay on the Dramatic Character of Sir John Falstaff* (1777). This book, certainly important and influential historically, is as wise and broad in its argument as it is vital in expression. There had been essays in the periodicals of the 1750s on the Shakespearean characters; Johnson had made pertinent comments on them in the notes to his edition; and William Richardson's *A Philosophical Analysis and Illustration of Some of Shakespeare's Renrarkable Characters,* more intent on indicating casebooks of experience for the benefit of the reader than on psychological analysis, had appeared in 1774; but Morgann's essay transcends these (and also its immediate issue: the courage or cowardice of Falstaff) in its large, liberal and refreshing response to the plays. Shakespeare, he says: "boldly makes a character act and speak from those parts of the composition. which are *inferred* only, and not distinctly shewn. This . . . seems to carry us beyond the poet to nature itself. . . ." This capacity in Shakespeare for seeing his characters as *"whole,* and as it were original," not imitated, "rather as Historic than Dramatic beings," was central to his purpose, and it remains true despite the critical perversions which have stemmed from it. With Thomas Whately's detailed comparison of *Richard III* and *Macbeth* (1785) it became clear, in Whately's words, that critics thought "the distinction and preservation of *character"* of first importance, and this insistence was to prevail throughout the 19th century and into the 20th. It informs the works of Hazlitt, Coleridge, Frederick Furnivall, Edward Dowden, A. C. Bradley, Harley Granville-Barker and John Dover Wilson.

William Hazlitt, admiring Whately's analysis, published his *Characters of Shakespear's Plays* in 1817. It is an excellent handbook: it has an air oi novelty and adventure, its author being (like all the romantics) more conscious of differences from his predecessors than of a tradition. Enthusiastic, reverential, intuitively perceptive, he has a flair for apt quotation and, coming as he did to Shakespeare as a dramatic critic, he is saved from some of the pitfalls of a purely literary study of character.

Coleridge's lectures on Shakespeare had been delivered before Hazlitt's book appeared. but though they share a primary interest in character, the poet's critical range is far beyond that of his contemporaries and releases us from the 18th-century modes of thought. He was concerned to recognize Shakespeare's powers of judgment and to see him as a conscious artist. He claimed to have argued in a lecture course in 1802 that "Shakespeare's judgment was . . . still more wonderful than his genius, or rather. that the contradistinction itself between judgment and genius rested on an utterly false theory" *(The Canterbury Magazine,* Sept. 1834). This recognition, and the further one that every work of art must be judged by its own organic laws, put an end to the balancing of faults against beauties. Coleridge directed attention to the poems, used before (when read at all) only as quarries for parallel passages, and he analyzed *Venus and Adonis* in chapter 1j of his *Biographia Literaria* (1817). Examples from Shakespeare illuminated his distinction between the imagination and fancy, and both he and Keats, as great poets, revealed much about Shakespeare's creative processes.

The 20th century has seen, indeed. deep affinities in the creative minds of Keats and Shakespeare. Keats's letters are permeated with an awareness of the dramatist. and his attribution to Shakespeare of that envied "negative capability"—"when a man is capable of being in uncertainties, mysteries, doubts, without any irritable reaching after fact and reason" *(Letter to* G. *and T. Keats,* Dec. 21. 1817)—has proved a fruitful issue.

Less fruitful have been the disputes about precedence and originality in the romantic movement. and it is more relevant to recognize that a philosophic temper stimulated. in Germany and England, certain approaches and presumptions. G. E. Lessing had recognized Shakespeare's closer affinity with the Germanic spirit and literature than with the French rules; C. M. Wieland's prose translations (1762–66) and A. W. Schlegel's in verse (1797–1801) had been enthusiastically seized on, and the latter's *Lectures on Dramatic Art and Literature* (1809–11) explored what was. or became, the Coleridgean world. The philosophical significance of character became central, Shakespeare's profundity as a formal artist was acclaimed and a leading idea was seen to inform his work as a whole. When this root idea was analyzed in particular plays (for example, H. Ulrici's analyses) the interpretation was often profitable, but there was in German criticism in this period the kind of insensitivity to language that made Schlegel accept *A Yorkshire Tragedy* as Shakespeare's without qualms. and a lack of knowledge—more serious. even, than that among English writers—about the circumstances in which the plays were written and about their stage origins. Schlegel has, however, fine things to say on particular plays.

In the Victorian period no major critic wrote on Shakespeare. Victor Hugo and Swinburne enthused eloquently, but the first original interpretative work was Walter Pater's *Appreciations* (1889). Scholarship, industry and scientific method were to the fore. Shakespeare societies were begun in England and Germany and their proceedings embody the virtues and faults of the time. Edmund Malone's work on the order of the plays was supplemented and interest in the development of Shakespeare in periods was stimulated: the reach of the whole was surveyed. The dominant work here is Dowden's *Shakspere: a Critical Study of His Mind and Art* (1875). Investigation of spiritual biography as revealed in the plays persisted into the 20th century, but the great book then was A. C. Bradley's *Shakespearean Tragedy* (1904). Here is the culmination of all character analysis. Bradley's very greatness and the finality with which some of his statements were received have irked later critics, and they have overinsisted on his obsession with character, neglect of the poetry and unawareness oi stage conventions. He irritated most when he pursued characters far beyond the circumstances of the play, or subordinated plot and action to psychological study, or, preoccupied with the moral order at the root of tragedy, sentimentalized some of the issues. But his chapters remain as a necessary counterbalance to the works of the undeniably fine interpreters who reacted against him.

This reaction typifies 20th-century criticism. (Some trends may be picked out, but its bulk defies summary.) Sir E. K. Chambers, whose *William Shakespeare* (1930) remains a standard work. brought to the study of Shakespeare's life and plays an unrivaled knowledge of the medieval and Elizabethan stage, and a study of the dramatic conventions of that stage inspired a new school of critics. L. L. Schiicking's *Character Problems in Shakespeare's Plays* (1919; trans. 1922) and E. E. Stall's *Art and Artifice in Shakespeare* (1933) are representative works. Dramatic realism, they argued rightly, was not that of actual life; and inconsistencies of character were best explained in terms of Elizabethan practice and convention. Much of this was salutary for a generation later accused of misunderstanding Ibsen (and, perhaps. Shaw) and putting its faith in dramatic realism. It is even necessary as a corrective to the criticism of Granville-Barker *(Prefaces to Shakespeare,* 1927–48), which was healthy in that it came from a dramatist-actor-producer who had illuminated Shakespeare's art in stage presentation, but limited in its reliance on Bradley and an underlying predilection for the naturalistic theatre.

A further aspect of historical research was the investigation of Elizabethan physiological psychology. Ruth L. Anderson's *Elizabethan Psychology and Shakespeare's Plays* (1928), Lily B. Campbell's *Shakespeare's Tragic Heroes: Slaves of Passion* (1930) and L. Babb's *The Elizabethan Malady* (1951) demonstrate the range of studies in this kind; studies that are either stimulating and corrective or stultifying and peripheral according tc the author's application of his thesis.

One may recognize as a counterblast to historical criticism the contribution of the psychoanalysts. Far from wishing to explain away inconsistencies of characterization. these critics positively welcomed them. J. I. M. Stewart's *Character and Motive in Shakespeare* (1949) discussed the general critical issues arising, and the same year brought Ernest Jones's *Hamlet and Oedipus* (a revision of ch. 1 of *Essays in Applied Psycho-Analysis,* 1921), a development of'ideas prompted by Freud in 1900. Specifically Freudian inspirations apart, there is no doubt that the popularization of notions of the unconscious and the mysteries involved in motivation brought a sense of freedom to interpretation. A wider freedom mas claimed by Lascelles Xbercrombie in his British Academy lecture of 1930. There, in A *Plea for the Liberty of Interpreting Shakespeare,* he says that "anything which may be found" in Shakespeare's art, "even if it is only the modern reader who can find it there, may legitimately be taken as its meaning" (Lascelles Abercrombie, A *Plea for the Liberty of Interpreting Shakespeare,* British Academy lecture, British Academy. London, 1930). His lecture answered the disintegrators who. led by J. M. Robertson, apportioned out plays or parts of plays. deemed to fall below some elusive. subjective standard. to other dramatists. Those elements which Shakespeare adopted and absorbed. Abercrombie argued. became his and were open to interpretation with the rest.

Before 1930, however, the freedom eloquently demanded by Abercrombie had already been exercised. L. C. Knights's article "How Many Children Had Lady Macbeth?" (1933; reprinted in *Explorations,* 1946) reacted against Bradley. and focused a movement which had begun with the early works of J. Middleton Murry and G. Wilson Knight and in the researches of Caroline Spurgeon. These writers, conscious that character analysis was not enough, in their various ways redirected attention to the poetry and symbolism. L. C. Knights argued that "we start with so many lines of verse on a printed page" and that we have to "allow full weight to each word, exploring its 'tentacular roots'" (L. C. Knights, "How Many Children Had Lady Macbeth?" in *Explorations,* Chatto and Windus Ltd., London. 1946). (This direction should be seen against the critical and poetical background of the 1920s and 1930s, with its emphasis on the image and on ambiguity. its reinterpretation of the metaphysical poets and its response to the verse of T. S. Eliot. A critical discipline can be seen evolving, sympathetic to Knights's aims and molded by the thought of I. A. Richards, T. S. Eliot. William Empson's *Seven Types of Ambiguity* [1930] arid F. R. Leavis.) Beginning indeed with the "printed page." Caroline Spurgeon card indexed Shakespeare's images and used them interpretatively. The most brilliant and influential discovery in her work was that of the iterative image, and in *Shakespeare's Imagery and What It Tells Us* (1935) she pointed to prevalent groups of images which characterize the individual plays and unconsciously fashion our response to them. Like Whiter she indicated clusters of images peculiar to Shakespeare, and these were used to throw light on his creative processes and to guide the attribution of scenes and plays to him. W. H. Clemen in The *Development* of *Shakespeare's Imagery* (1936: trans. 1951) studied with insight Shakespeare's dramatic use of metaphor.

The impressive and original body of work produced by G. Wilson Knight is historically linked with this school, but it is more free ranging. Actor. producer and (later) dramatist. he regards each play "as a visionary unit hound to obey none but its on-n self-imposed laws." and his examination relates each "given incident or speech" either to "the time sequence of story or the peculiar atmosphere, intellectual or imaginative. which binds the play" (G. Wilson Knight. The *Wheel* of Fire, Methuen and Co. Ltd.. London. 1930). The "symbolic overtones" are revealed. His method. in a series of books beginning with *The Wheel* of Fire (1930), has radically redirected the attention of the student and freshly interpreted in particular, perhaps. *Measure* for *Measure*, the Roman plays. *Timon* of *Athens* and the final romances. Emphasis on the image has made the business of interpretation more laborious. A book on each play has become common and among the best of these have been two by Roy Walker on *Hamlet* and *Macbeth (The Time* Is *Out* of Joint, 1948; The Time *Is* Free, 1949) and Robert Heilman's on *King* Lcar (*This* Great *Stage*, 1948).

The so-called new criticism. characterized by close, linguistic analysis, has had its brilliant successes. Its excesses. too. have been flagrant, and opposition has taken the form of a move nearer to Bradley, or another kind of historical criticism. Rosemund Tuve (Elizabethan and *Metaphysical Imagery*, 1947) attacked the Caroline Spurgeon approach, and Sister Miriam Joseph (Shakespeare's *Use* of the *Arts of Language*, 1947) pointed to the studied use of the figures of rhetoric in Shakespeare. A wider knowledge of the thought and beliefs in his day. demonstrated in such works as Hardin Craig's *The* Enchanted Glass (1936) and E. M. W. Tillyard's *The Elizabethan World Picture* (1943), has valuably checked and controlled. for instance, any tendency to think peculiar in Shakespeare what was common to his age. Scholarly work on the sources of the plays has also intensified. again with the implication that the ardent critic may overstress the liberty of interpreting. Scholarship and interpretation have, however, happily come more nearly into alliance than at any time since Johnson's day. The New Cambridge and new Arden editions of the plays are in the hands of enlightened critics. An interpretative work, however. roving over all the relevant fields of knowledge and research and surveying (as Johnson could) Shakespeare's achievement, is unlikely to appear. One is thrown back on Heming and Condell's First Folio preface: ". . . his wit can no more lie hid, then it could be lost. Read him, therefore; and againe, and againe. . . ." (G. A. O.)

Textual Criticism. — The textual critic of Shakespeare needs to know about four things: the status of texts and their value as evidence; the language of Shakespeare's time; the author's idiosyncrasies; and the barriers which the Elizabethan or Jacobean printer was likely to erect betueen his "copy" and the printed text.

Texts of Shakespeare. — Eighteen of Shakespeare's plays first appeared in quarto form before 1623. Important editions of the collected plays were published as follows:

First Folio ("F1") (1623)
Second Folio ("F2") (1632)
Third Folio ("F3") (1663)
F3, second issue (1664)
Fourth Folio ("F4") (1685)
Nicholas Rowe (1709, 1714)
Alexander Pope (1725, 1728)
Lewis Theobald (1733, 1740)
Thomas Hanmer (1744, 1745)
William Warburton (1747)
Samuel Johnson (1765)
Edward Capell (1768)
Johnson and George Steevens (1773, 1778)
Edmund Malone (1790)
Steevens (1793)
First Variorum, ed. I. Reed (1803)
Second I'ariorum, ed. by Reed and Malone (1813)
Third Variorum, ed. by James Boswell (1821)
John Payne Collier (1842–44, 1858, 1878)
Alexander Dyce (1857)
Cambridge, ed. by W. Aldis Wright, W. G. Clark and J. Glover (1863–66, 1891–93)
Globe, ed. by Wright and Clark (1864)
Henry Irving edition (1888–90)
Peter Alexander (1951)
New Cambridge, ed. by J. Dover Wilson *et al.* (1921 *et seq.*)

A few. among many, other dates of importance in connection with the study of Shakespeare's texts are:

1726, Lewis Theobald, *Shakespeare Restored*
1844–45, M. C. Clarke, *Complete Concordance to Shakspere*
1862–64, the L. Booth type facsimile of F1
1871, H. H. Furness. New Variorum edition of *Romeo* and *Juliet*
1874, P. A. Daniel (ed.), *Romeo and Juliet*
1874–75, Alexander Schmidt, *Shakespeare-Lexicon*
1880–89, the Griggs-Praetorius quarto facsimiles
1888–1928, *A New English Dictionary,* ed. by J. A. H. Murray *et al.*
1894, John Bartlett, *Shakespeare Concordance*
1902, the Sidney Lee F1 facsimile
1911, C. T. Onions. *Shakespeare Glossary*
1930, E. K. Chambers, *William Shakespeare*
1933, E. E. Willoughby, *The Printing of the First Folio* of *Shakespeare*
1939, R. B. McKerrow, *Prolegomena for the Oxford Shakespeare*
1942, W. W. Greg. *The Editorial Problem in Shakespeare*
1955, W. W. Greg, *The Shakespeare First Folio: Its Bibliographical and Textual History*

F1 collected 36 plays; F2, reprinting these, appeared at various times during and after the year 1632. retaining the date 1632 on the title page. F3 again printed these same plays, but the second issue added Pericles and six plays (*The* London Prodigall, *The* History *of Thomas* Lord *Cromwell*, Sir *John Oldcastle* Lord *Cobham*, The *Puritan Widow*, *A* Yorkshire Tragedy, The Tragedy of *Locrine*) not now believed to be by Shakespeare at all. F4 reprinted the 43 plays of the second issue of F3. Examination of the texts of the four folios makes it evident that. as Samuel Johnson realized in 1765, only the first has any authority. To F1. later folios added errors. modernizations and conjectural improvements; there can be no suggestion that an authoritative manuscript was consulted in connection with the printing of any of them. The text of *Pericles* printed in the second issue of F3 derives from a late (1635) quarto of the play.

Of the editors who preceded him, W. A. Wright wrote in 1893, almost certainly with some excess of charity. "And it is a study of great interest to follow them as they exercise their varied talents on the noblest field which the literature of their country afforded: Rowe. himself a dramatist of no mean skill; Pope, with his deep poetic insight; Theobald. with his fine tact and marvellous ingenuity; Hanmer. whose guesses. however they may pass the sober limits of criticism, are sometimes brilliant, often instructive, and never foolish; Warburton. audacious and arrogant. but now and then singularly happy; Johnson. with his masculine common sense; Capell, the most useful of them all, whose conscientious diligence is untiring. whose minute accuracy is scarcely ever at fault: Steevens. Malone. . . . Boswell, . . . with all their varied learning; together with their successors of the present generation in England. Germany and America, who have devoted themselves to the illustration of Shakespeare as to a labour of love."

It would be unfair, to suggest that the earlier editors. from Rowe onward, did not interest themselves in the establishment of a correct text of their author; but by modern standards they worked by hit-or-miss systems and substituted their own (often excellent) tastes for critical principles. They tended to assemble as many various readings. from various editions, as possible and to use their own judgment as to which was the best. Their success was striking.

The editors of the Cambridge Shakespeare seem to have been the first who made any sort of reasonable attempt to list the old editions and sort out the relationships between them. Their critical apparatus of variant readings and emendations remains unsuperseded. The publication of the Globe edition, based on the Cambridge, provided a standard text which modern scholars find it annoyingly impossible to dislodge. The almost impeccable Booth type facsimile of F1 (edited. it appears, by C. Wright) placed much necessary information before the public and remains the handiest edition for all but the most finical scholarship. The Griggs-Praetorius facsimiles "in photolithography" should no doubt have been even more reliable, but Aldis Wright demonstrated that they had undergone remarkable tinkering (one "facsimile" of a 1595 edition contains words foisted in from a 1619 edition) and that no confidence could be placed in their punctuation. The critical introductions to some of these quarto facsimiles, however — notably those by P. A. Daniel — are of great value. The Lee F1 facsimile, though notably less portable than the Booth, can be said to replace it on the score of indubitable reliability. A series of trustworthy collotype reproductions of quarto texts was begun, under the editorship of W. W. Greg, in 1939.

The path of the Shakespearean textual critic used to contain the major stumbling block of the problem of the early quartos of certain plays: Romeo and Juliet, Henry *V*, Hamlet, *Merry Wives* of *Windsor*, 2 and 3 Henry *VI* and likewise of Richard *ill* and King Lear. The disparity between the earlier texts and the later ones was remarkable. Of *Romeo and* Juliet and *Hamlet*, texts "newly corrected. augmented and amended" appeared in later quartos; better texts of the others were provided first by F1. The first six exhibit such symptoms of textual corruption that they could hardly be accounted for by the wildest theories of the illiteracy of scribes or the intemperance of compositors. Rival explanatory theories long disputed the field: either that here were early versions later revised by Shakespeare (the Henry *VI* plays being, it was suggested, the work of earlier: cruder dramatists,!, or that the corrupt texts were versions of stage performances obtained in shorthand. These theories seem to have been totally routed by the suggestions made by W. W. Greg, A. W. Pollard, J. Dover Wilson and Peter Alexander, that the corrupt versions, or bad quartos, are the result of reconstruction from memory of texts by actors to add to the repertories of near-derelict traveling theatrical companies, not. as was earlier suggested, that the shorthand writers went to work at the behest of fraudulent. stealthy and injurious publishers. It seems evident that the relationship between quarto and folio texts of Richard *III* and King *Lear* is strictly that the quartos are memorial reconstructions; but their relative quality is so good that no satisfactory explanation of them has been offered. Philip Edwards has convincingly suggested that Pericles should be added to the number of the bad quartos: it differs from the others in that it is the work of two reporters of widely differing skill. and in that no good version was ever found to replace it. The shorthand-writer theory was given its deathblow by G. I. Duthie's Elizabethan Shorthand and the First Quarto *of* King Lear (1950).

General attacks on the editorial problem began in three of the annual Shakespeare lectures of the British Academy: A. W. Pollard. *Foundations* of *Shakespeare's* Text (1923), W. W. Greg, Principles oj Emendation in Shakespeare (1928), and R. B. McKerrow, Treatment *of* Shakespeare's Text by His Earlier Editors: *1709–1768* (1933). McKerrow's Prolegomena for the Oxford Shakespeare is a full-dress discussion of the problems; the author's death prevented the publication of any of the projected edition, though more than one play was prepared for publication by him. Greg's *The* Editorial Problem in Shakespeare carried the discussion further; in this and The Shakespeare First Folio (1955) he laid before the scholar convincing arguments to support a theory of the text for every one of the plays. There is no starkness of simplicity in his findings. For no two plays, it seems, is the history of the text the same.

Two of the less complicated text histories may be given as samples. For Romeo and Juliet, the first edition (1597) is a bad quarto. Q2 (1599) is an authoritative text printed, it is believed, from a Shakespeare autograph. Q3 (1609) is printed from Q2, with no further authority. Q4 (undated, but probably 1619) is printed, with curious but apparently unauthoritative changes, from Q3. F1 is printed from Q3. Later researches have led to a belief that a pen-corrected example of Q1 may have been used as copy for Q2, which complicates a hardly pellucid situation with theories of a good text contaminated by a bad one. For Titus Andronicus, Q1 (1594) seems to have been set from a Shakespeare autograph, Q2 (1600) from Q1, Q3 (1611) from Q2. F1 was printed from Q3, with the addition of act iii, sc. 2, which is absent in all the quartos and must derive from authoritative manuscript. Complications arise from the fact that printer's copy was, for various plays, Shakespeare's fair copy, his rougher "foul papers," fair copies apparently made (by a known scribe) especially for use in the printing house, theatrical prompt copies, earlier editions corrected by pen and ink from manuscripts of various status. etc.

The conviction of most scholars that three pages of Shakespeare's autograph are preserved among the British museum manuscripts in The Booke of Sir Thomas Moore led. in the 1920s and 1930s, to a frenzy of solving all problems of text by appealing to Shakespeare's calligraphic style and methods of spelling. This phase of scholarship failed to survive World War II.

Under the influence of Pollard, Greg and McKerrow, a variety of new editions of single plays has been published. Peter Alexander's is the most satisfactory complete text as yet given to the world. The New Cambridge Shakespeare. begun in 1921 by J. Dover Wilson and A. T. Quiller-Couch with the publication of *The* Tempest and to reach conclusion under Wilson and others, after the death of Quiller-Couch, provided a number of stimulating and controversial (if not always convincing) texts. Some of the Arden (1951 et seq.) editions of single plays were evidently influenced; others were not.

Language oj Shakespeare's Time. — Eighteenth-century editors, particularly Theobald, Johnson, Capell, Steevens and Malone, were aware that much of Shakespeare's language was obsolete to the 18th-century reader, and in connection with their editorial task they made considerable study of earlier authors. Several glossaries and illustrative notes appeared. Knowledge of Elizabethan English was, however. genuinely advanced by the publication in 1822 of Robert Nares's Glossary. The next few decades saw, through the medium of various scholarly societies (the Percy, the Camden, the Shakespeare and others), the reprinting of a considerable corpus of Elizabethan literature; in these pies, the main fingers were those of J. P. Collier and J. O. Halliwell (Halliwell-Phillips). Zeal for scholarship, or some other motive, led Collier to extensive forgeries to support his emendations and theories. and Halliwell to the theft of a number of manuscripts from the library of Trinity college, Cambridge. These lapses do not prevent the modern Shakespearean scholar from acknowledging to them a considerable debt. The New Shakspeare society, under F. J. Furnivall (whose probity seems not to have been seriously questioned). later continued the task of reprinting illustrative works by Shakespeare's contemporaries. The publication of the New English Dictionary (N.E.D.), later the Oxford English Dictionary (O.E.D.), owes much to the labours of the (good or bad) reprinters who disseminated earlier English writings. Based on the slips of the N.E.D. is A Shakespeare Glossary by C. T. Onions, himself one of the editors of the greater work. Alexander Schmidt's Shakespeare-Lexicon is a remarkable compilation which antedates the N.E.D. and yet remains valuable to the scholar. Work on the language of Shakespeare is, naturally, not yet at an end. but the labours of Schmidt. Onions and his N.E.D. fellow workers must remain the foundation.

Shakespeare's Idiosyncrasies. — Knowledge of those matters in which Shakespeare differed from his contemporaries — versification, language, methods of thought, methods of composition and other matters — is necessary for the establishment of his text. Here, however, agreement among modern scholars is not easy and subjective thinking plays a larger part. Scholarly aids of the highest value for the language can be found in the great Shakespeare Concordance of John Bartlett (keyed to the Globe text) and its still useful pioneer predecessor by Mrs. Cowden Clarke. Studies of Shakespeare's education, his methods of writing, his use of images, his use of sources, continue to be made and to be published. It is impossible to sum the findings of the researchers; as yet no clearly recognizable pattern in the Shakespearean carpet emerges. Geoffrey Bullough's Narrative and Dramatic Sources of Shakespeare (1957 et seq.) provides the scholar with the poet's source material in reliable text and with trustworthy and illuminating comment.

Shakespeare and His Printers. — The modern scholar, presented with a text of Shakespeare, desires to know what relationship it bears to the author's manuscript — and hopes to be told how he can reconstruct that manuscript from it. Much of the effort to satisfy these feelings has been described above. Considerable activity, however, continues among those who, like Greg and many of the other later scholars mentioned, are interested in the happenings in the Elizabethan printing house. McKerrow's *Introduction to Bibliography fbr Literary Students* (1927) continues as the starting point for such investigations.

The first serious examinations of the First Folio came from Sidney Lee in the introduction to his facsimile and other writings, and from Pollard and Greg. largely in their attempts to traverse his theories. Appreciable headway began to be made. for later workers. with E. E. Willoughby's *The Printing of the First Folio of Shakespeare* (1933). Using a variety of innovating techniques. Willoughby was able to reconstruct many of the day-to-day events in William Jaggard's printing house while F1 was being printed. The later work of-C. J. K. Hinman and J. Shroeder destroyed the validity of some of Willoughby's work; his achievement is. however, more than can be passed off as merely deserving the epithet "pioneer."

The key question in this section at one time would have seemed to be "What did printers do to texts?" U'illoughby saw and showed that it must be narrowed to the particular printers dealing at a particular time with a particular text. Hinman clearly saw for the first time that a given line of type in F1 was composed by an individual man. possibly a different man from the one who composed a given line on the next page. Hinman. by a variety of techniques (including the use of an ingenious instrument for the mechanical collation of two copies of a single book, and the elaboration of methods for distinguishing between the works of different compositors) reached a stage of knowing far more of what went on in Jaggard's shop in 1623 than Jaggard ever knew. Hinman's mechanical labours were completed in the late 1950s but the results had not yet reached publication in their entirety. Some of his methods had been put to good use by A. Walker. F. Bowers and others; Bowers' *On Editing Shakespeare and the Elizabethan Dramatists* (195j) is a valuable manifesto. A knowledge of compositors' idiosyncrasies provides a new weapon for the textual critic; it seems that it also adds to his difficulties and pushes further and further away the goal of a satisfactory scholarly edition of Shakespeare.

Full publication of Hinman's results and the sharing of his techniques seemed likely to mean general approval of his conclusions. He had available not only the Hinman collating machine but also the 79 First Folios collected in the Folger Shakespeare library in Washington, D.C. Corrections at press were constantly being made throughout the printing of F1 (as of all other books of the time) and no two copies of the entire edition of F1 were. Hinman estimates, identical. With full knowledge of all his findings, it should be possible to publish a facsimile of the entire First Folio, not of a single copy of it. Such a publication need not bring textual criticism of Shakespeare to an end; rather it will enter a new phase. The conservative critic is already distressed to discover that new, and apparently more scientific, methods of work on texts have led some scholars to find justification for a new eclecticism in dealing with the plays of Shakespeare. This may grieve the conservative; it may be for the good. It may be hoped that the new textual studies will be purposefully directed toward the making of the desired new edition; it may be feared that bibliographical studies growing out of Hinman's findings and techniques may, in hands less competent than his, become a sterile scholarly game.

(J. Cw.)

The Anti-Shakespearean Theories. — The notion that Shakespeare's plays and poems were not actually written by William Shakespeare of Stratford-on-Avon has been the subject of scores of books and is regarded by many as at least an interesting possibility. The source of confusion over the authorship of the plays lies in the disparity between the greatness of Shakespeare's literary achievement on the one hand and, on the other, his humble origin, the supposed inadequacy of his education and the obscurity and ordinariness of his whole life. In Shakespeare's writings men have claimed to find a familiarity with languages and literature, with such subjects as law, history, politics and geography. and with the manners and speech of courts, which is inconceivable in a common actor, the son of a small provincial tradesman. This knowledge, it is said, is to be found only in a man of extensive education, familiar with such royal and noble personages as figure largely in Shakespeare's plays. And the dearth of contemporary record has been regarded as incompatible with Shakespeare's eminence and as therefore suggestive of mystery. That his greatness was not widely proclaimed and that none of his manuscripts has survived have been taken as evidence that the latter were destroyed to conceal the identity of the author.

Though one or two earlier writers had expressed skepticism about Shakespeare. the first identification of the author as Francis Bacon, viscount St. Albans. appears to have been made about 1785 by the Rev. James Wilmot, rector of Barton-on-the-Heath, Warwickshire. Wilmot communicated his views to one J. C. Cowell of Ipswich, whose account of the matter is contained in a manuscript now in the library of the University of London *(see* Allardyce Nicoll. "The First Baconian," *Times Literary Supplement,* Feb. a5, 1932). A letter from Sir Toby Matthew to Bacon contains the statement. "The most prodigious wit that ever I knew . . . is of your Lordship's name. though he be known by another," and this has been regarded as proof of Bacon's pseudonymous writings. Their similar treatment of references from the Bible. the law and the classics made Bacon a candidate for the authorship of the plays. The first published statement was W. H. Smith's Was *Lord Bacon the Author of Shakespeare's Plays?* (1856), which set on foot the Bacon-Shakespeare controversy. W. S. Melsome *(The Bacon-Shakespeare Anatomy,* 1945) found references in Shakespeare's plays to works of Bacon that were not published during Shakespeare's lifetime, and which he therefore could not have seen; from this Melsome concluded that, as only Bacon could have known of these unpublished works, he must have written the plays containing references to them. Another method of investigation was used by I. Donnelly who. in *The Great Cryptogram* (1887), found ciphered messages embedded throughout the plays that proved Bacon's authorship. and Sir E. Durning-Lawrence (*Bacon Is Shakespeare,* 1910) discovered in *Love's Labour's Lost* the word "honorificabilitudinitatibus;" which forms the anagram *Hi ludi F. Baconis nati tuiti orbi* ("These plays, the offspring of F. Bacon, are preserved for the world"). Others carried this cryptographic line of investigation further, but W. F. and E. S. Friedman, professional cryptologists, examined all the Baconian ciphers and rejected them all as invalid *(Shakespearean Ciphers Examined,* 19j7). Several societies and periodicals devoted to the Baconian claims were founded at the end of the 19th century, but interest later declined.

For several pears after the appearance of his *Shakespeare Identified in Edward de Vere, the 17th Earl of Oxford* (1920), the views of J. T. Looney attracted enough adherents to lead to the formation of Oxfordian societies in London and New York. Looney argued from the biographical similarity of Bertram in *All's Well That Ends Well* and of Hamlet to Oxford himself. and also from the resemblance of the latter's poems to Shakespeare's early work. Oxford's interest in the drama extended beyond noble patronage, for he himself produced some plays although there are no known extant examples. His 22 acknowledged poems were written in his youth, and as he was born in 1550 Looney argued that they were the prelude to his mature work that began in 1593 with *Venus and Adonis.* This is supported by the coincidence of Oxford's named poems ceasing just before Shakespeare's work began to appear. It is claimed that Oxford would have assumed a pseudonym in order to protect his family from the social stigma attached to the stage, and also because ruinous extravagance had brought him into disrepute at court.

Another candidate is William Stanley, 6th earl of Derby, whose claims were advanced by A. W. Titherley *(Shakespeare's Identity: William Stanley, 6th Earl of Derby,* 1952). He was keenly interested in the drama and became the patron of his own company of actors; his brother, Ferdinando Lord Strange, 5th earl of Derby, was patron of the company to which Shakespeare belonged. In the 1580s several poems were written that exhibit signs of an early and immature Shakespearean style, yet could not have been written by Shakespeare who was still a boy at Stratford. One of these poems is in Derby's handwriting, and three of them ("Of silver pure thy penne is made. dipte in the Muses well"; "What shall I say of Gold, more than tis Gold?"; "My thoughts are winged with hopes, my hopes with love") were signed W. S.; these initials were thought to conceal the identity of Derby, and later to have been expanded into William Shakespeare. Derby's motive for this self-concealment would have been. like Oxford's, to avoid the association of his family name with the lower social order of the stage.

A further theory, put forward by C. Hoffman in *The Murder of the Man Who Was "Shakespeare"* (1955), identified Shakespeare with Marlowe. The influence of Marlowe on Shakespeare's early work has long been recognized, and it has even been suggested that he collaborated with Shakespeare in some of the plays. but Hoffman discovered stylistic and linguistic similarities throughout the entire Shakespeare canon. He also noticed that Shakespeare emerged from obscurity with the publication of *Venus and Adonis* in Sept. 1593. only four months after it is generally accepted that Marlowe was stabbed to death at Deptford. Because Marlowe's avowed atheism and probable homosexuality are known to have incurred religious and political disapproval. Hoffman argued that, when Marlowe was arrested by order of the privy council, his friend and patron Sir Thomas Walsingham (cousin of Sir Francis Walsingham) evolved an elaborate plan for his escape. Two of Walsingham's servants murdered an unknown man and alleged it to be Marlowe, while Marlowe himself fled to France and thence to Italy. He continued to write in exile: his work first being sent to Walsingham, who arranged for it to be transcribed and who paid Shakespeare to "father" it. The original manuscripts were thought to be buried with Sir Thomas Walsingham at Chislehurst. Kent, but when the tomb was opened in 1956 this was not found to be so.

G. G. Greenwood (*The Shakespeare Problem Restated,* 1908) and others, not venturing to identify the "true" author, have vigorously disputed Shakespeare's claim to the title.

The Case for Shakespeare.—It can hardly be maintained that no difficulty exists. In spite of recorded allusions to Shakespeare as the author of many plays in the canon, made by about 50 men during his lifetime. it is arguable that his greatness was not as clearly recognized as we might expect. But the difficulties are not so great as the disbelievers have held. and their proposals have raised larger problems than they have resolved. The difficulty, insofar as it exists. can be viewed profitably only in the light of our extensive knowledge of the conditions, about 1600. under which plays were written, produced and preserved, and of the prevailing attitudes toward authorship in general.

Shakespeare's humble origin raises of course no difficulties, for in his time. as in others, poets and men of highest genius arose from all social levels. Of his education more must be said, Stratford-on-Avon possessed a grammar school of better than average quality, which was free for sons of burgesses, Shakespeare included. That we can point to no documentary evidence of his attendance there would be significant only if his name were missing from existing records of attendance. but no such records are known, and it is doubtful that they ever existed. Though we have no specific knowledge of the curriculum of the Stratford school, we can infer it with some confidence from that of other schools and from the degree of uniformity found among these. The natural assumption is. then. that the young Shakespeare spent the usual number of years in a good school where he would have acquired some competence in Latin, some acquaintance with Ovid. Virgil, Cicero. Horace. Livy. Quintilian and several others and a familiarity with certain parts of the Bible and the Book of Common Prayer, together with a thorough grounding in Christian ethics. As Virgil K. Whitaker has shown (*Shakespeare's Use of Learning,* 1953), the Latin authors whom we should expect a boy from a good grammar school of about 1575 to know are just the ones with whom Shakespeare in fact shows some familiarity in his earliest plays and poems. Neither in these nor in his later work does he reveal any knowledge of a large number of books. Latin or English, or a scholar's knowledge of those relatively few books more or less well known to him. Likewise his knowledge of the law as reflected in his plays has been shown (by P. S. Clarkson and C. T. Warren. *The Law of Property in Shakespeare and the Elizabethan Drama,* 1942) to be neither so broad nor so accurate as that of "about half of Shakespeare's fellows." Similarly his acquaintance with history was not extensive; his knowledge of English history appears to have been limited to what he. found in those portions of Holinshed, Hall and other works which he mined for the purposes of his own history plays. On his ignorance of geography (or carelessness about it) he was twitted by Ben Jonson. As for the accurate reproduction of the speech and manners of courtiers which has been thought to provide evidence of the author's high birth, this would be difficult to demonstrate in the absence of authentic records of conversation and comportment at the courts of Elizabeth I and James I. or, indeed, of King John, Richard II, etc. The fact is that we form our impressions of how such persons talked mainly from the plays of the time. How Shakespeare attained his unparalleled insight into human nature must always remain a mystery, and it will scarcely be maintained that university education or high caste have ever been of much service in this direction. Everyone agrees that the author of Shakespeare's plays was a man of extraordinary genius who was endowed with the most brilliant powers of observation and an unexampled ability to synthesize what he experienced (directly or in books) and to give to it artistic shape.

The often repeated assertion that we know almost nothing about Shakespeare's life must be tested historically. We are entitled to suspect the presence of a mystery in the dearth of our knowledge of Shakespeare's daily life, his personality and his opinions (as compared with those of, say. William Wordsworth or Robert Browning) only if we find that he is singular in this regard among dramatists of his day. This is not what we find. It is true that we know more about Ben Jonson. but this is quite clearly because, besides being a dramatist and actor, Jonson was a scholar, a literary critic, a friend and leader of poets, a writer of court and city masques, a man often involved in troubles which became matters of record; in short, a quarrelsome and colourful man. With the exception of Jonson, we know more about Shakespeare than about any other dramatist of the time. Stage plays were not regarded as serious literature, and their writers were not lionized. Much of our comparative ignorance about the dramatists must be attributed to the fact that it was not an age of biography or casual letter writing, of journalism or advertising. What men thought or said about Shakespeare was not, for the most part, written down.

These facts have bearing upon the disappearance of Shakespeare's manuscripts. Once a play was in print, the manuscript possessed no value unless for the acting company that owned it. Autographs of literary men were not collected. On the other hand, paper being a costly, imported commodity, manuscripts were in demand for many practical uses; all in themselves destructive. and used paper was constantly wanted for wrapping, for cleaning and for starting fires. It is not surprising, therefore, that we have no single manuscript, in the handwriting of Shakespeare or any one of his fellow dramatists, of any successful professional play printed before 1640.

There appears to be no obstacle, therefore, in the way of our accepting William Shakespeare as the author of the plays that bear his name. On the contrary, all the positive evidence supports this orthodox position.

From 1598 onward, Shakespeare is named as author on title pages of many editions of the separate plays and poems and the folio editions of the collected plays. Many of Shakespeare's contemporaries wrote of him unequivocally as the author of the plays. Ben Jonson, who knew Shakespeare well, contributed verses to the First Folio of 1623, where (as elsewhere) he criticizes and praises Shakespeare as the author. John Heming and Henry Condell, for a long time fellow actors and theatre owners with Shakespeare, sign the dedication and a foreword to the First Folio and describe their methods as editors. In his own day, in short, he was fully accepted as the author of the plays. Throughout his lifetime, and for 150 years after, no person is known to have questioned his authorship by so much as a hint. In an age that loved gossip and mystery as much as any, is it conceivable that the honest Ben Jonson and Shakespeare's theatrical associates shared the secret of a gigantic literary hoax without a single leak, or that they could have been imposed upon without suspicion? Unsupported and bald assertions that the author of the plays was a man of great learning and that Shakespeare of Stratford was an illiterate rustic do not carry any weight. and only when a believer in Bacon or Oxford or Marlowe produces sound e idence will scholars pay close attention to it and to him. (G. E. D.)

Conclusion.—When the apposite records had been discovered, inspected and interpreted. when the works had been stared at and assessed. critics of an earlier age turned to the elaboration of their portraits of Shakespeare the man. We have been shown Shakespeare the demigod. Shakespeare the shrewd businessman, the woodnotes-wild warbler (hardly distinguishable from Shakespeare the idiot boy), the preacher. the prophet. the sergeant. the seaman, the schoolmaster. the solicitor's clerk. the syndicate. the psyche-ravaged sibling, the Oedipus *de ses jours,* the play patcher, the self-effacing peer, the cipher expert, the man with the nervous breakdown — there was no end to the possibilities.

Some scholars seem to have left the attempt to limn Shakespeare the man for a study of Shakespeare the craftsman. "What was he like?" became a less fashionable question than "How did he work?" Shakespeare was an Elizabethan, the native of an important country town. the product (apparently) of a grammar school. a playwright who was the contemporary of other playwrights. writing for the same stage as they, of his age as well as for all time.

Much research has concerned itself with the normal background of Elizabethan thought and belief. Such matters as the physiological theories of the humours and the Ptolemaic astronomical system were a commonplace of scholarship in the 19th century. We know. as the result of the investigations of numerous researchers, how the ordinary contemporary of Shakespeare looked upon such matters as the organization of society, theories of the state, ideas of world order, political beliefs, theories of the monarchy and man in his environment. There have been many studies of what the Elizabethans said about such things; and the more difficult task of learning what they assumed to be self-evident (and therefore not needing to be said) continues to receive attention.

There is no cessation of study concerning the other Elizabethan dramatists. of the structure of their playhouse. of the dramatic companies. The business of investigating the text of Shakespeare has become a heavy industry; new and more scientific techniques are elaborated. and the old subjective methods are called scientific by their users and are given acceptance by many. Thought has been profitably expended on the questions of what an Elizabethan play audience n-as like and what it expected of the plays it paid to see—when. for instance. a history play was presented, would the audience bring to it a view of history, or would it merely gaze upon the winning and losing of battles. the shedding of blood and the coming of death?

The realization that some parts of some of Shakespeare's plays are less good than others has led in the past to strange conclusions and hypotheses. It has been held that many of the plays, particularly the earlier ones (being patently inferior to the later ones), are the result of the collaborative efforts of a number of minor playwrights. or that they are the end product of a series of revisions. by Shakespeare or others, of plays written by Shakespeare or others. This disintegratory scholarship had apparently fallen into relative desuetude by the 1950s. Scholars tended more and more to accept that the plays as we have them are moderately near to what Shakespeare wrote and that if some are better than others it is because he grew to be maturer. more experienced and richer in his poetic powers; when rawly beginning his labours he may have written in the style of Peele and of Greene and of Kyd so that he might, in the days of his maturity. write like Shakespeare alone.

Perhaps the most promising studies concern themselves with Shakespeare's source materials and precisely how he used them —what really is meant by a statement that he "used" North's Plutarch or Lodge's *Rosalynde* "as a source." With the publication of the sources in accurate texts, the resultant studies can, if competently handled. be expected to offer conclusions in which the subjective does not play too large a part.

No man expects the forts of folly to fall suddenly. and it is not surprising to discover that many remain unpersuaded that the plays of Shakespeare could have been written by a man who had the upbringing that the man of Stratford had. It is not only in monarchical countries that the desire rages to see the immortal bard sitting. writing away at his desk. with a graduate's hood and a peer's ermine hanging on the back of the study door. Authors will not cease to compose nor publishers cease to publish books which are based on the strangest of fixed ideas — that all the tragedies concern themselves only with the deadly sin of pride. or are powerful pleas for national unity, or are all about the earl of Essex. or are written by a blasphemous homosexual Cambridge graduate. or are thinly veiled Catholic (or Puritan) proselytizing propaganda. Highly subjective readings of the late plays will continue to woo (and win) supporters. Critics of eminence will continue to accuse Shakespeare of failing in his attempts without making much effort to discover what he was attempting. We have not heard the last of tragic flaws or the sense of waste. It will be demonstrated and redemonstrated that all the plays are vegetation myths and all the kings are fishers. and no one need believe that Shakespeare the "golden-bough" lad has yet come to dust.

There can never be. one would imagine, an agreement among all the faithful about what is the right doctrine of Shakespeare. He is a god whom all men'desire to make in their own image. To attempt to sum the findings of the interpreters is like trying to sum Niagara; the spate is too vast, too strong and too wild. And the findings are too contradictory to permit of synthesis. A man must take the facts as he knoivs them and construct a fictional hypothesis which will adequately account for them. The hypotheses of other men can provide shreds worthy the weaving into another man's cloth; they cannot be acceptable ready-made garments. (J. Cw.)

THE PORTRAITS OF SHAKESPEARE

The mystery that surrounds much in the life and work of Shakespeare extends also to his portraiture. There are only two likenesses of the poet that can be regarded as carrying the authority of his fellow workers. friends and relations. yet neither of them is a direct life portrait, and the fact that. they differ in essential points has encouraged the advance and foolish acceptance of numerous portraits of wholly different types. The result has been a series of portraits which may be classed as: (1) genuine portraits of persons, not Shakespeare but like the various conceptions of him: (2) memorial portraits based on one or a mixture of two originals believed at various times to be genuine; (3) portraits of persons known or unknown. which have been faked to resemble Shakespeare; and (4) complete fabrications.

The two portraits which can be accepted as authentic likenesses are the bust (really a half-length statue) with its structural wall monument in Holy Trinity church. Stratford-on-Avon, and the copperplate engraved by Martin Droeshout as frontispiece to the First Folio of Shakespeare's plays.

The Stratford bust and monument must have been erected on the north wall of the chancel or choir between Shakespeare's death in 1516 and the publication of the First Folio. as it is mentioned in the prefatory lines by Leonard Digges. The design in its general aspect was one often adopted by the "tombe-makers" of the period, and according to Sir William Dugdale was executed by Gerard Johnson (Gheerart Janssen), a Fleming who had settled and worked in London since 1j67. The bust is supposed to have been commissioned by the poet's son-in-law, John Hall, and like the Droeshout print must have been seen and could have been approved by the poet's widow, who did not die until Aug. 1623. It has been argued that it was modeled from a life or death mask, and is too individual to be considered a generalization of the kind common in funereal sculpture. As was usual, especially in the work of Flemish sculptors. the bust was coloured. which may account for the summary nature of the modeling and the forms. The eyebrows are only slightly indicated by the chisel, and a solid surface represents the teeth of the open mouth: detail was supplied with the paint brush. Malone had the bust covered in white paint in 1793 and the recolouring may be responsible for its present wooden appearance. which shocks many visitors. The bust is of soft stone. but careful examination reveals no sign of an alleged breakage and repair of the nose to which some writers have attributed the apparently excessive length of the upper lip. This is mostly an optical illusion caused by the smallness of the nose and the thinness of the mustache. Some repairs were made in 1649 and in 1748 but there is no mention in church records of any meddling with the bust itself. The inaccuracy of the print by one of W. Hollar's assistants illustrating Dugdale's *Antiquities* of *Warwickshire* (1656) made some writers think that the bust had not merely been restored but replaced. This is not so.

The Droeshout print derives its importance from having been executed at the order of Heming and Condell to form a frontispiece to the *Plays*, and from its claim to be the portrait of the author to whose memory their work was dedicated, and whose real monument lay in the volume itself. Anne Shakespeare must have seen the print; Ben Jonson extolled it, although his dedicatory verses may be regarded as conventional approval. An authentic portrait, since lost, must have been the basis of the engraving, and Sir George Scharf, judging from the contradictory lights and shadows in the head, deduced that the original must have been a shadowless painting which the youthful engraver attempted to put into chiaroscuro with only partial success. This was supported by the "unique proof" of "first impression" first discovered by J. O. Halliwell-Phillips and of which several copies are now known. In this plate the head is far more human and the bony structure corresponds. There is a thin, wiry mustache, afterward widened in the print as used, and there are divergences in several other details. In this engraving the body is too small for the head and the dress is out of perspective — an additional argument that the unpractised engraver had only a drawing as a model.

The portrait which has made the most popular appeal is that called the Chandos, successively known as the d'Avenant, the Stowe and the Ellesmere, which is in the National Portrait gallery, London. It was implausibly attributed to Richard Burbage, who is alleged to have given it to his fellow actor Joseph Taylor who then bequeathed it to Sir William d'Avenant, Shakespeare's godson. No will of Joseph Taylor has been found, and though there is a strong tradition there is no proof that the picture belonged to d'Avenant. It was certainly bought at the sale of the effects of the 2nd duke of Buckingham and Chandos in 1847 by the earl of Ellesmere, who presented it to the nation. The romantic, Italian-looking head differs in many respects from the Stratford bust and the Droeshout print. Though the history of its provenance is seriously faulty, many people approve of the portrait because it suits their notion of what Shakespeare should have looked like. The newly discovered portraits of Shakespeare which arrive at the National Portrait gallery for consideration at the rate of at least one a year tend to have much in common with the Chandos. That it has not been radically altered by restorers is proved by the copy made by Sir Godfrey Kneller to give to John Dryden, and that it was esteemed within 70 years of the death of Shakespeare is shown by the fact that it was then in the possession of the earl of Fitzwilliam.

After Gerard Johnson's bust no statuary portrait seems to have been made until 1740, when the statue in the Poets' corner of Westminster abbey was set up by public subscription. It was "invented" by William Kent, carried out by Peter Scheemakers, and is based on the Chandos portrait. David Garrick commissioned a statue from L. F. Roubiliac in 1758 which is in the British museum, London. Roubiliac is also responsible for the Davenant bust of blackened terra cotta now at the Garrick club, London. It was found bricked up on the site of the old Duke's theatre in Portugal row, Lincoln's Inn fields, London, built by d'Avenant in 1660.

GENERAL CLASSIFIED BIBLIOGRAPHY

Available for scholars are the standard bibliographies of William Jaggard, *Shakespeare Bibliography* (Stratford-on-Avon, 1911), and Walter Ebisch and L. L. Schücking, *A Shakespeare Bibliography* (Oxford, New York, 1931), *Supplement for the Years 1930–35* (Oxford, New York, 1937). The following brief select bibliography is designed for the general reader and young student. For amplification, *see* introductions to Shakespearean texts; the select bibliography by J. R. Brown in *Shakespeare* by C. J. Sisson in the bibliographical series of supplements to *British Book News*, no. 58 (London, 1955); *The Age of Shakespeare*, vol. 2 of the Pelican *Guide to English Literature*, ed. by Boris Ford, appendix on further reading and references by M. Tubb (Harmondsworth, Middlesex, 1955); *Shakespeare Survey*, which includes a survey of each year's work, ed. by Allardyce Nicoll (Cambridge, 1948 *et seq.*).

Texts: facsimiles of the quartos are available in editions of the plays and poems issued under F. J. Furnivall's superintendence (London, 1880–91) and in *Shakespeare Quarto Facsimiles*, ed. by W. W. Greg (London, 1939 *et seq.*); of the First Folio in Sidney Lee's edition (London, 1902), and of the poems and sonnets in the same editor's volumes (London, 1905). Useful one-volume texts include the Globe, ed. by W. G. Clark and W. A. Wright (London, 1864; New York, 1866), the Oxford, ed. by W. J. Craig (London, 1891), and the editions of G. L. Kittredge (London, 1936), Peter Alexander (London, 1951; New York, 1952), and C. J. Sisson (London, New York, 1954). Ascribed plays are in *The Shakespeare Apocrypha*, ed. by C. F. Tucker Brooke (London, 1908). The poems were edited by George Wyndham (London, 1898), and the sonnets by Edward Dowden (London, 1881), R. M. Alden (London, Boston, 1916), and T. G. Tucker (London, New York, 1924). Fully annotated modern editions of single plays include a New Variorum edition, ed. by H. H. Furness, Sr. and Jr., *et al.* (London, 1871 *et seq.*), the *Arden Shakespeare*, ed. by W. J. Craig, R. H. Case *et al.* (London, 1899–1924), the New Cambridge edition, ed. by Sir A. T. Quiller-Couch, J. Dover Wilson *et al* (London, 1921 *et seq.*), and the new edition of the *Arden Shakespeare*, general ed., U. Ellis Fermor (London, 1951 *et seq.*).

Textual studies: for the textual histories of particular plays the student is referred to the New Variorum, Cambridge and Arden editions. For an idea of the earlier phase in the 20th-century reorientation of textual studies, *see* A. W. Pollard, *Shakespeare Folios and Quartos, 1594–1685* (London, 1909), *Shakespeare's Fight With the Pirates*, rev. ed. (Cambridge, 1920), (ed.) *Shakespeare's Hand in the Play of Sir Thomas More* (Cambridge, 1923); C. H. Herford, *Sketch of Recent Shakespeare Investigation* (London, 1923); E. K. Chambers, *The Disintegration of Shakespeare*, British Academy lecture (London, 1924). Important subsequent works are: R. B. McKerrow, *Prolegomena for the Oxford Shakespeare* (Oxford, 1939); W. W. Greg, *The Editorial Problem in Shakespeare*, rev. ed. (Oxford, Toronto, 1951); F. P. Wilson, "Shakespeare and the 'New Bibliography'" in *The Bibliographical Society, 1892–1942, Studies in Retrospect* (London, 1945); Alice Walker, *Textual Problems of the First Folio* (Cambridge, New York, 1953); W. W. Greg, *The Shakespeare First Folio* (Oxford, New York, 1955); Fredson Bowers, *On Editing Shakespeare and the Elizabethan Dramatists* (Philadelphia, Oxford, 1955); Leo Kirschbaum, *Shakespeare and the Stationers* (Columbus, O., 1955); J. Dover Wilson, "The New Way With Shakespeare's Texts: an Introduction for Lay Readers," *Shakespeare Survey*, 7, 8, 9 (London, 1954–56).

Biography: documented studies of Shakespeare's life, or aspects of it, include Sidney Lee, *A Life of William Shakespeare* (London, 1898; rev. 4th ed., 1925); E. K. Chambers, *William Shakespeare: a Study of Facts and Problems* (Oxford, 1930), *Shakespearean Gleanings* (Oxford, Toronto, 1944), *Sources for a Biography of Shakespeare* (Oxford, Toronto, 1946); Leslie Hotson, *I William Shakespeare Do Appoint Thomas Russell, Esq. . .* (London, 1937). The best interpretative narratives are: Edward Dowden, *Shakspere: a Critical Study of His Mind and Art* (London, 1875); J. Q. Adams, *A Life of William Shakespeare* (Cambridge, Mass., 1923); Leslie Hotson, *Shakespeare Versus Shallow* (London, 1931); J. D. Wilson, *The Essential Shakespeare* (Cambridge,

New York, 1932); G. B. Harrison, *Shakespeare at Work: 1592–1603* (London, Toronto, 1933); Peter Alexander, *Shakespeare's Life and Art* (London, 1939): M. M. Reese, *Shakespeare: His World and His Work* (London, New York, 1953). For guidance in the multitudinous Baconian and kindred speculations and for works on Shakespeare's portraits, bust, mask and memorials, the reader is referred to the foregoing articles and to the Ebisch and Schiicking bibliography. *See* also R. Churchill, *Shakespeare and His Betters* (London, 1958).

Background studies: for general reference: John Stow, *A Survay of London* (London, 1598; rev. ed., 1603; modern ed. by C. L. Kingsford, Oxford, 1908; with additional notes, Oxford, 1927); Sidney Lee and C. T. Onions (eds.), *Shakespeare's England* (London, 1916); J. D. Wilson (ed.), *Life in Shakespeare's England* (London, 1911). On Elizabethan life and thought: Hardin Craig, *The Enchanted Glass* (New York, London, 1936); E. M. W. SHALE is a fine-grained, earthy sedimentary rock that is a somewhat indurated clay and is characterized by a thinly layered or laminated structure, by which it is differentiated from clay. It is usually harder than clay and has less tendency to slake in water. It is usually gray, yellow, green or red.

Shales are sediments that accumulated in past geologic time in lakes, lagoons, oceans, etc. Their properties and composition depend upon the character of those sediments; the uniformity of the source material from day to day and from year to year; variations within the area of accumulation; and changes that took place during and after its deposition in the area of accumulation (see SEDIMENTARY ROCKS).

Some shales contain components other than clay minerals (*see* CLAY AND CLAY MINERALS), and varietal names are given on this basis; *e.g.*, sandy shale. limy shale, bituminous shale, etc. Shales find extended use in the manufacture of structural clay products, such as brick, tile and portland cement. *See* also SHALE, OIL.

(R. E. GM.)

SHALE, OIL. Oil shale is a sedimentary deposit rich in organic matter, which yields oil when heated in the absence of air. Practically all sediments form oil upon distillation, but a sediment must produce 15 gal. of oil per ton to be classified as oil shale. Commercial grades of oil shale give 25–50 gal, per ton and extremes of 150 gal. have been found.

Oil shale in its characteristic form is a thin-bedded sediment, light or dark brown when broken but white on its weathered surface. It is composed largely of remains of small plants. principally algae, rich in fats and waxes, which have decomposed in their own juices in a reducing environment, usually in fresh water.

In its natural state oil shale contains less than 3% of oily and fatty material extractable by ordinary solvents. When heated to 400° F. most of its organic constituents are converted to a form soluble in organic solvents. When heated from 600° F. to 1,300° F. it yields oil and gases. The quantity and quality of oily and gaseous substances vary with the rate and temperature of heating and with the quantity of organic matter in the shale. For example, typical oil shale from the Green river shale deposits of Colorado and Utah, containing from 10% to 30% organic matter, gives 18–50 gal. per ton. The average composition of this organic matter is 12.4% carbon, 1.7% hydrogen, 1.5% oxygen, 0.4% nitrogen and 0.2% sulfur. Under optimum conditions the organic matter yields 65% oil, 10% gas and 25% residual products. The total heating value of the shale is approximately 5,000,000 B.T.U. per ton, of which 76% is produced by the oil, 6% by the gases and 18% by the residual products. Depending upon the temperature and rate of heating, the specific gravity of crude Green river shale oil ranges mainly between 0.900 and 0.930. The lightest oil is produced by slow heating at a temperature of 1,000" F. The crude oil when distilled itself yields 16%–30% naphtha, 15%–24% light distillate, 28%–36% heavy distiilate and 16%–37% residuum. The naphtha contains 19%–25 % paraffins and naphthenes, 43%–60% olefins and 21%–36% aromatics. The nitrogen and sulfur compounds cause difficulty in refining. Practically any grade of petroleum product can be made by appropriate cracking processes.

Shale oil from other regions is similar. In some commercial operations the use of steam facilitates the release of nitrogen compounds. The sulfur enables production of ammonium sulfate fertilizer as a by-product in quantities of 10 to 100 lb. per ton of shale.

The hydrocarbon gases are 28%–50% methane, 5%–11% ethane, 1%–3% propane and less than 1% butanes. Hydrogen is 21%–42%, ethylene 6%–15%, propylene 1%–7%, butenes 1%–4% and hydrogen sulfide 1%–3%. In addition, the gas contains appreciable quantities of carbon monoxide and dioxide.

Oil shale is widespread. being found in Scotland, England, Estonia, Sweden, France, Spain, Czechoslovakia, Rumania, Austria, Germany, the U.S.S.R., the Union of South Africa. New South Wales, Queensland and Tasmania, Austr., New Zealand, Brazil, New Brunswick, Nova Scotia and Ontario, Can., Kentucky, Indiana, Nevada, Wyoming, Colorado and Utah, U.S. Oil shale has been mined commercially for many years in a fen places. The United States has reserves of more than 500,000,000,000 bbl. of shale oil in the Green river formation of Colorado, Wyoming and Utah. In 1944 the U.S. bureau of mines established an experimental mine and refinery to facilitate development of these deposits.

See U.S. Bureau of Mines, "Synthetic Liquid Fuels," *Annual Report of the Secretary of the Interior for 1950,* part *4* (1951); H. S. Bell, *Oil Shales and Shale Oils* (1948). (P. D. T.)

SHALLOT (*Allium ascalonicum,* family Liliaceae), a hardy, onionlike perennial with small, elongated, somewhat angular bulbs that develop in clusters on a common base. The leaves are short, small, cylindrical and hollow. The flowers of the compact umbel are lilac or reddish in colour. The shallot is probably of Asiatic origin. The common so-called shallot that is marketed extensively as green spring onions is in fact a form of *A,* cepa. (V. R. B.)

SHALMANESER (Ass. SULMĀNU-ASARID, "the god Sulman [Solomon] is chief"), the name of five Assyrian princes.

SHALMANESER I, son of Adadnirari I, succeeded his father as king of Assyria about 1273 B.C. He carried on a series of campaigns against the Aramaeans in northern Mesopotamia, annexed a portion of Cilicia to the Assyrian empire and established Assyrian colonies on the borders of Cappadocia. According to his annals, discovered at Ashur, in his first year he conquered eight countries in the northwest and destroyed the fortress of Arinnu, the dust of which he brought to Ashur. In his second year he defeated Sattuara. king of Malatia, and his Hittite allies, and conquered the uhole country as far south as Carchemish. He built palaces at Ashur and Nineveh, restored "the world temple" at Ashur and founded the city of Calah.

SHALMANESER III succeeded his father Ashur-nasir-apli II, 859 B.C. His long reign was a constant series of campaigns against the eastern tribes, the Babylonians, the nations of Mesopotamia and Syria, as well as Cilicia and Urartu. His armies penetrated to Lake Van and Tarsus, the Hittites of Carchemish were compelled to pay tribute and Hamath (Hamah) and Damascus were subdued.

In 853 B.C. a league formed by Hamath, Arvad, Ammon, "Ahab of Israel" and other neighbouring princes, under the leadership of Damascus, fought an indecisive battle against him at Qarqar (Karkar), and other battles followed in 849 and 846. (See JEWS: The Dynasty of Omri.) In 842 Hazael was compelled to take refuge within the walls of his capital. The territory of Damascus was devastated, and Jehu of Samaria (whose ambassadors are represented on the black obelisk now in the British museum) sent tribute along with the Phoenician cities. Babylonia had already been conquered as far as the marshes of the Chaldeans in the south. and the Babylonian king put to death. In 836 Shalmaneser made an expedition against the Tibareni (Tabal) which was followed by one against Cappadocia, and in 832 came the campaign in Cilicia.

In the following year the old king found it needful to hand over the command of his armies to the Tartan (commander in chief), and six years later Nineveh and other cities revolted against him under his rebel son. Civil war continued for two years; but the rebellion was at last crushed by Samas-Rimmon or Shamshi-Adad, another son of Shalmaneser. Shalmaneser died soon afterward in 824 B.C. He had built a palace at Calah, and the annals of his reign are engraved on an obelisk of black marble which he erected there.

See V. Scheil in *Records of the Past,* new series, iv, 36–79.

SHALMANESER V appears as governor of Zimirra in Phoenicia in the reign of Tiglath-pileser III and is supposed by H. Winckler to have been the son of the latter king. At all events, on the death of Tiglath-pileser, he succeeded to the throne the 25th of Tebet 727 B.C., and changed his original name of Ululai to that of Shalmaneser.

The revolt of Samaria took place during his reign (see JEWS: The Fall of the Israelite Monarchy), and while he was besieging the rebel city he died on the 12th of Tebet 722 B.C. and the crown was seized by Sargon.

For these rulers *see* BABYLONIA AND ASSYRIA: *History.* (A. H. S.)

SHAMANISM is a religious phenomenon characteristic of Siberian and Ural-Altaic peoples. The word shaman itself is of Tungus origin (*saman*) and it has passed, by way of Russian, into European scientific terminology. But shamanism, although its most complete expression is found in the arctic and central Asian regions, must not be considered as limited to those countries. It is encountered, for example, in southeast Asia, Oceania and among many North American aboriginal tribes. A distinction is to be made, however, between the religions dominated by a shamanistic ideology and by shamanistic techniques (as is the case with Siberian and Indonesian religions) and those in which shamanism constitutes rather a secondary phenomenon.

The shaman is medicine man, priest and psychopompos; that is to say, he cures sicknesses. he directs the communal sacrifices and he escorts the souls of the dead to the other world. He is able to do all this by virtue of his techniques of ecstasy; *i.e.,* by his power to leave his body at will. In Siberia and in northeast Asia a person becomes shaman by hereditary transmission of the shamanistic profession or by spontaneous vocation or "election.' More rarely a person can become shaman by his own decision or upon request of the clan, but the self-made shamans are regarded as weaker than those who inherit the profession or who are "elected" by the supernatural beings. In North America, on the other hand, the voluntary "quest" for the powers constitutes the principal method. No matter how the selection takes place, a shaman is recognized as such only after a series of initiatory trials after receiving instruction from qualified masters.

Asia. — In Asia as a rule the trials take place during an indefinite period of time in which the future shaman is sick and stays in his tent or wanders in the wilderness, behaving in such an eccentric way that it could be mistaken for madness. Several authors went so far as to explain arctic and Siberian shamanism as the ritualized expression of a psycho-mental disease, especially of arctic hysteria. But the "chosen" one becomes shaman only if he can interpret his pathological crisis as a religious experience and succeeds in curing himself. The serious crises that sometimes accompany the "election" of the future shaman are to be regarded as initiatory trials (see PASSAGE **RITES**). Every initiation involves the symbolic death and resurrection of the neophyte. In the dreams and hallucinations of the future shaman may be found the classical pattern of the initiation: he is tortured by demons, his body is cut in pieces, he descends to the netherworld or ascends to heaven and is finally resuscitated. That is to say, he acquires a new mode of being. which allows him to have relations with the supernatural worlds. The shaman is now enabled to "see" the spirits, and he himself behaves like a spirit; he is able to leave his body and to travel in ecstasy in all cosmic regions. However, the ecstatic experience alone is not sufficient to make a shaman. The neophyte must be instructed by masters in the religious traditions of the tribe, and he is taught to recognize the various diseases and to cure them.

Among certain Siberian peoples the consecration of the shaman is a public event. Among the Buriats, for example, the neophyte climbs a birch, a symbol of the world tree, and in doing this he is thought to ascend to heaven. The ascension to heaven is one of the specific characteristics of Siberian and central Asian shamanism. At the occasion of the horse sacrifice, the Altaic shaman ascends to heaven in ecstasy in order to offer to the celestial god the soul of the sacrificed horse. He realizes this ascension by climbing the birch trunk, which has nine notches, each symbolizing a specific heaven.

The most important iunction of the shaman is healing. Since sickness is thought of as a loss of the soul, the shaman has to find out first whether the soul of the sick man has strayed off far from the village or has been stolen by demons and is imprisoned in the other world. In the former case the healing is not too difficuit: the shaman captures the soul and reintegrates it in the body of the sick person. In the latter case he has to descend to the nether world, and this is a complicated and dangerous enterprise. Equally stirring is the voyage of the shaman to the other world to escort the soul of the deceased to its new abode; the shaman narrates to those present all the vicissitudes of the voyage as it goes on.

Another type of descent is represented by the journey of the Eskimo shaman (see below) to the bottom of the ocean, to the Mother of the Seals; he undertakes this submarine voyage when the seals become scarce and the population is menaced by a famine.

As a rule the shaman has several auxiliary spirits at his disposal. but he is not possessed by them. The spirits help him to find the soul of the sick person, and sometimes they accompany him in his ecstatic voyages. In certain regions the shaman ends by being really possessed by his auxiliary spirits, and he becomes their mouthpiece; but the possession is a secondary phenomenon found especially in those regions where shamanism is mingled with other magico-religious conceptions and techniques.

Shamanism represents the mystical experience characteristic of the primitive and archaic religions. The "flight" of the shaman to heaven can be regarded as the most ancient expression of mystical experience known to mankind. But the shaman is not only a mystic. He is just as much the guardian (and largely the creator) of the traditional lore of the tribe, he is the sage and even the poet of primitive societies. The narrations of his adventurous descents to the netherworld and of his ascents to heaven constitute the material of popular epic poetry in central Asia and in Polynesia.

Eskimo. — Shamanism predominates in the religious life of the Eskimos. The chief prerogatives of the Eskimo shaman (*angakok*; pl., *angákut*) are healing, the ecstatic underwater journey to the Mother of Animals for the purpose of assuring an abundance of game, and the aid he brings to barren women. Sickness is brought on by the violation of taboos or results from the capture of the soul by a ghost. In the first case, the shaman strives to drive out the impurity by collecrive confessions; in the second case, he undertakes the ecstatic journey to heaven or to the depths of the sea to retrieve the sick person's soul and restore it to his body. The angakok is also a specialist in magic flight. Some shamans are reputed to have visited the moon: others claim to have flown around the earth. The *angákut* also know the future, make prophecies, predict changes in the weather and excel at magic feats.

American Indians. — Among many North American tribes shamanism constitutes the most important aspect of the religious life. The shaman is characterized by the supernatural power he acquires as the result of a direct personal experience. This power is obtained either spontaneously or after a voluntary quest. but in either case the future shaman has to undergo certain initiatory trials. In general, the power is utilized in such a may as to affect the whole society. The shaman's principal function is healing, but he also plays an important role in other magico-religious rites such as, for example, communal hunting and, where they exist, secret societies (*q.v.*) or mystical movements (Ghost Dance [*q.v.*] religion type). North American shamans, like all their fellows, claim to control the weather (bring on or stop the rain, etc.), know future events, expose the perpetrators of thefts, etc. Furthermore, they defend men against sorcerers. But the magico-medical powers held by North American shamans do not exhaust their ecstatic abilities. There is every reason to suppose that modern secret societies and mystical movements among the Indians have appropriated in large part the ecstatic activity that once characterized shamanism.

In the tribes of South America the shaman enjoys considerable prestige and authority. Not only is he the healer par excellence and, in certain regions, the guide of souls of the dead to their new abode; he is also the intermediary between men and the gods or spirits, substituting himself for the priest at times. He guarantees the respect for ritual observances. defends the tribe against evil spirits, points out places for fruitful hunting and fishing, increases the wild life, controls the weather, eases childbirth, reveals future events, etc. Of course, the South American shaman can also fill the role of sorcerer; he can, for example, change himself into an animal and drink the blood of his enemies. Yet it is rather to his ecstatic abilities that the South American shaman owes his magico-religious position and social authority.

It is probable that a certain form of shamanism was diffused on the two American continents with the first waves of immigrants from Asia; later contacts between northern Asia and North America made Asian influence possible well after the penetration of the first immigrants.

Africa. — Shamanism does not play a role of the first order in Africa.

Southeast Asia and Oceania. — Shamanism is prevalent in the Malay peninsula and in Oceania. Among the Negritos of the Malay peninsula, the shaman heals with the help of celestial spirits or by using crystals of quartz. But the influence of Indo-Malayan beliefs is noticeable, too (the shaman changing into a tiger, trance achieved by dancing. etc.). In the Andaman Islands, the shaman gets his power from contact with spirits. The commonest method is to "die" and return to life. the traditional pattern of shamanic initiation. The shamans gain their reputation through their acts of healing and their meteoroiogical magic (they are thought to bring on storms).

The distinctive marks of Malayan shamanism are the calling forth of the tiger's spirit and the achievement of the trance (*lupa*), during which the spirits seize the shaman, possess him and reply to questions asked by the audience. Mediumship is also characteristic of different forms of shamanism in Sumatra, Borneo and Celebes. Among the Ngadju-Dayak of Borneo there even exists a special class of shamans, the *basirs* (literally, "incapable of procreation"), hermaphrodites who dress and act like women. These are considered to be intermediaries between heaven and earth because they unite in their own person the feminine element (earth) and the masculine element (heaven).

Possession by gods or spirits is a peculiarity of Polynesian ecstatic religion. The extreme frequency of possession in that region has made possible a proliferation of healers. Priests, inspired persons, medicine men and sorcerers may all perform magical cures. For this reason it is not possible to speak of shamanism *stricto sensu* in Polynesia.

In Australia, a person becomes a medicine man through a ritual of initiatory death, followed by a resurrection to, a new and superhuman condition. But the initiatory death of the Australian medicine man, like that of the Siberian shaman, has two specific marks not found elsewhere in combination: first, a series of operations performed on the candidate's body (opening of the abdomen, renewal of the organs, washing and drying of the bones, insertion of magical substances); second, an ascent to heaven, sometimes followed by other ecstatic journeys into the other world. The revelation concerning the secret techniques of the medicine men are obtained in a trance, a dream or in the waking state before, during or after the initiatory ritual proper.

See Mircea Eliade, *Le Chamanisme et les techniques archaïques de l'extase (1951)*; *M. A.* Czaplicka, *Aboviginal Siberia* (1914).
(M. EE.)

SHAMASH (ŠAMAS), the common Semitic word for "sun." In pre-Islamic times *Šamsu* was regarded throughout Arabia as a goddess and often called *ilā,* "goddess," wife of the moon-god Wadd, and mother of Athtar, the planet Venus. Her symbol in Arabia was a disk. Among the north Semitic races (Canaanitic and Aramaean) the name is *šemeš, šimšā,* and always masculine. Traces of Canaanitish worship are found in the Old Testament, for which see II Kings 23, 11, where the horses and the chariots of Canaanitish heathendom were removed by Josiah. The sun-god is symbolized by the horse in pre-Islamic Arabia also, and pillars called *hammanim,* bearing the sun disk, were set upon the altars of the Canaanitish Ba'als. In Arabia this deity has the epithet '(mistress of heat" when she is the summer sun, and "mistress of the distant region (south)" when she is the winter sun.

When the Semites first appear in history in Babylonia they identified their sun-god (*šamaš*) with the older Sumerian sun-god, Utu, Babbar, and it is probable that this caused the change in gender throughout the north Semitic peoples. This contact of the Semite with the Sumerians occurred as early as 3200 B.C. He became there one of the great deities of ancient religion, and lost all earlier Semitic traces to be completely transformed into a Sumerian deity; as such his cult appears throughout Babylonian and Assyrian history and survived at various Syrian centres to a late period.

The two chief centres of sun worship in Babylonia were Sippar (Sippara), represented by the mounds at Abu Habba, and Larsa, represented by the modern Senkerah. At both places the chief sanctuary bore the name E-barra (or E-babbara), "the shining house"—a direct allusion to the brilliancy of the sun-god. Of the two temples, that at Sippara was the more famous, but temples to Shamash were erected in all large centres—as Babylon, Ur, Nippur and Nineveh.

The attribute most commonly associated with Shamash is justice. Hammurabi attributes to Shamash the inspiration that led him to gather the existing laws and legal procedures into a code, and in the design accompanying the code the king represents himself in an attitude of adoration before Shamash as the embodiment of the idea of justice. Several centuries before Hammurabi, Ur-Nammu of the Ur dynasty (c. 2600 B.C.) declared that he rendered decisions "according to the just laws of Shamash."

Together with Sin and Ishtar, Shamash forms a second triad by the side of Anu, Bel and Ea. The three deities, Sin, Shamash and Ishtar (*q.v.*), the moon, the sun and Venus, form an astronomical triad corresponding to the same early Arabian triad. At times, instead of Ishtar, we find Adad (*q.v.*), the storm-god, associated with Sin and Shamash. In Sumero-Babylonian religion Shamash was regarded as the son of the moon-god Sin.

The consort of Shamash was known as Aya.

SHAMMAI, a Jewish scribe of the time of King Herod, whom tradition almost invariably couples with Hillel (*q.v.*), with whom he stood in striking contrast, not merely in legal-religious decisions and discussions, but also in character and temperament. The opposition between Shammai and Hillel was perpetuated by their respective schools, till, under Gamaliel II, the strife was decided at Jabneh in favour of the school of Hillel.

SHAMROCK. According to an Irish legend, St. Patrick first chose the shamrock as a symbol of the trinity of the Christian church because of its three leafiets. With a shamrock he is said to have driven the snakes of Ireland into the sea. The term shamrock is applied to several plants, among them wood sorrel, Oxalis acetosella; white clover, Trifolium *repens;* suckling clover, *Trifolium dubium;* and black medic, *Medicago lupulina.* In Great Britain the wood sorrel is shipped from Ireland to London and other places in great quantity for St. Patrick's day. See also CLOVER; WOOD SORREL. For that holiday in the United States the plants most commonly used as shamrock are white clover and species of Oxalis. (J. M. BL.)

SHAMYL (c. 1797–1871), the leader of the tribes of the Caucasus in the war against Russia. He was born about 1797 and, educated by the mullah Djemaleddin, soon took a leading part in preaching a holy war against the Russians. He was both the spiritual and military leader of the tribes, who maintained the struggle for 25 years (1834–59). Shamyl's romantic fight for independence, making him a sort of ally of England and France at the time of the Crimean War (1853–55), earned him a European reputation. However, the capacity of the tribes for resistance was already failing, and when at the close of the Crimean War Russia was able to employ large forces on the Caucasus, the defenders were gradually subdued, Shamyl himself being captured in 1859.

The rest of his life was spent in an easy captivity at Kaluga, St. Petersburg and Kiev. He died at Mecca during a pilgrimage in 1871. One of his sons took service in the Russian, the other in the Turkish army.

SHAN, the Burmese term for speakers of Tai (or Thai) languages other than Siamese. Shan principalities (mong) of varying size exist in Assam, Burma, Thailand, Laos, Vietnam, Cambodia and throughout southwest China. No useful estimate of total population can be made, though in Burma Shans number over 1,000,000.

Despite wide geographical dispersal both language and associated culture are fairly uniform. Although holding mainly high upland territory, the Shans themselves live only in the valleys and in stretches of plain. The hill country round about is occupied by a variety of relatively primitive hill peoples living in economic symbiosis with the Shans, but there is no clear racial distinction between the Shans and their neighbours. With minor exceptions modern Shan communities are Buddhist. Most Shans are cultivators of rice; they have a characteristic species of feudal political structure.

Shan culture probably diffused southward and westward from west-central China from Han times onward. The powerful Nanchao kingdom, centred near modern Tali-fu, was of Shan type. The subordination of Nanchao to the Mongol rulers of China in A.D. 1253 was followed by greatly accelerated Shan political expansion toward the southwest. During the 16th century a loose federation of Shan rulers controlled most of Assam, Burma, Siam and the Indochina peninsula. Thereafter Shan power receded. In the early 19th century the political structure throughout this area was still Shan in type.

In a Shan *mŏng* the power of the prince (raohpa, anglicized tsawbwa) is theoretically absolute but is really exercised by appointed ministers (*amat.*). The prince has semidivine attributes and, unlike the commonality who are monogamous, is expected to maintain an extensive harem. In some areas he should marry a half-sister as chief wife. Emphasis on patrilineal descent is confined to the royal lineages. Rank status is hereditary but there is no rigid caste endogamy. Shans are known locally by a great variety of names; *e.g.*, Ahom, Khamti (Assam): Pai-i (Yunnan); Lu, Hkun, Lao (Thailand, Laos, Vietnam, Cambodia).

Davis, *Yunnan* (1909); L. de Reinach, *Le Laos* (1911); L. Milne and W. W. Cochrane, *Shans at Home* (1910); J. G. Scott and J. P. Hardiman, *Gazetteer of Upper Burma and the Shan States* (1900); J. G. Scott, *Burma and Beyond* (1932); E. A. Gait, *A History of Assam* (1906); J. F. Embree and L. O. Dotson, *Bibliography of the Peoples and Cultures of Mainland Southeast Asia* (1950). (E. R. L.)

SHANGALLA, a name loosely applied by Abyssinians to the non-Arab and non-Abyssinian tribes living in the fertile belt which bounds Abyssinia on the west. The principal tribes are the Legas, Bertat, Gumus, Kadalos and Sienetjo. In some, Galla blood predominates: others are Negroids.

SHANGHAI (SHANG-HAI), a commercial metropolis of China, and one of the world's largest seaports occupying an extraordinary favourable geographical situation for both internal and external trade. Geographic conditions have concentrated China's foreign trade into a single gateway to a degree unparalleled in any other great country. One of the original treaty ports (opened by the treaty of Nanking, 1842), it owed its phenomenal growth to occidental commercial enterprise.

The magnificent natural waterways united in the drainage of the Yangtze river, give to the port at its outlet to the Pacific a vast commercial hinterland producing a great range of commodities and a large consumer market of about 200,000,000 inhabitants. In addition, it serves as the master port for the lesser ports of the China coast from Fukien to Shantung province. Externally, it is the nearest port to Japan, and it lies directly on the great shipping lane from San Francisco to Singapore. Locally, Shanghai occupies one apex of the delta land south of the Yangtze containing 20,000 sq.mi. with over 40,000,000 people, of which about 70% are farmers who supply the city with food arid with cotton and silk for its industries.

Climatically, Shanghai has the monsoon characteristics common to most of the east coast region, with its concentration of high rainfall in the spring and summer. The annual average is 45 in. of precipitation. Weather variability is provided by the frequent cyclonic storms moving eastward along the Yangtze valley, especially in spring. Shanghai's latitude is almost as far south as that of New Orleans, so that summers are uncomfortably hot and humid. Summer temperatures are kept below 90° F. by rains for part of July and August, and they seldom rise above 98°, but humidity averages 84% for this period. In winter humidity drops to about 30% and absolute minimum temperature to 13°.

The harbour.—Shanghai does not escape the problems besetting delta cities. It lies about 14 mi. above the mouth of the Whangpoo river (Huang-p'u Chiang) a small tributary of the Yangtze near its estuary. Daily, rising tide water from the Pacific shunts Yangtze river water up the Whangpoo. The slow current at this stage leads to rapid deposition of sediments. In early times this also resulted in the silting up of Soochow creek (Wu-sung Chiang) which flows from Soochom into the Whangpoo. The Whangpoo during the mid-19th century scoured out a channel to the Yangtze estuary at least 15 ft. deep and was able to accommodate the sailing vessels of the time. This led the British to select Shanghai as one of the five treaty ports opened to trade as a result of their success in the war with China (1839–1842). The Whangpoo's initial advantages were rapidly reduced by further silting. however, and by 1905 the channel depth was only 10 ft. leading to gloomy forecasts of Shanghai's future as a port. The problem, however, was largely solved by the work of the Whangpoo Conservancy board. Its vigorous harbour policy resulted in the development of a good shipway with a minimum depth of 24–26 ft. at the lowest tides and a high water depth of 30–42 ft. Requiring much greater efforts were the main bars of the Yangtze itself at the so-called Fairy flats (Shen T'an). Large ships could enter the river only at high tide and through the south channel, while tides and currents made the approach to Shanghai somewhat difficult. Neglect during World War II and after the Communists took over resulted in a less commodious and useful harbour in the 1950s than during the 1930s.

Port communications.—Numerous canals, some navigable to 80-ton barges and steamboats, lead from the Whangpoo to the surrounding countryside. These include a 36 mi. long canal for navigation and flood control from T'ai Hu, a large lake in the west, to the Whangpoo and constructed in 1958. Shanghai's two chief railroad connections are with Nanking in the northwest and Hangchow in the south, 193 mi. and 118 mi. distant respectively. Through these cities Shanghai has rail connections with the north and south China networks. The role of railroads in Shanghai's growth has been minor, and in the 1930s her two main rail lines carried only the moderate amount of 1,000,000 tons annually per mile. The withdrawal of most of China's shipping by the Nationalist government of China to Formosa in 1949 left water transport at Shanghai at a low ebb. From June 1949 to May 1950 the Nationalist blockade brought the relative shares in total freight of railways and watercraft of all kinds to an approximate ratio of 3.2 to 1. The heavy reliance that was put on carriage by rail contributed in part to the piling up of large quantities of cargo here as in other parts of the country in the late 1950s when there were transport bottlenecks. Although several hard-surfaced roads usable to motor transport lead from Shanghai to the hinterland, the high cost of motor transport resulted in a low volume of trucking from the port.

Port development.—When the British first realized the port potentials of Shanghai during naval operations in the Anglo-Chinese war, Shanghai was a small unimportant walled city on the Whangpoo about a mile above its junction with the Soochow creek. In 1843 the British settlement was established between the Soochow creek and the Yang-ching canal a short distance north of the walled city. Later this strip between the canal and the walls became the site of the French concession, while the American settlement (Hong Kew) grew up on the northern side of the Soochow creek. The American and British sectors were joined in 1863 to form the International settlement. The foreign zones were administered separately until World War II. The settlement area once was marshy paddy land often flooded but through careful drainage and filling, the area was converted to sites suitable for buildings. However, construction faced the difficulty of finding stable foundations, since the unconsolidated sand and silt was about 1,000 ft. deep. Uneven settling of large buildings made it dangerous to construct skyscrapers until the problem was solved for buildings up to about 20 stories by floating them on concrete rafts. Many of the canals and open sewers were culverted over, although some were used for small boat and barge navigation. Pontoon jetties anchored along the bank provided landing facilities. From the wailed city down river on the left bank, and for a longer distance up and down the river on the right bank (an area known as Pootung or P'u-tung) there mere in the 1930s less than 10 mi. of riverside shipping frontages with a minimum depth of 12 ft. The congestion at Shanghai was great. Subsequent work by the Chinese municipality which was continued after 1937 by the Japanese, resulted in additional wharfage just below the Pootung sector of the water front. Postwar construction by the Communist regime include the K'ai-p'ing wharf at Jih-hui Chiang which for the first time provided railroad connection directly to a wharf, and the new wharf at Pei-p'iao begun in June 1956.

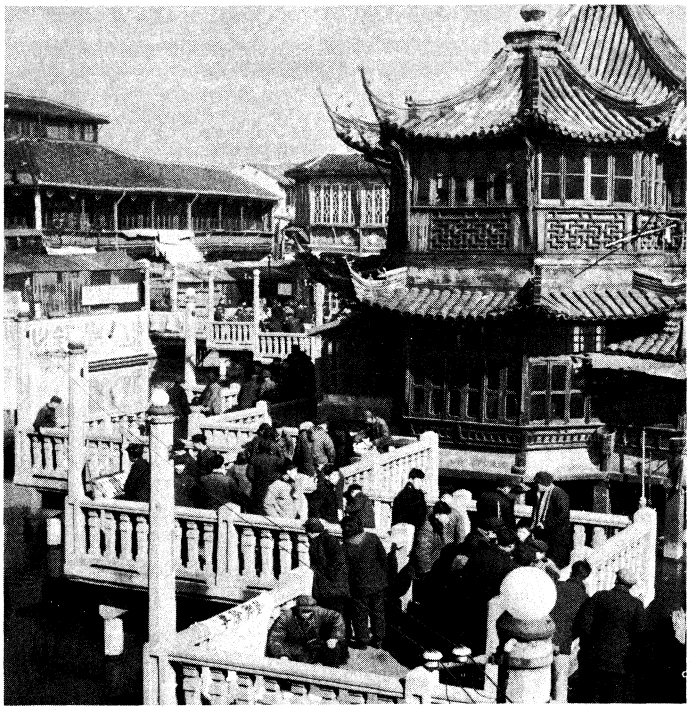
Trade—Shortly after being opened to foreign commerce in the 18th century the port of Shanghai began to dominate China's trade and by the 1870s it was handling about 62% of the total. By 1920 this had dropped to 45% as northern ports developed. In the post-World War II period before the Nationslists took refuge on Formosa, Shanghai accounted for 75% of the imports and 60% of the exports of China. Its importance declined abruptly after 1949 owing to the Nationalist blockade and by the mid-1950s Shanghai was in second place after Tientsin which had become the leading port for Communist China. By the early 1960s, Shanghai's trade had rapidly and progressively increased.

The export of tea and silk. and the import of opium and cotton textiles dominated the greater part of the trade period from 1850 to 1937. During the 20th century, however, especially during the 1920s and 1930s, imports of machinery, metals and raw materials rose to account for more than 65% of the import trade. In exports, the position of raw silk and tea. although not the quantity, diminished sharply, while bulk commodities such as ran' materials, vegetable oils, hides and skins and some manufactured products became increasingly important. T'ung oil and pig bristles were two important raw materials marketed predominantly through Shanghai. In 1939 the value of exports from Shanghai was about the equivalent of U.S. $126,000,000, while imports reached about $94,000,000. These figures, somewhat incomplete because of the abnormal war situation, gives some idea of the trade volume. Wartime trade from 1941 to 1945 was greatly reduced and toward the end amounted to little. The 1946 figures for China's exports as a whole (and Shanghai handled about 60% of this) were very small absolutely and relatively to their prewar ratio to imports. Large quantities of imports were UNRRA and American aid materials. After 1949, mainland China's trade mas predominantly nith the Soviet Union and Communist-dominated countries. There was a marked decline in the importance of consumer goods and a corresponding increase in the import of capital goods. Machinery, metals, chemical raw materials, scientific instruments, drugs and fibres, especially cotton, were leading imports. Food and raw materials continued to furnish the bulk of the exports, but manufactured goods and machinery were also of some importance.

The number of foreign ships visiting the port, not unexpectedly, has declined since the 1930s. While the People's Republic of China claimed in the late 1950s that Shanghai had regained its importance as a leading seaport, this was not borne out by observations of foreign travelers nor by official shipping statistics. It was reported in 1958 that Shanghai harbour handled a record volume of 2,220,000 tons of cargo, the highest in the history of the harbour. Hence, it is assumed that much of this pertained to domestic freight movements.

Industry. — Shanghai not only was China's leading port, but also her leading manufacturing city. Before 1937 it accounted for at least half of the country's large-scale Western-type industrial production. Of this industry, 407,–507, of the value of output and 50%–60% of the labour of the city was in textile manufacturing. This was led by cotton-spinning followed in order by silk-reeling, cotton weaving? wool spinning and wool weaving. Food industries came second with 30%–35% of the value of production. Among these, flour milling and cigarette manufacturing were most important. Other industries in order of importance were leather goods, rubber goods, paper and publishing, chemicals, and machine manufacturing. While cotton and silk industries found their raw materials in Shanghai's immediate hinterland in the Yangtze delta, flour mills depended upon wheat shipped from abroad, while tobacco came from the north China plain. The metals and rubber using industries were farthest removed from their sources of supply. Shanghai's coal was imported from north China, Japan and northern Vietnam prior to 1939. The Shanghai power company, using coal as fuel, produced 70% of the city's power and as coal could be brought in by cheap ocean transportation the city's power rates were among the cheapest in the world. Industries developed along both banks of the Whangpoo except along the Bund (a waterfront thoroughfare), but the east bank was less important because of location factors.

Shanghai emerged from World War II in a precariously depressed condition. Most of the textile plants and spindles as well as other factories were destroyed or inoperative. Rehabilitation began gradually. In 1949 Shanghai metal industries turned out 5,000 tons of steel and about 13,000 tons of steel products. Following the initial take-over, the Communist industrial policy was to keep privately owned plants in operation with the government absorbing the output but at fixed prices. The second step was the formation of joint government-private companies nhich by the beginning of 1956 took in all industrial ventures. This smoothed the transition to full government ownership and operation, since the old managerial staffs were largely retained on a salary basis. Following the Nationalist air bombardment of Feb. 1950, there was a temporary industrial exodus and a move to decentralize Shanghai's industries by removing them to the interior. In 1953 the city had only 20% the total value of mainland China's industrial output, but this was officially claimed to be 368% higher than that of 1950.



EASTFOTO

THE OLD CITY TEMPLE IN SHANGHAI IS FLANKED BY A MANY-ANGLED BRIDGE
According to Chinese legend, a devil must walk a straight line; his progress is thwarted by such bridges

In the late 1950s Shanghai had about one third of China's cotton spindles and produced about 2,000,000 bales of cotton yarn. China's first rayon plant went into production in 1958. In 1950 the city's flour mills had 20% of China's flour making capacity of approximately 140,000,000 bags per year. This was above the consumption requirements of Shanghai, so it was decided to move some of the plant equipment to wheat growing areas in the interior. Rice milling production, however, was insufficient and was increased by the construction of new mills.

Next to Tientsin, Shanghai in the early 1960s was a chief centre of chemical industry in China. The largest chemical factory was the Yung-li plant which produces ammonium sulfate and pure soda. One of China's chief cement plants is at Chiang-nan. A new policy to build up Shanghai as **a** heavy industry and machine manufacturing centre was well underway in the 1960s. In 1958, the year of the "great leap," Shanghai claimed to have achieved its goal of 1,222,000-tons of steel, 1.4 times the production of 1957. Output was scheduled to be further increased in subsequent years. The heavy industry was also pledged to make steel manufacturing equipment for other parts of China, electric power generators and tractors. Among the major plants built or enlarged during the first five-year plan (1953–58) were shipyards at Chiang-nan and Hu-tung, a steam turbine works, a boiler norks, and a lathe plant. Eight steel rolling mills for making seamless tubes, welded pipes, alloy steel and sheet iron were also included in the plan. Total industrial output of Shanghai in 1958 reached a value of 17,100,000,000 yuan. Heavy industrial development increased considerably in the 1950s but on the other hand there was a marked decline in light industry.

Population. — According to the Nationalist census bureau Shanghai's population was 4,630,385 in 1948. The distress in the rural areas following the Communist co-operative farm program grain collections together with natural calamities, brought a rapid urban influx of peasants which by 1953 had boosted Shanghai's population to 6,204,417. Efforts were made to reduce this, by forcible evacuation to the country, but many of these deportees probably managed to drift back. Shanghai's natural population increase since 1949 was estimated at an average rate of 200,000 per year. The city's industrial labour force in the early 1960s was more than 1,000,000. The male to female sex ratio of the population in the 1953 census was 123 to 100.

Social Change and Culture. — Shanghai's social character has greatly changed. In the 1930s there were between 30,000 and 60,000 foreign residents, now few foreigners are to be seen. Known once as a centre of gangsterism and a city of beggars and prostitutes, it is claimed that now not a single night club exists. About 10,000 prostitutes were put into reformatories for labour reform and rehabilitation to Communist society. Gambling was banned along with prostitution, and the famous racecourse and dog race stadium were converted into a recreation park and museum. Numerous regulations were applied to urban inhabitants of Shanghai after 1950 and individual movement about the city was greatly restricted. Under the so-called Democratic Reform movement, begun in Dec. 1952, former independent labour leaders were liquidated, and labour organizations were disbanded. Wholesale arrests of suspected Nationalist sympathizers were made. That the regime's problems were not all solved was indicated by the drive in 1958 to eradicate theft, gambling, vagrancy, census evasions, delinquencies, political sabotage and illegal capitalistic enterprises. Shanghai was charged in 1957 with having over 9,000 clandestine factories with more than 30,000 workers.

In conformity with the national policy of making office workers and officials do manual labour, thousands of cadres were reported to have been organized and sent to rural areas for work. The city is being used as a training centre for clerks, skilled labour, and technicians for the new plants being established in the interior regions. In spite of censorship and reorganization, Shanghai is a major publishing centre, and also maintains its position as a leading educational and cultural centre. It is the seat of Fu Tan and Tungchi universities and there are several medical colleges, museums and libraries. Institutes of Foreign Languages, Technology, Drama, Law, Finance and Economics, and Marine Products and the Shanghai Conservatory of Music are located there.

Municipal administration. — Shanghai is located in, but politically independent of, Kiangsu province. The Communist municipal government has a mayor, 11 elected deputy mayors, 44 members of a peoples' council, and a peoples' congress consisting of 737 delegates, The latter is a number equal to that of any provincial congress. The area of Shanghai at first was divided into 30 wards, but in 1959 only 12 municipal wards *(ch'u)*, three communications wards, and three districts (hsien) were listed. The districts include Shanghai, Chia-ting and Pao-shan. There are southern, western and northern communications wards. The area of Shanghai in 1958 was 270 sq.mi. When the communists first took over in 1949, they went into such detail of organization that in each of Shanghai's 11,185 streets a street committee was set up whose work was divided into six departments: health, education and culture, defense and security, social welfare, conciliation and relief. This was furthered by the establishment in 1951 of the Shanghai Peoples' Control commission. The control function was most likely performed by the Discipline Inspection committee already established in all the administrative units of Shanghai's Municipal Government. Moreover, the municipal peoples' court of Shanghai set up in 1949 was placed under the control of the local Military Control committee, thus reducing the court to a combination of military and administrative tribunal. The close tie with the party organization is shown in the position of Jao Shu-shih, the first secretary of the East China Party bureau and of the Shanghai Municipal Party committee, who in 1950 was also political commissioner to the 3rd Field army under Ch'en I.

SHANGHAI, to drug and ship aboard a vessel needing hands.

SHANHAIKWAN ("the gate between mountain and sea"), an important Chinese garrison town (pop. about 30,000) in the extreme northeast corner of the province of Hopeh in 40° N. and 119° 47' E. It occupies a notably strategic position, commanding the narrow coastal sill between the sea (Gulf of Liaotung) and the outlying mountain ranges of Jehol, followed by the Great Wall, which was formerly continued to the actual coast.

Its historic function has thus been that of a military post, guarding the crucial corridor communicating between the plain of north China and that of south Manchuria, and so it has come into prominence at different periods — as at the time of the establishment of the Manchu dynasty in China, during the Boxer rebellion and the Chinese-Japanese wars.

SHANKARA (780–820), the leading exponent of Advaita Vedanta, nondualism, and author of commentaries on the Upanishads, the Bhagavad-Gita and the Brahma Sutra which are known for their profundity of spirit and subtlety of thought. Shankara attempts to build a spiritual view of life on rational foundations: by reasoning we find that the world is not self-maintaining and must have a cause which is transcendent to it. In spiritual experience we apprehend the reality of this Absolute Spirit, which is called Brahman. The differences of knower, known and knowledge disappear when the Supreme Reality is known.

The world does not exist of itself but is derived from and dependent on Brahman and so is less real than Brahman. It is not, however, an illusion. The individual self which feels, suffers and is affected by the experiences of the world is a phenomenon while the truth is Brahman. To recognize the highest truth as Brahman is to attain release. Meditarion, worship, ritual are intended for a lower class of aspirants, and jnana (wisdom, knowledge of God) is the path to be pursued by the higher class of aspirants who have no desire for earthly prosperity or heavenly joy. There are two kinds of release: *sadyo-mukti* or instantaneous liberation and *krama-mukti* or gradual liberation. The former is the result of jnana, the latter of *upasana* or worship and prayer. Shankara makes out that the identity with the Highest Self is not destruction of soul. It is the perfection of the soul which has no more specific cognition or objective knowledge. See also INDIAN PHILOSOPHY: *Vedanta*. (S. RA.)

SHANKLIN: see SANDOWN-SHANKLIN.

SHAN LANGUAGE. Shan is a language of the Tai linguistic group spoken in the Shan and Kayah states of northern Burma. It is a noninflecting, basically monosyllabic, tonal language. It bears considerable phonological and grammatical resemblance to other Tai languages such as Lao and Siamese (Thai). Compared with these, Shan exhibits a simpler syllabic structure, but greater differences exist in lexicon. Long contact with the Burmese language has influenced Shan, which contains many Burmese loan words.

The Shan script was developed from the Burmese. The traditional writing system is inefficient and causes grave reading difficulties even to Shans. In particular, it lacks sufficient vowel symbols and does not mark tone. These deficiencies were remedied in a series of reforms culminating in that of 1955. and the modern Shan script is an excellent phonetically based writing system.

Dialectal differences exist within Shan, but these are relatively minor. Dialects to be grouped with Shan are spoken by some Tai peoples in southwest China, *e.g.,* the Tai Mao people, and on the borders of Assam, *e.g.,* the Khamti people. These groups employ scripts which, though generally similar to that of Shan, exhibit marked stylistic variations.

Within the Shan state some peoples, notably the Khu'n of the formerly autonomous Kengtung state, speak Tai dialects which must be grouped with those of north Thailand rather than with Shan. *See* SHAN; SHAN STATE: *Race and Language.*

SHANNON, CHARLES HASLEWOOD (1863–1937), English artist who was notable for his lithographs. He was born at Quarrington, Lincolnshire, April 26, 1863, the son of a clergyman. He was apprenticed to a trade wood engraver, in whose workshop he presently met Charles Ricketts, with whom he lived and worked until Ricketts' death in 1931, although their last direct collaboration was the periodical *The Dial* (1889–97).

Shannon's earliest designs were for Harry Quilter's *Universal Review;* but in 1893 he and Ricketts produced *Daphnis* and Chloe, a book in which text, illustrations and paper of choice quality formed a unique harmony. The first designs savour of early Renaissance book illustration, but the lithographs undertaken by Shannon from 1889 to 1898 are more personal. austere, delicate and full of a silvery chiaroscuro. Often their subject matter is of a recondite mythological character. but among them are valuable portraits such as those of Alphonse Legros. George Moore and Lucien Pissarro. Shannon as a painter was influenced by Titian, Tintoretto and. in allegorical subjects such as the "Vanity and Sanctity" (Diploma gallery, Royal Academy. London), by G. F. Watts; but here again he produced notable portraits such as the "Miss Bruce, Sculptress" in the Luxembourg. Paris. He was elected associate of the Royal Academy in 1911, full member in 1921. Between 1904 and 1919 appeared 46 more lithographs. fuller in form and richer in chiaroscuro than before. Shannon died at Kew, Surrey, on March 18. 1937, after eight years' disablement following a fall. The Ricketts and Shannon collection of prints, famous for its careful and original selection, is now in the British museum, London.

See E. B. George, *C.* H. *Shannon* (1924). (D. C. T. T.)

SHANNON, the principal river of Ireland. It flows with a bow-shaped course from north to south and southwest, from the northwest part of the island to its mouth in the Atlantic on the southwest coast, with a length of about 161 mi. and a drainage area of 4.j54 sq.mi. Rising in County Cavan in some small pools at the foot of Cuilcagh mountain, the Shannon crosses to County Leitrim, traversing Lough Allen (8 mi. in length). the first of a series of large lakes. It then separates County Roscommon on the right (west) bank from the counties of Leitrim. Longford. Westmeath and Offaly on the left. In this part of its course it forms Loughs Boderg (8 mi. long), Forbes (2 mi.) and Ree (18 mi.) and receives from the west the Boyle river and from the east the Inny, while in County Longford it is joined by the Royal canal. It now separates County Galway on the right from Offaly county and County Tipperary, received the Suck from the west and the Brosna from the east. and forming Lough Derg (24 mi.). Dividing County Clare from Counties Tipperary and Limerick. the Shannon reaches the city of Limerick and debouches upon an estuary 60 mi. in length with a direction nearly east and west. This divides County Clare on the right from Counties Limerick and Kerry on the ieft. A wide branch estuary. that of the Fergus. joins from the north. and the Mulkear. Maigue and Deel rivers enter from the south. With the assistance of short canals the river is navigable for light vessels to Lough Allen, and for small steamers to Athlone, while Limerick is accessible for vessels of up to 24-ft. draft. The salmon fishing is famous; trout are also taken in the loughs arid tributary streams. Carrick-on-Shannon. Athlone, Killaloe and Castleconnell are favourite stations for sportsmen. The islands of the loughs are in several cases sites of early religious settlements, while of those on the riverbanks the most noteworthy is that of the Seven Churches of Clonmacnoise (*q.v.*).

Like other rivers of the Irish lowland the Shannon pursues, as far as Lough Derg, a sluggish way through wide areas of lake, bog and marsh. In roo mi. its fall in level is only 44 ft. From its exit from Lough Derg at Killaloe to tidewater at Limerick the gradient increases to just over 100 ft. in 16 mi. No wholly satisfactory explanation of this change in character, from a mature, if not aged, upper course to a youthful lower course. has yet been given. It is this break, however, which has made possible the Shannon power scheme. The Erne system shows the same abrupt change of gradient, similarly used by the Ballyshannon power station, thus suggesting a common origin probably related to changing sea levels along the Atlantic coast.

It is now generally believed that the whole drainage system of central and southern Ireland was originally developed on a Cretaceous cover with a southward slope, although every trace of rocks of that age disappeared long ago. The upper Shannon and the Suck are probably relics of that early system. The existing streams flow generally over a surface of drift deposits left from the Ice Age and their distribution has certainly caused at least minor changes in the drainage pattern. Lough Derg. for example, lies in an ice-eroded basin. The drift cover over a surface of Carboniferous limestone is very thin in many places and there is therefore a considerable loss of water underground from the rivers. Solution of the limestone by this acidified water has caused the surface depressions in which most of the lakes and bogs lie. The water table varies in height with any marked change in rainfall. Since the levels of the lakes correspond to the water-table height, their areas expand rapidly and wide areas of low pasture are flooded when heavy rains or considerable snow melt occur. Dry periods similarly cause falls in level. These unpredictable changes in level create difficulties in power production at Ardnacrusha.

The wide. shalloa, bog-fringed Shannon has always been much more significant as a barrier than as a waterway. Almost throughout its entire length it is a boundary between counties and for over 800 years has limited Roman Catholic diocesan districts. Bridge construction has been hampered by the rare occurrence of firm ground on opposing banks of the river (intervals of 10 to 15 mi. between bridges is common). This has given added importance to such crossing places as Athlone and Killaloe on the Shannon and Ballinasloe on the Suck. The river is also a frontier between the region of small farms to the west and the larger farms of the east. Since the movement of Irish produce has always been eastward toward Dublin and England. the mere direction of the river has seriously limited its value as a waterway. Early in the 19th century it was hoped that its use could be developed by constructing canal links to Dublin. The Royal canal (1817) from Longford through Mullingar has never been of much use, but the Grand canal from Ballinasloe through Tullamore still carries a fair amount of traffic.

The Power Scheme.—One of the first concerns of the Irish Republican government was the provision of cheap electric power to encourage the development of industry in rural areas without increasing the costly import and transportation of coal from Great Britain. It was hoped that by thus creating opportunities for employment and improving living standards, the flow of emigration would be checked. The first step in this program was the establishment of a hydroelectric station on the Shannon at Ardnacrusha. below Lough Derg. The plant so increased the demand for electricity that other hydroelectric stations were established on the Erne at Cathaleen's fall. Ballyshannon. and at Pollaphuca on the Liffey, and the coal-fed stations on Dublin bay and at Cork were extended. The distribution of power is controlled by a semipublic corporation, the Electricity Supply board, with headquarters in Dublin.

In the 20 mi. between its emergence from Lough Derg and tidewater at Limerick the Shannon has a fall of a little over 100 ft. and it is on this difference of level that the power station at Ardnacrusha depends. It was intended that at first Lough Derg and later the whole course of the Shannon would be used for water storage. The lough alone is about 24 mi. long, from ½ to 8 mi. wide and has a maximum depth of 119 ft. A weir at Partreen, 4 mi. below Killaloe, raises the river level to a little over 100 ft. above sea level. The headrace carries nearly all the water of the Shannon by an excavated canal 40 ft. deep, 300 ft. wide and 7½ mi. long to a point 100 ft. above the power station whence it is returned through the tailrace to the river a half-mile above Limerick. Fish ladders permit the passage of salmon to the upper river and two 50-ft. locks carry barges past the power station. The old Shannon Navigation canal is now abandoned.

The scheme was an ambitious experiment in electricity supply to an almost purely agricultural community. It generated, however, only about half the power anticipated. The river, as has been shown, is subject to large and unexpected variations in the volume of water supplied and periods of low rainfall have frequently led to reduced power output. Shortage of rain appears to affect the underground supplies on which the level of Lough Derg largely depends. At such times the coal-fed stations are called upon to supply the deficiency in the national network. To protect the low-lying meadows from flooding in times of excessive rainfall, large embankment schemes have had to be carried out.

Two-fifths of the supply from the Shannon scheme is reserved for industrial power uses. The power is used for the milling of home and imported grains, the extraction of beet sugar, the manufacture of farm equipment and fertilizers, and the manufacture of clothing and boots.

(T. HER.)

SHANSI (SHAN-HSI SHENG), a province of north China, pop. (1953) 14,314,485, occupies part of the loess plateau and is bounded by the Yellow river in the west and south, the Great Wall in the north and Wu-t'ai and T'ai-hang mountains in the east where they drop off toward the north China plain. Area 60,393 sq.mi. A northeast-southwest series of river basins and valleys roughly divides the eastern plateau from the western plateau into nearly equal halves. The Wu-t'ai and T'ai-hang ranges rise above the general 5,000–6,500 ft. levels and reach 9,974 ft. in a Wu-t'ai peak. In the west the Lu-liang is the chief range of the dissected plateau and reaches a peak elevation of 9,186 ft. Most of the valley land ranges between 2,300–2,600 ft., but southwest of An-i drops to below 1,300 ft. In the north, tributaries of the Yung-ting and Hai Ho have created the Ta-t'ung and Hsin Hsien basins, the latter dividing the Wu-t'ai from the T'ai-hang range. Southward lies the T'ai-yuan basin and provincial seat on the upper Fen river, which runs thence southward and again widens into the lower Fen plain ending at the great lower bend of the Yellow river. The dry climate exhibits a decrease in precipitation from southeast to northwest and from 500 mm. to under 250 mm. yearly. much of the unreliable fall occurring in July and August.

A severe drought in 1957, resulting in a drop in production of 883,000 short tons of grain, was typical of the farming hazards. The growing season ranges from 150 days in the north to 250 days in the south. The rivers, which provide intermittent navigation in summer to flat-bottomed junks, are frozen as well as much constricted in winter. Millets, spring wheat in the north, and winter wheat in the south, kaoliang and corn are the chief crops. Some potatoes and oats are grown. Industrial crops include cotton, tobacco, hemp and peanuts, and there are fruits such as the pear, apricot, persimmon and grape, as well as walnut and the jujube date.

Animal husbandry is an important sideline, especially for the hill farmers who raise chickens, sheep, pigs, horses and donkeys and produce large quantities of eggs, wool, sheepskins and pig bristles. The fertile but easily eroded loess soil blankets most of the hill slopes and permits extensive dry-terrace cultivation. The agricultural heart of the province lies in the Fen valley which is part of the cotton belt that extends southwest into the Wei valley of adjoining Shensi province, and in 1954 the 200,000 ha. of cotton under cultivation produced some 92,000 tons of cotton lint. The landscape generally is barren of trees except in the higher mountains, where over scattered areas forest covers an estimated 10,000,000 mu (1,600,000 ac.). Another 60,000,000 mu were reported suitable for afforestation.

Shansi has numerous scattered iron ore deposits, copper ores in the An-i region in the southwest. where one of China's salt sources also is found in Chieh-chih lake (600,000-ton annual yield), and zinc and silver deposits in the north near Ta-t'ung. However, the province is most noted for being China's richest coal region, with about 47% of China's total coal or an estimated 400,000,000,000 tons, including coking and anthracite coals. The Ta-t'ung deposits lead among the six major fields in the province. Production is not as proportionately large, the planned target in 1957 being only 6,450,000 tons. The more important iron mines are near Ch'ang-chih in the southeast, and at Yang-ch'uan, about 100 km. E. of T'ai-yuan. Railroad communications connect T'ai-yuan with Ta-t'ung and Kalgan in the north, Shih-men in Hopeh province in the east, and the Yellow river bend in the south. Ta-t'ung has rail connections with the industrial centre at Pao-t'ou in Inner Mongolia, and itself is the second most important industrial centre in Shansi, producing cement, Iocomotives and mining machinery, as well as coal. T'ai-yuan is the leading industrial centre (pop. [1953] 720.700) and has one of the largest steel plants in China, as well as numerous chemical, machine and iron smelting plants. Of the new steel plants being built in the latter 1950s, the largest was the Hsiang-feng plant, which was to equal the T'ai-yuan plant in capacity. A phosphorus fertilizer plant with an annual capacity of 100,000 tons was completed in 1957. A high-voltage power line carries power to Yang-ch'uan along the railway eastward, while another line strung in 1957 carries high-voltage power to Fen-hsi in the Fen valley to the south. Highway connections are poor and limited, but a major highway leads from T'ai-yuan to Ta-t'ung in the north, and other roads connect the Fen valley with Ch'ang-chih in the east and the Yellow river in the west.

The provincial area has been part of the earliest heartland of Chinese civilization and was part of the state of Chin under the Chou dynasty. Its name originated during the Yuan period. From 1911 to 1949 it was governed for the most part by Yen Hsi-shan. Between 1937 and 1945 the Japanese occupied parts of the province, while Communist guerrillas harassed the Japanese from the T'ai-hang hills. (H. J. Ws.)

SHAN STATE. The Shan states are a collection of formerly semi-independent states on the eastern frontier of Burma inhabited by the Shan or Thai and other races. With an area of 57,816 sq.mi., they had in 1941 a population of 1,699,000. Before Burma's attainment of independence, the states were governed by their hereditary chiefs, called *sawbwas* by the Burmese, under the control of the governor of Burma, but in 1922 they were federated fer certain common purposes. Under the constitution of independent Burma, introduced on Jan. 4, 1948, the states, together with the Wa states, were constituted a single Shan state, with a minister of the Burmese government at its head, aided by a state council comprising all the members of the Burmese parliament representing the area; these members are elected by universal adult suffrage in the case of the lower house of parliament and by the *sawbwas* in the case of the upper house. The state was given governmental authority in matters of agriculture, fisheries, public works, communications, police, administration of justice, education, public health and local government, thus enjoying powers similar to those of a county council in the United Kingdom. The *sawbwas* retained their former administrative and judicial powers, subject to the minister and state council, until in Oct. 1952 they were induced by the government to surrender their authority, retaining only their right to elect to the upper house of parliament.

The state is divided into three administrative areas, Southern, Northern and Eastern, each under the charge of a resident, but the original states survive as minor administrative units.

Physical Features.—The Shan state borders Burma on the west. China on the north and east, the kingdom of Laos on the southeast and Thailand on the south. The shape of the state is roughly that of a triangle. with its base near the plains of Burma and its apex on the Mekong river. The Shan plateau is properly only the country between the Salween and Irrawaddy rivers. On the west it is marked by the line of hills running from Bhamo to the plains of Lower Burma. On the east it is defined by the rift of the Salween.

The average height of the plateau is between 2,500 and 4,000 ft., but it is seamed and ribbed by mountain ranges, which split up and run into one another. On the north the Shan state is barred by ranges following the line of the Nam Tu. The huge mass of Loi

Leng. 8,768 ft.. projects south from this, and from each side of it and to the south is the wide plain extending to Mong Nai. The highest peaks are in the north and the south. Loi Leng is the highest point west of the Salween and in Kokang and other parts of North Hsenwi there are many peaks above 7,000 ft. The majority of the intermediate parallel ranges have an average height of between 4,000 and 5,000 ft. with peaks rising to over 6,000 ft. The country beyond the Salween is a mass of broken hills, ranging in the south toward the Me Narn from 2,000 to 3,000 ft.. while in the north toward the Wa states they average from 5,000 to 7,000 ft. From December to March it is cool everywhere, and 10° of frost is experienced on the open downs. The hot season temperature is 80° to 90°, rising to 100° in the Salween valley. The annual rainfall varies frotn 60 in. in the broader valleys to 100 in. on the higher mountains.

Race **and** Language. — In 1931 there were 697,417 Shans in the Shan states out of 1,037,406 in all Burma. The Thai or Tai. as they call themselves. were first known to the Burmese as Tarôks or Tarets. The original home of the Thai people was China. It is probable that their first settlement in Burma proper was in the Shweli valley, and that from this centre they radiated at a comparatively recent date north, west and southeast. through Upper Burma into Assam and into Thailand and Indochina. It is supposed that the group numbers among its members not only the Shans proper, the Laos and the Siamese, but also the Muongs of French Indochina: the Hakas of south China and the Li, the inhabitants of the interior of the far eastern island of Hainan in the South China sea.

The Thai language may be divided into two subgroups, the north and the south. The south includes Siamese, Lao. Lu and Hkun; the north. the three forms of Shan, namely North-Burmese Shan. South-Burmese Shan and Chinese Shan with Hkamti and Ahom. The vernacular of the people who are known in Burma as Shan is South-Burmese Shan. This language is isolating and polytonic. It possesses five tones.

Trade, Mining, Agriculture. — The Shans are a peaceful race, fond of trading. During the 20th century the trade with Burma increased largely, especially after the construction of the Lashio (1903) and Shwenyaung (1928) railways. The huge silver-lead-zinc mines of the Burma Corporation, Ltd.. are at Bawdwin in the northern Shan state, but production declined for a time because of destruction suffered during the Japanese invasion and the frequent disruption of road and rail communications in the civil disturbances which often prevailed in Burma from 1948 on. The cultivation of wheat and potatoes in the southern states for export to Burma proper is normally profitable but similarly suffered from interrupted communications.

The States. — The southern area. containing 25 of the former states. has a toral area of 24,048 sq.mi. and a population (1931) of 644.336.

Mong Nai is the largest state with an area of 3,152 sq.mi. and a population (1931) of 55,791, and the smallest is Kyong with an area of only 24 sq.mi. and a population (1931) of 2,571.

Mong Pan ranks next to Mong Nai in size among the southern Shan states, with an area of 2.988 sq.mi. and a population (1931) of 20,712. The main state lies, except for a few circles, entirely west of the Salween. The only considerable area of flat land is around the capital, which lies in a large and fertile plain, marking roughly the centre of the state. From this plain rise low hills covered with scrub jungle, sloping up to ranges of about 5.000 ft. on nearly every side.

Rice is the only crop. irrigated where possible; elsewhere dry cultivation prevails. The state has valuable teak forests. The capital is small, and has only about zoo houses.

Lawksawk has an area of 2,362 sq.mi. and a population of 30,102, and ranks fourth in size among the states of the southern division. The crops are rice, sesamum, cotton, peanuts and oranges. The state is mountainous. To the north the country falls away to the Narn Tu (Myitnge), where there are teak forests. as well as along the Yam Lang and Narn Et, which with the Zawgyi form the chief rivers. Most of them disappear underground which makes the extraction of timber impossible except for local use. Lawksawk is the capital.

Mong Pai is the most southwesterly of the Shan states. It has an area of 736 sq.mi., and a population (1931) of 21,637. The country is hilly, rising westward from the chief stream. the Narn Pilu or Balu Chaung. This is navigable for native boats throughout the year to the point where it sinks underground in Karenni. The chief crop is rice, with about two acres of dry or hill rice to one of wet bottom rice, The hill fields are leit fallow for ten years after two years' cultivation.

Other states in the southern group with an area of more than 1,000 sq.mi. include: Mawkmai (2,500 sq.mi.), Mong Nawng (1.655 sq.mi.), Mong Kung (1,599 sq.mi.), Lai Hka (1.560 sq.mi.), Yawnghwe (1,389 sq.mi.) and Loilong (1,034 sq.mi.).

Taunggyi is the chief town of the Shan states and the meeting place of the state council. It is situated in 97° 02′ E. and 20° 47′ N., at an altitude of about 5,000 ft.. in a depressed plateau on the crest of the Sin Taung hills. It is in the state of Yawnghwe, 12 mi. by motor road from Shwenyaung, the present terminus of the Southern Shan States railway which joins the main Rangoon-Mandalay line at Tliazi. The five-day bazaar is the trading place of the natives. A special quarter contains the temporary residences of the chiefs when they visit headquarters, and there is a school for their sons.

The northern residency comprises North and South Hsenwi, Hsipaw, Namhsan and Mong Mit, with a total area of 18,035 sq.mi. and a population (1931) of 533,154.

Hsenwi, sometimes known by the burmanized name of Theinni, consists of North Hsenwi (6,422 sq.mi., pop. 243,499) and South Hsenwi (2.351 sq.mi., pop. 82,672). The northern part of Ncrth Hsenwi is a mass of hills. in the valleys between which are numerous tracts under rice cultivation. The southern portion has much more flat land, along the line of the Narn Tu, its tributaries. the Narn Yao and the Narn Nim, and the Nam Yek flowing into the Salween. This was formerly thickly populated, and still remains the most valuable portion of the state. Both north and south of the Nam Tu there are many peaks which rise to 6,000 ft., and several over 7.000 ft. The northern portion (about 4,000 ft.) might be called a plateau. It has large, grassy, open downs. This part of the state has fallen almost entirely into the hands of the Kachins. The Shans are found in the Nam Mao (Shweli or Lung Kiang) valley. and in the Nam Tu and other valleys in the southern part of the state.

South Hsenwi is bisected by the huge mass of Loi Leng, 8,768 ft. above sea level. Apart from this it consists of broken hill country or downs. It is watered by numerous streams, of which the chief is the Nampang Chaung, an affluent of the Salween. Considerable deposits of coal, or rather of lignite, exist in both North and South Theinni, but have not as yet been worked. Gold is washed in many of the streams in a fitful way. Little valuable timber exists. Pine forests cover some of the ranges, hut, as elsewhere in the Shan states, oak and chestnut are the commonest forest trees. The climate as a whole is temperate. The average rainfall is about 60 in. yearly. The state regained much population after the British occupation in 1888, especially after the opening of the Mandalay-Lashio railway and the Burma corporation's mine and smelting works.

Hsenwi, the capital of North Hsenwi, stands near the north bank of the Nam Tu. The ruins of the old capital lie at a short distance and show it to have been a large and well-built town. Mong Yai, capital of South Hsenwi, has a population of about 2,000.

Lashio, the chief town of the northern Shan states, lies in North Hsenwi at an altitude of 3,100 ft., on a low spur overlooking the valley of the Nam Yao. It is the terminus of the Mandalay-Lashio railway. A motor road from Mandalay, 176 mi. distant, passes through Lashio and reaches the Chinese frontier at Kyu-Hkok, a further 113 mi., so forming the Burma sector of the Burma road to China (Kunming).

Hsipaw or Thibaw (4,591 sq.mi., pop. [1941] 148,731) is called by the Shans, and officially, Hsipaw, and also frequently Ông Pawng (the name of an old capital). The chief plain land is in the valley of the Narn Tu (Myitnge), near Thibaw town, and the valley or strath of the Pyawnghkawng, Nawngpeng neighbourhood. The hills on the Mong Tung border reach their highest elevations in the peaks Loi Pan (6,848 ft.) and Loi Htan (6.270 ft.). Northwest of Thibaw town. on the Namhsan border, Loi Lung rises to 7,626 ft. The valley of the Nam Tu rises on the east in Mong Tung to a plain level of about 2,500 ft., and on the west in Mong Long to a mass of hills with an average height of 4,500 ft., broken up by the Narn Yawng and Narn Kaw valleys, which are about 3,000 ft. above sea level. The chief river is the Nam Tu or Myitnge Coal of poor quality is found at various places. The average maximum temperature at the beginning of April is about 96°, and the minimum about the same period, 6j°. The rainfall averages about 70 in. The chief crops are rice, cotton, sesamum, tea (in the hills), and *thanat*, the leaf of a tree used for the wrapper of the Burma, or "green," cheroot. Cotton cloth was formerly much more generally manufactured than it now is, and a coarse country paper is made. The government cart road to Lashio passes through the centre of the state, and the Mandalay-Lashio railway also passes through the capital. Teak forests exist along the banks of the Narn Tu and in the Manglun states.

The eastern residency, comprising the territory along the Yunnan China border, consists of Keng Tung. Manglun. Kokang and the Wa country, with a total area of about 15,000 sq.mi. and a population (1931) of about 380,000.

KENG TUNG (12,400 sq.mi.; pop., 1931, 225,894) is the most extensive of the Shan states. About 63% of the area lies in the basin of the Mekong river and 37% in the Salween drainage area. Some peaks rise to over 7.000 ft.; the elevation is nowhere much below 5.000 ft. Successive parallel hill ranges run north and south. Mountainous country predominates. The chief rivers, tributaries of the Salween, are the Narn Hka, the Nam Long, Narn Pu and the Nam Hsim. Much timber goes down the Narn Hsim but rocks and rapids make it unnavigable. Teak forests exist in Mong Pu and Mong Hsat, and also in the Mekong drainage area in the south of the state, but there is only a local market for the timber. Rice, as elsewhere in the Shan states is the chief crop. Next to it is sugar cane. Peanuts and tobacco are the only other field crops in the valleys. On the hills, besides rice. cotton, poppy and tea are the chief crops. The tea is carelessly grown, badly prepared, and only consumed locally. Much garden produce is raised in the valleys. The state is rich in cattle and exports them to the country west of the Salween. As in all parts of the Shan states, there are huge areas which may be capable of some development. Communications are poor: a road, motorable with difficulty in the rainy season, runs 283 mi. from Taunggyi to Keng Tung town. and a dry-weather motor road goes from the town for 110 mi. to the Siamese border near Tachilek.

Keng Tung, the capital (pop. 5,500), is surrounded by a ruined brick wall and moat about 5 mi. around.

MANGLUN (pop. [1931] 38,295) extends for 100 mi. along the Salween river. Its width varies from a mile or even less on either side of the river to perhaps 40 mi. at its broadest point near Ta-Kut, the capital. It is divided into East and West Manglun, the boundary being the Salween. The only flat land is along the banks of streams in the valleys. There are prosperous settlements and bazaars at Nawng Hkam and Mong Kao in West Manglun. Ta-Kut is on a hilltop 6,000 ft. above sea level. The *sawbwa* has control over two substates, Motai to the north and Maw Hpa to the south.

KOKANG, formerly a substate of North Hsenwi, lying between the Saiween and Yunnan, is inhabited almost exclusively by Chinese and was governed by a Chinese chief until Oct. 1952; the people, numbering about 45,000, breed mules and sheep.

The WA area. whose population was recorded in 1941 as 82.614, is an extremely hilly area on the Yunnan. China, border, which is still only loosely administered. The frontier in this region was finally agreed upon by the British and Chinese only in 1941 and was in 1953 still undemarcated on the ground. The Wa are the most primitive of all the peoples of the Shan states and regard head-hunting as essential to their fertility rites at plowing time; rows of skulls are placed in avenues near the villages, the largest being avenues of zoo or more skulls each at Ramoang and Hsan Htung villages. This practice has of late been checked by the authorities.

SHANTUNG (SHAN-TUNG SHENG), a densely populated coastal province of China between the Yellow sea and the Gulf of Chihli, is bounded by Hopeh in the north, Honan in the west and Kiangsu in the south. Area est. 54,000 sq.mi.; pop. (1953) 48,-876,548.

In early geological times its inland arid peninsular hill masses comprised at least two large islands. while an inland sea or strait stood between them and the T'ai-hang hills of Shansi. Heavy sedimentation from the Yellow and Huai rivers filled this in to form the low-lying Yellow plain around the central hill mass. The province thusforms three physiographic regions: (1) the central hills, a triangular mass culminating in T'ai Shan (Mt. T'ai). elevation 5,069 ft., about 12 mi. northeast of the junction of parallel 36° N. with meridian 117° E. most of the hill lands rise to only around 1,300 ft., but several peaks reach over 3,200 ft. (2) The peninsular hills, with most elevations around 600 ft., but rising to 3,707 ft. in the Lao Shan northeast of Chiao-chou bay and Tsingtao city. A submarine ridge connecting Shantung with Liaotung protrudes above the sea as the Ch'ang-shan archipelago. The islands and the indented peninsula favoured the development of sheltered harbours for fishing and commerce. (3) The plain which from the west slopes eastward to a northwest-southeast oriented trough at the western base of the central hills, and which in the north and south continues to the sea in the alluvial deposits of the Yellow river. The trough is occupied by several elongated lakes utilized in part by the Grand canal cutting through western Shantung. The Yellow river in its present course flows past the northern foothills. Between the central hills and the peninsular hills is the corridor plain formed by sediments of the Pei-chiao and Wei rivers, over 62 mi. long and from 18 to 30 mi. wide.

History.—Western Shantung formed the easternmost parts of the earliest known organized state of China, the Shang (1520–1030 B.C.). Even earlier, an indigenous culture had developed there, as shown by a unique type of polished black pottery excavated at Ch'eng-tzu-yai. Southern Shantung as the state of Lu gave birth to Confucius and Mencius, honoured by a temple on T'ai Shan. The Lu kingdom, together with the Ch'i kingdom in northern Shantung, formed parts of the feudal domains of the Chou dynasty which lasted until the 3rd century B.C. Thus Shantung has from the beginning been part of the core area of the Chinese state. In more recent history Shantung symbolized China's humiliation by Japan and by European powers. It was occupied by Japanese forces during the Chinese-Japanese war of 1894–95. In 1898 Germany forced a lease of Tsingtao from which to exploit the province, while Great Britain similarly obtained a lease of Wei-hai for a naval base. The Boxer rebellion developed out of Chinese resentment against foreigners in Shantung in 1899 and spread to other provinces in 1900. After World War I Japan tried to take over the German sphere of interest in Shantung and garrisoned troops there off and on between 1915 and 1929. When Japan attacked China in 1937, it was at T'ai-erh-chuang in southern Shantung that China won its first major victory over Japanese troops. In the Nationalist campaign against the Communists after World War II, the Communists were able to hold most of the province, and gained their first decisive victory in east China with the capture of the provincial capital of Tsinan in Sept. 1948.

Climate **and** Agriculture.— In climate the peninsula is more moderate than the inland mass which shares the continental dryness and severity of north China winters. The northern part of the province is especially exposed to the northwest winds from Mongolia, but these winds pick up some moisture from the Gulf of Chihli and deposit some snow and rain on Shantung. The harbours freeze over at Chefoo and Lung-k'ou, and the January average for Chefoo is 24° F. while at Tsingtao it is 31.3° F. In summer when the inland plains have 95° temperatures, Tsingtao and Wei-hai only reach about 77°. The precipitation has the usual summer peak, with south-facing slopes of the hill masses receiving over 30 in. and the interior plains only about 20 in. Some 1,200,000 wells (1951 estimate) provided the water for 85% of the land that is irrigated, although river water also is used. Expanded irrigation projects in 1956 provided water for some 17,930,000 mu (about 2,900,000 ac.) of additional irrigated land. The aggregate grain production (largely wheat, kaoliang, millets and corn) in 1956 was about 16,-170,000 short tons, which was about 37% higher than that for 1936 and 86% higher than that for 1949. Other crops include cotton, tobacco and peanuts. Live pigs numbered 5,239,000 in 1956.

The hills are capable of growing forests: but have been denuded during past centuries. Forests were being restored through afforestation in the second half of the 20th century, however, and along the coasts sand drift was being reduced by sand-fixing plants and trees. The convergence of warm and cool currents in the sea off Shantung is conducive to fish production. Tsingtao and Chefoo are the leading fishing centres.

Communications and Industry. — Communication facilities in the latter 1950s included over 9,100 km. of highways connecting all the 104 hsien (districts) of the province. but only about 1,500 km. were all-weather roads in 1957. One major railroad runs from Tsingtao westward to Tsinan, the provincial seat, where it meets the north-south line from Tientsin to P'u-k'ou on the Yang-tzu. A rail line also leads from Tsingtao, the chief port, to Chefoo which is an embarkation port for travelers to Manchuria. Spur lines lead to the coal mining centres of Tzu-pu, Hsin-t'ai and Tsao-chuang in the north-central, central and southern hill areas respectively. The mining development at Tsao-chuang is one of the largest and most mechanized in China. There are numerous gold mines in the peninsular hills, the most important being in Chao-yuan district. The more noted iron ore mines are at Chin-tien-chen and Li-kuo-i, and important aluminum ore mines are at Nan-ting. The coastal salt industry is centred at Chiao Hsien.

Important industries of the province include cotton textiles, cigarette and match making, flour milling and oil pressing, brewing and distilling, machinery and chemicals; 90% of the country's peanut oil was produced there in the latter 1950s. In 1957 almost 293,000 handicraft workers worked in more than 4,400 co-operatives. The industrial production in 1956 reached 1,634,000,-000 Yuan.

Education. — There were seven schools of higher education with 11,600 students in 1957; 416 middle schools with about 270,000 students; and 53,000 primary schools with about 5,016,000 students. (H. J. Ws.)

SHANTUNG. A plain silk fabric of light texture originally produced in the Chinese province of that name from a variety of native silk known as pongee silk obtained from the cocoons of wild silkworms that feed on oak leaves. Hence, pongee is of a strong and rough type of silk with a light tan natural colour and a coarser filament structure than that produced by cultivated silkworms that are fed on mulberry leaves.

Japanese pongee is also a type of wild silk of a similar character to Shantung silk, but of a smoother and more even filament structure than that of Chinese pongee. The word pongee is said to correspond with homespun, hand-spun and hand-woven, as it is chiefly conducted on a very large scale as a home or domestic industry both in China and Japan, although pongee silk or Shantung is now woven on power looms.

Tussah silk is the name applied to a type of low-grade fabric produced from silk spun by a species of wild native silkworms of India. and possessing characteristics similar to those of Chinese pongee silk. Fabrics produced from pongee or other types of wild silk partake of the physical characteristics of such silk and feel somewhat harsh and rough, although the better qualities of these wild silks are said to be of a more durable character and to wear better than silk fabrics produced from the products of cultivated silkworms.

Shantung silk fabrics are also sometimes sold under the trade-name of "Ninghai." (H. N.)

SHANTY or **Chanty,** a song of the class of labour songs which sailors on merchant ships sang as they pulled ropes to hoist yards and sail, raise anchors or work pumps. The word shanty, however it is spelled, is usually thought to be the British sailor's corruption of the French word *chanter* and to come from the French Canadian lumbermen, who sang as they hauied their logs; Sir Richard Terry derives it from the West Indian Xegroes, who move their huts or shanties with ropes and sing as they work, with a shantyman as soloist and leader.

On board ship two varieties of shanties evolved — one for pulling ropes, the other for winding the capstan. The former provides points in the tune for collective pulls (or a simple final pull on the last note), the latter for continuous rhythmical movement. Two kinds of pulling shanties may also be distinguished — the short drag. sung when a few strong hauls will do the work, as in reefing a topsail, and the halyard shanty, accompanying the longer and heavier pulls, such as hoisting a sail. The capstan shanty, as the name implies, was used for a steady winding operation, such as hoisting an anchor or warping a ship into its slip. A fourth variety, the forecastle shanty, which is not a labour song, is generally in the form of a ballad, sung by the sailors in their leisure hours.

The best known of the short drag shanties is "Haul Away, Joe." A famous halyard shanty is "Blow the Man Down." Of the capstan shanties, "Rio Grande," "Yo Heave Ho," and "Shenandoah" (or "Shanandar") are most familiar. "The Boston Come All Ye" and "The Golden Vanity" are typical forecastle shanties.

SHAPING MACHINES: *see* Planing Machines.

SHAPLEY, HARLOW (1885–), U.S. astronomer, pioneer in studies of the structure of the Milky Way and of the universe beyond it, was born in Nashville, Mo.. on Nov. 2, 1885. Having studied at the University of Missouri and at Princeton, he joined the staff of the Mount Wilson observatory in 1914, and later became professor of astronomy at Harvard university. From 1921–52 he was director of the Harvard College observatory.

Shapley's most important early work concerned eclipsing binary stars. With H. N. Russell, in 1913, he devised practical methods for deducing the dimensions of the component stars of these systems from measurement of the light variation during eclipse. These methods, in essentials, remained the standard procedure for more than 30 years. Shapley showed that Cepheid variables cannot be eclipsing binaries, and was the first to advocate the theoretically important view that they are pulsating stars.

He studied the colours and magnitudes of stars in clusters, especially of those in the globular clusters, and was a pioneer in the use of variable stars (Cepheids and RR Lyrae stars) as distance indicators. He made the bold hypothesis, then revolutionary. but later well established, that the globular clusters form a fairly symmetrical swarm about the centre of the Milky Way, and that our sun must therefore be located in the outer parts of the Milky Way system, some tens of thousands of light years from the centre.

With the aid of large numbers of photographs of the sky. made both at Harvard and at the Harvard southern station in South Africa, Shapley studied the structure of the Milky Way and of nearby galaxies, especially the Magellanic Clouds, and the distribution of galaxies in space. He was one of the first to demonstrate that galaxies tend to occur in clusters and that the Milky Way is a member of a local cluster.

Shapley's work, characterized by bold imagination and drive. was mainly of the nature of first surveys. As he himself pointed out in the late 1950s, much further detailed investigation was required.

Shapley's works included *A Source Book in Astronomy,* with H. E. Howarth (1929), *Star Clusters* (1930), *Flights from Chaos* (1930), *Galaxies* (1943), *Inner Metagalaxy* (1957), *Of Stars and Men...* (1957). He edited *Climatic Change* (1954); *A Treasury of Science,* 3rd rev. ed., with S. Rapport and H. Wright (1954). He also wrote many technical papers, especially in the *Astrophysical Journal* and in the *Proceedings of the National Academy of Sciences.* (R. O. R.)

SHAPUR (Pahlavi *Shahpuhr,* "son of the king"; Greek *Sapores;* commonly *Sapor*), the name of three Sassanian kings.

1. SHAPUR I (A.D. 241–272), son of Ardashir I and second in line of the Sassanian kings. The Persian legend that makes him the son of an Arsacid princess is not historical. Ardashir had. toward the end of his reign? renewed the wars against Rome inherited from the Arsacids. On his death Shapur continued the war, conquering Nisibis and Carrhae and advancing deep into Syria. Defeated at Resaena in 243, he was yet able to conclude an advantageous peace in 244 because of the murder of the emperor Gordian III. In 258 he took advantage of the internal chaos within the Roman empire to renew his attacks. Invading Syria, Asia Minor and Armenia. he sacked Antioch but was repulsed by the emperor Valerian. However, in 260 Shapur not only defeated Valerian at Edessa, but captured him and kept him a prisoner for the rest of his life. The capture of Valerian is a favourite subject of Sassanian rock carvings. In attacking the eastern Roman provinces. Shapur does not seem to have aimed at a permanent occupation. He merely carried off enormous booty both in treasure and men. The captives from Antioch were set to work to build the city of Gunde-Shapur (called in an inscription *Vahy-Andiok-Shapuhr,* "better than Antioch [has] Shapur [built]"), later to become famous as a centre of learning. Using the same captives, who excelled the Persians in technical skill, he built the dam at Shushtar (Shustar) known as the *Band-i-Qaisar,* "the dam of Caesar," to' this day.

Shapur was no longer content to describe himself as "king of kings of Iran" as his father had done: he styled himself "king of kings of Iran and Aniran (Aneran)," that is to say, of non-Iranian territories as well. Possibly in connection with these secular imperialist ambitions Shapur appears to have tried to find a religion that would be suitable to all his subjects, whether of Iranian stock or not. He showed marked favour to Mani, the founder of Manichaeism, and at least one of his brothers adopted the Manichaean faith. He himself does not seem to have taken this final step, for the inscriptions show that he founded fire temples both on his own behalf and on that of his wife and sons. He sought, however, to broaden the basis of the newly revived Zoroastrian religion by the addition of material derived from both Greek and Indian sources; there is evidence that he favoured the heretical "Zervanite" wing of Zoroastrianism which derived both Ohrmazd and Ahriman, God and the devil, from the principle of Infinite Time.

If the credit of the founding of the Sassanian empire belongs to Ardashir I, it was nevertheless Shapur who consolidated and expanded it. He thought of the new empire as a multinational state in which Manichaeism, drawing on Christian and Buddhist as well as on Zoroastrian sources, might serve as a unifying factor.

2. SHAPUR II (310–379, usually called "the Great"), ninth of the Sassanian kings. At the death of Hormizd II, the Persian nobles killed his eldest son, blinded the second and imprisoned the third. The throne was reserved for the unborn child of one of the wives of Hormizd. This was Shapur, who was thus born king.

With the adoption of Christianity by Constantine and the subsequent christianization of the Roman empire, Persia found itself saddled with what it considered to be a powerful Christian "fifth column." Thus Shapur resumed the policy of fierce intolerance toward non-Zoroastrians which had been initiated by the high priest Kartir in the reign of Bahram I, and singled out the Christians for fierce persecution. He summoned a conference of all creeds, and decided in favour of one Adhurbadh, son of Mahraspand, a dualist Zoroastrian of strictly orthodox views. Thus Shapur II sought to unite his empire by enforcing Zoroastrian orthodoxy on frequently unwilling subjects.

His external policy was one of war and expansion; during his reign the insane and semipermanent struggle between the rival empires of Rome and Persia swayed in favour of the latter. In 337 he broke the peace which had been concluded 40 years before between Narses and Diocletian, and embarked on a 26-year war. Shapur attempted with varying success to reduce the great Mesopotamian fortresses of Singara, Nisibis and Amida. Though Constantius was invariably defeated on the field, Shapur made little real progress. He was not strong enough permanently to occupy the conquered provinces because his eastern frontier was continually raided by central Asian tribes, prominent among which were the Chionites. After a prolonged struggle Shapur finally forced their King Grumbates to conclude a peace, whereupon the latter allied himself to Shapur in a renewed onslaught on the Roman power. With Grumbates' aid Shapur at last reduced both Amida and Singara (359–360). In 363 the emperor Julian advanced against him in force. but was killed in battle. His successor. Jovian. was defeated and made to sign an ignominious peace by which he ceded the frontier marches on the Tigris and Nisibis and gave the Persians a free hand in Armenia. This victory is celebrated in the rock carvings near Shapur. not far from the modern Shiraz.

Shapur now turned his attention to the subjugation of Armenia. He captured the pro-Roman Arsaces III and imprisoned him in Susiana, where he committed suicide. His attempt to force Zoroastrianism on an Armenia which had only just accepted the Christian faith met with fierce and successful resistance. Arsaces' son Pap was smuggled out into Pontus and the Armenian resistance remained unbroken. The emperor Valens succeeded in restoring Pap in violation of the treaty concluded between Jovian and Shapur, but Pap repaid him by poisoning the patriarch, Nerses, the very symbol of national resistance, and executed Cylax and Artaban, the leaders of the anti-Persian party. In so doing he may have been trying to preserve a precarious balance between Persia and Rome in Armenia. Be this as it may, he was treacherously murdered by the Romans in 374. For five years Armenia was progressively weakened by an internecine struggle among its nobles. Shapur's last act was to win over Armenia by a discreet distribution of gifts. The country's autonomy under Persian suzerainty was recognized and the Christian religion respected. Thus Shapur II left Persia with its territory considerably augmented: he had pacified the eastern frontier and gained the suzerainty over Armenia. The Persian empire had never been stronger; but war with Rome became a natural state of affairs. and its continuance did more than anything to undermine the strength of the Sassanian empire.

3. SHAPUR III (383–388), son of Shapur II, elevated to the throne by the nobles against his uncle Ardashir II, and killed by them after a reign of five years. He concluded a treaty with Theodosius the Great. (R. C. Z.)

SHARE. In the language of finance a share is defined as one of the portions into which the capital stock of a corporation is divided. In Great Britain the plural "shares" signifies all of the concern's capital invested by owners of the individual shares. The equivalent U.S. term is "stock," though the expression "share of stock" is also common. In Great Britain a share always has a definite nominal or face value, as £1 10s. or even 1*s*.

See STOCK.

SHARI, a river of north-central Africa. carrying the drainage of a large area into Lake Chad. Its headstreams rise on the watersheds between the Chad basin and those of the Nile and Congo. The principal headstream, known generally as the Wam, rises. in about 6° 30' N., 15° E. in mountainous country forming the divide between the Chad system and the basin of the Sanga affluent of the Congo. From the source of the Wam to the mouth is a distance, following the windings of the stream. of fully 1,400 mi.

The Wam flows east and then north and in about 7° 20' N., 18° 20' E. is joined by the Fafa, a considerable stream rising east of the Wam. The upper course of the Wam is much obstructed by rapids. but from a little above the Fafa confluence it becomes navigable. Below the confluence the river, now known as the Bahr Sara. receives three tributaries from the west. In about 9° 20' N., 18° E. it is joined by the Bamingi, which is formed by the junction of the eastern headstreams of the Shari. One of its branches, the Kukuru. rises in about 7° N., 21° 15' E. About 90 mi. from its source the Bamingi becomes navigable, being 12 ft. deep and flowing with a gentle current. In 8° 42' N. it receives on the west bank the Gribingi. a river rising in about 6° 20' N. It is narrow and tortuous with rocky banks and often broken by rapids. It flows in great part through a forest-clad country. A few miles above its confluence with the Bahr Sara the Bamingi receives on the right hand another large river, the Bangoran, which rises in about 7°

45′ N. and 22° E.. in a range of hills which separates the countries of Dar Runga and Dar Banda and. like the Bamingi, flows through open or bush-covered plains with isolated granite ridges.

Below the junction of the Bahr Sara and the Bamingi the Shari, as it is now called, becomes a large river, reaching, in places, a width of over 4 mi. in the rains; while its valley, bordered by elevated tree-clad banks, contains many temporary lakes and backwaters. In 9° 46' N. it receives the Bakare or Awauk (Aouk) from the east, known in its upper course as the Aukadebbe. This, like the Bahr es Salamat, which enters the Shari in 10° 2′ N., traverses a wide extent of arid country in southern Wadai, and brings no large amount of water to the Shari. In 10° 12' a divergent branch, the Ergig, leaves the main stream, only to rejoin it in 11° 30'.

In 12° 15′ N. and 15° E. the Shari receives on the west bank its largest tributary. the Logone, the upper branches of which rise far to the south between 6° and 7° N. The principal headstreams are the Pende and the Mambere. Its system is connected with that of the Benue (see NIGER) by the Tuburi swamp, which sends northward a channel joining the Logone in about 10° 30' N. Below the Logone confluence the Shari, there a noble stream, soon splits up into various arms. forming an alluvial delta, flooded at high water, before entering Lake Chad.

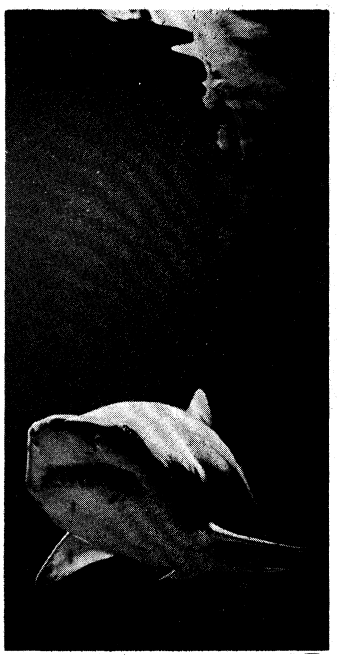
The existence of the Shari was made known by Oudney, Denham and Clapperton, the first Europeans to reach Lake Chad (1823). In 1852 Heinrich Barth spent some time in the region of the lower Shari and Logone, and in 1872–73 Gustav Nachtigal studied their hydrographical system and explored the Gribingi, which he called the Bahr el Ardhe. But the most prominent explorers have been Frenchmen. In 1896 Émile Gentil reached the Bamingi and in a small steamer passed down the river to its mouth. In 1907 an expedition under Capt. E Lenfant followed the M'am-Bahr Sara from its source to the confluence with the Bamingi and showed it to be the true upper course of the Shari. The same expedition also discovered the Pende tributary of the Logone. From the mouth of the Shari in Lake Chad there is a current toward the Bahr-el-Ghazal channel at the southeastern end of that lake (*see* CHAD, LAKE). This channel has been supposed to be a dried-up affluent of the lake. Investigations by the French scientists E. F. Gautier and R. Chudeau led Chudeau to the conclusion that the Shari did not end in Lake Chad, but. by way of the Bahr-el-Ghazal, passed between Tibesti and Ennedi and ended in some *shat* in the Libyan desert. The major part of the Shari basin is in former French Equatorial Africa; some of the western affluents are in Cameroon.

See the works of Barth, Nachtigal and other travelers, especially Lenfant, La *Découverte* des grandes sources du centre de *l'Afrique* (1909).

SHARK, any of the cartilaginous fishes with a pointed snout extending forward and over a crescentric mouth set with sharp triangular teeth, and with paired, largely lateral, gill slits. well defined eyes, pointed fins and a muscular, upturned tail (see CHONDRICHTHYES). Larger kinds are suspected as being dangerous to man; smaller ones, called topes, hounds and dogfishes, are fished commercially.

Description and Habits.—Shark species are often similar in appearance and nondescript in colour, varying from gray to bluish or brownish, often patterned with spots, bands, marblings or protuberances. The whale sharks (Rhineodon) and basking sharks (*Cetorhinus*), which may reach 50 ft. and weigh several tons, are harmless giants that subsist on plankton strained from the sea through modified gill rakers. All other sharks are carnivorous, the largest among them being the voracious 40-ft. white shark (*Carcharadon*), which attacks seals, sea turtles, large fish and, on more than one occasion, man (see Hazards to *Man,* below). The sluggish Greenland shark (Somniosus) of cold deep waters has been known to feed on seals. reindeer, large fish and whales. Normally sharks feed on fish, often attacking in schools; open-ocean species such as the mackerel. mako and thresher sharks frequently feed near the surface, and are much sought after by rod and reel sportsmen as prime game fish. Beautifully streamlined and powerful swimmers, these open-ocean sharks are adept at feeding on fast tuna, marlin, etc. Bottom-feeding sharks are stout, blunt-headed forms. tending to flattened bodies with well developed spiracles and larger eyes; the shellfish eaters have coarse, pavementlike crushing teeth. So characteristic are shark teeth that it is possible to identify fossil and modern species from one or two teeth.

The origin of sharks is obscure, but their geological record goes back to pre-Devonian times (more than 320.000.000 years ago). Their present diversity of forms and numbers, estimated at some 300 species, equals their past abundance; many recently found species have long been known from the fossil record.



BY COURTESY OF NEW YORK ZOOLOGICAL SOCIETY

SAND SHARK (CARCHARIAS TAURUS)

The living sharks (order Pleurotremi) fall into three suborders. The first is the Notidanoidea, a small group of primitive sharks distinguished by six or seven gill clefts and one dorsal fin; examples are the frilled (*Chlamydoselachus*) and six-gilled (Hexanchus) sharks. These are deepwater fishes; the former are eel shaped and may reach over 6 ft.; the latter attain a length of over 20 ft. The suborder Squaloidea is characterized by five, rarely six, gill clefts and two dorsal fins preceded by spines. This group includes the bullheaded, or horn, shark (Heterodontus); the spiny dogfish (*Squalus*), a small shark of temperate seas, which travels in schools and is a pest to commercial fisheries; the bramble shark (*Echinorhinus*), a bulky shark with spiny tubercles on the skin; and the Greenland shark (*Somniosus*), which grows to 25 ft. The specialized saw sharks (Pristiophorus) and the bottom-dwelling angel sharks (*Squatinidae*) with elongated bodies and muscular tails are also of this suborder. The third suborder, the Galeoidea, are typified by five gill clefts, two spineless dorsal and one anal fin The bulk of the sharks. and many aggressive representatives of the requiem sharks (Carcharinidae), feared because of their attacks on man, are associated with the galeoids. This suborder also includes the families Odontaspidae (the sand and elfin sharks), Lamnidae (man-eater, porbeagle, basking, mackerel and thresher sharks), Carchariidae (topes, hounds, blue and hammerhead sharks), Scyliorhinidae (dogfishes) and Orectolobidae (carpet, tiger, nurse and whale sharks).

Although chiefly marine. sharks often enter fresh water; requiem sharks of the genus *Carcharhinus* occur commonly in the Zambezi, Tigris and Ganges as well as other rivers in subtropical and tropical areas. The Lake Nicaragua shark is a landlocked form found in Central American lakes. Carcharhinus species are small to medium sized. but they are aggressive, persistent and generally feared wherever they occur.

Hazards to Man.—In Australia, South Africa and elsewhere along coasts exposed to the shark nuisance, public beaches are often provided with lookout towers, bells and sirens or nets—proof of public concern toward the shark hazard. The most feared species is the great white shark (Carcharadon), whose erratic presence in United States coastal waters has given rise to particularly distressing attacks in Buzzards bay, Massachusetts, off the New Jersey shore and, with most frequency, along the California coast. Other sharks involved in attacks on humans are the whale (Galeolamna), tiger (Galeocerdo). blue (Prionace), gray nurse (Carcharias) and hammerhead (*Sphyrna*).

Of course, the larger the shark. the more formidable the attack, but several small specimens can be equally hazardous, a fact well attested to by wartime sea survivors. The zone of greatest hazard lies approximately between latitudes 40° N. and 40° S. and coincides with the warmer months, when average surface sea temperatures vary between 60° and 70" F. Fatalities are greatest in late afternoon; men have been attacked more frequently than women. The majority of attacks are on bathers in shallow water (between 2 and 3 ft.); however. participants in underwater activities also risk injury from sharks in warm seas. Injury is greatest on the lower limbs and buttocks and, secondarily, on the forearms and hands. The above information, however, may reflect the habits of bathers as well as the habits of sharks. Mortality is as high as 70%; this is largely due to hemorrhage and shock, controllable through first-aid measures. Increasing public interest in seashores for recreation and sport emphasizes the need for uniform safety measures to prevent loss of life. The incidence of attack by sharks is no greater than that for land carnivores. but the probability of a rise in shark attacks is greater since increasingly greater numbers of people, with little realization of marine hazards, are entering the sea during the season when sharks are closest to the shore. Shark repellents are constantly being sought; several, like "Shark Chaser," consisting of copper acetate and a black marker dye, nigrosine, in a water-soluble wax, appear to be some help in repelling some species.

Economic Importance. — Shark fishing is a relatively minor industry of local importance in a few regions. Shark-liver oil, high in vitamin A, has been used for pharmaceutical and proprietary medicines when supplies of cod-liver oil, formerly a chief source of the vitamin, have been reduced. Lower-grade shark oils have industrial application in tanning and other industries. Shark skin is the source of shagreen, a very durable leather for which there is only a very limited demand. Spiny (*Squalus*) and smooth (*Mustelus*) dogfishes serve as objects of anatomical dissection in many school laboratories of zoology. Past attempts in the United States to popularize spiny dogfish *(Squalus acanthias)* flesh as edible "gray fish" proved unsuccessful. However, the use of shark flesh elsewhere is more widespread; large quantities are sold in Europe, South America and South Africa. In Latin-American countries sun-dried or salted shark flesh is shipped into inland areas.

The school shark *(Galeorhinus australia)*, originally fished for vitamin A in Australia, is now processed into fresh shark fillets. Several million pounds annually are sold as "flake," the principal source of fish in "fish and chips"; the Australian government has been concerned with the dwindling number of this commercially valuable species in its territorial waters. (Strangely enough, regardless of where shark flesh is sold, it rarely is described as a shark product.) Sharks are also used as bait for lobsters and crabs. and considerable amounts of shark meat are processed for fertilizer and for livestock feed.

SHARON, an industrial city of Mercer county, Pa.. U.S., is situated on the Shenango river at the Ohio-Pennsylvania border. It has plants manufacturing chemical. food, lumber, steel, electrical and textile products. The area contains significant deposits of natural gas, crude oil, bituminous coal and sand. Settled in 1795 and laid out by William Budd in 1815, Sharon was incorporated as a borough in 1841 and as a city in 1918. It has rail and road transportation, and air facilities through Youngstown, O. About equidistant from Erie and Pittsburgh, Pa., and Cleveland. O., the city is well located commercially. For comparative population figures *see* table in Pennsylvania: *Population.* (C. C. G)

SHARP, CECIL JAMES (1859–1924), British musician and writer, was born in London, Nov. 22, 1859. He was educated at Uppingham and at Clare college, Cambridge. and in 1853 went to South Australia where he founded a school of music at Adelaide. He was principal at the Hampstead Conservatoire, London, 1896–1905, and director of the English Folk-Dance society which he founded in 1911. His work in collecting and arranging English folk songs and dances and lecturing revived interest in English national music. During a visit to America he discovered in the Appalachian mountains survivals of old national melodies. He died in London, June 23, 1924.

Sharp's works include: *A Book of British Song* (1902): with C. L. Marson, *Folk Songs From Somerset,* series 1–5 (1904–19); *Folk Songs for Use in Schools,* sets 1–10; *English Folk Songs From the Southern Appalachians* (1917); *American English Folk Songs,* etc.; *English Folk Songs,* 2 vol. (1921) ; with A. P. Oppé, *The Dance, an Historical Survey of Dancing in Europe* (1924).

See W. A. S. Shaw, *Cecil Sharp, an Appreciation* (1925).

SHARP, GRANVILLE (1735–1813), English philanthropist, was born at Durham, the son of Thomas Sharp (1693–1758), a theological writer and the biographer of John Sharp, archbishop" of York.

Granville was apprenticed to a London draper, but in 1758 he entered the government ordnance department. A diligent student of Greek and Hebrew, he published several treatises on biblical criticism, one of which, *Remarks on the Uses of the Definitive Article in the Greek Text of the New Testantent,* gave rise to a controversy on account of the proposition, known as "Granville Sharp's canon," which it contained. His fame rests, however, on his untiring efforts for the abolition of slavery. In 1767 he became involved in a lawsuit with a slave owner in which it was finally laid down that a slave becomes free the moment he sets foot on English territory.

Sharp advocated the cause of the American colonies, supported parliamentary reform at home and the legislative independence of Ireland, and agitated against press gangs. In 1787 he founded a society for the abolition of slavery, and he was a joint founder of the British and Foreign Bible society and of the Society for the Conversion of Jews.

Sharp died on July 6, 1813, and a memorial to him was erected in Westminster abbey.

Bibliography.—Prince Hoare, *Memoirs of Granville Sharp* (1820), which contains observations by Bishop Burgess on Sharp's biblical criticisms; Sir James Stephen, *Essays in Ecclesiastical Biography* (1860) ; Thomas Clarkson, *History of the Rise, Progress and Accomplishment of the Abolition of the African Slave Trade by the British Parliament* (1839).

SHARP, JAMES (1613–1679), Scottish archbishop, the son of William Sharp, sheriff clerk of Banffshire, was born in Banff castle on May 4, 1613. In 1633 he went to King's college, Aberdeen, where he graduated in 1637. On the outbreak of the Covenanting War he visited Oxford, and perhaps Cambridge, becoming acquainted with the principal English divines. On his return he was chosen (1643) one of the "regents" of philosophy in St. Leonard's college, St. Andrews, and in 1648 was appointed minister of Crail in Fifeshire. In the great schism of Resolutioners and Protestors he took active part with the Resolutioners, and in March 1651 was taken prisoner by Cromwell, but subsequently liberated on parole. In 1657 he went to London to counteract the influence with the Protector of Archibald Johnston, Lord Warriston. He was again sent to London in Feb. 1660 to watch over the interests of the Resolutioners at the time of Monk's march to London. He was favourably received by Monk, who sent him to the king at Breda. He certainly regarded himself equally as the emissary of the Scottish kirk; he was also the bearer of a secret letter from Lauderdale to the king. There can be little doubt that he was finally corrupted by Charles and Clarendon, and decided that the interests of the kirk should not imperil his own chances. He returned to Scotland in May 1660 and. while successfully stopping all petitions from Scottish ministers to the king, parliament or council, was at pains to allay the suspicions of his loyalty to the kirk which had been aroused by his attitude in London. A letter of his to Middleton the high commissioner shows that he was in communication with Clarendon and the English bishops; that he was co-operating in the restoration of episcopacy in Scotland; that he was aware that Middleton, with whom he had held conferences, had all along intended it; and that he drew up the quibbling proclamation whose sole purpose was "the disposing of minds to acquiesce in the king's pleasure." The mask at length dropped in August when episcopacy was restored and Sharp was rewarded with the archbishopric of St. Andrews. On April 20, 1661, Sharp preached his first sermon at St. Andrews.

Sharp had kept on good terms with Lauderdale and avoided acting against him on the occasion of the billeting plot concocted in Sept. 1662 by Middleton. When Lauderdale's supremacy was established he co-operated in passing the National Synod act in 1663, the first step in the intended subjection of the church to the crown. In 1664 he obtained the grant of a new church commission. Sharp now placed himself in opposition to the influence of Lauderdale, in alliance with Rothes, Hamilton, Dalyell and others, but in 1665 he suffered a complete humiliation at the hands of Lauderdale. The result of their system of violence and extortion was the rising of the Covenanters, during which Sharp showed, according to Bellenden, the utmost fear, only equaled by his cruelty to the prisoners after the rout of Pentland. When the convention of estates met in Jan. 1667 Hamilton was substituted for him as president, and he now wrote groveling letters to Lauderdale, who extended him a careless reconciliation.

For a time he helped to restrain his brethren from complaining to London of Lauderdale's conciliation policy. In the debates on the Supremacy act, by which Lauderdale destroyed the autonomy of the church, Sharp's reluctance gave way upon the first pressure, but he actively opposed Leighton's endeavour, as archbishop of Glasgow, to carry out a comprehensive scheme. From this time he was completely subservient to Lauderdale, who had now finally determined upon a career of oppression, and in 1674 he was again in London to support this policy. In this year James Mitchell, who had shot at him six years before, was arrested, and Sharp obtained from him privately a full confession by a promise of pardon which he afterward repudiated. It was, however, confirmed by the entry of the act in the records of the court. Mitchell was finally condemned and Sharp refused to support the appeal for a reprieve. On May 3, 1679, while driving with his daughter Isabel to St. Andrews, he was set upon by nine men and murdered in revenge. The place of the murder, on Magus Muir, is marked by a monument.

SHARP, WILLIAM (1749–1824), English line engraver, was born at London on Jan. 29, 1749. He was originally apprenticed to what is called a bright engraver and practised as a writing engraver, but gradually became inspired by the higher branches of the engraver's art.

In his youth, owing to his hotly expressed adherence to the politics of Paine and Horne Tooke, he was examined by the privy council on a charge of treason. Mesmer and Brothers found in Sharp a staunch believer, and for long he maintained Joanna Southcott at his own expense.

As an engraver Sharp achieved a reputation throughout Europe and enjoyed many foreign honours as well. Among his earlier plates are some illustrations, after Stothard, for the *Novelists' Magazine.*

He also engraved the "Doctors Disputing on the Immaculateness of the Virgin" and the "Ecce Homo" of Guido Reni, the "St. Cecilia" of Domenichino, the "Virgin and Child" of Dolci and the portrait of John Hunter of Sir Joshua Reynolds.

Sharp died at Chiswick on July 25, 1824.

SHARP, WILLIAM (1856–1905), Scottish poet and man of letters, was born at Paisley on Sept. 12, 1856. During his lifetime he was known solely for poetical and critical works of great but not outstanding merit, while from 1894 onward he published, with elaborate precautions of secrecy, under the name of "Fiona Macleod," stories and sketches in poetical prose which made him perhaps the most conspicuous Scottish writer of the modern Gaelic renaissance. His early life was spent chiefly in the west Highlands of Scotland, and after leaving Glasgow university he went to Australia in 1877 in search of health. After a cruise in the Pacific he settled for some time in London as clerk to a bank, became an intimate of the Rossettis and began to contribute to the *Pall Mall Gazette* and other journals. He spent much time abroad, in France and Italy, and traveled extensively in America and Africa. In 1885 he married his cousin, Elizabeth Amelia Sharp, who collaborated with him in compiling the *Lyra Celtica* (1896). His volumes of verse were *The Human Inheritance* (1882), *Earth's Voices* (1884), *Romantic Ballads and Poems of Fantasy* (1886), *Sospiri di Roma* (1891), *Flower o' the Vine* (1894), *Sospiri d' Italia* (1906). William Sharp was the general editor of the "Canterbury Poets" series. He was a discriminating anthologist, and his *Sonnets of the Century* (1886), to which he prefixed a useful treatise on the sonnet, ran through many editions. This was followed by *American Sonnets* (1889).

Sharp wrote biographies of Dante Gabriel Rossetti (1882), Shelley (1887), Heinrich Heine (1888) and Robert Browning (1890) and edited the memoirs of Joseph Severn (1892). During the later years of his life he was obliged for reasons of health to spend all his winters abroad. The secret of his authorship of the "Fiona Macleod" books was faithfully kept until his death, which took place at the Castello di Manlace, Sicily, on Dec. 12, 1905. Publication of the tales and sketches of the primitive Celtic world began in 1894 with *Pharais: a Romance of the Isles.* They found only a limited public, though an enthusiastic one.

See a memoir by his wife (1910).

SHARP (IN MUSIC): *see* ACCIDENTALS.

SHARPEY-SCHÄFER, SIR EDWARD ALBERT (1850–1935), British physiologist and inventor of the prone-pressure method of artificial respiration (*q.v.*), was born at Hornsey, Middlesex, on June 2, 1850. He was educated at University college, London, where he met William Sharpey, the professor of general anatomy and physiology, and in 1918 he prefixed Sharpey's name to his own in order to perpetuate the name of his teacher. He became Jodrell professor at University college (1883), Fullerian professor at the Royal institution (1878–81) and professor of physiology at Edinburgh university (1899–1933). Sharpey-Schäfer made important contributions to the knowledge of cerebral localization, of the heart sounds and of muscular contraction. In 1894 (with George Oliver) he demonstrated the existence in the adrenal glands of a substance (adrenaline) which raised the blood pressure, and this stimulated research on the internal secretions (hormones) of the ductless glands. Sharpey-Schafer's method of artificial respiration was adopted by the Royal Life Saving society, and he received many honours, including the presidency of the British association (1912) and a knighthood (1913). He died at North Berwick, East Lothian, on March 29, 1935.

SHASI (SHA-SHIH), a commercial city and water transportation centre on the Yangtze in central Hupeh province, China. Pop. (1953) 85,800. Called "Little Hankow" after the most important commercial port of central China about 120 mi. eastward, Shasi is the centre for numerous canal connections, one of which shortens to a third the circuitous Yangtze river distance to the Wu-Han metropolitan area. Across the Yangtze and southward, the T'ai-p'ing and Ou-ch'ih canals lead to Tung-t'ing lake in Hunan. Between these two canals a flood-detention basin covering 350 sq.mi. was constructed in 1952–53. Because of its situation in the cotton-growing region of Hupeh, cotton and cotton seed, as well as other produce such as rape seed are exported through Shasi. The city also is a distribution point for upriver Szechwan salt. Cotton textile and flour mills west of the city form two of its most important industries. Shasi has no rail connections but a motor highway runs south from across the Yangtze around Tung-t'ing lake to Ch'ang-sha, and another highway runs north to Hsiang-yang on the Han river, crossing an east-west highway between Wu-Han and I-ch'ang.

Shasi was flourishing as early as the T'ang dynasty, and superseded in the 1870s contiguous Chiang-ling (formerly Ching-chou, which dates far earlier) as the local commercial centre. Shasi was one of the treaty ports opened in 1896, but the foreign trade only became significant after World War I. (H. J. Ws.)

SHASTA, an Indian group, of Hokan speech stock, lived on and south of Klamath river, east of Mt. Shasta. Culturally they stood intermediate between the northwestern tribes, such as the Yurok and Hupa (*qq.v.*) and the Maidu (*q.v.*) and other central Californians. Originally numbering an estimated 2,000 in 1770, they dwindled to a few dozen scattered households in the second half of the 20th century.

See John R. Swanton, *The Indian Tribes of North America,* Smithsonian Institution Bureau of American Ethnology Bulletin 145 (1953).

OLD ENGLISH AND AMERICAN SHAVING MUGS

1. Reading clockwise from the 12 o'clock position: three early American pottery mugs; English copper lustre mug; "The Utility Shaving Mug," containing spaces for razor, brush, hot water and shaving soap; silver dome covered mug; patented shaving mug (July 16, 1867), the first mug with a real soap compartment; patented shaving mug (Sept. 20, 1870) of the coal-scuttle type, in which the soap compartment was first given drain holes: head coal-scuttle mug; "The Requisite"; "The Champion"; "The Toilet." Centre, 18th century bishop's barber bowl

2. A different view of the same mugs shown in Fig. 1, except that the silver dome covered mug is omitted

SHAVER, ELECTRIC: *see* RAZOR.

SHAVING MUG. The shaving mug played an important part in man's effort to keep himself clean shaven during the period from 1830 to 1930. The parent of the shaving mug was the barber's shaving basin and shaving bowl, made of brass, silver, earthenmare or china, in use from the 15th to early 19th centuries. Each basin or bowl contained a half-moon indentation on the edge shaped to fit a customer's neck as he reclined in the barber's chair and held the bowl on his chest. The shaving mug, after sporadic appearances around 1800, came into its own in the United States in 1830 with early types in pottery ware, in Pennsylvania and New England. Originality was displayed in the fashioning of these pottery shaving mugs since a good number of them were furnished with soap compartments at front, side, or on the inside of. the mug near the handle, 30 years before the appearance of mugs with patented soap compartments.

The United States became the cradle of the shaving mug trade, (1) by reason of the many patented shaving mugs beginning with the year 1860; and (2) because of the trend toward individually decorated shaving mugs for barber shop use. The first patent for a shaving mug was granted on May 1, 1860, to Thomas E. Hughes of Birmingham, Pa., and during the 80-year period ending in 1940 —a good ten years beyond the popular taste for shaving mugs—a total of 94 United States patents mas granted for shaving mugs.

The vogue for the barber shop shaving mugs, decorated and named to suit each customer! was peculiar to the Gnited States. The following classifications cover the field of the individual shaving mug, decorated expressly for barber shop use, and placed in barber racks or pigeonholes for the daily customers:

1. *Glass covered label mug,* a white shaving mug to which was glued a thick lithographed label covered by a thin coating of glass for protection from moisture. Gold bands were added to top and bottom.
2. *Shaving mug with owner's name* in gilded lettering of Old English style, but occasionally in plain letrering and coloured blue or black.
3. *Shaving mug with floral, bird, or scenic design,* and with owner's name above or below design.
4. *The trades emblem* or occupational shaving mug, illustrating owner's trade, occupation, favourite sport, or secret society, together with his name or initials.
5. *Numeral shaving mug:* a shaving mug with nothing but a large gilded numeral for use in barber shops where the customer turnover was great.
6. *Photograph shaving mug:* a branch of trades emblem mug. Instead of a hand-painted scene of the owner's trade: the photograph mug carried a real photographic scene, developed on the surface of the mug and fired into glaze.

The quality of each shaving mug depended upon three things: the composition of mug (grade of china), the skill and care with which the artist decorated the mug, and the quality of gold used.

The individual barber shop shaving mug began to disappear during World War I when many soldiers learned to shave themselves. In addition, the Sunday curfew imposed on barber shop openings during and after 1905, coupled with the advent of the safety razor, made real inroads on the kept shaving mug. Brushless shaving creams appeared along with electric razors. The price of a shave rose high above the old 10 and 15 cent charge of 1900. In short, it became impractical to be shaved daily by the same barber. Finally, in the year 1930, the curtain fell and and the individual shaving mug became a custom of the past.

(W. P. W.; X.)

SHAW, ANNA HOWARD (1847–1919), English-born U.S. reformer, was born at Newcastle upon Tyne on Feb. 14, 1847. When she was a small child, her parents moved to the United States. From 1872 to 1875 she studied at Albion college, Albion, Mich., and in 1878 graduated from the theological school of Boston university. The district conference of the Methodist Episcopal Church granted her a local preacher's licence, but the New England conference of the M.E. Church refused to ordain her because of her sex, and the refusal was upheld by the general conference at Cincinnati in 1880. The same year she was ordained in the Methodist Protestant Church. While preaching she had studied medicine and received the degree of M.D. from Boston university in 1885.

She was associated after 1886 with the National American Woman Suffrage association in various capacities, from 1904–15 as president. In 1917 she was chairman of the woman's committee of the Council of National Defense. She died at Moylan, Pa.. on July 2, 1919.

SHAW, GEORGE BERNARD (1856–1950), Irish critic, pamphleteer and playwright, was born in Dublin, July 26, 1856. He claims descent from Macduff, Thane of Fife, and from Oliver Cromwell. His father, George Carr Shaw, son of Bernard Shaw, sometime sheriff of Kilkenny county, mas married to Lucinda Elizabeth Gurley, daughter of Walter Bagenal Gurley, landed proprietor of County Carlow. The Shaws were of the Irish gentry, "revolving impecuniously in a sort of vague second cousinship round a baronetcy."

Bernard grew up wild, his father being preoccupied with a declining business, his mother devoted to musical interests. After his civil service post in the Dublin courts of justice was abolished in 1850, Shaw's father received a small pension uhich he sold to become a member of the Dublin Corn exchange as a wholesale merchant. Tutored in the classics by his uncle, the Rev. William George Carroll, vicar of St. Bride's, Dublin, at the age of ten Shaw entered the Wesleyan Connexional school, and after a brief meteoric flight to the top, quickly declined and remained "generally at or near the bottom of his classes." In three other schools which he subsequently attended, he found he could learn nothing in which he was not interested, and consequently "took refuge in idleness." Algebra obfuscated him, the classics left him cold, but he excelled in English composition, for ahich no prizes were given; and he often regaled his classmates with stories from the *Iliad* and *Odyssey,* narrated with a Shavian slant. The vital interests of this pert, voluble and athletically tireless boy were literature, music and the graphic arts.

