By Feb. 2 the British 8th army had crossed into Tunisia and was approaching Ben Gardane. The situation was now causing Gen. Erwin Rommel, recently promoted to command all axis forces in Tunisia, grave concern; to gain time and space for the merging of those forces, he began a series of attacks on his western front. On Feb. 14 he thrust strongly at the thinly held U.S. 2nd corps's front, from Faid and Gafsa. This corps suffered heavily, retiring in considerable disorder, and the axis, following up the success, captured Sbeitla, Kasserine and Feriana. Thereafter, Rommel struck north but was halted by British and U.S. reinforcements hurried forward to restore the situation. On Feb. 22, after fierce fighting, the axis forces began an orderly withdrawal, though under heavy air attack; and by March 3, Allied forces had reoccupied their original positions. Meanwhile, on Feb. 26, Rommel struck another blow at the British jth corps, driving its northern flank back about 20 mi. to Djebel Abiod. The fighting was bitter and cost the axis dearly in tanks which could ill be spared; but it left the Allied northern flank dangerously exposed.

After this period of axis activity, far-reaching changes were made in the command and organization of the Allied forces in North Africa. The 8th army was placed under command of Eisenhower and, with the 1st army, became the 18th army group. Gen. H. R. L. G. Alexander, lately commander in chief of British middle east forces, became the army group commander and deputy commander to General Eisenhower. All Allied air forces operating in the Mediterranean were unified under the command of British Air Chief Marshal Sir Arthur Tedder; under him U.S. Lieut. Gen. Carl Spaatz commanded the Northwest African air force, comprising a strategic, a coastal and a tactical air force. The latter was subsequently most closely associated with the operations of the 18th army group and was in great measure responsible for its successes during the final stages of this campaign.

By now the net was drawing tight about the axis forces. To the west, the 1st army's line had been dented but not broken, and to the east, the 8th army was approaching Medenine. On March 6 Rommel, in a despairing effort to halt its advance and to retain his hold on the Tunisian beachhead, launched his picked Afrika Korps in four successive attacks against the 8th army. All failed, and the axis forces, hotly pressed, fell back to the strongly prepared Mareth line. On March 20, after a heavy air and artillery bombardment, the 8th army attacked; eight days of bitter frontal assaults followed. Finally, on March 28, after an outflanking movement through difficult country to the westward, carried out by an armoured and a New Zealand infantry division, the position was turned, and a further axis withdrawal to Wadi Akarit took place. At this point, Rommel was recalled to Germany and was succeeded by Gen. D. J. von Arnim.

On the western front, on March 17, the U.S. and corps had attacked, capturing Gafsa and thrusting farther east, and this threat contained at least one axis armoured division from the vital Mareth line battle. On March 27–28 the British 5th corps attacked to restore the position on its northern flank; after a few days of stiff and costly fighting, it recaptured Sedjenane, removing the threat to Medjez-el-Bab. The 8th army drove the enemy from the Wadi Akarit position on April 7, gaining contact with the U.S. 2nd corps near Gafsa the same day. On this day also, an Anglo-U.S. attack was launched through the Fondouk pass to cut off the axis forces retreating before the 8th army, and on April 11 it entered Qairwan. By now, however, the axis forces were racing for the last position, covering their beachhead, in the mountains north of Enfidaville, and the 8th army, in hot pursuit, occupied Sfax and Sousse in quick succession, regaining contact with Arnim's forces north of Enfidaville on April 14. Appreciating the strength of the axis position here, General Alexander decided to switch his main attack from the 8th to the 1st army's front and ordered the U.S. and corps, now freed by the contraction of the front, to take over the British 5th corps's front from Béja to the coast, while an armoured division from the 8th army was moved across to the 1st army.

On April 22 the main attack was launched on a two-corps front astride the Medjerda river; but so strong was the opposition that five days of fighting brought little progress, though the effort wore the axis forces down, costing them dearly in material. In the central sector, the French 19th corps advanced and captured Djebel Fkirine; and on April 23 the U.S. 2nd corps, attacking on the northern flank over very difficult country, made good progress toward Mateur. An attack by the 8th army on the Enfidaville position merely confirmed its strength; three more divisions were therefore transferred to the 1st army's front.

On May 6 the thrust astride the Medjerda river was renewed, under heavy air support, which proved to be the decisive factor; and on the next day the British entered Tunis, while the U.S. and corps entered Bizerta, thus trapping three axis divisions to the westward. Without pausing, a British force of an infantry and two armoured divisions swept eastward, and by May 10 one armoured division had reached Hammamet, while the infantry division drove unhindered round Cape Bon peninsula. This was the final phase of the battle. Thereafter all organized axis resistance ceased, and it remained only to round up the prisoners and collect the captured material. On May 13—after three days during which complete axis units drove themselves to the prisoner-of-mar cages in their own transport — Marshal Giovanni Messe, the Italian commander in chief in Tunisia, ordered all units to lay down their arms. More than 250,000 prisoners were taken, and very little of the enormous quantities of material escaped to Italy. (By April 22, Allied air power had disrupted the axis air supply route, and a tight sea blockade of the Tunisian coast prevented any shipping from leaving.)

Thus ended the campaign which opened the Mediterranean to Allied shipping and set the stage for the next phase of operations, the invasion of Sicily and Italy.

4. Summary. — From a review of this campaign, four major points of interest emerge.

First, it was a campaign of bold conception: to launch a huge expedition, composed mainly of troops untried in battle, on that most difficult of operations, an amphibious landing, needed judgment and planning of a high order.

Second, under Eisenhower there was forged that smoothly working Anglo-U.S. staff and command organization which contributed so largely to the final victory.

Third, the use of close air support for the army became fully understood during this campaign, the technique of its control being so perfected that, during the later stages of the fighting, its effect was often decisive.

Finally, the retarding influence of supply upon operations was clearly illustrated: the slowing down of the initial Allied advance into Tunisia, was, to a great extent, due to the weakness of the attenuated line of supply.

J. THE SICILIAN CAMPAIGN, MAY-AUGUST 1943

The decision to invade Sicily, after the completion of the Tunisian campaign, was taken at the Casablanca conference in Jan. 1943. Sicily was chosen because its capture would help to clear the Mediterranean for Allied shipping and provide a suitable springboard for the invasion of Italy. Tactically, however, it subsequently forced upon the Allies an extended land advance right up the Italian peninsula through very difficult country, which landings further north might have avoided. "Husky," as this operation was called, was to be launched about July 10, and the considerable pause between the end of the Tunisian campaign and the launching of "Husky" was a result of the difficulty of collecting enough landing craft.

Although widely dispersed assaults on both Palermo and Catania were considered initially. it became evident that the early capture of the airfields in the southeastern corner of Sicily was vital to the future success of the operation. This, together with the shortage of landing craft and available troops, led to the acceptance of a single expedition composed of two task forces operating within supporting distance of each other, against the 100–mi. coast line from just south of Syracuse westward to Licata. This plan involved taking the risk of landing a considerable force without the prospect of early capture of a major port through which it could be supplied and so of having to maintain it over open beaches. It created a precedent that was to be employed successfully later, notably in the landings in Normandy. The British 8th army, with the 13th and the 30th corps of approximately five divisions, under Gen. Sir Bernard Montgomery, formed the eastern task force; the U.S. 7th army with the 2nd and a provisional corps of approximately four divisions, under Gen. George Patton, Jr., formed the western.

In command was Gen. Sir Harold Alexander, acting as General Eisenhoner's deputy. Adm. Sir Andrew Cunningham dnd Air Chief Marshal Sir Arthur Tedder commanded the supporting naval and air forces, respectively.

In the third week of May, Pantelleria Island, midway across the Sicilian narrows, was attacked with sea and air bombardment of maximum intensity until it surrendered on June 11. Lampedusa Island, lying go mi. southwestward, surrendered the next day. The Sicilian channel was now clear.

Air attack in support of the Tunisian operations against the axis air forces, supply routes and bases in Sicily and Italy, begun in April, had achieved such success by the end of that campaign that the Allied air forces enjoyed a two-to-one superiority. On June 12 the attack was switched to the destruction of the airfields in Sicily. Most of them had been made unserviceable before "Husky" was launched.

On the night of July g, as the task forces were approaching the Sicilian coast, winds of near-gale force sprang up, jeopardizing the safety of the mighty armada of 600 big ships and 2,100 small craft that was transporting the expedition. However, they abated considerably before the hour of landing, having, moreover, put the defenses off their guard.

At 11 P.M. on July 9 a brigade of the British 1st air-borne division was dropped by parachute and glider to seize a vital road bridge and other objectives south of Syracuse. The high winds seriously hampered this operation (many gliders, released offshore, fell into the sea), but the objectives mere captured. Simultaneously, in the U.S. sector, four battalions of the U.S. 82nd air-borne division were dropped to clear routes for the advance of the ground forces to the airfields. Here also the high winds caused considerable scattering, but the paratroops prevented axis reinforcements from reaching the landing beaches.

Landings began at 2:45 A.M. on July 10 and met with little opposition. Licata was seized and opened to shipping that day, Syracuse was opened two days later and Augusta was occupied by July 14. The axis airfields were occupied on July 10, and from these the Allied tactical air force was able to maintain effective close support, flying as many as 1,200 sorties a day.

The Allies were confronted by 2 German and 11 weak coastal and field Italian divisions but maintained satisfactory progress. A German counterattack northeast of Gela became threatening, but the situation was saved by naval bombardment. The advance continued, until the 7th army struck northward through the hills toward Palermo, while the 8th army approached the critical area about Catania.

Problems of supply were acute during the first few days, when adverse weather conditions and occasional axis air attacks made difficult the unloading and handling of stores over open beaches or in small improvised ports. The situation was saved, however, by the new $2\frac{1}{2}$-ton amphibious DUKW (Duck) trucks, which enabled more than 80,000 men, with 7,000 vehicles and 300 tanks, to be landed during the first two days.

Advancing through the hills of western Sicily, the U.S. 7th army captured Palermo on July 22 and then turned east along the northern coast, turning the axis defenses by amphibious operations on three occasions. Between Aug. 1 and Aug. 6, in hard fighting on the slopes of Mt. Etna about Randazzo, it gave valuable support to the 8th army in its struggle to open the eastern coastal road north of Catania. On Aug. 17 it entered Messina from the west.

Approaching Catania, the British 8th army was faced with a hard task. Mt. Etna, with its defensively strong lower slopes, dominated the coastal route northward to Messina, and there the Germans concentrated all their divisions. General Montgomery, appreciating that the key to the position was Adrano, on the western face, transferred the weight of his attack there; hard fighting continued in this area with but little progress until Aug. 7, when, thanks to the pressure of the 7th army, Adrano was occupied. On Aug. 13 Randazzo, the road junction to the north, was captured. and this forced the Germans to carry out a general withdrawal. Immediately the 8th army pushed northward, along the coastal road, and on Aug. 17 its advance patrols entered Messina from the south — simultaneously with the advanced troops of the 7th army.

The campaign was now over. Under heavy anti-aircraft protection the Germans contrived to withdraw more than 40,000 men, with much equipment, over the Straits of Messina. Nevertheless the loss of Sicily was a severe blow to the axis, costing them 165,000 casualties, of whom 37,000 were German. together with considerable losses in tanks, guns and vehicles.

The shock of the invasion, combined with the heavy bombing of the Italian mainland, notably of the marshalling yards in Rome, sounded the death knell of the Fascist regime. On July 25, 1943, Mussolini resigned, to be succeeded by Marshal Pietro Badoglio.

K. THE ITALIAN CAMPAIGN, SEPT. 1943–MAY 1945

During the closing stages of the Tunisian campaign in May 1943, with the preparations for the invasion of Sicily well advanced, a top-level conference was held in Washington, D.C. This conference directed General Eisenhower to plan such operations in exploitation of the conquest of Sicily as would be best calculated to eliminate Italy from the war and to contain the maximum number of German divisions. Available to him would be 19 British and other Allied (including 3 Polish) with 4 U.S. and 4 French divisions, though a considerable proportion of the total would be required for internal security duties. Moreover, plans for the invasion of Normandy were taking shape, and seven U.S. and British divisions were to be returned to the United Kingdom by Nov. 1 for this operation.

The invasion of Italy offered certain notable advantages. The collapse of a major partner would have a tremendous effect on the axis powers, especially on the satellites. Italian air bases, particularly those in the Foggia region, would be of considerable use for the general Allied air offensive. In addition, the Allies could more effectively support the Yugoslav partisans and seriously threaten the axis positions within the Balkans, thereby assisting the Russians.

The risks to be accepted were numerous and serious. The demands of security in North Africa would reduce the forces available. In this first attack upon the European continent, the axis could be expected to exert every effort to maintain its prestige. The demand on shipping to supply the expedition would be heavy; and, granted success, the Allied lines of communication would be ever lengthening, requiring a heavy proportion of administrative troops. Conversely, the axis lines of communication would be entirely land-borne and would be ever shortening. Most important of all, an advance from the southern tip of Italy would have to traverse easily defensible country. The Apennine range, running down the centre of the peninsula, with its successive foothills and deep ravines stretching out to the coast, offered a series of natural defensive positions. These were further strengthened by countless streams, flooded in winter, and by coastal marshes, which would restrict the fuil exploitation of the expected Allied superiority in artillery and armour. As in the Sicilian operations, the acute shortage of landing craft presented a serious problem. No replacements from the United Kingdom or from the United States were forthcoming, and even the small stocks available were being drawn upon for other theatres. This chronic shortage was to dominate the whole strategy of the Italian campaign; it nearly stultified the initial landings and it limited the scope of the subsequent conduct of the operations. Despite this, on June 5, three months before the deadline date and one month before Sicily was invaded, the 15th army group was directed to plan for an assault across the Straits of Messina to capture the ports of Reggio di Calabria and San Giovanni, subsequently seizing the airfield at Crotone.

1. The Italian Surrender.—On Aug. 19 Marshal Badoglio established contact with General Eisenhower to negotiate a surrender, without the knowledge of the Germacs. Eisenhower was instructed to accept an unconditional surrender and to obtain the maximum military advantage thereby. Responding to Badoglio's plea that Rome should be seized to safeguard the king and the government from possible German reactions, Eisenhower offered to fly an air-borne division in, if the Italians would guarantee the use of the necessary airfields and silence the anti-aircraft batteries.

Meanwhile the Allied air offensive against axis marshalling yards, airfields and military installations was intensified. Pisa, Benevento, Salerno, Foggia and even the Brenner pass being heavily attacked. Field Marshal Albert Kesselring's headquarters at Frascati, south of Rome, was entirely bombed out, and axis fighter opposition decreased progressively.

The Italian unconditional surrender was signed at Cassibile in Sicily on Sept. 3 and announced on Sept. 8. The Germans evidently had been prepared for such an eventuality, for on the day of the announcement Badoglio informed Eisenhower that he could not guarantee the airfields for the landing of the Allied division, and on the next day the Germans occupied Rome. Unfortunately Sept. 9 was the day on which the Allied invasion was to land; but it was too late to change the objectives of the air-borne division destined for Rome, which was thus rendered inactive at a critical moment. On Sept. 9 also the Italian battle fleet vacated Taranto, just as the Allies were steaming in to occupy it, while a considerable force of battleships, cruisers and destroyers left Spezia and Genoa to surrender. This force was spotted and bombed by German aircraft, the battleship "Roma" being sunk, but the remainder sailed on via the Balearic Islands and Bône to Malta, where it joined the remaining units in surrender. The Italian army made only an apathetic resistance to the Germans, surrendering to them wholesale; and only 320 aircraft of the total Italian air force complied with the terms of surrender by flying over to the Allies.

The surrender had removed the Italian fleet from the war and left the Allies to face only the German army fighting in a country with a cowed but hostile population. With more decisive Italian leadership, Rome might have been occupied and the campaign shortened by many months.

The fall of Mussolini's regime, foreshadowing the collapse of Italy, opened new prospects for the Italian operations. An early assault upon the Naples area now appeared feasible; but a direct assault upon the city would certainly meet stiff German opposition, as it was the focal point covering their withdrawal routes from the south. North of the city the coast was unsuitable for landings and was beyond the range of Allied fighter aircraft; but to the south the Gulf of Salerno offered possibilities; surrounded inland by high mountains (2–10 mi. away) and crossed by routes to Naples running through narrow defiles, it possessed a 20-mi. stretch of excellent beach. It was estimated that, for the first few days, until an airstrip could be captured, Allied fighter aircraft. with detachable tanks, could maintain a continuous daylight patrol of 36 aircraft over the area. This was considered adequate, and Gen. Mark Clark with the jth army was ordered to plan Operation "Avalanche" for a landing in the Gulf of Salerno with Sept. 7 as the target date. General Montgomery, with the 8th army, was to carry out the landings previously planned across the Straits of Messina, called Operation "Baytown," several days earlier, with the object of containing as many German formations as possible to the south of Naples, so that "Avalanche" could cut them off. Moreover, the shortage of landing craft necessitated their employment for each landing successively.

2. The Landings.—Following heavy air preparation against axis airfields, batteries and communications in the "toe" of Italy, the 13th corps with the Canadian 1st and British jth divisions landed at 4:30 A.M. on Sept. 3, meeting negligible resistance. Inland, demolitions in the mountainous and easily defensible country slowed down the rate of advance of the forward troops, and this factor was to have a serious effect upon Operation "Avalanche." On Sept. 9, as the Italian fleet was steaming out to surrender, the 1st air-borne division landed and occupied Taranto. On Sept. 12 Crotone with its airfield was in Allied hands.

Early on Sept. 9 the 5th army landed at two points in the Gulf of Salerno. The northern force, sailing from Sicily and Bizerta and consisting of the British 10th corps, assaulted with the 46th and 56th divisions; the southern force, from Oran, consisting of the U.S. 6th corps, assaulted with the 36th division followed by the 45th. U.S. rangers landed to seize the defiles through the mountains leading to Naples, and British commandos to capture Salerno.

Expecting an Allied landing there, the Germans reacted swiftly and vigorously, and a series of strong counterattacks severely tested the Allied beachheads. Honever, by nightfall, these beachheads were 4 mi. deep. though a dangerous 5-mi. gap at the Sele river separated them (this was closed on Sept. 10). It had been estimated that eight German divisions were available in the area—two around Naples, two around Rome and four to the south facing the 8th army—and their proportion of armour was heavy. Shortage of shipping prevented the landing of any Allied armoured formations until Sept. 14, when the British 7th armoured division began to land; but by that time picked German troops had penetrated in places to within a mile of the beach, and the situation looked serious. At this point the Allied air force struck at the Germans and their communications with every available aircraft from the strategical and tactical air force. By Sept. 12 an airstrip was in operation within the beachhead, and on the three preceding days 3,000 fighter sorties had been flown from Sicily or from carriers. On the nights of Sept. 13 and 14 air-borne troops were flown in to reinforce the critical portions of the beachhead, and by Sept. 15 the crisis had passed. It is worthy of consideration whether, had it been able to land even a week earlier, the 8th army would have advanced to within closer supporting distance, in which case this crisis would never have arisen.

On Sept. 12 Capri and other islands in the Bay of Naples surrendered, and on Sept. 18 patrols of the 5th and 8th armies met at Vallo, 40 mi. S.E. of Salerno. The axis evacuated Sardinia to French 'occupation on Sept. 18.

3. Advance to the Gustav Line, Sept. 20–Dec. 10, 1943.—The 5th and the 8th armies now began to advance up the peninsula abreast. Bari fell on Sept. 13 and the 5th army occupied Naples and its harbour on Oct. 1. Repairs to the demolished port structures were begun immediately, and on Oct. 14 the unloading of stores over the Salerno beaches ceased (during the period Sept. 9–26, 108,000 tons of stores, 30,000 vehicles and 200,000 troops had been landed there).

With the Foggia airfields in their hands, the Allies' hold on the mainland was confirmed, as adequate close air support for the ground troops could now be provided by aircraft based close to the battle area. In addition, heavy bombers could easily strike at the German communications through the passes over the Alps and assist in the over-all air offensive against Germany and also disrupt industry and communications in the Balkans to assist the Russians.

As the Allies advanced, German resistance gradually stiffened, and progress became slow and painful. New divisions arrived to join the Allied forces, but concurrently the Germans hastily reinforced their own defenses. To avoid a costly frontal attack on Termoli, the 8th army by-passed it with an amphibious landing; but the town held out until Oct. 6. At 4 P.M. on Oct. 13 Italy declared war on Germany, which saved the Allies from the manpower drain necessitated by the establishment of military government in captured territory. On the night of Oct. 12–13 the jth army crossed the Volturno river after hard fighting; and the Germans withdrew to their winter line, known as the Gustav line, destroying every bridge and culvert en route. This line, which the Germans had been preparing since the Allies first landed, ran athwart the peninsula following generally the courses of the Sangro and Liri (Garigliano) rivers and was defensively very strong. The 5th army found the latter river an even stiffer obstacle than the Volturno, and costly attacks to cross the lower reaches began on Nov. 6. On Nov. 28 the 8th army launched an attack to cross the Sangro, and after repeated attacks it achieved its object. Nevertheless, it proved impossible to reach the Pescara-Popoli-Rome highway, thereby turning the defenses of Rome. By now, moreover, winter had set in, and heavy rains and snows limited offensive operations.

Though the Allied artillery was hastily reinforced with guns of the heaviest calibre in an attempt to blast a way through the Gustav line, it was without avail.

The jth army continued to fight its way into the entrance to the Cassino corridor, leading to Rome; but though it bent the German line did not break, and a period of stalemate descended upon the operations.

In December the first of the French divisions equipped by the U.S. arrived in Italy, and early in Jan. 1944 a complete corps under Gen. Alphonse Juin took over the 5th army's right sector. At the same time the Polish 2nd army corps, urider Lieut. Gen. Wladyslaw Anders, comprising two infantry divisions and one armoured, arrived from the middle east and was incorporated with the 8th army. But, although the Adriatic ports were handling 70,000 tons and Naples 80,000 tons weekly, the build-up of the Allied forces was considerably delayed because, apart from the shipping and land transport required to maintain the expeditionary force with its air force, a considerable volume was required to provide food to keep the liberated Italian population from starvation.

On Dec. 10 there were changes in the high command. Eisenhower, appointed supreme Allied commander of the projected invasion of Normandy, returned to the United Kingdom, being succeeded by Gen. Sir Henry Maitland Wilson. Montgomery returned with Eisenhower, and the whole hierarchy of the command underwent considerable changes.

4. Anzio and Cassino, January–May 1944.—In the third week of January, offensive operations were reopened on the southern flank. The British secured a bridgehead over the Garigliano at Minturno but were held there, while the 5th army, on Jan. 20–21, unsuccessfully attempted to force the Rapido river. Meanwhile, east of Cassino, the French corps made considerable gains.

ITALIAN CAMPAIGN. 1943–45

These operations were intended to divert German attention from a landing carried out by the U.S. 6th corps in the rear of the German forces at Anzio and designed to disrupt German communications in the Cassino area. The landing was a complete surprise, and a bridgehead 18 mi. long and 9 mi. deep was secured. Instead of driving straight to the Alban hills (a key area overlooking the German communications) the force consolidated its bridgehead. The German commander adjusted his dispositions accordingly, concentrated his forces against this threat and delivered a series of heavy counterattacks. By the end of January he had sealed off the bridgehead, and for four months kept 50,000 troops pinned within it under the most severe conditions. Meanwhile, the 5th army had been halted before the strong defenses at Cassino, blocking the southern entrance of the Via Casilina, the highroad leading northward. Around this position, particularly about the monastery, raged some of the bitterest fighting of the whole campaign. Week after week the Allies assaulted it without success; even after a combined air and artillery bombardment of such intensity that bulldozers had to be used to clear a way for the passage of tanks it still held out. Eventually, in the third week of March, the assault was given up.

5. The Summer Offensive, May–September **1944.**—During the early months of 1944, the Allied air offensive systematically destroyed all the axis rail nerve centres south of Florence, while the 5th and 8th armies regrouped their forces, concentrating their main weight to the west of the Apennines. Then, on May 11, Alexander delivered on the Gustav line a co-ordinated offensive. On May 18 units of the Polish 2nd corps took Monte Cassino.

In five days the Gustav line had been overrun, and the U.S. 6th corps, breaking out from the Anzio bridgehead on May 23, joined hands with the troops advancing over the mountains west of the Liri river. The Germans now decided to withdraw, and the Allied air forces took a heavy toll of their choked communications; yet their stubborn stand southeast of Rome delayed capture of the latter until June 4. Both armies took up the pursuit northward, and two days later the invasion of Normandy (Operation "Overlord") started (see below). In mid-June the French recaptured Leghorn and reached the river Arno. By this time, however, Alexander had had to surrender three first-rate U.S and seven French divisions to mount Operation "Dragoon," a landing on the French south coast designed to clear southern France, in support of the main "Overlord" operation. In their place the 15th army group received a Brazilian division and a Greek brigade that were not so battle-tried, with the result that its offensive power was lowered and its rate of advance slowed do n, which enabled the Germans to occupy their next prepared position, the Gothic line, running approximately from Pisa to Rimini. Despite their loss, the Allies captured Florence on Aug. 13 and breached the western end of the Gothic line with the capture of Pisa on Sept. 2. Then the 8th army, passing northward through the Apennines, captured Rimini on Sept. 21, thus breaching the eastern end of the Gothic line. Nevertheless, the Germans managed to seal off the two breaches, and their line held till the weather intervened, precluding any further offensive operations.

6. The Winter Pause, Oct. 1944—April **1945.**—During the winter, General Wilson, supreme commander in the Mediterranean, moved to Washington to join the combined chiefs of staff, being replaced by General Alexander. Gen. Mark Clark took over the 15th army group.

Early in January the Allies advanced their line to the south bank of the river Senio and, by their over-all action, managed to pin down the German 10th and 14th armies. But during this month three more divisions, two Canadian and one British, were transferred to France to reinforce "Overlord." Throughout the winter, the Allied air forces continued their attack on the German communications through the Alps, including oil and rail targets in Austria and southern Germany.

7. The Final Phase, **April–May 1945.**—By April, the general collapse of Germany had started. The Allied armies were running over western Europe, and the Russians were driving forward into eastern Germany. On April 9 the 15th army group opened its offensive to break into the Po valley. The 8th army, on the east, opened the attack across difficult swamp country intersected by many small rivers and had captured Imola in the Po valley by April 15. On April 14 the 5th army attacked and, after a week of heavy fighting, captured Bologna, advancing northward to the Po, over which bridgeheads were established southwest of Mantua on April 23. Bridgeheads were also established on the 8th army's front, and the German forces in the centre were faced with complete envelopment. Both armies now raced northward toward the foothills of the Italian Alps; the 5th army entered Verona on April 26 and Milan three days later. Part of the 5th army swept westward along the coast, capturing Spezia and Genoa, and then drove on to join the French. Everywhere effective support was received from the Italian anti-Fascists. On April 28 these patriots captured Mussolini and several other leaders who were trying to escape to Switzerland and summarily executed them.

By May 1 the 8th army troops, advancing on Trieste, had made contact with Yugoslav partisans at Monfalcone. On May 2 the German commander in chief signed the general surrender at Alexander's headquarters; under its terms nearly 1,000,000 Germans laid down their arms. On May 4 patrols of the U.S. 88th division met those of the 7th army moving down from Austria, south of the Brenner pass, and the Italian campaign was over.

8. Summary.—A review of this campaign discloses three major points of interest.

First, the objects laid down at the Trident conference were achieved: by pressure maintained throughout 20 months, the 15th army group, though frequently being drained of its battle-tried divisions, had made a major contribution to the over-all Allied effort, pinning down substantial forces which the Germans desperately needed to reinforce both their eastern and their western fronts in Europe. The cost was heavy, casualties and missing amounting to nearly 350,000; but the Germans paid more dearly.

Second, the plan of campaign had necessitated a land advance through terrain almost universally favourable to the defense.

Third—and with reference to the second point—the shortage of all types of landing craft precluded the Allies from exploiting their command of the sea by the use of large-scale amphibious operations; the Italian peninsula, with its extensive coast line, was peculiarly vulnerable to such a form of attack, and it is interesting to consider whether, had it been possible to land in strength, initially, nearer the base of the peninsula (perhaps in the rear of the Gothic line), the objects might have been achieved more quickly and at less cost. (A. W. LE.)

L. BALKAN OPERATIONS (1942–44)

1. Resistance in Yugoslavia and Greece.—With their mountains and lack of modern means of communication, with their populations having age-long traditions of conspiring against and resistance to the invader, Yugoslavia and Greece were ideally fitted for guerrilla warfare. Unfortunately, in neither did the political situation favour a unified underground movement. In Yugoslavia, particularly, the resistance was divided first by the Serbo-Croat feud and second by the tendency of the Communist party to pursue its aims without compromise. The German advance in April 1941, in its very swiftness, left in its rear tens of thousands of Yugoslav soldiers who hid with their arms. A month later Col. (later Gen.) Dragomir Mikhailovich started to organize *chetas* (companies) to fight the enemies of Yugoslavia. For the Chetniks, however, the enemies were not only the Germans but also the *ustaše* (insurgents) of the Croat quisling Ante Pavelic. From the outset, therefore, Mikhailovich, who had a unique chance to be a national Yugoslav leader, appeared in the narrower role of a Serbian patriot.

This situation was skilfully exploited by the leader of the rival underground movement, Josip Broz, called Tito. A Moscow-trained Communist, Tito organized his partisans and started guerrilla operations only after the German attack on the U.S.S.R. A meeting between Tito and Mikhailovich in Oct. 1941 was fruitless. Although at first Chetniks and partisans sometimes united against the Germans, their relations now became strained and they even fought each other. Mikhailovich was anxious to avoid reprisals against the civil population; he also considered the menace of communism at least as great as that of naziism or fascism. For this, after Aug. 1942, he was denounced as pro-German by the "Free Yugoslavia" radio broadcasting from Tiflis. In Nov. 1942 in the small Bosnian town of Bihac, Tito convened an Antifascist Assembly of National Liberation of Yugoslavia (AVNOJ, or Antifašističko Veće Narodnog Oslobodjenja Jugoslavije), which proclaimed that the Yugoslav national army of liberation was fighting for a "truly democratic and federal Yugoslavia in which equal national rights not only of Serbs, Croats and Slovenes, but also of Macedonians and Montenegrins would be recognized."

The first British officer sent into occupied Yugoslavia was Col. D. T. Hudson. Landed in Sept. 1941 by submarine on the Dalmatian coast, Hudson was instructed to co-ordinate the sabotage operations of Chetniks and partisans. but soon discovered how difficult was his assignment. The British, however, continued to help only Mikhailovich with money and munitions until March 1943 when a first British emissary to Tito, Lieut. Col. F. W. D. Deakin, was parachuted into the country. He reported that the partisans had both a political and a military organization on a large scale; he also recognized that Tito's soldiers were really fighting the Germans, despite setbacks and the sufferings of the civilian population. In Sept. 1943 a larger mission headed by Brig. Fitzroy Maclean was parachuted into Bosnia, and soon after came important material help to the partisans. By this time the Allies had established a special base near Bari, in southern Italy, so that it was no longer necessary to fly supplies from Egypt. The British mission to Mikhailovich was withdrawn in May 1944 and entire support was transferred to Tito. Speaking in the house of commons on Feb. 22, 1944, Winston Churchill stated that the partisans were the only people who were doing any effective fighting against the Germans and that they were checking no fewer than 14 German divisions out of the 20 in the Balkan peninsula.

In Oct. 1944 all southern and eastern Yugoslavia was liberated by the joint effort of Russians (Marshal Tolbukhin's army), Bulgarians (14 divisions now fighting with the Russians) and partisans of Tito. In April 1945 all Yugoslavia was free, and although many Chetniks took refuge in Allied-occupied Italy, Mikhailovich remained in his Serbian mountains. (He was arrested on March 13, 1946. condemned to death by a partisan court on July 16 and executed the next day at dawn.)

Compared with that of Yugoslavia, the situation in Greece was simpler in one respect; there was no feud similar to the Serbo-Croat. The political divisions, however, were serious enough not only to endanger the national unity but also to paralyze any large-scale operations against the axis. It must be remembered that Greece before the war had a dictatorship opposed by all Greek political parties. But while the royalists were ready to forgive the king for supporting General Metaxas if they were given power, the liberals and socialists were against both the dictatorship and the monarchy. After the occupation of Greece by the Germans and Italians the Communist party exploited this situation by sponsoring an underground national liberation front (E.A.M. or Ethnikon Apeleftherotikon Metopon) which proclaimed the necessity, after the war, of a Greek republic allied with the U.S.S.R. and other Balkan republics. The E A.M. organized its own national popular liberation army (E.L.A.S., or Ethnikos Laikos Apeleftherotikos Stratos), the commander in chief of which was Gen. Stefanos Sarafis.

When the first British military mission, under Brig. E. C. W. Myers and Col. C. M. Woodhouse, was parachuted into Greece during the night of Sept. 30, 1942, they found that both E.A.M. and E.L.A.S. were firmly established, capably organized, not badly armed and entirely controlled by the Communist party. The general headquarters, middle east, decided to support them with gold, arms and ammunition in the hope that they would start a large guerrilla campaign against the axis powers. In actual fact they were mainly fighting the non-Communist guerrilla bands such as that of Col. Demetrios Psaros, who was murdered by the E.L.A.S., or the more important E.D.E.S. (Ellinikos Dimokratikos Ethnikos Stratos, or Hellenic democratic national army) led by Col. Napoleon Zervas. In the house of commons on Jan. 18, 1945, Churchill said that the E.L A.S. leaders "were simply taking our arms, lying low and awaiting the moment when they could seize power in the capital."

2. British Reconquest of Greece.—There was no large-scale fighting for the liberation of Greece; it was not necessary. With two Allied armies north of Florence in Italy, with the Russians holding Rumania and Bulgaria, Hitler gave Field Marshal Maximilian von Weichs, commander in chief, Balkans, the order to abandon Greece. At the beginning of Oct. 1944 small British forces under Maj. Gen. Sir Ronald MacKenzie Scobie started the liberation of the country. On Oct. 18 the legal Greek government returned to Athens from Cairo. (K. Sm.)

M. ALLIED RECONQUEST OF WESTERN EUROPE

In March 1941, before the United States even entered the war, British and U.S. staff conversations had been held in Washington, D.C., to consider what should be the broad outline of the combined British Commonwealth and U.S. strategy in the event of the United States' being forced into it. It had been agreed that the paramount object must be the defeat of Germany and that, with this achieved, the destruction of any remaining enemies would be a much less formidable task.

In April 1942, after the United States' entry into the war, the combined chiefs of staff met in London and agreed that plans for a major invasion of western Europe in 1943, to be known as Operation "Round Up," should be studied. They reaffirmed that, provided the necessary measures be taken to hold the front against Japan, all resources were to be concentrated upon the defeat of Germany. But as at that time the Soviet Union was bearing the full brunt of the German offensive and was becoming exhausted, a proposal was considered for an invasion of northwestern Europe, on as large a scale as possible, by late summer or early autumn of 1942. Given the code name of "Sledgehammer," it would be launched only if the Russian situation so deteriorated as to render it imperative. In June 1942 the British prime minister, Winston Churchill, with the chief of the imperial general staff, Gen. Sir Alan Brooke, went to Washington for further discussions. The situation now was more serious: there was a possibility of a complete Russian collapse, and the British forces in Libya were falling back before Rommel's fierce offensive. Studies had shown that Operation "Sledgehammer" was impracticable in 1942 because resources, particularly landing craft, were insufficient and troops could not be trained in time. Something had to be done urgently, however, and the North African campaign, Operation "Torch," was born. In July Gen. George C. Marshall and Adm. Ernest King went to London to amplify the project and to discuss details, and the launching date was fixed for the end of October.

In Jan. 1943, with the tide of war in North Africa setting in favour of the Allies, it was decided at the Casablanca conference that the build-up for a full-scale invasion of northwestern Europe should be resumed and that, concurrently, the bombing of Germany should be intensified. Submarine construction yards and critical industries sustaining the German war effort were selected as initial objectives.

In May 1943 the Trident conference in Washington set May 1, 1944, as the target date for Operation "Overlord," the new code name given to the northwestern European invasion. In September, at the Quadrant conference in Quebec, it was directed that the air attack on Germany from the United Kingdom should be supplemented by strategic bombing from Mediterranean bases. Lieut. Gen. Sir Frederick E. Morgan had been appointed chief of staff to supreme Allied commander ("Cossac"), and his outline plan was now approved in principle.

In Nov. 1943 the Sextant conference in Cairo decided to supplement Operation "Overlord" with an invasion of southern France, named Operation "Dragoon"; and these two were to be given overriding priority in the combined Allied war effort. At Tehran, in Dec. 1943, Stalin agreed to these plans.

Meanwhile the Allied air offensive against Germany was reaching its climax with an all-out 24-hr. attack, the U.S. bombers carrying out high-level daylight attacks and the British royal air force continuing with night attacks to undermine the morale of the German workers. The former concentrated mainly against aircraft and ball-bearing plants, aerodromes and communications, while the latter destroyed industries in the Ruhr and Rhineland. Under this hammering the German fighter command was progressively weakened by the destruction of the industries that maintained it and by air combat.

On Dec. 10, 1943, Eisenhower, appointed supreme commander of the Allied expeditionary forces, returned to England and set up his headquarters, known as S.H.A.E.F., into which he absorbed Cossac's planning staff. In February the following year he received his directions, which read:

> Enter the Continent of Europe, and, in conjunction with the other United Nations, undertake operations aimed at the heart of Germany, and the destruction of her armed forces. The date for entering the Continent is the month of May 1944. After adequate Channel ports have been secured, exploitation will be directed towards securing an

BATTLE OF NORMANDY

area that will facilitate both ground and air operations against the enemy.

1. Plans for "Overlord." — Experience gained in the Mediterranean theatre caused the plan as proposed by Cossac to be expanded, the assault force being increased from three to four divisions, and the assault beaches being extended from the Caen area so as to include part of the eastern coast of the Cotentin peninsula. These beaches a stretch of about 50 mi., were selected after detailed study of the coast line from Denmark to Brittany. They possessed the advantage of being less obvious places to choose than those in the strongly defended Pas-de-Calais area, nhile being within supporting range of fighter aircraft based in England. Their disadvantage was that their angle of slope was so shallow as to expose a wide expanse of foreshore at low tide, which might not stand up to the passage of many vehicles and tanks. They included no major port, but the plan envisaged the early capture of Cherbourg. To ease the constricted exits from the Cotentin beaches, which were isolated by floods, two air-borne divisions were to be dropped inland, and a third was to seize the bridges over the Orne river and the Caen canal and to protect the left flank.

Selection of the date for the assault was based upon a combination of tidal, moonlight and daylight conditions. The tide had to be low enough to enable the initial assault troops to land and to clear gaps through the beach obstacles. some of which were covered except at low tide. This tide condition had to coincide with a time and date giving light enough to permit visual bombardment by aircraft and naval vessels. Finally, moonlight was

required for the air-borne landings on the previous night. Mainly because of the shortage of landing craft, some of which had to come from the Mediterranean theatre, the date of the assault had to be postponed from early May to early June. On June 5, 6 and 7 the requisite conditions were expected; of these days, June 5 was selected.

For the initial assault, the Allied ground forces were placed under command of Montgomery. The British 21st army group comprised the Canadian 1st army (2nd corps) under Lieut. Gen. H. D. G. Crerar, the British 2nd army (1st, 8th, 12th and 30th corps) under Lieut. Gen. Sir Miles Dempsey and the British 1st and 6th air-borne divisions under Lieut. Gen. F. A. M. Browning. U.S. forces consisted of the 1st army (5th, 7th, 8th and 19th corps) and the 82nd and 101st air-borne divisions, under Lieut. Gen. Omar N. Bradley. For the landing, the U.S. 7th corps was to assault with the 4th infantry division just north of the Vire estuary ("Utah" beach), and the U.S. 5th corps with one combat team from the 29th and one from the 1st infantry division was to assault east of the Vire estuary on "Omaha" beach. The British 21st army group was to assault with the Canadian 3rd and the British 5th and 50th divisions on Ouistreham ("Sword"), Courseulles ("Juno") and Asnelles ("Gold") beaches, respectively.

The objective of the U.S. 7th corps and air-borne division was to cut the Cotentin peninsula and seize Cherbourg. The U.S. jth corps was to advance southward toward St. Lô and then, with the support of the 7th corps, to continue to Avranches and to hold a line facing eastward. Meanwhile, the build-up forces, consisting of the U.S. 3rd army under General Patton, was to land and to be prepared to capture the Breton ports.

The British 21st army group was to gain ground about Caen and to protect the left flank against an expected German counterattack. This area mas favourable to armoured action, and it was there that the first strong German reaction was expected.

By June 1944 there were in the United Kingdom 47 divisions (26 British, Canadian and Polish, 21 U.S.); each, with its anti-aircraft, tank and tank-destroyer elements, amounted to approximately 17,000 men. This gives an idea of the quite unprecedented size of this expeditionary force; but by May 1945 their strength had increased to more than 4,000,000 men, of which the U.S. provided about 2,585,000, the British Commonwealth 1,073,000, France 413,000 and the other Allies collectively 67,000. Table I shows the progressive build-up of the forces in the European theatre until the German surrender in May 1945.

The Allied naval component was commanded by Adm. Sir Bertram Ramsay and was composed of two task forces, the western task force being U.S., the eastern British. Each was subdivided into a bombarding force and an assault force to land the assaulting troops on the five beaches. The total strength of this component exceeded 5,000 ships; viz., 4,000 assault and "ship-to-shore" craft, 6 battleships, 2 monitors, 22 cruisers and 93 destroyers, together with other miscellaneous craft.

Air Chief Marshal Sir Trafford Leigh-Mallory commanded the Allied air component of the expedition, which amounted to 4,900 fighter and 5.800 bomber aircraft grouped into tactical air forces. The strategic air force under Air Chief Marshal Sir Arthur Harris, consisting of R.A.F. bomber command and the 8th and 15th U.S. air forces, remained directly responsible to the combined chiefs of staff, though Eisenhower was authorized to call upon it if needed.

Supplies for this colossal undertaking had been accumulating in the United Kingdom since 1942. By June 1944 the monthly import had reached a total of 1,900,000 tons, and for the invasion 2,500,000 tons were required additional to normal loads carried by the troops themselves. Delay in the acquisition of a major port to handle this tonnage had been foreseen, and to meet this need a novel expedient was devised: two artificial harbours, called Mulberries. with breakwaters, quays and piers, each with the capacity of a medium-sized modern port, were prefabricated in the United Kingdom. These mere to be towed across the channel (a major naval operation) and assembled at two sites on the landing beaches, one for the U.S. forces and one for the British.

Further to ensure secrecy during the preparatory stages for "Overlord," an embargo was placed upon the movement of diplomatic personnel and upon their communications with their several foreign offices.

2. Western Europe before Invasion. — In western Europe, by June 1944, the Germans had about 60 divisions, or about a quarter of their total field force, under Field Marshal Gerd von Rundstedt; and of this force, 36 infantry and 6 panzer divisions were located in the coastal area facing England. The German 15th army held the Pas-de-Calais, where the main Allied assault was expected, and this error of judgment, which the Allies sedulously fostered, was to prove a major factor in the German defeat in Normandy. The 7th army, under Rommel, was located in Normandy, where the Allies actually landed, and consisted of one panzer and nine infantry divisions.

Against an invasion, the Germans had built their "Atlantic wall," which, according to Hitler. consisted of "a belt of strong points and gigantic fortifications from Norway to the Pyrenees." Along the beaches were successive rows of varying obstacles, some lying under water and many with mines attached to them.

During the spring of 1944, the Allied strategic air force concentrated its effort against European synthetic fuel plants and crude oil refineries, reducing production by 95% by the summer. Subsequently, it began directly to pave the way for the invasion by attacking bridges over the Seine and the Loire on road and rail routes leading into the area of operations, thus isolating the area so that the Germans would not be able to reinforce it.

For several months before the invasion, however, the British government and chiefs of staff had been mystified by the appearance on the French coast, particularly in the Pas-de-Calais, of several unidentifiable erections. It was thought that they were connected with some form of missile to be used against targets in England. and they were heavily bombed. They were, in fact, launching sites for "Hitler's secret weapons." the jet-propelled pilotless aeroplane (V–1) and the rocket bomb (V–2). The heavy bombing of the sites undoubtedly delayed the initial launching of these weapons until June 13, without which delay they might have disrupted the British war effort by making London uninhabitable or at least have caused havoc to the invasion plans and postponed its launching for several months.

The Germans launched about 18,000 V–1s between June 13, 1944, and March 29, 1945, of which 7,840 were fired at England (4,260 of these being destroyed in the air) and the rest at targets on the continent. Between Sept. 8, 1944, and March 29, 1945, they fired 3,000 V–2 rockets, of which 1,250 were directed at England and 1,750 at Antwerp in Belgium. These weapons collectively caused about 31,600 casualties in England and at least as many on the continent.

3. Beginning of the Assault. — During the weeks preceding D-day (as the date fixed for the invasion was called), the vast Allied armada of ships and landing craft had been assembling at every port, great and small, along the south coast of England. Concurrently the massive assaulting forces had been approaching that coast. During the last few days, the complicated task of loading them began. The Allied air forces had done their work so well that practically no hostile aircraft appeared over the area.

On June 4, rough weather in the channel forced Eisenhower to postpone D-day to June 6. At 1:30 A.M. on June 6, then, parachutists of the U.S. 101st and 82nd air-borne divisions began to drop beyond Utah beach and others of the British 6th air-borne division to drop east of the Orne river. Shortly after midnight R.A.F. bombers started to unload 6,000 tons of bombs on coastal batteries between Cherbourg and Le Havre. As day broke, U.S. heavy bombers dropped 3,000 tons on the shore defenses during the half-hour preceding the landings. Then medium, light and fighter bombers swarmed in to attack individual targets among the defenses. Again because of what the air forces had done during the preceding months, the Germans reacted little in the air.

The first troops disembarked at 6:30 A.M. under a heavy supporting fire of naval guns as well as of tanks and artillery pieces firing from tank-landing craft. Although still heavy, the sea had moderated; but some of the craft mislanded. partly because of the force of the current. First came tanks, some with jettisonable flotation attachments, but most of this type were lost. Next came infantry to cover the engineers and naval crews who were to blast gaps through the beach defenses, and then came successive waves of the assault infantry with their supporting weapons. Heavy resistance at some points caused serious losses to the assault waves; but the attacking forces stormed their way through the defenses, and by nightfall the five sea-borne assaulting divisions were firmly ashore. Integrating their efforts with those of the ground and naval forces, aircraft of all types contributed in large measure to the success of this critical day.

Differences between the German commanders, Rundstedt and Rommel, on the conduct of the defense also contributed much to the Allied success. Rommel wanted to destroy the invaders on the beaches, Rundstedt to check and to contain them and then to deliver a series of well-prepared counterattacks. Rommel, however, had his way; but, pinning his faith on the coastal fortifications, he had prepared few inland defenses and used his immediate reserves piecemeal in an effort to kill the invasion in the forward area. Once the Allied troops breached the Atlantic wall, he could never collect a mobile reserve large enough to endanger the beachheads. Moreover the preliminary isolation of the battle area by the Allied air forces prevented his receiving any further reinforcements speedily.

Attacking through difficult hedgerow country, the British and Canadians pressed on toward Caen, taking Bayeux on June 7. The U.S. forces worked down to join up the beachheads about Carentan. By June 11, one solid front had been established.

