Union With the Italian Kingdom.—A provisional government, led by Ubaldino Peruzzi and afterward by Bettino Ricasoli (*q.v.*), was established. It declared war against Austria and then handed over its authority to a Sardinian royal commissioner (May 9). A few weeks later a French force under Prince Napoleon ("Plon-Plon"; see BONAPARTE) landed in Tuscany to threaten Austria's flank, but meanwhile the emperor Napoleon III made peace with Austria and agreed to the restoration of Leopold and other Italian princes. Victor Emmanuel was obliged to recall the royal commissioners, but together with Cavour he secretly encouraged the provisional governments, and the constituent assembly of Tuscany voted for annexation to Sardinia. The king accepted the annexation (March 22, 1860). On Feb. 18, 1861, the kingdom of Italy, comprising Tuscany, was proclaimed. See ITALY: History. See also Index references under "Tuscany" in the Index volume.

(L. V.; X.j

TUSCARORA, an Indian tribe of Iroquoian family. originally numbering 5,000, in North Carolina. Encroachments by the whites, including kidnapping of their children as slaves, led to a war with the settlers (1711–13), at the end of which the Tuscarora fled or drifted northward and were admitted into the League of the Iroquois as a sixth nation. About 700 survive in Canada and New York.

TUSCULUM, an ancient city of Latium, in a commanding position on the north edge of the outer crater ring of the Xlban volcano, $1\frac{1}{2}$ mi. N.E. of the modern Frascati. The highest point is 2,198 ft. above sea level. It has a very extensive view of the Campagna. with Rome lying 1j mi. distant to the northwest: Rome was approached by the Via Latina (from which a branch road ascended to Tusculum. while the main road passed through the valley to the south of it), or by the Via Tusculana.

According to tradition, the city was founded by Telegonus, the son of Ulysses and Circe. When Tarquinius Superbus mas expelled from Rome his cause was espoused by the chief of Tusculum, Octavius Mamilius. who took a leading part in the formation of the Latin league. composed of the 30 principal cities of Latium, banded together against Rome. Mamilius commanded the Latin army at the battle of Lake Regillus (497 B.C.). but was killed, and the predominance of Rome among the Latin cities was practically established. In 381 B.C. the people of Tusculum received the Roman franchise. Several of the chief Roman families were of Tusculan origin; *e.g.*, the gentes Mamilia. Fulvia. Fonteia, Juventia and Porcia (to which the Catos belonged). By the end of the republic, and still more during the imperial period, the territory of Tusculum was one of the favourite places of residence of the wealthy Romans. The number and extent of the remains is very great. Even in the time of Cicero we hear of 18 owners of villas there. Much of the territory (including Cicero's villa). but not the town itself, which lies far too high, was supplied with water by the Aqua Crabra. On the hill of Tusculum itself are remains of a small theatre (excavated in 1839), with a reservoir behind it, and an amphitheatre. Both belong probably to the imperial period. while a temple (the substructures of which are preserved), often called the villa of Cicero, or of Tiberius, near the latter, is probably earlier. Between the amphitheatre and the theatre lay the forum. The citadel—which stood on the highest point, an abrupt rock—was approached only on the side, toward the city. Upon it remains of the medieval castle, which stood there until 1191, are visible.

It was there that Cicero composed his Tusculun Disputations and other philosophical works. His villa must have been at or near Grotta Ferrata and what is now known as Poggio Tulliano a little to the east (where remains of a villa exist) may well have been its site. After the transference of the seat of empire to Constantinople, Tusculum became an important stronghold, and in the 10th–12th centuries its counts occupied a leading position in Rome. During the 12th century there were constant struggles with Rome. but in *1191* the Romans destroyed the city. (T. A.)

TUSI, NASIR AL-DIN (1201–1274), an outstanding Persian philosopher, scientist and mathematician. Born at Tus, Feb. 18, 1201, he became astrologer to the Isma'ili governor Nasir al-Din 'Abd al-Rahim. His attempts to join the caliph's court at Baghdad led to his being detained in the fortress of Alamut, headquarters of the Isma'ili terrorist sect, the Assassins. In 1256 he betrayed the defenses of the fortress to the invading Mongols whose army he joined; Hulagu Khan took him as a confidential adviser when he attacked and destroyed Baghdad in 1258. Tusi profited by his office as head of the ministry of religious bequests to build a fine observatory at Maragha. A man of exceptionally wide erudition, he wrote many books in Arabic and Persian. He improved upon earlier Arabic translations of Euclid, Ptolemy, Autolycus, Theodosius, Apollonius and others, and made original contributions to mathematics and astronomy; his *Zij-i Ilkhani* is a splendidly accurate table of planetary movements. His *Tajrid* al-'aqa'id is a highly esteemed treatise on Shi'ite dogmatics; in philosophy he defended Avicenna (*q.v.*) against the attacks of Fakhr al-Din al-Razi. His most famous and popular work is the *Akhlaq-i Nasiri,* a treatise on ethics in the Greek tradition resting upon the Tuhdhib al-akhlaq of Ibn Miskawayh (d. 1030) which he drafted while a prisoner of the Assassins and later revised ior his Mongol master. Tusi is credited with a number of distinctively Isma'ili dissertations, notably the *Tasavvurat.* A "quisling" in politics, he made important contributions to many branches of Islamic learning and wrote an excellent philosophical prose. He died at Baghdad. June 26, 1274

TUSKEGEE, the seat of Macon county. Ala., U.S., 42 mi. E. of Montgomery. The city is best known as the site of Tuskegee institute, incorporated as a state coeducational and normal school for Segroes on Feb. 10. 1881. Booker T. Washington was principal of the school from its founding until his death in 1915. Tuskegee subsequently became an accredited. degree-granting institute offering professional, technological and teacher training and graduate work in some areas. On the campus is the laboratory used by George Washington Carver for his agricultural research. The library of the institute includes most of the known books relating to the southern Negro.

The town of Tuskegee was founded in 1533: the name is a variation of an Indian place name. Ft. Decatur, 8 mi. S.W. on the Tallapoosa river, founded as a military post in 1315. was the headquarters for John Sevier. the Indian boundary line commissioner appointed under the treaty of Fort Jackson. General Sevier died and was buried there but his remains were moved to Knoxville. Tenn.. in 1888.

Tuskegee has cottonseed oil. planing and gristmills and a fertilizer factory. There is also a large veterans hospital in the city. (P. A. B.)

TUSSAUD, MARIE (1760–1850), founder of "Madame Tussaud's exhibition" of wax figures in London, was born in Berne. Switz., on Dec. 1, 1760. After being taken to Paris she began to model in wax to assist her uncle. Philippe Curtius. During the Revolution Marie modeled the heads of many of the prominent leaders and victims.

On Oct. 20. 1795, she married François Tussaud, and together they ran Tussaud's museum. exhibiting Madame Tussaud's figures. In 1802 she took part of her collection to England and. after showing it successfully at the Lyceum theatre in London, traveled around the country exhibiting the collection. It was not established in permanent quarters. in Baker street. London, until 1833.

Madame Tussaud died there on April 16, 1850. The exhibition was moved in 1884 to a large building in Marylebone road.

Madame Tussaud's is one of the most continuously successful shows of London. The collection, which is of enormous value, still includes a number of molds cast by Madame Tussaud herself, including those taken from life of Benjamin Franklin. Sir Walter Scott and Voltaire, and a number of death masks, including that of Louis XVI. from the time of the Revolution. The most popular section of the exhibition, the chamber of horrors, includes models of many notorious murderers.

PICKOW FROM THREE LIONS

AMERICAN PRESIDENTS TABLEAU AT MARIE TUSSAUD'S WAXWORKS EXHIBITION, LONDON

Front row (left to right): Harry S. Truman, Dwight D. Eisenhower and Herbert Hoover (seated); back row (left to right): Woodrow Wilson, William Howard Taft, Franklin D. Roosevelt (seated), George Washington, William McKinley, Theodore Roosevelt, Grover Cleveland and Andrew Johnson

TUSSER, THOMAS (c. 1524–1580), English poet. son of William and Isabella Tusser. was born at Rivenhall. Essex, about 1524. He was a chorister at Wallingford castle and then at St. Paul's cathedral, and from there went to Eton college. He was elected to King's college. Cambridge, in 1543, moved to Trinity hall, and on leaving Cambridge went to court in the service of William, 1st Baron Paget of Beaudesart. as a musician. After ten years of life at court, he married and settled as a farmer at Cattiwade, Suffolk, where he wrote his *Hundreth Good Pointes of Husbandrie* (1557, 1561, 1562, etc.). For his wife's health he moved to Ipswich. After her death he married again and farmed at West Dereham. After farming at Fairsted. Essex. be moved to London. Thomas Fuller says he "spread his bread with all sorts of butter, yet none would stick thereon." He died on May 3. 1580.

The *Hundreth Good Pointes* was enlarged to *A Hundrath Good Pointes of Husbandry, Lately Maried Unto a Hundreth Good Poyntes of Huswifery . . . ,* the first extant edition of which, "newly corrected and amplified," is dated 1570. In 1573 appeared *Five Hundreth Pointes of Good Husbandry . . .* (reprinted 1577, 1580, 1585, 1586, 1590, etc.). The numerous editions of this book, which contained a metrical autobiography, prove that the homely and practical wisdom of Tusser's verse was appreciated. The later editions include *A Dialogue of wyvynge and Thryvynge* (1562). Modern editions are by William Mavor (1812), by H. M. W. (1848) and by W. Payne and Sidney J. Herrtage for the English Dialect Society (1878).

TUTENKHAMON (sometimes spelled TUTANKHAMUN, or TUT-ANKH-AMEN), son-in-law of the Pharaoh, Ikhnaton (*q.v.*), and himself Pharaoh for not less than six years in the middle of the 14th century B.C. The fame of this politically unimportant sovereign is due to the discovery of his tomb still containing the larger part of its magnificent equipment. Even in Egypt the survival of royal burial equipment is unique, for the plundering of royal tombs began at a remote date. A pyramid is a gigantic husk of masonry to protect the body of the Egyptian sovereign; but not a single pyramid escaped plundering by the ancient tomb robbers. The Egyptian rulers, therefore, abandoned the pyramid and excavated the kings' tombs in the face of the Nile cliffs. For 400 years the excavation of these royal cliff tombs continued; by 1150 B.C. there were over 500. After the fall of the empire about 1150 B.C. not a single known royal tomb was left intact.

The preservation of the burial of Tutenkhamon was due to accident, to its small size and to the unimportance of its occupant. The demoralization of the government at the death of Tutenkhamon, about 1350 B.C., was such that the cemetery ghouls found no difficulty in robbing his cliff tomb. Fortunately they were caught in the act, and much of their plunder was returned; although the heavy golden vessels and much other magnificent work was evidently too great a temptation for the officials. The tomb was never molested again. and 200 years later, when the empire was tottering. the architects of Rameses VI. excavating the tomb of this Pharaoh just above that of Tutenkhamon, ordered the workmen to throw their waste limestone chips down the slope below it, thus completely covering up the tomb of Tutenkhamon.

The expedition which discovered the tomb was maintained by Lord Carnarvon (*q.v.*), but the actual discovery was due to Howard Carter (*q.v.*), who on Nov. 4, 1922, uncovered the steps leading down to the entrance gallery. For eight seasons (October to April) following. Carter salvaged this magnificent treasure, nearly all of which was placed in the national museum in Cairo. The body of the youthful Pharaoh still lies in his beautiful stone sarcophagus in the burial chamber of his tomb. The stone lid has not been replaced, and the gorgeous outer coffin, richly wrought in gold, is a unique and impressive sight.

The mortuary furniture of Tutenkhamon will continue to make his name a household word, notwithstanding his lack of political significance. He succeeded to the throne by his marriage with

Ikhnaton's third daughter. and he must have been hardly 12 years old when he was crowned. A puppet in the hands of the priestly party which was vindictively striving to exterminate his father-in-law's memory, the boy king had little chance to survive. The examination of his mummy showed that he was about 18 years old at his death. after a reign of probably not more than six years. The body showed no discernible traces of foul play.

See Howard Carter and A. C. Mace, ***The Tonzb of Tut-ankh-amen,*** 3 vol. (London, Toronto. 1923–33). (J. H. Br.)

TUTICORIN, a seaport of India in the Tirunelveli district of Madras. Pop. (1961) 124.273. It is the southern terminus of the South Indian railway, 443 mi. S.W. of Madras city. Tuticorin is an old town, and was long in possession of the Dutch, who developed pearl fisheries there. Salt is manufactured, cotton woven, and there are cotton ginning and pressing factories.

TUTTLINGEN, a town of Germany. in Baden-Württemberg, on the left bank of the Danube, 37 mi. N.E. of Schaffhausen by rail and at the junction of lines to Stuttgart and Ulm. Pop. (1950) 21.271. The chief manufactures of Tuttlingen are shoes, cutlery, surgical instruments and woolen goods.

TUVA, an Autonomous Soviet Socialist Republic of the Russian Soviet Federated Socialist Republic of the U.S.S.R., bounded west by the Altai kray, northwest and north by the Krasnoyarsk kray, east by the Buryat X.S.S.R. and southeast and south by Mongolia. Area: 65.830 sq.mi. Pop.: (1925) 63,800; (1959) 171,928 (with a Turkic majority). Capital: Kyzyl, pop. (1959) 34,000.

The region comprises two valleys. Tuva and Todzin, separated by the Tumat-Taiga range which reaches 8.950 ft. The Sayan range, rising to 9.377 ft.. forms the greater part of the Tuvinian northern boundary. while its southern boundary is formed by the ranges of Tannu-Ola (10.043 ft.) and Sangilen (10,741 ft.). The Shapshal range, reaching 11.857 ft., forms its western boundary.

Tux-a has considerable timber resources and some mineral wealth (gold, coal, asbestos and salt). Under the Soviet regime the primitive nomadic hunters of Turkic race have been settled as agriculturists and livestock breeders. In 1941 the total number of livestock was 1,462,000 head. of which three-fourths were sheep and goats. In 1954 there were 128 primary and 22 secondary schools with 30,900 pupils. There are no railways, but good motor roads link Kyzyl with Abnkan (Khakassia), on the South Siberian railway, and Teli in western Tuva.

Tuva, known as Urianghni. was part of the Chinese empire until 1911, when tsarist Russia fomented a separatist movement and in 1914 took the country under its protection. It founded its capital. Byelotsarsk, renamed Kyzyl ("Red") in 1917, on the left bank of the upper Yenisei (Ulug-Khem), near the point where the Small Yenisei (Ka-Khem) joins the Great Yenisei (Biy-Khem). In Aug. 1921 the Tannu Tuva people's republic's independence was proclaimed. In 1924 Soviet diplomacy settled the Tuvinian-Mongolian territorial dispute and two years later Tannu Tuva and Mongolia recognized each other's independence. On Oct. 13, 1944, the supreme soviet of the R.S.F.S.R. decreed Tuva to be, an autonomous region of Russian federation. (K. Sm.)

TUY, a city of northwestern Spain, in the province of Pontevedra, on the right hank of the Miño river, opposite Valença do Minho in Portuguese territory. Population (1950) 13,738 (mun.).

During part of the 17th century Tuy was the I'isigothic capital. Túy is the southern terminus of the railways to Santiago de Compostela and Corunna: Valença do Minho is the northern terminus of the Portuguese railway to Oporto. To the east of Thy is the Louro river; and beyond the Louro, on the railway to Corunna. are the hot mineral springs of San Martín de Caldelas. The cathedral is of a fortresslike architecture.

TUZLA, a town of Bosnia and Hercegovina. Yugos., 50 mi. N. of Sarajevo; from 1949 the capital of Tuzla oblast. Pop. (1961) 37.673.

Tuzla is the seat of an Eastern Orthodox bishop, with several churches and many mosques. Petroleum fields and lignite mines are in the area and there are also salt deposits. Agricultural products include plums.

TVA, the abbreviation for Tennessee Valley Authority. *See* Electric Power; Tennessee River.

TVER (now Kalinin), an *oblast* in the Russian Soviet Federated Socialist Republic. U.S.S.R..surrounded by those of Smolensk. Leningrad. Vologda, Yaroslavl and Moscow, and not coinciding with the pre-1917 province of that name. Area 32.545 sq.mi. Pop. (1959) 1,806.787, mainly Great Russians. with Karelians in the north. The climate is continental, with severe winter frosts of five months' duration and an average July temperature of 67" F. Average rainfall is 18–20 in. per year. Coniferous forests. especially firs. cover 32.2% of the region, and 12% is marshland. In the remaining area meadow and grassland prevail, plowed land occupying only 25%. There was a marked diminution of grain production and a tremendous increase in the cultivation of long-fibred flax with the use of mechanized equipment on collective farms.

Industries developed there include fur preparation. wooden wares, sawmilling, flour milling, leather goods. textiles. bricks. glass. machinery, oil pressing and brewing. The principal cities are Kalinin (Tver), pop. (1959) 261.000; Rzhey. (1956 est.) 42,-200: Vyshni-Volochok, (1959) 66.000.

The region is well drained by the upper Volga and its tributaries. especially the Tvertsa and Mologa; 17% of the rivers are available for steam navigation, and boats and rafts can be floated on many of the others. The Vyshni-Volochok system of canals connects the Volga with the Baltic and the Tikhvin system connects the Mologa with Lake Ladoga. Railways are comparatively good and the region is thus well situated for trade.

TVER (now Kalinin), chief town of the Tver (Kalinin) *oblast,* U.S.S.R..on the Volga, at its confluence n-ith the Tvertsa in 56" 52′ N., 35° 48′ E. The low right bank is protected from inundations by a dam.

The town grew rapidly in the 20th century; pop. (1900) 45,-644; (1959) 261.000. Its situation on the Moscow-Leningrad railway and on the navigable Volga gave it great trading importance as a centre for a productive region. Its chief manufactures are machinery, textiles and leather goods.

A fort was erected in 1180 at the mouth of the Tvertsa to protect the Suzdal principality against Novgorod. In the 13th century it became the capital of an independent principality. and remained so until the end of the 15th century. It long remained an open question whether Moscow or Tver would ultimately gain the supremacy in Great Russia. In 1486. when the city was almost entirely burned down by the Muscovites, the son of Ivan III became prince of Tver; the final annexation to Moscow followed four years later.

In 1570 Tver had to endure, for some reason now difficult to understand, the vengeance of Ivan the Terrible, who ordered the massacre of 90,000 inhabitants of the principality. The town and region were renamed in honour of M. I. Kalinin, president of the supreme council of the C.S.S.R., 1938–46.

TWACHTMAN, JOHN HENRY (1853–1902), U.S. Impressionist landscape painter, was born in Cincinnati, O., on Xug. 4. 18j3, of German descent. He went to Munich in 187j for advanced study of painting and later studied at the Académie Julian in Paris. Before returning to the United States in 1884 he changed his style from broad brushwork with rich darks to a feathery touch in broken colour approximating to Impressionism. Unfortunately he sent his accumulated work ahead in a ship that was lost. Unsuccessful at first, he supported himself after 1889 by teaching at the Art Students' league, New York city. From that year, also, his lyrical interpretation of landscape attained its distinguished maturity; the delicacy of his high-keyed atmospheric treatment was only a veil for the underlying strength of form construction. He was prominent among the Ten American painters, a group exhibiting independently of the National Academy of Design from 1895 onward. A few honours were awarded Twachtman in his later years, but the importance of his work was not generally recognized until after his death, which occurred at Gloucester. Mass.. on Aug. 8, 1902.

See A. Tucker, ***John H. Twachtman*** (1931); ***E.*** Clark, ***John Twachtman*** (1924). (Vl. B.)

TWAIN, MARK, was the pen name of Samuel Langhorne Clemens (1835–1910), the United States most famous humorist and the author of popular and outstanding autobiographical works, travel books and novels. The first 36 years of Clemens' life gave him experiences—as a boy in a little town in Missouri, as a steamboat pilot. as a reporter on the far western frontier and as a traveler abroad—which he thereafter used as materials for his best and his most successful writings.

He was born Nov. 30, 1835, the third son and fifth child of John Marshall and Sarah (Lampton) Clemens, both descendants of Virginians. His birthplace was Florida. Mo., a village to which the family had moved the previous June. The boy's father, a storekeeper and at times a lawyer, had little talent for money-making and failed there as he had elsewhere. The Clemenses therefore moved in the fall of 1839 to Hannibal. Mo.

Hannibal was the town of Sam Clemens' boyhood. destined to figure importantly in several of his finest books. Almost in the geographical centre of the United States, it had the wide Mississippi river rolling past it on the east. and on the other sides were forests, farm lands and prairie. The river was the route from and to the rest of the nation, bringing as it did all sorts of exciting visitors—river men, revivalists, circus troupes, minstrel show companies. migrants to points as far westward as California. The steamboats which Sam and his gang of boyhood friends watched wheeling past or docking at the wharf were endlessly fascinating. So, too, were the steamboat men and the townspeople, many of whom were prototypes of characters in Twain's books. The river, an island nearby and the woods around the town mere wonderful places for boys to play. In the summer Sam ordinarily paid a vacation visit to the farm of his uncle John Quarles. near Florida. Some of his happiest and most vivid memories were to be of his play around Hannibal and of his visits to the farm.

Clemens had relatively little schooling. He attended for a time "a dame school" then two "common schools" operated by schoolmasters. His father's death in 1847 having left the family in straitened circumstances, he was apprenticed to a printer, and he probably ended his schooling about 1848. In 1851 when his elder brother. Orion, became a newspaper publisher in Hannibal, he worked for him. At his printer's case: Sam set up not only news stories but also some of the literary and humorous selections culled from other newspapers in various parts of the country for reprinting. The late 1840s and the 1850s were periods during which localized humour of a superior sort flourished in both New England and what then was the southwest, and the humorous writings introduced him to techniques which were to figure prominently in some of Twain's best writings. He contributed some amateurish bits of humour to Orion's *Journal* and quite possibly was the "S.L.C." of Hannibal whose sketch, "The Dandy Frightening the Squatter," was printed in a Boston humorous paper, *The Carpet-Bag,* May 1, 1852. This was an anecdote similar to a number then going the rounds, contrasting the strength and forthrightness of a frontiersman with the weakness and foolishness of an eastern dandy.

Since Orion was as poor a businessman as his father had been, the *Journal* did not do well. and young Clemens became restless. In 1853 he set out as an itinerant printer and worked his way eastward on newspapers in St. Louis, New York city and Philadelphia. In the summer of 1854 he rejoined Orion. who had now moved to Iowa. Except for a brief period as a printer in St. Louis, he worked at his trade for Orion in Keokuk. Ia., until the fall of 1856. One letter which he wrote at the time to a girl friend. Annie Taylor, stands out among his apprentice writings as the best and is closest in form and quality to his later work. When in 1856 he began another period of wandering, he had a commission to write some comic travel letters for the *Keokuk Saturday Post.* These, signed nith the pseudonym Thomas Jefferson Snodgrass, were characterized by the misspelling, the atrocious grammar and the weirdly constructed sentences then becoming fashionable among rising humorists.

In 1856 Clemens started down the Mississippi on a trip which he planned to South America; but a boyhood ambition revived, and he arranged to become an apprentice to Horace Bixby, the pilot of the boat. Having learned the mysteries of navigating up and down the tortuous river channels, he was licensed as a pilot after about 18 months of training. He plied his trade until the spring of 1861, when the Civil War disrupted river traffic. Clemens found his life during this boom period of the steamboat age both instructive and exciting. Later he was to say, "In that brief, sharp schooling, I got personally and familiarly acquainted with about ail the different types of human nature. . . . When I find a well-drawn character in fiction or biography I generally take a warm personal interest in him, for the reason that I have known him before—met him on the river."

After an inglorious few weeks during the spring of 1861 in the militia on the Confederate side, Clemens joined his brother in a trip to Nevada territory. Orion had been appointed territorial secretary. The west was still an exciting new frontier and there were rumours abroad about fortunes to be made in the mining districts of Nevada and California. The two reached Carson City. Nev., Aug. 14, 1861. Clemens at first tried his luck with a timber claim. then with mining speculations: he was unsuccessful with both. Confined in his cabin during a spell of bad weather in the spring of 1862, he wrote and sent off some humorous contributions, signed "Josh," to the *Virginia City* (Nev.) *Territorial Enterprise.* When, at a particularly unprosperous moment, he was offered a post as a feature writer on the *Enterprise,* he accepted. Clemens' travels about the territory and his work in a picturesque and rugged mining town gave him a fund of experiences. Day-to-day assignments developed his abilities as a writer; he became well known in the west; and he had a few sketches published in the east. Assigned to report the Nevada constitutional convention, he began to sign his stories with the nom de plume, Mark Twain, which he used thereafter. (It was derived from a phrase, meaning "two fathoms deep," which had been used to report river soundings during his steamboat days.)

From Virginia City, in the spring of 1864, he went to San Francisco. There he served as a local reporter for the *Call* and as a correspondent for the *Enterprise,* and wrote articles and sketches for two local periodicals, *The Golden Era* and *The Californian.* Bret Harte, on the verge of national fame, was a contributor to the former of these magazines and the editor of the latter. Though Twain and Harte later disagreed, at the time Harte's tutelage was valuable. During a vacation spent with Jim Gillis, the brother of a friend, in Calaveras county, Calif., Clemens heard a number of fireside tales. One of these he adapted with great skill in "The Celebrated Jumping Frog of Calaveras County." Published in a New York periodical, *The Saturday Press,* Nov. 18, 1865, this was an immediate hit when it was reprinted in newspapers far and wide. Written much in the manner of the southwestern humour of the period of Clemens' youth, this fine tall tale not only gave him his first national fame, it also won for the first time approval of his work by several discerning critics. In 1866 when he was sent to the Sandwich Islands by the *Sacramento Union,* he developed the art of writing travel reports which a few years later was to be utilized in his first sensationally successful book. And an article on a marine disaster, the survivors of which he interviewed in Honolulu, Hawaii, was published in *Harper's Magazine.* Lectures about his travels delivered in the west proved successful and launched him on a remunerative career as a humorous lecturer which was to last until late in the century.

Clemens left San Francisco Dec. 15, 1866, as a traveling correspondent of the *San Francisco Alta California,* "not stinted," so the newspaper announced, "as to time, place, or direction—writing his weekly letters on such subjects and from such places as will best suit him." He traveled by way of the isthmus to New York, sending back letters which recounted the journey. Later he contributed other letters about his exploration of New York city and about visits to St. Louis, Hannibal, Quincy, Ill., and Keokuk. He gave successful lectures in New York, Brooklyn and several midwestern cities. He found a publisher for his first book, a collection of sketches, *The Celebrated Jumping Frog of Calaveras County, and other Sketches,* in 1867. Then, the same year, between June 8 and Nov. 19, he took an excursion to France, Italy, Greece, Turkey and the Holy Land.

Letters reporting this trip and his reactions along the way, most of them published in the *Alta California,* a few in the *New*

York Tribune, were drawn upon for the substance of *Innocents Abroad* (1869). Despite high prices for the time—it sold for amounts ranging between $3.50 and $5—this book found 150,000 purchasers by 1874 and continued to sell at a lively rate long after that date. There were several reasons for its wide appeal: The excursion which it told of had been much publicized. It was distributed—as most of Twain's books were—by book agents, at the time more effective than bookstores in making sales. Before and after the book appeared, Twain plugged it widely in writings, interviews and lectures. As literature, it had appeals to readers of many sorts. Twain's purpose, as he said in his preface, was "to suggest to the reader how *he* would be likely to see Europe and the East if he looked at them with his own eyes instead of the eyes of those who traveled in those countries before him." Contemptuous of tourists who learned what they should see and feel by carefully conning guidebooks, the author sharply satirized them. He assumed the role of a keen-eyed, shrewd westerner who was refreshingly honest and vivid in describing foreign scenes and his reactions to them. It is probable that Americans liked the implication that a common man could judge the old world as well as the next man. But the chief attraction of the book was its humour, which readers of the time found delightful.

Some of the shrewder reviewers noticed that the setting of the humour gave it much of its impact and made the long book highly readable. The book showed that Mark Twain had found a method of writing about travel which, though seemingly artless, artfully employed change of pace. Serious passages—history, statistics, description, explanation, argumentation—alternated with laughable ones. What is more, the humour itself was varied, sometimes being in the vein of the southwestern yarn spinners whom he had encountered when a printer's devil, sometimes in that of contemporaneous "phunny phellows" such as Artemus Ward and Josh Billings. who chiefly used burlesque and parody, anticlimactic sentences, puns, malapropisms and other verbal devices to win laughter. Thereafter he was to use the formula successfully in a number of books combining factual materials with humour.

During the trip Clemens had been shown a miniature painting of Olivia Langdon by her brother, a fellow passenger. In 1867 he met her and began to visit her at the Langdon home in Elmira, N.Y. Rough though his background had been, Clemens had a typically Victorian chivalrous attitude toward womanhood. "I wouldn't have a girl that I was worthy of," he wrote a friend. "*She* wouldn't do." Olivia, a delicate semi-invalid and a cultured easterner, seemed to him to meet the test. His love letters were as rhapsodic as almost any in literature, and he was all but overwhelmed when she accepted him, when her well-to-do family gave consent and when, in 1870, she married him. Though in later years he wrote patently jocose letters to intimate friends about her tyranny (which some solemn biographers have been humourless enough to take seriously), his life with her was evidently his idea of the perfect married state. William Dean Howells, Clemens' most intimate friend, testified that Mrs. Clemens "was in a way the loveliest person I have ever seen, the gentlest, the kindest" and that "she merited all the worship he could give her, all the devotion, all the implicit obedience, by her surpassing force and beauty of character."

Some students of Clemens have accused his wife of having cramped his style by exercising too much censorship over what he wrote and printed, but there is a great deal of evidence against their claims. Concerning religious matters (about which Twain was to write frequently) she and her family were extraordinarily liberal. Clemens himself tended to be as skittish about treating sex—in print—as some of the sternest Victorians, and in this field he probably would have exercised censorship himself if Olivia had not. Finally, it should be recalled that, subdued though he may seem—as a rule—to moderns, Twain managed to shock many of his contemporaries by his irreverence and by his unconventional attitudes concerning numerous cherished beliefs.

After their marriage the Clemenses lived in Buffalo, N.Y., where Twain had purchased a share of a newspaper. Soon, however, they moved to Hartford, Conn., where he was a free lance writer during his most productive years. (The family left Hartford in 1891 and thereafter lived in Europe, in Redding, Conn., and in New York.) This move marked a turning point in his career. "Up to the time of his anchorage in Hartford," as Dixon Wecter noticed, "the most important facts about Mark Twain are the things that happened to him, shaping his development as an artist and filling the granaries of memory. After that date the chief milestones are books he wrote out of that accumulation." (Dixon Wecter, *Literary History of the United States*, rev. ed., vol. 2. p. 925, The Macmillan Company, New York, 1953.) There were two outstanding works of reminiscence: *Roughing It* (1872) recounted his journey to the far west and his experiences there. Since it caught the life of a picturesque section of the country at an exciting moment, the book had value not only as literature but also as history. "Old Times on the Mississippi," written for the *Atlantic Monthly* and published serially in 1875, was the story of Clemens' career as an apprentice and pilot on the river. These chapters, evocative as they are of a scene, a way of life and an atmosphere, stand high among the best autobiographical passages he ever wrote. Journalistic travel books such as *A Tramp Abroad* (1880) and *Following the Equator* (1897)—accounts of specific journeys—though they follow the formula for books compounded of facts and humour which Twain had used in *Innocents*, are now as wholes much less appealing. The same may be said of the chapters about a revisiting of the Mississippi which, added to "Old Times," eked out *Life on the Mississippi* to book size—and its final form—in 1883. All these journalistic writings, however, contain interludes of great merit. "Jim Baker's Blue-Jay Yarn" in the first of them, for instance, based upon a story heard in the Gillis cabin back in California, is, in its combination of comedy and underlying pathos, one of the best of Twain's shorter efforts.

Robust humour and pathos or sympathy here and else here were expressions of two aspects of the author's personality. His frontier upbringing and his wandering career had acquainted Mark Twain with aspects of life which were not. to put it mildly, genteel. For a good many years his idea of a fine time was a stag party with plenty of drinks and outrageous pranks; he once was jailed overnight for drunkenness. He was a shaggy-headed masculine person with ebullient spirits, a passion for the wildly incongruous and a tendency to speak his mind in the most uncompromising terms when the spirit moved him. Yet he was a man of great sensitivity, "Among the half-dozen, or half-hundred, personalities that each of us becomes," wrote Howells, "I should say that Clemens's central and final personality was something exquisite. His casual acquaintances might know him, perhaps, for his fierce intensity. his wild pleasure in shocking people with his ribaldries and profanities, or from the mere need of loosing his rebellious spirit in that way, as anything but exquisite, and yet that was what in the last analysis he was. . . . One could not know him well without realizing him the most serious, the most humane, the most conscientious of men." (William Dean Howells, *My Mark Twain* [New York, 1910], p. 34. By permission of the heirs of William Dean Howells.)

This latter aspect of Twain's character showed itself in his tendencies toward romanticism, in surprisingly delicate expressions of feeling, in his deep compassion and understanding. Often in Twain's writings the two facets shone incongruously at the same time, as when he combined earthiness and soaring fancy in his best tall tales. Sometimes the two attitudes came together more harmoniously, as in his best fiction—a combination of the realistic and the poetic.

In 1873 Twain began to turn some of his memories into fictional works in a novel written in collaboration with a Hartford neighbor, Charles Dudley Warner—The *Gilded Age*. This was made up, unfortunately, of a number of fairly complicated and rather shopworn plots. But weak as it was as a whole, it foreshadowed what Twain was destined to do with backgrounds and characters. Some of the pictures of the midwest of his boyhood were vivid and authentic, and in Colonel Sellers and Senator Dilworthy he created two memorable characters. The portions of the book representing the contemporary scene. moreover, offered telling satire against the speculative spirit and the corruption of government in the 1870s. For the scenes set in Washington, D.C., Twain drew upon memories of life in that city when he had lived there in 1867 and 1868.

The Adventures of Tom Sawyer (1876) was one of Twain's best books, certainly his best for a juvenile audience. The setting was St. Petersburg, which was Hannibal made idyllic by the passage of time; the characters were the grownups and the children of the town in the 1830s, also for the most part viewed sympathetically. Twain once characterized the book as "simply a hymn, put into prose form to give it a worldly air." The nostalgic attitude was typical of the period when in every section of the country writers such as Edward Eggleston, Harriet Beecher Stowe and George Washington Cable were writing local colour stories wistfully recreating pre-Civil War life. The happenings were shaped by American humour which for some time had been making fun of the Sunday-school story—its prematurely moral children who were rewarded and its prematurely immoral children who came to grief. Tom, says the first chapter, "was not the Model Boy of the village. He knew the model boy very well though—and hated him." Tom was by contrast "the normal boy," the book implied, mischievous and irresponsible but goodhearted; and the subplots in which he figured showed him again and again winning triumphs. These happy endings endear the book to children; the lifelike picture of a boy and his friends is enjoyed by both young and old.

Shortly after finishing *Tom Sawyer,* Clemens began to write his masterpiece, *The Adventures of Huckleberry Finn.* His work on this novel, however, was sporadically interrupted by work on other projects. One mas the writing of *The Prince and the Pauper* (1880), a historical novel making use of the ancient device of transposed identities. Since the pauper replaced a prince, the book offered some telling arguments for democracy. Children have always found the book engrossing, and in 1880 it was much praised for proving that Twain was "more than a mere humorist," but its reputation has faded. Another project was the return to the river to supply chapters for *Life on the Mississippi.* The trip reawakened Mark's interest in Huck and suggested new possibilities for the continuation of the book about him. It was finished in a burst of activity and published in 1884.

Huckleberry Finn, by general agreement, is Twain's finest book and an outstanding American novel. Its narrator is Huck, a much better realized character than the one with the same name—or indeed any other character—in *Tom Sawyer.* Modern critics and authors have enthusiastically praised his style, one which initially gives the impression of carelessly recorded vernacular speech, but which is admirably adapted to detailed and poetic descriptions of scenes, vivid representations of characters, renditions of actions or emotions and exploitations of comedy both broad and subtly ironic. The style gives the book a certain unity; so does the character whom it expresses.

Huck, son of the village drunkard, is uneducated, superstitious, sometimes credulous; but his faults are outweighed by such virtues as a native shrewdness, a cheerfulness which is hard to put down, compassionate tolerance and an instinctive tendency to reach the right decisions about important matters. At the start, as Twain once put it, "He has run away from his persecuting father and from a persecuting good widow who wants to make a nice, truth-telling, respectable boy of him." His companion is a runaway slave, Jim, and the story is of their movement, interrupted by frequent stops, far down the Mississippi on a raft.

During the journey Huck meets and comes to know members of greatly varied groups, so that the book memorably portrays almost every class living on or along the river. Jim, whom in time, despite initial prejudices, Huck learns to respect and love, offers a fine full-length picture of a slave. A pair of rapscallions who join the two for a while stand for the riffraff preying on folk along the shore. Pappy, Boggs and the "river rats" encountered in a sleepy little town are the poor whites; the Wilkses are a middle-class family; the Grangerfords are what Huck calls "the quality." The pages arc dotted with idyllic descriptions of the great river and the surrounding forests, and Huck's exuberance and unconscious humour permeate the whole. But a thread which runs through adventure after adventure is the theme of man's inhumanity to man—of human cruelty. Children miss this theme, but adults who read with the care this classic deserves cannot fail to be impressed by an attitude mhich was to become a reiterated preachment of the author during his later years.

Twain turned next to historical fiction. *A Connecticut Yankee in King Arthur's Court* (1889) employed the fantasy characteristic of the tall tale in a book-length narrative. It transplants a common-sensible Hartford Yankee to Camelot and through his comments—for he is the narrator—satirizes both past and contemporaneous follies. In this novel as in its predecessor there are bitter passages about what Twain more and more came to think of as "the damned human race." The writer returned to the American scene in *Pudd'nhead Wilson* (1894), interesting for its regional portraiture and also for its study of miscegenation. It has not rated as one of his best efforts, but its stock tended to rise among some critics 50 or 60 years later.

About the time *Pudd'nhead Wilson* went to press, Clemens' financial affairs became desperate. This was the result in part of the disastrous panic of 1893 and in part of the writer's mistakes as a businessman. Some years before he had become a publisher, and although some books his firm published (including his own) sold well, he backed others which failed. For another thing, this son of the venturesome frontier was almost incapable of resisting any temptation to gamble on a wild enterprise. At this unpropitious moment a typesetting machine into which he had sunk hundreds of thousands of dollars proved to be worthless. Clemens had to go into bankruptcy.

He turned over management of his affairs to a friend, Henry H. Rogers of the Standard Oil company, and set out to earn enough to pay off his indebtedness at 100 cents on the dollar. The returns from a historical novel. *Personal Recollections of Joan of Arc* (1896), a lecture tour around the world and *Following the Equator* (1897), nhich told of it, did the trick, though neither of the books was up to his best standard.

Both books had gloomy touches, the former in its stern depiction of Joan's enemies, the latter in a number of pessimistic aphorisms used as chapter epigraphs and in passages about the mistreatments and miseries of mankind. Personal misfortunes coming in this period doubtless added to Clemens' unhappiness. In England during the lecture tour, Clemens received news of a daughter's death in Hartford. Within the next few years, Orion and a sister, Pamela, died; his daughter Jean and Mrs. Clemens became hopeless invalids; and Mrs. Clemens died. But these misfortunes did no more than accelerate a trend in Clemens' thinking which had started long before. He completed a book, *What is Man?* which he had begun in the 1880s: it emphasizes the idea of determinism and argues that selfishness motivates all human actions. "The Man That Corrupted Hadleyburg" (1899), one of his best-wrought short stories, indicates that Hadleyburg—or any town—is corruptible because of the greed of its citizenry. *The Mysterious Stranger,* a novelette published posthumously in 1916, poetic though it is in style, underlines the grimmer aspects of life and offers as its only solace the possibility that life "is all a dream—a grotesque and foolish dream." There are similarly dark passages in the *Autobiography,* which he worked at fitfully beginning in 1877, but nhich became a major enterprise after 1906; but there are also happier passages which hark back to the days about which he always did his best writing—the days of his boyhood in Missouri, his youth on the Mississippi and his young manhood in the far west. The rambling, uneven account was uncompleted when he died April 21, 1910.

Twain's uritings vary in excellence largely ,because he was a self-trained artist who at both his worst and his best worked intuitively. Too often his journalistic tendencies or his habit of improvising misled him. But he was a man of great charm and remarkable sensibility, and frequently even his inferior writings delight readers by affording intimate glimpses of his fascinating personality. Furthermore, he looked back over a significant span of American history in which he had intimately participated. When his genius as a writer enabled him to make the best of his incomparable materials, he wrote greatly enough to win a high place among American authors.

TWAYBLADE (*Listeraj*, a genus of small plants of the orchid family (Orchidaceae). The greenish-yellow flowers, each with a down ardly directed, forked labellum, are borne in terminal racemes.

Four twayblades are native to North America—the heart-leaved (*L. cordata*), the broad-lipped (*L. convallarioides*), the southern (*L. australis*) and the western (L. *caurina*). The common twayblade (*L. ovata*) and the heart-leaved twayblade (*L. cordata*) are found in the British Isles. *Liparis lilifolia*, large or lily twayblade, is native to bogs, peaty meadows and damp thickets from Canada through the north central states to northern Alabama. *See* also ORCHIDS.

TWEED, WILLIAM MARCY, U.S. political boss and leader of the "Tweed ring," was born in New York city April 3, 1823. In 1852 he was elected an alderman of the New York city council. From 1854 to 1856 he served as U.S. representative in Washington, D.C. His real power in municipal politics began in 1857 with his election to the board of supervisors, which he came to dominate. By working the downfall of Fernando Wood, a notoriously corrupt mayor, Tweed came into power under a cloak of respectability.

He fortified himself through his political appointments. From 1858 to 1871, while holding successively the positions of school commissioner, deputy street commissioner, state senator and deputy commissioner of public works, Tweed, except for brief intervals, controlled the city administration. In 1868 he also controlled the state Democratic assembly at Albany, and in 1869, though he lost the assembly, he secured the election of his nominee as governor. The "Tweed ring" of history, composed of Tweed, Mayor A. Oakey Hall, Peter B. Sweeny and Richard B. Connolly, began its operations in Jan. 1869 and lasted until Tweed's downfall in 1871. Conservative estimates place the amount stolen directly from the city during that period at $45,000,000, though including taxes lost through arbitrary reductions by the "ring" for money or favour and the issuance of bonds at extravagant rates of interest some authorities have estimated as high as $200,000,000. Exposure came through a bookkeeper who placed evidence in the hands of the New *York Times*, where it was printed. Tweed was tried, found guilty and sentenced to 12 years in the penitentiary. In 1873 he escaped from the Ludlow street jail where he was confined. fled to Cuba and thence to Spain, where he was arrested by the Spanish government and returned to the United States. He was again imprisoned in Ludlow street jail where he died April 12, 1878.

See D. Lynch, *"Boss" Tweed* (New York, 1927).

TWEED, a river in the south of Scotland. It is 97 mi. long and drains an area of about 1,870 sq.mi. The last 2 mi. of its course, from just above Berwick. are in England and for the preceding 17 mi. it forms the boundary between the two countries. Its source is in Tweed's Well (1.500 ft.) near the foot of Hart Fell on the borders of Peebles and Dumfries. The Annan rises close by. For 16 mi. the Tweed flows northeastward to its junction with the Biggar water whose broad valley formerly brought in the waters of the upper Clyde. After receiving the Lyne on its left bank it turns eastward to Peebles where the Edelston water joins it, also from the left. From Peebles to Melrose the Tweed flows through a typical dale, deeply cut, narrow floored and wooded like those of the Ettrick, the Gala and the Leader which all join it in this section. Below Melrose the valley widens into the drumlin covered plain known as the Merse and the river course becomes tortuous. The sheep farming of the upper valleys, which gave rise to the wool and textile industry of Galashiels, Hawick and Selkirk, is now replaced by cultivation and stockfeeding. This richer farming extends up Teviotdale as far as Hawick. From Kelso the Tweed adopts the northeastward direction of the Teviot. It receives the Till from Northumberland and the Whiteadder from the Lammermuir hills before entering the North sea at Berwick. (T. HER.)

TWEED, a term of very general application in the woollen and worsted trades. It is employed as a trade description for a very large variety of woollen and worsted fabrics that embody the same general textural features, but which differ in the minor details of their manufacture, construction and finish. They are described as "Scottish," "Harris," "Cheviot," "Irish." "Yorkshire," "Saxony" and "West of England" tweeds, according to the particular locality of their origin, the yarn used in their construction, their character of structure, texture, finish and other details.

The description of this particular variety of worsted fabrics as "tweeds" is commonly, but erroneously, associated with the Scottish river of that name.

The origin of the word "tweed" has no reference to the Tweed river, but is said to be due to an error on the part of a London cierk who, in the year 1826, when writing out an invoice for these goods, inadvertently wrote the word "tweeds" instead of "tweels," the Scottish for "twills." Orders were placed for more "Scottish tweeds"—a novel description which immediately won the popular favour and became firmly established in the clothing trade as a brand of quality.

The chief characteristic feature of the true type of "tweed" fabrics in general is, as the name suggests, their construction on a twill weave basis, although they are not restricted entirely to the simple regular twill weave structures, as many tweed fabrics are based on the numerous modifications of those weaves. Tweed fabrics are produced from Scottish, Cheviot, Saxony and many other types of worsted and woollen yams of various counts and quality, and woven in solid colours, mingled "heather" tones, and coloured stripes and checks in endless variety of pattern and colour, and in every variety of texture suitable both for men's and women's clothing for outer wear, and for every season of the year.

"Herringbone" twills, "diamonds," "chevrons," "cross-twills" and "basket" weaves are popular styles for tweed designs, which are now more of a broken character than formerly, while more intricate patterns are introduced in textures of superior quality. A new vogue of recent origin consists of printed tweed effects with the pattern printed on both sides of the fabric to give the impression of woven designs. These printed tweeds are executed with such realistic effect that it is in some cases very difficult without close inspection to distinguish the printed imitation tweed effect from the genuine woven tweed patterns. (H. N.)

TWEEDDALE, JOHN HAY, 2ND EARL and 1ST MARQUESS OF (1626–1697), was son of John, 8th Lord Hay of Yester (*c.* 1599–1654), created earl of Tweeddale in 1646. Before succeeding to the peerage in 1654 the second earl fought for Charles I during the Civil War, but he was in the Scottish ranks at Marston Moor. Changing sides again, he was with the royalists at Preston; but he was a member of Cromwell's parliament in 1656, and was imprisoned just after the restoration of Charles II. He was soon, however, in the king's favour, and in 1663 was appointed president of the Scottish council, and in 1664 an extraordinary lord of session. In Scotland he sought to mitigate the harshness shown by the English government to the Covenanters, and for this attitude he was dismissed from his offices in 1674; but he regained an official position in 1680 and held it during the reign of James II. A supporter of William of Orange, he was made lord high chancellor of Scotland in 1692, and two years later was created marquess of Tweeddale and earl of Gifford.

He favoured the scheme for the expedition to Darien, and as lord high commissioner during William's absence he formally assented to the act establishing the trading company in 1695; for this action he was dismissed from office when the king returned to England in 1696.

He died on Aug. 11, 1697.

TWEED RIVER: see RICHMOND RIVER AND BASIN.

TWEEDSMUIR, JOHN BUCHAN, 1ST BARON (1875–1940), Scottish author and statesman, outstanding in his generation for achieving an equal reputation both as creative artist and as man of affairs. He was born in Perth, Aug. 26, 1875, brought up in Fife the Scottish Borders and Glasgow, educated at Glasgow university and Oxford, where he began to publish fiction and history, and was called to the bar in 1901. After working on Lord Milner's staff in South Africa (1901–03), he became a director of Nelsons, the publishers, for whom he wrote the best of his Stevensonian adventure stories, *Prester John* (1910), a vivid prophetic account of an African rising inspired by a pseudo religion. During World War I he held a staff appointment and in 1917 became director of information. His patriotism also found expression in *The Thirty-Nine Steps* (1915). the first of a successful series of secret-service thrillers. After the war he became assistant director of the British news agency, Reuters, and was member of parliament for the Scottish universities, 1927–35. His biographies, *Montrose* (1928) and *Sir Walter Scott* (1932), are illuminated by compassionate understanding of the tangled web of Scottish history and literature. In 1935 he was raised to the peerage and appointed governor general of Canada. His love of Canadian people and places and his foreknowledge of approaching death combined to produce the pity and terror of his fine novel, *Sick Heart River* (1941; *U.S.* title, *Mountain Meadow).* He died at Montreal, Feb. 11, 1940.

His autobiography, *Memory Hold-the-Door,* was published in 1940. (A. M. S.)

TWELVE TABLES, the tables of wood on which was engraved or painted the earliest codification of the Roman law. Originally ten in number, two supplementary tables were added, and the whole code was termed the *Lex XII tabularum* ("Law of the Twelve Tables"). *See* ROMAN LAW and ROME: *Ancient History: The Republic.*

TWELVE TRIBES OF ISRAEL. In the Old Testament Israel is presented as a community with a tribal structure from its emergence as a people until the absorption of the tribal structure in the monarchies of Israel and Judah (*qq.v.*). The 12 tribes. with some important exceptions, correspond to the 12 sons of the patriarch Jacob (Gen. xxix–xxx), whose mothers were:

1. *Leah:* Reuben, Simeon! Levi, Judah, Issachar, Zebulun.
2. *Rachel:* Joseph (or Ephraim and Manasseh), Benjamin.
3. *Bilhuh:* Dan. Naphtali.
4. *Zilpah:* Gad. Asher.

Only the enumeration of the blessing of Jacob (Gen. xlix) follows the list of the sons of Jacob. In the tribal lists of Num. i, ii, xxvi and Josh. xiii–xix, Levi is omitted and Joseph is replaced by Ephraim and Manasseh. In the blessing of Moses (Deut, xxxiii) Simeon is omitted and Joseph, while mentioned, has two places, one for each of his sons! Ephraim and Manasseh. These variations, together with other indications too numerous and scattered to be set forth here, lead most modern scholars to conclude that the tribal origins of Israel are too complex to be explained by descent from a single family. The 12-tribe structure appears as a constant; while it probably has reference to some family grouping, to some degree it rests also on reckoning by artificial genealogies through which tribal groups express their community. The structure admitted new members to replace tribes that departed from the group, merged with other tribes or perished, but the number remained at 12. Martin Noth, followed by many scholars, calls the 12-tribe federation of Israel an amphictyony (*q.v.*), the Greek name for a union of communities about a central shrine. In Israel the unity of the tribes rested upon their worship of the one God Yahweh, centred visibly upon the Ark of the Covenant, the symbol of the presence of Yahweh in Israel. Few scholars, however. accept Noth's view that the unity called Israel did not exist before the covenant assembly at Shechem related in Josh. xxiv where, in his view: the tribes accepted the worship and the covenant of Yahweh imposed by Joshua.

Israel is mentioned as a people dwelling in Palestine in the stele of Merneptah of Egypt (*c.* 1220 B.C.); many urge this as a difficulty against Noth's view. It is also employed as the name of a monarchy by Shalmaneser III of Assyria (859–824 B.C.) and in the Moabite stele of Mesha (c. 850–800 B.C.; *cf.* II Kings iii), both of which clearly designate the monarchy of northern Israel.

On the assumption that there is an artificial unification of the traditions which brings all the 12 tribes into the sojourn in Egypt, the Sinai episodes and the invasion and settlement of Canaan, scholars have proposed divergent theories of the prehistory of the various tribes. These theories are too numerous and complex to be set forth here, and it is possible to do no more than to point out certain features in the traditions and in tribal geography which suggest these conclusions.

Rachel Tribes.—The Rachel tribes (Ephraim, Manasseh, Benjamin) must, it seems, be identified with the sojourn in Egypt and the invasion and settlement. This conclusion rests upon the identification of Ephraim and Manasseh with "the house of Joseph" and the fact that Josh. i, 1—x, 28 deals almost entirely with Israelite victories in the territories of Ephraim and Benjamin. The Ark of the Covenant was located in the same territories until the destruction of Shiloh by the Philistines. Joshua himself was a man of Ephraim. Ephraim and Manasseh are possibly derived from Egyptian names. These tribes appear in Joshua and Judges as the largest and most powerful of the tribes, and Hosea uses Ephraim as a title of the kingdom of Israel.

Leah Tribes.—The Leah tribes (Reuben, Simeon, Levi, Judah, Issachar, Zebulun) present certain problems. Leah in the patriarchal tradition was the first wife of Jacob, and this implies some claim to pre-eminence on the part of the Leah tribes. The response of the Rachel tribes to this claim was the position of Rachel as the preferred, though second wife of Jacob. It is observed also that the first four sons of Leah, with the exception of Levi (Reuben, Simeon, Judahj, are located in the south on both sides of the Dead sea, removed from the other tribes by geographical barriers and Canaanite fortresses. The conquest of the territory of Judah is attributed to Joshua in Josh. x, 29 ff., but Judg. i, 1–20 reports a movement of Judah, Simeon and the Calebites into this territory. Most modern scholars believe that the account of Joshua is a later composition in which the separate movements of the tribes were telescoped into a single movement led by Joshua. Reuben and Simeon disappear early as distinct tribes; Reuben was probably merged into Moab and Gad. and Simeon into Judah. Levi is a landless tribe. Hence of the Leah group only Judah remains as a strong distinct tribe which later can be opposed to "Israel." Noth believes that the Leah tribes were the original 6-tribe amphictyony upon which the 12-tribe amphictyony was erected This view seems improbable to many scholars, but the distinct grouping of the Leah tribes is not easily denied, and perhaps the majority of scholars believes that the Leah tribes were not in Egypt and were in Canaan when the Rachel tribes arrived. The other two Leah tribes, Issachar and Zebulun. are located in Galilee; the tradition of their later birth (Gen. xxx) may represent their later union with the Leah tribes of the south.

The problem of the tribe of Levi remains without a satisfactory solution in this hypothesis, as it does in any hypothesis. In the traditions Moses was of this tribe. and hence the Sinai experience and the Israelite worship of Yahweh cannot be dissociated from Levi; yet Levi belongs not to the Rachel tribes but to the Leah tribes. The traditions reflect a time when the tribe of Levi was not a priestly tribe, and Gen. xxxiv is thought by many scholars to retain a recollection of an attempt by Simeon and Levi to take Shechem, later the central city of Ephraim and Manasseh. Levi's lack of land also appears to reflect some early disaster to the tribe. The complexity of the data has led Walther Eichrodt, followed by a few scholars. to suppose that two different but similar names are merged in Levi, which carries the traditions both of the priestly tribe and of the secular tribe that perished *(see* LEVITES).

Tribes East of Jordan.—The tribes east of the Jordan (Gad, Reuben, Manasseh) also present problems. Num. xxxii suggests that these tribes urged a claim to their territories that was older than the claims of the tribes of western Palestine, and-Josh. xxii narrates a dispute about the cult of Yahweh. This passage has possibly been softened in transmission and redaction; in its present form it is late but at its base there may lie a defection from the amphictyonic cult of Yahweh that was more profound than the text now reveals. The presence of two "half-tribes" of Manasseh, one on each side of the Jordan, is disturbing.

Bilhah and Zilpah Tribes.—The Bilhah tribes (Dan, Naphtali) and the Zilpah tribes (Gad, Asher) are reckoned as sons of slaves, and it may be suspected that this reflects an earlier subordinate position of these tribes. They do not, like the Leah and Rachel tribes. represent a geographical grouping, although Dan and Saphtali are found next to each other at the northernmost point of Israelite territory. Tradition, however, relates a movement of Dan from its territory adjacent to Philistia to the north because of Philistine pressure (Judg. xviii). Judg v, 17 suggests that Dan was seated in the north at the time of the battle of the Kishon, which is dated about 1125 B *c*.: the story of Samson (Judg. xiii–xvi), which can be dated only generally in the last three quarters of the 12th century B.C., supposes that the tribe was still dwelling in the south.

Asher in Galilee and Gad in eastern Palestine likewise are not geographically adjacent. Asher occupies an insignificant position in Israelite history, and many scholars believe it was the least "Israelite" of all the tribes; i e., most remotely akin, most geographically remote and most Canaanite in culture. The fact that the northern tribes (Zebulun, Issachar, Naphtali, Dan, Asher) are not grouped according to maternal descent suggests that there was no grouping of any kind antecedent to their entrance into the amphictyony.

Related Groups and Tribal Names.—The ultimate reason for the rigidity of the number 12 in the amphictyony is not altogether clear, but it seems that a number of other groups would rank easily as tribes if the number could have been enlarged. The Calebites in Judah seem as important as Simeon and appear later in the traditions (*see* CALEB). The same is true of the Renites (q *v.*). also connected with Judah. Two half-tribes of hlanasseh arouse suspicion; the eastern Manasseh is often designated as Machir. son of Manasseh. and it appears likely that the tribe of Machir entered the amphictyony only by merging with Manasseh A similar relationship with hlanasseh seems indicated for the clan of Jair of eastern Palestine.

Noth has made the suggestion that some tribal names are geographic names and that the original name of the tribe has been replaced by the name of the region in which it settled. Ephraim. hlanasseh. Judah and some of the Galilee tribes are alleged as examples. The relation of the tribal name Gad with the geographical name Gilead is obscure. The territory of Gilead is shared between Manasseh and Gad; yet Gilead is used in contexts which suggest its use as a tribal or clan name. and it is called the son of Machir, the son of hlanasseh (Suin. vi. 21). Soth's opinion is not widely accepted, but it shows another facet of the complexity of the question.

Intertribal Conflict.—Israel of the period of the judges exhibits the tribal structure. There is no central political authority. The Israelite victories related in Judges are victories of single tribes or small groups of tribes. and not even in the battle of the Kishon (Judg. iv–v). where the largest Israelite coalition was mustered, were all the tribes active. The intertribal war of Judg. xix–xxi is related in a form which was written much later than the events, and no accurate memory of the details is preserved; but the story itself illustrates the possibilities of conflict which were implicit in the tribal structure. Intertribal disputes are also attested in the stories of Gideon (Judg. viii. 1–7, 14–17) and Jephthah (Judg. xii, 1–6). Such unrestrained tribal freedom made Israel an easy victim for the more closely organized and disciplined Philistines. The Philistine danger moved the Israelites to elect Saul king. It is not clear, however, how many tribes acknowledged the monarchy of Saul, at least at the beginning of his reign. No doubt he gathered more tribes with his military successes, but it is not certain that "all Israel" in the sense of all the tribes accepted a single king before the reign of David.

This unity endured through the reigns of David and Solomon, but it was a unity in the person of the monarch rather than a true political unity. The administrative districts of Solomon (I Kings iv, 8–19) cut across tribal divisions and were probably intended to do so, but Solomon could not suppress the consciousness of the distinct realities of Israel and Judah which probably went back to the time when the Rachel tribes entered a land in which the Leah tribes were already present. The failure of Solomon's successor Rehoboam to give proper respect to the larger community of Israel led to the political breach that was never healed. The unity in the worship of Yahweh, however, survived the institution of separate Israelite shrines. and in the last phase of Israelite history. Judah was the sole survivor and heir of the faith of the 12-tribe amphictyony.

"Ten Lost Tribes."—Historians regularly find it necessary to explode the fable of "the Ten Lost Tribes" and their reappearance in some other part of the world. Some of the inhabitants of the kingdom of Israel were removed to other regions of the Assyrian empire after 721 B.C. Those who were removed and those who remained mere absorbed by other populations; they were neither lost nor did they survive as a distinct ethnic group. See also JEWS; JUDAISM.

TWENTY-FOUR PARGANAS, THE, a district of West Bengal, Republic of India; area 5.288 sq.mi. Pop. (1961) 6,293,-758. It occupies part of the Gangetic delta east of the Hooghly, surrounding (but not including) the city of Calcutta. It also includes the greater part of the almost uninhabited Sundarbans (*q.v.*), so that within its confines are found virgin forest, settled tilth and the busy life of the suburb of a great city. The administrative headquarters are at Alipore, a southern suburb of Calcutta. The country consists for the most part of an alluvial plain with a population devoted to agriculture, but a chain of industrial towns stretches along the bank of the Hooghlp from Garden Reach northward. Rice is the staple crop, followed by jute, pulses and sugar cane.

Of the industrial towns Bhatpara has (1961) 147,725 and Baranagar 107,542 inhabitants.

Other industrial centres are Titagarh ([1951] 71.622). Budge-Budge. Naihati, Ramarhati, south Dum-Dum and Kanchrapara, in the last of which are the works of the broad gauge system of the Eastern railway. In other towns various manufactures are to be found, principally jute mills, jute presses and, at Dum-Dum, government factories for rifles.

TWICKENHAM, a municipal borough and parliamentary division of Middlesex, Eng., 10 mi. W.S.W. of St. Paul's cathedral by road. It has a frontage to the River Thames of about 9½ mi. Pop. (1961) 100,822. The borough includes Teddington, Hampton and Hampton Wick (all added in 1937), as well as Hampton Court (*q.v.*) palace, Bushy park and Home park (all three crown property). It is a residential area and a popular centre for Thames fishing and boating. It has a famous Rugby Union football ground. At Whitton, Kneller hall. originally built in 1709 by Sir Godfrey Kneller but much altered, is the home of the Royal Military School of Music.

The church of St. Mary has a Perpendicular tower. Among men of eminence buried there are Alexander Pope and Sir Godfrey Kneller.

There are many fine houses, some in beautiful grounds and having historical associations. Strawberry Hill, the residence of Horace Walpole, was built to his taste in a medley of Gothic styles. Marble Hill was erected by George II for the countess of Suffolk, and Alexander Pope, Jonathan Swift and John Gay took part in its equipment. Orleans house was the residence in 1800 of Louis Philippe. It was pulled down in 1927. York house (now the municipal offices) was given to Lord Clarendon by Charles II.

Twickenham at the Domesday survey was included in Isleworth. Anciently it was called Twittenham or Twicanham. The manor was early in the hands of the monks of Christ church, Canterbury. but in the reign of Henry VIII it came into the possession of the crown, and by Charles I was assigned to Henrietta Maria as part of her jointure.

In 1670 it was settled for life on Catherine of Braganza, queen of Charles II. The old manor house, now demolished, was Catherine's residence. It had been, according to tradition. the place of the retirement of Catherine of Aragon after her divorce from King Henry VIII.

Twickenham was incorporated in 1926 and contains more than 2,050 ac. of public open spaces, including the crown property.

TWILIGHT, the period after sunset when light continues to be received from the region of the overlying atmosphere that is still in sunlight. The corresponding early morning period of light before sunrise is popularly known as the dawn; but the technical practice in navigation and astronomy is to distinguish between the two periods by the terms evening twilight and morning twilight.

The phenomenon of twilight is caused by the atmosphere. If there were no atmosphere, complete darkness would set in sharply at sunset, as it does on the moon; but on earth the upper atmosphere remains illuminated until the sun is some distance below the horizon, because the air within the illuminated region reflects and scatters light into the shadow of the earth. Darkness comes on gradually after sunset as the sun sinks farther below the horizon and illuminates less of the air above.

It was determined in ancient times that twilight ended when the sun dropped about 18" below the horizon. Subsequent observations have not materially modified this figure, and it has been adopted as the point that separates complete darkness from sunset or sunrise; this interval is termed astronomical twilight. However, illumination is practically imperceptible when the sun is only slightly less than 18° below the horizon. Two intermediate levels of illumination also are recognized. Civil twilight covers the period when the sun is 6" or less below the horizon. In this period after sunset or before sunrise, natural illumination is sufficient for conducting ordinary outdoor activities. The second level, nautical twilight, marks the time when the sun is 12° below the horizon; illumination has deteriorated so that only the general outlines of objects are visible, the horizon is indistinct and all the brighter stars can be seen.

The duration of twilight is dependent on the season of the year and the latitude of the observer. Near the equator the sun rises and sets almost vertically, while at higher latitudes its path is slanted with respect to the horizon and a longer time is needed for the sun to travel a given number of degrees vertically from the horizon.

The durations and times of civil, nautical and astronomical twilight for any latitude. for all days of the year and for any year of the 20th century can be obtained from "Tables of Sunrise, Sunset and Twilight" published by the U.S. Naval Observatory as a supplement to the ***American Ephemeris*** for ***1946.***

The intensity of illumination at any level of twilight depends to a considerable extent on the amount of atmospheric cloud and dust and also upon reflective objects such as buildings, hills and trees in the environment of the observer. The duration of twilight decreases with increasing height of the observer above the surface of the earth and approaches zero at the upper limit of the atmosphere. (R. F. HA.)

Optical Phenomena. — During morning or evening twilight, a range of optical phenomena can be seen on both horizons if the skies are cloudless. In unusually clean air, as on a mountain top or from an airplane these phenomena can be of startling clarity, but in misty air (as in Great Britain) careful observation is required to follow them. w Since there is not a great difference between morning and evening twilights, both will be described in the time sequence of the evening twilight.

As the sun sets it is surrounded by a large luminous patch, and a yellow-red band forms along the horizon. Coloured bands that appear on the eastern horizon form what is known as the counter-twilight. The counter-twilight develops steadily, the colours rising as the sun sets, with the earth's shadow appearing beneath as dark night sky belo a reddish border. The coloured bands and the earth's shadow, as seen from low levels, are caused by the scattering of sunlight from low-lying dust, but the earth's shadow can be seen more clearly at high altitudes where there is little dust and the scattering comes from air molecules. Under average conditions counter-hilight ceases about 30 minutes after sunset when the sun is about 5° below the horizon. The earth's shadow then moves rapidly to the zenith.

In the west, the luminous patch around the sun sets until, when the sun is about 2° below the horizon a purple light appears on its upper border, about 25° above the horizon. The purple light is a highly variable phenomenon but usually it rapidly broadens and sinks and seems to intensify, so that on a clear evening it gives a purple hue to ground objects. It lasts about half an hour and, when the sun is about 6° below the horizon it has sunk into and brightened the horizontal bands, which have remained during the whole period. The only acceptable explanation of the purple light is in terms of scattering from a haze layer about 10 km. high, although there is no strong supporting evidence for such a layer from other sources.

After the purple light disappears, the twilight glow is visible in the west as a broad arch of light stretching up to 20° above the horizon. It gradually sinks into the horizon, lasting about 1½ hours until the sun is 18° below the horizon. The twilight glow is caused by scattering from the high atmosphere, partly from dust and partly from air molecules, the precise role of each being uncertain.

The spectrum of the twilight glow shows some bright lines when only the atmosphere above 60 km. is illuminated. The negative bands of ionized nitrogen ($N_2{}^+$) and the sodium D-lines are caused by resonant scattering. The red atomic oxygen lines are also enhanced above their nighttime values, but this is a more complex process.

Like most atmospheric phenomena, all these effects are very variable, particularly when the air contains unusually large quantities of dust. (R. M. Go.)

TWILIGHT SLEEP, a state characterized by analgesia and amnesia produced by the administration of scopolamine in conjunction with morphine, formerly widely used in obstetrics. ***See*** SCOPOLAMINE.

TWILL, a woven cloth in which the passage of the weft is arranged, not in regular succession as in plain weaving, but over one thread and under two or more according to the kind of twill. This gives a succession of diagonal lines to the cloth, and though in the normal type of twill this diagonal traverses from selvage to selvage at an angle of 45°, considerable variations may be made.

TWIN FALLS, a city in south central Idaho. U.S.. the seat of Twin Falls county. is the centre of a large reclamation and irrigation project. Located close to Twin falls (140 ft. high), Shoshone falls (212 ft.) and Auger falls (140 ft.) of the Snake river, the city is adjacent to a spectacular canyon which bisects the broad, arid Snake river plains.

An average annual rainfall of 9.8 in. retarded settlement of the region until the 20th century. Established in the desert in 1004, the town grew up almost overnight with the coming of irrigation and a branch railway. Until then there had been no major development in that region. but half a dozen more cities sprang up in the area during the next four years. A city of agricultural industry,. Twin Falls obtained a number of important plants, including sugar, cheese and farm implement factories) and a fruit dehydrating plant. The city has a council-manager form of government, in effect since 1950. For comparative population figures ***see*** table in IDAHO: *Population.* (M. D. B.)

TWINING, NATHAN FARRAGUT (1897–), U.S. air force officer, was born in Monroe, Wis., on Oct. 11, 1897, and graduated from the U.S. Military academy, West Point, N.Y., in 1918. He became a U.S. army pilot in 1924 and gained further experience thereafter as a combat unit commander and as a staff and engineering officer.

In World War II, as commander of the 13th air force in the South Pacific, Twining directed the air war against the Japanese on Guadalcanal and Bougainville. During 1944–45 he led the 15th air force in the strategic bombing campaign from Italy against Germany and the Balkans, returning to the Pacific in the closing months of the war to command the 20th air force B-29s that were assaulting Japan from the Marianas. One of the most widely experienced and best qualified of U.S. air commanders, Twining became chief of staff of the U.S. air force in 1953, contributing much toward making it an almost all-jet combat force with a very high atomic capability. In 1957 he was appointed chairman of the joint chiefs of staff. (A, GG.)

TWINS AND TWINNING. Human twins are of two kinds: one-egg and two-egg twins. One-egg twins are variously known as identical, uniovular or monozygotic; two-egg twins, as fraternal, biovular or dizygotic. Most mammals regularly bear several young to a litter, each young derived from a separate egg. Some of the larger mammals, however, habitually bear only one young at a time (as in the case of man, cattle, horses), but sometimes bear srnall litters of two. three or more. When such uniparous species bear plural young, the latter are known as plural-egg tuins, triplets, etc. Some mammals, however, such as the nine-banded armadillo (*Dasypus novemcinctus*) and related South American species, have been shown to give rise to multiple offspring in an entirely different manner. A single early embryo divides and subdivides into four parts, which severally develop into four distinct offspring—one-egg quadruplets. In addition to two-egg twins, the human race produces considerable numbers of one-egg twins, triplets, etc., in a manner probably similar to that knonn for the armadillos.

Supertwins.—Both one-egg and plural-egg twinning in man go beyond mere twinning proper to produce triplets, quadruplets, quintuplets and sextuplets (the highest number known to occur). Two, three, four or five offspring from a single egg are known (the Dionne quintuplets being surely monozygotic). Plural-egg triplets may come from two or three eggs; quadruplets from two, three or four eggs; and quintuplets from two, three, four or five eggs.

Frequencies of Twins, Triplets, **etc.**—In the United States, which has a mixed population of almost all races, one out of 44 babies born is a tuin. For every 86 single births there is one twin birth, making a percentage of twin births of 1.15. Tain frequencies differ greatly among different races and countries, being highest among north Europeans and lowest among various Mongoloid peoples. Among countries keeping reliable vital statistics, Belgium claims 1.79% of twin births; Finland, 1.65%; while Japan has only 0.69%, due largely to relatively few two-egg twins. One-egg twins seem to have about the same incidence the world over. Triplets are about 86 times as rare as twins, and quadruplets about 86 times as rare as triplets. If then we speak of the frequency of twin births to singles as one to 86, that of triplets is about one in 86^2 and that of quadruplets about one to 86^3, a curious but unexplained set of ratios.

Diagnosis of One-egg Twins.—Two methods of distinguishing one-egg from tuo-egg twins are used. the foetal membrane method and the similarity method. According to the membrane method, one-egg twins should always be enclosed in a common birth robe (chorion) and two-egg twins in separate chorions, but some one-egg twins have separate chorions. Hence the membrane method is somewhat unreliable. According to the similarity method, twins that are so similar as to be easily confused are classed as one-egg twins and those that differ markedly, as two-egg twins. The few doubtful cases are resolved by meticulous comparisons of such details as blood groups, eye colour and fingerprints. In the hands of experts, few mistakes are likely to be made.

Hazards of **Twinning.**—The human species is highly specialized for single-offspring births, and plural-offspring births are less viable. The prenatal and infantile mortality rate of twins probably averages about 50%, or about five times that of singles. Also, more than half of all twins are born prematurely and are thus more likely to be injured at birth. All of these hazards increase progressively for triplets, quadruplets and quintuplets.

Sex Distribution.— Twins are more frequently of like than of unlike sex. Extensive counts covering more than 700,000 cases show that twins are of unlike sex in only about three-eighths of them. From such counts an estimate can be made of the frequency of one-egg twins, for these are never of unlike sex, while of the two-egg twins half are expected to be so. Since, in fact, three-eighths are of unlike sex, it may be inferred that tnice this number, or three-fourths, must be two-egg twins, and hence one-fourth, or the remainder, must be one-egg twins.

Joined-together Twins.—Occasionally twins are joined at birth, as in the famous Siamese twins. In most cases they are joined symmetrically, like part with like. Superficial unions are easily severed at birth. More deeply united pairs seldom survive, though a few have lived to become natural curiosities. Most joined tnins exhibit abnormal disposition of blood vessels and viscera, knonn as *situs inversus,* in which the organs of one twin are more or less completely a mirror image of those of the other. A few cases of separate one-egg twins show the same peculiarity. Joined tuins are always same-sexed, and much evidence points to the conclusion that one-egg twins always result when the twinning division of the originally single embryo has been incomplete.

Heredity of **Twinning.**—The tendency to bear twins is regarded as slightly hereditary, though its exact mode and pattern of inheritance is far from clear. That relatives of twins have twins somewhat more frequently than the general population has been claimed by many writers, though satisfactory records are rare. According to some investigators, the production of two-egg twins seems to be influenced only by the mother and depends greatly upon her age, for the frequency of twins increases at least three-fold from the age of 18 to that of 38. It is generally agreed that the tendency to bear two-egg twins is somehow hereditary, but opinions vary widely as to one-egg twinning. Some writers hold that the frequency of one-egg twinning depends on the inheritance of the father as well as that of the mother, but is uninfluenced by age or environmental factors. Others regard one-egg twinning as probably nonhereditary and due to an early arrest of development that disturbs the unity of the embryo and favours the development of two or more growth centres (organizers), each of which grows into a separate individual.

Twins and Human Genetics— Twins have been extensively used in attempts to estimate the relative shares of hereditary and environmental factors in determining differences in physical, mental and temperamental traits. In character differences determined wholly by heredity, one-egg twins should be exactly alike, whereas two-egg twins should show degrees of resemblance no greater than brothers and sisters by different births. Most human differences, however, are determined partly by heredity and partly by environment. With respect to each trait we wish to know what relative shares hereditary and environmental factors have in determining differences. A comparison of large numbers of one-egg twin pairs reared together with an equal number of two-egg pairs reared together should give for each trait the percentage share of hereditary determination, for the two groups differ only with respect to heredity, the one-egg pairs being alike and the two-egg pairs different. A second comparison has been made between 50 pairs of one-egg twins reared together and 20 pairs of one-egg twins (all that could be found) reared apart under various degrees of environmental differences. This comparison should give us the effects of environmental differences, for the two groups are alike as far as heredity is concerned. From both comparisons it was evident that physical traits are least affected by environmental differences; that mental ability is affected more; educational achievement, still more; and personality or temperament, the most.

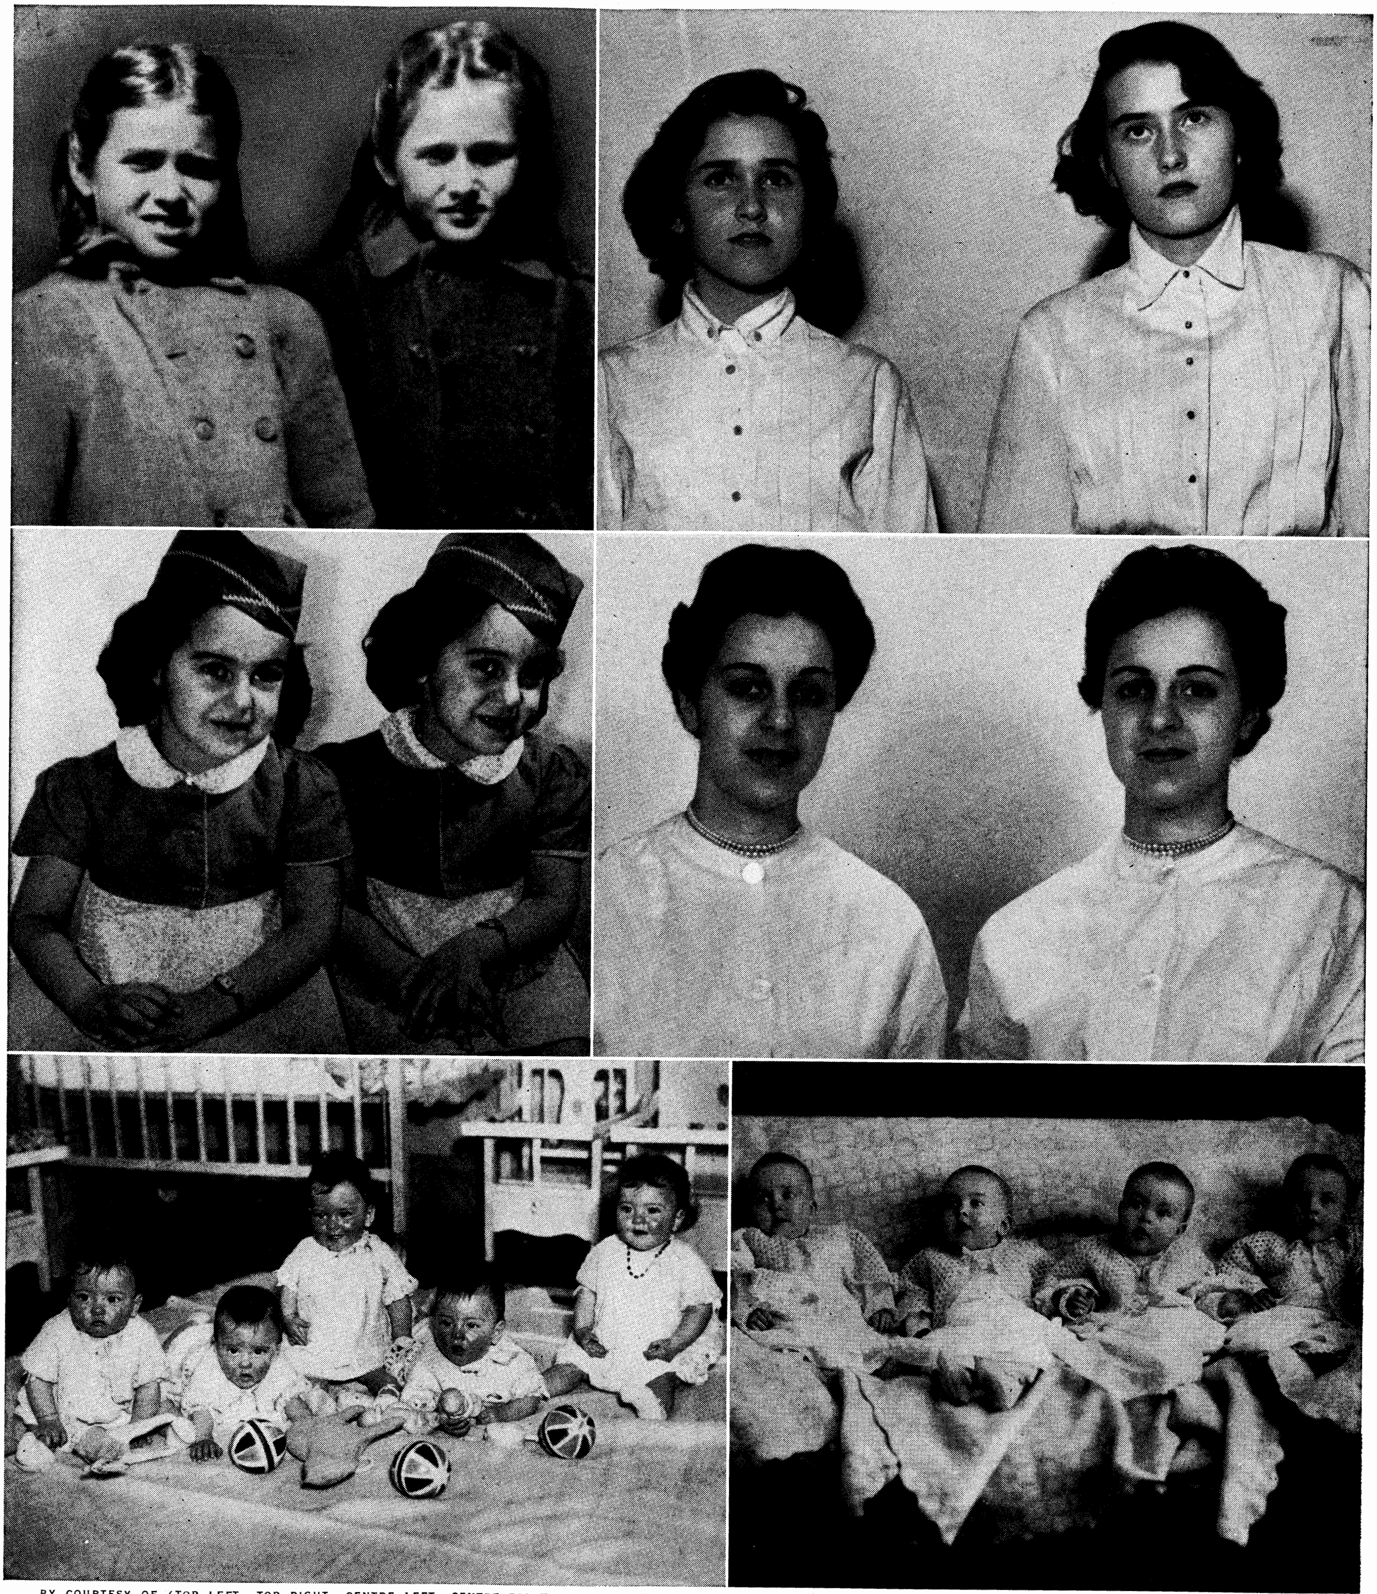
TWISS, SIR TRAVERS (1809–1897), English jurist, was born in London on March 19, 1809, the eldest son of the Rev. Robert Twiss. He was educated at University college, Oxford, of which he was afterward successively bursar, dean and tutor. While at Oxford he published an epitome of Barthold Niebuhr's History *of Rome,* an annotated edition of Livy and other works. His studies, however, were mainly in political economy, international law and international politics. In 1840 he was called to the bar and became an advocate at Doctor's commons. During his connection with Oxford he was a public examiner in classics and mathematics. Drummond professor of political economy (1842) and Regius professor of civil law (1855). He enjoyed a large practice in the ecclesiastical courts and held many posts, such as commissary general of the city and diocese of Canterbury (1849),



BY COURTESY OF (TOP LEFT, TOP RIGHT, CENTRE LEFT, CENTRE RIGHT) DR. F. J. KALLMANN, DEPARTMENT OF MEDICAL GENETICS, NEW YORK STATE PSYCHIATRIC INSTITUTE, (BOTTOM LEFT) NEA SERVICE, INC., (BOTTOM RIGHT) COPR. F. M. KEYES

TWINS, QUADRUPLETS AND QUINTUPLETS

Top left, top right: Two-ego twins at the ages of 9 and 15 years (dissimilar fingerprints and blood groups)

Centre left, centre right: One-egg twins at the ages of 4 and 16 years (no significant dissimilarity in fingerprints or blood groups)

Bottom left: The Dionne quintuplets, diagnosed as one-egg quintuplets, at the age of 13 months

Bottom right: Quadruplet daughters

vicar general to the archbishop (1852) and chancellor of the diocese of London (1858).

From 1852 to 1855 he was professor of international law at King's college, London. His successful career continued in the civil courts and, in addition to his practice, he was appointed in 1862 advocate general to the admiralty and in 1867 queen's advocate general. which officehe held until 1872, when, following his resignation. the position ceased to exist.

He was knighted in 1867. Twiss served during his legal career upon a great number of royal commissions, such as those dealing with marriage law, neutrality, naturalization and allegiance His reputation abroad led to his being invited by the king of the Belgians in 1884 to draw up the constitution of the Congo Free State. During the Berlin conference of 1884–85, he served as counsel extraordinary to the British embassy. Twiss lived in retirement after 1871 when he was involved in an unpleasant scandal concerning statements made about his wife's conduct before their marriage.

Twiss devoted himself to the study of international law and related subjects until his death on Jan. 14, 1897. Among his important publications of this period were *The Law of Nations in Peace* and *The Law of Nations in War*.

TWO RIVERS, a city of eastern Wisconsin, U.S.. in Manitowoc county, about 85 mi. N. of Milwaukee on Lake Michigan. Situated at the base of Door peninsula where the Neshoto and Mishicot rivers join to flow into the lake through a single channel (hence the name), Two Rivers and the surrounding region have developed into a popular resort area.

Manufactures include aluminum products, furniture, electrical toys and appliances, gasoline engines, iron and steel, castings, chemicals, yarn and knit goods, agricultural equipment and tile. The town is a marketing centre for the surrounding agricultural area which produces, among other crops, rye and barley. Dairying is also important.

Two Rivers was first settled by fishermen who began commercial fishing there in 1836. Until the 1870s the town was also a busy lake port. Lumbering was an important activity of the early settlers and shipbuilding was an important industry between 1850 and 1875. Two Rivers was incorporated in 1878 and in 1925 the city adopted a council-manager form of government.

For comparative population figures *see* table in WISCONSIN: *Population.*

TWO-STEP. A ballroom dance that stemmed from folk dancing in the early 1800s. The two-step consists of sliding steps taken to each side in 2/4 time. Though still prevalent in Europe, the dance is no longer much used in the U.S., except that it is sometimes substituted for the waltz and fox trot. *See* FOLK DANCE: *Continental Europe.* (A. Mu.)

TWYSDEN, SIR ROGER (1597–1672), English antiquary and royalist pamphleteer, was educated at St. Paul's school, London, and then at Emmanuel college, Cambridge. He entered Gray's Inn on Feb. 2, 1623. He succeeded to the baronetcy on his father's death in 1629. For some years he remained on his estate at Roydon, East Peckham, largely engaged in building and planting, but also in studying antiquities and the law of the constitution.

Twysden took the most prominent part in preparing the Kentish petition of March 1642 and in subsequent demonstrations on behalf of Charles. He incurred the wrath of the parliament and was arrested on April 1, 1642, but was soon let out on bail and on his promise to keep quiet. But his respect for legality would not let him rest, and he was repeatedly in trouble with the parliament until 1650, when he compounded and went home. He lived quietly there till the Restoration, when he resumed his position as magistrate. He died on June 27, 1672.

Twysden published *The Commons' Liberty* (1648), demonstrating that finings and imprisonings by parliament were illegal; *Historiae anglicanae scriptores decem* (1652), a work encouraged by Cromwell; and *Historical Vindication of the Church of England* (1657).

TYARD (THIARD), **PONTUS DE** (1521?–1605), French poet and member of the *Pléiade* (*see* DORAT, JEAN), was seigneur of Bissy in Burgundy. where he was born in or about 1521. He belonged to the Lyons group of poets and was a friend of Antoine Héroet (*q.v.*) and Maurice Scève.

His *Erreurs amoureuses,* originally published in 1549, was augmented with other poems in successive editions until 1573. He translated (1551) the *Dialoyhi d'amore* of Léon Hébreu, the breviary of philosophic lovers of that day. Two of his *Discours philosophiques* (1587) have a-hat may fairly be called parallel statements of the *De'fense et illustration de la langue française* of Du Bellay. Tyard was one of the first to write sonnets in French (the actual priority belongs to Mellin de St.-Gelais).

It is also said that he introduced the sestine into France, or rather reintroduced it, for it was originally a Provençal invention. In 1578 he became bishop of Châlon-sur-Saône. He resigned in 1594 and died Sept. 23, 1605.

TYBURN, a left-bank tributary of the Thames, England, now having its course entirely within London and below ground. The name, which also occurs as Aye-bourne, is of obscure derivation, though sometimes stated to signify Twy-burn; *i.e.* (the junction of) two burns or streams. The Tyburn rose on the southern slope of the Hampstead heights in two streams, the more westerly of which rose in the spring and was known as the Shepherd's well. It ran south, crossing Regent's park, its course being marked by Regent's park water, and farther south by the windings of Marylebone lane and the dip in Piccadilly near the junction of Half Moon street. It then crossed the Green park and entered the flood plain of the Thames near where Buckingham palace now stands. The exact point at which it entered the Thames is doubtful but its water is now drained off by sewer. After 1238 it supplied the city with water for a long time by means of nine conduits. The name is more famous in its application to the Middlesex gallows, also called Tyburn tree and Deadly Never green and also, at an early peribd, the Elms, through confusion with the place of execution of that name at Smithfield.

The Tyburn gallows stood not far from the modern Marble arch. Connaught squnre is said by several authorities to have been the exact site, but it appears that so long as the gallows was a permanent structure it stood at the junction of the present Edgware and Bayswater roads. The site, however, may have varied, for Tyburn was a place of execution as early as the end of the 12th century. In 1759, moreover, a movable gallows superseded the permanent erection. On some occasions its two uprights and crossbeam are said to have actually spanned Edgware road. Round the gibbet were erected open galleries, the seats in which were let at high prices. Among those executed there were Perkin Warbeck (1499), the Holy Maid of Kent and confederates (1535), Haughton, last prior to the Charterhouse (1535), John Felton, murderer of Villiers, duke of Buckingham (1628), Jack Sheppard (1724), Earl Ferrers (1760).

In 1661 the skeletons of Cromwell, Ireton and other regicides were hung upon the gallows. The last execution took place in 1783, the scene being thereafter transferred to Newgate. The Tyburn ticket was a certificate given to a prosecutor of a felon on conviction, the first assignee of which was exempted by a statute of William III from all parish and ward duties.

See A. Marks, *Tyburn Tree, its History and Annals* (1908).

TYDEUS, in Greek legend, son of Oeneus, king of Calydon, and Periboea. Having slain his uncle (or other relatives) he fled for refuge to Argos, where Adrastus purified him and married him to his daughter Deipyle, who became the mother of Diomedes (*q.v.*).

In the expedition of the Seven (cf. OEDIPUS), Tydeus, who had fought valiantly, was mortally wounded by Melanippus. Having killed Melanippus, he proceeded to devour his head; this so disgusted Athena, who had meant to make him immortal, that she left him to die.

See Roscher's *Lexikon,* art. "Tydeus."

TYLER, JOHN (1790–1862), 10th president of the United States, was born March 29, 1790, at Greenway, the ancestral home, in Charles City county, Va., and was reared in the aristocratic yet democratic republicanism of the Jeffersonian era. He attended a local school where, as the leader of those who opposed an unpopular schoolmaster, he gave evidence of the courage and independence that were to characterize his later life. At 12 years of age he entered the grammar school of the College of William and Mary and graduated from the college in 1807. He studied law in the office of his father) who was governor of Virginia (1808–11) and U.S. district judge (1812–13). Admitted to the bar in 1809 he developed a lucrative practice.

Tyler began his public career as a member of the state legislature in 1811. Elected for five consecutive terms. he resigned in 1816 when elected to the council of state, but returned to the legislature in 1823–25 and again in 1839. He supported President Madison's war measures and in 1813 served for a few months as captain of a company raised for the defense of Richmond. He early became a champion of state rights. favoured a strict interpretation of the federal constitution and was a bitter opponent of the idea of a national bank. He supported resolutions censuring Virginia's U.S. senators for voting to recharter the first Bank of the United States after having been instructed to vote against it.

In the U.S. house of representatives (1817–21), Tyler supported measures designed to repair the breaches of war but opposed the new nationalistic legislation brought forward by Henry Clay and John C. Calhoun—including protective tariffs, federal aid to internal improvements, establishment of the second Bank of the United States and recognition of the independence of Spain's South American colonies. He also opposed Andrew Jackson's exploits in Florida. Although Tyler recognized the evils of slavery and hoped the institution would gradually die out, he opposed the Missouri Compromise as an unconstitutional restriction on slavery in the territories and an infringement of the rights of slaveholders. Tyler declined re-election in 1821 because of ill health and business reasons but accepted election to the state legislature in 1823 and was elected governor of Virginia in 1825. The latter position was one of prestige but little power. Tyler urged upon the legislature, with little success, a program of public education and internal improvements. He resigned the governorship in 1827 when elected to the U.S. senate. He reluctantly accepted election to the Virginia constitutional convention of 1829–30 where he joined the conservative faction and opposed democratic reform of suffrage, representation and court procedure.

Tyler's senatorial career (1827–36) was marked by courageous independence of party and consistent support of state rights and strict construction of the constitution. Considering Jackson a mere military hero with little civilian standing. Tylcr supported William H. Crawford for the presidency in 1824. He refused to accept Jackson's cry of "corrupt bargain" when John Quincy Xdams. with the support of Clay, was elected president by the house of representatives and then appointed Clay as his secretary of state. He did not support either the Adams administration or the Jackson group. He was elected to the senate in 1827 by an anti-Jackson faction but in the presidential election the following year he threw his support to Jackson against. Xdams as the lesser of two evils. He opposed Jackson's appointment of newspaper editors to high federal office and his sending commissioners to Turkey without submitting their names to the senate for approval. On the other hand, he voted to confirm Jackson's appointment of Martin Van Buren as minister to England. Believing that protective tariffs were unconstitutional, he voted against the tariff acts of 1828 and 1832, but he condemned South Carolina's nullification of the two acts as unwise and inexpedient. He also condemned Jackson's proclamation, which denounced nullification, as subversive of constitutional principles. He declared that the Force hill, which authorized the president to use troops to enforce the law in South Carolina, tended toward "consolidated military despotism"; and he was the only senator to vote against it. Fearing dissolution of the union, Tyler approached Clay, urged him to sponsor a compromise and suggested that he consult Calhoun. Clay did so and the compromise tariff of 1833 was the result. Tyler's wisdom in adhering to state sovereignty may be questioned but not the courage, patriotism and sincerity he displayed in the nullification crisis.

Tyler heartily supported the stand Jackson took on federal aid to internal improvements in his veto of the Maysville road bill. He voted against the bill to recharter the Bank of the United States and also sustained Jackson's veto of the bill, but he refused to go along with Jackson on the removal of federal deposits from the bank. With the open support of the Clay faction, Tyler was re-elected to the senate in 1833 and in 1834 voted for the two resolutions censuring Jackson and his secretary of the treasury. Roger B. Taney, for the removal of deposits. Sen. Thomas Hart Benton immediately moved to expunge the resolutions of censure from the senate journal. The Virginia legislature, controlled by Jacksonians, in 1836 instructed the state's senators to vote for Benton's resolutions. Recognizing the legislature's right of instruction, but unwilling to vote as instructed, Tyler resigned from the senate on Feb. 29, 1536.

During his senatorial career Tyler served as chairman of the District of Columbia committee. In this position he sought to prohibit the slave trade in the district but opposed abolition of slavery in the district without the consent of Virginia and Maryland. Unlike Calhoun and other extreme proslavery men. Tyler believed that congress should receive abolition petitions and refer them to committee.

Having broken with the Democratic party, Tyler ran for vice-president on a ticket with Hugh Lawson White in 1836 and received 47 electoral votes. In 1838 he once more became a member of the Virginia legislature. The next year he conducted an unsuccessful campaign for the U.S. senate on the Whig ticket. The national Whig convention, meeting at Harrisburg, Pa.. in Dec. 1839, unanimously nominated Tyler for the vice-presidency on the ticket with William Henry Harrison, hero of the battle of Tippecanoe. Tyler's nomination came unsought in spite of his well-known opposition to the national bank, protective tariffs and distribution among the states of the money received from the sale of public lands. It came chiefly because, as a champion of state rights. it was thought he could win the southern states. With the slogan "Tippecanoe and Tyler Too," the Whig candidates won 234 of the 294 votes and were elected.

When Harrison died on April 4, 1841, one month after his inauguration, Tyler succeeded to the presidency. The opposition proposed to recognize him as acting president only but Tyler successfully claimed all rights and privileges of the office. Senator Clay, hoping to control the policies of the administration, publicly assumed leadership of the Whig party and in a special session of congress proposed four major measures: the repeal of the Independent Treasury act, distribution of the proceeds of public land sales. an increase in tariff duties and the establishment of a national bank. The contest was now joined between the nationalist senator and the state rights president. Tyler signed the act repealing the independent treasury and one levying new protective duties, but forced the dropping of distribution, and vetoed a national banking act. Clay declared that he would "drive the president before him" but Tyler vetoed a second bill providing for a "fiscal corporation." As a result, the entire cabinet, with the exception of Daniel Webster, promptly resigned. Tyler replaced them with men of state rights views. Webster remained in office long enough to complete negotiations with Lord Ashburton for the settlement of the northeastern boundary and then resigned. He was replaced first by Abel P. Upshur and then by Calhoun.

Tyler was now a president without a party; he had been repudiated by the Whigs but the Democrats refused to recognize him. Even so, Tyler's administration accomplished a great deal. It reorganized the U.S. navy, established a depot for nautical charts and instruments that later became the Naval observatory, tested and developed the system of magnetic telegraph, established the weather bureau, brought the Seminole War to an end, quieted the Dorr rehellion, negotiated a treaty with China, strengthened the Monroe Doctrine, and annexed Texas by a joint resolution of congress. The latter achievement gave Tyler some claim to the Democratic nomination for president in 1834 but he was passed over for James K. Polk. Tyler was nominated by an irregular convention but withdrew in favour of Polk and his expansionist platform.

'Tyler held no other public office until the eve of the American

Civil War but he took an active interest in public affairs; his opinions were often sought and he was in much demand as a public speaker. Returning to the Democratic party in 1844, he remained loyal to it until his death. He thought the Mexican War could and should have been avoided but he nevertheless advocated vigorous prosecution of the conflict. He voted for Lewis Cass in 1848, Franklin Pierce in 1852 and favoured Pierce over James Buchanan in 1856. He took a decided stand against the Wilmot proviso (1846) as a gross injustice to the south, and accepted Calhoun's doctrine that the constitution follows the flag; but he favoured the compromise of 1850 as a means of saving the union. He supported the Kansas-Nebraska act (1854) on the ground that the people of the territories had the right to decide the question of slavery for themselves. He had long held that congress had no right to restrict slavery in the territories and that Negroes were not citizens, hence he was pleased with the Dred Scott decision. He was much disturbed by John Brown's raid and commended the action of the Virginia governor in this matter.

Throughout the period of his retirement, Tyler was a strong champion of southern rights and southern interests but he held the view that the southern delegates acted unwisely in seceding from the 1860 Democratic convention in Charleston. He favoured John C. Breckinridge for the presidency but at the same time endorsed the Bell-Douglas fusion in New York and proposed that the Democrats pool their support for either Breckinridge or Douglas depending on which was the stronger. Tyler took a firm stand against secession and exerted himself on behalf of the' union although he believed that states had a constitutional right to secede. He served as a commissioner from Virginia to confer with President Buchanan and urged him to maintain the status quo at Ft. Sumter. He was largely responsible for, and presided over. the Washington peace convention of 1861. He hoped that it might "agree upon some suitable adjustment," but he did not believe the plan proposed constituted such an adjustment of differences and, after the plan had been rejected by the U.S. senate by a vote of 28 to 7, he gave up all hope of saving the union. He was elected to the Virginia secession convention and urged immediate secession. He was unanimously elected to membership in the provisional Confederate congress and to membership in the house of representatives under the permanent constitution. He died in Richmond on Jan. 18, 1862, before that body assembled.

Tyler was twice married, first in 1813 to Letitia Christian (1790–1842), and second in 1844 to Julia Gardiner (1820–1889). He made his home on plantations near his birthplace. In 1821 he bought the ancestral home, Greenway, where he resided until 1842 when he bought Sherwood Forest, a 1,200-ac. plantation only three miles distant. Tyler owned a labour force of more than 75 Negro slaves. He was a kind master but not a successful planter.

TYLER, MOSES COIT (1835–1900), U.S. historian who set high standards for subsequent intellectual and cultural histories by his pioneer research and writing. He mas born in Griswold, Conn., on Aug. 2, 1835, reared in rural Michigan. and educated in Detroit and at Yale university, where he graduated in 1857. After theological training in New Haven, Conn.. and Andover, Mass.. he was ordained as a minister and served Congregational pastorates at Owego and Poughkeepsie, N.Y. (1859–62). After several years in England as a lecturer and journalist Tyler became professor of rhetoric and English literature in 1867 at the University of Michigan. There he remained, except for 18 months in New York city as columnist on Henry Ward Beecher's *Chi-istian Union*, until called to Cornell university in 1881 to the first chair of U.S. history established in the United States.

Tyler considered literature the most sensitive register of dynamic ideas, and he searched the entire available written record at first hand. His interpretation of the spirit of national development broadened the scope of historical writing and challenged both anglophile and encyclopedic literary estimates. He was an energetic, volatile man whose enthusiasm for America's free republican progress was tempered by the canons of objectivity of scientific history. His most important published works were *A History of American Literature*, 1607–1765, 2 vol. (1878, rev. 1897); *The Literary History of the American Revolution*, 1763–1783, 2 vol. (1897); *Patrick Henry* (1887); and *Three Men of Letters* (1895). Tyler was a founder in 1884 of the American Historical association. He died in Ithaca. N.Y., on Dec. 28, 1900.

See Howard M. Jones, *The Life of Moses Coit Tyler* (1933). (L. W. C.)

TYLER, WAT (WALTER) (d. 1381), English rebel, was a native either of Kent or of Essex. Nothing definite is known of him previous to the outbreak of the peasant revolt in 1381, but Froissart says he had served as a soldier in the French War. The name Tyler. or Teghler, is a trade designation and not a surname. The discontent of the rural labourers and of the poorer class of craftsmen in the towns, caused by the economic distress that followed the Black Death and the enactment of the Statute of Labourers in 1351, was brought to a head by the imposition of a poll tax in 1379 and again in 1381. At the end of May in the latter year riots broke out at Brentwood in Essex; on June 4 similar violence occurred at Dartford; and on June 6 a mob several thousand strong seized the castle of Rochester and marched up the Medway to Maidstone. There they chose Wat Tyler to be their leader, and the rising spread over Kent. On the 10th Tyler seized Canterbury, sacked the palace of Archbishop Sudbury, the chancellor, and beheaded three citizens as "traitors." Next day he led his followers, strengthened by many Kentish recruits, on the road to London, being joined at Maidstone by John Ball (*q.v.*), whom the mob had liberated from the archbishop's prison. Reaching Blackheath on the 12th, the insurgents burned the prisons in Southwark and pillaged the archbishop's palace at Lambeth, while another body of rebels from Essex encamped at Mile End. King Richard II was at the tower, but neither the king's councilors nor the municipal authorities had taken any measures to cope with the uprising. The drawbridge of London bridge having been lowered by treachery, Tyler and his followers crossed the Thames; and being joined by thousands of London apprentices, artisans and criminals, they sacked and burned John of Gaunt's splendid palace of the Savoy, the official residence of the treasurer, Sir Robert Hales, and the prisons of Newgate and the Fleet. On the 14th Richard II, a boy of fourteen, rode out to confer with the rebels beyond the city wall. At Mile End the king met Wat Tyler; Tyler demanded the immediate abolition of serfdom and all feudal services, and the removal of all restrictions on freedom of labour and trade, as well as a general amnesty for the insurgents. Charters were immediately drawn up to give effect to these demands. Meanwhile, Tyler with a small band of followers returned to the tower, and dragged forth Archbishop Sudbury and Hales from the chapel and murdered them on Tower hill. During the following night and day London was given over to plunder and slaughter. Meantime the people of property began to organize themselves for the restoration of order. On June 15 Richard rode to Smithfield for a further conference with the rebels. Tyler formulated a number of fresh demands, including the confiscation of ecclesiastical estates and the institution of social equality. Richard replied that the popular desire should be satisfied "saving the regalities of the Crown." Tyler thereupon grew insolent, and in the altercation that ensued was killed by the mayor, Sir William Walworth (*q.v.*), and John Standwick, one of the king's squires. The enfranchisement of villeins granted by Richard at the Mile End conference was revoked by parliament in 1382, and no permanent results were obtained for the peasants by Wat Tyler's revolt.

BIBLIOGRAPHY.—The best original account of the rebellion of Wat Tyler is the "A Nominalle Chronicle of St. Mary's, York," printed by G. M. Trevelyan in the *Eng. Hist. Rev.* (1898). *See* also Thomas Walsingham, *Chronicon Angliae*, "Rolls Series," (1874); Froissart, *Chronicles*, ed. by G. C. Macaulay (1895); André Réville, *Le Soulèvement des travailleurs d'Angleterre en 1381* (1898); C. Oman, *The Great Revolt of 1381* (1906), and *The Political History of England*, vol. iv, ed by W. Hunt and R. L. Poole (1906).

TYLER, a city of northeastern Texas, U.S., 100 mi. E.S.E. of Dallas; the seat of Smith county. The town was laid out in

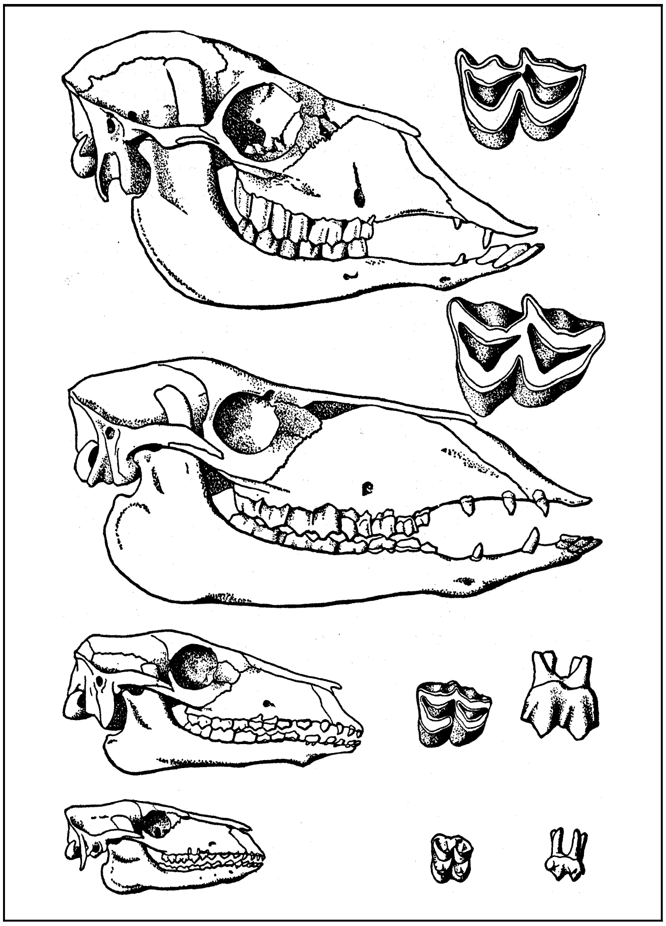
1846 and was named for Pres. John Tyler; its economy was based on trade and farming until 1930 when the East Texas oil field was discovered. Tyler subsequently became headquarters for many operators and oil companies and the population increased rapidly. In 1960 the population of the city was 51,230; that of the standard metropolitan statistical area (Smith county) was 86,350. (For comparative population figures see table in TEXAS: Population.) Tyler is also a distribution centre for densely populated east Texas, which produces cotton, corn, berries, pecans, oil and natural gas. Manufacturing includes oil refining, iron foundries, metal fabrication, prefabricated homes, air conditioners and ceramics. A majority of the nation's field-grown rose bushes are produced in nurseries in the area. Tyler was chartered as a city in 1907. It has a council-manager form of government, in effect since 1915. Educational facilities include Texas college, a private institution founded in 1894, and a public junior college organized in 1926. Tyler State park, a municipal rose garden, city parks and six nearby lakes provide excellent recreation. The Tyler Rose festival in October and the East Texas state fair in September attract thousands of tourists. (L. C. PI.)

TYLOPODA, a suborder of the paired-hoofed mammals (see ARTIODACTYLA) including the Xiphodontidae and Camelidae, of which the old world camels (see CAMEL) and the South American llamas and their allies (see LLAMA) are the only living representatives. The outstanding distinctions of the Tylopoda are: (1) the retention of the lateral incisors, canines and usually the first premolars as small recurved laniary tusks; (2) reduction of the remaining premolars and narrowness of the molars; (3) the peculiar form of tympanic bulla, folded in upon itself and filled with cancellous tissue; (4) elongate cervical vertebrae and peculiar course of the vertebral artery, perforating the inner side of the pedicle of the arch instead of the transverse process as in all other mammals (except *Macrauchenia, q.v.*); (5) carpal and tarsal bones remain separate, the trapezoid and magnum never co-ossified, nor the cuboid and navicular, while the trapezium is reduced to a small nodule in Miocene and disappears in later genera, only the ecto- and mesocuneiform are consolidated; (6) fore and hind feet completely didactyl, the lateral pair of digits absent except for small vestigial splints or nodules in the early forms, the median pair long, slender, appressed in early stages, consolidated into a cannon-bone in all later Tertiary and modem Tylopoda; (7) the distal ends of metapodials remain separate and slightly divergent, the keels of their distal facets confined to the palmar surface and not extending over the dorsal surface as in the pecora; (8) phalanges flattened and widened in varying degree and the hoof correspondingly reduced and limited to the upper surface of the terminal phalanx, conformant with the development of a heavy cutaneous pad on the palmar surface, and a digitigrade rather than unguligrade gait. No horns or antlers are developed. The femur and humerus are relatively elongate and the thigh and upper fore-limb are more free from the flank than in other ruminants. Many features of the soft anatomy are peculiar to the group; the absence of a distinct psalterium and presence of pockets in the stomach, the diffuse placenta and the oval blood corpuscles are the most remarkable.

The modern camels and llamas are the remnants of a group which played an important part among the Tertiary mammals of North America, and in the Pliocene and Pleistocene found its way to South America, Asia, eastern Europe and northern Africa. Fossil camels have been found in the Pleistocene of Alaska, in the Pliocene and Pleistocene of China, Siberia and Russia, the Pleistocene of Rumania and of Algeria, all of them related to the modern camels, but the Pliocene species from China and Russia are in a more primitive generic stage (Paracamelus). In South America the fossil Camelidae are related to the llama group, the older forms of late Pliocene and early Pleistocene more primitive in dentition (Palaeolama).

The ancestry of the camels is shown in North America by a very complete fossil record from Oligocene to Pleistocene, with more doubtful predecessors in the Eocene. The earliest stage is *Protylopus* of the Upper Eocene, about the size of a jack-rabbit. It has none of the characteristics of the Tylopoda well developed but is said to show them in a rudimentary stage. *Xiphodon* and other genera from the Upper Eocene of Europe have some claim to be associated with the Tylopoda.

Poebrotherium of the American Oligocene is the first of the undoubted ancestral line of the camels. It is about as large as a sheep and the long neck and limbs, peculiar course of the vertebral artery, the characteristic form of the tympanic bulla and the structure of teeth and feet are unmistakably camelid. The dentition is complete; the anterior teeth are all incisiform in some species, in others the canines are small, recurved, spaced tusks. The feet are two-toed, the lateral digits reduced to nodules, the median pair elongate and appressed but not co-ossified into a cannon-bone, the distal facets like those of modern Camelidae.



FROM SCOTT, "LAND MAMMALS OF THE WESTERN HEMISPHERE"
THE DEVELOPMENT OF THE SKULL AND MOLAR TEETH IN THE CAMEL

Oxydactylus of the Lower Miocene has the anterior teeth small recurved tusks, the vestiges of the lateral digits have disappeared or co-ossified, the median pair is more closely appressed and the size has increased to that of a llama or larger.

In Protolabis of the Middle Miocene the first and second upper incisors are reduced in size, the molar crowns are higher, and the metapodials are co-ossified to a varying degree in different species and at different ages. In Procamelus of the Upper Miocene the first and second upper incisors have disappeared, and the co-ossification of the metapodials is complete. Another side branch, *Alticamelus,* in the later Miocene and Pliocene differs from *Procamelus* in the long limbs and neck and relatively small head.

In the Pliocene follow a number of diverse genera incorrectly grouped under the name of Pliauchenia, and characterized by the loss of the second premolar in upper and lower jaw; but while they agree in this particular they differ widely in size, proportions, retention or loss of other teeth, height of molar crowns, etc. The best known is Megatylopus, probably identical with *Paracamelus* of the Chinese Pliocene, larger and more robust than the modern camel, with foot-pads less developed, but in most respects approximately ancestral. A group of smaller species, to which the name *Pliauchenia* may be found applicable, shows a similar approach to the llamas; a third group appears to be derived from *Alticamelus*, and a fourth parallels the Virginia deer in proportions (although not related).

In the Pleistocene the genus *Camelops* has lost the third lower premolar as well as p$\frac{2}{2}$, and p$\frac{3}{}$ is much reduced; p$\frac{1}{1}$ is present or absent in different species. It is of about the size and proportions of the modern camels, but lacks the broadly flattened toes and probably had not much padding on the foot. Another genus, akin to the llamas but with longer cannon-bones, relatively smaller head and sometimes retaining p$_{\overline{3}}$, occurs in the Pleistocene of the southern and south-western United States.

It has been generally believed that the camels became extinct in North America in the older Pleistocene, but recent evidence shows that some at least survived in Nevada until almost recent times, and probably elsewhere in the south and south-west until late Pleistocene. The splitting up of the family into the camels proper and the llama group is clearly foreshadowed in the geographical distribution of the Pliocene and Pleistocene species, many of the south-western species showing more affinities to the llamas, while those of the north-west are nearer to the camels. The Alaskan species and the Chinese *Paracamelus* make a still closer approach to the camel, and the Siwalik species is a typical *Camelus*. The Rumanian *"Camelus" alutensis* is, however, a side branch with low-cro ned molars, slender jaw and retaining p$_{\overline{3}}$, related to one of the North American Pliocene groups. In South America *Palaeolama* of the early Pleistocene, while retaining the second and third premolars like *Procamelus*, is quite llama-like in details of molar construction, in characters and proportions of skull and skeleton.

(W. D. M.; X.)

TYLOR, SIR EDWARD BURNETT (1832–1917), English anthropologist, a dynamic figure in the history of anthropology. was one of the first to apply a systematic, comparative method to cross-cultural studies. Born at Camberwell, London,.on Oct. 2, 1832, of a well-to-do Quaker family, he was educated at Grove House. Tottenham, a denominational school. During 1855–56 he traveled in the United States and in the latter year visited Mexico with Henry Christy, the prehistorian. Tylor's observations were published as *Anahuac, or, Mexico and the Mexicans, Ancient and Modern* (1861). In 1865, his reputation was established by his *Researches Into the Early History of Mankind;* this was followed in 1871 by his most important work, *Primitive Culture* (new ed., 2 vol., 1958). He also published a popular text, *Anthropology* (1881). Tylor was keeper of the University museum (1883) and reader in anthropology (1884) at Oxford university. In 1888 he became lecturer at Aberdeen university and, in 1896, first professor of anthropology at Oxford. A fellow of the Royal society, he was knighted in 1912.

Like most of his contemporaries, Tylor was a cultural evolutionist. but in moderation. On the question of diffusion versus independent invention as an explanation of cultural similarities! he put fact before theory, carefully assessing the evidence in each case. His studies on mythology and magic and his famous derivation of religion from animism are both scholarly and provocative. He died on Jan. 2, 1917, in Wellington, Somerset.

See also ANIMISM; FOLKLORE; MAGIC; ANTHROPOLOGY.

See N. W. Thomas (ed.), *Anthropological Essays,* a volume dedicated to Tylor with a bibliography by B. Freire-Marreco and an appreciation by Andrew Lang (1907); and R. R. Marett, *Tylor,* "Modern Sociologists Series" (1936).

TYNDALE (or TINDALE), **WILLIAM** (*c.* 1492–1536), translator of the New Testament and Pentateuch (*see* BIBLE, TRANSLATIONS OF), was born on the Welsh border, probably in Gloucestershire. between 1490 and 1495. In Easter term 1510 he went to Oxford. where Foxe says he was entered at Magdalen Hall. He took his M.A. degree in 1515 and removed to Cambridge, where Erasmus had helped to establish a reputation for Greek and theology. Ordained to the priesthood, probably towards the close of 1521, he entered the household of Sir John Walsh, Old Sodbury, Gloucestershire, as chaplain and domestic tutor. Here he lived for two years, using his leisure in preaching in the villages and at Bristol, conduct which brought him into collision with the backward clergy of the district, and led to his being summoned before the chancellor of Worcester (William of Malvern) as a suspected heretic: but he was allowed to depart without receiving censure or being given any undertaking.

Translation of the Bible. — But the persecution of the clergy led him to seek an antidote for what he regarded as the corruption of the Church, and he resolved to translate the New Testament into the vernacular. In this he hoped to get help from Cuthbert Tunstall, bishop of London, and so "with the good will of his master" he left Gloucester in the summer of 1523. Tunstall disappointed him, so he got employment as a preacher at St. Dunstan's-in-the-West, and worked at his translation, living as chaplain in the house of Humphrey Monmouth, an alderman, and forming a firm friendship with John Frith; but finding publication impossible in England, he sailed for Hamburg in May 1524. After visiting Luther at Wittenberg, he settled with his amanuensis William Roy in Cologne, where he had made some progress in printing a 4to edition of his New Testament, when the work was discovered by John Cochläus, dean at Frankfurt, who not only got the senate of Cologne to interdict further printing, but warned Henry VIII. and Wolsey to watch the English ports. Tyndale and Roy escaped with their sheets to Worms, where the 8vo edition was completed in 1525. Copies were smuggled into England but were suppressed by the bishops, and William Warham, archbishop of Canterbury, even bought up copies on the Continent to destroy them. Attempts were made to seize Tyndale at Worms, but he found refuge at Marburg with Philip, landgrave of Hesse.

Other Works. — About this time he changed his views on the Eucharist and swung clean over from transubstantiation to the advanced Zwinglian position. His *Parable of the Wicked Mammon* (1528), *Obedience of a Christen Man* (1528), in which the two great principles of the English Reformation are set out, viz. the authority of Scripture in the Church and the supremacy of the king in the state, and *Practyse of Prelates* (1530), a strong indictment of the Roman Church and also of Henry VIII.'s divorce proceedings, were all printed at Marburg. In 1529 on his way to Hamburg he was wrecked on the Dutch coast, and lost his newly completed translation of Deuteronomy. Later in the year he went to Antwerp where he conducted his share of the classic controversy with Sir Thomas More.

After Henry VIII.'s change of attitude towards Rome, Stephen Vaughan, the English envoy to the Netherlands, suggested Tyndale's return, but the reformer feared ecclesiastical hostility and declined. Henry then demanded his surrender from the emperor as one who was spreading sedition in England, and Tyndale left Antwerp for two years, returning in 1533 and busying himself with revising his translations. In May 1535 he was betrayed by Henry 'Phillips, to whom he had shown much kindness, as a professing student of the new faith. The imperial officers imprisoned him at Vilvorde Castle, the state prison, 6 m. from Brussels, where in spite of the great efforts of the English merchants and the appeal of Thomas Cromwell to Archbishop Carandolet, president of the council, and to the governor of the castle, he was tried for heresy and condemned. On Oct. 6, 1536 he was strangled at the stake and his body afterwards burnt.

Though long an exile from his native land, Tyndale was one of the greatest forces of the English Reformation. His writings show sound scholarship and high literary power, while they helped to shape the thought of the Puritan party in England. His translation of the Bible was so sure and happy that it formed the basis of subsequent renderings, especially that of the authorized version of 1611. Besides the New Testament, the Pentateuch and Jonah, it is believed that he finished in prison the section of the Old Testament extending from Joshua to Chronicles.

Beside the works already named Tyndale wrote *A Prologue* on ***the***

Epistle to the Romans (1526), *An Exposition of the 1st Epistle of John* (1531), *An Exposition of Matthew v.–vii.* (1532), a treatise on the sacraments (1533), and possibly another (no longer extant) on matrimony (1529).

The works of Tyndale were first published along with those of John Frith (*q.v.*) and Robert Barnes by John Day, in 1573 (folio). A new edition of the works of Tyndale and Frith, by T. Russell, was published at London (1828–31). His *Doctrinal Treatises and Introductions to Different Portions of the Holy Scripture* were published by the Parker society in 1848. For biography, *see* Foxe's *Acts and Monuments;* R. Demaus, *William Tyndale* (1871); also the Introduction to Mombert's critical reprint of Tyndale's Pentateuch (1884), where a bibliography is given.

TYNDALL, JOHN (1820–1893), British natural philosopher best known for his researches on radiant heat, was born at Leighlin Bridge, County Carlow, Ire., on Aug. 2, 1820. After a brief career as a surveyor and engineer he entered the University of Marburg in 1848 and obtained his doctorate in 1850. He became known through some early magnetic observations and in 1852 was elected a fellow of the Royal society.

In 1853 he was chosen professor of natural philosophy at the Royal institution, where he became a colleague and friend of Michael Faraday. Tyndall became superintendent in 1867. He retired in 1887 and died at Hind Head, Surrey, Dec. 4, 1893.

Tyndall's investigations of the transparency and opacity of gases and vapours for radiant heat, which occupied him during many years (1859–71), are frequently considered his chief work. But his activities were many-sided. He definitely established the absorptive power of clear aqueous vapour—a point of much meteorological significance. He made brilliant experiments elucidating the blue of the sky and discovered the precipitation of organic vapours by means of light. He called attention to curious phenomena occurring in the track of a luminous beam. He examined the opacity of the air for sound in connection with lighthouse and siren work, and he finally verified what had already been substantially demonstrated, that germ-free air did not initiate putrefaction. However, his contributions to science are due more to his gift for making difficult things clear than to his original researches.

For the substantial publication of his researches, reference must be made to the publications of the Royal societv: but accounts of many of them were incorporated in his books,-which include the famous *Heat Considered as a Mode of Motion* (1863), the first popular exposition of the mechanical theory of heat.

TYNE, a river in England, flowing into the North sea. It is formed by the junction near Hexham (30 mi. from the sea) of the North Tyne, flowing from the southwestern end of the Cheviots, and the South Tyne, coming from the northern slopes of Cross Fell. Lesser tributaries include the Rede to the North Tyne, and the East and West Allen which combine to enter the South Tyne, all flowing through picturesque wooded valleys in sheep- and cattle-raising country. The Derwent, which enters the Tyne 2 mi. W. of Newcastle, forms part of the boundary between Northumberland and Durham. The Tyne continues the boundary for the last 15 mi. of its course as it crosses the Northumberland and Durham coal field where its banks are lined with factories, shipbuilding yards and wharves. Before 1900 the principal shipbuilding centre in Great Britain, it now ranks second to the Clyde. For more than 600 years it shipped coal but the export section of the trade declined. The main road and rail routes to Scotland cross the river between Gateshead and Newcastle, the lowest bridging point, 8 mi. from the sea. The river is navigable for large craft to Newcastle and a few miles farther for colliers. (T. HER.)

TYNEMOUTH, a municipal (1849) county (1904) and parliamentary borough of Northumberland, Eng., at the mouth of the Tyne, on its left bank, 9 mi. E.N.E. of Newcastle. The borough is bounded on the south by the Tyne for 3.5 mi. and on the east by approximately 2.4 mi. of coast line. It is divided into the wards of Chirton, Collingwood, Cullercoats, Dockwray, Linskill, Percy, Preston, Trinity and Tynemouth. Pop. (1961) 70,112. Tynemouth is a residential district and seaside resort; it is also partly industrial and contains a small mining area.

North Shields is an important seaport with a big fishing industry and a regular steamship service to Norway. The municipal buildings are situated there. It is connected by ferry with South Shields, on the opposite bank of the river. The borough's main industries, beside fishing, include ship repairing, the manufacture of furniture, textiles, confectionery, plastic board and light engineering. At Chirton a 200-ac. estate has been laid out for light industries. The central public library contains a splendid collection of engravings; open spaces include five public parks. On a rocky promontory at Tynemouth stands the castle, originally a fort once occupied by the earls of Northumberland but now used as barracks. Within the grounds are the ruins of the priory of St. Mary and St. Oswin, founded in 617–633 by Edwin, king of Northumbria. The church is a magnificent example of Early English work engrafted upon Norman. The priory was probably fortified in Saxon times and again by Robert de Mowbray. After the Dissolution the fortifications were repaired by Henry VIII. Charters were granted in 1203 and 1204 to the prior and convept. In 1292 there were disputes between the citizens of Newcastle and the prior, who had built a quay at North Shields but was obliged by act of parliament to destroy it. Tynemouth and North Shields did not become important until the 19th century. After the Napoleonic Wars the trade of North Shields rapidly increased, and fish quays were constructed. With Whitley Bay urban district Tynemouth returns one member to parliament.

TYPE, PRINTING: *see* PRINTING TYPE.

TYPE-CASTING MACHINES: see PRINTING TYPE; PRINTING.

TYPE METAL, an alloy of lead, antimony and tin used to make type characters for printing by the raised letter or letterpress method, or used as the master for making duplicate printing plates. (*See* ELECTROTYPING.) The same basic alloy has been used for over five centuries because of its low melting point and good castability and its minimum of contraction upon solidification, which provides clean, sharp type characters. Additional advantages are: ease of machinability, ease of solderability, availability of raw materials, re-usability of the alloy, and the ease with which the hardness of the alloy can be adjusted for various applications simply by varying the percentages of tin and antimony (*qq.v.*). The composition of type metals is not critical; in actual practice, however, the composition of the alloy is controlled carefully to provide optimum working properties for use in the type of casting equipment employed.

Type metal alloys are divided into classes according to the methods of casting to be used. Typical alloy compositions are given in the table:

Alloy Compositions

	Lead	Tin	Antimony	Brinell hardness number†	Melting point C.°
Foundry type*	62	13	25	34	325
Linotype metal	86	3	11	19	247
Monotype metal	78	7	15	24	262
Stereotype metal	80.5	6.5	13	22	252

*Sometimes as much as 2% of copper is added.
†250-kg. lead, 30 seconds (see HARDNESS TESTING).

Metal for foundry or re-usable type, being harder and having a higher melting point than the other type metals, is die cast. Individual type characters are set by hand and foundry type is used when the highest quality of printing is required.

Metal for Linotype, used extensively for printing newspapers, magazines and books, is cast on an automatic machine right in the composing room.

An entire line of indented brass type molds is assembled, and the complete line is cast with Linotype metal and cooled to a solid bar while the next line is being set. After use in printing, the type is melted for re-use. An alloy having a low, sharp melting point is required for this use.

In the Monotype, single type characters are die cast in the composing room in a casting machine developed by the Lanston Monotype Machine company.

Monotype is desirable where molding operations are involved, as in making electrotypes, stereotypes, plastic printing plates or molded-rubber printing plates.

In the stereotype method of making duplicate printing plates, molten type metal is poured against a paper mat, usually after the mat has been curved so that final plate can be used on a cylindrical press.

The paper mat is made by moistening a special paper board and pressing it against a flat array of type and halftone plates. This process is used by practically all large newspapers.

Because it is easily cast, type metal can be used for making statuettes, metallic candlesticks and various other decorative objects.

See also PRINTING TYPE. (R. W. J.)

TYPESETTING. Up to the end of the 19th century type was composed by hand, letter by letter, much as it had been in the 15th century. Keyboard-operated composing machines, which came into use about the beginning of the 20th century. introduced the radically new principle of "hot-metal" composition in which type is cast especially for each occasion from molten metal. This method revolutionized the setting of what the printer calls body matter or straight matter (*e.g.*, the text of a book or a newspaper). For more than a generation, however, hot-metal composition found no application in the other main field of typesetting, the setting of display matter (cards, letterheads, advertisements, etc.). Even in the 1960s hand composition was widely used in this class of work.

Meanwhile, a new and much more revolutionary change began to affect both of these main divisions of type composition. For display work, it was possible, beginning in the 1920s, to compose letters on sensitized film in the variety of designs and large sizes required by advertisers. The principle of filmsetting was extended to straight matter. and by the 1950s keyboard-operated filmsetting machines that entirely eliminated the use of type metal were in operation.

Filmsetting (also known as photosetting or photocomposition) has the same aim as did the hand methods of the 15th century—to secure a uniform printed page with identical likeness of like characters, a flatness of the composite image and a general rectangularity of page or column. The characters are composed on photographic film from which a plate can be made for letterpress. intaglio or lithographic printing. A page reproduced from type set on film is indistinguishable from one set in metal type, but by abandoning the whole idea of metal casting and by eliminating the third dimension (depth) of the matrix (see below), filmsetting initiated the most profound technological revolution in the history of type composition since the development of movable type.

The Form.—For centuries after the invention of printing, replica casting in metal was the only way of ensuring perfect likeness between any prints of the same letter. The letters had to be cast in female dies called matrices, which were struck to a standard shallow depth by relief-cut, steel model letters called punches. The face, or printing surface, of the type, the only part that touches the paper, thus precisely reproduced the flat face of the punch. But the cast letters had to be tall enough to provide a convenient grip for the compositor's finger and thumb, so the matrix was clamped on a mold in order to seal the bottom of its casting orifice. The mold, in which the body (or shank) of the type was cast, was of vital importance to the whole invention of printing with movable type for it was the means of assuring that when the cast types were assembled, their bodies would fit together so precisely that the types could then be securely fastened together (locked up) into one rigid composite master image—the form, or forme, from which a whole sheet was printed at a single impression. The form had to be exactly rectangular in shape and of uniform thickness (height-to-paper) so that its composite printing surface, formed by the relief-cast faces of the letters, would be perfectly flat. Until the introduction of filmsetting, all methods of type composition were concerned with the fitting together of solid metal objects about one inch high; these objects were either individual printing types, such as the single piece (or "stamp") of type, or line-long "slugs." Each of these was given a name and the hot-metal machine operators took over the old hand composition phraseology wherever possible. Filmsetting in its turn is using the same terminology to describe its analogous methods of producing those effects.

The Mold.—The cavity of the two-part mold used in casting types had to be adjustable "setwise" (from side to side) to allow for the different widths of the characters of the alphabet. But in the dimension that the printer calls body size, *i.e.*, from the top to the bottom of the printing surface of the character, it was, and remains, inalterable. Hence every type cast in a particular mold, whatever the character on its face, was of the same body size. Types of different faces (in the sense of typographical designs) could thus be cast from the same mold, so long as the sets of matrices were of appropriate size. When type of another body size was cast, another mold and another set of matrices had to be used. One striking advantage of photographic composition is that it can produce images of any desired size from one set of master letters by a simple adjustment of lenses.

Type Size.—The pioneer printers, who had to make their own type, possessed molds that they had made or commissioned for themselves; their type was in whatever sizes they happened to need for the work at hand. Sizes were therefore roughly graded, though not by any common unit of measurement. Their earliest names identified merely the type size that was thought suitable for a particular kind of book. A famous instance is the pica size (now 12 point), which is said to have derived its name from the conventional type size for the pocket breviaries that William Caxton called "pies." But in the 16th century punch cutting became an independent profession and the distinction between sizes became established as the letter engravers sold "strikes" (brass matrices) of their steel punches to more than one printer in more than one country. In time printers found it convenient to purchase their supplies of type ready-made from founders; the type was made up in fonts, or founts (complete castings from one set of related character matrices), of types of the same alignment and body size. This meant that each type-founding firm had to establish and maintain to a fine tolerance the sizes that are still called pica, brevier (now 8 point) or long primer (10 point). But the measurement of the metal type might vary, according to the manufacturer's standard, by several thousandths of an inch, so that types from different founders could not be used interchangeably. The type founders profited by this anomaly, for once a printer had chosen his supplier, he had to go on ordering from that firm the tons of type that were required for the hand composition of books and periodicals.

Standardized Measuring Systems.—In the 18th century Pierre Fournier proposed a standard unit of measurement, the point, for all type sizes. The later Didot point system, in which the point was 0.0148 in., was widely adopted in France and is now the one most used in continental countries. English and American type founders, however, continued to resist adopting the standard units until the later years of the 19th century, when the arrival of the hot-metal machines altered the whole situation and forced in the point system. The square or quadrat or quad of pica (■) had meanwhile become a familiar unit of measurement, setwise as well as bodywise, in the English-speaking countries; so the pica size was arbitrarily fixed and the Anglo-American point made one-twelfth of it, or about +$ of an inch (.013837 in.). The traditional names are still used in some newspaper offices and print shops to refer to the nearest point sizes. and a number of eminent Scottish book-printing firms are using the old system of measurement.

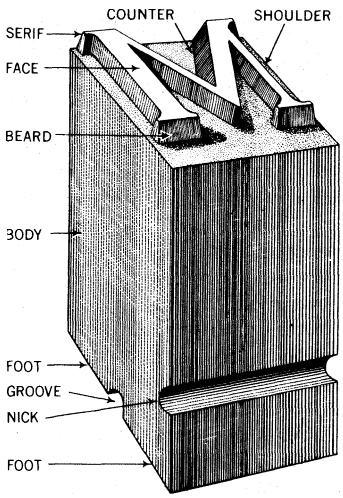

FIG. 1.—SINGLE PIECE OF TYPE USED IN HAND COMPOSITION

The other inalterable dimension of the mold, the depth of its cavity, had to be strictly standardized from the beginning for every mold that the typecaster used. Together with the depth of the intaglio matrix it determines the height-to-paper of the type from foot to face (see fig. 1). The Anglo-American printing world uses one standard height (.918 in.), but there is no uniformity of type height—or of point measurement—in other countries. When hot-metal casting was introduced, a great variety of molds had to be constructed for use in the other countries, where combinations of ten or more point systems, as well as regional varieties of type height, are to be found. The new filmsetting machines overcome such absences of uniformity.

Use of Film. — The whole idea of using photography instead of metal for typesetting was made to seem practicable and attractive to inventors by the steady increase in the amount of work printed by photolithography and, in display composition, by the mechanized process of serigraphy, or silk-screen printing. Both processes require photographic printing on a sensitized plate, and relief-cast type is used only in obtaining "repro proofs" (*i.e.,* proofs for photographic reproduction).

HAND COMPOSITION

The hand compositor, although he lives in an era of technological change and mechanization, remains an essential member of even the most completely mechanized printing house. In addition to assembling type by hand, he usually is also responsible for forwarding to the press, or to the platemaker. the machine-set type that emerges in long columns of lines. After (or before) corrections are made, the type has to be divided into pages or columns, which in turn have to be "imposed" in correct order upon the large flat table called the stone. In a book house this may mean placing 32 or more pages of composed type in such an order, head to foot, that when the whole large sheet is printed from the form (and "backed up" from a similar form) and then folded and trimmed, all the pages of the resulting "signature" will read consecutively. An elementary notion of the problems involved in imposition can be gained by folding any rectangular piece of paper twice across, numbering the resulting eight pages and then unfolding the sheet to see how the type pages would have to be arranged. In a ne spaper office the make-up man, or "stone hand," makes up the complex of headlines and text matter of each full page. No matter where he works, the compositor has the final duty of locking up the form in the chase, the iron frame in which it is taken to the next department.

All type for hand composition consists of individual letters or other characters. Hand type that is manufactured by specialist type founders from matrices of their own design is called foundry type; such type is made of metal that is harder than can be used in hot-metal composing machines. Type metal used in both foundry and hot-metal casting is a mixture of lead (the principal ingredient) and variable proportions of tin for toughness and antimony for sharpness of detail; foundry type also contains a small amount of copper to increase its durability. Single type can be cast in the print shop by the use of Monotype or other casting machines; such type is also cast for sale by trade houses that have such machines. Purchase of either foundry or Monotype type is by pound weight of font; that is, a sufficient quantity of one size and one design to serve for the kind of work that is to be done.

Each character (letter. figure or sign) is supplied in a number of "sorts" (identical examples), the quantity being proportioned to the expected frequency of appearance of that character in the language or in the class of work. A jobbing font of boldface type for occasional use in short lines might include 18 "a" (28 "e," 6 "f" and so on), 10 "A," 4 "&," proportionate quantities of figures 1 to 0, signs of punctuation, and such symbols as $. £, *, †, as well as ligatures, which are tied letters cast on one body, such as a?, ffl. It might also include accented sorts (à, ç, etc.). The strength of the font is reckoned by the number of sorts of some particular character, often the "a."

The scheme of the font is the indication of the particular characters that are included. A book font in a normal reading size would have a strength of 74 "a" (or more); a normal scheme (other than for mathematical, foreign language or other special purposes) would include not only roman a, A, etc., with related figures and signs, but also small capitals (A, B), the italic letters with their own figures and signs that must have the italic slant (cf. ; ;), leaders ( ) and perhaps the commoner fractions, although fractions and other mathematical signs are usually counted as "specials" that can be transferred from one font to another of the same body size.

Quads and spaces can also be transferred between fonts of similar size. These are the blank types that are cast less than type-high so as to leave white space in the print. Em, or "mutton," quads, as cast in foundry type. are the square (quadrat) of the point size and are mainly used for filling out short lines; *e.g.,* finishing out the last line in a paragraph. En, or "nut," quads are half as wide as the em; spacing widths most used for separating words grade down through thick, mid, and thin to the less-used "hair" space, which in careful display setting serves to equalize the visual differences in distance between letters.

A type case for hand type is a shallow tray subdivided into compartments for the respective characters and spaces. A jobbing case, *i.e.,* one for a font of large size and low strength, is made so as to contain the whole scheme of characters. Cases usually come in pairs, one for the capitals, small caps and certain less-used signs and spaces, and the other for the small letters that took their name of "lower case" from their position when the two cases are mounted in use—one above the other on a slanting frame on top of the storage cabinet or when the cases are partially pulled out of the cabinet. The cases form drawers in the cabinet and are labeled on the outside. There is a separate pair of cases for italic letters. The cabinets usually are ranged in rows that form aisles or corridors. Nearby is a circular power saw with which the compositor can trim, cut or mitre rules (long thin type-high strips, sometimes of brass, that are used as borders or column markers) or cut metal spacing material (long strips less than type-high used to provide white space between or around printed lines of type).

The compositor examines his copy and whatever specifications and layout (plan of arrangement) come with it. The layout represents a new event within the 20th century; whereas the 19th-century compositor was expected to be able to design as well as set his handbills, etc., his descendant must be able to interpret the directions of the customer or the typographic designer.

The compositor notes the measure (width of line) in which the job is to be set and accordingly adjusts his composing stick. What was originally a simple stick of wood hollowed out to receive a few lines of metal type has become a precision instrument of metal. It is often the personal property of the compositor and so in some sense is an emblem of his trade.

He slides out the pair of cases that he requires and fixes the copy within easy sight. Holding the stick in his left hand he reaches with first finger and thumb of his right hand for the first letter, positions it in his fingers by the feel of the "nick" or groove in the front of the type and places it at one end of the stick. The type is set upside-down so "The" is set "ꞱɥƐ." Between each word the compositor inserts a space. If the matter is to be set as text, *i.e.,* in a rectangular column or panel, at the end of the line he "justifies" the type by going back over the line and adding or removing equal amounts of spacing between words or letters until the line is filled to measure. Optically even spacing is the mark of a craftsman, whether at the case or at the keyboard.

The next line is set immediately above the preceding one, and so on until the stick is full; the type then is transferred to a galley, a long, shallow metal tray in which the composed lines are accumulated. If extra interlinear space is required, the compositor inserts between each line a thin, line-long strip of soft metal called a "lead" Leads are cast less than type-high in standard thicknesses usually from one point and up, in increments of half a point.

If the job is in display, the compositor takes all the lines that he has composed from different fonts and makes them up into the composite pattern of the whole area, inserting larger units of spacing material as required, together with any illustrative line or halftone engravings (blocks), etc. (When trade-marks. coats of arms, company names or other insignia are cast as metal type, they are called logotypes.) The whole composition is temporarily bound around its edges with cord. While still on the galley, it goes to the proofing press. The first proof goes to a proofreader and is marked for correction. "Literals" (*e.g.,* transposed letters) and any other departure from the copy may be corrected before the second, or author's, proof is sent out. After the form has been on the press, or printing plates have been made from it, it returns to the composing department. The surface is washed clean of ink and the form, while on the imposing stone, is unlocked. Type that was set by hand is retrieved for further use and "distributed," each letter being dropped back into its proper compartment in the case.

MECHANICAL COMPOSITION

Development of Hot-Metal Machines.—The earliest attempt at mechanical composition was patented by William Church in 1822. In 1842 J. H. Young and A. Delcambre in London used a machine for composing the *Family Herald.* For about the next 60 years inventors struggled with the problem of assembling and spacing out lines of cold (pre-cast) printing types by depressing keys that released each type as required from its channel in the magazine. Companion machines were invented for distributing the-types after use into their respective channels.

A key invention that helped make mechanical composition practicable was that of the pantographic punch-cutting machine, patented in 1884 by a U.S.type founder, Linn Boyd Benton of Milwaukee, Wis. Punches had previously been engraved by hand, and when a tiny steel letter broke in the course of striking a matrix, no hand engraver, however skilful, could reproduce it with absolute fidelity. Benton's machine made it possible to engrave any number of identical punches from a mechanical drawing; hence, for the first time, matrices could be manufactured in limitless quantity without the slightest variance.

In the same year (1884) Ottmar Mergenthaler (*q.v.*) of Baltimore, Md., a German-born U.S. citizen, patented the Linotype machine, the first and still the most famous of the hot-metal machines. It took over the general principle of the keyboard and resembled the earlier typesetting machines in that multiples of different characters were stored in a magazine. It was different in that it stored not type but a sufficient number of identical matrices to serve for the composition of one line of text. When the matrices for an entire line had been assembled, the line was cast as one solid slug and the matrices then returned to their respective channels in the magazine.

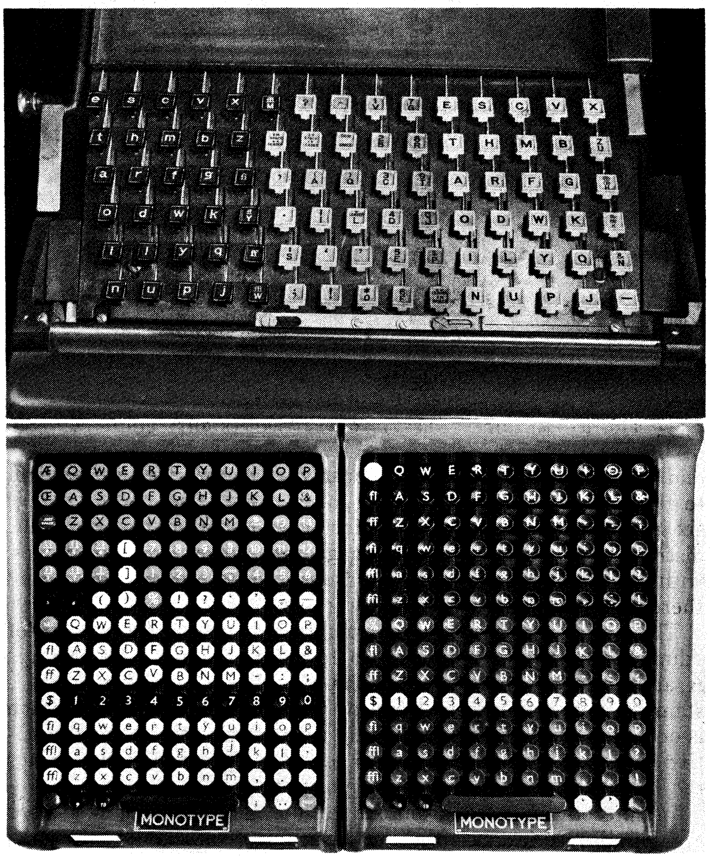
In the follo ing year (1885) Tolbert Lanston of Washington, D.C., took out the basic patent on his Monotype machine for hot-metal composition in single, or movable, type. This machine moved by means of a perforated ribbon encoded at a separate keyboard machine, a set of single matrices (one for each character in the font), from a traveling frame to the mold orifice where a single type was cast. This invention, which was developed after 1893, was equally dependent for its success upon the new means of making identical sets of matrices.

Immense capital resources were needed to manufacture in quantity any machine that had to work to the precise tolerance required in typecasting. The history of mechanical composition became that of a few powerful private enterprises formed to promote and defend patents and to develop an original mechanical concept by ancillary inventions. The Mergenthaler Linotype company of Brooklyn, N.Y., was first in the field. A Linotype machine was first used commercially in 1886 in the office of the New York *Tribune.* In a redesigned form it went into regular production in 1890 and was offered for sale on the world market in 1894. Since then, a succession of new and alternative models have improved and extended the machine's scope. When the basic Mergenthaler patents expired in 1914, a similar and competing machine was put on the market by the newly formed Intertype company of Brooklyn, N.Y. Lanston's more complex invention was developed during 13 years of engineering revision that exhausted the financial resources of the Lanston Monotype Machine company of Philadelphia. The $1,000,000 needed to put the machine into regular production was raised by selling the world rights outside the American continents to a specially formed English company, from 1931 called the Monotype Corporation Ltd.

Large-size display setting by hot-metal machines became possible when the Ludlow Typograph company of Chicago brought out in 1911 its Ludlow type-casting mechanism. With this machine, matrices, in sizes suitable for headlines and display work, are set and justified by hand and cast as slugs. Certain models of Linotype and Intertype machines also are equipped for casting large sizes of type. An attachment to Monotype casters extends the range of font casting to 36-point type. A Monotype Super Caster casts type fonts to 72-point size (one inch).

The words Linotype. Ludlow, Intertype and Monotype were registered as trade-marks by the respective manufacturing companies, and the latter three words are legally protected against misuse in a generic or descriptive sense. The word Linotype has been less successfully defended.

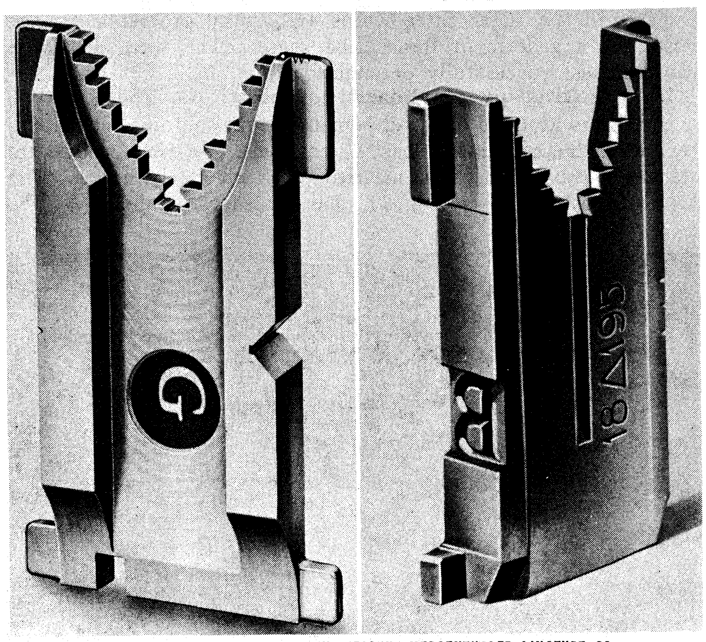
Line Casting by Keyboard Composition.—The Linotype machine has at least one and sometimes up to four magazines; each magazine contains at least 90 channels, in each of which are stacked up to 20 identical matrices of a given character. The keyboard has 90 keys (fig. 2), one for each channel. As the



BY COURTESY OF (TOP) KINGSPORT PRESS, INC., (BOTTOM) MONOTYPE CO

FIG. 2—KEYBOARD LAYOUTS: (TOP) LINOTYPE; (BOTTOM) MONOTYPE

operator touches a key, a pawl moves and releases the lowest matrix of the corresponding character. The matrix (fig. 3) slides down from the slanted magazine and is conveyed by a moving belt to the assembler (the "stick"). nhich has been adjusted to the required measure. After each nord is assembled, the operator presses a space key, which releases a steel spacehand (fig. 4) in the form of a sliding wedge. When the line contains as many matrices and spacebands as the measure will accommodate, the operator presses the elevator lever and the entire line is raised, securely gripped in steel fingers, and carried to the casting mechanism at the left of the machine. Here the line is automatically positioned between two vise jaws. There are four molds, all set in a revolving wheel. As the line of matrices and spacebands descends, the wheel makes a one-quarter turn and the mold to be used in casting that line comes into position. At this point a block presses upon the expandable spacebands and so drives out the line to the full measure by increasing the space between each word. The mold wheel moves forward and the mold seals the line under tight pressure. Molten type metal is pumped from the melting pot into the orifice and the line is cast. The slug, while still in the mold, is retracted from the matrices and a knife removes the rough jet of the casting. The slug is ejected and brought between two parallel trimming knives. Meanwhile, by successive automatic processes the line of matrices and spacebands is transferred to grooves, along which the teeth of the matrices slide. The spacebands fall out, since they have no teeth,



BY COURTESY OF (LEFT) INTERTYPE COMPANY, (RIGHT) MERGENTHALER LINOTYPE CO.

FIG. 3.— MATRICES: (LEFT) FOTOSETTER; (RIGHT) LINOTYPE

and are returned to their o n housing. The matrices are brought to the mouth of the distributing mechanism. The matrices have six pairs of teeth cut in particular combinations, and in the distributing mechanism they engage with corresponding grooves, with the result that each matrix drops into its proper channel and thereupon becomes available for re-use.

The number of available characters is increased by the use of "duplex" matrices, in which two forms of the same letter (*e.g.,* A and *A*, or b and **b**) are stamped. The alternative form is stamped below the normal casting position on the matrix, which is occupied by the more frequently used form. When the alternative sort is required, the operator presses a special key that brings the lower letter up into casting position.

In different machines from one to four additional side magazines are supplied to increase the operating range with additional fonts or sizes. The operating range also can be increased by exchanging magazines, which are interchangeable within certain type and mold size limits, and by hand insertion of special "sorts" into the assembled line before it is cast.

About 1950 a device called the Teletypesetter (developed in the early 1930s) came into wide use, especially on small daily newspapers in the United States, to set straight matter and special tabular material such as stock market quotations. The basic unit of this device was an attachment that fitted over the keyboard of a Linotype or Intertype machine; the attachment activated the keys as a perforated tape was passed through it. The tape, which was encoded with combinations of six holes, could be punched with a manually operated perforating unit in the same office or with a mechanical perforator operated by electrical impulses received over telephone wires from a transmitter many miles away.

Keyboard Composition in Single Type.—A separate and independent Monotype keyboard machine is first used to encode a paper ribbon by perforation. The ribbon is then transferred to an automatic Monotype composition caster. According to the nature of the work, from one to three casters, attended by one operator, may be fed by ribbon produced on one keyboard.

A Monotype keyboard has 276 or 304 keys arranged in two banks (fig. 2). As the operator presses a key, the paper ribbon at the top of the machine advances by $\frac{1}{8}$ in., unwinding from one spool to another, and is pierced by a combination of two punches, out of a row in line, that encode that particular letter by the relative positions of two holes. The width of each letter is registered on a moving scale. When the line is so nearly full as to accommodate only a few more letters, a revolving cylinder automatically calculates the amount of remaining space and indicates, from that point onward, which two justification keys,. out of a row of numbered red keys, should be pressed to complete the line. When the perforated ribbon of the text, or any part of it, is transferred to the caster, it passes in reverse direction over a row of air vents; thus the larger holes indicating justification, which control the width of each space to be cast between words, are the first to be presented to the caster. By releasing compressed air from corresponding vents, the justification holes set the spacing mechanism so that equal width will be cast between words so as to drive out the line to full measure.

The matrix case (fig. 5), which usually contains 255 different matrices arranged in rows according to the widths of the different characters, slides backward or forward in a frame at each revolution of the machine, and the frame itself moves laterally. According to the two perforations at that step of the ribbon, each movement is stopped by a pin blown up by compressed air. One perforation selects the required row, thereby controlling also the widening or narrowing of the mold cavity; the other determines the particular position (in the row) that contains the matrix. When the matrix is selected, it is clamped for a fraction of a second over the mold and the type is cast, trimmed and ejected.

In Monotype machine composition, the widths of letters and spaces are expressed in units—in effect, 18ths of the widest letter in the font. The basic unit is one-eighteenth of one point, or .0007687 in. The em is not necessarily square as in foundry type, for all space and letter widths are relative; *e.g.,* a condensed face in 10 point may be "$11\frac{1}{4}$ set,') the em being that much narrower (*i.e.,* $11\frac{1}{4}$ to 12) setwise than it is high pointwise.

Special single-type composing machines developed by the Lanston Monotype company increase the number of available matrices to 324. The separate keyboard has 120 keys and four shifts.

Filmsetting.—As early as 1895, a practicable invention for photographic composition was patented by William Friese-Greene, the English pioneer of cinematography, though it was abandoned for lack of financial support. The Dutch Hadego headline machine was in use before World War II; with it, display matrices of plastic are composed by hand and then photographed. In 1947 the Intertype company brought out its Fotosetter, the first keyboard-operated filmsetting machine to go into regular production. This adapts the general mechanical principles of the line-casting machines but uses toothed matrices that carry photographic negatives (fig. 3). The lines, composed on film as separately photographed characters, are justified in advance by a method that distributes excess space between letters as well' as between words.

FIG. 4.— LINOTYPE MATRICES AND SPACEBANDS IN ASSEMBLED FORM

Another adaptation of an existing hot-metal machine is that produced by the Monotype Corporation Ltd. under the trade-mark Monophoto. The matrix case is again positioned by a ribbon perforated on a conventional Monotype keyboard; through the transparent plastic matrices a beam of light photographs each required letter in turn. When the line is completed, the strip of film is advanced on a revolving drum.

Several systems emerged along radically different lines. The Photon was developed under the sponsorship of the Graphic Arts Research foundation of Cambridge, Mass.; it was invented by Rene A. Higonnet and Louis Moyroud in France, where it is known as the Lumitype. The operator types the copy on a standard electric typewriter that is connected with a telephone relay system and a photographing unit. By electronic means involving a memory storage and computer system, justified lines can be set in combinations of 16 different fonts. The various characters are arranged in concentric circles in a revolving glass matrix disk. A stroboscopic lamp passes light through the selected character into an optical system. by means of which it is projected in any of 12 different point sizes onto the sensitized film. In the Mergenthaler Linotype company's Linofilm machine. a separate keyboard encodes the copy and justification electromechanically on a tape. The independent photographic unit is automatic and capable of storing 18 grids of 88 characters each for combination setting. Under the control of the tape. the desired font grid is presented from a turntable and each character in turn is selected and projected by shuttering a multilens system.

FIG. 5.— MONOTYPE MATRIX CASE

The filmsetting methods that depart radically from any hot-metal principle gain very high projection speeds and a large range of characters but create special problems of servicing the machines and training operators. The filmsetting epoch was, in the early 1960s, in its infancy, since the influence of both the keyboard machines and the display machines, of which more than 50 competing makes had come on the market, was just beginning to be felt.

Rising labour costs and stoppages caused by labour disputes also encouraged the development of facsimile and other methods of reproduction from office typewriters, and several machines were invented that stood midway in development between the typewriter and the composing machine.

(B. L. WA.)

TYPEWRITER, a writing machine, enabling the operator to produce writing resembling printer's type at a speed far greater than that possible with the pen. It consists of a keyboard controlling the selection of characters for sequential impression from a group of type arranged on separate rods or on the periphery of a wheel. Formerly the term typewriter was also applied to the operator; later the operator became known as a typist.

History. — The first recorded attempt to invent a typewriter is found in the records of the British patent office. These show that on Jan. 7, 1714, a patent was granted by Queen Anne to Henry Mill, an English engineer, for "an Artificial Machine or Method for the Impressing or Transcribing of Letters Singly or Progressively one after another, as in Writing, whereby all Writing whatever may be Engrossed in Paper or Parchment so Neat and Exact as not to be distinguished from Print." No drawings of Mill's machine exist, and its construction is not known. Only one other attempt was recorded in the 18th century. This was a machine invented in France in 1784 for embossing characters for the blind. The first U.S. patent on a typewriter was granted in 1829 to William Austin Burt of Detroit. His machine (fig. 1), which he called a typographer, operated like modern toy typewriters, the type being mounted on a rotating semicircular frame which was positioned to bring the desired letter to the printing point and was then depressed against the paper by means of a lever. The only model of this machine was destroyed by fire at the Washington patent office in 1836. Various kinds of machines were attempted in the 19th century. Two models (one of which is illustrated in fig. 2) were developed by Charles Thurber of Worcester, Mass., in 1843–45; neither was successful, but they had such improvements as a cylinder or platen for holding the paper. Other machines of the time took various forms; most were large and cumbersome and several resembled pianos in size and general

shape. The machines of the early 19th century accomplished reasonable printing quality but actually were much slower than handwriting. Many of the machines were intended for producing copy which the blind might read by touch.

Although Alfred Ely Beach of New York had invented a typewriter in the mid-1800s, his most significant contribution to typewriter technology was as editor of the *Scientific American,* in which he reprinted an article describing the invention of John Pratt, an American, which had appeared in a London magazine, *Engineering.* Pratt's machine, which was patented in England, utilized the type-wheel principle; it had 36 type slugs in three rows on the type wheel. On the same general principle a model by Thomas Hall of Brooklyn (1867), illustrated in fig. 3, used a moving stylus to select keys through a perforated dial plate. The reprinted article on Pratt's machine was read by Christopher Latham Sholes, who was inspired to construct the first practical typewriter in 1867.

First Practical Typewriter. — In the early days of the design Sholes, Carlos Glidden and Samuel W. Soulé worked together; Soulé soon retired from the undertaking, but Sholes, within five years, made nearly 30 experimental models. The first of these, showing the working principles only, was covered in patent of June 23, 1868. The second one, patent of July 14, 1868, was the first efficient typewriter model, in that it would write well at a speed far exceeding the pen. It was still, however, a very crude machine, lacking the now familiar keyboard layout, typewriter

carriage and the cylinder or platen. Many improvements followed, and finally on March 1, 1873, with the assistance of James Densmore acting as promoter, a contract was made with E. Remington and Sons, gunsmiths, of Ilion, N.Y., for the development and manufacture of the Sholes machine. The first completed typewriters were placed on the market early in 1874, and the machine was soon renamed the Remington. Among its original features which were still standard in machines built in the second half of the 20th century were the cylinder with its line-spacing and carriage-return mechanism; the escapement which causes the letter spacing by carriage movement; the arrangement of the type bars so as to strike the paper at a common centre; the actuation of the type bars by means of key levers and connecting wires, printing through an inked ribbon; and the positions of the different characters on the keyboard, which conform almost exactly to the arrangement now known as universal. The Remington typewriter was not very successful; however, one *was* purchased by Mark Twain, who was the first author in history to submit a typewritten book manuscript.

Further Refinements.— The first typewriter had no shift-key mechanism—it wrote capital letters only. The problem of printing both capitals and small letters without increasing the number of keys was solved by placing two types, a capital and lower case of the same letter, on each bar, in combination with a cylinder-shifting mechanism. The first shift-key typewriter—the Remington model 2—appeared on the market in 1878. Soon there appeared another solution of the same problem in the so-called single-key or double-keyboard machines, which contained twice the number of keys—one for every character, whether capital or small letter. An example of this kind of machine is the Caligraph (fig. 4), designed by George Washington Yöst, Franz X. Wagner and H. L. Wagner in 1885. For many years the single-key and the shift-key machines competed for popular favour, but

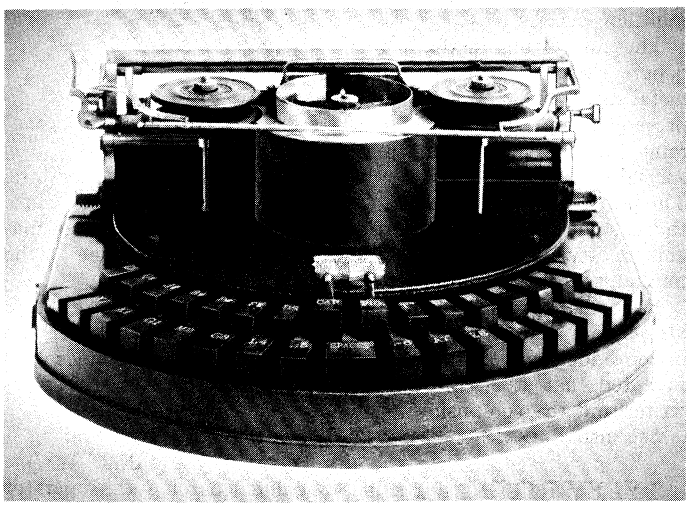
FIG. 4.—YÖST'S CALIGRAPH. 1885

the development of the touch method of typing, for which the compact keyboard of the shift-key machines was far better suited, decided this issue. Touch typing was slow in its early progress and before the 1890s was practised only by operators of exceptional skill. In the latter decade, however, it rapidly gained acceptance, and after 1900 it was virtually the universal method of instruction.

Another early issue in the field of the typewriter concerned the relative merits of the type-bar and the type-wheel principles. The latter construction traces its descent through the Burt machine of 1829 and the Pratt machine of 1866. In 1880, shortly after Sholes brought out his bar machine, James B. Hammond of New York patented a cylinder machine, shown in fig. 5; similar to the modern Vari-Typer, it had a hammer which hit the back of the paper, pressing it against the type cylinder. In 1881 Lucien S. Crandall of Groton, N.Y., developed a compact cylinder machine (fig. 6); depressing a key caused the cylinder to shift laterally and rotate, thus selecting the proper letter and pressing it against the paper.

In modern machines of this variety the type faces are mounted on a circle or segment, the operation of the keys brings each type to correct printing position, and the imprint of type on paper



BY COURTESY OF ROYAL MCBEE CORP.

FIG. 5.— HAMMOND'S MACHINE. 1880

is produced by a trigger action. The type-wheel machines offer an advantage in the ease with which the type segments may be changed, thus extending the range and versatility of the machine. However, machines of this construction have never been very serious competitors of the type-bar machines in the general commercial field.

Following the first shift-key typewriter of 1878, the next great advance was visible writing. On all the early type-bar machines the bars were arranged in a circular basket, located underneath the carriage, and the type printed at a common point on the underside of the cylinder. This construction compelled the operator to raise the carriage in order to see the writing line.

The first visible-writing machine appeared in 1883. The early machines employed the down-stroke principle, the type striking on top of the cylinder. Later the front-stroke machines took the lead in the general business field, the first machine of this type to attain prominence dating from 1890 as a result of the work of John N. Williams. In front-stroke machines the type bars are placed in a segment in front of the carriage, the type printing on the front of the cylinder. This solved the problem of visible writing, and all writing machines of the leading standard makes are of this type.

On nearly all typewriters the printing is done through an inked ribbon, nhich is fitted on spools, travels with the operation of the machine, and reverses automatically when one spool becomes completely unizound. On other machines an inking pad is used, the type contacting the pad prior to printing.

Noiseless **Typewriters.**—The noiseless linkage is a variation of the conventional type-bar linkage causing the type bar to strike the platen at a lower velocity but with the same momentum. Although it produces less noise than the conventional typewriter, the noiseless typewriter cannot produce as fine an impression or as many carbon copies. The noiseless typewriter has enjoyed only limited success.

Electric Typewriters. — A significant advance in the typewriter field was the development of the electrified typewriter; a modern model is shown in fig. 7. The electric typewriter is basically a mechanical typewriter, with the typing stroke powered by an electric motor drive. The typist initiates the key stroke, the carriage motion and other controls by touching the proper key. The actuation is performed by clutching the proper linkage to a constantly rotating drive shaft. Advantages of this system include lighter touch, faster and more uniform typing, more legible carbon copies and a greater number of them. and less operator fatigue. The electric typewriter made great progress as an office writing machine, having been adopted as standard equipment in many large offices. All major typewriter manufacturers produce electric typewriters.

Thomas A. Edison in 1872 produced the first electrically operated "typewriter," consisting of a printing wheel The machine later developed into the familiar ticker tape printer. The electric typewriter as an office writing machine was pioneered successfully by James Smathers, who produced a working model by 1920.

Portable Typewriters. — The early portables of the late 19th century were slow, awkward, type-wheel machines. In 1909 the first successful portables, invented by Frank S. Rose, appeared on the market By the 1950s practically every typewriter manufacturer produced a portable typewriter, all of which were type-bar machines similar in operation to the office machines. Designed with lighter parts than those of standard models. portables are more compact but less sturdy. Electrical operation of portable typewriters was introduced in 1956.

Modern Developments. — The inherent versatility of the typewriter, particularly the electric typewriter, led to its application to many tasks once considered beyond its scope. One example is the accounting machine, which evolved from the typewriter and the adding machine. This office machine is capable of tabulating in vertical columns, performing arithmetic functions concurrently, as well as typing horizontal rows, thus performing complete bookkeeping functions. The development of this equipment served as a natural bridge for the entry of the typewriter industry into the data-processing or computer field.

Special-purpose typewriting machines have been developed for use as composing machines. Although typewriters cannot compare in quality, style and versatility with special composing machines, which produce type directly on slugs of metal, the high cost of

FIG. 7.— MODERN ELECTRIC TYPEWRITER

skilled typesetting labour provided the impetus for the development of composing typewriters. use of which requires far less training. The fundamental requirement of a typewriter for this usage is the ability to supply different type font styles and sizes. For this purpose the type-wheel machine is far more suitable than the type bar. The Vari-Typer machine, especially developed for this service, operates on the principle of the Pratt machine of 1866. Other major requirements of a typing machine whose output must resemble print are the proportional spacing of characters in a word and justification, or alignment, of the right-hand margin. An electric type-bar machine was developed which provided proportional spacing — the assignment of space for each character in proportion to its width. The other requirement, margin justification, proved more difficult to attain. Most of these machines provided for preliminary typing of a line, determining the necessary compensation for the line length and retyping to the exact length. A more complicated machine was introduced which would automatically justify a line of type with one keyboarding. This was accomplished by a system on which the operator typed manually into a storage unit, from which a computer first automatically compensated for line length and then operated a second typing mechanism. By mid-20th century the typewriter already was in considerable use as a composing machine in spite of its limitations, and it promised to be even more widely used after the development of more efficient methods for justification.

One of the most important advances in the field of typewriters and office machines was the development of automatic controls that allow typing from remote electrical signals rather than from manual control. This technique provided the basis for a new concept in typewriter application. Office machine manufacturers developed an integrated system of business communication utilizing remote control typewriters and computer techniques. With this system, machines handling all the different office machine functions, such as the typewriter, calculating machine and printing telegraph, together with mass data processing computers and electronic storage systems, are tied together by the use of a "common language" coded electrical signals. Thus any component machine produced by any manufacturer could be connected to any other without the use of special code converters. Other automatic typewriter devices were available including a vacuum-operated system that controls and operates a standard typewriter from a perforated roll of paper tape in a manner much like that of the player piano.

The need for high-speed printing machines to convert the output of computers to readable form prompted the introduction of a specialized high-speed form of "typewriter" by 1953. In this class of machines, the paper is fed between a continuously rotating type wheel and a bank of solenoid-actuated printing hammers. At the instant when the proper character on the face of the type wheel is opposite the proper hammer, the hammer strikes the paper and prints the character, while the type wheel continues to rotate. By this means, speeds up to 100,000 characters per minute have been attained, as compared with about 1.000 characters per minute attainable with conventional type-bar mechanisms. A number of different models operating on this principle were developed, all of which required elaborate electronic controls to solve the complex synchronization problem.

Many other high-speed output devices for computers were developed. However, most of these utilize techniques that are remote from the typewriter field. in some cases using printing mediums other than paper. Speeds of up to 10,000 characters per second were attained by certain nonmechanical systems, which, although not actually typewriters, competed with typewriters as computer-output devices.

Effects of the **Invention.**—The typewriter was one of the great transforming factors of modern business. One problem which confronted the writing machine in its early days was the lack of competent operators. Out of that need arose the modern commercial school, which became a prominent feature in the educational system of every country. Socially the changes wrought by the typewriter have been even more noteworthy. The majority of stenographers and typists are women, and in all western countries it was the typewriter that first opened to women the doors of business life.

TYPHOID AND PARATYPHOID FEVERS. Typhoid fever is an acute infectious disease of man caused by a bacterium, Salmonella typhosa (*Bacillus typhosus,* Eberthella typhi).

Paratyphoid fever is a disease closely resembling typhoid, though usually milder, caused by *Salmonella* organisms of other species.

Typhoid **Fever.**—*History.*—This disease is ancient. It can be recognized with reasonable certainty in clinical descriptions by medical writers dating back to the time of Hippocrates. However, it was not until the first half of the 19th century (P. Bretonneau, 1820) that typhoid fever (enteric fever) was clearly distinguished from other continued fevers and termed *fièvre typhoide* (P. C. A. Louis, 1829) by the French and *typhus abdominalis* (J. L. Schoenlein, 1839) by the German writers.

Before the advent of bacteriology the infective and contagious nature of the disease was recognized by William Budd in 1856, and the presence of the infective agent in the feces of ill and convalescent patients and its spread through contaminated water and milk was postulated. The recognition of the typhoid bacillus by C. J. Eberth in 1880 and its isolation in pure culture by G. Gaffky in 1884 laid the foundation for the development of knowledge leading to accurate means of diagnosis, critically differentiating this disease from all others and making possible studies to determine the means of spread and methods of prevention

Nature of the Disease.—The organism usually enters the body through the mouth, in contaminated food or water. penetrates the intestinal wall and multiplies in the lymph follicles (Peyer's patches and solitary lymph glands) near the lower end of the small intestine (ileum), particularly in the region of the ileocaecal valve, and possibly in other locations in the body; later it enters the blood stream. causing septicemia and systemic infection. The incubation period averages 10–14 days but may be shorter or longer. There are few or no symptoms during this period.

Early symptoms are headache, lassitude and generalized aching, feverish sensations and restlessness that may interfere with sleep. There may be loss of appetite, nose bleeds, cough, diarrhea or constipation. Persistent fever develops and gradually rises, usually in a stepwise fashion, reaching a high of 103° or 104° F. after 7–10 days and continuing with only slight morning remissions for another 10–14 days. In favourable cases, about the beginning of the fourth week the fever commences to decline, daily fluctuations in temperature readings become greater and there is a gradual return to normal.

In the first few days of the disease the patient may remain ambulatory, but before the end of the first week he is seriously ill and confined to bed. He is restless, hot and uncomfortable, and the cheeks are flushed, particularly in the latter part of the day. The pulse is slow, the abdomen is slightly distended and may be tender to pressure, especially over the right lower part, the region overlying that portion of the intestines where a specific ulceration is in progress. Diarrhea is a common but by no means constant symptom. When present, it may be slight or extremely profuse; the stools are light yellow in colour, resembling pea soup.

At the beginning of or during the second week of fever, at the height of the septicemia when typhoid bacilli are present in great numbers in the blood stream. a skin rash usually appears. It consists of isolated round or oval spots of a pale pink or rose colour measuring from two to four millimetres in diameter. These "rose spots" are usually few in number and are found chiefly on the abdomen. chest and back. They appear in crops, last four or five days and then fade away, leaving a brownish stain at the site. Occasionally they may be very numerous and may continue to appear until near the end of the fever.

Also during the second week of the fever specific changes occur in the intestine. The lymph follicles previously mentioned as the site of multiplication of the typhoid organisms during the incubation period have become swollen and enlarged, and portions have undergone necrosis (death of tissue). These areas of necrotic tissue extend through the mucous membrane to the lumen of the bowel. Necrotic fragments or entire glands slough off, leaving ulcers in the wall which may be few or numerous, have thin ragged edges and are usually oval, extending in the direction of the long axis of the bowel. They may in their progress erode blood vessels, causing minor or massive hemorrhage into the bowel, or perforate the bowel wall. allowing the contents to enter the peritoneal cavity. Ulceration exists from this time onward during the remainder of the fever and into the period of convalescence. The ulcers heal by formation of scar tissue without contraction of the calibre of the bowel. They do not all appear at once, so that ulcers in all stages of development and healing may be simultaneously present.

With the continued high fever the symptoms usually increase in intensity. Mental confusion and delirium appear; there may be tremors and jerking of the muscles and occasionally generalized convulsions. By the end of the third week the patient presents the so-called "typhoidal state"; he appears prostrated and emaciated, the tongue is dry and brown. abdominal symptoms are marked and mental disturbance is prominent.

With cessation of fever. convalescence proceeds slowly. Relapses are common but usually of short duration.

Typhoid fever is a disease of complications. By eroding blood vessels, the intestinal ulcers may cause massive and even fatal hemorrhage; hemorrhage occurs in from 5% to 10% of the cases. Perforation of the bowel (1% to 5%) results in peritonitis, which prior to the advent of the sulfonamides and antibiotics was highly fatal. The patient experiences a sudden intense abdominal pain, vomits and shows signs of collapse. This development demands immediate surgical intervention for repair of the defect and the start of intensive antibiotic therapy. Osteomyelitis, chiefly of the long bones, may occur even some time after cessation of the fever. Localization and abscess formation may occur in any organ. Other complications include acute inflammation of the gall bladder, heart failure. pneumonia, encephalitis and meningitis.

Death may result from toxemia and general debilitation or from one of the complications. The mortality rate varies widely and is influenced by the quality of nursing and medical care.

Diagnosis.—The clinical picture should suggest the diagnosis. Lowered white blood cell count is characteristic and eliminates many other diseases from consideration. Final proof of the diagnosis depends on isolation and identification of the organism in culture from the blood, urine or feces.

As with many infectious diseases, specific antibodies arise in the blood of the patient which will agglutinate (clump) suspensions of known typhoid organisms. This test, first applied in typhoid fever by F. Widal in 1896 and named after him, is of presumptive value in diagnosis after the first week of the disease.

Epidemiology.—Every case of typhoid fever is due to ingestion of typhoid bacilli originating from a case of the disease or from a carrier. The common means of communication are through water, milk, food, flies and direct contact. The organisms are excreted in the urine and feces, and these excreta and the patient's bedding and environs are a source of exposure to attendants and others in contact with him. Water contaminated by infective sewage provides a major means of spread.

Most major epidemics have been due to such pollution of public water supplies. Milk may be contaminated through a carrier (or a case) employed in the handling and processing, through flies or from polluted water used for cleaning purposes. Food similarly becomes contaminated from the fingers of persons harbouring the organism, or through water or flies. Flies having access to infective feces carry the organism to food. Fresh vegetables grown on soil fertilized or contaminated by untreated sewage, and shellfish, particularly oysters, grown in polluted water, are dangerous. Milk and other foods offer opportunity for the organism to multiply before ingestion, increasing the hazard.

Prevention and Treatment.—Prevention depends mainly on proper treatment of sewage, purification of water supplies by filtration and chlorination and the exclusion of carriers from employment in food industries. In the early part of the 20th century prophylactic vaccination using killed typhoid organisms was introduced, mainly in military forces and institutions, and contributed to lowering of the incidence of the disease.

The disease, a scourge of armies, was formerly extremely prevalent and continues to be so in the less sanitized areas of the world. Where modern methods of sewage disposal and water purification are practised, however, the incidence is very low. In the United States in 1900, the annual death rate was more than 30 per 100,000 population. In 1955 the total number of deaths from typhoid in the U.S. was only 50; in the United Kingdom in the same year the total for both typhoid and paratyphoid was 19.

Treatment formerly was entirely symptomatic and supportive. After 1948 specific treatment with chloramphenicol (chloromycetin) proved to be of value. Cortisone is sometimes given as an adjunct to chloramphenicol.

Bacteriology.—Salmonella typhosa is an actively motile, short, rod-shaped, nonspore-forming Gram-negative bacillus. It grows readily on common culture media. Special complex differential media were developed for isolation from stools. It can be distinguished from other organisms of the Salmonella group by its biochemical reactions, particularly sugar fermentations, and by serological reactions. The organism is destroyed by heat, drying or exposure to sunlight; under natural conditions, as in water, soil or feces, it may remain alive for weeks or months. It is not destroyed by freezing.

In typhoid fever during the first week of the disease, the organism is almost invariably present in the blood stream and can be cultured from the blood with ease. From the second week onward the numbers in the blood progressively diminish. Although positive stool cultures may be obtained early in the disease, the organism becomes present in large numbers in the feces only during the second week. It also usually appears in the urine at this time. With convalescence the urine and feces gradually become free of the organism.

Approximately 30% of cases become transient carriers, excreting the organism in the stool or urine for several weeks or months. About 5% remain long-term carriers, harbouring the organism and shedding it for several to many years. In these carriers, who show no apparent ill effects, it is found mainly in the gall bladder and biliary passages. It may be excreted continuously or intermittently. One of the most famous instances of carrier-borne disease in medical history was the case of "Typhoid Mary" (see CARRIER).

Paratyphoid Fever.—A group of organisms are responsible for paratyphoid fever, the commonest being Salmonella *paratyphi* (paratyphoid A), *S. schottmülleri* (paratyphoid B) and the paratyphoid C group, of which there are three varieties.

Paratyphoid fever due to paratyphoid A or B is similar to typhoid, usually milder, though occasionally simulating it in all respects. The means of infection, spread, clinical course, pathology, diagnosis, prevention, treatment and prophylaxis are similar to those for typhoid.

Whereas typhoid and paratyphoid A are diseases of man only, the paratyphoid B organism has been found in other animals and fowl, and accordingly these provide for additional means of contamination of food and water. The variety of paratyphoid C caused by S. hirschfeldii is mainly limited to man.

There are more than 200 recognized species of the *Salmonella* (named after D. E. Salmon) group of organisms, which are widely distributed over the world. In the main they are harboured by or cause diseases of animals, though many may infect man.

Aside from the typhoid bacillus and paratyphoid A, B and S. hirschfeldii, they usually cause in man a sharp, brief gastroenteritis (food infection) with fever, nausea, vomiting and diarrhea of several days' duration. In addition, a number of them may cause prolonged febrile illness similar to typhoid with all the complications.

Since Salmonella organisms may be found in practically all species of animals, food products derived from animals often contain them, particularly eggs, egg products and meat. Many species are harboured by rodents and fowl. Food exposed to infected animals (mice, etc.) frequently becomes contaminated. The incidence of paratyphoid, like that of typhoid, is closely related to sanitation or its lack. Paratyphoid, however, is much commoner than typhoid.

Mild *Salmonella* infections generally need only symptomatic treatment. Severe infections require treatment with chloramphenicol or one of the tetracyclines.

The general prophylactic measures mentioned under typhoid apply to the entire group of Salmonella diseases. Prophylactic immunization is available for paratyphoid A, B and C. Protection of food from contamination and adequate heat treatment of foods liable to contain the organism should be practised.

TYPHON, in Greek mythology, youngest son of Ge and Tartarus; or of Hera without father. He is described as a grisly monster, with 100 dragons' heads, who was conquered and cast into Tartarus by Zeus.

In other accounts he was confined in the land of the Arimi in Cilicia, or under Etna, or in other volcanic regions, where he was the cause of eruptions. He was probably a personification of volcanic forces. Among his offspring by Echidna were Cerberus, the Lernaean hydra, and the Chimera. He was also the father of dangerous winds, and by later writers is identified with the Egyptian Set.

TYPHOON. Regional name of tropical storms in the tropical part of the western North Pacific ocean. The term is of uncertain origin but is probably connected with the Chinese t'ai *fung*, "great wind," or the Arabic and Hindustani *tufan*, "a tempest." William Dampier entered in his logbook under July 4, 1687, the earliest-known European description of a typhoon (tuffoon).

Typhoons are distinguished from tropical storms in other parts of the world by their large number (average 20 per year), by the occasional development of very large storms and by the fact that they have occurred in all months of the year. The peak season is in August, September and October; in these months typhoons are most likely to move out of the tropics on paths ranging from northwest to northeast and strike China or Japan, occasionally even Korea and southeastern Siberia. In the other months they are more apt to cross the Philippines on a westerly track toward southern China or Indochina. While generally rare in winter, series of as many as five typhoons have crossed the Philippines in December, with a quiet spell of only a few days between storms.

Typhoons occasionally grow to extreme size; their area of influence may then become as large as the eastern United States. Nevertheless, though the area suffering damage is widespread and the atmospheric pressure in the centre may drop below 26.5 in. of mercury, the peak violence is no greater than in many storms only one-tenth as big. Military planes have carried out regular reconnaissance flights to the central parts.

Because of the high frequency, damage is widespread in all countries bordering the western Pacific. Even so, the arrival of a typhoon may also bring needed relief from drought. Parts of Japan, for instance, depend on typhoons for a considerable fraction of their annual precipitation.

TYPHUS FEVER, a disease characterized by sudden onset with headache, chills, fever and general pains, an eruption appearing on the third to fifth day, toxemia, and terminating in about two to three weeks. Originally considered a single clinical entity, it is now regarded as a group of closely related diseases caused by different species of rickettsia transmitted by arthropod vectors, under the following general classifications: epidemic (louse-borne) typhus; murine (endemic; flea-borne) typhus; scrub (mite-borne) typhus or tsutsugamushi disease; tick-borne typhus (this is described under ROCKY MOUNTAIN SPOTTED FEVER AND OTHER SPOTTED FEVERS).

EPIDEMIC (LOUSE-BORNE) TYPHUS

History and Distribution.— This is the classic disease, well known in medical history and described under many names which usage gradually narrowed to typhus fever. Up to the middle ages its existence was obscured in the undifferentiated pestilences, but it can be recognized with certainty in the writings of Spanish physicians toward the end of the 15th century and called el *tabardillo* from its spotted character. According to Joaquim de Villalba, the first reference to an epidemic was one that began during the civil wars of Granada in 1489–90. During the 16th century it spread over the Spanish peninsula, causing great mortality. It is possible that the infection was transported to the new world about this time by Hernán Cortés and his followers, although there is some evidence that the disease was known to the Aztecs and to certain Indian tribes in Mexico in pre-Columbian days. During the 17th, 18th and 19th centuries typhus prevailed intermittently in devastating epidemics throughout Europe and the British Isles. Its epidemiological characteristics became as well known as its clinical manifestations. It was associated with human misery—with people crowded together in filth, cold, poverty and hunger, with wars and famine, with refugees, prisons and jails and with ships. Beginning about 1846, and associated with the failure of the potato crop, an epidemic of unprecedented magnitude and severity centred in Ireland. The disease was disseminated in the subsequent flood of emigration from that country. It was repeatedly introduced into Canada and the United States by the arrivals of immigrant ships. For example, of 75,540 Irish persons emigrating to Canada in 1847, there were 30,265 who sickened with typhus; 5,293 died at sea, 8,012 at Quebec and 7,000 at Montreal, a total of 20,305 deaths. In spite of repeated introductions from Europe and from Mexico, this form of typhus failed to establish a permanent foothold in either Canada or the United States. The American Civil War of 1861–65 was one of the few wars of any magnitude in which typhus was not epidemic among military camps, prisons and refugee populations.

Clearly differentiated from typhoid fever and "relapsing fever," during the latter part of the 19th century and the first part of the 20th century typhus fever decreased and practically disappeared from the British Isles and western Europe with improvement in the hygiene of living conditions. It remained intermittently epidemic in Poland, the U.S.S.R., the Balkans, the highlands of Turkey, Iran, Iraq, north Africa and some parts of central and south Africa.

At the close of World War I the disease was prevalent in Poland, Russia and Rumania, where the estimates of cases and deaths between 1919 and 1923 ran into millions. In World War II from these areas it again spread into western Europe and caused devastating epidemics among refugees and displaced persons, particularly in the German concentration camps. For the first time military populations learned how to protect themselves.

In Asia, the disease was still well known in the second half of the 20th century in China, Korea, Afghanistan and northern India; outbreaks were reported among Communist troops in the Korean war. In the western world epidemics still occurred from time to time among the inhabitants of the mountainous sections of Mexico and Central and South America.

Epidemiology.- he epidemiological distributions of typhus are explained by its mode of transmission. It is conveyed from person to person by the louse (Pediculus humanus). Lice are infected by feeding upon a person sick with the disease. The causative agent is a rickettsia (Rickettsia *prowazekii*). The microorganisms grow in the epithelial cells lining the gut wall and are excreted in the feces of the louse. The infection kills the louse in from 12 to 18 days. There is no transovarial transmission of these rickettsiae from generation to generation in the developmental cycle of the louse. It is probable that man is commonly infected from deposits of louse feces on the skin through abrasions resulting from scratching. Rickettsiae may remain viable and retain their virulence for many days in dried louse feces. There is evidence that inhalation or the deposition on mucous membranes of air-borne infected material of this kind may be responsible for some human cases. Biological survival requires that a continuous chain of contacts be maintained. The human host harbours the rickettsiae in the peripheral circulation for only a short time. 10 to 14 days, during the early part of the illness. In order to maintain propagation of the disease in a population the supply of infected lice must be continuously replenished by feeding upon such sources and reach new and susceptible human beings before they perish.

Clinical and Pathological Features.— The incubation period is about 8 to 12 days. but varies between 5 and 15 days. Onset is commonly abrupt, with headache, loss of appetite and malaise. The fever rises rapidly with chills or chilly sensations. Prostration becomes marked. The patient is nauseated. The temperature reaches a maximum range by the end of the first week and is sustained until about the 12th day, when, if the outcome is favourable, it falls rather rapidly, reaching normal in an uncomplicated course about the 14th to 16th day.

In cases proceeding to a fatal issue prostration is progressive and delirium and coma supervene. Cardiac failure may be the terminal event. In recovery, depression and weakness may be protracted, with slow convalescence.

The most characteristic symptom of the disease is the eruption which appears about the fourth to sixth day after onset. It consists of dark reddish discrete spots two to five millimetres in diameter, some of which become slightly elevated, scattered over the body and limbs. It may be accompanied by a general mottling. These lesions at first are red and disappear on pressure, but they rapidly become darker in colour and leave a brownish stain in the skin if the area is blanched. In the more severe and fatal cases the rash becomes almost confluent, involving the whole body surface, and subcutaneous hemorrhages occur. With recovery the rash fades slowly. The case fatality varies somewhat in diiferent epidemics, ranging from about 5% to 25%. The prognpsis becomes more and more grave with advancing age. While the proportion of deaths among children may be less than 5%, it may be ten times as great among the aged.

The course and characteristics of the illness in man are manifestations of the underlying pathology. The rickettsiae localize and multiply in the endothelial cells lining the blood vascular system. The essential lesion is a focal injury to the capillary and precapillary vessel walls characterized by swelling and necrosis of the cells, infiltration of lymphocytes, plasma cells and monocytes, thrombosis and rupture with extravasation of red blood cells. Such lesions are significantly common in the skin, giving rise to the eruption; in the cerebral cortex they cause headache, irritability, confusion and delirium; in the heart muscle, weakness and sometimes circulatory failure; in the alveolar walls of the lung, an interstitial pneumonia; and they are widely scattered but less important in other organs and tissues.

It has been demonstrated that suspensions of rickettsiae have an acute toxic effect when injected intravenously into mice. To this toxic substance, which is neutralized by immune serums, may in part be attributed the host cell damage and interference with normal function.

Diagnosis and Treatment.— The characteristics of the rash usually lead to the clinical diagnosis. Laboratory confirmation is afforded by the Weil-Felix agglutination reaction. A more specific and delicate test is afforded by complement fixation using a suspension of the specific causative rickettsia as an antigen. The causative agent can be recovered and identified by inoculating guinea pigs intraperitoneally with blood obtained from the patient in the early stages of the disease.

The treatment of typhus is symptomatic and supportive. It is largely a matter of good nursing care, maintenance of nutrition and fluid balance. Parenteral administration of 5% glucose in normal saline is necessary when the patient shows signs of dehydration. Analgesics and sedatives may be required to relieve pain and restlessness. Aureomycin appears to have a definite effect on the course of the disease. It usually is given for two to three days and is effective at any stage in the course of the disease.

Prevention.—Delousing.—The prevention of typhus depends upon protection from lice. Doctors, nurses and orderlies should be provided with louseproof clothing. The patient, his immediate environment and his contacts should be subjected to a thorough delousing procedure. Clothing may be disinfested by several methods using heat or pediculicide powders. The louse-infested patient should be bathed and the hair of the head and body clipped. Disinfestation can be accomplished most expeditiously and effectively by dusting with a 10% DDT louse powder. It is blown from a hand-operated dust "gun" and can be applied without removal of the clothing. It does not kill nits but remains active and kills lice as they hatch for a considerable period. About one pound of powder is required for every 15 persons.