A distinguished teacher of music, George John Vandaleur Lee, made his home with the Shaws; and Mrs Shaw, who had a pure mezzo-soprano voice, aided him in all his numerous musical activities. Bernard received from his mother lessons in voice culture, nhich later on stood in good stead the spellbinder of countless platforms. As a lad he sang incessantly to himself, and affirmed that before he was 15 "he knew at least one important work by Handel, Mozart, Beethoven, Mendelssohn, Rossini, Bellini, Donizetti, Verdi and Gounod from cover to cover." He scribbled incessantly with coloured crayons and even went through the prescribed subjects of the School of Design, only to discover that he had no talent for art. In solitary state he haunted the halls of the National Gallery of Ireland. and devoured the Bohn translations of Vasari and Duchesne's outlines of the old masters. He was an unusually matured, self-educated lad at 15, thanks to the all-pervasive influence of music, communism in art, and the free sky-gallery of Dalkey Hill, where the Shaws had a summer home

In 1871 an uncle secured for him the post of office boy to a Dublin estate agent. Charles Uniacke Townshend, at a monthly salary of $4.50; and sometime later he was temporarily tried out as cashier. He made good against his will, and held this position for four years, finally receiving $450 annually. During this period Shaw submitted to magazines and newspapers numerous literary contributions which were invariably rejected; and he and Edward McNulty, who later achieved some note as a novelist, carried on an extended correspondence full of imaginative outpourings. One only of Shaw's early compositions, a caustic comment on the vastly popular Moody and Sankey revival meetings, appeared in print (Public Opinion, April 3, 1875) to the scandal of all his relatives.

In 1872 Lee went to London to become a fashionable teacher of music: and soon thereafter Mrs. Shaw, accompanied by her two daughters, Lucinda Frances who became a professional singer, and Elinor Agnes aho died in 1876, went to London to become a professional teacher of music. In 1876 Bernard suddenly resigned his cashier's position to throw in his lot with his mother and sister. irresistibly impelled by two desires: to find his *métier* and, in violation of traditional filial duty, never again to do another "honest day's work." His subsequent history validated his decision to disregard "all the quack duties which lead the peasant lad of fiction to the White House."

During the next nine years, except for a brief interlude of employment by the Edison Telephone company in London, Shaw remained an incorrigible unemployable, being supported by his parents. The possession of a suit of evening clothes and facility in pianoforte accompaniment gave him the *entrée* to certain artistic and musical circles of London society. Over a period of nine years (1876–85) he earned by his pen over his own signature an average of only a cent a day; aside from ghost-writing music criticism for Lee on *The Hornet*, he sold an article, "Christian Names," to *One and All*, edited by George R. Sims, for 15*s*., a verse for a school prize book for 5*s*., and a patent medicine advertisement for £j. Only confidence in his own powers and belief that he belonged in the company of the immortals enabled him to rise above one of the most devastating initial failures in literary history.

From 1879 to 1883 he doggedly persisted in the attempt to write fiction, at the daily rate of five foolscap pages. Of his five novels, the first, fitly entitled *Immaturity*, remained unpublished; the other four, although refused by all the publishers of London, eventually padded out propagandist magazines edited by Shaw's radical friends and associates. *An Unsocial Socialist*, an instalment of a huge projected work to cover the entire social movement, appeared in a Socialist magazine, *To-Day* (1884) edited by Henry Hyde Champion, as did also a glorified juvenile with a pugilist hero, *Cashel Byron's Profession* (1885–86), which delighted William Archer and William E. Henley, and which convulsed Robert Louis Stevenson with its hilarious nonsense. It was published in a dramatized form. *The Admirable Bashville; or Constancy Unrewarded* in 1901. *The Irrational Knot*, which for its modernist treatment of marriage, Shaw pronounced a fictive forerunner of Ibsen's *A Doll's House*, appeared in *Our Corner* (1885–87), edited by Annie Besant, orator and radical leader; and it was followed in the same magazine (1887–88) by *Love Among the Artists*, based in part upon the life of Beethoven. The novels failed because of their immature criticism of Victorian respectability and morality. These novels are packed with dramatic situations; and in working off the "greensickness" of fiction, Shaw was unwittingly serving his apprenticeship to the profession of playwriting.

On joining in 1879 the Zetetical society, a discussion club, where he formed an historic and fruitful association with Sydney Webb, Shaw was launched upon one of the most extraordinary of careers as expository orator and spellbinder. By grim persistency he succeeded in transforming himself from a timid novice into a master of the platform. Over a period of 12 years (1883–95) he spoke, without compensation, three times weekly in harangues ranging from brief street corner talks to loitering listeners and watchful policemen and public debates in crowded halls to formal papers before the British association and four-hour addresses to great throngs in the open air.

On Sept. 2, 1882, at the Memorial Hall in Farringdon street, London, occurred Shaw's historic conversion to Socialism by Henry George, whose *Progress and Poverty* was then having an immense vogue in England. After hearing Henry George, Shaw confessed: "The importance of the economic basis of society dawned upon me." He studied Karl Marx's *Das Kapital*, attended a Marxist reading circle, and on Sept. 5, 1884, eight months after its founding, joined the Fabian society, a revolting sect from the Fellowship of the New Life, founded by the Utopian philosopher, Thomas Davidson.

From the outset of his career as a Fabian, Shaw became closely associated with many social reformers, notably Sydney Webb, Beatrice Potter, Hubert Bland, Graham Wallas, James Leigh Joynes, Sydney (later Lord) Olivier, Rev. Stewart D. Headlam, Henry S. Salt, William Morris, Annie Besant, Edward Carpenter, Walter Crane, Henry H. Sparling, Henry M. Hyndman, J. Ramsay MacDonald and Eleanor Marx. In the Fabian society, a sort of people's university, Shaw performed herculean labours in committee work, drafting tracts, editing books, and delivering notable addresses habitually boycotted by the press. The appearance of *Fabian Essays* (1887), edited by Shaw, was an event of the first importance in the history of contemporary Socialism: and the studies of the economic bases of society embodied in many of the society's publications exercised marked influence upon modern social and political movements. After serving 27 years, along with Webb, Bland, Wallas and Olivier, on the executive committee, Shaw resigned in 1911. After joining the Fabian society, he carried on with rare dialectical skill innumerable discussions in the press on many of the leading issues of the day along all lines. He achieved international notoriety as a pamphleteer with his *Common Sense about the War* (*The New Statesman*, supplement, Nov. 14, 1914), a drastic criticism of the British government, which sold 75,000 copies, cost him some friendships, and provoked an abortive attempt at ostracism. In the U.S.S.R., which he visited in 1931, he discerned the triumph of Fabian, rather than of Marxian, policy and the realization in practical operation of Webb's doctrine of "the inevitability of gradualness." Shaw's *The Intelligent Woman's Guide to Capitalism and Socialism* (1928), in which he expounds Edward Bellamy's doctrine of equality of income, was the most lucid *vade mecum* to socialist theory and practice so far penned. In 1897, Shaw became a member of the vestry of the Parish of St. Pancras, and three years later a member of the borough council, serving until Oct. 31, 1903. During this period he laboured unremittingly on vestry and borough council and also through communications to the press for the betterment of the poorer classes and tlia municipalization of industry. As a Progressive candidate for a seat on the London County council in 1903, Shaw was overwhelmingly defeated because of his irrepressible outspokenness. His small work, *The Common Sense of Municipal Trading* (1904) is an effective Socialist plea in behalf of the municipalization of enterprise. Ironically enough, one of the duties of this inveterate vegetarian, in serving on the Health committee, was the holding of inquests on tuberculous cattle, to guarantee the condition of meat in his parish.

Over a period of 13 years (1885–98), Shaw wrote for many newspapers and magazines as critic of art, literature, music and drama. After serving on *The World*, the *Scots Observer*, the *Daily Chronicle* and the *Pall Mall Gazette* he became in 1888 music critic on *The Star*, with the pseudonym, "Corno di Bassetto," a musical instrument which went out of use in Mozart's time. He wrote music criticism for *The World* (1890–94), winning wide appreciation for relating music to the life of the average man and woman. In 1895 he entered upon his most exciting era of critical propaganda, on *The Saturday Review*, edited by Frank Harris; and published his valedictory on May 21, 1898. He conducted a one-man crusade on behalf of Ibsen and the new drama, shocked all England by his extravagant depreciation of Shakespeare, and refused to accept Pinero as an English Ibsen. In a memorable correspondence with Ellen Terry, published in 1931, he sought unsuccessfully, as knight errant of modernism, to rescue the imprisoned damsel, Ellen Terry, from the dungeon of the demoded Lyceum, guarded by her jailer, Henry Irving. By his clever and propagandist drama criticisms (*Dramatic Opinions and Essays*, N.Y., 1907), Shaw won incontestable eminence as the most effective British *feuilletonist* of his day. Basic precipitations from these critical researches are *The Quintessence of Ibsenism* (1891, 1913), *The Sanity of Art* (1895, 1908), and *The Perfect Wagnerite* (1898). In 1898, after recovering from a nervous breakdown, Shaw was married to Charlotte Payne-Townshend, an Irish heiress. She died in 1943.

Shaw's career as a dramatist covers a period (1885–1939) of more than Shakespeare's entire life span. In 1885, William Archer suggested collaboration with Shaw on a play, as he was conversant with construction and Shaw was adept at dialogue. Archer outlined the plot, and Shaw soon reported that he had used up all the plot in one act and needed more to go on with. The project fell through; but seven years later, at the request of J. T. Grein, director of the Independent theatre, Shaw transformed Archer's "twaddling cup-and-saucer comedy" into a dramatic tract on slum landlordism. The play, *Widowers' Houses,* achieved a *succès de scandale* at the Royalty theatre, London, Dec. 9, 1892, with hostile repercussions in the press. *The Philanderer* (1893), a play on Ibsenism and the "new woman." proved unsuited to the resources of the Independent theatre; and *Mrs. Warren's Profession* (1893), a daring *exposé* of the "economic basis of modern commercial prostitution," was automatically barred from production by the existence of the British censorship. These Shaw-called "unpleasant" plays were succeeded by "pleasant" plays *(Plays, Pleasant and Unpleasant,* 2 vols., 1898); and Shaw's most internationally popular success, *Arms and the Man,* a satire on the military profession produced at the Avenue theatre, London, April 21, 1894, marks the true beginning of Shaw's recognition as a popular dramatist. Richard Mansfield's American productions of *Arms and the Man* (1894) and *The Devil's Disciple* (1897) enhanced Shaw's reputation as a popular entertainer and rendered him financially independent. Successful productions in Germany, Austria, Hungary and Russia of *Arms and the Man, The Devil's Disciple, The Man of Destiny* and *Candida,* in which plays Agnes Sorma, Lili Petri and Otto Sommerstorff played leading roles, gave Shaw continental vogue; and as early as 1904 he was, somewhat extravagantly, hailed in the Berlin press as "a king of the German stage." Arnold Daly's production of *Candida,* Princess theatre, New York, Dec. 8, 1903, produced a sensational effect; and Robert Loraine's admirable production of *Man and Superman,* Hudson theatre, New York, Sept. 5, 1905, achieved Shaw's conquest of the American theatre-going public, The (Vedrenne-Barker) productions at the Royal Court theatre, London (1904–07), of the New York Theatre guild, of the Malvern Festival, and of the Birmingham Repertory theatre were among the highest manifestations of contemporary dramatic art. By 1915 Shaw's international fame was firmly established and he was being played in many countries of the world, from Britain to Japan. He was awarded the 1925 Nobel Prize for Literature. He gave the prize, £7,000, to establish the Anglo-Swedish alliance for spreading a knowledge of Swedish literature in English-speaking countries.

During the period of his active dramatic composition (1893–1939) Shaw wrote 47 plays, an average of a play a year. Despite offers, he allowed the filming of only a few of his plays, the most notable being *Pygmalion.* He was the first economist in history to win world fame as a dramatist; and he informed his biographer: "In all my plays my economic studies have played as important a part as a knowledge of anatomy does in the works of Michelangelo." His characters are less individualized human beings than types, intellectual abstractions bearing the *vraisemblance* of reality. Many of the plays are not dramas in the classic sense, but moralities, presenting the clashing ideas and conflicting ideologies of the epoch.

Shaw took Shakespeare to task for having no message for his age. Every Shaw play is a message to the times, a testament of faith: *Candida* on love as pity, *Man and Superman* on eugenics and race betterment, *Major Barbara* on poverty, *Androcles and the Lion* on the nature of religious faith., *The 'Doctor's Dilemma* on the parlous state of the medical profession, *John Bull's Other Island* on the political contrasts of England and Ireland, *Saint Joan* on heroism and saintliness, *Heartbreak House* on World War I, *Caesar and Cleopatra* on genius and greatness. Following a practice common in English literature after Dryden, Shaw's plays carry carefully written prefaces, in excellent journalistic style; and often these prefaces, rather than the plays they precede, convey his immediate message. Shaw was primarily interested, not in events, but in people's reactions thereto; and many of his plays are dramas of conversion. the death of old, the birth of new, faiths. He derided plots as "clockwork mice," and insisted that he wrote plays without prematured design.

Shaw created a novel type of debated drama. He took his cue from the last act of Ibsen's *A Doll's House,* but spread discussion and controversy throughout the entire play, and disarmed the critics by calling his plays conversations, arguments and debates. Some of his plays resemble light operas of Mozartian *timbre,* notably *The Man of Destiny, Arms and the Man, The Devil's Disciple* and *Captain Brassbound's Conversion;* and after one of them, *Arms and the Man,* was drawn a widely popular musical comedy, *The Chocolate Soldier,* with libretto by Oscar Straus. Other Shaw plays, ostensibly period pieces and chronicle plays, are actually historical extravaganzas: *Caesar and Cleopatra, The Apple Cart, The Six of Calais* and *Geneva.*

It was not until he had appreciably exceeded Shakespeare's life span that Shaw began to create plays acclaimed great. *Pygmalion, Candida, Arms and the Man, The Doctor's Dilemma, You Never Can Tell* and *Man and Superman* were sure-fire popular successes, and *Fanny's First Play* ran continuously for more than 400 performances; but *Heartbreak House, Back to Methuselah, Androcles and the Lion* and *Saint Joan,* written between the ages of 57 and 67, deserve to rank as his greatest dramatic works. *Saint Joan,* exhibiting the Maid as the incarnation of the Protestant soul in tragic conflict with the mightiest forces of institutionalism in church and state, is one of the most uplifting dramas in English since Shakespeare. After *Saint Joan,* Barrie called Shaw "our only angel." *In Good King Charles's Golden Days,* published at the age of 83, is a *tour de force.* In persistence of creativity in art to an advanced age, Shaw belongs in the mighty company of Sophocles, Michelangelo, Voltaire, Goethe and Victor Hugo.

Shaw first appeared as a philosopher in *Man and Superman* (1901), a Shavian distillation of Bergson's *Creative Evolution;* but it was not until two decades later that his basic philosophy was fully expounded in *Back to Methuselah* (1921). Shaw's conversion, which was induced by a study of Samuel Butler, resulted in the discarding of Darwin's theory of Natural Selection in favour of Lamarck's doctrine of Functional Adaptation. Shaw identified God with what he called the Life Force *(élan vital)*; he saw the universe as God in the act of evolving Himself. Life will evolve, he believed, through all the stages from amoeba, through man, to God. In *Back to Methuselah,* Shaw opened up the prospect of man's ultimate redemption from the bondage of the flesh. Man, as expression of God, must will his own destiny. The philosophic man Shaw defined as "he who seeks in contemplation to discover the inner will of the world, in invention to discover the means of fulfilling that will, and in action to do that will by the so-discovered means " Shaw died at Ayot St. Lawrence, Eng , on Nov. 2, 1950.

SHAW, HENRY WHEELER: *see* BILLINGS, JOSH.

SHAW, LEMUEL (1781–1861), chief justice of the supreme judicial court of Massachusetts, from 1830 to 1860, who left an indelible mark on the law of the commonwealth and significantly contributed to the structure of American law. Born on Jan. 9, 1781 at Barnstable, Mass., he was educated at Harvard, studied law with David Everett, and was admitted to the bar in 1804. While a practitioner and Federalist officeholder in Boston he had extensive experience with public affairs, and was counselor to many ascendant industrial interests.

Respectful of the legislative will when statutes made it clear, Shaw did not hesitate to mold the common law to meet the needs of a changing society. He made the fellow-servant rule a principle of American law (*Farwell* v. *Railroad,* 4 Metcalf), he freed unions from the abusive application of the law of conspiracy *(Commonwealth* v. *Hunt,* 4 Metcalf) and he denied that racial segregation in public schools created unconstitutional inequalities *(Roberts* v. *Boston,* 5, Cushing). He died on March 30, 1861.

See F. H. Chase, *Lemuel Shaw* . . . (1918); L. W. Levy, *The Law of the Commonwealth and Chief Justice Shaw* (1957). (M. DeW. H.)

SHAW, SIR (WILLIAM) NAPIER (1854–1945), English meteorologist, whose scientific contributions bridge the transition from the 19th-century era to the rejuvenated state of meteorology resulting from the ideas of the Norwegian school (1919) and from the direct analysis of the upper air. Born March 4, 1854, at Birmingham, he began his career teaching physics at Cambridge, where he had been a student, a task he performed with distinction for more than 20 years. Elected a fellow of the Royal society in 1891, he was called from Cambridge in 1900 to become secretary of the Meteorological council, which was the governing body of the Meteorological office. His influence led to the reorganization, with noteworthy improvements, of the Meteorological office. In 1905 he became director of the office, serving until his retirement in 1920. He then was named the first professor of meteorology at the Royal College of Science of the Imperial College of Science and Technology, retiring in 1924. Subsequently he devoted his attention to international meteorological affairs and to completing his four-volume *Manual of Meteorology* (1926–31). He died in London, March 23, 1945. (H. R. B.)

SHAW, RICHARD NORMAN (1831–1912), British architect who specialized in domestic buildings, was born in Edinburgh, Scot., on May 7, 1831. After an apprenticeship to William Burn, he attended the architectural schools of the Royal Academy and later entered the office of G. E. Street. In 1863 Shaw began to practise. He broke away from the academic tradition in which he was trained to adopt the characteristic style which entirely changed English domestic archirecture. His style was vulgarized by the imitations of the speculative builder, but the houses he himself designed were admirable in proportion and in their adaptation to their purpose. As his powers developed, his buildings gained in dignity and had an air of serenity and a quiet homely charm which were less conspicuous in his earlier works; the "half timber" was more sparingly used and finally disappeared entirely.

Characteristic examples of Shaw's work are Preen manor. Shropshire; Pierrepont, Wispers, and Merrist wood, in Surrey; Lowther lodge. Kensington; Adcote, in Shropshire, one of his finest country houses; his houses at Kensington, Chelsea and at Hampstead; Flete house, Devonshire; Greenham lodge, Berkshire; Dawpool, in Cheshire; Bryanston, in Dorset; New Scotland Yard. London, considered his outstanding work; several fine works in Liverpool and nearby. He died at Hampstead, Nov. 17, 1912.

SHAWINIGAN, previously called Shawinigan Falls, is an industrial city in St. Maurice county, Quebec, Can., on the right bank of the St. Maurice river, 20 mi. above Three Rivers. Pop. (1956) 28,597. The falls near the city drop 165 ft. and 416.000 h.p. have been developed in two plants, supplying power both locally and to Montreal and Quebec. In 1901 an aluminum smelter and a pulp and paper mill were installed in the village of Shawinigan Falls, forming the basis for its considerable industrial expansion. Other industries produce chemicals, abrasives and textiles. The city is divided into two residential areas by the industrial belt and railway lines of Canadian Pacific and Canadian National railways. In 1951, 94% of the population was French-Canadian and 96% Roman Catholic. Shawinigan South, on the left bank of the St. Maurice river, had 10,947 persons in 1956. Shawinigan was incorporated as a village in 1901, a town in 1920 and a city in 1921. The name is the Algonkin word for "crest," used as a place name because the portage beside the falls of the river led over a crest of rocks. (M. C. Ba.)

SHAWL, a term applied to a square, oblong or triangular article of dress worn as a protective or ornamental covering over the shoulders, neck or head. It is found as clothing in most parts of the world. The word is of oriental origin deriving from the Persian *shal*. Records seem to indicate Bukhara as the birthplace of the shawl-weaving industry. Shawls have been worn since the earliest times but the 19th century is known as the "shawl period" because then the shawl reached such a height of popularity that it became a necessity in the wardrobe of every woman in western Europe and America.

The first of the handsome oriental shawls appeared in Europe after the Egyptian campaign in 1798. The most beautiful import was the Cashmere shawl produced in the valley of Kashmir in India. There the Tibetan goat produced a long fine fleece called pashm, which was softer than any wool known. The wool was woven into shawls by expert weavers trained for generations to a sensitive feeling for design and glowing colour. There are two types of Cashmere shawls, the woven shawl and those embroidered in imitation of weaving. In shape they were both square and oblong. The characteristic design was always the "cone" pattern inspired by the jeweled ornament in the turban of the Mogul emperors.

The Paisley shawl, machine produced in Scotland to meet the demand for the Cashmere, was an adaptation rather than an imitation of the oriental shawl. Scarves) boas, mufflers, stoles and smaller shawls are forms of the shawl popular as articles of dress in the 20th century.

(M. B. K.)

SHAWM (Shalm), the medieval forerunner of the wooden double-reed wind instrument now called the oboe (*q.v.*).

SHAWN, TED (Edwin M.) (1891–), U.S. dancer, choreographer, and dance educator who significantly increased the stature of the American dance and the respect accorded to it, especially to dancing as a career for men. Born in Kansas City, Mo., Oct. 21, 1891, he was originally destined for the ministry, but turned his attention to the dance after a serious illness interrupted his studies. He was just beginning his career when in 1914 he met and married Ruth St. Denis (*q.v.*), with whom he founded the Denishawn school, where every dance technique was taught, and the Denishawn company which toured extensively in the United States and visited the orient in 1925–26.

From 1933 to 1940, after his separation from St. Denis, Shawn devoted himself to building a group of men dancers that presented such impressively masculine works as *Labor Symphony, Olympiad* and *Kinetic Molpai.* He next developed the Jacob's Pillow Dance festival (Lee, Mass.), which was modestly inaugurated in 1933; under Shawn's leadership it became a dance centre of international importance, with its own school and theatre. Shawn also wrote and lectured extensively.

See Katherine S. Dreier, *Shawn, the Dancer* (1933), and the chapter on Shawn in Walter Terry, *The Dance in America* (1956). (Ln. Me.)

SHAWNEE, an Algonkian-speaking Indian tribe that lived in the central Ohio valley until the 17th century, when they were driven out by the Iroquois and scattered into widely separated areas. Some settled in what is now Illinois and others in the Cumberland valley, while one group moved to the southeast, giving its name to the Savannah river. After 1725 the tribe united again in the region of Ohio, nhere they formed the principal barrier to the advance of American settlers. Following the American victory at the battle of the Fallen Timbers and the failure of Tecumseh's attempt to unite the Indians of the Ohio valley, they moved westward, breaking up into three independent branches, the Absentee, Eastern and Cherokee Shawnee, which eventually settled in different parts of Oklahoma.

Closely related in language and culture to the Sauk, Fox and Kickapoo, the Shawnee were also influenced by their long association with the Delaware and Seneca, and combined eastern woodland and prairie traits. During the summer they lived in bark-covered houses grouped into large villages, where women raised corn while men hunted; in winter, small family groups realigned themselves into hunting camps. Each village had a large council house that was also used for religious ceremonies such as the ritual purification of warriors. Other important ceremonies included the spring Bread dance held when the fields were planted; the Green Corn dance marking the ripening of crops; and the autumn Bread dance. The social organization included patrilineal clans and an "Omaha type" kinship system, based on the lineage principle (*see* Kinship Terminology). Early Shawnee population was estimated at 2,000 to 3.000; in 1960 the three main settlements in Oklahoma numbered about 2,250.

See C. C. Trowbridge, "Shawnese Traditions" ed. by V. Kinietz and E. W. Voegelin, *Occasional Contributions From the Museum of Anthropology of the University of Michigan,* no. 9 (1939). (CH. C.)

SHAWNEE, a prairie city of central Oklahoma. U.S., on the North Canadian river. 38 mi. E.S.E. of Oklahoma City; the county seat of Pottawatomie county. It was named for the Shawnee Indians who came west after the defeat of Tecumseh in 1812, joined the Potawatomi and in 1867 were brought into the Indian Territory. In 1891 their land was opened to white settlement. The city. originally known as Shawnee Town because it was a trading place for Indians, was incorporated in 1894 as Shawnee. Farming, stock raising, oil and diversified industries are the bases of its economy. Educational facilities include St. Gregory's college, a Roman Catholic junior college for men established in 1915 and noted for its museum and library, and Oklahoma Baptist university, a four-year coeducational institution established in 1911. Places of historical interest include the Quaker Mission church, established in 1872, and the Shawnee Indian sanatorium.

For comparative population figures see table in OKLAHOMA: Population. (AN. L.)

SHAPS, DANIEL (1747–1825), U.S. soldier, the leader of Shays's rebellion, 1786–87 (see MASSACHUSETTS : History). Most accounts state that he was born in Hopkinton, Mass., in 1747. In the Revolutionary War he served as second lieutenant in a Massachusetts regiment from May to Dec. 1775, and became captain in the 5th Massachusetts regiment in Jan. 1777. He took part in the battle of Bunker Hill, and in the expedition against Ticonderoga, participated in the storming of Stony Point and fought at Saratoga. In 1780 he resigned from the army. During the depression that followed soon after the end of the war, Shays was a prominent leader of a group of insurgent debtors who in 1786–87 resisted state authorities in what came to be known to history as Shays's rebellion. After defeat of the insurgents, Shays escaped to Vermont and in June 1788 received a pardon. He spent the remaining years of his life in western New York and died at Sparta, N.Y., on Sept. 29, 1825.

SHCHERBATSKY, FEDOR IPPOLITOVICH (1866–1942), Russian philologist, whose works on Buddhist logic and philosophy became known as authoritative and valuable, was born in St. Petersburg on Oct. 1 (new style; Sept. 19. old style), 1866, of a family of old nobility. He was educated at Tsarskoye Selo and studied philology at St. Petersburg, Vienna and Bonn. In 1904 he became professor of Indian literature at St. Petersburg. He spent a few years in Mongolia and India and selected for special study Buddhist logic and metaphysics. He was greatly influenced by Dharmakirti's logical work, cf which he published a translation with a detailed commentary. His chief works are Logic *in* Ancient India (1902); Buddhist *Philosopher* on *Monotheism* (1904); Theory of Knowledge and Logic according to the Later Buddhists (part i, Text Book of Logic by Dharmakirti; part ii, Study *of* Perception and *Deduction* [1909]); *Study* of *the* Categorical *Imperative* Amongst Brahmans (1918); The Conception of Buddhist *Nirvana* (1927); and *Buddhist* Logic, 2 vol. (1930–32). He also published many Sanskrit manuscripts in the *Bibliotheca* Buddhica of the Academy of Sciences. He died on March 18, 1912. (S. RA.)

SHEARING MACHINES: see MACHINE TOOLS.

SHEARWATER, any of 40 or so medium-sized plainly coloured petrels (*q.v.*), chiefly of the genera *Puffinus* and *Pterodroma*. Most species nest in the southern hemisphere; a few, such as the sooty shearwater (*Puffinus* griseus) and the greater shearwater (*Puffinus* gravis), reach the shores of the northern hemisphere on their migrations. The Manx shearwater (P. *puffinus*) nests on the coasts of Europe. Shearwaters spend the greater part of their lives on the ocean. The single white egg is laid in a hole underground. The young are thickly covered with long down and become extremely fat. In this condition they are considered good eating, and enormous numbers are caught in some localities, especially on islands off Australia, where they are known as muttonbirds. (DN. A.)

SHEATHBILL, a bird so called from the horny case which ensheaths the basal part of its bill. There are two species, constituting the family Chionididae of the plovers. They are found only in the antarctic regions.

The sheathbill is about the size of a pigeon, which it in many ways resembles. Its plumage is pure white, its bill somewhat yellow at the base, passing into pale pink toward the tip. Round the eyes the skin is bare and beset with cream-coloured papillae, while the legs are bluish gray. The eastern species, *chionis* minor, is smaller than the western, C. alba, with a dark bill and legs and a differently shaped "sheath." The western species gathers its food, consisting of seaweeds and shellfish, on rocks at low water; but it is also known to eat birds' eggs. Though most abundant as a shore bird, it is frequently met with far out at sea. The eggs of both species are not unlike those of oyster catchers.

SHEBOYGAN, a city of Wisconsin, U.S., on Lake Michigan at the mouth of the Sheboygan river, 57 mi. N. of Milwaukee and 140 mi. N. of Chicago. It is the county seat of Sheboygan county.

Sheboygan was first visited by a white man in 1699 (the missionary Father St. Cosme). A trading post was established at the mouth of the Sheboygan river about 1820 and settlement began about 1834, when a sawmill was built at the first rapids, about 2 mi. above. It became a village in 1846 and a city in 1853. Early settlers, primarily of English ancestry, were from eastern states. After the 1848 revolution in Germany, Sheboygan received a large influx of German immigrants so that a majority of the population is of German stock. Many of them artisans, craftsmen and university graduates, they brought with them a reputation for industry and thrift.

The city ranks eighth in the state in population; in number of manufacturing employees it ranks fifth. It has diversified industries including furniture, plastics, leather, shoes, knit goods, toys, gloves, stainless steel, enamelware, paper products, hydraulic equipment and plumbing. It is an active Great Lakes port for coal, stone, oil; clay and other raw materials.

Sheboygan parks comprise about 300 ac. The city has numerous churches. two modern hospitals, a public-library system and a University of Wisconsin extension centre. A county normal school and Lakeland college are in the county. There is a community players organization and a symphony orchestra and there are several bands and singing groups.

For comparative population figures see table in WISCONSIN: *Population.* (M. W B)

SHECHEM (SICHEM), a city of ancient Palestine, 8 mi. S.E. of Samaria It is now a large mound calied Balatah about 1½ mi. E. of Nablus (Roman Neapolis) in western Jordan, in the valley between Mt. Ebal and Mt. Gerizim. A few hundred yards from Balatah touard the adjacent alluvial plain are the traditional sites of Jacob's well and of the tomb of Joseph. Since the mound, despite its extent, had been almost buried by the earth and stones washed down from the mountains, it was not identified with Shechem until shortly before World War I, when Ernst Sellin recognized its significance and led a German expedition to open it up (1913–14 and 1926–34). The excavations of Sellin, followed after 1928 by G Welter and H. Steckeweh, unearthed a massive pre-Israelite city wall, two monumental city gates, a citadel with a massive Canaanite temple and other important remains. Most of the German work was done before the chronological value of pottery was generally accepted. so the direct historical results were somewhat meagre. In 1956 excavations were resumed by a U.S. expedition headed by G. E. Wright and B. Anderson. By means of modern pottery chronology, the history of the site has been worked out in detail. Combined nith the information from Egyptian and cuneiform inscriptions, as well as with biblical and Greco-Roman data the archaeological finds on the site yield a fairly complete picture from *c.* 2000 B.C. down to the final abandonment of the site in the 1st century A.D.

By the time of the Egyptian middle kingdom (*c.* 2000–1800 B C.) Shechem was one of the most important towns of the Palestinian hill country, as shown by references to it as a focus of actual or feared rebellion. It must already have been a leading centre for trade and communication because of its position at the southeastern edge of the Nablus pass, which led directly across the watershed ridge of western Palestine. When the Hyksos were ruling in Egypt, Shechem became a stronger fortress than any yet excavated in Palestine. Its importance during the entire first half of the 2nd millennium B.C. is illustrated by numerous references to it in connection with the stories of Abraham and Jacob (*e.g.,* Gen. xii, 6; xxxiii, 18). In the 15th–14th centuries B.C. the population was already very mixed, as shown by the personal names in cuneiform tablets from the Shechem area found at Tell el-Amarna in Egypt as well as at Balatah itself. Horites (so read in Gen. xxxiv, 2, with the Greek translation, instead of "Hivite") and Indo-Aryans lived at Shechem together with Hebrews and other Semites. In the early 14th century B.C. a chieftain with the good Hebrew name of Lab'ay ("lion-man") ruled the Shechem district. In the Amarna tablets the Hebrews (Apiru) are said to have been in control of the town. (Note that in Gen. xxxiv the house of Jacob is said to have conquered Shechem.)

Shechem was not destroyed at the time of the Israelite occupation of the rest of the hill country of Palestine, and in the time of Joshua it became (together with Shiloh) the chief meeting place for representatives of the tribal confederacy (Josh. xxiv, 1). In the early 11th century it was briefly the capital of the ephemeral monarchy set up by Abimelech (Judg. ix), and Jeroboam made it the first capital of the northern kingdom (I Kings xii, 25), about 922 B.C. After the exile it became the religious capital of the Samaritan sect, which replaced Jerusalem by Gerizim as its holy mountain. About 130 B.C. it was occupied by the Hasmonaean king John Hyrcanus I, and it never recovered its importance.

See G. E. Wright, articles in *Bulletin of the American Schools of Oriental Research,* no. 144 (1956) and 148 (1957). (W. F. A.)

SHEEP. Sheep belong to the family of hollow-horned ruminants or Bovidae (*q.v.*). They pass almost imperceptibly into the goats. Both sexes often possess horns, but those of the females are small. In the males the horns are generally angulated, and marked by fine transverse wrinkles; their colour is greenish or brownish. They are directed outward. and curve in an open spiral with the tips directed outward. Although there may be a fringe of hair on the throat, the males have no beard on the chin; and' they also lack the strong odour characteristic of goats. Usually the tail is short; and in all the wild species the outer coat takes the form of hair, though beneath lies a short undercoat of fine wool which has been developed into the fleece of domesticated races. Weight varies from less than 100 lb. to several hundred pounds.

Like goats, sheep have narrow upper molar teeth, very different from those of the oxen. and narrow hairy muzzles. Between the two middle toes. in most species. is lodged a deep glandular bag, having the form of a retort with a small external orifice. which secretes an unctuous and odorous substance. This, tainting the herbage or stones over which the animal walks, affords the means by which, through the powerfully developed sense of smell, the neighbourhood of other individuals of the species is recognized. The crumen or suborbital face gland. which is so largely developed and probably performs the same office in some antelopes and deer, is present, although in a comparatively rudimentary form, in most species, but is absent in others. It may be added that the long tails of most tame breeds are, like wool, in all probability the results of domestication.

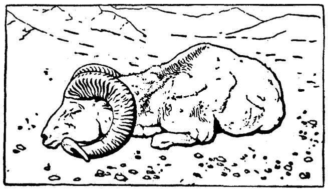
Origin and History. — The bones of sheep are found with other evidences of early human habitation at sites ranging from the middle east to the crannogs of Ireland. Remains at Tell Hassuna in upper Mesopotamia and at Tepe Sialk in central Iran are indicated as very early sites. But archaeological evidence presumably accumulated considerably later than domestication took place. for the Neolithic period appears to have opened with a well-established agriculture and a rather full complement of crops and animals which are still basic to the farmer of the old world. Other evidence. particularly that from religious history! also suggests early domestication — the sheep is the preferred animal for sacrifice in ancient as well as some modern religious ceremonials.

Carl O. Sauer associated domestication of sheep not with hunters or nomads but with sedentary seed farming, with southwest Asia indicated as the most probable hearth of domestication. Leopold Adametz associated an early domestic form with spiral horns with a variety of *Ovis vignei* living from the Salt range of the Punjab to Baluchistan, from where they passed to the near east and beyond. In the Copper Age a new breed *(Ovis aries studeri).* with massive spiral horns, appeared in Europe, and J. U. Duerst showed that it was almost certainly derived in part at least from the wild mouflon *(Ovis musimon).* In Sardinia. as has been known since the time of Pliny, the mouflon interbreeds freely with domesticated sheep. The bulk of modern breeds are obviously much more closely related to the sheep of the Copper Age than to the earlier turbary type; while it thus seems likely that the mouflon played the major part and the urial a minor part in producing farm flocks. it is by no means certain that other species, such as the argali *(Ovis ammon),* were not concerned.

VARIETIES AND DISTRIBUTION

Wild Sheep. — Wild sheep attain their maximum development, both in number and size, in central Asia. They associate either in large flocks or in family parties, the old males generally keeping apart from the rest. Although essentially mountain animals, sheep generally frequent open, undulating districts rather than the precipitous heights to which goats are partial.

The Pamir plateau, on the confines of Turkistan. at an elevation of 16,000 ft. above sea level, is the home of the magnificent *Ovis poli,* named after the celebrated Venetian traveller Marco Polo, who met with it in the 13th century. It is remarkable for the great size of the horns of the old rams and the wide open sweep of their curve, so that the points stand boldly out on each side, far away from the animal's head, instead of curling round nearly in the same plane, as in most of the allied species. A variety inhabiting the Tien-shan range is known as *O. poli karelini,* and other racial forms occur in the mountains and lower ground of Turkistan, and in central Asia.



BY COURTESY OF AMERICAN MUSEUM OF NATURAL HISTORY

THE *OVIS POLI* OF TURKISTAN, REMARKABLE FOR THE GREAT SIZE OF THE HORNS

An even larger animal is the argali, *O. ammon,* typically from the Altai range but represented by one race in Ladakh and Tibet (*O. ammon hodgsoni*), by a second in eastern Mongolia and by a third in the Gobi desert. Although its horns are less extended laterally than those of *O. poli,* they are grander and more massive. In their short summer coats the old rams of both species are nearly white. *Ovis sairensis* from the Sair mountains and *O. littledalei* from Kulja are closely allied forms.

In the Stanovoi mountains and neighbouring districts of east Siberia and in Kamchatka occur two sheep which have been respectively named *O. borealis* and *O. nivicola.* They are. however. so closely allied to the so-called bighorn sheep of North America that they can scarcely be regarded as more than local races of *O. canadensis* or *O. cervina,* as some naturalists prefer to call the species. These bighorns are characterized by the absence of face glands and the comparatively smooth front surface of the horns of the old rams, which are thus very unlike the strongly wrinkled horns of the argali group.

The typical bighorn is the khaki-coloured and white-rumped Rocky mountain animal; but on the Stikine river there is a nearly black race. with the usual white areas (*O. canadensis stonei*), while this is replaced in Alaska by the nearly pure white *O. c. dalli,* the gray sheep of the Yukon (*O. c. fannini*) being perhaps not a distinct form. Other geographical races of the bighorn. distinguished chiefly by the colour of the coat, include the mountain sheep of Mexico, of Lower California, of upper Missouri and of the Kenai peninsula.

Returning to Asia, we find in Ladakh, Astor, Afghanistan and the Punjab ranges a sheep whose local races are variously known as urin. urial and shapo and whose technical name is *O. vignei.* It is a smaller animal than the members of the argali group. and approximates to the Armenian and the Sardinian wild sheep or mouflon (*Ovis orientalis* and *O. musimon*). (*See* MOUFLON.) In Tibet is the bharal or blue sheep, *Ovis (Pseudois) bharal,* and in north Africa the udad or aoudad, *O. (Ammotragus) lervia,* both of

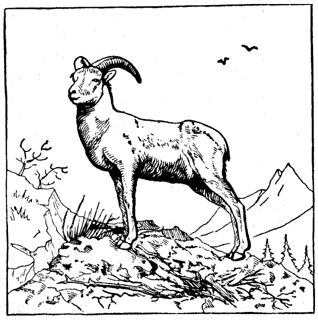
which have no face glands and in this and their smooth homs approximate to goats. *(See* BHARAL; UDAD.)

On the west coast of Africa two distinct breeds of hairy sheep are indigenous, the one characterized by its large size, long limbs and smooth coat, and the other by its inferior stature, lower build and heavily maned neck and throat. Both breeds, which have short tails and small horns (present only in the rams), were regarded by the German naturalist Leōpōld Fitzinger as specifically distinct from the domesticated *Ovis aries* of Europe; for the first type he proposed the name *O. longipes* and for the second *O. jubata.*

The long-legged hairy sheep, which stands a good deal taller than a Southdown, ranges, with a certain amount of local variation, from lower Guinea to the Cape. In addition to its long limbs, it is characterized by its Roman nose, large (but not drooping) ears and the presence of a dewlap on the throat and chest. The ewes are hornless, but in Africa the rams have very short, thick and somewhat goatlike horns.

In Angola occurs a breed of this long-legged hairy sheep which has probably been crossed with the fat-tailed Malagasy breed; while in Guinea there is a breed with lappets, or wattles. on the throat, which is probably the result of a cross with the lop-eared sheep of the same district. The Guinea lop-eared breed, it may be mentioned, is believed to inherit its drooping ears and throat wattles from an infusion of the blood of the Roman-nosed hornless Theban goat. *(See* GOAT.) Hairy long-legged sheep are also met with in Iran, but these are not purebred. being apparently the result of a cross between the long-legged Guinea breed and the fat-tailed Persian sheep.



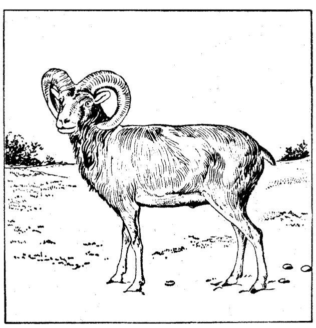
BY COURTESY OF THE CANADIAN NATIONAL RAILWAYS

THE ROCKY MOUNTAIN BIGHORN (OVIS CANADENSIS), A WILD SHEEP

The maned hairy sheep (*Ovis jubata*), which appears to be confined to the west coast of Africa. takes its name from a mane of longish hair on the throat and neck, the hair on the body being also longer than in the ordinary long-legged sheep This breed is frequently black or broun and nhite; but in a small subbreed from the Cameroons the general colour is chestnut or foxy red, with the face, ears. buttocks, lower surface of tail and underparts black.

The most remarkable thing about this Cameroon sheep is, however, its extremely diminutive size a full-grown ram standing only 19 in. at the withers. In point of size this pygmy Cameroon breed comes very close to an exceedingly small sheep of which the limb bones have been found in certain ancient deposits in the south of England: and the question arises whether the two breeds may not have been nearly related

Although there are no means of ascertaining nhether the extinct pygmy British sheep was clothed with hair or with wool it is practically certain that some of the early European sheep retained hair like that of their wild ancestor; and there is accordingly no prima-facie reason nhy the breed in question should not have been hairy On the other hand since the so-called peat sheep of the prehistoric Swiss lake dnellers appears to be represented by the existing Graubünden (Grisons) breed which is woolly and coloured something like a Southdonn. it may be argued that the former was probably also woolly and hence that the survival of a hairy breed in a neighbouring part of Europe would be unlikely. The latter part of the argument is not very convincing and it is legitimate to surmise that the small extinct sheep of the south of England may be a possible relative of the pygmy hairy sheep of nest Africa.



A SARDINIAN MOUFLON SHEEP

Fat-rumped sheep, *Ovis steatopyga*, are common to Africa and Asia. and are piebald with rudimentary horns and a short hairy coat. being bred entirely for their milk and flesh. In fat-tailed sheep, on the other hand, which have much the same distribution, the coat is woolly and generally piebald. Four-horned sheep are common in Iceland and the Hebrides, and in early historic times they occurred frequently in the sheep flocks then present in Lowland Scotland. There is another four-horned breed, distinguished by its black (in place of brown) horns, whose home is probably South Africa.

In the unicorn sheep of Nepal or Tibet the two horns of the rams are completely welded together. In the Himalayan and Indian hunia sheep, the rams of which are specially trained for fighting, and have highly convex foreheads, the tail is short at birth. Most remarkable of all is the so-called Walachian sheep or Zackelschaf (*Ovis strepsiceros*), represented by several more or less distinct breeds in eastern Europe. in which the long upright homs are spirally twisted in a manner similar to those of the markhor wild goat. (R. LY.; J. RI.; J. K. R.)

Domestic Sheep. — Domestic sheep differ from their wild progenitors and even among themselves in conformation, quantity and quality of fleece. colour. size, milk production and other characteristics. Breeds of sheep have been developed to meet environmental conditions influenced by latitudes and altitudes and to satisfy variable desires of the people for clothing and food. The commodities for which sheep have been bred include wool, fur, meat and milk.

Of more than 200 breeds of sheep in existence in the world, the majority are of limited interest, except in the localities where they are raised. About 30 of the breeds which are most extensively raised or have otherwise attained prominence provide the principal basis for this discussion. They may be grouped into the following six types according to the kind and quality of commodities which they produce:

Fine-wool type: Merino and Rambouillet.

Medium-wool type: white-face sheep—Cheviot, Columbia, Corriedale, Dorset, Ile de France, Le Contentin, Oldenburg White Head, Panama, Romeldale, Ryeland, Targhee, Texel and Welsh Mountain; dark-face sheep — Hampshire, Kerry Hill, Oxiord, Shropshire, Southdown and Suffolk. Except for the Kerry Hill, these dark-face sheep are also called Down sheep, as they originated in the Downs of England and may have been the autochthonous sheep of the open-field farmer.

Long-coarse-%lool type: white-face sheep — English Leicester, Border Leicester, Cotswold, Lincoln, Romney and Wensleydale; dark-iace sheep—Scotch Blackface Highland. The progenitors of these breeds, especially the Lincolns and the Romney Marshes, were probably of Flemish origin

Fur type: Karakul and Romanov.

Woolless mutton type: Blackhead Persian.

Milk type: East Fresian, La Razza Sarda, Pelvin, Sevlievo, Stara Zagora and Svishtov.

Brief descriptions of these breeds follow.

The *Merino,* a fine-wool sheep, originated in Spain. It was known as early as the 12th century and may have been a Moorish importation. It was particularly well adapted to semiarid climates and to rranshumance. It is a prominent breed in many countries, notably Australia. the United States, the Union of Soviet Socialist Republics, the Union of South Africa, Argentina, France and Germany. This breed has been designated by various names such as Australian Merino in Australia. American Merino and Delaine Merino in the United States, Merino Trashumante in Spain, Merino Volosh in the Cnion of Soviet Socialist Republics, Merino Argentino in Argentina, Merino Precoce in France and Thuringia Merino-Meat in Germany. Some of these names signify strains of the parent breed that have been modified by selective mating, but all the sheep have rather heavy fleeces of fine wool that is pure white when scoured.

Merinos vary considerably in size, conformation and extent of skin folds. but the prevailing trend in breeding the modern Merino breed is to develop sheep of medium size, fair mutton conformation and freedom from excessive skin folds. The colour of their faces and legs is white. .Although they have a considerable growth of wool on their faces, it is seldom extensive enough to cause wool blindness. The fine wool fibres of Merino fleeces are beautifully crimped and the fleeces hat-e a natural tendency to carry sufficient wool oil to keep the fibres oi the inner part of the fleeces soft and pliable. The wool oil in combination with the dust and soil of natural surroundings forms a dark covering on the outer part of the fleece that protects the beautiful. fine, white wool fibres of the inner portion. Through selective mating and crossing with other breeds, the Merino has served extensively as foundation stock in the creation of many useful breeds and strains of sheep. Of the iour Merino types which became widely known and provided the basis for the expansion in apparel wool production in the 19th century, the heavily wrinkled Negretti became the basis for most of the English Merino development. The small, tighter-skinned Escurial appears to have been basic to the Rambouillet and Saxon developments, whereas the Paular and Infantado appear to have participated only slightly.

The *Rambouillet,* also a fine-wool sheep, originated in France. It was developed from excellent selections in 1786 and again in 1799 of a few hundred oi the best Merino sheep in Spain. The French government made these selections and placed the flock at its national sheepfold. Rambouillet, Fr., where this breed originated. It is the largest of fine-wool sheep. Breeders in Germany made important contributions to the development of the Rambouillet, especially to its fleshing qualities.

Sheep of this breed mere first imported into the United States in 1840. Through selective mating the breed was successfully moulded to meet the needs of a large class of U.S. sheep producers. Rambouillets prevail on the western ranges where two-thirds of the sheep of the United States are produced. The face and legs of this breed are white. The face covering of wool is rather heavy, even to the extent of wool blindness in some specimens, but through selective mating breeders are making progress in developing strains free from such excessive face covering. Fleeces of Rambouillet sheep are relatively heavy. The lambs grow rapidly, attaining under good ieed conditions satisfactory market weights, and finish at from six to nine months of age. The crossbreeding oi Rambouillet emes with medium-wool and long-coarse-wool rams is practised extrnsively ior the production of choice market lambs and of rugged breeding ewes that produce heavy fleeces of attractive medium wool.

The *Cheviot* is a medium-wool breed. It is a hardy, white-face, hornless sheep developed in Scotland and Northumberland, Eng. Cheviots have no wool on their heads and ears or on their legs below the knees and hocks. As a consequence they present an attractive and alert appearance. The wool of their fleeces is relatively straight. of moderate length, close set and free from black fibre. Cheviots are used in crossbreeding, especially with Border Leicesters and Lincolns, for market lambs.

The *Columbia* is a medium-wool. white-face, hornless breed developed in the United States by the U.S. department of agriculture. It was formed by crossbreeding Lincoln rams and Rambouillet ewes and interbreeding the resulting crossbred ewes and rams and their descendants without backcrossing to either parent stock. The initial crossbreeding began at Laramie, Wyo., in 1912, and after 1918 the moulding of the breed was carried out at the United States sheep experiment station, Dubois, Ida. The sheep of this breed are large and rugged, and they excel in the production of both wool and lambs. The breed is popular, especially in the western U.S. range region, where private breeders organized the Columbia Sheep Breeders' association.

The *Corriedale* is also a medium-wool, white-face, hornless breed. It originated in New Zealand as a result of crossbreeding Lincoln rams and Merino emes, beginning about 1880. The breed is valued especially in New Zealand, Australia and the United States. Corriedales are of medium size, and they produce wool and lambs of very good quality. The breed is adapted to both iarms and ranges.

The *Dorset* is a medium-wool, white-face sheep. Both ewes and rams have horns; the breed is sometimes called the Dorset Horn. It originated in England. The ewes are heavy milkers and their lambs grow rapidly. The fleece is pure white, rather short and open. The breed is valued also in the United States and other countries for the production of fancy hothouse lambs, as a portion of the ewes will breed out of season. The?; also cross well with Merinos for the production of crossbred ewes well suited to hothouse lamb production.

The *Ile de France* is a medium-wool, white-face, hornless sheep that is an excellent producer of hoth meat and wool in France. It is especially noted ior its early maturity and the rapid growth of its lambs.

The Le *Contentin* is a medium-wool, white-face, hornless sheep of France maintained primarily as a grazing sheep. The emes are good milkers and raise their lambs well. They have good coniormation and their meat is of first quality. They are also good wool producers.

The *Oldenburg White Head* is a medium-wool, white-face, hornless sheep of Germany, noted as a hardy grazing breed. It is very prolific and an excellent producer of both lambs and wool.

The *Panama* is a medium-wool, white-face, hornless breed of the western United States, originated in Idaho in 1912 by crossbreeding Lincoln ewes and Rambouillet rams. These sheep have good size, are hardy and are well adapted to the range. The ewes are good milkers and raise their lambs well. Their fleeces of white wool are heavy.

The *Romeldale* is a medium-wool, white-face, hornless sheep of the western United States, especially raised in California. It resulted irom the crossbreeding of Romney rams and Rambouillet ewes, beginning about 1915. It is well suited to pasturage of alfalfa and heavy forage, as well as being hardy and well suited to range conditions. The Romeldale produces wool and lambs of high quality.

The *Ryeland* is a medium-wool, white-lace, hornless sheep oi England. The lambs grow quickly; the wool is good quality, of deep staple and thickly set on the skin. Sheep of this breed were raised to some extent in the United States, especially in Kentucky.

The *Targhee* was developed at the U.S. experiment station at Dubois, Ida., after 1926 by vigorous selection and inbreeding of various Rambouillet-Columbia-Corriedale combinations to produce a true-breeding strain intermediate to the smaller fine-wool breeds and the large crossbreeds. Hardy and of medium size, it is well adapted to the range; it is of compact conformation with a moderately low-set, broad, level back, good bones and straight legs. The rump and leg of mutton are well developed. The fleece is heavy, of desirable fineness (60s and 62s) and staple length. Ewes are good mothers and handle easily; necks are without folds and faces are open.

The *Texel* is a medium-wool, white-face, hornless sheep of the Netherlands, well adapted to range conditions and very prolific. The lambs grow rapidly. The fleeces of this breed are of good, heavy, white wool. The Texel is raised also in France, Belgium, Denmark, Spain, Indonesia, South America, South Africa and Mexico.

The *Welsh Mountain* is a medium-wool, white-iace sheep of Wales, and is of importance in other parts of the United Kingdom. The rams have horns and the ewes are hornless. It is noted for its very high-quality mutton. The fleeces are light in weight but of good quality.

The *Hampshire* is a medium-wool, dark-face, hornless sheep that originated in England. It is large and blocky and, as a superior mutton breed, is noted for its early maturity. It is one of the most popular meat breeds in the United States, where it is raised extensively for market-lamb production in farming regions and for crossing with white-iace range ewes in the western range regions for the production of market lambs. The wool of Hampshire fleeces is strong, oi medium fineness and length and desirable for manufacturing purposes except for the occurrence of black fibres in a small percentage of fleeces.

The *Kerry Hill* is a medium-wool, hornless sheep with markings that consist of black speckles on white iaces, ears and legs. It originated in the British Isles and is a hill sheep that combines desirable features of the Hill and Down types. Its fleece resembles that of the Shropshire but is not so good in quality. It produces good mutton and is excellent for crossbreeding.

The *Oxford* is a medium-wool, dark-face, hornless sheep, and it is the heaviest of the Down breeds. It was produced by mating Hampshires and Cotswolds in Oxford county, Eng. The ewes are good mothers and the lambs grow rapidly. Their fleeces are heavy and the wool is of good length for sheep of the medium-wool type. They are popular on farms that have abundant ieed. Considerable numbers are found in England and the Great Lakes region of the United States.

The *Shropshire* is a medium-wool, dark-face, hornless breed that originated in the Downs oi England. It is one of the most popular farm sheep in middle western United States. It produces good wool and mutton and subsists on sparse pasturage better than breeds such as the Hampshire or Suffolk. For crossbreeding it is better adapted to iarms than to range conditions. Its face covering of wool is excessive, which is more easily dealt with on iarms than on ranges.

The *Southdown* is a medium-wool, dark-face, hornless sheep. It is a Down breed that was raised on the Sussex hills of England. The Southdown is the oldest of all British breeds of sheep, and it has an ideal body conformation for meat production. Its fleece is close and the finest oi the British breeds; but although white and of good quality, the wool is short and the fleeces relatively light in weight. The colour of its face and legs is brown to light brown or mouse colour. Southdowns are popular in many parts of the world, especially in British countries and the United States.

The *Suffolk* is a medium-wool, dark-face, hornless sheep. It was developed in England by mating Norfolk horned ewes with Southdown rams during the years 1800 to 1850. Suffolks are prolific, early maturing sheep with excellent mutton carcasses. They are energetic and the whole carriage is alert, showing stamina and quality. Suffolk lambs gain rapidly and the breed is noted for mutton production. This breed is not desirable for wool production. The fleeces are short in staple and light in weight, and they have black fibres. As lamb producers, Suffolks are popular in British countries and in the United States.

The *English Leicester* is a long-coarse-wool breed that originated in England through improvement by the noted breeder, Robert Bakewell, about 1755. This breed has white faces and legs. They are hornless, broad-backed, thick-fleshed and early maturing. Their fleeces are heavy with a tuft on the forehead and wool hanging in compact locks on the body. Some of the choicest wool oi crossbred sheep is produced by offspring of Merino ewes and English Leicester rams.

The *Border Leicester* is a long-coarse-wool, white-face, hornless sheep that was developed in the border counties oi England and Scotland by crossbreeding sheep of the English Leicester and Cheviot breeds. The head is free from wool, bold and carried high. The whole carriage of this choice mutton body presents a square, alert, stylish appearance. The wool is long, soft and in small locks, but fairly compact.

The *Cotswold* is a long-coarse-wool, white-face, hornless sheep that originated in England. The back is broad and flat, but the body is only moderate in depth. The fleeces are heavy and on the surface the wool lies in open curls. This breed is used successiully in crossing with Merinos and Rambouillets to increase size of body and length oi wool fibre.

The *Lincoln* is a long-coarse-wool, white-face, hornless sheep, native of England. It is a large mutton sheep with heavy fleeces of tuited wool, and the poll is covered with wool. Rams of this breed are used extensively in many countries for crossbreeding with fine-wool ewes.

The *Romney* is a long-coarse-wool, white-face, hardy, polled sheep that originated in Kent, Eng. It is sometimes called the Kent or the Romney Marsh. Sheep of this breed are popular in South America, Australia, New Zealand and in some western areas of the United States. Their fleeces are relatively dense and on the average are the finest of the long-coarse-wool fleeces. The rams are used rather extensively in the western U.S. for crossbreeding with Rambouillet ewes.

The *Wensleydale* is a long-coarse-wool, white-face, hornless breed of England. The wool is long, lustrous and in wavy locks. The skin on the face, ears and legs, and sometimes on the body, is of a bluish tinge. In England they are crossed with other long-coarse-wool breeds. Their mutton is of good quality, but they mature rather slowly.

The *Black-lace Highland* is a long-coarse-wool, dark-face, horned, mountain sheep, native of Scotland. It is extremely hardy, matures quickly and produces mutton of excellent quality. The wool of the fleeces of this breed is used extensively in the manufacture of tweeds, and the coarsest of it makes good, strong carpet wool.

The *Karakul* is a fur sheep, native of central Asia. Black is the prevailing colour of newborn lambs, which in most eases have beautiful tight-curled coats that, when skinned at about one to three days old, provide the commercial lambskin fur for which they are raised. A large percentage of the lambskins are classified by the trade as Persian lambskins. The wool of grown sheep is a mixture of coarse and fine fibres, of colours varying from black to various shades of brown and gray. The prevailing colour of the face and legs is black. The ewes are good mothers, and the lambs grow rapidly and produce good meat, but the breed is primarily intended for lambskin-fur production. Horned and hornless sheep occur in both sexes. Karakul sheep are raised in several countries of Asia, Europe, Africa and the Americas.

The *Romanov* is a fur sheep of the Union of Soviet Socialist Republics, and it is found particularly in the Yaroslavl region. It is noted as a fur-producing sheep that excels in prolificacy. Black and white occur on face and legs and in the fibres of the fleeces.

The *Blackhead Persian* is a woolless fat-rumped sheep that has been highly developed for mutton production in South Africa, where it thrives on lands not well suited to woolled sheep. The head and neck are black and the body is white. This breed is indigenous to North Africa, Somaliland and Arabia. The name "Persian" is misleading, for none of these sheep have come from Persia.

The *East Fresian* is a white-face milk sheep, native of Germany. It is considered to be one of the best milk breeds of sheep in Europe. In addition to its heavy milking qualities it is also well fleshed and woolled with heavy fleeces of white medium to coarse wool. The head is bare of wool and polled.

The *La Razza Sarda* is a milk sheep, native of Sardinia, It. The face is white with small black spots about the eyes and muzzle. It is noted as a heavy milk producer and also valued as a producer of long, white wool of coarse but good quality.

The *Pelvin* is a black-face milk sheep of Bulgaria, valued especially for milk production in one of the largest sheep-producing areas. It also produces a good weight of wool that is grayish in colour and medium to coarse in fineness.

The *Sevlievo* is a dark-face milk sheep of the mountain type, from Bulgaria. It is one of the more abundant milk-producing sheep and a fair producer of pigmented wool of medium fineness.

The *Stara Zagora* is a large, white-face, horned milk sheep of Bulgaria, developed for an abundance of milk but also valued for its white medium-wool fleece.

The *Svishtov* is a white-face, horned milk sheep of the region between the Danube river and the Balkan mountains. It is noted for its abundant production of milk and for its good fleece of long, white, coarse wool. (D. A. S.; J. K. R.)

WORLD SHEEP INDUSTRY

Major Producing Areas.— Distribution of sheep is, of course, limited by grazing lands and somewhat by climatic conditions. Some cold areas, even if unfavourably wet, are usable. and warm areas, if dry, are used, but sheep are not numerous in the warmer areas of the tropics.

Honever, northern Australia above the Tropic of Capricorn contained in the mid-1950s between 5% and 10% of the sheep population of Australia—130,000,000. These were about 75% Merinos and grazed successfully, except for some problems of infertility which are not uncommon in hot arid areas with approximately equal hours of daylight and darkness

The distribution pattern of sheep differs from other livestock in the emphasis on the southern hemisphere. Entirely a development that occurred after 1850, it appears to be related, first, to the storability and transportability of wool. well adapted to frontier conditions of subhumid climates.

In such subhumid areas the Merino sheep with its fine apparel wool developed under large-scale ranching conditions. Later the development of refrigerated ocean shipping enabled some of the thinly settled areas to increase the production of lamb for the European market.

By the mid-1950s world sheep numbers increased nearly 22% as compared with pre-World War II figures, with major increases reported for the C.S.S.R. and Australia. There were increases in all continents except North America, where sheep numbers decreased by 35%. The decline in the United States is difficult to understand at first glance. One might think that emphasis on soil conservation. grassland farming, new developments in better-adapted and more productive grasses and the adoption of new ways of curing hay and making and using grass silage should have led to increased sheep production.

TABLE I.—Sheep *Distribution* by *Areas and Major Producing Countries* (in 000s)

Area	1936–40	1946–50	1951–55	1955*	1956*
Asia	156,700	156,000	176,040	182,400	184,600
India	41,000	38,200	39,900	40,000	—
China	30,000	28,000	—	—	—

*Preliminary.

Totals are estimated and rounded. Month of estimate and basis and source of data vary from country to country

Source U S Department of Agriculture, Foreign Crops and ***Markets,*** pp. 532–533 (April 23, 1956).

The explanation appears to be more in the realm of comparative economics and cultural trends. Cattle seemingly made more profitable the use of some grazing areas which previously had been devoted to sheep. paying a better return on capital invested. Moreover, labour of the types needed for successful sheep ranching, particularly the excellent Basques, was increasingly difficult to obtain after 1940.

Care and Management.— This differs considerably from area to area, and more particularly between the small flock of 10 to 100 operated as an incidental part of a general farming operation and the large ranch or station band of one to several thousand head. The latter may involve moving with the season from valley to mountain to valley again (transhumance) over long trails distant from the home base.

Such far-flung operations may require spending the major part of the year on public land, returning to the home base only for wintering and the spring lambing season.

Regardless of the size or nature of the operation, skilled care and attention is required at lambing time. not only to assist with difficult deliveries but especially to make certain that the lamb does not become chilled after birth and that the ewe recognizes the lamb and allows it to nurse. By the 1950s heat lamps were used to some extent to warm and dry the newborn. Protection and even rescue and perhaps supplementary feeding of the flock may be required during the worst winter months in some areas, particularly if there is deep snow.

It is seldom profitable to feed grain to breeding sheep or suckling lambs as long as they have an abundance of succulent grazing forage. Though they do best on pastures and ranges which provide choice grass or legume forage which is short and fine, they will consume considerable quantities of high, coarse, brushy material and weeds.

Hay and other roughage can be used, particularly in winter or drought periods. Grain may be used in small amounts for flushing at breeding time and, of course, for fattening. Fattening on grain and concentrates is carried on mostly between the ranch and the consuming market and in general is a more delicate operation than cattle fattening.

Except on alkali ranges, breeding sheep must be provided with about one-half ounce of salt a day and fattening lambs about half as much. Calcium supplements of about one-fourth ounce a day may be needed if legume forage or hay is not included. Phosphorus, if deficient in the range plants, may be supplemented by adding two parts of bone meal to one part of salt. In areas where newborn lambs are afflicted with goitre, iodized salt in moderate amounts may be fed to the pregnant ewes. Vitamin A appears to be the only one likely to be deficient and that when food is limited to cereal straws. low-quality hay or cottonseed hulls.

Sheep need as much as $1\frac{1}{2}$ gal. of water a day, though dew on grass or snow, if available, may suffice for much of the requirement. They should not have to travel more than three to four miles between grazing and water in cool weather. or about two miles in warm weather; animals with young should be even closer. Thus the number of animals which may be supported in semiarid areas is rather strictly limited by the availability and spacing of water holes. Shade during hot weather is desirable as is protection from predatory animals — dogs. wolves. eagles, etc. Sheep should be shorn only when the fleece is dry and settled weather is in prospect, for wet snowstorms or severe cold may cause heavy losses from exposure after shearing unless protection is available. Except in areas of bitter winter, only the simplest, cheapest shelter or none at all is required.

Approximately one mature ram is kept for each 3 j ewes. Range ewes are seldom kept beyond the sixth year though they may be moved to areas with softer food and used as breeding stock for one or more additional years.

There is considerable variation in lamb crop. loss of animals and, of course, in income, from year to year; a summary of various factors for a major U.S. area is given in Table II.

TABLE 11.—*Sheep Production Rates, Per Ranch, Family Operated Sheep Ranches, Southwestern Nonmigratory Area of the U S , 1940–54*

Year	Breeding ewes Jan. 1	Lamb crop*	Death loss†	Wool clip per sheep sheared	Net production per ewe in flock on Jan. 1‡

Diseases. — Prior to the 20th century, sheep owners commonly accepted heavy losses from disease in their flocks as inevitable. After the early 1900s, however, marked progress was made by the veterinary profession in the prevention and control of many of the diseases that were once ovine scourges.

Bacteria of the genus *Clostridium* probably cause greater death losses than any other single class of microorganisms. These spore-bearing organisms are capable. generally, of producing powerful, lethal toxins. Some of the diseases they produce in sheep, and the organisms which cause them, are as follows:

Enterotoxemia (struck. pulpy kidney disease); lamb dysentery — caused by *Bacillus (Clostridium) welchii.*

Braxy or bradsot; malignant edema — caused by *Bacillus (Clostridium) oedematis—maligni.*

Black quarter or blackleg — caused by *Bacillus (Clostridium) chauvoei.*

Infectious necrotic hepatitis or black disease — caused by *Bacillus (Clostridium) novyi.*

Tetanus — caused by *Bacillus (Clostridium) tetani.*

Struck, braxy and black disease are particularly acute and lethal diseases. As in infection by anthrax (*q.v.*), affected sheep may die in a few hours after they first show symptoms, or they may be found dead without symptoms ever having been observed. These diseases are peculiar in that they commonly affect the most vigorous and thrifty sheep in the flock. Fortunately, through proper management and vaccination, losses from these diseases may be largely controlled, if not eliminated.

Struck or lamb dysentery affects the young, as the latter name implies. Unsanitary conditions and close confinement contribute to the danger from this disease. which attacks in from a few hours to a week after birth. The mortality may be high if precautionary measures are not used. At mid-20th century the anthrax problem was not as serious in the western hemisphere as in the old world, where repeated epizootics of anthrax over the decades and centuries resulted in heavy contamination, particularly in Asia, southern Europe and Africa.

The spore form of *Bacillus anthracis* is very resistant to chemical and environmental influences and can survive for years in contaminated soil and in animal products, including wool. Feedstuffs and fertilizers. moreover, may be contaminated. The main source of infection in agricultural workers is from contact with contaminated carcasses! wool: hair, hides and insufficiently cooked meat. Many different preparations of anthrax spore vaccines are useful for the prevention of the disease, particularly spore suspensions in glycerin-saline solution for intradermic use and spore suspensions in saponin solution for subcutaneous use. The avirulent, noncapitulated strain of *B. anthracis* used in the spore vaccine developed at the Onderstepoort Veterinary Research laboratory, Pretoria, U. of S. Af., was used with considerable success in many countries.

Blackleg, tetanus and malignant edema result from infections of wounds. The freshly ruptured navel! shearing cuts and the wounds resulting from castration, docking and earmarking are the usual avenues for entrance. To prevent these diseases, great care should be taken in operations, using clean instruments and techniques. Lambing should be done in cleaned and disinfected buildings or, when weather permits, outside on uninfected land. Infections with pus-forming bacteria also enter through .wounds, resulting in arthritis and abscesses in the internal organs, including the brain and spinal cord. An effective means of prevention is to dip the stump of the navel cord in tincture of iodine or other effective antiseptic as soon as possible after birth.

Contagious pustular dermatitis or sore mouth is an especially widespread filterable virus disease of sheep and goats. The disease occurs in England and other parts of Europe, North and South America and Australia. Aside from the loss of body weight that results, the disease is usually not serious. The animals usually recover, but secondary infections caused by bacteria, especially *Bacillus (Actinomyces) necrophorus,* may cause death. An effective vaccine was developed as a preventive.

Bluetongue, a little-known virus, infected thousands of sheep in the southwestern United States and is known in other countries.

Foot rot or foul foot is more or less prevalent in most sheep-raising countries of the world. Because of extreme pain in the feet. some animals on sparse pastures may starve to death through inability to travel and procure feed. Cure is tedious and pains-taking. The infection may be largely avoided by preventing healthy sheep from having contact with infected sheep or soil.

Sheep rarely develop tuberculosis. The few cases observed were mostly of the avian type, contracted from tuberculous fowls. A common disease of sheep the world over is pseudotuberculosis or caseous lymphadenitis. It is a chronic, bacterial disease of the lymph nodes, caused by *Corynebacterium ovis* (*Preisz-Nocard bacillus*). It seldom causes death, except in aged animals, but it requires considerable attention from the standpoint of meat inspection.

In some flocks mastitis (inflammation of the udder, blue bag) is a serious problem. Various bacteria are implicated as causative agents. Sanitation and biological products may be applied as preventives.

Louping ill. an encephalitis caused by a filterable virus, mas reported only from Scotland and other parts of the British Isles. The disease is transmitted by the tick *Ixodes ricinus*. An effective vaccine was developed as a preventive.

Pregnant ewes. especially those carrying twins or triplets, may develop pregnancy toxemia or pregnancy disease if they are underfed, closely confined or subjected to sudden changes in feed or environment. Treatment is generally ineffectual for this highly fatal metabolic disease. Prevention consists in keeping ewes in a thrifty gaining condition during pregnancy, especially during the last two months.

Other diseases that affect sheep. but are generally less widespread or less serious than those mentioned, include sheep pox, Johne's disease, hemorrhagic septicemia, paratyphoid, rabies, foot-and-mouth disease (*q.v.*), Q fever and various forms of malnutrition. (M. S. Sn.: J. K. R.)

Parasites of Sheep. — Sheep probably suffer more from parasitism than any other class of livestock. the damage being greatest among lambs and young animals. The losses from the effects of protozoa. worms and arthropods are so extensive at times as to make sheep raising an unprofitable undertaking. Fortunately, control measures for most parasites are available and. if followed. the loss can be substantially reduced.

The most injurious of the protozoan parasites are coccidia. of which there are several species. Coccidia are minute organisms that develop in and destroy the cells lining the intestinal tract. causing bloody diarrhea and frequently death. Coccidiosis is particularly prevalent where lambs are concentrated in feed lots for fattening and finishing for market. It can be controlled to a large extent by sanitation and frequent cleaning of the feed troughs to prevent accumulation in them of manure containing the oocyst or infective stage of the organisms, which may be swallowed with the feed.

The worm parasites include flukes. tapeworms and roundworms. The common liver fluke. *Fasciola hepatica,* occurs in most parts of the world and is one of the deadliest parasites of sheep. The flat. leaflike parasite lives in the liver, causing a condition known as liver rot. The symptoms of fluke infestation are principally unthriftiness, anemia and abdominal dropsy. and differ little from those caused by other worm parasites. An acute. frequently fatal bacterial disease known as black disease is often associated with liver fluke infestation. The life cycle of the fluke is complicated. requiring water snails (*Lymnaea* and related genera) as intermediate hosts. The larval stages develop in the snails and the infective stage. or cercaria. that escapes becomes encysted on aquatic vegetation and is swallowed by sheep while grazing.

Control of liver flukes depends upon destruction of the snails. either by drainage to destroy their breeding places or by the use of chemical poisons. such as copper sulfate, broadcast over the snail-infested areas. Medicinal treatment with small individual doses of carbon tetrachloride or hexachlorethane will destroy the adult flukes in the bile ducts. Young flukes in the liver tissue are not affected by the treatment.

Several species of adult tapeworms parasitize the digestive tract of sheep. but as a general rule they cause little injury. The fringed tapeworm. *Thysanosoma actinioides,* frequently occurs in the bile ducts, rendering the liver unfit for human consumption. So far as known. the larval stage of sheep tapeworms develops in grass mites. The larval stages of several dog tapeworms (*Echinococcus granulosus, Taenia hydatigena* and *T. ovis*) occur in sheep; they render the carcass or the organs affect'ed unfit for food. As a preventive measure. all dogs on farms where sheep are kept should be examined periodically for tapeworms by a veterinarian. and the infested animal should be treated for their removal.

The important roundworms of sheep are the stomach worm (*Haemonchus contortus*), nodular worm (*Oesophagostomum columbianum*), and several species of small threadlike worms belonging to the genera *Cooperia*, *Ostertagia* and *Trichostrongylus*. Infestations are acquired by the animals while grazing. The common symptoms are unthriftiness. anemia and diarrhea. Death loss from stomach worms and the small roundworms is sometimes very extensive. In addition to the usual bad effects of parasitism caused by roundworms. the nodular worm ruins the small intestines for use as sausage casings. surgical suture material and for other purposes. In areas where freezing weather prevails for long periods. the infective larvae of roundworm parasites on pastures are destroyed. Treatment of the breeding flock with appropriate individual doses of phenothiazine in the late fall or early winter and again in the spring will remove the adult worms, the eggs of which contaminate the clean pastures.

Phenothiazine in salt was given to the same flock for ten years without ill effects and without losses from parasitism. After the sheep and lambs are placed on pasture. free access to salt licks containing phenothiazine in the proportion of one part of the drug to nine parts of granular silt will effectively control most roundworms. In warmer climates two or more individual doses of phenothiazine. in addition to the medicated lick, may be necessary for effective roundworm control.

The arthropod parasites include the sheep tick or ked. nose grub, screwworm and several kinds of lice and scab mites. The sheep ked is a wingless fly which sucks blood and causes skin irritation; it also stains the wool and reduces its market value. Keds may be controlled by immersing infested sheep in dips containing rotenone or other insecticidal substances and also in an aqueous suspension of 0.03% lindane. Nose grubs. which are larvae of the fly *Oestrus ovis,* live in the head sinuses. They may be destroyed by spraying into the nostrils. under pressure, a solution of saponified cresol. Screwworms are the larvae of the blowfly. *Cochliomyia americana;* they infest wounds and cause extensive damage. Screwworm infestations are best treated by the application of a smear having diphenylamine as its basic ingredient. Lice suck blqod and irritate the skin: they may be controlled by the use of insecticidal dips or applications containing coal tar creosote. arsenic or nicotine. Scab mites cause skin irritation, falling out of the wool. unthriftiness and even death; control or eradication is accomplished by dipping in lime sulfur and nicotine dips.

A dip prepared from benzene hexachloride (BHC). found to be highly effective against scale mites, requires only one dipping instead of the usual two needed when the older dips are used. The dipping vat should be filled with enough clean. .unheated water to cover the sheep and the required amount of BHC powder added and thoroughly stirred. The head of each sheep should be submerged at least twice for an instant so that the wool about the head and face are thoroughly wet. The dip should he changed when it becomes filthy because BHC will not kill bacteria and open wounds may become infected with dirty dip.

(E. W. Pe.; J. K. R.; M. A. D.)

Products. — For wool and meat production, *see* Wool; Lamb and Mutton. The pelt is also a major by-product of sheep slaughter. The pelts, with the wool removed, known as slats. are tanned for leather which is used for upholstery, bookbinding. gloves, clothing and shoe uppers. With the wool. the pelts are a basic material for the manufacture of durable and warm outer clothing.

Not only the carcass as such but the liver, heart. kidney and some other parts are used for human food. Some of the internal glands have pharmaceutical uses. The small intestines are valuable sausage casings and are significant in international trade. They also are used to make surgical and musical catgut. Wool grease or lanolin has important uses in lubricants. ointments and cosmetics. Sheep tallow has both edible and inedible uses.

Live sheep enter international trade in comparatively small numbers, mostly as select breeding stock.

Improvement of Sheep. — The existence of more than zoo different breeds of sheep. differing in appearance as well as in function. indicates the variety of ideals held by breeders. It also indicates the wide range of genetic material available for experimentation. Unfortunately, most herdsmen in the past made little use of either line breeding or inbreeding to develop their flocks. By mid-20th century those techniques were utilized as well as progeny testing and some selection indexes and performance yardsticks. Most sheep are raised for two principal products. meat and wool. In the case of the Merino. the annual wool clip is more valuable to the grower than the yearly crop of lambs sold for meat.

In most of the Down breeds, which originated in the British Isles, the meat produced chiefly as fat lambs is more valuable than the yield of wool.

In a few parts of the world, such as in the Roquefort cheese-producing region in France and the Balkan countries, sheep are triple-purpose creatures because of their yield of milk. Even in their production of wool, sheep vary greatly. Some breeds yield long, coarse wool used chiefly in rug- and carpetmaking, as the sheep bred by the Navaho tribe of American Indians, which yield a coarse, carpet-type fleece. Merino wool can be woven into a fabric almost as sheer and resilient as silk, yet possessing greater strength and warmth. Karakul sheep, which originated in Bukhara, are valuable chiefly for their lambs, which are sacrificed when less than a week old to yield a tightly curled, beautifully patterned and lustrous soft dark fur. It was found that the curl size of Karakul lambskin fur was shifted favourably toward a smaller curl by selection in the breeding flock over a few generations.

Environment, distance from market and economic competition also influenced sheep types. Some breeds, such as the Rambouillet, have a natural herding instinct. They graze by day and bed down at night in closely gathered flocks, sometimes containing more than 1,000 sheep. Sheep which scatter when grazing because of lack of the herding instinct would soon be lost or fall victim to predatory animals.

Fortunately it was possible, by careful breeding, to make notable progress with the Rambouillet as to staple length of wool, mutton type and freedom from skin folds. Not only are good mutton type and condition of flesh associated with heavier body weights and fewer skin folds, but staple length of wool and the weight of wool, either as clean or grease wool, are positively associated. Freedom from wool blindness is somewhat less closely associated. Progress was far greater from the selection of sires than from the selection of dams.

The semiarid regions of Australia, where an area three-fifths as large as continental United States averages only 15 in. of rainfall a year and offers spare grazing of a weedy, shrubby character, are unsuitable for producing choice fat lambs, but the Merino sheep with its excellent fleece of fine wool thrives there. The long distance of Australia from most of the world's markets is not a serious factor for a product as imperishable and light in weight as wool. Nevertheless, the Merino represented a declining percentage of the Australian sheep number from 1939 to 1947, due mainly to the wartime demand for crossbred sheep and to droughts in the pastoral areas where Merinos predominate. Merinos increased from 70% to 74% between 1947 and 1953. A notable postwar development was the increase in "other" breeds, mainly Corriedales and Polworths. The Merino was found to be uncommonly effective in grading up the common sheep flocks of India and the middle east.

Shifts in the relative profitableness of mutton and wool have been a cause of considerable crossbreeding in sheep production. The Corriedale breed, which originated in New Zealand from crossing the Lincoln and Merino breeds, is about equally valuable for lambs and wool under range conditions. The same is true of the Columbia, developed by the U.S. department of agriculture from a Lincoln-Rambouillet cross. The Corriedale and Columbia possess the herding instinct; their ewes have the mothering qualities so necessary in range sheep and they produce large lamb crops. The experiments which resulted in the Corriedale were begun before 1870, utilizing Lincoln, Romney or Leicester rams on Merino ewes, after which, by inbreeding, a not yet completely standardized dual-purpose animal was developed having a heavy yield of near-Merino quality wool as well as good meat quality whether taken as fat lamb or ewe mutton. It is adaptable to areas as diverse as Kenya and Tierra del Fuego and gives a high lambing ratio. Flocks were established in most sheep regions, particularly those of the southern hemisphere. In western United States, Corriedale rams were used especially on Rambouillet ewes to give an improved quarter-bred.

Scientific crossing has given good results. Crossbred Hampshire, Shropshire and Southdowns gave a much better survival ratio to weaning time, plus more rapid weight gains. Crossing of Columbia with Southdown gives wool production of very good staple length, quality and quantity, as well as producing excellent feeders with a satisfactory market finish at desirable weights. Southdown and Shropshire lambs excel in edible meat production, giving the highest proportion of preferred cuts, including legs, loins and ribs.

In the United States several state and regional experiment stations, particularly the sheep experiment station at Dubois, Ida., and the southwestern range and sheep breeding laboratory, Fort Wingate, N.M., compare different systems of breeding and develop more effective methods of selection. Various traits of lamb and wool production are analyzed for heritability and economic importance. Comparisons are made between inbred lines formed by selection within lines and by recurrent selection of sires from line-cross and top-cross progeny tests. Non-inbred selected groups are developed in each breed for comparison with inbred lines and their crosses. A genetically stabilized group is also established with selection at random to serve as a control for the selected groups.

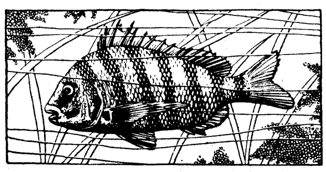
SHEEPSHEAD, one of the large species of the genus *Archosargus.* These fishes possess two kinds of teeth: one, broad and flat, like incisors, in a single series in the front of the jaws; the other, semiglobular and molar-like, in several series on the sides of the jaws. The genus belongs to the acanthopterygian family Sparidae, which includes the sea breams. The common sheepshead occurs in abundance on the Atlantic coasts of the United States, from Cape Cod to Florida and Texas, and is one of the most valued food fishes. It may attain a length of 30 in. and a weight of 15 lb. Its food consists of shellfish which it detaches with its incisors, then crushing them with its powerful molars. It may be distinguished from allied species by its seven or eight dark cross-bands.



BY COURTESY OF THE N.Y. ZOOLOGICAL SOCIETY

SHEEPSHEAD (ARCHOSARGUS PROBATOCEPHALUS), A FOOD FISH FOUND ALONG THE EASTERN COAST OF NORTH AMERICA

The term "sheepshead" is also given in some parts of North America to a fresh-water sciaenoid, *Aplodinotus grunniens.*

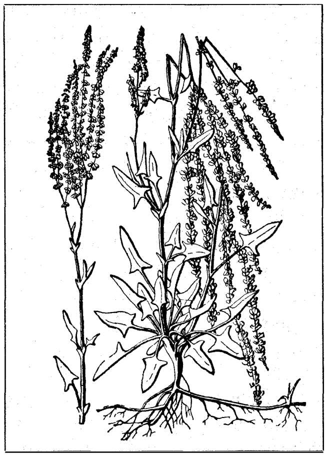
SHEEPSHEARING MACHINES. In countries where individual flocks of sheep are large or where wages are high, mechanical aids to hand clipping are employed in order to lower the cost or to speed up the work. In the pastoral districts of Australia, New Zealand and South America mechanical shearing is almost universal. In Great Britain, although hand clipping is still widely practised, the use of shearing machines is gradually extending. Hand shearing leaves the clipped surface in ridges whose evenness and symmetry are an indication of the skill of the operator while the machine leaves the surface level. It is claimed that the machine clips a heavier fleece than hand shears; but the result depends largely on the comparative skill of the operators.

The essential components of a shearing machine are a comb which is guided by hand over the body of the animal; a cutter with sharp edges which shears the wool by passing backward and forward across corresponding edges on the comb. a reciprocating device for actuating the cutter, a flexible or universally jointed coupling for driving the cutter, and the hand wheel or power unit. The moving parts of the actuating mechanism are protected so as to prevent them becoming entangled in the wool. Hand machines are usually mounted on a metal stand and can be easily carried by one man. They are driven by a chain or belt from a wheel to which the handle is attached, and require two persons to operate them, one to turn the handle and the other to clip the sheep. These machines are suitable only for small flocks. When large numbers of sheep have to be clipped, the machines are invariably power driven. A long shed may be specially adapted for shearing: shafting is then mounted along one side to which several shearing machines are connected: an internal-combustion engine or other motive power is used to drive the shafting. Portable shearing outfits are also common and enable the machine to be taken to the flock. The power unit (usually an internal-combustion engine) is mounted on a suitable transport truck and the shearing units are either connected to a portable shafting or to separate points on the truck itself. Electric drive has been found to be the most satisfactory for shearing machines and it is not unusual to employ an internal-combustion engine to drive a dynamo which in turn is used to operate separate motors for driving the shearing units.

(B. J. O.; H. G. R.)

Horse-clipping machines do not differ materially from sheep-shearing machines but special combs and cutters are used. The latest development for shearing small flocks is the self-contained electric machine having a motor in the handle.

SHEEP SORREL (*Rumex acetosella*), a small perennial plant of the buckwheat family (Polygonaceae), native to Eurasia. It is common in northern Europe and is naturalized in North America. It has two kinds of plants, staminate and pistillate; the latter usually turn red as the seeds mature in the numerous slender flower clusters. The leaves have a sour taste. The plant, though frequently considered as an indicator of acid soil, also thrives on neutral or alkaline soils if these are low in nitrate nitrogen.



SHEEP SORREL, A HARDY SUMMER WEED OF THE TEMPERATE ZONE

SHEERNESS, a seaport, naval establishment and urban district on the Isle of Sheppey (*q.v.*), in the Faversham parliamentary division of Kent, Eng., on the right bank of the Medway estuary at its junction with the Thames, 48 mi. E. of London. Pop. (1961) 14,123. Area 1.5 sq.mi. The town is divided into three sections—naval; residential and business; and recreational. Blue town, the oldest, contains the naval dockyard built on a site surveyed by Samuel Pepys. secretary to the navy, in 1665. The fort at Garrison point was built after the taking of Sheppey by the Dutch in 1667. In 1797 Sheerness was involved in the Nore mutiny by the landing in force of the mutineers and it was there that Lord Nelson's body was brought ashore irom his flagship, the "Victory." Mile town, built after Blue town, comprises shopping and residential streets; while Marine town, lying along the sandy eastern shore, forms an additional residential area, with pleasure gardens and an open-air swimming pool.

SHEETS, IRON AND STEEL. The production of rolled sheet iron dates back before 1620 in Bohemia and mas introduced in Wales in 1720. Most of the rolling was done by hand, and great skill was required. The sheets were usually made of puddled or wrought iron. Upon the development of the Bessemer process and the open-hearth process (*see* CONVERTER STEEL; OPEN-HEARTH STEEL PROCESS), steel was produced more rapidly and cheaply and practically replaced iron. However, steel sheets showed shorter service life under corrosive conditions, and interest in sheet iron reawakened. Metallurgists found methods of manufacturing it in larger quantities and less laboriously. To-day iron sheets are generally available and marketed at prices not greatly different from those of steel sheets.

Production.—In the production of sheets and strip, the first part of the process is much the same as that employed for plates, sections, and other products. The metal is refined, teemed into ingot moulds, heated again in the soaking pits to insure uniform heat before rolling.

Old Rolling Practice.—Under the old hand-operating practice—now largely outmoded by the continuous mill—ingots were reduced to slabs in the blooming mill, further reduced in the bar mill, cut into specified bar lengths, which became the width of the sheets to be rolled from the bars. Bar thickness governed the ultimate gauge of the sheet.

Continuous Mill.—In modern mills the ingot is rolled to a slab in a mill having horizontal rolls and a second mill with vertical rolls, known as an edger, arranged in tandem with a turning mechanism between and spaced approximately thirty feet apart. With this mill arrangement it is possible to roll a slab having any desired width (within the capacity of the mill) without regard to the ingot width. The width of the finished strip is not limited to the width of the ingot from which it is rolled. The usual practice is to roll the slab from 4″ to 6" thick and equal to the strip width. Slab is trimmed at ends and reheated before rolling on the continuous bar and strip mill. The reheated slab is discharged upon the mill table, which carries the slab to the bar mill. The bar mill may consist of four to six sets of rolls arranged in tandem! each succeeding roll reducing the thickness, and turning slightly faster. These rolling mills reduce the slab to a plate ranging from $\frac{3}{8}$″ to $\frac{3}{4}$″ in thickness. Plates can be removed beyond the last bar mill stand when plates of such thickness are desired.

Proceeding from the bar mill the steel passes to the strip mill, consisting usually of five to six stands of rolls, also arranged in tandem, which roll the plates ($\frac{3}{8}$″ to $\frac{3}{4}$″ thick) to thinner gauges such as ·0625″ to ·100″. These are delivered on a mill table beyond the last mill at surface speeds ranging from 1.000 to 2,000ft. per minute. The finished hot strip travels approximately 350ft. to a coiling machine that winds the strip into coils to facilitate handling for storage and further processing.

The coils may be cut up into units for rolling into lighter sheets or tin plate on the conventional hand-operated hot mill, or may further be reduced in gauge on the cold-reduction tandem mill. The wide tandem cold mill has now come into general use for producing tin plate and sheets and strip in the range of 14 to 32 gauge. Before the hot strip is delivered to the cold mill for further reduction, hot mill scale is removed in a strip pickler. The strip is passed through a sulphuric acid solution, washed, dried, oiled, and recoiled.

The strip is now ready for the cold-reduction mill, which consists of three or more roll stands arranged in tandem and a .spool-type coiling machine beyond the last stand. The operation here is much the same as described for the hot mill. except that the strip is under considerable tension between the mills and between the last mill and the coiling machine. Rolling under tension improves the gauge and flatness, and also gives a high finish texture to the sheets. The strip is either finished and marketed in coils or cut into sheet lengths as ordered; yet in either case the finishing process is the same. The sheets or strip are annealed in a controlled atmosphere to relieve the strains caused by rolling and to provide a dead soft sheet, which is then temper rolled on a mill to produce such hardness or temper as is specified. On orders requiring a dead flat surface, such as for metal furniture, the sheets are stretched flat in a hydraulic machine. The product is inspected, resquared when necessary, and shipped.

Galvanizing. — If the sheets are to be galvanized they are coated with zinc in galvanizing pots. (See GALVANIZED IRON AND STEEL.) The speed of the exit rolls and the temperature of the zinc control the weight of coating. Zinc makes a very good coating for iron and steel because it forms an alloy bond with the iron.

Painting. — Paint is often used to cover galvanized iron. Once the common practice was to permit the zinc coating to weather several months. A quicker alternative was to treat the zinc with acetic acid, which etched the smooth surface. Both methods had obvious drawbacks. Now many galvanized sheets are rendered paint gripping by a special phosphate treatment at the mill. No zinc coating is lost; the galvanized sheets take paint readily; and no zinc compounds are left on the surface prematurely to dry out the paint. Bitumastic or asphalt coatings are sometimes applied to galvanized sheets and plates. They are especially valuable where erosion is encountered.

Uses. — In general, galvanized sheets are used in products and construction where corrosion is a factor. Among the important uses are culverts, roofing, air conditioning and general sheet-metal work. In the uncoated classification are the cold-rolled grades for products that require a fine finish, such as automobiles and metal furniture; enamelling iron for products to be finished with porcelain enamel; electrical sheet steel for motors and transformers, as well as hot-rolled sheets for a wide variety of consumer products and industrial applications.

(See TIN PLATE AND TERNEPLATE; GALVANIZED IRON AND STEEL.) (E. B. H.)

SHEFFIELD, a city, county and parliamentary borough in the West Riding of Yorkshire, Eng., 158 mi. N.N.W. of London, 38 mi. E.S.E. of Manchester and 52 mi. S.S.W. of York by road. Pop. (1961) 493,954. Area 61.9 sq.mi. It is in the extreme south of the county, at the foot of the Pennines and at the junction of the Don with its tributaries the Sheaf, Porter, Rivelin and Loxley.

At the time of the Domesday survey Sheffield (Escafeld) was a subdivision of the large manor of Hallam. At that time the Meersbrook, the Limb Dyke and the Sheaf, which had divided Mercia from Northumbria, were the boundary between Yorkshire and Derbyshire and continued to be so until 1900. After that, extensions of the city boundary carried Yorkshire several miles into Derbyshire.

Early in the 12th century, the Norman William de Lovetot built a castle at the confluence of the Sheaf and the Don. and a parish church. These two focal buildings were in, or near to, the submanor of Sheffield. and this was no doubt why the name of Sheffield soon superseded that of Hallam for the town and manor; though Hallamshire (Sheffield, Ecclesfield and Bradfield) continued to be an area of administration cut off from the rest of Yorkshire by the great moors north of Bradfield.

In 1297 Thomas de Furnival, then lord of Hallamshire, granted to his "Free tenants of the town of Sheffield" certain privileges as burgesses. These free tenants continued to be the body most concerned with local government until in the reign of Edward VI certain property which had been left to them in trust was forfeited to the crown under the Act for the Suppression of Colleges and Chantries. On their petition it was restored by Queen Mary in 1554, and as she preferred to separate the ecclesiastical from the civil duties she created by charter a body of 12 capital burgesses who discharged their functions side by side with the free tenants. Both are now charitable trusts — the Church Burgesses and the Town Trustees. Mary, queen of Scots, spent some time at the Manor lodge during the 14 years of her captivity at Sheffield castle.

Industries. — The district is rich in sources for metalworking. From early times the local iron ore had been smelted by charcoal obtained from the abundant woodlands. Smiths, and probably cutlers, were active in the neighbourhood as early as the 14th century. The millstone grit of the district provided excellent grindstones During the 15th century the streams which converge on Sheffield began to be used for power for grinding and forging. Though the cutlery industry was for many years a rural one, carried on in a succession of water mills which packed the banks of the rivers from their sources on the moors to the boundary of Rotherham, the importance of Sheffield was established as the market town where the wares were finished and sold. This resulted in its emergence as the main provincial cutlery town and a powerful rival to the cutlery trade of London. By 1700 the London cutlers also were defeated; thereafter Sheffield enjoyed a monopoly of the English cutlery trade. The variety and quality of products reached a very high level in the late 18th and early 19th centuries — spring and table knives, razors. scissors, surgical and mathematical instruments, edge tools, saws, agricultural and joiners' tools, files and rasps of every grade and size. The introduction of steam grinding released the industry from its dependence on the rivers but until very recent times there was little change in the organization of an essentially small-firm industry.

The crisis of Sheffield's industrial history was reached about 1740, when Benjamin Huntsman moved from Doncaster to Handsworth (now within Sheffield) to experiment in the production of a steel harder and more even than could be made by the older methods of smelting and forging. The crown of his experiments was crucible steel. the reliable tool steel which marked the beginning of special steelmaking in England. By 1830 Sheffield was recognized as the centre of high-grade steel manufacture. Shortly afterward the opening of the first local railways made possible the movement, and therefore the manufacture. of really large castings. It followed naturally that when in 1856 Henry Bessemer invented his method of making inexpensive steel in large quantities, he should set up a works in Sheffield. During the remainder of the 19th century the heavy industries grew rapidly. aided by the development, by Sir John Brown *(q.v.)* and Charles Cammell, of the manufacture of armour plate for ships, and the discovery by Sir Robert Hadfield *(q.v.)* of a workable manganese steel. Development in alloy steels, including the perfection by Harry Brearley of noncorrosive ("stainless") steel, in 1912, went on apace. The area between Sheffield and Rotherham was quickly filled with the great works which clang and glow so impressively through the night in the Don valley.

About the same time that Huntsman was experimenting, Thomas Boulsover, a cutler, discovered the process of plating copper with silver by fusion which resulted in the beautiful ware known as old Sheffield plate. (See SHEFFIELD PLATE.) Factories for making it were established rapidly and played a large part in bringing to the town wealth which had eluded the older small-scale cutlery manufacturers. The discovery of the method of electroplating killed the more expensive plate trade almost overnight in 1850, and the surviving specimens have become museum pieces eagerly sought by collectors; but the silver and electroplating trades continue, and the city still has one of the few provincial assay offices (established 1773).

The cutlers organized their industry on craft guild lines very early; the first trade-mark known was granted in 1554. In 1624 they were incorporated as the Company of Cutlers in Hallamshire, with jurisdiction for six miles round Hallamshire as well. As a guild, the company relinquished most of its powers in 1812, but has since revived as a powerful influence in upholding the quality of Sheffield wares. By acts of 1883–88, the company has the right of registering trade-marks for all goods composed in whole or in part of any metal, wrought or unwrought, in its ancient area of jurisdiction, and its membership now includes the manufacturers of steel as well as cutlers.

Although the cutlery, steel and auxiliary trades still occupy the greater part of Sheffield's wage earners. there are important minor industries. Haft, handle and case making naturally accompany the cutlery trades. Sheffield has the largest type foundry in England and there are snuff factories, food factories, confectionary works. fruit and vegetable canning, iron and brass founding, paper manufacture, bookbinding and the making of optical instruments, bicycles, brushes, railway fittings, chemicals, paints and varnish.

Communications. — Sheffield lies on no great lowland route or natural highway. To the northwest and south the valleys lead to Pennine dales and lofty moorlands. For many centuries the only ways were along steep and narrow tracks, except beside the Don from Rotherham.

In 1726 improvements were made in the navigation of the Don from Doncaster west to Tinsley, to help the trade of Sheffield; in 1814 a canal from the heart of Sheffield to Tinsley completed the outlet by nater. Ten turnpike roads made between 1756 and 1819 brought the town out of its isolation, but the gradients daunted the early railway engineers, and the first line, opened in 1835, only connected Sheffield with Rotherham, on the original Midland line.

The present main line through Chesterfield was not built until 1876, after the tunnelling of the Sheaf-Rother natershed. Long tunnels connect Sheffield by rail with the west and even in the 1950s relatively little of the trunk traffic of England passed through the city.

Later History. — During the period generally known as the Industrial Revolution the population expanded so rapidly that the ancient bodies of local government could not cope with the new problems of urban management. The first interest of the day nas in parliamentary reform and in 1832 Sheffield was allotted two members in the reformed parhament. The Municipal Corporations act of 1835, allowing named towns to apply for a charter of incorporation as boroughs of the modern type, nas adopted in 1843. In 1893 the borough was created a county borough and city and in 1897 its chief magistrate received the title of lord mayor. In 1911 the census returns showed that Sheffield had taken a place above Leeds as the largest city in Yorkshire. In this period the built-up area spread rapidly along the valleys: during the 20th century pleasant new suburbs were extended over the hillsides.

In 1914 the diocese of Sheffield was created from the see of York, the old parish church becoming the cathedral church of St Peter and St. Paul. Only the tower and chancel of the 15th-century building (which replaced two earlier ones) remain, but the present building has some fine alabaster monuments and some interesting modern stained glass

In 1897 the university college was created by the amalgamation of the medical school (founded in 1828), the technical school (1886) and Firth college (1879), a university extension venture for which Mark Firth, a steel manufacturer, had provided the building. In 1905 the college received its charter as the University of Sheffield. Although it provides ample opportunities for a broad cultural education, the university especially developed branches of study and research in glass and fuel technology, metallurgy, mining and engineering. Sheffield was one of the first towns to provide secondary education; at mid-20th century there mere eight grammar schools, including King Ednard VII school, formed in 1905 by the union of the old Royal Grammar school and two private schools, administered by the municipality. There were also colleges of arts and crafts, and commerce and technology.

The town hall, opened in 1897, is a good example of Victorian Gothic housing the municipal offices. Twentieth-century buildings include the city hall (1932) for concerts and meetings; the city museum (1937) with excellent collections of cutlery, plate and Derbyshire antiquities. and the central library and Graves art gallery (1934) The library is a fine one, well known for material on ferrous metallurgy and for collections of local archives. In Meersbrook park uas the Ruskin museum (closed 1952) containing John Ruskin's collection of works of beauty lent to Sheffield from St George's guild by his desire.

Sheffield's growth and appearance have been adversely affected by the lack of large commercial undertakings in earlier periods, by the necessarily dirty nature of its major industries and by two heavy air raids sustained in Dec. 1940. Nevertheless, finely sited on a hill-and-valley system of great beauty, Sheffield is a pleasant and in some ways a beautiful city. There are open spaces and tree-lined streets less than a mile from the city centre, and the purple moors of the Pennines and the deep wooded dales of Derbyshire sweep up to the very edge of the residential area.

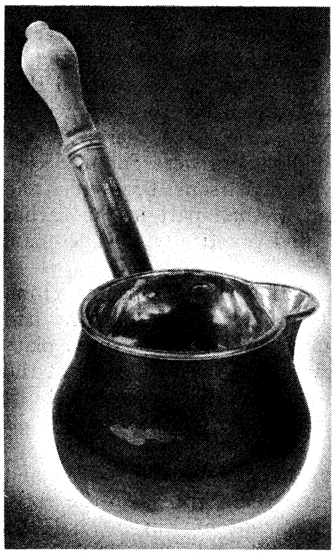
SHEFFIELD PLATE is the term applied to articles produced from copper and coated with silver by the process of fusion.

History. — About the year 1742 Thomas Boulsover, a Sheffield, Eng.. cutler, while undertaking repairs to the haft of a knife observed that by the application of heat a piece of silver and the copper to which it accidentally adhered had become fused and could be dealt with as one metal and that the two metals behaved as one when subjected to hammering. This caused him to experiment, with the result that he eventually produced buttons and boxes with a copper foundation coated with silver which had the appearance of being made entirely of the more precious metal. Joseph Hancock. who served his apprenticeship with a relative of the inventor, realized the wider possibilities of the discovery and was the first to apply the process to making saucepans, coffeepots, candlesticks and other large articles for domestic service: closely resembling in their detail hallmarked silver specimens.



BY COURTESY OF SHEFFIELD CITY MUSEUM
SAUCEPAN. BY JOSEPH HANCOCK, MADE ABOUT 1755, SHEFFIELD, ENG.

These pioneers were soon followed by other cutlers who added the production of Sheffield plate to their other undertakings. Two factors were necessary for the complete success of the new invention. viz, capital and skilled labour.

The money required was readily obtained locally, but the highly trained assistance of London silversmiths was also essential and ultimately nhen their services were enlisted the success of the undertaking was assured.

The excellent appearance and relative cheapness of these plated productions caused a widespread demand. Henry Tudor, a local gentleman, having realized the great possibilities of the invention, appears to have been the first to seek the assistance of a London silversmith, and about the year 1760 entered into partnership with Thomas Leader, and as Tudor and Leader they founded the first Sheffield plate and silver manufactory on an extensive scale. Boulsover apparently did not embark on this new phase of the industry. but turned to the rolling of metals, still however, carrying on his lucrative plated button manufactory.

Hancock appears to have carried on the making of Sheffield plate from about the year 1750 until 1765. He then interested himself chiefly in the production of plated materials required by manufacturers of the finished articles. Originally beaten out into sheets by hand the fused metal was subsequently manipulated by rollers turned by hand; the application of horse and water poner followed, and eventually steam was employed to drive the mills.

The establishment of Leader in Sheffield raised the artistic standard of the craft, and from being content at first to copy contemporary London-made silver the Sheffield plate workers soon evolved a style of their onn and found much inspiration in the work of the Adam brothers and John Flaxman, particularly in the construction of candlesticks. So cunningly devised were some of their productions and so peculiarly marked that in the year 1773. the London silversmiths were successful in obtaining an injunction restraining the Sheffield plate makers from using marks on their wares.

Prominent amongst men of local origin who assisted in the advancement of design and workmanship in this new craft, and who themselves built up lucrative businesses. were John Winter, Thomas Law, Richard Morton and Joseph Ashforth, whose marks

BY COURTESY OF SHEFFIELD CITY MUSEUM

DUMMY MARK. USED BY MANY EARLY PLATERS. ON HOT-WATER JUG MADE ABOUT 1755; UNIDENTIFIED

are still to be found on old Sheffield plate made previous to 1773.

By the year 1784, after much agitation the Sheffield platers were authorized to use marks once again, but it was enacted that such marks should bear the name of the maker together with a distinctive device not used for silver. About the year 1790 the most prominent manufacturers and designers were Samuel Roberts, Nathaniel Smith, Daniel Holy, the Watsons, Bradburys and Creswicks. Birmingham played but a small part in the earlier history of the trade, being represented practically by one man, Matthew Boulton.

Though his workmanship, in association with his partner John Fothergill, is excellent and dates from the period 1760, he had many other interests, and articles made by him from fused plate of the first period are somewhat scarce. In the early part of the 19th century he and his successors carried on an increasing business, and their device, the sun, is still to be found on many old Sheffield specimens.

The manufacture of fused plate, though confined in England to Sheffield and Birmingham for many years, spread in the early part of the 19th century to the continent of Europe, but the articles made in France, Russia and Central Europe never bore comparison in quality or craftsmanship with those of the Sheffield makers.

Processes. — To produce the plated metal sheets, ingots of copper containing a slight alloy, $1\frac{1}{2}$ in. to $1\frac{1}{4}$ in. thick by 24 in. wide by 8 in, long, were cast, and the surfaces planed, then smoothed. A sheet of silver was cut to the size of the face of the ingot, about $\frac{1}{8}$ in. thick, also smoothed on the surfaces. The two prepared surfaces were cleaned of all impurities, placed together and firmly pressed. A copper plate dressed with solution of chalk was placed upon the silver and all three firmly secured together, and bound with iron wire.

The ingot was now placed in a furnace especially prepared, and most carefully watched until the silver melted slightly when it firmly adhered to the copper surface. After being withdrawn from the oven and allowed to cool, the copper plate and iron wires were removed from the ingot which after being well cleaned and trimmed was ready for the rolling mills.

At first plated on one side only, a new process was discovered about the year 1765 which enabled the makers to produce sheets with a coating of silver on both sides of the metal. The ingenious craftsmen were now not far off realizing their ambition. viz., to produce articles that were indistinguishable from those made in London of standard silver.

Plated Wire. — About the year 1768, plated wire was introduced. A strip of fine silver $\frac{1}{32}$ in, thick was bent to fit a round copper rod 5 in. long by 1 in. diameter. The two metals were then united by fusion and afterward drawn continuously through a "whortle" until they assumed the form of a wire. The repeated drawings brought the two silver edges together almost as one piece. This early method was improved upon and superseded some years later, though the original principle was adhered to in its general details.

Silver Edges.—The next e that marked a great advance in manufacture was the addition f silver lg , invented t George Cadman in 1788. Previous to this tl raw copper edges had been hidden with solder.

The method consisted oi drawing a hollow silver wire tl g a hole which corresponded in size exactly with the edges of the article it was intended to cover: at the same time this process shaped up the silver thread to a groove, thereby enabling the operation of soldering on these silver edges to be carried out more easily.

Silver Shields for Engraving.—The method of rubbing in silver shields by applied heat was evolved about the year 1810. Previous to this in order to carry out the engraving of crests, etc., it had been necessary to solder in extra heavily plated sections of metal.

This invention has been attributed to a man of the name of Wilks, who also improved the method of production of plated wire. Having hammered the surface onto which the shield was to be fixed, a piece of pure silver was cut suitable to the size of article to which it was to be made to adhere and heated lightly in a flame, it was flattened all over and chamfered on the edges, as thinly as possible.

After being cleaned of impurities the shield was secured to the centre of the plate and heated till it adhered to the metal, then quickly rubbed with a burnish until it was definitely sealed to the under surface. The blank was subsequently hammered until both silver shield and fused plated sheet were brought to one level.

With all these discoveries and inventions allied to their skill in technique and design, it is not surprising that early in the 19th century the Sheffield platers then at the height of their prosperity led the fashion in production of domestic silver as well as Sheffield plate.

By the aid of steel dies in which the delicate tracery of their conceptions could be stamped, they continued to produce on an elaborate scale new designs with which the London silversmiths found it difficult to compete.

End of the Industry. — Having for close on a century held the field for pre-eminence in design and workmanship, Sheffield plate was gradually superseded'by articles plated by the process of electrodeposition; though even as late as the 1851 exhibition the reports of the jurors were unfavourable to this new invention. "They desired to guard against being considered as expressing an opinion on the merit of the application of the electro process of silverplating to objects of domestic use."

By the year 1860 the firms in Sheffield which had declined to adapt themselves to this innovation were gradually dying out. Though the two processes had merged into each other gradually by the year 1865, the older method of plating by fusion for articles of domestic use had ceased to exist. The production of fused plated silver is still carried on for the making of buttons, it having been found that the rolling and hammering of the sheets is conducive of greater lasting properties for articles so continuously subjected to hard wear.

Old Sheffield Plate. — About 30 years after its disappearance as a commercial commodity, the acquisition of what was by then termed "old Sheffield plate" became a cult amongst collectors of antiques. It was evident that the process of manufacture might be classed as a lost art. The superb workmanship could not be disputed and was well nigh impossible of reproduction. Most of the older skilled craftsmen had by then passed away, and the younger ones had adopted other callings. The demand soon began greatly to exceed the supply. This state of affairs was folloned by the appearance on the market of many imitations electro-plated on copper, which were dishonestly described as "Sheffield plate." To so great an extent were these spurious articles sold as Sheffield plate that in the year 1911 prosecutions were undertaken by the Sheffield Cutlers company, when it was established in court that the term "Sheffield plate" could only legally be applied to articles made by the older method of plating

by fusion.

The tendency today has not been toward a general increase in values of all specimens of old Sheffield plate, but those of utility such as candlesticks, candelabra, waiters, trays, entrée dishes, tea services, salt cellars and mustard pots, coffeepots, and many original designs in pierced work have advanced greatly in value. For such articles in perfect condition almost as high a figure is occasionally paid as for contemporary hallmarked silver specimens.

TWO SUNS, MARK OF MATTHEW BOULTON, ON CANDELABRUM MADE ABOUT 1815, BIRMINGHAM, ENG.

With regard to the large articles that, early in the 19th century, were so prominently displayed on sideboards and dining tables, these, under modern conditions of home life, are not now greatly in request, consequently they may frequently be purchased at a price which is under their original cost.

With regard to the future of the industry, the modern demands for a cheaper class of goods has led to a deterioration of design generally associated nith mass production. Possibly silver plated articles may eventually be superseded for domestic use by solid silver, which since the removal of duty in 1891 and decline in value of the raw metal has greatly grown in demand. Again, too, there has been a resuscitation of pewter for table use, which is treated more scientifically than formerly and bears a marked resemblance to a standard silver. Penter also has the advantage of practical immunity from tarnish, while the material is easily worked and very durable.

The manufacturers of best quality plated goods are today more concerned with the production of mares suitable for hotels, restaurants and clubs, than for domestic utility.

(F. BRA.)

SHEHITAH (SHECHITAH) is the special method of slaughtering animals employed in preparation for kosher food; *i e.*, food prepared in consonance with the Jewish dietary laws. It consists of an incision made across the neck of the animal or fowl by a qualified person especially trained for ritual slaughter, with a special knife that is razor sharp and has a smooth edge with absolutely no nicks. The cutting must be made by moving the knife in a single swift and uninterrupted sweep, and not by pressure or by stabbing. The cut severs the main arteries, permitting the blood to drain from the body, as well as rendering the animal unconscious.

The slaughterer (shohet) recites a prayer before the act of shehitah.

Objection has sometimes been raised to this method of slaughter of animals on grounds of cruelty. The sight of the struggling animal aroused the concern of humane societies, and in some European countries this resulted in legislation forbidding shehitah. In other countries it brought about the use of special pens in which the animal was kept during the process. Scientific opinion indicates, however, that severance of the carotid arteries and the jugular vein by one swift movement results in almost immediate loss of consciousness, and the afterstruggle is reflex muscular action.

SHEIKH (SHAYKH), an Arabic title of respect. Strictly it means a venerable man, of more than 50 years of age. It is specially borne by heads of religious orders, chiefs of tribes and headmen of villages. Every village, however small, every separate quarter of a town, has a sheikh in whom is lodged the executive power of government — a power loosely defined, and of more or less extent according to the personal character and means of the individual who wields it..

For the Sheikh ul-Islam *see* MUFTI.

SHEKEL, originally a Jewish unit of weight ($\frac{1}{50}$ of a mina, and $\frac{1}{3000}$ of a talent) and afterwards a coin of the same weight (Heb. *shakal,* to weigh). The Biblical references to shekels must refer to uncoined ingots. In the time of Josephus it seems that tho *light* shekel weighed from 210 to 210·55 grains; the *heavy* shekel was twice that amount, corresponding to 1s. 4½d. and as. 9d. respectively in English silver. Jewish shekels were first coined by Simon the Hasmanean, probably in 139–138 B.C. These bear inscriptions in the archaic Hebrew and various emblems, such as the cup or chalice, the lily branch with three flowers, the candlestick, the citron and palm branch and so forth. They never bear the portraits of rulers or figures of animals. A later series of shekels, belonging to the Roman period, are tetradrachms, "which came from the mints of Caesarea and Antioch and were used as blanks on which to impress Jewish types." Hence in Matt. xvii, 23 the temple tax of half a shekel is called a didrachm (2 drams). In 2 Samuel xiv. 26 we read of "shekels after the King's weight." The Hebrews divided the shekel into 20 parts, each of which was called a *gerah.* (*See* also NUMISMATICS.)

See articles in *Ency. Bibl.* col. 4,442, and Hastings' *Dict.* of *the Bible,* ii. 417 *seq.;* F. W. Madden, Coins *of* the *Jews* (1881); T. Reinach, *Jewish Coins* (1903).

SHEKINAH, a Hebrew word meaning "that which dwells," or "the dwelling." An expression used in the Targums in place of "God." The word "Shekinah" is of constant occurrence in the Targums (*q.v.*). Great care was taken by the scribes to mitigate the anthropomorphic expressions applied to God in the Scriptures, and, by paraphrase, to prevent such expressions from giving rise to erroneous views in the popular mind as to God's personal manifestation. Thus, whenever any indication of local limitation or action of God was implied or expressed, in the Hebrew text, the Targumists were careful to substitute some expression involving the use of "Shekinah." Thus Ex. xxix. 45 is rendered in the Targum (Onkelos): "And I will cause my Shekinah to dwell," etc. All expressions implying God's *local* presence are similarly rendered: e g, Habak. ii. 20 "Jehovah was pleased to cause His Shekinah to dwell." "To see" God is similarly paraphrased. Thus Is. xxxiii. 17 is rendered "Thine eyes shall see the Shekinah of the king of the worlds." So "hiding the face," when used of God is regularly paraphrased "remove His Shekinah" (Is. lvii. 17, viii. 17, lix. 2). Closely connected with the idea of the Shekinah is that of "the glory of the Lord" "Glory," indeed, in this connection was conceived of as a property of the Shekinah (as, in fact, it is of God). For the divine "glory" as a property of the Shekinah, *ef., e.g.,* Is vi. 5 which is rendered "mine eyes have seen the glory of the Shekinah of the King," etc.

This Shekinah-glory is several times denoted in the New Testament by δόξα. The most notable passage is Rom. ix. 4, where St. Paul, enumerating the list of Israel's privileges, says: "whose is the adoption, *and the* glory" (ie., the Shekinah-glory); *cf*, Luke ii. 9. There is also an obvious allusion to the Shekinah in the description of the theophanic cloud of the transfiguration-narrative (St. Matt. xvii. 5 and parallels? the same verb being used as in the lxx. of Exod. xl. 34, seq There can be no doubt too, that the word rendered "tabernacle" (σκηνή) with the corresponding verb "to tabernacle" (σκηνοῦν) is used in St. John i. 14, and Rev. xii. 3, because of its likeness to the term "Shekinah." In St. John i. 14, there is an allusion to the Word (the *mēmrā* of the Targums) the Shekinah. and the Shekinah-glory, all of which the writer declares became incarnate in Jesus. Cf. also Heb i 3.

It is remarkable that the *mēmrā* (Logos or "Word") of the Targums almost entirely disappears in the Midrashic literature and the Talmud, its place being taken by Shekinah The Rabbis apparently dreaded the possibility of such terms becoming hypostasized into personal entities distinct from God. Against this they emphasized the Shekinah-idea. It Is safe to say that wherever Shekinah is mrntioned in Rabbinic literature it is God's direct action or activity that is thought of Independent personality is never imputed to it (Maimonides, however, regarded the Shekinah, like the *mēmrā* and "the glory" as a distinct entity) It is probable that the use of the term was often in Rabbinic writings polemical (against Jewish Christians or gnostic sects).

(1901, 1925); also I. W. Weber, *Judische Theologie,* pp. 185–190 (1897). For the Targums in English *see* W. J. Etheridge. *The Targums on the Pentateuch,* 2 vol. (1862); C. W. Pauli, *The Chaldee Paraphrase of the Prophet Isaiah* (1871). (G. H. B.)

SHELDON, CHARLES MONROE (1857–1946), U.S. preacher and inspirational writer, famous as the author of the best-selling novel. *In His Steps,* was born in Wellsville, N.Y., Feb. 26. 1857. He was educated at Brown university, Providence, R.I.. and Xndover theological seminary. Andover, Mass. In 1889 he founded the Central Congregational church in Topeka, Kans. His serial sermons attracted a congregation that attended both morning and evening services, and were equally popular when printed. The most successful, *In His Steps,* concerned the inhabitants of a town who pledged themselves to live for a year as Jesus would live. First published serially in 1896 and in book form in 1897, *In His Steps* is said to have sold more copies than any other book except the Bible. A more conservative estimate is 6,000,000 sales throughout the world of which 2,000,000 were in the C.S. Sheldon died at Topeka on Feb. 24, 1946.

Sheldon's other works include *Richard Bruce* (1892); *The Heart of the World* (1905); *Charles M. Sheldon: His Life Story* (1925) and *He Is Here* (1931). From 1920 to 1925 Sheldon edited the *Christian Herald.* Pacifist and Christian socialist tendencies are discernible in his writings.

See Frank Luther Mott, *Golden Multitudes* (1947).

SHELDON, EDWARD AUSTIN (1823–1897), U.S. educator. principal of the Oswego State normal and training school, which for over a generation was a powerful influence in U.S. lower schooling, was born near Perry Center, N.Y., on Oct. 4, 1823. He entered Hamilton college in 1844 to prepare for law, but ill-health forced him to withdraw in 1847. The following year, after having been admitted to the Auburn theological seminary, he was persuaded to run an Oswego charity school for underprivileged children. Thereafter he laboured in education in one capacity or other.

In 1853 Sheldon became school superintendent of Oswego, N.Y. There he introduced the educational methods of the Swiss educator, J. H. Pestalozzi. These stressed learning through the senses, and thus called for observation, the use of objects and the spoken word, and the subordination of memorizing and book learning. To acquaint his teachers with the new methods, Sheldon organized a special training class. Fiercely contested, Sheldon's ideas nonetheless prevailed, and in 1861 the city of Oswego opened a normal school to train prospective teachers in the new pedagogy. In 1865 the National Teachers association endorsed object teaching. Finally, in 1866, the school at Oswego was transformed into a state normal school with Sheldon in charge. There the Pestalozzian movement reached its height, setting the style for teacher training in the Cnited States. Sheldon died on Aug. 26, 1897.

SHELDON, GILBERT (1598–1677), archbishop of Canterbury, was born at Stanton in the parish of Ellastone, Staffordshire, and educated at Oxford. He was ordained in 1622 and was appointed chaplain to Thomas Lord Coventry (1578–1640). Four years later he was elected warden of All Souls college, Oxford. In 1648 he was ejected from All Souls by order of parliament for his royalist activities, and imprisoned for some months, but he regained the wardenship in 1659. In 1660 he became bishop of London and master of the Savoy, and the Savoy conference was held at his lodgings. He was consecrated archbishop of Canterbury in 1663. He was greatly interested in the welfare of Oxford university, of which he became chancellor in 1667, succeeding Clarendon (1609–74). The Sheldonian theatre at Oxford was built (1669) and endowed at his expense.

See V. Staley, *The Life and Times of Gilbert Sheldon* (1913).

SHELDRAKE (SHELD-DRAKE) *(Tadorna tadorna),* a bird of the duck tribe, Anatidae, distinguished by its size and upright stature. and by its striking black, white and bay plumage. The head and neck are a very dark glossy green and the speculum, or uing spot bronze-green. The bill. which bears a fleshy knob at its base, is pale red. The female is smaller but very similar in coloration. The sheldrake inhabits sandy coasts in Europe, Asia and north Africa, penetrating inland in favourable localities. The nest is made under cover, usually in rabbit burrows; in the Frisian Islands the people supply artificial burrows to obtain the eggs and down for their own profit. The male assists in incubation and care of the brood. The allied *T. radjah* of Australia, Papua. and the Moluccas is less brightly coloured. and the head is white. *Casarca rutila,* the ruddy sheldrake, inhabits Barbary, southeastern Europe and central Asia; it is an almost uniform bay, but with some black and white markings and a green and purple speculum. Other species occur in various parts of Africa and Australia and also in New Zealand. In 1859, in the London Zoological Gardens, a male *T. cornuta* was mated with a female *C. cana* from Africa, the resultant offspring resembling the two Australasian species of *Casarca.* Related to the sheldrakes are the genera *Chenalopex,* including the Egyptian goose (C. *aegyptiaca)* and *Plectropterus,* the spur-winged goose of Africa.

SHELLAC: *see* RESINS: *Natural Resins.*

SHELLEY, MARY WOLLSTONECRAFT (1797–1851), English writer, only daughter of William Godwin and his wife Mary Wollstonecraft, and second wife of the poet Percy Bysshe Shelley, was born in London on Aug. 30, 1797. For the history of her girlhood and of her married life *see* GODWIN, WILLIAM, and SHELLEY, PERCY BYSSHE. When she was in Switzerland with Shelley and Byron in 1816 a proposal was made that various members of the party should write a romance or tale dealing with the supernatural. The result of this project was that Mrs. Shelley wrote *Frankenstein,* Byron, the beginning of a narrative about a vampire, and Dr. Polidori, Byron's physician, a tale named *The Vampyre,* the authorship of which later was frequently attributed to Byron himself.

Frankenstein, published in 1818, when Mary Shelley was at the utmost 21 years old, is a remarkable performance for so young and inexperienced a writer; its main idea is that of the formation and vitalization, by a deep student of the secrets of nature, of an adult man. who, entering the world thus under unnatural conditions, becomes the terror of his species, a half-involuntary criminal, and finally an outcast whose sole resource is self-immolation. This romance was followed by *Valperga, or the Life and Adventures of Castruccio, Prince of Lucca* (1823), a historical tale written with a good deal of spirit, and readable enough even now; *The Last Man* (1826), a fiction of the final agonies of human society owing to the universal spread of a pestilence—this is written in a very stilted style, but possesses a particular interest because Adrian is a portrait of Shelley; *The Fortunes of Perkin Warbeck* (1830); *Lodore* (183j), also bearing partly upon Shelley's biography, and *Falkner* (1837). Besides these novels there was the *Journal of a Six Weeks' Tour,* which is published in conjunction with Shelley's prose writings; and *Rambles in Germany and Italy* (1844) (which shows an observant spirit, capable of some true forecasts of the future); and miscellaneous writings.

After the death of Shelley, Mary in the autumn of 1823 returned to London. At first she had to live by her writings; but after a while Sir Timothy Shelley made her an allowance, which would have been withdrawn if she had persisted in a project of writing a full biography of her husband. In 1838 she edited Shelley's works, supplying the valuable notes She succeeded, by strenuous exertions, in maintaining her son Percy at Harrow and Cambridge; in 1840 his grandfather acknowledged his responsibilities and in 1844 Percy succeeded to the baronetcy. She died on Feb. 21, 1851.

See Richard Church, *Mary Shelley* (1928); R. G. Grylls, *Mary Shelley: A Biography* (1938); SHELLEY, PERCY BYSSHE: *Bibliography.*

SHELLEY, PERCY BYSSHE (1792–1822), English poet, was born on Aug. 4, 1792, at Field Place, near Horsham, Sussex. He was the eldest child of Timothy Shelley (1753–1844), member of parliament for Shoreham, by his wife Elizabeth, daughter of Charles Pilfold, of Effingham, Surrey.

In the character of Percy Bysshe Shelley three qualities became early manifest, and may be regarded as innate: impressionableness or extreme susceptibility to external and internal impulses of feeling; a lively imagination or erratic fancy, blurring a sound estimate of solid facts; and a resolute repudiation of outer authority or the despotism of custom. These qualities were highly developed in his earliest manhood, were active in his boyhood, and no doubt made some show even on the borderland between childhood and infancy. At the age of six he was sent to a day school at Warnham, kept by the Rev. Mr. Edwards; at ten to Sion House School, Brentford, of which the principal was Dr. Greenlaw, while the pupils were mostly sons of local tradesmen; at twelve (or immediately before that age, on the 29th of July 1804) to Eton. The headmaster of Eton. up to nearly the close of Shelley's sojourn in the school, was Dr. Goodall, a mild disciplinarian; it is therefore a mistake to suppose that Percy (unless during his very brief stay in the lower school) was frequently flagellated by the formidable Dr. Keate, who only became headmaster after Goodall. Shelley was a shy, sensitive, mopish sort of boy from one point of view—from another a very unruly one, having his own notions of justice, independence and mental freedom; by nature gentle, kindly and retiring—under provocation dangerously violent. He resisted the odious fagging system, exerted himself little in the routine of school-learning, and was known both as "Mad Shelley" and as "Shelley the Atheist." Shelley's first published work, a romance entitled "Zastrozzi" (1810), appeared shortly before he left Eton. This volume was followed quickly by "Original Poetry by Victor and Cazire" (1810) written in collaboration with his sister Elizabeth; and another romance "St. Irvyne or the Rosicrucian" (1811). In these early efforts Shelley played the sedulous ape to "Monk" Lewis, Ann Radcliffe, Rosa Matilda and other exponents of the "School of Terror," but worthless though they may be intrinsically, they are not without interest as having been written by the same hand that gave us "Prometheus Unbound," and "Hellas."

Oxford Life.—Shelley entered University College, Oxford, in April 1810. returned thence to Eton. and finally quitted the school at mid-summer, and commenced residence in Oxford in October. Here he met a young Durham man, Thomas Jefferson Hogg, who had preceded him in the university by a couple of months; the two youths at once struck up a warm and intimate friendship. Shelley had at this time a love for chemical experiment, as well as for poetry, philosophy and classical study, and was in all his tastes and bearing an enthusiast. He continued to write verse and published at Oxford a small collection entitled "Posthumous Fragments of Margaret Nicholson" (1810). The title was suggested by Hogg and is the only touch of the burlesque in what otherwise is a feeble attempt at serious poetry. Hogg was not an enthusiast, but he was a steady and well-read classical student. In religious matters both were sceptics; whether Hogg, as the senior and more informed disputant, pioneered Shelley into strict atheism, or whether Shelley, as the more impassioned and unflinching speculator, outran the easy-going jeering Hogg, is a moot point; we incline to the latter opinion. Certain it is that each egged on the other by perpetual disquisition on abstruse subjects, conducted partly for the sake of truth and partly for that of mental exercitation, without on either side any disposition to bow to authority or stop short of extreme conclusions. The upshot of this habit was that Shelley and Hogg, at the close of some five months of happy and uneventful academic life, got expelled from the university. Shelley—for he alone figures as the writer of the "little syllabus," although there can be no doubt that Hogg was his confidant and coadjutor throughout—published anonymously a pamphlet entitled *The Necessity of Atheism* (1811), which he sent round to bishops and all sorts of people as an invitation or challenge to discussion. It amounted to saying that neither reason nor testimony is adequate to establish the existence of a deity, and that nothing short of a personal individual self-revelation of the deity would be sufficient.

The college authorities heard of the pamphlet, identified Shelley as its author, and summoned him before them—"our master, and two or three of the fellows." The pamphlet was produced, and Shelley was required to say whether he had written it or not. The youth declined to answer the question, and was expelled by a written sentence, ready drawn up. Hogg was next summoned, with a result practically the same. The precise details of this transaction have been much controverted; the best evidence is that which appears on the college records, showing that both Hogg and Shelley (Hogg is there named first) were expelled for "contumaciously refusing to answer questions," and for "repeatedly declining to disavow" the authorship. Thus they were dismissed as being mutineers against academic authority, in a case pregnant with the suspicion—not the proof—of atheism; but how the authorities could know beforehand that the two undergraduates would be contumacious and stiff against disavowal, so as to give warrant for written sentences ready drawn up, is nowhere explained. Possibly the sentences were worded without ground assigned, and would only have been produced in *terrorem* had the young men proved more malleable.

Harriet Westbrook.—Shelley and Hogg came up to London, where Shelley was soon left alone, as his friend went to York to study conveyancing. Percy and his incensed father did not at once come to terms, and for a while he had no resource beyond pocket-money saved up by his sisters (four in number altogether) and sent round to him, sometimes by the hand of a singularly pretty school-fellow, Harriet Westbrook, daughter of a retired and moderately rich hotel-keeper. Shelley, in early youth, had a somewhat "priggish" turn for moralizing and argumentation, and a mania for proselytizing; his school-girl sisters, and their little Methodist friend Miss Westbrook, aged between fifteen and sixteen, must all be enlightened and converted to anti-Christianity. He cultivated the society of Harriet, being encouraged in his assiduity by her much older sister Eliza. Harriet fell in love with him; and he, though not it would seem at any time ardently in love with her, dallied along the pathway which leads to sentiment and a definite courtship. This was not his first love-affair; for he had but a very few months before been courting his cousin Harriet Grove, who, alarmed at his heterodoxies, finally broke off with him—to his no small grief and perturbation at the time. It seems that Shelley never indulged in any sensual or dissipated amour; and, as he advances in life, it becomes apparent that, though capable of the passion of love, and unusually prone to regard with much effusion of sentiment women who interested his mind and heart, the mere attraction of a pretty face or an alluring figure left him unenthralled.

After a while Shelley was reconciled to his father, revisited his family in Sussex and made the acquaintance of Miss Elizabeth Hitchener, a school-teacher at Hurstpierpoint with whom, for the space of one year he pursued an intimate and voluminous correspondence. He then stayed with a cousin in Wales, from whence he was recalled to London by Harriet, who wrote complaining of her father's resolve to send her back to her school, in which she was now regarded with repulsion as too apt a pupil of the atheist Shelley. He replied counselling resistance. "She wrote to say" (these are the words of Shelley in a letter to Hogg, dating towards the end of July 1811) "that resistance was useless, but that she would fly with me, and threw herself upon my protection." Shelley returned to London, where he found Harriet agitated and wavering; finally they agreed to elope, travelled in baste to Edinburgh, and there, on Aug. 28, were married with the rites of the Scottish Church. Shelley had by this time openly broken, not only with the dogmas and conventions of Christian religion, but with many of the institutions of Christian polity, and in especial with such as enforce and regulate marriage; he held—with William Godwin—that marriage ought to be simply a voluntary relation between a man and a woman, to be assumed at joint option and terminated at the after-option of either party. If, therefore, he had acted upon his personal conviction of the right, he would never have wedded Harriet, whether by Scotch, English or any other law; but as they were married without delay on their arrival in Edinburgh, it is probable that Harriet may have consented to the elopment on the understanding that Shelley would marry her.

Harriet Shelley was not only beautiful; she was amiable, accommodating, adequately well educated and well bred. She liked reading, and her reading was not strictly frivolous. But she could not (as Shelley said at a later date) "feel poetry and understand philosophy." She appears to have been a simple-minded affectionate girl who did her best to respond to her husband's somewhat nebulous ideas on sociology and politics. For nearly three years Shelley and she led a shifting sort of life upon an income of £400 a year, one-half of which was allowed (after his first severe indignation at the *mésalliance* was past) by Mr. Timothy Shelley, and the other half by Mr. Westbrook. The couple left Edinburgh for York and the society of Hogg; broke with him upon a charge made by Harriet, and evidently fully believed by Shelley at the time, that, during a temporary absence of his upon business in Sussex, Hogg had tried to seduce her (this quarrel was entirely made up at the end of about a year); moved off to Keswick in Cumberland, where they received kind attentions from Southey, and some hospitality from the duke of Norfolk, who, as chief magnate in the Shoreham region of Sussex, was at pains to reconcile the father and his heir; sailed thence to Dublin, where Shelley was eager in the good cause of Catholic emancipation, conjoined with repeal of the union; crossed to Wales, and lived at Nant-Gwillt, near Rhayader, then at Lynmouth in Devonshire, then at Tanyrallt in Carnarvonshire. All this was between September 1811 and February 1813.

Residence in Wales.—At Lynmouth an Irish servant of Shelley's was sentenced to six months' imprisonment, but released on his master's recognizances, for distributing and posting up printed papers, bearing no printer's name, of an inflammatory or seditious tendency—being a Declaration of Rights composed by the youthful reformer, and some verses of his named The Devil's *Walk.* At Tanyrallt Shelley was (according to his own and Harriet's account, confirmed by the evidence of Miss Westbrook, the elder sister, who continued an inmate in most of their homes) attacked on the night of Feb. 26 by an assassin who fired three pistol-shots It was either a human assassin or (as Shelley once said) "the devil." The motive of the attack was undefined; the fact of its occurrence was generally disbelieved, both at the time and by subsequent inquirers. A disclosure, some years later, proved that a shepherd close to Tanyrallt, named Robin Pant Evan, being irritated by some well-meant acts of Shelley in terminating the lives of dying or diseased sheep, did really combine with two other shepherds to scare the poet, and Evan was the person who played the part of "assassin." This was the break-up of the residence of the Shelleys at Tanyrallt; they revisited Ireland, and then settled for a while in London. Here, in June 1813, Harriet gave birth to her daughter Ianthe Eliza (she married a Mr Esdaile, and died in 1876). Here also Shelley brought out his first poem of any importance, Queen *Mab;* it was privately printed, as its aggressive tone in matters of religion and morals would not allow of publication. In July the Shelleys took a house at Bracknell near Windsor Forest, where they had congenial neighbours, Mrs. Boinville and her family. Early in the summer of 1814 Shelley paid his last visit to Field Place (during the absence of his father), to see his mother. Several attempts to arrive at a reconciliation with his father had failed, probably owing, among other circumstances, to the officious intervention of the family solicitor.

The **Godwin** Circle.—The speculative sage whom Shelley especially reverenced was William Godwin (*q.v.*); in 1796 he had married Mary Wollstonecraft, authoress of The Rights *of Woman,* who died shortly after giving birth, on Aug. 30, 1797, to a daughter Mary. With Godwin Shelley had opened a volunteered correspondence at the beginning of 1812, and he had known him personally since the winter which closed 1812. Godwin was then a bookseller, living with his second wife, who had been a Mrs. Clairmont; there were four other members of the household, two of whom call for some mention here—Fanny Wollstonecraft, the daughter of the authoress and Mr. Imlay, and Claire (Clara Mary Jane), the daughter of Mrs. Clairmont. Fanny committed suicide in October 1816, being. according to some accounts which remain unverified, hopelessly in love with Shelley; Claire was closely associated with all his subsequent career. It was towards May 1814 that Shelley first saw Mary Wollstonecraft Godwin as a grown-up girl (she was well on towards seventeen); he instantly fell in love with her, and she with him. Just before this, on March 24, Shelley had remarried Harriet in London, apparently with a view to strengthening his position in his relations with his father as to the family property; but, on becoming enamoured of Mary, he seems to have rapidly made up his mind that Harriet should not stand in the way. She was at Bath while he was in London. They had, however, met again in London and come to some sort of understanding before the final crisis arrived—Harriet remonstrating and indignant, but incapable of effective resistance—Shelley sick of her companionship, and bent upon gratifying his own wishes, which as we have already seen were not at odds with his avowed principles of conduct. For some months past there had been bickerings and misunderstandings between him and Harriet, aggravated by the now detested presence of Miss Westbrook in the house; more than this cannot be said, and it seems dubious whether more will be hereafter known. Shelley, and not he alone, alleged grave misdoing on Harriet's part—perhaps mistakenly. The upshot came on July 28, when Shelley aided Mary to elope from her father's house, Claire Clairmont deciding to accompany them. They crossed to Calais, and proceeded across France into Switzerland. Godwin and his wife were greatly incensed. Though he and Mary Wollstonecraft had entertained and avowed bold opinions regarding the marriage-bond, similar to Shelley's own, and had in their time acted upon these opinions, it is not clearly made out that Mary Godwin had ever been encouraged by paternal influence to think or do the like. Shelley and she chose to act upon their own responsibility—he disregarding any claim which Harriet had upon him, and Mary setting at nought her father's authority. Both were prepared to ignore the law of the land and the rules of society.

The three young people returned to London in September. In the following January 1815 Sir Bysshe Shelley died, and Percy, who had lately been in great money-straits, became the immediate heir to the entailed property inherited by his father Sir Timothy. This entailed property seems to have been worth £6,000 per annum, or little less. He came to an understanding with his father and, giving up certain future advantages, he received henceforth a regular income of £1,000 a year. Out of this he assigned £200 a year to Harriet, who had given birth in November to a son, Charles Bysshe (he died in 1826). Shelley, and Mary as well, were on moderately good terms with Harriet, seeing her from time to time. His peculiar views as to the relations of the sexes appear markedly again in his having (so it is alleged) invited Harriet to return to his and Mary's house as a domicile; an arrangement which did not take effect. He had, undoubtedly, while previously abroad with Mary, invited Harriet to stay in their immediate neighbourhood. Shelley and Mary (who was naturally always called Mrs. Shelley) now settled at Bishopgate, near Windsor Forest; here he produced his first excellent poem, Alastor, or *the* Spirit of Solitude, which was published soon afterwards (1816) with a few others. Thomas Love Peacock was one of his principal associates at Bishopgate.

With Byron in Switzerland.— In May 1816 the Shelleys left England for Switzerland, together with Claire Clairmont, and their own infant son William. They went straight to Sécheron, near Geneva; Byron, whose separation from his wife had just then taken place, arrived there immediately afterwards. A great deal of controversy has arisen as to the motives and incidents of this foreign sojourn. The clear fact is that Claire Clairmont, who had a fine voice and some inclination for the stage, had seen Byron, as connected with the management of Drury Lane theatre, early in the year, and an intrigue had begun between them in London. Prima facie it seems quite reasonable to suppose that she had explained the facts to Shelley or to Mary, or to both, and had induced them to convoy her to the society of Byron abroad; were this finally established as the fact, it would show no inconsistency of conduct, or breach of his own code, on Shelley's part. But documentary evidence shows that Mary was totally ignorant of the amour shortly before they went abroad. Whether or not they knew of it while they and Claire were in daily intercourse with Byron, and housed close by him on the shore of the Lake of Geneva, may be left unargued. The three returned to London in September 1816, Byron remaining abroad; and in January 1817

Claire gave birth to his daughter named Allegra.

The return of the Shelleys was closely followed by two suicides —first that of Fanny Wollstonecraft (already referred to), and second that of Harriet Shelley, who on Nov. 9 drowned herself in the Serpentine. The body was not found until Dec. 10. The latest stages of the lovely and ill-starred Harriet's career have never been very explicitly recorded. It seems that she formed a connexion with some man from whom circumstances or desertion separated her, and that she was treated with harshness by her sister during an illness of their father. She had always had a propensity to the idea of suicide, and she now carried it out in act. Shelley, then at Bath, hurried up to London when he heard of Harriet's death, giving manifest signs of the shock which so terrible a catastrophe had produced on him. So far from Shelley dismissing the subject from his mind it is more than probable that the memory of this tragedy was ever present to him, and especially so during his last days.

This was the time when Shelley began to see a great deal of Leigh Hunt. the poet and essayist, editor of the *Examiner;* they were close friends, and Hunt did something to uphold the reputation of Shelley as a poet—which, we may here say once for all, scarcely obtained any public acceptance or solidity during his brief lifetime. The death of Harriet having removed the only obstacle to a marriage with Mary Godwin, the wedding ensued on Dec. 30, 1816, and the married couple settled down at Great Marlow in Buckinghamshire. Their tranquillity was shortly disturbed by a Chancery suit set in motion by Mr. Westbrook, who asked for the custody of his two grandchildren, on the ground that Shelley had deserted his wife and intended to bring up his offspring in his own atheistic and anti-social opinions. Lord Chancellor Eldon delivered judgment on March 27, 1817. He held that Shelley, having avowed condemnable principles of conduct, and having fashioned his own conduct to correspond, and being likely to inculcate the same principles upon his children, was unfit to have the charge of them. He appointed as their curator Dr. Hume, an orthodox army-physician, who was Shelley's own nominee. The poet had to pay for the maintenance of the children a sum which stood eventually at £120 per annum; if it was at first (as generally stated) £200, that was no more than what he had previously allowed to Harriet. This is the last incident of marked importance in the perturbed career of Shelley; the rest relates to the history of his mind, the poems which he produced and published, and his changes of locality in travelling. The first ensuing poem was The Revolt of *Islam,* referred to near the close of this article.

Removal to Italy.—In March 1818, after an illness which he regarded (rightly or wrongly) as a dangerous pulmonary attack, Shelley, with his wife, their two infants William and Clara, and Claire Clairmont and her baby Allegra, went off to Italy, where the short remainder of his life was passed. Allegra was soon sent on to Venice, to her father, who, ever since parting from Claire in Switzerland, showed a callous and unfeeling determination to see and know no more about her. In 1818 the Shelleys—always nearly with Claire in their company—were in Milan, Leghorn, the Bagni di Lucca, Venice and its neighbourhood. Rome and Naples; in 1819 in Rome, the vicinity of Leghorn and Florence (both their infants were now dead. but a third was born late in 1819, Percy Florence Shelley, who in 1844 inherited the baronetcy and died in 1889); in 1820 in Pisa the Bagni di Pisa (or di San Giuliano), and Leghorn; in 1821 in Pisa and with Byron in Ravenna; in 1822 in Pisa and on the Bay of Spezia, between Lerici and San Terenzio.

The incidents of this period are but few, and of no great importance apart from their bearing upon the poet's writings. In Leghorn he knew Mr. and Mrs. Gisborne, the latter a once intimate friend of Godwin; she taught Shelley Spanish, and he was eager to promote a project for a steamer to be built by her son by a former marriage, the engineer Henry Reveley; it would have been the first steamer to navigate the Gulf of Lyons. In Pisa he formed an intimacy with the Contessina Emilia Viviani, a girl who was pining in a convent pending her father's choice of a husband for her; this impassioned but vague and fanciful attachment —which soon came to an end, as Emilia's character developed less favourably in the eyes of her Platonic adorer—produced the transcendental love-poem of *Epipsychidion* in 1821. In Ravenna the scheme of the quarterly magazine the Liberal was concerted by Byron and Shelley, the latter being principally interested in it with a view to benefiting Leigh Hunt by such an association with Byron.

In Pisa Byron and Shelley were constantly together, having in their company at one time or another Shelley's cousin and schoolfellow Captain Thomas Medwin (1788–1869), Lieutenant Edward Elliker Williams (1793–1822) and his wife, to both of whom the poet was very warmly attached, and Captain Edward John Trelawny, the adventurous and romantic seaman, who has left important and interesting reminiscences of this period. Byron admired very highly the generous, unworldly and enthusiastic character of Shelley, and set some value on his writings; Shelley half-worshipped Byron as a poet, and was anxious, but in some conjunctures by no means able, to respect him as a man. In Pisa he knew also Prince Alexander Mavrocordato, one of the pioneers of Grecian insurrection and freedom; the glorious cause fired Shelley, and he wrote the drama of *Hellas* (1821) with its magnificent choruses breathing of hope for the future of mankind.

Last Days.—The last residence of Shelley was the Casa Magni, a bare and exposed dwelling on the Gulf of Spezia. He and his wife, with the Williamses, went there at the end of April 1822 to spend the summer, which proved an arid and scorching one. Peacock describes Shelley as being disillusioned during his last days; there is certainly a trace of melancholy in his later lyrics and correspondence; a foreboding of some approaching fatality which, however, he appears to have attempted to divert. Shelley and Williams, both of them insatiably fond of boating, had a small schooner named the "Don Juan" (or more properly the "Ariel"), built at Genoa after a design which Williams had procured from a naval friend, but the reverse of safe. They received her on May 12, found her rapid and alert, and on July 1 started in her to Leghorn, to meet Leigh Hunt, of whose arrival in Italy he had just been notified. After doing his best to set things going comfortably between Byron and Hunt, Shelley returned on board with Williams on July 8. It was a day of dark, louring, stifling heat. Trelawny took leave of his two friends, and about half-past six in the evening found himself startled from a doze by a frightful turmoil of storm. The "Ariel" had by this time made Via Reggio; she was not to be seen, though other vessels which had sailed about the same time were still discernible. Shelley, Williams and their only companion, a sailor-boy, perished in the squall. The exact nature of the catastrophe was from the first regarded as somewhat disputable. The condition of the "Ariel" when recovered did not favour any assumption that she had capsized in a heavy sea--rather that she had been run down by some other vessel, a felucca or fishing-smack. In the absence of any counter-evidence this would be supposed to have occurred by accident; but a rumour, not strictly verified and certainly not refuted, exists that an aged Italian seaman on his deathbed confessed that he had been one of the crew of the fatal felucca, and that the collision was intentional, as the men had plotted to steal a sum of money supposed to be on the "Don Juan," in charge of Lord Byron. In fact there was a moderate sum there, but Byron had neither embarked nor intended to embark. This may perhaps be the true account of the tragedy; at any rate Trelawny, the best possible authority on the subject, accepted it as true. He it was who laboriously tracked out the shore-washed corpses of Williams and Shelley, and who undertook the burning of them, after the ancient Greek fashion, on the shore near Viareggio, on Aug. 15 and 16. The great poet's ashes were then collected, and buried in the new Protestant cemetery in Rome. He was, at the date of his untimely death, within a month of completing the thirtieth year of his age

Character.—The character of Shelley can be considered according to two different standards of estimation. We can estimate the original motive forces in his character; or we can form an opinion of his actions, and thence put a certain construction upon his personal qualities We will first try the latter method. It cannot be denied that his actions were in some considerable degree abnormal, dangerous to the settled basis of society, and marked by headstrong and undutiful presumption. Rut it is remarkable that, even among the censors of his conduct, many persons are none the less impressed by the beauty of his character; and this leads us back to our first point — the original motive forces in that. Here we find enthusiasm. fervour. courage (moral and physical), an unbounded readiness to act upon what he considered right principle, however inconvenient or disastrous the consequences to himself, sweetness and indulgence towards others, extreme generosity (he appears to have given Godwin, though sometimes bitterly opposed to him, between £4,000 and £5,000), and the principle of love for humankind in abundance and superabundance. He respected the truth, as he conceived it, in spiritual or speculative matters, and respected no construction of the truth which came to him recommended by human authority. No man had more hatred or contempt of custom and prescription; no one had a more authentic or vivid sense of universal charity. The same radiant enthusiasm which appeared in his poetry as idealism stamped his speculation with the conception of perfectibility and his character with loving emotion.

In person Shelley was attractive, winning and almost beautiful, but not to be called handsome. His height was nearly 5 ft. 11; he was slim. agile and strong. with something of a stoop: his complexion brilliant. his hair abundant and wavy, dark brown but early beginning to grizzle: the eyes. deep blue in tint, have been termed "stag-eyes" — large, fixed and beaming. His voice was high-pitched and wanting in richness and suavity; his general aspect, though extremely variable according as his mood of mind and his expression shiited. was on the whole youthful. The only portrait of Shelley. from which some idea of his looks used to be iormed. is that painted by an amateur. Miss Curran. in 1819; Mrs. Shelley, later, pronounced it to be "in many things very like." This is now in the National Portrait Gallery, together with a quasi-duplicate of it painted by Clint. chiefly from Miss Curran's likeness. and partly from a water colour (now lost) by Lieutenant Williams. In 1905 (*Century Magazine*) another portrait was brought forward: a pencil sketch taken in the last month of the poet's liie hy an American artist. William E. West. followed by an oil-painting founded on that sketch. The two works differ very considerably, and neither of them resembles Miss Curran's portrait: yet we incline to believe that the sketch was really taken from Shelley.

Place in European Literature. — If we except Goethe (and leave out of count living writers. whose ultimate value cannot at present be assessed). we must consider Shelley to be a supreme poet of the new era which. beginning with the French Revolution, remains continuous into our own day. Victor Hugo shares his lofty poetic stature. and might for certain reasons be even preferred to him; Byron and Wordsworth also belong to the same great period, and later. Tennyson and Browning. The grounds, however, on which Shelley's eminence is based are mainly three. He is unexcelled in his ideality. unexcelled in his music and unexcelled in his importance. By importance we here mean the direct import of the work performed, its controlling power over the reader's thought and feeling. the contagious fire of its white-hot intellectual passion, and the long reverberation of its appeal. Shelley is emphatically the poet of the future. In his own day an alien in the world of mind and invention, and in our day but partially a denizen of it, he appears destined to become, in the long vista of years, an informing presence in the innermost shrine of human thought. Shelley appeared at the time when the sublime frenzies of the French revolutionary movement had exhausted the elasticity of men's thought — at least in England — and had left them flaccid and stolid: but that movement prepared another in which revolution was to assume the milder guise of reiorm. conquering and to conquer. Shelley was its prophet. As an iconoclast and an idealist he took the only position in which a poet could advantageously work as a reformer. To outrage his contemporaries was the condition of leading his successors to triumph and of personally triumphing in their victories. Shelley had the temper of an innovator and a martyr; he united speculative keenness and humanitarian zeal in a degree for which we might vainly seek his precursor. We have already named ideality as one oi his leading excellences. This Shelleian quality combines, as its constituents, sublimity, beauty and the abstract passion for good. Perhaps no outstanding English poet, and he was essentially an English poet, has used a greater variety of forms and measures than Shelley. In the pure lyrics the rapture, the music and the emotion are in exquisite balance. and the work has often as much of delicate simplicity as of fragile and flower-like perfection. Great as Shelley's fame is now, it should be remembered that it was entirely posthumous. He practically received no encouragement during his lifetime. and died believing that the world had rejected his poetry.

Works. — Some of Shelley's principal writings have already been mentioned above; we must now give a brief account of others. *Alastor* (1816) was succeeded (1817) by *The Revolt of Islam,* a poem of no common length in the Spenserian stanza, preaching bloodless revolution: it was written in a sort of friendly competition with Keats (who produced *Endymion*) and is amazingly fine, but as a whole somewhat long-draw* and exhausting. This transcendental epic (for such it may be termed) was at first named *Laon and Cythna, or the Revolution of the Golden City*, and the lovers of the story were then brother and sister as well as lovers — an experiment upon British endurance which the publishers would not connive at. The year 1818 produced *Rosalind and Helen,* a comparatively weak poem, begun in England and finished in Italy, and *Julian and Maddalo,* a very strong one. written in the neighbourhood of Yenice — demonstrating in Shelley a singular power of seeing ordinary things with directness, and at once figuring them as reality and transfiguring them into poetry. In each of these two poems Shelley gives a quasi-portraiture of himself: and in the latter one may perhaps trace a veiled description of Harriet's tragic end. The next year. 1819, was his culmination. producing as it did the grand tragedy of *The Cenci* and the sublime ideal drama *Prometheus Unbound,* composed partly on the ruins of the Earhs of Caracalla in Rome. This last we have no hesitation in calling his masterpiece. It embodies, in forms of surpassing imagination and beauty: Shelley's deepest and most daring conceptions. Prometheus, the human mind and will, has invested with the powers proper to himself Jupiter, the god of heaven: who thereupon chains and torments Prometheus and oppresses mankind: in other words, the anthropomorphic god of religion is a creation of the human mind, and both the mind of man and man himself are enslaved as long as this god exercises his delegated but now absolute power. Prometheus. who is from of old wedded to Asia, or Nature. protests against and anathematizes the usurper enthroned by himself. At last the anathema (although Prometheus has revoked it by an act of self-conquest) takes effect: Eternity. Demogorgon, dismisses Jupiter to unending nothingness. Prometheus is at once unbound, the human mind is free: he is reunited to his spouse Nature, and the world of man passes from thraldom and its degradation into limitless progression. or (as the phrase goes) perfectibility, moral and material. This n-e regard as in brief the argument of *Prometheus Unbound.* It is closely analogous to the argument of the juvenile poem *Queen Mab*, but so raised in form and creative touch that. whereas to write *Queen Mab* was only to be an ambitious and ebullient tiro, to invent *Prometheus Unbound* was to be the poet of the future. *The Witch of Atlas* (1820) is the most perfect work among all Shelley's longer poems, though it is neither the deepest nor the most interesting. It may be rated as a pure exercise oi roving imagination—guided. however, by an intense sense of beauty, and by its author's exceeding fineness of nature.

The elegy on Keats. *Adonais*. followed in 1821. The translations—chiefly from Homer. Euripides. Calderon and Goethe—date from 1819 to 1822. and testify to the poetic endowment of Shelley not less absolutely than his own original compositions; there are also prose translations from Plato.

Shelley. it will be seen. was not only a prolific but also a versatile poet. Works so various in faculty and in form as *The Revolt of Islam*, *Julian and Maddalo*, *The Cenci*, *Prometheus Unbound*, *Epipsychidion*, and the grotesque effusions of which *Peter Bell the Third* is the prime example. added to the consummate array of lyrics. have seldom to he credited to a single writer — one. moreover, who died before he was thirty years of age. In prose Shelley could be as admirable as in poetry. His letters to Thomas Love Peacock and others, and his uncompleted *Defence of Poetry,* are the chief monuments of his mastery in prose; and certainly no more beautiful prose—having much of the spirit and the aroma of poetry, yet without being distorted out of its proper essence—is to be found in the English language.

The chief original authorities for the life of Shelley (apart from his own writings, which contain a good deal of autobiography, if heedfully siited and collated) are—(I) the notices by Mrs. Shelley interspersed in her edition of the *Poems;* (2) Hogg's amusing, discerning and authentic, although in some respects exaggerated, book; (3) Trelawny's *Records;* (4) the *Life* by Medwin; and (5) the articles written by Peacock. Some other writers, especially Leigh Hunt, might be mentioned, but they come less close to the facts. Among biographical books produced since Shelley's death, by authors who did not know him personally, the leading work is the *Lije* by Professor Dowden (2 vols., 1886), which embodies important materials imparted by the Shelley family. *The Real Shelley,* by *J. C.* Jeaffreson (1885), is controversial in method and decidedly hostile in tendency, and tries a man of genius by tests far irom well adapted (in our opinion) to bring out a right result; it contains, however, an ample share of solid information and sharp disquisition. The memoir by W. M. Rossetti, prefixed to an edition of Shelley's *Poems* in two forms of publication (1870 and 1878), was an endeavour to formulate in brief space, out of the then confused and conflicting records, an accurate account of Shelley—admiring, but not uncandidly one-sided. There' is valuable material in Lady Shelley's *Shelley Memoriuls,* and in Dr. Garnett's *Relics of Shelley;* and the memoir by J. Addington Symonds, in the *English Men of Letters* series, is characteristic of the writer. *Shelley in England* by Roger Ingpen contains new facts respecting Shelley's relations with his family, his expulsion from Oxford and some unpublished facts about Harriet's death. One of the handiest editions of Shelley's poems was edited by Thomas Hutchinson (Clarendon Press. 1905), which includes the emendations, &c., published by Mr. C.D. Locock (1903) from examination of the MSS. in the Bodleian Library. Mr. Locock edited in 1911 an excellent and fully annotated edition of the Poems, with some new material. A full edition of Shelley's letters was edited by Roger Ingpen in 1909, reprinted with additions in 1911 and 1916. The most complete collection of Shelley's Poems, Prose works and Correspondence is the *Julian Edition* edited *by* Roger Ingpen and W. E. Peck (1927–1929). France has by no means neglected Shelley. A. Koszul's *"La Jeunesse de Shelley"* (1910), is a valuable study of the subject, while André Maurois has written a popular romance in his *"Ariel ou la vie de Shelley"* (1923). Mr. Buxton Forman's earlier and excellent edition includes the writings in prose as well as in verse. (W. M. R.; R. I.)

SHELL MONEY: *see* CURRENCY, PRIMITIVE.

SHELL MOUNDS (KITCHEN MIDDENS; Dan. KJÖKKENMÖDDING), prehistoric refuse heaps or mounds, found in all quarters of the globe, which consist chiefly of the shells of edible mollusks mixed with fragments of animal bones and implements of stone, bone and horn. They may sometimes, as in the Strait of Magellan, be seen in process of formation. Many, of prehistoric origin, have been examined. notably on the eastern coast of Denmark. These were at first thought to be raised beaches, but a cursory examination at once proved their artificial construction. Further investigation proved these shell mounds to belong to the early part of the Neolithic age *(see* ARCHAEOLOGY: *Prehistory).* These mounds contained the remains of quadrupeds. birds and fish, the food of the prehistoric inhabitants. Among the bones were those of the wild bull or aurochs, beaver, seal and great auk, all now extinct or rare in this region. Moreover. shell mounds contain full-sized shells of the common oyster. which cannot live at present in the brackish waters of the Baltic except near its entrance. the inference being that the shores where the oyster at that time flourished were open to the salt sea. Thus also the eatable cockle, mussel and periwinkle abounding in the kitchen middens are of full ocean size. whereas those now living in the adjoining waters are a third of full size as a result of the want of saltness. This extension of the North sea is called the "Littorina sea"; and it existed about 4000–3000 B.C., the end of Brooks's Maritime period. The debris is in some places 10-20 ft. thick.

The men of the kitchen middens had seemingly no knowledge of agriculture. no traces of grain of any sort being found. The only vegetable remains were burned pieces of wood and some charred substance. possibly a sea plant used in the production of salt. Flat stones blackened with fire, forming hearths. were also found. That periods of scarcity must have been frequent is indicated by the discovery of bones of the fox, wolf and other carnivores, which would hardly have been eaten from choice. The kitchen middens of Denmark mere not mere summer quarters: the ancient fishermen appear to have stayed in the neighbourhood for two-thirds if not the whole of the year, since by examination of the bones of the wild animals it is often possible to tell the time of year when they were killed. Thus the remains of the wild swan (*Cygnus musicus*), a winter visitor, leaving the Danish coast in March and returning in November, are found in abundance. Additional proof is afforded among the mammalian remains by two periodical phenomena, the shedding of the stag's antlers and the birth and growth of the young. The flint implements found include flakes, axes, awls, slingstones or net weights and rude lance heads. A fragment of one polished ax was found, at Havelse, which had been worked up into a scraper. Small pieces of coarse pottery are also met with, the typical vessel having a pointed base.

The Danish kitchen-midden men were not cannibals. They seem to have resembled the Lapps, small men with heavy overhanging brows and round heads.

At Omori. Jap., in the Aleutian Islands, in British Columbia, Oregon and California shell mounds were explored, and always proved that the present populations had been preceded by ruder tribes of great antiquity. On the Atlantic coast. of Brazil shell mounds, which must have taken thousands of years to accumulate, are now overgrown with dense forests.

Shell mounds also occur round the coasts of Britain, at Chark near Gosport, inland at Blashenwell farm, Dorset, at Harlyn bay in Cornwall and in Cork harbour, but there is no reason to suppose all these deposits to be contemporary. The shell mounds on the west coast of Scotland are often associated with raised beaches.

SHELLS AND SHELL COLLECTING. Shells of mollusks, because of their bright colours, rich variety of shapes and designs, and abundance along sea shores, have probably from the earliest times attracted the attention of man. He used them for ornaments, tools and coin, and dined on the mollusks that formed them. Aristotle and Pliny wrote extensively about them. In the ruins of ancient Pompeii and in a crypt in a Mayan pyramid in Yucatan shells were found that may well be the remains of ancient collections.

Shell collecting as we understand it today, however, on the same plane as coin. stamp and china collecting. is of quite recent origin. Shell collecting reached its apex in England during the late 18th and early and middle 19th centuries. This was the period of the burgeoning Pacific and China trade; new islands were being discovered and the shells found there were first imported as'curiosities, later as specimens for the collectors among the newly rich merchant princes. This period reached its highest point in the 1850s and '60s when shell auctions became a common occurrence and relatively high prices were paid for particularly rare and perfect specimens. There followed a period of relative decline, probably because many formerly rare shells suddenly became common as their haunts were discovered and exploited. The shells were then dumped on the market and the prices suffered a sudden decline An example is *Voluta junonia* of Florida nhich fetched $50 or $60 for choice specimens nhen that state was still relatively unexplored and difficult of access. Then when Florida became one of the nation's winter playgrounds and *V. junonia* was collected in large quantities the price fell rapidly until superb specimens brought no more than $5. This drop happened in hundreds of other cases too.

Nevertheless. shells are so strikingly interesting and beautiful in themselves that the hobby nas rapidly revived The U.S.

troops stationed on lonely islands in the Pacific after the fighting had moved on learned to gather shells to while away the time. Stay-at-homes became interested in shells and soon the hobby began to rival stamp and coin collecting in popularity. Shells, because of their beauty and exotic points of origin, will long cause large numbers of persons to be interested in them.

The shell itself is the exoskeleton (external skeleton) of a soft bodied animal that secretes it to serve as protection as well as support for its various organs. The animal is bound securely to the shell and can no more survive separation from it than we can from our bony framework. After a mollusk has died other marine animals may become occasional inhabitants of the shells. Such an animal is the hermit crab, which makes use of the shell as a temporary abode. Most marine mollusks are able to shut themselves off completely from their watery world when they find themselves in danger, by closing their aperture by a horny or calcareus door, or operculum. The careful collector makes it a point to preserve the door with the shell in his collection.

The rarest, the most valuable, and in many senses the most beautiful shells are those that are found in the sea, but large numbers of species live only on land or in fresh water. The aristocrats of the shell world are the various members of the families Cypraeidae (cowry shells), Conidae (cone shells), Volutidae (volute shells), and Muricidae (rock shells). One of the rarest and most desirable single species is *Conus gloria maris,* the glory of the sea. This is a handsome cone shell, of which only about 30 exceptionally beautiful specimens have ever been known. They alnays command a very good price on the market—$1,250 in 1957. It is also the only shell known to have been stolen from a large museum.

The question might be asked: why are some shells rare, others relatively common, and still others exceedingly abundant? The answer is intimately bound up with the habits of mollusks. Many species can tolerate only the conditions of life that are found in the intertidal zone on sandy or rocky shores. Such shells are most easily collected, since one need only wait for a low tide to begin gathering them. In the intertidal zone some very handsome shells are found, *e.g.,* the glistening, richly coloured Olividae (olive shells), the Naticidae (moon shells), and Strombidae (strombs) as well as Terebridae (augur shells) and many bivalves (clams) that burrow in water soaked sand. On the rocks and under them are found Littorinidae (periwinkles), Turbo (turban shells) and limpets, as well as the Chitonidae (pill bug or coat of mail shells) that have the curious habit of curling up like the land crustacean (pill bug) for which they are popularly named.

Other shells live only in the shallow water below the extreme low tide line. These shells are washed up on the beach after storms. Since luck and some degree of effort—dredging or straining—is involved in capturing them, they tend to be scarcer and more costly than the intertidal species.

The really rare shells are species that can live only in deep water. There live the rarest and costliest volutes, cones, cowries and rock shells. They can be obtained only by expensive and difficult deep-sea dredging operations from specially designed ships. Such shells would be quite unavailable to the average collector if he had to depend only upon these sources for his specimens. Luckily, however, they are frequently obtained as a side line in shrimp or fish dredging. Many fishermen, especially in Japan, have discovered that selling shells can supplement their regular incomes. They keep the shells on board instead of discarding them with the muck that their dredges bring up and sell them to dealers or collectors. Some of our greatest rarities, such as *Busycon coarctatum* (the turnip shell) are obtained in this manner.

Another source of deep-water shells are fish stomachs. Many ground-feeding fish species such as haddock and cod are frequently caught with their stomachs full of nicely cleaned and faultless shell specimens. A few rare shells such as the costly *Cypraea fultoni* (Fulton's conry shell) are known only from this sort of "habitat," ex *pisce* as the scientist puts it. SCUBA and skin divers bring up many rare specimens from depths up to 30 ft. Many shells that hide regularly in coral crevices can be collected in no other manner.

Although most mollusks live in the sea, many colourful species are air-breathing land dwellers. These shells are found everywhere that their few simple requirements of shade, moisture and food (usually plant or fungi) are satisfied. The largest majority are tiny (some only a few millimetres in size) and quite plain looking. They excite the interest of only the dedicated scientist or the enthusiastic amateur collector who makes a specialty of the shells of special regions. Some of these shells, however, are brightly coloured, large and quite showy. Best known are the *Liguus* (tree snail) of southern Florida and Cuba, *Papuina* of Papua, *Helicostyla* of the Philippines and the very large *Achatina* of Africa. These shells are not so popular among most enthusiasts as are marine shells because few collectors are willing to undergo the discomforts and dangers of collecting them. The tree snail of Florida shares its habitat with diamondback rattlers and cottonmouths, as well as voracious mosquitoes; *Papuina* and *Helicostyla* are found on trees in hot malarial regions haunted by savage headhunters; the ground-dwelling *Achatina* of Africa frequently live in the very heart of the continent.

The shells that live in fresh water are even less popular with collectors, chiefly because none of them are colourful, and only very few have any claim to beauty. The river mussels of the midwestern United States have a beautiful internal pearllike covering, or nacre, and are sometimes handsomely ornamented with tubercles and wavy ridges. They are often sold in bulk to button manufacturers. Few if any command a respectable price per specimen. Their slight claims to beauty are further in-paired by the erosion of the shell caused by acids in solution. Fresh-water snail shells are of considerable interest to the student of tropical diseases. since some snails serve as unwilling hosts of severe human and animal diseases.

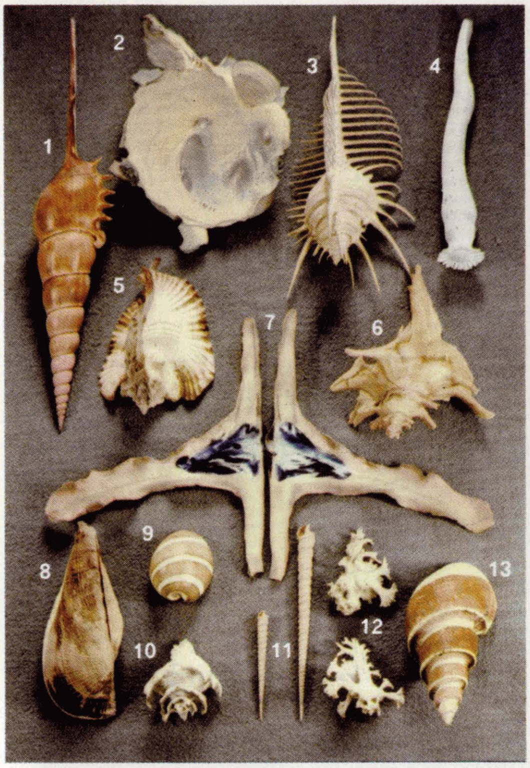
One of the pleasantest aspects of shell collecting is that the shells need little service to be stored. They do not require the careful attention and handling necessary in a butterfly, beetle or herbarium collection. They are not as heavy as minerals They are not subject to insect or fungus attack. Once the shell is reasonably well cleaned and provided with a complete label, it can remain unaltered for years in the drawer or cabinet to which it has been consigned.

Most collectors tend to specialize, since they realize very soon that their chance of obtaining even a fair proportion of the about 100,000 shell species known is very slight. Most collectors confine their interest to the aristocrats mentioned earlier. Others limit themselves to localities, collecting only the shells of Florida or California or even more immediate locales. Such specialists frequently contribute valuable scientific data in the form of exact locality records and observations on life habits of many mollusks. Another type of collector gathers only specimens of the type genus of shells, that is the single species of a shell that characterizes a particular genus. Such a collection is a valuable lesson in taxonomy and evolution and gives a perspective view of the entire field of conchology, the study of shells.

There are also specialists in land shells. Land shells have the virtue of being less bulky than marine shells and lend themselves to easier storing. They are also less expensive than marine shells, and complete family or generic collections can be made at low cost. The *Liguus* enthusiasts are a class apart, and in their zeal for completeness of their collections are sometimes ready to pay respectable prices for particularly desired specimens.

Shell collecting also can form the base for many interesting studies. All stamps and coins of the same type are machine made and therefore identical; however, like all living organisms, no two shells are exactly alike. Many an amateur has become interested in the variations of a single species and has often accumulated so much data that he could prove that what were considered two distinct and valid species are actually only the extreme variations of a single species. This aspect adds an element of excitement to shell collecting that is not found in many other collecting hobbies. In fact, many of the best-known scientists in the field of conchology began as amateur shell collectors.

A word might be said about the equipment of the shell collector. All that most collectors use are a basket or a small quan-



Shells of **unusual shapes:** (1) **Spindle** shell, *Tibia fusus* (Philippines); (2) ***Xenophora pallidula*** (Japan); (3) ***Murex tenuispina*** (Ryukyu Islands); (4) ***Brechites radix*** (Torres strait); (5) ***Murex bednalli*** (Australia); (6) ***Trophon triangulatus*** (California); (7) ***Malleus albus*** (Japan); (8) ***Arca tortuosum*** (China); (9) Bubble shell, ***Hydatina albocincta*** (China); (10) ***Latiaxis deburghiae*** (Japan); (11) ***Terebra triseriata*** (Japan); (12) ***Murex pele*** (Hawaii); (13) ***Ancistrolepis hirasei*** (Japan)

tity of bags and small boxes; some sort of tool to scrape away the sand or leaves; a knife to detach rock clingers from their perches; a hammer and chisel to remove rock borers from their nests; a sieve to strain out specimens from shallow water; a notebook to record locality and ecological data and a stout back ior much stooping. In addition there should also be a library of books on shells, limited only by financial means and availability of the classics of the shell world. These books, together with recourse to museum collections, are the only sources of the proper Latin names for shell species.

SHELTON, THOMAS (fl. 1612–1620), English translator of *Don Quixote,* seems to have been employed by Theophilus Howard, 2nd Baron Howard de Walden and afterward earl of Suffolk, to whom he dedicated *The History of the Valorous and Wittie Knight-Errant Don Quixote of the Mancha* (1612). In his dedication he states that he did the work "in the space of fourty dayes" at the request of "a very deer friend." Shelton did not use the original edition of Cervantes (1605) but that published at Brussels in 1607. On the appearance of the Brussels reprint of the second part of *Don Quixote* in 1616 he translated that into English also, and published it in 1620 with a revised version of the first part. Shelton's version is the happiest English translation of the great Spanish classic, combining robust vigour with grace and ease. It is possible that the translator was the Thomas Shelton who wrote the sonnet prefixed to *A Restitution of Decayed Intelligence* by Richard Verstegan (1605).

Shelton's *Don Quixote* was edited by J. F. Fitzmaurice-Kelly. 4 vol. (1896), A. W. Pollard (1900) and F. J. H. Darton (1923).

See also Edwin B. Knowles, *Four Articles on Don Quixote in England* (1941). (V. DE S. P.)

SHELTON: *see* ANSONIA.