There followed six weeks of gruelling fighting in which the Allies expanded the lodgment area and built up forces for their future break-out. The U.S. 7th corps cut the Cotentin peninsula on June 17 and, pushing northward, captured Cherbourg nine days later after heavy fighting; but the port's installations had already been thoroughly demolished by the Germans and unloading could not begin until July 19. Meanwhile the Mulberry harbours, having been towed across the channel, were being assembled on the beaches; but a heavy storm on June 19 completely wrecked the Mulberry serving the C.S. beaches, although that serving the British was repaired and kept in service until Antwerp became available in November. Throughout the summer months, the major passage of reinforcements and supplies was over the beaches or via this Mulberry; during the first six days of the invasion 326,000 troops, 54,000 vehicles and 100,000 tons of supplies passed along these routes, and by November the totals had reached 2,628,240 men, 549,664 vehicles and 4,522,192 tons.

During the latter days of June the British maintained their pressure toward Caen despite desperate but piecemeal efforts of German armoured units which revealed the German resolve to prevent, at all costs, a break-through up the Seine valley toward Paris. Caen fell on July 9, and after the capture of Cherbourg the U.S. 7th corps turned toward the south with the U.S. 8th and 19th corps and cleared the Cotentin peninsula. On July 18 St. Lô was taken. (A. W. LE.)

The moment had now arrived for a break-out from the lodgment area. Eisenhower decided to put to good account the German tenacity on the east flank by continuing to punch hard in that region and following with a smashing right-hand blow. Preceded by a powerful air assault by bombers and lighter aircraft, on July 18 British and Canadian forces renewed their drive in the Caen area. Dogged resistance was aggravated by bad weather, but on July 25, again preceded by a powerful air bombardment, the attack of Bradley's forces against the Germans beyond St. Lô was launched. Complete success was achieved; Coutances mas captured on July 28, parts of several German divisions being cut off to the north. Only now, too late, did the Germans recognize the Allied main effort and decide to bring reinforcements to this region from the army which had been retained in the Pas-de-Calais.

Patton's 3rd army officially came into existence on Aug. 1 when he took command of the U.S. 8th, 12th, 15th and 20th corps; the 5th. 7th and 19th corps remained with Lieut. Gen. Courtney H. Hodges' 1st army, both under Bradley's 12th army group. Crerar's Canadian 1st army had become operational on July 23, and Crerar now commanded the British 1st and Canadian 2nd corps on the east flank, which, with Dempsey's British 2nd army, formed Montgomery's 21st army group. On Sept. 1 Eisenhower was to assume personal direction in France of all operations, at which date the supreme headquarters, Allied expeditionary force (S.H A.E.F.), was established officially on the continent.

Pouring through the breach in the St. LB-Coutances line, the 3rd army seized Avranches on July 31 and, in a swift amputation of the Breton peninsula, reached Nantes on Aug. 10.

With the collapse of the Germans on the west flank, Eisenhower decided once more to adapt his plan to his opportunities and, despite his need for the Breton ports, to turn his back upon them and make a wide encirclement of the German 7th army and panzer group (west), which were still, with great obstinacy, holding their ground. Leaving to his 7th corps the task of reducing the Breton ports, Patton in a rapid advance overran Mayenne, Laval and Le Mans and on Aug. 13 reached Argentan.

As part of the manoeuvre, the U.S. 1st army and the British forces had maintained their pressure from the north and west. In a desperate effort to checkmate this offensive, on the express instructions of Hitler himself, Field Marshal G. von Kluge, who had succeeded Rundstedt, launched a major armoured attack. supported by infantry, from the Mortain area toward Avranches with the hope of cutting off Patton's army from the rear. Prepared for the blow, Bradley attacked the flanks of the moving German columns; and at the same time the Allied air forces blasted them from above

After this failure the Germans strove desperately to hold open the gap between Falaise and Argentan in order to extricate the forces caught in the pocket which the Allies were steadily squeezing; but by Aug. 22 the pocket was eliminated, the Polish 1st armoured division having distinguished itself in this operation. Although many were able to escape, the Germans lost 500,000 men (mostly captured) and a great proportion of their equipment, and their 7th army was virtually annihilated as an organization. An interesting feature of the rapid advance of the 3rd army was that the ground protection of its open right flank was carried out by the 19th tactical air command. Air power also played its part in the liquidation of the German 7th army by persistent attacks against its communications and by raking German columns as they retreated across the Seine.

4. Launching of Operation **"Dragoon."**—Meanwhile, on Aug. 15, Operation "Dragoon," the invasion of southern France, which had been agreed on at the Sextant conference in Cairo, Nov. 1943, had been launched. The demands of the operations in Italy, together with the necessity for transferring forces and landing craft for the cross-channel expedition, repeatedly overshadowed the plans for this invasion and finally occasioned its postponement from the originally planned date of early June. However, Eisenhower's needs for additional port capacity soon pointed to the desirability of the early capture of Marseilles. Moreover, such an operation would contain and destroy German forces which might otherwise oppose him and would also threaten the flank and rear of the main forces which already faced him.

Measures were taken to organize and arm large forces of French patriots who were to lend valuable support to Allied operations. On July 30, 1944, Lieut. Gen. Jacob L. Devers organized the 6th army group headquarters in Corsica; and Lieut. Gen. Alexander M. Patch was placed in command of the U.S. 7th army to carry out the landing.

After prolonged aerial attacks against the communications serving this region. on Aug. 15 at 8 A.M. the 7th army, escorted by a powerful fleet of British and U.S. warships and under their gunfire, landed on the beaches between Cap Cavalaire and Agay. the area which offered the most favourable approach to the RhBne valley. The assault forces consisted of the U.S. 6th corps with the 36th division on the right, the 45th division in the centre and the 3rd division on the left, Most of the U.S. forces had been loaded at ports in the Naples area, the French forces at Oran, Taranto and Brindisi. A British-U.S. air-borne task force jumped astride the Ardens river west of St. Raphael the night preceding the assault and seized the pass through which the Allied forces would debouch.

It had been estimated that there were 11 German divisions in southern France, 2 of them armoured, but that only 3 would be ready to oppose the landing immediately. Weak resistance was in fact encountered, the beachheads were promptly established and the main forces moved west toward the RhBne valley.

On the heels of the 6th corps, four divisions of Gen. Jean de Lattre de Tassigny's French 1st army went ashore. By Aug. 28 Toulon and Marseilles were in Allied hands and by Sept. 1 Nice had fallen. Meanwhile, part of the 36th division headed directly north, seized Grenoble and turned northwest to cut off the Germans who were retreating up the RhBne valley. This drive into the rear of the German 19th army, already under pressure from the south. together with the havoc caused by the air forces, caused it to fall back in confusion. On Sept. 3 Lyons fell.

On Sept. 15, after effecting a junction with Patton's forces at Sombernon (northwest of Dijon), the U.S. 7th and French 1st armies, forming Devers' 6th army group, passed to Eisenhower's command.

5. The Advance to the German Frontier.—In northern France, meanwhile, the Allied armies were hard upon the heels of the retreating Germans. As Allied strategy called for the main effort on the northern flank, the Canadian 1st army in a rapid sweep isolated the channel ports, reaching Bruges on Sept. 9 and so overrunning the majority of the flying-bomb sites in the Pas-de-Calais. The channel ports themselves were captured as separate operations, Le Havre falling on Sept. 12, Dieppe on Sept. 1, Boulogne on Sept. 23 and Calais on Sept. 30. The British 2nd army, advancing on the right of the Canadian 1st army, took Amiens on Aug. 31 and occupied Antwerp virtually intact on Sept. 4, though the Scheldt was still in German hands.

The U.S. 1st army crossed the Seine, east and west of Paris, capturing Soissons. Then, turning east, it freed Namur on Sept. 5, Liège on Sept. 8 and Luxembourg two days later. Eisenhower had left to the French 2nd armoured division the honour of receiving the surrender of Paris on Aug. 25. In its pursuit, the

1st army cut off and surrounded large pockets of Germans between Compiègne and Mons, taking 25,000 prisoners. Simultaneously, the U.S. 3rd army swept eastward, capturing Reims and Châlons; then, overrunning Verdun on Sept. 1, it gained a foothold beyond the Moselle on Sept. 7. On their right was the U.S. 7th army, which had made a remarkably rapid advance up the Rhône valley. A continuous front thus now ran from the Netherlands along the French frontier to Switzerland and thence to the Mediterranean.

The Germans were now withdrawing into the defenses of the Siegfried line, the "West wall" covering the German frontier; but large forces were still isolated in France, of which one block of 20,000 surrendered along the Loire. French ports along the western channel and Atlantic coast were still in German hands, but Eisenhower made no attempt to reduce them after the experience at Cherbourg and Brest, where the Germans reduced the port installations to ruins. The U.S. 9th army under Lieut. Gen. W. H. Simpson was created on Sept. 5, and its 8th corps (2nd, 8th and 29th divisions) finally reduced Brest on Sept. 18. On Oct. 3 the 9th army took over a sector of the line between the 1st and 3rd armies.

Not only was the German resistance stiffening as Allied troops closed up to the West wall, but the unprecedented speed of their advance had caused them to outrun their supplies; so that slowly the armies came to a halt. Herculean efforts were made to maintain the flow of supplies from the Normandy beaches and Mulberry harbour along the ever-lengthening lines of communication. Aircraft were employed, and the famous "Red Ball highways," which consisted of an almost continuous line of vehicles operating throughout 24 hr. over certain arterial routes, were established. Fuel pipes were laid from depots in England under the channel to points on the French coast and were carried forward behind the troops as fast as the engineers could lay them. Collectively, these measures saved the day.

The Allied forces were now up against the German West wall defenses. On Sept. 17 a brilliant large-scale air-borne attempt was made to turn the northern flank of this position by the establishment of a bridgehead over the lower Rhine, about 60 mi. in advance of the Allied line. The 1st air-borne army had been formed on Aug. 8 under the command of Maj. Gen. Lewis H. Brereton, consisting of the U.S. 17th, 82nd and 101st and the British 1st and 6th air-borne divisions. On three previous occasions it had been intended to use this army to drop in the rear of the retreating Germans so as to cut them off; but the speed of the Allied ground advance had rendered it unnecessary. Now it was decided to employ it, in conjunction with the ground forces, for this Operation "Market-Garden." In "Market," the air-borne operation, the British 1st division was to be dropped at Arnhem to establish the actual bridgehead over the lower Rhine; the U.S. 101st division was to be dropped north of Eindhoven to secure the crossings over the Scheldt-Meuse canal; and the U.S. 82nd division was to be dropped below Nijmegen to seize a crossing over the Meuse. The whole operation entailed the dropping of more than 20,000 men with their equipment and vehicles by parachute, as well as nearly 14,000 gliders. In "Garden," the ground forces' operation, the British 2nd army was to advance over the crossings seized by the 101st and 82nd air-borne divisions and to join up with the 1st air-borne division at Arnhem. Initially, all went well, the ground forces linking up with the two U.S. air-borne divisions and advancing jointly to capture the Waal river bridge at Nijmegen. Meanwhile, the 1st air-borne division at Arnhem was fighting for its life to hold the bridgehead; after desperate and costly efforts to hold on, the remnants of it, now only 2,400 strong, were forced to withdraw, on Sept. 25, before the ground forces could link up with them.

Montgomery (promoted to field marshal Sept. 1) now turned to opening the port of Antwerp. With naval and air support, Canadian and British forces attacked South Beveland and Walcheren Islands at the mouth of the Scheldt and completed their capture on Nov. 9. The estuary was swept and the first ship unloaded at Antwerp on Nov. 26. This important step materially eased the supply situation. Appreciating its importance to the Allies, the Germans for many months maintained a harassing bombardment of Antwerp with flying bombs and rockets but were unable to prevent, or even seriously delay, unloading operations.

The U.S. 1st army entered Germany near Trier on Sept. 11, breached the Siegfried line north of Aachen on Oct. 2 and captured that German city on Oct. 21. South of Metz, the 3rd army fought its way across the Moselle, taking Nancy on Sept. 15. In the Vosges the 7th army came up abreast of it. But with the approach of winter unusually heavy rains set in.

With Antwerp operating, Eisenhower could now complete his drive to the line of the Rhine. By Sept. 30 German casualties were approaching 1,000,000 in number; but rather than maintain a flexible defense, the Germans once more elected to contest every foot of the ground, with the result that they were decisively defeated west of what would have been for them a formidable natural defensive line. Conversely they yielded to the Allies that barrier behind which the latter could, with relative impunity, concentrate their forces at any point they desired for the final assault.

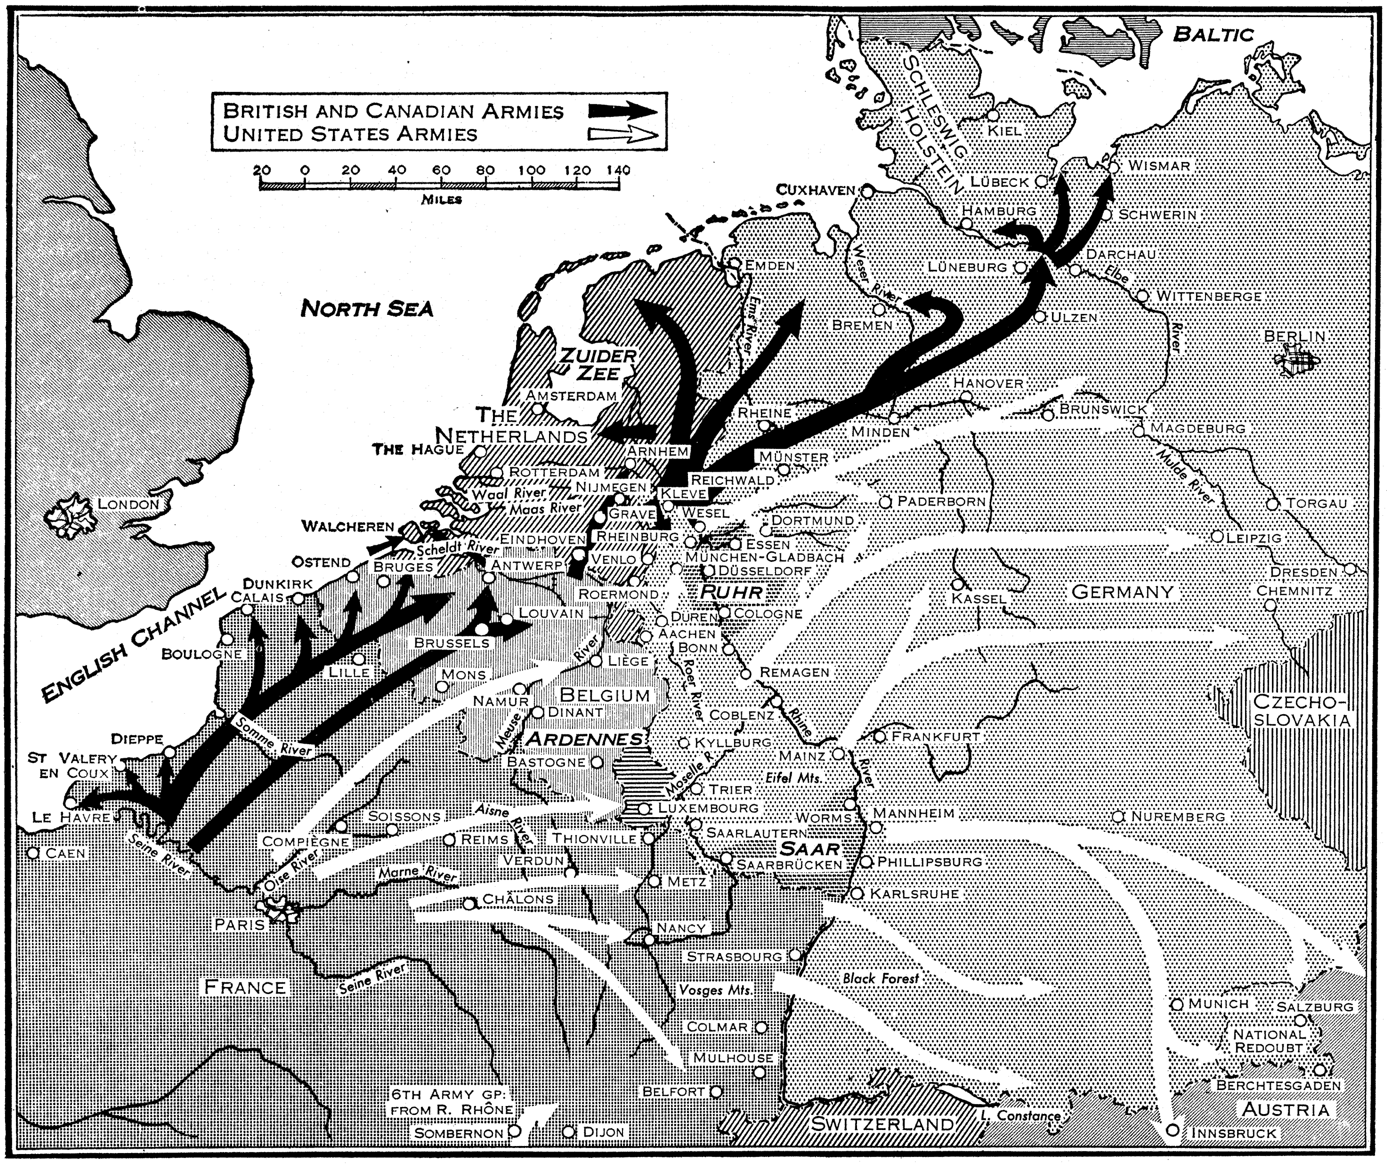
On Oct. 23 the 9th army was moved to the north flank of the 1st army and on Nov. 16 the 1st and 9th armies resumed their drive-toward the Rhine in the Aachen sector. Aided by powerful air support, U.S. troops in bloody fighting moved forward into Hiirtgen forest, and on Dec. 3 the 9th army reached the Roer (Rur) river. The Germans still held the series of dams higher up this river near Schmidt; and after air attacks had failed to destroy them, the 1st army on Dec. 13 undertook their capture lest the Germans, by releasing the waters, should flood the Roer at the moment of the 9th army's crossing.

East of Thionville the 3rd army had crossed the German frontier on Nov. 18 and reached the Siegfried line near Saarlautern. The last forts of isolated Metz finally fell on Dec. 13.

Belfort was captured on Nov. 22 by the French 1st army, which reached Mulhouse the same day; and the U.S. 7th army, which had reached the Rhine, took Strasbourg on Nov. 23. Between the prongs of the Allied advances at Strasbourg and Mulhouse the Germans were able to maintain a bridgehead west of the Rhine, known as the Colmar pocket, which was not liquidated until Feb. 1945.

6. The Counteroffensive in the **Ardennes.**—In order to make the powerful attacks in the Aachen sector and in the Saar, the Allied front had necessarily been left thin in some regions. This was the case in that sector of the Eifel hills between Monschau and the Moselle. It was there that Hitler decided to launch a desperate counteroffensive, presumably with the hope of capturing Liège and Antwerp and thus disrupting the Allies' supply system and severing their forces. Important, too, was the prospect of dampening the offensivedetermination of the Allied command. S.H.A.E.F. was alive to the possibilities of such an attack but felt that the German military leaders would hesitate to underlake a counteroffensive in this unfavourable terrain and with such faint hope of success. The Germans had taken meticulous precautions to ensure the secrecy of their preparations. Second-class Volksgrenadier divisions had gradually replaced panzer divisions in this sector, and the knowledge that the attack was to be made had been limited to a very few senior commanders.

On Dec. 16, aided by extraordinarily heavy fog, the Germans attacked. The first brunt of the assault was borne by the U.S. 4th, 28th, 106th infantry and 9th armoured divisions. Eisenhower at once alerted the army commanders to hold their free divisions ready for support if needed, and the 101st air-borne division was rushed into Bastogne, where it held out for five days. Eisenhower directed that the shoulders of the penetration be held, and all attacks elsewhere halted. Patton was to make a major counterattack in the direction Bastogne-Cologne. An attack by Montgomery from the north was to follow. A monumental piece of staff work was performed by the 3rd army, which, during a period of six days, broke off its general attack in the Saar region, faced to the left and mounted this new attack with six divisions, while Devers was instructed to extend his left flank to cover the front vacated by the 3rd army. By Dec. 19 the German penetration had become so deep as to impair Bradley's communications with



FROM PAMPHLET ISSUED BY BRITISH 21ST ARMY GROUP

SEINE TO THE BALTIC

his armies. Eisenhower therefore placed under Montgomery's command all U.S. troops on the northern face of the salient (the 9th and most of the 1st army), leaving to Bradley's control troops on the southern face.

The Germans in their attack used three armies, the 5th and 6th panzer and the 7th armies, including the 14th infantry and 10th panzer divisions. They also employed a panzer brigade using U.S. equipment with the mission of spearheading German combat units and spreading panic and confusion behind the U.S. front lines. Paratroops, dropped throughout the battle area as far to the rear as Paris, were to sabotage important bridges and headquarters. Although the penetration at its maximum reached a depth of about 50 mi. it never reached the Meuse; and since Bradley had not established any major installations east of the river in that region, this advance was not alarming. After the war it was learned from Rundstedt that the German high command privately conceded its failure when within 48 hr. it had failed to reach the Meuse. The prompt Allied measures proved successful, and by Jan. 25, 1945, the original front had been re-established. Simultaneously with this attack, Devers' 6th army group had also sustained a German assault. The net effect of the German effort was a delay in Allied operations of perhaps six weeks and a loss to the Germans of nearly 250,000 men, 600 tanks and assault guns and about 1,600 aeroplanes. The attack cost the Allies about 60,000 casualties. After this battle, the German 6th panzer army departed for the eastern front, taking seven panzer and three infantry divisions and virtually removing the last threat to the continuous advance of the Allied forces on the western front.

7. The Drive for the Rhine.—Eisenhower now resumed his manoeuvres to destroy the Germans west of the Rhine and to reach the banks of that river. These operations were performed in three successive steps: first, Operations "Veritable" and "Grenade," next, Operation "Lumberjack" and finally Operation "Undertone." On Feb. 8 "Veritable" was launched in difficult thaw and flood conditions resulting from the heavy January snows. Attacking from the Nijmegen area southeastward between the Rhine and the Meuse, the Canadian 1st army, in bitter fighting, forced its way through the Reichswald to the outskirts of Cleve and on Feb. 14 reached the Rhine at the site of the Allies' future major crossing. On Feb. 23, "Grenade" was launched. But before the U.S. 1st army captured the Roer dams (Feb. 10) as a preliminary to it, the Germans had opened the sluices of the Schwammenauer dam, causing the level of the Roer to rise about 4 ft. and thus delaying "Grenade" by 13 days. The 7th corps of the U.S. 1st army and the 19th and 13th corps of the 9th army crossed the flooded river, cleared Jülich and Düren on Feb. 24 and 25 and rapidly gained momentum. By March 1 the 9th army had cleared München-Gladbach and had reached the Rhine at

Neuss. This threat to ihe Germans' rear, coupled with frontal pressure, resulted in their withdra al across the Rhine of all units below Neuss.

The next operation was "Lumberjack," in which the 1st army advanced on the right flank of the 9th army; by March 7 it had captured Cologne. Farther south, on the same day; troops of the U.S. 9th armoured division seized an opportunity by crossing at Remagen the one bridge spanning the Rhine that the Germans had not yet demolished. Bradley mas ordered to put not fewer than five divisions promptly on the far bank. Despite the Germans' frantic efforts to retrieve their error, the 1st army on March 23, when the main crossings of the Rhine were begun, had three corps beyond Remagen in a bridgehead 25 mi. long and 10 mi. deep. On the right the 3rd army was pushing through the rugged Eifel hills, crushing the German front north of the Moselle; on March 9 it reached the Rhine just below Coblenz.

The third step was Operation "Undertone," a combined offensive by the U.S. 3rd and 7th armies. Instead of further exploiting the Remagen bridgehead. as the Germans might have expected, the 3rd army attacked southward across the hfoselle, behind them. in the Saar region; and on March 1j the Germans were attacked frontally by the 7th army. Zweibrucken and Saarbrücken were occupied by March 20, the Siegfried line defenses collapsed, and by March 22 Mainz had been occupied by the 3rd army. That night Patton sent his 5th division across the Rhine, and by March 25 all organized resistance ceased west of the river.

In all these activities the air forces had played a conspicuous part. Particularly in the Saar offensive the tactical air units effected noteworthy destruction upon German rail and road traffic. On Feb. 22 one single operation had involved nearly 9.000 aircraft from bases in England, France, the Netherlands. Belgium and Germany which attacked targets over an area of 250,000 sq.mi. extending from Emden to Berlin, Dresden, Vienna and Mulhouse. Their widespread blows struck minor communications facilities such as railroad signal points and grade crossings, canal locks and junctions. Against such attack the Germans could make no defense.

8. Crossing of the Rhine; the Ruhr Pocket.—Maintaining his main effort on the north flank, Eisenhower now forced the Rhine. Under Montgomery the U.S. 9th army and British 2nd army began their crossing at 9 P.M. on March 23 near Wesel. Shortly after the ground assault the Allied 1st air-borne army dropped the 18th air-bone corps (U.S. 17th and British 6th air-borne divisions) north and northwest of Wesel. On the left flank the Canadian 1st army guarded the Scheldt estuary and then followed the other two armies across the river. The whole operation was preceded by air attacks which severed all communications with the Ruhr. Since the Germans still had a number of jet aircraft which effectively assisted their defense, the airfields upon which these aircraft were being concentrated were heavily bombed from the air. The crescendo of air attacks reached a climax at the moment of the assault of the Rhine: from March 21 to March 24 British and U.S. air forces based in the United Kingdom and the continent flew more than 42,000 sorties against Germany.

The major crossing met relatively light resistance; contact was made promptly with the air-borne troops. Meanwhile, the U.S. 1st army attacked in the Remagen area and, breaking out to the southeast on March 26, raced toward Frankfurt. Farther up the Rhine the 3rd army crossed at several points and, clearing Frankfurt, joined hands with the 1st army in a plunge toward Cassel. On March 26 the 7th army crossed the Rhine near Worms and three days later captured Mannheim. On April 1 the French 1st army crossed the Rhine at Phillipsburg.

Now occurred another brilliant operation which constituted one of the outstanding military successes of the campaign. Racing toward Munster, the armoured elements of the 9th army swung round the north flank of the Ruhr and near Paderborn made contact with 1st army elements which had swept round the south flank of that area, thus trapping within the industrial heart of Germany the whole of the German army group C and two corps of the army group H. On March 30 the 15th army under Gerow had moved into the line along the Rhine opposite the Ruhr. Leaving strong forces to contain and reduce the defenders in the Ruhr, the 9th and 1st armies swept eastward and. with this huge operation still continuing at their backs, maintained their momentum toward the Mulde and Elbe valleys. On April 18 the Ruhr pocket was finally liquidated; German prisoners totalled 325,000, including 30 generals.

9. The German Collapse.—As the Russians were now at the gates of Berlin. Eisenhower decided to throw the weight of his advance toward Leipzig and thus cut the remainder of Germany in half. Jena. Chemnitz and Leipzig fell, and on April 18 the Allied armies set foot in Czechoslovakia. On April 25 patrols of the 273rd regiment, 69th division, jth corps, of the U.S. 1st army met Russian patrols in the vicinity of Torgau on the Elbe, thus effecting the junction of the eastern and western Allies.

Meanwhile, Montgomery's forces were sweeping the north German plains. The British 2nd army crossed the Weser and reached the Elbe on April 19, Bremen was captured on April 26 and Hamburg one week later. Pushing northward through the Netherlands, the Canadian 1st army cleared the area east of the Zuider Zee by April 21. Arnhem fell on April 1j, and the Germans withdrew into Fortress Holland beyond the Grebbe and New Water defense lines which had been built by the Dutch before the war. Had they been pursued there they would have opened the dikes. Eisenhower therefore reached an agreement with Arthur Seyss-Inquart, the nazi commissioner for the Netherlands. on April 30, whereby the Allied forces were to stand on the Grebbe line and the Germans were to cease flooding the country and to allow the introduction of food to the Dutch by land, sea and air. No further progress was made in the western Netherlands until the German troops surrendered simultaneously with those in northern Germany.

Covering the right flank of the 12th army group, the 7th army in early April pushed through Schweinfurt to Nuremberg, where stiff fighting delayed its fall until April 20. Karlsruhe fell to the French 1st army on April 4, Kehl on the 15th; and the Germans along the upper Rhine retired to the Black forest.

Evidence had reached S.H.A.E.F. that the German government intended to leave Berlin and to seek refuge in the "national redoubt" in the Berchtesgaden area. Into this mountainous region Eisenhower directed the 6th army group. On April 30 the 7th army captured Munich. Berchtesgaden and Salzburg fell on May 4. By this swift advance the possibility of resistance within the redoubt was dissipated. On the same day. elements of the 103rd division. 6th corps, which had pushed through Innsbruck and the Brenner pass to Vipiteno in Italy, met the 88th division of the U.S. 5th army.

Simultaneously, the French 1st army broke through resistance in the Black forest and pushed along the southern,boundary of Germany to Lake Constance, making contact with the 7th army at the western end of the redoubt. Farther east the western Allies had extended their contacts with the soviet forces.

Meanwhile. back in France. the French forces with powerful air assistance had on April 14 launched an attack against the Germans resisting at the mouth of the Gironde. which was cleared with the reduction of the island of Oltron on May 1. St. Nazaire and Lorient held out until the final surrender of the German army.

Hitler having disappeared, the German forces surrendered piecemeal. On May 5 Adm. Hans von Friedeburg arrived at Reims to represent Adm. Karl Donitz, who had taken over the direction of the German state. Gen. Alfred Jodl arrived the following day. Friedeburg and Jodl attempted to play for time in negotiating the surrender, presuinably to allow the remaining German forces to surrender to the western Allies rather than to the Russians; but under the threat that Eisenhower would seal his front within 48 hr., Donitz authorized the acceptance of Eisenhower's demands for unconditional surrender. At 2:41 A.M. on May 7 the act of surrender was signed by Jodl. to become effective at midnight May 8–9. This act mas ratified at Berlin on the night of May 9.

Casualties in these operations for the reconquest of Europe were heavy, the Germans losing in the region of 80,000 dead, 265,000 wounded and probably a considerable proportion of the

500,000 reported missing before the German surrender. Allied casualties were also heavy, amounting to approximately 187,000 dead, 546,000 wounded and 110,000 missing.

10. Summary. — Among the purely military reasons for Germany's defeat, the following are perhaps the most noteworthy: (1) faulty appreciation of the Allied intentions, which arose partly from Allied air superiority and partly from a fostering of the German error by the Allies before the landing in Normandy; (2) the destruction of German war industries and communications by Allied air forces; (3) the initial German failure to provide defenses in depth in Normandy, with the result that, once the Atlantic wall had been breached such reserves as mere available had to be used piecemeal; (4) the German stubbornness in fighting for every mile of ground, at tremendous expense of men and materials, which they could ill afford; (5) superior generalship, inexhaustible supplies and meticulous planning on the part of the Allies; (6) the two-front war, which Hitler himself had originally condemned but subsequently brought upon himself.

(T. N.; A. W. LE.)

III. THE CHINESE-JAPANESE WAR (1937–45)

A. PRIOR TO PEARL HARBOR

The overt act which made the Chinese-Japanese war inevitable was the Mukden incident of Sept. 18. 1931, when Japanese garrisons in the vicinity of that important northeast city forcibly took over control from the Chinese authorities. But this incident was only a manifestation of a long-planned Japanese policy for continental Asia which became evident after the Chinese-Japanese War of 1894–95. This war resulted in Japan's occupation of Korea and gave the island empire a foothold on the mainland.

1. Background of War.—After the Russo-Japanese War of 1904–05, Japan officially proclaimed the annexation of Korea. At the same time it began to exploit China's three northeastern provinces, obviously with a view to converting them into a base for the establishment of its continental empire. In the wake of World War I, Japan extended its control from the northeast to north China. At this time it acquired a mandate over the German islands in the Pacific which it began to fortify. Thus, with the simultaneous execution of Japan's twin programs of northward and southward expansion, what were later publicized as the New Order in East Asia and Sphere of Co-Prosperity in Greater East Asia gradually assumed physical shape. Because of abundant coal and iron deposits and the agricultural products in the northeast which Japan needed, together with its available manpower, in order to fight for world hegemony, the northeast became the first victim of Japan's ambition for territorial conquest. But no sooner had it considered its exploitation of the northeast complete, than it began to proclaim that north China was its "lifeline."

The Japanese adopted a policy of divide et *impera* in interfering with political and military affairs in China, Throughout the years of internal strife after the inauguration of the republic, Japanese intrigue or instigation in one form or another was always present. The Northern Punitive expedition, led by the Chinese Kuomintang, came to a successful end in 1928, and two years later national unification, though in crude outlines. became a reality in China. A unified China, however, was anything but agreeable and tolerable to Japan. The foreign policies of European and American nations were none too harmonious following the world economic depression of 1929 Capitalizing on this situation, Japan took a Sold step forward and invaded the northeast on Sept. 18, 1931.

After taking Mukden, Japan adopted an attitude of caution and "pulse feeling." Not being prepared for the invasion, China, on the one hand, offered what resistance it could muster to the onslaughts in Heilungkiang (northernmost province) and other places. On the other hand, it tenaciously maintained its adherence to the League covenant. the Nine Power treaty and the Anti-War pact and appealed to the League of Nations and the world at large.

In a proclamation to the world on Nov. 14, 1931, China pledged full support of the "sanctity of treaties" and urged the friendly nations signatory to the various pacts to "fulfill their obligations undertaken thereunder in order that peace in the Far East and the world may not be endangered by Japan and that international justice and humanity may not be bludgeoned into submission by brute force." For China was thoroughly aware of Japan's designs. Consistently it warned the world that the northeast issue and the Sino-Japanese conflict constituted a vital, integral part of the over-all problem of world peace.

China demanded the application of articles xv and xvi of the covenant of the League of Nations, which would mean imposing economic sanctions against Japan, but without success. As the second choice, article x of the covenant was invoked. The result was the organization of the Lytton Inquiry commission of the League of Nations.

On the eve of the arrival in China of the commission, Japan moved again. It occupied still more cities and towns in the northeast. It started hostilities in and around Shanghai (Jan. 1932) in an attempt to menace the Chinese national capital. Determined resistance by the Chinese brought Japan to the bitter realization of the futility of intimidation. So it signed an agreement with China for cessation of hostilities in and around Shanghai.

Frustrated in the south, Japan turned its attention to the north. In March of the same year, it established puppet Manchoukuo at Changchun, northeast railroad centre, with Henry Pu Yi, last emperor of the deposed Ching (Manchu) dynasty. on the throne. In addition, under Japanese instigation and coercion, a puppet Mongolian autonomous government appeared in Inner Mongolia.

Meanwhile, the general attitude of the League of Nations was one of appeasement and timidity. It was slow to act. Worse still, the proposal of Henry L. Stimson, then U.S. secretary of state, which called for an appeal to the Kine Power treaty and the adoption of joint action by the member states, brought no response from the powers in Europe. The impotency of international treaties and the League structure made Japan all the more audacious.

Thus, the existing peace structure, the League of Nations, was flouted by Japan. Then the inevitable took place. Other aggressive, ambitious nations were encouraged to follow suit. Benito Mussolini invaded Ethiopia. Adolf Hitler marched into the Rhineland, annexed Austria and dismembered Czechoslovakia.

China, although nor. adequately equipped to wage a major war, was nevertheless impelled to hasten its preparation for such an eventuality. In so doing it had to trade space for time. For instance, in the hostilities of 1933, despite the desperate resistance of its soldiers, China had to yield the provincial seat of Jehol, Chengteh and the Great Wall region to the invading Japanese.

In this interval, Japan feverishly pushed forward its program of "specialization of North China," while China applied itself assiduously to consolidating its national unification. With national defense as their objective, the Chinese renovated the army, developed an air force, improved ordnance by maximum possible standardization of arms, unified the national currency through the adoption of a *fapi* (legal tender) policy and within two and a half years rushed to completion the Canton-Hankow railway, beating a schedule which called for four years.

2. The **Loukouchiao** Incident. — At this moment, Koki Hirota, Japan's foreign minister, adopted toward China a three point program for "readjustment" of Sino-Japanese relations. Under point one. "abandon the policy of playing one foreign country against another," Japan demanded that China recognize the existence of Manchoukuo and its relation to Japan as protégé.

Point two, "iointly devise effective measures for preventing the spread of communism," was a demand for the privilege of stationing troops in certain northern provinces, apparently aimed at the U.S.S.R. It was tantamount to a Sino-Japanese military alliance in the cloak of "joint defense against Communism," which would have pressed China into the aggressor camp as a satellite. Hirota's third point, calling for "economic co-operation," aimed at expelling from China the economic Interests of Great Britain. the United States and other countries and giving Japan a monopolistic position in their stead.

In order to maintain a national independent existence while upholding international justice and the interests of all friendly nations in China, the Chinese government flatly refused to consider these three points. This taxed further the "endurance" of the Japanese samurai. Encouraged by the ever-deteriorating situation in Europe and the mounting influence of noninterventionism in the United States, Japan took another determined step forward and precipitated the Loukouchiao (Marco Polo bridge) incident.

On July 7, 1937, a party of Japanese troops held a large-scale manoeuvre at Loukouchiao, on the outskirts of Peiping, and, declaring that a soldier was missing, attacked the county seat of Wanping (at the southern end of Loukouchiao). The Chinese garrison resisted. The full-scale war which resulted was inevitable in view of the fact that Peiping, besides having been the Chinese capital for about 700 years, was the centre of Chinese culture and civilization and a vital strategic base in north China.

In a statement made at Lushan, Kiangsi province, on July 17, to the nation's leaders in all walks of life, who had been invited to the famed summer resort for consultation on important problems confronting the nation, Generalissimo Chiang Kai-shek proclaimed the "arrival of the stage where it is impossible to avoid the inevitable." The generalissimo specifically defined the mar as "a war between right and wrong, between good and evil, between right and might, between justice and brute force, between the treaty abider and the treaty violator." He further asserted: "Once war has begun there will be absolutely no premature cessation or compromise. For we should realize that terms for such an alternative will be nothing but terms for a total surrender and destruction of the nation." Again, in his message of Oct. 10, 1937, to the people of China, Generalissimo Chiang called their attention to the fact that the war was one of "seeking life from the jaws of death" and that it "can by no means be concluded within a short time."

Thus, with a determination steeled by indignation and the fight for survival, China went into the war. This determination sustained it through the more than eight years of hard and bitter fighting.

3. Strategy. — That China had to fight a long-term war was decided on the outset. This determined its strategy of attrition. In view of the lack of time necessary for building up coastal and river defenses, the shortage of both heavy industries and heavy armament, the deficiency of the air force, a loosely knit transportation system founded on inadequate means of communication and the slowness and difficulties in obtaining foreign aid, the Chinese supreme command took the vital decision that the Chinese should not fight decisive battles in the coastal and river regions but should fight city by city and town by town, thereby luring the Japanese into deep inland penetrations. This strategy, not only wearing down but also spreading thin the Japanese strength, was known as magnetic warfare.

Quite the reverse was the Japanese strategy. Encouraged by the easy success of their earlier adventures and whetted by sheer arrogance, the Japanese militarists were confident that the China campaign would not last more than three months. Following the conquest of China, they calculated that they could make use not only of their victorious forces but also of the newly subjugated manpower and material resources in their coming struggle for world hegemony. The Japanese, therefore, adopted a strategy of "a quick, decisive war" during the initial stage of the conflict. This strategy gave way to that of "a quick peace, a quick end" when Japan found China as undaunted and stubborn as ever despite the loss of Nanking, its national capital, and Wuhan, its heart. Japan, therefore, tried to employ all means and devices to entice China into a negotiated peace. This attempt, however, failed. And in view of the rapidly changing world situation, the Japanese strategy for the third stage of hostilities changed again into that of "a war to sustain war." This strategy was accompanied by the much-vaunted mopping-up warfare. Comparable to task force operations, this latter strategy called for grouping of a sizable force to launch surprise attacks on vital strategic points, its main tasks being the dislodging of field forces. the nullifying of counteroffensive preparations and the plundering of materials. Such strategy was resorted to only when there was a shortage of military strength for distribution and when the best defense was offense.

To meet the strategic changes of Japan, Chinese strategy also varied in formula from stage to stage, but its fundamental principle remained unchanged. Without grasping this fact, there can be no true understanding of the evolution of the various battles during the Chinese-Japanese War.

During the first days of the war, when the Japanese employed the strategy of a quick, decisive war, China avoided, wherever possible, large-scale, decisive battles. This was because Chinese military preparations in north China were yet incomplete, and Japanese heavy armament could easily be brought into full play on the vast plateaus there. Furthermore, the Japanese Kwantung army with its base in the already occupied northeast would have no diffieulty in furnishing reinforcements. When the Japanese drove westward into Shansi province, however, the Chinese were not hesitant to hit back and, in an east-west flanking assault in September in the vicinity of Pinghsingkwan (one of the Great Wall passes in northeastern Shansi) pounded the invaders severely. In Oct. 1937 three Japanese divisions, including two crack Kwantung army divisions, were dislodged from their stronghold, Sinkow, on the north-south Tatung-Puchow railway, after suffering numerous casualties. When the Japanese fought back with large reinforcements, the Chinese withdrew to their bases in the Taihangshan and Chungtiaoshan ranges and clung like barnacles to the south Shansi triangle, which placed them in control of the four rail lines, the Peiping-Hankow, the Lunghai, the Chengting-Taiyuan and the Tatung-Puchow. These lines were used as bases for harassing and counterattacking the Japanese from behind. Another portion of the Chinese forces, following the loss of the northern section of the Tientsin-Pukow railway, retreated into the mountains south of Shantung and controlled the basins of the Yangtze and Huai rivers in anticipation of future fighting.

China also offered stout resistance to the Japanese invasion of Shanghai on Aug. 13, 1937. In this unfortified region, the Chinese defenders stood their ground for three months in defiance of the combined onslaught of the Japanese land, navy and air forces. Time and again reinforcements arrived from Japan, totalling approximately 200,000 men. The Chinese retreated only after having exacted a large toll from the Japanese. China, too, paid very heavily in men. The battle, nevertheless, had a tremendous bolstering effect on the morale of both the fighting services and the civilians throughout the country.

4. Fall **of** Nanking.——With Shanghai and adjoining Woosung in their pocket, the Japanese rumbled westward by land and by river and, with their mechanized units, swooped down on Nanking, allowing the Chinese front line troops little breathing spell to regroup themselves. They took Nanking on Dec. 13, 1937, and plunged into the biggest slaughter ever known in human history. Even civilians were roped together and mowed down by Japanese machine-gun fire for sport. Shocking crimes were committed against women. Hardly any female, nith the exception of some of those concealed within mission compounds, escaped violation. Even the very aged and the very young received no mercy from the invaders. What was worse, a great many were ruthlessly butchered after they had been raped. This wrote, in every sense of the term, the blackest page in the modern annals of mankind.

China appealed to the League of Nations on Aug. 30, while hostilities were going on in and around Shanghai. On Oct. 30 the member nations signatory to the Nine Power treaty met in Brussels, Belg., but came to no agreement. The British ambassador, Sir Hughe Knatchbull-Hugessen, while travelling on the Nanking-Shanghai highway on Sept. 7, was machine-gunned by Japanese planes near Wusih (industrial town on the Nanking-Shanghai railway).

A similar incident occurred on Dec. 12, when the U.S.S. "Panay," Yangtze river gunboat, was bombed and sunk by Japanese planes near Wuhu (rice town in southern Anhwei). These incidents well reflected Japan's defiance of the United States and Great Britain.

On the eve of the fall of Nanking, the Japanese sent peace overtures through the German ambassador, Oscar P. Trautmann, but these were rejected flatly by the Chinese government.

To show its determination to fight the war to the end, even over a long period, China at this juncture announced the removal of the government to Chungking, 1,200 mi. up the Yangtze from Nanking. On the night before he evacuated Nanking, Generalissimo Chiang Kai-shek in a press statement asserted that in entering Nanking the Japanese were inviting ultimate defeat. By that he ruled out completely the possibility of peace negotiations.

China, naturally, suffered a grievous blow in the loss of its national capital. Most of its troops, notwithstanding, succeeded in redeploying themselves in western Chekiang and southern Anhwei. These areas were held, till the end of the war, as bases of guerrilla warfare and counteroffensives against the Japanese rear. By virtue of its strategic location, Wuhan (the triple cities of Hankow, Wuchang and Hanyang) became the new headquarters of the Chinese supreme command.

5. Victory at Taierhchwang; Defeat at **Wuhan.**—In April 1938 Chinese forces in Shantung and Hopei, taking advantage of the opportunity of moving into the hilly region of southern Shantung, scored a major victory near Taierhchwang, on the Tientsin-Pukow line. Two Japanese ace divisions crumbled in the battle. The significance of this victory was that it restored the morale of the entire Chinese rank and file, which had been impaired by the fall of Nanking.

A Japanese drive was launched against Hsuchow (important rail junction in northern Kiangsu) in May in an attempt to destroy the bulk of the Chinese strength in that sector but the invaders fell short of their objective. The fact was that the Chinese main force, after having given the Japanese considerable mauling, had long since retired to predesignated hill bases in southern Honan and northern Hupeh.

Hsuchow won, the Japanese made for the Wuhan cities, still bent on the realization of their fond hope of a quick, decisive war.

According to the original plans of the Chinese supreme command, the Chinese were to build up their counteroffensive strength west of the Peiping-Hankow and Canton-Hankow railways and to bide their time for fighting a decisive battle against the Japanese. Chinese resistance, however, was to continue east of the two railroads by capitalizing on the topographical advantages of the region, thus making the invasion as expensive as it could be for the Japanese and also trading space for time. Since Wuhan was the heart of China and a vital point on the Canton-Hankow railway and, moreover, since hills and marshlands were abundant on both sides of the Yangtze around Wuhan, it was decided to direct telling blows against the invading columns at the outer perimeter of the triple cities.

The Japanese offensive started in June 1938, with the navy blasting its way up the Yangtze to penetrate the Chinese river defenses. In a pincers movement, the invaders pushed one column from south of the Yangtze to attack the northern section of the Kiukiang-Nanchang railway with the object of covering the left flank as well as poising for a westward thrust. North of the Yangtze, the Japanese made a two-pronged advance. One prong wheeled westward along the river and another column fringed the northern foot of the Tapiehshan range on the Honan-Hupeh border in an attempt to seize Sinyang, on the Peiping-Hankow railway, and thus make a detour to the north of Hankow. The battle for the Wuhan cities began.

The Japanese lunge at Teian, on the northern Kiukiang-Nanchang line, was a costly failure, while on the north side of the Yangtze the invaders also received setbacks in a number of sectors. All in all, as many as 12 Japanese divisions were called in, with repeated regroupings and replenishments. On Oct. 25, 1938, after a campaign lasting four and a half months, the Japanese won control of the Wuhan cities.

Meanwhile, in south China, Canton, seat of Kwangtung province, also fell on Oct. 21 when the Japanese attacked the southern section of the Canton-Hankow line. This marked Japan's seizure of China's last seaport.

With the conclusion of the battle of Wuhan, the Chinese-Japanese War entered a new stage, in which terrain gradually became strategically favourable to China. The Chinese main strength retired to previously-built positions west of the Peiping-Hankow and Canton-Hankow lines. The supreme command moved to Chungking. Further westward penetration by the Japanese was prevented by hazards and dangers in the Yangtze gorges. The fertile plain of Chengtu, provincial seat of Szechwan, afforded a granary in the interior; and the Yunnan-Indo-China railway and the Burma road brought to China, though in dribbles, supplies from other countries, thereby sustaining the Chinese resistance.