Vaccination.—Specific vaccines are produced by cultivation of rickettsiae in the yolk sacs of developing eggs or in the lungs of mice; the resulting suspension is then inactivated. The vaccine is given in a series of three injections at approximately weekly intervals. The protection afforded is not complete, but if infection occurs in a recently vaccinated person, the disease usually runs an abortive course with little or no eruption, and the risk of death is reduced.

A stimulating dose of one cubic centimetre of the vaccine should be administered every four to six months as long as danger of infection exists.

With proper public health organization, adequate resources and the discriminating use of methods available for vaccination and for delousing, epidemics of typhus fever need not be feared. With a reasonable expenditure and effort they can be brought under control in a short period of time. It is still an ever-present threat, however, to impoverished and destitute peoples in many parts of the world.

MURINE (ENDEMIC; FLEA-BORNE) TYPHUS

History and Distribution.—Following the elucidation (1909–18) of the role of the common louse in the epidemiology of the classic typhus of the old world, it soon became apparent that in some parts of the world a disease was endemic which was clinically indistinguishable from it except for a relatively milder course and a lower fatality rate, and which was not associated with lousiness. It was described under such names as Brill's disease,[1] endemic typhus, mild typhus and tropical typhus. Studies conducted between 1922 and 1928 revealed widespread distribution of this form in the southeastern United States, in southern California and in Mexico.

It was later found to exist in certain areas of Central and South America, the Mediterranean littoral, the Balkans, China, India, Malaya, Indonesia and Australia, and probably has a much wider distribution, overlapping to some extent the areas in which epidemics of louse-borne typhus occur.

Epidemiology.— The Norway rat is the principal reservoir of infection. Occasionally, the common house mouse and other species of small rodents have been found to be infected. While several species of fleas and mites found upon rats can be infected experimentally, there is reason to believe that the tropical rat flea *Xenopsylla cheopis* is the principal vector. Transmission to man probably occurs through the medium of infected flea feces. Inasmuch as this is an accident, the frequency of occurrence of human cases is determined by the character of man's association with his domestic rodents. Passage from man to man by the flea is extremely unlikely, but it has been demonstrated that lice can be experimentally infected by feeding upon humans sick with the murine form of the disease. It is possible, thus, that the endemic flea-borne form may occasionally give rise to the epidemic louse-borne form where conditions are favourable.

Clinical Course, Diagnosis and Treatment.— The course of the illness is essentially the same as for iouse-borne typhus except with regard to severity. It is relatively milder, complications are less frequent and the over-all fatality rate is less than 5%. The underlying pathology is similar. The Weil-Felix reaction becomes positive during the second week. Complement fixation with properly prepared antigens affords a differentiation between the flea-borne and louse-borne forms. These forms can also be distinguished by the reaction of guinea pigs to experimental infection. With a murine strain the male guinea pig develops redness and swelling of the scrotum (Neill-Mooser reaction) which is absent or inconsistently present in animals inoculated with an epidemic strain. Treatment of the patient follows the lines indicated for louse-borne typhus.

Prevention.— Prevention of murine typhus is dependent upon control of the rodent flea reservoir of infection. The number of rats, and consequently of rat fleas, must be reduced below the threshold of sanitary significance. In an area of high prevalence the flea population may be rapidly but temporarily reduced by applying a residual spray of DDT along rat runs.

A vaccine made from a murine strain of typhus rickettsia should afford some degree of protection to persons especially exposed through occupation or living in buildings heavily infested with rats in an endemic focus.

SCRUB (MITE-BORNE) TYPHUS (TSUTSUGAMUSHI DISEASE)

History and Distribution.— A typhuslike fever ascribed to the bite of a minute insect was known to the inhabitants of certain river valleys in Honshu, Jap., in the mid-19th century. K. Tanaka in 1899 presented a careful description of its clinical and epidemiological features and identified the vector as a mite found in large numbers in the affected valleys during the summer months, when most of the cases occurred. From 1906 to 1932, tsutsugamushi disease was the subject of intensive investigation by Japanese scientists.

In the meantime, typhuslike fevers had been described under many names as endemic in localities scattered through southeastern Asia and the adjacent island archipelagoes. As a result of the studies of Japanese, British. French, Dutch and Australian investigators, and of the U.S. Typhus commission during World War II, it became clear that these belong in two categories: (1) flea-borne murine typhus and (2) mite-borne typhus fever, scrub typhus, indistinguishable from tsutsugamushi disease. The latter was recognized as occurring in Formosa, the Pescadores Islands, the Philippines, Indochina, Malaya, Burma, India, Ceylon, Sumatra, Java, New Guinea and adjacent islands and northern Queensland, Austr. During World War II this form of typhus was far more important as a cause of morbidity and mortality to military forces operating in the southwest Pacific area and in the China-Burma-India theatre than was louse-borne typhus to the forces operating in the Mediterranean and European theatres.

[1] In 1910 Nathan Brill called attention to a disease in New York city which resembled typhus but differed from it in its relatively mild course and epidemiological features. It occurred sporadically among Jewish immigrants and showed no tendency to spread. In 1934 Hans Zinsser reviewed the distribution of this typhuslike disease in New York city and Boston, Mass. On the basis of his observations, he advanced the hypothesis that these cases represented recrudescences of infections originally acquired many years previously, when the individual had been living in a European country where louse-borne typhus was epidemic. This hypothesis received support from later laboratory studies, which demonstrated conclusively that cases of Brill's disease were infected with thypus of the louse-borne type and not the murine type.

Epidemiology. — The causative agent, R. tsutsugamushi, is primarily a parasite of trombiculid mites of which two closely related species were identified as vectors—*Trombicula akamushi* and T. *deliensis*. During the larval stage these mites attach themselves to and feed upon various species of wild rodents, and are occasionally found upon other animals such as shrews and marsupials and upon birds. Rodents were found to be infected in nature with R. tsutsugamushi.

Infection contracted by the larvae while feeding is passed by stage to stage transfer through the lymph, free-living adult and egg to the next generation. Since the larvae feed but once upon a mammalian host, transmission from rat to rat and from rat to man requires this transovarial passage of the infection with R. *tsutsugamushi* in successive cycles of trombiculid with development. It follows that the distribution of the human disease is determined by the ecology of the affected localities, with regard to the number of rodents, numbers of the vector species of mites and the opportunities for the larval mites to make effective contact with human beings.

The larvae live in the upper layers of the soil and the organic detritus which covers it and crawl short distances up on blades of grass and other vegetation. Accordingly, the disease shows an occupational selection for agricultural labourers, persons foraging in new or overgrown fields and abandoned plantations, explorers and prospectors, soldiers, etc.

Clinical and Pathological Features, Diagnosis and Treatment. — The distinguishing characteristic of this form of typhus is the occurrence of a primary lesion or eschar, usually single but sometimes multiple, at the site of the infective mite bite or bites. While not always present, an eschar can usually be found by careful examination somewhere on the patient. The eruption is redder, spottier and more evanescent than that of louse-borne typhus or flea-borne typhus. While the course of the fever may be terminated in two weeks, it is not unusual for it to last three or even four weeks. A more or less extensive pneumonitis is common, and lesions in the myocardium may give rise to impairment of heart function and sometimes to circulatory failure. The case-fatality rate varies in different geographic areas from about 2% to 20%. The prognosis becomes increasingly grave with advancing age.

Diagnosis is usually made on the presence of fever, the primary eschar and characteristic eruption. Laboratory confirmation is afforded by the Weil-Felix reaction, which becomes positive during the second week of the disease. About the same time, complement fixation becomes positive with an antigen made from a suspension of R. tsutsugamushi. The causative agent can be easily recovered and demonstrated by intraperitoneal inoculation of white mice with a minute amount of clotted blood obtained from the patient early in the course of the disease. As with other typhuslike fevers, treatment is symptomatic and supportive. J. E. Smadel and his colleagues showed that the clinical reaction can be completely suppressed by the administration of chloramphenicol (chloromycetin). In an adult, this requires that the drug be given at intervals of four to seven days for four weeks or longer.

Prevention. — Prevention depends upon protection from mite bites in the endemic area. Camp sites should be cleared and the brush and grass burned before occupation. Persons may be protected by wearing clothing that has been treated with miticide chemicals. During World War II methods were developed for treating uniforms with terminal laundry rinse and impregnation with a soap solution containing dimethyl phthalate or dibutyl phthalate and benzyl benzoate.

A satisfactory vaccine for this form of typhus had not been developed by mid-20th century. Attempts to protect man against scrub typhus by immunization with inactive vaccines gave uniformly discouraging results under the conditions of field exposure. It was possible to provide immunity by inducing a subclinical infection with an attenuated strain of R. tsutsugamushi and suppressing the overt disease by chemoprophylaxis. This method, however, was cumbersome. *See* also RICKETTSIAE.

See N. H. **Topping** *et al., Studies* of *Typhus Fever,* National Institute of Health bulletin no. 183 (1945). (K. F. M.)

TYPOGRAPHER is a derivation of the word typography and means "a printer." The term has recently been revived and is used by those engaged in designing books of an exclusive character, such as those printed at private presses, where a specially designed type may be employed for some specific work. It is also sometimes adopted by "layout hands" employed in advertising departments where booklets and other advertisement matter is prepared and sent to the printer to produce.

TYPOGRAPHY is the art of printing. (See also the articles PRINTING, PRINTING TYPE and CALLIGRAPHY.) It has as its first object not ornament, but utility. The printer must never distract, even with beauty, the reader from his text. In the printing of books there is less room for individuality of style than in the typography of propaganda. The laws of typography in books intended for general circulation are based upon (a) the essential nature of alphabetical writing; (b) the force of tradition. But strict as the conventions are, there is not, and can never be, a rigid character of typography applicable to all books produced in a given geographic or ethnic area; or a universal formula acceptable to all books printed in Roman types. The strength of tradition expresses itself in the details of book arrangement and these vary widely. Certain laws of linear composition are, however, obeyed by all printers who use the Roman letter.

A fount of Roman type consists of (1) Roman: CAPITALS, SMALL CAPITALS, lower case, : . " ; 1 2 3 4 5 etc (); and (2) Italic: CAPITALS, lower case. In addition to these, as necessary adjuncts, the printer possesses (3) spaces; (4) leads-, (5) straight lines of metal known as rules, and (6) a collection of mobile ornaments, head- and tail-pieces, flowers, decorated initial letters, vignettes and flourishes, wood blocks of borders, etc. Another decorative medium at his command lies in his use of (7) colour (red being the most widely used). For emphasis he possesses (8) special types of notably heavy face, and may use colour for the same purpose. (9) Space is another valuable element, margins, blanks, etc. being filled in with what are known as "quotations." Finally (10) there is the nature (colour, weight and texture) of the paper.

Composition is the selection and arrangement of all these elements; Imposition is the due placing of the composition upon the sheet; Printing comprises the press-work, securing a perfection of register (backing up), the quality and crispness of inking. Typography, therefore, controls composition, imposition and paper. The paper (*q.v.*) must be of a character capable of expressing the value of the composition. The margins must be proportionate to the area of the text, allowing convenient space for thumbs and fingers at the side and bottom of the page. The mediaeval margins as adopted by the Kelmscott Press, are handsome and agreeable in certain books, but, are neither agreeable nor convenient in other books, *e.g.,* where the page dimension is necessarily small or narrow, and the book is to be carried in the pocket. For this and other books, the type may well be centered on the measure of the page, and slightly raised above ocular centre.

Composition. — The fundamental principles of page-composition are deducible from the ocular facts of alphabetical printing in the Roman letter. The eye cannot, with ease, read pages of words composed of letters designed with sharply contrasting thicks and thins. Nor can the eye agreeably read a mass of words composed even in a rightly constructed letter, unless the line is kept to a certain maximum length; that is to say, the reader's eye cannot comfortably seize more than a certain number of words in any given size except in a proportionate length of line. Nor can a reader comfortably seize a letter, a word or a line, unless the printer's setting is related to the reader's normal habit of vision when holding a book for reading. The typographer's respect for these principles will generally protect the reader from the risk of "doubling" (that is, reading the same line twice), or from being given a book in a large and "staring" type.

The average number of words which the reader's eye can conveniently seize is between 10 and 12 (some 48 characters). The typographer, while exerting himself to the utmost to respect this ocular limitation, may often be confronted with certain conditions which make it impossible for him to secure a type of the right related size. He is often forced to the use of a small type, and in order to obviate the risk of "doubling," he inserts leads between the lines of type and thus increases the space between them.

The practice of leading, denounced in certain quarters, is an essential necessity. The typographer, therefore, in making the best use of his material, must make legitimate use of leads. It may be added, too, that in certain compositions, leads produce a happy effect; and in not a few cases, their absence may ruin a composition set even in a relatively large type.

The typographer should know how to extract the utmost from the use of a type which is narrow in relation to its height—leading and spacing play a decisive part here. A round, open, wide letter may, for certain purposes, be set "loose"; *i.e.,* the space between the letters will be greater (or appear greater by reason of the curves of the c, o, e, g, in the lower case), than in a relatively condensed letter. Consistency will here insert a satisfactory lead between the lines.

The space between words composed in a condensed letter is less than that between words in a round, wide form. A lead should always precede and follow quoted matter. Where there is no leading between the lines, and the composition is necessarily tight, it may be an advantage to set leads between the paragraphs.

Indention is a most important detail. The opening sentence of every work should automatically manifest itself as such. This may be contrived by using a large initial letter, by printing the first word in CAPITALS, or SMALL CAPITALS, or CAPITALS and SMALL CAPITALS. The first word may be set into the margin; but it should not be indented. Indention marks paragraphs—the subsequent sections of the text: Where for any reason it may be necessary to avoid indention in paragraphs, a lead is plainly desirable. Absence of indention and of lead means the virtual extinction of the paragraph.

The depth of the page will be related to the length of line. The measure must be symmetrical, displaying a form pleasing to the eye. A rectangle is more pleasing than a square.

A rectangular page composed of lines of 10–11–12 words long will generally be satisfactory. It remains to add the running page-heading, and the folio. The page-heading may either range to the left and right in the opening (fixing the two pages as a unity); or range to the right and left; or it may be centred. The folio may be centred at the foot, or range either way at the top or bottom; but it cannot be centred at the top without abolishing the running page headline. This may be done, but it is an undesirable practice. The running headlines may be set in capitals of the text, in upper- and lower-case of the text, or in any combination of capitals. The use of full-sized capitals renders over-conspicuous a repetitive feature inserted for extrinsic convenience—that is, the identification of loose leaves. By reason of its position, the headline looks ragged if set in upper- and lower-case. It seems best, therefore, to employ small capitals; all capitals are best separated by hair spaces as their rectangular structure and preponderance of perpendiculars tend to solidify the composition.

Full-sized capitals may well be used for chapter headings, the number of the chapter being kept in small capitals, and both indications being hair spaced. The practice of dropping the chapter opening is justified by the fact that the eye, in travelling from the generally occasional blank at the end of a chapter to the beginning of the next, finds a companion blank an agreeable consistency. It has also the psychological advantage of saving the reader from feeling overpowered by the text. The rectangle of type is so imposed upon the edge as to allow centre, head, fore-edge and tail margins of a dimension proportionate, first, to the length of line and, secondly, to the disposition of space at points where the text is cut into chapters, and where the body joins the prefatory and other pages known as "preliminaries." These last, less strictly governed by convention than the text pages, offer the maximum opportunity of design to be found in the volume.

The history of printing is in large measure the history of the title-page. The title when fully developed occupied a recto page, either partially or wholly; and the title-phrase, or a catchword of it, has generally been set in a conspicuous size of type. Sixteenth century Italian printers generally used large capitals, copied from inscriptions, or more exceptionally, from caroline manuscripts; while English use followed the French in employing a leading line of large upper- and lower-case, followed by a few lines of pica capitals. Next came the printer's device, and at the foot of the page, his name and address. The large sizes of upper- and lower-case, being an inheritance from printers who were accustomed to black-letter (never set in solid capitals), have gone. The device also has vanished, except from the University Presses.

The contemporary title-page is a bleak affair; in nine out of ten cases the blank between the title and the imprint of the printer-publisher tends to be the most outstanding feature. When the device was first abandoned, the author, printer or publisher took advantage of the leisure of the reader and the blank at their disposal to draft a tediously long title, sub-title and indications of the author's qualifications, designed to fill the entire page. The present day publisher goes to the other extreme, reducing the title to as few short words as possible, followed with "by" and the author's name. A professional writer may insert, *e.g.,* "Author of *The* Deluge" under his name, but three and sometimes four inches of space separate this from the first line of the imprint. Consequently unless the title be deliberately set in a size of type out of all relation to that of the remainder of the book, this space is over-conspicuous. It is clear that a volume in 12-point does not require a 48-point title unless it be a 900-page folio in double-column.

Care for the typography of a book means care for its unity. There is no reason for a title-page to bear any line in a type larger than twice the size of the text-letter. If the book be set in 12-point, the title need be no larger than 24-point—or even slightly smaller. It should be set in spaced capitals as a rule. The author's name, like all displayed proper names, should also be in capitals. The headings to the preface, table of contents, introduction, etc., should be in the same size and fount as the chapter heads; and should be dropped if they are dropped. The order of these pages remains unsettled, except that all begin on a recto page. The logical order of the preliminary pages is half-title, title, dedication, contents, introduction, preface. This rule is applicable to most categories of books. Novels need neither table of contents nor list of chapters, though one or the other is generally printed. If it is decided to retain either, it would be reasonable to print it on the back of the half-title and facing the title page, so that the entire nature of the book will be indicated to the reader at a single opening. Where the volume is made up of a few short stories, their titles can be listed in the blank centre of the title-page.

Book Sizes.—In addition to fiction, belles-lettres and educational books are habitually published in portable, if not in pocketable formats, crown octavo $7\frac{1}{2}'' \times 5''$ (in America known as 12 mo) being an invariable rule for English novels published as such. The novel in the form of biography will be published as a biography, $6'' \times 8\frac{1}{2}''$, the size also for history, archaeology, science, art and almost everything but fiction. Novels are only promoted to this format when they have become "standard." Size, therefore, is the most manifest difference between books.

Another obvious difference is bulk, calculated in accordance with the publisher's notion, first, of the general sense of trade expectation, and, secondly, of the purchasing psychology of a public habituated to certain selling prices vaguely related to number of pages and thickness of the proffered volume. Inconsistently enough, weight does not enter into these expectations. These habits of mind affect the choice of fount and size of type, and may necessitate the adoption of devices for "driving out," *i.e.,* making the setting take up as much room as possible. By putting the running headline between rules or rows of ornaments; introducing unnecessary blanks between chapters; contracting the measure; exaggerating the spaces between the words and the lines; excessively indenting paragraphs; isolating quoted matter with picas of white space; inserting wholly unnecessary sectional titles in the text and surrounding them with space; contriving to drive a chapter ending to the top of a recto page so that the rest of it and its verso may be blank; using thick but not heavy paper; increasing the depth of chapter beginnings and inserting very large capitals thereto; the volume can be inflated to an extra 16 pages —a feat which the able typographer accomplishes without showing his hand to the reader.

Limited editions of standard authors, or of authors who desire to rank as such, are commonly given a rubricated title. Under no circumstances, however, should red appear anywhere else in the work. Hand-made paper is generally used for editions-de-luxe, and none but the brave among typographers will disregard the superstitious love of the book-buying classes for its untrimmed, ugly and dirt-gathering rough edges. There is another category of limited edition produced by typographers working freely, without the handicap of trade conditions. These books are rapidly increasing in number, and use a wide variety of format, of type, of illustration and of binding.

Because, rather than in spite of, mechanical methods and standardization, printing is more various to-day than ever before. Whereas English books of whatever category of 20 years ago were printed in only three designs of type, no fewer than eight founts are employed to-day. It has been necessary that most of these are reproductions of classic old-faces, but it may well be that the near future will witness a real renaissance of type design based upon a sensitiveness to rightly-controlled type forms, and not animated by an uninformed curiosity for the original and the bizarre. (S. Mo.)

TYPOLOGY. Typology results from a study of the various kinds of objects fashioned by man and the sorting of them into categories. The objects in each category can be often further classified, a geographical, chronological or evolutionary basis being taken. For example, in the case of artefacts made by primitive man in the Fiji islands the typologist might begin by sorting out all the paddles. These would then be further classified according to their locality and age. On studying such a group of objects it is often possible to make out an evolutionary series in a tool family, a certain type being clearly derived from an earlier one and itself the parent of some further development.

In prehistory, a typological study of the artefacts made by man is one of the four methods which yield information before written documents existed; the other three being stratigraphy (*q.v.*), a study of the state of preservation of the artefacts found, and of the objects associated with them. The two latter methods are useful as checks on the information obtained from stratigraphy and typology.

Although as shown above typology sometimes enables us to determine a chronological sequence, this is primarily obtained by the stratigraphical method; typology enables us to study systematically the industries belonging to the various cultures. By noting the peculiarities of the various tools which make up the industries we obtain type standards for each culture with which new finds, otherwise undatable, can be compared. Thus, it is found by experience that a particular implement, viz., the beaked burin, is almost exclusively confined to industries which on stratigraphical and other grounds, can be assigned to a Middle Aurignacian culture. If then a new industry is discovered otherwise undatable, but including a large number of beaked burins, we can assume, with some probability, that the age is Middle Aurignacian. Again, a certain type of celt, showing a rectangular cross-section and elaborate trimming, can at once be recognized not only as being of Scandinavian origin, but also as belonging to a definite period of late Neolithic date.

Typology can be applied to styles and techniques of painting. Thus, for example, in Southern Rhodesia palimpsests of Bushman paintings occur. The typologist can observe several different styles which are always found occurring in the same stratigraphical sequence, painted one over the other. In this way a succession of art styles has been determined. (M. C. B.)

TÝR was the Norse god of war and, perhaps, of justice as well. There is rich evidence, from inscriptions and in the works of classical authors, that Týr was worshiped in Germany, and he was also known in England, although his cult was not widespread in Scandinavia itself. Icelandic mythology has interesting stories of Tjrr. According to one of them, he placed his hand as a pledge between the jaws of the monstrous wolf Fenrir while the gods bound him, and the wolf bit it off. Tjrr was therefore known as the "one-handed god." He was identified with the Roman Mars, and hence Dies *Martii* was rendered "Tuesday" (O.E. *Tiwesdaeg,* O.N. *Týsdagr*). The name Tjrr is generally said to be of the same origin as the Sanskrit word devah and the Latin deus (god).

See J. de Vries, ***Altgermanische Religionsgeschichte,*** 2nd ed., vol. 2, pp 10–26 (1957). (G. T.-P.)

TYRANNOSAURUS: see DINOSAUR.

TYRANT, a term applied in modern times to a ruler of a cruel and oppressive character. This use is based on a misapprehension of the Greek word, which implied nothing more than unconstitutional sovereignty. Such rulers are not confined to a single period, the so-called "Age of the Tyrants" (see GREECE: History), but appear sporadically at all times. The use of the term in the bad sense is due largely to the ultraconstitutionalists of the 4th century in Athens, to whom the democracy of Pericles was the ideal of government. Thus the government which Lysander set up at the close of the Peloponnesian War is called that of the "Thirty Tyrants" (see CRITIAS).

TYRAS, a colony of Miletus, founded about 600 B.C., about 10 mi. from the mouth of the Tyras (Dniester). The types of its coins suggest trade in wheat, wine and fish. During the 2nd century B.C. it fell under the dominion of native kings. Destroyed by the Getae about 50 B.C., in A.D. 56 it seems to have been restored by the Romans and henceforth formed part of the province of Lower Moesia. Its coins display heads of emperors from Domitian to Alexander Severus. Soon after the latter's reign it was destroyed by the Goths. It was governed by five archons, a senate, a popular assembly and a registrar. Its site is covered by the medieval fortress of Monocastro or Akkerman (see BELGOROD-DNESTROVSKI).

TYRCONNEL, RICHARD TALBOT, EARL (TITULAR DUKE) OF (1630–1691), Irish Jacobite, son of Sir William Talbot (d. 1633), a Roman Catholic lawyer and politician, a royalist in the Great Rebellion, was at the storming of Drogheda by Cromwell (Sept. 3, 1647), later escaping to Spain. Arrested in London in Nov. 1655 for acting as agent in plots to upset the Commonwealth, he escaped once more. After the Restoration he was employed in the household of the duke of York, even after intriguing to ruin the character of Anne Hyde, the duke's wife. In 1678 he was arrested in connection with the "popish" plot agitation, and went into exile for a time. During the reign of James he was appointed commander in chief in Ireland and created earl of Tyrconnel (1685); in Feb. 1687 he was appointed lord deputy. Tyrconnel, who foresaw the revolution in England, intrigued for handing over Ireland to France, in the interests of the Roman Catholics, and in 1690, when James fled to France after the battle of the Boyne, Tyrconnel carried on the struggle against William III. When he raised the siege of Limerick Tyrconnel fled to France for help. Returning to Ireland, in Jan. 1691, he was of little use, and had to retire to Limerick, where he died on Aug. 14, 1691. In 1689 James created him duke of Tyrconnel, but the title was only recognized by the Jacobites.

TYRCONNELL (Tir-Conaill), an ancient kingdom of Ireland. Conall Gulban, a son of Niall of the Nine Hostages, king of Ireland, acquired the wild territory in the north-west of Ulster (the modern Co. Donegal, etc.), and founded the kingdom about the middle of the 5th century. Of the several branches of his family, the O'Connells, O'Cannanans and O'Dohertys may be mentioned.

The kings of Tyrconnell reigned until 1071.

TYRE, a seaport of Phoenicia, now Lebanon; pop. (1956 est.) 12,000. Tyre is built on a peninsula, once an island, has narrow streets and evident traces of antiquity in the material of its buildings. Of the two harbours which it formerly possessed, the northern, or Sidonian, still survives; the southern, or Egyptian, has disappeared. Once the great mart of the Mediterranean world, it has now an insignificant export trade in cotton and tobacco.

History.—The name Usu (Ushu), the designation of the mainland town, appears in the Tell el Amarna letters (14th century B.C.), and in Papyrus Anastasi I. (13th century). As it is not found in the list of Syrian cities tributary to Thutmoise III. (15th century B.C.), it is reasonable to conclude that it was founded before the beginning of the 14th century, but not before the beginning of the 15th. The earliest settlement, a colony of Sidon (*q.v.*), was in all probability divided between the mainland and the island. The building of a causeway connecting the island with the shore is attributed to Hiram, well known as the king of Tyre, who had commercial dealings with Solomon and supplied skilled labour and material for the erection of the temple at Jerusalem. Jezebel was a daughter of Ethbaal, a Tyrian king.

From her island fortress, Tyre, the mistress of the seas, could defy her enemies and for the most part Assyrian and Babylonian might spent itself against her defences in vain. Shalmaneser IV., after an unsuccessful attack by sea, maintained a blockade on the land side for five years until his death intervened. Ashurbanipal stormed the city in 664 B.C. In the 6th century B.C. it endured a 13 years siege from Nebuchadrezzar.

However, Tyre, with the marvellous vitality of those early times, recovered in a comparatively short time. The city passed under the sway of the Seleucids (198 B.C.) and the Romans (68 B.C.). Herod the Great endowed it with a temple. St. Paul spent a week there while the ship "unloaded her burden" on his journey from Ephesus to Jerusalem. By the 2nd century it had become the see of a bishop. With the rest of Syria it passed into the hands of the Muslims in the 7th century. The crusaders captured it (1124), and made it one of the chief cities of their kingdom of Jerusalem. After the fall of Acre, the Muslims destroyed it.

In Roman times Tyre, "seething with commerce" (*ebulliens negotiis*) was famous for the manufacture of silk and silken garments, as well as the famous Tyrian purple from the murex shell. Lucan (*Phars.* x. 41) tells how Cleopatra appeared at a banquet arrayed in thin-spun and clinging silk garments, made by the skilful Tyrians and then a new luxury.

A French archaeological expedition visited Tyre in 1921 and explored the neighbourhood. See PHOENICIA.

See Mme. D. le Lasseur, "Mission archéologique à Tyr" (1921): *Syria* 3 (1922); R. Dussand, *Topographie Historique de la Syrie Antique et Médiévale* (1927), 19 *seq.* (bibl.). (E. Ro.)

The most important references to Tyre in the Bible are 1 Kings v., vii., ix.; Is. xxiii.; Am. i. 9 *seq.;* Ezek. xxvi.–xxviii.; 2 Macc. iv. 18 sqq.; Mark iii. 8, vii. 24 *sqq.*; Matt. xi. 21 *seq.* *(and* parallels); Acts xii. 20. *Cf.* also Joshua xix. 29; 2 Sam. xxiv. 7; Ezra iii. 7; Neh. xiii. 16; Ps. xlv. 12, lxxxiii. 7, lxxxvii. 4.

Siege of, by Alexander the Great **(332 B.C.).**—After the battle of Issus, Alexander, as he marched southwards towards Egypt, called upon the Phoenician cities to open their gates, as it was part of his general plan to deny their use to the Persian fleet. The citizens of Tyre, who owed allegiance to the king of Persia, refused to do so, whereupon he laid siege to the city. New Tyre was built on a small island, about half a mile from the main land upon which the old city stood. Possessing no fleet Alexander demolished old Tyre, and with the *débris* built a mole 200ft. in breadth across the straits, and erected towers and war engines at its further end. Thereupon the Tyrians destroyed the towers by fire ships and damaged the mole. Many curious devices were made use of to defeat the Greeks, such as pots of burning naphtha and sulphur, and red-hot sand hurled from catapults. Alexander next widened the mole and rebuilt the towers, but he saw that without assistance of a fleet success could not be assured since the Tyrians had free access to the sea. From Sidon he obtained 80 Phoenician ships, and 24 from Rhodes, Malius, Soli, Lycia and Macedonia. Then the king of Cyprus, hearing of the defeat of Darius at Issus, joined Alexander with 220 warships. The reduction of Tyre was now but a matter of time, for if the assault from the mole proved unsuccessful, starvation must accomplish its work. Alexander was, however, impatient to complete the siege before Darius could raise another army, so he constructed floating batteries upon which rams were mounted, and forced his way into the Egyptian and Sidonian harbours, and scaled the city walls. Thus after a siege of seven months the city was taken, 8,000 of the citizens were slaughtered, 2,000 later on executed, and 30,000 sold into slavery.

TYRE: see TIRE.

TYROL: see TIROL.

TYRONE, EARLS OF: *see* O'NEILL (Irish Family).

TYRONE, a county of Northern Ireland, bounded north by Londonderry, west by the frontier of the Republic of Ireland, south by parts of Fermanagh and Armagh and another portion of the frontier, and east by Lough Neagh. The area is 1,261 sq.mi. Pop. (1951) 132,082.

The largest county in Northern Ireland, Tyrone is mountainous in the north and hilly in the centre, but the land falls away in the south to the Clogher valley district and the river Blackwater, in the east to Lough Neagh and in the west to the valleys of the Mourne, Strule and Derg. It is almost altogether an agricultural county with much grazing. It has great historic interest as the ancient seat of the O'Neills and the centre of the Tyrone war in the reign of Elizabeth I.

Running along the northeastern boundary with Londonderry are the schist ridges of the Sperrin mountains, the highest peaks being Sawel (2,240 ft.) and Mullaghcloga (2,088 ft.). Most of the south of the county is occupied by sandstone formations. From Coalisland to Dungannon in the southeast there are coal measures, but efforts to work them have not been very successful or profitable because of difficulties of access.

Tyrone became a principality of one of the sons of Niall of the Nine Hostages in the 5th century, and from his name—Eoghan—was called Tir Eoghan, or the land of Eoghan, gradually altered to Tyrone.

From Eoghan were descended the O'Neills and their various branches. Tyrone was the central territory of the O'Neills for many centuries, and the adjacent Tirconaill or Donegal was the territory of their rivals the O'Donnells. The chief seat of the O'Neills was Dungannon, and at Tullahogue in the east of the county was the place where the chief O'Neill was inaugurated with traditional ceremony. The isolated position of Tyrone and the difficulty of penetrating into it in mediaeval times left the O'Neills for the most part unmolested there, while the eastern part of Ulster was invaded by adventurers of the type of John de Courcy. There was constant friction down the centuries between O'Neills and O'Donnells.

In the reign of Henry VIII, Conn O'Neill was persuaded to come to terms with the king and received from him the title of earl of Tyrone. It was agreed that Conn was to be succeeded by his putative illegitimate son, Matthew, who was meanwhile given the title of baron of Dungannon. But on Conn's death in 1559 another son, Shane, was proclaimed chief of the O'Neills, Matthew having already been killed and the claims of his son Brian being set aside. Although vigorously attacked, Shane held his ground and later went in person to interview Elizabeth I. He made the error, however, of being merely an O'Neill dynast and carried on war not only with the English but with the O'Donnells and with the MacDonnells of Antrim. In this warfare he finally perished. He was succeeded by his cousin Turlough. The English government raised up young Hugh O'Neill, second son of Matthew, as a rival to Turlough. Hugh had been educated in England.

Feeling his way carefully, Hugh came to terms with Turlough. Later he established good relations with the O'Donnells and with other neighbours. From the early 1590s he became leader of a general movement among Ulster chiefs to assert their independence. Several government expeditions against him were defeated, his biggest victory being at the Yellow ford on the river Callan, an affluent of the Blackwater, in 1598. Further disasters came upon the English forces, and Hugh sallied out from Ulster to rally the Irish in Munster and Leinster. Disappointed by his Spanish allies, he was finally defeated and hemmed into his own territory and surrendered in 1603.

The Tyrone war, which lasted nine years, was enormously costly to the English government and helped to lay the foundation of those financial difficulties between king and parliament which troubled the Stuarts.

Hugh was restored to his dignities and territory, but he found his situation too difficult and went to the continent in 1607. Tyrone was then soon confiscated and colonized under the scheme for the plantation of Ulster.

The county saw further fighting after the rising of 1641, a Scottish army sent to protect the colonists being defeated by the insurgent Irish under Owen Roe O'Neill at Benburb in 1646. In 1689 the county was for several months partly occupied by the forces of James II.

Tyrone today is a county of small farms. In the hilly country there is much hill pasture and rough grazing. At Omagh, the county town (pop. [1951] 6,757), shirts and milk products are manufactured. At Dungannon there is linen and rayon weaving and the manufacture of clothing and fabrics. Clothing and felt goods are made at Cookstown, and bricks, fire clay and rough pottery at Coalisland.

The county returns five members to the parliament of Northern Ireland, and it forms a portion of each of two constituencies—Mid-Ulster, and Fermanagh and South Tyrone—each of which returns one member to the United Kingdom parliament. (Hu. S.)

TYRRELL, GEORGE (1861–1909), Roman Catholic priest who was prominent during the Modernist controversy, was born in Dublin on Feb. 6, 1861. In 1879 after a year at Trinity college he became a Roman Catholic, joining the Jesuits in 1880. Ordained in 1891, he taught philosophy at Stonyhurst (1894–96). Always devoted to St. Thomas Aquinas, he disliked the Jesuit writers, especially Francisco Suárez, and ultimately declared that the Society of Jesus had become "dust and ashes" in his mouth and that he was no more bound in conscience to it. Casting about for an interpretation of dogma that would enable it to coexist with modern knowledge, he was much attracted by Maurice Blondel's system of the role of will in belief, and, briefly, by Newman's theory of the development of doctrine. Official opposition to such experiments ended by convincing him that organized Christianity was a dismal failure.

The first and most humane of his books was *Nova et Vetera* (1897), informal meditations, which appeared after his move to Farm street, London. *Hard Sayings* (1898) and *External Religion* (1899), conferences given to Catholic Oxford undergraduates, aimed more frankly at bringing to life beliefs academically and heedlessly held. In Dec. 1899 a heavily censored article on hell embittered his relations with the Jesuits, but, like his *Lex Orandi* (1903) and *Lex Credendi* (1906), it was so pervaded with irony that his full meaning could only be guessed. He was also publishing work under pseudonyms, notably *Religzon as a Factor in Life* (1902) by "Dr. E. Engels" and *The Church and the Future* (1903) by "H. Bourdon," which cut at the root of religious authority. In 1906 the publication in Italian of extracts from *Letter to a Professor of Anthropology*, which appeared in England as *A Much.Abused Letter*, finally occasioned his dismissal from the Jesuits. In 1907 Tyrrell was refused the sacraments after criticizing the encyclical *Pascendi*. Further writings, *Through Scylla and Charybdis* (1907), *Medievalism* (1908) and *Christianity at the Cross Roads* (1909), only reiterated his distinction between the "prison of theology" and the "liberty of faith." In 1907 he settled at Storrington (where he died on July 15, 1909) determined that he was a Catholic, but refusing to retract what he had written. He was despondent, seeing that both his efforts and his theories had failed to win general acceptance, and unaware of the remarkable progress of Catholic scholarship. Tyrrell's intelligence was very acute, but he suffered from lack of historical, scriptural or linguistic training, and could not really judge the scriptural criticism to which Baron F. von Hiigel introduced him nor could he understand the position obtained by his other and more vivacious friend, H. Bremond.

See M. D. Petre, ***Autobiography** and Life of G. Tyrrell*, 2 vol. (1912). (Cy. C. M.)

TYRRELL, SIR JAMES (d. 1502), the supposed murderer of the English king Edward V, and of his brother Richard, duke of York, was a son of William Tyrrell and a grandson of Sir John Tyrrell (d. *c.* 1437), who was treasurer of the royal household and was on three occasions speaker of the house of commons.

The family is said to descend from Walter Tirel, the murderer of William Rufus. During the Wars of the Roses James Tyrrell fought for the Yorkists; in 1471 he was knighted and in 1477 he was member of parliament for Cornwall. With regard to his share in the murder of the princes in 1483, he appears to have been selected by Richard III and sent to the Tower of London, where he supervised the crime which was carried out by his subordinates.

Afterward Tyrrell received several appointments from Richard and was sent to Flanders. He was also employed by Henry VII and was made governor of Guisnes, but he seems to have incurred the king's displeasure through his friendship with Edmund de la Pole, earl of Suffolk. Having been treacherously seized he was conveyed to England and was executed on May 6, 1502. Just before his death he made a confession about the murder of the princes.

TYRTAEUS, Greek elegiac poet, lived at Sparta about the middle of the 7th century B.C. According to the older tradition he was a native of the Attic deme of Aphidnae and was invited to Sparta at the suggestion of the Delphic oracle to assist the Spartans in the second Messenian war.

Later accounts reject his Athenian origin, but it is admitted that Tyrtaeus flourished during the second Messenian war (*c.* 650 B.C.)—a period of musical and poetical activity at Sparta, when poets like Terpander and Thaletas were welcomed—that he not only wrote poetry but served in the field and that he endeavoured to compose the internal dissensions of Sparta (Aristotle, *Politics*, v, 6).

About 12 fragments (three of them complete poems) are preserved. They are mainly elegiac and in the Ionic dialect, written partly in praise of the Spartan constitution and King Theopompus and partly to stimulate the Spartan soldiers to deeds of heroism in the field. The interest of the fragments preserved is mainly historical, and connected with the first Messenian war. The inspirational poems were very popular in the army (Athen. xiv, 630 F.). Of the marching songs, written in the anapaestic measure and the Doric dialect, only scanty fragments remain.

Verrall (*Classical Review*, July 1896, May 1897) definitely places the lifetime of Tyrtaeus in the middle of the 5th century B.c., while Schwartz (*Hermes*, 1889, xxxiv) disputes the existence of the poet altogether; *see* also Macan in *Classical Review* (Feb. 1897); H. Weil, *Études sur l'antiquité grecque* (1900), and C. Giarratani, *Tirteo e i suoi carmi* (1905). There are English verse translations by R. Polwhele (1792) and imitations by H. J. Pye, poet laureate (1795), and an Italian version by F. Cavallotti, with text introduction and notes (1898). The fragment beginning *Tetknamenai gar calon* has been translated by Thomas Campbell, the poet, as "The Young Hero."

TYRWHITT, THOMAS (1730–1786), English scholar, especially notable for his work on Chaucer, was born in London, March 27, 1730. He was educated at Eton and Queen's college, Oxford, becoming a fellow of Merton in 1755. He was called to the bar but never practised. He became deputy secretary at war (1756) and then clerk of the house of commons (1762), retiring in 1768. He died in London, Aug. 15, 1786.

In classical and English scholarship alike Tyrwhitt showed the same qualities of balance, wide knowledge and critical acumen. He was the one man who was able (1777) to reject on linguistic grounds the authenticity of the Romley-Chatterton poems. Of his several classical editions, the most important was of Aristotle's *Poetics* (1794). His fame, however, rests chiefly on his edition of Chaucer's *Canterbury Tales* (5 vol., 1775–78). Chaucer's reputation had long suffered because the principles of his verse were no longer understood. It was Tyrwhitt who pointed out that *-e's* now mute, should be pronounced as separate syllables and that the accent was often placed in the French manner; *e.g.*, virtúe, not virtue. Of his work on Chaucer, T. R. Lounsbury said, "The sanest of English poets had the good fortune to meet with the sanest of editors." Advances in knowledge have made Tyrwhitt's work obsolete but have not diminished the respect in which he is held.

BIBLIOGRAPHY.—T. R. Lounsbury, Studies in Chaucer, 3 vol. (1892); C. Spurgeon, *500* years of Chaucer Criticism (1914–25); L. F. Powell, "Tyrwhitt and the Rowley Poems," Review of Eng. Studies (1931).

TYUMEN, a town in the Tyumen oblast of the Russian Soviet Federated Socialist Republic, U.S.S.R., in 57" 15' N., 65° 18' E., on the Tura, which is difficult for navigation because of its shallowness, though dredging has somewhat improved it; it is usually ice free from May 8 to Nov. 15. Pop. (1959) 150,000. The highway across the Urals passes through the town, and the railway links it with Sverdlovsk and Omsk. In 1580 Yermak wintered on the site and in the following year captured Isker or Sibir, the fort from which Siberia took its name; the fort of Tyumen was established in 1585. Later it became the centre for the colonization of the Tura, Tavda, Tobol and Ob rivers, but was superseded by Chelyabinsk (1959) 688,000, which had a railway link earlier than Tyumen. In 1893 the first dairy farm was begun near Tyumen by the English wife of a Russian, and this led to the rapid development of that industry in western Siberia. It has the largest tanning and leather industry in Siberia, and has smelting works, sawmills, match factories and steamer and boatbuilding yards. Wool is dressed, and there are potteries. The peasant industries include cooperage, the making of carts, furniture, sledges, horse collars and wooden household utensils. Tyumen carpets, with bright floral and animal designs, are famous; the former Samoyede vegetable dyes are being replaced by aniline. The plows of the Kamen volost are also noted.

TZETZES, JOHN, Byzantine poet and grammarian, flourished at Constantinople during the 12th century A.D. Tzetzes has been described as a perfect specimen of the Byzantine pedant. Excessively vain, he resented any attempt at rivalry, and violently attacked his fellow grammarians. O ing to want of books, he was obliged to trust to his memory; hence he is to be used with caution. But he was a learned man, and deserves gratitude for his efforts to keep up the study of ancient Greek literature. Of his numerous works the most important is the Book of Histories, usually called Chiliades ("thousands") from the arbitrary division by its first editor (N. Gerbel, 1546) into books each containing 1,000 lines (it actually consists of 12,674 lines in "political" verse). It is a collection of literary, historical, theological and antiquarian miscellanies, subsequently re-edited by the author with marginal notes. The Chiliades is based upon a collection of letters (107 in number) which are addressed partly to fictitious personages, and partly to the great men and women of the writer's time. They contain a considerable amount of biographical details. He is the author of the Iliaca, an abridgment of and supplement to the Iliad in 1676 hexameters, and the Homeric Allegories, dedicated to the empress Irene, two didactic poems in which Homer and the Homeric theology are explained on euphemistic principles. Tzetzes also wrote commentaries on Greek authors, for instance, on the Cassandra or Alexandra of Lycophron (ed. C. G. Miiller, 1811), in which his brother Isaac probably helped him. He is our earliest authority (Chil. 3, 88, 339–48) for the story of the beggary of Belisarius. Mention may also be made of a dramatic sketch in iambic verse in which he describes the wretched lot of the learned.

Editions:—Chiliades: *Corp.* Poet. Graec. (Lyons, 1612); ed. Kiessling (1826). Iliaca: ed. Lehrs & Diibner (Paris, 1868). Allegories in Matranga, Anecdota Graeca, vol. i. (1850); Scholia to Lycophron, ed. Miiller (1811).

For the other works of Tzetzes see J. A. Fabricius, *Bibliotheca* graeca (ed. Harles), xi. 228, and C. Krumbacher, Geschichte der *byz.* Lit. (2nd ed., 1897); monograph by G. Hart, "De Tzetzarum nomine, vitis, scriptis," in Jahn's Jahrbucher *für* classische Philologie. Supplementband xii. (Leipzig, 1881).

TZ'U-HSI (1835–1908), the empress HSIAO-CH'IN, who is best known in western literature as "Old Buddha" or the "Empress Dowager," was born on Nov. 29, 1835. She was a consort of the emperor Wen-tsung (reign title Hsien-feng, 1851–61), the mother of the emperor Mu-tsung (reign title T'ung-chih, 1862–75) and the adoptive mother of the emperor Te-tsung (reign title Kuang-hsii, 1875–1908). For almost half a century she ruled the Manchu imperial house and the Chinese empire with an iron will. After the end of the T'ai P'ing rebellion in 1864, there followed a period relatively free of disruptive foreign wars and internal unrest when China might have regenerated and adapted itself to the modern world, but Tz'u-hsi, despite her shrewdness and strength, lacked the vision of a statesman. Her greed gave rise to increasing corruption in the officialdom; her diversion of funds from naval construction in order to build an imperial pleasure garden was a factor in the defeat of China by Japan in 1895. Afterward she personally thwarted the reform movement of 1898 and connived in the disastrous antiforeign Boxer uprising of 1900.

One of the most powerful women in Chinese history, Tz'u-hsi died on Nov. 15, 1908, having contributed nothing to the ultimate welfare either of China or of the Manchu dynasty. (L. T. F.)

U IN the Semitic alphabet the letter Y (*vau,* "hook") was sixth in order and represented a labial semi-vowel (equivalent to English *w*). The Greeks used the letter to represent a vowel and placed it last in their alphabet following T (*tau*). In the place occupied by Y (*vau*) in the Semitic alphabet the western Greek alphabets had the letter digamma F, which they used to represent the bilabial semivowel (modern English *w*), a sound that had fallen out of use in some dialects (*see* F). Greek forms of the letter were Y, Y or V and the last of these passed from the Chalcidic alphabet into Latin. The form Y was identical in both the Etruscan and Lydian alphabets.

The Latins, who first used the combination FH to express the unvoiced labial spirant (English *f*), came under Etruscan influence to represent this sound by F alone. Thus, this letter, which in Greek had represented the bilabial semivowel (English *w*), was no longer available, and *v* had to do duty for both the vowel (English *u*) and the bilabial semivowel (English *w*). In later Latin before the separation of the Romance languages the bilabial passed into the voiced spirant equivalent to English *v*. Meanwhile, while the majuscule letter retained its form V, the minuscule and uncial had a rounded form, e.g., u (uncial), u (cursive of the 6th century) and, later, Carolingian u. Thus the letter passed into the mediaeval hands having the majuscule pointed form V and the minuscule rounded form *u* and representing two sounds, the vowel (*u*) and the spirant (*v*). In the later middle ages a differentiation took place similar to that between the letters *i* and *j*. The majuscule form, being generally used initially, came to represent the consonant, which usually occurred initially, in all positions; while the rounded form was used exclusively for the vowel. As a result a minuscule *v* and a majuscule *U* were adapted for use when required. The differentiation was wise and useful, and reversed the process by which in the Latin alphabet the single symbol had done duty for both consonant and vowel.

NAME OF FORM	APPROXIMATE DATE	FORM OF LETTER
PHOENICIAN	B.C. 1.200	?
CRETAN	1.100-900	V

OSCAN		Y V
UMBRIAN		V
CLASSICAL LATIN AND ONWARDS		U

THE DEVELOPMENT OF THE LETTER "U" FROM THE EARLIEST TIMES TO THE PRESENT DAY

In Attic Greek the sound represented by the letter was a high front rounded vowel (similar to French *u,* German *ü*). In Latin the vowel was a middle high rounded one (similar to the sound of *oo* in "*shoot*"). In modern English the short *ŭ* has become in most positions a low middle vowel closely resembling the original sound of short *ă* (*e.g.,* in the words "*but,*" "*dumb*"). There are certain exceptions, however (cf. "*bull,*" "*bush,*" "*put*"). The long vowel has within the last 200 years developed a palatal semivowel (the sound of *y*) before it, except when it follows a liquid (*r* or *l*). Contrast the sound of the pure vowel in the word "*brute*" with that in the words "*huge,*" "*rebuke.*" This change is sufficiently recent for such words as begin with long *ū* (e.g., "*university*") to be preceded, when the indefinite article is required, by the form *an,* not *a,* showing that the sound was a pure vowel sound. It is still so pronounced in certain cases in the United States. It is an interesting fact that this change was exactly paralleled in the Boeotian dialect of Greek. (B. F. C. A.; J. W. P.)

UAKARI, the name of certain tropical American monkeys, distinguished by their short tails. They constitute an aberrant group of the genus *Pithecia* confined to the forests of Amazonia, and frequently distinguished as the genus *Cacajao.* (*See* PRIMATES.)

UBANGI, a river of equatorial Africa (extreme length 1,400 mi.), the chief northern affluent of the Congo (*q.v.*). The Ubangi (otherwise Mubangi or Mobangi) enters the Congo by various mouths between 0° 22′ and 0° 37′ S. and 17° 40′ and 17° 50′ E. The Ubangi is formed by the junction of the Bomu and the Uele (Welle), the latter rising a few miles from the western edge of the western rift-valley, north of Lake Albert and after a course of 745 mi. it joins the Bomu at Yakoma. Both streams, which have hitherto received numerous affluents, flow westward as a wide river. A short distance below the junction of the Bomu and Uele, the Kota, coming from the borders of Darfur and forming the most northerly extension of the Congo basin, enters the united stream (right). The remaining tributaries, mostly on the right bank, are smaller. Below the confluence with the Kouma, which river offers water communication to within easy reach of the Shari basin, the Ubangi makes a great bend south and immediately it flows between hills and passes the Zongo or Grenfell rapids, which are a barrier to navigation save for small boats in flood season. Above Zongo rapids the river is navigable up to the confluence of the Uele and Bomu, and the former is navigable at high flood up to the Bomokandi confluence in 26° 8′. The Ubangi and the Bomu form the frontier between Belgian Congo and former French Equatorial Africa.

UBE, mining and industrial city, is located on the Inland sea in Yamaguchi prefecture, Japan. Between 1940 and 1958 its area increased from 15 sq.mi. to about 86½ sq.mi., and its population increased from 100,700 to an estimated 160,020. About 3,000,000 tons of coal, mostly bituminous but some anthracite, are produced annually. The Tertiary coal beds extending out under the sea are near the harbour, convenient for export to other parts of Japan. Coal is the basis of Ube's chemical industry and cement production rates next to coal.

(C. A. MR.)

ÜBERWEG, FRIEDRICH (1826–1871), German historian of philosophy, was born on Jan. 22, 1826 at Leichlingen, in the Prussian Rheinprovinz, where his father was Lutheran pastor. Educated at Göttingen and Berlin, he qualified himself at Bonn as *Privat dozent* in philosophy (1852). In 1862 he was called to

Konigsberg as extraordinary professor, and in 1868 he was advanced to the ordinary grade. He died on June 9, 1871.

Überweg's compendious, accurate and impartial *Grundriss der Geschichte der Philosophie* (1863–66) is his most lasting monument.

UCCELLO, PAOLO (PAOLO DI DONO) (1397–1475), Florentine painter, an artist of great distinction and individuality, whose works embody, more fully than those of his contemporaries, the ideals of early Renaissance art. The son of Dono di Paolo, a barber-surgeon from Pratovecchio in the Casentino. he was born in Florence. His only signed works are inscribed Pavli Vccelli or Vcieli Opvs. and the name Uccello also appears in documents; the reason for this appellation is not known. Uccello is mentioned as a member of the studio of Lorenzo Ghiberti in 1407 and 1412, and became a member of the Compagnia di San Luca in 1414. In 1425 he left Florence for Venice, where he is mentioned once more in 1427 and seems to have remained till 1430 employed as master mosaicist at St. Mark's.

The works Uccello executed there are lost, but a summary reproduction of a mosaic of St. Peter by Uccello is found in Gentile Bellini's "Procession of the Reliquary of the Cross" (Accademia, Venice).

A mistaken attempt has been made to connect Uccello's name with the mosaics in the Cappella Mascoli in St. Mark's. When in Venice Uccello must have come into close contact with International Gothic painting in north Italy, and this had a considerable influence on his later work.

In 1432 he was once more resident in Florence, and after this time he executed two frescoes in the Chiostro Verde of Sta. Maria Novella. These represent "The Creation of the Animals and the Creation of Adam" and "The Creation of Eve and the Fall"; they are ascribed to the artist by early sources but are not documented. In 1436 he was engaged to paint the effigy of Sir John Hawkwood in Florence cathedral. The new discipline of linear perspective plays an important part in this scheme, and is further developed in the somewhat later "Scenes From Monastic Legends" on the east wall of the cloister at S. Miniato al Monte. This group of works culminates in the decoration of the clock face of Florence cathedral (1443), where linear perspective is used to create an illusory architectural scheme. On the strength of these and later works Uccello has been credited with the invention of perspective, but their novelty resides less in the representational technique than in the decorative function which it serves. In 1443–44 Uccello prepared four cartoons for the circular windows of the cathedral cupola.

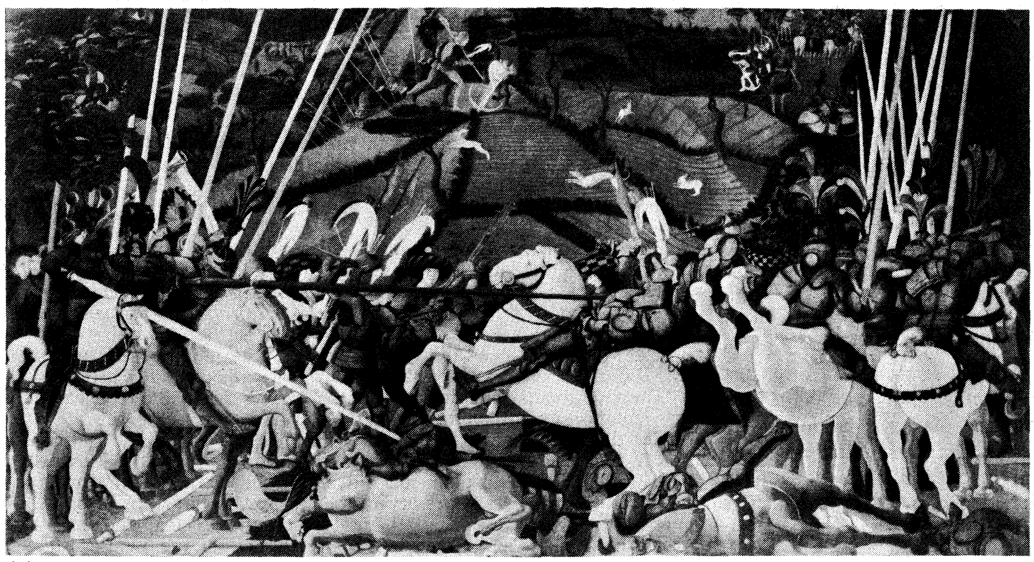
After this time he is said to have been in Padua, where he executed monochrome frescoes of giants in the Casa Vitaliani (now lost); these were much admired by Andrea Mantegna. Returning to Florence, he completed, probably about 1447, two further frescoes in the Chiostro Verde representing "The Drunkenness of Noah" and "The Flood." Though much damaged, these are Uccello's masterpieces, and are strongly influenced by the theory of L. B. Alberti and by the realism of Donatello. Their elaborate perspective schemes assume a yet more complex form in a later fresco of "The Nativity" in the cloister of S. Martino alla Scala, Florence. Three large battle pieces of "The Rout of San Romano," apparently painted on the commission of Cosimo de' Medici, date from about 1456 (National gallery, London; Uffizi, Florence; Louvre, Paris). The pronouncedly decorative character of these panels has made them the artist's best-known works. In 1465 Uccello was at Urbino engaged on an altarpiece of "The Institution of the Eucharist" for the Confraternity of Corpus Domini, of which the predella, with "The Profanation of the Host." survives in the Galleria Nazionale at Crbino. In 1468 Uccello returned to Florence, and after this time he executed the "Hunting Scene" now in the Ashmolean museum, Oxford. A reputed self-portrait of Uccello occurs, along with heads of Giotto, Donatello, Filippo Brunelleschi and Giannozzo Manetti, on a panel in the Louvre; the identification of this head and the authorship of the panel are both doubtful. Uccello died on Dec. 10, 1475. Many stories were told by Giorgio Vasari to illustrate Uccello's addiction to the study of perspective. His contribution to the development of perspective representation has been exaggerated.

See Giorgio Vasari, *Vite,* ed. by Milanesi; J. Pope-Hennessy, *The Complete Work of Paolo Uccello* (1950). (J. W. P.-H.)

UDAD (AOUDAD or AUDAD), the Barbary sheep. *Ammotragus lervia,* the only wild sheep found in Africa, where it inhabits all the mountain ranges of the north, descending eastward far into the Sudan.

It is distinguished by the abundant hair on the throat and forequarters of the rams. the length of the tail, the absence of face glands and the goatlike structure of the horns.

UDAIPUR or MEWAR, a town, district and division in the state of Rajasthan, India. The picturesque town is 2,469 ft. above sea level. Pop. (1951) 89.621. It is situated amid wooded hills on the bank of a large lake (Pichola), with palaces built of granite and marble. The maharana's palace, which crowns the ridge on which the city stands, dates from about 1570, but additions have made it a conglomeration of architectural styles. In Lake Pichola are two islands, on which are palaces dating respectively from the mid-17th and mid-18th centuries. In the neighbourhood are Eklingji (with a magnificent temple of the 15th century) and Nagda, the seat of the ancestors of the chiefs of Udaipur.



ALINARI

"THE ROUT OF SAN ROMANO," ONE OF THREE BATTLE PANELS BY PAOLO UCCELLO FOR THE PALAZZO MEDICI. NOW IN THE UFFIZI, FLORENCE.

The DISTRICT OF UDAIPUR (pop. [1951] 1,191,232) is one of five comprising the DIVISION OF UDAIPUR (pop. [1951] 3,171,114). The greater part of the country is hilly; in the south black cotton soil predominates. A section of the Aravalli hills runs from northeast to southwest and is rich in mica, lead zinc, steatite and asbestos. A great variety of building stones, such as sandstone, limestone and marble, is also to be found. The general inclination of the division is from southwest to northeast, the Banas and its numerous feeders flowing from the base of the Aravalli range. There are many lakes and tanks, the finest of which is the Dhebar or Jai Samand, with an area of 23 sq.mi.

Before 1948 Udaipur was a state ruled by the head of the Sisodia clan of Rajputs. He claimed to be the direct representative of Rama, the mythical king of Ajodhya, and was universally recognized as the highest in rank of all the Rajput princes. The dynasty offered a heroic resistance to the Mohammedans, and boasted that they never gave a daughter to a Mogul emperor. They are said to have come from Gujarat and settled at Chitor in the 8th century. After the capture of Chitor by Akbar in 1568, Maharana Udai Singh moved the capital to Udaipur. In the 18th century the state suffered greatly from internal dissension and from Maratha inroads. It came under British protection in 1817. In April 1948 it merged with Rajasthan and the maharana became maharajpramukh of that union.

The name Mewar is derived from the Meos, or Minas, a tribe of mixed Rajput origin.

There is another UDAIPUR, a former state now a district of Madhya Pradesh. (S. GL.)

UDALL, NICHOLAS (*c.* 1505–1556), English playwright and translator, was born in Hampshire, probably of the family of Uvedale who in the 14th century had become lords of Wykeham. He was educated at Winchester college and Corpus Christi college, Oxford, where he fell into some disgrace for suspected Lutheranism. When he left Oxford Udall took up schoolmastering. In June 1534 he was appointed headmaster of Eton, and in 1537 he became vicar of Braintree, although he did not take up residence there, but, according to a custom of the time, paid a curate to do the work of the living; which, however, he resigned in 1544. His rule at Eton was short. He was brought up before the privy council on March 14, 1541, for various offenses, was dismissed and for a time was sent to prison. He tried, but failed, to get restored to Eton. He maintained himself apparently by literary work and translations, which found favour with Catherine Parr, and he was made tutor to Edward Courtenay, the young earl of Devon who had been in the Tower since he was 12 years old. In 1551 he obtained a prebend at Windsor and two years later a living at Calborne, Isle of Wight. In spite of his Protestant tendencies, under Mary he became tutor in the household of Stephen Gardiner, bishop of Winchester, and in Dec. 1555 was appointed headmaster of Westminster, which post he held until his death, in Dec. 1556.

'Throughout his career Udall was an indefatigable writer. In 1533 he produced with John Leland "ditties and interludes" for Anne Boleyn's coronation. A year later he published *Flowers for Latin speaking selected and gathered out of Terence and the same translated into English*, a second edition of which he later published for the benefit of his Eton boys. Among his other translations were Erasmus' *Apothegms* (1542), *Paraphrases of the Gospels* (1552) and other works. Only the first three of the *Paraphrases* were translated by Udall himself; that on St. John was being translated by the princess Mary until she fell ill and handed her work over to Francis Mallett. The work was done at the suggestion and expense of Catherine Parr.

Udall is, however, better known as a playwright. John Bale credits him with *plures comediae*, and his pupils would have provided him with actors; but the only surviving play that can without doubt be assigned to him is *Ralph Roister Doister*. *Ralph Roister Doister* is famous as the first English comedy under classical influence. It has sometimes been described as a mere adaptation of Plautus' *Miles Gloriosus*. The central idea of the play — that of a braggart soldier (with an impecunious parasite to flatter him) who thinks every woman he sees falls in love with him and is finally shown to be an arrant coward — is undoubtedly taken from Plautus, but the plot and incidents, and above all the dialogue, are adapted to English conditions. The play was entered in the Stationers' Register and printed in 1566 (only one copy, presented to Eton in 1818, survives). It must, however, have been written earlier, for a quotation from the play was added to the third edition of Thomas Wilson's *Rule of Reason* in Jan. 1554. Since the reference does not appear in the previous editions of 1551 and 1552, the likelihood is that the play appeared in 1552 or 1553, and was therefore written neither for the Eton nor for the Westminster boys as has sometimes been asserted.

Other plays possibly by Udall are *The History of Jacob and Esau*, with divisions similar to *Ralph Roister Doister* into acts and scenes; *Jack Juggler*, which borrows from Plautus; and *Thersites*, with its farcical braggart figure. Another play, certainly by him, has unfortunately not survived. This was *Ezechias* ("Hezekiah"), acted before Elizabeth in King's college chapel on Aug. 8, 1564, during her visit to Cambridge. From the accounts of the performance it included Hezekiah's destruction of the idols of the grove, probably symbolizing Henry VIII's reforming measures.

BIBLIOGRAPHY.—*Cambridge Bibliography of English Literature*, vol. i, p. 519 (1940); G. Scheurweghs, *Nicholas Udall and His Roister Doister* (1939); *Roister Doister*, ed. by W. W. Greg, Malone Society reprint (1935).

UDINE, a town and archiepiscopal see of Veneto, Italy, capital of the province of Udine, situated between the Gulf of Venice and the Alps, 84 mi. by rail northeast of Venice, 450 ft. above sea level. Population (1951) 65,199. The interesting Porta Aquileia (14th century) is almost all that is left of the old city walls. Some of the streets are arcaded and there are some fine palaces. The old castle on a hillock in the centre of the town, at one time the residence of the patriarchs of Aquileia, and now used as a museum and picture gallery, was erected by Giovanni Fontana in 1517 in place of the older one destroyed by an earthquake in 1511. The Romanesque cathedral contains some interesting examples of native art by Giovanni Martini da Udine (a pupil of Raphael) and others. The church of S. Maria della Purità has frescoes by Giovanni Battista and Domenico Tiepolo. In the picturesque principal square stands the town hall, built in 1448–1456 in the Venetian-Gothic style, and skillfully restored after a fire in 1876; opposite is a clock tower resembling that of the Piazza di San Marco at Venice with the elegant loggia of S. Giovanni leading to the church of the same name (1533). In the square is a statue of Peace, erected in commemoration of the peace of Campo Formio (1796), which lies j mi. to the west southwest, and two columns, one with the tier of S. Mark, the other with a statue of Justice. The archiepiscopal palace contains frescoes by G. B. Tiepolo. The leading industry of Udine is silk-spinning, but it also possesses manufactures of linen, cotton, hats and paper, tanneties and sugar refineries, and has a considerable trade in flax, hemp, etc. Branch railways lead to Cividale del Friuli and S. Giorgio di Nogaro.

Udine lay on the line of the Via Julia Augusta, and there is proof of its existence in Roman times. In 983 it was given by the emperor Otto II to the patriarch of Aquileia, to whom it may have belonged even earlier. In 1222 or 1238 the patriarch Berthold made it the capital of Friuli, and in 1420 it became Venetian. In 1752 it became an archbishopric. It was the seat of the Italian Commando Supremo (G.H.Q.) during World War I from 1915 to 1917.

UDMURTSK (till 1932 VOTYAK) **AUTONOMOUS SOVIET SOCIALIST REPUBLIC,** within the Russian Soviet Federated Socialist Republic, U.S.S.R., originally part of Vyatka province. Area 16,178 sq.mi. Pop. (1956 est.) 1,285,000 (urban 502,000). It is surrounded by the Tatar A.S.S.R., and by the *oblasts* of Sverdlovsk and Kirov, and lies between 56° and 58° 30′ N. and 51° 30′ and 54° 15′ E. Geographically it includes a part of the Ural foothills forming the watershed between the Vyatka and Kama and the tributaries of the Chepsa. The soils, mainly sands and clays and gray forest soils, are not very productive, and 43% of the area is forest covered; there are vast swamps and marshes. The prevailing trees are fir (76%) and pine (12%); birch, ash, elm, maple and oak occur in small areas in the south.

Agriculture is the chief occupation. Rye and oats are the chief crops, and flax and potatoes are also grown.

There is an abundance of good quality timber. The rivers are unfavourable for navigation, but on many streams it is possible to float timber after the spring thaws; in summer they become very shallow. Mineral wealth includes the iron of the northeast region, slate, copper, quartz sand, chalk and red clay. Peat is abundant. The Varziachinsk district, a health resort from 1888, became noted for its mud and sulfur springs.

Factory industry was developed at Izhevsk (*q.v.*), the administrative centre, where there are steelworks and ammunition factories and where other metal goods are produced. In the northeast there is much iron smelting, and glass, pottery and vegetable oils are produced in the province. There are sawmills and rosin turpentine manufacture.

The Molotov-Kirov railway goes through the north of the area and the Kazan-Sverdlovsk through the south. Roads generally are poor.

The region was inhabited by Finnish tribes when Slav penetration and colonization began in the 12th century. For some time it was under the overlordship of Novgorod, but in the 15th century passed under that of Moscow. Though colonization went on continuously, the forest, marsh and poor soil did not prove attractive to Russians, and the Finnish tribes preserved their language and customs. The Votyaks (Otyaks), who call themselves Ot, Ut or Ud, and who are called Ar by the Tatars, may be akin to the Ars of the Yenisei. They are of middle stature, with light-coloured eyes and fair, often red, hair, and Finnish skull and facial characters. Their dialect is akin to that of the Permyaks. They are mainly agricultural, factory and town populations (43.3% of the total) being Russian.

UFA, the capital town of the Bashkir Autonomous Soviet Socialist Republic of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the high right bank of the Belaya river, just below its confluence with the Ufa river. Its site in a loop formed by the two rivers led to its foundation as a fortress in 1586 to protect the trade route across the Urals from Kazan to Tyumen. From its position on this major trade route the town derived its early importance, but with the industrialization of the Urals in the 20th century. it became a manufacturing centre. The great development of the petroleum industry of Second Baku after World War II gave an additional impetus to the growth of Ufa, the 1959 population of 546,000 being more than double the 1939 figure. After 1956 the satellite town of Chernikovsk, a few miles to the northeast, was united administratively with Ufa. The major industry is engineering, in particular the manufacture of power machinery, mining equipment, electrical apparatus (including telephones) and typewriters. Petroleum processing is carried on in Chernikovsk, as are a range of timber industries—sawmilling, veneer and match manufacture, papermaking and tannin extraction. The town remains an important centre of communications with railways west to the Volga at Kuibyshev and Ulyanovsk, east to Chelyabinsk and south to Sterlitamak and the Ishimbay oilfields. The Belaya is navigable below Ufa to the Kama river, thus linking the town to the Volga system of waterways. Ufa is the seat of Bashkir State university and has a teachers' training college and institutes of petroleum, aviation, agriculture and medicine. (R. A. F.)

UGANDA, a British protectorate in eastern equatorial Africa, bounded on the north by the Sudan, on the east by Kenya, on the south by Tanganyika and Ruanda-Urundi and on the west by the Republic of The Congo. The name is a derivation of Buganda, the African kingdom that forms one of its four provinces.

PHYSICAL FEATURES

The protectorate comprises 93,981 sq.mi., of which 13.689 sq.mi. are open water, 2,500 sq.mi. swamps, 6,200 sq.mi. forest reserves and 3,000 sq.mi. game parks and national reserves. It consists of a series of plateaus, broken up by wide, steep-sided valleys. Lake Victoria, about half of which is in the protectorate, is the size of Ireland and is the source of the Nile. This mighty river passes through the Owen Falls dam near Jinja and descends about 700 ft. in 50 mi. to Lake Kyoga. From there it is navigable for about 50 mi., after which it is unnavigable as far as the Murchison falls. Navigation can then be resumed into Lake Albert. After leaving this lake, the Victoria Nile becomes the Albert Nile and is navigable as far north as Nimule (3° 40' N.). Lakes Albert, George and Edward lie in the western branch of the Great Rift valley. Between these lakes extend the snow-capped peaks and glaciers of the Ruwenzori range, the highest point being Margherita peak (16,763 ft.); Ruwenzori forms part of the western boundary with the Republic of The Congo. The eastern boundary passes through Mt. Elgon (14,178 ft.).

The climate is tropical, though the temperature (60°–85° F.) is ameliorated by the relatively high altitude. The protectorate may be divided broadly into the long grass zone within the range of influence of Lake Victoria and enjoying well-distributed rainfall, and the short grass zone with about three months of hot, dry weather, the rain falling in two marked seasons.

Geology.—Pre-Cambrian rocks cover large areas of the protectorate. They include quartzites, gneisses and schists of the Basement complex in West Nile and Karamoja, and the Toro system of Toro, Ankole and much of Buganda, consisting of similar rocks with mudstones, grits and shales; this system forms the mass of Ruwenzori. The Karagwe-Ankole system is somewhat younger and includes quartzites, sandstones and conglomerates with phyllites and mica-schists near the margins of intrusive granites (granites underlie at least half the protectorate and are associated with economically important minerals). The Bunyoro series has tillites at the base, while the Singo series of Buganda consists of flat-bedded sandstones, conglomerates and siltstones. Fossiliferous shales of Karroo (Permocarboniferous) age occur near Entebbe. Plutonic ring complexes near Tororo are covered with laterite and are associated with phosphates and iron ore. Volcanic rocks of different types are found round Mt. Elgon and Ruwenzori. The Kisegi lacustrine beds of the Toro-Semliki part of the Albertine rift are of Lower Miocene age. The Kaiso sandstones and clays around Lake Albert contain early Pleistocene fossil mammal remains. In high terraces above the Kagera, Kafu and Muzizi rivers abundant stone implements testify to man's presence in Uganda from Lower Pleistocene times.

Vegetation. — Most of the protectorate lies within the floral province of the eastern and southern African steppes, but the forests of western Uganda are west African in character. In the region of lakes and mountains, elephant grass more than 10 ft. high dominates the landscape. Tropical rain forests of this zone have tall, evergreen and semideciduous trees, with shrubs and lianes beneath. The forests of the south, bordering Lake Victoria, are characterized by huge yellow wood trees (Podocarpus) and are intersected by swamps. Swampy ground everywhere has a thick growth of papyrus and other rushes and reeds, as well as wild date palms. Forests on higher ground farther north contain rubber trees and umbrella trees, while Podocarpus dies out. Parallel with this belt, 100 mi. farther west, are patches of forest of west African character. North of Lake George, ironwood trees predominate. The forests of Bunyoro, containing mahogany, are the most valuable in Uganda. Another economically important tree is the African teak, growing mostly in Busoga. The drier country of Northern province is characterized by figs, acacias and euphorbias. Above the forested lower slopes of the higher mountains such as Elgon and Ruwenzori, beginning at about 7,000 ft., is a zone of bamboo. This is followed by a zone where St. John's wort and tree heaths predominate; between 9,000 ft. and 14,000 ft. grow giant groundsels and lobelias up to 20 ft. in height.

Fauna. — The fauna of Uganda generally is of Ethiopian character, typical of eastern and southern Africa and of the Sudan. In the west, the fauna merges with the west African type. Along the eastern shores of Lake Edward, the western and northern shores of Lake George and beside Kazinga channel connecting the two lakes is the Queen Elizabeth National park which is 700 sq.mi. in extent and includes the forested volcanic foothills of the Ruwenzori range, the home of chimpanzees, colobus monkeys and giant forest hogs. The more open country is inhabited by elephants, buffaloes, lions, leopards and many kinds of antelope, while hippopotamuses abound in Lake George. The Murchison Falls National park farther north is 1,200 sq.mi. in extent and was once the paradise of ivory poachers. It contains certain forms which are not to be found in the Queen Elizabeth park, such as the black rhinoceros, giraffe, hartebeest and oribi. The square-lipped white rhinoceros is found in the West Nile. Notable among the birds are the splendidly coloured touraco. the gray parrot, whale-headed stork, ostrich and the crested crane which is the symbol of the protectorate. Hippopotamuses and crocodiles are common in the lakes and in the Nile, while tiger fish and the great Nile perch (running up to 300 lb.) afford great sport for anglers. (S. M. C.)

HISTORY

For perhaps a thousand years the territory now known as Uganda has been subjected to a series of immigrations of Hamitic, Nilotic and Nilo-Hamitic peoples from the north. The invaders dominated the original inhabitants of northern Uganda, imposing upon them their languages and attempting to introduce their social and political systems. The result of this pressure upon societies possessing only the most primitive forms of organization was to produce, by the mid-19th century, an agglomeration of small village and clan communities engaged in almost continual warfare with each other. To the south and west the invaders became, by the mid-16th century, a governing aristocracy in an area occupied mainly by Bantu-speaking peoples. A number of kingdoms were established, among them Bunyoro, Buganda and Ankole, each with a highly centralized and frequently despotic form of government. The distinction between the rulers and their subjects was most evident in Ankole, while in the other kingdoms it tended in time to disappear as the result of intermarriage. For nearly two centuries Bunyoro was the most powerful of these states but in the 19th century able rulers raised Buganda to the leading position.

Contact with the Outer World. — The first trade goods from the outside world reached Uganda in the late 18th century via the neighbouring state of Karagwe to the southwest. The first Arab trader to enter the country, Ahmed bin Ibrahim, arrived from Zanzibar by the same route in 1844 in search of ivory and slaves. Mainly for geographical reasons but also through fear of the Masai the road to Uganda passing through what is now Tanganyika was from the beginning preferred to the more direct route through Kenya. During the next ten years Ahmed was followed by several other Arab merchants whose penetration to Uganda was mainly due to the decline in the supply of slaves in Tanganyika. Firearms and cheap cotton cloth proved a great attraction in the kingdoms north of Lake Victoria as they had among the tribes to the south. The traders were welcomed in Buganda by Kabaka (king) Suna. Meanwhile, slave raiders from the Sudan had begun to prey upon the less well organized peoples to the north.

European explorers reached Uganda from north and south almost simultaneously. After travelling round the western shore of Lake Victoria J. H. Speke and J. A. Grant arrived at the Buganda capital in 1862 to find that Suna had been succeeded six years earlier by his more famous son, Mutesa. The latter was already worried by the news of slavers from the Sudan and in his anxiety to prevent a link-up between the foreigners from north and south tried to discourage Speke and Grant from continuing their journey. They persisted and, after discovering the source of the Nile near Jinja in July 1862, followed the river downstream through the Sudan and Egypt. At Gondokoro they met the explorer Samuel Baker and his wife, and these two, acting on information given by Speke, discovered Lake Albert in 1864.

In 1869 the vacant throne of Bunyoro was occupied by the warlike Kabarega, largely as a result of the assistance given him by Sudanese slavers. But almost immediately the threat to Uganda from the north took on a more serious shape in consequence of the expansionist policy of the khedive Ismail of Egypt. First Samuel Baker and later Col. Charles George Gordon carried the Egyptian flag into Uganda in the 1870s and only Mutesa's diplomacy checked Gordon's plan to attack the slave trade by planting a chain of military posts across Uganda and down to the coast at Mombasa. The Mahdist rising put an end to Egypt's designs upon the territory to the south but already, two years earlier, Gordon had ordered Eduard Schnitzer, better known as Emin Pasha, the new governor of Egypt's Equatorial province, to withdraw his garrisons from northern Uganda.

The Missionary Period. — In 1875 the explorer and journalist, Henry Stanley (*q.v.*), reached Uganda. Impressed by Mutesa's intelligence and apparent interest in religious discussions, he appealed to English missionary societies to send representatives to Buganda. The first party, sent by the (Anglican) Church Missionary society, arrived at Mutesa's capital after crossing Lake Victoria from the south in June 1877. They were joined in Feb. 1879, by further reinforcements which had come by the northern route up the Nile. A week later members of the Roman Catholic White Fathers mission also reached Buganda from the south. But Stanley had mistaken the reason for Mutesa's interest in Christianity: the kabaka had shown a similar enthusiasm for Islam when the Arab traders from the coast had offered the best means of support against the threat from Egypt. When the Christian missionaries showed no intention of supplying him with firearms, Mutesa's early friendship waned, and he became suspicious of complicity between England and Egypt when he found missionaries using the northern route to his kingdom. In the face of his growing opposition the White Fathers withdrew from Buganda in 1882.

In Oct. 1884 Mutesa died. He was succeeded by his son, Mwanga, a man of weak character and uncertain temper. Mwanga recognized that Islam and Christianity had introduced rival loyalties into his kingdom where hitherto loyalty had centred upon the kabaka. To counter the influence of the Anglicans he encouraged the White Fathers to return to the country but quickly showed his hostility to missionary activities by having three Anglican youths executed in Jan. 1885. On his orders James Hannington, first Anglican bishop of Eastern Equatorial Africa, was murdered in Busoga on his way to Buganda in October of the same year. In June 1886, 45 young African supporters of both Christian missions were put to death. Roman Catholics, Anglicans and Moslems united against Mwanga in 1888 when they discovered that the kabaka and his pagan followers had planned to massacre all supporters of the new religions. Mwanga fled from the country and was replaced briefly by his brother, Kiwewa, who was soon overthrown in an attempt by the Baganda Moslems to seize power with the aid of the Arab traders. Another brother, Kalema, was installed as kabaka. In Dec. 1888 an apparently chastened Mwanga presented himself to the White Fathers at the south end of Lake Victoria. After some initial reluctance he was accepted by them and by another large group of Christian exiles in Ankole as the leader whose return to the throne of Buganda held out the greatest hope of peace. At the head of a joint Anglican and Roman Catholic army Mwanga finally drove Kalema from power in Feb. 1890.

The Imperial British East African Company. — On his return to Buganda Mwanga was visited almost at once by the German adventurer Karl Peters, who, to promote Germany's colonial policy, negotiated a loose agreement with the kabaka. But Peters' work was undone by the Anglo-German agreement of July 1, 1890, which declared Uganda to be within the British sphere of influence. On Dec. 18, 1890, Capt. F. D. Lugard arrived in Buganda, representing the Imperial British East Africa company, which had been granted a charter authorizing it to develop the British sphere of influence in east Africa on behalf of the British government. On Dec. 26, Lugard induced Mwanga to sign a treaty under which the company undertook to keep order in Buganda. Recognizing the weakness of his position, Lugard planned to add to his military strength by enlisting the support of a force of Sudanese soldiers left by Emin Pasha in western Uganda in 1889. Lugard's plan involved the dangerous decision to leave Capt. W. H. Williams at Kampala, the company's fort in Buganda, with only a handful of troops, at a time when rivalry between Roman Catholic and Anglican factions was rapidly becoming acute. On Lugard's return in Dec. 1891 the situation at Mwanga's capital was tense. A slight incident led to fighting and Lugard, who hitherto had attempted to show favour neither to Anglicans nor Roman Catholics, gave his support to the former party. After the so-called battle of Mengo in Jan. 1892 the Roman Catholics, together with Mwanga who had favoured their cause, fled to Bulingugwe Island on Lake Victoria. The island was attacked by Captain Williams and Mwanga escaped to German East Africa. He was induced to return by Lugard who made a fresh treaty with him on the basis of allocating the Sese Islands and the southern county of Buddu to the Roman Catholics and the rest of Buganda to the Anglicans.

Uganda Protectorate. — Financial stringency forced the Imperial British East Africa company to review its commitments in Uganda in 1891. Lord Rosebery sent Sir Gerald Portal to report on the situation in Uganda and to make recommendations for the future. Portal arrived at Kampala in March 1893 and proclaimed a provisional protectorate on behalf of the British government on April 1. He also negotiated a new distribution of territory between the rival Roman Catholic, Anglican and Moslem factions. Various considerations, including Great Britain's obligation to suppress the slave trade within its sphere of influence, the insecurity of the missionaries in Uganda and the strategic necessity for checking French and Belgian expansion from the west, had induced the Conservative government in England to authorize the survey of a rail route to Uganda by Capt. J. R. L. Macdonald in 1891. Rosebery too, even before he received Portal's report, was disposed to proclaim a protectorate, a step which Lugard had strongly urged on his return to England in 1892. Portal's provisional treaty was therefore confirmed by the formal assumption of a British protectorate over Buganda on June 18, 1894. Its extension to other parts of Uganda was mainly due to military necessity. After completing the railway survey Macdonald had been ordered to report on the events culminating in the fighting of 1892. In 1893 he found himself temporarily in control of British interests in Buganda when the Imperial British East Africa company's responsibility had been cancelled by Portal's treaty. and Portal himself had left the country Almost immediately he had to deal with a Moslem rebellion against the terms of Portal's land settlement. Swift military action restored order, but there remained a threat to the security of the country in the presence of Kabarega of Bunyoro on its western border. Macdonald therefore planned an invasion of Bunyoro which was set in hand on Dec. 31. 1893, by Col. H. E. Colvile, commissioner in Buganda, who had arrived in the country in November. Kabarega's capital was quickly occupied but the king himself escaped to carry on guerrilla warfare until captured in 1839. The British protectorate was extended to Bunyoro on June 30, 1896. Fears of Belgian expansion from the Congo had already been modified by the Anglo-Belgian agreement of May 12, 1894, which fixed the 30th meridian of east longitude and the Nile-Congo watershed as the boundary between the rival spheres of interest.

Mwanga in 1897 gave his support to a revolt planned by some of his chiefs. When the plot was prematurely uncovered he fled to Buddu where he was defeated in battle by a protectorate military force. From Buddu he escaped to German East Africa and gave himself up to the German authorities. On Aug. 14 his infant son, Daudi Chwa, was proclaimed kabaka and a regency of three chiefs was set up. Almost immediately a section of the protectorate Sudanese troops mutinied as the result of arrears of pay and of the great demands placed upon them. The main action took place at Luba's fort, near Jinja, where the mutineers were besieged by a force led by Lieut. Col. J. R. L. Macdonald. The mutineers escaped northward but were defeated and scattered in a battle at Kabagambe, in Buruli, in Feb. 1898. Meanwhile Mwanga had escaped from the Germans and. after being defeated in Buddu by a force sent by Macdonald to deal with him, joined Kabarega. The two were finally taken in 1899 and exiled to the Seychelles.

Establishment of Civil Administration. — Under criticism for the expenses incurred in almost continuous military campaigns, the British government sent Sir Harry Johnston as special commissioner to Uganda to establish civil administration. Johnston arrived in Kampala in Dec. 1899 and on March 10, 1900, concluded an agreement with the regents and chiefs of Buganda. The agreement, referred to rather confusingly as the Uganda agreement, stated that Buganda should be a province of the Uganda protectorate and that the laws of the protectorate should be enforced in Buganda unless otherwise specified in the agreement. The kabaka was to continue to rule over his people as long as he remained loyal to the protectorate government. Of great importance was the section which won the support of the leading chiefs for the rest of the agreement by granting them, in freehold, land amounting in all to almost half the area of Buganda. Hitherto they had held it only as tenant officials of the kabaka. Similar though less complicated agreements were made with the rulers of Toro and Ankole in 1900 and 1901. The rest of the protectorate was divided into administrative districts. On April 1, 1902, the Eastern province, stretching as far as the Kedong river, was transferred to Kenya to provide that protectorate with a profitable hinterland; and during the next ten years the frontiers bordering on the Congo and German East Africa were settled by boundary commissions. In 1914 Gondokoro and Nimule districts were transferred to the Sudan and in 1926 Rudolph province was handed over to Kenya to. simplify administrative problems. The Uganda order in council of 1902 provided for a high court and subordinate courts.

Lugard and Johnston had both stressed the possibility of developing the country's economy on the basis of plantation-grown crops among which coffee, rubber and cacoa would be the most important. The idea of encouraging the immigration of European planters lingered on for about 30 years but their arrival was hindered by poor communications within the protectorate, by the slow progress of the survey of *mailo* (freehold) land allotted to the Buganda chiefs by the 1900 agreement and by the greater temptations offered to settlers in Kenya. Furthermore, Hesketh Bell, commissioner in 1905–07 and governor in 1907–09, encouraged by the promise shown by good-quality peasant-grown cotton introduced jointly in 1904 by K. E. Borup of the Church Missionary society and by the Uganda government, laid down the policy of developing the protectorate primarily as an African country. The trade of the protectorate, however, was developed and thereafter largely carried on by a number of European companies and numerous Asian traders. In the agreement districts the British mere able to exercise considerable control while retaining the outward forms of the traditional governments. Elsewhere effective administration was gradually extended by means of district officers working at first with the assistance of Baganda agents and later through a civil service of "chiefs" created by the protectorate authorities. On April 1. 1905, the responsibility for Cganda was transferred from the foreign office to the colonial office. Largely through the efforts of Hesketh Bell the construction of a network of all-weather roads was quickly undertaken. The railway from the coast had reached Kisumu at the end of 1901 and the rest of the journey to Uganda depended upon the marine service on Lake Victoria. By 1913 the Busoga railway had opened up the cotton-growing territory of the Eastern province, thereby creating a challenge to the previously overwhelming predominance of Buganda in the affairs of the protectorate. From 1915, largely as a result of the great output of cotton, Uganda was able to dispense with a grant in aid from the imperial government. This progress continued in spite of a serious sleeping sickness epidemic between 1901 and 1907.

From World War I to World War 11.—After a few skirmishes on the German border to the southwest World War I affected Uganda chiefly by the demands it made upon its manpower and the limitations it imposed on its trade. But the virility of the peasant-grown cotton industry revived the protectorate's economy in the mid-1920s. A lesson had been learned, however, and the agricultural department, set up as an independent body in 1910, encouraged peasants to grow other economic crops, particularly coffee. Coffee had also become the main crop of the European planters. Cacoa had failed in Uganda, and the decline in the world price of rubber had discouraged its planting on a large scale. A temporary ban, which in practice became permanent. was placed on the sale of land to Europeans in 1916 and made it clear that Uganda offered little future to large numbers of foreign planters although there was a boom in tea planting by Europeans in Toro district in 1926–27. In 1924, also, the first sugar refinery in Uganda was opened by an Asian businessman. The discovery of tin in Ankole in the 1920s raised hopes of a new field for European investment.

Progress was also made in other spheres. In 1920 an order in council empowered the creation of executive and legislative councils. In the same year a new currency was introduced based on the East African florin which replaced the rupee as the standard coin of the three East African territories and was itself replaced in the following year by the East African shilling. In 1925 an education department was created, primarily to assist the missions in a field which they had pioneered and in which they were still doing excellent work. The question of creating a federation of the east and central African territories gave rise to considerable opposition throughout the 1920s, especially in Buganda where fears were felt for the security of the 1900 agreement. In 1929 a railay linked the two Eastern province centres of Tororo and Soroti and the opening of the Nile bridge at Jinja in 1931 completed the important rail link between Kampala and the coast. In 1933 an agreement was made between the protectorate government and the ruler of Bunyoro along the lines of those made with certain other districts at the beginning of the century.

World War II and the Postwar Years. — During World War II the demand for food for export compelled Uganda to abandon its original idea of concentrating simply on being self-supporting so far as food was concerned. Large stocks of timber were also contributed to the war effort, and once again heavy demands were made on the protectorate's manpower. By the end of the war an interest had awakened in politics among some of the Africans, and largely as a result of the activities of political agitators riots took place in Buganda in 1945 and 1949. The first three African members were appointed to the legislative council in 1945, and the number was increased to eight in 1950. The first unofficial member of the executive council was appointed in 1946. Equally important steps were taken toward the development of responsible local government as a result of the African Local Governments ordinance of 1949 and the District Administrations ordinance of 1955. A source of mistrust, however, was the constitution of the East Africa high commission in 1947. It was suspected by some as a move toward political federation.

After the mar, at the invitation of the governor, Sir John Hall (1944–51), E. B. Worthington drafted a ten-year development plan for the protectorate. Investigations had shown great promise for the development of copper mining. and an extension of the railway was authorized from Kampala westward to the mining area. Work was also begun on the construction of a hydroelectric plant at the Owen falls on the Nile at Jinja. The scheme was inaugurated by Queen Elizabeth II during a visit in 1954. The high world price of cotton and coffee was bringing great profits to Uganda. A feature of the postwar period was the successful encouragement by the protectorate authorities of African co-operative marketing of produce. Sir Andrew Cohen appointed a committee to make recommendations on African education. Further constitutional reforms increased the unofficial representation in the legislative council in 1954. But these changes were overshadowed by a clash between the protectorate government and Kabaka Mutesa II of Buganda over the latter's constitutional position. This led to the withdrawal of recognition from the kabaka by the British government in Nov. 1953. During 1954 a committee elected by the Buganda Zukiko (parliament) sat at Namirembe, near Kampala, under the chairmanship of Sir Keith Hancock, to make recommendations regarding the future constitutional position of the kabaka. The committee proposed amendments to the 1900 agreement which would make the kabaka a constitutional ruler. The governor proposed the further enlargement of the legislative council from 56 to 60 members of whom 30 should be Africans. He also recommended the introduction of a ministerial system for the protectorate to include five unofficials as ministers of whom three should be Africans, He stated that there would then be no further change in the constitution for six years. The governor announced that if the Zukiko accepted the recommendations as a whole, they would be free to elect a new kabaka or to request the return of the exiled kabaka. (K. I.)

THE PEOPLE

At the 1948 census Africans in the protectorate numbered 4,917,555, Asians 36,696, Europeans 3,448. In 1954 it was estimated that the African population had increased to 5,350,000, Asians to 50,300 and Europeans to 7,000. The density of population in Uganda is 62 per square mile, the highest being in Kigezi (201) and the lowest in Karamoja (11).

The administrative capital of the protectorate is Entebbe (pop. 7,942), lying on a peninsula projecting into Lake Victoria in 0° 4′ N.. 32° 27′ E. About 20 mi. N.N.W. of Entebbe is Kampala, the capital of Buganda and an important commercial centre. Before World War II, its population was 8,000; after 1945, its growth was phenomenal, the population being 24,200 at the 1948 census and in 1953 estimated at 40,000. The town is built on seven steep hills. The town residence of the kabaka and the buildings of the lukiko are on Mengo hill. Port Bell, 7 mi. distant, is Kampala's lake port. The next most important town is Jinja (pop. 19,200), a cotton and transport centre which expanded greatly in the 1950s with the development of the Owen Falls hydroelectric scheme.

Ethnology. — The indigenous population may be divided into the Bantu-speaking negroids, the Nilotic negroes, and the Nilo-Hamites. In addition, there are people of Hamitic origin, the Bahima, who differ physically from the Bantu speakers among whom they live, but who have adopted their language. The "Bantu line" runs through the centre of the protectorate; south of this imaginary line, the people are almost entirely Bantu-speaking. Among them are the primitive tribes of the Ruwenzori and Lake Albert region (Baamba and Bakonjo), who have a strong infusion of pygmy strain and resemble the forest negroes of the Congo, and another aboriginal tribe (Bagishu) living on the slopes of Mt. Elgon. The most numerous group are the Baganda (17% of the African population of the protectorate), followed by the Basoga, who resemble them closely and speak a dialect of the Luganda language. The Banyankole speak Lunyoro and include both the Bahima pastoralist aristocracy of Hamitic origin, and the Bairu peasant or serf class. Other tribes speaking Lunyoro are the Banyoro and Batoro. Uganda north of the Victoria Nile is inhabited by Nilotic negroes or Nilo-Hamitic tribes; among the Nilotes or Luo are the Acoli. Alur, Lango and Jopadhola, while the Nilo-Hamitic peoples include the Iteso and the Karamoja group. such as the Karamojong. The languages spoken may be classified broadly as Bantu. Luo, Bari and Madi. Of the former, Luganda is the most important and is the lingua franca of the protectorate (though Kiswahili, the language of the east African coast, is widely understood and a knowledge of English is common, especially in Buganda). Lunyoro is spoken over a wide area, from the junction of the Victoria Nile with Lake Albert to the southern shores of Lake Victoria over the Tanganyika border. The Bakonjo of the Ruwenzori region have their own language, while in the southwest of Kigezi the Rundi language is spoken. The Alur, Acoli. Lango, etc., speak Luo or Gang. A Nilo-Hamitic group along the southern borders of the Sudan (the Kakwa and Kuku) speak Bari, a Hamitic language, while Madi is spoken in the north of West Nile district. Nilo-Hamitic languages are spoken by the Iteso, Karamojong, Sabei, etc.

In Buganda court and clan traditions are better preserved than elsewhere. The dynasty can be traced back through 23 generations, probably to the early 15th century. Its legendary founder, Kintu, may perhaps have been of Hamitic descent. The term Hamitic, strictly a linguistic one, is used to imply people with Caucasoid or Mediterranean physical features. The aboriginal inhabitants of Uganda were presumably of pygmy type, and there has been a complete assimilation between the Hamitic and Negro element. In the Lunyoro-speaking parts, the amalgamation was less complete than in the case of the Luganda-speaking areas, and the division between the Hamitic pastoral class and the Bantu-speaking agriculturalists has broken down only recently The former (the Bahima) are characteristically very tall and lean, with fine bone structure, long, narrow faces and noses, with reddish-brown skins; these cattle keepers contrast strongly with the prognathous negroid agriculturalists. Before the foundation of the royal Buganda dynasty, the semilegendary Bachwezi (probably Hamites) had made themselves supreme in the country now known as Uganda. During the late 15th century they were ousted by a Nilotic invasion from the north which brought the present dynasty (the Babito) to Nyoro country and left its traces in the physical appearance of the population. Over hundreds of years there was incessant warfare between the Baganda and the Banyoro; during the 19th century the latter gradually decreased in power and territory and their southern provinces were claimed by Buganda and Toro. Until the coming of the European, bark cloth was worn as a rule, especially in the western forest lands, while goat and sheep skins were more characteristic of the eastern savanna country; many tribes were entirely naked. In Buganda the men commonly wear an ankle-length cotton garment (the *kanzu*) with a European jacket, and the women long cotton dresses. Christianity has been adopted everywhere in Buganda.

Education. — African education remains largely in the hands of voluntary religious agencies under the general direction of the government. Makerere college, at Kampala, received recognition as a university institution in 1949, when courses were initiated to lead to University of London degrees. Most of the undergraduates are Africans.

Administration. — The protectorate is administered on crown colony lines; the governor is assisted by an executive council and (since 1921) by a legislative council. For more than 20 years, the legislative council had no representation of African interests, but by 1950 the African members equalled the European and Asian nonofficials together. Most African members are elected by their district councils, but those from Buganda are nominated by the governor because of the independent attitude adopted by the *lukzko*. In 1954, the legislative council consisted of 17 official members (all of the colonial service), 28 representative members (14 of whom were Africans, 7 Europeans and 7 Asians) and 11 "cross-benchers" who could speak and vote freely except on issues of confidence.

The executive council deals with important questions of policy; it includes six nonofficial members (two each of Europeans, Africans and Asians). The Buganda government collects taxes and deals with its own administration. Similar arrangements to those of Buganda (in which the kabaka is assisted by a ministry and the lukiko) exist in the states of Bunyoro, Ankole and Toro. In regions where no well-defined native state existed, administration under recognized chiefs has been built up wherever possible.

ECONOMY

Agriculture. — Agriculture and livestock form the basis of the protectorate's economy: 90% of the population is engaged in farming or in trades dependent on it; 6,500,000 ac. (10,000 sq.mi.) is cultivated and 75% of the country's income is derived from the land. Land is not alienated to non-Africans except for residential purposes or where it is judged that agricultural or industrial undertakings will promote the economic or social welfare of the inhabitants. There are three staple diets among the Africans: plantains (bananas) in the wetter areas around Lake Victoria in Buganda; grain, chiefly millet, with peas and beans, on the drier plains and uplands of Ankole, Toro and Bunyoro; and the diet of milk and blood of the pastoralists of southwest Uganda, which is now supplemented by grain and other foods. Sweet potatoes are grown everywhere, while cassava, sugar cane and maize in the south are other common food crops.

African cultivation is still based mostly on the hoe, though tractor hire services are now in great demand. Except for the initial clearing of the land, the women do all the work of hoeing, planting and harvesting. Ever-increasing measures are being taken to combat soil exhaustion and erosion; dams and boreholes are being constructed in large numbers. There were 2,750,000 cattle in the protectorate in 195j, mostly of the short-horned zebu type, but including also the long-horned cattle of Ankole; there were 3,500,000 sheep and goats. Cattle keeping and ox ploughing is only possible in tsetse-free areas. By the late 1940s, the tsetse fly area had advanced to one-third of the land area of the protectorate, but following the formation of the tsetse control department in 1947, more than 4,000,000 ac. were reclaimed by 1955. Locust control is also very costly.

More than half the total cultivated acreage is under food crops for domestic consumption; the remaining area is under cash crops of which the most important are cotton: coffee. tobacco, maize and oil seeds (the last two are exported only after internal needs have been met); 1,500,000 ac. are maintained annually under cotton. In 1952, the exports totaled 377,200 bales, valued at £29,942,764. Of the 140 ginneries working during the 1952–53 season, most were owned by Indians; 8 out of an agreed total of 20 ginneries passed to African co-operative unions in 1953.

Coffee was first exported from Uganda in 1902. In 1952, 39,426 tons were exported, valued at £12,345,092. Tobacco is cured by fire. air and flue; in 1953, 3,160 tons were cured. Of the oil seeds. peanuts are the most important; more than 80,000 tons are produced annually, of which more than 10,000 tons are surplus to internal food requirements. Tea grown in Cganda is not of the highest quality, but local African consumption of this commodity is rising; in 1953, 8,000 ac. were planted with tea, yielding 4,500,000 lb. (an increase of 300% since 1939). The production of sugar cane (which matures all the year round in Uganda) was 47,972 tons in 1953; this was still not enough for domestic consumption: and no more exports of sugar were allowed. The maize crop in 1953 reached the record figure of 1,400,000 bags.

Trade and Industry. — In 1901, when trade returns were first compiled, the value of exports was about £50,000, the chief articles being rubber, ivory, skins and hides. From 1910 onward, cotton was the leading export, nhile coffee first figured to a notable extent during World War I. Between 1904 and 1917, exports increased from £60,000 to £1 076,000. Over the same period. imports increased from £190,000 to £1,296,000, cotton goods being the largest single item. Soon after the end of World War I, exports began to exceed imports in value. During World War II. the increase in world prices of cotton and coffee created a national wealth unknown before. Subsequently, there was a spectacular advance in the economic position: exports in 1946 amounted to £9,657,000; in 1952, they were valued at £47,222,802. Over the same period imports increased from £3,000,000 to £25,000,000. The fall in the price of cotton in 1953 is reflected in the value of Uganda's exports for that year — £33,378,662 (£14,000,000 less than in 1952, when the value of external trade reached an all-time record). Exports go chiefly to India, the U.K. and Germany. More than half the imports come from the U.K., followed by India and the U.S. Road vehicles and tractors, machinery and apparatus are the chief imports, followed by cotton piecegoods.

Before 1936 (when there was a marked recovery from slump conditions) the government of Uganda discouraged commercial enterprise. When war broke out in 1939, for instance, the importation of industrial machinery was on a very limited scale and textiles formed 31% of the total value of imports (in 1953, textiles formed only 16.5% of imports). After 1949, the demand for industrial machinery increased enormously as a result of the modernization of the cotton and coffee industries, the needs of the new hydroelectric scheme, the building of a cement industry and the development and mechanization of mining. The first electric power station was opened at Kampala in 1936; as late as 1948, the maximum demand of the only two power stations was only 1.600 kw. The hydroelectric scheme initiated at Jinja was expected to revolutionize industry in Uganda, as well as supplying power to Kenya. The Owen Falls dam, opened by Queen Elizabeth II in April 1954, would also serve to store water for the Sudan and Egypt. Ten turbines were to be installed, with a combined capacity of 150,000 kw. The dam is 2,500 ft. long and 100 ft. high and is about a mile from the now submerged Ripon falls where Speke discovered the Nile's source in 1862. New industries in the postwar period included metal working, cement manufacture, furniture making and brewing. A textiles mill at Jinja began production in 195j. Fisheries and crocodile trapping are worth £1,000,000 a year; the most important economic species of fish is Tilapia, which abounds in the lakes (Lake George is particularly productive).

Wolfram was the most important mineral in the 1950s, though world prices declined severely in 1953. Tin production was declining. Columbite-tantalite ores in Ankole and Kigezi were becoming increasingly important; gold production in Eastern province was also increasing. Mica! phosphate and lead are worked on a small scale. Large pyrochlore, magnetite and apatite deposits in the Sukulu hills were awaiting development in the mid-1950s. The Kilembe mines in Toro district (at the foot of Ruwenzori) anticipated a production of 18,000,000 lb. of copper and 900,000 lb. of cobalt a year (beginning in late 1955), which were expected to increase the value of the country's exports by £2,500,000 annually.

Finance. — Revenue is derived from customs duties, export taxes, income tax and African poll taxes. The figures for 1926 were: revenue £1,389,000, expenditure £1,295,000; in 1937, revenue totalled £1,959,534 and expenditure £1,740,887; in 1948. revenue was £6,405,000 and expenditure £6.530,000; in 1953, revenue amounted to £17,905,000 and expenditure £18,393,000. During 1953, the largest amounts in the history of the protectorate were spent on education (£1,838,677) and on medical services (£1,051,373). Of the total expenditure, urban services and public utilities accounted for 39%, social services 20.5%, administration 16% and the development of national resources 15.5%. The Uganda Development corporation is an essential part of the economic life of the protectorate.

Communications. — The public works department maintained 2,847 mi. of all-weather roads in 1953, mostly of murram or gravel, but including 220 mi. of bituminized highways radiating out of Kampala. Buganda and other local governments maintained a further 8.300 mi. of roads. some only passable in dry weather, for which they receive grants from the protectorate government.

Access to the sea at Mombasa (879 mi. from Kampala) was provided by the completion of the railway from that port to Kisumu on Lake Victoria in 1902 and thence by steamers across the lake. With the great development of the cotton trade after World War I, it became imperative to avoid transporting goods across the lake; a railway was built from Nakuru on the Mombasa-Kisumu line to a point on the Busoga railway (this was begun in 1921 and completed in 1928). Its usefulness was increased by the building of a railway from Jinja to Kampala in 1929. Extension of the railway westward from Kampala was begun in the 1950s to serve the Kilembe mines.

Uganda is also well served with air communications. (S. M. C.)

UGRO-FINNISH LANGUAGES: see Finno-Ugric Languages.

UHLAND, (JOHANN) LUDWIG (1787–1862), German romantic poet, the author of historical ballads and lyrics of "folk" simplicity, was born at Tiibingen on April 26, 1787, and from 1802 to 1808 studied law, classical and medieval literature there. At Tübingen he wrote his first poems, and his *Vaterlandische Gedickte* (1815, 1817) was an effective collection inspired by contemporary political developments in Germany. In 1815 he also published another collection of *Gedichte;* nearly 50 editions of this appeared during his lifetime and to almost every one he added some fresh poems.

However, Goethe's prophecy that "der Politiker wird den Poeten aufzehren" (the politician will gobble up the poet) became increasingly true. From 1812 to 1814 he was secretary in the ministry of justice in Stuttgart and then worked as a barrister. He soon began to take part in the political struggles for the renewal of parliamentary democracy in Wurttemberg (*q.v.*). (Happily, his marriage in 1820 to Emilie Vischer brought him a fortune which enabled him to pursue his political and literary interests.)

From 1819 he represented Tübingen in the *Ständeversammlung* and from 1826 Stuttgart. In 1829 he was appointed professor in Tiibingen but when in 1832 the authorities refused him leave of absence to sit as a liberal in the *Landtag,* he resigned his chair (1833). In 1848 he was a member of the German national assembly in Frankfurt.

The national spirit of German romanticism inspired not only much of Uhland's poetry and his political services but also his researches into the literature of the German past. In 1810 he spent eight months studying manuscripts in Paris and in 1812 published the fruits of his work in his essay *Über das altfranzosische Epos*. In 1838 he withdrew from politics (except for his membership of the national assembly) and devoted himself to German philology. He was in fact the founder of modern German medieval studies and his works on *Walther von der Vogelweide* (1822) and *Minnesang* (1824) were contributions of permanent importance. In the field of German mythology and folklore he published *Der Mythus von Thor nach nordischen Quellen* (1836) and *Sagenforschungen* (1836) and he produced an edition of *Alte hoch-und niederdeutsche Volkslieder* (1844 *et seq.)*.

Uhland's fame, however, rests on his poetry. He uses the classical form developed by Goethe and Schiller but his style, with its naïveté, precision and grace, is his own. He is at his best in his historical ballads and romances ("Roland"; "Taillefer"; "Graf Eberhard"; "Bertram de Born," etc.). Some of his poems ("Ich hatt' einen Kameraden"; "Der Wirtin Tochterlein") have passed into the language as folk songs. Others ("Frühlingsglaube," "Schafers Sonntagslied") are best known in their settings by Schubert and other composers. Uhland also wrote two unsuccessful historical plays *Ernst, Herzog von Schwaben* (1818) and *Ludwig der Bayer* (1819). He died at Tiibingen on Nov. 13, 1862.

Uhland's collected works, ed. by H. Fischer, were first published in 1892 in 6 vol.

Bibliography.—Critical edition of the poems by E. Schmidt and J. Hartmann, 2 vol. (1898); Uhland's *Schriften zur Geschichte der Dichtung und Sage,* 8 vol. (1865–73); his *Tagebuch von* 1810–20, ed. by J. Hartmann (1893); letters ed. by J. Hartmann, 4 vol. (1911–16); Emilie Uhland (his wife), *Uhlands Leben* (1874). *See* also H. Maync, *Uhlands Jugenddichtung* (1899); H. Schneider, L. *Uhland, Leben, Dichtung, Forschung* (1920); O. W. Pansch, *L. Uhland* (1934); H. Moser, *Uhlands Schwäbische Sagenkunde* (1950); F. Wohlhaupter, *Uhland* in *Dichterjuristen,* vol. 2 (1955). (Fr. W. W.)

UIGUR, the name of a Turkish tribe and dynasty who came from the east and ruled in Kashgaria from the 10th to the 12th century. They used a variety of the Syriac alphabet. *See* Turks or Turkic Peoples.

UIST, NORTH AND SOUTH, islands of the Outer Hebrides, Inverness-shire, Scot. (*See* also Hebrides, The) In the mid-1950s only seven of the islands were inhabited. The district of North Uist (pop., 1951, 2,221) includes the islands of North Uist (1,890), Boreray (7), Leiravay, Ronay, Grimsay (236), Baleshare (75), Kirkibost, Heisker, the Monach group 8 mi. W., Vallay composed almost entirely of shell sand, etc. The district of South Uist (pop., 1951, 3,764) contains South Uist (2,462), Benbecula (924), Wiay, Eriskay (330), etc. In 1951 90% of the people spoke Gaelic; in North Uist 129 and in South Uist 294 spoke Gaelic only.

The North Ford bridge was begun in 1955 between North Uist and Benbecula, which is linked to South Uist by the South Ford bridge built in 1940. A ferry service connects South Uist with Eriskay and Barra to the south. Regular steamers ply between Kyle of Lochalsh, Lochboisdale, Lochmaddy and Mallaig, and between Oban and Lochboisdale. The civil airport at Benbecula connects with Glasgow and with Stornoway and Inverness.

North List, with its deeply indented coast line, is 13 mi. from north to south and 17 mi. east to west; a road runs round the island. Ben Eavel, in the southeast, is the highest point (1,138 ft.) and Loch Scadavay the biggest inland loch. On the east is swampy moorland, but the west is more fertile. The chief industries are cattle and sheep rearing, weaving and lobster fishing; in 1955 a seaweed-processing factory was begun. There are many archaeological remains. Lochmaddy, on the east coast, is the chief village.

South Uist is 22 mi. from north to south and $7\frac{3}{4}$ mi. in extreme width; a road runs the length of it. The east side, where Ben More rises to 2,034 ft., is mountainous and has poor soil with much peat and heather and a very indented coast line, but on the west is a belt of good arable land. Agriculture—mostly stock raising—is the main industry. The many fresh-water lochs are well known to anglers, and the sea produces lobsters, herring and whitefish and also seaweed from which chemicals, cattle-feeding stuffs, etc., are extracted. Tweeds are woven in the island. Lochboisdale, on the east coast, is the chief village.

Along the Atlantic coasts of most of the islands are great stretches of shell sand. Gray seals breed on the shores and graylag geese inland. There are many sea birds, ducks and waders.

UITENHAGE, a city of South Africa, 21 mi. from Port Elizabeth. Pop. (1951) 38,748, including 14,272 whites; 16,942 natives; 373 Asiatics; and 7,161 coloured. The town was founded by De Mist in 1804, on the Zwartkops river. Water courses flow along the sides of the streets, which are lined with trees. On the banks of the river are two large wool-washing establishments. In the town are railway workshops, the main industry of the place.

UITOTOAN (Witotoan), South American Indians of southeastern Colombia and adjoining Peru speaking a branch of the Macro-Tupi-Guarani linguistic phylum. Although settled farmers, the several Uitotoan groups were more primitive culturally than most Amazon basin Indians. They lacked canoes, had rudimentary fishing techniques and made cloth of bark.

A village consisted of about 100 persons related through the male line and occupying a single large house. The use of hollow-log signal drums, blowguns, and bark cloth have interesting old world parallels. (J. H. Sd.)

UJIJI, a town of Tanganyika, on the east side of Lake Tanganyika. African pop. (1957) 11,739. Ujiji was the meeting point of merchants and the terminus of a caravan route from Dar Es Salaam. The Zanzibar Arabs made it their headquarters in the first half of the 19th century and it became a slave and ivory mart. In 1858 Richard Burton and J. H. Speke reached Ujiji, being the first white men to see Lake Tanganyika. David Livingstone, coming from the south, reached *Ujiji* in 1869, and it was there that H. M. Stanley found him on Oct. 28, 1871. The first steamer on the lake was launched at Ujiji in 1884. Soon afterward it became part of German East Africa and was chosen as the lake terminus of the railway (completed in 1914) from Dar Es Salaam. Ujiji harbour has become very shallow and the terminus of the railway is at Kigoma, 4 mi. to the north. Ujiji was occupied by Belgian Congo troops in 1916, and in 1921 was transferred to Great Britain as part of the mandated territory of Tanganyika. It is the centre of the lake fishing trade.

UKRAINE. A soviet republic of southeastern Europe bounded on the south by the Black sea, on the southwest by Rumania and the Moldavian Soviet Socialist Republic, on the west by Rumania, Hungary, Czechoslovakia and Poland, on the north by Byelorussia and on the northeast and east by the Russian Soviet Federated Socialist Republic.

Physical Geography. — Underlying much of the country is the granite gneiss Azov-Podolian or Ukrainian shield which constitutes the structural foundation on which Palaeozoic and later geological formations were laid. This shield has a large outcrop in the Azov heights but is only revealed elsewhere in the deeper valleys of the Podolian plateau. Palaeozoic rocks with important coal measures are found in the Donets region where an east-west anticline bringing lower Carboniferous rocks to the surface is flanked by synclines containing coal. The principal surface structures, however, are the series of late Cretaceous and Tertiary strata dipping southward as cuestas sloping gently toward the Black sea. From the Don valley these plateaus are in successively younger strata; Cretaceous gives way to Eocene overlooking the Don, Oligocene in the Donets plateau and overlying the Podolian part of the shield, and Mio-Pliocene in the south.

From the point of view of surface relief, the Ukraine falls into three major divisions; part of Polesie, the marsh and forest zone in the north: the plateaus comprising most of the country, and a section of the Carpathians in the southwest. Polesie is a region of swamps, lakes and meandering rivers continuous with the Pripet marshes on the north, and with the lower similar land on the left bank of the Dnieper north of Kiev. The area contains much fluvioglacial sand, some in the form of fossilized dunes of the Pleistocene period. Pine grows on the sands, but isolated islands of oak-spruce forest are more characteristic of the region as a whole. On peat soils Pontic azalea (Rhododendron *flavum*) occurs.

The Volhynian-Podolian plateau forms the largest unit in the relief of the Ukraine. It rises generally to about 1,300 ft. in the west where also is a karstic region of Miocene reef limestones. River valleys cut deeply into the plateau often 300 ft. below its surface, exposing the crystalline rocks of the shield. At Krivoi Rog rich haematite ores appear in the Ingulets valley and in the Dnieper valley manganese at Nikopol. Thick loess. on which forms the rich black-earth soils, overlies the plateau and particularly where the vegetation is disturbed by deforestation or overgrazing, it is easily eroded into vertical-sided ravines. On its lower left bank the Dnieper has cut several terraces. and extensive flooding in spring helps to confine agriculture to the plateau tops. Spurs from the central Russian uplands enter this Dnieper lowland from the north and are widely covered with glacial sands, moraines and loess. Eastward again the Donets 'heights reach 1,184 ft. forming a rolling plateau, once an island of forest in the southern steppes but now cleared for agriculture and a rich source of coal and salt.

Toward the south the plateau slopes down to the Black sea lowlands, a monotonous flat plain, interrupted here and there by ravines and presenting to the sea a cliffed coast sometimes broken by stretches of lagoons protected seaward by sandspits. Sands are widespread on the lower left bank of the Dnieper and its estuary. In southeastern Ukraine the coastal lowlands rise quickly to Azov heights, an extensive outcrop of crystalline rocks, rising to more than 1,000 ft.

The vegetation in the plateau zones varies from forest steppe in the north to true grass steppe in the south and east. The typical plant assemblage in the forest steppe is oak-ash forest with groves of hornbeam, though on sands, pine is characteristic. Alternating with the forest, and probably formerly dominant, are areas of meadow steppe, in which broad-leafed grasses form a continuous cover in the moister north, becoming more tussocky southward. In marshy parts, sphagnum, cotton sedge, cranberry and other northern plants are found. Elk, roebuck, squirrel and marten are representative among the fauna, but human settlement continues to cause the wealth of wild life to diminish.

In the true steppe narrow-leafed grasses (*Stipa* species), fescue and *Koeleria gracilis* and many polyns (Artemisia) constitute the main cover. Forest patches occur on higher damper tracts as formerly on the Donets plateau but are more common on the floodplains (poplar, willow, elm, maple and alder) and sands (pine).

The Carpathian mountains (*q.v.*) lying within the Ukraine may conveniently be divided into the foothills in the northeast, the Carpathians proper, and a small section of Transcarpathia comprising part of the upper Tisa valley. Some oil, natural gas, salt and potash are found in the Carpathian Ukraine. The hills are thickly wooded; beech in the foothills merges into mixed forest between 1,000 ft. and 2.000 ft.. above which comes spruce until in the highest parts above 4,000 ft. subalpine meadow occurs. In the Tisa valley oak forest is more usual. An abundant fauna persists in the forest; *e.g.*, bear, roebuck, lynx and wolf.

The climate of the Ukraine is continental, tempered in the south by the Black sea and proximity to the Mediterranean. Winters are cold, the north having 120 days below freezing point, and only the Black sea coast fewer than 50 days. There snow lies 40 days in the year, the figure increasing to 100 in the north. The January mean increases from 21° F. at Kiev to 26° at Odessa. The heat of summer is best expressed in the July mean temperature of Kiev (66.7") and Odessa (72.7°) and in the fact that all the Ukraine has more than 30 days with temperatures above 68°, and much of it twice as many. Rainfall is abundant only in the Carpathians (40–60 in.), the sea coasts having less than 16 in., the north more than 20 in. and Kiev 21 in. The summer months show the highest fall, but the Black sea coast has a secondary maximum in winter, caused by the penetration of Mediterranean influences.

(B. L. C. J.)

HISTORY

Kievan **Rus.**—In the territory known in the 20th century as the Ukraine there existed in the 9th century a political organization called *Rus*, which belongs to the history of both the Russian and Ukrainian nations. It originally covered the areas of Kiev (Kyiv), Chernigov and Pereyaslavl, under the suzerainty of a duke of Varangian origin. These Varangians were called Rus by the surrounding Slavonic tribes. The name was borrowed from the Finns for whom the people from the other side of the Baltic were Ruotsi. The conquerors became Slavicized. St. Vladimir, who accepted the Christian faith from Byzantium in 988, was no longer a Varangian konung but a Slavonic knez or duke. This Kievan state extended westward and northward during the 11th and 12th centuries but was destroyed in the Tatar invasion of 1237–41 (see RUSSIA).

A century before the fall of the Kievan state two principalities existed with capitals at Wlodzimierz (Wlodzimierz-Wolynski or Volodymir) in Volhynia and Halicz (Halych) on the Dniester. Prince Roman of Volhynia, a direct descendant of St. Vladimir, united the two principalities in 1199 and founded a local dynasty which became extinct in 1323. The succession passed, by family ties, to a Polish prince of the Piast dynasty, Boleslaw of Mazovia, and, in 1340, to King Casimir the Great, who incorporated into his kingdom the principality of *Galiciae* et Lodomeriae.

Polish Expansion. — Meanwhile, Lithuania was extending rapidly eastward and southward. The dynastic union of Poland and Lithuania in 1386 opened up the Ukraine to Polish expansion. The frontier moved steadily eastward across the vast, sparsely populated *ukraina* (u-"at," *-kraj* "land" or "border"). A new social order was also being created, for the peasants were subject to their local lords for whom they were obliged to work. But it was easy for men to escape farther southeast into the great no man's land, and such a fugitive was called *kozak*, an adaptation of the Turkic word kazakh, meaning "outla " or "adventurer." These Cossacks (*q.v.*) were escaping "beyond the cataracts" (za porohy) on the lower Dnieper. Thus was born the *Zaporizhska* Sich or Zaporozhian clearing.

At the beginning of the 16th century, to protect their states against the incursions of the Tatars, both the Polish kings and the Muscovite grand dukes started to organize military colonies manned by the Cossacks; at the end of that century the Dnieper and the Don Cossacks alike owned land and led a settled life. When the Polish-Lithuanian union became a real one in 1569, the Ukrainian territory was separated from Lithuania and incorporated into Poland. The Cossacks believed that as warriors they were free from all serfdom. But for the estate owners Cossacks escaping to Zaporozhe were rebels and by trying to enforce obedience the landowners aroused resentment. This social antagonism had also a religious foundation, for landlords, sheriffs and magistrates were almost exclusively Roman Catholics. Slowly a national separatism was being born. This evolution was not stopped by the religious union achieved by the synod which met at Brzesc (Brest-Litovsk) in 1j96. Nine out of ten Orthodox bishops recognized in matters of doctrine the full primacy of the Holy See, but they retained the ancient oriental rite. As a result of the union of 1596 the population of the Ukraine became divided into three religious groups: the Roman Catholics of the Latin rite, who were generally identical with Poles; the Uniate Roman Catholics, who often called themselves gente Ruthenus, natione *Polonus;* and the Orthodox (*i.e.,* the Cossacks). From 1578 there existed a small standing force of "registered" Cossacks in Polish service, while all others were counted either among the feudal peasantry or formed the so-called self-governing Zaporozhian Cossacks. In 1630 the registered Cossacks were increased to 8,000 and the claims of the Orthodox population were in part fulfilled by dividing the high offices of the church between Uniates and Orthodox. But when Poland built the fortress of Kudak at the cataracts to keep the Sich in dependence, rebellions broke out between 1635 and 1638, but were all suppressed. The Polish sejm in 1638 passed an act reducing the registered Cossacks to 6,000 and aiming at the suppression of self-governing Cossacks.

The Chmielnicki Insurrection. — An officer of registered Cossacks, Bogdan Khmelnitsky or Chmielnicki (*q.v.*), who had suffered injustice at the hands of a local Polish official, went "underground" in 1646 and two years later was elected hetman (commander in chief) of the Zaporozhian Cossacks, gathered several thousand men, took Kudak by surprise, obtained help from the Tatars and in May 1648 defeated the Poles in the battles of Zhovti Vody and Korsun. He moved into Poland, won a fresh victory on Sept. 23 at Pilawce, took Lwow and besieged Zamosc. The slaughter of landlords, of the Latin and Uniate clergy and of the Jews spread throughout the conquered countryside. In the meantime, the king of Poland promised that he would send a commission of inquiry to the Ukraine. The hetman stopped fighting and in October entered Kiev to be greeted as liberator.

Meanwhile, in Warsaw, the party of conciliation was opposed by all the Ukrainian magnates, who were for repression by force. In March 1649 Chmielnicki resumed operations. The Poles again suffered defeat and in August, at Zborow, the king reached an agreement with Chmielnicki by which the number of registered Cossacks was raised to 40,000 and all officials of the crown in the provinces of Kiev, Chernigov and Bratslav were to be Orthodox. The Zborow agreement was criticized by both the Polish gentry and the Cossacks, the former objecting to the creation within the frontiers of Poland of what amounted to an autonomous Ukrainian principality and the latter resenting the return of Polish landlords to their estates. Since a ferment was spreading among the Cossacks against Chmielnicki's statesmanship, he started another campaign in the spring of 1651, but in June was defeated at Berestecsko. On Sept. 28. at Bila Tserkva, the hetman was compelled to accept a new agreement: the registered Cossacks were reduced to 20,000 and the provinces of Chernigov and Bratslav ceased to be Cossack territory. The Cossack rada (council) also rejected the new agreement, resolving in May 1652 to renew hostilities against Poland and to ask Tsar Alexius (Aleksey) Mikhailovich for protection.

Search for a Protector. — The second Romanov saw his chance to regain the Kievan Rus which the Muscovites called Malo-Rossiya (Little Russia). On Oct. 11, 1653, the Moscow council of state decided to grant Chmielnicki's request and to declare war on Poland. A deputation headed by Vasily Buturlin met Chmielnicki and the secretary-general of the rada, Ivan Vyhovsky, at Pereyaslavl. On Jan. 18, 1654, took place the act of submitting the Ukraine to "the tsar's hand," with the general reservation "of all rights and privileges" for the Cossacks. A Russo-Polish war, complicated by Swedish aggression, followed and was ended by an armistice in 1656. On Chmielnicki's death in 1657 Vyhovsky succeeded him as hetman. The new hetman decided to throw off Russian protection. On Sept. 16, 1658, an agreement was signed at Hadyach which created a commonwealth of the Poles, Lithuanians and Ruthenians. A second Russo-Polish war followed. It lasted eight years and was ended on Jan. 31, 1667, by the treaty of Andruszow, under which the Ukraine was partitioned between Poland and Russia along the Dnieper, and the two governments outlawed Petro Doroshenko, the then hetman, whom neither trusted.

Doroshenko conceived the plan that the Ukraine should form a vassal state of the Porte, and in Dec. 1668 Sultan Mohammed IV took the Ukraine under his protection. In 1672 a Turkish army marched against Poland, took Kamieniec Podolski and on Oct. 18 imposed the peace of Buczacz by which the "right-bank" or Polish Ukraine came under Ottoman suzerainty. Only in 1684, a year after his spectacular victory of Vienna, was John III Sobieski able to clear the Polish Ukraine of the Turks, but they remained at Kamieniec until 1699.

In the "left-bank" or Russian Ukraine, Ivan Mazepa (*q.v.*) became hetman of the Cossacks in 1687. He served Tsar Peter I, but planned to unite the two parts of the Ukraine. In 1708 he concluded an alliance with Charles XII of Sweden according to which the Ukraine was to become an independent state with Mazepa as ruler. Peter's victory over the Swedes at Poltava (June 27, 1709) put an end to this new Ukrainian orientation. There were three further hetmans, all of them Russian nominees. Kyrylo Razumovsky, the last, was the younger brother of Elizabeth Petrovna's morganatic husband. Catherine II forced him to resign in 1764.

Under Tsarist Rule. — In 1775 the Sich was suppressed, the Cossacks were disarmed and the Russian Ukraine was divided into three gubernyas. In 1793, at the second partition of Poland, the Ukraine was again united, but as part of Russia. Its political autonomy and even its name disappeared. In 1846 about 30 Ukrainian patriots founded in Kiev the secret Brotherhood of St. Cyril and St. Methodius. This marked the rebirth of Ukrainian nationalism. Its most prominent members were two historians, Mykola Kostomarov (1817–8j) and Panteleymon Kulish (1819–97), and Taras Shevchenko (1814–61), a poet, who in his poem The Dream accused Peter I of "crucifying" the Ukraine and Catherine II of "finishing off his victim." The brotherhood was discovered the following year, and its members were arrested and deported to other parts of Russia. In 1861, however, Osnova ("The Outset"), a periodical in Ukrainian, was authorized to appear in St. Petersburg, with Kulish and Volodymir Antonovich (1834–1908) as principal contributors. Two years later they returned to Kiev where a society called Hromada (Group) was formed. Their historical research led them to certain contradictory conclusions. Antonovich believed that placed between an autocratic Russia and an aristocratic Poland the Ukrainians represented a true democracy. Kulish, however, maintained that the Cossacks were anarchist rather than democratic. In 1876 the tsarist government forbade the use of Ukrainian in schools and for the printing of journals or books. Myhaylo Dragomanov (1841–95), a professor of Kiev university, moved to Geneva where he began publishing the Ukrainian periodical Hromada.

Galician "Piedmont." — After 1876, Lwow became the centre of Ukrainian nationalism. It was the capital of Galicia (*q.v.*), annexed to Austria in 1772, at the time of the first partition of Poland, and the name was thus extended far to the west, to include Cracow; in eastern Galicia, however, the rural population was mainly Ruthenian. The Vienna government had to recognize Polish supremacy in Galicia, but it also supported the Ruthenians. A Shevchenko Scientific society was founded in Lwow in 1873. Five years later the educational society *Prosvita* (Enlightenment) came into being. In 1890 a chair for the history of southeastern Europe was instituted at Lwow university and Myhaylo Hrushevsky (1866–1934), a Russian subject and a pupil of Antonovich, was appointed to this post. In 1898 he started publication of his ten-volume History of the *Ukraine-Rus* in which he defended the view that fhe Kievan Rus was the cradle of the Ukraine-Rus, while Moscow was the centre around which the Russian state was built. After 1905 the publication of journals and books in Ukrainian was again permitted in Russia and Hrushevsky returned to Kiev.

World War I and After.—In the eyes of the tsarist government the population of eastern Galicia and sub-Carphthian Ruthenia (*q.v.*) was "Russian." Count Gheorgy Bobrinsky, the newly appointed governor-general. affirmed this in Lwow (Lemberg) in Sept. 1914 when the Russian army entered the city. But tsarist Russia was defeated and plunged into revolution. The Ukrainians felt that once more history was presenting them with a chance to achieve unity and independence A National Ukrainian congress met in Kiev in April 1917 and elected a central council (rada) headed by Hrushevsky. On June 23 the rnda proclaimed that an autonomous Ukrainian republic had come into being with Hrushevsky as president. On July 16 a government was formed with Volodymir Vinnichenko (1880–1951) as premier and Simon Petlyura (1879–1926) as war minister. On Nov. 20, the rada announced the convocation of a freely elected Ukrainian constituent assembly. The Russian Communist government replied to this on Dec. 27 by forming a Ukrainian Soviet government in Kharkov. On Jan. 22, 1918, the rada proclaimed a "free and sovereign" Ukrainian republic.

On Feb. 9, 1918, the Central powers concluded a separate peace with this republic at Brest-Litovslr. On the following day the Communists captured Kiev, while the rada fled to Zhitomir. The German and Austrian armies occupied the Ukraine and soon came into conflict with the mda, which was too democratic for their liking. On April 24, they staged a coup d'état. appointing Pavlo Skoropadsky hetman of the Ukraine. After the collapse of the Central powers, a directorate of five, with Vinnichenko as chairman and Petlyura as commander in chief, assumed power in Kiev (Dec. 14, 1918).

Meanwhile, on Nov. 1, 1918, in Lwow, the last Austrian governor, Count Huyn, armed the Ukrainians, who proclaimed an independent Republic of the Western Ukraine. (See also POLAND: Poland Restored.) The Poles freed the town on Nov. 22, and the Ukrainian government headed by Evhen Petrushevych retreated to Stanislawow. There, on Jan. 22. 1919, the union of the two Ukraines was proclaimed; but on the same day the Red army reoccupied Kiev. While the directorate, now headed by Petlyura, moved to Vinnitsa, Christian Rakovsky (q v) formed in Kiev, on March 14, a government of a Ukrainian S S.R. In May 1919 the whole of eastern Galicia was in Polish hands and in the summer the Russian White army of Gen. A. I. Denikin started to advance toward Moscow. On Sept. 1 the White Russians and the Petlyurians entered Kiev, and the directorate suggested a common struggle against the Communists, but Denikin refused to negotiate with "separatists." Denikin was subsequently defeated, and on Dec. 20 Kiev was e acuated and almost the whole of the Ukraine was in the hands of the Red army.

On Dec. 28, 1919, Nicolai Lenin addressed an open letter to the workers and peasants of the Ukraine in which he recognized the equality of the Russian and Ukrainian peoples and suggested a treaty of alliance between the two. Such an alliance was concluded in Moscow on Dec. 28, 1920, and was signed by Lenin and Rakovsky; it was an act of incorporation, unifying the chief people's commissariats.

Petlyura retreated with the remnant of his army to Kamieniec Podolski and went to Warsaw to ask Marshal Joseph Pilsudski, head of the Polish state and commander in chief, for help. On April 22, 1920, Pilsudski signed a treaty of alliance with Petlyura, and three days later a Polish offensivestarted in the Ukraine. On May 6 the Poles occupied Kiev. Pilsudski dreamed of building a commonwealth of Polish, Lithuanian and Ukrainian nations and hoped that the Ukraine would answer Petlyura's call. It soon was obvious that it would not.

The fortunes of war forced Poland to sign the Riga peace treaty (March 18, 1921) with the Communist Russian and Ukrainian governments. Eastern Galicia and Volhynia (*q.v.*) were recognized as part of Poland. On May 25, 1926, in Paris, Petlyura was shot by a Communist agent.

Ukraine in the U.S.S.R.—On Dec. 30, 1922, the central executive committee of the U.S.S.R. voted a plan of federation between the four original Soviet Socialist republics, the Russian, Byelorussian, Ukrainian and Transcaucasian. The final constitution was published on July 6, 1923. This was the period of the New Economic policy and, in the Ukraine, the period of Ukrainization. A Language act of Aug. 1, 1923, proclaimed the priority of Ukrainian over Russian and many Ukrainian *émigrés* decided to go home to help the process of Ukrainization. Hrushevsky had shown the way and was appointed president of the Ukrainian Academy of Science founded in 1918. In 1928 J. V. Stalin abandoned the N.E.P., stopped the policy of Ukrainization and introduced Russian as the second official language of the republic. In 1930 the first Ukrainian political trial took place in Kharkov: 45 intellectual leaders, headed by Serhiy Yefremov, were accused of high treason; 13 were sentenced to death; and the rest were deported. Hrushevsky was not tried but was deported and died in 1934. In 1931 the trial of the "National centre" was staged; this time the accused were politicians headed by Vsevolod Holubovych, and all were sentenced to death. Another trial followed in 1933, when the O.G.P.U. (Soviet secret police) purported to have discovered a military conspiracy: Yury Kotsiubinsky, deputy premier of the Ukrainian Communist government, and many others were shot, while Mykola Skrypnik, another deputy premier, committed suicide. None of their accusers nor any of the Ukrainian Communists who helped Moscow to purge the Ukraine of "bourgeois nationalism" survived. Two successive Ukrainian premiers, Panas Lyubchenko and Vlas Chubar, were shot in 1937 and 1939 respectively.

World War II and After.—Between World Wars I and II there existed in Poland an underground Ukrainian Military organization (U.V.O.), and the Organization of Ukrainian Nationalists (O.U.N.), both with Col. Evhen Konovalets (b. 1891) as leader. On May 23, 1938, he was killed in Rotterdam (Neth.) by a Soviet agent and was succeeded by Col. Andriy Melnyk. When Germany started World War II, differences of opinion as to the best tactics to employ created a split in the O.U.N. Stefan Bandera became the leader of the majority and Roman Shukhevych (Lt. Gen. "Taras Chuprynka") was appointed chief of the U.V.O. For years the Ukrainian Nationalists looked to Germany for the realization of an independent Ukraine. Now they hoped to provoke a Ukrainian revolution in the Soviet empire.

On June 30, 1941, shortly after the occupation of Lwow by the German army, the O.U.N. proclaimed the "restoration of the Ukrainian state" and formed a government headed by Yaroslav Stetsko with the idea of waging war against the U.S.S.R. Bandera, Stetsko and most of the "ministers" were arrested, however, by the Germans, who did not wage a war of liberation. Walther Funk, German minister of economics, declared in Dec. 1941 in Prague that the Ukraine, this "promised colonial land" had become accessible to "European" exploitation. Erich Koch, the German *Reichskommissar* for the Ukraine, went so far as to praise Stalin's forcible collectivization of agriculture. In a circular dated Aug. 25, 1943, he wrote that only through a collective farm system was it possible "to squeeze anything from the Ukrainians."

In 1943 Shukhevych formed an underground Ukrainian Insurgent Army (U.P.A.). He remained in the Polish Ukraine after the Soviet occupation and on March 4, 1950, was killed by the Soviet security forces at Bilohorshcha, near Lwow.

As a result of World War II, the Ukrainian S.S.R. considerably enlarged its territory. The Soviet army occupied the eastern parts of Poland on Sept. 17, 1939. On Oct. 22, 1939, a plebiscite was organized in the "Western Ukraine" in which, according to Soviet sources, 92.83% of the electorate went to the polls, while 90.93% voted for the official candidates to the people's assembly. The assembly met in Lwow on Oct. 28 and unanimously voted for the incorporation of eastern Galicia and Volhynia into the Ukrainian S.S.R. After the war, a Soviet-Polish treaty, signed in Moscow on

TABLE I.—*Areas and Populations of the Ukraine**

Territories	Area (sq. mi.)	Nationalities (in thousands)					
		Ukrainians	Russians	Poles	Jews	Others	Total
Pre-1939 Ukraine	171,930	20,772	6,780	joo	2,200	708	30,960
From Poland	34,749	4,350	30	1,850	550	169	6,949
From Rumania	8,031	740	50	100	150	525	1,565
From Czechoslovakia	4,981	653			85	112	850
Crimea	9,993	113	490		83	441	1,127
Totals	220,684	26.628	7,350	2,450	3,068	1,955	41,451

*Areas as given in the *Bolshaya Sovietskaya Entsiklopedia*, 1st ed , vol. 55 (Moscow, 1947). They produce a total slightly less than that given in another volume of the same *Entsiklopedia:* S.S.S.R. (Moscow, 1948). According to the latter source the total area of the Ukraine in 1947 was 222,625 sq.mi., which, together with the Crimea, would give 232,618 sq.mi. According to the 1957 year book of the same *Entsiklopedia* (Moscow, 1958) the area of the Ukraine is 232,046 sq.mi. Population estimates in the table are those of 1939 (*i.e.*, before the changes in its composition caused by World War II, namely such as compulsory transfers, mass deportations, war losses and extermination of the Jews remaining under German occupation).

Aug. 16, 1945, confirmed the new frontier. Sub-Carpathian Ruthenia had to be ceded to the U.S.S.R. by the Soviet-Czechoslovak treaty of June 29, 1945. Rumania was forced to accept a Soviet ultimatum of June 27, 1940, and cede Bessarabia (*q.v.*) and northern Bukovina (*q.v.*) to the U.S.S.R. The new frontier was confirmed by the Rumanian peace treaty signed in Paris on Feb 10, 1947. Northern Bukovina and the Bessarabian districts of Hotin and Izmail were incorporated into the Ukraine.

The most unexpected addition to the Ukraine was the transfer to it of the Crimea (*q.v.*). This Russian gesture was made on Feb. 19, 1954, to mark the 300th anniversary of the Russo-Ukrainian union. (See Table I.)

Government-in-Exile.— After the peace of Riga a Ukrainian government-in-exile was formed in Paris with Andryi Livytsky as president of the republic. After World War II this government moved to Munich. Ger. Livytsky died in Feb. 1955, and on March 6 the Ukrainian National council elected Stefan Vytvytsky as his successor.

Population.— The Ukrainians (Ukraintsy) formerly called Ruthenes (*Rusyny*) are an eastern Slavonic nation sometimes erroneously described as Little-Russians (*Malorosy*). (See UKRAINIAN LANGUAGE.) In physical type just under half the population is Dinaric (*i.e.*, tall, round-headed, long-faced and dark); just under a quarter is Alpine (*i* e., short, round-headed, round-faced and dark); and the remainder are Nordic, Mediterranean, Armenian or Mongoloid in various combinations.

TABLE 11.—*Population of Major Cities in the Ukraine*

City	1939	1959	City	1939	1959
Kiev (Kyiv)	846,293	1,102,000	Lugansk	213,007	274,000
Kharkov (Kharkiv)	833,432	930,000	Krivoi Rog	197,621	386,000
Odessa	604,223	667,000	Nikolayev	167,108	224,000
Dnepropetrovsk	500,662	658,000	Dneprodzerzhinsk	147,829	194,000
Donetsk	462,395	701,000	Simferopol	142,678	189,000
Lvov (Lviv, Lemberg)	318,000	410,000	Poltava	130,305	141,000
Zaporozhye	289,188	435,000	Sevastopol	111,946	148,000
Makepevka	240,145	358,000	Chernovtsy (Czernowitz)	109,698	145,000
Zhdanov	222,427	284,000	Gorlovka	108,693	293,000

There is a rich indigenous folk culture with influences from other Slavonic peoples and also from Rumanians and Hungarians Each area has its own particular costume, richly embroidered. Dancing, singing and storytelling are popular.

Within the pre-1939 frontiers of the Ukraine, the population by mid-17th century was estimated at 2,500,000, whereas at the time of the first Russian census of 1897 it had grown to about 23,500,000. According to this census, in the nine southwestern *gubernyas* later to form the Ukraine. 50% of the population were Ukrainians, 20% Russians and the remaining 30% Jews, Poles, Tatars, Germans, Rumanians, Bulgars, Greeks, etc.

The Soviet census of 1926 revealed a total population of 29,042,934 which at the next census of 1939 had risen only to 30 960,221. The total number of Ukrainians in the U.S.S.R in 1926 was 31,194,976, of whom 23,084,226 (74%) lived in the republic. The 1939 census revealed only 28,070,404 Ukrainians in the U.S.S R, but no indication was given as to what percentage lived in the Ukraine. On the optimistic assumption that the proportion was still 74%, this would give 20,772,000 Ukrainians, or 66.7% of its total population. The progress of industrialization caused a great increase of the urban population, which was 36% of the total in 1939 compared with 19% in 1926. This process, together with forcible deportations of Ukrainian peasants to Siberia, undoubtedly helped the Russification of the country. In 1959 the population of the Ukraine S.S.R. was estimated to be 41,869,046. The largest cities are given in Table II.

Religion.—Until 1654 the Ukrainian (Ruthenian) Orthodox Church was autocephalous. After the treaty of Pereyaslavl, the patriarch of Moscow assumed the right to appoint Ukrainian Orthodox bishops. All trace of autocephaly disappeared on the partitions of Poland Roman Catholics of the Uniate rite mere at first tolerated: but in 1834 persecution by the Russian administration began, and in 1874 this rite was abolished. On Jan. 1, 1919, the Central Ukrainian rada re-established the Ukrainian Autocephalus Orthodox Church. In 1929 the Soviet government suppressed it by arresting, deporting or banishing the bishops and clergy. Autocephaly was reinstated in the Ukraine in 1942, under German occupation, but it was again suppressed in 1945 and the Ukrainian Orthodox returned under the jurisdiction of the Moscow patriarch.

In 1945–46 about 4,750,000 Ukrainian Roman Catholics of the Uniate rite living in eastern Galicia, northern Bukovina and sub-Carpathian Ruthenia were forcibly converted to Orthodoxy and the members of their hierarchy were arrested and imprisoned. including Mgr. Iosyf Slipyi, metropolitan of Halych (Halicz) and archbishop of Lviv (Lvov), and nine bishops; 2,950 priests and 520 monks were deported.

Education.—In 1953 there were 30,400 primary and secondary schools with 6,500,000 pupils, and 592 vocational schools with 233,700 pupils; there were also 4 universities (at Kiev, Kharkov, Odessa and Lvov) and 140 other institutions of higher education with a total of 177,100 students.

Ukrainian Communist Party.— In 1925 Stalin sent his friend L. M. Kaganovich to Kharkov. then the capital of the Ukraine (it was moved to Kiev in 1945), to be secretary-general of the U C.P. which had to be cleared of unreliable elements. At that time only 39 Ukrainians in every 10.000 inhabitants were members of the party. as against 88 Russians and 155 Jews.

P. P. Postyshev, a Russian, who succeeded Kaganovich in 1928, was shot in 1938. From then (with a short interval in 1947) this key-post was occupied by N S Khrushchev and from Dec. 1949 by L. G. Melnikov, both Russians. In June 1953, A. I. Kirichenko, a Ukrainian, succeeded Nelnikov At the time of the 19th congress of the Communist Party of the Soviet Union (Oct. 1952), its Ukrainian section had 676.190 members, including only 20.145 in the western (*i.e.*, formerly Polish, Czechoslovak and Rumanian) regions of the Ukraine.

Economy.— The Ukraine is the richest republic of the Soviet Union. Before World War II, although covering only 2% of the total area of the C.S.S.R. and embodying only 18% of its total population, the Ukraine produced three-quarters of the sugar and

TABLE 111.—*Bread Grain Crops in the Ukraine*
(In thousand metric tons, 1931–35 average)

	Wheat	Rye	Barley	Oats	Total

30% of the bread grain crops in the U.S.S.R. (see Table III). However, no reliable data were to be obtained for agricultural production of the Ukraine after 1935. The livestock figures are given in Table IV.

So much decentralization of the constantly growing Soviet industry had been achieved that the share of the Ukraine in the Soviet economy was considerably smaller in 1951 than in 1913. (See Table V.)

TABLE V. — *Contribution by Ukraine to Sosiet Industrial Production*
(*In* thousand metric tons; electricity in million kw.hr.; with percentages of the total Soviet output)

	1913*	1940*	
Coal	22,760 (78%)	83,728 (50%)	93,775 (33%)
Iron ore	6,388 (80%)	18,900 (60%)	[illegible] (48%)
Pig iron	2,832 (68%)	9,183 (62%)	10,836 (49%)
Steel	2,300 (55%)	8,622 (47%)	10,174 (33%)
Electricity	452 (24%)	11,938 (25%)	16,713 (16%)

*Figures taken from the *Bolshaya Sovietskaya Entsiklopedia: S.S.S.R.*, (Moscow, 1948).

UKRAINIAN LANGUAGE. This is the lineal descendant of the colloquial language of Kiev Russia and is less like Russian than is White Russian. Indeed, the last forms the link between them, as it has transitional dialects to both. On the other hand, there is no transitional dialect between Ukrainian and Russian. Ukrainian dialectal characteristics occur in mediaeval manuscripts as early as the 12th century, especially those originating in the west. They become very marked after the destruction of Kiev in the 13th century and the gradual incorporation of considerable parts of Ukrainian territory in the Grand Duchy of Lithuania, The official language of this state was White Russian (Byelorussian) till this was displaced by Polish in the 16th century. White Russian and Polish were used mainly in legal documents at that time, and Ukrainian figured in writs and private usage as it had since the 14th century. In the 16th the Reformation impinged on Ukrainian, as on White Russian and Polish, religious literature. The 17th saw a Ukrainian form of Church Slavonic in wide use among nationally minded Ukrainian scholars. But at the 'same time a more colloquial form of this language was used for scholastic verse and interludes. It is out of this colloquial style that modern literary Ukrainian emerged at the end of the 18th century with the *Enejida* of I. Kotljarevśkyj. Since then the language, like modern White Russian, has been used not only for literature but for academic and administrative purposes. Like White Russian, it has a large body of Polish words and expressions, although here again the fundamental linguistic features are of independent development.

Phonetically Ukrainian differs from Russian in its itacism or intermediate vowel between *i* and *u* (something like the English i in "sit"); the use of bilabial w, written v and found finally and before consonants (cf. buv "was," vovk "wolf" with Russian *byl, volk*); the affricates dz and *dž;* the glottal fricative h, as in White Russian; chv for f in many instances; hardened labials and final r, as in White Russian (cf. krov "blood" with Russian krov'); long soft consonants (cf. korinnja "roots," *žyttja* "life" with Russian koren'ja, *žit'jo*); and the retention of final voiced consonants (cf. *gorod* "town" with Russian *gorot*). Phonologically we have the alternation of *i/o* and *i/e* as in the nominative-genitive singular *vil/vola* "ox"; *pič/peči* "stove" (cf. Russian *vol/vola; peč/peči*), the closer vowel figuring in the closed syllable; and, as in White Russian. the alternation of *h/k/ch* with *z/c/s* (cf. nominative singular *noha* "leg," locative *na* nozi, with Russian noga, *na noge*). Ukrainian morphology is distinguished by retention of the vocative singular (*e.g.*, iinko! "woman!"), the extensive use of forms of the Old Church Slavonic *ŭ*-declension (cf. genitive singular *snehu* < *snih* "snow" with Russian genitive singular *snega*), contracted adjectival forms in the feminine and neuter nominative singular (cf. *zelena/zeleno* "green" with Russian *zeljonaja/zeljonoje*), a new future made by compounding the infinitive with the present tense of the auxiliary "to have" (cf. chodytymu "I shall go" with Russian budu chodit'), and the absence of the t-ending in the present tense of first-conjugation verbs (cf. nese "he/she carries" with Russian nesjot). Syntactically a notable feature of Ckrainian is the impersonal neuter passive construction, which is found also in Polish, but not in Russian and White Russian (cf. *dveri vidčineno* "the door has been opened" with Polish dano *trzecią potrawę* "the third course has been served").

UKRAINIAN LITERATURE. A literary language. so-called Church Slavonic came to Kiev from Byzantium with Christianity (988). The first original works were the chronicle of Nestor and the Kiev Lavra hagiography and sermons. Among prominent later works were The Discourse on *Law* and Grace of Metropolitan Ilarion (11th century); Pilgrimage of Abbot Danylo; and Instruction to Children by Volodymyr Nonomakh (12th century) and The Lay of *Igor's* Campaign (see RUSSIAN LITERATURE: Kievan Period). The sack of Kiev (1169) by Andrey, prince of Suzdal, and the Mongol invasion (1240) caused a transfer of cultural activity to Volhynia and Galicia. The colorful *Galician*-Volhynian Chronicle (1205–92) is a monument of this period.

Delayed influence of the Renaissance and Reformation in western Europe stimulated a cultural revival in the Ukraine, with new translations of the Gospel, establishment of the first university schools (collegiate edition of Bible in Ostroh, 1581) and a wealth of religious polemics. Ivan Vyshensky (d. 1625) was the outstanding polemist of the time. Poetic songs and the oral historical dumy appeared. A new Cossack aristocracy revitalized culture in Kiev, where Metropolitan Petro Mohyla (1596–1647) founded his academy in 1633. The Baroque literary period developed there, flowering especially in the 18th century. Prominent writers included the poet, dramatist and author of the monumental Lives of Saints, Dmytro Tuptalo (1651–1709); the master of interludes, M. Dovhalevsky; the epigrammatist, I. Velychkovsky (d. 1726); and the poet and philosopher Hryhory Skovoroda (1722–94). Literary language, still adhering to the traditional church style, turned more frequently to the vernacular in this period.

Classical literature at the time could not develop because of political reasons. Theofan Prokopovich (1681–1736), a dramatist and literary theoretician, became the political philosopher of Tsar Peter I. Ivan Kotlyarevsky (1769–1838), in his comedies and his travesty of Virgil's Aeneid, used the vernacular exclusively.

Kharkov university (1805) became the centre of romanticism. The ethnographic publications of N. Tsertelev (1819) and M. Maksymovych (1827–49), and the first attempts to interpret Ukrainian history scientifically (D. Bantysh-Kamensky), plus interest in history and folklore (as in the works of I. Sreznevsky) gave an impetus to romantic poetry: L. Borovykovsky (1806–89), A. Metlynsky (1814–70) and Mykola Kostomarov (1817–85) and, in Western Ukraine, Mykola Ustyanovych (1811–85). But it took the genius of Taras Shevchenko (1814–61) to breathe a new national spirit into romanticism and into all of Ukrainian literature. Panteleymon Kulish (1819–97), translator of the Bible and of Shakespeare, poet, historical novelist and essayist, enriched and developed it. Marko Vovchok (1834–1907), a prose writer, and I. Karpenko-Kary (1845–1907), playwright, ended the romantic period and introduced that of modern realism.

Modern Ukrainian literature was first headed by Ivan Franko (1856–1916), a great writer, and by the outstanding dramatist and poetess Lesya Ukrainka (1871–1913). Masters of impressionist prose were Mykhailo Kotsiubynsky (1864–1913) and Vasyl Stefanyk (1871–1936). The best in pure lyricism was written by O. Oles (1878–1944).

World War I, with the fall of tsarism and the Ukraine's struggle against Soviet Russia (1918–22), gave literature a further impulse. Pavlo Tychyna (1891–) was a new type of lyricist. Founded on Kievan tradition, a poetic school of neoclassicists appeared, revering antiquity and Parnassianism; it was headed by the erudite Mykola Zerov (b. 1890, deported 1933) and Maksym Rylsky (1895–), the most outstanding poet of the period. Masters of the modern novel were Valerian Pidmohylny (b. 1901, deported *c.* 1934) and Yuriy Yanovsky (1902–54); a master of drama was Mykola Kulish (b. 1892, deported *c.* 1934).

The Soviets began suppressing Ukrainian literature in 1923, and by 1929–30 there was a mass liquidation of authors and removal of their works from circulation. The novelist and pamphleteer Mykola Khvylovy (1893–1933) made heroic attempts from 1925 to 1930 to stem this activity conducted in the name of Communism and to organize an opposition but in the end committed suicide.

As a result, literature could develop freely only in the west (Lwow and Prague). Prominent writers beyond the boundaries of the Soviet Ukraine were M. Cheremshyna (1874–1927), Olha Kobylanska (1865–1942) and the historical novelist Kateryna Hrynevych (1875–1947); the lyricists Yuriy Darahan (1894–1926), Oleh Olzhych (1909–44), Yuriy Lypa (1900–44), Yuriy Klen (1891–1947) and others; and the essayist-critic Dmytro Donzov (1883–).

UKULELE. A small guitar (*q.v.*) used by the natives of the Hawaiian Islands and adopted as a jazz and solo instrument in England and the United States.

ULAN BATOR (ULAAN BAATAR), until 1924 called Urga, capital of the Mongolian People's Republic, lies on the Tola river on a wind-swept plateau 4,294 ft. above sea level. Summer temperatures reach 80° F. while in winter the thermometer falls to −50° F. Pop. (1956 est.) 129,000.

The town came into existence in mid-17th century with the foundation of Da Khure monastery, the residence of the *bodgo-gegen* (sometimes called "living Buddha"), who ranked third among the dignitaries of the Buddhist-Lamaist religion. By mid-18th century Da Khure, known to the Russians as Urga, was a trading centre between China and Russia and the seat of a Chinese viceroy. When in 1911 Outer Mongolia recovered its autonomy, Urga became its capital. In 1918 Chinese troops entered the town, but on Feb. 3, 1921, it was captured by White Russians under Baron Roman von Ungern-Sternberg. He, in turn, was defeated in June 1921 by the Soviet army who on July 6 occupied Urga, which became the capital of an autonomous Mongolian state nominally headed by the *bodgo-gegen.* The last holder of this title, Jebtzun Damba, also called *khutukhtu* ("saint"), died on May 20, 1924, after which no new "reincarnation" was permitted and the "green palace" became a museum. Urga was renamed Ulan Bator, meaning "Red Hero."

With Soviet help a new city was planned and by the late 1950s its central feature was Sukhe-Bator square, opening off the east-west Stalin perspective. A neoclassic Palladian government building stands on the square, and in front of it a mausoleum containing the mortal remains of the two builders of Mongolian independence, Sukhe-Bator and Choibalsan. On this square also are the National theatre (1932) and Hotel Altai. On Choibalsan street stands the university (1942). In 1949 Ulan Bator mas linked by rail with the trans-Siberian trunk line, and with Peking in 1956. Five motor roads link the town with the U.S.S.R., with Dalan-Dzadagad in the south of the republic and with Peking. There is also an international airport. (K. SM.)

ULANOVA, GALINA (1910–), prima ballerina of the Bolshoi theatre ballet, Moscow, and people's artist of the republic, was born on Jan. 10, 1910, in St. Petersburg (now Leningrad). She was trained in the Leningrad State School of Ballet, where she studied under Agrippina Vaganova. A lyrical dancer who may be said to have descended from Anna Pavlova, she excelled in such roles as the title role in *Giselle* and Maria in R. V. Zakharov's *Fountain of Bakhchisarai,* and in her creation of Juliet in L. M. Lavrovski's *Romeo and Juliet* (1940). She danced at the Royal Opera house, London, in 1956, gaining an immediate popularity not equaled since the first appearance of Pavlova.

See V. Bogdanov-Berezovski, *Ulanova and the Development of the Soviet Ballet,* Eng. trans. by S. Garry and J. Lawson (1952). (A. L. HL.)

ULAN UDE (formerly VERKHNE-UDINSK), the capital of the Buryat Autonomous Soviet Socialist Republic, Russian Soviet Federated Socialist Republic, U.S.S.R. It is on the Uda river at its confluence with the Selenga. Pop. (1959) 174,000.

The town was on the 18th-century Siberian road and was formerly a great centre for the tea trade from Mongolia via Kiakhta. *See* TROITSKOSAVSK.

ULCER, a lesion of the skin or any mucous membrane characterized by a loss of surface epithelium and more or less of the underlying connective tissue. The term is also applied to lesions of the aorta and valves of the heart in which there is a loss of the lining endothelium. An ulcer has a depressed floor or crater surrounded by sharply defined edges that are sometimes elevated above the level of the adjoining surface. The floor of an ulcer is formed by granulation tissue that is usually infected from bacterial contamination. It is most important to the patient to know whether the ulcer is benign or malignant. Benign ulcers are usually caused by infections or nutritional disturbances. The ulcers on the legs of persons with varicose veins are caused by the slow circulation of the blood in the skin. Any infection under the skin such as a boil, carbuncle or tuberculous lesion may break through the surface and form an inflammatory ulcer.

The significance of an ulcer is best explained by a separate consideration of the different regions of the body in which ulcers develop. When an ulcer of the skin has been present for a month or longer, the possibility of cancer must be considered. If the edges of the ulcer are hard and the patient is past middle life, the probability of cancer is great. Ulcers on the vermilion border of the lower lip in elderly men are frequently cancers; women rarely develop cancer in this site. Such cancers must be recognized and treated early before they spread and become inoperable. Superficial ulcers on the lips, the ordinary cold sores (*q.v.*), are caused by a virus and are not serious.

Ulcers in the mouth and throat are frequently caused by infection but are sometimes cancerous, especially in older persons. Malignant ulcers usually have hard edges. In diphtheria there is often extensive ulceration of the throat. Ulcers in the esophagus tend to be cancerous.

Peptic ulcer refers to an ulcer in the part of the intestinal tract bathed by gastric juice; *i.e.,* the stomach and the first segment of the duodenum. (These are discussed in a separate article, GASTRIC AND DUODENAL ULCER.) Ulcers do not occur in the duodenum below the ampulla where the alkaline bile and pancreatic secretion enter and neutralize the gastric acid.

Ulcers in the small intestine occur chiefly in the terminal portion not far from its entrance into the large bowel. The commonest causes of ulcers in the terminal ileum are typhoid fever and tuberculosis. In the large bowel, single large ulcers are usually cancers. Cancerous ulcers occur most frequently in the rectum but may develop in any part of the colon. They cause pain, constipation and blood in the feces, are highly malignant and can be successfully removed only when recognized in an early stage. Ulcerative colitis is a disease in which hundreds of small ulcers develop in the mucous membrane of the large intestine. Some cases are caused by amoebic dysentery and some by bacillary dysentery, but in the majority of cases no cause can be established. The cases of unknown causation are most difficult to treat, and it is sometimes necessary to remove the entire large intestine.

Ulcers developing in the urinary bladder may be inflammatory or cancerous in nature. Cancers of the bladder are highly malignant and few cures are effected.

Ulceration of the valves of the heart occurs in bacterial endocarditis. Bacteria, usually streptococci, lodge in the valve leaflets and produce an inflammation that destroys the surface of the valves and forms an ulcer. Many cases of bacterial endocarditis have been cured by penicillin. (E. T. BE.)

ULEMA, the learned of Islam, theologians, canon lawyers, professors, judges, muftis, etc., all who, whether in office or not, are versed theoretically and practically in Moslem science in general. In a narrower sense, Ulema is used, in a Moslem state, of a council of such learned men, holding government appointments. If all conception of intermediary priesthood is eliminated, the Ulema may be said to be equivalent to the secular clergy of Roman Christendom (*see* DERVISH). Opposed to them, again, are the *'ārifs,* to whom religious knowledge comes in the vision of the mystic, not by tradition or reason (*see* ṢŪFĪISM).

ULFILAS (*c.* 311–383), the apostle of Christianity to the Goths, and, through his translation of the Scriptures into Gothic, the father of Teutonic literature, was born among the Goths at the trans-Danubian provinces about the year 311.

The Arian historian Philostorgius (*Hist. eccl.* ii, 5) says that his grandparents were Christian captives from Sadagolthina in Cappadocia, who had been carried off to the lands beyond the Danube in the Gothic raid of 264, and became so naturalized that the boy received a Gothic name, *Wulfila* (Little Wolf). An authoritative record of the outlines of his life was only discovered early in the 19th century in a writing of Auxentius of Milan, his pupil and companion. At an early age Ulfilas was sent, either as an envoy or as a hostage for his tribe, to Constantinople, probably on the occasion of the treaty arranged in 332. Ulfilas may therefore have been a convert to Christianity when he reached Constantinople. But there probably he came into contact with the Arian doctrines which gave the form to his later teaching. For some time before 341 he worked as a lector (reader of the Scriptures). From this work he was called to return as missionary bishop to his own country, being ordained by Eusebius of Nicomedia and "the bishops who were with them," probably at Antioch, in 341.

He was then 30 years of age, and his work as "bishop among the Goths" covered the remaining 40 years of his life. For seven of these years he worked among the Visigoths beyond the Danube, till the success which attended his labours drew down the persecution of the still pagan chief of the tribe. To save his flock from extinction or dispersion, Ulfilas decided to withdraw both himself and his people. With the consent of the emperor Constantius he led them across the Danube, "a great body of the faithful," and settled in Moesia at the foot of the range of Haemus and near the site of the modern Trnovo (349).

The life of Ulfilas during the following 33 years is marked by only one recorded incident (Sozomen iv, 24), his visit to Constantinople in Jan. 360, to attend the council convened by the Arian or Homoean party. The part played by Ulfilas in these troublous times has not been determined with certainty. It may have been he who, as a "presbyter christiani ritus," conducted negotiations with Valens before the battle of Adrianople (378); but that he headed a previous embassy asking for leave for the Visigoths to settle on Roman soil, and that he then, for political motives, professed himself a convert to the Arian creed, favoured by the emperor, and drew with him the whole body of his countrymen—these and other similar stories of the Orthodox church historians appear to be without foundation. The death of Valens, followed by the succession and the early conversion to Catholicism of Theodosius, dealt a fatal blow to the Arian party within the empire. In 383 he was sent to Constantinople by the emperor. A split seems to have taken place among the Arians at Constantinople. Ulfilas was summoned to meet the innovators and to induce them to surrender the opinion which caused the dispute. No sooner had he reached Constantinople than he fell sick, "having pondered much about the council," and before he had put his hand to the task which had brought him, he died, probably in Jan. 383.

The Arianism of Ulfilas was a fact of pregnant consequence for his people and indirectly for the empire. It had been his lifelong faith, as we learn from the opening words of his own confession—"Ego Ulfilas semper sic credidi." If, as seems probable from the circumstances of his ordination, he was a semi-Arian and a follower of Eusebius in 341, at a later period of his life he departed from this position and vigorously opposed the teaching of his former leader. He appears to have joined the Homoean party, which took shape and acquired influence before the council of Constantinople in 360, where he adhered with the rest of the council to the creed of Ariminum. His version of the Scriptures is his greatest monument. By it he raised a barbarian tongue to the dignity of a literary language; and the skill, knowledge and adaptive ability it displays make it the crowning testimony of his powers as well as of his devotion to his work. For the linguistic value of the Gothic version of the Scriptures by Ulfilas *see* GOTHS: *Gothic Language.* It is preserved, though only in a fragmentary form, in the famous *Codex Argenteus* at Uppsala.

ULIANOVSK (formerly Simbirsk), a town in the *oblast* of the same name, in Russian S.F.S.R., founded in 1648, lying on a hill 560 ft. above the Volga at a point where the Svyaga closely approaches it, in 54° 23' N., 48° 25' E. Pop. (1959) 205,000. The town has sawmills, flour mills, breweries, distilleries and brickyards. The historian N. M. Karamzin was born there in 1766 and Nicolai Lenin in 1870. Ulianovsk was the scene of much fighting during the civil war of 1917–1920. The former province of Ulianousk was divided among the Gorki, Penza and Kuibyshev regions and the Tatar A.S.S.R. and Chuvash A.S.S.R.

ULLATHORNE, WILLIAM BERNARD (1806–1889), English Roman Catholic missionary to Australia and later bishop of Birmingham, who exposed the transportation of convicts, was born at Pocklington, Yorkshire, on May 7, 1806, in descent from Sir Thomas More. After a hard training at sea as a cabin boy he joined the Benedictines at Downside abbey (near Bath) in 1823 and was ordained priest in 1831. He volunteered to serve the convicts in Australia where he was sent in 1832 as vicar-general. He was the first chaplain to visit Norfolk Island where the worst criminals were imprisoned. In 1838 he revisited England to give evidence in parliament which helped to abolish transportation. He left Australia in 1840 to work in Coventry, where he remained until his appointment in 1846 as vicar apostolic of the western district, with residence in Bristol. In 1848 he was made vicar apostolic of the central district and bishop of Birmingham in the new hierarchy he had himself helped to found.

With Margaret Hallahan he founded the Dominican convent at Stone, Staffordshire, in 1853. At the Vatican council in 1870 he voted as a moderate for papal infallibility. He was the close friend as well as the diocesan of J. H. Newman, whom he defended from H. E. Manning and for whom he helped to secure the cardinalate in 1879. He resigned from his diocese in 1888, and was made titular archbishop of Cabasa.

He died at Oscott, March 21, 1889.

See Ullathorne's autobiography, *From Cabin-boy to Archbishop* (1941), ed. by Shane Leslie; E. C. Butler, *The Life and Times of Bishop Ullathorne,* 2 vol. (1926).
(SH. L.)

ULM, a city of Germany, in the *Land* of Baden-Württemberg, on the left bank of the Danube, at the foot of the Swabian Alps, 58 mi. S.E. of Stuttgart by rail and 63 mi. N.W. of Munich. Pop. (1950) 71,132. Ulm is mentioned as early as 854; it became a town in 1027 and was soon the principal place in the duchy of Swabia. Although burned down by Henry the Lion, it soon recovered from this disaster and became a free imperial town in 1155. Its trade and commerce prospered and in the 15th century it attained the summit of its prosperity, ruling over a district about 300 sq.mi. in extent and having a population of about 60,000. In 1803 Ulm lost its freedom and passed to Bavaria, being ceded to Wiirttemberg in 1809. In Oct. 1805 Gen. Karl Mack with 23,000 Austrians capitulated there to Napoleon. Ulm is remarkable in the history of German literature as the spot where the Meistersinger lingered longest, preserving without text and without notes the traditional lore of their craft.

Ulm still preserves the appearance of a free imperial town and contains many medieval buildings of historic and of artistic interest. Among these are the town hall, of the 16th century, in the Transition style from late Gothic to Renaissance; the Kornhaus; the Ehingerhaus or Neubronnerhaus, containing the industrial museum; and the commandery of the Teutonic order, built in 1712–18 on the site of a habitation of the order dating from the 13th century, and later used as barracks. The magnificent early Gothic cathedral, begun in 1377, and carried on at intervals till the 16th century, was long left unfinished; but in 1844 the work of restoration and completion was begun, being completed in 1890. The tower (528 ft.) in the centre of the west façade was completed in 1890. The Danube, joined by the Iller just above the town and by the Blau just below, becomes navigable, so that Ulm occupies the important commercial position of a terminal river port.

The market for leather and wool is important, and the manufactures include wire ropes, borax, paints, cheese, jute, leather, lace, perfumes and cement. Brewing and weaving, iron- and brass-founding are carried on as well.

ULMACEAE (elm family), a family of deciduous trees and shrubs, the best-known and most important members of which are the elms (*q.v.*), forming the genus *Ulmus*. The family, which contains about 15 genera and about 130 species, is widely distributed in both temperate and tropical regions around the world. *Celtis australis* is the nettle tree, the fruit of which is edible. C. *occidentalis* is the hackberry (*q.v.*), of the eastern U.S. and southern Canada.

ULMANIS, KARLIS (1877– ?), Latvian statesman, was born on Sept. 4, 1877, at Berze, Zemgale, a province of Latvia. He studied agriculture in Germany and helped to improve Latvian dairy farming and cattle breeding. In 1905, at the time of the first Russian revolution, he promoted Latvia's movement for political autonomy. After the revolution Ulmanis went into exile in the United States. Having been granted an amnesty, he returned to Latvia in 1913. Shortly after the Russian revolution of 1917 he founded the Latvian Farmers' union, claiming Latvia's independence. With other Latvian leaders he formed a Latvian National council which on Nov. 18, 1918, proclaimed the independence of Latvia and appointed him the head of the provisional government. He remained in power until June 18, 1921, his period of office coinciding with years when freedom had to be defended not only against the Russian and Latvian Communists but also against the Germans. With a Latvian army formed by Gen. Janis Balodis, he liberated the country and organized the election of the constituent assembly which convened at Riga on May 1, 1920. Peace with Soviet Russia was concluded on Aug. 11, 1920. Ulmanis was again premier from Dec. 1925 to May 1926, and from March to Dec. 1931. Since in the Latvian *saeima* (parliament) of 100 deputies there were 24 political parties, every government was necessarily a somewhat unstable coalition. Ulmanis returned to power for the fourth time on March 17, 1934, at a time of great political tension created by the Communists and right-wing nationalists (the Perkonkrustiesi or Thundercrosses). A third element of disloyalty was the nazified German minority. On May 15 he suspended the constitution and, backed by the army, established an authoritarian regime. On April 11, 1936, Ulmanis became president of the republic also, with General Balodis as vice-president.

In June 1940 he accepted a Soviet ultimatum to form a "friendly" government headed by August Kirchensteins. Ulmanis and Balodis were arrested on July 21, 1940, and deported to the U.S.S.R. Their fate remained unknown. (K. SM.)

ULMUS: *see* ELM.

ULPIAN (DOMITIUS ULPIANUS) (d. A.D. 228), Roman jurist from Tyre, Phoenicia, whose writings supplied one-third of the total content of Justinian's *Digest* and his edictal commentary alone about one-fifth. He served as assessor when Papinian was *praefectus praetorio* and was himself a member of Septimius Severus' council. He was *magister libellorum* under Caracalla and *praefectus praetorio* under Alexander Severus from A.D. 222, until he was murdered by his own underlings in A.D. 228. His literary activity lay before his accession to the praetorian prefecture.

Ulpian was a prolific writer and made numerous contributions to a wide range of legal literature. His principal works are his commentaries *Ad Sabinum* (51 books) and *Ad edictum* (81 books) in which he aimed to restate comprehensively the interpretation of the civil law and edictal law. He also wrote monographs on, *e.g.*, particular statutes and on *fideicommissa* ("will trusts"), elementary handbooks (*Institutiones* and *Definitiones)*, opinions *(Disputationes, Opiniones, Responsa)* and treatises on various offices, notably his *De officio proconsulis* (10 books) which provides an exposition of the criminal law. Ulpian also wrote seven books of *Regulae:* the somewhat doubtful work, *Tituli ex corpore Ulpiani*, purports to preserve another *Liber singularis regularum*. Ulpian prized elegance and his works are characterized by lucidity of language, style and presentation. As a jurist, he is remarkable for his familiarity with the works of his predecessors: indeed, his merits lie in exposition and in compilation rather than in original thought. Not that he is a mere reporter: his criticisms of the views he relates are invariably sound.

See F. Schulz, *History of Roman Legal Science* (1946) ; W. Kunkel, *Herkunft und soziale Stellung der romischen Juristen*, pp. 245 ff. (1952). The most recent edition of the *Tituli ex corpore Ulpiani* is in *Fontes Iuris Romani Anteiustiniani*, vol. ii (1940). (J. A. C. T.)

ULRICH, SAINT (*c*. 890–973), bishop of Augsburg, the first person known to have been canonized by a pope, was born at Zurich, Switz., of the noble house of Dillingen, related to the imperial family of the Ottos. He studied at the monastic school of St. Gall, and was then trained by Adalbero, bishop of Augsburg. Upon the death of the latter in 910 Ulrich returned home and remained there for 13 years, at which time he was appointed bishop of Augsburg by King Henry I. He was throughout a loyal supporter of the emperor, and acted as mediator in the struggle between Otto I and Ludolf of Swabia. He also enabled Augsburg to withstand a siege by the Magyars until the emperor arrived (Aug. 955). He was granted the right to coin money, a privilege previously unknown for a German bishop.

On the morning of July 4, 973, Ulrich had ashes strewn on the ground in the shape of a cross and himself placed on them; he died as the litany was chanted. He was canonized by John XV in 993, and his feast day is July 4.

Ulrich was a strong personality. He was devoted to his duties, deeply concerned with the education of his clergy, the religious life of the people and particularly concerned with care for the poor.

See H. Thurston and D. Attwater (eds.), *Butler's Lives of the Saints*, vol. iii, p. 16 (1957). (Fs. P. C.)

ULSTER, EARLS OF. The earldom of Ulster was the first title of honour in Ireland of English creation, and for more than a century was the only one. It dates from a grant to Hugh de Lacy in 1205. Hugh de Lacy, 1st earl of Ulster (d. 1242?), was descended from Walter de Lacy (d. 1085), who fought for William the Conqueror at Hastings. The first earl was the brother of Walter de Lacy (d. 1241), who succeeded his father as lord of Meath in 1186. In 1203 Hugh de Lacy drove John de Courcy out of Down and was rewarded by grants of land and in 1205 by the earldom of Ulster. He was then invested with quasi-viceregal authority, but in 1207 war broke out between the earl and the king's justiciar. King John came to Ireland and banished the earl to Scotland. He returned to Ireland in 1226, and died at Carrickfergus. On his death the earldom reverted to the crown.

A second creation followed, when Prince Edward (later Edward I) transferred "the county of Ulster" (*c*. 1255) to Walter de Burgh, lord of Connaught. The earldom remained in the family of De Burgh until the death of William, 3rd earl of this line, in 1333, when it passed to his daughter Elizabeth, who married Lionel, afterward duke of Clarence, son of Edward III. Lionel was succeeded in the earldom of Ulster by his daughter Philippa, who married Edmund Mortimer, earl of March. The third Mortimer earl of Ulster died unmarried in 1425, when his titles were inherited by Richard Plantagenet, duke of York, whose son Edward ascended the throne as Edward IV in 1461.

Since that date the earldom of Ulster, which then merged in the crown, has been held only by members of the royal family. In 1928 it was bestowed upon H.R.H. the duke of Gloucester.

ULSTER, the ancient northeastern province of Ireland, had a varying frontier and is now roughly coextensive with Northern Ireland. Uladh was its ancient Gaelic name. and the ending "ster" was of Norse origin. At the beginning of the Christian era a kingdom of Ulster stretched from the Shannon to the Boyne, with its chief stronghold near Armagh. By the close of the 4th century this had broken up and the name Ulidia was applied to an area roughly corresponding to the modern Down and Antrim. John de Courcy invaded the area successfully in the last quarter of the 12th century and contemporary writers referred to him as "Princeps Ulidiae" and "Conquestor Ultoniae" In 1205 King John deprived de Courcy of his territories and gave them to Hugh de Lacy with the title of earl of Ulster. In Tudor times the ancient provincial divisions of Ireland were used for administrative purposes. In 1585 Lord Deputy Sir John Perrot caused Ulster to be shired, defining the area of Ulster as the eight counties of Antrim, Down, Armagh, Monaghan, Coleraine, Donegal, Tyrone and Fermanagh. To this Sir Arthur Chichester added Cavan which had formerly counted as part of Connaught. By 1608 nine counties were regarded as making up Ulster. Coleraine became the county of Londonderry in 1613. The nine-county Ulster was made quite arbitrarily and did not correspond to the ancient kingdom or any earlier Ulster. It never had much reality as an administrative entity. The name Ulster has been generally used since 1920 as another name for Northern Ireland, appearing in the titles of many public bodies and institutions; but for a few purposes, including some forms of interprovincial sport, the name still indicates nine counties. The three counties of Cavan, Donegal and Monaghan form Ulster province (3,123 sq.mi.; pop., 1956, 235.863) in the Republic of Ireland. (Hu. S.)

ULTIMATUM is a technical diplomatic term, derived from the Latin word for "last." It signifies a formal, categorical declaration, addressed by one state to another to the effect that if certain demands are not met. serious consequences will ensue. These consequences may range from the rupture of the particular negotiations, economic measures, breaking-off of diplomatic relations or threat of force, to the actual application of force in the form of war. An ultimatum is called simple if it does not indicate the measures to be taken by the government sending it. It is called qualified if it indicates the nature of the measures to be taken. Art. i of convention iii, adopted by the second Hague conference (1907), regulates in detail the formalities to be observed with regard to an "ultimatum with a conditional declaration of war." The practical importance of these provisions was greatly diminished by the provisions of the covenant of the League of Nations and of the charter of the United Nations, limiting the right of the member states to use war as an instrument of national policies. It was also diminished by the disregard with which many states treated these provisions. (H. J. Mu.)

ULTIMOGENITURE, the custom by which the youngest son inherits the homestead, is known in English law as Borough English. In England it obtained in parts from Gloucester to Cambridgeshire. Under the name of Mainète and Jungerrecht it was known in northern France and northern Germany. In Assam it is found among the matrilineal Garos who possess the dual organization and speak a Tibeto-Chinese language, among the matrilineal Khasias who speak an Austric language, among patrilineal Lusheis, Meitheis, Kagas and Kachins, speakers of Tibeto-Chinese languages. Cases are known in Africa.

This custom has been regarded as derived from the *jus primae noctis*, the youngest son being of undoubted paternity. This view has been successfully traversed by Blackstone, Westermarck and Frazer. It has been ascribed among settled peoples, such as Nagas and Meitheis, to the custom of making provision for the elder sons as they marry and set up house independently. The rule requiring elders to marry before juniors is found among communities which do not now practise ultimogeniture. Among people like the Lusheis, who practise shifting cultivation, it is due to the custom by uhich the sons of chiefs, on marrying, swarmed off to found new villages. The view that it is connected with domestic worship is supported by the Khasi evidence, where the youngest daughter "inherits the religion"—in organic association with the homestead. With the Garos it is inseparably connected with the general system of marriage.

ULTRACENTRIFUGE: **see** CENTRIFUGE.

ULTRAMARINE is the colour principle of the gem lapis lazuli (*q.v.*) which, besides its use as an ornament, formed the blue pigment used by painters in the middle ages. Ore containing the colour was ground and the powdered lapis lazuli separated from the other mineral matter by an oil pasting process. The blue pigment so obtained is said to have been literally worth its weight in gold. The fact that the product was imported into Europe gave it its name—ultramarine, "beyond the sea."

The value of the material caused great efforts to produce it artificially and these succeeded in the late 1820s. It appeared on the market almost simultaneously in France and Germany. The ultramarine of those early days was a weak product from the present point of view, but it was the start of a development leading to the pigment of today.

Ultramarine is manufactured from more or less equal amounts of china clay, sulfur and soda ash (sodium carbonate), together with considerably smaller amounts of silica and rosin or pitch. Variations in the proportions of the ingredients are used to cause variations in the shade of the product from a greenish to a reddish blue. The mixture is very finely ground and loaded into crucibles with porous walls. More than 1,000 of these are stacked in a single furnace, which is then slowly fired up to a top temperature of about 750° C. Many and complicated reactions occur among the ingredients of the mix. When the top temperature has been reached, the fire is drawn, and the furnace is sealed and allowed to cool over a period of about two weeks. During this cooling period the atmosphere of the furnace exerts an oxidizing action upon the crucible contenfs, this action being of much importance to the character of the product. The crude ultramarine is removed from the crucibles, washed free from salts, very finely ground and separated by successive sedimentations from water suspension into a series of particle sizes. The varying characteristics required for different uses of ultramarine are satisfied by selection of the desired shade and particle size. For some purposes, the product requires further special surface treatments.

The uses of ultramarine are in paints and lacquers, calcimine, linoleum, paper (both in whitening and colouring), coloured roofing material and laundry blueing. It has a particularly brilliant blue colour, is very light-fast and is resistant to mild alkalies, but not to acids. The structure of ultramarine was a matter of much controversy until F. M. Jaeger finally settled the matter in 1929 by the use of the X-ray. The ultramarines consist of a lattice of cubical form with truncated corners, built up of aluminum and silicon atoms joined to one another through oxygen atoms. The ratio of aluminum to silicon atoms can vary within limits, but their combined number is always 12. Commonly the silicon atoms outnumber the aluminum atoms. The connecting oxygen atoms number 24. Within the lattice and in the spaces formed by the truncated corners of adjacent lattices are atoms of sodium and sulfur not rigidly fixed as to number or position.

Silicon	17.75 to 20.0% by weight
Aluminum	12.3 to 15.5% by weight
Sodium	12.8 to 15.3% by weight
Sulfur	10.0 to 14.0% by weight
Oxygen	Balance (except for small amounts of water and impurities)

It is clear from the above why there is a family of ultramarines and why variations in composition exist. The usual percentage limits within which the components fall are shown in the table.

The shades and properties of the ultramarines vary with changes in the proportions of the components. (A. P. B.)

ULTRAMICROCHEMISTRY. The term "ultramicrochemistry" refers to a set of chemical techniques by which chemical analyses and other chemical manipulations are performed on the most minute amounts of material. If a standard analytical method requires about 0.1 gram or sample, the micromethod for the analysis would require about 0.001 gram and the ultramicromethod about 0.00001 gram. It is less ambiguous, then, to term ordinary scale or macro-operations as "decigram methods," micromethods as "milligram methods" and ultramicromethods as "microgram methods" (1 microgram = 0.000001 gram = about 0.000000035 oz.). Microchemistry is then "milligram chemistry" (1 milligram = 0.001 gram) and ultramicrochemistry is "microgram chemistry." It is also termed "drop analysis" because a sample of blood or other solution being analyzed is usually less than a drop.

Systematic ultramicrochemistry originated in the Carlsberg laboratory in Copenhagen about 1930. The techniques developed there were used chiefly to analyze traces of enzymes, or biological catalysts, in tiny slices of tissues of plants and animals. The techniques applied to this purpose became known as "enzymic histochemistry." They were widely employed by K. Linderstrom-Lang and his co-workers of the Carlsberg laboratory, as well as by many others, to the solution of fundamental biological problems.

A broader chemical approach was made by Paul L. Kirk and his co-workers at the University of California, starting about 1933. Instead of specific applications to limited types of biological problems, the aim of the California group was to make all kinds of chemical operations practical with microgram quantities so that any chemical study could be made, regardless of the type of material studied. Although the chief applications of these techniques were also expected to be biological in nature, the general applicability was demonstrated when they were used to develop the chemistry of plutonium, the element used as an explosive in the atomic bomb. Microgram manipulation was made necessary in this case by the fact that only microgram quantities of plutonium could be made by methods then available, and larger amounts could not be manufactured until extensive chemical information was available. Virtually the entire chemistry of plutonium was elucidated before there was as much as a milligram of the pure material in existence and huge production plants were constructed with a scale-up of more than a billionfold—an all-time industrial record.

Up to about 1940, the strictly chemical techniques were largely confined to volumetric operations; *i.e.,* measurement of liquid volumes as a means of analysis. This was true of both the Copenhagen and California groups as well as several other laboratories in which microgram chemistry was being studied or used. Included in these developments were methods for study of chemical changes through gasometric methods depending on measurement of gas volumes, respiration of single cells and of very small organisms or bits of tissue, enzyme catalyzed reactions in droplets and various manipulative techniques. During World War II further advances occurred in ultramicroweighing, submicrogram chemical analysis through colour measurement and chemical study of reacting systems containing only a few micrograms of material through improved manipulative techniques.

Liquid Volumetric Techniques.—Analytical methods depending on measurement of volumes of liquids were peculiarly adaptable to ultramicroanalysis and were the first techniques developed. Titrations were readily performed with burets made from fine capillary tubes which delivered small volumes of reagent solutions with an accuracy of ± 0.02 microlitres or better (1 microlifre = 0.000001 litre; 1 litre = approx. 1 quart). Liquid samples were measured with the same accuracy by use of the same fine graduated tubing. The blood of a grasshopper or a droplet from a child's fingertip could then be measured accurately and its constituents accurately determined by titrating this bit of blood with a capillary buret. Operations other than titration usually needed to be done. If so, techniques for spinning down the corpuscles, removing the protein, ashing the blood, filtering it, stirring it or boiling it were developed and could be used without ever having a greater volume than about one drop of liquid. By such means, quantitative analysis for nitrogen, urea, sugar, amino acids, lactic acid, ammonia, chloride, sodium, potassium, calcium, phosphorus and other common constituents of blood could be performed. Adaptations of these procedures are applicable to the analysis of all types of materials other than blood.

They can be valuable in the clinical laboratory by avoiding the difficulty of obtaining large amounts of blood from patients; *e.g.,* from infants. They are useful to the research worker who can study insects, some single cells, small plants and animals and their parts which by common methods could not be analyzed at all. They can also be used for the study of minute amounts of inorganic material such as the radioactive isotopes obtained by the nuclear physicist. The dangers of radioactivity are less with the small sample, and very often only the smallest samples can be obtained.

Gasometric Ultramicromethods.—Methods depending on gas volume changes have been chiefly useful in measuring the respiration rate of cells, tissues and small organisms. Some of these devices have been made sensitive enough to measure the minute trace of oxygen used by single invisible protozoan cells. Several such instruments could determine the rate of oxygen consumption with slightly larger organisms or tissues. One ingenious device which has been widely used both for respiration and enzyme studies is the Cartesian diver micromanometer which was first described by Linderstrom-Lang.

Gas analysis also was highly developed as an ultramicrotechnique during World War II. Most significant were the methods of P. F. Scholander and his associates who succeeded in analyzing as little as ten microlitres of gas mixtures for their constituent gases with approximately the same accuracy as is possible with large samples. These techniques were applied to various physiological studies.

Weighing.—Although very sensitive balances were developed early in the 20th century, little refinement or use had been made of them until 1942. P. L. Kirk, Roderick Craig and J. Gullberg succeeded that year in combining earlier weighing principles and refining them in a quartz fibre balance which could carry a total load of about 100 milligrams and weigh a sample of 0.3 milligram with a sensitivity of about 0.005 microgram. A human breath weighs about 750,000 micrograms; a dime, 2,500,000. With little loss in load capacity, the sensitivity could be increased by about tenfold. This instrument for the first time made weighing a prac. tical technique of ultramicroanalysis and opened the way for development of all types of investigation of ultrasmall samples which require weight determination.

See BALANCE.

Colorimetric Submicrogram Analysis.—Most significant of developments in ultramicrochemistry during World War II was the initiation of submicrogram analysis by means of the spectrophotometer. By using specially designed capillary absorption cells, the sensitivity of the colorimetric methods could be so increased as to allow the accurate analysis of amounts of many materials as low as one or a few millimicrograms (1 millimicrogram = 0.001 microgram = 0.000000001 gram). Little application was immediately made of this type of technique in practical research work, but the field of application is so broad in all phases of chemistry, biochemistry and biology that developments along this line were expected to outdo all past efforts toward chemical study of the microscopic world.

Miscellaneous Techniques.—The development of fine manipulative methods for separating and handling minute objects, such as the nuclei of cells, has progressed markedly to supplement the quantitative techniques which constitute the foundation of ultramicrochemistry. Improved microscopic methods using fluorescence from ultraviolet light and improved methods of staining certain constituents of cells and tissues for identification purposes have come into use.

For the first time in history, the ultramicrochemist possesses the tools with which he can carry chemical investigations into the cells, the very seat of life processes of plants and animals, and elucidate their nature. He can elaborate the complete chemistry of a new synthetic element before the amount of it on earth is the size of a small pin head. He can facilitate or make possible all sorts of research investigations which were completely impossible without these extremely delicate techniques. Medicine, agriculture, radiochemistry and biology can now advance in their basic chemical knowledge just as they advanced as a result of the invention of the microscope, except that now it is chemical vision which is magnified, and now it is possible to see not only what is present and how much and how it is composed.

ULTRAMONTANISM, the name given to a certain school of opinion in the Roman Catholic Church (Lat. *ultra,* beyond, *montes,* the mountains). The expression *ultramontane* was originally no more than a term of locality, characterizing the persons so described as living—or derived from—"beyond the mountains"; but from the very beginning we find it used as a party appellation to describe those who looked "beyond the mountains" in order to obtain a lead from Rome, who represented the papal point of view and supported the papal policy. Thus, as early as the 11th century, the partisans of Gregory VII were styled ultramontanes, and from the 15th century onward the same name was given to the opponents of the Gallican movement in France.

It was not until the 19th century that "ultramontane" and "ultramontanism" came into general use as broad designations covering the characteristics of particular personalities, measures and phenomena within the Roman Catholic Church. At the present time they are applied to a tendency representing a definite form of Catholicism within that church; and this tendency, in spite of the individual forms it has assumed in different countries, everywhere displays the same essential features and pursues the same ends. It follows, from the very nature of ultramontanism, and from the important position to which it has attained, that the official organs of the church and all the people interested in the continuance of the actual state of affairs deny that it exists at all as an independent tendency. It is indisputably legitimate to speak of ultramontanism as a distinct policy, but it is very difficult to define its essential character.

(1) The first and fundamental characteristic of ultramontanism is its carrying to a logical issue the concentration of all ecclesiastical power in the person of the Roman Pontiff. (*See* PAPACY.) To the *curial system,* so evolved, continually fortifying its position in the domains of theology, ecclesiastical law, and politics, the *episcopal system* stands in opposition. The system admits that the pope represents the unity of the church, and acknowledges his primacy, while at the same time it claims on behalf of the bishops that, in virtue of the divine ordinance, they possess an inalienable right to a share in the government of the church (*see* FEBRONIANISM).