SHEM was the eldest of Noah's three sons (Gen, v, 32; x, 1). In the Old Testament genealogical tables tracing the origins and connections of the various peoples, the Hebrews, Aramaeans and Arabs are counted among the descendants of Shem, and from the name is derived the adjective Semitic (*see* SEMITIC LANGUAGES). Certain other peoples (as the Elamites) are referred to also as his descendants, on a geographical or political rather than linguistic basis.

Roughly speaking, the nations supposed to share Shem as their ancestor lie geographically between the descendants of his brothers Japheth (*q.v.*), on the north, and those of Ham (*q.v.*) on the south.

SHENANDOAH NATIONAL PARK, in Virginia, U.S., was established in 1935 to preserve 193,473 ac. in the Blue Ridge mountains. The most easterly of the Appalachian ridges, the Blue Ridge is geologically ancient, and has been eroded to its present elevation through countless thousands of years. (*See* APPALACHIAN MOUNTAINS.)

In general, mountain profiles are rounded, but rocky outcrops and precipitous ledges appear in a few places, such as on the highest point. Hawksbill mountain, 4,049 ft. above sea level, on Old Rag mountain and at Franklin cliffs.

The park is noted for its scenery. which affords some of the widest views in the eastern states. Skyline drive runs the length of the park, minding among the summits, dipping through highland valleys and gaps for about 105 mi., from the town of Front Royal on the north to Jarman gap on the south.

Except for a few grassy meadows along the crest, the park is heavily forested with hardwood trees, including black gum, yellow, gray and black birches, linden. tulip tree and several species of oak. Among the conifers are eastern hemlock, Virginia, white, Table mountain and pitch pines, red spruce and, on the highest peaks, Eraser fir. Wild flowers typical of eastern woodlands are abundant.

In spring, from April to June, there is a succession of blooms —redbud, flowering dogwood, azalea and mountain laurel—and in autumn a display of brilliant foliage.

White-tailed deer, bobcat, red and gray fox, and gray and flying squirrels inhabit the park, and the greatest number of bird species occurs in spring, when such migrants as rose-breasted grosbeak, brown thrasher, towhee, scarlet tanager and numerous warblers arrive to make their summer homes.

This park is joined to Great Smoky Mountains National park (*q.v.*) by the 470-mi. Blue Ridge parkway. (DX. B.)

SHENANDOAH VALLEY, in Virginia, U.S., extending southwest from the vicinity of Harpers Ferry on the Potomac river, lies between the Blue Ridge mountains and the Alleghenies. It is a part of the Great valley of Virginia. In a narrow sense the Shenandoah valley embraces only the nine counties drained by the Shenandoah river: Berkeley and Jefferson in West Virginia, and Frederick, Clarke, Shenandoah, Warren, Rockingham, Page and Augusta in Virginia.

In popular usage, however, the Shenandoah valley extends to the James river and includes Rockbridge county: it is approximately 100 mi. long and averages 25 mi. in width. From the floor of the valley near Harrisonburg rises Massanutten mountain which stretches to the northwest for 50 mi.; it divides the two forks of the Shenandoah river. Among the historic passes through the Blue Ridge are Swift Run gap and Rockfish gap.

The valley was once inhabited by Indians of the Tuscarora and Shawnee tribes whose Indian road ran the length of the valley. The road became the famous Valley pike, a main artery in the westward movement, and is now a U.S. highway. In 1707 Louis Michelle explored the lower valley, and in 1716 Gov. Alexander Spotswood led an expedition over the Blue Ridge to the Shenandoah river. Settlement of the valley by white men began about 1730; at this time buffalo and elk abounded. Most of the early settlers, German Lutherans and Scotch Irish Presbyterians, came from Pennsylvania, though some English came across the Blue Ridge. The various national groups usually settled in separate communities. In ante-bellum days the Shenandoah valley was a region of family-operated farms and few slaves. During the Civil War ".Stonewall" Jackson won immortality by his "Valley campaign." Near the end of the conflict the valley was devastated by Federal forces.

The backbone of the valley's economy is agriculture, with emphasis upon purebred cattle, sheep, poultry and dairy farming. Harrisonburg is a turkey capital and Winchester is noted for its apple orchards. Industry has enjoyed a remarkable growth with carpets, chemicals, cutting instruments, electric appliances and rubber goods being particularly important. The native limestone is suitable for building.

The labour force tends to commute from rural areas instead of moving to mill towns.

Colleges in the valley include Madison in Harrisonburg, Mary Baldwin in Staunton, and Virginia Military institute and Washington and Lee university in Lexington. There are numerous military preparatory schools in the area and many summer camps.

Large numbers of tourists are attracted by the Skyline drive and Blue Ridge parkway on the crest of the Blue Ridge, the Shenandoah National park (*q.v.*), the Natural Bridge, near Lexington, and many limestone caverns. (G. M. BE.)

SHENANDOAH VALLEY CAMPAIGNS. In the American Civil War (1861–65) the Shenandoah Valley was often the scene of military operations; at two points in the war these operations rose to the height of separate campaigns possessing great significance in the general development of the war. From a military point of view the Shenandoah Valley was valuable to the army which controlled it as a requisitioning area, for in this fertile region crops and cattle were plentiful. There were, moreover, numerous mills and factories. For the Confederates the Valley was also a recruiting area. A macadamized road from Lexington via Staunton and Winchester to Martinsburg gave them easy access to Maryland and enabled them to cover Lynchburg from the north. By a system of railways which united at Gordonsville and Charlottesville troops from Richmond and Lynchburg were detrained within easy distance of five good passes over Blue Ridge, and as Strasburg in the Valley lies almost due west of Washington it was believed in the North that a Confederate army thereabouts menaced a city the protection of which was a constant factor in the Federal plan of campaign.

In the spring of 1862 the immense army organized by Gen. McClellan advanced and threatened to sweep all before it. The Confederates, based on Richmond, were compelled to show a front westward to the Alleghanies, northward to the Potomac and eastward to the Atlantic. The main armies were engaged on the Yorktown peninsula and the other operations were secondary. Yet in one instance a Confederate detachment that varied in strength between 5,000 and 17,000 contrived to make some stir in the world and won renown for its commander. Gen. Thomas J. Jackson with small means achieved great influence on the course of the war in the main theatre. The Valley operations in 1862 began by a retrograde movement on the part of the Confederates, for Jackson on March 12 retired from Winchester, and Banks at the head of 20,000 men took possession. Banks pushed a strong detachment under Shields on to Strasburg a week later, and Jackson then withdrew his small division (5,000) to Mt. Jackson. Banks,. however, recalled Shields in accordance with orders from Washington, Jackson conceived that he was bound to follow Shields, and, when Shields stood at bay at Kernstown on March 23, with 7,000 men, Jackson at the head of 3,500 attacked and was badly beaten.

The proof thus afforded by Jackson of his inability to contend with Shields seems to have been regarded by the Federal authorities as an excuse for reversing their plans; Shields was reinforced by Williams's division, and with this force Banks undertook to drive Jackson from the Valley. A week after the battle of Kernstown, Banks moved to Strasburg with 16,000 men, and a month later (April 29) was at Newmarket, after much skirmishing with Jackson's rear-guard which burnt the bridges in retiring. Meanwhile Jackson had taken refuge in the passes of Blue Ridge, where he too was reinforced. Ewell's division joined him at Swift Run Gap, and at the beginning of May he decided to watch Banks with Ewell's division and to proceed himself with the remainder of his command to join Edward Johnson's brigade, then beset by Gen. Milroy west of Staunton. Secretly moving by rail through Rockfish Gap, Jackson united with Johnson and in a few days located Milroy at the village of McDowell. After reconnaissance Jackson concentrated his forces on Setlington Hill and proposed to attack on the morrow (May 8), but on this occasion the Federals (Milroy having just been joined by Schenck) took the initiative, and after a four hours' battle Jackson was able to claim his first victory. The Confederates lost 500 out of 6,000 men and the Federals 250 out of 2,500 men.

Meanwhile the army under Banks, now at Strasburg, had been largely sent elsewhere. Jackson's opportunity had come to destroy Ranks's force completely. The Confederates numbered 16,000, the Federals only 6,000 men. Jackson availed himself of the Luray Valley route on the eastern or "blind" side of the Massanutton range to surprise the post at Front Royal as a preliminary to falling upon Banks. He captured the post, but failed to intercept Banks who escaped northwards by the turnpike road and covered his retreat across the Potomac by a rear-guard action at Winchester on May 25. On May 31 Frémont had reached Cedar Creek. McDowell was at Front Royal and Jackson had retired to Strasburg, where he was compelled to wait for a detachment to come in. This rejoined on the evening of June 1.

Ewell's division held Frémont back until Jackson was on his way to Newmarket, McDowell had sent Shields up the Valley by the Luray route. But Jackson gained Newmarket in safety and destroyed the bridge up to Port Republic by which Shields could emerge from the Luray Valley to join Frémont, who was left to cope with Jackson single-handed. Jackson's rear-guard impeded Frémont's advance, although a week later (June 7) Frkmont at Harrisonburg located his enemy at Cross Keys and next day he attacked with 10,500 men. Shields was still at Luray. Jackson held Frémont with Ewell's division (8,000) and with the remainder moved to the left bank of the Shenandoah near Port Republic to await developments, for Shields had pushed forward a strong advanced guard under Tyler, whose vanguard (two squadrons) crossed the river while Frkmont was engaged with Ewell. Tyler's cavalry was driven back with heavy loss. Jackson retained possession of the bridge by which Tyler and Frémont could unite, and next day he crossed the river to attack Tyler's two brigades. The engagement of June 9 is called the battle of Port Republic. Jackson with 13,000 men attacked Tyler with 3,000 men, and Tyler retired with a loss of some 800 men, leaving as many Confederates *hors de combat.*

A few days later Jackson received orders to quit the Valley and join the main army. before Richmond, and President Lincoln simultaneously discovered that he could not afford to keep the divisions of Frémont, Banks and McDowell engaged in operations against Jackson; so the Valley was at peace for a time.

In stricter connection with the operations of the main armies in Virginia, the Confederates brought off two great *coups* in the Valley—Jackson's capture of Harper's Ferry and Martinsburg in the autumn of 1862 and Ewell's expulsion of Milroy from Martinsburg and Winchester in June 1863. The concentration of the Federal forces in north Virginia in May 1864 for the campaign which ultimately took Grant and Lee south of the James involved a fresh series of operations in the Valley. At first a Union containing force was placed there under Sigel; this general, however, took the offensive unwisely and was defeated at Newmarket. Next Hunter, who superseded Sigel in command in West Virginia and the Valley, was to co-operate with the Army of the Potomac. Grant detached Sheridan to join Hunter at Charlottesville, but Lee sent Hampton's cavalry by a shorter route to intercept Sheridan, and a battle at Trevillian Station compelled Sheridan to return and leave Hunter to his fate.

Meanwhile on June 13 Early added his command to the Confederate forces in the Valley. Early succeeded in interposing between Hunter and Lynchburg, and within a week drove Hunter out of Virginia by the Kanawha river route. Early then moved down the Valley turnpike unmolested. Expelling Sigel from Martinsburg on July 4, and crossing the Potomac opposite Sharpsburg, he soon appeared before Washington. Early, after creating serious alarm, retired, on July 13, by Leesburg and Snicker's Gap into the Valley at Winchester. Early soon after sent a detachment into Maryland to burn the town of Chambersburg. The alarm in the North for the safety of Washington was only quieted by the appointment of Sheridan to command in the Valley.

Sheridan's Campaign.—He arrived on the scene early in August. His mission was to drive Early up the Valley or, if the Confederates crossed into Maryland, to intercept their return, and in any case he was to destroy all supplies in the country which could not be consumed by his own army. Sheridan made Harper's Ferry his headquarters and concentrated at Halltown. Early retained his position about Bunker Hill, destroyed the Ohio railroad, and held the main road up the Valley until Sheridan moved out in force on Aug. 10. Early then retreated up the Valley to Fisher's Hill (Strasburg), where he expected to be joined by Anderson's corps from Richmond. Sheridan had followed Early, but hearing of this reinforcement to the enemy. he decided to take up a defensive line at Halltown—the only paint in the Valley which did not favour flanking operations—and await the arrival of adequate reinforcements. For a month the two armies had manoeuvred between Halltown and Strasburg, each commander hoping for such an increase to his own or decrease of his enemy's numbers as would justify attack. The Valley operations were aided indirectly by assaults and sorties about Petersburg. Grant aimed at preventing Lee sending reinforcements to Early until Sheridan's plans had been carried out. Meanwhile Early had been gathering up the harvests in the lower Valley. hut on Aug. 20 Sheridan was able to report "I have destroyed everything that was eatable south of Winchester, and they will have to haul supplies from well up to Staunton." Sheridan in September could put 23.000 infantry and 8,000 cavalry into action. and he was visited by Grant, who encouraged his subordinate to seize an opportunity to attack.

The first encounter of Sheridan and Early took place on Sept. 19, about 2 mi. E. of Winchester. Sheridan had crossed the Opequan and found the enemy in position astride the Winchester-Berryville road. Early was outnumbered and outfought. but he attributed his defeat to the enemy's "immense superiority in cavalry." and in fact Sheridan depicts Merritt's division as charging with sabre or pistol in hand and literally riding down a hostile battery, taking 1.200 prisoners. Early then retreated through Strasburg, but at Fisher's Hill behind Tumbling Run. where the Valley was entrenched on a front of 3 mi. between the Shenandoah river and Little North mountain, he rallied his forces and again detailed his cavalry to protect his left from a turning movement. But Sheridan repeated his manoeuvre, and again on Sept. 22 Early was attacked and routed. Gen. Crook's column having outflanked him by a détour on the western or Back road. Early now retreated to Mt. Jackson, checked the pursuit at Rode's Hill. and, evading all Sheridan's efforts to bring him again to battle. reached Port Republic on Sept. 25. In the first week of October Sheridan held a line across the Valley from Port Republic along North river to Back road. and his cavalry had advanced to Waynesboro to destroy the railroad bridge there, to drive off cattle, and burn the mills and all forage and breadstuffs. Early had taken refuge in Blue Ridge at Rockfish Gap, where he awaited Rosser's cavalry and Kershaw's division (Longstreet's corps), for Lee had resolved upon again reinforcing the Valley command. and upon their arrival Early advanced to Mt. Crawford and thence to Newmarket. The Federals retired before him, but his cavalry was soon to suffer another repulse. for Rosser and Lomax having followed up Sheridan closely on Oct. 9 with five brigades, the Federal cavalry under Torbert turned upon this body when it reached Tom's brook (Fisher's Hili) and routed it. Sheridan burned the bridges behind him as he retired on Winchester. and apparently trusted that Early would trouble him no more and then he would rejoin Grant at Petersburg.

Sheridan at Winchester was now free to detach troops to aid Grant. or remain quiescent covering the Ohio railroad. or move east of Blue Ridge. He had resisted the demand of the Government, which Grant had endorsed. that Early should be driven through the Blue Ridge back on Richmond. Sheridan pointed out that guerrilla forces were always in his rear, that he would need to reopen the Alexandria railroad as a line of supply, that he must detach forces to hold the Valley and protect the railroads, and that on nearing Richmond he might be attacked, by a column sent out by Lee to aid Early.

Early, however, showed great enterprise in following Sheridan down to Strasburg on Oct. 13 "to thwart his purposes if he should contemplate moving across the Ridge or sending troops to Grant." But as his forward position at Fisher's Hill could not be long maintained for want of forage, he resolved to attack Sheridan, who was in a defensive position along the line of Cedar Creek, and on the night of Oct. 18 he sent three divisions under Gordon to gain the enemy's rear: while Kershaw's division attacked his left and Wharton's division and the artillery engaged him in front. The attack was timed to begin at 5 A.M. on Oct. 19, when Rosser's cavalry was to engage Sheridan's cavalry and that of Lomax was to close the Luray Valley. This somewhat complicated disposition was entirely successful, and Early counted his gains as 1,300 prisoners and 18 guns after routing the Federal corps VIII and XIX and causing Wright's corps (VI) to retire. Yet before nightfall Early's force was in turn routed and he lost 23 guns. Sheridan had been called to Washington to consult Halleck, the "chief of staff." on Oct. 16, in reference to his future movements; for Halleck claimed to control Sheridan and pften modified Grant's instructions to his subordinate. Before Sheridan could rejoin his army on Oct. 19 Early had attacked and routed it. but Sheridan met the fugitives and rallied them with the cry: "We must face the other way." He resolved to attack as soon as his troops could be reorganized, but. disturbed by reports of Longstreet's corning by the Front Royal road to cut him off at Winchester, hesitated for some hours; however. at 4 P.M. he attacked and drove back the Confederates. recovering all the ground lost and recapturing his abandoned guns and baggage.

After the battle of Cedar creek. Early again retreated. The Federal Government had agreed to Sheridan's proposal to fortify a defensive line at Kernstown and hold it with a detachment while Sheridan rejoined Grant with the main body. In Feb 1865 the infantry remaining on each side was less than a strong division Sheridan seized the opportunity to advance with 10,000 cavalry. Early delayed this advance aith his cavalry. while he evacuated Staunton: he called up a brigade to defend Lynchburg and proceeded to Waynesboro to await developments. Sheridan feared to advance on Lynchburg, leaving Early on his flank. and decided to attack Early at Waynesboro; and on March 2 he was rewarded by decisive victory, capturing 1,600 Confederates and their baggage and artillery Early himself escaped and his cavalry dispersed to their homes in the Valley; all organized resistance in the Shenandoah Valley came to an end (G. W R.)

SHENSI (SHEN-HSI SHENG), is a northwest province in the loesslands of China between Kansu and Shansi provinces. It was one of the earliest seats of Chinese civilization, the site of a historic capital centred in the vicinity of Sian (*q.v.*), the present provincialseat. Area 74,131 sq.mi.; pop. (1953) 15,881,281.

Topographic barriers and the fertile productivity of the well-watered Wei Ho (river) plain supported its command over strategic gateways to central Asia in the northwest, Inner Mongolia in the north, Szechwan across the Tsinling Shan (*q.v.*) in the south, and the Yellow plain in the east. Shaped in a slender wedge 300 mi. long east and west! the Wei Ho plain begins with a width of about 1 mi. at Pao-chi in the west and widens near Sian to 30–40 mi., continuing thus to the fortress city of T'ung-kuan at the Yellow river elbow. Northward the land rises through a region of deeply gullied badlands to plateau remnants 3,000–6.500 ft. high near the Ordos desert and eastern Kansu. Halfway between the Wei Ho and the Ordos desert lies the town of Yenan, the Chinese Communist capital from 1935 to 1949. In the east, the land overlooks the deep gorge of the Yellow river which drops turbulently here and is only about 330 ft. wide through much of its course until Lung-men is reached. From there to T'ung-kuan the river broadens to 1–2 mi., then turns and leaves the province to flow eastward. Southward of the Wei Ho, the northern front of the Tsinling Shan rises abruptly from the plain, mantled with the same yellow loess on its northern slopes as that covering northern Shensi. Southern Shensi comprises the south slopes of the Tsinling Shan and the north slopes of the Ta-pa Shan and represents an entirely different landscape. Between them in the Han Shui valley lies the Han-chung basic, about 50 mi. long by 6 mi. wide.

North and south Shensi have greatly differing climates. The Tsinling Shan blocks the cold winter minds from moving south, while it greatly reduces the moisture in summer winds moving north. Thus in winter the Han-chung basin is mild and damp, while northern Shensi is cold and dry. Precipitation reaches a yearly average of 30 in. south of the Tsinling Shan, where the annual average temperature is 59.5° F., similar to that of Szechwan. By contrast, the Wei Ho plain gets under 20 in., while in the north this is reduced to as little as 4 in. The January average at Sian falls to 31.1° F., while at Yu-lin in the extreme north it falls to 17.5" F. July averages at these two cities are 82° F. and 75" F. respectively. The autumn rainfall concentration is combined with great fluctuations in annual amounts and seasonal occurrences, presenting great farming hazards. Canal and well irrigation is practised where possible.

The Wei Ho plain, the economic heart of the province, is especially noted for winter wheat and summer cotton production. In the north, spring wheat and millet are significant crops. Beans, kaoliang, corn and tobacco also are grown. In the Han-chung basin, paddy rice in summer is followed by winter wheat. Fruits grown include pears, apples, apricots and grapes. Farm sidelines include the raising of sheep, horses, donkeys, mules, goats and pigs. Forest remnants exist in the heights of the Tsinling Shan, but north Shensi is rather barren and brown. Sand encroachment from the Ordos desert in the north is countered with planted shelter belts.

Shensi has important coal deposits which are largely located in the drainages of the Ching and Lo rivers. Petroleum is being exploited in the Yen-ch'uan and Yen-ch'ang districts. Oil shale occurs in the Han-chung basin. Alluvial gold is panned in the streambeds of the upper Chia-ling Chiang and the south-slope rivers of the Tsinling Shan. Salt is obtained from lakes in the Wei Ho plain. Manganese and graphite also are mined in the province.

Cotton manufacturing is an important industry at the chief cities of Sian, Hsien-yang, Pao-chi and Han-chung. Sian is the major industrial, cultural and political centre. The Lunghai railroad from Honan follows the Wei Ho plain westward into Kansu. From Pao-chi on this line, a railroad crosses the Tsinling Shan to Szechwan. Highways radiate from Sian to Yenan and Yu-lin in the north, Kansu in the west and Honan in the southeast. A highway also crosses the Tsinling Shan from Pao-chi. Much industrial progress has taken place since the Communists consolidated their power and took control. In the early *1960s* output of electric power, coal and crude oil was reportedly to be much higher than before *1949*. Many other new industries were introduced, including textile plants, flour mills and brick factories.

(H. J. Ws.)

SHENSTONE, WILLIAM (*1714–1763*), English poet, son of Thomas Shenstone and Anne, daughter of William Penn of Harborough hall, Hagley, was born at the Leasowes, a property in the parish of Halesowen, now in Worcestershire but then included in the county of Shropshire. At school he began a lifelong friendship with Richard Jago, and at Pembroke college, Oxford, where he matriculated in *1732,* he made another firm friend in Richard Graves, the author of *The Spiritual Quixote*. In *1742* he published anonymously a revised form of *The Schoolmistress, a Poem in imitation of Spenser. . . .* The original was Sarah Lloyd, teacher of the village school where Shenstone received his first education. He inherited the Leasowes estate and retired there in *1745* to undertake what proved the chief work of his life, the beautifying of his property. He embarked on elaborate schemes of landscape gardening which gave the Leasowes a wide celebrity but sadly impoverished the owner. He corresponded with many of the literary people of the day, especially with Jago, Dodsley. Lady Luxborough and Bishop Percy. Shenstone first suggested to Percy the collection of the *Reliques*. Shenstone died on Feb. 11, *1763.*

His works were first published by his friend Robert Dodsley. 3 vol. *(1764–69).* The second volume contains Dodsley's description of the Leasowes. The last, consisting of correspondence with Graves, Jago and others, appeared after Dodsley's death.

See *The Letters,* ed. by M. Williams (1939), and ed. by D. Mallam (1939); for his life, *see* A. R. Humphreys, *William Shenstone* (1937).

SHEPPARD, JOHN (JACK) (*1702–1724*), English criminal, was born at Stepney. near London, in Dec. *1702,* and was brought up in the Bishopsgate workhouse. He was apprenticed to a carpenter, and at the end of *1723* was arrested as a runaway apprentice. Thenceforward: he says, "I fell to robbing almost every one that stood in my way," Joseph Blake, known as "Blueskin," being a frequent confederate. In the first six months of *1724* he twice escaped from jail, and toward the end of that period he was responsible for an almost daily robbery in or near London. Eventually. however. his independent attitude provoked the bitter enmity of Jonathan Wild, who procured his capture at the end of July.

Sheppard was tried at the Old Bailey and condemned to death, but. largely thanks to his accomplice. "Edgeworth Bess," he escaped from the condemned cell and was soon back in his old haunts. In September he was rearrested and imprisoned in the strongest part of Newgate, being actually chained to the floor of his cell. but he escaped through the chimney to the roof of the prison, nhence he lowered himself into the adjoining house After a few days he was rash enough to reappear in the Drury Lane quarter. He nas captured. hopelessly drunk in a Clare Market tavern and reimprisoned, his cell being non watched night and day *On* Nov. *16, 1724,* he was hanged at Tyburn. He uas then not quite *22.*

Sheppard has been a hero of romance, notably in Harrison Ainsworth's novel, *Jack Sheppard (1830).*

See R. W. Postgate, *Murder, Piracy and Treason* (1926).

SHEPPEY, an island off the Kentish coast of England. the largest of several low islands separated from the mainland by the ramifying creeks about the mouth of the Medway. The Kingsferry road and rail bridge over the Swale is the only direct link with the mainland. Pop. *(1951) 28,384.* Area *35* sq.mi. Sheppey is $10\frac{1}{2}$ mi in extreme length from east to west, and 5 mi. wide at its broadest point.

It is low lying with a small elevation near the north coast which presents slight cliffs toward the shallow sea. There are occasional incursions from the sea but protective measures have been taken to prevent further erosion and flooding. Except for the higher ground, the island is treeless but very fertile, producing grain and vegetables; its name, meaning the "island of sheep." is still appropriate. Leysdown and Minster are rapidly developing as holiday camping resorts. On the west are the ancient borough and port of Queenborough and the naval establishment of Sheerness (*qq.v.*).

SHEPSTONE, SIR THEOPHILUS (*1817*–1893), British South African statesman, who was largely responsible for the peaceful development of Natal (*q.v.*), was born at Westbury near Bristol on Jan. *8, 1817.* He migrated to Cape Colony in *1820.* In his early life on his father's mission station he acquired the fluency in Kaffir languages and insight into the Kaffir mind which made him an outstanding administrator. He served (1834–38) in the Cape headquarters as interpreter and during *1838–39* accompanied the forces which occupied Port Natal (Durban). In *1839* he was appointed British resident in Kaffraria.

Shepstone became agent for the tribes in Natal in *1845;* captain general of native levies *(1848)*; judicial assessor in native causes *(1855);* and from *1856,* when Natal became a crown colony. until *1877* he was secretary for native affairs and a member of the executive and legislative councils. Two of his achievements are clear. The death of Dingaan in *1840* was the signal for the return of tribal remnants dispersed by the Zulu reign of terror. With only one resort to force, Shepstone resettled them on locations and restored a species of tribal structure so successfully that the only subsequent major risings in Natal were those of *1873* and *1905.* His policy was based on security of tribal tenure and the custom based on that tenure, both subject to his own authority as supreme chief. This policy mas to be accompanied by progressive civilization for which, as happened, funds and possibly his own enthusiasm, were inadequate. Secondly. apart from the crisis of *1873.* he kept Natal tribes from being involved in frontier wars.

On two occasions he moved into Zululand (*q.v.*) on political errands. In *1861* he persuaded Panda formally to recognize Cetywayo as his successor: in *1873* he crowned Cetywayo and made him smear to rule without illegal violence. In *1874* he was consulted by the secretary of state for colonies in London and in *1876* attended the conference on South African affairs to discuss how to achieve a federal approach to native problems. He returned empowered, if the majority of the inhabitants so desired: to annex the Transvaal (*q.v.*). This he did in April *1877.* But he failed to get a clear majority in the *Volksraad,* was outwitted and obstructed in the Transvaal and ill-supported by the Cape and colonial office. In Jan. *1879* his position as administrator of the Transvaal was temporarily taken over by Sir Owen Lanyon, and he retired, though he was commissioned in *1883* to supervise the restoration of Cetywayo. During his retirement he was the victim of controversy, not least because he opposed the grant of responsible government to Natal in case native policy should become the shuttlecock between two political parties. The Zulus still regard him as "Somtseu." the father of his people. He died in Pietermaritzburg on June *23, 1893.*

See C. J. Uys, *In the Era of Shepstone* (1933); E. H. Brookes, *History of Native Policy in South Africa* (1924). (W. A. ML.)

SHER ALI KHAN (1825–1879), amir of Afghanistan, was born in 1825. one of the sons of the amir Dost Mohammed, whom he succeeded in *1863.* During the viceroyalties of Lord Lawrence and Lord Mayo in India, Sher Ali remained on good terms with the British government; but after the rebellion of his son Takub Khan he leaned toward Russia and welcomed a Russian agent at Kabul in 1878, at the same time refusing to receive a British mission. This led to long negotiations and ultimately to war, when the British forced the Khyber pass in Nov. 1878 and defeated the amir's forces on every occasion. Sher Ali fled from his capital and. taking refuge in Afghan Turkistan, died at Mazar-i-Sharif on Feb. 21, 1879.

SHERANI or SHIRANI, a Pathan tribe on the Dera Ismail Khan border of West Pakistan, who occupy the country and the Takht-i-Suliman, thence eastward down to the border of Dera Ismail Khan district. Sheranis are generally of middling stature, thin. but hardy and active. They have bold features, high cheekbones. and are wild and manly. Their chief occupation is agriculture. but they carry on an extensive trade in Dera Ismail Khan district. There are two well-defined branches called Bargha and Largha, or the Highlands and the Lowlands.

Marriage is adult. Dowry is paid and divorce is usually a repurchase of the woman for half the sum (less the dowry) received for her.

SHERATON, THOMAS (17; 1–1806), English furniture designer, was born at Stockton-on-Tees, County Durham, the son of a working cabinetmaker; an obituary notice in *The Gentleman's Magazine* (ii, 1082. London, 1806) states that he "worked for many years" at that trade. He settled in London probably about 1790, and his trade card gives his address as Wardour street, Soho, where he "teaches perspective. architecture and ornaments. makes designs for cabinet-makers, sells all kinds of drawing-books." Nothing is said of him as a maker of furniture, and all he tells us in his works is that "having possessed a strong attachment for carving in my youth, I was necessarily inclined to make attempts in this art . . . and was employed in the County occasionally in it."

Supporting himself "mainly by his exertions as an author" Sheraton published in four parts between 1791 and 1794 *The Cabinet-Maker and Upholsterers' Drawing Book,* by far his most important undertaking. The first part. which throws a curious sidelight on the author's mentality, is devoted to verbose dissertations on perspective, architecture and geometry. which strike the reader as a naïve attempt to display the author's learning. But the notes on the plates are much fuller than in any other comparable publication and reveal sound technical knowledge. They leave no doubt that Sheraton's primary aim was "to exhibit the present taste in furniture"; as he puts it himself. "I have made it my business to apply to the best workmen in different shops, to obtain their assistance in the explanation of such pieces as they have been most acquainted with." In one or two instances he even informs the reader where specialized pieces of furniture may be obtained: a worktable is "taken from one executed by Mr. McLean in Marylebone Street . . . who finishes these small articles in the neatest manner." It is on the designs in the second part of the *Drawing Book* that Sheraton's reputation (in a great measure misleading) is certainly based. Throughout they are admirable in draftsmanship, rarely at fault in form or proportion, while the distribution and propriety of the ornament may be explained in part by the author's "strong attachment and inclination for carving."

In 1803 Sheraton brought out his *Cabinet Dictionary* (with plates), containing *an Explanation of all Terms Used in the Cabinet, Chair and Upholstery Branches With Dictionary for Varnishing, Polishing and Gilding.* It does not fulfill the promise of the title: the selection of terms is arbitrary and eclectic, suggesting that the author's marked tendency to eccentricity was on the increase. It is however sober and informative compared with Sheraton's final project. the *Cabinet-Maker, Upholsterer and General Artists' Encyclopaedia,* of which only one volume covering A to C appeared in 1805, the year before his death (in Soho, Oct. 22, 1806). The text warrants the inference that he suffered at least from mental instability, while the garish colour plates may be said almost to travesty the prevailing Regency style so marked is the eccentricity of some of the designs.

Adam Black, a Scottish publisher and politician who was employed by Sheraton in connection with the encyclopaedia refers to the latter's "painfully humble circumstances" and describes his house as "half shop, half dwelling-house"—firsthand evidence which should alone have sufficed to refute the legend that Sheraton was a fashionable cabinetmaker. Even now. however. pieces are often described as "by Sheraton" in catalogues and press reports of sales. There are several examples which are either virtually identical with, or closely resemble, a Sheraton design, but this affords no presumption that he was the maker. Hundreds of cabinetmakers and joiners were among the subscribers to the *Drawing* Book; it was in fact a trade catalogue, the plates of which were reproduced throughout the country with varying degrees of accuracy.

Though doubtless Sheraton borrowed what served his turn, there is good reason to suppose that the bulk of the plates in his publications were engraved from his own designs. The version of the neo-classical style represented in Hepplewhite's *Guide,* which appeared only three years earlier than the *Drawing Book,* conveys a general impression distinctly different from that associated with Sheraton. The style in the earlier book, simple. elegant and notably free from extravagance and eccentricity, as interpreted by Sheraton becomes more refined and feminine in character; the eccentricity so conspicuous in Sheraton's later works is as yet scarcely perceptible. The designs bear the mark of a single controlling intelligence, eclectic and even now and again ready to reproduce existing models. but gifted with an innate sense of proportion and style. Much of what he borrowed he adapted and improved upon. The term "Sheraton" has been recklessly bestowed upon vast quantities of late 18th-century painted and inlaid satinwood furniture, but properly understood and used in a generic sense it is an appropriate recognition of the most powerful source of inspiration behind the furniture of the century's closing years. Sheraton writes slightingly of Hepplewhite's *Guide* in his preface, and it is significant that in the 3rd edition of the *Guide* (1794) the designs for chairs are drastically amended, some of those with square backs newly introduced being scarcely distinguishable from the chairs illustrated by Sheraton.

See R. Edwards and M. Jourdain, *Georgian Cabinet-makers,* 3rd ed. (London. 1955). (R. ED.)

SHERBORNE, a market town and urban district in the West Dorset parliamentary division of Dorset. Eng., 15 mi. N.N.W. of Dorchester by road. Pop. (1951) 5,987. Area 2.6 sq.mi. It lies near the border of Somerset on the southern slope of a hill overlooking the river Yeo, in a fertile, well-wooded district. In 1951 traces of Romano-British occupation were found in the southern part of the town, dating from the 2nd–3rd century A.D. Other sites include a large Roman settlement, 10 ac. in extent. overlying occupation of the British (Belgic) period. It is first mentioned in 705 as the place where St. Aldhelm fixed his bishop-stool for the new diocese of Western Wessex. In 1075 the see of Sherborne was transferred to Old Sarum and the cathedral of Sherborne became the abbey church of St. Mary the Virgin. Roger de Caen, bishop of Old Sarum from 1107 to 1139, replaced the Saxon church by a Norman building. parts of which remain today. Pre-Norman work appears in the western wall. and there are an Early English chapel and some Decorated windows. The church, however, was almost entirely reconstructed in the Perpendicular period; the colour decorations in the choir, and the stone-vaulted roof with fan tracery being particularly fine. The completion of this work in 1490 gave existence to the Pack Monday fair, which is still held annually on the first Monday after Oct. 10. Of the original building of the old castle, also built by Bishop Roger, only the gatehouse, portions of the curtain wall, the chapel, the keep, and certain domestic buildings remain. In 1139 the castle was seized by Stephen and remained with the crown until 1355, when it was returned to the bishops and retained by them until 1599 when it was given by Elizabeth I to Sir Walter Raleigh who built the present castle, now used as a museum. During the Great Rebellion the old castle was twice besieged, Cromwell himself being present in 1645 when it fell to Gen. Thomas Fairfax after a defense lasting 16 days. The almshouse of St. John Baptist and St. John the Evangelist was refounded in 1437 and retains a Perpendicular chapel. hall and other portions. The town is an educational centre. Sherborne boys' school now occupies the site of the school for which Edward VI granted a charter in 1550. There are also Sherborne girls' school and Lord Digby's school for girls. founded in 1743. Silk weaving was introduced by Huguenots in 1740 and the town also specializes in glove making and agriculture. It has a milk factory; light engineering and printing works and a brewery.

SHERBROOKE, ROBERT LOWE, VISCOUNT (1811–1892), British statesman. was born on Dec. 4, 1811. at Bingham. Nattinghamshire. He was educated at Winchester and University college. Oxford, and elected fellow of Magdalen college in 183j after a distinguished undergraduate career. Vacating his fellowship on marriage. Lowe became renowned as the outstanding tutor of his day, a savage examiner and an energetic controversialist. Called to the bar in 1842, he emigrated to New South Wales. where he was soon prominent in the courts and in the legislative council as a supporter of efficient but representative government. In 1850 Lowe returned to England, "with a tolerable fortune and a detestation of democracy," and became a familiar figure in society, noted for his caustic wit. He began writing leaders for the *Times* in 1851, and throughout J. T. Delane's editorship his influence remained considerable. Entering parliament in 1852.Lowe was appointed secretary of the board of control for India by Lord Aberdeen in December. and was later both vice-president of the board of trade and vice-president of the council for education under Lord Palmerston. In these minor offices he helped to establish competitive entry to the Indian civil service; his acts of 1856 and 1857 facilitated the formation of joint-stock companies. accepting the principle of limited liability; and he introduced the revised code of "payment by results" in elementary education, opposition to which caused his resignation in 1864.

Lowe proved an effective speaker and a capable administrator; but his brusque manner and sarcastic contempt for both vested interests and eager reformers gave much offence. An albino. and almost blind, he ascribed his faults to "physical rather than moral deficiencies." However. there can be no doubt of his intellectual arrogance, confidently and lucidly expressed, nor of the rigour with which he applied his harshly Benthamite views, stressing the sole tests of merit for the individual and of utility and economy for the actions of the state. Fortified by experience in both England and Australia. and his American observations. Lowe regarded democracy as the enemy of good government, which should be based upon a limited, informed electorate; and was satisfied with Palmerston's benign conservatism. tempered by Gladstonian efficiency. In 1866.by a series of shrewd and brilliant speeches. he turned the commons' distaste for Lord John Russell's Reform bill into hostility which brought down the ministry. In this "swan-song of the old constitutionalism" the case was never better stated. even by Walter Bagehot; and few men have more completely (or unexpectedly) dominated the house.

As leader of the "Adullamites" (the group of antireform Liberals, so-called by John Bright). Lowe's influence attained its zenith; yet his very success stimulated the demand for parliamentary reform and thus helped to produce Disraeli's more drastic measure, the Second Reform act. Despite the mutiny of 1866, Gladstone made Lome chancellor of the exchequer in 1868, admiring his talents and trusting his opinions on finance; and Lowe gave the reforms of a notable administration his regular support. Maintaining Gladstone's tradition at the treasury, Lowe was at first a success; but after 1871 his old maladroitness returned and he became a liability. He was transferred to the home office in 1873, but his active political life came to an end with the ministry's defeat in the following year. Failing powers forced him gradually into seclusion, enlivened by occasional journalism and a pioneer's enthusiasm for the bicycle and the typewriter. Cpon the Liberal victory in 1880,Lowe, already almost forgotten, was raised to the peerage as a viscount. saved from "the ruck of official barons" by Gladstone's insistence that his moment of greatness should be adequately recognized.

(A F. T.)

SHERBROOKE, a city and port of entry of Quebec. Can., and capital of Sherbrooke county, 101 mi. E. of Montreal and 30 mi. from the U.S. boundary at Darby Line. Vt. It is situated at the confluence of the Magog and St. Francis rivers, and on the Canadian National. Canadian Pacific and Quebec Central railways, and is known as the commercial metropolis of the Eastern Townships. Pop. (1961) 66,554. It is the seat of a Roman Catholic bishopric and of the district courts. and contains manufactories of woollen, silk and cotton goods; leather, rubber, and wood products; mining and pulp-mill machinery; also saw and grist mills. It derives its name irom Sir John Coape Sherbrooke(1764–1830), who from 1816 to 1818 was governor general of Canada.

SHERIDAN, FRANCIS (1724–1766), wife of Thomas Sheridan (1719–1788) (*see* below) and mother of the dramatist Richard Brinsley Sheridan (*q.v.*) was the daughter of Philip Chamberlaine of Dublin. When only 15 years of age she wrote a story. *Eugenia and Adelaide,* published after her death in two volumes. She took Sheridan's part in the Kelly riots. writing some verses and a pamphlet in his defense. This led to her marriage in 1747 with the unpopular manager. It was by Richardson's advice that she wrote the *Memoirs of Miss Sidney Bidulph.* It was issued anonymously in 1761 with a dedication to Richardson, and had great success, both in England and France. A second part (2 vol.) was published in 176;. Two of her plays were produced in 1763 at Drury Lane. *The Discovery* and *Tlze Dupe.* The former was one of Garrick's stock pieces, and Sir Anthony Branville one of his favourite characters. *The Dupe* was a failure and was only played once. Her last work was an oriental tale, *Nourjahad,* written at Blois, where she died on Sept. 26.1766.

SHERIDAN, PHILIP HENRY (1831–1888), U.S. soldier, was born at Albany, N.Y., on March 6.1831. His parents, who had recently migrated from Ireland, moved to Perry county, O., a year after Philip's birth. Obtaining through his own endeavours an appointment to West Point, he graduated in 1853. He had gained some experience in fighting Indians on the frontier when the Civil War began in 1861. A first lieutenant at the time, he was soon promoted to captain, and in the spring of 1862 became colonel of the and Michigan cavalry under Halleck in Tennessee. In July he was raised to the rank of brigadier general of volunteers as a result of his skilful conduct in the battle of Boonville (July 1). He was in charge of the 11th division of the Army of the Ohio under Buell in the battle of Perryville (Oct. 8); and under Rosecrans at Stone's river (Dec. 26) he won promotion to the rank of major general of volunteers. In the summer of 1863 he effectively supported Rosecrans in manoeuvring the Confederates under Bragg out of middle Tennessee. Following the latter into northern Georgia in September, Rosecrans met with a signal defeat at Chickamauga (*q.v.*) on the noth, his army being driven in confusion back to Chattanooga, Tenn. Sheridan's cavalry division, though driven back in the course of the battle, helped to cover the retreat. In the subsequent fighting around Chattanooga (*see* CHATTANOOGA, BATTLE OF) Sheridan won considerable distinction, especially in his daring and brilliant charge up Missionary ridge (Nov. 25). This attracted the notice of Gen. Grant, who. when he became lieutenant general (March 1864) and assumed command of the Army of the Potomac in Virginia. placed Sheridan in charge of his cavalry. He proved himself the most able cavalry leader on the Union side. His corps were active in the battles of the Wilderness (*q.v.*) and Spottsylvania Court House (May 5–21). While the latter was still in progress he was sent on a raid toward Richmond. in the course of which he cut the Confederate communications by destroying railroads and cutting telegraph wires. He returned to the main army in time to participate in the battle of Cold Harbor (*q.v.*). Soon afterward he set out upon a raid toward Charlottesville (June 7–20) to co-operate with Gen. David Hunter in the Valley.

The success of these expeditions led to his appointment (Aug. 7) to the command of a newly formed Army of the Shenandonh with instructions to clear the Valley of the Confederates This was the greatest opportunity of his military career, and he proved himself fully equal to it. His campaign was brilliant and decisive He defeated Gen. Early at Winchester (Sept. 19) and again at Fisher's Mill (Sept. 22). Then followed an act concerning which he has often been severely censured. In order to make the region useless to the Confederates, he destroyed all means of subsistence; so that one of the most fruitful regions in the South was left in utter desolation with non-combatants on the verge of starvation. At this time Sheridan was given the rank of brigadier general in the regular army. When a few weeks later (Oct. 19) the main body of his army was thrown into confusion by a surprise attack from Gen. Early at Cedar Creek, Sheridan, some 20 m away, made his famous ride, rallied his troops, and turned defeat into victory. He was then commissioned (Nov. 8) major general in the regular army. He made another raid (Feb. 27–March 24) from Winchester to Petersburg, again destroying supplies and means of communication and defeating Early at Waynesboro. In April he turned Lee's flank at Five Forks and forced him to retreat toward Appomattox where he surrendered to Grant on April 9, 1865.

A month later Sheridan was placed in command of an American force on the Mexican border to watch the struggle between Maximilian, who had been set up as emperor of Mexico by Napoleon III. in 1864, and the Liberals seeking his overthrow. His presence greatly added to the effectiveness of American diplomatic protests to the French Government, thus hastening the collapse of that ill-starred venture. In the spring of 1867 Sheridan was placed in command of the Fifth Military district embracing Louisiana and Texas and stationed at New Orleans. Himself an advocate of cxtrcme measures in dealing with the conquered South he soon came into conflict with President Johnson who opposed such policies. His unconciliatory measures led to his removal in Sept 1867. He was then placed in charge of the Department of the Missouri. In the winter of 1868–69 he conducted a successful campaign against the Indians. In the latter year he was made lieutenant general by President Grant. During the Franco-German war of 1870 he accompanied the headquarters of the German army as the guest of the king of Prussia. In 1883 he was given chief command of the US. army, and five years later, shortly before his death, was raised to the rank of general. He died at Nonquitt, Mass., on Aug. 5, 1888.

In physical appearance Cen. Sheridan was short and stout, and rather harsh-featured To those opposed to his policies, in peace as in war, he seemed gruff and needlessly severe, but to his friends he was kindly. Exceptionally gifted with personal magnetism, he was very popular with his troops. As a military leader he combined brilliant courage with careful, vigilant tactics. He was a devout Roman Catholic. In 1875 he married Irene, daughter of Gen. D. H. Rucker, U S A.

Sheridan's *Personal Memoirs* (z vols.) were published in 1888. *See* also Davirs, *General Sheridan* (1895); Newhall, *With General Sheridan in Lee's Last Campaign* (1866), Channing, *History of the United States*, vol. vi. (1925); W. G. Shotwell, *The Civil War in America* (192j). **(A. M A.)**

SHERIDAN, RICHARD BRINSLEY BUTLER (1751–1816), third son of Thomas and Frances Sheridan, was born in Dublin on Oct. 30, 1751. At the age of 11 he was sent to Harrow school, where he spent six years.

After leaving Harrow he kept up a correspondence with a school friend N. B. Halhed who had gone to Oxford, and between them they published (1771) a metrical translation of Aristaenetus. They also wrote a farce entitled *Jupiter*, which was refused by Garrick and Foote and remained in MS It contains the same device of a rehearsal which was afterwards worked out in *The Critic.* Some of the dialogue is very much in Sheridan's mature manner. The removal of the family to Bath in 1770–1771 led to an acquaintance with the daughters of the ccmposer Thomas Linley. The eldest daughter, Elizabeth Ann (b. 1754), a girl of sixteen, the *prima donna* of her father's concerts, was exceedingly beautiful. Her portrait, by Gainsborough, hangs at Knole, Kent. She had many suitors, among them Sheridan, N. B. Halhed and a certain Major Mathews. To protect her from this man's persecutions, Sheridan escorted Miss Linley, in March 1772, to a nunnery in France, having secretly gone through the ceremony of marriage with her near Calais. He returned and fought two duels with Mathews, while Mr. Linley brought his daughter back to Bath. Sheridan was sent to Waltham Abbey to continue his studies He was entered at the Middle Temple on April 6, 1773, and a week later he was openly married to Miss Linley.

Although he had no income, and no capital beyond a few thousand pounds brought by his wife, he took a house in Orchard Street, Portman Square, furnished it "in the most costly style," and proceeded to return on something like an equal footing the hospitalities of the fashionable world. His first comedy, *The Rivals*, was produced at Covent Garden on Jan. 17, 1775. It is said to have been not so favourably received on its first night, owing to its length and to the bad playing of the part of Sir Lucius O'Trigger. But at the second performance (Jan. 28) it at once took that place on the stage which it has never lost. His second piece, *St. Patrick's Day, or the Scheming Lieutenant,* a lively farce, was written for the benefit performance (2nd of May 177j) of Lawrence Clinch, who had succeeded as Sir Lucius. In November 1775, with the assistance of his father-in-law, he produced the comic opera of *The Duenna,* which was played 75 times at Covent Garden during that season. Sheridan now began to negotiate with Garrick for the purchase of his share of Drury Lane, and the bargain was completed in June 1776. The sum paid by Sheridan and his partners, Thomas Linley and Dr. Ford, for the half-share was £35,000; of this Sheridan contributed £10,000. The money was raised on mortgage, Sheridan contributing only £1,300 in cash. *(See* B. Matthews's 1885 ed. of Sheridan's Comedies pp. 29–31.) Two years afterwards Sheridan and his friends bought the other half of the property for £35,000.

The direction of the theatre seems to have been mainly in the hands of Sheridan. In February 1777 he produced his version of Vanbrugh's *Relapse,* under the title of *A Trip to Scarborough.* This is printed among Sheridan's works, but he has no title to the authorship. His task was to remove indecencies; he added very little to the dialogue. *The School for Scandal* was produced on May 8, 1777. Mrs. Abington, who had played Miss Hoyden in the *Trip,* played Lady Teazle, who may be regarded as a Miss Hoyden developed by six months' experience of marriage and town life. The lord chamberlain was only persuaded on grounds of personal friendship with Sheridan to license the play. There are tales of the haste with which the conclusion of *The School for Scandal* was written and of a stratagem by which the last act was got out of him by the anxious company, but we know from Sheridan's sister that the idea of a "scandalous college" had occurred to him five years before in connection with his own experiences at Bath. His difficulty was to find a story sufficiently dramatic in its incidents. The dialogue is so brilliant throughout, and the auction scene and the screen scene so effective, that the construction of the comedy meets with little criticism. *The School for Scandal,* though it has not the unity of *The Rivals*, nor the same wealth of broadly humorous incident, is universally regarded as Sheridan's masterpiece.

The Critic was produced on Oct. 29, 1779, *The School for Scandal* meantime continuing to draw larger houses than any other play every time it was put on the stage. In *The Critic* the laughable infirmities of authors, actors, patrons and audience are touched off with the lightest of hands; the fun is directed, not at individuals, but at absurdities that grow naturally out of the circumstances of the stage. It seems that he had accumulated notes for another comedy to be called *Affectation,* but his only other play was *Pizarro,* produced in 1799—a tragedy in which he made liberal use of the arts ridiculed in the person of Mr. Puff. He also revised for the stage Benjamin Thompson's translation, *The Stranger,* of Kotzebue's *Menschenhass und Reue*.

He entered parliament for Stafford in 1780, as the ally of Charles James Fox. He is said to have paid the burgesses five guineas each for the honour of representing them. His first speech in parliament was to defend himself against the charge of bribery, and was well received. Congress recognized his services in opposing the war in America by offeringhim a gift of £20.000 which, however, he refused. Under the wing of Fox he filled subordinate offices in the short-lived ministries of 1782 and 1783. He was under-secretary for foreign affairs in the Rockingham ministry, and a secretary of the treasury in the Coalition ministry. In those heated days of parliamentary strife he was almost the only man of mark that was never called out, and yet he had no match in the weapon of ridicule.

Sheridan found his great opportunity in the impeachment of Warren Hastings. His speeches were by the unanimous acknowledgment of his contemporaries among the greatest delivered in that generation of great orators. The first was on Feb. 7, 1787, on the charges brought against Hastings with regard to the begums or princesses of Oude. Sheridan spoke for more than five hours, and the effect was such that it was unanimously agreed to postpone the final decision till the House should be in a calmer mood. Of this, and of his last great speech on the subject in 1794, only brief abstracts have been preserved; but the second, the four days' speech delivered in his capacity of manager of the trial, in Westminster Hall, on the occasion so brilliantly described by Macaulay, is given in Gurney's verbatim reports of the speeches on both sides at the trial, published at Sir G. Cornewall Lewis's instigation in 1859. There are passages of gaudy rhetoric, loose ornament and declamatory hyperbole; but the strong common sense, close argumentative force and masterly presentation of telling facts enable us to understand the impression produced by the speech at the time.

From the time of the break-up of the Whig party on the secession of Burke he was more or less an "independent member," and his isolation was complete after the death of Fox. When Burke denounced the French Revolution, Sheridan joined with Fox in vindicating the principle of non-intervention But when it became apparent that France under Napoleon would interfere with the affairs of its neighbours, he employed his eloquence in denouncing Napoleon and urging the prosecution of the war. One of his most celebrated speeches was delivered in support of strong measures against the mutineers at the Nore. He was one of the few members who actively opposed the union of the English and Irish parliaments. When the Whigs came into power in 1806 Sheridan was appointed treasurer of the navy, and became a member of the Privy Council. After Fox's death he succeeded his chief in the representation of Westminster, and aspired to succeed him as leader of the party, but this claim was not allowed, and thenceforward Sheridan fought for his own hand. When the prince became regent in 1811 Sheridan's private influence with him helped to exclude the Whigs from power. Throughout his parliamentary career Sheridan was one of the boon companions of the prince, and his champion in parliament in some dubious matters of payment of debts. But he always resented any imputation that he was the prince's confidential adviser or mouthpiece. A certain proud and sensitive independence was one of the most marked features in his parliamentary career.

His last years were harassed by debt and disappointment. At the general election of 1807 he stood again for Westminster and was defeated, but was returned as member for Ilchester, at the expense apparently of the prince of Wales. In 1812 he failed to secure a seat at Stafford. As a member of parliament he had been safe against arrest for debt, but now his creditors closed in upon him. It may be regarded as certain, however, that the description of the utter destitution of the last weeks of his life given in the *Croker Papers* (i. pp. 288–312, ed. L J. Jennings) is untrue. It was not without reason that his grand-daughter Mrs. Norton denounced the unfairness of judging the real man from unauthenticated stories; and against reports of his reckless management of his affairs we must set the facts that he had no source of income but Drury Lane theatre, that he bore from it for thirty years all the expenses of a fashionable life, and that the theatre was twice rebuilt during his proprietorship. Enough was lost in this way to account ten times over for all his debts. The records of his wild bets in the betting book of Brooks's Club date from the years after the loss, in 1792, of his first wife, to whom he was devotedly attached. He married again in 1795, his second wife being Esther Jane, daughter of Newton Ogle, dean of Winchester. He died on July 7, 1816, and was buried with great pomp in Westminster Abbey

Sheridan's only son by his first marriage, THOMAS SHERIDAN (1775–1817), was a poet of some merit. He became colonial treasurer at the Cape of Good Hope.

BIBLIOGRAPHY.—*Memoirs of the . . . Life of . . . R. B. Sheridan, with a Particular Account of his Family and Connexions* (1817), by John Watkins made many false statements. The *Memoirs, etc.* (1825), compiled by Thomas Moore did not make full use of the papers submitted by the family. William Smyth *(Memoir of Mr. Sheridan,* 1840) who had been a tutor in Sheridan's house, was responsible for many of the scandalous stories connected with Sheridan's name. Of modern works and critical stories *see* W. Fraser Rae, *Wilkes, Sheridan, Fox* (1874), the *Letters and Journab* of Byron (especially vol. v. p. 411 *seq.*, ed. Prothero, 1901); Mrs. Oliphant, *Sheridan* (1883) in the "English Men of Letters" series; Percy Fitzgerald, *Lifes of the Sheridans* (2 vols., 1886); and the *Life of* R. *B. Sheridan* (1890) by Lloyd C. Sanders in the "Great Writers" series and W. Fraser Rae, *Sheridan: a Biography* (2 vols., 1896). The *Life of R. B. Sheridan* by Walter Sichel (1909) is the best account now available.

Among the numerous modern editions of Sheridan's plays, of which only *The Rivals* was published by the dramatist himself, may be mentioned: *Sheridan's Plays now printed as he wrote them* (1902), edited by W. Fraser Rae; *The Plays of R. B. Sheridan* (1900), edited by A. W. Pollard; and *Sheridan's Comedies* (Boston, U.S.A., 1885), with a valuable introduction by Brander Matthews. For further details consult the bibliography by J. P. Anderson in the *Life* by Lloyd C. Sanders.

SHERIDAN, THOMAS (1687–1738), grandfather of the dramatist, Richard Brinsley Sheridan *(see* above), was born at Cavan and educated at Trinity College, Dublin. He married Elizabeth, heiress of Charles MacFadden, and thereby restored to the Sheridan family Quilcagh House, which they had forfeited by their Jacobite sympathies. When Swift came to Dublin as dean of St. Patrick's, Sheridan was a schoolmaster of high repute, and the two men were soon close friends. Sheridan was his confidant in the affair of *Drapier's Letters;* and it was at Quilcagh House that *Gulliver's Travels* was prepared for the press. Through Swift's influence he obtained a living near Cork. His correspondence with Swift and his whimsical "Art of Punning" make clear from whom his grandson derived his high spirits. He was no mean scholar, and translated the *Philoctetes* of Sophocles (1725), the *Satires* of Perseus (1728), and the *Satires* of Juvenal (1739). His latter days were not prosperous. He offended Swift by fulfilling an old promise to tell the dean if he ever saw signs of avarice in him, and the friends parted in anger. He died in poverty on Oct. 10, 1738.

SHERIDAN, THOMAS (1719–1788), son of Thomas Sheridan (1687–1738; *see* above), was born in Dublin in 1719. His father sent him to Westminster; but he completed his education at Trinity college, Dublin, where he took his B.A. in 1739. Then he went on the stage, and wrote a play, *Captain O'Blunder,* or *the Brave Irishman,* which became a stock piece, though it was never printed. His first appearance in London was at Covent Garden in March 1744, when he acted for three weeks in a succession of leading parts, Hamlet being the first. In October he appeared at Drury Lane, playing Horatio in Rowe's *Fair Penitent,* and subsequently as Pierre in Otway's *Venice Preserved,* and in Hamlet and other parts. In 1747 he became manager of the Theatre Royal, Dublin, and married Frances Chamberlaine, the novelist. He conceived a scheme of British education, and to push this he lectured at Oxford and Cambridge, being incorporated M.A. in both universities. But the scheme did not make way, and in 1760 he was acting under Garrick at Drury Lane. As an actor, he is placed by Churchill *(Rosciad* 1. 987) in the second rank, next to Garrick, but there is no hint of possible rivalry, and he is described as one whose conceptions were superior to his powers of execution, whose action was always forcible but too mechanically calculated, and who in spite of all his defects rose to greatness in occasional scenes. Through Sheridan's efforts Samuel Johnson had been given a pension, and so impressed was Lord Bute with Sheridan's own scheme for a *Pronouncing Dictionary* that he granted him a pension of £200 a year.

In 1764 he went to live in France, partly for Mrs. Sheridan's health, partly to study the system of education. His wife died in 1766 and soon afterwards he returned to England. In 1769 he published a matured *Plan of Education for the Young Nobility and Gentry,* and in 1780 his *General Dictionary of the English Language* (2 vols.). After his son's brilliant success he assisted in the management of Drury Lane, and occasionally acted. His *Life of Swift,* a very entertaining work in spite of its incompleteness as a biography, was written for the 1784 edition of Swift's works. He died at Margate on Aug. 14, 1788.

SHERIFF or **SHIRE-REEVE,** often called "high sheriff," the English and Irish executive authority in a county, or other place, often called his "bailiwick." The office also exists in about 20 ancient cities and boroughs, among which may be named London, Norwich, York, Bristol, Oxford, Lincoln, Chester and Canterbury in England, and Dublin, Cork, Limerick and other places in Ireland. In most of these the office is of an honorary nature. The office is at present an annual one, though this has not been always the case. Three names are put on the list by the chancellor of the exchequer and the judges of king's bench division on the morrow of St. Martin, Nov. 12, and the first name is usually pricked by the king in council in the February or March following. City and borough sheriffs are usually appointed by the corporations on November 9. London and Middlesex are specially provided for by the act of 1887, s. 33, and the sheriffs of the counties of Cornwall and Lancaster are separately appointed, the act not applying to them.

The shrievalty was at one time an important office. The appointment appears to have been originally by popular election, a right confirmed by 28 Edw. I. c. 8, but ultimately vested in the crown except where the office was hereditary. At one time contributions to the expense of the office were made by the magistrates and others of the county. "Sheriff-tooth" was a tenure on condition of supplying entertainment to the sheriff at the county court. Up to the 19th century "riding with the sheriff" was an incident of the assizes, the riders being some of the principal men of the shire who brought with them wine and victuals in order to assist the sheriff in showing hospitality to the judges.

To-day the duties of the sheriff depend on numerous statutes beginning with 2 Edw. III. c. 3 (1328). The most important is the Sheriffsact 1887, mainly a consolidating act applying to England only. The person nominated is usually a magistrate for the county, but anyone is eligible if he has land in the county. Exempt are peers, clergy, officers in active service, practising barristers and solicitors and others. Poverty is also a ground of exemption. The sheriff appoints his undersheriff. The duties of the office are both administrative and judicial. He attends on the judges at assizes and election petitions and is responsible for the execution of writs and of the sentence of death, acts as returning officer at parliamentary elections, prepares the panel of jurors for assizes and is liable for the safe custody of prisoners. He or his deputy sits to assess damages under the Lands Clauses Act 1845, and also in cases sent to the sheriff's court for the assessment of damages. The expenses of the office are partly met by the Treasury. A sheriff cannot during his year of office act as a magistrate for the county of which he is sheriff.

See Sir M. Hale, A *Short Treatise Touching Sheriff's Accompts* (1683); W. Greenwood, *Bouleuterion* (1685); *The Compleat Sheriff* (1696); F. Pollock and F. W. Maitland, *Hist. Eng. Law* (1898); W. S. Holdsworth, *Hist. Eng. Law* (1903); P. E. Mather, *Compendium of Sheriff and Execution Law* (1903); W. S. McKechnie, *Magna Carta* (1905).

Scotland is divided into 15 territorial sheriffdoms in each of which a sheriff exercises administrative and judicial functions; his administrative functions being partly statutory, partly the result of custom. He is Returning Officer in Parliamentary elections for constituencies within his sheriffdom. The appointment, tenure of office and judicial duties of a sheriff are fixed by the Sheriff Court (Scotland) Acts, 1907 and 1913. The sheriff, in his judicial aspect, is one of the judges of the Sheriff court of the sheriffdom. That court, exercising an extensive local jurisdiction, in matters civil and criminal, comprises, on its civil side, a court of first instance and an appellate court, but on its criminal side it has no general appellate jurisdiction. The sheriff sits as the single appellate judge in the Appeal court.

The original jurisdiction of the Sheriff court is, generally speaking, exercised by the salaried sheriff-substitutes attached to the sheriffdom. At the present day the sheriff and salaried sheriff-substitutes are appointed by the Crown on the recommendation of the secretary of State for Scotland. The sheriff, to be appointed, must be an advocate or a salaried sheriff-substitute of five years' standing. He is removable by order of secretary of State for Scotland proceeding upon a report of the Lord President of the Court of Session and the Lord Justice Clerk declaring the sheriff, by reason of inability, neglect of duty or misbehaviour, to be unfit for his office. The order of the secretary of State must lie before both Houses of Parliament for four weeks before it becomes operative. The qualification for appointment as salaried sheriff-substitute is that he shall be an advocate or a law agent in Scotland of five years' standing. The salaried sheriff-substitute is removable from office by the secretary of State for Scotland *de plano* upon a report by the Lord President and the Lord Justice clerk for inability or misbehaviour.

Honorary sheriff-substitutes are appointed by writing under the hand of the sheriff and they hold office during his pleasure.

Besides the sheriffs of counties, there is a sheriff of Chancery appointed by the Crown whose duties are confined to the service of heirs.

See W. J. Lewis. *Sheriff Court Practice* (1923).

Ireland. — The sheriff has much the same duties as in England His position is defined by numerous statutes, beginning with 53 Geo. III. c. 68 (1817).

United States. — The office of sheriff is generally elective. The sheriff has administrative and limited judicial authority. He sometimes serves for combined counties, as in England for Cambridge and Huntingdon. (J. WA.)

SHERIFFMUIR, a battlefield near the western end of the Ochil hills, in the parish of Dunblane, Perthshire, Scot., and $2\frac{1}{2}$ mi. E. by N. of the town. It was the site of a drawn battle (Nov. 13, 1715) between the Jacobites, about 12,000 strong, under John Erskine, earl of Mar, and 4,000 Hanoverians, under John Campbell, 2nd duke of Argyll. About 500 men were lost on each side. Both armies claimed the victory, but Mar felt it prudent to withdraw, and the encounter, occurring one day before the final defeat of the English rising at Preston, was fatal to the Jacobite cause. (G. S. P.)

SHERLEY (SHIRLEY), SIR ANTHONY (1565–c. 1635), English traveler, was educated at Oxford and gained some military experience with the English troops in the Netherlands and also during an expedition to Normandy in 1591 under Robert Devereux, earl of Essex. In 1596 he conducted a predatory expedition along the western coast of Africa and across to Central America, but as a result of a mutiny he returned to London in 1597. In 1598 he led a few English volunteers to Italy to take part in a dispute over the possession of Ferrara; this, however, had been accommodated when he reached Venice, and he decided to journey to Persia to promote trade between England and Persia and to stir up the Persians against the Turks.

He was well received by the shah, Abbas the Great, who made him a mirza, or prince, and granted certain rights to all Christian merchants. Then, as the shah's representative, he visited Moscow, Prague, Rome and other cities, but the English government would not allow him to return to his own country. In 1605 he went to Prague and was sent by the emperor Rudolph II on a mission to Morocco; afterward he went to Lisbon and Madrid. He wrote *Sir Anthony Sherley: His Relation of His Travels Into Persia* (1613). He died at Madrid sometime after 1635.

SHERMAN, JAMES SCHOOLCRAFT (1855–1912), U.S. politician, was born near Utica, N.Y., on Oct. 24, 1855. He graduated from Hamilton college, Clinton, N.Y., in 1878 and was admitted to the bar in 1880. He was elected mayor of Utica in 1884. In 1886 he was elected to the U.S. house of representatives and was returned continuously until 1908, excepting the term 1891–93.

Sherman was chairman of the Republican state convention in 1895, 1900 and 1908; and chairman of the Republican national committee in 1906. At the Republican national convention of 1908 he was nominated vice-president and was elected on the ticket with William Howard Taft. Four years later he was renominated, but he died at Utica, on Oct. 30, 1912, shortly before the elections.

SHERMAN, JOHN (1823–1900), U.S. financier and statesman, a younger brother of Gen. W. T. Sherman, was born at Lancaster, O., on May 10, 1823. He began the study of law at Mansfield, O., and was admitted to the bar in 1844. For ten years he practised his profession with success, and with only casual interest in politics, but upon the repeal of the Missouri Compromise by the Kansas-Nebraska bill in 1854, he joined the great popular movement in Ohio against the policy represented by this bill, and was elected to Congress in the autumn of that year as an "Anti-Nebraska" man. In the summer of the next year he took an active part in the formal organization of the Republican Party in the State, and at the opening of Congress in December began a long career of public service. As a member of the House (1855–61) he quickly manifested the qualities which characterized his whole political life. Though a thorough and avowed partisan, he was within the party the counsellor of moderate rather than extreme measures, and thus gained on the whole a position of great influence. He was a member of the committee sent by the House in 1856 to investigate the troubles in Kansas, and drafted the report of the majority. In March of 1861 he took his seat in the Senate in which he sat continuously until he became secretary of the Treasury in 1877. His interest and efficiency in financial legislation in the House led to his appointment on the Senate committee of finance, and after 1867 he was chairman of this influential committee. He thus became associated with the enactment of all the great fiscal laws through which the strain of war and of reconstruction was sustained. He gave earnest support to the Legal Tender Act, and the substitution of the national for the State banking system. The Resumption Act of 1875, which provided for the return of specie payments four years later, was largely his work, and his appointment to the head of the Treasury department by President Hayes in 1877 enabled him to carry the policy embodied in the law to successful execution.

At the end of the Hayes administration he was again elected to the Senate from Ohio and held his seat until 1897. During this period he was largely concerned in the enactment of the Anti-Trust Law of 1890, and of the so-called Sherman Act of the same year, providing for the purchase of silver and the issuing of Treasury notes based upon it. In 1880 and 1888 he aspired actively to the Republican nomination for the Presidency, but failed to obtain the requisite support in the Convention. During the last years of his senatorial career he was chairman of the Senate committee on foreign affairs. Upon the accession of President McKinley in 1897, he became secretary of State; but under the tension of the war with Spain the duties of the office became too exacting for his strength at his age, and in April 1898 he resigned and withdrew into private life. He died at Washington on Oct. 22, 1900.

A selection from the correspondence of John Sherman and his brother Gen. W. T. Sherman was published as *The Sherman Letters* in 1894. Sherman published *Recollections of Forty Years in the House, Senate and Cabinet: an Autobiography* (Chicago, 1895). A volume of *Selected Speeches* was published in 1879. See *Life,* by T. E. Burton (1906).

SHERMAN, ROGER (1721–1793), American political leader, a signer of the Declaration of Independence, was born in Newton (Mass), on April 19, 1721 (Old Style). He removed with his parents to Stoughton in 1723, attended the country school there, and learned the cobbler's trade in his father's shop Removing to New Milford (Conn), in 1743, he worked as county surveyor, studied law, and in 1754 was admitted to the bar. He was treasurer of Yale college in 1765–76, a delegate to the Continental Congress in 1774–81 and again in 1783–84, a member of the Connecticut committee of safety in 1777–79 and in 1782, mayor of New Haven in 1784–93, a delegate to the Federal Constitutional Convention of 1787 and to the Connecticut ratification convention of the same year, and a member of the Federal House of Representatives in 1789–91 and of the U.S. Senate in 1791–93.

He was on the committee which drafted the Declaration of Independence, and also on that which drafted the Articles of Confederation. His greatest public service, however, was performed in the Federal Constitutional Convention In the conflict between the large State party and the small State party, he and his colleagues played the rôle of peacemakers. In the Federal Congress (1789–93) he favoured the assumption of the State debts, the establishment of a national bank and the adoption of a protective tariff policy. He was strongly opposed to slavery. He died in New Haven on July 23, 1793.

Lewis H. Boutell's *Life of Roger Sherman* (Chicago, 1896), based on material collected by Senator Hoar, is a careful and accurate work.

SHERMAN, WILLIAM TECUMSEH (1820–1891), American general, was born on Feb. 8, 1820, at Lancaster, O. He was descended from Edmond Sherman, who emigrated from England to the Massachusetts bay colony in 1634. His father, Charles R. Sherman, a judge of the supreme court of Ohio, died suddenly in 1829, leaving his widow with a family of young children William was adopted by Thomas Ewing, a close friend of the father, sometime a senator of the United States and a member of the national cabinet. In 1636 he entered West Point, and on graduating near the head of his class he was appointed second lieutenant. His first field service was in Florida against the Seminole Indians The usual changes of station and detached duty made him acquainted with the geography of all the Southern states. He also employed much of his time in the study of law. When the war with Mexico began in 1846 he asked for field duty, and was ordered to join an expedition going to California by sea. He was made executive officer in administration of local government till peace came in 1848 and the province was ceded to the United States. In 1850 he married Ellen Boyle, daughter of Thomas Ewing, then secretary of the interior.

In 1853 he resigned from the army and returned to California to conduct at San Francisco a branch of a St. Louis banking-house. He continued successfully in the management of this business until 1857. Afterwards for a short time he was engaged in business at New York and in 1858 practised law at Lenvenworth, Kansas In 1859, the state of Louisiana proposing to establish a military college, Sherman was appointed its superintendent. This institution was opened on Jan. 1, 1860, and here Sherman remained until the spring of 1861, when it was evident that Louis. iana would join the states seceding from the Union. He thereupon resigned the superintendency and returned to St. Louis. Though his brother John Sherman was a leader in the party which had elected Lincoln, William Sherman was very conservative on the slavery question, and his distress at what he thought an unnecessary rupture between the states was extreme. Yet his devotion to the national constitution was unbounded, and he offered his services as soon as volunteers for the three years' enlistments were called out.

On May 14, 1861, Sherman was appointed colonel of a new U S infantry regiment, and was soon assigned to command a brigade in Gen McDowell's army in front of Washington, serving uith it in the first battle of Bull Run. Promoted brigadier-general of volunteers. Sherman was in August sent to Kentucky to serve under Gen Robert Anderson In October he succeeded to the command of the department. Within a month he reported that 200,000 men would be required for the Kentucky campaign He was relieved of his post soon afterwards in consequence, but the event justified Sherman's view. He was soon re-employed in a minor position, and, at the head of a division of new troops, accompanied Grant's army to Pittshurg Landing At the battle of Shiloh Sherman's gallant conduct gained him promotion to major-general. He took part in Halleck's advance on Corinth. Miss., and at the close of 1862 led the Mississippi column in the first Vicksburg campaign He suffered defeat at Chickasaw Bayou, hut the capture of Fort Hindman, near Arkansas Post, compensated to some extent for the Vicksburg failure. In Grant's final Vicksburg campaign Sherman commanded the right of the line.

After the surrender (July 4, 1863) Sherman was sent to oppose Gen Johnston in the country about Jackson, Miss In July he was made a brigadier-general in the regular army When after Rosecrans's defeat at Chickamauga, Grant was placed in supreme command in the west. Sherman succeeded to the command of the Army of the Tennessee, with which he took part in the battle of Chattanooga (q v). In March, 1864, when Grant became general-in-chief Sherman was made commander of the military division of the Mississippi, including his Army of the Tennessee, now under McPherson, the Army of the Cumberland, under Thomas, and the Army of the Ohio, under Schofield. Making detachments for garrisons and minor operations in a theatre of war over 500m. wide, he assembled, near Chattanooga, his three armies, aggregating 100,000 men, and began (May 1864) the invasion of Georgia. After a famous campaign of careful manoeuvre and heavy combats (*see* AMERICAN CIVIL WAR), Sherman finally wrested Atlanta (*q.v.*) from the Confederates on Sept. 1.

His able opponent Johnston had been removed from his command, and Hood, Johnston's successor, began early in October a vigorous movement designed to carry the war back into Tennessee. After a devious chase of a month Hood moved across Alabama to northern Mississippi. Sherman thereupon, leaving behind Thomas and Schofield to deal with Hood, made the celebrated "March to the Sea" from Atlanta to Savannah with 60,000 picked men. After a march of 300m. Savannah was reached in December. Railways and material were destroyed, the country cleared of supplies, and the Confederate government severed from its western states. In Jan. 1865 Sherman marched northwards again, once more abandoning his base, towards Petersburg, where Grant and Lee were waging their final campaign. Every mile of his march northwards through the Carolinas diminished the supply region of the enemy, and desperate efforts were made to stop his advance. Gen. Johnston was recalled to active service but his forces were inadequate. Sherman defeated him and reached Raleigh, the capital of North Carolina, on April 13, having marched nearly 500m. from Savannah. Lee's position in Virginia was now desperate. Hood had been utterly defeated by Thomas and Schofield, and Schofield (moved 2,000m. by land and sea) rejoined Sherman in North Carolina. With 90,000 men Sherman drove Johnston before him, and when Lee surrendered to Grant Johnston also gave up the struggle.

Sherman had the good fortune to learn the art of command by degrees. At Bull Run his brigade was wasted in isolated and disconnected regimental attacks, at Shiloh his division was completely surprised owing to want of precaution; but his bravery and energy carried him gradually to the front at the same time as he acquired skill and experience. When therefore he was entrusted with an independent command he was in every way fitted to do himself justice. At the head of 100,000 men he showed, besides the strategy which planned the Carolinas march and the skill in manoeuvre which finally gained Atlanta, the strength of will which sent his men to the hopeless assault of Kenesaw to teach them that he was not afraid to fight, and cleared Atlanta of its civil population in the face of a bitter popular outcry. He is justly regarded as one of the great generals of the Civil War.

When Grant became full general in 1866 Sherman was promoted lieutenant-general, and in 1869, when Grant became president, he succeeded to the full rank. General Sherman, after serving as commanding general of the army for 15 years, relinquished command in Nov. 1883 and retired in Feb. 1884. He died at New York city on Feb. 14, 1891.

Sherman's *Memoirs* were published in 1875. *See* also Rachel Sherman Thorndike, *The Sherman Letters* (1894); *Home Letters of Gen. Sherman* (1909), ed. by M. A. De Wolfe Howe; S. M. Bowman and R. B. Irwin, *Sherman and His Campaigns: a Military Biography* (1865); W. F. Johnson, *Life of William Tecumseh Sherman* (1891); Manning F. Force, *General Sherman* in the "Great Commanders Series" (1899); B H Liddell Hart, *Sherman* (1929).

SHERMAN-DENISON, twin cities of Grayson county in northern Texas, U S. Sherman, the county seat, is 65 mi. N. of Dallas; Denison is 15 mi. from Sherman and 4 mi. from the Red river. The Butterfield stage line, from St. Louis to San Francisco, passed through both cities and since that time both have continued to be important transportation centres. The Sherman-Denison area is an important agricultural region and also one of extensive and diversified manufactures. Within the area is Lake Texoma, an outstanding recreational area. Sherman. incorporated in 1895 and named in honour of Gen. Sidney Sherman, commander of cavalry at the battle of San Jacinto, is the location of Austin college (coeducational. Presbyterian, 1849) and Perrin air base. Denison, incorporated in 1891, is the birthplace of Dwight Eisenhower. For comparative population figures *see* table in TEXAS: *Population.* (V. M. S.)

SHERRINGTON, SIR CHARLES SCOTT (1857–1952), English neurophysiologist pre-eminent for discoveries on limb movement by reflex action, who in 1932 received (with E. D. Adrian) the Nobel prize for medicine for discoveries regarding the functions of neurons, was born in London on Nov. 27, 1857. While at Caius college, Cambridge, he was invited to assist in unraveling the anatomy of nerve paths between the brain and spinal cord, but later he turned to the physiology of the spinal cord after isolation from the brain and proved the presence of sense organs in skeletal muscles, thus ending the ancient controversy about "muscle sense." Next, he showed how complex was spinal reflex action in the scratch reflex; the varying latency before response, but unvarying rhythm of response; the reciprocal activity of antagonistic muscles; the long afteraction; facilitation between distant receptive skin areas; central inhibition; postinhibitory rebound; and other characteristics. He interpreted his results with unparalleled insight and suggested that the lability of reflex nerve centres came from physicochemical states in the points of contact between nerve cells, which points of adjunction he called synapses.

In 1891 Sherrington became Brown professor of pathology. London, in 1895 Holt professor of physiology, Liverpool, and was Waynflete professor of physiology, Oxford, 1913–35. His Silliman lectures at Yale university, published as *The Integrative Action of the Nervous System* (1906), established his world-wide reputation and marked out new fields for physiological research, as well as guiding psychologists and clinicians. The remainder of his life was spent on still closer scrutiny of the working of spinal nerve centres. Sherrington died at Eastbourne, Sussex, on March 4, 1952.

See J. F. Fulton in J. *Neurophysiol.*, 15:167 (1952); E. G. T. Liddell in *Obit Not. Roy. Soc.*, 8:241 (1952). (E. G. T. L.)

SHERRY is a fortified and blended wine made from white grapes nhich are grown around the town of Jerez de la Frontera, in Andalusia, Spain. The area where sherry may be produced is about 100 sq.km. and is defined in Spanish law. "Sherries" from other countries, such as South Africa or Australia, declare their country of origin on the label.

Wine from southwest Spain has been imported into England since the 14th century, and possibly before; it is probable that the present method of vinification was developed in the 18th century. A third of all Spanish wine is sherry and Great Britain is the largest importer (about 600,000 gal. a year), while the United States is second largest (about 85,000 gal.).

Some 12 varieties of grapes are used, but the main types are the *Palomino*, a medium-sized grape, and the *Pedro Ximenez*, an expensive golden grape of great sweetness. The soil in which the vines are grown may be one of three main types: *albariza*, a firm chalky soil. of a whitish colour, which produces the finest wines; *burros*, which is less chalky and darker in colour, whose wine is less distinguished; and *arena*, a yellow sandy soil which produces poor quality wine. The sherry vintage normally begins in the first fortnight of September, and the Andalusians sing while they tread the grapes in specially strong *zapatos*, or shoes.

Sherry may be ideal as an apéritif, as a table wine or as a dessert wine, for it may be very dry, medium sweet or rich. The variety which may be obtained by judicious blending is infinite, but the unblended wine will resemble one of three main types. *Fino* is a straw-coloured wine, dry, sometimes very dry; in Spain it is drunk at a lower alcoholic strength than other Jerez wines. *Oloroso* is fuller in colour and richer in body, becoming drier with age; it finishes with distinct richness on the palate. *Amontillado* is neither as rich as the *oloroso* nor as light as the *fino;* in alcohol and in colour it is also in between.

Cream sherry is a fine *oloroso* blended with some rich *Pedro Ximenez* wine; the best has been kept for many years. Brown sherry is similar although even richer. Both these sherries can be produced more quickly by blending with a cheap *vino de color* instead of *Pedro Ximenez* wine. *Manzanilla* is a *fino* which has been matured on the sea coast near Sanlucar de Barrameda and has thus acquired a delicious, fresh, salty tang. East India sherry is an *oloroso* which originally traveled as ballast to the east, a journey which was supposed to improve it; the name, but not the practice, has survived. Finally, *Montilla* is not a sherry since it comes from the Cordoban hills and not from the Jerez area. It is, however. a dry fortified wine, similar to a *fino,* with a little more body, and an attractive nutty flavour.

There is no such thing as vintage sherry because the continuous quality of any wine is guaranteed by using wines from several years in its production. This is done by means of the *solera* system. which is simple although laborious. A *solera* is a series of butts, the wine in each of which is at a slightly different stage of maturity; a *solera* may consist of as few as 4 stages or as many as 20. There may, of course, be more than one butt in a stage, but each stage in a particular *solera* will contain an equal number of butts. Only wine from the most mature butt may be drawn off, and not more than a third of it at a time; this third is thereupon replaced from the butt next to it, and so on, until the first butt (containing the youngest wine) is replenished from a stock of wine held in the *criadera* or nursery. Wine is kept in the *criadera* for about two years after each vintage and here different blends of young wine are prepared to suit the characteristics of each *solera.* So long as not more than three withdrawals are made from the *solera* each year, its age (as well as the flavour of the blend) mill remain constant. (C. C. H. F.)

'S HERTOGENBOSCH, the capital of the province of North Brabant, the Netherlands, at the confluence of the Dommel and Aa rivers, which unite to form the Dieze, and a junction station 29½ mi. S.S.E. of Utrecht (also known as 'sBosch, or den Bosch, French *Bois-le-Duc*). Pop. (1957 est. mun.) 67.394. The Roman Catholic cathedral of St. John, the Janskerk, with its interior in a state of preservation rare in Holland, is one of the finest in the country. The grammar school was once attended by Erasmus.

SHERWOOD, MARY MARTHA (1775–1851), English author, was born at Stanford, Worcestershire, on May 6, 1775, the daughter of the Rev. George Butt. D.D., then rector of Stanford. In 1803 she married her cousin, Capt. Henry Sherwood, an officer in the British army, and subsequently accompanied him to India, where she devoted herself to charitable work and to writing. Her Indian story, *Little Henry and his Bearer,* was translated into many languages. Her best-known work, however, is *The History of the Fairchild Family* (3 pts., 1818, 1842 and 1847). Mrs. Sherwood wrote nearly a hundred stories of a religious type and tracts. mainly for the young. She died on Sept. 22. 1851.

SHERWOOD, ROBERT EMMET (1896–1955), U.S. author whose plays reflect the gradual shift of the intellectual position of his generation — from irresponsible detachment to responsible involvement in human problems. He was born in New Rochelle, N.Y., April 4, 1896. In 1917. he left Harvard to join the Canadian expeditionary forces in World War I and was wounded in France. Back in New York, he edited (1920–28) the humour magazine *Life.* His first play, the urbanely witty historical *The Road to Rome* (1927), criticizes war as pointless. The heroes of *The Petrified Forest* (1935) and *Idiot's Delight* (Pulitzer prize, 1936) begin as detached cynics but realize their own bankruptcy and sacrifice themselves for their fellow men. In *Abe Lincoln in Illinois* (Pulitzer prize. 1939) and *There Shall Be No Night* (Pulitzer prize. 1941), in which his pacifist heroes decide to fight, Sherwood shows that only by losing his life for other men can a man make his own life significant.

During World War II, Sherwood worked for the U.S. Office of War Information, where his help in writing some of President Roosevelt's speeches did much to make ghost writing for public figures an accepted procedure. From this wartime association with Roosevelt came much of the material for *Roosevelt and Hopkins,* for which he received a Pulitzer prize in 1949. Except for his Academy-award-winning film *The Best Years of Our Lives* (1946), Sherwood's theatrical work after World War II was negligible. Sherwood died in New York, Nov. 14, 1955. (Js. T. N.)

SHERWOOD FOREST, one of the ancient English forests, in Nottinghamshire. It extended from Nottingham northward to Worksop, being over 20 mi. long by j to 9 mi. broad. Though subject to forest law. it is not mentioned in Domesday Book because it was not liable for tax. Sherwood, a crown forest from the time of Henry I. is traditionally noted as the retreat of the outlaw Robin Hood. It once contained vast numbers of deer. Today about 12.500 ac. are under national ownership, administered by the Forestry commission as productive plantations. mostly of pines; many veteran oaks remain and there is some birch and beech and much bracken. The forest is on the Bunter sandstone and much of the ground is too poor for agriculture. but in the 18th century great parks. with extensive woodlands. were laid out to form the "Dukeries." Deep-lying coal seams have been extensively developed and colliery settlements built. Mansfield (*q.v.*) is the main town. (H. L. Ed.)

SHETLAND or Zetland, as it is often described officially, is a group of islands lying about 130 mi. to the north of the Scottish mainland, constituting the most northerly county of Scotland. The main island. Mainland, is much the largest, being, though narrow. about 50 mi. long. The total area of land in the county is 550.5 sq.mi. Lerwick, the county town, lies about a third of the way up Mainland on the east side.

The scenerv of Shetland is wild and in places verv fine. Its most distinct characteristics are perhaps the voes or sea lochs which indent all the coasts, often enclosed by steep hills and giving fine views over sea and coast. The common and gray seal is abundant in the Shetland waters, especially between Lerwick and the north isles. Brilliant red and purple sea urchins occur along the shores, due to the presence of the Atlantic drift.

The geological character of the islands resembles that of northern Scotland. Old Red Sandstone, red grits. sandstones and marls and conglomerate occur in a narrow belt on the east side of Mainland. The remainder of the island is occupied by metamorphic schists and gneisses with which are associated dikes and masses of intrusive igneous rock.

The Inhabited **Islands.**—Mainland is almost cut in half just north of Brae. The northern portion. Northmaven, is sparsely inhabited. It contains Ronas hill, the highest point in the islands (1.475 ft.). The western parishes. stretching out to Walls and Sandness. are also thinly populated. Tingwall, the site of the ancient "Ting" or Norse parliament, lying directly north of Lerwick, is the most fertile part of the island and contains one or two sizable farms. South of Lerwick in Dunrossness there is some good land and the districts are more thickly populated.

Of the islands. Yell (pop., 1951, 1.483), which lies just north of Mainland. is the largest. It is about 1; mi. long and largely covered in peat. There are piers and a safe anchorage at Cullivoe and Mid Yell. To the northeast of Yell lies Unst (pop. 1.101), the next largest and most populous and the most northerly of the islands. At Muness are the ruins of a 16th-century castle and at the north the Muckle Flugga lighthouse. the most northerly point of Britain. The name means "Eagle's Island." presumably from the sea eagle n-hich used to frequent the cliffs. In Unst were knitted the finest Shetland scarves, so fine that they could be drawn through a wedding ring. Only two or three people remain who spin their own wool and knit these scarves. Fetlar (pop. 161) lies to the east of Yell and southeast of Unst. It has some good soil but a small population. Off the east and northeast coasts of Mainland lie many small uninhabited islands. Whalsay (the "whales island")) sometimes called "The Bonnie Isle" (pop. 859), though only about j mi. by 2½ mi., has a comparatively large population engaged in fishing. Beyond Whalsay to the northeast lie Out Skerries (pop. 1joi and also fishing islands. Opposite Lerwick and protecting its harbour lies Bressay (pop. 335). Off the western seaboard lie a great number of uninhabited islands and five or. if Muckle Roe (the "great red island") now joined to Mainland by a bridge. be included, six inhabited islands. Of them Papa Stour (pop. 68) lies about 1½ mi. from Sandness. It has some very fine caves, one of which is ¾ mi. long. Vaila. which lies almost landlocked off Walls, has only two inhabited houses, one of which. however, is one of the finest mansions in the county. Off Scalloway, and reached by regular boat sailings from that town. lies Trondra (pop. 54) and Burra Isle (pop. 645) — really two islands. Burra Isle, like Whalsay, is largely inhabited by fishermen and has a village, Hamnavoe. at its northern end.

Farther out from the main group of islands are Foula and Fair Isle. Foula (pop. 75), "the edge of the world." lies in the Atlantic

16 mi. from the west mainland of Shetland. It is a high, rocky island with fine cliffs. The landing place is very exposed and for months in winter the islanders are cut off. Fair Isle (pop. 73) gives its name to "Fair Isle" knitwear, though that is now made generally throughout Shetland. There are two lighthouses and an ornithological observatory under the Fair Isle trust. Visitors may stay at the observatory where a wide variety of birds on migration are trapped and ringed each year. The island lies about 20 mi. S. of Sumburgh head, the most southerly part of Mainland and almost midway to North Ronaldsay.

History. — The word Shetland is a modernized version of the old Norse name *Hjaltland*. The original inhabitants were probably a primitive people who lived in rough. sunken dwellings. Various stone circles survive and brochs of Pictish origin. In the 7th or 8th century the islanders began to be converted to Christianity by priests of the Celtic Church from Ireland or the west of Scotland. although the work was not completed until later. In the 8th and 9th centuries the islands were invaded by the Norsemen who ruled them until the 1jth century. The Norsemen left a heavy imprint on the people and the local place names, most of which are Norse in origin. The language. Norn, survived don-n to the 18th century and various sea birds and parts of boats are generally known by their Norse names. In 1468 the islands. together with Orkney, were given as a pledge for the dowry of Margaret, princess of Norway, betrothed to James III of Scotland. The pledge was never redeemed and the islands were eventually annexed to the Scottish crown. Large tracts of land were granted to Scottish nobles and from the 16th century began a steady influx of Scots which. since many of them came as oppressive lairds, was by no mean; always popular with the native Shetlanders. For several centuries the islands have been famous for wool and knitwear. and fish. The origins of the "Fair Isle" patterns are disputed. They are probably native, although it has been suggested that they came from the crew of a Spanish Armada galleon which was wrecked on the Fair Isle. Development of herring fishing. which at one time supported stations in almost every voe and packed Bressay sound and Baltasound with ships. was largely due to the Dutch in the 18th century; but the Shetlanders have always been great seamen. Many local customs, mostly of Norse origin. survive, such as Up Helly 'aa, the winter festival. The islands on the whole have stood outside the main-stream of Scottish history.

Population. — The population in 1951 was 19,352, showing a decline of 2.069 after 1931; of these 9.001 were males and 10,351 females. In 1861 the population was as high as 31,670. Lerwick (pop.. 1951, 5.538) is the capital and main port of the county. It is a small burgh. The old part of the town is built on a hill falling down to the sea and is intersected by a narrow main street from which even narrower lanes give access to the top of the hill. The old town is surrounded by new buildings of orthodox Scottish layout and design. There are the remains of a fort dating from the time of Cromwell. The only other town is Scalloway, the ancient capital. which lies almost opposite Lerwick on the west coast. It is a considerable fishing centre. In the town stand the ruins of a castle built by Patrick Stewart. one of the most notorious of the Scottish landlords.

Shetland unites with Orkney to return a member to parliament. The island is divided into six districts. It forms a sherriffdom with Orkney and Caithness. and there is a resident sheriff-substitute at Lerwick.

Agriculture and Industries. — The soil of Shetland except in certain districts is poor and the climate inimical to many kinds of agriculture. The system of land tenure is mostly crofting. The main source of the crofters' income is wool. The Shetland breed of sheep produces a light fleece of very fine wool which is knitted by the crofters' wives and daughters into gloves, pull-overs. socks, berets, etc.. in the patterns known as "Shetland" or "Fair Isle." But many of the crofts do not yield a sufficient income for a family and the Shetland men often seek supplementary means of livelihood. usually at sea by fishing or in the navy. merchant service or antarctic whaling expeditions. Efforts were made to break out more land from the hill and increase the number of cattle, the native breed of which gives fair supplies of milk and, though light. the beef is of good quality. However. Aberdeen-Angus and crossbred cattle have to some extent taken their place. Shetland ponies which once did all the work on the crofts are found in considerable numbers, especially in Unst. But demand for both croft and farm work and for the mines has much diminished.

Lerwick is an important herring port; boats arrive there from the east coast of Scotland and England to join the local boats for the summer fishing. At Scalloway. too, considerable quantities of herring are landed early in the season. There is a fish-meal plant on the island of Bressay and a quick-freezing factory at Lerwick as well as facilities for curing fish. Most of the herring stations in the countryside and the outlying islands have, however, been closed. All the year round white fish of all kinds. principally haddock and whiting, are caught by seine nets. The main fishing centres are Whalsay, Burra Isle, Lerwick and Scalloway. White fishing is also carried on, however, from several districts, notably Out Skerries, Cullivoe, Baltasound and Voe. Many crofters keep small boats from which they catch haddock, whiting or piltock for their own use. Fishing boats of other nations frequently call at Shetland harbours. Whales are occasionally seen around the Shetland coast, but whaling locally has ceased.

Apart from agriculture, wool, knitting and fishing, the main native source of livelihood is a small amount of weaving. The stone in Unst is also quarried for talc.

SHEVKET, MAHMUD (1858–1913), Turkish pasha. From 1901 to 1903 he was military governor of the Hejaz, in Arabia, then in what amounted to a state of war. He next went in a like capacity to Uskub (Skoplje), and there came in contact with the Young Turk movement. which had its headquarters in Salonika. In the spring of 1909 the Old and Young Turks were struggling for supremacy. 4 powerful Old Turk counter-revolution was prepared. but. in mid-April. the jrd army corps, under Hussein Husni Pasha, marched from Salonika against Constantinople. At San Stefano Mahmud Shevket took over the command, and, after heavy fighting. on April 4 entered Constantinople.

Impressed by his victory, the national assembly no longer dared to oppose the will of the Young Turks, and on April 26 voted the deposition of Abdul-Hamid. Mahmud Shevket was the hero of the day. But he did not cnre for politics, which he considered had been the ruin of the Turkish corps of officers, and preferred to confine his activities to purely military matters. The next few years afforded him plenty of opportunities. In 1910–11 he put down a revolt of the Malissors with great energy. and in 1912 fought against the rebels in Albania. In the summer of 1912 he became minister of war. and in Jan. 1913 succeeded Kiamil as grand vizier. He took a very active part in army reforms. but he came into conflict with the Cnion Libérale. which took its orders from Sherif I'asha in Paris, and he was murdered by one of its members on June 11, 1913.

SHIBARGHAN, a town and khanate of Afghan Turkestan. The town lies some 60 m. W. of Balkh. It has a citadel, but is not otherwise fortified. and is surrounded by good gardens and excellent cultivation. The khanate was allotted to the Afghans by the Anglo-Russian boundary agreement of 1873.

SHIBBOLETH, a Hebrew word meaning an ear of corn or a stream or river, used by Jephthah, probably in the second sense with reference to the river Jordan. as a test word to distinguish the Ephraimites. who were unable to pronounce the *sh*, from the men of Gilead. at the passage of the Jordan (Judges xii). The word *ciceri* was similarly used in the massacre of the French known as the Sicilian Vespers, and other "shibboleths" are known to history. The term is used of a watchword. catchphrase or cry. to which the members of the party adhere even after any significance which it may have had has disappeared.

SHIDEHARA, KIJURO, BARON (1872–1951), Japanese diplomat and statesman. was born in Osaka on hug. 11, 1872. Graduating from the Imperial university at Tokyo in 1895, he entered the diplomatic service four years later, and after holding consular appointments in Korea and Belgium became successively counselor in Washington, D.C., and London. In 1914 he was appointed minister at The Hague. returning to Tokyo as vice-minister of foreign affairs the following year. He was ambassador to the United States. 1919–22, and a delegate to the Washington conference on limitation of armament; he was created baron in 1920. He held the portfolio of foreign affairs during 1924–27 and 1929–31. Shidehara's name was always associated with policies of peace. notably toward China, but his liberal outlook was not generally popular. He became prime minister for several months after the occupation of Japan in 1945, and later speaker of the house of representatives—a position he held at the time of his death (March 10, 1951). (F. S. G. P.)

SHIEL, LOCH, a lake near the Atlantic seaboard of Scotland, lying between the district of Moidart in Inverness-shire and the districts of Ardgour and Sunart in Argyllshire. The boundary line between the two counties is continued down the river Shiel to the sea. The loch is 17 mi. long and varies in width from 200 yd. to 1 mi.. and is only $11\frac{1}{2}$ ft. above the sea. The maximum depth is 420 ft. with a mean depth of $81\frac{1}{2}$ ft. Loch Dilate lies $1\frac{1}{2}$ mi. E. of Loch Shiel, into which it flows by the Polloch. It is $1\frac{1}{2}$ mi. long at its maximum, with a maximum depth of 55 ft. It receives the Finnan and other small streams and discharges by the Shiel to the salt-water Loch Moidart.

SHIELD FERN, the name applied to ferns of the genus *Dryoptevis,* embracing, in a broadly inclusive sense, about 1,000 species, widely distributed throughout the world. The name is given because of a shield-shaped indusium which, in many species,

RUTRERFORD PLATT

SHIELD FERN (DRYOPTERIS)

covers the spore-producing structures (sporangia) borne on the undersurface of the fronds These plants are also called wood ferns and, in England, buckler ferns. Many segregates from the inclusive genus have been proposed. In North America and Europe occur species of *Thelyptevis* (marsh fern group), *Gymnocarpium* (oak fern group) and true *Dryopteris* (male fern group).

SHIELS, ROBERT (?–1753), Scottish writer, was born in Roxburghshire shortly before 1700. Moving to London, where he was a printer, he was employed by Samuel Johnson as an amanuensis on the *Dictionary.* When this work nas completed Shiels, with others, began the compilation of a five-volume *Lives oj the Poets,* published shortly before his death. Although this work bore the name of Theophilus Cibber (1703–58), playwright and actor, it was actually Shiels who did most of the writing. Shiels also wrote a poem, "Marriage," in blank verse; "Musidorus," an elegy of James Thomson; and several other pieces. He died in London Dec. 27, 1733.

See J. Boswell, ed. by *G.* B. Hill, rev. by L. F. Powell, *Life of Johnson,* vol. iii, 6 vol. (1934–40).

SHIFNAL, a market town in the Wrekin parliamentary division of Shropshire, Eng., 17 mi. E.S.E. of Shrewsbury. Pop. (1951) 13.548. The town was known as Idesall in 1591 when a fund was raised by royal favour to restore it after a disastrous fire. The 12th-century church of St. Andrew is cruciform, combining examples of every period from late Norman to late Perpendicular. Trade is mainly agricultural. with some engineering. Nearby Tong castle, now demolished, shared with Tong castle in Kent the legend of the Saxon Hengest and the British chieftain Vortigern (*q.v.*). Tong church, early Perpendicular, contains a series of ornate tombs, of the 15th and 16th centuries: of the Vernon and Stanley families, former owners of the castle. Boscobel mansion is famous as the hiding place of Charles II after his defeat at Worcester in Sept. 1651 and the secret chamber which hid him is preserved. A tree close to the house bears the name of "Charles's oak" and is claimed to be the original tree in which he hid. White-ladies was a Cistercian nunnery founded about 1186 and dissolved in 13'38.

SHIGA, prefecture (Ken) northeast of Kyōto in South Honshu, Japan. Area 1,551 sq.mi. Pop. (1955) 853,734. Biwa-ko (*q.v.*), the largest lake in Japan, and the surrounding mountainous district form Biwa-ko recreational park and occupy about 25% of the total area of Shiga. The percentage of paddy fields is the highest in Japan. Ōmi cows are famous as beef cattle. The textile industry at Ōtsu, Hikone and Nagahama owes its development in part to the chemical qualities of the lake water. Ōtsu. the prefectural capital, is also an important tourist centre. The tomb of Bash6 (1644–1694), greatest *haiku* poet, is at Shiga. From Otsu boats provide tours to the scenic "Eight Views" and other points on Biwa-ko. (R. B. H.)

SHIH HUANG TI (259–210 B.C.), "First Sovereign Emperor," is the title assumed in 221 B.C. by King Cheng of the Chinese state of Ch'in (in northwest. China) when he completed Ch'in's conquest of the other independent states into which China was then divided, thereby creating the first unified Chinese empire. It is from the state and empire of Ch'in that the name China probably derived.

The first emperor was born in 259 B.C., allegedly the natural son of a rich merchant and Ch'in statesman, Lu Pu-wei, though this story is possibly a slanderous invention. He ruled as king of Ch'in from 246 to 221 and thereafter as first emperor of all China until his death in 210. Major innovations instituted in and after 221 included: (1) abolition of the formerly independent Chinese states with their landed aristocracy and replacement of them by an administrative system of 36 (later 42) *chun* or provinces, subdivided into lesser *hsien* or prefectures and all governed by centrally appointed, nonhereditary, salaried officials; (2) simplification and standardization of the Chinese script according to the written characters current in Ch'in; (3) extension of the Ch'in system of laws, weights and measures throughout the empire; (4) completion of the Great Wall as a barrier between China and its nomadic neighbours to the north and northwest; and (5) the "burning of the books," a governmental proscription of literature ordered in 213 to suppress Confucianism and other dissident schools of thought in favour of Legalism and to make the Ch'in version of past history the accepted one. These innovations, though formally ordered by the first emperor, were largely inspired by his prime minister, Li Ssŭ (*q.v.*).

The first emperor was a mighty conqueror, Machiavellian schemer, bold innovator and at the same time a superstitious megalomaniac whose fear of death caused him to be searching for the Taoist elixir of immortality when he died in 210. His harsh reign was followed within a year by rebellion, leading to the collapse of the Ch'in dynasty and its replacement by that of Han (206 B.C.–A.D. 220). Though the Confucian historians reviled him as a ruthless tyrant, the first Emperor's reign was crucially important for bringing China's feudal age to an end and inaugurating norms of empire that persisted until the founding of the Chinese republic in 1912. *See* also CHINA: *History*.

SHIHKIACHWANG (Shih-chia-chuang, Shih-men), an industrial. rail junction-terminal city in west Hopeh province, China. Pop. (1957 est.) 598.000. In the 1920s it was only a small village near the old city of Chenting close to the Peking-Hankow railway. It lay at the junction of a branch line built to T'ai-yuan, Shansi, in the 1900s. The village became a terminal point and grew into a city of 217,000 by 1935. A rail link built to Te-chou, Shantung, during World War II increased Shihkiachwang's importance. The Chinese Communists, by the early 1960s, had developed the city into a modern regional industrial, transport and trade centre. with an airport, rail yards, cotton mills and many new agricultural processing plants. (J. E. Sr.)

SHI'ISM is a branch of the religion of Islam (*q.v.*). distinguished from the majority Sunnism. One of the factions which disputed power over the early Moslem community and its vast conquests supported the claims of 'Ali (*q.v.*), who was nominated fourth caliph. and then of his descendants. From a political faction this gradually developed into a religious movement, Shi'ism (*tashayyu'*), which deeply influenced all Sunni Islam and also produced a number of important sects, to which especially the term Shi'a ("the party of 'Ali") is applied. In the mid-20th century, perhaps one-tenth of all Moslems were Shi'ites: *i.e.*, about 40,000.-000. Shi'ism is the majority faith in the Iranian plateau and Iraq and perhaps Yemen, and is found in Syria, Lebanon, east Arabia. northern India (especially around Lucknow), in the Deccan and Bombay and elsewhere.

'Ali was a first cousin and son-in-law of Mohammed, father of Mohammed's two grandsons, Hasan and Husain, by his daughter Fatima. 'Ali was noted for his devoted piety and his valour in war. Raised to the caliphate (656) with the support of the murderers of the third caliph (another son-in-law of Mohammed), he never received the allegiance of all the Moslems, but had to wage increasingly unsuccessful civil wars. When he was murdered (661), his chief opponent. Mu'awiya, was generally acknowledged caliph: for some time 'Ali was officially cursed from the pulpits of Islam. But many Moslems. especially at Kufa in Iraq, 'Ali's headquarters. hoped for an Alid restoration. On Mu'awiya's death they invited Husain, 'Ali's son, to become caliph. But they failed to support him at the crisis and he and his little band were cut down (680) near Kufa at Karbala, now a pilgrimage spot. The Kufans thereupon bewailed penitently the death of Mohammed's grandson and swore vengeance against the triumphant Islamic government. Repeatedly they supported insurrections by members of 'Ali's family. but without success.

The Alid cause soon gained support from other groups nhich opposed the Islamic *status quo*—for instance, from the aristocratic Moslem families of Medina. who eventually established a tradition of Alid rule in the holy cities: from pious men protesting against a too worldly interpretation of Islam; and from non-Arab Moslems. especially in Iraq. who demanded an equality refused them by the ruling Arabs. The Alids never won power (though it was initial Shi'ite help which set up the Abbasid dynasty [750], descended from another cousin of Mohammed). Yet 'Ali was rehabilitated as a major hero of Sunni Islam, and his descendants by Fatima have received a privileged status as sayyids and sherifs. (See also Caliphate.)

But the Shi'ites were not satisfied with this. Some, called Zaydis, whose principles were worked out in the 9th century. demanded sword in hand that the ruler must be whichever descendant of Hasan or Husain proved qualified, at a given time. by his knowledge and his practical ability: though otherwise they differed little from the Sunnis. They set up several small states along the Caspian and in Yemen, and rule in Yemen now. Other Shi'ites. called Imamis, asserted a more exalted religious role for the Alid claimants. They insisted that, in power or not, a given descendant of 'Ali was the divinely appointed imam, sole authority in his time on all matters of faith and law. The more speculative among them. called Ghulat ("extremists"), sometimes paid the imams practically divine honours. The more moderate came in time to claim at least that a supernatural "Mohammedan light," embodied in them. gave them superhuman knowledge and power, and that their sufferings mere means of divine grace to their devotees. Love of the imams and of their persecuted cause became equally obligatory with belief in God's oneness and in Mohammed's mission. Every year during the month Muharram, when Husain was killed, the Shi'ites mourned his death (sometimes with bloody self-lacerations) and condemned the guilty Sunnis. Under bigoted Sunni rule, they felt, they might have to protect themselves from persecution by dissimulating their faith (*taqiyya*); but in the end the imam. as mahdi, the "well-guided," would deliver the faithful and punish their enemies.

Several sects acknowledged as imams the line of Mohammed ibn al-Hanafiyya. a son of 'Ali not by Fatima. but these died out in the 9th century. Most Shi'ite sects have acknowledged one of two lines stemming from Husain's great-grandson Ja'far al-Sadiq (d. c. 765). One is that of the Ismailis. who developed a unique religious system and for a time established a powerful Fatimid caliphate, and are represented by the modern Khojas and Bohras, merchant communities of India and east Africa; from them split the Druzes of Syria. (See Druze.)

The majority of modern Shi'ites acknowledge a younger line down to a 12th imam, Mohammed al-Muntazar, supposed to have gone into hiding in 878 and expected to return as mahdi before the Last Judgment to establish justice in the earth. Among these are the Nusayris or 'Alawites of northern Syria. with a secret faith of complex origin; the 'Ali-Ilahis or Ahl-e Haqq, scattered peasants and herdsmen of Kurdistan. Turkey and Iran; and the Sufi order of Bektashis in Turkey and Albania. But most who acknowledge the 12 imams belong to the Ithna 'ashari or "Twelver" sect (in Syria, Mutawali).

Despite occasional Shi'ite rulers: the Shi'a remained almost everywhere a minority faith till at the start of the 16th century the Safawi dynasty made it the sole legal faith of their empire, embracing the Turks of Azerbaijan, the Persians of Iran and the Arabs of Iraq proper; these have since been all overwhelmingly Twelver Shi'ites. and have given that sect a vigorous modern life. Usulis. claiming the primacy of legal principle. have debated with Akhbaris. attached to established texts; with the speculative Shaykhis; and especially with the Babis and Bahais of the 19th century. At the Shi'ite pilgrimage places, especially Najaf near Kufa in Iraq, scholars qualified to make independent judicial decisions, mujtahids. regarded as representatives of the hidden 12th imam, expound Islamic law according to the school of Ja'far, which differs in some particulars from each of the Sunni schools. They also have a political role as popular authorities, especially in Iran.

SHILLING, an English token coin of the nominal value of 12 pence, denoted after a numeral by s. (from Lat. solidus). The origin of this Teutonic word is somewhat obscure. There was an Anglo-Saxon coin termed *scilling,* or *scylling,* worth about fivepence. which is said to be derived from a root. skel, to divide, + *ing* on the analogy of farthing (*q.v.*) (cf. Du. *schelling*). The silver shilling was first struck in 1504; in Charles II's reign the edges were first milled; and in George IV's reign were issued the so-called "lion shillings." bearing the royal crest. a crowned lion on a crown. a design reverted to in the coinage of Edward VII. A shilling is token money merely: it is nominally in value $\frac{1}{20}$ of a pound. but after 1921, when the silver content was reduced from $\frac{37}{40}$ to $\frac{20}{40}$, one troy pound of silver was coined into 66 shillings. The design of the shilling was altered in 1937; the reverse side after that consisted of either the royal crest of England or the royal crest of Scotland, with an inscription. See also Numismatics.

SHILLONG, the capital of Assam. India, and the headquarters of the United Khasi and Jaintia Hills district. It is on a plateau 4,978 ft. above the sea, 63 mi. by road south of Gauhati. Pop.

(1951) 53.756. Shillong in effect dates from 1864, when the district headquarters were transferred from Cherrapunji. It was chosen as the seat of government in 1874, when the province of Assam was constituted. It contains a cantonment (pop. 4,756), the Pasteur institute and research laboratory (for antirabies treatment) and four colleges connected nith Gauhati university. Its climate and surroundings make Shillong a popular resort.

The city was devastated by the great Assam earthquake of June 12, 1897.

SHILLUK: *see* NILOTES.

SHILOH, a town of Ephraim, where for three centuries after the Israelite conquest of the Holy Land it was the depository of the Tabernacle and Ark of the Covenant. In its sanctuary the boy Samuel had his vision. With the removal of the Ark Shiloh's glory departed and by the time of Jeremiah (vii, 12) it was a heap of ruins. Its identification with modern Seilūn, 2 mi S.E of El-Lubban (Lebonah) on an isolated hill affording an ideal site for a sanctuary and fortress, is not disputed. (E Ro.)

SHILOH, BATTLE OF. This, the second great battle in the American Civil War, also called the battle of Pittsburg Landing, was fought on April 6 and 7, 1862, between the Union forces under Gen. U. S. Grant and Gen. D. C Buell and the Confederates under *Gen A S. Johnston* and *Gen. P G. T. Beauregard.* In Feb. 1862 Grant had taken Ft. Henry on the Tennessee river and Ft. Donelson on the Cumberland. The Confederates had acknowledged the importance of these forts by abandoning their strong position at Columbus. Ken.. and evacuating Nashville on the upper Cumberland. Grant then sought to extend his advantage by an amphibious move up the Tennessee to attack the line of the Memphis and Charleston railroad, which followed the line of the upper river. High water frustrated these early efforts at raids from the river as a base He then disposed his five divisions in camps around Pittsburg Landing on the Tennessee river near Corinth, Miss. There *Johnston,* commanding Confederate forces in the west, and *Beauregard* were collecting a force aimed at recovering some of their recent losses. Buell's army mas marching somewhat leisurely across the country from Nashville to join Grant in an attack upon Corinth. Since they were planning for an offensive the Union troops had not fortified their camps. *Johnston,* to their surprise, seized the initiative and decided to attack Grant before Buell could arrive. Accordingly he led his army from Corinth against Pittsburg Landing early on Sunday morning, April 6.

This battle was fought by inexperienced troops on both sides. Gen. W. T. Sherman was holding the most exposed position at Shiloh church about 2 mi. W. of the Landing with recently recruited raw troops. The other Union divisions were scattered in several camps out of sight of each other. Sherman's men received the first assault and the two advanced divisions were swiftly driven in on the others, who had only a little more time to prepare themselves. Confederate leaders in the woods were unable to control and maneuver their untrained and excited men. But the Confederates continued to push each isolated Union division fighting hard toward the Landing. Thus the day passed in confused and savage scuffles between raw troops.

By late afternoon, Grant. who had come up from his headquarters at Savannah 9 mi. down the river, had rallied his troops. With one brigade of Buell's leading division, which had arrived on the previous evening, he formed a defense line in a naturally strong position barely 600 yd. from the Landing. Earlier in the afternoon *Johnston* had been killed, a sore and irreparable loss to the Confederate cause. At sunset *Beauregard,* as was customary, suspended the attack.' During the night Buell brought up 25,000 troops and he and Grant took the offensive early the next day. *Beauregard* thereupon decided to extricate his hard-pressed army and to retire fighting toward Corinth. A strong rear-guard action under *Gen. Braxton Bvagg* repulsed the attacks of Grant and Buell at Shiloh church for six hours and the Union forces succeeded in doing little more than reoccupying the camps they had lost the day before while the Confederates returned to Corinth. It was a Confederate failure but not a Union victory and, each side being weakened by about 10.000 men, neither made any movements for the next three weeks. See also AMERICAN CIVIL WAR.

SHIMANE, a prefecture *(ken)* in southwest Honshu, west Japan. Area, including the island group of Oki-gunto, 2,558 sq mi. Pop (1960) 888.886. It is located on the Sea of Japan, distant from the central part of the country. Because of this location and its unfavourable natural conditions. Shimane's culture. notable in ancient times, and its industry have become retarded. Forests cover most of the land, and forestry and stock breeding are well developed. However, agriculture supports most of the population. Paddy fields, chiefly of the one-crop type, are scattered throughout the prefecture. Matsue (*q.v.*), the prefectural capital. is known to the west through the writings of Lafcadio Hearn. The ancient shrine at Izumo is justly famous. (R. B. H.)

SHIMOGA, a municipality, with taluka (administrative subdivision), and a district in Mysore, southern India. The town is on the Tunga river, at the terminus of a branch railway and 152 mi. N.W. of Bangalore. It has cotton-ginning and pressing factories and iron- and steelworks. Pop. (1951) : town 46,524; taluka (409 sq.mi.) 96.620.

SHIMOGA DISTRICT has an area of 4.066 sq.mi. Pop. (1961) 1.014.723. In the east the Tunga. Bhadra and Varada rivers unite to form the Tuagabhadra, which ultimately falls into the Kistna and so into the Bay of Bengal, while in the west a few minor streams flow to the Sharavati, which near the northwestern frontier bursts through the Western Ghats at the Falls of Gersoppa (*q.v.*).

The western half of the district is mountainous and covered with magnificent forest, and is known as the Malnad or hill country, some of the peaks being 4.000 ft. above sea level. The general elevation of Shimoga is about 2,000 ft. Toward the east it opens out into the Maidan or plain country, part of the general plateau of Mysore. The soil is loose and sandy in the valleys of the Malnad, and in the northeast the black cotton soil prevails. Shimoga presents much variety of climate. The southwest monsoon is felt in full force for about 25 mi. from the Ghats, but the rainfall gradually diminishes to 31 in. at Shimoga station and to 25 in. or less at Chennagiri. Rice is the staple crop; next in importance is sugar cane; areca nuts are also extensively grown; other crops include vegetables, fruits and pepper. The mineral products of the district include iron ore and laterite. Manganese is worked. Next to Shimoga the largest town is Bhadravati (42.451).

During the Mohammedan usurpation of Mysore from 1761 to 1799, the whole country was in constant turmoil. After the restoration of the Hindu dynasty. Shimoga became the scene of disturbances caused by the maladministration of the Deshast Brahmans. These disturbances culminated in the insurrection of 1830, which led to the direct assumption of the administration by the British.

SHIMONOSEKI, largest city of Yamaguchi prefecture in extreme western Honshu, Japan. Pop. (1960) 246.941. Its strategic location on the Straits of Shimonoseki brought it to transportation and commercial prominence. The city was formerly called Akamagaseki or Bakan. Modern development began in 1905 with the opening of railroad .ferry service with Moji in Kyushu; more recent links include a 2.3 mi. railroad tunnel (1942') and a vehicular-pedestrian tunnel (1958) under the straits. Shimonoseki became a heavy industrial centre after 1942 and in 1910 its port was formally amalgamated with Moji (*q.v.*) and Kokura ports into the single port of Kammon.

The Straits of Shimonoseki (Shimonoseki-kaikyō), renamed Kammon straits, are the narrow western passageway between Japan's Inland sea and east Asian waters. Although about 2,200 ft. wide at the narrowest point and partially blocked by Hiko Island at the western end, the straits are 40–65 ft. deep and are easily navigable. (J. D. EE.)

SHINGLES. Shingles (herpes zoster) is a common virus infection which attacks various nerve trunks and the areas of the skin which these nerves supply. While shingles appears most frequently on the thorax or abdomen, it also occurs elsewhere. The infection may occur at any time of life, but is most common in adults and rare in infants. Before the appearance of the typical lesions of shingles on the skin, there is ordinarily a short period of mild to marked neuralgic pain or of increased sensitivity of the skin in the area involved. The skin lesions then appear as characteristic clusters of tense blisters on areas of red inflamed skin. In a typical case the groups of lesions extend from the midline of the back, partially or completely around one side of the chest or abdomen. If one of the branches of the fifth cranial nerve is involved, lesions may first appear in the scalp and then extend over the region of the eye. In this form, there is definite danger of involvement of the eye itself.

The symptoms and skin changes produced by shingles vary greatly, but tend to be more severe in older people. In some patients there may be an intense boring neuralgic pain which persists for many months after the skin lesions have subsided. The changes produced in the skin may vary considerably from mild to severe.

There is good evidence to indicate that the virus of shingles is the same as that which causes chicken pox (varicella). There are numerous recorded instances of patients who developed shingles after contact with a patient with chicken pox, or vice versa. In general, an adult is more liable to develop shingles from the virus, and a child to develop chicken pox, though this is by no means an absolute rule. Studies of material obtained from the skin lesions of chicken pox and of shingles and examined with the electron microscope demonstrate that the virus of these diseases is identical in appearance. If an adult has had shingles, a second attack is unlikely to develop. However, chicken pox in childhood seems to confer little immunity against shingles in adult life.

There is no specific method of treatment of shingles. Treatment will be dependent somewhat upon the severity of the disease; in mild cases the patient is often little inconvenienced. However, when pain is severe, or if there is any possibility of the lesion spreading to the eye, or if the inflammatory changes of the skin are marked, the disease may be quite disabling. The skin lesions heal best if a drying lotion rather than an ointment is used during the first few days after the appearance of the lesions.

SHINNECOCK, a North American Indian tribe of Algonkin stock which formerly inhabited the eastern half of Long Island, N.Y. A few survivors of the tribe occupy a reservation on Shinnecock Neck, near Southampton on the southern shore of Long Island. The rest, with remnants of other Algonkin tribes of the vicinity, formed the Brotherton tribe late in the 18th century, and many of them migrated to Wisconsin.

SHINTO, which literally means the way or teaching of the gods (kami) is a loosely organized, indigenous religious cult of Japan. This designation arose in order to distinguish the traditional religion of Japan from Buddhism when the latter was introduced there in the 6th century A.D. While Shintō has no founder, no official sacred scriptures and no dogma, it has preserved its ethos throughout the ages. In the modern period it has been used as a tool of ethnocentric nationalism and chauvinistic militarism, and is often thought of in these terms by outsiders.

Primitive **Shintō.**—The official chronicles of Japan are characterized by a smooth transition from the mythical past to the historical period. Though according to legend the first emperor of Japan was enthroned in the 7th century B.C.. most modern scholars agree that the historical period of Japan started about 1,700 years ago. Even before the historical period, of course, the inhabitants of Japan had some kind of religion but the origins of the ancient Japanese religious cult that gradually developed and was later referred to as Shinto are unknown. The ancient Japanese people mere an admixture of various groups who had migrated to the Japanese islands from the Asian continent, and their religion also betrayed northern and southern Asian influences. It took several centuries for these ethnic groups and peoples to become assimilated under the leadership of the so-called Yamato clan around the 4th century A.D At any rate, the early Japanese myths, many of which are unrelated and often contradictory, indicate that they were in part the legacy of the dominant Yamato clan and in part the sacred traditions of other clans and peoples that were subjugated by the Yamato.

The early Japanese by and large did not draw a sharp distinction between the celestial and earthly domains. They had only a vague notion about the life to come, and the veneration of ancestors that characterized the religious life of the later period was hardly known. Their religion was a simple polytheistic nature worship, emphasizing gratitude to the beneficent forces of nature: while also to some degree appeasing the malevolent forces. These forces of nature were indiscriminately called kami which is usually translated as "gods" or "deities." The term kami, however, meant "above," "superior" or "divine," and it signified anything that was the object of reverence and respect. Accordingly, all the heavenly and earthly forces, great men both living and dead, and many animate and inanimate beings such as plants, rocks, birds, beasts and fishes as well as earthquakes, thunder, water, sun and moon were kami. The early myths spoke of 800 myriads of kami, usually divided into heavenly kami (those who resided in the heavenly abode known as Takama-ga-hara) and earthly kami (those who resided on earth). In this connection it is necessary to remember that the Japanese did not regard spirit as superior to matter; rather, they believed that the two coexisted on an equal footing. *Kami* were thus regarded as inseparable from shintai (kami- or god-body) or *mitama-shiro* (visible representations of kami).

The religious rites of the early Japanese were mostly fertility cults. Purification in a ceremonial sense was emphasized. Disease, wounds, death, sexual intercourse and menstruation were considered displeasing to the kami, and those who were thus polluted could not participate in the rites. Three kinds of persons performed religious rites: (1) the heads of families or clans, considered priests de facto; (2) shamans, men and women with occult powers who performed divination, sorcery and lustration; and (3) hereditary lines of priests and shamans, known to have existed in at least some clans. These three types of priests and priestesses sometimes existed side by side, and in some cases one of them combined features of the others. In time, the Yamato clan overpowered other clans and its hereditary priest-king (Tennō or "emperor") acquired supreme prestige. Significantly. the function of the throne was to take charge of both religious rites (*Matsuri*) and political administration (*Matsuri-goto*) which were regarded as inseparable.

With the ascendancy of the Yamato clan its myths began to provide foundations for political theories. The prominent feature of the Yamato myths was the divine origin of the Yamato people. Briefly stated, a male deity named Izanagi ("He who invites") married a female deity named Izanami ("She who is invited"), and they bore mountains, rivers, seas, plants, animals and human beings, as well as kami. Among the kami thus born were the sun-goddess (Amaterasu Omikami), the moon ruler (Tsuki-yomi-no-mikoto) and the ruler of the nether regions (Susa-no-6-110-mikoto). The most important of these was the sun-goddess who sent her grandson Ninigi-no-mikoto to pacify the Japanese islands. Ninigi's grandson is said to have been the first emperor. Jimmu Tennō, the earthly ancestor of the imperial family. The sun-goddess was later enshrined at the Grand Shrine of Ise which became both the tutelary shrine of the imperial family and the central shrine of the whole nation. Eventually the myth of the solar ancestry of the imperial clan was widely accepted among the various clans including many clans of Chinese and Korean descent. The sun-goddess was worshiped side by side with other clan deities and nature deities all of which comprised the rich Shinto pantheon. While in the history of Japan the political authority of the throne was often precarious it never lost its bond with the masses through Shinto which was rooted both in the religious tradition of the Yamato imperial clan and in the sacred memories of other clans.

Foreign Influences. — With the introduction of Chinese civilization in the 5th century A.D., the religious and cultural situation in Japan became complex. Confucianism not only provided Japan with systematic theories of social and political institutions but also with ethical norms for individuals in a hierarchical society. Together with Confucianism came Taoism and the Yin-Yang philosophy, and they too contributed philosophical concepts. Gradually, Confucian moral virtues began to be attributed to Shintō deities and imperial edicts stressed such Confucian virtues as uprightness, sincerity and honesty as the guiding moral principles. The concepts of filial piety and the veneration of ancestral spirits were soon adopted by the Japanese.

Buddhism, introduced to Japan in the 6th century A.D., also had far-reaching influence. Buddhism initially penetrated the upper strata of Japanese society and with the encouragement and support of Prince Regent Shōtoku (593–621), Buddhism became for all practical purposes the state religion. Shinto, however, retained its prestige and influence among the masses, a fact the government could not ignore. Shortly after the death of Shōtoku the government established the department of Shinto which managed and controlled the festivals and rites at the imperial household as well as at the tutelary and ancestral shrines of powerful clans. The cause of Shintō was greatly enhanced by the compilation in the 8th century of the Kojiki ("Records of Ancient Matters") and the *Nihongi* or *Nihon-shoki* ("Chronicles of Japan") in which the ancient oral traditions mere assembled and recorded for the first time. Since Chinese script was used the myths and legends were inevitably influenced by Chinese thought; nevertheless, these records are an important storehouse of early Japanese myths and they are often considered as quasi-sacred scriptures of Shinto, although Shintō has no concept of scripture comparable to the Bible of Christianity or the Koran of Islam.

Coexistence of Buddhism and **Shintō.**—Buddhism began to overshadow Shinto during the Nara period (8th century A.D.), especially in the capital city of Nara, but it had to come to terms with the deeply rooted Shintō beliefs and practices of the people. Even the construction of the Tōdaiji, the national cathedral of Buddhism at Nara, required the blessing of the Shintō deities communicated to the throne by means of oracles; and emperors and empresses who considered themselves humble slaves of Buddha could not neglect the Shinto rites altogether. Buddhism and Shintō did not attempt to exterminate each other. What emerged was a pattern of coexistence that is often referred to with some exaggeration as the "amalgamation of Shinto and Buddhism."

This pattern of coexistence developed gradually. For example, wealthy landowning Buddhist monastic institutions found their tenants deriving solidarity from Shinto deities and Shinto cults; by allowing Shinto shrines to remain, the Buddhist institutions were protected by the Shinto taboos. Eventually. Shintō shrines found their way into the sacred premises of Buddhist temples and monasteries and in turn Buddhist chapels were built near Shintō shrines. During the Iiara period Buddhism became so powerful in the court that Shinto had nothing to lose by allying itself with the cause of Buddhism. Even the popular Shintō deity Hachiman came to be known as *Daijizaiten-bosatsu* (*Bodhisattva*).

When the capital was moved from Nara to Heian-Kyō (the present Kyoto) toward the end of the 8th century, ostensibly to be freed from the political pressure of Buddhist institutions, the pattern of coexistence persisted. As early as 794, Buddhist sacred scriptures (sutras) were recited at some Shintō shrines. Two new Buddhist schools, Tendai and Shingon, inaugurated in the 9th century not only welcomed an alliance with Shinto but also attempted to provide theoretical justification for coexistence. The Shingon Buddhist theory of coexistence was called Ryōbu ("Two Aspects") Shinto, the Tendai theory. Ichi-jitsu ("One Reality") Shinto. Both interpreted Shinto deities as manifestations or incarnations of the Buddha. and both attempted to incorporate Shintō into their frameworks of Buddhism. Shinto priests became dominated by the powerful and influential Buddhist ecclesiastics and were content to play only a minor role even in Shinto rites. Shintō continued to enjoy favour among the masses in the outlying districts and the folk elements of the Shintō tradition were represented in the Shugen-dō (order of Mountain Priests), but during the middle of the Heian or Fujiwara period the Shugen-dō also allied itself with the powerful Tendai and Shingon schools and came to be known as the Tendai Shugen-dō and Shingon Shugen-dō respectively.

Shintō Reaction Against Buddhism. — During the Kamakura period which succeeded the Heian, a Shintō reaction to the predominance of Buddhism gradually developed. The corruption of the Fujiwara oligarchy that had dominated the political scene during the Heian period resulted in the establishment of a feudal regime (bakufu) ruled by warrior-statesmen (*shōgun*) during the Kamakura period. The elegance of the court in Kyōto gave way to the austere culture of warriors; moreover, after centuries of peace and tranquility, Japan was threatened by the Mongols. The Kamakura period, however, with its social and political disruption, was an age of spiritual awakening in Japan, and this awakening was reflected in Shintō which tried to emancipate itself from the domination of the Tendai and Shingon schools. The spokesmen for Shintō were hereditary priests of the Watarai family who served at the Outer Shrine of Ise; hence the movement was called the Ise Shinto. Buddhism was too deeply rooted to be rejected altogether, and recognizing this, the spokesmen of the Ise Shintō movement attempted to reverse the Buddhist claim that Shintō deities were incarnations of the Buddha; they taught instead that Buddhas and Bodhisattvas were manifestations of the great kami nature of Shinto. By the middle of the Kamakura period the five-volume work *Shintō Gobushō* ("Shintō Pentateuch") was completed, proclaiming this type of Shinto apologetics.

The decline of the Kamakura feudal regime was followed by a period of imperial rule known as the Restoration of the Kemmu uhich greatly encouraged the Ise Shinto movement. A famous loyalist, Kitabatake Chikafusa (d. 1354), wrote in his work *Jinnō-shōtō-ki* ("Records of the Valid Succession of Divine Emperors"): "Great Yamato is a divine nation. It is only our land whose foundations were first laid by the divine ancestor. It alone has been transmitted by the sun-goddess to a long line of her descendants." He regarded the three imperial insignia—a mirror, a bead and a sword—as the symbols of the three Shintō virtues of veracity, mercy and justice.

The short-lived imperial rule of the Kemmu was followed by the Ashikaga feudal regime which saw the development of arts and culture, spurred on by political unrest and greatly inspired by Zen Buddhism. Shintō was again at a low ebb, with. however, notable exceptions. Ichijō Kanera (d. 1481) formulated a monotheistic view of Shinto. Also during this period Yoshida Kanetomo (d. 1511), deeply influenced by Taoist metaphysics, initiated a movement called Yoshida or Yui-itsu ("One and Only") Shinto, which taught that one unique *kami*-nature is the underlying substance of all Shintō deities and Buddhas. The influence of Shintō, however, was negligible during the Ashikaga period and the "dark age" that followed it. The country was in a state of political chaos until order was re-established in the late 16th century.

Confucian **Shintō.**—Japanese unification was completed with the establishment of the Tokugawa feudal regime, which ruled Japan from 1615 to 1868. While the Tokugawa rulers gave financial support and certain prerogatives to both Buddhist and Shinto clergy the ecclesiastics were strictly governed by the "commissioner of temples and shrines" appointed by the regime. The guiding ideology of the Tokugawa regime was the Chu Hsi school (Shushi-gaku) of Neo-Confucianism (see CHU HSI; CONFUCIANISM). Curiously enough it was the Confucian scholars of this period who allied themselves with the cause of Shinto, and eventually brought about the Shinto revival. Hayashi Razan (d. 1657), the noted Neo-Confucian scholar, held that Shinto is the way of the ruler, and the way of the ruler is the way of Confucius; thus Confucianism and Shinto are one He criticized the historic coexistence of Buddhism and Shintō from the Neo-Confucian point of view. Iiakae Tōju (d. 1648). on the other hand. tried to interpret Shintō in terms of the Wang Yang-ming school (*Yōmei-gaku*) of Neo-Confucianism.

Shinto leaders, such as Deguchi (Watarai) Nobuyoshi (d 1690) and Kikkawa (Yoshikawa) Koretaru (d. 1694), welcomed such an alliance with Neo-Confucianism which provided the cosmology that nas lacking in traditional Shintō. Deguchi Nobuyoshi attempted to interpret Shintō according to *I-ching* ("The Book of Change") Kikkawa Koretaru identified the 'Supreme Ultimate" (*T'ai* Chi) of Chu Hsi nith a Shinto deity, Kuni-tokotachi whose name now meant the Cosmic Lord and the Reason of Heaven. Meanwhile under the leadership of Yamazaki Ansai (d 1682), a former Buddhist monk and Confucian scholar, a new movement called Suika Shintō emerged. This school identified the Supreme Ultimate of Neo-Confucianism with two Shinto deities—Kunitokotachi (recorded in the Nihongi) and Ameno-minaka-nushi (recorded in the Kojzki); these two deities are essentially one reality which is both the substance of the universe and the source of morality, and the sun-goddess is their incarnation Yamazaki Ansai taught the importance of devotional prayer and the virtue of honesty and advocated an extreme respect for the emperor. Similar emphasis on respect for the emperor was taught by the Mito school of Neo-Confucianism which also laid the foundation for the loyalist movement in the later period.

Shintō Revival.—The revival of Shinto studies developed gradually in the 18th century along with the study of the Japanese classics. The scholars of the *Kokugaku* ("Japanese Studies") took keen interest in the *Manyōshū*, a collection of ancient poems compiled in the 8th century. Stimulated by the philological research in ancient Japanese poetry Kamo Mabuchi (d. 1769) dedicated his whole life to the study of the *Manyōshū* and *Norito*, a collection of old Shintō liturgies. Rejecting both the Buddhist- and Confucian-centred interpretations that characterized Shinto studies of his time, Kamo tried to restore the pre-Buddhist and pre-Confucian meaning of Shinto. Unconsciously espousing the Taoist ideal, he stressed pure simplicity in accordance with the order of heaven and earth as the best morality.

Kamo's disciple Moto-ori Norinaga (d. 1801) rejected his master's Taoist-oriented interpretation of Shinto, and insisted that Shintō was based on the revelation of *Takami-musubi-no-kami* ("August Producing Deity") transmitted by the sun-goddess. Moto-ori is credited with the most systematic interpretation of the concept of kami as "anything whatsoever which was outside the ordinary, which possessed superior power or which was awe-inspiring." In 1898 he completed his voluminous commentary on the Kojiki, which has remained the authoritative interpretation of the theoretical aspects of Shinto.

Another noted Shinto scholar, Hirata Atsutane (d. 1843), was a Confucian scholar before he was influenced by Moto-ori's writings. He tried to systematize Shintō "theologically" by holding *Ame-no-minaka-nushi* ("Heavenly Central Lord") as the creator god viewed above the sun-goddess. He also developed an eschatological concept within the Shintō framework. His *Hongyō-gaihen* ("Supplemental Compilation of Shinto," 1806) is divided into two parts: one based on the T'ien Chu Shih I ("True Doctrine of the Heavenly Lord") and other writings of the Jesuit Matteo Ricci (*q.v.*), who wrote in Chinese; the other based on selections from the Chi *Ko* Ta Ch'uan ("The Seven Books of the Seven Victories"), a manual of Christian ethics written in 1614 by another Jesuit missionary in China, Didace de Pantoja. Hirata's thought was to have a great influence on the development of modern Shinto.

Toward the end of the Tokugawa period, the folk elements of Shinto began to break through its traditional framework. The Konotabi movement, inaugurated by an illiterate peasant woman, Kinō (d. 1826), the Tenrikyō movement, founded by another peasant woman, Miki (d. 1887), and the Kurozumi-kyō movement, initiated by an obscure Shintō priest, Kurozumi Munetada (d. 1849), were but a few examples of this dynamic religious awakening among the poor and oppressed. They were destined to play important roles in subsequent periods. Meanwhile, these messianic movements among the peasantry were looked down upon as impure Shintō by the hierarchy and scholars of orthodox Shinto.

Shintō as the National Faith.—In 1867 the prerogative to rule the nation was returned to the throne by the last of the Tokugawa rulers. Thus began the modern age in Japan. The Meiji regime that followed the Tokugawa feudal regime had two diametrically opposed aims—the revival of the ancient Japanese pattern of *Saisei-itchi* (unity of religion and the state) and the modernization of Japan.

In 1868 the department of Shintō (Jingi-kan or Shingi-kan) was established; it immediately issued the separation edict in an attempt to abolish the age-old pattern of Shintō and Buddhist coexistence. Buddhist priests who had been connected with Shintō shrines were given the choice of either returning to lay life or being reordained as Shinto priests. The traditional custom of burying the Shintō priests according to Buddhist funeral rites was forbidden. and a nea Shinto burial office was introduced. In 1849 the department of Shinto was made independent of the cabinet and placed above the grand council of state. In 1871 Shinto was proclaimed the national religion and Shinto shrines were decreed to be the place of worship for all subjects of the emperor. The appointment of Shinto priests of all the shrines a-as to be made by the government. In order to counteract movements to restore the feudal regime, the government began to advocate emperor worship. But the measures taken to uphold the supremacy of Shinto at the expense of Buddhism failed for Buddhism was too deeply imbedded in the fabric of Japanese life.

The department of Shinto mas replaced in 1872 by the ministry of religion and education (*Kyōbu-shō*), which was given jurisdiction over both Shintō and Buddhism; it was abolished in 1877. In 1873 the edict banning Christianity was lifted. Recognizing the impossibility of suppressing the growing tide of spontaneous folk religious movements, the government in 1882 decided to classify them as Sect Shinto to be differentiated from Shrine Shinto, which had about 200,000 large and small shrines throughout the nation. The constitution promulgated in 1889 included a clause guaranteeing freedom of religious belief, but the government continued to favour Shintō not so much as a religion but as a national cult. Since the constitution separated religion from the state, the government felt the need for a nonreligious guiding principle to unify the nation. The result was the Imperial Rescript on Education issued in 1890. In 1900 shrines and religions mere placed in separate bureaus and in 1913 the religious bureau was transferred to the ministry of education.

In a real sense, modern Japan mas caught between its two objectives. One of these, to re-establish the ancient system of *Saisei-itchi*, drove Japan to assert the centrality of Shintō as the national religion. The second, modernization, however, drove it to pay lip service to freedom of religious belief. Toward the end of the 19th century an uneasy compromise was worked out, based on the theory that Shinto was not a religion but a suprareligious national cult, and as such could be superimposed on the nation. The emperor cult was almost arbitrarily devised and a course in *shūshin* ("Moral Teaching") was made the basis of compulsory education. Beginning with the Chinese-Japanese War (1894–95), Japan followed an expansionist policy, and from that time until the period of World War II Shinto was manipulated by the militarists and jingoistic nationalists as the spiritual weapon for mobilizing the nation to guard the prosperity of the throne.

Shintō After World War 11.—The disestablishment of State Shinto, effective immediately after World War II, had a far-reaching effect on the future of Shinto. Orders from the supreme commander for the Allied powers to the Japanese government stated explicitly that:

> The sponsorship, support, perpetuation, control, and dissemination of Shintō by the Japanese nation, prefectural, and local governments, or by public officials, subordinates, and employees acting in their official capacity are prohibited and will cease immediately; all financial support from public funds and all official affiliation with Shintō and Shintō shrines are prohibited and will cease immediately.

Equally drastic was the abolition of *shushin* from the school curriculum and the emperor's public statement:

> The ties between Us and Our people have always stood upon mutual trust and affection. They do not depend upon mere legends and myths. They are not predicated upon the false conception that the emperor is divine and that the Japanese people are superior to other races and are fated to rule the world.

Although the emperor cult was thus abolished, the time-honoured tradition of imperial family Shinto continues. Historically, four shrines have been set aside for the imperial household rites, the most important among them is the *Kashiko-dokoro*, dedicated to the sun-goddess, which is a branch of the Grand Shrine of Ise.

With the disestablishment of State Shinto, Shinto shrines were emancipated from government control and by the same token lost their financial subsidies from public funds. Of about 110,000 shrines governed before the war by the home ministry, over two-thirds came to belong to the Association of Shintō Shrines (Jinja *Honchō*): the rest are either independent or belong to a number of small local associations.

Many Shintō priests come from hereditary priesthoods, but anyone with proper training can become a priest. The main training centre is Kokugakuin university in Tokyo. From the Meiji period until the end of World War II, Shinto priests were government officials, graded into several ranks. After the war they were no longer on government payrolls and had to be supported by income from their shrines and other special offerings from the laity. Each shrine has *Ujiko* (parishioners), whose representatives act as a governing board for the shrine affairs. In addition, *Sūkeisha* (worshipers who are not regular parishioners) are welcome to participate in the ceremonies at any time. Many shrines have started various kinds of social welfare work and Shintō wedding rites are popular and widespread.

There are numerous types and kinds of shrines from the Grand Shrine of Ise with its 14 subsidiary shrines to small obscure roadside oratories that are not attended by any priest. Before the disestablishment of State Shintō, shrines were classified as national, special national, governmental, prefectural and district or village shrines, besides about 63,000 shrines "without rank." Most of the special national shrines enshrine the spirits of those who made conspicuous contributions to the nation. Most shrines are dedicated to some deities known in the Shinto, but some are dedicated to historical figures such as Emperor Meiji and General Nogi. Genealogies of deities enshrined in rural Shinto shrines reveal varied backgrounds.

The shrines assume various forms, but most of them are built in scenic surroundings. The two main units of a shrine are an inner sanctuary (*honden*) and an oratory (*haiden*). According to Shinto, deities are present in the *shintai* (kami- or god-body) or in the *mitama-shiro* (visible representation of kami) nhich is kept in the inner sanctuary. If a shrine is dedicated to the deities of a mountain or a forest, however, there is no need for an inner sanctuary. Usually, only the priests and their attendants are permitted to approach the inner sanctuary nhere they recite prayers. In larger shrines, there are other buildings, besides the two main units mentioned, such as a hall of reciting prayers (*Norito-den*), a hall of offerings (Hei-den) and a hall of liturgical dance (*Kagura-den*).

The entrance to the shrine is marked by a torii, a simple gate marking off the sacred compound of the shrine from the rest. Worshipers go through the *torii* to the ablution basin (*Te-mizu-ya*), nhere they wash their hands and rinse their mouths. They then approach the oratory bowing reverently to the inner sanctuary and clapping their hands. A small offering to the deities is usually made. On special occasions they ask the priests to perform a simple rite of purification (Harai) in which a branch of the sacred tree (*Eurya ochnacea*) is waved three times before them. Then they make offerings and secure charms at the shrine office.

The parishioners (*Ujiko*) are families that belong hereditarily to certain shrines in the sense that the deity of a given shrine is the tutelary *kami* for all members of the *Ujiko*. But the priests of the shrine have no pastoral relation with the *Ujikos*. The main duty of the priest is to perform his priestly functions of serving the deities and offering prayers. Shinto prayers (*norito*) are based on the ancient belief that the spoken word has a spiritual potency; therefore the prayers must be recited reverently. Prayers usually include, in elegant classical language, words of praise for the deities, lists of offerings and certain petitions. The norms of Shintō rituals and prayers are found in the *Engi* Shiki ("Ritual Notes"), a 50-volume work compiled in the 10th century.

Throughout its history Shinto has been conspicuously indifferent to any theoretical systematization of its beliefs. Theories have been advanced but they have been greatly influenced by Buddhist, Confucian and Taoist concepts. Though there exist movements to formulate a coherent theological system, no normative system has been widely accepted. Such central concepts as Kami (deity), *Musubi* (creating and harmonizing power), Makoto (truthfulness) and *Harai* (purification) are integrated into the total Shintō way of life and worship Probably the genius of Shintō lies in its refusal to formulate a *summa* theologica. An ancient Japanese poem well expresses the nebulous but genuine religious sentiment of Shintō: "Unknown to me who resideth here; tears flow irom a sense of unworthiness and gratitude."

The religious activities of Shinto, however, are not confined to the shrines. The traditional Japanese family performs a simple daily rite before the family kami-shelf (kami-dana) which is dedicated to the tutelary deity of the family. Before 1945 most of the national holidays were based on Shinto festivals: New Year's day when at the imperial court and elsewhere people worshiped in the four directions; the Empire Foundation day (Feb. 11) or the day when the first emperor, Jimmu, is supposed to have been enthroned; the Spring Season Imperial Spirit festival (spring equinox); the Anniversary of the Death of Jimmu (April 3); the Autumn Season Imperial Spirit festival (autumn equinox); the Festival of the Presentation of First Rice to the Deities at the Grand Shrine of Ise (Oct. 17); and the Autumn Thanksgiving festival (Nov. 23). After 1945 some of these national holidays lost their religious meaning but they remained holidays. For example, Nov. 3. previously set aside to commemorate the great achievement of Emperor Meiji became the "National Day of Arts and Culture," while Nov. 23, the traditional day of the Shintō festival at the sanctuary of the imperial household became the Japanese counterpart of Labor day.

Sect **Shintō (Kyōha** Shinto).— Throughout its long history, the nontheological Shinto has been supported by the folk piety of the masses. who were totally disinterested in complicated concepts and theories of religion. Although the masses did not take part in the culture of the aristocracy and gentry they developed arts and crafts to a high degree, and they had a vivid poetical sense and pious imagination for appreciating the mystery of life and the universe. Living close to the rhythms of nature they invoked deities of all sorts, depending on their physical and spiritual needs. Divination, spirit possession, protection from misfortune and disease and magical formulas for other benefits played important roles in the beliefs and practices of the masses, and they have infiltrated into official Shintō and Buddhism as well. In times of social unrest or natural calamity this folk piety was often intensified and supported various kinds of Shintoist, Confucianist and Buddhist messianic movements. More often than not these movements became established in the course of time and eventually were assimilated into Shinto or Buddhism.

The 19th century, a period of social upheaval and transition, witnessed the emergence of many such messianic movements. The Meiji government, in its determination to reshape Shinto into a suprareligious national cult, decided to separate these dynamic religious movements from Shinto and in 1882 created a new category for them known as Sect (Kyōha) Shintō. Between 1882 and 1908 the 13 Sect Shintō denominations were recognized as "churches" (*Kyōha* or *Kyōkai*), which, like Buddhist sects and Christian denominations, were dependent on nongovernmental, private initiative for their propagation, organization and financial support. Although the government arbitrarily included the 13 denominations in the category of Sect Shinto not all of them were Shintō in origin or in ethos.

Usually they are classed as follows: (1) Pure Shintō sects based primarily on certain aspects of Shintō beliefs and practices and emphasizing loyalty to the throne and gratitude to ancestors; (2) Confucian sects, which blend Confucian moral doctrines and certain Shintō beliefs; (3) Mountain sects, which hold that their deities reside in certain sacred mountains; (4) Purification sects, which stress mental and physical purification from evil and contamination; and (5) Utopian or Faith-Healing sects. Actually, the 13 Sect Shintō denominations have very little in common. Some of them worship certain deities of traditional Shinto and add some of their own; the Konkō-kyō sect, however, has no Shintō deities, and the god of Tenrikyō is not included in the Shinto pantheon. Most active among the 13 denominations is the Tenrikyō which boasts of more than 500 overseas churches in addition to its well-organized ecclesiastical institution in Japan. Most adherents of the Sect Shinto often sought worldly benefits such as cures for sickness, protection from disasters and misfortunes. wealth and success in life, which traditional Shintō as well as Buddhism failed to offer and which these Sect Shintō denominations promised. Gradually, however, the new denominations tended to become institutionalized and less concerned with the immediate needs of their adherents. The people began to look for new formulas of incantations and new prophets and shamans, thus creating a number of small splinter groups within the denominational framework. These small splinter groups were emancipated from their parent bodies after World War II and initiated the postwar boom of "New Religious Cults" (*Shinkō Shukyō*). An extremely precarious relationship exists between the Sect Shintō denominations, now organized as the Federation of Sect Shintō and the New Religious Cults. *See* also JAPAN : *History* and *Religion.*

SHIP, the vehicle by means of which man conveys himself and his goods by water; more precisely, the larger and more seaworthy of such vehicles, the smaller and simpler being boats To merit classification as a ship or boat it is necessary for the vessel to support weight, not merely because of the buoyancy of the material of which it is made, but because of its displacement of water. Structures depending simply on their inherent buoyancy are rafts, or, in their simplest form, floats. These must. however, be considered as the most remote ancestors of the ships of the present day.

After a discussion of the kinds of shipbuilding and the delimitations of this article, it is divided into the following sections:

I. Early Craft
1. Origins
2. Galleys
II. Mediterranean and Northern Vessels
1 Mediterranean Craft
2. Northern Craft
III. Medieval Ships
1. Caravel and Galleon
2 Notable Ships
IV. 17th and 18th Centuries
1. The Frigate
2. Improvements in Rigging and Equipment
V. The 19th Century
1. Clipper Ships
2. Last of the Sailing Ships
VI. Introduction of Steam and Iron

6. Packet Steamers
7. Standardized Ships
8 The Cabin Liner
9. Fast Cargo Liners
10. High-Pressure Steam
11. Gas-Turbine Propulsion
12. Express Luxury Liners
13. New Design and Development

For the practice and theory of modern shipbuilding, *see* SHIPBUILDING (MERCHANT AND NAVAL). *See* also SHIPPING, HISTORY OF, and SHIPPING INDUSTRY. For ships in naval history, *see* such articles on types of craft as AIRCRAFT CARRIERS, DESTROYER, etc.; articles on battles and wars, and sections on history in articles on countries. *See* also separate articles on types of ships, such as CANOE, GALLEY, etc.

All kinds of shipbuilding, from the most primitive to the most modern and elaborate, can be classified under six heads: (1) rafts (floating logs or bundles of reeds, etc., either singly or connected to form a platform); (2) dugouts (hollowed trees); (3) canoes of bark or skin with an internal framework; (4) canoes or boats formed from planks stitched together; (j) vessels with planking nailed together and with a framework inserted; (6) vessels of which the framework is first set up and the planking (or plating) attached afterward. These classes sometimes shade into one another. but in a general way any form of raft. canoe, boat or ship can be ascribed to one of the six

Rafts were no doubt used in all parts of the world at a certain stage of local culture. As seagoing craft in modern or comparatively recent times they are best known from the catamarans of India and the balsas of South America. The Ecuadorian balsa was a large sailing raft fitted with something like the modern centreboard. Its seaworthiness was sufficiently proved in 1947, when a party of Norwegian scientists, wishing to test a theory with regard to the peopling of the Pacific islands, built a similar raft. the "Kon-Tiki," at Callao. Peru. and succeeded after a voyage of three and one-half months in reaching the islands east of Tahiti. Dugouts are still characteristic of East Indian and Polynesian uaters, bark canoes are (or were) chiefly North American, skin boats belong to the arctic, building with seun planks is still practised in the East Indies. The two last classes correspond to the clinker building and carvel building of modern European small craft.

In the following survey it is proposed to deal only with what may, for want of a better name, be called European ships though it must be understood that this has to include the whole of the Mediterranean and. in later times, the shipping of North America. Eastern. far eastern (especially Chinese) and Polynesian craft form subjects of their own. *See* BOAT. *Existing Types of Boats.*

The more or less standardized European full-rigged sailing ship was produced in the 15th century by the combination in a single vessel of characteristics derived from tno almost distinct lines of descent, one having had its home in the Mediterranean and the other in the waters of northern and western Europe. Roughly speaking, construction came from the south and rig from the north. After this combination—from about 1460 to the last days of deepwater sailing ships—the European ship, in spite of a constant process of modification and improvement, remained unchanged in essentials.

It must be remembered that the southern line was very much older than the northern, or at least that it had reached a stage of comparative maturity much earlier. At the beginning of the Christian era the Mediterranean ship had a history of about 3,000 years and its builders had been producing more and more elaborate vessels for many centuries, while their fellow craftsmen in the north had only just evolved the method of building with keel, stem, sternpost and planks and in so doing passed the line separating the mere canoe from the potential ship.

I. EARLY CRAFT

1. Origins.—The earliest knowledge of boats and ships comes from Egypt. where as early as 4000 B.C. boats were already far advanced from the primitive form from which they must have been derived, in this case probably a bundle of reeds. It has been claimed that "naval architecture is an Egyptian art and that the main lines of the history of ship-building for the whole world were laid down in Egypt towards the end of the 4th millennium B.c." (Elliot Smith, *Ships us Evidence* [1917]). There is, however, at least one extremely weighty objection to this sweeping claim, the fact that the Egyptian method of construction was not transmitted to the neighbours and successors of that kingdom. Egyptian vessels were essentially built-up dugouts (to use a contradiction in terms); they had no keel. stem or sternpost and no internal framing, but consisted simply of a heavily built skin formed of many pieces of timber doweled or dovetailed together. With regard to matters of equipment such as mast and sail or steering gear, the claim is more easily substantiated.

Unfortunately, comparatively little is known of the ships of the Cretans, who were the dominant sea power in the eastern Mediterranean about 1500 B.C., or of the Phoenicians, who took their place; but that little suggests that both nations had begun to differentiate between the fighting vessel and the merchantman and between the rowing galley and the sailing ship. The few representations of Phoenician vessels (about 700 B.C.) do, however. illustrate two striking developments. the arrangement of oars in two banks at different levels and the fitting of a ram bow in galleys intended for fighting. It is possible that the ram was an Egyptian invention. and something of the sort is shown in action as early as 1200 B.C., but it was in Phoenician. Greek and Roman galleys that its importance was most clearly emphasized.

With the ships and galleys of the Greeks firmer ground is reached, though there is still much that remains a subject of controversy. One thing seems certain — Greek vessels were built on a system entirely different from that of Egypt. having keel. stem, sternpost and internal framing with the planks attached edge to edge on the sixth method mentioned above, practically the carvel building of modern times. In all probability the true Greeks. who were originally a race of nomadic shepherds. learned this from their predecessors in the Aegean, but how or where these first evolved so advanced a method of construction is still unknown.

2. Galleys. — The galley, an oar-propelled fighting vessel. is also included under the definition at the head of this article. At the time of the siege of Troy the normal large Greek rowing vessel seems to have been a 50-oared boat with a single row of 25 oars on each side, but we can already see suggestions of still larger vessels, which must have had their oars arranged in some nay which allowed more men to work in a given length. and it was this development which produced the bireme and began the process which led to the many-banked galleys of about 300 B.C.

Since galleys were always narrow, shallow craft, there was a very definite obstacle to increasing their length to any great extent because of the weakness of such a vessel against "hogging" or "sagging" strains tending to break it in half. Thus. the number of oars in a single simple row could not be increased very much and it became necessary to find some other method of getting greater power. It would seem the obvious course to put two or more men on each oar, but it was not until much later that the Mediterranean peoples did this. What was done was to arrange the oars in two staggered rows, the uppermost high enough to clear the heads of the lower rowers and their greater length allowing the upper rowers to sit far enough inboard for their legs to be clear of the ends of the lower oars. Another method was to have two oars quite close together at the same level with their two rowers sitting side by side! the foremost oar of a pair being the shorter. This plan was common in medieval times and was apparently employed to some extent in classical or postclassical times also, but it was the first kind of bireme from which the classical trireme and the later many-banked galleys were derived.

The Phoenician vessels of about 700 B.C. mentioned above were biremes of this type. and the trireme followed a little before 500. Its design is still to some extent a subject of dispute, but the view generally accepted is that its third set of rowers sat roughly above the lowest and at about the same level as the second, and that their oars worked on the outer edge of a long outrigger running almost the full length of the hull. This outrigger, once introduced, remained an almost invariable feature of the Mediterranean galley to the very last. Probably the trireme was invented in Greece or in one of the Greek colonies, and it was the Greeks of the last few centuries B.C. who produced the many-banked galleys which have still to be satisfactorily explained.

Galleys carried a mast and sail but were primarily rowing vessels, whereas the merchantman of Greece and Rome was a sailing ship pure and simple. It was much deeper and no doubt also much wider than the galley, without a ram and with stem and sternpost curving down to a comparatively short keel. Both ends rose well above the general level of the sides, but this was more pronounced at the stern, where the chief accommodation was situated. By Roman times, and probably before. the hull was what we should now call carvel-built, but one noticeable feature was that the ends of the deck beams usually projected through the side planking, as they had done in ancient Egypt.

The sail was what is called a square sail, set on a yard slung horizontally from the mast and carried more or less across the ship's fore-and-aft line. In early Egyptian vessels the mast had been like a narrow inverted V, but this had been replaced by a single stick long before classical times. At first there was only the one mast and one sail, but by the beginning of the Christian era Mediterranean merchantmen had a second much smaller sail on a mast projecting over the bows and could also set a triangular topsail or topsails above the main yard. Some representations show the foresail a good deal larger and its mast more nearly upright, but the other arrangement was probably the more usual. The steering gear was inherited from Egypt, at least in principle, and consisted of a large paddle-shaped rudder on each quarter, held to the ship's side, but free to rotate on its axis and worked by a thwartship tiller. This side rudder. which was found in galleys as well, had obviously been evolved from a mere steering oar, free to move in any direction, and that step had been taken in Egypt before. 1500 B.C.

II. MEDITERRANEAN AND NORTHERN VESSELS

1. Mediterranean Craft. — It will be convenient to take the story of Mediterranean sailing ships down to about A.D. 1300 before turning to parallel developments in the north. Actually, there was surprisingly little change as far as hulls were concerned, but there was a complete transformation in rig by the substitution of the lateen for the square sail. The lateen belongs to the family of fore-and-aft sails, carried so as to receive the wind on either side but to keep the same edge forward. whereas the square sail does just the reverse. It is triangular in shape and is set on a long yard coming down nearly to the deck forward and rising well above the mast-head at the other end. Evidence which came to light in 1955 showed that this sail was in use in the eastern Mediterranean at least as early as the and century A.D. Where it was first used is uncertain, though the probabilities seem to point to Egypt or the Persian gulf; in any case it is clear that the tide of Arab and Moslem conquest was mainly responsible for its spread. Even in modern times the area in which the lateen is the typical sail of local craft is much the same as that over which Moslem control once extended or threatened to extend.

The rig of a medieval lateener comprised two masts and two sails, the larger forward, and this rig was carried on a carvel-built hull with flush planking attached to a framework of keel, stem. sternpost and ribs. The deck beams still often projected through the side planking and the steering gear was still a semi-permanent oar-shaped rudder on either quarter. Except for a certain increase in the accommodation aft and a consequent widening and raising of the stern, the hull was not much different from that of a Roman ship.

2. Northern Craft. — Northern vessels of the 13th century had developed on different lines from their southern rivals and had, as has been said, a much shorter history. but in their own way they were no less efficient. while in one respect — that of steering gear — they were distinctly superior. Everything goes to show that they had descended from simple dugouts, and many such craft have been unearthed in various countries; but it has not been possible to say with confidence that any of these are actually older than the first of the more advanced types which have been discovered, while early attempts at depicting northern vessels are too crude to show much.

The earliest-known specimen of an actual northern boat is believed to date from about 300 B.C. and was found in Als, Den., in 1921. Its dugout ancestry is clearly shown by the way in which its two ends are carved from solid blocks. but between them it is formed of five planks overlapping in clinker-built fashion and sewed together. These planks, which must have been worked with an adze, have projecting cleats left on the inside at intervals of rather more than three feet and bent timbers are tied to holes in these cleats and kept in shape by passing through slots at the ends of the thwarts and in another series of transverse timbers beneath them. This boat is about 45 ft. long.

The remains of two vessels discovered at North Ferriby in Yorkshire in 1937 show a different form of development from the primitive dugout, or perhaps from the raft. In their case there is a flat bottom formed from three planks curving upward at the end with the side planks curving round to meet it. The planks are much heavier than those of the Xls boat and are fitted edge to edge with a sort of rudimentary tongue-and-groove joint; they also are sewed together and have internal battens covering the seams The bottom planks have internal cleats, but the short, straight transverse timbers run through holes in these instead of being lashed to them; how the side planking was supported is uncertain. The date of this find is believed, on geological evidence, to lie somewhere between 200 B.C and A.D. 100.

As far as can be judged, this type of construction was a dead end, perhaps merely local; certainly later developments in northern Europe followed more on the lines of the Nydam boat, found near Flensburg in Schleswig in 1863. In this 75-ft. vessel. dating from about A.D. 250 or a little later, one of the chief problems of the primitive shipbuilder, the treatment of the ends, was solved by the use of an almost modern-looking stem and sternpost, though there is still no true keel, but only a centre plank rather heavier than the others. The planks, too, are nailed together in modern clinker-built fashion, but the ribs—cut to shape instead of bent—are still lashed to cleats on their inside. This vessel shows another feature which remained characteristic of northern ships for almost another 1,000 years, the single side rudder on the starboard (steer-board) quarter.

The remains, or rather the traces. of a similar, rather larger boat dating from the early part of the 7th century were found at Sutton Hoo in Suffolk in 1939. Many objects of great interest were found in the excavation, but the actual wood of the boat had entirely disappeared, though changes in the sand where it had lain made it possible to determine the vessel's shape and even details of its construction, which was almost the same as that of the Nydam boat.

Both these last two boats were purely rowing craft, but those unearthed at Gokstad and Oseberg in Norway in 1880 and 1903 were definitely sailing ships. though still using oars as well. They date from about A.D. 900 and 800. respectively, and are built on much the same system as that from Nydam, clinker-built with ribs lashed to cleats and double ended. with the stern almost exactly similar to the bow. They were the picturesque Viking ships with simple square sails.

This double-ended type of ship remained in use for several centuries, but the method of lashing the ribs to cleats was superseded by nailing. and the keel plank was replaced by a true keel. This stage had been reached by the boats found in 1933–34 at Ohra near Danzig and believed to date from about 1000; the abandonment of internal cleats was perhaps due to the use of saws instead of adzes for shaping the planks.

The ships used by William I in 1066 (shown in the well-known Bayeux tapestry) had probably reached the same state of development. Some of them have their masts supported by shrouds and this suggests that by the time the tapestry was made—probably not earlier than 1150—northern ships were able to sail with the wind at least abeam. Roman ships had used shrouds centuries before, but this is their first appearance in the north; after this they are almost invariably shown in ships on seals and elsewhere.

From the evidence of such representations it can be said that there was little change during the 12th century apart from the fitting of light "castles" at either end of the larger vessels; but at the end of that period came one of the great steps in the history of sailing ships, the introduction of the stern rudder. When or where this first appeared is uncertain, but the date cannot have been far removed from 1200 and the place was probably the Netherlands or thereabouts. The step was important, not only for the increased efficiency it gave, but also for the fact that it was followed—almost necessarily—by a differentiation between bow and stern and the transformation of the double-ended northern ship into something far more like that of its contemporaries in the Mediterranean. When at length the nations of southern Europe recognized the superiority of the new type and adopted both the stem rudder and the square sail, a standard European ship was not far off. though there was still the distinction between the clinker-built northerner and the carvel-built southerner. This was about 1300 or a little later. See also RUDDER.

III. MEDIEVAL SHIPS

With the invention of gunpowder and the first use of guns on board ship soon after 1350 there began a process which caused the sailing man-of-war to become more and more distinct from the merchantman. Otherwise the 14th century brought little change, but developments in the 1 jth more than made up for this. In 1400 ships still had one mast and one sail; before 1450 some of them had three masts and three sails; by the end of the century the largest had four masts and eight sails. Meanwhile, carvel building had spread from the Mediterranean to the north and the ships of all Europe had become similar in both hull and rig, though there were still national or even local variations of type.

In view of the great importance of this short period it must be treated in some detail. The change from one mast to three was very rapid, but was not accomplished in a single step; there was an intermediate two-masted stage, at least in some instances. In inventories of the ships of the Royal Navy in 1410–12 may be found one ship, and only one, with "1 mast magn" and "1 mast parv"—one big mast and one small Whether this second mast was before or abaft the mainmast is still only a matter of opinion, but the ship in which it was carried was apparently southern in origin and thus more likely, because of her lateen-rigged ancestry, to have had her smaller mast aft rather than forward. In any case, the two-masted stage was so brief that the point need not be laboured; by 1435 or thereabouts the third mast had definitely come to stay.

One at least of the ships in these inventories of the early 15th century was surprisingly large. Henry V had a ship under construction at Bayonne in 1419 that measured 112 ft. on the keel, 186 ft. from stem to sternpost and 46 ft. in beam. This ship was never finished, but the "Grace Dieu," built at Southampton in 1418, was even larger. Investigation of her remains, resting in the mud of the neighbouring Hamble river, in 1933 established the fact that her keel uas more than 125 ft. long and her beam probably not far short of 50 ft. They also showed that she was clinker-built, as would be expected, but that each strake was made up of three thicknesses. Such a method of construction had not previously been suspected, but a later study of accounts for building a number of so-called galleys in England in 1295 suggested that these were of two-layer clinker work and the same may well have been the case in many of the larger vessels of the 14th and 15th centuries.

It is possible, in fact probable, that the "Grace Dieu" had three masts. though neither the foremast nor the mizzen would have been of much size or at all elaborately rigged. The foresail would undoubtedly have been a square sail, but the mizzen is more likely to have been a lateen; certainly it became the rule within the next few years for the third mast (and afterward the fourth) to carry a sail of that kind. This was one of the two essentially southern features of the nenly developed full-rigged ship; the other. carvel building with flush-fitting planks attached to frames previously erected, reached the north a little later. It may be that it had been used on the west coast of France as long ago as the time of Julius Caesar, who fought a naval battle on the Loire in j6 B.C and described the ships of his opponents, the Veneti, in some detail nithout suggesting that their construction was in any way radically different from that of Mediterranean ships. In any case. Brittany seems now to have been the centre from which the new method of building began to spread, but it was soon almost universal for large ships, whether men-of-war or merchantmen.

Toward the end of the 15th century ships of moderate size had three masts and five sails. main, fore, mizzen, main topsail and the spritsail under the bowsprit; these were, for instance, the sails carried by the "Santa Maria" in 1492. Considering that bowsprits had been present for more than 200 years, the spritsail was surprisingly late in appearing, as it did, at about the same time as the main topsail in the third quarter of the 15th century.

The original function of the bowsprit is, indeed, somewhat doubtful; it has usually been supposed that it was to give a better lead for the bowlines, which controlled the windward edge of the mainsail, and it is certain that it was afterward used for a similar purpose. but there is much to be said for a suggestion that the first bowsprits were used in connection with the anchors.

Besides the sails just mentioned. the largest and most elaborately rigged ships of about 1500 would carry a fore-topsail, a main topgallant sail above the topsail and perhaps a lateen topsail above one or both of the two lateen mizzens, the aftermost of which was usually called the bonaventure. They were still armed for the most part with a great number of small guns disposed in the towering structures which had grown from the two castles of the 13th century. but the time had almost come for larger guns to be carried and for them to be mounted between decks and to fire through openings in the main hull, as they did until the last days of sailing men-of-war and even later. The invention of these gun ports is traditionally ascribed to a French shipbuilder in 1501, and the date, at least, is approximately correct.

1. Caravel and Galleon. — Another change came about now in the shape of the stern. Starting from the pointed shape produced by giving the double-ended ship a straight sternpost, to carry the rudder. the stern had gradually had its upper part widened more and more by means of a transverse timber, the transom, on which the aftercastle was based, and as a result the lines of the stern had become fuller and fuller, until the shape of its lower part was not far from being a quarter of a sphere. In the new form, which probably originated in the south and in a comparatively small type of vessel, the caravel, the attempt to make the planking conform to the required shape was abandoned and the stern from a little below the water line to the transom was given a flat finish, while the lines below this were made much finer.

The true caravel was a lateen-rigged vessel with three masts. the largest forward. Being a southerner she was carvel-built and it is more than likely that the two words were connected. At all events. they soon became hopelessly confused. The "Santa Maria" is often said to have been a caravel, but this is incorrect; she was definitely a ship, though her two companions were caravels, at least in the shape of their hulls.

Then came the galleon, in which the general principles of the design of sailing men-of-war were finally established. As the name implies, she had something of the galley about her; though she was still purely a sailing ship. The Mediterranean galley had retained the ram of her classical predecessor. but had raised it from the water line and lengthened it into a long beak, and this feature with a square-ended forecastle rising abaft it was incorporated in the galleon in place of the triangular overhanging forecastle of the previous carrack type. At the same time. the hull was made longer, so that the keel became about three times the beam instead of two and a half times or less. while the number of heavy guns between decks was increased until they ran in one or two tiers for the full length of the broadside. This last change was well shown when the famous "Henry Grace a Dieu" of 1514 was rebuilt in 1j36. though in shape she remained a carrack rather than a galleon, as did most other large northern ships for another 40 years or more.

2. Notable Ships. — Competition among various countries in the first half of the 16th century produced a number of outstanding ships such as the Scottish "Great Michael," the English "Henry Grace a Dieu" (or "Great Harry"). the Portuguese "São João" and others, but none of these was as large as the "Grace Dieu" of 1418 and after their time there came a reaction. The biggest ship of Elizabeth I's reign. the "Triumph" of 1561, was only 100 ft. on the keel and 40 ft. in beam. while a Portuguese vessel captured in 1592 and then believed to be the largest ship in the world was still about 25 ft. shorter and 3 ft. narrower than the "Grace Dieu" of nearly 200 years before.

Some idea of the size of merchantmen at this time can be obtained from the list of the fleet which met the Spanish Armada in 1588. The largest of the privately owned vessels was of 400 tons, the smallest 20. Of these some of the larger were really private men-of-war built as such, while the smaller were mere coasters of no fighting value. The average tonnage of the 30 ships equipped by the city of London was 150, which would correspond to a keel length of 60 ft. at the most.

By this time. however, the opening of the sea route to India had led to the building of large state-owned merchantmen in Portugal, the ship just mentioned being one of these, and when the English and Dutch began at the opening of the 17th century to force their way into the same waters, they too began to use larger merchantmen than before. This was particularly the case in Netherlands, where for some time East Indiamen were larger than any man-of-war.

IV. 17TH AND 18TH CENTURIES

The first half of the 17th century saw the culmination of the galleon type in the "Prince Royal" of 1610, the "Sovereign of the Seas" of 1637 and her French contemporary, the "Couronne." The two English ships were three-deckers and the "Sovereign" was the first ship to carry what was for nearly a century the standard armament of a first rate, 100 guns. The "Couronne," though of almost the same size as the "Sovereign," was a two-decker of 72 guns. an early example of the French tendency to build ships very large for their armaments. The same period also saw certain noticeable changes in sail plan. The fourth mast (the bonaventure or after mizzen) disappeared, the lateen mizzen topsail was replaced by a square sail, the spritsail topmast appeared, standing upright on the end of the bowsprit, and royals above the topgallants became at least a possibility, though probably seldom actually set.

1. The Frigate. — Then came the frigate, not the well-known type of Nelson's day, but her 17th-century namesake. Originally the fregata was a small member of the galley family used in the Mediterranean chiefly as a dispatch boat. The name was then applied by the Spaniards to the small fast vessels used to bring treasure from America and from them passed to the ships of the semipiratical privateers of Dunkirk, from which the first English frigates were copied. The exact essentials of such a frigate are by no means clear, but they certainly included an increase in length (or a decrease in beam) and a reduction in top hamper. Soon, however, the name ceased to mean much more than a ship of modern design, since even three-deckers were occasionally called frigates, at least in England.

The chief reason for the growth of the frigate was no doubt the fact that the second half of the 17th century was a time of frequent naval fighting between well-matched opponents and of many hard-fought actions between enormous fleets. Experience soon showed that ships armed almost solely on the broadside should fight in line ahead in a prearranged order and this in its turn led to the conclusion that the ships in such a line must be of a certain minimum strength, 40 guns or more. Such was the origin of the term ship of the line or line-of-battle ship — abbreviated later to battleship.

2. Improvements in Rigging and Equipment. — Just before the appearance of the 17th-century frigate, somewhere about 1630, English shipbuilders had made a change in the shape of the stern by rounding off the sudden turn between the side planking and the flat stern of the galleon type sufficiently to admit of working the planking round to the sternpost and transom while maintaining the fine lines below water. Although the flat stern continued to occur at intervals almost to the last days of sailing men-of-war, especially in the smaller vessels, the new form of stern was more or less a distinguishing feature of English ships for at least 50 years; it was not imitated by other countries until the end of the 17th century or the beginning of the 18th.