Large Chinese forces, however, remained deployed in areas east of the Peiping-Hankow and Canton-Hankow railways, retaining strategic regions. To protect the left and the right flanks of Szechwan, the Chinese also massed considerable strength in the Siang river valley, north of the Yangtze, in Shensi west of the Yellow river (Hwang-Ho) as well as in the basin of Tungting lake (China's rice bowl) and mountainous western Hunan. In fact, vast territory behind the Japanese lines remained under Chinese control. South of the Yangtze, the Chinese held southern Anhwei, eastern Chekiang and areas in Fukien, Kiangsi and Kwangtung; on the lower reaches of the Yellow river, they retained hilly southern Shantung, most of the Huai river valley and certain areas north of the Yellow river; in north China, they preserved the southern Shantung triangle despite several unsuccessful Japanese penetrations. On top of all this, the Chinese held off the Japanese for six years in the Taihangshan range (eastern Shansi) and more than four years in the Chungtiaoshan range (southwestern Shansi).

All of the guerrilla operations to harass the Japanese rear were initiated by Chinese national troops which operated behind the Japanese lines or in adjacent areas. This Chinese strategy of advance through infiltration into the Japanese rear yielded excellent results. Its execution narrowed the Japanese occupation of any locality down to the extent of a point or line rather than a large piece of territory. Thus, even after the loss of a hsien, or county, the original magistrate could continue his official duties in the surrounding villages inasmuch as the Japanese occupied only the county seat. Likewise, the governor of a province would still be able to carry on his administration within his province even though his capital had been lost.

In the costly capture of Wuhan, Japan began to realize the difficulties of military subjugation. Therefore, the war cabinet under Prince Fumimaro Konoye changed to the program of a quick peace, a quick end. To that end, every artful stratagem was exploited; and, in order to slacken the Chinese army's will to fight, propaganda was dosed out that Japan was willing to cease fighting first. All these overtures of peace were spurned by the Chinese generalissimo.

Realizing that it could no longer hope for a negotiated peace, Japan, in the winter of 1938, entered into liaison with the Chinese arch defeatist, Wang Chinp-wei. Wang deserted from Chungking to the Japanese side, and March 1940 saw the inauguration of his puppet regime in Nanking and the conclusion of a Japan-Wang secret treaty. In these events the Japanese designs for establishment of a New Order in Greater East Asia were fully exposed.

Japan, on the one hand, tried to work for the disintegration of the central government in Chungking. On the other, beginning in May 1939, the Japanese carried out unremitting and indiscriminate bombing of Chungking and other cities in the interior.

China at this time was under most trying circumstances, both internally and externally. Its official invocation of articles xvi and xvii of the League covenant in Sept. 1938 had failed to bring any tangible result from the League except denunciation of the Japanese use of poison gas and adoption of a report urging the member states to abstain from any action that would weaken China. The League council meetings the following year, in January, May and September, again failed to achieve the collective application of article xvi of the covenant, aside from the passing of a resolution requesting the member states to "hold consultations to consider individually measures to aid China." As it was, China's only consolation was the branding of Japan as an aggressor.

What tormented China most at this juncture was the growing paucity of war supplies. Although it was capable of producing acceptable light arms and ammunition, there was an acute shortage of raw materials. Conversely, Japan, through its open sea lanes, shipped in all the U.S. scrap iron and metals and all the U.S. and Netherlands Indies gasoline it could possibly get.

Having attained its objective of blockading the south China coast through the occupation of Canton, Japan plunged headlong into the planned realization of its "Greater East Asia co-prosperity sphere" design. It occupied Hainan Island and the Spratley Islands, respectively, in February and March 1939. Upon the invasion of Hainan Island, Generalissimo Chiang Kai-shek sounded a warning to the world that it was "the 'Mukden Incident' of the Pacific," but it drew no attention from the nations concerned.

6. Situation After Outbreak of European War.—The outbreak of war in Europe in Sept. 1939 removed the big nations still farther from the far eastern arena. They strengthened their so-called appeasement policy and continued to give up pawns to Japan.

China, on the other hand, wavered not a whit in its determination to carry on resistance. In an address of the Chinese generalissimo before the People's Political council on Sept. 10 of the same year, he asserted: ". . . The Sino-Japanese conflict is not merely a world issue but one of the utmost importance. The present turmoil in the world is due mainly to Japan's wanton invasion of Chinese territory and violation of international pacts, thereby jeopardizing world peace. We of China are fighting to perpetuate our national independence and existence, and also to check the rise of international gangsterism, of which Japan is the ringleader, as well as to uphold justice and peace under the sun. In short, the Sino-Japanese war was the starting point of a general conflict, and is the real center of the present world-wide struggle." In that same year, on Oct. 29, the generalissimo declared at a military conference at Hengshan (southwest of Changsha, seat of Hunan province) that "we must fight on till the world war is ended and righteousness and justice fully vindicated, and only then shall we have attained our final victory."

In the continued execution of the appeasement policy of the big powers, Great Britain, on June 19. 1940, signed the Tientsin agreement with Japan and on July 18 declared closure of China's only remaining international outlet, the Burma road, for a period of three months. On the day following the signing of the Anglo-Japanese Tientsin agreement, France, too, concluded a Franco-Japanese agreement, which closed the Yunnan-Indo-China route of transit. On Sept. 22 an agreement mas concluded between Japan and Indo-China, permitting Japanese troops to enter Indo-China in three columns and to use the airfields in southern Indo-China as bases for bombing southwest China. On Sept. 29, in full appreciation of nazi Germany's military supremacy, Japan officially signed a tripartite pact with Germany and Italy.

Following a directive to stop the licensing of aviation gasoline shipments to Japan in August. the United States on Oct. 16, 1940, placed an embargo on the export of scrap iron and steel to the island empire. Two days later, on Oct. 18, the Burma road was reopened, after three months of closure. Not until July 1941, however, did the Netherlands Indies begin to stop shipping oil to Japan.

In this period, Japan was becoming increasingly aware of the futility of its plan for a quick peace, a quick end, and of the tremendous development of a global struggle. With the view, therefore, of conserving its military strength and, simultaneously, of exploiting the material and manpower resources in occupied China through the various puppet regimes, Japan reoriented its China program and decided upon a war to sustain war plan. This new program, as announced, was also one for long-term warfare, long-term reconstruction. In the northeast, fresh impetus was given to the development of the coal and iron industries. In the other occupied areas the Japanese established so-called national policy companies to issue paper currency and readjust taxation in order to absorb resources and materials.

Meanwhile, Japan's military blockade and pressure against Chungking continued. In the month following the outbreak of the European war (Oct. 1939), the Japanese staged a big drive on the Hunan capital, Changsha. But they were thrown back with heavy losses as the result of fierce Chinese resistance and encircling operations at the perimeter of the city. In November a fresh Japanese push started in south China, resulting in the occupation of Nanning, Kwangsi capital, and other localities in southern Kwangsi. However, in the ensuing encounters at Kunlunkwan, strategic mountain pass (northeast of Nanning), which culminated in the Chinese recapture of the pass and the Japanese retreat to the city of Nanning, the Japanese lost very heavily. (The Chinese regained Nanning in the following October and, three years later, in Oct. 1944, lost it to the Japanese again.) In May 1940, in order to remove the Chinese threat to the Wuhan cities. the Japanese started separate drives in southern Honan and northern Hupeh. Taking advantage of their mountainous positions in Tungpehshan and Tahungshan on the Honan-Hupeh border, the Chinese, in a flanking movement, sent the Japanese back.

But at that time the war situation took a critical turn. In June China lost Ichang, trading town in western Hupeh and gateway to the Yangtze gorges, thus giving the Japanese a greater threat against Chungking. Thereupon, in August, the Japanese subjected Chungking to successive, terrific air bombardments but again failed to break China as anticipated. Rather, the Chinese went on building industries in the interior in preparation for a protracted struggle.

7. Japan's Pre-Pearl Harbor Offensives.—In 1941, desirous of playing its part in the global theatre, Japan made repeated attempts to crush the Chinese field forces and eliminate the Chinese menace to their rear. In January they staged a fresh drive in southern Honan, throwing in huge forces. Chinese operations taking advantage of the mountainous terrain of Tungpehshan and Tahungshan again compelled the Japanese to retreat from Nanyang to the Sinyang sector on the Peiping-Hankow railway. A violent battle was fought in northern Kiangsi in March when the Japanese attempted to seize Shangkao, southwest of Nanchang (provincial seat), with the aim of clearing up the hilly northwestern part of the province, a mounting threat to the flank of the Japanese in case of a swoop on Changsha. The Japanese not only failed in this attempt but suffered greatly as the result of a Chines.: task force attack. In May the Japanese carried out another operation on the worst appendix behind their lines, the Chungtiaoshan range, against which they had during the preceding 5 years launched more than 15 unsuccessful attacks. This last appendectomy proved a success, but part of the Chinese defensive force broke through and infiltrated into the Japanese rear.

However, the Chinese remained hostilely entrenched in the Taihangshan range, an additional thorn in the flesh of the Japanese. Consequently, in Oct. 1941, when the Japanese in the Yellow river valley crossed over the flooded areas to attack Chengchow, key city in central Honan and rail junction of the Peiping-Hankow and Lunghai lines, they were intercepted and forced to retreat. This was partly because of frontal Chinese resistance and partly because of the harassing of the Chinese in the Taihangshan range, another testimony to the success of the Chinese strategy of advance through infiltration into the Japanese rear. In the same year, in September, the Japanese made another drive on Changsha but took another defeat at the beginning of October.

On April 13, 1941, Japan and the Soviet Union signed a neutrality pact. They mutually recognized Manchoukuo and Outer Mongolia. Two days later, Pres. Franklin D. Roosevelt declared that the United States had begun listing materials for China under the Lend-Lease act such as had been extended to Great Britain and Greece. He said: "China likewise expresses the magnificent will of millions of people to resist the dismemberment of their nation. China, through Generalissimo Chiang Kai-shek, asks our help. America has said that China shall have our help."

B. AFTER PEARL HARBOR

1. One World War.—The bold Japanese attack on Pearl Harbor in Dec. 1941 changed not merely the war situation of the world but also, in a much greater degree, the war situation in the far east. It marked the integration of the far eastern front and all other fronts into the global theatre.

In conformity with its consistent stand fcr international pledges and commitments, China on the day following the sneak Japanese attack declared war against the three major axis nations, Japan, Germany and Italy, Until this date China had not formally declared war on Japan lest the latter's belligerent status permit interception and seizure of China-bound military supplies on the high seas. There was no ground for such apprehensions now. Although the outbreak of war in the Pacific had a most stimulating effect on China, it entertained no overoptimism as to the conduct of the war during the initial stage. Rather, it was anticipating another interval of great tribulation.

Inadequate preparation in the beginning of the Pacific war caused a series of Allied reverses and setbacks—the successive fall of Guam, the Philippines, Hong Kong, Singapore and Rangoon. Not only was the Burma road closed, but the hostilities spread to China's back door, Yunnan province.

Its own difficulties and hazards notwithstanding, China assembled three of its crack armies, the 5th, the 6th and the 66th, which it had reserved for a general counteroffensive, and force-marched them to the Burma border to assist the Allied forces. Repeated negotiations with the Allied authorities gained the Chinese expeditionary force entrance into Burma and had it placed under the U.S. general, Joseph W. Stilwell. By that time the Japanese had already penetrated into Burma from Indo-China and Siam.

The Chinese on March 25, 1942, launched a vigorous offensive against the Japanese converging on Toungoo, important rail city in lower Burma. But because of the lack of time for developing an Allied air force capable of supporting ground troops and the disunity of Allied command coupled with army supply difficulties, the general battle order deteriorated into fighting by isolated units. The disparity between the Allied and the Japanese forces widened even more because of the latter's superior air might and easy sea supply. After a bitter defense of more than ten days the Chinese expeditionary force retreated because of lack of reinforcements.

Undaunted, the Chinese carried on the campaign on the Burma border. In the middle of April, at great risk, they rushed to the rescue of a besieged Allied force at Yenangyaung on the Irrawaddy river. After two days and nights of terrific fighting the Chinese breached Japanese defenses and reached the Allied troops, including several high-ranking commanding officers.

Western Yunnan was invaded when Lashio, Burmese terminal of the Yunnan-Burma highway (April 29), and Wanting, highway town on the Yunnan border, fell to the Japanese. Enormous losses were suffered by the Chinese expeditionary force, including the loss of Divisional Commander Tai An-lai of the 200th division. When the Burmese campaign was pronounced definitely lost, a part of the Chinese troops withdrew to Chinese soil, and another, led by Lieutenant Genera? Stilwell, retreated to Eedo on the eastern Indian border. This latter Chinese force, upon regrouping and training in India, later played a vital role in the Allied counteroffensive in Burma.

Generalissimo Chiang Kai-shek accepted supreme command of the China theatre of war on Jan. 3, 1942, and the Pacific war command was established in Washington, D.C., on March 30. Thenceforth, a more co-ordinated strategy was made possible between China and its allies.

Nevertheless, China's chief problem remained. It was the complete paralysis of its overland conimunication with the outer world and the inadequacy of its air transport. The most effective aid it received then was from the American Volunteer group (later known as the "Flying Tigers") formed in Kunming (Yunnan capital) by the U.S. Major General Claire L. Chennault in Aug. 1941. Scores of air victories were won by these airmen over the Kunming region, thereby reducing Japanese air raids on other interior cities. On July 4, 1942, the duties of the American Volunteer group were taken over by the 23rd fighter squadron of the United States army air force. In March 1943 the 14th air force of the United Stares army was officiaily inaugurated, and, by the latter half of that year, China had gradually gained control of its air domain.

2, New Japanese Objectives.—After the Pearl Harbor outrage the Japanese continued and intensified their war to sustain war program on the China front whereby Chinese resources and manpower were exploited to sustain Japanese military operations on other fronts. At this stage the Japanese war blueprint had a threefold objective: (1) to intensify its military blockade and blows against China; (2) to destroy the Chinese air bases in order to curb U.S. air activity in China; and (3) to make maximum exertions to put a corridor through the continent in view of the growing shortage of seaworthy vessels and the mounting U.S. air menace. The Chinese formulated a new operational plan aimed at smashing these Japanese objectives and thus achieving their twin objectives of protracted warfare and attrition. In the meantime, they tried to build up their combat strength, paving the way for a co-ordinated action with the anticipated Allied general counteroffensive.

Toward the close of 1941, Japan, intent upon accomplishing its first military objective as outlined above, pitted a large army against Changsha for a third time. Against this fresh drive the Chinese prepared a much better timetable than on the previous two occasions. The Chinese garrison in the city of Changsha stubbornly resisted the invasion, thus neutralizing large Japanese forces, while its own position remained firm and unshaken. Other Chinese units, deployed on the exterior lines, closed in on the Japanese in a counterencircling movement and gave heavy blows to group after group of Japanese reinforcements. On Jan. 15, 1942, came the wholesale debacle of the invading army after having suffered heavy casualties.

With a view to consolidating their hold on north China, the Japanese launched so-called mopping-up operations against the Chinese-held Taihangshan range in the summer of 1943. This was the third drive the Japanese had made against that region. Outnumbered and with their supply line severed, the Chinese gave up their mountain base in early August.

Simultaneously in western Hupeh, the Japanese, in heavy strength, lunged forward from the south side of the Yangtze, along the northwestern corner of the province, reducing the important pass of Yuyangkwan (southwest of Ichang). The Japanese push was aimed at a westward thrust against Enshih, war capital of Hupeh, thereby threatening Chungking, and also at a southward thrust against Changteh on the west bank of Tungting lake. The Chinese struck back, taking advantage of their mountainous positions, delivered a serious blow to the invaders and compelled them to retreat on May 31.

On Nov. 2, 1943, the Japanese massed a strength of more than 100,000 men and hurled them against Changteh in a full-scale attempt to seize the rice bowl of Tungting lake and to threaten the left wing of Changsha. Changteh changed hands several times but was finally retaken by the Chinese after five days. The battle ended late in December in favour of the Chinese. Japanese losses were high and, testifying to the severity of the fighting, the Chinese lost three division commanders. Effective Chinese air support was the most important factor for this victory; it was the first time throughout the China war, which had entered its 6th year, that as many as 280 interior-based bombers had been thrown into a single battle.

The Japanese northern Burma and western Yunnan campaigns were also integral parts of their general operations during this period.

In order to attain its second post-Pearl Harbor military objective'on the China front, the Japanese carried out widespread sorties and sweeps against the Chinese air bases, particularly those built for the U.S. air force. At a time when there was a critical shortage of machinery and instruments in China because of the Japanese blockade, construction of these air bases in many cases involved use of hundreds of thousands of labourers, and oftentimes several months were spent for the completion of a single base.

These bases presented a positive menace to the Japanese, all the more so since the Lieut. Col. James H. Doolittle raid on Tokyo, Yokohama and Osaka on April 18, 1942. The battle of the Chekisng-Kiangsi border in the summer of 1942, though in itself a mopping-up operation, was primarily designed to neutralize the largest seaboard airfield at Chuhsien in eastern Chekiang. Likewise, the Japanese objective in the drives on Suichuen and Kanchow in southern Kiangsi in Jan. 1944 was the destruction of the airfields in those localities. In addition, they sought to achieve full possession of the Canton-Hankow railway. The 35 days of fighting that ensued took a heavy Japanese toll.

In October of the same year, the Japanese attacked and took the twin Kwangsi cities of Kweilin and Liuchow, also because they were important strongholds of the Chinese and U.S. air forces. In May 1945 the Japanese threw their last stakes into an all-out assault on the Chihkiang airfield in western Hunan but underwent a disastrous defeat at the hands of newly trained Chinese ground forces supported by air operations.

As a necessary move toward the attaining of its third military objective in post-Pearl Harbor China operations Japan tried to gain full control of first the Peiping-Hankow line and then the Canton-Hankow line, thereby forming a corridor from the south to the north of China to be linked with the main military transportation artery of Indo-China and Burma. This need became all the more pressing to the Japanese in view of the extensive U.S. bombing operations in the Pacific theatre. Thereupon, the Japanese, at the end of April 1944, took Chengchow, Honan, strategic city on the northern section of the Peiping-Hankow railway, and, in May, fought into Loyang with the object of consolidating their defenses west of the railway. By June 17, 1944, they had won complete control of the entire line.

Moving toward its next objective, full possession of the Canton-Hankow railway, Japan brought up ten divisions early in May and threw them into what was its fourth drive on Changsha. The Hunan capital fell on June 19 as the result of a flanking movement by large Japanese forces from the east and west wings. Pushing south along the Canton-Hankow line, the invaders converged on Wengyang, important rail centre in southern Hunan, with good airfields. The Chinese garrison of rhe city, the 10th army, was ordered to make a determined stand at all costs in order to upset the Japanese military timetable for occupation of the entire length of a transcontinental line of communication. This lone Chinese force checkmated the Japanese advance for 48 days and fought virtually to the last man. The battle for Hengyang, though finally lost on Aug. 8, went down in hisrory as one of the most heroic defense actions in the Chinese-Japanese War.

Though the Japanese succeeded in occupying the whole Canton-Hankow line, the lack of time for repairs prevented through traffic even by the conclusion of the war. The four Changsha battles, the Hengyang defense and several major encounters on the Peiping-Hankow line, therefore, were closely related to the global war.

3. Shansi Front. — A summary of the Shansi front is essential before the general war situation in China on the eve of the all-out counteroffensive is described.

Ever since the Japanese invasion of Shansi and seizure of the Tatung-Puchow railway in 1938, practically the whole of western and northern-Shansi, with the exception of a handful of hsien (counties), had been under Japanese control. In reality, the contending forces kept a vigilant watch on each other across the Yellow river.

That the Japanese never pushed across the Yellow river for westward thrusts was the result of two causes. In the first place, such attempts would have made heavy claims on men and caused an overextension of their supply line. The other cause was purely political in character. The Chinese Communist party possessed armed troops, which at the outbreak of war hardly exceeded 10.000 men. When the hostilities began, the Communist party had announced its acceptance of the Three People's principles of Sun Yat-sen, its support of the national government and its obedience to the command of Generalissimo Chiang Kai-shek in the nation's united resistance to Japanese aggression.

The Chinese Communists participated in the battle of Pinghsingkwan in northeastern Shansi; but, after the Wuhan battle, they went counter to their promises. Insiead of obeying the supreme command, they tried to develop their own strength to be used in a future struggle for political power and to carry out their Communist revolution. For that purpose they made frequent attacks on national troops in order to seize weapons from them. Being fully preoccupied with the resistance campaign against a powerful foe, the Chinese government was unable to prevent such attacks. The Communist activities, therefore, sorely grieved the government. It was precisely with the purpose of exploiting and intensifying this internal strife in China that the Japanese had abstained from crossing the Yellow river and attacking Shansi province.

4. Increased **Air** Transport. — Besides devising effective measures to thwart the three major Japanese military moves in the post-Pearl Harbor period, China held to the strategy of protracted warfare pending aid fiom the Allies and, at the same time, reorganized and renovated its army in order to co-ordinate it with the future Allied counteroffensive. But everything hinged upon the reopening of international communication lines and the inflow of Allied arms and war materials.

From July 1942 on, U.S. supplies began trickling by air into Kunming, Chinese terminal of the China-India shuttle, via the Himalayan "hump." Not until the formation of the United States 14th air force in the following year, however, was there air cover or protection and a subsequent increase in air cargo tonnage. Hardships and hazards undergone by these "hump" fliers wrote a brilliant record of bravery and seif-denial. Most of the cargo flown in was aviation gasoline and equipment, which were sorely needed by the Chinese. There was no way of bringing in heavy arms, and only limited quantities of other arms were flown over the Himalayas. For these reasons, China pooled its resources with its allies to hack out the Stilwell road from Ledo on the eastern frontier of India to Yunnan and laid an oil pipe line through the entire length of the highway. It also fought a bitter battle to reopen the old Burma road and even had to fight for control of certain sections of the Stilwell road.

By then the United States had a fairly large and powerful air fleet based in China, and the huge airfields under construction in various places in Szechwan came into use one after the other. By 1944 China-based U.S. superfortresses were shuttling back and forth between China's interior and the Japanese empire on bombing missions. Contributory to the success of these raids was the intimate collaboration between the Sino-American Co-operation organization and the United States navy, which supplied military intelligence and reports on weather conditions along the China coast.

5. Japan's Last Adventure. — The Chinese army that was regrouped and trained by U.S. instructors for the general counteroffensive was composed of two portions. One portion comprised, in addition to the India-based Chinese troops as its nucleus, airborne men and officers selected for their good qualities from among various units within China. The second pcrtion consisted of a selected number of interior-based units transferred to Kunming and vicinity to be re-equipped and given intensive training by U.S. army personnel. Both were intended for performing China's role in a co-ordinated Allied counteroffensive against Japanese-held Burma.

Just as these picked troops were in training in Yunnan and the Chinese were still nursing their wounds sustained in the battle of Changteh, the Japanese, in the winter of 1944, drove with a powerful force into Kweichow from northwestern Kuangsi, heading toward Tushan, railroad and highway junction. The sudden and swift Japanese advance threatened the rear of Kweiyang (provincial seat of Kweichow) and China's war capital, Chungking. The Chinese fought back, making use of the favourable topography, and, by the beginning of December, forced the Japanese to retreat. Thus, the last Japanese adventurous move in China failed.

At that time Generalissimo Chiang Kai-shek sent out a "Join the Army!" call to the students of universities and secondary schools throughout China. It instantaneously brought to the colours nine divisions of students. This marked another forward step which China took to pit its strength against the Japanese in co-ordination with future Allied landings and counteroffensive operations against Japan.

China's 6 India-based divisions and about 10 Yunnan-based divisions (there were 36 divisions at the time of the Japanese surrender), in co-ordination with Allied forces, opened up well-timed assaults and counteroffensives separately in north Burma and western Yunnan.

On the north Burma front, they captured Maingkwan on March 5, 1944, and Kamaing shortly afterward. On June 26 they took Mogaung, important Japanese base in northern Burma, virtually putting out of existence the Japanese 18th division. Meanwhile, a Chinese task force, in collaboration with U.S. units, made a daring penetration against Myitkyina, important rail town in northern Burma, and in one swoop captured the city's airfield. The city itself fell on Aug. 3, thereby removing for the Allied air transport command the danger of Japanese air interception and the hazards of "hump" flying.

On the western Yunnan front, on May 10, 1944, the Chinese effected a forced crossing of the swift Salween river and battled their way, inch by inch, through the most difficult mountainous terrain and under adverse weather conditioris. By Sept. 7, Sungshan, Japanese stronghold in western Yunnan, was recaptured, thus reopening the important Huitung bridge spanning the Salween. On Sept. 14, another Japanese stronghold, Lungling, fell. With these achievements, the Chinese were now able to start the construction of the northern section of the Stilwell road.

In Jan. 1945 Wanting, the last Japanese base on the old Burma road, was recovered. By the end of that month the historic juncture of Chinese forces striking from the north Burma and Salween fronts took place at Maymyo in eastern Burma. which marked another significant Allied success and rendered possible the repairing of the old Burma road. These troops from the two fronts, fighting in well-nigh unnegotiable territory and inclement weather, demonstrated a tenacious combat spirit and achieved an excellent battle tally that formed an important chapter in the war history of the Allies.

Attesting further to the combat strength of these newly trained Chinese troops on their own soil, which had already been well-demonstrated in the Salwe-n offensive and the battle for Chihkiang (allied air base in western Hunan), were the Chinese counterattacks against Kweilin and Liuchow (Kwangsi cities) at the end of April 1945. The Chinese advanced in two separate columns.

One prong restored Nanning, border town near Indo-China, toward the close of May and by the middle of June was converging on the Liu river. Another prong made for Ishan, rail town northwest of Liuchow on the Kweichow-Kwangsi railway, which changed hands time and again. Well-co-ordinated assaults by both columns caused the Japanese to evacuate Liuchow at the end of June and Kweilin at the end of the following month. By then the weakening of the Japanese fighting strength became even more obvious.

6. Surrender. — Following the capitulation of nazi Germany in May 1945, sea battles moved ever closer to the Japanese homeland while intensified air assaults were made upon important Japanese cities. In China, increasingly high-degree co-ordination of Sino-U.S. combat strength for the continental counteroffensive was being attained. Japan itself realized that it had lost the contest.

China, the United States and Great Britain, on July 26, jointly announced the Potsdam declaration. On Aug. 6 the first atomic bomb was dropped on Hiroshima, and, three days later, the second atomic bomb fell on Nagasaki. On Aug. 9 the soviet government declared war on Japan.

On the afternoon of Aug. 10 Japan's surrender offer, accepting the Potsdam terms, was forwarded to the Allies through the governmerits of Switzerland and Sweden. After four days, the Japanese government officially proclaimed Japan's unconditional surrender on Aug. 14.

On Sept. 2 the representatives of China's supreme command participated in the formal signing of the instrument of Japanese surrender aboard the U.S.S. "Missouri" in Tokyo bay. In Nanking, on Sept. 9, Gen. Yasutsugu Okamura, commander in chief of the Japanese expeditionary army in China, officially signed the surrender instrument for the China theatre in the presence of Gen. Ho Ying-chin, commander in chief oi the Chinese army and personal representative of Generalissimo Chiang Kai-shek, supreme commander of the China theatre. Thus, the Chinese-Japanese War of 8 years and 2 months or, rather, the continuous Chinese-Japanese hostilities of 14 years after the Mukden incident, were brought to a victorious conclusion.

The area in which China was to accept the Japanese surrender comprised China and Indo-China north of latitude 16° N., but excluded the Japanese Kwantung army in the northeast, which was to surrender to the Soviet Union. The surrendering Japanese troops, which represented the entire remaining Japanese strength during the closing stage of the war, totalled about 1,300,000 (including about 30,000 in northern Indo-China but excluding those in the northeast). These were the troops which had been pinned down in China during the final phase of the war and which otherwise could have been used in other war theatres. This was the net result achieved through China's magnetic warfare strategy.

Throughout the war of more than 8 years, 22 large-scale battles, 1,117 major encounters and 38,931 minor engagements took place. China's total casualties amounted to 3,211,419 officers and men, including 1,319,958 killed, 1,761,335 wounded and 130,116 missing. Altogether, 14,050,521 able-bodied men were conscripted. Civilian casualties were far heavier; they included victims of shellfire, air raids and slaughter; those who were killed while constructing roads and airfields or transporting military and food supplies to the front; and war refugees who fell exhausted by the wayside.

Losses of public and private property, including that either destroyed or wasted, were incalculable.

Aside from strategical mistakes, Japan's failure may be traced to four other causes: (1) the militarists' underrating of the opponent's strength; (2) the absence of far-sighted statesmen at the helm of the state and the frequent conflicts inside of the militarist groups which controlled the government, as evidenced by the repeated cabinet changes in wartime Japan; (3) Japan's faith in the supremacy and dominance of military force over everything else; (4) a nationalism which centred on loyalty to the emperor and developed a feudalistic national character. Added to these was the blending of technological research with the worship of military force, which rendered it difficult for the Japanese to live peacefully with other racial groups in the modern society of nations.

The Japanese claimed that they knew China and were well-grounded in China, having an understanding of the individual habits and traits of Chinese political and social figures. As a matter of fact, they saw only the individual trees, not the whole forest. China's military might at that time was far weaker in comparison with Japan's, but Japan did not know: (1) that China's vast territory was a force; (2) that China's teeming population was a force; and (3) that China's national characteristic of tenacious resistance against any foreign rule, a legacy of China's long, continuous history and culture, when blended with national consciousness developed by the Three People's principles of Sun Yat-sen, was also a vital force. That any aggressive act in China would constitute a threat to world peace and therefore a grave world problem baffled Japan's understanding and appreciation even more.

It seemed a miracle to many that China, despite its inferior military might, was able to resist the Japanese aggression for more than eight years. Of course, the final victory was won by China in co-ordination with its allies. Nevertheless, during the first four and a half years of war China fought singlehanded against powerful Japan. Especially during the two years and more following the war in Europe, it struggled with a prospect darkened almost completely with gloom and dismay. But it never weakened or cringed from the Japanese. The integration of the China front with the other sectors of the world after the outbreak of war in the Pacific, the initial reverses of the Allies and the subsequent "Europe first" strategy — these forged China ahead, with greater hope but in more intense tribulation, until the winning of the ultimate triumph. (C. P.-LI.)

IV. THE WAR IN THE PACIFIC

A. THE PERIOD OF JAPANESE CONQUESTS

1. The Japanese Plan of Conquest.—The Japanese entered World War II with relatively limited objectives in mind and. contrary to the classic principles of warfare, had no plan to press home their attacks by meeting and defeating the main bodies of the Allied forces opposing them. Japan's offensive plans thus called simply for the occupation of an area they designated the Greater East Asia Co-Prosperity sphere, part of which they had seized before Dec. 1941. The region included Korea, Manchuria, China, French Indochina, Malaya. Burma, the Philippines and the Netherlands East Indies, as well as the Japanese empire as it existed before the Manchurian incident. To protect the Greater East Asia Co-Prosperity sphere against attack from the east, the Japanese were prepared to develop a defensive perimeter extending from the Kuriles on the north, southward through the Mariana Islands and Wake, the Marshall Islands and the Gilbert Islands to Rabaul, on New Britain of the Bismarck archipelago. The Japanese expected that the quick occupation and development of this vast region, coupled with a crippling attack upon the U.S. Pacific fleet, would lead ultimately to a negotiated peace which would leave Japan in possession of most of the Greater East Asia Co-Prosperity sphere.

The time the Japanese began their expansion into British, Dutch and United States possessions was chosen by reason of weather considerations, because further diplomatic negotiations seemed futile and because growing Allied air, land and sea power in the Pacific boded ill for the success of the initial offensive moves. The final Japanese decision to attack was made during November, and the first assaults took place on Dec. 7, 1941 (Dec. 8 west of the Hawaiian Islands).

2. Pearl Harbor.—Beginning an almost unbroken series of successes. the Japanese mounted a surprise air attack against the U.S. Pacific fleet at Pearl Harbor, Hawaii. The attack was executed by about 360 planes from 6 Japanese carriers which, with 2 battleships, 2 heavy cruisers, 11 destroyers and miscellaneous other ships, comprised the Pearl Harbor striking force, under Vice-Adm. Chuichi Nagumo. U.S. Pacific fleet units at Pearl Harbor comprised 70 combat vessels and 24 auxiliaries, most of them moored for the week end. There were also about 300 U.S. army, navy and marine corps planes present. Of eight U.S. battleships in the harbour, five nere sunk. one severely damaged and the other two hit. Two destroyers were also sunk and 9 other ships sunk or severely damaged, while 140 aircraft were destroyed and approximately another 80 damaged. About 2,330 military personnel were killed and 1,145 wounded, and about 100 civilians were killed or wounded.

The Japanese made no effort to land at Hawaii, nor had they any plans to do so. They succeeded in knocking out the battleship force, but as a result of a blunder in planning caused no damage to shore installations, power plants or oil storage facilities. The Pacific fleet's three aircraft carriers, not at Pearl Harbor on Dec. 7, escaped damage. The attack was a limited tactical success. and it prompted the immediate entry of a vengeful United States into the war.

3. The Philippines.—While not as important economically to the Greater East Asia Co-Prosperity sphere as were the Netherlands East Indies and Malaya, the Philippines threatened Japanese lines of communication to the Indies and Malaya Accordingly, on Dec. 8, Philippine time, the Japanese launched an air attack on Clark and Iba airfields, north of Manila. Formosa-based Japanese bombers caught most of the U.S. army air force's strength in the far east on the ground, destroying more than half its fighter and bomber planes. Other raids, two days later, resulted in the loss of more U.S. fighters and in the destruction of Cavite Naval yard, south of Manila.

Adm Thomas C. Hart (U.S.N.), commander in chief U.S. Asiatic fleet, had sent part of his force south in November. With little air protection available, the position of remaining surface vessels in the Philippines was untenable. and Hart sent the rest of his larger ships south to Java or Australia early in December. The U.S. bombers (there were only 14 left after the first Japanese attacks) were little better off and moved to Australia in mid-December. Only the ground forces, a few fighter planes, about 30 submarines and a few small vessels were left behind to hold the Philippines.

The Japanese began landing forces on Luzon on Dec. 10 and the main assault—the bulk of one division—came at Lingayen gulf on Dec. 22. Other landings were made on Luzon during the same month and from all directions the Japanese forces began converging toward Manila. Gen. Douglas MacArthur, the commander of all U.S. army forces in the Philippines, had prepared plans to make a final stand on Bataan peninsula and Corregidor Island in order to deny the use of Manila bay to the Japanese. As the Japanese advanced, he moved his Luzon forces, both U.S. and Filipino troops, into Bataan with a series of brilliant withdrawal actions. He declared Manila an open city on Dec. 26 to spare it from Japanese bombing. But the Japanese, possibly aware that the U.S. troops were still moving supplies out of the city and using some of its communications facilities, bombed Manila the next day. The last U.S. troops did not leave until the 31st, and two days later the Japanese marched in, unopposed.

The first Japanese attacks against the Bataan defenders were stalled by casualties from both battle and disease, but the Japanese could be reinforced while the Americans could not. The outcome on Bataan was inevitable and to save General MacArthur for important tasks elsewhere, Pres. Franklin D. Roosevelt, on Feb. 22, 1942, ordered him to leave the islands. The general finally left Bataan on March 11 and reached Australia on the 17th. Gen. Jonathan M. Wainwright (U.S.A.) became commander of all U.S. forces left in the Philippines.

The Bataan defenders, lacking sufficient ammunition, food and medicines, were gradually worn down and could not hold back a final Japanese offensive in the spring. Bataan fell on April 9. The Japanese intensified aerial and artillery bombardment of Corregidor and during the night of May 5–6 established a foothold on the island. On the 6th General Wainwright surrendered. The southern Philippines, where the Japanese had already occupied some ports and airfields, capitulated on May 9, 1942.

It is impossible to determine with any degree of accuracy U.S. and Filipino casualties during these operations. Probably no more than 5,000 men were actually killed in action, and figures for wounded, missing or captured are even less dependable. Japanese casualties are also unknown. Suffice it to say that both sides lost far more men from sickness and disease than from battle.

4. Malaya **and** the Netherlands East Indies.—Even before war began the Japanese were in an excellent position to move toward the Indies and Malaya. They had occupied Hainan Island and were using port facilities and airfields in French Indochina. Moreover, they had gained some measure of political control in Thailand and found it easy to occupy Bangkok. at the head of the Malay peninsula, on Dec. 9, 1941. The drive toward the Indies started with an air assault on Dec. 8 which destroyed British air power at Hong Kong. To safeguard their line of communications through the South China sea the Japanese began a ground attack against Hong Kong from the Kwantung peninsula, pushing back the 12,600 British and 1,900 Canadian defenders. By Dec. 24 the Japanese had gained a foothold on the island and the next day the garrison surrendered. Further protection for the Japanese flanks and rear during their push south was obtained on Dec. 20 when they occupied Davao, Mindanao, in the southern Philippines, establishing there an air and staging base.

The first landings at Malaya took place on Dec. 8 when a Japanese force, staged at Hainan Island. landed about halfway down the peninsula. More troops landed on the 9th and 14th while the defenders (two Indian divisions and an Australian division which lacked one brigade) organized hurriedly. Air cover for the garrison was inadequate and naval support, lacking air protection, was of no avail. In an attempt to cut the Japanese overwater communications to the landing forces, the British battleship "Prince of Wales" and the battle cruiser "Repulse" sallied from Singapore, only to be sunk on Dec. 10 by Japanese land-based aircraft. With their line of communications thus secured, the Japanese drove on down the Malay peninsula in a series of frontal attacks and flanking manoeuvres. By the end of December they had occupied all but the southern tip and Singapore.

President Roosevelt and Prime Minister Winston Churchill, conferring in Washington, D.C., decided on Dec. 31 to establish in southeast Asia and the southwestern Pacific a unified command known as ABDACOM, after its Australian, British, Dutch and American components. Command was assigned to Gen. Sir Archibald P. Wavell, whose area of responsibility included Burma, Malaya, the Netherlands East Indies and the Philippines (although for all practical purposes General MacArthur's command remained independent). The mission was to hold the Malay barrier — Malaya, Sumatra, Java and the approaches to Australia— as a defensive line-north of which the Japanese were to be halted. General Wavell assumed his command on Jan. 15, 1942. His chief deputy was Lt. Gen. George H. Brett (U.S.A.) ; his air commander Air Chief Marshal Sir Richard E. C. Peirse (R.A.F.) ; his naval commander Admiral Hart; and his ground force commander Lt. Gen. Hein ter Poorten (N.E.I.A.).

Before ABDACOM began operations, the Japanese had already started moving toward the oil-rich Indies. Sarawak was occupied on Dec. 17,1941 ; Brunei bay was secured on Jan. 6, 1942; Tarakan on Jan. 11; Jesselton the same day; and landings were made in the Celebes on the 11th also. Balikpapan fell on the 24th, and Kendari, in the southern Celebes, the same day. Ambon fell on Feb. 4 after a heroic four-day defense by Dutch troops and an Australian infantry battalion. So far, these actions had cost the Japanese only five transports or cargo ships. Despite opposition from an Allied naval striking force under Rear Adm. Karel W. F. M. Doorman (R.N.N.), the Japanese sent. convoys through Makassar strait to seize Makassar town on Feb. 8 and Bandjermasin, on the southwest coast of Borneo, on the 16th.

Japanese progress on the west flank of ABDACOM was equally steady. On Feb. 8 the Japanese landed on Singapore Island and a week later the garrison had to surrender. About 64,000 men— 17,000 British, 15,000 Australians and 32,000 Indian troops— were lost, 20,000 more than the British had lost at Dunkirk. On Feb. 13 the Japanese landed paratroopers at Palembang, Sumatra, following with amphibious assaults on the 16th. Admiral Doorman's striking force, although it had sallied forth many times to give battle. had been ineffectual in the face of Japanese air power, while such limited Allied air power as was available dwindled steadily in the face of the overwhelming Japanese air superiority. After an abortive attempt to stem the invasion of Sumatra by naval action there was a change in ABDACOM naval command and Admiral Hart, at Dutch insistence, was replaced by Vice-Adm. C. E. L. Helfrich (R.N.N.).

Swinging their offense back east the Japanese, on Feb. 19, 1942, launched a surprise air raid on Darwin, Austr., destroying valuable supplies and about 20 aircraft, sinking 11 ships, demolishing the airfield and killing almost 250 military and civilian personnel. The next day Japanese forces landed on Timor and by the 24th, pushing the small Australian and Dutch detachments back into the hills, had secured control of the island. Bali was invaded on the 18th. Just after the latter event Admiral Doorman again led his striking force against Japanese fleet units, but succeeded in inflicting damage only to one Japanese destroyer while one Dutch destroyer was sunk and two Dutch cruisers and a U.S. destroyer received considerable damage. Nothing stood in the way of an invasion of Java, the only important island still in Allied hands.

General Wavell had decided that the defense of Java was no longer feasible. Most of his fighter planes had been knocked out of the sky; the modern bombers had left for India or Australia; the naval forces were pitifully inadequate. On Feb. 25 he left for India and ABDACOM ceased to exist, all command functions passing to Dutch officers. A last effort to send fighter planes to Java ended with disaster on Feb. 27 when Japanese planes sank the U.S. tender "Langley" (once a carrier) and its deckload of aircraft. Ancther ship accompanying the "Langley" reached Java, but its cargo of crated planes was destroyed to keep it from falling into Japanese hands. The final blow to hopes of defending Java was struck during the naval battle of the Java sea on Feb. 27. Admiral Doorman's force, with incomplete planning and lacking adequate communications, struck at the Japanese invasion fleet. In the course of seven hours' manoeuvring, two Allied cruisers and three destroyers were sunk at a cost to the Japanese of only one destroyer damaged. The effort probably postponed the invasion of Java one day, but during the night of Feb. 28 the Japanese began landings at three points. Seeking to escape the final débacle, four Allied cruisers and four destroyers were sunk during the period Feb. 28–March 2, at a cost to the Japanese of only one transport and one mine layer sunk. Only four U.S. destroyers managed to make good their escape.

Java was finished. Admiral Helfrich and remaining senior British and U.S. officers left on March 2. On Java, Japanese ground forces had little difficulty once they attained momentum and on March 9 General Ter Poorten was forced to capitulate. About 20,000 Allied troops were surrendered, including 11,300 Dutch, 5.600 British, 2,800 Australians and 800 Americans. Only in the hills of Timor was any important Allied force left intact; that group was finally evacuated more than a year later.

5. Operations to the East. — While principally concerned during the early stages of the war with the quick seizure of the rich natural resources in Malaya and the Indies, the Japanese had not neglected their eastern flank. On the opening day of the war in the Pacific they had bombed lonely Wake atoll and on Dec. 11, 1941, attempted a landing which was beaten off by the U.S. marine corps garrison. A new invasion force reached Wake on Dec. 23 and started putting ashore about 2,000 men from a special naval landing force—a type of naval ground unit often erroneously known as imperial Japanese marines. The Wake garrison could not halt this force and surrender came quickly. The invasion cost the Japanese about 820 men killed and 335 wounded while the defenders lost 50 marines and 70 civilians killed. The rest of the Wake personnel, about 475 marines and U.S. navy men and nearly 1,150 civilian engineers, were captured by the Japanese.

Guam, a U.S.-held island in the otherwise Japanese Marianas, was also attacked from the air on Dec. 8, 1941. Invasion came on Dec. 10 when 5,000–6,000 Japanese troops landed at four different points. Since resistance was futile, the island's garrison — 365 marines and a militia of 300 Chamorro natives — soon surrendered. Further to secure their flanks. the Japanese also occupied Makin and Tarawa in the Gilberts during early December and, as at Wake and Guam, established air bases. The next move was toward strategically located Rabaul, New Britain, where invasion began during the predawn hours of Jan. 23, 1942. The Australian garrison of about 1,400 men was soon overwhelmed by about 5,000 Japanese who poured ashore under the cover of heavy naval guns. About 400 Australians ultimately escaped from New Britain but the small detachment at Kavieng, New Ireland, was captured when Japanese naval troops landed there late in January.

With the seizure of Rabaul and Kavieng, the fall of the Philippines and the Indies, and the loss of other points in the Pacific, the Japanese had realized their initial plans, bringing to a close one phase of the Pacific war. On the east, there was little to oppose them. The region in which Rabaul and Kavieng lay was included in the Anzac area, formally established by the U.S.-British combined chiefs of staff on Jan. 29, 1942. Anzac area comprised the waters around eastern Australia, New Zealand, New Caledonia, the New Hebrides, Fiji, the Solomons, the Bismarck Archipelago and eastern New Guinea. It was not a combined air-sea-ground command such as ABDACOM, and its commander, Vice-Adm. Herbert F. Leary (U.S.N.), was charged simply with the defense of the approaches to Australia and New Zealand. Anzac force, his operational command, initially comprised five Australian and U.S. cruisers and four destroyers from the same countries. A few U.S. and Australian aircraft were also placed under his command from time to time, and upon occasion carrier task forces of the U.S. Pacific fleet operated within Anzac area. But these latter operations appertain to another phase of the Pacific war, a phase which both sides were to begin sooner than expected.

B. THE ALLIES STRIKE BACK

1. New Japanese Plans. — Despite their success in quickly bringing under control most of the Greater East Asia Co-Prosperity

sphere, the Japanese found no signs of a negotiated peace. Instead, the Allies indicated they were prepared to strike back. Small carrier task forces of the U.S. Pacific fleet hit the Marshalls on Feb. 1, 1942, Wake on Feb. 23 and Marcus Island on March 1, while Anzac land-based bombers caused some damage at Rabaul on Feb. 23. These pinpricks did not accomplish much materially, but they gave Allied morale a boost and the Japanese something to worry about. Worse still, from the Japanese point of view, the Allies had begun estabiishing bases in Australia for future counter-offensives and were developing a well-protected line of communications across the southern Pacific to Australia and New Zealand.

Accordingly, the Japanese decided to expand their perimeter and cut the line of communications to Australia. First, they would occupy New Caledonia, the Fijis and Samoa, and they began preparations for these actions by pushing down the Solomons from Rabaul. To protect their flanks, the Japanese would seize eastern New Guinea and western New Britain, establishing an air base at Port Moresby in southeastern New Guinea. They also decided to take Midway Island and to establish air bases in the U.S. Aleutians. They hoped that the Allies would wear themselves cut in attacks against the new. outer perimeter, affording Japan better chances for a negotiated peace.

The new expansion began with the occupation of Gasmata, western New Britain, on Feb. 10. On March 8 the Japanese began occupying the Lae and Salamaua areas in eastern New Guinea and five days later made their first landings in the Solomons, at Buka. They started occupying the Admiralty Islands about April 8. thus ensuring complete control over the Bismarck archipelago. and on April 7 they began landings at Bougainville, in the Solomons. Serious opposition to these moves came only at the Lae-Salamaua area where, on March 10, U.S. carrier-based planes sank four Japanese ships and damaged three others. At all the new areas they seized, the Japanese began developing air bases from which to support the seizure of Port Moresby, southeastern New Guinea. After Port Moresby was to come the occupation of Midway and the Aleutians.

To gain control of the Indian ocean, isolating Australia from the west as well as the east, the Japanese seized the Andaman Islands on March 23, 1942. From April 2 through April 9 carrier-based aircraft and submarines succeeded in sinking 1 British carrier, 2 heavy cruisers, 1 destroyer and 28 merchantmen in the Indian ocean and Bay of Bengal. Great damage was also caused to shore installations at Ceylon. The British eastern fleet was crippled and Japan's western flank seemed secure.