The struggle between these two systems continued well into the 19th century; and, though episcopalism was not infrequently proscribed by the Curia, it still survived, and until the year *1870* could boast that no oecumenical council had ventured to condemn it. This was done for the first time, in *1870,* at the Vatican council (*q.v.*), whose decrees, recognizing the universal episcopate and the infallibility of the pope, marked the triumph of that doctrine by which they had been long anticipated. The Catholic church, in all countries, has become more and more dependent on the Curia: the bishops have lost their autonomous standing, and their position is little more than that of papal delegates, while all important questions are referred to Rome or settled by the nuncios.

(2) A second peculiarity of ultramontanism is that it claims for the Catholic church the functions of a political power, and asserts that it is the duty of the secular state to carry out its instructions and wishes. Since the conditions of the age no longer allow the pope to depose a temporal sovereign, the practical application of this conception of the relationship between the spiritual and temporal powers has taken other forms, all of which, however, clearly show that the superiority of the church over the state is assumed. This may be seen in the attitude of ultramontanism toward secular law. It assumes that God has conferred on the individual and on society certain rights and competences as inalienable possessions. This "natural law" ranks above all secular law, and all state legislation is binding only in so far as it is in harmony with that law. As to the provisions of this natural law, and the consequences they entail in individual cases, these can be decided only by the church, *i.e.,* in the last resort, by the pope. Thus, even at the present time, the opinion is very clearly expressed in ultramontane quarters that, in the event of the state issuing laws contravening those of nature or of the church, obedience must be refused. The attitude of ultramontanism, for instance, toward the right claimed and exercised by the state to make laws concerning marriage is wholly negative; it recognizes no marriage laws except those of the church, the church alone being regarded as competent to decide what impediments are a bar to marriage, and to exercise jurisdiction over such cases.

(3) Since ultramontanism cannot hope to realize its political ambitions unless it succeeds in controlling the intellectual and religious life of Catholic Christendom, it naturally attempts to extend its sphere of influence in all directions over culture, science, education, literature and the forms taken by devotion The development of these efforts may be easily traced from decisions of the congregation of the index and the holy office in Rome. Ultramontanism, too, labours systematically to bring the whole organization of education under ecclesiastical supervision and guidance.

(4) In the fourth place, ultramontanism is the embodiment of that intolerance toward other creeds which is the logical consequence of the authoritarian claims of the Catholic church. The general presupposition involved is that a man cannot be saved except within the Catholic church. Since, however, on the one hand—in virtue of a theory advanced by Pius IX against the emperor William I of Germany, in a letter which has since become famous—every Christian, whether he will or no, belongs to that church by baptism, and is consequently pledged to obey her, and, on the other hand, since the state lies under the obligation to place the "secular arm" at its disposal whenever one of its members wishes to secede, the most far-reaching consequences result. In the past this principle led to the erection of the Inquisition (*q.v*) and, even at the present day, there exists in the Curia a special congregation charged with its application. The gradual separation of state and church, a process traceable in its various degrees in all countries of Europe, has resulted in rendering impossible the strict application of a system to which human nature itself has rightly or wrongly, taken exception. As a result of this situation, the Catholic condemnation of heresy—though as stringent as ever in principle—has assumed forms less physically dangerous for the heretic.

(5) Lastly, ultramontanism opposes the nationalization of Catholicism. This peculiarity is connected, though not identical, with the above-mentioned tendency toward the Romanization of the church. Just as in Protestant countries there has often been an amalgamation of evangelical belief with national feeling, so many Catholics desire that Catholicism shall enter into the sphere of their national interests, and that the activities of the Catholic church should rest on a national basis. These aspirations have been proclaimed with especial emphasis in France, in Germany (*Reformkatholizismus*) and in the United States (*Americanism*) but they are everywhere met with a blank refusal from the ultramontane side. Ultramontanism fears that any infusion of a national element into ecclesiastical life would entail the eventual separation of the people in question from papal control, and would lead to developments fraught with danger to the supremacy of the papacy.

The relationship of ultramontanism to Catholicism is a much-disputed problem. The ultramontane maintains that there is no justification for distinguishing between the two; but, even within the pale of the Roman church, the identification provokes dissent, and is repudiated by all who are shocked by the effects on the life of the church of an overcentralized political Catholicism. It was on these grounds that in Jan. *1904,* it was proposed in the chamber of the Bavarian Reichsrath that the clergy should be deprived of the suffrage. The years between the Treaty of Frankfurt *(1871)* and the outbreak of World War I witnessed a growing difficulty on the part of Catholic Germans to reconcile ultramontane doctrine with the political and industrial development of united Germany. This was the real background of what is known as the *Kulturkampf* (*see* GERMANY, *History*).

The collapse of Germany after World War I (1914–18) tended, on the whole, to stimulate ultramontanism (*e g*, in Bavaria; ; but the republican elements which combined in *1919* to uphold the constitution of Weimar, proved strong enough to resist the more extreme manifestations of this tendency.

It may be admitted that for all the principal contentions of ultramontanism, analogies may be found in the past history of the Catholic church. Thus, in the middle ages, we find extremely bold pronouncements with respect to the position of the papacy in the universal church; while political Catholicism had its beginnings in antiquity and found very definite expression, for instance, in the bull *Unam sanctum* of Boniface VIII. Again, the attempt to subordinate all intellectual life to ecclesiastical control was a feature of the mediaeval church, and the fundamental attitude of that church toward heresy was fixed during the same period. But since then much has been altered both in the church and her secular environment. The state has become independent of the church, legislates on its own sole authority, and has recognized as falling within its own proper sphere the civilizing agencies and social questions formerly reserved for the church. Again, education, science, art and literature have been secularized; the printing press carries knowledge into every house, the number of illiterates diminishes from year to year in every civilized country, and the clergy are no longer the exclusive propagators of culture, but merely one factor among a hundred others.

The origin of modern ultramontanism is preceded and conditioned by the collapse of Catholicism in the period of the French Revolution. Pius VI and Pius VII were expelled from Rome, deprived of the papal states, and banished to France. In that country the church almost completely lost her possessions; in Germany they were at least considerably curtailed; in both the hierarchical organization was shattered, while the Catholic laity surveyed the catastrophe in complete passivity. But from this severe fall the church recovered with comparative readiness, and the upward movement is contemporaneous with the rise of ultramontanism. The birth of that system, however, cannot be fixed as a definite event by the day and the hour; nor was it created by any single personality. Rather it was the product of the first post-revolutionary generation. Neither is it merely fortuitous that the reaction proceeded from France itself. For in no other country had hostility to religion attained such a pitch or assumed such grotesque forms; and consequently in no other country did the yearning for religion manifest itself so unequivocally, when experience had demonstrated the necessity of a return to law and order. And in the other states of Europe there existed, more or less, a similar desire for peace and an equal dread of a fresh outbreak of revolutionary violence. In contrast to the struggle for an ideal freedom, which was at first hailed with tempestuous delight only to reveal itself as a dangerous tyranny, men became conscious of the need for a firmly established authority in the reconstruction of society. At the same time, the repression of idealism and sentiment during the period of "illumination" was amply revenged, and the barren age of reason gave place to Romanticism. These tendencies in contemporary opinion favoured the renovation of the Catholic church.

The papacy signalized its reinstation by restoring the Society of Jesus (1814) and re-establishing the index. In Germany ultramontanism had to contend with great difficulties; for here ecclesiastical affairs were not in so desperate a case that the most drastic remedies possessed the most powerful attraction; while, in addition, the clergy were unwilling to renounce all scientific work. The result was that a series of struggles took place between the old Catholicism and the new ultramontanism. But even here ultramontanism gained ground and derived inestimable assistance from the blunders of government after government. The growth of Jesuitical influence at Rome—more especially after the return of Pius IX from exile—implied a more definite protection of ultramontanism by the papacy. The proclamation of the dogma of the Immaculate Conception in 1854 was more than the decision of an old and vexed theological problem; it was an act of conformity with a pietistic type especially represented by the Jesuits. The Syllabus of 1864, however, carried with it a recognition of the ultramontane condemnation of some aspects of modern culture (*see* PIUS IX). Finally, in the Vatican council, the Jesuits saw another of their favourite theories—that of papal infallibility—elevated to the status of a dogma of the church (*see* VATICAN COUNCIL and INFALLIBILITY).

ULTRASONICS. The name ultrasonics is given to that branch of acoustics dealing with periodic sounds whose frequencies lie above the audible range; *i.e.,* are greater than approximately 20,000 cycles per second. The development of electronically controlled sound sources after World War I made possible the production of this high-frequency sound on a practical basis. Prior to 1935, the subject was generally referred to as supersonics, but confusion arose because of the use of the adjective supersonic to refer to fluid-flow velocity exceeding the velocity of sound. Since the above date, the term ultrasonic for high-frequency sound has become well established. In the late 1950s the maximum practically attainable ultrasonic frequency was about 10^9 cycles or 1,000 mc., corresponding to a wave length in air of about 3.4×10^{-5} cm. and in water 1.5×10^{-4} cm. In 1959, ultrasonic radiation of frequency 10,000 mc. was produced at the General Electric Research laboratory, though not in usable form. These small wave lengths and high frequencies lead to interesting characteristic effects on matter traversed by the ultrasound, particularly when the intensity is high. Prominent among these are cavitation phenomena in liquids or the appearance of bubbles in the path of the sound beam with associated light production and chemical action; the production of emulsions of immiscible liquids; the coagulation of aerosols and numerous others.

Because of their short wave length, ultrasonic waves travel in much sharper beams and can form sharper shadows than audible or low-frequency sound waves. Hence they can be used to detect solid obstacles present in liquids or gases. By appropriate devices such beams can be focused in small regions and produce considerable local heating as well as very large and rapid changes in density. This makes ultrasonic radiation very useful in studying living organisms and suggests its value in medical therapy. These and other uses of ultrasonics are discussed in detail below.

Sources and Detectors of Ultrasonic Radiation.—The standard ultrasonic sources are piezoelectric and magnetostrictive oscillators (see SOUND: *Electroacoustic Sources*). Both of these are electroacoustic devices whose flexibility depends on the possibility of designing oscillating electrical circuits to almost any frequency and power specification (see E. G. Richardson, *Technical Aspects of Sound,* vol. ii, ch. 2 [1957]).

Quartz and Rochelle salt are satisfactory and widely used piezoelectric crystals for ultrasonic transducers. During and after World War II, the search for other piezoelectric materials led to the employment of ammonium dihydrogen phosphate (ADP), ethylene diamine tartrate (EDT) and dipotassium tartrate (DKT). A particular advantage of ADP is that it is piezoelectrically more sensitive than quartz and at the same time more rugged than Rochelle salt, since it has no water of crystallization. These materials, however, were generally displaced after 1950 by the polycrystalline ceramic barium titanate which after having been polarized by the application of a static potential difference will vibrate mechanically on application of the usual alternating voltage. This substance is called a ferroelectric since it possesses electrical properties (dielectric constant, etc.) analogous to the magnetic properties of ferromagnetic materials (*see* MAGNETISM). A practical advantage of barium titanate is that it can be molded into practically any shape required. For example, to concentrate ultrasound in a small region a spherically shaped cup of the material may be used as a transducer. The Curie temperature of barium titanate, *i.e.,* the temperature above which the material ceases to show its equivalent piezoelectric or electrostrictive effect, is 120° C. (as compared with about 575° C. for quartz). The addition of small amounts of lead and calcium titanate raises the Curie point somewhat. Lead zirconate-titanate ceramics were introduced in the mid-1950s and because of their much higher Curie temperatures gave promise of widespread transducer use.

As equation III. 11–1 of the article on SOUND indicates, the production of high ultrasonic frequencies demands very thin plates of piezoelectric materials, as long as the fundamental resonance frequency is employed. Higher harmonics can be used to produce much higher frequencies from crystals of manageable thickness. Thus a quartz crystal of thickness 1.1 mm. corresponding to a fundamental frequency of 3 mc. can be driven at its 100th harmonic to produce radiation of 300 mc. Very thin crystals, however, are difficult to prepare with absolutely uniform thickness. One of the unsolved problems of acoustics in the late 1950s was to find a convenient way of producing usable ultrasonic radiation of high intensity and at arbitrarily high frequency, *e.g.,* up to 10,000 mc. The upper practical limit at that time was about 1,000 mc.

Magnetostrictive oscillators are discussed in SOUND: *Practical Sound Sources,* as are the siren and the Hartmann oscillator, which are other powerful sources of ultrasonic radiation.

Any reversible source of sound like a piezoelectric or magnetostrictive transducer can be used equally well as a receiver or detector. In the early stages of development the ceramic type (*e.g.,* barium titanate) molded in the shape of a cylinder was the most popular detector for nondirectional reception. Another method of detection, useful in optically transparent media, is based on the Debye-Sears effect: a progressive ultrasonic wave in such a medium with its associated density changes constitutes a diffraction grating for a beam of light directed at right angles to the direction of sound propagation. The theory of this effect connects the spacing in the optical diffraction bands with the "spacing" in the acoustic grating, *i.e.,* the sound wave length, and hence permits the evaluation of the ultrasonic velocity from a measurement of the band spacing and the sound frequency. An estimate of the sound intensity can also be read from the diffraction pattern and hence the method can be used to measure ultrasonic absorption. The accuracy, however, is not high. This optical diffraction technique works because the wave length of the ultrasonic radiation is so short, *e.g.,* 1.5 mm. for 1 mc. radiation in water, and the velocity of light is so much greater than that of sound.

Special Properties of Ultrasonic Radiation. — By focusing ultrasonic radiation on a small space by the use of a curved radiator, very high intensity can be achieved (*e.g.,* up to 5,000 w. per square centimetre). Striking physical phenomena are associated with such radiation. Thus when an intense ultrasonic beam is directed from below at the free surface of a liquid like transformer oil, the radiation pressure produces a fountain which can rise several centimetres from the surface. If a beaker containing a small amount of a volatile liquid like benzene is held partly immersed in an oil bath so as to be irradiated by an intense beam of ultrasound, the liquid is rapidly volatilized and the beaker fills with fog. This is attributed to the rapid formation in the liquid of vast numbers of bubbles, a phenomenon known as cavitation. This can also be produced by nonacoustical means as, for example, in the whirling of a ship propeller in water. In the latter case, the production of bubbles is due to the fact that the water in contact with the rapidly moving blade is unable in its flow to follow the blade; hence the pressure falls to or below the vapour pressure of the liquid and bubbles of vapour are formed. Their collapse produces violently destructive forces in the neighbourhood of solid surfaces.

Ultrasonic cavitation is of two kinds: (1) If the irradiated liquid contains dissolved air or other gases, the large and rapid changes in pressure produced by the sound cause the gas to come out of solution; this is called pseudocavitation; (2) If the liquid is completely degassed, bubbles can still be formed if the pressure change is great enough to overcome the tensile strength of the liquid. The latter is termed genuine cavitation. The excess acoustic pressure amplitude necessary to produce it (the so-called cavitation threshold) increases with the viscosity of the liquid. It ranges from about 1.5 atm. for liquids of very low viscosity like carbon tetrachloride to about 4 atm. for very viscous liquids like castor oil. The threshold also increases as the frequency increases. Thus in water at 15 kc. the threshold is about 1 atm. At 0.5 mc. it is 15 to 20 atm.

The inception of cavitation depends on the presence of nuclei on which the bubbles can form. The precise nature of these nuclei was not clear. One theory supposed that they are very small solid particles of foreign matter to which the dissolved gas may adhere. Another view assumed that the nuclei are genuine gas bubbles too small to be seen and whose persistence in the unagitated liquid despite surface tension is due to the protection of a monomolecular organic layer or skin. This theory checked well with the existence of a cavitation intensity threshold, since it will obviously take a certain radiation intensity to break the skin so that the gas may diffuse into the bubble and cause it to grow.

Ultrasonically produced cavitation leads to interesting effects in liquids. At acoustical intensities near the cavitation threshold, the bubbles tend to collect at the pressure nodes of a standing wave pattern and hence can be used to determine the wave length and velocity of the radiation. At high powers cavitation can bring about the complete mixing of otherwise immiscible liquids, such as water and oil, into a rather stable emulsion. Emulsions of mercury in water can also be produced by intense ultrasound, but because of the high density of mercury this result is not achieved by means of cavitation. Rather, the ultrasound is thought to force the water into the mercury with the formation of water droplets coated with thin layers of mercury. The mechanism whereby ultrasonic cavitation produces emulsification was not wholly understood at mid-20th century but was believed to be connected with the large forces released in the collapse of the bubbles. Another explanation advanced is the hydrodynamic streaming produced near cavitation bubbles by the acoustic radiation. This may, for example, have much to do with the biological action of ultrasonics in liquids; *e.g.,* its effects on living cells.

Emulsions of solid particles in liquids can be formed by the ultrasonic bombardment of a piece of the solid (*e.g.,* lead or silver) while immersed. This would appear to be due to the straightforward destructive action of cavitation in the liquid on the immersed solid.

Certain liquids become luminescent when irradiated by ultrasound, the intensity of the light being approximately proportional to the product of the viscosity and the electric dipole moment. Some thought that enough electric charge may be produced by friction between the cavities and the surrounding liquid to build up the electrostatic potential necessary for a discharge. On the other hand. it was believed that chemical action might be involved. It is a fact that in the collapse of a cavitation bubble very high local temperatures are produced (*e.g.,* of the order of 10,000° C.) and these may be sufficient to cause ionization of the contained gas with resultant emission of radiation. This ties in well with the observation that certain types of chemical reactions are promoted by ultrasonic radiation. Thus in water containing dissolved oxygen, hydrogen peroxide is formed; free chlorine is produced in the reaction of water with carbon tetrachloride in the presence of dissolved gases. These reactions appear to be best explained as gas phase reactions in the cavitation bubbles. Oxidation processes in general are stimulated by ultrasonic radiation. The accelerated aging of wine and distilled liquors is a practical application.

An important ultrasonic effect not associated with cavitation is the coagulation of aerosols like smoke and mist. The small particles, in following the vibrations set up in the medium, collide more frequently and tend to stick together, producing larger particles which gradually clear the field. This has an important industrial application to precipitation.

The heat effect of ultrasound can be very considerable; particularly when intense radiation is focused on a small region. Thus C. H. Allen and J. Rudnick, by irradiating 2 cm.^{3} of wax for 10 sec. with radiation of frequency 250 kc., observed a rise in temperature of 44" C. Experiments with the ultrasonic siren have shown that when the hand is held in a high intensity beam, a decided feeling of warmth is felt between the fingers. Heat resulting from an intensity of from 1 to 3 w. per square centimetre at 20 kc. is sufficient to kill small animals.

Other properties of ultrasound are discussed below under *Applications of Ultrasonics.*

APPLICATIONS OF ULTRASONICS

Technical and Industrial Applications. — The properties of ultrasound mentioned above have led to numerous important industrial and other technical applications, some of which have already been suggested. One interesting case is that of the ultrasonic delay line. If one has an electrical signal in the form of a pulse which one wishes to use for a certain purpose, but only after an appropriate time interval, it may be transformed into an equivalent ultrasonic pulse, fed into a suitable solid rod (preferably, of course, one with a low attenuation coefficient such as fused quartz) and allowed to travel back and forth until its presence is desired, when it is picked up and transformed back into an electrical signal. Since the velocity in the rod is accurately known, any desired time delay can be precisely provided. Liquid delay lines, *e.g.,* mercury in which the attenuation is relatively low, are also feasible. These delay lines have proved useful in radar installations as well as in high-speed electronic computers.

Since sound of sufficiently high frequency can be made to travel in a beam with little spreading, such a beam can explore a material medium and detect nonhomogeneities in it by reflection. This is the principle of the ultrasonic reflectoscope, invented by F. A. Firestone, in which an ultrasonic beam or pulse penetrating a metal, for example, produces an echo when it strikes a flaw which has different acoustical properties from the surrounding material. This echo can be detected by the same transducer which emits the original pulse. This device is the basis of the important industrial technique of nondestructive testing of metals and other solid bodies. It is important to note that electromagnetic radiation is not suitable for this purpose in conductors since it is so readily absorbed by them.

Another important industrial application of ultrasonics is the machining of very hard materials. If an abrasive paste is inserted between an ultrasonic vibrator and a brittle material, the latter is worn away rapidly as the paste and vibrator tip penetrate it. Effectively one has an ultrasonic drill, which since it does not rotate can produce holes of any shape.

Ultrasonic radiation in liquids can be used for cleaning metal parts (*e.g.*, the teeth in cutting tools) by removing all traces of foreign matter adhering to the metal in otherwise inaccessible places. It is found that frequency of the order one megacycle is desirable. The action has been attributed to cavitation, but the acoustic streaming mentioned above as well as the large accelerations due to the high-frequency vibrations at the liquid-solid interface may also play important roles. In the 1950s research was under way in the textile industry to determine whether ultrasonic radiation of synthetic fibres would lead to more efficient taking up of dyestuffs.

The soldering of aluminum by tin is made more efficient by an ultrasonic soldering iron which by removing the oxide scale from the aluminum produces a better bond without the need for fluxes.

In the production of alloys, it is found that ultrasonic irradiation of metal melts produces much finer and more uniform texture. The ability of high-frequency sound to disperse large pieces of metal into very small ones is back of this action, which has great metallurgical possibilities. Similar techniques have been employed in glass manufacture to degas melts.

The chemical effects of ultrasonics, already mentioned, have been put to extensive practical use. One of these is the depolymerization of high polymers. For example, when a solution of polystyrene in toluene was irradiated with 284 kc. ultrasound with an intensity of about 5 w. per square centimetre, the molecular weight of the long-chain molecule was reduced from 100,000 to 50,000 in 30 minutes. The exact mechanism was still a subject of controversy in the late 1950s. Another related effect is the action of ultrasound in thixotropic gels. Such a substance is a gel (*i.e.*, a colloidally dispersed system normally in solid form) which when agitated turns to a liquid and then returns to its solid state when the agitation ceases. It is found that ultrasonic radiation serves the same purpose as ordinary mechanical agitation in the gel-sol transition.

Biological Effect and Applications.—Through its direct heating action, through cavitation and related action and through direct mechanical action connected with the large accelerations and rapid changes in excess pressure and tension, it would be expected that ultrasound would prove a useful biological tool. By the mid-1950s, this expectation had been fully realized though fully accepted explanations of many of the observed actions were not at hand.

Bacteria and other microorganisms may be destroyed by ultrasonic radiation of sufficient intensity. Actually if the intensity is low, growth is stimulated. At a certain threshold, usually lower for large organisms than for small, destruction sets in and proceeds logarithmically with the time. This suggests the action of cavitation when the organisms are in a liquid environment. However, ultrasound is also lethal for some organisms in air, where cavitation cannot operate.

Ultrasound of frequency 1 mc. and intensity about 4 w. per square centimetre produces obvious necrosis of living animal tissue (*e.g.*, the tail of a mouse) if continued long enough; *i.e.*, around 30 minutes. Experiments indicate that this damage is due almost entirely to the heating effect produced in the absorption of the ultrasound by the tissues. Other investigations deal with the action of high-frequency sound on nerve tissue; *e.g.*, part of the spinal chord of a frog. It is found that with one megacycle radiation, irreversible paralysis of the hind legs takes place in a time which is inversely proportional to the excess pressure amplitude of the radiation. W. J. Fry, who made these studies up to intensities as high as 1,000 w. per square centimetre, concludes that the effect can be attributed neither to local heating of the nerve cells by the sound nor to cavitation. Whether the ultrasound produces its action by the physical disruption of the giant macromolecules in the cell because of the enormous forces it involves or whether some more subtle influence on nerve cells is at work was not clear in the late 1950s

The ability to focus very intense ultrasound in a small space without disturbing the surrounding tissue makes it a very plausible tool in neurosurgery. The full exploitation of this had not been realized in the late 1950s. However, its use in medical diagnosis had already proved successful and the development of equipment for the detection of nonhomogeneities in the macrostructure of soft tissues was under way. Here it was expected to be successful in areas for which X-rays are. completely inadequate. Also envisaged was the development of an ultrasonic microscope for the study of the actual structural distribution of proteins in living cells.

Ultrasonics has been employed extensively in medical therapy since 1939 and many types of applicators have been developed for irradiating different parts of the body. Clinical success has been claimed in many cases of arthritis, muscular rheumatism and sciatica. The precise therapeutic mechanism remained in doubt in the late 1950s, but most authorities leaned toward the view that it is due to selective heating in the interfaces between tissues of different physical properties. There were indications that more purely bioacoustical studies were needed. By mid-20th century, this had become a growing co-operative activity of biologists and physicists.

ULVERSTON, a market town and urban district in the Morecambe and Lonsdale parliamentary division, in the Furness district of Lancashire, just south of the Lake district, Eng., 9 mi. N.E. of Barrow-in-Furness and 37 mi. N.W. of Lancaster by road. Pop. (1951) 10,076. Area 5 sq.mi. Ulverston occurs in Domesday Book, where Vlureston is named as a manor. Early in the 12th century the manor passed to Stephen, count of Boulogne, who gave it to Furness abbey. In 1196 the abbot granted the vill of Ulverstone with the inhabitants to Gilbert Fitz-Reinfred, who granted it a charter and made it a free borough. The lordship became divided. One part passed to the Harringtons and finally to Henry Grey, duke of Suffolk, on whose attainder in 1553 it was forfeited to the crown; the other, returned to the abbey at the Dissolution, was surrendered to the crown. Early in the 17th century the crown alienated the manor, which descended to the family of Buccleuch. In 1280 Roger de Lancaster obtained a charter from Edward I for a weekly market and an annual fair. The council maintains the markets and the fairs are still held annually at Whitsuntide and Martinmas. The Church of St. Mary, founded in 1111, retains the original (Transitional) south door, but is mainly Perpendicular in style with an altar-tomb of 1588. Swarthmoor hall, former home of George Fox and a centre of the Quaker movement, is in the care of the Society of Friends. The lighthouse monument on Hoad hill is to the memory of Sir John Barrow, the explorer, author and secretary to the admiralty, who was born in the parish. Conishead priory, 2 mi. S.E., a mansion on the site of a priory founded in the reign of Henry II, is a convalescent home for mineworkers. Ulverston's former iron and steel works and the chemical and paper works have disappeared and the principal industries now include the manufacture of antibiotics, electrical accessories, leather tanning, light engineering and clothing.

ULYSSES: *see* ODYSSEUS.

UMBELLIFERAE (carrot or parsley family). a diverse family of herbs recognized since the time of Theophrastus (3rd century B.C.). The 2,500 species world-wide in distribution, primarily in temperate areas, include both familiar food plants and poisonous species. Important foods are the carrot (Daucus), celery (*Apium*), parsley (Petroselinum) and parsnip (*Pastinaca*) Cryptotaenia, Lomatium and other genera have been used locally as foods. Arracacha (Arracacia) is cultivated in northern Andean South America for its edible roots, which resemble parsnip in size. form, texture, colour and odour. They have a high starch content and serve as a substitute for potato. Propagation of arracacha is by offsets from the rootstock planted in well-fertilized and mulched soil; harvesting is from 10 to 14 months after planting. The varieties cultivated require the uniform day length of the tropical latitudes. but the best-quality roots are produced in the mountains with optimal growing temperatures of 15°–20° C.

Condiments belonging to the Umbelliferae are anise (*Pimpinella*), caraway (Carum), chervil (Anthriscus). dill (Anethum), fennel (Foeniculum), lovage (*Levisticum*) and angelica (Angelica). Gum resins are obtained from Ferula (galbanum, ammoniacum and asafetida) and *Dorema* (ammoniacum). Some genera have been used medicinally (*Ammi, Coriandrum, Ferula, Foeniculum*). Other genera possess poisonous alkaloids, especially in the

ROCHE

Sweet cicely (Myrrhis) showing flowers, fruit and leaves

roots and fruits, and may cause death if eaten (water hemlock or Cicuta, poison hemlock or Conium and fool's-parsley or Aethusa). A few have been grown as ornamentals—Queen Anne's lace (*Ammi*), blue lace flower (*Trachymene*), cow parsnip (*Heracleum*), sea holly (Eryngzum). angelica (Angelica) and goat weed (Aethusa). Two genera, Laretiu and Azorella, form large woody mounds, "vegetable sheep." used as a fuel in the Andes.

The family is closely related to the Araliaceae (ginseng family) and probably derived from the same stock. The Cmbelliferae differ in being predominantly herbaceous with sheathing petioles or leafstalks, and with a dry fruit, the schizocarp, that splits at maturity into two dry segments. The two families are placed in the order Umbellales to which some authors also refer the Cornaceae (dogwood family) and Nyssaceae (nyssa family).

The plants are annual or perennial aromatic herbs, rarely woody (Astericium, Azorella, *Bupleurum, Gymnophyton*, Laretiu, Trachymene, etc.) or treelike (*Myrrhidendron* and some species of Eryngium). They are dicotyledonous, bearing two seed leaves. The stems are commonly ribbed and hollow between the nodes. The leaves are alternate, or basal, or rarely opposite, usually much divided and incised and aith sheathing petioles. Species of *Eryngium* and Aciphylla have monocotyledonoid leaves resembling those of the bromelia family (Bromeliaceae). The flowers are small, regular, usually white, yellow or purplish. with separate petals arranged in simple or compound umbels that may be flat-topped, globose or somewhat concave. The umbels and umbellets are frequently subtended by bracts and bractlets. The umbel may be spreading with the outer flowers radiant as in *Ammi* and Heracleum, capitate as in Eryngium, or rarely reduced to a single flower (*Asciadium*). The flowers are mostly bisexual but are sometimes unisexual with occasionally entire umhellets being male or staminate. Both staminate and perfect flowers (with both stamens and pistils) may occur in the same cluster; or the flowers may be monoecious, bearing stamens and pistils on separate flowers (Echinophora) ; or unisexual or dioecious (as in Arctopus). Cross-pollination is general and the umbels are visited by a variety of beetles and small flies. The calyx lobes or outer floral leaves are small or absent The five free petals, each usually with an inflexed tip, alternate with five stamens inserted on a nectar-secreting disk. The pistil is composed of two united carpels and the inferior ovary is two-celled. Each cell contains one ovule. The tno styles are often swollen at the base. The fruit is a schizocarp, *i.e.*, composed of two dry segments that usually separate at maturity and are suspended from the apex of a carpophore, or part of the floral axis. The fruit characters are very diverse and have been used extensively in the classification of the family. The segments are united by their faces and may be flattened laterally (at right angles to the face) as in Carum and Apium, dorsally (parallel to the face) as in Lomatium and Peucedanum, or may be almost terete, circular in transverse section, as in Foeniculum. Each segment has five primary ribs which may be inconspicuous or may be developed into broad thin or corky wings. Oil tubes are usually evident in the intervals between the ribs and on the face and may occur in the ribs. Recorded haploid chromosome numbers are 5,6,7,8,9,10 and 11. Polyploidic and aneuploidic variations in chromosome numbers occur.

Three subfamilies are recognized: the Hydrocotyloideae with 270 species widely distributed particularly in the southern hemisphere (Azorella, *Bowlesia*, Centella, Hydrocotyle, Trachymene); the Saniculoideae with 260 species primarily in the northern hemisphere but with a few bipolar genera (Eryngium, Sanicula); and the Apioideae (1950 species) likewise best developed in the northern hemisphere but with a few bipolar or southern hemisphere genera. The Apioideae include many of the common genera such as Angelica, Apium (celery), Arracacia, *Bupleurum*, Carum (caraway), Cicuta (water hemlock), *Conium* (poison hemlock), *Cymopterus*, Daucus (carrot), Ferula (asafetida, galbanum), Heracleum (cow parsnip), *Ligusticum*, Lomatium, Oenanthe, Oreomyrrhis, *Osmorhiza*, Pimpinella (anise), Peucedanum, Prionosciadium, Seseli, *Sium, Smyrnium* (alexanders) and Tauschia.

See also Alexanders; Anise; Ammoniacum; Carrot; Celery; Water Hemlock and other articles on individual plants mentioned. (Md. E. M)

UMBRELLA, an accessory of dress, is a covering carried in the hand to ward off the rain. The original purpose of the umbrella was that of a sunshade and as such it is traced back to ancient Egypt and Nineveh uhere it early became a symbol of honour and authority. Ancient Egyptian art depicts the Pharaoh enthroned beneath an umbrella.

From the far east also come many interesting accounts and legends of the umbrella. There its use was permitted only to royalty and those of high office.

The Greeks are credited with introducing the umbrella as a sunshade into Europe. Paintings on Greek vases suggest that it was in common use. Roman sunshades were similar to those used by the Greeks. It is believed, however, that the Romans were the first to use the umbrella as a protection against rain.

The use of the umbrella almost disappeared during the middle ages but it appeared again in Italy in the latter half of the 16th century when it was regarded as a symbol of distinction and power by the pope and the clergy. By 1680 the umbrella appeared in France and later in England. The use of the umbrella was general in Italy, France. Britain, Germany and the Setherlands by the 18th century, by which time it was generally employed as protection against the rain. The general construction of umbrellas has changed little through the centuries; however, with the introduction of the steel frame in 1850, the weight was reduced considerably.

Though the umbrella, especially the handle, varied in style with the changes of fashion, it was generally black in colour. In the 20th century women's umbrellas were produced in a variety of colours though men's umbrellas continued to be black.

See Katherine Morris Lester and Bess Viola Oerke, Accessories of Dress (Peoria, Ill., 1940); Carolyn G. Bradley, Western World Costume (New York, 1954); Millia Davenport, *The* Book of Costume (New York, 1948; London, 1951). (M. B. K.)

UMBRELLA BIRD, the name for a species of the genus *Cephalopterus,* belonging to the American family Cotingidae. The males are black and bear a peculiar umbrellalike crest from which characteristic the name is derived. They also have long, plumed wattles depending from the throat.

UMBRELLA MAGNOLIA or UMBRELLA TREE, common names applied to *Magnolia* tripetala, a deciduous tree of the U.S. with spreading branches and an open head that grows to 40 ft. and bears pointed, oblong to broadly oval leaves one to two feet long that are pale green and are soft-hairy beneath. The flowers are cup shaped, white, ten inches across, pungently scented and appear when the leaves are well developed. It is native from Pennsylvania to Alabama and Arkansas.

See MAGNOLIA. (J. M. BL.)

UMBRELLA MAGNOLIA (MAGNOLIA TRIPETALA)

UMBRIA, an ancient and a modern district of Italy.

1. The ancient district was bounded in the period of the Roman supremacy by the Ager Gallicus (in a line with Ravenna) on the north, by Etruria (the Tiber) on the west, by the Sabine territory on the south and by Picenum on the east. The Via Flaminia passed up through it from Ocriculum to Ariminum; along it lay the important towns of Narnia (Narni), Carsulae, Mevania (Bevagna), Forum Flaminii, Nuceria Camellaria (Nocera) and Forum Sempronii; and on the Adriatic coast Fanum Fortunae (Fano) and Pisaurum (Pesaro). To the east lay Interamna (Terni), Spoletium (Spoleto), Fulginium (Foligno—on a branch of the Via Flaminia nhich left the main road at Narnia and rejoined it at Forum Flaminii) and the important town of Camerinum on the side of the Apennines toward Picenum. On the side toward Etruria lay Ameria (Amelia) and Tuder (Todi), both on the direct road from Rome to Perusia, Iguvium. which occupied a very advantageous position close to the main pass through the Apennines, and Hispellum (Spello). Not far off was Asisium (Assisi), while far to the north in the mountains lay Sarsina. Under the empire it formed the sixth region of Italy.

The name Umbria is derived from the Umbri, one of the chief constituent stocks of the Italian nation. The origin and ethnic affinities of the Umbrians are still. like their geographical location in early times (1200–1000 B.C.), unknown, but their language proves them to have been an Aryan people closely allied with the Oscans and in a remoter degree with the Latins.

The process by which the Umbrians were deprived of their traditional predominance in upper and central Italy and restricted to their confines of historic times cannot be traced in detail. Their easternmost territory in the region of Ancona was perhaps wrested from them by the Picenes, a branch of the Sabine stock; and it is probable that they were partly displaced in the valley of the Po by the Gaulish tribes which began to pour across the Alps from about 500 B.C. But their chief enemies were undoubtedly the Etruscans (*q.v.*), who eventually drove them into that upland tract athwart the Apennines to which the name of Umbria belonged in historical times without eradicating the Umbrian element of population in the conquered districts. In Etruria proper the persistence of the Umbrian stock is indicated by the survival of numerous Umbrian place names, and by the record of Umbrian soldiers taking part in Etruscan enterprises; *e.g.,* the attack on Cumae in 524 B.C. Indeed it is not unlikely that the bulk of the population in Etruria continued to be of Umbrian origin. and that the Romanization of this country was facilitated by the partial absorption of the Etruscan conquerors into the Umbrian multitude.

Against the Romans the Umbrians never fought any wars of importance. After the downfall of the Etruscan power they made a belated attempt to aid their Samnite kinsmen in their decisive struggle against Rome (308 B.C.); but their communications with Samnium were impeded by the foundation of a Roman fortress at Narnia (298 B.C.), and at the great battle of Sentinum (295 B.C.), which was fought in their own territory, the Umbrians did not lend the Samnites any substantial help. It is perhaps on account of this defection that in zoo B.C. they received from the Romans a portion of the Ager Gallicus reconquered from the Senonian Gauls. They offered no opposition to the construction of the Via Flaminia through the heart of their country, and in the second Punic War withheld all assistance from Hannibal. In the Social War (90–89 B.C.), they joined the rebels tardily and were among the first to make their peace with Rome. Henceforth they no longer played an-independent part in Italian history.

The material prosperity of Umbria. in spite of its unfavourable position for commercial intercourse, was relatively great, as a result of the fertility of the numerous small valleys which intersect the Apennine system in this region. The chief products of the soil were olives, vines and spelt; the uplands harboured the choicest boars of Italy. The abundance of inscriptions and the high proportion of recruits furnished to the army attest its continued populousness. Among its most famous natives were the poets Plautus (b. at Sarsina) and Propertius (b. at Assisi).

The Umbrians in addition to the city (tofu) had a larger territorial division in the *tribus* (triju, acc.) as is gathered from Livy (xxxi, 2). Ancient authors describe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemies in their habits. There is conclusive proof of strong Etruscan influences in Umbria, and their alphabet is undoubtedly of Chalcid-Etruscan origin, while the language, which is known from one or two inscriptions from Fulginium and Tuder, and from the so-called *Iguvine* Tables, the earliest parts of which may go back to the 5th cent. B.C. (see IGUVIUM), is a dialect which sprang from the Oscan, but is marked by some phonetic changes. Etruria also taught the towns near it (*e.g.,* Tuder and Iguvium) the art of minting, for they alone had a coinage. The Umbrians counted their day from noon to noon. But whether they borrowed this likewise from the Etruscans is not known. In their measuring of land they employed the *vorsus,* a measure common to them and the Oscans, 33 of which went to the Roman jugerum.

2. The modern territorial division is situated in the middle of the peninsula, between Tuscany and the Marches on the north and east, and Lazio (Latium) and the Abruzzi on the south and west, and comprising the two provinces of Perugia and Terni, with an area of 3,267 sq.mi.; pop. (1951) 803,918. Umbria and the provinces of Ancona and Pesaro and Urbino taken together form an area slightly more extensive than that of the sixth region of Augustus. The surface is mountainous, but affords good pasture, and there are numerous fertile valleys. Many treasures of

art and architecture are preserved, making Umbria one of the most interesting regions of Italy. *(See* PERUGIA.) Modern Umbria formed down to 1860 a part of the states of the church.

Three main lines of railway run through the territory. One from Florence to Rome skirts th'e borders of the province on the west, running north and south. Another Rome-Florence line bisects the territory north and south, while the Rome-Ancona runs across the province from northeast to southwest. The cross communication is given by three branch lines.

The steelworks of Terni (*q.v.*), the chloride factory at Nera Montoro near Narni, the chemical manure works at Narni. Foligno and Assisi, the wool and jute works of Terni and Foligno, the cotton spinnery of Spoleto may all be mentioned, while the hydroelectric plants of Umbria, which are concentrated at Terni, are of great importance, and help those of Lazio and Tuscany. (T. A.)

UMBRIAN LANGUAGE. The dialect in which the *Iguvine Tables (see* IGUVIUM) are written is usually known as Umbrian, as it is the only monument we possess of any length of the tongue spoken in the Umbrian district before it was Latinized. The language is that of a certain limited area, which cannot yet be shown to have extended very far beyond the eastern half of the Tiber valley (from Interamna Nahartium to Urvinum Mataurense).

Umbrian has diverged from Oscan in the following matters: (1) The palatalization of k and *g* before a following *i* or *e*, or consonant *i* as in *tiçit* (i.e., *diçit*) = Lat. *decet; muieto* past part. passive (pronounced as though the *i* were an English or French *j)* beside Umb. imperative *mugatu*, Lat. *mugire.* (2) The loss of final *-d, e.g.,* in the alb. sing. fem. Umb. *tōtā* = Osc. *toutād.* (3) The change of *d* between vowels to a sound akin to *r,* written by a special symbol ꟼ (*ḍ*) in Umbrian alphabet and by RS in Latin alphabet, e.g., *teda,* in Umbrian alphabet = *dirsa* in Latin alphabet, "let him give," exactly equivalent to Paelignian *dida.* (4) The change of *-s-* to *-r-* between vowels as in *erom,* "esse" = Osc. *ezum,* and the gen. plur. fem. ending in *-aru* = Lat. *-arum,* Osc. *-azum.* To this there are exceptions, *e.g., asa* = Lat. *ara,* which are generally regarded as mere archaisms. Unfortunately the majority of them are in words of whose origin and meaning very little is known, so that (for all we can tell) in many the *-s-* may represent *-ss-* or *-ps-* as in *osatu* = Lat. *operato, cf.* Osc. *opsaom.* (5) The change of final *-ns* to *-f* as in the acc. plur. masc. *vitluf* = Lat. *vitulōs.* (6) In the latest stage of the dialect the change of final *-s* to *-r,* as in abl. plur. *arver, arviis; i.e.,* "arvorum frugibus." (7) The decay of all diphthongs. (8) The change of initial *1* to *v,* as in *vutu* = Lat. *lavito.*

Save for the consequences of these phonetic changes, Umbrian morphology and syntax exhibit no divergence from Oscan that need be mentioned here, save perhaps two peculiar perfect-formations with -1- and *-nçi-;* as in *ampelust,* fut. perf. "impenderit," *combifiançiust,* "nuntiaverit" (or the like).

UNAKA MOUNTAINS is the name frequently applied to the mountains in Avery and Mitchell counties in North Carolina and Unicoi and Carter counties in eastern Tennessee. The Unaka mountains are actually the southwestern segment of the Blue Ridge Mountain system. The range runs between the Great Appalachian valley (to its west) and the Blue Ridge escarpment (to its east) along the Tennessee-North Carolina boundary, and extends into southwestern Virginia and Georgia. Elevations range from 2,000 to 6,000 ft. with the main ridges averaging 5,000 ft. Included in the Unaka Mountain range are: The Great Smoky mountains with Clingmans Dome (elevation 6,644 ft.); also Iron mountains (2,500–4,000 ft.); Chilhowee (1,500–3,000 ft.); Unicoi (5,472–5,600 ft.); Stone (3,400 ft.); Brasstown Bald (4,784 ft.); and the Holston ranges (2,500–4,000 ft.). The Unakas have been severely dissected by stream erosion; in general 80% to 90% of their area consists of steep slopes and deep, narrow valleys. Extensive geological faulting and folding along their western margins also has contributed to the development of their complex topography.

Most of the Unaka system is covered by national forests, including Pisgah, Nantahala, Jefferson and Cherokee. The forests consist principally of hardwoods and abound with wildlife.

(M. C. P.)

UNAMUNO, MIGUEL DE (1864–1936), Spanish scholar and writer, and one of the most influential Spanish thinkers of his time, was born of Basque parents at Bilbao on Sept. 29, 1864. He studied the classics and philosophy at Madrid, and in 1891 became professor of Greek at Salamanca. Most of his life was spent there: he was appointed rector of the university in 1901, removed for political reasons in 1914, re-elected in 1931, made rector for life in 1934, but again removed in 1936. In 1924 he was deported to Fuerteventura, in the Canary Islands, for his attacks on the dictatorship of Gen. Primo de Rivera: thence he fled to France, where he remained until the fall of the dictatorship in 1930. An opponent of the decadent Spanish monarchy, he was an independent Republican deputy to the *Cortes,* 1931–33. On the outbreak of the civil war, he at first declared in favour of the nationalists, but later denounced both sides, and was confined to his house in Salamanca, where he died on Dec. 31, 1936.

The eldest of the "generation of 1898," Unamuno early made his influence felt. Significantly, his first literary labour was the translation of Carlyle's *The French Revolution,* in which he "did violence to Spanish" to match Carlyle's "violation of English." His first published work, essays entitled *En torno al casticismo* (1895) on the theme of Spanish anachronism and isolationism, was the earliest effective questioning of Spain's place in an industrial and scientific world. His first novel, *Paz en la guerra* (1897), based on his childhood memories of the Carlist siege of Bilbao, may be regarded as the first "existentialist" novel. It was followed by several books of essays. In 1905 appeared *Vida de Don Quijote y Sancho* (Eng. trans., *Life of Don Quixote and Sancho,* 1927), a detailed analysis of Cervantes' characters, whose intrinsic reality and immortality was, Unamuno considered, greater than that of their author. The book is also a profession of a faith in quixotism, a plea for redemption through spiritual extravagance.

At the heart of Unamuno's view of life is his personal and passionate longing for immortality, most poignantly expressed in his masterpiece *Del sentimiento trágico de la vida* (1913; Eng. trans., *The Tragic Sense of Life in Men and in Peoples,* 1921), which explores the chasm between faith and reason. In *La agonia del Cristianismo* (first published in French, 1925; in Spanish, 1931; Eng. trans., 1928) he developed his philosophy of anguish and doubt, and, although he always called himself a Catholic, these two books express such a sense of uncertainty that they were later placed on the papal index.

Deeply concerned with man as an individual, not as "a social animal," Unamuno wrote innumerable essays, which, if they have any common theme, are calls to preserve personal integrity, however paradoxical this may seem in a compromised society, to search for one's own truth, however agonizing, and to a faith in faith itself, however doubt-ridden. Himself, as he said, a "sower of doubt and agitator of consciences," Unamuno preached the need to strive against fate and to deny annihilation. In his later novels his heroes are "agonists" rather than protagonists. They live in a world of passionate problems which they have created for themselves, immune from trivialities because of their tragic attitude. *Amor y pedagogía* (1902) describes a father's attempt to bring up his son scientifically, ending in failure and the ruin of the son. *Niebla* (1914; Eng. trans., 1928) demonstrates Unamuno's belief that a character in fiction may be as real as a man in the world of reality. *Abel Sánchez* (1917; Eng. trans., 1956), is a modern version of the tragedy of Cain, which censures all the ['petty Abels" for their smugness. His last, and perhaps his greatest novel, *San Manuel Bueno, mártir* (1933; Eng. trans., 1956), the story of an unbelieving priest, takes up again the characteristic themes of the agony of unbelief and the longing for immortality.

See J. Marias, *Miguel de Unamuno* (1943); J. B. Trend, *Unamuno* (1951). *(Ay. K.)*

UNAO (correctly UNNAO), a town and district of India, in the Lucknow division, Uttar Pradesh. The town is 10 mi. N.E. of Kanpur. Pop. (1951) 25,240.

The DISTRICT OF UNNAO has an area of 1,774 sq.mi. It consists of a flat alluvial plain, lying north of the Ganges. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barren *usar,* the whole being intersected by small streams used for irrigation. The Ganges is the only navigable river in the district, while the Sai forms its northeastern boundary. Pop. (1951) 1,067,055.

UNCERTAINTY PRINCIPLE, THE. This principle, which was formulated by Werner Heisenberg (in 1927), and which plays a fundamental role in quantum mechanics (*q.v.*) states that it is impossible to specify or determine simultaneously both the position and velocity of a particle as accurately as is wished. It is, to be sure, possible to fix either of these quantities as precisely as desired, but only at a price, for the greater the precision in one, the greater the inevitable lack of deftniteness in the other. A more exact formulation is as follows: there is no way in which quantum-mechanicallanguage permits us to say that a co-ordinate x and its conjugate momentum p_x simultaneously have values x' and p'_x with arbitrarily small uncertainty. Instead, if Ax and Δp_x denote the uncertainty in x and p_x respectively, there exists the inequality

$$\Delta x \Delta p_x \geq \frac{h}{4\pi} \qquad (1)$$

where h is Planck's constant 6.62×10^{-27} ergs$\times$sec. It is to be emphasized that the restrictions imposed by the uncertainty principle apply only to a pair of dynamical variables which are canonically conjugate. There is no limit in principle to the precision with which values can be assigned to a co-ordinate and a momentum conjugate to another independent co-ordinate, as, for example, the x component of position and the y component of momentum.

Because h is so small, the indeterminism caused by the uncertainty principle is of no consequence in ordinary experience. For instance, the resulting error in the position or velocity of a rifle bullet would be completely inconsequential even for the most refined ballistic calculation. On the other hand, the Heisenberg uncertainty principle is of great interest and importance in the interpretation of atomic experiments, and has startling philosophical implications.

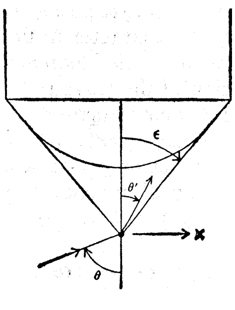
For discussion of the place of the uncertainty principle in the general scheme of things in quantum mechanics see QUANTUM MECHANICS: Statistical Significance. A quantitative definition is given there of the uncertainty in terms of root mean square deviation, as well as an outline of how the uncertainty principle is derived from the basic equations of wave mechanics, of which it is a necessary consequence.

A standard illustration of the uncertainty principle is furnished by the resolving power of a microscope, which shall be taken as an example.

Let the particle be at such a distance that the cone of rays scattered by the particle and entering the lens of the microscope have an angular opening ϵ, as shown in the figure. It is shown in optics that the resolving power of the instrument is

$$\text{Ax}= \frac{\lambda}{\text{sine } \epsilon} \qquad (2)$$

where λ is the wave length. In order for the particle to be observed it must scatter at least one quantum of light into the microscope. (If more than one quantum is scattered, the particle will receive extra recoil kicks, and the uncertainty will be even greater than with the estimate.) The theory of the Compton Effect (*q.v.*) and related subjects shows that a light quantum of frequency ν is endowed with a momentum $h\nu/c$, where c is the velocity of light. Consider for simplicity the case where the initial and scattered quanta fall in the same plane as the axis of the microscope, and make angles % %' with the latter, as shown in the figure. Since momentum is conserved in the interaction between the particle and the light quantum, the x component of momentum imparted to the particle is $(\text{sine } \theta - \text{sine } \theta')\frac{h\nu}{c}$ (Here the Compton change of frequency on scattering has been neglected, but this is a second order effect.) As θ' is comprised within the limits $\pm\epsilon$, in order to enter the microscope, the x component of momentum imparted to the particle may be anywhere between



$$(\text{sine } 0 - \text{sine } \epsilon)\frac{h\nu}{c} \text{ and } (\text{sine } \theta + \text{sine } \epsilon)\frac{h\nu}{c}$$

Hence the observation inherently introduces an uncertainty in the momentum of the particle amounting to $\Delta p_2 = 2 \text{ sine } \epsilon \cdot \frac{h\nu}{c}$. Combining this result with (1) and remembering that $\lambda = \frac{c}{\nu}$, it is seen that $\Delta p_x \Delta x = 2h$. The fact that ϵ does not appear in this result illustrates the futility of trying to defeat the uncertainty principle with any choice of aperture.

Too much significance should not be attached to the fact that the error is apparently 8 π times the minimum allowed by (1), for the estimate (2) of resolving power is accurate only to order of magnitude,

In classical mechanics, if the initial position and velocity are known, together with the forces acting, then a particle's path can be computed for all future time. On the other hand, the uncertainty principle prevents specification of the initial conditions in quantum mechanics, and as a result the future of a particle cannot be definitely predicted. Because of this the law of cause and effect ceases to apply, though the ambiguity is, of course, important only on the atomic scale. Instead the future of a particle can only be statistically predicted in quantum mechanics, but the type of information supplied is just that needed to describe actual experiments. For instance. in the theory of the scattering of alpha particles, quantum mechanics gives directly the formula for the distribution-in-angle of the scattered particles, without correlating a particular scattering angle with a particular distance of closest approach to a scattering centre. Such a correlation is involved in classical theory, but it is necessary to integrate over all distances of approach, and the latter are supernumerary quantities not capable of being observed in the experiment; hence it is unimportant that they are uncertain in the quantum-mechanical interpretation. In fact, it must be regarded as an element of strength in quantum mechanics that the statistics governing the distribution of distances of approach is self-contained in the formalism, and not introduced as an additional hypothesis as in the classical treatment.

It is to be emphasized that in making observations on a system, it is necessary to exchange energy and momentum with it. This exchange of necessity spoils the original properties of the system. The resulting lack of precision with which these properties can be measured is the crux of the uncertainty principle. In the microscope example, for instance, the momentum of the particle was rendered uncertain by the impact with the light quantum by which it was being observed.

The fact that there are intrinsic limits to the precision of experimentation obviously has profound philosophical significance. In particular, metaphysicians can argue whether nature inherently lacks determinism, or is instead completely deterministic. With the latter view, the ambiguity involved in the uncertainty principle, or the apparent breakdown of the law of cause and effect is to be considered as arising only by virtue of the "spoiling" by the experimentation.

It is in a certain sense a meaningless question which view is correct, as the properties of nature that are inherently incapable of observation have no realistic significance. In this connection it is well to quote a few sentences from an article by P. W. Bridgman in Harper's Magazine, vol. 158, pp. 443–451 (1929):

The immediate effect [of the uncertainty principle] will be to let loose a veritable intellectual spree of licentious and debauched thinking. This will come from the refusal to take at its true value the statement that it is meaningless to penetrate much deeper than the electron, and will have the thesis that there is *really* a domain beyond, only that man with his present limitations is not fitted to enter this domain. . . . The existence of such a domain will be made the basis of an orgy of rationalizing. It will be made the substance of the soul . . . the principle of vital processes will have its seat here; and it will be the medium of telepathic communication. One group will find in the failure of the physical law of cause and effect the solution of the age-old problem of the freedom of the will, and, on the other hand, the atheist will find the justification of his contention that chance rules the universe.

The safest conclusion is perhaps that man should remain humble in the face of nature since there are inherent limitations to the precision with which he can observe the latter.

See W. Heisenberg, ***The Physical Principles of the Quantum Theory*** (1930). The uncertainty principle was first formulated by Heisenberg in the ***Zeitschrift fur Physik,*** vol. 43, pp. 172–198 (1927), and somewhat amplified by Niels Bohr in ***Nature,*** vol. 121, p. 580 (1928). An interesting popular article on the philosophical implications of the uncertainty principle is that by P. W. Bridgman in ***Harper's Magazine,*** vol. 158, pp 443–451 (1929). (J. H. V. V.)

UNCLE SAM, the popular name for the United States. The origin of the name is unknown, but is not very credibly attributed to the initials U S.. placed on property of the government. It came into existence about the time of the outbreak of the War of 1812, spread rapidly and within a few years was recognized universally.

UNCONSCIOUS. Sigmund Freud. about 1885, began an era of thought by stating that ideas, feelings and memories outside consciousness may affect a person's behaviour even though he cannot report upon them. William James called this the most important step forward in the time he had been studying psychology.

Just as the activities of all units of an army are not always integrated, so all aspects of the mental processes and behaviour of an individual are not co-ordinated. Some mental systems which affect behaviour unconsciously are independent of and unrecognized by the controlling part of the personality.

Disparate and sometimes conflicting uses of "unconscious" occur in popular and scientific writings. The word has been used synonymously with "inanimate" or "subhuman" to describe whatever is incapable of discriminating or behaving. Individuals have been termed unconscious under many different circumstances —when unresponsive to stimulation because of absentmindedness, day-dreaming, hypnosis, sleep, anaesthesia, etc.; when not discriminating between different stimuli; when acting sheerly on the basis of conditioned responses (see below); when not sensing, because one or more factors are preventing adequate stimuli from affecting their nervous systems. A person may also be called unconscious if he is not attending to something; if he lacks insight into the nature of a situation involving him; if he forgets something; if his actions are purely instinctive; if he does not recognize the character of the determinants of his behaviour; if some of his acts are involuntary; if he cannot communicate all he is aware of, by word, gesture, facial expression or other means; if he deliberately ignores facts he knows; or if he makes discriminations but is unaware that he does.

The actions, ideas, emotions, needs or drives of a person are also often called unconscious in many of the above meanings, as well as in another sense—not mental. Various theoretical schools deny that unconscious processes exist, on the grounds that consciousness and mind are equivalent, that what is unconscious is therefore not mental, and that hence the concept of unconscious mental processes is self-contradictory. Freud contended that this apparent paradox arises from misunderstanding the psychoanalytic use of "unconscious," which refers to processes that (1) are dynamically repressed away from awareness, the organ of perception; (2) can be brought to awareness only by special techniques like hypnosis and psychoanalysis; and (3) are not controllable voluntarily.

The numerous uses of the word "unconscious" reflect great theoretical disagreements, and sometimes the same process is conscious in one sense and unconscious in another. For example, after a bell has been sounded routinely one minute before repeated feedings, the salivation that normally occurs upon presentation of food can eventually be elicited by the bell—a conditioned response. Psychologists who do not accept introspective reports as valid consider that behaviour indicating discrimination between the presence and absence of a stimulus is evidence of consciousness. Hence a conditioned response is such evidence—a sign, in the example, of consciousness of the bell. Other psychologists do not agree that mental processes are merely neural function evidenced by discriminatory behaviour, believing they also involve awareness of this discrimination. Some of the latter group hold that this consciousness is associated with every mental process, and since conditioned responses are often given a purely neurophysiological explanation, they are not mental—unconscious.

Various schools explain how it is determined which mental processes are conscious and which unconscious by using one or both of two concepts—the economy principle and the pleasure principle. The economy principle is that ordinarily one, or at most a few, thoughts or acts are attended to at a time. The organism appears to function most efficiently when it does not dissipate the energy of attention but concentrates this consciousness on a restricted range of activities, allowing the rest to be relatively or completely automatic. Moreover, certain activities, including composing, complex judgments and highly practised muscular acts, are often accomplished best automatically. If unattended processes develop unusual characteristics or threats to the organism's welfare, a guarding mechanism swiftly turns attentive consciousness to them. Along with this change appear expressions indicating surprise, characteristic objective signs of the onset of the new state of consciousness. Presumably this is associated with increasing "neural vigilance," a phrase of Henry Head meaning high-grade physiological efficiency in a part of the nervous system, which he postulated as developing as consciousness turns to the functions of that part.

Subjectively, various levels of unconsciousness merge imperceptibly into one another. The ordinary waking state differs from hypnosis which differs from sleep which differs from deep anaesthesia. Functional levels of the nervous system also exist, each with its own threshold. Stimuli may be strong enough to cross the threshold to one level and affect behaviour, without being capable of reaching the level of highest neural vigilance. Thus, behaviour may be affected and awareness not be. There is a range of intensity of stimulation at which perception and learning occur without awareness.

Freud described how the pleasure principle operates, thrusting painful thoughts and desires into unconsciousness and permitting pleasant ones to remain conscious. He considered painful those which produce shame, guilt or injury to self-esteem. These are repressed into unconsciousness, which psychoanalytic theory sharply delimits from consciousness, recognizing little merging. They are censored and kept from consciousness unless altered into dream symbols, slips of the tongue, jests or some other acceptable guise.

Because dreams seem distorted and for other reasons, unconscious processes are frequently called irrational. Clinical evidence indicates that one class of these is not illogical but shrewdly devoted to fulfilling socially unacceptable, anarchic desires for independence and self-centred pleasure. Other classes are not irrational either, but are determined by subthreshold stimulation, unconscious conditioning or forgotten events. They elicit unaccountable behaviour because they are not available to awareness. Society forces us to explain our acts, so we make them appear to ourselves and our fellows to arise logically from accepted principles of our culture. That this mechanism is called rationalization does not mean unconscious processes are irrational.

(Ja. G. M.)

UNDERGROUND RAILROAD, a term used popularly to designate an organized system existing in the northern states of the United States prior to the Civil War by which slaves were secretly helped by sympathetic northerners and in defiance of the Fugitive Slave laws (*q.v.*), to make their way to Canada, and thus to freedom. The name arose from the exaggerated use of railway terms in reference to the conduct of the system. Levi Coffin and Robert Purvis were the "presidents" of the road. Various routes were known as "lines," stopping places were called "stations," those who aided along the stages of the route were "conductors" and their charges were referred to as "packages" or "freight." The system reached from Kentucky and Virginia across Ohio, and from Maryland across Pennsylvania and New York or New England. The Quakers of Pennsylvania perhaps initiated the system; the best known of them, Thomas Garrett (1789–1871), is said to have helped 2,700 slaves to freedom. One of the most picturesque conductors was Harriet Tubman, a Negro woman called "General" Tubman by John Brown, and "Moses" by her fellow Negroes. who made about a score of trips into the south, bringing out with her perhaps 300 Negroes altogether. Levi Coffin, a native of North Carolina. in 1826 settled at New Garden (now Fountain City), Ohio, where his home was the meeting point of three "lines" from Kentucky. In 184; he removed to Cincinnati, where he was even more successful in bringing out slaves. Estimates of the number of slaves who reached freedom through the system vary from 40.000 to 100,000.

See W. H. Siebert, *The Underground Railroad* (1898), a scholarly study containing maps of routes and bibliography. W. Still, *The Underground Railroad* (1872); *R* C. Smedley, *History of the Underground Railroad* (1883); and *Reminiscences of Levi Coffin* (1880) are personal records of participants

UNDERWOOD, FRANCIS HENRY (1825–1894), U.S. author, one of the founders of the *Atlantic Monthly*, was born in Enfield, Mass., on Jan. 12, 1825. He attended Amherst college, Amherst, Mass., for a year and then studied law in Kentucky, being admitted to the bar in 1847. In Kentucky his original antipathy to slavery was heightened by close observation, and he eagerly returned to Massachusetts in 1850. After a year of law practice, and two years as a clerk of the state senate, he became literary editor for the Boston publishing house of Phillips, Sampson and company. He soon conceived the idea of initiating a New England magazine similar to *Harper's Magazine* in New York, in which the Free Soil movement could find a voice. He entered into correspondence on the matter with his friends, among them the most distinguished writers of the day — Emerson, Lowell, Holmes, Longfellow, Charles Eliot Norton and Whittier. By 1853 he had contracted for publication with John P. Jewett and Company. but the firm failed before a beginning was effected. With the help of Harriet Beecher Stowe he persuaded his firm to become publishers of the new magazine named the *Atlantic Monthly;* the first number appeared in Nov. 1857 with James Russell Lowell as editor and Underwood as his assistant.

In 1859, upon purchase of the magazine by Ticknor and Fields, Underwood's association with it was ended and he became clerk of the superior criminal court of Boston. a position he held for seven years. He was twice appointed U.S. consul in Scotland by Pres. Grover Cleveland, in 1886 and in 1893. He died in Edinburgh, Scot., Aug. 7, 1894.

Underwood wrote several books, of which the best known is *Quabbin, the Story of a Small Town* (1893), a novel of the Enfield of his boyhood. Other works include biographies of Longfellow, Lowell and Whittier; handbooks of English and American literature; *Cloud-Pictures* (1872), a volume of short stories; and the novels *Lord of Himself* (1874), *Man Proposes* (1885) and *Doctor Gray's Quest* (1895).

UNDERWOOD, OSCAR WILDER (1862–1929), U.S. politician, was born at Louisville, Ky.. on May 6, 1862. He studied at the University of Virginia, Charlottesville (1881–84), was admitted to the bar in 1884 and practised law thereafter in Birmingham, Ala.

From 1895 to 1915 he was a member from Alabama of the national house of representatives, and during his last two years chairman of the committee on ways and means. After the Democrats came into power in 1913 he had a large share in framing the tariff bill passed the same year. In 1914 he opposed the Panama Canal Tolls Repeal bill, but supported the resolution authorizing the president to use armed force in Mexico. He was opposed to the woman suffrage amendment to the federal constitution. holding that the question was a state issue. He also opposed the national prohibition amendment. In 1914 he was elected to the U.S. senate, and in 1920 re-elected. In 1919 he favoured the antistrike clause of the Cummins railway bill. A strong supporter of the peace treaty of Versailles, in Dec. 1919 he offered a resolution in the senate providing that the president of the senate should appoint a committee of ten senators to work out some acceptable plan for adopting the peace treaty; but this was blocked by Senator Lodge. In April 1920 he was chosen Democratic leader in the senate. He was a U.S. delegate at the Washington Conference on the Limitation of Armaments, which assembled in Nov. 1921.

At the Democratic national convention held in New York city, June 1924, Senator Underwood was an unsuccessful candidate for the presidential nomination. In 192; he was made a member of the U.S. delegation to the Pan-American congress. He published *Changing Sands of Purty Politics* (1927). He died at Woodlawn, Va., on Jan. 2j, 1929.

UNDERWRITING: *see* INSURANCE.

UNDSET, SIGRID (1882–1949), Norwegian writer and Nobel prize winner in literature. was born at Kalundborg. Den.. on May 20, 1882. After completing her studies at the Christiania Mercantile college. Mme. Undset entered a city office in 1899 and remained a clerk until 1909. She thus gained an intimate acquaintance with the empty and unenlivened existence of the girls with whom she came into contact, and used her experience in her first literary works, initiated in 1907 by *Fru Marta Oulie.* In 1912 she achieved fame by the great Christiania novel. *Jenny* (Eng. trans., 1920), remarkable for its courageous treatment of the erotic problem.

After revealing in one of her minor works (1919) the religious crisis in her mind which in 192j caused her to join the Roman Catholic Church. Mme. Undset published *Kristin Lavransdatter* (1920–22), Eng. trans.. part i. *The Bridal Wreath* (1923), part ii, *The Mistress of Husaby* (1925), part iii, *The Cross* (1930), a remarkable novel of the 14th century.

Mme. Undset's work shows psychological depth and an ability to appraise the mind and temper of bygone ages. Her work *Olav Audunsson,* a novel of the 13th century (192j), Eng. trans., *The Axe* (1928), has the same qualities. Other works are *In the Wilderness* (1929); *The Burning Bush* (1932); *The Faithful Wife* (1937); and *Men, Women, and Places,* an autobiography (1939). She was awarded the Nobel prize in 1928. She died at Lillehammer, Nor., June 10, 1949.

See J. Bing, *Sigrid Cndset* (1924).

UNDULANT FEVER: *see* BRUCELLOSIS.

UNEARNED INCREMENT, in economics, a term frequently applied to that part of the value of land which is due to the growth and development of the community using it, to the construction of buildings, roads, railways. canals, docks, harbours, upon it, or to the working of minerals beneath it. Thus a piece of land in one part of a country, although beautiful or fertile, may be worth very little, while in another part of the same country a piece of land of similar area required for a railway, or by a railway made accessible for residential purposes, may rise in value by a hundredfold or a thousandfold. The gains thus made by some landowners are so obvious and so great that the specific taxation of the unearned increment has been often proposed and in some countries carried into effect *(see* article on LAND TAXES). Among others, John Stuart Mill favoured a progressive tax on land.

Henry George's tax amounted to a proposal to absorb the whole of the surplus value *(see* SINGLE TAX).

UNEMPLOYMENT. The population of a modern industrial nation can be divided for labour market purposes into three groups: those who are actively engaged in producing economic goods and services; those who are able and willing to engage in such activities and, lacking at the moment the opportunity to do so, are looking for work; and those who are not engaged in such activities and have at the moment no intention of doing so.

The first group can be designated as the employed. using that term in its broadest sense to include not only employees receiving a wage or salary. but also all other persons producing for income or profit. The second group are the unemployed, while the third group may be designated as the nonproducers or the nonworkers. The first two groups constitute the labour force of a nation, which includes those who are actively in the labour market. The total labour force of a nation includes the armed forces as well as the civilian labour force, although for many economic analyses, the figure for the latter is used. In some countries, the numbers in the armed forces are not made known to the general public in any precise terms.

While these three groups seem quite clear and distinct as loosely defined above. in actual practice there are a good many knotty problems in defining the exact limits of each. Thus the employed are those who are engaged in some kind of economic activity for pay, income or profit. The great majority of these are readily identifiable because they are actually at work and are represented on some kind of a payroll. However there are a few areas of uncertainty which have to be taken into account when actual measurements are attempted.

For example. at any one time there may be a considerable number of employed persons on holiday or vacation with pay. It is obvious that such persons are not at the time actually working, yet they are employed, they draw income and they cannot be considered as withdrawn from the labour force entirely. In many statistical tabulations, these persons are listed as "having a job, but not at work." There are a considerable number of groups of workers in this category: the temporarily ill or disabled, employees on strike who may be picketing the establishment but not working in it, and other such groups.

Farmers and farm workers are sometimes marginal in this employed group, as during winter they may be taking care of the farm, or doing maintenance work for board and room, but without current income.

In another group which is difficult to classify are those who work without pay in a family business or on a farm, usually a wife or a child of working age. On the farm a youth may work with his father in the fields without receiving regular pay; in a small shop, the proprietor's wife may alternate in attending customers without pay. Such persons are considered to be in the employed labour force because they are engaged in selling or in producing for sale in the market.

At the other extreme, the group excluded from the labour force also contains some types which are difficult to classify. The counterpart of the unpaid family workers who are counted as employed are the housewives and other members of the family who are homemakers.

This group, mostly women, is not counted in the labour force. There is no question about the usefulness and productive worth of the homemaker's activities. If she were not doing the housework required, it \\-ould be necessary to hire a domestic servant. The difference is that the domestic servant is in the labour market working for pay, while members of a family do not ordinarily maintain strict economic relationships with each other Children often receive allowances, and the homemaker usually spends most of the chief wage earner's money, but these exchanges of funds are not governed by the bargaining which occurs in a paid job.

There are in fact many kinds of volunteer activities carried on by the so-called nonproducing members of society. In social welfare work, in community activities and in education, there are many unpaid people who work as hard and as usefully as those who work for pay. However, where there is no economic evaluation placed on the activity in the form of pay, there exists no basis for including such people in the labour market.

Between these extremes are the unemployed who constitute a small but important class of people. The usual type of unemployment is not hard to describe. The chief wage earner of a family has been working on a job, but, because of a decline in business, he loses his job and with it his income. The best solution for his problem is to find another job with an income attached to it. During the period he is out of a job, he is clearly unemployed.

However, in this group there are many marginal situations in which it is sometimes difficult to decide just what the labour force status of a person is at a particular time. One example is that of the housewife who takes a job in the canning factory during the summer months. She joins the employed labour force when she takes the job, but when the canning season is over and she returns to housework, is she unemployed or has she withdrawn from the labour force? A similar problem arises in connection with the numerous temporary workers who are employed during the Christmas shopping season but laid off in January.

When the laid-off worker is the chief wage earner of the family and actively seeks other work immediately, there is no difficulty in defining him as being unemployed. But a woman who resumes her housework and makes no effort to obtain another paid job has obviously withdrawn from the labour force. The problem is that a person's labour force status sometimes depends upon the worker's intentions. which may not be easy to discern.

Some difficult problems of classification arise in the small, one-industry town in which the plant closes down. In such cases, there may be few other employment opportunities in the district and many of the unemployed do not actively seek work since none is available locally. Under these circumstances, a common-sense definition is usually applied, and such people are considered to be truly unemployed, even though they are presently making no efforts to get jobs.

All these marginal cases are further complicated by the fact that people's activities and intentions vary widely over a period of time. In June of each year, several million high school and college students leave school for the summer and many of them seek paid jobs. In the U.S. and Canada, as well as in some other countries, such young people would be counted as unemployed when they start looking for work. On the other hand, in some countries, a new entrant into the labour force is not considered to be unemployed until he has first held a paid job and thereby demonstrated the capacity of being attached to the labour market. The result is that the unemployment trends for the summer months differ quite markedly in different countries.

There are many examples of people shifting back and forth to and from the labour force. During wartime, many millions of women enter the labour market to replace young men withdrawn for the armed forces. At the end of World War II, some of them remained in the labour force, while many others withdrew and returned to homemaking. From one season of the year to the next, large numbers of people shift their activities and enter and withdraw from the labour force at will.

Some idea of the magnitude of this shift may be obtained from figures published in 1956 in the U.S. by the bureau of the census. During the year 1955 the average civilian labour force was approximately 65,000,000 persons, but the total number who were in the labour force at one time or another during the year amounted to about 75,000,000.

As might be expected, the vast majority of these shifting workers were women. The average number of women in the U.S. labour force during 1955 was about 20,000,000, but the total number of women who were in the labour force at one time or another during the year was nearly 28,000,000. These figures demonstrate that the women of the U.S. constitute a reserve labour supply which becomes available on a short-time basis in seasonal industries, and on a long-term basis during a national emergency.

These borderline cases are cited, not to undermine the validity of labour force statistics, but to emphasize that the figures contain margins of haziness which should be taken into account when using them. The theoretical concepts of the employed, the unemployed and the nonworkers are quite clear, and the bulk of the population definitely falls into one or another of these groups.

METHODS OF MEASURING UNEMPLOYMENT

Prior to World War I, even though unemployment was becoming a growing problem in many industrial countries, there were no satisfactory statistics of unemployment. The earliest data on the subject came from trade-union reports of unemployment existing among their members. Union officials issued periodic statements on the proportion of their membership which was unemployed. Table I shows the average percentage of unemployment among the members of certain trade unions in Great Britain over the period 1881–1926.

These figures were useful, although their significance is limited. In many cases, they were undoubtedly rough approximations made by local trade-union secretaries. Furthermore, they do not give an indication as to the unemployment situations among the vast numbers of workers who were not members of .trade unions.

The first governmental approach to the problem of measurement came through statistics of employment, usually in the form of reports from business concerns that showed the number of persons on the payroll from month to month. In the U.S. certain state governments began to collect employment and payroll reports from employers immediately before and after World War I. The bureau of labour statistics in the U.S. department of labour began a systematic collection of such employment statistics in 1915. Since that time this type of reporting has been expanded and extended until it is now a common practice in many countries. These figures are useful in connection with unemployment, not as direct measures of the number of unemployed, but as indicators of the industries and communities where unemployment may be increasing because of declines in employment.

During the 1920s there were no official unemployment estimates in the U.S. In 1926, when the bureau of labour statistics was called upon to make an estimate, the bureau used the employment statistics to derive a measure of the decline in unemployment which had occurred from a previous date. This was the closest approximation that could be obtained at that time to the number of unemployed in that country.

The development o, unemployment insurance systems brought about a definite improvement in the methods of measuring unemployment. All workers protected by unemployment insurance laws were required to register at local employment exchanges or

employment offices as a condition of obtaining benefits. Thus the administration of the system brought about a full count of those unemployed workers covered by unemployment insurance. The earliest comprehensive reports of this kind were those in Great Britain, which are shown in Table II.

These figures did not constitute a completely accurate measure of total unemployment in Great Britain, but the coverage of that unemployment insurance system is so comprehensive that the statistics have served as a guide to national policy.

In the U.S. unemployment insurance did not come into existence until the depression of the 1930s. Consequently, the volume of insured unemployment in the U.S. has been known only since 1940. Table III shows the number and percentage of insured unemployed in the United States over the period 1940–55, including the unemployment in the railroad system and the ex-servicemen drawing veterans' unemployment benefits.

The insured unemployed in the U.S. do not constitute as large a proportion of the total unemployed in that country as do the total insured unemployed in Great Britain, where the unemployment insurance system covers a larger proportion of the working population. In years of downward trends in business, such as 1949 or 1954, the insured unemployed in the U.S. make up about three-quarters of the total unemployed, whereas in prosperous years the

proportion drops to as low as one-half.

Of course, these proportions hold good only during short periods of business recession. In a deep depression many of the insured unemployed exhaust their benefit rights and fall into the uninsured class. This happened in Great Britain during the 1920s. It was then considered necessary in that country to devise a system of extended benefits in order to assist the large numbers of workers who had exhausted their unemployment insurance rights before they obtained jobs.

Some efforts have been made to measure unemployment by means of the registrations at employment offices, that is, the total registrations, including those not covered by the unemployment insurance system. Canada, in addition to its other statistics of unemployment, issues a monthly figure on the number registered for work at the employment offices. In the U.S. during the 1930s some attempts were made to obtain measurements of this kind. These figures, while useful for many administrative purposes, are not wholly accurate as measures of unemployment. The insured unemployed are required to register and the count of that group can be accurately made.

However, the uninsured, if convinced that the employment offices could not help them, might fail to register at all; or, even if they do register, they might let their registration lapse while still being unemployed. Then, a moderate number of employed persons, currently dissatisfied with their jobs, register at the employment offices in the hope of obtaining better ones. This group is not unemployed.

Finally, when a registered worker gets a job, he may not report that fact to the employment office, at least in countries such as

Canada and the U.S. where workers do not carry workbooks. In Great Britain, where the unemployed person is required to deposit his workbook at the employment exchange as a condition of obtaining unemployment benefits, his taking of a job is immediately recorded administratively. However, at any one time the employment office registrations in the U.S. and Canada contain the names of a considerable number of workers who are in employment.

The most effective statistical method of measuring the unemployed is the sample population census, which is used in the U.S. and Canada, as well as in a few other countries. When a full population census is taken in a country, it is possible to obtain (on the basis of reports by the people themselves) the employment and unemployment status of the entire working population. In the U.S. the 1930 census was the first decennial census in which this question was asked. Since that time, it has become a regular feature of the population census. While decennial census figures provide useful detailed breakdowns, they become out of date as economic conditions change. Consequently, for obtaining current unemployment information some system had to be devised, which was done by establishing a measurement system based upon a small sample of the nation's population.

In the United States this type of measurement was begun in the late 1930s, primarily for the purpose of determining the number of workers needing jobs under the government's work programs. Until the spring of 1956, a sample of 21,000 families was considered large enough to provide reasonably accurate information for the country as a whole, though with limited details. At that time the sample was enlarged to 35,000 families and the number of local areas represented was increased to 330. Canada later adopted this same system of measuring unemployment. Table IV shows the unemployment figures for the U.S. and Canada based upon this method of measurement.

TABLE IV.—*Unemployment in Continental United States and in Canada, Annual Average, 1940–55*
(in 000s of persons 14 years of age and over)

The chief limitation in measuring unemployment by means of a sample census is that it is applicable primarily to large countries. The method is an expensive one, since a visit to the family by a census agent is necessary in order to obtain accurate information. If less populous countries could use proportionately small samples, the expense would not be a serious handicap, since it would be reduced proportionately. Unfortunately, such a practice is not statistically possible. A very thin sample of the total number of families in the country is quite feasible for a large nation like the U.S., but in small countries having only a fraction of the U.S. population, the sample would have to be relatively larger. The smaller the country, the larger the proportion of the population that would need to be included in the sample to obtain accurate data.

Therefore, while this method is undoubtedly the best yet devised for obtaining reasonably accurate information on the unemployment situation in a country with a large population, it is not likely to come into general use because of the comparatively high cost to small countries.

CAUSES OF UNEMPLOYMENT

Unemployment is not the result of any one factor. It arises from a wide variety of circumstances, some in the worker himself, some in the individual business concern and some in general economic conditions. However, it is possible to classify the major factors producing unemployment.

Seasonality.—One of the most obvious of the short-run factors is the seasonality of industry and agriculture. Crops are usually planted in the spring and harvested in the summer and early fall, with comparatively little farming activity during the winter months. As a result, there is a heavy seasonal demand for labour in agriculture.

In the U.S. the reports from the bureau of the census show that between the low point of employment in mid-winter and the peak of employment in summer, there is a range of about 2,500,000 workers each year. In the period 1950–55, the average farm employment in February was about 5,500,000 while the average in June was about 8,000,000.

After the season of high employment, the workers are no longer required. They are laid off, and some are considered to be unemployed and have to find other work during the off season. In many cases, however, these seasonal workers withdraw from the labour force entirely at the end of the season. Housewives returning to housework and students returning to school in September generally withdraw from the labour force when the work stops; that is, they shift from employment into nonemployment rather than to unemployment. When they attempt to join the labour force the following spring or summer, they may experience a period of genuine unemployment before they find a job for the next season.

Building and construction activities are another example of high seasonality. In the U.S. the reports of the bureau of labour statistics show that employment in contract construction varies by about 500,000 workers from the low point in midwinter to the high point in midsummer. Among the manufacturing industries there are similar examples in fruit and vegetable canning, logging and lumbering, slaughtering and meat packing and a number of others. In retail trade and in the post offices, there are sharp increases in employment during the Christmas season, with heavy layoffs immediately afterward.

Some individual firms and industries attempt to even out their seasonal variations by producing for inventory or by developing additional products to stabilize production during the year. Many workers who need year-round employment manage to shift jobs during the year. However, in spite of all the efforts which have been made, there is still a considerable amount of seasonal unemployment, even in the most prosperous years.

Industrial and Technological Change.—Unemployment may also arise from a series of factors associated with industrial shifts and economic change. One major factor is the change in consumer demand. When the motorcar became the popular form of transportation, the carriage industry declined. The demand for tractors on the farm has resulted in the growth of the agricultural implement industry, but it has reduced the need for raising draught horses and mules. The consumer demand for television sets has reduced to some extent the demand for radios, although fortunately for the manufacturers and workers concerned, these are generally produced in the same industry.

TABLE V.—*Employment in Selected Nonagricultural Industries in the United States, Annual Average 1939, 1947 and 1955*
(in 000s)

Selected industries	1939	1947	1955
Coal mining	477	505	246
Automobiles	466	776	921
Chemicals and allied products	406	694	813
Textile-mill products	1,232	1,335	1,075
Leather and leather products	383	409	382
Wholesale and retail trade	6,612	9,196	10,728

Source United States Department of Labor, *Bureau* of Labor Statistics, *Handbook of Labor Statistics* (1950); 1955 figures in *Employment and Earnings* (Feb 1956).

Table V shows for selected years the volume of employment in certain industries in the U.S. The table shows that while some industries are expanding and therefore hiring more labour, other industries may be in a long-run decline.

Geographic shifts of industry for one reason or another may leave pockets of unemployment in the declining areas, as was dramatically illustrated in the U.S. where, even in years of peak total employment during the postwar period after World War II, some local areas suffered heavy unemployment because of the decline of industries located there or the shift of some of the industries to other parts of the country.

The bureau of employment security in the U.S. department of labour officially classifies the major areas in the continental United

TABLE VI.—*Classification of Major Labour Market Areas in Continental United States According to Relative Adequacy of Labour Supply, May 1956*

Labour supply group	Number of major areas
Total, all groups	145
Group A	0
Group B	44
Group C	81
Group D	14
Group E	3
Group F	3

Note: Generally speaking, the classification groupings indicate a ratio of unemployment to total labour force in the following ranges:

Group A..... less than	1.5%
Group B.............	1.5%— 2.9%
Group C.............	3.0%— 5.9%
Group D.............	6.0%— 8.9%
Group E.............	9.0%—11.9%
Group F.............	12.0% or more

The extent of unemployment in a particular area is only one of several factors used in determining the appropriate area classification for each locality. Consideration is also given to the area's employment outlook, as reflected by local employer estimates of their manpower requirements; to the significance of essential activities; to the relationship between labour supply and demand; to the seasonal pattern of employment and unemployment fluctuations; and to several other factors.

Areas classified in categories D, E and F under this classification system are regarded as areas of substantial labour surplus or areas of substantial unemployment.

Source: United States Department of Labor, Bureau of Employment Security, *Bimonthly Summary of Labor Market Developments in Major Areas* (May 1956).

States with reference to the percentage of unemployment in each. In May 1956 there were 20 areas listed as having a substantial labour surplus. Unemployment in these areas generally represented 6% or more of the local labour force. In a few communities unemployment amounted to 12% or more. Table VI shows the classification of 145 major areas in the continental United States in May 1956.

Another related factor that causes unemployment is change in the method of production, that is, changes in technology which reduce the amount of labour required to manufacture a given product. Employers are always engaged in seeking new and cheaper methods of production; new materials, new processes, new machines. The result is the displacement of labour from certain jobs and occupations, accompanied by the creation of new jobs and occupations. Labour displacement brought about by these changes in production methods does not necessarily result in unemployment, because the workers displaced may be absorbed in the new jobs. However, some unemployment may result if the displacement is very large, or if some firms fail to keep up with the technological progress of the industry.

Unemployment resulting from technological change is only temporary, though it may last longer than seasonal unemployment. For example, in nearly all western industrial countries there has been a tremendous gain in productivity (that is, in output of product per man-hour of labour) in the half century from the early 1900s to the early 1950s. Yet, at the end of that great technological advance, most of those countries are experiencing practically full employment. Technological progress creates jobs as well as eliminating them. However, individual workers may suffer loss of jobs and earnings because of their inability to adjust to the change.

Labour Market Imbalance.— There is a continuing volume of unemployment due to a series of factors which are often characterized by such general terms as frictional, transitional, personal or even normal. However, this catchall group of causes can perhaps be best summarized as a short-term imbalance of labour demand and supply (excluding seasonal variations).

Unemployment of this type may be due to factors affecting the business concern and the demand for labour, or in workers themselves and the supply of labour. In a competitive economic system, business concerns are continually failing, while others are starting up. When a concern closes down it necessarily lays off the workers who have been employed. New or expanding firms are at the same time in the market looking for workers. Nevertheless, considerable unemployment may develop from this change-over because the new industries find it difficult to use the experience and skills of the displaced workers.

Thus the closing of a textile mill would result in the layoff of a great many women workers; a large construction project in the community would require many men workers. Unemployment in the one case could not be solved immediately by the employment created in the other.

Some of this short-term unemployment is due to actions or handicaps of the workers themselves. For example, during periods of prosperity and high employment levels there is a heavy volume of labour turnover due to quits, that is, to the voluntary job changing by the workers themselves. Workers dissatisfied with their current jobs often quit in the hope of obtaining better-paying jobs elsewhere. During this transition they may undergo varying periods of unemployment before they succeed in finding other jobs.

New entrants, that is, those previously not in the labour force, flow into the labour market almost continuously. These workers may undergo a period of unemployment before they find a satisfactory job.

A more general factor is the short-term immobility of the workers and their families. Working wives who become unemployed cannot leave their husbands and families to take a job in another community. Young workers cannot readily leave home. Health reasons may limit the kind of work an unemployed man can accept.

There is no need to elaborate further on this general point. There are many reasons why job opportunities and unemployed workers cannot be matched up quickly and completely. Among these are the factors of geography, sex, age, skill, legal restrictions, union rules and many others.

In Great Britain and Canada, efforts have been made to measure the significance of this labour market imbalance by counting the number of job vacancies which exist in all the employing business concerns. However, great caution needs to be exercised in interpreting any such figures as the jobs which are open may not at that time be suitable for the workers who are available. These job opportunities may need to be filled either by new entrants into the labour force or by a shift of workers now employed elsewhere. This shift in turn might vacate a job which could be filled by one of the unemployed.

There are many signs that this problem is growing in importance. One is the aging of the working population. In the 18th century, before the Industrial Revolution, economic change proceeded at a slow pace. Occupations remained unchanged for many decades. At the same time, life was short, and a comparatively small proportion of the labour force reached the age of 45 years or over. Thus there was a comparatively rapid turnover of the labour force, with the average worker serving perhaps 25 or 30 years at the most.

In the 1950s the situation is very different. On the industrial side, there are many new technological developments, including those which are usually summarized under the heading of automation. These developments presage exceedingly rapid changes in industrial processes and in production methods. Then also, under the improved conditions of health and medical care, the working population has a greater life expectancy.

In the U.S. the estimates of the National Office of Vital Statistics show that, as of 1950, a young man age 20 had a prospect of living until age 69, a period of nearly a half century. The bureau of labour 'statistics, using its Tables of Working Life, shows that this young worker is likely to be in the labour force until age 63, a total of 43 years. In the coming decades, if present trends continue, both the average life and the average working life are likely to increase further.

The problem is then that older workers are less flexible and adaptable to new jobs and new occupations than young workers. Thus the increasing rapidity of industrial change coupled with the gradual aging of the working population has the effect of lengthening the time required to readjust displaced workers, especially older ones, thereby enlarging to some extent the pool of unemployed.

Some institutional factors are also operating in this direction. In the period after World War II, in a number of countries and especially in the U.S. and Great Britain, there grew up a large number of private industry pension plans designed to produce retirement benefits for workers when they reached the end of their productive capacity.

These plans tend to lessen labour turnover and thereby produce steady employment for older experienced workers. However, they may also have the effect of limiting the employment opportunities of older workers who are seeking work. Some of this rigidity can be overcome by "vesting." which is the device of permitting a worker, after a certain limited period of service. to acquire pension rights and retain them even though he shifts to another firm or another industry. Also, insured pension plans can be written in terms which will not increase the employer's costs if he hires an older man instead of a younger.

Business Cycles.—Finally, the most serious cause of unemployment is the swing in general business conditions between various stages of prosperity and depression. This factor is of greater significance than all others combined. In the great depression of the 1930s, the volume of unemployment in the U.S. and Germany, both of which were highly industrialized economies which had previously enjoyed high levels of employment in the 1920s, amounted to fully one-third of the total labour force in each country. In Germany this economic disaster was a major factor in the rise of Hitler and naziism. In the U.S. it produced many far-reaching changes in social and economic policies.

The experiences of Great Britain with unemployment after World War I were the stimulus for the theoretical work of John Maynard Keynes. the economist whose theories about the causes of unemployment have profoundly influenced economic thinking since his time.

Theories of Cyclical Unemployment.—Since the Industrial Revolution, economic thinkers have been deeply concerned with the reasons for the periodic and occasional business depressions which have accompanied the development of the modern industrial system of production. Soon after the close of the Napoleonic Wars, analyses of business cycles appeared in economic literature and many theories were evolved. Some thinkers, especially the socialists, postulated that instability mas inherent in the economic system and that the only solution was the ownership of the means of production by the government. The presumption was that the government could manage industry in such a way as to prevent unemployment. Karl Marx based his confidence in the further triumphs of socialism on his belief that ever-increasing and ever-deepening business crises (depressions) would eventually bring about the collapse of the capitalistic free enterprise system. Evidence of the continued survival of this type of thinking was found in the official belief of the soviet government that the economic readjustments after World War II would produce a major business depression in the U.S. and other countries of the western world.

More orthodox economic thinkers in the 19th century attributed the depressions to the round-about system of production which is inherent in modern industry, in that the basic cause of the business cycle was the lack of co-ordination in production. A business boom is a period in which many businessmen expand capital development; a depression is a period in which the existing plant and equipment can produce all the goods that consumers are able to demand.

Other economic thinkers looked more to the money and credit problems which lie behind the processes of production. Statistical analysis of the different phases of the cycle showed that a considerable number of financial problems developed as production increased. The theory was that financial stresses eventually brought the boom to an end because prices and credit had become too far out of line with other factors in the economy.

The short but sharp depression in 1920–21 is one example of this type. In the U.S. the expansion of credit had reached the limitations established by law, and the rediscount rate in the federal reserve system was raised to 7%. The result was a swift deflation of commodity prices, stock prices, land values, etc. Much more disastrous was the world-wide deflation of 1929, during which the drop in the world's commodity markets, stock markets and bank assets produced the deepest and longest depression the world had yet seen.

Lord Keynes made an attempt to synthesize from all these ideas a comprehensive theory which would satisfactorily explain the economic factors contributing to the business cycle. His *General Theory of Employment,* Interest and Money (1936) is a landmark in economic theory. and economic thinking since the publication of his great book has been influenced by his ideas.

It is not necessary here to elaborate details of Keynes's theory, but it can be summarized briefly. People either spend or save income. Then businessmen planning to expand their plants and equipment require funds with which to do so. Funds so applied from income or savings are termed investment. The operation of the economic system brings together the investment and the savings.

Keynes pointed out that when investment exceeds savings, there is an expansion of credit which makes up the difference, and this brings about a rise in business activity. On the other hand, if savings exceed investment, there is a loss of purchasing power which produces a business decline. The problem, therefore, becomes one of trying to maintain as even a balance as is practicable in a changing economic system.

REMEDIES FOR UNEMPLOYMENT

In some respects, unemployment is the price of economic progress. In a competitive industrial society. new business concerns are started at the same time that other concerns are closing down. Whole industries are on the upgrade. while other industries are on the downgrade. With many thousands of firms employing millions of workers engaged in a competitive struggle, it is inevitable that some unemployment will always exist, no matter how prosperous a nation may be. Under the pressure of World War II shortages, unemployment in the U.S. seldom fell below 1,000,000 workers, or a little less than 2% of the labour force.

Even in the most prosperous years following World War II, unemployment in the U.S. seldom fell below 1,500,000 workers at any one time. The complete elimination of unemployment would be practically impossible; and if it were to be pursued as a goal, the result would be to limit the growth of the economy and to reduce it to a static state.

Furthermore, some unemployment is the result of the free choice of the workers themselves—a calculated risk, so to speak. A free economy means that workers are free to quit their jobs, either because they have decided to leave the labour force or because they are looking for a better job. In this situation it is not a case of the employer laying off a worker who is clinging to his job, but rather a worker who is exercising his own free enterprise by leaving the employer who may be very eager to keep him.

This aspect of unemployment is shown in the statistics of labour turnover. In times of prosperity and high-level employment, the great majority of separations from jobs occur through the voluntary quit by the worker. At certain times from two-thirds to three-fourths of all separations are on the worker's initiative. In addition, the unemployed worker in good times may exercise a great deal of caution in choosing another job. Unskilled. unpleasant and lev-paid jobs may be going begging, while skilled and semi-skilled workers elect to look around for a job in line with their previous experience.

When business turns down and job opportunities are less plentiful, the quit rate declines. It is then that the employer becomes the initiating factor in job separations. When his sales decline, he lays off workers. At those times, the layoff rate becomes the major factor in unemployment.

Also, since job opportunities are not plentiful, an unemployed worker is more likely to remain out of work for much longer periods of time. It is unemployment of this kind which produces social and economic problems.

The earnings from work constitute the main support of the average family. Any prolonged interruption of those earnings will generally cause destitution. The objective of social policy should be to limit the amount of involuntary unemployment as much as possible. Some methods are discussed below.

Stabilization by the Individual Firm. — Many employers have attempted to limit unemployment by stabilizing the employment in the individual firm. A remarkably high degree of employment stabilization has been achieved by some firms. A classic economic example in the U.S. is the integration of the coal and ice business, which matches winter and summer activities. Concerns engaged in producing Christmas cards, which sell during a very short demand season. have managed to round out the year by taking on other kinds of business. Many firms manufacture to stock during the slack season. When a concern finds itself with a declining product, it is often able to take on a new line which is expanding.

A few employers have devised the system of paying the worker a regular weekly wage, but varying the hours of work in accordance with production needs. Some employers prefer to have their employees work overtime, even at premium rates of pay, when production schedules are heavy, rather than to hire additional workers. When production falls off, they cut back to the standard weekly hours, or even share the work at reduced hours, in order to keep a stable labour force.

Despite all the achievements which have been made by individual concerns in pursuit of stabilized employment, these are only a partial solution of the problem. Many businesses cannot be stabilized. An employer in a declining industry may not find any way to prevent reduced employment. Manufacturing to stock has definite limits.

Unemployment Insurance. — Another suggested solution is the establishment of a system of unemployment insurance which will pay benefits to a worker when he is out of work through no fault of his own. Unemployment insurance is based on the principle that a certain amount of unemployment is inevitable. If it cannot be prevented, at least a worker and his family can be protected. Since the primary problem in unemployment is the loss of income. the provision of benefit payments overcomes some of the worker's difficulties. (For the workings of various systems see also UNEMPLOYMENT INSURANCE.)

In many countries, unemployment insurance is financed by contributions from the employed workers, the employers and the government. This type of insurance is based on the theory that unemployment is not the fault of either the employer or the worker, but that it is a natural consequence of the operation of the free enterprise system, the cost of which should be shared by all.

In the U.S., however, a somewhat different system has been developed. The theory in that country is that the employer, within certain limits, can control the amount of unemployment experienced by his workers. Therefore, the total cost of unemployment insurance is borne by employers only, and among them the rates are varied in accordance with the amount of unemployment attributed to their individual firms. The effect of this is to enable some employers to achieve comparatively low rates of contributions, while other employers pay higher rates, each based on his own experience. An additional argument for this system is that the variation of the individual employer rates will exercise some influence in stimulating an employer to stabilize his own employment insofar as it is possible.

Whatever the system of employment insurance, its chief advantage is that it permits the economic system to operate in accordance with competitive economic principles. This means that employers are free to expand or contract, to hire workers or to lay them off. Economic progress can take place at any desired rate. The insurance simply protects the workers and their families against some of the consequences of this progress.

Public Works Programs. — In times of business depression, the initiation by the government of a public works program is generally popular with all. There are several reasons for the popularity of this program. One is that public works are a governmental responsibility, and people look to the government for help when the private economy is not doing well. A second is that government can take a long view, inaugurating and carrying out projects which may not pay off for many years. Third, there is the belief that government construction activities could help counterbalance in some degree the swings of prosperity and depression in the private economy.

This general idea of public works as a partial remedy for unemployment received official sanction in the U.S. in 1923 when the Committee of the President's Conference on Unemployment published a report recommending the expansion of public works in times of business downturn as a countercyclical measure. During the great depression of the 1930s this idea was put into practice. In the U.S., beginning in 1933, an expanded public works program was begun under the Public Works administration. Two years later, the Works Progress administration was established for the specific purpose of providing jobs for the millions of the unemployed by means of special state and local projects, such as parks, schools and public buildings of various kinds. While these WPA projects were not wholly made work, they were definitely selected in such a way as to provide the maximum number of jobs per dollar of expenditure and to be of a character that would not interfere with the regular public works program. The Civilian Conservation corps was established to provide jobs for young men in forest conservation and similar types of activity.

In many countries throughout the world, similar types of programs were instituted, though seldom on a scale comparable with that in the U.S.

The experience of the 1930s led to a re-examination of the part which a public works program can play in the relief of unemployment. The limitations of such a program have been more clearly recognized. In the first place, the volume of public works constitutes only a small proportion of total economic activity. Even in times of great construction activity, the volume of construction constitutes only about 10% of the nation's gross national product. Employment on public works, even during peak periods, amounts to only a few per cent of the labour force.

Furthermore, public works construction has become in recent decades much more mechanized, with the result that it creates fewer direct jobs per dollar of expenditure. Increased mechanization in turn leads to greater skill requirements and to greater specialization of labour in construction. This condition became apparent in the U.S. during the WPA program when projects were held up for lack of the necessary skilled labour, although there were many thousands of unskilled workers available for jobs. As a result, more thought was given after World War II to the idea of establishing long-range public works programs and maintaining stability in these programs rather than attempting to use them to counterbalance changing business conditions.

Monetary Policy. — It has long been recognized by economists that periods of prosperity coincide with expansion of the money supply, while depressions have been accompanied by a contraction in money and credit. By law or custom the supply of paper money and credit instruments has generally been tied to the gold reserve in the central banks or in government vaults.

The gold standard was an automatic regulatory device. If a business boom in a given country went too far. the available supply of paper money reached the upper legal limit and could not be expanded further. In addition, an outflow of gold to other countries often required a contraction of money and credit in the expanding country. In a business downturn, the mechanism operated in reverse and an inflow of gold provided an opportunity for business recovery.

The gold standard in its old form broke down during the depression of the 1930s when all countries ceased redeeming their paper currency in gold on demand. A modified international gold standard has developed since that time, but most governments do not permit gold to operate as an automatic control mechanism, either domestically or internationally.

In the meantime, during the quarter century following 1930, strong support developed for the theory that government agencies and central banks can operate a somewhat flexible monetary policy, designed to regulate in some degree the supply of money and credit for business, without subjecting the economy to the rigid automatic operation of the old gold standard. The theory is that a central bank, by regulating the reserves required to be kept by commercial banks, or by buying and selling securities in the open market, can govern to some extent the available supply of credit. Since the government in nearly all countries either controls the central bank or has considerable influence on it, this control or influence effect means the operation of a conscious policy of regulating credit with a view to avoiding excessive business booms and subsequent depressions.

The import of this for unemployment is that a smoothing of the business cycle would avoid some of the worst aspects of unemployment.

MAINTENANCE OF ECONOMIC GROWTH AND STABILITY

The experience of prolonged unemployment during the depression of the 1930s, followed by the full employment of World War II, made many people apprehensive about the possibility of severe unemployment during the postwar readjustment. This problem received the attention of the governments of many different countries, but it received special consideration in the U.S. Western European countries had nearly all suffered severe war damage and were faced with the urgent task of restoring prewar production levels as soon as possible.

The U.S., on the other hand, had not suffered any such destruction, and the government in that country considered that the dismantling of the war industries might lead to considerable temporary unemployment. As the result of this concern, in 1946 a law was passed which established a council of economic advisers in the executive branch of the federal government. Among the functions assigned to this council were the preparation of periodic reports to the president of the U.S. and to congress on current economic conditions within the country, and the making of recommendations for the maintenance of high employment conditions. A council of three members was appointed in 1946. Congress, on its part, created a joint committee on the economic report, the function of which was to evaluate for the members of congress the analyses and advice provided by the council of economic advisers. The council issued semiannual and annual reports and became over a period of ten years one of the most influential agencies in the U.S. government. In general the objectives of the council have been to recommend policies to the government, as well as to industry and labour, designed to maintain economic stability while achieving economic growth.

Most countries with free enterprise economic systems have adopted similar policies. While the government agencies are not exactly the same as in the U.S., there does exist in most western countries some agency of government charged with the responsibility of devising policies to assist in the maintenance of full employment.

The significance of these developments for the problem of unemployment is that there now exist, on a scale never before seriously contemplated, government programs for dealing with cyclical unemployment. Furthermore, these programs are supported by public opinion and by government resources sufficiently large to have a marked impact on the private economy. Therefore, the statistics of unemployment, inadequate as they may be, have become one of the key figures for the determination of economic policy.

Up to the mid-1950s this program was apparently successful. Business downturns occurred in 1949 and 1954 in the U.S. Some moderately heavy unemployment existed at times during the postwar period in Belgium, western Germany and Italy. But there was no world-wide postwar depression and no serious prolonged depression in any western country. Nevertheless. questions were raised by economists and others as to whether this was due more to good luck than to good management.

The western world was engaged after World War II in making up wartime shortages and in rebuilding after wartime destruction. Some thinkers questioned whether the western world was yet returned to normal peacetime business conditions and whether, when it uas, the various government economic planning agencies would be as successful as they had been.

However, on one point there was no doubt. If ever and whenever a serious business downturn occurred involving heavy unemployment. the governments would not only be deeply concerned, but would be able to set in motion a whole series of policies and programs designed to offset the decline. The prevention of unemployment had definitely become a matter of national policy.

UNEMPLOYMENT INSURANCE. Although the first suggestion for providing financial assistance to persons involuntarily unemployed was made in Switzerland in the late 18th century, the introduction of national systems to provide this assistance came only in the 20th century. Such systems from the very beginning involved workers, employers and governments. singly or in varying degrees of co-operation; some were voluntary while others were compulsory. Unemployment insurance resulted from a shift from the opinion that lumped the unemployed and the unemployable together as the objects of charity to the 20th-century concept that involuntary unemployment is a matter for serious concern in terms of the health of the entire economic system.

This article is concerned primarily with the methods of financing, requirements for eligibility and general aims of the various national systems. For theoretical considerations and earlier attitudes, see UNEMPLOYMENT: *Remedies for Unemployment;* POOR LAW; SOCIAL SECURITY. (X.)

UNITED STATES

The first U.S. unemployment insurance law was passed in Wisconsin in 1932. Before that, U.S. experiments with unemployment insurance were limited to plans either initiated by employers or adopted by agreement between labour unions and employers.

The cornerstone of unemployment insurance in the United States was laid by the enactment of the Social Security act in 1935, which imposed a payroll tax on all employers having eight or more employees in "covered" employment. However, 90% of this tax could be offset if the employer paid unemployment insurance taxes under a state law meeting certain general standards. It also provided for federal grants to the states for the total cost of administering unemployment insurance laws if certain general statutory and administrative standards were met. These inducements were strong enough to bring about the enactment of unemployment insurance laws in every state, the District of Columbia, Alaska and Hawaii before July 1937.

Later, in 1938, a special federal system was adopted for the railroad industry. In Sept. 1954 amendments to the federal Unemployment Tax act extended coverage to employers of four or more workers as of Jan. 1, 1956, and a new title of the Social Security act provided benefits to federal civilian employees for unemployment beginning Jan. 1, 1955.

Unemployment insurance protected the regularly employed who became unemployed because of lack of work and were able and willing to accept suitable employment. It provided income as a matter of right in the form of a weekly benefit related to prior wages. This income was intended to cover the workers' nondeferrable expenses without reducing work incentives.

The objective was to provide benefits for a period long enough to tide most workers over spells of unemployment between jobs and help maintain their purchasing power to prevent the spread of secondary unemployment. Funds were accumulated during periods of high-level employment for use when benefit expenditures increased. Continuous contact with public employment offices facilitated absorption of claimants into employment.

The system involved close co-operation between the federal and state governments. Except for railroad and federal workers and special temporary programs for veterans, there was no national unemployment insurance law. Federal worker benefits, financed by federal funds, were paid by state agencies under their own benefit formulas.

Federal Responsibility. — The Social Security act of 1935 created a Social Security board to administer the various provisions of the act. After June 1939 the board exercised its function under the direction of the administrator of the Federal Security agency. Operational responsibilities were carried on by the bureau of employment security of that agency.

The United States employment service, created by the Wagner-Peyser act of 1933, was transferred by congress from the U.S. department of labour to the Federal Security agency in July 1948, and combined with the unemployment insurance program as the bureau of employment security. In 1949 the bureau was transferred back to the department of labour.

The bureau administered the federal part of both the employment service and unemployment insurance, maintaining direct relations with state administrative agencies through regional offices. Its primary responsibilities were to see that the state laws conformed with requirements of the federal acts and to determine, within the amounts authorized by congress, the amounts to be granted to the individual states for the administration of the state laws. A clearinghouse and service agency, the bureau promoted efficient administrative methods and made studies and recommendations to improve provisions for economic security.

Among the requirements that a state law had to meet to enable employers to secure credit against the federal tax were the following: that benefits be paid through public employment offices; that all taxes collected under the state law be deposited to the state's credit in the trust fund in the United States treasury from which they could be withdrawn only for the payment of benefits; that unemployment insurance could not be denied "to any otherwise eligible individual for refusing to accept new work under any of the following conditions: (1) if the position offered was due directly to a strike, lockout or other labour dispute; (2) if the wages, hours or other conditions of the work offered were substantially less favourable to the individual than those prevailing for similar work in the locality; (3) if as a condition of being employed the individual would be required to join a company union or to resign from or refrain from joining any bona fide labour organization."

To determine that a state was entitled to federal grants for the costs of administration, the secretary of labour had to find in the state law methods of administration reasonably calculated to ensure the full payment of benefits when due. These included the establishment and maintenance by the state of personnel standards on a merit basis and provisions for a fair hearing to anyone whose claim for benefits was denied. The secretary also had to find that there had not been a denial of benefits due under a state law in a substantial number of cases.

Grants to the states for the administration of unemployment insurance and the employment service were made quarterly. By the latter 1950s they totaled more than $220,000,000 annually.

State Responsibilities. — The state agencies collected and recorded taxes, received and passed upon claims for benefits. paid benefits, adjudicated disputes over benefits and managed state budgetary functions connected with the administration of unemployment insurance. They also furnished to the secretary of labour such reports as he might require. A nation-wide system of public employment offices was affiliated with the United States employment service of the bureau of employment security. Financed by federal funds, it was operated by the state agencies.

The states were free to enact unemployment insurance laws with such coverage, financing and benefit provisions as they desired. However, the state laws were strongly influenced by the provisions of the federal Unemployment Tax act.

Coverage. — This federal act originally taxed only employers of eight or more workers in 20 weeks in a calendar year. It remained unchanged in this respect until Sept. 1954 when it was amended to apply, as of Jan. 1, 1956, to employers of four or more workers. By 1956 all states covered employers of four or more workers; 23 states covered employers of fewer than four workers; 18 of these covered employers of one or more. About 80% of the work force was protected by unemployment insurance.

The growth in the labour force and in employment had increased the number of insured workers from 20,000,000 in 1938 to 36,000,000 at the beginning of 1955. The extension of coverage to federal workers in that year, and to firms employing four to seven workers in 1956, added another 4,000,000. The 12,000,000 wage earners still excluded in 1956 were in agriculture, domestic service, nonprofit religious, educational and charitable organizations and in state and local governments.

Benefits. — All state laws provided that weekly benefits be related to the weekly wages of the individual beneficiary. not based on claimants' sex and age, as in Great Britain. The original goal was to provide about 50% of wages, but the rise in wages immediately before and following World War II outstripped statutory maximums, and weekly benefits fell below that ratio in all states.

Pres. Dwight Eisenhower's economic reports of 1954 and 1955 suggested that states strengthen the benefit provisions so that most beneficiaries could receive half their weekly earnings for 26 weeks of unemployment.

During 1955, 32 states increased their basic weekly benefits. Maximum basic weekly benefits (without dependents' allowances), which had varied from $15 to $26 at mid-century, ranged from $24 to $45 after the 1955 amendments went into effect. Almost 70% of the covered workers lived in 32 states with maximum basic weekly benefits of $30 or more. About 73% of the covered workers lived in 27 states where the maximum potential duration of benefits was 26 weeks or more.

These changes did not fully achieve the president's goal. After they became effective, only seven states, with one-eighth of the covered work force, provided maximum basic benefits equal to half the state-wide average weekly wage.

The maximum potential benefits available to a claimant during a year varied widely. Fourteen states allowed potential benefits for the same number of weeks to all eligible workers. Thirty-six states limited the worker's total benefits to a fraction of his annual earnings, or limited the duration by a fraction of the number of weeks worked. In terms of money. maximum annual potential benefits (without dependents' allowances) ranged from $384 to $1,170 during 1956.

After mid-century, total annual benefit payments throughout the nation ranged between $840,411,000 in 1951 and $2,027,000,000 in 1954.

Dependents' Allowances. — By 1956 only 11 states had adopted provisions to increase the weekly benefits of claimants with dependents. The definition of dependent and the amounts of the allowances varied greatly from state to state. The laws usually provided an allowance of a specified weekly amount for each dependent, varying from $1 to $5, with a ceiling on the total allowance.

Disqualifications. — The major causes of disqualification from benefits were voluntary separation from work, discharge for misconduct, refusal of suitable work and unemployment arising from a labour dispute. The results of disqualification varied greatly from state to state. In some, benefit payments were postponed for a specified number of weeks on the theory that, after a time, the reason for a worker's unemployment resulted more from the general conditions of the labour market than from his disqualifying act. In other states, the disqualification lasted for the duration of the period of unemployment, and in some of these, all prior wage credits were cancelled, tending to put the claimant out of the system. Many states imposed penalties of varying severity for the different causes.

State Administration. — Certain administrative arrangements were common to all states. Every claimant filed his application for benefits at a public employment office and at the same time applied for work.

A report from the employment service or an employer that an applicant had refused suitable employment held up his right to benefits until it could be determined whether the refusal was justified. Each state law defined "suitable employment."

Procedures to settle disputed claims in all states authorized either the claimant or an interested employer to request a hearing before an appeal body on any decision denying or allowing benefits. Decisions of the appeal tribunals might be appealed further either to the state administrative agency or an independent review board, according to state law. Further appeal might also be made to the courts.

Financing. — Until 1954 federal unemployment tax collections went into the general treasury. The Employment Security Administrative Financing act approved in Aug. 1954 earmarked the proceeds of the federal tax for the employment security program. The annual excess of the federal collections over the costs of administration were automatically appropriated to the federal unemployment trust fund account. This account was to be maintained at a level of $200,000,000 for loans to states with depleted reserves. The excess collections beyond $200,000,000 were to be returned to the states for use in financing benefits and, under certain circumstances, for financing administration.

Experience Rating. — The federal law provided that employers could receive tax offset credit not only for the state taxes they paid, but also for those waived under a state experience rating system. Accordingly, all state laws provided for modifying employers' tax rates according to their experience with unemployment "or other factors directly related to unemployment risk."

As a result of the high payroll and employment levels during most of the program's history, and especially after 1941, many states reduced employer tax rates sharply from the 2.7% rate at which they began. Average tax rates fell to about 1.2% by 1947 and were at about that level in 1956.

World War II Servicemen's Readjustment Allowances. — The Servicemen's Readjustment act of 1944 provided veterans' allowances of $20 for each week of involuntary unemployment, up to 52 weeks. It also provided benefits to "self-employed" veterans trying to establish businesses or professions. The state agencies paid the benefits as agents of the federal government. More than 9,500,000 of the 15,100,000 World War II veterans filed claims for these benefits and were paid $3,800,000,000 in the five-year period of its major operations.

Unemployment Compensation for Veterans. — In Oct. 1952 a program providing unemployment compensation for veterans with military service between June 27, 1950, and Jan. 31, 1955, became effective under the Veterans' Readjustment Assistance act of 1952. Known as UCV, this program provided payments of $26 a week for each week of involuntary unemployment up to a maximum of $676. If a veteran qualified for unemployment insurance under any other law he could receive under the UCV law only the difference between $26 and the amount he was entitled to receive under the other program. To be eligible for these benefits, veterans had to meet all requirements of the law of the state through which the payment was made. Between Oct. 1952, when the program began, and Dec. 1955, benefits under this program totaled $240,000,000. During this period more than 1,000,000 veterans had filed claims for UCV benefits, about 750,000 of them had received at least one benefit payment and 139,000 had exhausted their $676.

Unemployment Compensation for Federal Employees. — Federal civilian workers became eligible for unemployment compensation on Jan. 1, 1955. Financed by federal funds, this program, like the veterans' programs, was administered by the state agencies. Unemployed federal workers were paid benefits in the same amounts and under the same conditions as workers in private employment in the applicable jurisdiction, which was usually the state in which the federal worker had his last official station. During 1955, the first year of operation, more than 165,000 claims were filed. Approximately 93,000 unemployed federal civilian workers received nearly $29,000,000 in benefits.

Temporary Disability Insurance Co-ordinated With Unemployment Insurance. — During the 1940s four unemployment insurance programs were expanded to provide weekly cash benefits to workers whose unemployment was due to inability to work as well as to those unemployed because of lack of work. Enacted in 1942 (Rhode Island), 1946 (California), 1947 (the federal Railroad act) and 1948 (New Jersey), these four temporary disability insurance (or cash sickness insurance) laws covered the same workers as the unemployment insurance laws with which they were jointly administered. The Rhode Island and California programs were financed by a 1% worker tax which had formerly been paid for unemployment insurance. In New Jersey workers paid one-half of 1% and employers, one-fourth of 1%. The railroad program was financed by an employer tax formerly paid for unemployment insurance.

Temporary disability benefits were paid under these laws to workers unable to perform their usual work because of illness or accident. California, New Jersey and the railroad program excluded disabilities covered under the workmen's compensation laws; and the California and New Jersey programs also excluded disability due to pregnancy.

California and New Jersey permitted individual establishments to substitute private group insurance for the state plan. Nearly half of the covered workers in California, and about two-thirds of those in New Jersey were under such private plans by 1956. In that year about 6,000,000 workers were covered by the four plans. In addition, in 1949 New York enacted a disability benefit law not co-ordinated with unemployment insurance. Under the New York program, private insurance was emphasized and the worker derived his rights to benefits from the insurance contract rather than from the law. Those coming within the law could be prosecuted for not having provided the insurance, either by self-insurance or by the purchase of insurance from private companies or a state-owned corporation. But this did not automatically protect the worker. (R. C. Gn.)

GREAT BRITAIN

Great Britain was the first country to establish a national system of compulsory insurance by the National Insurance act of 1911. Later the same policy was followed in many other countries. The act of 1911 covered only a few industries and 2,250,000 workers. Very few women were covered. Employers and workers each contributed 2½*d.* a week and the exchequer grant was equal to one-third of the total receipts from employers and employed. The rate of benefit was 7*s.* a week for adults. half rates for persons between 17 and 18 years of age. A one-week waiting period was followed by a right to draw a week of benefits for every five contributions paid up to a maximum of 15 benefit weeks in one year. To obtain benefit a person had to show that he had worked in an insured trade in 26 weeks during the preceding five years, had applied at the employment office for work, had since been continuously unemployed, was capable of work and had not exhausted his right to benefit. He could be disqualified if idle voluntarily through misconduct or because of a labour dispute. An insurance officer decided upon his application subject to power of appeal to a court of referees and final reference to an umpire appointed by the crown. The scheme was administered by the board of trade until it was taken over by the ministry of labour in 1917. A national system of employment exchanges had been established as an essential factor in the new scheme.

After World War I unemployment was severe and the insurance scheme was inadequate to meet the situation. Accordingly the Out-of-Work Donations act was passed in 1918 to provide assistance out of general taxation.

The Act of 1920. — The next major alteration was effected by the Unemployment Insurance act, 1920. which brought into insurance an additional 8,000,000 persons above the 4,000,000 already covered. The scheme was then made applicable to all persons of 16 years of age and upward employed under a contract of service or apprenticeship (except apprentices without a money payment), save those in certain excepted employments, mainly agriculture, private domestic service, government service, local government, railway and general utility companies. Nonmanual workers in receipt of remuneration exceeding £250 a year were also excepted. The waiting period was reduced to three days. Benefit and contribution rates and conditions for the receipt of benefits were altered.

Twenty Acts (1920–30). — Various alterations were made in the scheme by 20 acts of parliament during the next ten years. These were influenced considerably by mass unemployment and removed some of the restrictions on the granting of benefit. Provision was made for uncovenanted benefit for those whose rights under the main scheme had been exhausted. Rates of benefit and contribution were both increased and reduced several times but the debt on the insurance fund continued to increase and reached £25,000,000 in March 1927.

Following an examination of the whole subject by a committee under the chairmanship of Lord Blanesburgh the Unemployment Insurance act of 1927 was passed which made a number of alterations, including the creation of a class of young persons between 18 and 21 years of age and the abolition of extended benefit.

Drain on the Insurance Fund. — The unemployment insurance fund became still more insolvent. In 1931 benefits cost £125,000,000 while the contributions of employers and workers were less than £30,000,000. Benefits were reduced, later restored, and generally the operation of the scheme was made more stringent. This situation caused many unemployed men to apply for outdoor relief from the boards of guardians. The cost was, however, spread unevenly throughout the country, and the government was compelled to take action by providing a new form of relief called "transitional payments," subject to a means test. This scheme was administered by the boards of guardians at the cost of the national exchequer. Deep resentment by many people followed by considerable agitation caused the financial assistance of the unemployed outside the insurance scheme to be made a national responsibility by the establishment of the Unemployed Assistance board by the Unemployment Assistance act, 1934. It then became the duty of the board to provide assistance for all persons between the ages of 16 and 65 who were out of work whose normal occupation was an employment in respect of which contributions were payable under the national insurance schemes and who were capable of and available for work. Unemployment assistance (or national assistance as it was called later) continued to be available in supplementation of the national insurance scheme.

Effect of the Beveridge Report. — The comprehensive scheme provided by the National Insurance act, 1946, resulted from the report of the interdepartmental committee on social insurance and allied services presided over by Lord (then Sir William) Beveridge. The minister of national insurance was made responsible for the administration of the scheme. Coverage was extended without any exceptions to all persons aged 16 to 6j (60 for women) employed under a contract of service. This scheme brought in about 4,000,000 new contributors. Benefit became payable, after a three-day waiting period, at the rate of 26*s.* a week for persons over the age of 18; 20*s.* for married women; and 15*s.* for persons under the age of 18. In the case of a married woman or young person entitled to an increase for an adult dependent, or in the case of a married woman with a dependent child, the rate was 26s. An additional 16*s.* a meek was payable for an adult dependent and 7*s.* 6d. for the first child (the others being covered by the family allowance scheme). The conditions for receipt of benefit were the payment of 26 contributions between entry into insurance and the day for which benefit. was claimed, with an average of 50 contributions paid or credited (for periods of unemployment, sickness, etc.) in the last contribution year. Benefit continued to be payable weekly in cash at employment exchanges, which continued to be operated by the same ministry as before, which was now called the ministry of labour and national service.

Standard maximum duration of benefit was 180 days; after five years' coverage this duration might be gradually increased for additional contributions (not offset by benefits) up to 130 days more. Extended benefit might then be awarded by local tribunals after taking into account the claimant's circumstances but without imposition of means test (the right to extended benefit was later withdrawn).

Provision was made for claims for benefit to be decided by an insurance officer in the ministry of national insurance who might refer the question to a local tribunal. This tribunal consisted of (1) one member representing employers and persons other than employed persons; (2) one member representing employed persons; and (3) a chairman appointed by the minister. A claimant could appeal to the tribunal against a decision of the insurance officer. In certain circumstances there was a further right of appeal to the national insurance commissioner.

A person who lost his employment by reason of a stoppage of work due to a trade dispute at his place of employment was disqualified (subject to certain exceptions) during the stoppage except where he had meanwhile become bona fide employed elsewhere in his usual occupation or regularly engaged in some other occupation. A person was disqualified for a period not exceeding six weeks if (1) he had lost his employment through his misconduct or voluntarily left it without just cause; or (2) he had refused or failed without good cause to apply for suitable employment notified to him by an employment exchange; or (3) he had neglected to avail himself of a reasonable opportunity of suitable employment; or (4) he had without good cause refused or failed to carry out any reasonable written recommendation given by an officer of an employment exchange to help him find suitable employment; or (5) he had without good cause refused or failed to take reasonable opportunity of receiving approved training to make him or keep him fit for regular employment.

The National Assistance act, 1948, continued the responsibility of the board (now called the Assistance board) to grant assistance to insurable unemployed persons not qualified for unemployment benefit and to persons receiving such benefit who found it insufficient for their needs.

By the National Insurance act, 1954, benefit rates were increased to 40*s.* with an increase of 11*s.* 6d. for an only child or the eldest child; 3*s.* 6*d.* for each additional child and 25s. for an adult dependent. The rate for a person under the age of 18, with no dependent, was fixed at 23s.

(See also GREAT BRITAIN: Industrial and Social Conditions.)

OTHER COUNTRIES

Unemployment insurance schemes had been adopted by 23 nations at mid-20th century, including the limited-coverage scheme in Chile (for salaried employees only), Greece (where the arrangements were restricted to certain areas) and Uruguay (with special schemes in the wool and hide and cold storage industries, as well as pensions for unemployed persons with long coverage under the retirement system). Nineteen plans were compulsory and four (Denmark, Finland, Sweden and Switzerland) were government-subsidized trade-union schemes.

Europe. — The European countries with schemes in operation were Austria, Belgium, Bulgaria, Denmark, the Republic of Ireland, Finland, France, German Federal Republic, German Democratic Republic, Greece, Italy, Netherlands, Norway, Sweden and Switzerland. In Spain the voluntary plan formerly in existence had been replaced by public works. In the U.S.S.R. unemployment insurance was discontinued in 1930; in Czechoslovakia, in 1948.

The European schemes generally provided for rates of benefit according to the size of the family. But in Denmark provision was also made for fuel and rent allowances where there was prolonged unemployment. In the German Democratic Republic the scheme provided a basic benefit of one-fifth of the previous earnings of the unemployed person subject to a minimum and a maximum daily rate. This was supplemented by a housing allowance varying according to the size of the town or village in which the person was living. In Sweden, where unemployment insurance was voluntary, an unemployed person not so covered received unemployment relief through public works or cash assistance granted by the state or by municipalities subsidized by the state.

Outside Europe. — Outside Europe, by mid-20th century, unemployment insurance schemes had been adopted by Canada, Japan, United States, Union of South Africa and Uruguay.

Canada. — The existing unemployment insurance scheme in Canada came into operation in July 1941 and provided for a contributory scheme administered by the unemployment insurance commission. Regional and local officers throughout the country dealt both with applications for employment and claims for unemployment insurance benefit. All persons employed under a contract of service were insured unless specifically excepted. The exceptions included such employment as agriculture, fishing, domestic service, schoolteaching, etc. Employers and insured workers contributed equally, contributions being based on the wages earned. The federal government added one-fifth of the total employer-employee contribution and paid administrative costs.

Australasia.—*In* New Zealand unemployment benefit was subject to a means test as in the case of other social security benefits. The scheme was administered by the social security department.

In Australia no contributory unemployment insurance scheme existed in the mid-1950s but unemployment benefit was payable under a means test to persons who had been in Australia for 12 months and intended to reside there permanently.

General Characteristics.—Other schemes both in and outside Europe varied in detail but through the influence of international bodies such as the International Labour office and the United Nations there was a tendency for them to follow a somewhat uniform pattern. The conditions to be satisfied under the various national systems differed in points of detail, but there were broad lines of resemblance in most of them. For instance, the unemployment against which the worker was insured was involuntary unemployment. Nor would he be paid benefit under the schemes if there was suitable employment which he could take up. In this connection it was worthy of note that in countries which had instituted compulsory systems employment offices had been established by means of which the existence of suitable employment might be known and jobs offered to the unemployed. The loss of work through a labour dispute in which the worker was involved was commonly a reason for disqualification although there were various refinements on this point; *e.g.*, the duration of the disqualification might be for the period of the dispute or for any period after it had ended until the worker was again employed. Voluntarily leaving work without good cause and dismissal for misconduct were also generally grounds for refusal of benefit.

The financing of the various schemes differed in some respects but in most schemes the employer, the insured person and the government contributed. In a few the employer was the only contributor and in others the government made no contribution.

UNGARETTI, GIUSEPPE (1888–), whose innovations in form and language mark the true beginnings of modern Italian poetry, was born at Alexandria, Egy., the son of an Italian from Lucca, Feb. 2, 1888. In 1912 he went to study in Paris, where he became a friend of Guillaume Apollinaire. During World War I he served in Italy and France, and wrote his first published poems, *Il porto sepolto* (1916, included in his first collection, *Allegria di naufragi,* 1919) in the trenches. *Allegria* was followed by *Sentimento del tempo* (1933), *Il dolore* (1947), *La terra promessa,* a lyrical epic inspired by Vergil (1950) and the slighter *Un grido e paesaggi* (1952). In 1936 Cngaretti became lecturer in Italian literature at São Paolo, Brazil, and in 1942 he was appointed professor of modern Italian literature at Rome.

Ungaretti's first poems—brief fragments ivritten in language purged of traditional ornament, in which each word is charged with its original power and intensity—crystallized the revolution begun in Italian poetry by the Futurists and the *Vociani* (contributors to the periodical La *voce*), and placed him in the forefront of the "hermetic" movement. From the excessive brevity which sometimes impaired *Allegria,* he later developed a use of more elaborate and traditional forms, although he retained his emphasis on the need to restore to words their effective essence.

Ungaretti's poems were edited by E. Mondadori as *Vzta d'un uomo* (1947); and there is an English translation of a large selection, by A. Mandelbaum, in *Life of a Man* (1958).

UNGAVA, native name for the region south of Hudson strait; part of historic Rupert's Land (*q.v.*) The name was adopted officially, Oct. 2, 1895, for a district of the Northwest Territories. The Boundaries Extension act of 1912 annexed Ungava to the province of Quebec. *See* LABRADOR-UNGAVA; QUEBEC.

UNGER, FRANZ (1800–1870), Austrian botanist, prominent in the early development of paleobotany, was born near Leutschach in Steiermark on Nov. 30, 1800. He received a medical degree at Vienna in 1827. In 1836 he became professor of botany at Graz, and in 1850 professor of plant anatomy and physiology at Vienna. After retirement in 1866 he moved to Graz, where he died on Feb. 13, 1870.

Unger's numerous publications cover many areas of botany. He was the first to call attention (1855) to the resemblance between plant protoplasm and the animal sarcode. His observations on cell formation (1841, 1844) were of fundamental importance in the development of knowledge of this process, and he was among the first to admit the evolution in plants (1852). His *Anatomie und Physiologie der Pflanzen* (1855) was an early botanical textbook.

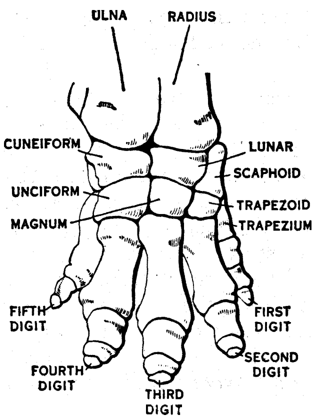
UNGULATA, an order or superorder of placental mammals including the hoofed herbivorous quadrupeds. Aristotle in his work on *The Parts of Animals,* in describing the extremities of the viviparous quadrupeds, says that ". . . some are bifid and have hoofs instead of nails, as the sheep, the goat, the elephant, the hippopotamus; and some have undivided feet, as the solid-hoofed animals, the horse and the ass. . . ."

After the Renaissance, E. Wotton (1552), following Aristotle, divided the viviparous quadrupeds into the many-toed, double-hoofed and single-hoofed. In 1693 John Ray divided the viviparous quadrupeds into two grand divisions, the Ungulata, or hoofed. and the Unguiculata. or clawed, forms. The former were subdivided into: (1) the Monochela, or Solidipeda, with solid hoofs, including the horse, the ass and the zebra; (2) the Dichela, or Bisulca, with cloven hoofs; and (3) the Tetrachela or Quadrisulca, including the rhinoceros and hippopotamus. The Dichela were again subdivided into the Ruminantia, or ruminants, and the Non-ruminantia, or swine; the Ruminantia were finally divided into those with permanent horns, namely the cattle, sheep and goats, and those with deciduous horns, of the deer kind. Here then was a usable and nearly correct classification of the ungulates before the beginning of the 18th century.



RIGHT FORE FOOT OF INDIAN ELEPHANT, SHOWING PARTS

Subsequent discoveries have added to the Ungulata a great many extinct and some recent groups which were wholly unknown to Ray. Thus in Osborn's *Age of Mammals* (1910) the "Cohort Ungulata" includes no less than 13 "orders" of hoofed mammals. While each of these is a more or less natural group of animals related by descent from a common ancestral stock, the derivation and interrelationships of the orders themselves are still far from clear. It is well established that the typical ungulates, namely the Perissodactyla (horses, tapirs, rhinoceroses, etc.) and the Xrtiodactyla (ruminants. swine, etc.) were wholly distinct from each other in the Lower Eocene, some 50 to 60 million years ago. It is indeed not improbable that the ungulate, or hoofed herbivorous type, was evolved several different times from different families of placental mammals of the Cretaceous period. or in other words. that many of the resemblances between ungulate orders are examples of either parallel or convergent evolution.

Order **Condylarthra.**—In the Basal Eocene formations of New Mexico and in the Lower Eocene of Wyoming have been found the fragmentary jaws and teeth, and very rarely more or less entire skeletons, of small hoofed mammals which on the whole were structurally intermediate between the oldest creodonts or flesh-eaters, and the true ungulates. Of these the most primitive was the genus *Mioclaenus,* known chiefly from the conical-cusped upper molars, which recall those of such primitive carnivores (creodonts) as *Tricentes* and Claenodon. Somewhat higher in the scale was the group of species of the genus *Hyopsodus*; these little animals were about as large as a hedgehog, the skull being of remarkably generalized type. The dental formula, (Incisors $\frac{3}{3}$ Canines $\frac{1}{1}$ Premolars $\frac{4}{4}$ Molars $\frac{3}{3}$)$\times 2=44$, was that of other very primitive placental mammals. The crown-patterns of the molar teeth were advancing ever further away from the primitive tritubercular type toward the more typical condylarth types presently to be described.

By far the most famous condylarth was the Lower Eocene *Phenacodus primaevus,* an animal about as large as a Newfoundland dog, which has figured in many textbooks as the "five-toed ancestor of the horse." But W. D. Matthew has advanced decisive evidence against this view. For in *Phenacodus* (*q.v.*) each quadrangular upper molar had four conical main cusps and two very small intermediate cusps or conules; whereas in the contemporary ancestors of the horse family the oblique crests of the molars were progressively developed. Even in the Lower Eocene genus Ectocion, which was related to Phenacodus, the detailed patterns of the upper and lower molars were not quite right to be structurally ancestral to the molars of the primitive horses. Another Eocene condylarth, the genus *Meniscotherium,* had more complex upper molar patterns of the type known as buno-lopho-selenodont (*i.e.,* with cones, ridges and crescents), which in some respects foreshadow the general molar types of such later ungulates as the hyracoids, the chalicotheres and the litopterns.

The foot structure of the condylarths was likewise of interest. In the five-toed hind foot the ankle bones were much like those of a contemporary creodont, with a ball-and-socket joint at the lower end, an arrangement to which the name Condylarthra refers. In the fore foot of Phenacodus the two rows of carpal bones were placed directly above each other, "like unstruck bricks," whereas in typical ungulates a more displaced, or alternating arrangement, was the rule. E. D. Cope supposed that Phenacodus was in this respect also ancestral to later ungulates but Matthew showed that in both Phenacodus and the later ungulates the contrasting arrangements of the carpal elements above mentioned were probably both derived independently from the still older interlocking creodont type.

Amblypoda.—In the basal Eocene of New Mexico occur the fragmentary remains of a diversified series of small hoofed mammals collectively known as Pantodonta or taligrade Amblypoda. Some of the smaller genera were hardly bigger than insectivores and with teeth suggestive of insectivore-creodont ancestry, while the larger taligrades (*Periptychus,* Pantolambda) were about the size and proportions of stocky badgers. The upper molar teeth in the smaller forms had three main cusps arranged in a triangle with the apex toward the inner side; the small intermediate cusps or conules were more or less circular; the main internal cusp was flanked by small cusps borne by the anterior and posterior ridges or cingula. In Periptychus the upper molar cusps were all subcircular and the enamel surface was pleated. The brain-cast indicates a brain of extremely primitive form with large olfactory lobes and a minimum development of the neopallium. In *Pantolambda* the upper molar crowns bore two sharp outer V's and a centrally placed conical internal cusp.

In all the taligrades the feet were short, especially so in *Pantolambda.* This feature becomes greatly emphasized in the later members of the order, the coryphodons and Dinocerata. *Coryphodon* is characteristic of the Lower Eocene of Wyoming and England. It was broad-headed and almost hippopotamus-like Related forms have recently been found in the Eocene of Mongolia. *Uintatherium,* Dinoceras and their allies were characteristic of the later Eocene. Their bodies were gigantic, larger than modern rhinoceroses, with massive, post-like limbs and extremely short stubby toes. They had sabre-like upper tusks, six or more horn-like bony outgrowths on top of the skull and a brain of low type.

Notoungulata.—The condylarths and taligrades disappeared from the fossil record of the northern hemisphere in early Eocene, but there is some reason to believe that some of them reached South America and there gave rise to the amazingly varied series of herbivorous mammals which are often referred to collectively as notoungulates. These flourished for millions of years in Patagonia and adjacent regions, while the perissodactyls, artiodactyls and other ungulates held sway in the northern world These notoungulates exemplified the law of adaptive radiation on a grand scale. Protected by geographical barriers from the deadly competition of their larger-brained northern analogues, they exploited all the economic possibilities for ungulates available in South America and gave rise to the wide diversity of forms that covered the ancient pampas. Some (the protypotheres) were small and swift-running like rabbits; others (the smaller litopterns) were like slender-limbed three-toed horses, some (*Macrauchenia*) paralleled the llamas and camels; others closely paralleled the rhinoceroses, while a few almost rivalled the elephants in bulk (Pyrotherium).

Litopterna (q v).—Among the most primitive of the entire series of notoungulates is the genus *Didolodus,* a small forerunner of the litopterns known only from the upper cheek-teeth, which in some ways recall those of the smaller taligrades. In the swift-footed proterotheres of the Miocene of Patagonia both cheek-teeth and feet suggest those of the Oligocene three-toed horses of the northern world. But in the upper molars the main inner cusp is central rather than anterior in position and the posterior cross-crests fail to meet the middle point of junction of the two main outer cusps, as they do in the three-toed horses, while the feet, although superficially horse-like, differ profoundly from the horses in the detailed arrangements and contacts of the tarsal elements. The larger litopterns (*Theosodon, Macrauchenia*), while in general appearance paralleling llamas and camels, yet are more nearly related to the horse-like proterotheres in their deeper characters.

Notioprogonia.—In the "*Notostylops* beds" of Lower Oligocene or Upper Eocene in Patagonia occur a strange group of ungulates, varying in size from a rabbit to a rhinoceros. Of these the most famous form, Notostylops, had a small skull in which the upper grinding teeth have oblique and flattened outer walls remotely suggesting those of recent rhinoceros. The lower molars bore long obliquely-placed blades on the hinder part or talonid. The skull as a whole suggests that of the recent Hyrax. In certain early members in which the feet are known there are five digits on the fore and hind feet, the terminal bones are cleft for the attachment of fairly large hoofs, the main ankle bone (astragalus) is more or less flattened. A single very small jaw, the genus *Arctostylops* of Matthew, found in the Lower Eocene of Wyoming, appears to be related to these South American Notioprogonia. Another apparently related type is found in the Eocene of Mongolia. These small jaws seem to increase the probability that the South American Xotioprogonia, like other members of the notoungulate series, had been derived from some basal Eocene or Upper Cretaceous forerunners of the taligrades and condylarths of the northern world.

The *Astrapotheria,* gigantic Santa Cruzian (Loner Miocene) forms nith long downwardly growing tusks, may be highly specialized derivatives of some early member of the Notoungulata.

Toxodontin — These uere perhaps the most numerous in species of all the notoungulate series One of the best known primitive toxodonts is the Santa Cruzian (Loner Miocene) genus *Homalodontotherium,* a larger form in which all the teeth had become high-crowned and all the incisors, canines premolars and molars were pressed together in a continuous series without break or interval. The Santa Cruzian (Lower Miocene) *Nesodon* was about the size of a rhinoceros but with the back curved and the limbs shorter. The front teeth were enlarged and flattened for cropping vegetation, the upper molar teeth had extremely long oblique outer walls and folded wearing surfaces. The three-toed feet, although rhinoceros-like in appearance, agreed with those of the litopterns in their fundamental characters. The Pampaean (Pleistocene) *Toxodon* was still larger, with a gigantic head and a huge curved back. This was one of the famous fossil South American mammals studied by C. Darwin (see *Voyage of the Beagle*).

Typotheria.—The smaller genera of this group, named protypotheres, included some that broadly resembled *Hyrax* and others that were rabbit-like. They were very abundant in the Lower Miocene of Patagonia. The extremely high-crowned molar teeth were much curved transversely, as in some rodents, and were adapted for grinding tough vegetation. The later form, *Typotherium,* from the Pampaean or Pleistocene of Argentina, had rodent-like incisors. It was about as large as a brown bear. This group is rather closely related to the toxodonts.

Pyrotheria.—In these curious animals the molars were bilophodont, that is they bore two cross-crests like those of tapirs and dinotheres. The skull in some ways resembled those of the Proboscidea (*q.v.*) and the same is true of the tusks, but on the whole it seems more likely that the pyrotheres are simply the South American analogues of the Proboscidea.

Hyracoidea (*q.v.*).—This characteristically African group is represented today by the "coneys" or dassies of southern and west Africa, Abyssinia, Arabia and Syria. These furry little animals have but slight external resemblance to ungulates but their jaws and teeth abound in resemblances to ungulates of many groups. The internal anatomy shows a curious mixture of resemblances to elephants and perissodactyls. There is no satisfactory evidence, however, of the relationship of *Hyrax* to any of the groups so far named. The hyracoids as a group must have been in Africa for many millions of years, since various forms of fossil hyracoids have been found in the Lower Oligocene of the Fayûm district in Egypt. In some of these very ancient hyracoids (*Megalohyrax*) the molar teeth recall those of Eocene titanotheres or of *Meniscotherium* among the condylarths. In its skull *Megalohyrax* was more or less swine-like.

Embrithopoda.—While the hyracoids played the part of the small ruminants in the ancient fauna of the Fayûm, the economic rôles of the rhinoceroses and elephants were assumed by gigantic beasts named *Arsinoitherium* in honour of an Egyptian queen. In these very strange animals the whole fore-part of the skull was surmounted by an enormous pair of bony horns, which in the front view rose to a great height. The folded surfaces of the molar teeth remotely recall those of the American Eocene amblypods, but the premolars rather suggest relationships with the hyracoids. The body was very massive and the skeleton shows a curious mingling of resemblances to elephants and amblypods, doubtless the results of similar adaptations to slow browsing movements and the support of the immense body weight. The existence of these highly specialized animals in Africa at such an early date as the Lower Oligocene and their apparent isolation, in spite of their adaptive resemblances to elephants and amblypods, all indicate a very long line of less and less specialized ancestors, traces of which may some day be discovered when still older fossil-bearing horizons are discovered elsewhere in Africa.

Barytherioidea.—Another strange type of extinct ungulate (named *Barytherium grave* by C. W. Andrews) was discovered in the Fayûm district of Egypt along with the fossil hyracoids, arsinoitheres and ancestral elephants. The only parts of the animal found were a large lower jaw, a humerus and a radius, all of which show a curious mixture of resemblances on the one hand to the primitive proboscidean *Moeritherium* and on the other hand to *Dinoceras* of the Amblypoda. In a general way it also resembles the ancient South American *Pyrotherium.*

Proboscidea.—The evolution and structure of the elephants (*q.v.*) are considered in the article PROBOSCIDEA, and further information can be found in H. F. Osborn's *Monograph* of this group. As to the remote origin of the Proboscidea, the fact that *Arsinoitherium,* in spite of its wholly different skull and dentition, shows so many curiously detailed resemblances to the Proboscidea in its limbs and backbone, lends some support to a view that the Paenungulata, a superordinal group, consisting of the Proboscidea, Hyracoidea, Embrithopoda, Amblypoda, may after all be a more or less natural assemblage of ungulates. In fact we may even advance the tentative hypothesis that some such small Lower Eocene condylarth as *Hyopsodus walcottianus* (described by Matthew and Granger), with short spreading feet, reduced canines, slightly procumbent incisors and bunodont molars, would have been an ideal starting-point for the entire subungulate series, including also the South American Pyrotheria and the Sirenia.

Sirenia (*q.v.*).—If "common sense" and superficial appearances were trustworthy, these surprisingly whale-like mammals would still be classified with the Cetacea (*see* WHALE) as they were by early naturalists. But De Blainville as far back as 1816 classified them as *"ongulogrades anomaux pour nager"*—anomalous ungulates adapted for swimming; in his later classification he brigaded them with the Proboscidea under "Gravigrades." Andrews in his description of *Eotheroides* (the oldest known sirenian, from the Upper Eocene of the Fayûm, Egypt) pointed out a number of significant features in which the skull of *Eotheroides* resembled that of *Moeritherium,* the oldest and most primitive known proboscidean from the same formation. He also cited a number of curious anatomical details in which even the modern Sirenia agree with the elephants in spite of the enormous difference in their external appearance and mode of life. On the other hand, R. Lydekker pointed out that the unworn molar teeth of certain extinct sirenians were curiously like those of certain extinct artiodactyls (*Merycopotamus*) and that this fact suggested the derivation of the Sirenia from very early Eocene artiodactyls; but one might equally say that the molar teeth of another extinct sirenian (*Miosiren*) suggest those of the Eocene rodent *Ischyromys* and that the order Sirenia had therefore been derived from primitive rodents. Either of these views would be hard, in the present meagre state of our knowledge of the subject, to disprove; but neither has nearly as much positive evidence in its favour as the view of De Blainville and Andrews that the Sirenia are an aquatic specialization from the Proboscidean stem.

Be that as it may, however, by the time of the Lower Oligocene *Eotheroides* was already definitely a sirenian in its dentition, skull and locomotor skeleton. Thereafter during the Oligocene, Miocene, Pliocene and Pleistocene epochs the changes in the skull and skeleton were comparatively slight and unimportant. The middle and late Tertiary sirenians (such as *Halitherium* and *Halianassa*) were for the most part considerably larger than the modern manatees and dugongs (*qq.v.*) and had a large vertically-placed pair of upper tusks, which have been retained by the dugongs but lost by the manatees.

The Sirenia are whale-like in their torpedo-like bodies and horizontal tail flukes, in the complete absence of external hind limbs and in their flipper-like forelimbs, which however still retain external nails or vestigial hoofs. They differ markedly from typical cetaceans in their relatively small heads, truncate flattened snouts with transversely expanded upper lips covered with very large bristles. The molar teeth are two-ridged—wholly unlike the conical teeth of toothed cetaceans. Their tusks when present are situated at the end of the muzzle and directed downward. They differ profoundly from cetaceans in their food and feeding habits, being the herbivores of the coasts and estuaries, whereas at least the typical cetaceans are essentially carnivores of the open seas. In their internal anatomy the sirenians likewise differ widely from cetaceans: the musculature of the forelimbs is less profoundly modified for aquatic life, the brain has a much less complexly convoluted surface and the digestive tract recalls that of the ruminants. The skeleton sirenians is peculiarly massive and dense, the swollen, heavy ribs serving apparently as ballast to keep these voluminous, gas-filled bodies below the surface.

Most of the many known extinct types of sirenians conform in essentials to the dugong type, but one extinct family, the Miocene Desmostylidae, is widely different from the rest. In these the large upper tusks almost suggest the earliest proboscidean types but the most remarkable peculiarity is found in the molar teeth, each of which consists of a closely packed cluster of cylindrical columns of circular cross-section.

Perissodactyla.—*See* PERISSODACTYLA.

Artiodactyla.—The Artiodactyla may be an offshoot of some forerunner of the mesonychid family of the creodonts, while the Perissodactyla may be related remotely to the Cretaceous ancestors of the condylarths.

Recent studies by Miss H. S. Pearson on the skull structure of the earliest artiodactyls have revealed that at a very early date the order was already subdivided into two series, one the amastoid series, in which the mastoid region of the periotic bone was completely covered by the squamosal and adjacent elements (as in the suines and their extinct relatives), and the other, the mastoid series, in which the mastoid was well exposed on the outer side, as in the Eocene Dichobunidae and all the ruminant artiodactyls. See also ARTIODACTYL.

UNICORN, a fabulous beast, usually having the head and body of a horse, the hind legs of an antelope, the tail of a lion (sometimes horse's tail), sometimes the beard of a goat, and as its chief feature a long, sharp, twisted horn, similar to the narwhal's tusk, set in the middle of its forehead. The earliest description is that of Ctesias, who states that there were in India white wild asses celebrated for their fleetness of foot, having on the forehead a horn a cubit and a half in length, coloured white, red and black; from the horn were made drinking cups which were a preventive of poisoning. Aristotle mentions two one-horned animals, the oryx, a kind of antelope, and "the so-called Indian ass." In Roman times Pliny mentions the oryx, the Indian ass, and an Indian ox as one-horned; Aelian, quoting Ctesias. adds that India produces also a one-horned horse and says that the Monoceros was sometimes called Carcazonon, possibly a form of the Arabic *Carcadān*, rhinoceros.

The medieval conception of the unicorn as possessing great strength and fierceness is perhaps due to the fact that in certain passages of the Old Testament the Hebrew word R'em, now translated in the Revised Version "wild ox," was translated in the Septuagint monoceros, in the Vulgate unicornis or rhinoceros, and in the Authorized Version "unicorn," though in Deut. xxxiii, 17 it obviously refers to a two-horned animal. Isidore xii, 2, 12 tells how the unicorn had been known to worst the elephant in combat.

As a decoration on drinking cups, it symbolized the ancient belief in the efficacy of the unicorn's horn against poison, which in England remained, even in the time of Charles II, though Sir E. Ray Lankester mentions that a cup made of rhinoceros horn was then handed over to the Royal society for experiment, with the result of entirely disproving the superstition.

In the court ceremonial of France as late as 1789 instruments of "unicorn's" horn were still used for testing the royal food for poison.

In heraldry the unicorn was sometimes used as a device (see HERALDRY), but oftener as a supporter, and subsists in modern times as the left-hand support of the royal arms. This position it assumed at the Union, the Scottish royal arms having been supported by two unicorns. When the unicorn became a supporter of the royal arms both of England and Scotland, a royal crown was added on the head of the unicorn, in addition to the crown with chain and ring round its neck, but this crown was removed after the Hanoverian succession. In England after the Union the unicorn became the left-hand supporter, but in Scotland, as late as 1766, it was still put on the right.

UNICORN PLANT (Proboscidea *jussieui*), a North American plant of the family Martyniaceae, called also proboscis flower and devil's-claw, native from Indiana to New Mexico and southward to Mexico, cultivated for its abundant foliage, peculiarly shaped flowers and oddly formed fruiting pods. It is a coarse, sticky-hairy, half-prostrate annual, with thick, rounded leaves; large violet or purple flowers, $1\frac{3}{4}$ in. long; and hanging, hornlike, woody pods, with a thick body 3 in. to 4 in. long. ending in a curved beak of equal or greater length. When dry, the beak splits into two opposed hooklike or clawlike appendages.

UNICORN PLANT (PROBOSCIDEA JUSSIEUI) SHOWING FLOWERS, HORNLIKE FRUITING POD AND LEAVES

UNIDENTIFIED FLYING OBJECT (UFO), in military parlance, means any aerial object that fails to identify itself to, or to be identified by, trained ground or air-borne crews using visual or electronic detection methods. Since 1947, owing to a sequence of bizarre circumstances, UFO has become an omnibus term connoting any object or optical phenomenon, usually aerial, that the observer cannot readily explain. UFO frequently is used interchangeably with "flying saucer," a term coined in 1947 as a result of the reported sighting by a civilian pilot, Kenneth Arnold, of a series of disk-like objects over the mountain ridges in the vicinity of Mt. Rainier, Washington. As a result of the wide publicity given to this sighting, there followed a wave of reports of unidentified objects by observers in various parts of the U.S., as well as in other countries.

First regarded by many as a bizarre, peculiarly American psychological phenomenon that would quickly fade away, the UFO instead showed an amazing tenacity over more than a dozen years, and the U.S. air force was officially charged with investigating the reports. Often several reports were made to the air force in one day, and reports came also from France, Great Britain and other countries. Indeed, if account is taken of the smaller area of some of the countries and the greater percentage of cloudy weather they experience, the sightings "per square mile per day" often were more frequent there than in the U.S.

The UFO should not be regarded as something that came into being in 1947, even though the phenomenon burst suddenly upon the public consciousness in that year. History is full of references to strange sights in the sky. In ancient and medieval times a comet was a strange and terrifying sight, as was an aurora, and it would be impossible to say whether the pattern of sightings in those days was the same as in the 20th century. Certainly, in some respects it must have been different. There were no "sky-hook" research balloons, unusual types of aircraft or re-entering missiles or artificial satellites. A comet, though described in terms recognizable to us, was often regarded as a true visitation.

It is easy to imagine that there were many UFO's in those times, many stories of strange sightings in the sky; but since communication was poor and record-keeping almost nonexistent, such sightings became part of the underbrush of local folklore and old wives' tales. Certainly, in times when people believed that a woman could give birth to dogs and pigs. that witches could levitate and fly about, and when credulity ran high, it would be not at all surprising to find a similarly uncritical attitude toward ordinary—and today well-understood—aerial phenomena.

Reports since the birth of the "modern" UFO in 1947 generally occurred in waves, but on the average, during the period of the U.S air force study, they numbered more than one a day. If consideration is taken of the fact that many reported sightings were not made through official channels, but to newspapers and to civilian groups interested in the phenomena, the rate of observations may have been as high as two or three a day in the U S over a period of a dozen years. France, Italy, England and a number of Latin American countries also experienced minor waves of CFO reports.

The steady stream of sightings became a cause for concern to the air force, and detailed investigations were made to discover

TABLE.—*Reported Sightings,* * *1947–61*

Year	Number	Year	Number
1947	79	1955	404
1948	143	1956	778
1949	186	1957	1,178
1950	169	1958	590
1951	121	1959	364
1952	1,501	1960	514
1953	425	1961	488
1954	429	Total	7,369

*U.S. air force reported sightings during the 15-year period of the official study.

reasons for such reports. The objectives were to determine (1) whether the reported UFO's constituted a threat; (2) whether the phenomena had any intrinsic scientific value; arid (3) what role UFO's might play as a factor in the sky surveillance program. It was concluded after the many years of investigation that (1) the phenomena bore no hostile purport and did not constitute a security threat; (2) there was no compelling reason ti; believe thnt the great majority of sightings arose from anything other than misidentification of natural objects and phenomena. and that the real cause of these sightings generally lay in the conditions under which an object or phenomenon was seen; and (3) the continued evaluation of UFO reports is of scientific value. especially in relation to the rriilitary sky surveillance problem.

It was estabiished that many sightings arose from seeing startling natural objects for the first time; *e.g.*, very bright meteors. high-altitude scientific balloons (which can attain high velocity nhen caught in the jet stream) arid especially distant terrestrial or celestial objects seen under such unusual meteorological conditions as those that produce mirages, which can distort, displace and animate objrcts detected visually or by radar. Such meteorological conditions. some thoroughly understood (mirages) and some poorly understood (ball lightning), can easily cause even an experienced observer to ascribe what he sees to a tangible: nearby, self-propelled object.

Indeed. it is not at all surprising, with so many more people turning their attention skyward. that many (including the scientifically trained) are confronted with an aeria! phenomenon they cannot readily explain.

Virtually all the reports received by the air force were highly subjective. lacking such verification as pictures, material fragments, spectroscopic analysis of lights seen or precise technical data on trajectories. distances. accelerations, etc. As the investigation progressed. it became ciear that most reports could be correlated with the appearance of aircraft, birds, celestial objects, balloons. etc.. under special conditions. and the number of unexplained cases fell from an early value of more than 10% to as little as 2% or 3%. It was readily admitted that this small residue—as reported—defied logical explanation. For none of the extraordinary "unknowns," however, were there scientific data on which to base valid, definitive investigations.

The early difficulties in corning to grips with the successive waves oi sightings, coupled with concern that UFO reports, often made by pilots, might constitute a threat to military security (and the consequent, unfortunate air of secrecy imposed in the early years of UFO reports), had an electrifying effect on the imaginations and emotions of a surprisingly large number of people. It led to an inordinate interest in UFO's and a logical, albeit scientifically unsupported theory of UFO's, encouraged by the real possibility of life elsewhere in the universe, as well as by a strong. often unconscious, desire on the part of many people to believe in the probability of visitors from outer space.

This theory of UFO's, with its strong quasi-religious emotional appeal. holds it not. only logical to assume that other inteiligent beings exist in the natural universe, but that superior extraterrestrial civilizations might visit here periodically, as if to rnake periodic checks on a tribe of aborigines. The theory is seen to have support throughout history in accounts of strange apparitions in the sky. suggesting to some that the earth could have been visited many times in the past. Some believe such visits became more frequent as atomic arid hydrogen bombs increased extraterrestrial concern.

In the face of continued lack of empirical evidence, persistent attempts to link UFO reports with visitations from space merit socio-psychological study.

It is amply evident that UFO's and "flying saucers" exist as reports. This has led to the quip that UFO's are any aerial sightings that remain unexplained long enough for the preparation of written reports about them. It is the problem of the serious investigator to probe for stimuli that give rise to the reports.

U.S. air force investigators long recognized that most originators of UFO reports are sincere, interested in the welfare and security oi their country and honestly puzzled by the sightings they report. Their frequent readiness to ascribe a UFO to extraterrestrial sources, their emotional attachment to this explanation and their reluctance to take into account the failure of continuous and extensive surveillance by trained observers to produce such sightings is surprising. It appears unreasonable that spacecraft should announce themselves to casual observers while craftily avoiding detection by trained observers.

Sonetheless. it must be recognized that knowledge of the universe and of the physics of our atmosphere is still imperfect. UFO sightings. as long as they continue, will merit serious study and may lead to advances not only in physical knowledge but in the area of human behaviour as well. (J. A. H.)

UNIFIED FIELD THEORY attempts to extend the general theory of relativity (*q.v.*) to electromagnetic forces and the forces between nuclear particles. General relativity incorporates the gravitational field into the structure of four-dimensional space time. and in this sense gravitation becomes part of geometry. Unified field theory has attempted to extend this treatment to the other forces mentioned, and if this were achieved. all the fundamental fields of force would be described by the geometry of space time. It was also hoped that a unified field theory would overcome certain difficulties in electromagnetism and atomic theory; *e.g.*, in classical electromagnetism there is no explanation of how elements of like charge. which must repel each other. can cohere to form an electron or other fundamental charged particle; and in atomic theory the occurrence of probability as a fundamental notion was thought unsatisfactory. especially by Albert Einstein and Erwin Schrodinger. There was also a more philosophical reason. Physical reality is supposed to consist of particles of matter and fields of force. Einstein believed that it should be possible to eliminate the notion of a particle and to represent the whole of physical reality by means of a field. so that matter becomes nothing more than a region of high field intensity.

General relativity is a highly developed field theory which still contains the idea of a particle because there are regions of space time where the field equations break down. and these "singular regions" must be supposed to represent particles. In an entirely successful field theory there would be no singular regions. and every physical situation would be completely described by the field alone.

Of the many unsuccessful unified field theories put forward there were three main types. The gauge-invariant geometry of Hermann Weyl (1918) extended the class of transformations to which the geometrical quantities characterizing space time must be invariant: he could thus introduce four quantities identifiable with the potentials in classical electromagnetism. This theory is unsuitable because it leads to field equations of the fourth differential order. whereas there is reason to believe that the correct equations are of the second order. The second important class of theories, stemming from work of T. Kaluza (1921), are those using five-dimensional spaces. and although they achieved a formal unification of the fields, they did not solve any outstanding physical problems nor lead to important new ideas of physical significance. The generalized theory of gravitation, or nonsymmetric unified field theory, was independently developed by Einstein (1945) and by Schrödinger (1943). In this the fundamental tensor g_{ik} of general relativity is allowed to be nonsymmetric. which introduces an antisymmetric tensor of the second rank presumably identifiable with the electromagnetic field variables. The investigations of the theory seem to show that it does not agree with experiment since it does not predict correctly the observed motion of charged particles in an electromagnetic field. However, nonsingular solutions of the field equations. which Einstein believed to be the only significant ones, have not been discovered, nor are they known to exist.

UNIFORMS (Lat. *unas*, "one." and *forma*, "form"), distinctive, homogeneous dress worn by naval, military and air services and other bodies.

BRITISH MILITARY UNIFORMS

From **Origins** to 1768.—The origin of the modern uniform, no doubt. was the armorial bearings and badges of the knight and his retainers. The first permanent body of troops was Henry VII's bodyguard. which exists today as the yeomen of the guard. First dressed in white and green coats. the Tudor colours, embroidered on breast and back with the crown and rose. they continued to wear this livery during the first part of the reign of Henry VIII, who later gave them a new dress of scarlet guarded with black. During the following reigns. the levies raised for various emergencies were frequently supplied with uniform coats of the same colour. sometimes ornamented with guards of coloured lace. During the Great Rebellion this custom continued. It seems, however, that there was no uniformity in the colour of the breeches; even in Cromwell's New Model army. although all were to wear red coats, the breeches were to be "grey or other good colour."

With the return of Charles II began the establishment of the regular army and regimental uniforms. The dress at first was still the short coat and the high-crowned buff-coloured felt hat. which soon gave place to a black one with a lower crown. The coal was made longer, reaching almost to the knees. It served also as an overcoat. which did not form part of the soldier's clothing. Regiments now began to have linings and cuffs of regimental colours, and the fall-down linen collar was replaced by a white neckcloth. Officers wore silk sashes. Sashes of different colours had formerly been used as a means of identification in the field and so became the emblem of military rank. The gorget was almost the last piece of mediaeval armour to be worn. It had now become a small semicircular object fastened round the neck with a ribbon, used as a badge of rank and worn to indicate that the officer was on duty. It survives as the staff officers' tabs.

In 1677 grenadiers were introduced and given a special headdress—:~baglike cap with a band of fur. The fur was later replaced by a cloth band and a stiffened front. on which was embroidered the sovereign's crown and cipher or the colonel's crest. The colour of a regiment's breeches and stockings now begins to be mentioned. The former became less voluminous and the stockings were worn pulled over the knees and fastened with a strap and buckle. Shoes and stockings were found impracticable for campaigning in the mud of the Low Countries; and spatterdashes or leggings reaching above the knee were introduced. The wide brim of the felt hat had been looped up on one side, then on two, and finally the three sides were fastened to the crown to form the three-cornrred cocked hat. In Great Britain at the end of the 17th century several regiments wore gray coats, the local homespun being the easiest cloth to obtain. These gray uniforms were discontinued by the end of the century, although they continued to be worn in the continental armies, especially by French regiments. who wore light gray uniforms for many years until they changed to those of a definite white cloth.

Cavalry. or "horse" as it was termed at the beginning of the Restoration. wore much the same dress as during the Great Rebellion. The buii coat was still part of its clothing but it became shorter and closer fitting until it developed into the "veste" or waistcoat. still retaining its buff colour. Cuirasses were worn up to 1697–98. The triple-barred helmet was soon replaced by a metal "skull." worn inside the crown of the felt hat as a protection against sabre cuts. Boots at first were made of brown or buff leather. but were soon replaced by the stiff black jack boot with wide tops to protect the legs and knees from being crushed in mounted action. The "horse" wore crimson coats with regimental facings and leather breeches. The dress of Marlborough's army remained more or less the same up to the reign of George II. when he and the duke of Cumberland made serious efforts to standardize regimental uniform. The single-breasted coat was changed to a double-breasted garment with half lapels, buttoned back for full dress or buttoned across for extra protection. The large cuffs were furnished with a laced slash and buttons. The linings. cuffs and lapels were of the facing colour, and each regiment had its own special pattern of lace. This strengthened those portions of the coat liable to extra strain such as the seams, buttonholes, edges of the cuffs, etc. The foot guards wore plain white lace. Nearly all regiments wore red coats and waistcoats. except the foot guards and royal regiments, who wore blue. The outer coat acted as an overcoat. The skirts could be buttoned back for parades or ease in marching, or allowed to fall loose as a protection.

The crowns of the grenadiers' and fusiliers' cloth caps were stiffened with pieces of cane. The fronts mere of facing cloth embroidered with the crown and cipher and scrolls or foliage, exceptions being the foot guards and those regiments entitled to special badges. During the Seven Years' War the grenadiers, in imitation of the European regiments, began to cover the front of their caps with fur, which finally developed into the bearskin caps authorized in 1768.

From 1768 **to** 1797.—The 1768 warrant made considerable changes in the army's dress. The coats were made closer fitting with fall-down collars and small round cuffs without the slash, the narrow lapels to the waist still retaining the loops of regimental lace. The linings. waistcoats and breeches were white. The three-cornered cocked hat usually had the front point raised into a more upright position. until finally it took the form of a two-cornered cocked hat. The long white leggings were now changed for black, with black leather tops. The fur cap of the grenadiers was furnished with a black metal plate with the devices in white, the crown at the back still showing the red cloth.

Light infantry had fallen into abeyance until the American Revolution. Their uniform was a short lapelled jacket, red waistcoat, white or buff breeches, stockings and the short spat-shaped gaiters which had come into general use during the war. The headdress was either the felt cap or one of jacked leather with a turned-up front and a black or green feather on the side.

In 1787 an attempt was made to issue clothing suitable for hot climates, and white round hats were given to the troops serving in the East and West Indies. In 1789 a complete kit was authorized, consisting of a white hat, jacket and trousers. The white hat was replaced by a black one shaped like a silk hat or later a "bowler," and often furnished with a fur crest as an extra protection against the sun. This was also worn by the light companies of the foot guards and the volunteers in 1794.

The style of the coats and hats of the cavalry and dragoons followed much the same changes as those of the infantry. The success of the light dragoons caused more regiments of heavy dragoons to change over. In 1784 their red uniform was changed to a short blue sleeveless jacket and underjacket, both heavily braided with white lace. The headdress was of black leather with a black bearskin crest and a turban of silk or leopard skin. The artillery and engineers in the 17th century came under the master general of the ordnance, the officers being commissioned by him. "The train of artillery," as it was called, was not a permanent force. The uniform of the gunners was red with a cocked hat, although grenadier caps were worn by some. William III's train for his Irish campaign wore blue with orange facings, however.

The red uniforms continued to the end of Marlborough's campaigns. In 1742 blue coats faced red took their place, and in 1778 all ranks wore white breeches ahd waistcoats, yellow lace having been added to the coats. In 1794 the cocked hat was changed to a flat-brimmed round hat with a tapering crown, the officers wearing the fur-crested hat.

The engineer officers were given their first uniform in 1757. This was scarlet with black velvet facings and was changed to blue with black facings in 1782 and to scarlet with blue facings in 1812. The engineers were a corps of officers only. In 1772 a separate company of military artificers was formed composed of noncommissioned officers and privates. The dress was a red jacket with orange facings and a cocked hat with a black feather. In 1787 blue coats with black facings and laced with yellow were adopted. Dark frocks with round hats were worn for working. After this the artificers, later the royal sappers and miners, followed the same styles as the infantry, although their lace remained yellow.

The success of the galloper guns of the light dragoons in India led to the formation of the royal horse artillery in 1793. Their uniform was at first a blue coat with red lapels and a iur-crested helmet. The coat was soon changed for a short yellow-braided jacket. which continued up to 1823. Their dress then followed the different styles of the light dragoons until 1846. when the hussar busby was adopted.

The drivers of the artillery were originally civilians hired with their horses by contract. In general they wore the smock frock, sometimes with the crown and cipher worked on it. Since they proved unreliable in action. a military unit was formed in 1806, called the corps of royal artillery drivers. Its members wore a helmet and uniform similar to that of the royal horse artillery.

Another driver corps raised in 1794 for the transport was the royal wagoners. They were dressed in red jackets with blue collars and yellow cuffs. blue breeches and a leather cap, the whole inspired by the Hanoverian train. A new corps was raised in 1799 named the royal wagon train, and dressed in blue jackets laced white and faced red, and a fur-crested helmet. In 1811 red jackets with white braid and a shako were approved. This dress with minor changes continued until 1831, when gold lace replaced silver for officers. The train was disbanded in 1833, and a new corps was hastily raised for the Crimea called the land transport corps, the uniform being a blue double-breasted tunic and black slouch hat. Reformed as the military train. it retained the blue tunic, but the facings were white. and a black shako (of French type) with black drooping plume and cap lines was added. This corps developed into the royal army service corps.

From 1797 **to** 1815.—In 1797 the coat was made to fasten down to the waist, the lapels, except for officers, were removed and replaced with lace loops. The cocked hat had now assumed its largest proportions, the lace edging was removed and a white tuft or feather with a red base became usual. The grenadiers and light infantry retained their white or green plumes. In 1800 a new short single-breasted jacket was introduced. Officers still wore the large cocked hat and the double-breasted lapelled coat; usually buttoned across. The men were given a tall cylindrical cap, first made of lacquered leather and soon changed to felt. It was also worn by the grenadiers and fusiliers when on active service,

During the Peninsular War. officers wore the same cap as the men with a short jacket. The general staff, however, wore the cocked hat, which became much reduced in height. In 1811 a new cap was made with the addition of a high front copied from that worn by the Portuguese troops. The white breeches and gaiters worn at home were replaced by slate-gray trousers and short gaiters in the field. Gray overcoats were issued in 1802. The Highland regiments wore the same type of jacket. The men's bonnets were covered with small feathers, and on service had a leather peak. Because the men lost their shoes in soft ground, short gray gaiters strapped under the instep were worn.

The coats of the cavalry and heavy dragoons followed much the same changes in style and cut as those of the infantry. Red cloth wings were added to the shoulder straps. In 1811 they changed to another short jacket, with bands of lace down the front instead of the bars of lace. It was fastened mith hooks and eyes, and a girdle of regimental colours was worn round the waist.

A helmet of black leather with metal comb and mountings replaced the cocked hat. The first pattern had a worsted crest, soon changed to a black horsehair tail in imitation of the French dragoons. The household cavalry, however, retained their red and dark blue worsted crest, and the Scots grays their fur caps. White breeches and high jack boots were worn in full dress, but on service slate-gray overalls with coloured stripes were worn. These had originally been worn over the white breeches and hoots to protect them from being soiled on the march. Later they became an actual garment by themselves.

From 1816 **to** 1854.—The poor appearance of the British infantry while stationed in Paris in 181j in comparison with the Allied troops led to the adoption of a shako copied from that of the French, but having a peak or neck covering at the back as well as the front. which was dispensed with in later patterns. The period following was the most elaborate for the dress of the army. The shako was first adorned with bands of gold or silver lace round the crown and base. then elaborate cap lines mere added which terminated in gold "flounders" or flat plaited knots fastened to the breast of the coat. Tall plumes were replaced in about 1835 by ball tufts. The short jacket was replaced by the long-tailed coatee and the Prussian or straight-up closed collar was introduced. The officers' wide lapels of facing colour curved to the waist, and had laced or embroidered buttonholes.

Black gaiters and breeches were abolished in 1822; white trousers were worn in the summer and light blue-gray in the winter, with gold or silver stripe for officers. An almost black cloth called Oxford mixture replaced the light blue. and a red welt was added to it. The white trousers were abolished (except for hot climates) in 1845. The bearskin cap of the grenadiers had been furnished mith a leather peak. cap cords and a brass plate. and these were gradually discarded until the cap was of fur only without any embellishments. In 1837 gold lace was to be worn by the regular army only. In 1843 a new shako was introduced. called the "Prince Albert." All bearskin caps except those of the foot guards and Scots grays were abolished. The rifle regiments wore green jackets and pelisses with bell-topped shakos and falling plumes, later changed to ball tufts. The jackets of the Highland regiments were similar to those of the line regiments, but the skirt tails mere small and short. The feathered bonnet was at its tallest and the sporran had large gilt fastenings and a long-haired covering with tassels and sometimes gilt fringes.

The heavy cavalry appeared in black japanned metal helmets with brass plates and ornaments: surmounted by large black bearskin crests. The light gray-blue overalls were full in the leg, becoming tight at the ankle in imitation of the Cossack garments. and so named after them. Later they were replaced by dark blue with coloured stripes. The helmet was again changed in 1834 for one similar in shape but of brass. For undress the fur crest could be removed and replaced by a brass crouching lion which fitted over the front and top of the comb. Later a brass helmet with an upright spike with drooping horsehair plume was adopted, resembling that worn by the household cavalry today. The household cavalry, about 1820, wore the same shaped helmet as the heavy cavalry but silver-plated with brass ornaments, and about the same time were again given their cuirasses. A little later, as well as helmets, they were given tall bearskin caps like those of the foot guards, reserved for ceremonial occasions. The dress of the light dragoons was still the short jacket. but the shako was more "bell-topped" with plaited cap lines and flounders, the officers wearing drooping plumes of feathers. the men's being horsehair. The hussars wore similar shakos in place of the busby.

William IV dressed the whole army in red except the royal artillery and rifle regiments. The hussars kept their blue dolmans, but wore scarlet pelisses, and the overalls for all cavalry had now been changed to dark blue. In 1840, the light dragoons, hussars and lancers were again dressed in blue, only the 16th lancers retaining their scarlet jackets. Some hussars retained their shakos and other regiments returned to the fur busby. During the Crimean War the overalls were again strapped with leather, which developed into the booted overall.

From the Crimean War (1853–56) **to** 1914.—During the Crimean War the coatee was found to give no protection to the loins and abdomen against cold and wet, so a Icing-skirted double-breasted tunic copied from the French was issued. A year or two later a single-breasted tunic and a more conical and lighter shako were issued.

Under the Card\\-ell system (see GREAT BRITAIN: Defense). to facilitate changing the facings of a man transferred from one linked battalion to another. the tunic was made red throughout, with only a patch of facing cloth sewn over the collar and cuffs. In 1870 the crown was worn on the men's collars and the regimental badge was placed on the shoulder strap. The crown, however, soon gave place to the regimental badge. In 1874 trousers of dark blue cloth instead of Oxford mixture were issued.

After the Crimean War the tunic was given to all cavalry regiments. the dragoons guards keeping their helmets of brass while dragoons were given helmets of white metal. Regiments began to have plumes of various colours. Light dragoons wore an upright shako. but changed to the French type with drooping plume. The royal artillery changed from the busby to the helmet in 1878, the horse artillery, however, still kept theirs. The royal engineers wore the busby up to 1870, when its shape was changed to one similar to that worn by rifle regiments, and in 1878 the helmet was adopted. After World War I there were changes in full dress. The royal artillery, royal engineers and royal corps of signals were again given the busby, the engineers having a blue bag and white plume, the corps of signals a red plume. The royal tank regiment was given a blue uniform with black facings.

Undress and Service Dress.—The forage cap of the mid-18th century consisted of a soft loose bag surrounded by a band of cloth, made irom pieces of the old discarded coat. During the 19th century a soft round cap made its appearance, which the foot guards in due course stiffened into the "pillbox," the cavalry, artillery and other corps following the same style. The infantry, on the other hand, wore the "pork pie"-shaped Kilmarnock with "touris" of different colours according to whether they were flank or battalion companies. This was replaced by the Glengarry, and in turn by the folding service cap. also worn by the cavalry and different corps in various colours according to regiment. At the end of the South African War the soft round cap of the 19th century reappeared and was known as the Broderick cap; sidepieces were added which could be let down as ear coverings. This was a replica of the "Marie Louise," worn by Napoleon's 1813 conscripts. Later this was stripped of its sidepieces, given a glazed leather peak and stiffened into the modern form. For field work a serge coat called a frock was worn with short leather gaiters over the blue trousers. Officers for many years had worn blue frock coats which were eventually authorized.

Khaki (dust colour) or a drab service dress was worn in the Indian mutiny and later became the universal service dress. worn with trousers or breeches and a topee or sun helmet. Sun helmets came into use in India; some of the first had a hollow comb or crest. the front of which was open. During the South African War the colonial slouch hat was worn by regular regiments. The cavalry in India began to wear chain mail on their shoulders, said to have originated from an officer's sewing curb chains onto his shoulder straps as a protection against sword cuts in the Afghan War. The modern battle dress of blouse, trousers and the resuscitated short gaiters. replacing the breeches and puttees which had been worn for a number of years. was evolved from various experiments before 1939. The steel shrapnel helmet was introduced during World War I. but the French had already given their artillery a steel helmet in 1902. After World War II, full dress. except for the household brigade and the king's troop. royal horse artillery, was declared obsolete. The only form of dress remaining to the army. therefore. was battle dress. The severity of this uniform was mitigated somewhat by the introduction, for other ranks. first of khaki collars and ties and second, and for more formal occasions. of a blue beret. At the same time the peaked forage cap was reintroduced for officers. while the wearing of swords and the prewar pattern service dress for ceremonial parades was made permissive.

It was intended. however. to equip the army with a blue uniform. described officially as no. 1 dress. This was modelled, largely, on the prewar officers' undress, or patrol jacket. with a stand-up collar, and was to be worn with a red sash. Regiments and corps would be distinguished by coloured piping on the shoulder straps and also by the colouring of the trouser stripes. This was to be worn with a blue forage cap, regiments and corps, in many instances, being distinguished by a difference in the colour of the hatband. The uniform was to be green for rifle regiments. while the style of the jacket was modified for Scottish regiments. The introduction of no. 1 dress was to be spread ovdr a number of years. but an early issue was made to bands. It was also provided for all detachments taking part in the coronation parade of 1953, but thereafter mas issued on a rank basis.

Officers wore the Sam Browne belt with no. 1 dress, but for ceremonial occasions they mere to wear a uniform known as no. 1 (ceremonial) dress. This consisted of the substitution of gold shoulder cords in place of the cloth shoulder straps on the no. 1 jacket and of a red sash instead of the Sam Browne belt. The sword would be carried in a plated scabbard suspended by gold sword slings, the hilt of the sword being decorated with a gold sword knot. For general officers. the general officers' pattern sword was restored, together with the gold and scarlet waist sash.

Women's Army Services.—Excepting the nurses of the military hospitals, the first British women's service unit appears to have been the First Aid Nursing yeomanry (F.A.N.Y.) formed at the end of the South African War. As this was a mounted unit, the dress was a scarlet tunic with white braid. blue riding habit with scarlet band and blue peaked cap. The uniform is now a khaki jacket and skirt.

The Women's Army Auxiliary corps (W.A.A.C.), formed in 1915, wore a khaki dress, coat and soft felt hat. When the title was changed to Auxiliary Territorial service (X.T.S.), a khaki uniform of tunic. skirt and peaked cap was worn. a flat service cap of brown and orange piped with green was also allowed. After World War II the service became the Women's Royal Army corps, and the uniform was changed to dark green with a green beret for the privates, but a peaked cap was worn by officers.

BRITISH NAVAL UNIFORMS

Although no regular dress was laid down for seamen, a naval costume had evolved irom the requirements of a seafaring life. From very early days clothing or livery had been provided for officers and men. Chaucer's seaman, in the 1480 edition of his *Canterbury Tales,* is shown wearing a sea gown of russet colour girt with a belt from which hang a knife and a leather wallet, and a loose red cap apparently edged with fur. The Cinque Ports in 1513 wore white coats with a red cross and "the arms of the Portis underneath, that is to say a halfe lyon and the halfe shippe." Elizabethan seamen are occasionally depicted. One book shows a master. 1590, wearing a loose cassock and full Venetian breeches, stocking and shoes and a fur or thrummed cap. Blue seems to have been often the colour of the jackets. The six principal masters of the king's ships in 1604 had the grant renewed for red livery coats guarded with velvet and embroidered with the crown, roses and ships.

The slop lists of 1663 mention red caps, Monmouth caps, stockings blue and white, shirts, cotton waistcoats and drawers, canvas suits and blue neckcloths. In 1690 wide canvas breeches striped crosswise with red are described; under these, canvas breeches fastened at the knees were worn. In 1706 orders were issued regarding the slop clothing to be supplied, which mention "grey Kersey jackets lined with red cotton with brass buttons, the button holes stitched with gold colour thread. red waistcoats, red breeches. shirts of blue and white checkered linen, leather caps faced with red cotton and shoes with brass buckles."

The officers of the "Kent" in 1748 all wore silver-laced gray coats faced with red. In 1748 a uniform was established for officers. It was to be blue faced with white, but as no details were issued. officers found great difficulty in closely conforming to it. The portraits of Lord Anson and Admiral Byng show them in blue gold-laced coats, with wide white cuffs but no lapels, while Admiral Boscawen's portrait shows a very similar uniform but with wide white lapels with gold-laced loops. The waistcoats in all three cases are white with wide gold lace, the breeches blue. With this the gold-laced cocked hat was worn.

In 1767 and 1774 more definite instructions were issued. The coats were to have narrow white lapels to the waist, white cuffs, white waistcoats and breeches. the master and commander having blue lapels, the midshipman none. Rank was also denoted by the buttons being placed at regular intervals or by twos or threes. In 1783 rank was indicated by the rows of lace on the white cuffs of the full-dress coat and on the blue lapels of the frock by the

UNIFORMS

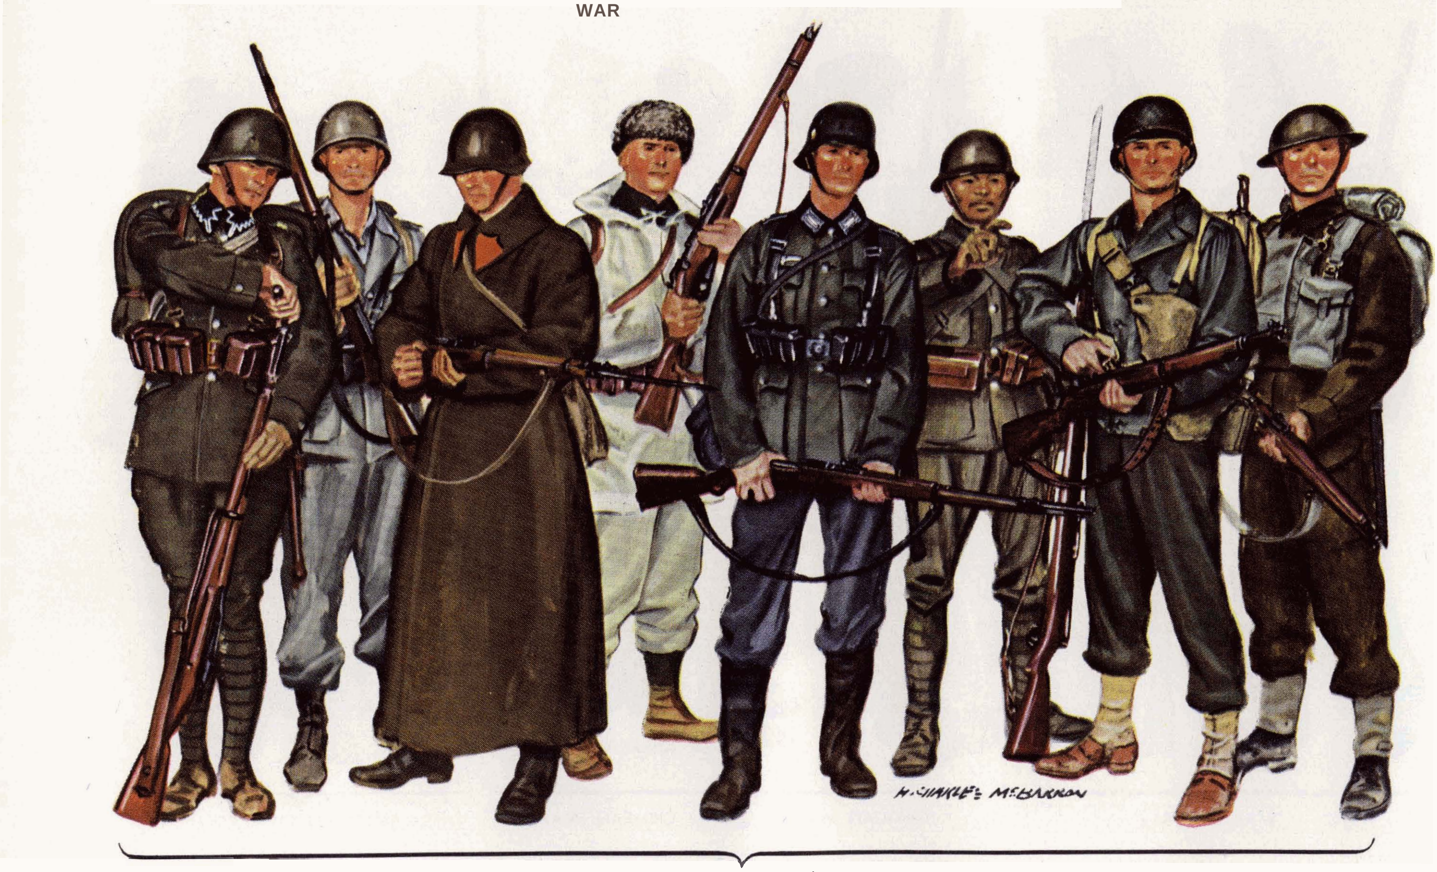
FRANCO-PRUSSIAN WAR | SPANISH-AMERICAN WAR | WORLD WAR I



WORLD WAR II

UNIFORMS OF THE 19TH AND 20TH CENTURIES

Franco-Prussian War: French infantry; Prussian infantry. Spanish-American War: Spanish regular infantry; U.S. infantry. World War I (Infantry): German, 1916–18; U.S., 1917–18; French, 1916–18; British, 1916–18; Italian, 1916–18. World War *II* (Infantry): Polish, Italian, Russian, Finnish, German, Japanese, U.S., British arrangement of the buttons. In 1787 a uniform was authorized for warrant officers, which included masters, physicians, gunners, boatswains and carpenters. consisting of a blue coat with blue turned-down collar and cuffs.

Epaulettes were authorized in 1795. The ranks of admirals were indicated by one or more silver stars on their epaulettes. Hessian boots with white or blue breeches began to be worn about 1800.

About the middle of the 18th century the gray coats and red breeches of seamen began to give place to blue jackets, red or buff waistcoats, white breeches and canvas petit-coat trousers. The headdress was a tarpaulin hat with the brim tacked up or left flat or a felt hat with a bunch of blue ribbons. A blue Kilmarnock cap with a red touri was also worn. The modern cap was eventually evolved from this, the French seamen still wearing it with its original red touri. now a pompon.

From 1800 onward a tarred or painted canvas or leather cap edged with fur is shown in contemporary prints and paintings; this may have been a cap with fur-lined ear flaps. A hat of the "topper" shape, sometimes of straw, with a ribbon band is aiso depicted. In 1834 it is shown glazed, with a more conical crown, and the ship's name painted in it; after this a lower crowned black hat with a wider brim appears.

The men's jackets had become shorter and were often strengthened with strips of canvas sewn along the seams. The cuffs from the early days are shown slashed and with three or four black buttons. There was at first no collar. but coloured or black handkerchiefs were worn round the neck. About 1823 the jacket is shown with a turn-down collar, the blue and white striped coliar of the shirt being worn over it. The waistcoat is blue and the trousers plain white or blue.

New regulations were issued in 1825–27. The coats of officers were to have wide white lapels and cuffs. all laced with gold. High-ranking officers were to have their badges of rank on their epaulettes; masters, physicians, secretaries, pursers, etc.. blue coats: lapels and collars. with blue twist buttonholes. Each branch was indicated by distinctive badges on the collar, *e.g.*, masters: three anchors: physicians. anchor and serpent; secretaries, crown and anchor. The frock dress was all plain blue with turn-down collar. Cocked hats were worn fore and aft. but black glazed round hats and short jackets could be worn at sea. Undress caps were flat round caps with a wide top and black peak.

Seamen's dress had become standardized, the striped shirt collar being blue with two or more white stripes. The senet hat, sometimes painted black. was worn, or the Scotch cap, which developed into the soft edition of the modern cap. In 1857 this dress was officiallyauthorized, the blue collar was ordered to have two white tapes. but the men preferred three as more decorative, and so were allowed to retain them. In 1863 the curl was added to the top row of the lace on the cuffs of the executive officers. and later granted to all officers. Coloured stripes were added to the cuffs indicating the different branches of the service. the buttons on the single-breasted coatee being placed in twos with a white stripe for paymasters. threes and scarlet stripe for surgeons and fours and purple stripe for engineers. The men's blue jackets. the straw senet hats and the cocked hats and tail coats of the officers were later abolished.

By 1955 naval officers! standard day uniform for all occasions was the double-breasted reefer jacket and trousers, with peaked cap. Commissioned officers wore horizontal bands of gold distinction lace on the sleeve—one row and curl for a sublieutenant. four rows and curl for a captain, one broad row and four ordinary rows with curl for an admiral of the fleet. Full dress was in abeyance. For ceremonial dress officers wore medals and orders instead of medal ribbons. Ratings wore blue serge or cloth suits for full dress and blue serge blouse and trousers as normal working dress.

Women's Royal Naval Service.—The Women's Royal Naval service (W.R.N.S.), formed in 1917, wore blue jackets and skirts with a soft blue felt hat, changed during World War II to the seamen's cap. the officers wearing hats with the brims curled up to form a tricorne hat.

Royal Marines.—The maritime regiment of 1664 wore coats of a yellow colour with red facings. breeches and stockings. The regiment of 1684–89 had red coats faced yellow, gray breeches and white stockings. The next description is of red coats and grenadier caps. In 1742 the ten regiments of marines had various coloured facings according to the regiment. The fronts of the caps were different in shape from those of the grenadiers. At about 1750, the cap was the usual grenadier type with a white front on which was embroidered an anchor. The half lapels were edged and looped with a white lace with blue and red stripes. The dress resembled that of the infantry until 1802 when the glazed round hat replaced the cocked hats and Bank company caps, and the nhite facings changed to blue nhen the marines became a royal corps. In 1804 an artillery branch was added and wore the same dress as the rest of the corps, a short blue fatigue jacket with red facings was however. allowed. From 1820 the blue uniform was given, which was almost the same as that worn by the royal artillery. In 1923 the artillery were amalgamated, the whole corps nearing the scarlet tunic.