By then the French navy had become important, not only because of its great expansion under Jean Baptiste Colbert, but also because of the quality of its ships. This was not merely a matter of increased dimensions, though French ships were, as has been mentioned. usually much larger than English or Dutch of the same number of guns; another reason was the greater attention paid in France to the scientific side of naval architecture. Because of these two factors the French, and at a later date the Spaniards, built ships more efficient, class for class, than anything produced in England. The first half of the 18th century was. indeed, a period of comparative stagnation in English shipbuilding. at least as far as men-of-war were concerned. It was the period of "establishments" laying down standard dimensions for ships of each class and thus cramping the initiative of the various builders. Each successive establishment certainly allowed some increase in size. but this was never enough to overtake what was being done on the continent.

The chief interest of the period lies in its developments in rig and equipment. Staysails had been in use for 50 years or more. and there were already such sails on the three stays leading to the bowsprit, but in 1700 or thereabouts a new sail of the same kind—the jib—was introduced, carried between the fore-topmast head and the jib boom. which was a small spar fitted as a prolongation of the bowsprit. Obviously this sail demanded the removal of the spritsail topmast. but an attempt was made for at least another 25 years to carry both together; then the spritsail topmast vanished and its sail was shifted to beneath the jib boom. The bobstay. to hold down the bowsprit, seems to have come just before the jib. Why it should have taken so long to produce so apparently essential a piece of rigging is hard to say, but no trace of a bobstay earlier than 1690 has yet been found. Bowsprit shrouds came a little later. At the other end of the ship the part of the lateen mizzen before the mast was done away with and. though the biggest ships kept the whole yard for a long time, it was gradually replaced by a gaff such as was carried in the 19th century; by 1800 the long mizzen yard was a thing of the past.

The introduction of the steering wheel was a less conspicuous but extremely important change. From the middle of the 16th century to the end of the 17th the tiller had been worked by means of the whipstaff, a vertical lever acting on its inboard end and passing through a pivot in the deck above, a device which must have been much less efficient than the wheel with its ropes leading to the end of the tiller. In England the wheel was first used about 1705; there is a suggestion that something of the sort may have been tried in France somewhat earlier, but other countries seem to have waited a few years before adopting it.

By 1750 the smallest ships considered fit for the line of battle were 64s or 60s, though there were still smaller two-deckers of 50 and even 40 guns. After them came the 24-gun ships, which were really small two-deckers with only four ports on the lower deck. and it was these which developed into the frigates of Nelson's time, where the lower deck, though still called in England the gun deck, carried no guns at all. The first of these new-type frigates were built in England in 1756 and in France a few years sooner; they carried 28. 32 or 36 guns. but soon grew, until the largest of them actually mounted as many as 56 guns, though classed, because of the peculiarities of official rating, as 44s One of these heavy frigates, the U.S.S. "Constitution" of 1797, has been more or less restored to her appearance in the War of 1812; while in England the 100-gun "Victory," built in 1765, is preserved in dry dock as she was at Trafalgar in 1805.

At the time of her launching the "Victory" was the largest British ship afloat, but even so she was hardly larger than the "Grace Dieu" of 1418 and no English (or British) ship in the meantime had been as large. She was 186 ft. on the gun deck and 52 ft. in beam, whereas her Spanish contemporary. the "Santissima Trinidad." measured 204 ft. by j3.8 ft. and the French "Commerce de Marseille" of 1790 was 208.6 ft. by 54.8 ft. Before the end of sailing men-of-war the beam of the largest ships had risen to as much as 60 ft.; but the length never went beyond the 210 ft. of the U.S.S. "Pennsylvania" of 183;. and about 205 ft. was usually the maximum. The reason for this was the tendency of long wooden ships with guns all along the broadside to "hog" or drop at the ends. Merchantmen did not present quite the same difficulty and in their case with improved methods of construction it proved possible to make the length much greater.

V. THE 19TH CENTURY

In merchantmen the increase of length. both actually and in relation to the beam, was associated with the rise and development of the clipper ship in the middle of the 19th century. At the time of the Napoleonic wars the largest and finest merchantmen afloat were those in the service of the East India company, heavily built vessels not unlike men-of-war and actually used as such on occasion. The largest of them. the 1.200-ton class. measured about 16j ft. by 42 ft. With the ending of the company's monopoly of trade with the east in 1833, the various owners who had supplied it with ships began trading on their own account and were at once driven by mutual competition to employ ships of greater efficiency as speedy carriers of cargo. The first of these were comparatively small. but by 1842 they were back at 1,200 tons with the "Prince of Wales" measuring 179.4 ft. by 39.; ft., much longer and at the same time narrower than the older type.

1. Clipper Ships. — By then the clipper was coming to the fore. It is a matter of controversy which was the first clipper ship and what were the essential characteristics dividing her from her predecessors, but on the whole the U.S. "Ann McKim" of 1833 seems to have the best claim to the title. In any case, it was a matter of gradual evolution rather than sudden change, since she was little more than a slightly enlarged version of the existing Baltimore clipper type. well-known as successful privateers and slavers. though she was rigged as a ship instead of as a schooner or a brig. Other claimants are the British "Glentanar" of 1842, developed from the schooner "Scottish Maid" of 1839, and the U.S. "Rainbow" of 1845. In the case of the "Scottish Maid" and her Aberdeen-built successors, it is possible that the most obviously revolutionary feature of the design, the long overhanging bow, was primarily a means of cheating the existing rule for measuring tonnage and that the increased speed it gave was to some extent a by-product. However this may be, clippers, in the strictest sense of that ill-defined and very elastic term, were being built in ever-increasing numbers on both sides of the Atlantic by the end of the 1840s.

They were chiefly employed in the tea trade from China, in carrying passengers from the eastern part of the C.S. to San Francisco after the discovery of gold in California in 1848, in similar voyages from Great Britain to Australia a few years later and finally in the Australian wool trade. On the whole, the U.S. clippers were larger and more powerful ships than the British and therefore capable of greater maximum speeds, but in the matter of all-round performance there was little to choose between the two types. The American "Lightning" of 1854 is believed to have made the best day's run ever recorded by a sailing ship. 436 mi., but the palm for consistently fast passages in all conditions should probably be given to two of the last British tea clippers, the "Thermopylae" and "Cutty Sark" of 1868–69.

Apart from their finer lines as compared with ships of an older type and the relatively greater spread of canvas which they carried. the clippers owed much of their speed to a further increase in length as compared with beam. The process had, as has been said. begun with the first successors of the old East Indiamen, but was taken much further in the clippers. The "Rainbow" had a length about 4 times her beam, as had been the rule toward the beginning of the century, but in the "Lightning" the ratio reached 5.6. British builders went in for ships still longer and narrower; the usual standard, from the "Stornoway," built three years before the "Lightning," to the "Cutty Sark." was about 6 beams to length, and this was sometimes exceeded, as in the "Lord of the Isles" of 1853 with 6.4 and the "Queensberry" of 1856 with the extreme figure of 7.2. This increase of length was to a great extent made possible by the advent of steam, which allowed these comparatively unhandy ships to be towed in and out of harbour.

Meanwhile. there had been many improvements in construction and rig. Even with new methods of framing introduced soon after the beginning of the 19th century it was still difficult to build wooden ships beyond a certain length. The use of iron did away with this difficulty and the "Lord of the Isles" was an iron ship, but this was found to be bad for a tea cargo and a compromise was effected by means of the composite method of building with wooden planking on iron frames. In the matter of equipment the great step was the introduction of wire in place of hemp for standing rigging in the early 1850s, soon followed by the invention of the double-topsail rig, which, though perhaps no more efficient, was much easier to handle than the large single sails previously carried.

2. Last of the Sailing Ships.—By the time these changes took place, the sailing man-of-war was rapidly becoming more and more obsolete. There had been paddle steamers in the British fleet from 1822 and some of the last of these had been ships of considerable importance, but it was not until the adoption of the screw in the 1840s that it became possible to combine steam propulsion with the complete broadside armament of the larger classes. When once this stage had been reached, ship after ship was given engines of steadily increasing power, till by 1850 no more purely sailing men-of-war were being built. Masts and sails were retained for a long time, but gradually the two systems of propulsion exchanged roles, and the man-of-war, instead of being a sailing ship with an auxiliary engine, became a steamship with auxiliary sail.

In the case of merchantmen the distinction between steamships and sailing ships was made much sooner and more definitely. It is true that unsuccessful attempts to give deepwater sailing ships auxiliary steam power were made before 1840 and that steamers, especially those employed on long voyages, continued to have masts and sails, though they seldom had anything like full ship rig; but on the whole the sailing merchantman was one thing and the steamship another almost from the first.

In one trade after another. particularly those where perishable cargoes had to be carried, steamers began to take the place of sailing ships. The opening of the Suez canal in 1869 was a heavy blow to the sailing ship, since, besides shortening the route to the east, it reduced the distance between coaling stations and so allowed steamers to devote more space to cargo. After this the surviving China clippers turned for the most part to the Australian wool trade and it was in this that such ships as the "Thermopylae" and "Cutty Sark" made their reputations. Then came grain from Australia and nitrate from the west coast of South America, till at length the Panama canal, opened in 1915, gave steamers the advantage even there.

For nearly 250 years the standard rig of men-of-war and of the larger ocean-going merchantmen had been that of the full-rigged ship with three masts all carrying square sails. When the square mizzen topsail was first introduced, the long yard of the lateen mizzen beneath it had made it impossible to carry a square course or lower sail; the yard spreading the foot of the topsail, the "crojack" in English, was in fact called in French the *vergue sèche* or "barren yard," because it set no sail of its own. One would have expected a square mizzen course to appear as soon as the long lateen yard was done away with, but actually this did not happen till about 50 years later, in the middle of the 19th century.

Meanwhile, many smaller vessels, in particular the collier harks of the North sea, had carried no square sails on their mizzenmasts. It is probable that originally the term bark as opposed to ship marked a distinction in size and in form of hull rather than in rig; but when large ships began once more to do without square sails on the mizzenmast, they were called barks or barques, the French form of the word being for some reason usually preferred. This became the fashion soon after the clipper ship era, when it was necessary for sailing ships to reduce their crews, and thus their running costs, to meet the competition of steam.

At the same time the need for greater cargo-carrying capacity produced ships both larger and fuller bodied, though the increased length and power did a good deal to compensate for the loss of the finer lines of the clippers. Composite building had only a short life, and iron (and afterward steel) ships became the rule; while with the increase of length it was found desirable to add a fourth mast, the result being the four-masted ship or four-masted barque, according to the rig of the aftermost or jigger mast. Four-masted square-rigged vessels had been almost unknown since about 1630, but not entirely so; the French privateer "L'Invention" of 1801 had been a four-masted ship in the strictest sense of the term, while the famous "Great Republic" of 1853, the largest of the U.S. clippers, 325 ft. long, had been a four-masted barque. On the whole, the barque rig proved the more satisfactory and at the beginning of the 20th century the four-masted barque could be considered the standard type, though there were some noteworthy exceptions.

For the most part this final development of the sailing merchantman was in the hand of British. French and German builders. In the U.S., which had taken so conspicuous a place in the days of the clippers, the building of square-rigged vessels declined rapidly after 1860; but as some compensation for this there came a boom in large fore-and-aft rigged vessels, the original two-masted schooner of the 18th century becoming by degrees three-masted, four-masted and even six- and seven-masted, the climax being reached in the "Thomas W Lawson" of 1902. At the same time, many square-rigged vessels bought from foreign owners were re-rigged as many-masted schooners.

French shipowners had the benefit of a system of bounties which are said to have been high enough to allow sending a ship round the world in ballast, without cargo, and still making a profit on the voyage, the result being that some very large ships were to be found under the French flag toward the end of the sailing-ship era. The five-masted barque "France" of 1890, with a length of 361 ft., was built in Scotland, but the next ship of the name, the largest sailing ship ever built, was launched at Bordeaux in 1911. She, too, was a five-masted barque and was 418 ft. long with a gross tonnage of 5,633. This ship was wrecked in 1922; her predecessor had been lost at sea in 1901.

In the same way the first of the German five-masters. the "Maria Rickmers," was built in Scotland in 1890 and was of about the same size as the first "France"; but the "Potosi" (1895), "Preussen" (1902) and "R. C. Rickmers" (1906) were all built in Germany and each was larger than the one before, the last being 410 ft. long and measuring 5.548 tons. All save the "Preussen" were rigged as barques, but she was a five-masted ship, the only such vessel ever built. She was wrecked in 1910.

World War I caused the loss of many sailing ships and it was no longer financially practicable to replace them. The Germans built a few curious five-masted vessels with auxiliary motors, rigged as schooners with square topsails on the first and third masts; uhile the Danish East Asiatic company had a large auxiliary five-masted barque, the "Kobenhavn," built in Scotland in 1921, but she was intended primarily for a training ship. She, too, was unfortunate, being lost at sea in 1929. Meanwhile, the survivors of the days of sail mere lost or laid up, until in 1929 the last British square-rigged sailing ship left in service was also lost; this was the "Garthpool," built as the "Juteopolis" in 1891. A few, mainly German in origin, passed into Finnish ownership and except for a break caused by World War II continued to bring grain from Australia as late as 1949. In 1950 the last two of these were for sale. (RR C. AN.)

VI. INTRODUCTION OF STEAM AND IRON

A revolution in the history of the ship may be said to have occurred with the changes from sails to steam engines for propulsion and from wood to iron for construction. These proceeded together, but at first slowly. There was still much ignorance of the principle of flotation by displacement, and it was urged by the unenlightened that iron would not float and was therefore unsuitable for ship construction. Even among those who realized the fallacy of this argument it was asserted that an iron ship would be far more easily damaged in the event of her touching the ground than a wooden one, while there existed the real difficulties of preserving the bottom from the action of the sea and fouling by weeds and barnacles, and of compensating the compass for the errors produced by local attraction. With regard to the strength of the ship, experience showed that iron construction was better able to withstand rough usage than was wood, and examples, such as the "Garry Owen" in 1834, were not lacking of iron and wooden ships being stranded together by the same gale and under similar circumstances and the iron ship getting off little the worse. while the wooden ship became a total wreck. Another remarkable instance of the endurance of iron ships was that of the "Great Britain," which, in 1846, ran ashore in Dundrum bay in Ireland and settled on two detached rocks; she remained aground for 11 months, was subsequently got off. and afterward did good service. In due course a suitable composition was discovered for painting the underwater surface oi iron ships; while trials carried out in the "Rainbow" at Deptford and the "Ironsides" at Liverpool went far toward providing the solution ior correcting the compass.

One of the earliest iron craft on record was a boat apparently intended for passenger service, built on the banks of the Foss river in Torkshire in 1777. In 1787 a canal lighter was constructed with a shell of iron plates. and for many years iron and wood were used in conjunction for the construction of what were known as composite ships.

For warships iron was at first objected to because it was thought that the enemy's shot would cause more serious damage to them than it would to a wooden ship. but this again was proved to be a fallacy. 'The first iron steamer was the "Aaron Manby," built at Horsley in 1821 and assembled in London.

1. The First Steamboats.— One oi the earliest proposals for a steam-driven boat was made in 1690 by Denis Papin. In 1707 he built a paddle boat and tried it on the Fulda; but the paddle wheels were turned by man power. not by steam. In 1736 Jonathan Hulls, of Gloucestershire, patented a steam tugboat. but it was never tried. The first experimental steamboat to be built. in France, by Comte J. B. d'Auxiron in 1774, foundered before it could be tried. In 1775, however, Jacques C. Perier contrived, for the first time in history, to move a small boat by steam power on the Seine at Paris. After unsuccessful experiments with a 43-ft. steamboat and palmipede or "duck-foot" paddles, on the Doubs in 1778, the Marquis Claude de Jouffroy d'Abbans built his "Pyroscaphe" of 182-tons displacement, fitted with double-ratchet mechanism to produce continuous rotation of the paddle wheels. In 1783 this vessel, the first really successful steamboat. mounted the Saône near Lyons. In 1787 James Rumsey drove a boat on the Potomac four miles an hour by means of a power pump. About the same time John Fitch produced his oar-driven steamboats.

A more practicable device was to be the paddle wheel. The "Charlotte Dundas," constructed by William Symington in Scotland in 1802, was one of the earliest of these vessels. She proved her utility for towing work on the Forth and Clyde canal. Robert Fulton. having witnessed the success of this craft, in 1807 constructed the "Clermont" on the Hudson river in the U.S. The engines for the vessel were made by Boulton and Watt in England. She proved popular as a passenger boat between New Tork and Albany. The first steamer to make a regular sea voyage was the "Phoenix" which, in 1809, steamed from Hoboken, S. Jto, Philadelphia, Pa. In 1812 Henry Bell produced his steamer "Comet," which carried passengers between Glasgow, Greenock and Helensburgh. She was 43 ft. long. 11 ft. broad and 5½ ft. deep and was driven by a one-cylinder engine. The success of these early steamers soon produced others. In 181j the "Margery" of 38 tons, built on the Clyde, was brought through the Forth and Clyde canal and then down the east coast to the Thames. In 1816 this same vessel, renamed the "Elise," was the first steamer to cross the channel to France.

In Great Britain the steamship was first used only as a passenger carrier and tug along rivers and canals. but gradually increased competition forced the steamer to seek other spheres and in doing so she found herself able to perform short coasting voyages. She then became a passenger carrier along the coast to the various holiday resorts, her novelty being her principal attraction. It was not long before it was realized by the owners that the steamship was capable of much more than this and vessels were built to cross the North sea, the Straits of Dover and the Irish sea. They were all modeled on the sailing ships that they replaced and 'all carried auxiliary sail either on masts or on their funnels: as the low-pressure machinery was wasteful and incapable of giving any considerable speed. The various methods of propulsion which had been experimented with in the 18th and earliest years of the 19th centuries, including a rudimentary screw propeller and jet propulsion. gave way to the side paddle wheel which remained in favour for many years.

2. Atlantic Crossing.— It was not long before steamship owners aspired to cross the Atlantic by steam. The sailing packet "Savannah." which had been designed to run on the service between New York and Le Havre, was given auxiliary steam machinery and crossed the Atlantic from Savannah, Ga., in May and June 1819. She only used her engines for about 8j hours of the voyage, but arrived off Ireland with her coal consumed. Afterward she visited the Baltic. where she aroused great interest. Although this is generally recorded as the first steam Atlantic crossing, the vessel returned to the U.S. under sail alone.

The first to use steam power on the Atlantic in a westerly direction was the "Rising Star" of 428 tons, built at Rotherhithe in 1821 for Thomas Cochrane, earl of Dundonald. She had internal paddle wheels. and in 1821–22 crossed from Gravesend to Valparaiso, Chile. In 1824–25 the "Caroline." first steamer in the French navy. crossed from Brest. France, to Cayenne, French Guiana.

The steamer "Curacao." built at Dover in 182j, a wooden paddler of 438 tons, was purchased by the Dutch government as a man-of-war but was employed on the mail service to the Dutch West Indian colonies. She left Rotterdam on her first passage to the West Indies in April 1827 and took 28 days to do the voyage, after which she made the regular sailing each year, until she was required as a warship during the troubles in Belgium in 1830, after which she never returned to the mail service.

The first transatlantic steamer of the Royal Navy was the "Rhadamanthus" of 813 tons, which crossed from Plymouth to Barbados in 1832. The next steamer to perform the feat n-as the "Royal William," whose performance was particularly remarkable because of the fact that she was built in Quebec with the idea of running from that port to Haliiax. Samuel Cunard, who afterward founded the great Atlantic company, was one of her owners. Trade depression and an epidemic oi cholera spoiled her chances in the trade for which she was designed and she did no better as a tug. Her owners. being forced to consider her sale and thinking that they would get a better price for her in Europe than in Canada. sent her across the Atlantic in 1833. She took 2j days to do the passage and burned 324 tons of coal. Afterward she was sold for £10,000 and later served in the Portuguese navy as a transport and in the Spanish navy as a warship until she was finally condemned in 1840.

3. Regular Atlantic Passages.— These early steamship passages across the Atlantic were more or less haphazard. but it soon became the object of the owners to provide a regular service. Pending the construction of suitable tonnage the 703-ton steamer "Sirius." which had been built for the Irish sea service, was chartered in 1838 by the British and American Steam Navigation company. She was considered a big steamship in her day and was one of the first steamers to be fitted with a surface condenser, patented by Samuel Hall in 1834. instead of using salt water in her boilers; this represented one of the milestones of steam engineering at sea. She sailed irom London to New York by way of Cork with 40 passengers and although she was grossly overloaded to modern ideas she made the passage in safety. Within a few hours of her arrival in New York a very much bigger and finer steamer, the "Great Western:" which had been constructed with the idea of continuing the Great Western railway across the Atlantic, arrived after a crossing of 1j days from Bristol. She had a tonnage of 1,320 and was regarded as the finest steamship of her day.

After this several other Atlantic liners were built but all the services were irregular and maintained by a heterogeneous collection of ships, suitable and unsuitable. It mas when Samuel Cunard founded his transatlantic line in 1840 that a new policy in shipping produced a revolution in shipbuilding— the construction of sister ships. He started operations with iour transatlantic ships and one small feeding steamer, the "Unicorn," in Canadian waters.

The sister ships "Britannia." "Acadia," "Columbia" and "Caledonia" were wooden steamers built on the Clyde, their tonnage according to the rule then in use being about 1,150 on dimensions 207 ft. by 34 ft. 2 in. by 22 ft. 2 in. depth of hold and their two-cylinder side-lever paddle engines of 740 i.h.p. (indicated horsepower) being sufficient for an average speed of nine knots in favourable circumstances. Charles Dickens crossed on the "Britannia" in 1842. The coal supply of these ships was the chief anxiety of their designers, and their passenger accommodation was not equal to the sailing packets which they rivaled, but the regularity of their passages compensated for the fact that they were frequently beaten by the sailing ships in a fair wind. They were barque-rigged and had a considerable area of canvas which was set whenever circumstances were favourable.

4. Long-Distance Steamers. — In the meantime, although the North Atlantic crossing had attracted popular attention to the exclusion of most other services, great progress was being made in the long-distance routes. When the General Steam Navigation company was founded in 1824 its promoters had the intention of running steamship services all over the world as material improved, and had every confidence that this would come about.

In 1825 the steamship "Enterprise" had proved that it was possible for a steamer to reach India, although at the same time she proved that it was not a commercial proposition. It had been suggested in 1822 to establish a company for the purpose of maintaining a steam service to India and a naval officer was sent out to arouse popular enthusiasm. Within two years 80,000 rupees had been raised in Bengal by public subscription, to which the government of India added 20,000 rupees and announced that the whole sum would be given as a prize to the first steamer that could contrive two round voyages between Great Britain and India before 1826, the stipulated time for each passage being 70 days.

This prize caused a syndicate to purchase the paddle steamer "Enterprise" of 470 tons when under construction on the Thames and to fit her out with a fore-and-aft rig to compete for the prize. Her dimensions were 122 ft. by 27 ft. and she had an engine of 120 nominal horsepower which was designed for nine knots speed but which could be relied upon for six or seven only. She sailed from Falmouth on Aug. 16, 1825, and reached Calcutta 113 days out, including 10 days spent coaling at St. Thomas and the Cape of Good Hope. The government of India awarded her half the promised prize and then purchased her as a warship.

The improvement and finally the real practicability of the overland route was brought about by the Peninsular and Oriental Steam Navigation company, which started in 1834 to maintain a mail service between Great Britain and the Spanish and Portuguese ports in competition with the sailing mail packets maintained by the government. It was then the Peninsular service, but in 1840 the service was extended to Alexandria to connect with the East India company's steamers and the company became the Peninsular and Oriental Steam Navigation company. It was not until 1854 that the East India company abandoned its end of the service, although its irregularities and the poor steamships employed on it were the cause of constant complaint.

Steamships of a type practically identical with those of the Cunard line, but of rather greater tonnage varying from 1,700 to 1,900, were built in 1841 for the West Indian mail service for which the Royal Mail Steam Packet company had obtained a royal charter. At that period the British West Indian colonies were of much greater importance than in more modern times, and the service was heavily subsidized in order to overcome the great difficulties of coal supply on the route. This service was afterward extended to the Brazilian coast and the Rio de la Plata, causing a steady increase in the size of the ships, although they were long built on the same principle.

5. The Screw Propeller. — Private shipowners who were untrammeled by the conditions of their subsidies were anxious to improve on the paddle wheel and in 1836 both Francis Pettit Smith, an Englishman, and Capt. John Ericsson, a Swede, patented practical screw propellers although the principle was not new. The year 1839 saw a ship built to each of these principles, the "Archimedes" to Smith's patent and the "Robert F. Stockton" to Ericsson's. Neither was a large vessel, but they both proved the superior economy and power of the screw and led to more important ships being built.

The most important of these steamers was the "Great Britain," which was laid down in dry dock at Bristol in 1839 and floated out in 1843. She was noteworthy not only because of her dimensions, which were 322 ft. by 51 ft. by 32 ft. 6 in. depth of hold, which gave her a tonnage of 3,270 according to the old burden measurement, but also because she was constructed of iron in spite of the great prejudice of the navy against that material. She was designed by I. K. Brunel, whose intention was originally to make her a paddle steamer. But he was so greatly impressed by the performance of the "Archimedes" on a cruise round the British coast that he altered the "Great Britain" and fitted screw machinery, reinforced by a big sail area on six masts.

Her machinery consisted of a simple engine with four cylinders each 88 in. in diameter, with a stroke of 72 and with indicated horsepower of about 1,500 at 15 lb. per square inch pressure, a speed of 11 knots being obtained on trial. Her stranding on the Irish coast in 1846, when she had to withstand the gales of a whole winter in an exposed position, finally convinced shipowners that iron construction was both strong and practical.

6. Atlantic Development. — In 1847 the U.S. brought out its first transatlantic steamers, the "Hermann" and "Washington," run by the Ocean line between New York and Bremen by way of Southampton in return for a heavy subsidy. They were ships of 1,750 tons each with paddle engines of 1,100 i.h.p. giving them a speed of 11 knots, their hulls being on the lines of the less extreme Atlantic sailing packets. They maintained their service with fair success until the reversal of the United States subsidy policy in 1857, when they were sent to end their days in the Pacific. In 1850 a second U.S. transatlantic service between New York and Le Havre was started with the "Humboldt" and "Franklin."

The straight stem of these two ships made them differ greatly in appearance from their British rivals and was an American conception adopted by E. K. Collins when he started the Collins line (U.S. Mail Steamship company) in 1850. The first fleet consisted of the wooden paddle steamers "Atlantic," "Arctic," "Baltic" and "Pacific," practically sister ships of 2,860 tons, with side-lever engines of 2,000 i.h.p. They were a great improvement on the existing material and although they were so well built and extravagantly fitted that it was necessary to obtain an additional subsidy they were the most noteworthy ships on the Atlantic in their day. In 1856 they were joined by the "Adriatic," of 3,670 tons gross with engines of about 3,600 i.h.p. designed for a speed of $13\frac{1}{2}$ knots, which marked the high-water mark of U.S. paddle-steamer construction on the Atlantic. When the subsidy on which the company relied was suddenly withdrawn after two disasters the service collapsed and although Cornelius Vanderbilt constructed somewhat similar ships to maintain U.S. interest on the Atlantic they were soon withdrawn and for more than 30 years U.S. steamship development was practically confined to the rivers and coasts of the country and to the Pacific trade.

While these big paddle steamers were being built the screw propeller was being introduced into European Atlantic companies, beginning seriously with the foundation of the Inman line in 1850. This company, which was intended to improve the emigrant service, began with iron screw steamers — the first of less than 2,000 tons — barque-rigged and still maintaining a full spread of canvas. Its example was soon followed. The North German Lloyd (Norddeutscher Lloyd) and Hamburg-American (Hamburg-Amerika Linie) companies in Germany, and the Compagnie Generale Transatlantique in France, saw the opportunities of the great continental fields of emigration with up-to-date steam tonnage and were soon encroaching on the third-class traffic which was the last stronghold of the sailing packet.

The Cunard line was endeavouring to carry on in its traditional way, in spite of the fact that by then the naval conditions were considerably relaxed, but it was gradually being forced into line. For its mail ships it remained faithful to the paddle until the early 1860s, the "Scotia" of 3,871 tons which was launched in 1861 being the last and finest of the type. It had, however, changed from wood to iron with the "Persia" of 1855 The first Cunard screw steamer was the "China" of 2,529 tons, built in 1862, which in spite of her smaller size showed her advantages in competitive service trials.

7. "Himalaya." — In 1853 the Peninsular and Oriental line, although not destined to abandon the paddle for several years afterward, built the iron screw steamer "Himalaya," which was the biggest vessel of her type in the world, having a gross tonnage of 3,438 on dimensions 340 ft. by 46.2 ft. by 34.9 ft. depth of hold.

Her trunk engines gave her a speed of 13.9 knots on trial, and yet were sufficiently economical to permit her to stow enough fuel to undertake long voyages under steam which showed a profit. After one or two voyages on her owners' service she was taken up as a transport for the Crimean War and so impressed the admiralty that they bought her and employed her as a naval trooper until the 1890s. She was then converted into a coal hulk for use at Portland, where she was destroyed in the air raids of World War II.

8. "Great Eastern." — The "Great Eastern" was one of the most discussed steamships ever built, and the most historic failure. She was originally conceived by I. K. Brunel on the success of the "Great Britain." and in 1851 a company was floated for the purpose of building her and trading to the east. At that period steam navigation to the east and Australia was greatly handicapped by the lack of coaling facilities, and the "Great Eastern" was specially designed to ply between England and either Calcutta or Colombo, where smaller steamers and sailing vessels could pick up her cargo and passengers and distribute them to various destinations. Her dimensions of 692 ft. on the upper deck by 82.5-ft. beam and 30-ft. draft gave her a gross tonnage of 18.914, and it became necessary to take particular precautions that her hull should have the requisite strength. She was, therefore, given not only a double bottom but a tubular upper deck and was one of the strongest ships ever built. The hull and the paddle engines were built by Scott Russell and company on the Thames, while James Watt and company of Birmingham built the screw engines, for Brunel had decided to provide alternate methods of propulsion, the greatest fault in the original design. Scott Russell of the building firm designed the details of her hull and gave her the wave-line principle in which he believed. The paddle engines had 3,411 i.h.p., while the screw engines which drove a four-bladed propeller had 4.886 i.h.p. Altogether 6.500 sq.yd. of canvas were set on her six masts and she was fitted with ample bunker accommodation for a long voyage, in addition to large holds and passenger accommodation.

Fearing for the narrowness of the river, Brunel insisted that she should be launched broadside on and was so anxious to avoid the huge mass taking charge that he checked her too soon on the ways and she stuck fast for three months. This delay, and the subsequent work of launching her, drove the original company into liquidation and she was purchased for use on the North Atlantic, a service for which she was not designed and was most unsuitable. The result was that she was a most expensive failure except for the excellent work that she did in laying the Atlantic cable.

9. Steam Colliers. — By this time the screw steamer was invading most of the trades of the world. including the coastal. The U.S. was building up a fine coasting fleet, differing very materially from European ideas of design. Most of the European nations were following suit, while steam colliers were even invading the coal trade between the northeast coast of England and the Thames, which was regarded as the stronghold of the sailing ship. The first was the 273-ton "Q.E.D.," which was really an auxiliary, schooner rigged, with the smoke from her low-powered screw machinery carried up through her mizzenmast. This vessel made her appearance in 1844. Eight years later, however, the first real iron steam collier was put into service, the "John Bowes." This steamer had dimensions 151 ft. 9 in. by 26 ft. 3 in. and was one of the first ships to be fitted with tanks for water ballast. Rebuilt out of all recognition, she was later transferred to the Spanish coasting trade as the "Valentin Fierro."

An important result of the success of the "John Bowes" was that it caused the introduction of the steam tramp, a cargo vessel which was open to charter on any trade instead of running to a definite schedule. Before that time all steamers were built for definite services and chartering for bulk cargoes was unusual, this business being left almost entirely to the sailing ship.

10. The Compound-Expansion Engine. — Increased economy was still the aim of the engineer, and this led to the introduction of the compound-expansion engine, in which the steam was used in a second cylinder at a lower pressure after it had done its work in the first. It was an invention of James P. Allaire, U.S. engineer, in the year 1824, but at that time it failed because of the low pressure used. As steam pressure increased John Elder, the head of what later became the Fairfield Shipbuilding and Engineering company on the Clyde, brought out his compound engine, which employed the steam in two stages and which did much to overcome the disadvantages of the steamship on long routes on which coaling stations were rare.

The first vessel to be so fitted was the "Brandon" of 1854, a screw steamer designed for the trade between London and Limerick and fitted with a vertical engine having the cranks diametrically opposite to one another. Her coal consumption on trial was returned as $3\frac{1}{4}$ lb. per indicated horsepower per hour, as compared with the 4 to $4\frac{1}{2}$ lb. which was the utmost economy to which the simple engine could aspire. Although built for a short-distance service, she was employed as a transport in the Crimean War and her success caused the compound engine to be generally adopted, while the steam pressure steadily increased. The first Atlantic steamship to be fitted with compound-expansion engines was the "Holland" of the National line in 1869.

As pressures still increased it became possible to add a third stage to the engine and triple-expansion machinery came into being. In France this system was sponsored by Benjamin Normand of the famous firm of Le Havre shipbuilders, who took out a patent in 1871 and installed his first set two years later. In England a patent was taken out by A. C. Kirk, a colleague of John Elder. who tried a triple-expansion engine and machinery first in 1874 in the 2,083-ton steamer "Propontis."

11. Water-Tube Boilers. — The original installation of the "Propontis" was fed by water-tube boilers, in which the water passed in tubes through the flame instead of the flame passing in tubes through the water as in ordinary mercantile practice. These boilers, which were later generally adopted in all navies and in many merchant ships, had already been introduced in France but had given much trouble. Those installed in the "Propontis" were no more satisfactory than those of French men-of-war which had been so fitted in the 1840s, and she is generally described as a failure. but when new boilers were installed with reduced pressure she continued to work satisfactorily for many years.

In 1881 the "Aberdeen" of 3.616 tons. designed to run on the Australian trade in which economy was more obviously necessary than in any other, was fitted with Kirk's triple-expansion engines. On trial she reduced her coal consumption to 1.28 lb. per indicated horsepower per hour and was a most satisfactory vessel on service, although this abnormally small consumption was naturally increased under working conditions. Her success caused a large number of steamers of all kinds, which had originally carried compound engines, to be tripled by the addition of a third cylinder during the 1880s and 1890s.

At the end of the 19th century steam expansion was taken one stage further, to obtain the best economy with steam pressures above about 180 lb. per square inch, and quadruple-expansion engines were built for marine use. Such engines were fitted in 1904 on the twin-screw "Caronia" of 19,687 tons, which was the last Cunard liner to be fitted with reciprocating engines. Her sister-ship, the "Carmania" (19,524 tons) of 1905, marked the transition of the Cunard line to turbine propulsion.

12. Twin Screws. — In 1862 the first full-powered twin-screw steamer. apart from certain experiments in the earliest days of steam. was built on the Thames. She was the 400-ton "Flora" and although her builders. the Dudgeons, made a specialty of twin-screw steamers and built the far larger "Ruahine" in 1865 for the Panama, New Zealand and Australian Royal Mail company, the idea did not attract the liner companies until the "Notting Hill" of 1881 proved the advantages of the system on the North Atlantic. Even so the single screw was not abandoned at once and as late as 1896 first-class liners were built with one shaft only, in spite of the uneasiness caused by several serious accidents.

13. Turbine Ships. — The experimental "Turbinia," built at Wallsend on the Tyne in 1894 and given turbine engines invented by Sir Charles Parsons, revived one of the earliest principles of generating power and proved that it was capable of being used at sea. Her dimensions were 100 ft. by 9-ft. beam by 3-ft. draft. her displacement being $44\frac{1}{2}$ tons. The original machinery installation consisted of three steam turbines, totaling 2,000 s.h.p. (shaft horsepower) and each driving a shaft csrrying three screws in order to overcome the disadvantages of high propeller speed. During the Diamond Jubilee naval review of 189; she was taken down to Cowes secretly and suddenly dashed out among the assembled ships at what was then the astounding speed of $34\frac{1}{2}$ knots. Naturally she caused a great sensation and the admiralty built two turbine destroyers which unluckily came to grief. the one by stranding and the other because of her light construction. There was a tendency to blame the machinery, which had nothing to do with either mishap, and it was some time before Parsons could persuade commercial shipowners to take an interest in his invention.

The "King Edward" of 1901 was the first merchant steamer to be given turbine machinery. a Clyde passenger steamer which ran for a considerable time after material alterations. She was followed by the cross-channel packet "The Queen" of 1903, which proved herself greatly superior in speed and far more economical than the reciprocating-engined steamers which had preceded her on the service between Dover and Calais. The next important ships to be fitted with turbines were the Allan liners "Virginian" and "Victorian" of 1904, ships of about 10,750 tons gross each with a trial speed of nearly 20 knots. With all these ships there was a certain amount of trouble in the early days, but the turbine made progress and proved its reliability in the Cunard liner "Carmania." whose success resulted in the turbine's being adopted for the Cunard steamers "Mauretania" and "Lusitania" which were the biggest and fastest liners in the world when they were built in 1906. The "Mauretania" held the blue riband of the Atlantic for 22 years.

The 22-ft. steam launch "Charmian" was the first vessel in which intermediate gearing between the turbine and the propeller was tried, the experiments taking place on the Tyne as early as 189; and being practically contemporary with similar experiments carried out on the continent. It had long been realized that the efficient speed of the turbine was far too great for the propeller, which was the reason why multiple screws were fitted to the shafts of the early passenger steamers. In 1909 these experiments had produced sufficient promise to warrant the cargo steamer "Vespasian" having her old triple-expansion engines taken out and turbine machinery with single-reduction mechanical gearing substituted. The great increase in speed and economy which was immediately obtained drew attention to the possibilities of the turbine for cargo as well as fast passenger vessels, and from this it became evident that the gearing, whether it was single or double reduction, was of the greatest advantage even at the maximum speed so that the direct coupled turbine came to be regarded as obsolete at sea.

14. Introduction of Steel.— Improvements in the hulls of steamers were introduced steadily while machinery was being improved, principally with the idea of increasing the strength and carrying capacity and reducing the weight of hull necessary. Iron had shown itself to be superior to wood in these respects, and the next step forward was the introduction of steel for shipbuilding. The first steel-hulled vessel to cross the Atlantic was the paddle steamer "Banshee" of 32j tons, built at Liverpool in 1862 for use as a blockade runner in the American Civil War. In 1876 a small steel paddler was built for river service in Burma and in the following year the Royal Navy built two fast dispatch vessels, the "Iris" and "Mercury." The first sizable merchant ship to be so built was the "Rotomahana," a ship of 1.777 tons built by William Denny on the Clyde for the Union Steamship company of New Zealand in 1879. Within a few months she was followed by a much bigger and more important ship, the Allan liner "Buenos Ayrean" of 4,005 tons, for the Canadian mail service. Although it was recognized that steel offered advantages in every direction except, possibly, durability, to begin with its general adoption was checked by the difficulty of obtaining supplies; but in the early '80s this was overcome and many steel ships were laid down.

The form of the hull was also the subject of numerous experiments in the constant effort to increase the carrying capacity on the same or smaller tonnage, and for this reason several revolutionary designs were brought forward. One of the most striking and permanent of these was the turret deck steamer which was evolved and built by the Doxford shipyard of Sunderland. In this type a curve in the side above the water line gave a narrow deck with a broad extreme beam, and for some time it permitted a great economy in dues.

The "Turret" of 1892 was the first ship of this type and was laid donn by the Doxford shipyard on speculation but bought by Peterson Tate and company for the Canadian trade. Other steamship lines took up the turret deck steamer enthusiastically, particularly the Clan line, but many of its advantages were negatived by the amendment of port and canal regulations, and although these steamers were capable of carrying a large cargo and were excellent sea ships if properly treated, in inexperienced hands they were apt to give trouble and they gradually fell out of favour.

Welded steel-hull construction was tried about 1516, and the first sizable merchant ship to be all welded, without any rivets in her hull. was the M.S. "Fullagar," built at Birkenhead in 1920.

VII. MOTOR SHIPS

The Caspian steamer "Wandal," which was built by the firm of Nobels in 1903, was the first sizable ship to be given an internal-combustion engine. but in her case it was used to generate electricity for the main drive.

Engines in which the charge was exploded by a hot bulb or an electric spark were found suitable for small craft soon after they had become general in automobiles on land, but their size was strictly limited. In the year 1892 Rudolf Diesel took out his patent for an engine in which the charge was exploded by raising its temperature by compression while it was still inside the cylinder, and ships propelled by such units, built up to large sizes and considered by many to be preferable to steam plants, are invariably termed diesel-engined.

The "Randal" was followed in 1906 by the "Venoge." a motor barge on Lake Geneva, and in 1910 the motor tanker "Vulcanus" of 1,179 tons marked a great improvement in size. One year later the motor ship "Selandia" was commissioned by the East Asiatic company, Ltd., of Denmark, one of the principal advocates of the diesel engine, and ran successfully until 1942. Her dimensions were 370 ft. by j3.2 ft. by 27.1 ft. depth of hold. her gross tonnage being 4,950. She was a twin-screw ship, each shaft being driven by an eight-cylinder four-stroke-cycle engine with cylinders $20\frac{7}{8}$ in. in diameter by $28\frac{3}{4}$ in. stroke, totaling a brake horsepower of 2,450 at 140 r.p.m. and driving her at a speed of 11 knots. She was rigged as a three-masted schooner and the absence of funnel attracted general attention. Most shipowners continued preferring to run the exhaust from the engines up through funnels and make their motor ships practically indistinguishable from steamers.

After the success of the "Selandia," for although all the early diesel-engined ships had a certain amount of difficulty with their machinery she was a distinct success and economical, a series of ships was built steadily improving in size, efficiency and economy. World War I practically held up experimental work in that connection as far as merchant ships were concerned, but the diesel improved rapidly in submarines and the Germans brought it to a high pitch of perfection. In Great Britain the results of admiralty experiments were also placed at the disposal of the mercantile engineers at the end of the war. Several submarine diesels were fitted into German cargo ships after the war, their speed being geared down to the efficient speed of the propeller as in the case of the turbine, with satisfactory results.

To begin with, the diesel engine was more or less confined to the cargo vessel, but after World War I it was seen that its adoption in large passenger vessels would mean a considerable saving in space and running costs, although the first costs were considerably higher than in the case of the steamer. After several trials in comparatively small ships, in 1924 the "Xorangi" of 17,491 tons was built at the Fairfield yard on the Clyde for the Union Steamship company of New Zealand and proved most successful on the service between Vancouver and Australia. She was followed in 1925 by the "Gripsholm" of the Swedish American line, a ship of 18.134 tons designed for service between Sweden and the United States. There was considerable doubt as to the wisdom of building this ship, for the diesel shows to its best advantage on long runs,

but she proved an unqualified success. In the same year a great advance in tonnage was made with the 22.048-ton "Xsturias," built at Belfast for the Royal Mail Steam Packet company, and the diesel-engined passenger liner became firmly established. Harland and Wolff, Ltd., the builders of the "Asturias," specialized in a big double-acting diesel built on the lines of Burmeister and Wain of Copenhagen, one of the earliest diesel builders, and developed high powers.

The "Augustus" of 30.418 tons was built for "Italia," Societa Anonima di Navigazione, in 1927. In deference to public opinion all these large passenger motor ships n-ere given funnels, the majority of them two, but the builders evolved a typical diesel funnel, short and stout. which does much to obviate the echo which can prove exceedingly troublesome when the exhaust is carried through a funnel of ordinary design. particularly in fog.

1. The Still Engine. — In the Scott-Still engine. first fitted in the Blue Funnel liner (A. Holt and company) "Dolius" of 5,507 tons in 1924, an effort was made to combine the steam and diesel systems, but although a certain economy was obtained, the system did not become a commercial success.

2. Electric Drive. — Electric propulsion at sea. with power generated by the internal-combustion engine, was first tried by Nobels in the "Wandal" on the Caspian in 1903, a vessel that has already been mentioned as the first motor ship. The German navy adopted it in the case of the submarine salvage vessel "Vulcan" in 1907 and it was also tried in 1913 in a Canadian lake vessel. the "Tynemount," where the current was generated by two diesel engines of 250 b.h.p. (brake horsepower). She was followed by the Swedish "Mjolner." in which the current was generated by two turbines of qjo s.h.p. each. The U.S. navy, which later brought the system up to its highest pitch of perfection, first tried it in the steam collier "Jupiter" of 20.000 tons displacement, in which the turbine generator was of the Curtiss type and where the results were so successful that the system was adopted in the latest and biggest battleships. The "Jupiter" later became the aircraft carrier "Langley." For cruisers and destroyers, however. the United States naval authorities found mechanical gearing better.

After World War I there was a growing tendency to favour electric propulsion for merchant ships, particularly in the U.S., and with the benefit of the experience gained in the U.S. navy it was possible to install large powers with perfect success. The most striking case was the Panama-Pacific liner "California." employed on the intercoastal trade between New York and California. She was a ship of 20,325 tons built in 1928, her electric machinery generated by turbines giving her a speed of 18 knots. A similar installation was chosen for the Peninsular and Oriental liner "Viceroy of India," launched on the Clyde in 1928. and the French liner "Normandie" was fitted in 1932 with turboelectric drive of 160,000 h.p.

VIII. STEAMERS FOR SPECIAL PURPOSES

1. Tugboats. — The use of steam power for tugboats was considered from the earliest times. In 1736 Hulls patpnted his proposal for a steam-propelled tugboat to carry vessels into and out of harbour in a calm. This he described in considerable detail; the vessel was to have a Newcomen steam engine of 30-in. cylinder diameter, fitted with ratchet gear to produce rotative movement of a paddle wheel at the stern. This scheme, so far in advance of its time. met with derision and never had a practical trial.

The first practical tugboat was the "Charlotte Dundas" of 1802, tried on the Forth and Clyde canal, but condemned because the canal owners feared that the wash from her paddles would cause damage to the canal banks.

The first steam tugboat on the Thames was put into service in 1816; and the first steam vessels in the British navy, from about 1822 onward, were used as tugboats, to tow the sail warships in and out of harbour. Screw propulsion for tugboats was first tried in the United States about 1850 and soon came into general use. In 1875 triple-screw tugs were in service on British inland waterways.

In the course of World War II a class of ocean tugboat was developed for rescue and salvage work. One notable vessel of this class was the "Turmoil" of 1,800 tons displacement, built in 1944 for the British admiralty. Her dimensions were 205 ft. by 38.j it.; she had diesel engines of 3,200 total b.h.p. and was capable of 1j knots.

For modern ocean liners, the use of tugboats in berthing and docking operations is normally considered indispensable; but it is on record that on Feb. 6, 19j3, the "Queen Mary," in exceptional circumstances. was able to berth at New York under her own power and without the help of tugs.

Even after the screw had been adopted for the propulsion of tugboats. the paddle wheel still continued to be used for this purpose. and in 19jj some paddle tugs with diesel-electric drive were built for the British admiralty.

2. Train Ferries. — The 417-ton steam train ferry "Leviathan," built in 1849 for the North British Railway company to run across the Firth of Forth from Granton to Burntisland, was the first of a type which later became quite general and was built to large size on several services. Almost at the same time another was built to cross the Tay at Dundee, but both these ferries were later replaced by bridges. In 1878 the Philadelphia and Reading railroad built its first ferry steamer to run across New York bay and in the early 1880s the Danes started a train ferry from Korsor to Nyborg. The idea of a similar service to run across the Straits of Dover was put forward in 1870, when the use of double-ended paddle steamers was proposed. Train ferries were introduced in 1936 between Dover and Dunkirk, in connection with the direct London-Paris service. Another train ferry on a large scale in Great Britain is that running from Harwich to Zeebrugge and employed largely for shipping French and Italian fruit to England.

3. Steam Trawlers. — In the early 1870s several attempts were made to introduce steam trawlers in the south of England. but they were not successful. Several years later a shipping slump caused numerous steam tugs to be laid up and the experiment of using some of these for trawling was tried. Most of these were paddlers, the first being the "Messenger" which made her first trip to the fishing grounds in 1877, but the experience gained in her and other converted ships showed that the paddle was unsuitable for the purpose. Experiments with screw boats were tried in the early 1880s and were an immediate success, the design developing rapidly and producing some of the finest sea boats afloat. Later, practically every maritime country acquired a big fleet of power trawlers and drifters. The internal-combustion engine made great strides in vessels of this type, and electric machinery was also tried on occasions.

4. **Icebreakers.**—"Eisbrecher I," launched in 1871, mas the first specially designed icebreaker to be built. She was planned on the experience gained a few years previously by a Russian shipowner named Britneff, who reconstructed the bow of the steamer "Pilot" in such a way that she could be driven onto the ice in the hope that she would break it by her own weight. In practice she was too small and light for this purpose, but the idea was appreciated and is embodied in all modern icebreakers, some of which run to a large size.

5. Tankers. — The increased consumption of oil for various purposes made it necessary to evolve some means of carrying it in bulk instead of in barrels as it had been carried from the earliest days of whaling. The first suggestion was in 1863, when the sailing vessel "Ramsey" had a few tanks built into her hold to carry oil in bulk in addition to stowing barrels in the ordinary way in her 'tween decks. From 1869 to 1872 the sailing vessel "Charles," of 794 tons, was carrying oil in 59 iron tanks which were built into her holds and which completely filled them. The problem of keeping ironwork oiltight was not then fully understood and these tanks were far too weak! with the result that in the working of the ship under sail constant leaks developed and eventually she was burned at sea. Several other ships were converted in similar fashion, mostly for the trade across the Atlantic to Le Havre and Antwerp, but they were all failures.

In 1872 the Red Star line of Philadelphia started a new system by having the steamship "Vaderland" of 2,748 tons built by Palmer Brothers and company on the Tyne with the idea of carrying a large cargo of oil in bulk in addition to her passengers. All the authorities were against this scheme on grounds of safety, and she was used for passenger and cargo only. as were also the "Nederland" of 1873 and "Switzerland" of 1874 which were designed on similar lines. This prohibition against shipping oil in passenger vessels still exists.

In 1879 Nobels, who were already noted for their work in building the pioneer motor and electrically driven ship. built a number of tank steamers to carry oil on the Volga river and attained considerable success with them. These steamers attracted some attention at the time. but the idea that oil would be safer in a sailing vessel than a steamer was still generally held and in 1886 the sailing ships "Andromeda" and "Crusader" were fitted with cylindrical tanks on an improved system for the purpose. Their designers attained a considerable measure of success in making their tanks oiltight, but in the same year the firm which later became Sir W. G. Armstrong Whitworth and Company. Ltd.. designed and built the first real tank steamer on modern lines.

The "Glückauf" had a dead-weight capacity of 3.000 tons and a speed of $10\frac{1}{2}$ knots, her engines being placed right aft for safety as is still almost invariably done in tankers. Her hull was subdivided into tanks and arrangements were made for pumping them on a principle which is still used.

After World War I a large number of tank steamers was built, although it is one of the most difficult trades to cater for and to maintain. In spite of numerous experiments oil remained almost invariably a one-way cargo. so that the ship had to be exceedingly economical because of the return journey in ballast. A large cargo is desirable for the ocean route and 13,000 tons dead weight and more became a usual size, while the speed seldom exceeded 11 knots.

After World War II, however, there has evolved a class of supertanker. One such notable vessel mas the "Spyros Niarchos." built at Barrow in 1955 for the Neptune Tanker corporation. Her dimensions were 757 ft. by 97.2 ft., with a dead-weight capacity of 47,750 tons. The hull was longitudinally framed and nearly all welded. The vessel was propelled by geared steam turbines of 18.000 s.h.p. at a normal service speed of 17 knots. The greatest shipbuilding activity of the 1950s was in tanker construction. Starting from the basic T-2 tanker of World War II, with a carrying capacity of 138,500 bbl., there was under construction a tanker with a carrying capacity over seven times that of the T-a. Tankers were constructed not only for transporting oil. but also for carrying liquid chemicals. gases, molasses and frozen fruit juices. Because of their tremendous length and unequal strain. the design of these tankers involves careful considerations of strength, and the majority of modern types are built on the longitudinal system, with great attention paid to fore-and-aft stresses.

6. Packet Steamers.—When the screw superseded the paddle for overseas work, the older fashion survived in the excursion steamers round the British coast, where shallow draft was generally necessary to get alongside the piers, and in the cross-channel services. The growing continental trade and the limitations in draft imposed by the French and Belgian harbours brought the paddle packet steamer to a high pitch of perfection in the last days of the 19th century, ships of considerably more than 2,000 tons gross with a speed of 22 knots and excellent seaworthiness being built in considerable numbers, mostly on the Clyde. No more of these big cross-channel paddlers were built after the turbine had proved its possibilities, but many other steamers propelled in this way, much smaller and rather slower, were built for the various excursion routes in the summer. Most of these again were excellent sea boats and were able to perform valuable mine-weeping service during World Wars I and II.

In the United States, however, where the huge inland waterways favour the side wheel, the paddle steamer was brought up to its highest state of development. Notable ships of this type were the "Greater Buffalo" and "Greater Detroit," built in 1923 for service on the Great Lakes, each having a gross tonnage of 7,739 and being driven by three-cylinder compound engines.

7. Standardized Ships.—In the early days of World War I mercantile construction was almost completely suspended in Great Britain, Germany and France in favour of warships, but it received a great impetus in the United States. When the German submarine campaign caused an acute shortage of tonnage it had to be resumed in an intensified form in Britain, while from 1917 the U.S. launched a shipbuilding campaign unprecedented in the history of the industry. In order to save time and money wherever possible, standardized shipbuilding came into vogue. It had existed within certain establishments for many years, the German yards, particularly. specializing in certain types and turning out large numbers of sister ships for various owners. During the war, however, it was carried right through the various countries and in some cases the inland steelworks, usually employed on bridge construction and the like, were utilized for fabricated ships with lines as straight as possible which were only put together and launched in the shipyards.

In the United States wood was largely used, both for full-powered ships and auxiliaries, but there was no time to permit the timber to season and they were built of green timber. Similarly a number of vessels of various types—lighters. tugs, tankers, etc.—were built of ferroconcrete, the rapidity with which they could be turned out compensating for their excessive weight in wartime, although only one or two of them survived more than a few months of peacetime trading.

In criticizing these standard ships built during World War I, there was a general tendency to forget the peculiar circumstances in which they were built and the necessity of getting something that would float into the water as quickly as possible. Their utility in competitive trading in peaceful circumstances was a secondary consideration. The United States shipping board, formed to run the tonnage so built in the U.S., was left with a large number of ships for which no purchasers or managers could be found, but many of them were later converted to diesel or electric power and their running expenses greatly reduced.

In the later years of World War II, quantities of standardized cargo vessels, called Liberty ships, were built in the United States. These were oil-burning ships; a fairly large number of such ships were built by Canada as coal burners. "Standardization and no changes" was an outstanding feature of World War II shipbuilding. The largest number of ships ever built in the world from one design was the Liberty ship. Another outstanding feature was the use of all welding in construction. Welding was not a new process but it was developed and used to a far greater extent than ever before, being applied not only to cargo but also to all classes of ships.

8. The Cabin Liner.—From the early days of regular services, the older and smaller units of the various companies were put on intermediate services at reduced prices, and these ships gradually came to be known as cabin-class ships. Few ships were specially built for the class until 1914, when Canadian Pacific Steamships, Ltd., commenced a long series with the "Metagama" and the "Missanabie," ships with a gross tonnage of about 12,500 and speed of 16 knots, having accommodation for 520 passengers in the cabin class, paying a fare approximating the second-class fare in the bigger ships, and 1,200 in the third class. Afterward the type was taken up enthusiastically by various companies, particularly on the North Atlantic, with such vessels as the "Duchess of Atholl" and her sisters, also owned by the Canadian Pacific line, having a gross tonnage of roughly 20,000, a sea speed of 17 knots and single reduction-geared turbines supplied by oil-fired high-pressure boilers which gave the remarkable economy of 0.64 lb. of oil fuel per shaft horsepower per hour for all purposes.

9. Fast Cargo Liners.—There was also a noteworthy tendency to build fast cargo liners after World War I, ships with a sea speed of 14, 15 and 16 knots, but carrying cargo only on regular schedule. Both steamers and motor ships were built for these services and found great favour with shippers. Great economy in running was obtained with the result that they secured a considerable proportion of the trade which was formerly carried by tramp steamers.

10. High-Pressure Steam.—In steamers this remarkable economy was made possible largely by the employment of high-pressure steam. The Clyde passenger steamer "King George V," built by William Denny and Brothers (Ltd.) in 1926 in conjunction with Yarrow, the boilermakers, and the Parsons Marine Steam Turbine company, had the first noteworthy installation apart from

unsuccessful experiments made about 1880. She was a steamer of 801 tons gross, burning coal under water-tube boilers working at a pressure of 550 lb. to the square inch with the steam temperature raised to a maximum of 750° F. This ship considerably exceeded her contract speed of 20 knots on trial and proved a success in many ways, particularly with regard to economy. But numerous adjustments and alterations had to be made after her launching.

In modified form high-pressure steam resulted in considerable economies, both in fuel consumption and weight. The general tendency was to increase the pressure both for naval and for mercantile work and 450 lb. became quite usual. While high-pressure steam saw its beginning in 1926, it developed rapidly in use, and in the 1930s very high-pressure and very high-temperature steam installations were made in U.S. navy destroyers and greatly increased their speed.

These principles were adopted in whole or in part by merchant vessels and became standard practice; *e.g.*, the tanker, "Atlantic Navigator," built in 1951, was equipped with boilers operating at a pressure of 650 lb. per square inch and a temperature of 1,020° F.

11. Gas-Turbine Propulsion. — The earliest recorded description of a gas turbine (in which the hot gases of internal combustion, instead of steam, act on the turbine blades) can be found in the patent obtained by John Barber, of Nuneaton, in 1791. The first vessel to be propelled at sea by a gas turbine was the 110-ft. triple-screw motor gunboat no. 2009 of the British admiralty, which in 1947 had a gas turbine of 2,500 s.h.p. fitted to the centre shaft. The first ship of the mercantile marine with gas-turbine propulsion was the motor tanker "Auris" of 12,250 tons dead weight, built in 1947 at Newcastle for the Anglo-Saxon Petroleum Co., Ltd. In 1951 one of her four main diesel engines was replaced by a gas-turbine installation of 1,200 b.h.p., constructed by the British Thomson-Houston Co., Ltd.

12. Express **Luxury Liners.**—The White Star liner "Oceanic" of 1871 was the first of the modern type of express luxury liner, which attracts more attention than any other type, but which can exist economically only on the direct service between Europe and the United States. The White Star line had then just been founded for the purpose of engaging in the Australian trade, and for that purpose had bought the name and house flag of one of the most famous of the clipper ship companies. Events caused the directors to change their intentions and the first ships were put on service between Liverpool and New York, the "Oceanic" being the pioneer. These ships differed materially from the accepted type of screw steamer, having more than ten beams to their length and being designed on the somewhat revolutionary lines advocated by Sir Edward Harland of Harland and Wolff, the Belfast shipbuilders. The tonnage of the "Oceanic" was 3,707 and while she was fully rigged as a four-masted barque her single-screw engines gave her a sea speed of 14.75 knots, and she proved herself an unqualified success after being generally condemned on theoretical grounds by the experts. Three years later the "Germanic" and "Britannic" were built, each with a gross tonnage of 5,000 and speed of 16 knots.

The Guion line, which until then had been engaged principally in the emigrant trade, then entered the race for the Atlantic blue riband with the "Arizona" of 1879, a ship of 5,147 tons with a sea speed of 16.25 knots. An improved edition of the same design was the same company's "Alaska" of 1881, her gross tonnage being 7,142 and her speed 17.75 knots. In the "Oregon," which was built just before the company got into serious financial difficulties and which eventually sank in collision with a small schooner, the gross tonnage went up to 7,375 and the speed to 19 knots.

The reply of the Cunard line was the construction of the "Umbria" and "Etruria" at the same establishment which had turned out the big Guion ships, Elder's Fairfield yard. They were ships of 8,120 tons with a speed of 19.5 knots and they marked the final development of the single-screw express liner on the Atlantic. Although they were specially designed to compete with the "Oregon," that ship had passed to the Cunard line before they were completed.

The next great improvement was the design of the "City of New York" and "City of Paris," when the twin-screw system was adopted for express ships. They were built for the Inman line in 1888 but were better known under the flag of the American line to which they were transferred in 1893. These ships secured the Atlantic blue riband and were the last big Atlantic liners to be built with the old-fashioned clipper stem. When it was desired to transfer them to the American line, congress permitted them to hoist the U.S. flag only on condition that two ships of at least equal tonnage were built in U.S. yards, which resulted in the "St. Louis" and "St. Paul," of 11,630 tons and 21 knots speed, being built in 1895, the first big Atlantic liners to be built in the United States since the 1860s.

The White Star line replied to these ships with the "Teutonic" and "Majestic" in 1889, ships which had a great struggle with the "City of New York" and "City of Paris" for the Atlantic record. In 1893 the Cunard line secured the blue riband without doubt with the "Campania" and "Lucania" of just under 13,000 tons with a sea speed of 22 knots.

In 1897 the German companies, which had built up a big business in comparative obscurity beside the companies racing for the blue riband, came out with the "Kaiser Wilhelm der Grosse" of the North German Lloyd, which lowered the record considerably. She had a gross tonnage of 14,350 and a speed of 23 knots. Their rivals, the Hamburg-American line, built the 14,500-ton "Deutschland" to compete for the record, but on their experience with her they decided to follow the policy of comfort and good cargo capacity on more moderate speed, a policy which was also followed by the White Star line after the "Teutonic." The North German Lloyd, on the other hand, steadily lowered its own record with the three ships which followed in the same series and to the same general design—the "Kronprinz Wilhelm" of 1901, the "Kaiser Wilhelm II" of 1902 and the "Kronprinzessin Cecilie" of 1906. Each of these ships marked a further advance in size and speed.

Before the last named could be tried at her best the Cunard line had built the "Lusitania" and "Mauretania" with the financial help of the British government. The dimensions of the latter were 762.2 ft. by 88 ft. by 57.1 ft. depth of hold, giving her a gross tonnage of 31,938, while her quadruple-screw direct-coupled turbines had a designed shaft horsepower of 68,000, intended for a speed of 25 knots. The "Lusitania" was sunk by a German submarine during World War I; the "Mauretania" had the unique distinction of holding the Atlantic blue riband for 22 years and when 20 years old proving herself capable of steaming at 29 knots to the rescue of a disabled cargo ship.

Maintaining their policy of avoiding excessive speed, the Hamburg-American line answered these Cunarders with the biggest steamers in the world. The first of the series was the "Imperator," later the Cunard "Berengaria." She was launched in 1912, her dimensions being 886.3 ft. by 98.3 ft. by 57.1 ft. depth of hold and her original gross tonnage 51,969. The second of the series was the "Vaterland," which became the "Leviathan" of the United States lines. Her dimensions were increased to 907.6 ft. by 100.3 ft. by 58.2 ft. depth of hold, and her gross tonnage was 54,282, later 59,957. The third ship was the "Bismarck," later the White Star "Majestic," similar to the "Vaterland" hut slightly longer.

Immediately after World War I nearly all the lines had to engage immediately in a shipbuilding program to replace casualties, although shipbuilding prices were at their highest level. The general tendency was to build a moderate-sized ship with good cargo capacity and comfortable passenger accommodation at reasonable rates. The Cunard line brought out the "Franconia" type of five ships of just over 20,000 tons gross with a speed of 17 knots, while the Hamburg-American line built four ships of the "Deutschland" type, having a sea speed of 16 knots and a tonnage of slightly more than 21,000.

This tendency was broken by the Compagnie Générale Transatlantique, which in 1926 built the "Ile de France," a ship of 43,450 tons gross with direct-acting turbines of 52,000 s.h.p. and a trial speed of 24 knots. The North German Lloyd responded by laying down the "Bremen" and "Europa," ships of about 50,000 tons each, with a speed of 28 knots on service. They had geared turbines and considerable weight was saved by a boiler pressure of 330 lb. to the square inch, while their design was revolutionary in many features, particularly in the bulb bow under the water line. The "Bremen," launched in 1328, beat all Atlantic records, but was outstripped by the "Europa," which later became the "Liberté" of the French line.

The first of the modern 1,000-ft. vessels was the "Normandie" of 83,423 tons, launched at St. Nazaire in 1932 for the Compagnie Générale Transatlantique. She had four-screw propellers with turboelectric drive of 160,000 total s.h.p., carried 2,170 passengers and crossed the Atlantic at a mean speed of 31.2 knots. At the outbreak of World War II the "Normandie" was in New York harbour, hut was not utilized by the French for war service. On Dec. 16, 1941, she was expropriated by the United States maritime commission for conversion into a troopship. In the course of conversion, however, fire broke out on Feb. 9, 1942, and the vessel capsized. This accident occurred just one day after the "Normandie" had been turned over to the U.S. navy by the U.S. maritime commission.

The first British vessel to exceed 1,000 ft. was the "Queen Mary" of 81,235 tons, built at Clydebank and launched in 1934 for the Cunard White Star line. She had four screw propellers 19.6 ft. in diameter, driven by turbines of 160,000 total s.h.p. In 1938 she recaptured the blue riband from the "Normandie" with a mean Atlantic speed of 31.7 knots. Another 1,000-ft. liner was the Cunard White Star "Queen Elizabeth" of 83,673 tons, built at Clydebank in 1438, carrying 2,288 passengers and propelled by turbines of 181,700 total s.h.p. supplied with steam at 450 lb. per square inch pressure.

In 1952 the 53,330-ton liner "United States," built at Newport News, Va., crossed from New York to Southampton at a mean speed of 35.59 knots (nearly 4 knots faster than the "Queen Mary") and thereby reclaimed for the U.S. the blue riband of the Atlantic. The "United States" was built to the specifications of the U.S. navy, to facilitate her rapid conversion into a troop carrier in the event of war. Wherever the choice lay between the demands of luxury or defense, the latter consideration is said to have prevailed.

14. New Design and Development. — In the 1950s impetus for new design and development came from the need for various special purpose ships, such as "roll-on, roll-off" ships for transporting automobiles, trailers, trucks and other vehicles. The prospect of the opening of the St. Lawrence waterway initiated the construction of a great many specially designed ships, in the U.S. and elsewhere, with automatic loading-on and loading-off features. Three types of offshore drilling rigs involved the art and science of ship construction. A whale factory ship, designed in Norway, was capable of utilizing in its self-contained structure everything in a captured whale except its spout. A modernizing process called "jumboizing" was being carried out on Liberty ships and tankers to increase capacity, the process consisting of cutting the ship in two, adding a new section, then welding together the new and old sections. Four new propulsion designs were in operation or under way: two types of gas turbine, a diesel and a modified turbine drive, to convert Liberty ships for greater speed and carrying capacity. The use of atomic energy for propulsion purposes was first made in the submarine "Nautilus," and was followed in other submarines, and designs were prepared for an atomic energy tanker, freighter, airplane carrier and cruiser. *See* also Index references under "Ship" in the Index volume.

SHIPBUILDING (MERCHANT AND NAVAL).

Shipbuilding is one of the oldest of the engineering arts. For centuries, shipbuilding skills were passed on from generation to generation. The history of shipbuilding parallels that of ships, reaching from the primitive craft of ancient times through the age of sail to the modern era of huge steel vessels driven by steam, diesel engines or nuclear power. (See MARINE ENGINEERING; SHIP; SHIPPING, HISTORY OF.)

Only in comparatively modern times has it become more of a science than an art. An important manifestation of this change has been the increasing importance of the design stage of shipbuilding as compared with the actual construction work. It has become possible to plan all the features and predict generally the performance of a ship on paper before a single piece of structure is in place. Because of the natural division between ship design and ship construction, the former is treated in a separate article, NAVAL ARCHITECTURE.

SHIPYARDS

Ships and small craft are constructed and repaired in nearly all countries in industrial plants known as shipbuilding yards or shipyards. Most shipyards are privately owned and operated to make a profit, but some are government-owned and government-operated. Privately owned shipyards build merchant ships and some also build naval vessels. A few private yards do repair and maintenance work but do not build ships. To provide work during slack shipbuilding periods, many private shipyards also manufacture machinery or fabricate structural steel. Naval shipyards repair, alter and overhaul naval vessels; many also build naval vessels, and a few have large dry docks and repair facilities that are occasionally used for the maintenance of merchant ships. (See DOCKYARDS AND NAVAL BASES.)

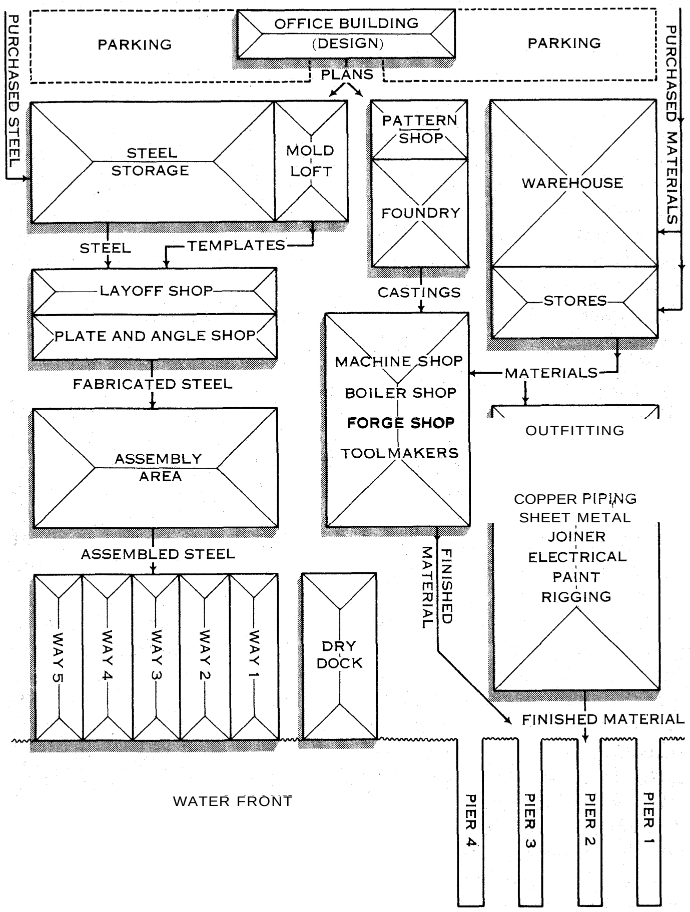
Over 90% of the world's merchant ships (including vessels of more than 1,000 gross tons) and all of the very large vessels are constructed in the following countries: Great Britain, West Germany, Japan, Sweden, the Netherlands. France, Italy, the United States, Norway and Denmark. The following countries or localities build comparatively few ships but have yards capable of constructing merchant vessels of over 1,000 gross tons: Spain, Belgium, Yugoslavia, Finland, Canada, East Germany, India, Australia, Portugal, Greece, Taiwan. Hong Kong. Bulgaria, Turkey, Argentina and Ireland. Figures for the U.S.S R. and China are not available.

The building ways on which new ships are constructed exceed 1,000 ft. in length in the larger shipyards. Most building ways are above the water level and the ships slide into the water stern first when launched. A few shipyards build large ships in a building dock, the equivalent of a graving dry dock. *(See* DOCKS.) Ships may be floated in or out of such docks by closing or opening a gate at one end and pumping water in or out. When a ship is built in such a dock its keel is horizontal and the framing and bulkheads are vertical instead of sloping. Men work more economically on a vessel if the keel is horizontal instead of on a slope such as is necessary for launching a vessel stern first. This reduces building costs and, when launched, the vessel is merely floated away instead of sliding down sloping ways. On the Great Lakes the usual practice is to launch vessels by sliding them sideways into the water. The keel and bottom plating are not sloped if the vessel is to be launched sideways.

Most of the larger private yards have either graving dry docks or floating dry docks. Small yards may have only relatively small marine railways. Graving docks capable of handling the largest merchant vessels are located in England, Scotland, France, Germany, Italy, South Africa, Japan, the United States and Canada. Some of the longer graving docks are so narrow that they cannot accommodate very large tankers having a beam of over 125 ft. Many graving docks in major shipbuilding countries are over 800 ft. in length.

The largest floating dry docks are in the United States. They have a lifting capacity of 90,000 long tons and can be towed at sea to new locations. They measure 927 ft. by 256 ft. and, when submerged to maximum draft, require over 78 ft. of water. They can accommodate vessels of more than 125-ft. over-all beam and more than 40-ft. draft. Very few floating dry docks have a lifting capacity of more than 50,000 tons, and most are of less than 10,000 tons' capacity.

Location.— Shipyards are located on bodies of water that are wide and deep enough to permit vessels to be launched from the building ways and delivered to the rivers. lakes or oceans on which they are to serve. As relatively deep water is necessary if a seagoing ship is to be operated at full power and attain maximum speed during the predelivery trial trip. it is desirable that the shipyard be within a few hours' steaming time of nater having a depth of at least five to ten times the vessel's draft. The location of a shipyard should permit the expeditious and economical delivery of the large quantity of heavy materials and equipment required for building Some items. such as boilers, may be too large to pass through railway tunnels or over bridges. A shipyard should also be close to a source of skilled workers,



SCHEMATIC DIAGRAM OF SHIPYARD ILLUSTRATING FLOW OF PLANS AND BUILDING MATERIAL

but not nithin a large city where taxes and the cost of land are high. There should be enough adjacent vacant land to permit expansion of the yard.

Layout.— With the exception of emergency shipyards built in wartime. most shipyards were of modest size when founded. The more successful ones gradually grew in both area and capacity into large yards nith many building ways, several dry docks. outfitting piers and the necessary design offices, shops and equipment to construct vessels of all sizes and types Most ships are launched nhen about tno-thirds complete and are then towed to outfitting piers where the rest of the nork is done. A few yards tow the vessel to another organization that does the outfitting work and prepares the vessel for the trial trip and delivery to the owners Many shipyards purchase such items as diesel engines, turbines and gears, boilers. propellers. joiner work, valves and castings. and merely install them in the vessel. Other yards produce such parts in their own shops.

In a typical large shipyard there are office departments devoted to administration, accounting, ship design. correspondence, cost estimating, employment. shipyard planning and maintenance, production control, blueprints and reproduction, purchasing and timekeeping. The principal yard departments may be subdivided into three basic groups. (1) the structural steel hull construction departments located near the building nays; (2) the outfitting departments convenient to the piers; and (3) the miscellaneous departments such as the pattern shop and foundry. warehouses and storerooms. shipyard maintenance shops. research and testing laboratories. heat-treating shop. fire department, clinic, apprentice training. yard transportation and inspection.

The usual hull steel construction departments and shops are the mold loft: steel storage department; steel layoff and fabrication shops; rolling, bending and galvanizing shops; and drilling, riveting. welding and shipwright erecting departments.

The major outfitting departments and shops include one or more machine shops, blacksmith forge shop, boiler shop, copper shop, joiner and furniture shops, electrical shop. piping shop. sheet metal shop and the painting. rigging. carpenter, machinery installation and toolmaking departments. In addition, there are many other operations or controls. including dry-docking, yard transportation of materials. tugboats, watchmen, steam plants, oxygen plants and a system for electric power distribution.

The figure diagrammatically illustrates a typical layout for a shipyard having five building ways, four outfitting piers and a dry dock. The materials purchased move only in the general direction of the vessel as they pass through the shops. In some shipyards the materials may crisscross back and forth as they are processed. This is wasteful of both time and manpower. Where vessels are launched sideways instead of stern first. a much longer water front is necessary and the layout of the yard is less compact.

Shipyard equipment includes the types of shops. tools and machines commonly found in other fields of industry— machine shops. furniture factories. sheet metal and plumbing shops, foundries, structural steel fabricators and electrical shops. In addition, well-equipped large shipyards may have several traveling cranes of 100-ton capacity, a huge 350-ton traveling gantry crane, a 1,200-ton forge press, vertical boring mills, lathes and long galvanizing kettles.

Organization and Personnel.— During normal times each large shipyard employs from 10 000 to 30,000 persons representing a nide variety of industrial trades. Many of the trades are used only in shipbuilding and require severa! years of training. If a skilled employee is laid off during slack times and takes another job, it may be difficult to replace him later.

Organization varies from yard to yard and from country to country. but basically the patterns are similar, since the fundamental problems are the same. The shipyard's principal activities may be classified as follows:

1. The cost-estimating and production control departments determine the bid that can be made on a proposal to build a ship; they also schedule the sequence of operations and required material deliveries after the contract has been signed.

2. The accounting department keeps abreast of the costs of current work. It also handles the payroll and timekeeping for the yard's labour force.

3. The personnel or employment department is responsible for personnel relations and the hiring and discharge of employees.

4. The plant engineering and maintenance department keeps the compressed air, water and steam pipes, electrical wiring, cranes, trucks and all other yard facilities up to date and in good operating condition.

5. The design departments produce the working plans needed for the construction of the ship and often prepare the basic design, contract plans and specifications. From requisitions prepared by the design departments, the materials department purchases the needed materials and provides for their storage.

6. The departments that fabricate or manufacture the materials. together with those that assemble, erect and complete them aboard the ship, employ about 75% of the yard's total personnel.

As ship design and construction involve many specialized trades used only in shipbuilding, apprentice training is customary. An apprentice is assigned to work as an experienced workman's helper for four or five years, after which he graduates and becomes a journeyman. In some of the larger shipyards apprentices also are paid while they take part-time classroom academic training, including calculus and advanced physics and chemistry. As college graduates in engineering need practical training, they may be given a special course through several departments for a year or so. Thereafter they are assigned to the departments that their talents seem best suited for.

Repair and Conversion.—Ship repair yards are located in major shipping ports. They specialize in repair and conversion work and seldom build new ships. Shipyards are primarily builders of new ships, but most also do repair and conversion nork.

In a typical large shipyard there is a ship repair department that arranges for new work, makes estimates of costs and oversees the work done on a vessel. Attached to the repair department is a materials procurement group. Production control and scheduling are under the supervision of the repair manager, who, together with his staff, co-ordinates the work of repairing ships in an effort to have the nork done on time and within the estimated cost. In shipyards engaged in building ships, the labour and direct supervision needed for ship maintenance, repair and conversion work is drawn from the personnel employed in new construction. The labour required fluctuates from day to day.

Routine maintenance work is done on seagoing ships at least annually. sometimes twice a year. It may consist merely of dry-docking the vessel to clean and paint the outside plating above and below the nater line while the ship's crew attends to topside and internal maintenance. In other cases it may involve replacement of propellers, tail shafts and boiler tubes and correction of a wide variety of defects.

Repair work is needed primarily because of damage due to accidents, abuse or carelessness. Accidents may include collision damage, bottom damage due to grounding, or damage to hatches as a result of careless cargo handling. Damage due to severe weather or fire may require extensive repair work. As ships represent a large investment and are manned by sizable crews, the depreciation, interest on the investment, stores, subsistence, crew wages, insurance and other costs may total a large sum for each day that a ship is under repair. This justifies the added cost of overtime to expedite completion of the work.

Conversion work may call for making major changes in a vessel, such as adding passenger quarters or converting from one type of vessel to another. A freighter or tanker, for example, may be converted to an ore carrier or collier. As the liquid cargo spaces of a tanker deteriorate more rapidly than does the remaining structure, it is sometimes necessary to remove the vessel's end sections, scrap the deteriorated amidship section which contains the bulk liquid cargo spaces, and replace it with new construction. Such a conversion requires the co-operation of nearly all the shipyard departments, including the design staff. *(See* also TANKERS.)

Production Control.—Production control in shipbuilding starts with the original proposal or contract for a new ship. The shipyard draws up a schedule of basic dates, including keel laying, launching and delivery. This schedule must be drawn up with proper regard for the availability of manpower, materials and shipways, for it would detract from the yard's reputation and be financially costly to be awarded a shipbuilding contract and then find that the delivery of steel, equipment components. boilers, engines. etc.. or the absence of an available shipway or manpower, mould prevent meeting the delivery date. If the shipbuilding contract contains a penalty clause, a delay could result in serious financial loss.

The time required for building large seagoing ships—from signing the contract to delivery—is about as follows: tankers. 15 to 18 months; freighters, 20 months; passenger vessels of moderate size, 30 months; and the largest, highest-powered passenger liners, about 40 months. To allow time for receiving from 40% to 50% of the steel, and time to fabricate enough structural steel to assure rapid progress on the building ways, from six to eight months usually elapse between the signing of the construction contract and the keel laying. This figure is for freighters and tankers; up to ten months or more may be required for large passenger vessels. The time on the building ways before launching varies, but under normal conditions it is approximately 60% of the time from keel laying to delivery for freighters, 50% to 60% for passenger vessels and 70% to 75% for tankers. If several sister ships are to be built, the keel of each being laid a few months after that of the one preceding it, the building time for the succeeding ships is usually less than that required for the first. To permit rapid and orderly erection. the hull structural steel drawings should be from 40% to 50% complete when the keel is laid. By the launching date nearly all design and material ordering should be completed for freighters and tankers and at least 75% completed for passenger vessels. The peacetime building period for a naval combat vessel. such as a large aircraft carrier, is a little longer than that for a passenger vessel of comparable size. The additional time is required between the keel-laying and launching dates.

Production control dates are prepared in elaborate detail. Large passenger liners and aircraft carriers, because of their greater complexity, warrant more detailed scheduling than do freighters or tankers. One of the primary purposes of the production control system is to provide design plans and the required material so that the ship may be completed economically and on schedule.

An inboard profile drawing is divided into sections along the natural boundaries of the ship's structure, such as between bulkheads and decks. The sections are numbered and scheduled in the sequence of erection on the shipway. Based on the time between keel laying and launching, a date for the completion of erection for each structural section is developed and assigned. Then suitable intervals for issuing drawings, material receipt, layoff, fabrication. subassembly and erection are determined and scheduled dates assigned. The hull structural design department compiles a list of the plans necessary to build the steel structure of the vessel and from the section or zone schedule assigns the schedule dates for starting and finishing each. Drawings needed as references for making associated drawings should be finished before the scheduled issue dates.

The next production control stage is scheduling of the piping, ventilation, electrical wire ways, joiner work, fixed furniture, portable furniture, carpets, decoration, etc., required to outfit the vessel, and the installation of boilers, main machinery and other components in the machinery spaces. The classes of work or operations involved in each zone are determined; and the scheduled dates for starting work on the vessel are decided for each class, based on the section or zone schedule. With each starting date assigned, schedules for shop work and materials are developed. All the outfitting work must progress in proper orderly sequence. In the machinery spaces, the boilers, condensers, turbines, reduction gears, pumps, generator sets, etc., should be installed in the sequence controlled by the corresponding structural steel erection schedules.

The stern frame, each size and type valve, each deck plate, even the ship's compass is identified by a piece mark or the equivalent on the working drawings and is scheduled for installation in the vessel. In a well-operated yard, every item needed for each installation phase should be delivered to the proper space in the ship in the sequence required by the schedules. The importance of doing so cannot be overemphasized; if proper sequence is not maintained, men may be forced to stand idle while waiting for some small part to be delivered to the ship, possibly only one valve that is needed to continue a pipeline installation.

Occasionally the receipt of materials is delayed by a strike in a vendor's plant, defective castings, the owner's changes in design, etc. If the delay involves only minor components or small areas of the vessel, it may be possible to absorb the delay without changing the basic dates. Accumulation of delays seriously affecting the sequence of structural erection or outfitting would require revision of the basic dates or costly overtime to meet the delivery date of the vessel. Most ship contracts contain *force majeure* clauses, absolving the contractor from a penalty for delays beyond his control. Supervisors meet frequently to decide upon schedule adjustments and overtime work that may be necessary.

In many shipyards, each design department has a small group that prepares the requisitions used by the purchasing department for ordering materials. The requisitions give all the information needed, including the date by which each item must be received In the shipyard. The distribution of blueprints to the many departments requiring them may be decided either by the design departments or by the production control department. As there are usually at least ten times as many yard employees doing the actual fabrication and erection as there are employees in the design departments. it often pays to work overtime in the design offices to provide the most efficient working period for the structural, outfitting and machinery installation personnel.

STEPS IN CONSTRUCTING A SHIP

Contract Plans and Specifications.—The basic design of a ship may be developed by an independent consulting naval architect or by a naval architect employed by the shipyard or the owner. (See NAVAL ARCHITECTURE.) The owner decides upon the vessel's general type, its cargo and passenger capacity, speed, cruising radius, maximum draft and other requirements. The contract plans and specifications are prepared to the owner's satisfaction and must meet governmental and classification society requirements. They are then usually issued to several shipyards for bids. The shipyard calculates the expected cost of construction, checks upon the availability of ways and equipment, decides upon the earliest possible delivery date for the finished vessel, and decides upon the bidding price and guaranteed time of delivery.

Working Plans.—The successful bidder promptly proceeds with the development of the detailed working plans. This is necessary because the contract plans show only the basic design features and are used only for the guidance of the design departments. Material ordering and detailed production control studies also are started. If the lines plan, nhich defines the shape of the hull, is not included with the contract plans, it is promptly drawn by the shipyard to permit model testing of the huil form and propellers in a towing tank. If the tests are satisfactory the small-scale ($\frac{1}{4}$ in. per foot) lines plan is sent to the mold loft where the lines are "faired" full size to eliminate minor irregularities in the curved parts of the hull shape. Accurate dimensions, to the nearest $\frac{1}{16}$ in., of the final shape of the hull, called offsets, are returned to the design division and used in the preparation of the detailed working drawings and in material ordering. For a very large merchant or naval vessel, over 5,000 working detail plans are made in the shipyard design departments. This does not include the subcontractors' plans used in the production of purchased materials. Usually, as the work progresses, the owner requests minor departures from the contract plans or specifications. They are treated as "changes under the contract." The bidding cost and, if necessary, the delivery date are adjusted for each such change.

The structural steel hull design work is expedited and steel requisitions are prepared as each drawing is completed. A few weeks of structural steel and arrangement plan progress is usually necessary before a large design staff can proceed effectively with the outfitting and engineering detail working plans. Orders are placed at an early date for major components that are to be subcontracted; these include turbines, boilers, diesel engines. reduction gears, electric generators and other parts requiring a long time to produce.

Construction.—The mold loft, in which the "lines" were faired full size. is a large unobstructed area nith a wooden floor more than 100 ft. wide and several hundred feet long. It may be the second floor over one of the larger shops. Using the hull design department structural steel plans, the loftsmen make full-size templates of nearly every piece of steel that is to be used in the vessel. Templates may be $\frac{3}{16}$-in. seasoned wood or thick paperlike material not affected by humidity. The templates outline the shape. which often involves curved edges; they contain full information on the welding to be done or show the centres and sizes of all rivets to be used in the structure.

Building Ways.—At about the time that the hull steel is being laid off preparatory to keel laying, the building ways are made ready. Oak keelblocks are spaced three or four feet apart along the vessel's centre line from the bow to near the stern. The topsides of these blocks slope at the angle from horizontal (usually about $\frac{5}{8}$ in. per ft.) specified by the design division. A temporary wood or metal structure is also installed to support all of the uncurved portion of the bottom shell plating of the vessel and in some yards even the curved portions of the bottom shell plating. Later, in addition to the keelblocks, wood shores 12 in. to 15 in. in diameter are wedged into place to support the vessel. If the ship is to be built in a building dock there is no slope, as the vessel mill be floated instead of sliding sternward into the water when launched. Similar arrangements are made for a sideways launch, except that the vessel and her supporting members are horizontal before the launching.

Laying Off Steel.—When the steel is available and the mold loft work has sufficiently advanced. the templates made in the mold loft are sent to the layoff area. Workmen centre punch and mark up each plate and shape delivered from the steel storage space, using the mold loft templates. The steel is then ready for fabrication.

If several duplicate ships are to be built, but not simultaneously, the full-size templates from which the steel is to be laid off and fabricated must be stored temporarily. This requires considerable space and handling and there may be occasional damage. An optical system is in use to replace full-size templates for plates that do not have to be rolled or pressed into curved shapes. Developed from the design shown on the small-scale hull design department drawings, new larger and very accurate pencil 'drawings are made. usually to about one-tenth of the full size of the steel that is to be marked up or laid off preparatory to fabrication. The small pencil drawings are traced in ink on special tracing film nhich is then photographically reduced in size on a small glass negative. The steel plate that is to be laid off is placed horizontally below a special optical projector, just as printing paper is placed below the photographer's enlarger. Full-size light lines from the projector are visible on the steel plate. and these lines are used for laying off. The negatives involve no storage problem as they are only about 4 in. by 5 in. instead of full size.

Fabrication and Assembly.—The plate and angle shop shears, acetylene torch equipment, planers, bending rolls, presses, furnaces, drill and countersink machines and other equipment prepare the finished steel plates and shapes ready for subassembly or for erection in the ship. After fabrication. the plates and shapes, if riveted, are usually moved directly to the ship by cranes; shipwrights then adjust them in final positions and secure them by a few bolts passed through the rivet holes. When aligned into final position in relation to the adjoining structure, the plates are riveted.

Much of the steel that is to be welded instead of riveted is subassembled after fabrication. A number of adjoining pieces of steel are placed together, each accurately located in the position it is to occupy permanently in relation to the associated pieces. The pieces are then welded together to form a large unit that will fit into place in the ship. This is done in the assembly area near the building ways. The size of subassemblies is limited by the capacity of the cranes that transfer them to the ship.

Securing heavy steelnork in place overhead and then welding it together may be slow, difficult work. In many cases, much of this work can be avoided by erecting and welding the subassembly upside down. When completed. the subassembly is inverted and transferred to the ship where it is welded to the adjoining structure or to other subassemblies. Although many modern ships have some riveting, welding has largely superseded the riveting used throughout most ships built before World War II.

Keel Laying.—The first keel plate or corresponding subassembly of bottom shell plates is lowered by a crane and accurately positioned on the keelblocks. Adjoining plating promptly follows. A prominent person is often selected by the owner to drive the first rivet or start the welding that joins the plating. Speeches and newspaper publicity follow. Immediately after the ceremonies, erection work proceeds and continues until the vessel is launched. The erection sequence depends upon the type of vessel, but normally the amidship portions of the vessel are advanced more rapidly than the structure near the bow and stern. Piping within the double bottom is installed as it is erected.

When the double bottom and inner bottom plating is well advanced, the side framing and bulkheads are erected. Machinery space foundations are installed. Pillars and girders, deck plating and side shell follow. Some yards delay installing the boilers, propulsion machinery and other large, heavy equipment until after the launching. This requires large engine and boiler room casings or other openings through which to lower or move them into place on their foundations. If such equipment is available in time, it can often be installed, even though not accurately aligned into exact final position, before structures are erected in the zones through which it must pass.

Many spaces, such as the double-bottom tanks used for fuel oil, fresh water and sea-water ballast. must be tested for tightness before the vessel is launched. Any leaks or defects are then corrected. Bulkheads and tank spaces above the double bottom are also tested and corrected if necessary. Lastly, the superstructure, or deckhouses, is installed. Outfitting work such as joiner work, piping above the inner bottom, ventilation ducts and electric wiring may be started before launching, but most of the outfitting work is done later. Shortly before launching, when the hull structural steelwork is nearly completed, the propeller shafting and machinery are accurately aligned and secured. This is done at the last moment as the main hull steelwork warps and changes slightly in shape as erection progresses.

Launching. — If the harbour or river is wide, building ways are at right angles to the water; in restricted waters the ways may be at an angle of 45° or so from the mater front. As noted above, the ship usually slides stern first into the water, though a few shipyards, particularly those on the Great Lakes, have the building way parallel to the water front and launch the vessel by sliding it sideways into the water. Whether the ship is launched stern first or sideways, a launching is an impressive spectacle usually witnessed by hundreds of workmen, townspeople and guests. The sponsor christens the vessel by breaking a bottle of champagne on the bow at the instant the vessel begins to slide toward the water. To see a large liner or naval vessel, perhaps 1,000 ft. long and weighing 30,000 tons, slide down the launching ways at considerable speed is a thrill even to shipbuilders who have launched dozens of ships.

Ships constructed in a building dock are usually fully afloat when the sponsor arrives; after the christening, tugboats slowly tow the vessel to the outfitting pier.

Most building ways are inclined toward the mater with a slope of from $\frac{1}{2}$ in. to $\frac{3}{4}$ in. to the foot. Up to the time of launching the ship has been supported by keelblocks and shoring. Just before launching, the neight of the ship is transferred from the keelblocks to the launching ways down which the ship will slide to the water. The launching ways consist of two parts: ground ways and sliding ways. There are usually two ground ways placed symmetrically on either side of the keel about one-third of the breadth of the ship apart. The ground ways are large timbers extending longitudinally beneath the vessel and beyond it into the water until the ends are submerged sufficiently to provide a satisfactory buoyancy and weight balance for the ship during the launch. On the ground ways there are sliding ways that carry the weight of the ship during launching. A timber cradle transmits the weight to the sliding ways. Between the sliding and ground ways is a thick, greaselike lubricant. The launching ways are erected well before the launch, but the weight of the ship is carried on the keelblocks and shoring until the day of the launching.

During the last few hours before launching time the hull is wedged up on its cradle, releasing the pressure from the keelblocks, which are then removed. The ship is kept from sliding down the ways by various methods; one of the commonest is that of joining each of the sliding ways to the ground ways by a piece of timber or metal. At the scheduled moment these membdrs are cut away, thus freeing the vessel to slide toward the water.

When launched in a narrow river or harbour the vessel must be stopped quickly before the stern strikes the opposite bank. Commonly the vessel drags heavy weights, usually chains, along the ground until they gradually bring it to rest. The vessel is then tow-ed to the outfitting pier where divers release the launching cradle and it is pulled clear of the ship.

Outfitting. — During the outfitting period all work necessary to complete the ship is done. This includes completing the installation of the propulsion and auxiliary machinery, electric generators and the electric system and equipment, and the air-conditioning, heating and ventilating systems. Outfitting also includes joiner work, painting and plumbing, and the installation of galley equipment, furnishings, lifeboats and navigating and radio equipment. Thorough tests are conducted for such parts as the steering gear, windlass, elevators, cargo-handling gear, davits and many other items so that during the trial trip the only tests made are those that cannot be done at the pier. Shortly before the trial trip the ship is "inclined" (see NAVAL ARCHITECTURE) to check her centre of gravity and weight.

Trials. — As soon as the propulsion machinery is in operating condition it is run at low power for a few hours while the vessel is secured to the pier. This dock trial permits testing and making minor adjustments before the trial trip. Shortly before the trial trip the vessel is put in dry dock and her outside plating is painted. If the ship was outfitted while afloat in salt water, barnacles and other marine growths that have accumulated on the hull must be removed.

A few days before delivery to the owners, shipyard personnel take the ship under its own power to deep water for a trial trip. During the trial trip the ship and her equipment are thoroughly tested and inspected. The ship is operated at varying speeds, and the speed at maximum power is checked. Fuel consumption is measured, steering and backing tests are conducted, even the anchors are lowered and then raised. Trial trips may last from a few hours to a week, depending upon the type of ship. Finally, when all the unsatisfactory items noted during the trial trip have been corrected, the completed vessel is delivered to the owners.

Shortly after delivery, a large passenger liner begins her maiden voyage. She is complete with electricity, running water, telephones and a sewerage system. The luxurious air-conditioned staterooms and suites, lounge rooms, ballroom, smoking room, theatre, cocktail room, dining room, bars, shopping centre, library, children's playroom, game deck, gymnasium, swimming pool, barber shop, beauty parlor, doctor's office, printing shop and many other features justify calling such a ship a mobile city afloat.

SUBSIDIES

The wage rates that prevail in each country affect the wages paid to shipyard employees and to ship crews. Prevailing wage rates are also reflected in the cost of the locally made materials used in shipbuilding. It follows that in a country having relatively high wage rates the cost of building, maintaining and operating ships is higher than it is in a country having low wage rates. If the ships of a country uith a low wage scale earn only a normal profit, then the ships of a country with a high wage scale in the same service would operate at a loss, unless subsidized.

The amount of the subsidy varies widely and changes from time to time. In a high-wage country such as the United States the subsidy for ship construction may approach half the cost of the vessel; the operating subsidy is also high. Although not truly a subsidy, the added cost to provide for national defense features, such as abnormally high speed, may be paid for by the government.

SHIPHERD, JOHN JAY (1802–1844), U.S. home missionary, who with Philo P. Stewart founded Oberlin college, was born near Granville. N.Y., on Mar. 28, 1802. While a student at Pawlet academy (Pawlet, Vt.). young Shipherd decided to become a minister. He went to Cambridge academy (Cambridge, N.Y.) in preparation for Middlebury (Vt.) college, but he was accidentally poisoned and his health so affected that he had to leave school. After failures in the marble and whetstone industries at Vergennes, Vt., he went to live with the Rev. Josiah Hopkins at New Haven, Vt., to study with him, and after a year and a half he was ordained an evangelist by a Congregational council at Blanton, Vt., in 182;. He preached a year at Shelburn. Vt., and in 1828 became general agent for the Vermont Sabbath School union with headquarters in Middlebury. In 1830 he decided to become a home missionary and went to Cleveland, O., without an appointment.

He was appointed pastor at Elyria, O., of a congregation that had agreed to the "Plan of Union" between the Congregationalists and the Presbyterians. His ministry was not very successful. In 1832 with a former classmate from Pawlet academy, Philo P. Stewart, who had been in charge of manual labour at a Choctaw Indian mission in Mississippi until his health broke. Shipherd planned a community of pious settlers and a school combining general education and manual labour, which would be open to women as well as men. They named the community for Jean Frédéric Oberlin (1740–1826), the Alsatian philanthropist, and Shipherd'set out for New York and New England to recruit settlers and teachers and to raise money and clear title to land 9 mi. from Elyria.

On Shipherd's return in Sept. 1833, preparatory and infant departments were opened, in December the Oberlin Collegiate institute was announced, and Shipherd returned east the following spring to raise more funds. In the following autumn the first college students were enrolled, but the financial status of the school was still poor. When students at Lane seminary in Cincinnati. O., rebelled against their trustees' refusal to allow discussion of abolition. Shipherd won them over to Oberlin on the conditions that financial backing be secured from Arthur and Lewis Tappan of New York city, who had established Lane seminary, and that Charles G. Finney (1792–187j), the evangelist. whom the brothers had established in a church in the Chadwick Street theatre in New Tork city, would be brought to Oberlin to teach theology. Shipherd again went east, fulfilled the conditions, and the Lane "rebels" came to Oberlin in 1835. After two vain efforts to found similar communities and schools elsewhere, Shipherd led a group to Michigan and founded Olivet college in 1844.

Shipherd died there on Sept. 16, 1844.

SHIPKA PASS, in Bulgaria, a pass in the Balkans, celebrated as the scene of fierce fighting in the Russo-Turkish War of 1877–78. The main road from Rumelia to Bulgaria. leading from Sistova by Tirnova and Eski Zagra to Adrianople. crosses the Balkans near the village of Shipka, and this passage was of necessity an important point in the Russian plan of operations. The road does not pass between high peaks, but crosses the main ridge at the highest point; it is therefore not a pass in the ordinary sense of the word.

Near the summit, running parallel, and close to the road is a series of three ridges, about zoo ft. high, and about 2 mi. from north to south, which formed the position for a force holding the pass. It was originally held by a Turkish force of about 4.000 men with 12 guns, prepared to resist the Russian advance. On July 17 they repelled a feeble attack from the north, and the following day faced round and drove back an attack by Gourko from the south. These attacks were to have been simultaneous, but Gourko, having met with unexpected resistance, was a day late. Though so far successful, the Turks evacuated their strong position, and it was occupied by the Russians on July 19.

Suleiman Pasha, having concentrated with Reouf Pasha and driven Gourko across the Balkans at the end of July, moved to the Shipka on Aug. 21 and attacked. The Russian force there, including five battalions of Bulgarians, then numbered 5,000, but that day a regiment from Selvi brought their numbers to 7,500, and this force held the position against 30,000 Turks for three days, when heavy reinforcements arrived. The fighting continued till the morning of the 26th. when Suleiman. his troops being exhausted, and having lost 10,000 men, entrenched himself in the position he then occupied in a semicircle round the southern end of the Russian position. Having called up more battalions from Yeni Zagra. after a four days' artillery bombardment. he attacked on Sept. 17 and was repelled with a loss of approximately 3,000 men.

There was no more fighting on the Shipka till the general advance of the Russians after the fall of Plevna. Radetzky's command of about 60,000 men advanced from Gabrova on Jan. j. in three columns. Radetzky. with the central column, moved by the main road and attacked the Turks. who still faced the position on the summit, while Skobelev and Mirski. crossing by trails about 3 mi. to the west and east of the Turkish position. attacked their reserves on the far side. about Shipka and Shenova, where Vessil Pasha (who had succeeded Suleiman in command) had formed an entrenched camp.

These flank columns made their way over the mountains. deep in snow, Mirski attacked alone on Jan. 8, as Skobelev's advance had been delayed. but the following day both columns attacked, and after fierce fighting the Turks surrendered. The force on the summit had that day repulsed, with heavy loss, a frontal attack by Radetzky, but they were included in the surrender. Their numbers were 36,000, including 6.000 sick and wounded, and 93 guns. The Russian losses were j.500.

Not only were the Turkish attacks on the Shipka unsuccessful, but they were made without object. At the end of July. when Suleiman forced Gourko back over the Balkans. the moral equilibrium and the plan of operations of the Russians had been upset by the second battle of Plevna, and the Shipka ceased to have any strategical importance for the time being. Had Suleiman at that time followed up Gourko and joined Mohammed Ali, or moving round acted with Osman against the Russian flank, the evacuation of the Shipka would have been compulsory. Suleiman. knowing nothing of strategy. preferred to act independently, and his action was supported by the still more ignorant ministers at Constantinople.

The Shipka was merely a geographical point until the Russians were prepared to advance, but, fortunately for them. the Turks chose to waste an army in fighting for it throughout the critical period of the operations. Suleiman divided his forces and used up his troops in costly frontal attacks on Mt. St. Nicholas, the southern and strongest point of the position, whereas a well-supported flank attack would probably have met with success. The manner in which he sacrificed his men earned for him the name of the "Shipka butcher." (J. H. V. C.)

SHIP LANES: see SHIPPING ROUTES.

SHIPLEY, an urban district in the Shipley parliamentary division of the West Riding of Yorkshire, Eng.. 3 mi. N.N.W. of Bradford. Pop. (1951) 32,680. Area 3.4 sq.mi. Shipley is in Airedale south of the hire river and on the Leeds-Liverpool canal.

Mentioned in Domesday Book as Scipeleia, it was developed when Sir Titus Salt started his vast woolen mills (1853) and built the model village of Saltaire with its Italian-style Congregational church (1859) and the Saltaire institute (1870).

Engineering is important. but Shipley is also a residential area. The urban district (created 1894) includes Shipley, Windhill. Wrose. part of Frizinghall and Saltaire parishes.

SHIP MONEY, a tax, the levy of which by Charles I of England without the consent of parliament was one of the causes of the Great Rebellion. The Plantagenet kings of England had exercised the right of requiring the maritime towns and counties to furnish ships in time of war; and the liability was sometimes commuted for money.

Notwithstanding that several statutes had made it illegal for the crown to exact any taxes without the consent of parliament, the levying of ship money in time of war had never fallen wholly into abeyance, and in 1619 James I aroused no popular opposition by levying £40,000 of ship money on London and £8,550 on other seaport towns.

On Feb. 11, 1628. Charles I issued writs requiring £173,000 for the provision of a fleet to secure the country against French invasion and for the protection of commerce, and every county in England was assessed for payment.

This was the first occasion when the demand for ship money aroused serious opposition and Charles withdrew the writs. His determination to rule without parliament. however, led him to re-employ this financial device.

The first of six writs issued annually 1634–39 appeared in Oct. 1634 and was directed to the justices of London and other seaports, requiring them to provide a certain number of ships of war of a prescribed tonnage and equipment, or their equivalent in money, and empowering them to assess the inhabitants for payment of the tax according to their substance. The distinctive feature of the writ of 1634 mas that it was issued to provide against not a present danger but one to be apprehended. The citizens of London immediately claimed exemption under their charter, while other towns demurred to the amount of their assessment; but no resistance on constitutional grounds appears to have been offered, and a sum of £80.000 was collected, all of which, as on future occasions, was spent on the fleet.

On Aug. 4, 1635, a second writ of ship money was issued, directed on this occasion, as in the revoked writ of 1628, to the sheriffs and justices of inland as well as of maritime counties and towns, demanding the sum of £200,000, which was to be obtained by assessment on personal as well as real property, payment to be enforced by distress. This demand excited growing popular discontent, so Charles obtained a written opinion, signed by 10 out of 12 judges consulted, to the effect that in time of national danger, of which the crown was the sole judge, ship money might legally be levied on all parts of the country by writ under the great seal. Had this ruling gone unchallenged the king's prerogative would have become the sovereign power in the realm. The issue of a third writ of ship money on Oct. 9, 1636, made it evident that the ancient restrictions, which limited the levying of the impost to the maritime parts of the kingdom and to times of war or imminent national danger, had been finally swept away, and that the king intended to convert it into a permanent and general form of taxation without parliamentary sanction.

Payment was refused by Lord Saye and by John Hampden (*q.v.*), a wealthy Buckinghamshire landowner. The case against the latter (*Rex* v. *Hampden,* 3 *State Trials,* 82;) was heard before all the judges in the exchequer chamber, Hampden being defended by Oliver St. John (*q.v.*) and Robert Holborne, and lasted for six months. Seven of the 12 judges, headed by Finch: chief justice of the common pleas, gave judgment for the crown, and 5 for Hampden. In 1639 Charles issued for the last time a writ of ship money, but of £217,000 demanded, only about £50,000 was collected. In 1641, by an act of the Long Parliament, introduced by Selden, the illegality of ship money was expressly declared.

SHIPPARD, SIR SIDNEY GODOLPHIN ALEXANDER (1838–1902), British colonial administrator, was educated at King's college school and Oxford, and was called to the bar in 1867. He was attorney general of Griqualand West from 1873–7, when he was made acting recorder of the high court of Griqualand. From 1880–5 he sat as a judge of the supreme court of Cape Colony; and he was British commissioner on the Anglo-German commission in 1884–5 for settling the claims of British subjects at Angra Pequena and other parts of the southwest coast.

Shippard, while at Oxford in 1878, had discussed with Cecil Rhodes the plan of the projected British advance in south central Africa. He saw in the German annexation of Damaraland and Namaqualand the first step in a design to secure for Germany territory stretching from ocean to ocean. Consequently when after the Warren expedition of 1885 he was chosen to organize the newly acquired British possessions in Bechuanaland he saw in his appointment an opportunity for forestalling the Germans, and also the Boer adventurers who likewise sought to be beforehand with Great Britain in the countries north of the Limpopo.

At the end of 1887 he went to Grahamstown to induce the high commissioner (Sir Hercules Robinson — afterward Lord Rosmead) to sanction the conclusion of a treaty with the Matabele King Lobengula binding that ruler not to cede any territory to any other power than Great Britain. He failed, and then telegraphed to Cecil Rhodes at Kimberley to come and try the effect of his eloquence. Rhodes came. and by taking upon himself all pecuniary responsibility succeeded in obtaining the requisite sanction. The treaty was signed and British interests secured. Shippard thenceforth governed Bechuanaland with conspicuous success. He was administrator, chief magistrate and president of the Land Commission for British Bechuanaland, and resident commissioner for the Bechuanaland Protectorate and the Kalahari. He was created knight commander of the Bath in 1887. In 1896 he played an unofficial part in the negotiations between Robinson and the Johannesburg reformers after the Jameson Raid.

Shippard then returned to England, where he died on March 29, 1902.

SHIPPING, HISTORY OF. The history of shipping is much more than an aspect of economics. It is an integral part of the history of civilization. When the ship, that is, a vessel propelled by sail or oars, equipped with steering gear and capable of seagoing voyages, emerged in the remote past, the sea, hitherto a barrier to intercourse between societies, became a highway across which men traveled for the exchange of goods and ideas. The peoples which have contributed most to the development of shipping throughout history have been the island races and the inhabitants of the coastal areas of land masses. Their environment does not of itself explain this fact. The urge to maritime activity has usually arisen from the need to wrest a living from the sea, from the desire to increase material prosperity or from the quest for geographical knowledge. In the absence of these factors, peoples favourably situated for it have failed to create a thriving maritime tradition, or have done so only during certain periods of their history.

Through the ages the greatest sea powers have been those societies whose livelihood, and indeed existence, have been dependent upon the security of their sea communications, since their natural policy has been to devote the major part of the state's resources to the maintenance of strong fleets for the protection of these vital interests.

This article is divided into the following sections:

1. Ancient Shipping
2. Rome and the Trade With the East
3. The Rise of Venice
4. Northern Shipping

12. The Organization of Shipping
13. International Rivalry
14. Maritime Disasters

For a general discussion of modern sea-borne trade, ship operation, maritime lan and related topics, *see* SHIPPING INDUSTRY. The history of various types of vessels is covered in detail under SHIP.

1. Ancient Shipping. — The scenes of the greatest maritime activity in antiquity were the Mediterranean and the northern part of the Indian ocean. Shipping in the Mediterranean dates from very early times. The first organized shipping there belonged to Crete, an island excellently situated on the natural sea routes of the eastern Mediterranean. By 3500 B.C., the Cretans had built up an extensive commerce, including trade with Egypt, Syria and Greece. The decline after 1400 B.C. of Cretan power, probably following an earthquake, was accompanied by the decay of its maritime importance. The principal beneficiaries of this event were the

Phoenicians.

The Phoenicians inhabited the coastal regions of Lebanon, and they were invited by their geographical position to engage in the trade of the Mediterranean. Situated as they were at the termini of the chief routes from Asia, the Phoenician merchants were able to exploit the transit of oriental luxury goods to Greece and the west. The period of Phoenician greatness, the age of the supremacy of Tyre and Sidon, lasted approximately from 1100 to 800 B.C. Their ships were to be found all over the Mediterranean, and to protect and extend this commerce the Phoenicians established a chain of trading posts and colonies from the Levant to the Straits of Gibraltar. One of these settlements was Carthage in North Africa. As the predominance of Tyre and Sidon declined under the pressure of external foes, Carthage gradually took over the leadership of the empire and became the strongest maritime power in the Mediterranean. Carthaginian enterprise was worthy of the great traditions which it inherited. Besides controlling the Mediterranean trade, the Carthaginians attempted the circumnavigation of Africa in the 5th century B.C., and from their outpost at Cadiz they sailed to Britain and established commercial contacts with Cornwall. The extent of its interests brought Carthage into conflict with the rising power of Rome, and the era of its supremacy ended with the destruction of the city by the Roman armies in 146 B.C.

Navigation in the Red sea, the Persian gulf and the Indian ocean originated. according to some authorities, before 3000 B.C. A coasting trade between the Malabar coast of India and the Persian gulf, whence eastern products were transported by land to Tyre and Sidon and exchanged for western goods, was operating on an organized basis by 1000 B.C. Sea communication between India and the Red sea came later, and was not very frequent until the end of the 4th century B.C. when the efficient rule of the Ptolemies began in Egypt. They encouraged the trade with the east in every possible way, restoring the ancient and disused canal across the Isthmus of Suez between the Red sea and the easternmost branch of the Sile delta, with the intention of making Egypt the entrepôt between east and west and a focal point for trade between three continents.

The systematic development of traffic between the Red sea and India continued from this time onward. but it was mostly indirect. Indian ships brought the cargoes to Aden and other ports near the mouth of the Red sea, whence they mere transported by local shipping. The Indians were active at sea during this period. In addition to the trade from the west coast. there was considerable shipping between Ceylon and the Ganges and regular sailings between India and the Malay archipelago where cargoes for Europe were obtained.

2. Rome and the Trade **With** the East.—The failure of the Ptolemies to establish direct shipping between Egypt and India was not remedied by their inefficient successors. The canals and roads which had been constructed fell into disuse (see TRADE ROUTES), and not until the Mediterranean world and the near east were welded together under the authority of the Roman empire did favourable conditions exist for further development of trade with the east. The emperor Augustus supported the expansion of this commerce, and during his reign Roman subjects, usually Greeks, began to make the direct voyage between the ports of the Red sea and India, coasting all the way. The Greeks had seafaring traditions dating back to the era of Phoenician greatness and beyond. They had taken second place to the Phoenicians, but their long experience as shipowners and merchants enabled them to benefit from the stimulus to trade provided by the Pax Romana. A great impetus to the direct trade was the discovery early in the 1st century A.D. by the sea captain Hippalus of the secret of the seasonal winds of the Indian ocean. This knowledge made possible the regularization and expansion of the trade. The passage time between Egypt and India was reduced. Sailing on the southwest wind which blows from July to September, seamen no longer had to follow the coast line but could steer directly across the sea, confident that the wind would bring them to their destination. In November the northeast wind sets in and a speedy return voyage could be made on it. The significance of the discovery is underlined when it is recalled that the ancient navigator possessed no instruments apart from the lead and line and that, although the ships carried sail, they could only run before a following wind. Without information of the sort obtained by Hippalus accurate navigation out of sight of land for days was impossible. The use of the prevailing winds as a navigational aid was not in itself novel. The Cretans, Phoenicians and Greeks had employed similar methods in the Mediterranean. They were also familiar with the polestar as a guide to direction. But in the Indian ocean Europeans, at least, were until the time of Hippalus ignorant of the monsoon winds and the discovery brought their ships in increasing numbers direct to ilialabar, to the east coast of India and beyond. The result, as attested about A.D. 80–89 by the author of the *Periplus* of *the Erythraean Sea*, was a remarkable expansion in traffic between east and west.

Westbound cargoes of precious stones, silks and other luxuries were shipped from India to the headwaters of the Red sea, transported to Alexandria and there reloaded for the voyage to Italy. Exports from the west included base metals and coral! and a large balance was settled in gold and silver. This trade continued to thrive in the 2nd and 3rd centuries and began to dwindle only with the decline of Rome. As it did so, commerce tended to return to its old channels, the goods being shipped to the mouths of the Red sea and Persian gulf for transport to the Mediterranean by the Arabs.

With the expansion of Islam, the Arabs came to control the shipping of the western part of the Indian ocean, and when the Portuguese reached the eastern seas in 1498 they found the trade there monopolized by the Moslems and similar in pattern to that which had been established in the centuries following the fall of Rome.

Under the Roman empire, trade flourished in the Indian ocean, the Mediterranean and in northern waters. Its growth was accompanied by the development of legal and commercial institutions in which the Roman instinct for law and order found expression. The Roman maritime code was based upon the ancient laws and customs of the sea first formulated, according to tradition, by the inhabitants of the island of Rhodes. It regulated among other things seamen's wages, the rights of merchants, the responsibilities of shipowners relative to passengers and cargo and punishments for offenses ranging from piracy to negligence. The code also governed matters affecting contracts, charter parties and bills of lading and bears witness to the existence of a highly organized shipping industry. Its main features survived the fall of Rome. They were incorporated in the laws of Oléron, n·hich provided the foundations of English maritime law, the sea laws of Visby (Wisby) and the Hanseatic ordinances of 1614 and 1681, and constituted the basis of modern maritime law.

3. The Rise of Venice.—After the collapse of the Roman empire in the west, the Mediterranean continued to be a great artery of commerce. The Byzantine empire, the capital of which was Constantinople. maintained the commercial traditions of Rome. Constantinople became the centre for the redistribution of eastern luxuries which arrived there by the Black sea and the land routes; and Byzantine merchantmen traded with the barbarian states of the west. The continuity with classical times was broken by the Islamic conquests of the 7th and 8th centuries. Commerce in the western Mediterranean was completely disrupted. Only in the Adriatic and Aegean seas did trade survive. Out of this wreckage emerged the maritime preponderance of Venice.

The Venetians, who lived on the islets of the lagoon at the head of the Adriatic, were dependent upon fishing and maritime trade for their existence since they possessed no land fit for cultivation. Content at first with the primitive exchange of necessities with their mainland neighbours, their interests and their shipping expanded without interruption. Profiting from their political connections with Constantinople, they obtained a share in the carrying trade upon which the supply of the flourishing cities of Byzantium depended, and by the 10th century they possessed trading posts from the Adriatic to the Bosporus. Their interests were further increased by the crusades, as a result of which the Venetians gained admission to the cities of the Levant where east and west met.

They excluded the Byzantines from the trade and won a monopoly (disputed only by the shipowners of Genoa and Pisa) over the shipment of spices to Italy for distribution throughout western Europe.

The Mediterranean was once more a great centre of shipping, over which Venice predominated. The Venetians practised the most highly developed commercial techniques, including marine insurance, and the organization of their merchant fleets which were partly state-owned was carefully regulated in the interests of safety and efficiency. By the possession of the strategic points they controlled the trade routes between the Levant and Italy and their predominance in the eastern Mediterranean was not effectively challenged until the late 15th century by the onslaught of the Ottoman Turks. The reduced importance of the Mediterranean trade in consequence of the discovery of the ocean routes also contributed to the decline of Venice; but the disappearance of its greatness was nevertheless a slow process.

4. Northern Shipping. — Information about. northern shipping in ancient times is slight. The exchange of commodities between the British Isles and the continent was common by 2000 B.C. The Frisians participated from an early date in a coasting trade along the shores of the North sea which persisted until the 9th century. The first great seafarers of the north were the Scandinavians. Their maritime activity originated in the 7th century in the search ior loot. and the destructive aspect of their expansion carried them to the British Isles and to the coastal regions of northwest Europe. Pillage may have been their initial inspiration, but they were also traders and explorers. In the 9th and 10th centuries their trade acquired considerable proportions. Goods from Russia, which had been opened up by the expansion southeastward from Sweden, were shipped across the Baltic to Gotland. From this island they were transported in the long open ships of the Norse to southern Denmark and to the harbours of the North sea. This same period saw the establishment of the Scandinavian settlements in the Faeroes, Iceland and Greenland. Their great knowledge of the North Atlantic enabled them to make regular voyages in the ocean and even to reach America, where a short-lived colony was established.

From about 1100 the Scandinavian mastery over the Baltic and the commerce between Russia and the west was disputed and eventually ended by the penetration to the Baltic region of the Germans. During the 12th and 13th centuries the Germans colonized the area east of the Elbe and founded the great ports on the Baltic coast from Liibeck to Riga, In 1160 they seized Gotland. Led by Liibeck. the new towns formed a maritime confederation known as the Hanseatic league (*q.v.*). The Low Country ports joined it. The Scandinavians could not compete with the superior wealth and organization of the Germans. The Hanseatic sailing ships with their greater tonnage capacity supplanted those of the northmen. Laden with timber, hemp, honey and wax from Russia and with corn from the Baltic provinces they navigated the Baltic and sailed through the Sound to discharge their cargoes in the Low Countries. France and England. The Hanseatic merchants also controlled the distribution of the commercially important Baltic herring throughout northern Europe. The return cargoes included Biscay salt, wine and cloth. Wherever they traded. they established agencies for the conduct of business, extending from Novgorod to London. Their operations anticipated the monopoly later exercised by the Dutch over the carrying trade of the north; indeed competition from the Hollanders contributed to the decline of the Hansa in the 1jth century and led. together with other factors. to its eventual eclipse.

5. Developments in Ship Design and Navigation.——Between the 13th and 1jth centuries ships became more seaworthy and there were important developments in the science of navigation. From ancient times there had been two types of ship: the galley and the sailing ship. The galley was in the main a warship. It was a swift and maneuverable vessel driven by oars. This made it independent of the wind. but its radius of action was limited by the endurance of the oarsmen, and, though employed in the merchant fleets of Venice, it was not very suitable as a merchantship because of lack of stowage for cargo and supplies. Moreover, it was not built for voyages in a rough sea. Traditionally the merchant vessel was a sailing ship. For centuries there had been little improvement in its design. It usually carried only one mast and sail, was dependent upon a following wind and was slow and clumsy. During the period in question the sailing qualities and sea-keeping capacities of ships were improved by the perfection of the stern post rudder which gave much greater control over the ship than did the traditional steering oar or oars, and by improvements and additions to the sail, masts and rigging. By the 14th century the three-masted sailing ship had been developed in the Mediterranean and was soon taken up all over Europe. Over the same period the chart and compass came into general use. Crude charts probably existed in the 9th century, but the art of chart making was the great skill of the cartographers of Venice and Genoa whose portolano charts with their accurately delineated coast lines were regularly used by the Mediterranean navigators. The use of the compass by Europeans also originated in the Mediterranean. The compass was transmitted to the Italians from the Chinese, who were active at sea between the 10th and 12th centuries: through the medium of the Arabs. The mathematical knowledge indispensable for the development of astronavigation was liken-ise obtained from the Arabs by the Italian maritime experts. The invention of the cross-staff in 1342, though it did not come into general use until much later: enabled the navigator to measure the altitude of the polestar and thus determine his latitude. There were still great deficiencies.

No method existed for the calculation of longitude; it was not known how to assess compass variation; and there was no means of estimating accurately the speed of the ship. Deep-sea navigation was therefore subject to great errors. but the progress registered was significant. All these improvements taken together were a great stimulus to shipping. Before their introduction European seamen. the Norse excepted, made only coastal voyages and short sea passages. Maritime activity centred around the landlocked Mediterranean and Baltic, and the Atlantic coasts. The Italians rarely passed beyond the.Straits of Gibraltar and northern mariners seldom went farther south than the Bay of Biscay. Soon a more enterprising spirit was evident. Sailing ships and even galleys began to make the direct voyage to England and the Low Countries from the Mediterranean. Nevertheless the essential patterns of European trade tended to remain static. Maritime predominance was transferred from one possessor to another. Venice had won the monopoly over trade in the eastern Mediterranean from Byzantium; the Hansa had eliminated the Scandinavians and was in the 15th century being undermined itself by the Hollanders. Longer voyages were being made. but the traditional trade routes were unchanged. The revolutionary happening was the conquest of the ocean by the Iberian seamen.

6. Oceanic Exploration. — Thepioneers of oceanic exploration were the Portuguese. The Portuguese were influenced by two maritime traditions. Their commercial connections with Italy introduced them to the scientific knowledge of the Italians. Their geographical position brought them face to face with the mystery of the Xtlantic and familiarized them with the problems of sailing there. The fusion of these elements produced a school of navigators equipped with Mediterranean geographical and navigational knowledge and schooled in the traditions of Atlantic seamanship. Under the guidance of Prince Henry the Navigator the systematic exploration of the African coast and of the Xtlantic islands began in 1418. Progress was slow. The adverse winds and currents encountered in African coastal waters drove the pioneers out to sea to obtain knowledge of the Atlantic wind systems. The problem of ascertaining latitude in regions where the polestar was no longer visible had to be solved. The design of ships had to be adapted to the needs of the explorers, hence the evolution of the swift and maneuverable caravel.

In 1488 the Cape of Good Hope was rounded. The climax of the Portuguese effort came in 1498 when Vasco da Gama reached India. The superiority of European ships and weapons over those of the Moslems in the Indian ocean soon became apparent. Portuguese predominance was established between the western boundary of the ocean and Malabar, and naval bases were set up at the strategic points. The next step was to wrest from the Moslems the control of the routes across the Bay of Bengal leading to the far east. To this end Malacca was seized in 1511. Within a short time, a direct trade with China was begun and a foothold was obtained in the Moluccas, the Spice Islands'. The rapid expansion in the eastern seas resulted in the establishment of a Portuguese monopoly over the shipment of spices and other oriental goods to Europe by the ocean route.

During the 1jth century there was much speculation among nautical experts as to the possibility of reaching Asia by sailing due west from Europe. All were agreed that the world was a sphere. What was disputed was the claim that the distance to be covered was nithin the limits of the endurance of ships and crews In 1492 the rulers of Spain authorized Christopher Columbus to attempt such a voyage. The result of this enterprise was the discovery of the West Indies and then of the American mainland. In 1j13 the Spaniards crossed the Isthmus of Panamá and reached the Pacific.

The relationship of the new continent to Asia was unknown until 1522, when Magellan's ship returned from the first voyage of circumnavigation The conquest of the Atlantic was followed by the establishment of a regular trade between Spain and its dependencies in the new world. This trade was carefully regulated by the cronn. From the middle of the 16th century, two fleets sailed annually from Seville, one for the Spanish blain and one for the Gulf of Mexico, to supply the colonists with European manufactures and African slaves. They loaded their return cargo of tropical produce and bullion during the winter and recrossed the Atlantic accompanied by an escort of narships in the spring. There was no direct trade between Spain and the far east. Spain tapped Asia through its settlement at Manila in the Philippines. whence the cargoes were shipped across the North Pacific to Mexico and transported by land to the Atlantic seaboard for shipment in the annual fleet.

The two Iberian powers claimed an exclusive monopoly over the trades opened up by their explorers. The enforcement of this monopoly depended upon their ability to control the sea communications in the face of attempts by interlopers to enter the trades. The ocean thus became a source of international rivalry.

7. The Rise of the Northern Maritime Powers.—Before the mid-16th century. English maritime enterprise was limited by the Venetian and Hanseatic monopolies. by the poor sailing qualities of the ships and by the ignorance of scientific methods of navigation. English trade was considerable. but most of it was conducted in foreign vessels. The medieval kings, though not indifferent to economic affairs. did little to encourage native shipping. their principal interest in commerce being to obtain a fiscal revenue from the duties paid by foreign merchants. The first navigation law for the increase of English shipping was enacted in the reign of Richard II. but foreign competition mas not thereby effectively checked. In any case, English merchants were primarily interested in the export of cloth and as long as the European markets provided a sufficient outlet for the industry, there was little incentive for oceanic exploration. The exception to the general indifference was the attitude of the west country merchants, whose commercial links with Spain and interest in the fisheries gave them an Atlantic outlook. The men of Bristol sponsored the voyages of John and Sebastian Cabot between 1497 and 1509 in search of an oceanic route to Asia across the northern latitudes of the Atlantic. The chief results of these voyages were the development of the Newfoundland fishery, a matter of some consequence since it gave English mariners experience in oceanic seamanship, and the emergence of the idea that it was possible to sail directly from the Atlantic to the Pacific by a passage situated to the north of America.

After 1576 a series of voyages was undertaken in search of this northwest passage. But the voyages of the Cabots aroused little immediate enthusiasm on a national scale Henry VII and Henry VIII, however. encouraged maritime expansion, provided that Englishmen did not enter those areas over which the Spaniards and Portuguese claimed jurisdiction. They also curbed the privileges of the Hansa and favoured the growth of English shipping. By 1550 a new outlook existed. Merchants and politicians recognized that the cloth industry needed new markets and they wanted direct access to the sources of luxury goods and precious metals. The intellectual background had also been prepared Geographical knowledge was more nidely diffused and the study of scientific methods of navigation was gaining ground. English ships began to appear regularly for the first time in the Mediterranean and off the Barbary and Guinea coasts John Hawkins attempted to trade directly with the Spanish colonists. offering for sale slaves which he had obtained in West Africa. The route to Archangel around the North cape was discovered and an important trade with Russia inaugurated.

Drake's voyage of circumnavigation (1577–80) opened the Indian ocean to the English by demonstrating the weakness by European standards of Portuguese seapouer there. This gronth of overseas trade the bulk of which was carried on by the chartered companies—the Muscovy, Levant. East India companies and others—was the first stage in the expansion of English shipping. It was accompanied by the rise of a naval tradition associated with the victory over the Spanish Armada in 1588, and was followed by the first successful plantation of settlements in North America and the West Indies in the early years of the 17th century. It remained to be seen, however, whether these modest beginnings could be consolidated

The English were not alone in developing an interest in overseas trade. The French Atlantic coast mas also a gateway to the ocean. The hardy seafarers of Brittany and Normandy were fishing in the north Atlantic in the early 16th century; by 1520 they were privateering in the Caribbean. The French crown encouraged maritime enterprise, but the promising developments under Francis I were arrested by the outbreak of religious civil war in 1559 French traders and fishermen continued their activity in the Mediterranean and Atlantic, but France was put out of the race for colonial and maritime predominance for 50 years.

It was otherwise with the Dutch. The shipping of the Netherlands like that of England had been restricted by the Hanseatic monopoly The development of the North sea herring fisher? in the 15th century stimulated native shipping in the ports of the northern Netherlands particularly at Amsterdam The shipping interest there soon sought other employment for its ships and crews. During the 1jth century ships from the Netherlands entered the Baltic and successfully challenged the Hansa The Dutch owed this success to the greater tonnage capacity of their ships and to their geographical position. The Netherlands were situated at the point where the north-south trade routes converged and at the mouths of important inland waterways which gave an outlet to the trade of the continent. The nar of independence from Spain during the 16th century fostered an aggressive economic nationalism in the nascent Dutch republic. Territorially the republic was small, but from its maritime resources it derived a power and influence which enabled it to resist Spain and to pursue a policy of commercial expansion

Increasingly self-confident. the Dutch rounded the Cape of Good Hope in 1595, entered the East Indies, succeeded by 1658 in expelling the Portuguese from the Spice Islands. Malacca and Ceylon and supplanted them as the carriers of spices to Europe, in addition to deriving vast profits from the control they exercised over trade between Asiatic ports. They crossed the Atlantic ,and founded colonies in the Caribbean and North and South America. These territorial acquisitions were made mith an eye to commerce. Dutch shipping soon predominated in an extensive carrying trade between Europe and the Spanish. French and English settlements across the Atlantic. In Europe they made thernselves indispensable as the principal carrier to states such as Russia and Sweden which did not possess sufficient ships for their commerce, and the Dutch flag was evident from the Baltic to the Levant. This supremacy m s based upon the technical superiority of their merchantmen. Dutch ships combined maximum cargo capacity and exceptional sailing qualities with low freight costs; owing to the incorporation in their design of devices which made possible small crews and reduced time on voyage. It also owed much to careful organization.

Amsterdam, the chief port of the republic and the supplanter of Antwerp as the depot for the distribution of spices in northern Europe, was a great financial centre and the home of the most efficient commercial methods. In the first half of the 17th century, Dutch merchantmen and fishing vessels numbered over 6.000. This period was the golden age of the Dutch shipping industry.

8. Anglo-Dutch Rivalry. — In comparison with the Dutch, English shipping made little progress between 1600 and 1650. Because of Dutch competition the English East India company failed to establish itself in the Spice Islands and had instead developed a trade with India. The Baltic trade upon which depended the supply of shipbuilding materials was largely in the hands of the Dutch. Trade to and from the plantations in America was often carried by Dutch instead of English ships. After 1650 a rapid expansion of the English mercantile marine took place, and possibilities inherent in the Elizabethan enterprises were realized. The merchant fleet is reckoned to have doubled itself. between 1660 and 1658 and at the end of the century numbered 3.381 seagoing ships with a total estimated tonnage of 293,703. The size of vessels remained small. Probably more than a quarter were of less than 200 tons; few were more than 400. Those employed in the American and West Indies trades, including those which called at West Africa to collect slaves, probably ranged from 200 to 300 tons. The big East Indiamen of 600 tons and more were the exception. The governments of the day promoted the increase of commerce and shipping by a protectionist policy which was given concrete expression in the navigation laws of 1651 and 1660, and by the construction of powerful fleets to secure the trade routes.

Anglo-Dutch rivalry came to a head in three hard-fought and indecisive maritime wars beween 1652 and 1674. After 1674, however, the Dutch were involved in a series of continental wars with France which overtaxed the resources of the state, with a consequent decline in its naval strength. Although they retained most of their colonies and an extensive overseas trade: they lost the initiative in maritime affairs and were no longer counted as a great seapower.

9. The Establishment of British Predominance. — The 18th century was a period of uninterrupted expansion for British shipping. In 1699 its tonnage was 293,703; in 1750, 609,798; in 1792, 1,540,000; in 1814, 2.616.000. It was also a period of endemic maritime war with France and Spain. For over a century the French had been striving to recover the ground lost during the civil wars. Richelieu. Colbert and their successors nurtured a colonial empire in Canada and the West Indies, and founded companies for the development of West Indian, Mediterranean and eastern commerce. But a large French merchant fleet did not materialize. Trade with the Levant, which employed about 800 ships annually, flourished. The West Indian trade at its peak employed about 500; but the French East India company never really flourished. Moreover, the carriage of a large part of French overseas trade remained in the hands of foreign shipowners. The inadequacy of French maritime resources and the country's extensive continental commitments handicapped French statesmen in their efforts to create a navy sufficiently powerful to win the dominion of the seas and secure the colonies. Canada was lost in 1759. The French merchant marine suffered heavy losses in wartime. and the colonial trade survived only under cover of the neutral flag. Dutch and Scandinavian shipping interests built up an extensive carrying trade in the mid-18th century between Europe and the French and Spanish colonies; but neutral shipping was severely curtailed during the Napoleonic Wars when Britain exercised an almost absolute dominion over the sea and strictly limited the employment by France of neutral bottoms. The failure of the French challenge left Britain predominant at sea.

When considering the employment of British shipping. the great transoceanic trades spring first to mind. The East India company's fleet numbered about 100. including some ships of 1,200 tons. the largest contemporary British merchantmen. They sailed to and from London. Those bound for India cleared the Thames one year and returned the next. The round voyage to China and back, an increasingly important aspect of the company's commercial activities as tea drinking increased, might occupy three years. The East Indiamen used the Cape of Good Hope route and their outward and homeward sailings were timed so that they could cross the Indian ocean on the monsoons. There was also the flourishing West Indies trade which supplied Great Britain with coffee. sugar and rum. much of it for re-export to Europe. and provided a market for British manufactured goods. The ships employed in this branch of overseas trade were of 200 to 500 tons, and they made one round trip a year, clearing from London, Bristol or Liverpool in the autumn and returning in the following spring. Before 1808, when the slavery act of 1807 came into force and slavery under the British flag was prohibited, many ships engaged in this trade visited the Guinea coast of Africa on the outward voyage to collect a cargo of Negro slaves.

Traffic with North America also gave employment to British ships. After the establishment of the independence of the United States in 1783, the British shipowners met with competition from the Americans in this trade and, in time of war especially. American vessels tended to predominate. Transatlantic traffic also included progressively expanding trades with Newfoundland and Canada, in both of which, as in trade with the United States: Liverpool was prominent. These long-distance trades, important though they were to the national economy, by no means account for the total employment of British tonnage. The Baltic and Mediterranean trades, even a-hen allowance has been made for the fact that foreign ships were permitted to share in them, probably employed as many British ships as did the long-distance trades, including vessels of 300 tons and more. Finally there were the coastal trades. Among these the coal trade between the Tyne and London in which some 500 vessels with an average size of 220 tons were engaged was rated high in the national interests, not only for its economic importance but as a nursery for seamen and as a pool of recruits for the Royal Navy. To complete the picture, and to prevent over-simplification, reference must be made to the numerous cross trades, including those between North America and the West Indies, Newfoundland and the Iberian peninsula, and to the existence of a considerable carrying trade between foreign ports.

The growth of British shipping coincided with changes in the structural organization of commerce. One such change in the 18th century was the decline of the old chartered companies. By 1800 the monopolization of a trade by one of these companies was exceptional; in fact, the East India company's monopoly over trade with the east which lasted until 1813 survived longer than any of the others. The chartered companies had been of great service in the establishment of overseas commerce when corporate trading had provided some degree of security for merchants. The regularization of the channels of trade and the support provided by British diplomatic representatives abroad reduced the need for the companies and they gradually fell into disuse. Commerce was conducted by small firms and partnerships. Another change which took place over the same period was a growing differentiation between merchants and shipowners.

In the early years of the 18th century merchants were often the owners or part owners of the ships in which their goods were carried; in its closing years shipowning was a business distinct from trading, a fact which the General Shipowners' society, founded in 1788, was at pains to emphasize. The interest of the shipowners was the carriage of other people's goods. In this increasingly complex and expanding world of shipping, subject as it was to the dangers produced by mar quite apart from those inherent in the normal navigational hazards, a stable marine insurance market was an essential element. This was provided in the 18th century by the underwriters who operated at Lloyd's and other London coffeehouses and, to a lesser degree, by provincial underwriters. The contribution made by the growth of sound insurance to the development of British shipping can hardly be exaggerated. A comparison between the dislocation and loss of confidence which resulted from an enemy swoop upon the Smyrna convoy in 1693 and the ability of shipping and commerce to withstand the strain of the Napoleonic Wars, and even to increase in spite of the heightened risks, is a measure of the significance of reliable marine insurance.

The regularity of ocean voyages also reflected the progress made in navigation since the 15th century. In 1731 the cross-staff and its successor the astrolabe were superseded by the sextant, the invention of John Hadley. which reduced the errors in astronomical readings resulting from the motion of the ship. The problem of assessing variation had also been overcome. The determination of longitude at sea was not practicable until the 18th century. The lunar method was known, but its application was prevented by the inaccuracy of instruments and it could not be employed until after the invention of the sextant. A simpler method depended upon the possession of an accurate clock. In 1735 John Harrison made a chronometer of great reliability and its successful employment by Capt. James Cook on his second voyage of discovery (1772–75) demonstrated finally the conquest of this problem. Over the centuries a great body of information relative to winds, currents and coast lines had also been built up. This information was incorporated in reliable charts and sailing directions which were more generally available than hitherto. The extent to which these more certain methods of navigation were employed by merchant marine skippers is difficult to measure. No provision as yet existed for examining the competence of the masters and officers, and it is probable that many of them were dependent upon rule of thumb methods and experience. The incidence of shipwreck was high. The government took some steps to supervise shipping, establishing, for instance, in 1787, a compulsory register; but not until 1850 did it accept any responsibility for the competence and discipline of the merchant service.

10. The Last Days of Sail.—The history of shipping in the 19th century is dominated by the transition from sail to steam and from wood to iron. Yet it was in some respects the age of the sailing ship's greatest achievements. There was little advance in ship design during the 18th century, but in the 19th century British and American ship designers were driven to experiment boldly when faced by the stimulus of Anglo-American rivalry and the challenge of steam. The American shipping industry had been nurtured in the New England states during colonial days! and it grew to maturity in the 18th century when the trade with the West Indies had flourished. The establishment of independence denied American ships legal entrance to the British West Indies under the terms of the navigation acts; but American shipping was sufficiently virile to flourish in other branches of commerce and an extensive trade with Europe was built up. It suffered as did all neutral shipping after 1793, and was further damaged by the War of 1812. By 1815, the total United States tonnage was half that of Britain. In ship design the Americans were ahead. British merchantmen were constructed with an eye to cargo capacity. Their beam was excessive in proportion to their length, and speed was sacrificed. As long as British supremacy was assured, there was little stimulus to change.

But during the war. the Americans developed fast sailing brigs and schooners, and after 1815 enterprising companies like the Black Ball line instituted regular packet services between American ports and Britain. They established a monopoly over the transatlantic passenger and mail services which was not seriously disputed by the British until 1838. The emigrant traffic also fell in great measure under the control of American shipowners. American tonnage increased rapidly in the first half of the 19th century. By 1850 it was, if lake and river craft are included, about 750,000 tons less than the British; by 1861, 250,000 tons less. The United States challenge must not be judged solely in terms of figures.

With vast quantities of softwood at their disposal American shipbuilders turned out cheaper and faster vessels than the British. and their designers continued to experiment. Their greatest achievement was the design of the Californian clipper. The discovery of gold in California in 1848 was followed by a great demand for passages from the Atlantic to the Pacific coast around Cape Horn. The clippers were built to meet this demand. They combined strength with speed and in all-round performance were superior to all contemporary sailing ships. The creation of these vessels occurred when a strong body of British political opinion favoured, for a variety of reasons, the repeal of the navigation acts. Despite opposition from sections of the shipping interests, repeal came in 1849. British shipping was thus exposed to foreign competition in the previously protected trades. Among those now thrown open was the China tea trade. The American clippers invaded it. In 1850 the "Oriental" was chartered at Hong Kong to carry tea to London. The passage was completed in the record time of 97 days. The spur of competition such as this stimulated the design in Great Britain of ships which could match the Americans. The result was the construction of the Blackwall frigates and the China clippers. In 1856 the "Lord of the Isles" beat two American clippers in the race from China to London. This ship was built of iron. Iron had still to win general acceptance as a shipbuilding material. Most of the British tea clippers in the 1850s and 1860s were wooden ships or else were of composite build. Composite ships were iron-framed and planked with wood. They could stow more cargo than wood-built ships and were fast sailers. The timber used was hardwood. This preserved the tea cargoes better than did softwood, thus giving the British clippers a distinct advantage over the Americans.

In 1861 the American Civil War began. American shipping was disrupted. After the war, American capital and energies were poured out into the westward expansion across the continent. The tonnage of the United States declined as a result. Another contributory factor to this decline was the general transition in the same period to iron-built ships. The American iron industry was not yet sufficiently developed to enable a major building program to be undertaken. Meanwhile, for two decades British clippers such as the "Thermopylae" and the "Cutty Sark" continued to demonstrate their sailing qualities in the China and Australia trades; but the era of the sailing ship was approaching its end. Already the steamship could undertake long voyages at an economic rate. Its employment in the tea trade was postponed by the belief that tea transported in a steamship would be tainted. In 1863 the steamer "Robert Lowe" delivered a cargo of tea in good condition at London. After 1880 most of the China clippers were transferred to other trades. The sailing ship held its own on'the Australian and New Zealand runs until the last decade of the century; it still engaged in some trades until the early years of the 20th century.

11. The Great Transition.—The construction of the steam engine was the starting point of the transition from sail to steam. Before the end of the 18th century the use of the steam engine to drive ships was recognized as possible in Britain. France and the United States. The experiments of William Symington led to the building of the "Charlotte Dundas." a steam paddle tug which was in service on the Clyde in 1802. Another British pioneer, Henry Bell, produced in 1812 the first successful passenger steamer built in Europe, the "Comet." The American Robert Fulton constructed the "Clermont" which began a regular service between New York and Albany in 1807. The next step was a transatlantic voyage. In 1819 the "Savannah" crossed from west to east in 29 days. This voyage can hardly be rated as a steamship crossing, since the "Savannah" was a sailing ship equipped with auxiliary engines for use when the wind failed. She was only under steam for about 85 hours. Four British steamships crossed in 1838, the most famous, the "Great Western," taking only 15 days between Bristol and New York. This achievement was followed next year by the foundation of the British and North American Royal Mail Steam Packet company (now the Cunard line) which began a regular mail and passenger service between Liverpool and North America in 1840. The paddle steamers of the Royal Mail company broke the monopoly of the American packet service in the Atlantic. The ensuing rivalry between Samuel Cunard and E. K. Collins of New York for the mail contract ended in victory for Cunard by 1855. The success of steamships in the Atlantic led to the establishment of other companies for the carriage of mail and passengers. In these specialized services. the sailing ship was steadily eclipsed. As a carrier of cargo in the long-distance trades, the steamship had yet to prove itself. Its heavy consumption of coal entailed expensive running costs. The shortage of coaling stations excluded it from certain routes. The success of the steamship was assured by three technical developments: the use of iron as the chief shipbuilding material; the invention of the

screw propellor; and the perfection of the compound engine. The tonnage capacity of iron ships was much greater than that of the largest wooden ship which could be built. I. K. Brunel's "Great Eastern" of 18.914 tons launched in 1858 may have been a commercial failure, but the construction by the great engineer of this vessel justified the claims of iron to be considered the best shipbuilding material. While the "Great Eastern" was on the stocks. the compound engine was perfected. This cut the consumption of coal. In 1866 the Holt brothers of Liverpool experimented with an iron-built vessel fitted with compound engines and a screw propellor on a voyage to China. The voyage, a technical and commercial success, ensured the ultimate triumph of the steamship as an ocean cargo carrier.

The opening of the Suez canal in 1869 clinched the issue. The canal and the Red sea were unsuitable for sailing vessels. The use of this route by steamships gave them an immense advantape over the clippers. With the establishment of coaling stations along the route, the steamship had no rival. From this time onward. a series of rapid developments—the transition from iron to steel, the adoption of twin screws. the introduction of the triple expansion engine. the replacement of coal by oil and other technical advances—combined to make maritime transport quicker. safer and cheaper than at any other period in history. The triumph of steam coincided with a remarkable growth of British tonnage. In 1880 the mercantile marine of the British empire exceeded the total tonnage of all foreign merchant fleets. Its steam tonnage of 2,949,282 tons was more than double that of the rest of the world. This pre-eminence was due directly to the technical revolution. Great Britain's coal resources and the highly developed state of the iron industry enabled it to take immediate advantage of the changes and to outstrip all other countries. World trade generally was expanding, and the British tonnage found full employment in an extensive carrying trade. British ships predominated the world over.

12. The Organization of Shipping. — The transition to steam and the building of larger ships caused changes in the structure of the shipping industry. Tramp steamers, that is. vessels which have no regular itinerary but which can be chartered for a definite period for a voyage or series of voyages. continued to be owned by small partnerships or by individuals. Modern tramps may be owned by a large company: however. since no costly organization is required, the small shipowning business still has a place where tramp steamers are concerned. The most important international centre for the transaction of business relative to the chartering of tramps is the Baltic Mercantile and Shipping Exchange. Ltd. (the Baltic) in London, founded in 1883. It derived its name from the Baltic coffeehouse where such business had been previously transacted, though in a much simpler form. The agreements between owners and charterers are arranged by shiphrokers.

The steamship led to the introduction of liner services. Liners differ from tramps in that they provide a regular service between fixed ports in accordance with an advertised timetahle, a thing that was impossible during the days of sail. To maintain this regularity, a complex and expensive organization is necessary. Many of the famous modern liner companies originated in the 19th century as small concerns which specialized in the carriage of mail. They have tended to increase in size, to unite with one another, and to pool their financial interests by the exchange of shares. Their interests too are much wider. Intense competition between rival liner companies resulted in the development of the conference system. In effect. this was an agreement between lines operating the same services. whether for passengers or cargoes. to standardize their tariffs for an agreed period and to offer deferred rebates to regular shippers on condition that they did not use vessels belonging to companies outside the conference lines. This system has been frequently attacked by shippers, and has been investigated by the governments of Great Britain and the United States. It was. and is. defended on the grounds that the provision of regular services involves costly overheads and that the lines are therefore entitled to a measure of protection from casual interlopers.

One of the best-known conferences is the North Atlantic Passenger conference which regulates the fares and services on the transatlantic routes. Modern competition from air travel gives a new significance to this method for the protection of common interests of the passenger liner companies. A specialized type of vessel. neither liner nor tramp, is the tanker which is designed to carry liquid cargoes. generally oil. in bulk. Between 1914 and 1939. tanker tonnage rose from 1,500,000 tons to 16.000.000 tons. because of the increased demand for oil as a ship fuel and for industrial purposes. Many tankers are owned by the oil companies themselves. Others are of the tramp type. They offer their services for the carriage of liquids wherever required, and are usually owned by Norwegians. During the war tanker tonnage rose again. In view of the importance of fuel oil. the part played by the tanker in world economy is likely to increase further in the future.

13. International Rivalry. — During the first decade of the 20th century, the British shipping industry began to feel the effects of competition from foreign liners and tramps. The Scandinavians, particularly the Norwegians, became keen competitors for the general carrying trade German. French. Italian. Dutch and American liners. many of them subsidized by their governments,

started to compete with British liner companies on all the chief routes. Nevertheless, by 1914 the British flag covered nearly half the world's total tonnage; and more than half the world's maritime trade, including a third of that between foreign countries. was carried by the British merchant fleet. its greatest rival in terms of tonnage was the German marine. The United States came next; the Japanese merchant fleet mas rising rapidly. Shipbuilding was not the only form of competition. Many nations excluded foreign ships from their coasting trades, and extended the prohibition to trades between one possession and another, even those separated by miles of ocean. The United States, for instance, reserved the trade between New York and San Francisco, ,Calif., which after 1914 passed through the Panama canal, to its own ships. and applied the same rule to trade between New Tork and Honolulu, T.H.

The diversion of large numbers of British merchantmen to war duties and the losses sustained by belligerent and neutral merchant fleets caused a general scarcity of tonnage during World War I. This situation created a favourable opportunity for neutral states to expand their merchant navies with the intention of making themselves self-sufficient in the matter of sea-borne trade. The British and U.S. need for tonnage between 1914 and 1918 resulted in a great program of shipbuilding by them. After the war. it was found, especially as international trade tended to contract, that world tonnage was in excess of world needs. Shipping everywhere suffered a serious depression. By 1922 about 11,000,000 tons were idle for want of employment. The depression hit both liners and tramps. In Great Britain. the tendency toward the amalgamation of different liner companies was accelerated; other countries subsidized their lines heavily to keep them in operation. Tramp shipping suffered heavily. State subsidies to enable merchantships to compete economically in the struggle for freights became the fashion. The British government had to fall into line. In 1935, after many small firms had been compelled to close, the British Shipping act was passed. This authorized the payment of a subsidy to tramp steamers for every voyage undertaken below a standardized freight rate. Shortly afterward, world trade began to expand. and the subsidy was no longer necessary. The situation was changed by the outbreak of World War II in 1939. The demands which it made upon shipping were enormous. British shipping was requisitioned in 1940, and charter agreements were made with Allied governments.

The entrance of the United States into World War II was followed by a colossal building program there. At the end of hostilities, the American marine was the largest in the world. During the war, the employment of Allied shipping was controlled successively by the Combined Shipping Adjustment board and the United Maritime authority. The United Maritime Consultative council was established in March 1946 for the voluntary pooling of shipping for relief work over a limited period. Meanwhile those maritime nations whose shipping had been depleted between 1939 and 1945 began. by building and purchase, the restoration of their merchant fleets. Shipping losses in World Wars I and II are shown in Tables I. II and III.

14. Maritime Disasters. — In the last 100 years maritime travel has become much safer. Improvements in ship design and the introduction of radio and radar navigational aids have contributed to this fact. With the support of marine insurance companies. persistent efforts have been made to enforce certain regulations. such as Plimsoll's compulsory load line. The international adoption of safety devices and of minimum standards of seaworthiness for vessels has been the subject of discussion between the principal maritime nations at conferences such as that held in London in 1948. At both the national and international level, safety at sea has become the business of the governments of the maritime powers. Disasters which occur are investigated carefully and recommendations are made on the basis of the lessons learned therefrom. Collision, fire and grounding have been, and continue to be, responsible for the majority of steamship losses (see Table IV).

BIBLIOGRAPHY.—*General Works:* Romola and R. C. Anderson, ***The***

TABLE IV.—*Some Major Steamship Disasters*

Date	Name	Flag	Circumstances of loss
1854	"Arctic"	U.S.	Sunk after collision with French steamer in Atlantic. As a result side lights, *i.e.*, red on port bow, grcen'on starboard, were made compulsory.
1873	"Atlantic"	British	Sunk on the breakers off Meagher's Island on between Great Britain and United States. This accident reflected the need for more careiul navigation.
1912	"Titanic"	British	This White Star passenger liner oi 46,000 tons, the largest ship afloat, vas lost on her maiden voyage after striking an iceberg in the North Atlantic. Lifeboat accommodation, ior 1,178 persons, was inadequate; passengers and crew numbered 2,224 of whom 1,513 were lost.
1914	"Empress of Ireland"	British	The most serious collision oi the first hali of the 20th century was that between this Canadian Pacific ship and a Norwegian collier in the St. Lawrence, in a fog. The "Empress': sank with the loss of over 1,000 lives.
1941	"Normandie"	French	The largest oi the inter-war Atlantic liners, of 86,000 tons, was put under restraint in New York harbour in 1940 by the U.S. authorities when France fell. She was destroyed there by fire.
1947	"Ramdas"	Indian	A qoo-ton ferry steamer sank in a storm in Bombay harbour, India; about 626 lives were lost.
1949	—	—	More than 600 Chinese were missing and assumed dead after a collier, a freighter and a liner carrying war refugees collided and sank.
1949	"Magdalena"	British	This Royal Mail liner of 17,500 tons ran aground near Tijucas Islands, 20 mi. S. of Rio de Janeiro. All the passengers were saved, but the ship was a total loss.
1952	"Champolion"	French	This 12,546-ton liner was wrecked off Beirut, Lebanon; 17 lives were lost.
1953	"Empress of Canada"	British	A Canadian Pacific liner which capsized in Gladstone dock, Liverpool, after having caught fire. Refloated in June 1954, she was sold to a firm oi Italian ship breakers.
1953	"Princess,, Victoria	British	This cross-channel motor ship of British railways foundered in the Irish sea on passage from Stranracr to Larne during a severe northerly gale, with loss of 128 lives. It was the most serious peacetime disaster to a British merchant vessel in terms of casualties for nearly 40 years.
1956	"Andrea Doria"	Italian	Had been on the North Atlantic service of the Società Italia di Navigazione since making her maiden voyage in 1953. She collided with the "Stockholm" of the Svenska Amerika linien, and sank off Nantucket Island, with loss of 52 persons.

SHIPPING BOARD: *see* UNITED STATES SHIPPING BOARD.

SHIPPING INDUSTRY. The function of the shipping industry is to transport goods and persons across water, that is, across the world's oceans or along its coast lines, or through its inland waterways. The chief work of the shipping industry is to provide, man and manage the vessels that carry most of the goods entering into world trade; and also to provide and maintain the ancillary services necessary for the receiving of cargoes and for their onward dispatch at ports of destination. As a transport industry it differs from most other industries in that it does not manufacture products to sell but exists to provide a service; and it performs this function almost entirely in an international field —the high seas—for the most part outside the territories of the shipowner's country of domicile. Shipping is an essential element in world commerce and is highly competitive on an international scale. It is also an important factor in the economy of the major trading nations; and, especially since the beginning of the 20th century. the possession of a merchant fleet has become important as a strategic necessity.

The shipping industry had its origin in the Industrial Revolution and its consequences—the invention of the marine steam engine screw propulsion and the use of iron and later steel, for shipbuilding. Although the transition from sail to steam was gradual, the early steam navigation companies were the real founders of the shipping industry. The great expansion of world commerce that followed the Industrial Revolution called for a new system of ship management and shipping services, by which the ship became an instrument of world trade and an essential service to commerce, rather than a private venture on the part of a merchant trader or shipmaster or shipowner-merchant. After the opening of the Suez canal in 1869. which sounded the death knell of the sailing ship, the expansion of the volume of world sea-borne trade became enormous. and the development of the mechanically propelled merchant ship, and its continual increase in size, efficiency and numbers made this possible.

Table I demonstrates the expansion of the world fleet of mechanically propelled merchant ships, and the decline of the sailing ship in the period between 1886 and 1935; Table II illustrates the subsequent development of the world merchant fleet (see *World Merchant Fleets* below). Though it is not possible to provide comparable statistics of the increase in the volume of world sea-borne trade over the same period. particularly for the 19th century, League of Nations statistics estimated that by 1929 the amount of world sea-borne trade had reached a level 35% higher than that in 1913. In the depression of the early 1930s the figure dropped at one time almost to the 1913 level, but by 1937 it had fully recovered to the 1929 level. According to United Nations statistics, the volume of sea-borne trade reached in 1937 (490,000,000 metric tons) had again been recovered by 1948. By 1953 the tonnage involved in sea-borne trade had further increased by over 40%.

For the early history of maritime commerce, *see* SHIPPING, HISTORY OF, and TRADE ROUTES. (The history of various types of vessels is covered under SHIP.)

I. MAIN ELEMENTS OF SEA-BORNE TRADE

While the volume of sea-borne trade has been steadily increasing after the introduction of steam navigation, its nature and direction have been subject to changes The main elements of seaborne trade are food and raw materials exported by primary producing countries and manufactured goods and capital plant exported by industrial countries in exchange The shipping industry exists to enable these goods to be interchanged. but the greater part of the cargoes carried by merchant ships consists of basic raw materials (such as coal. oil, mineral ores and fertilizers) and foodstuffs (particularly grain. sugar, rice, vegetable oils, fruit, meat and dairy produce).

The growth of the world's population and the expansion of industrial development continues to make additional demands on the shipping industry. The process is best illustrated by taking the development of British trade and shipping. The invention of the steam engine led to a world-wide demand for British coal exports, which increased from about 11,000,000 tons in 1870 to as much as 73,000,000 tons in 1913, not taking into account an additional 21,000,000 tons shipped overseas for use as ships' bunkers. After World War I the growth of motor transport and the development of diesel engines for industry and transport caused a decline in the demand for exports of United Kingdom coal, which amounted to about 36,000,000 tons in 1938, in addition to 10,000,000 tons for bunkers. Meanwhile, of course. the importation of petroleum products had already assumed large-scale proportions. By 1935 the United Kingdom was importing oil at the rate of 65,000,000 tons from the middle east alone.

Yet the demand for industrial energy was so great that Great Britain had also become a net importer of coal, and the continent of Europe as a whole was importing coal from the United States at the rate of about 30,000,000 tons a year. Another long-term development which can be traced is the increase of the requirements of the steel industry. For many decades British steelworks were able to rely on domestic supplies of native iron ore, but in the first half of the 20th century they had to draw more and more on supplies from sources such as Sweden, France, North Africa and Newfoundland. Demand for iron ore increased so rapidly after World War II that United Kingdom imports of iron ore rose from 11,500,000 tons in 1954 to about 15,000,000 tons in 1956, some of which had to be drawn from much more distant parts of the world. such as Venezuela, Brazil and Liberia, so that there was an additional load to be accepted by the shipping industry.

Parallel developments took place in the United States economy. Before R7orld War II the Cnited States was a prominent exporter of petroleum products to the rest of the world, but shortly after the war it became a net importer of oil. At the same time its coal export trade soared to new heights as a result of a deficiency of fuel in western Europe. The steel industry expanded so rapidly that it, too, could no longer rely on supplies of domestic ore, and a vast expansion of imports from Labrador, South America and Liberia began.

Technical and economic changes affect demands on the shipping industry, and basic trade routes are laid down according to the pattern of economic geography. It is the geographical position of sources of the principal commodities shipped and that of their main centres of consumption that chiefly shape the pattern of world shipping movements, although these are. of course, influenced by political and physical factors as well.

The chief grain-producing areas of the uorld, for example, are the United States and Canada, Australia, Argentina. the U.S.S.R. and France. India at one time was an exporter of wheat. but the growing population and rising standard of living of that part of the world have made India and Pakistan substantial importers of grain; much the same noa applies to the countries under Soviet influence, and the exportable surplus of France as often as not becomes a deficit. There is a steady flow of grain from the three principal exporting areas—North America, Australia and Argentina—to the continent of Europe and to Japan, as well as to most other countries in the world, but the largest importer of grain is the United Kingdom, as it is of most other foodstuffs. Britain's need for imported foodstuffs is indeed a staple element in seaborne trade, for it must rely on meat from Australia. New Zealand, Argentina and Uruguay; on fruit from South Africa, Australia, New Zealand, the Mediterranean countries, the West Indies and Central and North America; on dairy produce from Australia, New Zealand and Denmark; and on perishables from the near continent, particularly from France, Belgium and the Netherlands. Sugar comes mainly from Cuba, Mauritius and Queensland (Australia), which are the main exporters of this commodity to the rest of the world.

Of the sources of energy, oil is steadily surpassing coal in volume, but after World War II coal was a staple export from the United States to western Europe, mainly to Italy, France and the German Federal Republic, to Japan and to South America. The main oil-exporting centres after World War II were the middle east (Iraq. Iran. Kuwait, Saudi Arabia, Bahrein and other neighbouring oil fields) and Venezuela and the Caribbean area. The Soviet Union and the United States are prolific producers, but mainly for domestic consumption. Thus oil from the middle east flons to all parts of the uorld. the principal consumers being the United Kingdom and western Europe, with increasing consumption in India, Africa and the far east, the United States, South America and Australia.

Of industrial ran materials, mineral ores became predominant after World War II. The steel industries of the United States, the United Kingdom, the German Federal Republic and Japan are the greatest consumers of iron ore, which is imported from Labrador. West and h'orth Africa, India, Sweden (as a rule through Norwegian ports). Venezuela and other parts of South America Copper is imported by the major industrial countries chiefly from Rhodesia and Chile; tin from Malaya and Bolivia; lead and zinc from Australia. Bauxite, or alumina, the raw material for the production of aluminum. flons mainly from the Caribbean to the United States and Canada, and from West Africa and the south of France to the United Kingdom, Norway and other European producers. The produced metal is exported by Canada and the Gnited States in ingot form to other manufacturing countries particularly Great Britain, from which the finished manufactured products may be exported to all parts of the world.

Besides the principal commodities in the sea-borne trade mentioned above. many others are handled by the shipping industry in quantities exceeding 1,000,000 tons a year, and they include phosphates, iron and steel scrap, potash, nitrates and other fertilizers, pyrites, sulfur and sulfur compounds, basic slag, cement, rubber, aool, cotton, oilseeds and vegetable oils of various kinds, rice. coffee and so on. Other commodities, such as tea. jute, timber, tobacco. copra. salt, china clay, chemicals and other products are shipped by sea in large quantities; and a great variety of shipments of manufactures. machinery and processed goods are made possible by these imports.

II. SPECIALIZATION IN SHIPPING

It would be an oversimplification to suppose that international trade is mostly a two-way traffic between industrial manufacturing and primary producing countries, or even an interchange of manufactured goods between one country and another. Much of the world's trade is triangular in character, involving the shipment of raw materials from one country to another, where they are converted or processed for export to a third country. The rate and direction of flow of trade in various commodities, whether raw materials. foodstuffs or manufactured goods, is subject to continual change, which calls for considerable flexibility in the employment of ships.

The different types of goods carried by sea require, moreover, a wide variety of types of ships, and it is the business of the shipping industry to provide such vessels. The growth of international trade has thus encouraged the development of some specialization in shipping, nhich has taken various forms, such as the provision of ships designed to carry certain cargoes or to participate in certain trades along well-established routes.

1. The Liner and the Tramp.—The two main branches of the shipping industry are the liner business, and tramping. The essential difference between the liner and the tramp is that the former operates regular scheduled services on a predetermined trade route, whereas the tramp is prepared to carry any suitable cargo which offers from any part of the world to any other part of the world. The liner services are the railways of the oceans, running regular services at stated times between scheduled ports. and charging previously advertised tariff rates. The tramps are more like taxicabs or road transport operators. which may ply for hire or will contract to transport goods between any required ports, the terms being arranged by negotiation betu-een the parties on each occasion, or on a contract basis. The tramp system had its origin in the days when it was customary for the master to be o ner, or at least part owner, of his own ship. He would load it with a cargo of goods which he hoped to sell in some foreign country, and use the proceeds to buy a cargo which he could sell in another country or for which he could find a ready market at home.

As more regular trade developed between two overseas countries, such as that between the United States and the United Kingdom across the Atlantic, particularly with the advent of steam navigation, which gave greater assurance of regularity of communications. the steam navigation companies began to operate liner services. The liner services were. and still are, of particular value for passengers and mails, and for small traders not dealing in commodities normally consigned in shiploads. The shipper of commodities in bulk. such as grain or coal, naturally found it more economical to hire ships on the open market, offering his business of transportation to the lowest bidder, or buying and selling his commodity in the market where sea transport costs were for the time being cheapest. Thus the tendency is for tramp ships to be the carriers of homogeneous cargoes of commodities in bulk, while liners are principally carriers of heterogeneous cargoes, made up of hundreds of small consignments of goods of many kinds, as well as mail and passengers.

There thus grew up what is now a world-wide network of liner services between the principal ports of the world. The services link the metropolitan countries of the world with their overseas associates; they link the countries of Europe with the other continents. directly across the Atlantic to the eastern shores of North and South America. through the Panama canal to the western shores of America. the Pacific ocean, Australia and New Zealand; directly to North. West and South Africa and on to other parts of the world; or through the Suez canal to East Africa. the Indian ocean, the East Indies and the far east. They link the Cnited States in addition directly, or through the Suez and Panama canals, with Europe. South America, Africa and the countries of the Indian and Pacific oceans. They link Japan with Africa and America, India with Africa. China with India and. finally, by transshipment to coastal liner services they provide sea communications between practically all the seaports of the world.

The bulk cargoes carried by tramp ships also tend to flow in volume along regular routes from time to time, and where these coincide with regular liner services the liners will periodically pick up "parcels" of these commodities. particularly grain, but usually only in order to fill up holds that otherwise mould be empty.

2. Various Types of Cargoes. — The principal bulk cargoes have varying characteristics (liquid cargoes are in a category apart requiring specially designed ships and must be considered as a separate branch of the shipping industry). The normal dry-cargo tramp ship is adaptable in design. so that it is capable of carrying. as occasion arises, cargoes as different as iron ore, coal, grain. sugar. cotton or copra. Each of these cargoes has different characteristics. Owing to the difference in stowage factors (cubic capacity per ton) for example. a ship large enough to carry 10,000 tons of coal might be loaded down to its maximum draft with less thsn 5.000 tons of ore, and if it were to carry grain "shifting boards" would be necessary in the holds to prevent the cargo upsetting the stability of the ship by pouring over to one side when the ship rolled.

Different methods are used for loading and discharging different types of cargo. Cargoes shipped in cases, bales or bags must be handled by the ship's derricks or by shore cranes. and the same applies to cargoes of commodities like timber, steel or scrap. Iron ore and coal are discharged by grab, and grain by elevators or suction pipes.

3. Specialized Carriers. — Where any one commodity is carried in large quantities over regular routes. it becomes an economic advantage to build ships specially suited to the cargo concerned. and because of the vast expansion of world trade in bulk commodities the tendency is for specialized bulk-cargo carriers to be built. The specialized ore carrier is a typical example. Large numbers of these have been built since World War II. although they were in operation on the Great Lakes at the end of the 19th century. They rely entirely on shore appliances for cargo handling, not being provided with derricks. although some ore carriers designed for service to ports where shore-handling facilities do not exist are equipped with self-unloading gear. These, of course, are ultra-specialized.

Specialized ships such as ore carriers may still be divided into the two categories of liner and tramp. in that some of them are built by tramp ship-owning companies with the object of their being hired out. or chartered. to the shippers or importers of ore, usually on a long-term basis, while others are built and operated by the shippers or consumers of ore themselves. mainly the large steelworks. The latter vessels are liners in the sense that they are designed for and operate on regular routes between predetermined terminals, but they do not operate as common carriers and accordingly are better called industrial carriers. Several other industrial consumers of raw materials in bulk, such as major importers of sugar, newsprint, molasses, gypsum and chemicals, operate their own fleets of bulk carriers in a similar fashion. as well as hiring ships from tramp shipowners on the open market.

4. Tankers. — The transport of petroleum products by sea is a special branch of the shipping industry which has witnessed a vast expansion in the 20th century, particularly after World War II. Some indication of the rate of expansion is given by comparison of world tanker tonnage in 1939 and 1956. In 1939 the world tanker fleet totaled 11,586,000 tons gross, comprising 16.9% of the total tonnage of all merchant ships. By June 1956 the tanker fleet had reached a total of 28,211,000 tons gross, representing as much as 26.8% of the total world fleet then in existence, Measured in terms of dead-weight tonnage the world tanker fleet rose from 16,000,000 tons in 1939, to more than 23,000,000 tons in 1946; yet the 1946 figure had been doubled by 1957.

Liquid cargoes such as crude oil or gasoline 'need ships heavily subdivided into compartments in order to restrict the movement of the free surface derived from the motion of the ship at sea which would otherwise upset the stability of the vessel. No ship-borne cargo-handling facilities in the way of derricks or cranes are required, since the oil is pumped on board through pipelines at the oil terminals and discharged through pipelines by means of the ship's own pumping system at ports of destination. Owing to the inflammable nature of the cargo. special precautions have to be taken against the risk of fire. Before World War II the greater part of the world tanker fleet was owned and operated by the major oil companies, operating as industrial carriers, but they depended for their marginal requirements on the chartering of tramp tankers.

After World War II, despite the expansion of their own fleets, the oil companies had to rely to a much greater extent for their ocean transport on tankers operated by tramp companies. generally on a long-term time-charter contract basis. A particular feature of the tanker trade is that it is almost entirely a one-way traffic, and since tankers are not suitable for carrying any other type of cargo without structural alteration, the outward journey has to be made in ballast. An ekception is made for iron ore, which has a low stowage factor. Sweden. an ore-exporting and oil-importing country, evolved a ship capable of carrying an inward cargo of oil and an outward cargo of ore. As a result of the exploitation of the Labrador ore fields. this combined oil and ore carrier mas increasingly built after World War II. In the winter season the ore-loading ports of Labrador are closed by ice, so that these specially designed ships can find alternative employment as oil carriers in the off season. Other liquid cargoes besides oil products may be carried in considerable bulk. and there are tankers used only for goods such as molasses. caustic soda and other chemicals, wine (and sometimes water), or for semiliquid cargoes like asphalt and bitumen, and even gas in liquid form.

5. Coastal and Short-Sea Shipping. — Most of the ocean-going types of ship have their counterparr on a smaller scale in the coastal shipping industry. whose function and extent naturally varies in different parts of the world according to geographical conditions. Coastal shipping (sometimes referred to as cabotage) is another branch of the shipping industry, since its services are generally confined to the coastal waters of a particular country. In countries with continental coast lines. such as the Cnited States, Australia and India, for example, coastal shipping may not differ operationally from ocean-going shipping, and in the United States

the term is extended to include the intercoastal trades between the Pacific and Atlantic coasts via the Panama canal. and the noncontiguous trades between continental America and outlying areas such as Hawaii. In Europe. where national coast lines are comparatively short, and the restriction of coastal trades to ships of the national flag is not practised, coastal shipping has a more international character.

In the United Kingdom. for example, there can be distinguished the purely coasting trade, plying solely among the islands and along the coast of Great Britain; the home trades. which ply between the United Kingdom and the continent of Europe within the limits of Brest, in France, and the Elbe. in Germany; and the short-sea trades, between the United Kingdom and Scandinavia, the Baltic sea and the Mediterranean. Some shipping companies, of liners. tramps or tankers, may operate in all of these trades. while others may specialize in any one.

In the coasting and short-sea trades there are also many specialized vessels such as cross-channel passenger ships, train ferries, ramp-loading or roll-on roll-off motor vehicle transports, ships specially designed for container traffic and the like, as well as colliers and tankers. These tend to be operated by companies specializing in particular routes over which traffic is heavy but localized. As these services often form sea links between or extensions of railway systems, the railway companies often operate them. In fact, the coastal shipping industry may be regarded as complementary to the inland system of transport communications. as well as a link with neighbouring countries; and a most useful characteristic of the coastal ship is its ability to load cargo directly from the ocean-going vessel for transshipment along the coast and distribution to smaller ports whose depth of water or lack of facilities precludes the direct approach of the larger ship.

6. Inland Waterways. — The shipping industry also includes transport services along rivers and inland waterways. Vast quantities of materials are shipped along waterway systems such as those of the Mississippi, the Amazon. the Niger and the Rhine, sometimes penetrating thousands of miles into the heart of a continent.

(See also WATERWAYS, INLAND; INLAND WATER TRANSPORT.)