2. Allied Reorganization and Plans.—While the Japanese had been expanding their perimeter, the U.S.-British combined chiefs of staff, faced with the dissolution of ABDXCOM and recognizing the anomalies in the Anzac establishment, decided to establish new command structures in the Pacific. The entire area was placed under the strategic direction of the U.S. joint chiefs of staff, who divided the Pacific into two major theatres. General MacArthur was appointed supreme rornmander, Southwest Pacific area. which included the Netherlands East Indies (less Sumatra), the Philippines, Australia, the Bismarck archipelago and the Solomon Islands. Adm. Chester W. Nimitz (U.S N.), who had recently become the commander of the U.S. Pacific fleet, was appointed commander in chief. Pacific ocean areas, which included most of the rest of the Pacific not in General MacArthur's area.

Admiral Nimitz' area was subdivided into three parts: the North Pacific area (the region north of 42° N Lat.) ; the Central Pacific area (including the Hawaiians, the Marianas, the Marshalls, the northern Gilberts, the Carolines and Palaus, the Ryukyus, Formosa and Japan) ; and the South Pacific area (New Zealand, New Caledonia, the southern Gilberts, the Ellice Islands, the New Hebrides, Fiji, Samoa and others). Admiral Nimitz retained direct command of the North and Central Pacific areas but appointed Vice-Adm. Robert L. Ghormley (U.S.N.) to the operational command in the South Pacific area.

The missions assigned to Admiral Nimitz and General MacArthur by the U.S. joint chiefs of staff were practically identical: to hold the line of communications between the United States and Australia; to contain the Japanese within the Pacific; to support the defense of North America; and to prepare for major amphibious counteroffensives, the first of which would take place in the South and Southwest Pacific areas.

General MacArthur formally assumed his command on April 18, 1942, the same day that 16 U.S. army B–25 bombers, under Lt. Col. James H. Doolittle, delivered another pinprick at the Japanese by raiding Tokyo from the U.S. carrier "Hornet." The raid caused little destruction but provided Allied morale with another boost, caused considerable loss of face within the Japanese government, pinned down Japanese fighter planes on home fields and accelerated Japanese plans for extending their conquests.

Anzac force and area ceased to exist on April 22 and Vice-Adm. Herbert F. Leary became the first commander of the Allied naval forces S.W.P.A. under General MacArthur. Gen. Sir Thomas Blamey (A.I.F.) was appointed commander, Allied land forces S.W.P.A. while Lt. Gen. George H. Brett (U.S A) was the first commander of Allied air forces S.W.P.A. Admiral Nimitz began acting in his capacity as commander in chief, Pacific ocean areas on May 7 and Admiral Ghormley, who reached New Caledonia on May 17, assumed his duties as commander, South Pacific area on June 19. By that time much of importance had transpired in the Pacific's various theatres.

3. Battles of the Coral Sea, Midway and the Aleutians.—By the end of April 1942 the Japanese were ready to turn the Coral sea (between Australia and New Caledonia) into a Japanese lake by the establishment of air bases at Port Moresby in southeastern New Guinea and Tulagi in the southern Solomons. But Allied intelligence learned that the Japanese were to attempt an amphibious invasion at Port Moresby and alerted available sea and air power. The Japanese operations aimed at the seizure of Port Moresby began on May 3 with landings at Tulagi. Carrier-based planes from a task force commanded by Rear Adm. Frank J. Fletcher (U.S.N.) struck the Tulagi landing group, sinking one destroyer, three mine sweepers and four landing barges. The main Japanese invasion force left Rabaul for Port Moresby on May 4, the bulk of the Japanese naval cover, including carriers, taking a circuitous route to the east, inviting a clash with Admiral Fletcher's forces.

On May 5 and 6, 1942, opposing carrier groups looked for each other and on the morning of the 7th Japanese carrier-based planes sank a U.S. destroyer and an oiler. Admiral Fletcher's planes sank one Japanese light carrier and one cruiser. The next day Japanese aircraft sank the U.S. carrier "Lexington" and damaged the carrier "Yorktown," while U.S. planes so damaged a large Japanese carrier that it had to retire from the action. So many Japanese planes were lost that the Port Moresby invasion force, lacking adequate air cover and harassed by Allied land-based bombers, turned back to Rabaul. While the four-day engagement. designated the battle of the Coral sea, was a tactical victory for the Japanese, it was a strategic victory for the Aliies, whose naval forces, employing only aircraft and never closing within gunshot range of Japanese vessels, had saved Port Moresby.

As an anticlimax to the battle of the Coral sea, four Japanese midget submarines sneaked into the harbour of Sydney, Austr., during the night of May 31–June 1. The submarines were sunk before substantial damage was done. The action may have been intended to divert Allied attention from an impending attempt to seize Midway Island, off Hawaii, but again the Allied forces were prepared.

Seeking a naval showdown, the Japanese sent out with the Midway and Aleutians invasion forces the bulk of their fleet—4 heavy carriers, 3 light carriers, 2 seaplane carriers, 11 battleships, 15 cruisers, 44 destroyers, 15 submarines and miscellaneous small craft. The U.S. Pacific fleet mustered 3 heavy carriers, 8 cruisers, 18 destroyers and 19 submarines The Japanese had no land-based air support, but from Midway and Hawaii the U.S. Pacific fleet could count on the aid of about 115 navy, marine corps or army land-based planes.

Operations off Midway started on June 3 when U.S. army and navy bombers struck ineffectually at Japanese vessels about 500 mi. southeast of Midway Island. Early the next morning Japanese planes caused considerable damage at Midway and Japanese ships again escaped damage from Allied land-based planes. But at midmorning U.S. carrier-based aircraft began attacks which resulted in the sinking of three heavy Japanese carriers, one heavy cruiser, and damaging another carrier which was later sunk. During the afternoon the fourth Japanese carrier was knocked out and the U.S. carrier "Yorktown" disabled. On the 6th the "Yorktown" was struck by a torpedo and on the 7th it sank; a U.S. destroyer was sunk on the 6th. During June 3–4. while the battle of Midway was going on, another Japanese carrier force caused considerable damage at Dutch Harbor, in the Aleutians, and on the 7th, Japanese invasion forces occupied Attu and Kiska. No invasion of Midway was attempted, for the Japanese commander, appalled at the loss of the four carriers in that area, ordered a general retirement on the night of June 4–5.

If any one action can be called the turning point of the war in the Pacific, it is probably the battle of Midway. There the Japanese lost their first-line carrier strength and most of their best-trained naval pilots, bringing some semblance of naval parity back to the Pacific. For the Allies it was a great strategic victory. The Japanese were prompted to cancel their plans for the invasion of New Caledonia, Fiji and Samoa. and they lost all but the last vestiges of their earlier strategic initiative.

4. **Guadalcanal.**—Having decided to take positive steps to secure the lines of communication between the United States and Australia, the U.S. joint chiefs of staff on July 2, 1942, issued a directive to the commanders in the Pacific to begin limited offensive operations for the recapture of the New Britain-New Ireland-Solomons-eastern New Guinea area. The offensive had three stages: first, the seizure of Tulagi, the Santa Cruz Islands and adjacent positions in the South Pacific area; second, the occupation of the central and northern Solomons and the northeast coast of New Guinea as far as the Lae-Salamaua area; third, the seizure of Rabaul and other areas in the Bismarck archipelago. The first phase was to be controlled by Admiral Ghormley; the boundary between the South and Southwest Pacific areas was therefore moved westward to place the southern Solomons within the South Pacific area. The latter two stages mere to be conducted under General MacArthur's strategic direction.

On July 6 the Japanese landed troops on Guadalcanal and began constructing an air base there. The Allied high command, perturbed that this action might presage further advances toward the southeast, speeded preparations to move into the southern Solomons in order to strike before the Japanese were firmly entrenched, and to secure a base from which to stage later advances toward Rabaul. The U.S. 1st marine division poured ashore on Guadalcanal, Tulagi and adjacent islands on Aug. 7, 1942, against negligible opposition. By nightfall the next day the Japanese airfield at Lunga Point, Guadalcanal, and Tulagi's excellent harbour had been secured. So far, the task had been easy, but the Japanese were determined to hold the island and began sending reinforcements south from Rabaul and dispatching naval units to give battle to Allied vessels, bombard Allied positions ashore, sink Allied transports and protect the reinforcement ships.

During the battle of Savo Island, Aug. 8–9, Japanese surface forces sank four Allied cruisers and one destroyer while suffering damage to two cruisers, one of which was sunk on the 10th by a U.S. navy submarine. In the battle of the eastern Solomons, Aug. 23–25. Allied land- and carrier-based aircraft sank one Japanese light carrier, one destroyer and one submarine, damaging one cruiser and a seaplane carrier. Allied naval losses were one destroyer sunk and one heavy carrier severely damaged. Another U S. carrier was damaged severely on Aug 31 and on Sept. 15 Japanese submarines sank the U.S. carrier "Wasp" and damaged a battleship.

During these actions the Japanese had landed more than 6,000 fresh troops on Guadalcanal to reinforce what remained of the original 7.500-man garrison. On Aug. 20–21 the marine beachhead was ineffectually attacked, and another ground attack occurred during Sept. 12–14. On Sept. 18 another marine regimental combat team (RCT) arrived to reinforce the 1st marine division, just in time to help turn back more ground attacks. By mid-October the Japanese had assembled about 22.000 troops on the island in preparation for an all-out assault against the 23,000-odd defenders, who now comprised the 1st marine division, an RCT of the 2nd marine division and an RCT of the U.S. army's Americal division. In late October, during the naval battles of Cape Esperance and of the Santa Cruz Islands, further Japanese attempts to reinforce and bombard the island resulted in the loss of two Japanese cruisers and two destroyers sunk, and three carriers and two destroyers damaged. The Allies lost one carrier and two destroyers sunk and six other ships damaged. The Japanese ground attack, occurring during the period Oct. 20–29, failed.

After Oct. 1942 the Allies built up air and ground strength at Guadalcanal until by mid-November there were present two U.S. marine corps divisions (less one infantry regiment), two RCT's of the U.S. Americal division and most of a separate U.S. army infantry regiment. The Japanese organized another large-scale attempt to reinforce the island but during the naval battle of Guadalcanal, Nov. 13–15, lost 2 battleships, 3 destroyers, 1 cruiser, 2 submarines and 11 cargo vessels or transports. Of the nearly 12,500 Japanese troops who attempted to land, only about 4,000 managed to get ashore and they were without supplies or ammunition. Allied naval losses were two cruisers and seven destroyers sunk, and one battleship and one cruiser severely damaged. On Nov. 30 eight Japanese destroyers tried to land more troops, but failed after one destroyer had been sunk and another severely damaged. This action, the battle of Tassafaronga, cost Allied naval elements one cruiser sunk and three damaged.

U.S. army and marine corps troops gradually expanded their hold during Nov. and Dec. 1942 as fresh reinforcements were brought in and the 1st marine division was relieved. By Jan. 5 the Allied garrison included the U.S. 2nd marine division, the Americal division, the 2jth infantry division and the separate 147th infantry regiment, in all, about 44,000 men to oppose the 22,500 Japanese then on the island. By this time major command changes had also taken place within the Allied establishment. On Oct. 18 Adm. William F. Halsey, Jr. (U.S.N.) had become commander, South Pacific area. On Jan. 2, 1943, ground operations on Guadalcanal passed from the control of Maj. Gen. Alexander A. Vandergrift (U.S.M.C.), commanding the 1st marine division, to Maj. Gen. Alexander M. Patch (U.S.A.), commanding general, U.S. 14th corps. Steady pressure by the 14th corps pushed the Japanese northward, and early in January the Japanese decided to evacuate their remaining troops. In daring destroyer runs during the first week of Feb. 1943, about 12,000 Japanese escaped, effectively ending the operation. The Japanese had lost more than 24,000 men during the campaign, while Allied combat losses were about 1,600 men killed and 4,250 wounded, figures which do not reflect the higher number of casualties from diseases. Allied naval losses were 2 heavy carriers, 6 heavy cruisers, 2 light cruisers and 14 destroyers. The Japanese lost 2 battleships, 1 light carrier, 3 heavy cruisers, 1 light cruiser, 11 destroyers and 6 submarines. The final action in the Guadalcanal campaign began on Feb. 21, 1943, when the U.S. 43rd infantry division began occupying the Russell Islands against no opposition. There, as at Guadalcanal, air and naval bases were developed from which to support subsequent advances toward Rabaul.

5. The Papuan Campaign.—While operations at Guadalcanal were underway, another major ground action was taking place in eastern New Guinea. In accordance with the directive of July 2, 1942, General MacArthur's Southwest Pacific area headquarters had laid careful plans to secure eastern New Guinea and establish bases from which operations against the Lae-Salamaua area and New Britain could be mounted. But before these plans could be realized the Japanese moved into the north coast of Papua to begin an attempt to take Port Moresby by overland action. On July 21 the Japanese began putting troops ashore near Gona, from which an overland march via the Kokoda trail started about Aug. 22 by two Japanese RCT's. The Kokoda trail was defended by the 21st Australian infantry brigade, the bulk of the 30th Australian infantry brigade and a battalion of a third brigade, but by Sept. 17 the advance Japanese elements had reached a ridgeline only 32 mi. from Port Moresby. There they stopped, primarily because of supply difficulties, and the next day began withdrawing in order to regroup pending the outcome of operations at Guadalcanal.

Pursued by the 16th and 25th Australian infantry brigades, the Japanese fell back to Buna and Gona, where by Nov. 18 they had assembled about 7,500 men. By that time two regiments of the U.S. 32nd infantry division were near the front and on the 19th one of these regiments, together with the two Australian brigades, began attacks against the firmly entrenched Japanese. In the course of the next two months the Japanese moved in about 3,000 fresh troops by small craft while the Allies committed the 7th Australian division (the 16th, 18th and 25th brigades), the 21st and 30th Australian infantry brigades, the 2/7th Australian cavalry regiment, the Papuan infantry battalion, the U.S. 32nd infantry division and the 163rd infantry regiment of the U S. 41st infantry division. Until mid-Jan. 1943 operations were under the control of Lt. Gen. Edmond F. Herring (A.I F.) and then under Lt. Gen. Robert L. Eichelberger (U.S.A), commanding general of the U.S. 1st corps.

Gona fell on Dec. 9, 1942, to the 21st Australian infantry brigade; Buna village to the U.S. 127th infantry regiment on Dec 14; Buna government station to the same unit on Jan. 2, 1943; Sananända to the 18th Australian infantry brigade on Jan. 18; and the last resistance was over on Jan 22.

Other incidents of the Papuan campaign included a Japanese attempt to outflank Port Moresby to the east by seizing Milne bay. On Aug. 26 the Japanese began putting 1,900 men ashore. The defenders, comprising the 7th and 18th Australian infantry brigades and U.S. army engineers, held and on Sept 4 the Japanese evacuated 1,300 of their troops, the rest being killed. Goodenough Island. off southeastern New Guinea, was taken by Australian troops on Oct. 22–26 against scattered opposition from Japanese stranded there during supply runs to New Guinea The entire series of operations had cost the Japanese nearly 12,000 men killed and 350 captured. while about 4.000 escaped to the Lae-Salamaua area or Kew Britain. Allied combat losses were approximately 3,300 killed and 5,500 wounded. The operations had been undertaken principally by ground and air units, the Allied naval forces S.W.P.A. contributing only small craft. The Allied air forces S W.P A., now under the command of Lt. Gen. George C. Kenney (U.S.A.), had given a good account of itself interdicting Japanese supply lines and flying Allied supplies and reinforcements to the front.

6. Reduction of **Rabaul.**—The Allied victories at Guadalcanal and in Papua made it clear that the Japanese were forced completely on the strategic defensive in the Pacific, completing the trend which had begun with the Japanese naval defeat at Midway. With Guadalcanal and Papua out of the way, Allied forces in the South and Southwest Pacific areas prepared for the other phases of the operations directed by the joint chiefs of staff on July 2, 1942. The pace of these operations could not be as fast as hoped, since the Allied policy of defeating Germany first left relatively limited means for the Pacific. Therefore, a new schedule of operations, involving some new targets, was worked out by the joint chiefs of staff and high ranking commanders from the Pacific theatres during the Pacific Military conference held at Washington, D.C.. in March 1943.

The first major action in the Southwest Pacific after that in Papua occurred when the Japanese decided to send about 7.000 reinforcements to New Guinea from Rabaul. But during the battle of the Bismarck sea, March 2–5, 1943, U.S. 5th air force and royal Australian air force planes sank 4 destroyers and 8 transports of the 16-ship convoy which had set sail from Rabaul. U.S. navy PT boats mopped up survivors, of whom less than 1,000 reached the Lae-Salamaua area, their original destination. This was the last large-scale Japanese attempt to reinforce New Guinea from the Rabaul area. Thereafter, a few troops mere brought in by submarine or barge under cover of darkness, but the Japanese main supply line was pushed to the west, along the northern New Guinea coast.

In the next Southwest Pacific action, the U.S. 112th cavalry and the U S. 158th infantry (both separate regiments not part of any division) took Woodlark and Kiriwina Islands during the period June 22–30. Allied planes based on these islands were aithin closer range of Rabaul and could cover vast areas of the Coral and Solomon seas. Meanwhile, from Buna, Australian and C.S. units had worked up the coast of New Guinea toward Lae and Salamaua, while other Australian troops pushed toward the same areas from an inland air base at Wau. During the night of June 29–30, elements of the U.S 162nd infantry, 41st infantry division, landed at Nassau bay to secure a supply base for further advances toward Lae and Salamaua.

During the same night the advance was resumed in the South Pacific area as major elements of the U.S. 43rd infantry division began landing at New Georgia and Rendova in the central Solomons. The Japanese reacted strongly with air and naval forces to this step toward Rabaul and, as they had at Guadalcanal, began moving reinforcements south from New Britain. During the period July 5–16 these Japanese manoeuvres resulted in the battles of Kula gulf and Kolombangara, which cost the Allied forces one cruiser and two destroyers sunk and three cruisers severely damaged. The Japanese, at the cost of one cruiser and two destroyers sunk, had managed to land considerable reinforcements. Maj. Gen. Oscar W. Griswold (U.S.A.), now commanding the 14th corps in the area, therefore found it necessary to call for many additional ground force units before the New Georgia group and neighbouring islands could be secured. The operations, including the occupation of Vella Lavella, which began on Aug. 15, employed the entire 43rd infantry division, the 25th and 37th infantry divisions (both less one RCT), an infantry brigade of the 3rd New Zealand division and two U.S. marine corps raider battalions. Further naval actions also took place. At the battle of Vella gulf, Aug. 6–7, the Japanese lost three destroyers. and two more were sunk later by Allied aircraft. Evacuating Vella Lavella. the Japanese lost another destroyer during the battle of Vella Lavella, Oct. 6–7, an engagement which cost Allied naval units one destroyer sunk and two more severely damaged. U.S. losses on the ground in the New Georgia group were approximately 1.150 men killed and 4,100 wounded, while the Japanese lost about 10,000 men.

Meanwhile, operations in the Southwest Pacific area had gone on apace. In preparation for new ground offensives, the C.S. 5th air force struck Japanese fields at Wewak on Aug. 17–18. 1943, destroying more than 200 planes. On Sept. 4 the 9th Australian division began amphibious landings near Lae and on the next day the U.S. 503rd parachute infantry, a separate regiment, dropped at Nadzab, in the Markham river valley above Lae. On Sept. 6 the 7th Australian division began arriving at Nadzab by troop-carrier planes and started driving overland toward Lae and up the Markham river. Lae fell on Sept. 16, while Salamaua had been seized on the 12th after a series of operations involving the U.S. 162nd infantry and two brigades of the 5th Australian division. On Sept. 22 a brigade of the 9th Australian division landed near Finschhafen. which fell on Oct. 2. The 7th Australian division continued clearing the Markham and Ramu river valleys while the 9th Australian division pushed against Japanese trying to escape westward from the Huon peninsula.

Keeping the Japanese off balance, the Allied offensive shifted back to the South Pacific area in Oct. and Nov. 1943. Elements of the 3rd New Zealand division secured the Treasury Islands, just south of Bougainville, during the period Oct. 27–Nov. 6, while on Oct. 28 the U.S. 2nd marine parachute battalion made an amphibious landing on Choiseul Island to make the Japanese believe that the Shortland Islands and Choiseul were major Allied targets. But the principal target was Bougainville where, on Nov. 1, the U.S. 3rd marine division moved ashore at Empress Augusta bay, on the west coast. A beachhead was secured against negligible opposition, and airfields from which future advances could be supported were quickly constructed.

There was the usual Japanese aerial and naval reaction; and at the battle of Empress Augusta bay. Nov. 2, the Japanese lost one light cruiser and one destroyer, while the Allies lost one destroyer severely damaged. From Nov. 5 through Nov. 8 Allied land- and carrier-based aircraft hammered at Japanese shipping and airfields at Rabaul. sinking one destroyer, damaging other combat vessels and causing considerable destruction to shore installations The U.S. 37th infantry division began reaching Bougainville on Nov. 8

and by Jan. 9, 1944, all of that division as well as the U.S. America1 division mere on the island. Counterattacks in Dec. 1943 were beaten back and new reinforcement efforts cost the Japanese at least two more destroyers sunk by the time the 3rd marine division was relieved in mid-Jan. 1944. A final attack took place during March 1944 but was beaten off by the 14th corps' divisions with a loss of more than 6,000 Japanese killed. This was the last significant Japanese effort, and the remnants of the garrison remained in starving condition on the island to the end of the war, by which time Australian troops had replaced the U.S. forces.

In Dec. 1943 General MacArthur's Southwest Pacific area forces had instituted operations to open Vitiaz and Dampier straits, between New Britain and New Guinea, and thus make the straits safe for Allied shipping. On Dec. 15 the U.S. 112th cavalry RCT landed at Arawe on the southwest coast of New Britain, diverting Japanese attention from the main effort—a landing by the 1st marine division on the north coast at Cape Gloucester on Dec. 26. On Dec. 30 the marines captured Cape Gloucester airstrip and by Jan. 16, 1944, had secured a defensive perimeter. Talesea, almost halfway to Rabaul, was taken by the 1st marine division in March 1944, and shortly thereafter the 40th infantry division began relieving both the marines and the 112th cavalry RCT. Little further offensive effort was made on the island and late in the year the 40th infantry division was relieved by Australian troops. Rabaul was never taken, and the strong Japanese garrison there was left to die on the vine, beyond hope of succor. Control of Vitiaz and Dampier straits had been assured by the capture of the western part of the island.

In New Guinea, the 126th RCT of the U.S. 32nd infantry division had landed at Saidor on the northwest coast of the Huon peninsula on Jan. 2, 1944, and Allied planes were soon operating from an airstrip there. The 9th Australian division took Sio, on the northeast coast, on Jan. 16, while the 5th Australian division completed mopping up in the western section of the peninsula and the upper reaches of the Markham and Ramu river valleys. Elements of the 32nd infantry division landed at Mindiri, west of Saidor. on March j, and during the next month the 8th and 15th Australian infantry brigades (jth and 11th Australian divisions, respectively) moved up the coast to take Bogadjim, Madang and Alexishafen. The Japanese 18th army, in full flight. retreated westward toward Hansa bay and Wewak; the former was captured by elements of the 5th Australian division on June 15.

The isolation of the Rabaul area had been completed during Feb. and March 1944. Elements of the 3rd New Zealand division took the Green Islands, southwest of New Ireland. on Feb. 15, to secure an air base site from which the noose around Rabaul could be tightened. On Feb. 29, in a daring reconnaissance in force, a squadron of the dismounted U.S. 1st cavalry division landed at Los Negros, in the Admiralties. A beachhead was secured and the rest of the division began arriving on March 2. By March 9 Los Negros had been secured and the cavalrymen had moved on to Manus. The occupation of the Admiralties supplied the Allies with a base athwart Japanese lines of communication to Rabaul and also provided an invaluable air, naval and staging base for subsequent advances to the west.

The last step in the campaign against Rabaul was the unopposed occupation of Emirau Island by the U.S. 4th marine regiment on March 20. There another airfield was built to complete the ring of Allied bases around Rabaul and Kavieng. The campaign was strategically completed without the necessity of capturing the two strong Japanese bases. More than 100,000 Japanese were left behind, as the war moved westward and northward.

7. Recapture **of** the Aleutians.——While the joint chiefs of staff never had any serious intention of using the Aleutians as an avenue of invasion toward Japan, they did wish to clear the islands as early as possible to prevent further Japanese attacks on Alaskan bases; to secure the north flank of Allied forces in the Pacific; and to create in the minds of the Japanese. high command the ides that an offensive might come from that direction, thus forcing the Japanese to pin down troops in the home islands. Allied air and naval units bombarded Japanese bases in the Aleutians during early hug. 1942, and on Aug. 30 occupied Adak in order to establish an air base closer to Kiska and Attu. Air attacks from Adak began in Sept. 1942, and on Jan. 11, 1943, Amchitka, 70 mi. W. of Kiska, was occupied to establish another airfield. The Japanese were unable to support their Aleutians garrison through the air and naval blockade which was set up and made no attempts to do so after an effort in March ended in disaster.

By-passing Kiska, the U.S. 7th infantry division landed at three points on Attu on May 11, 1943. Under the most adverse weather conditions, the division slowly fought its way over the island toward an end which was speeded by a Japanese suicide attack. By May 31 most of the Japanese garrison of about 2,300 men had been annihilated, at the cost of approximately joo Americans killed. The Japanese, realizing their position on Kiska was now untenable, evacuated the latter island, and when an invasion force of U.S. and Canadian infantry arrived there on Aug. 15 they found Kiska unoccupied. Any danger from the north was over. and the Aleutians could be used by the Allies to mount bombing attacks against Japan's northern Kuriles, contributing to the cause of deception in the Pacific and helping to tie down Japanese forces.

C. ACROSS THE PACIFIC

1. Allied **Offensive Plans.**—With the completion of the campaign against Rabaul, the war in the Pacific entered a new strategic phase for which the Allies had long been planning. Prewar plans having been rendered obsolete by early Japanese successes, the U.S. joint chiefs of staff developed new ones, which were ready by April 1943. The new plans were based on two premises: first, that an invasion of Japan proper might be necessary before the war could be successfully ended; second, that the main offensive against Japan would be launched across the Pacific rather than from the Aleutians, China or southeastern Asia. Before an invasion of Japan became possible, it would be necessary to undertake extensive aerial bombardment of that country and to cut Japan's lines of communications to the Netherlands East Indies and Malaya. In early 1943 it appeared to the joint chiefs of staff that the necessary aerial bombardment could best be undertaken by land-based planes operating from southeastern China. The construction of airfields and the supply of air units in China in turn demanded the seizure of a port on the south China coast. while to reach the south China coast and cut Japan's supply lines to the south, it would be necessary to gain control of the South China sea. This would be accomplished by the occupation of the Luzon-Formosa-south China coast triangle, which would be reached by driving across the Pacific from bases already in Allied hands or which would be in Allied hands by the time the offensive could gain momentum in 1944.

This plan was approved in principle by the U.S.-British combined chiefs of staff at the Trident conference, held at Washington during May 1943 and was further developed before and during the Quadrant conference at Quebec, Que., in August of the same year. In detail. it provided that after completion of the tasks set forth in the directive of July 2, 1942 (see above), General MacArthur's forces would push up the north coast of New Guinea into the southern Philippine Islands, which would be invaded late in 1944. Simultaneously, Admiral Nimitz' Central Pacific forces mould drive across the Pacific via the Gilberts, Marshall~, Marianas, Carolines and the Palaus toward Formosa. Emphasis was to be given the Central Pacific route since that one promised more speed. threatened Japan's vulnerable eastern flank, permitted best use of the U.S. Pacific fleet for a naval showdown and provided for occupation of bases in the Marianas from which the U.S. army air force's huge B-29 bombers could hit Japan. Advances both through the Southwest and Central Pacific areas would be mutually supporting.

While there were changes in detail in this plan, it remained basically the same until Japanese offensives in eastern China made it obvious to the joint chiefs of staff that seizure of a foothold on the south China coast would probably entail an extended land campaign for which the Allies could not muster sufficient strength. Formosa also began to appear an unnecessary and costly operation. Thus, as the plan was ultimately developed. the seizure of an early foothold in the southern Philippines, coupled with a rapid advance to Luzon in the northern Philippines, became of prime importance. After Southwest Pacific area forces were firmly established on Luzon, from which Japan's supply lines to the south could be cut by concerted air and naval action, including extensive employment of submarines, further advances toward Japan could be undertaken. The China coast and Formosa operations were abandoned and the seizure of bases in the Ryukyu Islands was substituted.

2. The **Gilberts** and **Marshalls.**—While the joint chiefs of staff envisaged that the offensive across the Pacific would not gather momentum until mid-1944, they decided during the summer of 1943 that a limited offensive could be opened in the Central Pacific, both to accelerate the pace of the war and to draw Japanese forces away from the Southwest and South Pacific areas. Accordingly, on Nov. 20, 1943, Admiral Nimitz sent his forces into the Gilbert Islands. The 165th RCT of the U.S. 27th infantry division took Makin Island, losing about 70 men killed and 150 wounded. Simultaneously the 2nd marine division, against stronger resistance from well-fortified positions, pushed ashore on Tarawa. The atoll was secured four days later, but the operation cost the marines about 990 men killed and 2,300 wounded. The Japanese had lost perhaps 8,500 men in the Gilberts.

From airfields which were soon established in the Gilberts, U.S. army and navy land-based planes continually struck at Japanese bases in the Marshalls. Preceded by heavy carrier attacks, the U S. 7th infantry division and the 4th marine division landed on Kwajalein atoll in the Marshall Islands Jan. 31, 1944. The same day a battalion of the 7th infantry division's 106th RCT and the reconnaissance company of the U.S. marine 5th amphibious corps took Majuro. By the end of the first week in February most resistance at Rwajalein had been overcome. Admiral Nimitz had planned to move further in the Marshalls in mid-April, but Japanese resistance and reactions at Kwajalein and Majuro had been so weak that he moved his forces on to Eniwetok on Feb. 17. There the 106th infantry (less the 2nd battalion) of the 7th infantry division and the 22nd marine regiment landed, securing the atoll by Feb. 22. American casualties in the Marshalls operations numbered about 640 men killed and 1,885 wounded, while the Japanese lost approximately 9,000 men.

To support the Marshalls operations, the U.S Pacific fleet had launched a heavy carrier strike against the strong Japanese fleet base at Truk in the central Carolines on Feb. 16–17. The bulk of the Japanese fleet had already fled westward and Truk's defenses proved much weaker than had been supposed. Admiral Nimitz therefore cancelled plans to occupy the atoll and left it to be neutralized by land-based aircraft from the Marshalls.

3. Up the New Guinea Coast.—While these operations were underway in the Central Pacific, General MacArthur and Admiral Halsey had been completing the final phases of the campaign against Rabaul, and the Southwest Pacific commander was ready to institute his offensive up the New Guinea coast toward the Philippines. Ground operations during this offensive were directed by Lt. Gen. Walter Rrueger, commanding general of the U.S. 6th army, whose headquarters during the drive acted as a special task force under General MacArthur and was designated "Alamo" force. Vice-Adm. Thomas C. Kinkaid (U.S.N.) commanded the Allied naval forces S.W.P.A. and the U.S. 7th fleet during these operations, while amphibious phases of the advances were carried out under the direction of Rear Adm. Daniel E. Barbey (U.S.N.), the commander of the 7th amphibious force, 7th fleet. The Allied air forces S W.P.A. remained under General Kenney's command.

The Admiralty Islands having been seized a month ahead of schedule, General MacArthur could accelerate his advance toward the Philippines. He had planned to move first to Hansa bay, but with airfields operational in the Admiralties the Hansa bay operation nas deemed unnecessary and was cancelled in favour of a daring jump to the Hollandia area of Dutch New Guinea, bypassing Japanese strongholds at Wewak and Hansa bay.

Landings were made at two points in the Hollandia area on April 22. 1944 with the U.S. 24th infantry division moving ashore at Tanahmerah bay and the 41st infantry division (less one RCT) pushing inland at Humboldt bay, 25 mi. to the east. The landing was supported by carrier-based planes of the U.S. 5th fleet, which had also struck Japanese air installations at Wakde and Sarmi to the northwest. Land-based planes of the Allied air forces S.W.P.A. had softened up the Hollandia area, destroying more than 300 aircraft of the Japanese 4th air army there in the weeks preceding April 22. Opposition at Hollandia mas negligible and by April 26 the two divisions had secured inland Japanese airfields. Ultimately, a major air and staging base was developed in the Hollandia area and most of the higher headquarters in the Southwest Pacific area established their command posts there during the summer of 1944.

Meanwhile, the 163rd RCT of the 41st infantry division had gone ashore at Aitape, in British New Guinea about 12j mi. southeast of Hollandia. There, by April 24, Australian engineers had completed an airstrip from which the Allied air forces could have supported ground operations at Hollandia after the US. 5th fleet's carriers left the latter area. Although such support was not necessary, the Allied perimeter at Aitape provided flank protection for the more important Hollandia area bases.

During late April and May, the U.S. 32nd infantry division moved up to Aitape, relieving the 163rd RCT for another operation. The Japanese 18th army, based on Wewak. mounted an attack against the Aitape perimeter during July and August, employing more than 20,000 troops in the forward area. But the 32nd infantry division, reinforced by the 112th cavalry RCT and the 124th RCT of the 31st infantry division, all co-ordinated by headquarters, U.S. 11th corps, broke the impetus of the Japanese attacks and began pushing the Japanese 18th army back toward Wewak. The U.S. 43rd infantry division, elements of which had participated in the heavy actions during July and early August, relieved the rest of the 11th corps later during the latter month.

While the Hollandia area had been seized cheaply — about 130 men killed and 1,050 wounded as compared with the 4.475 Japanese killed and 655 captured — the Aitape action was much more costly. There, about 450 U.S. troops uere killed and 2,j50 wounded, while 8,82j Japanese were killed and 125 captured. In Nov. 1944 the 6th Australian division relieved the last U.S. army units in the Aitape area and instituted a drive down the coast toward Wewak, which fell on May 10, 1945. By the end of the war the campaign against the Japanese 18th army had cost the Australians about 450 men killed and 1,160 wounded, as opposed to approximately 7,200 Japanese killed and 270 captured.

The advance of Southuest Pacific area forces continued, and on May 17, 1944, the 163rd RCT of the 41st infantry division landed at Arara, on the Dutch New Guinea mainland about 125 mi. N.W. of Hollandia. The next day a reinforced battalion of the 163rd infantry moved across a narrow channel to Wakde Island, site of a Japanese airfield. There, in two days mas fought a bitter action which was the only one undertaken in the Southwest Pacific to bear close resemblance to the island warfare in the Gilberts and Marshalls. About 760 Japanese were killed and the 163rd RCT had approximately 40 men killed and 110 wounded.

The 163rd RCT was replaced on the mainland by the separate 158th RCT, which moved westuard from Arara to secure the shores of Maffin bay, needed for a forward staging area. The latter region was not taken until the U.S. 6th infantry division, in a series of bloody assaults, seized a dominating hill. Later. the 31st infantry division (less one RCT) and the 123rd RCT of the 33rd infantry division saw action in the area. The Maffin bay area was secured by late June. but before final defense lines had been established, about 415 U.S. army troops had lost their lives in the Wakde-Arara-Maffin bay region and another 1,500 had been wounded. Almost 4,000 Japanese were killed and 75 were taken prisoner.

On May 27, 1944, the 41st infantry division (less the 163rd RCT) landed near Bosnek on Biak Island which, lying about 200 mi. N.W. of Wakde, dominated the entrance to Geelvink bay. An initial offensive west along the coast toward Japanese airfields was thrown back by about 10.000 defending Japanese and it was not until late June that the airfield area was finally secured By that time the 163rd RCT had reached the island, and headquarters, U.S. 1st corps, had arrived to take control of operations, bringing with it the 34th RCT of the U.S. 24th infantry division. As they had previously in the Solomons and eastern New Guinea, the Japanese attempted to reinforce Biak, and succeeded in landing about 1,100 fresh troops during early June, losing for their pains 2 destroyers sunk, 5 destroyers and 1 cruiser damaged, and at least 50 aircraft shot down. By the time Biak was declared secure in early August, the Japanese had lost about 6,125 men killed and 450 captured, mhile U.S. army and navy forces involved had lost about 470 men killed and 2,400 wounded.

4. The **Marianas.**—While the reinforcements the Japanese put ashore at Biak could not effect the ultimate outcome of operations on the island, they were sufficient, combined with the fanatic defense of the original garrison, to prevent the Southwest Pacific area's land-based aircraft from using Biak fields to support the Central Pacific area's invasion of the Mariana Islands on June 1j, 1944. It appears, indeed, that the Japanese gave up further attempts to reinforce Biak only when they learned of Admiral Nimitz' move to the Marianas, and they hurriedly assembled the bulk of their fleet to give battle to the U.S. Pacific fleet off the Marianas. On the other hand, Japanese preoccupation with Biak had diverted much land-based air strength from islands in the central Pacific to western New Guinea, where many of the pilots had been shot down or fell prey to malaria, thus making the Allied invasion of the Marianas easier.

On June 15 the U.S. 2nd and 4th marine divisions moved ashore on Saipan Island in the Marianas against stubborn opposition from almost 30,000 Japanese. Occupation of the island went slower than anticipated, and by June 20 the army's 27th infantry division had been sent ashore to reinforce the marine corps units. Gradually compressed into smaller and smaller pockets, the Japanese themselves ended most organized resistance with a suicidal counterattack on July 7. After the U.S. forces had thrown back this counterattack, only mopping up remained. On July g the island was declared secure.

The Japanese combined fleet had meanwhile steamed northward from anchorages in the Philippines and the Netherlands East Indies determined to greet the Allied invasion of the Marianas with a naval showdown battle. On June 19 Japanese carriers launched air attacks against U.S. 5th fleet vessels supporting the landing operations at Saipan. These attacks cost the Japanese more than 400 aircraft, while the 5th fleet's carriers lost only 26. With the bulk of its carrier planes lost, the Japanese fleet began withdrawing, pursued by U.S. 5th fleet aircraft. By June 21, when the pursuit ended, the Japanese had lost 3 carriers and 2 tankers sunk; 4 carriers, 1 battleship, 1 cruiser and 1 tanker severely damaged; and, finally, almost 450 planes. The U.S. 5th fleet lost only 20 aircraft in combat and damage to ships was negligible. For some time the Japanese combined fleet would not be a factor with which the Allies would have to reckon.

After Saipan, Admiral Nimitz' Central Pacific area forces proceeded with the occupation of the rest of the major islands in the Marianas. The invasion of Guam began on July 21, follotving extensive naval bombardment, but before the island was secured on Aug. 10 the U.S. 3rd marine division, the 1st marine provisional brigade and the U.S. army's 77th infantry division had all been committed to the action. Tinian was taken, beginning July 24, by the 2nd and 4th marine divisions, which met relatively light opposition. The entire Marianas campaign cost U.S. forces about 4,750 men killed and 18,100 wounded, while the Japanese lost approximately 46,000 men killed and captured.

While the fighting had been going on, U.S. army and navy engineers had started work on an extensive system of airfields for the army's huge B-29s and other planes. On Nov. 24 the first B-29 raid from the Marianas was sent against Japan. From the strategic point of view, the capture of the Marianas was even more important, The Japanese defensive perimeter had been breached at a vulnerable point and the Allies were assured control over vast reaches of the Pacific ocean. To realists in the Japanese high command, the loss of the Marianas spelled the ultimate loss of the war.

5. **Allied** Reorganfzations in the Pacific.—In mid-1944 many changes in organization were made in the Pacific theatres. First, with completion of the reduction of Rabaul, the South Pacific area was closed out as an active theatre and Admiral Halsey left to take command of the C.S. 3rd fleet for future advances. Army units in the South Pacific were transferred to General MacArthur's direct control in June, and the U.S. 13th air force moved bodily over to the Southwest Pacific area to form, with the U.S. 5th air force, the far eastern air force, which was commanded by General Kenney in addition to his position as commander, Allied air forces S.W.P.A. The royal Australian air force and Dutch air units remained under General Kenney's control as part of the Allied air forces, while the royal New Zealand air force, together with certain U.S. marine corps and U.S. navy land-based air units, continued to operate along the Solomons axis.

Administratively, the U.S. army units in the South Pacific area passed to the control of Lt. Gen. Robert C. Richardson (U.S.A.), previously commander of U.S. army units in the Central Pacific area under Admiral Nimitz. General Richardson now became commanding general, U.S. army forces Pacific ocean areas, in which capacity he remained subordinate to Admiral Nimitz' operational control. U.S. army air forces in the Pacific ocean areas (except the B-29s) were placed under Lt. Gen. Millard F. Harmon (U.S.A.), who was also subordinate to Admiral Nimitz. The B-29s in the Pacific, forming a part of the C.S. 20th air force, were controlled by the U.S. joint chiefs of staff, acting through Gen. Henry H. Arnold, commanding general of the U.S. army air forces.

In the Southwest Pacific area, in addition to the creation of the far eastern air force, there were few changes. General MacArthur, the supreme commander in the area, also commanded all U.S. army troops in the Southwest Pacific in his capacity as commanding general, U.S. army forces in the far east. The U.S. 6th army continued to operate as "Alamo" force until September, when it dropped the pseudonym. Australian ground units operated under General Blamey, commander of the Allied land forces S.W.P.A., while Air Vice-bfarshal William D. Bostock (R.A.A.F.) commanded Australian air units assigned to the Allied air forces. Late in the summer Lt. Gen. Robert L. Eichelberger (U.S.A.), previously commander of the U.S. 1st corps, became commander of the newly formed U.S. 8th army. The naval command in the Southwest Pacific remained as it had been.

6. Westward Toward the **Philippines.**—After Biak, the advance in the Southwest Pacific area was resumed when, on July 2, 1944, the 158th RCT landed at reef-studded Noemfoor Island, 90 mi. S.W. of Biak. Two battalions of the U.S. 503rd parachute infantry jumped during the ensuing two days to reinforce the 158th RCT, and the other battalion arrived by ship later in the month. There was little strong organized resistance and Noemfoor's airfields were soon in Allied hands, deepening the air penetration of which the Allied air forces S.W.P.A. were capable. The operation cost U.S. forces involved about 70 men killed and 350 wounded, while the Japanese lost almost 2,000 killed and 250 captured.

The next step was the occupation of the Sansapor-Mar area at the northmest tip of New Guinea's Vogelkop peninsula on July 30 and 31 by elements of the U.S. 6th infantry division. Airfields from which Allied planes could strike the southern Philippines and the northern Netherlands East Indies were soon operational. There had been negligible opposition by the time the area was secured, and only 15 men had been killed and 45 wounded. The Japanese lost about 700 killed and 100 captured.

On Sept. 1j the U.S. 11th corps, comprising the 31st infantry division and the 126th RCT of the 32nd infantry division, started ashore at Morotai Island, between the Vogelkop peninsula and Mindanao, southernmost large island of the Philippines By-passing Japanese strength at Halmahera, south of Morotai, the 11th corps quickly secured a defensive perimeter behind which airfields were rapidly constructed in order to provide air support for further advances. Except for some fairly severe air raids, the Japanese attempred little reaction to this penetration of their last defenses before the Philippines, and the Morotai operation cost the U.S. forces only 45 men killed and about 95 wounded. The Japanese lost about 325 men killed or captured.

With the occupation of Morotai, the long drive up the New

Guinea coast was strategically completed. The only subsequent operation of offensive significance in the area occurred Nov 15–20, when the U.S. 8th army, directing its first operation, sent elements of the 31st infantry division off to capture the Asia and Mapia Island groups, north of the Vogelkop. There, the U.S. forces, losing 20 men killed and 45 wounded and killing 170 Japanese, established radar stations and navigational guides. The forces of the Southwest Pacific area were ready to move on to the Philippines.

Simultaneously with the Morotai landings in the Southwest Pacific, Admiral Nimitz' forces had moved into the Palau Islands in the western Carolines. On Sept. 15 the U.S. 1st marine division pushed ashore against heavy opposition on Peleliu, while two days later the 81st infantry division (less one RCT) landed on Angaur Island, immediately to the south. The most important area of Angaur, where airfields were to be constructed, was secured by Sept. 20, but it was not until Oct. 23 that the 81st division's 322nd RCT had overcome the last stubborn, organized resistance in rugged terrain at the island's northwest corner.

On Peleliu, although the 1st marine division had secured the southern part of the island with its important Japanese airfield by Sept. 17, the Japanese continued fanatic resistance from rough, dominating ground in the centre of the island, and also held the northern tip. where reinforcements from more northerly islands in the Palau group could be landed. Fighting was so fierce and casualties so high that the 1st marine division had to be reinforced by the 81st division's 321st RCT from Angaur. The 321st RCT swung into action on Sept. 22, soon isolating the central Japanese pocket and helping the marines secure the northern tip and offshore islets.

The 1st marine division, having lost almost 6,500 men from combat and many more from disease and fatigue, had to be relieved in the latter part of October and the 81st infantry division completed the job. The 321st RCT bore much of the burden of the final offensive, but the 323rd RCT, fresh from the unopposed occupation of Ulithi atoll (Sept. 23), had taken over when, on Nov. 25, organized resistance ceased.

Operations in the Palaus cost the U.S. army, marine corps and navy forces involved approximately 2,850 men killed and 9,000 wounded, while the Japanese lost about 13,600 men killed and 400 captured, including about 650 men sent from the northern Palaus to reinforce the original 11,000-man garrison on Peleliu. The occupation of Peleliu and Angaur had proved to be one of the bloodiest battles in the war, but with the southern Palaus and Ulithi in Allied hands the western Pacific was safe for Allied air and naval forces. The rest of the Palaus could be neutralized by air action alone. The road to the Philippines was open from both the south and the east.

D. THE LAST CAMPAIGNS

1. Revised Allied Plans.—At the time of the Morotai and Palau landings, General MacArthur was intending to invade the Philippines at Sarangani bay, Mindanao. on Nov. 15, 1944, to establish air and naval bases from which to support a larger invasion at Leyte Island on Dec. 20. Admiral Nimitz' plans called for an invasion of Yap, in the Carolines east of the Palaus, on Oct. 5. But the U.S. 3rd fleet. striking the Philippines on Sept. 9–10 in strategic support of the Palaus and Morotai landings, discovered unexpected Japanese weakness on Mindanao. Cancelling further strikes against that island. Admiral Halsey sent his 3rd fleet planes against the central Philippines on Sept. 12 and 13, again finding hostile reaction meagre. Admiral Halsey suggested to Admiral Nimitz, General MacArthur and the joint chiefs of staff that the Palaus, Yap and Mindanao operations might well be cancelled in favour of a direct move to Leyte. Admiral Nimitz did not believe it safe to by-pass the Palaus, but he was willing to forget about Yap and he offered General MacArthur the use of the U.S. 24th corps (the 7th, 77th and 96th infantry divisions) already staged for Yap, for an early invasion of Leyte. In the name of General MacArthur, who was keeping radio silence aboard a ship off Morotai, Lt. Gen. Richard K. Sutherland (U.S.A.), General MacArthur's chief of staff, accepted this proposal and so informed the joint chiefs of staff. The joint chiefs. then meeting with the British chiefs of staff at the Octagon conference in Quebec, quickly approved the proposed changes, and the Yap and Mindanao operations were cancelled for a direct move to Leyte, now rescheduled by General MacArthur for Oct. 20.