After World War II marines wore blue serge or khaki, but for working battle dress was worn and for mess dress, scarlet mess jackets. Full ceremonial dress consisted of blue tunics with medals or orders.

ROYAL AIR FORCE

The royal flying corps when formed in 1913 wore khaki tunics, which fastened down the right side of the chest, the breeches. puttees. dnd flat folding service cap being also khaki. The royal air force wore blue-gray tunics. breeches and puttees (later trousers) with a peaked cap, the officers for full dress wearing a leather cap with turned-up fur flaps. a gold and blue-gray plaited cap cord and a blue-gray plume. the whole based on the cap worn when flying.

After World War II, full dress was in abeyance; for ceremonial occasions a gold belt and snord were worn with service dress.

The dress of the Women's Royal Air force (W.R.A.F.) is a blue-gray tunic and skirt, blue-gray collar, black tie and peaked cap.

UNITED STATES

All the U.S. services, army, navy (including marine corps) and air force, have service uniforms for summer and winter and dress uniforms. Also special clothing and uniforms are authorized for individuals whose duties so require (*e.g.*, cooks and bakers; members of the army medical service. armed services police, personnel stationed in areas of extreme climatic conditions, etc.). Special clothing is also authorized for wear while engaging in sports.

Army.—Service *Uniforms*.—The army service uniform is of two types—an olive drab wool uniform for winter and a cotton or other fabric in khaki colour for summer. The coat is single-breasted, lapel design. with four buttons and four pockets (two patch breast pockets and two inserted lower ones). all covered with flaps. The winter coat has a matching cloth belt with a gold colour buckle. The winter trousers are of a lighter shade than the coat while the summer trousers are of the same colour as the summer coat. A service cap with leather visor or a garrison cap with cord edge braid is authorized for both uniforms. An overcoat is authorized for winter wear. Russet colour low quarter shoes are authorized for normal wear. Combat boots of the same colour are worn under combat or simulated combat conditions. The shirt is khaki and the necktie is olive drab.

Blue Dress *Uniform*.—The blue dress uniform is for winter wear. The coat is single breasted. with two upper and two lower inverted pockets. covered with flaps. The coat has shoulder straps on which insignia of grade and branch colour appear. The coat and cap are of matching dark'blue material. The cap visor for officers above the grade of captain is embroidered in gold with groups of gold leaves. The trousers are sky blue, except those for general officers. whose trousers match the coat. The shirt is white;

necktie is black four-in-hand type.

White Dress Uniform.—The white dress uniform is for summer wear. It is of cotton twill or duck. The design is in general the same as that of the blue dress uniform. Shoes, shirts and socks are white; the tie is black.

Mess Uniforms.—The blue mess uniform (for winter) consists of the mess jacket, trousers and cap of dark blue wool Gold colour shoulder knots are on the jacket. The vest is of white pique; tie is black, bow. with square ends. Shoes and socks are black. The white mess uniform (for summer) is of the same design as the blue mess.

Evening Dress.—Coat and trousers are of blue-black or black commercial type, tailed coat with army buttons. ornamentation and insignia. The wing collar is white; civilian commercial-type socks and shoes are black. Gloves are white. The cap matches the coat and trousers. The vest is single breasted, low cut, of white pique or other conventional-type commercial evening dress vest material.

Combat; Work Details.—For combat and for working parties where the service uniform would be inappropriate, a "fatigue" or "utility" uniform consisting of olive drab cotton jacket and trousers is issued.

Uniforms for Women.—The women of the army have service, semidress and dress uniforms. The service and semidress uniforms are taupe in colour; the dress uniform is white. The uniform consists of a cotton dress (for summer service), coat, skirt. hat (or cap). shirtwaist, shoes and handbag. The evening dress consists of dark blue skirt. jacket. white blouse and tiara.

Navy.—The U.S. naval officer's uniform in general corresponds to that worn by the officers of the various navies of the world. They are made readily distinguishable by the ornamentation, trimmings and insignia.

The dark blue uniform consists of a double-breasted wool sack coat, trousers without cuffs, white shirt, white cap cover, black belt, black tie and black shoes.

The white and khaki uniforms, worn in summer, are made of tropical worsted or cotton material. Khaki belt, shirt and cap cover and brown shoes and socks are worn with the khaki uniform. White shirt, cap cover, shoes and socks are worn with the white uniform.

The uniforms worn by enlisted men of the U.S. navy consist, in general, of the seaman's overshirt or jumper, with trousers that flare slightly at the bottom and a cap. Blue wool and white cotton uniforms are authorized.

The evening dress uniforms are similar to civilian dress with the exception of the ornamentation, buttons and insignia. The women have summer and winter service, semidress and dress uniforms. The uniforms are blue or white and consist of cotton dress (for summer), skirt, blouse, hat (or cap), handbag and shoes. The marine corps service uniforms are green (for winter) and khaki (for summer). The dress uniforms are blue; the coat, with a stand-up collar, is of a darker shade than the trousers. The women's uniforms are of green or white. The uniforms of the military sea transportation service are, in general, of standard navy pattern. However, the insignia, buttons, etc., are distinctive to this service.

Air Force.—The air force winter uniform is of blue and the summer one is tan. The uniform consists of a single-breasted coat, trousers and service cap with a leather visor. The flight cap (oversea type) and a single-breasted jacket are authorized for optional wear. Shoes are black; neckties and belts are dark blue. The overcoat is blue. The raincoat is single-breasted box-style model of dark blue nylon-rayon. Shirts are blue for winter and tan for summer. Evening dress uniforms are similar to civilian dress except for ornamentation, buttons and insignia.

The women have summer and winter service, semidress and dress uniforms. The uniforms are tan, light blue or white. The uniforms consist of cotton dress (for summer), skirt, blouse, hat (or cap), handbag and shoes. The service cap is designed so that removable and interchangeable crown covers may be worn (gray for winter service; cotton cord, blue, white and white stripe with summer uniform and white with white dress uniform). A blue wool flight cap is authorized for optional wear. (A. E. Du.)

UNION CITY, a city of Hudson county, N.J., C.S.. lies on the Hudson river adjacent to Hoboken and Jersey City just opposite Manhattan Island, with direct access to New York city via the Lincoln (auto) tunnel. The site, on the Palisades of the lower Hudson, was originally settled by the Dutch in 1640 as part of an ideal community to be known as Pavonia in honour of Michael Pauw, the leading colonizer of the area. It subsequently became known as West Hoboken (incorporated in 1884) and Union Hill (incorporated in 1808), which merged to form Union City in 1925.

It is an industrial manufacturing centre producing such products as automotive parts, electrical appliances and equipment, embroideries, novelties, paperboard, pharmaceuticals, rubber products, jewelry, textiles, and tobacco products. Despite its relatively small area (1.3 sq.mi.), it is also a residential community. The population in 1960 was 52,180; for comparative population figures see table in NEW JERSEY: Population. (D. N. A.; M. P. M.)

UNIONIST PARTY: see CONSERVATIVE PARTY (BRITISH).

UNION LEAGUE OF AMERICA, THE, was organized by a group of Ohio Republicans in 1862 when the Union armies were meeting defeat after defeat and the Democratic party was winning an uncomfortable number of local elections. Its purpose was to inspire "uncompromising and unconditional loyalty to the Union." It was to combat the Copperheads (*q.v.*) and other subversive groups and infuse new vitality into the slipping Republican party. The movement caught hold and spread rapidly to other states. It reached its most effective form in Philadelphia and New York city where it became a social as well as a political organization. Within a year it had spread to cities as widely separated as Boston and Chicago, and something of a loose federation had been developed between the different leagues. As time went on, the social idea became more and more important, but the membership continued to be primarily Republican.

As the Union armies moved southward in the last years of the war, the league followed them with teachers and organizers. Its efforts were concentrated primarily on the Negro. Military companies were organized and their expenses paid; supplies were sent to the field, and political literature was distributed. Even a few dissatisfied southern whites were attracted to the organization.

Its chief importance, however, came at the close of the war when talk of giving the Negro the vote and of disenfranchising the southern whites began to be heard. Officers of the Freedmen's bureau and northern adventurers in the south quickly saw the league as an agent both for spreading propaganda in favour of Negro enfranchisement and for controlling that vote if secured. State councils were created and a Grand National council set up in New York. A lobby was organized in Washington to support the radical reconstruction program and to oppose the more liberal efforts of Pres. Andrew Johnson. Tales of southern mistreatment of the Negro were widely circulated, and the impression was created that the Negro's future welfare depended entirely on his right to vote. Activities in the south were stepped up and membership rapidly increased in every state. The great object became one of creating a powerful Republican party in the south.

In its first days league membership in the south had been made up largely of white men—northern officials, carpetbaggers and southerners who had opposed secession or had fallen out with the Confederate government. Gradually, as the Negro gained the vote, southern whites withdrew and membership consisted almost entirely of Negroes under the direction of a few white politicians. By appeal to racial pride, past injustices and the chance for group activities, the league provided the kind of organization needed to bind the Negro to the Republican party and to hold him in line. Its nocturnal meetings were secret, with armed guards to drive away intruders. It initiated members with elaborate ceremonies in which an altar, the Bible, the flag, the Declaration of Independence and the constitution all came into play. To give a more practical turn, the sword, the ballot box, the shuttle, the anvil and other implements were introduced. Then, while members sang patriotic songs, the new members pledged their lives and fortunes to the preservation of liberty and union, the protection of each other, the maintenance of the constitution, the observance of the duties of citizenship and the support of those who did likewise. Then the password and the signs by which members could recognize each other were revealed.

The league proved an effective political agent and played an important part in southern affairs from 1866 to 1869. After that it declined rapidly as Negroes and white leaders quarreled over the spoils of office and discipline became too harsh It had, however, done its part in bringing the Ku Klux Klan (*q.v*) into being, put a heavy strain on race relations and brought the harsh reactions against Negro voting in the years after 1890 (AY. CN.)

UNION OF SOVIET SOCIALIST REPUBLICS, THE: *see* RUSSIA.

UNIONTOWN, the seat of Fayette county in southwestern Pennsylvania, U S , lies 70 mi. S E. of Pittsburgh. The county is noted for agriculture and is rich in coal deposits; coal mining. though greatly reduced, is the chief industry. Uniontown factories produce textiles. building and fire brick. glass, chemicals and explosives, gas and water meters, machinery and steel scaffolding. Limestone and sandstone deposits are located nearby and silica sand used in glass manufacturing is of local origin.

'The vicinity of Uniontown is rich in historical interest, especially the period of the French and Indian War. Jumonville, Ft. Necessity and Gen. Edward Braddock's grave are located only a few miles from the city. Uniontown was founded by Henry Beeson in 1769, incorporated into a borough in 1796 and became a city in 1916. For comparative population figures see table in PENNSYLVANIA: *Population.* (M. R. WO.)

UNITARIANISM, a system of Christian thought and religious observance, deriving its name from its doctrine of the single personality of God the Father, in contrast with the Trinitarian conception of His threefold being as Father, Son and Holy Spirit. The significance of the movement, however! is imperfectly indicated by its name and its true importance lies in its undogmatic approach to religious questions and its teachings concerning God, man. the nature and work of Jesus Christ and religious belief.

Origins. — The greatest single influence which led to the origin and growth of Unitarian Christianity was the free and independent study of the Bible in the Reformation and post-Reformation period. Criticism of the orthodox doctrine of the Trinity was voiced by a few advanced thinkers, the most notable of whom was Michael Servetus (1511?–53), who was put to death for his heretical opinions at the instigation .of John Calvin. Other outstanding names were Laelius Socinus (1525–62) and Faustus Socinus (1539–1604) and by the 17th century Unitarian communities had been established in Poland (now extinct) and in Transylvania. Sporadic anti-Trinitarianism was also to be found in England during the 16th and 17th centuries and was again the product of independent judgment in the interpretation of Scripture. John Biddle (1615 or 1616–62) is known as the "father of English Unitarianism" and during the Commonwealth organized meetings for worship and the study of the Bible,

Unitarian ***Church*** Life.—As a consequence of the Act of Uniiormity of 1662, more than 1,700 clergymen of the Church of England were deprived of their livings. It was among dissenting ministers and congregations for whom chapels were built in the years that followed the Toleration act of 1689 that Unitarian church liie had its beginnings although the act excluded Unitarians from its provisions. Although these chapels were almost always orthodox at the start, during the 18th century many of them came to adopt Unitarian opinions. This was made possible through the ireedom which was allcwed by their principle of nonsubscription to human creeds. Hence it was that approximately a third of the 323 Unitarian congregations existing in the British Isles in the mid-1950s had a continuous history from the last quarter of the 17th century. Many of the traditional doctrines of orthodox Christianity such as the Trinity, inherited guilt, eternal punishment and vicarious atonement were either abandoned or regarded as nonessential to the Christian liie. The most characteristic movement of thought was that which saw "Arian" or "Socinian" views of the person of Jesus Christ develop into acceptance of him as a purely human figure, though still central to the spiritual and devotional life. The rapid crystallization of Unitarian opinion at the end of the 18th century was mainly due to such commanding figures as Joseph Priestley (1733–1804), Theophilus Lindsey (1723–1808) and Thomas Relsham (1750–1829). Lindsey, aiter withdran·ing from the Church oi England, opened in Essex street, London, the first Unitarian chapel specifically so named. Although penal laws against those who impugned the doctrine of the Trinity were not repealed until 1813, Unitarian societies for the spread of literature and mission work had been formed in 1791 and 1806. Together with the Association for Civil Rights of 1819 these were amalgamated in the British and Foreign Unitarian association of 1825 as the first effective consolidation of Unitarian interests.

Changing Bases of Belief.—At the beginning of the 19th century Unitarian Christianity was, broadly speaking, a biblical religion, accepting miracles, and rejecting creeds, not as incredible, but as nonbiblical, resting its hopes on an external revelation and attaching·little importance to what it regarded as the uncertain influences and promises of "natural religion." This position was radically changed by the development of scientific knowledge and biblical and historical criticism, aided by the influence of new teachers and thinkers. As a result of the work in the United States of W. E. Channing (1780–1842) and Theodore Parker (1810–60) and, in England, of J. J. Tayler (1797–1869), J. Hamilton Thom (1808–94) and, above all, James Martineau (1805–1900), Cnitarianism became a spiritual religion which finds its supreme authority in religious history and experience, interpreted by the reason and conscience of mankind. It welcomes the findings of modern biblical criticism and seeks to understand non-Christian religions and to co-operate with them.

The 20th Century. — The 20th century witnessed further developments of Unitarian Christianity in organization and thought. The deeply felt need ior more effective corporate union was met by the formation in 1928 of the General Assembly of Unitarian and Free Christian Churches, which comprised all the principal related denominational organizations. The principles of nonsubscription to creeds and private judgment were steadfastly maintained and no official statement of belief binding upon all adherents has ever been issued. Unitarians and Free Christians are bound together by a common purpose, which has iound concise expression in a statement adopted by many congregations: "In the love of truth, and in the spirit of Jesus Christ, we unite for the worship of God and the service of man." Changes in the contemporary spiritual and intellectual climate led to the appointment by the assembly of a Commission on Doctrine which published its findings in 1943 in a volume entitled *A Free Religious* Faith. This contains a series oi papers by several writers on the beliefs which are commonly accepted by most Unitarians, though it is in no way an authoritative statement of those beliefs. (F. KY.)

UNITED STATES

Unitarianism in the United States followed essentially the same development as in England, and passed through the stages of Arminianism, Arianism, antitritheism, to rationalism and a modernism based on a large-minded acceptance of the results of the scientific and comparative stud:; of all religions. As early as the middle of the 18th century Harvard college represented the most advanced thought of the time, and a score or more of clergymen in New England were preaching what was essentially Unitarianism. The most prominent of these men was Jonathan Mayhew (1720–66), who was pastor of the West church in Boston, Mass., from 1747 to 1766.

The first official acceptance of the Unitarian faith on the part of a congregation was by King's chapel in Boston, which settled. James Freeman (1759–1835) in 1782, and revised the Book of Common Prayer into a mild Unitarian liturgy in 1785. Unitarian congregations were organized at Portland and Saco, Me., in 1792 by Thomas Oxnard; in 1800 the First church in Plymouth, Mass., accepted the more liberal faith. Joseph Priestley came to the United States in 1794 and organized a Unitarian church at Northumberland, Pa., in the same year, and one at Philadelphia in 1796. His writings had considerable influence. Thus from 1725 to 1825 a more tolerant belief was developing in New England, and to some extent elsewhere.

William Ellery Channing was settled over the Federal Street Congregational church. Boston, 1803; and in a iem years he became the leader oi the Unitarian movement. At first mystical rather than rationalistic in his theology, he took part with the "Catholic Christians." as they called themselves, who aimed at brinzing Christianity into harmony with the progressive spirit of the time. His essays, "The System of Exclusion and Denunciation in Religion" (1815) and "Objections to Unitarian Christianity Considered" (1819), make him a defender of Unitarianism. The Unitarian movement grew slowly; its influence has been chiefly exercised through general culture and the better literature of the country. Many of its clergymen have been trained in other denominations; the Harvard divinity school was distinctly Unitarian from its formation in 1816 to 1870, when it became an unsectarian department of the university. By 1950 there were four colleges and seminaries and two preparatory schools associated with the Unitarian denomination. One of the oldest Unitarian schools is Meadville Theolozical school, founded in Meadville, Pa., in 1844 and moved to Chicago. Ill., in 1926.

Periods of Unitarian Thought. — By mid-20th century Unitarian thought in the United States had passed through three periods. The first. from 1800 to 1815. was formative, mainlv influenced by English philosophy, semisupernatural, imperfectly rationalistic, devoted to philanthropy and practical Christianity. Channing was its distinguished exponent. The second, from 1835 to 1885, profoundly influenced by German idealism, was increasingly rationalistic, though its theology was largely flavoured by mysticism. The leaders were Ralph Waldo Emerson and Theodore Parker. The third, beginning about 1885, was one of rationalism, recognition of universal religion, large acceptance of the scientific method and ideas and an ethical attempt to realize the higher affirmations of Christianity. It was marked by harmony and unity to a great degree, by steady growth in the number of churches and by a widening fellowship with all other progressive phases of modern religion. During this period the influence of Emerson became predominant.

An International Council of Unitarian and Other Liberal Religious Thinkers and Workers was organized at Boston on May 25, 1900, "to open communication with those in all lands who are striving to unite pure religion and perfect liberty, and to increase iellowship and co-operation among them." In 1910 this organization became the International Congress of Free Christians and Other Religious Liberals, and in 1930, the International Association for Liberal Christianity and Religious Freedom. Beyond its own borders the body has obtained recognition through the public work of such men as Henry Whitney Bellows and Edward Everett Hale, the remarkable influence of James Freeman Clarke and the popular power of Robert Collyer.

In May 1960 the Universalist Church (*q.v.*) and the American Unitarian association. in Boston, Mass., approved consolidation of the two denominations, effective one year later. As the Unitarian Universalist association, the new denomination had about 200,000 adult members in the U.S., Canada and Mexico in about 800 churches and 300 lay fellowships. (J. H. L.; X.)

UNITED ARAB REPUBLIC (AL-JUMHURIYA AL-ARABIYA AL-MUTAHIDA), the union of Egypt (*q.v.*) and Syria (*q.v.*) proclaimed Feb. 1, 1958, and ratified overwhelmingly in nationwide plebiscites Feb. 21. The two parts or regions of the United Arab Republic (U.A.R.) were not adjacent but were separated by about 150 mi., Lebanon, Israel and Jordan lying between them.

Particularly among the Syrians, Arab unity had long been a popular idea. Serious Egyptian interest dated from 1955 when formation of the Baghdad pact (*q.v.*) and evidence of Israeli military strength emphasized Egypt's growing isolation. A joint Egyptian-Syrian military command was established, conventions looking toward increased economic integration were signed and an agreement was made to co-ordinate educational processes. The Egyptian constitution of 1956 proclaimed Egypt to be "part of the Arab Nation." The Syrian constitution of 1950 had made the same proclamation about Syria. Negotiations toward union began in 1956; they became urgent late in 1957 when Syrian Pres. Shukri al-Kuwatli and leaders of the dominant Baath party sought Pres. Gamal Abdal Nasser's agreement on immediate and full organic union. Certain to be widely popular, it was felt that union under the strict no-party ban of the Nasser regime would negate the imminent threat of a Communist coup in Syria. Forestalled by their erstwhile Baathist allies, the Syrian Communists promptly went underground; their leader, Khalid Bagdash, left for Moscow. The U.A.R. was promptly recognized by other nations; it had but one vote in the United Nations in place of the two votes that Syria and Egypt had had before the union.

Government and Administration. — The provisional constitution of March 8, 1958, defined the new state as a "democratic, independent, sovereign Republic" based on a planned economy aimed at increasing national productivity and raising the standard of living. Private property and other rights and freedoms were explicitly endorsed "within the limits of the Law." Discrimination was proscribed and military service was made obligatory. Broad executive authority was vested in a president who was also to be head of the armed forces. He was given power not only to appoint and dismiss vice-presidents and cabinet ministers but also to appoint and dismiss members of the national assembly. He was empowered to initiate and promulgate legislation, convene and dismiss the national assembly, conclude treaties and enact decrees during legislative recess subject to subsequent reversal by a two-thirds assembly majority. Nasser was elected president by a nearly unanimous vote in the plebiscites on Feb. 21, 1958.

The assembly approved or rejected treaties and legislation, including taxes and budgets; interpellated cabinet ministers and could force their resignation by a vote of no confidence; and debated government policy. Judges were independent, subject only to the law; they could not be dismissed.

The citizenry participated in government at all levels through the national union, a single-party system intended to create a "socialist, democratic, and co-operative society." On July 8, 1959, Egypt's 6,500,000 and Syria's 1,500,000 voters elected 16,000 local council members, each representing about 500 voters. The local councils, designed to deal with local affairs and thus to encourage self-government, in turn elected 33 provincial councils to function as provincial legislatures under governors appointed by the president. These councils in turn elected a general congress of the national union from whom were appointed the members of the U.X.R. national assembly

The provisional constitution provided that the separate laws, administrations, treaties and budgets of each region were to remain operative until modified or repealed; executive councils for the two regions were appointed by the president. In the first U.A.R. cabinet of March 6, 1958, foreign affairs, education, armed forces, national guidance, *waqfs* ("religious endowments"), presidential affairs and Arab affairs were put under single ministers (all but one of whom were Egyptians) with separate interior, economy and commerce, agriculture, treasury, etc., ministries for each region. A program of gradual unification was envisaged, but the revolution in Iraq in July 1958 made that country more attractive to Syrians as an alternative to Egypt, and the pace toward centralized Egyptian control was accelerated. This was largely at the expense of Syrian Baathist leaders, many of whom had retained or gained high office under the new regime.

Disruption. — The United Arab Republic was brought to an end by the secession of Syria in Sept. 1961 as a result of a military coup. Egypt did little to oppose this move and an independent Syrian government was established. This government was-shortly afterward recognized by the leading powers and Syria resumed its seat as a separate member of the United Nations. *See* also ARAB LEAGUE; UNITED ARAB STATES. (R. H. N.; X.)

UNITED ARAB STATES (ITTIHAD AD-DUWAL AL-'ARABIYA), formerly a federal union of the United Arab Republic and the kingdom of Yemen proclaimed in Damascus on March 8, 1958. The charter, which was left open to acceptance by other Arab states. maintained the international personality and governmental system of each member but called for unified armed forces, a concerted foreign policy, a customs union, common currency and co-ordination of education. The heads of state constituted a supreme council that exercised authority in union affairs. A federation council of representatives with attached councils of defense, economics and culture prepared annual programs (*e.g.,* for Yemen's economic development) for ratification by the supreme council. The seat of the union was in Al Hudaydah, Yemen.

The federal association between Egypt and Yemen ostensibly continued for a time after Sept. 28, 1961, when Syria seceded from the United Arab Republic, but on Dec. 26, 1961, Egypt formally ended the federation. *See* also ARAB LEAGUE; EGYPT; SYRIA. (R. H. N.; X.)

UNITED CHURCH OF CHRIST: *see* CONGREGATIONALISM: *United States.*

UNITED FREE CHURCH OF SCOTLAND, a religious organization, representing the union made in 1900 between the Free Church of Scotland (except a dissentient section which separated and retained the name of Free Church) and the United Presbyterian Church. (*See* FREE CHURCH OF SCOTLAND and UNITED PRESBYTERIAN CHURCH.) The Free Church brought into the union 1,077 congregations, the United Presbyterians 599; the revenue of the former was £706,546, of the latter £361,743.

The minority of the Free Church which had refused to join the union lost no time in testing the legality of the act of the majority in entering it. Their summons, dated Dec. 14, 1900. claimed that in uniting with the United Presbyterian Church, which did not hold the principles of the Free Church, the majority had forfeited the right to the property of the Free Church, which must be judged to belong to the minority who remained faithful to the principles of the Free Church and were that church. In the Scottish courts the case was decided in favour of the union on Aug. 9, 1901, and on July 4, 1902; but, on appeal, the house of lords, on Aug. 1, 1904, by a majority of five to two, reversed these decisions and found the minority entitled to the funds and property of the Free Church.

Few legal decisions have occasioned such great consternation or such serious practical difficulties. At first sight it deprived the majority of the Free Church section of the United Church of all its material goods—churches, manses, colleges and missions, even of the provision for the old age of the clergy—and handed them over to a body which could have little prospect of making effective use of them. Nothing remained but to invoke the intervention of parliament to put an end to an impossible situation. In December a commission was appointed, consisting of Lord Elgin, Lord Kinnear and Sir Ralph Anstruther, to inquire into matters connected with the two churches, while the question of interim possession was referred to Sir John Cheyne, as commissioner, for inquiry and action.

The commission sat in public and in their report (April 1905) said that the state of feeling on both sides had made their work difficult. They had concluded, however, that the Free Church was unable in many respects to carry out the purposes of the trusts, which, under the verdict of the house of lords, was a condition of their holding the property, and that there was a case for parliamentary inference. They recommended that an executive commission should be set up by act of parliament in which the whole property of the Free Church, as at the date of the union, should be vested, and which should allocate it to the United Free Church, where the Free Church was unable to carry out the trust purposes. The Churches (Scotland) act, which gave effect to these recommendations, was passed on Aug. 11, 1905.

In Oct. 1929 most of the Cnited Free Church reunited with thr Church of Scotland. The joint group was renamed the Church of Scotland. At mid-20th century the combined organization was composed of a general assembly, 12 synods and 66 presbyteries in Scotland. 1 presbytery in England and 3 in continental Europe. There n-ere 2,360 congregations with 1.300.000 members and 2,900 Sunday schools with more than 300,000 scholars and teachers. Including natives, there were about 13.000 agents in the church's foreign missions, which had an annual income of more than £1,000,000.

The church was affiliated with four Scottish universities: Edinburgh, Glasgow, Aberdeen and St. Andrews.

In 1954 the United Free Church of Scotland, made up of those congregations from the then United Free Church which in 1929 dissociated themselves from union with the Church of Scotland, was composed of nine presbyteries. Its congregations in 1954 numbered 121, its ministers 83 and its communicant members 24,712. It is served by a number of missionaries in the foreign field. For the training of its ministers it maintains its on-n theological college conjointly with the Congregational Union of Scotland. Its general assembly meets annually in June at Edinburgh and Glasgow alternately.

See also SCOTLAND, CHURCH OF.

UNITED KINGDOM OF GREAT BRITAIN AND IRELAND, the title of the former political unity composed of England. Wales, Scotland and Ireland, officially adopted on Jan. 1. 1801, when the Act of Union between Great Britain and Ireland came into force. The name Great Britain has been used since the union of the kingdoms of England and Scotland in 1707 as the official designation of the united countries.

When, in 1922, 26 Irish counties mere severed from the United Kingdom and erected into a dominion of the British empire under the name of the Irish Free State (later Eire. Ireland), no pro!-ision was made in the act for any change in the royal style or in the title of the imperial parliament. From 1922 onward, however, the title of United Kingdom of Great Britain and Northern Ireland was frequently used in official documents to designate those parts of the British Isles represented in the imperial parliament, meeting at Westminster. In the report of the interimperial relations committee of the imperial conference of 1926 it was suggested that, in view of new constitutional developments. the words "United Kingdom" should be omitted from the royal style, which should run: "George V, by the Grace of God. of Great Britain, Ireland, and the British Dominions beyond the Seas King, Deiender of the Faith, Emperor of India."

By the Royal and Parliamentary Titles act, 1927 (17 Geo. 5, ch. 4). accordingly, the king was authorized to change the style and titles of the crown by royal proclamation. This was done. on May 13. 1927. by a proclamation adopting the recommendation of "the representatives of our Governments in Conference." and declaring that in the English style "Great Britain, Ireland and . . ." should henceforth be used instead of "the United Kingdom of Great Britain and Ireland." By the same act of parliament (2. 1) it was enacted that "Parliament shall hereafter be known as and styled the parliament of the United Kingdom of Great Britain and Northern Ireland." The accession of Queen Elizabeth II in 1952 provided an opportunity to bring the royal title into harmony with the parliamentary. On May 29, 1953, under the Royal Titles act, a proclamation mas issued by which the queen adopted the title of "Elizabeth II, by the Grace of God, of the United Kingdom of Great Britain and Northern Ireland. . . ."

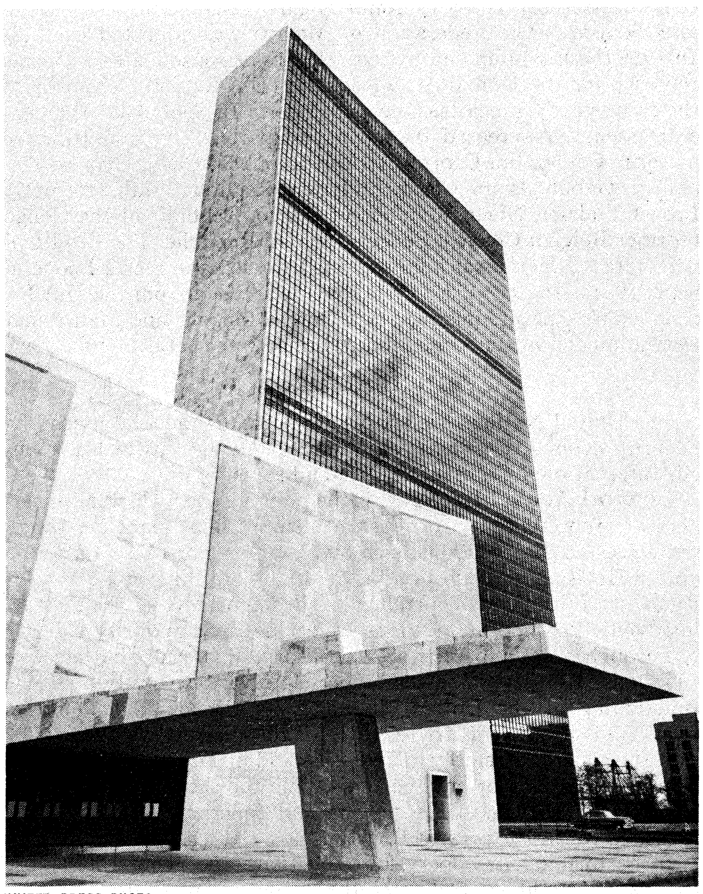
UNITED NATIONS. Upon the basis of proposals submitted by China, the U.S.S.R., the United Kingdom and the United States, the Cnited Nations Conference on International Organization which convened at San Francisco. Calif.. on April 25, 1945, drafted the charter of the United Kations. It was signed at the conclusion of the conference June 26 and entered into force Oct. 24, 1945, when the above states and France, and a majority of the other 46 signatories had deposited their ratifications. (See also SAN FRANCISCO CONFERENCE [1945].)

Purposes **and** Membership.—The first article of the charter outlines the purposes of the organization. The primary objective is the maintenance of international peace and security. The organization also dedicated itself to the development of friendly relations among nations: based on the principle of equal rights and self-determination of peoples; to the achievement of international co-operation in solving international problems of an economic, social: cultural or humanitarian character; and to serving as a centre for harmonizing the actions of nations in the attainment of these common ends. Some of the basic principles of the United Kations, as outlined in art. 2 of the charter. are as follows: the United Nations is based on the sovereign equality of its members; disputes are to be settled by peaceful means; members undertake not to use force or the threat of force in contravention of the purposes of the Cnited Nations; each member must assist the organization in any action it takes under the charter; and states not members of the



UNITED PRESS PHOTO

UN GENERAL ASSEMBLY BUILDING SEEN FROM THE FIRST AVENUE ENTRANCE, NEW YORK CITY. THE SECRETARIAT BUILDING IS BEHIND IT

United Nations are required to act in accordance with these principles so far as may be necessary for the maintenance of international peace and security. Art. 2 also stipulates that the organization shall not intervene in matters within' the domestic jurisdiction of any state, except to take enforcement measures.

The original members of the United Nations mere as follows: Argentina, Australia, Belgium, Bolivia, Brazil, Belorussian S.S.R., Canada, Chile, China, Colombia, Costa Rica, Cuba, Czechoslovakia. Denmark. Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France. Greece: Guatemala: Haiti, Honduras. India, Iran, Iraq, Lebanon, Liberia, Luxembourg, Mexico, the Netherlands, New Zealand, Nicaragua, Norway, Panamá, Paraguay, Peru, Philippines, Poland, Saudi Arabia, Syria. Turkey, Ukrainian S.S.R., Union of South Africa. Union of Soviet Socialist Republics, United Kingdom, United States, Uruguay, Venezuela and Yugoslavia.

Ne members are admitted to the United Nations on recommendation of the Security council by a two-thirds vote of the general assembly. They must be "peace-loving states." accept the obligations contained in the charter and be able and willing to carry out these obligations. The requirement of concurrence of the permanent members of the Security council has been a serious obstacle to the admission of new members. By 1950, only 9 of 31 applicants had been admitted: Afghanistan, Iceland. Sweden. Thailand (1946); Pakistan. Yemen (1947); Burma (1948); Israel (1949); and Indonesia (1950). A number of efforts had been made by the general assembly to break the deadlock. In the tenth assembly (1955) there was wide support for a "package deal" sponsored by 29 members, under the leadership of Canada. Though it became necessary to drop Japan and Outer Mongolia from the package, in modified form the proposal was approved by the Security council. and the general assembly voted to admit 16 new members: Albania. Austria. Bulgaria, Cambodia. Ceylon, Finland. Hungary, Ireland. Italy, Jordan, Laos, Libya; Nepal, Portugal, Rumania and Spain. In its 11th session (1956-57) the general assembly voted to admit Ghana, Japan, Morocco. Sudan and Tunisia. The Federation of Malaya was admitted in 1957. In 1958 the Egyptian and Syrian delegations ronsolidated into one, representing the United Arab Republic (U.A.R.); in December of the same year Guinea became a member. In Sept. 1960 the general assembly increased the membership to 98 by admitting 16 nations: Cameroon. Central African Republic, Chad, Cyprus. Dahomey, Gabon. Ivory Coast. Malagasy Republic. Mali (formerly French Sudan). Niger. Republic of Congo. Republic of the Congo (former Belgian Congo). Senegal. Somali Republic, Togo and Upper Volta. Nigeria was admitted in Oct. 1960 and Sierra Leone in Sept. 1961. In Oct. 1961 Syria. having seceded from the U.A.R., resumed its separate membership; Outer Mongolia and Mauritania were admitted in the same month, bringing the total to 103.

PRINCIPAL ORGANS

The United Nations has six principal organs: general assembly. Security council, Economic and Social council, Trusteeship council, International Court of Justice and secretariat.

General Assembly. — This is the only body on nhich all members are represented. Although a member inay send five representatives to the general assembly, each member has only one vote. Decisions on substantive questions are taken by a majority or two-thirds vote, depending on the importance of the matters involved. Procedural questions are decided by a majority vote

Through its deliberative, supervisory, financial and elective functions, the general assembly occupies a key position in the functioning of the United Nations. Its role as a deliberative organ finds its basis in art. 10 to 14 of the charter. Art. 10 states that the general assembly may discuss and make recommendations on "any questions or any matters within the scope of the present Charter or relating to the pouers and functions of any organs provided for in the present Charter."

In performing its supervisory functions, the general assembly exercises general control over the activities of United Nations organs in the economic and social fields and in dealing with the problems of nonself-governing territories. The general assembly receives annual reports from the secretary-general and the Security, Economic and Social, and Trusteeship councils, and may make recommendations to these organs. The Economic and Social council and the Trusteeship council operate under the authority of the general assembly. The assembly approves trust agreements and through the Trusteeship council supervises the administration of trust territories. It exercises general supervision and control over the operations of the secretariat. The financial power of the assembly is exercised through its control over the budget of the United Nations and the scale of assessments levied on members. In its elective capacity, the general assembly chooses all members of the Economic and Social council and the elective members of the Security and Trusteeship councils. Along with the Security council, it also participates in the election of judges of the International Court of Justice and the appointment of the secretary-general. The assembly shares with the council the power to initiate amendments to the charter as well as the right to convene a conference for the purpose of revising the charter.

During its first ten years, the general assembly progressively increased in importance as an organ of deliberation and influence in the political field. The decline in the influence and effectiveness of the Security council because of the inability of the permanent members to co-operate encouraged the greater use of the general assembly. The broad language of the charter permitted a substantial increase in the role of the general assembly beyond what nas originally envisaged and most members of the organization had an interest in encouraging this incresse. Members consequently became more and more concerned with ways and means of equipping the assembly, in organization and procedure, for the more effective performance of its growing responsibilities.

The assembly convenes annually; its rules permit special sessions on short notice. In performing its tasks, it works through a fairly complex structure of main committees. procedural committees, standing committees and subsidiary and *ad hoc* bodies.

Security Council. — The charter places on the Security council the primary responsibility for maintenance of international peace and security. Eleven members of the United Nations are members of the council, the five permanent members (Republic of China. France, the United Kingdom, the U.S.S.R. and the United States) and six nonpermanent members elected by the assembly for two-year terms. In selecting nonpermanent members, the assembly must strive for an equitable geographical distribution as well as consider their contribution to the maintenance of international peace and security. From the beginning. nonpermanent members of the Security council were elected with a view to giving representation to certain regions or groups of states. This practice ran into increasing difficulty as the number of United Nations members increased and there were not enough seats to distribute among the groups and regions desiring representation. This problem has led to a demand for additional nonpermanent seats.

Under the charter. all members of the United Nations agreed to carry out the decisions of the Security council. This agreement was interpreted to refer primarily to decisions under ch. vii of the charter. The council is authorized to investigate any dispute which might threaten international peace and security, and to make recommendations for its peaceful settlement. The council may also call on members of the United Nations to apply economic and diplomatic sanctions against any state which the council has found guilty of breach of the peace or act of aggression. It may also decide what military measures are to be taken by members, but this power did not become operative because of the failure to conclude agreements specifying the armed forces and facilities to be placed at the disposal of the Security council by members. The council may also make recommendations on the regulation of national armaments.

On procedural matters, decisions by the council are made by an affirmative vote of any seven of its members; on substantive matters. including the investigation of a dispute and the application of sanctions, seven affirmative votes including those of the five permanent members are required. A vote on whether a matter is procedural or substantive is itself a substantive question.

The council is required to be so organized as to be able to function continuously. Each member is represented at all times at the seat of the organization. The presidency of the council rotates monthly. Like the general assembly, the council has established a number of subsidiary organs to assist it.

Economic and Social Council. — The Economic and Social council is charged with directing and co-ordinating the complex system of economic, social, humanitarian and cultural activities of the United Nations. It comprises 18 members, elected by the assembly for three-year terms with the possibility of re-election. Although the council, unlike the Security council, has no permanent members, states whose participation is considered necessary to the work of the council have been regularly re-elected.

The Economic and Social council meets at least twice a year; it is directed by the charter to make or initiate studies and make recommendations with respect to the promotion of international co-operation in economic and social matters. It may prepare draft conventions for submission to the assembly and call international conferences for specific purposes.

The council is assisted in its work by functional and geographical commissions. The functional commissions carry out studies in the economic and social field and otherwise assist the council in the performance of its duties. They formulate resolutions, recommendations and international conventions on which the council and general assembly take action. Three regional commissions—on Europe, Asia and the far east, and Latin America—which were established to deal with specific regional economic problems assumed roles of considerable importance both as advisory organs and as organs with important operational responsibilities.

Trusteeship **Council.**—Acting under the authority of the general assembly, the Trusteeship council supervises the administration of trust territories by the administering states. The council is composed of those members of the Cnited Nations who administer trust territories; the permanent members of the Security council not administering trust territories; and as many other nonadministering members elected by the assembly for three year terms as are necessary to ensure an equal number of administering and nonadministering members in the total membership of the council. The Trusteeship council is authorized to send visiting missions of inspection into the trust territories to receive and examine petitions, to consider reports submitted to it annually by the administering authorities and to make recommendations with respect to all matters coming within its purview. The council is required to submit annual reports on its activities to the general assembly. *(See* TRUSTEESHIP SYSTEM.)

International Court of Justice. — The court is the principal judicial organ of the Cnited Nations. Its statute is an integral part of the charter of the United Nations. The 15 judges of the court are elected by the general assembly and the Security council voting independently. No two judges may be nationals of the same state. Representation of the main forms of civilization and of the major legal systems of the world is to be assured. Judges serve for nine years and are eligible for re-election.

The jurisdiction of the court comprises all cases which parties submit to it, and all matters specially provided for in the charter or in other treaties. States, by formal declaration, may accept the compulsory jurisdiction of the court in specified categories of disputes. The court may give advisory opinions at the request of the general assembly or the Security council, or at the request of other organs and specialized agencies authorized by the general assembly. *(See* INTERNATIONAL COURT OF JUSTICE.)

The Secretariat. — The secretariat is headed by the secretary-general and consists of such staff as the organization may require. The secretary-general is appointed by the general assembly upon the recommendation of the Security council. At the beginning of its first session in 1946, the general assembly chose Trygve Lie (Norway) for a term of live years, which in 1951 was extended for three years. This extension was bitterly opposed by the U.S.S.R., and in Nov. 1952 Lie resigned. In April 1953 Dag Hammarskjold (Sweden) succeeded him and was re-elected in 1957. In Sept. 1961 Hammarskjold was killed in an airplane crash in Northern Rhodesia and in November U Thant (Burma) was appointed his successor. The secretary-general is the chief administrative officer of the United Nations. He also has important political functions, being specially charged with bringing before the organization any matter that threatens or violates international peace and security. He and his staff perform secretarial functions for the various organs. He submits an annual report to the general assembly on the work of the organization during the preceding year.

DISPUTES AND SITUATIONS AFFECTING INTERNATIONAL PEACE AND SECURITY

By the terms of the charter, the members of the United h'ations conferred upon the Security council primary responsibility for the maintenance of international peace and security. At the San Francisco conference the basic assumption underlying the United Nations as an international security organization was that there would be co-operation among the five permanent members of the Security council on important questions. In fact, it was made a charter requirement that substantive decisions of the council could be taken only with the concurrence of the permanent members. The growing rift between the Soviet Union and the western powers after 1945 resulted in frequent use of the veto, which seriously reduced the effectiveness of the Security council in the discharge of its primary responsibility. As a result, there was an increasing tendency on the part of members to seek security through collective self-defense arrangements, such as NATO, concluded under art. 51 of the charter and, so far as United Nations action was concerned, to look to the general assembly to assume responsibilities in this field.

In 1936 the assembly was asked to deal with the Spanish question, originally brought before the Security council. The U.S.S.R. had vetoed a proposal dealing with Spain on the ground that it should have been more strongly worded, and the question was subsequently brought before the assembly which finally adopted a resolution on Dec. 12, 1946. In the summer of 1947 a Soviet veto prevented the adoption by the Security council of a resolution approving the findings of a commission which had been set up to investigate the disorders on the northern borders of Greece. The question was removed from the council's agenda, and the United States brought the question before the assembly.

In the Korean case, the absence of the U.S.S.R. from the council in protest against the allegedly illegal representation of China by the nationalist government enabled the council in June 1950 to take prompt action against the North Korean forces attacking the Republic of Korea. Realizing that this condition was not likely to be repeated in the future, the general assembly in Nov. 1950, on United States initiative, adopted the Uniting for Peace resolution by which the assembly assumed additional responsibilities for the maintenance of international peace and security. This resolution provided that the assembly should take action with reference to a threat or breach of the peace or act of aggression should the Security council fail to exercise its primary responsibility in that field. The resolution requested Cnited Nations members to set aside contingents in their national armed forces to be made available to the United Nations should the assembly recommend the use of armed force under this resolution.

The resolution also established the Peace Observation commission to observe and report on areas of the world where existing tension might impair international peace and security. The commission was directed to be at the disposal of the Security council or the assembly if the council was not exercising its functions. It also established the Collective Measures committee to study and report on methods which the assembly might use in strengthening international peace and security.

Iran. — The first situation to be brought before the United Nations m s Iran's complaint to the Security council of Jan. 19, 1936, that the Soviet Union was interfering with Iran's internal affairs by not withdrawing its troops from northern Iran. The council called on both parties to negotiate their differences. However, on March 18 Iran reported that the Soviet Union had not withdrawn its troops. On April 4, 1946, the council requested both parties to report by May 6 on progress made in withdrawal of Soviet forces. On May 6 Iran reported withdrawal of Soviet troops from all provinces except Azerbaijan where facts were not known.

Greece.—In Dec. 1946 Greece charged that Albania, Bulgaria and Yugoslavia were aiding Communist guerrillas in northern Greece, and asked the council to investigate this situation The council established the Commission of Investigation, which, after an on-the-spot examination of the alleged disorders, supported the Greek accusations by a majority vote. The council, unable to agree on a resolution, removed the question from its agenda on Sept. 15, 1947. The matter was brought before the general assembly by the United States. In its resolution of Oct. 21, 1947, the assembly requested all parties concerned to negotiate their differences, and established the United Nations Special Committee on the Balkans (UNSCOB) to facilitate peaceful settlement of the dispute. The Soviet Union and the satellite states refused to co-operate. In its first report to the assembly in 1948 the committee reported the continuation of aggressive interventionist activity by Greece's northern neighbours. The general assembly in Nov. 1948 called on Albania, Bulgaria and Yugoslavia to terminate their support of the communist guerrillas in Greece. It authorized the committee to continue its mediatory efforts. The situation had markedly improved by the end of 1948, largely because of United States aid to Greece and Yugoslavia's break with Moscow. The sixth session of the assembly terminated the Special Committee on the Balkans, and the task of observing and reporting condition; along Greece's northern frontier was delegated to the Peace Observation commission.

Indonesia.—In July 1947 Australia and India called the Security council's attention to hostilities which had broken out between the Republic of Indonesia and the Netherlands. Although the Netherlands argued that the United Nations could not act because the matter was within the Netherlands' "domestic jurisdiction." the council called on the parties to cease hostilities and settle the dispute peacefully and appointed a committee of good offices to facilitate a peaceful settlement. In Jan. 1948 both parties signed the "Renville" agreement, providing for a truce and setting forth the political principles to govern a final settlement. The Netherlands renounced the agreement in Dec. 1948 and resumed hostilities. In Jan. 1949 the Security council again called on both sides to terminate armed action, recommended the establishment of a federal. independent and sovereign United States of Indonesia at the earliest possible date, created a new commission for Indonesia and charged it to assist the parties in implementing this resolution. With the assistance of the commission, the parties involved finally reached agreement on the transfer of sovereignty from the Netherlands to the Republic of Indonesia at a round-table conference which met at The Hague from Aug. 23 to Nov. 2, 1949. The formal transfer of sovereignty took place on Dec. 27, 1949.

Palestine.—After World War II, because of the increased agitation on the part of the Jews for a national home and place of refuge and the deterioration of relations between the Jews and Arabs, Great Britain requested that the matter be considered by the general assembly. A special session, meeting from April 28 to May 15, 1947, established the United Nations Special Committee on Palestine (UNSCOP) to investigate possible solutions of this problem. After inspecting conditions in Palestine, the special committee submitted majority and minority reports to the general assembly in Nov. 1947. The majority report, violently opposed by the Arab states, proposed the partition of Palestine into an Arab and a Jewish state and the establishment of an international regime for Jerusalem. the three areas to be joined by an economic union. The minority plan called for an independent federal state. The general assembly accepted the majority plan and called on the Security council to take enforcement action should any interested party attempt to use force to alter the proposed partition. Great Britain announced its intention to terminate the mandate on May 15, 1948.

There was an increase in fighting between Arabs and Jews following the adoption of the assembly's resolution. The assembly, meeting in special session in April and May 1948, decided to invite the permanent members of the Security council to appoint a United Nations mediator. Count Folke Bernadotte of Sweden was subsequently appointed. He was directed to use his good offices to promote cessation of hostilities and a peaceful settlement of the dispute and also to assist the Security council's Truce commission which had been established previously.

On May 15, 1948, Britain terminated its mandate over Palestine, and the new state of Israel was proclaimed. The Arab states immediately had recourse to armed force. In a series of resolutions, progressively more insistent, the Security council called on the parties to cease hostilities. On July 15 the council passed its strongest resolution, warning the parties that, unless they desisted from military action; enforcement measures by the United Nations would be undertaken. Through the efforts of Count Bernadotte, agreements for a truce were finally reached on July 16 and 18. Following the assassination of Count Bernadotte by Jewish terrorists in Sept. 1948, Ralph Bunche of the United States was appointed acting mediator. During 1949 he was successful in negotiating armistice agreements between Israel and the Arab states.

In the autumn of 1948 the general assembly established the United Nations Conciliation commission to assist Israel and the Arab states to reach agreement on boundaries, repatriation of refugees and a general political settlement. This action, followed in Aug. 1949 by a Security council resolution relieving the acting mediator of further responsibilities under council resolutions! meant that responsibility for achieving a political settlement was placed on the commission, while the truce organization under the armistice agreements, headed by the chief of staff, and the Security council had responsibility for maintaining peace.

Failure to find an acceptable solution of the Arab refugee problem and the intransigent positions of both Jews and Arabs blocked all efforts of the Conciliation commission to achieve a political settlement. Complaints of armistice violations were numerous and became increasingly serious in 1954 and 1955. The announcement in Sept. 1955 of a Soviet-Egyptian trade agreement for the exchange of cotton for arms was followed by increased tension. Relations between Egypt and Israel were particularly acute and, following border clashes. the Security council in September called upon the two governments to withdraw their armed forces along the demarcation line to avoid further incidents. On April 14, 1956, the council directed the secretary-general to go to the area to assist in preserving peace.

After discussions with the governments concerned, the secretary-general reported to the Security council on May 10 that he had found a "general will to peace" and that unconditional cease-fire agreements had been established between Israel and its Arab neighbours. He stressed that further initiative rested with the governments concerned. However, during the summer and early autumn. relations between Egypt and Israel rapidly deteriorated. Finally, on Oct. 29, Israeli armed forces invaded the Sinai peninsula and quickly overran the peninsula and the Gaza strip. Israel cited in justification Egypt's blockade of Israeli shipping through the Suez canal, Egyptian president Gamal Abdel Nasser's threats and military plans and *fedayeen* ("Arab infiltrator") raids. On Oct. 30 the British and French governments demanded that Egypt and Israel agree to a cease fire within 12 hours, withdraw their armed forces from the vicinity of the Suez canal and agree to temporary British-French occupation of key points in the canal zone. Egypt refused, and the British and French began military action against Egypt.

On Oct. 29 the U.S. asked that the Security council consider the Israeli attack. On the 30th France and the United Kingdom vetoed a United States draft resolution calling for an immediate cease fire and the withdrawal of Israeli forces. The next day the Security council called a special session of the general assembly under the Uniting for Peace resolution to consider the Israeli, French and United Kingdom military actions. On Nov. 2 the assembly adopted a resolution calling for a cease fire, the withdrawal of troops and no introduction of military goods in the area. On Nov. 5 the assembly established a United Nations command for an emergency international force (UNEF), "to secure and supervise the cessation of hostilities," under Gen. E. L. M. Burns, chief of staff of the UN Truce Supervision organization. Israel, Egypt. France and the United Kingdom then agreed to a cease fire unconditionally and Egypt accepted UNEF. On Nov. 7 the assembly approved the recommendations contained in the secretary-general's report on the duties, organization and functioning of this force, to be composed of contingents from the smaller countries. The first contingents of UNEF arrived in Egypt on Nov. 15. British and French forces finally completed withdrawal on Dec. 22. By the middle of Jan. 1957 Israeli forces had been withdrawn from all occupied territory except the Sharm el Sheikh area and the Gaza strip. The UNEF withdrew from the Suez canal zone iollowing withdrawal of French and U.K. forces and was being used to facilitate the withdrawal of Israeli forces. Israel conditioned complete withdrawal on guarantees of future Israeli security.

Suez Canal Question. — The Egyptian. government first brought the question before the Security council in 1947 when a revision of the 1936 treaty with the United Kingdom was being sought. In 1954 an agreement was concluded between Egypt and the United Kingdom providing for the withdrawal of U K. forces from the canal zone. After Colonel Nasser nationalized the canal in July 1956, the United Kingdom and France first sought to get Nasser's agreement to a plan for the effective internationalization of the canal. Failing this, they brought the question to the Security council which, on Oct. 13, adopted a resolution setting forth six principles on which a settlement should be based. Failure of subsequent efforts to implement these principles was thought to be one reason for the British-French military action against Egypt on Oct. 30. Following the blocking of the canal by Egypt in opposing British-French military action, the UN, by agreement with Egypt, undertook the task of clearance.

Hungary. — Popular discontent in Hungary led in Oct.–Nov. 1956 to the use of Soviet forces to prevent an anti-Communist regime from being established. On Oct. 27 the United States, the United Kingdom and France asked that the Security council consider the situation. The Soviet Union vetoed a U.S. proposal calling on the U.S.S R. to cease and desist. The council requested an emergency session of the general assembly, but resolutions of that body calling on the Soviet Union to desist from military intervention and to respect the right of the Hungarian people to independence, affirming the desirability of free elections and requesting the secretary-general to carry out an investigation of conditions in Hungary were disregarded by the Soviet and Hungarian governments on the grounds that this was a domestic matter.

India-Pakistan Question. — The state of Jammu and Kashmir, located in the northern part of the Indian subcontinent between India and Pakistan, was given its choice, under the British Indian Independence act of 1947, to accede to either of its neighbours. Both India and Pakistan pressed their claims. In the autumn of 1947 Moslem tribal groups invaded Kashmir, and Indian forces were sent in at the request of the Kashmir government after it had elected to accede to India. India brought the situation before the Security council on Jan. 1, 1948, and demanded that the council order Pakistan to desist from encouraging and supporting hostilities in Kashmir. Pakistan, however, denied India's accusation and requested the council to appoint a commission to assist in ending hostilities in Kashmir and to facilitate the withdrawal of Indian and Pakistan troops so that a plebiscite could be held. On Jan. 20, 1948, the Commission on India and Pakistan was established by the council and was directed to place its good officesand mediatory services at the disposal of the two states.

A cease-fire agreement became effective on Jan. 1, 1949, and United Nations observers helped in its enforcement. The commission was unsuccessful, however, in its effortsto achieve a political settlement. In April 1950 Sir Owen Dixon of Australia was appointed by the Security council as United Nations representative to serve as mediator between the parties.

In April 1951 Frank Graham of the U.S. replaced Dixon. The commission and the representatives were able to narrow the area of disagreement but could not get full agreement on the two main issues. the demilitarization of Kashmir and the conduct of a free and impartial plebiscite.

Korea. — Shortly after the end of World War II the northern half of the peninsula of Korea was occupied by the U.S.S.R. while the area south of the 38th parallel was occupied by United States forces. When the Soviet Union and the U.S. reached an impasse in their negotiations to achieve a united democratic Korea, the U.S. requested the general assembly in Sept. 1947 to consider the question. The assembly passed a U.S.-sponsored resolution calling for elections in Korea under UN supervision preparatory to constituting a national government for that country. On May 10, 1948, elections were held in South Korea alone after the Soviet military authorities had refused UN supervision in North Korea, and a government of the Republic of Korea was established in the south. The general assembly in Dec. 1948 declared that this was the only government in Korea based on free elections. Meanwhile. Soviet authorities assisted in the establishment of a government in North Korea, known as the People's Republic of Korea. During 1948–49 both the U.S. and Soviet troops were withdrawn from Korea.

On June 25, 1950, the armed forces of North Korea invaded South Korea. On the same day the Security council called on North Korean authorities to withdraw their armed forces and demanded an immediate cessation of hostilities. When the North Korean authorities disregarded this resolution, the council on June 27 called on members of the United Nations to "furnish such assistance to the Republic of Korea as may be necessary to repel the armed attack and to restore international peace and security in the area " Led by the United States, many UN members gave material assistance to the Republic of Korea. On July 7 the council requested the U.S. to appoint a supreme commander for United Nations forces in Korea, and Gen. Douglas MacArthur was so designated. Following the Inchon landing in mid-Sept. 1950, the United Nations forces sought to drive the Communists from all of Korea. the general assembly in Oct. 1950 having implicitly approved this course. The assembly established the United Nations Commission for the Unification and Rehabilitation of Korea to carry out the original unification goal of the United Nations. In late Oct. 1950 contingents from the Communist Chinese army actively intervened.

After failing to achieve a cease fire and the peaceful settlement of the dispute, the assembly, on Feb. 1, 1951, labeled Communist China an aggressor and established an Additional Measures committee to consider the application of sanctions against that government. On May 18 the assembly recommended that members apply an embargo on arms, munitions and other implements of war against areas controlled by the Communists. Many states had already applied such measures.

After two years of negotiations a truce agreement was signed on July 27, 1953, which contained guarantees against future aggression and which provided for a line of demarcation in the vicinity of the 38th parallel that was more defensible than the original line. It recommended that within three months a political conference be held to arrive at a peaceful settlement of the Korean question. A conference for this purpose met at Geneva, Switz., in 1954, but ended in failure. While the Korean question was considered by the assembly at every subsequent session, the deadlock remained unbroken. The assembly in 1957 again called for the reunification of Korea under a representative government and as an independent and democratic state. (See also KOREAN WAR.)

Corfu Channel. — In Jan. 1947 Britain called the Security council's attention to a dispute with Albania concerning damage incurred by British warships and naval personnel as a result of the detonation of mines in the Corfu channel. The U.S.S.R. vetoed a resolution which placed the blame on Albania, and the council recommended that Britain and Albania submit the dispute to the International Court of Justice. The parties agreed to submit the dispute to the court. but Albania refused to carry out the court's judgment as to the amount of compensation.

Berlin. — In Sept. 1948 the Security council considered the question of the Soviet blockade of west Berlin which severed contact between the western powers and their zones in the German capital. The U.S.S.R. argued that the council had no authority to deal with this matter. and when the council, in Oct. 1948, voted to place the question on its agenda, the Soviet Union refused to participate in the council's discussions of the blockade. Although the council was unable to work out an acceptable solution to the question after several attempts, the United States and Soviet representatives on the council reached an understanding which permitted a settlement to be subsequently reached.

Italian Colonies. — After the Council of Foreign Ministers was unable to agree on the disposal of the former Italian colonies of Libya. Somaliland and Eritrea following World War II, a clause was inserted in the Italian peace treaty of 1947 to the effect that, in the event of continued disagreement, the matter would be referred to the general assembly for a final determination. When agreement was again found impossible, the matter was placed before the assembly in April 1949. In Nov 1949 the assembly decided that by Jan. 1. 1952, Libya should become an independent state and that until then it should be administered by a United Nations commissioner, advised by a council of representatives consisting of six United Nations members and four local inhabitants.

Under the guidance of Adrian Pelt, United Nations administrator. Libya was prepared for statehood: and on Dec. 24, 1951, became the first formerly dependent area to become an independent state under the aegis of the United Nations. Somaliland was placed under U S trusteeship, with Italy serving as the administering authority. The assembly declared that this former colony should receive its independence ten years after the assembly approved of the trusteeship agreement, which it did in Dec. 1950. The assembly decided in 1950 that Eritrea should be federated with Ethiopia, although it should retain as much local autonomy as possible. The United Kingdom was selected as the administering authority to prepare for federation. which took place Sept. 15, 1952.

Anglo-Iranian Oil Dispute.—Following Iranian nationalization of the properties of the Anglo-Iranian Oil company in May 1951 the United Kingdom asked the International Court of Justice to adjudicate. The court called upon Iran to take certain provisional measures and when Iran refused. the United Kingdom, on Oct. 1, asked the Security council to take action. The council deferred action until after the court had determined its jurisdiction. In July 1952 the court decided that it did not have jurisdiction and the dispute was subsequently settled by negotiation between the interested parties.

Tunisia, Morocco and Algeria. — In 1951, at its sixth session, and at succeeding sessions. the general assembly was asked by Asian and African members to consider the situation in Morocco resulting from the alleged denial by France of Moroccan national aspirations. In 1952 the assembly adopted a moderate resolution expressing the hope that the parties through continuing negotiations would reach agreement on the development of free political institutions in accordance with the principles of the charter. The question of Tunisia was brought first before the Security council and then the general assembly by the same Asian and African members. Assembly action was similar to that in the case of Morocco. When in 1955 the question of Algeria was brought before the assembly, the French delegation entered a more vigorous protest against United Nations jurisdiction than in the other cases. arguing that the question was clearly domestic since Algeria was a part of metropolitan France. When the assembly placed the question on its agenda. the French delegation left the general assembly and returned only when the assembly decided at a later date to remove it. France accepted the decision of the 11th session to include the question in its agenda. In 1957 the assembly passed a resolution expressing the wish "that in a spirit of effective cooperation discussions will be entered into, and other appropriate means utilized, with a view to a solution in conformity with the purposes and principles of the Charter of the United Nations."

Other Questions. — A number of other disputes and situations were brought to the attention of the United Nations during its first ten years. for the most part without any positive results being achieved. Early efforts by the general assembly to eliminate the Franco regime in Spain as a menace to the peace proved to be fruitless and were terminated in 1950. From the beginning the general assembly considered the question of racial discrimination in South Africa, first in its application to persons of Indian origin and then in its application to the native African population. The government of South Africa denied the competence of the assembly even to discuss these matters and disregarded assembly recommendations. In 1948 the Security council was asked to consider Soviet intervention in Czechoslovakia but action was prevented by Soviet use of the veto. In 1949 the assembly was asked to consider alleged violations of human rights in Bulgaria, Hungary and Rumania but, even when backed by an opinion of the International Court, the assembly resolution of condemnation was disregarded. Efforts by the Greek government in 1954 and 1955 to get general assembly consideration of its claim that the inhabitants of Cyprus were being denied the right of self-determination failed, the United Kingdom invoking the domestic jurisdiction principle. Indonesia likewise sought the aid of the UN in obtaining control of west New Guinea which it claimed the Netherlands was illegally occupying. This territory was formerly a part of Netherlands Indies, which upon independence became the Republic of Indonesia.

Art. 2(7) of the charter, which excludes intervention by the UN in "matters which are essentially within the domestic jurisdiction of any state." has been frequently invoked to deny the competence of the organs of the UN and to restrict their activities, but the appeal has almost invariably been rejected. Prime Minister Jan Christiaan Smuts for the Union of South Africa in 1946 vainly requested the assembly to submit the question of whether the treatment of Indians fell within domestic jurisdiction to the International Court of Justice, agreeing to abide by the decision. The organs of the UN have assumed the right to decide upon their own competence and are disinclined to ask the court for an advisory opinion on the preliminary question of domestic jurisdiction.

GENERAL QUESTIONS RELATING TO PEACE AND SECURITY

Regulation of Armaments. — The charter places responsibility on the Security council for preparing and submitting plans for the regulation of national armaments. The general assembly may discuss and recommend principles governing "disarmament and the regulation of armaments." "Regulation" implies the availability of armaments for United Nations purposes as well as limitation and reduction. The development of the atomic bomb during World War II and its use in Aug. 1945 created a situation in which it seemed to the United States and other governments that the international control of atomic energy demanded consideration even in advance of any perfection of collective security arrangements. Consequently, the first action of the United Nations was the establishment of the Atomic Energy commission by the general assembly in Jan. 1946 to prepare plans for the control of atomic energy. In Dec. 1946 the general assembly adopted a resolution providing for the urgent consideration of the control of atomic weapons and other weapons of mass destruction. and at the same time the consideration of practical measures for the regulation and reduction of all armaments and armed forces.

The Atomic Energy commission began its deliberations in June 1946. It soon became apparent that there was complete disagreement between the United States and the U.S.S.R. The commission submitted reports to the Security council in 1946, 1947 and 1948. The majority of the commission called for international managerial control or ownership of atomic energy activities, international inspection by a proposed international atomic development authority and the elimination of the veto from enforcement provisions of the agreement. The majority also insisted that the control system should be in operation before the existing stockpile of atomic bombs was destroyed. The Soviet Union, however. took an opposite view. It refused to agree to international ownership and to the kind of international inspection demanded by the majority; it demanded that the veto be applicable to enforcement measures under the plan and that the destruction of atomic stockpiles should accompany the establishment of a system of control. The commission recorded an impasse in negotiations in its 1948 report, though some agreement had been reached on matters of detail.

To deal with armaments other than weapons of mass destruction, the Security council organized the Commission for Conventional Armaments. Progress in this field was likewise blocked by disagreement between the U.S S R. and the western powers. Although the commission and the general assembly in 1949 approved a plan whereby each state would submit full information to the commission on its conventional armaments and armed forces, the refusal of the U.S S.R. to accept the plan prevented any implementation. By early 1950 it was clear that a hopeless deadlock had been reached.

At its fifth session in 1950 the general assembly considered a United States proposal to combine the work of the Atomic Energy and the Conventional Armaments commissions. In Jan. 1952 the assembly voted to merge the two commissions into a Disarmament commission, thus recognizing the interdependence of the various elements of the problem. The Disarmament commission, which consisted of the members of the Security council and Canada. was directed to prepare proposals for the regulation. limitation and balanced reduction of all armed forces and armaments, for the elimination of major weapons adaptable to mass destruction and for the effective international control of atomic energy to ensure its use for peaceful purposes only. The development of atomic and hydrogen weapons by the Soviet Union fundamentally altered the terms of the problem of the regulation and reduction of armaments and resulted in important changes in national positions. In spite of vigorous efforts to achieve constructive results through the commission and the general assembly itself, there was little progress in working out an acceptable plan.

In his annual report to the 12th assembly which convened in 1957, Secretary-General Hammarskjold stated that the year had witnessed "most sustained and intensive efforts by the members of the disarmament subcommittee to find common ground." Instead of attempting to work out a comprehensive, detailed, general disarmament plan there was a shift toward efforts to obtain a limited "first step" agreement. After over a decade of stalemate there was some hope that a limited agreement might be possible. Much attention was devoted to means of preventing surprise attacks; the United States urging acceptance of the Eisenhower "open skies" proposal for aerial inspection and exchange of military blueprints, and the U.S.S.R. supporting the Bulganin plan of ground posts at strategic centres. The United States suggested combining the two proposals.

The increased activity in the negotiations on arms limitation was reflected in the 12th general assembly which urged the Disarmament commission to give priority to six main provisions of a proposal submitted by the western powers in Aug. 1957: (1) immediate suspension of nuclear weapons tests with effective international control; (2) the cessation of production of fissionable materials for weapons; (3) the reduction of stocks; (4) reduction of nonatomic armaments and armed forces; (5) aerial and ground inspection to guard against surprise attacks; and (6) joint study of an inspection system designed to insure that sending of objects into outer space would be exclusively for peaceful and scientific purposes. The assembly also called upon the Disarmament commission and the secretary-general to co-operate in a world-wide publicity campaign on the need for a disarmament agreement with effective controls. (See also DISARMAMENT.)

Peaceful Use of Atomic Energy.—In Dec. 1953, in an address to the general assembly, Pres. Dwight D. Eisenhower offered a new approach to the question of atomic energy, proposing the establishment of an international agency to further the peaceful use of atomic energy. At its ninth session the general assembly, by unanimous vote on Dec. 4. 1954, expressed the hope that "the International Atomic Energy agency will be established without delay," and decided that an international technical conference should be held to explore the peaceful uses of atomic energy. The conference met in Geneva, Switz., Aug. 8–20. 1955, with delegates from 60 members and 23 other states participating. After preliminary work by a limited number of members a conference to draft a statute for the proposed new agency met in Sept. 1956 in New York. The statute for the International Atomic Energy agency was approved on Oct. 23 by the 82 states represented at the conference and went into effect July 29, 1957.

Holding of a Review Conference.—Under art. 109 of the charter, the question of holding a review conference was placed on the agenda of the general assembly at its tenth session. At its eighth session in 1953 the assembly had anticipated the need of advance preparations if a conference should be held and had directed the secretary-general to prepare certain documents, including a Repertory of Practice of *United Nations* Organs The assembly decided that a general conference to review the charter should be held at an appropriate time and that a committee consisting of all members of the United Nations should consider, in consultation with the secretary-general, the time, place, organization and procedures of the conference, and that the committee should report in two years. The assembly in 1957 voted to continue this committee and charged it to make a report with recommendations, not later than the 1959 session.

DEVELOPMENT OF INTERNATIONAL LAW

In Nov. 1947 the general assembly established the International Law commission of 15 members to make recommendations for the progressive development of international law and its codification. In setting up the commission, the assembly directed it to formulate the principles of international law recognized at the Nürnberg trial of Nazi war criminals and to prepare a draft code of offenses against the peace and security of mankind.

In 1950 the commission submitted its formulation of the Nürnberg principles, which covered crimes against the peace, war crimes and crimes against humanity. The commission presented to the assembly in 1951 draft articles on offenses against the peace and security of mankind, which enumerated 12 crimes against international law, including any act of aggression, threat of or preparation for aggression. annexation of territory and genocide. The commission prepared a draft declaration on the rights and duties of states which it had submitted to the assembly in 1949.

The commission made studies of the possibility of codifying certain branches of international law, giving priority to the law of treaties and the law of the sea. Also. it prepared a study on the legal aspects of reservations to multilateral conventions. Draft conventions were prepared on statelessness, the peaceful settlement of disputes and the law of the sea. The commission was also concerned about the subjects of arbitral procedure. offenses against the peace and security of mankind. and international criminal jurisdiction. A conference to consider two draft conventions on statelessness and one to consider the Law of the Sea were called to meet in 1958.

The UN made considerable effort to arrive at an acceptable definition of aggression. The League of Nations, the San Francisco conference, the International Law commission and special committees set up by the assembly failed to reach an agreement on a definition of aggression. 4 minority of states opposed attempting a definition chiefly on the ground that it could never be made completely comprehensive. The majority wanting a definition were divided over the form it should take; that is, whether it should be a general definition or a list of acts that constitute aggression. Failure to reach agreement on the definition of aggression delayed progress on the drafting of certain conventions. (See HUMAN RIGHTS; SELF-DETERMINATION.)

ECONOMIC AND SOCIAL CO-OPERATION

A major purpose of the United Nations is "to achieve international co-operation in solving international problems of an economic, social, cultural, or humanitarian character, and in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion." The general assembly, the Economic and Social council, along with the council's commissions, the secretariat and the specialized agencies are the organs primarily responsible for action in this field. An important part of the United Nations activity consists of research, publication and the rendering of technical assistance to governments. The United Nations has no authority to legislate or to enforce measures of economic and social co-operation; it can only make recommendations which the member governments may or may not follow.

The Specialized Agencies.—Those who drafted the United Nations charter believed that many areas of econom c and social co-operation, while requiring an intergovernmental approach, could be more effectively covered by relatively autonomous functional organizations. Consequently, it was assumed that international co-operation in this field would find expression in a great variety of intergovernmental organizations. Of these. those with "wide international responsibilities" were to be brought into relation with the United Nations as specialized agencies. The charter provided that the general assembly and the Economic and Social council should undertake to co-ordinate the policies and activities of the specialized agencies. The general assembly may review and make recommendations subject to the administrative budget of an agency; both the assembly and the Economic and Social council map make recommendations with respect to program. Each specialized agency in fact concluded an agreement with the United Nations defining in general terms its relation to the latter.

The general structure of each specialized agency follo s a common pattern. There is provision for a general conference in which all members are represented. The conference elects an executive body which is charged with initiating proposals and carrying out decisions of the general conference. Each agency has a permanent secretariat, headed by a director. Many agencies have regional subcommissions operating in various parts of the world. Some of the specialized agencies were in existence before the United Nations was organized, some were in process of establishment during World War II and some agencies were organized under the auspices of the UN.

(For those agencies in operation in the late 1950s *see:* INTERNATIONAL LABOUR ORGANIZATION, THE; FOOD AKD AGRICULTURE ORGANIZATION; UNITED NATIONS EDUCATIONAL. SCIENTIFIC AND CULTURAL ORGASIZATION; INTERNATIONAL CIVIL AVIATION ORGANIZATION; BAKK FOR RECONSTRUCTION AND DEVELOPMENT. INTERNATIONAL; INTERNATIONAL MONETARY FUND; WORLD HEALTH ORGANIZATION; UNIVERSAL POSTAL UNION. For International Telecommunication union and World Meteorological organization *see* RADIO and METEOROLOGICAL SOCIETIES.)

Economic Reconstruction. — 'The devastation of large areas during World War II, and the dislocation of normal economic relations resulted in the need of concerted measures of relief, rehabilitation and reconstruction. The United Nations Relief and Rehabilitation administration, established in 1943, did much to alleviate the situation. To assist in dealing with special regional problems in Europe and the far east, the Economic and Social council established in 1946 the Economic Commission for Europe and the Economic Commission for Asia and the Far East. Particularly after 1947, the Economic Commission for Europe was hampered in its work by the "cold war"; notwithstanding, it provided a useful means of contact between European countries in dealing with their common problems. When war produced a similar need in Korea, the general assembly created the United Nations Korean Reconstruction agency to assist in the rehabilitation and reconstruction of that part of Korea accessible to it.

Technical Assistance. — A modest program of technical assistance was undertaken at an early stage. World attention became centred on the problem with the announcement of Pres. Harry S. Truman's Point Four program. The expanded program for technical assistance was approved by the general assembly in 1949. It was undertaken with a view to raising the standard of living and promoting economic assistance to underdeveloped areas.

Aside from the Technical Assistance administration, a branch of the secretariat, there are two other United Nations agencies with responsibilities in connection with the implementation of this program. The Technical Assistance board, composed of the secretary-general of the United Nations and the executive heads of the participating specialized agencies or their representatives, coordinates operations under the program and makes recommendations on proposed projects to the Technical Assistance committee. The committee, consisting of the members of the Economic and Social council, acts on the recommendations of the board and reviews the working relationships between the co-operating organizations.

The expanded program of technical assistance is financed by voluntary contributions from members. Pledges are made at an annual conference of members. At the seventh conference. 63 countries pledged more than $29,000,000 for the 1957 program, an increase over previous plrdges both in the number of countries participating and the total amount pledged. During the previous six years, $142,000,000 had been contributed.

In its ninth session in 1954 the general assembly approved a new procedure for the adoption of programs and the allocation of funds which was subsequently Introduced. This procedure provides for the development of programs on a country basis ii stead of on the basis of a fixed percentage of the available funds being allotted to each organization. It emphasized the responsibility of the recipient country for establishing priorities in drawing up its proposed program. and placed increased responsibility for coordination on the Technical Assistance board's resident representative in the recipient country.

Financing Economic **Development.**—The United Nations has given a great deal of consideration to ways and means of making capital available to underdeveloped countries for financing projects which are not self-liquidating or which do not meet the requirements of the International ("World") bank for loans. In 1954 the general assembly recommended that both capital-importing and capital-exporting countries examine their policies and practices with a view to encouraging the flow of private capital. In April 1955 the bank submitted to its members the draft charter of the International Finance corporation to come into operation as soon as ratified by 30 states and as soon as 75% of $100,000,000 capital had been subscribed. The corporation was to make direct loans to private enterprise without government guarantees and was to be allowed to make loans for other than fixed returns. The charter entered into force on July 20. 1956. To assist in the financing of nonself-liquidating development projects a proposal was submitted to the general assembly for a Special United Nations Fund for Economic Development (SUNFED). The proposal was considered by the tenth assembly but final action was deferred pending further study by governments and a special committee. The 12th assembly unanimously adopted a resolution to set up a separate fund to provide systematic assistance in fields essential to technical, economic and social development of less developed countries.

Refugees. — The International Refugee organization, a specialized agency which was established in 1946 and terminated its activities in 1952, took over the refugee functions of the United Nations Relief and Rehabiiitation administration which expired in 1947. The IRO was successful in resettling. repatriating. transporting and maintaining more than 1,000.000 European refugees. Since the IRO was conceived as a short-term emergency organization. a new refugee structure alas devised in 1951. A United Nations high commissioner for refugees was appointed and was directed to act under the Convention Relating to the Status of Refugees, which was drawn up by the Economic and Social council and approved by the general assembly in 1951. An Advisory Committee on Refugees was appointed by the council in 1951 to assist the high commissioner. The assembly in 1957 voted to continue the office of UN high commissioner for refugees for five years from Jan. 1959, appealed to member governments to aid Chinese refugees in Hongkong and urged them to meet the critical need for funds for Arab refugees. (See also REFUGEES).

Human Rights. — The general assembly in 1948 adopted the Universal Declaration of Human Rights. which was prepared by the Commission on Human Rights. In 1948 the commission began to draft a Covenant of Human Rights which. upon ratification by governments, would become legally binding upon them, Wide differences in economic and social philosophies hampered efforts to achieve agreement on a common text. but finally a Draft Covenant on Economic. Social and Cultural Rights and a Draft Covenant on Political and Civil Rights were completed'in 1954 and submitted to the ninth general assembly for its consideration. In the general field of human rights. the assembly also concerned itself with discrimination against Indian nationals in the Union of South Africa and the violations of civil-rights provisions of peace treaties by Hungary. Rumania and Bulgaria.

Control of Narcotics. — The Commission on Narcotic Drugs was authorized by the assembly in 1946 to carry out the functions entrusted by international conventions to the League of Nations Advisory Committee on Traffic in Opium and Other Dangerous Drugs. The agreements, conventions and protocols on the control of narcotic drugs concluded in 1912, 192j, 1931 and 1936 were amended in a draft protocol which was approved by the assembly in Nov. 1946 and subsequently came into force among its signatories. In addition to re-establishing the pre-World War II systrm of narcotics control, which had sufiered from the dislocations of the war. the UN concerned itself with new problems resulting from the development of synthetic drugs. Efforts were made to simplify the system of control by drafting one convention incorporating the provisions of all agreements in force.

Other Activities. — The United Nations has rendered an invaluable service in the economic and social field by publishing carefully prepared information, statistical data and surveys of recent developiiients in the economic and social fields. Among the more significant of its publications are :he *World Economic Report*, the *Statistical Yearbook*, the *Demographic Yearbook* and the *Yearbook on Human Rights.*

The general assembly established the United Nations International Children's Emergency fund !later styled the UN Children's fund but still officially called UNICEF) in Dec. 1946. to provide for the emergency needs of children in devastated areas. Financed by contributions from member states; UNICEF has neen effective in sustaining basic nutritional requirements for destitute children in more than 50 countries, preventing such communicable diseases as tuberculosis, whooping cough and diphtheria and providing for children's clothing and other needs. In 1953 it was made a permanent organization.

In addition to matters specifically mentioned above. the United Nations has been concerned with such questions as freedom of information. the status of women. genocide and social policy.

DEPENDENT AREAS

On two different levels. the United Kations maintains concern for people residing in nonself-governing territories: (1) under principles and procedures developed for making administering states internationally accountable for the treatment of their nonself-governing territories; and (2) under the United Nations trusteeship system applicable to certain territories placed under it.

Nonself-Governing Territories.--Under art. 73 of the charter. members of the United Nations with responsibilities for the administration of nonself-governing territories agreed to grant the people of such territories political, economic. social and educational advancement. just treatment and protection against abuses; to develop self-government; to further international peace and security; to promote constructive measures of development; and to transmit to the secretary-general information of a technical nature concerning the economic, social and educational conditions in their territories. In 1947 the general assembly created the Special Committee on Information Transmitted under Article 73e of the Charter to receive and analyze information on these territories and to make recommendations to the administering authorities on the basis of information received. An attempt to give the committee permanent status failed. In 1949 it was given a three-year term which was extended for a similar period in 1952 and 1955. In 1952 its name was changed to Committee on Information from Non-Self-Governing Territories.

Attempts of the Committee on Information to obtain political information on their territories from the sdministering states met with resistance. Only Australia, the Netherlands, New Zealand and the United States transmitted such information, the other administering states contending that the charter did not require the transmission of political information.

There was considerable controversy over the determination of the territories which were nonself-governing and when they ceased to be such. France soon ceased to transmit information on a number of territories on the ground that they had either become self-governing or had become an integral part of France. Later Great Britain ceased to send information on Malta and Ghana, the United States on the Panama Canal zone and Puerto Rico, Denmark on Greenland and the Netherlands on Surinam and the Antilles. Administering states claimed the sole right to decide whether art. 73(e) did or did not apply to one of their territories but this position was challenged by the assembly which in 1952 adopted a resolution containing a list of factors to serve as a guide in deciding whether a territory has obtained a full measure of self-government.

The general assembly placed emphasis on economic development. raising standards of nutrition and health, and land reform in nonself-governing territories. Furthermore, the assembly encouraged the administering authorities to co-operate with nongovernmental organizations and the specialized agencies in meeting the United Nations' objectives under art. 73. A notable achievement in this respect was the conclusion of an agreement in 1951 between the United Kingdom and the United Nations Technical Assistance board nhich provided for the application of the technical assistance program to dependent areas under British administration.

Trusteeship System. — For a discussion of the UN trusteeship systern, successor to the League of Nations mandate system of supervision of nonself-governing territories, see TRUSTEESHIP SYSTEM.

ADMINISTRATION AND FINANCE

Personnel. — The secretariat of the United Nations, serving under the secretary-general. is part of the United Nations machinery influencing the day-to-day work of the organization to a degree which the words of the charter would not indicate. The extent of this influence is in large measure a result of the fact that the secretariat memhers are permanent expert officials. The secretariat staff is recruited on a merit basis but with regard to equitable geographical distribution. Members of the organization are required to take an oath of loyalty to the United Nations and are not permitted to receive instruction from member governments. The staff of United Nations headquarters at the beginning of 1955 numbered approximately 3,200, with about 1,500 other members located in Geneva and other parts of the world In Nov. 1949 the general assembly established a United Nations Administrative tribunal to hear and pass on alleged violations of staff contracts and other conditions of employment in the secretariat.

A United Nations Field service and a United Nations Panel of Field Observers were organized by the assembly in 1949. The Field service performs security functions for United Nations missions in many parts of the world, and the Panel of Field Observers assists the various missions in supervising truces and observing plebiscites. Both are under the secretary-general,

Finance. — The secretary-general must submit an annual budget including estimated expenditures to the general assembly for approval. The United Nations' annual budget began at $19,390,000 for 1946, rose to $49,869,450 for 1953 and then declined slightly. The budget for 1958 was $jj.062 850.

The charter stipulates that the expenses of the organization shall be borne by members as apportioned by the general assembly. The Committee on Contributions prepares a scale of assessments for each member, based on the general economic level and capacity of each state, which is submitted to the general assembly for approval. The United States is the largest contributor, but a few members make a larger per capita contribution. The U.S. assessment began at 49% of the total but at the request of the United States government was steadily reduced until in 1958 it was 32 51%. The large increase in membership in 1955 dnd 1956 made possible a reduction in contributions of a majority of members.

Privileges and **Immunities.**—A General Convention on Frivileges and Immunitics of the United Kations approved by the general assembly in Feb. 1946 asserted that the UN possesses juridical personality. It provides for such matters as the immunity from legal process of the property and assets of the United Nations and for the privileges and immunities of the representatives of members, officials of the United Nations and experts on missions of the organization. A headquarters agreement between the UN and the United States was signed in June 1947, defining the privileges and immunities of the United Nations headquarters in New York city.

Headquartem--The general assembly decided during the second part of its first session in New York to locate its permanent headquarters in that city. John D Rockefeller. Jr., made a gift of land for a building site in Manhattan, and a loan of $65,000,000 from the United States permitted plans to be initiated for the construction of permanent buildings. Temporary headquarters were established at Lake Success on Long Island, N.Y. The permanent Secretariat building was completed and occupied in 1951. The building providing accommodations for the general assembly and the councils was completed and occupied in early 1952.

In 1947 the assembly adopted a United Nations flag. Its design consists of the official emblem of the United Nations in white, centred on a light-blue background. The assembly designated Oct. 24 as United Nations day. (L. M. GH.; A VH.)

UNITED NATIONS EDUCATIONAL, SCIENTIFIC AND CULTURAL ORGANIZATION (UNESCO), a specialized agency of the UN whose purpose is to contribute to peace by promoting co-operation within the fields of education, science and culture. It has its own constitution, member states and budget. In the late 1950s it had 79 member states and an operating annual budget of about $11,000,000. Its permanent headquarters are in Paris.

UNESCO was created as an agency of its member states and it did only what those states specifically authorized through resolutions of the biennial general conference. It is administered by a director-general and an international civil service of approximately 800 persons selected from among most of its member states. Over the director-general is an executive board of 22. representing nations selected by the general conference. Individual members are designated by the member states concerned.

Two special characteristics of UNESCO have been: (1) extensive reliance upon international nongovernmental organizations for carrying out its program; and (2) the constitutional requirement that member states establish national citizen commissions for UNESCO to advise on policy and to encourage citizen participation in activities that flow from UNESCO's purpose and program. The organization's varied field of interest includes the full range of education, science, culture and mass communications, in all of which areas the accomplishments and needs of the member states vary greatly in character and quality.

UNESCO sponsored activities might be classified as follows:

1. Emergency Aid and Reconstruction. — In the first two years after World War II. emergency aid was provided to war-devastated countries, an attempt being made to identify educational and cultural needs and to provide information for private fund-raising agencies. Subsequently, through its gift coupon scheme, UNESCO helped needy libraries, schools and individual scholars overcome financial difficulties in the acquisition abroad of materials requiring "hard" currency payments. UNESCO also helped develop and administer educational facilities for Arab refugees after 1948 and in Korea after 1950.

2. Advancement of Knowledge. — The advancement of knowledge has been encouraged by strengthening international professional nongovernmental organizations in the fields of education, science and culture; by maintaining a clearinghouse for exchange of information about international educational. scientific and cultural developments; by encouraging special publications for scientific abstracts; by maintaining offices in Montevideo, Cairo, New Delhi and Djakarta to stimulate the international exchange of knowledge; by helping maintain centres of social science research in Calcutta, Rio de Janeiro and Cologne; and by aiding the development of free public libraries. Other major contributions by UNESCO were the successful drafting of the Universal Copyright convention and a Convention for the Importation of Educational. Scientific and Cultural Materials.

3. Promotion of Human Welfare. — In the broad category of human nelfare activities the best-known activity is UNESCO's fundamental education program serving especially economically less developed countries and financed in part by UNESCO's normal budget and In part through the United Nations Expanded Technical Assistance program. In many countries UNESCO aided extension of free and compulsory education and the strengthening of secondary and higher education. A Center for Nuclear Research was established with UNESCO initiative in Geneva as was an International Computation centre in Rome. UNESCO encouraged basic research in cell biology, on ways of making arid and humid zones more inhabitable and productive and on the social impact of technological change.

4. International Understanding. — Furthering international understanding in many respects is the area in which the greatest need exists but it is most difficult to accomplish by direct means. Exchanges of persons are arranged. UNESCO's publication *Study Abroad* is the most comprehensive index to foreign study opportunities. Seminars of teachers on teaching methods produced limited results; a preparation for multivolume *A Scientific and Cultural History of Mankind* was begun; co-operative reviews of textbooks by teachers of different countries were undertaken on a very small scale with a view to removing national bias; research nas promoted on differences of national character, problems of immigrants and race relations; and there was a small effort to promote support for the United Nations. After 1956 a major project nas to increase understanding between Asian and western countries. Although the direct efforts to promote international understanding were modest and largely exploratory, UNESCO's other activities indirectly contributed to greater understanding by producing greater objective knowledge of each other among members.

Those western countries which were responsible for the creation of UNESCO supported only a modest program and budget and did not see a major role for UNESCO in lessening the tensions that kept nations after World War II preoccupied with fear of war. By contrast, newly developing countries of south and southeast Asia, the middle east, Africa and Latin America generally welcomed the opportunities provided by UNESCO for nations to meet on a basis of equality, irrespective of military and economic power, to discuss and to authorize assistance in developing economic, scientific and cultural resources.

See Walter *H. C.* Laves and Charles **A.** Thornson, ***UNESCO — Purpose, Progress, Prospects*** (1957). *See* also the numerous official publications of UNESCO. (W. H. C. **L.**)

UNITED NATIONS RELIEF AND REHABILITATION ADMINISTRATION (UNRRA), the administrative body for an extensive social welfare program under the UN, was created at a ceremony presided over by Pres. Franklin D. Roosevelt at the White House on Nov. 9, 1943, when the international agreement was signed by 44 nations.

UNRRA's operations concentrated primarily on assisting those war-ravaged nations in the greatest need and without resources to finance their own relief imports. The assistance consisted of relief supplies — food, clothing, fuel, shelter, medicines; relief services, with trained personnel; and agricultural and industrial rehabilitation supplies and services needed to strengthen the economy of the war-torn countries. In addition, UNRRA also provided camps, personnel and food for the repatriation or care of millions of the war's displaced persons.

UNRRA operated in about 25 countries and served the needs of more than 1,000,000,000 people whose countries had been occupied or ravaged by the war. It administered the largest peacetime shipping business in history and sent abroad 25,000,000 long tons of relief and rehabilitation supplies. The value of the goods and services furnished was nearly $4,000,000,000, and its staff at its peak numbered nearly 25,000 persons. UNRRA rigidly adhered to a policy of "helping people to help themselves." The principal supplies shipped are shown in Table **I.**

All member nations not invaded during World War II were asked to contribute 1% of their national income for the fiscal year ending June 30, 1943. The three largest contributors were the United States ($2,700,000,000), the United Kingdom ($624,650,000) and Canada ($138,738,000). The first director-general, elected by the unanimous vote of all the member nations, was Herbert H. Lehman, who served from Nov. 11, 1943, until he resigned on March 28, 1946. The second director-general was Fiorello H. LaGuardia, who was succeeded in Dec. 1946 by Maj. Gen. Lowell W. Rooks.

Missions to aid relief programs in Europe mere closed on June 30, 1947. Many of the activities carried on by UNKRA, but

TABLE I.—*Total Shipments Summary by Recipient Countries and Commodity Divisions** (gross long tons)

Commodity programs	Total	Food	Clothing, textiles, footwear	Medical and sanitation	Agricultural rehabilitation	Industrial rehabilitation	Take overs from military
Grand total all commodity programs	24,106,891	9,131,030	626,293	134,537	2,314,363	11,290,558	610,110

UNITED PRESBYTERIAN CHURCH (of Scotland). This Presbyterian organization, merged since 1900 in the United Free Church of Scotland, was formed in 1847 by the union of the United Secession and Relief Churches The general causes which led to the first great secession from the Church of Scotland. as by law established in 1688, are indicated in the article SCOTLAND, CHURCH OF Its immediate occasion rose out of an act of assembly of 1732. which abolished the last remnant of popular election by enacting that, in cases where patrons might neglect or decline to exercise their right of presentation the minister was to be chosen, not by the congregation, but only by the elders and Protestant heritors.

The act itself had been passed by the assembly, although the presbyteries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were rejected. The protests however were vigorously renewed by Ebenezer Erskine, minister of Stirling He was soon joined by other ministers. who in Dec. 1733 constituted themselves into a presbytery, disowning the authority of the general assembly. The members of the Associate Presbytery and its adherents steadily increased. until in 1745 there were 45 congregations under its jurisdiction, and it was reconstituted into an associate synod. A violent controversy respecting the religious clause of the oath taken by burgesses in Edinburgh. Glasgow and Perth ("I profess and allow with my heart the true religion presently professed within this realm and authorized by the laws thereof"), resulted in April 1747 in a breach, when two bodies were formed. each claiming to be the Associate Synod; those who condemned the swearing of the burgess oath as sinful came to be popularly known as "Anti-burghers," while the other party, who contended that abstinence from it should not be made a term of communion, were designated "Burghers."

The Associate (Anti-burgher) Synod held its first meeting in Edinburgh on April 10, 1747. It grew with considerable rapidity, and for purposes of organization was formed into four provincial synods, and took the name of the General Associate Synod. The Associate (Rurgher) Synod held its first meeting at Stirling on June 16, 1747. The number of congregations under its charge also increased; and in 1820 the General Associate or Anti-burgher Synod (to the number of 129 congregations) united with the 154 congregations of the Associate or Burgher Synod. The body thus constituted, the United Secession Church, increased by 1847 to 400 congregations.

In 1847 a union was formed between all the congregations of the United Secession Church and 118 of 136 Relief Churches, in what became the United Presbyterian Church. Doctrinally there was little difference between the United Presbyterian Church and the Free Church of Scotland, and in 1863–73 negotiations were carried on for a union, which were fruitless.

In 1896 the United Presbyterian Church again made advances and on Oct. 31, 1900, the United Free Church of Scotland was horn.

UNITED PRESS INTERNATIONAL: see NEWS AGENCY.

UNITED STATES (OF AMERICA), the foremost nation of the western hemisphere in population and resources, composed of 50 states joined in a federal republic. The first official use of the name United States of America was in the Declaration of Independence: a facsimile of which is included in this article under that title. The name is usually abbreviated informally to "the United States."

The character of national institutions was molded largely by the pioneering spirit, which left a lasting imprint. (See AMERICAN FROSTIER. THE.) Another shaping factor was immigration, which had passed the 35.000.000 mark before the adoption of the quota system in 1921. The motives that brought the immigrants were similar to those of the early settlers, and widely varied ethnic strains have contributed to the formation of a distinctive national culture. (See Growfh *of the Nation* in *Population,* below; see also. MIGRATION: Migvation to *the* United States.)

The block of 48 states extending from the Atlantic to the Pacific is in the temperate zone. but within this area there are wide variations of regional climate. A unique degree of diversity has been attained in both agriculture and industry. Reports by U.S. department of agriculture experts have divided the country into more than 500 type-of-farming areas; such classifications, however, are subject to rapid obsolescence as regional production is adapted to new agricultural patterns and to shifts of population.

Isolation from European affairs, made possible by the approximately 3.000 mi. of the Atlantic ocean separating the east coast states from Europe, was an important factor in the nation's early development. The decline of this tradition after World War II is illustrated by the establishment of the headquarters of the United Nations in New York city. In the economic sphere, the nation is still much less affected than those of Europe by international trends; in the 1960s foreign commerce, though of great volume and of key importance to some industries, amounted to only a small percentage of national income. (See *Foreign Commerce,* below.)

The block of 48 states forms a broad belt across the North American continent, from approximately latitude 24' 30' to 49° N., and longitude 66° 57' to 124° 45' W. On the north it is bordered by Canada, the boundary in the west being an arbitrary line at the 49th parallel and in the east largely a natural one formed by the Great Lakes. The eastern half of the southern boundary is naturally defined by the Gulf of Mexico, but in the west the nation is separated from Mexico by an oblique line following first the Rio Grande river and continuing afterward generally west-northwest across the highlands to the Pacific ocean.

The west-coast states of Washington, Oregon and California are separated from the oriental nations of the far east by 5,000 to

6,000 mi., but Hawaii (*q.v.*), which became the 50th state in 1959, is situated approximately midway. Alaska (*q.v.*), which became the 49th state the same year, occupies the northwestern end of the North American continent and the adjacent islands. extending northward into the Arctic circle and westward beyond the 180th meridian. The distance from Alaska's southern continental boundary—the long, narrow coastal strip known as the Panhandle—to the northwestern tip of the state of Washington is approximately 500 mi. A more practical gauge of the distance from its sister states is the fact that about 1,200 mi. of the Alaska highway are on Canadian soil. (*See* YUKON TERRITORY.) In contrast, Alaska is separated from Soviet Siberia by only about 50 mi. of the Bering strait at the nearest mainland point, and about 2½ mi. between the U.S. and Soviet Diomede Islands.

Each of the 50 states is theoretically sovereign, joined to the others by a federal government to which the original 13 states delegated certain powers as outlined in the federal constitution adopted in 1787 and put in force in 1789. The total area of the nation is 3,615,208 sq.mi. Its population in 1960 was 179,323,175. Outlying possessions with a total area of 5,798 sq.mi. had a population in 1960 of about 3,445,000.

An individual article is devoted to each state and dependency. Also, regions of conterminous United States (the 48 states not including Alaska and Hawaii) are discussed in the following articles: MIDDLE WEST, THE; NEW ENGLAND; NORTH, THE; SOUTH, THE; and WEST, THE. (See also NORTH AMERICA.) A selected bibliography appears at the end of the article.

The article which follows is divided into these sections:

I. PHYSICAL GEOGRAPHY

The following description of the physical geography of the United States deals with conterminous U.S., the 48 contiguous states stretching in a broad band across the North American continent and therefore presenting certain unifying features of geologic history. physiographic structure, climate and natural life. For the physical geography of Alaska and Hawaii, see the separate articles on those states.

A. GEOLOGY AND STRUCTURE

The surface of North America, like that of all continents stands two to three miles above adjacent ocean floors and apparently has so stood during the more than 4,000,000,000 years of its known geologic history. Variations from time to time in ocean-basin capacity. in oceanic volume and in relief of the continent's surface have, however, produced great variations in the amount of continental surface emerging as land above ocean levels. Shallow seas comparable to Hudson bay (average depth 420 ft.) have repeatedly spread over large fractions of the North American continental platform, leaving their record in limestone, shale and sandstone sediments with entombed remains of the marine life of the time. Repeatedly, also, these shallow, marine floodings have been withdrawn and the destructive processes of weathering and erosion from exposure to the atmosphere have attacked the land areas, destroying part of the earlier sedimentary record. Thus marine deposits made during the next time of flooding have come to lie unconformably on the eroded surfaces of older deposits, the unconformity being essentially the land surface at the close of the intervening time of emergence. Elsewhere. large areas remained above sea level and experienced only erosion while the marine transgressions were occurring.

None of the marine submergences exactly duplicated any other, yet the deciphered history shows that the continent possessed certain recurring lineaments, the invading seas early taking possession of linear tracts (geosynclines) subparallel to the eastern, western and southern continental margins and lingering there when marine withdrawals were occurring. Other negative areas (epicontinental, epeiric shelf) were more briefly inundated and certain tracts (shields, geanticlines, positive areas, cratons) repeatedly, although not invariably, escaped even the maximum floodings.

These alternating experiences of the continental surface, largely constructional when beneath epicontinental or geosynclinal seas and largely destructional when exposed to the atmosphere, constitute the framework of its geologic history. The correlation of successive similar events in widely separated regions is possible because of the concomitant progressive evolutionary changes which the embedded fossils, chiefly marine invertebrates, in the sedi-

*Total area does not include boundary water. †Land area includes dry land and land temporarily or partially covered by water, streams less than ⅛ mi. in width, and lakes and ponds less than 40 ac. in area. ‡Inland water includes permanent inland water of over 40 ac. in extent, streams over ⅛ mi. in width, coastal waters near islands separated by less than one nautical mile of open water, and islands of less than 40 ac. §Boundary water consists of deep embayments or sounds and other coastal waters lying outside inland water and protected by islands or headlands separated by less than ten nautical miles of open water; and the Great Lakes; other claimed areas not included. ‖Rank excludes boundary water. ¶Density computed on areas exclusive of boundary water.

mentary rocks record.

Based on the stratified sediments and their fossils, on the interrupting unconformities and on evidence for successive times of mountain making (orogeny) and igneous activity, most geologists have adopted a classification of four great eras of earth history, subdivided into about 15 periods. The terms for these divisions of earth history used herein are those commonly accepted in the United States and Canada.

1. Pre-Cambrian Time.—This slightly awkward term springs from two facts. One is that Cambrian sedimentary rocks, the oldest in the record of the succeeding Paleozoic era, are also the oldest rocks with a good record of abundant and varied organisms. Pre-Cambrian rocks have only very rare showings of organic structures. The other fact is that these Pre-Cambrian rocks have been so tremendously disordered and metamorphosed by orogenic movements and so extensively intruded by igneous invasions from below that the number of years actually involved in making them is unknown. In most geological literature two such eras are specified, Archeozoic, or Archean (Early Pre-Cambrian) and Proterozoic (Late Pre-Cambrian), but the distinctions of dominantly igneous origin of the Archeozoic rocks and dominantly sedimentary origin for the Proterozoic rocks has proved in later studies to be inapplicable and the terms are being abandoned.

Theoretically the rocks made during this earliest era of earth history underlie all younger rocks. Large areas also exist where there is no cover of later deposits, either because one was never made or because erosion destroyed any cover once existing. In the United States all exposed Pre-Cambrian rocks belong to the second group and owe their present position to the occurrence of orogenic deformations in later geological time and the inescapable consequence of such uplifts, destructive erosion. Indeed, the largest of these areas, in northern Minnesota, Wisconsin and Michigan, has virtually lost the mountains themselves, only a few residual hills surviving the reduction of former massive ranges to a peneplained area of low relief. Traced northward into Canada, this tract about the west end of Lake Superior broadens into a great expanse of uncovered Pre-

Cambrian rocks, occupying almost all of the province of Quebec, Labrador and most of Manitoba, Ontario, the Northwest Territories and Baffin Island. This, the Canadian shield. is North America's greatest positive area. Some of it may never have been sub merged in any later time; most of it has certainly had but slight and geologically short-lived sedimentary cover.

The Piedmont plateau and Great Smoky mountains. lying west of the Atlantic coastal plain. are portions of a smaller positive area (Appalachia) composed largely of Pre-Cambrian rocks. The Adirondack mountains of New York, the Green mountains of Vermont and the White mountains of New Hampshire are, despite their magnitude as topographic eminences, only the Pre-Cambrian core rock of former ranges whose folded and faulted structures indicate the way such cores have been forced locally higher than the surrounding "basement" rocks Still covered by perhaps a mile of later formations. Small and isolated outcrops of Pre-Cambrian rocks in the central lowlands and Great Plains are the St. Francis mountains of Missouri, the central part of the Black hills of South Dakota, tracts in southwestern Minnesota and adjacent South Dakota, the Wichita and Arbuckle mountains of Oklahoma and the Llano uplift of central Texas. In the Rocky mountain system many ranges possess exposed Pre-Cambrian core rock, the uplift and erosional uncovering of which is in general of later date than in the eastern occurrences noted. Some basin range mountains, particularly in Arizona and adjacent California, are similar in this respect. The mile-deep Grand canyon of the Colorado was cut down into the Pre-Cambrian basement which there is under a thick plateau cover of flat-lying younger rocks.

Most of these ancient rocks have suffered great metamorphic alteration under repeated high compressions and temperatures during past orogenies. Prevailingly, the high-angle foliation of schists and slates, from growth of platy mineral crystals oriented at right angles to the lateral pressures, largely obliterated original stratification and possible organic records. Little success attended attempts at correlation of formations, orogenies and erosion cycles of widely separated regions. Even unraveling the stratigraphic succession in any one region is difficult. The most nearly satisfactory classification is for the Canadian shield where four systems of sedimentary rocks and contemporaneous lava flows were deposited, each time of deposition being terminated by orogenic deformation and associated granitic intrusions, and each orogeny followed by erosion so long continued that the newly made mountains, were virtually wiped off the face of the earth and a peneplain left truncating the profoundly altered roots of those vanished ranges. 'Unconformably on such peneplained surfaces were deposited the sediments of the next following submergence.

Later Pre-Cambrian rocks in the southern part of the Canadian shield record glaciation by an ice sheet nearly 1,000 mi. across. Elsewhere and at other times, aridity seems recorded. Whatever organisms existed, as they assuredly did, were marine aquatic forms. little affected by climates of the land areas. Seaweed vegetation that secreted calcium carbonate is on record. Animals allied to sponges, worms, corals and crustaceans existed but left very few fossil traces, chiefly because of lack of hard parts. Abundant disseminated graphite in some Pre-Cambrian metasedimentary rocks is accepted as derived from organic carbon.

The pre-eminence of the United States in the manufacture of steel is in part the result of the enormous Pre-Cambrian iron ore deposits (altered ferruginous sediments) of the Lake Superior region. The native copper-mining district of the Keweenaw peninsula, in Michigan, is developed in lavas and conglomerates of Late Pre-Cambrian age, the metal having been deposited in cavities by thermal water rising from deep-seated magma bodies.

Pre-Cambrian time was tremendously long. Perhaps three-fourths of all known earth history occurred before the Cambrian seas with their abundant population of marine invertebrates transgressed the continents. Reckoned from the radioactive disintegration of uranium and thorium minerals of the oldest Pre-Cambrian igneous rock studied, their intrusion, cooling and crystallization occurred 2,500,000,000 years ago. And the Pre-Cambrian rock which received the intrusion was already in existence.

2. The Paleozoic Era.—The pattern for North American positive and negative areas for Pre-Cambrian time is known only in fragments and traces. The Paleozoic record. however, is sufficiently well preserved that generalized maps of the land and water areas of the continent may be made, not only for each of the six periods but for different epochs during the advance, the maximum spread and the retreat of each marine flooding. Four persistently positive areas are known. The Canadian shield. nearly 2,000.000 sq.mi. in area, was the largest. It still exists with only Hudson bay submerging a relatively small part of it. Appalachia lay along the Atlantic seaboard. reaching from the Canadian maritime provinces southwestward to Georgia and Alabama and extending an unknown distance eastward beyond the present continental margin. Llanoria lay to the south and largely subsided during later time into the depths of the present Gulf of Mexico. Cascadia, along the Pacific coast, similarly vanished.

Parallel and close to the inner margins of these positive areas lay three geosynclines or repeatedly subsiding troughs, the Appalachian geosyncline where the Appalachian mountains are now, the nearly east-west Ouachita geosyncline across Oklahoma, Texas and northern Mexico and the Cordilleran geosyncline reaching from the Gulf of California northward across Nevada. Utah, Idaho and British Columbia. The thick and relatively coarse detrital sediments deposited in them (now exposed in eroded mountain structures) are in contrast with the much thinner, finer-textured and largely calcareous deposits made contemporaneously in the broad shallow epeiric seas of the continental interior. Obviously. the thick trough fillings of shallow-water deposits record repeated subsidences in the geosynclines as aggradation continued. The coarseness indicates derivation from closely adjacent positive areas. Repeated risings in those land areas, either as mountainous uplifts or broad warpings, are also required to account for the enormous thicknesses of land waste in the trough sediments. The Appalachian geosyncline received from 30,000 to 50,000 ft. of Paleozoic deposits.

Cambrian Period.—During Early Cambrian time, marine overlap on the continent was limited to the Appalachian and Cordilleran geosynclines. By the middle of the period, the sea had spread across the interior also and aquatic forms could pass from the Atlantic to the Pacific. At least 30% of the continent was then below sea level. The dominant limestone and dolomite formations of the Middle Cambrian Age were derived largely from calcareous tests and shells of inconceivable numbers of Middle Cambrian marine invertebrates. Late Cambrian time witnessed a gradual withdrawal of this epicontinental flooding but, for the first time, the Ouachita geosyncline appeared in the history.

This is a generalized statement of events, the like of which were occurring in other continents as well during the approximately 80,000,000 years of Cambrian time. Minor fluctuations of the sea level and warpings of the continent make a more complicated history than can be outlined here. The period was brought to a close by an almost complete emergence of all continents, perhaps because of a deepening of the ocean basins. The newly exposed Cambrian deposits thereupon suffered some erosion before the return of the sea in the next submergence. Because no mountain folding occurred in North America during this emergent interval and therefore erosion could not bite deeply into the new land, most of the Cambrian sediments survived to become buried later beneath Ordovician and younger deposits.

Cambrian time is noteworthy for the spectacular appearance in the fossil record of almost all invertebrate phyla. Evolutionary changes that occurred during the Cambrian provide index fossils, certain species which lived only during the Early, Middle or Late Cambrian. There were even more extinctions of old and appearances of new forms during the interval following the withdrawal of Cambrian waters and preceding the advance of the Ordovician seas.

Ordovician Period.—The relatively shallow epicontinental seas, returning to inaugurate the Ordovician period, first. entered the geosynclinal troughs, later spread from the arctic to the Gulf of Mexico in the greatest submergence the continent has ever had.

The remaining land areas, scarcely half of North America's total area. were low-lying islands which determined the shifting outlines of embayments and supplied detritus. chiefly fine-grained. to their associated basins. Dominantly the basins received organically derived calcium carbonate, hence the large proportion of limestone and dolomite in the record.

Several low domes (Cincinnati-Nashville, Ozark. etc.) with intervening saucerlike basins (Michigan. Illinois) were prominent in the Ordovician paleogeography. The domes (or arches) were repeatedly submerged and emerged, as numerous discontinuities in their stratigraphic sequences show, while the basins were undergoing more nearly continuous sedimentation.

The fossil record tells of different immigrations at different times into the shiiting epeiric seaways from bordering oceans.

Crustal disturbances in northern Appalachia; chiefly during the Late Ordovician, culminated in close folding, thrust faulting, mountainous uplifts and volcanic activity. Interbedding of lava flows and volcanic ash beds (bentonite) with Ordovician marine deposits are part of this record. So are the coarse nonmarine clastics in the nearby Appalachian geosyncline.

Insofar as the deposits tell of climate, there could not have been a zonation like that of the present earth for some coral species ranged in latitude from the southern United States north into arctic Canada and even Greenland. Only wide and equably distributed mild temperatures of the epicontinental waters can account for this.

Ordovician rocks have yielded immense quantities of petroleum and natural gas, in Ohio for a decade or so before 1900 and in Oklahoma and adjacent Texas beginning about 1920. Most roofing slate quarried in the United States comes from metamorphosed Ordovician shales in the northern part of the Appalachian geosyncline. Most decorative marbles of domestic origin are secured from altered Ordovician limestones in the same great trough oi sedimentation. The Illinois-Wisconsin-lowa lead- and zinc-mining district is developed in mid-continent Ordovician sediments; the sulfide ores, however, postdating the host rock.

Duration of the Ordovician period appears to have nearly equaled that of the Cambrian.

Silurian Period.-.—The stratification of most Silurian rocks in the United States parallels that of the subjacent Ordovician formations. But the differences in fossil fauna below and above the contact indicate a considerable time of emergence (a hiatus or lost interval) when the Ordovician marine forms had been forced to retreat to already populated continental margins and were there crowded into intense competition for living room and food. Evolutionary changes in marine life during all such emergences were maximal, both in extinctions and in appearance of new forms.

The Silurian record, like the Cambrian and the Ordovician, tells of slow and irregular advance of the sea into the geosynclines and epicontinental areas, interrupted at least twice by emergences suggesting those greater ones which geologists use for delimiting periods. The Early Silurian transgression entered the United States along the Appalachian geosyncline and spread westward across part of the central lowlands and into the Great Plains along the Ouachita trough. By Middle Silurian time, the sea had spread over the Great Lakes region and northward to reach the arctic, actually lapping over on parts of that great positive area, the Canadian shield. In Late Silurian time, restriction and dismemberment of the epicontinental seas left a relict "dead sea" in the Great Lakes region. In it immense quantities of salt were deposited; along with much gypsum and associated marine sediments. This huge evaporation pan must have had a connection with the sea by which it became replenished at intervals with more salt water. By this time, also: the Late Ordovician mountains above noted had been so reduced by erosion that the sea overlapped the disordered strata of their stumps and buried them beneath Late Silurian sediments.

There is scarcely a more striking feature of any Paleozoic period's history than that of the Middle Silurian mid-continent archipelago of coral reefs. Dozens are known in outcrops and quarries of Niagaran (hiid-Silurian) strata in Indiana, Illinois, Iowa, Wisconsin and Canada. Their wide range in latitude indicates the nonzonal character of the Mid-Silurian climate; just as the Late Silurian salt and gypsum record at least a local aridity.

In addition to the great salt reserves, early Middle Silurian rocks along the Appalachian trough contain a sedimentary iron ore, basis of the Birmingham, Ala., iron-mining and steelmaking district.

The 30,000,000 years of Silurian time closed quietly in North America although in high northern iatitudes of all continents, one of the great mountain-making events of earth history occurred. Vulcanism of Late Silurian age occurred in Maine and adjacent Canada.

Devonian Period.—The marine withdrawal and continental emergence, conventionally chosen for subdividing geological time, was incomplete in parts of the Appalachian geosyncline for the Silurian-Devonian interval, sedimentation and a faunal record bridging the gap left elsewhere by the unconformity between the two systems. Indeed. only this trough of sedimentation seems to have gone below sea level during the entire Early Devonian. By

FIG. 1.—GEOLOGICAL MAP OF CONTERMINOUS UNITED STATES

the middle of the period, overflow had submerged the Great Lakes region and a much more extensive flooding had advanced southward from the arctic. skirting the Canadian shield and reaching the upper Mississippi valley. It also connected with marine water in the Cordilleran geosyncline and so remained until the end of the period. The eastern and western seas were joined across the continental interior briefly but long enough for mingling oi arctic and low latitude organisms.

By the middle of Devonian time, mountains were again growing in northern Appalachia. the Early Devonian deposits deformed in their making. but the Late Devonian sediments unaffected. The tremendous quantities of coarse waste deposited in the adjacent Appalachian trough testify to the rapid growth of a lofty range.

In the evolution of living forms, the Devonian probably ranks next to the Cambrian in importance for at this time begins the record of life on land and in fresh water. The first known air-breathing vertebrates (Amphibia) and a great variety of primitive fishes appeared. The oldest known land plants, some with trunks 40 ft. long, are buried in Middle Devonian nonmarine deposits of southeastern New York. Favouring climates appear to have prevailed, both on land and on the northern shallow seas.

Mississippian Period.—During the Mississippian, or Lower Carboniferous, Period all the familiar seaways of the continent, excepting the northern part of the Appalachian geosyncline, were occupied, the invasion following the familiar plan of an early possession of the great troughs and a later shallow spreading over the continental interior. The northern Appalachian geosyncline trapped great thicknesses of waste from renewed upbowing of the Middle Devonian mountains but, like most of Late Devonian sedimentation there, the subsiding trough was kept filled above sea level and the deposits were nonmarine. Erosion to the penultimate stage of peneplanation had preceded the Mississippian marine encroachments and the invading seas spread so widely over this lowland that their deposits lie in places on all older systems, even Pre-Cambrian. Apparently Appalachia and Llanoria were one continuous land mass, the sea with its fauna entering from the arctic, Pacific and western Gulf of Mexico. Hundreds of feet of limestones characterized the interior deposits; thousands of feet of more largely clastic rocks were laid down in the troughs adjacent to Llanoria and Appalachia. Either late in Mississippian time or early in the Pennsylvanian period, much crustal unrest occurred in these margining lands and the deformations were extended to sediments in the troughs. Other unrest occurred in the interior. Upper Mississippian formations in Illinois recording eight successive brief withdrawings and returnings of the sea.

Mississippian time, 25.000.000 years long. saw the beginnings of that very extensive swampiness which, for an equal length of time, characterized much of the continent during the following period. Commercial coal of Mississippian age occurs in Virginia. A later mineralization was responsible for the Missouri-Oklahoma-Kansas lead- and zinc-mining district in Mississippian rocks.

Pennsylvanian Period. — Except for mountainous Llanoria and Appalachia, the continent was a great flat lowland in opening Pennsylvanian, or Upper Carboniferous, time. The habitually subsiding geosynclines first went below sea level but only the western one received marine deposits. The other two were filled as rapidly as they sank with waste from their high borderlands. The Appalachian trough also received thick peaty accumulations made in immense swamps and now constituting the Early Pennsylvanian coal beds of West Virginia and Alabama.

By the Middle Pennsylvanian, swamps had spread over much of the interior as well, and the enormous coal reserves of six central lowland states were. being initiated. Repeatedly sea water inundated and was withdrawn from these s amps, leaving interbedded marine deposits and minor unconformities. Farther west Pennsylvanian sediments are chiefly marine.

Orogenic movements occurred in the United States, not only during initial Pennsylvanian stages but at different times and places throughout and at the close of the period. Southern Oklahoma saw a northward thrusting from Llanoria into the Ouachita trough. Southwestern Texas and western Colorado had comparable deformations. These seem to have been forerunners of the enormous lateral squeezings of parts of the continent during the following period. Pronounced orogenies of Late Pennsylvanian and of Permian time occurred in most continents.

The great coal deposits, also made in other continents, bespeak a warm, humid, equable climate for most of the globe. The character of the plants and associated amphibians, insects, spiders and fresh-water clams and snails tells the same story. So do the high-latitude Pennsylvanian corals.

Permian Period. — Despite the orogenies noted, Pennsylvanian time passed into Permian without marked breaks of sedimentation in the geosynclines. It was not for long, however. By Middle Permian time the Appalachian trough had been completely filled and before the Paleozoic era had closed that incredible thickness of sediments (maximum, 50,000 ft.) had been crushed into longitudinal folds and thrust sheets of a great mountain range. As a site of sedimentation, the geosyncline ceased to exist from that time on. Lingering seas in Texas and New Mexico left a great limestone reef (Carlsbad) with adjoining salt-pan lagoons and associated highly oxidized red sands and muds. Obviously the humid Pennsylvanian climate had been altered there to one of marked aridity. A "dead sea" finally came to exist in this region.

The Appalachian orogeny, styled a "revolution," culminated at the close of the period. The 500 mi. of original width of the trough was squeezed into half of that. Restoration of the great folds indicates uplift of three or more miles. The Ouachita geosyncline was also crushed from the south and the dominant folded mountain structures of Arkansas and adjacent Oklahoma were made. Without undergoing such marked orogeny, the Cordilleran geosynclinal region experienced considerable volcanic activity.

The greatest salt deposits of the world are in the Permian system. Associated gypsum and dune sand indicate an aridity exceeding that of today. Not too surprisingly, another climatic consequence of the widespread emergence and uplift was glaciation on four continents, the vicinity of Boston, Mass., yielding a record for the United States.

As might he expected, great changes in the life of the earth resulted from these extreme geographic and climatic changes. The typical coal swamp plants were replaced by conifers and cycads. Reptiles took precedence over amphibians and among their varied forms was a group whose teeth, jaws and skulls foreshadowed the arrival of mammals in the Mesozoic era.

3. The Mesozoic Era. — The widespread mountain making, continental emergence, climatic rigours and biological changes of the Permian mark the close of the Paleozoic era and the opening of succeeding Mesozoic time.

Triassic Period. — The waning importance of Appalachia and Llanoria as positive areas and the elimination of their persistently subsiding bordering geosynclines left only the Cordilleran trough for marint sedimentation on the continent during the Triassic. Interbedded with such marine deposits is much volcanic material. Eastward from this trough are interfingered nonmarine shales and sandstones, part of a great alluvial plain where the Rocky mountains, Colorado plateau and western Great Plains are now. In the eastern United States erosion of the newly made Appalachian mountains took place during much of Triassic time. Late in the period, tensional faulting made a series of elongated basins from North Carolina to Nova Scotia which were filled with nonmarine deposits and intercalated lava flows as rapidly as they were deepened. At the close of the period, tilting and uplift gave this faulted region a mountainous aspect again.

During the Triassic appeared the great conifers of the Arizona petrified forest, nearly 200 ft. high. The small beginnings of the greatest land reptiles, the dinosaurs, date from this time. The sea also had its reptiles, the plesiosaurs and ichthyosaurs. True mammals, however, are not known from Triassic deposits.

Jurassic Period. — The marine Jurassic overlaps on United States territory were from the Pacific, arctic and Gulf, only the former enduring for the entire period. The arctic invasion reached as far south as Colorado and Utah late in Jurassic time; the Gulf invasion (reaching north to Arkansas) did not begin until late in the period. Vigorous vulcanism, some of it submarine, accompanied marine sedimentation in the west. The arctic embayment was long and narrow. During the next period it developed into a new geosyncline which, in the end, suffered the fate of all subsiding troughs with excessively thick sediments; it was crushed into a mountain system, the Rocky mountains. Much Jurassic nonmarine deposition also occurred in the western states, thick dune sand formations dovetailing with marine beds.

Orogeny which deformed and metamorphosed the thick western sediments at about the period's end was accompanied by enormous granitic intrusions, reminiscent of similar Pre-Cambrian events. The California mother lode and the Nevada Comstock lode date from this igneous activity. It was modern stream waste from erosion of the mother lode (placers) which gave California the gold rush of 1849.

Xonmarine Jurassic deposits have yielded skeletons of almost unbelievably huge dinosaurs. A new reptilian venture was the ptcrosaur, a flying saurian. The first birds appeared and, most significant, the first mammals. Small but agile, they lived successfully with the enormous dinosaurs in Wyoming and vicinity.

Cretaceous Period. — The last great submergence of North America marks the last period of the Mesozoic era. The world over. Cretaceous seas probably submerged more continental surface than any previous flood had ever done. In a pulsatory fashion western Gulf water advanced northward to meet arctic water, forming a huge mediterranean sea by the middle of the period. Marginal overlap by Atlantic and Pacific water indicated the final disappearance of Appalachia and Llanoria as borderlands. The eastern Gulf reached north to the southern tip of Illinois.

This North American mediterranean occupied the Rocky mountain geosyncline and its sediments, mostly clastics from the Late Jurassic mountains to the west, eventually obliterated the seaway and made another great alluvial lowland with swamps and sluggish streams. The Late Cretaceous coal beds of this part of the United States are second only to the Pennsylvanian coal reserves.

Major orogeny again followed thick sedimentation in a subsiding trough. Thrusting from the west at the end of Cretaceous time compressed the weak Cretaceous strata and all subjacent rocks into uplifted folds and fault blocks along the entire length of this geosyncline. The making of the Rocky mountain system, coinciding with that of other systems on other continents, is therefore the time marker for closing the Mesozoic era and opening the Cenozoic.

In plant evolution, Cretaceous time saw the appearance of angiosperms (plants with covered seeds), dominant among land plants ever since. The reptilian horde reached its climax and gave place, following the Rocky mountain revolution! to mammals of almost all existing orders. From the variety of land-living organisms and the known paleogeography, Cretaceous climates are judged to have been about as diversified as those of today.

4. **The Cenozoic** Era.—Almost all landscapes of the world, whatever their character, are products of Cenozoic events. In the United States existing mountain ranges are Cenozoic uplifts, most of them along the axes of earlier orogenies. Most of them have even-crested ridges (summit flats, or accordances), surviving from a peneplanation that had destroyed earlier deformative uplifts. Plateaus are broad uplifts with little deformation or are lava-flooded areas. All volcanic cones of the country are Cenozoic growths. The great drainage systems were outlined and developed during this era, as were the coast lines. The monotonous plains are determined by Cenozoic stream and coastal deposits, the debris derived from destruction of the late Mesozoic and early Cenozoic highlands. All lake country in the northern states records a late Cenozoic ice-sheet glaciation. All soils and subsoils are Cenozoic in age. Almost all existing exposures of older rocks are the result of the vigorous erosion of Cenozoic time. Most of these features are consequences of crustal movements which produced at the maximum as emergent a condition and as great a relief as the continent has ever had.

The two Cenozoic periods are differentiated on the basis of climate, the coming of the Ice Age, or Pleistocene Epoch, closing the Tertiary and inaugurating the Quaternary. Marine overlaps were limited to coastal lowlands and the lower Mississippi valley. Cenozoic formations therefore are largely nonmarine deposits occupying intermontane basins and piedmont areas. The life record thus is largely of land animals and plants.

The story of Cenozoic erosion, generalized, is that of the reduction of early highlands to worn-down peneplains which truncated the stumps of the newly made Rockies and the rejuvenated Appalachians and are recognizable even in the landscapes of the Appalachian plateaus and the central lowlands. Several times of renewed uplift interrupted this erosion and complicated the record with successive partial peneplains whose remnants constitute even-crested summits and steplike erosional flats at lower altitudes. Rivers came to flow across such base-leveled surfaces without respect to hard or soft rocks below their valley bottoms. In later uplifts many hard rock crossings have become spectacular water gap canyons in all areas of Pre-Cenozoic folding and faulting. Other canyons are because of physiographic youth alone. Quaternary glaciers aided in the deep sculpturing of many western mountain ranges. The submerged continental shelf is notched by submarine canyons that seem to date from greatly lowered ocean levels at times during the era. Elevated shore lines tell of other times when the ocean level was higher even than now.

Cenozoic deposits made by streams, wind and glacial ice and in lakes of closed basins are limited to favourable places, are very diverse in character and in many cases are difficult to correlate. Particularly difficult has been the correlation of coastal marine sediments with the intermontane, although each class possesses a wealth of paleontologic material.

The Gulf coast Tertiary rocks have been penetrated from below by a large number of cylindrical salt domes or plugs, the salt derived from older rocks and forced upward "like grease in a grease gun" (R. C. Moore) at weaker points. Another noteworthy feature of the Gulf coast is an actively subsiding structural and sedimentational trough across southern Louisiana, known from well logs to contain Tertiary sediments twice as thick as the Gulf is deep. It is pointed out as a modern geosyncline.

Cenozoic vulcanism was most marked in the Pacific border states where a row of towering cones surmounts the Cascade range and where the Columbia plateau of nearly horizontal lava flows covers about 200,000 sq.mi. Yellowstone park plateau is another well-known area of Late Cenozoic vulcanism, its geysers testifying to hot rock at no great depth.

An orogeny which is still continuing began in Middle Tertiary time. Most of the displacements were by faulting and occurred (and still are occurring) along the west coast. A continental uplift throughout the country seems to have been contemporaneous with this.

Of much significance to human occupation was the extensive continental glaciation in Quaternary time. Canada, the source area of the great ice sheet, four times sent its marginal overflow south into the Great Lakes and central lowlands region, which four times was melted back in as yet unexplained climatic oscillations. The interglacial stages had climates as mild as—even milder than—that of the present. The Ohio and Missouri river courses were determined by these encroachments of glacial ice, the Great Lakes basins outlined and the cover of "drift" deposited over the region invaded. Outwash gravel and sand is traceable down the Mississippi to within 150 mi. of the Gulf. Dust blown off these outwash tracts settled on drift-covered and driftless areas alike to constitute the fertile loess soils of Mississippi valley states. The ice-weighted part of the continent sank under its load and is still slowly rising from removal of that load. The entire Cenozoic Era extends over about 60,000,000 to 70,000,000 years.

The present forests of deciduous trees were already outlined at the close of Mesozoic time. Grasses possessed the Cenozoic subhumid plains. Herbivorous mammalian evolution responded to the new food plants and carnivorous mammals swarmed to prey on the herbivores. Migration from other continents brought many kinds to North America, other kinds evolved there and spread to South America and the eastern hemisphere. Land bridges for such migrations, presumably in high latitudes, were essential. Extinctions of earlier mammals went along with appearance and deployment of newer types. The Tertiary record of these faunal changes is wonderfully detailed and diversified. Early human cultures arrived from Eurasia late in the Quaternary period, charcoal and flint implements being far more numerous, however, than skeletal remains.

To the igneous and crustal activity of Cenozoic time are attributed most of the metalliferous veins of the western states. Some of the large oil pools of the United States are found in Cenozoic sediments as are also the Pacific coast coal deposits and the "bench" placers in California. (J. H. Bz.)

B. Physiography

Broadly, conterminous United States consists of a rounded eastern highland trending roughly parallel to the Atlantic coast and bordered south of Plymouth, Mass., by a coastal plain; an interior plain drained mainly by the Mississippi system; and a vast, generally rugged western highland covering a third of the country and dominated by high mountains. the general trend of which is a little west of north. A more accurate analysis divides the country into 8 major physiographic regions which are in turn subdivided into 25 divisions and 86 subdivisions as shown in fig. 2 and 3 and briefly characterized in Table II, to which the maps are keyed.

The larger divisions are described at greater length below, together with the rivers arid harbours of conterminous U.S.

1. Laurentian Upland.— This division, which in the United States comprises the Superior upland, is for the most part rough cutover land of little value to agriculture. Its rocks are igneous and Pre-Cambrian metamorphic; all have been upraised and eroded, first by running water, more recently by continental glaciers.

Although small in size, the area has been of tremendous importance economically because of its rich deposits of iron and copper. The iron mines of the Lake Superior district, although showing some signs of exhaustion, have been probably the most productive in the world.

2. The Atlantic Plain.--The Continental Shelf.—South of New York the continent slopes almost imperceptibly to the shore, beyond which the sea bottom continues the very gentle slope for many miles and then descends less gradually to the oceanic abyss. The line where this relatively rapid descent begins is the real edge of the continent and the margin of shallow sea bottom is the continental shelf. Within this margin is deposited most of the sand and mud carried down from the land. A large part of the ocean's life is concentrated on this shallow bottom where the water is relatively warm and food is abundant. The equivalent Pacific shelf is similar but much narrower.

The Coastal Plain.—Repeatedly in late geologic time this border of the continent has stood either lower or higher than at present, thus alternately broadening and narrowing the continental shelf. The part of the shelf above water at any one time is coastal plain. The present coastal plain has been continental

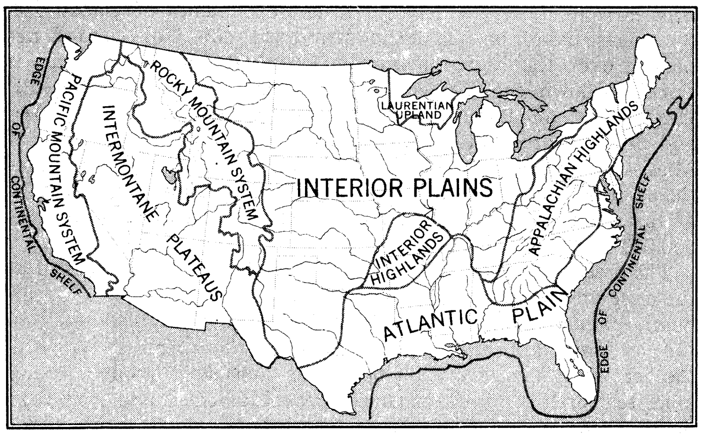

FIG. 2.— THE EIGHT MAJOR PHYSIOGRAPHIC REGIONS OF THE U.S.

shelf at a time so recent that its structure remains unchanged. The materials of its underlying strata are the same as those now accumulating beneath the adjacent shallow sea. Some of the sand, clay and ooze has been poorly consolidated into sandstone, shale or limestone. All beds dip faintly seaward. the older and lower ones passing seaward beneath the younger beds; as the beds offer unequal resistance to erosion and are unlike in their soil-making properties, the several formations appear at the surface in strips parallel to the coast, the lower beds outcropping farthest inland.

As the surface of the continental shelf is extremely flat, so also is the land nearest the coast, which has but recently emerged and lies too near sea level to favour the cutting of valleys. The landward edge of the coastal plain was necessarily first to emerge from the sea. It is also the highest. For both of these reasons it is more deeply eroded and niore completely dissected by small streams than is the seaward edge. In the southern states this inner edge is at places more than 700 ft. above the sea and has a relief of 300 to 400 ft. At places erosion has even made new lowlands or peneplains. Other things being equal, the number and depth of valleys increase inland.

Where the underlying strata resist erosion unequally, a strong stratum may give rise to a cuesta, a ridge with a very gentle slope toward the sea and a steeper slope cutting across the strong stratum and leading down to an "inner lowland" on the underlying weak stratum. The effect on topography is to make the belted coastal plain wherein the stronger beds (usually sandy) make higher. rougher and less fertile belts and the weaker beds (usually clay, marl or chalk) make belts of smooth, fertile lowland Thus central Alabama has its well-known black belt on the outcrop of the Selma chalk (Cretaceous) which erosion has reduced to a lowland with a rich black soil, famous for its cotton. Dipping seaward, the chalk passes under stronger sandy beds which are poor soil makers, hence the rich lowland is paralleled by a broad, now much dissected cuesta of poor upland. Another lowland and another upland follow but are less well known. Northern Texas has a similar belt, the black prairie, along the western boundary of the coastal plain. It is likewise on a chalk outcrop and has an infertile cuesta on its seaward side. New Jersey also has a lowland on the weak Raritan clays which outcrop along the landward edge of the coastal plain. From Trenton southwestward this low strip is followed by the Delaware river. Northeast from Trenton, N J , the railroads from New York city to Philadelphia, Pa., have been built on it.

The coastal plain is broadest at the south and narrows toward the north The opposite is true of the continental shelf. indicating that the continent is now relatively depressed at the north and elevated at the south. One effect of this is seen in the islands from New York to Cape Cod. These islands, Staten. Long, Block, Martha's Vineyard and Nantucket, are disconnected fragments of the coastal plain, parts of one or more cuestas whose corresponding inner lowlands are submerged The low strip across New Jersey is continuous with Long Island sound. The same weak clays underlie both.

Throughout the Atlantic and Gulf coast recent (not necessarily current) sinking is in evidence. From New England to Texas the smaller streams have estuaries, as the larger ones had also uptil filled by sediments. North of southern Virginia all the major streams crossing the coastal plain are drowned across its entire width. The numerous large estuaries from New York to North Carolina make that part of the coast extremely ragged or crenulated. Sand reefs or barrier beaches form a nearly straight "outer coast" and these continue most of the way from Long Island to Mexico. They are especially long and continuous along the coast of Texas where tides are weak.

The peninsula of Florida is the result of an uplift of the sea bottom on an axis almost at right angles to the outline of the continent. Its southern third is so little above sea level that valley cutting is all but impossible. The vast Everglades (*q.v.*), swamps whose water surface is less than 20 ft. above the sea, are located there. The most valuable part of the peninsula is a low limestone ridge on the Atlantic side, bearing Miami and other winter resorts. The northern section has undergone some erosion. Its underlying limestone suffers solution, giving rise to many sinkholes, some of them clogged and making lakes of considerable size. The largest deposits of phosphate rock in the eastern United States are there.

In the vicinity of the Mississippi river the coastal plain is greatly widened, extending north in a pronounced embayment to southern Illinois. The greater part of this area is occupied by the alluvial plains, 40 to 80 mi. wide, of the Mississippi and its tributaries. At the south this plain merges with and includes the great protruding delta, the entire alluvial plain covering an area of nearly 30,000 sq.mi. A large part of it is subject to flooding or would be if not protected by artificial levees. The natural levees are at places 15 to 20 ft. above the back swamps.

3. The Appalachian Highlands— Piedmont and Blue Ridge Provinces.—Inland from the Atlantic coastal plain is a belt underlain mainly by very old rocks, much deformed, generally metamorphosed and resistant to erosion. This belt extends from central Alabama northeastward into Canada, but the part to be described here terminates at the Hudson river. Its greatest width in the south is nearly 200 mi., but north of the Potomac river it averages barely 60 mi. This relic of the early Paleozoic continent is marked by a mountain range on its northwestern side. From southern Pennsylvania, where it is called South mountain, to southern Virginia, where it is called the Blue Ridge, it is rarely more than 10 or 15 mi. wide and from 1,500 to 3,000 ft. high. In North Carolina and adjacent states it broadens to 70 mi. and culminates in Mt. Mitchell (6,684 ft.), the highest point in the eastern United States. The range is interrupted by a short gap in southern Pennsylvania. Northeastward from this gap it is known as the highlands of New Jersey and New York. This part, being detached from the main range (Blue Ridge province) and contiguous with the New England province, which is largely of the same character, is considered as belonging to the latter. From New England to southern Virginia the crest, viewed from a distance, is gently undulating and is considered to be the remains of an uplifted peneplain preserved by the strength of the rocks, while weaker rocks on both sides have been reduced to a new and lower peneplain. In western North Carolina the ancient mountains were not all worn down to the peneplain indicated by the crest farther north. Partly for this reason and partly because of greater recent uplift these mountains are several thousand feet higher.

Between the mountains and the coastal plain is the Piedmont province, most of it a low plateau sloping seaward, consisting in the main of the same rocks found in the mountains. Where the rocks of the Piedmont and mountain belts are similar the existence of a newer and lower peneplain in the former and not in the latter is explained by the fact that the new peneplain developed first along the lower courses of streams flowing from the mountains to the sea. It spread westward, its limit of advancement being the eastward slope of the Blue Ridge. This newer peneplain is itself uplifted and dissected by revived streams. Much of the northern end of the Piedmont province in Pennsylvania and adjacent states is exceptional, consisting of softer Triassic rocks. As these were more readily worn down and, as already pointed out, the continent in this latitude has been less uplifted, this part of the Piedmont province is lowland rather than plateau, though still distinctly higher than the coastal plain.

Ridge and Valley Province.—West of the Piedmont, Blue Ridge and New England provinces is a narrow belt of folded sedimentary rocks stretching from the St. Lawrence valley to the Gulf coastal plain. The length is 1,000 mi. and the width rarely 75 mi., more often half that amount. Between New England and the Adirondacks it is very narrow. In its present state this belt consists of alternating ridges and valleys, the former being parallel, even topped and rarely 3,000 ft. high. For the most part they are nearly straight and in line with the major belt but a zigzag pattern appears in Pennsylvania. The valleys occupy more than half the space. Throughout its length the Paleozoic sandstones, shales and limestones are folded and often faulted by great lateral compression which made mountains of great height.

The ridges now seen are not those made by the folding. Those lay far above the level of the present mountaintops. Even the synclinal trough bottoms were above the present crests. All were eroded away to a peneplain covering this and adjacent provinces. At the time of its making it could not have been, at highest, more than a few hundred feet above the sea. The tilted strata came to the surface of this plain in parallel strips. Later there was a general rise of the whole Appalachian region and the limestones and shales were worn down to a new and lower level (often a peneplain) while the sandstones, being stronger, along with the hard rocks of the Blue Ridge province and the sandstone-capped plateau on the west, retained more nearly their former level.

The greatest breadth of this Ridge and Valley province is in Pennsylvania where it is almost 90 mi. From there to southern Virginia the eastern third or fourth is almost without ridges. Its several parts from the Lebanon valley in Pennsylvania to the Shenandoah valley in Virginia are well known for their agricultural wealth. In this central portion the master streams cross the belt transversely, their longitudinal tributaries being developed on the softer outcrops. In the northern section of the province, the Hudson-Champlain valley, and again in the southern section, the valley of east Tennessee and neighbouring states, the main streams are longitudinal. In the latter case this probably came about by the headward elongation of the Tennessee river capturing the former streams which flowed from the Blue Ridge to the Ohio river.

St. Lawrence Valley.—Only a minute part of this valley is in the United States; essentially it is a young marine plain with low rocky bills projecting above the general level.

Appalachian Plateaus.—West of the Ridge and Valley province is a plateau of almost equal length with a minimum width of about 35 mi. at the south but more than 200 mi. wide farther north. On the side toward the Ridge and Valley province, it is at least as high as the ridges already described, 2,000 to 3,000 ft., but it declines northwestward and is barely 1,000 ft. high where its edge approaches Lake Erie. Its rocks are almost horizontal, generally outcropping on the southeast in an escarpment overlooking the adjoining valley of the folded province. Except at the north end the rocks at the surface are Carboniferous and Permian. Thick beds of strong sandstone are common and generally cap the hills. Soils, therefore, are generally not good. They are least fertile at the south end where the sandstones are most dominant, and best at the north end where Devonian rocks form the plateaus and glaciation has left its heterogeneous drift.

The larger part of the province is almost or quite completely dissected by stream valleys. These may approximate 1,000 ft. in depth on the higher southeast side, but the relief diminishes toward the north and west. Nevertheless the hilltops are about at the same altitude and the horizon is nearly level. The Cumberland plateau at the southern end, mainly in Tennessee, is exceptional in preserving large patches of undissected upland on beds of strong sandstone. In parts of the eastern margin the beds are mildly folded though not enough to develop the topography of the next province to the east. The elevation is less uniform than elsewhere in this province and the horizon less level. As these are also places of greater height these districts are known as mountains, the Allegheny mountains in Pennsylvania and the Cumberland mountains in Kentucky, Tennessee and Virginia, but these names are applied somewhat broadly and without exact boundaries to the deeply dissected eastern margin. The Catskill mountains in southeastern New York are like the adjacent plateau but are covered by an additional thick plate of strong conglomerate now deeply and maturely dissected. The plateau in New York, and to some extent in Pennsylvania and Ohio, was glaciated, leaving the hills and valleys less angular; many lakes and displaced streams were also left, some of which in carving new valleys have made picturesque falls and gorges. The main plateau ends at the north in an escarpment not far south of the 43rd parallel and 600 to 1,000 ft. high. West of Rome, N.Y., this escarpment overlooks the lacustrine plain along Lake Ontario, a part of the central lowland. East of Schenectady, N.Y., the descent from the plateau is to the valley of the Hudson river (Ridge and Valley province). Between these two cities the descent is only to a lower bench of the plateau province. In this bench the Mohawk river has cut its valley, connecting the two lowlands named. As all strata there dip slightly southward, the valley of the Mohawk is a strike valley.

The glaciated northern portion of the Appalachian plateau is favoured agriculturally and is one of the leading dairy districts of the United States. The remainder of the province is almost coextensive with the Appalachian coal fields, 75,000 sq.mi. in extent. As this area was never folded the coal remains bituminous. In the province to the east the folds were so high that the Carboniferous beds, being uppermost, were almost wholly eroded away. Only in a few small spots were the synclines so deep as to leave the coal below the base level of erosion. There the coal was metamorphosed to anthracite. The total original area of the anthracite fields was 484 sq.mi. In the central part of the plateau province are also the Appalachian oil and gas fields.

New England Province.—The New England province is a broadened northeastern extension of the belts already described under the Blue Ridge and Piedmont provinces. It has the same rocks along with some younger Paleozoics, generally deformed, metamorphosed and peneplained. Residual mountains rising above the general level to an altitude of 4,000 to 6,000 ft. are found in the Green mountain section of Vermont and Massachusetts and the White mountain section of New Hampshire and Maine. Between and around these mountains the upland level is generally a little above 1,000 ft., studded here and there with isolated residual mountains or monadnocks, the original Mt. Monadnock being in southwestern New Hampshire. This upland is an uplifted peneplain, dissected by sharp valleys since uplift. The surface declines seaward to the seaboard lowland and it is probable that newer and lower peneplains are represented there. The coastal margin below a level of 500 ft. has a rolling surface with wide open valleys in contrast with the narrow and steeper valleys that incise the plateau. The land below 500 ft. also includes the broad valley of the Connecticut river carved from Triassic rocks and analogous in most ways to the low northern end of the Piedmont province.

Elevation was followed by depression and the valleys are drowned. This is typically shown on the coast of Maine where the style of depressed coast line is quite different from that of the coastal plain because of difference in topography previous to drowning. Outlying islands, formerly hills or mountains of hard rock, are abundant there. Harbours are numerous and fishing is favoured by this as well as by the broad continental shelf.

Unlike the Piedmont and Blue Ridge provinces, New England was severely glaciated: its mountains overridden and scraped by the continental ice sheet and its surface generally covered by ice-laid drift abounding in boulders. Some of its valleys are partly filled with sandy outwash. Both topography and the stony soil are unfavourable to agriculture. The northern part of the province was long the great lumbering district of eastern Cnited States. One of the chief effects of glaciation was the dislocation of streams. Drainage, in beginning anew, was obliged to fill many basins and cross many rocky ledges. Lakes and rapids, therefore, are numerous, the latter being a source of abundant water power.

The Adirondack Province.—In its physical geography the Adirondack area in northern New York is much like northern New England, a combination of subdued mountains and hilly plateaus, all severely glaciated and containing many lakes. Like the White mountains and the New England coast it is a popular summer resort. The state of New York has reserved large areas of forest.

4. **Interior** Plains.—Interior Low *Plateaus*.—West of the southern part of the Appalachian plateaus is a lower plateau province, mainly in the states of Kentucky and Tennessee. At its eastern edge it abuts against the western escarpment of the Cumberland plateau. There the lower plateau is 1,000 to 1,400 ft. high and scored by valleys between which the surface is little eroded. The ragged escarpment of the Cumberland plateau rises 800 ft. higher. Everywhere the level of the interior low plateau declines toward the Ohio river near which, in western Kentucky, the uplands are little more than 500 ft. high. Dissection by streams increases toward the west end where it is complete. The upland level in most of the province, except in the northwest, is approximately that of the Lexington (highland rim) peneplain which covers much of the continental interior. It is developed there on Mississippian rocks. Two low structural domes were thus truncated, the Nashville in Tennessee and the Cincinnati anticline, partly in Kentucky. Ordovician (Lower Silurian) limestones, were exposed in each, affording excellent soils. In Tennessee these soluble rocks were later cut down 500 ft. making the fertile Nashville basin, surrounded by steep slopes rising to the relatively barren highland rim. The bluegrass region in Kentucky preserves, in the main, the general level of the peneplain but is overlooked on the east by the Cumberland plateau and on the south by a narrow monoclinal rim remaining from the former dome. In the central bluegrass district are exposed the oldest rocks and the best soil makers of the Cincinnati anticline. Western Kentucky embraces the south end of a great coal field with its centre in Illinois. There! in a broad, faint syncline, the Pennsylvanian rocks were sufficiently depressed to escape the erosion that stripped them away from neighbouring areas.

Central Lowland.—The term lowland is not capable of exact definition. As applied to north central United States it signifies that most of the area is not obviously much above the level to which streams can cut. down.

Within this great province, roughly one-fourth of the United States, the chief contrasts in topography are determined by glaciation. The entire province may be divided into six sections. Two of them were never covered by the ice; two of them were left after glaciation as relatively smooth till plains without lakes; two others were left with abundant moraines and undrained basins. The Great Lakes section has a topography controlled in detail by its thick glacial deposits, though its large features betray the relief of the underlying rock as carved by preglacial drainage. Terminal and recessional moraines and outwash deposits, with morainic lakes and swamps, cover perhaps half of the area; the other half is till plains (ground moraine) and lacustrine plains.

The beds of all the Great Lakes except Lake Superior follow belts of weak strata which were presumably lowlands in preglacial time and were deepened by glacial erosion. As the ice front retreated northward from the Mississippi-St. Lawrence divide, lakes formed between the divide and the ice. With further retreat of the ice these lakes expanded and merged, changing from time to time in shape, altitude and outlet but generally discharging into the Mississippi system. When the vanishing ice covered only the St. Lawrence the lakes discharged for a time through the Mohawk valley to the Hudson. As each newly discovered outlet lowered the lake levels the water was progressively withdrawn from the farther ends of the basins and the old lake bottoms at the heads of the lakes (south or west ends) were laid bare. An important though minor part of this Great Lakes section consists of these perfectly flat former lake bottoms. The glaciation of this section was in the last, or Wisconsin, ice epoch and the surface has been little altered by erosion. Lakes and swamps are beginning to disappear but stream systems are poorly developed.

The western young drift in Minnesota, northern Iowa and the Dakotas is similar but with a smaller proportion of morainic topography. It has also a smaller rainfall, so that forests are limited to northern Minnesota. An important feature of this section is the great lacustrine plain of former Lake Agassiz in the valley of the Red river. This valley was flooded when the retreating ice cap obstructed the drainage to Hudson bay. The lacustrine plain (most of it in Canada) is the greatest area of spring wheat production in North America.

Southwestern Wisconsin and small parts of adjacent states, the Wisconsin driftless area, were missed by the several ice invasions though surrounded by a glaciated surface that extends 250 mi. farther south. Probably at no one time did the ice close around it. The margin of the ice sheet was divided into lobes following the great valleys. In the different ice epochs they came from different directions, at one time from the northwest, at another from the northeast? the areas covered by these different advances overlapping south of this driftless area. The southern and western parts of this area are limestone uplands rather deeply and at places sharply carved by erosion. The northern part is mainly a lowland underlain by friable Cambrian sandstone covered by glacial outwash. With due allowance for the effects of different kinds of rocks on topography, this driftless area may be regarded as a sample of the topography that was elsewhere overridden by the ice. It is not very different from that which is seen beyond the limit of glaciation in eastern Ohio, western Kentucky or central Missouri.

Most of Illinois, Indiana and western Ohio have a drift cover remarkable for its small relief and distinguished by a total absence of lakes. The flatness is not absolute, for the retreating ice front halted at various stages, building recessional moraines, a few of which have the distinctive topdgraphy of moraines, while others are barely visible, being made apparent only by their effect on drainage. The major streams have cut down moderately into this surface and tributaries are developing, but not much headway has been made except near the Ohio and the Mississippi. A margin near these streams belongs to an older drift sheet (Illinoian) while most of the section was again covered by ice in the last (Wisconsin) glacial epoch. West of this section in Iowa and northern Missouri and parts of eastern Nebraska and Kansas are the dissected till plains, distinguished from the till plains east of the Mississippi by greater erosion. This difference results from the fact that the glacial mantle west of the Mississippi was spread in the Kansan glacial epoch and is the oldest glacial drift widely exposed in the country. Complete drainage is re-established; valleys occupy fully four-fifths of the area. In the type of agriculture that distinguishes the central lowland (grains and livestock) the till plains and dissected till plains are pre-eminent.

South of the latitude of Kansas City (39°) the central lowland (Osage section) was not glaciated. It extends almost to central Texas in a belt nearly 200 mi. wide. The underlying rocks dip gently west beneath the Great Plains syncline and away from the interior highland. As the surface slopes in the opposite direction the formations outcrop in parallel strips trending nearly north and south. The stronger beds form cuestas with east-facing escarpments, some of them so eroded as to make hilly belts a few miles wide.

Great *Plains* Province.—The vast area known as the Great Plains is a north-south belt averaging about 400 mi. in width between the mountains of the western United States and the lowlands of its centre. Its height at the base of the mountains is 5,000 to 6,000 ft. and at its eastern edge 1,500 to 2,000 ft. An eastward slope of ten feet to the mile is common. A part of this great area is literally plain, most of the northern third is peneplain and considerable areas on the borders both in the east and west, are dissected into hills. All of it is semiarid and the only trees are in river bottoms or on certain isolated mountains like the Black hills. Most of it has good soil without the necessary water to take full advantage of the fertility.

The flat portions of the province are best illustrated in the Llano Estacado (staked plains) of Texas and eastern New Mexico. Interrupted by the valleys of transverse streams these flats extend north to southern Nebraska and, in modified form, to the South Dakota boundary forming a belt known as the high plains. These are remnants of a vast alluvial slope made by coalescing alluvial fans from the mountains. When the streams ceased depositing and began again to erode, the eastern edge of the deposit was the first to suffer. In Texas the edge is retreating westward as a well-defined escarpment, there being but a few miles between the flat upland and the lowland on the east. In Kansas and adjacent states the wasting edge of the former upland plain is represented by a broad belt of hills. In Nebraska a thick mantle of loess obscures the transition from high plains to central lowland. Between the belt of preserved high plains and the mountains, erosion was also more favoured, partly by original slopes, partly by the nature of the vegetation. There the fluviatile mantle, where formed, was destroyed and the landscape is one of varied relief. The South Platte, Arkansas and Pecos rivers have broad terraced and well-formed valleys, but northeastern New Mexico and the adjacent part of Colorado is a region of plateaus, trenched by angular valleys and surmounted by various features of volcanic origin. The Edwards plateau at the southern extremity of the province is a limestone tableland almost as flat as the Llano Estacado but without the fluviatile mantle. It is cut off on the south and east sides by the great Balcones fault which for 300 mi. forms the inner boundary of the coastal plain. Streams dissect the plateau at the edges and have in part removed the same limestone from a large area just north of the Edwards plateau. This hilly section in central Texas is in a stage of the erosion cycle intermediate between the youth of the well-preserved plateaus and the old age of the lowlands on the north.

North of latitude 43° the Great Plains province is in large part upraised peneplain, though perhaps not all of the same cycle. Second in areal importance are the extensive gravel plains, some of them perhaps being remnants of a sheet similar in origin to that which covers the high plains. Others are simple stream terraces of Pleistocene age. Some of the streams, especially near the mountains, have valleys hundreds of feet deep and their tributaries have deeply dissected the upland. Isolated mountains are domelike uplifts, the largest of which is the Black hills, about 88 mi. long and 50 mi. wide, crossing the Dakota-Wyoming border. The structural uplift approximates 10,000 ft. but erosion has truncated the dome leaving the actual height less than 4,000 ft. above the plain on the east. The core of granite has thus been exposed at the top, while the strata outcrop in concentric ellipses, the stronger ones making ridges.

The northern part of the Great Plains province and a margin on the east was covered by the Pleistocene icecap leaving a strongly morainic topography in the Dakotas. The course of the Missouri river results from the obstruction of former drainage northeastward to Hudson bay. Its relative youth is shown by the small width of its valley (one to three miles between bluffs) as compared with that of the Yellowstone river and other tributaries.

5. Interior **Highlands.**—*Ozark* Plateaus.—Surrounded by the lowlands of south central United States is the interior highlands. Its northern and larger part consists of the Ozark plateaus on nearly horizontal though slightly domed rocks. The rocks of its southern third are folded along east-west axes. Altitudes in the Ozark plateaus are generally less than 1,600 ft., being highest near the centre, but in northern Arkansas on the southern slope of the dome the strong sandstone beds of the Pennsylvanian are preserved in a plateau that is locally more than 2,000 it. high and ruggedly eroded, making the Boston mountains. In southeastern Missouri in the midst of the plateau stand the Saint Francis mountains, composed of granite, rising no higher than the surrounding horizontal sediments which once covered all. These ancient granite mountains were buried by marine sediments and are being exhumed. They are among the best examples of their class. The Ozark province is one of the leading sources of lead and zinc.

Ouachita Province.—The belt of folded structure in Arkansas and Oklahoma, the Ouachita mountains, is essentially like the Appalachian Ridge and Valley province, the product of two cycles of erosion with ridges on the stronger outcrops and intervening lowlands on the weaker rocks. The rocks of the Arkansas valley are only mildly folded and although the stronger sandstones make either flat or sloping uplands the whole strip is less uplifted than its neighbours. This province has large supplies of coal. The Ouachita mountains have the famous hot springs of Arkansas and produce novaculite (natural whetstone) of the United States. In and near it also are important bauxite deposits.

6. Rocky **Mountain System.**—*Southern* Rocky Mountains.—The southern Rocky mountain province is a group of linear uplifts initiated by east-west compression. The original folds were in large part leveled by erosion which thereby exposed the underlying granite, now revealed in north-south belts with a maximum width of 40 mi. Later uplift raised the general level to mountain heights but without sharp deformation. The old erosion surface mas warped rather than folded, producing intermontane basins. This later uplift enabled erosion to carve valleys in the granite and reduce the weaker rocks to lowlands. Commonly the granite belts are bordered by upturned sedimentary rocks, the several formations being of unlike strength, thus developing monoclinal foothills and valleys. Some large areas of granite 8,000 to 10,000 ft. high are plateaulike with a relief of only several hundred feet. These plainly represent a former lowland made by approximately peneplaining the first mountains. The largest of these tracts is South park, 9,000 to 10,000 ft. high, west of Pikes peak. The same surface farther east and at many other places is carved into mountains whose summits approximate the same level. Looking across these crests, or over the undissected upland, Pikes peak is seen to rise as an isolated eminence 5,000 ft. above the level. It was a monadnock on the South park peneplain. North of the park and extending almost to Wyoming is the main crest of the Front range with many peaks 12,000 to 14,000 ft. high. Along this entire line residual mountains rise clearly above a dissected plateau. Only a minor part of what is called mountains in the southern Rockies consists of these residual eminences. The greater part are carved from the uplifted peneplain. In the entire system, both north and south, most of the residual mountains have "alpine" features caused by former glaciers. These are cirques and U-shaped troughs, often separated by steep and narrow crags. The San Juan mountains in southwestern Colorado consist largely of volcanic rocks which once covered the area in sheets of relatively small relief. Later they were carved by water and ice into their present forms.

Wyoming Basin. — North of the southern Rocky mountains is the Wyoming basin whose floor, about 42,000 sq.mi. in extent, is a plateau 6,500 to 7,500 ft. high and largely without mountains. Beneath its horizontal Tertiary rocks, and rising through them here and there, are the older folded sedimentaries and granite, showing that the Rocky mountain system is structurally continuous. Within and around this plateau the drainage is strikingly out of harmony with the structure and topography. Green, Yampa, Bighorn! North Platte and Laramie rivers all leave the basin by canyons 1,000 to 3,000 ft. deep which might be avoided by going around the mountains. Green river, especially, was once a favourite illustration of an antecedent river. This assumes that the river was in its place before the mountains rose across its course.

It is now believed that these streams are superposed; *i.e.,* they chose their courses when the mountains were buried by weak Tertiary rocks (since eroded away) lying on top of those that now make the basin floor.

Middle Rocky *Mountains.*—The middle Rocky mountains. between the Wyoming basin and through the Yellowstone National park. consist of definite ranges in which structures and trends are clearly related. The axes radiate from Yellowstone park to the south, southeast and east. A long sickle-shaped arm whose eastern side is the Bighorn range almost surrounds the Bighorn basin. Of the group of ranges trending south, the Wasatch in northern Utah is outlined on the west by a great fault, the range on the upthrown side overlooking Great Salt lake on the downthrow. Meeting this range at right angles is the Uinta range which extends eastward forming the southern rim of the Wyoming basin.

Yellowstone park is a plateau of rhyolitic lava with an average height of about 8,000 ft., enclosed by mountains on three sides but open to the west where a rapid descent leads down to the Snake river (basalt) plateau. A single narrow belt of mountains north and east of the plateau connects those to the north and those to the south. The lava fills a basin probably 2,000 ft. deep and appears to have conserved the heat revealed by geysers and hot springs. The hot springs are among the most extensive in the world and the geysers have no rival.

Northern Rocky *Mountains.*—North and west of Yellowstone park the mountains (with few exceptions) are not in ranges in the usual sense of that word. Linear arrangement in agreement with structure is found to a limited extent, *e.g.,* in the Lewis range of Glacier National park, but in general the present relief does not suggest corrugation. Much the larger part of the area is a vast mountain upland divided only by stream valleys or by Tertiary basins in which the mountain surface has sagged. Generally the dominant ridges within a single view are of nearly equal height so that the horizon is not far from level. Altitudes between 6,000 and 9,000 ft. are prevalent. The Bitterroot mountains on the Montana-Idaho boundary are the upturned edge of a fault block tilted westward. Except for this deformation the surface is as described above. Passes through the northern Rockies are much lower than those in the southern Rockies. The history of the northern Rocky mountains is much like that of those farther south. At similar altitudes glacial features are more pronounced. They are specially marked and picturesque in Glacier National park in the Front range near the Canadian boundary. The Selkirk and Bitterroot ranges are likewise noteworthy in this respect.

7. Intermontane **Plateaus.**—*Columbia* Plateau. — The surface of the Columbia plateau between the northern Rocky mountains and the cascades is made by flows of dark lava. These flows submerged an uneven surface of erosion, locally almost mountainous as may be seen in vertical section in the mile-deep canyon of the Snake river between Idaho and Oregon. The Snake river basin east of the 115th meridian represents the simplest and most youthful phase of lava plains. There the flat surface, 4,000 to 5,000 ft. high, remains as it was when the lava cooled, without erosion and only beginning to weather and to form soil. It is trenched only by the canyon of the Snake river whose depth increases westward to 700 ft. Farther west, in southwestern Idaho and southeastern Oregon, there is more erosion. Near the state boundary the terraced valleys afford valuable irrigable land. The plateau in eastern Washington declines from nearly 3,000 ft. on the east to less than 500 ft. where the Columbia river breaks through the Cascades. This northern section consists of older lavas, subjected to long erosion and having a roiling surface covered (at least in the east) with wind-blown soil. In this area are the famous wheat fields of eastern Washington and western Idaho, cultivated by methods of dry farming by which a crop is raised in alternate years. In eastern Oregon near the middle of the province a group of mountains stood as an island in the floods of lava. Around these a later bulging raised the plateau surface to 7,000 ft., exposing it to greater erosion. This is the Blue mountain section. The rise lay across the course of the Snake river which succeeded in cutting down as fast as the land rose, making a canyon over 7,700 ft. deep.

Colorado Plateaus.—South and west of the Rocky mountains is a region of about 130,000 sq.mi. whose underlying rocks are in the main horizontal and whose surface is tabular. In part it consists of wide-spreading plains at high altitude; elsewhere the plateau consists of tabular remnants between deep and branching canyons. In general the plateau abuts against the mountains

FIG. 3.— DIVISIONSAND SUBDIVISIONS WITHIN THE EIGHT MAJOR PHYSIOGRAPHIC REGIONS (SEE TABLE II)

on the north and east and ends in an escarpment overlooking lowlands on the west and south. The best-known part of the province is the southwestern section traversed by the Grand canyon of the Colorado. This has a maximum depth of 6,000 ft. and a minimum width of less than 5 mi. from rim to rim. The conditions favouring canyons are all present in this province. Great altitude above base level, strong through-flowing streams and geologically recent uplift favour downcutting, while strong rocks and arid climate favour preservation of steepness. In this section the surface is on Permian limestone not deeply eroded. These rocks dip north under younger strata. At the same time the surface rises terracelike over system after system until Eocene beds and lava flows are found capping the high plateaus of Utah, 9,000 to 11,000 ft. high, bounded both east and west by escarpments. Most of the strata underlying the high plateaus iormerly extended southward over the plateau in which the Grand canyon is cut. A mass of rock equal in thickness to the entire depth of the canyon was stripped from this plateau leaving a relatively low surface which was later uplifted. In other words, if the present canyon broadens and similar canyons develop and broaden until the entire plateau has been carried away to the depth of the present canyon bottom, then the streams of the present, newly inaugurated erosion cycle will have accomplished what was done once before. The same Eocene beds which appear in the high plateaus form a wide band on the northern margin, dipping northward until they turn up in the foothills of the Uinta range and ending at the south in an escarpment. The general surface slopes agree with the structure. This is the Uinta basin. South of it, and east of the high plateaus is the area of arid canyon lands deeply trenched by the Colorado river and its tributaries, though its eastern margin in Colorado contains some broad fertile valleys. Farther south is the Navajo section, like the canyon lands but more arid and less canyoned because there are no mountains on the border to supply through-flowing streams. The Datil section on the southeast is largely lava covered as is a considerable area farther west (San Francisco mountain and vicinity) in the Grand canyon section. There also is the Zuni uplift, a dome like the Black hills.

Basin *and* Range Province.—West and south of the Colorado plateau is a region marked by numerous small, roughly parallel mountain ranges separated by nearly flat detrital plains generally 4,000 to 5,000 ft. above the sea, but declining in altitude toward the Gulf of California. The northern half has long been known as the Great Basin and is the largest area of internal drainage in North America. The 100 or more mountain ranges divide it into an almost equal number of undrained basins. The hydrographic centres of some of these are marked by salt lakes; some others have playas, or mud flats covered occasionally by a few inches of water. All are filled or veneered by detritus eroded from the mountains and deposited as alluvial fans. Such sur-

Table 11.—Physiographic Divisions of Conterminous United States

Divisions	Characteristics
A. Laurentian upland	
1. Superior upland	1. Submaturely dissected, recently glaciated peneplain on crystalline rocks of complex structure
B. Atlantic plain	
2. Continental shelf	2. Sloping submarine plain of sedimentation
3. Coastal plain	
a. Embayed section	3a. Submaturely dissected and partially submerged, terraced coastal plain
b. Sea island section	3b. Young to mature terraced coastal plain with submerged border
c. Floridian section	3c. Young marine plain: sand hills, swamps, sinks and lakes
d. East Gulf coastal plain	3d. Young to mature belted coastal plain
e. Mississippi alluvial plain	3e. Flood plain and delta
f. West Gulf coastal plain	3f. Young, grading inland to mature coastal plain
C. Appalachian highlands	
4. Piedmont province	
a. Piedmont upland	4a. Submaturely dissected peneplain on disordered resistant rocks; moderate relief
b. Piedmont lowlands	4b. Less uplifted peneplain on weak strata; residual ridges on igneous rocks
5. Blue Ridge province	
a. Northern section	5a. Maturely dissected mountains of crystalline rocks; accordant altitudes
b. Southern section	5b. Subdued mountains of disordered crystalline rocks
6. Ridge and Valley province	
a. Tennessee section	6a. Second-cycle mountains of folded strong and weak strata: valley belts predominating over even-crested ridges
b. Middle section	6b. The same, but even-crested ridges predominate over valleys except on east side
c. Hudson valley	6c. Glaciated peneplain on weak folded strata
7. St. Lawrence valley	
a. Champlain section	7a. Rolling lowland, glaciated; in part covered by young marine plain
b. Northern section	tb. Young marine plain with local rack hills
8. Appalachian plateaus	
a. Mohawk section	8a. Maturely dissected, glaciated plateau; varied relief
b. Catskill section	8b. Maturely dissected plateau of mountainous relief and coarse texture (glaciated)
c. Glaciated Allegheny plateau	8c. Mature elaciated plateau of moderate relief
d. Allegheny mountain section	8d. Mature plateau of strong relief; some mountains caused by erosion of open folds
e. Unglaciated Allegheny plateau	8e. Mature plateau of fine texture; moderate to strong relief
f. Cumberland plateau section	8f. Submaturely dissected plateau of moderate to strong relief
g. Cumberland mountain section	8g. Higher mature plateaus and mountain ridges on eroded open folds
9. New England province	
a. Seaboard lowland	9a. Peneplains below 500 ft., post maturely eroded and glaciated; few monadnocks
b. New England upland	9b. Dissected and glaciated peneplains on complex structures; monadnocks
c. White mountain section	9c. Subdued and glaciated mountain masses of crystalline rock
d. Green mountain section	9d. Linear ranges of subdued and glaciated mountains and residual plateaus
e. Taconic section	9e. Maturely dissected and glaciated mountains and peneplain on resistant folded strata
10. Adirondack province	10. Subdued mountains and dissected peneplain glaciated
Interior plains	
11. Interior low plateaus	
a. Highland rim section	11a. Young to mature plateau of moderate relief
b. Lexington plain	11b. Peneplain on weak rocks, trenched by main rivers and locally dissected
c. Nashville Basin	11c. Peneplain on weak rocks; slightly uplifted, moderately dissected
d. Shawnee section	11d. Low, maturely dissected plateau with silt-filled valleys
12. Central lowland	
a. Great Lakes section	12a. Maturely dissected and elaciated cuestas and lowlands; moraines, lakes and lacustrine plains
b. Western young drift section	12b. Young glaciated plain; moraines, lakes and lacustrine plains
c. Wisconsin driftless section	12c. Maturely dissected plateau and lowland invaded by glacial outwash (margin of old eroded drift included)
d. Till plains	12d. Young till plains; morainic topography rare; no lakes
e. Dissected till plains	12e. Submaturely to maturely dissected till plains
f. Osage plains	12f. Old scarped plains beveling faintly inclined strata; main streams entrenched
13. Great Plains province	
a. Missouri plateau, glaciated	13a. Glaciated old plateaus; isolated mountains
b. Missouri plateau, unelaciated	13b. Old plateau; terrace lands; local badlands; isolated mountains
c. Black hills	13c. Maturely dissected domed mountains
d. High plains	13d. Broad intervalley remnants of smooth fluviatile plains
e. Plains border	13e. Submaturely to maturely dissected plateau
f. Colorado piedmont	13f. Late mature to old elevated plain
g. Raton section	13g. Trenched peneplain surmounted by dissected, lava-capped plateaus and buttes
h. Pecos valley	13h. Late mature to old plain
i. Edwards plateau	13i. Young plateau mith mature margin of moderate to strong relief
k. Central Texas section	13k. Plateau in maturity and later stages of erosion

d. Snake river plain	20d. Young lava plateau
e. Harney section	20e. Young lava plateau; features of recent volcanism; ineffective drainage
21. Colorado plateaus	
a. High plateaus of Utah	21a. High block plateaus in part lava-capped; include terraced plateaus on south side
b. Uinta basin	21b. Dissected plateau; strong relief
c. Can,-on lands	21c. Young to mature canyoned plateaus; high relief
d. Navajo section	21d. Young plateaus; smaller relief than 21c. into which it grades
e. Grand canyon section	21e. High block plateaus, trenched by Grand canyon
f. Datil xction	21f. Lava flows entire or in remnants; volcanic necks
22. Basin and range province	
a. Great Basin	22a. Isolated ranges (largely dissected block mountains) separated by aggraded desert plains
b. Sonoran desert	22b. Widely separated short ranges in desert plains
c. Salton trough	22c. Desert alluvial slopes and delta plain; Gulf of California
d. Mexican highland	22d. Isolated ranges (largely dissected block mountains) separated by desert plains
e. Sacramento section	22e. Mature block mountains of gentle dip; block plateaus; playa-drained intermontane desert basins (bolsons)
H. Pacific mountain system	
23. Sierra-Cascade mountains	
a. Northern Cascade mountains	23a. Sharp alpine summits of accordant height; higher volcanic cones
b. Middle Cascade mountains	23b. Generally acrordant summits; higher volcanic cones
c. Southern Cascade mountains	23c. Volcanic mountains variously eroded; no very distinct range
d. Sierra Nevada	23d. Block mountain range tilted westward; accordant crests; alpine peaks near east side
24. Pacific border province	
a. Puget trough	24a. Lowlands of diverse character; in part submerged
b. Olympic mountains	24b. Generally accordant crests; local alpine peaks
c. Oregon Coast range	24c. Uplifted peneplain on weak rocks, dissected; monadnocks of igneous rock
d. Klamath mountains	24d. Uplifted and dissected peneplain on strong rocks; extensive monadnock ranges
e. California trough	24e. Low fluviatile plain
f. California Coast ranges	24f. Parallel ranges and valleys; on folded, faulted and metamorphosed strata; rounded crests of subequal height
g. Los Angeles ranges	24g. Uplifted fault blocks; alluviated lowlands
25. Lower Californian province	25. Dissected west-sloping granite upland (in northtrn part)

faces are nearly level and tend to rise until the basin is full. A few basins along the course of the Humboldt river have been so aggraded with detritus as to establish through drainage which may reach Carson sink or stop at Humboldt lake, according to season and weather. Many of the mountain ranges are 50 to 75 mi. long and 3,000 to 5,000 ft. above the basins and trend approximately north-south. Trees appear only in exceptional spots. Some of the ranges are known to be upraised or uptilted fault blocks. As there is a strong family resemblance among ranges, it is considered probable that faulting is at least the master process in the making of these ranges. The internal structures are complex showing that the rocks were strongly folded and (in the best-known cases) peneplained and lava covered before faulting made the present mountains. In northern Nevada and southern Oregon the mountains were uplifted so recently that their origin by faulting is beyond doubt. Farther south some ranges are so old and eroded that their origin is not obvious.

Some of the ranges bear evidence that the master faults were made before the peneplain, the present mountains consisting of the more resistant fault blocks exhumed by selective erosion.

South of latitude 35° 30′, and extending from California to New Mexico, many of the intermontane basins are connected by through drainage or at least by continuous slopes on which water might flow to the sea if the rainfall were sufficient.

8. **Pacific** Mountain *System.—Sierra-Cascade Mountains.*—From Canada to southern California a continuous barrier of mountains separates the Pacific border from the interrnontane plateaus. The Sierra Nevada south of the 40th parallel presents to the Great Basin one of the highest and steepest mountain fronts on the continent. It is the escarpment of a great fault, or compound fault, west of which an old mountain range, worn down almost to a lowland, rose again with a westward tilt. Streams descending its long western slope have greatly increased its ruggedness by cutting gorges. These were laler occupied by glaciers which deepened the valleys and steepened their sides. Yosemite valley is only an extra fine example of the typical glacial trough with its uneven floor whose basins retained lakes until filled by gravel and its oversteepened walls notched at the top by tributary valleys, the "hanging valleys" which end in falls. These mountains are mainly of granite but in the northern half is a belt of folded and metamorphosed sedimentaries making the gold belt which has yielded a large part of California's output of gold.

North of the Feather river the range changes completely. There is no evidence of uplift, only a piling up of volcanic materials from hundreds of vents. Lava flows, ash beds and cinder cnnes are of all ages, from those that are fresh and shapely to others almost eroded away. Mt. Shasta with its beautiful cone (14,162 ft.) and Mt. Lassen (*see* LASSEN VOLCANIC *NATIONAL* PARK) belong to this southern section of the Cascades. A little north of the Oregon boundary there is evidence that crustal uplift is added to volcanic accumulation. Farther north the range owes its height more and more to uplift and less and less to the piling up of ejecta. The volcanic cover gives out entirely in central Washington, north of which the northern Cascade mountains consist of metamorphosed Paleozoic rocks and granite, intricately dissected into sharp peaks and ridges most of which, in a single view, rise to an almost uniform height. The level thus determined varies from 6,000 to 8,500 ft., being gently arched.

Above this nearly level horizon in both Oregon and Washington rise the isolated cones of extinct volcanoes 3,000 to 7,000 ft. higher. The best known are Mt. Rainier (14,410 ft.) in Washington and Mt. Hood (11,245 it.) in Oregon. Crater lake in southern Oregon is the finest example of its class in North America. It originated by the engulfment of the upper part of a volcano, thus truncating the cone and leaving a pit $4\frac{1}{2}$ to o mi. in diameter at the water level, which is there 6,176 ft. high. Above it the walls of the caldera rise 500 to 2,200 ft. and below it the basin is 2,000 ft. deep.

Pacific *Border Province.*—The Pacific border province embraces a chain of coast ranges with long arid important valleys between these and the Sierra-Cascade mountains. The most northerly range, the Olympic mountains, is not unlike the northern Cascades but lower. The Oregon Coast range is a gentle anticline of Tertiary beds, relatively recent in origin. It is succeeded on the south by the Klamath mountains, a range of long standing, consisting largely of metamorphosed Paleozoic rocks, once eroded down to a peneplain but uplifted again, locally as high as 7.000 ft., then deeply and ruggedly eroded. Most of the California coast is occupied by the California Coast ranges, relatively low mountains (generally between 2,000 and 4.000 ft.) ranged in parallel ridges caused largely by faulting of an earlier, much deformed and much worn-down mountain belt. Some broad valleys south of San Francisco, Calif., are filled with late Tertiary sediments because of depression at that time. Still later the coast seems to have been depressed about 1,500 ft. below its present level. Shore lines etched against the mountainsides are preserved here and there at various levels between the sea and the 1,500-ft. contour. As shown by these old shore lines, the depression that caused San Francisco bay is relatively recent.

Puget sound is the submerged northern end of a trough 350 mi. long between the Cascades and the Coast range. Its southern end is the valley of the Willamette river, a southern tributary of the Columbia. Some of the valleys in this long trough are agriculturally rich. Commercially the region of the sound is favoured by its fine harbours and the transcontinental railroads which these harbours have attracted. The Central valley or Great valley of California between the Coast range and the Sierra Nevada is 400 mi. long and 50 mi. wide. In the upwarp of the adjacent mountain belts, this belt was bent down. As a consequence it was covered with the silt, sand and gravel washed from the mountain slopes. That deposition is still going on in the valley is evident from the habits of the two master streams. the Sacramento from the north and the San Joaquin from the south. These have small gradients and run between high natural levees; sand bars are abundant; at the head of San Francisco bay the two streams unite to build an extensive delta. The filling of the valley is mainly from the higher mountains on the east. Deposition is in the form of alluvial fans which in the southern part have crowded the San Joaquin westward to the foot of the Coast range; the great alluvial fan of Kings river, extending across the valley, has cut off its southern third forming Tulare basin, partly occupied at times by a playa lake. The climate is so arid that all inflow is evaporated and there is no drainage to the San Joaquin. Irrigation is highly developed, especially in the more arid southern half on the great alluvial fans.

Lower *Californian Province.*—The Sierra Nevada and the Great valley extend south to latitude 35" beyond which there are ranges trending nearly east-west from the Mojave desert to the Pacific. The famous fruit-growing lowlands of California lie mainly farther south. The Gulf of California occupies a downwarped trough similar to the Great valley. In recent geologic time the gulf reached 150 mi. farther north. This extension was cut off by the delta of the Colorado river and its waters evaporated. It is now the basin of the Salton sea, still in part below sea level and known, where irrigated, as the rich Imperial valley.

9. Rivers and Harbours.—In a very general way the major divides follow the great highlands, hence the rivers entering the Atlantic between the St. Lawrence and the Gulf of Mexico are of moderate size and of little direct value to navigation. Their indirect value is great, however, because all their valleys were carved when the continent stood at a higher level. Subsidence of the land drowned the lower courses of streams, making estuaries and harbours as at New York city, Baltimore, Md., and all the other Atlantic seaports. The Hudson was drowned to Albany, N.T., and the Delaware to Trenton. S.J., permitting ocean vessels to reach Philadelphia. Chesapeake bay is the largest indentation thus made. One of its branches, the Potomac, is at sea level as far up as Washington, D.C.

The St. Lawrence system embraces the five Great Lakes on the Canadian border. The divide limiting the drainage basin of these lakes on the west and south is not far from their shores, hence all tributary streams are short. But the mouths of these streams have likewise been drowned by the tilting of the basin in such a manner that the southwestern shores of these lakes are being progressively submerged while the northeastern shores are rising. Milwaukee, Wis.. Chicago, Ill.. Toledo, O., and some other ports owed their original harbours to this cause. The extraordinary harbour of Duluth, Minn., lies behind a sand bar which has cut off the western end of Lake Superior.

Nearly 1,250.000 sq.mi. of the United States, mainly in the interior plains, drain to the Mississippi and its branches. These afford thousands of miles of navigable water, chiefly on the main stream and its tributaries from the humid east. The Ohio river is the most navigated stream in North America. New Orleans, La., is a river city 100 mi. from the Gulf; it is a seaport only in the sense that seagoing vessels can reach it. Mobile, Ala., and some other Gulf ports are on drowned valleys altered and supplemented by artificial works. A small estuary at Galveston, Tex., is fronted by a broad sand reef on which the city stands.

The Mississippi river has received much attention on account of navigation and flood prevention. More than three-fourths of its water comes from three main streams: the Missouri, the upper Mississippi (above the mouth of the Missouri) and the Ohio. The hlissouri drains the largest basin but has the least rainfall, hence its volume is least. Each year the Mississippi carries to the sea approximately 340,500,000 tons of solid matter in suspension and 136,400,000 tons in solution. Erosion would thus reduce the level of the entire drainage basin by one foot in 6,000 years.

West of the continental divide on the Rocky mountains are two long rivers. the Snake-Columbia in the north and the Colorado in the south. which traverse the full width of the intermontane plateaus. Other streams are short and the total amount of water reaching the Pacific is small in proportion to the great area drained. In this part of the United States, chiefly in the states of California: Nevada, Utah and Arizona and in the adjacent part of Mexico, is a vast area too arid to drain to the sea. comprising 3.2% of the area of the continent or nearly 250,000 sq.mi. The I'acific shore, like the Atlantic, has suffered submergence, drowning the lower courses of most streams. Thus was made the harbour of Portland, Ore., on the Columbia river, 100 mi. from the sea. The local subsidence that made San Francisco bay came at a point where the chief rivers of California break through the coast ranges to the Pacific. Puget sound, with Seattle, Tacoma and other harbours, is similar to San Francisco bay. San Diego, Calif., near the Mexican border, owes its harbour to the protection of a magnificent sand reef. (Pi. M. F.; O. P. S.)

C. Climate

The climate, or average weather. within conterminous United States exhibits a wide diversity although the country lies almost wholly within the prevailing westerly wind belt. The characteristics of this generally easterly drifting air are changed as the air crosses the continent; these modifications are caused by changes of latitude and altitude, proximity to oceans and their currents, ascent and descent of the air over high mountain barriers and flow across the low smooth interior. Further, surges of polar and tropical air masses and the several types of storms add their effects to increase the variety of climates. The effectiveness of each of these so-called controls differs from one place to another. However, there are wide areas within which the characteristics of temperature, precipitation, etc., are nearly similar, but are distinctly different from the characteristics of adjacent areas.

There are almost as many climate classifications as there are climatologists, but one of the most useful—based solely on moisture characteristics, especially with respect to their effect on either native or cultivated vegetation—divides conterminous United States into five climatic provinces: superhumid, humid, subhumid, semiarid and arid. These provinces are large, in some cases extending through a latitudinal range of 10" or more, and may be subjected to alternating flows of polar *v.* tropical or marine v. continental air masses. Though each province may experience rather wide variations in temperature, except on the highest mountains, at least three months of the year have temperatures conducive to plant growth.

Superhumid Province. — This province lies along the north Pacific coast inland to the crest of the Cascade mountains. Precipitation varies from more than 30 to more than 150 in. annually. Winter is the distinct wet season, the precipitation being caused by frequent cyclonic storms which enter the United States in this latitude and by ascent of the wind up the Olympic, Cascade and Coast ranges. In the mountains much of the precipitation falls as snow which may be 10 to 30 ft. deep by the end of March. Summer is predominantly dry, most weather stations receiving less than one inch in each summer month. So little precipitation falls during the summer that there is a distinct water deficiency despite the enormous surplus in the rest of the year. Temperatures are relatively high during the winter rainy season, averaging about 40° F. at sea level — much higher than to the east at the same latitude. The highest summer temperatures rarely reach 90° and the warmest month is much cooler than it is inland. This is the cloudiest region in the United States; 140 to 200 days are overcast, but there may be more than 80 clear days, mostly in summer, each year. It is foggy along the immediate coast in the summer and inland from the coast in the autumn. There are fewer than ten thunderstorms per year.

Humid Province. — All of the United States east of a line from Lake Superior to the Texas coast and scattered small areas in the western mountains have adequate rainfall, varying from not less than 30 in. to slightly more than 50 in. annually. It is nicely distributed for plant growth because the rainier season is in summer. This seasonal distribution is the result of convectional showers, cyclonic storms and thunderstorms, the latter occurring between 25 (northern part) and 80 (central Florida) times a year. Much of the winter precipitation is snow north of the Ohio river where it may cover the ground from 40 days to nearly 150 days (northern Michigan). Along the Gulf coast snow is rare. The average annual temperature is less than 40° in northern Minnesota but increases to 70° along the Gulf coast and 75° in southern Florida. In January the averages are 5°, 55° and 70° respectively. Arctic and polar air may flow easily and rapidly across this area, bringing cold-wave temperatures in its wake. The coldest observed temperatures are about −50° in Minnesota, −20° in Tennessee, 0° in northwest Florida and 40° in Key West, Fla. In summer there is much less difference from the northern part (July average, 65°) to the southern part (80°). Except for southern Florida and eastern Maine, temperatures of 100° or higher have been observed everywhere in this province. There are about 100 frost-free days in the north and about 300 along the Gulf coast. Killing frosts may occur each year down to central Florida. Frost may penetrate the soil to depths of four to six feet in the north. In general, there are from 100 to 140 clear and 100 to 140 overcast days each year except in Florida. Dense fog is present from 5 to 30 times a year, chiefly in winter. Prolonged drought in summer is rare, but heat waves, caused by flows of warm and very moist air from the Gulf of Mexico, are frequent. During the autumn months devastating hurricanes, with wind speeds up to 125 m.p.h. and torrential rain, may strike Florida and the east coast or, less commonly, the Gulf coast. The southern half and the northwestern segment are frequently visited by tornadic storms between March and September.

Subhumid Province. — This province is a belt 300 to 500 mi. wide to the west of the humid province. The western boundary is a north-south line from mid-North Dakota through Texas. More distant from the moisture-bearing winds from the Gulf of Mexico and the Atlantic ocean than the humid province, it thus receives less precipitation. From east to west the annual totals decrease from about 30 to 18 in. along the Canadian border and from more than 40 to about 25 in. in southern Texas. The higher temperatures and greater evaporation in the south make the precipitation less effective for plant growth than it is to the north. The precipitation is largely concentrated in the late spring and early summer months and thus is especially important for cereal crops. The amount varies considerably; along the east side 1 year in 20 is semiarid whereas along the western boundary the ratio is 10 years in 20. Temperatures are strikingly continental, *i.e.*, cold in winter and hot in summer. and are quite similar to those of the western edge of the humid province. Rapid and large temperature changes are a winter characteristic with blizzards and cold waves in the north and "northers" in the south of frequent occurrence. In North Dakota temperatures of −50" F. have been observed and in central Texas, 0°. Summer temperatures are nearly the same from north to south despite the 25° difference of latitude. The highest temperatures recorded have been between 105° and 115°. The frost-free season is the same as in the western part of the humid province. Tornadoes occur in the southern three-fourths of the area.

Semiarid Province. — West from the subhumid province to the eastern slope of the Rocky mountains is an unbroken belt 300 to 500 mi. wide, extending from Mexico into Canada and including much of the area between the Cascade-Sierra Nevada ranges and Rocky mountains, in which semiarid conditions prevail. Most of it is higher than 3,000 ft. above sea level. Being still farther removed from moist Gulf of Mexico and Atlantic air and with moisture from the Pacific largely removed by passage of the air over the mountains, it receives still less rain and snow than the region to the east. In northern Montana the annual average precipitation is about 12 in.; this increases to about 25 in. in the south of Texas. Over the Great Plains the rainy season in late spring and early summer results from convection and cyclonic storms; much of the rain falls as intense showers with as much as one-third the annual amount falling in a single day. On the other hand, two, three or four months may pass without any rain. Hail is frequent in spring and early summer. In the intermontane area the precipitation is more evenly distributed throughout the year. From 20 to 40 in. of snow may fall during the winter, but ordinarily it does not remain long. Chinooks — warm, dry air descending on the lee (east) slope of the Rockies — are fairly frequent during the winter. The lowest winter temperatures have varied between −66° (Yellowstone park) and 10° (Texas), and the highest summer temperatures have ranged between 105° and 115°.

The Great valley of California, while it receives the same amount of rain as the Great Plains and Rocky mountain areas, is quite different in that almost no rain falls from May to September. Winter rain is caused by cyclonic storms and by the ascent of air over the mountains. Summer drought is so long that nearly all crops must be irrigated. Summer temperatures closely approach those of the arid province. Killing frosts occur regularly each year. Snow, hail and thunderstorms are almost unknown at low altitudes and fog is a frequent winter phenomenon.

Arid Province. — This province is largely restricted to parts of Nevada, Utah, Arizona, New Mexico, southeast California and part of southwest Texas. Precipitation is generally less than 10 in. per year, most of which falls as showers during the summer. The smallest annual average is 1.35 in. per year at Greenland ranch, Calif. Summer temperatures are so high and hence evaporation is so great that no cultivated crops can be raised without irrigation. July averages about 80° and the highest temperatures are well above 110°. On July 10, 1913, 134° F., the second highest temperature ever recorded, was reached at Greenland ranch. Winter averages well above freezing though frost may be expected during at least two months each year. More than 200 clear days and 60 or less overcast days occur annually; Yuma, Ariz., averages more than 280 clear days and more than 90% of the total possible amount of sunshine. because of the clear dry air it is not uncommon for midafternoon temperatures to be 40" to 50° warmer than those at sunrise. (P. E. Ch.; C. C. Mo.)