7. Ancillary **Services.**—At the port. where the sea transport and inland transport systems meet, many ancillary services must be provided for ships. such as towage, stevedoring. warehousing, replenishment of stores. repair and maintenance and the like. At this point industrial practice varies widely between different ports. the various services being provided by independent contractors, by the port authority or by the shipping companies themselves. In many ports, particularly where large liner companies operate, the companies have their own subsidiary organizations which provide such services. not only for their own ships but also for others. Some of the larger shipping groups operate or control fleets of tugs, loading and discharging facilities and labour, warehouses and refrigerated stores. lighterage and land transport, and even provide for the building. repairing. equipment and maintenance of ships for themselves and for other shipowners.

Inland waterways and seaports must be kept clear by dredgers, and in northern waters which freeze in winter icebreakers must be used to clear shipping lanes; salvage services must be provided for clearing wrecks and other obstructions to navigation and for rescuing ships which have broken down; and cable ships must be provided to maintain telegraphic communications between all parts of the world. All these maritime services. essential to the operation of international sea-borne trade. are part of the shipping industry. However. the fishing industry, including whaling. may be regarded as a separate maritime activity unconnected with the commercial operation of merchant ships. (See FISHERIES; WHALE FISHERIES.)

III. SHIP OPERATION

The essential differences between the liner and tramp sections of the shipping industry. namely in the kind of transport service they perform, have been described above. As the carrying performance of liners and tramps differ, so do the operational organization and methods of the companies that run them.

1. Liner Operation. — The growth of liner services resulted from the introduction of steam navigation, which enabled ships to maintain regular services at predictable intervals, mechanically propelled ships being much less dependent than sailing ships on the vagaries of wind and tide. A sailing ship, wherever bound, did not ordinarily sail. either with general merchandise or a bulk cargo, until its holds were full. Sailing dates were therefore uncertain. and arrival dates even more so. The merchant was obliged to ship his goods in speculative anticipation of the state of the market at the time of their arrival at destination, and shippers of small consignments or parcels of cargo were even more uncertain of being able to deliver at a specified time. Fast sailing ships (such as those of the American Black ,Ball line) were actually the first to attempt regular liner services across the North Atlantic early in the 19th century, but it was not until the coming of the steamship that such services became firmly established.

The possibility. with liner steamships, of regular sailings from a wider range of loading and discharging ports. with a guarantee that ships would sail whether full or not. and the development of more reliable postal and, later. telegraphic communications, allowed much more international business to be done. particularly by traders wishing to send small consignments of goods to various destinations at frequent intervals or even only occasionally. Thus liner cargoes are usually composed of a wide variety of general merchandise, of differing values. nature and quantity, including material that does not customarily move in shipload lots along the trade route concerned. The first modern liner services naturally followed the direction of the greatest demand. The Cunard line started the first regular steamship liner services to the United States in 1840, and in the same year the Peninsular and Oriental Steam Navigation company began a liner service to the Mediterranean area. In 1842 the Royal Mail Steam Packet company (now Royal Mail lines) started a regular steam packet service to the West Indies. with the aid of a government mail subsidy.

The operator of a liner service has special interests in the particular trade route that he caters for. The design and performance of his ships will be directed toward fulfilling in the most economical way possible the requirements of shippers using his services. Some liner routes, for example, like those between the United Kingdom and Australia and New Zealand. have to cater for a large proportion of refrigerated cargoes such as meat and dairy produce, as well as wool and parcels of grain or base metals, in the direction of Great Britain. and for machinery and motor vehicles and other manufactured goods in the opposite direction. The requirements of liner trades on any particular route range widely in character and fluctuate in quantity. They are apt to be shipped by numerous individual exporters and consigned to no less numerous individual consignees. The collection of such consignments and their assembly into the ship at the loading port, or ports, and their distribution at the ports of discharge obviously require an extensive. permanent organization at either end of the liner route; and the liner company must have staff and offices at the ports that it serves. although in some of the less active ports these functions may be carried out by agents acting for one or more liner companies. Besides this, the services of forwarding agents or travel agents must be employed for soliciting cargo or passengers from inland centres sometimes far removed from the ports of shipment. and it must always be possible to arrange for the transshipment or onward movement of cargo and passengers from terminal ports to eventual destination.

2. The Conference **System.**—Not only do the liner companies provide regular and frequent services between different parts of the world for the carriage of every conceivable kind of cargo in consignments large and small, but they are prepared to do so at previously advertised fixed charges. They are enabled to do this by means of the liner conference system, which first began to be practised in the United Kingdom-Calcutta trade in 1875. The object of the conference system is to regulate uneconomic competition. The shipping companies of different ownership and nationality that operate services between the same range of ports form a conference agreement to regulate the freight rates that they will charge for each type of goods carried; and in some cases the agreement also allocates a specified number of sailings to each company. Coupled with this agreement there is generally a deferred rebate system by which regular shippers of goods by conference vessels receive a rebate of a percentage of the tariff freight rate. payable after a period of proved loyalty, provided they use conference vessels exclusively.

The shipping conference system has sometimes come under attack as tending to create monopolies and to restrict competition against the public interest. After investigations, however, the evidence has weighed in favour of the conference system (which in the United States is subject to regulation and approval by the maritime administration). It has been felt that no combination of shipping companies can force unreasonable freight rates on shippers, since under those circumstances an outside company will step in to provide a genuine service at reasonable rates; and. on the other hand, shipping companies that provide regular sailings with good ships and maintain staffs and organizations in ports to handle and dispatch cargoes, irrespective of whether trade is good or bad, are entitled to some protection against the casual ship that picks up an occasional cargo at cut rates. It is to the advantage of the shipper that through this system he can rely on a well-managed service, running ships that will carry any desired quantities of his goods at predetermined rates, and that these rates are not usually changed without at least three months' notice.

3. Tramp Operation.--Unlike liners, tramp ships do not provide scheduled sailings between predetermined ports. and they are generally used solely for the carriage of bulk commodities, or homogeneous cargoes, in whole shiploads. There is no fixed tariff of freight rates and no conference system. Every voyage of a tramp ship is the subject of a separate negotiation between the owner of the ship and the owner of the cargo, and its terms are generally arranged through a shipbroker in one of the shipping exchanges located in various parts of the world, but mainly in London and New York.

4. Brokerage and Chartering. — Most of the world's tramp ship chartering business is carried out in the Baltic Mercantile and Shipping Exchange. Ltd., in London, commonly known as the Baltic. This exchange had its origins in the early 18th century, when merchants and ships' captains were accustomed to meet in coffeehouses (the most famous of which was Lloyd's) to arrange cargoes for ships. The Virginia and Baltic, and the Jerusalem were the two coffeehouses chiefly patronized by merchants and captains until the business was moved to the Baltic tavern in 1810. In 1823 the first rules and regulations of a "Baltic club" were drawn up, limiting membership to 300 and providing for accommodation and refreshments. At that time tallow mas the principal commodity in the Baltic trades, but with the repeal of the corn laws in 1846 the buying and selling of grain cargoes became one of the chief activities and called for larger premises. In 18j6 larger premises were taken in South Sea house and two years later membership had doubled.

The opening of the Suez canal and the growth of steam navigation caused a further expansion of trade and in 1903 the Baltic exchange in its present form was opened in an entirely new building. After World War II air chartering was added to the exchange's activities. and in 1956 a new building was opened as an extension to the 1903 structure, doubling its size.

On the floor of the Baltic exchange brokers circulate daily, some of them representing the shippers of cargoes such as grain. coal or ores who require shipping space for their movement, and others representing the owners of tramp ships wanting further employment. When seeking a ship for the carriage of a cargo, the broker naturally looks out for a ship of the right size and specifications, ready at the right time and in the right port, and prepared to carry the cargo at the cheapest possible rate. Conversely, the owner's broker must attempt to anticipate the charterers' requirements by having his ship at the right place at the right time, but he must also try to obtain the highest freight rate possible without running the risk of losing the contract to a competitor. This constant interplay of supply and demand, of ships as well as of cargoes, has the effect of reducing sea transport costs to a minimum, although tramp freight rates fluctuate frequently and widely, at times.

These conditions of fluctuating rates also offer opportunities for specuiation, as on a stock exchange. The shipper of grain, for example. may decide to charter a ship at what he considers to be a cheap rate even before he has sold the cargo, which he will attempt to dispose of in the best market while it is still afloat. In this case the ship will be chartered for a voyage from, say, the Plate river to the English channel "for orders," freight rates having been previously arranged to cover a variety of alternative eventual destinations. Again a shipper or an owner may agree to charter a ship for a period of time at a certain rate, in the hope that he will later be able to "re-let" it to another owner or shipper at a higher rate, if the market improves. A good deal of "forward" chartering may also occur, in which a contract is entered into for performance at some specified time at a predetermined rate that both owner and hirer hope will prove favourable, according to their view of future market conditions.

5. Methods of Chartering. — There are four principal methods of chartering a tramp ship—on voyage charter, on time charter, on bareboat charter, or on a contract or "lump sum" basis. The voyage charter is the commonest. Under this a ship is chartered for a single voyage between specified ports with a specified cargo at a negotiated rate of freight. The charterer agrees to provide the cargo for loading at the port or ports and the owner to present the ship for loading within an agreed range of dates. As soon as the cargo has been delivered at the port or ports of destination, the ship is free for further employment at the owner's discretion. Sometimes, however, the arrangement is for a series of consecutive voyages, generally for similar cargoes over the same route. The freight rate is expressed in terms of so much per ton of cargo delivered.

On time charter, the charterer undertakes to hire the ship ior a stated period of time, or for a specified round voyage or occasionally for a stated single voyage, the rate of hire being expressed in terms of so much per ton deadweight per month (see below for meaning of tonnage measurement). Whereas on a voyage charter the owner bears all the expenses of the voyage (subject to agreement about costs of loading and discharging), on time charter the charterer bears the cost of bunkers and stores consumed.

On bareboat charter, which is less frequently used in ordinary commercial practice, the owner of the ship delivers it up to the charterer for the agreed period without crew, stores, insurance or any other provision, and the charterer is responsible for running the ship as if it were his own for the period of the contract.

Contracts can also be arranged on a lump-sum basis, when an owner agrees to ship a given quantity of a stated cargo from one port to another for a stated over-all sum of money. Sometimes large quantities of cargoes such as coal are arranged for on a contract basis. The shipowner agrees to undertake the shipment of a given quantity over a given period at a fixed price per ton of cargo, but not necessarily in any specified ship, although he will generally use his own ships if they are available, unless he can subsequently charter other ships at a cheaper rate. The question of substituted ships, however, often leads to disputes and the terms of the contract may make special provisions for this eventuality.

6. Legal Aspects of Chartering. — Once the owner's broker and the charterer's broker have agreed on the terms of contract, the ship is "fixed,'! although by word of mouth alone. The proud motto of the Baltic exchange is "our word is our bond," and that code of ethics is observed by shipbrokers throughout the world, whether they are members of the Baltic or not, for the simple reason that any shipbroker who did not abide by it would be unable to transact further business. Legally, however, the final contract is the written "charter party," which for most transactions is accepted as a standard document and is agreed to by all parties normally concerned in a tramp ship "fixture" for a particular trade. The standard form of charter party covers all the main points which experience has shown might later lead to misunderstanding or disputes about the liabilities of each party. while the variable details; such as the particulars of the voyage, cargo, ship, loading and discharging conditions and ports, rate of freight, etc., can be inserted in accordance with the prior verbal agreement. The charter party is the document that is subject to scrutiny and interpretation by a court of law in the event of dispute, but in practice most disputes are by agreement submitted to arbitrators (generally independent shipbrokers appointed by each participant) for settlement, unless an important legal precedent is involved.

Among the most important clauses in any charter party are generally those nhich lay down the number of days allowed for loading or unloading, and those which determine who is to hear the expenses involved. As a rule, a certain number of days are allowed for loading, and if the charterer fails to finish loading in the time specified the shipowner is entitled to compensation for demurrage, while the charterer on the other hand is entitled to dispatch money if the cargo is loaded in less than the time agreed in the charter party. Similar conditions usually apply in the port of discharge.

Tankers, ore carriers and other industrial carriers operate either like dry-cargo liners or like tramps, except that on scheduled services they do not normally act as common carriers. In other words the tanker or the ore carrier is operated by an oil company or a steel company or an ore exporter exclusively on company business, whether on a regular schedule or not; or it is owned by an independent tramp shipowner and taken on charter by an oil or steel company to fulfill its marginal transport requirements on terms similar to those employed in the dry-cargo tramp shipping market. That is, perhaps, a simplification of the procedure, since in fact the oil company may, for example. find it convenient to charter its own ship to another oil company for a voyage or for a period of time, just as a tramp shiponner might do. Most of the major oil companies (and permanent large shippers of bulk commodities) build and operate for themselves fleets of ocean carriers—and their operation is a matter of company convenience. requiring no contractual obligations or other arrangements except suitable shore staffs and organizations or agencies at the terminals. The great expansion of oil transport requirements after World War II led to a rapid growth of the world tanker fleet, and capital commitments made it more than ever necessary for oil companies to rely on the tankers built and operated by the growing number of independent tank shipowners.

IV. INTERNATIONAL MARITIME LAW

1. The International Conventions.—Ships operate in an international field, the high seas, and are subject not only to the laws of the country in which they are registered and to the laws of the country in whose territorial waters they may be, but also to a series of internationally agreed conventions, the principles of which are incorporated into the domestic legislation of most maritime countries. There has gronn up, particularly in the years since the expansion of steam navigation, a body of international maritime law—"the common law of the sea"—nhich has been developed through international agreement. For example, nearly all the world's maritime nations have adopted the International Rules for the Prevention of Collision at Sea, which were originally based on British rules formulated in 1862 and made internationally effective after a series of international meetings culminating in a conference at Washington, D.C., in 1889. These rules lay down in great detail how ships must navigate in respect of each other, what lights must be shown and what signals must be given in accordance with circumstances; and any infringement of this international code of conduct is accepted in all maritime courts of law as prima-facie evidence of liability in case of collision.

Similarly, the internationally accepted requirements for the protection and safety of life at sea, as far as the ship and its equipment are concerned. are embodied in the International Convention for the Safety of Life at Sea. The sinking of the "Titanic" in 1912 gave rise to a general desire to raise the standards of safety of life at sea and a convention nas drawn up in 1914, requiring certain minimum standards for passenger ships, but this did not become fully operative owing to World War I. A second Safety of Life at Sea convention was drawn up in 1929; this decided minimum standards for the construction of passenger ships engaged in international voyages and for the provision of lifesaving appliances, and extended its rules for the safety of navigation to all ships on all voyages. The provisions regarding radio equipment mere extended to cover cargo ships of more than 1,600 tons gross.

Improved techniques led to the convening of a third Safety of Life at Sea conference in London in 1948, after which a third International Convention on the Safety of Life at Sea was adopted. This came into force on Nov. 19, 1952, having been ratified one year previously by the following countries in order of acceptance: United Kingdom, New Zealand, the United States, France, the Netherlands. Sweden, Norway, South Africa. Iceland. Portugal, Canada, Pakistan. Denmark, Yugoslavia, Italy. Belgium, Israel, Japan and the Philippines. The scope of the 1949 convention was again extended to include, in several matters, cargo ships of 500 tons gross and above. Minimum requirements were laid down for the construction of ships, for the provision of watertight bulkheads. for the closing of openings in hulls for lifesaving appliances, for fire appliances, for radio equipment and direction finders for grain divisions in ships carrying grain cargoes, for the carriage of dangerous goods and for emergency musters and drills. The 1952 convention also embodied the recommendations of governments associated with the World Meteorological organization. and provided for the continuance of the International Ice patrol maintained by the United States coast guard in the North Atlantic.

Whereas the Safety of Life at Sea convention deals with the construction of ships from the safety point of view, particularly in respect of passengers and crews, the International Load Line convention deals with the strength and seaworthiness of ships in normal operating conditions. This convention emerged from the efforts of Samuel Plimsoll, who succeeded in securing the passage of the British Merchant Shipping act, 1875, which provided for the marking of a load line, thereafter popularly known as a Plimsoll mark, on the ship's side, indicating the maximum depth to which a ship could legally be loaded.

In order to protect the competitive position of British ships, the Merchant Shipping act of 1890 required all foreign ships leaving British ports to comply with the load line regulations. This led to the adoption of the load line rules by most maritime countries, and the International Load Line convention of 1930 was ratified by 54 nations. The 1930 rules followed the British proposals closely, but provided for the deeper loading of tankers, of ships of special construction and of vessels carrying deck loads of timber. Provision was also made for the adjustment of load lines to suit seasonal and geographical variations in conditions.

2. Commercial Legislation.—International agreements and international law are also concerned with the business dealings between maritime countries. In this connection the International Maritime committee (Comité international maritime) and the International Law association did invaluable work. Delegates to the International Conference on Maritime Law held at Brussels in 1922 recommended to their respective governments the adoption of a set of rules. known as The Hague rules, which establish the responsibilities, rights and immunities of carriers under bills of lading (documents acknonledging receipt of cargo for shipment and proving entitlement to the goods). The Hague rules. which are generally also incorporated into the terms of a charter party, were given widespread legislative sanction by maritime countries, in Britain by the Carriage of Goods by Sea act. 1924, and in the United States by the Carriage of Goods by Sea act, 1936, which is also taken in conjunction with the Harter act, 1893. Legislative sanction is not necessary to secure international agreement or observance in every case.

The York-Antaerp Rules of General Average, for example, differ in some respects from English law relating to marine insurance and contracts of affreightment. They were formulated by delegates from various maritime countries meeting at York, Eng., in 1864 and at Antwerp in 1877. and nere revised at Stockholm in 1924 and at Amsterdam in 1950. They were so widely adopted by the maritime nations that for all practical purposes they have the force of law. (See MARINE INSURANCE.)

V. SHIPOWNERS' AND SEAMEN'S ASSOCIATIONS

Shipo-cvners themselves are generally organized on a national, and sometimes on a regional. basis. The most highly organized associations of this kind grew up in the United Kingdom. where all but a negligible minority of shipowners are members either of the Chamber of Shipping of the United Kingdom, based in London, or the Liverpool Steam Ship Owners' association. These two associations have sections which look after the special interests of subgroups in the industry. such as tankers, tramps, liners, coasters: etc. In order to speak with one voice in negotiations with the government on matters of highest policy, the two associations created a joint organization known as the General Council of British Shipping. These organizations speak for shipowners as a whole in respect of a great many industrial matters. such as pilotage and towage agreements and contracts? port organization, dock labour and national legislation, and to settle countless points at which external matters touch the maritime industries. Foreign associations often also undertake wage negotiations with seafarers; the British associations. however. do not. Wage negotiations are handled by a separate organization known as the Shipping federation. which was formed early in the 20th century in order to combat the activities of the newly created National Union of Seamen. Wage negotiations in the British mercantile marine since World War I have been conducted entirely through the medium of the National Maritime board, which consists of representatives of the Shipping federation on the one side and representatives of the seafarers' and officers' unions on the other. The work of the National Maritime board extends. in addition. to the associated subjects of manning scales, hours and conditions of work and standards of accommodation. etc.. as well as to such matters as sickness benefits. pensions and contracts of employment. Since 1947 it has been possible for British officers and seamen to enter either into individual service contracts with shipping companies, or into a general service agreement with the industry as a whole which guarantees a minimum wage for a minimum period of two years, whether or not the seafarer is in employment, provided that he undertakes to serve in any British ship to which he may be posted. (See also LAWS RELATING TO SEAMEN.)

On the international level. the national shipowners' associations are members of the International Chamber of Shipping, provided that the national industries concerned are not state controlled. This organization, whose offices and secretariat are housed at the London headquarters of the Chamber of Shipping of the United Kingdom, was formed before World War II. and excluded state shipping organizations of any kind. The ownership of the national fleet. or of a substantial part of it, had to be vested in private individuals or companies. The International Chamber of Shipping was suspended during World War II but in 1946 shipowners representing 14 nations (Australia, Belgium, Canada. Denmark, Finland, Greece, India, the Netherlands. New Zealand. Norway, Spain, Sweden, the United States and the United Kingdomj met in London to reconstitute it. The assembly wished to avoid the overlap of its functions with those of other organizations and, "bearing in mind the vital need for preserving the principles of private enterprise in a complex industry which must essentially operate in an international sphere," drew up a broad definition of its own purposes as follows:

(a) To promote internationally the interests of the shipping industry on all matters of general interest not already dealt with by other specialized organizations within the industry.

(b) To co-ordinate expert advice within the industry in regard to technical questions affecting it and, in particular, with a view to securing improvements in standards of safety and the fullest advantage of technical and scientific progress. In this connection it will be necessary at the outset to consider the procedure which should be followed in the light of postwar circumstances and in relation to government activities in this field.

(c) To provide a medium for the exchange of views and information on questions affecting the industry internationally.

To deal with matters of a more routine nature other international shipping organizations exist. Prominent among these is the Baltic and International Maritime conference, which was started in 1905 as the Baltic and White Sea conference, in Copenhagen, with the object of putting a stop to the cut-throat competition which then existed between tramp shipowners engaged in the Baltic and White sea trades. The conference mas organized primarily with the object of securing minimum freight rates and arranging uniform chartering terms among shipowners of different flags. By 1955 the Baltic and International Maritime conference consisted of shipowner and shipbroker members from 3j different countries representing some 17,000,000 tons gross of tramp shipping. The conference now embraces many kinds of trades in all parts of the world, and one of its principal functions is to inform members of changes in port expenses, in costs of loading and discharging cargoes and in labour conditions in ports; but perhaps the most valuable part of its work consists of the drawing up of standard forms of charter party for use in a wide variety of tramp shipping trades. and of securing acceptance for them. Most of this work is carried out in co-operation with the documentary committee of the Chamber of Shipping of the United Kingdom.

VI. CLASSIFICATION AND TONNAGE MEASUREMENT

1. Classification. — To ensure compliance with the various international safety and load line and other maritime conventions. as well as with the requirements of national legislation concerning the registry and constructibn of merchant ships, most maritime nations require ships to be built under the supervision of government surveyors or of surveyors belonging to recognized classification societies and in accordance with their standards.

Lloyd's *Register*.—The leading classification society. operating in almost every country in the world. is Lloyd's Register of Shipping. which began its work long before any national legislation existed for the performance of its purposes. The history of Lloyd's Register of Shipping can be traced back to 1760, when the first printed "register of ships" appeared. Particulars of ships were listed. with various classification symbols affixed, each denoting the condition of various parts of the ship's structure or equipment. This was for the guidance of marine underwriters and insurers, and it is generally agreed that Lloyd's took its name from Edward Lloyd's coffeehouse in London, the home of the modern marine insurance market. The society was reconstituted in 1834. and again in 1914. The shipping community maintains it voluntarily and its management committee is composed of shipowners, shipbuilders. marine engineers and marine underwriters. with naval architects. master mariners and others with specialized knowledge and qualificatioris serving on the various technical committees. Its principal work is the supervision of the survey and classification of merchant ships of all nationalities according to rigid standards. Through a world-wide organization of surveyors initial classifications are made when ships are built, and maintenance surveys of hull, machinery, boilers, refrigerating plant. etc.. are carried out periodically or whenever the ship has suffered damage from collision or from any other cause. Lloyd's Register surveyors test and approve. during its manufacture, the steel intended for use in the ship's structure or for its engines and boilers; they survey refrigerating machinery at sea or on land: they supervise the testing of chains. anchors and pressure vessels; and are competent authorities for the assignment of freeboard to all classes of ship in accordance with the provisions of merchant shipping acts or the load line regulations.

The society publishes annually a register book which contains in several volumes full details of all merchant ships in the world of more than 100 tons gross; this is kept up-to-date by means of fortnightly supplements. Separate registers are kept of British and American yachts. The society also publishes annual and quarterly statistical summaries of shipping registered or under construction in the world. In 1949 Lloyd's Register of Shipping took into amalgamation the British Corporation for the Survey and Registry of Shipping, a similar organization founded by shipowners in Glasgow in 1890 as a rival classification society.

Lloyd's Register of Shipping operates in most maritime countries. often in co-operation with classification societies established by other nations. These include the American Bureau of Shipping, originally established in 1867, and resuscitated as a result of the large volume of merchant ships built in the United States during World Wars I and II; the Bureau Veritas, which was founded in Antwerp in 1828 but moved its headquarters to Paris in 1832; the Norske Veritas, established in Norway in 1894; Germanischer Lloyd, founded in Germany in 1867; and Kegistro Italiano Navale, originally founded in Italy in 1861. Most of these and other national classification societies work in close conjunction with Lloyd's Register of Shipping.

2. Tonnage Measurement.—Classification societies are largely agreed as to the strength requirements of different types of ship; and the technical. legal or commercial enactments of the conventions are almost universally accepted; but complete international agreement on methods of tonnage measurement was slow to develop. The two chief reasons for this were, first the possibility of interpreting the term tonnage in several senses, and secondly the fact that a ship's tonnage is calculated by one of several methods according to the standard of measurement required. In speaking of shipping, the term ton may be used not only to name a unit of weight, in the usually accepted sense: but also to name a unit of volumetric capacity.

Displacement Tonnage and Deadweight Tonnage.—As far as weight is concerned. the ton is the long ton of 2,240 Ib. avoirdupois, and this is used to measure the weight of the ship and its contents. According to the law of Archimedes, the weight of a floating vessel and its contents is equal to the weight of water that it displaces. This weight is known as the displacement tonnage, and the term is used ,most commonly in comparing the size of warships. In a cargo-carrying ship it is obvious that the displacement varies according to the amount of cargo, bunkers and stores that are in the ship, and as it is important to determine the amount of cargo that can be carried, the ship's displacement must be calculated both when it is in light condition and when it is loaded, to find the difference which represents the weight of cargo that can be carried. The lightweight displacement tonnage is equivalent to the weight of water displaced by the ship's hull. machinery and equipment, plus the weight of the crew and their effects, when no cargo or bunkers are carried. When the maximum permissible weight of bunkers and cargo is added, the ship has reached its full displacement tonnage. The difference between the full displacement tonnage and the lightweight displacement tonnage is called the deadweight tonnage, and this corresponds to the weight of cargo and bunkers the ship can carry. Deadweight tonnage is the measurement ordinarily used to describe and compare the sizes of dry-cargo ships and tankers.

Many procedures, for example the assessment of harbour dues and canal transit dues, require the use of a different system of tonnage measurement, based on the volumetric ton. The volumetric ton is a measure of the capacity of the enclosed space in a ship. one ton equalling 100 cu.ft. of enclosed space. The volume of the ship up to the tonnage deck (which is generally the uppermost continuous deck) excluding certain exempted spaces such as the double-bottom tanks: the steering-gear compartments, the galley and other spaces not used for the carriage of cargo, is described as the underdeck tonnage. and is expressed in terms of 100 cu.ft. per ton. The internal volume of 'tween decks and deck erections used for the carriage of cargo is added to the underdeck tonnage to give what is called the gross tonnage, again in terms of 100 cu.ft. of enclosed space per ton gross. In merchant shipping statistics the gross registered tonnage is usually given. It is also given for passenger ships. whose deadweight tonnage is relatively unimportant as a means of comparing them in size. For the purpose of assessing dues payable for port, canal. pilotage. lighthouse and other services, the freight-earning capacity of the ship is usually accepted as the criterion of measurement, and this is commonly arrived at by deducting from the gross tonnage the space devoted exclusively to such items as machinery. bunkers, crew accommodation and navigating quarters in order to calculate the net registered tonnage. It is apparent that the final tonnage measurement of a ship according to the volumetric reckoning depends much on the definition of the spaces exempted from computation for various reasons.

The British system of tonnage measurement is the one most used by maritime nations. but in certain areas, notably the Suez and Panama canals: there are different systems of measurement for the assessment of tonnage on which dues are payable, and all ships have to be specially measured for the assessment of their dues when passing through these areas.

For the purpose of assessing freight rates on cargo, yet another form of volumetric tonnage is employed, known as the measurement ton, which is equivalent to 40 cu.ft. of capacity. This term has no connection with the tonnage measurements used for registration and for the assessment of dues. It derives from the fact that the charge made for carrying cargo is normally based either on the weight of the cargo or on the amount of space it occupies. Freight rates cannot all be fairly assessed by weight alone. It is obvious that a ton of feathers would occupy a far greater amount of the ship's hold than a ton of coal; for example. Likewise a heavy item of machinery, although occupying much less space than a ton of coal, would prevent the extra space being used for the carriage of more cargo, for such a deadweight cargo would bring a ship down to its load line limits with much of the cubic capacity of its holds still unfilled. Hence liner freight-rate tariffs are generally expressed in terms of so much per ton weight or measurement? the measurement ton being the equivalent of 40 cu.ft. of capacity, and the rate paid being the higher of the two.

VII. INTERNATIONAL PROBLEMS

Despite the large measure of international agreement and co-operation which has been achieved in the shipping industry, particularly in the 20th century, there is still much competition betn-een merchant fleets. Those of one nation compete among themselves, and international rivalries are also strong. The situation is complicated by the fact that merchant shipping has an economic and strategic as well as a commercial value for most maritime nations. They depend on merchant fleets for the survival of their military power—troops and supplies must be carried by sea. and so must food and industrial raw materials. Many maritime nations too. particularly island nations such as Great Britain and Japan. depend for their economic existence on imports of food and of raw materials for industry, as well as on a flow of exports sufficient to pay for these. All this depends on merchant shipping. Moreover, Great Britain. Japan, Norway and many

other maritime nations, depend to a great extent for their economic well-being on the ability to balance their international trading accounts with the invisible exports represented by the earnings of their shipping industry.

Politics and strategy interfere with the ordinary business activities of the shipping industry in several ways. For internal political reasons, some states decide that the provision of shipping services shall be a state monopoly. but in practice this is difficult to achieve since a state's jurisdiction does not extend beyond territorial waters. Various practices observed from time to time, however, are designed to protect the domestic shipping industry and to discriminate against shipping of other flags. These discriminatory measures may be used to protect the shipping of the national flag, even if the ships are not state owned. Higher port dues may be charged to foreign ships, for example, or national-flag ships may be favoured. In bilateral trade agreements it is sometimes stipulated that a fixed proportion of the cargoes must be carried in ships of the national flag. A common method of assisting the domestic shipping industry is to reserve coastal shipping to ships of the national flag, a policy abandoned by Great Britain with the repeal of the Navigation acts in 1850. This decision greatly assisted the expansion of the British mercantile marine, but several other nations, notably the United States, adopted the opposite attitude and strictly reserved coastal trade.

Another means of assisting the national shipping industry and of protecting it against economic competition is the payment to it of direct or indirect subsidies from the national exchequer. These subsidies may take many forms, varying from tax exemptions or preferential credit terms to direct subsidy of shipbuilding or of operating costs. In the United States, where shipbuilding costs and manning costs are much higher than in most maritime countries, the Merchant Marine act of 1936 and its successors attempted to promote the use of U.S.-flag merchant ships by means of direct subsidies to liners on specified essential trade routes. In France, Italy, India and Argentina, the state participates directly in the ownership of the larger liner organizations. Ships engaged in international trade, whatever their flag, all have similar expenses. They pay much the same for bunkers. for repairs and maintenance. for cargo-handling, and for port dues, except insofar as flag discrimination may be practised. Crews' wages, however. do differ among ships of different flags. Shipbuilding costs tend to vary widely from one country to another, but in general shipowners may build where they please. The payment of direct shipbuilding or operating subsidies, therefore, is not as objectionable to unsubsidized shipowners as is the reservation of cargoes to ships of a particular national flag, whether this rule is incorporated in trade agreements or written into legislation. In the United States, for example, after World War II, the shipment of gift cargoes under the Mutual Security act and the cheap sale of surplus farm products were allowed only on condition that at least half the ships used were of the U.S. flag.

Although operating costs are much the same for ships of all flags. profits are subject to the rates of taxation in different countries. If all ships paid the same taxes, the margin of profit for each company would depend largely on its efficiency. After World War II, heavy taxes combined with a sharp rise in shipbuilding prices to cause the registration of more and more shipping companies in countries such as Panamá and Liberia. where taxation was low. Greek and American shipowners resorted in large numbers to registry under these so-called flags of convenience, with the result that by 1957 the merchant fleets of Liberia and Panamá combined were the largest in the world, after those of the United Kingdom and the United States.

VIII. WORLD MERCHANT FLEETS

Statistics of world merchant shipping tonnage are little more than estimates until the later years of the 19th century, when steamships began to oust sailing ships from predominance in world trade. The statistics given in Table I illustrate the decline of the sailing ship between 1886 and 1935, and the increase in the total tonnage of merchant shipping in the world, which rose from 10,291,000 tons gross (steam only) in 1886 to 64,886,000 tons gross (including sail and barges) in 1935. By 1939, before the outbreak of World War II, the world total had reached 69,440,000 tons gross including sail (see Table II, which, however, excludes sail), and despite the enormous losses suffered during the war (Table III) the world fleet had reached 80,292,000 tons by 1948. The growth continued so that by 1955 the total tonnage exceeded 100,000,000 tons gross for the first time.

A significant feature of the development of the world merchant fleet after 1920 was the growth of the number of ships propelled by diesel engines, and Table IV illustrates the increase in the proportion of motorships. A simultaneous development was the replacement of coal by oil as fuel for steamships, a movement which reached its peak just after World War II. By 1956 the coal-burning ships still in existence accounted for less than 10%

TABLE IV.—*Fuel Analysis* of World Tonnage
(Tons gross)

Source: Lloyd's Register of *Shipping.*

of the total tonnage! and the number of coal-burning ships still being built mas negligible.

After World War II a vast increase in world tonnage took place. This was partly due to the existence of many ships in the United States defense emergency reserve fleet, but chiefly to the rapid increase in the demand for oil tankers (see Table V). The United States became a net importer of oil, while the United Kingdom and the continent of Europe also required sea transport for oil, The middle 1950s saw a rapid expansion of world industry, especially of the steel industry in the German Federal Republic, in the United Kingdom and in Japan. The United States, though its domestic supplies of iron ore were inadequate, likewise expanded its steel industry. These circumstances caused an even greater demand for merchant shipping.

Although the total gross tonnage of the world merchant fleets constantly increased, the actual number of ships remained more or less steady (see Table II) because the average new merchant ship was larger. especially after World War II. The average speed of ships also increased, although to what precise extent it is impossible to measure. Large ships tend to have higher speeds than small ones, however, and there can be no doubt that the ton-mile capacity of the world fleet after the end of World War II increased proportionately even more than the total gross tonnage.

1. British Commonwealth. — As a result of British war losses and of the U.S. emergency shipbuilding programs of World Wars I and **11,** the mechanically propelled tonnage registered in the United States on two occasions exceeded that registered under the British flag. Great Britain nevertheless retained the largest active merchant fleet in the world, although its proportion of the world total declined in the 20th century. The British commonwealth owned 63.6% of the mechanically propelled merchant shipping in the world in 1886, 35.2% in 1914, 37.4% in 1920 and 34.6% in 1927. By 1935 the proportion was 31.9%, and in 1939 it was 30.4%. The tonnage in 1939 was 21,215,000 tons gross, and despite heavy war losses amounting to nearly 12,000,000 tons gross, the 1939 tonnage total was exceeded by 1948. Great Britain's proportion of the world total, however, including the U.S. inactive fleet: had been reduced to 27.4%. By 1955 British tonnage had increased to 23,231,000 tons gross, but its percentage had dropped to about 23.4%.

Most of the British-registered tonnage is owned and operated by the United Kingdom. In 1939, 7,009 ships of 17,984,158 tons gross were registered in the Gnited Kingdom and 2,479 ships of 3,231,103 tons gross in the British commonwealth outside the United Kingdom, mainly in Australia, Canada, Hong Kong, India, Malaya, New Zealand, South Xfrica and the West Indies. Canada acquired a substantial fleet of vessels built during World War I, but after a few years most of the ocean-going ships were re-registered in the United Kingdom, although the beneficial ownership remained in Canada. The general movement toward flags of convenience. referred to above, however, started a tendency from 1956 onward for United Kingdom shipowners to register new tonnage in such commonwealth countries as Bermuda and the Bahamas, so that profits used for the purpose of replacing obsolescent tonnage would not be subject to United Kingdom taxation.

The privately owned United Kingdom merchant fleet at Jan. 1, 1957. excluding fishing vessels, tugs and other nontrading vessels, as well as ships of less than 500 tons gross in size, exceeded 18,000,000 tons gross. Oil tankers and whaling factory ships accounted for more than 5,000,000 tons gross of the total gross tonnage. Passenger and cargo liners totaled nearly 8,500,000 tons gross and tramps just over 2,800,000 tons gross. The remainder consisted of ships engaged in the coastal and short-sea trades. The United Kingdom continued to maintain the largest fleet of purely passenger ships in the world. They are engaged principally in the following trades: (1) Great Britain, France and Ireland to Canada and the Gnited States; (2) Great Britain to South Africa, Australia, New Zealand, India and the far east; (3) Great Britain to Spain, Portugal and Central and South America; (4) cross-voyages, for example Australia to the far east and New York to Bermuda; (5) cross-channel services between Great Britain and Ireland and the continent of Europe; and (6) pleasure cruising in off-seasons from Great Britain, Australia. the United States and elsewhere. Specially designed refrigerated cargo liners, often carrying up to 100 passengers, sail between Great Britain and Australia, New Zealand, South America and South Africa, carrying homeward cargoes consisting mainly of meat and dairy produce. Cargo liners, many of them able to accommodate not more than 12 passengers, operate regular services from Great Britain and the continent of Europe to all parts of the world. They also sail between overseas countries, for example from the United States to India, from Canada to West and South Africa: from the United States to the far east; and they may go around the world without touching Great Britain. British shipping services make a substantial contribution to the nation's balance of international payments through earnings of foreign currency. An inquiry carried out into the earnings of the British shipping industry for the year 1952 showed that receipts of foreign currency for freight, passenger fares and charter hire totaled £509,700,000, while disbursements abroad totaled £288,300,000, making a net contribution of £221,400,000 to the nation's balance of payments.

Many of the well-known British shipping companies were founded in the earliest days of steam navigation, and some of them have even longer continuous histories. One of the biggest shipping groups in the world is centred on the Peninsular and Oriental Steam Navigation company, which operates passenger and cargo-liner services between Great Britain and the continent of Europe to India, Pakistan, Ceylon, Malaya. Australia and the far east. The group also includes the Orient line passenger services to Australia, New Zealand and the Pacific coast of North America and the refrigerated cargo-liner services to Australia and New Zealand operated by ships of the New Zealand Shipping company and the Federal Steam Navigation company. It includes the Nourse line, trading between the West Indies and India, the British India Steam Navigation company, trading between Britain and India and East Africa, as well as in the Indian ocean, the Hain Steamship company, engaged in world-wide dry-cargo tramping, the General Steam Navigation company, with a network of liner services between the Mediterranean and the Baltic seas, and the Union Steamship company of New Zealand. In 1956 the P. and O. group broke new ground by ordering a fleet of 25 tankers.

The Cunard line is famous for its transatlantic liners, but it also operates cargo services to the Mediterranean. The Port line, affiliated to the Cunard line! sends refrigerated liners to Australia and New Zealand. The Brocklebank line, another Cunard affiliate, runs to the Indian ocean from Great Britain and the United States. The Union-Castle line, which operates mail, passenger and cargo services to South Africa, merged in 1956 with the Clan line, a company running a world-wide network of cargo-liner services, to form the British Cominonwealth Shipping company. Royal Mail lines operate passenger and refrigerated cargo-liner services to South America, and cargo-liner services to the Caribbean and the Pacific coast of North America, while their subsidiary, the Pacific Steam Navigation company, operates passenger and cargo services to the west coast of South America.

Another large group is the Furness Withy group, operating passenger and cargo-liner services in many parts of the world. Most of the companies referred to above are public companies, but there are also some private companies or partnerships in which there is no public participation by means of shareholdings. Some of these, for example Alfred Holt and Company (the Blue Funnel line) and Ellerman lines, operate substantial fleets. The P. and O. group and several other shipping companies have substantial interests in independent air transport undertakings. Tramp shipping companies tend to be larger in number and smaller in size. Large tanker fleets are operated by the British Petroleum and Shell oil companies, but there is also a large number of independently owned and operated tramp tanker companies.

2. Denmark. — The Danish merchant fleet, which totaled 705 vessels of 1,122,608 tons gross in 1939, suffered heavy losses during World War II. hut by 1950 the strength of the fleet had more than recovered, and it reached 718 vessels of 1,269.011 tons gross. By 1956, although the number of vessels had declined to 687, the gross tonnage had advanced to 1,695,221 tons gross, of which about 30% consisted of tankers. Most Danish ships are propelled by diesel engines, the Danish firm of Burmeister and \Vain having built the motorship "Selandia," the first ocean-going motorship in the world. There is a substantial ferry traffic between Denmark and Sweden and Denmark and Germany, as well as plenty of trade between Denmark and the United Kingdom?in which Danish ships participate; but only about one-third of the foreign trade passing through Danish ports is carried in Danish ships. Danish shipowners, however, find much employment in overseas trading and in 1953 carried more than 9,400,000 tons of cargo between foreign ports. In 1953 gross earnings of Danish shipping in foreign currency totaled 976,000,000 Kr., excluding 119,000,000 Rr. in time-charter earnings. More than four-fifths was earned in purely foreign trade. By far the largest shipowning company in Denmark is the A. P. Moller concern, which operates around-the-world services as well as tramps and tankers, with a fleet totaling more than 400,000 tons gross. Next largest is the East Asiatic company, running regular liner services to India. Australia, the far east and North America, with a fleet of nearly 300,000 tons gross. The United Steamship company operates cargo liners to all parts of Europe, as well as to North and South America, while the J. Lauritzen concern operates refrigerated cargo-liner services to North and South America and to the Mediterranean, and also provides ships specially built for service in polar waters.

3. France. — The principal activity of the French mercantile marine is the carrying of trade from metropolitan France to other parts of the French union, notably to those in North Africa. \Vest Africa and the West Indies. and to former French-controlled territories in southeast Asia. A world-wide network of liner services. however, is operated by the state-controlled Compagnie Générale Transatlantique (French line) and other lines such as Messageries Maritimes. A good deal of coasting trade is carried in French vessels, and traffic between French territories in Africa and metropolitan France is largely reserved to vessels of French registry. The French liner fleet includes a substantial number of large passenger liners, like those of the French line which operate in the North Atlantic trade, and a high proportion of specially designed banana carriers and fruit ships. France runs fewer dry-cargo tramp ships than do many other European nations.

In 1939 the French merchant fleet numbered 1,282 vessels totaling 2,952,975 tons gross. About half of this fleet was lost during World War II, but by 1949 its previous strength was restored, partly in consequence of a prompt rebuilding program and partly through the purchase of surplus U.S. ships and the acquisition of ex-enemy vessels as war reparations. Regular planned and subsidized shipbuilding programs enlarged the French-flag fleet until by 1956 it had reached the total of 3,943,201 tons gross. of which 32% consisted of tankers. Much of the postwar expansion was due to the building up of a tanker fleet much larger than that considered necessary before the war.

4. Germany.---German merchant shipping reached its peak in 1914 after a decade of highly successful competition on the high seas. In that year the German merchant fleet totaled nearly 5,500,000 tons gross, and the flags of such liner companies as Norddeutscher Lloyd, the Hamburg-America line and the Hamburg South America line. were well known throughout the world. The defeat sustained in World War I. however, caused the disruption of this fleet. By 1920 less than 700,000 tons gross remained under the German flag. But by persistent effort. the merchant fleet was rebuilt. and although it had not quite reached 4,500,000 tons gross by 1939, its quality and efficiency were above average. A world-wide network of liner services had been re-established, as well as a tramp fleet which flourished particularly in the Baltic and short-sea trades.

World War II resulted in a second eclipse of the German merchant fleet, and postwar restrictions on the size and speed of the ships that the Allies permitted to be built deferred the rebuilding of the fleet for several years. By 1949 the German-flag fleet had been reduced to 300,000 tons gross. A rapid expansion began in 19j0. however, the bulk of the building program being confined to fast modern cargo liners of moderate size. By 1956 the fleet of the German Federal Republic had grown to 2.08; vessels of 3,206,381 tons gross, nearly all of them being of post-1950 construction. The nucleus of a Federal Republic tanker fleet emerged, and plans were made for the resumption of the passenger trade.

5. Greece. — The Greek-flag merchant fleet expanded steadily between World Wars I and II. from 496,996 tons gross in 1920 to 1,780.666 tons gross in 1939, but this was due not so much to new construction as to the purchase of second-hand ships from other flags. As a result the average age of the ships of the Greek fleet was high. and in 1939 some three-quarters of the total tonnage was more than 20 years of age. For the most part this fleet was engaged in international dry-cargo tramping. Severe losses were suffered during World War II, but after the war large numbers of n-ar-built Liberty ships were purchased from the United States and by 1950 the Greek-flag fleet totaled 1,348,874 tons gross. Thereafter a decline set in, for many Greek owners preferred to register their ships under foreign flags, especially under flags of convenience such as those of Panamá and Liberia. Indeed, even before World War II, many Greek shipowners felt their gift for shipping commerce restricted by successive Greek legislatures. and transferred their operations to other flags. Owners of Greek nationality achieved a predominant position in world dry-cargo tramping in the years following World War II. They operated mainly from London and New Tork.

6. Italy. — Between World Wars I and II the principal Italian liner companies were liquidated and reconstituted as a state-owned organization known as the Finmare group, comprising four major lines. the Italia line, the Lloyd Triestino line. the Adriatica line and the Tirrenia line. Capital was provided by the state. which in 1937 also assumed control of the major shipbuilding yards, and in 1939 the Italian merchant fleet consisted of 1,335 vessels, totaling 3,448.453 tons gross. Only about 12% of this tonnage remained at the end of World War II. but by purchase. salvage and new construction the prewar total was passed by 1953. The state-owned liner group continued in existence and was responsible for the building of several large passenger liners, fast cargo liners and specialized ships. The privately owned section of the industry, engaged in liner: tramping and tanker operations, also succeeded in rebuilding and expanding, and by 1956 the Italian-flag fleet had reached the record total of 4,196,762 tons gross, of which 31% were tankers.

7. Japan. — The maritime expansion of Japan was extremely rapid between World Wars I and II, tonnage having almost doubled between 1920 and 1939, when the peak figure of 5,629,845 tons gross was reached. The geographical situation of Japan is favourable to the natural development of a large shipping industry, which was fostered between the wars by comparatively low-wage rates and a measure of state support. A great deal of the tramp and liner trades between Japan. China and other Pacific countries fell to Japan during this period, and in addition such large liner groups as Nippon Yusen Kaisha and Osaka Shosen Kaisha built up a world-wide network of passenger and cargo-liner services. Defeat in World War II left Japan with a largely obsolescent fleet totaling little more than 1,000.000 tons gross, but by 1950 postwar restrictions had been for the most part removed and the Japanese fleet again began to increase. largely as a result of government-sponsored shipbuilding programs. By 19j6 the Japanese merchant fleet had reached a total of 4,075,781 tons gross. consisting mainly of postwar dry-cargo liners and tramps. A start had been made on building tankers and ore carriers, and plans were being made to resume passenger services.

8. Liberia. — The rise of a merchant fleet registered under the flag of Liberia is entirely a development of the decade following 1 War I Whereas in 1939 the tonnage registered in Liberia was too negligible to be noted separately, by 1956 it totaled 5 584,-378 tons gross, and the Liberian fleet was the fourth largest merchant fleet in the world. This phenomenal increase was due entirely to the postwar tendency of shipowners of other nationalities, eiperially Greeks and Americans, to register their new ships under flags of convenience, thereby evading onerous taxation burdens or other restrictive measures imposed by their national legislatures. Most of the ships registered in Liberia are vessels of postwar build, and in 1955, 69% of the total consisted of tankers, almost all the remainder being dry-cargo ships engaged in international tramping.

9. Netherlands. — There are three principal branches of the Netherlands shipping industry, which consists mainly of ocean-going passenger and cargo liners, tankers owned by the major oil companies. particularly the Royal Dutch/Shell group, and coasting and short-sea vessels engaged mainly in trade with the United Kingdom and neighbouring and Baltic sea countries. The chief mainstay of the ocean liner companies before World War II was the trade with the Dutch East and West Indies. Despite the granting of political independence to Indonesia after the war, the principal Dutch liner companies were able to retain a great part of their network of services. The Netherlands merchant fleet in 1939 totaled nearly 3,000,000 tons gross, a figure which was again achieved, despite war losses, by 1949. By 1956 the fleet had grown to 4,006,077 tons gross. much of the increase being due to the growth of the tanker fleet.

10. Norway. — The Norwegian merchant fleet expanded to a marked extent during the 20th century, owing to the traditional skill and seafaring bent of the Norwegian race and the dependence of Norway's economy on its income from international shipping services. Although the overseas trade of Norway itself is not sufficient to maintain a large merchant fleet, the iatter grew to comparatively large proportions mainly through the enterprise of Norwegian shipowners in the world-wide tramping trades. From mainly tramp origins, a number of liner groups developed, operating world-wide services. but the expansion of the fleet since the end of World War 11 has been largely due to the enterprise of tramp tanker owners. The Norwegian merchant feet grew from 2,219,388 tons gross in 1920 to 4,834,902 tons in 1939, but about 40% of this tonnage was lost during World War II in the service of the Allied powers. Substantial purchases of U.S. war-built tonnage, together with an intensive postwar reconstruction program. helped to restore the prewar strength by 1949; but the potentialities of the international tanker market were such rhat Norwegian shipowners made even greater efforts to build. As a result, by 1956 the fleet had reached the figure of 8,035,340 tons gross, of which 57% consisted of tankers.

The net foreign currency earnings of the Norwegian shipping industry contribute a substantial amount to the nation's international balance of payments. In the period covered by the years 1930 to 1939, both inclusive, the net foreign-currency earnings of the shipping industry, the cost of importing ships built abroad being deducted. paid for 23.3% of the nation's total import bill. Between 1946 and 1949. because of the high cost of replacing war losses with new ships built abroad, the net shipping contribution accounted for only 5.5% of the balance, but between 1950 and 1953 the prenar percentage nas restored.

11. Panam&. — Statisticsof ships registered under the flag of Panamá were not kept separately by Lloyd's Register of Shipping until 1924, when 1j vessels totaling 85,593 tons gross were listed. From 1931 onward there was a gradual increase in the merchant shipping registered in Panamá, although the beneficial ownership was vested almost entirely in the United States, until the total of 717,525 tons was reached in 1939. After World War II the practice grew for U.S. oil companies and Greek and other independent tramp shipowners to register their ships under the flag of Panamá, and by 1949 the merchant fleet registered in Panamá exceeded 3,000,000 tons gross. By 1954 the figure of 4,000,000 tons gross had been exceeded. but then a slight decline began, owing to the preference for Liberia as a flag of convenience. The fleet in 1956 totaled 3,925,751 tons gross, of which 2,066,562 tons gross (52.5%) consisted of tankers.

12. Sweden. — The Swedish merchant fleet reached 1,000,000 tons gross in 1913 and gradually increased its tonnage until by 1939 it reached 1.581,919 tons gross. This expansion continued after World War II and by 1949 the total exceeded 2,000,000 tons gross. In 1956 the total reached 2,922,092 tons gross, of which about 30% consisted of tankers. In addition to a substantial coasting and short-sea traffic, and a fair-sized ocean-going tramp fleet, Sweden has a number of well-established liner groups, such as the Brostrom concern! which includes the passenger liners of the Swedish American line, the Transrederierna group, operating world-wide cargo-liner services, and the Johnson line, which specializes in high-speed cargo-liner services. Iron ore is one of Sweden's major exports, and the Grangesberg-Oxelosund concern built up a large fleet of ore carriers to cope with this trade, many of the larger units being able to carry iron ore exports on the outward voyage and cargoes of imported oil products on the return voyage.

13. United States. — In 1913 the United States ocean-going merchant fleet, including the coastwise fleet, totaled nearly 3,000,-000 tons gross. As a result of an emergency shipbuilding program toward the end of World War I, the U.S. ocean-going fleet reached a total of 14,738,506 tons gross by 1922. but a gradual decline then set in until by 1939 the total ocean-going fleet amounted to 9,336,15j tons gross, of which only about two-thirds was then active. High-wage costs and high shipbuilding costs made it impossible for the U.S. privately owned merchant fleet to compete effectively with foreign flags. In an endeavour to stem the decline of the U.S. foreign-going fleet. the Merchant Marine act of 1936 introduced a system of differential subsidies for the building and operating of liner services on specified "essential trade routes." These helped to sustain the cargo-liner companies. although they failed to provide any incentive for private investment in shipping. They did not apply to the tramp companies. which almost disappeared, or to the tanker companies. which found the obligations of the shipbuilding subsidy provisions irksome and sought refuge in registration in Panamá and other countries abroad, or to the intercoastal and coastwise shipping companies which, despite the protection afforded them by the reservation of their trades to U.S. flag ships. were unable to cope with the competition of inland transport systems.

TABLE VI.— U.S. Water-Borne Foreign Commerce Carried in U.S. Flag Vessels
(cargoes in 000,000 lb.)

Sear	Exports				Imports			
	Dry cargo		Tanker		Dry cargo		Tanker	
1946 . . .	143,474	60.9%	30,360	39.9%	50,703	56.3%	47,679	75.8%
1950 . . .	107,618	30.6%	18,270	43.5%	93,777	31.1%	100,162	54.9%
1956 . . .	258,403	18.7%	33,153	19.5%	159,843	26.4%	162,707	23.2%

World War II saw another intensive shipbuilding effort in the United States, which agreed with Great Britain to build chiefly cargo ships of emergency type, while Britain for the most part built warships. As a result the United States merchant fleet in 1946 totaled 36,000,000 tons gross. This was more than half the world total tonnage at the end of World War II. because ships of other flags were often lost. and few losses were replaced during the war years. Disposal of the U.S. surplus tonnage to the other Allied powers began in 1936 and many ships were sold at favourable prices. By 1950 the United States-flag merchant fleet had been reduced to 25,000,000 tons gross, but of these 14,000,000 tons gross had been permanently laid up in the emergency defense reserve fleet. The Merchant Marine act of 1936 continued in force and various other legislative measures were taken in an attempt to maintain the volume of U.S.-flag shipping in commercial service. At least half the ships carrying government-sponsored cargoes had to be of the U.S. flag. United States-controlled tanker tonnage under foreign flags continued to increase, and the subsidized passenger and cargo liners maintained their tonnage, but the decline of coastwise and intercoastal shipping continued.

By 1956 the total United States seagoing merchant fleet, including inactive ships but excluding Great Lakes vessels. comprised 3.989 ships totaling 23,643,154 tons gross. Of the ocean-going fleet 496 vessels, totaling 4,210,162 tons gross, were tankers, practically all of which were active.

United States shipping on the Great Lakes continued busy. Tonnage reached a peak of 2,611,040 tons in 1934. By 19j6 the total was still just over 2,500,000 tons gross, but prospects began to decline with the decrease of iron ore deposits in the area.

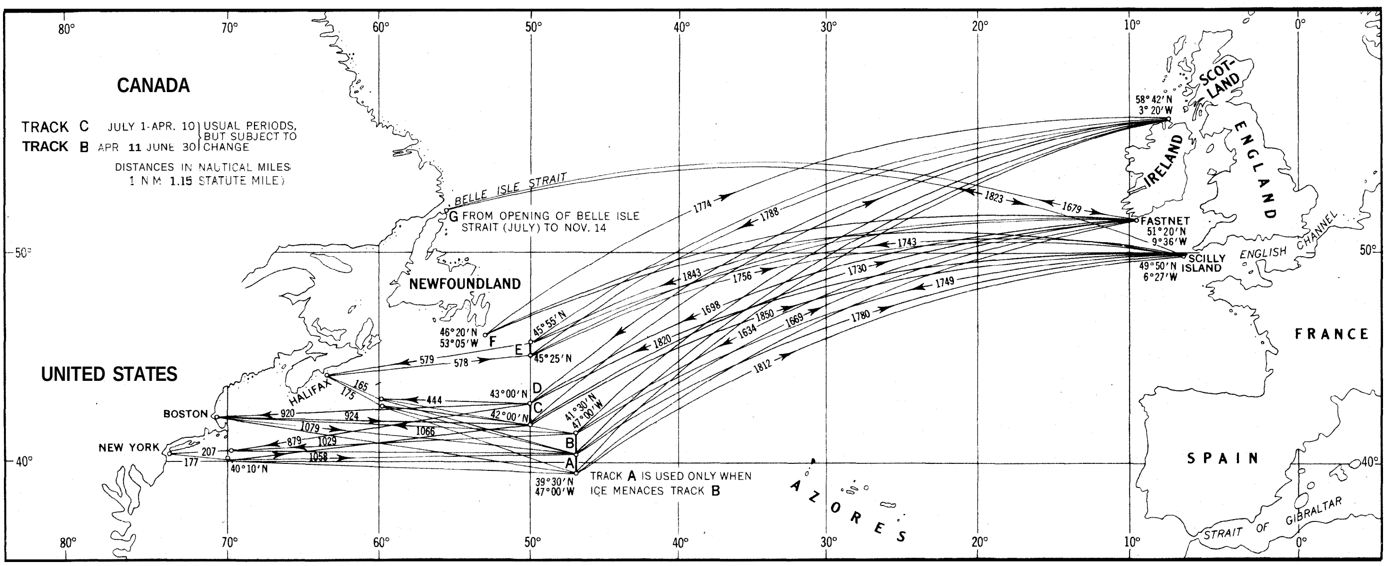
SHIPPING ROUTES. When man first began to venture on the sea, his route was determined by the landmarks along the shore. As the science of navigation developed and he could determine his latitude by the heavenly bodies. he was no longer bound to the coast. It was not, however, until the perfection of the chronometer by John Harrison in 1762 that a shipmaster could accurately plot both his latitude and longitude. Then with exact positions he became more aware of the effects of winds and currents on his ship and began shaping his course to take advantage of them. The shortest route was not always the quickest one: for example, the westbound clipper ships from Europe to America made much faster passages by following a southerly route to avoid the influence of the Gulf stream and the prevailing westerly winds.

No systematic effort was made to study regular ship routes until the decade preceding the American Civil War when Lieut. Matthew Fontaine Maury, then superintendent of the depot of charts and instruments, the forerunner of the present U.S. navy hydrographic office, enlisted the aid of shipmasters generally to furnish him with copies of their log books. From these he produced his Pilot *Charts* with recommended routes that by estimate saved the merchants and shipmasters of the United States more than $2,000,000 annually, and those of Great Britain about $10,000,000 each year. His contributions to the maritime world earned him the title of "Pathfinder of the Seas."

The development of steam navigation ended the shipmaster's dependence on wind as the sole means of propulsion and led to the gradual adoption of the ship lanes of today. The shortest distance between two ports is a great circle on the earth's surface and the modern high-powered steamer follows such routes whenever practicable. However, deviations are made to avoid intervening land masses: ice infested waters and regions of continuous adverse meteorological conditions. Low-powered steamers travel routes taking advantage of favourable winds and currents. The leading hydrographic offices of the world have made studies of the various routes and publish in their volumes of sailing directions advice on the routes to follow. While the high speed of planes has led to international agreements on air lanes and a rigid control on plane flights, there are at present no mandatory international rules governing the ocean lanes, and the selection of the routes to be followed is left to the discretion of the steamship owners and shipmasters.

North Atlantic. — The combination of frequent fog, high density of travel and the annual incursion of ice has led to the establishment of definite ship lanes that are recognized internationally in the North Atlantic between the United States and Europe; these are traveled by the largest and fastest liners. The danger of collision in the North Atlantic was first recognized by Maury, following the sinking of the U.S. mail steamer "Arctic" in Oct. 1854 by the French steamer "Vesta" in a thick fog about 50 mi. east of Cape Race. Nfd., which resulted in the loss of about 300 lives. This disaster inspired him to include in his *Sailing Directions* (185j) a section "Steamer Lanes Across the Atlantic." wherein were graphically depicted and recommended for the first time separate lanes for steamers eastbound and westbound that would not only lessen the danger of collision between ships, but would also provide nearby help in case of disaster. The lane to Europe crossed the 50th meridian of west longitude in latitude 42" and was from 15 to 20 mi. wide; the lane from Europe crossed the 50th meridian of west longitude 200 mi. to the northward and was from 20 to 25 mi. wide, the latter being made wider on account of the greater percentage of fog, the greatest width in both lanes being given where most fog was to be expected.

The pioneer work of Maury was continued by the U.S. navy hydrographic office which emphasized the necessity of lanes across the Atlantic, not only to obviate collisions, but also to avoid the danger from ice. In 1875 the Cunard Steamship company ordered its shipmasters to follow ship lanes that were laid south of the zone into which icebergs normally drifted. Several of the other large



NORTH ATLANTIC LANE ROUTES

and more progressive passenger lines followed this policy, and as a result the number of accidents due to ice showed an encouraging decline. In the meantime. through the medium of the monthly *Pzlot Chart of the North Atlantic Ocean,* the hydrographic office pointed out to the maritime world in general the need to adopt steamer lanes.

The International Marine conference, held at Washington. D.C., in 1889, and attended by delegates from 26 maritime countries, decided: "Steamer lanes for trans-Atlantic navigation are not adopted, although the various steamship companies are urged to adopt regular routes for vessels of their own line." At the urging of the hydrographic office, a conference nas held in 1891 between representatives of five principal trans-Atlantic steamship companies, the Cunard, White Star. Inman, Sational and Guion lines, to consider the lanes as recommended on the *Pzlot Chart* These routes were formally adopted to be followed by all ships of the lines concerned and in 1898 the North Atlantic Track agreement came into being with the adherence of all the major passenger lines of that day. The agreement. although purely voluntary in nature, has remained in effect into the second half of the 20th century with seasonal shifts of the lanes being made as recommended by the commandant of the U.S. coast guard and the U.S. hydrographer. This adoption of recognized steamer lanes contributed greatly to the safety of navigation in the Sorth Atlantic and aas especially gratifying to the hydrographic office, which had so long advocated the lanes as shown on the *Pzlot Charts.*

As a result of the sinking of the British steamer "Titanic" on April 1j, 1912, with a loss of over 1,500 lives. the first International Convention for Safety of Life at Sea was convened at London in 1913. The steamer lanes were considered and the following resolution adopted: "The selection of the routes across the North Atlantic in both directions is left to the responsibility of the steamship companies, nevertheless the High Contracting Parties undertake to impose on these companies the obligation to give public notice of the regular routes which they propose their vessels should follow. and of any changes which they make in them. The High Contracting Parties undertake, further, to use their influence to induce owners of all vessels crossing the Atlantic to folloa, as far as possible. the routes adopted by the principal companies." Similar resolutions were adopted at the subsequent conventions of 1929 and 1948.

With but minor changes. the lanes of the North Atlantic Track agreement, used by the principal steamship companies prior to the London conference, remained unchanged until 1924 when the tracks A, B, C. D, E, F and G were adopted. These. with slight modifications, are the tracks in use today and are shown on the accompanying chart. The routes are seasonal and provide, as far as possible, for safety from the danger of ice, fog and collision with fishing vessels on the Grand Banks. Tracks A. B and C are the United States-European lanes, while D. E, F and G relate to vessels bound to and from Canada. The seasonal United States track empioyed is the one that is ice-free.

An additional safeguard to the North Atlantic lanes resulting from the conference of 1913 was the establishment of the International ice patrol. which, during the ice season, guards the region in the vicinity of the Grand Banks of Newfoundland. warns ships of dangerous ice, recommends safe tracks and makes studies of ice conditions. The cost of the patrol is borne by those nations whose vessels traverse the area. The management of the ice patroi is entrusted to the United States government and is carried out by the U.S. coast guard.

Originally conducted with surface craft, the ice patrol today is maintained principally by reconnaissance aircraft based at the headquarters of the commander of the international ice patrol in Argentia, Nfd. Only in serious ice years is it necessary to dispatch a cutter to stand by ice known to be drifting into the steamer lanes. Since the inauguration of the International ice patrol services, not a single life has been lost or a vessel sunk on the United States-European lanes as the result of collision with icebergs. *See* also TRADE ROUTES. (W. G. WT.)

SHIP'S BELLS, in use as early as the 15th century, make possible the distinctive method of sounding the time on board ship. The mariner's 24-hour day is divided into six watches, each four hours long. except that the 1600 to 2000 watch (4 P.M. to 8 P.M.) may be "dogged" or shortened into the first and second dogwatches, each two hours long, in order to rotate the watches and to allow the men on duty to have their evening meal. Through the 18th century, time was ordinarily measured on board ship by using a sandglass which approximated 30 min. The quartermaster or ship's boy turned the glass when the sand ran through, and it became customary for him to strike the bell as he did this. Eight times in each watch the glass was turned and the number of strokes on the bell indicated the number of half hours elapsed after the men came on deck. These strokes are sounded in pairs, with an interval following each pair.

The time and place of origin of this seagoing custom is unknown but it was nearly universal among Europeans and sailors of the Mediterranean area by the 18th century. After the mutiny at the Nore (1797), British ships followed a special numbering in the dogwatch. From 1600 to 1800 the usual bells are struck, but at 1830 (6:30 P.M.) only one bell is struck instead of five; two at 1900 (7 P.M.); three at 1930 (7:30 P.M.); and eight bells at 2000 (8 P.M.). Thus, the signal for the mutiny, five bells in the second dogwatch, has never been given.

International law required that a ship at anchor sound a series of rapid successive strokes on the bell as a fog signal, while at other times this is a fire signal. (J. B. HN.)

SHIPS' FIGUREHEADS: *see* FIGUREHEADS. SHIPS'.

SHIPTON, MOTHER, a reputed witch and prophetess who is supposed to have lived in early Tudor times. There is no really trustworthy evidence of her existence! but tradition has it that her maiden name was Ursula Southill. Sowthiel or Southiel. that her parents were peasants, living near the Dropping Well. Knaresborough. Yorkshire and that she was born about 1486–1488. Her mother, Agatha Southill. was a reputed witch, and Crsula. who was phenomenally ugly, was regarded by the neighbours as "the Devil's child."

When about 24 she married a builder of York, Tobias Shipton. Her most sensational prophecies had to do with Cardinal Wolsey, the duke of Suffolk, Lord Percy and other men prominent at the court of Henry VIII. She is said to have died at Cliiton, Yorkshire, in 1561, and mas buried there or at Shipton. Her whole history rests on the flimsiest authority, but her alleged prophecies had an extraordinary hold on the popular imagination. The suggestion that Mother Shipton had foretold the end of the world in 1881 caused most poignant alarm in rural England in that year, the people deserting their houses and spending the night in prayer in the fields, churches and chapels.

SHIRAKAWA (1053–1129), Japanese emperor who succeeded his father Gosanjō II on the throne in 1072. The times were troubled. The encroachment of private estates (*shōen*) on the public domain seriously undermined the economic foundations of the imperial government. The warrior monks of the nearby temples threatened the capital city of Kyoto, and the weakening of the Fujiwara family. which had dominated the emperors for over two centuries. made for bitter factionalism within the court. Shirakawa left the throne in 1086 and as retired emperor (*jōkō*) succeeded in retaining power in opposition to the Fujiwara regent (*kampaku*). Drawing around him a group of courtiers, many of whom were from the Minamoto and other non-Fujiwara families, he established an administrative centre replete with judicial functions and a military guard. This was the cloister government (*in-no-chō*) through which former emperors exercised power until 1183. Shirakawa himself held the reins of government until 1129. Although at first Shirakawa sought to reduce private estates. he soon gave up the effort and became instrumental in converting large tracts of public domain into imperial *shōen.* With these sources of wealth he lavishly patronized Buddhism. He failed to strengthen the imperial government and prevent the rise of the provincial warrior gentry. *See* also JAPAN : *History.* (J. W. H.)

SHIRAZ, the capital of the province of Fars in Iran. 180 mi. N.E. by E. of Bushire. Pop. (1956) 169.088.

According to Moslem authors the town arose after the Mohammedan conquest. Shiraz owes some of its architectural distinction to Karim Khan Zand (1751–79), who governed it as regent (declining the title of shah)?made it his capital and greatly beautified it by many handsome monuments; but much of this work was destroyed by the eunuch ruler Agha Mohammed Khan. Of its numerous mosques, the ruined Jami Atiq is'the most noted and ancient, parts of it dating from the 9th century. The largest mosque in Shiraz is the Masjid i Nau, or New Mosque.

North of the city, is the Sa'diyyeh, an enclosure planted with cyprus and orange trees, which holds the tomb of the celebrated mystic poet Sa'di, and in a cemetery nearby is the Hafiziyyeh with the tomb of the poet Hafiz. Shiraz was also the birthplace of the religious reformer called the Bab.

Shiraz is an important trade centre. The area produces sugar beets, barley, oats and gum tragacanth. The most noted product is wine of the Khullar vineyards. The town is noted for its silverwork, inlaywork made of *Khatam-Kari,* cloths, brocades and silk floss, and is the centre of a rug industry. (P. Z. C.)

SHIRÉ, a river of east central Africa, the only tributary of the Zambezi navigable from the sea. The Shirk (length about *300* mi.) issues from Lake Nyasa and almost immediately enters a shallow sheet of water called Malombe or Pa-Malombe, *18* mi. broad and *12* or 13 mi. long. A shifting bar of sand obstructs the end of Malombe nearest Nyasa, but does not prevent navigation. Below hlalombe the bed of the Shirk deepens. The river flows through a mountainous country and in its descent to the Zambezi valley forms rapids and cataracts, rendering its middle course unnavigable for a distance of *60* mi. A little before the Zambezi is reached the country becomes flat. The Shirk joins the main river in about *35° 25'* E., 17° *50'* S.

The lower part of the Shirk is in Portuguese territory; the upper part is in the Nyasaland. Below Port Herald the Shirk is navigable all year. *(See* NYASALAND PROTECTORATE; ZAMBEZI.)

SHIRE, one of the larger administrative divisions in Great Britain, now generally synonymous with "county" (*q.v.*), but the word is still used of smaller districts. The Anglo-Saxon shire was an administrative division next above the hundred (*q.v.*) and was presided over by the ealderman and the sheriff (*q.v.*).

SHIRE MOOT, an assembly of the free men of a shire for judicial, fiscal and other administrative business. It is first mentioned in the reign of Edgar (958–975), and then probably consisted of all the free landholders of the shire. In course of time the burden of suit to this court became attached to particular estates, and by the 13th century the number of persons present at a shire court was small. Each shire moot met at a specified place, and in the 10th century twice a year only, though more frequent sessions were held in later centuries. The shire court received fresh importance in the 12th century from the occasional presence of royal justices itinerant, and at a later time it came to play an important part in the machinery by which members were elected to parliament from the counties.

SHIRLEY or SHERLEY, **JAMES** *(1596–1666),* English dramatist, was the most successful writer for the stage when the playhouses were closed in *1642.* He was probably born in London in Sept. 1596. He was educated at Merchant Taylors' school and Catharine hall, Cambridge, where he took his B.A. degree in or before *1618.* Before going to Cambridge he seems also to have spent a short time at St. John's college, Oxford. He took orders and went to a living near St. Albans, which he left on his conversion to Roman Catholicism. He was then (1623–25) master of St. Albans grammar school, but failing to settle to the work he eventually went to live at Gray's Inn, London, and became a playwright.

From *1625* till the Puritans closed the theatres in *1642* he was most successful. There survive 31 plays of his sole authorship, and six masques and entertainments. Ftom *1636* to *1640* Shirley was in Ireland and had several plays produced in Dublin, presumably at the Werburgh street theatre, the first in Ireland, which opened in *1637.* In the Civil War, he served with the Cavaliers, but on their defeat returned to teaching and writing educational textbooks. Throughout his career he wrote and published poems.

Driven from their London house by the Great Fire of *1666,* Shirley and his wife died from the experience within a day of each other. They were buried at St. Giles's-in-the-Fields on Oct. *29,* 1666.

Shirley's plays are packed with situations and types such as had been used more and more recklessly by Jacobean dramatists. His tragedies deserve regard mainly for their consummate stagecraft and their astonishing but rare bursts of poetry and psychological insight. The romantic plays and realistic comedies that form the bulk of his work use old conventions delightfully to create fantasy and mild satire. Shirley's reputation as an individual artist may rest on such plays as *The Opportunity, The Gratefail Servant* and *The Imposture,* as well as on one of the finest lyrics in English, "The Glories of our Blood and State."

Shirley wrote the magnificent entertainment presented by the members of the Inns of Court to the king and queen in *1633.* entitled *The Triumph oj Peace,* scenery devised by Inigo Jones and music by W. Lawes and S. Ives; and *Cupid and Death (1653). The Contention of Ajax and Ulysses (1659)* closes with "The Glories of our Blood and State."

The standard edition of Shirley's works is *The Dramatic Works and Poems of James Shirley, with Notes by William Gifford,and Additional Notes, etc.,* by Alexander Dyce, *6* vol. *(1833).* Edmund Gosse edited *(1888)* six plays for the Mermaid series.

See also R. S. Forsythe, *The Relation oj Shirley's Plays to the Elizabethan Drama* (1914); *A. H.* Nason, *James Shirley, Dramatist (1915).* (P. GN.)

SHIRLEY, WILLIAM (1694–1771), colonial governor of Massachusetts, was born at Preston in Sussex, Eng., Dec. *2, 1694.* He studied at Cambridge and was later admitted to the bar. In 1731 after *11* years of law practice in England, he migrated to Boston. Mass. Shirley was a constant but not always successful office seeker. His loyalty to the imperial prerogatives, his ability and his friendship with the duke of Newcastle resulted in his being appointed admiralty judge in *1733* and the king's advocate general in *1734.* In 1741 he was appointed to the governorship of Massachusetts and proved to be a popular and successful governor in a rather difficult period. He handled such problems as that of the proposed land bank adroitly enough to win the respect of the advocates of that ill-fated scheme, and he managed to give Massachusetts a relatively sound currency. His most important achievements as governor were in the realm of colonial and imperial defense. He was quite successful in building up the Massachusetts fortifications and unusually astute in his analysis of the nature and importance of the struggle between England and France for control of North America. During King George's War (1740–48) he organized and planned Britain's one great victory, the capture in *1745* of Louisbourg on Cape Breton Island. In *1753* Shirley renewed his recommendations for united action against the French and drew up a plan for offensive warfare. After the defeat and death of Gen. Edward Braddock in western Pennsylvania in *1755.* Shirley became commander in chief of the English forces in America but neither in America nor in England could he command the respect and co-operation necessary to carry out his well-conceived plans. After the failure of his expedition against Ft. Niagara he was replaced as commander and governor and was recalled to England where he was charged with treason. After being vindicated he was appointed governor of the Bahamas in 1761. In *1770* he returned to Roxbury. Mass., and died there on March *24,* 1771.

SHIZUOKA, prefecture *(Ken)* on the Pacific coast in central Japan. Area *3,000* sq.mi.; pop. *(1960)* 2,756,271. Served by the Tōkaidō central trunk railway line. Favoured by a warm climate, Shizuoka has developed a varied agriculture. Oranges and tea are the chief products, and fishing is highly developed at Shimizu, the principal port. The processing of food and other industries are important. Hamamatsu (*q.v.*) is famous for the manufacture of musical instruments. Topographically and geographically the eastern and western sections differ. Volcanoes and hot springs dominate the east, while large river valleys occur in the west.

SHIZUOKA-SHI, the prefectural capital *11960* pop. 328,819) is situated on the delta of the Abegawa river. The climate is mild, Shunpei, as Shizuoka was called until 1869, was a castle town as well as one of the 53 stage towns on the Tōkaidō highway. About 70% of Japan's tea is raised in its environs and the city is famous as a trading and processing centre for green tea. Shizuoka is the site of Shizuoka university, a women's pharmaceutical college and several industrial and agricultural experimental stations.

(R. B. H.)

SHMIDT, OTTO YULIEVICH (1891–1956), Russian scientist and polar explorer, was born on Sept. 30 (new style; Sept. 18, old style), 1891, at Mogilev. He was a university teacher of mathematics before and immediately after the Revolution of 1917. His support for the new regime and his administrative ability caused him to be appointed to various senior civil service jobs: he was manager of the state publishing house, deputy head of the central statistical administration and a member of the state planning commission. After taking part in the Soviet-German Pamir expedition of 1928, he became interested in the arctic and went on an expedition to Franz Josef Land in 1929. Next year he was made director of the Arctic institute and in 1932 first head of the chief administration of the northern sea route (Glavsevmorputj. the newly formed government department responsible for arctic development. During his six years in this job he directed the extensive Soviet program of exploration and exploitation of arctic resources: and generally spent the whole of each summer season aboard an icebreaker off the north Siberian coast. He led the expeditions in the "Sibiryakov" (1932) and "Chelyuskin" (1933–34), the establishment of the north pole drifting station (1937) and its relief (1938). In 1939 he left arctic work and devoted himself to science for the rest of his life. He had been elected an academician in 1935 and vice-president of the Academy of Sciences in 1939. On his initiative the academy created the Institute of Theoretical Geophysics in 1938. He was its director until 1918. advancing at this time a new theory of the origin of the earth. He was chief editor of the *Great Soviet Encyclopaedia* from 1921 to 1931 and of the journal of popular science, *Priroda.* To this remarkable record of activity he added a professorship of mathematics at Moscow University from 1926 until his death, becoming in this capacity the founder and leader of the Moscow school of algebra. His publications were mainly mathematical papers and articles on polar work. His influence on Soviet life and thought was both considerable and remarkably diverse. He died in Moscow on Sept. 7, 1956. (T. E. A.)

SHOA, a former province of the Abyssinian empire. From about the middle of the 10th century until nearly the close of the 13th century. Shoa was the residence of the Abyssinian sovereigns, who had been driven out of Axum. About 1j28 Shoa was overrun by Moslem invaders and was for over a century afterward a prey to Galla raiders. It remained independent of northern Abyssinia until 185j, when the emperor Theodore reduced it to submission. In 1889 Menelek II, king of Shoa, made himself master of the whole of Abyssinia. *See* ETHIOPIA.

SHOCK. The usual signs of the syndrome called shock are weakness, profound depression and pallor. The skin becomes moist, cold and grayish. The pulse is rapid and weak. The blood pressure usually is below normal. Respirations are shallow. If the patient has sufficient strength, he may be restless, but frequently he can be aroused only with great difficulty. The metabolism is low and there is suppression of all vital functions, so that the patient is obviously gravely ill.

The term shock was first used in the 19th century to characterize the alarming symptoms known to result from a wide variety of causes, both physical and psychic. Such an uncritical use of the term robbed it of significance, and many workers who were attempting to clarify the problem of shock advocated discontinuance of the term altogether and substitution of a more descriptive word; but nevertheless it persisted. Qualifying words or phrases indicative of the probable cause of the condition are usually employed with the word shock, as, for example, traumatic, postoperative, anaphylactic, histamine, transfusion, etc. In the last analysis, death from almost any cause might be preceded by a number of symptoms that are characteristic of shock; therefore, consideration of the condition usually has been limited to collapse resulting from hemorrhage and from various forms of physical trauma.

Traumatic shock was classified by W. B. Cannon into two types, primary and secondary. The primary type was defined as the collapse occurring immediately after severe injury and was considered as indistinguishable from syncope and collapse. Secondary shock was defined as collapse occurring after a variable period of time following severe injury.

Medical authors at mid-20th century made little distinction between shock and collapse or syncope, except to recognize that if collapse or syncope persists for a sufficient time, shock will result. According to V. H. Moon, the attempt to distinguish between shock and collapse is like distinguishing between breeze and wind. N. E. Freeman defined shock as "the clinical condition characterized by progressive reduction in circulating blood volume due to increased capillary permeability." (Norman E. Freeman, "The Mechanism of Shock," *Military Surgical Manuals,* vol. v, 1943.) Moon defined it as "a disturbance of fluid balance resulting in a peripheral circulatory deficiency which is manifested by decreased volume of blood, reduced volume flow, hemoconcentration and by renal functional deficiency." (Virgil H. Moon, *Shock: Its Dynamics, Occurrence and Management,* 1942.)

H. N. Harkins defined shock as "An oligemia [decreased volume of blood] *initiated by* traumatic local fluid loss, either whole blood, plasma or both; *accompanied by* decreased cardiac output, diminished volume flow, lowered venous pressure, decreased oxygen consumption, arteriolar vasconstriction, progressive hemoconcentration, capillary congestion, acapnia [diminished carbon dioxide in the blood], and secondary blood pressure fall; and *perpetuated by* a summation of these factors and possible hyperpotassemia [increased blood potassium], increased generalized capillary permeability, anoxia [lack of oxygen], action of tissue metabolites, and deficiency of adrenal cortical hormone." Harkins also pointed out that "other changes. both chemical and pathologic, may occur in shock, including increased blood nonprotein nitrogen, decreased coagulability of the blood, and in some instances increase in plasma magnesium." (Henry N. Harkins, "Recent Advances in the Study and Management of Traumatic Shock," *Surgery,* 9:231–294, Feb. 1941; *ibid.,* 9:607–655, April 1941.)

Knowledge of the cause of shock has been obtained from the obserVztion and treatment of patients and from experimentation with animals. One of the most attractive theories of the cause of traumatic shock, the so-called traumatic toxemia theory of Cannon and W. M. Bayliss, afforded a satisfactory concept of the initiating factor of shock. According to this theory, a toxic substance is absorbed from the injured tissues and distributed to all parts of the body. where it injures the capillaries which in turn allow fluid to leak through them to such an extent that the volume of circulating blood becomes inadequate. In view of the fact that histamine or histaminelike substances had been demonstrated in animal tissues and that shock had been produced experimentally by injections of this drug, the toxemia theory was readily accepted. It was called into question, however, by A. Blalock and by E. Parsons and D. B. Phemister; though weakened, it was not abandoned. There is substantial agreement among authorities that loss of blood, blood plasma or body fluids by whatever means is the most important initiating factor in shock of most types.

Hemorrhage, excessive sweating, vomiting, dehydration, diarrhea, extensive bruises of the flesh, severe injury to the body or limbs, low blood pressure, cold, pain, burns and psychic stimuli such as fear and grief predispose the individual to shock, since any one of these. if severe and prolonged enough, may result in reduction of the volume of circulating blood. Some of the results of this are known, such as increased capillary permeability after anoxia. but others have been only surmised. Clearly, reduction of the circulating blood volume causes anoxia of the tissues. in turn causing injury to the capillaries which permits further loss of plasma volume. This cycle, if uninterrupted, becomes irreversible. and death is certain.

Treatment. — With more knowledge of the cause, prevention and treatment can be better carried out. Treatment of shock depends to some extent on the nature of the injury or disease responsible for its development. Attention is first directed to the loss of blood or other body fluids, and steps are taken to prevent further loss. Hemorrhage, vomiting, sweating and diarrhea are controlled as soon as possible, and pain is relieved. In case of severe injury of the extremities, the part is immobilized. Rest and quiet are recommended as soon as the patient has been made reasonably comfortable. Prevention of further loss of body heat is accomplished by use of covers, hot-water bottles and heating pads, but caution against overtreatment is frequently suggested. Elevation of the foot of the bed or placing of the patient in the "shock position" may be of benefit. Vasoconstrictor drugs are not indicated as a routine treatment but may be of benefit in exceptional cases such as so-called spinal shock. In cases in which pulmonary ventilation is inadequate for saturation of the blood, oxygen is administered. Operations in the presence of shock are done when possible with local-acting or short-acting drugs such as pentothal sodium or evipal.

Finally. since the fundamental factor in the production of shock is a decreased volume of circulating blood, the best treatment of the condition is the transfusion of whole blood or blood plasma, but if these are not available appropriate doses of solution of acacia, pectin, dextran or any of the other recommended blood substitutes should be injected. Isotonic solutions of sodium chloride and glucose are recommended for temporary use until more adequate measures can be instituted.

Prevention. — In civilian and army hospitals prevention of shock is of paramount importance. Patients who have lost large amounts of blood are prepared for operation by adequate transfusion. Those who have become dehydrated receive fluids by infusion or are given proper quantities of fluid by mouth. Every effort is made to avoid the onset of shock by taking proper preventive measures in preparation of the patient for operation.

Preparation for intravenous administration of fluids is routinely made before the operation begins. At the first sign of a deficient circulation, fluids are supplied to the patient. In case of severe hemorrhage during the operation, blood is administered in sufficient quantities to prevent the occurrence of shock. *See* also references under "Shock" in the Index volume.

SMOCK ABSORBER, a device for controlling the motion of an elastic suspension system such as that of a vehicle. The spring elements of such a suspension system are deformed by an impulse applied to the wheels and tend to react after the force of the impact is spent. Shock absorbers slow down the vibratory motion of the suspended portion and quickly restore equilibrium.

Modern shock absorbers are hydraulic devices and are double acting in that they oppose both the compression of the springs and the rebound. The direct-acting or strut type (*see* figure) is attached to the vehicle frame and axle by two eyes. The central tubular cylinder is fitted with a piston that is attached by a piston rod to the upper eye. The cylinder moves with the lower eye and an annular fluid reservoir surrounds it. A spring-loaded one-way seal prevents fluid flow downward past the piston, but permits controlled flow upward. A valve in the under side of the piston controls the rate at which fluid can flow from the chamber during rebound. The fluid reservoir communicates with the compression chamber through two spring-loaded valves in the base of the cylinder. The discharge valve at the right controls the rate at which fluid can escape from the cylinder during a compression stroke and the valve at the left later refilis the cylinder. Relative motion of the sprung and unsprung portions of the vehicle can be only as rapid as the reciprocation of the piston in the shock absorber, which can be no faster than the fluid flow from one compartment to another permits. Controlled resistance to fluid flow limits the rate at which the suspension can vibrate.

Shock absorbing mountings are used to isolate the vibration of machines, such as diesel engines. These mountings usually employ some resilient member, such as blocks of cork or rubber, interposed between the engine and the floor on which it rests.

SHOCKLEY, WILLIAM BRADFORD (1910–), U.S. physicist, received the Nobel prize for physics in 1956 jointly with John Bardeen and Walter Houser Brattain (*qq.v.*) for their work on the transistor (*q.v.*). Shockley was born in London of American parents Feb. 13, 1910. Reared in California, he was educated at California Institute of Technology (Pasadena) and Massachusetts Institute of Technology (Ph.D., 1936).

He joined the technical staff at the Bell Telephone laboratories in 1936, and there he began experiments which led to the invention and development of different forms of the transistor. During World War II he served as director of research for the antisubmarine warfare operations group of the U.S. navy and as an expert consultant for the office of the secretary of war. After the war he served as director of transistor physics research at the Bell laboratory. He was visiting professor of physics at the California Institute of Technology in 1954, deputy director of the weapons system evaluation group of the defense department in 1954–55, and joined Beckman Instruments, Inc., to establish the Shockley Semiconductor laboratory in 1955. In 1958 he became president of the Shockley Transistor corporation in California, a subsidiary of Beckman Instruments, Inc.

SHODDY, a special type of fabric made from materials which have already been spun into yarn and woven into cloth but have been torn up into a fibrous mass, respun and rewoven. The re-manufactured materials are very short in fibre. so it is usually necessary to mix some better material with them to carry the bulk through the machines into the yarn Good wool or noils (the short from combing). but more often cotton, is employed. The yarns thus spun are in the majority of cases woven into pieces as weft yarns, the warps usually being cotton. See also YARN.

SHOE-BILL (*Balaeniceps* rex), a giant bird from the White Nile, related to the herons. In singularity of aspect few birds surpass Balaeniceps, with its gaunt gray figure, about 5 ft. in height. its large head surmounted by a little curled tuft. its scowling eyes and its huge bill. in form not unlike a whale's head but tipped nith a formidable hook. It forms large flocks and frequents dense swamps. The flight is heronlike, and the birds settle on trees. The food consists of any small animals or carrion. The nest is a hole in dry ground, roughly lined with herbage, and from 2 to 12 chalky white eggs are laid.

SHOEBURYNESS, a promontory on the Essex coast of England, 4 mi E. of Southend-on-Sea, and the point at which the coast line trends northeast from the estuary of the Thames. It has a gunnery testing establishment On the seaward side of the Ness is an earthwork attributed to the Norsemen.

SHOES and boots are very ancient items of dress, their value as protective covering in severe climates or rough terrain being obvious. In all early civilizations shoemaking skills were developed by hand craftsmen to a high degree; styles and variety were produced by the artisan but the process was slow and expensive. Modern mass production depended upon the development of shoe machinery. which began about the middle of the 19th century, and the industry developed most extensively in the more highly industrialized nations. In the early 1960s the United States alone, for example, produced and consumed more than 25% of the world's leather footwear—an average of 3½ pairs per capita annually. It is estimated that purchase of about half of these was for replacement or utility, that of the other half was motivated by the appeal of fashion Women's dress shoes are influenced by fashion' to a greater extent than are other types, and in the United States in the 1960s about 47% of all shoes manufactured were women's shoes (The remainder consisted of men's shoes, 17%; children's shoes, 23%; slippers, 12%; athletic and other specialized types, 1%) Somewhat similar figures apply in Great Britain, another leading producer of leather footwear, although the consumption rate was slightly lower—just over three pairs a person. Per capita consumption and spending for footwear is also directly related to personal or family income (except that high-income families spend proportionately less on all clothing, including footwear, than middle- and low-income families). Thus in the United States low family income states such as Mississippi and Arkansas averaged less than 2.5 pairs per capita a year, while high family income states such as Connecticut and New Jersey averaged 4.7 pairs.

CONSTRUCTION AND DESIGN

History.—The first type of footwear was a simple wrap-around of leather (the basic construction of a moccasin). held together on the foot with raw-hide lacings. Gradually this design was improved upon and assumed many variations. Another early design was the simple sandal, consisting of a sole held on the foot by a leather thong. The oldest shoe now known is a sandal made of woven papyrus, found in Egypt and dating from about 2000 B.C.

Moccasins, sandals and simple boots were the prevailing types of footwear almost up until the middle ages. Wooden clogs or shoes, commonly used by the poorer classes, were also important, though distinctly different from the more desirable leather types. Until modern times footwear was largely homemade, though a considerable share was produced by artisans and craftsmen; large guilds of these shoemaking specialists date back to ancient Rome. While there were small shoemaking shops consisting of a few craftsmen, the first signs of the "mass-production" factory did not appear until the 18th century. The first shoe factory in the United States is credited to John Adams Dagyr, a Welshman who opened a shop in Lynn. Mass., in 1760. He employed a number of shoemakers. each performing only one operation, who produced a supply of shoes from mhich customers could purchase directly from stock. Previously. most purchased shoes mere custom-made.

In 1818 lasts (wooden forms) for shaping shoes were first made in rights and lefts. Another milestone was reached in 1846 when Elias Howe invented the sewing machine. Previously, the majority of shoes mere made by attaching sole to upper with tacks or nails or wooden pegs; if they were sened the work was done by hand. The sewing machine not only greatly speeded production but made a better shoe. Shortly after, and over the next 60 or 70 years, a steady flow of new and improved shoe machinery was introduced, and by the beginning of the 20th century the shoemaking industry was on a full mass-production basis.

Materials.—Since time immemorial the universal basic material for shoes and boots has been leather, used for uppers, linings, counters, inner soles, outer soles. welting and other parts. It is still dominant but in modern times is being replaced by other materials to an increasing extent, particularly in the component parts of shoes. For example. at one time the great majority of inner soles and outer soles were of leather but most are now made of nonleather materials, such as rubber or synthetic fibres or composition materials. Other parts of the shoe are also being made of nonleather materials. There are, for example, plastic melting and plastic heels; coated fabrics for linings; natural and coated fabrics for uppers; plastic counters or back-part stiffeners and chemically compounded box toes. Most of these materials, the products of modern chemistry, are priced lower than leather and at the same time meet all required performance standards.

Leathers commonly used in shoe uppers and linings include side leather (cowhide), calf, kid, sheep, reptile (alligator, snake and lizard), horsehide (cordovan). and certain specialty types such as kangaroo, deer and ostrich. Each leather has its distinctive characteristics and each tends to find its own specialized applications in footnear. Calf is the "luxury" leather, used in the finest grade men's and women's shoes. Side leather (made from cattle hide, and called "side" because the large hide is cut down the middle, lengthwise, into two sides for easier handling) is the most versatile of all shoe leathers. It comes in several grades and is used for a great variety of footwear—women's lightweight casual footwear, children's school shoes and other kinds. An estimated 70% of all leather used in shoe uppers is side leather.

Kid leather, made from goatskin, also has wide use, ranging from women's high-grade dress shoes to men's comfort shoes. Sheepskin is used largely in slippers and linings Reptile leathers (alligator, lizard and snake) are used in some women's and a few men's shoes. Cordovan (from horsehide—a small "muscle" layer in the hide) is a heavy leather popular in men's shoes. Certain specialized leathers such as kangaroo (used in comfort and athletic shoes), ostrich (used in a few women's shoes) and pigskin also find application.

Patent leather is usually made from cattle hide and given a special surface finish. Suede is made from any of several leathers (calf, kid, cattle hide) by a process consisting of buffing the inner surface to create a napped finish.

Certain fabrics, among which are linen. satin and silk, have found increasing use in footwear. Another modern development has been coated fabrics, consisting of a fabric base coated nith a chemical surface finish to give a vast variety of textures and designs, many of them simulating leather grains to a remarkable degree. These find wide use in less expensive shoes, especially in women's and girls' footwear. Synthetic fibres are producing new families of materials. such as nylon mesh and nylon velvet. Much synthetic patent and suede is also produced for shoes.

Some of these leathers and other materials are used for linings as well as for outside uppers of shoes.

Styling and Design.—Many kinds of footuear—men's work shoes, oxfords and riding boots, for example—remain essentially unchanged from year to year, but in other types fashion plays a considerable role. Each year new styles are prepared to conform with the seasonal turnover and the general trends of fashion In the U.S. it is estimated that more than 100.000 new sample styles are prepared annually by the manufacturers. After the retailers have made their selections, about 20% to 25% of the original samples will go into production.

Most manufacturers design their lines twice yearly, for spring-summer and fall-winter. Some designing is done for one brief season, such as summer, or for resort-cruise wear. The greatest demand for variety of style is in women's shoes, followed by men's and girls' shoes. Seasonal turnover in women's styles is quite pronounced. while in men's shoes it usually requires several seasons before distinct changes take place.

Determining the styling features to be incorporated in a new season's line is a highly complicated procedure. In women's shoes, for example, consideration must be given to colours, materials, lasts. patterns. ornamentation, silhouettes, heel shapes and heights, textures and surface finishes. All these must be welded into a "line" of scores of different styles for the new season. And all these must be attuned to general fashion trends in women's apparel, for shoes are regarded as the most important accessory in a woman's ensemble.

Styling a new line involves an expert team of specialists: the designer, fashion co-ordinator, style man. sales manager, sales staff and pattern man. New lines are usually prepared from 4 to 12 months ahead of season. New styles or style trends in footwear are usually initiated by the makers of higher-grade, higher-priced shoes. Once a new shoe is launched and receives the first signs of consumer interest, it is immediately adopted by the volume or medium- and lower-priced shoe lines.

After about 1945 in the U.S., juvenile footwear, particularly in girls' shoes. moved toward "fashion." While the conventional school oxford remained a basic shoe. a wide variety of new types and styles of shoes uon increasing favour among the young.

Methods of Construction. — There are said to be more than 800 ways in which to make a shoe, but only a few of these are actually used. Fundamentally, shoe construction consists of attaching the sole to the upper in such a way as to create a bond sufficiently durable to withstand the wearing conditions for nhich that shoe was designed. There are four basic construction methods:

1. Sening, which includes such types as the Goodyear welt process. in which the sole is sewed to a welt strip that has previously been sewed to the upper and insole; and the stitchdown, in which the upper is turned out and stitched down to the sole.
2. Cementing, in which the outer sole is attached to the insole and upper by adhesives.
3. Molding. in which the sole is vulcanized or "molded" to the upper.
4. The use of fasteners, as in nailed or stapled shoes.

There are numerous variations nithin each classification, and special features of one process may be combined with special features of another to provide a sort of "crossbreed" construction.

Each kind of shoemaking has certain distinctive features uhich make it particularly adaptable to certain kinds of wear. For example. the Goodyear welt process is known for its sturdiness and hence is commonly used in men's and boys' dress shoes as well as in better-grade children's shoes of certain types. Cement construction enables shoes to be built on lighter, sleeker lines and is therefore used for most women's and many girls' shoes. as well as for some lighter types of men's shoes. Molding. as in the vulcanized process, combines economy of construction with rugged durability and is used in men's work shoes as well as in some juvenile footwear. It is also used in all rubber-canvas shoes.

About 80% of all shoes manufactured in the United States in the 1960s were made by three of these processes: cement (54%), Goodyear melt (19%) and stitchdown (7%). Trends or shifts in the use of certain shoe constructions are motivated by technological changes. economics and fashion. The cement process was launched commercially in the early 1930s and by the 1960s was used in over half of all shoes made in the C.S. The Goodyear welt was still regarded as one of the best of shoemaking methods but had steadily declined from its once dominant position. Market demand for lighter shoes and the proportionately higher number of women's shoes manufactured partially account for this Differences in manufacture are also significant. In most basic constructions about 150 different operations are required to make the shoe, and as many as 200 may be required. Certain modern methods of construction, such as the vulcanized and injection-molding methods. have been well received because they reduce the number of operations required as well as the number of component parts. In Great Britain, for example, one-fifth of all the footwear made at the beginning of the 1960s was produced by these methods, and the proportion was increasing.

Steps in Production. — Shoe manufacturing is essentially an assembly process of fusing together a number of components: heel. sole, counter. upper (vamp and quarter). lining. toe box, welting, insole, ornamentation and the like. Proper assembly on a high-speed production line requires the most meticulous planning and precision of prefabricated parts so that the shoe fits well, looks well, wears well, performs well and feels well. The assembly line is actually a series of departments, each specializing in a group of operations, from the cutting of the leather to the packing of the finished shoes in boxes. A great variety of machines and devices, each for a specialized operation, is utilized. Work proceeds on a pretimed schedule. Each style or type of shoe has its own preplanned schedule in moving through the production line. Operations and machines must be adjusted differently for different styles or types of shoes: or even when different materials are used.

Because the shoe industry is so largely mechanized (the day of the hand craftsman is virtually gone). it is highly dependent upon machines and the shoe machinery industry. Several large shoe machinery companies provide these many different machines.

The individual components of a shoe are usually purchased by the shoe manufacturer from outside suppliers who specialize in such components. The manufacturer purchases these components (linings, soles, insoles, counters, heels, etc.) according to his specifications for size, weight, grade, colour, finish: etc., all to be assigned to a particular style or type of shoe in his line.

Each specialized construction has its distinctive procedures but there are certain essential features common to all constructions. The major steps in shoe construction may be briefly outlined as follows:

The cutting room is the launching point in the shoemaking process. Here the upper materials and linings are cut out with dies that have been designed especially for that particular shoe, but in the case of short production runs the older method of hand cutting around templates is still retained. The cutter must be an experienced craftsman; upper materials are costly, and a high degree of precision is required so that the parts will assemble according to plan. The dies are used with clicking or cutting machines, and the weight and cutting edge of the die must be accommodated to the particular type of material being cut. Special machines are also used to perforate the upper material or emboss it with a particular design. Splitting machines (for reducing the thickness of a material) or crimping machines (for preforming leather parts) may also be used in the cutting room.

The shoe then moves to the fitting (or closing) room where the precut parts of the upper are fitted together, usually by sewing or stitching, although some cementing is done. This assembly includes the upper portions of the shoe, linings, stays, facings. eyelets, etc. Many types of sewing machines are used, some of them attaining speeds of more than 4.000 r.p.m. and able to sew from one to eight rows of stitching at one time. In the U.S. and Great Britain almost all the operators in the fitting room are women (who constitute about half of all shoe production employees).

As the shoe moves out of the fitting room in preparation for the important lasting operations, it begins to take shape. The assembled upper, in loose form, is ready to be fitted over the wood last for which the patterns were precisely designed. First. however, the insole is placed on the bottom of the last. This insole, of a shape and size to conform exactly to the bottom of the last, is a sort of "security layer" between upper and outer sole to fuse the shoe parts into a firm unit. The counter or stiffener at the back part of the shoe is placed between the lining and outside of the upper. These parts — insole. counter and upper — are now on the last and the entire unit is presented to the assembling machine. The shoe is thus made ready for lasting.

The lasting machines are ingenious mechanisms that grip the

CONSTRUCTION OF MEN'S WELT SHOE

upper at the toe and sides with pincers. pulling the leather tightly over the wood last so that the material conforms in minute detail to the whole fore part of the last. The heel or back part is also lasted.

The shoe is now ready to have the outer sole applied. After lasting. however, a number of operations are required to prepare the shoe for bottoming. It is at this point that some of the essential differences between the various types of shoe constructions are evidenced. The Goodyear welt. cement, stitchdown and vulcanized constructions enter the sole-laying stage under different sets of prepared conditions. Also. of course. the method by which the sole itself is attached is distinctly different. Once the sole is attached it must still receive finishing touches such as trimming and staining and burnishing the edges. The bottom of the sole must be cleaned or buffed and polished.

Applying the heel is an equally meticulous operation, done with special heeling machines. These attach the heel with nails driven securely into the heel; in the case of high heels, a long screw goes down into the heel for added security. Once the heel is attached, it also undergoes trimming and finishing operations.

The final series of operations consists of such details as applying heel or sock linings, inserting laces, attaching buckles to a strap, and brushing or polishing. Finally there is a thorough inspection, and the shoes are then ready for packing and shipping.

Boots are made in much the same way, the major differences being in the lasts. which generally have a bootlike shape. and in the patterns for the uppers. The type of construction depends upon the type of boot; for example. a work shoe or boot might be made on a vulcanized construction while a riding boot would be made on a Goodyear welt process.

THE FOOTWEAR INDUSTRY

United States: *Industry Structure.*—In the 1960s there were about 850 shoe manufacturing firms in the U.S. The leading 10 firms accounted for 30% of the total production: the leading 30 firms for 42%; and the top 80 for more than 54%. Though shoe production has shown a steady gain (averaging out to about 10,000.000 pairs a year increase). the number of shoe manufacturing firms continues to decline. marginal firms being eliminated under the duress of competition and capital requirements.

New England accounted for about one-third of the nation's shoe production, with Massachusetts the leading state, representing 17% of all shoe output in the 1960s. Other major shoe-producing states were New York and Pennsylvania, each with 14%; Missouri. 10%; and Ohio, Tennessee. Wisconsin and Illinois. each averaging between 3% and 5% of the total.

Unlike shoe factories in most other countries. American plants are highly specialized, making only men's or women's or children's shoes or slippers. with further specialization in grades or price lines produced. The American shoe worker averages an output of about 2.900 pairs a year, the highest productivity level in the world. Factories tend to be medium sized. The best efficiency level is found to be at a production rate of between 4.000 and 10.000 pairs a day. The largest shoe-manufacturing firm produces over 200.000 pairs a day, but this is distributed over some 50 different plants. Most shoe factories are located in smaller communities rather than in large cities or heavily industrialized areas.

Retailing and Marketing.—Approximately 850,000,000 or more pairs of footwear (including rubber footwear and imports) are sold in retail stores annually in the United States. Slightly over half of these are sold through shoe stores. The rest are distributed through various types of retail establishments— department stores, mail-order and variety store chains, clothing stores, general merchandise stores, discount houses and even drugstores. About 71% of all shoes is sold in only 13 states. and 44% is sold in only 5 states (New York, California, Ohio, Illinois and Pennsylvania). New York alone accounts for 14% of all shoe sales.

The annual dollar volume for the average shoe store is below $75.000. Shoe retailing is a relatively complex function, involving not only the basic inventory and operating requirements of any retail establishment but also consideration of fashion, foot health, fitting and other specialized requirements. For this reason, it is a higher-risk business than comparable retail stores in other fields. The seasonal turnover of styles, for instance, necessitates astute judgment to hold losses on wrong selections to a minimum. In women's shoes, careful selections must be made in terms of colours, heel heights, patterns, etc.

Shoe fitting is an extremely important function in the shoe store and requires experience and judgment combined with highly specialized knowledge and training; badly fitted shoes do not wear well, feel uncomfortable and in addition constitute a health hazard (see FOOT, DISEASES AND DISABILITIES OF). In addition to size (length and width) fitting involves the proper adaptation of shoe to foot in terms of leathers (some have more "yield" than others), lasts, heel heights, gait characteristics, etc. The store must carry a large and costly inventory to fit the vast variety of feet it must service, to say nothing of the customer's desires in style. A shoe factory may produce as many as 140 different sizes on a single style of shoe. A shoe store may carry as many as 65 sizes on a single style and have only one pair in each size. It would require duplication cf sizes in the more popular ranges. A store may carry 50 to 100 different types and styles of shoes, and it can readily be seen that the problem of inventory and risk is extremely complex.

After 1945 there were some important changes in shoe retailing trends in the U.S. One change was in the locations of shoe stores, many of which are now situated in suburbs and shopping centres and even as "free-standing" stores on highways. A considerable amount of shoe business is done outside the downtown districts. Certain types of outlets formerly not associated with shoes have gone increasingly into the business. Among these are supermarkets, discount stores. variety stores, some drugstores, and various general merchandise stores. Another trend has been toward "self-service" shoe stores with interior layouts where customers can browse and shop. These are called self-selection layouts but are accompanied by fitting services.

Another change. particularly after the mid-1950s. was in the amount of footwear imported into the U.S. In 1954 leather shoe imports amounted to about 7,700,000 but by 1962 reached over 55.000.000 pairs. Rubber footwear imports showed an even more spectacular gain—from less than 1,000,000 pairs in 1954 to 100,000.000 pairs in 1961. These gains in footwear imports were expected to continue through the 1960s, though perhaps at a slower rate. Principal sources were the Cnited Kingdom, Italy, Japan and Hong Kong; except for rubber footwear, most of the imports were men's and women's shoes, and chiefly in the lower price lines.

U.S. manufacturers have given only token effort to the exporting of shoes. For many years before and after World War II shoe exports remained around 4.000.000 pairs a year and by the early 1960s had dropped to around 3.000.000 pairs.

The U.S. shoe industry as a whole continues to show steady though rarely spectacular growth. It is known as a "stabilized" industry, not subject to sharp' increases in times of prosperity, nor sharp declines in times of recession or slump. Its production and sales growth pattern is closely related to population growth and to a lesser extent to income growth, with some proportionate increase in consumer spending for shoes. (WI A R)

Great Britain.— In the early 1960s there were some 1.200 shoe manufacturing firms in the United Kingdom. but a third of these mere very small employing under 20 workers As in the United States. there was a tendency for manufacturing units to become fewer and larger but shoemaking, as compared nith other industries. nas still one of small-size factories. only five employing more thdn 1.000 workers. Almost equal numbers of men and women were employed, and piecework was common.

After the United States. Great Britain is one of the world's largest footwear producers. The main centres of production are Leicestershire and Northamptonshire, traditional shoemaking areas where originally cattle and sheep were plentiful (for hides and skins) and the country was well wooded with oak (for bark-tanning), Northampton is world renowned ior its high grade of men's footwear, and Leicester has developed into a centre for medium-grade \\-omen's shoes. High-grade fashion shoes are made in Norwich and London. and these two centres also manufacture children's shoes. Southwest England. once the centre for heavy boots for miners and agricultural workers, has developed as the main centre for molded footwear and good-quality women's and children's shoes. The Rossendale valley in Lancashire is noted for its slipper production. The tendency for larger manufacturing units accentuated the trend toward greater specialization as regards type and price of shoe produced in different firms and areas.

Although the labour force in the industry steadily decreased (in the early 1960s it was about 100.000 compared with 115.000 a decade earlier), improved techniques and machinery raised productivity. and after World War II total output rose steadily by an average of 3.000.000 pairs a year. In 1960 the industry produced nearly 160.000.000 pairs of leather footwear (*i.e.*, excluding rubber), of which some 40% was women's shoes while men's and children's shoes and slippers each accounted for about 20%.

With financial support from the government, the industry maintains an efficient research station (British Boot. Shoe and Allied Trades Research association). In addition to laboratory research. it offers to its members consultancy services on practicai problems and acts as independent arbiter on matters concerning consumer complaints.

Retailing *and Marketing.*—The end of the 1950s saw a spectacular rise in consumption of footwear in Great Britain, largely because of the growing "teen-age" market and a general increase in consumer expenditure on clothing and footwear. Speedier changes in fashion, particularly in women's shoes, also caused the buying public to spend more on shoes. but these changes brought new problems for manufacturers and retailers alike. Total consumption of leather footwear in 1960 amounted to more than 160,000,-000 pairs (or more than 3 pairs a person) and rubber footwear purchases made up a further 40,000,000 pairs, the over-all value being 1290.000.000.

Multiple retail organizations (covering 7,700 outlets) sold 45% of this footwear, and independent retailers (comprising 5.900 outlets). 26%. Co-operatives, department stores, mail-order and credit trading concerns accounted for 5%–6% each. Some 20%–25% of British footwear was retailed under manufacturers' brand names. but the great majority of shoemaking firms produced anonymously to orders irom wholesalers and retailers.

Domestic production only partially satisfied the increased consumption. and imports of leather footwear rose from 2.500.000 pairs in 1955 to 14.500.000 in 1960. when one in every 11 pairs sold came from abroad. Most of these came from Europe. with Italy and France predominating. and were mainly women's shoes and slippers. Imports of rubber footwear also rose. with Hong Kong traditionally the largest supplier.

British footwear was exported to more than 100 overseas markets. and in 1960 some 9.000.000 pairs of leather footwear worth F12.000.000 were sent abroad, nearly half of them being men's shoes. The biggest single market was the United States. taking practically one-third of Britain's footwear exports; one-half went to the commonwealth and one-sixth to Europe. The commonwealth countries. however. were a diminishing market for British shoes, as quantitative restrictions were imposed to protect the growth of the young. local footwear manufacturing industries. As old markets contracted. new ones opened up, and 1959 saw the start of a flow of British footwear exports to the U.S.S.R.

Western Europe.— Besides Great Britain. the main footwear producing countries in Europe are Germany. France and Italy. Italy's output rose conspicuously during the 1950s. trebling itself between 1951 and 1559. Italy also became the leading European exporter of footwear, accounting for 40% of the continenr's exports of leather footwear. This success was due to the development in Italy of an elongated. light-weight styling of shoes which proved extremely popular. All the European countries experienced a rise in consumption of footwear in the 1950s and all. except Norway, increased their output. The emergence of the European Common Market and the European Free Trade area led to greater trading in footwear between the countries concerned. On the retail side the main outlets were independent shops and department stores: multiple organizations were not developed to the degree they had in Great Britain, but buying groups began to be established by retailers. Both the Common Market and the Free Trade area had their own liaison committees of manufacturers' organizations, and the Organization for Economic Cooperation and Development hides and skins committee compiled production and trading statistics on footwear in their member countries to encourage greater co-ordination of footwear production and marketing in this area.

SHOFAR, SCHOFAR or SHOFER, the ancient ram's horn trumpet of the Hebrews. It consisted of a natural horn turned up at the bell end. and. having a short conical bore of very large calibre, it would be capable of producing at most the fundamental octave and twelfth.

SHŌGI is a Japanese form of chess (*q.v.*), the history of which is obscure. Traditionally it is thought to have originated in India and to have been transmitted to Japan via China and Korea.

Shōgi, like chess, is played on a squared board with pieces of varying powers, and the ultimate object is the checkmate of the king. Two distinctive features, however, differentiate shōgi sharply from European chess: (1) captured men are not "dead" but may be replayed as part of the captor's forces; (2) there is no pawn chain or blocked pawn position. Each player has 20

WOODEN SHOGI CHESSMEN: JAPANESE. 20TH CENTURY

men. which oppose each other on a board composed of nine horizontal and nine vertical rows. There are nine pawns (*fu*), a rook (*hisha*) and a bishop (*kaku*), one king (*ōshō*), two gold generals (*kinshō*), two silver generals (*ginshō*), two knights (*keima*) and two spearmen (*kyōsha*). From the standpoint of mobility. *hisha* and kuku roughly correspond in chess to the queen, *kyōsha* to the rook. *kinshō* and *ginshō* to the bishop: the others are the same in both games. Rook and bishop oppose each other diagonally. the rest on the same file. The pieces are flat, blunt and slightly tapering toward the front. Each bears identifying characters. Captive men are held at reserve bases until they are needed on the field again, hence the number of pieces in play remains approximately the same from the beginning to the end of the game.

All men except the king and gold generals are promoted on entering the last three rows of enemy territory.

See E. Ohara, Japanese Chess: the Game of *Shogi* (1958); Stewart Culin, Games *of* the Orient (1958). (E. D S)

SHOGUN, abbreviation of sei-i-tai-shogzcn (barbarian-subduing generalissimo), was one of several titles under which early Japanese emperors commissioned supreme military commanders for campaigns against the Ainu of northern Japan. The title first appeared in A.D. 720 but lost its original meaning with the pacification of the north country in the 9th century. Minamoto Yoritomo (1148–99) first used the title as a basis for asserting military and political authority over the country. Yoritomo won military hegemony of Japan in 1185 and acquired imperial appointment as shogun in 1192. Together with other inheritable high court ranks and titles it provided the legal foundation from which his military headquarters (*bakufu*) exercised control over all military families in Japan. As the military class acquired increased powers over national and local affairs, the shogun became de facto ruler of Japan, though the emperor continued to retain formal sovereignty. Yoritomo's successors as shogun ruled from Kamakura (1192–1333). The second line of shogunal succession, begun by the Ashikaga family, ruled from Kyōto (1338–1573). The third line, established by the Tokugawa house, used Edo as its capital (1603–1867). With the intrusion of western powers into Japanese affairs in the 19th century, the question of definition of powers between the shogun (called "tycoon") and emperor (mikado) became an issue. In 1867 the Tokugawa shogun resigned his title and "returned" his prerogatives of civil and military administration to the emperor. See also JAPAN: History. (J. W. H.)

SHOLAPUR, city and district in Maharashtra state, India. The city is 140 mi. S.E. of Poona. Pop. (1961) 337,544. Two colleges connected with Poona university are there.

SHOLAPUR DISTRICT (5,811 sq.mi.) is watered by the Bhima and its tributaries, feeders of the Kistna river system. The district's liability to drought is partly offset by canals and tanks. Pop. (1961) 1,858,512. The chief trade centre (for cotton, oilseeds and oil) is Barsi (pop. 41.849). 37 mi. N. of Sholapur. Pandharpur (40,514), 33 mi. W. of Sholapur, is the popular centre for the worship of an aspect of Vishnu, Vithoba, whose image is the object of an elaborate bathing rite.

SHOLEM ALEICHEM, pseudonym of SOLOMON RABINOWITZ (1859–1916), popular Yiddish classical author. Born in Pereyaslav, in the Poltava district of the Ukraine, on Feb. 18. 1859, he was educated for the rabbinate at nearby Varonkov. Drawn to writing as a youth, he became a private tutor of Russian at the age of 17, and at 18 went to the estate of Elimelech Loeff near Kiev to tutor his 12-year-old daughter Olga. He fell in love with her, an event that cost him his position. He served as a government rabbi in Lubin and when he was 21 married Olga. Her father's death in 1885 brought him a considerable fortune. His first writing had been in Russian and Hebrew, but between 1883, when his first story in Yiddish appeared, and his death he published over 40 volumes of novels, stories and plays in Yiddish. He used part of his fortune to encourage Yiddish writers and edited the annual, Die Yiddishe *Folksbibliotek* (1888–89); he lost the rest of it in business. His works were widely translated. and he became known in the United States as the "Jewish Mark Twain." He left Russia in 1905, established his family in Switzerland, and lectured in Europe and the United States.

At the outbreak of World War I he went to New York city where he died on May 13, 1916.

English translations from his Verk, 14 vol. (1908–14), include Jewish Children, trans. by Hannah Berman, 3rd ed. (1937); *The* Old Country, trans. by Julius and Frances Butwin, 3rd ed. (1954); and Adventures of Mottel, the Cantor's Son, trans. by Tamara Kahana (1953). He was the first to write in Yiddish for children. Adaptations of his work nere important in the founding of the Yiddish Art theatre in New York.

See Maurice Samuel, The World of Sholom Aleichem (1943).

SHOOTING: see HUNTING.

SHOOTING STAR (Dodecatheon), the common name for a genus of beautiful plants of the primrose family (Primulaceae), comprising some 30 species native to North America and northeastern Asia. They are stemless, perennial herbs, with basal leaves and a naked flower stalk which bears at its summit a cluster (umbel) of singularly shaped flowers similar to those of the garden cyclamen. The shooting star, commonly grown in gardens (D. meadia), with pink or white flowers, is native to open grounds from Pennsylvania to Manitoba south to Georgia and Texas. Numerous species occur in the western states, seven being found in California, among which are the Sierra shooting star (D. *jeffreyi*), the lowland shooting star (D. *patulum*) and the upland shooting star (D. *hendersonii*).

SHOP FRONT DESIGN. The shop front, since the earliest days of barter, has been a pertinent problem in design for the obvious reason that, apart from the requirement of presenting merchandise attractively, the interest of the prospective customer has had to be maintained.

History. — The stores of the Roman forum, and in particular the light thrown upon the habits of the populace by the resurrections of Pompeii, show that the shops of earlier generations had much in common with ours. Chifflot completed a remarkable work showing a restoration of the house of the Centenaire which showed the palatial home of the owner with its interior courts away from the street, and facing the street the small shops which were rented to merchants whose interests were quite separate from the house at the back. The stores were open to the street, inasmuch as the use of glass, for enclosure, was unknown. The design of the stores themselves, however, indicate an attempt at design which would attract the passer-by. The stores always clustered around the main buildings of the city throughout the East, and later throughout Europe.

Throughout the East, the bazaar has been, and still is, the source of barter of goods of any type. The arrangement of goods consists primarily in displaying the complete stock.

Throughout the middle ages, the cathedral was the focal point of public interest. and around it would be found the stores of popular appeal, The bridges of the great cities long held the stores that still divert the tourist on the Rialto in Venice or the traveller crossing the Arno in Florence. Pont Neuf, in Paris, lost its stores in the final rebuilding during the 19th century.

Throughout France, many examples are still in evidence at Caen, Bourges, Rouen, Compiegne and as well in Paris, itself, of historic buildings of excellent design, where the store was planned as the important feature of the building. It is of course equally clear that during the middle ages, and even up to the French Revolution, the shopkeeper under the guild system maintained a certain dignity quite distinct from the aristocratic classes, and inasmuch as the store was often the outlet for goods manufactured above by the family, or the outlet for merchandise assembled by the owner, it was possible to beautify the store in proportion to the artistic intelligence of the proprietor.

The inns, such as the 16th-century Hostellerie du Grand Cerf, at Les Andelys, are quite definite instances of unusually good design developed under trade requirements. The inns, like the modern restaurants, had similar requirements of attraction and were successful in proportion to the charm and interest they maintained An exhibit of the Metropolitan Museum of Art in New York city, emphasizing a quite different social phase, is an 18th-century store front of painted and carved wood.

Holland. in the days of its great commercial glory. built homes for the great houses that maintained business contacts throughout the world and in particular during the 16th, 17th and 18th centuries erected many buildings that are standing to this day as examples of industrial production of high order. The home of the merchant was, and usually still is, part of the business structure and this has tended to produce a particular feeling of intimacy in detail that is lost when the typical store building of the modern scheme is projected. The Dutch houses along any of the great canals in Amsterdam, for instance, are built of brick and are extremely simple in their decoration. The more recent Dutch store design has completely emancipated itself from the domestic store policy and has broken every restriction either of form or of use of material. These façades are interesting experiments though it is more than likely that another generation will choose certain elements of strength from which to evolve a simpler and less bizarre form of building.

On the whole, the variation between the store preceding the 19th century and our own type is essentially that of a change in business policy; the larger store developing from a bazaar into a great organization has required monumental buildings. At the same time, a parallel development of the specialized store has resulted in the construction of special settings for the display and sale of merchandise requiring environment, as, for example, small shops, candy stores and the particularly American development of the drug store which is quite in sharp contrast to the dignity of the apothecary of Europe. With the development of the modern store and the distinctly modern use of large sheets of glass, the frame of the store, in many instances, has become the band enclosing the expanse of display within. The only reasonable explanation of this boldness is the demand for sudden changes of display — hardware in the morning to clothes or food in the afternoon. Under such circumstances the less striking the setting the simpler the problem of the window designer. (E. J. K.)

Technique. — The great development in recent years in the design of shop fronts has been caused by the growing expanse of display space, the use of new materials and the intensification of sales technique. The modern shop front is designed as a picture frame for the contents of the window and also as a means of attracting customers at long range. Intelligent merchants have discovered that mere expanse of plate glass is not enough. In other words, the picture needs a frame, but at the same time, the frame must not be so important that it overpowers the picture. The attraction of customers from a distance offers a more difficult problem — the reconciliation of the desire of the shopkeeper to have his shop as conspicuous as possible with the desire to preserve the beauty of the street as a whole. It is obtained by richness of material, interesting form, prominent signs, bright colours, strong lighting.

The extent of display space has been increased by new types of glass joints, metal mouldings and deep vestibules with elaborate convolutions of plan, so that even on a short frontage a large display is possible — more powerful lights and greater control by colour screens and spotlights, together with a great advance in the art of window dressing have added to the effectiveness of the display itself. Show window interiors should be designed as a background for the display, not so dark as to absorb light or so light as to make prominent shadows, or of a colour or treatment so strong as to overpower the display. The display itself is treated as a composition of sculpture or painting, arranged in mass with stands and drapery and accented by lighting. (R. H. S.)

Modern Tendencies. — In the modern store, wood and plaster have practically disappeared and the use of marble, stone, bronze and the less expensive materials, such as cast iron, copper and quite recently polished rustless steel, is usual.

As a matter of solution of design, the stores in America have not shown great brilliancy in spite of the tremendous opportunities that have been presented. This, in large measure, is due to extreme conservatism Two influences appear in recent years: one, an attempt to introduce into store design the principles of the Colonial or English Georgian architecture, and many excellent examples of store fronts are now in evidence throughout New England. The very close derivation of detail from historic sources has produced charm of design and intimate scale that is in thorough sympathy with the buildings surrounding the shop. The other tendency has been to copy the specialty store, as was particularly developed in Paris during the 19th century, and up to this particular day, the theory being largely that of creating a striking frame for a very special display of goods. In quite a number of these stores, however, where the designer has proceeded with a free hand in the solution of a problem, unusually excellent results have been obtained, and on a number of the streets in Paris examples of these stores may be seen. The Rue St. Honoré, the Rue de la Paix, Avenue de L'Opéra and the Rue Royale, in Paris, as well as Unter den Linden and the Kurfiirstendam, in Berlin, are especially to be noticed and there the variety of design is almost as extensive as the quality of merchandise which the stores contain. In these various stores the proportion and size of the show window are in direct relation to the scale of the merchandise in the store. The back of the window is very often made an interesting part of the composition, but it is not clear that this element of design is of sufficient importance to warrant comparison with the well developed façade and the illumination within.

Fifth avenue, in New York, has a character thoroughly at variance with the streets noted. Although the original theory of the shopkeeper had quite simply been a willingness to adapt European forms, the rapid development of the Avenue has forced serious changes in style in so breathless a form that the description is difficult. At one period, particularly at the beginning of the 20th century, the classic revival produced excellent varieties of Italian palaces transformed into stores that are slowly feeling the pressure of business changes. The uneven sky-line which the daily rebuilding further exaggerates tends to complicate the problem by presenting difficult questions of scale. The struggle seems to lie between the policy of the large show window of the Altman, Bonwit Teller and Franklin Simon store type as against the smaller window and larger wall surface as exemplified in the Cammeyer, Dobbs and Bergdorf-Goodman stores. The tendency on Fifth avenue has been thoroughly conservative and its appearance, in spite of the restraint, is dignified and well worthy of the most important shopping district in the country.

In Germany, the illumination of the exterior and the interior of the window has been greatly exploited by the use of tubular lamps which, on occasion, frame the store opening, or where the same lamps are used to develop a store name and appear during the day as letters against a proper background, at night presenting a brilliant design against the dark surface of the building. These tubular lamps do not throw a large amount of illumination but show themselves as brilliant units of glowing colour. In Germany, likewise, the use of sheets of glass is to be noted, wherein varying possibilities of effect are produced. In some cases a white glass is used to form surface patterns through which, at night, light is thrown, thereby presenting a very brilliant impression to the street. This is particularly noticeable in restaurants or stores where the major requirement is a sensational effect. Another use of the glass is in the application of sheets of opaque material; blue, black and white glass acting as a veneer, either framed in metal or bolted to the wall as purely decorative material. Throughout France and Germany, mosaic has been extensively used, and the possibilities of colour effect which this material permits appear to be unlimited.

In Paris, the large stores, as contrasted with the specialty shops of the streets before mentioned, have developed a design extremely characteristic of Paris. The Printemps, Bon Marché and the Galleries Lafayette have, during the past few years, redesigned their façades, not only to keep abreast of the modern note in design, but to maintain the public's interest, apparently in their own evolution. It is quite likely that Paris, being a cosmopolitan city, requires more active development than similar cities in the United States or England might find advisable, and it is likewise obvious that according to American and English standards French stores are somewhat over-elaborate. There must be a nice balance between the interesting frame and the merchandise within, quite in the same proportion that a painting or a piece of sculpture requires careful handling to be enhanced by its background. In spite of this criticism, however, the French stores unquestionably are of great interest and apparently hold the popular enthusiasm through their present policies.

The German stores, in particular the Wertheim building, designed by A. Messel in 1905, and which is still the prototype for big store design in Germany, resemble the French stores in their elaboration, with profuseness of carving and decoration, explaining a period when money was available for such use. It would seem to be a happy misfortune that the requirement for economy

20TH-CENTURY SHOP FRONTS

Top left: Typical U.S. shop front of the 1930s. Standard sign and lettering easily identified merchandise for sale

Top right: Fur store in Milan, It. An example of the mid-1940s, the entire store front was treated as a large window

Centre left: Cigar store familiar in many U.S. cities

Bottom left: Shoe store, Washington, D.C. An example of open-front design popular in the 1950s

Bottom right: Design by Frank Lloyd Wright in which shop front is a wall of yellow brick in Germany today is causing the designers to simplify the forms to a point where effects are obtained with a great reduction in decoration and more emphasis on proportion, colour and purity of form.

Among American examples might be noted the work of Louis Sullivan, in New York and Chicago, in particular the Carson Pirie Scott and Co. store which, although most exuberant in detail, shows an interesting variance in pattern from the work of its day.

In more recent days through 1935, the tendency has veered more and more toward simplicity—note the stores in the new Rockefeller group in New York. Materials are given most careful consideration for the simple reason that ornamentation being secondary, proportion and substance are of primary importance. Lettering is often the only enrichment and has, therefore, been studied in relation to the scale and character of the establishment. Lighting of the store windows has progressed far beyond the requirements of a decade ago. New reflectors are available and the amount of light has increased materially. Show window backs have changed from elaborate wooden structures to far simpler elements that permit rapid change of displays and settings.

SHOPPING CENTRE (SHOPPING PLAZA), a shopping district or area in which is located a group of shops offering a balanced variety of goods and services. In the United States, such centres or plazas may be classified (1) as controlled or uncontrolled, depending on sponsorship or ownership, planning and organization, or (2) as neighbourhood, district or regional, depending on the size of the operation and the trading area served. The first shopping centres developed without formal planning in neighbourhoods of large cities not far distant from the central shopping district. Later, many centres were established in suburban areas, where they were planned to provide adequate parking space and harmonious architectural treatment.

The shopping centre or plaza is primarily a post-World War II development and constitutes a response to such changing environmental factors as movement of population to suburbs, changes in consumer buying habits, increased use of the automobile, increased traffic congestion in cities (particularly in the central districts), and scarcity and high cost of parking facilities. Designed to serve the needs of their surrounding areas, shopping centres vary widely in regard to size, number and kinds of shops, location and over-all design.

The controlled type, for example, may be subdivided into two groups. One is the centre built by a real-estate organization that expects to profit from its investment by leasing all the units of the centre to others. The second is the centre developed by a large retailer whose own branch shop constitutes the focal point of the centre; ownership of the facilities enables the retailer to control selection of tenants, extent of competition, types of sales promotion and similar factors.

On the basis of size and trading area served. three different kinds of shopping centres may be distinguished: (1j the convenience or neighbourhood centre, usually serving from 5.000 to 10,000 families, arranged in a strip pattern and with a supermarket as the chief tenant; (2j the community or district centre. serving 20,000 to 40,000 families: often arranged in an L-shaped pattern, with a department store as the chief tenant; and (3) the regional centre, serving as many as 500,000 people or more and laid out around a central mall or with shops clustered around the chief tenant, commonly a branch of a large department store.

Among these three kinds of centres, the regional, because of its size and large variety of merchandise, is most important. Regional centres provide an environment conducive to regular patronage through attractive facilities, including arcades, benches and well-designed store interiors and fixtures; in addition, evenng hours, nhich encourage family shopping, aid them in attracting customers. Increasingly, chain-store companies in such fields as food. variety goods and apparel are recognizing that shopping centres, since they constitute strongholds of established brand names, provide the most promising locations for new units.

The growth of shopping centres and plazas has had significant effects on downtown areas or the central shopping districts of the cities near which the centres are located. Sufficient business has been deflected from the central shopping districts to induce downtown merchants to adopt various measures to regain this lost volume or at least to prevent further losses. Such measures include increasing expenditures for store and equipment modernization, promoting improved transportation facilities for easier access to downtown areas. providing enlarged and improved parking areas, holding special sales promotional events and, surprisingly. encouraging the renovation of the downtown sections of many cities to resemble shopping plazas by converting some streets to pedestrian malls and building peripheral roadways.

These measures probably will slow but not stop the growth of shopping centres; the share of retail money spent in the downtown section of the metropolitan area probably will continue to decline. No shopping centres exactly comparable to those in the United States exist in Great Britain or Europe. The nearest approach to this type of planned shopping centre is to be found in the English New Towns, the new centres of blitzed cities such as Coventry, and in postwar development in Denmark and Sweden. None of these, however, has been designed to serve a motorized society. (D. J. D.)

SHOP STEWARDS. Prior to 1914, shop stewards in Great Britain were confined to certain of the skilled trade unions. The duties of the shop steward were to inspect trade union contribution cards at regular intervals. to recruit new members for the union, to keep a watch on possible encroachments in the trade of other sections of labour. and to report regularly to the trade union branch or district organization which he represented on matters arising in the ivorkshop demanding official attention. In some cases he was also responsible for representing grievances of members of his union in the workshop to the management. His powers were, therefore restricted.

The conditions of wartime led to the assumption of new functions by shop stewards. The official trade union organizations were parties to the industrial truce agreed upon at the beginning of the war, and in any event, their machinery was too cumbrous to deal with the questions which arose from day to day in almost every munitions factory.

During the war, therefore, shop stewards became negotiators and superseded in a large degree in factories and TI-orkshops engaged on war production, the ordinary official machinery of trade union negotiation. At the end of the war, the restoration of more normal conditions broke the power of the shop stewards. They have, however: in many unions now become a normal part of trade union organization. Shop stewards have been appointed in factories and workshops in a variety of industries where they did not exist prior to the war. In addition to carrying out their well-established duties. they are in some industries empowered to negotiate on minor matters, but their negotiating powers are derived from the unions and are not exercised independently of the unions as was so frequently the case during the war. See TRADE UNIONS.

SHORE, JANE (d. 1527), mistress of the English king Edward IV, is said to have been the daughter of Thomas Wainstead, a prosperous London mercer. She was well brought up, and married young to William Shore, a goldsmith. She attracted the notice of Edward IV, and soon after 1470, leaving her husband, she became the king's mistress, Edward called her the merriest of his concubines. and she exercised great influence; but, says More, "never abused it to any man's hurt, but to many a man's comfort and relief." After Edward's death she was mistress to Thomas Grey, marquess of Dorset. She also had relations with William Hastings, and may perhaps have been the intermediary between him and the Woodvilles. At all events she had political importance enough to incur the hostility of Richard of Gloucester, afterward King Richard III, who accused her of having practised sorcery against him in collusion with the queen and Hastings. Richard had her put to public penance, but the people pitied her for her loveliness and womanly patience; her husband was dead, and now in poverty and disgrace she became a prisoner in London. Thomas Lynom, the king's solicitor wished to marry her, but was apparently dissuaded.

Jane Shore survived till 1527; in her last days she had to "beg a living of many that had begged if she had not been." She figured much in 16th-century literature, notably in the *Mirrour for Magistrates,* and in Thomas Heywood's *Edward* IV. The legend which connected Jane Shore with Shoreditch is quite baseless; the place name is very much older.

BIBLIOGRAPHY.—Most of our information as to Jane Shore comes from Sir Thomas More's Life *of* Richard *III,* edited by J. R. Lumby (1883), supplemented a little by Edward Hall (*Chronicle,* pp. 363–364). See also H. B. Wheatley's edition of Percy's Reliques, ii. 264 (1876–77), and J. Gairdner's Life and Reign *of* Richard *III* (1898).

SHOREDITCH, a northeastern metropolitan borough of London, Eng., adjoining the city. Pop. (1951) 44.871. Area 1 sq.mi. It has large housing estates and is a centre of the furniture-making industry. Furniture and woodwork are the theme of the Geffrye museum (1914) in Kingsland road. In 1576 James Burbage (*see* BURBAGE, RICHARD) built in Shoreditch London's first theatre. In City road stood the Eagle tavern and there too is the Royal Chest hospital. The Grand Union canal runs through the borough.

SHOREHAM-BY-SEA, a seaside resort and urban district in the Arundel and Shoreham parliamentary division of West Sussex, Eng., 6 mi. W. of Brighton. Pop. (1951) 13.057. Area 4.8 sq.mi. It lies at the mouth of the Adur river and 1 mi. upstream is the village of Old Shoreham, the original port, whose importance declined with the eastward shift of the river mouth, now 1 mi. from New Shoreham. The modern harbour embraces this lower reach of the river and also a semiartificial waterway that extends eastward from the river mouth for 2 mi. to Portslade and where ships can lie afloat at all states of the tide.

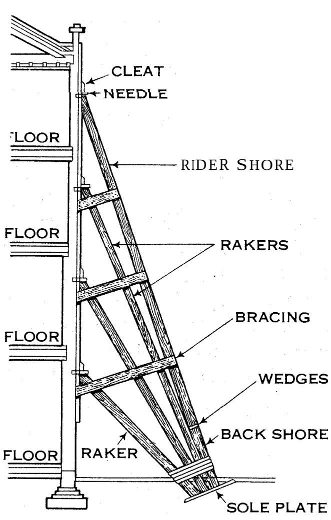
Shoreham was called a borough in 1236 and from 1272 to 1883 returned two members to parliament. Weekly markets and an annual fair dating from the time of Edward I were held for centuries. Shipbuilding has been carried on since the 13th century, and there is trade in coal, grain, timber and cement.

On the west side of the Adur opposite Shoreham is the Brighton-Worthing municipal airport; to the northwest of it is Lancing college, a public school for boys. At Shoreham Gap, 2 mi. N.E., 596 ac. of downland were presented to the National trust in 1946.

SHOREY, PAUL (1857–1934), outstanding U.S. classical scholar and humanist, was born at Davenport, Ia., on Aug. 3, 1857. Having graduated from Harvard in 1878 he mas admitted to the Chicago bar in 1880. Later he studied at Leipzig, Ger. (1881–82), Bonn, Ger. (1882), the American School of Classical Studies at Athens (1882–83) and the University of Munich, from which he received the Ph.D. in 1884. He was professor of Greek at Bryn Mawr college (1885–92), then went to The University of Chicago as professor of Greek and chairman of the department of Greek. He was Roosevelt professor in the University of Berlin, 1913–14. A man of vast erudition, Shorey was a brilliant teacher and lecturer, especially in the fields of Greek poetry and philosophy.

Shorey's writings include *The Idea of Good in Plato's Republic* (1895); *The Odes and Epodes of Horace* (1898); *The Unity of Plato's Thought* (1903), his most significant work in that it summed up his whole concept of Plato; *The Assault on Humanism* (1917); *What Plato Said* (1933); and his edition (with English translation) of Plato's *Republic* (Loeb Classical Library, 1930–35). He was a constant contributor to *Classical Philology,* of which he was managing editor from 1908 until his death in Chicago on April 24, 1934. (G. SM.)

SHORING, a form of prop or support, generally temporary in nature, used during repair or original construction of buildings, and in excavations. Temporary support may be required, for example, to relieve the load on a masonry wall while it is repaired or reinforced. The support may be supplied by shoring the wall with heavy timbers sloping upward at about 60°–75°. The top of the timber is so arranged that part of the wall load will be transferred to the shore. The lower end of the shore will frame onto a base in order to transfer the load to the ground with a minimum of deformation. Wedges may be used to bring the shore snuggly into contact aith the wall. If the wall is several stories high, as in the figure, more than one shore is required. The spacing betaeen the shores depends upon the condition of the wall, magnitude of the load. structural quality of the shores, and the character of supporting base and ground.



SYSTEM OF RAKING SHORES

Shores are used to support the forms for cast-in-place concrete slabs, beams and girders in reinforced concrete frames. Such supports may be 4 × 4's or larger timbers cut to appropriate length and placed to true grade by wedges. The size of the timber depends upon the load and length of the shore. Lateral bracing is needed in both directions t~ prevent the buckling of the shore. In some cases timbers may be framed into towerlike arrangements to provide capacity for greater loads. There are several patented shores that may be used in place of timber shores for concrete forms. These have the great advantage of easier placement and easier adjustment for length. The adjustment may be made by means of a threaded member or by a gripping device.

One method of constructing a pier in water is to use a cofferdam, which may be a rectangular enclosure made by driving sheet piling. usually steel, around a horizontal frame system. The outside members of the frame against nhich the sheet piles bear are called wales. The transverse and longitudinal members between the wales are shores. The wales and shores may be constructed of heavy timbers, structural steel, or a combination of the two materials.

The shores must be sturdy and well braced to withstand the shock of being hit by a heavy dredging bucket; they must also be able to withstand the horizontal forces resulting when the water is pumped from the cofferdam. The number of horizontal frames required may vary from one to five. (F. W. ST.)

SHORNCLIFFE, a military camp in Kent, England, on high ground immediately north of Sandgate and 3 mi. W. of Folkestone.

It was first established in 1803, when Sir John Moore used it to train the troops which afterward formed the Light Division during the Peninsular War.

Its location was chosen to be a strategic position, on the flank of Napoleon Bonaparte. who was expected at that time to cross the channel and invade England. During World Wars I and II, it was used as a training camp for British soldiers.

SHORT, SIR FRANK (**FRANCIS** JOB) (1857–1945), English topographical engraver and water-colourist, was born at Wollaston, Worcestershire. on June 19, 1857. He was educated to be a civil engineer, and in 1881 came to London. In 1883 he studied at the Royal College of Art, the Westminster School of Art and the Royal Institute of Painters in Water-Colours. Short's style was at first closely modeled on that of Seymour Hayden's, and earlier successes included mezzotints after J. M. W. Turner's *Liber Studiorum* (1885 *seq.*) and his best original works are mezzotints and aquatints such as "The Night Picket at Hammersmith" (1916) and "Morning Flare in Chichester Harbour" (1922). Elected A.R A. in 1906. he was knighted and made a royal academician in 1911. As director of engraving at the Royal College of Art from 1391 to 1924, he greatly influenced younger engravers. He published *On The Making of Etchings* (1888) He was president of the Royal Society of Painter-Etchers and Engravers from 1910 to 1938.

Short died on April 22, 1945, at Ditcliiing. Sussex. (D. L. Fr.)

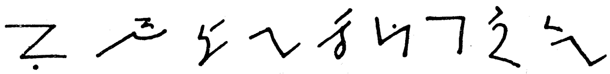
SHORTER, CLEMENT KING (1857–1926), English journalist and author. was born in London on July 19, 1857. He was editor of the *Illustrated London News* from 1891 to 1900, and founded and edited the weekly *Sketch* (1893), the *Sphere* (1900) and the *Tatler* (1903). In 1896 he published *Charlotte Bronte and her Circle,* and later edited the Haworth edition of the Brontes nith Mrs. Humphrey Ward. In 1924 he issued a private edition of Patrick Branwell Bronte's *And the Weary are at Rest.* He died Nov. 19, 1926.

SHORTHAND is the art of writing legibly, by means of brief signs, at a rate sufficiently rapid to record speech. It has been variously known as stenography (close, little or narrow writing), tachygraphy (snift writing), brachygraphy (short writing). But the term "shorthand" is now almost universally applied to it. Shorthand is now employed widely in reporting the proceedings of parliament and legislative bodies, the trial of cases in courts of law and especially for taking dictated business correspondence.

The Shorthand of the Ancients. — The earliest record we have of an organized system of shorthand dates from the year 63 B.C., the age of eloquence in Rome. At that time a freedman and friend of Cicero, Marcus Tullius Tiro, invented a system of *notae* that was used in recording the speeches of Cicero, Seneca and others of the Roman senate. The system invented by Tiro mas taught in the Roman schools, uas learned by emperors, and remained in use for several centuries. We are informed by Plutarch, in his life of Cato the younger, that the speeches of Caesar and Cato in connection with the conspiracy of Catiline were taken down verbatim by *notarii* who had been placed by Cicero in various parts of the Senate.

An inscription on a marble slab from the Acropolis at Athens. attributed to the 4th century B.C., indicates that a system of brief writing was practiced among the Greeks. Tiro's system was based on the orthographical principle; it abounded in the use of initials, following in this respect the abbreviating formulae in common use with the Romans; and, principal distinction of all, it was marked by this peculiar excellence which renders it superior to every other system known till to-day — namely, that by it, one and the same consonant letter, without the addition of points or any other signs whatsoever, expressed. by the inclination of such letter in three different directions, the exact vowel, *a, e,* or *i,* ahich followed. In the case of some of the consonants the whole five vowels, and even the diphthongs, were capable of like indication.

Example of Tironian Notae:



Nemo fideliter diligit quem fastidit nam et calamitas querula

Shorthand in the Middle Ages. — After the fall of the Roman empire, the use of the Tironian system survived for several centuries. In A.D. 625, Tironian notes were used in the royal diploma of the Merovingian King Clotaire II. In subsequent years we find on public documents brief notations as to the composition of deeds, names of officials concerned, etc. It is the opinion of some authorities that such notations were a protection against forgery. Examples of Greek shorthand are confined to a few fragmentary papyri and waxen tablets ranging from the 4th to the 8th century, chiefly among the Rainer collection at Vienna to which Prof. Wessely has devoted much labour. A manuscript (Add. ms. 18231) in the British hluseum contains marginal notes in shorthand of the date A.D. 972 (Wattenb., *Script. Graec. specim.,* tab. 19). Dating from the 10th century, we find the Paris ms. of Hermogenes, with some tachygraphic writing of that period which Bernard de Montfaucon deciphered with incredible labour *(Pal. Gr.,* p. 351). But the largest amount of material is found in the Vatican ms. 1809, a volume in which as many as 47 pages are covered with tachygraphic nriting of the 11th century. Cardinal Angelo Mai first published a specimen of it in his *Scriptorum veterum noca collectio* (1832); and in his *Novae patrum bibliothecae tom. secundus* (1844) he gave a second, which, in the form of a marginal note, contained a fragment of the book of Enoch.

Shorthand and the Early Christian Church. — With the rise of the Christian Church and a demand for the exact utterances of the religious ieaders of the day, the teaching and practice of the Tironian *Notae* received a new impetus. Many of the trials of the early Christians were reported by shorthand writers who were employed by the church for that purpose.

Revival of Shorthand in England. — England was the birthplace of modern shorthand. The publication by Dr. Timothy Eright in 1588 of his *Characterie: an Arte of Shorte, Swifte, and Secrete Writing by Character* marked the beginning of this development in England. Bright's system was invented during the reign of Queen Elizabeth and dedicated to her. It provided that each sign could be given four different slopes, and that the base of each could be modified by 12 varying terminations.

With the publication of the *Arte of Stenographie* in 1602 by John Willis began the introduction of the systems based on the alphabet. These systems are sometimes referred to as orthographic, because they followed the spelling of the words, omitting silent letters and in many cases the vowels in a word. One of the best known of these orthographic systems is that of Thomas Shelton, published about 1630, in which the famous diary of Samuel Pepys was kept. In 1767, Dr. John Byrom published his *Universal English Shorthand.* His principal contribution to the art was greater lineality in writing, and representation of the five vowels by writing a dot in five different positions with respect to the consonant outline. His system was popularized by Thomas Molyneux, who published seven cheap editions between 1793 and 1825. In 1786, Samuel Taylor published in London an *Essay Intended to Establish a Standard for a Universal System of Stenography.* He siniplified his system considerably by limiting each letter to one sign, except w, and by the elimination of a great many of the arbitrary signs that had characterized previous systems. His system was eventually adapted for use in France, Italy, Holland, Sweden, Germany and other Continental countries.

Development of Phonetic Shorthand. — Most of the early systems of shorthand in England were orthographic or alphabetic, but the idea of writing according to sound continued to gain in favour. The first published system using a phonetic base was that of William Tiffin (1750). Others were Lyle (1762), Holdsworth and Aldridge (1766), Roe (1802), Phineas Bailey (1819), Towndrow (1831) and De Stains (1839).

PITMAN SYSTEM

The publication by Isaac Pitman, in 1837, of *Stenographic Sound Hand* marked *a* new era in the development of phonetic systems. Not only did he classify the sounds of the language scientifically and arrange his material for writing accordingly, but he introduced simple expedients of abbreviation that made for rapidity. A short summary of the principles underlying the system is given.

Since the system is phonetic, all words are written according to their sounds. The words *lain, deal, may, knife* would therefore be written as if they were spelled *lān, dēl, mā, nīf.*

Consonants.—The consonants in the system are drawn from simple geometrical forms, straight lines and shallow curves. It is a curious fact that, while the tendency in longhand writing, beginning about A.D. 600 with the development of the Uncial letters, was anay from the Roman capital letters and toward a cursive style, this tendency did not affect shorthand writing, although several systems appearing before Pitman's were cursive in form. In Pitman's system there are 26 signs for 24 consonant sounds in the language, two of the signs being provided nith duplicates for convenience in joining with other signs. The first 16 signs occur in pairs, a light sign for a light sound, and a heavier sign for a heavy sound.

Vowels.—The 12 vowels in the language, *ah, a, e, aw, o, oo,* as heard in the words, "Pa, may we all go too'" and their corresponding light sounds, a, *e, i, o, u, oo,* as in the words, "That pen

PITMAN'S SHORTHAND **ALPHABET**

CONSONANTS

Names	Sign	Names	Sign	Names	Sign	Names	Sign
pee	P	chay	CH	ef	F	es	S
bee	B	jay	J	vee	V	zee	Z
tee	T	kay	K	ith	TH	ish	SH
dee	D	gay	G	thee	TH	zhee	ZH

em M ... en N ... ing NG ... el L ... ar R ...
way W ... yay Y ... hay (aspirate) H ...

VOWELS

LONG		SHORT	
1. AH	1. AW	ă	ŏ
2. EH	2. OH	ĕ	
3. EE	3. OO	ĭ	ŏŏ

DIPHTHONGS

I OI OW U

is not much good," are represented by a dot and a dash, disjoined. A heavy dot placed opposite the beginning of a consonant represents the long vowel ah; opposite the middle of the stroke it represents *ā;* and opposite the end of a stroke it represents *ē*. A short, heavy dash placed similarly represents the sounds *aw*, 6, *ōō*. The dot or the dash is made very light to represent the corresponding light or short vowel sounds. To illustrate: pa ... a y ... tea ... sigh ... ode ... bug ...

The sound *s* when preceding or following another consonant is expressed by a small circle: pays ... tease ... spy ... spouse ... When the sound ses occurs other than at the beginning of a word, it is represented by a large circle: paces ... teases ... spices ... excessive ... When the large circle is the beginning of a consonant it represents sw: swoop ... Swede ... swim ...

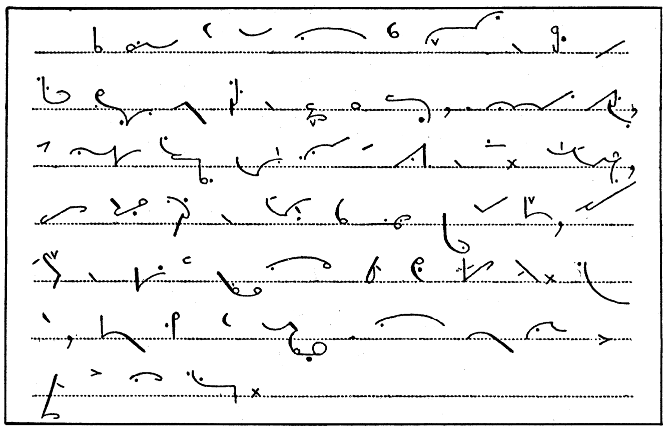
The small circle for *s* is turned into a small loop to represent *st*, and into a larger loop to represent *str:* past ... pastor ... b o a s t boaster ... must ... muster ... state ... steam ...

Use of Hooks.—The hooks used as abbreviating devices are obtained from segments of the circle s, or of the large circle for *ses*. A small hook written at the beginning of a consonant on the left of straight downstrokes and under horizontal strokes adds r: a small hock written at the end of a consonant under the same conditions represents n: pray ... brain ... tray ... train ... grow ... grown ... A small initial hook written on the right side of downstrokes or above horizontals represents 1; at the end of these strokes, it expresses *f* or *v*: play ... pave ... brave ... blow ... bluff ... glow ... glove ... The common sound of shun, no matter how it is spelled, is expressed by a large hook: passion ... petition ... occasion ... When used with curved letters, the hooks are always written inside the curve. The small hook represents r at the beginning of a stroke and *n* at the end of a stroke: frayed ... fan ... fans ... loan ... A large hook at the beginning of a curve adds *l* and at the end of a curve it adds shun: flow ... flung ... evil ... notion ... motion ... The halving of a stroke indicates the addition of *t* or d. This principle is of great value in writing the past-tense forms of verbs: float ... floated ... plate ... plated ... pain ... pained or paint ... grade ... graded ... label ... labelled ... Doubling the length of a consonant adds *ter*, *der* or ther: track ... tractor ... laugh ... laughter ... bill ... builder ... mole ... moulder ... pore ... porter ...

Vowel Indication.—In rapid writing it is not possible to insert all vowels, nor is it necessary. Three methods are employed to indicate the presence or absence of a vowel. Letters having alternate forms are used for this purpose; the downward *r* usually indicates that a vowel precedes it, whereas the upward form is usually used when a vowel follows. By writing a word in position with relation to the line, it is possible to indicate a vowel. Words may be written above the line to indicate a first-place vowel, on the line for a second-place vowel and through the line for a third-place vowel. The first up or down stroke in the word generally takes the position, and the rest of the outline follows in regular order. The position of the word is determined by the first vowel. The third method of vowel indication is by the use of some of the consonant outlines instead of their abbreviated form, as the use of the *s* stroke in place of the circle at the beginning of a word, or the writing of the *n* stroke in place of the *n* hook in such a word as *funny*.

Grammalogues.—A large number of the most commonly occurring words have been condensed in outline form so that they can be written with one stroke of the pen without vocalization. These words are memorized and learned thoroughly so that they can be written with great facility. Illustrations: that ... is ... as, has ... are ... our ... it ... should ... cannot ... you ... this ... Just as the early authors discovered that joining words increased the speed of writing, so Pitman's system affords an extensive use of this principle of phrasing: you cannot ... you cannot be ... Besides the list of grammalogues, there

Illustration of Pitman Shorthand



It is certain that any matter that is likely to strain our attention severely should be attended to when the mind is clear, the memory retentive and the mental faculties fully alert and ready to act. Unfortunately, we cannot always arrange to follow this excellent division of our time, and we are obliged to deal with business matters just as they turn up. After all, it may be said that in all these cases the matter may be left to the judgment of the man affected.

is a list of contractions which it is necessary for the writer to memorize before he can develop much speed. These contractions are usually long or awkward outlines that have been reduced in form by dropping parts of the word but at the same time keeping them significant enough to establish their identity. Examples of these are: indispensable dangerous.

The Pitman system was introduced into America a few years after its publication. Alfred Baker tells us in the *Life of Sir Isaac Pitman* that the first instruction book in Pitman shorthand was brought out by Mr. Stephen Pearl Andrews (Boston, 1844). In 1852, Mr. Benn Pitman, brother of the author of the system, came to America to continue the work he had been doing for several years. After the publication of the 10th ed., in which the vowel scale was changed, Benn Pitman refused to adopt the change and adhered to the old forms. Many others who had learned and practised the system began to modify it and publish it in altered form. Among these were A. J. Graham, J. E. Munson, E. Longley and Eliza B. Burns.

Script Systems.—Just as Pitman and his predecessors rejected the orthographic principle in shorthand and adopted the phonetic basis, so another group of authors discarded the use of geometrical signs. As early as 1787, S. G. Bordley had presented his cursive shorthand. This was followed by R. Roe (1802), T. Oxley (1816), J. and J. Aitchison (1832) and D. Cadman (1835). In France and Germany script systems had been introduced successfully and are in nide use to-day. Fayet's French system and Gabelsberger's German system are illustrations.

GREGG SYSTEM

In 1888, John Robert Gregg published his Light-Line Phonography, in which he incorporated what he considered this fundamental idea of employing shorthand characters that were in harmony with the slant and movement of longhand as well as many other principles, the lack of which had given rise to many criticisms of existing systems. Gregg adopted the phonetic principle and added a scientific analysis of *handwriting.* The title of the first book of his system was The Phonetic *Handwriting.* Gregg brought his system to America and offered it to the public soon after its publication in England. At present it is taught in more schools in the United States, and practised by more stenographers, than any other. A summary of the system is presented. The basic principles given below are taken from a copy of the original Light-Line Phonography, published in 1888: (1) Total absence of shading or thickening. (2) The characters being based on the elements of the ordinary longhand, the strokes are familiar and the motion uniform. (3) The insertion of the vowels in their natural order without lifting the pen. (4) The absence of positions, or the placing of words on, above, or through the line of writing to imply the omission of certain vowels or consonants. (5) The preponderance of curve motion.

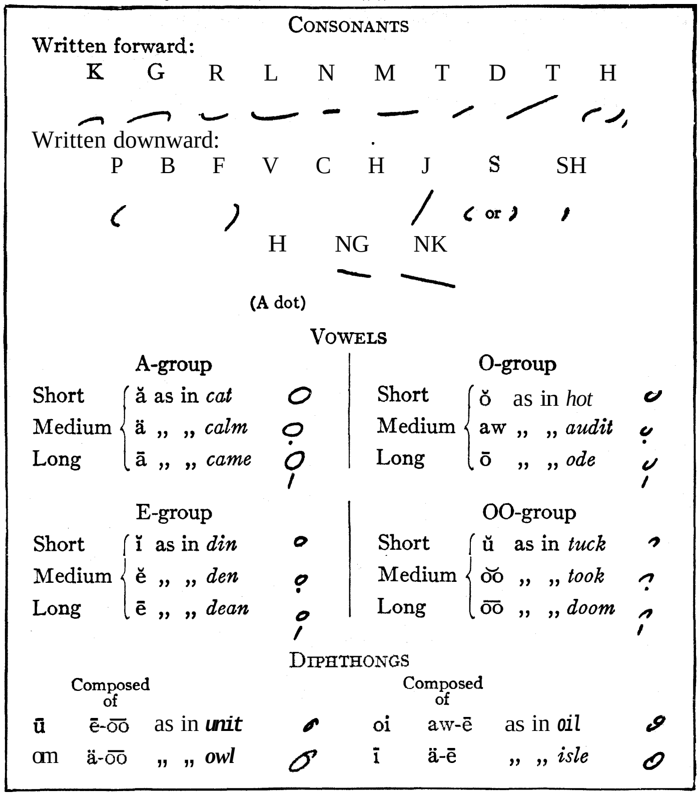
Although some changes have been made in the system since 1888, these principles have remained the same.

Consonants.—The consonants generally are paired according to affinity of sound and are distinguished by length. Consonant signs were selected which would permit the joining of many frequently recurring consonantal combinations nithout modifying the primitive form and to make possible the writing of these forms with but one movement of the pen, thus: pr br pl bl kr kl gr gl

The Signs *for S and Th.*—To facilitate joining in various combinations alternative signs are provided for the frequently recurring sound of *s*, written downward, and for th, written upward. In the use of these forms two principles serve as guides: uniformity of rotation and forward movement when joined to curves; sharp angles when joined to straight strokes.

***Vowel** Signs.*—The vowels are expressed by circles, small and

GREGG SHORTHAND ALPHABET



large, and by hooks. A small circle expresses the E-group of vowels, *ĭ, ĕ, ē;* a large circle, the A-group, *ă, ä,* a. The circle is written on the inside of curves and on the outside of angles; before and after straight strokes, or between straight strokes in the same direction, the circle is written clockwise; between reverse curves the circle is turned back on the first curve. A system of diacritics is provided for showing the exact shade of sound, as for example *ă, ä,* a, but since the large circle expresses an a-sound in any case, the need for these diacritics arises rarely. To illustrate the application of the rules for joining circles: key air meet gain make aim me mean wreck lake The hook vowels are derived from a small elliptical figure, thus: the lower part expressing the O-group of vowels, *ŏ, aw, ō;* the upper part expressing the OO-group, *ŭ, ŏŏ, ōō.* These hooks join naturally in most combinations but they are modified in two instances to avoid unnecessary angles, thus: the O-hook is turned on its side before n, m, *r*, l; the OO-hook is turned on its side after n, *m,* and after k, g, if followed by r or *l.* Illustrations: ought wrote know shop ,obey to foot mode mood cull coal on nor

Signs for W and Y.—*W* has the sound of *ōō*, as *ōō-ā-t* in **wait,** and is expressed by the sign for *ōō. W* within a word is expressed by a short dash struck under the vowel sign. The sound for y is equivalent to long e, as *ē-ōō-th* in youth, and is so expressed, except *ye* is expressed by a small loop, and *ya* by a large loop. Illustrations: wait weave youth yacht yellow Yale queen

Diphthongs.—The signs for the four pure diphthongs, ***ū, ow, oi,*** i, are written by simply joining the signs for the sounds composing them. Concurrent vowels are written in the same way. **Illustrations:** feud now toil try price science enjoy radio

Blended Consonants.—When two straight lines form an obtuse or blunt angle the natural tendency of the hand is to slur the angle and allow the lines to form a curve, thus

This principle is applied in securing a number of frequently recurring syllable signs:

TEN, DEN		as in tenor	denote	
TEM, DEM		as in temper	demolish	
ENT, END		as in paint	bond	
EMT, EMD		as in prompt	deemed	
DEF-V, TIVE		*as in* defeat	native	
JENT-D, PENT-D		as in gentle	happened	
MEN, MEM		*as* in mention	memory	
TED, DED, DET		**as** in heated	seated	
SES		*as* in passes	faces	
XES		as in boxes	mixes	

Expressing R.—By writing the circle with a reverse movement before or after straight lines; between a horizontal and an upward character; between a downward character and t, *d*, *n*, *m*, the sound *r* following the circle is expressed. Illustrations:

art share **yard** tardy
barn chart earn cart

Wordsigns and Phrases.—The Gregg system includes a list of forms, called wordsigns, for the commonest words of the language which are reduced to the simplest outlines. Examples: the **of** **and** a-an in-not that at-it is-his I

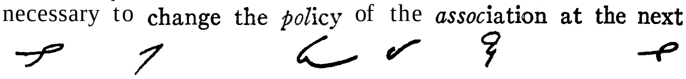
These words, through repetition, comprise more than one-quarter of all written and spoken English.

Phrasing.—Phrasing forms a very important function in the Gregg system. Since the words do not depend on position for vowel indication, phrasing is limited only by whether or not outlines can be joined easily. The following phrases will show how the principle is applied to wordsigns: of the that the **it** is in the in that and in

General Abbreviating Principle.—The rule for abbreviation given in the first edition of Light-Line *Phonography* remains the same to-day. It reads, "Drop the termination of words, *i.e.*, write so much of the outline as will, with the aid of the subject matter and vocalized context, suggest the whole word, as *unan* for unanimous, etc." This principle is already familiar in longhand, as Rev. for Reverend, *Ans.* for answer, Jan. for January, *Phila.* for *Philadelphia*, etc. Illustration:

It is ***pos*****sible that the** ***suc*****cess of the** ***mag*****azine may make it**

necessary to **change the** ***pol*****icy** of the ***asso*****ciation at the next**

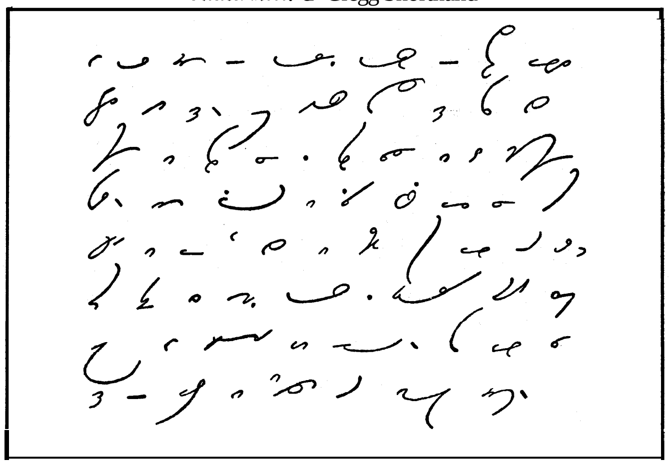


meeting at Philadelphia.

The principle is applied generally to long words not taking regular suffix endings. Its application gives brief and legible word-forms for a large number of words.

Prefixes and *Suffixes*.—The system is provided with joined and disjoined prefixes and suffixes, built up on the principle of analogy, for the most part, thus: forgive submit parallel overthrow going fairly nation common **envy** **impress** express proper

Illustration of Gregg Shorthand



The real success in learning lies in absolute honesty particularly to yourself. Never try to make yourself believe that you have done your best when a voice within you says you should have done better. You can hold your head high only when you have satisfied your own self that your efforts have been honest and thorough. Having chosen your calling, lay a solid foundation on which to build the structure of your knowledge. Be honest with yourself in whatever you undertake, and you will be successful.

Conclusion.—Expert writing of shorthand has been recognized in some States as a profession; the Department of Education of the State of New York conducts an annual examination and awards to those successful in passing the test the degree of C. S. R. (certified shorthand reporter). From 1909 to 1927, the National Shorthand Reporters' Association conducted an annual speed contest consisting of three five-minute dictations on different classes of matter. Records have been established of 280.4 words a minute on court testimony (Charles L. Swem); 2j9.6 words a minute on judge's charge to the jury (Martin J. Dupraw); and 220 words a minute on straight literary matter (Martin J. Dupraw, Nathan Behrin, Solomon Powsner), the degree of accuracy attained in all cases being greater than 99%.

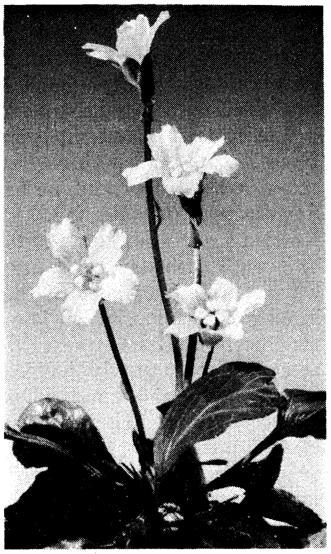
SHORTHOUSE, JOSEPH HENRY (1834–1903), English novelist, was born in Great Charles street, Birmingham, on Sept. 9, 1834, of Quaker parents. He was the eldest son of Joseph Shorthouse, a chemical manufacturer, and Mary Ann, daughter of John Hanker, of the same town. He was educated at Grove house, Tottenham, where he proved a promising and industrious pupil, and upon leaving school entered his father's business, in which he was all his life actively engaged. His literary interest was fostered by a local essay club, to which he contributed many papers.

Shorthouse wrote his most famous story. *John Inglesant,* when he was 40; he finished it in 1876 and after keeping it for three years in manuscript printed 100 copies (1880), one of which came into the hands of Mrs. Humphry Ward, who recommended it to Macmillan, but Gladstone was at once struck by its quality, and made its reputation by his praise. It became the most discussed book of the day, and its author was suddenly famous. Besides *John Inglesant* (1881). Shorthouse published other novels, none of which had the same success. Shorthouse died March 4. 1903.

SHORTIA. a rare herb *(Shortia galacifolia)* of the family Diapensiaceae, called also colts-foot, found only locally in the mountains of North and South Carolina. It is an early-blooming stemless perennial, with round, shining, slightly toothed leaves borne on stalks rising from the base, and beautiful white. some-what bell-shaped flowers, each solitary on a stalk, three to six inches long, which rises above the leaves. It is cultivated in the wild garden. One other species is found in Japan.



ROCHE

LEAVES AND BLOSSOMS OF SHORTIA (S. GALACIFOLIA)

SHORT STORY, a kind of prose fiction, distinguished from the novel *(roman)* and the nov-elette *(nouvelle* or *novella)* by its compression and intensity of effect. More prescriptive def-initions than this have been ad anced, some of them so ar-bitrary as to place unattractive and unnecessary limitations upon a developing art form. For the short stdry,-like the novel, is still in a process of development and perhaps ultimate definition. The serious short story of the 20th century might be visualized as occupying a square. the four corners of which are marked by the narrative essay or sketch, the lyric poem, the prose drama and the unit of local social his-tory. Some short stories would be located in the centre of the square: others although within the square, would be closer to one corner than to the others Washington Irving's 19th-century "The Legend of Sleepy Hollow," with its slight uncomplicated action, its embellishments of time and place and the immediate presence of the voice and personality of the author, can only with difficulty be distinguished from a narrative essay or sketch. James Joyce's "The Dead," with its luxuriant evocation of sen-suous images and its intensity of mood, differs from a lyric poem only in its expansiveness and its failure fully to utilize rhythm and sound.

Ernest Hemingway's "The Killers." stripped as it is of overt comment or analysis, and making its effect primarily by the im-plications of dialogue and a few simple actions aithin a limited scene, could easily be produced as a one-act play. Finally. Theo-dore Dreiser's "Old Rogaum and His Theresa," concentrating as it does upon a conflict within an immigrant family in special eco-nomic and social surroundings, is akin to a chapter in a social history of New York city.

Early Forms of Short Fiction.—If it has been largely in the 20th century that the lyric and dramatic possibilities of the short story have been explored. the similarities of the short story to particularized history and to the expanded anecdote are tradi-tional. These likenesses may be suggested by the origins of the words used to denote a short prose fiction: "story." with its roots in the Latin historia, suggests the relation of fictional accounts to the presentation of historical events; the English tale and the French conte suggest something told or recounted, and by impli-cation the felt presence of the teller or narrator. Short stories, in the sense of short tales told by an oral teller, of course antedate the records of human history. The most primitive man undoubt-edly could arrange a series of remembered events in a time se-quence and thus have the rudiments of a story. Among the earliest writings of man are *Tales of the Magicians,* a collection of stories from ancient Egypt which probably date from about 4000 B.C., and similar collections may be found in the ancient writings of Arabian, Hindu, Greek and Hebrew cultures. It has often been pointed out that the Bible contains tales that would fit the present conception of the short story: the books of Ruth and Jonah, for example, or such parables in the Gospels as that of the Prodigal Son. The literature of the middle ages and the Renais-sance abounds in short narratives in both prose and verse, of which the *Decameron* of Giovanni Boccaccio is the foremost ex-ample.

Western European literature after the Renaissance has produced numerous fables, romances, tales and sketches, which kept a tra-dition of short prose narration alive.

Emergence of the Short Story.—It was not until the be-ginning of the 19th century, however, that the short story as a distinct literary form began to attract the attention of serious writers in large numbers. Almost simultaneously in Germany, the United States. Russia and France collections of short fiction be-gan to appear. In Germany, E. T. W. Hoffmann published his exotic tales between 1814 and 1821; Jacob and Wilhelm Grimm collected popular legends and fairy tales; and Johann Ludwig Tieck wrote his fantastic stories during the same decade. In the United States the publication of Irving's *The Sketch Book* in 1819 and 1820 marked the beginning of a long tradition in the American short story. One of the three taies in that collection, "Rip Van Winkle," has generally been regarded as the first Ameri-can short story. In 1832 the first stories of Edgar Allan Poe and Nathaniel Hawthorne began to appear. With Irving, these two authors were to become the best American writers of the short story in the first half of the century. At almost exactlv the same time, two Russians, Alexander Pushkin and Nikolai Gogol, turned from the writing of novels and the drama to the short story. where their attention to the details of ordinary life Lon-trasted sharply with that of the fantastic and the legendary which had been exploited by the earliest German and American story writers.

Finally by 1830, three writers in France—Prosper Mérimée, Honoré de Balzac and Théophile Gautier—had begun a distin-guished tradition of the conte nhich was to continue throughout the century. What is remarkable about this sudden flourishing of a literary form in several countries at approximately the same time is that all of these writers, in spite of their varying tech-niques and subjects, were united in their conception of the short prose narrative as a potentially important form of literary art and in their consequent exploration of the possibilities and limits of the short story as a genre. Indeed the term short story was not to appear very frequently until much later in the century. Even story was quite infrequent. although as early as 1824 Irving used "Strange Stories by a Nervous Gentleman" as a subtitle for an installment of his *Tales of a Traveller.* Tieck called his first collection of stories *Die Gemalde* (pictures); Irving called his stories sketches or tales; Poe called his tales or articles; Haw-thorne used tales. sketches, even parables.

Why the conception of the short story as a new form should have come at just this time, relatively so late in the development of western literature, is somewhat difficult to explain. Possibly the short story could not be developed until the novel itself had reached the status of serious art and some degree of maturity in the latter half of the 18th century The widespread experimenta-tion with new forms as part of the romantic movement at the beginning of the 19th century may also be suggested as a con-tributing factor. In the United States the form found special favour, not only as a literary medium in the refinement of which the U.S writer could participate from the very beginning, but also as a type of writing admirably suited to publishing conditions in the new republic. There the flood of annuals or "gift books." which followed the first number of *The Atlantic Souvenir* in 1826 provided a ready market for short works which the U.S. writer, handicapped in the publication of novels by the international copyright situation, could supply on equal terms with British writers. From the annual gift books, which provided a first publishing outlet for Hawthorne, evolved the popular magazines, in which Poe's work most often appeared. Because magazines editors competed with each other for short fiction to fill the pages of their monthly issues, a whole new market was created. These editors probably adopted the sentiment expressed facetiously by Irving in a preface to his *Tales of a Traveller:* "If the tales I have furnished should prove to be bad, they will at least be found short; so that no one will be wearied long on the same theme."