2. Leyte.—In preparation for the Leyte invasion, Admiral Halsey's 3rd fleet struck the Philippines again during the period Sept. 21–24, and provided additional strategic support by hitting the Philippines, Formosa and the Ryukyus from Oct. 10 through Oct. 21. The Allied air forces S.W P A. sent available land-based planes against the southern and central Philippines also, while escort carriers of the Allied naval forces S.W.P.A. provided direct air support for the landings of the U.S. 6th army.

First landings in the Leyte area were made on Oct. 17 and 18 by the U.S. 6th Ranger infantry battalion, which seized offshore islands in Leyte gulf. On Oct. 20 the 10th corps (1st cavalry and 24 infantry divisions) and the 24th corps (7th and 96th infantry divisions) poured ashore on the east coast of Leyte. where strong opposition was met at only one of the four division beaches. Within three days a fair-sized beachhead had been secured and work had started on airfields.

Japanese plans for the defense of the Philippines had originally called for the main effort to be made at Luzon, but possibly as the result of exaggerated claims of damage to the U.S. 3rd fleet off Formosa, the Japanese high command made an eleventh-hour change and decided to make an all-out effort to defeat the Allied forces at Leyte. First, they reinforced their land-based aircraft in the Philippines to attack Allied shipping in Leyte gulf and to support a three-pronged fleet offensive aimed at the destruction of the U.S. 3rd and 7th fleets and the severance of the Allied lines of communication to Leyte. For this purpose, the bulk of the Japanese combined fleet, under Adm. Soemu Toyoda, was divided into three sections and sent toward Leyte. One group of battleships, cruisers and destroyers advanced on Leyte gulf from the south, through Surigao strait. and was soundly trounced by U.S. 7th fleet surface vessels during the predawn hours of Oct. 25. In the centre, moving into Leyte gulf via San Bernardino strait, came a force of the most modern Japanese battleships, cruisers and destroyers. This force created considerable damage among 7th fleet escort carriers, destroyers and other ships before it retired on the same day, apparently frightened lest Admiral Halsey's 3rd fleet launch strong carrier aircraft attacks.

The 3rd fleet had moved north, off the east coast of Luzon, to intercept the third Japanese force, which was built around carriers. Launching strong carrier-based air attacks, the 3rd fleet turned back this Japanese force on Oct. 25 also. The next day Allied planes from the 3rd and 7th fleets, as well as available land-based aircraft of the Allied air forces S.W.P.A , pursued Japanese stragglers as the remnants of the three Japanese forces fled toward safer waters. The battle for Leyte gulf cost the Japanese combined fleet three battleships. one large carrier. three light carriers. six heavy cruisers, four light cruisers and nine destroyers. Almost all the rest of the Japanese ships engaged received considerable damage. Allied losses were one light carrier, two escort carriers, two destroyers and one destroyer escort sunk, while some additional ships received some damage. The core of the Japanese navy had been demolished, and was no longer a significant factor in the Pacific war.

Despite their huge naval losses, the Japanese were determined to hold Leyte and after the naval battle started sending strong reinforcements to the island, while continuing aerial attacks against Allied shipping in Leyte gulf. During October too few Japanese reinforcements arrived to have much effect upon operations, and the U.S. 10th corps drove rapidly up Leyte valley to the north coast, while the 24th corps pushed inland and sent one division overland to the southwest coast. Continued bad weather and strong Japanese reinforcements—the equivalent of two and a half divisions by late November—slowed the 6th army's advances during November and early December, while the Japanese defended the Ormoc valley and the mountainous interior. General MacArthur therefore found it necessary to reinforce the 6th army, and during November the U.S. 11th airborne division, the 32nd infantry division and the separate 112th cavalry RCT reached the island. Both the 10th and 24th corps maintained heavy pressure on all fronts to keep the Japanese off balance and to prevent them irom organizing strong, co-ordinated counter-attacks.

Japanese reinforcements continued to arrive at Ormoc, on the northwest coast, despite staggering losses of ships and troops to Allied air and naval elements. The Japanese even tried some abortive airborne assaults which accomnlished little. To speed the inevitable end and to prevent further reinforcements from reaching the island, General MacArthur sent the 77th infantry division (which reached Leyte late in November) on a shore-to-shore movement from the east coast to Ormoc, near which town the division landed on Dec. 7. Ormoc fell on Dec. 10 and the 77th infantry division pushed up the Ormoc valley to establish contact with the 10th corps units fighting their way southward. This contact marked the end of the strongest organized resistance on Leyte and General MacArthur declared the island secure on Dec. 25

The 6th army, preparing for future operations, turned over the arduous task of mopping up to the U.S. 8th army. The 24th corps (the 7th, 77th and 96th infantry divisions) was relieved by the U.S. Americal division. The Americal division, Filipino troops, the 10th corps, the 38th infantry division and elements of the 81st infantry division, continued operations against the 20,000 Japanese left on Leyte at the end of Dec. 1944, and mopping up continued well into 1945, until almost 75,000 Japanese had been killed or captured on Leyte by the 6th and 8th armies.

3. The Luzon Campaign. — Even before Leyte had been declared secure, the U.S. 6th army had started moving toward Luzon, and on Dec. 15, 1944, the 19th RCT of the 24th infantry division and the separate 503rd parachute RCT made amphibious landings at the southwest corner of Mindoro Island. There was negligible opposition, and airstrips were rapidly constructed. The move to Luzon by Southwest Pacific area forces again had the strategic support of the U.S. 3rd fleet, which struck the island on Dec. 14–16, 1944, and again on Jan. 3–9, 1945. On the latter date the 6th army started invading Luzon at Lingayen gulf, putting ashore the U.S. 1st corps (6th and 43rd infantry divisions) and the 14th corps (37th and 40th infantry divisions). The generally unopposed landings were supported by escort carriers of the U.S. 7th fleet and by land-based planes of the U.S. 5th and 13th air forces. The 3rd fleet moved into the South China sea to strike the Indo-China coast, Formosa, Hong Kong, Canton, Hainan and the Ryukyus during the period Jan. 12–22, 1945.

Realizing that the diversion of forces to Leyte and the inability of the Japanese high command to send reinforcements to Luzon gave him little hope of defeating the 6th army, Gen. Tomoyuki Yamashita, commanding the Japanese 14th area army, decided upon static defense aimed at pinning down Allied troops on Luzon for as long as possible. He established three principal defensive sectors: one in the mountains west of Clark field in the Central Plains; a second in mountainous terrain east of Manila; and the third and strongest in the mountains of northwestern Luzon, centring initially around Baguio. Manila was also strongly defended, although General Yamashita at one time apparently had some thought of abandoning the city.

First Allied contact with strong Japanese forces came at the outskirts of the Baguio sector as the U.S. 1st corps, securing the 6th army's left flank so that the 14th corps could drive south through the Central Plains unmolested, drove north and east from Lingayen gulf. The 14th corps met negligible resistance until it reached the Clark field area. There the 40th infantry division was dropped off and the rest of the corps, now including the 1st cavalry division, continued toward Manila.

While the drive south gained momentum, the U.S. 11th corps (comprising the 38th infantry division and the 34th RCT of the 24th infantry division) landed on Jan. 29. 1945, at the west coast north of Bataan peninsula to secure Subic bay and cut access routes to the peninsula, thus preventing the Japanese from using Bataan as General MacArthur had employed it in 1942. By Feb. 5 the 11th and 14th corps had established contact inland at Dinalupihan. On Jan. 31 the U.S. 11th airborne division (less the 511th parachute RCT but reinforced by two infantry battalions of the 24th infantry division) made an amphibious landing at Nasugbu, south of Manila bay. On Feb. 3 the 511th parachute RCT jumped on Tagatay ridge, inland, soon linking up with the amphibious units from Nasugbu. The division then pushed northward toward Manila. The landings of the 11th corps and the 11th airborne division had been made under the operational control of the 8th army, control passing to the 6th army early in February.

On Feb. 3 the 1st cavalry division reached Manila and the 37th infantry division arrived there the next day. The 11th airborne division reached the southern outskirts on Feb. 6. Manila was bitterly defended by the Japanese with steady house-to-house warfare, and it was not until March 3 that the 14th corps could announce that organized resistance was over. With Manila under siege, further steps had been taken to open Manila bay for Allied shipping. On Feb. 15 the 151st RCT of the 38th infantry division secured the southern tip of Bataan and the next day the 503rd parachute infantry dropped on Corregidor Island, supported by an amphibious assault on the part of an infantry battalion of the 34th RCT, 24th infantry division. Within two weeks the island was secured, with Japanese dead numbering 4,500. The east and west coasts of Bataan peninsula were cleared by elements of the 6th infantry division, while other 11th corps troops secured smaller islands in Manila bay during March and April. The 11th airborne division cleared the bay's south shore.

The 6th army's strength was rapidly built up, and divisions wete moved from one sector to another as the need arose or when troops needed a rest by assignment to a quieter front. At the Clark field defegse sector, for instance, the 40th, 43rd and 38th infantry divisions all fought before organized Japanese resistance had ceased in April and the Central Plains could be declared secure. With the Central Plains, Manila and Manila bay secured, the Luzon campaign turned into a sort of grandiose mopping-up operation against firmly entrenched and fanatically resisting Japanese. Southern Luzon and the Bicol peninsula were cleared by the 11th airborne division, the separate 158th RCT (which made an amphibious landing at Legaspi on April 1), and a brigade of the 1st cavalry division. Organized resistance in those areas was over by the end of May, but in the mountainous defensive sector east of Manila organized resistance continued almost to mid-June. In the latter area. the 1st cavalry division and the 6th, 38th and 43rd infantry divisions, as well as many Filipino guerrilla organizations, were committed to action at one time or another.

The defensive sector in the mountains of northwestern Luzon held out the longest. There, at various times, the 158th RCT, the 6th, 25th, 32nd, 33rd, 37th and 43rd infantry divisions, and Filipino units were all employed in drives north and northeast from Lingayen gulf before Baguio iell on April 26. During March, April and May the 1st corps continued to drive northeastward toward the Cagayan valley, the southern entrances to which were secured in mid-May. Operations to occupy the entire valley continued through June, and included a drop by elements of the 11th airborne division on June 21. The valley was declared secure a week later, leaving as the only strong, organized resistance on Luzon the Kiangan pocket, located in mountain fastnesses north of Baguio.

On July 1 headquarters, 14th corps, assumed control of operations against the Kiangan pocket and headquarters, 1st corps, began preparing for other advances. On July 4 General MacArthur declared Luzon secure, and the U.S. 8th army took over the task of final mopping up. just as it had at Leyte. The iast drive into the Kiangan area was undertaken by the 6th and 32nd infantry divisions and former Filipino guerrilla units now reorganized as regular elements of the Philippine army. By the end of the war the Japanese 14th area army mas still maintaining some organized resistance in northern Luzon, and only the final surrender ended the fighting there.

4. The Southern Philippines and Borneo. — The campaign for the reoccupation of the southern Philippines was conducted by

the U.S. 8th army, and the operations went on simultaneously with those on Luzon. The first major step was the seizure of Palawan Island by the 186th RCT of the 41st infantry division, beginning Feb. 28, 1945. At Palawan airfields were quickly constructed to assure complete Allied control over the South China sea. Panay Island was invaded by the 40th infantry division on March 18 and the island was secured against negligible opposition, Filipino guerrillas under the leadership of Col. Marcario Peralta (P.A.) having previously bottled up the small Japanese garrison at three or four isolated posts. The 40th infantry division moved to northwestern Negros Island on March 29 and was reinforced there by the 503rd parachute RCT on April 8. There was bitter fighting in the hills of northern Negros and it was not until mid-May that organized resistance was broken. The Americal division landed on Cebu Island on March 26. Again there was some stiff resistance and the last organized opposition was not over until May 2. The Americal division also cleared southeastern Negros and Bohol Island.

By the end of May almost all the rest of the many small islands in the central Philippines had been secured, many of them by or with the aid of Filipino guerrillas.

Mindanao, second largest island in the Philippines, had been General MacArthur's first target before the change in plans made in Sept. 1944, but as events turned out, Mindanao was the last island secured. The first landings were made by the 41st infantry division (less the 186th RCT) on March 10, 1945, at Zamboanga, southwestern Mindanao. Airfields were quickly constructed from which to support operations against the Netherlands East Indies, and the 41st infantry division secured the Sulu archipelago, between Borneo and Mindanao, in a series of shore-to-shore manoeuvres beginning on April 2. On April 17 the U.S. 10th corps, comprising the 24th and 31st infantry divisions, started landings in central Mindanao to begin the seizure of the interior of the island. The 108th RCT of the 40th infantry division reinforced the 10th corps on May 9, and elements of the 41st infantry division were also employed in the central and eastern sections of the island. A strong guerrilla organization, under Col. Wendell Fertig (U.S.A.), proved of considerable help to the 10th corps, but some isolated pockets of Japanese resistance were still holding out at the end of the war.

The reoccupation of Borneo began on May 1, 1945, when the 26th Australian brigade group of the 9th Australian division landed at Tarakan Island, northeastern Borneo, to establish bases from which future operations could be supported. The rest of the 9th Australian division landed at Brunei bay, on the northwest coast, on June 10, rapidly securing the area against scattered resistance. The 7th Australian division went ashore at Balikpapan on the east-central coast July 1, meeting resistance which delayed the seizure of the oil-rich area until the middle of the month. A Dutch infantry company and U.S. army amphibious engineers had participated in these operations, which had been supported also by available elements of the Allied air forces and Allied naval forces S.W.P.A. Borneo's oil was denied to the Japanese, and bases were secured from which further operations in the Netherlands East Indies could have been mounted, had they proved necessary before the end of the war.

5. Iwo **Jima.**—To provide a base from which fighter planes could protect B–29s on their raids against Japan; to step up air operations against Japan; to secure fields for B–29 emergency landings; to maintain pressure against Japan from all directions; and. finally, to extend Allied control over new areas of the Pacific, the Allies decided to seize Iwo Jima, in the Bonin Islands about 750 mi. S. of Tokyo. Following prolonged aerial and naval bombardment, the U.S. marines' jth amphibious corps began landing at Iwo on Feb. 19. 1945. The initial assault was made by the 4th and 5th marine divisions and the 3rd marine division (less one RCT) was put ashore later in the month. With little manoeuvre room available, the 5th amphibious corps faced a fanatically resisting Japanese garrison which organized strong counterattacks from well-fortified positions. But the island was declared secure on March 14, and only mopping up of a few stubbornly resisting pockets remained to be accomplished.

The Iwo Jima operation was primarily a marine corps action. U.S. army port companies, amphibious truck companies and anti-aircraft battalions also participated in the assault phase. The island garrison force had as its principal ground element the army's separate 147th infantry regiment, which completed the mopping up, and the air garrison stationed on the island comprised principally units of the army's 7th air force. The Iwo Jima operation resulted in the killing or capturing of about 22,000 Japanese, while U.S. forces engaged suffered more than 21,000 casualties, including almost 4,500 men killed. Despite this heavy cost, Iwo Jima proved an invaluable air base, and the first fields there became operational in early April.

6. **The Ryukyus; Okinawa.**—The seizure of positions in the Ryukyus was to have been the last step in the Pacific war prior to actual invasion of the Japanese home islands. From bases there, preassault aerial bombardment of Japan could be intensified; the invasion forces could be provided with direct land-based air support; and the islands could be used as staging and supply bases.

Okinawa. largest island in the Ryukyus, lies only 350 mi. S. of Kyushu Island, where the initial invasion of the Japanese home islands was to have taken place.

Ground operations in the Ryukyus mere under the direct command of Lt. Gen. Simon Bolivar Buckner (U.S.A.), commanding general of the U.S. 10th army, which fought under Admiral Nimitz' operational control. The 10th army comprised the U.S. 24th corps (the 7th, 27th, 77th and 96th infantry divisions) and the marines' 3rd amphibious corps (the 1st, 2nd and 6th marine divisions). Of the 2nd marine division, only one RCT was actively engaged in the Ryukyus fighting.

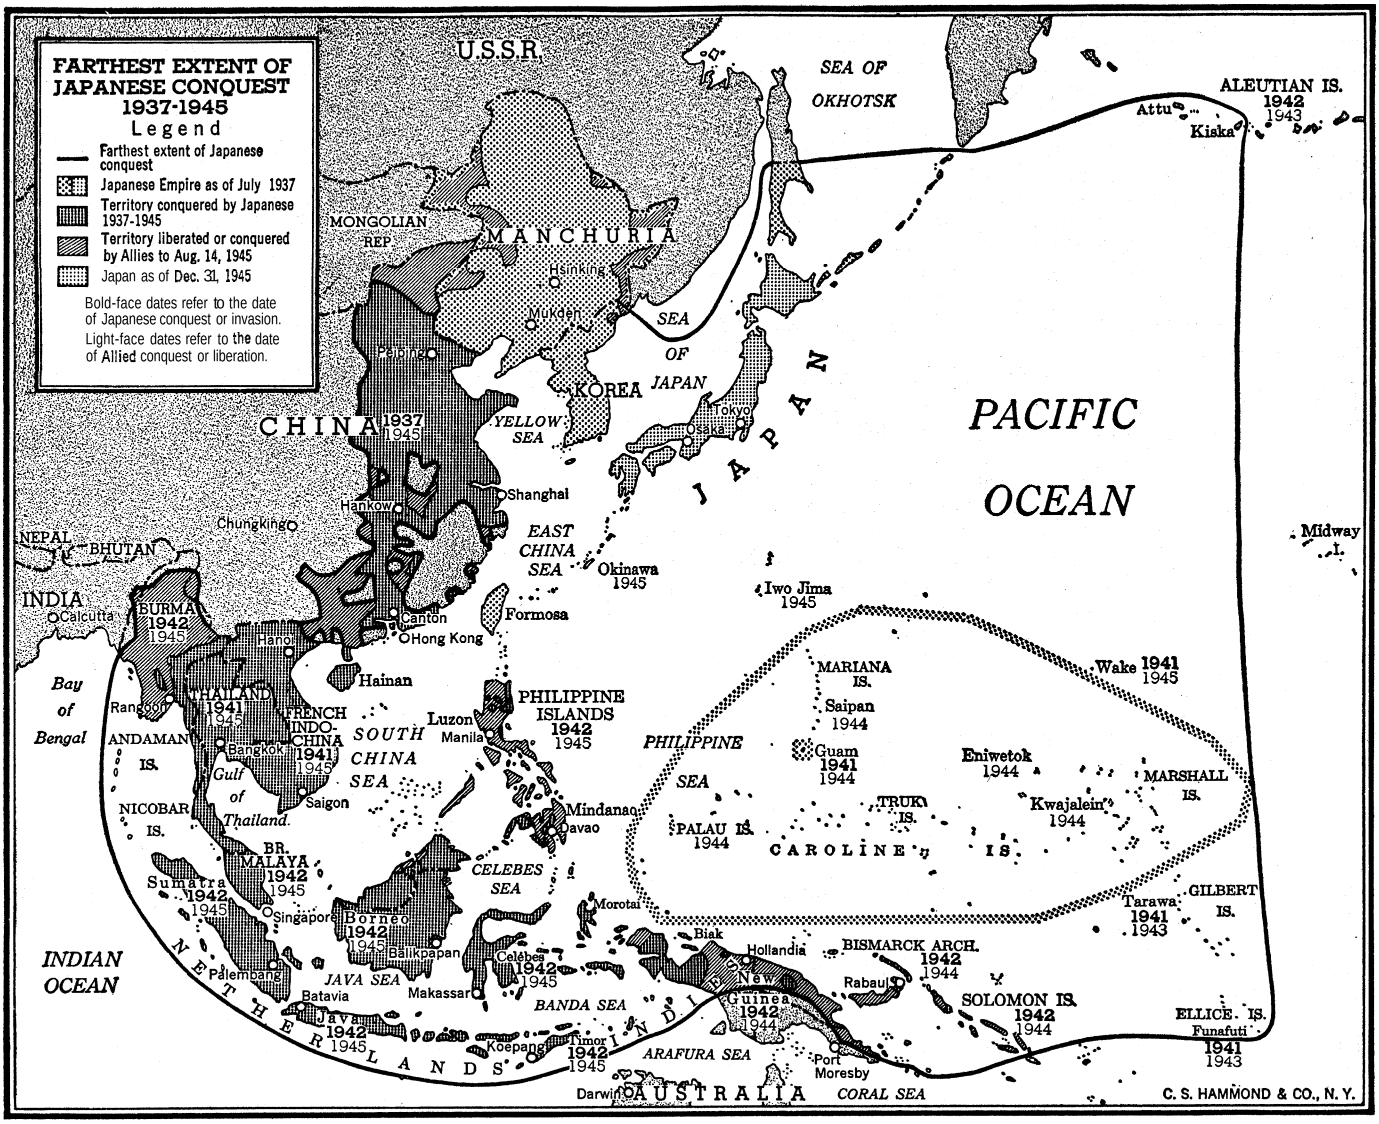
Following extensive aerial and naval bombardment by the U.S. 5th fleet, landings in the Ryukyus began on March 26, 1945, when the 77th infantry division began securing the Kerama Islands, 1j mi. W. of Okinawa. On March 31 army artillery was put ashore on Keise Island, only 11 mi. from Okinawa. A seaplane base and fleet anchorages were quickly established in the Keramas, and about 350 suicide boats, with which the Japanese had expected to destroy the Allied invasion convoys off Okinana. were destroyed. Artillery was soon bombarding Okinawa from Keise Island.

The main landings in the Ryukyus were made by the 7th and 96th infantry divisions and the 1st and 6th marine divisions at Okinawa on April 1. There was little opposition at the beaches, the Japanese having decided to maintain a static defense inland. The 3rd amphibious corps' two divisions secured northern Okinawa by April 18, while the 24th corps instituted a drive against the main Japanese defenses, located in the southern part of the island. While attacks on the south continued, the 77th infantry division, during the period April 16–21, secured tiny Ie Shima, off northwestern Okinawa. There, airfields were constructed from which to support ground operations on Okinawa and to undertake early air attacks against Japan.

In southern Okinawa vicious fighting continued against well-entrenched Japanese who launched local counterattacks and fought stubbornly for every square inch of ground. The 27th infantry division was committed to action on April 18, and the 77th infantry division had to be brought over from Ie Shima later in the month. By mid-May the two marine divisions were moved to the south and the 3rd amphibious corps was reinforced by an RCT of the 2nd marine division.

Organized resistance was not over until June 21, mopping up not completed until June 30 and the campaign not declared over until July 2.

The Ryukyus operations cost the 10th army about 7,600 men killed, 31,800 wounded and 26,200 nonbattle casualties. Total U.S. casualties during the campaign, including those of naval and air units, were about 12,500 men killed and 36,650 wounded. Approximately 110,000 Japanese were killed and 7,400 more were taken prisoner. The Japanese had reacted strongly with aerial attacks executed by planes based in Japan, Employing a multitude of suicide planes and small, one-man rocket missiles, the Japanese sank 36 Allied ships and damaged 368 more. In addition,



about 763 U.S. aircraft were destroyed. The Allied air units, both carrier- and land-based, destroyed about 7,800 Japanese aircraft in the Ryukyus or Japan and sank 16 Japanese ships. General Buckner lost his life and was replaced first by Maj. Gen. Roy S. Geiger (U.S.M.C.), commander of the 3rd amphibious corps, and then by Gen. Joseph W. Stilwell (U.S.A.), previously commander of U.S. army forces in China, Burma and India. However costly the operation, the seizure of the Ryukyus provided the Allies with an invaluable base.

The Japanese knew that invasion of the home islands could not be far off.

7. Victory in the Pacific.—While the campaigns in the Philippines and the Ryukyus were underuay. Allied commanders had been busy preparing plans for the assault on Japan. First, there was a sweeping reorganization of forces in the Pacific. On April 3, 1945, the U.S. joint chiefs of staff appointed General MacArthur commander of all U.S. army forces in the Pacific and Admiral Nimitz the commander of U.S. navy units. For the invasion of Japan, General MacArthur would also have retained operational control of marine corps and allied ground force units, and his position as supreme commander, Southwest Pacific area. Admiral Nimitz would likewise have had operational control over the naval units of Allied nations during the invasion. The U.S. 10th army on Okinawa passed to General MacArthur's control on July 31, and the headquarters of the U.S. 1st army, redeployed from Europe, set up an advance command post in the Philippines about the same time. The U.S. 20th and 8th air forces (units of the latter were being redeployed from Europe) were combined to form a bomber command designated the U.S. strategic air forces, under Gen. Carl Spaatz (U.S.A.), whose operations remained subordinate to the directives of the U.S. joint chiefs of staff. The U.S. 7th air force, based in the central Pacific, passed to the control of General Kenney's far eastern air force, while the U.S. Pacific fleet was reinforced by a British carrier task force.

Throughout July, Allied carrier- and land-based planes hammered at the Japanese home islands, and the area from northern Hokkaido to Tokyo was subjected to severe naval bombardments. The invasion schedule contemplated an assault at southern Kyushu in Nov. 1945 and a major effort in the Tokyo plain area of Honshu in March 1546. But what would obviously have been a most costly assault on Japan never had to be undertaken.

U.S.-British-Canadian research and development had succeeded in making possible the atomic bomb, the first experimental explosion of which was undertaken in the United States during July 1945. At that time the U.S., British and Russian chiefs of staff and heads of states were meeting at Potsdam, Ger., discussing both European problems and the prosecution of the war against Japan. The Allies decided to use the atomic bomb against Japan in an effort to shorten the war and save lives. Accordingly, on July 27 (Tokyo time) the Allies issued an ultimatum inviting Japan's immediate and unconditional surrender. This ultimatum was rejected.

On Aug. 6 a U.S. army air force B–29 bomber dropped a single atomic bomb on Hiroshima, Japan, creating unbelievable destruction and killing thousands of Japanese civilians. On Aug. g the

U.S.S.R. declared war on Japan and immediately began invading Manchuria and northern Korea. The cream of Japanese army forces in these areas had been drained away for operations in the Pacific or for the defense of the homeland, and the Russian troops found that resistance melted rapidly away. Still there was no satisfactory indication from the Japanese government that surrender was acceptable, and on Aug. 9 an even more powerful atomic bomb was dropped on Nagasaki.

The next day, Aug. 10, the Japanese declared their acceptance of the Potsdam ultimatum with the reservation that the emperor be retained as head of the state. The Allies, in turn, accepted this condition with the proviso that the emperor would remain subject to the directives of the supreme commander for the Allied powers, to which position General MacArthur was appointed. The Japanese accepted these final terms on Aug. 14. Five days later a Japanese delegation arrived in Manila to confer with General MacArthur's staff for the procedure concerning cessation of hostilities through the Pacific and Asia, the peaceful occupation of Japan by the Allied powers and the signing of formal surrender papers. Surrender ceremonies were conducted aboard the U.S. battleship "Missouri" in Tokyo bay during the morning of Sept. 2. The war in the Pacific was over.

The occupation of Japan was soon complete and Japan's scattered forces were rapidly rounded up and sent home. The nation had surrendered while still possessing a strong army capable of determined defense of the home islands. Japanese air strength had been considerably reduced in the summer of 1945, but there were still about 3,000 operational planes of various types available in the homeland. The navy, however, had practically ceased to exist, and Japan's industries had suffered such damage that the nation's ability to prolong the war was severely impaired. Finally, Allied air, surface and submarine operations had cut the home islands from all sources of raw materials. The effective and close blockade the Allies established around the home islands would ultimately have made it impossible for the Japanese to supply their military and civilian components with even the bare essentials of life. An early surrender was inevitable, probably even without the impetus supplied by the atomic bombs. It was better for both the Allies and the Japanese that the end came when it did. (R. R. SH.)

V. THE WAR AT SEA

A. PRIOR TO U.S. ENTPY INTO WAR

For many decades it had been a keystone of Britain's policy to maintain a fleet equal to any combination of two opponents likely to be brought against it. This policy rested on the belief that Britain could exist only by the importation of a large proportion of its food and could maintain the unity of its world-wide commonwealth of nations only by the mobile power of a dominant navy. The Washington naval treaty (1922) accepted equality with the United States while limiting the navies of France, Italy and Japan in proportion to their needs. The German navy already, by the Versailles treaty, had been reduced to impotence. The treaty of London (1936) imposed further limitations on cruisers and destroyers; but Italy, under fascist influence and expansionist ideas, declined to be bound, being already engaged in developing a fleet which might in favourable conditions give it mastery of the Mediterranean. The growing nationalism of Germany and the feeling that that country could be made peaceful only by allowing it a navy sufficient to satisfy national self-respect, resulted in the Anglo-German agreement of 1935 and declaration of 1937. These gave Germany the right to build up to 35% of Britain's strength in all categories and to 100% in submarines. Germany had started to rebuild its fleet and had produced the pocket battleships "Deutschland." "Admiral Graf Spee" and "Admiral Scheer," nominally 10,000-ton cruisers but in fact powerful commerce raiders of considerably larger tonnage. It now settled down to construct a modern fleet. "Gneisenau" and "Scharnhorst," 26.000-ton battleships, were completed in 1938 and 1939, respectively; the "Tirpitz" and "Bismarck," capital ships more powerful than any afloat or contemplated elsewhere, were laid down. Submarines were built in great numbers.

Britain became conscious of the inevitability of war as early as 1936 when a rearmament program was begun, but the recovery of the navy was slow. As forecast in 1938 the naval strength of the countries likely to be involved in the coming struggle would in 1940 be as given in Table II.

***TABLE 11.—Anticipated 1940 Naval Strength of Belligerents,** 1938*

	Battleships	Aircraft carriers	8-in. cruisers	Light cruisers	Destroyers	Submarines
British empire .	17	7–11	15	63	188	69
Germany . .	7		5		22	119–129
France , . .	10		7	10	66	94
Italy . . .	6	...	7	12	99	120–130
				28		

The British battleships were old, and the new program of battleship construction, introduced by Lord Chatfield when first sea lord, could not reach completion till 1941–42.

1. Two Great Strategic Aims.—British strategy had a threefold object: to ensure the safe arrival of supplies of all kinds to the home country, to prevent the landing of any enemy military expedition on its coasts and to provide force whereby a British expedition could be landed and maintained on enemy territory. Long experience had taught Britain that these essentials were best met by seeking out and destroying any enemy force which showed itself at sea.

German strategy aimed at cutting off Britain's supplies, primarily by submarines, secondly by surface raiders and thirdly by aircraft. Britain could thus be reduced to impotence, after which an actual invasion, well supported by air, could destroy its power forever. This plan involved disregard of the limitations on the use of submarines agreed on at Washington and demanded not only a large fleet of U-boats but an invincible army and overwhelming air power, all of which Germany had attained by 1939 when it invited war with Britain and France by its invasion of Poland.

The events which followed all took their place in the struggle between these two great strategic aims. Either one might be successful; both could not.

Britain declared war on Germany on Sept. 3, 1939; but before that date Germany had already stationed its fleet for the attack on British merchantmen. The "Admiral Graf Spee" was at sea in the South Atlantic with a number of improvised commerce raiders. U-boats were on the trade routes, and supply ships were in position. Britain had a battle fleet based on Scapa flow to contain the German fleet, another at Malta to contain the Italian fleet, which, in view of the axis treaties, could not be ignored. A number of cruiser squadrons were formed for trade protection and the hunting of raiders. Britain's greatest weakness lay in the absence of escort craft for merchant-ship convoys. Nevertheless, it was British policy to establish convoys as soon as possible for all except fast merchant ships.

On the opening day of the war the "Athenia," a British passenger liner outward-bound carrying 1,480 passengers and crew, was torpedoed off Ireland; and in the first fortnight Britain lost 27 merchant ships totalling 131,000 tons. By Sept. 7, however, the first outward-bound convoy had been assembled and sailed, and by the end of the first fortnight the convoy system was in regular operation and being extended daily. Convoys were escorted by destroyers and trawlers from British waters to longitude 20°–30° W., and thereafter by cruisers, battleships or armed merchant cruisers as defense against raiders. Many U-boats were attacked and a few were sunk, but as the war developed it became evident that the U-boats could and would operate right across the North Atlantic and that anti-submarine escort must accompany convoys for the whole journey. To meet this threat, the range of action of a number of destroyers was increased by the sacrifice of a boiler to permit added oil stowage, and a simple type of escort vessel known as the corvette was designed and laid down in large numbers in British building yards. A separate organization, coastal convoy, was created for the protection of coastal traffic resulting from the assemblage and dispersal of the great ocean convoys which took place off the west coast of Scotland.

On Sept. 6 Britain suspended its obligations under the London naval treaty. On Sept. 17 the great aircraft carrier "Courageous" was torpedoed by a U-boat and sunk in the North Atlantic. On Oct. 14 a German U-boat under the command of Capt.-Lieut. Gunther Prien made a daring entry into Scapa flow through a narrow channel between two islands and there found and torpedoed the battleship "Royal Oak." This proof that Scapa flow was not impregnable came as a shock to the British. Urgent measures were then taken to strengthen the base.

Germany meanwhile had developed new types of mines, and on Nov. 19 came the first announcement of sinkings by magnetic mines. Fifteen ships, largely neutrals, were lost in four days by the indiscriminate use of this secret 'weapon, laid sometimes by aircraft and sometimes by ships. The British secured a mine, discovered its secret and in a very short time developed an antidote and equipped their rapidly swelling fleet of mine sweepers with the means to explode it and so clear a safe channel.

The surface raiders mere also active; a German battle cruiser sank the AMC (armed merchant cruiser) "Rawalpindi" off Ireland on Nov. 26, and about the same time the "Admiral Graf Spee" sank the Polish liner "Pilsudski." the British "Doric Star" and a number of other ships. Despite these setbacks Winston Churchill was able to report on Dec. 6 that the convoy system was in full operation and only one ship per 750 sailings had been sunk. In addition, the British expeditionary force had been safely conveyed to France.

2. Battle of the River Plate: the **"Altmark."**—On Dec. 13, 1939, a British cruiser squadron under Comm. (later Admiral Sir) Henry Harwood, consisting of "Ajax," "Exeter" and "Achilles," fought the pocket battleship "Admiral Graf Spee" in the South Atlar tic. The "Ajax" and "Achilles" had 6-in. armament, the "Exeter" 8-in., while the "Graf Spee's" armament of six 11-in. and eight 5.9-in. exceeded in broadside weight that of all three British cruisers. The action opened soon after dawn; the British divided their force, the "Exeter" taking one side and the two 6-in. cruisers the other so as to force the "Graf" to split its fire. The "Exeter" received the brunt of the fire and was heavily hit and eventually forced out of action while the three British, together, so pummelled the German that it turned away and made for the neutral port of Montevideo with the British in pursuit. On Dec. 17 the "Admiral Graf Spee" left harbour and to the surprise of the British. waiting outside, scuttled itself in mid-channel. Its crew was interned and its commander, Capt. Hans Langsdorff, committed suicide. The action was remarkable for the tactical handling of the cruisers which enabled them to defeat the-much more heavily armed "Graf Spee."

The problem of transporting large contingents of troops from overseas was now urgent and was met throughout the war by the use of large iast liners specially fitted up for troop transport. The first Canadian consignment arrived in Britain on Dec. 17, 1939, and the method proved extremely successful, the liners' speed rendering U-boat attacks very difficult.

In Jan. 1940 the British requisitioned all British shipping capable of overseas trade, and in February the Germans announced that all British ships nould be sunk without warning

On Feb. 16 an incident occurred which, though relatively unimportant. created considerable stir. The armed merchantman "Altmark." returning to Germany after its campaign in the South Atlantic with 300 British prisoners of war, was known to be working its way down the Norwegian coast to Germany, inside territorial waters. It put into Josing fiord, and thereupon the British destroyer "Cossack", Commander (later Admiral Sir) Philip Vian, entered the fiord, ranged alongside and rescued the prisoners.

3. Operations off Norway and Denmark. — On April 9 Germany invaded Norway and Denmark. It claimed that it was forced to this action because the British had laid mines in Norwegian naters. In fact, however, the mines were laid only on the morning of April 8, when some of the Germsn invading force had already left for Norway. The Germans occupied Oslo. Trondheim and Narvik as well as a number of other ports On April 9 the battle cruiser "Scharnhorst" was engaged and severely damaged in an action with H.M.S. "Renown" but escaped under the cover of smoke screens laid by the cruiser "Hipper." On April 10 a British destroyer force led by Capt. H. Warburton-Lee in the "Hardy" entered Narvik fiord to attack German naval forces. In the ensuing battle, one German destroyer was sunk, three were set on fire and a number of supply ships sunk or burned. The British lost the "Hardy" and "Hunter" and Captain Warburton-Lee was killed. On the same day German troopships were sunk by submarines in the Skagerrak and the cruiser "Koenigsberg" was sunk by the fleet air arm at Bergen.

On April 13 the battleship "Warspite" and a strong force of destroyers made a second attack on Narvik under Vice-Adm. William Whitworth and succeeded in sinking seven German destroyers and capturing the fiord. On the same day the cruiser "Blucher" was sunk in Oslo fiord. The "Karlsruhe" was sunk by the British submarine "Truant" while the British lost the aircraft carrier "Glorious" by U-boat, and the cruisers "Curlew" and "Effingham." Two days later a British, French and Polish force was landed in Norway, and the British occupied the Faroe Islands. The German invasion had been successful, though at a heavy cost, including 26 transports. It remained to establish their position, and in the ensuing struggle on land, assisted by greatly superior air support, they forced the Allies to evacuate between June 1 and 4.

The Norwegian adventure gave Germany a long Atlantic coast line and many harbours. It greatly facilitated the submarine campaign and improved the flow to Germany of the important Swedish iron ore. These advantages were bought at the cost of a serious dispersion of force in all three arms, as well as the moral stigma of having invaded two peaceful countries without the slightest justification. an action which shocked the neutral world.

4. Germany on the Atlantic. — By May 14, 1940, the Netherlands, overrun by German troops, capitulated; four days later Brussels was taken and German forces had broken through in France. The royal navy was doing all in its power to evacuate Dutch and Belgian merchantmen to British ports and succeeded in saving considerable tonnage. On May 28 Belgium surrendered. The British army, split off by the German advance from its French allies, was compelled to retreat to the coast. Dunkirk was chosen as the place of evacuation.

The British mobilized every available small vessel to assist their destroyers in this evacuation. The operation started on June 1 and lasted four days, during which 345,585 men were brought back, mostly from open beaches; but their equipment was lost.

On June 10 Italy declared war on Britain and France; four days later Paris surrendered and on June 15 the British completed their army's evacuation from Brest and St. Nazaire. On June 24 an armistice was concluded between Germany and France. Britain then stood alone, its army without equipment, and only its navy and its air force (greatly reduced by losses in France) between it and invasion. The occupation of the Netherlands, Belgium and France, as well as Denmark and Norway, now gave Germany a vast Atlantic coast line. Its U-boats need no longer run the gauntlet of the Dover straits or the Fair Island channel, and it promptly developed U-boat bases at Brest, St. Nazaire, Lorient and Bordeaux. Its aircraft based near the coast in the Netherlands, Belgium and France could operate over the North sea, English channel and Bay of Biscay, while its iast coastal craft, based on Dutch and Belgian ports, were well placed to attack British coastal convoys moving in and out of the port of London. The British prepared to meet invasion. They kept a close watch on channel ports where invasion barges were collecting and harried them by bombing.

5. Immobilization of French **Navy.**—Now that Italy was in the war the French navy presented a serious problem; for if Germany obtained possession of it, the combined Italian and German-French navies would be superior in every arm to the royal navy. The French armistice provided that the French fleet was to be assembled in French and Italian ports and demilitarized except for units which the Italian or German governments desired for the protection of French colonial interests. This obvious loophole and the distrust in German promises prompted the British to take decisive action. On July 3 all French warships in British ports were boarded and placed under British control. Ships in North African ports were offered alternative conditions designed solely to keep them out of German hands. An important contingent, including the battle cruiser "Dunkerque," lay at Oran; Adm. Marcel-Bruno Gensoul, in command, refused to accept any conditions and prepared his ships for sea and for action. A British force under Adm. Sir James Somerville, after a delay of $8\frac{1}{2}$ hr., opened fire; a battle ensued in which the majority of the French force was destroyed. The battleship "Richelieu" lay at Dakar, and there again the French admiral refused the alternatives offered. On July 8 a launch manned

by British personnel entered Dakar, placed depth charges against the "Richelieu's" hull and seriously damaged it. Naval aircraft completed the damage which kept the ship immobilized for two and one-half years.

On July 9 a British fleet was at sea to the east of Malta, covering an important convoy, when a mixed Italian force of two battleships, cruisers and destroyers was encountered. The British force gave chase, but the Italians turned away, covering their retreat with smoke screens. One Italian battleship was hit and a cruiser torpedoed by aircraft. The British pursued to within sight of land and although heavily attacked by aircraft suffered no loss. Ten days later the cruiser "Sydney," under Capt. (later Rear Adm.) J. A. Collins, accompanied by destroyers, encountered two Italian cruisers and sank the "Bartolomeo Colleoni."

6. Operations during Battle of Britain. — In Aug. 1940, the threatened invasion of Britain appeared imminent. The Germans had reorganized their armies for the task, and embarkation was being practised. On Aug. 8 the campaign opened with mass air raids, and the battle of Britain began. In this, British fighter aircraft created havoc in the German bombing forces, which were eventually so weakened that the German high command was forced to abandon its plans for invasion, a fact which became apparent to the British as the autumn wore on. In November Germany concentrated its air attacks on British ports. Southampton was the first to suffer. Portsmouth, Plymouth, Portland and Bristol all experienced severe raids and were gravely damaged. The London docks were frequently attacked and immense fires caused. None of these ports, however, was entirely immobilized; and work continued.

The battle of the Atlantic also continued. In June 1940 the liner "Lancastria," carrying troops, was bombed and sunk, as was the AMC "Andania." In July the "Arandora Star" was sunk, in August the AMC "Transylvania," and in September the "City of Benares" carrying *évacuée* children, all by U-boat. In October the "Empress of Britain" was sunk by bombing. Against these successes the British could claim the capture of the German liner "Weser" in the Pacific.

The British were desperately short of escort vessels, and on Sept. 3 an agreement with the U.S.A. was announced leasing a number of bases to the latter in exchange for 50 overage U.S. destroyers, transferred to the royal navy. These vessels, after a good deal of modernization, helped greatly to fill the void.

7. Mediterranean Operations. — In the Mediterranean the British continued to command the sea, operating by extensive sweeps in search of the Italian fleet. On Oct. 12 the cruiser "Ajax," under Capt. (later Vice-Adm.) E. D. B. McCarthy, encountered three large Italian destroyers south of Sicily and sank two of them. In a subsequent action against a cruiser and four destroyers it crippled one, the remainder escaping in darkness. Next day the cruiser "York" found the crippled destroyer and sank it after allowing time for its crew to abandon ship. British submarines maintained continuous pressure against Italian supply ships plying to the African coast and sank three in October.

These results did not satisfy the British naval commander in chief, Admiral of the Fleet Sir Andrew (later Viscount) Cunningham. The Italian battle fleet of two new and four reconstructed battleships constituted an ever-present threat to his supremacy. A carefully prepared attack by carrier-borne torpedo aircraft was delivered against the great Italian base at Taranto on the night of Nov. 11. All the six battleships lay in the outer harbour; three were hit and left in a sinking condition. Only the shallowness of the water prevented their final loss. In the inner harbour two cruisers were badly damaged and two fleet auxiliaries sunk. The British lost only two aircraft. This shattering blow established British naval supremacy in the Mediterranean, but shore-based aircraft operating from Sicily, Sardinia, the African coast and the Dodecanese still interfered with free movement of British transports. The majority of these, including troop transports and ammunition ships, now made the long journey around the cape in order to maintain and reinforce the British armies operating against Ethiopia, Eritrea and Libya.

In the North Atlantic the struggle continued to be severe. On Nov. 5 the AMC "Jervis Bay," under Capt. E. S. F. Fegen, was escorting a convoy of 38 ships when the pocket battleship "Admiral Scheer" was sighted closing to attack. Captain Fegen at once ordered his convoy to scatter and make smoke, while he steamed rapidly toward the raider and opened fire. It was evident from the first that the odds were hopeless; nevertheless, he engaged the "Scheer" for nearly an hour and held the Germans' fire. When at last the "Jervis Bay," crippled and in flames, sank beneath the waves, the merchantmen had had time to scatter so that of the whole 38 only four were sunk.

In the Mediterranean the British now scored a series of successes. The offensive launched from Egypt on Dec. 9, 1940, led to a rapid advance culminating in the capture of Benghazi. This advance was strongly supported by the royal navy whose main base was now, by agreement with the Egyptians, at Alexandria. But at this point, because of the pressure on Greece from German and Italian forces, the British decided to send reinforcements there. There followed a number of contacts between naval forces in which the Italians invariably retired behind smoke screens. Powerful forces of Italian and German aircraft, however, attacked with determination; and on Jan. 14, 1941, while protecting a convoy en route for Greece, the aircraft carrier "Illustrious" was damaged and the cruiser "Southampton" set on fire so seriously that the British sank it. On Feb. 9 Adm. Sir James Somerville led a heavy bombardment on the naval base at Genoa which caused great destruction.

8. Battle of Cape Matapan.—On March 19, 1941, aircraft reported Italian cruisers southeast of Sicily steaming to the southeastward. The British commander in chief dispatched a force of four cruisers, a carrier and some destroyers under Vice-Adm. (later Adm. Sir) Henry Pridham-Whippell to make contact and followed with three battleships screened by destroyers. The light forces sighted an Italian battleship and two cruisers, and while attacking the battleship by torpedo, aircraft led the cruisers toward the British battle fleet. The Italian battleship received several hits in the course of the day's fighting but escaped, badly damaged, to its base.

A second Italian force of two battleships and several cruisers was now sighted some distance to the northward, and a chase ensued until the 8-in. cruiser "Pola," which had been attacked by torpedo aircraft, was sighted, stopped and heavily damaged, and the British battle fleet closed on it. Night had already fallen when three more large cruisers crossed the British battle fleet's bows, possibly in support of the "Pola." The battleships opened fire and the cruisers were quickly destroyed. The result of this action was that the three 8-in. cruisers "Pola," "Zara" and "Fiume," one or two smaller cruisers and two destroyers were sunk. The remaining Italian forces escaped northwestward. The British lost two aircraft but had no other casualties; they picked up more than 900 Italian officers and men next morning. The action was notable in having been brought on by the delay imposed on the Italians by torpedo aircraft. The Italians had 3 battleships, 11 cruisers and 14 destroyers at sea against the British 3 battleships, 1 aircraft carrier, 4 cruisers and a number of destroyers. Greek destroyers co-operated effectively with the British.

On April 1, 1941, Asmara, the capital of Eritrea, surrendered; and an Italian flotilla in the Red sea was engaged and sunk.

The necessity for reinforcing Greece seriously weakened the British forces in Africa. The Germans were coming to the rescue of their Italian allies and pouring panzer troops and ammunition into Tripoli. This supply line had Malta on its flank, and although the island had suffered severe bombing and was no longer used by the battle fleet, it remained the base of destroyers and submarines. These harried the Italian convoys. On the night of April 15–16 a force of four British destroyers led by the "Jervis" sighted a convoy of five large ships escorted by four destroyers. In the first few minutes of the British attack the leading Italian destroyer was overwhelmed and sunk, then every ship of the convoy was set on fire and a battle ensued between the remaining destroyers. The British lost the "Mohawk" by torpedo. All the Italian destroyers were sunk or set on fire, while the entire convoy which consisted of ammunition ships, motor transport and German troops was destroyed. Despite naval victories the British position in the Mediterranean now suffered a decline. On April 3, 1941, the British evacuated Benghazi; and a retreat to the Egyptian frontier followed. Tobruk held out and was supplied from the sea.