D. Vegetation

The dominant features of the vegetation are indicated by the terms forest, grassland, desert and alpine tundra. A coniferous forest of white and red pine, hemlock, spruce, jack pine and balsam fir extends interruptedly in a narrow strip near the Canadian border from Maine to Minnesota and southward along the **Ap-**

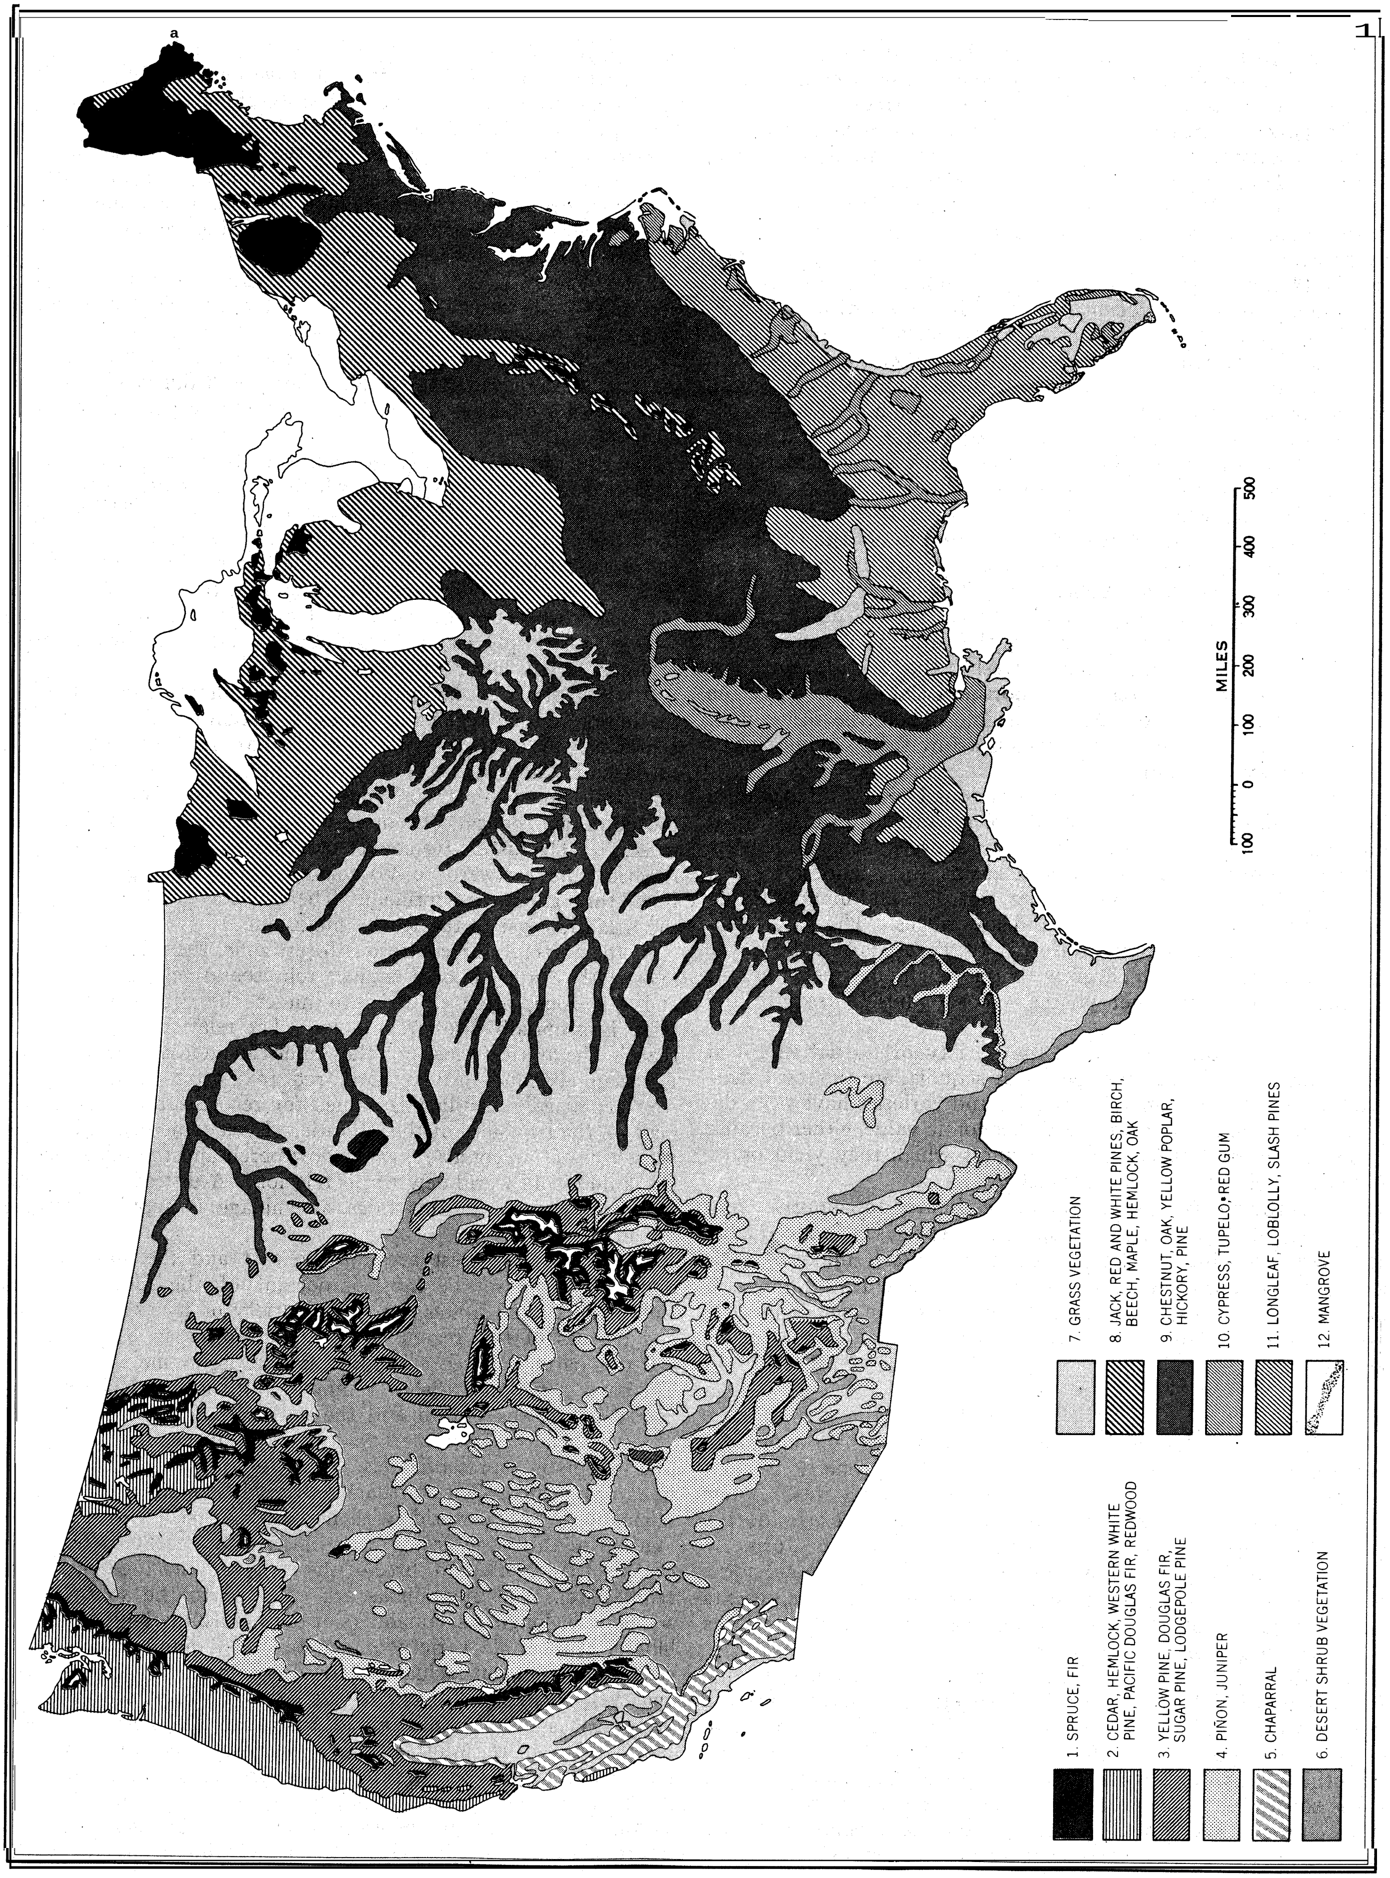

FIG. 4.—DISTRIBUTION OF MAIN TYPES OF NATURAL VEGETATION IN THE U.S.

palachian mountains. There may be found smaller stands of tamarack, spruce, paper birch, willow, alder and aspen or poplar. Southward, a transition zone of mixed conifers and deciduous trees gives way to a hardwood forest of broad-leaved trees. This forest, with varying mixtures of maple, oak, ash, locust: linden, sweet gum, walnut, hickory, sycamore, beech and the more southerly tulip tree, once extended uninterruptedly from New England to Missouri and eastern Texas. Pines are prominent on the Atlantic and Gulf coastal plain and adjacent uplands, often occurring in nearly pure stands called pine barrens. Pitch, longleaf, slash, shortleaf, Virginia and loblolly pines are commonest. Hickory and various oaks combine to form a significant part of this forest, with magnolia, white cedar and ash often seen. In the frequent swamps, bald cypress, tupelo and white cedar predominate. Pines, palmettos and live oaks are replaced at the southern tip of Florida by the more tropical royal and thatch palms, figs, satinwood and mangrove.

The grasslands occur principally in the Great Plains area and extend westward into the intermontane basins and benchlands of the Rocky mountains. Numerous grasses such as buffalo, grama, side oak, bunch, needle and wheat grass, together with many kinds of herbs, make up the plant cover. Coniferous forests cover the lesser mountains and high plateaus of the Rocky mountains, Cascades and Sierra Nevada. Yellow pine, Douglas fir, western larch, white pine, lodgepole pine, several spruces, coast hemlock, grand fir, red fir and the lofty redwood are the principal trees of these forests. The densest growth occurs west of the Cascade and Coast ranges in Washington, Oregon and northern California, where the trees are often 100 ft. or more in height. There the forest floor is so dark that only ferns, mosses and a few shade-loving shrubs and herbs may be found.

The alpine tundra, found in conterminous United States only in the mountains above the limit of trees, consists principally of small plants that bloom brilliantly for a short season. Sagebrush is the commonest plant of the arid basins and semideserts west of the Rocky mountains, but juniper, nut pine and mountain .mahogany are often on the slopes and low ridges. The desert, extending from southeastern California to Texas, is noted for the many cacti, some of which grow to the height of trees, and for the Joshua tree and other yuccas, creosote bush, mesquite and acacias.

The United States is rich in the variety of its native forest trees, some of which, as the species of sequoia, are the most massive known. More than 1,000 species and varieties have been described, of which almost 200 are of economic value, either because of the timber and other useful products which they yield or by reason of their importance in forestry.

Besides the native flowering plants, estimated to comprise from 20,000 to 25,000 species, many hundreds of species introduced from other regions—chiefly Europe, Asia and tropical America—have become naturalized. A large proportion of these are common annual weeds of fields, pastures and roadsides. In some districts these naturalized .'aliens" comprise 50% or more of the total plant population. (P. H. O.; R. C. R.)

E. Animal Life

The fauna includes most of the types of animals of temperate and arctic North America. Only a very few properly tropical forms enter the limits of the conterminous United States. A few tropical frogs and snakes are in extreme southern Texas, and the American alligator is present in southern Florida; the formerly more wide-ranging jaguar and ocelot are scarcely to be found north of the Rio Grande, though the common armadillo, which represents a distinctively South American group, has extended its range as far east as the hlississippi and north into Oklahoma.

Excluding from consideration these tropical and arctic elements, the fauna falls into a well-marked pattern, associated with the more conspicuous botanical formations. The southeastern region of hardwood and pine, a rich mixed forest, extends somewhat beyond the Mississippi, contrasting sharply with the Sonoran desert of the southwest. The great central grasslands from the Dakotas to the Gulf contrast as sharply with the transcontinental coniferous forest at the north; this forest sends great "peninsulas" southward in the Appalachian and Rocky mountains, accompanied by northern types of animals.

The Rocky mountains, with other western ranges, supply a suitable environment for various rock-dwelling types, whose relatives are found in the mountain ranges of Eurasia. The more western ranges, the Cascades and the Sierra Nevada and the Pacific coastal region, have a distinctive fauna with a mixture of unique elements and of forms related to those of the southeastern forest region. The Pacific region has a varied flora, mostly sharply distinct from that of the southeastern forest.

Arrangement of the account of the distribution of the fauna according to these regional provinces has the merit that it can be compared further mith the distribution of insects and of other invertebrates, some of which may be expected to fall into the same patterns as the vertebrates, while others, with different modes or different ages of dispersal, will have geographic patterns of their own.

The transcontinental zone of coniferous forest at the north, the taiga and the tundra zone into which it merges at the northern limit of tree growth are strikingly paralleled by similar zones in the Rockies and on Mt. Washington in the east, where the area above timber line and below snow line is a kind of tundra, often with tundra animals like the ptarmigan and the white *Parnassius* butterflies, while the spruce and other conifers below timber line form a belt sharply set off from the grassland or hardwood forest or desert at still lower altitudes.

A whole series of important types of animals spread beyond the limits of such regions or zones, sometimes over most of the continent. Aquatic animals, in particular, may live equally in forest and plains, in the Gulf states and at the Canadian border. Such widespread animals include the Virginia deer and black bear, the puma and bobcat, the otter and mink, and the beaver and muskrat. The distinctive coyote ranges over all of western North America and eastward to Wisconsin. The larger gray wolf is found throughout the continent. The snapping turtle ranges from the Atlantic coast to the Rocky mountains.

At the north, in the coniferous forest zone, the relations of animals with European or Eurasian representatives are numerous and this zone, often referred to under the Siberian name of taiga, is essentially also circumpolar. The relations are less close than in the arctic forms, but the American moose represents the Eurasian elk, and beaver, hare, red fox, otter, wolverine and wolf are equally familiar as names for recognizably related animals on the two sides of the Atlantic. Even some fishes, like the whitefishes (Coregonidae), the yellow perch and the pike, exhibit this kind of old world-new world relation. A distinctively North American element in this taiga assemblage is supplied by the Canada porcupine.

The hardwood forest area of the east and the southeastern pinelands compose the most important of the faunal regions within the United States. A great variety of fishes, amphibians and reptiles of this region have related forms in eastern Asia, and this pattern of representation is likewise found in the flora. This area is rich in catfishes, minnows and suckers. The curious ganoid fishes, the bowfin and the gar, are ancient types. The "spoon-billed cat," a remarkable type of sturgeon in the lower Mississippi, is represented elsewhere in the world only in the Tangtze in China. The Appalachian region is headquarters for the salamanders of the world, with no less than seven of the eight families of this large group of amphibians represented; no other continent has more than three of the eight families together. The eellike sirens and amphiumas are confined to the southeastern states. The lungless salamanders of the family Plethodontidae exhibit a remarkable variety of genera and a number of species centring in the Appalachians. There is a great variety of frogs, and these include tree frogs of the genus Hyla, whose main development is South American and Australian. The emydid freshwater turtles of the southeast parallel those of eastern Asia to a remarkable degree, though the genus *Clemmys* is the only one represented in both regions. Much the same is true of the water snakes (*Natrix*), the pit vipers (*Ancistrodon*) and various other genera of snakes (*Elaphe, Opheodrys*), though still others are peculiarly American. The familiar alligator is a form with an Asiatic relative, the only other living true alligator being a species in central China.

In its mammals and birds the southeastern fauna is less sharply distinguished from the life to the north and west and is less directly related to that of eastern Asia. The forest is (or was) the home of the Virginia deer, the black bear, the gray fox, the raccoon and the common opossum. The wild turkey and the extinct hosts of the passenger pigeon were characteristic. There is a remarkable variety of woodpeckers. The bird life in general tends to differ from that of Eurasia in the presence of birds, like the tanagers, American orioles and hummingbirds, that belong to South American families. Small mammals abound with types of the world-wide rodent family Cricetidae, and with distinctive moles and shrews.

The western grasslands merge by insensible degrees into semi-desert and desert toward the Great Basin and the Sonoran desert. Most distinctive of the grassland animals proper is the American bison, whose nearly extinct European relative, the wisent, is found in the forest. The most distinctive of the American hoofed animals is the pronghorn, or prongbuck, which represents a family intermediate between the deer and the true antelopes in that it sheds its horns like a deer but retains the bony horn cores. The pronghorn is perhaps primarily a desert mammal, but it formerly ranged widely into the short-grass plains. Everywhere in open country in the west there are conspicuous and distinctive rodents. The burrowing pocket gophers are peculiarly American, rarely to be seen, but making their presence known by their pushed-out mounds of earth. The ground squirrels of the genus *Citellus* are related to those of central Asia, and resemble them in habit; in North America the gregarious prairie dog is a closely related form. The American badger, not especially related to the badger of Europe, has its headquarters in the grasslands. The prairie chicken is a bird distinctive of the plains region, which is invaded everywhere by birds from both the east and the west.

The Sonoran desert of the southwest, which may be regarded as including southeastern California, southern Nevada and Arizona, a corner of Utah, parts of New Mexico and extreme western Texas, is a paradise for reptiles. Distinctive lizards abound, and the rattlesnakes, of which only a few species are found elsewhere in the United States, have their headquarters there. Among lizards the poisonous Gila monster is wholly Sonoran, though with a Mexican relative. Sonoran types range to the Pacific coast and northward in the Great Basin. Noteworthy mammals are the graceful bipedal kangaroo rats (almost exclusively nocturnal), the ring-tailed cat, a relative of the raccoons, and the piglike peccary.

The Rocky mountains and other western ranges afford distinctive habitats for rock- and cliff-dwelling hoofed animals and rodents. The little pikas, related to the rabbits, live in the rock-slides at high altitudes as they do in the mountain ranges of eastern Asia. Marmots live in the Rockies as in the Alps. Every west American range formerly had its own race of mountain sheep. At the north the so-called Rocky mountain goat lives at high altitudes—it is more properly a goat antelope, related to the takin of the mountains of western China. The dipper, remarkable for its habit of feeding in swift-flowing streams, though otherwise a bird without special aquatic adaptations, is a Rocky mountain form with relatives in Asia and Europe.

In the Pacific region, the extremely distinctive frog *Ascaphus*, which inhabits icy mountain brooks, represents a family of frogs by itself, perhaps more nearly related to the frogs of far-off New Zealand than to more familiar types. The Cascades and Sierras form centres for salamanders of the families Ambystomidae and Plethodontidae second only to the Appalachians, and there are also distinctive newts. The burrowing lizards, of the well-defined family Anniellidae, are found only in a limited area in coastal California. The only family of birds distinctive of North America, that of the wren tits, Chamaeidae, is found in the chaparral of California. The mountain beaver, *Aplodontia* (which is not at all beaverlike), is likewise a type peculiar to North America, confined to the Cascades and Sierras,; and there are distinct kinds of moles in the Pacific area.

The mammals of the two coasts are strikingly different, though true seals (the harbour seal and the harp seal) are found on both. The sea lions, with longer necks and with projecting ears, are found only in the Pacific—the California sea lion, the more northern Steller's sea lion and the fur seal. On the east coast the larger rivers of Florida are inhabited by the Florida manatee or sea cow, a close relative of the more widespread and more distinctively marine West Indian species.

II. GEOGRAPHIC REGIONS

The division of the earth's surface into regions for descriptive purposes is an attempt to portray the individuality of the various parts of the earth. By this device, thousands of places which have much in common can be grouped together and conveniently discussed as a unit. If a single criterion for regionalization is selected, as in *Physiography,* above, the resulting classification is fairly straightforward. But when geographic regions based on a multiplicity of physical and human factors are laid out, the results tend to be more arbitrary and to reflect, at least in part, the prejudices of their authors. And since the human factors may change rapidly, the regions delimited by them may be valid only for a short time.

The easiest way to delimit regions is to use established political boundaries. The United States government, for example, publishes much of its data by statistical divisions based on state groupings. In addition, a considerable amount of census data are compiled by metropolitan areas and economic areas based on clusters of counties. This method is convenient, but it overlooks the fact that political boundaries are often arbitrary; a given part of a large political unit may have more in common with parts of neighbouring units than with other parts of its own.

The regions presented below, often cutting across political boundaries, are based on areas which for historic, economic or other reasons are commonly thought of as belonging together. The boundaries are somewhat arbitrary and are in almost every case transition zones rather than fixed lines. The zonal nature of these boundaries is suggested by the broad boundary symbols used in fig. 5.

1. New England.—Physically New England is a poor region, a rocky lake-studded upland that ends abruptly in a forbidding coast line. The continental glacier in passing over it carried off much of the topsoil and deposited the rocks which, piled into walls and fences, became a familiar part of the New England landscape. Except in a few valleys the winters are severe and the summers pleasant, but neither climate nor soil favours a fruitful agriculture. Nor are other natural resources superabundant. The early settlers found fish on the adjacent banks, virgin forests—since cut over—marble and granite in Vermont and limited water-power sites. Other than these, nature offered little but challenge.

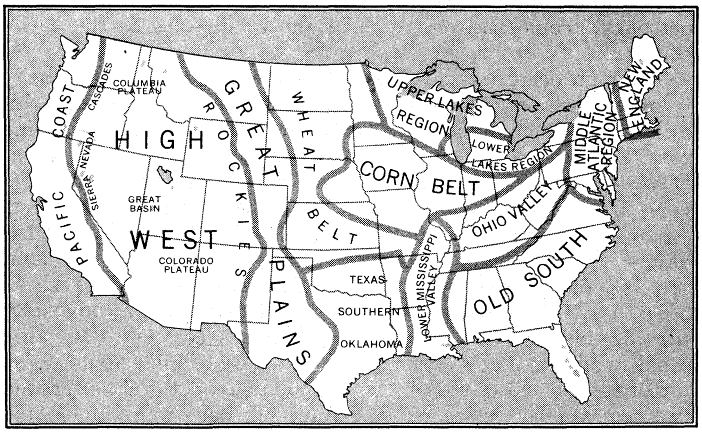

FIG. 5.— GENERALIZED GEOGRAPHIC REGIONS OF CONTERMINOUS UNITED STATES (**see** TEXT)

The history of New England shows that the challenge was met. Lumber was used to build the ships that brought fish: whales and trade to its ports. Imported raw materials, processed first with the aid of water power and muscle, iater with the help of imported coal and intricate machinery devised by Yankee mechanics, gave New England leadership in industry. Yankee thrift, business sagacity and the advantages of an early start put New England in the lead among American regions in education, culture, finance and engineering during the 19th century. Its greatest resource proved to be the ability of its people.

During the 20th century New England has been in retreat. Most of its farms were unable to compete with those of the middle west. The textile mills, long vital to the New England economy, began to move south in search of lower costs and cheaper labour. Trade was challenged by the rise of new ports; the opening of the St. Lawrence seaway enabled ocean-going vessels to travel as far away as the inland cities of Milwaukee, Wis., and Chicago, Ill. It was a retreat, however, and not a rout. New England industry retrenched, diversified, began to place more emphasis on quality, service, prestige and skill and less on quantity and cost.

The population pattern of mid-20th century New England was one of concentration in a few metropolitan areas — Boston, Mass., Providence, R.I., the lower Connecticut valley. The hinterland was used principally to supply the needs of these urban clusters. Dairying, poultry raising and truck gardening, all geared to the urban market, dominated the local agriculture, although in a few favoured spots intensive, specialized farming was practised. Aroostook county, Me., for example, was famous for its potatoes and Cape Cod for its cranberries. Much of the land remained unused or little used: three-fifths of Connecticut mas in forest, two-fifths of New Hampshire and two-thirds of Maine were uninhabited. As tourists discovered many of these areas they became less of a liability, providing recreational facilities not only for urban New Englanders but for visitors from all over the country.

Of the cities, the Boston area specialized in finance, fishing, machine tools, electrical equipment and shoes; Providence in jewelry, lace, metalwares and plastics; the Connecticut valley in hardware, clocks, firearms, motors and office machinery.

Even in the face of agricultural decline and industrial reorganization, New England, with its long tradition of leadership, continued to enjoy national prestige and influence much greater than its 1.8% of the country's area and 5.9% of the population would indicate. (*See* also NEW ENGLAND.)

2. The Middle Atlantic Region.—This region has much in common with New England: a considerable amount of poor land, concentration of population in metropolitan centres and more emphasis on a skilled labour force as a base for industrial prosperity than on raw materials. It also has several advantages over New England: proximity to coal, cement rock and slate, easier access to the interior of the continent and larger areas of good farmland with a somewhat longer growing season. The eastern focus of C.S. business developed there, and at mid-20th century the region accounted for one-iourth of all U.S. personal income. The New York metropolitan area alone accounted for one-eighth of the personal income and one-tenth of the retail sales of the entire country.

The high degree of development of this region arose primarily from its position as a gateway to the mid-continent. Geographically this seems paradoxical, for the Appalachian ridges, running parallel to the coast, cut off the coastal plain from the interior. However, gaps in the mountains mere cut by rivers flowing transverse to the grain of the country, and these rivers terminate in estuaries offering commodious harbours. New York city, with the best of these harbours, is connected inland up the Hudson, navigable by many ocean-going ships as far as Albany. West of Albany the glacier-broadened Mohawk valley provided a convenient site for the New York State Barge canal, successor to the Erie canal, which connects with the Great Lakes. Philadelphia, more fortunate than New York in its immediate agricultural hinterland, had to iay out a more difficult trans-Appalachian route up the Susquehanna tributaries and across the Allegheny front to the navigable headwaters of the Ohio. Baltimore found a similarly difficult route up the Potomac valley.

Agriculturally the middle Atlantic region possesses more level or gently rolling land than New England. The Atlantic coastal plain offers broad areas of sandy soil, suitable. when fertilized, for vegetables. The red soils of the Piedmont lend themselves to dairying and poultry raising and, in the more favoured spots. to corn, wheat and tobacco. The interior valleys specialize in dairying and fruits. Most of these areas are not especially fertile; they are passable farmlands made profitable by their proximity to metropolitan markets.

The chain of cities extending from Boston to Washington, D C., has been called the Atlantic metropolitan belt. With only brief interruptions industrial centre, commercial centre and residential suburbs adjoin each other. The focal point of this metropolitan belt is New York city. One-fourth of all U S. imports enter the port of New York and one-eighth of all U.S. manufactures originate there. The city is a leader in such diverse fields as banking, finance, education, fashion, the theatre, publishing, oil refining and clothing manufacture. to name only a few. Other cities in the middle Atlantic region specialize in somewhat heavier industries; for example. steel manufacturing at Bethlehem and Morrisville, Pa. Baltimore and Philadelphia, while priding themselves on their financial and cultural activities, are more heavily industrialized than New York. Washington, of course, is almost exclusively a governmental centre.

Although the interior contains almost empty lands comparable to the resort areas of New England, there are also scattered small industrial cities. Special note should be made of those along the New Tork State Barge canal: Albany, Schenectady, Utica, Syracuse and Rochester, all of which produce a wide assortment of manufactures. If the region as a whole can be characterized, it is as a closely knit network of towns subdivided by strips of semiwilderness.

3. The Old South. — The Appalachians, the Piedmont and the Atlantic plain, the physical components of the middle Atlantic region. broaden as they continue into the old south, a region which is more and more taking on some of the characteristics of its northern neighbours. The south is hard to define. It has been called the land of the cotton plantation, of the Negro, of the former Confederacy and of the solid Democratic vote, but these criteria no longer suffice. Cotton is no longer grown in many parts of the old south; the Negro is moving north; the plantation is often becoming a ranch or, in winter resort areas, a subdivision. The old south may be delimited on durable physical grounds to include the area with long, warm summers and short, mild winters and with associated red and yellow soils of low fertility. Another unifying factor is the consciousness that its people have of being southern. On the other hand, the old south is a patchwork of diverse soil belts, each with its own specialties, and scattered industrial towns that grew up where convenient rail, road and river junctions offered good transportation.

Along the coast and across most of Florida lies a broad belt of infertile sands interspersed with muddy lagoons and swampy flood plains along the streams. In some places the muds are worth draining for intensive winter-vegetable production and the sands, when fertilized, have supported Florida's orange groves. Elsewhere there are huge pine forests. Many of these are grown for lumber, a profitable venture since trees grow rapidly in the warm climate — twice as fast as in New England. Inland, the coastal plain has bands of well-drained farmlands that can be fertilized to raise local specialties such as cotton, tobacco and peanuts. Farther inland, adjoining the Piedmont, are soils well suited to orchards. The Piedmont itself is a rolling to hilly, often eroded area of clayey soil extending from the Atlantic plain to the Appalachians. Once important for cotton, it supports the most diversified agriculture in the old south including hay and pasturage, soybeans, peanuts, grain sorghums and fruits. In the Piedmont also are many industrial cities, utilizing the coal, stone, lumber and water power of the adjacent mountains.

The rise of manufacturing in the old south has been well advertised. Cheap power, available factory sites, low labour costs and low taxes have attracted many industries which, since they were new, were able to provide themselves with modern plants and machinery. By the early 1960s industrial production in the old south represented about 7% of the U.S total. Although many small factories are widely distributed, the bulk of this industry is concentrated in a few areas. The Piedmont area, around Richmond, Va., Winston-Salem and Charlotte, N.C., specializes in textiles, tobacco and furniture; Atlanta, Ga., in a wide variety of consumer and capital goods; Birmingham, Ala., in iron and steel; and the port cities in chemicals, fertilizers and lumber products.

The old south remains largely a region of subtropical crops, lumber and other ram materials, but is broadening its economic base in agriculture, in industry and in tourism. Once an area of extremely low income, by the early 1960s it had increased its average annual per capita income to about three-quarters of the average for the U.S. as a whole. (See COTTON BELT; SOUTH, THE.)

4. The Lower Mississippi Valley. — Culturally this valley is part of the old south, but the natural wealth provided by about 30,000 sq.mi. of river-deposited soil makes it worth distinguishing as a separate region. A large percentage of this land is too moist for anything but cypress forest, but much has been drained and converted into fertile sugar cane fields (in Louisiana), rice fields (in Louisiana and Arkansas), soybean fields (in Missouri) and cotton fields (throughout the area). Mechanized methods of cultivation and harvesting are widely used. Less intensive agriculture and lumbering are common on the sandy uplands which rise abruptly east and west of the flood plain.

New Orleans, La.. Memphis, Tenn., and St. Louis, Mo., are key centres in the commercial life of the valley. The picturesque steamboats which once gave colour to river life have been replaced by tows of barges able to carry more than the steamboats ever could. Highways and railways add to the freedom of movement through the valley.

River transport together with nearness to oil, salt and natural gas have encouraged the chemical industries. Local raw materials or materials easily brought in by river have given rise to lumber, furniture, vegetable oil. sugar refining and a host of small industries depending on cheap fuel and labour. (See MISSISSIPPI RIVER.)

5. Texas-Southern Oklahoma. — This vast, almost level region is a transition zone where the old south, the wheat belt and the west blend together. Physically, the land consists of north-south strips of prairie and open forest with highly diverse types of soil. The better soils are devoted to farming—especially cotton farming; the poorer areas remain for cattle grazing. This is oil country and oases of prosperity result from local oil booms.

Along the Gulf coast a flourishing industrial region has developed around Houston and the nearby ports of Galveston, Corpus Christi. Port Arthur and Beaumont, Tex. Houston and Galveston first developed as exporters of cotton, grain and oil. Subsequently the wealth of local petroleum, natural gas, salt, sulfur and minerals from the sea made the chemical industries so predominant that the region is sometimes called the petrochemical belt. Other industries include packing, transportation and construction.

Inland, the cities of central Texas are found close to the belt of limey soil known as the black waxy prairie. Cotton is the leading crop there but livestock raising and general farming are also common. Toward the west the country changes from farmland to mediocre grazing land and the threat of drought, prevalent throughout Texas, becomes more serious.

The cities vary widely in character. Dallas, an eastern city in appearance, is the financial capital not only of Texas but of the entire southwest as well. Neighbouring Fort Worth, more western in appearance, is a trade centre for the ranches, dryland farms and oil fields to the west. Austin, nestled against the Balcones escarpment, is the state capital and the site of the University of Texas. San Antonio, most Mexican of large Texas cities, is noted for stockyards and meat packing. All of these cities have some manufacturing but the greatest industrial development has occurred between Dallas and Fort Worth where even aircraft and automobile assembly plants have sprung up.

To the north, in Oklahoma, wheat fields border cotton fields. Oil refining is the outstanding industry but cities such as Tulsa and Oklahoma City add meat packing, flour milling, textiles and other light industries.

6. The Ohio Valley. — The Ohio river (*q.v.*) has cut a narrow winding valley into a low plateau. The dissection of the plateau by the Ohio and its tributaries has formed a broad belt of hill country with soils that are mediocre and much eroded. Except in such rolling areas as the blue grass country of Kentucky and the Nashville basin of Tennessee, farming is on the decline and the rural population is declining with it. Industry rather than farming is the major source of income in the valley.

The Ohio participated with the blississippi in the steamboat boom of the 19th century and both rivers share in the 20th century's bustling barge traffic. A series of dams maintains the Ohio and some of its tributaries at a nine-foot depth. Each dam is easily negotiated by means of locks large enough to accommodate the lengthy, tug-drawn barge convoys. Coal from the hills thus becomes available to the entire valley — an advantage which has caused the region to be nicknamed the American Ruhr. Barges also carry oil, chemicals and even such bulky articles as automobiles. Through connecting streams and canals goods can be taken from the Ohio up the Tennessee to northern Alabama, down the Mississippi and over the Intracoastal waterway to Texas and up the Mississippi and the Illinois to the Great Lakes.

Although new industrial and power developments mere being dispersed along the river in the early 1960s, the major industries were still concentrated in a few areas. The oldest is around Pittsburgh. Pa., where local coking coal and Lake Superior iron ore support a major steel industry. Downstream, another centre noted especially for chemicals has grown up on the lower Kanawha around Charleston, W.Va. A highly diversified industrial complex lies around and north of Cincinnati, O., where the Ohio bends abruptly southward. From it routes fan out toward the rich farmlands to the northwest. The falls of the Ohio, later bypassed by a canal, gave rise to Louisville, Ky., an industrial city noted for horse racing, tobacco, whisky and electrical products. Knoxville, Tenn., and smaller scattered industrial districts have developed in response to the cheap power offered by the Tennessee Valley authority.

7. The Corn Belt. — From the air this flat to rolling region appears in sharp contrast to the partly wooded, much dissected Ohio valley. This lack of major relief features made it possible to lay out fields, farms and roads in close accord with the rectangular land survey used in most pioneer areas after 1800. A lime-rich veneer of glacial deposits, commonly several hundred feet thick, covers almost the entire region. This fertile soil and the hot, humid summers, ideal for growing corn, form the bases for corn belt agriculture.

Corn is usually grown on about half of the land but only in the cash-grain areas near large markets is it sold as grain. The prevailing system is to feed the corn to cattle, hogs and poultry and to obtain cash from the sale of milk, eggs and, especially, meat. Many of the cattle are shipped in lean from western grasslands for fattening. The manure remains on the farm to maintain the fertility of the already rich soil.

Corn is, of course, the mainstay of the corn belt, but it is by no means the only crop. Crop rotation is normally practised and wheat. oats! alfalfa, hay and soybeans are widely cultivated. Most farmers raise vegetables, fruit and fodder for home consumption and frequently have small surpluses for the market.

The typical corn-belt farm is a big, well-operated business. Many are worth well over $100,000, and $1,000,000 farms are not extraordinary. The farm is commonly rectangular in shape, 160 to 400 ac. in size, with a substantialiy built house equipped with all modern conveniences. The outbuildings are spacious and the machinery is elaborate. Probably nowhere in the world is so much land efficiently tilled with so little labour.

The mechanization of the corn belt has caused a decline in the rural population and surplus farm labourers have moved into adjacent towns and cities to find jobs in industry, especially in factories producing farm tools and consumer goods.

The large cities of the region — Chicago (within the lower lakes region). Indianapolis, Ind., and Omaha, Neb., especially—owe their initial development to the packing and marketing of corn-belt produce. They have, however, attracted diverse industrial and commercial activities.

8. The Lower Lakes Region.—North of the corn belt dairying and small grains replace corn. More important than agriculture, however, is the network of transportation routes around the Great Lakes, the greatest fresh-water navigation system in the world. Before the construction of railways water offered the only form of cheap transportation and it remains the best medium for shipping heavy goods. The canal era (1820–50) saw the connection of the lower lakes with the Hudson river via the Erie canal and with the Mississippi-Ohio system via five canals, and the railways, generally, followed the canal routes. This made possible the northward movement of coal, farm produce and other heavy commodities to the lakes and thence to the Atlantic. Lower lakes ports were the obvious places to combine upper lakes ores and lumber with fuels and other materials from the Ohio valley. Before long a continuous industrial section had grown up, roughly in the shape of a triangle with Buffalo, N.Y., Cleveland, and Pittsburgh as its apices. This industry followed the railroads across southern Michigan and northern Indiana to Chicago.

Buffalo, at the eastern end of the region, was and still is important as a transshipment point from lake steamer to canal barge. The focus of many transportation routes and with a nearby source of hydroelectric power at Niagara falls, Buffalo attained world leadership in the flour-milling industry. Other outstanding products of the area include steel, electrical and mechanical machinery, chemicals and foodstuffs.

Cleveland is noted as the financial centre for the Lake Erie area. Its industry is diversified with emphasis on hardware, machine tools, chemicals apd electrical equipment. The many smaller cities along or near the lake shore have local specialties, for example, steel in Lorain and rubber goods in Akron, O.

Detroit, Mich., was a commercial centre long before it became the automobile capital of the world. Its rise to that position was partly an accident of history, but Detroit was not without natural advantages for the automotive industry. In 1900 Michigan had lumber and associated furniture, wagon and carriage industries. As steel bodies became important, Detroit was at first convenient to lower lakes steel centres and later used lake-borne ores and coal to produce its own steel. Finally Detroit could draw on a large number of smaller industrial cities in the lower lakes region to supply batteries, tires and other automobile parts and accessories.

Chicago, located nearly at the southern end of Lake Michigan, became the terminus of the eastern railroads and the starting point of those going to the west. bleats and grains from an arc of farmlands extending at least 1,000 mi. to the west were brought there for processing and shipping, and the city was the logical place for the wholesale and mail-order businesses serving the same area. Because raw materials could be brought in easily by rail and lake steamer, and from the south by canal and pipeline, it was the best place to manufacture many of the goods sold by Chicago merchants. Chicago manufactures goods ranging from bacon to watches to steel girders; it surpasses even the New York area in the variety of its industries although New York holds pre-eminence in finance, commerce and cultural activities.

9. The Upper Lakes Region.—The northern half of the Great Lakes area is a region of rigorous winters and pleasant summers. There the glaciers scraped away much of the soil and blocked the drainage, forming numerous lakes and extensive swamps. The cool, damp climate is conducive neither to the formation of fertile soil nor to the growth of most crops. Only in the southern portion is the land really suitable for fodder crops and dairying; northward it is limited to pine trees, potatoes and rye. Immigrants from northern Europe found conditions on the upper lakes similar to those of their homeland, and the population is largely of Scandinavian origin.

Wisconsin and southern Minnesota are ideal dairying areas. Clover and timothy hay, corn for silage and other fodder crops flourish. Large silos for fodder storage and huge barns for the comfort of the cattle enable the herds to survive the long minters. Milk is marketed in the lower lakes region, but there is also a huge surplus which is converted into butter, cheese and evaporated and powdered milk. Some of the surplus cream is shipped as far as New Tork by tank car.

Farther north, the original pine, birch and maple forests have been cut over and are regrowing slowly into a wilderness pleasing to summer iishermen and winter hunters. Unless they contain minerals, these northern lands are for the most part abandoned. The major mineral, hematite iron ore, is approaching exhaustion and several companies are already using low-grade ore (taconite) which inust be concentrated before it can be used in blast furnaces.

The largest cities. Minneapolis and St. Paul, Minn., have developed in relation to their trade with the dairying area and the wheat belt to the west. Duluth's economy is mainly based on iron ore and on the city's services as a Great Lakes port. (See Great Lakes; The.)

10. The Wheat Belt.—The dark soils of the flattish wheat belt are extremely fertile and in years when the rainfall is good a bumper crop can be produced at low cost. This type of farming is hardly for the poor man, however. To survive, the farmer must have a sufficient reserve to carry him through drought, hail, infestations of locusts, wheat rusts and the many other threats to his crop. He must also have enough capital to buy expensive machinery and the square mile or more of land required to operate it efficiently.

The risk of farming in the wheat belt is so great that throughout its history political groups have arisen to assist the farmer who meets with disaster—disaster which often affects whole counties or even whole states. Besides the natural hazards, the price of wheat is uncertain and even a bumper crop may be unprofitable. In an attempt to level out the ups and downs of wheat-belt agriculture some steps have been taken toward diversification. Cattle, both beef and dairy, are common throughout the region. Oats, barley, rye, flax and potatoes help to vary the crops and, when used in rotation with wheat, assist in maintaining soil fertility.

Throughout the entire region settlement is sparse and towns are small and far apart. The rectangular-field pattern of the corn belt is universal but there is little need for the big cities and prosperous industrial towns which lend variety to the corn belt economy. A possible exception to this is in the Williston basin of North Dakota where oil was discovered.

A distinction should be made between the northern and southern parts of the wheat-belt region. In the south winter wheat is planted in the fall! dies down under the winter snow, grows rapidly in the spring and is ready for harvest in early summer. In the north spring wheat is planted in the spring, grows all summer and is harvested in late summer or early fall. Both wheats are hard and well suited for the manufacture of bread flour. (See Middle West, The.)

11. The Great Plains.—The American west begins with the Great Plains. In the regions considered above settlement is fairly continuous; in the west settlement is scattered. While the more densely populated areas are taking on a resemblance to the older parts of the country and the west of the movies and television is largely a thing of the past, many parts of the west lack water, minerals or any other basis for settlement.

The flat or gently rolling plains of the wheat belt pass without a conspicuous break into the pasture lands of the Great Plains. Water supply on the plains is uncertain. Much of the available water originates in the Rockies towering to the west. Some of it flows from the mountains through long braided streams such as the Arkansas, the Platte and the Yellowstone and is used to irrigate narrow strips of intensively cultivated land yielding sugar beets, melons, grain and fodder crops. In other cases, water from the Rockies flows underground and is brought to the surface through wells.

A relatively small percentage of the Great Plains is cultivated by dry farming—a laborious method of conserving rainfall so that a grain crop can be raised on the dry margin of cultivation. For the most part, however, the land is pasture which supports a few cattle or sheep per square mile and even fewer men. The small towns are widely spaced along the east-west railways and highways and except for agricultural and mineral production there is little business activity.

The rocks underlying the plains are sedimentary and there are few ore deposits. The minerals include low- or middle-grade coal mined for local consumption and some building stone. Petroleum has brought prosperity to a few areas in Texas, the Wyoming basin and western Montana. Some of the ores from the Rockies are smelted on the plains.

Such cities as there are on the plains are generally located close to the Rockies. Denver, Colo., the largest, was originally a supply centre for mining camps. It still manufactures mining machinery and mints coins and, in addition, has the leading stockyard in the west and the leading sheep market in the country. It is also the principal financial and wholesale centre for both the Rockies and the plains.

12. The High West.—This mass of plateaus, mountains, canyons, deserts, salt lakes, forests, scrublands, prairies and irrigated valleys is as varied as would be expected for a region occupying one-third of the country. Yet its development is limited to a few tourist, mining and irrigation centres and the whole huge area supports only 3.8% of the population of the United States.

The eastern edge of the highland consists of the Rockies—high, sharp-edged mountains divided into numerous discontinuous ranges. On the slopes the grasslands of the adjacent plains blend gradually into open pine forest until at the timber line the forest gives way to alpine pastures overshado ed by snow-covered peaks. The Rockies are rich in minerals—gold, silver, lead, tungsten and molybdenum in the Colorado Rockies, copper, silver and gold around Butte, Mont., and silver, lead, zinc and copper in the Coeur d'Alene district of Idaho.

The Cascade-Sierra Nevada ranges make up the western wall of the highlands The fir-covered Cascades are volcanic mountains whose conical, snow-capped peaks rise abruptly from the surrounding plateau. The wooded Sierra Nevada is a huge block of rock tilted up toward the east where its snow-covered crest overlooks the Great Basin. Neither of these ranges is as rich in minerals as the Rockies.

Between the western wall and the Rockies are two huge plateaus and two immense areas of basins and ranges. In the north the volcanic Columbia plateau contains much fertile soil suitable for wheat farming and some arid areas which, when irrigated, support prosperous orchards. In contrast is the almost barren Colorado plateau whose major industry was tourism (Grand canyon) until the discovery of uranium. Between these two plateaus is the vast Great Basin (*q.v.*), an area of inland drainage subdivided into flattish arid basins by abrupt north-south trending ranges. As in the basins and ranges of southern Arizona and New Mexico the land is barren or poor pasture except in the few places where irrigation is possible.

As would be expected in an arid and semiarid area, the outstanding commercial centres are located at oases. Spokane, Wash., is on the Spokane river at the eastern edge of the Columbia plateau; Salt Lake City, Utah, was founded where a river drops onto the eastern edge of the Great Basin; and Phoenix, Ariz., is on the Salt river. Few sections of the high west can support cities and there is little prospect for its intensive development.

13. The Pacific Coast.—In contrast to the high west, the coastal areas are populous, but even they contain sections of wilderness, some lying almost within sight of Seattle, Wash., and San Francisco and Los Angeles, Calif. But the main resource of the Pacific coast is its mild climate.

The climate of the Pacific states is modified by tempering winds blowing eastward from the ocean. Extreme summer heat is rare except in the interior valleys because the coastal currents are cool. There are three varieties of climate. Along the coast north of San Francisco and in the Willamette valley of Oregon the weather resembles that of western Europe with pleasantly warm summers and mild but often foggy or drizzly winters. Along the coast south of San Francisco the weather resembles that of the Levant; the winters are mild with some rain, the summers are hot, sunny and dry. In the interior Great valley of California the winters are mild with some rain, the summers are very hot and irrigation is commonly necessary to supplement the slight annual rainfall.

The coastal regions of Oregon and Washington are green lands of Douglas fir forest, pastures, grain fields and orchards. Seattle, the largest city, with a well-sheltered harbour on Puget sound, is the commercial and financial capital of the area as well as an important centre for lumber and the Alaska trade. At the junction of the Columbia and the Willamette rivers lies Portland, Ore., centre of trade for the agriculturally rich Willamette valley and rival of Seattle for the trade of the Columbia plateau and the northern Rockies—the so-called inland empire. Both cities have developed important industries producing largely for Pacific markets.

Over 100 mi. of sparsely settled, forested mountains separate the Willamette and its sister valleys of western Oregon from the Great valley of California, an alluvium-filled trough over 400 mi. long. The aridity of the Great valley contrasts sharply with the area to the north. Fortunately streams from the rimming mountains enable much of the valley to be irrigated and farmed, the exact crop depending on local soil and temperature conditions. In the north there are pastures and wheat fields; near Sacramento, Calif., rice fields; southward, middle-latitude vegetable gardens and orchards producing for canning or freezing; near Fresno, grapes for wine or raisins and subtropical crops; and in the extreme south, cotton fields. The commercial outlet of this area is the cluster of cities around San Francisco bay, rivaling Los Angeles in an industrial development exceptional in the west.

Southern California, with the mildest climate on the Pacific coast, is tributary to Los Angeles, the most populous city west of Chicago. Once noted for its cattle, then for citrus fruit, then for its motion-picture studios and oil wells, then as a place for retirement, Los Angeles has grown into a mammoth, sprawling industrial, commercial and recreational centre. Its fundamental limitation is water. In succession, the city utilized local well water, the Owen river of the Sierra Nevada slopes and the Colorado river and began to consider the possibility of desalting sea water. This problem, common to all the west, is rendered acute in Los Angeles by the mushrooming population. (See WEST, THE.)

14. Alaska and Hawaii.—Southern Alaska (*q.v.*), because it is bathed by the waters of the Pacific, has a remarkably mild climate. In January Juneau is slightly warmer than Cleveland and July temperatures in Juneau average about the same as Cleveland temperatures in May. Although most of southern Alaska is mountainous, fish and lumber are produced and make up the bulk of its exports.

North of the Alaska range the Yukon valley has severe winters and short, warm summers. This is a huge area of rolling uplands whose resources are largely undeveloped and, for that matter, largely unknown.

The volcanic islands of Hawaii (*q.v.*) are populated by a mixture of peoples, largely oriental in origin. The principal industries of the islands are the raising of sugar cane and pineapples.

(O. P. S.)

III. THE PEOPLE

The Aborigines.—The territory represented by continental United States had, of course, been discovered, perhaps several times, before the voyages of Columbus. When Columbus came he found the new world inhabited by peoples who in all likelihood had originally come from the continent of Asia. Probably these first inhabitants had arrived 10,000 to 30,000 years before in a series of migrations from Asia to North America by way of the Bering strait. By the time the white man appeared the aborigines had spread and occupied all portions of the new world.

Racially speaking, these first human inhabitants of the new world in general, and of what is now continental United States in particular, are believed by physical anthropologists to have emerged largely from Mongoloid (east Asian) physical stock, but precise agreement on racial characteristics is lacking. Indians are not really red men (except when painted so); rather they have brown skin, straight stiff black hair, a minimum of beard and body hair and broad faces.

Language, which has nothing whatever to do with race, presents a highly variegated and interlaced pattern. Languages run into the hundreds, although linguists group them into families. Within the United States the Indian languages are commonly classed into six major groups: Eskimo-Aleut in Alaska; Nadene through much of the Pacific coast area; Penutian in the northwest; Algonkian and Hokan-Siouan in varying parts of the middle west and Atlantic coast; and Aztec-Tanoan in the southwest.

Indian culture patterns are as differentiated as languages. In this area as well as in the linguistic realm anthropologists are continually engaged in research and in the furtherance of knowledge and understanding of the American Indian. The culture patterns, referring to manifestations of human behaviour—to means of subsistence, material accoutrements, economics and tribal social organization—have been at least tentatively classified by areas. Within the United States these culture areas are the arctic and subarctic (Alaska), the northwest coast, California, the southwest, the basin-plateau or intermontane, the plains and the eastern woodland.

The food resources available in each physiographic region largely determined the type of subsistence prevailing there. Fish and sea mammals, for example, contributed the bulk of the food supply of coastal tribes, although the acorn was a staple for California Indians; plant life and wild game (especially the American bison or buffalo) were sources for the plains Indians; small-game hunting and fishing (depending again on local resources) provided for middle-western and eastern tribes. These foods were supplemented by corn and corn in turn was a staple food for the Indians of the southwest. The procurement of these foods called for the employment of fishing, hunting, plant and berry gathering and farming techniques, the application of which depended, in turn, upon the food resources utilized in given areas.

Foods and other raw materials likewise conditioned the material culture of the respective regional groups. All Indians transported goods by human carrier; the use of dogs to pull sleds or travois was widespread; and rafts, boats and canoes were used where water facilities were available. The horse was the white man's importation, but it was quickly adopted by the Indians once it had made its appearance. The horse became widely used by the buffalo-hunting Indians of the plains.

Indian culture groups are distinguished among other things by house types. The dome-shaped ice houses were developed by the Eskimos; rectangular plank houses were produced by the northwest Indians; earth and skin lodges and tepees by plains and prairie tribes; flat-roofed and often multistoried houses by the Indians of the southwest; barrel houses by the natives in the northeast. Clothing, or the lack of it, likewise varied with native groups, as did crafts, weapons and tribal economic, social and religious customs.

At the time of Columbus' discovery there were probably roughly 1,500,000 Indians in what is now continental United States, although estimates vary greatly. In order to assess the role and the impact of the American Indian upon the subsequent history of the United States in any meaningful way, it is imperative that the differentiating factors, such as those mentioned above, be clearly understood. Generally speaking it may be said, however, that the American Indians as a whole exercised an important influence upon the white civilization transplanted from Europe to the new world. Indian foods and herbs, articles of manufacture, methods of raising some crops, war techniques, words, a rich folklore and racial infusions are among the more obvious general contributions of the Indians to their white conquerors. Indian resistance to the white man's advance, taking the form of a protracted brutal conflict on the westward-moving frontier of white settlement, constitutes one of the most tragic chapters in the history of the United States. *(See* INDIAN, NORTH AMERICAN; NORTH AMERICA: *Anthropology;* ARCHAEOLOGY: *Prehistory: The New World Prior to Urban Civilization; Anglo-America.)*

The People of Colonial America.—Not only was Columbus' discovery made under the auspices of the kingdom of Spain, but the first white settlers in the new world were Roman Catholic Spaniards. Their settlement was concentrated in areas south of the present United States, but Spaniards and mestizos (Spanish and Indian mixed blood) nevertheless advanced during and after the 16th century from Cuba into Florida and from present-day Mexico into the American southwest—present-day Texas; New Mexico, Arizona and California. Not until the first half of the 19th century did these Spanish-American provinces become territorial possessions of the United States, but by the close of the colonial period the foundations had been laid for a very significant Spanish contribution to the future U.S. population matrix. It has been calculated that by 1790 (the date of the first United States census) there were approximately 25.000 persons linguistically classified as Spaniards within the future United States. By the time these territories had finally become U.S. possessions (1853), the number of Spanish-speaking peoples had increased roughly fourfold.

Coming later in point of time but constituting the main core of American (U.S.) colonial society were the English. Out of an aggregate white population of more than 3,200,000 in the 1790 census, plus an additional 54,400 living in areas not as yet a part of the United States, the English (and Welsh) represented a range (depending on various statistical analyses made) of 60%–83.5%.

The 13 original colonies were, of course, English governed and the constitutional, institutional and cultural life of American colonial society was therefore predominantly Anglo-Saxon in character. English was the official language and it was spoken in all but isolated "foreign" communities. Either the Church of England or dissenting English Protestant sects dominated colonial religious life) although not to the exclusion of other denominations. In most colonies English customs prevailed but many of these became modified as the frontier of settlement pushed continuously westward.

One distinctive feature of the English colonial system, compared with the colonies of Spain and France in the new world, was its relative tolerance for peoples of non-English nationality. Each and every one of the 13 original colonies was host to such non-English elements. Most numerous of these were the Scots which included descendants of emigrants from Scotland and from northern Ireland, the latter known as Scotch-Irish. According to figures presented by the department of commerce and labour *(A Century of Population Growth,* p. 116, 1909), derived from an analysis of names of heads of families, those of non-English nationality living in the United States in 1790 were as follows: Scots, 188,589; Irish, 44.273; Dutch, 56.623; French, 13.384; Germans. 156,457.

These non-English peoples exerted a profound influence on English colonial society. First to arrive in what eventually was to become New York colony were the Dutch. They came as settlers to New Netherland colony where they founded New Amsterdam (New York city), contributed a distinctive style of architecture, developed a prosperous agriculture (including tobacco raising), engaged in fur trading and general commerce and, as adherents of the Dutch Reformed Church, carried on some missionary work among the Indians. Before succumbing to English conquest the Dutch had absorbed the Swedish colony on the Delaware river. In time they blended with the English as well and so contributed to the making of an American mixed stock. Later, Germans (adhering to assorted Protestant faiths) and Scots-Irish (Presbyterians) helped immeasurably in spearheading settlement in western Pennsylvania and the Shenandoah valley. French immigrants, for the most part relatively prosperous Huguenots, found the emerging American cities to their liking and engaged in business and trade.

Not only did American colonials comprise numerous national groups, as the foregoing figures indicate, but by the close of the colonial period these various stocks had become so extensively mixed through intermarriage that they could properly be called a new people—"American" as distinguished from "British." Moreover, by the time of independence from Great Britain these Americans, representing many faiths and backgrounds, had through several generations of living in the new world developed culture patterns that were also distinctively American.

The New United States (to **1860**).—The winning of independence from Great Britain in 1783 ushered in a multiplicity of

changes, important among them the growth and spread of the American people. A detailed account of population growth is given in Population, below. Suffice it to say here that according to the decennial census figures the total population of the United States in 1790 (white and Negro) was 3,929.214. Seventy years later, on the eve of the American Civil War, this number had increased to 31,443,321. During the first half of this period this increase was largely the result of the multiplication of the native American stock, but during the latter part, especially from 1830 to 1860, the population growth was augmented considerably by immigration, mainly from northern Europe.

These were years of great territorial expansion as well as numerical growth. National boundaries were enlarged to embrace Florida to the south and the huge area lying between the blississippi river and the Pacific ocean to the west. So as the United States suffered from "growing pains," its proliferating population found its major outlet in westward expansion. By 1860 the frontier of settlement had pushed across the Mississippi river well into Minnesota, Kansas, Missouri, Arkansas and eastern Texas. Parts of Colorado were by then experiencing a mining boom; the Great Salt Lake valley was undergoing rapid settlement by a religious sect known as Latter-day Saints; and overland migrations to Oregon in search of free land and to California in search of gold had enabled these two areas to enter the union as states.

The invention of the cotton gin in 1793 had been largely responsible for the surge of migration, especially after 1815, into the rich cotton-producing regions of the trans-Allegheny south. This development in turn was destined to alter the racial complexion of the south and southwest, for as cotton production increased, so too did the encouragement of Negro slave labour. Even though the further importation of Negro slaves was forbidden by law as of 1808, and even though Negro slavery vanished in all northern states, the Negro population multiplied rapidly. In 1860 there were 3,953,760 Negro and mulatto slaves and 476,636 free Negroes and mulattoes (total 4,430,396) in the United States. Free people of colour were to be found in every state and in every territory except Dakota, whereas the slave element was, as indicated, confined to the southern slave states. In some southern states the white-Negro population ratio had, by 1860, attained a rough equality in numbers. And in Mississippi, for example, there were considerably more Negroes than white inhabitants in that year. So regardless of the disposition of the slavery question

TABLE IV.—*Country of Origin of Foreign-Born Residents in the United States, 1900*

in the impending sectional conflict, it is quite clear that the racial complexion of the United States was destined to remain mixed and, to a limited extent, intermixed.

Just as the Negro element was an inheritance of colonial society, so too was the immigration or acquisition of alien European peoples. European immigration, however, was erratic in its pace. Between 1790 and 1820 approximately 120,000 aliens arrived from Europe, to which number should be added another 30,000 Europeans who came under U.S. suzerainty by virtue of new territorial acquisitions. It was, however, the second portion of this period, 1820–60, that witnessed the first really major wave of foreign, or alien, immigration into the United States. A devastating potato famine in Ireland during the late 1840s and serious political upheavals in the Germanies in 1848 and after gave rise to a heavy exodus from the countries involved. England and Scotland, as always, continued to contribute to the American population growth as did, to a lesser degree, the countries of France, the Netherlands and Scandinavia (not including Denmark).

In general, the superintendent of the United States census (1860) attributed this substantial rise in immigration to "the form of our government" and to opportunities within the United States that offered reward for "patient, persevering industry." More specifically the immigrants of this period were attracted to the land, to agriculture rather than to industrial urban areas. And even though the country faced, in 1860, the grim prospect of civil mar. the impending passage of the Homestead bill provided a renewed impetus to prospective immigration during the years ahead. "The gift, substantially, by the government," continued the superintendent, "will induce a large emigration to the new States and Territories."

Table III shows national elements represented in the United States in 1860 and the numbers and proportions involved.

By 1860 certain characteristics of U.S. society stood out boldly. During the first three-quarters of a century of independence, population increases — native and foreign — had kept pace with territorial expansion. The north had emerged as an important industrial as well as an agricultural section of the nation; the south had extended its cotton economy throughout the cotton-growing areas of the old south and into the southwest, including Texas, and with it the "peculiar institution" of Negro slavery; the frontier of settlement continued to move rapidly westward into new agricultural areas. The general complexion of the people was being continually modified, as in colonial times, by the growth of the Negro population. mainly in the south, by the infusion of new blood from northern Europe and by an ever-present frontier element. The outward character of the American people remained essentially that of colonial America: predominantly Anglo-Saxon, industrious, independent, aggressive, Protestant, nationalistic (or independent) and relatively democratic. But in spite of these all-prevailing characteristics the United States was, in 1860. a nation divided. It took the Civil War to establish the principle of federal supremacy over the states' rights principle, and it took this same civil conflict to bring about the abolition of Negro slavery.

A Century of Change. — During the 100 years from 1860 to 1960 the United States experienced a phenomenal population growth; it also underwent significant shifts in the movement and regional distribution of its entire population (see Population, below). The total population increased from 31,443.321 in 1860 to 179,323,175 in 1960. At the same time the population centre of the nation moved relentlessly westward. In 1860 this population centre was located 20 mi. S. of Chillicothe, O. (having moved there from a point 23 mi. E. of Baltimore in 1790); in 1960 it was located at Ferrin, Clinton county, Ill. Until 1920 the direction of movement was slightly north by west but after that time the decennial centres veered slightly south by west.

Apart from the impressive over-all growth of the U.S. population during this 100 years, the most significant discernible trend was the mounting size and shifting source of origin of the immigrant contingents. (See Table IV; cf. Table III.) Immigration from the northern and western countries of Europe dechned, and more and more newcomers arrived from the eastern and southern parts of the continent. Furthermore, beginning in about 1848, a new racial element entered the American stream with the coming. chiefly to the west coast, of oriental peoples. first the Chinese. later the Japanese.

By the turn of the century the nation had become fully aware of this shift in the national origins of its huge immigrant element and with the outbreak of World War I speculation arose regarding the ultimate impact of these changes upon American society and culture (*see* AMERICANIZATION). This awareness had political repercussions which in turn led to the passage of restrictive legislation. The oriental groups were the first to suffer. Welcomed at first because of a shortage of labour following the gold rush. they were eventually resented as depriving native-born workers of jobs. Not only were most orientals prevented from entering the country, but foreign-born orientals already resident in the United States were barred from becoming citizens. Their children. however, became citizens by virtue of being born on U.S. soil. A further series of congressional acts culminated with the passage of the Immigration act of 1924 which limited the immigrant quota to 2% of the nationals of a given country living in the United States in 1890—an arrangement which resulted in a bias in favour of the northern European groups. World War I had seen a marked slowing up of immigration into the United States; the Immigration act of 1923 reduced it to a mere trickle. (*See* also MIGRATION: *Migration* to *the United States.*)

The presence of these "new Americans," many of whom did not assimilate readily. posed new and often serious problems for 20th-century United States. One of these was: how to assess the role and status of minority peoples. Many students of the problem felt that. while economic conditions are factors in this assessment, the problem is largely one of attitudes—the attitudes of older and larger groups toward smaller and in most instances newer ones. Symptomatic of these attitudes were the placing of west coast Japanese—almost all of them citizens—in detention camps during World War II and the difficulties attending desegregation in the public schools in the postwar period.

It must not be assumed that the changes in the composition of the American people that occurred after about 1880 are deleterious. But this changing matrix does bring with it significant alterations in political and social attitudes; it is reflected in the character of America's ever-expanding urban life; it is reflected in turn in the creative arts of the nation. A contemporary observer of the American scene today might validly ask what Michel Crèvecoeur asked in 1780: "What then is the American, this new man?" This question might be answered in part in Crèvecoeur's own words, that an American is still "that strange mixture of blood, which you will find in no other country." He is. however, unlike his colonial progenitor, largely an urban dweller and one possessed of a relatively high standard of living. He is literate, English-speaking. socially conscious, still independent, practical and inventive and, more than ever, he is on the move. (O. O. W.)

IV. HISTORY

COLONIZATION AND EARLY SELF-GOVERNMENT, 1600–1765

The opening of the 17th century found three nations—France, Spain and Great Britain—contending for dominion in North America. Of these Britain. the tardiest on the scene, finally took control of the beginnings of what is now the United States. The French, troubled by foreign wars and internal religious quarrels. long failed to realize the great possibilities of the new continent, and their settlements in the bleak St. Lawrence valley grew feebly. The Spaniards were preoccupied with South America and the lands washed by the Caribbean and Gulf of Mexico. But the British. after initial failures under Humphrey Gilbert and Walter Raleigh, planted firm settlements all the way from Maine to Georgia. nourished them with a steady flow of people and capital and soon absorbed the smaller colonizing venture of the Dutch in the Hudson valley and the tiny Swedish effort on the Delaware river. Within a century and a half the British had 13 flourishing colonies on the Atlantic coast.

These colonies had a number of characteristics that differentiated them from any other communities in the world. For one thing, they possessed a cosmopolitan population. Though English culture set the general political and socioeconomic mold, the people by 1750 included large bodies of Dutch. Germans and Scotch-Irish and smaller groups of Huguenot French, Scotch Highlanders. Swiss and Scandinavians—not to mention the Negroes. The colonists also tended to look to the west. Seeking cheap land. they pushed from the tidewater strip toward the Appalachians. and finally crossed the mountains by the Cumberland gap and Ohio river. Decade by decade they became less European in habit and outlook and more American—the frontier in particular setting its stamp on them (see AMERICAN FRONTIER; AMERICAN COLONIES [U.S.]). Their freedom from most of the feudal inheritances of western Europe, and the self-reliance they necessarily acquired in subduing nature, made them highly individualistic.

How Colonization Took Place.—A variety of motives—political, religious and economic—contributed to the settling of the Atlantic seaboard. Both labour and capital in England had become fairly fluid by 1600, and were seeking more profitable fields. A sharp rise in prices and living costs made many people restless; the increase in sheep grazing and the fencing-in of former common lands drove many from the soil; bold young men, including younger sons of the gentry, losing in peace the occupation which the wars with Spain had given them, looked abroad. Many Englishmen saw that the colonization of the new world might contribute to the power and affluence of the mother country, and that Spain, Portugal and other lands should be given competitors. Finally, the spread of great commercial trading companies assisted in the work.

These companies were chartered by the crown to give Great Britain new outlets abroad. The Muscovy company, for example. founded in 1555, intended to trade with Russia; the Levant company controlled trade with Venice and the near east; and the East India company (1600) covered the Pacific and Indian ocean coasts. Companies were also organized for Newfoundland, the northwest passage and Bermuda: Most important for America. however, were the two companies for which King James I granted a charter in 1606: one to colonize the American coast anywhere between parallels 34° and 41° N. and the other anywhere between 38° and 45° N. As members of the first company lived in London it became known as the London company; since members of the second dwelt in Plymouth, it was called the Plymouth company. Shareholders in the companies were to provide settlers and capital, and were to control production and trade. Government, however, was to remain in the hands of the crown, acting through councils. A guarantee was given the colonists of all the rights and liberties of British subjects, without any definition of their scope. In return. the grantees were forbidden to draft any orders or make any laws contrary to those of England.

The London company lost no time in using its powers. Before Christmas in 1606 three ships sailed for Virginia. carrying among others Capt. John Smith, who was to take an important part in the American story, and Bartholomew Gosnold, who had previously visited the New England coast. In the spring of 1607 the three ships sailed into Hampton Roads. christened the James river! landed 120 men and founded Jamestown. Starvation, disease and Indian warfare ensued, and though more ships with fresh settlers arrived, for a time the colony had but precarious life. In the end Virginia took sturdy root. "We hope to plant a nation, Where none before hath stood," sang a ballad maker among the early adventurers, and they achieved their ambition. (See also VIRGINIA: *History.*)

In these years the London company had achieved a broader legal basis. It obtained two new charters from the crown, one in 1609 and one in 1612. These new grants practically severed it from the Plymouth company and confirmed to it a great belt of territory 400 mi. wide extending through the American continent to the Pacific ocean. The London company thus became proprietor of the colony of Virginia. At the same time it obtained large rights of government. It could appoint the resident governor, his resident council and other officers, and hold full control of them. The old system of joint-stock management of land and trade was abolished, and private property in land and stores took its place. An able soldier. Sir Thomas Dale. went to Virginia in 1611 with three ships, 300 colonists and some livestock, and for five years exercised statesmanlike control. During these years the colony took up the cultivation of tobacco with great profit.

Meanwhile, the Plymouth company had failed in an effort to plant a colony at the mouth of the Kennebec river in Maine. Nothing more was done to colonize what is now New England until a group of Separatists, who believed that the Bible was the only test of faith and revolted against all other creeds, turned to this area. These Pilgrims placed themselves in partnership with a group of merchants and other businessmen, who agreed to finance the venture. In return for advances of ready money, the colonists promised to labour for seven years. throwing all they produced into a common pool; both profits and land were to remain undivided for that period. Of two vessels dispatched, one turned back; but the other, the "Mayflower," set sail on Sept. 6 with about 100 passengers and reached Cape Cod before the year ended. After much suffering and peril courageously met, the colony at Plymouth, Mass. (*q.v.*), took root. Within ten years it was prosperously expanding, had separated itself from the partners in England and had replaced the joint-stock arrangement with private properties and private enterprise.

First Steps in Self-Government.— Both in Virginia and New England the colonists soon began to exercise a certain autonomy. In 1619 Gov. George Yeardley brought out to Jamestown a new plan of government and a momentous step forward was taken. A two-part legislature was created, one part consisting of the governor and his council, named by the company in England, and the other a house made up of two burgesses from each settlement. It was to legislate upon Virginian home affairs, subject to the approval of the governor and the company. During the summer the first true legislature in continental America met in the log church in Jamestown. A little later the Pilgrims, before leaving the "Mayflower," adopted an agreement or compact. It was not a form of government but an agreement that they would live together in orderly fashion under civil officers of their own selection. On board the ship John Carver was chosen governor, soon to be succeeded by William Bradford. As soon as they had begun housing themselves, the Plymouth settlers met and consulted upon laws both for their civil and military government resulting in the first New England town meeting.

But a colony of sturdier individualism, with a bolder degree of self-government, was soon to be established. In the 12 years 1630–42 occurred the "Great Migration" of the Puritans from England to America. These believers in a church purged of old forms and abuses, and a society purified of gross evils, were unhappy under King Charles I, who in 1629 dissolved parliament for 11 years, and under Archbishop William Laud. who declared war upon them. Two men, John Endecott, who led a body of settlers to Salem, Mass., and John Winthrop, a country squire of great energy, showed special leadership. The crown in 1629 gave a charter to the Massachusetts Bay company; the Puritans quickly obtained control of it; and Winthrop as governor persuaded the members to decide in favour of transporting company, charter and a large assemblage of colonists all together to Boston, Mass. New groups at once migrated to this colony of Massachusetts Bay, with Boston as its centre. Careful estimates show that by 1641, 300 ships had carried 20,000 settlers to America. This was an almost purely English migration, which included a few aristocrats and many university graduates. Religious zeal animated most of the migrants. (*See* also MASSACHUSETTS : History.)

The result was the erection of a church state which fell far short of democracy, but cherished a passion for liberty and self-government. Each town of Massachusetts Bay had its own church, minister and town government and was an independent Congregational community. Voting rights were limited to church members, and the ministers exercised a powerful authority in civil affairs. From an early date the voting freemen elected deputies to sit in the general court, or legislature, where they, the governor and a small body of his assistants made laws and levied taxes. Thus a self-sufficient commonwealth of oligarchical type sprang into being. Governor Winthrop and others declared that it had absolute powers of self-government under the crown, and owed no allegiance or deference to the British parliament. The dominance of the clergy, however, and the narrowness and harshness of their government aroused great discontent.

A combination of two impulses, the restlessness of men seeking better land and a desire for greater independence in religion and politics, led various elements in New England to establish other colonies. Thus Roger Williams, a stout adherent of freedom and tolerance, helped bring Rhode Island into existence; Thomas Hooker and others founded settlements on the Connecticut river; and the Rev. John Davenport and others established New Haven colony, which expanded along Long Island sound. The early inhabitants of Maine and New Hampshire were controlled by Massachusetts Bay. All the New Englanders until 1680 practically ruled themselves. They regarded the government in England as sovereign, but passed their own laws, traded under their own regulations and raised their own forces for defense. Their tie with Britain was one of sentiment, not force, and they developed themselves in full freedom.

Particularly during the years of the civil war and Commonwealth in England did the colonies profit from the preoccupation of the mother country with its own affairs. The Massachusetts legislature boldly asserted that the laws of the English parliament did not reach into New England. Under Cromwell and the Commonwealth, Virginia was permitted to elect its own governor and council as well as burgesses. During the period of civil strife in England, the four colonies of Massachusetts Bay, Plymouth, Connecticut and New Haven in 1643 formed a New England confederation which lasted for a full generation. Its primary purpose was defense against the Indians, French and Dutch, but it also dealt with boundary controversies and provided "mutual advice" on various questions.

Land Policy in New England and Virginia.— The New England colonies grew by a process of group settlement. The general courts of the various colonies, most notably that of Massachusetts Bay, would make a grant of land to a migrating group, fixing its boundaries carefully. This group would then establish a new town. Its common lands, fencing, grazing practices and the mode of apportionment of farms were regulated by the general court or legislature; but each town then took control of land allotments and management. The legislature determined who should be admitted to the town as settlers and freeholders. The town meetings, or boards of town proprietors, laid out the land of each settlement as house lots, common fields, meadow and pasture, and ultimately divided it among owners. Inhabitants of each town commonly dwelt together for society and protection and traveled from the town centre to till their acres. The typical town was thus closely akin to an English manor, but with no lord of the manor at its head. The town was, of course, the church centre, and its pastor was the community leader. Militia service, elections and taxation were based on the town.

In Virginia, settlement followed an entirely different pattern. There the colonists spread out widely up the creeks and rivers, soon moving westward as far as the falls of the James river where the city of Richmond now stands. Partly because tobacco rapidly impoverished the soil, they tilled land in much larger units, known as plantations, with almost no village centres; and they made much greater use of servants than did New England. This pattern was unfavourable to social life. co-operation and communal activities, but it created quite as strong a spirit of independence as that existing farther north. Throughout the 17th century the planters preferred white indentured servants to Negroes, and for a time as many as 1,500 arrived every year. They were mainly English, with an admixture of Scotch and Irish, and in general bound themselves, in return for transportation and support, to work without wages for from four to six years. This indenture or redemptioner system became a highly efficient aid to colonization. When they had worked out their terms, the servants moved up the streams, took land, began shipping tobacco from their own wharves, and thus became in turn independent planters or freehold farmers.

The natural political units in Virginia were parishes and counties. Parish institutions were chiefly ecclesiastical, but under the English system they included education; every minister kept a school and the vestry saw to it that all poor children could read and write. Children of prosperous families usually had private tutors. The counties increased in number to keep pace with the steady spread of population. By 1652 Virginia had 13 counties, of which 9 lay on the James river and 2 on the York. The county courts held large powers of local government and tended to come under the control of a few influential families. Until 1636 the house of burgesses was practically elected on manhood suffrage; thereafter the vote was restricted, and when Sir William Berkeley became governor under the Restoration, he kept a compliant house in power for 15 years.

Founding of the Middle Colonies. — Henry Hudson's voyage of 1609 to what is now New York bay was intended to serve trade rather than colonization. The Dutch wished for cargoes of fur, lumber and tobacco. But in 1621 the Netherlands government chartered the Dutch West India company with power to build forts, to establish a government and to colonize the land over wide areas, including the American coast. Two years later the heads of the company sent a vessel with 30 families of Walloons, Protestant refugees from the southern provinces of the Netherlands, to the mouth of the Hudson river, where they established the first permanent settlement on the island of Manhattan. More settlers arrived, and in 1626 Peter Minuit purchasing the island from the Indians, founded New Amsterdam as the seat of government for a colony. Ft. Orange (now Albany) had been planted up the Hudson two years earlier as a fur-trading post. New Amsterdam quickly became a cosmopolitan town, attracting people of various nations and faiths. It had the self-reliant, lawless atmosphere of a seaport, full of privateers, smugglers, tavern keepers and roistering sailors.

For several reasons New Netherland did not grow as vigorously as the British colonies. The Dutch West India company was at first much more interested in preying on Spanish commerce in the Caribbean and Atlantic than in finding permanent settlers. It was also anxious to develop the fur trade and to share in the tobacco trade. When it turned to settlement in earnest, it adopted an unfortunate method. Beginning in 1629 it granted any patroon who brought out 50 families a great estate on which to settle them as tenants, with certain monopolies, as of milling, in the hands of the owner. This kind of feudalism gave a few great families an unhealthy share of wealth and power. Some small farmers did establish independent farms or boweries here and there, as did interloping Puritans from New England who sifted into Westchester and the northern reaches of Long Island; but they were not numerous. Finally, the governors and councils appointed by the Dutch West India company, who ruled without any such popular assemblies as Virginia and New England possessed, were harsh, autocratic and blundering. Far from gaining any popular following, they were generally disliked. The most famous of governors, Peter Stuyvesant was also the most headstrong and shortsighted.

It was impossible for England long to permit a Dutch colony to break the line of its possessions on the Atlantic seaboard. In 1664 a small English naval force obtained the surrender of the New Netherland without firing a shot. The 7,000 inhabitants of the area accepted the new regime without protest. Charles II appointed his brother James, the duke of York, ruler and proprietor of the colony of New York, a domain stretching from the Connecticut river to the Delaware. At once a more liberal regime began. The proprietor sent over a governor with instructions to treat the Dutch inhabitants generously, permit them to keep their lands and to make no interference with their language or religion. Immigration was encouraged and settlements thickened. In 1683 Gov. Thomas Dongan summoned a representative assembly for the province of New York. *(See* NEW YORK *[STATE]*: *History;* NEW *YORK* [CITY] : *History.)*

One of the greatest of all colonial figures presided over the founding of what became Pennsylvania and Delaware. William Penn, son of a prominent English admiral, had been converted to the Society of Friends, or Quakers, in 1667, in his early 20s. He aspired to establish a colony where every race and every sect could find both political and religious freedom. His friendship with the duke of York and the fact that the king owed a large unpaid debt to Admiral Penn, enabled William Penn to gain control of a great part of the imperial domain assigned to the duke. When the crown gave him a proprietary charter in 1681, he immediately began to advertise for settlers. Publishing a description of Pennsylvania in four languages, he offered newcomers land on very liberal terms: 50 ac. free. larger farms at a purely nominal rent, and 5,000 ac. for £100. Penn visited his "Holy experiment" in 1682. And in that year he laid down a charter of government uhich provided for a small elective council, to sit with himself as governor and initiate laws, and a larger elective assembly to pass or reject the proposed laws. Within a few years the assembly gained much larger powers, and itself proposed legislation. In 1701 Penn granted a new charter that lasted until the American Revolution.

It is not strange that Pennsylvania flourished beyond other colonies. Immigrants flocked in large numbers, from England and Germany especially, to enjoy the religious freedom, the humane criminal legislation, the easy terms for gaining fertile land and the opportunities for trade and manufacture. Penn had hoped that Philadelphia, his "city of brotherly love," would always be "a green country town," with gardens surrounding every house; and it did become a beautiful as well as a prosperous city. Quakerism, softened from its originally somen-hat fanatical outlines, gave the colony a special atmosphere. It was in Pennsylvania that a number of institutions on which America later prided itself found their first full-scale trial: complete religious freedom, the distribution of land to actual settlers at very low cost, the encouragement of a melting pot of races and the establishment of excellent schools open to all. Because of the high intellectual and moral standards of the Quakers, the cultural level of Pennsylvania soon became one of unusual elevation. It was noted for its libraries, its refined homes, its interest in science and its architectural taste. When it was only ten years old it had the first printing press to be established outside of New England. *(See* also PENNSYLVANIA: *History.)*

Before Penn died, he bought from the duke of York three counties on the Delaware river which became the province and state of that name. Though they shared their governor with Pennsylvania, from 1702 they had their own elective assembly.

The other middle colonies also began under proprietors. Maryland had a history of special interest because of its initial status as a refuge for Roman Catholics. Charles I granted the district between the Potomac river and the 40th parallel in 1632 to George Calvert, Lord Baltimore, who was much interested in colonization. His son, Cecilius, almost immediately succeeded to the grant, and resolved to establish a colony where his fellow Roman Catholics could find peace. Early in 1634 the first shipload of Roman Catholic settlers chose a site at St. Marys on a tributary of the Potomac near its mouth. Actually, Protestants soon constituted a majority of the settlers, for the Roman Catholics preferred to stay in England. To meet this situation, Cecilius Calvert persuaded the assembly which he called to pass an act of religious toleration in 1649. Unfortunately, this act was repealed before many years.

Though Maryland profited from the proximity of Virginia, which gave it protection and trade, it had a troubled history. The Protestant settlers were irked by Calvert's bestowals of land, offices and favours on his relatives and his Roman Catholic friends. They were also irritated by the very limited authority that he allowed his assembly. Friction over religious and economic questions culminated in hostilities in 1654, the Protestant small farmers finally winning their main objectives. When William and Mary came to the throne in England in 1689, the Calverts lost control of Maryland; but when a new Lord Baltimore embraced Protestantism in 1715 the family regained its rights. *(See* also MARYLAND: *History.)*

Meanwhile the future New Jersey had undergone some confusing and unprofitable changes of name and jurisdiction. The duke of York, the original proprietor, had given the lands between the Hudson and Delaware rivers to two friends, Lord John Berkeley and Sir George Carteret, as the province of Nova Cesaria or New Jersey. To bring in more settlers, they drew up a charter or set of "concessions and agreements" which largely anticipated Penn's liberal ideas. That is, they offered generous terms for acquiring land, complete freedom of conscience and a popular assembly. But Berkeley in 1674 sold his half share to two Quakers, who took the southwestern part of the future state, while the widow of Carteret six years later sold the northeastern half to a new body of proprietors. Ultimately, in 1702 the crown took over both sections. (See also NEW JERSEY: History.)

The Carolinas and Georgia.—The lands south of Virginia were also colonized under royal grants to great proprietors. Under Charles II, a group of eight men obtained a grant of all North America between the 31st and 36th parallels. Two segments of this great domain were developed in very different ways. Sir John Colleton and Anthony Ashley Cooper, who later became Lord Shaftesbury, founded Charleston, S.C., in 1670 with settlers from England and overcrowded Barbados. Groups of French Huguenots and Scots at once migrated to South Carolina, giving it by the year 1700 a population, including Negro slaves, of about 5,000. At first the colony was based on exports of foodstuffs to the West Indies and of turpentine, tar and furs to Europe. Then rice was introduced from Madagascar, and the South Carolinians developed large plantations which grew rice and indigo very profitably. The area to the north, meanwhile, was settled in moderate-sized farms by a variety of immigrants: British, Germans, drifters from Virginia and adventurous New Englanders. A settlement of Swiss at New Bern added one specially prosperous element.

The "Fundamental Constitutions" which John Locke helped Shaftesbury draw up for the Carolinas, providing for a hereditary landed nobility bearing bizarre titles, was totally unsuited to the American scene and never went into real effect. The proprietors gave each colony instead a simple, workable form of government with governor, council and assembly. In the Carolinas, as in Virginia, population spread widely over the land, and though Charleston became an opulent and fashionable little city, other towns were few and small. In social and economic character the two colonies differed sharply. North Carolina found that its tobacco and naval stores, shipped from poor harbours, offered much less revenue than South Carolina's staples. It had no merchants and ship captains to match those of Charleston, and very few great planters. Its populace was poor, ill-educated and restless, and only a few coastal centres had any touch of learning or aristocratic manners. In South Carolina, however, many planters accumulated wealth at their country estates, where they lived most of the year; they had fine town houses in Charleston, where in the hottest summer months they kept up a pleasant social life with rich traders and professional men; and they gave the commons house, as they called the assembly, an English tone.

But North Carolina had two compensations: its white population grew much faster than that of South Carolina, while slaves were fewer; and its people had a much stronger sense of democracy. (See also NORTH CAROLINA: History; SOUTH CAROLINA: History.)

Georgia, the last of the 13 colonies to be founded, was the creation of a group of British philanthropists. These proprietors, obtaining a grant of lands between the Savannah and Altamaha rivers, hoped to give debtors and other deserving poor people a new start in life. In 1733 they sent over Gen. James Oglethorpe with 100 settlers to establish the town of Savannah. Some of the regulations imposed by the trustees were more idealistic than realistic. Slavery was prohibited; the importation of rum, brandy and other strong drink was forbidden; and, to prevent the growth of large estates, every charity colonist was restricted to 50 ac. of land, which he might transmit only to a male heir. This benevolent paternalism retarded the growth of Georgia. The settlers quickly found that they needed larger units of land for economic tillage, and that slave labour would be advantageous. They wanted to exchange their lumber for importations of rum from the West Indies. The trustees gradually liberalized their rules, while in 1751 they allowed the colonists to elect an assembly. The following year, when their tenure of the proprietorship lapsed, they made no effort to renew it, but allowed the crown to take over Georgia.

As a crown colony it still remained so weak that it needed constant subsidies. Its agriculture became more and more like that of South Carolina, and it developed a society of slave-owning planters in the lowlands, merchants in Savannah and small farmers in the uplands. But the philanthropists had accomplished three valuable results: they had saved a considerable number of neglected and abused people; they had maintained a buffer between the other southern colonies and Spanish Florida; and they had laid the foundations for one of the greatest of the southern states. (See also GEORGIA: History.)

New Shapes of Colonial Development.— In the 80 years between 1660 and 1740, three great new forces began to reshape the British colonies in North America. They were the economic regulations embodied in the Acts of Trade and Navigation; the partial systemization of imperial administration; and the contest with the French for dominion over the continent. By the year 1700 the colonists probably numbered about 250,000, and were increasing at a rate that has seldom been equaled in the history of western nations. Immigration, early marriages, the economic value of children in an agricultural society and the relatively high level of health sped this growth.

Under the concept of mercantilism generally accepted by western Europe, English economic policy regarded the colonies as part of an imperial whole which should aim at self-sufficiency and a favourable trade balance. Each part of the empire had something to give and something to receive. This policy was first embodied in three acts of parliament in 1651, 1660 and 1663. The law of 1651 provided that all goods imported into England or the colonies must be carried in ships of which the owner, captain and crew were English (colonials, of course, rated as Englishmen). The exception to this rule was that all goods imported into England and the colonies from Europe might come in ships of the nation which produced the goods. The law of 1660, strengthening the first, required that ships used in carrying goods in and out of Great Britain must be built as well as owned and manned in England or the colonies. It also required that certain "enumerated articles," of which sugar, tobacco and indigo were the chief, be sold only to England or to other colonies. To give the colonists full control of the home market, no one could grow tobacco in England or import it from a foreign land. The law of 1663 was more serious. It stipulated that European goods must be shipped to the colonies through England, and thus made it necessary for many colonial merchants to add an extra leg to their voyages.

Many colonists attempted to evade these acts. They shipped enumerated articles to Europe instead of to England; they imported European goods directly from Europe without stopping in English ports. New laws of 1663 and 1696 were then passed by parliament to end the evasions. Moreover, the list of enumerated articles was lengthened, so that by the year 1721 rice, molasses, naval stores (tar, pitch and turpentine), furs and copper, all important to the colonies, had been placed under control. In 1733 parliament adopted a still more serious measure, the Molasses act, which placed heavy duties on all sugar, molasses, rum and other spirits imported into the colonies from the French, Dutch and Spanish possessions. The object was to restrict trade to the British West Indies. Had it been enforced this law would have been disastrous, for the colonies exchanged large quantities of fish, lumber, meat and foodstuffs with the foreign islands for these commodities. Fortunately, the English government winked at the wholesale violations.

Other irksome restrictions on the colonies concerned manufactures, for the mother country wished to preserve the colonial market for its own industries. The Wool act of 1699 forbade the shipment of woolen fabrics across any colonial boundary. The Hat act of 1732 similarly forbade any colony to export its hats and limited the number of apprentices. Late in the colonial period the Iron act of 1750 stopped the erection in the colonies of rolling and slitting mills, forges and steelmaking plants. Like all new communities, the colonies needed a more abundant currency than they had, and wished to print paper money, but the British authorities feared an inflation which would hurt British creditors and raise the price of colonial exports. In 1751 they therefore forbade the issuance of paper money by New England, and in 1764 applied the ban to the other colonies.

But the mercantilist enactments had many features favourable to the colonies, and in total effect they were far from harsh. The navigation laws fostered shipbuilding in the colonies. A number of important American products were given a monopoly of the British market. Colonial pig iron and bar iron were admitted to Great Britain without duty. British bounties were paid on the production of naval stores. These facts, coupled with the "salutary neglect" of the colonies introduced by Robert Walpole and the nonenforcement of the more onerous laws, permitted a steady development of American economic life. The colonists meanwhile had the protection of the British army and navy. Nevertheless, two facts respecting the acts of trade had their bearing on later events. First, the colonies, like most frontier agricultural communities, were plainly exploited by the older nations both as a source of low-priced raw materials, and as a market for manufactured wares—and like other frontier lands, they resented the fact. Second, widespread law evasion fostered in the colonists a spirit of disobedience and insubordination.

Imperial Organization.— Step by step the list of royal provinces lengthened. On the accession of the duke of York to the throne as James II, this proprietary colony entered the new status and there remained. New Hampshire became a royal province in 1679. The restoration of the Stewarts put an abrupt stop to the wide free autonomy of Massachusetts Bay. A royal commission inquired into charges that the Puritans had violated their charter and disobeyed imperial enactments. Continued contumacy led Charles II to abrogate the charter in 1684 and take special measures for governing the colony. Massachusetts, with Maine, New Hampshire and part of Rhode Island, were first given a single governor; then in 1686 Sir Edmund Andros arrived with instructions to take all New England, New York and New Jersey under his jurisdiction. His arbitrary regime ended, however, with the "glorious Revolution" of 1688 in England, and Massachusetts Bay by adroit effort obtained from William and Mary a new charter which incorporated Plymouth in the colony.

By the time of George I, eight of the colonies were royal provinces. Connecticut and Rhode Island under their old charters were virtually little republics; Pennsylvania and Maryland were still under proprietary regimes; and Georgia, as we have seen, struggled along under its trustees until 1752. Some British leaders wished all the colonies put under uniform royal control, but successive ministries hung back, unwilling to arouse popular resentment or increase the power of the crown. All the colonies had representative assemblies which controlled appropriations and filled many offices and were usually in sharp opposition to the royal governors or proprietors Connecticut and Rhode Island elected their own governors. The colonists had the best of it in these continuous quarrels, for self-interest gave them more persistence and skill. But representative self-government did not mean a true democracy. The franchise in all the colonies was on a property basis, so that the poorest people were unrepresented in the assemblies. Moreover, the oldest settled seaboard communities saw to it that apportionment of seats favoured them as against the newer frontier settlements.

In all the royal and proprietary colonies, the assembly attempted to whittle away the powers of the executive. Using their power of taxation as a lever, they steadily encroached on the authority of the governor and widened that of the legislature. They seized control of fees on which the executive depended, turned appointive positions into elective offices and staged frequent revolts against the governors' councils and other "official cliques." Popular government thus broadened decade by decade. One province, Pennsylvania, after 1701 had no legislative council, the assembly controlling all legislation.

Ultimate authority over British America rested in the crown, acting through the secretary of state and privy council. But it was deputed to a succession of committees or boards: first, in 1660, to the privy council committee for foreign plantations, then in 1673 to the privy council committee called lords of trade and finally in 1696 to the commissioners of trade and plantations, separate from the privy council. It was impossible, however, to keep control highly centralized; it was distributed to various agencies. The treasury board audited whatever revenues came from the colonies, oversaw expenditures for them and scrutinized appointments for the colonial service. The admiralty board dealt with the equipment of the navy in American waters, the protection of commerce and the punishment of smugglers. The war office had control over military affairs within the colonies. The bishop of London supervised the appointment of clergymen of the Anglican Church, watched over their conduct and the parish schools they helped keep. The privy council received letters and petitions on colonial business, arranged hearings and inquiries and issued letters, instructions and orders in council on a wide variety of subjects. It also acted as a colonial court of appeals.

The administration thus required a considerable bureaucracy. But in time a good deal of the business was handled directly by the office of one of the secretaries of state in London, without going before the privy council. That is, the cabinet took control; the secretary of state for the southern department became specially important. Various colonies sent to London agents like Benjamin Franklin, or hired some able British subject, such as Edmund Burke, to make sure their views were effectively presented. In general, imperial administration was loose rather than strict. The very remoteness of the colonies helped ensure this; to send a letter from England to New York and get an answer took at least three months. Distance, a tradition of letting well enough alone and a belief that the Americans could mind their own affairs capably combined to make the crown authorities complaisant. Until 1760 the colonists possessed a greater political freedom than perhaps any other people on earth. They enjoyed many privileges and rights that were totally unknown in French and Spanish lands.

Until 1760 parliament passed only about 100 statutes in all relating to the colonies, and most of these dealt with military and economic matters. Some of the provinces adopted great parts of the statute law of England, and all of them attached high importance to the English guarantees of fundamental rights. The English common law automatically came into force throughout British America. While the crown after 1690 generally required the colonial assemblies to send their acts to England for approval or disapproval by the king in council, this was not a great hardship. As the 18th century advanced the imperial government was concerned primarily with the acquisition of more colonial territory, the fixing of boundaries and the maintenance of commercial interests. It also gave some attention to the Anglican Church and its revenues.

By the end of the colonial period the Puritan or Congregational Church enjoyed establishment in Massachusetts, New Hampshire and Connecticut. Farther south the Anglican (Episcopal) Church was established in the. two Carolinas, Georgia, Virginia and Maryland and in four southern counties of New Tork; but its hold in North Carolina and western Virginia was precarious. In the other colonies, Rhode Island, Pennsylvania, Delaware and New Jersey, church and state were separated. The discrimination involved in the Congregational and Episcopal establishments did not mean that religious tolerance suffered. On the contrary, in the 18th century freedom of faith was much more widely accepted in British America than in most other parts of the world. The crusading Roger Williams and the liberal William Penn had founded model commonwealths whose influence was widely felt. The crown, the various proprietors and important colonial interests, eager to attract settlers, had encouraged a variety of religious sects: Jews to New York and Rhode Island; Huguenots to South Carolina and New York; Mennonites, Dunkards and other German sects to Pennsylvania; Scotch-Irish Presbyterians to lands all the way from New Hampshire to North Carolina; and Roman Catholics to Maryland. This variety of denominations helped keep the religious atmosphere free. In some colonies Jews were barred from the franchise and from office, but Jews were few in number; in most colonies Roman Catholics (partly because of fear of the French) lay under some disabilities, but they had far more freedom than Protestants enjoyed in Roman Catholic lands.

The temper of colonial life was friendly to freedom of thought in every field. Both in New England and the southern provinces the grip of the established churches was gradually loosened as the 18th century wore on; dissenting sects grew rapidly among the common people, and deism among the intellectuals. Taxation for the establishment of churches naturally aroused increasing resentment. The widespread religious revival called the Great Awakening (*q.v.*), which reached full force in the 1730s, perhaps indicated that the older churches had failed to provide the emotional and intellectual nutriment the people needed. It was led in Massachusetts by Jonathan Edwards, an eloquent Yale graduate whose sermons dealt with faith, sin and punishment; in the middle colonies by William Tennent, who came from Scotland to preach with fervour and to establish a log college in Pennsylvania for training other zealous clergymen; and in Georgia by the indefatigable George Whitefield, who soon began touring other colonies, and cast his spell everywhere over immense audiences. The movement continued with vigour throughout the 1740s, converted multitudes and by strengthening a spirit of revolt against older forms of religion gave new strength to the Baptists, to new light Presbyterianism, and in time to the Methodists headed by John Wesley.

The colonists had at least as much freedom of speech, of assembly and of the press as did the British at home. When John Peter Zenger allowed a political leader in New York to criticize the royal governor in his *New York Weekly Journal*, he was arrested for libel. By a spirited appeal to the jury the aged but intrepid Andrew Hamilton, an attorney of Philadelphia, won Zenger's release on the ground that a fundamental English liberty was at stake. As this case suggests. America was soon a land of newspapers. By 1765 every colony but Delaware and New Jersey had at least one. and the whole list numbered 25. Debate in the colonial assemblies had even fewer inhibitions than in Westminster, and was in general fully reported and discussed. Pamphlet publications increased. Intermarriage among peoples of different national stocks produced new generations, with no firsthand knowledge of Europe, who considered themselves purely American. All the conditions of life in the new country. where the abundant natural resources could be seized only by determined efforts. encouraged a spirit of individual enterprise which chafed at restraints.

The Contest With France.— It was inevitable that Great Britain and France should wage a struggle for mastery in North America. Two great powers could not occupy the same land without a desperate battle for supremacy. In its century-long course and its far-reaching consequences, this became one of the epic contests of modern history. It was a protracted war between two peoples, two cultures and two sets of political and religious institutions. Fought out with the deep wilderness as the setting and background, and involving the savage Indian tribes as participants on both sides, its marches. sieges and battles have a picturesqueness seldom found in modern war. It produced leaders of high character and ability: the comte de Frontenac, Antoine de la Mothe Cadillac and the marquis de Montcalm on the French side; James Wolfe, Lord Amherst, John Forbes and George Washington among the Anglo-Americans. w

Led by Samuel de Champlain and by Jesuit, Recollect and Franciscan churchmen, the French strove with little success in the first half of the 17th century to develop Canada as a colony. Seeking fish, furs and converts in a chilly, difficult land, they failed to plant strong agricultural settlements. The despotic if paternal government in Paris kept the colonists under tight rein instead of encouraging self-government and individual initiative based on the British model; it refused to allo any but Roman Catholics to emigrate instead of inviting persons of all faiths. By 1660 only a few thousand French were settled in all of Canada. But when Louis XIV came to the throne he showed an intelligent interest in New France. His government sent out shiploads of emigrants, gave generous subsidies, encouraged exploration and helped fur traders and missionaries carry French influence through the Great Lakes region. In 1659 the first bishop, François Xavier de Laval Montmorency, an able, iron-willed man, arrived in Quebec. determined to make the church dominant in a livelier, more energetic colony.

Then in the last quarter of the century the greatest of the French governors, the comte de Frontenac, made New France a genuine threat to British America. During his regime, which with one short interval lasted from 1672 to 1698, the great explorations of Pere Jacques Marquette, Robert Cavelier, sieur de La Salle and Louis Jolliet opened the way into the west. They mapped much of the upper Mississippi and Ohio valleys; La Salle descended the Mississippi to its mouth and penetrated Texas. Two other explorers. Pierre Esprit, sieur de Radisson and Médart Chouart. sieur de Groseillers, entered the country beyond Lake Superior. Frontenac, with characteristic ability and determination, asserted the authority of the secular arm over the church. The hostile Iroquois had practically wiped out the friendly Huron and Erie tribes among whom the Jesuits had made their best converts: Frontenac chastised the Iroquois and temporarily broke their strength. As New France expanded, the English became alarmed. In Europe the Stewarts, subservient to the French crown, made way in 1688 for William and Mary; and William of Orange, who had defended the Netherlands against the attacks of Louis XIV, was ready to continue hostilities. The conflict at once spread to North America, where it was called King William's War (1689–97).

In this first round of the long conflict neither side accomplished much. Enlisting Indian allies in a warfare of barbaric ruthlessness, the French raided the English colonies from Schenectady, N.Y., to Haverhill. Mass., and along the Maine coast. In return the English organized an expedition which captured Port Royal in Acadia (now Annapolis Royal. Nova Scotia), and sent a fleet of 34 ships under Sir William Phips which disastrously failed to take Quebec. The final treaty of Ryswick left matters just as they had previously stood. After a brief breathing space the War of the Spanish Succession, called in America Queen Anne's War, followed (1701–14). While Marlborough won his brilliant victories in Europe, hostilities ran their former course in America. The French once more conducted horrifying raids with the Indians on exposed settlements; the Anglo-American forces once more retaliated with descents on Canada. While a new expedition against Quebec again failed, this time by shipwreck, New England troops and British marines recaptured Port Royal. But this time the treaty of Utrecht (1713) gave the British empire great gains—in Europe, Gibraltar and Minorca; in America, Acadia. Newfoundland and a great belt of territory surrounding Hudson bay.

The final test of strength lay not far ahead. In preparation the French set up a belt of forts around British America. They had founded Mobile. Ala., in 1702, and established New Orleans, La., in 1718. They connected these Gulf ports with Quebec by nine important posts: Ft. Chartres on the Mississippi opposite St. Louis. Mo.; Vincennes and French Fort on the Wabash river; Ft. Miami on the Maumee river; Ft. St. Joseph near the lower tip of Lake Michigan; Michilimackinac and Ste. Marie on the upper lakes; Detroit, guarding Lake Huron; and Niagara, guarding Lake Erie. Thus New France possessed itself of the heart of the continent, confining British America to the seaboard. When a new conflict broke out, the War of the Austrian Succession, 1740–48 (called in America King George's War), the French maintained their vital positions. They had built a strong fortress at Louisburg on Cape Breton Island to guard the mouth of the St. Lawrence river, and it sheltered privateers who harried New England commerce. Gathering all their energies, the New Englanders under William Pepperrell astonished everyone by capturing it. This was a brilliant feat. When peace was made, houever, Great Britain returned Louisburg to France.

Once more the French took steps to strengthen their position. Laying claim to the whole Ohio valley, they built a new chain of forts from what is now Erie, Pa. (Presque Isle), to the Allegheny river. This was an area in which Anglo-American fur traders and land companies had a strong interest. When the French warned English traders away from the country, Gov. Robert Dinwiddie of Virginia sent George Washington to tell the French in turn to keep off, and to build a fort on the site of present-day Pittsburgh. The sequel was the capture of the site by the French. their erection of Ft. Duquesne and a clash between French troops and Virginia militia under Washington. Thus opened the final conflict of the two empires in North America (1754–63).

The French and Indian War.—The French had certain advantages in this hard-fought struggle, which became known as the French and Indian War in America and the Seven Years' War in Europe. France was more populous than Great Britain, with larger military forces and theoretically could send over greater armies. The highly centralized government of New France could wage hostilities more efficiently than the loosely associated colonies under 13 different governments. The strategically placed French forts were an important asset. But in the end the British colonies were certain of victory. They had a population by 1754 of about 1,500,000, 15 times as great as that of New France. They held a superior strategic position; operating from inside lines, they could strike at almost any point in the long. thinly peopled French crescent extending from Louisburg to New Orleans. The British navy, superior to the French, could better reinforce and supply the armies and could lay siege to the ports of New France. Finally, both Britain and British America excelled in leadership. William Pitt (Lord Chatham) as prime minister of Great Britain proved himself a greater statesman than anyone in France; Wolfe, Amherst and Lord Howe were a trio of generals the French could not equal; and such colonial officers as Washington and Phineas Lyman showed real ability.

At first the war went badly for the Anglo-American effort. Expeditions in 1755 against the French forts at Niagara and at Crown Point on Lake Champlain broke down. An army marching under Gen. Edward Braddock to seize Ft. Duquesne fell into an ambush and was almost destroyed, with the death of its commander. The next year a brilliant French soldier, the marquis de Montcalm, arrived, and gave his forces new energy and organization. He at once captured the British post at Oswego on Lake Ontario. while in 1756 he took Ft. William Henry at the southern tip of Lake George. Later he defeated a British attempt to invade New France by way of Ticonderoga and Lake Champlain.

But after Pitt flung himself into the tasks of war with enthusiasm and vision, the current changed its course. He mobilized the army and navy on a scale never before seen in America. He obtained from the colonial governments, impressed at last with the gravity of the contest, a new degree of co-operation. In 1758 a three-pronged plan of campaign was pushed with adequate resources, able generals and indomitable determination. Forbes cut a road across Pennsylvania and seized Ft. Duquesne, evacuated by the French; Amherst took the fortress of Louisburg for the second and last time; and other troops took possession of outposts on the Ohio. In the summer of 1759 came the decisive stroke of the war in America. Wolfe. after two months of an unsuccessful siege at Quebec, found a path up the cliffs; led 4.500 troops up under cover of night; and at dawn of Sept. 12 confronted Montcalm on the Plains of Abraham commanding the city. Wolfe died in battle. but not before he heard that the French were in flight. Montcalm was borne back mortally wounded during the rout. The capture of Quebec decided the campaign, the war and the fate of New France. The next year Montreal fell to Amherst.

The treaty of Paris (1763) gave Great Britain all the French possessions in America east of the Mississippi save two small fishing islands, and the island of New Orleans. Spain, which had entered the war, ceded Florida to Great Britain. The whole eastern half of the continent, except for New Orleans, which France turned over to Spain, became part of the British empire. It was a matter of great and almost immediate concern to Americans that Louisiana and all French claims west of the Mississippi were ceded to Spain. The British during the war had captured Cuba and the Philippines from the Spaniards; the fact that they were quietly returned to Spain would in time also concern American policy. But the greatest fact of all was that for the moment the colonies seemed free from all threat of aggression. (*See* FRENCH AND INDIAN WAR; SEVEN WEARS' WAR.)

American Social and Cultural Development.—Seven of the colonies made an effort in 1754 to devise a plan of closer association. Their governors met at Albany to agree upon a treaty with the Iroquois. Benjamin Franklin. who was present, offered a scheme of colonial union which. if adopted, might have prevented or delayed the American Revolution. It called for a congress with power to treat with the Indians, control the public lands, maintain military forces and collect taxes for common objects. But though the Albany meeting accepted the scheme, the colonies mere too jealous of their separate powers to approve it, while the British government feared that it might unduly increase the strength and independence of the provinces. The 13 colonies were separated by geographical distance and difficulties of travel, by differences of temper, religious thought and custom and by provincialism of spirit. Even in the crisis of war with the French they co-operated poorly. (See ALBANY CONGRESS.)

Yet they were united by their common English tongue and its rich literature; by their common experience with representative forms of government; by the English common law; and by a basic similarity of outlook. They all believed in democracy in the sense of a rough equality of opportunity, and the possession by every man of the basic human rights of life, liberty and property. During the 18th century barriers between the colonies were steadily reduced. Roads were opened, coastal shipping increased and intercolonial travel became commoner. The newspapers and pamphlets of one province were read widely in others. Restless young men migrated freely, as Franklin moved from Boston to Philadelphia, and Alexander Hamilton from the British West Indies to New York. A post-office service was established for British America, with Franklin as postmaster, 1753–55. Businessmen made frequent journeys from colony to colony to promote trade, and if they were members of a fraternal order such as the Masons, or of a special religious body such as the Quakers, found warm welcomes from fellow members. Mechanic groups were much the same in Charleston, New York or Boston; the lawyers and large landholders of the various colonies held the same views.

Seven different colleges and a large number of private academies were established in the colonies before the Revolution. Harvard was founded in 1636, William and Mary in 1693, Yale in 1701 and King's college (later Columbia) in 1754. The Great Awakening helped bring about the opening of the institutions which grew into Princeton (1746), Brown (1764) and Dartmouth (1769). At first collegiate studies emphasized the classical languages. mathematics, logic, rhetoric and astronomy, but later science gained a strong foothold. Some large private libraries were collected, those of William Byrd in Virginia and Cotton Mather in Massachusetts being especially noteworthy. Not all the books were imported. for American printers began reaching up toward a total of 1.000 titles, chiefly British, a year. Benjamin Franklin was the most versatile American author, publishing essays, satires, scientific papers and collections of aphorisms. Historical works of importance were written in the first 60 years of the 18th century by Robert Beverley for Virginia, John Lawson (an expert on Indian life) for North Carolina and Thomas Prince for New England.

Thirteen colonials obtained the high honour of election to the Royal society in the 60 years preceding the Revolution; among them were Cotton Mather of Massachusetts. Benjamin Franklin of Pennsylvania and Alexander Garden of South Carolina. Mather's greatest work was the mélange of history, biography, religion and science entitled *Magnalia Christi Americana.* Jonathan Edwards made an important contribution to philosophy in his treatise on *Freedom of the Will* (1754). The Pennsylvania botanist John Bartram, the astronomer David Rittenhouse of the same province and the mathematician John Winthrop IV of Harvard all did creditable work. Many specimens of a truly beautiful architecture, mainly English in design and detail, could be found by 1750 in all the colonies from Maine to South Carolina. Skilled cabinetmakers, migrating from Europe, trained excellent colonial artisans. At least four painters attained such distinction that their work has been carefully preserved and highly prized. John Singleton Copley, John Smibert, Robert Feke and Benjamin West—the last-named in time becoming head of the Royal Academy in London Town planning of a high order was to be found in Philadelphia. Williamsburg and Savannah.

Altogether, the colonies by the end of the French and Indian War were becoming mature in some cultural as well as political and economic respects. Their lawyers, doctors, educators and other professional men lookec! to Europe for standards, but hardly felt inferior to their European contemporaries. Their intellectual ties with Great Britain grew closer with the improvement in communications. Newspapers clipped much of their foreign intelligence from English journals; students pursued law at the London Inns of Court and medicine at the university in Edinburgh; Anglican priests had to be trained and ordained in England; and English ideas, notably those of Sir Edward Coke, the Commonwealth thinkers and John Locke, shaped political thought. Loyalty to the crown and affection for the mother country were still strong in 1765—stronger than intercolonial ties. Franklin thought that a union of the colonies was impossible without a course of flagrant oppression by Britain.

But after the French and Indian War the colonists had no intention of accepting a subordinate position in the empire. They were proud of the fighting record of their soldiers. They knew well that Philadelphia was the second largest city under the British flag and that as a seat of learning, scientific inquiry and the arts it compared well with any city outside of London. They knew that American commercial enterprise equaled that of England and that they were making more rapid advances in some respects than any other people in the world. A spirit of self-sufficiency pervaded the land. It was especially strong among the settlers of mixed stocks who had moved out toward the frontiers and among the artisans, mechanics and labourers of the towns. The atmosphere was changing, and John Adams spoke truly when he later declared: "The Revolution was effected before the war commenced. The Revolution was in the minds and hearts of the people."

The Contest for Independence, 1765–83

The addition of Canada and Florida to the British empire, coinciding with the overthrow of French power in India, created a tremendous problem of imperial reorganization. Thus far the colonies had been allowed to grow without much control, with an eye to the development of their potentialities in trade—the supply of raw materials and the purchase of manufactured goods. The mercantilist concept of self-sufficiency had dominated the empire. Now the ruling groups in Great Britain began to value the colonies as sources of world powers; that is, for their strategic position, revenues and contributions to the strength of the imperial army and navy. The new world possessions of Great Britain had been doubled in extent. They were still vulnerable to French and Spanish attack. The steady westward march of population posed difficult problems of land policy and relations with the savage tribes. The Catholic French-Canadians had somehow to be brought into workable accord with the richer and stronger Anglo-Saxon population. Troops, forts and warships had to be maintained for protection. The growing trade had to be regulated.

It was certain that British and American ideas on imperial reorganization would differ. The English government emphasized a careful co-ordination of the different parts of the empire, a strengthening of the central administration and greater efficiency in law enforcement and tax collection. The colonists emphasized their hereditary English liberties and the principle of local autonomy. As all history shows, the problem of adjusting general authority to provincial libertarianism is difficultin any federation or confederation. The imperial problem after the Seven Years' War was rendered specially difficult by the lack of precedents, the great distances involved and the long-established dislike of the mixed body of colonists for any controls whatever. Moreover, Great Britain did not regard the empire as a federation but as a consolidated state. The authorities in London neither planned nor executed any "tyranny," but their new strictness seemed tyrannous, to many Americans.

The West and the Proclamation of 1763.—The first important imperial measure after the war dealt with the lands and Indians of the west. The tribes along the frontier had long been restive under white encroachments on their lands and the fraudulent methods of many fur traders. In 1763 a spasmodic uprising of the northwestern Indians, stimulated by French fur traders, found a leader of talent in the Ottawa chief Pontiac. They battled with desperation, for they saw that their lands north of the Ohio would soon be occupied by English settlers. Every fort in the west except Detroit and Pittsburgh fell, while Indian bands slew and burned all along the border settlements. So weak were the colonial counterattacks that British regulars had to crush the revolt. Clearly it was necessary to adopt some policy for the frontier, and its consideration would take time.

As an emergency step, effective until a full policy could be perfected, the British ministry inspired a royal proclamation in Oct. 1763 to fix temporary boundaries for Quebec, east Florida and west Florida, and to halt settlement beyond the Alleghenies. For the whole area between northern Florida and the 50th parallel, settlers were forbidden to advance beyond the crest of the Alleghenies; and the region stretching thence to the Mississippi was for the time being reserved to the Indians. The crown during the next five years tried to consolidate peace on the border by making treaties with the Iroquois, Cherokee, Choctaw and Chickasaw Indians. Quite naturally, however, settlers paid no attention to the proclamation line. They soon placed permanent settlements on the upper Ohio and its branches, making Pittsburgh and Wheeling, W.Va., busy towns; they pushed into the Watauga, a valley in western North Carolina, and there set up an independent government which endured several years; and on the Virginia frontier they provoked a new outbreak of hostilities, Lord Dunmore's War (1774). A combination of hunters, settlers and the energetic land speculator, Richard Henderson of North Carolina, opened up the rich lands beyond the Cumberland gap, so that before the Revolution Daniel Boone and his associates were in eastern central Kentucky and James Harrod had founded Harrodsburg, Ky., farther west. (See American Frontier, The.)

The garrisoning of the frontier was a special problem. The board of trade in London believed that it would be necessary to establish a line of posts from Florida to Quebec, and from Lake Ontario westward to Mackinac at the junction of Lakes Huron, Michigan and Superior. To man these forts, and maintain the military establishment elsewhere, they estimated that 10,000 men would be needed. This was a grossly exaggerated guess. British field commanders in America would have been satisfied with half as many regulars, and the proposal probably had ulterior motives, including the care of veterans at the expense of the colonies. For a time it stood, however, and efforts had to be made to raise the needed money.

The Sugar and Stamp Acts.—The ministry headed by George Grenville first tried to find revenue by the Sugar act of 1764, replacing the 30-year-old Molasses act, which had never been enforced. The tariff on molasses was cut in half, but the duty on refined sugar imported into the colonies was raised. Duties were placed on wines, coffee and some textiles unless they moved to the colonies by way of England, and measures were taken to give strict effect to the law. This act hurt colonial traders by cutting off the direct flow of wine from the Azores—for Americans drank much Madeira—and largely destroying commerce with the French West Indies. At the same time the new law required that all lumber sold to Europe be transported via British ports. An angry protest came from the northern colonies in particular, Rhode Island even declaring that its existence was threatened. Virginians were simultaneously irritated by the Currency act of 1764, which extended to them and other colonies the prohibition of paper money issues originally limited to New England; for Virginians were heavily in debt to British merchants and wished a cheap legal tender.

Other grievances seemed minor, however, beside those caused by the Stamp act passed in March 1765. In order to raise an estimated £150,000, the Grenville ministry carried a measure requiring that all legal documents, licences, commercial contracts, newspapers, pamphlets and playing cards should carry a tax stamp. The cost of the stamps ranged from a halfpenny to £10, and violations were subject to severe fines. Among the many groups on whom this law laid burdens, some were specially well equipped to arouse discontent and resistance. Newspaper editors, tavern keepers, lawyers and printers had effective ways of reaching the general public and used them. The enactment created more resentment because it was swiftly followed by a Quartering act, which provided that when British garrisons were moved to any place where inadequate barracks existed. they might be put into barns, inns and private residences. Of course, they would pay for their quarters, but few people wanted soldiers in their households.

Parliament quickly learned its mistake in passing the new legislation with practically no debate. The Massachusetts assembly instantly published a vehement protest. If parliament could tax trade. it could tax land, houses and any other property. violating the charter right of Massachusetts to tax and govern itself The law struck at "our British privileges," declared the assembly, and such measures would reduce freeborn subjects "to the miserable state of tributary slaves." The Virginia burgesses, equally angry, were inspired by Patrick Henry's fiery eloquence to pass five resolutions of protest. Two additional resolutions, threatening resistance and coercive treatment of anybody who supported the imperial government, failed but were nevertheless published throughout America. Meanwhile, editors, lawyers and merchants took steps to arouse mass resistance. Angry crowds rioted in New York, Newport, Boston and Philadelphia, hanging crown officials in effigy, forcing stamp collectors to resign and pillaging the houses of even such respected men as Thomas Hutchinson, an able Massachusetts jurist. The opposition organized an intercolonial body called the Sons of Liberty, which kept the flame of protest burning.

At the same time, businessmen in the leading ports tried economic pressure. They signed agreements to stop importing British goods until the Stamp act was repealed and enforced them so well that a general trade paralysis marked the day Nov. 1, the law became effective. Strongly argued pamphlets dealt with the principles at stake. James Otis of Massachusetts had already denounced the writs of assistance (in effect, search warrants to assist in enforcing the acts of trade) as subversive of American liberties. He had also been active with Samuel Adams in organizing the "caucus" which planned measures in the Boston town meetıng, and had attacked the Sugar act in *The Rzghts of the British Colonies Asserted and Proved,* a pamphlet basing these rights on natural law (1764). In 1765 he brought out three more pamphlets, asserting that taxation without representation was tyranny, and pointing out that the imperial economic system involved exploitation of the colonists. As John Adams wrote later, Otis was "a flame of fire." John Dickinson of Pennsylvania took an almost equally advanced stand in his pamphlet "The Late Regulations Respecting the British Colonies . . . Considered" He opposed violent resistance and favoured economic pressure on British merchants, but was as firm as Otis on basic principles.

On a motion of Otis, the Massachusetts assembly sent a circular letter to the other colonies inviting them to meet in a Stamp act congress. This body met in New York on Oct. 7, 1765, with Otis and Dickinson prominent in the proceedings. It passed resolutions embodying Otis' doctrines, though it rejected his proposal of colonial representation in parliament. Nine of the 13 colonies had representatives present, though New York, New Jersey and Delaware sent only men chosen by informal action. Their "Declaration of Rights and Grievances" asserted that all subjects of the king in America had the same rights and liberties as those in Great Britain; that taxation without consent was a violation of these rights; and that as the colonists could not be represented in London, the only taxes that could constitutionally be imposed on them mere those laid by their own legislatures. The congress drew up petitions to the king, the commons and the house of lords.

Meanwhile, the nonimportation movement gained strength. In the last three months of 1765 nearly 1,000 merchants in Boston. New York and Philadelphia signed agreements to stop purchasing European goods until the act was repealed. Refusal to use the stamps on business papers was practically universal; the courts closed rather than to enforce their use on legal documents. British exports to America fell from £2,250,000 in 1764 to £1,944,000 in 1765. Mercantile groups in Great Britain brought forth their own demand for repeal. and many towns sent petitions to parliament. When parliament met in Jan. 1766 it began an immediate debate on the subject. Grenville's ministry had been overthrown on another question, and had been replaced by one under Lord Rockingham. Franklin, as agent for Pennsylvania, appeared before the commons, sitting as committee of the whole, on Feb. 13, with a set of forceful arguments. Emphasizing the heavy colonial expenses during the French and Indian War and the subsequent Indian hostilities, he declared that the colonies did not have enough coin to pay the stamp taxes during a single year. Grenville had told parliament that the army should be used to enforce collections in America. If this were attempted. said Franklin, it might cause rebellion. Agreeing with the pamphleteer Daniel Dulany of Maryland that parliament must distinguish between internal and external taxation and had no right to lay burdens on an unrepresented people. he asserted that repeal was the only solution. William Pitt brought his great prestige behind the same contention. The king also stood for repeal.

On March 4, 1766. complete repeal passed the commons, on March 17 the house of lords and on March 18 gained the royal assent. When late the following month the news reached America, the merchants at once dropped nonimportation. Widespread expressions of gratitude and fealty followed, the New York assembly voting statutes to the king and Pitt. In the general relief most men overlooked the fact that parliament had reached no agreement on the constitutional principles involved. Lord Mansfield asserting the absolute dominion of parliament while Pitt drew the same sharp line between legislation and taxation upon which the colonists insisted Americans also paid scant attention to the fact that repeal was accompanied by a Declaratory act, modeled on previous legislation for Ireland. asserting the right of parliament to pass laws binding the colonies "in all cases whatsoever." Some new trade legislation which followed in 1766 was generally favourable to the colonies. It reduced the molasses duty to one penny a gallon, and abolished export duties on sugar from the British Rest Indies—at the same time, however, requiring all colonial products shipped to northern Europe to pass through British ports.

A Fresh Storm: the Townshend Acts.—Pitt took office as prime minister in Aug. 1766, with his new title of Lord Chatham—"a fall upstairs." as Chesterfield wrote—and in such poor health that his effectiveness nas limited. His chancellor of the exchequer, Charles Townshend, at once took steps to reduce home taxes and raise fresh American revenues for American purposes. The Townshend acts of 1767 placed import duties on glass, lead, paints, paper and tea sufficient to raise an estimated annual revenue of £40,000; this amount was to be used for defense, the administration of justice and the support of civil government in America. As the colonists had controlled governors and judges by use of the purse strings, the idea that their salaries should now be met out of imperial revenues was offensive. Moreover, the ministry passed a set of accompanying measures to facilitate enforcement. It asserted the poaer of the higher judges to issue writs of assistance for bringing smugglers to trial; established new vice-admiralty courts for trying violations of the trade acts; and created in Boston an American board of commissioners of customs, directly controlled by the British treasury. Some trouble had arisen in New York over the Quartering act, and the assembly had refused to comply with requests made by Gen. Thomas Gage for certain unusual barracks supplies. The Tonnshend acts therefore included a suspension of the assembly's powers until it obeyed; but this was unnecessary, for the assembly yielded before the new law reached America.

Once more the colonies turned to various emphatic measures of resistance. Merchants in port towns signed new agreements not to import lists of specified British goods. and a New York mass meeting appointed a committee to make plans for fostering home manufactures. New pamphlets arguing the rights of the colonists as British subjects were published John Dickinson's *Letters From a Farmer in Pennsylvania to the Inhabitants of the British Colonies,* a series of 14 essays printed in the *Pennsylvania Chronicle* (Nov.-Jan 1767–68) and then reissued as a pamphlet. had a wide influence both in America and Great Britain. Moderate in tone, they declared that while parliament had a right to regulate trade it had no just authority to tax Americans for revenue; denounced the suspension of the New York assembly as a blow at the liberties of all the colonies; and, while urging conciliation, hinted at the possible use of force. The Pennsylvania legislature adopted a petition to the king which Dickinson drafted. The Massachusetts assembly sent a circular letter, written by Samuel Adams, to the other 12 colonial legislatures, assailing the Townshend acts, pointing out the danger- in the new move to make governors and judges independent of the people, and calling for united action (Feb. 1768). This so incensed the royal governor, Sir Francis Bernard, that he dissolved the general court. Delegates of Massachusetts towns then met in an irregular convention, the first step toward a revolutionary legislature.

Repeal: the Tea Tax. — Far from abating the storm increased during 1768. The colonial secretary, Lord Hillsborough, wrote to all the colonial governors, attacking the Massachusetts circular and ordering them to dissolve their respective assemblies rather than to let them make favourable responses. But before this order reached America, Virginia, New Jersey, Connecticut and Rhode Island had taken action supporting hiassachusetts. The merchants of New York and Boston united in still more stringent nonimportation measures. In Boston violence broke out. When the customs commissioners tried to enforce the new laws, they met forcible obstruction and asked the ministry (March 1768) for armed assistance. The frigate "Romney," in response to this appeal, arrived in Boston in May. But the Sons of Liberty were not overawed. Early in June they locked up a customs officer while Madeira wine was smuggled ashore, attacked other officers on the wharves and rioted in town. The customs commissioners, taking refuge in Castle William on a harbour island, sent London an urgent plea for troops. On Oct. 1, 1768, two infantry regiments, with some artillery, landed in Boston where they became a centre of irritation, with petty affrays between soldiers and townspeople.

Once more the economic weapon proved potent. By the end of 1769 nonimportation agreements were being observed in every colony but New Hampshire. The action of Virginia was especially influential. The burgesses in May adopted a set of resolutions which were drawn up by George Mason and introduced by George Washington. They criticized the British ministry, asserted that only the governor and legislature of Virginia had the right to tax Virginians and with great vigour attacked a proposal in parliament to enforce the statute of 35 Henry VIII by bringing rebellious subjects across the ocean for trial in England. Patrick Henry and Richard Henry Lee drafted an address to the king. When the governor, Lord Botetourt, dissolved the burgesses, they at once held an informal meeting in the Raleigh tavern in Williamsburg (May 18, 1769). There they adopted the Virginia association, by which they agreed to stop the importation of all dutiable British goods except paper; to cease importing slaves; and to abstain from the use of European luxuries. This association was adopted or copied during the summer by Maryland, South Carolina, North Carolina and the people of Savannah. Other colonies uhich had hung back took parallel action. The imports of the colonies from Great Britain had totaled £2,157,000 in 1768; in 1769 they fell to £1,336,000.

These losses inevitably impressed the ministry. Although English merchants, who largely compensated themselves by a rising continental trade, this time mainly supported the government, many complained. Even in the spring of 1769 the imperial authorities notified the colonial governments that a relaxation of the Townshend duties was being considered. In Jan. 1770 the duke of Grafton, who had become head of the ministry, gave way to Lord Frederick North. who was still more willing to adopt a policy of retreat. North, whom Townshend described as a "great, heavy, booby-looking" man, was amiable, witty and honest, but shortsighted and stubborn. Taking office on the king's entreaties, he was determined to serve George III as completely as possible. He at once showed his lack of vision. Though he believed in repeal, he believed that complete repeal would betray governmental weakness. He moved in the commons (March 5, 1770) a bill to annul the main body of Townshend duties and promised that the ministry would lay no new taxes on the colonists; but he maintained a small duty on tea and with it the principle of parliamentary authority. This decision, in the end, was to lead to war.

The First Armed Clashes. — Repeal of the Townshend acts was hailed with great relief in the colonies. The Quartering act was simultaneously allowed to die without renewal. Not at once. but gradually during 1770. all the colonies except Virginia gave up their nonimportation programs; Virginia finally acquiesced in the summer of 1771. There was a lull in the agitation against the British ministry. This was interrupted early in 1770, however, by two memorable affrays between British troops and Americans. In January the Sons of Liberty in New York, led by Isaac Sears and Alexander McDougall, quarreled with the regulars; and when British soldiers cut down a liberty pole, the Sons of Liberty tore down British banners. These disturbances culminated on Jan. 19 in a riot on Golden hill in Manhattan, the patriots using clubs and swords while 30 or 40 troops wielded bayonets. Several men on both sides were badly hurt, but nobody was killed. More serious was the encounter in Boston early in March which patriots incorrectly dubbed a "massacre." Fist fights and name calling between mechanics and troops had become common, and feeling had mounted. A crowd of unruly civilians on the evening of March 5 began baiting a sentry near the state house. He called for help; a body of the guard, coming to his rescue, was assaulted with stones and lumps of ice; after one soldier fell the others fired upon the colonists, killing three and mortally wounding two more. While the troops mere sent to islands in the harbour, seven of the guard were put on trial for murder. Two able American attorneys, John Adams and Josiah Quincy, consented to defend them. The officer and four men were acquitted, while two others were found guilty of manslaughter, branded on the hand and released. (See also New York [City].)

The "Gaspee": the Colonies Join Hands. — No other incident of note occurred until June 1772, when Rhode Islanders demonstrated their hostility to royal measures. On June 9 a schooner used in customs enforcement, pursuing a smuggling vessel, ran aground below Providence, R.I. Illegal trade had become extensive in Narragansett bay. That night the merchant John Brown headed a party of Providence men who boarded and burned the "Gaspee" as she thus lay helpless. Rewards of £1,000 were offered for proof of the identity of the ringleader, and Brown was put under arrest. But the influence of his powerful family brought about his release, and a commission of inquiry which sat in Newport and Providence failed to amass any real evidence. Such breakdowns of the law irritated the British authorities; indications that if the commission had succeeded the lawbreakers would have been taken to England for trial equally irritated the Americans.

When later in the year Gov. Thomas Hutchinson of Massachusetts announced that the home government would provide the salaries of the governors and superior court justices, many men felt outraged. The legislature was determined to keep such officers under check; it could not do this if their payment came from England. Samuel Adams, James Otis and others, overruling the more conservative John Hancock, appealed to the Massachusetts towns. The Boston town meeting, under their inspiration, created a committee of correspondence to communicate with the smaller towns and with other provinces. Thus a mighty engine was brought into existence. Other provinces one by one formed similar committees, until the continent was knit together by their network*. The Virginia burgesses led the way by appointing a standing body for intercolonial exchanges, with Thomas Jefferson, Patrick Henry and Richard Henry Lee among the members. Early in 1774 all the colonies but two, Pennsylvania and North Carolina, shared in the web.

The Boston Tea Party. — While this was happening the situation was complicated by the troubles of the East India company, important for its control over India. Hard hit by Dutch competition in America and elsewhere. it had piled up both financial losses and a huge surplus stock. The British government was anxious to help it outsell the Dutch. Parliament therefore passed the Tea act in April 1773. The new land maintained the duty of three pence a pound on all tea imported into America, but allowed a remission of the duty on tea shipped by the company to the colonies. This would enable the company to sell at a much lower price in America, undercutting even colonial smugglers who had brought in Dutch tea duty-free. But the threat of a company monopoly of the American market alarmed important interests; it could use its own picked merchants to dominate the market. Meetings of protest were held in Philadelphia, New York and Boston. Some of the merchants chosen as agents gave up their privileges.

When the first tea ship arrived in Boston harbour in Nov. 1773, mass meetings demanded that the cargoes be returned to England. But Governor Hutchinson insisted that the tea duties first be paid, and the people took matters into their own hands. A crowd assembled at Old South church on the evening of Dec. 16; then, at a signal from Samuel Adams, a group rushed to the wharf, boarded the vessel and hurled the whole cargo into the water. At no port did the East India company meet any success in unloading and selling its tea. In Charleston a cargo was seized for nonpayment of duties and was then left to molder in warehouses. A shipment to Annapolis was burned, and the Sons of Liberty tossed a small lot into New York harbour. This amounted to open defiance of the royal government; the decision of the king and the North ministry to resort to coercion brought on the final crisis.

The Coercive Measures of 1774.—The next meeting of parliament, in March 1774, found a majority of members angrily aroused. Edmund Burke, Lord Chatham and others tried without success to allay their feelings. The king and ministry were resolved that punitive action should be taken, and a series of drastic bills was hurried through. One closed the port of Boston to any shipments save those of food and fuel; the port was not to be opened until the East India company and the treasury had received payment for their losses occasioned by the Boston Tea Party. A second law provided that when a crown officer was indicted for a capital offense, committed in the discharge of his duties, and a fair trial seemed unobtainable in Massachusetts, the governor might act to transfer the trial to Great Britain. A third lam so severely curtailed popular government in Massachusetts that it largely nullified the charter. A long list of officers, down to sheriffs and justices of the peace, mas made appointive by the governor; he alone could remove these officers; and he was given power to name the higher judges for confirmation by the king. Town meetings were put under severe restrictions.

At the same time parliament enacted two other measures which increased the resentment of Americans. The Quebec act, passed near the close of the session! was primarily an effort to give Canada the permanent civil administration which it had not received since the end of the French and Indian War. Features of government peculiar to New France, but alien to British America, were wisely retained. The Roman Catholic Church was given a status of special privilege. This inspired colonial criticism; but what chiefly irritated the colonies was the treatment given the west in the law. For lack of adequate American revenue, the imperial government had been compelled to abandon its program for a vigorous, well-planned administration of Indian affairs and western lands. For the time being it seemed wisest and cheapest to handle western matters through the government of Quebec, where authority rested in a governor and legislative council chosen by the crown, without any popular assembly. The boundaries of Canada were therefore extended to the Ohio river, cutting across claims held by Massachusetts, Connecticut and Virginia. (A. N.)

The First Continental Congress.—Patriots at once said that the crisis demanded united colonial action. Gen. Thomas Gage. who had been commander in chief in America, was now appointed governor of hlassachusetts, with authority to maintain the "intolerable acts" by military force. A new Quartering act (June 2, 1774) revived and broadened the old legislation. During the spring of 1774 numerous cities and towns called for the immediate summoning of an intercolonial congress. Massachusetts had at first thought that the best defensive step would be new measures for an economic boycott of Great Britain, but it was clear that a broader program was now needed. Gage had been in Boston hardly a month when the assembly proposed to the other provinces that they send representatives to a congress in Philadelphia in September. During the summer all but Georgia responded favourably.

The 56 delegates who met in Carpenters' hall on Sept. 5, 1774, were a body of real distinction. John and Samuel Xdams attended from Massachusetts; Patrick Henry, Peyton Randolph, Thomas Jefferson and Richard Henry Lee from Virginia; James Wilson, Joseph Gallon-ay and Charles Thomson from Pennsylvania; James Duane from New York; and Christopher Gadsden from South Carolina. The members had been instructed to consult together and to adopt measures calculated to secure the just rights of the colonists; nobody as yet thought of independence. But a sharp difference of temper separated radicals like the Adamses and Patrick Henry from conservatives like Galloway. The Massachusetts men pressed the Suffolk resolves, written by Joseph Warren, adopted by Suffolk county in Massachusetts and brought to Philadelphia by Paul Revere. These resolves declared the coercive measures unconstitutional, null and void; called on the people of Massachusetts to collect their own taxes and impound them until the obnoxious laws were repealed; advised them to arm and drill; and called for drastic measures of economic reprisal.

Voting by colonies, but hearing some speakers who implied that Americans were now thrown into a single mass, the congress sent addresses to the king, and to the people of the colonies, of Quebec and of Great Britain, and prepared a declaration of rights. It is a significant fact that no address was sent to either of the houses of parliament. In its statement of rights the congress (known as the first continental congress) limited itself to those which it believed had been infringed since 1763. These acts they described as innovations, and claimed themselves to be the true conservatives who only desired peace on the basis of the former constitution. The opposition mhich Massachusetts was making to the recent acts of parliament was approved. and the view mas expressed that, if an attempt were made to execute them by force, all America should support Massachusetts. Though the work of this congress was deliberative, it performed one positive act which contained the germ out of which new governments were to develop. That was the issue of the association, or nonimportation and nonexportation agreement, accompanied with resolutions for the encouragement of agriculture and home manufactures and for the organization of committees to carry these measures into effect. Coercion, according to the principle of the boycott, was to be applied by the colonies and other local bodies to all who declined to accept and obey the terms of the association. This policy had been followed at intervals from the time of the Stamp act. It had been revived by many local and provincial bodies for the past few months. The association became the touchstone by which loyalty to the colonies, or to the king, was determined. Those whose loyalty to the king forbade their submission to the new regulations now felt the power of the committees, even to the extent of virtual trial. imprisonment or banishment. From this action the first continental congress derived its chief significance.

Increase of Friction.—The association, with its threats and dependence upon extralegal bodies for enforcement, was a direct blow at the commercial system of the empire and could scarcely help provoking retaliation. When the congress adjourned, some of its members predicted war. In New England the impression that war was inevitable was widespread. In Massachusetts a provincial congress was at once organized, mhich assumed the reins of government and began to prepare for defense. A committee of safety was chosen to carry on the work during recesses of the congress. Thomas Gage, the governor, began fortifying Boston, while he looked about for opportunities to seize military stores which the colonists were accumulating. The raising of voluntary militia companies was soon begun in Virginia In South Carolina. where planters, merchants and attorneys of high repute took charge of the movement, a general committee assumed practical control of the province. From New York city and Philadelphia, as centres, the process of revolutionizing the two most conservative provinces was carried on. When parliament met, at the close of 1774, the king and his ministers declared that a most daring spirit of resistance existed in Massachusetts. which was countenanced by the other colonies, where unlawful combinations against the trade of Great Britain already were widely extended. In these opinions the government had the support of the majority in the two houses. and in a joint address the rebellion in Massachusetts was declared to be a fact. As a conciliatory measure Chatham proposed that parliament agree by resolution not to levy any tax upon the colonies, but that the continental congress be required to make a free grant of a perpetual revenue which should be fully at the disposition of parliament, the congress fixing the quota which should be paid by each province. But the imperialist and mercantilist ideas of Chatham were expressed in the further provisions that the system of trade and navigation should not be changed and that the army might be lawfully kept in any part of the dominions, though it should never be used to violate the just rights of the people. Edmund Burke, in his great speech on conciliation, advocated a return to the system of requisitions and did not consider a representation of the colonists in parliament as a possibility. But these motions were rejected, and a resolution introduced by Lord North was passed. This contained no recognition of extralegal bodies, but provided that when the assembly of any colony should engage to support civil government within the colony and contribute according to its ability to the common defense, the king and parliament would then forbear to levy any more taxes on that province except what were necessary for the regulation of trade. The colonies, with the exception of New York, North Carolina and Georgia, were excluded from the fisheries, as a counterstroke to the association. North's resolution proved futile, and the two parties drifted steadily toward war, though the British government in its military estimates made no adequate provision for meeting the crisis.

Lexington and Concord.—On April 19, 1775, hostilities began in Massachusetts. A force was sent overland to Concord, 20 mi. from Boston, to seize or destroy the military stores which the colonists had brought together at that village. The minutemen were warned to oppose the approaching force, and at Lexington, a village situated on the road to Concord, occurred a skirmish in which the first blood of the American War of Independence was shed. (For this and later military actions, see AMERICAN REVOLUTION, THE.) The troops marched on to Concord and destroyed such of the stores as had not been removed or concealed. On their return march they were pursued by a galling fire from behind fences and buildings, and had it not been for the arrival of a relieving force the command would have been destroyed before it reached the protection of the British vessels of war at Boston. The "Lexington alarm" brought in throngs of militiamen from all parts of New England. Officers were appointed by the provincial congress of Massachusetts and by similar bodies in the other colonies, and immediately the so-called siege of Boston began. Cannon, as well as every other form of military equipment, were now in great demand. In order to secure supplies and at the same time strike a telling blow at British authority in the north, Ticonderoga was surprised and taken on May 10. Men from Connecticut, Massachusetts and the New Hampshire grants (later Vermont) co-operated in this enterprise. It was soon followed by a dash into Canada, by steps which involved New York in the affair, and by the organization of a military force under Gen. Philip Schuyler for permanent service on the northern frontier. Meantime reinforcements reached Boston, led by Howe, Clinton and Burgoyne, and it was resolved to extend the British lines by occupying the heights of Dorchester on the south and those of Charlestown on the north.

Bunker Hill.—The Americans, hearing of this, seized Breed's hill, overlooking Charlestown, where they hastily threw up a redoubt on the night of June 16. The British might easily have entrapped them, but instead on the next day the American position was assaulted on the left and carried, though with much difficulty and after a loss to the assailants of more than 1,000 men. Such was the battle of Bunker hill, one of the most dramatic encounters in the war. In all these events the Americans claimed to be acting on the defensive. But it was not difficult to perceive that, especially in New England, this claim only imperfectly concealed an intensely aggressive spirit.

Second Continental Congress.—The news of the outbreak of hostilities aroused strong feeling throughout the colonies. The second continental congress met under its influence. Its members, however, had been chosen and instructed before the clash of arms, and for that reason the course which had been worked out for them differed only slightly, if at all, from that which had been followed by their predecessors. To a certain extent the new body adhered to the former course of action. But a state of war now existed in New England and on the Canadian border. Troops were expected soon to arrive at New York. Reports of these events were thrust upon the attention of congress at once, and the provinces involved asked for advice as to what course they should pursue. As a result of these events in the colonies generally, the association was being changed from a system of co-operation against British trade into a union for purposes of defense. This new situation the congress was forced to meet. This it did largely by resolutions of advice to the colonies, but also by positive orders. Of the former class were the resolutions about the procuring of military supplies. the assumption of powers of government by the various colonies, and concerning defense at New York city, on the northern frontier and, later, in the highlands of the Hudson. Of a more decisive character was the appointment of officers for the army, George Washington being made commander in chief, the prescribing of their pay, the issue of continental bills of credit, the issue of articles of war, the regulation of trade and of Indian affairs and the establishment of postal communication. As the revolutionary movement progressed through 1775 and the early months of 1776, executive authority in the royal and proprietary provinces collapsed. The assemblies were either dissolved or ceased to meet. The governors, their authority gone, retired on board British vessels of war, returned to England or, perchance, found themselves prisoners. This gradual fall of the old governments, imperial and colonial, was the revolution on its negative side. The rise of the system of congresses, conventions and committees, deriving their authority from the people, was the revolution on its positive side, and foreshadowed the new federal system which was rising on the ruins of the half-federated empire.

Collapse of the Royal Governments.— In Connecticut and Rhode Island the corporate system of government, which they had inherited from the 17th century, necessitated no change. The general assemblies always had been the centres of power, and the leading officials were elective for short terms and were subject to the control of the electorate. So far as the internal organization of the colonies was concerned that was all which the revolution demanded. In the two proprietary provinces—Pennsylvania and Maryland—the executives were not so directly interested nor were they so specifically pledged to support the imperial government as were those of the royal provinces. But Gov. Robert Eden of Maryland was so tactful that, though the last assembly met in 177.4, he was able, with the courts, to keep up some form of government there in the name of the crown and proprietor until the early summer of 1776. In Pennsylvania the proprietors, though in sympathy with the British government, never sought actively to influence events. In the royal provinces the prorogation of the legislatures for indefinite or prolonged periods caused them early to disappear—that of Massachusetts in Oct. 1774. The burgesses of Virginia last met for business in May 1774. They were prorogued to several later dates, but the governor was never again able to meet them. The long and important session of January–March 1775 was the last ever held by the New York assembly. In April 1775, Gov. John Martin of North Carolina met the assembly for the last time, and even then the provincial convention was in session at the same time and place and the membership of the two bodies was the same. The assembly of Georgia disappeared in May 1775; those of New Hampshire and South Carolina met for the last time in June. Gov. William Franklin was able to meet the assembly of New Jersey as late as November, but months before that date the provincial convention had practically assumed the control of affairs.

Widening the Breach.—After Bunker hill the command at Boston had been transferred from Gage to Sir William Howe. In July Washington took command of the colonists and gradually estabiished some degree of order and discipline among them. Though the American troops were raw and ever fluctuating in numbers, the British never seriously attempted to break through their lines. Indeed, it was not the plan of the British to make New England the chief seat of war. As early as Aug. 2, 1775, Lord Dartmouth wrote to General Gage on "the obvious advantages that would attend the taking Possession of New York and the hazard of the Army's continuing at Boston." Rhode Island was considered as a convenient naval station, and steps were soon taken to secure possession of it and its surrounding waters. The British wished to so plan the war as to secure the maximum advantage from their fleet. This would give them an easy command of the entire coast, and enable them to secure a foothold at strategic centres. Hence, though the arrival of a fresh supply of cannon enabled Washington to fortify Dorchester heights, this simply enabled him to hasten a process for which Howe had long been preparing. The evacuation occurred on March 17, 1776, and the British force withdrew temporarily to Halifax. Meantime the bold expeditions of Arnold and Montgomery against Canada had met with only a partial success. Montreal had been occupied, but the assault upon Quebec had failed.

The view, as it was now repeatedly expressed by king and parliament, was that the colonists were in open rebellion. North's offer of conciliation was peremptorily rejected by the continental congress. The acts of parliament were being openly resisted, and the congress in its manifestoes had ignored the two houses. Therefore the British government stood committed to coercion. That was the meaning of the legislation of the winter of 1776—the prohibition of trade with the rebellious colonies, the increase of the estimates for the army and navy, the employment of German auxiliaries for service in America. Preparations were made to send a large military and naval force the folloning season, which should operate in part against the insurgents in New York and the southern colonies and in part through Canada. New England was no longer to be the direct object of attack. The Howes, as commanders of the royal army and navy, uere appointed commissioners to grant assurance of peace and pardon and the repeal of the obnoxious acts, provided submission uas made and some way could be found by parliament in which an imperial revenue for purposes of defense could be secured from the colonies. Military operations, meanwhile, should be directed against points of least resistance, and in that way, if possible, the union of the colonies should be broken. The trend of British policy indicated that an invasion from Canada might be attempted and an effort made to hold Charleston, S.C., Philadelphia and especially New York as strategic points on the coast.

The series of steps in the colonies by which this situation was met was the erection of a system of feeble defenses about New York and the removal there of the army of about 9,000 men in the spring of 1776; the fitting out of privateers to prey on British commerce; the disarming of loyalists; the opening of American ports to the trade of all peoples who were not subject to the British crown; and the tentative opening of relations with France. As the result of a combination of ill luck, bad management and American energy the British suffered a repulse at Charleston in June, which was analogous to the affair of the year before at Bunker hill and which necessitated a postponement of their plans in the south.

The congress and the various revolutionary bodies in the colonies were forced to carry on war upon a constantly increasing scale. They had to assume powers of government and gradually to perfect their organization for the purpose. Committees in congress became more permanent. Conditions approximating to those which existed the year before in New England extended through the colonies generally.

The Declaration of Independence.——On May 15, 1776, as the result of various earlier applications and especially of one from certain Whigs in New York, the congress recommended to the assemblies and conventions of the colonies where no government sufficient to the exigencies of their affairs had been established, "to adopt such government as shall, in the opinion of the representatives of the people, best conduce to the happiness of their constituents in particular and of America in general." The preamble to this resolution set forth as facts the statements that the colonies had been excluded from the protection of the crown, that no answer had been given to their petitions for redress, and tliat the whole force of the kingdom was to be used for their destruction, and therefore that it was no longer reasonable or honest for the colonists to take the oaths or affirmations necessary for the support of government under the crown. Though the preamble was warmly debated. it was adopted. And this act marked a turning point, for the progress of events from that time to the Declaration of Independence was rapid and decisive. The colonies—now becoming states—one after another, in response to letters from Philadelphia, empowered their delegates to concur in declaring independence. On June 7, Richard Henry Lee of Virginia introduced in the congress a resolution "that these United Colonies are and of right ought to be free and independent states," that it was expedient forthwith to take effectual measures for securing foreign allies and that a plan of confederation should be formed. The debate showed that the delegates from the middle colonies and South Carolina could not act, and the decision was postponed for three weeks. In the interval steps were taken to draft a plan of treaties and articles of confederation. A board of war and ordnance, the earliest germ of an executive department, was also created by the congress.

At the end of the three weeks the delegates from all the colonies except Georgia, South Carolina and New York had received instructions favourable to independence. The two former left their delegates free, and under the influence of the British attack on Charleston they voted for independence. News had just come that Howe had landed with a large force at Sandy Hook. Under the impression of these stirring events the Declaration, substantially in the form given to it by Thomas Jefferson, was agreed to (July 4, 1776), only three adverse votes being cast. The delegates from New York took no part, but a few days later the act was approved by the convention of that state. The signing of the document by the members took place at a later time. Thus triumphed the tendencies toward self-government which had been predominant in the continental colonies from the first, and which the system of imperial control had only superficially modified and restrained. But the most significant part of the document for the future was the preamble, in which the democratic aspirations of the new nation mere set forth, the spirit to which Thomas Paine had just made so powerful an appeal in his *Common Sense.* Governments, it was said, derive their just powers from the consent of the governed, and when any system becomes destructive of these ends it is the right of the people to abolish it and to institute a new government, establishing it upon such principles and under such forms as seem most likely to effect their safety and happiness. *(See* DECLARATION OF INDEPENDENCE.)

Weakness of the General Government.—Viewed from one standpoint, the Declaration of Independence was apparently an act of the utmost recklessness. The people were by no means a unit in its support, and in several of the states widespread indifference to it, or active sympathy with the British, prevailed. The Cnited States, as yet, had no international status, and it would seem that that must be secured, if at all, by a series of victories which would ensure independence. But how could these be won against the greatest naval power on the globe, supported by veteran armies of continental and British troops? The colonies had no money; the few vessels which, as a collective body, they did send out, were more like privateers than anything else. Their army was an undisciplined throng of militiamen, serving on short enlistments, without organized commissariat, and for the most part under inexperienced officers. Its numbers, too, were far inferior to those of the British. Taxation by the continental congress for the support of the war was not among the possibilities of the case. A strong tendency toward the provision for immediate needs by the issue of bills of credit had been inherited from the period of the French wars, and that device was again resorted to. The battle of Bunker hill had been immediately followed by an order of the congress for the issue of $2,000,000 in that form of currency. Issues followed in rapidly increasing amounts, until by the close of 1779, $241.000.000 had been authorized. The states put out nearly as much ($209,000,000). The continental paper money depreciated until it became aorthless, as to a large extent did that of the states also. The states decreed it to be legal tender, and dire threats were uttered against those who refused to receive the bills; but all to no purpose. The congress also tried to induce the states to tax themselves for the general cause and was forced to rely on requisitions for the purpose. These measures proved as complete a failure as when resorted to by the crown. The Revolution was therefore never financed. It early became necessary to resort to loans and that chiefly from foreign sources. It was therefore an absolute necessity that the colonies should secure international recognition and status. Then loans were obtained from the governments of France and Spain and from private bankers in the Netherlands to the amount of about $7,830,000.

The collapse of royal government left the colonies in a chaotic state. The old institutions had disappeared and new ones could not be immediately developed to take their place. But the institutions of local government, the town and county systems, were left intact, and upon these as a basis the new fabrics were erected. It was therefore easier to construct the governments of the states than to define and develop the general government. At first little else was intended than that the congress should be the mouthpiece of the patriot party. It proceeded mainly by way of recommendation, and looked to the states, rather than to itself, as the ultimate sources of authority. Upon them it depended for the execution of its measures. As the war proceeded the states grew jealous of the central body and tried to prevent appeals to it from the state courts in prize cases. Under the pressure of war, moreover, the enthusiasm. which had been strong at the outset. declined, and it became increasingly difficult to secure co-operation or sacrifice toward any general enterprise.

Difficulties of the Congress.—At the same time, war devolved upon the congress an enormous burden of work. It was forced to devise general policies and provide for their execution, and also to attend to an infinite number of administrative details. Most of the able members were drawn off into the army, into diplomatic service or official service in the states. Sectional and state jealousies also developed and became intense. As the congress voted by states the smaller commonwealths were often moved by jealousy of their larger rivals to thwart important measures. But, above all, the conduct of the war and foreign relations occasioned infinite jealousies and cabals, while many of the most important measures seemed to meet with downright indifference. Washington's correspondence abounds in evidence of these facts, while it is well known that he was the object against whom one of the cabals of the time was directed. Franklin was the object of somewhat similar jealousies. But, as time passed, rudimentary executive departments, beginning with the board of war and the postmaster general, were developed, and some advance was made toward a working and permanent system. In 1781 the offices of foreign secretary, superintendent of finance, secretary of war and secretary of marine were created.

Military Disasters.—Until almost its very close the campaign of 1776 was a disheartening failure. The battle of Long Island was lost by the Americans and, as at Bunker hill, it would have been quite possible for the British to have captured the entire force which opposed them on Long Island. Howe compelled Washington to evacuate New York city. On Nov. 16 the practical abandonment of the state of New York by the main army was necessitated by the capture of Ft. Washington. Earlier in the year the Americans had been compelled to retire from Canada, while the Tories in northern New York were contributing valuable aid to the British.

The Tide Turns.—But there was another side to the picture, and already certain faint outlines of it were being discerned. The British commander was, at practically every step, failing to seize the advantages that were within his reach, while Washington was learning to play a losing game with consummate patience and tact. After Washington had crossed the Delaware, Howe, instead of seizing Philadelphia and driving the congress and the American army to some remote places of refuge, as he might have done, prepared for winter quarters. Washington seized the opportunity to return across the Delaware and surprise the British outposts at Trenton (Dec. 26, 1776) and Princeton (Jan. 3, 1777), and thus secured a safe post of observation for the winter at Morristown. Confidence was to an extent restored, the larger part of New Jersey was regained, and many loyalists were compelled to take the oath of allegiance. Howe's plan for the next campaign involved the strengthening of his army by large reinforcements. With this force he proposed to capture Philadelphia and thereby to bring the War of Independence to an end in Pennsylvania, New Jersey and New York. New England and the states farther south could then be dealt with in detail. But Howe was overruled by Lord George Germain. the colonial secretary, whose plan included an invasion from Canada, in which Tories and Indians should share, while Howe should advance up the Hudson and meet the northern forces at Albany. If this ambitious scheme should succeed, the British would occupy the valley of the Hudson and New England would be cut off from the rest of the colonies. General Burgoyne was appointed to command the northern expedition. But the failure of the plan was almost ensured from the outset by the neglect on the part of British officials to instruct General Howe as to his part in its execution. Burgoyne was forced to surrender near Saratoga on Oct. 17. Meanwhile, Howe, who had long waited for instructions respecting the northern expedition, was finally informed that he might undertake the Pennsylvania campaign, but with the hope that at its close he would still be able to march up the Hudson. Thereupon, embarking his army, Howe sailed for Chesapeake bay, at the head of which he landed and advanced toward Philadelphia. Washington's army opposed his march at the Brandywine (Chad's Ford), but was defeated (Sept. 11, 1777) and forced to retire beyond Philadelphia. The British then entered the city (Sept. 26) and the congress withdrew to Lancaster, and later to York, in the interior of Pennsylvania. The British fleet had in the meantime arrived in Delaware bay, and, after a prolonged and brave defense, had captured Forts Mercer and Mifflin. When winter began the Delaware, as well as lower New York and Rhode Island, was in the possession of the British. With the fragments of an army Washington retired to Valley Forge.

French Alliance.—But the influence of Burgoyne's surrender in Europe was to prove a turning point in the war. From 1763 a strong sentiment at the French court had been favourable to a resumption of war with Great Britain. An opportunity was now presented by the colonial revolt. In Feb. 1776 Silas Deane was sent to Paris, ostensibly as a business agent, and with the connivance of the French government supplies were sent to America and American vessels were received into French ports. Soon American privateers were bringing their prizes into French harbours, and British commerce began to suffer from these attacks. On the French side Beaumarchais and others actively co-operated in this. In the autumn of 1776 congress appointed three commissioners to France, and resolved that Spain. Prussia, Austria and other European states should be approached with a view to securing recognition and aid. In Dec. 1776 Franklin, who. with Deane and Arthur Lee, had been appointed commissioner to France, arrived at Paris, bringing with him proposals for treaties of commerce and alliance. But, though the attitude of the French court toward the Americans was friendly, and though it continued to send secret aid, and to exert a favourable influence upon Spain, yet it could not be induced to abandon its outward appearance of neutrality until after the news of Burgoyne's surrender arrived. Then the real purpose of the French government was revealed. On Feb. 6, 1778 the treaties were signed, and in the following summer war between France and England began. The influence of France under the family compact brought Spain into the alliance in April 1779. In Oct. 1779 Henry Laurens was elected minister to the Netherlands, and sailed for Europe, taking with him a plan of a commercial treaty. But Laurens and his papers were captured by the British at sea, and partly by that event the Netherlands were forced into war with England. With the other states of northern Europe they undertook to defend the interests of neutrals against the arrogant enforcement by Great Britain of the rights of search at sea. Thus the conflict expanded into a commercial and naval war, Great Britain being confronted by the larger part of Europe.

Philadelphia Recaptured.—The conclusion of the treaty of alliance by France was immediately followed by the equipment of a fleet under Charles Hector, the comte d'Estaing, which sailed from Toulon in April 1778. Sir Henry Clinton had now succeeded Howe in command of the British army. The certainty that a French fleet would soon appear in American waters made it necessary for the British to evacuate Philadelphia and return to a point on the coast where the army could be in easy communication with the fleet. This fact shows how the French alliance had changed the nature of the war. It now became to a large extent a contest between the two navies, the principal evolutions of which occurred in West Indian and European seas. In the north the British now relatively neglected the land war, and refrained from sending such forces to the eastern coast as had supported Howe in 1776. The Americans, on the other hand, had a naval force upon which they relied, in the hope that the blockade of their coasts might be raised and trade routes opened more freely. On the evacuation of Philadelphia in June Washington's army pursued the British as they retired toward New York, and the indecisive battle of Monmouth was fought on June 28. It did not prevent Clinton from reaching New York, and that city continued to be the centre of British power and operations in the north until the close of the war. The congress returned to Philadelphia. Washington's army came gradually to occupy a line of forts, of which West Point in the highlands of the Hudson was the citadel. From there as a centre it was possible to communicate with Newport on the east and with the Delaware region on the south, and at the same time to prevent the British from gaining access to the interior of the country. Though the fleet of D'Estaing carried a heavier equipment of cannon than did that of Admiral Howe, the French commander did not choose to risk an attack on New York, but passed eastward to Newport. Howe followed him, while Washington and his generals planned active co-operation with the new allies by land. But a sudden storm so dispersed and injured the fleets that the French admiral retired to Boston for repairs and later sailed for the West Indies.

State **Constitutions.**—While the war and foreign relations were thus developing, the states were organizing their governments and the congress was beginning to consider articles of confederation between the states. In this way an effort was made to gather up and make permanent the positive results of the Revolution. As under the chartered and royal governments of the colonial period the source of political authority had been the crown. now by a necessary reaction this was sought in the people. This principle had been stated in the Declaration of Independence, and had been implied throughout the earlier controversy. The colonies had insisted on a more precise definition of the powers of government: they had opposed parliament because its powers were undefined and therefore dangerous. Following these ideas. tlie states now described their institutions of government and defined their powers by means of written constitutions. These were formulated by the provincial congresses—which had now become the legislatures—or. as they came to insist upon a more specific expression of the popular will, by conventions chosen for the purpose by the electors. Connecticut and Rhode Island retained their colonial charters. In the earlier days of hasty and temporary devices. the constitutions, like statutes, had been promulgated by the legislatures which formed them and had been put into force by their authority alone. But as time passed and more permanent arrangements became necessary an express popular approval of the instruments was obtained before they were put into force.

The establishment of state governments in this way began before the issue of the Declaration of Independence. It was actively continued during 1776 and the early months of the following year. by which time all of the states had secured at least a temporary constitution. Of the constitutions of the Revolutionary period the two most striking features were the bills of rights and the provisions which restricted most executives and defined their relations to the legislatures. The men of that generation were jealous of government. They insisted upon individual rights, not as acquired and guaranteed by the state, but as original, natural and inhering in time prior to all governments. Governments were instituted for the common benefit, protection and security. Officials were trustees and were accountable to the people. There should be no hereditary title to office or power. There should be no titles of nobility, and in Virginia the system of entails was swept away. Monopolies were declared to be inconsistent with the spirit of a free state. Freedom of the press and of conscience was asserted, and no obstacles to fair and speedy jury trials were to be tolerated. Elections should be free and frequent, and a preference was expressed for short terms of office. The legislature nas universally regarded as the most important department of government. Although the principle of the separation of powers mas recognized. in 8 states provision was made that the executives should be elected by the legislatures. 11 withheld from them the veto, and the states generally provided for a council to advise them. So manifold and important, however, were the restrictions on suffrage that the states were as yet far from being democracies.

The Articles of Confederation.—The first draft of the Articles of Confederation (*q.v.*) between the states was prepared by John Dickinson in the early summer of 1776. Because of the pressure of war it was then laid aside until the autumn of 1777. By that time the feeling in favour of state sovereignty had so increased that the impossibility of securing assent to the articles in any form had begun to be feared. But the document was completed and submitted to the states in Nov. 1777, when all were encouraged by the news of Burgoyne's surrender. The system for which provision was made in this document was a "confederacy," or "firm league of friendship" between the states. The congress was to be continued, and was to consist of delegates annually appointed by the legislature of each state and paid by their states. No attempt was made to create an executive for the confederacy, though authority was given to the congress to appoint a council of state which should manage general affairs, especially during recesses of the congress. To the congress various general powers were entrusted, such as deciding on peace and war and superintending the conduct of the same, building a navy.);: controlling diplomatic relations, coining money and emitting bills of credit, establishing post offices, regulating Indian trade and adjusting boundary disputes between the states. The financial powers entrusted to the congress included those of borrowing money and determining necessary expenditures, but not the power to tax. For supplies the general government had to depend on requisitions from the states. The same system also had to suffice for tlie raising and equipment of troops. The congress could not make its laws or orders effective in any matter of importance. This was simply a continuation of the policy under which the Revolution was being conducted. The control of trade was practically left with the states, the Americans in this matter failing to live up to the requirements of the British system. The predominance of the states was further ensured by the provision that no votes, except those for daily adjournment, could be carried without the assent of a majority of all the states, and no important measure without the consent of nine states. But a common citizenship was declared to exist, and the congress received authority to establish a court of appeal which might pass finally on all disputes between states. Taken as a whole, the Articles of Confederation would bear favourable comparison with other schemes of their kind, and they fairly represented the stage of development to which the American states had then attained.

The West.—It has been seen that, on the whole, the attitude of Great Britain, after the peace of 1763. was not favourable to the colonization of the Mississippi valley. To the colonists the Quebec act gained in offensiveness by seeming to imply that it was intended to exclude them from the west. But all such plans were swept away by the outbreak of the American Revolution. Already. before the beginning of hostilities, emigrants had begun to flock across the mountains. Plans were on foot for the establishment of a number of commonwealths, or proprietary provinces, as the case might be. Daniel Boone and his associates pushed farther west into the Kentucky region, and there it was proposed to establish the commonwealth of Transylvania. Other similar projects were started, all repeating in one form or another the political methods which were used when the seaboard colonies were

first settled. The backwoodsmen who managed these enterprises were extreme individualists, believed in the propriety of resistance to governments, and were in full sympathy with the Revolution. The states which had claims in the west opposed the founding of independent settlements there and, if possible, induced the settlers to be content with the status of counties within some one of the eastern states. After the beginning of the Revolution, the British from Detroit incited Indian raids for the purpose of destroying or driving out the settlers, especially in Kentucky. These raids provoked the important expeditions of George Rogers Clark in 1778 and 1779. With a force of Virginians he seized Kaskaskia and later, after a long march, captured Vincennes and compelled Gen. Henry Hamilton, who had come with a relief force from Detroit, to surrender. This secured to the Americans a permanent hold upon the northwest.

But Spain, after it entered the war, was determined, if possible, to wrest the valley of the Mississippi from the British and to keep all, or the larger part of it, for itself. To that end, operating from New Orleans, its troops took possession of Xatchez, and other posts on the lower Mississippi, and occupied Mobile and Pensacola.

Articles of Confederation **Ratified.**—Within the confederacy a fundamental line of cleavage was that between the large and small states. It was jealousy on the part of the small ones, their fear lest they might be absorbed by their larger neighbours, which had necessitated the adoption of the plan that in the congress the delegates should vote by states. When the articles were referred to the states for ratification, the difficulty reappeared. Massachusetts, Connecticut and New York, with Virginia and the three states to the south of it. had large claims to territory between the Appalachians and the Mississippi. New Hampshire, Rhode Island, Xew Jersey, Delaware and Maryland, which were without hope of westward extension. hesitated to enter the confederacy. if the large states were to be still further increased by additions to their areas of vast stretches of western country. They insisted that before ratification the states which had claims to western lands should surrender these for the common benefit of the United States. Maryland insisted upon this until, in the end, the cause of state equality and of nationality triumphed.

Congress declared that the ceded lands should be formed into states, which should become members of the union with the same rights as other states. When in 1781 the course of action had become possible, Maryland ratified the articles and they came into effect.

War in the South.—So far as the North American continent was concerned, the character of the last stage of the struggle with Great Britain was determined by the fact that the British resolved to transfer the main seat of war to the southern states, in the hope that Georgia and South Carolina might be detached from the union. At the close of 1778 Savannah was captured. In Sept. 1779 D'Estaing returned and assaulted Savannah, but, failing to capture it, sailed for France. In 1780 Clinton sailed from New York, besieged Charleston with a superior force and captured it (May 12). State government in South Carolina ceased. But the chance of detaching those states from the union and of bringing the war in that region to an end was finally lost by the British. This was chiefly because of an order which recalled the paroles of many of those who had surrendered at Charleston and required that they should perform military service under the British. The attempt to enforce this order provoked a bloody partisan conflict in the upper districts, especially of South Carolina, which contributed more than any other cause to run the scale against the British in the remote south. By the winter of 1781 they were forced back to Charleston and Savannah.

Yorktown.—During the summer of 1780 Washington was prevented from accomplishing anything in the north by the demoralized condition of the finances and by the decline of public spirit. It was very difficult to secure recruits or supplies. The pay of the troops had fallen so into arrears that some of them had already begun to mutiny. A second French squadron and military force, under Gen. Jean Baptiste Rochambeau, landed at Newport, but they were at once shut up there by the British. Clinton and Cornwallis were now planning that Cornwallis, having put down resistance in the remote south, should march through North Carolina and Virginia to Baltimore and Philadelphia and that a junction of the two British forces should be effected which, it was believed, would complete the ruin of the American cause. But the turn of the tide in favour of the Americans began with the partisan warfare in South Carolina, which delayed the northward march of Cornwallis, who retired to U'ilmington and then marched north with a small force into Virginia, and in July retired to Yorktown, in the peninsula of Virginia. Washington and Rochambeau had meantime been planning a joint move against the British at New York, or possibly in Virginia, and a letter was sent to the comte de Grasse, the French admiral in the West Indies, suggesting his co-operation. De Grasse replied that he would sail for the Chesapeake. This confirmed Washington and Rochambeau in the opinion that they should march at once for Virginia and, after junction with the force of Lafayette, co-operate with De

Grasse against Cornwallis. By well-timed movements the forces were brought together before Yorktown and Cornwallis was forced to surrender on Oct. 19, 1781.

Treaty of Peace.—This proved to be the last important operation of the war in America. The king was compelled to give way. Lord Rockingham was called into office at the head of a cabinet which considered the recognition of American independence to be indispensable. The negotiations fell into the hands of William Petty Fitzmaurice, earl of Shelburne, the friend of Franklin and disciple of Adam Smith. Richard Oswald was the leading British agent, while Franklin, Jay, John Adams and Henry Laurens were the American negotiators. From the first the acknowledgment of independence, the settlement of the boundaries and the freedom of fishing were insisted on as necessary terms by the Americans. The three points were early conceded by the British. They also agreed to restrict Canada to its ancient limits. But discussions later arose over the right to dry and cure fish on the British coasts, over the payment of debts due to British subjects prior to the war and over the compensation of the loyalists. Adams vigorously insisted upon the right to dry and cure fish on British coasts, and finally this concession was secured. Franklin was opposed to the demands of the loyalists, and they had to be content with a futile recommendation by the congress to the states that their claims should be adjusted. It was also agreed that creditors on either side should meet with no lawful impediment to the collection of their debts. Both France and Spain considered the claims of the Americans to be excessive, and were not inclined to yield to them. But the Americans negotiated directly with the British and the articles were signed without consultation with the French government. Peace was formally ratified on Sept. 3, 1783.

The American army was now disbanded. Since the close of active military operations both officers and men had been striving to secure their pay, which was hopelessly in arrears The congress had voted half pay to the officers for life, and many had agreed to accept a commutation of this in the form of full pay for a certain number of years. Certificates for these amounts were issued. But in this, as in other cases, it was found impossible to procure the money for the purpose from the states. Parts of the army repeatedly mutinied, and it was only the influence of Washington which prevented a general outbreak. When the disbandment was finally effected the officers found their certificates depreciated and the states indisposed to honour them. They received only a small part of their due, and the privates scarcely anything. (H. L. O.)

Struggle for National Government, 1783–1865

The long struggle to secure the ratification of the Articles of Confederation had given time for careful consideration of the new scheme of government. Maryland's persistent criticism had prepared men to find defects in them. Conventions of New England states, pamphlets and private correspondence had found flaws in the new plan; but a public trial of it was a necessary preliminary to getting rid of it. The efforts of the individual states to maintain the war, the disposition of each state to magnify its own share in the result, the popular jealousy of a superior power, transferred now from parliament to the central government, were enough to ensure the articles some lease of life.

Territorial **Cessions.**—Congress and its committees had already begun to declare that it was impossible to carry on a government efficiently under the articles. Its expostulations were to be continued for several years before they were heard. In the meantime it did not neglect the great subject which concerned the essence of nationality—the western territory. Virginia had made a first offer to cede its claims, but it was not accepted. A committee of congress made a report (1782) maintaining the validity of the rights which New York had transferred to congress; and in the next year Virginia made an acceptable offer. Its deed was accepted (March 1, 1784); the other claimant states followed; and congress, which was not authorized by the articles to hold or govern territory, became the sovereign of a tract of about 430,000 sq.mi.

In this territory congress had on its hands the same question of colonial government in which the British parliament had so signally failed. The manner in which congress dealt with it has made the United States the country that it is. The leading feature of its plan was the erection, as rapidly as possible, of states, similar in powers to the original states. The power of congress over the territories was to be theoretically absolute, but it was to be exerted in encouraging the development of thorough self-government, and in granting it as fast as the settlers should become capable of exercising it. Copied in succeeding acts for the organization of territories, and still controlling the spirit of such acts, the ordinance of 1787 (July 13, 1787), the Northwest ordinance, became a dominant influence in U.S. history (see Northwest Territories).

Difficulties of the Confederation.—In the interval of the settlement of the territorial question the affairs of the "league of friendship," known as the United States, had been going from bad to worse, reaching a crisis in 1786. The public debt amounted in 1783 to about $42,000,000, of which $8,000,000 was owed abroad—in the Netherlands, France and Spain. Congress had no power to levy taxes for the payment of interest or principal; it could only make requisitions on the states. In the four years ending in 1786 requisitions had been made for $10,000,000 and the receipts from them had amounted to but one-fourth of what had been called for. Even the interest on the debt was falling into arrears, and the first installment of the principal fell due in 1787. To pay this, and subsequent annual installments of $1,000,000, was quite impossible. Robert Morris, the financier of the war, resigned in 1783 rather than "be the minister of injustice," hoping thus to force upon the states the necessity of granting taxing powers to congress. Washington, on retiring as the command in chief, wrote a circular letter to the governors of all the states. urging the necessity of granting to congress some power to provide a national revenue. Congress (April 18, 1783) appealed to the states for power to levy specific duties on certain enumerated articles, and 5% on others. It was believed that with these duties and the requisitions, which were now to be met by internal taxation, $2,500,000 per annum could be raised. The proposal never received the necessary ratification of all the states. The obedience to the requisitions grew more lax. In 1786 a committee of congress reported that any further reliance on requisitions would be "dishonourable to the understandings of those who entertain such confidence."

The States and Congress.—In the states the case was even worse. Some of them had been seduced into issuing paper currency in such profusion that they were almost bankrupt. Great Britain, in the treaty of peace, had recognized the independence of the individual states, naming them in order; and its government followed the same system in all its dealings with its former Colonies. Its restrictive system was maintained, and the states, competing with each other for more commerce, could adopt no system of counteracting measures. Every possible burden was thus shifted to American commerce; and congress could do nothing, for, though it asked for the power to regulate commerce for 15 years, the states refused it. Several states, toward the end of this period, began to prepare or adopt systems of protection of domestic productions or manufactures, aimed at preventing competition by neighbouring states. The Tennessee settlers were in insurrection against the authority of North Carolina; the Kentucky settlers were disposed to cut loose from Virginia. Poverty, with the rigid execution of process for debt, drove the farmers of western Massachusetts into an insurrection (Shays's rebellion) which the state had much difficulty in suppressing; and congress was so incompetent to aid Massachusetts that it was driven to the expedient of imagining an Indian war in that direction, in order to transfer troops there. Congress itself was in danger of disappearance from the scene. The necessity for the votes of 9 of the 13 states for the passage of important measures made the absence of a state's delegation quite as effective as a negative vote. Congress even had to make repeated appeals to obtain a quorum for the ratification of the treaty of peace with Great Britain. In 1784 congress broke up in disgust, and the French minister reported to his government—"There is now in America no general government — neither Congress, nor president, nor head of any one administrative department."

Congress was evidently incompetent to frame a new plan of national government; its members were too dependent on their states, and would be recalled if they took part in framing anything stronger than the articles. The idea of a convention of the states, independent of congress, was in the minds and mouths of many; Thomas Paine had suggested it as long ago as his Common *Sense* pamphlet: "Let a continental conference be held . . . to frame a continental charter."

Convention of 1786. — The country drifted into a convention by a roundabout way. The navigation of Chesapeake bay and the Potomac needed regulation; and the states of Maryland and Virginia, having plenary power in the matter, appointed delegates to arrange such rules. The delegates met (1785) at Alexandria, Va., and at Washington's house, Mount Vernon, Va., in adopting their report, proposed that Pennsylvania and Delaware be asked to nominate commissioners. Virginia went further and proposed a meeting of commissioners from all the states to frame commercial regulations for the whole. The convention met (1786) at Annapolis, Md., but only five states were represented, and their delegates adjourned, after recommending another convention at Philadelphia in May 1787.

Constitutional Convention. — Congress had failed in its last resort — a proposal that the states should grant it the impost power alone; New York's veto had put an end to this last hope. Confessing its helplessness, congress approved the call for a second convention; 12 of the states (all but Rhode Island) chose delegates; and the convention met at Philadelphia (May 25, 1787) with an abler body of men than had been seen in congress since the first two continental congresses. Among others. Virginia sent Washington, James Madison, Edmund Randolph, George Mason and George Wythe; Pennsylvania: Franklin, Robert, Gouverneur Morris and James Wilson; Xlassachusetts: Rufus King, Elbridge Gerry and Caleb Strong: Connecticut: William S. Johnson, Roger Sherman and Oliver Ellsworth; New York: Alexander Hamilton; New Jersey: William Paterson; and South Carolina the two Pinckneys and John Rutledge. With hardly an exception the 55 delegates were clear-headed, moderate men, uith positive views of their own and firm purpose, but with a willingness to compromise.

The Virginia Plan. — Washington was chosen to preside, and the convention began the formation of a new constitution, instead of proposing changes in the old one. Two parties were formed at once. The Virginia delegates offered a plan proposing a congress, of two houses. having power to legislate on national subjects, and to compel the states to fulfill their obligations. This was a "large-state" plan, proposed by those states which had or hoped for a large population. It meant to base representation in both houses on population, so that the large states could control both of them, and it left the appointment of the president or other executive and the federal judges to congress — so that the whole administration of the new government would fall under large-state control.

The New Jersey **Plan.**—On behalf of the "small states" Paterson of New Jersey brought in another plan. It continued the old confederation, with its single house and equal state vote. but added the power to regulate commerce and raise a revenue, and to compel the states to obey requisitions. The large states had a general majority of six to five, but the constant dropping off of one or more votes, on minor features, from their side to that of the small states prevented the hasty adoption of any radical measures. Nevertheless, the final collision could not be evaded; the basis of the two plans was in the question of one or two houses, of equal or proportionate state votes, of large-state supremacy or of state equality. In July the large states began to show a disposition to force their plan through, and the small states began to threaten a concerted withdrawal from the convention.

The Compromise. — The Connecticut delegates, from their first appearance in the convention, had favoured a compromise. They had been trained under the New England system, in which the assemblies were made up of two houses, one representing the people of the whole state, according to population, and the other giving an equal representation to the towns. They proposed that the new congress should be made up of two houses, one representing the states in proportion to their population, the other giving an equal vote to each state. At a deadlock the convention referred the proposition to a committee, and it reported in favour of the Connecticut compromise. Connecticut had been voting in the large-state list, and the votes of its delegates could not be spared from their slender majority; now another of the large states, North Carolina, came over to Connecticut's proposal, and it was adopted. Thus the first great struggle of the convention resulted in a compromise, which took shape in an important feature of the constitution, the senate.

The small states were still anxious, in every new question, to throw as much power as possible into the hands of their special representative, the senate; and that body thus obtained its power to act as an executive council as a restraint on the president in appointments and treaties. This was the only survival of the first alignment of parties; but new divisions arose on almost every proposal introduced. The election of the president was given at various times to congress and to electors chosen by the state legislatures; and the final mode of choice, by electors chosen by the states, was settled only two weeks before the end of the convention, the office of vice-president coming in with it. The opponents and supporters of the slave trade compromised by agreeing not to prohibit it for 20 years. Another compromise included three-fifths of the slaves in enumerating population for representation. This provision gave the slaveholders abnormal power as the number of slaves increased.

Any explanation of the system introduced by the constitution must start with the historical fact that, while the national government was practically suspended, from 1776 until 1789, the only power to which political privileges had been given by the people was the states. and that the state legislatures were, when the convention met, politically omnipotent, with the exception of the few limitations imposed on them by the early state constitutions. The general rule, then, is that the federal government has only the powers granted to it by the federal constitution, while the state has all governmental powers not forbidden to it by the state or the federal constitution. But the phrase defining the federal government's powers is no longer "expressly granted," as in the Articles of Confederation, but merely "granted." so that powers necessary to the execution of granted powers belong to the federal government, even though not directly named in the constitution. This question of the interpretation or "construction" of the constitution is at the bottom of real national politics in the United States.

The Constitution. — Popular sovereignty, then, is the basis of the American system. But it does not, as does the British system, choose its legislative body and leave unlimited powers to it. It makes its constitution the permanent medium of its orders or prohibitions to all branches of the federal government and to many branches of the state governments: they must do what the constitution directs and leave undone what it forbids. The people, therefore, are continually laying their commands on their governments; and they have instituted a system of federal courts to ensure obedience to their commands. A British court must obey the act of parliament; the American court is bound and sworn to obey the constitution first, and the act of congress or of the state legislature only so far as it is warranted by the constitution. But the American court does not deal directly with the act in question; it deals with individuals who have a suit before it. One of these individuals relies on an act of congress or of a state legislature; the act thus comes before the court for examination; and it supports the act or disregards it as "unconstitutional," or in violation of the constitution. If the court is one of high rank, or one to which a decision may be appealed, as the U.S. supreme court, other courts follow the precedent. and the law falls to the ground.

The preamble states that "we, the people of the United States," establish and ordain the constitution. Events have shown that it was the people of the whole United States that established the constitution, but the people of 1787 seem to have been inclined to the belief that it was the people of each state for itself. This belief was never changed in the south; and in 1861 the people of that section believed that the ordinances of secession were merely a repeal of the enacting clause by the power which had passed it, the people of the state. For an account of the form of government established by the constitution see *Constitution* and *Goverrtment* below.

The constitution's leading difference from the confederation is that it gives the national government power over individuals. The federal courts are the principal agents in securing this essential power; without them, the constitution might easily have been as dismal a failure as the confederation. It has also been a most important agent in securing to the national government its supremacy over the states. From this point of view the most important provision of the constitution is the grant of jurisdiction to federal courts in cases involving the construction of the constitution or of laws or treaties made under it. The 25th section of the Judiciary act of 1789 permitted any supreme court justice to grant a writ of error to a state court in a case in which the constitutionality of a federal law or treaty had been denied, or in which a state law objected to as in violation of the federal constitution had been maintained. In such cases, the defeated party had the right to carry the "federal question" to the federal courts. It was not until 1816 that the federal courts undertook to exercise this power; it raised a storm of opposition, but it was maintained, and has made the constitution what it professed to be—"the supreme law of the land."

Sovereignty.—The system of the United States is almost the only national system, in active and successful operation, as to which the exact location of the sovereignty is still a mooted question. The contention of the Calhoun school—that the separate states were sovereign before and after the adoption of the constitution, that the union was purely voluntary and that the whole people, or the people of all the other states, had no right to maintain or enforce the union against any state—has been ended by the Civil War. But that did not decide the location of the sovereignty. The prevalent opinion is still that first formulated by Madison: that the states were sovereign before 1789; that they then gave up a part of their sovereignty to the federal government; that the union and the constitution were the work of the states, not of the whole people; and that reserved powers are reserved to the people of the states, not to the whole people.

By whatever sovereignty the constitution was framed and imposed, it was meant only as a scheme in outline, to be filled up afterward, and from time to time, by legislation. The idea is most plainly carried out in the federal judiciary: the constitution only directs that there shall be a supreme court, and marks out the general jurisdiction of all the courts, leaving congress, under the restriction of the president's veto power, to build up the system of courts. But the same idea is visible in every department, and it has carried the constitution safely through a period which has radically altered every other civilized government. It has combined elasticity with the limitations necessary to make democratic government successful over a vast territory, having infinitely diverse interests, and needing, more than almost anything else, positive opportunities for sober second thought by the people. A sudden revolution of popular thought or feeling is enough to change the house of representatives from top to bottom; it must continue for several years before it can make a radical change in the senate, and for years longer before it can carry this change through the judiciary, which holds for life; and all these changes must take place before the full effects upon the laws or constitution are accomplished. But minor changes are reached easily and naturally in the course of legislation.

Submission to Congress.—The convention adjourned on Sept. 17, 1787. Its last step was a resolution that the constitution be sent to the congress of the confederation, with the recommendation that it be submitted to conventions elected by the people of each state for ratification or rejection; that, if nine states should ratify it, congress should appoint days for the popular election of electors, and that then the new congress and president should, "without delay, proceed to execute this Constitution." Both congress and the convention were careful not to open the dangerous question, How was a government which was not to be changed but by the legislatures of all the states to be entirely supplanted by a different system through the approval of conventions in three-fourths of them?

Action **of** the States.—Before the end of the year Delaware, Pennsylvania and New Jersey had ratified; and Georgia, Connecticut and Massachusetts followed during the first two months of 1788. Thus far the only strong opposition had been in Massachusetts, a "large state." In it the struggle began between the friends and the opponents of the constitution, with its introduction of a strong federal power; and it raged in the conventions, legislatures, newspapers and pamphlets. In a classic series of papers, the *Federalist,* Alexander Hamilton, with the assistance of Madison and John Jay, explained the new constitution and defended it.

The seventh and eighth states—Maryland and South Carolina—ratified in April and May 1788; and, while the conventions of Virginia and New York were still wrangling over the great question, the ninth state, New Hampshire, ratified, and the constitution passed out of theory into fact. The Anti-Federalists of the Virginia and New York conventions offered conditional ratifications of all sorts; but the Federalists stubbornly refused to consider them, and at last, by very slender majorities, these two states ratified. North Carolina for a time refused to ratify the constitution. In Rhode Island it was referred to the several towns instead of to a convention arid was at first rejected by a majority, the Federalists, who advocated the calling of a convention, refraining from voting. Congress named the first Wednesday of Jan. 1789 as the day for the choice of electors, the first Wednesday in February for the choice of president and vice-president, and the first Wednesday in March for the inauguration of the new government, at New York city. The last date fell on March 4, which continued the limit of each president's term for a century and a half.

When the votes of the electors were counted before congress, it was found that Washington had been unanimously elected president, and that John Adams, standing next on the list, was vice-president. Long before the inauguration the congress of the confederation had expired of mere inanition; its attendance simply ran down until (Oct. 21, 1788) its record ceased and the United States got on without any national government for nearly six months. The struggle for nationality had been successful, and the old order faded out of existence.

Slavery.—The first census (1790) followed so closely upon the inauguration of the constitution that the country may fairly be said to have had a population of nearly 4,000,000 in 1789. Something over 500,000 of these were slaves, of African birth or blood. Slavery of this sort had taken root in almost all the colonies, its original establishment being everywhere by custom. When the custom had been sufficiently established statutes came in effect to regulate a relation already existing. But it is not true, as the Dred Scott decision held long afterward, that the belief that slaves were chattels simply, things, not persons, held good at the time of the adoption of the constitution. Times had changed somewhat. The peculiar language of the constitution itself, describing a slave as a "person held to service or labour," under the laws of any state, puts the general feeling exactly: slaves were persons from whom the laws of some of the states withheld personal rights for the time. In accordance with this feeling most of the northern states were on the high road toward abolition of slavery. Vermont had never allowed it. In Massachusetts it was swept out by a summary court decision that it was irreconcilable with the new state constitution. Other states soon began systems of gradual abolition, which finally extinguished slavery north of Maryland, but so gradually that there were still 18 apprentices for life in New Jersey in 1860, the last remnants of the former slave system. In the new states north of the Ohio slavery was prohibited by the ordinance of 1787 and the prohibition was maintained in spite of many attempts to get rid of it and introduce slavery.

The sentiment of thinking men in the south was exactly the same, or in some cases more bitter from their personal entanglement with the system. Jefferson's language as to slavery is irreconcilable with the chattel notion; no abolitionist agitator ever used warmer language than he. Washington, George Mason and other southern men were almost as warm against slavery as Jefferson, and there were societies for the abolition of slavery in the south. In the Constitutional Convention of 1787 the strongest opposition to an extension of the period of noninterference with the slave trade from 1800 to 1808 came from Virginia, whereas every one of the New England states voted for this extension. Like most slave laws, the laws of the southern states were harsh: rights were almost absolutely withheld from the slave and punishments of the severest kind were legal; but the execution of the system was milder than its legal possibilities might lead one to imagine. The country was as yet so completely agricultural that southern slavery kept all the patriarchal features possible to such a system.

Industries. — Indeed, the whole country was almost exclusively agricultural, and, in spite of every effort to encourage manufactures by state bounties, they formed the meagrest element in the national production. Connecticut, which now teems with manufactures, was just beginning the production of tinware and clocks; Rhode Island and Massachusetts were just beginning to work in cotton from models of jennies and Arkwright machinery surreptitiously obtained from England, and other states, beyond local manufactures of paper, glass and iron, were almost entirely agricultural, or were engaged in industries directly dependent on agriculture.

Population. — There were but five cities in the United States having a population of more than 10.000—New York (33,000), Philadelphia (28,500), Boston (18,000), Charleston (16,000) and Baltimore (13.000). The revenues of the new government in 1790 were only $4,000,000; the expenditures, excluding interest on the public debt, but $1,000,000. It is not easy for the modern American to realize the poverty and weakness of his country at the inauguration of the new government.

Travel. — Outside the cities communication was slow. One stage a week was enough for the connection between the great cities; and communication elsewhere depended on private conveyance. The western settlements were just beginning to make the question more serious. Enterprising land companies were the moving force which had impelled the passage of the ordinance of 1787: and the first column of their settlers was pouring into Ohio and forming connection with their predecessors in Kentucky and Tennessee. Marietta and Cincinnati had been founded. But the intending settlers were obliged to make the journey down the Ohio river from Pittsburgh in bulletproof flatboats, for protection against the Indians. and the return trip depended on the use of oars. For more than 20 years these flatboats were the chief means of river commerce in the west; and in the longer trips. as to New Orleans, the boats were generally broken up at the end and sold for lumber. John Fitch and others were already experimenting on what was soon to be the steamboat; but the statesman of 1789. looking at the task of keeping under one government a country of such distances, with such difficulties of communication, naturally felt anxiety as to the future.

Literature. — The comparative isolation of the people everywhere, the lack of books, the poverty of the schools and newspapers, were all influences which worked strongly against any pronounced literary development. Poems, essays and paintings were feeble imitations of European models; history was annalistic, if anything; and the drama hardly existed. In two points the Americans were strong. and had done good work. Such men as Jonathan Edwards had excelled in various departments of theology, and American preaching had reached a high degree of quality and influence; and, in the line of politics. the American state papers rank among the very best of their kind. Having a very clear perception of their political purposes, and having been restricted in study and reading to the great masters of pure and vigorous English, and particularly to the English translators of the Bible, the American leaders came to their work with an English style which could hardly have been improved. The writings of Franklin, Washington, the Adamses, Hamilton, Jefferson, Madison, Jay and others show the secret of their strength in every page. Much the same reasons, with the influences of democracy, brought oratory, as represented by Patrick Henry, Fisher Ames, John Randolph and others, to a point not very far below the mark afterward reached by Daniel Webster. The effect of these facts on the subsequent development of the country is not often estimated at its full value.

Limits of Settlement. — The cession of the Northwest Territory by Virginia and New York had been followed by similar cessions by Massachusetts (1785), Connecticut (1786) and South Carolina (1787). North Carolina did not cede Tennessee until early in 1790, nor Georgia its western claims until 1802. Settlement in all these regions was still very sparse. The centres of western settlement, in Tennessee and Kentucky, had become more firmly established, and a new one, in Ohio, had just been begun. The whole western limits of settlement of the old 13 states had moved much nearer their present boundaries; and the acquisition of the western title, with the liberal policy of organization and government which had been begun, was to have its first clear effects during the first decade of the new government. Almost the only obstacle to its earlier success had been the doubts as to the attitude which the Spanish authorities, at New Orleans and Madrid, would take toward the new settlements. They had already asserted a claim that the Mississippi was an exclusively Spanish stream from its mouth up to the Yazoo, and that no American boat should be allowed to sail on this part of it. To the western settler the Alleghenies and bad roads were enough to cut him off from any other way to a market than down the Mississippi; and it was not easy to restrain him from a forcible defiance of the Spanish claim. The northern states were willing to allow the Spanish claim for a period of years in return for a commercial treaty; the southern states and the western settlers protested angrily; and once more the spectre of dissolution appeared, not to be laid again until the new government had made a treaty with Spain in 1795 securing common navigation of the Mississippi.

The Development of Democracy. — All the tendencies of political institutions in the United States had been toward democracy; but the leading men were not unanimous in their agreement with this tendency. Not a few of them were pronounced republicans even before 1775, but the mass of them had no great objections to a monarchical form of government until the war spirit had converted them. The Declaration of Independence had been directed rather against the king than against a king. Even after popular sovereignty had pronounced against a king, class spirit was for some time a fair substitute for aristocracy. As often happens, democracy at least thought of a Caesar when it apprehended class control. Certain discontented officers of the continental army proposed to Washington that he become king, but he promptly and indignantly put the offer by.

The state constitutions were democratic, except for property or other restrictions on the right of suffrage, or provisions carefully designed to keep the control of at least one house of the state legislature "in the hands of property." The federal constitution was so draan that it would have lent itself kindly either to class control or to democracy. The electoral system of choosing the president and vice-president was altogether antidemocratic, though democracy has conquered it: rarely has an elector disobeyed the purely moral claim of his party to control his choice. Since the senate was to be chosen by the state legislatures, "property," if it could retain its influence in those bodies, could control at least one house of congress. Whether the constitution was to have a democratic or an antidemocratic interpretation was to be settled in the next 12 years.