Later Poe expressed the importance of these economic circumstances when he argued that the short story was the child of the American magazine. Certainly the popular magazine, both in the United States and in Europe, has continued to be by far the largest outlet for short stories, consuming hundreds of thousands of them during a century and a half and creating various formulas for "the popular story," which provides ephemeral entertainment for readers without disturbing them unnecessarily, and conceats old plots and hackneyed ideas in ingeniously invented novelties of detail.

The importance of Poe in the history of the short story is that he used the magazine to insist that a short story was potentially a superb art form. It is true that such writers as Hoffmann, Irving and Gogol had recognized the rewards of attention to the artistry of the tale; but Poe in his famous review of Hawthorne's *Twice-Told Tales* in *Graham's Magazine* for May 1842, claimed that "the tale proper, in our opinion, affords unquestionably the fairest field for the exercise of the loftiest talent, which can be afforded by the wide domains of mere prose," reserving the highest order of excellence for the lyric poem. Furthermore, he formulated the first set of principles for the art of the short story in a famous paragraph:

> A skillful literary artist has constructed a tale. If wise, he has not fashioned his thoughts to accommodate his incidents, but having conceived, with deliberate care, a certain unique or single *effect* to be wrought out, he then invents such incidents—he then combines such events as may best aid him in establishing this preconceived effect. If his very initial sentence tend not to the outbringing of this effect, then he has failed in his first step. In the whole composition there should be no word written, of which the tendency, direct or indirect, is not to the one pre-established design.

Some of Poe's principles—coherence and design, for example—were hardly new, being those assumed for literary art from the time of Aristotle onward; yet their application to the short story indicated that it had grown by 1842 into a significant literary form. Moreover, if it is true that Poe's somewhat mechanical conception of composition and his emphasis on a "single effect" could in the hands of critics like Brander Matthews 60 years later lead to a falsely rigid reduction of the short story to certain "essential ingredients" which could be concocted for the popular magazines, it must be remembered that Poe achieved a notable variety of works within his definition: the classic horror tale "The Cask of Amontillado"; the detective tale "The Purloined Letter"; and the tales of psychological exploration "Ligeia," "William Wilson" and "The Fall of the House of Usher."

The two other U.S. writers of this period whose work deserves mention, Hawthorne and Herman Melville, were more important as novelists than as writers of shorter works. Hawthorne in his *Twice-Told Tales* (1837) and Melville in *The Piazza Tales* (1856) added a moral ingredient to the short story which Poe's tales of effect lacked. Rich in symbol, proceeding from the depths of human experience, and appealing to the intellect as well as to the emotions, their work has an integrity and complexity which for many modern readers Poe's and Irving's have seemed to lack. Each of Hawthorne's stories, like the black cloth in his "The Minister's Black Veil," holds a "mystery which it obscurely typifies," and it examines the ambiguities of human life in a manner which Poe's "single effect" does not comprehend.

The Short Story in Europe.—While U.S. writers were taking advantage of their special circumstances to build a strong tradition of the short story, writers in France and Russia were no less active. In contrast to the romantic fantasy and eccentric distortions of Tieck, Hoffmann and the Grimms in Germany, or the U.S. variations of the tale of romance and terror in the comic Gothic of Irving, the psychological interest of Poe and the moral concern of Hawthorne, such French writers as Mérimée and Balzac were grounding their work in realism and emphasizing such clarity of observation, vividness of detail and precision of statement that the stories "stand and speak before the reader." the writer remaining impersonal and objective. This tradition of objectivity, which led the short story away from its similarities to the narrative essay or sketch, where the presence of the author's personality continuously is felt, toward the direct representation of the drama, uhere the incidents must reveal the meaning of the work implicitly rather than explicitly, has been the major contribution of the French story writers, not the early masters. but also those who continued this tradition much later in the century—Gustave Flaubert and Guy de Maupassant.

The Russian tradition, beginning with the stories of Gogol in *Dead Souls*, reached an early maturity in the nork of Ivan Turgenev, whose first and perhaps finest collection of stories, *A Sportsman's Sketches* (1852), indicated the direction which the Russian story was mainly to take. These stories. grounded in the ordinary circumstances of peasant life as Gogol's had been, have little of the appearance of the striking combination of incidents leading to a climax which Poe had recommended in his review of Hawthorne's tales ten years before. Each story catches a character in a particularly revealing incident one which illuminates the whole life of the individual in an impression which seems deceptively casual. In one of his best stories, "The Country Doctor," Turgenev seems to express wonder at the very method which he invented: "It's strange how things happen in life: you live with someone for a long time, you are on the best of terms, yet you never once speak to them frankly and from the heart; with someone else, you've hardly even got acquainted—and there you are: as if at confession, one or other of you is blurting out all his intimate secrets." The overheard revelation of the "intimate secrets" of a character or characters is the primary intention of Turgenev's stories, and the representation of character rather than the combination of striking incidents is his primary method.

Thus in the contrasting emphases of Poe and Turgenev two different approaches to the short story appeared, the one assuming that the proper method of the story was to invent incidents which when plotted to a suspenseful climax offered a sweeping total effect, and the other assuming that the proper method was to begin with the representation of characters who themselves seemed to suggest incidents that would reveal the quality of their lives.

This basic division can be seen again in the contrasting methods of the two most influential short story writers of the beginning of the 20th century—one French and the other Russian. Guy de Maupassant mastered the method of Poe, bringing to it the compression. the economy of detail and the vivid precision of style which were typical of the French story almost from the beginning. His ingeniously constructed plots and striking climaxes were imitated by writers on both sides of the Atlantic, to whom such a story as "The Necklace" seemed a perfect model. That the mannerisms and tricks of the Maupassant story should have been adopted by great numbers of writers of the popular magazine story and converted into a sterile formula does not deny the achievement of Maupassant himself, whose ironic pessimism and realistic examination of life set him apart from the writers who packaged his wares for mass consumption. The influence of Anton Chekhov, on the other hand, was not so much to be found among the writers of the popular story as among the large number of young writers of the 1920s in England and the United States, to whom the plotted story of Poe and Maupassant, as brought to a superficial polish in the tales of O. Henry. Jack London and Rudyard Kipling, seemed to eliminate the possibilities of individual experiment.

Chekhov's stories, like those of Turgenev's, focused on revealing moments in the lives of his characters, and their climax comes not so much in a striking incident as in a growing understanding of the nature of a character and his situation. A story, he argued, should have neither beginning or end, for it was at these points that the author was tempted to impose an artificial neatness and certainty on the complexity of life. The unity for which he strove was not an external resolution of a complicated action, but rather an internal unity of revelation of character.

Each tradition, the Poe-Maupassant story emphasizing plotted action or the Turgenev-Chekhov story emphasizing revelation of character, could of course provide successful stories, for plot and characters are inextricably intertwined in a significant story. The best stories of the 20th century proceed from an organic theory of the form, for which Henry James became not only a tireless explicator but also a distinguished practitioner. In his important essay "The Art of Fiction" (1884) James argued that a piece of fiction "is a living thing, all one and continuous, like any other organism. and in proportion as it lives will it be found . . . that in each of the parts there is something of each of the other parts . . . What is character but the determination of incident? What is incident but the illustration of character? . . . It is an incident for a woman to stand up with her hand resting on a table and look at you in a certain way; or if it be not an incident I think it will be hard to say what it is. At the same time it is an expression of character." James's preoccupation with discovering the proper form for each work. in which each of its elements contributes fully to its effect and in which the total structure embodies its meaning, is reflected less in his immediate influence on his contemporaries than in the influence which his fiction and his criticism had on English and American writers after World War I.

The Short Story in English.—James's own contemporaries in the U.S. were developing two other schools of the short story. both of which seemed more promising at that time than they did several decades later. Near the beginning of James's career, the "local colour" movement produced hundreds of stories aimed at exploiting the regional peculiarities of the different sections of the United States. Among the best of the local colourists were Bret Harte and Mark Twain in the west. Hamlin Garland in the mid-west. George R'ashington Cable and Joel Chandler Harris in the south, and Sarah Orne Jewett and Mary E. Wilkins Freeman in New England.

At best. the movement provided its readers with genuinely imagined representations of the regional life of a nation only recently torn by civil war, and it extended the range of short fiction into localities not before explored by the short story writer. At worst, the local colourists merely dwelt upon the quaintness of local characters and dialect. and marketed an "atmosphere" applied with a broad brush. Near the end of James's career "the O. Henry manner" was in vogue. The stories of O. Henry, with their rush of incident, crackling style and startling trick endings, achieved for their author an immense popularity and a host of imitators who filled the popular magazines with stories written to his formula. Later critics have found his work to be lacking in intellectual depth and his central theme—the effect of coincidence on character—scarcely worthy of the endless variations he played upon it; yet for many ordinary readers in the United States and England. O. Henry is pleasantly remembered as "a man who could tell a story."

.Although storytelling has been a folk pastime in England for centuries and short fiction has been written in England from the time of "The Green Knight" of Arthurian romance on to the present, the English short story was quite undistinguished until late in the 19th century. The masters of the English novel—Sir Walter Scott, Charles Dickens, George Meredith and Thomas Hardy—occasionally attempted short works. but they gave little evidence of comprehending the potentialities of the form which was maturing in Russia. France and the United States. Short fiction filled the English magazines. but most of the stories were merely amusing anecdotes or sentimental and pious recountings of minor domestic crises.

During the 1880s, however, the influence of such American writers as Irving, Poe, Bret Harte and Ambrose Bierce began to be felt in the romances and fantasies of Robert Louis Stevenson, Oscar Wilde and the contributors to *The Yellow Book*. It was in Rudyard Kipling, however, that the short story in England found a talent comparable to Maupassant in France. Kipling's stories abounded in flamboyant effects and striking incidents of British colonial life; well plotted and colourful, they provided the models for many English writers during the first two decades of the 20th century. Yet it was not until after World War I that the short story in Great Britain really flourished. The major novelists—Joseph Conrad, James Joyce. E. M. Forster. Virginia Woolf and D. H. Lawrence—showed an awareness of the short story form that their 19th-century counterparts had lacked. Ironically, the two writers whose influence has been strongest on the 20th-century story were Joyce of Ireland and Katherine Mansfield of New Zealand. Joyce's *Dubliners* (1914) showed a remarkable ability to transmute the incidents of ordinary life into classic art through richness of imagery, objectivity and restraint. Mansfield's delicate stories, rendered in poetic prose and focusing upon internal, psychological conflicts. have an obliqueness of narration and subtlety of observation which reveal plainly the influence of Chekhov.

Though probably not so influential in determining new courses for the short story as Joyce and Mansfield. W. Somerset Maugham undoubtedly had the widest public of any English short story writer throughout almost half of the 20th century. A sleek objectivity and an incisive dissection of human frailties are the marks of his stories; their sardonic comedy is an acid variation on the wry humour which characterizes many English stories. A later generation of writers—V. S. Pritchett, Graham Greene, H. E. Bates, Elizabeth Bowen and William Sansom—have demonstrated that the short story in England reached maturity by the middle of the 20th century, after scarcely 50 years of distinguished achievement.

The Short Story in the **U.S.**—The 20th-century short story in the United States has been equally rich. justifying Poe's prediction in 1842 that the form could encompass "a vast variety of modes or inflections of thought and expression." As in England, the major novelists—Willa Cather. F. Scott Fitzgerald, Hemingway, William Faulkner. John Steinbeck and Robert Penn Warren—were likely to be equally at home in the short story and the novel.

From Stephen Crane to Eudora Welty, the U.S. writer! whose only tradition sometimes seems to be to break with tradition! was constantly evolving new individual forms for his vision of life. His work has been marked by an intense devotion to craft, a thorough grounding in actuality without false sentiment or moralizing and an ability to discover the universal in the regional. His American "voice," a robust colloquial speech, has gone through successive stages of refinement in the style of Mark Twain. Sherwood Anderson and Hemingway. His preoccupation with the regional qualities of U.S. life, particularly the south (as in Faulkner, Warren. Katherine Anne Porter and Welty) and the mid-west and west (as in Anderson, Steinbeck and Walter Van Tilburg Clark). has come not merely from the attraction of local colour but rather from the hope that the human spirit could best he caught at close range. His concern for his native scene has not prevented influences from Europe from being absorbed into the American short story, particularly the work of Thomas Mann, Franz Kafka. Mansfield. Joyce, Chekhov, Riaupassant and Flaubert. and in turn the impact of the U.S. story has been widely felt in Europe. By mid-20th century the short story had reached full stature, an essential literary medium for writers throughout the western world.

Patrick (eds.), *American Short Stories* (1952); Ray B. West, Jr., *The Short Story in America, 1900–1950* (1952). (W. L. Ps.)

SHOSHONE, a North American Indian group which occupied, in the early 19th century, a large continuous territory extending from the present Inyo county in southeast California across parts of Nevada and Utah into southern Idaho and western Wyoming. In addition. one tribe of Shoshone, the Comanche, occupied much of western Texas. Among all the Shoshone there were at least 50 bands or territorial subdivisions which were never united politically. All these people spoke dialects of the same language which differed so little that persons from Death Valley, Calif., could understand those from west Texas. The Shoshone may be divided into four major groups: western, centring in Nevada; northern, in northern Utah and southern Idaho; Wind River, in the western half of Wyoming; Comanche, in west Texas.

The western group did not acquire the horse until the Mormons arrived in the area about 1847, and then only in very small numbers because the desert environment would not support many horses. When first discovered the Shoshone were living principally on wild plant foods, especially seeds. Houses were small, domed structures of brush, called *wickiups*. There was no political organization; the largest unit was a family group or a small fluid band. Hostilities were confined to feuds and small raids.

The northern group possessed horses by the time the expedition of Meriwether Lewis and William Clark visited them in the early 19th century, and probably much earlier. They also had some measure of band organization. They traveled into Wyoming and Montana to hunt buffalo in season. lived in hide tepees and wore hide clothing like the Plains Indians. They were more warlike than the western Shoshone.

The Wind River Shoshone and Comanche acquired horses as early as 1joo; and the Comanche, who were living in Wyoming at that time, traveled south to Texas on horses during the next few decades. All the Wind River bands stayed together under one chief for about half the year, but the Comanche bands probably never all assembled at any one place. The Comanche were unusually aggressive, even for Plains tribes.

The population of the Wind River Shoshone is estimated to have been 2.500 in the early 19th century, and that of the Comanche 7,000. The northern and western Shoshone combined did not exceed 10,000 at that time. In 1950 there were a total of about 5,000 in all four groups, living for the most part on reservations within the territory they once held. *See* also INDIAN. NORTH AMERICAN; CENTRAL AND NORTH AMERICAN LANGUAGES.

SHOSTAKOVICH, DMITRI (1906–). Russian composer. was born on Sept. 25. 1906, in St. Petersburg (later Leningrad), Kussia. He received his formal training at the Leningrad conservatory from 1919 to 192j, where he studied pianoforte and composition. His work in advanced composition was done under the direction of Alexander Glazunov.

A child of 11 years of age at the time of the October revolution, Shostakovich associated himself intimately with the "revolutionary tradition." In 1925, when he left the Leningrad conservatory, he became a member of the Union of Soviet Composers, an organization dedicated to the propagation of socialist theory through art. He based his aesthetic principles on the interrelation of music and political philosophy; his art could not be its own end but had to reflect Communist ideology in its struggle with conflicting political systems.

In 1926 Shostakovich's *First Symphony* mas performed; within a short time it became a part of the standard repertory of most major orchestras throughout the world. From that time, save for two or three notable redressings from the Communist party: he rose steadily to a place of eminence both within and without the Soviet Union. In 1930 Shostakovich presented his opera, *The Nose.* It immediately invoked the displeasure of the Communist party for its "decadent formalism." His next opera. *Lady Macbeth oj Minsk,* fared little better within the Soviet Union. The composer was accused of composing music rife with "bourgeois decadence." The opera was. however, received somewhat more favourably by audiences abroad.

For the next several years Shostakovich managed to remain within the good graces of his government. His *Fifth Symphony,* written in 1937, pleased the political critics for its alleged conformance to the national spirit; moreover, it received acclaim throughout the world. In 1941 Shostakovich recorded the siege of Leningrad in his long *Seventh* or *Leningrad Symphony*. In the same year he was awarded the Stalin prize for his piano quintet.

In 1948, along with several other Soviet composers, Shostakovich was sharply rebuked by the central committee of the Communist party for once more falling into "decadent formalism." The composer recanted, again making his peace with his government. In March 1949 he was sent as a delegate to the Cultural and Scientific Conference for World Peace, held in New York city.

Among Shostakovich's other well-known works may be included *The Age of Gold,* a ballet (1930); *The Limpid Stream,* an opera (1935); *Sonata for Cello and Piano* (1935); *Trio in E Minor* (1944); and *String Quartet No. 2* (1945).

SHŌTOKU TAISHI (574–622), regent of Japan, one of the most important contributors to development of Japanese civilization, who brought to it new political, religious and artistic institutions, was a nephew of the empress Suikō. He became crown prince and regent in 593. By means of persuasion and political maneuver, he greatly expanded the power of the imperial house, bringing back into its hands powers that had been delegated to the nobles.

A brilliant scholar, Shōtoku was instrumental in introducing Chinese culture to Japan. His motives were not entirely intellectual and aesthetic, however, for he saw in Chinese political institutions and technology a means of building a stronger central government in Japan. His 17-article constitution expressed the ideals of a centralized bureaucratic state on the Chinese order; he was thus the forerunner of the Taika reform. Shōtoku was a devout believer in Buddhism, and in order to spread that faith through the country he began the building of temples in areas far beyond the capital city. After his death, he was looked upon in popular belief as a Buddhist saint.

SHOT PEENING: *see* BLAST CLEANING AND SHOT PEENING.

SHOT-PUT, a sport in which a spherical weight is thrown or put from the shoulder for distance. It derives from the ancient sport of putting the stone. First to use a shot instead of a stone competitively were British military sports groups, and later the idea was adopted by civilians.

While the weight varied from 8 lb. to 24 lb., the 16-lb. shot was adopted for men in Olympic games. national and international competitions. Weight for women's competition is 8 lb. In the United States a 12-lb. shot is used for high school boys' competition. ages 15–19.

Constant improvements in technique resulted in the virtually doubling of record distance in less than 80 years. The International Amateur Athletic federation recognized the first official world record as 30 ft. 11½ in., by J. M. Mann of the United States in 1876. E. J. Borr of Great Britain surpassed 40 ft. in 1880 and Ralph Rose (U.S.), in 1909 became the first to exceed 50 ft. Speculation over man's ability to attain 60 ft. paralleled, in a lesser way, the topic of man's ability to run the 4-min. mile. Interestingly, the 60-ft. shot-put was achieved two days after Roger Bannister, the British runner, broke through the 4-min. barrier.

Parry O'Brien (U.S.) put the shot 60 ft. 5¼ in. on May 8, 1954. In 1960 Bill Nieder of Austin, Tex., who beat O'Brien in the Olympics that year, raised the world record to more than 65 ft., thus breaking another psychological barrier. Athletes from the U.S. proved world leaders in the event, holding records in most of the years after 1876.

In women's competition with the 8-lb. shot, Galina Zybina of the U.S.S.R. brought the record above 50 ft. when she won the 1952 Olyinpic championship. In 1956 Miss Zybina extended the record to 54 ft. 11¾ in.. and in the 1960 Olympics Tamara Press of the U.S.S.R. put the shot more than 56 ft.

The shot generally is made of solid iron or brass, although any metal not softer than brass may be used. It is put from a circle 7 ft. in diameter.

Technique. — The put is started at the back of the circle by shifting the weight of the body to the right foot with good balance. left knee bent and the left toes raised so that the spikes clear the ground. Next, the left knee is brought close to the right knee and the right leg bent gradually as the hips cross the circle. This method of starting the put enables the shot-putter to be in a correct position when he reaches the centre of the circle and thus able to start lifting the shot immediately.

The shot is lifted via the medium of the leg muscles, and the put must always be made upward and not outward by a rhythmic movement of the arm muscles. which can be acquired by constant repetition.

Whereas it was conventional to start from a position at right angles to the direction of the put, O'Brien developed a style of beginning from a backward position. Thus he brought the implement around 180°, rather than 90°. He found that the longer one pushed the shot, applying force against a moving object, the longer the throw would be.

See OLYMPIC GAMES.

BIBLIOGRAPHY.—Frank G. Menke, *The Encyclopedia of Sports* (1953); Amateur Athletic Union, *Official Track and Field Handbook* (1958); G. T. Bresnahan, W. W. Tuttle and F. X. Cretzmeyer, *Track and Field Athletics*, 4th ed. (1956). (H. AR. RN.; SY. S.)

SHOT TOWER, originally a cylindrical tower of brick or masonry about 200 ft. high used for making gunshot. Modern versions are built of structural steel and often incorporated in other buildings. Gunshot is made by dropping molten lead through a sieve at the top into a water tank below. All sizes from the smallest (known as dust shot) up to no. 2 or "BB" size, are made in this manner. Arsenic and antimony are added as alloys to keep the shot spherical and to control hardness. (B. R. L.)

SHOVE-HA'PENNY, the game of pushing a coin or disk along a polished board so that it stops between closely ruled lines. The game originated in the 15th century in England. The modern version, like darts, is mainly and competitively centred on premises licensed to sell liquor. The winner is the player who can first place a disk three times in each of the nine "beds." See SHUFFLEBOARD. (N. D. M.)

SHOVEL, SIR CLOUDESLEY or CLOWDISLEY SHOVELL (c. 1650–1707), English admiral, was baptized at Cockthorpe in Norfolk on Nov. 25. 1650, and went to sea in 1664 under the care of his kinsman Sir Christopher Mynns. He set himself to study navigation. He became a general favourite and obtained quick promotion. In 1674 he served as lieutenant under Sir John Narborough in the Mediterranean, where under the castles and walls of Tripoli. he burned four men-of-war belonging to the pirates of that place. After a long period of service in the Mediterranean, he was present as captain of the "Edgar" (70) at the first fight at Bantry bay (1689), and shortly afterward was knighted. In 1690 he convoyed William III across St. George's channel to Ireland; the same year he was made rear admiral of the blue. In 1692 he was appointed rear admiral of the red, and joined Admiral Russell. under whom he greatly distinguished himself at La Hogue by being the first to break through the enemy's line. When Russell was superseded. Shovel was put in joint command of the fleet with Admiral Killigrew and Sir Ralph Delaval. In 1702 he brought home the spoils of the French and Spanish fleets from Vigo, after their capture by Sir George Rooke, and in 1704 he served under Rooke in the Mediterranean and co-operated in the taking of Gibraltar. As commander in chief of the British fleets he co-operated with Peterborough in the capture of Barcelona in 1705. and commanded the naval part of the unsuccessful attempt on Toulon in Oct. 1707. When returning with the fleet to England his ship, the "Association," struck on the rocks near Scilly (Oct. 22), and was seen by those on board the "St, George" to go down in three or four minutes' time, not a soul being saved of 800 men that were on board. The body of Sir Cloudesley Shovel was cast ashore next day, and was buried in Westminster abbey.

See *Life and Glorious Actions of Sir Cloudesley Shovel* (1707); Burnet's *Own Times;* various discussions in *Notes and Queries,* 5th series, vol. x and xi; and T. H. Cooke, *Shipwreck of Sir Cloudesley Shovel* (1883).

SHOVELER, a word originally applied to the bird later termed spoonbill (*q.v.*), but now used of *Spatula clypeata,* a duck characterized by its broad flat beak, the edges of which are beset with long lamellae by means of which food particles are filtered off from the water just as is done by the baleen in whalebone whales. Its food consists of small aquatic plants and fishes, crustacea, snails. tadpoles. etc.

The shoveler is a surface-feeding duck and the male, with his contrasted plumage of white, brown and bay. dark-green head and speculum and orange feet, is a handsome bird. The female resembles in plumage the ordinary wild duck.

The shoveler breeds locally over the greater part of Europe (including Great Britain), Asia and North America. wintering farther south, where it reaches India, Abyssinia, Central America and even Australia. It nests among the swamp grass and lays 7 to 12 olive-gray or olive-buffy eggs.

Other species inhabit South America, South Africa, Australia and New Zealand. (HT. FN.)

SHOWBOAT, a genuine American folk institution, which for more than a century did much to relieve cultural starvation on river frontiers of the middle west and the south. Long before motion pictures, these entertainment boats penetrated regions where churches, schools, newspapers and theatres had not gone.

The British-born actor William Chapman (1760–1841), built the first showboat, the "Floating Theatre" (14 by 100 ft.). at Pittsburgh, Pa.. in 1831. He and his family floated from landing to landing, playing such dramas as August Friedrich Ferdinand von Kotzebue's *Menschenhass und* Reue (translated as The *Stranger*) and Shakespeare's The *Taming of the* Shrew, with music and dance specialties added. Gpon reaching New Orleans late in winter, they junked the boat and returned by steamer to Pittsburgh, to repeat the pattern the next year. After Chapman's death, showboats first degenerated and then, because of the Civil War, disappeared entirely.

When showboats were revived (1878), they specialized in vaudeville and melodrama. Steamer tows and the calliope greatly increased territory and audiences, and Stephen Foster's songs added sentimental charm to their programs. Such boats as **A.** B. French's "Xew Sensation." McNair's "New Era," E. A. Price's "Water Queen," Thom's "Princess" and dozens of others, with seating capacities of 100 to 300, carried their rich cargoes of humour, music and simple emotion to every river on the Ohio-Mississippi system, from the narrow Monongahela in the northeast to the Atchafalaya bayous (creeks) in the south. Thousands of persons who had never witnessed public entertainment saw for the first time an imaginary world on a stage, and were able to laugh and cry at this simplified battle of good and evil.

With the disappearance of river frontier conditions in the 1900s, and with the coming of better roads, automobiles and motion pictures, the decline of showboats was inevitable. To compete with land entertainment, they became larger and more elaborate. Menke's "Goldenrod" seated 1.400 persons and cost more than $35.000. The "Cotton Blossom." the "Sunny South" and Bryant's "New Showboat" were floating theatre palaces. All emphasized melodrama. With the burlesquing of these programs in the 1930s to attract sophisticated audiences, showboats ceased to perform their original function. The last one to travel the rivers in authentic pattern was the "Goldenrod" in 1943.

SHREVEPORT, a city of northwestern Louisiana. U.S., on the Red river, 317 mi. N.W. of New Orleans and 185 mi. E. of Dallas, Tex. Shreveport is the centre of a standard metropolitan statistical area that covers all of Caddo parish and is bordered by Arkansas, Texas and the Red river. The area is slightly hilly except for parts of the river valley, has several lakes and is forested with hardwood and pine. Pop. (1960) city 164,372; standard metropolitan statistical area 281,481.

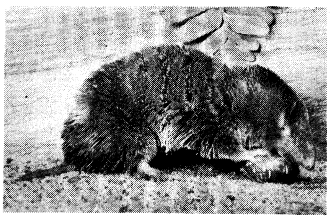
Henry Miller Shreve, after clearing the Red river of a huge natural timber raft, founded the city in 1835 on lands obtained from the Caddo Indians at the head of navigation on the river. Cotton and river traffic formed the economic basis of life, and Shreveport's association with nearby Texas is indicated by the many city streets named for heroes of the Texas revolution. At the end of the Civil War, Shreveport was the Confederate ,state capital and headquarters for the Trans-Mississippi forces of the Confederacy. Using logs to simulate artillery, its defenders constructed Fort Humbug to command the river; but the only major attempt to take the city was halted 40 mi. S. at Mansfield. By 1900 the river was no longer used for commerce but railroads and cotton trade kept the city growing. Discovery of oil in the area in 1906 gave the city new impetus, and oil and gas continue to be of major economic significance.

A police jury administers Caddo parish except for the incorporated places of Shreveport, Vivian, Mooringsport and Oil City. Of the 1950 population of the metropolitan area, 75.6% was urban. 16% rural nonfarm, and 8.4% rural farm; about 66% was native white. 33% Negro, and 1% foreign born.

The area produces lumber, glass. metals, machinery, foods. and chemical and petroleum products. Cotton remains the chief farm crop. and wholesale and retail trade are large. Educational facilities include a modern parish-uide public school system, a state trade school. and Centenary college, a Methodist institution founded in 1825. Shreveport has a public library system. a symphony orchestra and two amateur theatres. The Louisiana state fair and Holiday in Dixie. a spring festival. are major annual festivals. Parks, golf courses, boating and fishing on Cross. Caddo and Wallace lakes. a municipal auditorium, a large stadium and an indoor arena are available.

Three highway bridges connect Shreveport with Bossier City (pop. [1950] 15,470), the location of Barksdale Field, a major air force base. (W. M. Lo.)

SHREW, a term applied to the members of the family Soricidae of the mammalian order Insectivora, which includes also moles, hedgehogs, etc. The common shrews or shrewmice of the northern hemisphere, belonging to the genus *Sorex,* are about the size of mice, although with no resemblance to mice in structure or in habits. They are distinguished externally by the long, pointed muzzle. which projects far beyond the lower lip. The small eyes are almost concealed by fur; the ears are short, broad and provided internally with deep folds; the tail is usually slightly shorter than the body, generally quadrangular in section and thinly haired, often with a small tuft at the tip. The fur is short and velvety, grayish or brownish in colour. On the side of the body there is a gland secreting a fluid with an unpleasant odour, a fact which renders shrews unpalatable to many larger predators. The short-tailed shrews, genus *Blarina*, common to eastern North America, are reputed to have a poisonous bite; the toxin, however, is only powerful enough to affect the shrews' favourite prey.



JOHN H GERARD

AMERICAN SHORT-TAILED SHREW (BLARINA BREVICAUDA) FEEDING ON A SNAIL

Shrews feed largely on insects. snails. worms and small mammals. and are active day and night and in all seasons. They usually live in moist situations, burrowing in leaf mold in search of their food. They must feed almost continuously because of their very rapid metabolic rate. and are said to consume their own weight in food about every three hours. In the sorecine shrews all teeth are tipped with red pigment. while crocidurine shrews of Africa. Asia and part of Europe have white teeth. Skulls of shrews have no cheek arch. Several shrews are minute, among the smallest of mammals. weighing only $\frac{1}{7}$ oz.. about 2 in. long with the tail an additional $1\frac{1}{4}$ in. The largest species is probably one of the Asiatic water shrews, *Chimarrogale,* some 6 in. long, the tail 3 in. See also INSECTIVORA. (J. E. HL.; X.)

SHREWSBURY, EARLS OF. Shrewsbury, one of the most ancient earldoms in the English peerage, dates from the time of William the Conqueror. Roger de Montgomery (c. 1030–1094), son of another Roger de Montgomery, known as "the Great," was a councilor of William, duke of Normandy, before his invasion of England, and was probably entrusted by William with the government of Normandy during the expedition of 1066. Roger received territory in Sussex, including the city of Chichester and the castle of Arundel, he became earl of Arundel, or probably and more correctly earl of Sussex. In 1071 the greater part of the country of Shropshire was granted to him, carrying with it the title of earl of Shropshire, though, from his principal residence at the castle of Shrewsbury, he like his successors was generally styled earl of Shrewsbury. He probably exercised palatine authority. He was the founder of Shrewsbury abbey in 1083. His first wife was Mabel, daughter of the seigneur of Belesme and Alençon; hence his son Robert, who, after the death of another son, Hugh, succeeded to the earldoms of Shrewsbury and Arundel, was generally known as Robert of Belesme (*q.v.*), one of the most celebrated of the feudal nobles in the time of Henry I. Robert having been deprived of all his English estates and honours in 1102, the earldom of Shrewsbury was next conferred in 1442 on John, 5th baron Talbot. whose descendants have borne the title to the present day. (See TALBOT; and SHREWSBURY, JOHN TALBOT.)

SHREWSBURY, CHARLES TALBOT, DUKE OF (1660–1718), English statesman, was born on July 24. 1660. the son of Francis. 11th earl of Shrewsbury. As his parents were Roman Catholics he was brought up in the Catholic faith and educated mainly in France during the years 1674–78. In the spring of 1679, under the influence of John Tillotson, then dean of Canterbury, he joined the Church of England, thus qualifying himself, although under age. to take his seat in the house of lords and to accept appointment as lord lieutenant of Staffordshire.

His real introduction to political life, however, took place in the reign of James II, when he not only resisted every temptation to return to the Roman Catholic Church but took an active part in the conspiracy which led to the Protestant revolution. The early meetings of the conspirators were held in his house; he was one of the famous seven who signed the letter of June 30, 1688, inviting William of Orange to come over with an armed force to England. In September he joined William in Holland and in November returned to England with his expedition, securing Bristol and Gloucester for him. In the convention which assembled on Jan. 22. 1689. he advocated the elevation of William and Mary to the throne, and as soon as the new monarchs had been proclaimed he was rewarded with a seat in the privy council and the post of secretary of state for the southern department.

Although moderately successful in office he was never happy there. Responsibility weighed heavily upon him, and in the party rivalries which followed the Revolution he found himself unable either to give full support to the aims of his Whig associates or to repudiate them altogether. On June 2, 1690, disgusted at the growth of Tory influence in the government, he resigned his secretaryship, and for four years thereafter, on the plea of ill-health, resisted every attempt to induce him to resume office. This obstinacy on his part inevitably exposed him to being called a Jacobite, an imputation somewhat supported by his mother's activity in the Jacobite cause and his intimate association with the earl of Marlborough, whose own conduct was giving great dissatisfaction to the king. On June 23, 1692, accordingly, he and blarlborough were both struck off the privy council. and for a year thereafter he pursued a policy of opposition to the government. criticizing their conduct of the war and advocating in the house of lords an Abjuration bill and a Triennial bill which they considered ill-timed or worse. Nevertheless. William continued to entertain a real trust in and affection for him, and on March 2, 1694, when the Whigs were regaining influence at court, he was persuaded to accept appointment as secretary of state for the northern department, transferring shortly after to his original post in the southern department. On April 25 of the same year he was rewarded with the Garter and on April 30 was created duke of Shrewsbury.

His second period of office, though longer. was no more satisfactory than his first. Ill-health, real or imaginary, continued to worry him, the imputation of Jacobitism still hung over his head. and his chief energies mere directed toward securing permission to retire. Although appointed one of the lords justices entrusted with the administration of the country during the king's absences on the continent in 1695, 1696 and 1697, he was accused during these years both by the conspirator Sir John Fenwick and by the informer Matthew Smith of complicity in Jacobite intrigues. and felt his position so keenly that he practically ceased to take any part in the government. On Dec. 12. 1698, he was allowed to resign his secretaryship, accepting in exchange. a year later. the less responsible post of lord chamberlain: but this also he resigned on June 20. 1700.

Leaving England a few months later, he spent the next five years in travel on the continent where, on Sept. 9, 1705, he made a somewhat unfortunate marriage with Adelaide, daughter of Andrea. Marquis Paleotti of Bologna. On his return early in 1706 he became increasingly dissatisfied with the conduct of his former Whig associates, and in 1710 went over to the Tories. He was appointed lord chamberlain on April 14 and admitted to the privy council on April 16 of that year; appointed lord lieutenant of Ireland on Sept. 22, 1713 and lord high treasurer on July 30, 1714, when Queen Anne was on her deathbed. His possession of this last great office enabled him to exercise a decisive influence in favour of the peaceful recognition of George I, who rewarded his services by appointing him groom of the stole and keeper of the privy purse on Sept. 26. a privy cpuncilor on Oct. 1 and lord chamberlain on Oct. 17, 1714. On Feb. 1, 1718, he died in London of inflammation of the lungs: and as he had no children his dukedom became extinct and his earldom passed to a cousin.

Shrewsbury was generally regarded as one of the finest and most cultured gentlemen of his day, and was endowed with a personal charm which earned for him the title of the "king of hearts": but an excessive sensitiveness and a reluctance to face the harsh realities of life in troublous times greatly impaired his effectiveness as a statesman. On the occasion of the Revolution and on the death of Anne he pursued a bold and determined policy, but as a rule his attitude was weak and vacillating. His declaration that if he had a son he "would sooner breed him a cobbler than a courtier, and a hangman than a statesman," is a reflection on himself no less than on his political world. (A. BG.)

SHREWSBURY, ELIZABETH TALBOT, Countess of (1518–1608), better known as "Bess of Hardwicke," was the daughter and co-heiress of John Hardwicke of Hardwicke. Derbyshire. She was four times married—to John Barlow. Sir William Cavendish, Sir William St. Lo (or St. Loe), and finally, in 1568, to George Talbot. 6th earl of Shrewsbury. With each marriage she made a good settlement, and before she married Shrewsbury was accounted the wealthiest woman in England. She arranged a marriage between her daughter Elizabeth and Charles Stuart, brother of Lord Darnley. without consulting her husband. Since the Lennox family were of royal blood, Elizabeth thought the countess over-ambitious, and sent her to the Tower for a short time. The child of the Stuart marriage was the unfortunate Arabella, a claimant to the throne.

By this time the earl of Shrewsbury and his wife were on very bad terms with one another, and the former tried to obtain a divorce. The countess revenged herself by accusing him of a love intrigue with the queen of Scots, a charge which she was forced to retract before the council. In the meantime she repeated scandal about Elizabeth to Queen Mary. who made use of it in the extraordinary letter she wrote some time in 1384. In 1583 the countess of Shrewsbury went to live apart from her husband. with whom she was afterward reconciled formally by the queen. After his death, in 1590, she lived mostly at Hardwicke. where she buiit the noble mansion which still stands. She was, indeed, one of the greatest builders of her time at Hardwicke, Chatsworth and Oldcoates. It is said that she believed she would not die so long as she was building. Her death came on Feb. 13, 1608, during a frost which put a stop to her building operations. She was buried in All Saints' church. Derby, under a fine monument with a laudatory inscription which she took care to put up in her lifetime.

See White Kennett, *Memoirs of the Cavendish Family* (London, 1708); and Mrs. Murray Smith (Miss E. T. Bradley), *Life of Arabella Stuart* (London, 1889); Mrs. Stepney Rawson, *Bess of Hardwicke* (1910).

SHREWSBURY, JOHN TALBOT, 1st Earl of (c. 1384–1453), English soldier. celebrated for his exploits, in the Hundred Years' War, was the second son of Richard. 4th Baron Talbot, and Ankaret. heiress of the last Lord Strange of Blackmere. By the death of his elder brother Gilbert's daughter Xnkaret (1421) he acquired the baronies of Talbot and of Strange. In or before 1433 he married his second wife, Margaret (d. 1467), eldest daughter of Richard Beauchamp, earl of Warwick, and coheiress of the barony of Lisle.

After campaigns in Wales between 1404 and 1413, Talbot served as lieutenant of Ireland from 1414 to 1419. He was later to be justiciar of Ireland (1425) and lieutenant again (1445–47). In these offices he showed great vigour: the Irish said that "there came not from the time of Herod any one so wicked in evil deeds."

After 1419, however, most of Talbot's career was spent in France. where he became one of the foremost English captains. He fought at Verneuil in 1424 and took part in the siege of Orleans in 1429. His rashness was chiefly to blame for the English defeat at Patay (*q.v.*) in June 1429, when he was captured by the French. Released in 1433, he took Clermont-en-Beauvaisis in 1434 (the countship was then assigned to him). was present at the siege of Saint-Denis in 1435 and suppressed the revolt of the Pays de Caux in 1436. Henry VI made him a marshal of France. The mainstay of the English cause in France for the next five years. Talbot defeated the Burgundians before Le Crotoy in 1437 and took Harfleur in 1440. In May 1442, on a visit to England. he was created earl of Salop (Shrewsbury was the name that he himself used for the title); but the next winter, before Dieppe. he "fared so foul n-ith his men that they would no longer abide with him" and was forced to raise the siege. His fighting qualities, however, made him something of a popular hero: in the rhymes of the day he was "Talbot our good dog," whose valour was frustrated by the duke of Suffolk's treason.

After the iall of Rouen in Oct. 1449, Shrewsbury was held for a time as a hostage by the French (1449–50); a pilgrimage to Rome was stipulated as a condition of his release. In command of the expedition for the relief of Gascony, he landed in the Médoc in Oct. 1452; the Bordelais rose in his favour and Fronsac fell to him in the summer of 1453. The French. however, laid siege to Castillon. Shrewsbury hurried to its relief and on July 17, 1453, attacked the enemy in their entrenched camp without waiting for his artillery. He and the flower of his troops were killed, and English rule in Xquitaine ended with them. (T. B. P.)

SHREWSBURY (Welsh. *Amwythig*), an ancient market centre. municipal borough and the county town of Shropshire (Salop). Eng.. in the Shrewsbury parliamentary division. 153 mi. N.W. of London by road. Pop. (1951) 44,919. Area 12.7 sq.mi. Its position in relation to the routes leading into Wales and along the border has made it a town of great importance. The old and central part of the ton-n lies almost entirely on a peninsula within the remarkable southward loop described by the river Severn. The strategic position of this peninsula rising above the Severn flood lands was recognized from the time of the princes of Powys, who made it their seat. called Pengwern, in the 5th and 6th centuries. At the end of the 8th century it was engulfed in the provinces of Mercia and given its Saxon name Scrobbesbyrig. from which comes Shrewsbury. In the reign of Edward the Elder it had a mint, and in Domesday Book it is styled a city. After the Norman conquest. Shropshire was granted to Roger de Montgomery, who made Shrewsbury his headquarters and founded the abbey. At about this time. alternative names arose, Sloppesbury or Salopsbury, from which comes the modern Salop. In the next 200 years it was frequently involved in wars with the Welsh, and in 1283 Edward I called an assembly of parliament to meet at

Shrewsbury. In 1403 the battle of Shrewsbury was fought close to the town on the north side, when Henry IV by defeating the Percys consolidated his position on the throne. During the late middle ages and again in Tudor and Elizabethan times the establishment of law and order in the Marches and trade with the Welsh in wool and flax resulted in a period of great prosperity. In the Great Rebellion Shrewsbury supported the king. who took up his quarters there in 1642, but the town was captured by parliament in 164j. Subsequent development was continuous and Shrewsbury became the cultural. business and transport centre for a large area of surrounding country.

Shrewsbury is a borough by prescription. The town possesses more than 30 royal charters from the charter of Richard I (1189) to that of James II (1685) and earlier charters were granted by Henry I and II. The charter of Charles I gave to the town a new constitution, and under its authority the first mayor was elected in 1638. The borough returned tn-o members to parliament from 1394 till 1885, when the number was reduced to one. It is now included in the Shrewsbury division of Shropshire.

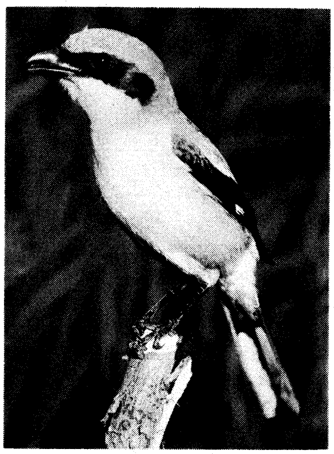
There are many buildings, streets: lanes and "shuts" of architectural and historic merit, including 1jth- and 16th-century timber framed houses of which Ireland's mansion. Owen's mansion, the Abbot's house and Rowley's house are outstanding examples; the latter contains a museum of Roman antiquities from the nearby Roman–British city of Uriconium. The old Market hall is a fine stone building dating from *c.* 1596; there are also many Georgian and regency houses. A considerable length of the old town wall. including one of the watchtowers, still remains. Within the loop of the river (hut outside the ton-n walls) is a public park called the Quarry. Over its two ancient bridges, the English and the Welsh. the town spreads east into Abbey Foregate and around Abbey church and west into Frankwell on the Welsh side. In the Mount. at the top of Frankwell, Charles Darwin was born. St. Mary's church, on high ground south of the castle, is a noble building with a lofty tower and spire dating from early Norman to Perpendicular. It has some remarkable stained and painted glass, including the great Jesse window of English glass dating from about 1345; the St. Bernard glass from the Abbey church of Altenburg. attributed by some to Xlbrecht Dürer (1471–1528); and 15th-century glass from the cathedral of Treves. St. Alkmund's. St. Julian's and St. Giles' are old foundations, much altered subsequently. Old St. Chad's church. dnting mainly from the 12th century. was largely destroyed by the fall of the tower in 1788, and only the 15th-century Lady chapel remains. The new St. Chad's church erected in 1790–92 on another site is built to a circular plan. The restored Abbey church (Holy Cross) retains its massive Korman nave. built of deep-red sandstone, and two Early English arches and a Decorated western tower; of the monastic buildings little is left, save a remarkable roofed outdoor pulpit of ornate Decorated work. Shrewsbury is the seat of a Roman Catholic bishop.

A fortification of some sort probably existed on the site of Shrewsbury castle before the Norman conquest. but the first reliable evidence of a castle being constructed there is in 1067. In 1071 it was given to Roger de Montgomery, then made earl of Shrewsbury. who continued working on it. and it was entirely rebuilt by Edward I. It was held for the king in the Great Rebellion but fell to parliament in 1645. It continued fortified until the reign of James II. but subsequently came into private ownership. The castle was converted to residential use by Thomas Telford toward the end of the 18th century. In 1924 it was bought by the Shropshire Horticultural society, restored as nearly as practicable to its 14th-century condition, and given to the corporation; it is used as a council chamber.

Shrewsbury school (founded by King Edward VI in 1552) occupied buildings opposite the castle until 1882. when it was moved to Kingsland, south of the river. formerly the scene of the Shrewsbury show, a pageant held during the festival of the Trinity. The old school buildings in the town centre were taken over by the corporation and are now used as a library, museum and art gallery. The cross at the junction of Pride hill and St. Mary's street, on the site of the original High cross. was given by the school to the town in 1952 to commemorate the 400th anniversary of the school's foundation.

The cattle market, one of the busiest in England. was enlarged and moved to the north of the town in 1959. Also in the north are most of the main industries which include locomotive. rolling stock and general engineering; the manufacture of machine tools, safes and electrical equipment; and malting. (S. R. H. L.)

SHRIKE (BUTCHERBIRD), the common name for members of the songbird family Laniidae, nhich contains about 73 species. They are robust birds, about thrush size, with a heavy bill hooked at the tip. Their colours are usually boldly patterned and vary from gray, white and black to browns. greens and reds. Their call notes are harsh but some have pleasing songs. Their nests are rather bulky structures, with many twigs in them, and the eggs are spotted. The distribution of the family covers Africa, where most species live; Europe and Asia to New Guinea (one species); and North America (two species).



ALLAN D. CRUICKSHANK FROM NATIONAL AUDUBON SOCIETY

LOGGERHEAD SHRIKE (LANIUS LUDOVICIANUS) A COMMON NORTH AMERICAN SPECIES

The loggerhead shrike, *Lanius ludovicianus* is the common American species, found from southern Canada to Mexico. It is gray above, white below, with a black mask, and is about nine inches long. The more northern birds retire southward in winter. The northern shrike, L. *excubitor*, is similar but larger (ten inches long), with fine barring on the breast. It breeds in northern Canada and Alaska, as well as in the old world. Some winter in the northern United States.

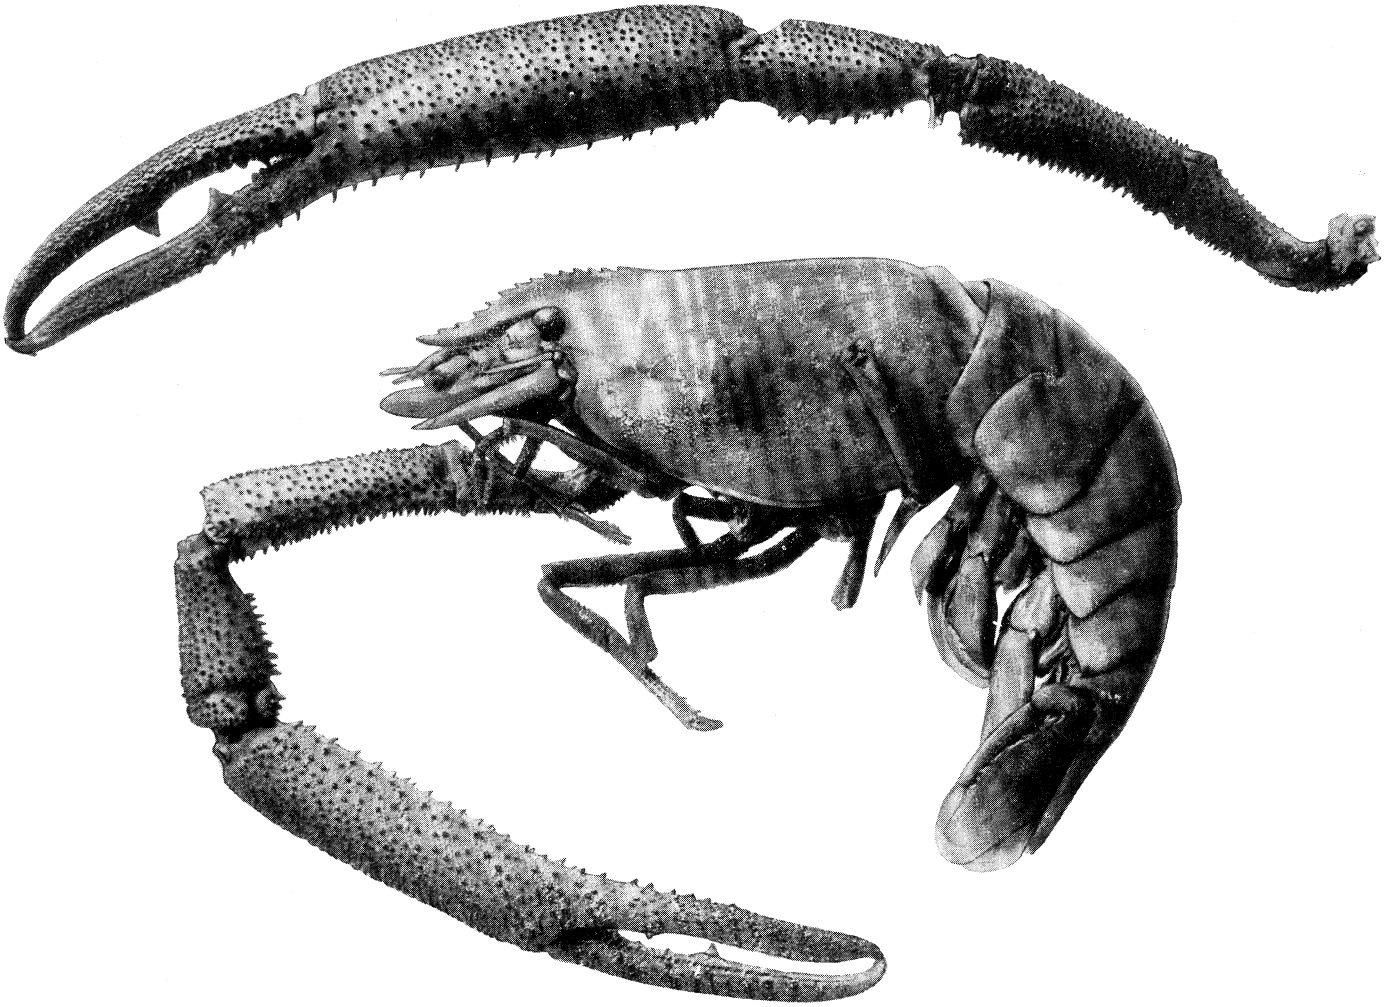
Typical shrikes sit upon vantage points, hawklike. watching for their prey of large insects, small reptiles, mammals or birds. Though predacious in habit, they lack strong feet for holding their prey and some species impale their food on thorns. sometimes leaving part of it uneaten. This fancied resemblance to meat in a butcher shop is the reason for one of their common names. Certain bush shrikes and helmet shrikes of Africa are only doubtfully placed in this family. Birds of an unrelated Australian family of butcherbirds and bell magpies also have the habit of impaling food on thorns. The vanga shrikes of Madagascar and the cuckoo shrikes, widespread in the warmer parts of the old world, form two other unrelated groups of songbirds. (A. L. RD.)

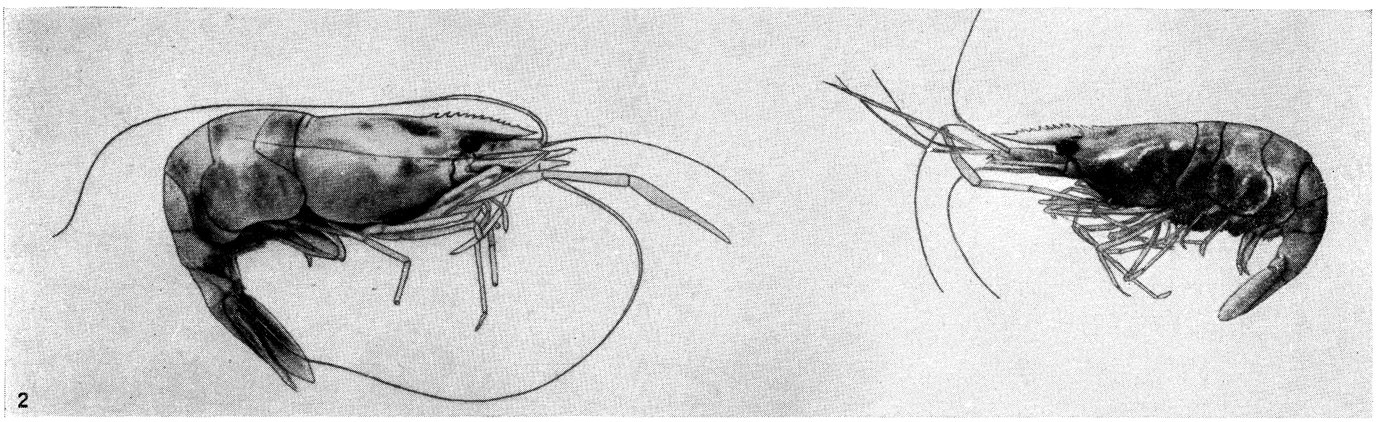
SHRIMP, a common name generally applied to Crustacea distinguished from such other larger long-tailed members of their order (Decapoda) as lobsters and crayfishes. Shrimps (suborder Macrura) differ in greater development of the paddlelike limbs of the abdomen used in swimming and in their thin and sometimes fragile shell or exoskeleton. Like other crustaceans: shrimps wear their skeleton on the outside of the body and, in order to grow, must cast off this shell and replace it with a new and larger one. In the process of shedding, all of the hard structures of the shrimp are cast off and renewed.

The common shrimp swims in a forward direction by the use of the pleopods or abdominal feet. When frightened or when rapid movement is desired. the shrimp with a flexing of the powerful, muscular abdomen, can propel itself backward with remarkable speed and also can leap clear of the water.

Shrimp occur on mud bottoms of inshore and offshore waters in many parts of the world. Important fisheries operate in European. North American and Asian waters. Although often thought of as a warm-water shellfish. shrimp are also found in northern seas, and there are commercial shrimp fisheries in the waters off Norway, Greenland and Alaska. Considerable effort was expended in the search for new shrimp grounds in many parts of the world following World War II, and important new fisheries for the browngrooved shrimp. *Penaeus aztecus*, and the pink-grooved shrimp,

SHRIMP





2

BY COURTESY OF THE U.S. NATIONAL MUSEUM

1. Fresh-water shrimp. *Macrobrachiurn jamaicense* (Eucarida, order Decapoda, Natantia) from Devils River, Texas. Length of specimen from tip of extended claws (one placed above the animal) to posterior extremity of tail or abdomen, 20 in.; live weight, 3 lb. This and closely related species are found in America from Florida to Brazil and from Lower California to Peru. The largest known fresh-water shrimp is a specimen of *M. carcinus* from the Philippines, the body of which measured about 13½ in. in length; this species ranges from the Philippines to India. The Macrobrachiums are widely used for food in Latin America and the orient and to some extent in the southern United States

2. Mississippi river shrimp, *Macrobrachium ohionis* (Eucarida, order Decapoda, Natantia), slightly less than natural size. This Mississippi basin species occurs also in the Savannah river, Georgia, where the photographed specimens were taken

SHRIMP

BY COURTESY OF THE U.S. NATIONAL MUSEUM

1. Conventionalized shrimp, illustrating terms used in description
2. *Fenaeus setiferus* (Eucarida, order Decapoda, Natantia), commercially the most important species on the South Atlantic and Gulf coasts of the United States. About three-fourths natural size

Penaeus duorarum, were developed in the Gulf of Mexico. A red shrimp, *Hymenopenaeus robustus,* was found in the deeper waters of the gulf at depths of 180 to 3jo fathoms.

There are several hundred species of shrimp. The catch of species of Penaeus probably exceed that of all other crustacean fisheries in magnitude and importance. The world's greatest shrimp fishery, based principally on species of *Penaeus,* is in the Gulf of Mexico, where several hundred million pounds of these shellfish are taken annually by United States, Mexican and Cuban fishermen.

Shrimp are taken in a variety of ways—with hand or cast nets, baited traps, haul seines. stake or channel nets set in tideways and with boat-drawn beam and otter trawls. The trawls. which account for the major portion of the world catch, consist of large, baglike nets which are dragged over the floor of the ocean. scooping up the shrimp in their path.

Shrimp are marketed fresh, frozen, dried, canned and cooked-and-peeled. Shrimp bran, a by-product, is manufactured from dried heads and hulls and sold for animal feed. Development of machines for removing the hulls from the shrimp meat, and the production of fresh-frozen and frozen-breaded shrimp, have assisted in a remarkable expansion in the market for shrimp in the United States, the world's largest producer and consumer of shrimp.

River shrimp or prawns of the genus *Macrobrachium* (*Palaemon*), found in most tropical countries, are also much used for food. (E. A. Pr.)

SHRINE, THE (Ancient Arabic Order of Nobles of the Mystic Shrine), an appendant order of Freemasonry (*q.v.*) in the U.S., was founded in 1870 by William Jermyn Florence (1831–1891) and Walter Millard Fleming (1838–1913). The first Shrine temple was organized in New York city on Sept. 26, 1872, and a parent body, the Imperial Grand council, was formed in 1876 but dropped the word "Grand" from its title 10 years later. Rituals and costumes of the order are supposedly of Arabic origin and the founders, in order to promote the organization, at first claimed that it had descended from a 7th-century secret Arabic society. In the years following its founding, membership: limited to 32nd degree Scottish Rite Masons or Knights Templar of the Pork Rite, increased until the Shriners' red fezzes, jeweled costumes and colourful parades were a common sight throughout the United States.

In 1922 the Shrine: as a philanthropic project, took steps to establish hospitals for the care of crippled children. The first 3 of 17 such hospitals were founded that year at Shreveport. La., St. Louis, Mo., and Minneapolis, Minn. The hospitals are supported by annual assessments on Shrine members, contributions, estate benefits and fund-raising projects. (G. M. Sa.)

SHROPSHIRE or Salop, an English county bordering on Wales and with Cheshire to the north. Staffordshire to the east. Worcestershire and Herefordshire to the south. The geographical area is 1,346.6 sq.mi., with a population (1951) of 289.802. The boundary with Wales was fixed in the reign of Henry VIII: the Staffordshire border was modified in 1657 and Halesowen (Salop detached) annexed to Worcestershire and Farlow (Herefordshire detached) added to Shropshire in 1844. In 1895. Sheriffhales, Tittenley and part of Ludford were added to Shropshire: Dowles transferred to Worcestershire and Leintwardine to Herefordshire. Both names. Shropshire and Salop, derive from O. E. *Scrobesbyrigscir* (shire with Shrewsbury at its head), Salop being the product of a Normanized form.

Physical Features.—Shropshire is crossed by the Serern, which divides the hilly south and west from the undulating plain to the north and east. The upland is composed of a series of ridges including Wenlock edge. View edge. Stiperstones and Stapeley hill. and hogbacks (Ragleth. Caradoc. Lawley, the Wrekin). all running from northeast to southwest with deep valleys between them. Among them lies the Longmynd plateau (1.696 ft.); south of Corvedale is a triangular plateau with two table-topped heights, Brown Clee (1.790 ft.) and Titterstone Clee (1,749 ft.). A third mass of high ground, Clun forest. lies between the rivers Clun and Teme. The northern plain (about 200 ft. or less) is broken by a band of sandstone knobs (Nesscliff, Grinshill. Hawkstone). Streams. such as the Tern, have little fall and large areas mere formerly marsh (*e.g.,* the Wealdmoors). Peat mosses (Whixall) and meres, especially near Ellesmere, Whitchurch and Baschurch. give variety to the landscape. The eastern plain has been cut by rivers—the Worf. Bowhill brook. Claverley brook. etc.—into a series of valleys and low ridges (Shatterford. Tuckhill. High Rock) running from north-northwest to south-southeast.

The geological pattern runs on similar lines. older rocks being found in the uplands and later rocks mainly under glacial drift in the plain. but this pattern was broken by volcanic upheaval. The main series of rocks are: pre-Cambrian in Longmynd. Wrekin and Ercall districts; Cambrian in Church Stretton district; Ordovician in the Shelve area and a strip north of Wenlock edge from the Wrekin in the northeast to Hopesay in the southwest; Silurian in Wenlock edge and the Corvedale area. View edge, Clun forest and the Ludlow district: Carboniferous. limestone poorly represented but seen near the Wrekin. at Lilleshall and Llanymynech: four small coal-measure basins (1) Chirk (2) Hanwood. with continuation northwest (3) Coalbrookdale and (4) Wyre forest. Trias is found principally in two areas (1) north of the Severn above Shrewsbury and north of Wellington (2) east of Shifnal and Bridgnorth. A small area of Lias is exposed round Prees; and glacial drift covers most of the plain.

History.—Considerable prehistoric traffic through Shropshire is indicated by portable antiquities of late Neolithic and Eronze Ages (collections in Rowley's house. Shrewsbury; Clun and Ludlow museums) and by field monuments of the Bronze Age. such as the round barrows on the Longmynd and Old field near Ludlow. stone circles on Stapeley hill and remains in the Clun region. Hill forts of Early Iron Age character abound, especially the Bury ditches. Hopesay Burrow camp, the two Caer Caradocs. the Wrekin. Bury walls and Old Oswestry. Related island sites—the Berth. Baschurch and Kynnersley wall—were possibly occupied later.

Traces of Roman military conquest are rare. but a legionary fortress existed in the 1st century at Viroconium. later the cantorial capital of the Cornovii and one of the largest towns in Britain. There were small towns or posting stations; *e.g.,* Bravonium (Leintwardine), Uxacona (Oakengates), Rutunim (unidentified). The country appears to have been sparsely cultivated, with farms at Acton Scot. Linley Hall, Cruckton. etc.. but silver-bearing lead ores and outcrop coal were probably exploited.

The Saxon conquest was marked by the construction of Wat's dyke and Offa's dyke. Anglo-Saxon villages are recognizable by their names. terminating in "bury." "ton." "ley." etc.. while Celtic place-names include elements like "pentre," "llan," "tre"; and Offa's dyke is generally the linguistic boundary. Some Welsh elements, however, may be attributed to later infiltration which has gone on since the 11th century.

After Danish incursions had been finally repulsed. Edward the Elder divided Mercia into shires, Shropshire being one; and Shrewsbury became a mint town. At the Conquest, large areas of Shropshire were set aside as forests, or hunting grounds, subject to special forest jurisdiction. such as those of Morfe. Mount Gilbert. Shirlet. Clee and Stiperstones. Roger de Montgomery was given extensive estates for the defense of the border. A double line of castles against the Welsh was established during the 12th and 13th centuries, and the history of medieval Shropshire is a chronicle of Welsh incursions and baronial rebellions.

All Shropshire's religious houses, except Brewood. were for men. The most important (with foundation dates) were: Benedictine at Shrewsbury (1083) and Bromfield (refounded 1135): Cluniac at Wenlock (refounded 1080); Cistercian. originally Savigniac. at Buildwas, (1135); Augustinian canons at Haughmond (*c.* 1135), Wombridge (*c.* 1130). Chirbury (from Snead) in the late 12th century; Arroasian canon at Lilleshall (from Donnington Wood) *c.* 1144; Grandmontines at Alberbury (c. 1220–1441); Templars at Lydley (*c.* 1158–1308); Hospitalers at Halston (c. 1221); Dominican friars at Shrewsbury (1222); Franciscan friars. also at Shrewsbury (1245–46) and at Bridgnorth (1244). Augustinian friars at Ludlow (1282). Shrewsbury (1298) and Woodhouse near

Cleobury Mortimer (1250).

The midland system of three open fields was general in Shropshire, but some traces of Welsh land custom are found.

The high quality of Shropshire wool brought prosperity in the 13th century, Ludlow, Shrewsbury and Bridgnorth being the main centres. As trade grew, Shrewsbury became established as the principal market for an area including much of north Wales. There was plenty of heath available for sheep and therefore no outcry was made against conversion of common field to sheep-walk. But Welsh raids, plague depopulation and bad seasons brought a decline in arable farming. In areas of high rainfall, cattle raising became important. From the 15th to the 17th centuries there are indications of a general increase in the size of holdings, piecemeal inclosure of common fields and some attempts to drain and inclose marshes and wastes.

A prerogative court, the council in the Marches of Wales, was established about 1473 with headquarters at Ludlow and jurisdiction in Wales and the four border counties to check disorder and provide quick, cheap, effective remedies for local litigants. It was suppressed in 1642, re-established in 1660 but never regained prestige. and was abolished in 1689. On the outbreak of the Great Rebellion. many families declared for the king. who came in person to recruit, but Puritan influence divided the north and extreme south of the county. While Shrewsbury and Bridgnorth stood siege for the king, Wem and Hopton castle stood siege for parliament. Fortified country houses were skirmishing centres. After the battle of Worcester in 1651, Charles II in his escape found many Shropshire friends.

In 1708, Abraham Darby I came to Coalbrookdale and developed his new method of smelting ironstone with coke from pitcoal. He found a tradition of iron-working. local supplies of ironstone, sulfur-free coal, limestone and charcoal, and an ideal site with water power in the dale and water transport on the Severn. In the 18th century, the Darbys, the Reynolds, John Wilkinson and others introduced many improvements and made Shropshire the greatest iron-producing area in England. The first cast-iron bridge was erected at Ironbridge in 1779; the first iron-built boat floated on the Severn in 1787; the first locomotive engine for use on a railway was built by the Coalbrookdale company for Trevithick in 1802. In the same period: Caughley and Coalport were producing fine china and Broseley became noted for churchwarden pipes.

Architecture.— Good examples of ecclesiastical, military and domestic Brchitecture are to be found in Shropshire. The development of castle-building techniques from the 12th to 14th centuries may be studied at Ludlow. Clun, Bridgnorth, Shrewsbury and Hopton castles, where considerable portions survive. Ludlow and Shrewsbury retain parts of their town walls. In domestic architecture, Shropshire possesses outstanding examples from the 13th century. Shropshire had no dominant noble family but many ancient county families, no great seat but many fine country houses. Stokesay (c. 1260–80) and Acton Burnell (1283) show the fortified manor house; the Old Mint, Shrewsbury, and Forester's lodge, Millichope (c. 1280), are comparable town and country dwelling houses; the Provost's house, Edgmond, is 14th century and the Abbot's house, Shrewsbury, dates from about 1450. Many Shrewsbury houses are partly medieval. There are numerous Elizabethan country houses. either half-timbered (Pitchford, *c.* 1570) or stone, for example, Benthall 1580, Wilderhope 1586, Condover c. 1590. Moreton Corbet (early 17th-century) is a magnificent ruin. A great buildingperiod (c. 1670–1730) produced such houses as Longnor (1670), Court of Hill (1693), Ludstone (1685), Cound (1704) and Davenport (1726). Ludlow and Shrewsbury are rich in 18th-century townhouses.

Agriculture, Industries and Communications.—Shropshire is still an agricultural county. Holdings vary from large farms (1,000 ac. or more) to many highly efficient small holdings. The total area in 1955 of crops and grass was 691,000 ac. (rough grazing 38,700 ac., oats 33,000 ac., wheat 33,000 ac., barley 31,000 ac., sugar beet 16,000 ac., potatoes 13,000 ac.). Potatoes became an important crop in the 1950s because certain traditional potato-growing areas elsewhere became infested with eelworm. There is some intensive tomato cultivation under glass.

The southwestern uplands are devoted mainly to cattle and sheep raising, the native sheep breeds being Clun Forest and Kerry Hill. Shropshire sheep are also bred in the lowlands. The indigenous beef breed is the Hereford, of which there are many famous herds. In the northern plain, dairy farming for the sale of milk off farms is the main industry. There the predominant dairy breed is the British Friesian, followed by Ayrshires and Shorthorns. Shropshire also has a high population of pigs and poultry. The main cattle market towns are Shrewsbury, Oswestry, Wellington, Ludlow and Craven Arms; sheep sales at Craven Arms are among the biggest in the country.

The total area under tree crop in 1955 was about 36,000 ac. (hardwoods 21,610 ac., conifers 12,696 ac., coppice 2,000 ac.), with another 17,000 ac. of scrub and felled woodland. The most heavily wooded district is the southwest. where pine and spruce are found on higher ground, larch and mixed woods on slopes and hardwoods in valleys. Replanting at Walcot and new afforestation round the Anchor was entirely coniferous. Northeastern Shropshire lacks woodland but is heavily timbered with hedgerow trees, and some fine woods are found in the Severn valley below Buildwas, ending with a large remnant of Wyre forest, as yet oak and coppice.

Ironfounding and engineering are major Shropshire industries. In addition to constructional engineering, typical products are large castings, machine tools: locomotives, motor vehicles, wheels and chassis. steel furniture, safes, agricultural machinery, grates and cookers. Other factories produce radios, toys, mats. lenses, aluminum pans. carpets and clothing. The principal collieries working in the 1950s were Granville, Grange, Madeley Wood (Coalbrookdale coal field), Highley (Wye coal field) and Ifton Heath (Chirk coal field); some coal board opencast working: and small private pits. Fireclay is excavated and a large number of refractory products are made. Agricultural limestone is quarried in the Wenlock area, dolomite at Llanyblodwel and road stone at Titterstone Clee, Squilver, Pontesbury, Maddocks Hill. etc.; but the best Grinshill freestone and Stiperstones lead and barytes veins are exhausted. Timber is largely exported; and maltings, breweries, creameries and a sugar factory use local agricultural products. Electricity is obtained from the power station at Buildwas.

The Severn was once navigable for barges up to Welshpool, and in the 18th century a brisk trade was carried on between Shrewsbury and Bristol. while a canal network connected the Severn with the Dee, Mersey and Stour. Both rivers and canals fell into disuse in favour of railways, supplemented by road transport.

Population and Administration.—The population in 1951 was 289,802. Ecclesiastically. Shropshire is divided between Lichfield and Hereford dioceses. It is in the Oxford circuit and assizes are held at Shrewsbury. It has one court of quarter sessions (Shrewsbury borough alone retains its commission of the peace) and 18 petty sessional divisions. There are four parliamentary divisions: Ludlow, Oswestry, Shrewsbury and the Wrekin. The municipal boroughs are Shrewsbury, the county town (pop., 1951, 44,919), Bridgnorth (6,250), Oswestry (10,712), Ludlow (6,456), Wenlock (15,095) and Bishop's Castle (1,290).

Shropshire has many ancient, grammar schools: Ludlow (founded *c.* 1300); Oswestry (1407); Bridgnorth (medieval); Whitchurch (1552); Shrewsbury (1552); Market Drayton (1556); Wem (1650); and Newport (refounded 1657). Some primary schools also have a long history, such as Nesscliff (1753).

SHROVE TUESDAY, the day before Ash Wednesday, the first day of Lent, so called as the day on which "shrift" or confession was made in preparation for the great fast. Shrove Tuesday is called in French *Mardi gras*, "Fat Tuesday," in allusion to the fat ox which is ceremoniously paraded through the streets.

The Germans know it as *Fastendienstag.* It is celebrated in Catholic countries as the last day of the carnival. with feasting and merrymaking, of which. in England, the eating of pancakes alone survives as a social custom, the day having been called at one time "Pancake Tuesday."

In the United States the festival season preceding Lent, particularly associated with New Orleans. La., is known as the Mardi Gras. The season begins with the New Year and terminates with parades, pageantry ahd a ball on Shrove Tuesday. Celebrations, accompanied by masking, are recorded as among the activities of the soldiers at Ft. Louis de la Louisiane (1702–10), on the first site of Mobile, Ala. Similar festivities were observed by the residents of New Orleans from its foundation. and were continued during the Spanish control of Louisiana. The custom was retained after the United States purchased that territory, but it was not until 1857 that a group of former residents of Mobile. Ala., where masked parades had long been a prominent feature of the celebration, organized "The Mystick Krewe of Comus," and produced the first spectacular parade with floats at New Orleans. Later "King Rex" was introduced to rule the city on Shrove Tuesday from 11 A.M. to sunset. After that Comus takes over accompanied by his "Mystick Krewe of Comus." In the evening the frolic season terminates with brilliantly illuminated pageantry, depicting scenes from literature or history, followed by a ball.

SHRUB, a low, woody plant that usually has several stems instead of a single trunk, as in most trees. The distinction between small trees and large shrubs is often difficult to make because some species of trees tend to assume shrublike habits under severe environmental conditions. Also, some trees bear several trunks or develop branches low on the trunk and are thus shrublike, while some shrubs show a tendency toward one main stem and are then treelike.

In general, a tree is assumed to be at least 20 ft. tall at maturity. while a shrub is normally less than that height when mature. Exceptions are not uncommon in both cases. The terms shrub and bush are frequently used interchangeably.

Shrubs have two important values in the landscape. (1) as individual or single specimens and (2) as part of the whole design of the ornamented space. Some shrubs also have edible fruits. *(See* STEM: TREE; LANDSCAPE ARCHITECTURE.) (J. M. BL.)

SHUBERT, LEE (1875–1953), U.S. theatre manager and producer, was born at Syracuse, N.Y., on March 15, 1875 With his brothers Sam S. (1876–1905) and Jacob J. (1880–), he formed the Shubert Theatre corporation. which came to control a large chain of theatres throughout the United States. The Shuberts began as theatre managers in Syracuse, where they organized several touring companies for the comedies of Charles A. Hoyt. In 1900 they leased the Herald Square theatre in New York city and proceeded to acquire other theatres, from which grew the vast theatrical empire that once was estimated to be worth $400,000,000. Impetus for the growth of this empire came early from David Belasco and other independent producers during the struggle against the theatre trust. headed by Klaw and Erlanger. The Shuberts were in a position to rent theatres to producers discriminated against by the syndicate. Soon, however, the Shubert corporation, originally a booking agency, became a producing organization also. As its productions increased in number, fewer theatres were available to other producers, with the result that the Shuberts were subject to much criticism for their harsh contracts and for their "stifling effect upon the American theatre." Lee Shubert died in New York city on Dec. 25, 1953. (M. Rs.)

SHUFFLEBOARD (SHOVELBOARD; originally SHOVE-BOARD), a game in which plastic or metal disks are shoved by the hand or with an implement so that they come to a stop on or within certain lines. or compartments marked on the "board" or court (on a table, floor, or outdoor hard surface like concrete). It was popular in England as early as the 15th century, especially with the aristocracy, under the names shove-groat, slide-groat or shovel-penny. Some of the great country houses had boards of exquisite workmanship; that at Chartley hall, in Staffordshire, was over 30 ft. long, comprising 260 pieces. It is said that King Henry VIII issued a royal decree forbidding its play because it prevented the proper practice of archery. Shove-ha'penny (*q.v.*), a later version of shovel-penny, is still a popular game in English pubs.

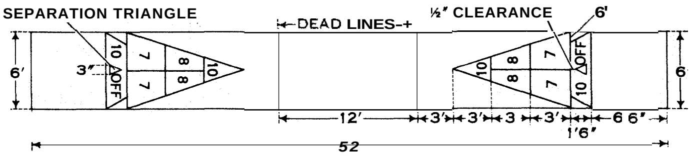

DIAGRAM OF SHUFFLEBOARD COURT

In modern times, a modified form of the old indoor game became popular among travelers on ocean liners as a deck game. For the shipboard version, called shuffleboard, courts of various designs were marked on the deck, with lined sections at either end, numbered one to ten; the section nearest the player, called ten-off, reduced scores by ten. The winning score was 50 points.

U.S. Game.—Shuffleboard was introduced about 1913 at Daytona Beach, Fla. So popular was the game that it spread rapidly through the United States, with each community devising its own rules of play. The modern form of shuffleboard mas defined at St. Petersburg, Fla., in 1924, when Pierce V. Gahan, city recreation director, called a conference of all state shuffleboard clubs.

The rules adopted at that meeting defined the size and shape of courts (concrete or terrazzo, 6×52 ft.); the maximum length of the cues (6 ft. 3 in.) and the disks (either wood or composition, 1×6 in.; four red, four black). The rules also set forth the method of choosing partners, rotation of play, method of scoring and a list of penalties for violations of good sportsmanship, and introduced methods of strategic play. Though it is played by persons of all ages, and is a popular family game, shuffleboard is especially well-suited for elderly persons and others interested in light physical exercise.

Modern shuffleboard may be defined as a competitive game in which disks are propelled by means of cues onto a scoring diagram at the opposite end of a court. in order to score, to prevent opponent's scoring or both. It may be played by two persons (singles) or four (doubles). Interest is sustained as shots are made alternately by "red" and "black."

Strategy may play an important part in the game; the player's first shot (the red disk is shot first) may place a "pilot" or blocking disk in opponent's line of play just outside the scoring section, for example; or he may place a "sleeper" in the part of the scoring section nearest himself so that later he may "sneak" behind it a disk his opponent cannot reach. The blocking play may be met with a carom shot to remove the disk; or the opponent may elect to place a sleeper shot on his side of the court. In singles, when eight shots have been made from the head of the court, players move to the opposite end or foot of the court and continue play in turn until game score is made. In doubles, team players remain at the ends they occupy at the beginning of the game, though play alternates as in singles. Game may be 50, 75 or 100. as players desire. To count, disks must be entirely within scoring sections. clearing all lines. In match play (best two out of three games) the second game is started with a black disk.

During the depression of the 1930s, there was a revival of table shuffleboard in the United States. Played usually in amusement halls. it was often accompanied by gambling, and, being largely a game of chance, soon declined in popularity. (G. B. W.)

SHUMEN (KOLAROVGRAD), incorrectly SHUMLA, a town of Bulgaria, 50 mi W. of Varna, on the Sofia-Varna railway. Pop. (1956) 41,670. The toun is built within a cluster of hills, northern outliers of the eastern Balkans, which curve round it on the west and north in the shape of a horseshoe. As a centre of communications in the southern Danube valley, Shumen has great strategical importance. In the picturesque upper quarter is the magnificent mausoleum of Jezairli Hassan Pasha. The principal mosque is the largest in Bulgaria. The town has an important trade in grain and wine, besides manufactures of clothes and copper and tin wares.

In 811 Shumen was burned by the emperor Nicephorus, and in 1087 besieged by Alexius I. In 1387 it was taken by the Turks. In the 18th century it was enlarged and fortified. Three times, in 1774, 1810 and 1828, it was unsuccessfully attacked by Russian armies. The Turks consequently gave it the name of Gazi ("Victorious"). In 1854 it was the headquarters of Omar Pasha and the point at which the Turkish army concentrated (*see* CRIMEAN WAR). On June 22, 1878, it capitulated to the Russians and ceded to Bulgaria. It was renamed Kolarovgrad in 1950.

SHURUPPAK (modern FARA), an ancient city of Mesopotamia situated on the old course of the Euphrates, 50 mi. N.W. of Lagash in 31° 30′ N., 45° 30′ E. The city is of special importance in the prehistoric period. It was famous as the home of Zuisudu, the hero of the flood story, and the Semitic version actually places the construction of the ark and all the details of the story at Shuruppak, which, with Sippar, Larak and Eridu are mentioned as the only cities before the flood. The town entirely disappears from ancient records after the last dynasty of Ur, somewhere before 2300 B.C. Excavations have thrown considerable light on the earliest period. Burials have been found with the bodies folded in the so-called embryonic position and wrapped in a reed mat. Clay coffins have also been found with the mat burials. The goddess of the city was Ninlil, the earth mother of Nippur, and the chronology of the town was kept by calling the year after the annual magistrate. A few tablets have been found before the time of Urnina. The town probably belonged to the southern kingdom of Lagash, and Langdon believes that it is not included in the dynastic list because there was the contemporary kingdom of Unzi of Akshak. He suggests that there was an extensive Sumerian kingdom at Lagash for a short period before Urnina, and cites the evidence of the similarity of legal terms in the business documents of Shuruppak, Lagash and Akkad.

SHUSHTAR, a town in Khuzistan, Iran, about 32° N. and 49° E., in the angle formed by the bifurcation of the Karun river into the Ab-i-Gargar and Ab-i-Shatait, about 40 mi. below the point where the Karun debouches into the plains from the Bakhtiari mountains. The town covers a larger area than its population (1956) of 18,548 warrants, being in large part in a ruinous and deserted condition; it has indeed been described as one of the most tumble-down places in all Iran. Many of the houses, of stone and brick, have cellars, called *Zir Zamin,* in which the inhabitants shelter in the excessive heat of summer, which on occasion reaches 128° F. The bazaar is a poor one and the few permanent shops are to be found in the street leading through the centre of the town to the Pul-i-Bulaiti (bridge). Even the mosques are devoid of special architectural features except perhaps the oldest one built under the Abbasids. On the other hand, the citadel, or Qal'ah Salasib, is a most imposing though ruinous mass, crowning the cliff, covering an area 350 by 150 yd., and described by P. M. Sykes as "the finest fort he had ever seen in Persia."

Water Works.—Shushtar is most famed for the great works constructed in ancient times for the disposal of the voluminous water of the Karun river. These comprise (1) the Ab-i-Gargar canal (the Masruqan of the middle ages). (2) The great barrage called the Band-i-Qaisar which is thrown across the Ab-i-Shatait (the principal arm of the river) west of the town. It is about 440 yd. long and supports a bridge, the Pul-i-Dizful. (3) The canal called Minau, which takes off above the barrage by a tunnel cut out of the rock on the western side of the town below the citadel, the purpose of which was to irrigate the Miyanab.

Tradition says that the Minau canal was built by Darius the Great and that it was Ardashir I (the Sasanid) who began to construct the barrage after the canal mouth had dried up. The barrage was only completed under Shapur II by the Roman prisoners with Valerian II. The Ab-i-Gargar was first dug simply to divert the volume of the water of the main river; the Band-i-Qaisar was then constructed, and the bed of the river above the barrage was paved with huge stone slabs bound with iron, to prevent further erosion. This paving was called *Shadurwan,* a term also applied to the barrage itself. Ultimately, a new barrage is said to have been built across the Gargar.

Population and Industries.—The population is a mixture of Arab and Iranian or proto-Iranian elements, known locally as Shushtaris, speaking a patois of their own and all Shi'ah Moslems. A few Bakhtiaris are the only other element. Travelers speak of the disagreeable and fanatical character of the inhabitants; but among the Persians their devoutness earned for the town the honorific title of *Dar al Muminin.* Its position gives the town a considerable commercial as well as strategic importance. It stands on a trunk road from Mohammerah via Ahwaz, Dizful, Khurramabad and Qum to Tehran. The industries are carpet weaving called *gilim,* the making of coarse cotton canvas and turbans, glazed earthenware, pack and riding saddles; copper, brass and silver work; tanning and dyeing.

History.—In the Umayyad period Shushtar became a stronghold of the Kharijites, one of the earliest religious sects of Islam. Under the Caliphs it was the capital of one of the seven provinces into which Khuzistan was then divided. When Baghdad became the centre of the empire, Shushtar, by its proximity was advantageously affected. The town was conquered by Timur and remained in the hands of the Timurids until 1514, when it fell to a Shi'ah dynasty of Sayyids under the suzerainty of the Safavids and became a centre of Shi'ah propaganda. In the beginning of the 19th century it was governed by a son of Fath Ali Shah who restored the barrage and the bridge; at that time it was said to have a population of 45,000.

SHUTTLE: *see* WEAVING.

SHUVÁLOV or SCHOUVALOFF, **PETER ANDREIVICH,** COUNT (1827–1889), Russian diplomatist, was born in 1827 of an old Russian family which rose to distinction and imperial favour about the middle of the 18th century. Several of its members attained high rank in the army and the civil administration, and one of them may be regarded as the founder of the Moscow university and the St. Petersburg Academy of the Fine Arts. As a youth Count Peter Andreivich showed no desire to emulate his distinguished ancestors. He studied just enough to qualify for the army, and for nearly 20 years he led the agreeable life of a fashionable officer of the guards.

In 1864 court influence secured for him an appointment as governor general of the Baltic provinces, and in that position he gave evidence of so much natural ability and tact that in 1866, when the revolutionary fermentation in the younger section of the educated classes made it advisable to place at the head of the political police a man of exceptional intelligence and energy, he was selected by the emperor for the post.

In addition to his regular functions, he was entrusted with much work of a confidential, delicate nature, including a mission to London in 1873. The ostensible object of this mission was to arrange amicably certain diplomatic difficulties created by the advance of Russia in central Asia, but he was instructed at the same time to prepare the way for the marriage of the grand duchess Marie Alexandrovna with the duke of Edinburgh, which took place in January of the following year. At that time the emperor Alexander II was anxious to establish cordial relations with Great Britain, and he thought this object might best be attained by appointing as his diplomatic representative at the British court the man who had conducted successfully the recent matrimonial negotiations.

Count Shuválov accordingly was appointed ambassador to London; he justified his selection by the extraordinary diplomatic ability he displayed during the Russo-Turkish War of 1877–78 and the subsequent negotiations, when the relations between Russia and Great Britain were strained almost to the point of rupture. After the publication of the treaty of San Stefano, which astonished Europe and seemed to render a conflict inevitable, he concluded with Lord Salisbury a secret convention which enabled the two powers to meet in congress and find a pacific solution for all the questions at issue. In the deliberations and discussions of the congress he played a leading part and defended the interests of his country with a dexterity which excited the admiration of his colleagues; but when it became known that the San Stefano arrangements were profoundly modified by the treaty of Berlin, public opinion in Russia condemned him as too conciliatory and reproached him with having given up needlessly many of the advantages secured by the war, For a time Alexander II resisted the popular clamour, but in the autumn of 1879, when Bismarck assumed an attitude of hostility toward Russia, Count Shuválov, who had been long regarded as too amenable to Bismarckian influence, was recalled from his post as ambassador in London. After living for nearly ten years in retirement, he died at St. Petersburg in 1889. (D. M. W.)

SHWEBO, town and district in the Sagaing division of Burma. The town is situated on a railroad about 50 mi. N.N.W. of Mandalay. It is of historic interest as the birthplace and capital of Alompra, the founder of the last Burmese dynasty. Formerly it was an important cantonment.

The area of the district is 5,735 sq.mi.; pop. (1941) 496,185, showing an increase of 49,395 in the decade 1931–41. The population of the town (1953) was 17.842. The district lies between the Katha, Upper and Lower Chindwin and Mandalay districts. The Irrawaddy forms the dividing line on the east. The physical features of the district vary considerably. The Minwun range runs down the whole eastern side. skirting the Irrawaddy. In the north it is a defined range, but at Sheinmaga, in the south, it sinks to an undulation. West of the Mu river, in the centre of the district. there is a gradual ascent to the hills which divide Shnebo from Upper Chindmin. Between these ranges and on both sides of the Mu is a plain, unbroken except for some isolated hills in the north and northeast and the low Sadaung-gyi range in the southeast The greater part of this plain is a rice-growing tract, but on the sloping ground maize, millets, sesame, cotton and peas are raised. A good deal of sugar is also produced from groves of the *tari* palm. The Mu river is navigable for three months of the year, from June to August, but in the dry season it can be forded almost anynhere. Extensive irrigation works existed in Shwebo district. but they fell into disrepair in King Thibaw's time. Chief of these was the Blahananda lake. The old works were later restored and extended, and in 1906 the main canal was formally opened. The district is on the northern borders of the dry belt; the southern tracts have between 25 and 40 in. of rain, the northern tracts rather more. The Mandalay-Myitkyina railway mas built through the heart of the district.

SHYOK, a large tributary of the upper Indus Kashmir. which rises near the southern foot of the great pass of the Karakoram range, on the route from Leh to Yarkand Tno important streams uith affluents, flon south from the Karakoram until they reach one of the great longitudinal troughs north of and parallel to the Himalaya system and the Indus-Brahmaputra line and north of the latter. They both join the stream along this trough. nhich, flowing northwestward, makes a sharp bend and joins the Indus in Baltistan. Below a station called Yapchan, situated about 35 mi. S. of the Karakoram pass, at a junction of valleys, the river bed begins to encase itself in a deep, narrow gorge, in which, normally, it receives the drainage of the Little Khumdan glacier. In 1926 this glacier pushed its way into and across the gorge, and thus built an ice dam 480 ft. high. The ice-dammed lake above had grown to a length of 9 mi., an average breadth of 1,000 yd. and a depth of 25 ft. by July 1928. At the beginning of August the level of the lake rose steadily, and on Aug. 4, 1928, a crack in the dam had developed. This caused widespread anxiety, and elaborate beacon-signalling arrangements were improvised and some villages below were evacuated. The alarm was intensified as a beacon fire was seen, but it proved to be a fire kindled by a Yarkandi caravan. Subsequent reports showed that the lake was leaking slowly through the crack in the ice dam, and the danger of flood passed away.

SIALKOT (SEALKOTE), a municipality and military cantonment, *tehsil* (subdivision) and district in the Lahore division of West Pakistan. The town, which is on the North-Western railway, is 67 mi. N.E. of Lahore. Pop. (1951) 167,543 (municipality 135,401; cantonment 32,142). It is the seat of Murray college, connected with Panjab university, Lahore. There are remains of a fort dating from about the 10th century, but the mound on which they stand is traditionally supposed to mark the site of a much earlier stronghold, and some authorities identify it with the ancient Sakala or Sagal. The town has an extensive trade and manufactures sporting implements, boots, paper, cotton, cloth and shawl edging.

SIALKOT TEHSIL had a population in 1951 of 418,393.

SIALKOT DISTRICT has an area of 2,071 sq.mi.; pop. (1951) 1,474,253. It is an oblong tract of country occupying the submontane portion of the Rechna (Ravi-Chenab) Doab. Sialkot is above the average of the Punjab in fertility. The upper portion is very productive, and the southern portion, though less fertile, now receives irrigation from the upper Chenab canal. Sialkot is reputed to be salubrious; it is free from excessive heat, judged by the common standard of the Punjab, and its average annual rainfall varies from 35 in. near the hills to 22 in. in the parts farthest from them. The principal crops are wheat, barley, maize, millets and sugar cane.

The early history of Sialkot is closely interwoven with that of the rest of the Punjab. It was annexed by the British after the second Sikh war in 1849; thereafter its area was considerably reduced, assuming its present proportions in 1867.

SIAM (officially named THAILAND in Bfay 1949; Siamese name MUANG THAI), an independent kingdom in southeast Asia occupying an area of 198,263 sq.mi. The country lies on the north and west shores of the Gulf of Siam. On its southern extremity it is bounded by Malaya; on the southwest by the Andaman sea; on the west and north by Burma; on the northeast and east by Laos; and on the southeast by Cambodia. Siam extends from approximately 6° to about 20° N. lat. and thus has a north-south extension of a little more than 1,000 mi. Its greatest east-west extent is about 480 mi. (along the 15th parallel of latitude).

PHYSICAL FEATURES

On its land side Siam is almost completely enclosed by surrounding mountains. which reach their maximum elevation in the northwest in Doi Inthanon (8.514 ft) near the Burmese border. The central portion of the country is occupied by the great, low alluvial plain of the Mae Nam Chao Phraya (or Menam Chao Phya; often incorrectly called the Menam; *menam* or mae *nam* means river).

Climate.—Siam lies in that portion of the world affected by the so-called tropical monsoon climate—a zone of marked seasonal wind shifts. From May to October (the rainy season) winds are prevailingly from the southwest, bringing rain to most of the country. From October to February (dry season) winds are from the northeast. This is generally a cool, dry period except along the east coast of the peninsula which receives the full force of the northeast winds. From March until May a transitional season (hot season) occurs. During this period the northeast winds lose force and, except in the peninsula, a hot. dry condition prevails until the return of the southwest monsoons. Temperatures at this season are the highest of the year. Except in the elevated interior northern section of the country minimum temperatures seldom go below 65° F. Maximum temperatures above 100° F. are rare. In the north frost may occur in the mountains during the cool season, and most homes are equipped with fireplaces.

Total annual rainfall ranges from 30 to more than 100 in. Most of it occurs in the form of convectional showers. Rainfall in the north averages about 50 in. per year. In the northeast it is about the same, with somewhat drier conditions prevailing in the western portion. Central Siam also gets about jo in. annually. The heaviest rainfall occurs in southern Siam. The peninsula has rainfall every month of the year. Despite the apparent abundance of Siam's rainfall, there are many areas on the lee side of mountains which are too dry for rice culture. Such a region is the western portion of the central plain.

Flora and Fauna.—Flora and fauna of Siam are similar to those of adjacent areas. Along the coast are mangroves. *Pandanus,* rattans and similar palms. Extensive rice cultivation has left little natural vegetation in the central region. In the temperate uplands of the interior oaks, pines, chestnuts, raspberries, honeysuckle, saxifrages, Cichoraceae, anemones and Violaceae are found. There are also many valuable timber trees—teak. sapan, eaglewood, wood oil (Hopea) and other Dipterocarpaceae, Cedrelaceae, Pterocarpaceae, *Xylia,* ironwood—as well as dyewoods and resinous trees.

Among the big game animals are the elephant, tiger, leopard, fishing cat, leopard cat and other species of wildcat, honey bear, large sloth bear and one-horned rhinoceros. Wild cattle include the gaur, banting and water buffalo. The goat antelope, several varieties of deer, wild pig. rats, bats and monkeys also exist. There are 56 varieties of snakes, of which only 12 are poisonous. Crocodiles haunt the rivers and estuaries. Fresh- and salt-water fish are numerous and, after rice. form the main food of the population. The country is rich in birds, many of which are common to Burma and Cambodia.

Regions.--On the basis of difference in topography, climate and human activity. Siam may be divided into four regions: (1) northern. (2) northeastern, (3) central basin and (4) peninsula.

Northern Siam is that area between the Salween and Mekong rivers and north of 18° N. lat. The central part of this region is drained by the four chief tributaries of the Chao Phraya. This is a region of parallel mile-high north-south limestone ranges interspersed with deeply cut valleys which lie at an elevation of about 1,000 ft. The region occupies an area of about 35,000 sq.mi. Approximately 7% of the land is under cultivation. Rice is the predominant crop. with tobacco and sugar cane of secondary importance. Where irrigation waters are available, two crops of rice per year are obtained. Teak is the chief export of the region. Chiengmai (pop. 75,715) is the chief town. a railroad terminus and the centre for the teak trade. Other urban centres are Tak (26,761 pop.), a timber station and the starting point of a Burmese trade route, and Muang Lampang, the terminus of the once-important road in the north.

Northeastern Siam occupies an area of about 63,000 sq.mi. Sometimes known as the Korat plateau (after the ancient name of the town of Nakhon Ratchasima), this low, southeast-sloping plateau is underlain with nearly horizontal beds of sandstone and shale. Although elevations do not exceed 600 ft., its isolation, poor soil and unreliable rainfall handicap its development. Only about 7% of the land is under cultivation and population is generally sparse. Aside from a small surplus of rice, crops primarily are consumed locally. Because of the shortness of the rainy season most crops are grown under irrigation. They include, in addition to rice, corn, cotton. tobacco and mulberry, the latter providing the basis for a modest sericulture industry. The raising of cattle, hogs, buffaloes and horses is more important than crop agriculture. Cattle and pigs provide export items from the region. The chief towns in this area include: Nakhon Ratchasima, or Korat (114,296), centre of silk weaving; Muang Ubon (72,230), the eastern terminal of the rail line from Ayutthaya (Ayuthia) ; and Nong Khai (54,919), an ancient place on the Mekong.

The *central basin* covers an area of about 70,000 sq.mi. and includes the southern portion of the Chao Phraya valley, the valley of the Mae Klong and the coastal areas of the southeast. This is the heart of the country in terms both of population and economic productivity. The region is one of alluvial plains surrounded by hills. Relief is especially monotonous in the central plain. In the 180 mi. from the southern edge of the northern region (18" N. lat.) to the sea, the difference in elevation is of the order of only 150 ft.

Of the entire region about 15% or 16% is under cultivation. Paddy rice occupies about three-fourths of all the land in crops. About 10% is in peas, tobacco, corn, sesame and pepper. Gardens and orchards occupy another 15%. Rice is generally sown broadcast at the beginning of the rainy season and is irrigated by the streams when they attain flood proportions. Away from the flooded areas along the streams the land is generally not utilized and is a wild jungle. These lands cannot be worked with the crude pointed plow used in the rice lands. A steel plow is needed. Moreover, the water buffalo used in the rice fields is not suited to work in dry fields, because it does not perspire through the skin and cannot stand the work.

The chief town of central Siam is Bangkok (Krung Thep), the capital, chief port and major city of the country. It had a population, according to the 1947 census, of 620,830. It is located 15 mi. from the sea on the Chao Phraya. A bar at the mouth of the river forces larger steamers to anchor outside and transfer their cargoes to lighters. Parts of Bangkok are thoroughly modern, with wide streets, large warehouses, a modern transport system and most of the other accoutrements of a western-style city. It does maintain an oriental atmosphere, however, with its numerous Buddhist temples and narrow streets crowded with shops.

In addition to Bangkok other important towns in central Siam include Muang Phitsanulok (66,783), a centre of agricultural activity and historical interest; Samut Prakan (50,679), naval fortifications at entrance to the Chao Phraya (Phya) ; Nonthaburi (34,815), a big market centre; Ayutthaya (49,717), former capital of Siam, located on an island in the Chao Phraya, of great historical interest; Lop Buri (78,931), capital before Ayutthaya, famous for its ruins and revitalized as a military and railway centre; Suphan Buri (70,530) and Rat Buri (77,674), ancient cities; Nakhon Pathom (85,063), famous for its huge pagoda on the site of the capital of Sri Wichaiya, a kingdom of the pre-Christian era, and now important for military, agricultural and other schools; Chon Buri, a fishing centre; Rayong (34,258) and Chanthaburi (Chantabun) (28,472), which produce gems and pepper.

Peninsular Siam is a region of about 28,000 sq.mi. lying within the Malay peninsula. Low mountains, seldom more than 3,000 ft., divide the area lengthwise and account for difference in the rainfall regime east and west of the mountains. Although rain falls the year around, it is rainier on the western side of the peninsula from May to October and rainier on the east coast from October to February. Sea breezes tend to moderate the high temperatures.

Rice is the chief crop, though only about 7% of the land is under cultivation. Much of the land is not suited to agriculture, but much that is has not been brought under cultivation. Production methods there are generally inefficient.

Peninsular Siam is the locale of the principal mineral deposits of the country. Tin is the chief metal and is a leading export of the region. It is mined on Phuket and Phangnga islands and at Ranong and Yala. Other minerals of lesser importance are tungsten (found in association with tin), lead and coal.

In addition to tin, coconuts and rubber are the chief exports of the peninsula. (W. F. Cs.)

HISTORY

The town of Muang Lamphun (Labong or Haribunchai), the first Lao capital in Siam, was founded about A.D. 575. The fusion of races may be said to have begun then, and the Siamese language, written character and other racial peculiarities were in course of formation. But the finishing touches to the new race were supplied by the great expulsion of Lao-Tai from southwest China by Kublai Khan in A.D. 1250. Thereafter the north, the west and the southwest of Siam, comprising the kingdom of Swankalok-Sukhotai and the states of Suphan and Nakhon Sithammarat (Ligore), with their subfeudatories, were reduced by the Siamese (Thai), who, during their southern progress, moved their capital from Sukhothai to Muang Nakhon Sawan, thence to Kamphaeng Phet and thence again to Suvarnabhumi near the present Kanchanaburi. A Sukhothai inscription of about 1284 states that the dominions of King Rama Kamheng extended across the country from the Mekong to Phet Buri, and thence down the Gulf of Siam to Ligore; and the Malay annals say that the Siamese had penetrated to the extremity of the peninsula before the first Malay colony from Menangkabu founded Singapore; *i.e.,* about 1160. Sano also was attacked, and its fall completed the ascendancy of the Siamese (Thai) throughout the country. The city of Ayutthaya which rose in A.D. 1350 upon the ruins of Sano was the capital of the first true Siamese king of all Siam. This king's sway extended to Moulmein, Tavoy, Tenasserim and the whole Malacca peninsula. About this time Siam attacked Cambodia, seized Angkor and carried off 90,000 prisoners. This was the beginning of a series of wars lasting about 400 years, until Cambodia fell entirely under Siamese rule and influence. Vigorous attacks were also made during this period on the Lao states to the northwest and northeast, and Siamese supremacy was pretty firmly established in Chiengmai and its dependencies by the end of the

18th century and over the great eastern capitals, Luang Prabang and Vien-chang, by about 1828.

Phra **Naret.**—During the 15th and 16th centuries Siam was frequently invaded by the Burmese and Peguans, who, attracted probably by the great wealth of Ayutthaya, besieged it more than once without success, the defenders being aided by Portuguese mercenaries, till about 1555, when the city was taken and Siam reduced to dependence. From this condition, however, it was raised a few years later by the great conqueror and national hero, Phra Naret, who after subduing Laos and Cambodia invaded Pegu, which was utterly overthrown in the next century by his successors. But after the civil wars of the 18th century the Burmese, having previously taken Chiengmai. which appealed to Siam for help, entered Tenasserim and took Mergui and Tavoy in 1764, and then advancing simultaneously from the north and the west destroyed Ayutthaya after a two years' siege (1767).

The intercourse between France and Siam began about 1680 under Phra Narain, who, by the advice of his minister, the Cephalonian adventurer Constantine Phaulcon, sent an embassy to Louis XIV. An interesting episode was the intercourse, chiefly commercial, between the Siamese and Japanese governments from 1592 to 1632. Japan in 1636 was closed to foreigners; but trade was carried on down to 1745 through Dutch and Chinese and occasional English traders. In 1752 an embassy came from Ceylon, desiring to renew the ancient friendship and to discuss religious matters. After the fall of Ayutthaya a great general, Phaya Takh Sin, collected the remains of the army and restored the fortunes of the kingdom, establishing his capital at Bangkok; but, becoming insane, he was put to death and was succeeded by another successful general, Phaya Chakkri, who founded the present dynasty. Under him Tenasserim was invaded and Tavoy held for the last time by the Siamese in 1792, though in 1825, taking advantage of the Burmese difficulty with England, they bombarded some of the coast towns. The supremacy of China is indicated by occasional missions sent, as on the founding of a new dynasty, to Peking, to bring back a seal and a calendar.

European **Contacts.**—Of European nations the Portuguese first established intercourse with Siam (1511). They were supplanted gradually in the 17th century by the Dutch. English traders were in Siam very early in the 17th century; there was a friendly interchange of letters between James I and the king of Siam, who had some Englishmen in his service, and, when the ships visited "Sia" (which was "as great a city as London") or the queen of Patani, they were hospitably received and accorded privileges. The important items of export were, as now, tin, varnish, deerskins and "precious drugs." Later on, the East India company's servants, jealous at the employment of Englishmen not in their service, attacked the Siamese, which led to a massacre of the English at Mergui in 1687, and the factory at Ayutthaya was abandoned in 1688. A similar attack is said to have been made in 1719 by the governor of Madras. After this the trade was neglected. Pulo Penang, an island belonging to the Siamese dependency of Kedah, was granted on a permanent lease to the East India company in 1786, and treaties were entered into by the sultan of Kedah with the company. In 1822 John Crawfurd was sent to Bangkok to negotiate a treaty with the suzerain power, but the mission was unsuccessful. In 1824, by treaty with the Dutch. British interests became paramount in the Malay peninsula and in Siam, and two years later Captain Burney signed the first treaty of friendship and commerce between England and Siam. A similar treaty was effected with the United States in 1833. Subsequently trade with British possessions revived, and in time a more elaborate treaty with England became desirable. Sir James Brooke opened negotiations in 1850 which came to nothing, but in 18jj Sir John Bowring signed a new treaty whereby Siam agreed to the appointment of a British consul in Bangkok and to the exercise by that official of full extraterritorial powers. Siam entered into treaties with Japan in 1898 and Russia in 1899. A further convention afterward provided for a second British consular district in northern Siam, while England and France both appointed vice-consuls in different parts of the country.

France and England. — For centuries Siam had been distracted by wars with Cambodians, Peguans and Burmese, but the incorporation of lower Cochin-China, Annam and Tongking by the French, and the annexation of lower and upper Burma successively by the British, freed it from all further danger on the part of its old rivals. But later, disputes with frontier tribes led to complications with France, which asserted that the Siamese were occupying territory that rightfully belonged to Annam, which was then under French protection. France, while assuring the British government that it laid no claim to the province of Luang Prabang, which was situated on both banks of the upper Mekong, roughly between the 18th and 20th parallels, claimed that farther south the Mekong formed the true boundary between Siam and Annam, and demanded the evacuation of certain Siamese posts east of the river. The Siamese refused to yield, and early in 1893 encounters took place in the disputed area in which a French officer was captured and French soldiers were killed. The French then dispatched gunboats from Saigon to enforce their demands at Bangkok, and these made their way up to the capital in spite of an attempt on the part of the Siamese naval forces to bar their way.

In consequence of the resistance with which they had met, the French now greatly increased their demands, insisting on the Siamese giving up all territory east of the Mekong, including about half of Luang Prabang, on the payment of an indemnity and on the permanent withdrawal of all troops and police to a distance of 25 km. from the right bank of the Mekong. Ten days' blockade of the port caused the Siamese government to accede to these demands, and a treaty was made, the French sending troops to occupy Chanthaburi (Chantabun) until the provisions of this treaty should have been carried out.

In 1895 lengthy negotiations took place between France and England concerning their respective eastern and western frontiers in farther India. These negotiations bore important fruit in the Anglo-French convention of 1896. By this convention Siam's independence was guaranteed by the two European powers which alone had interests in the Indochina peninsula. Encouraged by the assurance of the Anglo-French convention, Siam now turned its whole attention to internal reform and to such good purpose that, in a few years, improved government and expansion of trade aroused a general interest in its welfare, and gave it a stability which had before been lacking. With the growth of confidence, negotiations with France were reopened, and, after long discussion, the treaty of 1893 was set aside and Chanthaburi evacuated in return for the cession of the provinces of Bassac, Melupré and the remainder of Luang Prabang, all on the right bank of the Mekong, and of the maritime district of Krat. These results were embodied in a new treaty signed and ratified in 1904.

Meanwhile, in 1899, negotiations with the British government led to agreements defining the status of British subjects in Siam and fixing the frontier between southern Siam and the British Malay states, while in 1900 the provisions of Bowring's treaty of 1855, fixing the rates of land revenue, were abrogated in order to facilitate Siamese financial reform.

In 1907 a further convention was made with France, Siam returning to the French protectorate of Cambodia the province of Battambang, conquered in 1811, and in compensation receiving back from France the maritime province of Krat and the district of Dansai, which had been ceded in 1904. This convention also modified the extraterritorial rights enjoyed by France in Siam and disclosed an inclination to recognize the material improvements of the preceding years. In 1907 also negotiations were opened with Great Britain, the objects of which were to modify the extraterritorial rights conceded to that power by the treaty of 1855 and to remove various restrictions regarding taxation and general administration, which, though diminished from time to time by agreement, still continued to hamper the government. These negotiations resulted in a treaty, signed and ratified in 1909, by which Siam ceded to Great Britain its suzerain rights over the dependencies of Kedah, Kelantan, Trengganu and Perlis, Malay states situated in southern Siam just north of British Malaya, containing in all about 1,000,000 inhabitants, and obtained the practical abolition of British jurisdiction in Siam proper.

In July 1917 Siam entered World War I with a declaration against Germany and Austria-Hungary. All enemy subjects were interned and a quantity of German shipping taken as prize.

King Prajadhipok (1893–1941) succeeded his brother Rama VI in Nov. 1925. On June 24. 1932, a small group of middle-class soldiers and civilians engineered a revolution whereby Siam became a constitutional monarchy. Royalist opposition was effectively eliminated when the revolt of Prince Bovaradej was crushed in Oct. 1933. Prajadhipok. progressively shorn of many of his powers. abdicated in March 1935 in favour of his 10-yr.-old nephew Ananda Mahidol. for whom a three-member council of regency was established. A succession of coups d'état and conspiracies in the ensuing years showed, however, that there was a growing cleavage between the civilian and the military leaders of the revolution. This cleavage. together with public reaction against two major scandals in which high officials were involved, served to enhance the prestige of the newly created national assembly.

Under the absolute monarchy a legislative council of 45 nominated members had been established by a royal decree of Jan. 1895. Prajadhipok. however. at the beginning of his reign instituted the supreme council of state. an advisory body of five princes that met every week to consider secret business and matters affecting the royal family. This supreme council. with the cabinet of ministers and the department of legislative redaction of the ministry of justice, had taken over the functions of the legislative council, which in fact was seldom assembled. The revolution, then. by its provisional constitution of June and its constitution of Dec. 1932, set up a unicameral national assembly with legislative power, control over the budget and ministerial actions, freedom of speech and the right to override the royal veto. It was specified that for 10 years this assembly was to be composed of 156 members, half to be appointed on the advice of the government and half to be chosen by popular election. Elections were to be held every four years. candidates had to be 23 years old or over and to satisfy certain educational and residential requirements. The supreme council of state was dissolved. Executive power was to be shared between the king and the state council. The latter body, combining the functions of cabinet and of privy council. was to comprise 15–2j members, two-fifths of their number being nominated by the king.

World War II created a situation in which the military leaders were able to assume control of affairs. Increasingly nationalistic legislation in the economic sphere, including measures designed to replace foreigners (especially the Chinese) by Siamese in the country's industries and commerce. was followed by a revival of claims to those areas of Indochina which had been taken by the French between 1893 and 1907. Synchronizing its demands with Japanese pressure on French Indochina. from Sept. 1940 to March 1941, the state became involved in spasmodic warfare on its eastern border. Through Japanese mediation the French ceded in May 1941 about 21.000 sq.mi. to Siam. namely that part of the protectorate of Laos nhich lay west of the Mekong river and three-fourths of the Cambodian province of Kampong Thom (the new frontier there running through Battambang and Siemréap). Although not wholly satisfied with these Japanese-arranged terms and desirous above all of maintaining its independence. Siam was swinging increasingly into the Japanese orbit and away from its traditional friendship with Great Britain. On Dec. 8, 1941, after five hours of fighting, Siam agreed to permit Japanese troops passage through the country to invade British Malaya. This was followed by Japanese occupation of the country. (*See* World War II.)

On Jan. 25, 1942, Siam declared war on Great Britain and the Cnited States. The United States did not declare war on Siam. In R'ashington the Siamese ambassador: Seni Pramoj, organized a free Thai movement to counteract the Japanese. Through its offices about 90,000 guerrillas were organized in Siam under the leadership of the regent Pridi Phanomyong. In July 1943 Japan transferred 30.164 sq mi of territory to Siam. This included the four Malay states that had been ceded to the British in 1909 and tno Shan states from Burma.

With the defeat of Japan the declaration of war of 1942 mas declared null and void. In 1946. peace treaties between Siam and Great Britain and between Siam and France were signed on Jan. 1 and on Nov. 1;; territories and properties acquired during the war were returned; and on Dec. 16 Siam joined the United Nations. From 1950, Siam participated in the Korean War in support of the United Nations. In Sept. 1954 Siam was one of the signatories of the Southeast Asia collective defense treaty.

Internal politics after the war were marked by another series of coups d'état and attempted coups. and by a number of changes in the constitution. The first postwar constitution (May 1946) established a bicameral legislature, comprising an elective house of representatives and a nominated senate or house of elders. Then. on June 9, 1946. King Ananda Mahidol was found shot dead in circumstances that gave rise to suspicion of murder. As his brother Phumiphon Adundet (1927–) who succeeded him was a minor. a new regency had to be set up. Meanwhile the governments since the end of the war had been dominated by Pridi Phanomyong, but he was forced to flee from Siam by the coup of Nov. 1947. The power behind this coup was Marshal Pibul Songgram, who had emerged as a leader of the army politicians in the 1930s and had been prime minister from Dec. 1938 to July 1944. Under the provisional constitution of Nov. 1947 the legislature remained bicameral, with 100 members to either house; but membership to the upper house was reserved to nominees of the crown. By a further coup in April 1948. Pibul Songgram made himself again prime minister. The constitution promulgated in March 1949 embodied most of the features of that of 1947. In the last days of Nov. 1951, on the eve of the young king's return from Switzerland where he had been completing his education. the ruling group of politicians organized a new coup. whereby the constitution of 1932 was restored (Dec. 1951). The unicameral assembly was to comprise 123 elected and 123 nominated members, the latter alone sitting until elections would take place; the real point of the change seemed to be to reduce the royal power. In March 1952, however. a somewhat modified version of this constitution was promulgated. The nominated members were gradually to be replaced by elected members until in 1962 the whole assembly would be elected. In Sept. 1957 Pibul was forced to flee the

THE PEOPLE

Population.—Siam is not densely populated in comparison with many countries of the east. The density is about 100 per square mile for the country as a whole but varies widely from section to section, being less than 12 per square mile in one of the northern provinces but more than 500 per square mile around Bangkok. There is little or no pressure on the land. though it is believed that by the late 1950s most of the more fertile land was occupied. The population, estimated at 22,811,701 in 1956 (17,442,689 in 1947; 14,464,489 in 1937), is predominantly rural. The urban population. however, increases more rapidly.

Oi the total population the great majority (about 94%) belongs to the Thai group of peoples. These may be divided into the southern Thai or Siamese and the northern Thai or Lao. The two groups are closely related, though there are minor physical differences. The Chinese, who constitute the largest minority group (2.8% of the total) and tend to retain their own customs. are found mostly in the port cities and are active in retail trade, commerce, industry and mining (since 1947 Chinese immigration has been vigorously discouraged). Moslem Malays account for about 3% of the population. the majority of them living in peninsular Siam. Cambodians. Annamese. Shans and Burmese make up most of the balance. Sumerous but small remnants of ancient tribes. and tribal groups that mav have entered Siam from the north in the 19th century. inhabit the remote hill sections of the north. west and south.

The typical Siamese is of medium height and has an olive complexion (darker than the Chinese, fairer than the Malays), eyes slightly inclined to the oblique. a broad. flat nose, prominent lips. a face wide across the cheekbones and a short chin. A thin moustache is common: beards are plucked out. Hair is black. coarse and cut short. Lips are often deep red and teeth black as a result of chewing betel, though the habit is declining. The social position of women is good. Polygamy is common only among the upper classes: the first wife is the head of the household.

For the language *see* SIAMESE LANGUAGE AND LITERATURE.

Religion. — Buddhism is the prevailing religion of the Siamese and Lao. but the Malays of the peninsula are Moslem. Buddhism in Siam is tinged by Burmese and Sinhalese influences and. in most country districts. by the spirit-worship characteristic of the hill peoples of Indochina. In Bangkok. Brahmanical influence is still noticeable. and Brahman priests assist at all acts of public importance. The Siamese. as southern Buddhists, pride themselves on their orthodoxy: and when Burma. Cambodia and Ceylon had fallen under, European influence the king of Siam came to be regarded as the sole defender of the faith. A close connection exists between the laity and the priesthood, as the Buddhist regulation that every man should enter the priesthood for at least two months is very widely observed. Many of the temples were placed under the direct supervision of the king, and in these a stricter rule of life is observed. Some of the priests are learned in the Buddhist scriptures, and most of the Pali scholarship in Siam is to be found in the monasteries.

According to the 1947 census, Buddhists made up 89% and Moslems 4% of the population. Under Rama VI and under the constitutional regime. Buddhism was pressed into the service of the state to create national unity. Temple-building and expensive, time-consuming ceremonials were curtailed; the state intervened in the administration of clerical and monastic affairs; but the priests did not concern themselves with politics. and the new regime could proceed with secularizing education and democratizing institutions without encountering much monkish opposition.

Education. — Up to the beginning of the 20th century education in Siam was mainly in the hands of the monks. King Chulalongkorn, who inaugurated the state educational system in the 1870s and 1880s, had at first to rely on monastic help, and even in the 1950s. though monks were no longer responsible for the teaching. nearly 50% of the state schools were still housed within temple precincts. The department of education. founded in 1887, became a ministry in 1889. The first teachers' training college was founded in 1892 and the first university, Chulalongkorn. in 1917. Some Christian missionary schools were also opened in the 19th century.

LI KAI—PIX

YOUNG GIRL IN TRADITIONAL COSTUME OF SIAMESE DANCERS

A law to make education compulsory for children between the ages of 7 and 14 was passed in 1921. In 1935, when the system was practically complete. the age limits were changed to 8 and 15. In 1937, in which year 31.1% of the population aged 10 and over were reckoned to be literate. a new scheme of national education was introduced covering preprimary schools, elementary schools. secondary schools. technical schools. teachers' training institutions. higher education and adult education.

In 1954 the numbers enrolled were: preprimary. 11.634: primary. 2,937.j34; secondary. 251.934; vocational. 40.073: teachers' training institutions. 4.232: higher education. 21.078. These totals included 1,388,820 girls at the primary stage. 82,242 at the secondary and j.194 at the higher. By 1954 literacy had risen to 53.7% of those aged 10 and over.

In 1950 a plan to add three years of compulsory secondary education to the four years of primary education already compulsory under the existing scheme and to re-organize educational methods was drawn up. At that time more than 60% of the districts were without secondary schools. Rut qualified teachers were scarce. teaching methods inadequate and school attendance irregular. with the result that many children failed to complete the existing four-year program before the age of 15. The immediate introduction of the additional program all over the country was therefore not practicable. but with United Nations' help a pilot scheme mas begun in 1950 in Chachoengsao province.

The administration of education is strongly centralized. All books used in the schools have nominally to receive official approval. Yet private schools have been encouraged provided that they conform to certain government requirements, especially with regard to the language of instruction. This requirement has caused difficulties with the numerous Chinese schools, one of whose main purposes is the maintenance of Chinese rather than Thai ideas and culture.

GOVERNMENT AND ADMINISTRATION

The constitution of March 1952 was based ultimately on that of 1932 as reintroduced in Dec. 1951 (see above. *History*). The principal modifications that it stipulated were that within ten years the nominated half of the assembly should be replaced by elected members to make the assembly wholly elective; that there should be a privy council of nine, chosen by the king, and that the royal family should be allowed to take part in politics.

For administrative purposes the country was divided, from April 1, 1926, into *monthon* (divisions) which were in turn subdivided into *changwats* (provinces). Following the 1932 coup d'etat the *monthon* were abolished and the *changwat* became the primary administrative division. Each *changwat* was in charge of a commissioner responsible to the minister of the interior and was in turn subdivided into *amphur* (districts), *tambol* (communes or groups of villages j and *moo ban* (villages). There were 71 *changwats* in 1957.

Justice. — A ministry of justice was instituted in 1892. Thereafter the old tribunals, in which customary law had been corruptly administered by ignorant satellites of the great, were replaced by organized courts with judges appointed from the Bangkok law school and under the direct control of the ministry (except in the most outlying parts). A provincial judicial scheme provided a court at the headquarters of each *changwat*, and a central court at the chief town of each *monthon*. A supreme court was established at Bangkok. In 1915 a bar association was formed.

Meanwhile the independence of the Siamese courts was still compromised by international treaties under which extraterritorial rights were secured to foreigners until the national law should be fully codified. After the absolute monarchy had dallied years over the work of codification, the constitutional regime rushed it to completion. enabling Siam to denounce the international treaties in 1936 and to be freed from extraterritoriality within 14 months. Further legislation by the constitutional government was designed to reform procedure. to introduce the western type of will, to strengthen the status of the judiciary and to extend the course in the law school to three years. The spread of crime, stimulated by the political changes. provoked a reorganization of provincial justice. The *gendarmerie* courts were replaced by district courts and police authority was strengthened. Prison reform mas begun. penal colonies were established and reformatories for juvenile delinquents constructed.

Siam is divided into four divisions for judicial purposes, though certain courts in Bangkok are excluded. There is a court of appeal and a final court of appeal to deal with points of law. Civil cases and serious criminal cases have to be heard by at least two judges. There is no jury system.

Defense. — Something of the part played by the armed forces in Siamese politics is indicated in the paragraphs on history above. Conspiracies in 1912 and in 1917 foreshadowed the struggle between civil and military elements that dominated the early constitutional period and culminated in the army's supremacy from 1938, save for the interval 1944–47. Symptomatic of this military influence was the Yuvajon movement, started in 1935, for the military training of schoolboys. A law of 1937 made all males between the ages of 18 and 30 liable for military service.

The navy. which had been officered wholly by Siamese since 1906, had its strength doubled in the first decade of the constitutional regime, when modern warships were bought from Italy and Japan. The traditions of the national air force go back to 1912, when Rama VI sent some of his subjects to France for training as pilots and mechanics and to World War I, when Siamese aviators were sent to the western front.

ECONOMY

Siam is well endowed with rich alluvial soil in the central basin. Mineral wealth exists to a limited degree. with tin the most important. Associated with the tin are deposits of tungsten. Gold, antimony and precious and semiprecious stones are produced in small quantities. Salt is produced by evaporation of sea water. Also present are limited deposits of other minerals, largely unworked or mined on a small scale. They include coal. iron, copper, lead, zinc, silver and manganese. Water power resources remain largely undeveloped. By far the most important economic activity of the country is agriculture.

Agriculture. — Of the 51,400.000 ha. of land in Siam about 7,793.000 were devoted to agriculture in 1954. Of the latter total. 846.500 ha. (11%) were irrigated. The area of irrigated land increased to 977.400 ha. in 1955. Rice and agriculture are almost synonymous terms in Siam, since rice dominates all farming. In 19jh some 6,000,000 ha. were under rice. this figure being inflated in relation to total land in agricultural use since land cropped twice is counted twice. Production in 19j6 amounted to 8,179,700 metric tons. In 1947, 84.78% of the population was engaged in agriculture, forestry and fishing.

The agricultural policy of the constitutional regime was directed externally to finding new markets for rice and other exports; internally to improving agricultural technique, diversifying production. relieving the farmers' dangerous indebtedness by fostering the co-operative movement and by eliminating the Chinese middleman, establishing agriculturist colonies and finally to placing the whole rice industry under state control in production and marketing. The sowing and planting season is from June to August and the reaping season from December to February; 40 or 50 varieties of paddy are grown, and Siam rice is of the best in the world.

Advised by an irrigation expert loaned by the government of India. the Siamese began work in 1915 on the Prasak South Canal system. This. completed in 1924 at cost of £1,200,000, provided not only for the irrigation of nearly 100.000 ha. but also for navigation in a practically roadless region. The dubious success of this first canal system delayed until 1932 completion of the complementary Jiengrak and Bang Hai drainage by the construction of a 32-mi. dike permitting the irrigation of more than 533,000 ha. Various other schemes were also undertaken. An important project inaugurated after World War II was the great Chainat scheme, for which a loan of U.S. $18,000,000 was received from the International bank in 1950. By the beginning of 1958 the Chainat dam across the Chao Phya river had been completed together with some of the distributory canals. Efforts were also made to improve water supplies in the arid northeastern provinces.

The government encouraged the development of crops other than rice. Cotton, tobacco. soybeans, sugar. peanuts and maize were produced in larger quantities after World War II. In 1956 the 39.087 ha. under cotton yielded 32,339 metric tons, principally near Nakhon Pathom. The yield of tobacco. grown to some extent in every province. but mainly in the valleys of the north. amounted to 58.211 metric tons in 1956; the industry is largely under state control. Pepper growing had declined because of high production costs and a blight which ruined most of the Chanthaburi plantations. With about 6.000.000 coconut palms. Siam produced only 15,000 metric tons of copra in 1953, the industry being little developed. The area under soybeans was about 22.000 ha. in 1956, and the crop 22,000 metric tons. Sugar cultivation. formerly important. was found to need official support from the government in 1936, when a refinery was built at Muang Lampang. About 30.000 metric tons of crude brown sugar were produced in 1955. The government tried to foster the declining silk industry by building a silk-spinning factory at Nakhon Ratchasima in 1937.

The output of rubber was rapidly expanded after World War II. Net exports. which stood at 41,600 metric tons in 1939, amounted to 110,600 in 1950 and then, after falling to 97,100 in 1953, rose to 136,700 in 1956. The rubber however was neither uniform in quality nor scientifically produced: the industry was chiefly in Chinese hands. Peanuts are an important secondary crop: in 1956, from 76,000 ha. sown, production was 101,000 metric tons. Maize, occupying 81.66; ha.. yielded 114,770 metric tons in 1956.

Forestry. — In 1949 approximately 60% of Siam was under forest. but much of this contributed little to national economy. Teak is the chief forest product and is found in all the hill lands north of lat. 15° N. Normally production amounts to about one-third of the world's total. The industry has been operated mainly by British firms and the Siamese government. A rotation system of cutting was developed: half the area is set aside for reforestation over a 1j-yr. period and half is under active exploitation at any one time. In the mid-1950s production amounted to about 400,-000 cu.m. The next most important timber is yang (*Dipterocarpus alatus*), of which about 290.000 cu.m. were produced in 1954. Other forest products include stick-lac, thingan wood (*Hopea odoratus*) used for boatbuilding, dammar oil from the *Dipterocarpus*, eaglemood, sapan, rosewood, ironwood, ebony and rattan.

Livestock and Fisheries. — Livestock is poor in quality and small in quantity. According to the region, bullocks or buffaloes predominate as draught animals; they are raised principally on the Korat plateau. Horses are used extensively only by the mountain tribes of the northwest. In 1955 there were 178,000 horses. 5,862,000 cattle! 2,859,000 pigs and 5,960,000 buffaloes.

Fisheries, both marine and riverine, ordinarily rank second to agriculture in extent and value. The prosperity of the gulf's fisheries depends chiefly on mackerel, but there are also many kinds of anchovies. molluscs and crustaceans. In 1956 the total catch. including molluscs. amounted to 217,900 metric tons. Progressive governmental intervention attempted to conserve fish resources. to modernize methods of catch and preservation and finally to reserve fishing rights to Siamese nationals.

Mining. — Mining, except for tin, is not of major importance in the country's economy. Siam. however, usually ranks fifth among world producers of tin and accounts for 5%–7% of the world's output. The production of tin concentrates amounted to 12.661 metric tons in 1956 This was considerably belon the annual level obtaining immediately before World War 11 (I 5,000 in 1938) but well above that of the early 1930s. Deposits of tungsten, found in association nith tin, yielded 1,180 metric tons in 19j6. Control of the mines is largely shared between British and Chinese interests the latter being the less numerous, though virtually all the labour is Chinese. The industry's development was hampered by the comparative inaccessibility of the mines, which made the cost of transport high, by the obligation to pay royalties and by certain effects of speculation. Tin is mined at Phuket. Phangnga. Ranong and Yala. Other minerals include lead (9,434 tons mined in 1956), found in association with tin at Pattani and also in the form of galena at Kanchanaburi; coal in the peninsular provinces; silver and gold at To Mo, Bang Saphan, Muang Lom Sak and Wattana; semiprecious stones at Chanthaburi, Bo Phloi and Chiang Khong. and copper at Chanthuk. Iron occurs in 30 of the 70 provinces, but most of it is low grade; 6,775 metric tons were mined in 1956. The mining of lignite, at Me Moh in the north, began in 1955.

Manufacturing. — Manufacturing in Siam is of little consequence. It is confined largely to food processing for local use and to production of building materials. matches, cigarettes. furniture and native handicraft. Most manufactured goods are imported. The installed capacity of electricity in 1956, at only 69,000 kw., was low as compared, for instance, with that of Belgium. which had 3,603,000 kw. uith a population less than half that of Siam. Production of cement increased from 92,000 metric tons in 1938 to 397.608 in 1956.

Communications. — Central Siam is traversed by natural waterways; and east-to-west canals link the three main river systems and connect distant parts of the kingdom with Bangkok. In 1903 a department of government was formed to control the canals, the traffic being so great that the collection of a small toll is more than enough to pay for maintenance. Both on the soft soil of the low-lying areas and in the mountains road building is difficult. Although highways have been constructed to join the railways at the main trading centres. travel in the remoter parts is still uncomfortable. The road-building program of 1936 proposed the construction of 9,250 mi, of roads connecting the principal towns. Military roads (notably three radiating from Bangkok to Don Muang, to Nonthaburi and to Samut Prakan) were to receive immediate attention. By April 1941, 20 roads had been built at a cost of about 30,000,000 baht. By 1954 there were about 4,700 mi. of roads, and the government had undertaken a program designed to provide 3,400 mi. of new trunk roads and an additional 5,400 mi. of provincial trunk roads. Some of this work was to be undertaken with the financiai and technical assistance of the United States. The country had 23,200 passenger cars and 27,600 commercial vehicles in 195j.

Work on the first state railway (from Bangkok to Nakhon Ratchasima) was begun in 1892. Bangkok is the terminus of ail main lines. The main line to the northwest terminates at Chiengmai; the southern line threads the Malay peninsula to Ban Hat Yai, whence one branch goes to join the Malayan railway from Penang at Padang Besar and another serves the east coast. also connected with the Malayan railway (Kelantan lines). A line from Nakhon Ratchasima to Muang Khon Kaen (11j mi. to the north) was opened in 1933 and an express service between Bangkok and Muang Uhon in the east in 1938. In 1941 the extension from Muang Khon Kaen to Udon Thani (74 mi.) was opened, as well as the double track from Ayutthaya to Ban Phachi junction. After World War 11 damage sustained by the railways called for laborious repair. and the line to Burma constructed by the Japanese was abandoned. In 1955, however, the extension of the line from Muang Khon Kaen to Nong Khai. on the Mekong opposite Vientiane, was at last completed, with U.S. assistance. In 1955 there were more than 2,000 mi. of metre-gauge track, 374 locomotives, 6.212 freight cars and 637 passenger cars. Siam was an oriental pioneer in the use of diesel locomotives — the first diesel engines were put on the Malayan run in Dec. 1931 and were drawing the northern express to Chiengmai two years later.

In 1919 Siam became one of the first signatories to the International Convention for Aerial Navigation, and the development of international aviation made this previously isolated country the aerial gateway to the far east. An internal air service to the northeastern provinces, started in 1922, was operated at first by the army but from 1930 by a private company. with a wholly native personnel. In conjunction with Air France and with Imperial Airways, this company operated a line between Burma and Hanoi, which was extended to Hong Kong in 1938. The government cooperated in this development by constructing aerodromes at Uttaradit, Muang Phitsanulok, Muang Lom Sak, Udon Thani. Ban Perm and Nern Teng, as well as emergency landing fields. In 1930–34 Siam so modernized Don Muang that it became one of the largest and best-equipped aerodromes in Asia.

After World War II Siamese air services expanded rapidly. Bangkok became the civil airline centre for southeastern Asia. Secondary airfields mere built all over the country and air services to the main provincial centres were developed. International services were also expanded. The number of passenger-kilometres flown rose from 14,000 in 1938 to 11,190,000 in 1948 and to 60,108,758 in 1956.

Siam joined the Universal Postal union in 1885. Thereafter postal, telegraphic and telephonic communications were steadily developed throughout the kingdom. Foreign telegraph lines communicate with Saigon, Singapore (via Penang) and Moulmein. In 1935 a telephone service with Singapore was opened; services with Berlin were started in 1930 and with Japan and London in 1934. A wireless telephone service between Bangkok and Nakhon Ratchasima was inaugurated in Sept. 1940.

Foreign Trade. — Siam's principal exports are rice and teak (both shipped irom Bangkok), tin (shipped irom Phuket) and rubber (shipped from Songkhla). Rice is by far the chiei export: 1,555,500 metric tons were exported in 1951 and 1,264,986 in 1956. The latter quantity mas below the yearly average of 1,388,000 tons for the period 1934–38, and the decrease irom 1951 was accompanied by a fall in price. Exports of rubber amounted to 132,610 metric tons in 1955 and to 135,000 metric tons in 1956. Exports of tin, 17,000 metric tons in 1956, represent practically the whole of Siam's production. Cotton textiles, metal manuiactures. foodstuffs, electrical goods and petroleum products are the principal imports. Before World War II and for several years after 1948 Siam had a favourable balance of trade. In 1955, however, imports were valued at 7,288,700,000 baht against exports at 7,120,500,000; and in 1956 the corresponding figures were 7,562,100,000 and 6,923,200,000 respectively.

Finance. — In 1955 the Siamese budget showed total expenditures of 6,344,100,000 baht and total receipts of 5,120,000,000 baht. The two main expenditures were for economic development and defense. Import and export duties, indirect taxes and fiscal monopolies provided the major sources of revenue. The unit oi currency is the *baht* or *tical*. Originally it was a gold-standard unit fixed at 11 baht to the pound sterling. In 1932 the gold standard was abandoned and the unit was fixed in silver at the equivalent of 11 baht to £1. In 1949 the gold value mas fixed at 12.50 baht to the U.S. dollar; but in March 1955 the government altered the rate from 12.50 to 20 for the valuation of currency reserves. The free market value stood at 20.83 baht to the U.S. dollar in Jan. 1958. Currency in use is mainly in the form of notes, of which the first issue was made in 1902.

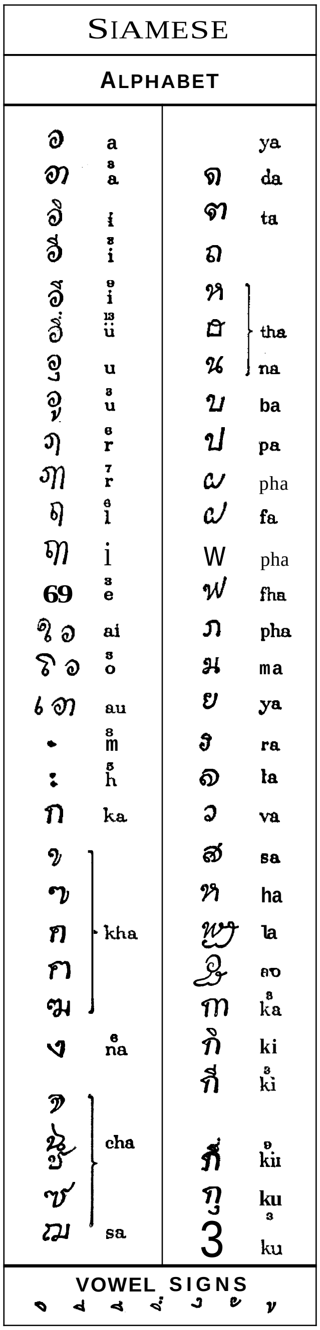
SIAMESE LANGUAGE AND LITERATURE. Siamese belongs to the Tai group of the Siamese-Chinese family of languages. Its connection with Chinese is distant but with other languages of the Tai group very close. It is spoken throughout central Siam, in all of southern Siam except Patani Monton, in northern Siam along the river-banks as far up as Gtaradit and Raheng, and in eastern Siam as far as the Korat Monton. Siamese was purely monosyllabic, each true word consisting of a single vowel sound preceded by, or followed by, a consonant. Of such monosyllables there are less than 2,000, and therefore many syllables have to do duty for the expression of more than one idea, confusion being avoided by the tone in which they are spoken.



The current Siamese characters are derived from the Cambodian alphabet, which owes its origin to the alphabet of the inscriptions, an offshoot of the character found on the stone monuments of southern India in the 6th and 8th centuries.

The Siamese alphabet consists of 44 consonants, in each of which the vowel sound "aw" is inherent, and of 32 vowels all marked not by individual letters, but by signs written above, below, before, or after the consonant in connection with which they are to be pronounced. Several of the 44 consonants express each a slightly different intonation of what is practically the same consonant, the sound of "kh," for instance, being represented by six different letters and the sound of "t" by eight. Other letters are present only for use in certain words imported from Pali. The vowel signs have no sound by themselves, but act upon the vowel sound "aw" inherent in the consonants, converting it into "a," "i," "o," "ee," "ow," etc. Each of the signs has a name, and some of them produce modulations so closely resembling those made by another that at the present day they are scarcely to be distinguished apart. Only vowel or diphthong sounds, or the letters "m," "n," "ng," "k," "t," and "p" are permissible at the end of words. Hence the final letter of all words ending in anything else is simply suppressed or is pronounced as though it were a letter naturally producing one or other of those sounds. Thus many of the words procured from foreign sources are more or less mutilated in pronunciation, though the entirely suppressed or altered letter is still retained in writing.

Siamese is written from left to right. In manuscript there is usually no space between words, but punctuation is expressed by intervals isolating phrases and sentences.

The **Tonal** System.—Of the simple tones there are five—the even, the circumflex, the descending, the grave, and the high—any one of which when applied to a word may give it a quite distinct meaning. Four of the simple tones are marked in the written character by signs placed over the consonant affected, and the absence of a mark implies that the one remaining tone is to be used. The consonants are grouped into three classes, to each of which a special tone applies, and consequently the application of a tonal sign to a letter has a different effect, according to the class to which such letter belongs. Though many syllables have to do duty for the expression of more than one idea, the majority have only one or at most two meanings, but some are used with quite a number of different inflections, each of which gives the word a new meaning. Thus, for example, the syllable *khao* may mean "they," "badly," "rice," "white," "old," or "news," simply according to the tone in which the word is spoken. Words are unchangeable and incapable of inflection. There is no article, and no distinction of gender, number, or case. These, when necessary, are expressed by explanatory words after the respective nouns; only the dative and ablative are denoted by subsidiary words, which precede the nouns, the nominative being marked by its position before, the objective by its position after, the verb, and the genitive (and also the adjective) by its place after the noun it qualifies. Occasionally, however, auxiliary nouns serve that purpose. Words like "mother," "son," "water" are often employed in forming compounds to express ideas for which the Siamese have no single words, *e.g.* *lûk cân,* "the son of hire," a labourer; *mê mü,* "the mother of the hand," the thumb. The use of class words with numerals obtains also. In Siamese the personal pronouns are mostly represented by nouns expressive of the various shades of superior or lower rank according to etiquette. The verb is, like the noun, perfectly colourless—person, number, tense, and mood being indicated by auxiliary words only when they cannot be inferred from the context. Such auxiliary words are *yû,* "to be," "to dwell," (present); *dai,* "to have"; *leao,* "end" (past); *cǎ,* "also" (future); the first and third follow, the second and fourth precede, the verb. *Hài,* "to give" (prefixed), often indicates the subjunctive. There are compound verbs; thus, *e.g., pai,* "to go," is joined to a transitive verb to convert it into an intransitive or neuter; and *thûk,* "to touch," and *tòng* "to be compelled," serve to form a sort of passive voice. The number of adverbs, single and compound, is very large. The prepositions mostly consist of nouns.

In Siamese the subject of the sentence precedes the verb and the object follows it. The possessive pronoun follows the object. The adverb usually follows the verb. In compound sentences the verbs are placed together as in English, not separated by the object as in German. When an action is expressed in the past the word which forms, with the verb, the past tense is divided from the verb itself by the object.

In addition to the ordinary language of the people there is a completely different set of words ordained for the use of royalty, to avoid the employment of downright expressions of vulgarity or of words which might be capable of conveying an unpleasant or indelicate idea other than the meaning intended. Words of Sanskrit origin have been freely adopted and many Cambodian words are also used. The language is so complete that the dog, pig, crow, and other common or unclean animals are all expressed by special words, while the actions of royalty, such as eating, sleeping, walking, speaking, bathing, dying, are spoken of in words quite distinct from those used to describe similar actions of ordinary people.

See O. Frankfurter, *Elements of Siamese Grammar* (1900); *Linguistic Survey of India,* vol. ii. (1904).

LITERATURE

The genius of the Siamese finds its best literary expression in verse which contains a great variety of metre, but the three commonest metres are called *Kton, Kap* and *Klong.* The tones of the language play a very important part in Siamese poetry—indeed they may be said to take the place of rhymes; the *Kap,* however, has rhymes in addition. Every subject is material for the Siamese poet and the verses are comparable with those of almost any land. *Klong* and *Kap* forms are combined in the style known as *Nirat* poetry, or extended narrative love-verse, and the *Klon'pet ton* or thumb-nail love-songs are numbered by hundreds. They are unrivalled for elegance of diction and sweet sound, perfectly balanced little pieces of eight lines divided into two stanzas; each line having eight syllables. This form of verse is confined to the treatment of love and passion. The other metres are of interest only to the academician.

Siamese is rich in quasi-historical and mythological literature. The purely native material is informed by an imagination far less vivid than that of the Indian *Ramayana (Ramakien)*, but is decidedly interesting as an index of the Siamese mind. It is sometimes very difficult to decide whether a story is purely native, as Sian drew upon the mighty sources of India, Cambodia and China; where the material was not too definitely alien, the Siamese pressed it very closely into their own mould, producing a very different piece of literary effort from the original. *Wet ya Sun yin* and *Wo ra loongs* are examples of stories originally borrowed from India. Semi-magical stories are numerous and nature-stories abound. A study of the mythological literature sheds a flood of light on the origin and development of Indo-Chinese superstition. *Phum hon*, a very popular tale, tells of a young woman loved by an elephant, and *Prang tong* is a story of a princess who was prenatally betrothed to a giant. Siamese cosmogony is enshrined in the *Nok khum*, and these mythological works may be considered the earliest examples of native literature.

There exists much religious material in Siamese—almost the whole of the Buddhist canon having appeared. some parts of it existing in many different versions: *Pattama Sompothiyan* is the standard Siamese life of Buddha. There is often great difficulty in distinguishing between Buddhist literature proper and *Niti* or traditional literature. Much of this is from the Bali language and from Javanese, which in their turn were inspired from India. The outstanding work in this division is called the *Maxims of Phra Ruang*. Phra Ruang was the national hero-king and he is held up to Siamese youth as the mighty ideal of manhood.

It is in law that Siamese literature shows its best early prose. Five ancient canons, some of them founded on the *Law of Manu*, exist and present the earliest form of Siamese law and a very early style of Siamese literary composition. A large collection of early royal edicts has come down to our day although a modern code of laws has long since superseded the old statutes. A penal code based on foreign procedures was issued in 1908 and additions are made periodically. Never has Siam published so lavishly; every month new legal codes, translations of religious texts, new versions of foreign classics or translations of alien literature roll from unwearied presses. More especially versions from the Pali scriptures of Buddhism abound and there is nowadays a movement on foot to supply the lacunae in historical literature.

The wars of the middle ages and early modern times in Siam have robbed us of much literary material which must have existed centuries ago. There is as yet no reliable, connected history of Siam in the native tongue, although we have a fairly complete history of the Aguthia dynasty and of the modern line of kings. The cause for dissatisfaction with these histories is almost entirely concerned with the earlier parts which have drawn largely upon the quasi-historical and legendary literature. Modern works on general history are of almost daily publication. however. and histories of Siam, based on material drawn from foreign contemporary sources are in course of preparation. The educational department of the Siamese government is indeed the modern fairy godmother of the people in matters of dissemination of general knowledge. (See *Catalogue of the India Office Library*, London.) (A.. J. W.)

SIAN (HSI-AN), capital of China's northwest province of Shensi and in early history the site of China's capital for a total of 970 years during the western Chou, the Ch'in, the Western Han. the Sui and the T'ang dynasties. Its earlier names were Changan and Siking and it reverted to its Manchu name Sian (meaning "western peace") in 1043. The city is situated on a broad loess terrace at the northern foot of the Tsinling Shan not far from the south bank of the Wei Ho. In the 14th century. Marco Polo. who called it Kenjanfu or Quengianiu. described it as a thriving trade centre. Its significant position derives from the productivity of the Wei plain and its natural topographic defenses. as well as its strategic command over radiating communications routes to Kansu and Turkistan in the west, Szechn-an in the south, the Ordos desert in the north, Shansi and the Yellow plain in the northeast and east. It was there in 1936 that Chang Hsiieh-liang kidnaped Chiang Kai-shek in the "Sian incident" leading to a united front between Nationalist and Communist forces to resist Japan (see CHINA: *History*). However, during the Chinese-Japanese war, a strong Nationalist army was garrisoned at Sian, not only against the Japanese, but also to contain, the Communists who had established a base at Yenan in north Shensi after 1935 under Gen. Hu Tsung-nan.

The city is surrounded by a rectangular wall, (approximately 3.1 mi. by 1.8 mi.) with a city pate on each side except the east which has two gates. Suburbs extend from each gate. The 1939 population of about 209.000 grew to iYi.300 by 1953, because of industrial developments extending from the western suburbs. The expansion has resulted from new economic developments in China's northwest, including the completion of the trans-Tsinling railroad and the extension of the now doubled-tracked Lung-hai railroad passing Sian into Sinkiang.

Sian was one of the key cities in the Communist First Five-year plan. A small iron and steel mill was constructed. a cotton textile combine set up, and a new thermal electric power plant built which supplies nearby cities and Sian with power. Also constructed were a cement plant, with a seamless steel tube rolling mill, and a moderate-size chemical plant.

Historically important. the city contains temples; tombs and monuments. The collection in the Shensi provincial museum (formerly the Pei-lin) is noteworthy, and the Nestorian tablet disco\-wed in 1625 was housed there. Sian is the seat of Northrestern university and Medical college, and the location of the Northwestern Institutes of Art and Music. (H. J. Ws.)

SIANG FRONTIER DIVISION is the central of the five divisions constituting the North East Frontier Agency of the Republic of India. It is through the heart of this division that the Dihang river (a section of the Brahmaputra) passes in a series of stupendous gorges from the plateau of Tibet to disgorge on the valley plain of upper Assam less than 1.000 ft. above sea level. Navigability on the Brahmaputra ceases at Pasighat; from there a rough track runs alongside of the valley west of the river. eventually passing into Tibet and linking with the motor road to Lhasa. The Abor is the principal tribe living in this division. They were first visited by the British in 1826. From 1848 they carried out numerous raids and outrages on the neighbouring territory and several expeditions were sent against them. From 1912–13 the territory known as the Abor hills formed part of the Sadiya frontier tract (from Sadiya, near the confluence of the rivers Lohit and Dibang with the Dihang) and was loosely administrated by the government of India. Eventually it was included in the North East Frontier Agency (*q.v.*). (L. D. S.)

SIBAWAYH, the nickname of ABU BISHR 'AMR IBN 'UTHMAS IBN QANBAR (*c.* 760–793), the most celebrated Arabic grammarian. He was a Persian client of an Arab tribe. and studied under Khalil (*q.v.*) in Basra. He wrote the first known full-scale Arabic grammar, called *al-Kitab fi'l nahwi,* on which all subsequent Arabic grammars were based. The book defines three parts of speech — noun. verb and particle — and explains *i'rab,* or accidence. as applied to noun. and verbs. Then the parts of speech and their use are dealt with in great detail. with supporting quotations from the Koran and from Arabic poetry.

Editions of the *Kitab* are by H. Derenbourg, *Le Livre de Sibawaihi* (1883); and by G. Jahn. with commentary and German trans.. 2 vol. (1895–1900).

See also G. L. Flügel, *Grammatische Schulen der Araber (1862)*; C. Brockelmann, *Geschichte der arabischen Litteratur,* vol. 1 (1898), suppl. vol. 1 (1937). (J. A. HD.)

SIBELIUS, JOMAN JULIUS (1865–1957), Finnish composer. known as Jean Sihelius. was born at Tavastehus on Dec. 8. 1865. He studied music under Martin Wegelius at Helsingfors 1885–89, under Albert Becker 1889–90 in Berlin. and under Robert Fuchs and Karl Goldmark in Vienna 1890–91. He showed imagination and power of expression and a respect for his art which never allowed him to abuse his profound technical powers for the display of mere virtuosity.

Sibelius' compositions include symphonic poems. seven symphonies. a violin concerto. a string quartet. *Voces Intimae, Valse*

Triste, Finlandia, orchestral works, incidental music to *Pélléas et Mélisande, As You Like It, The Tempest,* the pantomime. *Scaramouche,* numerous songs and miscellaneous pieces.

Sibelius died on Sept. 20, 1957, at Traeskaenda, near Helsinki.

ŠIBENIK, a port of Croatia, Yugoslavia, on the Adriatic sea (Ital. *Sebenico*). Pop. (1961) 26,253. Sibenik, full of Venetian Gothic and Renaissance architecture, is built on a steep hill, and is partly walled. On the seaward side are two forts, now dismantled, and the castle of St. Anna. There is a beautiful cruciform church built entirely of stone, even the wagon vaults over the nave, choir and transepts being unprotected by lead or tiles.

Electric power is supplied by the celebrated falls of Kerka. Industries include weaving: woolen mills, oil refining, the preparation of dyes. wine and honey. Fishing is also carried on.

Sibenik is said to have been founded by the Uskoks fleeing from Turkish oppression, who then took to piracy. Later the town became famous as a favourite residence of the Croatian kings. In 1117 it was captured by Venice, but held by Hungary from 1351 to 1412, when it again became Venetian. In 1647 it was unsuccessfully besieged by the Turks, and after the fall of Venice in 1797 it became French. From 1815 to 1918 it was Austrian, and in the latter year it was occupied by the Italians, before incorporation in Yugoslavia.

SIBERIA (Russian SIBIR), a conventional term used to describe the Asian part of Russia, excluding the Central Asian Turkic-populated lands. For the geography of Siberia *see* RUSSIA.

History. — The earliest-known inhabitants of Siberia were the Finno-Ugrian Nentsy (called Samoyeds by the Russians), Khanty (Ostyaks) and Mansi (Voguls). They came from the Mongolian plateau in the 3rd century B.C. To them must be assigned the remains dating from the Bronze period which are scattered over southern Siberia. Iron was unknown to them. but they were expert in bronze. silver and gold work. They also practised irrigation.

In the 5th century A.D. the Turkic peoples, Khakass (later known as Kirghiz) and Uigurs. were compelled to migrate northeastward from their homes. They subdued the Finno-Ugrians and established themselves on the upper Yenisei. They too left many traces of their sojourn. They were acquainted with iron and learned from their subjects the art of bronze-casting. which they used for decorative purposes and which they raised to a still higher artistic level. The Khakass empire lasted until the beginning of the 13th century when it was destroyed by the Mongols.

At the end of the 15th century Tatar fugitives from Turkistan subdued the loosely associated tribes of Mansi and Khanty inhabiting the lowlands to the east of the Crals and founded a Siberian khanate with its capital at Kashlyk (or Sibir) on the Irtysh river, near its junction with the left-bank tributary, the Tobol. At the same time Muscovy was expanding eastward and northeastward and at the beginning of the 16th century it extended to the estuary of the Ob river. an area populated by the Nentsy. This extension brought the Russians and the Tatars into collision. In 1555 the Siberian khan Yadiger sent envoys to Moscow and consented to pay yearly *yasak,* or tribute, of 1,000 sables. Three years later Ivan the Terrible authorized Grigory Stroganov to establish a settlement on the upper Kama river. In 1 j68 Yakov Stroganov was allowed to extend Russian colonization along the Chusovaya river, a left-bank tributary of the Kama. Many adventurers were escaping to the Stroganov frontier settlements and tradition has it that in order to get rid of their embarrassing guests the Stroganovs hired a Cossack ataman, Yermak Timofeyevich, and suggested to him that he should recruit a small army and, following the Chusovaya valley. cross the Urals and conquer new lands for the tsar. They promised to help with supplies of food and arms. Termak started with a band of 840 men in Sept. 1581. The following year. progressing along the Taghil, Tura and Tobol rivers, he successfully laid siege to the residence of Khan Kuchum at Sibir, on the Irtysh. 12 mi. southeast of what is now Tobolsk. Kuchum fled southward to the steppe while Yermak on Oct. 26, 1582, entered Sibir.

In 1584 Yermak was drowned in the Irtysh while fighting Kuchum's counter-oiieasive. After the death of their leader, the Russians abandoned the country they called Siberia. New bands of hunters and adventurers. however, thronged across the Urals every year and were supported by Moscow. The fort of Tyumen was founded on the Tura river in 1585, that of Tobolsk in 1587, Tara on the Irtysh in 1594, Narym on the Ob river in 1596 and Tomsk on a right-bank tributary of the Ob in 1604. At the beginning of the 17th century Russian expansion reached the Yenisei river east of which lived the Tunguses (Evenki), nomadic hunters related to Manchus and scattered between the Yenisei and Lena rivers. They were subdued and by 1628 the Russians reached the middle Lena, an area occupied by the Yakuts, a Turkic tribe with Mongolian elements. The fort of Yeniseisk was founded in 1618, that of Krasnoyarsk in 1628. Kirensk on the upper Lena in 1630 and Yakutsk on the middle Lena in 1632. The Sea of Okhotsk was reached in 1639, 57 years after the conquest of Sibir by Yermak. Such rapid progress toward the Pacific is explained by the fact that the Russians advanced across sparsely populated areas and that they moved generally in boats along the rivers across the Siberian *taiga* (dense coniferous forest without shrub).

The area west and east of Lake Baikal, populated by the Buryats (Mongols), who offered some opposition, was subjugated in 1641–52. Vasily Poyarkov's expedition (1643–46) descended from Yakutsk to the Amur, returning to its point of departure by the Sea of Okhotsk and the Aldan river, a right-bank tributary of the Lena. In 1648–49 Semen Dezhnev, leaving the estuary of the Kolyma river, sailed around the Chukotsky peninsula, the homeland of the Chukchi. discovered the strait named So years later by Vitus Bering (*q.v.*), and landed at the estuary of the Anadyr river. In 1651–53 Yerofey Khabarov occupied the banks of the Amur river and the so-called Daur land lying to the north of it: but according to the Russo-Chinese treaty of Nerchinsk (1689) Russia had to retreat from there. Only in 1858 did Count N. N. Muraviev-Amursky, governor-general of eastern Siberia. conclude a treaty with the local Chinese authorities at Aigun fixing the Russo-Chinese frontier along the Xmur and its right-bank tributary, the Gssuri. Two years later this was recognized by Peking.

Vlndivostok, a port which with the help of ice-breakers is open to navigation all the year round, was founded in 1860. Started from Chelyabinsk in 1891, the construction of the trans-Siberian railway played a decisive part in the economic development of the country. By 1895 Omsk was linked with the Russian railway system and three years later the rail was extended to Irkutsk. By 1894 the Vladivostok-Khabarovsk line was built. In 1897 Vladivostok was linked with Chita via Manchuria, but the 4,498-mi. trans-Siberian railway was completed only in 1917.

Administration and Population. — In 1803 the whole of Siberia was organized as a single *guberniya* with a governor-general residing at Irkutsk. Count Mikhail Speransky (*q.v.*), governor-general in 1819–21, drew up a comprehensive scheme of administration and policy for the huge province and one of his acts, fixing relations between the Russian government and the *inorodtsy*, or native populations, was in force until 1917. It aimed at maintaining the patriarchal system among subjugated nationalities.

In 1824 the population of Siberia was estimated at 1,698,000 and in 1851 at 2,681,000. The Siberian *guberniya* was subsequently divided into smaller but still large administrative units. In 1897, at the time of the first Russian census. Siberia n-as composed of four *guberniyas* (Tobolsk, Tomsk. Yeniseisk and Irkutsk) and five territories or *oblasts* (Transbaikal, Yakut, Amur. Primorski or Maritime and the island of Sakhalin). Together these nine administrative units covered 4,795,900 sq.mi. and had in 1897 a total population of 5,758,800.

This did not, however, represent the total population of Siberia, because about half of the Perm *guberniya,* with Ekaterinburg (now Sverdlovsk), and about a third of the former Orenburg (now Chkalov) *guberniya* with Chelyabinsk lie east of the Urals. If the Ekaterinburg-Chelyabinsk region is added, Siberia covers an area of about 4,858,800 sq.mi. which in 1897 had a total population of 7,788,000.

After the 1917 revolution the Soviet government continued to subdivide Siberia into provinces called *oblasts* and into territories (*krai*). By 1956 there were 12 oblasts (Kurgan, Tyumen, Omsk, Tomsk. Novosibirsk, Kemerovo, Irkusk. Chita, Magadan, Amur, Kamchatka and Sakhalin) and 4 krais (Altai, Krasnoyarsk, Khabarovsk and Primorski).

The areas inhabited by non-Russian peoples were organized into two autonomous Soviet Socialist Republics namely Buriat-Mongol and Yakutsk; four autonomous *oblasts* namely Gorno-Altai, Khakass. Tuva and Yevrey (formerly the Jewish autonomous *oblast*); and eight national okrugs namely Taimir, Evenki, Khanti-Mansi, Yamalo-Nenets, Chukot, Koryak, Ust-Orda and Aginsk, the last two named inhabited by Buriat-Mongols.

All Siberia lies within the Russian Soviet Federated Socialist Republic and by the 1926 census it had 14.747.000 inhabitants. A 1956 estimate placed the population at 22.701.000 and the 193'9 census showed the population to number 24.797.000. The area of Siberia as constituted by the above listed political units is 4,956,-868 sq.mi. with an average density of 5 per square mile, but the population is concentrated mainly in the southern fringe of the region. In the late 1950s the Soviet government inaugurated a program of development of the virgin. and sometimes marginal; land of the region. creating a movement of people into the area.

From the reign of Peter the Great, Siberia was used by the government for the deportation of political convicts and ordinary criminals sentenced by the tribunals to forced labour (*katorga*). It was also used for the administrative deportation (*ssylka*) of persons considered by the minister of the interior dangerous to public order. Both practices continued until World War I, and both were meant to supplement the policy of organized emigration. But the percentage of deportees as opposed to migrants was small.

This policy changed when the Soviet government launched in 1928 its first five-year plan. Siberia's resources of coal, ores and timber were often situated in uninhabited places far away from all means of transport.

The Soviet government found the way to dispose of political opponents; supply cheap manpower for transport and industrial projects and forestry undertakings and populate vast empty areas, even beyond the Xrctic circle. Russian and Ukrainian peasants resisting collectivization in the early 1930s were the first to be deported there; after 1939 they were joined by the Polish. Estonian, Latvian, Lithuanian! Ukrainian and Rumanian intelligentsia from the annexed territories.

From 1934 there existed a *Glavnoye Upravlenye Lagherey* (main administration of labour camps, or GULAG). Estimates of the number of inmates in these "corrective labour camps" by 1947 varied between 5,000,000 and 12,000.000, at least half of them being in Siberia.

SIBERIAN AREA, a former administrative unit of Asiatic Russia, with an area of 1,555,448 sq.mi. The Arctic ocean. from Gyda bay to Khatanga bay forms its northern, and Mongolia and the Kazakh S.S.R. its southern boundary. To the west lies the Uralsk Area, and to the east the Yakutsk and Buriat-Mongol republics.

The area coincides roughly with the former Yeniseisk. Tomsk and Irkutsk *guberniya* of Imperial Russia. The name Siberia (Sibir) n-as the Russian name given to the chief settlement. Isker on the Irtysh, of the Tatar Khan Kuchum, and was subsequently extended to include the whole of the Russian dominions in Asia.

After the 1917 revolution various republics and areas, each having a good deal of local autonomy were separated off and now the name Siberia is limited to the central region which was not thus split off. Much of it consists of the basin of the Yenisei river (*q.v.*). Stretching from the Sayan alpine regions in the south (lat. 51° 45' K.) to Cape Chelyuskin in the north (77° 38' N.), it displays much orographical variety. The West Sayan mountains have their southern base on the plateau, and their northern at a much lower level, and reach heights of 10,000 feet. Around and north-east of Lake Baikal well-marked ridges fringe the plateau, with steep north-western slopes turned toward the valleys (*e.g.,* the beautiful and fertile valley of the Irkut river between the Tunka Alps and the Sayan).

An Alpine region, 100 to 150 mi. in breadth, fringes the plateau to the north-west. and is called in east Siberia the taiga: it consists of separate chains of mountains (4,800 to 6,500 ft.) clothed with dense forest, except on the highest parts, and having narrow marshy valleys, thickly strewn with boulders, *e.g.,* the Altai in the west, the Kuznetskiy Ala-tau, the Us and Oya mountains in West Sayan, the Nizhne-Udinsk taiga, and several chains pierced by the Oka river. North of these alpine regions is the broad belt of fertile black-earth high plains (1,200 to 1,700 ft.) stretching from Tomsk eastwards, and from Kansk penetrating in a great arc south-eastwards to Irkutsk.

North of the town of Yeniseisk, and east of the Yenisei river is a broad belt of Alpine tracts of Archaean origin reaching their greatest elevation in the Yeniseisk taiga. between the Angara (Upper Tunguska) and the Middle or Stony Tunguska. North of this region begins the slope towards the Arctic plains. interrupted by the north-west to south-east ranges of the Upper Inbatsk district and the Syverma, beyond which lie the bleak tundra plains. The Taimyr peninsula is strictly the name of the northward projection from Taimyr bay on the west to Khatanga gulf on the east. but it is often applied to the whole district between the Yenisei gulf and the Khatanga gulf. The northern coast and the islands off it are not yet accurately known; the Russian explorer Vilkitski, in 1913–14. discovered the islands named after him. lying south of the Nordenskjöld archipelago. East of Cape Chelyuskin good harbours are scarce. A rolling treeless tundra plain (100 to 150 ft.) covers Taimyr except for the Byrranga mountains (1.600 to 1.900 ft.) and. though comparatively well drained. is difficult to cross except in winter: erratic blocks are widely distributed. Polar bears and seals are found in summer, and in that season Samoyede reindeer breeders migrate to Taimyr Land with their herds, avoiding the Taimyr gulf region, which is deficient in reindeer "moss."

Ethnology.— The majority of the population in the Siberian Area is Russian. but there are still survivals of earlier immigrants. Of the Palaeo-Siberians. the most interesting are the Yenisei Ostyaks living along the Yenisei and its tributaries from Yeniseisk to the Lower Tunguska. and most numerous about Sumarokovo, near the confluence of the Stony Tunguska. They are probably a remnant of the primitive aborigines of Siberia, and their race and language are unrelated to any other. They are in no way connected with the Ostyaks of the Ob basin. and are not Mongolian in appearance. They are fairer than the other Yenisei races and sometimes have long, oval faces and fine hair. They call themselves Tindigyet, Kanacket or Din (people), and live in birch bark tents and use hollowed trees for boats. They are a hunting and fishing people, apparently from the Tom basin.

Of the Neo-Siberians, the Samoyedes are the most widespread They have migrated from the Altai. driven north by the Turco-Tatars in the 5th century A D and may be the descendants of the people nhose civilization can be traced in the Cpper Yenisei. They are closely related to the Finno-Ugrians and Samoyede may be a corruption of *Suomi*, the name the Finns give to their native land The three chief branches in the Siberian Area are the Tavgi reindeer nomads of the Taimyr region. the hunting Ostyak Samoyedes between the taiga and the tundra, and the fishing and hunting Samoyedes along the banks of the Yenisei They are meso- to brachycephalic. have straight black hair, sallon skin, narrow oblique eyes and broad flat faces and noses They are short. stout and muscular. Related to them are the Beltirs of the Abakansk steppe, the Kaibals of the Upper Yenisei. the

Kamassins of Kainsk, the Karagasses, Motors, and Soyots of the Sayan district. These southern peoples are being absorbed; they frequently speak Tatar and have become settled cultivators or herdsmen. Of the Tatars, the chief branches are those of the Baraba steppe and the Chulim river, who are gradually becoming Russianized, the Altai Tatars, including the Teleuts or Telengites of the Kuznetsk district, the Chern or Black Forest Tatars of the Biya river, and the Tatars of the Abakansk steppe. The Tatars of the Altai mountains are successful cattle and horse breeders, and have large flocks of sheep and goats. There are some Tungusic tribes between the Lower and Middle Tunguska, the best known being the Chapogir. Their original home was Manchuria and they are of the Ural-Altaic group to which the Manchus belong, and are nomad reindeer breeders. The Russian population is mainly settled in the rich agricultural belt through which the trans-Siberian railway passes.

Agriculture and Stock Raising.—Cultivation is densest round Omsk, especially to the south, and in the region to the south of the railway from Lake Chany eastwards to Tomsk. Eastward from that region there are scattered patches along the railway, and along the courses of the Upper Yenisei and its tributaries, especially in the Abakan and Tuba valleys. From Irkutsk a belt of cultivation extends along the Angara and its tributaries as far north as lat. 55° N. The chief crops are wheat, rye, barley, potatoes, flax, hemp, sunflower seed, beans and grasses. In the Minusinsk district beet is successfully grown and there are beet sugar factories; water melons also thrive. In Irkutsk rye is the predominant crop. The sandy black soils of the Kainsk and Mariinsk districts near Tomsk, and of the Altai favour wheat production, as does the black earth of the Baraba steppe, and wheat in these districts forms 50 to 75% of the harvest. The brown, less fertile soils of Tomsk are favourable to barley and spring rye. Winter rye and oats flourish east of Tomsk. The long winter and slight snowfall everywhere make spring corn a better crop than winter corn, and fruit growing is rarely successful. Makhorka tobacco is grown along the Irtysh, south of Omsk, and supplies the Omsk tobacco factory.

Of wild produce, the cones of the *Pinus* Cembra of the northern Tomsk *oblast* and Mari A S.S.R. and of the mountain regions of Bisk and Kuznetsk find a ready market in the oil-pressing factories of Tomsk, bilberries. cranberries and dried mushrooms are also exported. The introduction of agricultural machinery and of fertilizers is improving the harvest. Novosibirsk and Omsk are the chief centres of distribution, and there is a machine-testing station at Novosibirsk. Grain elevators are increasingly common. Most grain is exported unmilled, but Tomsk, Bisk, Barnaul and Novosibirsk have extensive milling industries. Freightage costs militate against the export of Siberian grain. Dairying is the most productive occupation, though only introduced in 1893. There are technical dairy schools at Omsk, Kainsk, Barnaul and Zmyeinogorsk, in addition to a central laboratory at Tomsk and other small local laboratories. The reasons for its success are its small bulk which lessens transport difficulty, and the fact that Siberian milk contains a high proportion of fat owing to the rich pasture; the average yield is 1 lb. of butter to 20.05 lb. milk as against 1 lb. to 28 lb. in Denmark. Ice trucks for butter leave Novosibirsk several times a week during the summer and collect from the various butter transit centres en route. Siberian cheese is increasingly finding its way on to the market. East of Krasnoyarsk dairy farming is of little importance; the cattle are few in number, small and yield little milk.

Horses and working cattle are raised, especially in the west, for local use; the Kuznetsk breed is famous, but the number of horses fell after World War I. The stock-raising districts of Minusinsk, Achinsk and Turukhansk recovered more rapidly. Sheep-breeding, especially of the newly introduced merino sheep, is rapidly developing on the Yenisei plains, where the hay is excellent.

Pig-breeding has developed with the increasing dairy industry, which provides buttermilk as pig food, and bacon and sausage factories are springing up. Reindeer are valuable in the Turukhansk district, while in the southern hill regions the *maral*, a kind of wapiti, is bred in farms for the sake of its horns, which are in demand in China for the preparation of a drug called panty. Bee-keeping is of very ancient origin, and is profitable in the Achinsk, Minusinsk, Kuznetsk, Bisk and Zmyeinogorsk districts; the destruction of the forests and the desiccation of the steppe have diminished it elsewhere. In spite of the vast forest wealth of the region the timber industry is little developed, mainly owing to the lack of transport facilities; the Tomsk district is markedly deficient in timber and receives some of its timber from camel transport across the Kirghiz steppe. If the Yenisei sea-route comes into regular use, a timber export may spring up on that river. There are timber mills at Omsk, Novosibirsk and Tomsk; those at Novosibirsk use the wood from the district between Barnaul and the railway, but these mills supply local needs only, as do the mills at Irkutsk.

Mining.—The mineral wealth of the region is great, but little worked at present. Rich deposits of magnetic iron ore exist on the Telbes, a tributary of the Kondoma near Kuznetsk, with beds of good coking coal 20 mi. away. Gold exists in quantity, but is hampered by lack of proper dredging apparatus. The Mariinsk taiga gold mines are prosperous, and the first dredger in west Siberia was established here, but the Altai placer mining is declining. The Bogom-Darovanni reef gold mine near the Abakan river is up-to-date and flourishing. The Yenisei gold areas, one in the region between the Pit and the Angara rivers, and one in the upper basins of the Teya and Kalami, tributaries of the Stony Tunguska, are less fully developed in the absence of roads. They are, however, able to get food from the rich Minusinsk district and do not suffer from the danger of starvation, as do some mines in Yakutsk.

The Bodaibo district on the Vitim river lies within the Siberian Area and produces 25% of all the gold in U.S.S.R. The gold is alluvial and 13 tons can be produced per annum; transport is a difficulty, since necessaries have to be brought from Irkutsk, but a light railway to the Vitim river somewhat lessened the costs. There is an assaying and gold-smelting laboratory at Bodaibo. Silver is produced in quantity in the Altai region, and platinum from Verkhoture in the Tara river district. Platinum occurs with the gold in the Pitski Mountains and in the Vitim district. Asbestos is worked in the Angara district and from the dolomite veins of the left bank of the Kamishta, a tributary of the Abakan. It is reported from other places in the Altai. Graphite of good quality exists near Turukhansk on the Yenisei and on the Lower Tunguska, but is little exploited.

Mica is spasmodically worked in the Krasnoyarsk district.

There are antimony mines in the Yeniseisk district and in Minusinsk also, while radium has been found on the Ayakhta, a tributary of the Pit, and osmiridium is known in the Nizhne-Udinsk district. Coal is mined in the Kuznetsk beds which extend from Sudžhenka on the railway to 40 mi. S. of Kuznetsk and the output consists mainly of coking or semianthracite coal used on the railway. The hlinusinsk region and Dudinsk on the Lower Yenisei have rich deposits. Copper exists in the Rlinusinsk district, and near Plan Ude (formerly Verkhne-Udinsk).

Salt is obtained from salt lakes in the Baraba steppe; from Lake Abakanskoe, which produces about 7,500 tons per annum; and from Ussolye near Irkutsk where the annual output is about 10,000 tons. Glauber's salt (sulphate of sodium) is found in the lakes of the Baraba steppe. Hot mineral springs exist near Bisk. Lime, building-stone and clays are abundant, and the Irkutsk district produces kaolin and white clay for porcelain. The jasper and porphyry of the Altai region are famous. The above is an indication only of the great mineral wealth of the Siberian Area; much of the region is as yet unsurveyed and of the mineral wealth reported, little is worked. Increasing colonization and consequent improvement of transport may lead to a great development of mining.

Industries and Communications.—Factories are springing up in the larger towns, the chief occupations being distilling, brewing, tanning, soap- and tallow-making, flour-milling, saw-milling, weaving, oil-milling, glass-making, brick- and cement-making and pottery. There are printing works at Omsk, Tomsk and

Irkutsk, and the latter town has cigarette-case factories, steam sausage and pearl-barley factories. Rope-making is usually a koustar (peasant) industry, but Barnaul and Minusinsk have rope factories. The most famous glass factory is that 28 mi. from Krasnoyarsk, established in 1840. Of timber industries, apart from saw-milling, Minusinsk has boat-building, and Omsk, Tomsk and Irkutsk, carriage-building; Omsk also manufactures railway sleepers. At Tomsk and Bisk are match factories. In the western districts *koustar* industries carried on in the peasants' cottages are common; they are less so in the east. The most noted of these are the smiths and joiners of Kuznetsk and Tomsk, the making of metal pots for milk and *barnaulkas,* or skin coats of the Barnaul district, the cedar-nut oil of Bisk, the pottery of Yeniseisk, the boot-making of the Irkutsk district. Woodwork, the dressing of sheepskin and wool products, weaving and metal work are widespread peasant industries in the Yenisei basin and the Irkutsk district.