9. Operations off Greece and Yugoslavia.—On April 6, 1941, the Germans invaded Greece and Yugoslavia, the Yugoslav army withdrawing. Salonika fell to the Germans on April 9, and Monastir was reached the next day. The British forces in Greece now fell back fighting, and on April 23 the Greek government was evacuated to Crete. Two days later the Germans occupied Lemnos Island and shortly afterward the whole of the Dodecanese group. The British were forced to evacuate their army in Greece, and about 43,000 escaped to Egypt and to Crete, 3,000 being left. The Germans then brought overwhelming air superiority to bear on Crete and made parachute and glider landings. Their air- and sea-borne troops suffered heavy losses but gained a foothold, and the British found it necessary to evacuate Crete also. This proved a costly operation. In the course of May and June the British lost by aerial attack three cruisers and eight destroyers, proving beyond all doubt that naval operations within the reach of shore-based aircraft could not be carried out without air support. By June 1, however, the evacuation of Crete was complete.

In the summer months of 1941 the air attacks on Malta were intense, but the fortress held out and the British fought their convoys through and took a heavy toll of Italian supply ships to Africa. In the course of these operations the battleship "Nelson" was torpedoed on Sept. 27, but not fatally. The aircraft carrier "Ark Royal" was torpedoed and sunk on Nov. 14. The "Barham" was torpedoed and sunk on Nov. 25.

On the reverse side, Capt. (later Rear Adm. Sir) William G. Agnew in the cruiser "Aurora," patrolling on the night of Nov. 9 in the central Mediterranean with a force of two cruisers and two destroyers, encountered two convoys of ten supply ships escorted by destroyers and covered by two 8-in. cruisers. In the resulting action all the supply ships were destroyed and three destroyers sunk, a fourth being subsequently sunk by a British submarine. The British suffered no casualties. An armed merchant cruiser and several supply ships were sunk two days later. British submarines had many successes.

Supported by the fleet, the British attacked in Libya on Nov. 18 and gained much ground. Severe fighting followed but by Dec. 1 the German and Italian tank forces had pressed the British back once more to the Egyptian frontiers and beyond, and Tobruk was again invested.

Turning to the Atlantic, the British had planned a raid on the Lofoten Islands where, under German occupation, quantities of fish oil and other products were made and sent to Germany. On March 4 the raiding squadron fell upon the islands, captured the garrison, sank ten merchant ships and some armed trawlers, revictualled the Norwegian inhabitants, destroyed the fish-oil plant and withdrew with their prisoners. The operation was sudden, swift and precise. There were a few German but no British casualties.

10. The "Hood" and "Bismarck."—In the middle of May 1941 the battleship "Bismarck," which for some time had been sheltering at Bergen, set out in company with the heavy cruiser "Prinz Eugen" on a commerce-raiding expedition, and the task of finding and bringing it to action fell to the commander in chief of the home fleet, Vice-Adm. Sir John (later Admiral of the Fleet Lord) Tovey. He sent the cruisers "Norfolk", and "Suffolk" to the Denmark straits, while three groups containing capital ships took up intercepting positions. On the evening of May 24, the "Suffolk," commanded by Capt. R. M. Ellis, sighted the "Bismarck" and a cruiser and started to shadow, and as a result the battlecruiser "Hood" and the new battleship "Prince of Wales" made contact and engaged next morning. The engagement was fortunate for the Germans, for while both the "Bismarck" and "Prince of Wales" received only slight damage the "Hood" was hit in a magazine and blew up. The "Bismarck" turned southwestward and broke off action; but it was shadowed, and the "Prince of Wales" again engaged toward evening. The Germans turned to the west and then to the south in an endeavour to shake off pursuit. But on May 25 the "Victorious" launched a torpedo aircraft attack which scored a hit at 12:15 A.M. At 3 A.M. in misty weather, contact was lost, the "Bismarck" being then about 350 mi. S.S.E. of the southern point of Greenland. Admiral Tovey's squadron, led by the "King George V," was closing in from the north, while another group under Admiral Somerville was converging from the south. It was not until 10:30 A.M. on May 26 that the quarry was again located by aircraft. The "Bismarck" was now alone and steering east, about 550 mi. W. of Land's End. In the course of the day the "Ark Royal" sent off two striking forces, the second of which succeeded in making two torpedo hits. Cruisers were then in touch, and during the night successful torpedo attacks were led by Captain Vian in the "Cossack," after which the "Bismarck" was reduced to eight knots though its gun armament was still intact. At 9 A.M. on May 27, the "King George V" and "Rodney" engaged and silenced it; finally the "Dorsetshire" sank it with torpedoes. About 100 officers and men were rescued. This lesson made the German grand commander in chief, Adm. Erich Raeder, very chary of sending out commerce raiders.

11. Naval Help for Russia.—On June 22, 1941, the war entered a new phase when Germany invaded Russia. Russia was desperately short of munitions and means had to be found to supply it. Stretched to the limits though it already was, Britain organized a system of convoys to Archangel, the first convoy sailing in August. These convoys continued throughout the war. The Germans based on Norway were well placed to interfere by aircraft, surface ships and submarines. Each successive convoy was attacked, but the great majority of ships got through.

On Aug. 15 President Roosevelt met Winston Churchill in Argentia bay, Newfoundland, and drew up the Atlantic charter. That these two leaders, so vital to their countries' welfare, could risk an Atlantic voyage was a measure of the mastery of the submarine menace which had been attained. But while fast and well-escorted ships could travel with relative safety, the slower convoys, still inadequately protected, were far from safe. In the first 11 months of the war, Britaig lost 1,500,000 tons of shipping, out of a total of 21,000,000. Losses averaging 500,000 tons a month were sustained in the early part of 1941, when Germany had developed its Atlantic bases and its production of U-boats had become gigantic. Adm. Karl Donitz, directing the U-boat war, constantly introduced new tactics, while, step by step, the British countered them. April 1940 had seen the first corvette at sea; by 1941 they were afloat in large numbers, and many U-boats had been sunk. In the latter months of that year losses diminished markedly to 180,000 tons per month and it seemed that, for the time being at least, the British had the upper hand in the unending struggle.

Mine sweeping had developed to vast dimensions, the sweepers now being equipped to destroy magnetic and acoustic mines as well as the older contact mines.

In British waters hundreds of motor gunboats had been built and were at sea guarding the coastal convoys and fighting the E-boats which operated from Dutch and Belgian harbours. The struggle to protect shipping was at a peak. The percentage of losses on a voyage was never great, but cumulatively they were serious.

British eyes were turning to the east, where Japan was becoming increasingly menacing. On Aug. 24, 1941, Churchill warned Japan that opposition to the passage of supplies to Russia must stop. Such reinforcements as could be spared were sent to Hong Kong and Singapore. (C. V. U.)

B. WAR AT SEA AFTER PEARL HARBOR

(For complete figures on naval losses in the Pacific, see section IV, *The* War in *the* Pacific.)

In Dec. 1941 the United States was confronted with war at sea in both the Atlantic and Pacific oceans. The geographical position of the nation necessarily required control of the seas before U.S. troops could fight offensively upon land.

In the Atlantic, United States strategy involved maintaining lines of communication to Great Britain and to future bases of operations against the continent of Europe, in opposition to the vigorous efforts of the German submarine and air forces to secure and maintain control of that ocean. In the Pacific, not only the initial success of the Japanese attack upon Hawaii but the lack of any well-developed bases in Australia and in the South Pacific islands, combined with the immense distances, placed Allied naval forces immediately upon the defensive. However, before the end of 1942 the offensive had been seized in both oceans.

1. Defensive Phase in the Pacific.—After the Pearl Harbor attack, which resulted in the permanent loss of two battleships of the United States Pacific fleet and the incapacitation of six others for varying periods of time, the Japanese withdrew from the Central Pacific and, except for the capture of Guam and Wake Island, devoted their attentions to the Philippine Islands, the Malay region and the Netherlands Indies. The Allied naval forces in that part of the world were hopelessly outnumbered, but though incapable of permanently checking the Japanese advance, they undertook with great gallantry to delay it as long as possible. The British battleship "Prince of Wales" and battle cruiser "Repulse"—sent to Singapore as a token force, without adequate escorts or air support—were sunk on Dec. 10, 1941, by Japanese torpedo-carrying planes before they had an opportunity to give any account of themselves. With no hope of predictable reinforcement from the United States Pacific fleet, the small U.S. Asiatic fleet (commanded by Adm. Thomas C. Hart, consisting of 3 cruisers, 13 overage destroyers, 29 submarines, 2 squadrons of patrol planes and a few gunboats and auxiliaries, operating in conjunction with equally slender British and Dutch forces) was all that was available to stem the Japanese tide. At the outbreak of war Admiral Hart's forces in the Philippines were already skilfully deployed in anticipation of a possible attack, which soon came. On Dec. 10 the navy yard at Cavite was practically wiped out by Japanese bombing, and the Asiatic fleet (save for units which remained to assist in support of the army's positions on Bataan and Corregidor) moved south to the Netherlands Indies. On Jan. 3, 1942, Gen. Sir Archibald P. Wavell of the British army assumed supreme command of the Australian, British, Dutch and U.S. forces in the theatre, and Admiral Hart became commander of the Allied naval forces.

During the next few months, the Japanese advanced rapidly in many directions by overcoming the inferior Allied air opposition at a given point of attack and then sending heavily screened amphibious forces to make landings. As soon as they were in control of a new area, they would repair the airfields and move on to still another. With totally inadequate air support, the Allied naval forces could only attempt to delay the Japanese advance by breaking up landing operations wherever possible. In the battle of Makassar strait, early in the morning of Jan. 24, 1942, and in Madura strait on Feb. 4, naval attempts were made to disrupt Japanese invasion forces. Though one drive might be impeded by one of these gallant delaying actions, others would go forward almost simultaneously, and by mid-February the Japanese were in a position to advance on Java. At this point, in accordance with previously made international agreements, the command of the Allied defensive was assumed by Netherlands officers, and Admiral Hart relinquished operational command of the Allied naval forces to Vice-Adm. C. E. L. Helfrich of the royal Netherlands navy. Attempts to halt the Japanese invasion of Java were made in Bandung strait on the night of Feb. 19-20 and in the battle of the Java sea on Feb. 27. Allied losses were heavy, and on Feb. 28 the Japanese landed on the north coast of Java. As no suitable base for naval surface forces remained, the Allied naval command was dissolved, and the surviving U.S. naval vessels proceeded to Australia.

In the course of March 1942 Java was occupied, and the Japanese continued their plan of conquest in directions as widely separated as Burma and New Guinea. A British fleet including old battleships and aircraft carriers under command of Adm. Sir James Somerville had been assembled in the Indian ocean to prevent the westward spread of the Japanese offensive. This force suffered the loss of the cruisers "Dorsetshire" and "Cornwall" in the Japanese attack on Colombo, Ceylon, on March 28, and of the aircraft carrier "Hermes" and other smaller vessels in a Japanese raid on Trincomalee, Ceylon, on April 9. The possibility that the Japanese would follow up this successful offensive in the Indian ocean by threats farther west emphasized the strategic importance of Madagascar, which was in Vichy-French possession. Consequently, to forestall any Japanese aspirations in that direction, a British force, under command of Rear Adm. E. Syfret, successfully occupied the main base at Diego Suarez at the northern end of Madagascar on May 5–7. However, the April raid on Trincomalee proved to he the last blow struck by the Japanese in the Indian ocean; and it was to the eastward in the Pacific, where the United States navy was gathering its strength, that the war at sea was to be decided.

No United States aircraft carriers had been at Pearl Harbor during the Dec. 7 attack, and so Adm. Chester W. Nimitz, who had become commander in chief, United States Pacific fleet, late in Dec. 1941, was able to use these ships in the first offensive strikes of the Pacific war, while the situation was still going from bad to worse in the far east. A force consisting of the carriers "Enterprise" and "Yorktown," cruisers and destroyers, under the command of Vice-Adm. William F. Halsey, Jr., struck various points in the Marshall and Gilbert Islands beginning Feb 1, 1942, with such success that several similar raids were conducted during the following weeks on Wake Island, Marcus Island and the New Guinea ports of Salamaua and Lae, where Japanese troops were landing in early March. On April 18 United States army bombers, which took off from the carrier "Hornet," struck Tokyo.

By the middle of April 1942 the Japanese had extended their conquests into New Guinea, New Britain and the Solomon Islands and had attained a position from which they could threaten the whole of Melanesia as well as the continent of Australia; they were moving their forces in anticipation of an offensive to the southeast that would threaten the lines of sea communication between the west coast of the United States and Australia and New Zealand. To protect these lines of communication, advance bases were being developed in the Fijis and New Caledonia to serve as fuel and troop staging stations, and consequently any Japanese movements in that direction were anxiously watched.

2. Battle of the Coral Sea.—Thus, when the Japanese began to occupy Florida Island in the Solomons on May 3, 1942, Rear Adm. Frank Jack Fletcher, who was cruising in the Coral sea with a force consisting of the carrier "Yorktown," cruisers and destroyers, undertook to binder them. Planes from "Yorktown" on May 4 sank and damaged various Japanese vessels at Tulagi, and on the following day Fietcher's force joined other United States and Australian units, including the carrier "Lexington."! The concentration of Japanese forces in the Bismarck archipelago-New Guinea area indicated that an amphibious operation, possibly against Port Moresby, New Guinea, was in prospect. Consequently, Rear Admiral Fletcher placed part of his force within striking distance of the probable course of the invasion fleet and moved his remaining ships northward in search of the Japanese covering forces. On the morning of May 7 aircraft from the "Lexington" and "Yorktown" located and sank the Japanese carrier "Shoho." The carrier "Shokaku" was attacked and damaged to such an extent that it could not be used, as planned, in the forthcoming operation against Midway. In a counterattack by Japanese carrier planes, both the "Lexington" and "Yorktown" were damaged, and it later became necessary to abandon the "Lexington" and have it sunk by one of the United States destroyers. The battle of the Coral sea, from which the Japanese forces withdrew with heavy losses, was the first major check that Japan had received in an otherwise successful campaign of aggression. It was, moreover, the first major naval engagement in history between aircraft of opposing fleets, with no contact between the surface vessels of the fleets.

Thus ended the period in which the United States navy was entirely upon the defensive in the Pacific, save for the operations of its submarines, which from the very beginning brought the war to regions that the Japanese thought they controlled. Although entirely unpublicized, for reasons of operational security, the activities of these submarines reduced the Japanese supply of fuel from the East Indies and decimated their shipping. Postwar interrogations of Adm. Osami Nagano and Adm. Soemu Toyoda, successively chiefs of the Japanese naval general staff, indicated that during the first half of the war U.S. submarines caused the greatest difficulty, just as naval aviation did in later years.

3. Battle of Midway.— During the lull which followed the battle of the Coral sea, it was correctly assumed that the Japanese were preparing for a large-scale operation somewhere, and the best evidence seemed to indicate that they would strike in the central or northern Pacific or both. In consequence the carriers and supporting vessels that had been operating in the South Pacific were recalled, and the ships available--carriers "Enterprise," "Hornet" and "Yorktown," 8 cruisers, 14 destroyers and about 20 submarines—were organized into task forces commanded by Rear Adm. Raymond A. Spruance and Rear Admiral Fletcher. A marine corps air group based on Midway Island and army bombers from Hawaii were made ready for active operations.

Scouting and patrol lines, which had been established to the westward of Midway, sighted a large Japanese attack force on the morning of June 3 which was bombed later in the day by a squadron of army B-17s. On the following day Japanese aircraft bombed Midway, while army, navy and marine corps planes from Midway attacked the Japanese fleet. Planes from the "Hornet," "Enterprise" and "Yorktown" attacked a force of four Japanese carriers with telling results? though planes from a Japanese carrier inflicted damage on the "Yorktown." Throughout June 5 and 6, army and navy aircraft, which had now won control of the air, pursued and attacked the fleeing Japanese. Although the damaged "Yorktown" and the destroyer "Hammann," which was aiding her, were fatally torpedoed by a submarine on June 6, the score was heavily against the Japanese, for United States carrier planes sank the carriers "Akagi," "Hiryu" and "Kaga" and the heavy cruiser "Mikuma," while the carrier "Soryu," which was damaged by carrier planes, was later sunk by the submarine "Nautilus." These losses, plus damage to other ships, were the first serious setback to the Japanese fleet since the outbreak of the war.

4. Solomon Islands Campaign.— The landing of the U.S. 1st marine division, reinforced, on Guadalcanal and Tulagi Islands in the Solomons on Aug. 7, 1942, marked the first Allied offensive move in force in the Pacific war. In this so-called offensive-defensive phase of the war, United States forces had seized the initiative, though progress was slow since they were still obliged to use a large part of their efforts to defend recent gains. Just before the battle of the Coral sea in early May the Japanese were occupying Tulagi Island in the Solomons, and in July they began the construction of an airfield on Guadalcanal. irom which land-based planes could have endangered Allied control of the New Hebrides and New Caledonia. This penetration toward Allied lines of communication to Australia and New Zealand represented a peril that had to be stopped at all costs, and prompt steps were taken to eject the Japanese from that area.

This operation, under the command of Vice-Adm. R. L. Ghormley, involved moving the marines, under Maj. Gen. A. A. Vandergrift, from New Zealand, with naval surface and air support. The landings on Aug. 7 took the Japanese by surprise, and good progress was made in the early stages. Later the Japanese reacted strongly, and for many months there followed intense ground fighting, with frequent actions at sea between the fleets that were endeavouring to reinforce and support the opposing land forces. An initial reverse occurred in the battle of Savo Island in the early hours of Aug. 9, when Japanese cruisers and destroyers attacked Allied naval forces protecting the landings, and sank the cruisers "Quincy," "Vincennes," "Astoria" and "Canberra." After this action the U.S. positions were under frequent attack from air and sea, but the marines held their ground, and in a battle beginning on Aug. 20 were successful in repelling counterattacking Japanese troops. In anticipation of a further Japanese reinforcement, Vice-Admiral Ghormley concentrated southeast of Guadalcanal two task forces, which included the carriers "Saratoga" and "Enterprise," the battleship "North Carolina," cruisers and destroyers. On Aug. 24 contact was made with a powerful Japanese force, and the battle of the eastern Solomons ensued, during which planes from the "Saratoga" sank the Japanese carrier "Ryujo." Marine and army land-based planes joined in, and the Japanese, after the loss of carrier support, broke off the action, although not before inflicting damage on the "Enterprise."

During the next six weeks, no major action took place in the Solomons, although Japanese planes and submarines, which were harassing U.S. supply lines, were responsible for the loss of the carrier "Wasp" and several destroyers. The Japanese also succeeded in reinforcing their positions on Guadalcanal by almost nightly runs of the so-called "Tokyo express," naval runs of supplies and reinforcements. On the night of Oct. 11–12 United States cruisers and destroyers, in a surprise attack, engaged a sizable force in the battle of Cape Esperance, near Guadalcanal, but the Japanese showed no signs of discontinuing their efforts to launch a full-scale attack. A fortnight later, on Oct. 26, while Japanese troops were actively attacking the marine positions on Guadalcanal, the carriers "Hornet" and "Enterprise" exchanged blows with carriers operating with a powerful naval force moving to support land operations on Guadalcanal. In this action, known as the battle of Santa Cruz Island, although damage was done to Japanese carriers, the United States carrier "Hornet" was lost.

The climax of sea fighting in the Solomons came in the battle of Guadalcanal, Nov. 13–15, 1942, when the Japanese, having concentrated an invasion force at Rabaul, were met by United States naval forces (covering reinforcements for troops on Guadalcanal) and defeated in a series oi violent engagements which caused heavy losses on both sides. On Nov. 11 and 12, two contingents of reinforcements and supplies were landed at Guadalcanal. When strong Japanese forces were located approaching Guadalcanal from the northwest, a force of cruisers and destroyers under the command of Rear Adm. D. J. Callaghan (who was, with Rear Adm. h'orman Scott, killed in the ensuing action) was assigned to fight a delaying action to cover the withdrawal of the transports and cargo vessels. Shortly after midnight on the morning of Nov. 13 the opposing forces met in a surface engagement of great violence. During the 24 min. that it lasted, gunfire was exchanged at close range, and though the Japanese battleship "Hiyei" was lost in consequence of this action, so were the United States cruisers "Atlanta" and "Juneau," as well as several destroyers.

On the morning of Nov. 14 Japanese cruisers and destroyers shelled Henderson field on Guadalcanal, and an invasion force, preceded by an escort of battleships, cruisers and destroyers, mas discovered to the north of the island. This was subjected to air attack throughout the day, and on the evening of Nov. 14 the battleships "Washington" and "South Dakota" and the carrier "Enterprise" reached the scene of the action. Shortly after midnight, contact was made north of Savo Island. and in another fierce night action, which resulted in the loss of the Japanese battleship "Kirishima" and three United States destroyers, the Japanese were turned back. Although United States losses were heavy, the battle of Guadalcanal was decisive in that U.S. positions in the southern Solomons were never again seriously threatened. After this action, United States forces on Guadalcanal retained the offensive, gradually driving the Japanese westward.

On Nov. 30, a Japanese effort at reinforcement was broken up by the battle of Tassafaronga (Lunga point), although at the cost of the loss of the cruiser "Northampton." Through December and January the Japanese ground forces found themselves in an increasingly unfavourable position as U.S. troops were reinforced. and the 1st marine division was gradually replaced by fresh army forces. However, in anticipation of another Japanese effort to retake the island. Admiral Halsey (who had replaced Vice-Admiral Ghormley as commander, South Pacific force, on Oct. 18) maintained considerably augmented naval forces in adjacent waters. On Jan. 29, 1943, the heavy cruiser "Chicago," escorting a convoy from New Caledonia to Guadalcanal, was torpedoed and sunk; but no further major action developed in the southern Solomons since on the night of Feb. 7–8, 1943, exactly six months after the initial U.S. landings, the Japanese withdrew their remaining forces irom Guadalcanal. So ended the first Allied offensive campaign of the Pacific war.

5. Defensive War in the Atlantic.—When the year 1942 opened, the Allied navies were fighting a defensive war in the Atlantic, as they were in the Pacific. The Germans, who had been unable in their years oi rearmament to build up a powerful and balanced fleet, had concentrated upon submarine construction and counted upon this underseas iorce to cut the sea routes to Great Britain. The German U-boat campaign followed the submarine strategy of World War I, which had been so nearly successiul in isolating the British Isles. As the basic Allied strategy of the war called for the defeat first of Germany and then of Japan, it was essential that the control of Atlantic sea lanes be maintained to ensure the safe passage to Great Britain of U.S. troops and supplies. The shipment oi supplies to Russia could be accomplished only through the northern ports of Murmansk or Archangel and required naval protection against German forces based in Norway, while the royal navy had heavy commitments to maintain the vital supply line to the Mediterranean.

Germany was able to operate a large number of submarines in the Atlantic, and sustained attacks on German shipyards by the British bomber command did not appear materially to have reduced production. In the minter and spring of 1942 submarine attacks were extended westward to the Atlantic coast of the United States and continually reduced the available total of Allied tonnage throughout the rest of the year. At that point increased Allied forces, improved anti-submarine measures and the growing production of U.S. and British shipyards turned the tables, and from 1943 onward new construction of merchant ships far outweighed the tonnage sunk by German submarines.

The battle of the Atlantic was a war of wits and of scientific devices, in which new measures and countermeasures were constantly evolved by the opposing navies, but upon its success depended the outcome of the military operations that eventually led to the defeat of Germany. Its pattern throughout the entire war may most clearly be seen in Table III included in Adm. Ernest J. King's third report to the secretary of the navy.

TABLE 111.—Naval *Military* Statistics, *1939–45*

Year	German sub-marines sunk	Allied shipping sunk	New Construction			Net gains or losses
			U.S.	British	Total	
	(Number)		(In thousands of tons)			
1939 (4 mo.)	9	810	101	231	332	−478
1940	22	4,407	439	780	1,219	−3,188
1941	35	4,398	1,169	815	1,984	−2,414
1942	85	8,245	5,339	1,843	7,182	−1,063
1943	237	3,611	12,384	2,201	14,585	+10,974
1944	241	1,422	11,639	1,710	13,349	+11,927
1945 (4 mo.)	153	458	3,551	283	3,834	+3,376
Totals	782	23,351	34,622	7,863	42,485	+19,134

Although the major German naval effort was devoted to submarine warfare, German shore-based aircraft were a menace to shipping, and a small number of powerful surface ships had to be taken into account. On Feb. 12, 1942, the German battleships "Scharnhorst" and "Gneisenau" and the cruiser "Prinz Eugen" made a successful dash from Brest, France, through the English channel to German waters, despite gallant attacks by British destroyers and Swordfish aircrait. The new battleship "Tirpitz," based in Norway, with cruisers, destroyers, submarines and aircrait, constituted a continuing menace to Allied north Russian convoys, which ran a gauntlet on every voyage requiring a strong covering force. The protection of these convoys was the main task oi the British home fleet, which mas irom time to time augmented by U.S. heavy ships. Particularly vicious attacks were made upon these north Russian convoys in July and Sept. 1942, and during the last quarter of 1942 they were discontinued because of the requirements of shipping and escorts elsewhere. When they were resumed in December the Germans were on the alert, and on Dec. 31, 1942, a convoy was attacked by the German pocket hattleship "Lutzow," the cruiser "Hipper" and six destroyers. In a series of short, sharp engagements, these iorces were held off ior iour hours by six British destroyers commanded by Capt. Robert Sherbrooke, and eventually were driven out oi the area by two 6-in.-gun cruisers of Rear Adm. Sir R. Burnett's covering iorce.

In Sept. 1943, royal navy volunteers manning midget submarines entered Aalten fiord, Norway, and torpedoed the "Tirpitz," putting it out of action for six months; on April 3, 1944, when repairs were advancing, fighters and bombers oi the naval air arm operating from carriers attacked the battleship again and mauled it severely, thus neutralizing one of the potential threats to the north Russian convoys. The "Tirpitz" was attacked three times in July and Aug. 1944 by carrier planes and finally sunk on Nov. 12, 1944, by royal air force bombers.

The most dramatic action of the royal navy in arctic waters occurred on Dec. 26, 1943, when the German battleship "Scharnhorst" attempted to molest a convoy. Adm. Sir Bruce Fraser was at sea with the battleship "Duke of York" and other ships, providing distant cover for a convoy escorted by iour cruisers under Rear Admiral Burnett. The "Scharnhorst" was sighted when the convoy was to the southeast of Bear Island, and was shadowed by the British cruisers, while the "Duke of York" moved up from the southwest at high speed to intercept. The British hattleship obtained a hit at long range, and the "Scharnhorst" was prevented from escaping by destroyers which delivered a torpedo attack that reduced its speed enough to allow the "Duke of York" to close the range and renew the battle. In a short time the German battleship had been set on fire and almost stopped, and it was then sunk, 60 mi. northeast of North Cape, by a torpedo fired by the cruiser "Jamaica."

Throughout 1942, while the German navy was impeding the progress of north Russian convoys in Norwegian waters, the Italian navy constituted a potential threat to supplies and reinforcements in the Mediterranean. The fluctuations of the land fighting in the North African campaign emphasized the vital importance of a naval base in the central Mediterranean and the necessity of maintaining Malta at all costs. A Malta convoy got through in Jan. 1942, but the February convoy was driven back. On March 22, 1942, Vice-Adm. Sir Philip Vian, with inferior forces, outwitted and repelled a larger Italian naval force. The convoy that he was covering, though subsequently attacked by German aircraft, got through to Malta. In the spring Spitfires were flown in to the island from carriers that penetrated the Mediterranean, the United States carrier "Wasp" taking part in these operations with the royal navy. In June an attempt was made to relieve Malta simultaneously from the east and from Gibraltar, and in August a heavily escorted convoy was sent from England. Although these attempts involved heavy fighting and losses and were only partially successful, some ships got through, and by September the situation at Malta had improved. The Italian navy at no time made adequate use of its extensive resources, and until its surrender in the autumn of 1943 remained in the character of a potential threat rather than a true adversary of the numerically inferior British Mediterranean naval forces.

During the defensive period of 1942, two operations of very limited scope against the continent of Europe were attempted. On March 27–28 an attack was made upon the French port oi St. Nazaire to put the graving docks there out of action; the British destroyer "Campbeltown," loaded with high explosives, rammed the lock gates and scuttled itself. On Aug. 19 a commando raid upon Dieppe was carried out, with very heavy casualties. Though continuous fighter cover was maintained by the royal air force, this raid indicated the necessity of being able to support landings of troops by naval gunfire.

6. Amphibious Assaults upon North Africa and Europe.—World War II was characterized by a series of successful amphibious operations of unparalleled magnitude, which were made necessary by the geographical extension of axis aggression on both sides of the world. In the Pacific, the Japanese could be reached only by crossing thousands of miles of ocean. In Europe, the rapid successes of German arms in 1940 had driven the Allies irom the continent and had penetrated Africa. There also, Allied ground troops could come to grips with the axis only aiter transportation over water and landings on hostile shores. Amphibious landings required the most complicated planning and co-ordination between the various branches of the armed forces of the United States and Great Britain.

(a) North Africa.—The combined chiefs of staff decided in July 1942 to effect landings in force in French North Africa in the autumn oi that year, and to postpone the assault upon the continent of Europe until a later date. Lieut. Gen. Dwight D. Eisenhower was appointed commander in chiei of the Allied force, with Adm. Sir Andrew Browne Cunningham as his principal naval subordinate. Three points were to be attacked: Oran and Algiers by U.S. army troops supported by British naval forces, and Casablanca by U.S. troops under Maj. Gen. George S. Patton, Jr., supported by naval forces commanded by Rear Adm. H. Kent Hewitt, who commanded United States naval units in all subsequent amphibious operations in the Mediterranean. The Oran and Algiers iorces proceeded from the British Isles, but the Casablanca force came entirely from United States ports and crossed the Atlantic without untoward incident. Landings were made early in the morning of Nov. 8, and though there was resistance ashore and a naval action off Casablanca with French ships, good progress had been made before an armistice was negotiated with the French forces on Nov. 11. By this operation, the largest overseas expedition ever dispatched to that time, the axis was denied the use of northwest Africa, and ports and bases had been secured which were essential for the control of the Mediterranean and subsequent entry into Europe.

(b) Sicily and Italy.—Within six months after the North African landings, German forces had been driven from Tunisia, and Allied strength was augmented to a point that made it possible to plan for a movement across the Mediterranean into axis territory. During May and June naval forces were assembled at Algerian and Tunisian ports for the invasion oi Sicily. The specially designed landing craft, which allowed the landing of troops and tanks directly upon assault beaches, had just begun to emerge from U.S. and British shipyards and were used for the first time in large numbers in the Sicilian operation. The larger types of these craft mere capable alike of crossing the ocean under their own power and beaching themselves in shallow water for the discharge of their loads by means of ramps. The development of these highly specialized vessels contributed immeasurably to the amphibious successes of the war.

Landings took place on July 10, the United States forces having objectives at Scoglitti, Gela and Licata, on the south coast of Sicily, while

British iorces attacked beaches on the southeastern coast. Naval gunfire was extensively used before the landings; and for several weeks afterward, as troops were pushing across the island toward Messina, cruisers and destroyers assisted them by bombarding axis positions.

Messina was occupied on Aug. 17; with Sicily under control, immediate invasion of the Italian mainland was planned. British forces began crossing the Straits of Messina, and to assist them in their advance up the Italian peninsula, amphibious landings were made in the Bay of Salerno on Sept. 9. In spite of counterattacks, some of which naval fire succeeded in breaking up, the port of Salerno was captured on Sept. 10, and on Oct. 1 Allied troops entered Naples.

After the Italian surrender, the greater part of Italy's fleet sailed to Malta to surrender, arriving on Sept. 11. Thus ended the astonishing and ignominious career of a powerful navy, which gave no useful account of itself in the day of battle. The Mediterranean was free once more of axis surface vessels, though not of German aircraft.

There were no further amphibious operations against the Italian peninsula on the scale of the Sicilian and Salerno landings, although on Jan. 22, 1944, a joint force landed at Anzio, south of Rome, and established a beachhead behind the German lines. Resistance and counterattacks were so severe that it required great effort to support the troops.

(c) The Normandy *Landings.*—In Jan. 1944, General Eisenhower arrived in Britain from the Mediterranean and assumed the duties of supreme commander, Allied expeditionary force. His principal naval subordinate in the planning for the cross-channel invasion of France was Adm. Sir Bertram Ramsay, designated as Allied naval commander in chief. The site chosen for the attack was the Baie de la Seine in Normandy, near the ports of England and within easy range of fighter-plane bases; but, since there was no adequate harbour for a quick build-up aiter the initial assault, it was necessary to devise artificial harbours which could be quickly constructed once the beachhead was secured. This involved a naval problem of great magnitude. Added to the large numbers of ships and craft needed to move the troops and their supplies were those necessary to tow the hollow concrete caissons that had been secretly built in England for sinking at designated points to establish breakwaters. The scale of the operation was indicated by the fact that 5,000 ships and about 200,000 officers and men of the Allied navies and merchant fleets were involved. After the first landing about 2,000 merchant ships (totalling 4,000,000 tons) were continually employed in supplying the armies.

The beaches on the western half of the Baie de la Seine were assigned to United States troops, landed from U.S. vessels, while the eastern half of the area was taken by British and Canadian troops, transported chiefly in British vessels. Loading of troops began on June 1, 1944, and by June 3 all had been loaded and briefed. D-day had been initially set for June 5, but because of unfavourable weather was postponed 24 hr. This great armada, setting sail from various ports in the British Isles upon an intricately timed and involved schedule, was preceded by great ncmbers of mine sweepers, clearing the channels, and by about 80 fire support vessels—battleships, cruisers and destroyers—which brought 800 guns, ranging in calibre from 4-in. to 16-in., to batter shore defenses and cover the landing of the troops. On June 6 the initial landings took place, substantially according to schedule, closely followed by the build-up convoys of transports and cargo ships. On June 7 all the elements of the artificial harbours, or Mulberries as they were called in code, had been towed from England, and the work of installation began.

For many days aiter the landings, while the Allied troops were still within range of ships' guns, the battleships, cruisers and destroyers furnished highly useful fire support, and on June 25 Cherbourg was bombarded to assist the army forces that were advancing on the port from the land side. Cherbourg fell on June 27, and naval salvage forces began clearing the port, as they subsequently did at Le Havre when that city surrendered on Sept. 12. The build-up following the invasion proceeded so rapidly that 100 days after the initial landings more than 2,000,000 men, nearly 500,000 vehicles and 4,000,000 tons of stores had been landed in France; and the Allied armies were far advanced in their drive across France to Germany.

(d) Southern France.—Landings on the south coast of France were also involved in the plan for the penetration of the continent, and consequently the fire support ships and landing craft of the Normandy invasion were deployed to the Mediterranean as soon as they could be spared from the English channel operations. On Aug. 15 United States and French troops were put ashore on beaches near St. Tropez, Fréjus and St. Raphael, on the southern coast of France in the area between Toulvn and Nice. These operations, of which the naval commander was Vice-Admiral Hewitt, were successful in establishing a firm beachhead. With strong air support, the army pressed rapidly inland up the Rhône valley and eventually effected a junction with troops from the Normandy beachhead. By the end of August Toulon and Marseille had surrendered, and by the end of September the last beaches were closed and the amphibious phase of the campaign had ended, leaving the United States navy free to concentrate on the Pacific.

7. Offensive-Defensive in the Pacific.—Although the landings in the Solomon Islands in Aug. 1942 had wrested the initiative from Japan, progress in the Pacifir was necessarily slow for more than a year thereafter. When the Japanese evacuated Guadalcanal on Feb. 8, 1943, it remained to eject them from the northern Solomons, and then (as it seemed at that time) from an almost endless chain of island positions. The Japanese had held some of the latter since World War I and had fortified them in defiance of mandate agreements.

Throughout the spring of 1943 naval forces bombarded Japanese positions in the central Solomons, while the Japanese still continued air attacks upon Guadalcanal. On June 30 amphibious landings were made on Woodlark and Trobriand Islands (between the Solomons and New Guinea), at Nassau bay on New Guinea and at Rendova harbour and Viru harbour in the central Solomons. On July 2 and 3 landings were made on New Georgia and at Vangunu Island near by. This movement to the northward soon brought contact between United States naval iorces and the "Tokyo expresses" that were making nightly runs to supply and reinforce Japanese positions in the central Solomons. The battle of Kula gulf on July 6 and the battle of Kolombangara (also called second battle of Kula gulf) on July 12–13 discouraged interierence with U.S. operations on New Georgia and prevented the Japanese from using Kula guli as a route for supply runs. The former action, however, resulted in the loss of the cruiser "Helena," and the latter in the loss of the destroyer "Gwin" and damage to other ships.

The capture of Munda airfield on Aug. 5, six weeks after the invasion of New Georgia, marked the climax of the central Solomons campaign, which ended with the Japanese evacuation of Kolombangara and Vella Lavella Islands on Oct. 6.

8. The Pacific Offensive.—In the autumn of 1943, United States strength in the Pacific had reached a point where it was possible for the army and navy to attack at points of their own choosing. Allied strategy called for an advance upon the core of the Japanese positions from two different directions, which, reduced to the simplest terms, consisted of a movement northward from Australia by forces under the command of General MacArthur, and a thrust westward across the central Pacific from the Hawaiian Islands by forces under the command of Admiral Nimitz. During the next year these two great advances from different points in the Pacific rapidly converged, finally closing in a gigantic pincer movement upon the Philippines in Oct. 1944. From that point on, there was but a single route to Tokyo.

Both routes involved a constant succession of amphibious landings, though in the move northwarc! from Australia the large land masses of New Guinea entailed a greater amount of ground fighting than in the Central Pacific, where the distances were greater and the island groups of diminutive size. The Central Pacific campaign consequently offered more points of naval interest, for it was there that the technique of the fast carrier striking forces was evolved.

In Oct. 1942 United States carrier strength was at its lowest point; four of the seven U.S. aircraft carriers in commission at the outbreak of war had been lost in the Pacific. New and more powerful types were, however, under construction in large quantities, and by the late summer of 1943 a sufficient number had joined the fleet to make large-scale offensive operations possible. Since the battle of Midway in June 1942 there had been no naval operations of importance in the Central Pacific. At the time of Midway, the Japanese, in a thrust into the North Pacific. had occupied Kiska and Attu in the Aleutians; but Attu had been recaptured by United States forces in May 1943 and Kiska was reoccupied in Aug. 1943 aiter its evacuation by the Japanese. The North Pacific was therefore no longer a threat, but in the Central Pacific the Japanese were thoroughly established in the Marshall, Gilbert, Caroline, Palau and Mariana Islands. The great distances between groups of islands required the development of a special technique for attack. The new carriers, accompanied by fast battleships and cruisers, were formed into mobile striking forces that were able to travel far afield and deliver a powerful attack from the air, or by naval gunfire, upon Japanese ships and bases.

(a) *Gilbert* and Marshall *Islands.*—In Aug., Sept. and Oct. 1943 the first large-scale carrier-based air strikes were made against Marcus Island, Tarawa in the Gilbert group, Apamama and Wake Island. Following in rapid succession, they were designed to soften Japanese installations and to confuse the Japanese as to U.S. intentions. During October and November major units of the Pacific fleet were placed under the command of Vice-Adm. Raymond A. Spruance, who was designated commander, Central Pacific force (later commander, 5th fleet); and plans were made for an amphibious assault upon the Gilbert Islands. This group of coral islands, lying athwart the equator, which had been seized by the Japanese from the British in Dec. 1941, was of great strategic importance since it lay to the north and west of Allied bases in the South Pacific and to the south and east of Japanese bases in the Caroline and Marshall Islands. During the second week in November, the Central Pacific force headed west from the Hawaiian Islands and on Nov. 20, 1943, attack groups were off Tarawa and Makin Islands in the Gilberts. After heavy shore bombardment, army units were put ashore on Makin and marines on Tarawa. The fighting on Tarawa was particularly severe and casualties were heavy, but after four days the island was captured. The capture of Makin was announced on Nov. 22.

On Jan. 29, 1944, Admiral Spruance's forces began the most intensive offensive operations yet conducted against the Marshall Islands. Carrier planes simultaneously struck Kwajalein, Roi, Taroa and Wotje, while cruisers bombarded Taroa and Wotje, and shore-based aircraft bombed all four islands as well as Mille and Jaluit. The attacks were resumed the next day, with battleship bombardment of Kwajalein and Roi in addition. On Jan. 31 an unopposed landing was made on Majuro, and on Feb. 2 landings were made on Roi, Namur and

Kwajalein. Resistance on Roi and Namur was quickly overcome; although it was stiffer on Kwajalein, that entire atoll was secured by Feb. 8.

It was now possible for Admiral Spruance's forces to venture further with impunity. His fast carriers, battleships, cruisers and destroyers on Feb. 17–18 carried out an attack upon the Japanese base at Truk, far to the westward in the heart of the Caroline Islands. Similar strikes against the western Carolines were made at the end of March, when carrier-based planes attacked shipping in the Palau group on March 30 and 31, while others attacked Yap and Ulithi. In April these forces were in New Guinea waters, in support of General MacArthur's assault upon Hollandia. For an understanding of the significance of this operation, it is necessary to leave the Central Pacific temporarily, and turn back to the beginning of accelerated operations in the South and Southwest Pacific.

(b) New Guinea.—While forces of the South Pacific area were attacking the central Solomons in the summer of 1943, General MacArthur's troops in the Southwest Pacific were launching powerful attacks in New Guinea to the westward. Landings had taken place at Nassau bay on June 30. Early in September amphibious forces moved against the Huon gulf area. On Sept. 11 Salamaua was captured, and Lae fell five days afterward. Finschhafen was captured on Oct. 2.

With the conclusion of the central Solomons campaign, South Pacific forces continued the northward advance through the Solomons in order to protect the eastern flank of the Allied troops in New Guinea and to aid in the ultimate isolation of the Japanese stronghold in the Rabaul-Kavieng area. At the end of October, United States marines landed at Empress Augusta bay, on the west coast of Bougainville, and so established a position in the northern Solomons. The intention there was not so much to eject the Japanese from Bougainville as to gain a perimeter in which air facilities could be established for attacking the port oi Rabaul, which had until that time been in a key position to control the area to the south. On Nov. 5, and again in the following week, carrier forces of the Pacific fleet attacked Rabaul, and during the last ten days of December it was struck by land-based planes operating from bases in the Solomons. Carrier strikes were made against Kavieng, another important base on the northern tip of New Ireland, on Dec. 25 and 28, 1943, and Jan. 1, 1944.

Amphibious landings were made on the western end of Kew Britain Island at Arawe on Dec. 15 and at Cape Gloucester on Dec. 26, while on Jan. 2 an unopposed landing was made at Saidor on the New Guinea coast. On Feb. 13, 1944, the final occupation of the Huon peninsula in northeast New Guinea was completed by United States and Australian troops. Thus, from the Solomons (to the eastward) and from New Guinea (to the westward) Allied pincers were closing upon Rabaul. Although not directly assaulted and captured, its usefulness was neutralized, and it no longer represented a major threat to Allied progress along the northern coast of New Guinea. Landings were made on Green Island, 120 mi. from Rabaul, on Feb. 15, on the Admiralty Islands on Feb. 29 and on Emirau (in the St. Matthias group north of New Britain) on March 20. The capture of the Admiralty Islands, which established Allied forces in a position to interfere with Japanese supply lines to the Bismarck archipelago from the north, isolated large numbers of troops in that region.

This same leapfrog strategy was pursued with telling effect by General MacArthur in a series of amphibious landings which carried his troops westward along the northern coast of New Guinea. In accordance with it, the next major bypassing move was directed at the coastal area in the vicinity of Aitape and Hollandia, about 200 mi. beyond Wewak, where the Japanese had concentrated a considerable force. The assault on Hollandia involved three separate attacks; one at Tanahmerah bay and a second at Humboldt bay (30 mi. to the eastward) secured the Hollandia airstrips, while a third at Aitape (go mi. to the eastward) won another airfield. On April 21 the Pacific fleet carriers that were supporting the operation attacked the area, which had previously been bombed for some days by land-based aircraft. The actual landings, which took place on April 22, were virtually unopposed. By this operation approximately 50,000 Japanese troops were cut off, and airfields indispensable for future progress were obtained.

Returning north from the support of the Hollandia landings, the fast carrier task force attacked Truk again on April 29 and 30, carrier planes dropping 740 tons of bombs on land installations. Similarly, cruisers and destroyers of the force bombarded Satawan Island on April 30, while battleships and destroyers bombarded Ponape on May 1. The task force then returned to the central Pacific, in anticipation of impending operations against the Mariana Islands, for which preparations had begun as soon as bases in the Marshall Islands were secured.

(c) The Marianas; Battle of the Philippine Sea.—The Mariana Islands provided the Japanese with a series of highly useful airfields and bases that afforded protected lines of air and sea communication to distant possessions. Allied occupation of the group would not only hamper Japanese communications, but provide United States forces with bases from which aircraft could bomb Tokyo; also, the sea areas farther to the west could be controlled. The operation for the capture of the Marianas, which involved more than 600 ships, 2,000 aircraft and 300,000 navy, marine and army personnel, was under the command of Admiral Spruance, who had already conducted the Gilberts and Marshalls operations. Japanese air bases on Marcus Island and Wake Island to the northward, which might have threatened the operation, were attacked by carrier planes, cruisers and destroyers during the third week in May 1944. Marcus was struck on May 19 and 20 and Wake on May 23. From the beginning of June, land-based aircraft from the Admiralty Islands and Hollandia kept neighbouring bases at Truk, Palau and Yap under attack, while the fast carrier task force began attacks on the Marianas on June 11. As the island of Saipan had been in Japanese hands since World War I, it was formidably fortified; and an intensive attack was necessary before landings could take place. Surface ships began bombardment on June 13, and early on the morning of June 15 marine and army troops were put ashore. The Japanese resisted vigorously; and, though initial beachheads were established, progress inland was slow.

At this point it became apparent that the Japanese fleet was en route to the Marianas, apparently bent upon provoking a full-scale action. This presented a problem in objectives, for although Admiral Spruance's ships and planes were entirely ready and able to meet the Japanese at sea, his basic mission was to capture the Marianas, and therefore the forces attacking Saipan had to be protected from interierence at all costs. In consequence, he operated aggressively to the westward of the Marianas, but did not move so far away from the islands that he could not protect the amphibious forces from any possible attack. While some of the fast battleships and carriers were operating to the westward in anticipation of the arrival of the Japanese fleet, other carriers went north and struck Iwo Jima and Chichi Jima, thus eliminating temporarily the threat of air attack from the Bonin and Volcano Islands. Upon completion of this attack, the carriers rejoined Admiral Spruance's other ships west of Saipan.

On June 19, 1944, the battle of the Philippine sea began in the form of a large-scale attack by Japanese carrier aircraft on Admiral Spruance's fleet. Four hundred Japanese planes were shot down, with only very moderate United States air losses and minor damage to surface vessels, while the Japanese carriers, "Taiho" and "Shokaku" were sunk by United States submarines. Because of these substantial carrier-plane losses, further Japanese attacks upon Saipan seemed unlikely; and Admiral Spruance's forces therefore headed to the westward in the hope of intercepting and destroying the Japanese fleet in a decisive engagement. Search planes did not locate the Japanese surface ships until afternoon, and it was nearly sunset by the time carrier strikes were launched. These attacks had to be made at extreme range; nevertheless, they sank the carrier "Hiyo," damaged the carrier "Junyo," sank two fleet tankers and damaged one. Nightfall cut short the attack. Although only a small number of United States planes were lost to Japanese anti-aircraft fire, 73 were lost while returning to their carriers when they ran out of fuel and crash landed in the darkness, although a high percentage of the personnel of planes that landed in the water near their carriers was rescued.. The Japanese fleet continued its retirement during the night of June 20, and on June 21 was out of range. Though it had not been destroyed, its effort to reinforce the Marianas had been very thoroughly broken up, and its corps of carrier-plane pilots had been practically eliminated. Japanese naval aviation never entirely recovered from this severe blow. The occupation of the Marianas, in consequence of the battle of the Philippine sea, then proceeded without further threat of naval interference, although the land fighting on Saipan was bitter and protracted, All organized resistance finally ceased on the island on July 9.