The states were a strong factor in the final settlement, from the fact that the constitution had left to them the control of the elective franchise: they were to make its conditions what each of them saw fit. Religious tests for the right of suffrage had been quite common in the colonies; property tests were almost universal. The religious tests disappeared shortly after the Revolution; the property tests survived in some of the states far into the constitutional period. But the desire to attract immigration was always a strong impelling force to induce states, especially frontier states, to make the acquisition of full citizenship and political rights as easy and rapid as possible. This force was not so strong at first as it was after the great stream of immigration began about 1848, but it was enough to tend constantly to the development of democracy.

Organization of the New Government. — The Anti-Federalists had been a political party, but a party with but one principle, The absolute failure of that principle deprived the party of all cohesion; and the Federalists controlled the first two congresses almost entirely. Their pronounced ability was shown in their organizing measures, which still govern the American system very largely. The departments of state, of the treasury, of mar, of justice and of the post office were rapidly and successfully organized; acts were passed for the regulation of seamen, commerce, tonnage duties, lighthouses, dealing with the Indians, territories and the militia; a national capital was selected; a national bank was chartered; the national debt was funded, and the state debts were assumed as part of it. The first four years of the new system showed that the states had now to deal with a very different power from the impotent congress of the confederation. The new power was even able to exert pressure upon the two states which had not ratified the constitution. As a first step, the higher duties imposed on imports from foreign countries were expressly directed to apply to imports from North Carolina and Rhode Island. North Carolina having called a second convention, its case was left to the course of nature; the second convention ratified the constitution (Nov. 21, 1789). The Rhode Island legislature asked that their state might not be considered altogether foreigners, made their duties agree with those of the new government, and reserved the proceeds for "continental" purposes. Still no further steps were taken. A bill was therefore introduced, directing the president to suspend commercial dealings with Rhode Island, and to demand from it its share of the continental debt. This was passed by the senate, and needed but two steps further to become law. Newspaper proposals to divide the little state between its two nearest neighbours were stopped by its ratification of the constitution (May 29, 1790). The "old 13" were thus united under the constitution; and yet, so strong is the American prejudice for the autonomy of the states that these last two were allowed to enter in the full conviction that they did so in the exercise of sovereign freedom of choice.

Protection. — Protection was begun in the first tariff act, whose object. said its preamble, was the protection of domestic manufactures. The duties, however, ranged only from $7\frac{1}{2}\%$ to 10%, averaging about $8\frac{1}{2}\%$. The system. too, had rather a political than an economic basis. Until 1789 the states had controlled the imposition of duties. The separate state feeling was a factor so strong that secession was a possibility which every statesman had to take into account. Hamilton's object. in introducing the system. seems to have been to create a class of manufacturers, running through all the states, but dependent for prosperity on the new federal government and its tariff. This would be a force which would make strongly against any attempt at secession. The same feeling seems to have been at the bottom of his establishment of a national bank, his assumption of state debts and most of the general scheme which his influence forced upon the Federalist party.

Development of Parties. — In forming his cabinet Washington had paid attention to the opposing elements which had united for the temporary purpose of ratifying the constitution. The national element was represented by Hamilton, secretary of the treasury, and Henry Knox, secretary of war; the particularist element (using the term to indicate support of the states, not of a state) by Jefferson, secretary of state, and Edmund Randolph. attorney general. At the end of 1792 matters were in train for the general recognition of the existence of two parties, whose struggles were to decide the course of the constitution's development. The occasion came in the beginning of 1793, when the new nation was first brought into contact with the French Revolution.

The controlling tendency of Jefferson and his school was to the maintenance of individual rights at the highest possible point, as the Hamilton school was always ready to assert the national power to restrict individual rights for the general good. The Jefferson school supported the states, in the belief that they were the best bulwarks for individual rights. When the French Revolution began its course in America by agitation for the "rights of man," it met a sympathetic audience in the Jefferson party and a cold and unsympathetic hearing from the Hamilton school of Federalists, who were far more interested in securing the full recognition of the power and rights of the nation than in securing the individual against imaginary dangers, as they thought them. For ten years the surface marks of distinction between the two parties were to be connected with the course of events in Europe.

The new government was not yet four years old; it was not familiar, nor of assured permanency. The only national governments of which Americans had had previous experience were the British government and the confederation: in the British they had had no share. and in the confederation had had no power. The only places in which they had had long-continued, full and familiar experience of self-government were their state governments. The governing principle of the Hamilton school, that the construction or interpretation of the terms of the constitution was to be such as to broaden the powers of the federal government, necessarily involved a corresponding trenching on the powers of the states. It was natural, then, that the Jefferson school should look on every feature of the Hamilton program as "antirepublican." The disposition of the Jefferson school to claim for themselves a certain peculiar title to the position of "republicans" developed into the appearance of the first Republican, or the Democratic-Republican, party. about 1793.

Many of the Federalists were shrewd and active businessmen, who naturally took prompt advantage of the opportunities which the new system offered. The Republicans therefore believed and asserted that the whole Hamilton program was dictated by selfish or class interest; and they added this to the accusation of monarchical tendencies. These charges, with the fundamental differences of mental constitution, exasperated by the passion which differences as to the French Revolution seemed to carry with them everywhere, made the political history of this decade a very unpleasant record. The provision for establishing the national capital on the Potomac (1790) was declared to have been carried by a corrupt bargain; and accusations of corruption were renewed at every opportunity. In 1793 a French agent, Edmond Genet, appeared to claim the assistance of the United States for the French republic, and went to the length of commissioning privateers, and endeavouring to secure recruits. Washington decided to issue a proclamation of neutrality, the first act of its kind in American history. It was the first indication, also. of the policy which has made the course of every president, with the exception of Polk. a determined leaning to peace, even when the other branches of the government have been intent on war. Genet, however, continued his activities, and made outrageous demands upon the government, so that finally Washington demanded and secured (1794) his recall. The proclamation of 1793 brought about the first distinctly party feeling; and it was intensified by Washington's charge that popular opposition in western Pennsylvania (1794) to the new excise law (see WHISKY INSURRECTION, THE) had been fomented by the extreme French party. Their name, Democrat, was applied by the Federalists to the whole Republican party as a term of contempt, but it was not accepted by the party for about 20 years; then the compound title Democratic-Republican became, as it long remained, the official title of the party. There was no party opposition, however, to the re-election of Washington in 1792, or to the admission of Vermont (1791), Kentucky (1792) and Tennessee (1796) as new states.

Jay's Treaty. — The British government had accredited no minister to the United States, and it refused to make any commercial treaty or to give up the forts in the western territory of the United States, through which its agents still exercised a commanding influence over the Indians. In the course of its war with France, the neutral American vessels, without the protection of a national navy, fared badly. A treaty negotiated in

1794 by Chief Justice John Jay settled these difficulties for the following 12 years. But, as it engaged the United States against any intervention in the war on behalf of France, was silent on the subject of the right of search, and agreed to irksome limitations on the commercial privileges of the United States, the Republicans made it very unpopular, and the bitter personal attacks on Washington grew out of it. In spite of occasional Republican successes, the Federalists retained a general control of national affairs; they elected John Adams president in 1796, though Jetierson was chosen vice-president with him; and the national policy of the Federalists kept the country out of entangling alliances with any of the European belligerents. To the Republicans, and to the French republic, this last point of policy was only a practical intervention against France and against the rights of man.

At the end of Washington's administration the French Directory broke off relations with the United States, demanding the abrogation of Jay's treaty and a more pronounced sympathy nith France. Adams sent three envoys, Charles C. Pinckney, John Marshall and Elbridge Gerry, to endeavour to re-establish the former relations; they mere met by demands for "money, a great deal of money," as a prerequisite of peace. They refused; their letters home were published, and the Federalists at last had the opportunity of riding the whirlwind of an intense popular desire for war with France. Relations nith France were suspended by congress (1798); the treaties with France were declared at an end; American frigates were authorized to capture French vessels guilty of depredations on American commerce and the president was authorized to issue letters of marque and reprisal; and an American Army was formed, Washington being called from his retirement at Mount Vernon to command it. The war never went beyond a few sea fights. in which the little American navy did itself credit, and Napoleon, seizing power the next year, renewed the peace which should never have been broken.

The Alien and Sedition Laws. — The reaction in Great Britain against the indefinite "rights of man" had led parliament to pass an alien law, a sedition law suspending the writ of habeas corpus and an act giving wide and loosely defined powers to magistrates for the dispersion of meetings to petition for redress of grievances. The Federalists were in control of a congress of limited powers; but they were strongly tempted by sympathies and antipathies of every sort to form their program on the model furnished from England. The measures which they actually passed were based only on that construction of the constitution which is at the bottom of all American politics; they only tended to force the constitution into an antidemocratic direction. But it was the fixed belief of their opponents that they meant to go farther, and to secure control by some wholesale measure of political persecution.

Three alien laws were passed in June and July 1798. The first (repealed in April 1802) raised the number of years necessary for naturalization from 5 to 14. The third permitted the arrest or removal of subjects of any foreign power with which the United States should be at war. The second, which is usually known as the Alien law, was limited to a term of two years; it permitted the president to arrest or order out of the country any alien whom he should consider dangerous to the country. As many of the Republican editors and local leaders were aliens, this law really put a large part of the Republican organization in the power of the president. The Sedition law (to be in force until March 1801, and not rene ed) made it a crime, punishable by fine and imprisonment, to publish or print any false, scandalous and malicious writings against the government of the United States, either house of congress, or the president, or to stir up sedition or opposition to any lawful act of congress or of the president, or to aid the designs of any foreign power against the United States. In its first form the bill was even more sweeping than this and alarmed the opposition.

Most of the ability of the country was in the Federalist ranks; the Republicans had but two first-rate men — Jefferson and Madison. In the sudden issue thus forced between individual rights and national power, Jefferson and Madison could find but one bulwark for the individual — the power of the states; and their use of it gave their party a pronounced list to state sovereignty from nhich it did not recover for years. They objected to the Alien law on the grounds that aliens were under the jurisdiction of the state, not of the federal government; that the jurisdiction over them had not been transferred to the federal government by the constitution, and that the assumption of it by congress nas a violation of the constitution's reservation of powers to the states; and, further, because the constitution reserved to every "person." not to every citizen, the right to a jury trial. They objected to the Sedition law on the grounds that the constitution had specified exactly the four crimes for whose punishment congress was to provide; that criminal libel was not one of them; and that the 1st amendment forbade congress to pass any law restricting freedom of speech or of the press.

The Republican objections might have been made in court, on the first trial. But the Republican leaders had strong doubts of the impartiality of the federal judges. who were Federalists. They resolved to entrench the party in the state legislatures. The Virginia legislature in 1798 passed a series of resolutions prepared by Madison, and the Kentucky legislature in the same year passed a series prepared by Jefferson. Neglected or rejected by the other states, they were passed again by their legislatures in 1799. The leading idea expressed in both was that the constitution was a "compact" between the states, and that the powers (the states) which had made the compact had reserved the power to restrain the creature of the compact, the federal government, whenever it undertook to assume powers not granted to it. Madison's idea seems to have been that the restraint was to be imposed by a second convention of the states. Jefferson's idea is more doubtful; if it meant that the restraint should be imposed by any state which should feel aggrieved, his scheme was merely Calhoun's idea of nullification; but there are some indications that he agreed with Madison.

The first congress of Adams' term of office ended in 1799. Its successor, elected in the heat of the French war excitement, kept the Federalist policy up to its first pitch. Out of congress the execution of the objectionable laws had taken the shape of political persecution. Men were arrested, tried and punished for writings which the people had been accustomed to consider within legitimate political methods. The Republican leaders made every trial as public as possible, and gained votes constantly, so that the Federalists began to be shy of the very powers which they had sought. Every new election was a storm signal for the Federalist party; and the danger was increased by schism in their own ranks.

Election of 1800. — Hamilton was now a private citizen of New York; but he had the confidence of his party more largely than its nominal head, the president, and he maintained close and confidential relations with the cabinet which Adams had taken unchanged from Washington. The Hamilton faction saw no way of preserving and consolidating the newly acquired powers of the federal government but by keeping up and increasing the war feeling against France; Adams had the instinctive leaning of an American president toward peace. Amid cries of wrath and despair from his party he accepted the first overtures of the new Napoleonic government, sent envoys to negotiate a peace and ordered them to depart for France when they delayed. Then, discovering flat treachery in his cabinet, he dismissed it and blurted out a public expression of his feeling that Hamilton and his adherents were "a British faction." Hamilton retorted with a circular letter to his party friends, denouncing the president; the Republicans intercepted it and gave it a wider circulation than its author had intended. The result depended on the electoral vote of New York; and Aaron Burr, who had introduced the drill and machinery of a modern American political party there, had made the state Republican and secured a majority for the Republican candidates. These (Jefferson and Burr) received the same number of electoral votes (73) and the house of representatives (controlled by the Federalists) was thus called upon to decide which should be president. There was an effort by the Federalists to disappoint the Republicans by making Burr president; but Jefferson obtained that office, Burr becoming vice-president for four years. This disputed election. however. led to the adoption in 1804 of the 12th amendment to the constitution, which prescribed that each elector should vote separately for president and vice-president, and thus prevent another tie vote of this kind.

The "revolution of 1800" decided the future development of the United States. The new dominant party entered upon its career weighted with the theory of state sovereignty; and a civil war was necessary before this dogma. put to use again in the service of slavery. could be banished But the democratic development never was checked. As the Republicans obtained control of the states they altered the state constitutions so as to cut out all the arrangements that favoured property or class interests, and reduced political power to the dead level of manhood suffrage. In most of the states outside of New England this process was completed before 1815; but New England tenacity was proof against the advancing revolution until about 1820. For 20 years after its downfall of 1800 the Federalist party maintained its hopeless struggle, and then it faded away into nothing, leaving as its permanent memorial the excellent organization of the federal government, which its successful rival hardly changed. Its two successors — the Whig and the second Republican party — have also been broad constructionist parties, but they have admitted democracy as well.

The New Capital. — The disputed election of 1800 was decided in the new capital city of Washington, to which the government had just been moved, after having been for ten years at Philadelphia. Its streets and parks existed only on paper. The Capitol had been begun; the executive mansion was unfinished. and its audience room was used by Mrs. Adams as a drying room for clothes; the congressmen could hardly find lodgings. The inconveniences were only an exaggeration of the condition of other American cities. Their sanitary conditions were bad, and yellow fever and cholera from time to time reduced several of them almost to depopulation. More than once during this decade the fever visited Philadelphia and New York city, drove out most of the people and left grass growing in the streets. The communication between the cities was still wretched. The traveler was subject to every danger that bad roads, bad carriages, bad horses, bad inns and bad police protection could combine to inflict upon him.

The **West.**—About this time the term the west appears. It meant then the western part of New York, the new territory north of the Ohio, and Kentucky and Tennessee. In settling land boundaries New York had transferred (1786) to Massachusetts, whose claims crossed its territory, the right to (but not jurisdiction over) a large tract of land in central New York and to another large tract in the Erie basin. The sale of this land had carried population considerably west of the Hudson. Between 1790 and 1800 the population of Ohio had risen from almost nothing to 45,000, that of Tennessee from 36.000 to 106.000 and that of Kentucky from 74,000 to 221,000 — the last-named state now exceeding 6 of the "old 13" in population. The difficulties of the western emigrant, however, were still enormous. He obtained. land of his own, fertile land and plenty of it, but little else. The produce of the soil had to be consumed at home, or near it; ready money was scarce and distant products scarcer; and comforts, except the very rudest substitutes of home manufacture, were unobtainable. The number of post offices rose during these ten years from 75 to 903; the miles of post routes from 1,900 to 21.000 and the revenue from $38.000 to $231.000.

Cotton. — The power of congress to regulate patents was already bearing fruit. Until 1789 this power was in the hands of the states, and the privileges of the inventor were restricted to the territory of the patenting state. Now he had a vast and growing territory within which all the profits were his own. Twenty patents were issued in 1793. and 23,471, 100 years later. One of the inventions of 1793 was Eli Whitney's cotton gin.

When the constitution was adopted it was not known that the cultivation of cotton could be made profitable in the southern states. The roller gin could clean only six pounds a day by slave labour. In 1784 eight bags of cotton, landed in Liverpool from an American ship, had been seized on the ground that so much cotton could not be the produce of the United States. Eli Whitney invented the saw gin, by which the cotton was dragged through parallel wires with openings too narrow to allow the seeds to pass; and one slave could now clean 1,000 lb. a day. The exports of cotton leaped from 189,000 lb. in 1791 to 21,000,000 lb. in 1801, and doubled in three years more. The influence of this one invention, combined with a series of British inventions which had paved the way for it, can hardly be estimated in its commercial aspects. Its political influences were even wider, but more unhappy. The introduction of the commercial element into the slave system of the south robbed it at once of the patriarchal features which had made it tolerable; while it developed in slaveholders a new disposition to defend a system of slave labour as a "positive good."

Democracy and Nationality. — When Jefferson took office in 1801 his party, ignoring the natural forces which tied the states together even against their wills, insisted that the legal basis of the bond was in the power of any state to withdraw at will. This was no nationality; and foreign nations naturally refused to take the American national coin at any higher valuation than that at which it was current in its own country. The urgent necessity was for a reconciliation between democracy and nationality; and this was the work of this period. An underlying sense of all this has led Democratic leaders to call the war of 1812–15 the "Second War of Independence"; the result was independence of past ideas as the first had been of Great Britain.

Louisiana and Oregon. — The first force in the new direction was the acquisition oi Louisiana in 1803. Napoleon had acquired it from Spain, and, fearing an attack upon it by Great Britain, offered it to the United States for $15,000.000. The constitution gave the federal government no power to buy and hold territory, and the party was based on a strict construction of the constitution. Possession of power forced the strict-construction party to broaden its ideas, and Louisiana was bought, though Jefferson quieted his conscience by talking for a time of a futile proposal to amend the constitution so as to grant the necessary power. The acquisition of the western Mississippi basin more than doubled the area of the United States, and gave it control of all the great river systems of central North America. The difficulties of using these rivers were removed almost immediately by Robert Fulton's utilization of steam in navigation (1807). Within four years steamboats were at work on western waters; and thereafter the increase of steam navigation and that of population stimulated one another. The centre of population during this period advanced from about the middle of Maryland to its earlier extreme western limit; that is, the centre of population was in 1830 nearly at the place which had been the western limit of population in 1770. (See AMERICAN FRONTIER, THE.)

Jefferson also laid the basis for a further acquisition in the future by sending an expedition under Meriwether Lewis and William Clark to explore the territory north of the then Spanish territory of California and west of the Rocky mountains — the Oregon country as it was afterward called. The explorations of this party (1804–06), with Capt. Robert Gray's discovery of the Columbia river (1792), made the best part of the claims of the United States to the country 40 years later.

Election **of** 1804. — Jefferson was re-elected in 1804. His great success as president was the acquisition of Louisiana, which was a violation of his party principles; but all his minor successes were, like this, recognitions of the national sovereignty which he disliked so much. After a short and brilliant naval war the Barbary pirates were reduced to submission (1805). The long continued control of New Orleans by Spain, and the persistent intrigues of the Spanish authorities, looking toward a separation of the whole western country from the United States, had been ended by the acquisition of Louisiana. There still existed a dangerous ignorance of federal power and control, of which Aaron Burr took advantage (1806–07). Organizing an expedition in Kentucky and Tennessee, probably for the conquest of the Spanish colony of Mexico, he was arrested on the lower Mississippi and brought back to Virginia. He was acquitted; but the incident opened up a vaster view of the national authority than democracy had yet been able to take.

Jefferson and his party persistently refused to recognize the inherent power of the nation in international affairs. The Jay treaty expired in 1806 and American commerce was left to the course of events, Jefferson refusing to accept the only treaty which the British government was willing to make. All the difficulties which followed may be summed up in a few words: the British government was then the representative of the ancient system of restriction of commerce, and had a powerful navy to enforce its ideas; the American government was endeavouring to force into international recognition the system of neutral rights and unrestricted commerce, but its suspicious democracy refused to give it a navy sufficient to command respect.

Neutral Commerce.—Great Britain was now at war, from time to time, with almost every other nation of Europe. In time of peace European nations followed generally the old restrictive principle of allowing another nation. like the United States, no commercial access to their colonies; but, when they were at war with Great Britain, whose navy controlled the ocean. they were very willing to allow the neutral American merchantmen to carry away their surplus colonial produce. Great Britain had insisted for 50 years that the neutral nation, in such cases, was really intervening in the war as an ally of its enemy; but it had so far modified its claim as to admit that transshipment, or breaking bulk, in the United States was enough to qualify the commerce for recognition. The neutral nation thus gained a double freight, and grew rich in the traffic; the belligerent nations no longer had commerce afloat for British vessels to capture; and the "frauds of the neutral flags" became a standing subject of complaint among British merchants and naval officers. About 1805 British prize courts began to disregard transshipment and to condemn American vessels which made the voyage from a European colony to the mother country by way of the United States.

Impressment.— The question of expatriation, too, furnished a good many burning grievances. Great Britain maintained the old German rule of perpetual allegiance, modified by the right of emigration. The United States, founded by immigration, was anxious to establish the right of the subject to divest himself of allegiance by naturalization under a foreign jurisdiction. Four facts thus tended to break off friendly relations: (1) Great Britain's claim to allegiance over American naturalized subjects; (2) its claim to the belligerent right of search of neutral vessels; (3) its claim of right to impress for its vessels of war its subjects who were seamen wherever found; and (4) the difficulty of distinguishing native-born American from British subjects, even if the right to impress naturalized American subjects were granted. British naval officers even undertook to consider all who spoke the English language as British subjects, unless they could produce proof that they were native-born Americans. The American sailor uho lost his papers was thus open to impressment. A particularly flagrant case of seizure of Americans occurred in 1807. On June 27 the British ship "Leopard" fired upon the American frigate "Chesapeake," which, after having lost 3 men killed and 18 wounded, hauled down its flag; the British commander then seized four of the "Chesapeake's" crew. This action aroused intense anger throughout the country, and but for the impotence of the government would undoubtedly have led to immediate war. The American government in 1810 published the cases of such impressments since 1803 as numbering over 4,000, about one-third of the cases resulting in the discharge of the impressed man.

In May 1806, the British government, by orders in council, declared a blockade of the whole continent of Europe from Brest to the Elbe, about 800 mi. In November, after the battle of Jena, Napoleon answered by the "Berlin decree," in which he assumed to blockade the British Isles. thus beginning his "continental system." A year later the British government answered by further orders in council, forbidding American trade with any country from which the British flag was excluded, allowing direct trade from the United States to Sweden only, in American products. and permitting American trade with other parts of Europe only on condition of touching in England and paying duties. Napoleon retorted with the "Milan decree," declaring good prize any vessel which should submit to search by a British ship; but this was evidently a vain fulmination.

The Navy.—The Democratic party of the United States was almost exclusively agricultural and had little sympathy with commercial interests; it was pledged to the reduction of national expenses and the debt, and did not wish to take up the responsibility for a navy; and, as the section of country most affected by the orders in council. New England, was Federalist, a tinge of political feeling could not but colour the decisions of the dominant party Various ridiculous proposals were considered as substitutes for a necessarily naval war; and perhaps the most ridiculous was adopted. Since the use of nonintercourse agreements as revolutionary weapons against Great Britain, an overweening confidence in such measures had sprung up, and one of them was now resorted to—the embargo of Dec. 22, 1807. forbidding foreign commerce altogether. It was expected to starve Great Britain into a change of policy; and its effects may be seen by comparing the $20,000.000 exports of 1790, $49,000,000 of 1807 and $9,000,000 of 1808. It does not seem to have struck those who passed the measure that the agricultural districts also might find the change unpleasant; but that was the result. and their complaints reinforced those of New England. The pressure had been slightly relieved by the substitution of the Non-Intercourse law of March 1, 1809; it prohibited commercial intercourse with Great Britain and France and their dependencies. leaving other foreign commerce open, prohibited the importation from any quarter of British and French goods, and forbade the entrance of British or French vessels, public or private, into any port of the United States. Madison, Jefferson's secretary of state, who succeeded Jefferson in 1809, assumed in the presidency a burden which was not enviable. New England was in a ferment, and was suspected of designs to resist the restrictive system by force; and the administration did not face the future with confidence.

The **War of 1812.**—The Non-Intercourse law was to be in force only "until the end of the next session of Congress" and was to be abandoned as to either belligerent which should abandon its attacks on neutral commerce, and maintained against the other. In 1810 the American government was led to believe that France had abandoned its system. Napoleon continued to enforce it in fact; but his official fiction served its purpose of limiting the nonintercourse for the future to Great Britain, and thus straining relations between that country and the United States still further. The elections of 1811–12 resulted everywhere in the defeat of "submission men" and in the choice of ne members who were determined to resort to war against Great Britain. Henry Clay, John C. Calhoun, William H. Crawford and other new men seized the lead in the two houses of congress, and forced Madison. it is said, to agree to a declaration of war as a condition of his renomination in 1812. Madison sent to congress a confidential "war message" on June 1 and on the 18th war was declared. The national democracy meant to attack Great Britain in Canada. partly to gratify its western constituency, who had been harassed by Indian attacks, asserted to have been instigated from Canada. Premonitions of success were drawn from the battle of Tippecanoe, in which William Henry Harrison had defeated in 1811 the northwestern league of Indians formed by Tecumseh. Between the solidly settled Atlantic states and the Canadian frontier was a wide stretch of unsettled or thinly settled country, which was itself a formidable obstacle to war. Ohio had been admitted as a state in 1802, and Louisiana was admitted in 1812; but their admission had been because of the desire to grant them self-government rather than to their full development in population and resources. Cincinnati was a little settlement of 2,500 inhabitants; the fringe of settled country ran not very far north of it; all beyond was a wilderness. The case was much the same with western New York. It would have been far less costly, as events proved. to have entered at once upon a naval war; but the crusade against Canada had been proclaimed all through Kentucky and the west, and their people were determined to wipe out their old scores before the conclusion of the war. (For the military and naval events of the war see WAR OF 1812.)

The home dislike of the war had increased steadily with the evidence of incompetent management by the administration. The

Federalists, who had always desired a navy, pointed to the naval successes as the best proof of folly with which the war had been undertaken. New England Federalists complained that the federal government utterly neglected the defense of their coast. and that southern influence was far too strong in national affairs. They showed at every opportunity a disposition to adopt the furthest stretch of state sovereignty, as stated in the Kentucky resolutions; and every such development urged the national democracy unconsciously further on the road to nationality. When the New England states sent delegates to meet at Hartford, Conn.. and consider their grievances and the best remedies, treason was suspected, and a readiness to suppress it by force was plainly shown. The recommendations of the convention came to nothing; but the attitude of the dominant party toward it is one of the symptoms of the manner in which the trials of actual war were steadily reconciling democracy and nationality. The object which Hamilton had sought by high tariffs and the development of national classes had been attained by more natural and healthy means.

In April 1814 the first abdication of Napoleon took place, and Great Britain was able to give more attention to its American antagonist. The main attack mas to be made on Louisiana, the weakest and most distant portion of the union. A fleet and army were sent there, but the British assault was completely repulsed (Jan. 8, 1815) by the Americans under Andrew Jackson. Peace had been made at Ghent 15 days before the battle was fought. but the news of the battle and the peace reached Washington almost together.

The United States secured a fairly good treaty. It is true that it said not a word about the questions of impressment, search and neutral rights, the grounds of the war; Great Britain did not abandon its position on any of them. But everybody knew that circumstances had changed. The new naval power whose frigates alone in the past 20 years had shown their ability to fight English frigates on equal terms was not likely to be troubled in future with the question of impressment; and in fact, while not renouncing the right, the British government no longer attempted to enforce it.

Postwar Political and Economic Trends.—The remainder of this period is one of the barrenest in American history. The opposition of the Federalist party to the war completed the measure of its unpopularity. and it had only a perfunctory existence for a few years longer. Scandal, intrigue and personal criticism became the most marked characteristics of American politics until the dominant party broke at the end of the period, and real party conflict was renewed. But the seeds of the final disruption are visible from the peace of 1814. The old-fashioned Republicans looked with intense suspicion on the new form of Republicanism generated by the war, a type which instinctively bent its energies toward the further development of national power. Clay was the natural leader of the new Democracy; but John Quincy Adams and others of Federalist antecedents or leanings took to the new doctrines kindly; and even Calhoun, Crawford and others of the southern interest were at first strongly inclined to support them. One of the first effects was the revival of protection and of a national bank.

The charter of the national bank had expired in 1811, and the dominant party had refused to recharter it. The attempt to carry on the war by loans resulted in almost a bankruptcy and in a complete inability to act efficiently. As soon as peace gave time for consideration, a second bank mas chartered (April 10, 1816) for 20 years with a capital of $35,000,000, one-fifth of mhich was to be subscribed for by the national government. It was to have the custody of the government revenues, but the secretary of the treasury could divert the revenues to other custodians, giving his reasons for such action to congress.

Protection was advocated again on national grounds. but not quite on those which had moved Hamilton. The additional receipts were now to be expended for fortifications and other national defenses, and for national roads and canals. The war and blockade had been an active form of protection, under which American manufactures had sprung up. As soon as peace was made English manufacturers drove their American rivals out of business or reduced them to desperate straits. Their cries for relief had a double effect. They gave the spur to the nationalizing advocates of protection, and, as most of the manufacturers were in New England or New York, they developed in the citadel of Federalism a class nhich looked for help to a Republican congress. This was the main force nhich brought New England into the Republican fold before 1825 An increase in the number of spindles from 80.000 in 1811 to 500.000 in 1815. and in cotton consumption from 500 bales in 1800 to 90 000 in 1815. the rise of manufacturing towns, and the rapid development of the mechanical tendencies of a people nho had been hitherto almost exclusively agricultural were influences which were to be reckoned with in the politics of a democratic country.

The tariff of 1816 imposed a duty of about 25% on imports of cotton and woolen goods, and specific duties on iron imports except pig iron. on which there nas an ad valorem duty of 20%. In 1818 this duty also was made specific (50 cents a hundredweight). The ad valorem duties carried most of the manufacturers through the financial crisis of 1818–19, but the iron duties nere less satisfactory. In English manufacture the substitution of coke for charcoal in iron production led to continual decrease in price. 4s the price went down the specific duties were continually increasing the absolute amount of protection. Thus spared the necessity for improvements in production, the American manufacturers felt English competition more keenly as the years went by, and called for more protection.

James Monroe succeeded Madison as president in 1817, and, re-elected nith hardly any opposition in 1820. he served until 1825 So complete was the supremacy of the Republican party that this is often called the era of good feeling It came to an end when a successor to Monroe was to be elected; the two sections of the dominant party then had their first opportunity for open struggle. During Monroe's two terms of office the nationalizing party developed the policy on which it proposed to manage national affairs This was largely the product of the continually swelling western movement of population The influence of the steamboat was felt more and more every year, and the nant of a similar improvement in land transport was correspondingly evident The attention drann to western New York by the war had filled that part of the state with a new population The southern Indians had been completely overthrown by Andrew Jackson during the War of 1812. and forced to cede their lands The admission of the new states of Indiana (1816), Mississippi (1817) Illinois (1818), Alabama (1819) Maine (1820) and Missouri (1821)—all but Maine the product and evidence of western growth—were the immediate results of the development consequent upon the war. All the territory east of the Mississippi, except the northern part of the North-west Territory. was now formed into self-governing states: the state system had crossed the Mississippi; all that was needed for further development was the locomotive engine. The 4,000,000 inhabitants of 1790 had gronn to nearly 13 000.000 in 1830

The "American System."—The urgent demand of western settlers for some road to a market led to a variety of schemes to facilitate dealings between the east and the west—the most successful being that completed in New York in 1525. the Erie canal The Hudson river forms the great natural breach in the barrier range which runs parallel to the Atlantic coast. When the traveler has passed up the Hudson through that range he sees before him a vast flat, open country extending westward to the Great Lakes, and perfectly adapted by nature for a canal Such a canal. to turn western traffic into the lake rivers and through the lakes. the canal and the Hudson to New York city. was begun by the state through the influence of De Witt Clinton It nas derisively called Clinton's big ditch until its completion laid the foundations for the great commercial prosperity of New York state and city Long before it was finished the evident certainty of its success had enticed other states into far less successful enterprises of the kind and had established as a nationalizing policy the combination of high tariffs and expenditures for internal improvements which was long known as the "American system"

The tariffs or duties on imports were to be carried as high as revenue results would justify; the superabundant revenues were to be expended on enterprises which mould tend to aid the people to subdue the continent. Protection was now to be for national benefit, not for the benefit of classes. Western farmers were to have manufacturing towns at their doors, as markets for the surplus which had hitherto been rotting on their farms; competition among manufacturers was to keep down prices; and Henry Clay's eloquence was to commend the whole policy to the people. The old democracy, particularly in the south. insisted that the whole scheme really had its basis in benefits to classes, that its communistic features mere not such as the constitution meant to cover by its grant of power to congress to levy taxation for the general welfare. The dissatisfaction in the south rose higher when the tariffs were increased in 1824 and 1828. The proportion of customs revenue to dutiable imports rose to 37% in 1825 and to 44% in 1829; and the ratio to aggregate imports to 33% in 1825 and 37% in 1829.

The Monroe Doctrine.—In international relations the action of the government was strong, quiet and self-respecting. Its first weighty action took place in 1823 It had become pretty evident that the Holy alliance meant to aid Spain in bringing its rebellious South American colonies to obedience. Great Britain had been drifting steadily away from the alliance, and George Canning. the new secretary, determined to call in the weight of the transatlantic power as a check upon it. A hint to the American minister was followed by a few pregnant passages in Monroe's annual message in December. "We could not view," he said, "any interposition for the purpose of oppressing them [the South American states]. or controlling in any other manner their destiny by any European power, in any other light than as the manifestation of an unfriendly disposition towards the United States." If both the United States and Great Britain were to take this ground the fate of a fleet sent by the alliance across the Atlantic was not in much doubt, and the project was at once given up.

It was supposed at the time that Spain might transfer its colonial claims to some stronger power; and Monroe therefore said that "the American continents, by the free and independent condition which they have assumed and maintained, are henceforth not to be considered as subjects for future colonization by any European powers." This declaration and that quoted above constitute together the Monroe Doctrine as originally proclaimed. The doctrine has remained the rule of foreign policy for all American parties. (See MONROE DOCTRINE. THE.)

By a treaty with Russia (1825) that power gave up all claims on the Pacific coast south of the present limits of Alaska. The northern boundary of the United States had been defined by the treaty of 1783; and, after the acquisition of Louisiana, a convention with Great Britain (1818) settled the boundary on the line of latitude 49° N. as far west as the Rocky mountains. West of these mountains the so-called Oregon country, on whose limits the two powers could not agree, was to be held in common possession for ten years. This common possession was prolonged by another convention (1827) indefinitely, with the privilege to either power to terminate it, on giving 12 months' notice. This arrangement lasted until 1846.

Elections of 1824 and 1828.—Monroe's term of office came to an end in March 1825. He had originally been an extreme Democrat, who could hardly speak of Washington with patience; he had slowly modified his views, and his tendencies were now eagerly claimed by the few remaining Federalists as identical with their own. All the candidates for the presidency in 1824—Andrew Jackson, a private citizen of Tennessee; William H. Crawford, Monroe's secretary of the treasury; John Quincy Adams, his secretary of state; and Henry Clay, the speaker of the house of representatives—claimed to be Republicans alike; but the personal nature of the struggle was shown by the tendency of their supporters to call themselves "Adams men" or "Jackson men," rather than by any real party title. Calhoun was supported by all groups for the vice-presidency, and was elected without difficulty. The choice of a president was more doubtful.

None of the four candidates had anything like a party organization behind him. Adams and Clay represented the nationalizing element. as Crawford and Jackson did not; but there the likeness among them stopped. The strongest forces behind Adams were the new manufacturing and commercial interests of the east; behind Clay were the desires of the west for internal improvements: and the two elements were soon to be united into the National Republican or Whig party. Crawford was the representative of the old Democratic party, with all its southern influences and leanings. Jackson was the personification of the new democracy—not very cultured, perhaps, but honest, and hating every shade of class control instinctively. As he became better known the whole force of the new drift of things turned in his direction. Crawford was taken out of the race, just after the electors had cast their votes. because of ill-health, and Adams. later, by the revival of ancient quarrels uith the Federalists of New England; and the future was to be with Clay or with Jackson. But in 1824 the electors gave no one a majority; and the house of representatives, voting by states, gave the presidency to Adams.

Adams' election in 1825 was attributed to the fact that Clay's friends in the house—unable to vote for him, as he mas the lowest in the electoral vote, and only three names were open to choice in the house—very naturally gave their votes to Adams. As Adams appointed Clay to the leading position in his cabinet. the defeated party at once raised the cry of "bargain and intrigue." one of the most effective in a democracy, and it was kept up throughout Adams' four years of office. Jackson had received the largest number of electoral votes, though not a majority and the hazy notion that he had been injured because of his devotion to the people increased his popularity. Though demagogues made use of it for selfish purposes, this feeling was an honest one, and Adams had nothing to oppose to it. He tried vigorously to uphold the American system, and succeeded in passing the tariff of 1828; he tried to maintain the influence of the United States on both the American continents; but he remained as unpopular as his rival grew popular. In 1828 Adams was easily displaced by Jackson. the electoral vote being 178 to 83. Calhoun was reelected vice-president.

Jackson's inauguration in 1829 closes this period, as it ends the time during which a disruption of the union by the peaceable withdrawal of any state was even possible. The party which had made state sovereignty its bulwark in 1798 was non in control of the government again; but Jackson's proclamation in his first term, in which he warned South Carolina that "disunion by armed force is treason," and that blood must flow if the laws were resisted, speaks a very different tone from the speculations of Jefferson on possible future divisions of the United States. Even the sudden attempt of South Carolina to exercise independent action shows that some interest dependent upon state sovereignty had taken alarm at the drift of events. and was anxious to lodge a claim to the right before it should slip from its fingers forever.

Slavery and the Westward **Movement.**—When the vast territory of Louisiana was acquired in 1803 the new owner found slavery already established there. Congress tacitly ratified existing law by taking no action; slavery continued legal, and spread further through the territory: and the state of Louisiana entered as a slave state in 1812. The next state to be carved out of the territory was Missouri, admitted in 1821. A territory. on applying for admission as a state, brings a constitution for inspection by congress; and when it was found that the new state of Missouri proposed to recognize and continue slavery, a vigorous opposition spread through the north and west, and carried most of the senators and representatives from those sections with it. In the house of representatives these two sections had a greatly superior number of members; but. as the number of northern and southern states had been kept about equal. the compact southern vote, with one or two northern allies, generally retained control of the senate. Admitted by the senate and rejected by the house, Missouri's application hung suspended for two years until it was successful by the admission of Maine, a balancing northern state, and by the following arrangement, known as the Missouri Compromise of 1820: Missouri mas to enter as a slave state; slavery was forever prohibited throughout the rest of the Louisiana

Purchase north of latitude 36° 36'. the main southern boundary of Missouri; and, though nothing was said of the territory south of the compromise line, it was understood that any state formed out of it was to be a slave state, if it so wished. Arkansas entered under this provision in 1836.

The question of slavery was thus set at rest for the present, though a few agitators were roused to more zealous opposition to the essence of slavery itself. In the next decade these agitators succeeded only in the conversion of a few recruits, but these recruits were the ones who took up the work at the opening of the next period. It is plain now, however, that north and south had already drifted so far apart as to form two sections, and it became evident during the next 40 years that the wants and desires of these two sections were so divergent that it was impossible for one government to make satisfactory laws for both.

The vast flood of settlers which had been pouring westward for years had now pretty well occupied the territory east of the Mississippi, while, on the west side of that stream, it still showed a disposition to hold to the river valleys. The settled area had increased from 240,000 sq.mi. in 1790 to 633,000 sq.mi. in 1830, with an average of 20.3 persons to the square mile. There was still a great deal of Indian territory in the southern states of Georgia, Alabama, Mississippi and Florida, for the southern Indians were among the finest of their race; they had become semicivilized, and were formidable antagonists to the encroaching settlers. The states interested had begun preparations for their forcible removal, in public defiance of the attempts of the federal government to protect the Indians (1827); but the removal was not completed until 1835. In the north, Wisconsin and Michigan, with the northern halves of Illinois and Indiana, were still very thinly settled, but everything indicated an early increase of population. The first lake steamboat, the "Walk-in-the-Water," had appeared at Detroit in 1818, and the opening of the Erie canal in 1825 added more vessels.

The land system of the United States had much to do with the early development of the west. From the first settlement, the universally recognized rule had been that of absolute individual property in land, with its corollary of unrestricted competitive or "rack" rents; and this rule was accepted fully in the national land system. The public lands were to be divided into hundreds each 10 miles square and containing 100 mile-square plots The hundred was called a township. and was afterward reduced to 6 miles square, of 36 mile-square plots of 640 ac. each. From time to time principal meridians and east and west base lines have been run, and townships have been determined by their relations to these lines. The price fixed in 1790 as a minimum was $2 per acre; in 1820 it was reduced to $1.25 per acre; it has tended to decrease, and no effort has ever been made to gain a revenue from it. When the nation acquired its western territory it secured its title to the soil, and always made it a fundamental condition of the admission of a nen state that it should not tax United States lands. To compensate the new states for the freedom of unsold public lands from taxation, one township in each 36 was reserved to them for educational purposes; and the excellent public-school systems of the western states have been founded on this provision. The cost of obtaining a quarter section (160 ac.), under the still later homestead system of granting lands to actual settlers, came to be only about $26 to cover fees for filing claim and granting title; the interest on this, at 6%, represents an annual rent of 1 cent per acre—making this. says F. A. Walker, as nearly as possible the "no-rent land" of the economists

The bulk of the early westward migration was of home production; the great immigration from Europe did not begin until about 1847. The west as well as the east thus had its institutions fixed before being called upon to absorb an enormous foreign element

Industrial Development and Sectional Divergence, 1829–50.—The years 1829–37 have been called the reign of Andrew Jackson; his popularity, long struggle for the presidency and his feeling of his official ownership of the subordinate offices gave to his administration at least an appearance of Caesarism. But it was a strictly constitutional Caesarism; the restraints of written law were never violated, though the methods adopted within the law were new to national politics. From about 1800 state politics in New York and Pennsylvania had been noted for the systematic political use of the offices. The presence of New York and Pennsylvania politicians in Jackson's cabinet taught him to use the same system. Removals, except for cause, had been relatively rare before; but under Jackson men were removed almost exclusively for party purposes and a clean sweep was made in the civil service. Other parties adopted the system, and it remained the rule at a change of administration until near the end of the century.

Parties.—The system brought with it a semimilitary reorganization of parties. Hitherto nominations for the more important offices had been made mainly by legislative caucuses; candidates for president and vice-president were nominated by caucuses of congressmen, and candidates for the higher state offices by caucuses of the state legislatures. Late in the preceding period conventions of delegates from the members of the party in the state were held in New York and Pennsylvania; and in 1831–32 this became the rule for presidential nominations. It rapidly developed into systematic state, county and city conventions; and the result was the appearance of that complete political machinery, the American political party. The Democratic machinery was the first to appear, in Jackson's second term (1833–37). Its workers were paid in offices, or hopes of office, so that it was said to he built on the "cohesive power of public plunder"; but its success was immediate and brilliant. The opposing party, the Whig party, had no chance of victory in 1836; and its complete overthrow drove its leaders into the organization of a similar machinery of their own, which scored its first success in 1840.

Bank of the U.S.—The Bank of the United States had hardly been heard of in politics until the new Democratic organization came into hostile contact with it. A semiofficial demand upon it for a political appointment was met by a refusal; and the party managers called Jackson's attention to an institution which he could not but dislike the more he considered it. His first message spoke of it in unfriendly terms, and every succeeding message brought a more open attack. The old party of Adams and Clay had by this time taken the name of Whigs, probably from the notion that they were struggling against the reign of Andrew Jackson, and they adopted the cause of the bank with eagerness. The bank charter did not expire until 1836, but in 1832 Clay brought up a bill for a new charter. It was passed and vetoed; and the Whigs made the veto an important issue of the presidential election of that year. They were beaten; Jackson was re-elected, receiving 219 electoral votes, and Clay, his Whig opponent, only 49, and the bank party could never again get a majority in the house of representatives. But the president could not obtain a majority in the senate. He determined to take a step which would give him an initiative, and which his opponents could not induce both houses to unite in overriding or punishing. Taking advantage of the provision that the secretary of the treasury might order the public funds to be deposited elsewhere than in the bank or its branches, he directed the secretary to deposit all the public funds elsewhere. Thus deprived of its great source of dividends, the bank fell into difficulties, became a state bank after 1836 and then went into bankruptcy.

All the political conflicts of Jackson's terms of office were close and bitter. Loose in his ideas before 1829, Jackson showed a steady tendency to adopt the strictest construction of the powers of the federal government, except in such official perquisites as the offices. He grew into strong opposition to all traces of the American system, and vetoed bills for internal improvements unsparingly; his feeling of dislike to all forms of protection is as evident, though he took more care not to make it too public.

Nullification. Calhoun and **Jackson.**—Calhoun and Jackson were of the same stock—Scotch-Irish—much alike in appearance and characteristics, Calhoun representing the trained and educated logic of the race, Jackson its instincts and passions. Jackson was led to break off his friendly relations with Calhoun in 1830. and he had been led to do so more easily because of the appearance of the doctrine of nullification which was generally attributed, correctly enough, to Calhoun. Asserting, as the Republican party of 1798 had done, the sovereign powers of each state, Calhoun held that. as a means of avoiding secession and violent struggle upon every occasion of the passage of an act of congress which should seem unconstitutional to any state, the state might properly suspend or "nullify" the operation of the law within its jurisdiction. The passage of the tariff act of 1832, which organized and systematized the protective system, forced his party into action. A state convention in South Carolina on Nov. 24, 1832, declared the tariff act null, and made ready to enforce the declaration.

But the time was past when the power of a single state could withdraw it from the union. The president issued a proclamation. warning the people of South Carolina against any attempt to carry out the ordinance of nullification; he ordered a naval force to take possession of Charleston harbour to collect the duties under the act; he called upon congress for additional executive powers, and congress passed what nullifiers called the "bloody bill," putting the land and naval forces at the disposal of the president: and he is said to have announced, privately and profanely, his intention of making Calhoun the first victim of any open conflict. Affairs looked so threatening that an unofficial meeting of "leading nullifiers" agreed to suspend the operation of the ordinance until congress should adjourn: whence it derived the right to suspend has never been stated.

Tariff of 1833.—The president had already asked congress to reduce the duties; and many Democratic members of congress, who had yielded to the popular clamour for protection, were very glad to use the crisis as an excuse for now voting against it. A compromise tariff act, scaling down all duties over 20% by one-tenth of the excess every two years until 1842. when the remaining excess over 20% should be dropped, was introduced by Clay and became law. Calhoun and his followers claimed this as all that the nullification ordinance had aimed at; and the ordinance was formally repealed. But nullification had received its deathblow, even those southern leaders who maintained the right of secession refused to recognize the right of a state to remain in the union while nullifying its laws.

Railways.—All the internal conditions of the United States were completely altered by the introduction of railways. For 20 years past the Americans had been pushing in every direction which offered a hope of the means of reconciling vast territory with enormous population. George Stephenson's invention of the locomotive came just in time, and Jackson's two terms of office marked the outburst of modern American life. The miles of railway were 23 in 1830, 1,098 in 1835, about 2.800 in 1840, and thereafter they about doubled every five years until 1860.

A railway map of 1840 shows a fragmentary system, designed mainly to fill the gaps left by the means of communication in use in 1830. One or two short lines run back into the country from Savannah and Charleston; another runs north along the coast from Wilmington to Baltimore; several lines connect New York city with Washington and other points; and short lines elsewhere mark the openings which needed to be filled at once—a number in Nen England and the middle states, three in Ohio and Michigan and three in Louisiana. Year after year new inventions were made to increase and aid this development. The anthracite coal of the middle states was now successfully applied to railways (1836), and to the manufacture of iron (1837). Steam navigation across the Atlantic was established in 1838. The telegraph came next, Samuel F. B. Morse's line being erected in 1844. No similar period in American history of the 19th century is so extraordinary for material development as the decade 1830–40. At its beginning the country was an overgrown type of colonial life; at its end American life had been shifted to entirely new lines, which it has since followed.

The steamboat had aided western development, but the railway aided it far more. The steamboat influenced the railway, and the railway gave the steamboat new powers. Vacant places in the states east of the Mississippi were filling up; the long lines of emigrant wagons gave way to the new and better methods of transport. Chicago was but a frontier fort in 1832; within six years it was a flourishing town, with eight steamers connecting it with Buffalo, N.Y., and dawning ideas of its future development of railway connections. Two new states, Arkansas and Michigan, were admitted (1836 and 1837). The population of Ohio grew from 938,000 to 1,519,000, that of Michigan from 32.000 to 212,000, and that of the country from 12,866,000 to 17,069.000, betneen 1830 and 1840.

Social Conditions.—With the change of material surroundings and possibilities came a steady amelioration of social conditions and a development of social ideals. Such features of the past as imprisonment for debt and the cruel indifference of old methods of dealing with crime began to disappear; the time was past when a state could use an abandoned copper mine as its state prison, as Connecticut had formerly done The domestic use of gas and anthracite coal. the introduction of expensive aqueducts for pure water and the changing life of the people forced changes in the interior and exterior of American dwellings. Wood was still the common building material; imitations of Greek architecture still retained their vogue; but the interiors were models of comfort in comparison with the houses even of 1810. In the "new" regions this was not yet the case. and there social restraints were still so few that society seemed to be reduced almost to its primitive elements. Western steamers reeked with gambling, snindling, dueling and every variety of vice. Public law was almost suspended in some regions; and organized associations of counterfeiters and horse thieves terrorized whole sections of the country. But this state of affairs was altogether temporary, as well as limited in its area; the older and more densely settled states had been well prepared for the change and had never lost command of the social forces. and the process of settling down went on, even in the newer states, with far more rapidity than could have been expected

Literature.—A distinct American literature dates from this period. Most of the publications in the United States nere still cheap reprints of foreign works; but native productions no longer followed foreign models nith servility. Between 1830 and 1840 Whittier, Longfellow, Holmes, Poe, Hanthorne, Emerson, Bancroft and Prescott joined the advance guard of American writers—Bryant. Dana. Halleck. Drake, Irving and Cooper; and even those ariters who had already made their place in literature showed the influence of new conditions by their growing tendency to look less to foreign models and methods. Popular education was improved. The new states had from the first endeavoured to secure the best possible system of common schools. The attempt came naturally from the political instincts of the class from which the migration came; but the system which resulted was to be of incalculable service during the years to come. Their absolute democracy and their universal use of the English language made the common schools most successful machines for converting the raw material of immigration into American citizens. This supreme benefit is the basis of the system and the reason for its existence and development, but its incidental advantage of educating the people has been beyond calculation. It mas an odd symptom of the general change that American newspapers took a new form during these ten years. The old blanket sheet nenspaper, cumbrous to handle and slow in all its ways, met its first rival in the type of newspaper which appeared first as the *New York Sun*, the *New York Herald* and the *New York Tribune* (1833, 1835 and 1841). Swift and energetic in gathering news. and fearless, sometimes reckless, in stating it, they brought into American life, with very much that is evil, a great preponderance of good.

Speculation.—The chaos into which a part of American society had been thronn had a marked effect on the financial institutions of the country which went to pieces before it for a time It had not been meant to make the public lands of the United States a source of revenue so much as a source of development. The sales had touched their high-water mark during the speculative year 1819, when receipts from them had amounted to $3,274,000; in other years they seldom went above $2,000,000. When the railway set the stream of migration moving faster than ever, and cities began to grow like mushrooms, it was natural that speculation in land should feel the effects. Sales rose to $3,200,000 in 1831. and to $25,000,000 in 1836. In 1835 the president announced to congress that the public debt was extinguished, and that some way of dealing with the surplus should be found. Calhoun's proposal, that after the year *1836* any surplus in excess of $5,000,000 should be divided among the states as a loan. was adopted. as regards the surplus (almost $37,000,000) of that year; and about *$28.000.000* was actually distributed before the crisis of *1837* put an end to the surplus and to the policy. The states had already taken a hand in the general speculation by beginning works of public improvement. Foreign, particularly English, capital was abundant; and states which had been accustomed to think a dozen times over a tax of *$100.000* now began to negotiate loans of millions of dollars and to appropriate the proceeds to the digging of canals and the construction of railways. Their enterprises were badly conceived and badly managed. The imaginations of individuals ran riot. Everyone wanted to buy; prices rose and everyone was growing richer on paper. The assessed value of real estate in New York city in *1832* was $104,000,000; in *1836* it had grown to *$253.000.000.* In Mobile the assessed value rose from *$1.000.000* to *$27.000.000.*

When Jackson in *1833* ordered the government revenues to be deposited elsewhere than in the Bank of the United States, there was no government agent to receive them. The secretary of the treasury selected banks at various points in which the revenue should be deposited by the collecting officers; but these banks were organized under charters from their states. The Democratic feeling was that the privilege of forming banking corporations should be open to all citizens, and it soon became so. Moreover. it was not until after the crash that New York began the system of compelling such deposits as would really secure circulation. In most of the states banks could be freely organized with or without tangible capital. and their notes could be sent to the west for the purchase of government lands, which needed to be held but a month or tno to gain a handsome profit. "Wildcat banks" sprang up all over the country; and the "pet banks," as those chosen for the deposit of government revenues were called, nent into speculation as eagerly as the banks which hardly pretended to have capital.

Panic of 1837.—The Democratic theory denied the power of congress to make anything but gold or silver coin legal tender. There have been "paper-money heresies" in the party; but there was none such among the new school of Democratic leaders which came in in *1829;* they were "hard-money men." In July *1836* Jackson's secretary of the treasury ordered land agents to take nothing in payment for lands except gold or silver. In the following spring the full effects of the order became evident; they fell on the administration of Martin Van Buren, Jackson's successor. Van Buren had been Jackson's secretary of state, the representative man of the new Democratic school, and it seemed to the Whigs poetic justice that he should bear the neight of his predecessor's errors. The "specie circular" turned the tide of paper back to the east, and when it was presented for payment most of the banks suspended specie payment. There was no longer a thought of buying; everyone wanted to sell; and prices ran down with a rapidity even more startling than that with which they had risen. Failures on a scale unprecedented in the United States made up the panic of *1837.* Many of the states had left their bonds in the hands of their agents, and. on the failure of the agents, found that the bonds had been hypothecated or disposed of, so that the states got no return from them except a debt nhich was to them enormous. Saddled suddenly nith such a burden, and unable even to pay interest, some of the states repudiated their obligations; and repudiation was made successful by the fact that a state could not be sued except by its own consent. Even the U.S. government felt the strain, for its revenues were locked up in suspended banks. A little more than a year after congress had authorized the distribution of its surplus revenues among the states, Van Buren was forced to call congress into special session to provide some relief for the government itself.

The Subtreasury.— Van Buren held manfully to the strictest construction of the powers of the federal government. He insisted that the panic would best right itself nithout government interference, and, after a four years' struggle, he succeeded in making the "subtreasury scheme" law *(1840).* It cut off all connection of the government with banks, putting collecting and disbursing officers under bonds to hold money safely and to transfer it under orders from the treasury, and restricting payments to or by the United States to gold and silver coin. Its passage had been preceded by another commercial crisis (1839), more limited in its field. but more discouraging to the people.

Election of 1840.—Van Buren's firmness was unpopular. and the Whig party now adopted methods which were popular if somewhat demagogical. It nominated William Henry Harrison in *1840;* it contrasted his homely frontier virtues with Van Buren's "ostentatious indifference to the misfortunes of the people" and after the first of the modern campaigns of mass meetings and processions Harrison was elected, receiving *234* electoral votes and Van Buren only *60.* Harrison died only a month after his inauguration, and the vice-president. John Tyler, became president.

Tyler was of the extreme Calhoun school, which had shown some disposition to grant to Van Buren a support which it had refused to Jackson; and the Whigs had nominated Tyler to retain his faction with them Now he was the nominal leader of the party, while his politics were opposite to theirs, and the real leader of the party, Clay, was ready to force a quarrel upon him. The quarrel took place; the Whig majority in congress was not large enough to pass any measures over Tyler's veto; and the first two years of his administration were passed in barren conflict with his party. The subtreasury law was repealed *(1841)*; the tariff of *1842* introduced a modified protection; and there the Whigs were forced to stop. Their dissensions made Democratic success comparatively easy. The success of the Democratic machinery, and the reflex of its temporary check in *1840,* with the influences brought to bear on it by the returning Calhoun faction, were such as to take the control of the party out of the hands of the leaders who had formed it. They had had high regard for political principle, even though they were willing to use doubtful methods for its propagation; these methods had now brought out new men, who looked mainly to success, and to close connection with the controlling political element of the south as the easiest means of attaining success. When the Democratic convention of *1844* met it was expected to renominate Van Buren, but James K. Polk nas nominated. The Whigs nominated Clay.

Abolitionist Movement.— The beginning of the abolitionist movement in the United States, the establishment of the Liberator (1831), and of the American Antislavery society (1833), and the subsequent divisions in it, are dealt with elsewhere *(see* GARRISON, *WILLIAM* LLOYD). Up to that time abolition had meant gradual abolition; Garrison called for immediate abolition. The basis of the American system mas in the reserved rights of the states, and slavery rested on their will. The mission of the abolitionists was to force the people to think of the question; and, in spite of riots, assaults and persecution of every kind, they fulfilled it manfully. In truth, slavery was more and more out of harmony with the new economic conditions which were taking complete control of the north and west, but had hardly been felt in the south. Thus the two sections, north and south, were more and more disposed to take opposite views of everything in which slavery was involved, and it had a faculty of involving itself in almost everything. The status of slavery in the territories had been settled in *1820;* that of slavery in the states had been settled by the constitution; but even in minor questions the intrusive element had to be reckoned with. The abolitionists sent their documents through the mails, and the south wished the federal government to stop this practice. The abolitionists persisted in petitioning congress for the passage of various measures which congress regarded as utterly unconstitutional; and the disposition of congress to deny or regulate the right of petition in such matters excited the indignation of northern men nho had no sympathy with abolition. But the first occasion on which the views of the two sections came into flat contrast was on the question of the annexation of Texas.

Texas and Oregon.—The United States had had a vague claim to Texas until *1819,* when the claim was surrendered to Spain in part compensation for Florida. On the revolt of Mexico, Texas became a part of that republic. It was colonized by Americans, mainly southerners and slaveholders, seceded from Mexico in 1835 and defeated the Mexican armies and established its independence in the following year. Southern politicians desired its annexation to the United States. People in the north were either indifferent or hostile to the proposal; Van Buren had declared against it. and his action was a reason for his defeat in the Democratic convention.

On the other hand, there were indications that the joint occupation of the Oregon country could not last much longer. American immigration into it had begun, while the Hudson's Bay company. the British tenant of the soil was the natural enemy of immigration. The two points were coupled; and the Democratic convention declared for the reannexation of Texas and the reoccupation of Oregon.

Election of 1844.—One of the cardinal methods of the political abolitionists was to nominate candidates of their own against a doubtful friend, even though this secured the election of an open enemy. Clay's efforts to guard his condemnation of the Texas annexation project were just enough to push the Liberty party, the political abolitionists, into voting for candidates of their own in New York; on a close vote their loss was enough to throw the electoral votes of that state to Polk. and its votes decided the result. Polk was elected (Nov. 1844); and Texas was annexed to the United States in the following spring. At the next meeting of congress (1845) Texas was admitted as a state.

West of Texas the northern prolongation of Mexico ran right athwart the westward movement of American population; and though the movement had not yet reached the barrier the Polk administration desired further acquisitions from Mexico. The western boundary of Texas was undefined; a strip of territory claimed by Texas was settled exclusively by Mexicans; but the Polk administration directed Gen: Zachary Taylor, the American commander in Texas. to cross the Nueces river and seize the disputed territory. Collisions with Mexican troops followed; they were beaten in the battles of Palo Alto and Resara de la Palma, and were chased across the Rio Grande. Taylor followed and took the city of Monterrey.

War With Mexico.—On the news of the first bloodshed, congress declared war against Mexico. over the opposition of the Whigs. A land and naval force took possession of California and a land expedition occupied New Mexico, so that the authority of Mexico over all the soil north of its present boundaries was abruptly terminated (1846). At the beginning of 1847 Taylor fought the last battle in northern Mexico (Buena Vista). defeating the Mexicans. and Gen. Winfield Scott. with a new army. landed at Vera Cruz for a march upon the city of Mexico. Scott's march was marked by one successful battle after another, usually against heavy odds: and in September he took the capital city and held it until peace was made (1848) by the treaty of Guadalupe Hidalgo. Among the terms of peace was the cession of the present California. Utah. Arizona and New Mexico. the consideration being a payment of $15.000.000 by the United States and the assumption of about $3.000.000 of debts owed by Mexico to American citizens. With a subsequent rectification of frontier (1853) by the Gadsden treaty (*see* GADSDEN. JAMES). this cession added about 500.000 sq.mi. to the area of the United States: Texas itself made up a large additional area. The settlement of the northeast and northwest boundaries by the Webster-Ashburton and Buchanan-Pakenham treaties (1842. 1846) with the Texas and Mexican cessions. gave the United States the complete territorial form retained until the annexation of Alaska in 1867.

Slavery in the New Territory.— In the new territory slavery had been forbidden under Mexican law: and its annexation brought up the question of its status under American law. If slavery was to he excluded from the new territory. the states which should ultimately be formed out of it would enter as free states. and the influence of the south in the senate would be decreased. For the first time the south appears as a distinct *imperium* in *imperio*.

The first appearance of these difficulties brought out in the Democratic party a solution which was so closely in line with the prejudices of the party that it bade fair to carry the party through the crisis without the loss of its southern vote. This was squatter sovereignty. the notion that it would be best for congress to leave the people of each territory to settle the question of the existence of slavery for themselves. The broader and democratic ground for the party would have been that which it at first seerned

TABLE V.—*The States of the Union*

State	Date of admission	Order of admission	Capital
United States	—	—	Washington, D.C.
Alahama	Dec. 14, 1819	22	Montgomery
Alaska	Jan. 3, 1959	49	Juneau
Arizona	Feb. 14, 1912	48	Phoenix
Arkansas	June 16, 1836	25	Little Rock
California	Sept. 9, 1850	31	Sacramento
Colorado	Aug. 1, 1876	38	Denver
Connecticut	Jan. 9, 1788 ♁	5	Hartford
Delaware	Dec. 7, 1787 ♁	1	Dover
District of Columbia	—	—	—
Florida	Mar. 3, 1845	27	Tallahassee
Georgia	Jan. 2, 1788 ♁	4	Atlanta
Hawaii	Aug. 21, 1959	50	Honolulu
Idaho	July 3, 1890	43	Boise
Illinois	Dec. 3, 1818	21	Springfield
Indiana	Dec. 11, 1816	19	Indianapolis
Iowa	Dec. 28, 1846	29	Des Moines
Kansas	Jan. 29, 1861	34	Topeka
Kentucky	June 1, 1792	15	Frankfort
Louisiana	Apr. 30, 1812	18	Baton Rouge
Maine	Mar. 15, 1820	23	Augusta
Maryland	Apr. 28, 1788 ♁	7	Annapolis
Massachusetts	Feb. 6, 1788 ♁	6	Boston
Michigan	Jan. 26, 1837	26	Lansing
Minnesota	May 11, 1858	32	St. Paul
Mississippi	Dec. 10, 1817	20	Jackson
Missouri	Aug. 10, 1821	24	Jefferson City
Montana	Nov. 8, 1889	41	Helena
Nebraska	Mar. 1, 1867	37	Lincoln
Nevada	Oct. 31, 1864	36	Carson City
New Hampshire	June 21, 1788 ♁	9	Concord
New Jersey	Dec. 18, 1787 ♁	3	Trenton
New Mexico	Jan. 6, 1912	47	Santa Fe
New York	July 26, 1788 ♁	11	Albany
North Carolina	Nov. 21, 1789 ♁	12	Raleigh
North Dakota	Nov. 2, 1889	39	Bismarck
Ohio	Mar. 1, 1803	17	Columbus
Oklahoma	Nov. 16, 1907	46	Oklahoma City
Oregon	Feb. 14, 1859	33	Salem
Pennsylvania	Dec. 12, 1787 ♁	2	Harrisburg
Rhode Island	May 29, 1790 ♁	13	Providence
South Carolina	May 23, 1788 ♁	8	Columbia
South Dakota	Nov. 2, 1889	40	Pierre
Tennessee	June 1, 1796	16	Nashville
Texas	Dec. 29, 1845	28	Austin
Utah	Jan. 4, 1896	45	Salt Lake City
Vermont	Mar. 4, 1791	14	Montpelier
Virginia	June 26, 1788 ♁	10	Richmond
Washington	Nov. 11, 1889	42	Olympia
West Virginia	June 20, 1863	35	Charleston
Wisconsin	May 29, 1848	30	Madison
Wyoming	July 10, 1890	44	Cheyenne

♁Original state; date shown is that of ratification of constitution.

likely to take—the Wilmot proviso, a condition proposed to be added to the act authorizing acquisitions of territory, providing that slavery should be forbidden in all territory to be acquired under the act. In the end apparent expediency carried the dominant party off to squatter sovereignty, and the Democratic adherents of the Wilmot proviso, with the Liberty party and the antislavery Whigs. united in 1848 under the name of the Free-Soil party. The Whigs had no solution to offer; their entire program consisted in a persistent effort to evade or ignore all difficulties connected with slavery.

Election of 1848.—Taylor. after the battle of Buena Vista. resigned and came home. considering himself ill-used by the administration. He refused to commit himself to any party; and the Whigs were forced to accept him as their candidate in 1848. The Democrats nominated Lewis Cass; the Free-Soilers nominated Van Buren. Taylor was elected president, receiving 163 electoral votes. while Cass received 127. Taking office in March 1849. he had the whole burden of the territorial difficulties, aggravated by the discovery of gold in California and the sudden rise of population there. Congress was so split into factions that it could for a long time agree upon nothing; and the Californians. with the approval of the president, proceeded to form a constitution and apply for admission as a state. They had so framed their constitution as to forbid slavery; and this was really the application of the Wilmot proviso to the richest part of the new territory. and the south felt that it had been robbed of the cream of what it alone had fought cheerfully to obtain.

Compromise of 1850.—The admission of Califorria was not secured until Sept. 1850, soon after Taylor's sudden death (July 9). and then only by the addition of a bonus to Texas, the division of the rest of the Mexican cession into the territories of Utah and New Mexico without prohibition of slavery. and the passage of a fugitive slave law. The slave trade, but not slavery. was forbidden in the District of Columbia. The whole was generally known as the Compromise Measures of 1850. Two of its features need notice. As has been said, slavery was not mentioned in the act; and the status of slavery in the territories was thus left uncertain. Congress can veto any legislation of a territorial legislature but, in fact, the two houses of congress were hardly ever able to unite on anything after 1850. and both these territories did establish slavery before 1860, without a congressional veto. The advantage there was with the south. The other point. the fugitive slave law was a special demand of the south. The constitution contained clauses directing that fugitive criminals and slaves should be delivered up, on requisition, by the state to which they had fled. In the case of criminals the delivery was directed to be made by the executive of the state to which they had fled; in the case of slaves no delivering authority was specified. and an act of congress in 1793 had imposed the duty on federal judges or on local state magistrates. Some of the states had passed personal liberty laws. iorbidding or limiting the action of their magistrates in such cases; and the act of 1850 transferred the decision of such cases to United States commissioners, with the assistance of United States marshals.

New States.—Five states were admitted during the last ten years of this period: Florida (1845), Texas (1845), Iowa (1846), Wisconsin (1538) and California (1850). The early entrance of Iowa. Wisconsin and Florida had been largely attributed to Indian wars. after each of which the defeated Indians were compelled to cede lands. The extinction of Indian titles in northern Michigan brought about the discovery of the great copper fields of that region. Elsewhere settlement followed the lines already marked out. except in the new possessions on the Pacific coast, whose full possibilities were not yet known. Railways in the eastern states were beginning to show something of a connected system; in the south they had hardly changed after 1840; in the west they had been prolonged only on their original lines. The telegraph was brought into use in 1844; but it was not until the census of 1860 that its effects were seen in the fuliy connected network of railways which then covered the whole north and west.

Inventions.—The sudden development of wealth in the country gave an impetus to the spirit of invention. Charles Goodyear's method of vulcanizing rubber (1839) had come into use. Cyrus Hall McCormick had made an invention the results of which have been hardly less than that of the locomotive in their importance to the United States. He had patented a reaping machine in 1834, and this, further improved and supplemented by other inventions, had brought into play the whole system of agricultural machinery. A successful sewing machine came in 1846; the power loom and the surgical use of anesthetics in the same year; and the rotary press for printing in 1847.

The **Mormons.**—All the conditions of life were changing so rapidly it was natural that the minds of men should change with them. This was the era of new sects, of communities. of transcendentalism in literature. religion and politics. The most successful of these was the sect of Mormons (see LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF). They settled in Utah in 1847, calling their capital Salt Lake City. and spread through the neighbouring territories. Their numbers were so great that it was against American instincts to deprive them of self-government. while their polygamy and total submission to their hierarchy made the rest of the country unwilling to erect them into a state having complete control of marriage and divorce. The difficulty was lessened by their renunciation of polygamy in 1890.

The South.—The material development of the United States from 1830 had been extraordinary, but every year made it more evident that the south was not sharing in it. It is plain now that the fault was in its labour system: its own labourers were slaves, and a slave who was fit for anything better than field labour was prima iacie a dangerous man. The divergence had as yet gone only far enough to awaken intelligent men in the south to its existence, and to stir them to efforts as hopeless as they were earnest, to find some artificial stimulus for southern industries. In the next ten years the process was to show its effects on the national field.

Slavery had put the south out of harmony with its surroundings. Even in 1850, though they hardly yet were aware of it, the two sections had drifted so far apart that they were practically two different countries.

The south remained much the same as in 1790; while other parts of the country had developed, it had stood still. The remnants of colonial feeling, of class influence, which advancing democracy had wiped out elsewhere, retained their force there. The ruling class had to maintain a military control over the labouring class, and a class influence over the poorer whites. It had even secured in the constitution provision for its political power in the representation given to three-fifths of the slaves. The 20 additional members of the house of representatives were not simply a gain to the south; they were still more a gain to those districts in which whites were few, and the slaveholder controlled the district. Slaveowners and slaveholders together, there were but 350.000 of them; but they had common interests. the intelligence to see them and the courage to contend for them. The first step of a rising man was to buy slaves; and this was enough to enroll him in the dominant class. From it were drawn the representatives and senators in congress, the governors and all the holders of offices over which the slave power, as it came to be called, had control.

Immigration into the United States was not an important factor in its development until about 1847. The immigrants, as late as 1820, numbered but 8,000 per annum; their number did not reach 100.000 until 1842; and then it fell for a year or two almost to half that number. In 1847 it rose again to 239,000, in 1849 to 300,000, and in 1850 to 380.000; all told. more than 2,814,000 persons from abroad settled in the United States between 1837 and 1853. Leaving out the dregs of the immigration, which settled down in the seaboard cities. its best part was a powerful nationalizing force. It had not come to any particular state. but to the United States, yet all the influences of this enormous immigration were confined to the north and west; the immigration avoided slave soil as if by instinct. And as the sections began to differ further in aims and policy the north began to gain heavily in ability to ensure its success.

Texas nas the last slave state ever admitted: and, as it re fused to be divided, the south had no further increase of numbers in the senate. Until 1850 the admission of a free state had been so promptly balanced by the admission of a slave state that the senators of the two sections had remained about equal in number: in 1860 the free states had 36 senators and the slave states only 30. As the representation in the house had changed from 35 free state and 30 slave state members in 1790 to 147 free state and 90 slave state in 1860, and as the number of presidential electors is the sum of the numbers of senators and representatives, political power had passed away from the south in 1850. If at any time the free states should unite they would be supreme.

Tendencies to Disunion.— In circumstances so critical a cautious quiescence and avoidance of public attention was the only safe course for the slave power, but that course had become impossible. The numbers interested had become too large to be subject to complete discipline; not all could be held in cautious reserve; and when an advanced proposal came from any quarter of the slaveholding lines the whole army was shortly forced up to the advanced position. If collision came it must be on some question of the rights of the states; and on such a question the whole south would move as one man.

The Protestant churches of the United States had reflected in their organization the spirit of the political institutions under which they lived. Acting as purely voluntary associations, they had been organized into governments by delegates. much like the "conventions" which had been evolved in the political parties. The omnipresent slavery question intruded into these bodies, and split them. Only the Episcopal and Roman Catholic Churches retained their national character.

The political parties showed the same tendency. Each began to shrivel up in one section or the other. The notion of squatter sovereignty, attractive at first to the western democracy, and not repudiated by the south, enabled the Democratic party to pass the crisis of 1850 nithout losing much of its northern vote, while southern Whigs began to drift in, making the party continually more proslavery. This could not continue long nithout beginning to decrease its northern vote but this effect did not become plainly visible until after 1852. The efforts of the Whig party to ignore the great question alienated its antislavery members in the north. while they did not satisfy its southern members The Whig losses were not at first heavy, but. as the electoral vote of each state is determined by the barest plurality they were enough to defeat the party almost everywhere in the presidential election of 1852. The Whigs nominated Gen. Winfield Scott and the Democrats Franklin Pierce; Pierce carried all but four of the 31 states, and was elected, receiving 254 out of the 296 electoral votes. This revelation of hopeless weakness was the downfall of the Whig party; it maintained its organization for iour years longer, but the life had gone out of it. The future mas with the Free-Soil party, though it had polled but few votes in 1852.

Party leadership had been changing. During the administration of Taylor (and Vice-president Millard Fillmore, who succeeded him) Clay. Webster, Calhoun and Polk had died, and there was a steady drift of other political leaders out of public life. New leaders were appearing everywhere, and in both sections they showed the prevailing tendency to disunion. The best of them nere unprecedentedly radical. Charles Sumner, William H. Seward and Salmon P. Chase came into the senate, bringing force and ability to the antislavery feeling in that body. The new southern men. such as Jefferson Davis. and the Democratic recruits from the southern Whig party, such as Alexander H Stephens, were ready to defend the position on which Calhoun had always insisted—that congress was bound not merely to the negative duty of not attacking slavery in the territories. but to the positive duty of protecting it. This, if it should become the general southern position, was certain to destroy the notion of squatter sovereignty, and thus to split the Democratic party, which was almost the last national ligament that now held the two fragments of the union together.

The social disintegration mas as rapid. Northern men traveling in the south were naturally looked upon with increasing suspicion, and were made to feel that they were on a soil alien in sympathies. Some of the worst phases of democracy were called into play in the south; and, in some sections, law openly yicldcd supremacy to popular passion in the cases of suspected abolitionists. Southern conventions, on all sorts of subjects, became common; and, permeated by a dawning sense of southern nationality, hardly any proposition looking to southern independence of the north was met with disfavour.

Calhoun in his last and greatest speech, called attention to the manner in which one tie after another was snapping. But he ignored the real peril of the situation—its dangerous facts: that the south was steadily growing weaker in comparison with the north, and more unable to secure a wider area for the slave system; that it was therefore being steadily forced into demanding active congressional protection for slavery in the territories; that the north would never submit to this; and that the south must submit or bring about a collision by attempting to secede.

Kansas-Nebraska Act.—Antislavery feeling in the north was stimulated by the manner in which the fugitive slave law was enforced immediately after 1850. The chase after fugitive slaves was prosecuted in many cases with circumstances of revolting brutality. The added feeling showed its force when the Kansas-Nebraska act mas passed by congress (1854). It organized the two new territories of Kansas and Nebraska. Both of them were forever free soil by the terms of the Missouri Compromise. But the success of the notion of squatter sovereignty in holding the Democratic party together while destroying the Whig party had intoxicated Stephen A. Douglas and other northern Democrats; and they now applied the doctrine to these territories. They did not desire "to vote slavery up or down," but left the decision to the people of the two territories.

The Republican Party.— The Kansas-Nebraska act was one of the grossest political blunders in American history. The status of slavery had been settled, by the constitution or by the compromises of 1820 and 1850, on every square foot of American soil; right or wrong the settlement was made. The new act took a great mass of territory out of the settlement and flung it down as a prize for nhich the sections mere to struggle The first result of the act was to throw parties into chaos. An American or Know-Nothing party. a secret oath-bound organization. pledged to oppose the influence or power of foreign-born citizens, had been formed to take the place of the defunct Whig party. It had been quite successful in state elections for a time. and was now beginning to have larger aspirations. It, like the Whig party. intended to ignore slavery. but, after a few years of existence. the questions complicated with slavery divided it also. Even in 1854 many of its leaders in the north were forced to take a position against the Kansas-Nebraska act, while hosts of others joined in the opposition without any party organization. No American party ever rose so swiftly as this; nith no other party name than the awkward title of anti-Nebraska men, it carried the congressional elections of 1854 in the north, forced many of the former Know-Nothing leaders into union with it. and controlled the house of representatives of the congress which met in 1855. The Democratic party, which had been practically the only party from 1852, had now to face the latest and strongest of its broad-constructionist opponents. It acknowledged, at first, no purpose aimed at slavery, only an intention to exclude slavery from the territories; but, under such principles, it was the only party which was potentially an antislavery party The new party had grasped the function nhich belonged of right to its great opponent, and it seized nith it its opponent's original title. The name Democrat had quite taken the place of that first used—Republican—but Republican had never passed out of popular remembrance and liking in the north. The new party took quick and skillful advantage of this by assuming the old name and early in 1856 the two great parties of the present—Democratic and Republican—were drawn up against one another.

Foreign Relations.—The foreign relations during Pierce's term of office were overshadowed by the domestic difficulties, but were of importance. In the Koszta case (1853) national protection had been afforded on foreign soil to a person nho had taken only the preliminary steps to naturalization. Japan had been opened to American commerce (1854). But the question of slavery was more and more thrusting itself even into foreign relations. A great southern republic. to be founded at first by the slave states, but to take in gradually the whole territory around the Gulf of Mexico and include the West Indies, was soon to be a not uncommon ambition among slaveholders, and its first phases appeared during Pierce's administration. Efforts mere begun to obtain Cuba from Spain; and the three leading American ministers abroad. meeting at Ostend, Belg., united in declaring the possession of Cuba to be essential to the well-being of the United States (1854). "Filibustering" expeditions against Cuba or the smaller South American states. intended to revolutionize them so as to lay a basis for application for annexation to the United States. became common. But these yielded in importance to the affairs in Kansas.

Kansas. — Nebraska was then supposed to be a desert, and attention was directed almost exclusively to Kansas. No sooner had its organization left the matter of slavery to be decided by its people than the antislavery faction of the north and west felt it to be their duty to see that the people of the territory should be antislavery in sympathy. Emigrant associations were formed, and these shipped men and families to Kansas, arming them for their protection in the new country. Southern newspapers called for similar measures in the south, but the call was less effective. Southern men without slaves. settling a new state. were uncomfortably apt to prohibit slavery. as in California. Only slaveholders were trusty proslavery men; and such were not likely to take slaves to Kansas and risk their ownership. But for the people of Missouri. Kansas would have been free soil at once. Lying across the direct road to Kansas, the Missouri settlers blockaded the way of free-state settlers, crossed into Kansas and voted profusely at the first territorial election. The struggle passed into a real civil war, the two powers fighting battles, capturing towns and paroling prisoners. The struggle was really over in 1857, and the south was beaten. There were. horn-ever. many obstacles yet to be overcome before the new state of Kansas was recognized by congress, after the withdrawal of the senators of the seceding states (1861).

Election of 1856. — In the heat of the Kansas struggle came the presidential election of 1856. The Democrats nominated James Buchanan, declaring. as usual, for the strictest limitations of the powers of the federal government and reaffirming the principle of the Kansas-Nebraska act — the settlement of slavery by the people of a territory. The remnant of the Whig party, including the Know-Nothings of the north and those southern men who wished no further discussion of slavery. nominated Millard Fillmore. The Republican party nominated John C. Frémont: the bulk of its manifesto was taken up with protests against attempts to introduce slavery into the territories; but it showed its broad construction tendencies by declaring for appropriations of federal money for internal improvements. The Democrats were successful in electing Buchanan; but the position of the party was quite different from the triumph with which it had come out of the election of 1852. It was no longer master of 27 of the 31 states; all the free states but 5 had gone against it; its candidate no longer had a majority of the popular vote. For the first time in the history of the country a distinctly antislavery candidate had obtained an electoral vote, and had even come near obtaining the presidency. Fillmore had carried but one state, Maryland; Buchanan had carried the rest of the south, with a few states in the north and Frémont the rest of the north and none of the south.

Dred Scott. — Oddly enough the constitutionality of the Compromise of 1820 had never happened to come before the U.S. supreme court for consideration. In 1856–57 it came up for the first time. One Dred Scott, a Missouri slave who had been taken in 1834 to Illinois, a free state, and in 1836 to Minnesota, within the territory covered by the compromise, and had some years after being taken back to Missouri in 1838 sued for his freedom. was sold (1852) to a citizen of New York. Scott then transferred his suit from the state to the federal courts, under the power given them to try suits between citizens of different states, and the case came by appeal to the supreme court. Its decision, announced on March 6 1857. put Scott out of court on the ground that a slave. or the descendant of slaves could not be a citizen of the United States or have any standing in federal courts The opinion of Chief Justice Roger Taney went on to attack the validity of the Missouri Compromise, for the reasons that one of the constitutional functions of congress mas the protection of property, that slaves had been recognized as propeity by the constitution, and that congress was bound to protect, not to prohibit, slavery in the territories Most of the northern people held that slaves were looked upon by the constitution not as property but as "persons held to service or labour" by state laws A large part of the north flouted the decision of the supreme court and the storm of angry dissent nhich it aroused did the disunionists good service in the south. From this time the leading nenspapers in the south maintained that the radical southern view first advanced by Calhoun, and but slowly accepted by other southern leaders. as to the duty of congress to protect slavery in the territories had been confirmed by the supreme court; that the northern Republicans had rejected it; even the squatter sovereignty of northern Democrats could no longer be submitted to by the south.

John Brown. — The population of the United States in 1860 was over 31 000 000 an increase of more than 8 000 000 in ten years As the decennial increases of population became larger, so did the divergence of the sections in population. and still more in nealth and resources Two more free states came in during this period — Minnesota (1858) and Oregon (1859) — and Kansas was clamouring loudly for the same privilege The free and slave states, which had been almost equal in population in 1790 stood non as 19 to 12. And of the 12.000 000 in slave states, the 4.000 000 slaves and the 250,000 free Negroes were not so much a factor of strength as a possible source of weakness and danger No serious slave rising had ever taken place in the south; but John Broun's attack (1859) on Harpers Ferry, as the first move in a project to rouse the slaves and the alarm uhich it carried through the south. were tokens of a danger which added a new horror to the chances of civil war

Democratic Party Split. — Northern Democrats, under the lead of Douglas, had been forced already almost to the point of revolt by the determination of southern senators to prevent the admission of Kansas as a free state, if not to secure its admission as a slave state When the Democratic convention of 1860 met at Charleston. the last strand of the last national political organization parted; the Democratic party itself was split by the slavery question The southern delegates demanded a declaration in favour of the duty of congress to protect slavery in the territories It was all that the Douglas Democrats could then do to maintain themselves in a fen northern states, such a declaration meant political suicide everywhere and they voted it donn The convention divided into two bodies The southern body adjourned to Richmond and the northern and border state convention to Baltimore There the northern delegates. by seating some delegates friendly to Douglas, provoked a further secession of border state delegates, nho. in company with the Richmond body, nominated John C. Breckinridge and Joseph Lane for president and vice-president. The remainder of the original convention nominated Douglas and H V. Johnson.

The remnant of the old Whig and Know-Nothing parties, now calling itself the Constitutional Union party, met at Baltimore and nominated John Bell and Edward Everett The Republican convention met at Chicago Its platform of 1856 had been somenhat broad constructionist but a strong Democratic element in the party had prevented it from going too far The election of 1856 had shown that, nith the votes of Pennsylvania and Illinois, the party would have then been successful, and the Democratic element was nou ready to take almost anything which would secure the votes of these states. This state of affairs will go to explain the nomination of Abraham Lincoln, of Illinois for president, with Hannibal Hamlin, a former Democrat, for vice-president. and the declaration of the platform in favour of a protective tariff. The mass of the platform was still devoted to the necessity of excluding slavery from the territories.

Election of 1860.—No candidate received a majority of the popular vote, Lincoln standing first and Douglas second. But Lincoln and Hamlin had a clear majority of the electoral vote, and so were elected, Breckinridge and Lane coming next. It is worthy of mention that, up to the last hours of Lincoln's first term of office. congress would always have contained a majority opposed to him but for the absence of the members from the seceding states. The interests of the south and even of slavery were thus safe enough under an antislavery president. But the drift of events was too plain. Nullification had come and gone, and the nation feared it no longer. Even secession by a single state was now almost out of the question: the letters of southern governors in 1860, in consultation on the state of affairs, agree that no state would secede without assurances of support by others. If this crisis were allowed to slip by without action, even a sectional secession would soon be impossible.

Secession.—In Oct. 1860 Gov. W. H. Gist of South Carolina sent a letter to the governor of each of the other cotton states except Texas, asking co-operation in case South Carolina should resolve upon secession: and the replies were favourable. The democratic revolution which, since 1829, had compelled the legislature to give the choice of presidential electors to the people of the states had not affected South Carolina; its electors were still chosen by the legislature. That body, after having chosen the state's electors on Nov. 6, remained in session until the telegraph had brought assurances that Lincoln had been elected; it then (on the 10th) summoned a state convention and adjourned. The state convention on Dec. 20 unanimously passed an "ordinance of secession," repealing the acts by which the state had ratified the constitution and its amendments, and dissolving "the union now subsisting between South Carolina and other states, under the name of the 'United States of America.'" The convention took all steps necessary to prepare for war, and adjourned. Similar ordinances were passed by conventions in Mississippi !Jan. 9, 1861). Florida (Jan. 10), Alabama (Jan. 11), Georgia (Jan. 19), Louisiana (Jan. 26) and Texas (Feb. 1).

The Confederate States.—The opposition in the south did not deny the right to secede, but the expediency of its exercise. Their effort was to elect delegates to the state conventions who would vote not to secede. They were beaten, says A. H. Stephens, by the cry. originally uttered by T. R. R. Cobb before his state legislature (Nov. 12, 1860), "We can make better terms out of the Union than in it." That is. the states were to withdraw individually. suspend the functions of the federal government within their jurisdiction for the time, consider maturely any proposals for guarantees for their rights in the union, and return as soon as satisfactory guarantees should be given. When the conventions of the seceding states had adopted the ordinances of secession, they proceeded to other business. They appointed delegates, who met at Montgomery, the capital of Alabama. formed a provisional constitution (Feb. 8) for the "Confederate states," chose a provisional president and vice-president (Jefferson Davis and A. H. Stephens), and established an army, treasury and other executive departments. The president and vice-president were inaugurated on Feb. 18. The permanent constitution, adopted on March 11, was copied from that of the United States, with variations meant to maintain state sovereignty, to give the cabinet seats in congress and to prevent the grant of bounties or any protective features in the tariff or the maintenance of internal improvements at general expense; and it expressly provided that in all the territory belonging to the Confederacy but lying without the limits of the several states "the institution of negro slavery, as it now exists in the Confederate States, shall be recognized and protected by Congress and by the Territorial Government."

Under nhat claim of constitutional right all this was done passes cornprehension. That a state convention should'have the final poner of decision on the question which it was summoned to consider is quite as radical doctrine as has yet been heard of; that a state convention, summoned to consider the one question of secession, should go on. with no appeal to any further popular authority or mandate, to send delegates to meet those of other states and form a new national government, which could only exist by warring on the United States, is a novel feature in American constitutional law. It was revolution or nothing. Only in Texas, where the call of the state convention was so irregular that a popular vote could hardly be escaped, was any popular vote allowed. Elsewhere the functions of the voter ceased when he voted for delegates to the state convention.

The Border States.—The border states mere in two tiers—North Carolina, Tennessee and Arkansas next to the seccding states, and Delaware, Maryland, Virginia, Kentucky and Missouri next to the free states. None of these was willing to secede. There was, however, one force which might draw them into secession. A state which did not wish to secede, but believed in state sovereignty and the abstract right of secession, would be inclined to take up arms to resist any attempt by the federal government to coerce a seceding state. In the following spring, the original seven seceding states were reinforced by four border states.

In the north and west surprisingly little attention was given to the systematic course of procedure along the Gulf. The people of those sections were very busy; they had heard much of this talk before, and looked upon it as a kind of stage thunder. Republican politicians, with the exception of a few. were inclined to refrain from public declarations of intention. Some of them such as Seward, showed a disposition to let the "erring sisters" depart in peace, expecting to make the loss good by accessions from Canada. A few, like Sen. Zachariah Chandler, believed that there would be "bloodletting," but most of them were still doubtful as to the future. In the north the leaders and the people generally shrank from the prospect of war. Among the various proposals to this end, that offered in the senate by John J. Crittenden, of Kentucky, and known as the Crittenden compromise, was perhaps received with most favour. This took the form of six proposed amendments to the constitution, of which two were virtually a rephrasing of the essential feature of the Missouri Compromise and of the principle of squatter sovereignty, and others provided that the national government should pay to the owner of any fugitive slave, whose return was prevented by opposition in the north, the full value of such slave, and prohibited the abolition of slavery in the District of Columbia "so long as it exists in the adjoining states of Virginia and Maryland or either." This proposed compromise mas rejected by the senate by a close vote on March 2, 1861. A peace congress. called by Virginia. met in Washington from Feb. 4 to 27, 1861, 21 states being represented, and proposed a constitutional amendment embodying changes very similar to those of the Crittenden compromise, but its proposal was not acted upon by congress. Congress did nothing, except to admit Kansas as a free state and adopt the protective Morrill tariff; even after its members from the seceding states had withdrawn, those who remained made no preparations for conflict, and, at their adjournment in March 1861, left the federal government naked and helpless.

The War Governors.—The only sign of life in the body politic, the half-awakened word of warning from the democracy of the north and west, was its choice of governors of states. A remarkable group of men, soon to be known as the "war governors"—Israel Washburn of Maine, Erastus Fairbanks of Vermont. Ichabod Goodwin of New Hampshire, John Albion Andrew of Massachusetts. William Sprague of Rhode Island, William Alfred Buckingham of Connecticut. Edwin Dennison Morgan of New York. Charles Smith Olden of New Jersey, Andrew Gregg Curtin of Pennsylvania, William Dennison of Ohio, Oliver Perry Morton of Indiana, Richard Yates of Illinois, Austin Blair of Michigan, Alexander Williams Randall of Wisconsin, Samuel Jordan Kirkwood of Iowa: and Alexander Ramsey of Minnesota—held the executive powers of the northern states in 1861–62. Some of these governors, such as Andrew and Buckingham, as they saw the struggle come nearer, went so far as to order the purchase of warlike material for their states on their private responsibility, and their action saved days of time.

U.S. Property Seized.—The little army of the United States had been almost put out of consideration; wherever its detachments could be found in the south they were surrounded and forced to surrender and were transferred to the north. After secession, and in some of the states even before it, the forts, arsenals. mints. customhouses, shipyards and public property of the United States had been seized by authority of the state. and these were held until transferred to the new Confederate States organization.

Only a few forts, of all the magnificent structures with which. the nation had dotted the southern coast, remained to it—the forts near Key West, Fortress Monroe at the mouth of Chesapeake bay, Ft. Pickens at Pensacola and Ft. Sumter in Charleston harbour. Both of the last-named were beleaguered by hostile batteries, but the administration of President Buchanan, intent on maintaining the peace until the new administration should come in. instructed their commanding officers to refrain from any acts tending to open conflict. The federal officers, therefore, were obliged to look idly on while every preparation was made for their destruction, and even while a vessel bearing supplies for Ft. Sumter was driven back by the batteries between it and the sea.

The divergence between the two sections of the country had thus passed into disunion, and was soon to pass into open hostility. The legal recognition of the custom of slavery, acting upon and reacted upon by every step in their economic development and every difference in their natural characteristics and institutions, had carried north and south farther and faster apart, until the elements of a distinct nationality had appeared in the south.

Secession had taken away many of the men who had for years managed the federal government, and who understood its workings. Lincoln's party was in power for the first time; his officers were new to the routine of federal administration; and the circumstances with which they were called upon to deal were such as to daunt any spirit. The government had become so nearly bankrupt in the closing days of Buchanan's administration that it had .escaped only by paying double interest. The army had been almost broken up by captures of men and matériel and by resignations of competent and trusted officers. The navy had come to such a pass that, in Feb. 1861, a house committee reported that only two vessels, one of 20, the other of two guns. were available for the defense of the entire Atlantic coast. And, to complicate all difficulties, a horde of clamorous office seekers crowded Washington.

Civil War, 1861–65.—Soon after Lincoln's administration began. the starting of an expedition to provision Ft. Sumter brought on an attack by the batteries around the fort, and after a bombardment of 36 hours the fort surrendered (April 14, 1861). It is not necessary to rehearse the familiar story of the outburst of feeling which followed this event and the proclamation of President Lincoln calling for volunteers. The 75,000 volunteers called for were supplied three or four times over.

There had been some belief in the south that the northwest would take no part in the impending conflict, and that its people could be persuaded to keep up friendly relations with the new nationality. In the spring months of 1861 Douglas, who had long been denounced as the tool of the southern slaveholders, was spending the closing days of life in expressing the determination of the northwest that it would never submit to have "a line of customhouses" between it and the ocean. The batteries which Confederate authority was erecting on the banks of the Mississippi were fuel to the flame. California, considered neutral by all parties, pronounced as unequivocally for the national authority.

The shock of arms put an end to opposition in the south as well. The peculiar isolation of life in the south precluded the more ignorant voter from any comparisons of the power of his state with any other; to him it was almost inconceivable that his state should own or have a superior. The better educated men, of wider experience. had been trained to think state sovereignty the foundation of civil liberty, and, when their state spoke, they felt bound to follow their state. The president of the Confederate states issued his call for men, and it also was more than met.

Lincoln's call for troops met with an angry reception wherever the doctrine of state sovereignty had a foothold. The governors of the border states generally returned it with a refusal to furnish any troops. Two states: North Carolina and Arkansas, seceded and joined the Confederate states. In two others, Virginia and Tennessee. the state politicians formed military leagues with the Confederacy. allowing Confederate troops to take possession of the states and then submitted the question of secession to popular vote. The secession of these states was thus accomplished, and Richmond became the Confederate capital. The same process was attempted in Missouri, but failed, and the state remained loyal. The politician class in Maryland and Kentucky took the extraordinary course of attempting to maintain neutrality; but the growing power of the federal government soon enabled the people of the two states to resume control of their governments and give consistent support to the union. Kentucky. however, had troops in the Confederate armies; and one of its citizens. the former vice-president, John C. Breckinridge. left the senate and became an officer in the Confederate service. Delaware cast its lot from the first with the union.

The first blood of the mar mas shed in the streets of Baltimore, when a mob attempted to stop Massachusetts troops on their way to Washington (April 19). For a time there was difficulty in getting troops through Maryland because of the active hostility of some of its citizens, but this was overcome, and the national capital was made secure. The Confederate lines had been pushed up to Manassas Junction, about 30 mi. from Washington. When congress, called into special session by the president for July 4, came together, the outline of the Confederate states had been fixed. The length of the line. including also the Atlantic and Gulf coasts, has been estimated at 11,000 mi. The territory within it comprised about 800,000 sq.mi., with a population of over 9,000,000 and great natural resources. Its cotton was almost essential to the manufacturers of the world; in exchange for it every munition of war could be procured; and it was hardly possible to blockade a coast over 3,000 mi. in length, on which the blockading force had but one port of refuge, and that at about the middle of the line. Nevertheless, President Lincoln issued his first call for troops on April 15. President Davis then issued a proclamation (on the 17th) offering letters of marque and reprisal against the commerce of the United States to private vessels, and on the 19th Lincoln answered with a proclamation announcing the blockade of the southern coast. The news brought out proclamations of neutrality from Great Britain and France.

The president found himself compelled to assume powers never granted to the executive authority, trusting to the subsequent action of congress to validate his action. He had to raise and support armies and navies; he even had to authorize seizures of necessary property, of railroad and telegraph lines, arrests of suspected persons, and the suspension of the writ of habeas corpus in certain districts. Congress supported him, and proceeded in 1863 to give the president power to suspend the writ anywhere in the United States; this power he promptly exercised. The supreme court, after the war. in the Milligan case (4 Wallace 133) decided that no branch of the government had power to suspend the writ in districts where the courts were open—that the privilege of the writ might be suspended as to persons properly involved in the war, but that the writ was still to issue, the court deciding whether the person came within the classes to whom the suspension applied.

When congress met (July 4, 1861) the absence of southern members had made it heavily Republican. It decided to consider no business but that connected with the war, authorized a loan and the raising of 500,000 volunteers, and made confiscation of property a penalty of rebellion. While it was in session the first serious battle of the war—Bull Run, or Manassas—took place (July 21), and resulted in the defeat of the federal army.

The **"Trent"** Case.—The overzealous action of a naval officer in taking the Confederate envoys James M. Mason and John Slidell out of the British steamer "Trent" sailing between two neutral ports almost brought about a collision between the United States and Great Britain in November. But the American precedents were all against the United States, and the envoys were given up.

The broad construction tendencies of the Republican party showed themselves more plainly as the war grew more serious; there was an increasing disposition to cut every knot by legislation, with less regard to the constitutionality of the legislation. A paper currency commonly known as greenbacks, was adopted and made legal tender (Feb. 25, 1862). Slavery was prohibited (April 16) in the District of Columbia and the territories (June 19); the army was forbidden to surrender escaped slaves to their owners; and slaves of insurgents were ordered to be confiscated. In addition to a homestead act giving public lands to actual settlers at reduced rates. congress began a further development of the system of granting public lands to railways Another important act (1862) granted public lands for the establishment of agricultural and mechanical colleges.

Railways. — The railway system of the United States was but 20 years old in 1850, but it had begun to assume some consistency. The day of short and disconnected lines had passed, and the connections which were to develop into railway systems had appeared. Consolidation of smaller companies had begun; the all-rail route across the state of New York was made up of more than 12 original companies at its consolidation in 1853. The Erie railway, chartered in 1832, was completed from Piermont to Dunkirk, N.Y., in 183'1; and another line—the Pennsylvania—was completed from Harrisburg to Pittston, Pa., in 1854. These were at least the germs of great trunk lines. The cost of American railways has been only from one-half to one-fourth of the cost of European railways: but an investment in a far western railway in 1850–60 was an extrahazardous risk. Not only did social conditions make any form of business hazardous: the new railway often had to enter an uninhabited territory. and there create its own towns, farms and traffic. Whether it could do so was so doubtful as to make additional inducements to capital necessary. The means attempted by congress in 1850, in the case of the Illinois Central railroad, was to grant public lands to the corporation, reserving to the United States the alternate sections. At first grants were made to the states for the benefit of the corporations; the act of 1862 made the grant directly to the corporation.

The vital military and political necessity of an immediate railway connection with the Pacific coast was hardly open to doubt in 1862; but the necessity scarcely justified the terms uhich were offered and taken. The Union Pacific railroad was incorporated; the United States government was to issue to it bonds, on the completion of each 40 mi., to the amount of $16,000 per mile, to be a first mortgage; through Utah and Nevada the aid mas to be doubled. and for about 300 mi. of mountain building to be trebled; and, in addition to this, alternate sections of land were granted. The land-grant system, thus begun. was carried on extensively. the largest single grants being those of 47,000,000 ac. to the Northern Pacific (1864) and of 42,000,000 ac. to the Atlantic and Pacific line (1866).

Economic Patterns. — Specie payments had been suspended almost everyahere toward the end of 1861; but the price of gold was only 102.5 at the beginning of 1862. About May its price in paper currency began to rise. It touched 170 during the next year. and 285 in 1864; but the real price probably never went much above 250. Other articles felt the influence in currency prices.

The duties on imports were driven higher than the original Morrill tariff had ever contemplated. The average rates, which had been 18% on dutiable articles and 12% on the aggregate in 1860–61, rose, before the end of the war, to nearly 50% on dutiable articles and 35% on the aggregate. Domestic manufactures sprang into new life under such encouragement; everyone who had spare wealth converted it into manufacturing capital. The probability of such a result had been the means of getting votes for an increased tariff; free traders had voted for it as well as protectionists. For the tariff was only a means of getting capital into positions in which taxation could be applied to it, and the internal revenue taxation was merciless beyond precedent. The annual increase of wealth from capital was then about $550,000,000; the internal revenue taxation on it rose in 1866 to $310,000,000 or nearly 60%.

The stress of all this upon the poor must have been great, but it was relieved in part by the bond system on which the war was conducted. While the armies and navies were expending future income that would be realized from the crops of 1880 or 1890, work and wages were abundant for all who nere qualified and able. It is true, then, that the poor paid most of the cost of the war; it is also true that the poor had shared in that anticipation of the future which had been forced on the country. and that. when the drafts on the future came to be redeemed, it was done mainly by taxation on luxuries. The destruction of a northern railway meant more work for northern iron mills and their workmen. The destruction of a southern road was an unmitigated injury; it had to be made good at once. by paper issues; the south could make no drafts on the future, by bond issues, for the blockade had put cotton out of the game, and southern bonds were hardly salable. Every expense had to be met by paper issues; each issue forced prices higher. *A Rebel War-Clerk's Diary* gives the following as the prices in the Richmond market for May 1864: "Boot. $200; coats, $350; pantaloons, $100; shoes. $125; flour. $275 per barrel; meal, $60 to $80 per bushel; bacon, $9 per pound; no beef in market; chickens. $30 per pair; shad, $20; potatoes, $25 per bushel; turnip greens. $4 per peck; white beans, $4 per quart or $120 per bushel; butter, $15 per pound; wood, $50 per cord."

The complete lack of manufactures told heavily against the south from the beginning. As men were drawn from agriculture in the north and west, the increased demand for labour was shaded off into an increased demand for agricultural machinery; every increased percentage of power in reaping machines liberated so many men for service at the front. The reaping machines of the south—the slaves—were incapable of any such improvement and, besides, required the presence of a portion of the possible fighting men at home to watch them. But no insurrection took place

The pressing need for men in the army made the Confederate congress utterly unable to withstand the growth of executive poner. Its bills were prepared by the cabinet, and the action of congress was quite perfunctory. The suspension of the writ of habeas corpus, and the vast powers granted to President Davis, or assumed by him, made the Confederate government almost a despotism. It was not until the closing months of the war that the expiring Confederate congress mustered up courage enough to oppose the president's will.

The Emancipation Proclamation. — At the beginning of the war the people and leaders of the north had not desired to interfere uith slavery, but circumstances had been too strong for them. Lincoln had declared that he meant to save the union as best he could—by preserving slavery, by destroying it or by destroying part and preserving part. Just after the battle of Antietam (Sept. 17, 1862) he issued his proclamation calling on the rebellious states to return to their allegiance before the next year, othernise their slaves would be declared free men. No state returned and the threatened declaration was issued on Jan. 1. 1863. As president. Lincoln could issue no such declaration; as commander in chief of the armies and navies of the Cnited States he could issue directions only as to the territory within his lines; but the Emancipation Proclamation applied only to territory outside of his lines. It has therefore been debated whether the proclamation was in reality of any force. It may fairly be taken as an announcement of the policy which was to guide the army and as a declaration of freedom taking effect as the lines advanced. At all events, this was its exact effect. Its international importance was far greater. The locking up of the world's source of cotton supply had been a general calamity, and the Confederate government and people had steadily expected that the British and French governments would intervene in the war. The conversion of the struggle into a crusade against slavery made intervention impossible.

The Victory of the North. — The turning point of the war was evidently in the early days of July 1863, when the victories of Vicksburg and Gettysburg came together. The national government had at the beginning cut the Confederate states down to a much smaller area than might well have been expected; its armies had pushed the besieging lines far into the hostile territory; and the war itself had developed a class of generals who cared less for the conquest of territory than for destroying the opposing armies. The great drafts on the future which the credit of the federal government enabled the north to make gave it also a startling appearance of prosperity; so far from feeling the nar. it was driving production of every kind to a higher pitch than ever before.

The war had not merely developed improved weapons and munitions of war; it had also spurred the people on to a more careful attention to the welfare of the soldiers, the fighting men drann from their own number. The sanitary commission, the Christian commission and other voluntary associations for the physical and moral care of soldiers, received and disbursed very large sums. The national government was paying an average amount of $2,000,000 per day for the prosecution of the mar and. in spite of the severest taxation, the debt grew to $500,000,000 in June 1862, to twice that amount a year later, to $1,700,000,000 in June 1864 and reached its maximum on Aug. 31, 1863' —$2,845,907,626. But this lavish expenditure nas directed with energy and judgment. The blockading fleets were kept in perfect order and with every condition of success. The railway and telegraph were brought into systematic use for the first time in modern warfare. Late in 1863 Edwin M. Stanton, the secretary of war, moved two corps of 23 000 men from Washington to Chattanooga. 1,200 mi., in seven days.

Conscription. — On the other hand. the federal armies now held almost all the great southern through lines of railway, except the Georgia lines and those which supplied Lee from the south. The want of the southern people was merely growing in degree, not in kind. The conscription, sweeping from the first, had become omnivorous; toward the end of the war every man between 17 and 55 was legally liable to service, and in practice the only limit was physical incapacity. In 1863 the federal government also mas driven to conscription. The first attempts to carry it out resulted in forcible resistance in several places. the worst being the "draft riots" in New York (July), when the city was in the hands of the mob for several days. All the resistance was put down; but exemptions and substitute purchases were so freely permitted that the draft in the north had little effect except as a stimulus to the states in filling their quotas of volunteers by voting bounties.

Election of 1864. — In 1864 Lincoln was re-elected with Andrew Johnson as vice-president. The Democratic convention had declared that, after four years of failure to restore the union by war, during which the constitution had been violated in all its parts under the plea of military necessity, a cessation of hostilities ought to be obtained, and had nominated Gen. George B. McClellan and G. H. Pendleton. Farragut's victory in Mobile bay (Aug. 5), by which he sealed up the last port, except Wilmington, of the blockade-runners, and the evidently staggering condition of the confederate resistance in the east and the west, were the sharpest commentaries on the Democratic platform; its candidates carried only 3 of the 25 states taking part in the election. The 36th state — Nevada — had been admitted in 1864.

Surrender of Lee. — The actual fighting of the war ended with the surrender of Gen. Robert E. Lee to Gen. U. S. Grant at Appomattox, Va., April 9, 1865. All the terms of surrender named by Grant were generous: no private property was to be surrendered; both officers and men were to be dismissed on parole, not to be disturbed by the Gnited States government so long as they preserved their parole and did not violate the laws; and he instructed the officers appointed to receive the paroles "to let all the men who claim to own a horse or mule take the animals home with them to work their little farms." Gen. Joseph E. Johnston, with the only other considerable army in the field, surrendered on much the same terms at Durham Station, N.C. (April 26), after an unsuccessful effort at a broader settlement. All organized resistance had now ceased; union cavalry were ranging the south, picking up government property or arresting leadtrs; but it was not until May that the last detached parties of Confederates gave up the contest. (For the military events oi the war, *see* AMERICAN CIVIL WAR.)

Death of Lincoln. — Just after Lee's surrender President Lincoln was assassinated on April 15. Even this event did not impel the U.S. people to any vindictive use of their success for the punishment of individuals. In the heat of the war, in 1862. congress had so changed the criminal law that the punishment of treason and rebellion should no longer be death alone, but death or fine and imprisonment. Even this modified punishment was not inflicted. There was no hanging; some of the leaders were imprisoned for a time, but never brought to trial.

The Armies. — The armies of the Confederacy are supposed to have been at their strongest (700,000) at the beginning of 1863; and it is doubtful whether they contained 200.000 men in March 1865. The dissatisfaction of the southern people at the manner in which Davis had managed the war seems to have been profound; and it was converted into hero worship only by the ill-advised action of the federal government in arresting and imprisoning him. Desertion had become so common in 1861, and the attempts of the Confederate government to force the people into the ranks had become so arbitrary, that the bottom of the Confederacy had dropped out of it before Gen. William T. Sherman moved northward from Savannah) Ga. On the contrary, the numbers of the federal armies increased steadily until March 1865, when they were a few hundreds more than 1,000,000. As soon as organized resistance ceased, the disbanding of the men began; they were sent home at the rate of about 300,000 a month, about 50,000 being retained in service as a standing army.

Cost of the War. — The direct cost of the Civil War has been variously estimated. the best estimate including the first three years of Reconstruction being $5,000,000,000 to the north and $3,000,000,000 to the south. But if pensions. interest and other such items up to 1910 are included, the result is a total of between $11,000,000,000 and $12,000,000,000 for the north alone. But the cost to the south also was enormous; $4,000,000,000 cannot be an exaggeration. (A. J.; X.)

FROM 1865 TO 1910

The capitulation of Lee, followed by the assassination of Lincoln and the surrender of the last important Confederate army, under J. E. Johnston, marked the end of the era of war and the beginning of that of Reconstruction, which involved a revolution in the social and political structure of the south, in the relation of state and nation in the American federal union and in the economic life of the whole country.

Condition of the South. — Economically the condition of the south was desperate. The means of transport were destroyed; railways and bridges were ruined; southern securities were valueless; the Confederate currency system was completely disorganized. Emancipated Negroes wandered idly from place to place, trusting the union armies for sustenance, while their former masters toiled in the fields to restore their plantations.

The social organization of the south had been based on Negro slavery. Speaking generally, the large planters had constituted the dominant class, especially in the cotton states; and in the areas of heaviest Negro population these planters had belonged for the most part to the old Whig party. Outside of the larger plantation areas, especially in the hill regions and the pine barrens, there was a population of small planters and poor whites who belonged in general to the Democratic party. In the mountain regions: where slavery had hardly existed, there were union areas, and from the poor whites of this section had come Andrew Johnson, senator and war governor of Tennessee, who was chosen vice-president on the union ticket with Lincoln in 1864 as a recognition of the union men of the South.

The North. — The importance of personality in history was clearly illustrated when the wise and sympathetic Lincoln, who had the confidence of the masses of the victorious north, was replaced by Johnson, opinionated and intemperate, whose antecedents as a Tennessean and Democrat, and whose state rights principles and indifference to norihern ideals of the future of the Negro made him distrusted by large numbers of the Union Republican party.

The composition of this party was certain to endanger its stability when peace came. It had carried on the war by a coalescence of Republicans, War Democrats, Whigs, Constitutional Unionists and Native Americans, who had rallied to the cause of national unity. At the outset it had asserted that its purpose was not to interfere with the established institutions in slave states, but to defend the constitution and to preserve the union. But the war had destroyed slavery, as well as preserved the union, and the civil status of the Negro and the position of the former Confederate states now became burning questions. To the extremists of the radical wing it seemed in accordance with the principles of human liberty that the Negro should not only be released from slavery but should also receive full civil rights. including the right to vote. This group was also ready to revolutionize southern society by destroying the old ascendancy of the great planter class.

For many years before the war, parties had differed on such important questions as the tariff, internal improvements and foreign policy; and the south had used its alliance with the northern Democrats to resist the economic demands of the industrial interests of the north. A return of southern congressmen might mean a revival of the old political situation, with the south and the northern Democrats once more in the saddle.

Attitude of the Two Sections.—Any attempt to restore the south to full rights, therefore, without further provision for securing for the freedmen the reality of their freedom, and without some means of establishing the political control of the victorious party, mould create party dissension. Even Lincoln had aroused the bitter opposition of the radical leaders by his generous plan of reconstruction. Johnson could have secured party support only by important concessions to the powerful leaders in congress; and these concessions he was temperamentally unable to make. The masses of the north, especially in the first rejoicings over the peace, were not ungenerous in their attitude; and the south as a whole, accepted the results of defeat in so far as to acquiesce in the permanence of the union and the emancipation of the slaves, the original issues of the war.

Reconstruction.—In the settlement of the details of reconstruction. however, there were abundant opportunities for the hatred engendered by the war to flame up once more. As it became clear that the northern majority was determined to exclude the leaders of the south from political rights in the reconstruction of the union, and especially as the radicals disclosed their purpose to ensure Republican ascendancy by subjecting the section to the rule of the loyalist whites and, later to that of the emancipated Negroes, good will disappeared, and the south entered upon a fight for its social system. The natural leaders of the people. men of intelligence and property, had been the leaders of the section in the war. Whatever their views had been at first as to secession, the great majority of the southern people had followed the fortunes of their states. To disfranchise their leaders was to throw the control into the hands of a less able and small minority of whites; to enfranchise the Negroes while disfranchising the white leaders was to undertake the task of subordinating the former political people of a section to a different race, just released from slavery, ignorant, untrained and without property.

These underlying forces were in reality more influential than the constitutional theories which engaged so much of the discussion in congress. theories which, while they afford evidence of the characteristic desire to proceed constitutionally were really urged in support of, or opposition to, the interests just named.

The most extreme northern Democrats. and their southern sympathizers, starting from the premise that constitutionally the southern states had never been out of the union, contended that the termination of hostilities restored them to their former rights in the federal union unimpaired and without further action. This theory derived support from President Lincoln's view that not states, but assemblages of individuals, had waged war against the government. The theory of the extreme Republican radicals was formulated by Sumner and Stevens. Sumner contended that, while the states could not secede. they had by naging war reduced themselves to mere territories, entitled only to the rights of territories. Stevens, appealing to the facts of secession, declared the southern states conquered provinces, subject to be disposed of at the will of the conqueror. In the end congress adopted a middle ground, holding that while the states could not leave the union, they were, in fact, out of normal relations, and that the constitutional right of the federal government to guarantee republican governments to the various states gave to congress the power to impose conditions precedent to their rehabilitation.

It is necessary to recall the initiation of reconstruction measures by President Lincoln rightly to understand the position which was taken by President Johnson. Impatient of theoretical discussion, Lincoln laid down practical conditions of restoration in his proclamation of Dec. 8, 1863. In this he offered amnesty to those who would take an oath of loyalty for the future and accept the acts of congress and the proclamation of the president with reference to slaves. From the amnesty he excepted the higher military, civil and diplomatic officers of the Confederacy as well as those who had relinquished judicial stations, seats in congress, or commissions in the army or navy and those who had treated persons in the federal service otherwise than lawfully as prisoners of war. The proclamation provided, further, that when in any of the seceding states (except Virginia, where the president had already recognized the loyal government under Gov. Francis H. Pierpont) a number of peisons not less than one-tenth of the voters in 1860 should have taken the above described oath, and, being qualified voters under the laws of the state in 1860, should have established a state government, republican in form, it should be recognized.

The First Reconstruction Bill.—Although Lincoln expressly pointed out that the admission of the restored states to representation in congress rested exclusively with the respective houses, and announced his readiness to consider other plans for reconstruction, heated opposition by the radicals in congress was called out by this proclamation. They feared that it did not sufficiently guarantee the abolition of slavery, which up to this time rested on the war powers of the president, and they asserted that it was the right of congress, rather than of the president, to determine the conditions and the process of reconstruction. In a bill which passed the house by a vote of 73 to 59 and was concurred in by the senate, congress provided that reconstruction was to be begun only when a majority of the white male citizens of any one of the Confederate states should take oath to support the constitution of the United States. The president should then invite them to call a Constitutional Convention. The electors of this convention would be required to take an oath of allegiance which excluded a much larger class than those deprived of the benefit of the amnesty proclamation, for it eliminated all who had voluntarily borne arms against the United States, or encouraged hostility to it or voluntarily yielded support to any of the Confederate governments. The bill also required that the state constitution should exclude a large proportion of the civil and military officers of a Confederate government from the right of voting, and that it should provide that slavery be forever abolished and that state and Confederate debts of the war period should never be paid. In July I864 Lincoln gave a "pocket veto" to the bill and issued a proclamation explaining his reasons for refusing to sign. The triumph of Lincoln in the election of 1864 did not clearly signify the will of the people upon the conditions of reconstruction, for the declaration of the Democratic convention that the war was a failure overshadowed the issue, and the Union party which supported Lincoln was composed of men of all parties.

The 13th Amendment.—On Jan. 31, 1865 the house concurred in the vote of the senate in favour of the 13th amendment to the constitution abolishing slavery throughout the union. Four years earlier congress had submitted to the states another 13th amendment by the terms of which no amendment should ever authorize congress to interfere with slavery within the states. But because of the war this amendment had remained unratified, and now congress proposed to place beyond constitutional doubt, or the power of states to change it, the emancipation of slaves. By Dec. 18, 1865 the amendment had been ratified and was proclaimed in force.

In the meantime. Louisiana, in accordance with Lincoln's proclamation. had adopted a constitution and abolished slavery within the state. As a result of the obstructive tactics of Sumner. aided by Democrats in the senate, congress adjourned on March 4. 1865. without having recognized this new state government as legitimate. "If we are wise and discreet." said Lincoln. "we shall reanimate the states and get their governments in successful operation with order prevailing and the Union re-established before Congress comes together in December."

President Johnson. — Such was the situation when Johnson became president upon Lincoln's death. After an interval of uncertainty in which he threatened vengeance against various southern leaders. President Johnson accepted the main features of Lincoln's policy. Congress not being in session, he was able to work out an executive reconstruction on the lines of Lincoln's policy during the summer and autumn of 1865. On May 29 he issued a proclamation of amnesty, requiring of those who desired to accept its provisions an oath to support the constitution and union, and the laws and proclamations respecting the emancipation of slaves. Certain specified classes of persons were excepted. including certain additions to those excluded by Lincoln, especially "all persons who have voluntarily participated in said rebellion and the estimated value of whose taxable property is over twenty thousand dollars.!' This provision was characteristic of Johnson. who disliked the southern planters aristocracy, and aimed at placing the preponderant power in the hands of the Democratic small farmers. As part of his system he issued another proclamation in which he appointed a governor for North Carolina and laid down a plan for reconstruction. By this proclamation it was made the duty of the governor to call a convention chosen by the loyal people of the state, for the purpose of altering the state constitution and establishing a state government. The right to vote for delegates to this convention was limited to those who had taken the oath of amnesty and who had been qualified to vote prior to the secession of the state.

Already Virginia. Tennessee. Louisiana and Arkansas had governments which had been recognized by Lincoln. Between June 13 and July 13. 1565 Johnson applied the same process which he had outlined for North Carolina to the remaining states of the confederacy. Before congress met in December all the Confederate states, except Texas (which delayed until the spring of 1866). had formed constitutions and elected governments in accordance with the presidential plan. All of their legislatures, except that of Mississippi, ratified the 13th amendment.

Gradually, however, the south turned to its former leaders to shape its policy. and the radical Republicans of the north were .alarmed at the rapidity of the process of restoration on these principles. The disorganized and idle condition of the former slaves constituted a serious element in the southern situation. as Lincoln had foreseen. The Negroes expected a grant of land from confiscated southern estates, and it was difficult to preserve order and to secure a proper labour supply.

Under these conditions the efforts of the south to provide security for their communities by bodies of white militia were looked upon with apprehension by the north, and there was sufficient conflict between the two races to give colour to charges that the south was not accepting in good faith the emancipation of the slaves. Especially irritating to northern sentiment were the so-called "black codes" or "peonage laws," passed by the newly elected southern legislatures. They rested on the belief that it was necessary that the former slaves should be treated as a separate and dependent class. Some of these imposed special disabilities upon the Negro in the matter of carrying weapons and serving as witnesses. Vagrancy laws and provisions regarding labour contracts which had precedents in colonial and British legislation. but were specifically framed to restrain the Negroes only, were common. Mississippi denied them the right to own land, or even to rent it outside of incorporated towns; South Carolina restricted them to husbandry and to farm or domestic service, unless ipecially licensed.

The Freedmen's Bureau. — The problem of succouring and protecting the Negroes had forced itself upon the attention of the north from the beginning of the war. and on March 3, 1865 congress had created the Freedmen's bureau with the power to assign abandoned lands. in the states where the war had existed. to the use of the freedmen; to supervise charitable and educational activities among them; to exercise jurisdiction over controversies in which a freedman was a party; and to regulate their labour contracts. The local agents of the bureau were usually northern men: some of them gave the worst interpretation to southern conditions and aroused vain hopes in the Negroes that the lands of the former masters would be divided among them; and later many became active in the political organization of the Negro.

Although the national government itself had thus recognized that special treatment of the freedmen was necessary, congress. on assembling in Dec. 1865. was disposed to regard the course of the south in this respect with deep suspicion. Moreover. as the 13th amendment was now ratified, it was seen that the south, if restored according to the presidential policy. would return to congress with added representatives for the freed Kegroes. Only three-fifths of the Kegro slaves had been counted in apportioning representatives in congress; though now free they were not allowed to vote. Under the leadership of the radicals, congress refused, therefore, to receive the representatives of the states which had met the conditions of the president's proclamations. A joint committee of 15 took the whole subject of reconstruction under advisement. and a bill was passed continuing the Freedmen's bureau indefinitely. When this was vetoed by President Johnson (Feb. 19, 1866) congress retaliated by a concurrent resolution (March 2) against admitting any reconstructed state until congress declared it entitled to recognition. thus asserting for the legislative body the direction of reconstruction.

While the measure was under consideration the president in an intemperate public address stigmatized the leaders of the radicals by name as labouring to destroy the principles of the government and even intimated that the assassination of the president was intended. It was hardly possible to close the breach after this, and the schism between the president and the leaders of the Union Republican party was completed when congress passed (April 9. 1866) the Civil Rights bill over Johnson's veto. The act declared the freedmen to be citizens of the United States with the same civil rights as white persons and entitled to the protection of the federal government.

The 14th Amendment. — To place this measure beyond the danger of overthrow by courts or by a change of party majority, on June 13. 1866. congress provided for submitting to the states a 14th amendment to the constitution. This gave constitutional guarantee of citizenship and equal civil rights to freedmen. and in effect provided that when in any state the right to vote should be denied to any of the male inhabitants 21 years of age and citizens of the United States, except for participation in rebellion or other crime, the basis of representation in the state should he reduced in the proportion which the number of such citizens bore to the whole number of male citizens 21 years of age in the state. This section of the amendment, therefore, left the states the option between granting the suffrage to the Negro or suffering a proportionate reduction in the number of representatives in congress. It was a fair compromise which might have saved the south from a long period of misrule and the north from the ultimate breakdown of its policy of revolutionizing southern political control by enfranchisement of the Negroes and disfranchisement of the natural leaders of the whites.

In order to ensure the passage of this amendment the radical leaders proposed bills which declared that. after its adoption. any of the seceding states which ratified it should be readmitted to representation. But it also provided that the higher classes of officials of the Confederacy should be ineligible to office in the federal government. These bills were allowed to await the issue of the next election.

For further protection of the rights of the Negro. congress succeeded in passing. over President Johnson's veto. an act continuing the Freedmen's bureau for two years. Tennessee, having ratified the 14th amendment, was (July 24, 1866) restored to representation and congress adjourned, leaving the issue between the president and the legislative body to the people in the congressional elections.

Party Changes.—The campaign brought with it some realignment of party. President Johnson. having broken with the leaders of the Union Republican party, was more and more forced to rely upon Democratic support. although his executive appointments were still made from the ranks of the Republicans. The so-called National Union convention, which met in Philadelphia in midsummer in an effort to abate sectionalism, and to endorse the president's policy, included a large number of war Democrats who had joined the Union party after the secession of the south, many moderate southerners, a fragment of the Republican party, and a few Whigs, especially from the border states. They claimed that the southern states had a right to be represented in congress. Other meetings friendly to the radicals were called, and under the designation of Union-Republican party they declared for the congressional policy. While the campaign for elections to congress was in progress the president made a journey to Chicago, speaking at various cities en route and still further alienating the Republicans by abuse of his opponents. As a result of the autumn elections two-thirds of the members of the house of representatives were opposed to him. Almost contemporaneously every seceding state except Tennessee rejected the 14th amendment, paving the way for the entire triumph of the northern extremists.

Tenure of Office Act.—In the ensuing minter and spring congress completed the conquest of the president. awed the supreme court. and provided a drastic body of legislation to impose Negro suffrage on the south. By the Tenure of Office act (March 2, 1867) congress forbade the president to remove civil officers without the consent of the senate, and at the same time by another act required him to issue military orders only through the general of the army (Grant), whom the president was forbidden to remove from command or to assign to duty at another place than Washington. unless at the request of the officer or by the prior assent of the senate. These extraordinary invasions of the presidential authority were deemed necessary to prevent Johnson from securing control of the military arm of the government, and to protect Edwin Stanton, the secretary of war, and General Grant. Fearing the president might take advantage of the interim when congress would not be in session, the 40th congress was required to meet on March 4. immediately following the expiration of the 39th.

Other Legislative Acts.—The Reconstruction act of March 2, 1867, provided for the military government of the southern states while the drastic policy of congress was being carried out. It was passed over the veto of the president and declared that no legal governments or adequate protection for life or property existed in the seceding states, except Tennessee. These states it divided into five military districts) each to be placed under the command of a general of the army. whose duty it was to preserve law and order. But the existing civil governments were declared provisional only and subject to the paramount authority of the United States to abolish, modify, control or supersede them. The act further provided that a constitutional convention might be elected by the adult male citizens of the state, of whatever race, colour or previous condition, resident in the state for a year, except such as might be disfranchised for rebellion or felony.

When the convention, thus chosen under Negro suffrage, and with the exclusion of Confederate leaders, should have framed a state constitution conforming to the federal constitution and allowing the franchise to those entitled to vote for the members of the convention. the constitution was to be submitted for the approval of congress. If this were obtained and if the state adopted the 13th amendment. and this amendment became a part of the federal constitution: then the state should be entitled to representation in congress; but the senators and representatives sent to congress were required to take the "iron-clad oath," which excluded those who had fought in the confederate service? or held officeunder any government hostile to the United States, or given support to any such authority.

By the pressure of military control congress thus aimed at forcing the adoption of the 14th amendment, as well as the acceptance of Negro suffrage in the state constitutions of the south. A supplementary act of March 23, 1867, and an act of interpretation passed on July 19 completed this policy of "thorough." In the registration of voters the district commanders were required to administer an oath which excluded those disfranchised for rebellion and those who after holding state or federal office had given aid and comfort to the enemies of the United States.

Supreme Court Decisions.—Against this use of military power to govern states in time of peace the supreme court interposed no effective obstacle. Like the executive it was subordinated to congress. It is true that in the case *ex parte Milligan,* decided in Dec. 1866, the court held military commissions unlawful where the ordinary civil tribunals were open. In the case of *Cummings* v. *Missouri* (Jan. 14, 1867) it decided also that a state test oath excluding Confederate sympathizers from professions was a violation of the prohibition of ex post facto laws; and the court (ex *parte Garland*) applied the same rule to the federal test oath so far as the right of attorneys to practise in federal courts mas concerned.

But threats were made by the radicals in congress to take away the appellate jurisdiction of the court, and even to abolish the tribunal by constitutional amendment. The judges had been closely divided in these cases and, when the real test came. the court refused to set itself in opposition to congress. When Mississippi attempted to secure an injunction to prevent the president from carrying out the reconstruction acts, and when Georgia asked the court to enjoin the military officers from enforcing these acts in that state, the supreme court refused (April and May 1867), pleading want of jurisdiction. Chief Justice Salmon P. Chase argued that if the president refused to obey, the court could not enforce its decree, while if he complied with the order of the court, and if the house of representatives impeached him for refusing to enforce the law, the supreme court would he iorced to the vain attempt to enjoin the senate from sitting as a court of impeachment.

In one instance it seemed inevitable that the court would clash with congress; the McCardle case involved an editor's arrest by military authority for criticizing that authority and the reconstruction policy. But congress, apprehending that the majority of the court would declare the reconstruction acts unconstitutional, promptly repealed that portion of the act which gave the court jurisdiction in the case, and thus enabled the judges to dismiss the appeal. Afterward, when the reconstruction policy had been accomplished, the court, in the case of *Texas* v. *White* (1869), held that the constitution looked to "an indestructible Cnion composed of indestructible states"; and that although the secession acts were null, and the federal obligations of the seceding states remained unimpaired, yet their rights were suspended during the war.

Impeachment of President Johnson.—The powerful leaders of the Republicans in congress had been awaiting their opportunity to rid themselves of President Johnson by impeachment. For full details of these efforts *see* JOHNSON, ANDREW. His trial in the spring of 1868, however, by the senate resulted in a verdict of acquittal.

"Carpetbaggers."—Meanwhile the military reconstruction of the south and the organization of the Negro vote progressed effectively. The party management of the Negroes was conducted by "carpetbaggers,!' as the northern men who came south to try their fortunes were nicknamed, and by the white loyalists of the south, to whom was given the name "scalawags." In the work of marshaling the freedmen's vote for the Republican party secret societies like the Loyal league, or Union league played an important part. As the newly enfranchised mass of politically untrained Negroes passed under northern influence politically, the southern whites drew more and more together and although they were unable under the existing conditions to take control, they awaited their opportunity. A solid south was forming in which old party divisions gave way to the one dominant antagonism to Republican ascendancy by Negro sufirage. Politically the important fact was that the Republicans had rejected the possibility of reviving the old party lines in the south, and had gambled upon the expectation of wielding the united Negro vote with such leadership and support as might be gained from former Northerners and loyal ahites. In the end Negro rule failed. as was inevitable when legal disabilities and military force were removed; but the masses of the southern whites emerged with a power which they had not possessed under the old rule of the planters aristocracy. For the time being, however, Segro votes gave control to the Republicans. In South Carolina, Florida, Alabama, Mississippi and Louisiana the Segroes were in a majority; in Virginia, North Carolina. Arkansas and Texas they were in the minority; while in Georgia the two races were nearly evenly balanced.

Ku-Klux Klan.—The white leaders of the south were divided as to the best means of meeting the problem. Some advocated that those entitled to vote should register, and then refrain from the polls, in order to defeat the constitutions made under Negro suffrage, for the law required them to be ratified by a majority of the qualified voters. Others would have the white race bear no part in the process. Societies such as the Ku-Klux Klan and the Knights of the White Camelia were organized to intimidate or restrain the freedmen. But for the present the Republicans carried all before them in the south. Some of the new state constitutions imposed severe disfranchisement upon the former dominant class, and before the end of July 1868 all of the former Confederate states, except Virginia, Mississippi and Texas, had ratified the 14th amendment, which was proclaimed in effect. By the beginning of 1870 these three states had also ratified the amendment, as had Georgia a second time, because of its doubtful status at the time of its first ratification.

The Southern States Restored to the **Union.**—By the summer of 1868 Arkansas, South Carolina, North Carolina, Georgia, Alabama, Louisiana and Florida, having satisfied the requirements of the reconstruction acts, were entitled to representation in congress. But Georgia did not choose its senators until after the adjournment of congress, and, inasmuch as the state excluded the Negro members of the legislature in September, congress on reassembling returned the state to military rule until its submission. Alabama was restored in spite of the fact that its white voters had remained away from the polls in sufficient numbers to prevent a majority of all the voters registered from having ratified the constitution. The nominating conventions and the campaign of 1865 gave interesting evidence of the trend of political and economic events. Party lines, which had broken down in the north when all united in saving the union, were once more reasserting themselves. President Johnson, who had been elected by the Union Republican party, had found his most effective support among the Democrats. The Republicans turned to General Grant, a Democrat before the outbreak of the war.

Grant Nominated.— The Republican nominating convention met on May 20, 1868, a few days after the failure of the impeachment proceedings, and it chose Grant as the candidate for the presidency. The platform supported the congressional reconstruction measures. Upon the vital question whether universal Negro suffrage should be placed beyond the power of states to repeal it by a new constitutional amendment, the platform declared: "The guarantee by Congress of equal suffrage to all loyal men at the South was demanded by every consideration of public safety, of gratitude and of justice, and must be maintained; while the question of suffrage in all the loyal states properly belongs to the people of those states." Nowhere in the north was the Negro an important element in the population, but the north had shown an unwillingness to apply to itself the doctrines of Negro rights which had been imposed upon the south. Between 1865 and 1868 Connecticut, Wisconsin, Minnesota, Kansas, Ohio and Michigan had refused to give the Negro the right to vote within their own bounds, and this plank was evidence of the unwillingness of the party to make a direct issue of universal Negro suffrage. The platform pronounced in favour of payment of the public debt, not only according to the letter hut the spirit of the laws under which it was contracted. The significance of this lay in its challenge to the Democratic agitation on the currency question.

It was this question which gave the tone to the proceedings of the Democrats at their convention in July 1868. The situation can best be presented by a brief review of the financial history just preceding the convention. Together with the discussion over political reconstruction in the south. congress and the administration had been obliged to deal with the reconstruction of debt, taxation and currency in the nation at the close of four years of expensive war. The problems of funding, readjustment of taxation and resumption of specie payments proved to be so complicated with the industrial growth of the nation that they led to issues destined to exert a long-continued influence.

Finance.— The various war tariffs, passed primarily for the sake of increased revenue, had been shaped for protection under the influence of the manufacturing interests, and they had been framed also with reference to the need of compensating the hea y internal taxes which were imposed upon the manufacturers. When the war ended, public sentitnent demanded relief from these heavy burdens, especially from the irksome internal taxes. The rapidly growing grain-raising districts of the middle west exhibited a lively discontent with the protective tariff. but this did not prevent the passage in 1867 of the Wóol and Woolens act, which discriminated in favour of the woolen manufacturers and raised the ad valorem duty on wool. In spite of several large reductions of internal revenue, the national debt was being rapidly extinguished.

The currency question, however. furnished the economic issue which was most debated. One set of interests aimed at rapidly reducing the volume of the currency by retiring the legal tender notes, or greenbacks. The secretary of the treasury, Hugh McCulloch, pressed this policy to the foreground, and desired authority to issue bonds to retire these notes. Another set of interests demanded the retention of the greenbacks, supporting their views by arguments varying according to the degree of radicalism of the speakers. The more moderate, like Sen. John Sherman, of Ohio, who reflected the views of parts of the west, argued that the recuperation of the nation and the rapid increase of business would absorb the existing currency, while gold would cease to go abroad. Thus, by the increasing credit of the government, specie payment would be automatically resumed. The most extreme, so far from contracting the currency by retiring the greenbacks, wished to increase this form of money, while diminishing the circulation of the notes of the national banks. The discussion tended to produce a sectional issue with the west against the east, and a social issue with bondholders and the creditor class in general arrayed against the less well-to-do. Congress agreed with Secretary McCulloch, and in the Funding act of 1866 not only provided for converting short-time securities into long-term bonds, but also for retiring $10,000~000 of greenbacks in six months and thereaiter not more than $4,000,000 monthly. But the agricultural depression of 1866 produced a reaction. Loud demands were made that bonds should be paid in greenbacks instead of coin and the national banknotes suppressed. In 1868, on the eve of the presidential campaign! congress! alarmed by the extent of these popular demands, suspended the process of contraction after $40,000,000 in greenbacks had been retired. Ohio was the storm centre of the agitation. The "Ohio idea" that greenbacks should become the accepted currency of the country was championed by George H. Pendleton, of that state, and his friends now brought him forward for the Democratic nomination for president on this issue. In the national convention of that party they succeeded in incorporating into the platform their demands that there should he one currency for the government and the people, the bondholder and the producer, arid that where the obligations of the government did not expressly provide for payment in coin, they should be paid in lawful money (*i.e.,* greenbacks) of the United States.

But another wing of the Democratic party desired to make prominent the issue against the reconstruction measures of the Republicans. This wing added to the platform and declaration that these acts were unconstitutional and void. and the demand that the southern states should be restored to their former rights and given control over their own elective franchise.

Democrats Nominate Seymour.— Although the followers of

Pendleton had shaped the financial plank of the platform, they could not nominate their leader. The opposition was at first divided between the various candidates. New York, mhich feared the effect upon the conservative financial interests of the east if Pendleton were nominated, attempted to break the deadlock by proposing an Ohio man, Chief Justice Chase. But eager as Chase was for the presidency he had flatly refused to abandon the views which he held in favour of Negro suffrage. Ohio was, therefore, able to retaliate by stampeding the convention in favour of Horatio Seymour, of New Uork. As the war governor of his state he had been a consistent critic of the extremes to which the federal administration had carried its interpretation of the war power. For vice-president the convention nominated Francis P. Blair of Missouri.

Grant Elected. — But the popularity of Grant' in the north, together with the Republican strength in the states of the south mhich had been reconstructed under Negro suffrage. gave an easy victory to the Republicans in the election of 1868. Seymour carried only Delaware, New Jersey, New York and Oregon, of the north; and Maryland, Kentucky, Georgia and Louisiana of the south. Tennessee. and five of the former Confederate states, upon which Negro suffrage had been imposed (North Carolina, South Carolina. Florida, Alabama and Arkansas) voted for Grant. Virginia, Mississippi and Texas had not yet been restored.

The 15th Amendment. — This decisive victory and the knowledge that it had been won by the advantage of the Negro vote in the restored states led the Republican leaders 'to ignore their recent platform declaration in regard to Negro suffrage. Shortly after congress assembled propositions were made to place the freedman's right to vote beyond the power of the states to change. To do this by constitutional enactment it was necessary to make the provision universal, and congress, therefore, submitted for ratification the 15th amendment declaring that "the right of citizens of the United States to vote shall not be denied or abridged by the United States or by any state on account of race: color or previous condition of servitude." Congress was given power to enforce the amendment by appropriate legislation. By March 30, 1870 the amendment had been ratified; but it is doubtful whether this could have been accomplished by legislatures chosen on the issue. As it was, the states of Virginia, Mississippi, Texas and Georgia were required to ratify it as a condition of their readmittance to representation in congress, and the three former states. having been permitted to vote separately on the obnoxious provisions of their constitutions in regard to the disfranchisement of former Confederates, rejected those clauses: adopted the 15th amendment and were restored in 1870. Georgia, after a new experience of military rule, likewise ratified the amendment, and its representatives were likewise admitted to congress.

As soon as the 15th amendment was proclaimed in effect, and the military governments of the south were superseded, the dominant party proceeded to enact measures of enforcement. These seemed especially necessary in view of the fact that, partly by intimidation of the Negro vote, Louisiana (1868) and Tennessee (1869) broke away from the Republican column; while in the election of 1870 Tennessee, North Carolina, Georgia, Virginia and Alabama went Democratic. The enforcement legislation of 1870 provided penalties for violating the 14th and 15th amendments and re-enacted the Civil Rights act of 1866. In the years 1871 and 1872 acts were passed providing for effective federal supervision of congressional elections, and the Ku-Klux acts (1871 and 1872) still further increased the power of the federal courts to enforce the amendments and authorized the president to suspend the writ of habeas corpus and use military force to suppress public disorders. But these stern measures were accompanied by some efforts to restore harmony, such as the repeal' of the "iron-clad oath" for former Confederates! in 1871, and the passage of the General Amnesty act of 1872. The north was becoming restive under the long-continued use of the federal military arm within state borders in time of peace.

Reconstruction Governments. — In any case the cost of rehabilitating the public works and providing education and the political and judicial institutions which should apply equally to the hitherto nonpolitical class of the Negroes: would have been a heavy one. But the legislatures, especially of Louisiana. South Carolina, Tennessee, Arkansas and Alabama, plunged into an extravagance made possible by the fact that the legislatures contained but few representatives who paid considerable taxes. In 1872 it was estimated that the public debts of the 11 reconstructed states amounted to nearly $132,000,000, two-thirds of which was composed of guarantees to corporations. Legislative expenses were grotesquely extravagant. the Negro members in some states engaging in a saturnalia of corrupt expenditure. This alienated from the so-called Radical party the support of southern whites, because they resented the concessions of the carpetbag leaders to the Negro vote, because they suffered from the burden of taxation. and above all because race friction increased.

By 1872 a coalition had been formed under the name of Conservatives. But the control of electoral machinery in the strongly centralized state executives chosen by Negro votes, and coercion by the federal authority, still upheld Republican rule in various southern states. Virginia and North Carolina were practically bankrupt. the capitals of Louisiana. Arkansas and Alabama, where rival state officers claimed possession, were occupied by federal troops, and many of the governments were so corrupt that only the comparable practices in New Uork city and in certain branches of the federal government afford a parallel.

Southern Changes.——An important economic reorganization was in progress in the south. White districts were recovering from the war and were becoming the productive cotton areas by the use of fertilizers and by more intelligent management. Cities were rising, and the mines and manufactures of the southern Appalachians were developing. In the "black belt." or region of denser Negro settlement the Negroes became tenant farmers, or workers on shares. The effective and just direction of Negro labour was a difficult problem and was aggravated by the political agitation which intensified race friction. It became evident that there was a Negro problem as well as a slavery question, and that the north was unable to solve it.

Foreign Relations. — In the meantime important foreign relations had been dealt with by Secretary William H. Seward. under Johnson, and by Secretary Hamilton Fish: under Grant. Not only were many treaties of commerce and extradition, including one with China, negotiated by Seward, but he also brought about a solution of more important diplomatic problems. The relations of the United States with France and Great Britain had been strained in the course of the war. Not only had Napoleon III been inclined to recognize the Confederacy, but he had also taken advantage of the war to send into Mexico a French army in support of the emperor Maximilian. The temptation to use force while American military prestige was high appealed even to General Grant; but Seward by firm and cautious diplomatic pressure induced France to withdraw its troops in 1867, and the power of Maximilian collapsed. Russia's friendly attitude throughout the war was signalized by its offer to sell Alaska to the United States in 1867. Seward promptly accepted it and the treaty was ratified by the senate and the purchase money ($7,200,000) was voted by the reluctant house, which saw little in the acquisition to commend it.

With Great Britain, affairs were even more threatening than with France. Confederate cruisers (notably the "Alabama"), built in England and permitted by the negligence of the British government to go to sea; had nearly swept the American merchant marine from the ocean. Unsettled questions of boundary and the fisheries aggravated the ill feeling, and Britain's refusal in 1865 to arbitrate made a serious situation. Prolonged negotiations followed a change of attitude of Great Britain with regard to arbitration. and in 1870 President Grant recommended to congress that the Cnited States should pay the claims for damages of the Confederate cruisers? and thus assume them against Great Britain. However, in 1871, the treaty of Washington was negotiated under Secretary Fish, by the terms of which Great Britain expressed regret for the escape of the cruisers and provided for arbitration of the fisheries, the northwestern boundary and the "Alabama" claims. The case of the Cnited States was victorious, the tribunal awarding damages against Great Britain to the amount of $15 500,000 Two months later the German emperor gave to the Cnited States the disputed northweit boundary, including San Juan Island in Puget sound.

In the West Indies also important question? were presented Senard had negotiated a treaty of purchase of the Danish West Indies, but the senate refused to ratify it, nor did Grant's attempt to acquire Santo Domingo meet with a different fate at the hands of that body (1870) In Cuba another insurrection was in progress. Secretary Fish "pigeon-holed" a proclamation of President Grant recognizing the Cubans as belligerents, and secured a policy of neutrality which endured even the shock of the "Virginius" affair in 1873, when 50 of the men of the filibustering steamer flying the American flag were shot by the Spanish authorities It was shonn that the vessel had no right to the flag Negotiations for an isthmian canal resulted only in a treaty with Nicaragua in 1868 giving to the United States a right of way across the irthmus and providing for a government survey of the Panamá route

It was in the field of domestic concerns, in economic and social development, that the most significant tendencies appeared The old issues were already diminishing in importance before the other aspect of reconstruction which came from the revived expansion of the nation toward the west and the new forms taken by the development of American industrial society.

Finance. — The Republican party, following the traditions of the Whigs, was especially responsive to the demands of the creditor class. who demanded legislation to conserve their interests. Its victory in 1868 was signalized by the passage in the spring of the following year of an act pledging the faith of the United States to pay in coin or its equivalent all the obligations of the United States. except in cases where the law authorizing the issue had expressly provided otherwise. In 1870 and 1871 refunding acts were passed. providing for the issue of bonds to the total amount of S1.800.000.000. $1,000,000,000 of which was to run for 30 years at 4%. This abandonment of the doctrine of early convertibility was made in order to render the bonds acceptable to capitalists, but in fact they soon went to a premium of more than 25%.

While the legislature was thus scrupulous of the credit of the nation and responsive to the views of capital, the supreme court was engaged in deciding the question of whether the legal tender notes (greenbacks) were constitutional. Successive decisions in 1868 determined that they were not legal in certain cases. In these decisions the judges had divided, four to three. Within a year the court was changed by the appointment of one new judge to fill a vacancy. and the addition of another in accordance with a law enlarging the court. In 1871 the former decision was reversed and the constitutionality of the Legal Tender acts sustained on loose construction reasoning. In 1884 the court went to the extent of affirming the right of congress to pass legal tender acts in time of peace. In 1871 and 1872 Secretary George S. Boutwell illustrated the power of the administration to change the volume of the currency, by issuing in all over $6,000,000 of legal tender notes; and, following the practice of his predecessors. he sold gold from the treasury to check speculations in that part of the currency.

Economic Changes. — Speculation and the rapid growth of great fortunes were characteristic of the period. The war itself had furnished means for acquiring sudden riches; the reorganization of taxation: currency and banking increased the opportunities; and the opening of new fields of speculative enterprise in the oil fields of Pennsylvania and Ohio and the gold and silver mines of the mountains of the far west tended in the same direction. An enormous development of manufactures resulted from the diminished commerce and increased demand for manufactured goods, the protection afforded by the tariff, the stimulus because of rising prices and the consumption of the rapidly growing west. It was officially reported in 1869 that "within five years more cotton spindles had been put in motion, more iron furnaces erected, more iron smelted, more bars rolled, more steel made, more coal and copper mined, more lumber sawn and hewn. more houses and shops constructed. more manufactories of different kinds started. and more petroleum collected, refined and exported, than during any equal period in the history of the country."

Pacific Railways. — Between the Civil War and 1872, the extension of the nation's activity to the industrial conquest of the great west, as well as the economic reorganization of the east, had a profound effect upon the development of the United States. Between 1862 and 1872 grants were made to the Union Pacific and Central Pacific companies, and to other connecting corporations. for railways from the Missouri to the Pacific, amounting to nearly 33,000,000 ac., and in the same period large loans of funds were made by the general government for this enterprise. Construction advanced rapidly after 1866, and by 1869 an all rail connection had been established on the line of the Union Pacific and Central Pacific railways between the east and San Francisco, Calif. Various grants were made in these years to other roads, both transcontinental and middle western. Between 1850 and 1871 congress granted about 155,000,000 ac. for railway construction. but not all these grants were perfected. It is estimated that about $500.000.000 were invested in the construction of western railways between 1868 and the panic of 1873, and about 30,000 mi. of railway had been added.

The effects of this extraordinary extension of railway transportation were immediately apparent. In the far west the railway lines rapidly made possible the extinction of the bison herds. This opened the way for the great extension of the cattle country. following the retreat of the Indians. Upon the plains Indians the effect was revolutionary. Their domain had been penetrated by the railways at the same time that their means of subsistence had been withdrawn. During the Civil War most of these western tribes had engaged in hostilities against the federal government. By the Peace Commission act of July 20. 1867, commissioners, including General Sherman, were sent to negotiate treaties. As a result the tribes of the Indian Territory were so concentrated as to permit the transfer of other western tribes to the same region. while the Sioux of the northern plains were given a reservation embracing the western portions of the Dakotas. Discontent with these treaties resulted, however, in hostilities following 1867. Between the close of the war and 1880 about $22,000,000 were expended in Indian wars; although the act of 1871 inaugurated the change of policy whereby the Indians were no longer dealt with by treaty, but were regarded as wards of the nation. to be concentrated on reservations and fed at the expense of the nation under the supervision of Indian agents.

Mining. — Part of these Indian difficulties were the result of the opening up of new mining areas in the Rocky mountains, some of them within the Indians' choicest hunting grounds. At the beginning of the Civil War a preliminary mining boom struck Colorado; the rich Cornstock lode was opened in Nevada; Arizona was the scene of mining rushes; the Idaho mines mere entered; and the Montana ores were discovered; so that in the period of the Civil War itself the territories of Nevada, Idaho and Montana had been organized. The discovery of gold in the Black hills in 1874 continued the same movement. In 1860 the nation produced $156,000 worth of silver, in 1361 over $2,000,000 and in 1873 nearly $36.000.000. Capital in mines and quarries of the United States was over $65,000,000 in 1860, over $245,000,000 in 1870, and nearly $1,500,000,000 in 1880.

The Middle West. — This revolution in the life of the Great Plains and the Rocky mountains, opening the way to agriculture and to cattle raising, and preparing for the exploitation of the precious metals of that great area, was contemporaneous with the important development of the farming regions of the middle west. Even during the Civil War the agricultural development of the northern half of the Mississippi valley had continued. This was aided by the demand for food products to supply the armies and was made possible by the extension of railways, the taking up of the prairie lands through the operation of the homestead law of 1862, the marketing of the railway land grants and the increased use of agricultural machinery in those years. Between 1860 and 1870 the population of the north central group of states increased over 42%, and in the next decade by 34%, a total addition to the population in those two decades of 8,000,000. Between 1870 and 1880 about 200.000 sq.mi. were added to the farmlands of the Cnited States: an area almost equal in extent to that of

France. In the same decade the north central states increased their improved farms from near 78,500,000 ac. to over 136,800.000 ac. The production of corn about doubled between 1860 and 1880, and that of wheat and oats more than doubled. The addition came chiefly from the middle west.

Railway Scandals. — The pressing need of increased transportation facilities had led, as we have seen, to lavish land grants and to subsidies by nation states and municipalities to the railways. The railways themselves, tempted by these opportunities, had extended their lines in some cases beyond the immediate needs of the regions Extravagances in construction and operation, aggravated by "construction rings" of railway officials and by rolling stock companies who received extravagant prices by favouritism, brought about a condition where the roads were no longer able to meet the demands of their stockholders for returns on the investment without imposing rates that the western farmer deemed extortionate. In the competitive development of these roads and in the struggle of business corporations and localities with each other, the roads also discriminated between persons and places. This condition chiefly accounted for the political unrest which manifested itself in the west in the so-called Granger movements of the 1870s.

Granger Movement. — The farmers felt the pressure of the unsettled currency. taxes were very heavy. the protective tariff seemed to them to bear unduly upon the producers of crops which exceeded the home consumption and had to seek the foreign markets. The price of corn, wheat and cotton in the early 1870s tended to fall as production rose, so that the gold value of the total crop was not greatly increased during the decade after the war, in spite of increase of production Dissatisfaction with their share in the prosperity of the country, and especially nith the charges of middlemen and transportation companies, discontent nith the backwardness of rural social conditions and a desire for larger political influence, all aided in fostering the growth of organizations designed to promote the farmers' interests. The most influential of these organizations mas the Patrons of Husbandry, which was founded in 1867 and spread chiefly after 1872 by local clubs or granges. especially in the west and south.

The height of the movement was reached in the autumn of 1874. It threatened the disruption of the old political parties in most of the middle western states. By holding the balance of power the Grangers secured legislation in many of these states. fixed maximum railway rates and provided for regulation through commissions. In the reaction after the panic of 1873 (when nearly one-fifth of the railway mileage of the United States had passed into the hands of receivers) many of the Granger laws were repealed, the regulation was rendered nominal and the railways more than regained their political power; yet the agitation had established the important principle, sanctioned by decisions of the supreme court, that the railways were common carriers subject fully to public regulation so far as it was not confiscatory. The movement for regulation of interstate commerce by congressional legislation was begun at this time under the leadership of congressmen from the Granger states. Later efforts were more wisely considered and more effective; but the rural democracy showed its opposition to the increasing political influence of capital. to special privileges and to the attempts of corporations to avoid public control periodically thereafter.

The presidential election of 1872 took place in the midst of this western upheaval At the same time in the south the reform Republicans and Democrats were uniting under the name oi Conservatives against the carpetbag rule, and control was passing into their hands A reform movement was active against the evident corruption in national and municipal administrations, for Grant's trust in his appointees was grossly violated. The Tweed ring nas systematically looting New York city, and prior to Tneed's indictment in 1871 it was acquiring large power in state legislation. Civil service reformers, men of moderate views with respect to reconstruction. many war Democrats who had adhered to the Union party, and tariff reformers began to break away

Grant Re-elected. — The Liberal-Republican movement started in Missouri. and a national convention was called to meet at Cincinnati, O., on May 1. 1872. Their platform attacked the corruption of civil service by the administration, supported the results of the war as embodied in the last three amendments and demanded amnesty and local civil government for the south. It opposed further land grants to railways, but denounced repudiation and demanded specie payments in terms which excluded from its support the advocates of inflation of the currency. This effort to combine the opponents of Grant's administration was wrecked by the nomination of Horace Greeley, a strong protectionist, who did not command the confidence of the masses of the disaffected. Although endorsed by the Democrats, Greeley was defeated by Grant, who ran on the record of the Republican party. which now dropped the word Union from its name. Greeley died before the electoral count; the Democrats won only the states of Maryland, Kentucky. Missouri. Tennessee, Georgia and Texas, the votes of Louisiana and Arkansas being thrown out.

Panic of 1873. —The enormous cost of the war. the excessive railway building, overtrading, and inflated credit and fluctuating currency, the sinking of capital in opening new farming lands and in readjusting manufactures to new conditions brought their results in the panic of 1873, precipitated by the failure (Sept. 18) of Jay Cooke. the financier of the Northern Pacific railway. For over five years the nation underwent a drastic purgation; railway building almost ceased and as late as 1877 over 18% of the railway mileage of the nation was in the hands of receivers. The iron industry mas prostrated and mercantile failures for four years amounted to $775,000,000 At the close of the period there was a replacement of partnerships and individual businesses by corporations. but in the interval political unrest was in the foreground

Crédit **Mobilier.**—The charges that congressmen had been bribed by stock in the Crédit Mobilier, a construction company controlled by Union Pacific stockholders, led to a congressional investigation which damaged the reputations of prominent Republicans, including Vice-President Schuyler Colfax; but the same congress which investigated this scandal voted itself retroactive increases of salary. and this back-pay grab created popular indignation. Evidences of fraud and corruption in revenue collection under the moiety system, and the general demoralization of the civil service continued. The demand for relief from the stringency of the crisis of 1873 expressed itself in the so-called Inflation bill (passed April 1874) providing a maximum of $400,000.000 for greenback issues. This was vetoed by Grant, but he later signed a bill accepting as a maximum the existing greenback circulation of $382,000,000. This compromise was satisfactory neither to contractionists nor greenbackers.

Republicans Lose Congress. — The tidal wave in the congressional elections of 1874 was the result of these conditions. It marked a political revolution. The house of representatives, which exhibited a two-thirds Republican majority in 1872, showed an opposition majority of about 70, and the senate was soon to be close. Such Republican strongholds as Pennsylvania. Ohio and Massachusetts went over to the Democrats in the state elections. while in the grain-raising states of the middle west the Grangers were holding the balance of power, and in the south the Republican radicals remained in force in few states and only by the use of federal troops. President Grant in his message of Dec. 1874 acknowledged that public opinion was opposed to this use of force, but declared that without it Negro suffrage would be worse than a mockery. Thus by the year 1874 the era of triumphant Republicanism and Reconstruction was closing. The leaders perceiving power about to pass from them rapidly enacted a series of party measures before the meeting of the newly elected congress. Under the leadership of Sen. John Sherman an act was passed (Jan. 14, 1573') providing for resumption of specie payments on Jan 1, 1879, gradually contracting greenbacks to $300,000,000 and compensating this by expanding the circulation of the national banks.

In the field of the tariff a similar policy was followed. The act of 1870 had somewhat reduced duties on tea, coffee. sugar and iron; but under western pressure in 1872 the Republican congress had consented to a 10% reduction on most classes of goods in order to save the general system of protection. On the eve of their relinquishment of full power the Republicans (March 3. 1875) repealed the Tariff act of 1872, increased the duties on molasses and sugar and increased the revenue tax on tobacco and spirits. Thus the tariff was restored to the war basis, before the incoming Democratic house could block the advance. Similarly on March 1 congress passed a Civil Rights act. milder than the measure for which Sumner had fought so long, guaranteeing equal rights to the Negroes in hotels, public conveyances and places of amusement and forbidding the exclusion of them from juries. An effort to pass a new force bill leveled against the intimidation of Negro voters failed. By these measures the Republicans placed the important features of their policy where they could be overturned only by a Democratic capture of presidency and senate

Supreme Court Decisions.—In the midst of these changes the supreme court handed down decisions undoing important portions of the reconstruction system by restraining the tendency of the nation to encroach on the sphere of the state; and restricting the scope of the recent constitutional amendments. On April 14, 1873, in the Slaughterhouse cases, the courts held that the amendments were primarily restrictions upon the states for the protection of the freedom of the Negro, rather than extensions of the power of the federal government under the definition of Cnited States citizenship, and that general fundamental civil rights remained under state protection In the case of the *United States* v *Reese,* decided March 27, 1876, the court declared parts of the act of 1870 (nhich provided for the use of federal force to protect the Negro in his right to vote) unconstitutional, on the ground that they did not specify that the denial of suffrage must be on the sole ground of race or colour. A reasonable prerequisite, such as a poll tax. for voting was permissible. The south later took advantage of this decision to restrain Negro suffrage indirectly. In *United States* v. *Cruikshank* (1876) the court held that the amendments to the constitution left it still the duty of the state rather than of the United States, to protect its citizens. even when whites had mobbed the Negroes. In 1883 the court declared the conspiracy clause of the Ku-Klux act unconstitutional and reitricted the application of the law to acts of a state through its officers and not to private citizens. In the same year it declared the Civil Rights act of 1875 invalid.

In 1875 President Grant refused the appeal of the carpetbagger Gov. Adelbert Ames of Mississippi to be supported by troops, whereupon Ames resigned his office to the conservatives. The Mississippi plan of general intimidation of Negroes to keep them from the polls was followed in Louisiana, South Carolina and Florida uhich alone remained Republican. Thus steadily the radical reconstruction policy and Republican control of the south were being reversed. It was made clear that Negro suffrage could be enforced upon the south only by military rule which could no longer command northern sympathy or the sanction of the federal court Northern interest increasingly turned to other issues, and especially to discontent over administrative corruption.

Corruption.—The spoils system had triumphed over the advocates of civil service reform to such an extent that Grant abandoned the competitive system in 1875 on the ground that congress did not support him in the policy. Enormous frauds in the collection of the internal revenue by the whisky ring with the connivance of federal officials were revealed in 1875, and at about the same time. Secretary of War William W. Belknap resigned to avoid impeachment for corruption in the conduct of Indian affairs. The enforced resignation in 1876 of Secretary of the Treasury Benjamin H. Bristow, after he had successfully exposed the whisky ring, and of Postmaster General Marshall Jewell, who had resisted the spoils system in his department, tended to discredit the administration. Blaine, the leader of the Republicans in the house of representatives, fell under suspicion on account of his earlier relations with the Little Rock and Fort Smith and Northern I'acific railways, which left it doubtful, in spite of his aggressive defense, whether he had not used his influence as speaker in previous congresses to secure pecuniary advantages from land grant railways.

Campaign of 1876.—Thus the campaign of 1876 approached, with the Republicans divided into (1) steadfast supporters of the Grant administration; (2) a discontented reform wing (which favoured former Secretary Bristow); and (3) an intermediate group which followed Blaine. This statesman made a bold stroke to shift the fighting which the Democrats planned to make against the scandals of the administration, to the old-time war issues. By proposing to exclude Jefferson Davis from amnesty, he goaded southern congressmen into indiscreet utterances which fanned anew the fires of sectional animosity. A compromise candidate was selected in the person of Gov. Rutherford B. Hayes. of Ohio, who had vigorously opposed the greenback movement in his state, and whose life and character, though little known to the general public. made him acceptable to the reform leaders of the party. The Democrats, demanding reform, economy, a revenue tariff and the repeal of the resumption clause of the act of 1875, chose the reform governor of New York, Samuel J. Tilden, as their candidate. The Independent National. or Greenback, party. which was to develop rapidly in the next two years, nominated Peter Cooper, a New York philanthropist, and demanded the repeal of the Resumption act, and the enactment of a law providing a paper currency.

Hayes Elected.—The election proved to be a very close contest. Tilden, according to the count of both parties, had a plurality of over 250,000 votes, and at first the leading Republican journals conceded his election. He had carried New York, Indiana, New Jersey and Connecticut and, by the Democratic count, the solid south. But the Republican headquarters claimed the election of Hayes by one electoral vote, based on the belief that the states of South Carolina, Florida and Louisiana had gone Republican. Since these states were in the midst of the transition from Negro to white government and elections were notorious for fraudulent practices, a serious question was raised. first as to the proper authority to count the electoral vote, and second, how far it was permissible to go behind the returns of the state authorities to ascertain the validity of the canvass of the votes in the state. The political capacity and moderation of the nation were severely tested; but in the end a characteristic American solution was found by the creation of an electoral commission in which five associate justices of the supreme court were joined with an equal number of representatives from each of the two houses of congress. The result was that this commission refused to "go behind the returns," and Hayes was declared elected by one vote. To prevent the threatened danger of a filibuster by Democrats of the house of representatives against the completion of the count until after the legal date for the inauguration of the president, Hayes's friends agreed with leading Democrats that he would withdraw the federal troops from Louisiana.

Thus a new era began under a moderate and reforming Republican president, a close Republican senate and a Democratic house of representatives. The southern question was not settled. but other issues of an economic and social nature increasingly forced themselves to the front. During the 12 years that followed Hayes's inauguration neither party held complete possession of both the executive and the two houses of congress. His own moderate character, the conditions of his election and the check imposed during the first two years by a Democratic house of representatives (and during the second two years by an opposition in both houses) made the period of Hayes's administration a transition from the era of Reconstruction to the era of dominant economic and reform agitation.

When he withdrew the troops which sustained the Republican governments in Louisiana and South Carolina. those states returned to the rule of the white Democrats. In the congress elected in 1878 the former slave states chose 101 Democrats to the house of representatives and only four Republicans. Leading Republicans like Blaine protested vigorously against the policy, declaring that the men who saved the union should govern it; and on the other hand the Democrats in congress added "riders" to appropriation bills designed to starve the administration into complete cessation of the use of troops and federal deputy marshals at southern elections. As a result of this policy extra sessions had to be iummoned in 1877 and 1879 to provide supplies for the government Hayes assisted his party by vetoing these coercive attempts of the Democrats and it was not until later that federal attempts to supervise southern elections entirely ceased.

Civil Service Reform.—As his early policy toward the south had dissatisfied many of the leaders of his party, his opposition to the spoils system alienated others. In 1877 a Civil Service Reform association was formed in New York and extended to other states. In June 1877 President Hayes issued an executive order against the participation of federal officers in political management, and he furnished evidence of his sincerity by removing Alonzo B. Cornell, the naval officer of New York, who was also chairman of both state and national Republican committees, and Chester A. Arthur, collector of the port of New York. As both were friends of Sen. Roscoe Conkling of that state, the leader of the Grant men, this was a bold challenge. The "Stalwarts" answered it by securing the nomination of Cornell as governor of New York and Arthur as vice-president of the United States.

Finances.—The monetary question rose to primary importance at this time. Hayes himself had campaigned in Ohio successfully against the greenback movement, and he chose as his secretary of the treasury, John Sherman, whose long service as chairman of the finance committee had made him familiar with conditions and influential with moderate men. The per capita circulation of the nation had fallen from $20.57 in 1865 to $15.58 in 1877 and was still declining. The remarkable increase in the production of silver, as the new mining regions were opened, was accompanied by a fall in its ratio to gold from 15 to 1 in 1860 to 17 to 1 in 1877. Congress had, in 1873. passed an act dropping the standard silver dollar from the list of coins; but though the significance of this omission of a coin not widely circulated passed almost unnoticed at the moment, the demonetization of silver was afterward stigmatized as a conspiracy, "the crime of 1873." As the date (Jan. 1, 1879) for the redemption of the greenbacks in specie approached, demands were renewed for the replacement of national bank notes by greenbacks, for the postponement, or abandonment of resumption, for the free coinage of silver, and for the use of silver as well as gold in payment of bonds redeemable in coin. Sectional grouping of debtor against creditor regions, rather than party alignment, showed itself in the votes, for each party had its "soft money" as well as "hard money" followers.

A monetary commission, appointed in 1876, reported in 1877, but without agreement or real influence upon the country. The president took strong ground against free coinage and against the payment of bonds in silver; but the house of representatives passed the measure, known as the Bland bill, for the free coinage of silver. by a vote of 163 to 34. In the senate this was amended and as it finally passed both houses it was known as the Bland-Allison act after the two leaders, the Democratic representative from Missouri and the Republican senator from Iowa. This compromise was carried over the veto of President Hayes and became a law Feb. 28, 1878. In the vote of Feb. 15, all but one of the senators from New England, New York and New Jersey opposed it, while the states west of the Alleghenies furnished only four opposing votes. The law restored the legal tender character of the silver dollar and authorized the secretary of the treasury to buy silver bullion at the market price, to an amount of not less than $2,000,000 nor more than $4,000,000 per month, and to coin the bullion into silver dollars.

Hardly had the Bland-Allison compromise been effected on the silver issue when an act was passed (May 31, 1878) forbidding the further retirement of greenbacks, which remained at $346,681,000. Substantially the same sectional alignment was followed in the vote on this bill as in the silver votes. Not satisfied with this legislation, nearly 1,000,000 voters cast their ballots for Greenback party candidates at the congressional elections in the autumn of 1878. The preparations of Secretary Sherman had been so carefully made, and the turning tide of trade brought coin so freely to the United States, that before the date of resumption of specie payments a gold reserve had been accumulated to the amount of $133,000,000 in excess of matured liabilities and the greenbacks rose to par before the date of redemption.

Election of 1880.—In the campaign of 1880 Hayes and Tilden both declined to stand for renomination. Thus the issue of the "fraud of 1876," which the Democratic platform called the paramount issue, was subordinated. Nor was it possible for the Republicans to force the tariff question into a commanding position, for although the Democratic platform declared for a tariff for revenue only, a considerable wing of that party led by Samuel J. Randall, of Pennsylvania, favoured protection. Gen. Winfield S. Hancock, a distinguished soldier in the Civil War, whose nomination for the presidency by the Democrats was designed to allay northern distrust, refused to make the tariff a national issue. The recent adjustment of the monetary question and return of prosperity relegated the discussion of the currency also to a subordinate place.

The Republicans, after a heated convention in which the followers of Grant, Blaine and Sherman fought each other to a deadlock, selected Gen. James A. Garfield of Ohio, who was political manager for Sherman in the convention. This was a blow to the Grant or Stalwart wing, which was, however, partly placated by the nomination of Arthur for the vice-presidency. Garfield's popular plurality was only a little over 9,000 out of a total vote of over 9,000,000; but his electoral vote was 214 to Hancock's 155. The area of the former slave states marked the boundaries between the Republican and the Democratic states, except that Hancock also carried New Jersey, Nevada and California. The Republicans won the elections for the house of representatives which would meet in 1881, and the senate was at first nearly evenly divided, two independents holding the balance. In the ensuing four years party lines were badly broken, factions made bitter war upon each other, and the independent reformers or Mugwumps grew in numbers. The selection of Blaine as secretary of state committed Garfield to the anti-Grant wing, and the breach was widened by his appointment of the collector of the port of New York against the protests of Roscoe Conkling and Thomas C. Platt, the Stalwart senators from New York. They resigned, then sought re-election in order to vindicate the right of senatorial recommendation, but were defeated.

Garfield Assassinated.—In the midst of this excitement the president was assassinated by a disappointed office seeker. Vice-President Arthur, who succeeded Garfield in Sept. 1881, by his tact and moderation won the admiration of former opponents; but the poor crops in 1881 and the dissatisfaction with boss rule among independent voters caused a Democratic victory in the congressional campaign of 1882.

Legislative Acts.—Garfield's assassination had given new impetus to the movement against the spoils system, a National Civil Service Reform league had been organized in 1881, President Arthur presented the question in his message of December of that year, and in 1882 George H. Pendleton, a Democratic senator from Ohio, urged the subject upon the attention of congress. Stimulated by the elections of 1882 congress passed an act (Jan. 16. 1883) authorizing the president to appoint a commission to classify certain of the federal employees, and providing for appointment and promotion within this classified list by competitive examination. Congressional recommendacions for these offices were not to be received, and political assessments for campaign purposes were forbidden. This was an effective beginning in the purification of the civil service; but the evil of assessment of employees was succeeded by the evil of soliciting campaign contributions from corporations interested in legislation. The extension of the competitive list proceeded gradually through succeeding administrations. The Edmunds Anti-Polygamy act (1882) was leveled at the Mormons and the Chinese Exclusion act was passed at the demand of labour, after a long agitation in 1882. the way having been prepared by the treaty of Peking in 1880. Bills to this effect had been vetoed by Hayes and Arthur as violative of international agreement, but the desire of the politicians to win the California vote, and the compromise by which the exclusion was limited to ten years finally carried the measure, and the supreme court (1889) held it constitutional.

Surplus Revenues.—From 1879 to 1890 the treasury showed a surplus of revenue over expenditure. This furnishes the explanation of much of the legislation of that period. It led to extravagant appropriations, such as the Arrears of Pensions act of 1879, and the River and Harbor act of 1882 providing for the expenditure of more than $18,000,000 which was passed over the veto of Arthur. Appropriation bills were merely constructed in various committees of congress under a system of bargaining between interests and sections with primary reference to the political fortunes of the congressmen.

The surplus also strengthened the demand for a reduction of the tariff. A tariff commission, composed of men friendly to protection. appointed in 1882, proposed an average reduction of 20% to 25%. Nevertheless, in the act as passed in 1883 duties were increased in general on those protected articles which continued to be imported in large volume, especially on certain woolen goods and about two-thirds of the imported cotton goods, and on iron ore and some steel products. while they were lowered on finer grades of wool and cheaper grades of woolen and cotton fabrics. etc. It was unsatisfactory to large portions of both parties and did not materially lower the revenue; but the act of 1883 made extensive reductions in internal taxes. As the senate had just fallen into the hands of the Republicans, and the house would not become Democratic until the new congress met, this protective law gave the Republicans the advantage of position. Moreover, the Deinocrats were themselves divided, 19 representatives voting with the Republicans on the act of 1883. In the next congress (1884), when the leaders made an attempt to rally the Democrats to show their position by passing a bill for a horizontal reduction of 20% in general, 41 Democrats voted against the bill and prevented its passage through the house.

Election of **1884.**—Thus the campaign of 1884 found both parties still lacking unity of policy although it seemed possible that the tariff might become the touchstone of the contest. The Republicans challenged the independents by nominating Blaine. whose record was objectionable to many reformers, and who had been chiefly identified with the Reconstruction politics. The Democrats, taking advantage of the situation, nominated Grover Cleveland of New York. He had won approval by his reform administration as mayor of Buffalo and as governor of New York during the past two years, when he had shown an independence of party "bosses" and had convinced the public of his sincerity and strength of character. He represented conceptions and interests which had grown up since the war, and which appealed to a new generation of voters. The platform emphasized the idea that "new issues are born of time and progress." and made the leading question that of reform and change in administration, lest the continued rule of one party should corrupt the government. On the question of tariff the Democrats took a conservative attitude, emphasizing their desire to promote healthy growth, rather than to injure any domestic industries, and recognizing that capital had been invested and manufactures developed in reliance upon the protective system. Subject to these limitations, they demanded correction of abuses. The Greenbackers nominated Gen. Benjamin F. Butler of Massachusetts, recently chosen governor of that state on the Democratic ticket, but he polled only 175,000 votes. John P. St. John, the candidate of those who would prohibit the liquor traffic, secured 150.000 votes, an unprecedented gain.

Cleveland President.— The campaign abounded in bitter personalities, and the popular vote was close, Cleveland's plurality being only about 23,000. The state of Kew York, with electoral votes enough to have turned the scale. was carried by the Democrats by only a few more than 1.000 votes out of a total of over 1,000,000. Cleveland's electoral majority was 37. The election was nevertheless recognized as marking an epoch. For the first time since victory came to Lincoln and the Republicans on the eve of the Civil War, nearly a quarter of a century earlier, the country had entrusted power to the Democrats, although over two-thirds of their electoral vote came from the former slave states. Kew York, Connecticut, New Jersey and Indiana constituted their northern territory. Perhaps the most significant thing about the result was the evidence that in the north political and sectional habits and prejudices were giving way among a sufficient number of independent voters, responsive to strong personal leadership on reform issues, to turn the political scale. The transition from war issues which began in 1872, and became marked in 1876, was completed by the election of Cleveland in 1884.

During the first half of his term President Cleveland had the opposition of a strongly Republican senate. In the second half the senate remained Republican by a majority of two, and the house continued Democratic. His civil service policy naturally met severe criticism not only from his party foes, but also from the spoilsmen among his Democratic followers, who desired a clean sweep of Republican officeholders, and from those of his independent supporters who looked to him to establish the service on a strictly nonpartisan basis. The outcome of the first two years of his administration was that. of the entire body of federal officeholders. two-thirds were changed and the Tenure of Office act was repealed. thus leaving the president the right of removal without presenting his reasons. Nevertheless there was a gain, for the criticism by the Republicans placed them on record against the former spoils system; Cleveland somewhat checked the political activity of officeholders; and before leaving the presidency he transferred the railway mail service to the classified list requiring competitive examination.

The transition of executive power for the time to the Democratic party, however much it impressed the imaginations of the public, as the end of an era, was not so significant as the national growth and expansion in the decade between 1880 and 1890 whereby forces were set loose which determined the characteristics of the succeeding period. Between these years the nation grew from about 50,000,000 to nearly 63,000,000. The middle west, or north central group of states, gained over 5,000,000 and the western division over 1,250,000. West of the Alleghenies altogether more than 8,000,000 persons had been added. while the old eastern states gained but 4,000,000. In 1890 the north central division alone had achieved a population more than 5,000,000 greater than that of the north Atlantic, while the trans-Allegheny region surpassed the whole east by about 10,000,000, and the numbers of its representatives in house and senate placed the political destiny of the nation in its hands.

The West.—One of the most important reasons for the wholesale taking up of western resources in these and the following years was the burst of railway building subsequent to the interruption of the panic of 1873. The eager pioneers pushed into western Kansas and Nebraska as they had into the northern Ohio valley a half-century before. Nebraska grew from a population of 123.000 in 1870 to 450,000 in 1880 and to over 1,000,000 in 1890. From about 365.000 in 1870, Kansas rose to almost 1,000,-000 in 1880, and to nearly 1,500,000 in 1890. The railway had "boomed" the "golden west" and a cycle of abundant rains seemed to justify the belief that the Great American desert mas a myth. Thus settlers borrowed money to secure farms beyond the region of safe annual rainfall under the agricultural methods of traditional pioneering. Swift disappointment overtook them after 1886, when droughts and grasshoppers ruined the crops and turned back the tide of middle western colonists until the western parts of these states were almost depopulated, Kansas alone losing one-seventh of its population; nor did prosperity return for a decade.

As the column of settlement along the Ohio valley had extended its flanks into the old northwest between the Ohio and the Great Lakes, and into the old southwest of the lower Mississippi after the War of 1812, so the later pioneers by railway trains began to take possession of the remoter and vaster northwest and southwest. The granger roads, centring in Chicago, thrust their lines out to develop wheat farms in interior Iowa, Minnesota and the Dakotas, where the virgin soil of the prairie farms brought returns that transferred'the wheat belt to this new land of promise, and by competition forced the older wheat areas to develop varied agriculture. The introduction into the Minneapolis mills of the recently invented steel-roller system of making flour not only built up a great flour industry there but created a demand for the hard wheat suited to the northwestern prairies. The pine forests of Michigan, Wisconsin and Minnesota were exploited in the same era.

A more impressive movement was in progress as additional transcontinental railways were extended from the frontier to the Pacific. In 1870 for 1,000 mi. W. of Duluth. Minn., at the head of Lake Superior, along the line of the projected Sorthern

Pacific railway there a-ere no cities or little towns. Relying upon its land grant and upon the undeveloped resources of the vast tributary region, the railway, after halting for a few years subsequent to the panic of 1873 at Bismarck, N. Dak., on the Missouri rushed its construction to Seattle. Wash.. and was opened in 1883. The Great Northern, a product of the vision and sound judgment of James J. Hill, started from St. Paul, Minn., without a land grant and reached Puget sound in 1893. Thus a new industrial zone had been brought into existence. Colorado had become a state in 1876; in 1889 North Dakota, South Dakota, Washington and Montana were admitted as states and the next year Idaho and Wyoming were added. The western political forces. especially the friends of silver, were thus given the balance of power in the senate.

As a new northwest was opened by the completion of the Canadian Pacific (1883). the Northern Pacific (1883) and the Great Northern (1893), so the new southwest was entered by the completion of the Southern Pacific from New Orleans, La.. across Texas, New Mexico, Arizona and southern California to San Francisco by 1883. In 1883 also the lines which became the Atchison, Topeka and Santa Fe, extending from the lower Missouri valley, with St. Louis and Kansas City. Mo., as important terminals, through southeastern Colorado, northern Arizona and New Mexico. reached the same goal. The Denver and Rio Grande opened new mining areas between Denver, Colo., and Ogden. Utah.

Not only additional mines were reached by these lines: but a great cattle country, recently the habitat of the bison and the Indian, was opened. All the large cities commanding the approaches to this country developed packing industries. but Chicago especially profited. Southeastern Texas was the original home of these cattle ranches, but the driving of herds to supply the miners of the Rocky mountains revealed the fact that the whole bison country was capable of supporting range cattle. and the practice grew of driving the stock to the feeding ground of the north and returning. The height of the movement along the cattle trail, which in its largest extent ran through the public lands of the Great Plains from Texas to the Dakotas and Montana. was reached in 1884. In that period cattlemen fought over the possession of the range, controlled vast tracts by seizing the approaches to the water supplies under perversion of the land laws, fenced in the public domain! either defiantly or by leases from land-grant roads, and called out proclamations of presidents from Hayes to Cleveland. The steady advance of the farmer, and protective measures against the spread of the cattle disease known as Texas fever, gradually prevented the continuance of the trail and ultimately broke down the system of great ranches. About 1870 shipment of livestock from Chicago had become significant,and within a decade the refrigerator car revolutionized the packing industry by making possible the shipment of dressed beef not only to the markets of the eastern United States but even to Europe. The value of slaughtering and packing industries in the United States increased from less than $30,000.000 in 1870, to $564,000,000 in 1890.

Another important revolution in American economic life was effected by the opening of new iron mines, the growth of the steel and coal industry and the rise of an extraordinary internal commerce along the whole length of the Great Lakes. By 1890 the output of pig iron in the United States surpassed that of Great Britain! having doubled after 1880. The full meaning of the revolution is seen in the fact that by 1907 the United States produced more pig iron and steel than Great Britain. Germany and France combined. As a result of the growth of the wheat, lumber and iron-ore production of the northwest, the traffic along the 1,000 mi. of the Great Lakes grew (chiefly after 1890) by leaps, and changed from wooden sailing vessels to steel ships driven by steam. The traffic through the Sault Ste. Marie canal came greatly to exceed that through the Suez canal.

The New South. — The south shared in these industrial transformations. Not only did white labour produce an increasing proportion of the cotton crop, but cheap white labour came from the uplands to cotton mills situated at water-power sites. This, with the abundant supply of raw material, enabled the south to develop cotton manufacture between 1880 and 1890 on a scale that threatened New England's dominance. The southern Appalachians began to yield their treasures of coal and iron; northern Alabama became one of the great centres of the iron industry and the south produced nearly 400,000 tons of pig iron in 1880 and 2,500,000, 20 years later. By 1890 the production of coal, iron ore and pig iron in this section was as great as that of the United States in 1870. The value of the products of manufacture in the south rose from $338,000,000 in 1880 to $1,184,000,000 in 1900. The exploitation of the longleaf pine forests also attracted northern capital. Fruit and truck gardening grew rapidly, and the south began to exhibit traits of industrial development familiar in the north and west. The Negro problem continued to hold the south as a whole to the Democratic party.

Industrial Changes. — The opportunities opened to capital by these forces of growth in the west and south, as well as the general influence of an age of machine production, led to transformations in the east which brought new difficulties for political solution. The east began to exhibit characteristics of other long-settled countries where increasing density of population and highly developed industry were accompanied by labour troubles. To capital the opening resources of the west, and the general national prosperity after 1879, offered such inducements that large-scale production by corporations became the order of the day. The forces which had exhibited themselves in increased manufacture and railway development between the Civil War and the panic of 1873 now found expression in a general concentration of industries into fewer plants with vastly greater capital and output, in the combination of partnerships into corporations, and of corporations into agreements and trusts to avoid competition and to secure the needed capital and economies for dealing with the new problems of industrial magnitude. Western farming competition led to the actual abandonment of much inferior land in New England and to agricultural disadvantages in the middle states. As agriculture became less attractive and as industrial demands grew, the urban population of the east increased at the expense of the rural. The number of cities of the United States with a population of more than 8,000 nearly doubled between 1880 and 1890; by 1900, the urban population constituted more than one-third of the total; this phenomenon was especially marked in the north Atlantic division, where, by 1900, more than one-half the population was in cities of more than 8,000 inhabitants.

In similar fashion concentration of industry in large establishments was in progress. In 1880 nearly 2,000 mills were engaged in the woolen industry; in 1890 not many more than 1,300. Even more marked was the change in iron and steel, where large-scale production and concentration of mills began to revolutionize this fundamental industry, and other lines of production showed the same tendency. The anthracite mines of Pennsylvania fell into the possession of seven coal-carrying railways which became closely allied in interest. In most of the important industries the tendency of large organizations to subject or drive out the small undertakings became significant. Already the railways, to avoid cut-throat competition, had begun to consolidate, to form rate agreements and to pool their earnings.

Interstate Commerce Act. — The Cullom bill as enacted into the Interstate Commerce law of Feb. 4. 1887, was framed to prevent unjust discriminations by the railroads between persons, places and commodities, the tendency of which was to foster monopoly. The law forbade discriminations and pooling, made a higher charge for a short haul than for a long haul over the same road illegal, required publicity of rates. and provided for a commission to investigate and fine offenders. But the decisions of the commission were reviewable by the federal courts and the offender could be coerced. if he refused to obey the commission, only by judicial proceedings. The commission was empowered to provide uniform accounting and to exact annual reports. The principle settled by the lam was an important one, and marked the growing reliance of the former individualistic nation upon federal regulation. But the difficulties by no means disappeared; the federal judiciary, refusing to accept the findings of the commission on questions of fact, retried the cases; and the supreme court overruled the commission on fundamental questions, and narrowed the scope of the act by interpretation.

Social Unrest.—Labour exhibited the tendency to combination shown by capital. The Knights of Labor, founded in 1869, on the basis of "the individual masses" instead of the trades unions, and professing the principle that "the injury of one is the concern of all." grew from a membership of about 100,000 in 1885 to 730.000 in 1886. The number of strikes in 1886 was more than twice as many as in any previous year. In one of the strikes on the Gould railway system 6,000 mi. of railway were held up. In New York, Henry George, author of books proposing the single tax on land, ran for mayor of the city and received 68,000 out of 219,000 votes. At the same time socialistic doctrines spread. even among western farmers. But sympathetic strikes, anarchistic outbreaks and drastic plans for social change did not appeal to the people as a whole. The Knights of Labor began to split, and the unions, organized as the American Federation of Labor, began to take their place with a less radical membership. President Cleveland broke with precedents in 1886 by sending in the first message on labour, in which he advocated. without success, a labour commission to settle controversies. A national bureau of labour to collect statistics had been established in 1884; state legislation increasingly provided for arbitration of labour disputes and regulation of factories and child labour.

Early in 1885 a law had been enacted forbidding the importation of labour under contract, and in 1888 the Chinese Exclusion act was continued. Immigration was exceptionally large in the decade from 1880 to 1890, amounting to about 5,250,000 as compared with 2,800,000 for the previous decade. But a large number of these newcomers settled on the newly opened lands of the middle west. By 1890 persons of German parentage in the middle west numbered more than 4,000,000. Minnesota held 373.-000 persons of Scandinavian parentage. The Irish constituted the largest element among the English-speaking immigrants. The population of foreign parentage amounted to one-third of the whole population of the United States in 1890.

In the midst of this national development and turmoil President Cleveland struggled to unite his party on a definite issue. The silver question continued to divide each party, the continued fall of silver leading to renewed agitation for free coinage. The surplus led to extravagant appropriation bills, such as special pension bills, which Cleveland vetoed altogether, thereby incurring criticism by veterans of the Civil War, and river and harbour improvement measures, particularly the act of 1886, to which the president gave reluctant assent, and the bill of 1887, to which he gave a pocket veto by refusing his signature. But the retention of the surplus in the treasury would create a monetary stringency, its deposit in banks aroused opposition and its use to buy bonds was unpopular with the Democrats.

The Tariff.—Cleveland boldly met the issue and gave purpose to his party by his annual message of Dec. 1887, which he entirely devoted to an exposition of the situation arising from the surplus, and to a demand for a revision of the tariff in order to reduce revenue. He did not profess free-trade doctrines: "It is a condition which confronts us, not a theory,'! he declared. The election of 1386 had reduced the Democratic majority in the house, but the president was able to induce his party to pass the Mills hill (1888) through that body as a concrete presentation of policy. The hill put many important raw materials (including wool) on the iree list. substituted ad valorem for specific duties to a large extent. and generally reduced the protective duties. It was believed that the measure would remit more than $50,500.000 of duties, nearly $20,000,000 of which would result from additions to the free list. The Republican senate also found party unity on the tariff issue and its committee on finance, under the leadership of Sen. Nelson W. Aldrich of Rhode Island, drafted a counter-proposal. They would reduce revenue by repealing the taxes on tobacco, and the taxes on spirits used in the arts and for mechanical purposes, and by revising the tariff so as to check imports of articles produced at home.

Harrison Elected.—On the tariff issue the two parties contested the election of 1888, the Republicans denouncing the Mills bill and the Democrats supporting it. Blaine having withdrawn from the contest, and John Sherman having secured but little more than half the votes necessary to nominate, the Republicans picked from a multitude of candidates Gen. Benjamin Harrison of Indiana, grandson of Pres. William Henry Harrison, to run against Cleveland. The popular vote was exceedingly close, but Harrison had an electoral majority of 65, having carried all of the states except the solid south. Connecticut and New Jersey. The increasing use of money to influence the election, and particularly the association of great business interests with such political bosses as Matthew S. Quay of Pennsylvania and Thomas C. Platt of New York, were features of the campaign. The congressional elections ensured to the Republicans the undisputed control of all branches of the government when the 51st congress should convene, and it was generally agreed that the party had a mandate to sustain the protective tariff.

Lacking a large majority in either house the Republicans were exposed not only to the danger of free silver defections in the senate, but also to filibustering by the Democratic minority in the house as the means of blocking the victorious party's program. These obstructive tactics were made possible chiefly by the use of privileged motions and roll calls to delay business, and the refusal to respond on the roll call for a vote, thus preventing a quorum. Speaker Thomas B. Reed of Maine, a virile and keen-witted leader, greatly strengthened the power of the speaker, as well as expediting the business of the house, by ruling that the constitution required a present, not a voting: quorum; and in spite of disorderly protests he "counted a quorum" of those actually present. By securing rules sanctioning this action and empowering the speaker to refuse to entertain dilatory motions, that officer became the effective agent for carrying on the business of the party majority. As his power through the committee on rules, which he appointed, grew, he came, in the course of time, also to dominate the action of the house, refusing to recognize members except for motions which he approved. This efficiency of action was secured at a loss to the house as a representative and debating body, responsive to minority proposals.