The Yenisei and its tributaries form the main avenue of communication north of the trans-Siberian railway, but rivers and roads alike are impassable during spring and autumn. The great military road or *Trakt* of Siberia passes through the south from Omsk via Tomsk and Krasnoyarsk to Irkutsk, and traffic along it is by post horse in summer and sledge in winter. Even this road is difficult and in places impassable in spring and autumn. In many places there are no bridges and ferries are used. The effect of the building of the railway in 1891–1905 in these conditions was marked and immediate; villages became towns with large populations in a few years, colonization and settlement near the railway increased, and the possibilities of export produced remarkable developments, *e* g., the dairy industry. In 1915 a branch from Novosibirsk to Barnaul and Semipalatinsk was opened, with a branch line to Bisk and this line was later prolonged to link up with the Turkestan and Chkalov-Tashkent railways. The effect on the development of Siberian products, especially grain and coal, should be marked. and settlement further increased. Other branch lines link Tatarskaya, 105 mi. E. of Omsk, with Slavgorod and the Kulundinsk steppes, practically uninhabited in 1907. but rapidly settled during 1907–12, Taiga with Kuznetsk, and Achinsk with Minusinsk. No branch lines go northward except a short one to Tomsk.

Colonization.—The administrative centre was Novosibirsk (*q.v.*), and other towns are Barnaul. Irkutsk, Krasnoyarsk, Omsk and Tomsk (*qq.v.*), with populations from 249.000 to 579,000. Bisk has a population of 146,000 and Minusinsk of over 20,000. It will be noted that all these towns are on the railway.

Colonization did not begin to any extent, in the west, until the 18th century. when forts were constructed from Omsk southeastwards along the Irtysh to protect the settlers from Kirghiz raids. Criminal, political and religious exiles were banished to Siberia up to 1900; the first mention of such exile is in 1648. In 1904 exile for political offenses was again restored. Between 1823 and 1898. 700,000 exiles, with 216,000 voluntary followers, passed through Tobolsk.

Of the religious exiles the raskolnik (Old Believers), or dissenters from the ecclesiastical changes introduced by the Patriarch Nikon in the second half of the 17th century, and from the changes introduced by Peter the Great, formed a valuable element among the colonists, being ascetic, industrious and abstemious. Some colonists were peasants ordered to settle at certain places so as to maintain road communication. But the largest element and the most important was the voluntary immigrants. who are still pushing eastwards in great numbers and gradually bringing all the fertile regions of the south of the Siberian Area under cultivation.

Between 1896 and 1909 over a million immigrants settled in the Altai region and few returned. Of those settling east of the Yenisei and in the Irkutsk district, many found the climatic conditions impossible and returned westwards. Education varies with accessibility. The large towns on the railways have schools and technical institutions, but the more remote settlements and the nomads present a difficult problem and among them the illiteracy rate is high. (R. M. F.)

SIBI, a town and district in the Quetta division of West Pakistan. The town is near the south end of the Bolan pass. 73 mi. S.E. of Quetta, at the junction of the main Sukkur-Jacobabad-Quetta railway with the Harnai line. Pop. (1951) 11.832.

SIBI DISTRICT consists of: (1) areas of Baluchistan assigned to the British by the treaty of Gandamak, 1879, with the Afghans; (2) small areas formerly under lease from Kalat; (3) Bolan pass subdivision. separate till 1950; (4) the Mari and Bugti tribal country; and (5) Lahri tehsil, transferred from Kalat in 1955. Total area 11.864 sq.mi.; pop. (1951 census) 208.971.

SIBIU (Ger. HERMANNSTADT, Hung. NAGYSZEBEN), a town of Rumania. in the region of Stalin. Pop. (1956) 90.475. of which Germans and Rumanians form the majority, with a Magyar minority.

Sibiu is beautifully situated in the fertile valley of the Sibiu! surrounded by mountains. An old Saxon colony, it still retains a medieval Germanic appearance. The Gothic Protestant church, begun in the 14th century and finished in 1520. contains a beautiful font (1438) and a mural painting of the Crucifixion by Johannes von Rosenau (1445). The "new church," a 15th century addition, comprising the western part of the building. contains many beautiful monuments of Saxon notables. The fine 15th century town hall contains the archives of the Saxon nation. Sibiu is the seat of an Orthodox archbishopric and of the superintendent of the Transylvanian Protestants.

It contains a good museum. an Orthodox seminary, a law academy, several secondary schools and manufactures of cloth. linen, leather, caps, boots, soaps, candles, ropes and breweries and distilleries.

Sibiu was a Roman colony (Libinium) refounded by colonists from Nürnberg in the 12th century. Its history is bound up with that of the Saxon communities in Transylvania (*q.v.*).

SIBLEY, HIRAM (1807–1888), a founder and second president of the Western Union Telegraph company, was born at North Adams. Mass., Feb. 6, 1807. When he was 16 his family moved to western New York where he later operated a foundry and machine shop and w s in 1843 elected sheriff of Monroe county.

Visiting Washington, D.C., Sibley met Samuel F. B. Morse, the telegraph inventor, and helped obtain congressional backing for construction of the first telegraph line in 1844. Recognizing the need for a national telegraph system, Sibley and other Rochester, N.Y., citizens in 1851, formed the New York and Mississippi Valley Printing Telegraph company, which bought 11 small lines north of the Ohio river. In 1856 the company was renamed The Western Union Telegraph company.

Sibley became president of Western Union later that year. Under his leadership, the first transcontinental telegraph line was built in 1861, to help hold the western states in the Union in the Civil War and to develop the west.

Sibley began building a line to Europe via Russian America, the Bering strait and Siberia in 1865. When he was in St. Petersburg, negotiating to buy right-of-way, the tsar's nephew offered to sell what is now Alaska to Western Union. Sibley refused, but launched a campaign to persuade the United States to buy it, which was done in 1867. The expedition was abandoned when the first permanently successful transatlantic cable was laid in 1866, but it had mapped and reported Alaska's vast resources.

Sibley retired as president of Western Cnion in 1865 and became a builder of railroads in the middle west and south and owner of vast farm holdings. Part of his fortune was used to establish the Sibley College of Mechanic Arts Engineering (later Mechanical Engineering) at Cornell university. of which with Ezra Cornell (*q.v.*) he was one of the incorporators. He died in Rochester on July 12, 1888. (G. P. O.)

SIBONGA, a municipality of the province and island of Cebu, Republic of the Philippines, on the east coast 30 mi. S.W of Cebu, provincial capital. Pop. (1959 est.) 23,588. It is a port for the coasting trade and is connected by rail with Cebu. The chief agricultural products are maize (corn) and tobacco. Cebuano is the vernacular.

SIBSAGAR, a town and district in Assam, India. The town is on the Dikhu river, 8 mi. from the Brahmaputra, and connected by rail with Nazira, 12 mi. S.E. on the main Assam line of the North-Eastern railway. It is situated round a small lake. Pop. (1951) 10.622. Sibsagar college is connected with the University of Gauhati.

SIBSAGAR DISTRICT has an area of 3,454 sq.mi.; pop. (1951) 1,212,224. It consists of a level plain, much overgrown with grass and jungle, and intersected by numerous tributaries of the Brahmaputra. Reserved forests extend over 1,100 sq.mi. Sibsagar is the chief centre of tea cultivation in the Brahmaputra valley. There are also several timber mills.

SIBYLLA, a proper name, afterward used as a common noun (as we say. "a Daniel"); the derivation and meaning are unknown but certainly are not Greek; they are possibly Semitic. In the disturbed period preceding the development of the full classical culture, *i.e.*, about 800–600 B.C., religious movements of all sorts were common in Greece and Asia Minor, and especially, inspired prophets were numerous. Of these one of the most famous was Sibylla of Marpessus, a village near Troy, also claimed as a native of Erythrae; of her Heracleitus says (Frag. 12. Bywater) that "with her maddened mouth . . . she reaches a thousand years with her voice by the power of the god," *i.e.*, Apollo, by whom this real or imaginary person was thought to be inspired. Numerous prophecies. generally in hexameter verse, the usual metre of Apolline oracles, were attributed to her, and her great popularity led ultimately to her multiplication, numerous places claiming, from about the 4th century on, to be her native city, or to have been visited by her, or to be the birthplace of another Sibyl of like inspiration. Varro (*ap.* Lactantius, *divin. instit.* i, 6) gives a list of ten, which includes the famous Cumaean Sibyl, often identified with the Erythraean.

She was supposed to be the authoress of the Sibylline oracles, which were kept in the temple of *Iuppiter Capitolinus* at Rome under the care of the *quindecimviri*, and consulted in emergencies by order of the senate. Apollo loved her and granted her the gift of prophecy, and also a life of as many years as she had grains of dust in her hand; but she forgot to ask for youth, and so gradually withered away almost to nothing. It was presumably she who offered Tarquinius Superbus nine books of prophecies, and, on his declining to pay the price asked. burned first three and then three more, finally selling the remainder for the sum she originally demanded for all. (Ovid. *Metam.*, xiv, 130 et seq.; Dionysius Hal. iv, 62). Of the official collection supposed thus to have originated, one or two fragments still survive (see Diels, *Sibyllinische* Blatter).

Finally. Jewish and Christian apologists discovered a Judaean or Babylonian Sibyl, to whom were attributed the numerous prophecies, still extant, containing Judaeo-Christian propaganda.

SIBYLLINE ORACLES, a collection of Apocalyptic writings. composed in imitation of the heathen Sibylline books by the Jews and. at a later date. by the Christians in their efforts to win the heathen world to their faith. The fact that they copied the form in which the heathen revelations were conveyed (Greek hexameter verses) and the Homeric language is evidence of a degree of external Hellenization, which is an important fact in the history of postexile Judaism.

Book III contains Jewish oracles relative to the Golden Age established by Roman supremacy in the east about the middle of the 2nd century B.C. (especially 175–181: cf. I Macc. viii. 1–16). The evacuation of Egypt by Antiochus Epiphanes at the bidding of the Roman ambassadors suits the warning addressed to "Greece" (lines 732–740) against overweening ambition and any attempt upon the Holy City, which is somewhat strangely enforced by the famous Greek oracle, "Let Camarina be, 'tis best unstirred." Older than these are the Babylonian oracle (97–154) and the Persian (381–387). A later Jewish oracle (46–62) refers to the wars of the second Triumvirate of Rome, and the whole compilation seems to come from a Christian redactor.

Book IV is a definite attack upon the heathen Sibyl (the Jews and Christians did not attempt to pass off their "forgeries" as genuine) as the mouthpiece of Apollo by a Jew who speaks for the Great God and yet uses a Greek review (49–114) of ancient history from the Assyrian empire. There are references to the legendary escape of Nero to Parthia (119–124) and the destruction of Jerusalem in A.D. 70 (130–136).

Book V contains a more developed form of the myth of *Nero redivivus* in which a panegyric on him (137–141) has been brought up to date by some Jew or Christian. and eulogies of Hadrian and his successors (48–51) side by side with the legend of the miserable death of Titus in quittance of his destruction of Jerusalem (411–413) which probably represents the hope of the zealots who survived it. The remaining books appear to be Christian (some heretical) and to belong to the 2nd and 3rd centuries.

Bate in the S.P.C.K. *Translations of Early Documents* (1918); Schiirer, *Geschichte des jüdischen Volkes*, iii, 555–592, who gives full bibliography. (J. H. A. H.; W. O. E. O.)

SICANI, in English SICANS, the ancient inhabitants of western Sicily. Sikania, as the Greeks called the island, is mentioned in the Odyssey (xxiv, 307). The name appears to be a doublet of *Sicilia* (Greek *Sikelia*, from *Sikeloi*, Siculi or Sicels), and archaeologically there is no substantial difference between Sicans and Sicels in historical times; but ancient authorities distinguish the two peoples and assign a different origin to them. The Sicans were driven by the invading Sicels, c. 1000 B.C.. into the western and southern parts of the island (Thucydides, vi, 2). The Greek colonists of Gela and Acragas on the south coast had to fight Sican wars; the people of this part of the interior retained more cultural independence of the Greeks than the Siculi of eastern Sicily did. In the Roman period no distinction is drawn between Sicans and other inhabitants of Sicily. (T. J. DN.)

SICILY, in Italian SICILIA, the largest island (9,925 sq.mi.) in the Mediterranean, is separated from continental Italy by the Straits of Messina, which at their narrowest point are less than 2 mi. wide; it lies almost in the centre of the Mediterranean, and the Straits of Sicily between the island and Cape Bon in Tunisia are shallow and only about 90 mi. wide. Geographically and administratively Sicily includes the groups of small islands off its coasts—the Aeolian or Lipari Islands, Ustica, the Aegadean Islands, Pantelleria and the Pelagean Islands—the administrative region so constituted being the largest in Italy.

PHYSIOGRAPHY

Sicily may be roughly described as a plateau with a northern edge ranging from 3,000 to 6,000 ft. in height, which drops abruptly to the sea on the north and slopes gradually to the south and southwest to heights of about 1,000 ft. near the south coast. Two-thirds of the island are more than goo ft. above sea level and only 15% is below 330 ft. The only real plain is that of Catania on the east coast between Etna and the Iblei mountains; it is an alluvial plain intersected by rivers and irrigation channels, much of it intensively cultivated with vineyards and groves of citrus fruit.

The most distinctive feature of Sicily is the active volcano of Etna (10,705 ft.), composed like Vesuvius of layers of lava and ash. It forms a distinct region cut off from the other hills and mountains by the Simeto and Alcantara rivers and contains three clearly marked zones of widely different climate and vegetation. The lowest zone, up to 4,000 ft., is very fertile, well watered by springs and closely cultivated. and is one of the most densely populated areas in Sicily. In this zone the southern and eastern slopes are covered with vineyards and citrus groves, which grow up to 1,500 ft.. while the northern and western slopes mainly produce olives and cereals. The second zone, lying between 4.000 and 6,000 ft., is known as the forest zone; it was once covered with oak, chestnut, birch and, in the higher parts, pine; but there is little forest left, except on the less accessible northwestern slopes, and there is little water and very few houses. Between 6,000 and 9,000 ft. there is thorny mountain scrub, and above 9,000 ft. only ash and lava and only one building, the observatory (9,670 ft.).

North of Etna is the long northern ridge of Sicily formed by the Peloritani, Nebrodi and Madonie mountains. which constitute a barrier 100 mi. long from east to west crossed by high road passes and by only one railway line. The lower Monti Erei, flat-topped hills with steep sides, which run in a southeasterly direction from Gangi down to Caltagirone, form the watershed between the Ionian sea and the Straits of Sicily. There are crossings at either end of the Erei, but only one gap in the range, the deep valley just north of Enna. Through this gap goes the main road from Catania to Palermo and the only inland east-west railway.

In western Sicily, between the hills where they run out into the sea, there are small coastal plains and terraces; by far the most famous of these is the Conca d'Oro behind Palermo, closely cultivated with fruit trees and ground crops beneath them. The coastal plain from Trapani south to Marsala and thence east to Sciacca is about 5 mi. wide with a low plateau behind it; both plain and plateau are covered with vineyards, which produce Marsala wine.

Climate. — Sicily is warm both in winter and summer. Near the coast the mean January temperatures are more than 50° F. and even inland more than 40°. In summer the temperature rises considerably: near sea level the mean temperatures are 75° to 79° F. with extremes of 100°. The effects of the heat are accentuated by the low rainfall. The rainy season is confined to the late autumn and winter; the total rainfall on the north and south coasts and in much of the interior is less than 25 in., in the extreme south only 15 in. The result of this low rainfall, combined with deforestation and failure to systematize the mountain torrents, is that most of Sicily suffers from severe lack of water. The frequency of the dry type of sirocco is a scourge of the island; it is oppressive to everyone and can be dangerous to young children.

Vegetation. — The only natural vegetation left in Sicily occurs in the scanty remains of forest, in the hill pastures and on the coast. Forests now cover only about 3½% of the island, the largest areas being on the northern slopes of the northern highlands, particularly those of the Nebrodi, where oak and beech and *macchia* are found; the Madonie, where there are evergreen and deciduous oaks, holly and beech; the northern slopes of Rocca Busambra round the upper part of Etna, chiefly covered with oak; and the basin of the Acate river in the southeast. The lower limits of the deciduous forest trees are high: for oak 2,000 ft., for chestnut 1,600 ft., while beech is only common above 4,000 ft. There is *macchia* on the dry hill slopes containing, in the southeast and southwest, dwarf palms. Papyrus grows along the low-lying banks of the rivers Anapo and Ciane near Syracuse, and the reed grass Arundo *donax* is used for vine stakes. (M. M. C.)

ARCHAEOLOGY

The pre-Hellenic inhabitants of Sicily, are called by classical authors Sicani or Siculi, and it is convenient to retain these two names for designating those early cultures which have been revealed in the course of years since Paolo Orsi began investigation in 1889. The term Sicanian is applied to that period of the Stone Age which followed the palaeolithic period exemplified in the remarkable rock engravings of the cave near Palermo (first published in 1953); the term Siculan is applied to the Chalcolithic, to the Bronze and to the Iron Ages, the first Siculan period being Chalcolithic, the second being Bronze Age, the third, from 900 to 700 B.C., being Iron Age and the fourth from c. 700 B.C., being the period when the native civilization was hybridized with the Greek. The earlier cultures tended to persist in "retarded" communities,

The Sicanian Period. — The Sicanian period is known principally from two sites, Stentinello and Matrensa. Stone implements from these places were of poor quality, and there were no other objects of interest except the pottery. This was handmade and baked in an open fire. Its surface is blackish-gray, and the geometrical ornament upon it, which appears merely incised, has in parts a strange regularity produced by real stamps — not by puncture by bone a ls — a phenomenon unique at this early time. There were hemispherical bowls, basins with ring handles and conical vases with a ring foot. The pottery of the caverns at Villafrati and Moarda belongs to a later stage of the neolithic. The finding of bell beakers connects it with the civilization of the dolmen builders.

The First Siculan Period. — So far as the present material goes, the first Siculan period does not seem to have been evolved from the Sicanian, or, if it was, the steps are still missing; all the outward and material evidence of the two civilizations shows them to be very different, and the affinities of the Siculi were with the Italian mainland. A few rock-hewn tombs of the first Siculan period have been discovered near Palermo and a considerable number near Agrigento, but the largest cemeteries were found by Paolo Orsi in the Syracusan district. The principal sites are those of Castelluccio, Melilli, Monte Racello, Monte Tabuto, Vallelunga and Monte Salia. The typical burial was in a rock-hewn chamber, the construction varying according to the nature of the ground, so that at Monte Tabuto the dead were buried in disused flint-mines, while at Monte Racello natural caverns were enlarged for the purpose, and actual surface graves were even formed out of slabs on the top of the broken ground. At Castelluccio, however, which may be taken as the standard case, the circular or elliptical chambers were hewn in a vertical face of rock and entered by a short horizontal corridor.

Each chamber contained many skeletons, in one case no less than 26. They were invariably buried in the squatting position, accompanied by a small number of weapons and ornaments and a regular equipment of pottery. It seems that the idea was to seat them as at a banquet, with large jars beside them to hold water and smaller decorated cups out of which to drink it. The weapons and implements were sometimes of stone, especially flint, sometimes of copper in primitive forms as if the neolithic period was only just past and hardly forgotten. Of personal ornaments there were few. Of pottery, all handmade, there were three kinds: a rough household ware; pots of a better clay coated with a red or yellow slip; and — far the most important — a ware covered either with a cream-coloured or dark-red slip on which very simple geometric patterns were executed in dark brown. This painted ware is the peculiar distinction of the first period. Nothing very closely resembling it is known anywhere else.

The Second Siculan Period. — The second Siculan period of the full Bronze Age is represented at its best by the cemeteries of Plemmirio, Milocca, Cozzo Pantano and Thapsos close to Syracuse and by Caldare and Cannatello near Agrigento. All these contain Mycenaean imports, of which the earliest are clearly to be dated as late Minoan third period. (See AEGEAN CIVILIZATION.) Bronze swords from the same sites are also quite definitely of Mycenaean origin and prove the existence of a considerable direct trade with the Aegean. To Aegean influence is probably due the remarkable development in tomb construction which characterizes the second Siculan. All the cemeteries consist of rock-hewn tombs, a natural evolution from the rock tombs of the first Siculan. The roof of the chamber, however, is sometimes of tholos form, which again recalls Aegean precedents. Inside it is usually elliptical; a raised bench cut in the rock runs round it, and niches are often hewn in the walls. Within this chamber the dead were buried as if seated at a stately banquet with the finest products of Sicilian potters for their table service and the rarest of foreign drinking cups. The size of the great food basins is remarkable; they are often 2½ or 3 ft. in height.

The native pottery is made principally in a gray-faced ware ornamented with moulded strips or with a few sparsely incised lines; there is also a yellow-faced ware. Painted ware is unknown. The shapes are very few — a high stand, a biconical cup with side handles, a conical cup, a jug and one or two large water jars. Foreign trade added the amphora, pyxis, pedestalled cup and stirrup-handled vase and gave a great impetus to metalworking. Swords, daggers and even basins were imported, but the various hoards of bronze objects show that a great quantity of native work must have existed. The tombs, however, mere systematically ransacked for metals after the Roman time. Another proof of foreign influence is the introduction of the fibula, which appears at Cozzo Pantano for the first time. The earliest fibulae are of two types, the plain violin bow with bamboo knots and the harp-shaped or elbowed fibula. each made in a very massive form.

The four cemeteries near Syracuse must be assigned on the evidence of the foreign imports to the 14th and 13th centuries B.C. Caldare and Cannatello, farther inland, date from the 12th to the 11th centuries. Latest of all and marking the last stage of the Bronze Age is Cassibile, a large cemetery near Syracuse, in which there were no Mycenaean products and the fibulae were perceptibly less archaic.

Intermediary Period. — Next in chronological order come four sites between Syracuse and Agrigento which span the gap between the Bronze and Iron Ages, the later graves in them belonging entirely to the early Iron Age. On Orsi's system they are to be classed as intermediate between the second and the third Siculan. These are Pantalica, Grammichele, Caltagirone and Monte Dessueri. Here the form of the tomb is already beginning to be modified, the number of burials in each grave is smaller, and the tomb furniture is later in character. This is especially perceptible in the personal ornaments; the fibulae have quite changed, for in place of the primitive violin bow the simple rounded bow is predominant and more sophisticated forms, like the eyed harp fibula, begin to appear.

In addition to arm rings and finger rings and mirrors of bronze there are now found, though rarely, gold rings, silver armlets and silver rings. Rectangular bronze razors come into use, like those known in Italy but of different origin. There are no weapons, perhaps because of the rifling of the graves, but flame-shaped and leaf-shaped bronze knives occur. The native pottery is very varied in form at this time, the best of it being in a ware faced with red haematite. Feather-patterned ware soon goes out of fashion; the impulse toward originality is killed by a fondness for geometrically painted wares, the products of new Greek schools. These begin to appear sporadically about 900 B.C.

The Third and Fourth Siculan Periods. — On a site like Pantalica, with a range of several centuries, we pass into the Iron Age without any striking changes. Modifications occur in the types of the fibulae and there is a gradual, but quite perceptible, deterioration of the pottery. All the Bronze Age types of fibulae gradually give way to later forms, of which the most general and popular is the two-eyed serpentine, which continues in use down to 500 B.C.

The first appearance of this fibula marks a distinct chronological point; it is the beginning of the early Iron Age, and if the contents of tombs belonging to this stage are isolated and examined separately from the rest, then certain definite characteristics begin to appear. The old Siculan civilization of the great days survives in a much impoverished form; it has entered upon its decadence. The architecture has lost all its beauty and elaboration of detail. Within a very simple chamber the dead are no longer seated at a banquet but extended at full length on the ground with their heads resting on a block of stone; and the objects buried with them consist of little but a few small water jars and trumpery pots. We now pass into Orsi's third period. The partial regeneration of Siculan life which begins gradually in the 9th century is entirely due to Greek influence, through trade, which preceded any actual colonization by fully 150 years. Thus everything of interest in Siculan life from the 9th century to the 5th B.C. is either a Greek importation or the direct imitation of a Greek original.

From a number of sites, the most important of which were Lentini (the ancient Leontini), Licodia and Finocchito, were obtained examples of geometrically painted vases, the earliest of which are of pure Dipylon style, while the latest are a hybridized product which may be termed Graeco-Siculan. A characteristic vase shown from Lentini belongs to the third Siculan period. If not an actual importation it is a close copy of some Dipylonic original at least as early as the 8th century B.C. At Lentini there were still earlier types, little oenochoai and askoi painted with the simplest kind of linear designs. This style is not found even in the first of the Greek colonies and must therefore precede the period of colonization. Orsi is evidently justified in assigning it to the 8th and possibly to the 9th century B.C.

The introduction of these new models led to the imitation of purely Greek shapes by the native potters, so that oenochoai and askoi were copied in the rough country ware, and to a closer study of decorative designs, which resulted in the production of a new kind of white-faced ware with geometrical patterns painted upon it. This gradually improved in technique until it reached its high-water mark in the late third and early fourth Siculan periods. The Graeco-Siculan ware continued in use until it was finally replaced about 500 B.C. by purely Greek imported vases. For this whole period. the stratigraphic investigations at Megara Hyblaea in 1949 and the following years yielded valuable results.

(D. R.–M.; A. W. V. B.)

Classical Archaeology. — After having long been relegated to secondary rank in art as merely a provincial area in relation to Greece proper, Sicily in recent years has steadily emerged as an artistic entity in its own right. The earliest works of sculpture confirm the literary tradition of a Daedalic school; and the art of the later archaic period, including clay statues and statuettes, pursues a course of development parallel to that of the schools of the motherland, with which it clearly remained in contact while achieving considerable freedom in style and technique. "Nowhere more forcibly than in its mouldings does the architecture of the West stand forth as a vigorous, original architecture, based on, but independent from, the forms of Greece, the Aegean, and Asia Minor" (L. T. Shoe, *Profiles of Western Greek Mouldings*, American Academy in Rome, 1952). Down to the beginning of the 5th century B.C., when the traditional terra-cotta revetments were superseded by marble. the coloured adornment of the temples showed features distinctly characteristic of this area. Throughout the 5th and the early 4th centuries, the issues of coins exhibited an exuberance and a standard of artistic excellence all their own; clearly the die cutters stood in close relation to the gem engravers and, in some cases, were identical with them. Although the rich ceramic yields of the cemeteries consist largely of imported products, first of the Corinthian and later of the Athenian potteries, there is an abundance of local wares as well, revealing several clearly defined schools of the 4th century and later; some of the painted decoration suggests the influence of the Western Greek theatrical plays. The island is rich in remains of villas and other edifices of the Roman period; and the architecture and mosaic art of late antiquity are nobly represented in the establishment at Piazza Armerina. (*See* further GREEK ARCHITECTURE; ROMAN ARCHITECTURE; GREEK ARCHAEOLOGY; GREEK ART; ROMAN ART; NUMISMATICS: *Italy and Sicily.* For some of the outstanding architectural monuments, see AGRIGENTUM; GELA; HIMERA; SEGESTA; SELINUS; SYRACUSE.)

HISTORY

At the coming of the Greeks three peoples occupied the island of Sicily: in the east. the Siculi (*q.v.*) or Si'cels (*Sikeloi*), who gave their name to the island but were not long arrived in it and had relatives of the same name in Latium and in southern Italy; to the west of the river Gelas. the Sicani (*q.v.*); and in the extreme west the Elymians, a people to whom a Trojan origin was assigned, with their chief centres at Segesta (*q.v.*) and at Eryx with its temple of Aphrodite. The Siculi spoke an Italic dialect; there are no remains of the languages of the other peoples.

Thucydides says (vi.2) that the Greeks were preceded in Sicily by Phoenicians, who established trading stations on promontories and small islands all round the coast. But no material remains of such settlements have been found. Thucydides adds that when the Greek colonization began, the Phoenicians withdrew to the western comer of the island, where they had the Elymians as allies and the support of Carthage. Here they had three towns, Motya, Soloeis and Panormus (now Palermo, *q.v.*). Hostilities between Greeks and Phoenicians are not heard of earlier than the Cnidian attempt to settle on the westernmost point of Sicily c. 580 B.C. (see below).

Greek Sicily, to 413 B.C.—Mycenaean traders had already visited Sicily and the Lipari Islands between the 15th and 13th centuries B.c., and at a later date the fibula was introduced by direct or indirect importation from the Aegean (see above, *Archaeology*). There is then a long period when Sicily was beyond the horizon of Greek sailors (the few references in the Odyssey need be no older than the early period of colonization). Toward the middle of the 8th century intercourse was resumed, and the first colony was planted c. 734 B.C. at Naxos on the east coast, by Chalcidians from Euboea, who had already founded Cumae near Naples. (Precise dates for the foundation of the Sicilian colonies are given by Thucydides; and though some modern scholars suppose that these are based only on calculations made about 300 years after the era of the first colonies, they may be accepted as approximately correct.) In the year after Naxos, according to Thucydides, the Corinthians founded Syracuse, the greatest city of ancient Sicily, and at the same time occupied Corcyra (Corfu) which commanded the way thither. The east coast was rapidly occupied: the Chalcidians founded other colonies at Leontini and Catana (both c. 729) and held the Straits of Messina by the foundation of Zancle (later Messana, Messina) on the Sicilian side and Rhegium (or Regium, *q.v.*) on the Italian side (both probably in the last quarter of the 8th century). The Megareans founded Megara Hyblaea (*q.v.*), at about the same time as Leontini. On the south coast, the earliest colony was Gela, a joint Cretan and Rhodian settlement (c. 688). The southeastern corner was occupied by the secondary Syracusan foundations of Acrae (c. 663), Casmenae (c. 643) and Camarina (598), the last of which was the most important. In or about 628 the Megareans founded Selinus, the westernmost Greek city of Sicily, facing the coast of Africa. Between Gela and Selinus was Acragas (Agrigentum, *q.v.*) a Geloan colony, the last of the foundations of the great age of colonization (580), which rapidly rose to be the second city of Sicily. On the north coast there was long only a single Greek city, the Chalcidian Himera (c. 649). About 580 the Cnidians founded Lipara, after an unsuccessful attempt to settle in the neighbourhood of Eryx. The defeat of this attempt by the Elymians and Phoenicians marks the first recession of the tide of Greek settlement, and the Greeks never succeeded in occupying the western part of the island. The mountainous centre remained in the hands of Siculi (Sicels) and Sicani, who were increasingly hellenized in ideas and material culture.

After the foundation of the colonies, little is known of them until the 5th century. They prospered materially, building temples whose remains, at Syracuse, Acragas and Selinus, are among the finest monuments of archaic and classical architecture. Their sculpture and other arts are vigorous. though provincial and largely dependent on impulses from mainland Greece. There is some reason to believe that they had a colonial economy. producing food (corn, sheep and cattle, fish) and importing manufactured objects (of which clay vases are the chief survivors) from Greece —in the peridd before 550 B.C. mainly from Corinth, after this from Athens. The broad acres of the colonies and, at Syracuse and probably also elsewhere, the use of Sicel serfs gave rise to a life of easy circumstances and, in the 5th century, to the great wealth of the tyrants (see below). The fine series of Sicilian coins begins toward the middle of the 6th century (see NUMISMATICS: Italy and *Sicily*). The poet Stesichorus of Himera, who retold many of the stories of epic with a new spirit reflected in archaic vase paintings, belongs to this period.

There were many tyrants — unconstitutional monarchs — in the 6th century, especially in those towns which were pressed by the growing hostility of the Carthaginians; the most famous is Phalaris (*q.v.*) of Acragas; in general, however, this is a period of aristocratic or oligarchical constitutions. The early 5th century saw tyrants in most cities. The tyranny of Gela was founded in 505, and Hippocrates (498–491) carried his arms over most of eastern Sicily; his successor Gelon (*q.v.*; otherwise Gelo) took Syracuse in 485 and transferred his seat thither, enlarging the city with men from other colonies and settlers from old Greece. This is the beginning of Syracusan rule over Greek Sicily. The families of Gelon and of Theron (tyrant of Acragas, 488–472) were united by marriage. Theron seized Himera, expelling its tyrant Terillus, who with his father-in-law, Anaxilas of Rhegium (494–476), ruler also of Zancle, formed a coalition against Gelon and Theron and invited Carthaginian support. The Carthaginian invasion was defeated in a single battle at Himera (480), and its commander Hamilcar son of Hanno (his mother was a Syracusan) killed. The victory opened a short period of brilliant prosperity for Greek Sicily. The courts of Gelon and of his brother and successor Hieron or Hiero (*q.v.;* 478–467) and of Theron were visited by Pindar. Aeschylus, Simonides and Bacchylides; the leading artists of Greece were commissioned to make rich offerings at Olympia and Delphi; fine temples were built as thank offerings for the victory of Himera. Hieron extended his activity to Italy, where he protected Locri against Anaxilas of Rhegium and defeated the Etruscans at sea off Cumae (474). The darker side of the tyrants' rule is seen in forced movements of population from city to city and in the destruction of many Greek cities (*e.g.*, Megara Hyblaea). Hieron refounded Catana with great splendour, under the name of Aetna, after expelling the Chalcidian inhabitants; he set up his son Deinomenes as king and hoped that this would be a refuge for his family; but within a few years of his death the original inhabitants returned, and the new settlers carried the name Aetna to a small town inland, on the slopes of Mount Etna.

These tyrannies were short-lived. Theron's power fell to pieces when his son Thrasydaeus succeeded. Hieron's brother Thrasybulus was overthrown by a combined movement of Greeks and Sicels (466). They were succeeded by uneasy democracies in most cities, Syracuse still taking the lead. The Sicels now for the first time formed a united power, under Ducetius, who founded a new city at Palici in the plain of Catana and developed a serious threat to Syracuse and to Acragas. He was defeated and his political work largely undone, except for the foundation of Cale Acte on the north coast. The Sicels did not again attempt to combine as a force, but their hellenization continued; many Sicel cities now began to coin on the Greek model.

The extent of the native contribution to Sicilian culture is disputed. The Sicels may have had a worship akin to the cult of Demeter and Persephone, which was widely spread over both Greek and native Sicily; but the localization of the rape of Persephone at Enna is due to Greek influence. The material culture of the Greek colonies shows no Sicel elements. Some words of Italic origin were taken into the Greek dialects of Sicily; and the racy comedies of Epicharmus and the mimes of Sophron may show some kinship of spirit to Italian comedy. The main Sicilian contribution to Greek literature and thought in the 5th century was in the development of rhetoric and its transference to Athens by Gorgias (*q.v.*). A more original philosopher mas, it appears, Empedocles of Acragas, who was poet, physician, politician and perhaps something of a charlatan.

The Athenians looked for allies in Sicily at least as early as 458–457, when they made a treaty, still extant, with Segesta. At the beginning of the Peloponnesian War they sought for means to cut off supplies from Sicily to their enemies and allied themselves with the Ionian cities, Leontini and Rhegium. In 427–426 they sent a small squadron to Sicily but accomplished little. In 415, during the peace of Wicias, they were led by expansionist ideas, expressed by Alcibiades, to send a large force in answer to an appeal for help from Segesta and Leontini. The ultimate object of this expedition was the subjection of the whole of Sicily. The Athenians were received with suspicion, even by some of their allies, and Naxos and Catana were the only Greek cities to support them; they also had help from some of the Sicels. The utter defeat of the Athenian force under the walls of Syracuse (see

PELOPONNESIAN WAR; SYRACUSE) was achieved in part by the arrival of the Spartan leader Gylippus and was followed by the dispatch of small forces from Syracuse and other Sicilian cities to help the Spartans against Athens.

Carthaginian Wars.—The failure of Athens left the field open for Carthage, with whom the Athenians had sought an alliance. In 409 an army under Hannibal, son of Gisgo, landed to support Segesta against Selinus. Selinus and Himera were taken and destroyed; Himera, where Hannibal sacrificed 3,000 of the citizens to avenge his grandfather Hamilcar, was never rebuilt but was replaced by a new town, Thermae Himeraeae. In 406 Acragas fell also. Dionysius (*q.v.*) rose to power at Syracuse as its military leader but was forced to evacuate the populations of Gela and Camarina before he could obtain a peace with the Carthaginians, which left him in control of Syracuse. For the rest of his life he fought a series of inconclusive wars with the Carthaginians. In 397 he took Motya, the chief Phoenician city in Sicily (which had a considerable Greek element within its walls) and seemed on the point of driving the Phoenicians out of the island. But in the following year the tables were turned by the arrival of a Carthaginian fleet under Himilco in the harbour of Syracuse. A pestilence, spread among Himilco's troops from the marshes of Lysimeleia, assisted Dionysius in winning a complete victory, which confirmed his position as ruler of Syracuse and master of most of Sicily. But he had to fight other Carthaginian wars in 392–391, 383–378, and 368–367, the year of his death. In the peace which followed the last war, the boundary between Greek and Carthaginian Sicily was fixed at the river Halycus. Selinus and Himera remained on the Carthaginian side, Acragas became a frontier town. Lilybaeum (the modern Marsala) replaced Motya in 396 and became the chief centre of the Phoenicians in Sicily.

Dionysius used his position as defender of Greek Sicily to build up a personal power which anticipates the Hellenistic monarchies in many ways. The transplantations of population and refoundations of cities which had been a feature of the rule of Gelon and Hieron continued. New foundations were Tauromenium (modern Taormina), which replaced Naxos, and Tyndaris on the still rather empty north coast. The Sicel towns of Hadranum near Mount Etna and Halaesa on the north coast were also refounded, one by Dionysius, the other by his Sicel ally Archonides of Herbita. Dionysius made considerable use of the forces of Sicel allies, and the distinction of barbarian from Greek Sicily begins to disappear. He also employed large mercenary forces, some of them from Gaul and Spain.

After 390 he intervened in the affairs of Magna Graecia, in alliance mith the Lucanians, who had recently pressed donn into the foot of Italy. Locri was his base in Italy. He took Rhegium and Caulonia and defeated the forces of Croton and Thurii, thus winning control over most of Greek Italy, except Tarentum. He sent a fleet into Etruscan waters, nhich plundered the wealthy temple at Caere. His activities in the Adriatic were of more permanent importance; he planted a colony at Lissus to control the crossing of the Ionian sea; he helped the Parians to colonize the island of Pharos; and Syracusan exiles founded Ancona, perhaps with his consent and backing. He had as ally the Molossian Alcetas and engaged Illyrian mercenaries. These activities appear to have been in preparation for intervention in the affairs of Greece.

The rule of Dionysius at Syracuse depended on foreign mercenaries and on secret police, and many of the typical features of Plato's and Aristotle's accounts of Greek tyrants are no doubt derived from him. But he was well served by efficient ministers, such as Philistus the historian (who however went into exile at Adria). He was himself a poet and, like earlier tyrants. kept a court, which mas visited by Plato and other philosophers and poets. He made Syracuse the greatest power in the Greek world, and it became the largest and, probably, the most populous of Greek cities. with its extensive fortifications (*see* SYRACUSE). His poner, however did not long survive him. Most of his conquests in Italy fell to the Lucanians and Bruttians, and at Syracuse his son Dionysius II was expelled after ten years' rule (367–357) by his uncle Dion (*q.v.*). Dion was killed in 354, and there follows ten years' confusion: fighting in Syracuse between Dionysius II and the citizens; tyrannies in other cities; and renewed danger from Carthage, allied with Hicetas, tyrant of Leontini and rival of Dionysius. The Syracusans appealed to their mother city Corinth, and Timoleon (*q.v.*) came as a deliverer. He freed the cities from tyrants and defeated the Carthaginians at the battle of Crimissus (341); but the boundary remained at the river Halycus. Timoleon's reputation was high because he restored the democracy at Syracuse and retired after his work of liberation was done; but his settlement did not last long after his death (c. 336). The Carthaginians, who had already played off one city against another, continued this policy, while the Greeks consumed their energies in struggles between would-be tyrants. They found another leader in Agathocles (*q.v.*), one of the ablest soldiers of the time, who made himself tyrant of Syracuse in 317. Acragas, strengthened by Syracusan exiles, stood out again as the rival of Syracuse; and Hamilcar son of Gisgo won many Greek cities to the Carthaginian alliance and blockaded Agathocles in Syracuse. Agathocles broke through and carried the war into Africa, where he won many successes (310–307), but was finally completely defeated and had to flee back to Sicily. In spite of this defeat he maintained his position at Syracuse and made peace on the old terms with Carthage. He formed marriage alliances with Ptolemy I of Egypt and with Pyrrhus of Epirus, who married his daughter. He was the first of the Sicilian tyrants to take the title of king. He died in 289. In spite of his reputation for treachery and massacre, his rule was remembered as a period of prosperity.

In the troubles which followed Agathocles' death, his disbanded Campanian mercenaries seized Messana and called themselves the Mamertines, children of Mamers or Mars. The fortunes of Sicily were thus linked with Rome. Another new foundation of this time is that of Phintias (Licata) at the mouth of the southern Himeras, named after the Agrigentine tyrant Phintias (289–279). New Carthaginian attacks called forth another liberator from overseas. Pyrrhus (*q.v.*) of Epirus, but his Sicilian war (278–276) was a mere interlude between the two acts of his war with Rome. When he left Sicily to fight for Tarentum against Rome, he had to fight his may out through Carthaginians and Mamertines, the latter already allied with Rome; he said, in true prophecy, that he left Sicily as a wrestling ground for Romans and Carthaginians.

The Syracusans chose as leader Hieron II (Hiero II, *q.v.*), who defeated the Mamertines and came near to capturing Messana; he won the title of king of Syracuse (269). In 264 his attack on the Mamertines led to the intervention of Rome and the First Punic War (264–241). The war began as a three-comered event between Rome. the Carthaginians and Hieron; but in 263 Hieron turned from the Carthaginians to Rome and formed an alliance to which he remained loyal for the rest of his long life. The Romans were thus free to use Greek Sicily as a base for war with Carthage. The western part of the island, both Greek and Phoenician. suffered greatly in this long nar (for its course *see* PUNIC WARS). By the treaty which ended it Carthage ceded to Rome all its possessions in Sicily, which thus became the first Roman province (241). Hieron retained possession of eastern Sicily, south of Messana. His rule mas able and enlightened, and his financial enactments, particularly his corn lams. were taken over when Rome incorporated his kingdom. This period of peace was the last golden age of free Sicily: the great theatre at Syracuse was rebuilt by Hieron, and Theocritus sang the pastoral pleasures of his native island and offered an encomium to Hieron (*c.* 275):

Roman Sicily.—At the outbreak of the Second Punic War Hieron held firm to the Roman alliance, but after his death in 216 his grandson Hieronymus repudiated it. Hieronymus was overthrown by revolution at Syracuse (215), but the city had to stand a siege from the Romans. The great fortress of Euryelus (*see* SYRACUSE: *Archaeology)* perhaps took its final form now, under the inspiration of Archimedes, not in the time of Dionysius I as used to be believed. Syracuse was taken and sacked in 212, Acragas after a further campaign in 210. The whole of Sicily was now Roman.

Little is known of the early organization of the Roman province. It was governed by a praetor sent out yearly from Rome, who after the annexation of Syracuse had his capital there. Two quaestors were appointed, one with his office at Syracuse, the other at Lilybaeum. The province included a number of free cities: Messana, with Tauromenium and Netum, were allied cities (the two latter had probably taken the Roman side in the Second Punic War); a number of others, including allies from the First Punic War, were also free—Segesta, Halicyae, Panormus, Halaesa and Centuripe. The rest paid tithe to the Roman people according to the law of Hieron, which was extended to the whole island. Sicily had long had a surplus of corn for export, and Livy records occasional dispatch to Rome as early as the 5th century B.C.; the island now became the granary of the Roman people. The rolling country of the central part of the island was suitable for pasture and cultivation on a large scale, in *latifundia*, and slave gangs were introduced on the estates both of rich Sicilians and of Roman citizens. Hence rose the two great slave revolts of the second half of the 2nd century B.C., the first from 135 to 132, with Enna and Tauromenium as its centres, the second from 104 to 100; both periods of internal and external stress at Rome. The settlements after these two wars by Publius Rupilius (131) and Manius Aquilius (99) modified the organization of the province, which is well known from Cicero's speeches against Verres.

In spite of slave wars and the burden of Roman provincial governors and tax farmers, Sicily was not unprosperous under the Roman republic. It was free from external dangers; and even the unprivileged cities kept their own laws, magistrates and assemblies, and provision was made for lawsuits between Romans and Sicilians and between Sicilians of differentcities. There seems not to have been much commercial exploitation; tax collecting was normally in the hands of the Greeks themselves, not of Roman *publicani;* and smallholdings continued to be the rule in many cities. The wealth of the cities, both free and tributary, may be seen from the speeches of Cicero in prosecution of the propraetor Verres, who in three years' rule (73–71) had plundered widely, with especial attention to works of art. He also failed to defend the province against pirates.

Sicily was again a battlefield between 43 and 36 B.C., when Sextus Pompeius held Messana and cut off the corn supply of Rome. In the division of provinces between Augustus and the senate, Sicily fell to the latter. It had perhaps received Latin rights from Julius Caesar. Augustus planted colonies at Panormus, Syracuse, Tauromenium, Thermae, Tyndaris and Catana. But the island remained Greek; not only the old Greek cities, but also the old Sicel towns. which had long been completely assimilated to the Greek, used Greek as their everyday language, though Latin was used for official purposes. Christianity was early introduced to Syracuse. where the catacombs and early churches (belonging mainly to the Byzantine period) are second only to those of Rome. The island has little history in the Roman imperial period; its continued prosperity is shown by the Roman amphitheatres of Syracuse and Catana and by Roman remains in other cities large and small; a few cities declined and show now only Greek remains, but these were in general replaced by others. The tourist traffic in Sicily is as old as the Roman period. Cicero praises the climate of Syracuse, and the emperor Hadrian climbed Etna in A.D. 126 to see the sunrise. In the late 3rd century a rich Roman, perhaps a high court official, perhaps even an emperor (the name of Maximian has been suggested), retired and built a huge villa, with floor mosaics with lively pagan scenes, near the modern town of Piazza Armerina. In the division of Constantine, Sicily became one of the provinces of Italy and, together with Africa, Raetia and western Illyricum, was made part of the Italian prefecture; with Sardinia and Corsica, it was part of the Italian diocese.

The Byzantine Period, to 827.—The earlier Germanic invaders of the Roman empire did not reach Sicily, though Alaric had designs upon it. The Vandals under Gaiseric, however, raided and invaded Sicily from Africa for about 40 years intermittently until in 476 they ceded the greater part of it to Odoacer, the barbarian king of Italy, against the payment of an annual tribute. The Ostrogothic successors of the latter paid no tribute to the Vandals after 491, but Theodoric gave Libybaeum to the Vandal king Thrasamund, to whom his daughter Amalafrida was married in 500. Belisarius, having destroyed the Vandal kingdom in 533–534, occupied Sicily in 535, when the Byzantine emperor began hostilities against the Ostrogoths in Italy; and though Totila recovered part of the island in 550, it was lost again before the final overthrow of the Ostrogothic kingdom at Taginae (552).

Sicily had thus come under Byzantine rule. When the emperor Heraclius and his successors divided the empire into themes, Sicily became one of them, placed between the exarchate of Ravenna in the north and that of Carthage in the south; it was administered by a *patricius* responsible to the government at Constantinople. Probably after the Italian revolt of 726 and certainly after the fall of the exarchate in the middle of the 8th century, the Byzantine dominions in southern Italy were incorporated in the theme of Sicily, an arrangement which lasted until the time of the Arab conquest, when the mainland dominions were formed into the themes of Calabria and Longobardia.

Ecclesiastically, Sicily remained at first under the papacy, which in addition to rights of jurisdiction had considerable interests in the island, arising from its vast Sicilian estates. Gregory I's letters admirably illustrate the importance attached to them by the pope. The iconoclastic controversy and the ensuing revolt against Byzantine rule under papal leadership (726) led to the confiscation by the emperor of the papal estates in Sicily and southern Italy; soon after, the ecclesiastical jurisdiction of these regions passed to the patriarch of Constantinople.

These political and ecclesiastical changes corresponded to demographic and cultural developments of longer standing. In Sicily and southern Italy, the Greek element had been greatly strengthened since the end of the 6th century as a result of emigration from other Byzantine provinces after the Avar and Slav invasions of Greece and, later, of the Persian and Arab conquests. The Hellenization of Sicily, which appears to have been all but complete in the 8th century, is revealed in the history of the Sicilian church. The Greek rite, already used at the time of Gregory I, spread during the 7th century from the eastern coast over the whole of the island. By the time of its separation from Rome, the Sicilian church was virtually Greek. Sicily was thus well on the way to becoming a fully integrated part of the Byzantine empire when the Arab conquest, which began in 827, interrupted this development.

Ever since the 7th century, Arab expansion in North Africa had constituted an immediate threat to Sicily and to southern Italy, the occupation of which would moreover expose Greece, the exarchate of Ravenna and Dalmatia to Saracen attack. Sicily consequently became a vital link in the imperial defense against Islam. Constans II (641–668) was the first Byzantine emperor fully to appreciate this; in 663–668 he tried to strengthen the Byzantine position in Sicily by his own presence. Constans, however, was assassinated during a rebellion at Syracuse in 668. Mizizes, who was then proclaimed emperor by the Byzantine militia, fell from power in 669.

This rebellion was followed by other risings in Sicily in 718 and in 781, which, although primarily of a military nature, doubtless also reflected separatist tendencies. A more dangerous revolt, that of the naval commander Euphemius about 826, was to be the immediate cause of the final conquest of Sicily by the Arabs.

Sicily under the Arabs.—Following the conquest of North Africa, Arab descents from Africa began in 'jog. They were interrupted for the invasion of Spain (710), and the next serious attacks were probably not made before 740 and 752–753. Energetic Byzantine reaction on this last occasion was followed by a respite lasting more than 50 years. But in 827 Euphemius, who had been proclaimed emperor in Sicily, appealed for help to the Aghlabite amir of Africa. But once the Arabs had landed they began the conquest on their own account. Euphemius was murdered by Sicilians in 828; and Palermo fell in 831 and became the base for further conquests. When a stronger policy was adopted under the emperor Michael III, it was too late; after the Byzantine defeat near Butera in *c.* 845, the whole of the Val di Noto fell into Arab hands; its occupation was practically completed with the capture of Enna in 859. A Byzantine offensive under Basil I led to some temporary successes. but the fall of Syracuse in 878 all but sealed the fate of Sicily; when they captured Taormina in 902, the Arabs were practically masters of Sicily. Local resistance and insurrections however continued. Together with internal discords in the Arab camp, they did much to slow up the Arab advance, despite the scant help from Constantinople. The Val Demone (*i.e.,* the region between Etna, Messina and Caronia) held out longest; and the last Byzantine stronghold. Rametta, was not lost until 965. The Byzantines, however, did not abandon hope of reconquering Sicily. Basil II was planning a Sicilian expedition at the time of his death (1025); it was actually dispatched in 1038 under the gieat Byzantine general, George Maniaces. The campaign was highly successful, and a large part of eastern Sicily, including Messina and Syracuse, was recaptured; but after Maniaces had been suddenly recalled, the Byzantine position on the island collapsed.

The Arab conquest separated Sicily not only from Constantinople but also from the Italian mainland, where the Arabs did not succeed in establishing themselves permanently. The history of Arab Sicily, on the other hand, is marked by growing independence from Africa. Until 909, it was under the Aghlabites; after their fall, it passed under the Fatimites, who moved their capital to Cairo in 972. But from the middle of the 10th century the office of the governor (amir) became hereditary in the dynasty of the Kalbites. until the anarchy after Maniaces' conquests led to the fall of that dynasty and to the division of Sicily into a number of principalities, while Palermo acquired self-government.

During and after the conquest, large Arab immigration from Africa took place; this, together with the conversions of Christians, contributed to make Sicily not only politically but also culturally part of the Arab world. However, the Greek Christian element remained predominant in the Val Demone; and even after the Arabs gained a majority in the rest of Sicily, Christian groups remained scattered over the island.

As in other Arab countries, the Christians, although placed in a position of legal inferiority, enjoyed religious toleration and a measure of self-government, against the payment of taxes that may have been often less burdensome than those levied by the Byzantines. Relics of the Greek episcopate seem to have survived to the end of the Arab period; so did a number of Basilian monasteries; both provided the principal link with the Byzantine world outside (particularly with Calabria, where the Greek population had been strengthened by emigrants from Sicily). As far as the Sicilian clergy, secular and regular, was concerned, this emigration seems to have been less the result of persecutions than of the gradual spread of Islam over Sicily.

The Norman Conquest: Roger I.—When the Normans began to conquer Sicily in 1060, they were at first welcomed as liberators and their progress was doubtless assisted by the Christian population. They were no newcomers to the island. Norman mercenaries from the mainland, among them two sons of Tancred of Hauteville, had fought in George Maniaces' army and had taken part in the capture of Messina. In 1059, Pope Nicholas II invested another son of Tancred, Robert Guiscard (*q.v.*), with his past and future conquests not only in Apulia and Calabria, but also in Sicily. In his oath of allegiance, Robert styled himself "by the grace of God and St. Peter duke of Apulia and Calabria and. with their help, hereafter of Sicily."

The conditions under which the Norman expedition took place were to leave a profound mark on the history of Sicily. The papal enfeoffment of Robert with Sicily may have been legally contestable — it mas naturally not recognized by Constantinople—but it forged a link between the papacy and Sicily, which long outlasted Norman rule.

It was Robert's brother, Count Roger I (*q.v.*), who as the former's vassal and with his assistance became the real conqueror of Sicily. Internal conflicts among the Arabs served him well The amir of Syracuse and Catania, at war with his brother-in-law, the amir of Girgenti and Castrogiovanni (as Enna came to be called), went so far as to offer Roger his help to conquer the island. The first landing (1060), near Messina, was followed by an equally inconclusive attack on that town in 1061; the third, made in greater strength and with the participation of Robert, succeeded (summer, 1061). The possession of Messina gave the Normans control of the straits and a military base for further advance; the capture of Palermo (1072) concluded the first phase of the conquest; and the capture of Noto (1091) completed it. Although Robert's assistance was at first all-important, Roger soon assumed the leading role. After the conquest, Robert probably retained only Palermo — apart from the suzerainty over the whole island, which suzerainty became entirely nominal under Roger Borsa, Robert's weak successor as duke of Apulia (1085–1111), who in 1091 surrendered half of Palermo to his uncle.

If Roger was the real conqueror of Sicily, he was also the founder of the Norman Sicilian state. By distributing fiefs sparingly, he gave feudalism a less important place in Sicily than it had acquired on the mainland, where Robert Guiscard had established his ducal power by making the Normans accept him as their ruler. At the same time, he accepted much of the existing law and institutions. In his treatment of the Arab majority, his policy of religious toleration resembles that previously practised by the Arabs. Their legal conditions varied considerably, ranging from the liberties that they enjoyed at Palermo, where they had their own quarter and mosques, to the serfdom of the mass of the country population. Roger made use of their military and administrative services; many leading Arabs, however, seem to have left the country after the conquest.

Roger showed much favour to the Greeks, as appears from his lavish patronage of Basilian monasticism. He founded or restored at least 14 Greek monasteries as against 4 Benedictine ones. The Norman conquest was followed by an increase of the Greek population, Basilian monks from Calabria forming only one element of the new immigration. The Sicilian church, however, became Latin, according to the promise made by Robert Guiscard to Pope Nicholas II in 1059. But the papacy was left only little influence in it; the concession of the apostolic legation to Roger (1098) made the Sicilian church practically independent of Rome by sanctioning an already existing state of monarchical control.

Roger II and the Foundation of the Kingdom. — The survival of Roger I's work during the difficult period after his death (1101) was a measure of his success. Roger's son and heir Simon died in 1105 and was succeeded by his brother Roger II; but their mother Adelaide ruled as regent from 1101 until Roger attained his majority in 1112. Roger continued his father's efforts to take advantage of the difficulties of the duke of Apulia (Roger Borsa had been succeeded by his son William in 1111), not only by eliminating the last relic of ducal authority on the island. obtaining the second half of Palermo in 1122, but also by extending his lands and influence in the duchy of Apulia and in Calabria. After Duke William's death in 1127, Roger II crossed over to the mainland to assert his claims as his heir.

Roger's expedition opens a period of struggles which lasted until 1139. His claims were opposed not only by many lords and towns but also, until 1128, by Pope Honorius II. By supporting the antipope Anacletus II after the disputed papal election of 1130, Roger obtained the royal title for Sicily. Apulia and Calabria (1130). But this led to an alliance of Innocent II and the emperor Lothair against the ruler who by his support of the antipope nas primarily responsible for the prolongation of the schism. Lothair's invasion of the kingdom in 1136 in alliance with Pisa and Venice and, perhaps, Byzantium brought Roger's fortunes to their lowest point. But after Lothair's withdrawal, Roger soon recovered lost ground, and aiter the death of Anacletus (1138), Innocent II confirmed him in the royal title. The treaty of Mig-

nano (1139) meant the final acknowledgment by the papacy of the Norman kingdom, which included the mainland provinces of Apulia, Calabria and Capua as well as Sicily.

The political problems of the kingdom were, to no small extent, a legacy of the different territories of which it was formed. Thus the conflicts with the German and Byzantine emperors belong largely to the history of the South Italian provinces; while Roger's and his successor's African policy is rooted in the earlier history of Sicily. The first expeditions against the Zeirite prince of Mahdia in North Africa (1118, 1123) were failures; but in 1134–35 internal discords in the Zeirite state provided Roger with fresh opportunities for intervention, which was facilitated by the growth of the Sicilian navy; the expedition led to the occupation of the island of Jerba. The capture of Tripoli in 1146 initiated a series of conquests which culminated in that of Mahdia in 1148; by that year, Roger's African empire extended from Tripoli to Tunis, from the desert of Barca to Kairwan. That it was short-lived was primarily due to the failure to check the growing power of the Almohades; and the death of the grand admiral George of Antioch, the conqueror of Africa, in 1151–52 and that of Roger II in 1154 jeopardized its survival. The crisis was to begin in 1156 with an Arab rising in Africa; by 1160, the African empire was lost. The Norman kings, however, did not abandon their African ambitions: William II was to send a fleet to lay siege to Alexandria in 1174, and further expeditions were to be undertaken against the North African coast in the following years.

Expansion in Africa had sharpened the antagonism between Norman Sicily and Constantinople. At first, when the Byzantines had received support from the western emperors, the alliance of the two empires constituted a formidable threat to the Sicilian kingdom; but the clash between Byzantine and western imperial claims led, after Frederick I Barbarossa's accession (1152). to the end of the alliance, Frederick continuing an anti-Norman policy of his own. Roger took the initiative against Byzantium in 1147 and 1149, seized Corfu and invaded Greece. The Byzantines, on the other hand, reconquered part of Apulia in 1155, after Roger's death; but they lost the conquered territories again after their crushing defeat at Brindisi (1156). Peace was concluded in 1158 and was not broken until 1185, when King William II invaded the Byzantine empire, took Durazzo and Thessalonica and advanced toward Constantinople, with the ultimate aim of seizing the eastern imperial crown. But the counteroffensive under the new emperor Isaac II Angelus put an end to this expedition. It was the last great enterprise of the Norman kings.

Internal Development under the Normans.—Roger II's internal policy was based on that of his father and was continued by his son William I (1154–66) and by the latter's son William II (1166–89); but his own contribution to the building of the Sicilian state was very great. The combination of Norman, Arabic and Byzantine elements is perhaps the most striking but at the same time a very natural characteristic of the government and civilization of the kingdom. Roger's Assizes (1140) derive largely from Justinian and later Byzantine law; very strong Byzantine influence can be found in the judicial and fiscal administration and in the central financial department, the duana (diwan), the personnel of which was originally Arabic. The Norman chancery issued documents in Latin, Greek and Arabic. On the other hand, the curia was primarily modelled on that of the northern European states; and not only were feudal institutions accepted, but feudal barons also played an important part in the provincial and local administration. At the same time, some of the most influential ministers of the Norman period, the grand admirals or amirs of amirs such as George of Antioch were Greeks. Roger's capital was cosmopolitan Palermo.

But despite the role played by Greeks and Arabs in the bureaucracy, Sicily became progressively latinized. While the Moslem population was decreased by conversions, the Latin element was strengthened by the settlement of colonies of "Lombards" (*i.e.*, mainlanders), Greeks and Arabs being gradually reduced to small minorities. This process is also reflected in the large number of Latin monasteries founded by the kings, after the initial favour shown to the Basilian monks. But Sicilian civilization retained the composite character that it had possessed from the beginning; Sicilian scholars translated Greek classical texts into Latin; Idrisi (*q.v.*), on the orders of Roger II, composed one of the outstanding works of Arab geography; and Sicilian architecture was the product of Roman, Byzantine. Arabic and Norman influences.

The **Hohenstaufen** Accession.—The death of William II (1189) was followed by a struggle for the succession. William I and William II had long supported Pope Alexander III in his conflict with Frederick Barbarossa; but a truce had been concluded in 1177, and the subsequent rapprochement between king and emperor had resulted in William II's sanctioning the betrothal of Frederick's son Henry to Constance, daughter of Roger II and heiress apparent to the kingdom (1184). This created a situation of great potential danger for the papacy, as it strengthened imperial claims on the kingdom of Sicily by the addition to them of Constance's rights. On William's death, however, there was strong Norman opposition to the prospect of German rule, and Tancred, an illegitimate grandson of Roger II, was crowned king. Frederick's son, who had succeeded his father as Henry VI, failed to assert his claims in 1191, when he was forced to raise the siege of Naples; but the sudden death of Tancred early in 1194 proved a turning point. The reign of his young son, William III, under the regency of Queen Sibylla lasted only ten months; Henry VI finally occupied the kingdom and was crowned king at Palermo in 1194. A new period in the history of Sicily had begun.

Henry aimed at including Sicily permanently in the empire, which he unsuccessfully tried to make hereditary in his family, the house of Hohenstaufen; and the distribution of high offices and lands among his followers was to strengthen his control of the kingdom. His death in 1197 temporarily put an end to imperial domination. Constance, as ruler with her young son, the future emperor Frederick II (*q.v.*), returned to a strictly Norman policy. But she died in 1198, leaving Frederick under the guardianship of Pope Innocent III. The following years were marked by growing anarchy, due to the weakness of the monarchy, to the attempts of German lords to seize hold of the kingdom, to the Arabs' endeavours to improve their position and to the commercial expansion of Pisa and Genoa. In 1208, Innocent handed the government to Frederick on his reaching his majority.

The Emperor Frederick **II** (Frederick I of Sicily).—Three years later, the pope saw himself forced to support Frederick's renewed election as king of the Romans in order to defeat Otto IV. Frederick promised Innocent, just before the latter's death in 1216, to renounce the kingdom in favour of his son Henry after his imperial coronation; but the papacy's hope to prevent in this way the reunion of Sicily and the empire was not fulfilled. for in 1220 Frederick succeeded in having Henry elected German king. The eventual union of the German and Sicilian crowns, foreshadowed by this election, made papal insistence on Frederick's renunciation obsolete; and when Frederick was crowned emperor, in the same year, Honorius III tacitly recognized him also as Sicilian king.

Frederick devoted the following years to the restoration of royal power in the kingdom; and in this formidable task he revealed himself the true successor of Roger II. In Sicily, Frederick acted as Norman rather than German ruler: symptomatically, his edict on the resignation of privileges (1220) put the deadline at the death of William II, not of Henry VI. His preoccupation with the affairs of the kingdom was largely responsible for the postponements of his crusade, which led in 1227 to his excommunication. Papal troops invaded the kingdom during his absence in Syria (1228–29); but Frederick's return meant his immediate victory, and the peace of San Germano (1230) was followed by further internal reforms. The outstanding legislative achievement of this period mas the constitution of Melfi (1231), a legal code which, inspired by Roger II's Assizes, gives a remarkable insight into the organization of the kingdom and also into the political ideas of its ruler. Frederick carried the evolution of the Sicilian administration considerably beyond what had been achieved by the Normans; on the other hand, the use that he made of assemblies of estates was a landmark in the history of the Sicilian parliament (see below). In his highly centralized government. Frederick was the heir to his Norman predecessors, whose work he continued.

The same continuity can also be seen in Sicilian culture; but at Frederick's brilliant cosmopolitan court Italian poetry provided a new formative element.

The End of Hohenstaufen Rule: Manfred.—Frederick's work was jeopardized and his dynasty ruined by the union of Sicily with the empire. The conflicts with the papacy and with its allies, the Lombard communes, meant a serious strain on the Sicilian economy and started a chain of events which was finally to lead to the establishment of the house of Anjou in the kingdom. Innocent IV, having deposed Frederick from the imperial throne (1245), desired to deprive him and his descendants of the Sicilian crown as well. Frederick's death in 1250 and that of his son Conrad IV in 1254 provided the papacy with new opportunities, but the success of Manfred, one of Frederick's illegitimate sons, in establishing control over the kingdom even before Conrad's death complicated the situation and gave rise to lengthy and tortuous negotiations in which papal offers of the Sicilian crown to foreign princes alternated with rapprochements to Conrad and to Manfred. Manfred was crowned king at Palermo in 1258—a usurpation of the rights of Conradin, Conrad IV's young son and heir. In 1263, after negotiations with Manfred had broken down for the last time, Pope Urban IV announced the choice of Charles of Anjou (*see* CHARLES I of Naples), brother of Saint Louis, as king of Sicily (Edmund, son of Henry III of England, who had been invested by the papacy with the kingdom in 1255, had failed to substantiate his claims). In 1265, Charles was invested with the kingdom by Pope Clement IV in Rome; at Benevento, in 1266, he defeated Manfred, who was killed in the battle.

Charles of Anjou.—After Benevento, there was no serious resistance to Charles in the kingdom. But his rule had still to stand its test when Conradin came to Italy in 1267 to seize his inheritance. A rising in his favour swept the kingdom and showed the fragility of Charles's position. In 1268, however, Conradin was defeated at Tagliacozzo and executed at Naples. There followed severe suppression of the revolt, especially in Sicily, where it had been more widespread than on the mainland. Charles tried to put his power on a firm foundation by a large-scale distribution of fiefs among his French nobility. At the same time he preserved, in its main outlines, Frederick's system of government. The "French colonization," however, and the sense of grievance that it caused among the Sicilians was partly responsible for the great Sicilian revolt of 1282, the Sicilian Vespers (*see* VESPERS, SICILIAN), which severed Sicily once more from the mainland.

The House of Aragon and Spanish Rule.—On the outbreak of the revolt a parliament at Palermo offered the crown to Peter III of Aragon, son-in-law of Manfred, who became Peter I of Sicily; and the 20 years' war that followed led to the permanent establishment of the Aragonese dynasty in Sicily. However, the treaty of Caltabellotta (1302) did not put an end to the attempts of the house of Anjou, whose state was now limited to the mainland, to reconquer the island (*see* NAPLES, KINGDOM OF). The Italian expedition of the emperor Henry VII (1310–13) led to a renewal of hostilities and was followed by several Neapolitan expeditions against Sicily; in 1356 the house of Anjou even succeeded in occupying Messina for a short period.

From 1296 to 1402, Sicily was ruled by the Sicilian branch of the Aragonese dynasty: by Peter's third son Frederick II, who styled himself Frederick III (*q.v.*; 1296–1337), crowned after four years' regency for his brother James (king of Aragon since 1291); by Frederick's son, Peter II (1337–42); by Peter's son, Louis (1342–55); by Louis's brother, Frederick III the Simple (1355–77); and by Frederick's daughter, Mary (1377–1402), who from 1392 reigned together with her husband, Martin I, son of the future Martin I of Aragon. After Mary's death in 1402, her husband Martin I became sole ruler; after his death in 1409, his father Martin I of Aragon became king of Sicily as Martin II but died in 1410; and in 1412, the crowns of Sicily and Aragon passed to Ferdinand I. Thus Sicily came under direct Spanish rule; and when Alphonso V of Aragon, who had succeeded Ferdinand in 1416, conquered the kingdom of Naples from René of Anjou in 1442, the old Sicilian kingdom was reconstituted. The political union of Sicily and the mainland was, however, again broken when Alphonso (d. 1458) left the "kingdom of Naples" to his illegitimate son Ferdinand, while his brother John succeeded in Aragon and Sicily. In 1500, the treaty of Granada divided the kingdom of Naples between Ferdinand the Catholic, who had become king of Aragon and Sicily in 1479, and Louis XII of France; and after the expulsion of the French (1503), the union of Sicily and the kingdom of Naples under the Spanish monarchy lasted until 1707. Continuous Spanish rule in Sicily came to an end in 1713.

The power of the Sicilian nobility increased considerably during the early Aragonese period at the expense of the monarchy and of the towns, thanks to the lavish grants of lands and privileges by the kings; and the 14th century was marked by feudal struggles —which were largely determined by the conflicts between the older nobility and the families which had immigrated from Spain— until order and strong government were restored by the Spanish Aragonese. The kings of Aragon ruled Sicily through viceroys from 1415 onward; Ferdinand I refused the Sicilian request to make the viceroy a separate king (1416), and the governor remained the representative of the Aragonese monarch. His very extensive powers, and indeed those of the monarchy itself, were, however, to some extent limited by the Sicilian parliament, whose growth was the most outstanding constitutional development of the Aragonese period. The importance of the Sicilian parliament had increased greatly from the time when the emperor Frederick II had given municipal representatives a place in his general assemblies (1232); in the 14th century, under the influence of the Aragonese assemblies of estates, the parliament was formed into an assembly of three houses (*bracci*), the third being composed of towns of the royal domain, which by the end of the next century was meeting regularly every three years.

By the middle of the 15th century it had become a basic principle of the Sicilian constitution that no new taxes should be levied without the consent of the parliament. As elsewhere in Europe, the voting of subsidies could be used by the parliament to influence policy and legislation; and the Sicilian estates thus became the most important obstacle to the absolute power of the Aragonese monarchs and their viceroys.

For later history, up to the incorporation of Sicily in the kingdom of Italy, *see* NAPLES, KINGDOM OF, and articles on the persons therein mentioned. *See* also MAFIA and, for the invasion and occupation of the island in 1943, WORLD WAR II.

POPULATION, GOVERNMENT AND ECONOMY

Population.—The census of Nov. 1951 showed that Sicily had a population of 4,486,749 (2,206,031 males and 2,280,718 females), an increase of 486,671 or 12.2% on the census of 1936, to be compared with an increase of 10.5% for Italy. The average density was 175 per square kilometre (452 per square mile), to be compared with Italy's 159 per square kilometre (409 per square mile). The population of the several provinces of the region is tabulated in the article ITALY: *Population.* The distinctive feature of the population distribution is the small number of people living in scattered houses. In 1936 only 10% of the population was given as scattered (*cf.* 26% in Italy as a whole). About one-third of the population lives closely packed together in the towns and villages on the Tyrrhenian and Ionian coasts and on the lower slopes of Etna; in the interior most people live at an average height of 1,000 ft. in towns having not less than 5,000 inhabitants and mostly more than 10,000, built on the flat hilltops.

The birth rate fell from 27 per 1,000 in 1938 to 22.6 in 1955 (*cf.* Italy's 17.7), but the death rate also showed a big drop, from 15.3 to 8.7 per 1,000, so that the natural increase was 13.9 per 1,000 (*cf.* Italy's 8.6). The rate of infant mortality dropped steadily and had fallen to 57.3 per 1,000 live births in 1954, a high figure compared with Liguria's 36.4 and Tuscany's 37.1 but a great improvement on that of 127.1 for 1938 The gloomy side of this picture is Sicily's continuing overpopulation. During the first ten years of the 20th century vast numbers of Sicilians emigrated. The annual average number of overseas emigrants from 1906–10 was more than 80,000, about 22% of Italy's total; in 1955 about 21,500 were able to emigrate.

Government.—Sicily is one of the five regions or *regioni* of Italy which obtained a special form of local autonomy under the constitution of 1948 (*see* ITALY). The Sicilian regional statute was conferred by an Italian constitutional law on Feb. 26, 1948. The capital of the region is Palermo.

The background of regional government in Sicily is totally different from that of the other regions enjoying local autonomy. The history of Sicily, occupied by many invaders and for long periods separated politically from the mainland, had produced a people differing greatly in character and habits from the inhabitants of the mainland. Sicily accepted incorporation in Italy in 1860, but the political institutions of Piedmont were not well suited to it, and the centralized control imposed by the government in Rome, afraid of any threat to Italy's recently won unity, checked the possibility of local autonomy. There was no political separatist movement before 1940, but there was a general feeling of discontent and a widespread belief that the interests of Sicily were sacrificed to those of the industrial north.

The sense of neglect and isolation accentuated by the unsettled conditions arising from the fall of the Fascist government and the Allied occupation in World War II produced the separatist movement of the summer of 1943. It gradually became clear that very few Sicilians wanted separation from Italy but that a large number wanted a considerable measure of local autonomy. The Italian government installed a high commissioner with plenary executive powers in Jan. 1944; and a royal decree law of May 15, 1946, granted Sicily a statute of autonomy which was converted unchanged into the constitutional statute of Feb. 26, 1948.

The statute gave Sicily a very considerable degree of self-government. The regional assembly (the local parliament) can be dissolved only for persistent violation of the statute and then only after a debate in the Italian parliament. The assembly's legislative powers are more extensive than those of any other region. Elementary education is in its hands, and legislation on higher education (including university education) is limited only by the need to conform to the general principles of national education. Without prejudice to the national parliament's plans for agrarian and industrial reform, the regional assembly has exclusive power to legislate on all questions concerning agriculture, land reclamation, industry and commerce.

The president of the region, elected by the assembly from among its members, is an important person. He not only represents the region, promulgates regional laws and, together with the *giunta* (the executive committee of the assembly), constitutes the government, but also has the right to attend meetings of the Italian council of ministers with the rank of minister and to speak when Sicilian questions are under discussion (though he has not the right to vote). He also represents the national government in the region, although the government may send temporarily special commissioners to explain particular functions which belong to the state. The president and *giunta* are invested by the statute with the supremely important executive function of maintaining public order by means of the national police force, although at their request the national government can act jointly with them.

Sicily has a high court of justice of its own in Rome, half of whose members are nominated by the Italian parliament and half by the regional assembly. This court decides on the constitutionality of laws issued by the regional assembly and of national laws which affect the regional statute.

The financial provisions of the statute are peculiar to Sicily. The island is expected to provide for its own expenditure by raising its own taxes. but the Italian state has agreed to hand over to the region a share of the taxation raised from firms which have factones or offices in Sicily though their central offices are not in the island. The state has also to pay over a lump sum annually for public works in Sicily.

The first regional parliament of 90 members was elected in April 1947; at the elections, held in June 1955, the Christian Democrat party obtained 37 seats, the Communists 20, the Socialists 10, the neo-Fascist *Movimento Sociale Italiano* 9 and the Monarchist party 8, while the other 6 seats were divided among Liberals, Social Democrats and the Popular Monarchist party.

The Sicilians are jealous of their independence and intolerant of any interference, but their experiment in regional autonomy began under difficult conditions and had to be carried on against a background of agrarian unrest, extreme poverty and a general feeling of resentment against Rome.

Agriculture and **Stockraising.**—In 1936 more than half the employed population of Sicily were engaged in agriculture. World War II did not materially alter the economic structure of the island and in 1951 the proportion was 51%. The outstanding feature of Sicilian land use is the very high proportion of the total area given over to agriculture and forest, more than 95% (cf. Italy's 92%).

Sicilian agriculture is dominated by the lack of water, which limits production and restricts the use of modern technical methods. Both intensive and extensive methods of cultivation exist in Sicily. Water and irrigation produce marvels of intensive farming, which is found along the narrow coastal fringe of the north and east coasts, on the slopes of Etna and of the Iblei mountains, in the immediate neighbourhood of towns in the south such as Xgrigento and Sciacca, around Marsala in the west and in the Conca d'Oro behind Palermo. Citrus fruits and vegetables grow in abundance and provide the main source of the island's exports. In these fertile areas small holdings are important and the majority of the farms are small (less than seven acres). Extensive farming prevails all over the interior, where the practically treeless land produces the wheat for which Sicily has been famous for more than 2,000 years.

The characteristic estates of the interior were the *latifondi*, large extensively cultivated estates frequently owned by absentee landlords and run on capitalist lines by middlemen who employ a few workers engaged by the year (*salariati*) and large numbers of badly paid day labourers. Before 1939 farms of more than 125 ac., which constituted less than 1% of the total number of farms in Sicily, occupied 36% of the land. Large areas were also sublet in fragmentary holdings to peasants who farmed the land extensively and thus created what is known as the *latifondo contadino* (the peasant's *latifondo).*

Subject to general conformity with the Italian parliament's plans for land reform, the regional government of Sicily has exclusive power to legislate on all agrarian questions. To change the system of extensive *latifondo* farming, however, was a difficult proposition : the shortage of water throughout the interior meant that any scheme for abolishing the great estates and for establishing peasant proprietors would be meaningless unless it made provision for a regular and sufficient water supply, which alone would make it possible to grow other crops than wheat; and supplies of water and better local roads were also required if the peasants were to be persuaded to live in small villages near their fields. Yet the Sicilian regional government made a beginning. On Dec. 27, 1950, a law was issued on the expropriation of land applicable to the whole island: 69,500 ac. were listed for expropriation (this amount was expected to rise to 250,000 ac.). Intensively cultivated land was exempt. The work of expropriation and redevelopment was entrusted to the Sicilian Land Reform agency in Palermo under the general supervision of the Italian ministry of agriculture.

Sicily's most important crop is wheat. In 1955 there were nearly 1,500,000 ha., or 3,750,000 ac. of arable land (61% of the cultivable area), of which 680,000 ha. were sown to wheat; production amounted to 774,300 metric tons or 10% of the total Italian wheat production. The yield, however, was low: Sicily produced only 11.4 quintals per hectare. as compared with an average of 19.6 for the whole of Italy and 35.0 for Lombardy. The second most important crop consists of citrus fruits, particularly lemons, of which Sicily produced 286,000 metric tons in 19jj, about 90% of Italy's total crop. The island also produces large quantities of fresh vegetables, particularly tomatoes, artichokes, peas and beans, and their early season makes them a profitable export crop. Quantities of wine are produced, mostly for local consumption; Marsala, however, is a valuable export wine.

The estimated number of cattle in Sicily had risen from 168,000 in 1930 to 238,000 in 1955; although the latter figure could be compared favourably with those for the southern regions of continental Italy it was admittedly much too low. The supply of fodder is poor, there are few permanent meadows, and much of the pasture is rough, only suitable for sheep and goats, both of which abound. The characteristic animals of Sicily are the donkeys and mules; there are enormous numbers of them (295,000 in 1955) and the sound of their bells and the size of their packs, often surmounted by a large peasant, are striking features of Sicilian life.

Fisheries.—In 1955, about one-quarter of the Italian fishing fleet was registered in Sicily (11,381 vessels, with a total tonnage of 35,750 metric tons), and fishing was an important source of employment. The most valuable fish caught is tunny (tuna); some is eaten fresh in Sicily, but most is canned for export. In 1935 the total Sicilian catch amounted to about one-third of Italy's, the tunny catch to one-half.

Industry.—The small canning industry of fish, fruit and vegetables was greatly expanded after 1945. The only important industry, sulfur mining. was adversely affected by the high cost of production and by the need for heavy capital expenditure to modernize the mines, so that the output of sulfur in 1950 only amounted to about half what it had been in 1938.

Communications.—Sicily's three chief ports are Palermo, Messina and Catania. A regular steamer connects Palermo with Naples, and Messina is linked to the mainland by the train-ferry service across the straits. The three chief ports are connected by three main railway lines, all single-track: one along the north coast from Palermo to Messina; one along the east coast from Messina to Catania and Syracuse; and one running inland from Catania to Palermo via Enna. The remarkable narrow-gauge circum-Etna railway, which climbs to 3,196 ft., is not a mere tourist line but carries heavy loads of agricultural produce. There are other secondary lines, but severe gradients and curves make traveling difficult. Main roads between important towns are good, but there is a dearth of good secondary roads, and some small hill towns or villages can only be reached by steep mule tracks. (M. M. C.)

SICKERT, WALTER RICHARD (1860–1942), influential British painter, was born at Munich on May 31, 1860, the son of Oswald Adalbert Sickert, a Danish-born German draftsman who settled in England in 1868. After some years on the stage, Sickert went in 1881 to the Slade school of art in London; he retained, however: something of the make-up of a late Victorian actor-manager. He studied under Alphonse Legros but through his father knew the works of Thomas Couture and Gustave Courbet. In 1832 he became a pupil of Whistler and in 1883 met Degas in Paris; these artists much influenced his work and personality. His first pictures of London music-hall interiors appeared in 1886, and, at the New English Art club, founded in that year. Sickert exhibited until 1917. Like Whistler, Sickert used tonal methods to' gain his effects, and his colours up to about 1904 are sombre. To Degas he was indebted for the ability to establish a situation merely by the attitudes of the figures—an innovation in England, where narrative painting was then governed by literary principles. Sickert coupled this with a refreshing vein of satire.

Between 1885 and 1905 Sickert spent most summers at Dieppe and worked in Venice. Returning to London in 1905 he became the focus of a group of painters which included Lucien Pissarro, Spencer Gore. Harold Gilman and Augustus John. Through Gore's and Pissarro's influence, Sickert's work began to show the influence of Neuimpressionism, though he was unmoved by the more advanced French styles then beginning to be known in London. He was a founder of the Camden Town and London groups (1911 and 1913) and was made a royal academician in 1934, resigning in 1935. He painted at Brighton and Kath in the 1920s and 1930s and wrote occasional criticism) supporting the principles of drawing observed by Degas. Such principles, and Sickert's own style, have been vital to English art and teaching. He died at Bath, Somerset, on Jan. 22, 1942. His grandfather, Johann Jürgen Sickert (1803–64) and his brother Bernhard Sickert (1862–1932) were also painters.

SICKINGEN, FRANZ VON (1481–1523), German knight, was born at Ebernburg near Worms on March 2, 1481. He fought for the emperor Maximilian I against Venice in 1508, inherited large estates on the Rhine and increased his wealth and reputation by numerous feuds. In 1513 he took up the quarrel of Balthasar Schlör, a citizen who had been driven out of Worms, and attacked this city with 7,000 men. He made war upon Antony, duke of Lorraine, and compelled Philip, landgrave of Hesse, to pay him 35,000 gulden. In 1518 he interfered in a civil conflict in Metz, ostensibly siding with the citizens against the governing oligarchy. He led an army of 20,000 men against the city, compelled the magistrates to give him 20,000 gold gulden and a month's pay for his troops. In 1518 Maximilian released him from the ban, and he took part in the war carried on by the Swabian league against Ulrich I, duke of Württemberg. In the contest for the imperial throne upon the death of Maximilian in 1519, Sickingen accepted bribes from Francis I, king of France, but when the election took place he led his troops to Frankfurt, where their presence assisted to secure the election of Charles V. For this service he was made imperial chamberlain and councillor, and in 1521 he led an expedition into France, which ravaged Picardy, but was beaten back from Mezières and forced to retreat. About 1517 Sickingen became intimate with Ulrich von Hutten, and gave his support to Hutten's schemes. In 1519 a threat from him freed John Reuchlin from his enemies, the Dominicans, and his castles became in Hutten's words a refuge for *righteousness.* Here many of the reformers found shelter, and a retreat was offered to Martin Luther. After the failure of the French expedition, Sickingen, aided by Hutten, formed, or revived, a scheme to overthrow the spiritual princes and to elevate the order of knighthood. He declared war against his old enemy, Richard of Greiffenklau, archbishop of Trier, and marched against that city. Trier was loyal to the archbishop, and the landgrave of Hesse and Louis V., count palatine of the Rhine, hastened to his assistance. Sickingen fell back on his castle of Landstuhl, near Kaiserslautern, collecting much booty on the way. On Oct. 22, 1522 the council of regency placed him under the ban, to which he replied, in the spring of 1523, by plundering Kaiserslautern. The rulers of Trier, Hesse and the Palatinate decided to press the campaign against him, and having obtained help from the Swabian league, marched on Landstuhl. On May 6, 1523 he was forced to capitulate, and died the next day.

SICKLES, DANIEL EDGAR (1819–1914), American soldier and diplomatist, was born in New York city on Oct. 20, 1819. He learned the printer's trade, studied in the University of the City of New York (now New York university), and was admitted to the bar in 1846. In 1833 he became corporation counsel of New York city, and from 1857 to 1861 was a Democratic representative in Congress. At the outbreak of the Civil War, Sickles was active in raising United States Volunteers in New York, became a brigadier-general of volunteers in Sept. 1861, led a brigade of the Army of the Potomac with credit up to the battle of Antietam, and then succeeded to a divisional command. He took part with distinction in the battle of Fredericksburg, and in 1863 as a major-general commanded the III. Army Corps. His energy and ability were conspicuous in the disastrous battle of Chancellorsville (*q.v.*); and at Gettysburg (*q.v.*) the part played by his corps in the desperate fighting around the Peach orchard was one of the most noteworthy incidents in the battle. He himself lost a leg and his active military career came to an end. Sickles was one of the few successful volunteer generals who served on either side. In 1869 he was retired with the rank of major-general (U.S.A.). He was minister to Spain from 1869 to 1873, and took part in the negotiations growing out of the "Virginius affair." In 1893–95 he was again a representative in Congress His last years were disturbed by financial difficulties. He died in New York city on May 3, 1914.

SICULI, ancient Sicilian tribe (Gr. *Sikelói*). In historical times it occupied the eastern half of the island to which it gave its name. It plays a large though rather shadowy part in the early traditions of pre-Roman Italy. There is abundant evidence that the Siculi once lived in Central Italy east and even north of Rome (*e.g.* Servius ad Aen. vii. 795; Dion. Hal. i. 9. 22; Thucydides vi. 2). Thence they were dislodged by the Umbro-Safine tribes, and finally crossed to Sicily. They were distinct from the Sicani (q *v.;* Virg. Aen. viii. 328) who inhabited the western half of the island.

The towns of the Siculi were under independent rulers. They played an important part in the history of the island after the arrival of the Greeks (see SICILY). Their agricultural pursuits and the volcanic nature of the island made them worshippers of the gods of the nether world, and they have enriched mythology with some national figures. The most important of these were the Palici, protectors of agriculture and sailors, who had a lake and temple in the neighbourhood of the river Symaethus, the chief seat of the Siculi; Adranus, father of the Palici, a god akin to Hephaestus, in whose temple a fire was always kept burning; Hybla (or Hyblaea), after whom three towns were named, whose sanctuary was at Hybla Gereatis. The connexion of Demeter and Kore aith Henna (the rape of Proserpine) and of Arethusa with Syracuse is due to Greek influence. Their chief towns were: Agyrium (*San Filippo d'Argiró*); Centuripa (or Centuripae; *Centorbi*); Henna (Castrogiouanni, a corruption of Castrum Hennae through the Arabic Casr-janni); Hybla, three in number, (a) Hybla Major, called Geleatis or Gereatis, on the river Symaethus, probably the Hybla famous for its honey, although according to others this was (b) Hybla Minor, on the east coast north of Syracuse, afterwards the site of the Dorian colony of Megara, (*c*) Hybla Heraea in the south of the island. For authorities see SICILY.

SICYON (or SECYON, the older local form), an ancient Greek city in northern Peloponnesus between Corinth and Achaea, on a low triangular plateau about 2 m. from the Corinthian Gulf, at the confluence of the Asopus and the Helisson. Between city and port lay a fertile plain with olive-groves and orchards. Its primitive name was Aegialeia "beach-town"; its original population Ionian; the myth and cult of Adrastus show early connection with Argos; and in the Iliad it is a dependency of Agamemnon. After the Dorian invasion it had the three Dorian tribes with an equally privileged tribe of Aigialeis (probably old Ionian) and a class of land-serfs (*κορυνηφόροι* or *κατωνακοφόροι*). For some centuries Sicyon remained subject to Argos, and acknowledged a certain suzerainty as late as 500 B.C. But virtual independence was established in the 7th century by anti-Dorian tyrants, known after their founder as the Orthagoridae, whose mild rule lasted longer than any other Greek tyranny (about 665–565 B.C.). The founder's grandson Cleisthenes held intercourse with many commercial centres of Greece and south Italy and gave his heiress in marriage to Megacles of Athens, whose son was the Athenian legislator of that name. Cleisthenes (*q.v.*) besides reforming the city's constitution and replacing Dorian cults by the worship of Dionysus, was chief instigator of the First Sacred War (590) in the interest of Delphi. After the fall of the tyranny, Cleisthenes' institutions survived till the end of the 6th century, when Dorian supremacy was re-established, and the city joined the Peloponnesian League. Henceforth its policy was usually determined by Sparta or by its powerful neighbour Corinth. During the Persian wars Sicyon furnished 3,000 heavy-armed men; its school of bronze sculptors produced Canachus (*q.v.*) a master of the late archaic style. In the 5th century it suffered like Corinth from the commercial rivalry of Athens and was repeatedly harassed by Athenian ships. In the Peloponnesian war Sicyon followed Sparta and Corinth. Again in the Corinthian war Sicyon sided with Sparta. In 369 when it was captured and garrisoned by the Thebans a powerful citizen Euphron established himself tyrant by popular support. His deposition by the Thebans and subsequent murder freed Sicyon for a while, but new tyrants arose with the help of Philip II. of Xiacedon. Nevertheless during this period Sicyon reached its zenith as a centre of art: its school of painting under Eupompus attracted Pamphilus and Apelles as students; its sculpture culminated in Lysippus and his pupils. After participating in the Lamian war and the campaigns of the Macedonian pretenders the city was captured (303) by Demetrius Poliorcetes, who transplanted the inhabitants to the Acropolis and renamed the site Demetrias. In the 3rd century it passed from tyrant to tyrant, until in 251 it was liberated and enrolled in the Achaean League (*q.v.*). The destruction of Corinth (146) brought an acquisition of territory and presidency over the Isthmian games; yet in Cicero's time Sicyon had fallen deep into debt. Under the empire it was quite obscured by the restored Corinth and Patrae; Pausanias (A.D. 150) found it almost desolate. In Byzantine times it became a bishop's seat, and its later name "Hellas" reveals it as a refuge for Greeks from Slavonic immigrants of the 8th century.

An insignificant village, Vasiliko, now occupies the site. Ancient fortifications are still visible, and remains of a theatre, a stadium, aqueducts and foundations of buildings.

SIDDONS, SARAH (1755–1831), English actress. the eldest of 12 children of Roger Kemble, was born in the "Shoulder of Mutton" public house, Brecon. Wales, on July 5, 1755.

She became attached to William Siddons. whom she married at Trinity church, Coventry, on Nov. 26. 1773. In 1774 she played Belvidera in Otway's *Venice* Preserved at Cheltenham, and moved to tears a party of "people of quality" who had come to scoff. Garrick then sent his deputy to see her as Calista in Rowe's Fair Penitent, the result being that she was engaged to appear at Drury Lane at a salary of £5 a week.

After a very successful engagement at Bath, beginning in 1778 and lasting five years, she again appeared at Drury Lane. when her acting as Isabella in Garrick's version of Southerne's Fatal Marriage (Oct. 10) was a triumph, only equaled in the history of the English stage by that of Garrick's first night at Drury Lane in 1741 and that of Edmund Kean's in 1814

As Lady Macbeth. Mrs. Siddons found the highest and best scope for her gifts. It fitted her as no other character did, and as perhaps, it will never fit another actress Her tall figure. brilliant beauty, expressive eyes and her dignity of demeanour heightened the tragedy of the part. After Lady Macbeth she played Desdemona. Rosalind and Ophelia, all with great success; in Queen Catherine—which she first played on the occasion of her brother John Kemble's spectacular revival of *Henry VIII* in 1788—she discovered a part almost as well adapted to her peculiar powers as that of Lady Macbeth. As Volumnia in Kemble's version of *Coriolanus* she also secured a triumph. Her last appearance was on June 9, 1819, as Lady Randolph in Home's *Douglas.* Mrs. Siddons died in London on June 8. 1831.

SIDE (mod. ESKI ADALIA), an ancient city on the Pamphylian coast about 12 mi. E. of the mouth of the Eurymedon. Possessing a good harbour in the days of small craft, it was the most important place in Pamphylia. Alexander visited and occupied it, and there the Rhodian fleet defeated that of Antiochus the Great, and in the succeeding century the Cilician pirates established there their chief seat. An inscription shows it had many Jews in early Byzantine times. The great ruins cover a large promontory, fenced from the mainland by a ditch and wall which has been repaired in medieval times and is singularly perfect. Within this is a maze of structures out of which rises the colossal ruin of the theatre. built up on arches like a Roman amphitheatre.

SIDEBOARD. Originally the sideboard was what its name implies—a side table. Then two- or three-tiered sideboards were in use in the Tudor period, and were perhaps the ancestors, or collaterals, of the court cupboard, which in skeleton they much resembled. Early in the 18th century they began to be replaced by side tables properly so called. In the beginning these tables were entirely of wood and comparatively slight. but before long it became the fashion to use a marble slab instead of a wooden top. which necessitated a somewhat more robust construction. Many of the sideboard tables of this period were exceedingly handsome. with cabriole legs, claw or claw and bill feet, friezes of acanthus, much gadrooning and mask pendants. Many such tables came from Chippendale's workshops, but he had no influence upon the evolution of the sideboard. which arose from the growth of domestic needs. Save upon its surface, the sideboard table offered no accommodation; it usually lacked even a drawer. Even, however. in the period of Chippendale's zenith separate "bottle cisterns" and "lavatories" for the convenience of the butler in washing the silver as the meals proceeded were. no doubt, sometimes in use. By degrees it became customary to place a pedestal. which was really a cellarette or a plate warmer, at each end of the sideboard table. One of them would contain ice and accommodation for bottles: the other would be a cistern. Sometimes a singie pedestal would be surmounted by a wooden vase lined with metal and filled with water, and fitted with a tap. To whom is clue the brilliant inspiration of attaching the pedestals to the table and creating a single piece of furniture out of three components there is nothing to show with certainty. It is most probable that the credit is due to Shearer, who unquestionably did much for the improvement of the sidebosrd; Hepplewhite and the brothers Adam distinguished themselves in the same field but it was Sheraton who brought it to its full bloom. By the use of fine exotic woods, the deft employment of satin wood and other inlays, and by the addition of gracefully ornamented brasswork at the back. sometimes surmounted by candles to light up the silver. Sheraton produced effects of great elegance. But for sheer artistic excellence in the components of what presently became the sideboard, the Xdams stand unrivaled: some of their inlay and brass mounts were almost equal to the first work of the great French school.

SIDERITE (Chalybite), a mineral consisting principally of ferrous carbonate, but frequently containing substantial amounts of manganese and magnesium and lesser amounts of calcium substituted for iron. Also known as spathic iron ore. its principal use is as a source of iron for the manufacture of iron and steel, especially in Great Britain and Austria (*see* Iron: *Compounds of Iron;* Iron and Steel: *Iron Ore).* Ferrous carbonate, not necessarily produced directly from siderite, is used in the treatment of anemia and in the preparation of other iron compounds. 'The composition is expressed by $FeCO_3$. 'The hardness is $3\frac{1}{4}$–$4\frac{1}{4}$, the specific gravity is 3.96 (for pure $FeCO_3$) and the colour is usually a shade of brown because of partial oxidation.

Siderite is found in small amounts in cavities in basaltic igneous rocks and as a subordinate gangue mineral in hydrothermal metallic veins and in some pegmatites. It is widely distributed as a fine-grained concretion (*q.v.*) and in thin beds associated with shales and coal seams. The organic matter preserved in the latter rocks has been taken to indicate that they were formed in chemically reducing environments, and indeed siderite has been observed in some swamps forming under such conditions. Siderite is also found in sedimentary rocks of Jurassic age in England and western Europe admixed with varying amounts of calcitic shells and oolites of the iron silicate chamoisite. It is a constituent of the banded iron ores of the Lake Superior district.

(D. L. G.)

SIDEROSTAT, an instrument which. like the coelostat and heliostat (*q.v.*), reflects a portion of the sky in a fixed direction notwithstanding the diurnal motion of the heavens. The name is applied especially to the polar siderostat, a form of telescope in which the observer looks down the polar axis on to a mirror; by adjusting the mirror he can bring any part of the sky into the field of view without changing his own position.

SIDGWICK, HENRY (1838–1900). English philosopher. best known for his theories concerning ethics. was born at Skipton in Yorkshire on May 31. 1838. He was educated at Rugby and at Trinity college. Cambridge. In 1859 he was elected fellow of Trinity and then lecturer in classics. In 1869 he exchanged this lectureship for one in moral philosophy, but resigned his fellowship on religious grounds.

He was appointed praelector in 1875 and elected to an honorary fellowship in 1851. In 1883 he was appointed Knightsbridge professor of moral philosophy: and in 1885, the religious test having been removed, Trinity again elected him to a fellowship on the foundation. He died on Aug. 29, 1900.

Sidgwick took an active part in university business and especially in promoting the higher education of women through the foundation of Newnham college. He had married in 1876 Eleanor Mildred Balfour (sister of A. J. Balfour) who succeeded Miss A. J. Clough as principal of Newnham in 1892. He was active in social and philanthropic work and deeply interested in psychical phenomena. being a founder and first president of the Society for Psychical Research. But his energies were mainly directed to the study of religion and philosophy.

Sidgwick's major work was *Methods of Ethics* (London, Cambridge. 1874; 6th ed., London. 1901; reissue of 7th ed.. 1930). His three "methods" are egoism. utilitarianism and intuitionism. Egoism is the theory that justifies an action by its contribution to the greatest happiness of the agent, utilitarianism by its contribution to the greatest happiness of all those affected by it. Sidgwick uses "intuitionism" to designate all theories which recognize ultimate ends other than happiness or ultimate rules other than the rule that the maximum happiness ought to be promoted. In support of intuitionism, Sidgwick admits that ordinary men regard many rules as binding on them independently of the happiness produced and also that they often regard ends other than happiness (ends such as knowledge, beauty and virtue) as intrinsically desirable. Rut he argues that the rules of common sense are vague and indefinite: they allow exceptions and conflict with each other. Thus they cannot be regarded as providing an adequate rational basis for conduct. Most of them can, however, be justified as tending to promote general happiness, and the principle of utility can always be invoked to render their application more precise, to explain their exceptions and to resolve their conflicts.

While rejecting psychological hedonism. Sidgwick points out that any action can be rationally justified by demonstrating its contribution to the happiness of the agent. This egoistic principle, indeed, if taken as the sole guide to life, seems repellent to the moral sentiment; and when a man's private good conflicts with the general good most men agree that the former should yield. Yet even such lofty moralists as Joseph Butler and Samuel Clarke are found suggesting that enlightened self-love is the supreme principle of rational conduct. Utilitarianism appears to Sidgwick to be the only principle capable of giving rational unity to moral consciousness. But he finds it difficult to reconcile its moral claims with the rational supremacy of self-love. There is no empirical evidence that a man's achievement of the greatest general happiness will in fact entail his own greatest happiness. Some thinkers, such as Plato and Kant. relied here on a belief in the divine ordering of the world to guarantee this coincidence. Sidgwick concludes that only such a belief (whether based on theology or imported as an ad *hoc* postulate) will serve to bring unity to the world of rational conduct.

Sidgwick's claim to distinction does not rest on the originality or conclusiveness of the doctrines summarized above. His work is marked by caution and thoroughness, a masterly exposure of confusions and ambiguities, an acute and balanced presentation of complex argument and an open-minded candour and honesty.

Sidgwick's chiei works are *Principles of Political Economy* (1883; 3rd ed., 1901); *The Scope and Method of Economic Science* (1885); *Outlines of the History of Ethics* (1886; 6th ed., 1931), enlarged irom his article "Ethics" in the *Encyclopædia Britannica,* 9th ed., vol. viii (1879); *Elements of Politics* (1891; 2nd ed., 1897; reissue of 4th ed., 1929). The following were published posthumously: *Philosophy: Its Scope and Relntions* (1902); *Lectures on the Ethics of T. H. Grern, Mr. Herbert Spencer and J. Martineau* (1902); *The Development of European Polity* (1903); *Miscellaneous Essays and Addresses (1904); Lectures on the Philosophy of Kant (190.5).*

SIDGWICK, NEVIL VINCENT (1873–1952). English chemist whose conception and elaboration of electronic bonding was a valuable interpretation of chemical union, was born on May 8. 1873, at Oxiord. Sidgwick received his M.A. at Oxford university and his Ph.D. at Tubingen. He became fellow and tutor at Lincoln college. Oxford. in 1901, reader in chemistry at Oxford in 1926 and professor in 1935, a position which he held until 1945. His books are. *Organic Chemistry of Nitrogen* (1910), *Electronic Theory of Valency* (1927), *The Covalent Link in Chemistry* (1933) and *The Chemical Elements* (1950) in two monumental volunies. Sidgwick was Baker lecturer at Cornell (N.Y.) in 1931, vice-president of the Royal society in 1935–37, president of the Faraday society in 1932–34 and president of the Chemical society in 1935–37. He received the Royal medal of the Royal society in 1937 and the Longstaff medal-in 1945. He died March 1j, 1952, at Oxford.

(V. Bw.)

SIDI-BEL-ABBÈS, chief town of an *arrondissement* in the *département* of Oran. Alg., 48 mi. by rail S. of Oran. 1,552 ft. above the sea. on the right bank of the Mekerra. It lies in what was once a barren area but which is now a great cereal-producing region. The town is the headquarters of the 1st regiment of the Foreign Legion. It is encircled by a crenelated and bastioned wall with a fosse. and has four gates, named after Oran. Daia. Mascara and Tlemçen respectively. Starting from the gates. two broad streets, shaded by plane trees, traverse the town east to west and north to south. Pop. (1960) 101,000 (commune).

SIDMOUTH, HENRY ADDINGTON, 1st Viscount (1757–1844), English statesman. son of Anthony Addington, a physician, was born on Play 30, 1757. Educated at Winchester college and at Rrasenose college, Oxford, he became a member of parliament for Devizes in 1784. He was a personal friend and strong supporter of William Pitt. and in 1789, with Pitt's support, became speaker of the house of commons. Rejecting offers of a position in the cabinet. he held this post until 1801. In that year, after Pitt had quarrelled with the king on the question of Catholic emancipation. the more pliable and very Protestant Addington became prime minister. He held the position until April 1804. when Pitt returned to office. As prime minister. Addington was responsible for the treaty of Amiens in March 1802, a settlement which increased his popularity in the country. hut. when it proved only temporary. Addington's Fortunes became less favourable. When the war was renewed in May 1803. it was clear that Addington lacked the necessary gifts of a war leader, and Pitt. who began openly to oppose the government, took his place. Addington's continued importance in politics depended not on his personality and his abilities so much as on the little group of about jo followers in the house of commons. who provided an important element in political calculations. In Jan. 1805 Addington and his group supported Pitt, and Addington himself. who was created Viscount Sidmouth. re-entered the cabinet as lord president of the council. In July 1805 he broke away again but entered the opposition ministry of Charles James Fox and George Grenville in Feb. 1806 as lord privy seal. Remaining true to his Protestant. Church of England allegiance. he left the new ministry also in 1807. when the government proposed to throw open commissions in the army and navy to Roman Catholics and dissenters. As a spokesman of the Church of England party he attempted in 1811 to bring in a private bill requiring all dissenting ministers to be licensed, and restraining unlicensed preachers. The bill was unsuccessful. but a year later he returned to the cabinet under the prime ministership of Spencer Perceval. After Perceval's assassination in June 1812 and the formation of the earl of Liverpool's ministry. Sidmouth became home secretary. He held this post until Dec. 1821. As home secretary Sidmouth had to deal with a discontented population disposed to demonstration and riot. The first year of his office was one of high prices. commercial difficulties and large-scale unemployment: to control the situation, in face of demonstrations both by manufacturers and by Luddites. he increased the power of the magistrates. After 181j he carried this policy of firmness much farther. In 1817, for instance. he issued a circular to the lords lieutenant declaring that magistrates might apprehend and hold to hail persons accused on oath of seditious libels. and was supported by parliament even after William Hone had been acquitted by a jury on charges which followed Sidmouth's instructions. He was mainly responsible for the later policy embodied in the "Six Acts" of 1819, which. among other provisions, limited the rights of public meeting and the circulation of political literature. His instructions to magistrates and his use of police spies made him detestable to radicals and liberals of every shade. Exhausted by his efforts, he resigned office in Dec. 1821. but, with the strong support oi the king, he remained a member of the cabinet until 1824, when he resigned because of his disapproval of the recognition of the South American republics. Subsequently he took little part in public affairs. although he remained a strong supporter of church and king, in 1829 speaking against Catholic emancipation and in 1832 voting against the Reform bill. He died at Richmond Park on Feb. 15, 1844.

Sidmouth was a statesman of limited imagination and no outstanding ability, but his character and integrity could not be questioned: his inability to assess the forces of change in English politics prevented him from leaving any permanent mark on English history.

SIDMOUTH, a seaside town and urban district in the Honiton parliamentary division of Devon, Eng.. 15 mi. E.S.E. of Exeter by road. Pop. (1961) 11,139. Area 17.9 sq.mi. It lies in the valley formed by the Sid in the red sandstone cliffs edging the western end of Lyme bay. Traces of a Bronze Age camp have been found on High Peak; on Salcombe hill is the Norman Lockyer observatory, now belonging to the University College of the South West. The beach is of shingle with sand at low tide. and most of the houses were built during the Regency period when Sidmouth became a watering place. Catering for visitors and agriculture are the main industries

SIDNEY or (Sydney) **ALGERNON** (1622–1683), English politician second son of Robert 2nd earl of Leicester and of Dorothy Percy daughter ot Henry 9th earl of Northumberland was born at Penshurst Kent As a boy he showed much talent. which was carefully trained under his iather s eqe In 1632 with his elder brother Philip he accompanied his father on his mission as ambassador extraordinary to Christian IV ot Denmark In May 1636 Sidney nent with his father to Paris nhere he became a general favourite and from there to Rome In Oct 1641 he was given a troop in his father's regiment in Ireland of which his brother knonn as Lord Lisle was in command In Aug 1643 the brothers returned to England At Chester their horses were taken by the Royalists, ahereupon they again put out to sea and landed at Lirerpool Here they nere detained by the Parliamentarq commissioners and by them sent up to London for safe custody From this time Sidney ardently attached himself to the Parliamentary cause On May 10 1644 he was made captain of horse in Manchester's army under the Eastern Association He mas shortly afterward made lieutenant-colonel, and charged at the head oi his regiment at Marston Moor (July 2) where he was wounded, and rescued with difficulty. In April 164j he was given the command of a cavalry regiment in Cromwell's division of Fairfax's army, was appointed governor of Chichester on May 10, and in December was returned to parliament for Cardiff. In July 1646 he went to Ireland, where his brother was lord-lieutenant, and was made lieutenant-general of horse and governor of Dublin. He had hardly reached Ireland when he was recalled and stationed at Dover castle as governor. He was at this time acting with the Independents, and was nominated one of the commissioners for the trial of Charles I. But he took no part in the trial, and remained at Penshurst until the trial was over. He states that he opposed the proceedings on the grounds, "first, that the king could be tried by no court; second, that no man could be tried by that court." In 1651 he lost his governorship of Dover castle, and spent some months in Holland. In the autumn he became a member of the council of State, but he disapproved of Cromwell's assumption of the supreme power, and retired to Penshurst, and then to The Hague, where he became a close friend of De Witt

Upon the restoration of the Long Parliament, in May 1659, Sidney again took his seat, and was placed on the council of

State. He was now, as before, especially concerned with the foreign work of the council. In June he was appointed one of three commissioners to mediate for a peace between Denmark, supported by Holland, and Sweden. He was probably intended to watch the conduct of his colleague, Admiral Montagu (afterwards 1st earl of Sandwich), who was in command of the Baltic squadron. Upon the conclusion of the treaty he went to Stockholm as plenipotentiary; and in both capacities he behaved with resolution and address. Meanwhile the Restoration had taken place and Sidney, instead of returning to England, went to Copenhagen, and then to Hamburg to await the turn of events. He then travelled by way of Venice to Rome. His father sent him very little money. Five shillings a day, he says, served him and two men very well for meat, drink and firing in Rome. He devoted himself to the study of books, birds and trees, and speaks of his natural delight in solitude being largely increased. In 1663 he left Italy, passed through Switzerland, where he visited Ludlow and came to Brussels in September, where his portrait was painted by van Egmondt; it is now at Penshurst. He had thoughts of joining the imperial service, and offered to transport from England a body of the old Commonwealth men; but this was refused by the English court. The enmity against him was so great that now, as on other occasions, attempts were made to assassinate him. On the breaking out of the Dutch war, Sidney, who was at The Hague, urged an invasion of England, and shortly afterwards went to Paris, where he offered to raise a rebellion in England on receipt of 100,000 crowns. Unable, however, to come to terms with the French Government, he once more went into retirement in 1666.—this time to the south of France. In Aug. 1670 he was again in Paris, and Arlington proposed that he should receive a pension from Louis; Charles II. agreed, but insisted that Sidney should return to Languedoc.

His father was now very ill, and after much difficulty Sidney obtained leave to come to England in the autumn of 1677. Lord Leicester died in November; and legal business connected with other portions of the succession detained Sidney from returning to France as he had intended. He soon became involved in political intrigue, joining, in general, the country party, and holding close communication with Barillon, the French ambassador. In the beginning of 1679 he stood for Guildford, and was warmly supported by William Penn, with whom he had long been intimate, and whom he is said (as is now thought, erroneously) to have helped in drawing up the constitution of Pennsylvania. He was defeated by court influence, and his petition to the House, complaining of an undue return, never came to a decision. His *Letters to Henry Savile,* written at this period, are of great interest. He was in Paris, apparently only for a short while, in Kov. 1679. Into the prosecution of the Popish Plot Sidney threw himself warmly, and was among those who looked to Monmouth, rather than to William, to take the place of James in the succession, though he afterwards disclaimed all interest in such a question. He now stood for Bramber (Sussex), again with Penn's support, and a double return was made. He is reported on Aug. 10, 1679, as being elected for Amersham (Buckingham) with Sir Roger Hill. When parliament met, however, in Oct. 1680, his election was declared void. But now, under the idea that an alliance between Charles and William would be more hostile to English liberty than would the progress of the French arms, he acted with Barillon in influencing members of parliament in this sense.

Upon the dissolution of the last of Charles's parliaments the king issued a justificatory declaration. This was at once answered by a paper entitled *A Just and Modest Vindication, etc.,* the first sketch of which is imputed to Sidney. It was then, too, that his most celebrated production, the *Discourses concerning Government,* was concluded, in which he upholds the doctrine of the mutual compact and traverses the High Tory positions.

For a long while Sidney kept himself aloof from the duke of Monmouth, to whom he was introduced by Lord Howard. After the death of Shaftesbury, however, in Nov. 1682, he entered into the conferences held between Monmouth, Russell, Essex, Hampden and others. That treasonable talk went on seems certain, but it is probable that matters went no further. The watchfulness of the court was, however, aroused, and on the discovery of the Rye House Plot, Sidney, who had always been regarded in a vague way as dangerous, was arrested while at dinner on June 26, 1683. His papers were carried off, and he was sent at once to the Tower on a charge of high treason. For a considerable while no evidence could be found on which to establish a charge. Jeffreys, however, was made lord chief-justice in September; a jury was packed; and, after consultations between the judge and the crown lawyers, Sidney was brought to listen to the indictment on Nov. 7.

The trial began on Nov. 21; Sidney was refused a copy of the indictment, in direct violation of law, and he was refused the assistance of counsel. Hearsay evidence and the testimony of the perjured informer Lord Howard, whom Sidney had been instrumental in introducing to his friends, were first produced. This being insufficient, partial extracts from papers found in Sidney's study, and supposed only to be in his handwriting, in which the lawfulness of resistance to oppression was upheld, were next relied on. He was indicted for "conspiring and compassing the death of the king." Sidney conducted his case throughout with skill. Against the determination to secure a conviction, however, his courage, eloquence, coolness and skill were of no avail, and the verdict of "guilty" was given. On Nov. 2j, Sidney presented a petition to the king. The necessity, however, of checking the hopes of Monmouth's partisans caused the king to be inexorable. The last days of Sidney's life were spent in drawing up his *Apology* and in discourse with Independent ministers. He was beheaded on the morning of Dec. 7, 1683. His remains were buried at Penshurst.

An edition of the *Discourses concerning Government,* containing his letters, the report of his trial, and the "Apology" written in his last hours, was published in 1763, and reprinted in 1772, with corrections and additions. There is a notice of Algernon Sidney in the preface to Collins's *Sidney Papers,* and some letters of his appear in that collection. *See* also A. C. Ewald, *Life and Times of Algernon Sidney* (2 vols., 1873); and the life by C. H. Firth in the *Dictionary of National Biography.* (O. A.; X.)

SIDNEY, SIR HENRY (1529–1586), lord deputy of Ireland, was the eldest son of Sir William Sidney, a prominent politician and courtier in the reigns of Henry VIII. and Edward VI. from both of whom he received extensive grants of land, including the manor of Penshurst in Kent, which became the principal residence of the family. Henry was brought up at court as the companion of Prince Edward, afterwards King Edward VI.; and he continued to enjoy the favour of the sovereign throughout the reigns of Edward and Mary. In 1556 he went to Ireland with the lord deputy, the earl of Sussex, who in the previous year had married his sister Frances Sidney; and from the first he had a large share in the administration of the country, especially in the military measures taken by his brother-in-law for bringing the native Irish chieftains into submission to the English Crown. In the course of the lord deputy's Ulster expedition in 1557 Sidney devastated the island of Rathlin; and during the absence of Sussex in England in the following year Sidney was charged with the sole responsibility for the government of Ireland, which he conducted with marked ability and success. A second absence of the lord deputy from Ireland, occasioned by the accession of Queen Elizabeth, threw the chief control into Sidney's hands at the outbreak of trouble with Shane O'Neill, and he displayed great skill in temporizing with that redoubtable chieftain till Sussex reluctantly returned to his duties in August 1559. About the same time Sidney resigned his office of vice-treasurer of Ireland on being appointed president of the Welsh Marches.

In 1565 Sidney was appointed lord deputy of Ireland in place of Sir Nicholas Arnold, who had succeeded the earl of Sussex in the previous year. He found the country in a more impoverished and more turbulent condition than when he left it, the chief disturbing factor being Shane O'Neill in Ulster. With difficulty he persuaded Elizabeth to sanction vigorous measures against O'Neill; and although the latter successfully avoided a decisive encounter, Sidney restored O'Neill's rival Calvagh O'Donnell to his rights, and established an English garrison at Derry which did something to maintain order. In 1567 Shane was murdered by the MacDonnells of Antrim *(see* O'NEILL), and Sidney was then free to turn his attention to the south, where with vigour and determination he arranged the quarrel between the earls of Desmond and Ormonde, and laid his hand heavily on other disturbers of the peace; then, returning to Ulster, he compelled Turlough Luineach O'Neill, Shane's successor, to make submission, and placed garrisons at Belfast and Carrickfergus to overawe Tyrone and the Glynns. In 1367 Sidney went to England. On his return he urged Cecil to improve the economic condition of Ireland, to open up the country by the construction of roads and bridges, to replace the Ulster tribal institutions by a system of freehold land tenure, and to repress the ceaseless disorder prevalent in every part of the island.

Sidney left Ireland in 1571, aggrieved by the slight appreciation of his statesmanship shown by the queen; but he returned thither in September 1575 to find matters in a worse state than before, especially in Antrim, where the MacQuillins of the Route and Sorley Boy MacDonnell (*q.v.*) were the chief fomenters of disorder. Having to some extent pacified this northern territory, Sidney repaired to the south. where he was equally successful in making his authority respected. He made shire divisions on the English model, having earlier combined the Ardes and Clandeboye to form the county of Carrickfergus, and converted the country of the O'Farrells into the county of Longford; in Connaught the ancient Irish district of Thomond became the county Clare, and the counties of Galway, Mayo, Sligo and Roscommon were also delimited. He suppressed a rebellion headed by the earl of Clanricarde and his sons in 1576, and hunted Rory O'More to his death two years later. Meantime Sidney's methods of taxation had caused discontent among the gentry of the Pale, who carried their grievances to Queen Elizabeth. Greatly to Sidney's chagrin the queen censured his extravagance. He was recalled in September 1578, and died at Ludlow Castle on May 5, 1586.

SIDNEY, SIR PHILIP (1554–1586), the finest English example of the Renaissance ideal of the perfect gentleman. He was virile and cultivated: a soldier. statesman, courtier, poet and patron of scholars and poets. The eldest son of Sir Henry Sidney and Mary Dudley, he was born at Penshurst, Kent, on Nov. 30, 1554. On Oct. 17, 1564, he and his lifelong friend Fulke Greville were entered at Shrewsbury school. Sidney's training was based on the assumption that he would be heir to his uncle, the earl of Leicester. He visited Kenilworth. Leicester's home, in Aug. 1566 and with Leicester took part in Queen Elizabeth I's progress to Oxford. In 1568 he went to Christ Church, Oxford. As lord deputy Sir Henry was much in Ireland and Sidney spent some vacations with the Cecils: a match was proposed in 1569 with Sir William Cecil's daughter Anne, but came to nothing.

On May 2j, 1572, Queen Elizabeth granted Sidney a licence to travel for two years to learn foreign languages. He left England in the earl of Lincoln's suite and reached Paris, where he lodged with the English ambassador, Sir Francis Walsingham, on June 8. The massacre of St. Bartholomew's day caused his departure for Frankfurt, where he lodged with the scholar-printer, Andrew Wechel, and met Hubert Languet, an ardent Huguenot who, like other mature scholars and men of affairs, conceived warm affection and admiration for Sidney. In the early summer, 1573, he went on to Heidelberg, Strasbourg and Vienna and in October left for Italy, spending some time in Venice where his portrait was painted by Paolo Veronese. In Oct. 1574 he returned to Vienna, and after a second visit to Prague in Feb. 1575, to England. He spoke French and Italian well, and his letter to Lord Burghley (Dec. 1574) shows that he had also a firm grasp of European politics.

Insufficient use was made of his training and exceptional ability during the next ten years. His father had once more been sent to Ireland, and this brought Sidney into touch with the earl of Essex, earl marshal for Ireland, who desired a marriage between Philip and his daughter, Penelope—the "Stella" of his sonnets. But nothing came of this, and Essex died in 1576. In 1577 Sidney was sent on an embassy to the emperor Rudolph II. He met Don John of Austria at Louvain, proposed a Protestant league to the emperor at Prague and on the way back was warmly received by William of Orange. On his return he defended his father's government of Ireland, particularly from the attacks of Lord Ormond, writing the *Discourse on Irish Affairs* for the queen. In 1580 he was bold enough to oppose the queen's proposed marriage to the duc d'Alençon in a *Letter to the Queen.* He was knighted in 1583 to enable him to receive the Garter as Prince John Casimir's proxy.

Sidney divided his time between his uncle's town residence, Leicester house, and Wilton, where his sister Mary. now countess of Pembroke, lived. He took part in the court festivities and composed *The Lady of May* for Leicester's entertainment of the queen at Wanstead in 1578. In this year he met Spenser at Leicester house and discussed with him and Edward Dyer the use of classical metres in English verse. Spenser's *Tlze Shepheardes Calender* (1579) was dedicated to Sidney. During these years he himself wrote the *Arcadia, An Apologie for Poetrie* and *Astrophel and* Stella—some of the sonnets in this cycle would seem to have been written after Penelope Devereux's enforced marriage to Lord Rich toward the end of 1581. Sidney's literary output was the result of his lack of employment in serious affairs, and it is unlikely that his untimely death prevented further imaginative works.

In the autumn of 1583 he married Frances Walsingham; Elizabeth stood godmother to the daughter born in 1585. Sidney still desired active service and took an interest in the colonizing enterprises of Martin Frobisher, Richard Hakluyt and Sir Walter Raleigh. He advocated a direct attack on Spain, and was himself preparing to sail with Drake in 1585 when the queen recalled him and appointed him governor of Flushing. Leicester, in command of the English forces in the Netherlands, leaned heavily on his advice during the next difficult months.

In July 1586 Sidney made a successful raid on Axel, near Flushing; on Sept. 22 he was with a small force under Sir John Norris which Leicester ordered to intercept a convoy of provisions near Zutphen. According to Fulke Greville, Sidney cast off his cuisses because Sir William Pelham was without his, and so received the fatal bullet wound in his thigh. Greville is also responsible for the story that he refused a cup of water in favour of a wounded soldier with the words, "Thy necessity is yet greater than mine." Greville was not present, but both stories are in keeping with Sidney's character. He died at Arnhem on Oct. 17.1586.

Sidney's death was an occasion for universal mourning. The most famous of some 200 elegies is Spenser's *Astrophel,* published, with others by the countess of Pembroke, Fulke Greville, Raleigh, Matthew Roydon and Lodowick Bryskett, in his *Colin Clouts Come home againe* (1595).

Writings.—None of Sidney's works was printed during his lifetime. Between 1577 and 1580 Sidney wrote the first version of his prose romance *Arcadia,* in five books or acts, for the entertainment of his sister and her friends. This version remained in manuscript until A. Feuillerat printed it from the Clifford manuscript in 1926. Between 1580 and 1584 Sidney embarked on a radical revision, using nearly all the old material, but enlarging books i and ii with many additional episodes and writing a new book iii, which breaks off in the middle of a sentence before he had reached the point where the old book iii began. This version was published as The *Countesse of Pembrokes Arcadia* (1590), probably under the supervision of Fulke Greville, who claimed that it truly' represented Sidney's serious and moral intentions. In 1593 Hugh Sanford prepared a folio edition which included the 1590 version and books iii–v of the old *Arcadia* with some changes which may represent Sidney's intentions,'but were probably made by his sister. This was the *Arcadia* known to countless later writers and readers. Sidney's early pastoralism seems to have been mainly influenced by Jacopo Sannazaro's *Arcadia* (poems with short prose links) and his later epic narrative by Heliodorus' *Aethiopica* (a Greek novel with a complicated "Chinese box" structure of stories within the main story). The golden world of innocent shepherds and shepherdesses is combined by Sidney with a sterner world of violent action and crime. The main narrative concerns the adventures of two princes, Musidorus and Pyrocles, who fall in love with Pamela and Philoclea, the daughters of Basilius and Gynecia. The characters of the two girls are well differentiated and in her struggle with illicit passion Gynecia has been likened to Phèdre. There are some good comic and dramatic episodes, and many serious debates on such topics as justice, atheism and suicide. The sentences are long and laden with rhetorical devices, for example:

> There were hills which garnished their proud heights with stately trees; humble valleys whose base estate seemed comforted with refreshing of silver rivers; meadows enameled with all sorts of eye-pleasing flowers; thickets, which bring lined with most pleasant shade, were witnessed so to by the cheerful disposition of many well-tuned birds; each pasture stored with sheep feeding with sober security, while

the pretty lambs with bleating oratory craved the dams' comfort; here a shepherd's boy piping, as though he should never be old; there a young shepherdess knitting and withal singing, and it seemed that her voice comforted her hands to work, and her hands kept time to her voice's music.

Sidney's use of this style was deliberate. In all his work he observed the principle of decorum, suiting style to subject. That he could be plain and direct is shown in this letter to his father's secretary:

I assure you before God that if I know you do so much as read any letter I write to my Father, without his commandment, or my consent, I will thrust my dagger into you. And trust to it, for I speak it in earnest.

Many poems in which Sidney experimented in metrical forms are introduced into the *Arcadia;* they include a few sonnets. These, however, do not reach the high standard of those in his *Astrophel and Stella.* Sir Thomas Wyat and the earl of Surrey had introduced the sonnet into English poetry, but *Astrophel and Stella* was the first English *canzoniere*—a series of songs and sonnets telling a love story. Sidney's sonnets were partly autobiographical, but they were also indebted to Petrarch, Du Bellay, Ronsard, Desportes and others. His metre is extremely regular. The rhyme scheme of the octave is that adopted in Europe; Sidney usually followed Surrey in ending the sestet with a couplet. He often adopted Wyat's colloquial tone; for example.

"Fool," said my Muse to me, "look in thy heart and write!"

The fondness for word play and the use of personification apparent in the *Arcadia* reappear here. More striking is the freshness he managed to infuse into the stale Cupid imagery.

With how sad steps, o Moon, thou climb'st the skies,
How silently, and with how wan a face'
What, may it be that even in heav'nly place
That busy archer his sharp arrows tries?

After Shakespeare's sonnets, *Astrophel and Stella* is the finest Elizabethan sonnet cycle. Thomas Newman published a faulty quarto edition, with preface by Thomas Nashe and some sonnets by other writers, in 1591. He followed this with a better text in the same year. The 1598 *Arcadia* folio offered a still better text and included *Certain Sonnets* and *The Lady of May.* To the 1613 folio was added *A Dialogue Between Two Shepherds. Two Pastorals* appeared in Francis Davison's *Poetical Rhapsody* (1602). (On the authenticity of these last two items, *see* W. Ringler, "Poems Attributed to Sir Philip Sidney," *Studies in Philology,* xlvii. pp. 126–151; 1950.)

Sidney seems to have had Stephen Gosson's *The Schoole of Abuse* (1579) in mind when he sprang to the defense of poetry, though the exact date of his treatise is not known. It mas published in 1595, by W. Ponsonby as *The Defence oj Poesie* and by H. Olney as *An Apologie for Poetrie,* and Ponsonby included it in the 1598 *Arcadia.* It is the first work to introduce the critical ideas of Renaissance theorists into England. Sidney's arguments for the lofty nature of poetry and against its detractors have been repeated countless times—partly by reason of the easy and persuasive style. He is urbane and courteous where Gosson was shrill and abusive. He wrote just before the great Elizabethan age of poetry and drama, and without the example of Shakespeare, he cannot be blamed for missing the English genius for tragicomedy. He praised the best English works available.

A Woorke Concerning the Trewnesse of the Christian Religion, translated from Duplessis-Mornay, was completed and published by Arthur Golding in 1587. Sidney was responsible for the first 43 psalms in the metrical versions completed by his sister. His translations of the first *Semaine* of G. Du Bartas and of the first two books of Aristotle's *Rhetoric* are lost. Sidney's letters. especially the Latin correspondence with Languet (trans. and ed. by S. A. Pears: 1845), and his three political treatises, not published in his lifetime, the *Discourse on Irish Affairs,* the *Defence of Leicester* and the *Letter to the Queen,* are of historical interest.

Sidney's *Complete Works,* including both versions of the *Arcadia,* were ed. by A. Feuillerat, 4 vol. (1912–26). The texts are not, altogether satisfactory. and for *Astrophel and Stella* see the edition of M. Poirier (1957). A modernized text of *The Countess of Pembroke's Arcadia* with the linking passage in bk. iii supplied by W. Alexander in 1621, and the vith bk.. added by R. Beling in 1627, mas ed. by E. A. Baker (1907).

BIBLIOGRAPHY.—Fulke Greville's *Life of the Renowned Sir Philip Sidney* (1625) was ed. by N. Smith (1907). The best biography is M. W. Wallace, *The Life of Sir Philip Sidney* (1915); the works are more fully treated by M. Wilson, *Sir Philip Sidney,* 2nd ed. (1950). There is a full bibliography by M. Poirier, *Sidney: le chevalier poète élisabéthain* (1948). *See* also J. Buxton, *Sidney and the English Renaissance* (1954); J. W. Lever, *The Elizabethan Love Sonnet* (1956); R. W. Zandvoort, *Sidney's Arcadia: a Comparison between the Two Versions* (1929). (J. RN.)

SIDON (modern SAIDA), once the chief city of Phoenicia, is now the principal town of the southern district of Lebanon. Pop. (1956 est.) 20.000. As well as being an agricultural trading centre it is a fishing and trading port. From 1950 it acquired importance as the Mediterranean terminus of the pipeline from the Saudi Arabian oil fields, and has large storage tanks from which the oil is transferred to offshore tankers. The silting up of the harbour was a major problem facing the government in the late 1950s.

History.—Older than Tyre and acknowledged as its mother, Sidon has had an eventful history. The Homeric poems laud the skill of its artisans. The Philistines destroyed its fleet and laid the city in ashes. Assyria and Babylonia coveted the wealth of Sidon's bazaars and a splendid succession of monarchs led armies against the city to disturb the peace and loot its treasures. In the 7th century B.C. during a pause in Babylonian oppression Egypt intervened. The Persian yoke in due course supplanted the Babylonian and an injudicious revolt against Artaxerxes Ochus met with condign punishment. Unlike Tyre it submitted without resistance to Alexander the Great. The Seleucids of Syria, the Ptolemies of Egypt and the Romans exercised lordship in turn. Herod the Great, as was his wont, embellished the town. Jesus visited its neighbourhood and St. Paul on his way to Rome was permitted to land to visit his friends and refresh himself. Sidon's bishop attended the Council of Nicea. To maintain its independence it leagued itself with the Crusaders (1107), and four years later Baldwin dealt faithfully with the city for bad faith. Saladin took and dismantled it after Hattin. The Franks were back again within it in 1197, only to see it relapse quickly into Moslem hands and be turned to ruins. The Franks rebuilt (1228), the Saracens redevastated (1249). King Louis restored it (1253); the Mongols ravaged it (1260). Once more assisted to rise by the Templars it was abandoned after the fall of Acre (1291). It blossomed into vigorous existence. in the 17th century under Fakhru'd-din Maan II. the Druse emir, who encouraged and protected its commerce. Jezzar Pasha drove the French forth from its gates (1791). In 1840 it was bombarded by the allied fleets (Britain, Austria, Turkey), and British troops occupied it Oct. 6, 1918.

Archaeology.—A large necropolis was discovered southeast of the town in 1855, and yielded numerous sarcophagi and wall paintings. The most important were the sarcophagi of two Sidonian kings, Eshmunazar, and Tabnith. Both have valuable Phoenician inscriptions. A further discovery of 17 sarcophagi was made in 1887, including the famous "Alexander" sarcophagus.

SIDONIUS APOLLINARIS, SAINT (GAIUS SOLLIUS APOLLINARIS SIDONIUS) (*c.* 430–*c.* 480), Christian writer and bishop of Clermont, was born in Lyons about A.D. 430. He married (about 452) Papiania, the daughter of Avitus, who was consul and afterward emperor. After Majorian deprived Avitus of the empire and took the city of Lyons (457), Sidonius fell into the hands of the enemy. Majorian treated him with the greatest respect, however. and in return Sidonius composed in his honour a panegyric that won for him a statue at Rome and the title of count. In 467 the emperor Anthemius raised Sidonius to the post of prefect of Rome and afterward to the dignity of a patrician and senator. In 472, moie for his political than for his theological abilities, he was made bishop of Arverna (Clermont). On capture of that city by the Goths in 474 he was imprisoned, but afterward restored to his bishopric by Euric, king of the Goths. His feast day is Aug. 21.

Sidonius' extant works are his *Panegyrics* on different emperors (in which he draws largely upon Statius, Ausonius and Claudian); and nine books of *Letters* and *Poems*, whose chief value consists in the light they shed on the political and literary history of the 5th century. The *Letters*, which are very stilted, reveal him to have been a man of genial temper, fond of good living and of pleasure. The best edition is that in the *Monumenta Germaniae Historica* (1887), which gives a survey of the manuscripts. There is an English translation of the *Poems and Letters* by W. B. Anderson in the "Loeb Classical Library" (1936).

See C. E. Stevens, *Sidonius Apollinaris and His Age (1933).*

SIEBENGEBIRGE ("The Seven Hills"), a group of hills on the Rhine, 6 mi. above Bonn. They are of volcanic origin. The hills are as follows: Drachenfels (1.053 ft.) surmounted by the ruins of an old castle; immediately behind it, Wolkenburg (1.063 ft.); and to the north Petersherg (1.086 ft.), with a pilgrimage chapel, then, to the south, a chain of four—viz. Ölberg (1.522 ft.), the highest of the range; Lonenburg (1.493 ft.); Lohr-Berg (1,427 ft.); and, farthest away, Nonnen-Stromberg (1,101 ft.).

SIEBOLD, KARL THEODOR ERNST VON (1804–1885), German zoologist who investigated the morphology and life history of lower animals, mas born in Il'iirzburg on Feb. 16, 1804. Aiter practising medicine briefly, Siebold was professor of zoology at Erlangcn, Freiburg, Breslau and Munich. In 1848 he founded the *Zeitschrift für wissenschaftliche Zoologie*. He died at Munich on April 7, 1885.

Siebold was probably the first to discover that the Protozoa consist of a single independent cell. This important finding emphasized the cell as a basic unit of living matter, and suggested that evolution from one- to many-celled organisms, and also embryonic development, involved a progressive specialization and division of labour among cell units. Siebold also clearly showed that eggs of some insects were normally parthenogenic, developing without iertilization. His studies on the life histories of tapeworms demonstrated to medical men oi his day the bearing of basic zoological research on certain clinical problems. His work on the anatomy oi invertebrates was one oi the first important texts on the comparative anatomy of lower animals. His major works include *Lehrbuch der vergleichenden Anatomie der Wirbellosen Thiere* (1845–48; Eng. trans., W. I. Burnett, *Anatomy of thr Invertebrata,* 1854); *Über die Band- und Blasenwürmer* (1833); *Wahre Parthenogenesis bei Schmetterlingen und Bienen* (1856; Eng. trans., W. S. Dallas, On *a True Parthenogenesis in Moths and Bees,* 1857). (H. H. S.)

SIEDLCE, a town of Poland in the province of Warsaw, 56 mi. E.S.E. of Warsaw. It is a Roman Catholic episcopal see. The Oginskis, to whom it belonged, embellished it with a palace and gardens. Pop. (1960) 32,000. Siedlce was occupied by Germany in World War II and was returned to Poland in 1945.

SIEGBAHN, KARL MANNE GEORG (1886–), Swedish physicist, awarded the 1924 Nobel prize in physics for his discoveries and investigations in X-ray spectroscopy, was born in Örobro, on Dec. 3, 1886. He obtained his doctor's degree in 1911 from the University of Lund. He served as assistant to J. R. Rydherg in the physics institute of the university from 1907 to 1915 and in the latter year was appointed deputy professor of physics. On Rydberg's death in 1920 he succeeded to the chair. In 1923 he became professor of physics at Uppsala and in 1937 he accepted the corresponding chair at Stockholm and became director of the Nobel Institute of Experimental Physics of the Swedish Royal Academy of Sciences, Stockholm. His early researches were mainly concerned with problems in electricity and magnetism, but after 1914 he was engaged in the systematic investigation of the X-ray spectra of the different elements. In 1916 he discovered a new spectral series, the long-wave M-lines. With the aid of high vacuum spectrographs and other apparatus of his own invention he carried the measurement of wave lengths to an extraordinary level of accuracy. In 1923 he and his colleagues succeeded in furnishing proof of the diffraction of X-rays in prisms: he later investigated the immediate field between X-rays and ultraviolet rays. (W. J. BR.)

SIEGBURG, a town in North Rhine-Westphalia (former Prussian Rhine province), Germany, on the Sieg, 16 mi. S.E. of Köln (Cologne) by the railway to Giessen. Pop. (1959 est.) 32,617. The town, founded in the 11th century, attained great prosperity in the 15th and 16th centuries because of its pottery wares.

SIEGEN (SECHTEN), **LUDWIG VAN** (1609–*c.* 1680), Dutch engraver, the inventor of mezzotint (*q.v.*), was born in Utrecht. He spent most of his early life in the services of the landgravine Amelia Elizabeth and the landgrave William of Hesse-Kassel. He lived in Amsterdam from 1641 to about 1644 and here it is supposed he was influenced by Rembrandt. Later he served Johann Philipp von Schönborn, elector of Mainz, and the duke of Brunswick while in Wolfenbüttel, where he is mentioned for the last time in 1676. His first mezzotint was a portrait of Amelia Elizabeth, in the dedication of which he claims the invention of the process as one not of lines, but of dots. There are seven known rouletted mezzotint plates by him.

See A. M. Hind, *History of Engraving and Etching, From the 15th Century to the Year 1914 (1923).* (H. Es.)

SIEGEN, a town in North Rhine-Westphalia (former Prussian province of Westphalia), Germany, 63 mi. E. of Köln (Cologne) by rail, on the Sieg, a tributary entering the Rhine opposite Bonn. Pop. (1959 est.) 48,025. Siegen mas the capital of an early principality belonging to the house of Nassau. In 1815 the congress of Vienna assigned it to Prussia. The town contains two palaces of the former princes of Nassau-Siegen. The surrounding district, to which it gives its name, abounds in iron mines, and iron founding and smelting are the most important industries of the town. Rubens is said to have been born there in 1577.

SIEGFRIED (SIGURD), a figure from the heroic literature of the ancient Teutons, known to us as Sigurd in Old Norse and as Siegfried in German literature, although these two branches of the tradition do not always agree. He plays a part in the story of Brunhild (*q.v.*), in which he meets his death, but in other stories he is the leading character and triumphs. A feature common to all is his outstanding strength and courage. One story tells of his fight with a dragon, and another of how he acquired a treasure from two brothers who quarreled over their inheritance. These two stories are combined into one in the *Eddn* (*q.v.*) and told in detail, whereas in German, where they arc kept entirely separate, the information is scant and largely contained in allusions. Siegfried plays a major part in the *Nibelungenlied* (*q.v.*), where this old material is used but much overlaid with more recent additions. *Das Lied voni hürnen Seyfrid,* not attested before about 1500, still retains it in identifiable form, although the poem's central theme is the release of a maiden from a dragon; and an *Edda* poem tells how Sigurd awakened a maiden, a valkyrie (*q.v.*), from a charmed sleep. Here, too, many critics have tried to establish a connection between German and Norse; not only, however, are there many important differences, but there is great doubt, on internal evidence, about the antiquity of both poems.

In the original stories Siegfried was presented as a boy who, although of noble lineage, grew up bereft of parental care; this shows through clearly, although in the full accounts in both Norse and German it is overlaid with elaborate accounts of his courtly upbringing. As with Brunhild, it is still disputed whether the figure is of mythical or historical (Merovingian) origin.

See *Das Lird vom hürnen Seyfrid,* edited by K. C. King (1958). (K. C. K.)

SIEMENS, a German-born family best known as engineers, inventors and manufacturers in the electrical industry.

WERNER VON SIEMENS (1816–1892), the chief founder of the electrical firm of Siemens and Halske, was born on Dec. 13, 1816, at Lenthe, Hanover. Between 1838 and 1848 he held a commission in the artillery, was entrusted with many specialized works and in particular became acquainted with the recently developed electric telegraph. In 1847 he founded, together with a skilled mechanic, J. G. Halske, the firm of Siemens and Halske for the manufacture of telegraphic apparatus. This firm under Siemens' guidance became one of the most important electrical undertakings in the world, with branches in different countries of which those in England and Russia were particularly important. It carried out many large telegraphic projects and later expanded into other electrical fields, as new applications of electricity were developed.

Many of Werner von Sikmens' inventions relate to telegraphic apparatus. He used gutta-percha as an insulant for telegraphic cable in 1847; this form of insulation was later widely used for electric light cables. The Siemens armature, which he invented in 1856 for use in telegraphy, afterward found further application in larger generators for electroplating and lighting and, following the invention of the ring armature, was modified by F. von Hefner-Alteneck. Siemens' designer, into the basic form of the modern armature. One of the most important of Siemens' discoveries was that of the dynamo-electric principle. the principle governing the self-excitation of the dynamo. This idea was also put forward by C. A. Varley and by Sir Charles Wheatstone about the same time, but Siemens appears to have more fully appreciated the possibilities of the invention and was certainly more responsible for their development. He died at Charlottenburg, Berlin. on Dec. 6, 1892.

SIR WILLIAM SIEMENS (KARL WILHELM; 1823–1883). brother of Werner. is known for his work in electricity and in the application of heat. In both fields he combined the functions of innovator, manufacturer and successful man of business. He was born at Lenthe, Hanover. on April 4, 1823. After attending the University of Gottingen he entered, as a pupil, the manufacturing concern of Count Stolberg at Magdeburg. At the age of 19 he first visited England in the hope of introducing an electroplating process invented by himself and Werner and which he succeeded in selling to Rlessrs. Elkington of Birmingham. He returned to Germany. but in 1844 was again in England. this time with another invention, the "chronometric." or differential, governor. Finding that British patent law afforded the inventor a protection then lacking in Germany, he henceforth made England his home.

The next few years were spent in trying to develop his inventions, of which at this time his water meter was commercially the most successful. His activities made him a respected figure in scientific circles: his paper "On the Conservation of Heat Into Mechanical Effect" read to the Institution of Civil Engineers in 1853 gained him the Telford medal: and in 1862 he was elected a member of the Royal society. William's chief work in the field of heat was concerned with regenerative heating and consequent improvements in steelmaking processes. He invented the regenerative condenser in 1848 and, together with his brother Friedrich. first tried to apply it to the steam engine, using the heat from the regenerator to preheat the boiler feed water. When this did not meet with success, other applications were sought and the idea occurred of applying the principle to furnaces, using the heat regained from the flue gases to heat the air supply to the iurnace. This was patented in Friedrich Siemens' name in 1856 and met with great success for use both in glassmaking and in steel manufacture. Later the use of gas instead of solid fuel greatly extended the use of the regenerative furnace.

At that time the quality and reliability of steel was much inferior to that of iron and Siemens did much to develop steelmaking processes, using a large-scale trial plant equipped with regenerative furnaces. This work led to the Siemens-Martin process, shown at the Paris exhibition of 1867, and to the founding of the firm of Landore-Siemens, which was established for the application of the process.

In the field of electricity William, though making no great inventions, became an acknowledged authority and leader. From 1848 onward he represented the firm of Siemens and Halske in London. and when the separate firm of Siemens Brothers was established in 1865 he became a partner and director. At first the chief business was the erection of overland telegraph lines and the laying of submarine telegraph cables. William was, however. in constant close liaison with all the ideas and projects of his brother Werner in Berlin and, when the latter discovered the dynamo-electric principle, William introduced it to England by reading. in Feb. 1867, a paper to the Royal society entitled "On the Conversion of Dynamical Electric Force Without the Aid of Permanent Magnetism." Gradually in the late 1870s and 1880s the electric-light side of the business grew. One of the last projects with which William was associated was the Portrush electric railway in the north of Ireland, opened in 1883, which utilized water turbines driving a Siemens dynamo. The power so produced was transmitted to another machine acting as a motor on the tramcar. William Siemens was knighted in 1883 and died in London on Nov. 19 of the same year.

ALEXANDER SIEMENS (1847–1928), nephew of William, was born in Hanover on Jan. 22. 1847. In 1867 he went to England, nhere he worked first in the workshops of Siemens Brothers at Woolwich, and consequently in the erection of the Indo-European telegraph line in Persia (1868) and in the laying of the Black sea cable (1868). In 1878 he became a naturalized British subject. The following year he took over the management of the electric-light department of Siemens Brothers, and was responsible for the installation of electric light at Godalming, Surrey, the first English town to be so lighted. Like many other members of the family. Alexander patented several inventions. After the death of Sir William he became a director of the company, a position he retained until 1918. He took an active part in public activities associated with his profession. was a member of several important committees and was twice president of the Institution of Electrical Engineers. He died at Milford-on-Sea, Hampshire, on Feb. 16, 1928. (M. K. W.)

SIENA, a city and archiepiscopal see of Toscana, Italy, capital of the province of Siena, 31 mi. S. of Florence. Pop. (1951) 39.906. The city possesses a university, founded in 1203 and limited to the faculties of law and of medicine.

The horse races of Siena known as the "Palio delle Contrade" have a European celebrity. They are held in the public square, the curious and historic Piazza del Campo (now Piazza di Vittorio Emanuele) in shape resembling an ancient theatre, on the 2nd of July and the 16th of August of each year; they date in their present form from the 17th century and were instituted in commemoration of victories and in honour of the Virgin Mary (the old title of Siena having been "Sena vetus civitas Virginis").

Siena is divided into 17 *contrade* (wards), each with a distinct appellation and chapel and flag of its own; and every year 10 of these contrade, chosen by lot, each send one horse to compete for the prize *palio* or banner. The aspect of Siena during these meetings is very characteristic, and the whole festivity bears a mediaeval stamp in harmony with the architecture and history of the town.

Among the noblest fruits of Sienese art are the public buildings adorning the city. The cathedral, one of the finest examples of Italian Gothic architecture, obviously influenced in plan by the abbey of S. Galgano (infra), built in black and white marble, was begun at the end of the 12th century, but interrupted by the plague of 1248 and wars at home and abroad, and by 1325 a great part of it and the baptistery of San Giovanni were completed; a further enlargement (which would have made what had been already built into merely a transept of a larger church) was begun in 1339 but never carried out and a few ruined walls and arches alone remain to show the magnificence of the uncompleted design, which would have produced one of the largest churches in the world. In 1355 the construction of the older church was resumed.

The splendid west front, of tricuspidal form, enriched with a multitude of columns, statues and inlaid marbles, dates from 1377 seq.: it closely resembles that of Orvieto, which is earlier in date (begun in 1310). Both façades have been recently restored, and the effect of them not altogether improved by modern mosaics. The fine Romanesque campanile belongs to the first half of the 14th century. Conspicuous among the art treasures of the interior is the well-known octagonal pulpit by Nicolò Pisano, dating from 1265–68. It rests on columns supported by lions and is finely sculptured. Numerous statues and bas-reliefs by Renaissance artists adorn the various altars and chapels. The cathedral pavement is inlaid with designs in colour and black and white, representing biblical and legendary subjects; the finest portions beneath the domes, with scenes from the history of Abraham, Moses and Elijah, are by Domenico Beccafumi and are executed with marvellous boldness and effect. The choir stalls also deserve mention: the older ones (from S. Benedetto, a church long ago destroyed) are in *tarsia* work; the others, dating from the 16th century, are carved from Riccio's designs. The Piccolomini library, adjoining the duomo, was founded by Cardinal Francesco Piccolomini (afterwards Pius III.) in honour of his uncle, Pius II. Here are Pinturicchio's famous frescoes of scenes from the life of the latter pontiff, and the collection of choir books (supported on sculptured desks) with splendid illuminations by Sienese and other artists. The church of San Giovanni, the ancient baptistery, beneath the cathedral is approached by an outer flight of marble steps built in 1451. It has a beautiful but incomplete façade designed by Giovanni di Mino del Pellicciaio in 1382, and a marvellous font with bas-reliefs by Donatello, Ghiberti, Jacopo della Quercia and other 15th-century sculptors. The Opera del Duomo contains Duccio's famous Madonna (or Maestà) painted for the cathedral in 1308–11, and other works of art.

Among the other churches are S. Maria di Provenzano, a vast building of some elegance, designed by Schifardini (1594); Sant' Agostino, rebuilt by Vanvitelli in 17jj, containing a Crucifixion and Saintes by Perugino, a Massacre of the Innocents by Matteo di Giovanni and the Coming of the Magi by Sodoma; the beautiful church of the Servites (15th century), which contains another Massacre of the Innocents by Matteo di Giovanni and other good examples of the Sienese school; San Francesco, recently restored, containing fine paintings by the two Lorenzetti and others, close to which is the 15th century oratory of S. Bernardino, with fine frescoes by Sodoma, Pacchia and Beccafumi (1518–32) and a good ceiling (1496); San Domenico, a fine 13th-century brick building with a single nave and transept, containing Sodoma's splendid fresco, the Swoon of St. Catherine, and a contemporary portrait of the saint in a fresco by Andrea di Vanni. This church crowns the Fontebranda hill above the famous fountain of that name immortalized by Dante, and in a steep lane below stands the house of St. Catherine, now converted into a church and oratory, and maintained at the expense of the inhabitants of the Contrada dell' Oca. It contains some good works of art, but is chiefly visited for its historic interest. The Accademia di Belle Arti contains a good collection of pictures of the Sienese school, illustrating its development.

The Palazzo Pubblico in the Piazza del Campo (1288–1309) built of brick. is a fine specimen of pointed Gothic, and was designed by Agostino and Agnolo. The light and elegant tower (Torre del Mangia) soaring from one side of the palace (1338–48) is 334 ft. high, and the chapel standing at its foot as a public thank-offering after the plague of 1348 was begun in 1352 and completed in 1376. The interior is lined with works of art. The two ground-floor halls contain a Coronation of the Virgin by Sano di Pietro and a splendid Resurrection by Sodoma. In the Sala dei Nove or della Pace above are the noble allegorical frescoes of Ambrogio Lorenzetti, representing the effects of just and unjust government; the Sala del Mappamondo is painted by Simone Martini and others, the Cappella della Signoria by Taddeo di Bartolo, and the Sala di Consistoro by Beccafumi. Another hall, the Sala di Balia, has frescoes by Spinello Aretino (1408) with scenes from the life of Pope Alexander III., while yet another has been painted by local artists with episodes in recent Italian history. The former hall of the grand council, built in 1327, was converted into the chief theatre of Siena by Riccio in 1560, and, after being twice burnt, was rebuilt in 1753 from Bibbiena's designs. Another Sienese theatre, that of the Rozzi, in Piazza San Pellegrino, designed by A. Doveri and erected in 1816, although modern, has an historic interest as the work of an academy dating from the 16th century, called the Congrega de' Rozzi, that played an important part in the history of the Italian comic stage.

The city is adorned by many other noble edifices both public and private, among which the following palaces may be mentioned: Tolomei (1205); Buonsignori, an elegant mediaeval brick construction; the Palazzo del Capitano di Giustizia; Sansedoni; Marsili; Piccolomini, now belonging to the Government and containing State archives; Saracini; Piccolomini delle Papesse, like the other Piccolomini mansion, designed by Bernardo Rossellino, and now the Banca d'Italia; the enormous block of the Monte de' Paschi, a bank of considerable wealth and antiquity, enlarged and partly rebuilt in the original style between 1877 and 1881; the old Dogana and Salimbeni palaces; the Palazzo Spannochi, a fine early Renaissance building by Giuliano da Maiano; the Loggia di Mercanzia (1417–28) imitating the Loggia dei Lanzi at Florence, with sculptures of the 1jth century; the Loggia del Papa, erected by Pius II.; and other fine buildings. We may also mention the two celebrated fountains, Fonte Gaia and Fontebranda; the former in the Piazza del Campo, by Jacopo della Quercia (1409–19), but freely restored in 1868, the much-damaged original reliefs being now in the Opera del Duomo; the Fonte Nuova, near Porta Ovile, by Camaino di Crescentino, also deserves notice (1298). Thanks to all these architectural treasures, the narrow Sienese streets with their many windings and steep ascents are full of picturesque charm, and, together with the collections of excellent paintings, foster the local pride of the inhabitants and preserve their taste and feeling for art. The mediaeval walls and gates are still in the main preserved. The ruined Cistercian abbey of S. Galgano, founded in 1201, with its fine church (1240–68) is interesting and imposing. It lies some 20 m. south-west of Siena.

A kind of marzipan, known as *panforte,* is a speciality of Siena, and ironwork and wood carving are still carried on.

Literary History.—The literary history of Siena begins (13th century) with Folcacchiero the humorist, Cecco Angiolieri, and Bindo Bonichi. Next comes St. Catherine (Benincasa) of Siena (1347–80: *q.v.*) and St. Bernardino (Albizzeschi) of Siena (1380–1444), a popular preacher. Pope Pius II. (*q.v.*) may also be mentioned, as well as several members of the Sozzini family, one of whom, Lelio (1525–62), founded the sect of the Socinians; Bernardino Ochino (1487–1564), a supporter of Protestantism, the satirist Girolamo Gigli (1660–1722) and the economist Sallustio Bandini (1677.–I760).

Art.—Lanzi happily designates Sienese painting as "Lieta scuola fra lieto popolo" ("the blithe school of blithe people"). The special characteristics of its masters are freshness of colour, vivacity of expression and distinct originality. The Sienese school of painting owes its origin to the influence of Byzantine art; but it improved that art, impressed it with a special stamp and was for long independent of all other influences. Consequently Sienese art seemed almost stationary among the general progress and development of the other Italian schools, and preserved its mediaeval character down to the end of the 15th century, when the influence of the Umbrian and—to a slighter degree—of the Florentine schools began to penetrate into Siena, followed a little later by that of the Lombard. The first master of real significance was Duccio di Buoninsegna (*c.* 1260–1318); then followed Simone Martini (or Memmi), Lippo Memmi, Pietro and Ambrogio Lorenzetti, and Taddeo di Bartolo, to name only the principal painters. In the 15th century we have Domenico di Bartolo, Sano di Pietro, Giovanni di Paolo, Stefano di Giovanni (I1 Sassetta) and Matteo di Giovanni di Bartolo, who fell, however, behind their contemporaries elsewhere, and made indeed but little progress. The 16th century boasts the names of Bernardino Fungai, Guidoccio Cossarelli, Giacomo Pacchiarotto, Girolamo del Pacchia and especially Baldassare Peruzzi (*q.v.*) (1481–1536), who while especially celebrated for his frescoes and studies in perspective and chiaroscuro was also an architect of considerable attainments; Giovanni Antonio Bazzi, otherwise known as I1 Sodoma (1477–1549), who, born at Vercelli in Piedmont, and trained at Milan in the school of Leonardo da Vinci, came to Siena in 1504 and there produced some of his finest works, while his influence on the art of the place was considerable; Domenico Beccafumi, otherwise known as Micharino (1486–1551), noted for the Michelangelesque daring of his designs; and Francesco Vanni.

There may also be mentioned many sculptors and architects, such as Lorenzo Maitani, architect of Orvieto cathedral (1275–1330), Camaino di Crescentino and his son Tino di Camaino, sculptor of the monument to Henry VII in the Campo Santo of Pisa; Lando di Pietro, entrusted by the Sienese commune with the proposed enlargement of the cathedral (1339), and perhaps author of the famous Gothic reliquary containing the head of S. Galgano in the Chiesa del Santuccio, which, however, is more usually attributed to Ugolino di Vieri, author of the tabernacle in the cathedral at Orvieto, or Jacopo della Quercia (1371–1438), the creator of the Fonte Gaia, in the Piazza del Campo; Lorenzo di Pietro (Il Vecchietta), a pupil of Della Quercia; Antonio Federighi (d. 1490); Neroccio di Bartolommeo (1447–1500); Francesco d'Antonio, a skilful goldsmith of the 16th century; Francesco di Giorgio Martini (1439–1502), painter, sculptor, military engineer and writer on art; Giacomo Cozzarelli (1453–1515); and Lorenzo Mariano, surnamed Il Marrina (1476–1534). Wood carving also flourished here in the 15th and 16th centuries, and so also did the ceramic art. According to the well-known law, however, the Renaissance, made for the people of the plains, never fully took root in Siena, as in other parts of Tuscany, and the loss of its independence and power in 1555 led to a suspension of building activity, so that the baroque of the 17th and the classicism of the 18th centuries have had hardly any effect here; and few towns of Italy are so unspoilt by restoration or the addition of incongruous modern buildings, or preserve so many characteristics and so much of the real spirit (manifested to-day in the grave and pleasing courtesy of the inhabitants) of the middle ages, which its narrow and picturesque streets seem to retain. Siena is, indeed, unsurpassed for its examples of 13th and 14th century Italian Gothic, whether in stone or in brick.-

HISTORY

Siena was an ancient city of the Etruscans; in the time of Augustus it was a Roman colony, known as *Saena* Julia. There are, however, very few relics of antiquity found there. The present city is almost entirely mediaeval. It has been the seat of a bishopric since the 7th century and possibly earlier; and the development of Sienese history is closely connected with the growth of the Church and the power of the episcopate. Under the rule of the Lombards in the 8th century Siena was governed by Gnstaldi and was not subject to the dukes of Tuscany; in the quarrel between the bishops of Siena and of Arezzo, the Gastaldi were supported by the people in their adherence to the cause of their bishops; and the counts who, in the time of Charlemagne, superseded the Gnstaldi, were also faithful to the church in civic matters, until in the 11th century, after 1056, the bishops gradually made themselves independent, at any rate within the city, of the counts and the consuls who succeeded them. During the 12th century the consuls, who were patricians, had to make conccssions to the plebeians; and in 1137 there was a government by 100 nobles and 50 plebeians. Just as the power of the counts yielded to the bishops', and the bishops' to the consuls', so the nobles had to give way, until in 1199 there was a government by a foreign *podestà;* so Siena became a feudatory of the Italian kingdom, and was a tenant in *capite* of the emperor. Her rule was admitted by the lords of the neighbouring country, who were in the same relation to her as was Siena to the emperor, who welcomed on his side, as against Florence, the growing power of the city and contado.

Florentine Wars.—Yet the great quarrel between Siena and Florence in the 13th century would have probably occurred if there had been neither pope nor emperor, neither Guelf nor Ghibelline. The conflict was primarily economic. Siena at the beginning of the 13th century mas the bank and trade-capital of Italy; for the freedom of trade the Sienese bankers and traders desired to keep safe the master roads to Rome, to the sea, and to the North It was for this purpose that she made feudatories of the neighbouring lords, in an effort to associate them with her enterprise. Florence, desiring also a commercial supremacy, was Siena's natural enemy. She supported those lords who were irked by their allegiance to the city, and resisted the efforts of the Sienese to establish themselves in such key positions as Montepulciano in the south, or Poggibonsi in the north. So the history of Siena in this century is a history of futile and ultimately hopeless wars—wars to secure the fidelity of her feudatories, a struggle which must involve her in conflict with Florence. In 1254 a treaty was concluded between the two cities; but three years later Florence found a pretext of war in the fact that Siena had given shelter to Ghibellines she had expelled. Siena appealed to Manfred for military assistance while Florence equipped a large citizen army. The first victory, though small, was Florence's, whose forces on May 18, 1260 conquered a small force outside Siena; but on Sept. 4 the Florentines were signally defeated, and the Guelf cause for the moment lost.

Had Manfred lived the course of history might have been different: but his death, and a defeat at Benevento (1266) badly damaged the Ghibellines. The cause of the Guelfs made more and more adherents throughout Italy. Lucca, Pistoia, Volterra joined the party and the succession of Charles of Anjou to the throne of Naples added greatly to its prestige. Siena was disheartened, too. by the death of Provenzano Salvani, who was killed in cold blood by his captor in the battle of Calle do Valdelsa (1269), and Siena's loyalty to the Ghibellines was also shaken by the growth in the city of a strong Guelf and popular party. There was war in the contado and unrest in the city, and in 1273 when Charles of Anjou visited Siena, there was nothing but sentiment left for the Ghibelline side; Siena had lost any chance of wresting the supremacy from Florence by espousing the cause of the Guelfs. For while Siena might have gained a position of power as leader of the Ghibellines she was hopelessly outclassed by other cities when she joined the increasing party of the Guelfs.

To her wars with Florence were added internal dissensions. The rule of the nobles had become so tyrannical that in 1277 it was decreed that no patrician could occupy the chief magistracy; power was to remain in the hands of the middle-classes and traders who were adherents of the Guelfs. The size of the magistracy—which had varied from 24 to 36 members—was reduced to 15 in 1280, and seven years later to nine. This government by nine merchants was successful for about 70 years, and under it Siena, while she may have lost in political importance, gained much in peace and prosperity. Florence was no longer alarmed at a possible rival, trade flourished, the university was reorganized with the help of scholars from Bologna, great buildings were constructed—indeed for this period Siena is as good an example as one could wish of a successful oligarchic plutocracy.

The 14th Century.—In the early years of the 14th century there were many minor riots and battles, and in 1355 when the Emperor Charles IV. passed through Siena he gave his blessing to an irregular government of 12 which had been set up by the reformers against the nine. Power was given to the proletarians —the lower classes called *ordini* and *monti;* but they depended for not a little of their authority on the backing of the nobles. It was really a rising of the patricians and the plebeians against the tradesmen. The whole city was faction-ridden, and there is nothing but a dreary passing back of power from one set to another. Charles IV. intervened in 1368 on behalf of a rebellion; and he with Malatesta di Rimini attacked the public palace and was completely defeated by the Sienese who rallied to the call of the 1j. The emperor was captured, and used his imprisonment to borrow money from Biccherna, for which he granted Siena a *privilegium* and appointed the magistrates imperial vicars for ever in Siena and the district. After this the new government had the usual difficulties with the dissatisfied and the unenfranchised, and took refuge in the usual device of creating a special police, whose chief was called esecutore, which should repress the activities of the nobles. The continuance of internal disorders was naturally an incentive to those forces outside the city proper. The lords, who had once been feudatories to the growing power of the Ghibelline city, threw off its yoke and were helped in their disloyalty by mercenary companies from Brittany and Gascony.

The age-long quarrel between Siena and Arezzo gained a new impetus from the contentions between Carlo di Durazzo and Louis of Anjou for the crown of Naples. First Durazzo held Arezzo and then Louis; but when the Sienese hoped to win the city, Louis sold Arezzo to Florence (1384). Disappointed. the Sienese turned on the reformers. A successful revolution was concluded in 1385 and resulted in the expulsion of many families on uhose industry and experience in trade the prosperity of Siena depended. In 1387 there was a renewal of war between Florence and Siena, who called to aid her Gian Galeazzo, duke of Milan, who made himself master of Siena until 1403.

The 15th Century. — The city now became involved in the schism which was threatening the very life of the Papacy. Siena, as well as Florence, declared itself against Gregory XII (1409); and Ladislaus of Naples, his supporter, attacked Sienese territory. His death ended this war; and then came another conflict with Florence, which supported Venice and Eugenius IV, while Siena favoured Milan and the king of the Romans. In 1433 the warring parties made peace. There was another affray with Florence in 1454; and in a year or two later some of the citizens plotted to hand over Siena to Alphonso of Naples, whose death ended the conspiracy. In these years the magistracy was strengthened by the creation of an extraordinary body, the balia, which could act independently of the ordinary council. When Aeneas Sylvius Piccolomini was elected pope in 1455. the Sienese readmitted the nobles to a share in the government, a special concession which came to an end with the pope's death in 1464; although any members of the Piccolomini house were declared, eo ipso, to be popolani and privileged. In 1480, Alphonso, duke of Calabria, tried to obtain suzerainty of Siena. An alliance between the *noveschi* and some of the plebeians favoured his claims, and a revolt (June 1480) ended in a reorganization of the government. The old reformers as such were excluded, and the power vested in the hands of the popolani and a body called aggregoti, consisting of nobles, and citizens of other orders who had not before been allowed to take office. The Neapolitan royal family, however. fell out of favour in 1487. For nine months there were riots in the city which culminated on Feb. 20, 1483. The popolani took again the spoils of office. But in 1487 the noveschi, prosperous, influential tradesmen, returned. and overthrew the popolani, and placed Siena under the patronage of Our Lady.

The 16th Century. — Her legate in government was a returned exile, Pandolfo Petrucci. who was till his death in 1512 master of Siena. He was a thoroughly sensible tyrant. Expelled by Cesare Borgia in 1502, he was restored through the intervention of the Florentine government and the king of France in March 1503. In 1522 Siena became a free city under the protection of the Emperor Charles V. On Aug. 5, 1552, the Spanish "protection" ended. To attain this end Siena had called in Cosimo of Florence as well as France, and once more she suffered from the possession of powerful friends.

There were battles and desperate diplomacies; until in 1555 the Spaniards. having defeated the French, took possession of the town; Philip II of Spain then gave Siena to Cosimo I de'Medici.

The separate history of Siena as a city-state ceased, though it retained a separate administration for more than two centuries. until the general reforms of the grand-duke Pietro Leopoldo, the French domination, and finally the restoration swept away all differences between the Sienese and Florentine systems of government. In 1859 Siena was the first Tuscan city that voted for annexation to Piedmont and the monarchy of Victor Emmanuel II.

See also references under "Siena" in the Index volume.

SIENKIEWXCZ, HENRYK (1846–1916), Polish novelist, born on May 5, 1846, received his schooling in Warsaw and graduated in 1870 from the philological faculty of the university there. He reviewed books in various newspapers in 1869. His first novel, *Na marne* (Run to *Waste*), appeared in 1872, his first short story, Stary *sluga* (An Old Retainer), in 1875. Between 1876 and 1878 he traveled in the United States as a special correspondent. On his return via Italy and France he published more short stories, including Janko *muzykant* (Janko the *Musician*) in 1881 and Bartek *zwyciezca* (*Bartek* the *Conqueror*) and Latarnik (The *Lighthousekeeper*) in 1882. In 1882–83 he was co-editor of the daily newspaper *Slowo*. His Listy z Afryki (Letters from Africa) are the fruits of a journey made in 1891. For his 30th anniversary as a writer (celebrated in 1900) he received from the Polish people the gift of the small estate of Oblegorek, near Kielce, where he resided until 1914. In 1905 he was awarded the Nobel prize for literature. During the early years of World War I he promoted the cause of Polish independence and organized relief for Polish war victims. He died on Nov. 15, 1916. at Vevey. Sienkiewicz's great trilogy, which began to appear in Slowo in 1883, was written, in his own words, "to fortify the hearts" of his countrymen. It comprised Ogniem *i* mieczem (*With* Fire and Sword), published separately in 1884; Potop (The Flood), 1886; and Pan *Wolody*jowski (Pan Michael), 1887–88. Historians differ over the trilogy's value as a picture of Poland's struggles against its enemies in the third quarter of the 17th century, but critics are unanimous in their praise of its literary qualities. Bez dogmatu (Without Dogma), a penetrating if lengthy psychological novel, appeared in 1891. Rodzina Polanieckich (The Polaniecki Family), a didactic *roman* de *moeurs,* in 1895. Quo Vadis, a historical novel of Rome under Nero, came out in 1896. Sienkiewicz's other works include Krzyzacy (The Knights of the Cross), 1900, and W *pustyni i puszczy* (In Desert and Wilderness), 1911, a children's novel.

See M. M. Gardner, *The* Patriot *Novelist of* Poland, *H.S.* (London, 1926); J. Birkenmajer, "H.S.," *Thought,* xiv, pp. 579–593 (London, 1939). (L. R. Lr.)

SIERRA LEONE, west Africa, since April 1961 an independent sovereign state within the Commonwealth of Nations, is bounded north and east by the Republic of Guinea, south by Liberia, and west by the Atlantic ocean. Area 27,925 sq.mi. The area formerly known as the colony is wholly coastal, consisting of the Sierra Leone peninsula (at the northern end of which stands the capital and chief port of Freetown), Sherbro and smaller islands (with the town of Bonthe) and Turner's peninsula. The former protectorate included the headwaters of the Niger river, which flows northeast (away from the Atlantic), eventually reaching the Gulf of Guinea in Nigeria.

PHYSICAL GEOGRAPHY

Relief and Drainage. — The mountains of the Sierra Leone peninsula, consisting of igneous (norite) rocks, run parallel to the sea for about 25 mi., with a maximum width of 12 mi., and reach 2,912 ft. in Picket hill. They are well watered, thickly wooded and much dissected by deeply cut ravines. The name Sierra Leone derives from that given to the range by the Portuguese explorer Pedro da Cintra in 1462. Along the Atlantic coast there extends a flat, low-lying and frequently flooded coastal plain, composed of sands and clays and 20–40 mi. wide. The numerous estuaries are fringed below high-tide mark by extensive mangrove swamps. In the south the plain gives way inland to rolling wooded country with isolated hills rising to more than 1.000 ft. In the north the plain is backed by an upland plateau reaching to 1.500 ft. or more. The plateau is bounded westward by a narrow outcrop of metamorphic rocks, the Kambui schists, in which valuable metal ores, including gold. iron and chromite, occur, but which is principally composed of granite. Above the plateau surface rise several mountain ranges, reaching 6.390 ft. in Bintimane (Loma mountains) and 6,080 ft. in Sankan Biriwa (Tingi hills).

Numerous rivers rise in the well-watered Fouta Djallon plateau and flow down its steep slopes southwest to the Atlantic ocean. Their middle courses are interrupted by rapids, but they are navigable in parts and those in the south are important for the commercial movement of goods, particularly during the rains. From north to south the principal rivers are the Great Scarcies (or Kolenté), Sierra Leone's northwestern boundary with the Republic of Guinea; Little Scarcies (Kaba); Rokel (Seli), known in its lower course as the Sierra Leone river, with the large, sheltered harbour of Freetown at its mouth; Jong (Taia); Sewa (Bum); Waanje; Moa; and Mano (Moro), forming the country's boundary with Liberia.

Climate. — Conditions are generally hot, with average temperatures of 75°–85° F. on the coast and between 69° and 95° in the interior. and, during the rains (May–October), very wet. During the dry season (November–April) the harmattan wind from the northeast frequently blows, bringing with it fine Saharan dust, poor visibility and very low relative humidity. The rainy season is introduced by a series of squalls, known locally as tornadoes, with thunder and lightning. Relative humidity during the rains may be as high as 90% for considerable periods, particularly during the wettest months, July to September. Annual average rainfall totals range from more than 150 in. in the peninsula mountains to 80 in. in the north. Freetown (128 in.) recorded 13.40 in. in one day in July 1948 and 5.91 in. in an hour in September 1944.

Sierra Leone was formerly known as "the white man's grave" but during the 20th century living and health conditions greatly improved, although at times the climate is distinctly trying, especially for Europeans.

Vegetation. — Forest probably covered most of Sierra Leone in the past, but has been greatly reduced in area, particularly through felling for cultivation. The wetter areas are still forest-covered, but savanna woodland (often termed orchard bush) and grassland are increasingly common, especially where forest reserves have been constituted, as on the hills of the peninsula and in the Gola forest near the Liberian boundary. Valuable timber trees exploited include species of Khaya (African mahogany) and African teak (*Oldfieldia africana*). In the interior there is much secondary forest, where trees have at some time been felled to permit cultivation; in these areas the African oil palm (*Elaeis guineensis*) is often common and has great economic value as a source of palm oil and palm kernels. Where the annual rainfall decreases, savanna woodland with fire-tolerant trees, such as lophira, and grassland become increasingly common. Grassland has developed throughout the country where the soils are too thin or the slopes too steep for tree growth and is particularly characteristic on lateritic patches. Swamps, which flood seasonally, abound along the beds of streams, and mangroves flourish in the saline tidal areas of river estuaries. though they are being drained and cleared in places for the cultivation of swamp rice. The swamps of the southern coastlands are important producers of the fibre piassava, used in the manufacture of strong brooms and obtained from the swamp palms Raphia *vinifera* and R. *gaertneri*.