Landings on the neighbouring island of Guam (which had been captured by the Japanese in Dec. 1941) had been scheduled for June but had been postponed because of the unexpectedly intense resistance on Saipan and the threat of the battle of the Philippine sea. Because of the postponement, a long period of preliminary bombardment and air attacks was possible, beginning on June 16. From July 8 until July 21, when U.S. troops landed, battleships, cruisers and destroyers shelled the island daily, while planes from fast and escort carriers, as well as from the newly won fields on Saipan, bombed defense installations. Japanese resistance, although stubborn, was less intense than on Saipan, and on Aug. 10 all organized resistance ended. Guam was rapidly developed as a naval and air base for further offensive operations.

Amphibious operations in the Mariana Islands were completed by the capture of Tinian, an island located across the narrow channel to the south of Saipan. There also were heavy advance air and surface attacks before the actual landings, which began on July 24. Resistance was less severe there than in the other islands, and in a fortnight the assault and occupation phase was completed.

(d) The *Carolines*.—The next major objective in the Central Pacific was the western Caroline Islands, the capture of which would complete the isolation of Truk and other Japanese positions in the central and eastern Carolines. This operation was commanded by Adm. William F. Halsey (commander, 3rd fleet) who, having completed the mission in the South Pacific that had begun in Oct. 1942, thereafter alternated with Admiral Spruance in command of the great striking forces of the Pacific fleet. As new ships were constantly joining the fleet, the forces available for the western Carolines operation were even greater than those used in the Marianas; nearly 800 vessels were employed.

Prior to the landings, which were scheduled for Sept. 15, air and surface strikes were made in many directions to divert and eliminate Japanese forces that might have interfered. Attacks were made by the fast carrier task iorce on the Bonin and Volcano Islands, to the northward, between Aug. 31 and Sept. 2, and on Yap on Sept. 7 and 8. As the plan for a landing on Peleliu Island in the Palau group of the western Carolines by Admiral Halsey's forces was co-ordinated with a simultaneous landing on Morotai Island (between New Guinea and the Philippine Islands) by General MacArthur's forces, who had advanced the length of New Guinea, the fast carrier task force made strikes on Mindanao Island in the southern Philippines on Sept. 9 and 10 to prevent opposition from that direction. Because of the slight resistance encountered at Mindanao, further carrier strikes were made against the Visayas, in the central Philippines, from Sept. 12 to 14, which achieved tactical surprise and inflicted considerable damage on Japanese installations, ships and planes.

Preceded by three days of surface bombardment, air bombing, mine sweeping and clearing of beach obstacles, landings took place on Peleliu Island on Sept. 15, and on Angaur Island, six miles south of Peleliu, on Sept. 17. No landings were made on Babelthuap, the largest of the Palau group, since the bases obtained on Peleliu and Angaur made possible the domination of the group and neutralized Japanese ground forces on the other islands. Progress ashore on Peleliu was slow, and it was the middle of October before the assault phase of the operation was completed, but the island of Angaur was overrun by Sept. 20. An unopposed landing was made on Ulithi on Sept. 23, and steps were immediately taken to develop an anchorage for large surface forces.

Simultaneously with the landings on Peleliu, General MacArthur's forces landed on Morotai Island, in a move calculated to isolate Japanese forces on Halmahera Island, which were in a position to impede any movement into the southern Philippines. This operation was the result of a succession of amphibious landings that had been made along the north coast of New Guinea after the capture of Hollandia five months before. The landings, designed to prevent Japanese air and troop movements in New Guinea and to secure the southern flank of the offensive operations to the northward in the central Pacific, were in general not heavily opposed. Consequently, they involved the support of no ships larger than heavy cruisers, unlike the Hollandia operation in April, which had been supported by battleships and carriers of the Pacific fleet. The Wakde Island area, 70 mi. west of Hollandia, was occupied on May 17–19, and on May 27 an amphibious assault was made on Biak Island to secure a forward base for the operation oi heavy bombers. On July 2 a landing was made on Noemfoor Island, southwest of Biak, and on July 30 an amphibious force landed in the Cape Sansapor area on the Vogelkop peninsula in western New Guinea. Thus, during the spring and summer, General MacArthur's forces had reached the western extremity of New Guinea, neutralizing that great island as a base for Japanese operations and obtaining airfields that facilitated the attack on the southern approaches to the Philippines.

(e) Leyte—After supporting the western Carolines landings, the fast carrier task force resumed the attack upon the Philippine Islands, making the first carrier strike of the war on Manila and Luzon Island on Sept 21 and 22. On Sept 24, carrier planes hit the central Philippines and photographed the area around Leyte and Samar, where landings were to take place in October. It had originally been planned to attack the Philippines at a somewhat later date, but Admiral Halsey's air strikes had revealed an unexpected weakness of Japanese defense in the islands; and, accordingly, the joint chiefs of staff, acting with the greatest rapidity, undertook to capitalize upon this situation. Plans were quickly revised, and preparations were made for the invasion of Leyte Island in the central Philippines on Oct. 20.

The Leyte operation marked the joining of the two advances upon Japan from different directions. It was under the command of General MacArthur, to whom Admiral Nimitz made available strong forces of the Pacific fleet. Admiral Halsey's 3rd fleet covered and supported the landings by air strikes over the northern and central Philippines and Formosa and provided protection against an attack upon the landings by the Japanese fleet. Preparatory carrier strikes occupied the period from Oct. 9 to 20. The Ryukyu Islands (including Okinawa) were attacked on Oct. 9 and 10, northern Luzon on Oct. 11. Formosa and the Pescadores on Oct. 12 and 13. On Oct. 13 and 14 a part of the fast carrier task force was attacked by Japanese planes and two cruisers were damaged. To prevent further attacks while these damaged ships retired, U.S carrier aircraft attacked airfields in Formosa and the northern Philippines repeatedly during Oct 14 and 15. On Oct. 18 and 19 further strikes were made against objectives in the central and northern Philippines, and during and after the actual landings on Leyte some of the fast carriers furnished direct support while others conducted searches for Japanese fleet units.

On Oct. 20. after heavy bombardment and air bombing, forces of the central Philippine attack force, commanded by Vice-Adm. Thomas C. Kinkaid (commander, 7th fleet, and General MacArthur's principal naval subordinate), went ashore on the east coast of Leyte Island. The initial landings mere entirely successful, but they were soon challenged by the Japanese navy in a full-scale operation, designed to drive U.S. forces from the Philippines.

(f) Battle of Leyte Gulf.—There followed the battle of Leyte gulf, the greatest naval engagement of the war, which resulted in the complete and thorough defeat of the Japanese. This battle, which consisted of a series f surface and air-engagements taking place between Oct. 23 and 26, culminated in three actions, designated as the battle of Surigao strait, the battle off Samar and the battle off Cape Engaño.

The Japanese attack came from three directions. One force (the southern) approached Leyte from the south through Surigao strait; another force (the central) came through San Bernardino strait, while a third (the northern) approached from the direction of Japan. As the battle of the Philippine sea had resulted not only in the sinking of three Japanese carriers, but in the virtual destruction of the air groups of three carrier divisions, the fleet had been reorganized for surface action. The Japanese plan for driving U.S. forces from the Philippines was consequently dependent upon surface ships' provoking a decisive naval engagement. The only Japanese carriers involved were in the northern force, which was intended chiefly for a decoy since the only air support counted upon by the Japanese was from land-based planes

Early in the morning of Oct. 23 the Japanese central force was discovered off Palawan by two United States submarines, "Darter" and "Dace." The "Darter" sank the heavy cruiser "Atago" and damaged the heavy cruiser "Takao," but in manoeuvring went aground and was itself lost. The "Dace" sank the heavy cruiser "Maya." On the following day 3rd fleet carrier planes located and attacked the central iorce in the Sibuyan sea and the southern force in the Sulu sea. In the course of the Sibuyan sea action heavy damage was inflicted, and the Japanese battleship "Musashi," equipped with 18-in. guns and one of the two largest battleships in the world, was sunk. Nevertheless, the central force pushed doggedly onward toward San Bernardino strait and Leyte. The Japanese southern force entered Surigao strait in the early hours of Oct. 25 and was annihilated there in a surface engagement with destroyers and battleships of the 7th fleet. The battleships "Yamashiro" and "Fuso" and three destroyers were sunk almost immediately in this battle of Surigao strait, which was one of the few actions of the war in which aircrait did not participate.

The central iorce, having passed through San Bernardino strait, moved southward off the coast of Samar and shortly after daybreak attacked a group of lightly armed escort carriers of the U.S. 7th fleet. This battle off Samar was finally broken off by the retirement of the greatly superior Japanese force.

During the night of Oct. 24–25, Admiral Halsey's carrier task force had been moving northward to meet the Japanese northern force. In the resulting battle off Cape Engaño the Japanese carriers "Zuikaku," "Zuiho," "Chitose" and "Chiyoda" were sunk; but upon receiving word of the battle off Samar, Admiral Halsey sent a detachment of carriers and battleships to assist the 7th fleet escort carriers. These ships were unable to intercept the retiring Japanese central iorce before it had reentered San Bernardino strait, but on the afternoon of Oct. 25 and during Oct. 26 carrier planes attacked the fleeing Japanese and inflicted further damage. At the end of the battle of Leyte gulf, three Japanese forces had either been destroyed or had retired out of range. While 6 U.S. vessels (the light carrier "Princeton," 2 escort carriers, 2 destroyers and 1 destroyer escort) had been sunk, the Japanese had lost in the course of the battle 3 battleships, 4 carriers, 10 cruisers and 9 destroyers—a total of 26 combatant ships. The battle of Leyte gulf represented the end of the Japanese navy as *a* powerful element in the Pacific war.

During the remainder of 1944 no major naval actions developed, but the fast carriers were constantly employed in support of the Leyte campaign; and, because of delays in establishing airfields on shore during unfavourable weather, naval aircraft gave direct support to the troops on Leyte for a considerably longer period than had been anticipated. Manila and other targets on Luzon were attacked repeatedly. In furtherance of the Leyte operation, an amphibious landing was made at Ormoc bay, on the west coast of the island, on Dec. 7, while on Dec. 15 a further landing was made on Mindoro Island, nearly 300 mi. to the northwest.

(g) The Philippines.—The attacks upon Manila in December had caused the Japanese to expect landings in that area, but the next large amphibious operation entirely bypassed Manila and was directed against Lingayen gulf, in the northern part of Luzon Island. In preparation, the 3rd fleet attacked Formosa and the southern Ryukyu Islands on Jan. 3 and 4, 1945; and on Jan. 9, while troops were going ashore on beaches in the Lingayen gulf area, Formosa was again attacked by carrier planes. A thrust by the fast carrier task force into the South China sea then followed, during mhich the coast of Indochina between Saigon and Camranh bay was attacked on Jan, 12, Formosa on Jan. 15 and Hong Kong and Canton on Jan. 16. The coinplete inability of the Japanese to resist the movements of the United States navy on the very shores of the continent of Asia was indicated by the fact that Admiral Halsey's forces traversed 3,800 mi. in the South China sea during this series of attacks without receiving damage to any ship.

Although U.S. forces were securely established in the Philippines, large land areas and innumerable islands remained to be cleared; and until the end of the war land fighting, accompanied by amphibious landings, was going on in various parts of the group. Landings to accelerate the capture of Manila were made in the vicinity of Subic bay on Jan. 29 and 30 and at Nasugbu, south oi Manila bay, on Jan. 31. On Feb. 13 cruisers and destroyers bombarded the entrances to Manila bay; on Feb. 15 troops landed on the Bataan peninsula and on Feb. 16 on Corregidor Island—the scenes of bitter United States reverses three years earlier. Subsequent operations were undertaken to gain control of the straits leading into the waters of the central Philippines and to seize coastal cities and strongly held Japanese positions in various central and southern islands. Landings were made at Zamboanga on Mindanao Island on March 10, at Iloilo on Panay Island on March 18 and at Cebu Island on March 26. On April 17 a landing at Malabang in southern Mindanao resulted in the seizure of the important Davao gulf area. In May similar operations were extended to the westward into Borneo to recover Japanese conquests in the Netherlands Indies and cut off Japanese oil supplies. The first Borneo landings were against the island of Tarakan on May 1; the second large operation was against the Brunei bay area on the north coast on June 10, and on July 1 an amphibious force attacked Balikpapan on Makassar strait.

(h) Attacks on the Home Islands.—While the Philippine Islands were still being fought over, the war was simultaneously being carried not only to the inner deienses of the Japanese empire but to the home islands themselves. The occupation of the Mariana Islands in the summer of 1944 had furnished bases from which U.S. long-range bombers could attack Japan, but to increase the effectiveness with which these planes could operate, fighter support was desirable. The island of Iwo Jima in the Volcano Islands, only 750 mi. from Tokyo, offered an ideal site for a fighter base to support the Mariana-based B-29s, as well as for the operation of medium bombers. An amphibious assault upon Iwo Jima was therefore undertaken in Feb. 1945, although it was known that the island was heavily fortified and would be vigorously deiended. The operations for the capture of Iwo Jima were under the command of Admiral Spruance, who had relieved Admiral Halsey in command of the fast carrier task iorce of the Pacific fleet after the latter's successful sweep through the South China sea. Although the island was only 2 mi. wide and 5 mi. long, such severe fighting was anticipated that a landing iorce of 60,000 United States marines, put ashore by a naval iorce of more than 800 ships, was provided ior its capture. Iwo Jima had been intermittently attacked since June 1944 by surface ships and carrier planes, and irom December onward the attacks had been intensified. Landings were scheduled ior Feb. 19; as a preliminary move the carrier aircraft of Admiral Spruance's 5th fleet struck Tokyo on Feb. 16, one year to the day after the first attack on Truk. This'attack was renewed on Feb. 25. Meanwhile, surface ships and planes were attacking the deienses of Iwo Jima. As soon as the marines were ashore, severe fighting developed which continued for several weeks; but on March 16 all organized resistance ceased. The airfields which mere immediately developed on the island greatly facilitated the air attack upon the Japanese home islands.

To bring Japan even more closely under attack, a very large amphibiohs operation was directed against Okinawa, in the Ryukyu Islands, in the spring of 1945. The capture of the Mariana and Philippine Islands had brought U.S. iorces within 1,300 mi. of the Japanese homeland. The capture of Iwo Jima placed them about 750 mi. from Tokyo, while Okinawa offered sites for airfields within 350 mi. of Kyushu, the southernmost oi the main islands of Japan. The difficulty of this assault was considerable, for Okinawa was heavily defended, and its proximity to Japan meant that any attack upon it could readily be resisted by the main strength of the Japanese air iorce.

After preliminary strikes by the iast carriers, and intensive nayal bombardment, landings were effected on the southwest coast of Okinawa on April 1. Though there was relatively light resistance on the beaches, and the northern two-thirds of the island was occupied in a matter of three weeks, Japanese resistance in the southern portion of Okinawa, where strong deiensive positions had been established, was extremely bitter and protracted. It was not until June 23 that the entire island was captured. During this long period, many naval vessels were required for the support of the troops ashore. More than 1,200 had been employed in the initial landings, and a considerable number were required for many weeks thereafter. These ships were subjected to heavy air attack by Japanese suicide planes and received considerable damage. There was relatively little danger irom Japanese naval vessels in consequence of the defeat inflicted the previous October in the battle of Leyte gulf, and through April, May and June the fast carrier task force constantly operated in support of the Okinawa assault, frequently launching attacks upon Kyushu. On April 7, in a last attempt to make some use of surviving surface vessels, the great Japanese battleship "Yamato" (sister ship of "Musashi," which had been sunk in the battle of Leyte gulf) sortied, but was promptly sunk off Kyushu.

With the approaching conclusion of the war in Europe, major units of the royal navy had been dispatched to the Pacific and organized as a British Pacific fleet, under the command of Adm. Sir Bruce Fraser. These ships were placed under the operational control of the commander in chiei, United States fleet, and in the spring of 1945 a British carrier task force was assigned to Admiral Spruance's 5th fleet to assist in the air support of the Okinawa operation. This iorce attacked Sakishima Gunto, southwest of Okinawa, from March 26 to April 20 and again from May 4 to 25 to neutralize air installations there.

After the conclusion of the Okinawa operation, Admiral Halsey's 3rd fleet, the greatest assembly of sea power in the history of naval warfare, moved northward toward Japan to conduct a preinvasion campaign aimed at the destruction of the remaining units of the Japanese navy and of industrial sites. Strikes were made against airfields and iactories in the vicinity of Tokyo on July 10, and against northern Honshu and southern Hokkaido on July 14–15. On July 17, in company with units of the British Pacific fleet, 3rd fleet ships conducted the first U.S.-British bombardment of the Japanese home islands. Carrier planes attacked the Yokosuka naval base in Tokyo bay on July 18; the Inland sea area on July 24, 25 and 28; northern Honshu on Aug. 9 and 10 and Tokyo on July 30 and Aug. 13 and 15. These 3rd fleet operations were in preparation for Operation "Olympic," a vast amphibious landing projected against southern Kyushu, which was to be followed later in 1945 by Operation "Coronet." an amphibious assault into the Tokyo plain area. These last great efforts were not required, ior on Aug 14 Japan accepted the terms of the Potsdam proclamation, which involved the absolute surrender of all military iorces. The cease-fire order was given on Aug 1;.

Amphibious iorces were organized ior the occupation which began on Aug. 28. On Sept. 2, on board the battleship "Missouri" in Tokyo bay, the formal surrender was signed. (W. M. W.)

VI. CONCLUSION

The costs of war could not be measured alone in such mathematical terms as battle casualties, dollar expenditures and similar data. Such figures were but partial and inadequate yardsticks. The data regarding casualties among civilians were only partially available. They were known to be very great, often exceeding the military losses. The loss of life because of the privations, cruel treatment and mass murders which were a feature of the axis concentration camps had to be included in any comprehensive record of costs in terms of human lives. A more difficult problem was to appraise the losses occasioned by the displacement and dislocation of populations. Recognition had to he given to the long-term effects of devoting the major portion of the world's over-all capabilities for a period of years to the objective of destruction.

Costs, computed in terms of dollars, of raising and supporting armed forces, lost their significance as the conflicts of war extended from high in the air to the depths of the oceans and over most of the earth's surface. The destruction of homes, industries and means oi livelihood of millions of people probably represented a greater monetary cost factor than the support of armed iorces. The destruction common to World War II could not be measured in terms of the replacement cost alone.

The figures in the succeeding paragraphs must be considered in light of the foregoing factors.

Fifty-seven nations, Allied and axis, were belligerents in World War II. In the final compilation of figures as to casualties and expenditures of resources, the data ior each nation should be viewed in the light of that nation's total manpower and national wealth. The major portion of the cost was borne by the United States, the British commonwealth, the Union of Soviet Socialist Republics, China and France and by the three major axis powers, Germany, Italy and Japan. The battle dead gave a partial picture of that cost.

The cost of victory for the United States in battle dead was more than 292,100 lives, or about 1 in every 450 of the 1940 population. Separate service casualty figures for persons killed in action, died of wounds or died as prisoners of war are: army (including the air force which was the army air corps during World War 11), 234,874; navy, 36,950; marine corps, 19,733; coast guard, 574.

The cost to the British commonwealth in military personnel killed and missing during the period Sept. 3, 1939, to V-J day mas 544,596. This represented 0.09% of the population of the British commonwealth. These casualties came irom all parts of the empire, but the majority were suffered by people of the home islands. The figures for those killed and missing were approximately 397,762 from the United Kingdom itself, or 1 in every 150 of the population; 39,319 irom Canada, 29,395 from Australia, 12,262 irom New Zealand, 8,681 irom South Africa, 36,092 from India and 21,085 irom the rest of the empire.

The Union of Soviet Socialist Republics reported its losses as approximately 7,500,000 military personnel killed and missing, or one in every 22 of its 1940 population.

In France, the number of servicemen killed was 210,671 (one in every zoo of its 1940 population) including 22,219 members of the forces of the interior; 36,877 prisoners oi war who died in captivity. The total number of civilians killed in war operations was 107,874, including 6,450 foreigners killed on French soil.

Germany lost 2,850,000 military personnel killed and missing, or one in every 25 of its 1940 population.

Italy had about 300,000 military casualties, or one in every 1jo of its 1940 population. It was estimated that losses in the campaign against the Allies, June 10, 1940, to Sept. 8, 1943, totalled 294,297, including 57,422 dead, 112,405 wounded and maimed and 124,470 missing. In the campaign against the Germans, Sept. 8, 1943, to May 2, 1945, losses totalled 13,151, including 3,482 dead, 6,848 wounded and 2,821 missing.

During the course of the war, China suffered the second largest number of casualties of any of the Allied nations. Its battle losses numbered 2,200,000 or 1 in every 200 of its 1940 population, excluding Manchuria. These figures covered the period during which time China was formally at war with Japan and did not include the six years of undeclared hostilities beginning in 1931.

Japan had lost 1,506,000 military personnel killed and missing since 1937, or 1 in every 46 of the 1940 population of its home islands.

The total number of military personnel of the major Allied powers killed and missing during World War II was about 10,650,000. The total number of military personnel of the major axis powers killed and missing during the war was approximately 4,650,000. The total cost to the principal belligerents, both Allied and axis, in military personnel killed and missing in battle exceeded 15,000,000.

The very considerable costs to the smaller countries, particularly

Poland and the nations in southeastern Europe, added hundreds of thousands more to the total.

As a result oi nazi slave labour drafts and the battles fought over so much of the European continent, approximately 10,000,000 civilians were displaced outside their own country on V-E day. More than 8,000,000 of these displaced persons had been returned to their homes by early 1946. The International Refugee organization subsequently repatriated 72,800 persons, resettled 1,050,000 in immigration countries and established 300,000 in countries of refuge. At the termination of the I.R.O. in Jan. 1952, approximately 100,000 refugees of World War 11 still required assistance and new refugees from Central and Western Europe continually increased this residue.

In the far east, by the end oi March, 1950 approximately 1,000,000 Chinese, Formosans, Koreans and other Pacific ocean area inhabitants had been repatriated from Japan, while 6,500,000 Japanese nationals had been returned home. At that date, however, 60,000 Japanese remained unaccounted for in Manchuria and 300,000 in the Soviet-controlled areas of Siberia, Karafuto and the Kuriles.

World War II, both in the operations and in the weapons developed, demonstrated that, with the exception of the wealthy powers, a nation could no longer depend on its armed forces alone ior security against external aggression. The Netherlands, Norway and even Poland fell in a matter of a few days. Modern methods of war required large populations, large national areas and great industrial capacity not only to support these methods, but to sustain the impact when attacked. Hence, the majority of the nations in the world had to depend primarily on international action for their security. Even if all other elements were available to them, they would not possess the wealth to support the costly modern weapons and forces.

Turning to the political results of World War II, the world was left with two great political forces: soviet communism and western democracy in its various forms. Germany had been eliminated as a great pomer. France, recognized as a major power in the 1930s, one of the victorious allies of 1918, was weaker than before the war. Italy, a cobelligerent at the end of the war, was definitely a minor pomer. Thus the four great powers on the European continent in 1939 had bern reduced to one—soviet Russia.

The destruction oi Germany and the impact of the war on other European countries left a weak western Europe overshadoxved by the military pomer of the U.S.S.R. The Soviet Union emerged as one of the two greatest world powers, although with temporary weaknesses to overcome resulting from its enormous expenditures and losses during the war. All Europe suffered from the economic ills of dislocation and scarcity and from the artificial barrier separating eastern and western Europe as established by the occupation forces.

Great Britain had been weakened, not only directly by the cost of the mar but also relatively by the shifts in the power potential of other nations and the impact of the war on the controls through which it had long made its influence felt throughout the world.

World War II gave a great impetus to the awakening of backward and colonial peoples, and the generation of a feeling of nationalism and some cohesion in such peoples. This was true in the iar east and in the middle east and even in Airica.

It was U.S. industrial and military power which provided the additional strength necessary to stem the high tide of initial axis successes and finally to bring the war to a victorious conclusion. The direct military cost to the U.S. for the mobilization of more than 12,000,000 men and the supply of war materiel to its allies was approximately $350,000,000,000 between 1939 and 1946. It required three to five years for the United States to bring the various components of its pomer actually to bear against the axis. It was U.S. industry which was called upon to equip and support not only U.S. iorces, but considerable portions of allied forces, and earned the title of "the arsenal of dcmocracy." But all this required time, since the total mobilization of a nation's iorce is dependent on mobilization of its industry.

An important economic result of World War II was the tremendous expenditure of resources, either through destruction or through absorption in the manufacture of implements oi war.

During the struggle there mas developed to a high degree of efficiency a form oi psychological warfare, or the war of nerves. Extensive use was made oi propaganda in all its forms, both during the mar and aiter cessation oi hostilities. This mar of words had an unhappy aftereffect seriously complicating and retarding the negotiations concerning the terms ior peace settlements. (*G.* C. ML.; X.)

WORLD WAR II CONFERENCES, ALLIED. The Allied war of 1939–45 was. in a sense. fought by conference. When it broke out in Sept. 1939, Great Britain and France revived the Supreme War council of World War I. The British prime minister and the French premier, as members of the council, met 16 times before the French collapse in 1940. Though the United States was not an active belligerent until Dec. 1941, Anglo-C.S. conferences began much earlier. Secret talks between British and U.S. military and naval staffs were held in Washington, D.C.. Jan. 29–March 29, 1941, resulting in an agreed report (ABC-1), which stipulated. among other things, that if the United States found itself at war with both Germany and Japan, it would give first priority to the defeat of Germany. Pres. Franklin D. Roosevelt then met Prime Minister Winston S. Churchill at sea off Argentia, Nfd., Aug. 9–12, 1941.

Further staff conversations were held. The president and prime minister were able to exchange views about a possible Japanese attack on British or Dutch possessions in Asia and to perfect arrangements for U.S. assistance in protecting supply vessels against German submarines. At the end of the conference, they issued a declaration, subsequently known as the Atlantic Charter, which stated the "common principles . . . on which they base their hopes for a better future for the world." The charter called, in effect, for self-determination of nations, freer trade, freedom of the seas, disarmament of aggressor nations. common action to secure higher living standards for the world and "After the final destruction of the Nazi tyranny . . . a peace which will afford to all nations the means of dwelling in safety within their own boundaries, . . ."

This article is divided into the following sections:

I. Arcadia and After
1. Arcadia
2. The Hyde Park and Washington Meetings (June 19–25, 1942)

I. ARCADIA AND AFTER

On the day after the Japanese attack at Pearl Harbor, Churchill proposed a fresh meeting with the president, and from Dec. 22, 1941, to Jan. 14, 1942, he, Roosevelt and their chief civil and military advisers conferred at Washington. The leading item on their agenda was combined strategy and, to the relief of the British, the first act of the conference was a re-endorsement of ABC-I, the "Europe-first" accord reached earlier.

1. Arcadia.—It remained to determine how British and U.S. forces should be used. British planners envisioned the Allied position as a ring around the European Axis. It was their concept that this ring should be closed and tightened by operations on the Russian front, in Africa and perhaps in the Scandinavian region, while the enemy was worn down by air attack, blockade and the constant drain of fighting on the periphery of the European stronghold. Eventually, either in emergency or as a coup de *grâce*, forces were to be put ashore in France.

Although U.S. planners already entertained some doubts about this concept, they mere not yet prepared to challenge it. As a result, the conference (code-named Arcadia) produced highly tentative agreement upon build-up in the United Kingdom of an attack force ready to land in France if it became necessary or expedient to do so (Operation "Sledgehammer") and upon combined operations to secure all of north Africa for the Allies.

The British had already drafted a plan (Operation "Gymnast") for landing forces in northwest Africa behind the German desert army. In conjunction with this attack, U.S. forces were to land at Casablanca, the combined operation to be known as "Super-Gymnast." But the execution of all these arrangements depended on factors still uncertain, such as the developing situations on the Russian front and in Africa and the availability of troop and cargo shipping.

Since events modified most of these military arrangements, a more lasting result of the Arcadia conference was the creation of machinery for future conduct of the war. It was agreed that the United States joint chiefs of staff and the British chiefs of staff committee should join together as a combined chiefs of staff. The result was that virtually all major military decisions were made by a staff representing both nations. The organization was one of the most extraordinary creations in the history of warfare.

On the political side, the Arcadia conference brought forth the declaration of the United Nations. A carefully drawn document, it embodied the general war aims of the Allies and committed all signatories to making no separate peace or armistice. After a reaffirmation of the Atlantic Charter, it declared the purpose of the Allies "to defend life, liberty, independence, and religious freedom, and to preserve human rights and justice." Ultimately, this declaration received the adherence of all states allied against the Axis powers.

Though Arcadia indicated the solidarity of the great Allies, its practical decisions were reached in such an atmosphere of uncertainty that other meetings were necessary very soon after its adjournment. As the United States chiefs of staff examined the worsening position on the eastern front, in the Pacific, in Africa and in the Atlantic, they became convinced that the closing-ring strategy evolved by the British was inadequate and perhaps perilous.

Super-Gymnast, proving impossible of execution in the spring of 1942, was temporarily abandoned. In its place the U.S. military chiefs hoped to put a massive build-up in the United Kingdom ("Bolero") and a landing in force on the European continent at the earliest possible date ("Roundup"). In mid-April 1942 Harry Hopkins and Gen. George C. Marshall traveled to England to urge acceptance of this concept by the British government. Though they obtained agreement in principle, it was not long before Churchill and the British chiefs of staff displayed belief that early execution of Roundup would be impractical if not impossible and that U.S. troops ought to be fighting Germans somewhere else during 1942.

2. The Hyde Park and Washington Meetings (June 19–25, 1942).—A new conference was necessary. The prime minister had already proposed to the president reviving Super-Gymnast, and Roosevelt had indicated that, while hoping for Roundup, he was as eager as Churchill to see a fighting front opened speedily. In meetings at Hyde Park, N.Y., and in Washington, the prime minister urged a north African operation with all his expertness, eloquence and charm. In the same period he had his first conversations with the president about the research then in progress on nuclear weapons. But the main issue. Super-Gymnast v. Roundup, remained unsettled when Churchill returned to London.

Not until July 18–25, when Hopkins, Marshall and Adm. Ernest J. King conferred with Churchill in England, was a provisional decision at last reached. The U.S. representatives sought with all their powers to obtain acceptance of the Roundup concept, but the British remained firm, and the president had instructed his delegates to yield, if necessary. Recent British reverses in Africa had emphasized the peril if Germany achieved control of Suez and established a link with Japan. The U.S. therefore agreed that north African landings (renamed Operation "Torch") should proceed in the autumn.

II. CASABLANCA

When the success of Torch appeared certain, a new conference became imperative. The president had hoped for a meeting of British, U.S. and Russian leaders, but Soviet Premier Joseph Stalin proved unable to leave his headquarters. It was only Roosevelt, Churchill and their staffs, therefore, who joined at the Anfa hotel near Casablanca, Mor., Jan. 12–23, 1943, for the conference code-named Symbol.

Debate on military questions was trying, often tense and sometimes acrimonious. It was an indication of the growing unity in the Anglo-U.S. alliance that issues were fought out rather than disguised. The major question, however, was one that, in any case, demanded a clear-cut answer: where were Anglo-U.S. troops to operate after triumph in Africa? General Marshall and other U.S. military leaders wished to concentrate on build-up for a landing in France; they opposed any further operations in the Mediterranean. Churchill and the British chiefs of staff favoured strengthening units in Africa and employing them for an attack on Sicily or Sardinia and perhaps later for an invasion of Italy. They reasoned that a landing in France could not come before 1944, unless Germany suddenly weakened, and that while forces for that operation were accumulating in the United Kingdom. offensives should be continued in the Mediterranean. Some officers on U S. staffs concurred, and the president was sympathetic. As a result, the military conferees eventually accepted the British point of view. The combined chiefs of staff reported in favour of an invasion of Sicily, and the president and prime minister set the time for it as the favourable July moon.

The conferees also discussed future operations in the Pacific. The initiative had passed into Allied hands, and two major lines of attack were agreed upon. Gen. Douglas MacArthur in the South Pacific was to move toward Rabaul in northern New Britain, which Gnited States planners regarded as the key to the Japanese position. Another operation ("Anakim"), to recover Burma, was to be carried out by forces available on the Asian mainland. In co-ordinated attack, British forces were to advance from India while U.S. forces conducted an amphibious attack toward Rangoon. Though the directive to MacArthur was subsequently modified and Anakim never carried out, the combined chiefs also reached a tacit decision of great importance for the Pacific war.

From Casablanca forward they accepted the principle that the Mediterranean and Pacific theatres should have roughly equal priority. Whatever was diverted from the build-up in England was divided 50–50.

Though the work of the conference was primarily military, the president and prime minister also found time to resume discussions of nuclear bomb research, to consider the competing claims of French leaders in exile and, most important of all, to proclaim a demand for "unconditional surrender" by Germany, Italy and Japan.

This announcement was made by Roosevelt at a final press conference. As an alternative to a statement of specific terms, as a reassurance to Russia and as a comfort to those in the United States who had criticized earlier arrangements with the Vichy government of France, a demand for "unconditional surrender" had been under consideration for some time. The president had discussed it with the joint chiefs of staff at a meeting on Jan. 7, 1943, and the prime minister had taken up with the war cabinet the possibility of naming only Germany and Japan so as to encourage overtures from Italy for a negotiated peace. Roosevelt's utterance nevertheless surprised Churchill, but he immediately endorsed it. Afterward, he and Roosevelt both restated the demand several times, always declaring that they had no intention of enslaving the German people but that they needed a free hand in dealing with the Axis leaders.

Both the announcement and the policy came in for severe criticism after the mar, when it was contended that opposition groups in Germany might have overthrown Hitler and negotiated an earlier peace if they had not been discouraged by fear of Allied vindictiveness. Churchill's reply was that any statement of the terms then acceptable to Allied leaders and their peoples. such as the dismemberment of Germany, its complete demilitarization and reparations in kind and in forced labour, would have been more discouraging still.

III. TRIDENT

Though the range of Casablanca decisions had evidenced the meshing of British and U.S. staff work, the result had been to expose issues rather than clearly to resolve them. In the spring of 1943, the British became fearful that the U.S. might retract its approval of the Sicily landing or, at any rate, refuse to approve further operations in the Mediterranean after Sicily had been secured. The British also became alarmed at what seemed a steady drain of force toward the central and south Pacific theatres of operations.

The joint chiefs of staff, at the same time, had suddenly been brought to realize how short was the supply of shipping. MacArthur estimated, for example, that he would need more than seven fresh divisions and at least 30 new air groups to attempt the operations toward Rabaul that had been authorized at Casablanca; studies in Washington showed that available shipping could bring him, at most, two divisions and a few additional aircraft; the South Pacific program had, as a result, to be made much more modest in scale. Such recalculations in Washington, added to apprehensions in London and to the approach of the target date for Sicily, necessitated a new conference. The president, the prime minister and the combined chiefs of staff agreed upon a new meeting (code-named Trident) to be held in Washington, May 12–25, 1943.

The most pressing question before the conferees was where to go after Sicily. Both Churchill and the British chiefs of staff were insistent that Italy should be the next point of attack. It was evident that no landing in France was likely before the spring of 1944, and the British chiefs of staff argued that an Italian campaign, by holding down large enemy forces, would make that invasion easier. Churchill stressed the psychological effects of forcing Italy's surrender. Though Roosevelt saw merit in these arguments, he and his chiefs of staff were fearful that the diversion of shipping required to support an Italian campaign might make it impossible to carry out any effective operations in the Pacific and even prevent the landing in France in 1944. They would not accept the British proposition until the situation, especially with regard to shipping, was more clear. It was decided, therefore, that the combined chiefs of staff should make their decision later. May 1, 1944, was, at the same time, set as the date for the landing in France, and the size of the landing force mas fixed at 29 divisions. According to U.S. planners, this figure ensured first priority in shipping for the build-up in the Cnited Kingdom.

Much time of the conference also went into discussion of Pacific strategy. The British had concluded that it would be wrong to carry out the attack on Burma that had been agreed upon at Casablanca. Although the United States chiefs of staff had also come to view the earlier scheme as unrealistic, they urged a more limited campaign, intended, in the end, to open a free supply route to China. In view of the curtailments in Pacific operations seemingly necessitated by the shortage of shipping. the U.S. chiefs of staff were all the more eager to reinforce China and to establish secure air bases there. In the upshot, the combined chiefs, the prime minister and the president agreed to a limited campaign in Burma, conducted with forces already in the theatre. The scale of this operation was to be so small that recapture of Rangoon was not expected before the end of 1944. But the decision itself may have had unforeseen consequences. for a by-product of it was a gradual change in U.S. activity in China. Theretofore, the main effort had been to equip and train the army of Generalissimo Chiang Kai-shek; thereafter, the emphasis went to building up U.S. bomber forces in China.

It has been argued that if the former program had been continued, Chiang might have been better able to cope with Chinese Communist forces in the conflict of 1946–49.

IV. QUADRANT

Though barely three months elapsed before the next Anglo-U.S. conference, the question of an Italian invasion had already been resolved before Churchill, Roosevelt and their staffs gathered at Quebec for the Quadrant meeting (Aug. 11–24, 1943). The Sicilian campaign, launched in early July, had proved overwhelmingly successful. In the meantime, the shipping shortage had been appreciably relieved, partly by the reopening of the Mediterranean, partly by successful intensification of antisubmarine measures. Then, in late July, came the fall of Italy's Fascist premier, Benito Mussolini. These events brought a relaxation of U.S. fears and, before the beginning of August, a decision by the combined chiefs of staff in favour of an ambitious campaign in Italy. At Quadrant, all that remained was to discuss the supplementary action that should be taken in response to secret peace overtures from Italy.

A hot debate on strategy nevertheless occupied many of the sessions at Quebec. The issue was whether the cross-channel attack, renamed Operation "Overlord," should be given "over-riding priority," as the U.S. chiefs of staff proposed. The U.S. position was that the invasion should take place on schedule even if the enemy had, in the meanwhile, concentrated forces to oppose it. The British were willing to undertake it only if German fighter-plane strength had been reduced and if the enemy had no more than 12 divisions on hand and 15 on call in the west; they held a vigorous Italian campaign to be essential in order to draw off German strength.

Though debate on these propositions involved no immediate military questions, representatives of the opposed points of view dug in their heels and grappled. Neither, however, won, and the military protocol of the conference read:

> As between operation OVERLORD and operations in the Mediterranean, where there is a shortage of resources, available resources will be distributed with the main object of insuring the success of OVERLORD. Operations in the Mediterranean Theater will be carried out with the forces allotted at TRIDENT except as these may be varied by decision of the Combined Chiefs of Staff.

This agreement merely meant that the issue would be debated again.

The conferees did agree that Overlord itself should be carried out with an assault force one-fourth larger than originally scheduled. With little discussion or consideration, they also decided that it should be supported by a landing in southern France, made by troops from the Mediterranean command. This decision was to provoke much controversy later.

Though the president and prime minister took some part in the debates on strategic issues, they also concerned themselves aith questions of command and with postwar topics. To evidence his undiminished interest in the far east, the prime minister proposed creation of a new southeast Asia theatre under British command. He also volunteered to cancel the earlier arrangement that a British officer should lead the cross-channel attack. Since the preponderance of forces would be U.S., he declared that a U.S. officer should be in command, and Roosevelt gratefully acquiesced.

In the interludes between conversations on such military subjects, the prime minister and president supervised discussions between the British foreign secretary, Anthony Eden. and the U.S. secretary of state, Cordell Hull, on a wide range of political topics, notably the principles to guide an organization that would succeed the League of Nations.

V. THE MOSCOW FOREIGN MINISTERS CONFERENCE

Though the U S S R had been at war with Germany since 1941, Russian, British and U.S leaders had had little opportunity for consultation Eden visited Moscow in Dec. 1941. The Soviet foreign minister. Vyacheslav Molotov, traveled to London in May 1942, mainly to conclude negotiations for a 20-year Anglo-Russian alliance, and then to Washington for a meeting with President Roosevelt In Aug. 1942 Churchill went to Moscow for three days in order to explain to Stalin why he and Roosevelt had reached the disappointing decision to postpone opening a second front and nhy only meagre supplies were reaching Russia over the perilous northern route. It proved difficult, however, to arrange a conference *à trois*, and problems requiring mutual consultation became increasingly urgent It was finally arranged, therefore, for the foreign ministers of the three Allies to confer in hloscow, Oct. 18–30, 1943.

The conferees found themselves in agreement that Austria should. in effect, be restored to its pre-1938 status. On the treatment to be accorded Germany, they did not disagree, but they found no common formulas. As a result, it was decided to create a European advisory commission. which would sit in London and continue deliberations on this difficult problem. Finally, the conferees endorsed a four-power declaration which Hull had submitted to Eden at Quebec and which the Chinese had subsequently accepted, calling for an international organization and for postwar collaboration among the great Allies—a document faintly reminiscent of the Quadruple Alliance of 1814.

VI. CAIRO AND TEHERAN

1. Cairo.—In the late autumn of 1943, conferences among the principal Allied leaders finally took place. Churchill and Roosevelt met Chiang Kai-shek at Cairo. Nov. 23–27, for the Sextant conference. They then traveled to Teheran, the capital of Iran, for Eureka, a separate conference with Stalin. Afterward they spent five more days in Cairo (Dec. 2–7) for Anglo-C.S. staff talks.

During the first Cairo talks, the far east dominated the conversation. Churchill had hoped that most of the meeting could be devoted to further consideration of Overlord v. the Mediterranean, so that the English-speaking Allies would be more of one mind when they met the Russians, but Roosevelt willed otherwise. Churchill did have an opportunity to argue against further weakening of the Italian front, stressing recent indications of intensified German resistance. He was also able to urge the need of supporting partisan movements in the Balkans which he said were holding donn as many German divisions as the Anglo-U.S. forces already in combat. And he presented his own substitute for the U.S. formula of "over-riding priority" for Overlord: a division of resources allocating six-tenths of all available for the invasion build-up, three-tenths for Italy and the remaining one-tenth for the eastern Mediterranean. But the issues which he raised were not threshed out.

Instead, debate centred on plans proposed by Chiang and Roosevelt for new undertakings in Burma: an Anglo-U.S.-Chinese force to move from the north in concert with a British amphibious attack on the Andaman Islands (Operation "Buccaneer"). The C.S and Chinese insisted upon these operations, even if they required a diversion of strength from Overlord. Churchill resolutely opposed the diversion of landing craft required by Buccaneer. The issue remained unresolved nhen the president and prime minister departed for Teheran.

While in Cairo. they had, moreover, reached one important political agreement. They drew up a declaration of Allied aims in the far east. Japan was to lose all Pacific islands which it had acquired after 1914 and was to be "expelled from all other territories which she has taken by violence and greed." Manchuria. Formosa and the Pescadores were to be restored to China, and Korea was, "in due course," to become free and independent. Though these terms appear to have been devised by the president and prime minister without much consultation of political advisers, the Cairo declaration, published Dec. 1. 1943, was one of the most explicit and far-reaching statements of Allied aims issued during World War II.

2. Teheran.—At Teheran the disputes between the U.S. and the British were temporarily shelved. There was little discussion of the far eastern war. in which Russia was not yet engaged. Stalin did listen to a long summary by Roosevelt of Allied operations in the Pacific, and he renewed the promise, which he had first made during the Moscow foreign ministers meeting, of eventual action against Japan. In discussing the peace settlement, he acknowledged desire for a year-round port on the Pacific, and Roosevelt suggested internationalizing Dairen. Manchuria, for the purpose. Stalin indicated, too, that Russia might want south Sakhalin Island and the Kuril Islands from Japan Otherwise, however, the three-power negotiations concentrated on the war against Germany and postwar settlements outside of Asia.

There was much conversation about a second front. Stalin desired categorical assurances that the invasion of France would take place in 1944. The U.S. undertook to satisfy him. The British sought to do so as well, without yielding the reservations which they still hoped their allies would accept, and Stalin declared that the Red army would stage an offensive timed to coincide with Overlord, so that Germany could not transfer strength from east to west. On the plan for a co-ordinate landing in southern France (Operation "Anvil"). which Roosevelt described, the Soviet premier not only stated his approval, but he suggested that it might be scheduled two months ahead of Overlord. so as to disrupt enemy defenses. He was more reserved in endorsing a project, advanced by Roosevelt and enthusiastically supported by Churchill, for small-scale operations at the head of the Adriatic. It was his view, as it was that of Hopkins and the U.S. military staffs, that no such actions should be taken if they reduced the force available for Overlord or the southern France landing.

Though military questions still dominated, the Teheran conference saw more discussion of political issues than had occurred in any previous meeting between Allied governmental heads. The Soviet leader restated the territorial objectives that had been disclosed during the Anglo-Soviet alliance negotiations: the eastern frontiers provided in the Nazi-Soviet pact of 1939 and in the Russo-Finnish peace treaty of 1940. Stalin added that Russia would also wish the Baltic coast of East Prussia. Although the settlement for Germany nas discussed at length, all three Allied leaders appeared as uncertain as their foreign ministers had been. Nor were their views any more precise on the topic of a postwar international organization. On Iran, which Allied forces were partly occupying, they were able to agree on a declaration (published Dec. 1, 1943), guaranteeing the postwar independence and territorial integrity of that state and promising postwar economic assistance.

The only question upon which the conferees found themselves in sharp disagreement was the tortured issue of Poland. While the Soviet premier made no secret of Russia's desire for portions of eastern Poland, he indicated possible approval of compensatory Polish annexations in eastern Germany, perhaps to the line of the Oder river. The president and prime minister were not averse to such an arrangement, although they had some reservations about

Russian acquisition of purely Polish districts and Polish acquisition of purely German districts. The real difference of opinion arose, not over Poland's frontiers, but over its government, for Stalin expressed distaste for the Polish exile regime resident in London, and he left Roosevelt and Churchill with the accurate impression that the Polish question might cause difficulty later on. Even so, the meetings seemed to justify Stalin's farewell statement: "Now it is assured that our peoples will act together jointly and in friendship both at the present time and after the end of the war."

3. Second Cairo Meeting. — The subsequent conference between Churchill and Roosevelt at Cairo saw resumption of the Anglo-U.S. debate on strategy. As the president summarized the compromises agreed upon: "(a) Nothing should be done to hinder OVERLORD. (b) Nothing should be done to hinder ANVIL. (c) By hook or by crook we should scrape up sufficient landing craft to operate in the eastern Mediterranean if Turkey came into the war." Reluctantly, the U.S. agreed to abandon Buccaneer and therefore the whole Burma campaign envisioned by Chiang. A much smaller campaign mas to be undertaken, with China to be compensated by increased airlift of supplies over the Himalayas.

Toward the end of this second Cairo meeting. Roosevelt informed Churchill that he had at last reached a decision on the command for Overlord. Gen. Dwight D. Eisenhower was to have the job. Coupled with the decisions of the Washington, Quebec, Cairo and Teheran conferences, the actual naming of an invasion force commander indicated that the central Anglo-U.S. debate was ended and that Overlord would proceed as scheduled.