Sherman Anti-Trust Act.—But the discipline of party caucus and house rules enabled the Republican leaders to put through with rapidity a number of important laws. One of these was the measure known as the Sherman Anti-Trust act of July 2, 1890, which declared combinations affecting commerce between the several states, or with foreign nations, illegal and punishable by fine or imprisonment or both. This act, the full power of which was not exhibited until later, was a response to the growing unrest of the nation as other corporations emulated the success of the Standard Oil trust (formed in 1882). The members of a trust combined in an organization managed by boards of trustees whose certificates the former owners accepted instead of their shares of stock in the component companies. Competition was thus eliminated within the combination and the greatly increased capital and economies enabled it not only to deal with the increasing magnitude of business operation! but also to master the smaller concerns which opposed it. State legislation had proved unable to check the process. partly because the trust was an interstate affair. By putting into operation its power to regulate interstate commerce: congress responded to the popular demand for federal restraint of these great combinations which threatened the old American ideals of individualism and freedom of competition. The trusts, although embarrassed, soon showed their ability to find other devices to maintain their unified control. Nor was the act used, in this period, to prevent the railways from agreements and combinations which in large measure neutralized the anti-pooling clause of the Interstate Commerce act of 1887.

Silver **Purchases.**—Another important law was the so-called Sherman Silver Purchase act of July 14, 1890. By 1885 the ratio of silver to gold had fallen to 1 to 22. In the 12 years of the Bland-Allison act of 1878 over 378,000,000 silver dollars had been coined from bullion purchased at the market price. This bullion value was falling: it was 89 cents in 1877 and 72 cents in 1889. The production of gold in the United States in 1878 was about 2.500.000 fine ounces, and of silver about 35,000,000: in 1890 the gold production was 1,588,000 and the silver j1.500.000. The Silver Purchase act authorized the secretary of the treasury to purchase each month 4,500,000 oz. of silver at its market price and to pay for it in treasury notes redeemable at his discretion, in silver or gold.

McKinley Tariff. — The customs duties upon which the fighting of the campaign of 1888 had turned was promptly taken up, and in the McKinley Tariif act of Oct. 1, 1890 the Republicans embodied their conceptions of protection to American industry. Some of the main features of this law were: the addition of agricultural products to the protected articles; the extension of the free list. particularly the inclusion therein of raw sugar, which had been bringing in a revenue of $50.000.000 annually; the granting of compensating bounties to sugar planters to an amount of about $10,000,000 a year; and the raising of duties to the prohibitory point on many articles of general consumption which could be produced at home. Blaine, then secretary of state, had just been active in promoting closer relations with South America wherein he hoped for an extension of American trade and he severely criticized the bill as it passed the house, because the free list opened wide the doors of American trade, particularly to sugar-producing countries, without first exacting compensating advantages for U.S. products in those markets. To meet this criticism a provision was finally added authorizing the president to impose discriminating duties where it was necessary to obtain the advantages of reciprocity.

This tariff. which passed on the eve of the congressional elections of 1890. was immediately followed by such increases in prices and the cost of living that it was potent in bringing about the political revolution. or landslide. which swept the Republicans from power in the house of representatives. The Republicans returned but 88 members as compared with nearly twice that number in the congress which passed the McKinley bill. Looked at broadly, the movement was a rural uprising, strongest in the south and middle west, the old Granger areas. against forces which seemed to them to threaten their ideals of American democracy. But the movement was recruited by the silver-mining states and discontented labour interests.

Farm products had not proportionately shared the general increase in prosperity. This convinced large portions of the agricultural west that the currency system had too narrow a basis in gold, which was appreciating ,in value. Much of the middle western agricultural development had been made on borrowed eastern capital, and it seemed to the farmer that the principal of his mortgage was in effect increasing with the rise in the price of gold, at the same time that his crops brought a smaller net profit. He did not give due attention to the effect of greatly increased production; as the new wheat lands mere opened on such a grand scale; but he was keenly sensitive to increased freight rates and to the influence of eastern capitalists, banks, bondholders. trusts and railways upon federal and state legislatures arid judiciary. After the evidence of the power of this tide of western discontent in the elections of 1890, those portions of it which were ripest for revolt combined in 1892 as the People's party or Populists. soon to prove an important political factor.

'The Republicans meanwhile had been actively reducing the surplus. In 1892 the excess of revenue over expenditures was $10,000,000; in 1893 only $2,000,000. This was effected not only by the Tariff act but by such measures as the Dependent Pension act of 1890 (resulting in a list of pensioners of the Civil War which cost the nation $68,000,000 by 1893, over one-half of these pensioners having been added during Harrison's administration ι; the rapid construction of the new navy, raising the United States from 12th to 5th in the list of naval powers; the repayment of the direct war tax to the states (1891) to the amount or' $51,000,000; and other appropriations such as those provided by river and harbour bills. The Democrats stigmatized this congress as a "billion-dollar congress" from its expenditures: to which Speaker Reed replied that the Cnited States was a billion-dollar nation. In fact the Democrats when they regained power were not able greatly to diminish the cost of government.

Homestead Strike. — The Democratic house in the 52nd congress repressed obstructive Republican tactics by methods like those adopted by Speaker Reed. and contented itself with passing a series of bills through that body proposing reductions of the tariff in special schedules, including free wool and a reduction of the duty on woolens, free ram material for the cotton planters of the south, free binding twine for the farmers of the north and a reduced duty on tin plate for the fruit raisers Of course these bills failed in the Republican senate. A bloody strike on the eve of the election of 1892 in the great steel norks at Homestead, Pa , where armed guards engaged by the company fired upon the mob which sought higher wages, was not nithout its adverse effect upon public sentiment in regard to the Republican tariff for the protection of labour.

During the campaign of 1892 the Democrats rejected a conservative tariff plank, dcnounccd the McKinley tariff in violcnt language, and denied the constitutional power to impose tariff duties except for the purpose of revenue only. But Cleveland, who was renominated in spite of vigorous opposition from leading politicians of his own state, toned down the platform utterances on the tariff in his letter of acceptance. In their declarations upon the currency the Democrats furnished a common standing ground for the different factions by attacking the Silver Purchase act of 1890 as a cowardly makeshift.

Cleveland Re-elected. — The People's party, in its national convention at Omaha, Neb. (July 1892), drew a gloomy picture of government corrupted in all of its branches, business prostrated, farms covered with mortgages, labour oppressed, lands concentrating in the hands of capitalists. Demanding the restoration of government to the plain people, they proposed an expansion of its powers, to afford an adequate volume of currency and to check the tendency to "breed tramps and millionaires." Among their positive proposals were: the free and unlimited coinage of silver at the legal ratio of 16 to 1; the expansion of a national currency issued directly to the people; the establishment of postal savings banks; government ownership of the railways, telegraph and telephone; restoration to the government of the lands held by railways and other corporations in excess of thei needs; and a graduated income tax. Combining with the Democratic party in various states beyond the Mississippi, and with Republicans in some of the southern states, they won large masses of voters in the west, and exerted an influence upon public opinion in that section beyond what was indicated in the returns, although Gen. James B. Weaver of Iowa, their candidate for the presidency, received over 1,000,000 popular votes and 22 votes in the electoral college. The Republicans renominated President Harrison, though he lacked an enthusiastic personal following. They supported the McKinley Tariff act in spite of the wave of opposition shown in the elections of 1890. But, fearing party divisions, they, like the Democrats, made an ambiguous declaration on the currency. The result of the election of 1892 was to return the Democrats under Cleveland to power by a plurality of over 380,000 and an electoral plurality of 132. Congress in both branches was to be Democratic in 1893, and the way was open for the first time in a generation for that party to carry out a policy unchecked by any legislative or executive branch of government.

Panic of 1893. — But before Cleveland was fairly started in his second administration the disastrous panic of 1893 swept the nation, nor did prosperity return during the four years that followed. The panic is not, directly at least. to be traced to the silver purchases; but was the result of various causes, including the agricultural depression, farm mortgages, reckless railway financing and unsound banking in the Cnited States. The panic began in the spring with the failure of the Reading railway and the collapse of the National Cordage company: one of the numerous examples of reckless trust financiering into which large banks had also been drawn. Clearinghouse certificates were resorted to by the New Tork banks in June, followed in August by partial suspension of specie payments. Currency remained at a premium for a month; deposits in national banks shrank enormously; national bank loans contracted more than 14.7%; failures were conimon; 22,000 mi. of railways were under receiverships and construction almost ceased.

The panic of 1893 was in many ways a turning point in American history. It focused attention upon monetary questions. prostrated the silver-mining states, embittered the already discontented farming regions of the west, produced an industrial chaos out of which the stronger economic interests emerged with increased power by the absorption of embarrassed companies, and was accompanied by renewed labour troubles. Most noteworthy of these was the Pullman Car company strike near Chicago in 1894, which led to sympathetic strikes by the American Railway union, extending over 27 states and territories from Cincinnati to San Francisco, Mobs in Chicago burned and looted cars The refusal of Gov John P. Altgeld of Illinois to call out the militia, and interference with the United States mails, led President Cleveland to order federal troops to the scene, on the constitutional ground that they were necessary to prevent interference with interstate commerce and the postal service and to enforce the processes of the federal courts. The courts issued a sweeping injunction requiring that the members of the American Railway union or other persons to desist from interference with the business of the railways concerned. The president of the striking organization. Eugene V. Debs, was imprisoned for contempt of court and conspiracy.

Silver Issue.—The most immediate political effect of the panic was upon the silver issue. Soon after the outbreak of the financial crisis, the gold reserve, which protected the greenbacks and the treasury notes issued under the Silver Purchase act, shrank ominously, while foreigners returned their American securities instead of sending gold. To sell bonds in order to replenish the gold reserve, and to repeal the Silver Purchase act without substituting free coinage, would aggravate western discontent and turn away the promise of recruits to the Democratic party from the Populists of the prairie and silver-mining states; to carry out the Democratic platform by a tariff for revenue only while mills were shutting down would be hazardous in the east The fruits of victory were turning to ashes; but Cleveland summoned a special session of congress for August, while the panic was acute, and asked his party to repeal the Silver Purchase act without accompanying the repeal with provisions for silver. Not until the last of Oct. 1893 was repeal carried, by a vote in which the friends of repeal in the house were about equally divided between Democrats and Republicans, and nearly two-thirds of its opponents Democrats.

By this time the surplus had disappeared and the gold reserve was drawn upon for ordinary expenses. Early in 1894 the administration, failing to secure legislation from congress to authorize the sale of gold bonds on favourable terms to protect the reserve, sold under the Resumption act of 1875 $50,000,000 5% bonds, redeemable in ten years. Part of this very gold, however. was withdratvn from the reserve by the presentation of legal tender notes for redemption. and the endless chain continued this operation to the verge of extinguishing the reserve, so that another loan of $50,000,000 in 1854 was followed in 1855 by a dramatic meeting between Cleveland and some of his cabinet with the Wall street banker, J. Pierpont Morgan, who agreed on behalf of his syndicate to sell the government $65,166,000 of gold for $62,315,000 of bonds, equivalent to 4% bonds for 30 years at a price of 104. In return the syndicate agreed to use its influence to protect the withdrawals of gold from the treasury. These securities were oversubscribed when offered to the public at 1124. President Cleveland had protected the treasury and sustained the parity of gold and silver, but at the cost of disrupting his party. Again, in the beginning of 1896, the treasury was forced to sell bonds, but this time it dealt directly with the public and easily placed $100,000,030 in bonds at about 111, affording a rate of interest about equal to 3.4%.

Tariff Reform.—Before the political harvest of the monetary issue was reaped, the Democrats had also found party ties too weak to bear the strain of an effective redemption of the party pledges on the tariff. The Wilson bill prepared as the administrative measure was reported late in 1893, while the panic was still exerting a baneful influence. Its leading features were the substitution of ad valorem for specific duties in general, the extension of the free list to include such materials of manufacture as iron ore wool coal, sugar and lumber and the reduction of many prohibitory rates. The loss in revenue was partly provided for by an income tax significant of the new forces affecting American society, and an increase in the duty on distilled liquors. Although the bill passed the house by an overwhelming majority, it met the opposition in the senate of the representatives. Democratic as nell as Republican, of those states ahose interests were adversely affected. Led by Senators Arthur P. Gorman of Maryland, Calvin S. Brice of Ohio, and David B. Hill of New Tork, the bill was transformed by an alliance between Democratic and Republican senators on the plea that it would otherwise result in a deficit of $100,000 000 Coal, iron ore and sugar were withdrawn from the free raw materials and specific duties replaced ad valorem in many cases. while many other individual schedules were amended in the direction of protection. The house, given the alternative of allowing the McKinley act to remain or to accept the senate's bill, yielded, and the Wilson-Gorman Tariff act became a law without the president's signature, Aug 27, 1854. Even the income tax was soon (1895) held by the supreme court to be unconstitutional.

Venezuela Message.—Tonard the close of his administration Cleveland s brusque message on the Venezuelan boundary question aroused such excitement and so rallied the general public (though not the more conservative) that the war spirit, shown soon afterward against Spain, might have been a potent factor in the election of 1896 had not Great Britain exhibited exceptional moderation and self-restraint in its attitude. The silver question, therefore, became the important issue. The Republicans nominated McKinley and declared for the gold standard in opposition to free coinage, losing thereby an influential following in the silver-mining and prairie states, but gaining the support of multitudes of businessmen among the Democrats in the east and middle west.

William J. Bryan.—The Democratic convention marked a revolution in the party. The old school leaders were deposed by decisive majorities, and a radical platform was constructed which made "the free and unlimited coinage of both silver and gold at the present legal ratio of 16 to one, without waiting for the aid or consent of any other nation," the paramount issue. Objecting also to the decision against the income tax, and to "government by injunction as a new and highly dangerous form of oppression," they incurred the charge of hostility to the federal judiciary. William Jennings Bryan made a brilliant speech in behalf of free coinage. and so voiced the passion and thought of the captivated convention that he was nominated by it for the presidency over the veteran free-silver leader. Richard P. Bland of Missouri. The Cleveland men, or "gold Democrats," broke with their party after it became committed to free silver, and holding a convention of their own, nominated Gen. John McA. Palmer, of Illinois, for the presidency on a platform which extolled Cleveland. attacked free coinage and favoured the gold standard. Its main influence was to permit many Cleveland men to vote against Bryan without renouncing the name of Democrats. On the other hand the Populist convention also nominated Bryan on a platform more radical than that of the Democrats.

The contest was marked by great excitement as Bryan traveled across the country addressing great audiences. The endangered business interests found an efficient manager in Marcus A. Hanna of Ohio: McKinley's adviser, and expended large sums in a campaign of education. In the event, the older states of the middle west, holding the balance between the manufacturing and capitalistic east and the prairie and mining states of the west. gave their decision against free silver. But class appeals and class voting were a marked feature of the campaign, the regions of agricultural depression and farm mortgages favouring Bryan, and those of urban life favouring McKinley. Labour was not convinced that its interests lay in expanding the currency. and Hanna had conducted McKinley's campaign successfully on the plea that he was the advance agent of prosperity under the gold standard and a restoration of confidence. McKinley carried all the northern states east of the Missouri, and North Dakota, Oregon and California of the far west. as well as Maryland, Delaware, West Virginia and Kentucky. His plurality over Bryan in the popular vote was less than 600,000, and his electoral majority 95. All the departments of government were transferred by the election to the Republicans.

Dingley Tariff.—Having secured power, the administration called a special session of congress, and enacted the Dingley protective tariff (July 24, 1897), under which the deficit in the treasury was turned into a surplus. The act raised duties to their highest point, and as the protective schedules included some important articles produced by trusts which had a practical monopoly, such as sugar and petroleum, this was seized upon by the Democrats to stigmatize the tariff as the "mother of trusts." Many articles which had been placed on the free list in the Tariff act of 1894, including lumber and wool were made dutiable.

Gold Standard. — The Republicans also wrote their triumph into the Gold Standard act of March 4, 1900, which ensured the maintenance of this standard by reserving $150,000,000 of gold coin and bullion to redeem the United States notes and the treasury notes of 1890, and by authorizing the sale of bonds when necessary to maintain the reserve. National banks were authorized in the smaller towns (3,000 or less) with a capital of $25.000, half of that formerly required, and increased circulation was further provided for by permitting the national banks to issue notes on United States bonds up to their par value.

Economic Changes. — The economic policy of the Republicans was facilitated by the prosperity which set in about 1898. The downfal! of silver-mining turned the prospectors to seek new gold fields, and they found them, especially in Alaska; and contemporaneously the chemists discovered cheaper and more efficient methods of extracting the gold from low-grade ores. Within five years after the crisis of 1893 the gold production of the United States nearly doubled. The United States coined $437,500,000 in gold in the five-year period 1897–1902, while the average for five-year periods from 1873 had been only $224,000,000. Thus gold instead oi silver began to inundate the market, and to diminish the demand for expansion of the currency. Agriculture, prostrated in the years immediately preceding and following the panic of 1893, turned to the scientific study of its problems, developed dry farming, rotation and variety of crops, introduced forage crops like alfalfa, fed its corn to cattle and hogs, and thus converted it into a profitable and condensed form for shipment. Range cattle were brought to the corn belt and fattened, while packing industries moved closer to these western centres of supply. Dairy farming replaced the unprofitable attempts of older sections of the middle west and the east to compete with the wheat fields of the far west. Truck and fruit farming increased in the south, and the canning industry added utility to the fruits and vegetables of the west. Following the trend of combination the farmers formed growers' associations and studied the demand of the market to guide their sales. The mortgaged farms were gradually freed from debt. The wheat crop increased from less than 400,000,000 bu. valued at $213,000,000 in 1593 to 675,000,000 bu. valued at $392,000,000 in 1898. Prosperity and contentment replaced agitation in the west. and the Republican party gained the advantage of these changed conditions.

In the south also there was greater contentment as the new industries of iron, textiles and forestry grew, and as the cotton crops increased. Unrest was diminished by the new state constitutions: which aiter 1890 disqualified Negro voters by educational and tax requirements so contrived as not to disfranchise the poor whites.

In the decade which followed the crisis of 1893 a new industrial structure was made out of the chaos of the panic. High financing was undertaken on a scale hitherto unknown. Combinations absorbed their weaker rivals; Standard Oil especially gained large interests in New York banks and in the iron mines and transportation lines about the Great Lakes, while it extended its power over new fields or' oil in the southwest. In general, a small group of powerful financial interests acquired holdings in other lines of business, and by absorptions and "community of interest" exerted great influence upon the whole business world. The group of financiers, headed by Morgan, came to dominate various southern transportation lines and the anthracite coal roads and mines, and extended their influence to the Northern Pacific railway: while a new genius in railway financing, Edward H. Harriman, began an avowed plan of controlling the entire railway system of the nation. Backed by an important banking syndicate he rescued the Union Pacific from bankruptcy, and with its profits as a working basis he began to acquire connecting and competing lines. Labour also shared in the general prosperity after 1898. Relative real wages increased, even allowing for the higher cost of living and the length of the working day in general decreased except in special industries.

General Prosperity. — By 1900 the continental United States had a population of 76,000,000; an aggregate real and personal wealth of $88,500,000,000; a per capita public debt of $14.52, and per capita money circulation of $26.94 against $21.41 in 1896. In 1901 bank clearings amounted to nearly $115,000,000,000 against $45,000,000,000 in 1894. Imports of merchandise had fallen in this period, while exports rose from about $847,000,000 in 1893 to $1,394,000,000 in 1900. Of these exports foodstuffs and food animals, crude and partly manufactured, aggregated nearly 40% of the total. The production of pig iron, which was about 7,000,000 long tons in 1893, mas nearly twice that in 1900. This economic prosperity and these far-reaching processes of social change by which the remaining natural resources of the nation were rapidly appropriated, went on contemporaneously with the extension of the activity of the nation overseas. The first rough conquest of the wilderness accomplished, the long period of internal colonization drawing to a close, the United States turned to consider its position as a world power.

To understand this position it is necessary to return to an earlier period and briefly survey the foreign relations since the close of the Reconstruction era. The most significant and persistent influence came from the growing interest of the United States in the Pacific, as its population and economic power extended to that ocean. The problem of an overflow of Chinese migration to the Pacific coast, and the jeopardizing of the American standard of labour by this flood, had been settled by various treaties and laws after 1880. The question of the relation of the United States to an interoceanic canal was not so easily settled. In 1878 Colombia granted a concession to a French company, promoted by Ferdinand de Lesseps, the engineer of the Suez canal, to dig a tide-level canal through the Isthmus of Panamá. President Hayes voiced the antagonism of the United States to this project of European capital in his message of 1880 in which he declared that such a canal should be under the control of this nation, and that it would be "virtually a part of the coast-line of the United States." Although an American company was organized to construct a canal under a concession from Nicaragua in 1884, no real progress was made, and the French company, defeated by engineering and sanitary difficulties. failed at the close of 1888.

Pan-American **Congress.**—Meantime, for a few months, Blaine, as secretary of state under President Garfield, began a vigorous foreign policy with especial reference to the Pacific. He attempted to get the consent of Great Britain to abrogate the Clayton-Bulwer treaty of 1850, which contemplated the construction of an isthmian canal by private enterprise under joint control and neutralization of the United States and Great Britain, together with such other powers as should join them. In South America he actively pressed the influence of the United States to settle the war between Chile and Peru. Again, in the years from 1889 to 1892, Blaine held the portfoiio of state, and attempted to increase the influence of his country in Spanish America by the Pan-American congress of 1890, which proposed a great international railway system and bank, commercial reciprocity and arbitration, without immediate results. Indeed: the bad feeling aroused by his earlier policy toward Chile found expression in 1891 in a mob at Yalparaíso, when some of the men from the United States ship "Baltimore" on shore leave were killed and wounded. An apology averted the war which President Harrison threatened. Blaine also asserted, against Canada particularly, the right of the Cnited

States to the seals of the Bering sea; but in 1893 arbitrators decided against the claim.

Foreign Affairs.—As the navy grew and American policy increasingly turned to the Pacific, the need of coaling stations and positions advantageous to its sea power was appreciated. By a tripartite treaty in 1889 the Samoan islands were placed under the joint control of the United States, Great Britain and Germany, and, a decade later, they were divided among these powers, Tutuila and the harbour of Pago-Pago falling to the United States. The Hawaiian Islands, which had been brought under the influence of civilization by American missionaries, were connected by commercial ties with the United States. Upon the attempt of the ruler to overturn the constitution, the American party, aided by the moral support of the United States, which landed marines, revolted, set up a republic and asked annexation to the union. A treaty, negotiated under President Harrison to this end, was withdrawn by President Cleveland, after investigation, on the ground that the part of the United States in the revolution was improper. He attempted, without success, to restore the original state of affairs, and on July 7, 1898, the islands were annexed.

President Cleveland's conservatism in this and other matters of foreign policy had not prepared the people for the sudden exhibition of firmness in foreign policy with which he startled the nation in his message of Dec. 1895 upon the question of the boundary of Venezuela. Venezuela and Great Britain had a long-standing dispute over the line which separated British Guiana from Venezuela. Great Britain declined to arbitrate, at the suggestion of the United States, and gave an interpretation to the Monroe Doctrine which the administration declined to accept. President Cleveland thereupon brusquely announced to congress his belief that Great Britain's attitude was in effect an attempt to control Venezuela, and proposed that a commission on the part of the United States should report upon the disputed boundary, and support Venezuela in the possession of what should be ascertained to be its rightful territory. Secretary of State Richard Olney declared: "To-day the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition." Great Britain tactfully accepted arbitration, however, and in the end (1899) was awarded most of the territory regarding which she had been unwilling to arbitrate.

Spanish-American War.—The growing activity of the United States in foreign relations next manifested itself against Spain. Cuba in its commanding position with reference to the Gulf of Mexico and the approaches to the proposed isthmian canal, as well as in its commercial relations, and its menace as a breeding spot for yellow fever, had long been regarded by the United States as an important factor in its foreign policy. Between 1868 and 1878 a harsh war had been in progress between the island and the mother country, and American intervention was imminent. But Spain promised reforms and peace followed; again in 1895 revolt broke out, accompanied by severe repressive measures, involving grave commercial injury to the United States. (For the military events of the conflict see SPANISH-AMERICAN WAR OF 1898.)

By the treaty of Paris, signed Dec. 10, 1898, Spain lost the remaining fragments of its ancient American empire. It relinquished Cuba, which the United States continued temporarily to occupy without holding the sovereignty pending the orderly establishment of an independent government for the island. Puerto Rico, Guam and the Philippines were ceded outright to the United States, which agreed to pay $20,000,000 to Spain, and to satisfy the claims of its citizens against that power. By the treaty congress was to determine the civil rights and political status of the native inhabitants of the ceded territory.

As a result of the Spanish-American War, the United States found itself in a position of increased importance and prestige among the nations of the world. Especially in the Pacific, it was immediately involved in the diplomatic situation created by the efforts of European states to divide China into spheres of influence or of actual possession. The interests of the United States in the trade with China, as well as its new position in the Philippines, inclined it to oppose this policy, and Secretary of State John Hay showed himself to be one of the great American diplomats in his treatment of this difficult problem. In order to preserve Chinese entity and the "open door" for trade, he drew replies from the nations concerned, the result of which was to compel them to avow and moderate their intentions.

The acquisition of Puerto Rico and the acceptance of responsibilities in Cuba gave new importance to the isthmian canal and increased the relative weight of the United States in regard to its control. The popular excitement with which the voyage of the "Oregon" was followed, as it took its way 14,000 mi. around South America to participate in the destruction of the Spanish fleet in the battle of Santiago, showed the American people the need of such communication between the Atlantic and Pacific coasts.

But the immediate political issues were concerned with problems of the relation of the newly won lands to the United States government. Bryan had persuaded his party to join in ratifying the treaty of Paris, expecting to determine the status of the islands later. But attention soon turned to the insurrection which broke out (Feb. 4, 1899) in the Philippines under Emilio Aguinaldo, after it became probable that the administration intended to retain these islands, not under a weak protectorate, but as a possession to be ruled and "assimilated." It was not until the spring of 1902 that this insurrection was completely put down, and in the interval the question of the destiny of the islands and the harshness of the measures of repression aroused political debate. The Democrats and many Republicans charged the administration with a policy of imperialism.

Puerto Rico.—The same issue was involved, in its constitutional and economic aspects, in the treatment of Puerto Rico and Cuba. While the insurrection continued in the Philippines the government there was legally a military one, although exercised in part through civil officers and commissions. But in the case of Puerto Rico the question was whether the "Constitution follows the flag," that is, whether it extended of its own force without an act of congress to acquired territory, and covered the inhabitants with all the rights of citizens of the United States, as an integral part of the American people.

The Foraker act of 1900 imposed a special tariff for two years upon Puerto Rico, the proceeds to go to that island's own treasury. The act further asserted the principle that the inhabitants of the new possessions were not incorporated into the United States or entitled to all the privileges of citizens of the United States under the constitution, by declaring that statutory acts of the United States locally inapplicable should not be in force in Puerto Rico. The supreme court sustained this act in 1901, holding that Puerto Rico was not so strictly a part of the United States that separate customs tariffs could not be imposed upon the territory. The Foraker act also provided a government for the island. In Cuba the United States remained in authority until May 20, 1902. Details of the arrangements whereby the United States secured the substantial advantages of a protectorate without destroying the independence of Cuba, will be found in the article on CUBA.

Re-election of McKinley.—Meantime, in the election of 1900, the Democrats renominated Bryan on a platform which opposed the Republican administration's acts in relation to the newly acquired territory and declared that "imperialism" was the paramount issue. The platform reaffirmed its silver doctrine of the previous campaign and denounced the tariff as a breeder of trusts. The Republicans renominated McKinley and endorsed his administration. McKinley received an electoral majority of 137 and a popular plurality of 849,790. Before his second term was fairly begun he was shot by an anarchist while attending the Pan-American exposition at Buffalo, N.Y., and died on Sept. 14, 1901. His wisdom in choosing able cabinet officers, his sympathetic tact in dealing with men and with sections, as well as the victories of the Spanish-American War, had brought him popularity even among his political opponents. But McKinley, like Cleveland, lacked the imagination to perceive and the desire to voice the aspirations and demands that had been gathering force for many years for legislation and executive action that should deal with the problem of effective regulation of the economic forces that were transforming American society. This gave his opportunity to Theodore Roosevelt, who as vice-president now succeeded to office.

Roosevelt President. — It was in foreign relations, which Secretary Hay continued to conduct, that continuity with McKinley's administration was most evident. But even here a bolder spirit, a readiness to break new paths and to take short cuts was shown by the new president. Venezuela had long delayed the payment of claims of citizens of various nations. In 1901 the president. having been informed by Germany of its intention to collect the claims of its citizens by force, but without acquisition of territory, announced that the United States would not guarantee any state against punishment if it misconducted itself, provided that the punishment did not take the form of acquisition of territory. As a result. a blockade of Venezuela was undertaken by the joint action of Germany, Great Britain and Italy at the close of 1902. The diplomatic intervention of the United States early the next year resulted in Venezuela's agreement to pay the claims in part and to set aside a portion of its customs receipts to this end. But since the blockading powers demanded preferential treatment, the United States secured a reference of the question to The Hague court, which decided that this demand was justified. Santo Domingo offered a similar problem, having a debt incurred by revolutionary governments, beyond its power to pay, and being threatened with forcible intervention by European states. President Roosevelt, in 1904, declared that in case of wrongdoing or impotency requiring intervention in the western hemisphere the United States might be forced "to the exercise of an international police power." In 1905 Santo Domingo and the United States signed a protocol under which the United States government was empowered to take possession of the customhouse, conduct the finances and settle the domestic and foreign debts of Santo Doming~. In spite of the refusal of the senate to assent to this protocol, President Roosevelt put the arrangement unofficially into effect, until, in 1907, the senate consented to a treaty authorizing it with some modifications.

In the far east the Boxer insurrection in China had been followed by the combined military expedition of the powers to the relief of Peking (in which the United States shared). and the exaction of a huge indemnity, of which the United States relinquished nearly half of its share, as in excess of the actual losses. The United States protested against Russian demands upon China, and actively participated in the negotiations which resulted in Russia's agreement to evacuate Manchuria. The delays of that power and its policy toward China having led Japan to declare war, Secretary Hay's diplomacy was influential in limiting the zone of hostilities; and the offices of President Roosevelt brought about the conference between the two powers at Portsmouth, N.H.. which terminated hostilities in 1905. The dispute over the boundary between Alaska and Canada was narrowed by diplomatic discussion, and the remaining questions, involving the control of important ports at the head of the great inlets which offered access to the gold fields, were settled by arbitration in 1903 favourably to the American contentions.

The isthmian canal also received a settlement in this administration by a process which was thoroughly characteristic of the resolution of President Roosevelt. See PANAMA CANAL.

The Philippines. — In the Philippines early in 1901 municipal and provincial governments were provided for, and the president had been for a brief time granted full power to govern the archipelago. He appointed Judge William Howard Taft civil governor, and limited the power of the military governor to regions where insurrection continued. On July 1, 1902, congressional authority was substituted for that of the president, but Taft remained governor. The provisions of the constitution guaranteeing life, liberty and property were in general extended specifically to the dependency, and a legislative assembly was promised. the lower house elective and the upper house to consist of the Philippine commission. By negotiations with Rome Governor Taft secured for the Philippines the "friars' lands" which had been a source of friction. On Oct. 16, 1907 the first Philippine assembly was convened in the presence of Taft, then secretary of war.

The tariff question complicated American relations with both the Philippines and Cuba. Beet sugar and tobacco interests feared the competition of these products, and opposed freedom of trade between the United States and the new territories. The Philippine tariff of 1902 made a reduction of only 25% from the Dingley tariff in the case of the products of those islands. instead of the 75% urged by Taft; but the duties were to go to the Philippines. In the case of Cuba a more heated controversy arose over the tariff — Roosevelt strongly urged a substantial reduction in justice to Cuba at several regular and special sessions of congress; but not until the close of 1903 was a treaty in operation which, under the principle of reciprocity, admitted some products of the United States to Cuba at reduced rates, and allowed Cuban products a reduction of 20% from the Dingley tariff.

The Trusts. — The dominant historical tendencies at the beginning of the 20th century in the United States, however, were characterized by huge combinations of capital and labour, the rapid passing of natural resources into private possession, and the exploitation of these resources on the principle of individualism by aggregations of capital which prevented effective competition by ordinary individuals. Pioneer conceptions of individual industrial achievement free from governmental restraint were adopted by huge monopolies, and the result was a demand for social control of these dangerous forces.

After the Sherman Anti-Trust act of 1890 the combinations found in the favourable laws of states like New Jersey opportunity to incorporate under the device of the holding company, which was supposed to be within the law. A "promotion mania" set in in 1901. The steel industry, after a threatened war between the Standard Oil and Carnegie groups, was united by Morgan into the United States Steel corporation with stocks and bonds aggregating $1,400,000,000. This was only one of the many combinations embracing public utilities of all kinds. Where open consolidation was not effected, secret agreements, as in the case of the meat packers. effectively regulated the market. In the field of railway transportation, Edward Henry Harriman used the bonds of the Union Pacific to acquire the Southern Pacific with the Central Pacific, and by 1906 he was dictator of one-third of the total mileage of the United States. Meanwhile the Great Northern and the Northern Pacific had been brought into friendly working arrangements under James J. Hill, and tried to secure the Burlington railway. A fierce contest followed between the Hill, Morgan and Harriman forces, resulting in a compromise by which the Northern Securities company, a holding company for the joint interests of the contestants, was created. It was admitted by the counsel for this company that the machinery provided in this organization would permit the consolidation of all the railways of the country in the hands of three or four individuals. By using notes of one railway company, based on its treasury securities, one could acquire a controlling interest in others; and by watering the capital stock, recover the cost of the undertaking, while the public paid the added rates to supply dividends on the watered stock.

Following a similar tendency the great Wall street banking-houses were dominated by the large financial groups in the interest of speculative undertakings, the directors of banks loaning to themselves, as directors of industrial combinations, the funds which flowed into New York from all the banks of the interior. By a similar process the great insurance and trust companies of New York became feeders to the same operations. Thus a community of control over the fundamental economic interests of the nation was lodged in a few hands.

Such was the situation in domestic affairs which confronted Roosevelt when he became president. In his first message he foreshadowed his determination to grapple with these problems. In 1903 he instructed the attorney general to bring suit to dissolve the Northern Securities company as a combination in restraint of trade and in 1904 the supreme court held the merger illegal. But the effect was to increase the tendency to change from incomplete combination of financial interests to consolidated corporations owning the property, and to lead the government. on the other hand, to seek to regulate these vast business interests by legislation. The Elkins law, passed in 1903. increased the power of the Interstate Commerce commission to prosecute offenders, especially those who violated the antirebating clauses. In the same year the creation of the federal bureau of corporations provided for increased publicity in the affairs of these organizations.

Combinations of Labour. — Labour was combining in its turn. Not only did local unions in most of the trades increase in number and power, but workers in separate industries over large areas were combined for collective bargaining and a national organization, the American Federation of Labor, had a membership by 1905 of approximately 2,000,000. Labour legislation by the states increased under these influences, and political leaders became increasingly aware of the power of the labour vote, while employers began to form counter organizations to check the growth of the movement. In 1902 Pennsylvania members of the United Mine Workers of America struck. Inasmuch as their employers were the owners of the anthracite coal monopoly under the control of an allied group of coal-carrying railways, the contest was one of far-reaching importance, and soon brought about a coal famine felt throughout the nation. So threatening was the situation that President Roosevelt called a conference of the contestants, and induced them to submit their difficulties to an arbitration commission which, by its report, in the spring of 1903, awarded to the miners shorter hours and an increase of wages.

Steadily the United States enlarged its economic functions. In 1903 congress created a department of commerce and labour and made the secretary a member of the cabinet. The reports of this department gave publicity to investigations of the perplexing industrial conditions. The department of agriculture enlarged its staff and its activity, investigating different plants and animals, ascertaining means of checking insect pests, advising upon the suitability of soils to crops, seeking new and better seeds and circulating general information. The contemporaneous development of agricultural education in the various western and southern states whose agricultural colleges had been subsidized by land grants and appropriations by the federal government, and the experimental farms conducted by railways, all worked to the same end. The nation began also to awake to the need of protecting its remaining forests, which were rapidly falling into the hands of corporations by perversion of homestead and other land laws. President Cleveland had withdrawn large forest tracts. and in 1898 Gifford Pinchot was made head of a division of forestry in the department of agriculture. In 1901 the work was organized under a separate bureau, and four years later the national forests were placed under his management.

Reclamation. — The increasing demand for lands for agriculture led also, under Roosevelt, to the real beginning of national irrigation actively in the vast arid area of the far west. The reclamation service was created by the act of June 17, 1902, which set aside the proceeds of the sale of public lands in 13 states and three territories as a fund for irrigation works. The government itself reserved timber and coal tracts, water powers and other requisites for construction, and sold the irrigated lands to actual settlers in small farms, while retaining title to the reservoirs and the works. The income from the reclamation fund between 1901 and 1910 aggregated over $60,000,000. By the use of suitable crops and dry farming, agricultural occupation was extended into formerly desert lands.

Election of 1904. — In the election of 1904 the popularity of President Roosevelt, after his strenuous activity in challenging some of the strongest tendencies in American life, was put to the test. His political management exhibited the fact that he was trained in the school of the New York politician as well as in the reformer's camp, and he was easily nominated by the Republicans on a platform which endorsed his administration, and made no promise of tariff changes. The Democrats turned to the Conservative wing, omitted any reference to silver or the income tax, and nominated Judge Alton B. Parker, of New York. The issue of imperialism had been largely eliminated by the current of events and the antitrust issue was professed by both parties. In the outcome Roosevelt won by the unprecedented popular plurality of over 2,500,000 and an electoral majority of 196.

The state elections of the same period showed that a wave of reform and of revolt against former political forces was rising. In five states which Roosevelt carried by his popularity the machine Republican candidates for governor were defeated by reforming Democratic candidates, and in cities like Chicago and Philadelphia the issues of reform and radicalism won unexpected though temporary success. Roosevelt had "stolen the thunder" of the parties of social unrest, including the old populistic areas of the middle west and the labour element of the cities and also retained control of the Republican party machinery.

Roosevelt's Second Administration. — In his second administration President Roosevelt pressed his policies so hard and with such increasing radicalism that he lost control of the regular organization in congress before the end of his term. Speaker of the House Joseph G. Cannon of Illinois exhibited the full power of his office in concentrating party policies in the hands of the few regular leaders, while in the senate a directing group of New England men who had served for a long time, chiefly Nelson W. Aldrich and Eugene Hale, showed a similar mastery. Against this control a significant revolt, illustrative of revived discontent in the middle west, was made by the Republican Sen. Robert M. La Follette of Wisconsin, who had won his fight in that state against the faction friendly to the railways, and had secured primary elections, railway rate regulation on the basis of expert valuation of the physical property of the railways and a system of taxation which rested more heavily upon public utilities. In pressing similar policies upon congress he became isolated from the party leaders, but forced them to go on record by roll calls.

In New York a legislative investigation of the insurance companies disclosed such connections with the high financing of Wall street as to create widespread distrust and to lead to reform legislation. The attorney who conducted the investigation, Charles Evans Hughes, had shown such ability that he was chosen governor of New York in 1906. His administration was marked by independence of the party machine and a progressive policy. Foreign relations were conducted during the second administration of Roosevelt by Secretary Elihu Root from 1905. He fostered friendly relations with the other American nations, allaying their concern lest ambitious designs of their larger neighbour might endanger their independence. In Cuba a signal illustration of the good faith of the United States was exhibited when an insurrection in the summer of 1906 left the republic substantially without a government. Taft, then secretary of war, was sent, under the treaty provisions for intervention, to organize a provisional government. During his few days' service as governor general he set in motion the machinery for restoring order. But Roosevelt had plainly stated that if the insurrectionary habit became confirmed in Cuba it could not expect to retain continued independence.

Japanese Immigration. — Attention was again fixed upon the Pacific coast, not only by the earthquake and conflagration which in 1906 destroyed the business area and much of the residential section of San Francisco, but also by municipal regulations there against the presence of Japanese in the public schools. The incident seemed to threaten grave consequences, which were averted by the popularity of Roosevelt both in California and in Japan. In the Immigration act of Feb. 20, 1907, the problem of exclusion of Japanese labour, which underlay the difficulty, was partly solved by preventing the entrance to the continental United States by way of neighbouring countries of persons holding passports issued by a foreign government for going to other countries or dependencies of the United States.

As a demonstration of the naval power of the United States in Pacific waters, the president sent the American fleet on a cruise around the world, in the course of which they were received in a friendly spirit by Japan. The navy was increased to keep pace with the growth of that of other nations, both in numbers and size of vessels, in this period, but not to the extent demanded by the administration. Already a more efficient organization of both army and navy had been effected. While the nation prepared for war, it also engaged prominently in the successive international peace congresses between 1899 and 1907, aiming consistently to increase the use of arbitration.

Railway Regulation. — The tendencies of the government to deal with social improvement were exemplified by the laws of 1906 providing for pure food and meat inspection. The Railway Rate Regulation act of 1906 strengthened previous interstate acts by including pipelines (except for gas and water) under the jurisdiction of the Interstate Commerce commission, and extending the meaning of common carrier to include express and sleeping-car companies. Published rate schedules were required, not to be changed without 30 days' notice, and more stringent provisions were made to prevent rebating. The act provided for review by the federal courts, and did not permit the commission to investigate an increase of rates until the rates went into operation, nor did it provide for a valuation of the railways as a basis of rate-making which the commission had desired. Later acts partly met the demands of railway employees by increasing the liability of common carriers and by providing for shorter hours.

Panic of 1907.—Although Roosevelt had made concessions to the railways in the formation of the act of 1906, his utterances showed a tendency alarming to the large business interests and the holders of corporation securities generally. The unsettled business conditions were reflected in the stock market, and began to produce a reaction against the activity of government in this direction. The panic of 1907 started with the downfall of an attempted combination of a chain of banks, copper interests and other enterprises, and was followed by the collapse of the Knickerbocker 'Trust company in New York (Oct. 21, 1907). The country was generally prosperous, though much of the banking funds was tied up in New York city at this juncture. Clearinghouse certificates were resorted to; by Nov. 1 partial suspension was general throughout the nation; and banking facilities were more completely interrupted than at any time since the Civil War. The government greatly increased its deposits, and offered Panamá 2% bonds to the amount of $50,000,000, and 3% certificates for $100,000,000, with the object of providing the national banks a basis for additional note issues. But these were taken only to a small amount. as they proved useful for their moral effect chiefly. An enormous addition to the money supply was made in the course of the panic, both by governmental activity, gold imports and national bank notes. The crisis was brought to a close before the end of 1507 by the vigour of the government and the activity of the large financial interests under the lead of Morgan, who finally entered the field to stop the decline, at the same time that his associates in the Steel trust acquired possession of their last remaining rival of importance, the Tennessee Coal and Iron company.

The reaction after the panic, and the loss of influence resulting from this announcement that he would not permit his renomination for the campaign of 1908, left Roosevelt unable to exercise the compelling power which he had displayed in previous years. Congress under the control of the conservatives refused him legislation which he asked, but before he left the presidency he raised a new issue to national importance in his calling of a congress of state governors and experts to consider the need of the conservation of natural resources. This congress met in May 1508 and endorsed the proposal for vigorous attention by state and nation to the question.

Election of 1908.—In the campaign of 1908 he succeeded, against the opposition of both the extreme conservative and the radical wings, in procuring the nomination of Secretary Taft by the Republicans on a platform endorsing the Roosevelt policies, promising a revision of the tariff at a special session, on the basis of such protection as would equal the difference between the cost of production at home and abroad, together with a reasonable profit to American industries, and providing for maximum and minimum rates to be used in furthering American commerce and preventing discriminations by other nations. A postal bank was promised, a more effective regulation of the railways and a modification of the Sherman Anti-Trust act. The Democrats again selected Bryan as their candidate; demanded the enforcement of criminal law against trust magnates and such additional legislation as would prevent private monopoly; opposed the use of injunctions in cases where they would issue if no industrial dispute was involved; impugned the Republicans' good faith in tariff revision, promising for themselves a substantial reduction of duties; favoured an income tax and a guarantee fund by national banks to pay depositors of insolvent banks, or a postal savings bank, if the guaranteed bank could not be secured; demanded election of United States senators by direct vote of the people, legislation to prevent contributions by corporations to campaign funds and a more efficient regulation of railways. The Republicans won a sweeping victory, Taft's popular plurality reaching about 1,270,000 and his electoral majority 159. (F. J. T.)

From Roosevelt to Roosevelt

The total population of the continental United States in 1910 was 92,000,000. Of these, only 50,000,000 were native whites of native parentage; 13,000,000 were foreign-born and 19,000,000 others were of foreign-born or mixed parentage. The Negroes and Indians together numbered about 10,000,000. Everybody in the United States except the American Indian was an immigrant from some other country or a descendant of an immigrant. The main race groups were: (1) the descendants of the colonists, who were mainly Anglo-Saxons, with some Germans and Scotch-Irish and small elements of other races; (2) descendants of the Europeans who came over in great numbers from 1820 to 1870; (3) the large number of later immigrants and their children.

In the opening years of the 20th century the country was not yet aroused to the problems arising from this mixture of unassimilated races. Few voices were raised against admitting not only western Europeans, whose languages and customs were much like those of the United States, but men and women from east and southeast Europe and from western Asia. The only bar to immigration based on race was the prohibition, after 1888, of Chinese immigration and the practical exclusion of Japanese labourers by a gentlemen's agreement with the Japanese government (1907). The undigested load was becoming heavy.

The units of U.S. society uere held together by a strong, if complicated, democratic government, well fitted to rule a diverse population. The political forms were familiar to every schoolboy: (1) a group (in 1910) of 46 states, each with its own government rigidly conhned by the traditional principle of checks and balances into three departments, legislative, executive and judicial; (2) a widely distributed franchise almost equivalent to universal suffrage for adult males; (3) a belief that the courts were the highest authority, not only as to questions of personal rights and duties, but as to the validity of the laws and acts of the other two departments; and (4) local government of city and town, township and county. This combination of governments was expensive and not highly skilled, but was supported by the conviction of a large part of the population that it was the "best government on earth."

In the organization and conditions of business there could be traced some startling contradictions between the word liberty and the fact. Nominally all kinds of business not prohibited by law were open to all comers in free and honourable competition. In reality, by 1908, a considerable number of both employers and employees were engaged in a combat outside the laws, constant and conscienceless. It was hard for individuals and firms to compete with corporations, and hard for small corporations to compete with large ones. The railways were among the most conspicuous of the large corporations, and they, too, tended to combine into larger and more powerful units. The states could not deal adequately with these powerful bodies because most of the railways and many of the other corporations operated from state to state, and could not be controlled at either end by anything short of federal power.

Political organizations were on nearly the same basis as business companies: they also grew bigger and more powerful and gathered into fewer groups. Xominally, parties are simply associations of voters for common ends. Actually. they are armies acting under commanding leaders who in many cases hold no offices. The evils of this "invisible government," as Root called it, were apparent. The political philosophy of Americans was based on the belief that mankind was steadily growing better. Hence a tendency to rely upon laws and political devices for correcting the ills of popular government. What was most needed was the leadership of bold and farseeing men.

Finances and the Tariff (1908–13).—Every growing unit in the country was harassed by questions of taxation and expenditure. The U.S. government also sought new resources. and found them in the income tax. This was made possible by the 16th amendment to the constitution, which came into effect on Feb. 25, 1913. Another new resource of the federal government was a tax upon corporations levied on net income (Aug. 5. 1909). The important question of reorganizing the national banking system. so as to furnish a strong national institution, was debated from 1908 to 1912, and was the subject of an elaborate report by a national monetary commission; but no action was taken at that time. The net federal debt was $1,000,000,000, or only about $11 per head of the population.

A financial resource over which congress had sole authority was the tariff. Under strong pressure from members of the party to carry out the promises of the Republican convention of 1908, President Taft, a few days after his inauguration, summoned congress to meet in special session, for the purpose of revising the tariff.

As usual there was a long controversy. which resulted (Aug. 5. 1909) in the Payne-Aldrich tariff. The act created a permanent court of customs appeals, with power to determine finally all questions as to the value of imports, together with a tariff board, expected to make investigations and recommend specific measures which congress might adopt. As to rates, the act was not very different from its predecessor, except for a decided increase of duties on cotton and silk manufactures.

There was a loud outcry that the revision intended by the party platform was a revision downward and not upward. Nevertheless President Taft signed the bill, and in a speech delivered at Winona, Minn.. on Sept. 17, 1909, surprised the country by declaring that it was the "best tariff bill that the Republican party has ever passed."

Political Reform (1908–131.—When Roosevelt left the presidency in 1909 the position of president was at a high point. Most presidents had found their principal legislative influence in the veto; Roosevelt had followed the McKinley method of emphasizing his wishes in personal discussion with members of congress. He did more: he revived the Jacksonian method of announcing a legislative plan, and if congressmen hung back, of appealing over their heads to the country at large. A similar policy was adopted by President Taft, who had many of the qualities of leadership. He had served as first civil governor of the Philippines and as secretary of war in the cabinet of Roosevelt. who practically designated him as his successor. Nevertheless, as an avowed inheritor of Roosevelt's policies, he drew upon himself the opposition of Roosevelt's enemies while it soon became apparent that he was not relying upon Roosevelt's friends.

At this time the primary method of selecting candidates was spreading rapidly through the union. Candidates for each party mere selected by the ballots of the people. thus undermining the convention system. From nominations for local officers the new method had spread, by 1911, to state officers in numerous states; and after 1910 it began to be applied to the choice of delegates to the national party conventions. An unforeseen effect was that the official ballots were made upon the basis of party nominations, nith an opportunity for independent voting. The primary thus became a part of the system of public elections, and therefore the party system was engrafted on public law, as a part of the government. *(See* PRIMARIES.)

The distrust of conventions and controlled elections extended to the numerous and powerful bosses in city and state legislatures. Three new devices were set at work to curb them and to interest the electors in public measures. The first of these, the referendum *(see* REFERENDUM AND INITIATIVE), was by 1909 spreading rapidly through the western states, as a means of checking legislative action contrary to public sentiment. The referendum system furnished a mechanism, usually imbedded in state constitutions, by which on the demand of a sufficient number of voters, a statute could be held back from effect until submitted to a vote of the electors. What was to be done if the legislature refused to enact a statute demanded by the people? The initiative was invoked, by which a designated number cf voters could unite on a measure, which must then be submitted to the electors for their suffrages.

A third branch of this system of appeal to the people was the recall (q v), under which a public officer already chosen by popular vote (and in a few cases those who were appointed in some other way) could be subjected to an election and, should the majority decide against him, be thereby removed from office. In 1911–12 the question arose in connection with the proposed constitution of the new state of Arizona, which included a provision for the recall of judges. Because of this provision President Taft vetoed the act of admission. The state withdrew the clause, was duly admitted in 1912, and thereupon proceeded to reinsert the recall.

A still wider application of the principle of the responsibility of functionaries to the voters was the recall of judicial decisions, which was advocated by Roosevelt in 1912, but proved to be more than the country desired.

United States senators, until then chosen by state legislatures, were next made subject to popular choice. Urged by public sentiment, congress submitted (June 12, 1912) the 17th amendment, which was duly ratified and added to the constitution (May 31, 1913). Under this, all elections to the senate were to be made by direct popular vote. Another evidence of a rising feeling of responsibility in congress was a statute (Aug. 7, 1911) requiring candidates for the house and senate to submit statements of the money raised and expended in their behalf and limiting the amount which they themselves might spend. One purpose of both these measures was to make it difficult for men to purchase their way into the senate. On July 13, 1912 Sen. W. Lorimer of Illinois was practically expelled from the U.S. senate for buying votes in the legislature.

Another slow reform was in the ballot system. Most cities, towns and states were loaded down with long lists of the officers to be chosen. The result was an agitation for the reform commonly known as the short ballot, by reducing the number of elective officers and increasing the officers to be appointed by the few elective officials. Working difficulties were found in many of these reforms. It was hard to keep the public keyed up to the necessary pitch of thought and attention at every election; but it was evident that the American people intended to free themselves from the shackles of "invisible government."

Social Questions (1908–12).—The spirit of discontent extended to many questions outside of politics. Throughout the Taft administration there mas an increasing pressure for equal suffrage — that is, woman suffrage — which, introduced in the territory of Wyoming in 1869, had gradually spread among the far-western states, and then begun working its way eastward. Again. both state and national governments mere compelled to deal with the question of alcoholic beverages. From the earliest times there had been restriction on liquor selling and liquor sellers. By 1909 in almost all states there was some form of general legal restriction — prohibition, local option. high licence or a state dispensary system. The question became national, because the liquor trade transported its wares from one state to another; and that brought it aithin the interstate commerce clause of the constitution and the Interstate Commerce act. Eventually by the original Package act of 1890, congress adopted the policy of prohibiting shipments of liquor into prohibition states. Pure food laws in force before 1909 were supplemented by the Drug Label act of 1912, which greatly aided in preventing the adulteration of drugs.

Many questions arose out of immigration. The laws in 1909 forbade the entry of labourers under a contract to work in the United States, of convicts, diseased persons and the insane; but the execution of the laws was slack. The first statute looking toward decided control of immigration was that of Feb. 1907, which increased the grounds of exclusion, and at the same time provided a plan to help the immigrants in finding work. It also created an immigration commission, which in 1910 made a report in 41 volumes. strongly recommending the sifting of immigrants by testing their ability to read and write some language. Meanwhile, in the decade 1901–10 the number of immigrants rose to an average of nearly 1,000.000 a year. Later. however, the record showed that from 300,000 to 500,000 annually returned to their old homes, the actual rate of increase of population by immigration was no more than about ½% annually.

Labour Questions.—No legal obstacle stood in the way of the right to organize, first, by local trade unions, then by nationwide unions for single trades, and finally by national unions combining many trades. To this was slowly added by the unions the principle of the right to labour, which meant both that it was the duty of the community to see that the worker had a job and that at least the skilled workers had a kind of title in their employment, so that it became contrary to good morals for a scab to take the place of a striker.

The legal position of labour unions in these controversies was brought out by suits of national importance against unions. In the test case of *Gompers* v. Buck's Stove and Range Co., the charge was that the federation, by posting the company in its publications as "unfair to labour," was boycotting, and thus infringing legal rights. Samuel Gompers, president of the American Federation of Labor, was convicted for contempt of court on the ground that he had refused to obey a court order to abandon the boycott. In 1908 a suit was decided with a verdict of $74.000 damages against a union of the hatters of Danbury, Conn., who had attempted to boycott the products of a local hat manufacturer.

Another phase of the labour situation was the spread of employers' liability laws through various states, and the passing of an act of congress (April 22, 1908) for the protection of the employees of interstate railways. In June 1912 congress added to its previous enactment of an eight-hour maximum regular day for public employees, by providing that all contract work for the federal government must also be on the eight-hour basis. As most labourers were voters they brought powerful influences to bear on state legislatures and on congress in favour of labour. On the other hand. the courts, particularly those of the states, were slow to recognize the changes in industrial conditions.

In addition, the courts began to use a system of labour injunctions: workmen, labour unions and their members were ordered to abstain from committing acts which if committed would presumably violate a law and would thus lead to a prosecution, in which the question of guilt could be settled by a jury. Instead, the courts by injunction would decide on the responsibility and affix a penalty not specifically laid down in any statute.

Trusts and Transportation.—During the 20 years ending with 1910 it became clear that the most difficult question before the United States government was the regulation of the vast aggregates of capital, commonly called trusts, which, combined into corporations, aimed at the control of particular lines of business, and also of the railways. The efforts of congress to adjust the question were registered in two lines of restrictive statutes, headed by the Interstate Commerce act of 1887 and the Sherman Anti-Trust act of 1890. Upon these was built a structure of decisions by the United States supreme court. To carry out and partly to avoid these decisions, the Mann-Elkins act of June 18, 1910, widely extended the Interstate Commerce acts by including telephones, telegraphs, express and sleeping-car companies, and by setting up a commerce court which was to render decisions on transportation questions. Federal control of railways on the whole worked well. The commission was a striking example of disregard of the principle of separation of powers, inasmuch as it was a rule-making body, an executive body and a court which interpreted its own rules, subject as to some questions of appeal to the federal courts.

The great problem of the trusts was much farther from a solution than that of the railways because the large corporations were linked together through the holding and manipulation of stocks by capitalists and banks, and through the so-called interlocking of interests. The only effective way of dealing with large corporations whose activities extended from state to state was to bring suit against them for monopolizing or conspiring to monopolize in their lines of trade. It was considered a triumph when (May 9, 1911) the United States supreme court rendered decisions against two of the most powerful trusts—the Standard Oil company and the American Tobacco company. The court held that the antitrust legislation must be interpreted by the "standard of reason"—namely, that a combination was not unlawful or against the public interest unless it actually caused a restraint of trade and commerce among the federal states or with foreign nations. Having thus set up a "rule of reason" which congress had refused to enact, and having created an example of judicial legislation, the court proceeded in both the pending cases to hold that the companies were guilty of attempts to monopolize their lines of trade. As to penalties, the court contented itself with ordering the offenders to disintegrate. The general danger of vast aggregations of capital was ignored.

Foreign Affairs.—The fields of the diplomacy of the United States for many years had been American and Pacific, and in a much smaller degree European. In the second Hague conference of 1907 the United States delegates urged international arbitration; and in accordance with the general principles put forth at that conference, Root as secretary of state secured 25 arbitration treaties with as many countries (1908). The United States and Great Britain arranged (Jan. 27, 1909) to refer to The Hague tribunal their long-standing dispute on the Newfoundland fisheries. The result was a decision acceptable to both sides (Sept. 7, 1910). In 1911 the Republican majority under President Taft's leadership initiated a policy of commercial reciprocity with Canada. An agreement was made with the Canadian government by which each side should by legislation reduce or abolish duties on certain raw products and manufactures. With great difficulty the necessary bill was pushed through congress (July 1911); but two months later the Canadian electors refused to support the reciprocity agreement, and the plan broke down.

Notwithstanding the position of the United States as the responsible holder of the Philippine Islands, and hence an Asian power, the tradition of isolation continued to be a strong force in the public mind. Nevertheless no formidable public protest was made to a policy of special U.S. intervention in Mexico, the Caribbean and the isthmus region. The arrangements of 1902 made Cuba practically a dependency, subject in the last resort to decisions from the White House. President Taft continued the occupation of the Dominican Republic, consent of the senate under a treaty to that effect having been obtained by Roosevelt in 1907.

The Panama canal was now approaching completion and the little republic of Panamá. which it bisected, though nominally an independent state, was in fact under U.S. control. An act of congress (Aug. 24, 1912) laid tolls on shipping, from which U.S. ships engaged in coastwise trade were to be relieved. The British government lodged a protest on the ground that by its treaty with the United States the canal was to be opened on equal terms to the ships of "all nations"; President Taft, however, stood by the act, and the question was passed on to the next administration.

Still more serious were the relations with Mexico, where, in 1910, a revolution headed by Francisco Madero assailed the government of Porfirio Diaz and drove him after a few months out of the country. Mexico was thrown into confusion, and President Taft found it necessary to place troops on the border. In 1912 he proclaimed an embargo on the export of arms or military supplies to Mexico. Meanwhile the concessions and property of Americans in Mexico were threatened or destroyed. The Americans uho had interests in Mexico began a steady pressure for intervention by the United States.

Across the Pacific, clouds rose on the diplomatic horizon. The commercial treaties with Japan allowed a reciprocal freedom of residence and trade to the nationals of the two countries. The immigration of Japanese mas very distasteful to the people of California, who undertook to restrict Japanese children to separate schools. Behind this difficulty were the rising power of the Japanese and their national spirit, greatly enhanced by their victory over the Russians in 1905. In 1908 Roosevelt sent around the world a powerful naval fleet, which visited Japan and was received with elaborate courtesy by a welcoming Japanese squadron exactly equal in number, ship for ship. In the Root-Takahira reciprocal note of Dec. 1, 1908 (which was never submitted to the senate). the United States practically admitted Japan's special interest in Asian affairs. The question of Japanese immigration was settled for the time being by a renewal of the commercial treaty (July 24, 1911). It continued the previous gentlemen's agreement, according to which, though claiming a right of immigration into the United States, the Japanese government pledged itself not to issue passports to labourers.

Politics 1909–12.—In the action of congress on many of the important issues above discussed no party lines were drawn, though such measures as the tariff and new taxes were distinctly Republican. On the tariff, some members from middle western states, particularly Minnesota, voted against the Payne-Aldrich measure of 1909. Another disturbance was caused by resentment against the Speaker of the House Cannon, who through the union of various powers virtually had a veto on any measure or proceeding mhich he did not like. Cannon kept too tight a hand; hence (March 19, 1910) a group of Republican "insurgents" joined hands with the Democrats to reduce his prerogatives until Cannon became simply a partisan moderator.

A new issue upon which both parties were divided was covered by the general term conservation. Although most of the arable land had passed out of its possession, the federal government was still the possessor of great tracts of forest, of mineral lands and of water power. Congress in 1902 provided for a system of irrigation, the cost to be advanced by the government and repaid in installments by the users of the water. President Roosevelt became interested in stopping the waste of timber and minerals, in preserving part of the gifts of nature for future generations and in retaining public ownership of the utilities of the country, particularly the forests and streams. In 1910 new statutes provided for a fresh classification of land and for the reservation of coal by the government.

Roosevelt and Wilson.—By 1910 it became clear that the Republican party was weakening and that President Taft's popularity and influence were lessening. The state and congressional elections of 1910 were unfavourable to the Republicans. The insurgents, who soon came to be called Progressives, gained most of the Republican districts in the west, and the Democrats gained about 50 seats in congress. This result transferred to the Democrats the control of the house, while in the senate they secured 41 of the 92 members.

A group of dissatisfied Republicans gathered about Senator La Follette as a leader and presumptive candidate for president. Meannhile state legislatures were passing primary laws which included the election of delegates to national nominating conventions. This made it easier to break through the old-line organizations, as La Follette had done in his own state. Taft's friends and supporters naturally expected that the president would be renominated.

All these calculations were disturbed by the greatest personality in the country, Theodore Roosevelt. A few weeks after leaving the White House (1909) he started on an expedition to central Africa, and was, on his way back, received in Europe as the former president of the most important of republics and as a commanding personage. He returned to the United States (June 18, 1910) to find political conditions little to his liking. Most of his friends had disappeared from the administration: his policies seemed to him to have been slighted. Taft did not satisfy the former president, and the two drifted apart. On Aug. 31, 1910, at Osawatomie, Kan., Roosevelt set forth a program which he called "the New Nationalism," favouring publicity of the accounts and proceedings of trusts, a tariff commission, a graduated income tax, an adequate army and navy, conservation, protection of labour and the direct primary with the recall of elective officers. For the time being Roosevelt made no direct movement toward standing for the presidency. Meanwhile several of the western states, particularly California under the guidance of Gov. Hiram Johnson, accepted a radical program of political and social reform. A formal breach with Taft and the open candidature of Roosevelt seemed inevitable. The crisis came when (Feb. 12, 1912) President Taft in a speech alluded to the Progressives (evidently having Roosevelt in mind) as "Extremists—not Progressives; they are political emotionaries, or neurotics." This was taken as a challenge, and a few days later Roosevelt openly declared himself a candidate.

The Election of 1912.—As the convention held in Chicago approached, the lines of battle were developed. Behind Taft were William Barnes of New York, Boies Penrose of Pennsylvania, Winthrop Murray Crane of Massachusetts and other "standpat" leaders. Among those in favour of Roosevelt were James R. Garfield of Ohio, Pinchot of Pennsylvania and a strong body of Republican governors. Roosevelt himself went to Chicago, and threw his immense energy and enthusiasm into the campaign. The convention was a scene of unusual excitement.

The critical decision was made in the preliminary meetings of the national committee, which was strongly "standpat"; for that committee had to decide upon the right of claimants to be inscribed in the preliminary roll of delegates. Every contest except one was settled in favour of the Taft claimants. The shifting of 30 delegates from one side to the other would have brought about a stampede to Roosevelt, but they were not to be had. Roosevelt advised his delegates to take no further part in the proceedings. At the final roll call, June 22, there were 561 votes for Taft, 58 scattering and 107 for Roosevelt, besides 344 Roosevelt men not voting. In the last issue, therefore, Taft had a majority of 50 votes out of 1,070. In the minds of Roosevelt and most of his followers the nomination was a violation of the principles of popular government. Roosevelt openly advised a bolt. This was duly accomplished by a formal Progressive convention. It met in Chicago in August and nominated Roosevelt for president and Hiram Johnson for vice-president.

Meanwhile the Democratic convention met at Baltimore with Bryan in a position to dictate the choice. The apparently sure candidate was Champ Clark of Missouri, speaker of the house of representatives. But under the rules of the Democratic convention requiring a two-thirds majority, he was finally defeated by Woodrow Wilson, governor of New Jersey. The platforms of the two old parties were of the usual type. The Republicans declared for protective duties. The Democrats stood by their platform of a tariff for revenue only, additional regulation of the railways and presidential preference primaries. The Progressive platform was a general program of political reform and "an enlarged measure of social and industrial justice."

Woodrow Wilson's Victory.—Not platforms, however, but men, appealed to the voters. All three candidates took the field. From the first it was clear that the real fight was between Roosevelt and Wilson. The Progressives were well organized, and their convention and campaign included many women. The final question was whether Roosevelt could draw to himself a sufficient number of Democrats to reduce the Democratic vote below the winning point. The result in November showed that the Democrats in the main stood by their party candidates. The total popular Democratic vote, 6,293,454, was only about 115,000 less than in 1908. The total Taft and Roosevelt vote combined was almost exactly the same as that of the Republicans in 1908. Roosevelt polled 4,119,538 popular votes to 3,484,980 for Taft; but he carried only 6 states, with 88 electoral votes, against 2 states with 8 votes for Taft and 40 states with 435 votes for Wilson.

Woodrow Wilson.—On March 4, 1913 Wilson was inaugurated as president. As governor of New Jersey during 1911 and 1912 he had shown his skill as a party leader and his interest in reform. In 1912 he was taken up by Bryan, who saw in him an exponent of the political principles for which Bryan had stood and a president who could meet the Progressives on their own ground.

In making up his cabinet it was only reasonable that Bryan should enter it. He was made secretary of state, an office for mhich he had little adaptation. To a new cabinet office recently created by congress, the secretaryship of the department of labour, Wilson appointed W. B. Wilson, a strict labour organization man. Lindley M. Garrison, secretary of war, and Franklin K. Lane, secretary of the interior, were strong men. Albert S. Burleson, postmaster general, and Josephus Daniels, secretary of the navy, had insufficient training for their duties. David F. Houston of Missouri was made secretary of agriculture, William G. McAdoo, secretary of the treasury and James C. McReynolds, attorney general. Most of the members of the cabinet were men who could be trusted to follow the president's lead. One remarkable statesman not included in this list was Col. E. M. House of Texas, who for six years was the president's most trusted counselor and political friend without holding any political office. In the minor civil service Wilson carried out his principles by enlarging the classified list of posts which could be entered only by competitive examinations.

A genial man, who could be a delightful companion, full of experience and of dry humour. President Wilson had a powerful mind, an amazing skill of expression and an intense belief in the power of ideals to arouse and inspire a people. He thought he had no need of conferences. of feeling the public pulse, of mixing with members of congress and party leaders, of personally greeting the average voter.

Finance and Tariff, 1913.—The election of 1912 carried with it a safe Democrat majority in the senate and a two-to-one majority in the house. On April 8, 1913, the president created a surprise by appearing in person to address the two houses of congress jointly at the opening of a special session, instead of sending a written message. This practice he followed throughout his administration, with great effect. He felt himself not only chief magistrate of the nation. but head of the Democratic party, and practically the premier of the government from which ought to proceed plans for important legislation.

A special session was called particularly to frame a tariff act. Rep. Oscar Underwood (Ala.), chairman of the committee of ways and means, gave to the new measure his name and experience. The purpose of the statute nas to enlarge the free list of raw materials, foodstuffs and some manufactures, to make a moderate reduction of the protective duties and to correct some of the things that made the Payne-Aldrich act unpopular. Included in the statute was an income tax, at last made possible by the adoption of the 16th amendment (Feb. 25, 1913), which was expected to supply any revenue that might be lost by the reduction of duties. A tariff commission was created to make researches into the workings of the act and to find out what was the actual difference between the cost of labour in the United States and in other countries (Oct. 3, 1913).

The powerful influence of the president was again exerted to secure a systematic banking system, with the result that (Dec. 23, 1913) the Owen-Glass Federal Reserve Bank act was added to the statutes The principle was to create a national institution. which was to be divided into 12 regional banks, in each of which was a body of directors, besides the central organization in Washington, D.C. In these 12 subdivisions clustered such banks. whether national or state chartered, as chose to accept. The new institution was also to issue a new form of paper money. The system from the start was recognized as a large national asset. At the same time a Rural Credits act was passed (July 17, 1916), ahich created a special group of banks to lend money to farmers on the security of their farms.

Transportation.— Under a statute of March 1, 1913 the Interstate Commerce commission was authorized to enter on an elaborate valuation of the railway property throughout the country as the basis of a judgment as to what was a reasonable profit. The Panama canal was now approaching completion. This was the first great agency of transportation owned and managed by the United States government. President Wilson used to the utmost his personal influence for a bill to repeal discrimination in favour of U.S.-owned vessels, of nhich the British government had complained; it became an act. June 15, 1914. On Aug. 15 the first steamer passed through the canal from sea to sea and in a few months the canal was paying its own way. A new question of transportation was arising through the rapid development of motor vehicles. At first a plaything, then a luxury, by 1908 they were spreading throughout the land. The attention of the whole country was called to the absolute necessity of good roads. In 1916 congress passed an act appropriating approximately $85,000,000 to be paid in about five years to such states as would contribute equal sums for good roads. From this beginning the movement spread rapidly throughout the whole country.

The **Trusts.**—A few hours before the end of President Taft's term a congressional committee reported against the "great and rapidly growing concentration of the money control and credit in the hands of a few men." In June 1914, in a suit involving the International Harvester company, the United States supreme court upheld state antitrust laws.

Yet the trusts still flourished; and huge corporations, such as the U.S. Steel corporation, paid dividends on thousands of millions in stocks and bonds. President Wilson urged successfully a radical amendment of the Sherman act (Oct. 15, 1914) against discriminating freight agreements, interlocking directorates and holding corporations.

Another branch of the same attack on the money power was the Federal Trade commission, created Sept. 26, 1914, which was an attempt to find means of dealing with corporations engaged in interstate commerce other than banks and common carriers.

In the same direction went the blue-sky laws passed in this period by many states, to break up the practice of floating the stock of companies which had no property more substantial than the atmosphere.

Labour.— The example of capital, in rolling itself into masses too great to be controlled by ordinary means, was followed by labour. The American Federation of Labor was a loosely woven council of representatives from the great trade organizations. It did not undertake to call strikes, though it was likely to support them, and it had great effect in bringing about combined and simultaneous demands for the various items in the labour program. The leaders fixed upon an eight-hour day as the basic working time. The next item was the minimum wage, which made its way slowly and was not altogether acceptable to labour. Another demand was that U.S. citizens should have preference over aliens in employment. Labour in general was unfriendly to child labour and was, therefore. interested in a federal statute of Sept. 1, 1916, to prevent the transport of products made by child labour under specified conditions.

As the labour unions gained in numbers and strength they used their energies in favour of the closed shop, a system under which union men refused to work in any establishment where men not members of the union were also employed. From this idea rapidly developed the system of sympathetic strikes, in which members of one union back up another union by refusing to handle, use or transport products of nonunion labour. Hence boycotts, and perhaps ruin for employers who had no difficulty or quarrel with their own workmen. Never in the prior history of the U.S. had there been so many and such violent strikes as from 1913 to 1917. The Industrial Workers of the World (I.W.W.) organized long and tumultuous strikes among the silk weavers of Paterson, N.J., and the textile workers of Lawrence, Mass. In the trying years of 1916–17 violent strikes were directed not only against nonstriking. workmen, but against the public peace. In July 1917, at Bisbee, Ariz., the tables were turned. A kind of vigilance committee seized and carried out of town, with orders not to return, about 1,200 striking miners and their friends. No jury would convict those responsible for this illegal action. The most serious of all these labours struggles was the threatened strike in 1916 of the large and powerful unions of railway employees. President Wilson intervened and practically compelled congress to pass (Sept. 3, 1916) the Adamson act by which a basic eight-hour day was secured with pro rata for overtime. The supreme court upheld this statute, which went to the farthest verge thus far of the federal government's authority over labour matters.

Social Movements.— These struggles between the railways and the courts, between the trusts and congress, between labour and state governments. between strikers and the president of the United States, are part of U.S. history because they were vital. to the welfare of the country. The farmers everywhere were aroused, for they looked on railways as hostile to their interests, by overcharging for carrying their products; and they resented the trusts, which they believed raised prices. The antiliquor forces steadily developed strength. They urged out-and-out prohibition and secured it in more than half the states. At the end of 1917 war prohibition was enacted by the federal government and also prohibition in the District of Columbia. On Dec. 19. 1917, a two-thirds majority was secured in congress for a prohibition constitutional amendment — the 18th amendment — nhich was at once submitted to the states. Woman suffrage also advanced steadily. Congress submitted a woman suffrage amendment in 1919. Thus changes that had been 50 years on the way finally were brought about by the force of public opinion. A change was also visible in the attitude of the country toward immigration which congress was determined to reduce by an intelligence qualification. A new bill (Feb. 5, 1917) mas passed over Wilson's veto. Besides a literacy test it raised the head tax to $8 and excluded oriental labourers coming from certain geographical areas. mhich did not include Japan but did apply to Hindus and Malays.

Educational Progress. — The several years following 1909 were marked by a new sense of the possibility of general education, and the need for a more direct, searching and practical type of education. The country was accustomed to a system of graded public schools, offering the common school education, and leading up to a few endowed and private schools, and to thousands of public high schools, which were expected to prepare the small proportion of young men and women who went on to institutions of higher education. Secondary education was subdivided into literary, commercial and industrial schools. The institutions of higher learning set up new professional departments, including the intensive study of education and separate schools of science, engineering, agriculture and other specialties. Private enterprise created a great number of so-called business colleges, and a few very efficient trade schools.

Nevertheless there was general complaint that the schools did not relate themselves to the life of the community. A National Society for the Promotion of Industrial Education became the focus of a movement to organize what now became generally known throughout the country as vocational education. A national commission was appointed by President Wilson, in 1914, to consider the whole subject. The resulting Smith-Hughes act (Feb. 22. 1917) created a federal board for vocational education which framed an elaborate plan for instruction in the four vocational fields of agriculture, commerce, industry and home-making.

The act promised to appropriate federal funds to be paid to such states as would match these funds dollar for dollar.

Private enterprise accompanied this movement by building up advanced engineering and trade schools of a high type, such as the Carnegie institute at Pittsburgh; by improving the private commercial schools and by establishing advanced schools of business training in colleges. Some of the great manufacturers, especially of automobiles, set up schools within their own works.

When the United States plunged into World War I in 1917. the government established a variety of vocational schools to train men for the numerous specialties of military service. It made use of the shops and other vocational facilities of the existing schools and colleges. Great sums were raised by special drives among the alumni and friends of the endowed institutions, and the state universities were allotted hitherto unheard-of grants. The strictly vocational schools were admitted into fellowship with the other institutions.

Wilson's Foreign **Policy.**—Woodrow Wilson was naturally a man of peace, and so emphatically was Secretary Bryan. They set themselves to aid the cause of general peace by arbitration treaties. Secretary Bryan prepared a definite project for treaties by which the nations concerned should, in case of difficulties, pledge themselves to submit their grievances and claims to a special examining commission and to abstain from war or preparations for war until the commission should have had time to report. The presumption was that a sensible nation would submit to the judgment of an impartial tribunal. There was little difficulty in concluding more than 30 treaties upon this basis in the course of a year. hut none was put into effect. The truth was that the American people, as a whole little accustomed to international questions had no definite foreign policy.

Philippines and Caribbean. — The government of the Philippine Islands was altered by setting up the first Filipino assembly in 1907. In response to the pleading of President Taft, congress in 1909 grudgingly included them within the customs boundary of the United States. Under President Wilson, Gov. Gen. Cameron Forbes was withdrawn and Burton Harrison was appointed his successor, to carry out a policy of liberalization and preparation for independence. The Filipinos were allowed to hold a majority of the seats in the commission, which became a kind of administrative upper house. Filipinos were substituted for Americans in many of the civil offices. The people were thus given a definite opportunity to govern themselves. The Jones bill, enacted Aug. 29, 1916, greatly enlarged the power of the popular part of the government. and the commission ceased to exist. The act promised that the Filipinos should be given their independence when their ability to govern themselves should be demonstrated.

At the other end of the American sphere of influence, Cuba, while nominally independent, remained a protectorate of the United States. On March 2, 1917, the Puerto Ricans were for the first time made American citizens and received a popular government of two elected houses. President Wilson continued the administration of the Dominican republic which dated back to Roosevelt. He also took military control of Haiti in 1914, and followed it by a controlling treaty which was ratified by the senate (Feb. 28, 1916). He carried even further Taft's policy in Nicaragua by a treaty (ratified Feb. 18, 1916) which converted that country into a virtual protectorate. Another area came under control of the United States by a treaty for the annexation of the Danish West Indies proclaimed in 1917. These islands were duly organized under the title Virgin Islands of the United States. Little opposition was made to this creation of a virtual empire, including dependent provinces.

Latin America and the Orient, 1913–17.—The peaceful policy of the United States toward its neighbours was severely tested by disturbances in Mexico. In 1913 Francisco Madero, president of that republic, was murdered, presumably by order of Victoriano Huerta, an insurgent officer, who thereupon declared himself the head of the state. The almost invariable policy of the United States had been to recognize any de facto head of a Latin-American government without inquiring into the source of his title. But on this occasion President Wilson adopted what he called a policy of "watchful waiting." He steadily refused to recognize Kuerta against rival revolutionists. In April 1914 a trifling dispute arose at Tampico as to a salute of the U.S. flag and Wilson, apparently yielding to strong public sentiment, ordered the navy to attack and capture Veracruz, of which the United States remained in possession for several months. The real object was to discredit Huerta, who was compelled to flee the country. When in 1916 the brigand Pancho Villa raided Columbus, N.M., the president ordered a military expedition under Gen. John J. Pershing to advance into the interior of Mexico. It remained about eight months without capturing Villa or accomplishing any other definite result. The three friendly nations of South America — Argentina, Brazil and Chile, commonly known as the "ABC powers" — offered a kind of mediation. At their suggestion V. Carranza was recognized as president by the United States. Disorder continued, and in May 1920 Carranza was overthrown and killed by the troops of Álvaro Obregon. For a time thereafter Mexico emerged from the state of revolution.

This long controversy was highly disturbing to the desired close relations with Latin America in general. In spite of four Pan-American congresses and several scientific congresses, in spite of visits of Roosevelt and of Root and Philander Chase Rnox as secretaries of state to South America, thkre could be no harmony if the United States were to continue "administering" small and defenseless Latin-American nations and waging undeclared wars with Mexico. Nevertheless, President Wilson in a speech at Mobile. Ala. (Oct. 27, 1913), declared that the United States had no designs on the territory or independence of its Latin-American neighbours. Colombia, too, had a grievance arising out of the loss of the isthmus when the Panama canal zone was annexed in 1904. A treaty negotiated by Bryan to pay to Colombia $25,000,000 as a kind of reparation was ratified by the Republican administration in 1921.

In regard to the far east, Wilson had little opportunity to develop a policy. He began by disavowing the plans made under the advice of President Taft for a loan by U.S. bankers to China. He argued with the people of California because they insisted on passing a statute restricting alien ownership of land by Japanese residents. World War I soon united the United States and Japan in a common cause, and on Nov. 2, 1917, the Lansing-Ishii note, on the same plan as the Root-Takahira note of 1908, set forth that the United States recognized Japan's "special interests in China."

Neutrality. — The United States in 1914 expected to remain indefinitely at peace, as was shown by lack of anything that could be considered national military preparation in terms of modern warfare. When, on Aug. 4, 1914, President Wilson issued a proclamation of neutrality as between the two groups of European nations just engaging in a gigantic struggle, the authorized military establishment was about 107,000 men, of whom about 87,000 were enrolled. The United States had not one military airplane of approved type; had only four modern heavy field guns and no transport for them; had not a trench bomb or a mine thrower; nor considerable supplies of any weapons or equipment except 800,000 rifles; nor any officers experienced in the kind of warfare used in modern wars; nor any instruction camps for officers or men. The navy included a fleet of battleships recently built, but it was weak in small and swift vessels and particularly in submarines. The militia proved to be of little service, though Secretary Bryan publicly declared that the nation needed no preparation, for it "could raise a million men between sunrise and sunset."

Neither the foreign policy nor the diplomatic organization of the United States was fitted for such a crisis. The traditional Monroe Doctrine was expected to keep the nation out of dangerous controversies with the other American states. The counterpart principle of isolation forbade the United States to take any part in European crises or wars. As a neutral it stood by the principle of "freedom of the seas," by which was meant in particular the right to carry on commerce with all belligerents in case of war, subject to the limitations of the then acknowledged international law as to contraband and blockade. Soon after the beginning of World War I relief was organized on a large scale for the Belgian people, most of whose country was overrun and held by the Germans. This system soon included French refugees, the unhappy peoples of Serbia and Asia Minor and other combatant or noncombatant sufferers, besides the sick and wounded of the contending armies.

Difficulties With the Belligerents, **1914–17.**—The United States was compelled at once to take into account the relation between the war and U.S. industries, commerce and finance Heavy loans were placed in the United States by Great Britain, France and Russia. As fast as the money was borrowed it was spent in the United States for the purchase of food, clothing, animals and especially munitions. President Wilson issued a proclamation (Aug. 18, 1914) advising that the people remain neutral "not only in act but in word and in thought." Such neutrality mas impossible. In the first weeks of the war, German commerce was driven from the seas. The command of the sea by the Allies very nearly cut off trade of any kind between the United States and Germany and Austria, while commerce continued in ever-increasing volume with England and France. This disparity led to protests on the part of the German government, and also to lawless acts perpetrated or directed by agents dispatched by the German government for the purpose of paralyzing the munition factories. Violent antipathies were caused by the German methods of carrying on war, and particularly the treatment of the occupied areas of Belgium and France. The American population included hundreds of thousands of citizens of the belligerent countries, many of whom attempted to return to their homes in order to serve in the army. The road for such recruits was blocked for the Germans and their allies, but open to the Allies. For the first time in half a century the United States found within its own borders a sharp division on questions of foreign policy.

On the other hand, the war trade brought immense profits. The favourable balance of trade rose from $690,000,000 in 1913 to $1,770,000,000 in 1915 and $3,000,000,000 in 1916. This prodigious debit was balanced by about $3,000,000,000 sent to the United States in securities and gold, besides $2,000,000,000 in foreign war bonds. Under these circumstances genuine neutrality was out of the question. A decided preponderance of sympathy developed toward the western Allies, who were profitable customers, were in close and almost undisturbed dealing with the United States and were considered to be fighting against a ruthless, arrogant and dangerous autocracy.

International Controversies, **1914–17.**—The internal tension of the United States mas tightened by the insistence of Germany on the right to use new weapons, tactics and practices of war, without the traditional limitations of international law, without mercy to noncombatants, on the basis of "a law of necessity." No able-bodied German man or woman was really a noncombatant; the Germans insisted that they must regard all civilian enemies as combatants. There was no way to stop them without using similar new methods of warfare.

Great Britain, which in the London Maritime conference of 1908–09 had shown some disposition to enlarge the privileges of neutral commerce, now seized U.S. ships and shipments, and arbitrarily extended the list of contraband, until (Dec. 26, 1914) a dispatch signed by Secretary Bryan, but expressing the conclusions of President Wilson, made a protest. In the course of 1915 the British government began to apply the U.S. principle of "continuous voyage" as applied by the United States during the Civil War to cover shipments to neutral ports in cases where those shipments were likely ultimately to reach Germany; and also where they might replace products of the neutral countries that could thus be spared for Germany; or if the neutral countries declined to make a hard and fast agreement not to reship.

In 1916 the British were practically blockading neutral European ports and capturing vessels, U.S. and other, wherever they liked. The Central Powers set up a new war practice of using submarines as commerce destroyers. The U.S. government protested. A crisis came through the sinking by a submarine of the British passenger liner "Lusitania" (May 7, 1915), with the loss of 139 American lives. That sinking seemed a deliberate act of the Germans to test the temper of the United States. Apparently they were greatly surprised when the people of the United States rose in resentment. President Wilson, who had earlier insisted on "strict accountability," insisted on a sharp protest. Bryan thought milder measures sufficient, and on that issue resigned the secretaryship of state (June 8, 1915), being succeeded by Robert M. Lansing. The correspondence went on until October when Germany at last informed the U.S. government that merchant ships would not be sunk without warning and an opportunity to save noncombatant lives. Meanwhile, throughout 1915 and 1916, systematic violations of the neutrality laws of the United States by Germans and Austrians caused the dismissal of the Austrian ambassador to the United States and of two members of the German ambassador's staff.

"Preparedness." — By the end of 1915 it became clear that with or without their own desire, the people of the United States might find themselves involved in the war. President Wilson desired peace. A day or two after the sinking of the "Lusitania" he spoke of there being such a thing as "a nation that was too proud to fight." In his message of Dec. 1915 he urged national defense and the protection of American shipping. Long before this time World War I had brought about a violent change in the economic conditions of the country. The great demand for foodstuffs raised the price of grain and other farm products. The high cost of living became a political issue. The munition factories offered unheard-of uages and drew hundreds of thousands into improvised tonns. The war caused a great change in immigration. Hundreds of thousands of men left the United States for Europe, while the net immigration fell from 1,200,000 in 1914 to 300,000 in 1916.

The Election of 1916.—In the midst of this turmoil and confusion of business came the preliminaries of the presidential election of 1916. President Wilson carefully abstained from taking sides between the Allies and the Central Powers; but the aggressive submarine policy of Germany provoked a much sharper tone than did the aggressions by the English. He felt the need of caution, particularly because a growing group of men, among them Roosevelt, were coming to the conclusion that eventually the United States would have to join in the war.

The Republican nominating convention met in Chicago, June 7. A strong effort was made by friends of Roosevelt to capture the Republican convention, but the standpat Republicans had control of the party machinery. The Progressives—who in Nov. 1914 had cast 1,800,000 votes for congressional and state candidates—also met in convention in Chicago. Their purpose was to compel the Republicans to nominate Roosevelt as the only means of healing the breach. That effort failed: the Republicans nominated Justice Charles E. Hughes of the supreme court, who had been a reform governor of New York state. The days of the Progressive party seemed numbered.

In the Democratic convention (June 14) there was practically no opposition to Wilson and his running mate T. R. Marshall. The platform in many respects was similar to that of the Republicans. Both favoured woman suffrage, the conservation of national resources and national enforcement of child-labour laws; both reaffirmed the Monroe Doctrine. But the Democrats upheld tariff for revenue only; they endorsed the promise of ultimate independence to the Filipinos; they commended the establishment of a federal trade commission; and they approved a merchant marine owned and operated by the federal government. In the campaign Roosevelt publicly supported Hughes, though it was well-known that he felt no enthusiasm for him. The only slogan that caught the public ear was favourable to Wilson: "He kept us out of war." Wilson received about 9 000,000 popular votes against 8,500,000 for Hughes, and was chosen by a close vote in the electoral college.

Entry Into World War I.—President Wilson stood in a strong position in the United States and in the world. He had been reelected. His policy was approved. He felt that he had the nation politically united behind him. He hoped that the one great neutral nation might bring about peace. On Dec. 18, 1916, he sent a communication to the warring powers suggesting that they come to an understanding of each other's demands. On Jan. 22, 1917, in an address to the senate on foreign affairs, the president described the replies he had received to the identic note of Dec. 18.

> The Central Powers united in a reply which stated merely that they were ready to meet their antagonists in conference to discuss terms of peace. The Entente Powers have replied much more definitely, and have stated, in general terms indeed, but with sufficient definiteness to imply details, the arrangements, guarantees and acts of reparation which they deem to be indispensable conditions of a satisfactory settlement.

He went on to speak of an "organized common peace," and of a "peace without victory"; he outlined the principle of self-determination, declaring that "Governments derive all their just powers from the consent of the governed," and that "no right anywhere exists to hand people about from potentate to potentate as if they were property." The German answer was a brief note communicated by Ambassador Count von Bernstorff to Secretary Lansing (Jan. 31, 1917), withdrawing the pledge given in Oct. 1915 and renened in May 1916 that merchant ships would not be sunk without preliminary warning and announcing that the Germans would shortly resume unrestricted submarine warfare. High military authority in Germany believed that Americans would never sacrifice the large profits of export trade and incur the huge expenses of war merely for the sake of a question of neutral maritime rights.

Immediate steps were taken to make the U.S. navy ready for war. For a time the president dallied with a plan of arming merchant ships. One result of the controversy was the adoption by the senate (March 8) of a mild and cumbrous method of cutting short debate by closure. During February and March 1917 a few U.S. vessels were torpedoed by German submarines. On March 1 the government published an intercepted German dispatch to the Mexican government asking it to join in the war, promising it the "former Mexican provinces," long incorporated in the United States. The participation of the United States in the war was now inevitable. A formal declaration of a state of mar was signed by the president (April 6) after a house vote of 373 to 50 and a senate vote of 82 to 6, which stated that war had already been begun by Germany. Relations with Austria and Turkey were at once broken off, but the declaration of war with Austria was delayed until Dec. 7 and no declaration was ever made against Turkey or Bulgaria.

The breach with Germany was a spontaneous national action representing a national belief that the United States could no longer live in peace with such a nation as Germany had become. As President Wilson put it the war was to make the world "safe for democracy." Moreover, there was widespread sympathy with the three western powers, France, Belgium and Great Britain, which were closest to the United States in their political principles and system of government. Wrath was aroused by the German treatment of the people of Belgium and other conquered countries. In some minds there existed a genuine and well-grounded fear of a future attack upon the United States by Germany if the resistance of the Allies should be destroyed. Amid all the motives for the war, the one thing was that the American people recognized Germany as an enemy, and the enemies of Germany as natural friends and partners in the great enterprise of subduing "the Hun."

War Measures.—Passionate national spirit, patriotism and urgent reasons for war were all useless unless the United States could enroll, train, equip, convey and continuously supply an immense army. The U.S. navy, though the vessels were good and the crews skilled and well commanded, was in no position to give direct aid in the process of destroying the German army. What was most needed was to raise and convey to the fighting front a large force of U.S. troops.

Soon after the declaration of war by the United States, missions from the various Allied countries were sent to America. The British mission, headed by Arthur (later Lord) Balfour, British foreign secretary, reached Halifax April 20 and proceeded to Washington. The French mission, headed by Rene Viviani, the former premier, and including Marshal Joseph Joffre, landed April 24. Other missions came from Italy, Belgium, Russia, Rumania and Japan. The United States was able at once to help the western Allies in their pressing financial difficulties. Taxes were low and little felt; money abounded. Under acts of congress beginning Oct. 17, 1917, the Allies received essential credits, which amounted eventually to $9,500,000,000.

These enormous payments were made possible by the Liberty Loans. In June 1917, 4,000,000 people joined in offering $3,000,000,000 to the government; and at the end of World War I the interest-bearing debt had increased from $972,469,290 on Dec. 31, 1916, to $25,234,496,274, on June 30, 1919. These loans were supplemented by the War Revenue act (Oct. 17, 1917) and later statutes, which laid a variety of new taxes, increased the income tax heavily and combined with it an excess-profits tax to bring into the treasury unreasonable profits likely to be made in the war industries.

All traditional limitations on raising an army were discarded. On May 18 the Selective Service act was passed which provided for the enlistment of 1,000,000 men by "selective draft." When called up, the men had to be clothed, housed, fed and drilled. Thousands of officers were necessary, and training camps. both for men and officers, were established on a vast scale. In May 1917 a few U.S. destroyers reached England. On June 9 General Pershing, who had been selected as commander in chief, arrived in England. On June 26 a small detachment of United States troops reached Europe. New branches of military service were established, among them the chemical warfare service which provided materials for lethal gases and for gas masks and other means of resisting the enemy attacks. Congress, on July 24, appropriated $640.000.000 for aviation. By August about 700 000 men were enrolled in the army and 230.000 in the navy.

Control of Industry and Transportation.— The establishment of huge war industries put a great strain on the industry and transportation of the United States. On Aug. 10, 1917, a Food Control act gave the president powers never before conferred aith regard to food and fuel. Herbert C. Hoover of California, who had distinguished himself in the management of the American Red Cross in Europe, was made food administrator with large powers. Before World War I ended he had established "meatless" and "wheatless" days; the price of grain mas fixed; eventually the farmers were assured $2.20 a bushel for their wheat crops. H A. Garfield, fuel administrator, carried through drastic measures for stimulating the production of fuel, regulating shipments and distributing supplies. On March 21, 1918, the Federal Control act placed the management of all the railways in the country in the hands of the government during World War I and for a period after its close. McAdoo, secretary of the treasury, was made director general of the railways; later Walker D Hines an experienced railway man, succeeded him. One of the most serious needs of the times was a merchant fleet adequate to carry across the Atlantic the army and its supplies. The government undertook the great task of improvising such a fleet, and vast construction was authorized in both steel and wood.

War Activities at Home.—At once after the declaration of war the American people through official and unofficial channels gave support by civilian service and money contribution. Among the multifarious public agencies was a committee on public information, of which George Creel. journalist, was chairman, which kept up a lively system of publicity aided by the National Board for Historical Service. A censorship board censored all communications—mail, cable, radio—passing between the United States and foreign countries. As early as Aug. 29, 1916, the Council of National Defense was created by act of congress. Under it were created numerous special organizations. The Council of National Defense appointed a women's committee to co-ordinate the patriotic nork of the women throughout the country. The advisory commission of the Council of National Defense created a committee on transportation and communication. A railroad mar board undertook to secure unity of operation among all the railways, to subordinate private interests and to eliminate competition. Important coastwise steamship lines were added to this system. In 1918 the government assumed control of telegraph, telephone, marine cable systems and radios. Many scientists were engaged in research throughout the country under the Kational Research council. Commerce also was regulated.

By the Espionage act of June 15, 1917, the president was empowered to control exports, and he created a bureau of export licences and a trade board. A list was prepared of firms throughout the world with nhom Americans should not trade. The government formally took charge of all foreign trade Feb. 15, 1918, and seized all German ships interned in United States ports.

Gompers co-operated in organizing a committee on labour, and a mediation commission was appointed. The National War Labor board (April 9. 1918) acted throughout the country as a kind of supreme court to settle labour disputes. For the recruiting of essential labour and directing it into necessary industries a U.S. employment service was created.

Several private war agencies were established. Chief among these were the American National Red Cross, which was to be found wherever there was fighting, sickness, suffering or starvation: the Young Men's Christian association; Young Women's Christian association; Knights of Columbus (Roman Catholic); Salvation Army; Jewish Welfare board; American Library association; and War Camp Community Service.

While the people of the United States were practically a unit in favour of a vigorous prosecution of World War I, a few, chiefly foreign-born or sons of foreign-born, were opposed to the war or more often to the nations in concert with which the United States was fighting. Ever since 1914 the country had been irritated and aroused by a series of illegal, violent and often murderous acts which were traced to German and Austrian agents. Such were determined efforts to blow up the international bridge at Vanceboro. Me., and the locks of the Welland canal, Ont. The German consul general at San Francisco, Calif., was convicted and imprisoned for aiding German vessels in the Pacific in defiance of neutrality laws. Franz von Rintelen (after the war specially rewarded by the German government) was sent to the federal prison at Atlanta, Ga., for aiding in placing bombs on outgoing vessels with intent to destroy them.

The Navy.—Beginning with patrol work on the American coast as soon as war was declared, the activities of the United States navy extended to co-operation with the British and French in the tracking down of submarines and the protection of convoys and in the laying of the North sea mine barrage, extending from the Orkneys to Norway. The U.S. navy had some part in blockading the Austrian coast of the Adriatic, and it participated in maintaining that Allied command of the sea which in the end was fatal to Germany. By a remarkable convoy system more than 2.000.000 troops were carried safely 3.000 mi. overseas to France. In this work the utmost secrecy was necessary. In June 1917 a few cruisers and transports were provided and the first troops sent across. At intervals vessels assembled and sailed on definite routes under the protection of destroyers. According to the report of the secretary of the navy (1920), 911,047, or nearly half of the U.S. troops, were carried on United States navy transports; the rest chiefly by the British. Not one eastbound U.S. transport was torpedoed by the German submarines; and only three ships were sunk on their return voyage. Three small fighting ships were destroyed by the enemy.

During the campaign of 1918 efforts were made to extend the possible field of enlistment by the passage of the Man Power act of Aug. 27. All men between 18 and 45 were required to register with a view to service if needed. and 11,000,000 were registered. By a statute of Oct. 6, 1917 provision was made for a system of military and naval insurance available for all men in the service. (For military events. see WORLD WAR I.) (A. B. H.; X.)

Rehabilitation, 1919.—The task of post-bellum economic adjustment was long and costly. At the end of the war the federal government by means of war statutes was attempting to control the distribution of food, was in fact limiting and rationing manufactured goods and mas continuing to direct mining of coal and its shipment. The government was directing the operation of railways, and the telegraph and telephone services. It had taken over the property of aliens through an alien property custodian. For foreign commerce there was still the Shipping board, the Emergency Fleet corporation, the War Trade board and the War Finance board. Two million U.S. soldiers were overseas and wanted to come home as soon as possible. The United States had spent on the war about $35,500,000,000, including $9,500,000,000 lent to the Allies. Expenditures after peace came continued on a scale far beyond any previous experience of the country.

In the course of six months after the Armistice, about two-thirds of the troops were brought back, leaving behind them enormous stores, large parts of which were sold at heavy discounts to European governments. On June 1, 1920 the only U.S. troops left in Europe were en army of occupation in western Germany.

The Election of 1918.—The Armistice had come a few days after the state and congressional elections of the autumn of 1918. Despite the deep political and sectional divisions in both the Republican and Democratic parties that had preceded the declaration of nar in 1917, the nation had been a unit in waging war. Partisan politics did not enter into the organization of the armed forces. Little attention was paid to politics in the civilian administration of the war. Yet the administration of the president was subject to constant attack by prominent Republicans and by Republican members of congress, and in Jan. 1918 the Republican national committee began a campaign to capture control of congress in the autumn elections.

A few days before the elections, President Wilson issued a circular letter urging the voters to return a Democratic majority to the senate and the house. The result of the election, however, made the new house decidedly Republican and the senate Republican by two votes. It was apparent, therefore, that the administration in making the necessary adjustments after the war had to take into account the preponderant opposition in both houses of congress.

Throughout 1918 the influence of Roosevelt in the Republican organization was manifestly growing. It became clear that he would wield great influence in the Republican convention of 1920 and might be chosen as candidate of the party, despite his defection in 1912. But he died suddenly on Jan. 6, 1919.

The Peace Conference.—In Dec. 1918 President Wilson decided that he would attend the forthcoming peace conference in person, and designated as peace commissioners Secretary of State Lansing, Colonel House, Gen. Tasker Bliss of the army and Harry White, formerly minister to France. Wilson was one of the representatives of the four great powers—Great Britain, France, Italy and the United States—who prepared the articles of the treaty of peace.

A part of the treaty was the covenant of the League of Nations, a crystallization of long-debated suggestions for a world confederation of states. President Wilson was deeply interested in the foundation of such a league as was envisioned in the covenant, and was willing to agree to a suggestion of the French for a treaty of mutual protection in order to gain the support of the French for the proposed covenant.

U.S. Action on the Treaty, 1919.—It had been apparent during the course of the negotiation of the treaty that in the U.S. congress and electorate there would be vigorous debate on the covenant of the League and, indeed: upon the question of U.S. membership in such a league. President Wilson returned home for a short stay (Feb. 24–March 4), defending the general terms of the treaty and the covenant. On June 28, 1919, he and his four commissioners signed for the United States the formal treaty of Versailles, including the covenant of the League, which was so interwoven into the text of the treaty that it was impossible to ratify one without the other. The treaty had many powerful supporters among all parties, particularly former President Taft, the League of Free Nations association and the League to Enforce Peace. The senate was divided into strongly opposed groups. Most of the Democrats, under the lead of Sen. Gilbert Hitchcock (Neb.), followed the president in favouring the treaty with the covenant as it stood. A group of Republicans, headed by Sen. Henry Cabot Lodge of Massachusetts, favoured "amendments" to the treaty and "reservations" to the League. Another group desired reservations that would practically destroy both. A small group, including Sen. William Borah of Idaho and Senator Johnson of California, were against both the treaty and the covenant in any form or with any reservations.

The contest ostensibly centred about art. x of the covenant, under which the members of the League undertook "to respect and preserve as against external aggression the territorial integrity and existing political independence of all members of the League." The implacable group expressed fear lest the United States be drawn into foreign wars and insisted that "no American soldiers or sailors must be sent to fight in other lands at the bidding of the League of Nations." The president, on the other hand, regarded art. x as the heart of the whole treaty. He declined at the critical moment to accept either amendments or reservations, except certain minor alterations. After strenuous debate and by a test vote, Nov. 19, 1919, the senate refused to ratify the peace treaty with reservations—the vote being 53 to 38 in favour, but not the necessary two-thirds. In the regular session upon resubmission, the vote was 49 to 35, again not the necessary two-thirds. Thus after five months' discussion the treaty was rejected, and the United States was left in the situation of remaining technically at war with Germany and Austria though all hostilities had ceased a year before.

President Wilson, believing that he could arouse public sentiment to force senate ratification, had undertaken a tour of the country in September. He was greeted by great audiences, but the response of the country was not convincing. Not only did senate opponents speak before great audiences in rebuttal, but it was apparent in public discussion that many elements in the population were pledged to U.S. "isolation" from Europe.

The president's tour was abruptly ended when he collapsed, in Colorado, and a paralytic stroke in October removed him for months from active participation in work of the government.

On March 4, 1921. Wilson accompanied President-elect Warren G. Harding to the Capitol as the last act of his official life. Wilson had been president for eight years, during six of which he was the undisputed leader of his party. He was responsible for important revenue. banking and labour laws. He had a great hold on millions of citizens. For a time in Paris he was the foremost man in the world, and he succeeded in inducing foreign statesmen to accept the League of Nations. At the height of his career he lost the prestige gained as war president of the whole country. was no longer fully accepted by his party and ceased to be the one man who could appeal from congress to the people. He lived in Washington in retirement, physically unable to take part in public affairs. and died Feb. 3, 1924.

Presidential Election of 1920.—The peace revealed underlying elements of dissatisfaction. The soldiers received in many states a money bonus and an organized lobby demanded a bonus from congress. The general public complained bitterly against the rising cost of living. A multitude saw their incomes and expectations reduced by the fall in the purchasing power of the dollar. As the presidential election opened, the Democratic party was paralyzed by internal dissensions over the peace treaty and by lack of leadership of the president; it had no accepted policy in foreign relations or reconstruction and no commanding figure to put forward for the presidency.

The Republicans were rent by personal rivalries. Gen. Leonard Wood, Gov. Frank Lowden of Illinois and Senator Johnson were outstanding candidates. The convention at Chicago (June 9, 1920) passed them all by, and gave the nomination to Sen. Warren G. Harding of Ohio. He was backed by a strong group of standpatters. Calvin Coolidge. governor of Massachusetts, mas put on the ticket as vice-president. The Democratic convention held at San Francisco was confronted with similar difficulties. The nomination went to Gov. James Cox of Ohio, a man little known in national affairs, with Franklin D. Roosevelt of New York, who had served as assistant secretary of the navy. as candidate for the vice-presidency. In the campaign for the first time women were eligible to vote in every state. The election was a complete triumph for the Republicans, who elected Harding by a popular majority of about 7,000,000. and an electoral majority of 404 against 127 for Cox, besides securing solid majorities in both houses of congress.

The presidency was thus transferred to a man little experienced in national politics. whose task it was to take over the discordant elements and build out of them a coherent policy. President Harding began his administration under favourable auspices, although several members of his cabinet had been chosen in the face of strong opposition from various quarters. The new president displayed keen interest in all attempts to restore business to a sound basis and urged prompt action in the assistance of the railways. By nature conservative, he laboured to bring the country back to a state of "normalcy."

Harding's foreign policy was to remain outside the League of Nations. Special treaties of peace negotiated with Germany, Austria and Hungary were ratified by the U.S. senate Oct. 18, 1921. Of world-wide importance was his call for a conference at Washington of the different powers bordering on and interested in the Pacific ocean, to discuss both questions of the Pacific and the limitation of armaments. The conference assembled Nov. 12, 1921 and closed Feb. 6, 1922. The nine participants were the United States, Great Britain. France, Italy, the Netherlands, Belgium, Portugal, China and Japan. Important agreements were signed: to limit construction of capital warships; against improper use of submarines; against gas warfare; for maintenance of the status of Pacific insular possessions; and other questions involving relations with Japan and China (see WASHINGTON CONFERENCE).

Before Harding came to the presidency, two constitutional amendments had crystallized some of the results of the mar. The various prohibition measures passed by the congress led finally to passage and ratification of the 18th amendment. The service of women in the war, together with the votes they already enjoyed, caused congress (June 7, 1919) to submit the 19th constitutional amendment annulling all restrictions of sex on suffrage. It received the ratification of the 36th state on Aug. 24, 1920. and went into force Aug. 26.

Political and Social Conditions. — A study of the political, social and economic history of the United States must take account of the extraordinary national elation following World War I. It produced a profound effect upon the national mind and was the beginning of an enlargement of national life in every direction. The nation felt free to expand its influence in the Caribbean and the Pacific. Hence the maintenance and enlargement of a policy of paramount interest in the three normally independent countries — Cuba, Haiti and the Dominican Republic, and a strengthening of the control over Panama, Honduras and Nicaragua.

To carry out great national policies. the United States could call upon a population expanding from year to year. The total continental population rose from 92,000,000 in 1910 to 106 000,000 in 1920. Net immigration of 818,000 in 1910 sank to 19,000 in 1918. but rose in 1924 to 663,000. The wealth of the country, estimated at $187,000,000,000 in 1912 was counted at $321,000,000,000 in 1922, and was still swelling in volume. Against these figures, such burdens as a national debt of $25,000,000 000. bearing $1,000,000,000 of annual interest, besides $6,000,000,000 of state and municipal debts were insignificant. Manufacturing, transportation, mining, distribution and financial business were all prosperous.

Political rancour and party spirit diminished during these years. President Harding drew several strong men into his cabinet in March 1921. Secretary of State Hughes had been a justice of the U.S. supreme court and candidate for the presidency in 1916. Secretary of the Treasury Andrew Mellon nas a successful banker and financier uho had never before appeared in public life. Hoover, secretary of commerce, contributed his extraordinary gift of business organization. Henry C. Wallace, secretary of agriculture. was the editor of a great agricultural newspaper. President Harding's career was cut short by a very brief illness, however. and he died in San Francisco. Aug. 2. 1923.

President Coolidge, now elevated from the vice-presidency, set up a new regime in the White House. He proved to be a man of strong character, nho consulted those whom he trusted and then made up his own mind and stood by his decisions. Coolidge for the time being continued Harding's cabinet, but later changes were made. so that at the end of five years Secretary of the Treasury Mellon, Secretary of Commerce Hoover and Secretary of Labour James Davis were the only men left of Harding's first cabinet.

The growth in wealth and enterprise reacted upon the government where even the president's cabinet mas disturbed and dismembered by a painful series of accusations and investigations. For several years the government had conserved certain oil-bearing areas of public land as a supply of oil fuel for the navy. On April 7, 1922. jurisdiction over this matter was transferred from the navy department to the interior department by an order of President Harding. Under this authority Secretary of the Interior Albert B. Fall leased to the Sinclair interest a large tract in the Teapot Dome district in Wyoming, and also leased one of the California reserves to the oil magnate, Edward L. Doheny. There was an investigation by a senate committee under the chairmanship of Sen. Thomas J. Walsh of Montana. Secretary of the Navy E. Denby resigned and was replaced by Judge Curtis D. Wilbur of California. Meanwhile Atty. Gen. Harry M. Daugherty came under attack. A special committee of the senate under Sen. B. K Wheeler of Montana unearthed questionable procedures and Daugherty refused to allow the files of his office to be examined by the senate committee. President Coolidge demanded his resignation March 28. 1924. Criminal proceedings were instituted against Fall, Doheny and Daugherty, but legal technicalities were invoked by the defense and President Coolidge took a neutral attitude in these proceedings, which he considered to be outside the scope of the executive power. Daugherty was succeeded as attorney general by Harlan F. Stone of New York; then Stone was placed on the supreme court bench and Tohn G. Sargent of Vermont became attorney general.

In the congressional elections of 1922 the Republicans had retained small working majorities in both house and senate. There was, however, a return of earlier conditions in the appearance of a small group of independent Republicans. with La Follette as leader. who were able sometimes to hold the balance of power between the regular Republicans and Democrats. President Coolidge's conduct during his eight months in office seemed to justify the confidence of his party; and when the Republican convention met in Cleveland there was little opposition to his nomination. The vice-presidency offered difficulties. In the end the choice fell upon Charles G. Dawes, known through his association with the commission of 1923 which had devised a scheme for the payment of reparations by Germany. The Democratic convention, held in New York city, was the longest and fiercest in 60 years. The vote was divided between McAdoo, former secretary of the treasury, and Alfred E. Smith, who had won a national reputation as governor of New York.

The convention balloted 103 times; but neither candidate could secure the necessary two-thirds. The convention finally nominated John W. Davis of West Virginia, former ambassador to Great Britain. mith Charles Bryan (brother of William Jennings Bryan) as vice-presidential candidate. The campaign was quiet; in the election (Nov. 1924) Coolidge received 15.725 016 votes, as against 8,386,503 for Davis and 4 822.856 for La Follette, who gathered up many discontented Republicans and the considerable vote usually cast for Socialist and other minor candidates. La Follette, honever, had only the 13 electoral votes of his own state as against 136 for Davis and 382 for Coolidge. It was a substantial Republican victory, accompanied by a Republican majority over-all of 59 in the house and 16 in the senate.

Finance. — Throughout both his terms of presidential service Coolidge addressed himself to a policy of economy. He stood by the budget bill which President Harding had secured from an unwilling congress and continued the appointment of Gen. Herbert M. Lord as chief budget officer. This reform meant simply that congress would not begin to act on the main appropriation bills until a budget based upon the ascertained needs of all the various departments had been drawn up, totaled and submitted by the budget officials.

During World War I the income tax mas used to transfer some of the immense mar profits to the public treasury. Thenceforward the income tax was the largest factor in the national revenue and nas vigorously collected from individuals and corporations. The policy of the government was to break down the high scale of war expenditure, to dispense with superfluous employees and so to come back to the public needs in time of peace. Several acts of congress, begun in 1921, reduced the rate of income tax. The result nas that the amount paid in income taxes, nhich was $2.600.763.000 in 1919 and $3,956,936,000 in 1520, came down to $1 691.090.000 in 1923 but rose to $1 761,659,049 in 1925. By the act of Feb. 26, 1926, the rates were still further lowered but without any decrease in the total collected; and the provision in the statute of 1924, under which the amounts paid by individuals or corporations nere open to the public, was repealed.

The Underwood tariff of 1913, passed by the Democrats and somewhat altered in 1916 and 1921, was repealed by a Republican majority after the inauguration of President Harding; and an emergency act nas passed (Mav 27, 1521). Soon afterward the Republicans framed a nen bill. the Fordney-McCumber tariff, signed by President Harding Sept. 21, 1922. It included a provision, never before a part of a United States statute, under which the president (informed by a tariff commission) was to have power to alter rates of duty if necessary to "equalize the differences in cost of production in the United States over similar articles produced elsewhere." The receipts from duties on imports, which were $334,000.000 in 1910 and $324,000,000 in

1920, rose to $549,000,000 in 1925. The public debt, which for many years previous to 1917 stood at about $1,000,000,000, was $26,594,268,000 after the close of World War I (Aug. 31, 1919); but on June 30, 1926, had been reduced to $19,643,183,000, partly by selling surplus war material and chiefly by payments made out of surplus.

Industry and Commerce.—However much the wealth of the nation increased, large areas of the country were far from prosperous. The rural credits banks, established under President Wilson, furnished needed capital, and the farmers from 1917 to 1919 had a guaranteed government price of $2.20 per bushel for wheat. When that protection was taken off after the war, a group of members of congress in both house and senate, commonly called the agricultural bloc, demanded special consideration for the agriculturists. Prices had tumbled and agricultural land values, inflated during the war, fell back to or below ante-bellum prices. The cost of living had nearly doubled. Discontent was reflected in the large popular vote for La Follette in 1924. Various propositions were made by farmers' associations and sympathetic members of congress that the federal government permanently guarantee a price for the principal staples. The south was also affected by this movement because the inroads of the boll weevil for a time greatly reduced the output. In some degree the conditions of 1885–95 were reproduced; only it was no longer east against west so much as it was the farmers of all sections against the group of manufacturers and distributors wherever established.

In spite of federal suits and supreme court decisions substantially upholding federal control under the Sherman act, the Mann-Elkins act and other measures against combinations, consolidations of capital went on steadily. The railways, which had been sustained during World War I by the government, were returned to their owners in 1920. For several years, notwithstanding a great increase in passenger and freight rates during the war, they were unable to make a fair profit. Under the Esch-Cummins act of 1920 they uere alloned to retain a profit of 54% earnings, plus one-half of 1% to make provision for improvements chargeable to capital accounts, all excess over 6% to be evenly divided uith the government. Meanwhile the administrative commissions lost prestige. The Tariff commission was disregarded. The Labour board was unable to enforce its decisions. The Interstate Commerce commission and the Federal Trade commission suffered in prestige and influence from internal strains and quarrels. The special Shipping commission, created during the war to build up a national merchant fleet, was left with a large number of vessels for which profitable business could not be found. The supreme court decisions, under which great corporations like the Standard Oil company and the American Tobacco company were regulated, left them more prosperous than ever. The hold of the great banks and the smaller banks and bankers on the finances of the country was unshaken. Deposits in national and state-chartered banking institutions in 1925 aggregated more than $40,000,000,000.

Social Questions.—During World War I the United States offered extraordinary wages in order to activate the pursuits necessary to supply the armed forces. This led to a general rise in u-ages of skilled workers, some increase for the unskilled and considerable increase in the earnings of domestic and agricultural workers. The labour unions made it their business to see that no systematic reduction of wages should succeed. In 1923 and again in 1925 came serious strikes of the miners' unions. The last one endured 170 days, and was settled only with great difficulty.

The most serious social question and most difficult governmental problem was national prohibition (see PROHIBITION). In 1918, while 30 states had laws on their statute books for the restriction of the liquor traffic, 28 states prohibited it outright. A prohibition (18th) amendment to the federal constitution became a part of the constitution Jan. 16, 1919. On Oct. 28, 1919, the Volstead act for enforcing the amendment was passed by congress over the veto of President Wilson. It forbade the sale or transportation of "intoxicating liquor" which was defined as any liquor which contained one-half of 1% of alcohol. To administer this act required a large force of officials distributed over the country. The amendment contained a clause under which the states were to have "concurrent jurisdiction," which appeared to mean that state laws might continue in force and be carried out by state courts. From the very beginning there was an organized system of evasion of the laws. A regular system of bootlegging, illegal sale and transportation sprang up. It was countered by highjackers—that is, bandits who seized bootleggers' supplies and carried them off by force, knowing that they were not likely to be followed by officers of the law. An organized marine bootlegging trade placed a line of foreign sailing craft and steamers just outside the three-mile limit of the United States, whence they supplied the markets of the adjoining coasts.

The United States entered into treaties with Great Britain and other nations in which it was agreed that vessels carrying their flags might be captured within that distance from the United States coast which could be traversed in one hour by the vessel suspected of endeavouring to commit an offense. Within the United States large numbers of otherwise law-abiding persons bought and sold or gave away bootleg liquor, and the difficulties of executing the law were shown by the figures of national enforcement. In one fiscal year (1924–25) 20,000,000 gal. of distilled and fermented liquors were seized; 77,000 persons were arrested; 50,000 criminal cases were entered against bootleggers; 35,000 pleas of guilty were entered; and 38,000 convictions were obtained. A national law regulating the traffic in habit-forming drugs was enacted May 26, 1922.

National Defense.—The armies were returned and disbanded after World War I as quickly as possible; but a demand was made at once for some immediate acknowledgment of their services. The government had attempted to head off this movement by an elaborate system of life insurance. It also instituted a large rehabilitation system for training disabled veterans in pursuits in which they could earn their own living. The government provided hospitals and care for sick and disabled soldiers. Provision was made for special privileges to former soldiers. On Sept. 20, 1922 a national bonus bill was defeated by President Harding's veto. On March 18, 1924 a bonus bill was passed by a large majority vote in congress; it was vetoed by President Coolidge but passed over his veto, May 17–19.

Notwithstanding the experience of the United States in 1917, when it declared a war without any mobile army, strong pressure was put on congress to reduce the regular army. By an act of Feb. 12, 1925 the force of the regular army was set at 125,000 enlisted men and 7,953 enlisted men of the Philippine scouts. Many veterans joined the American Legion, the most widely distributed society of servicemen; and that body had considerable influence in the legislation for former soldiers.

International Relations.—President Coolidge, accepting the resignation of Hughes from the department of state, appointed as his successor (Feb. 1925) Frank B. Kellogg, previously a senator and ambassador to Great Britain. Borah succeeded to the powerful chairmanship of the committee on foreign relations after the death of Lodge. A great improvement in the conduct of foreign relations uas introduced by the Rogers act, which took effect July 1, 1924, and under which the consular and diplomatic services were merged and the policy of training young men with the prospect of lifelong service was adopted.

The general policy of the United States toward other nations was much affected first of all by changes in international trade caused by the disruption of World War I; then by the refusal of the senate in 1919 to approve the Versailles treaty and further by a strong popular opposition to any formal relation with the League of Nations. A treaty with Germany (July 2, 1921) formally restored peace, provided for commerce and arranged for an adjustment of claims. Similar treaties were made shortly afternard nith Austria and Hungary. The Lausanne treaty with Turkey, signed on July 24, 1923, was defeated in the senate on Jan. 18, 1927.

An important question of the early 1920s, partly social and partly international, was that of immigration, which went through a new phase because of the rush of people from other parts of the world as soon as the war was ended. Complaint mas made that in the previous two decades the greater number of immigrants

ANIMALS OF THE UNITED STATES

1. Wild ducks (Anatidae) cross the U.S. during the migration season. They range from the Arctic circle in the summer to Panamá in the winter
2. Chipmunks (*Tamias striatus*) are native to wooded areas from Canada to Georgia
3. The American beaver (Castor canadensis) lives near small streams in northern mountainous areas throughout the U.S.
4. American bison (Bison bison), popularly called buffalo, now survives only in protected areas
5. Fur seal (Otariidae) ranges in its migrations from islands off Alaska south to Lower California
6. American barn owl (Tyto *alba*) inhabits the entire warmer region of North America
7. Northern banded or timber rattlesnake (*Crotalus* horridus), found from southwestern Maine and northern Florida to the western Gulf states
8. Young pelicans (*Pelecanus occidentalis*) of the Florida Everglades
9. Grizzly bears (*Ursus horribilis*), formerly found in western North America, are almost extinct
10. Mule deer (*Odocoileus hemionus*), found only in North America, ranges from Alaska to Lower California

PLANTS OF THE UNITED STATES

1. Spanish dagger (Yucca *aloifolia*), found along the southern Atlantic and Gulf coasts of the U.S., is widely used in landscaping
2. A grove of aspens (Populus *tremuloides*). Aspens grow from Pennsylvania to California, mostly in mountainous areas
3. Bear grass (Xerophyllum *tenax*) in bloom, native to mountainous districts from California to Montana
4. Mountain laurel (*Kalmia latifolia*) in bloom, surrounded by mossy lichens; both are found in rocky soil from Ontario, Can., to Florida
5. Suwarro or saguaro cactus (Cereus *giganteus*), native to arid districts of Arizona and southeastern California, grows to a height of 70 ft.
6. Jack pine (*Pinus* banksiana) near a Wisconsin lake. This variety of hard pine is found east of the Rocky mountains, from Minnesota to Kentucky
7. Apple (*Pyrus pumila*) and elm (*Ulmus americana*) trees. Apple trees range from the Atlantic to the Pacific coasts; elms west to the Rocky mountains
8. Western hemlock (*Tsuga* heterophylla) at Crater lake, Oregon. This tree grows from southeastern Alaska to northern Montana and central California
9. View of a northern hardwood forest in Pennsylvania. Large tree in the foreground is a sugar maple (*Acer saccharum*); smaller trees are beech (*Fagus grandifolia*) and black cherry (*Prunus serotina*)
10. Blue *or* Colorado spruce (*Picea pungens*), native to the central Rocky mountain region, grows from 80 to 150 ft. high
11. Cypress trees (Taxodium *distichum*) covered with Spanish moss (*Tillandsia usneoides*), typical of those found in gardens and swamps from Mexico to the southern Atlantic coast

*Composition at opening of first session.

came from southern and eastern Europe, and were not by tradition and inheritance of the same type as most of the previous immigrants. Several changes were made in 1918 to reduce the number of "undesirables." yet the year 1920–21 brought 800,000 immigrants. By an emergency act of 1921 a quota was provided, assigning to each nation 3% of the nationals in the United States according to the census of 1910. By the act of 1924 a permanent quota system was enacted, based on 2% of the number of nationals of that country shown to be in the United States by the census of 1890. After July 1, 1927, the limit was placed at 150,000 annually.

Among the incidents of foreign relations after World War I was the recognition of various new countries created by the treaty of Versailles: Poland, Latvia, Lithuania, Estonia, Finland, Czechoslovakia, Yugoslavia, Hungary and the enlarged Rumania. In 1924 the United States received a minister from the Irish Free State. The British government consented to the appointment of a Canadian representative at Washington.

The last U.S. troops were withdrawn from Germany in 1923. Meanwhile a joint commission on German claims was far advanced in its task. A troublesome difficulty was that a treaty with Prussia, entered into in 1828 and assumed in 1871 by the German empire, entitled German citizens in case of war to nine months to dispose of their property in the United States and leave the country. Instead, all discernible property of Germans, and particularly of German corporations, was seized at the beginning of the war and placed in the hands of a custodian of enemy property. Valuable German patents were turned over, for a very small payment, to U.S. manufacturing chemists. It was not until March 10, 1928, that President Coolidge signed a bill appropriating $50,000,000 to cover the value of the property seized.

Reparations and Allied Debts.—The United States was no party to the provisions of the Versailles treaty providing for German reparations, particularly to France, and the payment of an indemnity by Germany. However, the costs of the U.S. force of occupation were to be paid by Germany. In 1921 when Germany did not pay the stipulated sums to the Allies, the French occupied the Ruhr valley. The United States suggested a commission which, headed by Dawes, succeeded in working out a plan (1924) that was acceptable to France, Great Britain and Belgium, for a method of payment secured by a lien on German railways and factories. Financially the importance of the Dawes plan to the United States was that it cleared the way for considerable investments of private capital in German municipal and corporate securities.

A serious and difficult issue was that of the sums lent by the United States to other governments during World War I, aggregating $9,500,000,000. Without those large advances the Allies would have broken down economically before a U.S. army could have been placed in Europe. Nearly all the Allied European countries shared in these advances. At the end of 1922 the total principal was about $10,000,000,000 and the accumulated interest $1,500,000,000 more. This sum was funded in United States government bonds placed at about 4% interest, mostly in U.S. hands, upon the same footing as other obligations of the government. The interest was paid by the United States treasury. In 1923 the first important adjustment of the debt was made by an agreement with England (Feb. 28, 1923). The whole amount of the principal and interest then due was funded at $4,000,000,000 to be paid in annual installments beginning with $23,000,000 a year and increasing, until in the 62nd year the debt and accruing interest would be extinguished.

Latin America.—With Latin America the United States in the main enjoyed peaceful relations during this period. The longstanding question of the Isle of Pines was adjusted by a treaty (March 13, 1925), under which the title of Cuba was acknowledged. At the request of Chile and Peru, President Harding agreed in 1922 to arbitrate the dispute over the ownership of the Tacna-Arica region. After Harding's death President Coolidge took up the task and rendered his decision (March 4, 1925) to the effect that the delayed plebiscite of the inhabitants should now be taken; and General Pershing was made the head of a commission to preside over this process. Chile objected, and nothing was done.

With Mexico relations became strained by a dispute over the application of the new Mexican constitution of 1917 under which aliens were forbidden to hold lands or concessions. Mexicans claimed that this was in accord with the practice of several states in the United States. In 1925 Secretary of State Kellogg protested against the attitude of Mexico as unfriendly and declared that the government of Mexico was on trial before the world. In March 1926 a financial understanding was reached.

The League of Nations.—After the refusal of the United States to ratify the treaty of Versailles or to take part in the League of Nations, no official relations with the League were established. However, large numbers of U.S. citizens were interested in the work of the League and some of them were appointed to advisory committees in which, however, they did not represent the U.S. government. Eventually the United States consented to appoint official delegates or "observers" to the League commission on opium traffic. The United States became a party to treaties, with regard to the white-slave trade, drawn up by the League but to take effect for only such countries as might ratify them. Gradually even the warm friends of the League accepted the view that it was useless for the time being to urge participation by the United States in the League.

The World Court.—Down to 1914 the International Court of The Hague, founded in 1899 and strengthened in 1907, was functioning and rendered occasional decisions. It was, however, entirely ignored by the contending parties in the six wars that broke out from 1900 to 1914 and after World War I it remained ineffective. Root, who had a share in framing the court, came forward in 1920 as the leader of an unofficial group of experts in international affairs, to propose a new world court with wide powers and jurisdiction. An advisory committee of jurists sat at The Hague and drew up a plan for the Permanent Court of International Justice. The League of Nations accepted the project and established the court (Dec. 1920) and chose the judges (Sept. 1921). (*See* International Court of Justice.) The United States had no official relation with the court; but the force of U.S. public sentiment for a world league concentrated on a proposition for qualified entrance of the United States into the World Court. This was warmly urged by President Harding and later by Presidents Coolidge, Hoover and F. D. Roosevelt. Strong opposition was made in the United States on the plea that the court was an entering wedge to the League of Nations. The whole discussion was presently merged in consideration of proposals for the outlawry of war. (A. B. H.; E. E. R.)

President Coolidge and Congress.—In the mid-term congressional elections of 1926 the Democrats captured 7 of the contested seats in the senate, wiping out the Republican majority in the 69th congress, and gained 13 seats in the house, making the complexion of the 70th congress (1927–29) 237 Republicans, 195 Democrats, 3 Independents in the house, and 48 Republicans, 47 Democrats, 1 Farmer-Labourite in the senate. The election foreshadowed embarrassment for the administration. Elimination of the Republican margin in the senate made it necessary for that body to conciliate the insurgent members who had supported La Follette in 1924 and had been punished therefor by being dropped from important committee assignments in the 69th congress. The Republican progressives, like Robert La Follette (the younger), John Blaine, Lynn Frazier and Gerald P. Nye, were now restored to regular standing, and exacted from the floor leader, Charles Curtis, as the price of their support of the party the promise that "certain legislation of paramount interest to the people" (farm relief, investigation of U.S. policy in Latin America, a bill to regulate the issuance of injunctions) should be brought to a vote during the first session of the 70th congress. On these questions, as on several others of major importance, such as the details of tax reduction, the disposition of Muscle Shoals, the naval program, Mississippi flood control, the method of prohibition enforcement, President Coolidge found himself at odds with congress. He did not, however, attempt to drive congress, as Roosevelt and Wilson had done. With characteristic patience he held to his policies, vetoing 16 bills and resolutions in the first session of the 70th congress (Dec. 5, 1927–May 29, 1929), and insisting in his messages and speeches on obedience to law and on rigid economy.

National Finances.—The era of prosperity which set in at about the time of Coolidge's accession to the presidency continued unabated during his entire administration. Except in a few "spots," such as the bituminous coal and textile industries, production mounted steadily, consumption kept pace and labour was well employed and content. The national wealth. which had stood at about $7,000,000,000 in 1850, $25,000,000,000 in 1870. $65,000,000,000 in 1890 and $350,000,000,000 in 1920. was approaching the $450,000,000,000 mark by 1929. The annual income had reached $90,000,000,000 and annual savings were more than $17,000,000,000. The United States was investing about $2,000,000,000 of surplus wealth abroad and diminishing the national debt by nearly $1,000,000,000 each year. The abundant receipts of the treasury (more than half from income taxes), combined with the careful co-operation of the committees of the administrative departments under President Coolidge and Director of the Budget Herbert M. Lord, resulted in substantial surpluses at the end of every fiscal year. On Feb. 26, 1926, the president signed a bill for a tax reduction of $388,000,000.

In spite of the cut in taxes the surplus continued to mount. and on May 29, 1928. the president signed the third tax reduction hill of his administration (relieving corporations and certain industries but leaving the personal schedules unchanged), involving a cut of about $220,000,000. The refunding of the second and third Liberty Loans in 1928 effected a saving to the government of $75,000,000 a year in interest charges. As President Coolidge's term drew toward a close, however, the prospect for further tax reduction vanished, and there was even some apprehension that the treasury might be confronted for the first time in the administration with a deficit instead of a surplus. This was caused by certain extraordinary demands on the government, such as the appropriation of $75,000,000 for the refund of taxes illegally collected, of $50,000,000 for the settlement of claims arising out of taking over alien property during World War I, of nearly $50,000,000 for a public buildings program and of about $20,000,000 for initiating work on the vast $315,000,000 program for federal engineering work on the lower Mississippi river.

National Defense.—Since it was still the view that the geographic position of the United States brought immunity from fear of attacks by strong and hostile neighbours. the country followed the traditional policy of a small and well-equipped army supplemented by state militia. The regular army of about 132,000 men meant only 1.1 soldiers to every 1,000 of population and every $3,250,000 of national wealth. Reduction of land armaments was not a problem in which the United States was directly interested. But the government worked diligently for the reduction of naval armaments. After the failure of a proposed conference on disarmament, President Coolidge came out more positively for a "policy of adequate defense." A five-year building program had been approved by Secretary of the Navy Curtis D. Wilbur in the summer of 1926, calling for 71 new vessels (cruisers, submarines, destroyers and carriers) to cost nearly $800,000,000. Cutting this program to 15 cruisers and 1 aircraft carrier, the house, on March 17, 1928, passed a bill for the construction of the 16 vessels in three years at a cost of $274,000,000. The cruiser bill was put over to the short session of the senate; where it met sharp opposition, especially as it was pending at the same time as the ratification of the Kellogg pact for the renunciation of war as an instrument of national policy. However. the bill was passed on Feb. 5, 1929, by a vote of 68 to 12, and was signed by the president. On Feb. 28, 1929, congress agreed to a $12,370,000 addition to the naval appropriation for the new vessels, $200,000 to be available at once for starting the 1929 group of five and $200,000 to be available on July 1, 1929, for the beginning 1930 group. The progress of aviation began to play a great part in the field of national defense.

Efforts at Farm Relief.—In the midst of general prosperity the farmers complained that they mere poorer. The value of their capital investment had shrunk from $79,000,000,000 to $59,000,000,000 in the five-year period 1922-27, and the return on this capital was less than 3%. While overproduction kept the prices of their products down. state and local taxes and the cost of farm implements and machinery were rising. The farmers asked the government to come to their relief (as it helped the manufacturers by the tariff, and labour by the restriction of immigration) by purchasing their surplus product of wheat, corn. cotton, hogs and tobacco and selling it abroad for what it would bring in the world market, assessing the loss and the cost of the operation on the industries benefited (the "equalization fee"). The McNary-Haugen bills embodying these demands were kept before congress during the last three years of the Coolidge administration. The first bill failed of passage in the late spring of 1926, but in Feb. 1927 a McNary-Haugen bill went through both houses. President Coolidge vetoed it because it put the government into the farming business. though he was willing to help the farmers help themselves by generous contributions to co-operative marketing projects and by aid from the department of agriculture. The veto was accompanied by an opinion from Atty. Gen. John Sargent condemning certain features of the bill as unconstitutional. Nothing daunted. the advocates of farm relief came forward with a third McNary-Haugen bill: which passed congress by increased majorities in the spring of 1928, only to meet with a second veto from the president (May 23). The senate failed by the margin of 50 votes to 31 to pass the bill over the veto. On the first day of the short session of the 70th congress (Dec. 4, 1928) the fourth McNary-Haugen bill was introduced, this time without the equalization fee. No action was taken on it during the session, but President Hoover called an extra session of the 71st congress to meet on April 15, 1929, to deal with farm relief and the revision of the tariff. President Coolidge's vetoes of the farm relief bills roused opposition in the west and led to predictions that the farming sections of the country would not support an administration candidate for the presidency in the campaign of 1928. But Hoover carried every one of the agricultural states (see below).

Latin-American Relations.—The controversy with Mexico over its legislation to put into effect the provisions of art. 27 of the constitution of 1917, regulating alien exploitation of mineral and agricultural lands, was further embittered by the appeal made to the Roman Catholics of that country against Pres. Plutarco Calles' measures against the foreign clergy of the Roman Catholic Church in Mexico, and by the report that the Mexican Bolshevists were encouraging the rebels in Nicaragua in their resistance tc the U.S. marines. So serious was the situation at the beginning of 1927 that the United States senate by a unanimous vote asked President Coolidge to submit the controversy with Mexico to arbitration. The president ignored the request, but in the autumn he sent Dwight W. Morrow, of the firm of J. P. Morgan & Co., as ambassador to Mexico. Morrow's friendly and tactful diplomacy resulted in an early agreement with President Calles, and the amicable relations of the two countries were greatly strengthened when Col. Charles A. Lindbergh, after a nonstop flight from Washington, arrived at Mexico City (Dec. 14, 1927) as a U.S. "ambassador of good will."

President Coolidge, in spite of criticism in congress and in the liberal press of the country, held to his policy of maintaining about 5,000 marines in Nicaragua to quell the revolt against Adolfo Diaz and to protect U.S. lives and property. The forces of Diaz and Juan Sacasa agreed to lay down their arms when Coolidge sent Henry L. Stimson to Nicaragua with an ultimatum in April 1927. but the rebel leader Augusto Sandino continued a guerrilla warfare in which 20 U.S. marines were killed and 50 wounded. When Sandino was overcome, both parties agreed to an election, which was held under the supervision of U.S. troops (Dec. 4, 1928) and resulted in the victory of the Liberal candidate, José Moncada.

The sixth Pan-American congress was opened by President Coolidge in person. at Havana, Cuba, on Jan. 16. 1928. Hughes headed the U.S. delegation, and steered the conference away from the embarrassing political questions raised by the United States intervention in Nicaragua. A supplementary Pan-American Conference on Arbitration and Conciliation met at Washington, D.C.. on Dec. 10, 1928, which not only negotiated a score of arbitration treaties between the Latin-American nations, but was influential in keeping Bolivia and Paraguay from going to war over disputed territory.

The **Briand-Kellogg** Peace Pact.—On the tenth anniversary of the entrance of the United States into World War I (April 6, 1927), the French foreign minister, Aristide Briand, proposed that the United States and France should agree to a treaty renouncing war as an instrument of national policy, and agreeing to settle disputes of whatever origin or nature by pacific means. Secretary of State Kellogg replied, suggesting that the treaty be extended to other nations. On Aug. 27, 1928, the representatives of 15 nations met at Paris and signed the Briand-Kellogg pact. Secretary Kellogg represented the United States at Paris. On Jan. 15, 1929. the senate ratified the pact.

The Election of 1928.—President Coolidge having announced that he would not run for the presidency in 1928, the field was left open for Secretary of Commerce Herbert C. Hoover, who was easily nominated, receiving 837 out of the 1.084 votes cast in the first ballot, at the nominating convention at Kansas City, June 12–15, 1928. The delegates to the Democratic nominating convention at Houston, Tex.. on June 26–29, cast $849\frac{2}{3}$ votes out of 1,100 for Alfred E. Smith, then serving his fourth term as governor of New York. Senator Curtis of Kansas and Sen. Joseph T. Robinson of Arkansas were named as the respective vice-presidential candidates. Each of the four nominations was made on the first ballot cast. The platform of the Republican party promised farm relief and a careful revision of the tariff, defended the Coolidge policy in Nicaragua and adopted a prohibition plank written by Senator Borah, pledging the administration to a "vigorous enforcement" of the 18th amendment. The Democratic platform contained a scathing denunciation of the "sordid corruption and unabashed rascality" of Republican rule, which had left "agriculture prostrate, industry depressed, and workmen without employment," and pledged action instead of broken promises for the relief of the farmer. Governor Smith telegraphed to Chairman Robinson of the convention endorsing the platform in general, but adding that it was his duty as the chosen leader of the party to say that he advocated "fundamental changes in the present provisions for national prohibition." Hoover made only a few campaign speeches. Governor Smith, on the other hand, toured the country and discussed definite policies which he proposed to adopt if he were elected. On election day, Nov. 6, 1928, Hoover carried 40 of the 48 states, including four (Virginia, North Carolina, Florida and Texas) which had been Democratic since the days of Reconstruction. The electoral vote was 444 for Hoover to 87 for Smith. But the popular vote of 21,391,381 to 15.016.443 indicated no such crushing defeat for the Democratic candidate The Socialist candidate. Norman Thomas of New York, polled 267.835 votes; the Communist party candidate, William Z Foster, 21,181; the Socialist-Labour candidate, V L. Reynolds, 21,603; and the Prohibitionist candidate, William Varney, 20,106. Hoover's invasion of the solid south was attributed by the Democrats to the prejudice in that section against Governor Smith as a "wet" and a Roman Catholic, while the Republicans saw in it the swing of the south toward tariff-protected industry and the recognition of Hoover's wide experience as an executive. Soon after the election Hoover sailed from San Diego, Calif, on the battleship "Maryland," for a good-will tour to the countries of Central and South America. He visited Honduras, Nicaragua, Costa Rica, Ecuador, Peru, Chile, Argentina, Uruguay and Brazil.

Hoover retained Secretary of the Treasury Mellon and Secretary of Labour Davis of the Coolidge cabinet in office, the former remaining until Feb. 1932 when he was appointed ambassador to Great Britain, and was succeeded in the treasury department by Undersecretary Ogden L. Mills; and the latter resigning the secretaryship of labour in 1930 to run for U.S senator from Pennsylvania, being replaced in the cabinet by William N. Doak of Virginia. The eight new appointees (none from the states of the south which Hoover had carried) were Col. H. L. Stimson, governor general of the Philippines, for secretary of state; James W. Good of Iowa, secretary of war (succeeded in December by P. J. Hurley of Oklahoma); William De Witt Mitchell of Minnesota (a conservative Democrat), attorney general; Charles Francis Adams of Massachusetts, secretary of the navy; Walter F. Brown of Ohio, postmaster general; Ray L. Wilbur of California, secretary of the interior; Arthur M. Hyde of Missouri, secretary of agriculture; and Robert P. Lamont of Illinois, secretary of commerce, succeeded in 1932 by Roy D. Chapin of Michigan.

The Agricultural Marketing Bill.—In accord with the campaign pledge President Hoover called the 71st congress (senate 55 R., 39 D., 1 F. L.; house 269 R., 165 D., 1 F. L.) in special session on April 16, to consider the problems of farm relief and the revision of the tariff. After the senate had tried in vain to insert a debenture clause into it, an agricultural marketing bill was passed by large majorities and signed by the president on June 15. The bill aimed at the encouragement of producer-owned and producer-controlled co-operative associations, which should eliminate. wasteful methods of distribution and prevent the accumulation of surpluses which caused "undue and excessive fluctuations or depressions" in the prices of agricultural products. It created a federal farm board of nine members (including the secretary of agriculture), and provided a revolving fund of $500,-000.000 from which loans were to be made to the farmers' co-operatives at a rate of interest not to exceed 4%. For a few months the Federal Farm board promised to be a great success. New co-operatives were formed for the marketing of grain, fruit, cotton, vegetables and livestock, and the board approved loans to 132 co-operatives! totaling $165,000,000. But as farm prices continued to sag in the disturbed condition of world markets, it became evident that the farmers could not borrow themselves out of debt. The board then departed from its announced plan of not buying or selling farm products itself. The government entered the market and backed the grain and cotton Stabilization corporations by purchasing 330,000,000 bu. of wheat and more than 1.000.000 bales of cotton, in the endeavour to peg the prices of these commodities by holding the surpluses off the market. The endeavour failed; and at the close of 1931 the books of the board showed a loss of about 50% on the $378,000.000 advanced for the purchases. It was evident that the agricultural problem was no nearer solution in 1932 than it had been in 1922. The farmer, because of high taxes, tariff walls and world depression, could not sell his staple crops for what it cost to raise them.

The Hawley-Smoot Tariff.—A "limited revision" of the tariff had been advocated in the Republican party platform and recommended by President Hoover. But the bill passed (264 to 147) by the house on May 28, 1929, bearing the name of W. C. Hawley of Oregon, chairman of the ways and means committee, increased the duties on more than 1,000 articles, raising the average rates far above those of the Fordney-McCumber act of 1922. In the senate the insurgents (Borah, George Norris, La Follette, Brookhart. Frazier and Nye) fought against the high rates. The final vote on the bill (June 13–14, 1930) was 44 to 42 in the senate and 222 to 153 in the house. President Hoover signed the bill, justifying his action on the ground that the "flexible" provision permitting him to alter the rates within a compass of 50% on advice of the Tariff commission would enable him to remedy any injustices in the bill. The evil effects of continuing to maintain a Chinese wall around the country, when the health of world commerce depended on international co-operation, were soon evident. Before the close of 1931, about 25 foreign countries had raised their tariff malls, chiefly against U.S. goods, by way of reprisal. Debtor nations, whose only means of payment was the shipment of merchandise to the U.S., found their goods shut out by the customs barrier. In the 17 months preceding June 1930, C.S. exports had been $6,828,000,000 and U.S. imports $5,766,000,000. In the next 17 months these figures had dropped to $4,007,000,-000 and $3,262,000,000 respectively—a total shrinkage of $5,326,-000.000 in U.S. foreign trade. Widespread depression in Europe, revolutions in Latin America and riots and civil war in India and China were playing havoc with world trade.

The Wickersham Commission.—President Hoover was concerned with the widespread disregard for law, as evidenced by the operations of bootleggers, highjackers, kidnapers and racketeers and the failure of the courts to convict and punish criminals. The Cnited States led the world in the sinister statistics of homicide, burglary, holdups and graft. Gangsters armed with machine guns and provided with high-powered motorcars terrorized the cities and defied, bribed or cowed the sworn guardians of the law.

The court records showed that the chances that the criminal would be convicted and brought to punishment were only about 3 in 100.

On May 20 1929, President Hoover appointed a commission of 11 citizens, headed by former Atty. Gen. George W. Wickersham, end including Newton D. Baker, Dean Roscoe Pound of the Harvard law school, and 3 federal judges. to investigate and report on the "dominant national problem" of the observance and enforcement of the law. After 18 months of investigation the commission submitted the first installment of its report (Jan. 19, 1931). This report, described by one newspaper as "the most astonishing document ever submitted to our government by a responsible committee," instead of clearing up the confusion of opinion on prohibition only made it worse Ten of the 11 members signed the body of the report. which opposed the repeal of the 18th amendment or the modification of the Volstead act: but in individual opinions appended to the report only four members favoured the continuance of the law as it stood, while five recommended modification and two absolute repeal The commission subsequently submitted 12 reports dealing with the causes of crime, the machinery of the courts, penal institutions. police methods, probation and parole and the deportation of aliens

The Stock Market Crash.—Long before the Wickersham reports were submitted, public interest was absorbed in the sudden eclipse of the prosperity which had seemed to all but a few to be established on a firm and enduring basis. For the first six months of the administration the road to wealth for all seemed to stretch broad and smooth before the American people. The prices of stocks soared to fantastic heights. Billions of dollars were drawn from the banks into Wall street for brokers' loans to carry margin accounts. In the midsummer of 1929 about 300,000.000 shares of stock were being carried on margin.

In Oct. 1929 the market broke, and the wild rush to buy stocks gave way to an equally wild rush to sell. On Oct. 29, 16.-410,030 shares were thrown on the market for what they would bring. Prime securities tumbled like the issues of bogus gold mines. General Electric fell from 396½ on Sept. 3 to 210 on Oct. 29. American Telephone and Telegraph dropped 100 points. Du-Pont fell from a summer high of 217½ to 80; United States Steel from 261½ to 1664; Delaware and Hudson from 224¾ to 141; Radio common from 505 to 26. Savings of a lifetime were wiped out. Politicai and financial leaders at first affected to treat the matter as a mere spasm in the market. President Hoover and Secretary Mellon made optimistic predictions that business was "fundamentally sound" and that a great revival of prosperity was "just around the corner." In Jan. 1930 the president declared that the trend of business was "upward," in March, that the crisis would be over in 60 days, in May, that we had "passed the worst" and "would rapidly recover." Secretary Mellon saw "nothing in the present situation that warrants pessimism." But as the months passed it became evident that the nation was entering a period of severe depression. Foreign trade fell sharply, factories were closed, the number of unemployed grew alarmingly, mortgages were foreclosed, banks failed, dividends were passed, the prices of wheat, cotton. copper. oil and other commodities kept on sinking, the federal surpluses were turned into deficits and the buying power of the nation was paralyzed.

Efforts **for** Relief.—In Oct. 1930 President Hoover appointed a cabinet committee to formulate measures for the relief of unemployment. In December he laid before congress a vast program for road construction, public buildings, flood control and airways development, and signed 22 bills appropriating more than $300,000,000 for loans by the Federal Farm board. for emergency construction and for drought relief. In Oct. 1931 he got the bankers to form a $500,000,000 pool to help rescue the weaker banks from failure, and on Jan. 22, 1932, he signed the bill creating a $2,000,000,000 Reconstruction Finance corporation, empowered to make loans to banks, insurance companies, agricultural associations, railroads and other industries. The management of the board was vested in seven directors under the chairmanship of Dawes who had just resigned the post of ambassador at London. Democrats and Republicans joined in passing the bill.

The Plight **of** the Treasury.—It would have been comparatively easy lor the treasury to provide the relief clamoured for if it had continued to enjoy the abundant revenues and the surpluses of the Coolidge administration. But the depression which had stopped the wheels of industry had also dried up the sources of revenue. Federal taxes from all sources were supplying only 50% of the expenses of the government at the beginning of 1932. Appropriations for national defense, the veterans' service and interest on the public debt absorbed every dollar of the national income. The treasury deficit, which stood at $900.000.000 at the close of the fiscal year 1931, threatened to exceed $2,000.000.000 before June 30. 1932. Yet the demands on the treasury increased. In Feb. 1931 both houses of congress had overridden by huge majorities (328 to 79 and 76 to 17) President Hoover's veto of a bonus bill, extending cash loans to the war veterans up to 50% of the face value of their adjusted certificates, at an estimated cost of $1,000,000,000. Agitation was immediately started for the full cash payment of the certificates, amounting to another $2,000,000.000, although the American Legion in its convention at Detroit in Sept. 1931 disapproved this "raid on the treasury" by a vote of 902 to 507. The treasury was still further crippled by the loss of about $238,000,000 which should normally have been collected from the debtor nations in Europe, when President Hoover, in order to save Germany from imminent financial collapse, proposed a year's moratorium on all intergovernmental debts (June 20, 1931). both principal and interest.

Efforts to Balance the Budget.—The mid-term elections, coming in the midst of the depression, naturally turned against the administration. The 72nd congress, which met on Dec 7, 1931, saw the Democrats in control of the house (220 to 214) while the senate was almost equally balanced (48 R., 47 D.). However, 12 senators from the agricultural states of the west who bore the Republican label could be counted on to join the Democrats in opposition to any administration policies that smacked of favours to the "special interests." Considering the distress under which the country was labouring, congress declared it would "postpone politics," much as it had done in the emergency of World War I, and Speaker John Nance Garner of the house rallied the Democrats to support the president's recommendations for the enlargement of the credit facilities of the banks (the Glass-Steagall act) and the creation of the $2.000.000,-000 Reconstruction Finance corporation (Jan. 22, 1932). The leaders of both parties agreed that the budget must be balanced; but when it came to framing the necessary tax bill harmony ceased. Everybody knew that taxes must be increased if the deficit was to be wiped out, but nobody wanted them to be increased at his own expense. The advocates of "soaking the rich" demanded high taxes on incomes, inheritances and stock transfers. Those who favoured spreading the burden over the consumers supported the sales tax recommended by the ways and means committee of the house, The bill which was passed by the house (April 1, 1932) and (after some inconsequential changes by the senate) signed by the president on June 6, mas declared by Secretary of the Treasury Mills to be "inadequate' to check the growing deficit. About $1,118,000,000 was expected from its provisions, nhich raised the normal income tax to 8% on sums above $4.000, with supertaxes rising to 55% on incomes in excess of $1,000,000. 'Taxes were also levied on bank checks, telephone, telegraph and radio messages and the sales of various luxury articles such as automobiles, radios and phonographs. But congress resisted the president's efforts to cut down government expenses. In the first four months of the new fiscal year (July–Oct., 1932) the treasury deficit mounted by almost $700.000.000

Gestures Toward International Co-operation.— president Hoover was sincerely desirous of redeeming his inaugural pledge to co-operate with Europe in efforts for recovery from the political, financial and industrial chaos which World War I had produced throughout the whole world In 1929 an international committee of which Owen D. Young was chairman revised the Dawes plan (*see* REPARATIONS) of dealing with the reparations payments demanded from Germany. The Young plan, besides revising the amounts of the payments, tried to take the whole matter nut of the realm of politics and national revenge and make it a scientific procedure of international finance, controlled by and operating through a bank of international settlements established at Basle, Switz. In October of the same year, the British prime minister, J. Ramsay MacDonald, visited the Cnited States and held informal conversations with Secretary of State Stimson and President Hoover. The outcome was an invitation to the five naval powers of the Washington conference of 1921–22 to meet at London in Jan. 1930 for the purpose of controlling competition in those types of war vessels (cruisers, submarines, destroyers) which had not been included in the Washington agreement. The London conference lasted from Jan. 21 to April 22, 1930. France and Italy withdrew from the conference when they thought that their "security" in the Mediterranean was threatened; but the United States, England and Japan signed the London treaty, which extended the ban on battleship construction until 1936, fixed ratios for the building of auxiliary craft and established a definite naval "parity" between the United States and Great Britain. The treaty was disappointing to the advocates of naval limitation, however, because it permitted the nations to build up to a certain limit rather than scaling down naval construction and, by the "escalator clause," allowed them to increase the ratios if their security seemed to be threatened by other nations (France and Italy). Though Europe's armies were of less concern to the United States than the navies, the Cnited States sent a full delegation to the Limitation of Armaments conference at Geneva on Feb. 2, 1932—and accomplished nothing.

The League of Nations and the World **Court.**—While not departing from the official position of nonmembership in the League, the United States gave some endorsement to Hoover's pledge in his acceptance speech of Aug. 11, 1928, that the country would be "glad to co-operate with the League in its endeavours to further scientific, economic and social welfare and to secure the limitation of armaments." By the autumn of 1931 the government had signed more than 12 international agreements made under the League's auspices. In October of that year Prentiss B. Gilbert, U.S. consul general at Geneva, sat at the table of the League council when it discussed the Japanese aggression in Manchuria, and a U.S. general (Frank R. McCoy) served on the Lytton commission appointed by the League to visit Manchuria and report on the situation. The deadlock over the adherence to the World Court continued during the Hoover administration. Root (who had helped frame the original statute of the court) went to Geneva late in 1928 and secured the assent of the statesmen there to the "Root formula," which so guarded U.S. interests in the matter of advisory opinions that Secretary of State Stimson instructed the U.S. acting minister at Geneva to sign the protocol of adherence (Dec. 9, 1929). Just a year later President Hoover presented the protocol to the senate for ratification. Senator Borah and the other determined opponents of the court in the committee on foreign relations prevented the protocol from being reported out to the senate until May 1932. By that time the presidential campaign was beginning to absorb the attention of the country, and there was little probability that the senate would take any action on the protocol until the election was over. Then the emergency measures of the New Deal under Pres. Franklin D. Roosevelt so absorbed congress and the public that action on the World Court was not taken until Jan. 29, 1935. On that date 52 senators voted in favour of joining the court and 36 against—thus failing by 7 votes to register the two-thirds necessary for ratification.

Campaign of 1932.—The Republican national convention met at Chicago on June 14, 1932, and renominated Hoover and Curtis on the first ballot. The platform stood pat on the merits of the Hoover administration, warned against the danger to business interests and national finances if the Democrats should come into power, and rejected a plan for a repeal of the prohibition amendment. The Democrats met on June 27, in the same building that the Republicans had vacated a few days before. Though the primaries had given Gov. Franklin D. Roosevelt of New York a substantial majority of the delegates, he was still far short of the two-thirds (770) necessary for nomination. An anti-Roosevelt group headed by Alfred E. Smith, John J. Raskob and Jouett Shouse developed considerable strength in New England and New York Nine candidates were put in nomination. including, besides Roosevelt and Smith, four state governors and Speaker of the House Garner. Roosevelt had $666\frac{1}{4}$ votes on the first ballot, to $201\frac{3}{4}$ for Smith, $90\frac{1}{4}$ for Garner and $195\frac{3}{4}$ divided among the other candidates. On the fourth ballot Garner released his delegates to Roosevelt and McAdoo, who had been supporting Garner. threw the entire California delegation to the New York governor, who was nominated with 945 of the 1,154 votes. Roosevelt immediately flew from Albany to Chicago to deliver his acceptance speech to the assembled delegates. Garner was named for vice-president. In the campaign which followed, Roosevelt had little difficulty in persuading the people that a change of administration, a New Deal, was the only hope of recovery from the depression. Banks were failing by the hundreds. Mills and factories were shut down. The unemployed numbered more than 10,000,000. Mortgages on farms and homes were being foreclosed. National, state and local taxes were taking one dollar out of every three of the national income, and the public debt was increasing at the rate of $2,000,000,000 a year. A "bonus army" of 10,000 to 20,000 men marched on Washington in the midsummer, determined to remain until congress voted them full cash payment of their adjusted certificates. A thousand farmers in Iowa picketed the roads to prevent the delivery of their grain, milk and livestock at prices which did not pay them for production. Roosevelt toured the country attacking the Republican administration and promising economy, a balanced budget, relief for the farmers and rehabilitation of business. Prominent Republicans. including Senators Johnson and Norris, supported him openly. Toward the end of the campaign President Hoover attempted to stem the tide that was running more strongly against him every week. But it was of little avail. The verdict at the polls on Nov. 8 was a Democratic landslide. Roosevelt carried every state in the union except six (Maine, New Hampshire, Vermont, Connecticut, Delaware and Pennsylvania) with 472 electoral votes to 59 for Hoover, dnd a popular majority of approximately 7,000,000. The Democrats secured an overwhelming majority in both the house and the senate.

Two New Amendments.— The final short session of congress, which met in Dec. 1932, was the last of the "lame duck" sessions. For in Jan. 1933 the 20th amendment to the constitution was ratified, which provided that thereafter the congress elected in November should begin its session on the third day of the following January, and that the president should be inaugurated on Jan. 20. The last "lame duck" congress also passed a 21st amendment in Feb. 1933 (ratified in December) repealing the 18th (prohibition) amendment.

The New Administration.— The cabinet, announced on the eve of the inauguration, consisted of Cordell Hull of Tennessee (state); William B. Woodin of New York, who resigned in December and was succeeded by Henry Morgenthau, Jr. (treasury); Homer S. Cummings of Connecticut (attorney general); Gov. George H. Dern of Utah (war); Sen. Claude A. Swanson of Virginia (navy); James A. Farley of New York, chairman of the Democratic state and national committees (postmaster general); Harold L. Ickes of Illinois (interior); Henry A. Wallace of Iowa (agriculture); Frances Perkins of New York, the first woman to have a cabinet seat (labour); and Daniel C. Roper of Washington, D.C. (commerce). Besides these official heads of departments, President Roosevelt took intimate counsel from a number of advisers who were called the "brains trust" because many of them were college professors. Notable among them were Raymond Moley (for a time assistant secretary of state), Rexford G. Tugwell (later undersecretary of agriculture) and A. A. Berle of Columbia university, Felix Frankfurter (later supreme court justice) and O. M. W. Sprague of Harvard, and George F. Warren of Cornell. In his brief inaugural address the president scored the prevailing practices in industry and finance which he said had brought the country to distress in the midst of plenty, promised to drive the "money-changers" out of the temple, declared that the only thing the country had to fear was fear itself, and in words recalling Woodrow Wilson's inaugural of 20 years before asked the people to join him in a "national consecration" to the work

Table VII.—*Summary of Presidential Elections in the United States, 1860–1960*

(Successful candidate in boldfaced type; unsuccessful, in lightface type. Candidates receiving no electoral vote are not mentioned)

Year	Candidate	Party	Popular Vote	Electoral Vote
1860	**Lincoln**	Republican	1,866,452	180

of restoring prosperity through united effort.

Meeting the Crisis.—Shortly after the election President Hoover had invited President-elect Roosevelt to Washington to confer with him on measures that might ease the situation during the four months "interregnum" before the latter's inauguration. But Governor Roosevelt was not willing to commit himself to policies before the power and responsibility were actually in his own hands. The winter of distress wore on, and when inauguration day arrived the country was confronted with a crisis of the first magnitude. Beginning with Michigan in mid-February, state after state had closed its banks to prevent runs by panic-stricken depositors. In the eight days preceding March 4, more than $1,500,000,000 had been drawn from the banks which were still open. The New York banks closed that morning by order of Gov. Herbert Lehman, and by noon every bank in the country had shut its doors. After a White House conference lasting well into the night of Sunday, March 5, President Roosevelt issued a proclamation closing all the banks for four days; and at the same time summoned congress to meet in extra session on March 9. On that day the house. without the formality of a roll call, and the senate, with only seven dissenting votes, passed the administration's Emergency Banking bill, giving the secretary of the treasury power to appoint "conservators" (quasi-receivers) for all the national banks in the country and to reopen them according to his discretion. Confidence was restored and deposits began to flow into the banks again. But, unfortunately, too many of the weaker banks were reopened. The president's Economy bill. designed to save $500,000,000 by reducing federal salaries and veterans' pensions (signed March 20), was hailed with enthusiasm by the country; but its effect was neutralized a year later (March 28, 1934) when congress passed over the presidential veto the Independent Offices bill, restoring most of the cuts. On March 22, 1933, a bill was signed legalizing the sale of 3.2% beer, from which a revenue of from $100,000,000 to $150,000,000 was expected for the treasury.

The **AAA.**—The extra session sat from March 9 to June 16, 1933. In those 99 days an amazing amount of legislation was adopted. The Agricultural Adjustment act of May 12 was designed to raise the prices of farm products and relieve the farmers. who were burdened by a mortgage indebtedness of $8,500,000,000. The plan was to take about 40,000,000 ac. out of cultivation, and to reimburse the farmers for the value of the crops and the hogs they would lose by a processing tax levied on flour millers, meat packers, etc. Of course this would raise the price of bread, bacon and clothing, because the processor would pass along the tax to the consumer. Since there was a large group in congress who favoured inflation of the currency as the means of raising prices, it was necessary, in order to get the bill through, to adopt an amendment of Sen. Elbert Thomas of Colorado, empowering the government to issue $3,000,000,000 of paper money and to reduce the gold content of the dollar by not more than 50%. No greenbacks were issued. but on April 19 the government abandoned the gold standard by forbidding the export of gold, and the next January the president by proclamation reduced the gold content of the dollar to 59.06 cents. This action, which made public and private bonds payable at 60 cents on the dollar, was subject to violent attack, but the supreme court, in Feb. 1935, upheld the devaluation by a vote of five to four. The processing tax of the AXA brought in more than enough to pay the benefits to the farmers in the first year of its operation, but in 1935 was falling far behind. as cases involving its constitutionality came before the courts. In Jan. 1936 the supreme court, by a vote of six to three (Stone. Brandeis, Benjamin Cardozo) declared the AAA unconstitutional.

The **NRA.**—Perhaps the most startling measure of the New Deal was the National Industrial Recovery act of June 16, 1933, by which the government assumed control over the major industries of the country. Representatives of the industries were invited 'to come to Washington to work out with the NRA administrator, Gen. Hugh S. Johnson, codes of fair dealing to be followed. These codes fixed maximum hours and minimum wages, abolished sweatshop and child labour in many industries, gave labour the right to bargain with employers through representatives of their own choosing (as against the open shop or the company unions), and required businessmen to open their books to government inspectors. Violators of the codes would have the Blue Eagle (the symbol of co-operation) taken away from them, and industries refusing to formulate a code were brought under a blanket code imposed by the president. More than 700 codes were drawn up by representatives of business. From the first the SRA met violent opposition on both constitutional and economic grounds. The act was to expire in June 1935, and the administration was bent on asking for its extension when the supreme court, in the Schechter Poultry Corporation case. on May 27, handed down a unanimous decision that the codes by their wages and hours provisions exceeded the powers of congress under the interstace commerce clause, and that. hence the NRA was unconstitutional. At the same time the Frazier-Lemke Mortgage Relief act was unanimously declared unconstitutional.

Emergency Relief,——Two objects, not always easily separable, were envisaged in the program of the New Deal: immediate (emergency) relief for the millions of unemployed who could no longer be taken care of by private charity or state and local funds; and long-time plans for the recovery of business and agriculture, On May 12, 1933, a Federal Emergency Relief act appropriated $500,000,000 for direct aid, one-half the sum going as a gift to supplement the amounts raised by the states and the other half to match state appropriations in the ratio of one to three. This was followed by various acts to create jobs for the unemployed at federal expense, such as the Civilian Conservation corps and the Civil Works administration. By June 1934 the total "emergency" expenditures of the government under such public works schemes, the RFC and the AAA amounted to more than $5,000,000,000. Dismayed at the burden of public debt being piled up for a future generation to pay in taxation, critics of the New Deal called for an end to extravagant spending, tinkering with the dollar, price and wage fixing and, in the words of the Republican *New York Herald Tribune,* "the whole succession of unrelated and hastily devised remedies . . . that had produced an economic chaos with no end in sight." President Roosevelt still had the confidence of the people, however. In the mid-term elections of 1934 the administration won a complete victory. The Democrats secured 322 of the 435 seats in the house and 69 of the 96 senators for the 74th congress.

President Roosevelt asked and obtained from the new congress in Jan. 1935 the sum of $4,880,000,000, to be spent virtually at his own discretion. Scores of alphabetical agencies were at work dispensing huge sums for relief and for constructive work. The projects of the Tennessee Valley authority and the Grand Coulee and Bonneville irrigation plants were being pushed. The public debt in the autumn of 1935 passed the $30,000,000,000 mark—exceeding by nearly $4,000,000,000 the World War I debt at its peak. With the adjournment of congress in Aug. 1935, after the passage of the Social Security act providing for old-age and unemployment pensions, the attention of the country turned to the approaching presidential race.

The Recovery of Business.—Shortly after the adjournment of congress President Roosevelt wrote (Sept. 6, 1935) to Roy Howard, in reply to a letter asking for "the grant of a breathing spell to business and a recess from further experimentation," that the basic program of the administration "has now reached substantial completion and the breathing spell of which you speak is here—very decidedly so." Since the autumn of 1934 the upturn in business had been steady, if not rapid. Railroads, banks' and insurance companies mere paying back their loans from the RFC. Firms which had been deep in the red were cutting their deficits and going on to make profits. Dividends were resumed. Wages and salaries mere stepped up. The farm income rose from $5,300,000,000 in 1932 to $8,000,000,000 in 1935. Foreign trade, which had reached its nadir of $2,933,000,000 in 1932. increased to $1,329,000,000 in 1935. Opponents of the New Deal insisted that the tide of prosperity would be rising far more rapidly were it not for the uncertainty in business circles as to what further measures of government interference the president might recommend. Nevertheless the indisputable fact of business improvement, a fact which the president emphasized more and more strongly in his speeches and press conferences, was a powerful factor in holding lor him the continued confidence of the nation.

The Growing National Debt.—In spite of the fact that business was improving, the treasury was showing staggering deficits from year to year. The numbers of the unemployed still remained, after three years of enormous expenditures for relief, somewhere between 10,000,000 and 12,000,000. In his budget message of Jan. 1936 the president asked congress for $1,425,000,000 for relief work, in addition to the $4,880,000,000 which he had obtained the previous year. By June 1936 it was estimated that close to $9,000,000,000 had been appropriated for relief, direct and indirect, and two further features added to the immense burden of debt which the relief work was imposing upon the government. First. the disallotvance of the AAA by the supreme court on Jan. 6, 1936, cut off the revenue of nearly $1,000,000,000 accruing from the processing tax, which was relied on to compensate the farmers for curtailing their production of wheat, cotton, tobacco and hogs. Then, three days later, congress, by an overwhelming vote, passed over the president's veto the bonus bill, which provided for the immediate payment to World War I veterans of their adjusted cornpensation certificates, due in 1945. Eight months earlier (May 22, 1935) the president had appeared before congress to read in person his veto of a similar bill, and had been able to prevent the senate (by a vote of 54 to 40) from overriding his veto. But this time both houses repassed the bill immediately, and the treasury found itself obligated to the payment of more than $2,000,000,000. The veterans were paid on June 15, 1936, in ten-year 3% bonds of $50 each which they might turn into cash at will at any one of the 300 main post offices of the country.

The result of these outlays, both anticipated and unforeseen, was to raise the national debt at the end of the fiscal year 1935–36 to more than $34,500,000,000, or double the amount of the debt at the beginning of the Hoover administration. Republicans asserted that such pyramiding of the debt would endanger the credit of the government, and deplored the burden of taxation that its servicing would entail upon future generations. But administration leaders replied that the government was able to borrow all the money that it needed at the lowest interest rates in U.S. history.

The National Conventions of 1936.—On June 9, 1936, the Republicans met at Cleveland, O., to write their platform and select their candidates for the presidential campaign. The platform condemned the Roosevelt administration for its regimentation of business, its contempt for the constitution, its waste of the taxpayers' money, its flouting of the civil service regulations, its encouragement of class hatred and its march toward a dictatorship in concentrating unprecedented power in the hands of the executive. It recommended turning the administration of relief over to the states, with subsidies from the national government, pledged efficient aid to the farmer and the labourer, advocated the restoration of a stable currency and promised to balance the national budget without either neglecting the worthy poor or increasing taxes. For several weeks the tide of popular favour had been setting strongly toward Gov. Alfred M. Landon of Kansas as the Republican nominee. On the first ballot he received all the votes of the convention except those of 18 delegates from Wisconsin and 1 from West Virginia who voted for Senator Borah. Col. Frank Knox, owner of the Chicago *Daily News* and, like Landon, a follower of Theodore Roosevelt in 1912, was unanimously named for the vice-presidency. On June 23 (two days after the end of the 74th congress) the Democrats held their convention at Philadelphia, Pa., and renominated Roosevelt and Garner by acclamation. The president, in his acceptance speech, stood pat on his program of relief, recovery and reform, scored the "economic royalists," and pledged himself to the necessary readaptation of social and economic life within the bounds of the constitution. The Socialists nominated Norman Thomas again; the Communists put up Earl Browder; and a new party appeared under the title of the Union for Social Justice, sponsored by Father Charles E. Coughlin of Detroit, F. E. Townsend, and the political heirs of Sen. Huey P. Long of Louisiana, nominating as its candidate Rep. William Lemke of North Dakota.

The Campaign of 1936.—The main issue: of course, was the approval or disapproval of the New Deal. The Republicans were hampered by the fact that their representatives and senators in congress had voted for many of the administration measures and by the anomalous position of Governor Landon, who condemned the New Deal and at the same time promised to continue the program of relief and recovery. A split in the Democratic ranks had been threatened when prominent members of the party, calling themselves "Jeffersonian Democrats," led the formation of the Liberty league. Alfred E. Smith and former Secretary of State Bainbridge Colby accused President Roosevelt of having repudiated the party platform of 1932. It was believed that the opposition of these dissidents, added to that of the Coughlin-Lemke party, the long existing campaign of the utility companies against the TVA and the hostility of conservatives to deficit financing and to extensive control of business would so far reduce President Roosevelt's strength as to make his victory in any case a narrow one. Indeed a Literary Digest poll gave Landon a popular lead of 1,293,669 to 972,897 and predicted a Landon victory of 370 to 161 in the electoral college. But the vote on Nov. 3 registered an overwhelming victory for Roosevelt. He carried 46 of the 48 states (all except Maine and Vermont), with 523 electoral votes to 8 for Landon. His popular plurality over the Republicans exceeded 11,000.000. The various minor parties polled 1,490,861 votes combined. of which Lemke had 882,479. The Republicans elected governors in only three states (Vermont. New Hampshire and South Dakota) in which gubernatorial contests were held. The Democrats gained 12 seats in the house and 5 in the senate.

Foreign Affairs.—Absorbed in his program of relief and recovery at home, President Roosevelt had paid comparatively little attention to foreign matters. The questions of the Allies' debt to the United States and of limitation of armament were not pushed. The tariff and international trade got little attention. In Nov. 1933, the government recognized the U.S.S.R., sending William C. Bullitt as the first ambassador to that country since the overthrow of the tsar's regime. The government participated in the seventh Pan-American congress at Montevideo, Crug., in the same autumn, with Secretary Cordell Hull again leading the delegation. By the McDuffie-Tydings act of 1934 the United States gave independence (to be final in ten years) to the Philippine Islands and in 1935 Manuel Quezon was elected first president of the Commonwealth of the Philippines; and the United States at last freed Cuba from what the islanders considered an embarrassing dependence, by abrogation of the Platt amendment (May 1934). On June 12, 1934, the president signed a Reciprocal Tariff act, under which Secretary of State Hull negotiated 24 reciprocity agreements with foreign nations, which at once resulted in an increase in U S. foreign trade. What nas thought to be a guarantee of the preservation of US. neutrality in the event of another European war was provided by the Neutrality act of April 1935. forbidding Americans to furnish munitions or money to foreign belligerents and refusing protection to Americans sailing on belligerent ships.

But the launching of an attack on Ethiopia by Italy in the autumn of 1935, the steady encroachment of Japan on the territorial integrity of China and the outbreak, in July 1936 of civil war in Spain brought the problem of U.S. neutrality into sharp relief. While temporary neutrality legislation was passed in 1935 and 1936, the arguments continued in congress and the country between the advocates of a mandatory law, leaving no discretion to the president in case of the outbreak of war, and a flexible law. permitting the president to handle each case as it should arise.

The outcome was the War Policy act of May 1, 1937, which embodies a compromise. The mandatory provisions of an embargo on arms and ammunition, the prohibition of loans to belligerents and the refusal to allow Americans to travel on ships of the belligerents were retained; but the president was granted the all-important power of determining whether the law was to be put into effect by proclamation that a war actually existed, and was allowed wide discretion in other respects.

The President and Congress.—President Roosevelt was inaugurated for his second term on Jan. 20, 1937, in accordance with the 20th amendment to the constitution. The first session of the 75th congress, which assembled on Jan. 3, contained enormous Democratic majorities which had been returned in the party's victory in the election of 1936. Interpreting the victory as an endorsement of the New Deal, the president announced in his inaugural address that he had "just begun to fight" for his program, and in his message to congress he asked that "action now" be taken on proposed measures for the regulation of hours and wages, the relief of farm tenants, the extension of social security, the control of speculation, federal health insurance and a housing program for the elimination of slums. The president also wanted legislation for a more effective crop control, for the creation of six great regional projects like the TVA and for authorization to reorganize the agencies of public works, relief and loans according to his discretion. But the congress proved to be unwieldy and unmanageable. Factions developed. and adjournment came on Aug. 21, 1937, without the enactment of any of the major measures.

The "Recession" of 1937.—A sharp decline in prosperity set in during the latter half of the year. In midsummer the production index stood higher than it had in a decade. The first quarter's output of steel had exceeded by 600,000 tons the previous high record of 1929. The national income had risen from less than $40,000,000,000 in 1932 to nearly $70,000,000,000. Then there began a decline which sent the business index down from 111.2 in August to 88.9 in November. Steel production fell from 80% to 31% of capacity. The average price of 50 stocks fell from 135.5 to 82; relief rolls swelled and the number of unemployed rose to about 10,000,000. The president called an extra session of congress on Nov. 15 to try again to get through some of the measures which he had proposed at the beginning of the year. But the session adjourned six weeks later without accomplishing any more than its predecessor had done.

The Supreme Court Issue.—Still further friction between the president and congress developed when Roosevelt proposed the addition of six new justices to the supreme court (with the purpose of inducing the six actual members more than 70 years of age to resign), and advocated a similar "infusion of new blood" into the lower federal courts. The latter proposition did not arouse much interest, but the so-called attempt to "pack" the supreme court with men who would uphold the legislation of the New Deal met with immediate opposition. The court had nullified nine of the measures of the New Deal, including such important ones as the NRA and the AAA: and on the occasion of the NRA unanimous decision in May 1935 the president had commented impatiently on the judges who were still living in the "horse and buggy days." During the entire four years of his first term President Roosevelt had had no opportunity to make an appointment to the supreme court, whereas, President Taft, for example, had six vacancies to fill in his single term. The controversy over the court reform occupied much of the attention of congress during the spring and early summer, until the president gave up the struggle when the senate, by a vote of 70 to 22, defeated the reorganization plan on July 22. Meanwhile the court had receded somewhat from its hostility to "progressive" measures. On March 29 it upheld the Washington Minimum Wage law for women. On April 12 it sanctioned the Wagner Labor Relations act. On May 27 it held the Social Security act of 1935 constitutional. The decision in practically all these cases was by a five to four vote. Justices James McReynolds, George Sutherland, Pierce Butler and Willis Van Devanter taking the negative and Chief Justice Hughes and Stone, Brandeis, Owen J. Roberts and Cardozo the affirmative.

Rapid changes in the personnel of the court from the summer of 1937 on gave the president the opportunity to create a "liberal" tribunal without resorting to innovating proposals. On June 2 Justice Van Devanter, taking advantage of the law permitting retirement at the age of 70, left the court, and was replaced by Sen. Hugo Black of Alabama, a staunch advocate of the New Deal. In 1938 Justice Sutherland of Utah, another conservative, resigned, to be succeeded by Roosevelt's solicitor general, Stanley Reed of Kentucky. Justice Cardozo died the same year, and Felix Frankfurter of the Harvard law school was appointed in his stead. In 1939 the aged Justice Brandeis, an appointee of Wilson in 1916, left the bench and the president appointed William O. Douglas of Connecticut to succeed him. Justice Butler of Minnesota, a consistent conservative, died in 1939, and was replaced by the former governor of Michigan and of the Philippines, Atty. Gen. Frank Murphy. In 1941 Justice McReynolds, the most conservative member of the court, resigned, to give place to Sen. James F. Byrnes of South Carolina. Finally, in 1941 Chief Justice Hughes resigned after 11 years of service. The president promoted the Coolidge appointee Harlan F. Stone to the chief justiceship, and named Robert H. Jackson of New York (who had taken Murphy's place as attorney general) to fill the vacancy. So by 1942 every member of the court except Chief Justice Stone and Justice Roberts was an appointee of President Roosevelt.

The Labour Struggle. — The year 1537 saw the fiercest conflict in the field of labour since the demoralizing period immediately following World War I. The battle started late in 1935 with the formation. by John L. Lewis, president of the United Mine Workers of America, of the Committee for Industrial Organization (later changed to the Congress of Industrial Organizations [C I.O]) to supplant the craft unions of the A F of L by industrial or "vertical" unions comprising all the workers in a given industry, something on the pattern of the "one big union" advocated by the Industrial Workers of the World (I.W.W.) a generation earlier. The new weapon used by the C.I.O. in its bitter fights with automobile and steel industries was the "sit-down strike" in which the strikers entrenched themselves in the factories and refused to work or to let others in to work. Although this trespassing mas an infringement on property rights, Governor Murphy of Michigan, fearing bloodshed, refused to evict the strikers by force. President Roosevelt declined to take part in the struggle, calling down "a plague on both your houses." Secretary of Labor Perkins at first took a complacent view of the matter, saying that the legality of the sit-down strike had not been determined; but later she condemned the movement. It petered out after a few months, but the C.I.O. grew rapidly, until by midsummer of 1937 it claimed to have drawn away more than half the members of the older organization. General Motors came to terms with the C I.O. in March. and the major steel companies followed suit. Fully aware that the split in the ranks of labour was hurting the cause, the tno presidents of the rival organizations tried in a series of conferences to come to some agreement. But neither William Green of the A.F. of L. nor John L Lewis of the C I.O. would yield a point, in spite of the pleas of some of their important lieutenants for harmony. It was hoped that the National Labor Relations board (NLRB), set up under the Wagner-Connery act of July 1935, would serve to iron out disputes in the industrial field, as the Railway Labor board in 1526 had averted serious strikes on the railroads, and, indeed, up to the close of the year 1938, the NLRB did handle more than 10 000 cases involving approximately 2,000.000 workers with fair success. It provided protection to workers in interstate commerce industries, in the formation of associations to elect their own representatives to conduct collective bargaining with the employers, and forbade the latter to interfere with labour organizations or to refuse to bargain collectively. The board might issue "cease and desist" orders, subject to judicial review, to prevent employers from violating the act. However, the board encountered opposition from the beginning. The A.F. of L. complained that it constantly favoured the C.I.O. in its rulings and demanded its revision. The employers protested against its unfairness in allowing appeals from the workers only. Although the NLRA was declared constitutional by the supreme court in April 1937, the effort to have it amended or repealed was continuous. Between Jan. and Aug. 1937 more than 3.200 strikes affecting 1,470,000 workers were reported by the bureau of labour statistics. To be sure, the number of strikes decreased in the next two years, averaging 231 a month in 1938 and 192 a month in the first seven months of 1935, as against 395 a month in the year 1937. But still the hostility of the two great labour organizations to each other and of both to the NLRB continued, in spite of the president's sporadic efforts to bring peace in the labour ranks. A concession was made to industry in July 1939, when employers were given the right to call for an election to determine the proper body for collective bargaining. Also the supreme court by a six to two decision reversed a decision of the board which had ordered the Fansteel Metallurgical company to rehire the men discharged in the sit-down strike of 1937.

The outbreak of World War II in Sept. 1939 invested the labour controversy in the United States with more than a domestic significance. Following labour-management conferences. a new policy was adopted early in 1942. proscribing strikes and lockouts for the duration of the war. The president appointed a War Labor board of 12 men (4 labour leaders, 4 industrialists and 4 members of the public) with William H. Davis as chairman. Lewis (who had resigned the presidency of the C.I.O. after turning against Roosevelt and threatening to resign if the latter were re-elected) then proposed a united front in labour: both President Green of the A.F. of L. and Pres. Philip Murray of the C.I.O. should resign, and George Meany should become president of the merged organization. with Lewis as vice-president. But neither Green nor Murray (who was not consulted) favoured the suggestion; nor did President Roosevelt.

Political Rivalry. — When the president met the final session of the 75th congress on Jan. 3, 1938, he asked for legislation on farm relief and on wages and hours in industry. He disclaimed any hostility to business in general, but accused a minority of big businessmen of antisocial practices in tax evasion, unfair competition and the maintenance of high prices. As contrasted with the "do nothing" sessions of 1937, congress passed two acts of major importance. On Feb. 14 came the elaborate Crop Control act of 1938 which had for its purpose what Secretary Wallace called the "ever normal granary," that is, the maintenance of a fairly steady ratio between the production and consumption of the chief surplus crops of the United States: wheat, corn, cotton, tobacco and rice. The government was to store the surplus in fat years and release it in lean years, extending loans of the stored surpluses through the Commodity Credit corporation. A novel feature of the act mas the provision for a referendum among the raisers of the crops in question to determine whether or not they agreed to the quotas of production which were fixed by the Agricultural administration.

In June 1938 congress passed a Fair Labor Standards act (or Wages and Hours act) for industries entering into interstate commerce. The act was designed to "put a floor under wages and a ceiling above prices." Wages were to increase from a minimum of 25 to 40 cents an hour, and hours to decrease by the same sliding scale from a maximum of 44 to 40 a week. But in spite of these major measures, opposition to the president's program went on. A combination of Republicans and anti-New Deal Democrats slashed hundreds of millions from appropriation bills, defeated the reorganization of the executive departments: refused to amend the Neutrality act, ignored the request for the establishment of six regional projects like the TVA and so amended the tax bill of 1938 in favour of the corporations that the president allowed it to become a law without his signature.

As the head of his party the president deemed it proper to intervene in the primaries of 1938 by letters, conferences and speeches, to eliminate certain discordant Democrats (notably Sen. Millard Tydings of Maryland, Ellison Smith of South Carolina, Walter George of Georgia and Guy Gillette of Iowa and Rep. John O'Connor of New York) from congress. This course, taken against the advice of Chairman James Farley, proved to be a boomerang. All the senators attacked were easily renominated and re-elected, while two prominent New Deal senators (James Pope of Idaho and William McAdoo of Californiaj were defeated. Farley had predicted that the Republicans might gain 40 seats for the 76th congress, but they actually increased their numbers from 89 to more than 160 in the house, and gained 7 seats in the senate. They elected 1I governors, and outside the solid south polled 51.5% of the popular vote, as compared with 40.1% in the election of 1936.

World War II

The Problem of Neutrality. — The outbreak of war in Europe with Adolf Hitler's invasion of Poland on Sept. 1. 1939, and the immediate declaration of war on Germany by Great Britain and France brought a decided change in the attitude of the American people toward the foreign policy of the administration.

Since his inauguration in 1933, Pres. Franklin D. Roosevelt had subordinated questions of foreign policy to his battle for the reforms of the New Deal. To meet the overwhelming desire of the American people to keep out of war in any part of the world, congress had in the years 1935–37 provided the most stringent neutrality legislation in the nation's history. Deprived of discretion to discriminate between "aggressor" and "nonaggressor" belligerents, the president had asked the 76th congress in its first session (Jan 3–Aug. 5, 1939) to rescind the mandatory provisions of the Neutrality act of 1937. On July 11 the senate committee on foreign relations declined, by a vote of 12 to 11, to consider any changes in the law.

When the war came, Roosevelt, eager to keep the United States out of it but convinced that the only way to do so was to give all aid possible to France and Great Britain, called the congress in extra session on Sept. 21, 1939. for the purpose of amending the neutrality legislation. He wished to keep the "cash and carry" provision and the denial of war credits to belligerent nations He approved barring U S merchant ships from combat areas. But he pleaded that the embargo on arms be lifted in order that aid might be given nonaggressors. After a spirited debate, the senate on Oct. 27 repealed the embargo by a vote of 63 to 30, and the house concurred a few days later.

National Defense.—After the outbreak of World War II in Europe, the Latin-American republics were inclined to foster closer relations with the United States. Latin-American nations at the conference of Panamá in Oct. 1939 took a long step toward hemispheric defense in agreeing to pool their navies to patrol the 6.000 mi. of the eastern coast of South America from the mouth of the Amazon to Cape Horn. At Havana, Cuba, the following July, they adopted the policy announced by the United States of not recognizing the transfer of any region of the western hemisphere from one non-American power to another, and agreed to consult for the protection of any of the republics which might be threatened by subversive activity.

On May 28, 1940, as France was succumbing to the drive of the German armies which had previously swept through Denmark, Belgium and the Netherlands, President Roosevelt set up an advisory Council of National Defense with six cabinet members and seven expert industrial advisers.

When Hitler took Paris in June 1940, a Gallup poll indicated that 64% of the American people favoured military training in contrast with 37% favouring it after the Munich agreement of Sept. 1938. The Selective Service and Training bill introduced into the congress provided for the registration of men between the ages of 21 and 35 inclusive, no more than 900,000 to be called into service at any one time during peace. The act was to expire on May 15. 1945. Opposition mas strong. but the bill passed by majorities of about two to one and was signed by the president in Sept. 1940. The drawing of numbers began on Oct. 29. For the first time when the nation was not actually at war, the government resorted to compulsory military service.

The problems of national defense absorbed the attention of the administration increasingly during 1940 and 1941, affecting not only the policies of the army and the navy, but also the whole field of production, transportation, labour, finance and education. Late in 1940, as defense preparations were lagging, a "supercommission" of four was created as the Office of Production Management. After the United States formally entered the war, the president appointed Donald M. Nelson the head of a new War Production board.

The Election of 1940.—Despite the fact that the precedent of no more than two terms in the presidency seemed to be firmly established, the critical situation in 1940 led most of the Democratic leaders to insist that Roosevelt should run for a third term. The president, himself making no move to secure or refuse the nomination, was unanimously nominated on the first ballot at the convention in mid-July. Secretary of Agriculture Wallace was named as his running mate. The chief Republican aspirants mere Sen. Robert A. Taft of Ohio, Sen. Arthur Vandenberg of Michigan and Thomas E. Dewey of New York. The Republican national convention. however. responded to a widely supported movement for Wendell Willkie, president of the Commonwealth and Southern Utilities corporation, and nominated him on the sixth ballot with Sen. Charles L. McNary of Oregon as the candidate for the vice-presidency.

Willkie aroused great enthusiasm by a vigorous and forthright campaign, but his cause was weakened by the fact that he had had no experience in political life. He polled 22,305,198 votes to Roosevelt s 27,244,160 in the election in November, but carried only 10 states with 82 electoral votes to 449 for his opponent. The election made little change in the new congress, the Democrats gaining 7 seats in the house and the Republicans, 5 in the senate. The vote for minor parties (Socialist, Communist and Prohibition) was insignificant.

Aid to Great Britain.— In Sept. 1940 President Roosevelt had transferred 50 destroyers to Great Britain in exchange for leases for naval bases at eight points on the Atlantic coast from Newfoundiand to British Guiana. He told the first session of the 77th congress in Jan. 1941 that the United States must become the "arsenal of democracy." A few days after it had assembled, the house received bill 1776 calling for supply to the enemies of Hitler to help them win the war. Despite opposition by the noninterventionists, the Lend-Lease bill was passed in March 1941. The ties between the British Commonwealth and the United States became stronger. Prime Minister Winston Churchill and President Roosevelt met on the Atlantic ocean off the coast of Newfoundland on Aug. 14, 1941. and drew up the "Atlantic charter."

The Japanese Attack on the U.S.—The relations of the United States with Japan had for a decade grown steadily less friendly. On Jan. 26, 1940, the U.S. had abrogated its commercial treaty of 1911 with Japan. Yet Americans continued to sell to Japan materials Japan was using in its war against China. When Japanese armies invaded French Indochina in Sept. 1940, with the apparent purpose of establishing bases for an attack on the East Indies, the U.S. placed an embargo on scrap iron and steel intended for shipment to Japan. Japan retaliated by signing a triple alliance agreement with Germany and Italy (Sept. 27). Japanese Foreign Minister Yosuke Matsuoka, though asserting that his country wished to preserve peace with the Cnited States, acknowledged that if the Axis powers should become involved in war with the United States, Japan would be in duty bound to join them.

Meanwhile, the transfer of the 50 destroyers to Great Britain, the repeal of neutrality legislation, the aid given in the Lend-Lease act, occupation of the Danish islands of Greenland and Iceland as lying in waters "necessary for the defense of the United States" and the patrol of North Atlantic waters by U.S. destroyers —all these were in effect warlike measures against Germany, and the Germans did not hesitate to retaliate. During 1941 they sank American merchant vessels and launched torpedoes at three U.S. destroyers. President Roosevelt did not ask the congress for a declaration of war, but on Sept. 11 he gave orders to naval vessels protecting lines of commerce to "shoot at sight" on any hostile craft.

Although the administration had anticipated a possible attack by Japan somewhere in the Pacific, both the American government and its military advisers were surprised when Japanese planes descended on Pearl Harbor, Hawaii, on Sunday morning, Dec. 7, 1941. In this attack, 3 American battleships were destroyed, 16 other war vessels were sunk or disabled, grounded planes were destroyed and about 3,000 casualties were inflicted. Simultaneous attacks were made by the Japanese on the Philippines (Manila falling at the beginning of Jan. 1942) and on Wake, Guam and Midway Islands in the Pacific. On Dec. 8 the congress of the United States declared war on Japan with a single dissenting vote. (For military events of the war, *see* WORLD WAR II, especially *After Pearl Harbor; see* also PEARL HARBOR ATTACK.)