Animal Life. — The relatively few large game animals are rarely seen because of the density of the vegetation; they include elephant, leopard, bush cow or dwarf buffalo (*Syncerus nanus*) and antelope (including duiker, the harnessed antelope and. in the Gola forest. the bongo). Tiger cats, civets, chimpanzees, various species of monkey, porcupines, bush pigs and cane rats (always called "cutting grass") are common. Some of these are responsible for much damage to growing crops. During the dry season lions occasionally come in from Guinea in search of game. Birds and insects abound, the latter including mosquitoes. tsetse flies, termites, locusts and sand flies. Hippopotamuses, both normal and pygmy, crocodiles and manatees are common in the rivers, and the estuaries are often shark-infested. Fish, caught both in the rivers and at sea, include tarpon, barracuda, mullet and "bonga" (a species of shad). The coastal waters off Sierra Leone constitute an excellent fishing ground, which is as yet little exploited.

(**R.** W. SL.)

THE PEOPLE

The Mende, Lokko, Kono, Vai, Koranko, Susu and Yalunka tribes belong to the Mande linguistic group (see MANDINGO), and the Temne. Limba and Bulom (Sherbro) to the semi-Bantu group. The tribes have many cultural features in common, from long association with the Muslim Fulani and Mandingo. the dominating influence of the two largest tribes (Mende and Temne) and contact with Europeans. The Mende in the centre and south, and the Temne in the north, divide into 60 and 44 chiefdoms respectively, each ruled by a paramount chief and a council of section chiefs. The main economic activity is agriculture; in most areas rice is the staple crop, but the Sherbro grow cassava and fishing is important among them. Descent is normally patrilineal, although there are close links with certain maternal relatives. The Temne divide into 25 patriclans. The Poro and Sande secret societies (for men and women respectively) sanction behaviour in most aspects of life; the Temne have the Ragbenle society in addition. The population in the former colony area also includes the Creoles, the descendants of repatriated slaves mainly from Nova Scotia and the West Indies.

The only lingua franca is a form of pidgin English which is fairly widespread, though by no means universal. There are diverse animist beliefs, rites and practices among tribes and families The Muslim religion is followed in parts of Sierra Leone and Christianity is well established. Freetown is the seat of the Anglican archbishop of west Africa and also of a Roman Catholic bishop. (ME. F.)

Population and Towns. — In 1957 the population was estimated to be 2,253,000 with a density of about 81 per square mile and included 1,000 Europeans and 2,000 Asians.

Freetown (*q.v.*) is the capital and chief port, but iron ore is shipped from Pepel, a short distance up the Sierra Leone river. The other chief towns are Bo (the former capital of the protectorate) in Southwestern province, the diamond-mining centre of Kenema in Southeastern province and the trading centre of Makeni in Northern province. Lunsar, near the Marampa iron mines, grew rapidly in the 1950s. Other important settlements are Waterloo, a Creole town on the peninsula, Kabala in Northern province and Kambia in the Scarcies river rice district. (R. L.)

HISTORY

Sierra Leone was originally divided into many small independent kingdoms or chiefdoms; each had its own ruler whose power was checked by his council of subchiefs. In many areas there were also secret societies, of which the Poro society is the best known, which maintained law and order as well as instructing initiates in the traditions and customs of the country. The Bulom (or Sherbro) people have been settled immemorially on the coast. The Temne, by tradition migrants from the north, were well established on the coast by the 15th century. The Mende only reached it by slow migration in the 19th century.

Portuguese voyagers named the mountainous peninsula at the mouth of the Rokel river, Serra Lyoa (Lion mountain), corrupted later to Sierra Leone. From the late 15th century European ships of all nationalities put in regularly, near the site where Freetown now stands, to take on water and firewood and to trade manufactured goods for slaves and ivory. Though English trading posts were built on Bunce Island and York Island in the 17th century, no European power exercised jurisdiction in Sierra Leone. Traders settled there under the protection of the African rulers, who welcomed them for the goods they brought. In the early 18th century the Fulani and Mandingo (Mandinka) Muslim peoples in Fouta Djallon (Futa Jalon), north of Sierra Leone (later in Guinea), started a holy war of conversion. From Fouta Djallon. Islam spread gradually to the coast. By the end of the 19th century it was firmly established in northern Sierra Leone and in the 20th century began to spread among the Mende.

A group of freed slaves of African birth or origin arrived in Sierra Leone from England to form a settlement in 1787. Its sponsor, Granville Sharp, the English slave abolitionist, called it "the Province of Freedom" and hoped it would become a base against the slave trade. King Tom. a Temne subchief, gave them a strip of land, but his successor, King Jimmy, drove them away in 1789. The settlement was revived in 1791 by the Sierra Leone company, a trading company sponsored by opponents of the slave trade, with headquarters in London. The town was rebuilt and named Freetown. The company brought from Nova Scotia. as settlers, some former slaves who had gained their freedom by serving the British in the American Revolutionary War. They were joined in 1800 by "Maroons," free Negroes from the mountains of Jamaica, who had been deported to Nova Scotia for insurrection. These settlers, African in origin, were English-speaking and many were literate and Christian. After the British parliament made the slave trade illegal in 1807, the British government took over the settlement (Jan. 1, 1808) as a naval base against the slave trade and as a centre to which slaves, captured in transit across the Atlantic, could be brought and freed. Between 1807 and 1864, when the last slave ship case was adjudicated in the Freetown courts, the British navy brought in more than 50.000 "recaptives." Drawn from all over west Africa, these heterogeneous people lacked any common language or culture. Inspired by Sir Charles MacCarthy, governor from 1814 to 1824, the government undertook a deliberate policy of turning them into a homogeneous, Christian community. Missionaries of the Church Missionary society (C.M.S.) and Methodist Missionary society, and the pastors of the Freetown settler churches, worked among them with such success that within a generation the policy was virtually fulfilled. As well as opening boys' and girls' secondary schools, the C.M.S. founded an institution at Fourah bay, near Freetown, to train teachers and missionaries (see Education, *Welfare, Defense* below). The recaptives and their children (known as "Creoles") prospered as traders. opening stores or bartering imported European goods in the neighbourhood for exportable palm produce. Many left the colony to trade along the coast or to work there as clerks, teachers or missionaries. At their suggestion, English missions were started in the Yoruba country (later part of Nigeria) the homeland of many recaptives. Thus they formed an educated west African elite, bringing the new ways they had learned to their distant homeland.

The most famous recaptive was Samuel Adjai Crowther, who became an Anglican priest in 1845 and bishop in the Niger territories in 1864. Among distinguished Creoles were Africanus Horton and William Davies who qualified in Britain in 1859 as doctors and served as officers in the British army; and Samuel Lewis, a barrister, who served many years on the colony's legislative council and was knighted in 1896.

Colony and Protectorate.— The colony made treaties of friendship with most of the neighbouring chiefs and gradually acquired jurisdiction over the adjoining coastline. The Creoles wanted to extend the colony inland, but the British government was unwilling to accept ne west African responsibilities. However by 1890 it was realized in London that the French, rapidly advancing inland. would soon hem the colony into a tiny enclave and destroy Freetown's value as a naval base. A more expansive policy was sanctioned, frontiers were delimited with the French and Liberian governments and a British protectorate was proclaimed in 1896 over the area within the frontier lines. The British government made no contribution toward governing the new protectorate, so Sir Frederic Cardew, governor from 1894 to 1900, introduced a hut tax to raise extra revenue to pay for the enlarged administration. The chiefs, who had not been consulted about the protectorate, objected. A revolt broke out in the north in 1898 under an experienced war chief, Bai Bureh. It spread among the Mende but was suppressed by the end of the year. There was no further armed rising against the British.

The protectorate was governed on the principles of indirect rule, later introduced by Frederick (later Lord) Lugard into Nigeria. The chiefs retained much of their power, under the supervision of British district commissioners. Traditional ways were encouraged, and for the first decades of the 20th century little was done to extend education in the protectorate. During the 19th century many Creoles held senior official posts and looked forward to governing themselves ultimately. But after the protectorate was assumed they were gradually removed from office and both colony and protectorate were ruled by British administrators. A new constitution in 1924 allowed a few Creoles to be elected. and protectorate chiefs nominated, to the legislative council. but this did not satisfy nationalist aspirations.

Independence.——After World War II British policy changed. In Sierra Leone, as elsewhere in west Africa, it was agreed to constitute democratic institutions through which the dependent territories could evolve into independent states. The Creoles, a small educated minority, hoped to entrench themselves politically, lest under a fully democratic constitution they should be overwhelmed by the protectorate peoples. But the 1951 constitution gave power to the majority. The government elected under it was led by Dr. Milton (later Sir Milton) Margai, leader of the Sierra Leone People's party, a predominantly protectorate party. In succeeding years, under his leadership, responsible government was gradually introduced, by peaceful evolution. The last stage was reached in 1961. and Sierra Leone became an independent state within the Commonwealth. (C. FY.)

ADMINISTRATION AND SOCIAL CONDITIONS

Under British rule the country was administered as a crown colony and protectorate, the governor being assisted by an advisory council of ex officio and appointed members until 1863, and thereafter by executive and legislative councils. A protectorate assembly, composed mainly of paramount chiefs, nominated members to the legislative council. The development of parliamentary institutions modeled on the British pattern was continuous, and amendments to the constitution in 1951, 1956 and 1958 increased the measure of responsible government. The ministerial system was introduced, the chief minister being the leader of the majority party in the legislative council, which itself became the house of representatives. At the 1957 general election almost all adult males and all adult female taxpayers or property owners were eligible to vote. In 1958 ex officio members were excluded from the administration and in 1960 the constitutional changes involved in the granting of complete independence were agreed upon in London.

The constitution provides for a governor general appointed by the British sovereign on the advice of the Sierra Leone prime minister; for a house of representatives of not fewer than 60 members and a normal life of five years; for universal adult suffrage; and for executive responsibility by a cabinet of ministers appointed by the prime minister and presided over by him. There are a supreme court and a court of appeal, with further appeal lo the judicial committee of the British privy council in certain cases. The cliief justice is appointed by the governor general on the advice of the prime minister; other judges are appointed on the advice or' the judicial service commission. The constitution includes the customary provisions governing citizenship and safeguarding individual rights and freedoms.

In the 1957 election the Sierra Leone People's party led by Sir Milton Margai formed an alliance (the United Front) with the United Progressive party, the National Council of Sierra Leone, the Independent Progressive party and the People's National party; the United Front was elected by a large majority. The administration was reconstituted in 1960 from members of parties within the United Front, which also won the 1962 election.

Local government is organized on the British pattern, with elected town councils composed of a mayor and aldermen and district councils in the rural areas. Each chiefdom has its own revenues from taxes and the district councils have powers to raise revenue as well as to obtain grants for local services from the central government.

Education, Welfare, Defense.—Fourah Bay college, the institution that was reconstituted in 1960 as the University College of Sierra Leone, was founded at Leicester near Freetown by the Church Missionary society in 1827. In 1876 it was affiliated to Durham university, Eng., and in the 1950s moved to Mt. Aureol overlooking Freetown. It has 300–400 students. Other missions conduct teacher training colleges, high schools, secondary schools and hospitals. Illiteracy is still widespread, but by the date of independence there were about 600 primary schools (80,000 pupils). 30 secondary schools (7,000 pupils), 6 teacher training colleges and 2 technical institutes (Freetown and Kenema). Hospital beds in establishments conducted by the government, missions and mining companies exceeded 1,500 and there were in addition about 50 government dispensaries and health centres, as well as treatment centres attached to the Endemic Diseases Control unit. Wages and conditions of employment are regulated by joint industrial councils and wages boards. By the early 1960s there were a number of registered trade unions, including mineworkers, railway workers and maritime and waterfront workers. The army consisted of headquarters, one battalion of the Sierra Leone regiment, a signal troop and service units.

THE ECONOMY

Although since the 1930s minerals have been of increasing importance. the economy is still largely a subsistence one based on rice growing on the upland slopes or in the swamps and estuaries.

Agriculture.— Agriculture occupies about 80% of the population. Besides rice, the main food crops are palm oil and cassava.

The chief export crops are palm kernels (about 60,000 tons annually), cocoa (3,000 tons), *Robusta* coffee (4,500 tons) and piassava (5,000 tons). Cultivation, transport and marketing are assisted hy co-operatives and by marketing and credit societies. Market gardening is carried on around Freetown and in the Northern province around Kabala in the Koinadugu district, which is the centre of the livestock industry.

Mining. — Iron ore (about 1,500,000 tons annually) is extracted from opencast workings at Marampa; deposits of rutile and bauxite exist near the coast in Southwestern province. Diamonds, the country's most valuable product, were first found in river gravels of the Kono district. about 140 mi. E. of Freetown. Subsequent prospecting revealed diamondiferous deposits over much of the Bafi-Sewa river system and in 1935 a British company obtained a 99-yr. concession covering the whole country. Following World War II, local poverty combined with boom prices for diamonds encouraged illicit mining, which was carried on not only by the inhabitants but also by thousands of immigrants (largely from French Guinea) and organized by the Lebanese community. The company's monopoly was in 1955 rescinded except for 450 sq.mi. around Yengema in Southeastern province. The government thereafter opened up the surrendered area to licensed Sierra Leonean diggers and in 1959 established its own buying office. By these measures, illegal exports of diamonds (estimated in the mid-1950s to exceed half the output) were materially reduced. The Sierra Leone deposits lie in gravel layers up to 4 ft. thick beneath a shallow alluvial covering and about 50% of the diamonds they yield are gem stones. The concessionary company produces between one-quarter and one-third of the total output; during the dry season about 30.000 licensed diggers are at work. Total exports of diamonds were estimated at £15,250,000 in 1960.

Industry and Power. — The main industrial undertakings are those concerned with the processing of agricultural and forest products (oil mills, rice mills, sawmills). Furniture. cigarettes, soft drinks, nails and industrial gases are produced locally. but further industrial development depends chiefly on power supplies. By the early 1960s the generating capacity in Freetown was less than 15.000 kw. and there mere 15 small power stations in the provinces. Fishing is important and village industries include fish curing and smoking, hand-expressing of palm oil and cracking palm kernels.

Trade and Finance. — Sierra Leonean overseas trade expanded substantially in the 1950s. More than 50% of imports come from other commonwealth countries (the bulk from the U.K.); the main imports are manufactured goods, machinery. cement, coal. petroleum products and tobacco. Minerals account for about 70% of total exports by value and agricultural products for about 16%; most of the exports went to the U.K. Currency at par with sterling (W.A.sh.20 = £1) is issued by the West African Currency board. in notes of W.A.sh.100, 20 and 10 and in coins of smaller denominations.

Transport and Communications. — A state-owned railway of 2 ft. 6 in. gauge runs east from Freetown to Pendembu ($227\frac{1}{2}$ mi.) near the Liberian frontier. A branch line from Bauya runs northeast to Makeni. The railway has many difficult gradients, limited carrying capacity and has never covered its capital costs. An iron-ore railway of 3 ft. 6 in. gauge joins Marampa with Pepel. Inland waterways total about 500 mi. and there is a considerable volume of river traffic, carried by launches. including coastwise routes from Freetown southward to Bonthe and northward on the Great and Little Scarcies rivers. Freetown, the finest natural harbour in Africa, is a regular port of call for numerous shipping lines and can accommodate large ships alongside the Queen Elizabeth II wharf. opened in 1954. The international airport of Lungi is on the north bank of the Sierra Leone river opposite Freetown, but domestic air services use Freetown's smaller Hastings airfield. The principal towns are accessible by road and the majority of villages can be reached by truck; in the early 1960s the system comprised about 1,700 mi. of main roads and 1,800 mi. of secondary roads.

The Sierra Leone Broadcasting service (founded 1934) transmits in English and a number of indigenous languages.

Current history and statistics are summarized annually in the *Britannica Book of the Year.*

SIERRA MORENA, THE, Spain, is so called because of the long dark line of the southern scarp of the Meseta as seen from the Andalusian plain. It has a mean elevation of about 2.500 feet rising above this in the east toward the steppe region of Albacete. The easternmost and loftiest ridge is called the Sierra de Alcaraz (5.899 ft.), while some of those in the extreme west are classed together as the Sierras de Aracena. The great breadth of the Sierra Morena long rendered it a formidable barrier between Andalusia and the north; as such it has played an important part in the social, economic and military history of Spain. It separates the plateau region of Castile and Estremadura from the Andalusian plain and the highlands of the Sierra Nevada system, and forms the watershed between two great rivers. the upper Guadiana on the north and the Guadalquivir on the south. Parts of the Sierra Morena are rich in minerals; the central region yields silver, mercury and lead, while the Sierras de Aracena contain the celebrated copper mines of Tharsis and Rio Tinto (*q.v.*).

SIERRA NEVADA, is a range of high mountains south of the basin of Andalusia in southern Spain. It is a well-defined range. stretching from the upper valley of the river Genil or Jenil eastwards to the valley of the river Almería. It owes its name, meaning "the snowy range." to the fact that several of its peaks exceed 10.000 feet in height and are thus above the limit of perpetual snow. Its culminating point, the Cerro de Mulhacen (11,-411 ft.) reaches an altitude unequalled in Spain. while one of the neighbouring peaks, called the Picacho de Veleta (11.128 ft.). is only surpassed by Aneto (11.168 ft.), the loftiest summit of the Pyrenees. The Sierra Nevada is composed chiefly of soft micaceous schists. sinking precipitously down on the north, but sloping more gradually to the south and southeast. On both sides deep transverse valleys (*barrancas*) follow one another in close succession, in many cases with round, basin-shaped heads like the cirques of the Pyrenees (*q.v.*). In many of these cirques lie alpine lakes, and in one of them, the Corral de Veleta, there is even a small glacier. the most southerly in Europe. The transverse valleys open on the south into the longitudinal valleys of the Alpujarras (*q.v.*). On the north, east and west are the Sierras of Parapanda. Harana. Gor. Baza, Lucena. Cazorla. Estancias. Filabres, etc.. connected with the main range, sometimes collectively termed the Sierra Nevada system.

SIERRA NEVADA (Spanish. "Snowy hlountains"). of California, one of the major ranges of the United States, extends from Tehachapi pass north-northwestward 400 mi. to Lake Almanor. Its breadth varies from 40 to 80 mi. The highest peak is Mt. Whitney. 14.495 ft.

The range consists chiefly of granite, flanked in places by belts of metamorphosed sediments. and overlain elsewhere by Tertiary volcanic materials. The range was created by block faulting: this great section of the earth's crust was broken apart from its surroundings. raised and tilted into a new position. The eastern edge became a massive escarpment. towering nearly three miles above Owens valley. Streams cut deep valleys into the gentle western slope and deposited the resultant detritus onto the depressed western portion, creating the vast alluvial plains of the San Joaquin-Sacramento valley ("Great valley"). During the Pleistocene epoch alpine glaciers reshaped some valleys. creating the spectacular scenery of Yosemite valley and producing peaks. pinnacles and rock-rimmed lakes along the eastern crest. In a few high sheltered valleys, small glaciers still remain.

This massive. unbroken barrier lifts the prevailing winds moving eastward off the Pacific ocean. producing heavy precipitation. especially in winter. on the western slope (30–40 ft. of snowfall at 6.000 ft. in an average winter) and creating a desert eastward into Kevada. The range is a vast reservoir for water, supplying irrigation requirements for the Great valley and municipal requirements for several cities, notably San Francisco and Los Angeles.

The great differences in altitude produce marked contrasts in vegetation. On the west, the grasslands of the Great valley are succeeded upslope by a belt of oak woodland, replaced in turn by chaparral (drought-resistant dense brush), yellow pine forest. white fir—red fir forest, lodgepole pine forest, subalpine forest and culminating finally in alpine meadows and bare rock slopes above the timberline. On certain unglaciated interfluves amidst the yellow pine forests are groves of Sequoias (Sequoia *gigantea* "big tree"), world renowned for their great age and size. On the steep eastern slope the transition from forest to desert is abrupt. Some lumbering is carried on in the west-slope forests. The upper zones are grazed by sheep in summer and the foothills support cattle through the year.

Gold was discovered in 1848 in Sacramento valley gravels derived from the Sierra Nevada. Soon, thereafter, the bedrock source or "mother lode" was discovered on the western slope. After a wild period of mining booms and a longer period of steady production, mining activity gradually declined and the old mining towns became more important as tourist attractions than as mineral producers.

Tourists also visit the Sierra Nevada mountain recreation centres in great numbers in both summer and midwinter. Among the chief attractions are the three national parks—Yosemite, Sequoia and Kings Canyon (*qq.v*)—and several ski centres in the national parks, the Donner pass—Reno region and the Mammoth area on the eastern slope.

Donner pass (7.017 ft.). used by the Southern Pacific railroad and highway U.S. 40, is the most important transmontane route. connecting San Francisco with Reno, Nev. Farther south, the mountains constitute an almost impenetrable barrier to land transportation: from Tioga pass to Walker pass, a distance of 165 mi., no road crosses the range.

Aside from scattered recreation areas, lumber camps and small towns serving the transmontane transportation routes, the Sierra Nevada range is virtually devoid of permanent inhabitants. Much of it is included in the national parks and several national forests.

SIEYÈS (Sē-ā-yās), **EMMANUEL-JOSEPH** (1748–1836), French abbé and statesman, one of the chief theorists of the revolutionary and Napoleonic era, born at Fréjus, S. France, on May 3, 1748. He was educated for the church at the Sorbonne; but while there he eagerly imbibed the teachings of Locke, Condillac, and other political thinkers, in preference to theology. Nevertheless he entered the church, and owing to his learning and subtlety advanced until he became vicar-general and chancellor of the diocese of Chartres. At the crisis of 1788, when Necker asked for opinions as to the constitution of the estates Sieyks wrote his celebrated pamphlet, "What is the Third Estate?" He thus begins his answer—"Everything. What has it been hitherto in the political order? Nothing. What does it desire? To be something." For this mot he is said to have been indebted to Chamfort. The pamphlet had a great vogue, and its author was elected as the last (the twentieth) of the deputies of Paris to the States General. He strongly advised the constitution of the Estates in one chamber as the National Assembly, but he opposed the abolition of tithes and the confiscation of church lands. Elected to the special committee on the constitution, he opposed the right of "absolute veto" for the king, which Mirabeau unsuccessfully supported. He had a considerable influence on the framing of the departmental system, but after the spring of 1790 his influence was eclipsed by men of more determined character. Only once was he elected to the post of fortnightly president of the Constituent Assembly. Excluded from the Legislative Assembly by Robespierre's self-denying ordinance, he reappeared in the third Kational Assembly, known as the Convention (September 1792–September 1795); but he effaced himself partly from disgust, partly from timidity. He abjured his faith at the time of the installation of the goddess of reason; and afterwards he characterized his conduct during the reign of terror in the ironical phrase, *J'ai vécu.* He voted for the death of Louis XVI., but not in the contemptuous terms La *mort* sans phrases sometimes ascribed to him.

In 1795 he went on a diplomatic mission to The Hague. He dissented from the constitution of 1795 (that of the Directory) in some important particulars, but without effect, and thereupon refused to serve as a Director of the Republic. In May 1798 he went as the plenipotentiary of France to the court of Berlin in order to try to induce Prussia to make common cause with France against the Second Coalition. His conduct was skilful, but he failed in his main object. He was elected a Director in place of Rewbell in May 1799. Already he had begun to intrigue for the overthrow of the Directory; he now set himself to sap the base of the constitution of 1795. With that aim he caused the revived Jacobin Club to be closed, and made overtures to General Joubert for a *coup d'état* in the future. The death of Joubert at the battle of Novi, and the return of Bonaparte from Egypt marred his schemes; but ultimately he came to an understanding with the young general. After the coup *d'état* of Brumaire, Sieyks produced the perfect constitution which he had long been planning, only to have it completely remodelled by Bonaparte. Sieyks soon retired from the post of provisional consul, which he accepted after Brumaire; he entered the senate, where he defended the arbitrary and illegal proceedings whereby Bonaparte rid himself of the leading Jacobins. During the empire he rarely emerged from his retirement, but at the time of the Bourbon restorations (1814 and 1815) he left France. After the July revolution (1830) he returned; he died at Paris on June 20, 1836. The thin, wire-drawn features of Sieyks were the index of his mind, which was keen-sighted but narrow, dry and essentially limited. His lack of character and wide sympathies was a misfortune for the National Assemblies which he might otherwise have guided with effect.

SPFAKA, the name of three species of large wooly lemurs (*q.v.*) of the genus Propifhecus, allied to the indri (*q.v.*), but distinguished by their long tails. Sifakas, found only in Madagascar, are variable in colouring, but always show a large amount of white. See PRIMATES.

SIGEBERT (d. 575), king of the Franks, was one of the four sons of Clotaire I. At the death of Clotaire in 561 the Frankish kingdom was divided among his sons, Sigebert's share comprising the Rhine and Meuse lands and the suzerainty over the Germanic tribes beyond the Rhine as far as the Elbe, together with Auvergne and part of Provence. At the death of his brother Charibert in 567 Sigebert obtained the cities of Tours and Poitiers, and it was he who elevated to the see Gregory of Tours (*q.v.*), the historian of the Franks. Sigebert married a royal princess, Brunhilda, daughter of Athanagild, the king of the Visigoths; the nuptials were celebrated with great pomp at Metz, the Italian poet Fortunatus composing the epithalamium. Shortly afterwards Sigebert's brother Chilperic I. married Brunhilda's sister, Galswintha; but the subsequent murder of this princess embroiled Austrasia and Neustria, and civil war broke out in 573. Sigebert appealed to the Germans of the right bank of the Rhine, who attacked the environs of Paris and Chartres and committed frightful ravages. He was entirely victorious, and pursued Chilperic as far as Tournai. But just when the great nobles of Neustria were raising Sigebert on the shield in the villa at Vitry, near Arras he was assassinated by two bravoes in the pay of Fredegond, Chilperic's new wife. At the beginning of his reign Sigebert had made war on the Avars, who had attacked his Germanic possessions, and he was for some time a prisoner in their hands.

toire du royaume d'Austrasie (1863). (C. PF)

SIGEBERT OF GEMBLOUX (*c.* 1030–1112), medieval chronicler. became in early life a monk in the Benedictine abbey of Gembloux. Later he was a teacher at Metz, and about 1070 he returned to Gembloux, where, occupied in teaching and writing, he lived until his death on Oct. 5, 1112. As an enemy of the papal pretensions he took part in the momentous contest between Pope Gregory VII and the emperor Henry IV; and he also wrote against Pope Paschal II. Sigebert's most important work is a *Chronographia,* or universal chronicle, covering the years 381–1111. which is published in vol. vi of the *Monumenta Germaniae historicae Scriptores,* with an introduction by L. C. Bethmann.

SIGER OF BRABANT (d. between 1281 and 1284), professor of philosophy at Paris and leader of heterodox Aristotelianism, was a native of the duchy of Brabant. From 1266 (when his name first appears) to 1276 he was prominent in the dissensions that troubled the faculty of arts in Paris. From his earliest years as a teacher he professed a disquieting Aristotelianism, without regard for orthodox Christian doctrine. His teaching was attacked by Bonaventura, the minister general of the Friars Minor, and by Thomas Aquinas, the head of the Dominican school. On Dec. 10, 1270, Étienne Tempier, bishop of Paris, condemned 13 errors taken from the teaching of Siger and his partisans. On Nov. 23, 1276, the inquisitor of France summoned Siger, Goswin of the Chapel and Bernier of Nivelles before his tribunal; they fled to Italy and probably appealed to the tribunal of the papal curia. On March 7. 1277, Tempier pronounced the condemnation of 219 propositions, aiming especially at the teaching of Siger and Boetius of Dacia, Siger was probably condemned to stay at the curia in the company of a cleric; he was stabbed at Orvieto, by his cleric, who had gone mad, and died under the pontificate of Martin IV, before Nov. 10, 1284. Dante (*Paradise,* x, 133–138) puts Siger in the Heaven of Light in the brilliant company of 12 illustrious souls who are glorified because of their fidelity to their own providential mission: Siger fought all his life for the autonomy of philosophy.

By the middle of the 20th century 14 certainly authentic works of Siger's and at least 6 probably authentic commentaries on Aristotle were known. The most important are: *Quaestiones in Metaphysicam; Impossibilia* (six exercises in sophistry): *Quaestiones de necessitate et contingentia causarum; Quaestiones in tertium de Anima;* and *Tractatus de animn intellectiva.*

Siger is an important representative of that school of radical Aristotelianism which arose in the faculty of arts at Paris when Latin translations of Greek and Arabic works had led to the discovery of philosophy by the masters there. Some of these masters, after 1260. inaugurated a purely rational teaching. without any concern with the exigencies of Christian faith; and Siger appears as the leader of this group. His capital source is Aristotle; secondary sources are Proclus and Avicenna (chiefly in metaphysics), Averroes (chiefly in psychology): Albert the Great and Thomas Aquinas. Siger's most typical doctrines are: the First Being is the immediate cause of a single creature. the first intelligence; all other creatures derive indirectly from God, by way of a progressive emanation; there is no real distinction between essence and existence in creatures; the created world is necessary and eternal, and every species of being (mankind, for instance) is eternal; there is only one intellectual soul for mankind and consequently one will; this unique soul is eternal. but the human individuals are not immortal (on the question of the soul. however. Siger's teaching was not consistent); human will is a passive potency moved by the intellect. Siger never accepted the theory of a double truth (one of reason and one of faith). To characterize his philosophy as "Latin Averroism" is inaccurate: his system must be called a radical or heterodox Aristotelianism.

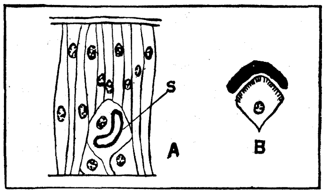
SIGHT, SENSE OF. Under the term "eyes" we include organs. or. in the simplest cases, groups of sensory cells, which are specially adapted for the perception of light. Nevertheless, sensitiveness to light can frequently be established for animals in nhich eyes are not demonstrable. We must assume, therefore, either that the whole surface of the skin is sensitive to light, or that single sensory cells are scattered in the skin ahich are very inconspicuous in their structure, and which are the bearers of this sense of light perception.

THE STRUCTURE OF THE EYES IN THE LOWER ANIMALS

Already in the Protozoa, however, true eyes are found. In Volvox and other Flagellates they consist of a lens, and, behind this, an accumulation of the plasma, which frequently is pigmented. The earthworm has isolated photo-sensitive cells, which may be distinguished by their structure; the simplest of the vertebrates *(Branchiostoma)* has numerous isolated photo-sensitive cells scattered over the whole of the dorsal nerve cord, each of which is half surrounded by a pigment cell (fig. 1).



AFTER HESSE

FIG. 1.—(A) SECTION THROUGH THE SKIN OF AN EARTHWORM. (S) PHOTO-SENSITIVE CELL. (B) PHOTO-SENSITIVE CELL WITH PIGMENT-CAP FROM BRANCHIOSTOMA

Eyes of the most simple kind originate through the concentration of a number of such photo-sensitive cells in a small space.

Eye-spots.—Eye-spots are found in Medusae, starfishes and some Annelid worms (fig. 2). The first step in the perfecting of this very primitive apparatus is the sinking of the eye-spot into a pit-like depression, thus forming an eye-cup (optic cup). This type already, perhaps, is adapted for the perception of the direction of light, and is of very general occurrence, being found in some worms, gastropods, bivalves, starfishes, Arthropods, etc. (fig. 3). This type of eye when it occurs in Arthropods is called an *ocellus,* and is more complicated, as the thin cuticle, which envelopes the whole of the body, becomes thickened over it, and forms a strongly arched, or occasionally, ball-shaped lens. At the same time division of labour takes place among the cells forming the eye-cup. The sides of this remain transparent, and secrete a kind of vitreous humour, only the cells situated at the back of the cup forming the retina (fig. 4a). In yet other cases two layers may be formed in the optic cup by a peculiar process of folding, which cannot be described here. A vitreous outer layer and an inner retinal layer can then be distinguished (fig. 4b). The open cup-shaped eye may become quite closed in, forming an optic vesicle, by the growing together of the outer margins (as in many Chaetopod worms, gasteropods and cuttlefishes). The interior of this optic vesicle is then filled by a jelly-like substance, the vitreous humour. The anterior portion of the vesicle is transparent, like the skin which grows over it; the inner half becomes the retina (fig. 5). This type of eye is found in its most perfect form in some worms (*Alciope*) and gasteropods (*Helix, Limax*) with the formation of a lens, which is free in the vitreous humour, and condenses the rays of light. The cuttlefish alone shows a further development. This is the highest of all invertebrate animals. In general, as well as in psychical, development, it ranks at least as high as fishes.

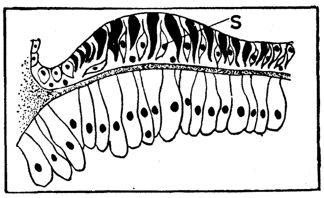


FIG. 2.—EYE-SPOT OF A MEDUSA: S RETINAL CELLS

The eye represented in fig. 6, presents a striking resemblance to that of a vertebrate. All the separate parts of the one are repeated in the other. The posterior chamber is the principal part; it is bounded at the back by the retina, and in front by the

iris. It is filled by a jelly—the vitreous humour.

The lens is spherical, as in fishes. It differs from the lens of a fish, however, in that it does not consist of cells; it is divided by a delicate skin which separates the anterior chamber of the eye from the posterior, half lying to the front, and half to the back.

The anterior chamber is closed by a transparent cornea, in front of which are movable eyelids. The power of accommodation is exactly the same as in the vertebrate eye. The cuttlefish can focus its sight either for near vision or for distant by means of particular muscles, which alter the length of the axis of the eye. It is hardly necessary to mention that the pupil in the iris can be expanded or contracted according to the strength of the light falling on it. In the structure of the retina, also, the eye of the cuttlefish is equivalent to those of vertebrates.

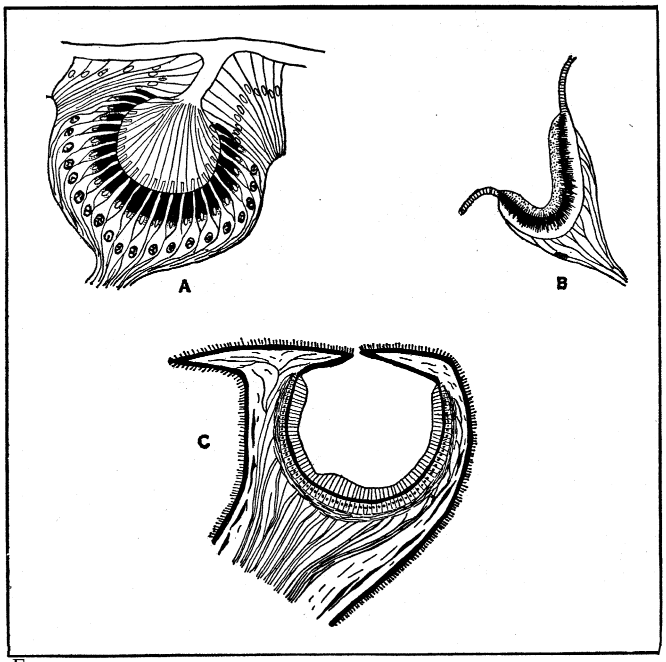

FIG. 3.—OPEN. CUP-SHAPED EYES OF (A) CHAETOPOD WORM (SYLLIS); (B) GASTROPOD, COMMON LIMPET (PATELIA); (C) CHAMBERED CEPHALOPOD (NAUTILUS)

It is made up of more than 100,000 elements per sq.mm., and thus is certainly adapted for the formation of a sharp image. Lastly, it may be mentioned, that in size also it is in no way inferior to the vertebrate eye. Eyes 37 cm. in diameter have been found in the giant cuttlefishes of the genus Architeuthis.

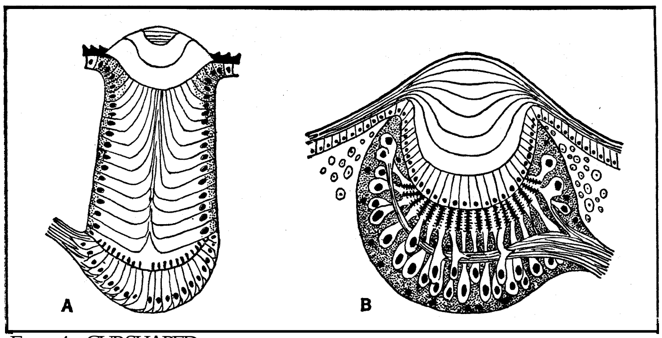

FIG. 4.—CUP-SHAPED EYES OF (A) THE LARVA OF A BEETLE (ACILUS); (B) A SPIDER (TEGENARIA)

The eyes of turbellarian worms and leeches have a somewhat different structure. In these animals, it is true, eye-cups are present, but they are not formed by the retinal cells themselves, but of pigment cells, which absorb the light, while the sensory cells penetrate into the interior of the cup (fig. 7).

Faceted **Eyes.**—We find quite a different type in the faceted eyes of insects and crustaceans. As the name implies, the eye may be seen to be formed of a great number of facets, usually square or hexagonal in shape, which in their regularity resemble closely those cut on a precious stone. Each facet corresponds to a single eye or ***ommatidium,*** which always takes the shape of an elongated cone. In each of these eyes, taken by itself, the following parts may be distinguished. The outermost part consists of a small, somewhat rounded, transparent lens. Under this is the crystalline cone, a conspicuous structure, usually gelatinous, which is quite transparent, and allows the rays of light to pass freely, and directs their path. If we examine the eye of a diurnal insect, we find that the inner extremity of the crystalline cone is adjacent to the cells which, collectively, correspond to our retina. Each ommatidium has only 6 or 7 of these cells. Among them they secrete a remarkable body, the rhabdom, which evidently represents a kind of transformer.

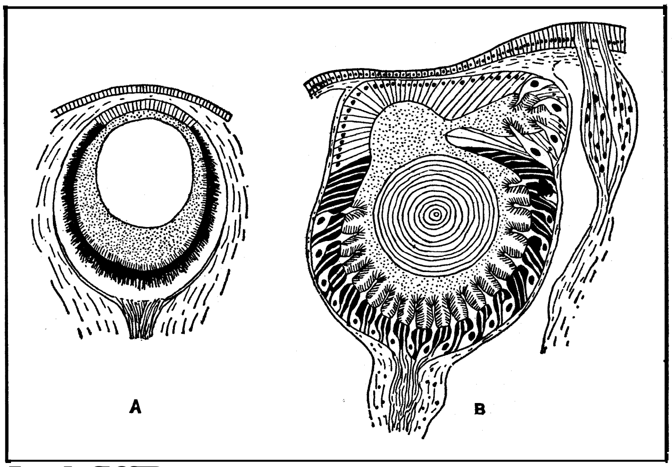

FIG. 5.—CLOSED, VESICULAR EYES OF (A) A MARINE GASTROPOD (MUREX); (B) A LAND GASTROPOD SLUG (LIMAX)

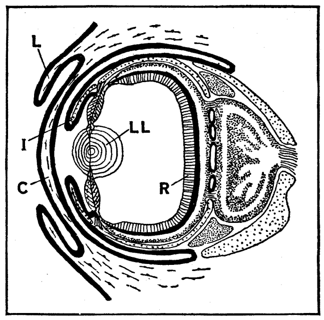

FIG 6.—EYE OF A CUTTLEFISH; L. LID; C. CORNEA; I. IRIS; LL. LENS; R. RETINA

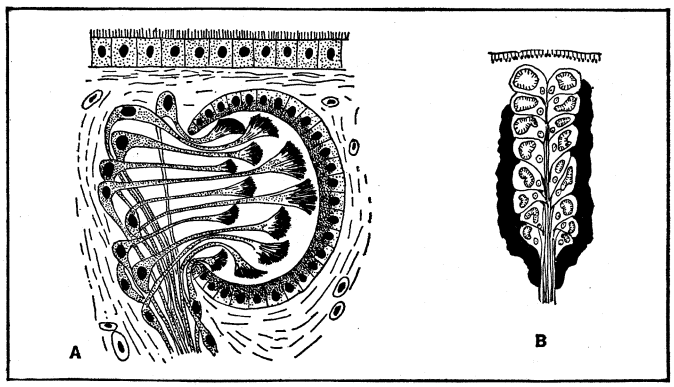
The rays of light which enter the eye are focused on the rhabdom, and there are evidently brought into such a form of energy that they are available to the sensory cells. The nervous layer immediately adjoins the sensory cells. In diurnal insects each ommatidium is separated from its neighbour by a layer of pigment.

somewhat comprehensive conclusions may be drawn from the structure of the faceted eye as to its functional powers. It seems certain that each ommatidium functions separately. It projects the image of a point of light. The whole image seen thus by an insect is composed only of as many elements as the eye possesses facets. The number of these, however, is surprisingly small. Even those insects which have the best sight, such as dragonflies, have only about 60,000 ommatidia. With this we



AFTER HESSE

FIG. 7.—(A) EYE OF A TURBELLARIAN WORM (PLANARIA); (B) EYE OF A LEECH (HIRUDO)

must compare the fact that in the vertebrate eye a single sq.mm., which gives only an exceedingly small portion of the whole image, contains about 300,000–700,000 separate elements. It follows as a matter of course that only in a very slight degree is an insect

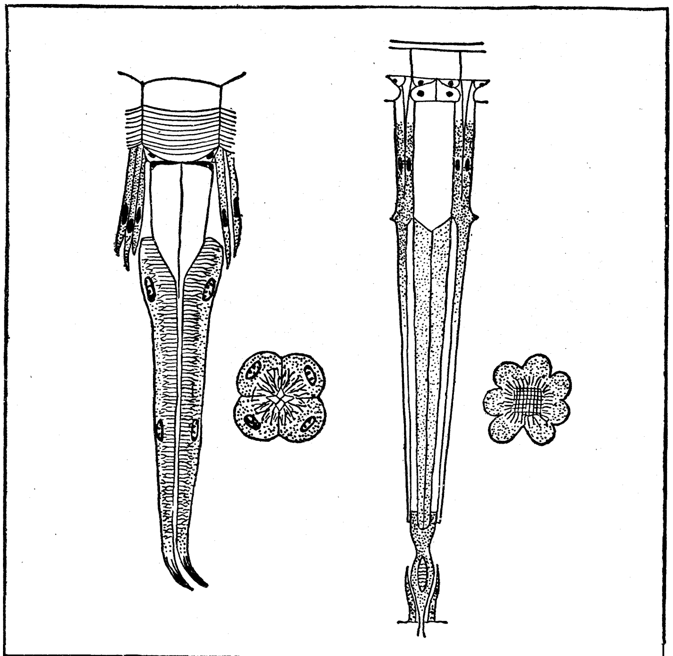


FIG. 8.— (LEFT) **OMMATIDIUM** FROM THE FACETED EYE OF AN INSECT (COCKROACH, **PERIPLANETA**) AND CROSS-SECTION THROUGH THE **RETINULA**. **(RIGHT) OMMATIDIUM** OF A CRUSTACEAN (CRAYFISH. ASTACUS), WITH CROSS-SECTION THROUGH THE **RETINULA**

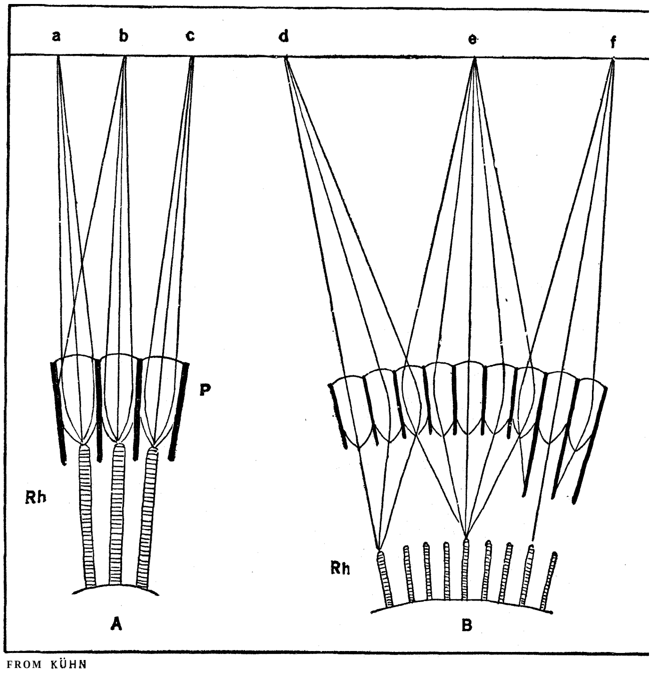
able to distinguish form, as is borne out by the previously mentioned experiments. Most insects, which have only a few thousands or even hundreds of ommatidia, cannot do this at all. On the other hand, these eyes are eminently adapted for the perception of movement. When an insect the size of a fly passes

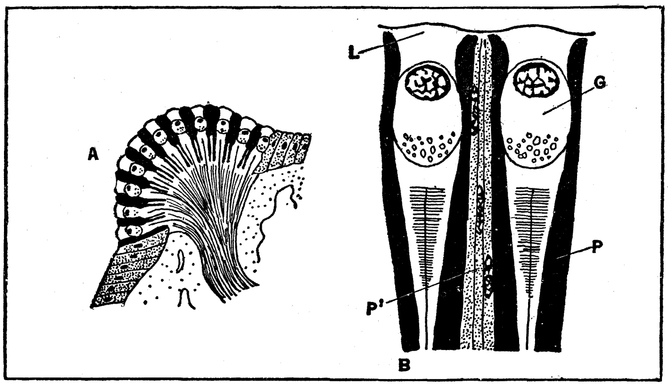


FROM KÜHN

FIG. 9.—PATH OF THE LIGHT-RAYS IN **A** FACETED EYE: (A) IN ONE GIVING AN APPOSITION-IMAGE. **(B)** IN ONE GIVING **A SUPERPOSITION-**IMAGE; P. PIGMENT; RH. RHABDON

in front of a dragonfly at a distance of about 2 metres, it is seen by the latter only as a black point, for it can be proved that, in this case, only one single ommatidium catches the image of the fly. In spite of this it is pursued, captured and eaten.

Eyes of **Nocturnal** Insects.—The eyes of nocturnal insects and of the mostly nocturnal crustaceans are constructed in a remarkably different manner from those of diurnal insects. As is to be expected, such an eye is constructed so as to admit a greater amount of light than that of a diurnal insect. This is attained by the ommatidia being no longer separated by pigment layers. In addition, the crystalline cone has, in such animals, other physical peculiarities. The physiologist Exner has proved this conclusively for the eyes of the glow-worm. He showed



AFTER (A) KUEPFER, **(B)** JACOB

FIG. 10.—FACETED EYE FROM THE MARGIN OF THE MANTLE OF THE BIVALVE MOLLUSC ARCA

that the light given out by a luminous point penetrates not only one ommatidium but many (fig. 9). After leaving the crystalline cone, however, the rays are refracted in such a way that, ultimately, they again become focused upon one point of the retina. Each rhabdom receives, therefore, a much greater amount of light than those in the eyes of diurnal insects. On account of the arrangement one upon the other of the points of light which come from the various crystalline cones, such eyes are described as giving "superposition images," while those of diurnal insects give "apposition images." It is of interest that crustaceans are able to use their eyes either for superposition or for apposition vision, according to their needs. This is attained by the movement of the pigment in the cells which separate the ommatidia.

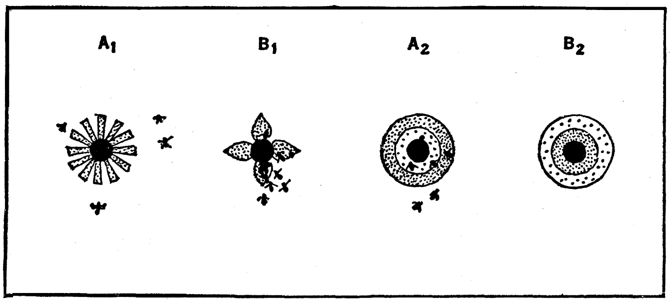

FIG. 11.— TRAINING HONEY-BEES TO DISTINGUISH FORMS

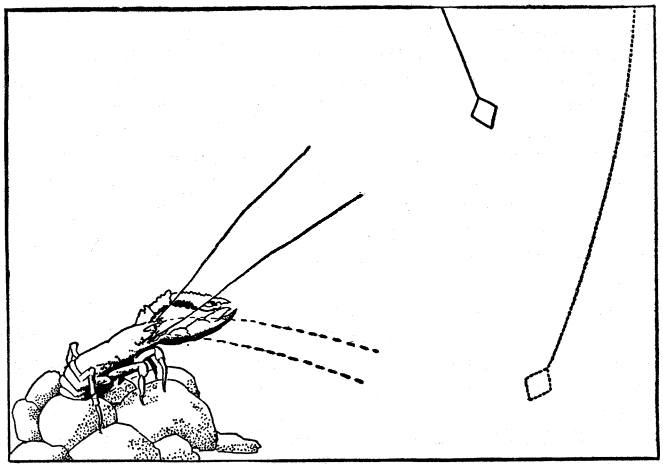
B_1 and A_1 are the boxes with forms to which the bee had been previously trained to come; A_1 and B_2 are other boxes

Faceted eyes are found in some bivalves (*Arca*) and Chaetopod worms, as well as in Arthropods, but serve, however, only for perception of movement (fig. 10).

THE FUNCTION OF THE EYE

To man the eye is by far the most important of all the sense organs. With the help of our eyes we recognise our fellow men, animals and plants, the things we use in daily life, in short all the world around us. He who studies the sight of animals is apt to make the mistake of supposing that their eyes function like ours.

Such perception of form as permits us, from the appearance of an object, to draw conclusions as to its other qualities, and thus to understand its nature, is only to be found in the highest animals, mammals, birds, and, perhaps, some reptiles. Even the frog does not recognise a motionless fly as desirable food, but is quite indifferent to it; it is, so to speak, "intellectually blind." This applies in a still greater degree to the invertebrate or lower animals. Of these, so far as is known at present, only bees and their relatives show a definite sense of form. Von Frisch demonstrated that bees can be trained to distinguish forms. Food was given them in a closed box, into which they were obliged



AFTER DOFLEIN

FIG 12 —GALATHEA SQUAMOSA, SHOWING REACTION TO OPTICAL PERCEPTION OF AN APPROACHING OBJECT, BY BENDING ANTENNAE DOWN

to crawl through a hole. Around this hole was glued the picture of a flower, while round a hole in another box, which was placed beside the first, but was empty, was gummed the picture of another flower. After food had been given thus for several days, the boxes, which could be distinguished only by the difference in the pictures of the flowers, were placed before the bees empty. A much greater number of visits was paid to the box which had contained food (*see* fig. 11). Bees, therefore, are able to distinguish between two flowers according to their shape. Similar experiments may be made also by using simple geometrical figures.

Perception of Movement. — As far as is known at present, none of the other lower animals are capable of such a performance. It is easy to guess for what purpose they use their eyes if we consider the behaviour of some mammals. The hare takes not the least notice of the sportsman standing motionless at the edge of the wood, but as soon as he makes the slightest movement, it takes to flight. It, therefore, exhibits in a marked degree the power of perception of movement. Spontaneous movement can take place only in living organisms. Since the animal heeds only the movement, and not the motionless form, it is able, in the simplest way, to distinguish between "living" and "lifeless."

The power of perceiving movement is very distributed. Schrader has made interesting experiments with falcons These intelligent birds, under normal conditions also, are able to distinguish motionless prey as such. If, however, the cerebrum is removed, they notice movement only. A falcon from which the cerebrum has been removed, pursues and strikes a living, active mouse just as skilfully as would a normal bird; as soon as the mouse is dead, however, it takes no more interest in it. In general, frogs and salamanders snap only at moving prey, and every angler knows that fishes act in the same way. Among the lower animals interesting observations have been made on insects, crustaceans and molluscs. The scallop, *Pecten jacobaeus,* has, on the edges of its mantle, a large number of eyes of complex structure. On account of the poor development of its brain, however, it is unable to distinguish its enemies by means of sight, and is able only to perceive movement. If another animal crawls slowly towards it, as soon as the scallop perceives the movement, it extends the long, thread-like tentacles, which are its olfactory organs By means of these it determines whether the approaching animal is friend or foe. If it be the former, the scallop quickly becomes quiet again; if the latter, it swims away hurriedly. A corresponding co-operation between eyes and feelers is often to be seen in decapod crustaceans. These animals react to a moving object by holding the antennae straight out towards it. (*See* fig. 12.) Uexkuell showed that the house-fly finds its mate by means of this perception of movement. If a small, black bead, about the size of a fly, is fastened to a thread, and drawn fairly rapidly through the air, the male flies immediately throw themselves upon it. If the surface of the bead be smeared with a sticky substance, it makes an ideal fly-trap. That dragonflies and other predatory insects only pursue moving prey need hardly be mentioned.

The most lowly animals which undoubtedly possess the power of perceiving movement are certain marine Chaetopod worms (*Branchiomma*). They live in tubes, constructed by themselves, from which only their heads project, which bear numerous, long tentacles. Each tentacle has at its extremity a compound eye. If one makes a rapid movement with the hand in front of the aquarium, every worm retreats into its tube with lightning rapidity. That this is a typical case of the visual perception of movement is proved by the fact that darkness or light, produced by the switching off or on of an electric lamp, without movement. makes no impression whatever upon the animals.

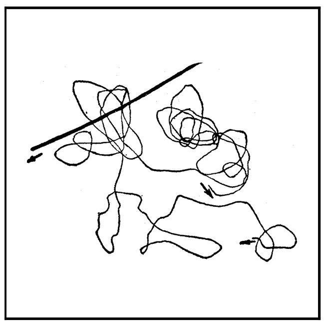
That the lower animals perceive and take heed of motionless objects is really only to be observed when they have to turn aside from their path on account of them. When an insect flies about in a forest it must not run the risk of colliding with every tree. This also applies to the deliberately moving gasteropods.

We can well observe in these slow-moving creatures how skilfully they avoid the obstacles which may be placed in their path.

This is also the case if we place between the animals and the obstacle a glass screen, which excludes all impressions of it other than visual ones. We do not know as yet how widespread this "avoiding reaction" is in the animal kingdom. On the other hand, visual perception of direction is almost universal. This power enables the animal to pursue an orderly path in a straight line. It hardly requires to be proved that it is a necessity of life for all freely-moving animals to crawl, fly or swim straight ahead. It suffices to remember that, without this power. an animal runs the risk of moving round and round in circles, in a quite aimless manner. Mephistopheles says in "Faust":—

> I tell you, the man who speculates,
> Is like a beast upon a barren heath,
> Led in a circle by an evil spirit,
> While just beyond are spreading, fresh, green fields.

We can conjure up this evil spirit in our experiments by conducting them in darkness. If we allow small insects to creep about in the dark on a piece of glass lightly smeared with soot, we can see from their tracks that they have crawled here and there, not indeed in circles, but in a totally aimless manner, without moving far from one place (*see* fig. 13). We can increase this restriction of movement by amputating one of the legs of the insect; it then frequently runs in a narrow spiral, always turning towards the same side. As soon as we admit light into the darkened chamber, however, matters are instantlv changed; the creature runs away from the light in a course straight as a line.



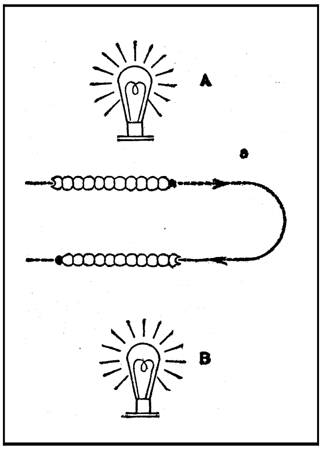
AFTER V. BUDDENBROCK

FIG. 13.—TRACK OF A BEETLE IN THE DARK (THIN LINE), AND IN THE LIGHT (THICKER LINE)

Visual Sense of Direction. — These experiments prove the existence of the visual perception of direction. This applies to human beings also. It has long been known that a man in desert or snow covered regions, or in dense brush, unable to use his sight for orientation, moves round in circles, and, after walking for hours, finds himself back at the point from which he started. The manner in which man and the higher animals orientate themselves in space by means of sight is generally known. Quite unconsciously they choose some prominent object, such as a tree, for which they aim; on approaching this they select as their goal another, more distant object, lying in the same direction.

The lower animals regulate their movements on a different principle. They shape their course in relation to the light.

This method of orientation is well illustrated by the following example. Xenophon frequently writes in his "Anabasis":—"We marched keeping the sun on our right." That is to say, we can in a quite unfamiliar region, travel in a straight course in a particular direction, if we take care that the rays of the sun and the line of march enclose a constant angle. What man does intelligently the lower animals accomplish by blind instinct.



AFTER V. BUDDENBROCK

FIG. 14.—THE MOVEMENTS OF A CATERPILLAR IN RELATION TO LIGHT

The particular motion with relation to the light may be demonstrated experimentally in two ways. A small candle is put on a table in a dark room, and the animal to be studied is placed about half a metre distant from the light. (Some small beetles or caterpillars are good subjects for this experiment.) The animal begins by running past the light, apparently without heeding it; if, however, we suddenly take up the light and place it on the other side of the animal, the latter turns in an angle of 180°, and continues its way in the opposite direction to that previously followed (fig. 14). This very pretty experiment does not succeed with all species. The following is simpler, and can be carried out with all sorts of insects, crustaceans, and gasteropods. The animal is placed on a table near the light, and left to its own devices; it may then be observed that, under the influence of the light which radiates outwards in a circle, the animal performs a circus-movement round the source of illumination. It moves, therefore, in such a way that the angle formed by the light rays and its path remains constant. In this instance the angle is roughly a right angle; the animal is able, however, to change it at will. For example, it may crawl in such a way that the light falls upon its eyes obliquely, from behind; it then moves in a spiral which gradually removes it from the light (see fig. 15).

The long known fact that nocturnal insects are attracted by a lighted lamp is connected with this particular type of movement.

Usually, on their nocturnal flights, they orientate themselves by the moon, the clouds, or other far distant sources of light. If, however, they come by chance within the influence of a near source of light, such as an electric arc-lamp, they are compelled to fly around the artificial light in circles or in spirals. Often enough they come thus into the immediate neighbourhood of the light, and are burnt.

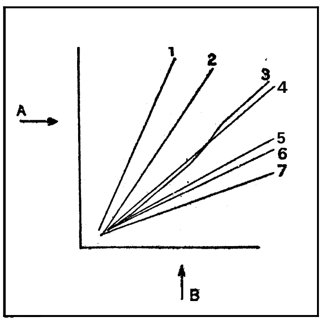
Visual perception of direction in animals may show itself in quite another way, namely, in what is called *phototaxis.*

The following example illustrates what is meant by this. If a bee is taken, and released in the middle of a room, it flies with absolute certainty towards the window, and, therefore, towards the light. Such an animal is called positively phototactic. The cockroach illustrates an opposite condition; it is negatively phototactic. It avoids the light, and when turned out of its hiding place, it will assuredly make for the dark.

That phototaxis is not always a constant character is shown by the bee. We cannot say off-hand "the bee is positively phototactic." It is so only under quite definite conditions; in very macy other circumstances it is not so. For example, when it returns from gathering honey, and flies into the dark hive, it is much rather to be described as negatively phototactic.

Sometimes it is easy to state the conditions under which an animal will become phototactic. The bee becomes positively phototactic if it is caught, and strives to free itself. In nature, where there are no glazed windows, brightness means the open air and the sky. A very clear example of phototaxis appearing only under certain conditions is furnished by the water scorpion (Nepa *cinerea*). This creature lives in shallow waters among the plants on the bottom. It is, however, an air-breather, and is obliged to ascend to the surface of the water from time to time, in order to inhale it. In this it is aided by positive phototaxis, which, in this case, co-operates with negative geotaxis. Since light only enters the water from above, the creature, which becomes phototactic only with lack of air, creeps up the water plants as much as possible in a vertical direction, until it reaches the surface. Scarcely, however, has it breathed in the fresh air, when phototaxis ceases, and the water scorpion is able to descend again into the deeper regions. As a final example, the water-flea, *Daphnia,* may be mentioned, in which we can produce phototaxis at wiil. We have only to introduce water containing carbon dioxide into a vessel in which there are Daphnia, to see at once that all the animals swim as quickly as possible towards the light. Here, however, we must again make it clear that, normally, the light enters from above. Daphnia live in stagnant waters, frequently very unclean, at the bottom of which poisonous carbon dioxide can be very easily formed through putrefactive processes. In this instance, phototaxis serves to protect the Daphnia from poisoning by carbon dioxide.

The Mechanism of Phototaxis.— While these matters are comparatively simple, the naturalists of the present day are as yet very divided in their opinions regarding the mechanism of phototaxis. There are various theories, of which we may, perhaps, go so far as to say that each is correct in some instances. The best known is the Theory of Tropisms (also called the Ray-Verworn Theory, or the Theory of Tropotaxis). It is founded on the fact that the majority of animals which are prototactic have bilateral symmetry. These all have a median plane dividing the body into two, absolutely identical halves. The entire animal is regarded as a small automaton. The light rays which fall on the eye are ccnverted into nervous energy, which is conducted to the brain. The latter transmits the stimulus to the limbs, which are under its control, and thus, according to this theory, the movements of the legs are, by a natural law, dependant on the strength of the illumination of the eyes. If the rays of light come from the front, they strike both eyes equally, and, therefore, the legs of each side move with equal force, and the animal runs straight forward. If, however, the light comes from one side, so that one eye is more strongly illuminated than the other, there is also a difference between the two sides in the working of the legs. The consequence must be that the animal turns until its median plane coincides with the direction of the light rays. When this is accomplished, it again runs in a straight line towards the light. This theory is so very striking in its great simplicity that, at first, it was received with much enthusiasm, particularly by everyone interested in Natural Philosophy.



AFTER MULLER

FIG. 15.—TRACK OF A NEGATIVELY PHOTOTACTIC WOODLOUSE UNDER THE INFLUENCE OF TWO BEAMS OF LIGHT AT RIGHT ANGLES (A & B)

With time, however, the opposition to this theory has been greatly increased, and there are many naturalists who have almost completely relinquished it. Frequently, the law which governs the movements of such animals is known by another name, namely the "Law of *Resultants.*" Thus, if we allow an animal to crawl into a field of light which is formed by two crossing beams, it is compelled to move according to the resultant. A fine example of this manner of reaction has been furnished by Frl. Müller, who worked with woodlice (see fig. 15). It appears that the animals under the influence of two equally strong beams of light, run exactly in the diagonal; if the beams are made to be of unequal strength the angle alters. It can be calculated in advance if we know the strength of both beams of light.

A second theory, which is in opposition to the theory of tropisms, asserts that the lower animals behave similarly to man and the higher animals. If a man walks towards a light, or let us say in a general way towards some optically perceptible point, first of all he fixes his eyes on the light, that is to say he moves them so that the light falls on the central point (*fovea centralis*); he then turns his head and body towards the light and goes straight forward. Kuehn has named this kind of reaction "telotaxis"; it is fundamentally opposed to tropotaxis, as will appear if we close one eye. A telotactically reacting animal is just as well able to direct its course when using only one eye as when using both; a tropotactically reacting animal, on the other hand, when it has only one eye is compelled continually to move round in circles. It is easy to convince oneself, on the basis of this alternative, that the majority of the more highly developed animals, such as insects or the higher groups of Crustacea, behave for the most part telotactically.

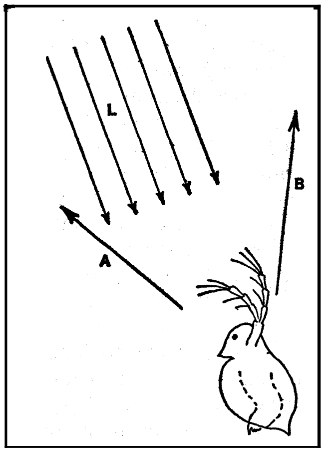


FIG. 16.— UPWARD MOVEMENT OF A POSITIVELY PHOTOTACTIC DAPHNIA, DIAGRAMMATIC

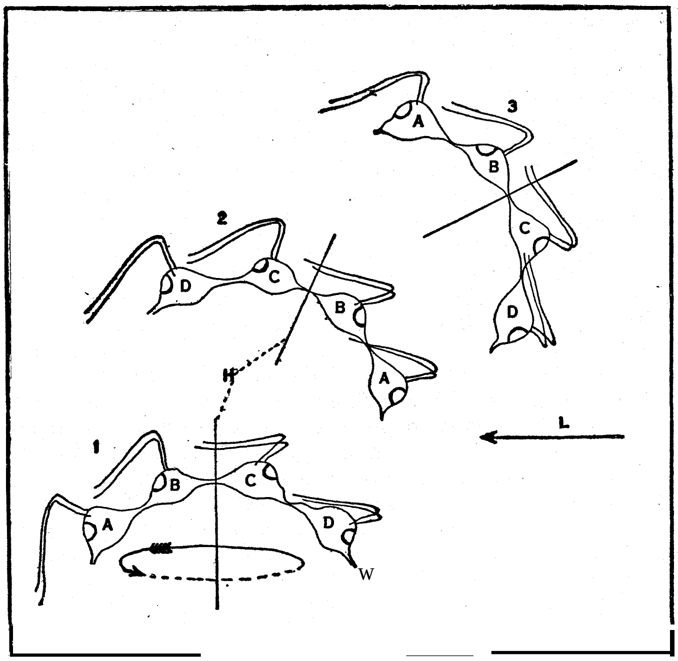
The numerous partial refutations which the theory of tropisms has undergone cannot be given in detail here. Only one particularly important argument can be mentioned. It used to be considered a proof of its validity that animals blind on one side constantly-run round in circles. If they are positively phototactic, they continualiy turn towards the side on which they can see; if they are negatively phototactic they turn towards the blind side. Now, in the first place, this certainly does not apply to all cases The majority of the higher insects learn very quickly to run straight when they have only one eye. Above all, Mast was able to prove that the animal does not move round in circles involuntarily, as the theory of tropisms would require, but that the animal voluntarily runs round thus, and moves its legs in such a manner as to attain this end. If some of the legs are amputated the remaining ones completely alter their movements, so that, in spite of the totally different locomotor conditions, the circus movement is still possible.

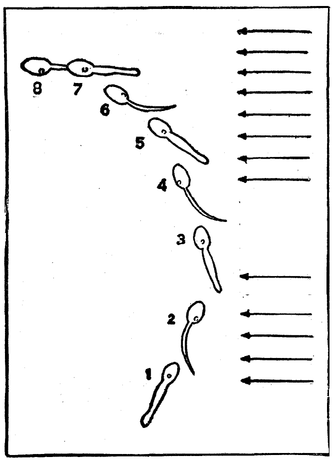
A second argument of general application is as follows:—The naturalist usually makes use of horizontal light in his experiments, which strikes the animal from one side. Only under these artificial conditions is it possible to turn about an axis which lies in the plane of symmetry of the body. Under natural conditions, on the contrary, the light, as far as aquatic animals are concerned, comes always from above. The Daphnia on becoming positively phototactic turns from its former position, not to right or left, but backwards. That it swims in the end towards the light, and not in the direction A or B is impossible to understand on the theory of tropisms (fig. 16).

Frequently, however, it is impossible to decide with certainty from such rough experiments the manner in which an animal orientates itself in relation to light, and a closer, more exact analysis is required. We are indebted to S. O. Mast for the best work on this subject. He showed that in many cases, neither tropotaxis nor telotaxis sufficed to account for the phenomena. As the first example we may mention briefly the researches of Mast on the orientation of the colonial Flagellate, Volvox. The colony is composed of about 20,000 individuals, which are arranged on the surface. Each zooid has two flagella, and an eyespot, provided with a lens. The colony has an anterior pole, which is always turned towards the front in swimming, and a longitudinal axis round which it rotates. If a light is placed to one side of a positively phototactic colony, it turns until the anterior pole is directed to the light, and then swims straight towards it. This gives the impression of being a clear case of tropotaxis, but Mast was able to prove that the zooids on the illuminated and on the shaded sides differ, not in the strength of the lashing of the flagella, but in the direction of the strokes, On the former side the flagella lash sideways, on the latter, straight out to the back (see fig. 17). It is apparent, therefore, that in this reaction we are dealing neither with a case of tropotaxis nor with one of telotaxis, but with a phenomenon *sui generis*. Very interesting are the orientation movements of asymmetrical animals, as for example one-eyed animals such as the Ascidian larvae also studied by Mast. These animals are negatively phototactic, and in s imming revolve about their longitudinal axis. When the light comes from one side, the eye, which is set in a pigmented cup, is alternately illuminated and in shadow with each revolution. Every time it is in shadow, the animal makes a stroke with its tail towards the ocular side; every time it is illuminated, it makes a stroke towards the abocular side (see fig. 18). In this way the larva quickly turns away from the light.



AFTER S. O. MAST

FIG. 17.— PHOTOTACTIC ORIENTATION OF A VOLVOX COLONY, SHOWING ONLY FOUR CELLS. L. THE DIRECTION OF LIGHT



AFTER S. O. MAST

FIG. 18.— REACTION OF THE NEGATIVELY PHOTOTACTIC, ASYMMETRICAL LARVA OF AMAROUCIUM

We find the least development of the sense of sight in those animals which are unable to perceive either images, movements, or direction, but can only distinguish light and darkness.

They react mostly to alterations in the light intensity to which they are accustomed. A very common phenomenon of this kind is the "shadow reflex." Many of the lower animals, particularly those which dwell in shells or shelters of some kind, into which they can withdraw, do so directly a shadow falls on them.

An animal particularly suitable for the demonstration of this reflex is the vineyard (Roman) snail, Helix *pomatia,* which has a wide distribution in Europe. If we cause a shadow to fall upon its head, it withdraws its horns very quickly, or completely retreats into its shell. Among marine animals may be mentioned the small sessile crustacean, *Balanus,* which, every time a shadow falls on it, withdraws its feet, which normally move in a constant rhythm. Further, many tubicolous worms react in a similar way, and many bivalves close their shells, if a shadow falls on them.

In short, the phenomenon is unusually widespread. The biological significance of this shadow reflex most certainly is that by this means the animal hides from danger, since the shadow may perhaps indicate the approach of some animal. This is, of course, a very poor expedient, since, in the first place, it fails to give protection from enemies which are in an opposite direction to the sun, and, in the second place, it causes the animal to withdraw unnecessarily thousands of times. Animals which do not possess any well-developed sense organs to give them certain warning of the approach of their enemies, are obliged, however, to help themselves even in this primitive manner.

The animals here mentioned, which respond to the slightest shadow, very frequently do not react in any way if we increase the degree of illumination. Other animals withdraw only in the latter circumstance, and are not disturbed by any shadows. Among these is the sand-dwelling *Mya arenaria,* which is found on the coasts of Europe and America. It lives in the sand at a depth of about 20 cm., and makes a shaft which leads upwards in a vertical direction, in which lies its tubular siphon, the organ by means of which it takes in food and oxygen. If this fleshy siphon were pushed so far out of the shaft that it stretched out into the water, fishes would immediately come and bite it off. The light reflex serves to prevent this; as soon as the siphon pushes out into the water, it is exposed to stronger light, and the reflex movement of withdrawal promptly takes place.

It is just these simple phenomena which are frequently of interest to the naturalist, since by their means we may easily understand the laws which govern the perceptual life of animals, and of mankind also. Weber's Law is very well known This states that a man is first sensitive to a new stimulus when it stands in a particular numerical ratio to that already present.

Thus, if originally light "L" prevails, an animal sensitive to shadow first withdraws when the light is shaded by about L/20. In this case the value of L is quite immaterial.

The table is compiled from the results of the author's experiments on *Balanus.* L_1 indicates the original light, L_2 the greatest amount of light which yet gives rise to the shadow reflex. L_1/L_2 is, as can be seen, roughly constant.

L_1	L_2	L_1/L_2
1,000	967	1·034
933	875	1·066
750	720	1·0415
500	480	1·0415
250	240	1·0415

From these experiments the fact of *Adaptation* may be proved as a logical inference. The sensitiveness of our eyes is considerably greater in weak light than in strong. The eye thus adapts itself completely to the light conditions present. Starting with an original intensity of 1,000 light units, *Balanus* first reacts when this is diminished by 33 units. With an original intensity of 250 units the animal first notices a diminution by 10 units. On pursuing the subject further, we find that with an original intensity of 25 units. diminution of this by only one unit is noticed by the animals. The eye, therefore, becomes more sensitive as darkness increases.

THE COLOUR-SENSE OF ANIMALS

Colours play such a large part in human life that the question whether animals also possess a sense of colour is of extreme interest to us. In speaking of the colour-sense of animals it behoves us to make it perfectly clear at the outset that it is quite impossible for us to study the sensations of animals. We cannot even say anything about the sensations experienced by our fellow men. On the other hand, we can decide objectively whether an animal is able to distinguish different colours.

The investigation of the colour-sense of animals has followed a remarkably zig-zag course. In the time of Darwin man, almost universally, was convinced that the lower organisms also possessed a sense of colour similar to his own. Later we went to the opposite extreme. Hess pronounced the definite opinion that all invertebrates and fishes were totally colour-blind, and that only the highest organisms, such as mammals, birds, reptiles and amphibians, were able to enjoy the colours of nature. This sweeping generalisation was contradicted, and so gave rise to a very active investigation of the whole subject. The result of these labours may be summarised thus:—very many of the lower animals, such as cuttlefishes, insects and the higher Crustacea, do indeed possess a sense of colour. Further, in cases in which it has not yet been proved to exist we hesitate to draw the conclusion that it is absent.

Experiments.—The methods by which we have sought to investigate the colour-sense in various animals are very numerous. All animals which possess a certain amount of intelligence can be trained to distinguish a particular colour. v. Frisch was the first to attempt this, with bees. It is just in dealing with these insects, for which the array of colours in flowers would seem to have been evolved, that this statement by Hess must give cause for reflection.

In order to understand the following it is necessary to consider more precisely the nature of coloured light. In this two factors are always to be distinguished, the brightness of the light, in physical terms, the intensity, and the colour of the light, or in physical terms its wave-length. In studying the colour-sense of animals we are concerned only with the question whether they are able to distinguish light of different wave-lengths, and we have to take the greatest care, therefore, that the reactions of the animals are not connected with differences in the intensity of the light. v. Frisch made use of the "chess-board" method. On a square board were fixed a large number of pieces of cardboard of all shades of grey, from the lightest white-grey to the darkest black-grey. Among these was placed a piece of cardboard of the colour on which the bees had been trained (blue). If the bees had no sense of colour, but distinguished between the different pieces of cardboard only by their degree of brightness, they would coniuse the blue with one or other of the greys, one of which would certainly be of the same tone. If, on the other hand, they had a true colour-sense, such confusion would not occur. The result of the experiment was in favour of the possession of such a sense by the bees. The trained bees, having been accustomed to find their food on a blue background, flew to the blue pieces of cardboard only, and paid no attention to any of the others.

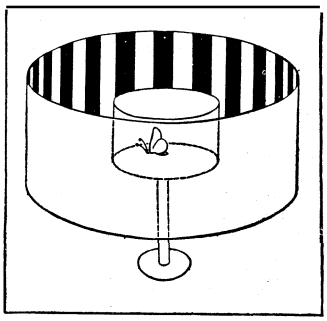
Since these fundamental researches were made by v. Frisch, the colour-sense of bees has been studied with much finer technique, particularly by Kuehn. Above all, we have learnt to train these insects to distinguish the pure colours of the spectrum. We are now able, therefore, to form a fairly precise estimation of the colour-sense of these insects. Bees perceive all wave-lengths between 650–313 $\mu\mu$. Within this range they distinguish four different colours. The first comprises wave-lengths from 650 to about 500 $\mu\mu$, and includes our red of shorter wave-length, and also yellow and green. Seemingly, all these appear to them as one colour. On the other hand, the red of longer wave-length, which we use in our photographic dark-rooms, bees do not distinguish at all; they confuse it with black. The second comprises wave-lengths from 500–480 $\mu\mu$ and corresponds to our blue-green, the third lies between 480 and 400 (our blue and violet). Lastly, bees perceive a fourth visual region in the ultra-violet, which is beyond our powers of sight.

It lies between 400–310 $\mu\mu$. Bees may therefore be trained to distinguish ultra-violet just as well as blue or yellow.

A sense of colour has been proved to exist also in Lepidoptera, dragonflies and flies; perhaps it is universal among insects

We have gone to work in quite a different manner to prove the existence of a colour-sense in Crustacea. Some of these possess the remarkable power of matching their colouration to that of the surface on which they live. On light backgrounds they are light, on dark ones they are dark. This is brought about by means of particular pigment cells (chromatophores) which are present everywhere beneath the transparent cuticle. The majority of species have several kinds of chromatophores of different colours. *Crangon,* the species which up to the present has been studied most, has white, yellow, red and black. Stimulation takes place through the eyes; blind crustaceans are no longer able to mimic their background. The light stimuli which reach the eye are communicated to the brain, and by this are transmitted to the pigment cells in a way which we do not yet understand more exactly. Koller was able to prove that the chromatophores which expand are always those which conform in colour to the background. On a grey ground the black cells expand, on a yellow ground, the yellow cells, and on a red ground the red cells. The intensity of the light plays as unimportant a part as in the case of bees.

With the simple inquiry whether a given animal is able to see or distinguish between colours the problem of the colour-sense of animals is by no means exhausted. It can be proved that every organism, including man himself, responds differently to light and its colours, according to the conditions under which it finds itself. According to Schlieper's investigations, in the optomotor reactions about to be described, all the animals studied hitherto act as if they were colour-blind, even those in which a sense of colour has been proved beyond all doubt, either by the "training method" or in some other way. The best-known instance of such a reaction occurring in everyday life is what is called "railroad nystagmus." If we watch a person opposite us in a railway carriage who is looking out of the window, we notice that his eyes do not remain still. They seek to follow the images of the rapidly passing landscape, and move in the direction opposite to that in which the train is going. They are directed forwards again in a particular rhythm. When studying animals we can represent the railway by a rotating cylinder, in the middle of which is placed the animal under observation. The inside of the rotating cylinder has vertical strips of paper stuck on it, of which half are coloured and half grey (fig. 19). Every animal must be studied in relation to a whole series of such cylinders, which differ from one another in the shades of grey, while the coloured strips are the same in all of them. The individual animals react differently to the rotation. Some move the head, some the feelers, some the eyes. In every species, however, a particular combination of grey and colour can be found to which no movement-reaction takes place. This means that, in this instance, the animal perceives no difference between the grey and the coloured strips; it sees a uniform grey, and is thus, in this experiment, certainly as blind to colours as in the previously described experiments it was aware of them. The reaction to the other "grey and coloured" combinations is only to the different degrees of brightness of the strips, not to perception of the colour contrast. The following little table may make this clear; it is taken from the results of experiments with the common white butterfly, *Pieris brassicae,* using the colour "blue." Grey 1 is the lightest, 12 is the darkest; the measured angle is that described by the feelers of the captive insect.



AFTER SCHLIEPER

FIG. 19.—OPTOMOTOR REACTION IN BUTTERFLIES AND MOTHS

Shades of grey	Angle
1	10–15°
3	5°
4 and 5	0°
6	3°
8	10–15°
10	15–20°
12	25°

From these results emerges the startling fact, which has not yet been explained, that the same animal reacts sometimes as if perceiving colours, at others as if colour-blind.

Another important result can be obtained by the methods used by Schlieper. By comparison with the grey papers, of known numerical degrees of brightness, we can calculate the relative brightness which different colours possess for the individual animals. We then reach the remarkable result that this value for the whole of the animal kingdom corresponds to that which prevails in totally colour-blind human beings. This had already been affirmed by Hess, but not sufficient heed was paid to it.

Relative Brightness-values of Hering's Coloured Papers for

	Ladybirds (*Coccinella*)	Bees	Shore crab (*Carcinus maenas*)	*Epinephelus justina*	Man (dark adapted)	Lizard (*Lacerta*)	Man (light adapted)
Green	62	69	64	64	65	64	74
Yellow	51	62	49	49	53	73	79
Blue	24	22	24	23	25	16	22
Red	8	14	11	10	9	57	31

(W. v. Bud.)

SIGHTS, GUN, are mechanical or optical devices that help the gunner aim. his weapon at a target. They range from simple iron sights for small arms weapons to complex "fire control systems" for long-range artillery. To understand their nature and use it is essential first to know something of the behaviour of projectiles during fight.

When a projectile is Ered from a gun, its flight path. or trajectory, forms a curve due to the action of the force of gravity and the resistance of the air. The force of gravity causes the trajectory to bend downward. If the projectile is rotating about its longitudinal axis, air resistance will cause it to drift to the right or left. depending upon the direction of rotation. These and other factors affecting the trajectory of a projectile are discussed quantitatively in the article BALLISTICS.

In view of these characteristics of the trajectory. it is obvious that the axis of a gun must be pointed above and to one side of the target to make the projectile hit that target. The process

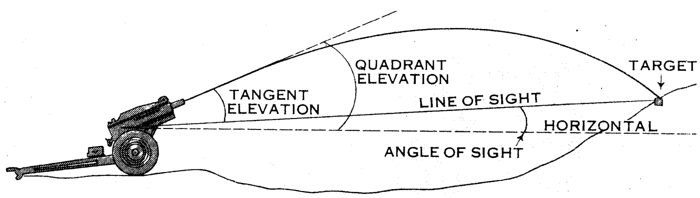


FIG. 1.— SIGHTING TERMS

of pointing a gun in the proper direction and at the desired angle of elevation is known as "laying" the gun.

The devices employed to determine the proper direction and elevation for laying the gun constitute the sight or fire control system

Terminology. — Indiscussing the principles of sighting, the following terms need to be clearly understood (*see* fig. 1):

Line of Sight —A straight line joining gun and target.

Angle of Sight.—The angle between the line of sight and the horizontal plane through the gun.

Elevation —The degree to which the axis of the gun is elevated above some line of reference. Quadrant elevation is the angle between the axis of the gun and the horizontal plane; tangent elevation, or superelrvation. is the angle between the axis of the gun and the line of sight

Rifles and Machine Guns.—The sights used for these types of weapons diifer very little throughout the world. They are based on the principle that two points in fixed relation to each other may be brought into line with a third point. A typical rifle sight consists of a fixed foresight near the muzzle and a rearsight that is movable in a vertical plane. as shown in fig. 2. Vertical movement is calibrated in range (yards or meters) and is constrained to follow a curve that compensates for lateral drift of the bullet.

A lateral adjustment is also provided to permit correction for the effect of wind.

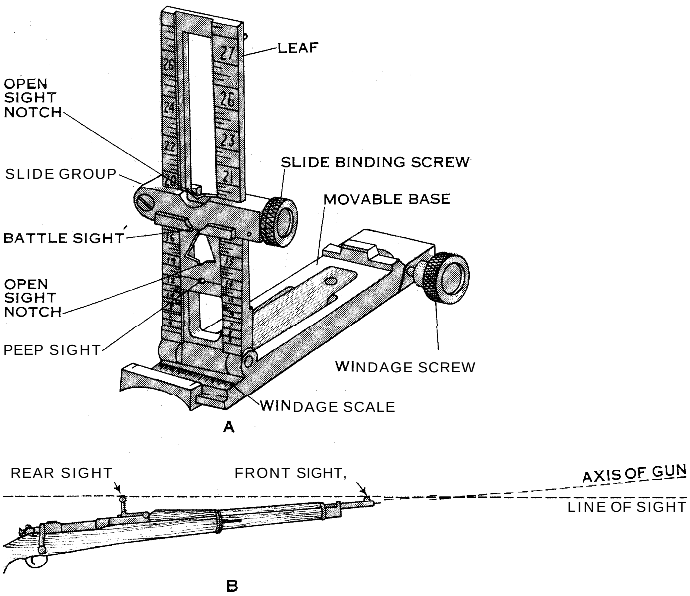

FIG. 2.— RIFLE AND MACHINE-GUN SIGHTS: (A) CLOSE-UP VIEW OF LEAF SIGHT; (B) ARRANGEMENT OF RIFLE SIGHTS

Field Artillery, Mortars and Free Rockets.—Before discussing the sighting systems of these weapons. it is necessary to understand the arrangement of the basic parts of a gun mount. The top carriage is that portion of a gun mount that rotates (traverses) about a vertical axis and forms the support for the tipping parts of the gun. Any component of the sighting system attached to the top carriage will move uith the gun in traverse. but will not move with it in elevation. The gun proper is usually mounted in a cradle attached to the top carriage by means of trunnions that form the horizontal axis about which the cradle and gun (tipping parts) rotate in elevation. The gun recoils in the cradle along the axis of the bore. Components of the sighting system attached to the cradle will move with the gun in both elevation and traverse. but will not move with the gun in recoil.

Since the elevating and traversing mechanisms are independent of each other. the laying of the gun can be simplified by having one member of the crew lay the gun in direction, and another lay it in elevation. It is. therefore, common practice to have the devices used for laying the gun in direction attached to the top carriage on one side (usually the left side) and the devices for laying in elevation attached to the cradle on the other side of the gun.

Mobile weapons are usually out of level (canted) due to irregularities in the ground and the axes of rotation are therefore not truly horizontal and vertical. When the gun is traversed under this condition, quadrant elevation will change and, conversely, when the gun is elevated the direction of fire will change. Sighting devices are so constructed that reference planes can be adjusted to the true vertical, hence laying accuracy is not impaired.

For protection from hostile fire, these weapons are usually emplaced in a position not visible to the enemy. Since the target can not be seen from the gun. laying in direction is accomplished by sighting on stakes set in the ground at a known direction from the gun. The horizontal angle between the gun axis and the aiming stake line required to hit the target is measured from accurate maps and corrected by ballistic computations. A panoramic telescope which permits sighting in any direction from the same eyepiece position is used to measure this horizontal angle. (See fig. 3.) The panoramic telescope is mounted on the cradle and the mount compensates for the out-of-level condition by leveling the telescope about a bar parallel to the gun axis. (See fig. 4.) This determines the vertical plane containing the gun and permits the panoramic telescope to accurately measure the direction of fire.

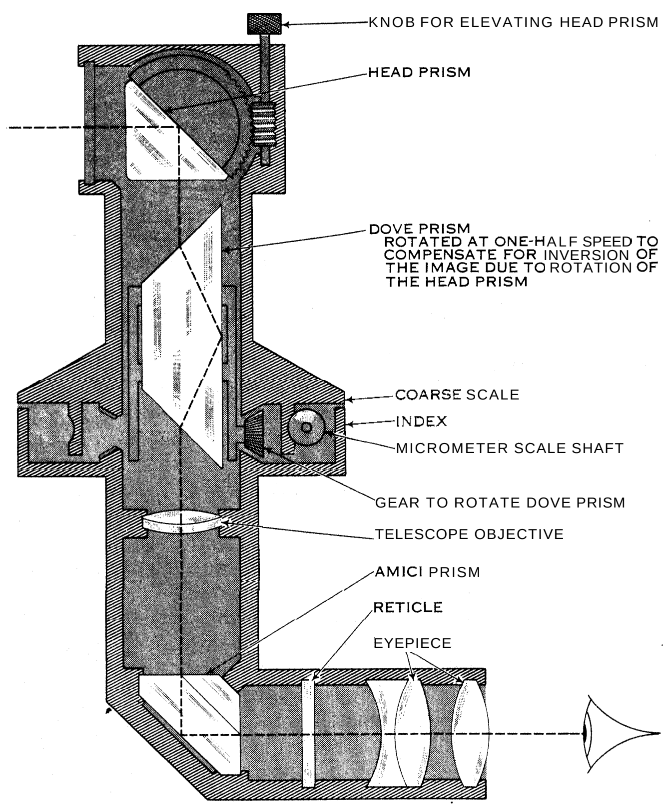

FIG. 3.— PANORAMIC TELESCOPE

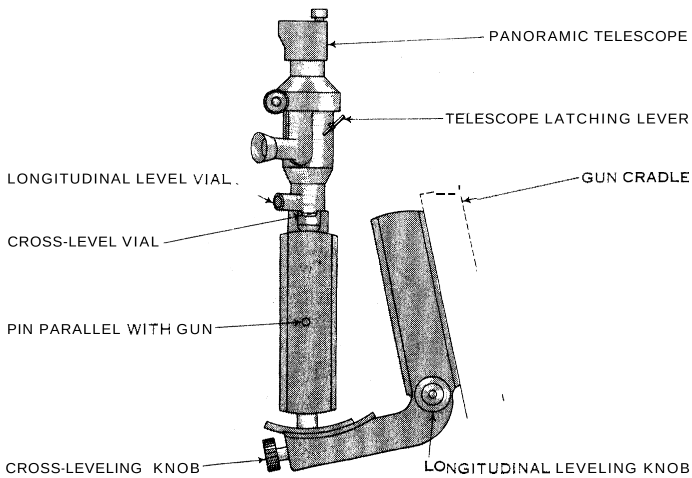

FIG. 4.— CANT COMPENSATING TELESCOPE MOUNT

Laying in elevation is accomplished by a device known as an elevation quadrant mounted on the cradle. The quadrant is also cross-leveled by rotation about a bar parallel to the gun axis so that elevation will be measured in the vertical plane. The precomputed quadrant elevation is set into the quadrant, offsetting a fore-and-aft spirit level. The gun is then elevated until the spirit level indicates that the gun has been elevated the desired amount. The elevation quadrant is sometimes incorporated into the compensating mount of the panoramic sight. Sights for mortars are usually so designed since laying of the mortar is performed by one man.

Antitank Guns and Recoilless Rifles.—As these weapons are employed at greater range than rifles or machine guns, they employ telescopic sights to increase the accuracy of fire. The telescopic sight contains a reticle with range markings (yards or metres) calibrated to the ammunition and offset at the longer ranges to compensate for drift. (See fig. 5.) The sight is mounted on the cradle (or directly on the recoilless rifle, which has no cradle) and in some cases provision is made for leveling the sight about an axis parallel to the gun to compensate for the error due to the gun being canted. In most cases the range of the target is estimated, but some guns are equipped with small-calibre spotting or ranging rifles to help determine the range. The spotting rifle is ballistically matched to the main gun. Both range and nindage

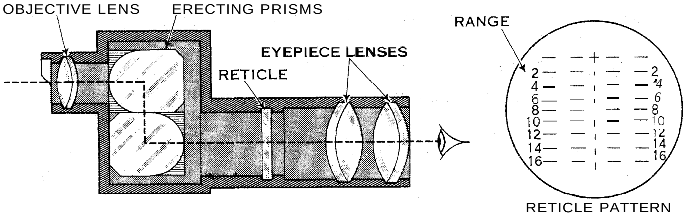

FIG. 5.— DIRECT FIRE TELESCOPIC SIGHT

corrections are determined by trial fire with the small gun until a target hit is obtained before firing the main gun.

Tank **Gunnery.**—High-power telescopic sights are always used for tank gunnery because direct hits are required on small targets at long range. The physical configuration of the vehicle often makes it impractical to use a simple telescope. An articulated telescope, one with a rotating joint parallel with the gun trunnion. is sometimes used to bring the eyepiece to the gunner and eliminate movement as the gun is elevated. Rlore frequently this problem is resolved by mounting a periscope in the turret roof and mechanically linking it to the gun to follow it in elevation. In some modern tanks: optical range finders (see RANGE FINDERS) are used to measure target range. Mechanical or electrical devices accurately compute the vertical and lateral corrections for each type of ammunition fired by the tank gun.

Naval Gunnery.——Modern naval guns are traversed and elevated by electronic and hydraulic servomechanisms. Direct laying by the gun crew is used only in emergencies. In normal practice. guns are sighted and the range of the target is determined either by radar or by optical means from director stations located high on the ship. The sighting data is electrically transmitted to a plotting room in the hull where mechanical or electronic computers generate the gun orders for electrical transmission to the turrets. A stable vertical gyroscope in the plotting room supplies data to the computer. usually called a range keeper, for conversion of director data into true horizontal and vertical tracking angles thus eliminating errors due to pitch and roll of the ship. The firing direction and quadrant elevation required to hit the target are computed by the range keeper with allowance for speed of both the firing ship and target. The laying angles are then converted, by data from the stable vertical gyroscope, into angles of turret elevation above deck plane and turret traverse in deck plane. The servomechanisms then keep the guns at the desired quadrant elevation and direction.

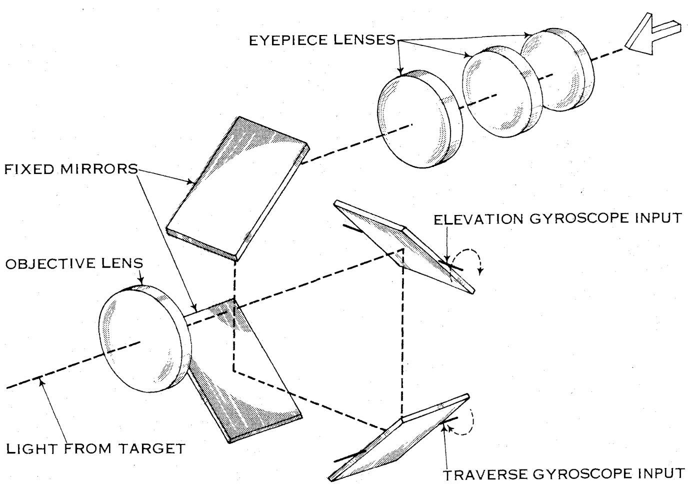

FIG. 6.— LEAD COMPUTING SIGHT

The guns are fired at any time, for ship motion does not disturb the lay of the guns.

See GUNNERY, NAVAL.

Antiaircraft Artillery.— Lowflying aircraft can be engaged successfully by antiaircraft artillery because the flight time of the shell is short. The high speed of jet aircraft makes it almost impossible to compute accurately the movement of the target during the time the projectile fired by an antiaircraft gun is in flight. The only effective weapons for use against high-flying aircraft are guided missiles or fighter planes.

Radar is used with antiaircraft artillery and missiles to measure the range to the target, but telescopic tracking in elevation and traverse usually gives greater accuracy than radar tracking, which is used only at long range or when visibility is poor. Electronic or mechanical computers are used to calculate the angle the gun must "lead" or be aimed ahead of the target. The gun is moved by electronic and hydraulic servomechanisms since the tracking rates are high.

Gyroscopes are used as the basic element in one type of lead-computing sight. Gyroscopic precession (see GYROSCOPE) is induced by the rotation of the sight while tracking the target in elevation and traverse. Precession is controlled by springs and weights designed to match the ballistics of the gun and adjusted as the target range changes. The amount the gyros precess against the restraining springs and weights is a measure of the required lead. This movement of the gyro is used to tilt mirrors in the sight (see fig. 6) which causes the target to appear ahead and above its true position; hence the gunner will track ahead by the appropriate amount.

Aircraft Gunnery.— Fighter aircraft carry rockets, machine guns or small-calibre cannon to engage both aerial and ground targets. Rigidly mounted guns are aimed by pointing the aircraft in the proper direction while approaching the target. Radar is used to measure the range to the target. A gyro lead-computing sight similar to that described above is used to compute the lead required to compensate for the motion of the firing aircraft and the target. (G. M. T.; W. T. AL.)

SIGIRI, the Lion's Rock, the ruin of a remarkable stronghold *i*° 59' N.. and 81° E.. 14 mi. N.E. of Dambulla, and about 17 mi. W. of Pulasti-pura, the now ruined ancient capital of Ceylon. There a solitary pillar of granite rock rises to a great height out of the plain. and the top actually overhangs the sides. On the summit of this pencil of rock there are five or six acres of ground; and on them. in A.D. 477, Kasyapa the Parricide built his palace, and thought to find an inaccessible refuge from his enemies. His father Dhatu Sena carried to completion, among other good works. an ambitious irrigation scheme—probably the greatest feat of engineering that had then been accomplished anywhere in the world. This was the celebrated Kala Wewa, or Black reservoir, more than 50 mi. in circumference.

SIGISMUND (1368–1437). Roman emperor and king of Hungary and Bohemia. was a son of the emperor Charles IV. He was born on Feb. 15. 1368. Having become margrave of Brandenburg on his father's death in 1378, he was educated at the Hungarian court from his eleventh to his sixteenth year. and was entirely devoted to his adopted country. Sigismund had been crowned king of Hungary on March 31. 1387, and having raised money by pledging Brandenburg to his cousin Jobst, margrave of Moravia, he was engaged for the next nine years in a ceaseless struggle for the possession of this unstable throne. (See HUNGARY.)

In 1396 Sigismund led the combined armies of Christendom against the Turks. who had taken advantage of the temporary helplessness of Hungary to extend their dominion to the banks of the Danube. This crusade. preached by Pope Boniface IX.. was very popular in Hungary. The nobles flocked in thousands to the royal standard, and were reinforced by volunteers from nearly every part of Europe, the most important contingent being that of the French led by John. duke of Nevers, son of Philip II., duke of Burgundy. After' capturing Widdin, he sat down before the fortress of Nicopolis, to retain which Sultan Bajazid raised the siege of Constantinople, and at the head of 140,000 men completely overthrew the Christian forces (Sept. 25–28, 1396). Deprived of his authority in Hungary, Sigismund then turned his attention to securing the succession in Germany and Bohemia, and was recognized by his childless step-brother Wenceslaus as vicar-general of the whole empire. But on the deposition of Wenceslaus (1400) Rupert III., elector palatine of the Rhine, was elected German king in his stead. Sigismund was involved in domestic difficulties out of which sprang a second war with Ladislaus of Naples; and on his return to Hungary in 1401 he was once imprisoned and twice deposed. This struggle in its turn led to a war with Venice, as Ladislaus before departing to his own land had sold the Dalmatian cities to the Venetians for 100,000 ducats. In 1401 Sigismund assisted a rising against Wenceslaus, during the course of which the German and Bohemian king was made a prisoner, and Sigismund ruled Bohemia for nineteen months. In 1410 the German king Rupert died, when Sigismund, ignoring his step-brother's title, was chosen German king, or king of the Romans, first by three of the electors on Sept. 20, 1410, and again after the death of his rival, Jobst of Moravia, on July 21, 1411; but his coronation was deferred until Nov. 8, 1414, when it took place at Aix-la-Chapelle.

During a visit to Italy the king had obtained from John XXIII. a promise that a council should be called to Constance in 1414. He took a leading part in the deliberations of this assembly, and during the sittings made a journey into France, England and Burgundy in a vain attempt to secure the abdication of the three rival popes. (See CONSTANCE, COUNCIL OF.) The complicity of Sigismund in the death of John Huss is a matter of controversy. He had granted him a safe-conduct and protested against his imprisonment; and it was during his absence that the reformer was burned. An alliance with England against France, and an attempt to secure peace in Germany by a league of the towns, which failed owing to the hostility of the princes, were the main secular proceedings of these years. In 1419 the death of Wenceslaus left Sigismund titular king of Bohemia, but he had to wait for seventeen years before the Czechs would acknowledge him. But although the two dignities of king of the Romans and king of Bohemia added considerably to his importance, and indeed made him the nominal head of Christendom, they financially embarrassed him. It was only as king of Hungary that he had succeeded in establishing his authority and in doing anything for the order and good government of the land. Entrusting the government of Bohemia to Sophia, the widow of Wenceslaus, he hastened into Hungary, but the Bohemians, who distrusted him as the betrayer of Huss, were soon in arms; and the flame was fanned when Sigismund declared his intention of prosecuting the war against heretics who were also communists. Three campaigns against the Hussites ended in disaster; the Turks were again attacking Hungary; and the king, unable to obtain support from the German princes, was powerless in Bohemia. His attempts at the diet of Nuremberg in 1422 to raise a mercenary army were foiled by the resistance of the towns; and in 1424 the electors, among whom was Sigismund's former ally, Frederick I. of Hohenzollern, margrave of Brandenburg, sought to strengthen their own authority at the expense of the king. Although the scheme failed, the danger to Germany from the Hussites led to fresh proposals, the result of which was that Sigismund was virtually deprived of the leadership of the war and the headship of Germany. In 1431 he went to Milan where on Nov. 25, he received the Lombard crown; after which he remained for some time at Siena, negotiating for his coronation as emperor and for the recognition of the Council of Basel by Pope Eugenius IV. He was crowned emperor at Rome on May 31, 1433, and after obtaining his demands from the pope returned to Bohemia, where he was recognized as king in 1436. though his power was little more than nominal. On Dec. 9, 1437 he died at Znaim.

Sigismund was one of the most far-seeing statesmen of his day, and steadily endeavoured to bring about the expulsion of the Turks from Europe by uniting Christendom against them. As king of Hungary he approved himself a born political reformer, and the military measures which he adopted in that country enabled the kingdom to hold its own against the Turks for nearly a hundred years. His sense of justice and honour was slight; but as regards the death of Huss he had to choose between condoning the act and allowing the council to break up without result.

BIBLIOGRAPHY.—W. Berger, *Johannes Hus und Konig Sigmund* (1871); G. Schonherr, *The Inheritors of the House of Anjou* (1895); and J. Acsády, *History of the Hungarian Realm*, vol. i. (1903). Of the German books Aschbach is the fullest, and Windecke the most critical. Schonherr is the best Hungarian authority. Acsády is too indulgent to the vices of Sigismund. *See* also A. Main, *The Emperor Sigismund* (1903).

SIGISMUND I. (1467–1548), king of Poland, the fifth son of Casimir IV. and Elizabeth of Austria, was elected grand-duke of Lithuania on Oct. 21, 1505 and king of Poland on Jan. 8, 1506. He had served his apprenticeship in the art of government first as prince of Glogau and subsequently as governor of Silesia and margrave of Lusatia under his elder brother Wladislaus of Bohemia and Hungary. His little principality of Glogau soon became famous as a model state, in the prevailing anarchy of waning principalities, and as governor of Silesia he suppressed the robber knights with an iron hand, protected the law-abiding classes, and revived commerce. In Poland his first step was to recover control of the mint, and place it in the hands of capabie middle-class merchants and bankers, like Caspar Beer, Jan Thurzo, Jan Boner, the Betmans, who reformed the currency and opened out new ways for trade and commerce. In foreign affairs Sigismund was largely guided by the Laskis (Adam, Jan and Hieronymus), Jan Tarnowski and others, most of whom he selected himself. His first wife, whom he married in Feb. 1512, was Barbara Zapolya, daughter of Stephen Zapolya of Hungary. On Barbara's death three years later without male offspring, Sigismund (in April 1518) married the beautiful and wealthy Bona Sforza, a kinswoman of the emperor and granddaughter of the king of Aragon. who used her great financial and economic talents almost entirely for her own benefit, corrupted society, degraded the clergy, and became universally detested.

During the first twenty years of his reign, Sigismund was almost incessantly at war with Muscovy. The Tatars too, ravaged the border with a frequency which ultimately led to the establishment of the Cossacks. (See POLAND: History.) Protracted quarrels, again, with the grand-masters of the Teutonic Order, who were anxious to shake off Polish suzerainty led to a war in 1520–21, but were composed in 152j when the last grand-master professed Lutheranism and as first duke of Prussia did public homage to the Polish king in the market-place of Cracow.

Personally a devout Catholic, Sigismund was nevertheless too wise and just to permit the persecution of non-Catholics; and in Lithuania, where a fanatical Catholic minority of magnates dominated the senate, he resolutely upheld the rights of his Orthodox subjects, and protected the Jews.

After his 60th year there was a visible decline in Sigismund's energy and capacity. His gigantic strength and herculean build lent him the outward appearance of health and vigour, but during the last two-and-twenty years of his reign he apathetically resigned himself to the course of events. He died on April 1, 1548.

See August Sokolowski, *History of Poland* vol, ii. (1904), Zygmunt Celichowski, *Materials for the history of the reign of Sigismund the Old* (1900); Adolf Pawinski, *The youthful years of Sigismund the Old* (1893); Adam Darowski, *Bona Sforza* (1904).

SIGISMUND II. (1520–1572), king of Poland, was the only son of Sigismund I. (*q.v.*), whom he succeeded in 1548, and Bona Sforza. At his first diet (Oct. 31, 1548), he came into conflict with the *szlachta*, now becoming powerful, who, secretly supported by the Austrian court and the queen-mother, threatened to renounce their allegiance unless he repudiated his second wife, the beautiful Lithuanian Calvinist, Barbara Radziwill, daughter of the famous Black Radziwill. But his firm refusal produced a reaction, and at the second diet (1550) the *szlachta* was less turbulent. On the death of Barbara, under suspicious circumstances, five days after her coronation (Dec. 7, 1550) Sigismund made a purely political marriage with the Austrian archduchess Catherine, sister of his first wife Elizabeth, who had died young. Catherine proving childless, Sigismund, being the last male of the Jagiellos in the direct line, was anxious to have an heir, and the diet had undertaken to legitimize and acknowledge any fruit of his liaisons with Barbara Gizanka and Anne Zajanczkowska; but the Habsburgs, who coveted the throne, successfully opposed the wish of the Protestant party, that he should divorce Catherine and remarry. Actually he survived the queen's death (Feb 28, 1572) barely six months and died childless. Sigismund's reign was a period of internal turmoil and external expansion. He saw the invasion of Poland by the Reformation, the democratic upheaval which placed ail political power in the hands of the sslachta; the collapse of the ancient order of the Knights of the Sword in the north (which led to the acquisition of Livonia by the republic); and the consolidation of the Turkish power in the south. Sigismund's most striking and personal achievement was the union of Lublin, which made of Poland and Lithuania one body politic, and put an end to the jealousies and discords of centuries. (See POLAND: History.) He died at Knyszyne on July 6. 1572

SIGISMUND III. (1566–1632), king of Poland and Sweden, son of John III, king of Sweden, and Catherine Jagiellonika, sister of Sigismund II., king of Poland, thus uniting in his person the royal lines of Vasa and Jagiello Educated as a Catholic by his mother, he was on the death of Stephen Báthory elected king of Poland (Aug. 19, 15873 through the efforts of the Polish chancellor, Jan Zamoyski, and of his own aunt, Anne, queen-dowager of Poland. Sigismund promised to maintain a fleet in the Baltic, to fortify the eastern frontier against the Tatars, and not to visit Sweden without the consent of the Polish diet. The articles of Kalmar regulated the future relations betueen Poland and Sweden, when Sigismund should succeed his father as king of Sweden. The two kingdoms were to be perpetually allied. but each of them was to retain its own laws. Sweden was also to enjoy its religion subject to such changes as a general council might make. During Sigismund's absence from Sweden that realm was to be ruled by seven Swedes, six to be elected by the king and one by Duke Charles. his Protestant uncle. Sweden, moreover, was not to be administered from Poland. The Poles first wished the cession of Estonia to Poland, but eventually the territorial settlement was postponed; and Sigismund was duly crowned at Cracow on Dec. 27, 1587.

From the first Sigismund was out of sympathy with the majority of his subjects. As a man of education and refinement, he was unintelligible to the *szlachta,* who regarded all artists and poets as either mechanics or adventurers. His reserve was called stiffness and his calm, haughtiness. Even Zamoyski who had placed him on the throne complained that the king was possessed by a dumb devil. He lacked, moreover, the tact and bonhomie of the Jagiellos.

Sigismund's difficulties were also increased by his political views which he brought with him from Sweden, and which were diametrically opposed to those of the omnipotent chancellor. Yet, impracticable as it may have been. Sigismund's system of foreign policy as compared with Zamoyski's was at any rate, clear and definite. It aimed at a close alliance with the house of Austria, with the double object of drawing Sweden within its orbit and overaning the Porte by the conjunction of the two great Catholic powers of central Europe. A corollary to this system was the much needed reform of the Polish constitution. nithout which nothing beneficial was to be expected from any political combination. But his efforts foundered on the jealousy and suspicion of the magnates headed by the chancellor. The first 23 years of Sigismund's reign is the record of an almost constant struggle between Zamoyski and the king, in which the two opponents nere so evenly matched that they did little more than counter-poise each other. At the diet of 1590 Zamoyski successfully thwarted all the efforts of the Austrian party; whereupon the king. taking advantage of sudden vacancies among the chief offices of state, brought into power the Radziwills and other Lithuanian dignitaries, thereby for a time considerably curtailing the authority of the chancellor. In 1592 Sigismund married the Austrian archduchess Anne. and a reconciliation was patched up between the king and the chancellor to enable the former to secure possession of his Swedish throne vacant by the death of his father john III. He arrived at Stockholm on Sept. 30, 1593 and was crowned at Upsala on Feb. 19, 1594, after he had consented to the maintenance of the "pure evangelical religion" in Sweden. On July 14, 1594 he departed for Poland leaving Duke Charles and the senate io rule Sweden during his absence. Four years later (July 1598) Sigismund was forced to fight for his native crown by the usurpation of his uncle. aided by the Protestant party in Sweden. He landed unopposed at Kalmar.

After fruitless negotiations, Sigismund advanced with his army, but was defeated by the duke at Stangebro on Sept. 2j. He never saw Sweden again, but refused to abandon his claims; and this unfortunate obstinacy was to involve Poland in a whole series of unprofitable wars with Sweden.

In 1602 Sigismund wedded Constantia, the sister of his deceased first wife, an event which strengthened the hands of the Austrian party at court and still further depressed the chancellor. At the diet of 1605 Sigismund endeavoured to substitute a decision by a plurality of votes for unanimity in the diet. The opposition of Zamoyski nullified the effect of this salutary reform. His death, however, in the same year left his more ardent followers without a check. From 1606 to 1610 Poland was in an anarchical condition. On foreign affairs these disorders had a disastrous effect.

Poland was unable to take the opportunity of breaking the power of the tsars, which the collapse of Muscovy had shaken. At the outbreak of the Thirty Years' War Sigismund prudently leagued with the emperor against the Turks and the Protestants. Sigismund died very suddenly in his 66th year, leaving two sons, Wladislaus and John Casimir, who succeeded him in rotation.

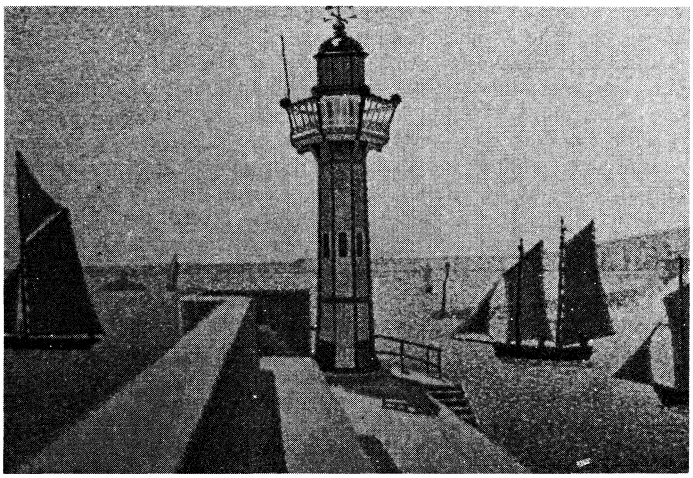
SIGNAC, PAUL (1863–1935), French painter, developer, with Georges Seurat, of the technique called Neoimpressionism, was born in Paris, Nov. 11, 1863. After youthful attempts to study architecture, he turned, at the age of 18, to painting. Through Armand Guillaumin, Signac became a convert to the tone division of impressionism, and he was represented by several landscapes at the exhibition of the Maison Dorée in 1886.

In 1884 Signac had helped found the Salon des Indépendants. There he met Seurat, whom he initiated into the broken-colour technique of Impressionism. The two went on to the method they called Pointillism or Neoimpressionism. They continued to divide their canvases into minute dabs of pure pigment, as had the Impressionists, but they adopted an exact, geometrical system of applying the dots instead of the somewhat intuitive application of the earlier masters. This technique was not unlike the mechanical process of printing photographic iilustrations in colour by means of halftones. Some critics denounced Signac's landscapes



BY COURTESY OF RIJKSMUSEUM KROLLER-MULLER, OTTERLO, THE NETHERLANDS

"PORTRIEUX" BY PAUL SIGNAC. IN THE RIJKSMUSEUM KRÖLLER-MÜLLER, *THE NETHERLANDS* as monotonous and mathematical rather than artistic, but others found that the optical mixture of detached colours separated by pure white created an admirable luminosity. In water colours Signac used the principle in a much freer manner. After 1886 Signac took part regularly in the annual Salon des Indépendants, to which he sent landscapes, seascapes and decorative panels. He traveled widely over Europe with Seurat and other painters, and in his later years painted many scenes of Paris, Viviers and other French cities.

Signac produced much critical writing and was the author of *De Delacroix au néo-impressionnisme* (1899) and *Jongkind* (1927). The former book is an exposition of Pointillism or Neoimpressionism as developed by Seurat and himself. Signac died in Paris on Aug. 15, 1935.

Paintings by Signac may be seen at the Museum of Modern Art and in the Frick collection in New York city; at the Musée National d'Art Moderne in Paris; and in many other public collections.

SIGNAL, a word common in slightly different forms to nearly all European languages, derived from Lat. *signum,* "a mark" or "sign," a means of transmitting information, according to some prearranged system or code, in cases where a direct verbal or written statement is unnecessary, undesirable or impracticable. For military signaling *see* SIGNAL COMMUNICATION; *see* also RAILWAY: *Communications and Signaling: Signals.*

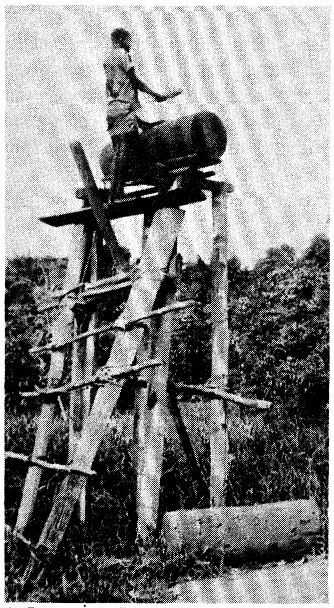
SIGNAL COMMUNICATION.. Signal communication or signaling has long played an important role in warfare. It serves to provide the means for transmitting information from reconnaissance and other units in contact with the enemy, and the means for exercising command by transmitting the orders and instructions of commanders to their subordinates. It comprises all means of transmitting messages, orders and reports both in the field and between all army headquarters and installations. In U.S. army usage, signal communication includes automatic transmission of data over military wire and radio circuits, between such electronic equipment as the computers and control systems employed in gun laying, in air navigation, in guided-missile control and in the various logistic and clerical activities of the military arms and services.

Signal communication in some armies includes such visual means as photography and television.

The history of the science can be divided into four phases: (1) the early period of origin and growth up to the invention of the electric telegraph and the Morse code of dots and dashes in the mid-19th century; (2) the advent of the telegraph, the telephone and wireless radio and their development up to World War I in 1914; (3) development during World War I and up to the beginning of World War II; and finally (4) the great expansion during and after World War II.

Early Development. — Some of the ancient writers! such as Polybius, make reference to the employment of various means of visual signaling. Before the end of the 18th century European armies used the visual telegraph system devised by Claude Chappe, employing semaphore towers or poles with movable arms. The Prussian army in 1833 assigned such visual telegraph duties to engineer troops. Messengers—still one of the valuable means of signal communications — were employed in war from ancient times. Alexander, Hannibal and Caesar each developed an elaborate system of relays by which messages were carried from one messenger post to another by mounted messengers traveling at top speed. They were thus able to maintain contact with their homelands during their far-flung campaigns and to transmit messages with surprising speed. Jenghiz Khan at the close of the 12th century not only emulated his military predecessors by establishing an extensive system of messenger posts from Europe to his Mongol capital but also utilized homing pigeons as messengers. As he advanced upon his conquests he established pigeon relay posts across Asia and most of Europe. He was thus able to utilize these messengers to transmit instructions to his capital for the governing of his distant dominions.

At the same time that these elementary methods of signal communication were being evolved on land, a comparable development was going on at sea. Early signaling betneen naval vessels was by prearranged messages transmitted by flags, lights or the movement of a sail. Codes were developed in the 16th century which depended upon the number and position of the flags or lights or on the number of cannon-shot discharges.



UNITED PRESS INTERNATIONAL

NATIVE DRUMMER OF THE CONGO RELAYING A MESSAGE IN THE JUNGLE COMMUNICATION BY DRUMS IS PRACTISED WIDELY IN AFRICA

In the 17th century, Adm. Sir William Penn (1621–70) and others developed regular codes for naval communication, and toward the close of the 18th century, Adm. Richard Kempenfelt developed a plan of flag signaling similar to that non in use. Later Sir Home Popham increased the effectiveness of ship-to-ship communication by improved methods of flag signaling

Advent of Electrical Signaling. — Despite the early pioneering efforts on land and sea the real development of signal communication in war did not come until after invention of the electric telegraph by Samuel F. B. Morse. In his successful demonstration of electric communication between Washington, D.C., and Baltimore, Md., in 1844, he provided a completely new means of rapid signal communication. The development of the Morse code of dots and dashes used with key and sounder was soon adapted to augment the various means of visual signaling. Vice-.\dm. Philip Colomb's flash signaling, adopted in the British navy in 1867, was an adaptation of the Morse code to lights. The first application of the telegraph in time of war was made by the British in the Crimea in 1854, but its capabilities were not well understood and it was not widely used. Three years later, in the India mutiny, the newly established telegraph, which was controlled by the British, was a deciding factor.

In the U.S. Civil War, wide use was made of the electric telegraph. In addition to its employment in spanning long distances under the civilian-manned military telegraph organization, mobile field service was provided in the Union army by wagon trains equipped with insulated wire and lightweight poles for the rapid laying of telegraph lines. Immediately before and during the Civil War visual signaling also received added impetus through the efforts of two British officers. Capt. Frank Bolton of the army and Capt. Colomb of the royal navy. and Maj. Albert Myer, signal officer of the U.S. army (*see* SIGNAL CORPS). The two former, working together, and Myer, working independently, arrived at the same end. They developed a system, applying the Morse code of dots and dashes. for spelling out messages by flags by day and lights or torches by night. Another development for light signaling placed a movable shutter. controlled by a key, in front of a strong light. An operator. opening and closing the shutter. could produce short and long flashes in accordance with the Morse code and this could spell out messages.

Simultaneously with U.S. and British developments in military telegraph. the Prussian and French armies also organized mobile telegraph trains. During the short, decisive Prussian campaign against Austria in 1866, field telegraph enabled Count Helmuth von Moltke. the Prussian commander, to exercise command over his distant armies. Soon afterward the British organized their first field telegraph trains in the royal engiceers. In the British Abyssinian campaign. 1867–68. Sir Robert Napier's forces made extensive use of Bolton and Colomb's new method of visual signaling and of the field telegraph. Success mas immediate and remarkable.

Another instrument was added to the techniques for visual signaling through the development of the heliograph. This instrument employed two adjustable mirrors so arranged that a beam of light from the sun could be reflected in any direction. The beam was interrupted by a key-operated shutter which permitted the formation of the dots and dashes of the Morse code. Where climatic conditions were favourable this instrument found much use. notably by the British army in India and the United States army in the southwestern U.S. Because consistency and regularity of sunshine were important, the heliograph was never widely adopted throughout the armies of continental Europe.

The invention of the telephone in 1876 was not followed immediately by its adoption and adaptation for military use. This was probably due to the fact that the compelling stimulation of war was not present and the added fact that the development of long-distance telephone communication required many years to accomplish. The telephone was used by the United States army in the Spanish-American \Tar. by the British in the South African War and by the Japanese in the Russo-Japanese War. This usage was not extensive and there was little material contribution to the development of voice telephony. Between the turn of the 20th century and the advent of World War I. military adaptation of the telephone did take place, but its period of major growth had not yet arrived.

Near the close of the 19th century, a new means of military signal con~municationmade its appearance — the wireless telegraph. or. as named in the United States and Canada — the radio. In 1894 Sir Oliver Lodge successfully demonstrated that the electromagnetic waves first discovered by Heinrich Hertz, and later studied by James C. Maxwell. could be guided and used for signaling. He was followed by Marconi. who developed but did not discover the use of these waves for signaling. The major powers throughout the world were quick to see the wonderful possibilities of this new agency for military and naval signaling. Its development was rapid and continuous and, by 1914, it was adopted and in extensive use by all the armies and navies of the world. It soon became apparent that wireless telegraphy was not an unmixed blessing to armies and navies, because it lacked secrecy and messages could be heard by the enemy as well as by friendly forces. This led to the development of extensive and complicated codes and ciphers as necessary adjuncts to military signaling. The struggle between the cryptographer and the cryptanalyst expanded greatly with the adoption of radio and continued to be a major factor affecting its military use. (See CRYPTOLOGY.)

From World War I to 1940. — The onset of World War I found the opposing armies equipped to a varying degree with modern means of signal con~municationbut with little appreciation of the enormous load that signal systems must carry to maintain control of the huge forces that were set in motion. The organization and efficiency of the armies varied greatly. At one end of the scale was Great Britain, with a small but highly developed signal service, and at the other end stood Russia, with a signal service inferior to that of the American Union army at the close of the Civil War. The fact that commanders could not control. co-ordinate and direct huge modern armies without efficient signal communication quickly became apparent to both the Allies and the Central Powers. The Germans, despite years of concentration on the Schlieffen plan, failed to provide adequately for communication between higher headquarters and the rapidly marching armies of the right wing driving through Belgium and northern France. This resulted in a lack of co-ordination between these armies which caused a miscarriage of the plan. a forced halt in the German advance and the subsequent withdrawal north of the Marne. On the Allied side. the debacle of the Russian forces in East Prussia — a crushing defeat at the hands of Gen. Paul von Hindenburg in the battle of Tannenberg — was largely due to an almost total lack of signal communication.

As the war progressed a growing appreciation prevailed of the need for improved electrical communications of much greater capacity for the larger units and of the need within regiments for electrical communications which had heretofore been regarded as unessential and impractical. Field telephones and switchboards were soon developed and those already in existence improved. An intricate system of telephone lines involving thousands of miles of wire soon appeared on each side. Pole lines with many cross-arms and circuits came into being in the rear of the opposing armies and buried cables and wires laid in trenches were installed in the elaborate trench systems to the forwardmost outposts. The main arteries running from the rear to the forward trenches mere crossed by lateral cable routes roughly parallel to the front. Thus there grew an immense gridwork of deep buried cables, particularly on the German side and in the British sectors of the Allied side with underground junction boxes and test points every few hundred yards. The French used deep buried cable to some extent but generally preferred to string their telephone lines on wooden supports set against the walls of deep open trenches. Thus electrical communication in the form of the telephone and direct-current telegraph gradually extended to the smaller units until front-line platoons were frequently kept in touch with their company headquarters through these mediums. At the beginning of the war most of the armies were using military telegraph instruments employing an alternating current at frequencies from 500 to 700 cycles per second These instruments could transmit well through the long and generally defective wire lines used in open warfare. However, when used in the trench systems in close proximity to the enemy it was found that their signals could be readily intercepted by using amplifiers associated with earth induction pickup devices A new type of telegraph instrument was soon developed nhich transmitted an interrupted direct current which could not be picked up by the listening devices then in use.

Despite efforts to protect the wire lines they mere frequently cut at critical times as the result of the intense artillery fires. This led all the belligerents to develop and use wireless (radio) as an alternate means of communication. Prewar wireless (radio) sets were too heavy and bulky to be taken into the trenches and they also required large and highly visible aerials. Radio engineers of the belligerent nations soon developed smaller and more portable wireless sets powered by storage batteries and using low inconspicuous aerials Although radio equipment came to be widely issued to the headquarters of all units to include battalions. the ease of enemy interception, the requirements for cryptographing or encoding messages and the inherent unreliability of these early nireless systems caused them to be regarded as strictly auxiliary to the wire system and reserved for emergency use when the wire lines nere cut. Visual signaling returned to the battlefield in World War I with the use of electric signal lamps. Pyrotechnics, rockets. Very pistols and flares had a wide use for transmitting prearranged signals. Messenger service came to be highly developed and motorcycle, bicycle and automotive messenger service was employed Homing pigeons nere extensively used as one-way messengers from front to rear and acquitted themselves extremely well. Dogs also were used as messengers and, in the German army, reached a high degree of efficiency.

A nen element in warfare, the airplane, introduced in World War I. immediately posed a problem in communication. During most of the war, communication between ground and air was difficult and elementary. The pilot had to land or to drop messages to make his reports. and he received instructions while in the air from strips of white and black cloth called "panels" laid out in an open field according to prearranged designs. Extensive development efforts were made to make practical the use of radio telegraph and telephone betneen the airplanes and ground headquarters. The closing stages of the war san many planes equipped with radio but the service nas never satisfactory or reliable and had little influence on military operations.

During World War I, wireless telegraph communication was extensively employed by the navies of the world and had a major influence on the character of naval warfare. High-powered shore and ship stations made possible wireless communication over long distances

World War I left a host of lessons to be studied by the army, naval and air force personnel of all of the nations. Important among these lessons was the need to improve mobility, fire power, communication and the effectiveness of air power. Advances in military communications after the war were greatly aided by the large increase in electronic and communication development for civilian purposes.

The growth of radio broadcasting following World War I brought into existence in most of the nations a greatly increased interest in communication engineering and the expansion of manufacturing facilities to exploit the new art. Carrier telephony on wire systems also made great advances in providing for several unconflicting conversations over the same wires. There was a rapid growth in long-distance telephone techniques and plant. The design of amplifiers for telephone repeaters made rapid progress.

One of the war lessons learned in most of the major nations was the compelling need for scientific research and development of equipment and techniques for military purposes. Although the amount of funds devoted to military development during the period from World War I to World War II n-as relatively small, the modest expenditures served to establish a bond between industry. science and the armed forces of the major nations.

Of great importance in radio communication was the pioneering by the amateurs and by industry and science in the use of very high frequencies. These developments opened up to the military the possibilities of portable short-range equipment for mobile and portable tactical use by armies, navies and air forces. Military work in these fields was carried out actively in Germany. Great Britain and the United States. As early as 1938 Germany had completed the design and manufacture of a complete line of military portable and mobile radio equipment for its army and air force.

The increased interest in scientific research and development on the part of the military brought about the birth of radar which was destined to become one of the major technological advances of World War 11.

Radar (*q.v.*), signifying radio detecting and ranging, was developed for long-range location and tracking of enemy aircraft and for antiaircraft fire direction. It used sharply beamed short pulses of radio energy which n-ere reflected back from the surfaces of aircraft in flight to give a visual signal indication on the face of a receiver oscilloscope. Using radar. it became possible to detect and locate enemy aircraft at distances of 100 to 150 mi.. which enabled the defending air force then to take off and intercept enemy bombers prior to reaching their targets. In Britain. radar became one of the major factors which enabled the British to meet and neutralize mass German bombing attacks during the battle of Britain. Although, strictly speaking. radar is not used for communication. it formed part of the complex communication systems required for antiaircraft warning and fire-control nets. The employment of radar in IFF systems (identification. friend or foe) to distinguish friendly aircraft from hostile on the oscilloscopes of search sets did in fact serve a communication function.

Between World Wars I and II the printing telegraph, commonly knon-n as the teleprinter or teletypewriter machine. came into civilian use and was incorporated in military wire-communication systems. Compared with the World War II period. military wire teleprinter networks n-ere not extensive. Prior to World War II military radioteleprinter circuits were nonexistent.

Another major communication advance which had its origin and early growth during the period between World Wars I and II was frequency modulated (FM) radio. Developed during the late 1920s and early 1930s by Edwin H. Armstrong, inventor and a major in the United States army signal corps during World War I. this new method of modulation offered heretofore unattainable reduction of the effect of ignition and other noises encountered in vehicular radio applications. It was first adapted for military use by the United States army. which, prior to World War II. had under development tank. vehicular and man-pack frequency modulated radio transmitters and receivers.

On the eve of World War II, all nations employed generally similar methods for military signaling. The messenger systems included foot, mounted, motorcycle, automobile, airplane. homing pigeon and the messenger dog. Visual agencies included flags. lights. panels for signaling airplanes and pyrotechnics. The electrical agencies embraced wire systems providing telephone and telegraph service. including the printing telegraph. Both radiotelephony and radiotelegraphy were in wide use, but radiotelephony had not as yet proved reliable and satisfactory for tactical military communication. The navies of the world entered World War II with highly developed radio-communication systems. both telegraph and telephone. and with development under way of radar and sonar (sound navigation and ranging) and many other electronic navigational aids. Blinker-light signaling was still employed. The use of telephone systems and loud-speaking voice amplifiers on naval vessels had also come into common use. Air forces employed wire and radio communication to link up their bases and landing fields and had developed modern air-borne long-range. medium-range and short-range radio equipment for air-to-ground and air-to-air communication.

World War II and After.—In the communication and electronics field. World War II was in one sense similar to World War I—the most extravagant prewar estimates of military. naval and air communication requirements soon proved to represent only a fraction of the actual demand. Requirements for all kinds of communication equipment and for improved quality and quantity of communications pyramided beyond the immediate capabilities of industry. Expansion of manufacturing facilities becaine vital, and the expansion of research and development activities in the communications-electronics field was unprecedented. The early German blitzkrieg, with tank and armoured formations. placed a new order of importance on reliable radio communication. The development of the air, infantry, artillery and armoured team created new requirements for split-second communication by radio between all members. Portable radio sets were provided as far down in the military echelons as the platoon. In every tank there n-as installed at least one radio and in some command tanks as many as three. In the field of wire communications multiconductor cables were provided. which could be rapidly reeled out and on which as many as four conversations could take place simultaneously through the use of carrier telephony. The Germans were the first to bring forth this type of military long-range cable and their example was promptly followed by both the British and the C.S. forces. High-powered mobile radio sets hecame common at division and regimental level. With these sets telegraph communication could be conducted at distances of more than 100 mi. with vehicles in normal motion on the road. Major telephone switchboards of much greater capacity were needed. These were developed. manuiactured and issued for use at all tactical headquarters to satisfy the need for the greatly increased number of telephone channels required to co-ordinate the movements of field units whose mobility and speed of movement capabilities had been expanded many times.

Radio relay. born of the necessity for mobility. became the outstanding communication development of World War II. Sets employing frequency modulation and carrier techniques were developed and used. as were also radio relay sets which used radar pulse transmission and reception techniques and multiplex time-division methods for obtaining many voice-channels from one radio carrier. Radio relay telephone and teletypenriter circuits spanned the English channel for the Normandy landing and later furnished important communication service for Gen. George S. Patton, Jr.. after his breakout from the Normandy peninsula.

The need for communication between the homelands and many far-flung theatres of war gave rise to the need for improved lone-range overseas communication systems. r\ system of radioteletypewriter relaying n-as devised. by n-hich a radioteletypewriter operator in Washington, London or other capitals could transmit directly by teleprinter to the commander in any theater of war. In addition. a system of torn-tape relay centres was established so that tributaries could forward messages through the major centres and retransmission could be effected in a minimum of time by transferring the perforated tape message from the receiving to the transmitting positions. In addition a system of holding teletypewriter conferences was developed. These conferences were called "telecon" and enabled a commander or his staff at each end to view on a screen the incoming teletypewriter messages as fast as the characters were received. Questions and answers could thus be passed rapidly hack and forth over the thousands of miles

INTERNATIONAL CODE FLAGS AND PENNANTS

The two-letter signal RY flying from the masthead signifies "Crew have mutinied." The other two-letter groups on the halyards hoisted to the yardarm have the following meanings: NC—"I am in distress and require immediate assistance"; KA—"My vessel is very seriously damaged"; K1—"Have you a line-throwing apparatus?"; IX—"I have received serious damage in collision"; CG—"You should alight as near to me as possible"; AD—"I must abandon my vessel."

separating the Pentagon in Washington, D.C., for example, from SHAEF headquarters in Europe or Gen. Douglas MacArthur's headquarters in the far east.

During the latter years of the war, new and improved communication and electronic devices came forth from research and development in ever-increasing numbers. A new long-range electronic navigation device, known as loran. used for both naval vessels and aircraft was brought forth. Short-range navigational systems, called shoran, made their appearance. Combinations of radar and communications for the landing of aircraft in zero visibility were perfected. One such system was the GCA or ground controlled approach system. Combinations of radio direction-finding. radar and communications systems were developed and used for ground control of intercept aircraft—the system called GCI (ground controlled intercept). Radio-controlled guidance of falling bombs was brought forth to enable the operator in the bomber to direct the bomb to the target.

Electronic countermeasures made their appearance in the form of jamming transmitters to jam radio-communication channels and radar, navigation and other radio aids to military operation.

At the end of World War II the military forces of the Allied nations were called upon to occupy the territories of their former enemies. The Allied signal communications staffs were usually charged with responsibility for the supervision of military and civilian communication within the occupied areas.

The military services learned well from their wartime experiences the importance of scientific research and development in all fields including communications electronics. Advances were made toward increasing the communication capacity of wire and radio relay systems and toward improving electronic aids for navigation and for the detection of enemy forces. Measures to provide more comprehensive and more reliable communication and electronic equipment continued to be stressed in the armies, navies and air forces of the major powers. Further impetus to these developments came from the conflict in Korea. which reaffirmed the vital importance of signal communication in the co-ordinated and combined operations of air. ground and naval forces.

After mid-century, accordingly. military efforts in all the many facets of signal communication continued to intensify almost as extravagantly as during World War II. Two major additions in the U.S. army were television and electronic "brain" equipment. The latter. in many forms of digital and analogue computers and of such data-processing devices as punch-card machines, were applied increasingly to personnel record handling and to depot and supply operations interconnected over wide areas by signal-communication networks.

Television systems proved valuable training aids in military schools where mass instruction, especially in manual functions, was needed and where instructors were few. Such systems enabled a single instructor to teach many small classes simultaneously, each grouped before a receiver where they could watch demonstrations closely. Two-way communication systems permitted the instructor to call and question any student in any classroom and, inversely, enabled any student to put questions to the instructor. Portable television equipment in the field proved valuable for sending back to headquarters, by antenna radiation or coaxial cable. a picture of any scene of operations such as a river crossing. Equally valuable was a television camera in the hands of a forward scout or in a reconnaissance aircraft, whether piloted or remotely controlled. to scan enemy territory.

Thus signal communication, combining in itself the powers of photography, television, radar and other instruments using the electromagnetic radiation spectrum, moved into such new areas of military communications electronics as battle area surveillance and electronic warfare devices to interfere with, or jam, enemy transmitters. In the U.S. army, battle area surveillance activity radically augmented conventional reconnaissance methods. An electronically controlled target acquisition system. to discover enemy troops or transport on the ground or in the air. was being developed by the signal corps using optical, sonic. photographic, infrared and other sensory equipment. The aggregate of information gathered by these devices over a wide enemy front can be electronically assembled and displayed in the headquarters where the combat commander can quickly estimate the situation and make tactical decisions.

Gravely, *The Second World War 1939–45: Signal Communications* (London, 1950); Dulany Terrett, *The Signal Corps: the Emergrncy* (Washington, D.C., 1956); G. R. Thompson et al., *The Signal Corps: the Test* (Washington, D.C., 1957). (G. I. Bk.; G. R. T.)

SIGNAL CORPS. Organizations of this or an equivalent title have existed in the armies of many nations since the creation of the first signal corps in the Union and Confederate armies of the C.S. Civil War.

United States.—The signal corps, U.S. army, dates from June 21, 1860, when congress authorized the post of signal officer, filled on June 27 by Maj. Albert J. Myer, assistant surgeon. who had won war department acceptance of a simple but effective method of flag signaling (wigwag). Obtaining officers on detail, he trained a number, some of whom later served with the Confederate army and helped establish the Confederate signal corps in 1862. The signal corps, U.S. army, under Myer and his officers in the Union cause was established on March 3. 1863.

The provision of signal communication and related tasks of observation brought the corps a variety of responsibilities, including weather reporting over army wire lines from 1870 until that responsibility was transferred to the weather bureau in 1891, observation balloons and early army aircraft and army photography. The signal corps made still and, later, motion pictures for many purposes, including military analysis and tactical reconnaissance; it produced and distributed all army training films. Responsibility for electrical communications (lost during the Civil War to the civilian military telegraph organization but recovered soon after) led to wire-line construction and operations to serve army posts and camps throughout the U.S. territorial west, and later to the provision of all communications in Alaska. The Alaska communication system, assigned to the signal corps in 1900, became the principal means by which civilians and government agencies in Alaska maintained rapid communication with the United States. Installed and operated by the signal corps! the system utilized submarine cable. overland pole lines and radio (more than 35 radio stations at mid-century).

Signal corps responsibility for army communications led to such electronic assignments as applications of radar and television. Army radar equipment was developed by the signal corps prior to World War II. Many types received wide use. especially in aircraft detection and in gun laying during that war. In 1946. using high-power radar designed at its laboratories at Fort Monmouth, N.J.. the signal corps succeeded in receiving radar reflections from the moon. Television closed-circuit systems for better training in army schools and field television for use in battle area surveillance were developed (*see* SIGNAL COMMUNICATION).

Signal corps research and development laboratories work upon a wide array of electronic aids, such as individual helmet radios for use in short-range communication with each soldier in combat, and theatre-wide area communication systems for the interconnection of headquarters by multiple routes. Such developments as these are necessary to provide the flexibility and universality needed for the command control of widely dispersed mobile forces in an atomic era.

In its global responsibility for the army command and administrative network the signal corps installs and operates increasingly dependable and automatically relayed high-capacity radio and wire circuits and teletypewriter conference systems the world over. In its equally world-wide depot and supply operations the signal corps seeks to speed service and reduce the amount of costly overseas stocking of equipment by making use of automatic data processing machines, which greatly facilitate the formerly slow paperwork involved in signal equipment requisitions and supply and replace the lengthy labours of clerical workers of the past.

Unlike the signal organizations of other armies, the U.S. army signal corps is responsible for the production and distribution of military communications equipment. Toward combat support, the signal corps mission includes the installation, operation and maintenance of communications within all commands down to and including the brigade. Communication within regiments and below has been generally handled since World War I by personnel of the several arms. But the equipment and techniques are usually those of the signal corps. Army doctrines and methods for signal communications are taught by the signal corps to selected personnel of the combat arms and technical services, the air forces, the navy and the marine corps.

Field units of the signal corps are organized into signal operations, construction and service battalions and into operations, construction, photographic, repair, depot and service companies. Signal battalions are organic units of infantry: air-borne and armoured divisions. Service companies and battalions are composed of teams. organized and equipped to perform one of the technical functions of the signal corps.

Other Countries. — In European armies the signal function, dating generally from the first military applications of the electrical telegraph in the mid-19th century. developed under engineer organizations. But the rapid multiplication of the means of signal communication. especially with the advent of radio early in the 20th century, took military signals from the engineers and established the function as a separate and independent organization. The commander usually serves on the general staff while directing also the many-sided operations of the signal communication system of a modern army. In Great Britain the director of signals in the war office became head of the British royal corps of signals. This corps. which took form in 1920 from the signal service of the royal engineers, provides communication facilities down to brigades and forward to infantry battalions and artillery battery headquarters. In France the signal service of the army was lodged, after World War I, with the engineers until mid-century when it separated as the *corps* des *transmissions.* The commander. directly responsible to the minister of national defense. is charged with the organization and operations of the corps, the training of signal personnel and the provision of technical advice on research and development and on supply requirements. In Germany signal troops served as a separate organization, the *Nachrichtentruppe,* after 1899.

Signal communications in the U.S.S.R. operated as a general staff function directly under the soviet war minister. Soviet signal troops serve under the ground forces along with the infantry. cavalry and engineers. In Japan the signal section, one of the technical services of the national safety forces of the country, is represented on the general staff by the chief of the signal section. A signal company serves each army division. performing functions similar to those in the U.S. army.

See R. F. H. Nalder. *The History of British Army Signals in the Second World War* (London. 1953) ; Dulany Terrett, *The Signal Corps: the Emergency* (Washington, D.C., 1956) ; G. R. Thompson *et al., The Signal Corps: the Test* (Washington, D.C., 1957). (G.R.T.)

SIGNATURE (through Fr. from Lat. *signatura, signare,* "to sign.!' *signum,* "mark," "token," "sign"), a distinguishing sign or mark. especially the name, or something representing the name. of a person used by him as affixed to a document or other writing to show that it has been written by him or made in accordance with his wishes or directions. In the early sense of something which "signifies" (*i.e.,* marks a condition, quality or meaning) the word was formerly also used widely, but now chiefly in technical applications.

In old medical theory, plants and minerals were supposed to be marked by some natural sign or symbol which indicated the particular medicinal use to which they could be put; thus, yellow flowers mere to be used for jaundice. the "scorpion-grass," the old name of the forget-me-not. was efficacious for the bite of the scorpion. Many superstitions were based on the human shape of the roots of the mandrake or mandragora. The bloodstone was taken to be a cure for hemorrhage. This theory was known as the "doctrine of signatures."

In printing or bookbinding the "signature" is a letter or numeral placed at the bottom of the first page of a section of a book, as an assistance to the bookbinder in folding and arranging the sections consecutively; hence it is used in connection with a sheet ready folded. In music it is the term applied to the signs affixed at the beginning of the stave showing the key or tonality and the time or rhythm.

SIGN LANGUAGE. Speech as a mode of human communication is normally used between persons who are in visible contact. Therefore the gestures, facial expressions, bodily movements of the two parties are integral, even at times essential, elements in the communication. Thus "when the postural tensions and the spoken word contradict each other it is plain which should be given credence" (W. A. White, *Foundations* of *Psychiatry,* 1921, p. 79). There is therefore in all speech when the two parties are in visible contact an element of natural gesture. From this concept we arrive at the position that to speak with the hands is to think with the hands.

Organized sign language is found in many parts of the world. In Assam "the signs used depend on the genius and personality of the speaker, but the natural aptitude for their use is such that from one Naga to another their meaning is rarely obscure. Indeed, a dumb man has been known to make a long and detailed complaint of an assault in which nothing was missing except proper names, and even these were eventually identified by means of the dumb man's description of his assailant's dress and personal appearance" (J. H. Hutton, *Angami Sagas,* 1921, p. 291). Natural gestures form the basis of an extended system of sign language, as is evident in Australia. *See* DEAF AND HARD OF HEARIXG. TRAINING AND WELFARE OF.

SIGNORELLI, LUCA (LCCA DA CORTONA, originally LUCA D'EGIDIO DI VENTURA DE' SIGNORELLI) (c. 1445/50–1523), Italian painter, the most powerful exponent of the nude before Michelangelo, was born in Cortona, Umbria, probably between 144j and 1450. He was first recorded as a painter in 1470, but it is very likely that he was a pupil of Piero della Francesca, along with Perugino. in the 1460s. The first certain surviving work by him is a fragmentary fresco. now in the museum at Città di Castello, which he finished in Nov. 1474. This shows a strong influence from Piero della Francesca. and the style is responsible for the attribution to Signorelli at this date of several other pictures, including the beautiful Madonna in Christ Church library, Oxford. His first signed work was a processional banner with a Madonna on one side and a Flagellation on the other; these are now in the Brera. Milan. as separate pictures. They still show links with the style of Piero, but the dominant influence is that of Florence, and especially that of the Pollaiuoli. which suggests that Signorelli visited Florence in the 1470s. The scientific naturalism represented by the Pollaiuoli now becomes the principal feature of Signorelli's style. In 1479 he was elected to the council of 18 in his native Cortona and for the rest of his life'he was active in politics.

About 1483 he went to Rome. for the "Testament of Moses" fresco in the Sistine chapel is unanimously attributed to him; yet his name does not occur in the only two documents — of 1481 and 1482—known to us. It is likely that his friend Perugino got him the commission to help complete the cycle. By this date his style was fixed and his interest in dramatic action and the expression of great muscular effort mark him as an essentially Florentine naturalist working outside Florence. The altarpiece for Perugia cathedral, of 1484, shows the same qualities. Between 1497 and 1398 he was at work on a fresco cycle of scenes from the life of St. Benedict in the monastery at Monteoliveto Maggiore, near Siena, but these are hardly more than a prelude to his masterpiece, the frescoes of the "End of the World" and the "Last Judgment" in the chapel of S. Brizio in Orvieto cathedral. A small part of the ceiling had been painted by Fra Angelico in the 1440s, and he had determined the subject by painting the "Christ in Judgment" over the altar. On April j, 1499, Signorelli was commissioned to complete the ceiling and it was not until April 27, 1500, that he received the more important commission to paint the walls. At this moment Italy was in turmoil. partly because of the incursions of the French armies and partly because of the preaching and death of Savonarola, who seemed to have predicted the French invasion as a judgment. The French had actually by-passed Orvieto on their way south, and the completion of the frescoes was therefore in the nature of a thanksgiving. It also explains the grim and terrible treatment of a subject well suited to Signorelli's genius. The large scenes on the walls represent the last days of the world, with the portents of doom followed by the appearance of Anti-christ and the false miracles worked by him before his final destruction. In the frescoes nearer to the altar we see the next stages, the "General Resurrection" and the "Last Judgment." "Heaven" and "Hell." The 'Judgment' itself is represented only by the small figure of Christ over the altar, painted by Angelico. Behind the altar are a Dantesque "Hell" (with the classical figure of Charon and the River Styx) and a part of the "Blessed in Heaven." Signorelli had little sense of colour, but here his greenish and

purple devils add to the horror induced by the strained poses and the anatomical details in the resurrected and decayed bodies.

The Orvieto frescoes reach a level that he never again achieved, although he lived nearly 20 years after he received the final payment on Dec. 5, 1504. He was in Florence in 1508 on official business as prior of Cortona and he went to Rome at about this time, and again in 1513, but the new generation—Michelangelo and Raphael—had now won all the commissions and Signorelli returned to his less sophisticated Umbrian clientele. Most of his later works betray the hands of his numerous assistants, but among his better works are the altarpiece in the National gallery, London (1515), the "Deposition" (1515/16) in Sta. Croce. Umbertide. and the "Assumption" and "Immaculate Conception" begun in 1519 and 1521 (both in the Museo Diocesano, Cortona). One of his finest works, the "Pan" formerly in Berlin, was destroyed in World War II. He died in Cortona on Oct. 16. 1523.

SIGOURNEY, LYDIA HOWARD (née HUNTLEY) (1791–1865), U.S. author. whose numerous popular poems were characterized by sentimental morality, was born in Norwich, Conn., Sept. 1. 1791. After conducting schools in Norwich and Hartford, she was married, in 1819, to Charles Sigourney, a Hartford merchant. She contributed more than 2,000 articles to nearly 300 periodicals, and wrote 67 books and thousands of elegies, many of them distributed at the subjects' funerals. She died in Hartford, June 10, 1865. In 1866 her autobiography *Letters of Life,* appeared.

See Gordon S. Haight, *Mrs. Sigourney: the Sweet Singer of Hartford* (1930).

SIGSBEE, CHARLES DWIGHT (1845–1923), U.S naval officer, commander of the "Maine" at the time of her sinking in Havana harbour, was born in Albany, N.Y., Jan. 16, 1845, and graduated from the United States Naval academy in 1863. He served in the battle of Mobile bay and in both attacks on Ft. Fisher. After a deep-water survey of the Gulf of Mexico, he had other hydrographic experience before serving as hydrographer of the navy, 1893–97, in which office he made many improvements in surveying techniques. Taking command of the U.S.S. "Maine" on April 10, 1897, he survived her sinking on Feb. 15, 1898, and afterward commanded the U.S.S. "St. Paul." which defeated the Spanish cruiser "Isabella II" off San Juan on June 22, 1898. Sigsbee published two books. *Deep Sea Sounding and Dredging* (1880) and *The Maine, an Account of Her Destruction in Havana Harbour* (1899). He became a rear admiral on Aug. 11, 1903, and died July 19. 1923.

SIGURD: *see* SIEGFRIED.

SIGURÐSSON, JÓN (1811–1879), Icelandic statesman and man of letters, was born in the west of Iceland in 1811. He received an excellent education. In 1830 he was secretary to the bishop of Iceland, the learned Steingrimr Jónsson. In 1833 he went to Copenhagen to study Icelandic history and literature. His important works include: *Lögsögumannatal og Lögmanna à Islandi* ("Speakers of the Law and Law-men in Iceland"); the edition of *Landnáma* and other sagas in *Islendinga Sögur,* i–ii (Copenhagen, 1843–47); the large collection of Icelandic laws edited by him and Oddgeir Stephensen; and last but not least, the *Diplomatarium Islandicum,* which after his death was continued by others.

But although he was one of the greatest scholars Iceland has produced, he was still greater as a politician. The Danish rule had, during the centuries following the Reformation. gradually brought Iceland to the verge of economic ruin. Jón Sigurðsson began a hard struggle against the Danish government to obtain a reform. In 1854 the trade of Iceland was declared free to all nations. In 1840 the *althing* was re-established as an advisory, not as a legislative body. But when Denmark got a free constitution in 1848, which had no legal validity in Iceland. the island felt justified in demanding full home rule. To this the Danish government was vehemently opposed; it convoked an Icelandic national assembly in 1851, and brought before that body a bill granting Iceland small local liberties, but practically incorporating Iceland in Denmark. This bill was indignantly rejected and, instigated by Jón Sigurðsson, another was demanded of far more liberal tendencies. The Danish governor general then dissolved the assembly. but Jón Sigurðsson and all the members with him protested to the king against these unlawful proceedings. The struggle continued with great bitterness on both sides, but gradually the Danish government was forced to grant many important reforms. *(See* ICELAND. *History.)*

The grant of the constitution in 1874 was, in fact, the victory of Jón Sigurðsson, whose high personal qualities had rallied all the nation round him. He made Reykjavik not only the political, but the spiritual capital of Iceland by removing all the chief institutions of learning to that city; he was the soul of many literary and political societies and the chief editor of the *Ny Félagsrit,* which has done more than any other Icelandic periodical to promote the cause of civilization and progress in Iceland. Jón Sigurðsson lived the greater part of his life in Copenhagen, and died there in 1879; but his body, with that of his wife, Ingibjorg Einarsdóttir, whom he had married in 1845, and who survived him only a few days, was taken to Reykjavik and given a public funeral. On his monument is the inscription: "The beloved son of Iceland, her honour, sword and shield." (S. BL.; X.)

SIKANG, a former Chinese province, formed out of parts of western Szechwan and eastern Tibet, was given full provincial status on Jan. 1, 1939. When British India contested the Chinese sovereignty in Tibet, the Manchu government tried to retain control over the thirty-nine tribes, which had been under special jurisdiction of the Chinese commissioner at Lhasa, by creating a special district, Kham, out of their territory. This district remained contested between Tibet and China until the establishment of the larger province enclosing territory of Szechwan, which followed the restoration of full Chinese authority. The province was traversed by the southward courses of feeders of the Yangtze, the Mekong, Salween and Brahrnaputra rivers. The western border, which reached to within 125 mi. E. of Lhasa was uncertain, as the whole western part of the province was little explored. The eastern part of the province. organized from more than 50 former Szechwan counties, had rich mineral and forest resources and was not only geographically but in planning for economic development closely linked with the neighbouring Szechwan.

The capital of the province, Paan (Patang, Batang), is in a rich plain with several lamaseries on the route from Tatsienlu to Chamdo, a city of lamaseries and a commercial centre in the north, The population in 1953 was 3,381,064 with an area of 174,332 sq.mi.

In 1955 Sikang was absorbed into Szechwan province.

SIKELLANOS, ANGELOS (1884–1951), one of the leading modern Greek lyrical poets, was born on the island of Leukas. His first important work, the *Alnfroiskiotos* was published in 1909, and revealed his lyrical powers. It was followed by a group of outstanding lyrics. His next period was introduced by the philosophic poem *Prologos tes Zoes* ("Prologue to Life"; 1917) and includes the long works *Meter Theou* ("Mother of God") and *Pascha ton Hellenon* ("The Greek Easter"), culminating in the *Delphikos Logos* ("Delphic Ctterance"; 1927). The Greek tradition and the national historic and religious symbols are here given a mystic turn and a universal significance. In the 1930s and 1940s there appeared a second group of lyrics, which display the full power of Sikelianos' art. They express in rich and incisive language and with forceful imagery the poet's belief in the beauty and harmony of the world. The tragedies of Sikelianos (*Sibylla, Daedalus* in *Crete, Christ in Rome, The Death* of *Digenis* and *Asklepius,* which are introduced by the long dramatic poem *The Dithyramb of the Rose)* are more notable for their lyric than their dramatic qualities.

In his mature works Sikelianos is fulfilling in poetry the aspirations of the "demotic movement" of the 1880s, which sought to combine Greek tradition with western thought, and to introduce as a consciously literary language the idiom of the people. Although occasionally the power of his inspiration drives him to grandiloquence which blunts the poetic effect of his work, some of his finer lyrics are among the best in 20th-century western literature.

Sikelianos died at Athens, June 19, 1951.

See P. S. Sherrard, The *Marble* Threshing *Floor; a Study in Modern Greek Poetry* (1956). (CE. A. T.)

SIKHOTE-ALIN is a mountain range and region forming the southeastern part of the Soviet Pacific realm and adjoining the Sea of Japan and the Tatar strait. It lies east of the 700-mi.-long depression running from the Amur river mouth to the Bay of Peter the Great.

Topography.—Most of the region is occupied by the range comprising up to eight parallel chains of ridges running roughly north-northeast. The maximum elevations in the central ridges range from about 6.400 ft. at the Golez Komarov in the south, with gradually decreasing heights northward, to peaks about 4.300 ft. high in the north. Geologically. this is a folded range of mineraliferous metamorphic and sedimentary rocks of Paleozoic age, with frequent basalt extrusions and many tectonic faults. The whole block has been uplifted in the east and tilted down westward, so that the longer rivers run to the west and the short eastern rivers often tumble over falls and rapids down a steep slope to the Sea of Japan. The range appears high and rough from the sea, but from the central peaks the general aspect reveals a succession of round-domed peaks and a surprising over-all mild relief declining gradually toward the Ussuri river, which follows the depression at the western feet of the range. The Ussuri source in the extreme south of the range is only about 40 mi. from the coast near Vladivostok, and the water divide between the Ussuri and the short: south-running Sui-fen river is only about 600 ft. above sea level. Because of the trend of the main ridges parallel to the coast, the major part of the coast is relatively regular, with few bays and harbours. These are found chiefly at the south end of the range where the coast cuts across the parallel ridges almost at right angles.

Climate, Vegetation and Animal Life.—The Sikhote-Alin acts as a divide between the cool marine climate of the Sea of Japan region and the continental climate of the Xmur basin. The winter January isotherm of $-20°$ C. roughly follows the crestline of the range which separates the severely cold, dry Siberian air masses in winter from the humid, often fogbound seaward side of the range. In summer the temperature situation is reversed, with the Amur-Ussuri valley, as well as the southern end of the range, being much warmer than the drizzly eastern slopes. Precipitation in the Sikhote-Alin is as low as 23 in. annually in some parts of the lower western slopes and as high as 40 in. in the interior mountains. Because of the great summer monsoon concentrations of rainfall, destructive floods are common in the valleys. A rich virgin forest covers all except the highest altitudes and the settled lowlands and swamps. Nowhere is a permanent snow zone reached, although scrubby brushes and tundra mosses cover small areas of the peaks. Broad-leaved trees such as oak, birch, elm and linden intermixed with Korean pine and +Manchurian fir grow on the southern part of the mountains up to about 2.000 ft.; a transition to a coniferous zone of Okhotsk spruce follows in the higher altitudes of the south and continues down to sea level in the north. Although destructively cut in small areas of the settled valley slopes, the forests form one of the rich Sikhote-Alin resources still not systematically exploited in modern times. In the forests, especially in the south, roam a great variety of wild animal life, including the fearsome man-eating Manchurian tiger, the leopard, the Manchurian bear and the red wolf. Lesser furred animals are the sable, lemming, squirrel. marten and badger. Grass-eating game include the destructive wild boar, the Ussuri moose. wapiti, sika deer and musk deer. Bird life is abundant.

Political Divisions and Population.— Primorski *krai* (province) includes roughly the southeastern two-thirds of the physical region of the Sikhote-Alin. The northern region, including Sovetskaya Gavan, is part of Khabarovsk *krai.* This division accords with the economic hinterlands of Vladivostok and Khabarovsk, respectively, as well as with topographical considerations. The population is sparsely settled along both lower flanks of the Sikhote-Alin with increasing density toward the south and especially in the southwest end around Vladivostok. Along the east coast slopes, only Sovetskaya Gavan and Tetyukhe have significant populations. ranging up to 30,000 for the former and more than 50,000 for the latter in 1950. The southwest has such centres as Vladivostok, with about 265,000 people in 1956 (est.), and Voroshilov, with about 101,000. Lesser cities occur northward along the lower flanks of the range in the Ussuri-Lake Khanka depression. Ethnically, in the southern third of the region and in the lower flanks on each side of the range as far north as the Amur mouth in the west and to about the 47th parallel along the coast, the Great Russians predominate. There is local Ukrainian predominance south of Ol'ga, at Tetyukhe, Artem, the lowland east of Lake Khanka, the area around Bikin and the foothills between Khabarovsk and Vyazemskaya. The rest of the Sikhote-Alin to the north and in the centre is the realm of the few and scattered indigenous Tungusic tribes such as the Ude (Udet), the Orot and the Olt.

Natural Resources and Economic Development.— Relatively limited geological surveying revealed great mineral resources, including coal, iron, graphite, manganese, gold, tin, silver, lead and zinc, as well as raw materials for the glass and cement industries. The coastal waters are rich in fish and other marine products. Agriculture is chiefly important in the lower, valley grasslands of the southwest, although where level space permits in the terraces of the coastal hinterlands small farm settlements exist. The Eesources thus indicate that there are essential bases for a considerable measure of economic and industrial development in the Sikhote-Alin.

Land communications were poorly developed in the 1930s except along the western depression. The isolated east coast ports and settlements are visited by occasional steamships. Sovetskaya Gavan, connected with Khabarovsk by a railroad across the low part of the range, is the only harbour and port of consequence in the north. It is a lumber and fish-canning centre and docs some wooden shipbuilding. Fish canneries also are found at Nelma and at Tetyukhe which, however, is more important for its lead, zinc and silver mines and smelter at the end of a narrow-gauge railroad about 20 mi. inland from the port. Ol'ga bay in the southeast has an iron-mining town of several thousand people with a small agricultural hinterland. Suchan on the railway north of the port of Nakhodka mines coal for Vladivostok. Suchan is the most important Soviet Pacific port militarily and economically because of its long ice-free season and natural harbour. It is a large naval centre and has numerous industries, including large cold-storage plants and canneries for marine products, plywood plants and match factories. Northwest of it and part of the southwestern Sikhote-Alin industrial complex are Voroshilov with a beet-sugar plant, Lesozavodsk with a wood-tar factory and Spassk with large cement works. (H. J. Ws.)

SIKHS, a sect of dissenters from Brahmanical Hinduism. It originated in the Punjab, where most of the *Sikha,* "disciples," are still to be found. Although the fetters of Brahmanism have long been firmly riveted on India, attempts to loosen them date back to Buddhism (*see* BUDDHA AND BUDDHISM) and were renewed by many religious and social reformers from whom Sikhism borrowed ideas and even devotional hymns. Such were Jaidev, composer of the *Gita Govind* (translated by Edwin Arnold), who c. A.D. 1100 taught that Yoga (*q.v.*) was worthless in comparison with God's worship in thought, word and deed; Rāmānand, at the close of the 14th century, freed his followers from caste restrictions; a little later Kabir (b. 1398) denounced idolatry and ritualism. Nearly a century later, in 1469, was born Nānak, the first founder of Sikhism, contemporary with Luther. His name means "he who was born at the home of his mother's parents." and it lay at Talwandi, near Lahore. Of a Kshatri family (the Kshatriya had once been formidable spiritual rivals of the Brahmans) a curious, but hardly contemporary, Sikh account of his descent makes him a reincarnation of the king of the Videhas, Janaka the great patron of the Kshatrya *Upanishads*. The tradition may contain a grain of truth. As a young man he must have seen something of Sultan Sikandar Lodi's (1489–1517) measures against Hinduism.

Early **Period.**—Nānak's faith was sternly monotheistic. He taught the worthlessness of religious vestments: of ostentatious prayer and penance, pilgrimages and fanes. He declared that all men had a right to search for knowledge of God, irrespective of caste. He was a quietist, and though we have no authentic biography of him, we may conjecture that his life and doctrines did not expose him to persecution, and we hear nothing of any efforts to suppress his teaching. He was employed by a Muslim, and was married, leaving on his death in 1533 two sons, Sri Chand and Lakhmi Das, both Hindu names. Nānak, however, had designated as his successor in his spiritual mission the Guru-ship, another Kshatri, Lehna, who took the name of Angad. (Angada was a lesser legendary hero of the Epic age.) To Gurii Angad is due the inception of the *Granth* ("book") *Sahib* ("holy"), in which he embodied what he had learnt from Gurii Nānak, adding devotional reflections of his own. To mark the sacred character of the work, he is said to have invented Gurmukhi, the "Guru's tongue," the peculiar script of the Sikhs, by modifications of the Shārada alphabet. Dying in 1552, Angad in turn excluded his sons and designated the Kshatri Amār Dās as his successor. The reforms of this Gurii were important, including the separation of the Udisi order, founded by Ninak's own son Sri Chand, from the laity, denunciation of Sati, and the stressing of Ninak's attitude to caste by making all his Sikhs eat together. He also divided the country covered by his missioners into 22 sees. Dying in 1574, Amir Dās bestowed the Gurii-ship on his servant and son-in-law Jetha, under the name of Rim Dis.

To him is due the foundation of the golden temple built at Amritsar in 1579 on a site granted him by the emperor Akbar, whose policy aimed at welding all the creeds of India into one. Rām Dās taught no new doctrines but is still much revered. He died in 1581.

So far, the Gurus had aimed at continuing the Gurii-ship by designation, not at setting up a hereditary spiritual dynasty. But after Rām Dās the eastern tendency, so marked in Islam, to regard saintship as vested in a saint's physical descendants asserted itself. Still Rām Dās selected his third son, Arjan Dev (*Arjuna* was a legendary, semi-divine hero of the Epics; *Deva* was a title borne by an old Rajput dynasty of Jammii), to follow him as Gurii, though the Sikhs regarded Pirthi Chand as so entitled by right of primogeniture and the latter would probably have made good his claim to inherit the Guru-ship but for his exactions. Arjan was induced to insist on his right, though he had meekly surrendered his father's turban, the symbol of temporal rulership, to Pirthi Chand. He established a rude fiscal system appointing collectors of offerings. Gurii Arjan enlarged the *Granth,* half of which is due to him, and is said to have been arraigned before Akbar for setting up a new divinity, but the eclectic emperor naturally acquitted him. Arjan, however, made a fatal mistake in aiding Prince Khusrū, a rebel against his father Jahāngīr, with a modest sum of money. Possibly this act was dictated by a belief that Khusrū would continue Akbar's tolerant policy, but it may have been a forced loan.

Jahāngīr punished it with a fine of two lakhs of rupees, which Arjan was unable or unwilling to pay and so he was, it is said, tortured to death in 1606. To his son Har Govind, who succeeded him without contest he left a behest to maintain his throne by arms. Gurū Har Govind was installed with turban and necklace only but added an aigrette to the one and for the other substituted a sword-belt. The Guru-ship was now launched on a new adventure — the foundation of a militant sacred dynasty. The Guru founded the first Sikh stronghold, enlisted horse and foot, and encouraged his disciples to eat flesh to improve their physique.

After 12 years' imprisonment in the fortress of Gwalior, Har Govind obtained his freedom, probably by paying the fine imposed on Arjan. This imprisonment must have preceded his military activities. By them he was enabled to resist Shāh Jahān (1627–66) and claimed three victories over the imperial troops. But he died in 1645 in a remote valley of the lower Himalayas at Kiratpur on the upper Sutlej, which indicates that he had found it safer than Amritsar. Shāh Jahān, who had destroyed many Hindu temples, appears to have taken no special measures against the Sikhs. Har Govind's grandson, Har Rai, who succeeded him, was undoubtedly a supporter of the unfortunate Dārā Shikoh, who had the *Upanishads* partly done into Persian and professed mystical Siifi heresies. On that prince's execution in 1659 Har Rei was summoned to Delhi but sent his elder son Rām Rai instead, and on his death two years later Ram Rai was excluded from succeeding him as being a hostage or prisoner, his younger brother Har Kishen assuming the Guru-ship, though still a child. His death in 1664 left the direct line extinct and the inheritance reverted to Teg Bahādur, Har Govind's second son, but he was executed by Aurangzeb in 1675 for having refused to accept Islam. His prophecy that Europeans were coming from beyond the seas to destroy the Moghul empire became the Sikh battle-cry at the siege of Delhi in 1857.

Middle Period. — The tenth and last Guru was his son, Govind Rai, who took the affix *Singh,* "lion," in lieu of Rai and remodelled the Sikh organization which he renamed Khalsa, "pure." He made the Sikh initiation (*pahul*) a rite of admittance into a militant order. In that rite, with a two-edged dagger (*khanda*) sugar is stirred up in water, which the novice drinks and with which he is lustrated five times. He then utters the Sikh war-cry vowing adherence to the Sikhs' tenets. Thenceforth he must wear the five k's, the kes, unshorn hair, the kachh, drawers reaching only to the knee, the kara, iron bangle, the kirpan, sword (or khanda, small dagger) and khanga or hair comb. Of these the first four have soldierly uses, the long hair rolled round steel rings serving as a helmet and so on. But they have also a spiritual meaning, *e.g.,* the kachh symbolizing self restraint, the bangle obedience, and the comb purity of mind. The use of flesh and liquor is permitted as to a warrior, but tobacco as a narcotic is prohibited. Govind Singh also instituted the *karā parshād,* a kind of communion at which flour mixed with butter and sugar is eaten by all castes together.

Govind Singh waged an active defensive against the Moghul power but his levies were dispersed and his two sons put to death by the governor of Sirhind. On Aurangzeb's death, however, he aided Bahādur Shad, but in 1708 he was assassinated at Nander in the Deccan. Sonless and mistrustful of Banda Bairāgi, who claimed to be the eleventh Guru, Govind Singh declared the line of Guriis extinct and the Guru-ship vested in the Granth Sahib as God's representative on earth. Sikhism was thenceforth to be a militant theocracy, but it soon formed a mass of military bands under Sirdārs ("chiefs"). The earlier military organization of the Sikhs is obscure. Banda seems to have formed an almost regular army, but after gaining notable successes against the Moghuls, sacking Sirhind and compelling the allegiance of the Hindu hill-rajas who had generally refused to submit to the Gurus, he had to cede Amritsar to the true Singhs, the Tat Khālsa, elect of the elect, and was finally executed in 1716. His death left the Sikhs leaderless, but they were strong enough to extort grants of land from Farrukhsiar and formed two armies, a veteran and a younger. The latter comprised five companies, including the militant order of *shahīds,* which carried its forays in Rājpūtāna. On the Punjab, thus distracted, fell Nādir Shāh's invasion of 1738–39. Its last great Moghul governor, Adina Beg, recovered part of the province, but on his death in 1758 the Sikhs mastered the central and north-east Punjab. They now appear as better organized. Besides the Shahids, three new orders were formed with eight misls or confederacies. Under Jassa Singh (elected head of the Ahluwālia *misl; bādshā* ["monarch"], to his own followers, and by caste a potter on the earlier Sikh coins) there materialized as it were a cabinet of *gurūs,* the *gurū* matta "sacred council," convened by the Akalis or the *granthis* about 1762 at Amritsar. South of the Sutlej the reversion to kingship was accelerated when Ala Singh of Patiāla leased the province of Sirhind from Ahmad Shāh with the title of king (rājā) of kings, and the lessor's retreat from the Punjab left the Sikhs its masters from the Jamna to the Indus in 1767. But in 1808 Ranjit Singh suppressed the confederacy which bore the standard of the Khalsa; and the dissensions of the other *misls* enabled him, then merely the chief of the territorial confederacy, to absorb the rest, conquer Kashmir and Peshāwar, subdue the hill states and set up a hereditary monarchy, though he still minted Sikh coins and upheld Sikhism as the state religion. But he appointed Mohammedan *qāzīs* and muftis ("judges and law-officers"), and protected Muslim states like Maler Kotla and many institutions of that creed, which had befriended Sikhs from time to time.

Later Period.—The history of Sikhism in the 19th century belongs rather to the history of the Punjab (see INDIA, History), but the Sikh sub-sects and orders were mostly maintained. The differences with Hinduism tended, however, to be suppressed. Thus the Akalis lost ground, though the Kiikas remained staunch to their extremist tenets, with diminished numbers. Sects like the Sanwal-Shāhis, followers of a disciple of Guru Nānak, are all but confined to the south-west Punjab, while the Sewapanthis are still more restricted to the Sindh Sāgar Doāb. The Hindālīs forfeited their once influential position by throwing in their lot with Ahmad Shāh Abdali and are now known as Narinjani or worshippers of the Bright One (God). The Nirankāris, a modern sect, revived Nānak's teaching though they respect later Guriis also. The older orders became Sikh castes, like the Rāmgarhias, whose founder was a carpenter and which is now the Sikh carpenter caste; as the Sikh Kallāls or Nebs (potters) style themselves Ahluwālia. Every confederacy worked out its own destiny, tending to form hereditary chiefships and divide the villages it had occupied among its members as if they were private lands. To a certain extent the mutiny revived Sikhism by stimulating anti-Muslim feeling, and this recrudescence probably saved it from becoming a mere collection of more or less Hinduized sects in which the Nānak-panthis would have absorbed the Khālsa or sect of Gurii Govind Singh. But the revival was militarist rather than religious. The sectarian institutions decayed. Little was added to religious literature. In a sense the Granth became the Guru, receiving divine honours, for example at Conjeeveram, in the south, where it became the object of a fire sacrifice. The book of common prayer was the Panjgranthi, including five poems from the Granth, three of which have to be recited daily by the Khalsa Sikhs; yet Sikh ascetics used to make pilgrimages to Hindu temples. The Khalsa college at Amritsar was, however, founded, and there too the chief Khālsa Dīwān had his headquarters. It made grants to various schools, including some 30 for girls. Local societies, Singh Sabha, were established throughout the Punjab and even beyond it.

There was very little innovation in the religious sphere, but Sikhism was still alive awaiting a stimulus to arouse its latent power. This came to it from education, the general awakening of India, and the mal-administration of the sectarian shrines and temples.

Laity.—When Sikhism revived, all its divisions were equally resuscitated. A notable example of this was furnished by the Kiikas ("shouters"), who professed to be ethically strict followers of Govind Singh but observed such secrecy that they were debited with the degrading practices so often ascribed to such sects. The Kūka insignia, a high straight turban and a knotted necklace or rosary of wool, hint at an originally military asceticism and possibly at some connection with Banda Bairāgi, but their significance has never been disclosed. Supposed to be hostile to British rule, the Kiikas were certainly anti-Muslim, especially resenting the slaughter of kine, carefully planning the assassination of Mohammedan butchers and once organizing, in 1872, an armed rising which took the shape of a raid into the Muslim state of Maler Kotla. Owing to the drastic action of the district officer of Ludhiāna who executed over 100 mutineers by artillery the rising speedily collapsed, but severe as was the method of its suppression, it had undoubtedly excited the Sikh population and a less decisive one might in the end have resulted in more bloodshed. On the other hand the fanatical Akalis only revived as a body of harmless eccentrics practising their rites at Sikh gatherings, and not taken seriously by any other Sikh body. The Udāsi order became hardly distinguishable from a Hindu religious sect and was even regarded as Vaishnava.