(D. S. Mu.; E. E. R.)

Following the Japanese attack on Pearl Harbor, the president asked congress for a formal declaration of war on Germany and Italy. As a result of conferences between the president and Prime Minister Churchill later that month, a union of nations (originally 26) was formed early in 1942 and plans were made for joint conduct of the war.

The Nation at War.—The first year of the war for the United States mas one of disaster, of mounting defeat and of definite uncertainty as to the outcome. It was not until a year after American entrance into the war that the Axis powers had been placed upon the road to defeat. This did not mean that the Allies had won. although by Nov. 1942 in Africa, Europe and Asia the tide had turned. The year 1943 was one of continuous advance against the enemies everywhere. In May the Allies achieved control of

North Africa and were preparing for the attack upon Italy. In early July. Sicily was invaded and the advance upon the mainland of southern France began. Two months later Italy surrendered. Meanwhile. the battle of the Atlantic had been won. Likewise. the spring and summer of 1943 witnessed the advance of American forces in the islands of the Pacific. This was accompanied by such destruction of Japanese ships and planes as to ensure early exhaustion of Japanese naval and air power.

In 1943, the year of conferences, six major meetings took place. At Casablanca in January. when the decision was made to invade Italy, came the declaration for "unconditional surrender." In May in Washington, D.C., came the decision to increase the bombing of Germany. At Quebec in August came the decision to invade German-occupied France in a "second front" and to launch a far eastern military expedition under joint control. In October Secretary of State Cordell Hull journeyed to Moscow and there, with Foreign Secretary Anthony Eden of Great Britain and Foreign Commissar Vyacheslav Molotov of the U.S.S.R., made a preliminary agreement for the establishment of the United Nations organization, together with declarations favourable to setting up democratic regimes in Italy and Austria and a demand for trial and punishment of war criminals. At Cairo in November Roosevelt and Churchill, meeting with Pres. Chiang Kai-shek of the republic of China, affirmed a war against Japan until its unconditional surrender. Territories taken from China were to be restored, China was to have control of Manchuria and it was agreed by the three powers that in due course Korea was to be free and independent. Later in the month at Tehran, Roosevelt, Stalin and Churchill agreed upon plans for the launching of the second front in Europe. (See World War II Conferences, Allied.)

In June 1944 a cross-channel landing took place in the invasion of German-occupied Normandy. By the end of August most of France was occupied by Allied forces, and Belgium and Luxembourg as well. In August, at Dumbarton Oaks in Washington, D.C., representatives of the United States, Great Britain, the U.S.S.R. and China met and agreed upon a charter for a permanent international organization for the maintenance of world peace and security. In mid-September President Roosevelt again met with Prime Minister Churchill in Quebec, and they tentatively agreed upon plans for dealing with Germany after the war. Summer successes of 1944 in the Pacific were followed by re-entrance of American forces into the Philippines in October. When the year 1945 opened. it was clear that the invasion of the islands of Japan was soon to come.

Election of 1944.—Once before in national history a presidential election had been held while the issue of war was in the balance. As in 1864, so in 1944 there was no thought on the part of responsible leaders that the election would not be held. Indeed, there were men who felt a greater need of the elective process because of the fourth-term candidacy of President Roosevelt. Prior to his nomination, in his messages to congress, the president had made clear his program for peace as well as for war. He pointed out that the costs of war, thus far, had been six times the costs of World War I. He estimated that the actual war cost would exceed $200,000,000,000 by the middle of the year. At the same time looking to the future, he called for a "five-point plan" to deal with the days of peace to follow the war. He envisaged a vast government spending plan and a new eight-point economic "bill of rights." These were to include the right to a job—to earn money for adequate food, clothing and recreation. For farmers, there was to be a decent living; for businessmen, freedom from unfair competition. There was to be protection for all in old age and during sickness and unemployment.

In mid-February congress had passed a tax bill which, although approved by both administration and legislative party leaders, did not meet the plans of the president. His veto message caused a violent outburst in the press and among his own party supporters. The bill was passed over his veto by overwhelming majorities.

The year was marked by violent labour disputes and long-drawn-out controversy between the president and his representatives and the representatives of organized labour (in particular, musicians and coal miners) and of business. Each added some uncertainty to a wartime election.

In their national convention held in June, the Republicans nominated Governor Dewey of New York. with Gov. John W. Bricker of Ohio as the vice-presidential candidate. As had been expected for several months, the Democratic convention meeting in July nominated Eranklin D. Roosevelt for a fourth term The vice-presidential candidate was not the incumbent, Wallace, but Sen. Harry S. Truman of Missouri.

Labour took an unusually active part in the campaign. The Political Action committee (P A.C.) and Congress of Industrial Organizations had been active in the preliminary campaign for Wallace as vice-presidential candidate, and in October Murray of the C.I.O. and Sidney Hillman of the P.A.C. issued statements calling on labour to support the Democratic ticket.

There had been early discussion of the "soldier vote," estimated at nearly 10,000,000. Various devices were used to poll it, but it did not change the final result, which was decisive. Roosevelt polled 25,602,504 votes to 22,006,285 for Dewey. Only 367.474 votes, or less than 1%, were cast for other parties. It mas notable that, although the electoral majority was overwhelming (432–99), the minority vote was not only great (45.9% of the total vote), but spread over two-thirds of the nation. Congress remained in the possession of the Democrats.

Aftermath of World War II

End of the **War.**—Most important in 1945 mere events that brought the end of the war. Second in importance were problems of inter-Allied co-operation. President Roosevelt, in February following his fourth inauguration. met with Marshal Stalin and Prime Minister Churchill at Yalta in the Crimea. There, policies were agreed upon to enforce the unconditional surrender of Germany: to divide it into zones for occupation and policing by the respective Allied forces; to provide for reparations from Germany; and to establish a United Nations organization. A series of secret agreements made at the Yalta conference were later revealed. Chief among these was the agreement that the U.S S.R. would enter the war against Japan after the German surrender, the condition being a restoration and increase of Russian influence in the far east. (See Yalta Conference)

President **Truman.**—Upon the death of President Roosevelt on April 12, 1945, scarcely three months after the beginning of his fourth term. Harry S. Truman became president of the United States The problems he faced were known to him only in a general may, for he had not had close association with the administration. The United Nations conference took place as planned, opening on April 25 in San Francisco On May 7 all German forces were unconditionally surrendered. On July 2 President Truman presented the United Nations charter to the senate. Five days later he sailed for Europe, where he met at Potsdam with Stalin and Churchill (later succeeded by Clement R. Attlee) to discuss the surrender ultimatum addressed to Japan and to plan for the control of Germany and the adjustment of various European territorial problems.

The Problem of World Peace.—In the preliminary steps toward the establishment of a United Nations organization there had been disagreements as to forms and procedures, and in particular as to the location of headquarters, finally established at New York city. By the end of the year the question of the veto (by any one of the five permanent members of the Security council) had become the leading problem. The Russians insisted that the veto power of one member might be used to oppose even a motion to permit debate. The Russian position upon the matter of debate was finally relaxed, and a compromise was reached as well on the demands of the small powers for greater influence, especially in amending the charter of the UN. Preliminaries for the United Nations charter had been approved by the house on June 7. The charter was approved by the senate on July 28.

The Atomic Bomb.—Japan having failed to respond to the Potsdam surrender ultimatum, an American plane dropped a single atomic bomb on the city of Hiroshima. Two days later the Russians declared war on Japan. advancing upon Manchuria and Korea. A second atomic bomb dropped on Nagasaki on Aug. 9

brought the surrender of the Japanese, which was signed on the' battleship "Missouri" in Tokyo harbour on Sept. 2. The American armed forces. except those assigned to occupation of Germany and Japan. were speedily returned home. Russian forces were strongly entrenched in eastern Europe and in the far east, positions the significance of which was later revealed by unfolding events.

The Congress.—The domestic problems that pressed at once upon President Truman were the demands of labour and the danger of inflation follom-ing removal of wartime controls in an immediate effort to return to a peace economy. The 79th congress, however, passed few of the president's major recommendations. A number of southern Democrats who were opposed to continuance of New Deal policies joined the Republican minority on occasion to form an opposition bloc. The' congressional elections of 1946 were of unusual interest because Truman's leadership had never been tested. and because shifts in domestic policies following the end of the war had given new impetus to both political parties. There was more interest on the part of the voters than in 1942, as was evidenced by a vote greater by nearly 7,000,000. The Republicans carried 30 states and gained control of both houses of the congress.

Legislation reducing taxes passed by the 80th congress was vetoed by President Truman, as was the Taft-Hartley bill; although the latter was subsequently passed over his veto. This legislation banned the closed shop forbidding the hiring of nonunion men; permitted employers to sue unions for broken contracts or damages inflicted during strikes; required unions to observe a 60-day "cooling-off" period before striking; required unions to make public their financial statements; forbade union contributions to political campaigns; ended the collection of union dues by employers; and required union leaders to take oath that they were not members of the Communist party.

Other action taken by congress in 1947 included the proposal. for ratification by states, of a constitutional amendment limiting the presidency to two terms (ratified in Feb. 1951 as the 22nd amendment) ; a law fixing the presidential succession, after the vice-president: in the speaker of the house and then the president pro tem of the senate; an act merging the armed forces into a single department of defense. The congress approved a $400,-000.000 appropriation to implement what came to be called the Truman doctrine, a proposal to bolster by economic and military aid—in this case to Greece and Turkey—countries threatened by Communist domination. This mas followed by a broader plan that came to be known as the Marshall plan: inasmuch as it was first proposed by Secretary of State George C. Marshall. The billions voted by congress beginning in April 1948 were administered under an Economic Cooperation administration! and within a few years the nations of western Europe which benefited were recovering their productivity.

A major episode in the continuing "cold war" with the Soviet Union occurred during 1948–49, when the Russians blockaded all land traffic between west Germany and the Allied sectors of Berlin. The U.S. and Great Britain were, nevertheless, able to maintain a gigantic air lift for the delivery of food and supplies. The blockade was officially ended in May 1949. On Sept. 21, U.S. military government in Germany was replaced by a high commission.

Election of 1948.—The election of 1948 was marked by unusual features. A considerable number of the Democratic party organization members were opposed to the nomination of Truman. Some disagreed with his policies, both domestic and foreign; others were convinced that his defeat was a certainty. Many of those differing with his policy in foreign affairs: particularly with the utterances of the administration in the political conflict with the U.S.S.R.. united in supporting an independent movement. eventually presenting R'allace as a candidate on the platform of a newly formed Progressive party.

The more extreme members of the Democratic party in a number of southern states left the Democratic convention after the adoption of a platform stressing civil rights and formed an independent party, the States' Rights Democrats (Dixiecrats), and nominated Gov. J. S. Thurmond of South Carolina for president. The national Democratic convention renominated Truman with Sen. Alben W. Barkley of Kentucky as vice-presidential candidate, and called for repeal of the Taft-Hartley act.

The Republican party entered the campaign confident of success, and after a sharp contest in convention, united in supporting Governor Dewey of New York for president and Gov. Earl Warren of California for vice-president. The Republican campaign was listless, the candidates calling for retention of the Taft-Hartley act and for a limitation upon the activities of the federal government. President Truman campaigned actively and with unusual vigour. The result was unexpected. for all public opinion polls had indicated Truman's defeat. Despite his loss of four states because of States' Rights defection (1,169,021 votes) and the loss of 1,156,103 votes (presumably nearer Democratic than Republican) cast for Wallace. Truman won 24,105,695 votes (303 electoral votes) to 21,969.170 for Dewey (189 electoral votes).

Second Administration of Truman.—Both houses of the 81st congress were Democratic as they organized in Jan. 1949. The president called for a vigorous advancement of his Fair Deal program to aid underprivileged people by housing, full employment and higher minimum wages, higher price supports for farmers, conservation of water power and an extension of social security. With the exception of the Social Security act of 1950, which added almost 10.000.000 persons to the beneficiaries of old-age insurance, only a small part of the Fair Deal was achieved.

Additional funds were voted for the economic recovery program and for national defense, but proposals for higher taxes were defeated. In foreign affairs, bipartisan co-operation continued. Congress in July 1949 ratified the North Atlantic treaty which had been signed in Washington. D.C.. by the foreign ministers of the United States, Great Britain, Canada, France, Belgium, the Netherlands. Luxembourg. Italy. Denmark, Norway, Iceland and Portugal. obligating the signatories to rearm under a system of integration in an organization known as NATO. (Greece and Turkey joined in 1952.)

The congressional campaign of 1950 was carried out largely on local, regional and personal issues. Democrats retained control of both houses, but by a sharply reduced margin in the house and by only two seats in the senate.

The Decade 1950–60

The Communist Threat.—The collapse of nationalist China in 1949 as Communist forces swept Chiang Kai-shek's army from the mainland and the announcement in September of that year that an atomic explosion had taken place in the U.S S.R. emphasized the fact that events beyond U S. national borders were to influence the development of national policy in nearly every field of activity. These events gave impetus to President Truman's "Point Four" program launched in 1950 for aid to impoverished nations that might otherwise turn to the Soviet Union for help. In January of that year the president also announced that he had directed the U S Atomic Energy commission to produce a hydrogen bomb that would be vastly more powerful than an atomic bomb. (See Atomic Energy: *The Atomic Bomb.*)

The Korean War.—In this precarious world situation, the U.S. suddenly found itself largely responsible for the conduct of a highly concentrated but major war against Communist forces in Korea On June 25, 1950, armed forces of the Korean People's Republic, supported by Soviet Russia, advanced south of the 38th parallel separating the northern Communist state from the southern Republic of Korea established in 1948. The issue was presented by the U S. to the United Nations, where strong measures were advocated to suppress aggression in Korea. (See Korean War.)

Led by the U.S , the UN Security council (the Soviet member not attending) voted for intervention by armed forces of the United Nations Under the command of General of the Army Douglas MacArthur. the campaign for liberation of South Korea proceeded satisfactorily after initial setbacks, and the Communist North Korean forces were driven north of the 38th parallel. As the year ended, however. the situation in North Korea was reversed; the United Nations armies were forced into a costly and precarious retreat by overwhelming numbers of Chinese Communists, whose entrance into the struggle had been foreseen as a possibility but was not expected. The situation of the United States, as the leader in an attempt to suppress aggression by Communist forces in the far east. now became critical, and congress supported the president in a gigantic program for defense. On Dec. 16, 1950. President Truman declared a national emergency and outlined plans for placing the nation on a war basis.

Gen. Douglas MacArthur, whose view of the conduct of the war in Korea was in sharp contrast with the policy of the administration, was recalled from his commands by President Truman on April 11, 1951. MacArthur was succeeded by Lieut Gen. (later Gen.) Matthew B. Ridgway, commander of the U.S. 8th army in Korea.

Armistice talks to end the Korean war began on July 10, 1951, but not until July 27. 1953, was the armistice signed. After further difficult negotiations over the status of prisoners, an exchange of prisoners was completed by Sept. 6, 1953. Efforts to negotiate the unification of Korea ended in failure at Geneva, Switz., in June 1954.

Peace Treaties.—The United States had meanwhile taken the lead in concluding a peace treaty with Japan; the treaty was signed in San Francisco on Sept. 8, 1951, by 49 nations not including the Soviet Union. At the same time, Japan and the U.S. agreed upon a bilateral security treaty, which provided that U.S. troops could be stationed in Japan for an indefinite period, and the U.S. signed defense pacts with the Philippines, Australia and New Zealand.

At the height of the Korean war, in Dec. 1950, General of the Army Dwight D. Eisenhower was appointed commander of the new supreme headquarters of the Allied powers in Europe (SHAPE), charged with creating effective military forces for the North Atlantic Treaty organization (*q.v.*) as a deterrent to Communist aggression in western Europe.

On July 1, 1952, the senate approved a peace agreement between western Germany and the western Allies. Eastern Germany remained under the control of the U.S.S.R. As in the case of Korea, the U.S.S.R. retained control of the territory occupied by it at the end of World War II, and drew an "iron curtain" between eastern and western Europe.

Election of 1952.—While he was serving SHAPE in western Europe. General Eisenhower's name was entered in Republican state presidential primaries, a number of which he won. After he retired from his military post, the general's supporters campaigned actively for his nomination. When the national Republican convention met in Chicago it was about evenly divided between him and Sen. Robert A. Taft of Ohio. but Eisenhower was nominated on the first ballot. Sen. Richard M. Nixon of California was named the Republican vice-presidential candidate.

The Democratic national convention, also held in Chicago, nominated Gov. Adlai E. Stevenson of Illinois as its presidential candidate and Sen. John Sparkman of Alabama for vice-president. Like Eisenhower, Stevenson had been a reluctant candidate in the early stages of the preconvention campaign.

Eisenhower vigorously attacked the Democratic administration, charging it with responsibility for events leading up to the Korean war and promising that he would make an inspection trip to Korea before his inauguration if he were elected. In the Republican campaign, scandals among top Democratic administrators were charged along with accusations of Communist infiltration in government offices. President Truman vigorously defended his administration and supported Stevenson, who conducted an energetic and impressive campaign.

In the November election, the popular vote of more than 61,000,000 was the largest in the nation's history. Eisenhower swept 39 states (442 electoral votes), while Stevenson carried 9 states (89 electoral votes). Eisenhower, shattering several political precedents, carried the southern states of Florida, Virginia, Tennessee and Texas. The Republicans gained control of the house and also won a narrow 48-to-47 margin in the senate, not including one independent Republican. Gubernatorial contests in 30 states resulted in 20 Republican victories.

Domestic Policies.—The new president had run far ahead of his party ticket, attracting portions of the labour vote that had been consistently Democratic for 20 years, as well as a substantial Negro city vote and a widespread middle-western farm vote. His middle-of-the road policy in domestic affairs weakened the influence of labour elements in the Democratic party and strengthened liberal elements in the Republican party. Outstanding among his appointments were those of Gov. Earl Warren of California as chief justice of the supreme court and John Foster Dulles as secretary of state.

After taking office. Eisenhower was not supported by the united action of his party members in house and senate. His differences with the extreme "right" elements were most marked The president won important victories in legislation only because of frequent Democratic support.

The administration was plagued throughout the first two years by political demonstrations of the senate subcommittee charged with investigation under the loyalty-security program. President Eisenhower took the position that loyalty and security maintenance were the responsibility of the executive branch of the government. Yet he did not interfere with the sensational activities of the subcommittee whose chairman, Sen. Joseph R. McCarthy of Wisconsin, later became himself the subject of a special senate committee investigation. The senate voted 67–22 to "condemn" McCarthy for abuse of senatorial privileges.

The years 1953–56 were characterized by general prosperity. Confidence on the part of investment capital contributed to business development. The federal reserve board checked expansion of bank credit by adopting a "tight money" policy intended to check inflation. The national budget was brought into balance, despite huge expenditures for national defense, because taxes were maintained at the necessary level and employment and earnings were high.

The most important decision of the supreme court in a half century was unanimously delivered on May 17, 1954, to the effect that racial segregation in elementary and secondary public schools in the United States was unconstitutional. This decision resulted in a division of sentiment in both political parties, especially the Democratic party, and became one of the most controversial issues of the 1950s.

Foreign Policy.—President Eisenhower's attempts to improve international relations were ably seconded by his energetic and professionally equipped secretary of state, John Foster Dulles. who traveled widely on diplomatic missions. But the administration suffered a series of defeats in promoting the objectives of the United States. With the termination of the prolonged Korean armistice discussions in the summer of 1953, a stalemate ensued in the far east; Communist strength in that area continued to grow, soon extending throughout southeast Asia.

Eisenhower's "atoms for peace" plan launched in 1953 was a step toward using the development of nuclear science for the welfare of the world. His proposals for international control of atomic armaments and his suggestion for open-sky inspection of military installations were not adopted but they conferred an important initiative on the democracies in the controversy with Soviet Russia over arms limitation. The Geneva conference of the heads of the Big Four powers in the summer of 1955 was influenced by Eisenhower's spirit of fair play and his insistence upon good faith. The results, however, were inconclusive and the main feature of the conference was Soviet propaganda threatening the middle east.

Eisenhower's Re-election.—The president's personal role in government was basically altered in the months following his heart attack on Sept. 24, 1955. Although he gradually resumed the general responsibilities of the presidency, the temporary disability raised once more two matters for debate nhich had never been quite absent from the discussions of the presidency in the previous 35 years. The first was the increasing burden placed upon a president of the United States; the second was the calibre of men nominated as candidates for the vice-presidency. The gradual return to health of the president was interrupted by a severe attack of ileitis and a surgical operation on June 9, 1956. Recovering, he resumed his duties and, well in advance of the Republican national convention held in San Francisco in August, let it be known that he would accept the nomination for re-election. His nomination was unanimous and was enrhusiastically given. Vice-President Nixon was also renominated by unanimous vote of the convention.

Adlai E. Stevenson was again nominated by the Democrats on the first ballot of their convention in Chicago. He asked the convention to vote on the vice-presidential nominee and Sen. Estes Kefauver of Tennessee, who had made an impressive showing in several state primaries, was nominated.

The outcome of the election, in the absence of outstanding domestic issues; was determined in large measure by external events. Late in October an apathetic electorate was aroused when eastern Europe and the middle east burst into flames. A crisis had come to the administration in September, following the seizure of the Suez canal in July by Egyptian president Gamal Abdel Nasser and the counterefforts of France and Great Britain in protest. The subsequent outbreak of anti-Communist revolt in Poland; a violent anti-Communist revolution throughout Hungary; an invasion of Egyptian territory by national forces of Israel claiming self-defense against border depredations; the swift attack of Great Britain and France upon Egypt with the immediate purpose of regaining control of the Suez canal—these events made headlines during the final days of the presidential campaign.

Stevenson, meanwhile, had proposed the ending of hydrogen bomb tests by international agreement because of the danger from radioactive fall-out. He also urged a cut in the draft for Selective Service.

The electorate voted overwhelmingly for President Eisenhower. He carried all but seven states with a popular vote of 35,582.236 to Stevenson's 26,028,887. It mas more a personal victory than a party victory. however. for the Democrats won a majority in both house and senate, thus ensuring a divided government for the term beginning Jan. 20. 1957.

Eisenhower's Second Administration.—The Democratic majority in house and senate was divided, especially on civil rights, while division among the Republican minority in congress was reminiscent of the progressive-conservative split of the 1920s. President Eisenhower's vetoes defeated Democratic plans on public housing, enlarged social security and deficit spending.

In the mid-term elections. the economic recession of 1957–58 and especially the continued increase in unemployment were determining influences. The Democrats continued to gain and won a widespread national victory: including 32 governorships. The new congress. meeting in Jan. 1959, comprised 64 Democrats and 34 Republicans in the senate, and 283 Democrats and 153 Republicans in the house. In addition, two senators and a congressman came from the new state of Alaska, formally admitted to the union on Jan. 3, 1959. The resolution admitting Hawaii as the 50th state was signed by the president on March 18.

The various problems of attempted racial desegregation. especially in the schools, that had aroused widespread discussion throughout the country following the supreme court decision of 1954. increased in intensity. Not only was public-school integration hotly contested by seven southern states; peaceful demonstrations of Negroes asking service at "white!' lunch counters ("sit-in" movements) led to police action.

In July 1959, 500,000 steelworkers went on strike, recalling to public attention the steel crisis of 1952. At that time President Truman had ordered Secretary of Commerce Charles Sawyer to seize control of the nation's steel mills in order to avert a strike in the industry while the nation was still at war in Korea. Two months later the U.S. supreme court held. by a vote of 5 to 3, that the executive order was unconstitutional. and the steel mills were returned to private management. The strike of 1959 lasted for 116 days before the government acted to obtain an injunction forcing the workers back for 80 days while efforts were made for government arbitration. No decision completely satisfactory to either side was reached, but work in the steel industry was resumed. Organized labour lost support among the public at large through charges of illegal use of union funds, chiefly in the Teamsters' union. Investigation of union leadership by committees of the congress led to passage in 1959 of the Landrum-Griffith hill aimed at corruption in labour unions and the establishment of procedures to maintain democratic elections within unions.

The **U.S.** in World Affairs.—The continuance of the "cold war" was emphasized in the public mind by the Soviet Union's successful launching of the first earth satellite on Oct. 4, 1957. The implications of this achievement seemed catastrophic in shifting the balance of power in the world to the Soviet Union until. on Jan. 31. 1958, the U.S. army launched the free world's first earth satellite. Within the U.S., the dramatic arrival of the "space age" brought with it increased attention to the long-range program of education necessary for scientists and the increased'costs of experimental programs, both public and private.

The Communist threat to southeast Asia brought the U.S. again to the brink of war when the Chinese Communists attacked Quemoy Island near Formosa in late Aug. 1958. The previous month President Eisenhower had ordered American troops to Lebanon, in response to a request by the Lebanese government. to prevent its overthrow by elements unfriendly to the western powers. In late November the Soviet Union threatened again to isolate the city of Berlin. On the last day of December, bloody revolution came close to the U.S. as Cuban rebels under the leadership of Fidel Castro seized the government and forced Pres. Fulgencio Batista into exile.

The hospitalization of Secretary of State Dulles in early March 1959 led to increased activity in foreign affairs by the president himself. He called for a firm stand in the Berlin crisis. On April 15, President Eisenhower announced the resignation of Dulles and on April 18 designated Undersecretary of State Christian Herter as his successor. Herter was sworn in on April 22. Dulles died on May 24. Herter represented the U.S. at the western foreign ministers' meeting in Paris, April 28–30, and at the Big Four foreign ministers' conference in Geneva, May 11–Aug. 5.

Eisenhower's Personal Diplomacy.—The president on Aug. 26. 1959, flew to Europe, where he conferred with British Prime Minister Harold Macmillan, French President Charles de Gaulle and west German Chancellor Conrad Xdenauer, returning to Washington on Sept. 7. On Sept. 15 Soviet Premier Nikita Khrushchev, at President Eisenhower's invitation, began a tour of the U.S. which included visits to Washington, D.C., New Tork city, Los Angeles, San Francisco. Coon Rapids, Ia., and Pittsburgh. Pa.

President Eisenhower had accepted personal diplomacy by heads of states as a desirable innovation in the "cold war." In Dec. 1959 he traveled 22,000 mi. in 19 days, visiting countries as far apart as Iran, Afghanistan, India and Pakistan in the east, and Morocco, Tunisia, Spain and France in the west, including as well Italy, Greece and Turkey. Early in 1960 he made a brief trip to Latin America, where he visited five countries.

Premier Khrushchev proposed that a "summit" conference be held in hlay 1960 at Paris to discuss relaxation of world tensions. The proposal was accepted by the western powers and Prime Minister Macmillan, President de Gaulle and Chancellor Adenauer journeyed to Washington during the spring for discussion of mutual interests in preparation for the conference. But as the heads of state met in Paris, Premier Khrushchev, citing the shooting down of a U.S. reconnaissance plane over Soviet territory on May 1. broke up the conference in a torrent of rage.

After some initial denials by U.S. authorities, President Eisenhower had taken full responsibility for the flight of the unarmed U-2 plane and revealed that such flights throughout the past four years had yielded important information for the defense of the free world. The incident appeared to indicate to the entire world U.S. capacity to "penetrate" Soviet Russian skies. Both the U.S. and the U.S.S.R. had also demonstrated that they would soon be able to carry out aerial reconnaissance by earth satellites.

After the collapse of the Paris meetings. President Eisenhower pursued his original plan to visit the far east in the early summer of 1060. He included the new states of Alaska and Hawaii in this tour and also visited the Philippines, Okinama, Formosa and Korea. Violent outbreaks of anti-American feeling in Japan brought about cancellation of his intended visit to Tokyo. On his return to Washington, in answer to critics, he restated his belief in the efficacy of personal diplomacy.

A Decade of National Growth.—The decade 1950–60 had been marked by steady increase in population, reaching the figure of more than 179,000,000 as reported on June 1, 1960, by the bureau of the census. The shift of population from east to west continued, with a new emphasis upon movement from urban to suburban areas. Widespread prosperity, increased productivity and higher incomes for all wage groups had resulted in an impetus to construction and building activities of all kinds. Recessions in 1953--54 and 1957–58 did not alter the generally prosperous character of the 10-year period, although agricultural income lagged, and there was general agreement that no satisfactory solution had yet been found for the perennial farm problem.

The Election of 1960.—The national conventions of July 1960 were held in an atmosphere of mounting tension in international relations. The Soviet Union threatened the program of the United Nations in its use of an international police force to suppress disorders arising out of Belgian withdrawal from the African Congo. The Soviet Union not only gave economic aid to Cuba, where the revolutionary government headed by Castro seized the properties of U.S. firms, but it also threatened to use Cuba as a base for military action against the United States. Meanwhile Soviet propaganda activities increased throughout Latin America.

The presidential candidates of both parties were comparatively young men. Richard M. Nixon, who during both terms had been Eisenhower's vice-president, was 47 years of age. John F. Kennedy, the Democratic candidate, had served eight years in the U.S. senate and was four years younger than Nixon.

A national movement of uncertain strength had called for the third nomination of Stevenson as the Democratic presidential candidate. Senator Kennedy won a majority on the first ballot at the Los Angeles convention and the nomination was made unanimous. Sen. Lyndon B. Johnson of Texas, who had had the support for the presidency of more than 400 delegates, was nominated for the vice-presidency.

At the Republican party convention in Chicago, despite a declaration of position by the conservative members led by Sen. Barry M. Goldwater of Arizona, no serious rival of Vice-President Nixon appeared. Gov. Nelson Rockefeller had withdrawn his candidacy for nomination for either the presidency or the vice-presidency, and Nixon was nominated by acclamation after the first ballot. Henry Cabot Lodge, U.S. ambassador to the United Nations since 1953, was unanimously nominated for the vice-presidency.

Surface unity in both parties did not obscure vital differences within each. The Democratic party, attempting to combine—through its candidates, Kennedy and Johnson—northern liberals with southern conservatives, staked its efforts to win the presidency on a promise of more benefits to the people through the federal government. In world affairs the Democrats promised to strengthen the position of the U.S., which they claimed was not keeping pace with the U.S.S.R. The Republican party hoped to heal the long-standing schism between its liberal and conservative elements. It claimed the Eisenhower administration had not only advanced in every field of government action for the people's benefit without forsaking the traditional American system of free enterprise, but had also been successful in preventing war. Both parties recognized the deadly danger inherent in the Communist world policy of infiltration and subversion, and both emphasized the crucial part that foreign policy would play in the next administration.

The most dramatic feature of the campaign was a series of television appearances, widely described as debates, during which the two candidates stated their positions and answered questions from newsmen.

In the general election on Nov. 8, Kennedy defeated Vice-President Nixon in a closely contested race: and the Democrats retained their control of both the senate and the house of representatives.

Kennedy won 303 electoral votes to Nixon's 219, with Sen. Harry F. Byrd, who had not been a candidate, receiving 15 electoral votes. (E. E. R.)

V. POPULATION

Growth and Geographic Expansion.— Results of the 1960 census indicated that the population of the United States, excluding armed forces overseas, was 179,323,175 on April 1, 1960. This compares with a population of 3,929,214 as reported in the first census in 1790. In the late colonial and early national periods. population increased approximately 30% a decade, doubling every 25 years. Numbers more than quadrupled from 1800 to 1850; more than trebled from 1850 to 1900; and nearly doubled from 1900 to 1950. The increase of 27,997,377 (excludes Alaska and Hawaii) between 1950 and 1960 is the largest increase in population for any decade. The increase between 1940 and 1950 was 19,028,086 and that for the decade of the 1930s was only 8,894,229 The rate of increase during the 1950s was greater than that for any decade after 1910.

'Includes Alaska and Hawaii, which were not included prior to 1960

The growth of the population during the 1950s was essentially the result of an excess of births over deaths. Net civilian immigration is estimated to have amounted to less than 3,000.000, whereas the excess of births over deaths was approximately 25,000,-000. For the 1940s net immigration is estimated at 1,898.000 and the excess of births over deaths at 17,056,000. From 1955 to 1960 the population increased annually by about 2,900,000—the largest such increase in the country's history.

Decennial rates of growth remained fairly unchanging at high levels in the years from 1790 to 1860, declined irregularly but quite rapidly from 1860 to 1940, then increased from 1940 to 1960. The absolute amount of the increase moved upward from decade to decade with only two exceptions—the years from 1910 to 1920 and those from 1930 to 1940. In the decades from 1790 to 1860, while the intercensual increase remained above 30%, the amount of the increase grew from 1,379,269 in the years from 1790 to 1800 to 8,251,445 in the years from 1850 to 1860. Almost 16,000,000 were added in the single decade from 1900 to 1910. The decade including World War I brought an interruption in the continued increase in the numbers added, but the prosperous decade of the 1920s

Hawaii	632,772	499,794

showed a resumption of the earlier trends with a population increase of 17,064,426. The increase between 1930 and 1940, when the rate of growth had declined to 7.2%, was smaller than that for any other decade after 1870 but it was more than that for any decade before 1870. Prior to 1950 the largest number ever added during a decade was 19,028,086, the increase during the 1940s.

In the formative years of the nation, population growth, the expansion of areas of settlement and increase in the national territory proceeded in rough relationship to each other. The area of the United States was 888,811 sq.mi. at the time of the first census. The Louisiana Purchase in 1803 nearly doubled the land area. Florida was added in 1819. Between 1840 and 1850 the land area was increased by two-thirds through the annexation of Texas in 1845, the establishment of title to the Oregon territorv in 1836 and the cession by Mexico in 1848 of the southwestern areas, including California, Nevada, Utah, most of Arizona and parts of Colorado, Wyoming and New Mexico. The Gadsden Purchase in 1853 completed the territorial expansion of conterminous United States. Alaska and Hawaii were admitted as states in 1959.

In 1790 nearly all of the 3,929,214 inhabitants lived along the Atlantic seaboard; less than 5% were living west of the Appalachian mountains. On the average, settlement had penetrated about 250 mi. from the east coast, but there had been a number of extensions farther west, with settlements along the Ohio, Kanawha and Cumberland rivers. There were beginnings of occupation at Elmira and Binghamton, N.Y., and there were settlements at the places now known as Detroit: Mich., Green Bay, Wis., Mackinac, Mich., Prairie du Chien, Wis., and Vincennes, Ind. By 1900 the area of coritinuous settlement had moved westward to approximately the 100th meridian in the western half of the Great Plains states. East of that line there were only isolated areas which did not yet have a density of two or more persons per square mile. These were in southern Florida, northern Maine and northern Minnesota. West of that line, density of settlement was generally low, but there were already areas of considerable settlement. Ey 1950 the settled areas more nearly covered the entire country, and the arid regions of the Great Plains, the mountain and Pacific coast states were interspersed with rnany settled areas.

Centre of Population.— The growth of the population and the occupation of the area of the United States have led to a persistent westward movement of the centre of population. As defined by the U.S. bureau of the census, the centre of population is ". . . that point which may be considered as the center of population gravity of the Cnited States: in other words, the point on which the United States would balance if it were a rigid plane without weight and the population were distributed thereon with each individual assumed to have equal weight and to exert an influence on a central point proportional to his distance from that point."

In 1790 the centre of population was located 23 mi. E. of Baltimore. By 1950 it had moved 686 mi. westward and was near Olney in Richland county, Ill. By 1960 it moved 57 mi. W. of that point (near Centralia, Clinton county, Ill.), taking into account the addition of Alaska and Hawaii to the United States. The movement of the centre of population reflects the rapid growth of the population in the western states and the fact that the growth in the northern and southern states has been nearly equal with a slight preponderance in later years in the southern states.

Urbanization.— The United States is largely an urban nation. Approximately two-thirds of the inhabitants live in urban areas and a considerable proportion of the remainder live in close relation to a large city. Throughout the national history the urban population grew more rapidly than the rural. Between 1790 and 1950 the total population increased about 38 times, the rural population less than 15 times. In every decade except 1930 to 1940 the urban population grew much more rapidly than the rural.

Table X shows the urban population and the number of urban places at selected dates from 1790 to 1960. For 1960 the urban population includes not only the inhabitants living in incorporated

and unincorporated places of 2,500 and over, but also those in the thickly settled suburban areas around cities of 50,000 or more.

In 1790 the nation had only 24 places with a population of more than 2,500 persons but by 1950 there mere 4.284 such .places. Five of these had a population of more than 1,000,000 persons each. Forty-one had more than 250,000 each, and 106 had more than 100,000 each. By 1960 there were five cities over 1,000,000, fifty-one over 250,000 and 130 cities of 100,000 or more.

Milwaukee, Wis.	741,324		

Metropolitan Areas.—The economic and social influence of a city is not limited to the territory included within its political boundaries. For most of the larger cities there is a closely built-up area immediately outside the city limits which is essentially a part of the city. Beyond that there tends to be an area less closely built-up, but nevertheless intimately linked to the city. For many purposes, all the population that is closely related to the city needs to be taken into account. The total area is frequently included under the term metropolitan area. Standard metropolitan statistical areas include cities of 50,000 or over, the county or counties in which they are located and the adjoining county or counties which meet certain prescribed conditions of integration with the central city. In New England the political units used are towns.

Of the total population increase in the United States between 1950 and 1960 84.2% occurred in the 212 standard metropolitan statistical areas which included 112,885,178 persons, or 63% of the total. The rate of growth within the standard metropolitan statistical areas was very uneven. Although the central cities in 1950 included nearly three-fifths of the total population of the areas, they had only about one-fifth of the total increase that occurred in such areas. While the central cities increased by approximately 9%, the suburban areas outside these cities increased by about 48%. Among the 212 standard metropolitan statistical areas, 203 gained population and 9 lost population between 1950 and 1960. However, of the 258 central cities in the metropolitan areas. 185 gained population and 73 lost. Four of the five cities of 1.000.000 or more population in 1950 lost population during the 1950 to 1960 decade (New York, Chicago, Philadelphia and Detroit). while one (Los Angeles) gained. Standard metropolitan statistical areas as a whole increased their population by 26 4%; the remainder of the country increased by only 7%.

Declining Farm Population.—As the nation has become increasingly urbanized. there has been a decline in the proportion of its population living on farms. After the mid-1930s there was also a decline in the number of persons living on farms. In 1910 the farm population included 32,077,000 persons, or 34 9% of the total population. By 1950 the farm population amounted to 25,058,000. or 16 6% of the total population, and by 1959 it had declined to 21,172,000, or 12% of the total. A continued large-scale migration of population from the rural areas, and particularly from farm areas to cities, has been one of the major population movements of the 20th century.

Racial Composition.—In 1790, eight of each ten persons were white. two were Negroes. Indians were few in the settled areas. In 1960, 88 6% of the population was classified as white and 11.4% as nonwhite—the majority of which was Negro. Less than 1 in each 100 persons was American Indian or Asian. In 1960, out of a total population of 179,323,175, 158,831,732 were white, 18,871,831 were Negro, 523.591 were Indian, 464,332 were Japanese and 237,292 were Chinese.

During the 19th century the proportion of the population which was white increased more rapidly than the proportion of Negro, in part because the great majority of immigrants to this country were white. In later years the nonwhite population grew more rapidly than the white. From 1950 to 1960 the white population increased by about 16% and the nonwhite population by 26%. This difference arises from the marked excess of the birth rates of the nonwhites which is only partially offset by a higher death rate. Betneen 1910 and 1920 there had been little change in the proportion of nonwhites. It was 10 3 in 1920 and 10.2 in both 1930 and 1940. and 10 5 in 1950. The 1960 proportion is still less than that at the beginning of the century, when it was 12.1.

Persons of Foreign Origin.—In the 136 years from 1819 to 1955, more than 40000,000 aliens entered the United States. About 34,000,000 of these were from Europe. The early immigrants came predominantly from western Europe and the peak immigration from northern and western Europe came in the decade from 1881 to 1890. By this time there were already substantial numbers of immigrants from the countries to the east and south, and after this the numbers and proportions of immigrants from eastern and southern Europe increased substantially. Between 1901 and 1910 approximately 8,000,000 Europeans emigrated to

TABLE XIII.—*Nativity and Parentage of Foreign White Stock by Country of Origin, 1950*

Country of origin	Foreign born	Native white of foreign or mixed parentage	Country of origin	Foreign born	Native white of foreign or mixed parentage
Total	10,161,168	23,589,485	Yugoslavia	143,956	239,920
England and Wales	584,615	1,443,230	U.S.S.R.	894,844	1,647,420
Scotland	244,200	463,325	Lithuania	147,765	249,825
Northern Ireland	15,398	29,890	Finland	95,506	172,370
Ireland (Eire)	504,961	1,891,495	Rumania	84,952	130,100
Norway	202,294	652,380	Greece	169,083	195,235

Hungary	268,022	437,080			

the United States, 6,000,000 of them from eastern and southern Europe. After the enactment of the quota legislation, the balance shifted again. Between 1951 and 1954, 518,000 European immigrants came to the United States, of whom 411,000 were from northern and western Europe. With the reduction in the number of immigrants beginning in the 1920s, the proportion of the population that is foreign born steadily declined. In 1900, 13.4% of the white population was reported as foreign born. By 1930 this had dropped to 11.4% and in 1950 it was only 6.7%. This was less than the proportion reported in 1850.

Under the classification foreign white stock, the census reports included foreign-born white persons and persons with one or both parents foreign born. In 1950 this classification included 22.4% of the population. Early in 1900 it had been 34%.

Persons born in Italy were most numerous among the foreign-born white population in 1950, numbering about 1,427.000. Second were Germans with 984,000. There were 861,000 immigrants born in Poland, 884,000 born in the United Kingdom and 505,000 born in Ireland. However, the relative rankings were different in relation to country of origin for persons born in the United States of foreign parentage. There were 23,589,000 native white persons of foreign or mixed parentage. The largest number of these were of German parentage—3,743 000, and of Italian parentage—3,143,000. Persons of English, Irish, Polish and Russian descent were next in numbers.

Age and Sex.—In the 1950s the numbers of the very young and of the older population grew more rapidly than the number of persons at other ages. Estimates for 1959 indicate that between 1950 and 1959 the number of children 5–13 years old grew about two and one-half times as rapidly as the total population, and the number of persons 65 and over grew about one and one-half times as rapidly as the total.

Table XIV.—*Population Change, by Age: 1950 to 1959*
(In thousands)

Age	Population including armed forces abroad			Population change			
				July 1, 1958, to July 1, 1959		April 1, 1950, to July 1, 1959	
	July 1, 1959	July 1, 1958	April 1, 1950	Number	Per cent	Number	Per cent
All ages	177,103	174,054	151,132	+3,050	+1.8	+25,971	+17.2
Under 5 years	19,795	19,512	16,164	+283	+1.4	+3,632	+22.5
5 to 13 years	32,388	31,144	22,180	+1,244	+4.0	+10,208	+46.0
14 to 17 years	10,990	10,634	8,409	+356	+3.3	+2,581	+30.7
18 to 24 years	15,872	15,525	16,081	+347	+2.2	−209	−1.3
25 to 34 years	23,042	23,390	23,893	−347	−1.5	−851	−3.6
35 to 44 years	23,783	23,560	21,491	+223	+0.9	+2,292	+10.7
45 to 64 years	35,853	35,242	30,720	+612	+1.7	+5,134	+16.7
65 and over	15,380	15,047	12,195	+333	+2.2	+3,185	+26.1

The economic development of the country was accompanied by great changes in the age structure of the population. In 1880, 38% of the population were under 15 and only 3% were 65 and over. By 1950 the proportion of persons under 15 had dropped to 27%, but by this time 8% of the total were 65 and over. After 1950 there was a relatively sharp increase in the proportion of children under 15 and a continuation in the growing proportion of persons 65 and over. The median age of the population, *i.e.*, the point which divides the population with one-half older and one-half younger, was 29.3 years in 1959. This was approximately one year less than it had been in 1950, but was more than six years above the median of 22.9 reported in 1900.

Sex Composition.—In 1950 for the first time in U.S. history the census showed more females than males in the population. At that time the excess of females was about 1,800,000. Females generally outnumber males in the adult age groups. There was an excess of 3,200.000 females 25 years of age and over, and about 1,500,000 females 65 and over in 1959. Males continued to outnumber females in the age group under 25. The excess of females in the older ages is attributed essentially to the fact that women have lower death rates than men at all ages. The age and sex composition of the nonwhite population is different from that of the white, primarily as a result of its much higher birth rate. The nonwhite population is substantially "younger" than the white

FIG. 9 — PER CENT OF DISTRIBUTION BY AGE OF THE POPULATION OF THE U.S., 1900 TO 1960. (FIGURES FOR 1940 AND LATER YEARS INCLUDE ARMED FORCES ABROAD; 1960 DATA BASED ON PRELIMINARY FIGURES)

population, having a median age in 1959 of 22.9 years as compared with 30.2 years for the white population.

Families and Households.—The decline in size of households has been persistent and widespread. The average size was 5.7 in the white population of 1790, 4.8 in the total population of 1870 and 3.4 in the total population of 1950. After 1950 there was an increase in the average size of families, that is, related persons living together, a decrease in the number of cases in which two or more families live in the same household and an increase in the number of households which included no relatives of the head. The average number of persons per household in 1959 was approximately the same as that in 1950, but the average size of families increased from 3.54 persons in 1950 to 3.66 persons in 1959. Families in rural areas tended to be larger than families in urban areas and farm families were larger than rural nonfarm families.

The total number of households in the United States in March 1959 was 51,300,000 and had been 43,600.000 in March 1950, and the average annual increase was 861,000. However, there was an annual average decline in the number of rural farm households amounting to 98,000. Thus the average annual increase of the urban and rural nonfarm households was 959,000.

Education.—Education has been a major force in the develop-

Table XV.—*Level of School Completed by Persons 25 Years Old and Over and 25 to 29 Years Old, by Colour, for the United States: 1940 to 1959*
(The small number of Persons not reporting on years of school completed were included in base of percentages but mere not distributed)

Date, age and colour	Per cent by level of school completed			Median school years completed

April 1940	26.7	12.1	1.3	7.1

ment of a single people with a single language from immigrants with many diverse backgrounds. The percentage of illiterates in the population aged ten and over declined slowly in the last decades of the 19th century. Illiteracy was more prevalent among the foreign-born whites than among the native whites, but it was far higher among the natives of native parentage than among the American-born children of the immigrants. By 1930 only 4.3% of the total population aged ten and over were illiterate. In 1959 it was estimated that 2.2% of the population 14 years old and over and not living in institutions were illiterate. This is the smallest proportion of illiterates ever recorded in this country. Illiteracy rates have declined for both whites and nonwhites, but the decline has been more rapid for the nonwhites. Among persons 14 to 24 years old in 1959, the illiteracy rates were 0.5% for whites and 1.2% for nonwhites.

By 1959 the average years of school completed by persons 25 years old and over was 11.0. This compares with 9.3 in 1950 and 8.4 in 1940. The average was about one-half year greater for women than for men in 1959.

College graduates constitute a relatively small percentage of the adult population (8%). Among men 25 to 29 years old, the proportion who had completed four or more years of college went up especially sharply in the 1950s, and by 1959 it was 15%.

Economic Activity. — There have been a number of significant changes in the economic activity of the population throughout the nation's history. The proportions engaged in agricultural and related industries, and in private household services, have shown a long-time decline. The proportions engaged in manufacturing, transportation, communication and trade continue to move slowly upward. There have been substantial increases in the proportions of persons engaged in clerical occupations, professional service and public administration.

Rates of participation in economic activity after 1870 declined for the younger persons and for those 65 and over. There has also been a decrease in the predominance of men in the economically active population as increased numbers of women have entered the labour force. In 1910 there were almost 3,900 men for each 1,000 women among gainful workers, but the labour force in 1950 had approximately 2,600 men for each 1,000 women.

Labour-force participation rates are low at age 14. They increase rapidly from 15–19 and through 24. At that age 86% of the men and 38% of the women were in the labour force. For men, rates increase to a maximum of 95% at ages 34–41, decline

Table XVI.—*Employment Status of the Population, by Sex: Annual Averages, 1959*
(Current survey levels)

Employment status	Total: Number (000s)	Total: Per cent	Male: Number (000s)	Male: Per cent	Female: Number (000s)	Female: Per cent

*Independent estimate of armed forces, including those stationed overseas.

†Excluded from labour force by definition. Special surveys in 1950 indicated an estimated 600,000 age 10 to 13 working in agriculture and 500,000 in other industries in a peak summer month.

‡Based on 1950 federal census.

Note: Annual averages are arithmetic means of observations for survey week in each month; detail may not add exactly to totals because of rounding.

slowly to age 50 and then decline rapidly until they become very low for persons 75 and over.

For women, rates of labour-force participation increase to age 20, decline to about age 30, then increase again to age 44, after which there is a rapid decline.

During and after World War II there was a significant increase in the numbers and proportions of women in the labour force. By 1960 approximately one-third of all workers were women and approximately one-third of women 14 and over were in the labour force. The increases had been particularly large for women over 35.

Prospective Growth. — During the country's history there have been many changes in the rates and prospects of growth. The average family in 1960 had less than half as many children as a family of 1790, but the expectation of life of those who are born was perhaps two and one-half times as great. Cities and suburban areas have replaced farms and villages as the places where the majority of the people live.

At the beginning of the 1960s the United States was adding approximately 3,000,000 persons to its population each year. Although this increase is less than 2% per year, if continued for a half century it would mean more than doubling the numbers, such as that which occurred between 1910 and 1960. Increases in the numbers of births after World War II have been the results of a combination of trends. After 1940 there was an increase in the proportion of women aged 15–44, who had given birth to at least one child. There were substantial increases in the proportion who had borne at least two children. The proportion who had borne five or six children changed little, but there was a major decrease in the proportion who had borne seven or more children.

Earlier marriage, earlier childbearing and longer duration of married life may lead to relatively rapid population growth. On the other hand, the higher birth rates during the 1950s were in part a crowding together of births which under other circumstances would have occurred during a longer period of time. They represent decisions as to childbearing during a time of relatively high employment and income levels and it is difficult to tell to what extent there have been long range changes in family values and attitudes toward children.

If one could assume that the birth rates of 1955–57 would continue, the population of the United States might be expected to reach 214,000,000 by 1970 and 260,000,000 by 1980. If, however, birth rates should drop to the rates experienced in 1942–44 the population in 1970 might be only 203,000,000 and that for 1980, 231,000,000.

It is impossible to foretell whether either of these sets of birth rates will exist, or whether during the 1960s and 1970s the American people will have a different set of birth rates. However, the relatively high birth rates in the 1950s resulted in a relatively large number of persons who will be passing through the grade and high school ages and into the labour force in the 1960s and 1970s. It is also clear that as a result of past trends the number and proportion of persons 65 and over will continue to grow rapidly for many years. (C. T.)

VI. ADMINISTRATION AND SOCIAL CONDITIONS

A. Constitution

The following pages contain the constitution of the United States and the 23 amendments (with effective dates).

Constitution of the United States of America

Preamble

We the People of the United States, in Order to form a more perfect Union, establish Justice, insure domestic Tranquility, provide for the common defence, promote the general Welfare, and secure the Blessings of Liberty to ourselves and our Posterity, do ordain and establish this Constitution for the United States of America.

Article I

Section 1. All legislative Powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

Section 2. The House of Representatives shall be composed of Members chosen every second Year by the People of the several States, and the Electors in each State shall have the Qualifications requisite for Electors of the most numerous Branch of the State Legislature.

No Person shall be a Representative who shall not have attained to the Age of twenty five Years, and been seven Years a Citizen of the United States, and who shall not, when elected, be an Inhabitant of that State in which he shall be chosen.

Representatives and direct Taxes shall be apportioned among the several States which may be included within this Union, according to their respective Numbers, which shall be determined by adding to the whole Number of free Persons, including those bound to Service for a Term of Years, and excluding Indians not taxed, three fifths of all other Persons. The actual Enumeration shall be made within three Years after the first Meeting of the Congress of the United States, and within every subsequent Term of ten Years, in such Manner as they shall by Law direct. The Number of Representatives shall not exceed one for every thirty Thousand, but each State shall have at Least one Representative; and until such enumeration shall be made, the State oi New Hampshire shall be entitled to choose three, Massachusetts eight, Rhode Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies.

The House of Representatives shall chuse their Speaker and other Officers, and shall have the sole Power of Impeachment.

Section 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six Years; and each Senator shall have one Vote.

Immediatelv after they shall be assembled in Consequence of the first Election, they shall be divided as equally as may be into three Classes The Seats of the Senators of the first Class shall be vacated at the Expiration of the second Year, of the second Class at the Expiration of the fourth Year. and of the third Class at the Expiration of the sixth Year, so that one third may be chosen every second Year; and if Vacancies happen by Resignation, or otherwise, duiing the Recess of the Legislature of any State, the Executive thereof may make temporary Appointments until the next Meeting of the Legislature, which shall then fill such Vacancies.

No Person shall be a Senator who shall not have attained to the Age of thirty Years, and been nine Years a Citizen oi the United States, and who shall not, when elected, be an Inhabitant of that State for which he shall be chosen.

The Vice President of the United States shall be President of the Senate, but shall have no Vote, unless they be equally divided.

The Senate shall chuse their other Officers, and also a President pro tempore, in the Absence of the Vice President, or when he shall exercise the Office of President of the United States.

The Senate shall have the sole Power to try all Impeachments. When sitting for that Purpose, they shall be on Oath or Affirmation. When the President of the United States is tried, the Chief Justice shall preside: And no Person shall be convicted without the Concurrence of two thirds of the Members present.

Judgment in Cases of Impeachment shall not extend iurther than to removal from Office, and disqualification to hold and enjoy any Office of honor, Trust or Profit under the United States: but the Party convicted shall nevertheless be liable and subject to Indictment, Trial, Judgment and Punishment, according to Lam.

Section 4. The Times, Places and Manner of holding Elections for Senators and Representatives, shall be prescribed in each State by the Legislature thereoi; but the Congress may at any time by Law make or alter such Regulations, except as to places of chusing Senators.

The Congress shall assemble at least once in every Year, and such Meeting shall be on the first Monday in December, unless they shall by Law appoint a different Day.

Section 5. Each House shall be the Judge of the Elections, Returns and Qualifications of its own Members, and a Majority of each shall constitute a Quorum to do Business; but a smaller Number may adjourn irom day to day, and may be authorized to compel the Attendance of absent Members, in such Manner, and under such Penalties as each House may provide.

Each House may determine the Rules of its Proceedings, punish its Members for disorderly behaviour, and, with the Concurrence of two thirds, expel a Member.

Each House shall keep a Journal of its Proceedings, and from time to time publish the same, excepting such Parts as may in their Judgment require Secrecy; and the Yeas and Nays of the Members of either House on any question shall, at the .Desire of one fifth of those Present, be entered on the Journal.

Neither House, during the Session of Congress, shall, without the Consent of the other, adjourn for more than three days, nor to any other Place than that in which the two Houses shall be sitting.

Section 6. The Senators and Representatives shall receive a Compensation ior their services, to be ascertained by Law, and paid out of the Treasury of the United States. They shall in all Cases, except Treason, Felony and Breach of the Peace, be privileged from Arrest during their Attendance at the Session of their respective Houses, and in going to and returning irom the same; and for any Speech or Debate in either House, they shall not be questioned in any other Place.

No Senator or Representative shall, during the Time for which he was elected, be appointed to any civil Office under the Authority of the United States, which shall have been created, or the Emoluments whereof shall have been increased during such time; and no Person holding any Office under the United States, shall be a Member of either House during his Continuance in Office.

Section 7. All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as on other bills.

Every Bill which shall have passed the House oi Representatives and the Senate, shall, before it becomes a Law, be presented to the President oi the United States; If he approve he shall sign it, but if not he shall return it, with his Objections to that House in which it shall have originated, who shall enter the Objections at large on their Journal, and proceed to reconsider it. If after such Reconsideration two thirds of that House shall agree to pass the Bill, it shall be sent, together with the Objections, to the other House. by which it shall likewise be reconsidered, and if approved by two thirds of that House, it shall become a Lam But in all such Cases the Votes of both Houses shall be determined by yeas and Nays, and the Names of the Persons voting ior and against the Bill shall be entered on the Journal of each House respectively. If any Bill shall not be returned by the President within ten Days (Sundays excepted) after it shall have been presented to him, the Same shall be a Law, in like Manner as if he had signed it, unless the Congress by their Adjournment prevent its Return, in which Case it shall not be a Law.

Every Order, Resolution, or Vote to which the Concurrence of the Senate and House of Representatives may be necessary (except on a question of Adjournment) shall be presented to the President of the United States; and before the Same shall take Effect, shall be approved by him, or being disapproved by him, shall be repassed by two thirds of the Senate and House of Representatives, according to the Rules and Limitations prescribed in the Case of a Bill.

Section 8. The Congress shall have Power To lay and collect Taxes, Duties, Imposts and Excises, to pay the Debts and provide for the common Defence and general Welfare of the United States; but all Duties. Imposts and Excises shall be uniform throughout the United States;

To borrow Money on the credit of the United States;

To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

To establish an uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;

To provide for the Punishment of counterfeiting the Securities and current Coin of the United States;

To establish Post Offices and Post Roads;

To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries;

To constitute Tribunals inferior to the supreme Court;

To define and punish Piracies and Felonies committed on the high Seas, and Offences against the Law of Nations;

To declare War, grant Letters of Marque and Reprisal, and make Rules concerning Captuies on Land and Water;

To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;

To provide and maintain a Navy;

To make Rules for the Government and Regulation of the land and naval Forces;

To provide for calling forth the Militia to execute the Laws of the Union, suppress Insurrections and repel Invasions;

To provide for organizing, arming, and disciplining the Militia, and for governing such Part of them as may be employed in the Service of the United States, reserving to the States respectively, the Appointment of the Officers, and the Authority of training the Militia according to the discipline prescribed by Congress;

To exercise exclusive Legislation in all Cases whatsoever, over such District (not exceeding ten Miles square) as may, by Cession of particular States, and the Acceptance of Congress, become the Seat of the Government of the United States, and to exercise like Authority over all Places purchased by the Consent of the Legislature of the State in which the Same shall be, for the Erection of Forts, Magazines, Arsenals, dock-Yards, and other needful Buildings.—And

To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereoi.

Section 9. The Migration or Importation of such Persons as any oi the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight, but a Tax or duty may be imposed on such importation, not exceeding ten dollars for each Person.

The Privilege of the Writ of Habeas Corpus shall not be suspended, unless nhen in Cases of Rebellion or Invasion the public Safety may require it.

No Bill of Attainder or ex post facto Law shall be passed.

No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken.

No Tax or Duty shall be laid on Articles exported from any State.

No Preierence shall be given by any Regulation oi Commerce or Revenue to the Ports oi one State over those of another: nor shall Vessels bound to, or from, one State, be obliged to enter, clear, or pay Duties in another.

No Money shall be drawn irom the Treasury, but in Consequence of Appropriations made by Lam; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time.

No Title of Nobility shall be granted by the United States: And no Person holding any Office of Profit or Trust under them, shall, without the Consent of the Congress, accept of any present, Emolument, Office, or Title, of any kind whatever, from any King, Prince, or foreign State.

Section 10. No State shall enter into any Treaty, Alliance, or Coniederation; grant Letters of Marque and Reprisal; coin Money; emit Bills oi Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts; pass any Bill of Attainder, ex post iacto Law, or Law impairing the Obligation of Contracts, or grant any Title of Nobility.

No State shall, without the Consent of the Congress, lay any Imposts or Duties on Imports or Exports, except what may be absolutely necessary ior executing its inspection Laws: and the net Produce of all Duties and Imposts, laid by any State on Imports or Exports, shall be for the Use of the Treasury oi the United States: and all such Laws shall be subject to the Revision and controul of the Congress.

No State shall, without the Consent of Congress, lay any Duty of Tonnage, keep Troops, or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power, or engage in War. unless actually invaded, or in such imminent Danger as will not admit of delay.

Article II

Section 1. The executive Power shall be vested in a President of the United States of America. He shall hold his Office during the Term oi four Years, and, together with the Vice President, chosen for the same Term, be elected, as follows

Each State shall appoint, in such Manner as the Legislature thereof may direct, a Number of Electors, equal to the whole Number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative, or Person holding an Office of Trust or Profit under the United States, shall be appointed an Elector.

The Electors shall meet in their respective States, and vote by Ballot for two Persons, of whom one at least shall not be an Inhabitant of the same State with themselves. And they shall make a List of all the Persons voted for, and of the Number of Votes for each; which List they shall sign and certiiy, and transmit sealed to the Seat of the Government of the United States, directed to the President of the Senate. The President of the Senate shall, in the Presence of the Senate and House of Representatives, open all the Certificates, and the Votes shall then be counted. The Person having the greatest Number of Votes shall be the President, if such Number be a Majority of the whole Number of Electors appointed; and if there be more than one who have such Majority, and have an equal Number of Votes, then the House of Representatives shall immediately chuse by Ballot one of them for President; and if no Person have a Majority, then from the five highest on the List the said House shall in like Manner chuse the President. But in chusing the President, the Vote shall be taken by States, the Representation from each State having one Vote; A quorum for this Purpose shall consist of a Member or Members from two thirds of the States, and a Majority of all the States shall be necessary to a Choice. In every Case, after the Choice oi the President, the Person having the greatest Number of Votes of the Electors shall be the Vice President. But ii there should remain two or more who have equal Votes, the Senate shall chuse from them by Ballot the Vice President.

The Congress may determine the Time oi chusing the Electors, and the Day on which they shall give their Votes; which Day shall be the same throughout the United States.

No Person except a natural born Citizen, or a Citizen of the United States, at the time of the Adoption of this Constitution, shall be eligible to the Office of President; neither shall any Person be eligible to that Office who shall not have attained to the Age of thirty five Years, and been fourteen Years a Resident within the United States.

In Case oi the Removal of the President from Office, or of his Death, Resignation, or Inability to discharge the Powers and Duties of the said Office, the Same shall devolve on the Vice President, and the Congress may by Law provide for the Case oi Removal, Death, Resignation or Inability, both of the President and Vice President, declaring what Officer shall then act as President, and such Officer shall act accordingly, until the Disability be removed, or a President shall be elected.

The President shall, at stated Times, receive for his Services, a Compensation, which shall neither be encreased nor diminished during the Period ior which he shall have been elected, and he shall not receive within that Period any other Emolument from the United States, or any oi them.

Before he enter on the Execution of his Office, he shall take the following Oath or Affirmation:—"I do solemnly swear (or affirm) that I will faithfully execute the Office of President of the United States, and will to the best of my Ability, preserve, protect and defend the Constitution of the United States."

Section 2. The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States; he may require the Opinion, in writing, of the principal Officer in each of the executive Departments, upon any Subject relating to the Duties of their respective Offices, and he shall have Power to grant Reprieves and Pardons for Offences against the United States, except in Cases of Impeachment.

He shall have Power, by and with the Advice and Consent of the Senate, to make Treaties, provided two thirds of the Senators present concur; and he shall nominate, and by and with the Advice and Consent of the Senate, shall appoint Ambassadors, other public Ministers and Consuls, Judges of the supreme Court, and all other Officers of the United States, whose Appointments are not herein otherwise provided for, and which shall be established by Law: but the Congress may by Law vest the Appointment of such inferior Officers, as they think proper, in the President alone, in the courts of Law, or in the Heads of Departments.

The President shall have Power to fill up all Vacancies that may happen during the Recess of the Senate, by granting Commissions which shall expire at the End of their next Session.

Section 3. He shall from time to time give to the Congress Information of the State of the Union, and recommend to their-consideration such Measures as he shall judge necessary and expedient; he may, on extraordinary Occasions, convene both Houses, or either of them, and in Case of Disagreement between them, with Respect to the Time oi Adjournment, he may adjourn them to such Time as he shall think proper; he shall receive Ambassadors and other public Ministers; he shall take Care that the Laws be faithfully executed, and shall Commission all the Officers of the United States.

Section 4. The President, Vice President and all civil Officers of the United States, shall be removed from Office on Impeachment for, and Conviction of, Treason, Bribery, or other high Crimes and Misdemeanors.

Article III

Section 1. The judicial Power of the United States shall be vested in one supreme Court, and in such inferior Courts as the Congress may from time to time ordain and establish. The Judges, both of the supreme and inferior Courts, shall hold their Offices during good Behavior, and shall, at stated Times, receive for their Services, a Compensation, which shall not be diminished during their Continuance in Office.

Section 2. The judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority;—to all Cases affecting Ambassadors, other public Ministers and Consuls;—to all Cases of admiralty and maritime Jurisdiction;—to Controversies to which the United States shall be a Party;—to Controversies between two or more States;—between a State and Citizens oi another State;—between Citizens of different States,—between Citizens of the same State claiming Lands under Grants of difierent States, and between a State, or the Citizens thereof, and foreign States, Citizens or Subjects.

In all Cases affecting Ambassadors, other public Ministers and Consuls, and those in which a State shall be Party, the supreme Court shall have original Jurisdiction. In all the other Cases before mentioned, the supreme Court shall have appellate Jurisdiction, both as to Law and Fact, with such Exceptions, and under such Regulations as the Congress shall make.

The Trial oi all Crimes, except in Cases of Impeachment, shall be by Jury; and such Trial shall be held in the State where the said Crimes shall have been committed: hut when not committed within any State, the Trial shall be at such Place or Places as the Congress may by Law have directed.

Section 3. Treason against the United States, shall consist only in levying War against them, or in adhering to their Enemies, giving them Aid and Comfort.- No Person shall be convicted of Treason unless on the Testimony of two Witnesses to the same overt Act, or on Confession in open Court.

The Congress shall have power to declare the Punishment of Treason, but no Attainder oi Treason shall work Corruption of Blood, or Forfeiture except during the Life of the Person attainted.

Article IV

Section 1. Full Faith and Credit shall be given in each State to the public Acts, Records, and judicial Proceedings of every other State. And the Congress may by general Laws prescribe the Manner in which such Acts, Records and Proceedings shall be proved, and the Effect thereof.

Section 2. The Citizens of each State shall be entitled to all Privileges and Immunities of Citizens in the several States.

A person charged in any State with Treason, Felony, or other Crime, who shall flee from Justice, and be found in another State, shall on Demand of the executive Authority of the State from which he fled, be delivered up, to be removed to the State having Jurisdiction of the Crime.

No Person held to Service or Labour in one State, under the Laws thereof, escaping into another, shall, in Consequence of any Law or Regulation therein, be discharged from such Service or Labour, but shall be delivered up on Claim of the Party to whom such Service or Labour may be due.

Section 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the Jurisdiction of any other State; nor any State be formed by the Junction of two or more States, or Parts of States, without the Consent of the Legislatures of the States concerned as well as of the Congress.

The Congress shall have Power to dispose of and make all needful Rules and Regulations respecting the Territory or other Property belonging to the United States; and nothing in this Constitution shall be so construed as to Prejudice any Claims of the United States, or of any particular State.

Section 4. The United States shall guarantee to every State in this Union a Republican Form of Government, and shall protect each of them against Invasion; and on Application of the Legislature, or of the Executive (when the Legislature cannot be convened) against domestic Violence.

ARTICLE V

The Congress, whenever two thirds of both Houses shall deem it necessary, shall propose Amendments to this Constitution, or, on the Application of the Legislatures of two thirds of the several States, shall call a Convention for proposing Amendments, which, in either Case, shall be valid to all Intents and Purposes, as Part of this Constitution, when ratified by the Legislatures of three fourths of the several States, or by Conventions in three fourths thereof, as the one or the other Mode of Ratification may be proposed by the Congress; Provided that no Amendment which may be made prior to the Year One thousand eight hundred and eight shall in any Manner affect the first and fourth Clauses in the Ninth Section of the first Article; and that no State, without its Consent, shall be deprived of its equal Suffrage in the Senate.

ARTICLE VI

All Debts contracted and Engagements entered into, before the Adoption of this Constitution, shall be as valid against the United States under this Constitution, as under the Confederation.

This Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made, under the Authority of the United States, shall be the supreme Law of the land; and the Judges in every State shall be bound thereby, any Thing in the Constitution or Laws of any State to the Contrary notwithstanding.

The Senators and Representatives before mentioned, and the Members of the several State Legislatures, and all executive and judicial Officers, both of the United States and of the several States, shall be bound by Oath or Affirmation, to support this Constitution; but no religious Test shall ever be required as a Qualification to any Office or public Trust under the United States.

ARTICLE VII

The Ratification of the Conventions of nine States shall be sufficient for the Establishment of this Constitution between the States so ratifying the Same.

DONE in Convention by the Unanimous Consent of the States present' the Seventeenth Day of September in the Year of our Lord one thousand seven hundred and Eighty-seven and of the Independence of the United States of America the twelfth IN WITNESS whereof We have hereunto subscribed our Names,

Amendments to the Constitution of the United States

"*Resolved*, By the Senate and House of Representatives of the United States of America, in congress assembled, two-thirds of both Houses concurring, that the following articles be proposed to the Legislatures of the several States, as amendments to the Constitution of the United States; all or any of which articles, when ratified by three-fourths of the said Legislatures, to be valid to all intents and purposes, as part of the said Constitution, namely:"

*The Ten **Original** Amendments*
(Dec. *15,* 1791)

Article I—Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

Article II—A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

Article III—No soldier shall, in time of peace, be quartered in any house without the consent of the owner, nor in time of war, but in a manner to be prescribed by law.

Article IV—The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

Article V—No person shall be held to answer for a capital or other infamous crime unless on a presentment or indictment of a grand jury, except in cases arising in the land or naval forces, or in the militia, when in actual service, in time of war or public danger; nor shall any person be subject for the same offence to be twice put in jeopardy of life or limb; nor shall be compelled in any criminal case to be a witness against himself, nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

Article VI—In all criminal prosecutions, the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which districts shall have been previously ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining-witnesses in his favor, and to have the assistance of counsel for his defence.

Article VII—In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

Article VIII—Excessive bail shall not be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted,

Article IX—The enumeration in the Constitution of certain rights shall not be construed to deny or disparage others retained by the people.

Article X—The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

Subsequent Amendments

Article XI—(Jan. **8,** 1798)—The judicial power of the United States shall not be construed to extend to anv suit in law or equity, commenced or prosecuted against one of the United States, by citizens of another State, or by citizens or subjects of any foreign state

Article XII—(Sept. *25,* 1304)—The electors shall meet in their respective States, and vote by ballot for President and Vice-President, one of whom at least shall not be an inhabitant of the same State with themselves; they shall name in their ballots the person voted for as President, and in distinct ballots the person voted for as Vice-President; and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which list they shall sign and certify, and transmit, sealed, to the seat of the Government of the United States, directed to the President of the Senate; the President of the Senate shall, in the presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted; the person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of electors appointed; and if no person have such majority, then from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President shall be the Vice-President, if such number be a majority of the whole number of electors appointed, and if no person have a majority, then from the two highest numbers on the list the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two-thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

***Article* XIII**—(Dec 18, 1865)—1. Neither slavery nor involuntary servitude, except as a punishment for crime whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

2. Congress shall have power to enforce this article by appropriate legislation.

Article XIV—(July 28, 1868)—1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens of the United States and of the State wherein they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of lam, nor deny to any person within its jurisdiction the equal protection of the laws.

2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed. But when the right to vote at any election for the choice of electors for President and Vice-President of the United States, Representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereoi, is denied to any of the male members of such State, being of twenty-one years of age, and citizens of the United States, or in aay way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

3. No person shall be a Senator or Representative in Congress, or elector of President and Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath, as a member of Congress, or as an officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid and comfort to the enemies thereof. But Congress may, by a vote of two-thirds of each House, remove such disability.

4. The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection and rebellion, shall not be questioned. But neither the United States nor any State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave; but all such debts, obligations, and claims shall be held illegal and void.

5. The Congress shall have power to enforce by appropriate legislation the provisions of this article.

Article XV—(March 30. 1870)--1. The right of the citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of race, color, or previous condition of servitude.

2. The Congress shall have power to enforce the provisions of this article by appropriate legislation.

Article XVI—(Feb. 25, 1913)—The Congress shall have power to lay and collect taxes on incomes, from whatever sources derived, without apportionment among the several States, and without regard to any census or enumeration.

Article XVII—(May 31, 1913)—1. The Senate of the United States shall be composed oi two Senators from each State, elected by the people thereof, for six years; and each Senator shall have one vote. The electors in each State shall have the qualifications requisite for electors of the most numerous branch of the State Legislatures.

2. When vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the peopie fill the vacancies by election as the Legislature may direct.

3. This amendment shall not be so construed as to affect the election or term of any Senator chosen before it becomes valid as part of the Constitution.

Article XVIII—(Jan. 29, 1919)—1. After one year from the ratification of this article the manufacture, sale, or transportation of intoxicating liquors within, the importation thereof into, or the exportation thereof from the United States and all territory subject to the jurisdiction thereof for beverage purposes is hereby prohibited.

2. The Congress and the several States shall have concurrent power to enforce this article by appropriate legislation.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the Legislatures of the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

***Article* XIX**—(Aug 18, 1920)—1. The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex.

2. The Congress shall have power by appropriate legislation to enforce the provision of this article.

Article XX—(Feb. 6, 1933)—1. The terms of the President and Vice-President shall end at noon on the 20th day of January, and the terms of Senators and Representatives at noon on the 3rd day of January, of the years in which such terms would have ended if this article had not been ratified; and the terms of their successors shall then begin.

2. The Congress shall assemble at least once in every year, and such meeting shall begin at noon on the 3rd day of January, unless they shall by law appoint a different day.

3 If, at the time fixed for the beginning of the term of the President, the President elect shall have died, the Vice-President elect shall become President. If a President shall not have been chosen before the time fixed for the beginning of his term, or if the President elect shall have failed to qualify, then the Vice-President elect shall act as President until a President shall have qualified; and the Congress may by law provide for the case wherein neither a President elect nor a Vice-President elect shall have qualified, declaring who shall then act as President, or the manner in which one who is to act shall be selected, and such person shall act accordingly until a President or Vice-president shall have qualified.

4. The Congress may by law provide for the case of the death of any of the persons from whom the House of Representatives may choose a President whenever the right of choice shall have devolved upon them, and for the case of the death of any of the persons from whom the Senate may choose a Vice-President whenever the right of choice shall have devolved upon them.

5. Sections 1 and 2 shall take effect on the 15th day of October following the ratification of this article.

6. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission.

***Article* XXI**—(Dec. 5, 1933)—1. The Eighteenth Article of amendment to the Constitution of the United States is hereby repealed.

2. The transportation or importation into any State, Territory, or possession of the United States for delivery or use therein of intoxicating liquors, in violation of the laws thereof, is hereby prohibited.

3. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by conventions in the several States, as provided in the Constitution, within seven years from the date of the submission hereof to the States by the Congress.

Article XXII—(Feb. 26, 1951)—1. No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President, for more than two years of a term to which some other person was elected President shall be elected to the office of the President more than once. But this Article shall not apply to any person holding the office of President when this Article was proposed by the Congress, and shall not prevent any person who may be holding the office of President, or acting as President, during the term within which this Article becomes operative from holding the office of President or acting as President during the remainder of such term.

2. This article shall be inoperative unless it shall have been ratified as an amendment to the Constitution by the legislatures of three-fourths of the several States within seven years from the date of its submission to the States by the Congress.

Article XXIII—(March 29, 1961)—1. The District constituting the seat of Government of the United States shall appoint in such manner as the Congress may direct:

A number of electors of President and Vice-President equal to the whole number of Senators and Representatives in Congress to which the District would be entitled if it were a State, but in no event more than the least populous State; they shall be in addition to those appointed by the States, but they shall be ccnsidered, for the purposes of the election of President and Vice-President, to be electors appointed by a State; and they shall meet in the District and perform such duties as provided by the twelfth article of amendment.

2. The Congress shall have power to enforce this article by appropriate legislation.

B. Government

An account of the governmental system of the United States must be descriptive of the organization of national and state governments. It must also analyze certain of the fundamental characteristics that distinguish the U.S. government from other governments. With this twofold object in mind, the discussion of the constitution and government of the United States is organized on the following plan: (1) the constitutional framework; (2) the federal system; **(3)** judicial review; (4) separation of powers; (5) the independent executive; (6) the national government; (7) state governments; (8) local government in the states; (9) elections and political parties.

1. The Constitutional Framework. — Under a federal system it would be extremely difficult to operate without a written document defining the respective powers of the states and the central government. Consequently, it was to be expected that articles of confederation would be framed for the creation of the first union of the American states and that, when improvement was needed, these articles would be replaced by a written constitution.

There was no similar necessity that written constitutions be framed for the government of the American states. Yet the colonies had been accustomed to written instruments of government. Certain of them operated under royal charters. Massachusetts largely retained the forms of its charter government until 1780, Connecticut until 1818 and Rhode Island until 1842. In most colonies the royal commissions to governors gave some written basis for government. Moreover, the leaders in the colonies were familiar with and largely adherents of the theory that government is a result of social compact, and theories of natural rights were strong.

It was therefore natural that upon separation from England the several states should embody in written form a declaration of their rights and the general organization of their governments. Before the framing of the national constitution, constitutions had been framed and adopted by all the original 13 states except Connecticut and Rhode Island. The framers of the national constitution therefore had before them the texts of state constitutions and were familiar with the experience under these constitutions. Each state is still governed by a written constitution.

The constitution of the United States, framed in 1787 and adopted in 1789, is a brief and well-drafted document. Its influence has been felt, not only in the United States, but in the federal systems of Switzerland, Argentina, Brazil, Canada and Australia. It outlines the organization of the three departments of the national government, defines the powers of that government and the relationship between the nation and the states. The first ten amendments, adopted in 1791, were the direct results of criticisms of the constitution at the time of its adoption and may almost be regarded as parts of the original document (see Bill of Rights, United States). Of the other amendments, the 11th, adopted in 1798, overcame a decision of the United States supreme court to the effect that a state might be sued by a citizen of another state. The 12th amendment, adopted in 1804, corrected a defect in the original constitution as to the method of choosing the president and vice-president. The 13th, 14th and 15th amendments were the immediate outcome of the Civil War. The 13th amendment (1865) abolished slavery, the 15th (1870) forbade denial of the right to vote "on account of race, color, or previous condition of servitude." The 14th amendment (1868), regarded for a while by the courts as limiting itself to the protection of the freed slaves, has become, by expansion of the terms "due process of law" and "equal protection of the laws," the means through which the United States supreme court determines the policy of state enactments in the field of social legislation. The 16th amendment in 1913 gave congress an effective power to levy a federal income tax. Popular election of United States senators under the 17th amendment, adopted in 1913, has somewhat reduced the importance of the state, as did the 18th amendment (1919) transferring the liquor problem to the national government. The 19th amendment (1920) nationalized women's suffrage. The 20th amendment (1933) altered the time of the beginning of terms of president, vice-president, senators and representatives; changed the time for sessions of congress; and provided for certain contingencies which may arise as the result of the death or failure to qualify of a president-elect. The 21st amendment (1933) repealed the 18th amendment and restored the control of intoxicating liquors to the states. The 22nd amendment (1951) limited the presidential tenure of office to two elective terms. The 23rd amendment (1961) gave the residents of Washington, D.C., the right to vote in presidential elections. On the whole. the process of amendment, while to some extent enlarging federal powers, has been less influential in this direction than the decisions of the U.S. supreme court.

2. The Federal System. — A fundamental feature of the U.S. constitutional system is the division of political authority between two levels of government — state and national. The constitution as originally enacted attempted to parcel out power in such a way as to allow the central government to deal effectively with problems that were national in scope while leaving the states free to handle matters that were of purely local concern. It was widely expected that this would leave the states in a pre-eminent position. After the Civil War and especially during the 20th century, however, U.S. history has seen a steady rise in the influence and authority of the national government. Although the states still remain vital centres of legal power in the federal system, they have been increasingly overshadowed in the public eye by the events and personalities of national politics.

The Articles of Confederation, adopted in 1781, constituted a legal symbol of union, but the central government under these articles had no coercive power over the states and no power whatever capable of exercise directly upon the citizens of the states. The national constitution was intended to remedy this situation by creating a central government with large powers and with authority to exercise these powers, not merely upon the states but directly upon all citizens of the country. When the first congress assembled in New York in April 1789, the union had a membership of 11 states. North Carolina and Rhode Island soon joined the states of the original 13 states.

The Role of the States. — Under the original constitution of the United States, the states, as such, are guaranteed their territorial integrity and are expressly recognized as units in the organization of the national government. They have equal representation in the United States senate. They are treated as units in the election of president and vice-president and of members of the national legislature. They have a decisive share in the amendment of the constitution of the United States.

When the national government was being formed, a sharp conflict of interests arose between the small and the large states. The smaller states contended for complete equality among the states in the organization of the national government, and the larger states contended for influence in proportion to population. A compromise was reached by which the states are equally represented in the United States senate, irrespective of population, and in proportion to their population in the house of representatives. By the terms of the constitution no state may without its consent be deprived of its "equal suffrage in the Senate."

Representation in the national house of representatives is based upon population. Under the constitution, each ten years, after the decennial federal census, the congress of the United States determines how many members will constitute the house of representatives. This number is then divided into the total population of the states. In this manner a ratio of representation is obtained. Each state is entitled to as many representatives as this ratio is contained in its population, although each state, no matter how small its population, is entitled to at least one representative. After the division of the representative ratio into the population of each of the states, large fractions of population may remain. and the states having the largest iemainders received additional representatives, as long as the number agreed upon was not exceeded. The problem of fractions presented difficulties. A method known as the method of major fractions was used in 1910; choice of several methods of computation was provided by an act of 1929; and by an act of 1941 the method known as the method of equal proportions was adopted. No apportionment was made after the census of 1920, and provision was made in 1929 for automatic reapportionment of the existing number of representatives in case congress did not enact an apportioning act within 60 days after receiving the decennial statistical information on which apportionment is based. By an act of 1941 automatic decennial reapportionment was provided without change in the existing number of representatives. The number of representatives and the method of apportionment are subject to change by congress. The boundaries of the congressional districts are on the other hand, determined by each state legislature. Using this power, many state legislatures under rural dominance have drawn the lines of congressional districts so as to iavour rurai at the expense of urban or suburban areas.

In the election of the president and vice-president of the United States, the framers of the national constitution provided for so-called electoral colleges. Each state chooses a number of presidential electors equal to the number of its members in the national house of representatives, plus its two senators (thus it was necessary to amend the constitution [art. xxiii] to enable the residents of Washington, D.C., to vote for electors). The plan of the constitution was that these electors should actually exercise a choice as to who should be president. However, almost since the beginning of the government, candidates for the presidency and vice-presidency have been nominated by the great political parties of the country in advance of the choice of electors. These political parties also nominate within each state their candidates for presidential electors. The candidates of any party for electors are usually pledged in advance to vote for the candidates nominated by that party for president and vice-president. For this reason, everybody knows who will be president immediately after the November election, at which the electors themselves are chosen. In this respect, as in others, unwritten law, developed by usage, has altered the operation of the written text of the constitution. In recognition of the fact that presidential electors are merely a device for casting a certain number of votes allotted to the state, at least one-third of the states now provide for a direct vote for candidates for president and vice-president and omit from their ballots the names of candidates for presidential electors. Although each state has power to appoint its presidential electors in such a manner as the legislature thereof may direct, each state has. except in a few cases, chosen such electors by popular vote, its electoral vote then being cast for the presidential candidate with the larger popular vote in the state, even though such vote may not have been a majority.

There have been several proposals for altering the method by which presidents are elected. The simplest of these new plans provides for the abolition of the electoral college and the election of a president by direct popular vote. Another proposal is that the electoral vote in each state be divided among all candidates in proportion to the popular vote they received in that state. It has also been suggested that each state be divided into a number of election districts for the purpose of electing a president, and that single electors be chosen from each district rather than voting for all electors on a state-wide basis as is presently done. The ostensible purpose of these proposals is to prevent the election of a president who has a majority in the electoral college but not in the popular vote. Both Hayes in 1876 and Harrison in 1888 were elected president under the electoral college system although receiving a smaller popular vote than their principal opponents.

Two methods are provided for amending the constitution of the United States. An amendment may be proposed by two-thirds of the members of both houses of congress and goes into effect when ratified by the legislatures of three-fourths of the states or by conventions in three-fourths of the states, as congress shall determine. Congress is required by the constitution to call a convention for proposing amendments on the application of the legislatures of two-thirds of the several states No such convention has ever been called. and until 1933 congress always provided for the ratification of federal amendments by state legislatures rather than by conventions called for this purpose. In 1933 Longress chose the alternate method of ratification and submitted the question of repealing the 18th amendment to state conventions. Adopted later in the year, this proposal became the 21st amendment.

Because of their role in the amending process, the states still have a decisive influence with respect to any change in the national constitution. In other respects, the states have lost some of their prestige as units in the government of the nation. The decreased political importance of the state as a unit in national affairs has been caused in part by the development of rapid means of travel and of communication. The constant shifting of population from one state to another prevented the nener states from developing the solidarity possessed by the original 13. The very increase in the number of states also reduced the importance of each as a unit in the national government.

Furthermore, since the establishment of the federal system national politics has dominated. The ambitious political leader looks to advancement from state to national office. Nominations for the presidency are the most conspicuous prizes in the political system. The popular election of United States senators by each state under the 17th amendment itself tended to reduce emphasis upon the state as a political unit and to treat it as merely an electoral area in the organization of the national government. While the states still determine affirmatively who shall vote in state and national elections, the 15th and 19th amendments forbid discrimination because of race, colour, previous condition of servitude or sex. and the United States supreme court held that the 14th amendmenr forbids state legislation with respect to like discriminations in party primaries. As soon as national and state elections came generally to be held upon the same day. there was a full establishment of the dominance of national politics.

The Division of Power.—The states under the federal system are units in the formation of a nation, not governments independent of a nation. Before the Civil War a number of conflicts arose between national and state power, in nhich first one group of states and then another asserted its authority to proceed indeperdenrly of the nation. Pennsylvania, Massachusetts, Virginia, South Carolina and other states in turn opposed the supremacy of national power under the constitution. The Civil War settled finally and conclusively that the states are merely units, although indispensable units, in the formation of a single national framework of government.

The limitations imposed upon the states by the constitution clearly indicate the purpose of establishing a single national systeni. States are forbidden, without the consent of congress, to "Keep troops. or Ships of War in time of Peace, enter into any Agreement or Compact with another State, or with a foreign Power or engage in War. unless actually invaded, or in such imminent Danger as will not admit of delay." They are forbidden to enter into treaties, alliances or confederations. These types of limitations upon the states indicate a definite purpose to deprive the states of any independent existence as governments in themselves. and this purpose is supported by the language making the "Constitution, and the Laws of the United States which shall be made in Pursuance thereof; and all Treaties made, or which shall be made. under the Authority of the United States" the supreme law of the land.

The power of congress to consent to an agreement or compact by one state with another state is important, particularly where states are close to each other. Such consent has authorized co-operation between states in the construction and use of bridges and tunnels, the apportionment of waters, harbour development, improvement of navigation, flood control. sanitation or abatement of pollution, conservation of fisheries: recreation, crime prevention and the regulation of oil production. Political compacts, however, have not been undertaken between. states.

The powers of the national government are such as are granted to it by the constitution of the United States. They must be found within the terms of that document. It has no others. This basic principle was implied but not expressed in the constitution as first adopted. So important was its expression in the constitutional text regarded that the 10th amendment provides that "powers not delegated to the United States by the Constitution. nor prohibited by it to the States, are reserved to the States respectively, or to the people." The states gave up certain powers in establishing the national government. They set out these powers in a written document and expressly reserved all other pomers to themselves or to the people. The powers of the nation, found within the terms of this written document, are superior to the poners of the states.

Who is to determine, in case of doubt or conflict, whether such a superior power, asserted by the government of the United States, is within the terms of the constitution? Before the Civil War, states often asserted the authority to determine for themselves what powers belonged to the national government, but such assertions were unsuccessful. After 1816 the legol principle nas established that the line between national and state powers is to be drawn by the United States supreme court, an organ of the national government.

What are the powers granted to the national government? Express legislative powers, couched in most cases in broad language, are conferred on congress, by a series of 18 paragraphs in art, i, sec. 8, of the constitution. In even more general terms powers are conferred on the executive and judicial departments of the United States. Certain powers are of such a character that they must be exercised exclusively by the national government, as, for example, the levying of federal taxes, borrowing money on the credit of the United States, constituting federal tribunals inferior to the supreme court and the establishment of a uniform rule of naturalization. Others are made exclusively national by constitutional prohibitions upon the states. The federal power to coin money is supplemented by forbidding states to coin money. The federal war pomers are made exclusive by prohibitions upon the states. The federal treaty-making power is supplemented by forbidding state treaties and by inhibiting state compacts nithout the consent of congress. Other powers are of such a character that they may be exercised by either of two governments, but not by both. The grant of such a power to the national government makes it exclusive.

Of necessity, many of the powers granted to congress are not exclusive. In such matters, states may exercise power also, provided state action does not conflict with the superior powers of the national government in the same field. Congress has complete power to regulate bankruptcies. but during a good part of the time after 1789 there was no federal bankruptcy law, and the matter was left to the states. Congress has only in small part exercised its power to fix the standard of weights and measures. and there is valid state legislation upon this subject in all the states. The constitution itself expressly provides for concurrent authority over the militia. Gnder a general grant of power to regulate interstate commerce. congress has full power, but the states may legislate in regard to local needs and circumstances unless congress otherwise directs.

Although all powers of the national government must be found within the terms of a written document, this by no means implies that all powers must be expressly granted by that document. The constitution of the United States grants a number of important poners in broad terms to congress and to the other departments of the national government. It further empowers congress "to make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof."

Throughout the earlier decades of government under this constitution, political and legal contests centred about the meaning of the nords "necessary and proper," one party emphasizing the word "necessary" as narrowing the powers conferred and the other the word "proper" as broadening them. The rule of broad and liberal construction announced by Chief Justice John Marshall in 1819 has prevailed:

> Let the end be legitimate, let it be within the scope of the Constitution, and all means mhich are appropriate, which are plainly adapted to that end, and which are not prohibited, but consistent with the letter and spirit of the Constitution, are constitutional.

Substantially all powers not national belong to the states, and such powers must be determined in large part by a process of subtraction. Naturally no precise result can be obtained when the powers to be subtracted are based on broad implications and are not definitely determined. The important national powers with respect to interstate commerce, taxation, treaties, post offices and post roads and maritime jurisdiction have been construed broadly, almost nithout exception.

The United States supreme court has long been engaged in determining the line between national and state power. This is a continuing judicial duty in a federal system. It is impossible to draw any definite or permanent line between national and state functions. The steamboat and the railroad, the telephone and the telegraph, the airplane, the radio and television were potent factors in the development of national power. Railroad regulation began with the states but tended to come almost completely under national control, rapid progress in this direction having been made after the creation of the Interstate Commerce commission in 1887. The so-called antitrust movement began with the states, but restrictive commercial practices came largely under national supervision with the Sherman Anti-Trust act of 1890 and the creation of the Federal Trade commission in 1914. Where a problem is national in character. its solution will by some means fall to the national government. The broad and flexible powers of that government are capable of further expansion as new needs develop with economic. social and technological changes.

Along with the increase in national powers and in the activities of the national government has come also a similar increase in the functions performed by the state government. State governments now do more than ever before and cost more in proportion.

Powers of state governments are broad and comprehensive. Subject only to the condition that the government shall be republican in form, the states organize their own central and local governments and provide revenues for the support of these governments. The state courts administer the great body of law affecting the rights of individuals and for the suppression of crime. Education, though aided by the national government, is under the control of the states and of the local governments created by them. The same statement applies to the construction and maintenance of highways and to the great mass of governmental details with which the citizen comes in daily contact. The American remained in much the position described by James Bryce in the 19th century:

> The State, or local authority constituted by State statutes, registers his birth, appoints his guardian, pays for his schooling, gives him a share in the estate of his father deceased, licenses him when he enters a trade (if it be one needing a license), marries him, divorces him, entertains civil actions against him, declares him a bankrupt, hangs him for murder. The police that guard his house, the local boards which look after the poor, control highways, impose water rates, manage schools—all these derive their legal powers from his State alone.

But attention should be called to the fact that developments after 1933 greatly increased the importance of the national government, not only in the functions which it performs but also in its influence over state governments. Unemployment compensation and old-age pensions are theoretically under state control, but in fact federal control over state action is maintained through conditional federal subsidies and through a federal tax subject to 90% credit upon state compliance with federal requirements. Through a broad construction of federal power to regulate "coinmerce . . . among the several States" there came a federal control over labour disputes and over hours and wages of labour where a substantial part of the commodities dealt with has passed from one state to another or is to be marketed across state lines, or where the transaction is associated with the means of interstate traffic. Through the same power the national government came to determine the planting acreage of crops and the conditions and prices in the marketing of milk. Through the enormous funds spent on public welfare programs the national government also established a substantial role for itself in that area.

Showing up the power of the states depends upon the more efficient conduct of state governments and upon more effective co-operation among the states as to problems which extend beyond the boundaries of a single state. Insurance was in 1944 held subject to control by congress as interstate commerce, but congress left control to the states and the continuance of such state control would most probably depend upon the efficiency and uniformity of state regulation.

The Two Systems of Government. — Throughout the territory of each state two governments operate — the nation with its administrative and judicial organizations for the enforcement of national law and the state with its administrative and judicial organizations for the enforcement of state law. Federal revenues are collected through officers controlled from Washington; state revenues are collected by independent state and local officers. Taxes levied by the two are in some cases similar in character. The nation and a number of states impose income taxes, but their administration is independent. Violations of state law are tried and punished in state courts; violations of national law in separate federal courts. However, a decision by the United States supreme court in 1945 made violation of state law by a state officer punishable in federal courts where the disobedience of state law by the state officer is violative of due process of law under the 14th amendment. In some cases the laws of the two are directed to the same purpose, and are substantially identical. The constitutions of both forbid that a person be twice put in jeopardy for the same offense, but in legal theory the two governments are so distinct that one act, forbidden by substantially identical laws of each, may be punished by each as a separate offense.

The reasons for this sharp distinction between the two governments are historical. The Articles of Confederation sought to act through the governments of the several states and not directly upon the citizens of the states. Government under these articles faiied because each state finally determined for itself whether it would enforce the policies of congress. The national government, organized under the constitution, had it thought proper, might have sought to use the states as agencies for the enforcement of national law, as is largely done under the federal system of Switzerland. But under the circumstances it was natural to build up an independent sdministrative and judicial system. This system has steadily grown with the expansion of national activities.

For many years it was the established principle in the United States that the exercise of independent powers by the nation and the state forbade either government to tax the employees or securities of the other. This principle, which was based on the theory that "the power to tax is the power to destroy," was later in large part replaced by the principle that each government may without discrimination tax the income of employees of the other; and the same principle may eventually be applied to the taxation of securities issued by the national, state and local governments. However, the U.S. supreme court expressed the view that the national government may enter upon an enterprise personal in nature and forbid state taxation thereon, but that a similar state enterprise may be taxed by the national government.

3. Judicial Review. — The constitution was regarded from an early date as law of a superior order and of a more permanent character than legislative acts. Under the first state constitutions legislatures were the dominant organs of government. They abused their wide powers and helped develop a feeling that legislative authority should in some measure be curbed. In New Jersey in 1780 a statute was declared invalid as violative of the state constitution. Other decisions of this character gradually accumulated. Apparently the framers of the federal constitution were of the opinion that it would be the iunction of the federal courts to preserve the powers of state and nation under the federal constitution. Such a power in the federal courts carries with it authority, in a case involving the issue, to declare either a federal or a state law invalid as violative of the constitution of the United States. Since Chief Justice Marshall's opinion in 1803, in *Marbury* v. Madison, the principle of judicial power to declare laws unconstitutional has been established in the federal system. The authority of state courts to declare state laws invalid as violative of state constitutions is equally well established. Except for a few provisions which are regarded as committed to the political organs of government, it may therefore be said that placing language in a written constitution makes such language judicially enforceable as against the legislative bodies. Whereas parliament is the supreme lawmaker under the English system of government, in the United States the written constitution as finally construed by the courts is supreme. Where constitutional provisions are clear and precise, this supremacy of the constitution as judicially construed makes little difficulty. But where language is used that is not capable of precise definition, as that of the 14th amendment that no state shall "deprive any person of life, liberty, or property without due process of law," the court may in fact determine not only the constitutionality but also the wisdom of legislative action.

The exercise of broad judicial power in such a manner as to control legislative policy has, however, largely ceased; the "due process of law" clause, the principle of the separation of powers and the broad language of the constitution with respect to federal powers are now construed not only in such a manner as to enlarge national authority but also in such a manner as to leave larger powers in the hands of the political departments of government— the president and the congress in the national system.

Not the least important function of the courts in the U.S. system of government is the protection of individual and minority rights from encroachment by the state. This is a highly controversial side of the supreme court's activity, since it brings the judiciary into conflict with the executive and legislative branches of government. Thus, a primary characteristic of civil and political rights in the United States is the fact that they are judicially enforceable even against congress and the president. In England on the other hand, civil liberties rest upon the support of public opinion rather than the courts.

4. Separation of Powers. — National and state governments in the United States are each organized into three departments. The theory of separation of powers is formally announced in 40 state constitutions. In the remaining state constitutions and in the constitution of the United States the same constitutional result arises from the fact that these documents create three departments of government and vest the legislative power in one, the executive power in another and the judicial power in a third.

There are no clear lines separating one governmental function from another, and the courts have therefore been unable to develop consistent lines of division. Legislative power having once been delegated to congress and the state legislatures, the courts frequently say that legislative power may not be further delegated, but the very necessities of modern life hare made it necessary, in the United States as in England and on the continent, to vest a large amount of subordinate legislative authority in permanent administrative bodies within the executive department. In order to avoid terming this a delegation, the courts have come to designate such powers as quasi-legislative, rather than legislative. In the same manner, administrative bodies within the executive department have come to exercise powers that are sustained on the ground that they are quasi-judicial rather than judicial. The result is therefore not dissimilar from that in countries that have not attempted to set up three separate departments through judicially enforceable constitutions. But such flexibility as develops under the U.S. plan comes more slowly and can be achieved only with judicial approval. A study of U.S. political institutions must, therefore, always take into account the greater rigidity in governmental structure resulting from the constitutional principle of separation of powers, although that rigidity has been to a large extent abandoned through less strict judicial construction.

5. The Independent Executive. — The federal government and the states of the United States have adopted the presidential system of executive leadership as distinguished from the cabinet or ministerial system found in England and most other countries. Under the presidential system there is an independent executive

(president or governor) elected for a fixed term and holding office during that term irrespective of whether he is or is not in political harmony with both legislative bodies or either of them. The members of the legislative bodies are elected at fixed times and for fixed terms, and no power is vested in the executive to dissolve them or to force elections at any other times than those fixed. The principle of separation of powers as applied in the United States precludes any member of the executive department from having a seat in a legislative body. Under this system the president or governor has real executive authority, and in all states but North Carolina the governor has and exercises large power to control legislation by an executive veto. Under the presidential system, the executive and the legislature may at times not be in political harmony. This is, in fact, the case in many of the states and in the national system. In the states of New York and New Jersey, for example, the governors have often been members of the Democratic party, while both houses of the state legislature have been controlled by the Republican party. The power ordinarily vested in the legislative bodies to impeach and remove the executive is judicial in character, and efforts have only occasionally been made to employ the power of impeachment to remove an executive politically hostile to the two houses of the legislature. In 1868 such an effort was made, unsuccessfully, to remove Andrew Johnson from the presidency of the United States.

The presidential system has some disadvantages as compared with the cabinet form of government, but it accords with the U.S. doctrine of separation of powers. When the country faces a crisis, as during the Civil War and World Wars I and II, popular sentiment maintains political harmony between the president and congress; and the executive tends to become the dominant factor in government. The presidential system of the United States in fact met the serious problems of the world wars with less difficulty than did the ministerial systems of England and France.

***6. The* National Government.**—Congress.—Legislative power in the national system is exercised by a congress composed of two houses. The two houses have grown—the senate from 26 to 100 members, and the house of representatives from 65 to 435 members.

With respect to the house of representatives, art. i, sec. 2 of the constitution provides that: "when vacancies happen in the Representation from any State, the Executive Authority thereof shall issue Writs of Election to fill such Vacancies." With respect to the senate, the 17th amendment provides that: "when vacancies happen in the representation of any State in the Senate, the executive authority of such State shall issue writs of election to fill such vacancies: Provided, That the Legislature of any State may empower the Executive thereof to make temporary appointment until the people fill the vacancies by election as the Legislature may direct."

United States senators are elected for six-year terms, and terms are so arranged that one-third of its members retire every two years. From 1913 the elections in each state have been by popular vote of the whole state, except that temporary appointments to fill vacancies are permitted. Members of the house of representatives are elected for two years, and the whole membership changes at the same time. Each state is required to be divided into districts equal to the number of members it has in the house of representatives; but if the number of representatives apportioned to a state is increased, and the state legislature makes no reapportionment of districts within the state, then the additional representative or representatives are elected by the state at large; if the number of representatives apportioned to a state is decreased, and the state legislature makes no reapportionment of districts within the state, then all representatives are elected by the state at large. Each member of the house of representatives is required to be a resident of the state from which he is chosen; political and sectional interests make it practically impossible for a person to be elected for a district within the state in which he does not reside. The result is that an able and experienced person ceases to be a member of congress if he fails of re-election by his district. In addition to the elected members, one resident commissioner from Puerto Rico has a seat in the house but does not have a vote.

Prior to the adoption of the 20th amendment the president, vice-president, senators and members of the house of representatives assumed office on March 4 following their election; and the congress met annually on the first Monday of December. Under this plan newly elected members of the senate and house, elected in November of an even-numbered year, did not take office until March 4 of the succeeding year; and, unless the president called a special session of congress, the newly elected members did not actually begin to function until the regular session in the succeeding December, more than a year after their election. It was possible that the session meeting from Dec. 3 of the even-numbered year until March 4 of the odd-numbered year be controlled by members who had already failed of re-election, and who might therefore be regarded as no longer representing their constituents. In order to avoid control of a session of congress by defeated members, who were termed "lame ducks," the 20th amendment was adopted, under which the terms of the president and vice-president begin on Jan. 20 following their election; the terms of senators and representatives begin on Jan. 3 following their election and congress assembles each year on Jan. 3. The regular sessions of congress usually adjourn in the early summer. The president may on extraordinary occasions convene the two houses in special session.

The organization and procedure of the two houses of congress are to a limited extent determined by congress and to a larger extent by the size and traditions of the two houses. The rules of the senate permit great freedom of debate; those of the house of representatives restrict debate and expedite business. Under the senate rules obstructive tactics may be and are often resorted to, though such tactics relate in fact to relatively few measures. The house of representatives, with its larger membership, would be helpless with complete freedom of debate, yet both houses accomplish a large amount of legislative business.

The house of representatives elects from its own members a speaker as presiding officer. The vice-president of the United States is the presiding officer of the senate. The work of both houses is largely done in committee. The committee systems of both houses developed largely by accident and many committees in each house, once created for important tasks, remained long after their usefulness had ceased. The senate in 1921 and the house of representatives in 1927 reorganized their committees and materially reduced their number. But further increases immediately began, and multiplicity of committees, with conflicts of their jurisdiction in each house, led to confusion and interfered with joint action by committees of the two houses. With legislation enacted in 1946, 15 standing committees replaced 32 in the senate and 19 replaced 48 in the house. The act also specifically defined the authority of each committee, and encouraged co-operation between the two houses. Under this system subcommittees have tended to proliferate.

Committees in each house are controlled by the political party having a majority of the members of that house. Appointment to important committees is based largely on seniority in term of service: and a member serving continuously over a long period is likely to become chairman of an important committee if his political party is in control. Seniority as such naturally plays a larger part in the house of representatives than in the senate with its smaller number of members, though the business of the senate is in good part controlled by a small group of experienced members. Leadership in the two houses is always exercised by a few members of the dominant party. For many years before 1911 the real leadership in the house of representatives was largely vested in the speaker, who made the appointments to standing committees. After 1911 the speaker was relegated more distinctly to the position of presiding officer, and committees were elected by the house itself on the basis of selections first made by the party organizations. The majority and minority floor leaders have large influence. In the senate there is less individual leadership than in the house of representatives. (See also CONGRESS, UNITED STATES.)

The National Executive.—In discussing the presidential system, the relation between the president and congress has been generally described. Originally there were no constitutional limitations upon a president succeeding himself, but a tradition long existed that a president should not serve for more than two terms, a tradition based on the example set by Washington and other early presidents. This tradition was broken by Franklin D. Roosevelt. who was elected successively in 1932. 1936, 1910 and 1944, and who served from 1933 until his death on April 12, 1935. The 22nd constitutional amendment. proposed in 1937 and ratified by three-fourths of the states in 1951, provides that: "No person shall be elected to the office of the President more than twice, and no person who has held the office of President. or acted as President, for more than two years of a term to which some other person was elected President shall he elected to the office of the President more than once." This amendment was made specifically inapplicable to the person holding the office of president during the time of proposal and adoption of this amendment.

The constitution expressly authorizes the president to make certain appointments to office and the expansion of the national administration has greatly increased the number of officers owing their appointments to him. The more important appointments are subject to confirmation by the senate. The United States supreme court has determined that where power to appoint to an executive office is vested in the president, this carries with it a complete power to remove from office. It was an effort on the part of congress to impose restrictions upon the president's power to remove even his more direct advisers that led to the impeachment of President Johnson. who escaped conviction by one vote. However, the president's power of removal may be limited by act of congress with respect to quasi-legislative or quasi-judicial officers. who are required to discharge their duties independently of executive control: and the use of such officers (particularly as members of independent commissions) has greatly increased with the extension of federal control with respect to commercial transactions of various types. including labour disputes and the activities of the transportation mediuins.

The president's control over the national executive administration is primarily exercised through the heads of ten executive departments. appointed by the president. These departments are: department of state; department of the treasury: department of defense; department of justice; post office department; department of the interior; department of agriculture; department of commerce; department of labour; department of health, education and welfare. Department heads (the cabinet) are responsible to the president. and the extent to which he meets with them and seeks their advice rests entirely on his discretion. In addition to these ten departments there are numerous hoards and offices. The federal executive organization under the president is not systematically organized by the constitution, and plans for its reorganization came under consideration early in the 20th century. During World Wars I and II the creation of new governmental agencies was necessary. and wide powers were conferred upon the president to redistribute the functions of governmental agencies. The need for reorganization in time of peace had become increasingly apparent n-ith the expansion of activities of the national government. Definite steps toward such reorganization were taken by an act of congress in 1933 which vested some power in the president for a two-year period and by an act approved April 3, 1930. which vested authority in the president to submit reorganization plans to congress before Jan. 21, 1931, the organization submitted by the president to take effect within 60 days after submission unless the two houses should disapprove by concurrent resolution. Substantial improvements were obtained under this act. Some readjustments were obtained under a similar act of 1935, which. however, did not give sufficient power to the president. A reorganization act of 1949 was based upon investigation by a commission headed by former President Hoover. Under this act the president might submit reorganization plans to take effect upon the expiration of the first period of 60 calendar days of continuous session of congress. unless rejected by a so-called constitutional majority of one of the tno houses of congress. All presidents since Franklin Roosevelt have been granted extensive reorganizational authority. (See also GOVERNMENT DEPARTMENTS : *United States.*)

The great mass of the lesser employees are selected under a merit system, for whose conduct a civil service commission was first created in 1883. (See CIVIL SERVICE: *The United States.*) The finances of the national government were to a large extent systematized through the creation of a bureau of the budget in 1921 and through an improved committee organization effected in the house of representatives in 1927 for the consideration of national appropriations and expenditures.

The president's influence in the national government rests upon (1) powers granted him by the constitution and by federal statute; (2) political factors not found in constitutions or statutes; (3) the personality of the president,

The president's position as head of a large executive organization, with wide powers of appointment and removal, in itseli makes the position important. The authority to veto legislation. subject to being overridden by two-thirds of the two houses, gives him a power that may be employed with effect. The authority to recommend measures to congress is only oi such value as may be given to it by the position and influence of the president making the recommendation. He is charged with the conduct of foreign relations, though here his authority is materially crippled by the requirement that two-thirds of the senators must concur in treaties. But the president's political position is equally as important as his constitutional power. He is in effect the chieftain of his party. He is also the outstanding figure in U.S. politics.

The possibilities of exercising power are great. The extent to which power is actually exercised depends upon the personality of the prcsident and his capacity for political leadership. The influence of the presidency varies with the man who occupies the office and with the circumstances that surround him. as in time of war.

As far as the vice-president is concerned. his chief official duty is to preside over the senate. though he does not play a direct part in the deliberations of that body. He does cast a deciding vote. however, in the case of a tie. In the absence of the president he presides over cabinet meetings. Under Presidents Truman and Eisenhower an increasing effort was made to elevate the position of the vice-president by granting him mcinbcrship on the National Security Council and in other ways.

The machinery for nominating party candidates ordinarily chooses a vice-presidential candidate almost purely on the basis of political expediency and with little consideration of the fact that the vice-president may succeed to the presidency. Yet within the first half of the 20th century three vice-preiidents — Theodore Roosevelt. Coolidge and Truman—succeeded to the presidency as a result of death. arid thereafter were elected to the office.

In the case of death or disqualification of both president and vice-president, the Presidential Succession act of 1947 provided that succession to the presidency be first to the speaker of the house of representatives; nest to the president pro tempore of the senate: and successively to members of the cabinet who are heads of departments.

The president receives for his services the sum of $100.000 per year with an added $50,000 per year for expenses. The salary of the vice-president is $30.000 per year.

Federal Judiciary.—The constitution of the United States provides for a supreme court and "such inferior courts as the Congress may from time to time ordain and establish." For the enforcement of federal law, congress has provided a complete judicial system paralleling that of the states. The judges of these courts are appointed by the president of the United States and hold their offices during good hchaviour. They are removable only by the cumbersome machinery of impeachment.

At the head of the judicial system is the supreme court of nine justices, which sits at Washington, D.C. There are 11 judicial circuits of the United States. each with at least 3 judges, one being the District of Columbia with 9 judges, the 11 together having 68 circuit judges. To each circuit is assigned a justice of the United States supreme court. one of the justices being assigned to two circuits and the chief justice being assigned to both the District of Columbia and an additional circuit. The pressure of business in the United States supreme court, hcwever, has made it impossible for the justices of the supreme court to go on circuit. The district court is the court of original jurisdiction. In erecting districts for the organization of this court. states lines are regarded. The smaller states constitute single districts; the larger are divided. For the districts in which federal judicial business is especially heavy, more than one district judge is provided. For example, four districts with 26 judges exist in New York. There are 93 districts with more than 200 judges, and the number of judges constantly increases. In addition to the general system of courts here outlined, there are a court of claims, court of customs and patent appeals, the tax court of the United States and federal courts for the District of Columbia and the territories.

With the two systems of courts — federal and state — exercising jurisdiction over the same territory, it is necessary that there be certain principles as to their relationship. Such principles may be chiefly summarized as follows:

1. On questions of federal constitutional lam, the United States supreme court is the final court of review. If the highest court of a state holds a federal statute or treaty to be invalid, or a state statute valid that is alleged to violate the federal constitution or federal statutes, the losing party has a right to appeal to the highest federal court. Where federal constitutional issues are otherwise involved in state courts, the United States supreme court may, in its discretion, review the state decision.

2. Substantially all cases involving enforcement of criminal law of the federal government are tried in federal courts.

3. With few exceptions, cases of admiralty and maritime jurisdiction and bankruptcy proceedings are tried in the federal courts.

4. Under federal statutes, the federal courts alone have jurisdiction of suits against the Cnited States, and of suits for the enforcement of federal revenue, immigration and other similar laws directly affecting the administration of the federal government.

5. In civil cases involving as much as $3.000, and (a) arising between citizens of different states or (b) arising under the constitution, lans or treaties of the United States, the parties have the choice of suing either in state or federal courts; but if the plaintiff sues in the state court, the defendant may transfer the case to the federal court.

6. By statute it is provided "that the laws of the several States, except where the constitution, treaties or statutes of the United States otherwise require or provide, shall be regarded as rules of decision in trials at common law, in the courts of the United States, in cases where they apply." By decisions of the United States supreme court, the federal courts must apply not only state statutes but also the law as found in the decisions of the state courts. Until the adoption of uniform rules of civil procedure for United States district courts in 1937, the procedure in such courts in cases at common law was required to conform, as near as may be, with the procedure "in like causes in the courts of record of the State within which such district courts are held."

Through legislation of 1925 an effort has been made to reduce the number of cases that must be decided by the United States supreme court. That court has a limited original jurisdiction, the most important cases of such jurisdiction being cases to which a state is a party. Cases not infrequently arise in which one state sues another state. Aside from its original jurisdiction. cases come to the Cnited States supreme court either from the highest state courts or from the lower federal courts. The decisions of the Cnited States supreme court are of primary importance in the fields of constitutional and public law. (See also SUPREME COURT OF THE UNITED STATES, THE.)

7. State Governments. — The state governments of the United States have certain common characteristics. Each state is legally the equal of every other state in the federal system. Each controls the organization of its own state and local governments. Each has a written constitution providing for three departments of government, with a legislature of two houses (with one exception) elected by popular vote and a popularly elected governor as head of its executive department. Each state has a judicial system not essentially dissimilar in external organization from that of the other states. Each state has created'local governing areas for the performance of certain functions.

Superficially, all the state governments appear to be more or less alike and appear to be doing the same things. The constant shifting of population has prevented the development of sharp differences in governmental organization. Not only this, but from one state to another there has been a great deal of copying of political and legal institutions. However, each state is distinguished from other states, not only in size and population, but also in location, climatic conditions and resources; and these differences reflect themselves in the political and governmental organization of the states.

State Constitutions. — The constitutions in force in the states vary a great deal in length and in content. Some were adopted in an earlier period, and some bear recent dates. The constitution of Connecticut, adopted in 1818, together with subsequent amendments, requires only about 16 printed pages; the Louisiana constitution of 1921 requires 90 pages. The constitutions of Oklahoma, California and a number of other states are highly detailed. Massachusetts boasts that it is governed by the constitution of 1780; but this constitution has been altered in form by so many amendments that it would hardly be recognized by its original framers. By amendment or by the adoption of new constitutions, the states have attempted to readjust their institutions to. meet changing needs. The national constitution has proved a model for much of the development in the field of state constitutional history, particularly with reference to the establishment of three co-ordinate departments of government.

In most of the states the state constitutions organize three departments of government in some detail. They contain elaborate declarations or bills of rights, and most of them contain provisions regarding the organization of local government. Limitations on the power of state legislatures have multiplied. Moreover, the framers of constitutions are inclined to include in these documents regulations of any matters of great public interest at the time. State constitutions have in this way come to contain many matters of temporary detail, and such detail requires frequent amendment.

The state constitutions provide for methods of change. The methods employed are three: (1) constitutional conventions; (2) legislative proposal of amendments; (3) proposal by popular initiative petition. All but 12 of the state constitutions expressly provide for constitutional conventions; in all of these 12 it is recognized as proper to employ conventions for constitutional change. Ordinarily conventions assemble as a result of popular vote and submit their recommendations for popular approval.

Proposals of constitutional amendment may be made by the legislatures in all states except New Hampshire where chdnges may be made only by constitutional convention. Methods of amendment through legislative proposal differ, but in all states except Delaware a legislative proposal of amendment must be submitted to and approved by popular vote before it becomes effective. Details of the amending process vary. In some states. as California. Louisiana and New York, the adoption of amendments through legislative proposal is easy; in others, as Illinois and Minnesota, the constitution is substantially impossible to amend.

The proposal of constitutional amendments through popular initiative petition, folloned by popular vote, is a fairly late development; but this plan was adopted by 14 states. Among these states there is varying ease or difficulty in employing the initiative plan of amendment. In Oregon and four other states it is as easy to amend the constitution through initiative petition and popular vote as it is to enact a statute through the same devices. Where the plan of popular initiative has been adopted, it has merely been added to the two already existing devices of constitutional conventions and proposals by legislative action.

State Legislatures. — In all of the states except Nebraska, legislative power is exercised by a body composed of two houses. Constitutional amendments for the organization of a legislative body composed of only one house were proposed in Oregon in 1912 and 1914, in Oklahoma in 1914 and in Arizona in 1916. All of these proposed amendments failed, but the plan of a unicameral legislature was adopted by Nebraska in 1934. After Vermont abandoned

TABLE XVII.—State Flowers, Birds, Trees, Mottoes and Nicknames

State	State flower	State bird	State tree	State motto	Nickname is)—or slogan
United States	Goldenrod □ Columbine □	Bald eagle □		"In God We Trust"	—
Alabama	Camellia	Yellowhammer	Longleaf (southern) pine	Andemus jura nostra defendere ("We Dare Defend Our Rights")	Cotton state, Yellowhammer state, Lizard state, Heart of Dixie (slogan) △
Alaska	Forget-me-not	Alaska willow ptarmigan	(none)	(none)	The Last Frontier, America's icebox
Arizona	Saguaro cactus blossom	Cactus wren	Paloverde	Ditat Deus ("God Enriches")	Grand Canyon state, Apache state
Arkansas	Apple blossom	Mockingbird	Short-leaf pine	Regnat populus ("The People Rule")	Land of Opportunity, Wonder state
California	Golden poppy	California valley quail	Sequoia semper-virens (redwood)	Eureka ("I Have Found It")	Golden state
Colorado	Rocky mountain columbine	Lark bunting	Colorado blue spruce	Nil sine numine ("Sothing Without the Deity")	Centennial state
Connecticut	Mountain laurel	Robin	White oak	Qui transtulit sustinet ("He Who Transplanted Still Sustains")	Nutmeg state, Constitution state, Land of steady habits
Delaware	Peach blossom	Blue Hen chicken	American holly	"Liberty and Independence"	The First state, Diamond state, Peach state
District of Columbia	American beauty rose	—	—	Justitia omnibus ("Justice to All")	Our nation's capital
Florida	Orange blossom	Mockingbird	Palmetto palm (cabbage palmetto)	"In God We Trust"	Sunshine state, Peninsula state
Georgia	Cherokee rose	Brown thrasher	Live oak	"Wisdom, Justice and Moderation"	Empire state of the south, Peach state, Cracker state
Hawaii	Red hibiscus	Nene □ (Hawaiian goose)	Kukui	Ua Mau Ke Ea O Ka Aina Ka Pono ("The Life of the Land Is Perpetuated in Righteousness")	Aloha state
Idaho	Syringa	Mountain bluebird	Western white pine	Esto perpetua ("May You Last Forever")	Gem state
Illinois	Sative Violet	Cardinal	Oak	"State Sovereignty, National Union"	Prairie state, Land of Lincoln (slogan), Sucker state
Indiana	Peony	Cardinal	Tulip tree	"The Crossroads of America"	Hoosier state
Iowa	Wild rose	Eastern goldfinch	(none)	"Our Liberties We Prize; and Our Rights We Will Maintain"	Hawkeye state, Corn state, Breadbasket state, The beautiful land
Kansas	Sative sunflower	Western meadow lark	Cottonwood	Ad astra per aspera ("To the Stars Through Difficulties")	Sunflower state ◇
Kentucky	Goldenrod	Cardinal	Tulip tree	"United We Stand, Divided We Fall"	Bluegrass state
Louisiana	Magnolia	Eastern brown pelican □	Magnolia	"Union, Justice and Confidence"	Pelican state, Creole state, Bayou state, Sugar state
Maine	White pine cone and tassel	Chickadee	White pine	Dirigo ("I Guide")	Pine tree state
Maryland	Black-eyed Susan	Baltimore oriole	White oak	Scuto bonae voluntatis tuae coronasti nos ("With the Shield of Thy Good Will, Thou Hast Covered Us")	Free state, Old Line state
hfassachusetts	Mayflower (Trailing arbutus)	Chickadee	American elm	Ense petit placidam sub libertate quietem ("By the Sword We Seek Peace, But Peace Only Under Liberty")	Bay state, Old Bay state, Puritan state, Baked Bean state, Old Colony state
Michigan	Apple blossom	Robin	White pine	Si quaeris peninsulam, amoenam circumspice ("If You Seek a Pleasant Peninsula, Look About You")	Wolverine state, Water Wonderland (slogan)
Minnesota	Pink and white lady's-slipper	Loon	Red pine	L'Etoile du Nord ("The Star of the North")	North Star state, Gopher state, Land of 10,000 Lakes (slogan), Land of Sky-blue Waters (slogan)
Mississippi	Magnolia	Mockingbird	Magnolia	Virtute et armis ("By Valor and Arms")	Magnolia state, Hospitality state

the unicameral system in 1836, the Nebraska legislature of 1937 was the first to be so organized. It is composed of a single chamber of 43 members elected on a nonpartisan basis. In all other states, the smaller of the two houses is called the senate. All but eight of the states call their larger house a house of representatives. but the eight have such varying titles as assembly, general assembly and house of delegates. Nearly half of the states use the term legislature to designate the two houses together; but 20 use the term general assembly and 3 use the term legislative assembly. Massachusetts uses the term general court, which was first employed in the colonial charter and New Hampshire uses the same term. In view of the fact that the legislative bodies have somewhat varying names in the several states, it has been customary to refer to the larger of the two houses as the lower house and to the smaller as the upper house.

To a large extent the exact number of members of the two houses, or of one of the two houses, is left to legislative determination. subject to constitutional restrictions. The size of the two houses varies a good deal from one state to another. The Minnesota senate is the largest, with 67 members, and that of Hawaii the

□ Unofficial.
◇ State animal: Kansas, American buffalo (bison); South Dakota, cqyote; West Virginia, black bear; Wisconsin, badger and white-tailed deer (wildlife).
⧍ State fish: Alabama, tarpon; Wisconsin, muskellunge; New Mexico, cutthroat trout.

smallest, with 15. The size of the lower house ranges from 24 in Alaska to 443 in New Hampshire. The membership of the lower houses is especially large in several of the New England states because of the system of town representation, but in these states the senate is relatively small.

In a majority of states, senators are elected for four years and representatives for two years. In some states, one-half of the members of the senate are elected every two years, so that the senate has continuous membership, as contrasted with the house, whose membership is chosen as a whole at each election. In Alabama, Louisiana, Maryland and Mississippi, however, four-year terms have been provided for members of both houses; and a number of states have a two-year term for members of both houses.

In some states financial measures must originate in the lower house, and in most of the states the senate has certain powers with respect to confirmation of executive appointments. The provisions for impeachment of public officers also ordinarily prescribe that charges shall be brought by the lower house and tried by the senate. On the whole, however, it may be said that from the standpoint of legislation the two houses of state legislature have equal powers and do not represent different points of view in the community. Distinct differences that existed in many states in earlier times have substantially ceased to exist, although in a number of states differences in territorial representation have grown up.

In the earlier state governments the substantially equal representation of local areas was not grossly unfair, because of the absence of great inequalities in their population. To a large extent, the idea of geographical representation survives in a number of states. The lower houses of Connecticut, New Hampshire and

Vermont, and both houses of Rhode Island, are based upon town representation, and with the growth of large urban communities this basis has become highly unequal. The same situation prevails elsewhere in the country. A study published in 1955 showed only two states—Massachusetts and Wisconsin—with equal representation in both houses of the legislature.

This representative system is the result of two conflicting forces. In most of the states some attention is paid to local governmental areas. It is common for constitutional provisions to forbid the crossing of county boundaries in the establishment of representative areas. On the other hand, the principle of equal representation upon the basis of population has steadily developed. The commoner plan is to provide for the periodical reapportionment of membership in the two houses upon the basis of population. Delaware, however, permits a reapportionment only by constitutional change; and other states, while providing for periodical reapportionment, limit the basis of representation in such a manner as to preserve an inequality. In California, New York and some other states representation in one house is based on population and in the other in large part upon the counties as units, in an effort to balance urban and rural interests and to prevent domination of the legislature by a single large community.

Members of the state legislature are chosen from local districts by popular vote. Proportional representation has been proposed, but has not been adopted for the choice of members of state legislatures, although in municipal elections it has come to some use. All states adopt the plan under which a candidate is elected who receives a plurality of the votes in his district; though Illinois from 1870 provided for three members of the lower house in each electoral district, each voter having the choice of voting for three or cumulating his votes for one or two candidates.

Under the first state constitutions provision was generally made for the annual election of members of legislative bodies and for annual legislative sessions. Frequent and regular sessions of the legislature were deemed essential safeguards of popular rights and were at that time thought sufficient safeguards. By mid-20th century, however, most state legislative bodies met in January of odd-numbered years. Constitutions ordinarily prescribe the number of days for which the session may continue, Biennial sessions are held in even years in Kentucky, Mississippi and Virginia. Annual sessions are held in 19 states. Massachusetts adopted the plan of biennial sessions in 1938 and returned to annual sessions in 1944. Alabama and Mississippi experimented for a time with quadrennial sessions.

As is the case with congress, the work of state legislatures is largely done through committees. There is little in the way of an effective legislative program or organized leadership in the two houses. A number of states have sought to devise a more definite legislative policy through the creation of legislative councils composed of representatives of the two houses, such councils to remain continuously in existence and to consider important matters of legislation with the aid of a permanent body of experts. An efficient and influential governor occasionally exercises a distinct leadership in important matters of constructive legislation, but over legislative enactments in general his influence is negative rather than affirmative.

The governor has a veto power over legislation in all of the states except North Carolina; and the veto can, in most of the states, be overcome only by a two-thirds vote, although only a three-fifths vote is required in some states and a bare majority in others. There has also been a definite increase of the governor's control over appropriations, through the vesting in him of a power to veto items in appropriation bills. Such a power exists in all but ten of the states. There has been a tendency in some states to extend the governor's veto power still further. The Washington and South Carolina constitutions confer upon the governor the power to veto any item or section of a bill presented to him, and a similar power exists in Alabama. In addition, several states have given the governor wide powers with respect to the state budget.

The veto power is not an idle weapon in the governor's hands. Its use and effectiveness depend upon several factors—the extent of the governor's constitutional power, the personality of the governor and the political agreement or disagreement at the time between the governor and the two houses. Of about 16,500 measures passed in 1923, for example, by the legislatures of 44 states, more than 1,100 were disapproved in their entirety, and more than 1.000 parts of bills were disapproved. Of the bills disapproved, 104 were repassed by legislatures; and of the parts vetoed, only 40 were repassed.

State Executives.—In the first state constitutions the executive department was subordinate to the legislature. In most states the governor and certain other state officers were chosen by the legislature; and an executive council, also chosen by the legislature, was substantially placed on guard to prevent executive usurpation. Such an attitude toward the governor was natural in 1776; but the governor's power almost immediately began to grow. New York in 1777 made its governor popularly elective, though at the same time it created two councils—the council of revision and the council of appointments—to share with the governor the powers of veto and of appointment to office. Massachusetts (1780) and New Hampshire (1784) followed with the plan of popular election. Executive councils remain in Massachusetts, Maine and New Hampshire.

In all states the governor became a popularly elected officer and hence independent of legislative dominance. Other state officers also became popularly elective, though some are still chosen by state legislatures. Until late in the 19th century the functions of state government were few and were chiefly conducted by a small group of popularly elected officers. As new needs developed, the constitutions themselves provided for new offices, which have usually been filled by popular election. Illinois has six such officers in addition to the governor; Idaho and Nebraska, seven each. Chief among the state executive offices, independent of the governor in most states, are: lieutenant governor; secretary of state; superintendent of public instruction; attorney general; treasurer; and auditor or comptroller.

By creating a group of state officers, all popularly elected in the same manner, state constitutions in fact create a plural executive, although the theory of state government presupposes a single head of the executive department. But only to a slight extent are constitutional powers directly conferred upon the lieutenant governor, secretary of state and other popularly elected state officers. The governor has thus had the opportunity to become the chief state executive in fact as well as in constitutional theory. The increase in the governor's executive power has come about primarily through the creation of new offices by statute and the vesting in the governor of power to appoint to such offices. In this manner, as new state functions were assumed, numerous offices were created, without reference to any efficient supervision by the governor. Some states had as many as 200 independent officers, most if not all of whom were appointed by the governor, but over whom it was physically impossible for the governor to exercise an effective supervision. A later movement sought to organize executive functions into a small group of departments, each under a director appointed by and responsible to the governor. One of the chief difficulties in building up an effective state executive system is that the governors of almost a third of the states are elected for terms of only two years. In the other states the term is four years. There has, however, been an increase in state executive powers and leadership, but any possibility of leadership is greatly handicapped by the fact that the majorities of one or both of the houses of the state legislature may often be politically opposed to the governor. This lack of political harmony is commoner in the states than in the national government.

State Courts.—Generally the states have courts of three types:

1. Justices of the peace, having a limited and inferior jurisdiction in both civil and criminal cases. Justices of the peace are ordinarily elected from towns or to nships or from districts created for the purpose within the county. The jurisdiction of justices of the peace is strictly limited by statute, and their courts are not courts of record. Appeals are allowed from their action to a court of general trial jurisdiction, and ordinarily the trial in the higher court is a trial de novo. The system of justices of the

THE GREAT SEALS
OF THE UNITED STATES OF AMERICA

THE GREAT SEALS OF THE UNITED STATES AND OF THE INDIVIDUAL STATES

The design for the Great Seal of the United States of America was adopted June 20, 1782 peace paid on a fee basis has not proved satisfactory and has been replaced in the larger communities. Virginia and Missouri have taken steps which may lead altogether to the abandonment of the system. To some extent a major defect in the system has been met by placing the justice of the peace on a salaried basis:

2. In all states there are courts of general trial jurisdiction, known as superior courts, district courts, circuit courts and in some states by a still different name. The court of general trial jurisdiction ordinarily has a general authority to try all cases in law and equity. Five states still retain the old English plan of separate courts for the trial of cases at law and in equity, but most of the states have abolished this distinction. In some states, as in Arizona, California and Ohio, the court of general trial jurisdiction is organized upon a county basis, and there is a separate court for each county. The commoner plan, however, is to have the court of general trial jurisdiction go on circuit from one county to another, at least in the smaller counties of the state.

3. Each state has a court of review, the function of which is chiefly that of hearing appeals from the courts of general trial jurisdiction. This court is ordinarily termed the supreme court; in Kentucky, Maryland and New York it is called the court of appeals and slightly different names are used in several other states. The highest court is usually given some original jurisdiction, but ordinarily this original jurisdiction is small and its use is strictly limited by the court itself in order that time may be available to hear appeals from other courts.

Once these three features are outlined, state judicial organization becomes to a large extent a mass of diversities. In many larger communities a municipal court has been organized which not only replaces justices of the peace but is granted a much more extended jurisdiction. In a number of states there is also a so-called county court, with some jurisdiction, both civil and criminal, and usually also a fairly large authority with respect to rather distinctly administrative matters, such as those relating to county affairs, elections and charities. Where county courts exist independently of the court of general trial jurisdiction, they are often vested with authority in probate matters as well.

There are also other types of trial courts with special jurisdiction. Every large community has a juvenile court, and separate probate courts are not uncommon. Other specialized courts, such as domestic relations courts, morals courts, boys' courts, speeders' courts and small claims courts have been established in many larger communities, often as branches of a municipal court. In some cases there are separately organized criminal courts, although ordinarily criminal jurisdiction is exercised by the courts of general trial jurisdiction. In all of the states the prosecution of criminal offenses is by and in the name of the state and is conducted by prosecuting attorneys, who are usually elected by the voters of the county.

The state judicial organization has placed great emphasis upon appeals from lower to higher courts. No case of any importance is regarded as settled until it has been taken to the highest court. Increased complexity of appellate court organization has been forced by the growing number of appeals to be heard. The increased mass of appellate work has been handled in three ways: (1) by increasing the number of judges of state supreme courts; (2) by authorizing such courts to sit in sections; and (3) by creating intermediate appellate courts, standing midway between the trial courts of general jurisdiction and the highest court.

There are three methods of selecting judges in the United States: (1) In 39 states, with the exceptions hereafter noted in California, Missouri and Alaska, judges of the highest court are elected by the people; in all of these states except one the trial judges are chosen in the same manner; (2) in four states the judges are elected by the legislature, and in one they are appointed by the legislature upon the nomination of the governor; (3) in 6 states the highest judges are appointed by the governor, subject to confirmation by the governor's council in Maine, Massachusetts and New Hampshire, and to confirmation by the senate in Delaware, New Jersey and Hawaii. Certain inferior judges in other states are also appointed by the governor.

A plan adopted by California in 1934 removes that state from any one of the classes indicated above. The California plan, which applies to justices of the supreme court and of the district courts of appeal, provides that upon the expiration of the term of office of any such judge, such judge may file a declaration of candidacy to succeed himself. If he does not do so, the governor nominates a suitable person, subject to confirmation by a commission composed of the chief justice of the supreme court, the attorney general of the state and a justice of one of the district courts of appeal. The name of the candidate to succeed himself, or of the candidate nominated by the governor and confirmed by the commission, is then placed upon the ballot at the next general election and the electors vote upon the question as to whether he shall be elected. If a majority vote "yes" he is elected to or continues in office. Under this plan a candidate has no opposing candidate, but an election determines whether he shall become or remain a judge. By popular vote in any county the same plan may be adopted for the superior court judges of that county.

In 1940 Missouri adopted a plan similar to that of California with respect to judges of the supreme court, the courts of appeal and the circuit and probate courts in the city of St. Louis and Jackson county. The Alaska constitution provides for the appointment of supreme and superior court judges by the governor from nominations made by a judicial council. The judges are approved or rejected, on a nonpartisan ballot, by the voters at the first general election three years after an appointment.

A major problem in judicial administration is the existence of crowded dockets. In some areas this has assumed near astronomical proportions. In New York alone, more than 1,000,000 civil and criminal disputes are brought before the state's judicial system each year. This congestion has brought great pressure for more efficiency in the procedures of state courts.

8. **Local Government in the States.**—What is ordinarily referred to as the "state government" is the central organization located at the state capital. But this central organization does only a comparatively small part of the work of the state. Unlike the national government, which establishes its central organization for substantially all national activities, the state conducts a large part of its governmental business through locally elected officers. There is no one system of local government for the states or even for any one of them. The geography of local government in each state is a patchwork, with the same territory often occupied by from 10 to 12 separate governing bodies, each with slightly varying boundaries and with independent powers. In the 50 states, there are more than an estimated 95,000 local governing units, of which more than 3,000 are counties (parishes in Louisiana); approximately 17,000 are towns or townships; a like number are cities or villages; and more than an estimated 45,000 are school districts. In addition, there are more than 14,000 special units.

Certain types of organization may be termed the usual forms of local government. There are (1) the county, which is found in all of the states, though the name parish is employed for a similar unit of local government in Louisiana; (2) towns or townships which, in most of the states where they exist, are merely subdivisions or units of the county, although the New England town was the original area for local government and is more important than the county; (3) the city. In addition to the city, which is theoretically the chief unit of local government for urban areas, most state laws provide for the incorporation of small communities as villages, with a simpler form of government than that provided or permitted for cities. Besides these usual types of local government, other forms are common to all the states. Park and sanitary districts in more settled areas, drainage and irrigation districts in rural communities, road districts, school districts and numerous others will be found, often occupying the whole or a part of the same territory as that covered by the county, town or city.

The County.—Aside from several New England states in which the county is merely a convenient area for direct state administration, county government has certain common characteristics. There is a locally elected county board, of varying size and composition, and there are a number of locally elected county officers who perform their duties largely without subordination to the county board, except as they may often depend upon the county board for appropriations. County boards are usually grouped into two classes: (1) small boards of commissioners elected at large by the county; (2) large boards elected by townships and cities within the county. In a number of states, however, counties are divided into districts for the election of a small county board. In each county will be found a clerk (or clerks) of court and a sheriff. Each county provides a courthouse and a jail. Ordinarily there are locally elected county judges and treasurers and a prosecuting officer elected by the voters of the county. In many states the county is a unit of school administration, and there is a county superintendent of schools, usually elected. In the second half of the 20th century a movement was actively underway toward a more centralized executive organization in the county.

Town and Township.—New England towns have areas of from 20 to 30 sq mi., and usually include both rural territory and more compact village settlements. About three-fourths of them have fewer than 2,500 inhabitants each, and hence may properly be classed as rural communities. The large communities usually become incorporated as cities, and generally the creation of city government terminates the existence of town government within the city limits. The town meeting is the chief organ of government. (See also MASSACHUSETTS: Government.)

So-called town or township systems of government are found in the great central group of states extending from New York to Nebraska. The forms of township government in these states may be classified as follows: (1) those which, as in New York, have the town meeting and township representation on the county board; (2) those, as in Minnesota, which have the town meeting but no township representation on the county board; and (3) those, as in Pennsylvania, which have merely a local township organization, but no representation on the county board and no town meeting.

Efforts have been made to introduce the township system in the states of the south and the west, but there the counties are ordinarily divided into subordinate districts, largely for administrative purposes, and such districts though sometimes called townships, usually have little if anything of independent authority in the field of local government.

City Government.—The growth of urban population has naturally led to the development of cities as the chief agencies for meeting local needs occasioned by more compact population. The forms of city government in the United States are primarily three: (1) the mayor-council system; (2) the commission plan; and (3) council-manager government.

The mayor-council plan is the most general. It is to a large extent organized upon the analogy of the national government. There is a popularly elected mayor with powers which have steadily tended to develop. The mayor normally has a veto power and a fairly large power of appointment, although several of the more important officers, such as clerk and treasurer, are usually elected. Under the mayor there is ordinarily a group of departments whose heads are appointed either by the mayor alone or by the mayor with the approval of the council. Usually there is a council composed of a single house whose members are elected from wards into which the city is divided, although occasionally some or all of the members are elected from the city at large.

The fundamental characteristic of the commission plan of city government is an elective commission, usually of three or five members, having large municipal powers, both legislative and executive. Each of the commissioners is the head of a department: and there are as many main city departments as there are commissioners. This system has usually been accompanied by the initiative and the referendum on municipal ordinances and a power to recall the members of the commission by petition and popular vote.

Though discussion of the council-manager type of city government had begun earlier, it first received serious consideration upon its adoption by the city of Dayton, O., in 1913. Over 1,400 cities in the U.S. were governed under the manager plan in the early 1960s. Under it there is a commission or council, whose members are usually elected from the city at large, often by the use of proportional representation. This body determines the policy of city government and selects a manager to administer the affairs of the city. Through the commission plan, which originated in 1901 and for perhaps 15 years had great sway in U.S. city development, and through the manager plan, which tended to replace the commission plan, much was done toward the reconstruction of U.S. city government. Later, however, the strong mayor plan came back into favour as a device for municipal reform. particularly in the larger cities. (See also CITY MANAGER.)

Special Units.—A primary problem of local government in the United States is the existence of a large number of units which are neither economically nor politically self-sustaining. In the case of school districts, recognition of this inadequacy inspired a consolidation movement that eliminated many of the units no longer capable of supporting an effective educational system. Elsewhere proposals have been made to abolish units of township and county government that can no longer perform significant governmental tasks. However, except in the case of the school district (from 1942 to 1959 the total number of school districts declined from 108,579 to an estimated 45,394) it has proved very difficult to bring about any substantial reduction in the number of governmental units. During the period after World War II the number of municipalities and special districts actually increased. The growth of special districts is particularly pronounced. It reflects a variety of pressures, especially the need for new forms of government in metropolitan areas.

The Metropolitan Area.—Especially after World War II, metropolitan areas came to present a problem of particular concern. The presence of a multiplicity of governmental units operating within one metropolitan region makes it difficult to develop coherent local policy on matters such as zoning, transportation and crime control. Moreover. the emigration of the population from city to suburb deprives urban areas of an important source of tax revenue while demands for municipal services are accelerating. Suburban counties organized to meet the needs of sparsely populated rural areas suddenly find themselves faced with the necessity of serving and controlling a vast suburban population. These problems of change and adjustment gave rise to demands for radical alteration in traditional political boundaries and forms of government in metropolitan U.S.

9. Elections and Political Parties.—Conduct of Elections.—Constitutional responsibility for the conduct of elections rests with the state governments (except in the case of Washington, D.C.). State laws set up election machinery and determine the qualifications for voting, subject to the federal restrictions against discrimination because of race, colour, previous condition of servitude or sex.

Through a succession of changes the states have established virtually universal suffrage for males and females above the age of 21 years. Georgia and Kentucky reduced the voting age to 18. Suffrage for women became national in 1920 through the adoption of the 19th amendment to the federal constitution. Educational qualifications for voting have been imposed in some states, for example, New York; and qualifications as to education or tax paying imposed in a number of southern states tend to discourage voting by Negroes. In order to identify those qualified to vote, state laws require registration of voters everywhere except in Arkansas and Texas. Nonvoting, even by those legally entitled to the suffrage, is common.

At the national level only members of the two houses of congress and presidential electors are chosen by popular vote. A much more numerous group of state officers and an even larger number of county. city and other local officers are elected. When all of these types of offices are united on one ballot or in one election, the voter is at times faced with the problem of choosing 100 or more officials from among several times that number of candidates. Moreover the voter may be asked to vote on issues as well as men, through the initiative, the referendum, the constitutional amending process and the fact that, under many state laws, proposals of municipal bond issues and other local questions must be submitted for popular approval. The short-ballot movement made some headway in cutting down the number of elective offices, but the U.S. voter continued to be faced with the extraordinarily difficult problem of informing himself on a large number of candidates for primary as well as general elections. (See also ELECTORAL SYSTEMS.)

Political Parties.—At the national level, U.S. political history has been characterized by a two-party system. Occasionally a third party has risen to importance as was the case with the Progressive party under the leadership of Theodore Roosevelt in 1912. In the early years of the nation, the Federalist party represented the interests of a stronger nationalism; the Republican party under Thomas Jefferson, the interests of the states. By the period of Andrew Jackson the Jeffersonian Republicans had become dominant and had changed the name of their party to Democratic. By this time also, the Federalists had disappeared, and the Whigs became the other great party. The Whigs were eventually replaced by the Republicans, who elected Abraham Lincoln to the presidency in 1860. From that time, the Republican and Democratic parties were the only groups with the political capacity to win a national election. (See History: The Struggle for National Government, 1783–1865, above.)

Political parties originated as voluntary organizations. But they soon came to exert considerable influence over election to local, state and national offices; no one except a candidate of one of the two leading parties had much possibility of being elected. The methods of the political party thus became of importance to the government itself. Eventually political parties became an indispensable part of the governmental process, and they are controlled in great detail by state legislation.

Government Regulation of Parties.—One of the first respects in which political parties came under official control was the printing of the ballot. Before 1888 parties printed their own ballots and naturally determined also the conditions under which the names of their candidates should appear upon such ballots. Serious abuses arose under this arrangement, particularly with respect to the secrecy of the ballot. Beginning in 1888 the states adopted the official or so-called Australian ballot. Under the official ballot system, ballots are printed at governmental expense. This expense is usually borne not directly by state government but by the local bodies charged by the state with the conduct of elections. In providing for the printing of ballots or the provision and maintenance of voting machines (*q.v.*), state laws at the same time necessarily determine the conditions under which party organizations shall be entitled to have the names of their candidates appear.

Under the Australian ballot system, the parties take a great deal of interest in the manner in which candidates are listed. Massachusetts and 16 other states adopted a plan whereby the names of the candidates are grouped under the titles of the offices; the party to which each candidate belongs follows his name. This arrangement makes it necessary for the voter to mark separately on his ballot the name of each candidate for whom he desires to vote. Twenty-seven states, however, adopted the so-called party-column ballot. The party-column ballot varies in different states, but its fundamental purpose is to facilitate straight-ticket voting. Usually all the candidates for one party appear in a single column so that a voter may vote for all of them by placing one mark on the ballot or moving one counter on the machine. If the voter does not wish to vote the party ticket, he is put to the burden of marking (or moving a counter for) each of the candidates for whom he wishes to vote, or at least each candidate not belonging to his own party.

The methods of party nomination next came under state control. Serious abuses in the party convention system for the nomination of candidates and the framing of party platforms led to legislation regulating the convention, but such regulation did not appear sufficient. The primary election system (see PRIMARIES) was established in some form in all the states, although a strong political movement against primary elections resulted in some gain for the older convention system. Where the primary system was adopted, conventions normally remained with more limited functions such as the adoption of a party platform.

Control by law over the official ballot and over the methods of party nomination was naturally followed by a detailed regulation of the machinery of party organization. Through primary elections, the party voters in most of the states choose their party committeemen. State laws determine the power of such party committeemen and also determine the manner in which they shall form the various party governing bodies. State laws also determine how party organizations shall frame platforms. Governmental regulation of political parties was largely occasioned by a feeling that party organizations themselves control the government and that they should, therefore, be subject to legal control. As the costs of political campaigning rose, the necessity of regulating the financial affairs of parties drew increasing attention.

The Party in Operation.—When it is first created, a party may stand for political principles which set it apart from other parties. Ordinarily, however, parties serve as convenient devices for the operation of government and for presenting political issues to the voters when such issues arise. Political issues are not created merely by the existence of two opposing parties; and during much of the time no real issues exist on the basis of which parties may oppose each other. At such times parties proclaim principles but have no sharp differences. When issues are altogether absent, parties still perform the functions of narrowing the choice of the voter and of uniting candidates into groups for final elections.

The belief that national parties should not control the election of local and judicial officers led to a movement for nonpartisan elections. In a number of states judicial officers are nominated and elected through ballots bearing no party designations. But a candidate must actually be sponsored by a political organization if he is to fare well in any election. The nonpartisan movement accomplished more in municipal than in state elections.

The climactic function of the party in U.S. politics is the nomination and, if possible, the election of a president. It is, in fact, the existence of the presidential office which primarily serves to hold the parties together as national coalitions. Otherwise, state and local party organizations might have little reason for coming together in a nationwide alliance. Here it is important to note that effective power resides in the state and local rather than the national party headquarters. Decentralization is characteristic of U.S. political parties as it is of its constitutional system. Some strengthening of the staffs at national party headquarters failed to bring about any substantial drift of power away from state organizations.

The quadrennial conventions at which presidential candidates are nominated are the chief instrument through which the national parties function. Voting power at both the Republican and Democratic conventions is parceled out among the states in terms of (1) population; and (2) the extent to which the state has supported either party at a previous election. Each of the states selects its own delegations to the national conventions. In about two-thirds of the states the selection is made by party conventions or committees. In the other third selection is made by the voters through the primaries. (See NATIONAL CONVENTION [U.S.].)

The tactics used in winning elections underwent considerable change in the post-World War II years. At one time an effective party organization was a primary prerequisite for a successful campaign. The activity of party workers served to "sell" a candidate to the voters, and the organization enjoyed correspondingly great influence, particularly in state and local politics.

With the arrival of new mediums of communication, particularly radio and television, however, a candidate was able to reach the voter directly. The party organization, therefore, lost some importance as a channel of communication between candidate and voter, though, needless to say, organizational support remained a valuable political asset. A related development which party organizations sometimes viewed with misgiving was the emergence of the volunteer, nonparty organization for the purpose of supporting candidates, especially in presidential elections. While these volunteer groups drew many individuals into political activity who would not work through the machinery of regular political parties, they were to some extent competitors with party organizations for patronage and the other rewards of power.

(W. F. D.; C. A. BA.; F. E. RO.)

C. TAXATION

Under the national constitution, congress is authorized to levy taxes only "to pay the debts and provide for the common defense and general welfare of the United States." Generous interpretation of these clauses by the U.S. supreme court has given broad latitude to the national taxing power. Some restrictions remain, however. For example, the constitution prohibits congress from taxing exports and the national legislature is required to apportion direct taxes among the states in accordance with population. In 1895 the supreme court held that the income tax was a direct tax, and it required a constitutional amendment (the 16th) to enable congress "to lay and collect taxes on incomes. from whatever sources derived," without regard to apportionment among the states.

The taxing power is frequently used for regulatory as well as revenue purposes. Tariffs, for example, are commonly imposed more for the purpose of discouraging imports than to raise money. Congress has even used the taxing power to outlaw certain forms of economic activity; *e.g.,* the sale of white phosphorous matches and the issuance of bank notes by the states. As a rule the courts have upheld such taxation when the activity it affects lies within the scope of congressional authority. The taxing power was increasingly used, particularly after 1932, to achieve broad social purposes, including economic stabilization. *(See* TAXATION.)

For most of its history, the national government relied on customs duties for a great part of its revenue. By the middle of the 20th century, however. it had come to depend mainly on income taxation, corporate and personal. Out of $68,158,000,000 revenue for the fiscal year 1959, for example, approximately $37,000,000,000 was obtained from personal and $17,000,000,000 from corporate income taxation. These taxes thus accounted for more than 80% of all tax income of the national government. (See *Trade and Finance,* below.)

Both state and local governments have been increasingly hard pressed to find sources of revenue adequate to their needs. State governments, in particular, have ranged widely in their quest for financial support. During 1958 total state tax revenue amounted to nearly $15,000,000,000, drawn principally from sales, income and motor fuel taxes, as well as licensing fees. In addition, the states received about $7,000,000,000 in other income, principally grants-in-aid from the national government.

Units of local government rely heavily upon the general property tax to finance their activities. During 1957, for example, $12,618,000,000 out of a total of $14,511,000,000 in local tax income came from property taxes. Some cities have turned to an income or earnings tax to help meet their fiscal needs. A principal advantage of this form of taxation is that it enables a city to tax wage earners within its boundaries who live in the suburbs and are not, therefore, directly subject to a municipal property tax. *(See* TAXATION, LOCAL: *State and Local Taxation in the United States; see* also *National Finance,* below.)

D. LIVING CONDITIONS

Any discussion of living conditions must be comparative, in both the chronological and spatial sense. All nations have ideal standards of living by which they measure progress, but these vary from nation to nation. Most Americans and many visitors to the United States have agreed with Émile Levasseur, a 19th-century observer, who said in *The American Workman,* The Johns Hopkins Press (1900):

> Real wages being higher in the United States, the American workman lives more comfortably than the European . . . He has acquired settled habits of consumption and enjoyment, his food is more substantial . . . he dresses better; he is more comfortably lodged . . . he insures his life, and is provident in his own way; he spends more for amusement and upon the societies with which he is affiliated: in other words, he has *a higher standard of life* than the European workman.

The way people live depends on many things: the land: for instance—what kind of food it provides and what other resources of fibres and minerals it yields. The United States is a continental empire with nearly every type of geographic environment. Although most of it lies in the temperate zone, portions of it are subtropical and its largest state lies mainly within the Arctic circle. It has mountains, deserts, grasslands and fertile river valleys. The United States is now highly urbanized and industrialized. It is also a very heterogeneous nation—and people of diverse racial and national backgrounds have many different tastes and preferences which persist despite the homogenizing influences of the economic, social and political milieu.

The people of the United States, favoured with the opportunities offered by the expanding area of the country throughout most of its history and with tremendous resources, have been able to enjoy a high level of living with respect to the basic necessities. Only in some areas and at certain times have there been conditions of severe want and deprivation. In modern times relatively smaller proportions of income have been spent on food, clothing and shelter and there have been progressively greater outlays on the secondary necessities, such as lighting. refrigeration, transportation and education, and on luxuries. Criticism of living conditions in the United States has therefore taken the form of deploring inefficient utilization of the resources of the land and the energies of the people, rather than dissatisfaction with U.S. standards as compared with those of other countries.

Family and Personal Income.—Before the American Civil War, differences in the level of living among Americans were real enough, but they were concealed to some extent by the peculiar economic conditions of the south and by the relative unimportance of monetary income on the frontier. Although the judgment of Levasseur quoted above was reasonably correct, it was being disputed, by 1500. by many social philosophers and economists who were concerned about the poverty, slums, disease and ignorance that existed in the midst of prosperity.

In the 1930s it was frequently stated that one-third of the American people lived at or below subsistence level. By the 1960s even the gloomiest observers assumed that this figure had been reduced. However, the census bureau in 1959 reported that the median family income in the U.S. was $5,400. Of the nation's 45,000 000 families, 12% received incomes of $10,000 or more, 43% incomes ranging from $5,000 to $10,000 and 23% less than $5,000. If, as mas sometimes said, at least $6,500 and preferably $10.000 was needed to maintain a family of four at a "good" level of living, many U.S. families were on the edge of or below that level. Both money income and real income showed cyclical variations after World War II, although the spread between them was growing. Various governmental measures, beginning with the New Deal, seemed to have checked the more violent swings of the business cycle, but periods of economic distress known as recessions caused hardship in certain areas and among the lower income classes.

In the south, as a whole, incomes were substantially below the national average; in 1953, for example, only 31% of southern families had real inccmes over $5,000. The north central region was periodically depressed. The government also recognized the existence of hundreds of smaller depressed areas. Causes of distress included work stoppages in the steel and automobile industries, the persistent falling off in the demand for coal, cotton, lead, wool and hides, and technological unemployment. Distress in the farming areas, most acutely felt in the 1920s and '30s and again in the '50s, had many causes, including the high cost of goods and equipment the farmer must buy, the high cost of credit and uncertain prices for farm products. During the 1950s farm income sank $3,500,000,000 and 700,000 farm units were liquidated.

Certain classes of families have very small incomes. Families with a female head, frequently a widow, average only half the income of husband-wife families. Minority groups—Negroes, Mexicans, Puerto Ricans—and marginally employable whites are often in a low income bracket. Of the 12,000,000 American families in which the head of the family is 55 or older, nearly 6,500,000 have total incomes under $4,000 and 3,800,000 have incomes under $2,000. For these people, the basic needs of income, medical care and housing pose acute problems. Many are dependent on public assistance for support.

Employment. — The worst unemployment of modem U.S. history occurred during the depression of the 1930s, but there have been other periods of unemployment, usually correlating with business recessions. In the early 1960s, many economists no longer regarded full employment as a reasonable goal, but they felt that 3% unemployment was optimum and regarded 5%–6% as unsatisfactory though not necessarily calamitous. Naturally, the ability of the nation to sustain such a burden could be comprehended only in terms of savings, insurance and public or private expenditures for relief.

Of the civilian labour force, there were in the early 1960s about ten times as many workers in the nonagricultural industries as in farming, and the number of the latter was constantly declining. Stated another way, the population was continuing its long-term shift from rural to urban. Furthermore, the rural ideals of family living were more and more reflecting urban pressures. Within the urban population, the percentage of employed persons in industrial work seemed to be declining while the percentage of white-collar workers was rising. The latter tend to have higher "standards" and greater demands are made upon them by the sociopolitical-economic situation in which they live. Partly because of this and partly because of the practice of encouraging overtime and the addition of large numbers of young people and women to the labour force, there was some evidence that the bargaining power of union workers was declining from its 1948 peak.

Consumption. — The percentage distribution of total expenditures of urban consumer units, as estimated in the mid-1950s, was as follows:

Food	31.3	Household operation*	14.7
Housing	11.6	Clothing	10.2
Transportation	13.0	Medical care	5.5
Personal care	2.4	Recreation, education	6.0
Other goods and services	4.9		

*Includes also: fuel, light and refrigeration 4.4%; furnishings and equipment 5.9%.

Such data do not disclose differences in expenditures by income class or size of family or the differences in object of expenditures. However, there are two safe conclusions that may be drawn: most families allocate about one-third of their expenditures to food; and with food, as with clothing, housing and other satisfactions, increased purchasing power has meant more money spent for what might be called luxuries rather than bare necessities.

Housing. — In all countries, there is a close relation between income and housing. If the photographs in U.S. magazines and newspapers fairly represent the sort of housing Americans want, they prefer comfortable, detached single-family villa houses or tall, well-constructed apartment houses. As with most standards, this is only partially realized.

In 1950–60 the decennial percentage increase in number of housing units was 27%, or about 58,500,000. The smallest increases during this period were in Arkansas (2.2%), Mississippi (3.4%) and West Virginia (5.8%) — states where general living conditions were poor. From 1950 to 1956 there was a slight increase in "owner-occupancy"; the median value of owned homes went up from $7,900 to $10,700 and rentals rose from $38 to $50. About 65% of new properties and well over half of previously occupied properties were mortgaged. On the whole, U.S. dwelling units have more total rooms and more bedrooms than comparable European dwelling units.

Health.--On a comparative basis, sociologists found that the American people were healthier than most of the peoples of the world. In 1960 Americans paid more than $20,000,000,000 in medical expenses, six times as much as in 1940. A somewhat larger amount, $25,000,000,000, was expended for health services and health facilities, a fourth of which was assumed by national, state and local governments.

However, the picture was not entirely satisfactory. Congressional investigations indicated that the cost of many drugs was high, and other studies concluded that the whole apparatus of medical care was inadequate and costly. During the 1950s many persons went into debt or went without essential care when serious illness struck — older citizens especially were disadvantaged by lack of funds to pay medical expenses. With a growing and aging population, the number of hospital beds per 1,000 population was declining and provisions for persons suffering from mental illness were far from adequate. Attempts to meet these problems included private health insurance and suggestions that federal funds be provided for health insurance, medical schools, research and hospitals.

Food. — The problem of providing food for the U.S. family has many ramifications, involving eating habits, dietary values, systems of production and processing, imports and exports; subsidies, technical assistance and controls; and marketing and advertising. As an element in the living standards of a people, food takes first place. Studies of the amounts of standard foods that can be bought with an hour's take-home pay show that food in the United States costs less in proportion to income than in most other parts of the world. Nevertheless, about one-fifth of the American people do not have the means to provide themselves with adequate food.

Education. — In civilized communities the intellectual level of the citizens is an important element in their standard of living. There is a direct relation between amount of education and income. In the early 1960s education had become the next to the largest single category of U.S. public expenditure, second only to national defense. This burden rested primarily on states and local school districts. In addition, vast sums were expended by parents, private persons and foundations for parochial and higher education. How much was spent for other purposes that might be termed educational could not be calculated, although a rough estimate might be made from data on sales of courses, books, periodicals, admissions to lectures and the like. Outside the U.S. only the small highly developed countries of western Europe spent more on education or attached as much value to it. In spite of this, the post-World War II population expansion resulted in a shortage of an estimated 150,000 classrooms, and teachers continued to be underpaid in relation to many other professions.

E. Welfare Services

Welfare in the sense of economic security for the masses did not become a major government function in the United States until well into the 20th century. Before the American Revolution responsibility for aiding the economically helpless fell to the parishes and to voluntary church or individual efforts; orphaned and dependent children were apprenticed to masters who trained them in return for their services, and charity was more or less available as need occurred. Until the late 19th century all provisions were local and most were private rather than public. Orphanages, almshouses and now and then specially endowed schools variously met the needs of poverty in preindustrial communities, according to provisions made by churches, individuals, special voluntary organizations and local units of government.

The waves of unemployment and hardship that first troubled the country during the economic depressions of the mid-19th century, especially that of 1837, required new welfare services. Emergency provisions in the form of soup kitchens and the like were thrown together in the cities. Something like system entered industrial-age welfare work only in the 1880s, when charity organization societies began to investigate and participate in relief efforts.

At the time when the leading industrial nations of Europe, the United Kingdom and the German empire, were launching programs of public responsibility for basic welfare, an awakening to the problem of industrial-age types of poverty in the United States was stimulated from several directions. Depression conditions during most of the 1870s, the middle 1880s and the middle 1890s called attention to desperate living conditions, in the eastern cities especially. Henry George and socialist agitation multiplied the awareness, and important writings by professors of economics and sociology confirmed the needs. The Salvation Army, the social work of Protestant and Roman Catholic churches and the voluntary work of secular organizations all promoted concern with welfare. Action mas spotty and hardly sufficient anywhere. but by the 20th century social work had become a profession and many facets of the welfare problem were being explored and somewhat improved.

The elimination or restriction of labour by women and children and the improvement of industrial slums were the phases of welfare which first led to political action. Many states enacted child-labour laws during the 1870s, and 1880s, and this kind of reform was gradually extended and made effective during the 20th century. Federal-government interest in the field appeared in White House conferences on child welfare in 1909 and 1919 and in the distinguished work of the children's bureau under Grace Abbott and her successors. Although child-labour lans passed by congress in 1916 and 1919 were held unconstitutional by the supreme court and the child-labour amendment submitted in 1924 was never ratified, New Deal legislation in 1938 brought a degree of federal control into the child-labour field.

On the side of housing. the leading efforts of state reform were made by New York. It passed the first tenement house law in 1867 and a more effective one in 1901. In 1938 special taxation mas authorized to support new housing for low-income groups in New York city. Meanwhile the federal government entered the field, establishing the United States Housing authority in 1937 and, subsequently, the Federal Housing administration and the Federal Public Housing authority. By the middle of the 20th century, the national government was engaged in large-scale expenditures for slum clearance and urban renewal and rehabilitation activities.

The two central problems of social security, protecting the worker against catastrophic loss of income during unemployment beyond his control and providing old-age pensions for large numbers of people within the industrial economy, proved during the 1930s to be federal problems after all. Many reasons explain why the United States government had not acted earlier on such a pattern of social insurance as had been established in most countries of Europe and the British Commonwealth: the financial and political strength of private insurance companies in the C.S. the tradition that social legislation belongs to the states, opposition to the gronth of bureaucracy and so on. But the shock and suffering of the great depression of 1929 and after and the enlargement and experimentalism of New Deal policy broke down the resistance. Early relief measures of the Roosevelt administration supplied variously dole and employment for the unemployed, and in 1935 a landmark in the history of U.S. social legislation was reached with the passage of the Social Security act. By mid-century the United States had a massive system of old-age and unemployment insurance which, including old-age assistance, aid for dependent children and aid for the blind and totally and permanently disabled, was accepted and developed by leaders of both major parties and almost all political persuasions.

For specific phases of C.S. welfare services see the sections on the United States in PHILANTHROPY; CHILDREN, LAWS CONCERNING; CHILD WELFARE; CHILD LABOUR; HOUSING; RELIEF; and SOCIAL SECURITY.

F. LAW ENFORCEMENT

The enforcement of law in the United States has traditionally been centred in the hands of local police officials. It is the police department in the case of cities and the sheriff's office in rural areas, acting as agents of the state, which exercise jurisdiction over the great body of ordinary crimes and misdemeanours. However, the mobility which the development of rapid transportation gave the laubreaker made crime control increasingly difficult for police officers having only limited jurisdiction. As a result, law enforcement became more and more a matter of direct state and national concern.

The chief agency of national law enforcement is the Federal Bureau of Investigation (*q.v.*), which has been granted responsibiity for enforcing a long list of national statutes. The FBI was organized in 1934 to stem the rising tide of criminal activity that sprang up in the wake of prohibition and the depression. During and after World War II it came into prominence as a result of its efforts to combat espionage. Other national agencies that play an important role in the law-enforcement process include the secret service (*q.v.*), the bureau of internal revenue, the bureau of narcotics and the coast guard (*q.v.*).

The states also moved toward the establishment of law-enforcement agencies to supplement the activities of local police departments. Although the movement for a state police met with some resistance from those who feared the establishment of any centralized police system. more than half the states set up a law enforcement agency with state-wide police jurisdiction. Each of the other states maintains a highway-patrol system for traffic-law enforcement.

Efforts at improving law enforcement have concentrated on facilitating co-operation among law-enforcing agencies and lifting the level of competence in police administration. The need for greater co-operation was dramatized by investigations of organized crime in the United States. These inquiries uniformly shon that criminal activity is encouraged by the opportunity a federal system provides lawbreakers to escape from one jurisdiction to another. A further benefit of interagency co-operation is that it enables local officials to use the facilities available at higher echelons of government; *e.g.*, state crime laboratories and the fingerprint service maintained by the FBI. This gives local law enforcement a technical skill it would not otherwise possess. *(See* also POLICE.)

For a description of the federal and state court systems in the United States, *see* under *Government,* above.

G. EDUCATION

The educational system of the United States may be said to have two outstanding characteristics: availability of primary and, in most cases, secondary education to almost all children, and decentralization. The public provision of free, compulsory schooling has been a cornerstone of U.S. educational thought from the early days of the republic, and by the middle of the 20th century universal education was very close to being an accomplished fact.

Unlike the highly centralized systems of Europe, education in the United States has always been largely a local responsibility. The role of the federal government has been limited principally to guidance and federal financial assistance has been peripheral. The authority for maintaining public schools rests with the states, and day-to-day administration is in the hands of approximately 45,000 local school districts. Aside from the relatively small amount of federal aid, financing is by a combination of state and local revenues, with the ratio varying from almost 90% local revenue in Nebraska and New Hampshire to more than 80% state revenue in Delaware. The number of local districts decreased by more than half after World War II, mostly as a result of consolidation of rural schools, More than a tenth of U.S. children attend private schools, about 90% of them Roman Catholic.

State colleges and universities and, especially in the larger cities, publicly supported junior colleges are important in U.S. higher education. Nevertheless. a large percentage of post-secondary school training is provided by privately endowed institutions, most of them, at least originally, with denominational connections.

As it passed the middle of the 20th century, the United States experienced a grouing concern about its system of education. The domestic tension created by the supreme court decision of 1954, which declared the segregation of races in public schools unconstitutional was matched by cold-war comparisons with the U.S.S.R. and by a public anxiety that U.S. schools were training young Americans less effectively than Russian schools were training young Russians.

Public concern over education was not really new. From the time of the American Revolution education has been understood in the United States to be the special bearer of national strength and character. Laws passed by the New England colonies in the 17th century had long since placed that part of the country ahead of the rest of the world in respect of making universal literacy a matter of public policy, and before the Revolution Virginia and each of the colonies north of Delaware had built a college of its own.

During the first half-century of the republic private colleges multiplied in all regions including the newly settled west; state universities sprang up, particularly in the south and the west; and important extensions and reforms of primary education were launched in New England, in the middle Atlantic states and in the old northwest. The fact that the quality of much schooling in America was low, far-removed from centres of learning and little-controlled by people of professional knowledge and competence — a problem not yet eliminated at mid-20th century — hardly diminished the significance of the effort. During and after the Revolution church had been separated from state. Under the policy of the republic religion would grow or not according to religion's own strength, but education was being built into the public system. Thomas Jefferson's goals of educating all citizens to the point of literacy and providing higher education to those most qualified for public leadership became in time matters of national principle and policy.

In the century and a quarter following the reforms of the 1830s which substantially established the principle of a tax-supported common-school system open to all children, education in the U.S. passed through three main phases. From about 1835 to the Civil War, the standards of the public primary schools were raised, under the pressures and ideals of social reform, principally by way of establishing new state boards or commissions and by the establishment of normal schools for the education of teachers, especially in the northeast. The old private or semiprivate academy gave way to the new public high school, a secondary school for everyone. The role of women in education increased, as the earliest women's and coeducational colleges were established and as women entered the teaching profession, particularly in the primary schools. Engineering and scientific schools began to appear. both independently, as in the case of Rensselaer Polytechnic institute at Troy, N.Y., and in association with the older colleges, as in the cases of the Lawrence school at Harvard and the Sheffield school at Yale. Adult education made its first important appearance in the American lyceum movement.

During the second main phase, from the Civil War until the end of the 19th century, primary and secondary schooling extended rather than changed. The immigration of those years, enlarging the Roman Catholic element in the population, resulted in a great expansion of the Catholic parochial schools. Reconstruction in the south led to the establishment at last of public-school systems more or less on the northern pattern, but with the races segregated. Many private institutions, including training schools like the Hampton (Va.) and Tuskegee (Ala.) institutes and universities such as Howard at Washington, D.C., Atlanta in Atlanta, Ga., and Fisk at Nashville, Tenn., were established for Negroes. At the same time a real revolution occurred in higher education. The word university had appeared earlier, when Harvard and Pennsylvania acquired law and medical schools. Now, however, certain institutions began to expand into centres not simply for transmitting but for gathering and creating learning. An old school, Harvard, and a new one, Johns Hopkins at Baltimore, were leaders in this development, which was to bring American institutions of higher learning closer in organization and prestige to the universities of Europe. Furthermore, scholarship became much more departmentalized according to fields of knowledge than before, and the professor, as investigator and systematizer of knowledge, became increasingly a professional person.

During the third, 20th-century phase, the principal general change was the more complete fulfillment of goals stated in earlier periods. In elementary education this meant the achievement of almost universal literacy. Public education — though greatly varying in quality — was available from kindergarten to graduate school in all regions including the south. The high school, having spread into every part of the union, became a peculiarly American institution serving the function of social assimilation as well as teaching. With secondary education almost universal, vocational training was expanded, and at least in the larger cities there was some differentiation among high schools according to purpose,

In the Atlantic seaboard states, the idea of state universities and colleges had beginnings traceable to the 18th century. Through the 19th century such institutions were established one after another as the new territories achieved statehood, and the movement was greatly strengthened by federal favour under the Morrill act of 1862 (*see* LAND GRANT COLLEGES AND UNIVERSITIES). In the 20th century these schools continued to grow in size and importance. In conspicuous instances — for example, the University of Michigan at Ann Arbor in the old northwest, the University of California at Berkeley in the west and the University of North Carolina at Chapel Hill in the south — they became distinguished also as centres of advanced learning.

The development of many private colleges into major universities continued. With the passage of time the differences, once sharp, between these older institutions — Harvard, Yale, Columbia and Princeton, for example — and the new universities founded near the end of the 19th century, such as Johns Hopkins. Cornell university at Ithaca, N.Y., The University of Chicago and Stanford university in California, diminished considerably. However, the larger number of the older private colleges retained their character as small undergraduate, primarily liberal arts institutions and some of them, such as Amherst in Massachusetts and Oberlin in Ohio became wealthy and distinguished. During this period also new types of institutions of higher learning, devoted to training more and more students, appeared in great numbers. These included the state teachers colleges, successors to the old normal schools; state-college branches and public and private junior colleges. which brought collegiate training to many cities that previously lacked such facilities; and institutions devoted to adult education in many forms. At the other end of the scale, a few specialized institutions for advanced study beyond the Ph.D. were established. The Institute for Advanced Study at Princeton and the Center for Advanced Study in the Behavioral Sciences at Stanford, both located near major universities but not part of them, were conspicuous cases. Institutions such as the Brookings in' Washington, research libraries like the Folger at Washington, D.C., the Crerar at Chicago, and the Huntington at San Marino, Calif., and special research centres in physics and biology offered different, but parallel, opportunities for higher training.

If the first goal of a system of education in a republic is literacy, achievement in the United States was reassuring. The percentage of illiteracy in the total population, as shown by official census figures, decreased from 20.0 in 1870 to 4.3 in 1930. On the latter date only 1.5% of the native white population was illiterate and when classified by age, it appeared that practically all of this group was in the older age bracket.

The amount of schooling received by the general population also increased appreciably. Of the total population 25 years old and over in 1940, 4.6% had completed college, 14.1% had completed high school only and 34.6% had completed grade school only, while 13.5% had completed less than five years of formal school attendance. Less than 20 years later, only about 23% of males and 20% of females 25 years and older had completed less than eight years of elementary school. Approximately 39% of males and 43% of females had completed four years of high school, and the ratio of improvement for Negroes was more than twice that for the age group as a whole. Four years of college had been completed by almost 10% of males and almost 6% of females (more than 2.5% ior Negroes in both cases.)

In spite of these attainments, the post-World War II spurt in population raised some questions as to whether the educational system would be able to keep pace with the rapid increase in the number of children, and some parts of the country were experiencing serious shortages of classrooms and teachers. This, combined with the overstrained tax structures and increased financial burdens of many states and localities, raised demands from many quarters for greater federal aid to education. The question was a controversial one, for the states and localities, however strained their resources might be, were reluctant to give up any of their time-honoured prerogatives in the educational field.

At the college level, institutions of higher learning were faced not only with an absolute increase in the number of young people of college age, but with an increase in the percentage of those desiring a college education. Caught between rising costs that necessitated raises in tuition and a growing concern over the need to educate all those able to profit by advanced training, university and college administrators gave increasing attention to the possibility of more selective admissions and to scholarships, student loans and other devices for helping the needy student. Especially in the years following World War II, business corporations and foundations came into prominence as major contributors to university and college financing.

At the same time, critics of the educational system expressed concern not merely with the quantity but also with the quality of U.S. education, especially in relation to the achievements of the Russian system. Particular attention was being paid to the need for adequately training the gifted child, and the old dispute between vocational and general or liberal arts training came into prominence once more. See also ADULT EDUCATION; COEDUCATION; EDUCATION. HISTORY OF; ELEMENTARY EDUCATION; LEGAL EDUCATION; MEDICAL EDUCATION; SECONDARY EDUCATION; UNIVERSITIES; WOMEN, EDUCATION OF.

H. DEFENSE

1. Army.—When the second continental congress voted on June 14, 1775, to adopt the colonial militia besieging Boston, Mass., the United States army was born. Although it was still more than a year before the Declaration of Independence, the event marked the union of the forces of the 13 separate colonies under one head. When George Washington formally took command of the colonial troops on July 3, he found that they were largely militia and minutemen of local communities, given to going home whenever a particular danger was past. In Jan. 1776 the continental congress wisely decided that the troops it had directly raised and equipped should be separate in organization from those of local communities. These "Continentals" were enlisted for longer terms, mere trained more thoroughly and thereafter provided General Washington with a small but comparatively more stable nucleus with which to work, and they proved his chief reliance in the dark hours of the war. They mere the beginning of a regular army.

Washington's force varied from 8.000 troops in the operations around New York to as low as 4,000 after the winter at Valley Forge and as high as 26,000 in Nov. 1779. Other generals seldom had more than 6,000 men at their command, while some of the most important work of the war was done by bands of a few hundred under Thomas Sumter on the Catawba. Francis Marion in the Peedee swamps and George Rogers Clark in the northwest. (See AMERICAN REVOLUTION.)

When peace was declared, congress ordered the disbandment of the entire army except "t enty-five privates to guard the stores at Ft. Pitt and fifty-five to guard the stores at West Point." Indian disturbances on the frontier soon caused an increase, and, when Washington was inaugurated president, the number of men in service was 595. Until 1812 the army passed through snift periods of rise and fall, an index of national fear. From a single regiment when the constitution went into force, it changed to 3 in 1791, 6 in 1796, 9 in 1798, 6 in 1800, 3 in 1802, 11 in 1808. though the number authorized was always much higher than the number actually in service. Under stress of the War of 1812 the army increased from 21 regiments in Jan. 1812 to a paper strength of 51 regiments a year later, though it is doubtful if a sixth of the authorized 58.000 men were ever recruited. Counting militia and local combatants, possibly 60,000 men at the most served during the war.

The regular army was reduced to 6,600 by 1820, the artillery stationed largely in the coast fortifications and the infantry in the northern, western and southern frontier posts. Just before the Mexican War the army had shrunk to an actual strength of 5.300 men, occupying more than 100 posts. When war was declared the regular army was recruited to war strength, and about 20,000 volunteers responded to the call, many of whom had to be sent home again because they could not be outfitted About 20.000 troops took part in the war altogether, Gen. Winfield Scott having about 10,500 with him in the Valley of Mexico. In 1848 the troops were reduced to 8,000, scattered over the immense area to which the country had grown. The task of dealing with the Indians in the far west increased the army to a strength of 12,698 men by 1855, which it retained up to the Civil War.

Civil War to World War 1.—Enlistments in the Federal army during the Civil War numbered 2,898,304, including re-enlistments. The number in service at one time was probably a little more than 1,500,000. Estimates of the men in Confederate service varied from 700,000 to 885,000. Reduction on the usual scale in the regular army was impossible after the Civil War because of the large number of troops (about 19,000) stationed in the south to support the military governments of the Reconstruction period, because of the threat of Maximilian in Mexico which sent Gen. Philip Sheridan to the border with a large command and because of increased Indian outbreaks in the west during the Civil War and immediately afterward. The act of 1866 provided for a regular army of 54,000 men paper strength. The actual strength was 38,540 men, which decreased until in 1878 the effective strength was less than 20,000 men. The force was well trained, however, because it saw almost constant service against the Indians in the west. At the beginning of 1896 the army numbered slightly less than 25,000 men, the smallest force in proportion to the total U.S. population at any time after the Revolutionary postwar period. Calls for volunteers in the Spanish-American War increased the army to 216,029 men on Aug. 31, 1898. An act in 1899 authorized the president to keep the strength of the regular army at a maximum of 65,000, and in 1901 the allowable maximum was raised to 100,000. (X.)

Following the Spanish-American War the army launched upon a slow but increasingly accelerated struggle to bring itself up to the forefront as a military organization. To what extent this goal was achieved was demonstrated upon the entrance of the United States into World War I in the spring of 1917. While modernization of equipment and specialized training of troops had much to do with the army's progress, two radical changes in the military organization during the first 15 years of the 20th century had a lasting effect upon the defense establishment. The first was the establishment of a general staff corps in 1903 which provided for a policy-making group of officers to co-ordinate the specialized activities of infantry, artillery and other arms and services, and to act as a liaison organization between the field soldiers and the secretary of war and members of his civilian staff. (See STAFF, MILITARY.) The second, occurring in 1907, was the creation of an aeronautical division in the U.S. army signal corps. This was the beginning of the United States air force, a sister service holding comparable rank with its historic predecessors, the army and the navy (see Air Force below).

World Wars I and 11.—After the experiences gained by the concentration of a big segment of the regular army and the mobilization of the national guard for duty on the Mexican border in 1916, and in view of the threatening aspects of the war in Europe, which had been in progress from the summer of 1914, the U.S. government realized the necessity of building up its military strength as rapidly as possible. On June 3, 1916 congress passed a national defense act which raised the authorized strength of the regular army to 287,846 officers and enlisted men and provided for a reorganized military establishment which included the national guard, the organized reserve corps and a volunteer, or emergency, army.

The dress rehearsal for the army's participation in World War I started with the mobilization of the bulk of the regular establishment and the national guard in 1916. During the war the army grew from 100,000 officers and men to 4.000.000—up until then a high-water mark of U.S. military manpower. Approximately 2,000.000 soldiers went to France under the leadership of Gen. John J. Pershing and joined forces with the French, English and other Allies to crush the Central Powers in a struggle that was primarily a trench war of relatively fixed positions. (See WORLD WAR I.)

After World War I the U.S. army experienced the usual contraction that had followed in the wake of every other conflict in which it had taken part. In World War I approximately 75% of the personnel requirements of the army were met through conscription as provided by the Selective Service act of May 18, 1917. Another big percentage came from the citizen soldiers who comprised the national guard and those who enlisted "for the duration." With the advent of World War II, the army again went through the process of expanding from a force of about 200,000 regulars and a national guard of about the same size to an organization of more than 8,000,000 at peak strength. Its component parts were the army ground forces, the army air forces and the army service forces. (See WORLD WAR II.)

World War II experiences, from the outset, pointed out new lessons as well as new experiences for the American people; and the combined political, economic, industrial, diplomatic and military representatives of the nation began to make adjustments and rearrangements in the over-all defense organization even before the war drew to a close. Technological progress, electronic developments, atom- and hydrogen-bomb advancements, guided-missile inventions, aircraft perfection and other world-shaping factors contrived to "shrink" the protecting oceans on the east and the west of the United States. Previously, the army's history had been one of great expansion in time of emergency upon a mainland protected from attack by two wide water areas and supported by friendly neighbours, only to contract after each national crisis had been met and overcome. World War II emphasized the fact that homeland security could no longer depend entirely on the protection of geography, nor could national interests remain centred exclusively in its particular section of the North American continent. Moreover, the arrival of nuclear weapons brought the possibility that the issue in future wars might be decided so quickly that only those forces in being at the outbreak of hostilities would affect the outcome.

The *Army* at Mid-20th Century.—Forced into an accelerated program of implementing its revised plans and policies by the large burden assumed by the United States in the United Nations' intervention in Korea, the mission of the army at mid-20th century mas threefold in its major aspects. The first was constant preparation to maintain by timely and effective military action on land the security of the United States, its possessions abroad and other areas vital to its interests. Second was the formulation of workable plans for organizing, training and combining with allied forces for land operations. Third was the development of organization, tactics, techniques and equipment for use by army personnel in amphibious and air-borne operations. These were the missions, enumerated by the National Security act of 1947, the Key West and Newport agreements among the armed forces and the National Security act amendments of 1949.

Under the provisions of the Armed Services Unification act of July 26, 1947, the air force was established as a separate organization and was divorced from the control of the United States army. The same act created the national military establishment (later called the department of defense), in which the secretaries of the army and the navy relinquished presidential cabinet status and. along with the secretary of the air force, reported to the secretary of defense instead of directly to the president.

At mid-century the U.S. army was reorganized in accordance with the provisions of public law 581 passed by the 81st congress on June 28, 1950. This law, known as the Army Organization act of 1950, established the civilian control, the military directorate and the component elements of the nation's ground fighting service. Under the act, the army's civilian head is the secretary for the army. His immediate assistants are an undersecretary of the army and several assistant secretaries. The military head is the chief of staff. He is the chief of the general staff and reports directly to the secretary of the army. On the immediate staff of the chief are a vice-chief, four deputy chiefs and a comptroller. Each of the four deputy chiefs supervises a major element of the army organization—personnel, logistics, research and development and military operations. The deputy chief for logistics supervises the technical services, which include the chemical, medical quartermaster, ordnance, transportation, engineer and signal corps. While the signal corps and the corps of engineers are generally considered to be technical services, they are also classified as arms or combat branches, because they carry out missions as combat troops as well as engage in procurement, development and research.

Each of the three combat arms provided for under the reorganization act—infantry, artillery and armour—is especially equipped and trained for its specific type of work. Training of troops in the field is the responsibility of the chief, continental army command. In the training programs emphasis is placed on teamwork with other arms and with elements of the sister services. The results of the training are tested in combined maneuvers and exercises held at frequent intervals.

The conterminous United States at mid-20th century was divided into six army areas, plus the military district of Washington (D.C.), as follows:

1st army, with headquarters at Governors Island, N.Y., and consisting of the New England states, New York and New Jersey.

2nd army, with headquarters at Ft. George G. Meade, Md., including Delaware, Pennsylvania, Maryland, Virginia, West Virginia, Kentucky and Ohio.

3rd army, with headquarters at Ft. McPherson, Ga., and including North and South Carolina, Georgia, Florida, Tennessee, Mississippi and Alabama.

4th army, with headquarters at Ft. Sam Houston, Tex., and including Texas, New Mexico, Louisiana, Arkansas and Oklahoma.

5th army, with headquarters at Chicago, Ill., and including Illinois, Michigan, Indiana, Wisconsin, Minnesota, Iowa, Nebraska, Kansas, Missouri, Wyoming, Colorado and North and South Dakota.

6th army, with headquarters at the Presidio of San Francisco, Calif., and including California, Oregon, Washington, Montana, Idaho, Utah, Nevada and Arizona.

Overseas, the army had specific missions carried out by commands in Europe, the Pacific area and the Caribbean.

The basic combat organization in the field is the division. It is the smallest fighting team that contains representation of all the arms and most of the services and is capable of sustaining itself over an extensive period of time in combat. Divisions are of three types—infantry, air-borne and armour—depending on the type of troops that make up the main element of the organization. An infantry division, for example, consisted at mid-century of three infantry regiments (the major element) supported by five battalions of artillery, a tank battalion and an engineer combat battalion, a reconnaissance company, a signal company and the necessary service and supporting units.

The United States's strong military leadership and participation in the United Nations' action in Korea, which began in the latter part of June 1950, provided a realistic combat test for the organizational setup as well as the equipment and techniques of the country's land warfare establishment—just as the mobilization of the army along the Mexican border in 1916 provided a proving ground for the evaluation of the national strength prior to World War I. For three years after the Korean campaign ended, the structure and training doctrine of the army remained virtually unchanged, while study continued on the tactical lessons of that conflict and of the impact of atomic weapons on land forces and the form of land warfare.

The first general army-wide conference on the requirements of the future, dictated by main weapons changes, was held in 1956. One result was to popularize within the army the feeling that the greater part of its combat power should be made air transportable over strategic distance if it was to continue as an efficient instrument of national policy. This easily stated goal remained unattainable for reasons of cost and the necessity of supporting other main programs.

Within the following year, however, reform was initiated in another direction. While the division was continued as the basic self-maintaining field unit, all of its components, its weapons, methods of operation and systems for supplying and communicating were fundamentally changed. The reform was called the "pentomic" concept. Instead of a tight and mutually supporting triangle composed of three infantry regiments, the division became a much looser, but more flexibly mobile body consisting of five infantry "battle groups." Battalions were also dropped from the infantry structure. Each battle group was formed of five double-strength companies, thus eliminating one layer of command.

Not less radical was the reform of the supporting fire structure. Organic artillery within the division was cut to two battalions to make room for rocket batteries while artillery mortar batteries became integral in the rifle battle groups. The aim of this revision in gun power was to substitute atomic missiles for artillery concentrations, thereby lessening over-all weight, increasing shock and speeding the flow of force in a form of warfare certain to be operationally fluid. Logistical support for the division became centralized in a single support group, charged to move supplies for all fighting components up to the firing line. A signal battalion replaced the normal signal company serving the division because of the anticipated need for multiple lines between all echelons of command.

As a prototype for the pentomic reform, the 101st air-borne division was reactivated in Sept. 1956 to serve as the experimental laboratory. Before its first field tests could be held to determine the practicality and limits of the new design, it was announced that all air-borne and line divisions within the army would be remolded on the same general pattern. Manpower strength was scaled down slightly for all types of division.

Though the requisite reorganization was ordered. the weapons essential to the reform were still in short supply, the outlook being that the rearming would be more than 25% complete by 1962. For the fiscal year 1960 the army maintained 14 divisions: 8 of these were stationed overseas; 3 were kept in a strategic Army corps for deployment where needed; and 3 engaged in training activities in the U.S.

One other main army reform of the period sought the build-up of an adequate ready reserve and an equilization of all army training uithin the regular establishment and civilian components alike. It started with the passage of a reserve bill by congress in Aug. 1955, designed to provide an easier training option for youths otherwise subject to the draft. The bill provided that the volunteer recruits would take six months training under professional instruction and periodic drill for eight years thereafter, while remaining subject to mobilization. The program was described as the essential step toward raising a ready army reserve of 2,900.000 men within five years. Before the program was two years under way, houever, budget limitations forced a reduction of that figure to 700,000 men including 425,000 in the national guard. Under pressure from the army, the national guard in 1957 raised its level of recruit training to the standards of the regular service. This was the chief manpower advance from the army's effort to build a strong reserve. Throughout the period which followed the Korean campaign, the army was under constant and increasing political pressure to continue reduction of forces. Part of the pressure came from public feeling that because of nuclear weapons, armies mere in eclipse and the count of trained field soldiers under arms no longer decisively influenced the military poner balance between nations.

The army, like each of the other branches of the armed forces, gave increasing attention to research and development in the field of missile warfare. Its modernization program included plans for the Pershing, Sergeant, Lacrosse, Hawk, Honest John and Little John missiles. The Pershing, with an 800-mi, range, was the most powerful weapon contemplated in this area. The Hawk was an antiaircraft missile intended for use against low-flying aircraft, and both the Honest John and Little John missiles were to replace traditional field artillery weapons. Each of these weapons was designed to use ammunition with nuclear warheads, as was Davy Crockett, a short-range nuclear rocket for infantry squad use that was to replace the bazooka.

2. Navy.—"The genesis of the United States Navy is to be found in the maritime origins and early development of the country," wrote Commodore Dudley W. Knox in *History of the U.S. Navy* (G. P. Putnam's Sons), recording that 2,342 U.S.-built vessels were included in the total of 7.694 engaged in the commerce of Great Britain in 1775. The earliest sea battles of the American Revolution were fought by small vessels armed for service by 9 of the 13 colonies. after the battle of Lexington, and intended for the protection of local water-borne commerce.

When Washington took command of the Continental army in July 1775, he found his troops without ammunition and arranged for a ship of the Rhode Island navy to sail to Bermuda for powder. Soon aftenvard, Washington fitted out seven small vessels and manned them with seagoing troops in order to interfere with British supply ships. Commodore John Manly directed this force and commanded the most successful of the vessels, capturing in one British ship a quantity of munitions equivalent to the manufacturing capacity of the colonies for about 18 months. On Oct. 13, 1775, the continental congress voted to fit out ships, and the marine committee, later appointed, sent the first Continental squadron to the Bahamas for the purpose of capturing munitions.