VII. SPECIAL CONFERENCES ON POSTWAR SUBJECTS

While the heads of the Allied governments brooded over methods of bringing the war to an end, their technical experts laboured over problems of the postwar world.

1. UNRRA.—After complex negotiations that began in London in 1940, an agreement was finally worked out for a United Nations Relief and Rehabilitation administration (*q.v.;* UNRRA). The document was signed at the White House in Nov. 1943, and the council of the new agency assembled immediately at Atlantic City, N.J., with the United States represented by Dean G. Acheson and Francis B. Sayre. Subsequently, former New York Gov. Herbert H. Lehman became UNRRA's first director general.

2. FAO.—A conference of Allied and neutral delegates at Hot Springs, Va., May 18–June 3, 1943, had meanwhile produced an interim commission that was, by the summer of 1944, to have devised the United Nations Food and Agriculture organization (*q.v.;* FAO).

3. International Monetary Fund and the International Bank. — From still another series of conferences, beginning in Washington in Sept. 1943, and culminating at Bretton Woods, N.H., in July 1944, had come charters for the International Monetary fund (*q.v.*) and the International Bank for Reconstruction and Development (*q.v.*).

4. ILO and **ICAO.—An** international labour conference was held in Philadelphia in 1944, resulting in the "Philadelphia Declaration" looking toward a larger role for the International Labour organization (*q.v.*) after the war. Later in the same year a conference in Chicago established the International Civil Aviation organization. (See AVIATION, CIVIL.)

5. **UN.**—The formation of an international organization to supersede the League of Nations was also undertaken by technical experts of the Allied nations. In the United States, numerous state department and interdepartmental committees studied the intricate problems of organization, membership, voting procedure and sanctions, upon which the heads of governments had found their views clouded and imprecise. At Dumbarton Oaks, Washington, D.C., Aug. 21–Oct. 7, 1944, U.S., British, Russian and Chinese experts finally gathered to draw up a charter for the United Nations (UN) organization (*q.v.*). As a result of careful preparation and cautious procedure, the experts were able to reach agreement on all but two issues.

One was whether a permanent member of the Security council should be able to employ the veto in a case in which it was a party. The other was whether the 16 Soviet republics should enjoy individual membership. These two issues had to be resolved by Roosevelt, Churchill and Stalin in their conference at Yalta (*q.v.*). At the San Francisco conference, April 25–June 26, 1945, the charter produced at Dumbarton Oaks and Yalta proved, with relatively few changes, to be acceptable to all the United Nations.

VIII. THE SECOND QUEBEC CONFERENCE

After the Cairo and Teheran conferences, the president and prime minister did not meet again until they came together at Quebec in Sept. 1944, for Octagon. By that time, Overlord had been launched, and the Allied invaders had met unbroken successes. Despite British efforts to cancel the operation, Anvil (renamed Dragoon) had also been brought off, apparently to the benefit of the major undertaking farther north. In the meanwhile, Rome had been captured, and Allied troops in Italy had made steady though slow progress northward. Successes in the Pacific had brought Allied forces within striking distance of the Philippine Islands rind of bases near the Japanese homeland. Coupled with steady Russian advances in eastern Europe, these events seemed to make eventual triumph certain.

Military questions still occupied most of the conference agenda. Eisenhower's forces were in position either to concentrate for a drive into Germany across one point on the Rhine or to advance more slowly in co-ordinated offensives along the coast and south of the Ruhr. The conferees discussed these alternatives and finally approved Eisenhower's own compromise, which was to stage a major attack in the north and a subsidiary attack in the south. They talked still more about the far eastern war, where they did not expect victory until one or two years after Germany had been defeated. The combined chiefs discussed Burma, where unexpected successes by the Allies had made it possible to plan a land and amphibious assault on Rangoon. It remained uncertain whether Chiang, beset by internal problems, would undertake any useful action in that theatre, and. during the conference, Roosevelt sent off a dispatch, strongly urging Chiang to place his armies under U.S. command. It has been argued that both of these acts were fraught with political consequence, for Anglo-U.S. forces, advancing on two fronts, failed to reach Berlin ahead of the Russians and Chiang, by rejecting Roosevelt's urging, missed an opportunity to make the United States responsible for Nationalist China's future. But these eventualities did not enter into deliberations at Quebec.

Some other military issues, however, were considered with an eye to their political implications. It was agreed that a few landing craft might be left with the Allied middle east command for a landing on the Istrian peninsula, so that Anglo-U.S. troops could occupy Vienna and perhaps Hungary before Russian forces arrived. For much the same reason, it was also agreed that British units should be landed by parachute in Greece. And the British insisted successfully on being assigned air and naval tasks in the U.S. plan for defeating Japan, because, as Churchill explained, he did not want it said that the U.S. had helped Britain against Germany while Britain had failed to help against Japan.

Two largely nonmilitary questions were also dealt with at the conference. It was agreed that lend-lease aid to Britain should continue after the defeat of Germany, ostensibly because of the Japanese war but actually to help in rebuilding the British economy. And the president and prime minister approved accords on the treatment of defeated Germany. One, drawn up by the European advisory commission, provided for British, U.S. and Russian occupation zones, the Russian to reach 200 mi. W. of Berlin, the British to include northwestern Germany and the U.S. the area south of the Saar and the Lower Palatinate. A second stipulated a "programme for eliminating the war-making industries in the Ruhr and in the Saar . . . looking forward to converting Germany into a country primarily agricultural and pastoral in its character."

Known as the Morgenthau plan, this document had emerged from conferences between U.S. Secretary of the Treasury Henry Morgenthau. Jr., Secretary of War Henry L. Stimson and Hull. Signed with some reluctance by Churchill, it was subsequently revoked and replaced by a more moderate program for the treatment of Germany.

The second Quebec conference was the last at which military issues dominated. In Oct. 1944, when Churchill again went to Moscow, it was primarily to discuss postwar problems. The Soviet premier did outline his plans for eventual massive intervention in the Japanese war, and he and Churchill discussed the co-ordination of British and Russian operations in the Balkans. But their main business was the still unsettled issue of Poland's frontiers and future government, and their most important transaction was a provisional agreement on division of influence in southeastern Europe: Russia's interest to be considered paramount in Rumania and Bulgaria, Britain's to be paramount in Greece and the two to divide influence in Yugoslavia and Hungary.

When Churchill and Roosevelt met again at Malta early in 1945, just prior to their conference with Stalin at Yalta, they dealt summarily with military problems. It was agreed that three divisions from Italy should reinforce the Allied armies in northern Europe, thus making possible a sustained drive across the Rhine but precluding any ambitious campaign in southeastern Europe. It was also agreed that in Asia, U.S. forces should aid China while British troops undertook the reconquest of Malaya and Singapore. This latter decision, by implication, assigned Britain chief responsibility for the future of southeast Asia, but it was treated as a military problem. When the president and prime minister then met with Stalin, political issues occupied all but a fraction of their time. At the Yalta conference (*q.v.*) of Feb. 1945 the three leaders dealt with postwar problems in both Europe and Asia.

IX. POTSDAM

The last conference of World War II, appropriately code-named Terminal, was held at Potsdam, outside Berlin, July 17–hug. 2, 1945. Roosevelt had died in April, and his seat was occupied by the new president, Harry S. Truman. Though Churchill attended the initial sessions, a British general election resulted in overthrow of the Conservative party, and his place was taken by Clement Attlee as the new prime minister. Of the wartime leaders, Stalin was the only one to sign the Potsdam protocols.

The war with Germany had ended in May, but the war in Asia went on. There was some discussion, therefore. of the operations to be conducted against Japan. The combined chiefs of staff debated the U.S. plan for invading Honshu and attendant preliminary operations. Since Russia had promised to enter the war shortly, there were also meetings between the combined chiefs and the Russian chiefs of staff. Most important among the military exchanges, however, was a brief after-dinner conversation in which Truman disclosed to Stalin that the United States had successfully tested an atomic bomb and was shortly to employ it against Japan.

Most of the questions before the three government heads concerned either the procedure or the substance of the peace settlement. At U.S. instance, it was agreed to create a council of foreign ministers, in which the United States, Britain, Russia, France and ultimately China would have seats. It was hoped that this high-level committee could draft peace treaties for Germany and other defeated Axis states, and many of the questions that proved too intricate or too difficult for the Potsdam conferees were left for debate within this council.

Stalin. Truman and Attlee were able to reach provisional agreement among themselves on some comparatively minor issues. Without acrimonious debate it was agreed that Russia should have one-third of the German navy and the German merchant marine. The reparations problem was partly solved by a compromise which gave Russia the right to exact its quota from its zone of occupation and from Bulgaria, Finland, Hungary, Rumania and eastern Austria. Russia was also to receive a percentage from the western occupation zones, but the total figures for all were to be determined at a later date. Finally, agreement was reached on the trial of Axis war criminals. A United Nations commission to investigate war crimes had been in existence since the autumn of 1943, and a conference of jurists. held in London concurrently with the Potsdam sessions, created an international military tribunal to conduct the trials. The only difference among the Potsdam conferees mas whether a list of those to be tried should be published, and accord was reached on printing the list a month later.

On a number of other questions, disagreements could not be reconciled, but the issues were deferred. Stalin's desire for a treaty with Turkey which would return to Russia the districts of Kars and Ardahan was displeasing to the British and U.S. So was the Soviet indication of a wish to serve as UN trustee for one or more of the former Italian colonies in north Africa. But both matters were left for debate in the council of foreign ministers. Russian proposals for united action to unseat Gen. Francisco Franco in Spain and for four-power discussions of the situation in Syria and Lebanon were tabled. The president and the prime minister feared precipitating a new war in the Iberian peninsula, and the British insisted that affairs in the Levant concerned only Britain and France.

On some issues, profound disagreement among the great Allies was impossible to disguise. One of these was the situation in the Balkan areas occupied by Russian forces, for both the U S. and the British felt obliged to protest the treatment being accorded their representatives and observers in those states and to complain of Russia's lone-handed management of affairs there. Another was the extension of Poland's western boundaries, which the British and U.S. conferees at Potsdam found as a *fait accompli*. The line of the Oder, which had been approved at Teheran, had been taken by the Poles, but so had the land lying between the Oder and the western Neisse. Truman, Churchill and Attlee all protested against Poland's having been given a large occupation zone without their sanction. Stalin simply replied that there were no Germans remaining in the area, and Poles had moved in. The matter occupied much hot debate, but, in the end, the conferees could do nothing but approve Polish administration of the zone, pending a peace treaty for Germany.

The protocols of the conference suggested continued harmony among the great Allies. The memoirs of Churchill, Truman and others who attended indicate that there was great hope for continued collaboration. The president did write to his mother and sister, " 'You never saw such pig-headed people as are the Russians. I hope I never have to hold another conference with them — but, of course, I will.' " (Harry S. Truman, *Memoirs*, New York: © Time Inc. 1955.) But he toasted the hope of a future meeting in Washington, to which Stalin responded, "God willing." That conference never took place.

WORM, a term used popularly to denote almost any kind of elongated, apparently limbless creature, from a lizard, such as the blindworm, to the grub of an insect or an earthworm. In old usage it sometimes denoted a mythical dragon. The Latin term for worms, *Vermes*, was employed as a taxonomic unit to include practically all invertebrates by Linnaeus in his system of classification of animals. Although later zoologists, such as Lamarck and Cuvier, working in the early 19th century, realized the unsatisfactory nature of Linnaeus' Vermes and restricted it somewhat, the term Vermes continued to be applied off and on during much of the 19th century to a heterogeneous assemblage of vermiform invertebrates. Although still having some vogue in Europe, the concept of a phylum Vermes has been abandoned by most modern zoologists as an impossibility because the animals termed worms belong to many different groups and have widely varied anatomical construction and life histories.

Worms in the zoological sense include the following main groups: flatworms (see PLATYHELMINTHES), elongated flattened animals of solid construction and soft consistency, divided into the Turbellaria (*q.v.*), including planarians, the flukes (see TREMATODES) and the tapemorms (*q.v.*) or Cestoda; the roundworms or Nematoda (*q.v.*), slender elongated worms of cylindrical form with tapering ends and clothed in a smooth tough cuticle; the nemertine worms (see NEMERTINA), marine worms common along ocean shores. often of very great length and notable for a long protrusile proboscis: the spiny-headed worms (see ACANTHOCEPHALA), intestinal parasites with an eversible spiny head; the gordian worms (see NEMATOMORPHA), very long slender worms found in wet places and popularly called horsehair worms from a myth that they originate from horsehairs dropped in water; and the segmented worms (see ANNELIDA), worms with elongated jointed bodies including the earthworms (*q.v.*), leeches (*q.v.*) and a variety of marine and fresh-water types. Other minor groups of less typical worm shape but allied to the above groups are the Rotifera, Gastrotricha, Kinorhyncha, Echiurida, Priapulida, Sipunculida and Phoronida (*qq.v.*).

Many of the groups of worms are wholly or partly parasitic during all or part of their life cycles and have therefore secured a large measure of attention from zoologists and physicians. In the groups of the flukes. tapemorms and roundworms are included many important parasites of man, some of which, as for instance the hookworm! a roundworm and the oriental blood fluke (*Schistostoma*). constitute health problems of vast proportions. It is characteristic of parasitic worms that they have complicated life cycles involving a succession of larval stages in hosts different from those that harbour the adult worm. The working out of these life cycles and identification of larval stages have required the earnest labours of a succession of zoologists and still constitute an active branch of zoological research. See also Index references under "Worm" in the Index volume. (L. H. H.)

WORM, a screw which touches tangentially and which rotates a toothed wheel (the worm wheel). *See* GEARS.

WORMS, a city of Germany, in the *Land* of Rhineland-Palatinate. It is on the left bank of the Rhine, 20 mi. N.W. of Heidelberg and 9 mi. by rail N.W. of Mannheim. Pop. (1950) 52,239.

History. — Worms was known in Roman times as Borbetomagus, which in the Merovingian age became Wormatia. The town had before Caesar's time become the capital of a German tribe, the Vangiones. Drusus is said to have erected a fort there in 14 B.C. In 413 the emperor Jovinus permitted the Burgundians under their king Guntar or Guntiar to settle on the left bank of the Rhine between the Lauter and the Nahe. There they founded a kingdom with Worms as its capital. Adopting Arianism they came into conflict with the Romans, and under their king Gundahar or Gundicar (the Gunther of the Nibelungenlied) rose in 435 against the Roman governor Aetius, who called in the Huns against them. The destruction of Worms and the Burgundian kingdom by the Huns in 436 was the subject of heroic legends afterwards incorporated in the Nibelungenlied (*q.v.*) and the *Rosengarten* (an epic probably of the late 13th century). Worms was rebuilt by the Merovingians, and became an episcopal see, first mentioned in 614, although a bishop of the Vangiones had attended a council at Cologne as early as 347. There was a royal palace from the 8th century, and in it the Frankish kings, including Charlemagne, occasionally resided.

Under the German kings the power of the bishops of Worms gradually increased. Otto I granted extensive lands to the bishop, and in 979 Bishop Hildbold acquired comital rights in his city. Burchard I (bishop, 1000–25) destroyed the castle of the Franconian house at Worms, built the cathedral and laid the foundations of the subsequent territorial poner of the see. There were frequent struggles between the bishops and the citizens, who espoused the cause of the emperors against the church, and were renarded by privileges which fostered trade. The city retained its freedom until 1801, in spite of the bishops, who ruled a small territory south of the city, on both sides of the Rhine, and resided at Ladenburg near Mannheim till 1622.

The city of Worms was frequently visited by the imperial court. The concordat of Worms closed the investiture controversy in 1122. The "perpetual peace" (*ewiger* Landfriede) was proclaimed by the emperor Maximilian I at the diet of 1495, and Luther appeared before the famous diet of 1521 to defend his doctrines in the presence of Charles V. Four years later, Worms formally embraced Protestantism, and religious conferences were held there in 1540 and 1557. It suffered severely during the Thirty Years' War. The French under Mélac burned the city almost entirely in 1689, and it; only fully recovered from this blow in recent years. Thus the population, which in its prosperous days is said to have exceeded 50,000, had sunk in 1815 to 6,250. By the treaty of Worms in 1743 an offensive alliance was formed between Great Britain, Austria and Sardinia. The city was annexed to France at the peace of Lunéville in 1801, together with the bishop's territories on the left bank of the Rhine. The remaining episcopal dominions were secularized in 1803 and given to Hesse-Darmstadt, which acquired the whole by the Vienna congress in 1815.

Antiquities. — Some parts of the ancient walls and towers still remain. The cathedral of SS. Peter and Paul ranks beside those of Spires and Mainz among the noblest Romanesque churches of the Rhine. This basilica, built of red sandstone, with a choir at each end, has an imposing exterior. Only the ground plan and the lower part of the western towers belong to the original building consecrated in 1110; the remainder was mostly finished by 1181, but the west choir and the vaulting were built in the 13th century, the elaborate south portal was added in the 14th century, and the central dome has been rebuilt. The baptistery contains five stone reliefs of the late 15th century. The church of Our Lady (Liebfrauenkirche) is a Gothic edifice outside the town, finished in 1467. The principal Protestant place of worship is Trinity church. built in 1726. Second in interest to the cathedral is the church of St. Paul. also in the Romanesque style. dating from 1102–16. with a choir of the early 13th century, cloisters and monastic buildings. This church has been converted into a museum. The late Romanesque church of St. Andrews is not used.

The old synagogue, an unassuming building erected in the 11th century and restored in the 13th. is completely modernized. The Jewish community of Worms claims to be the most ancient in Germany and to have existed continuously since the very early Christian era, though the earliest authentic mention of it occurs in 588. The old Bischofshof, in which the most famous Diet of Worms (1521) was held, has been replaced. The Luginsland is an old watch-toner of the 13th century. The Lutherplatz contains a group of statuary commemorating the Protestant reformers and their forerunners. Extensive burial grounds, ranging in date from neolithic to Merovingian times, were discovered near the city.

Worms is the centre of a vine-growing country. The manufactures include patent leather, machinery, cloth, chemicals, paints, cork, furniture, slates, etc. Worms possesses a good river harbour and carries on a considerable trade by water.

See also Index references under "Worms" in the Index volume.

WORMSEED, the name given to various plants whose seeds are used as vermifuges. Among the best known is the Levant wormseed (Artemisza *santonica*), from whose dried Bower heads is extracted the drug santonin, very efficacious in expelling roundworms. The American wormseed (*Chenopodium ambrosioides* var. *anthelminticum*), also called Mexican tea, yields wormseed oil. an officinal vermifuge. See ARTEMISIA; CHENOPODIUM

WORMWOOD, the popular name for any aromatic herb of the genus *Artemisia,* a member of the family Compositae. The best knonn is A. *absinthium,* one of the ingredients of absinthe. It grows from one to three feet high and is silkily hairy; the leaves are small and much cut, and the flowers are small yellow hemispherical heads among the leaves at the end of the branches. It is a native of Europe, grows in waste places in the British Isles, is widely naturalized in eastern North America and is cultivated for use in domestic medicine. *A. pontica* is Roman wormwood; *A. stelleriana,* a dusty miller, is sometimes called beach wormwood, etc. *See* MUGWORT.

WORSAAE, JENS JACOB ASMUSSEN (1821–1885), Danish archaeologist who founded the science of prehistoric archaeology, mas born in Vejle, Den., on March 14, 1821. He was interested in excavation from his school days, and when very young he argued with senior researchers who went to old written sources for the explanation of archaeological finds instead of looking at the finds themselves. In 1843 the publication of his *Danmarks Oldtid,* Eng. trans., *Primaeval Antiquities of England and Denmark* (1849), aroused great interest. After several years' research abroad, Worsaae was in 1847 appointed inspector of Danish prehistoric and historic monuments and in 1855 became in addition a lecturer at the University of Copenhagen. In 1865 he succeeded C. J. Thomsen as director of the Museum of Northern Antiquities, later the National museum, in Copenhagen. Among Worsaae's greatest discoveries (1850) were Denmark's Early Stone Age kitchen middens, which consisted chiefly of accumulations of shells. In controversy with the zoologist Japetus Steenstrup he maintained that these were older 'than the large, stone Neolithic tombs. Worsaae's many publications show his broad views and deep knowledge of European archaeology. He died at Copenhagen on Aug. 15, 1885. (T. MN.)

WORSHIP (*i.e.,* "worth-ship"), honour, dignity, reverence, respect. In religion the word is used in a special sense of the service, reverence and honour paid, by means of devotional words or acts, to God, to the gods or to hallowed persons and hallowed objects. The Roman Catholic Church distinguishes three kinds of worship: (1) latria, the worship due to God alone; (2) hyperdulia, the worship or adoration due to the Virgin Mary as the Mother of God; and (3) dulia, that due to the saints.

WORSLEY, an urban district in the Farnworth parliamentary division of Lancashire, Eng., 7 mi. W. of Manchester. Area 11.3 sq.mi. Pop. (1951) 27,365. The district is divided into a residential area in the south, where there are many parks and open spaces, and an industrial area in the north. The arterial road from Manchester to Liverpool passes through Worsley and there are two main railway stations and a freight yard. Two Roman roads passed through the district which remained agricultural until the coal mines were developed in the 18th century by the 3rd duke of Bridgewater, who also built the Bridgewater canal which ran underground. Worsley has many beautiful old houses among which are Wardley hall, originally built in about 1290 but rebuilt in 1550–51, now the residence of the bishop of Salford; Worsley Old hall, an Elizabethan mansion now the regional office of the National Coal board; Kempnough hall, a half-timbered house dating from the 14th century; the originally moated Elizabethan Peel hall, now a tuberculosis sanatorium; and Kenyon Peel hall, also a fine Elizabethan house.

The district's chief industries are coal mining, cotton spinning and weaving, clothing manufacture and engineering works producing sheet metal, stainless steel, etc.

WORSTED MANUFACTURE. Straightness of fibre is the essential feature of worsted yarn (for distinctions between woolen and worsted yarns, *see* WOOLLEN MANUFACTURE). The manufacture of worsted yarn in the United States rests basically on two systems, the English and the French; the latter is more expensive and produces a softer, finer and less hairy yarn. Ordinarily the wool is first scoured, dried and prepared by dusting, shaking and teasing (*see* WOOL).

It is then ready to be carded. Exceptionally long wools such as mohair are fed into sheeter gill boxes for straightening and disentanglement — a process of five or six operations which takes the place of carding; these long wools are not generally prepared in the United States.

Carding. — Worsted carding straightens, parallelizes, cleans and blends the fibres, so as to make a sliver of uniform quality, thickness and weight. This uniformity is necessary for a yarn of strength and fineness; hence great care is exercised. Long fibres must be whole, short ones must not curl up even though they are later combed out. Extraneous substances must be removed since they interfere with the operations. Worsted carding, unlike woolen carding, is done on one long card.

Modern cards are divided into three parts, feeding, carding and delivery, and consist primarily of sets of rollers moving in different directions at varied speeds. Automatic feeders have spiked lattices that pull loose wool from hoppers at a regular pace to be beater combed and form a uniform sliver; these are adjustable to form any sliver weight. The spikes deposit the wool on an apron from which it passes onto the card covering which opens and uniformly deposits the wool on an automatically weighing feed apron and from there it moves to the card proper. The latter has feed rolls, licker-ins (breast works), main cylinders, fancies and doffers. The feed rolls, inserted with saw-toothed wire or intersecting rings and pins, control the feeding of stock. Three feed rollers and a brush or wire stripper suffice for even fine wool. The licker-ins are the chief stock-opening machinery. Cylindrical in shape, from 20 to 30 in. in diameter, they are studded with garnet wire and angular flattened saw-teeth to keep burrs, etc., on top so that bladed beaters can remove them. For the removal of burrs the United States mills use a chemical treatment or burr breast works set close to high speed revolving burr knives; in England a burr crusher is also used. When the wool is freed of burrs and opened up it passes onto cylinders and strippers for carding.

From there it passes to the fancies and doffer dickeys, which latter, facing and running against the doffer, are small cylinders covered with flexible-tooth card clothing for raising any stock missed by the beater comb. The stock is delivered from the card by any one of four types of heads depending on the type of wool used: (1) can coiling; (2) railway balling; (3) centre balling; and (4) side drawing balling. The object of all these heads is to put the sliver in a convenient form. The centre balling head is generally used in the United States.

Backwashing. — Impurities not removed by scouring and those acquired in preparing or carding (such as oil, dust or dirt) are removed from the carded (or sheeter gilled mohair) wool by backwashing, which precedes combing. Many balls or cans of card slivers are fed to the backwashing machine at once. These machines have from one to four bowls for washing and have can or hot-air dryers. Coloured slivers get no more than four bowl washings — white slivers get three or less. The bowls contain olive or olein soap full of suds; at least one bowl contains warm rinsing water to which is added, on occasion, blueing or ammonia. The slivers are squeezed and then dried; in the United States a hot-air dryer is preferred. Because backwashing and drying tend to make the fibre brittle, wool oil is added at this point.

Gilling (preparing). — After backwashing, drying and oiling, the slivers pass into a giller to be combed out by steel pins and to be straightened by other pins. The sliver is delivered from the gill boxes faster than it enters; the ratio of delivery to speed of entering is termed the draft. The sliver enters between rollers and passes over strong steel pins (fallers) which move in the same direction as the sliver but at a faster rate, giving a combing and straightening action. The wool is then passed through delivery rollers to calender rollers (to prevent any bunching) and into a can (or from the delivery rollers to an apron for coiling). There are various types of mechanical drafts in gill boxes — front, back and total. The front (delivery) rollers move faster than the fallers and the fallers move faster than the back (entering) rollers. The ratio of surface speed of the front rollers to the fallers is the front draft; the ratio of the fallers to the back rollers is the back draft; and that of the back rollers to the front rollers is the total draft. These drafts, differing with different types of wool and gilling operations, are important. There is also a material draft which is the weight per unit of the sliver entering the back rollers compared with the sliver weight leaving the front rollers. The mechanical ratio is the product of the surface speed of all the increasing rollers divided by the product of the surface speeds of all the decreasing rollers. Usually, the rollers (back and front) are fluted spirally to grip but not break the fibres and keep them straight; obviously these flutes affect the draft. In the English system a simple measuring device is used in the gill box to keep the length of the slivers uniform. Usually, particularly in the English system, two more gillings may occur; these additional gillings vary from the first gilling only in the number of teeth per faller and the speed of the rollers. They are used for thickening the sliver and making it more uniform in a-eight and stock.

Combing. — The purpose of combing is to eliminate short fibres of a given length as well as to further straighten the fibres and eliminate impurities. There are four types of combs — the Noble, Lister. Holden (square motion) and French (rectilinear). The first two are used in the English system and the latter two in the French system.

The English System. — In the United States the Noble circular comb, imported from England, is most widely used. It is most productive and has a good length of fibre range. The Lister comb, while used somewhat, requires longer fibres and gives a smoother, straighter yarn. Preparation varies — the Noble comb has a ball winder attachment which makes a tight ball out of four slivers.. The Lister comb takes the wool in long slivers much as a gill box does. The Noble comb requires a good deal of moisture in the wool; this is left in from backwashing and by having the humidity high where the work is done. Rings of pins of varied number and sizes are used in Noble combing, the size and number depending on the wool used.

The French System. — The Heilman comb is used in the French system. It is good for long and short wools (and rayon staple fibre), is nearly as productive as the Noble comb, occupies much less room, uses 20% of the power and needs only half of the supervision — it is a straight comb. It is fed by groups of slivers (8) placed side by side. The wool, drawn off in tufts, is pressed into slivers and passes through feed rolls and a feeding gill onto nipper jaws that hold the sliver while it is combed by a circular comb which has 18 pin bars with needles of varying density. As the nippers open, another comb comes over the uncombed part of the sliver, and as the drawing-off rollers remove the wool it is completely combed. A brush removes the noil from the combs as the usable wool is being delivered in overlapping tufts onto an apron and then to a can. Burrs are removed by special blades.

Recombing. — This is done on special occasions, usually where dyed slivers are used because dyeing often causes the fibres to curl. Often it is used where blending of different coloured slivers is desired although such blending is reputedly best done in the gill boxes.

Drawing. — The theory of drawing in the English and French systems is to create a fine roving that can be spun into an even yarn. Drafting is used to thin out the sliver and doubling to make it uniform; care is exercised to maintain straightness and parallelism of the fibres. All systems use drafting rollers and a winding up of the reduced sliver.

In the United States the English, French and cone systems are generally used. The English system is used on long coarse lustre and crossbred wools; the French system on unoiled tops of short fine wools, of from 1½ in. to 4 in.; and the cone system is used on oiled tops.

Spinning. — Having obtained the roving by any one of the systems described, the next step is to spin the roving into yarn. There are four methods of spinning — flyer, cap, ring and mule. The English system uses ring, cap and flyer spinning. While most U.S. mills using the English system use cap spinning there is a definite trend toward ring spinning. Flyer spinning is used on mohairs and carpet wools. About 85% of the U.S. mills operating under the French system use mule spinning although ring spinning is increasing. In all systems there are three steps to spinning: (1) final drafting; (2) twisting the roving; and (3) packaging— these are continuous operations except in worsted mule spinning.

Flyer Spinning.——Invented by Richard Arkwright in 1769 and known in England as the "throstle," the flyer spinner gives its yarns smoothness and lustre. The flyer frame is similar to the English system drawing frame with front, back and carrier rollers to thin the roving. The flyers which impart the twist are at the top of spindles, revolving at 2,500 to 3,000 r.p.m. The yarn is automatically wound onto bobbins or tubes. Production is low, but the flyer is necessary for spinning mohair and does a good job. The yarn is laid on the bobbins in horizontal layers by use of friction drag — automatic doffing is common. The amount of twist depends on the speed of the flyer.

Cap Spinning. — Invented by Charles Danforth, an American. in 1828, cap spinning is the most common spinning method used in the United States for English system worsteds. The spindles are stationary and the methods of inserting twist and the bobbin winding differ from the flyer frames. The bobbin rotates at 6,000 to 9,000 r p m. by the lifting of a tube fitted with a whorl which is placed over the spindle; a twist is imparted to the yarn as the bobbin revolves and the spindle and cap do not. Weaknesses of this system are roughness and hairiness of yarn due to the great speed. Calculating the amount of twist is complicated; the number of twists varies according to type of wool, from 3 to 20 per inch, equalling the number of revolutions of the bobbin per inch of delivery.

Ring Spinning. — The use of ring spinning, formerly used for cotton has become widespread in the worsted field. The benefits of this type of spinning are quality yarns at low cost. The most prominent feature is the large size of the bobbin which holds many times that held by the ordinary one. Very few knots are found in the yarn and it is superior to cap-spun yarn. The yarn is fed through an eye, and onto a traveler which is dragged around a ring, lubricated to reduce friction, which in turn is fastened to a stationary ring rail. The yarn goes at right angles from the traveler to the bobbin. The bobbin motion inserts the twist and the traveler runs slower than the bobbin to ensure tension. Spindle speed is variated to compensate for loss of tension due to the filling up of the bobbin, hence the smaller the bobbin load the greater the spindle speed.

Mule Spinning. — Mule spinning, which was replaced in the United States by ring spinning, produces an exceptionally fine, soft yarn with short wools. The operations are performed intermittently rather than continuously, and the process is used only in the French system. Twist is put into the flat yarn by using cylinder-driven tapered spindles on a carriage which runs about five feet. When the carriage reaches the end of its run the yarn is completed and removed from the top of the spindles; the carriage then travels back and the yarn is again wound on the bobbin.

Doubling, etc.—It is often necessary to double or further thicken the yarns; this is done on the spinning frames. Similarly, fancy twists are often desired and these are imparted by numerous attachments on ring frames. Since yarns are available in many forms, spools, bobbins, etc., the buyer has a broad choice.

Weaving, Finishing. — The principles of weaving apply generally to worsted weaving (see WEAVING) except in a fen cases. Generally, the processes used in finishing worsteds are similar to those used in woolens except that the worsted is more nearly a completed fabric when it leaves the looms; hence though similar operations are required for finishing they are more lightly applied and the change from the unfinished to the finished worsted is not so noticeable. Worsteds may be crossed with other fabrics to form hybrids. See also WOOLLEN MANUFACTURE.

WORTH, CHARLES FREDERICK (1825–1895), the famous English dressmaker, was born at Bourne, Lincolnshire, in 1825 and was sent to London as an apprentice to Swan & Edgar, drapers. In 1846, he went to Paris, without capital or friends, and after 12 years in a wholesale silk house he began business as a dressmaker in partnership with a Swede named Dobergh. Worth won the patronage of the empress Eugénie, and, through her. of fashionable Paris. After the Franco-German War, Worth continued the business with his two sons John and Gaston— both naturalized Frenchmen. For more than 30 years he set the taste and ordained the fashions of Paris.

WÖRTH, a village of Alsace region, Bas-Rhin *Département,* France, on the Sauer, 6 mi. N. of Hagenau. The village gives its name to the battle of Aug. 6. 1870, fought between the Germans under the crown prince of Prussia and the French under Marshal MacMahon. The battle is also called Reichshoffen and Fröschweiler. Pop. (1954) 1,146.

The events which led up to the engagement, and the general situation on the 6th are dealt with under FRANCO-GERMAN WAR.

WORTHING, a municipal and parliamentary borough, and seaside and residential resort in West Sussex, Eng., 11 mi. W. of Brighton by road. Pop. (1951) 69.431. Area, 12.5 sq.mi. It has a fine marine parade and a promenade pier. The mother parish of Worthing is Broadwater, the church of which, 1 mi. N. of Worthing, is a fine example of transitional Norman work. Richard Jefferies and W. H. Hudson are buried in the churchyard.

A Roman villa, evidence of a pottery works and a "mile-stone" have been discovered there. Sompting church (2 mi. N.E.) has a Saxon tower with a unique tower roof. The town was incorporated in 1890. An important industry is the raising of flowers and fruit, especially tomatoes, in greenhouses. The corporation owns about 1,000 ac. of downland.

The parishes of Durrington and Goring were added to the borough in 1929 and a portion of the parishes of Findon and Sompting in 1933.

WORTHINGTON-EVANS, SIR LAMING (1868–1931), British statesman, was born Aug. 23, 1868. In 1910 he was elected Conservative M.P. for Colchester, and in 1918 for the Colchester division of Essex, which he represented in succeeding parliaments.

In 1916 he entered the coalition government as parliamentary secretary to the ministry of munitions. He left the ministry of munitions in 1918 to become minister of blockade, and afterward filled the following offices under Lloyd George and Baldwin: minister of pensions, 1918–20; minister without portfolio, 1920–21; secretary for war, 1921–22; postmaster general, 1923–24; and again secretary for war, 1924–29. He wrote books on company law. He died Feb. 14, 1931.

WOTTON, SIR HENRY (1568–1639), English author and diplomatist, son of Thomas Wotton (1521–87) and grand-nephew of Nicholas Wotton, was born at Bocton hall in the parish of Bocton or Boughton Malherbe, Kent. He was educated at Winchester school and at New college and Queen's college, Oxford. At Oxford he was the friend of Albericus Gentilis and of John Donne. While at Queen's he wrote a play, *Tancredo,* which has not survived, but his chief interests appear to have been scientific.

About 1589 Wotton went abroad, probably in preparation for a diplomatic career, and his travels appear to have lasted for about six years. At Altdorf he met Edward, Lord Zouch, to whom he later addressed a series of letters (1590–93) which contain much political and other news. These (*Reliquiae Wottonianae,* pp. 585 *et seq.*, 1685) provide a record of the journey. He travelled by way of Vienna and Venice to Rome, and in 1593 spent some time at Geneva in the house of Isaac Casaubon. Wotton returned to England in 1594, and in 1595 was admitted to the Middle Temple. While abroad he had provided Robert Devereux, and earl of Essex, with information, and he now entered his service as one of his agents or secretaries to supply intelligence of affairs in Transylvania, Poland, Italy and Germany. Wotton was not actually involved in Essex's downfall, but he left England, and within 16 hours of his patron's apprehension he was safe in France, whence he travelled to Venice and Rome. In 1602 he was resident at Florence, and, a plot to murder James VI of Scotland having come to the ears of the grand duke of Tuscany, Wotton was entrusted with letters to warn him of the danger, and with Italian antidotes against poison. As "Ottavio Baldi" he travelled to Scotland by way of Norway. He remained three months at the Scottish court, retaining his Italian incognito. He then returned to Florence, but on receiving the news of James's accession hurried to England. James knighted him, and offered him the embassy at Madrid or Paris; but Wotton, knowing that both these offices involved ruinous expense, desired rather to represent James at Venice. He left London in 1604 accompanied by Sir Albertus Morton, his half-nephew. as secretary, and William Bedell, the author of an Irish translation of the Bible, as chaplain.

Wotton spent most of the next 20 years, with two breaks (1612–16 and 1619–21), at Venice. He helped the doge in his resistance to ecclesiastical aggression, and was associated with Paolo Sarpi, whose history of the Council of Trent was sent to King James as fast as it was written. In 1611 Caspar Schoppe, whom Wotton had offended. wrote a scurrilous book against James entitled *Ecclesiasticus,* in which he fastened on Wotton a saying which he had incautiously written in a friend's album years before. It was the famous definition of an ambassador as an "honest man sent to lie abroad for the good of his country." Wotton was at the time on leave in England, and made two formal defenses of himself, one a personal attack on his accuser addressed to Marcus Welser of Strasbourg, and the other privately to the king. He seems to have won back James's favour by obsequious support in parliament of his claim to impose arbitrary taxes on merchandise. In 1614 he was sent to The Hague and in 1616 he returned to Venice.

In 1620 he was sent on a special embassy to Ferdinand II at Vienna, to do what he could on behalf of James's daughter Elizabeth, queen of Bohemia. Wotton's devotion to this princess, expressed in his exquisite verses beginning "You meaner beauties of the night," was sincere and unchanging. At his departure the emperor presented him with a jewel of great value, which Wotton received with due respect, but before leaving the city he gave it to his hostess, because, he said, he would accept no gifts from the enemy of the Bohemian queen. After a third term of service in Venice he returned to London early in 1624 and in July he was installed as provost of Eton college. In 1627 he received a pension of £200, and in 1630 this was raised to £500 on the understanding that he should write a history of England. His most constant associates were Izaak Walton and John Hales. A bend in the Thames below the Playing fields, known as "Black Potts," was the spot where Wotton and Izaak Walton fished in company. He died at the beginning of Dec. 1639.

Of the 25 poems printed in *Reliquiae Wottonianae* 15 are Wotton's. Two obtained a place among the best-known poems in the language, the lines already mentioned "On his Mistris, the Queen of Bohemia," and "The Character of a Happy Life."

During his lifetime he published only *The Elements of Architecture* (1624), which is a paraphrase from Marcus Vitruvius Pollio, and a Latin prose address to the king on his return from Scotland (1633). In 1651 appeared the *Reliquiae Wottonzanae,* with Izaak Walton's *Life*. An admirable *Life and Letters,* representing much new material, by Logan Pearsall Smith, was published in 1907. *See* also A. W. Ward, *Sir Henry Wotton, a Biographical Sketch* (1898).

WOUND may be defined as a breach in the continuity of any body tissue. It is produced by intentional (as in surgical procedures) or accidental violence which is sufficient to overcome the tolerance of the tissue involved. This violence may be direct or indirect, and seldom is it confined to any single tissue structures. Wounds of bone such as fractures (breaks) are frequently caused by indirect violence and, unless of the most simple nature, cannot occur alone. For example, a person falling backward instinctively places his arm behind him and strikes on the palm; the hand is not injured but the force is transmitted along the bones of the forearm and the fracture occurs at the elbow. The wound is not confined to the bone, however, as the broken fragments will, by their displacement, injure muscles, blood vessels, joint capsules, ligaments and nerves. Wounds of direct violence are inflicted by knives, bullets, fire and the like. Minimal direct violence-may involve the skin alone as in a scratch (excoriation) or a friction burn (abrasion). Other forms of direct violence may wound deep structures without external evidence, as in the case of a blow with a sandbag fracturing the skull without opening the scalp; or a blow on the abdominal wall rupturing the spleen, liver, stomach or intestines, yet leaving no visible sign of its impact. These are also examples of closed wounds in which there is no open portal of entry for bacteria which commonly cause local (abscess) or general infection (blood poisoning). A bruise (contusion of the skin) is another wound of the same type; the blow does not open the skin covering proper, but ruptures the blood vessels in the deeper layers of the subcutaneous tissues. The typical black and blue appearance followed by fading green and yellow is due to the disintegration and gradual absorption of blood pigment thus freed.

Open wounds fall into many categories and their classification may be based on: (1) their appearance (incised, lacerated. punctured, avulsed, burned); (2) their depth and the related possibilities of involvement to important deeper structures (compound fractures, perforation of heart, lung, bladder, liver, bowel, brain, spinal cord) and (3) their potentialities as a future focus of infection or poisoning (barnyard dirt, snake bite, rabid-dog bite, retention of foreign material). Whatever the appearance of the wound, it can be of a minor or a deadly serious nature.

In the management of any open wound its possibilities must first be appreciated. Since such wounds are able to bleed, and since bleeding is frightening to most laymen, a doctor usually has the opportunity to evaluate it. Gradually, after about 1919, the strong so-called antiseptics were reluctantly excluded from wound treatment. Nature must, after all, heal the wound; treatment should be concerned only with restoration of the involved tissues and should preclude any interference with the natural' healing process. If any medication strong enough to kill bacteria is put into a wound, that substance is bound to also kill the delicate tissue cells that, from the moment of injury, are initiating the reparative process. Such treatment has been established to be a deterrent and not a stimulant to wound healing.

The open surface should be covered with sterile gauze or cotton and the surrounding skin shaved and washed with sterile water and plain white soap for a minimum period of ten minutes. Following this the wound should be similarly treated and all particles of foreign material scrubbed, picked or flushed from the surfaces and depths. It is then ready for closure. This procedure converts a contaminated open wound into a clean closed one, thus fulfilling the ideal of all wound treatment. The stage is then set for healing by so-called primary intention. Such favourable healing is further helped by application of a pressure dressing which, while not constricting, keeps the wound cavity collapsed and prevents accumulation of pockets of blood or serum which, by tension, could interfere with coaptation and repair. If nature's defenses cannot overcome the bacterial elements present in all wounds, infection will follow. If the infection remains local and an abscess forms, the wound will have to be opened for evacuation of pus, and then healing from the "bottom" (secondary intention) will follow. This is a slower and less satisfactory method, with defects and visible scars a likely result.

In the avulsed type of wound there is an avulsion or tearing away, with actual loss of substance. If circumstances permit, this loss may be replaced by a suitable skin graft as part of the initial treatment. Otherwise, transference of new skin is made after a suitable base of granulation tissue has developed in the defect. Similarly, wounds caused by thermal burns are closed by skin taken from uninvolved areas of the body.

The systemic effect of wounds should not be overlooked. Serious haemorrhage (*q.v.*) may be immediate or delayed. Shock may be primary or secondary. Infection may occur early if extremely virulent, or late by the classic signs of fever, malaise, rapid pulse and an increase in the white cells of the circulating blood. Penicillin, streptomycin or other appropriate antibiotics and the sulfa drugs have been of great value in lowering the incidence of wound infection. However, these agents are to be considered a supplement and not a substitute for competent surgical treatment. The antitoxins and specific sera are used as an adjunct to local care, to protect the patient from the general effects of the substances entering wounds, mentioned in category (3) above. (*See* INFLAMMATION.) (J. K. SK.)

WOUWERMAN, PHILIPS (1619–1668), Dutch painter of battle and hunting scenes, was born at Haarlem. where he was baptized on May 24. 1619. He learned the elements of his art from his father, Paul Joosten Wouwerman, a painter from Alkmaar. He then became a pupil of Frans Hals and probably of J. Wynants and of Pieter Verbeek. a painter of horses. He became a member of the guild of painters at Haarlem in 1642. and he died there on May 19, 1668.

Wouwerman is credited with more than 1.000 pictures, but probably many of these are the productions of his brothers Pieter (1623–82) and Jan (1629–66) and of his many other imitators His authentic works are distinguished by great spirit and are infinitely varied, though dealing recurrently with cavalry battle pieces, military encampments, cavalcades and hunting or hawking parties. He is equally excellent in his vivacious treatment of figures, in his skillful animal painting and in his admirable and appropriate landscape backgrounds. Horses were his favourite study, and a white horse is generally introduced. Three different styles have been observed as characteristic of the various periods of his art His earlier works are marked by the prevalence of a foxy-brown colouring and by a tendency to angularity in draftsmanship; the productions of his middle period have greater purity and brilliancy; and his last and greatest pictures possess more of force and breadth, and are full of a delicate silvery-gray tone. Pictures by Wouwerman may be seen in a number of public collections, including the Frick collection, New York city ("Cavalry Camp"), and the National gallery, London ("Interior of a Stable" and "On the Seashore").

WRAITH, a general term in popular parlance for the appearance of the spirit of a living person. (*See* PSYCHICAL RESEARCH.)

WRANGEL, FRIEDRICH HEINRICH ERNST, COUNT VON (1784–1877), Prussian general field marshal, was born at Stettin, on April 13, 1784. He entered the Prussian army in 1796 and distinguished himself in the campaigns against Napoleon. He was in command of the 13th division, with headquarters at Munster, in Westphalia, in 1834, when riots resulting from differences between the archbishop of Cologne and the crown occurred, and the determination and resolution with which he treated the clerical party prevented serious trouble. He was promoted lieutenant general, received many honours from the court, enjoyed the confidence of the Junker party, and commanded successively at Konigsberg and Stettin. In 1848 he commanded the 2nd corps of the German federal army in the Schleswig-Holstein campaign, was promoted general of cavalry and won several actions.

In the autumn he was summoned to Berlin to suppress the riots there. As governor of Berlin and commander in chief of the mark of Brandenburg (appointments which he held till his death) he proclaimed a state of siege, and ejected the Liberal president and members of the chamber. Thus on two occasions in the troubled history of Prussian revival Wrangel's uncompromising sternness achieved its object without bloodshed. In 1856 he was made a field marshal. At the age of 80 he commanded the Austro-Prussian army in the war with Denmark in 1864. The prestige of his name, and the good work of his subordinates, made the campaign a brilliant success. After the capture of Diippel he resigned the command, was created a count and received other honours. In 1866 "Papa" Wrangel assisted in the Bohemian campaign, but without a command because of his great age. He took a keen interest in the second reorganization of the cavalry arm, 1866–70, and in the war with France in 1870–71., He died at Berlin on Nov. 2, 1877.

See supplement to *Militar. Wochenblatt* (1877), and lives by Koppen and Maltitz (Berlin, 1884).

WRANGEL, KARL GUSTAV VON (1613–1676), Swedish soldier, was descended from a family of Estonian origin, branches of which settled in Sweden, Russia and Germany: His father, Hermann von Wrangel (1587–1643), was a Swedish field marshal in Gustavus Adolphus' wars. Karl Gustav was born near Uppsala on Dec. 23, 1613, and at the age of 20 distinguished himself as a cavalry captain in the war against the army of the league. Three years later he was colonel, and in 1638 major general, still serving in Germany. In 1644 he commanded a fleet at sea, which defeated the Danes at Fehmarn on Oct. 23. In 1646 he returned to Germany as a field marshal and succeeded Count Lennart Torstensson as commander in chief of the Swedish army in Germany, which post he held during the last three campaigns of the Thirty Years' War. Under Wrangel and Turenne the allied Swedish and French armies marched and fought in Bavaria and Wurttemberg. At the outbreak of a fresh Polish war in *1655* Wrangel commanded a fleet, but in *1656* he was serving on land again and commanding, along with the Great Elector of Brandenburg, in the three days' battle of Warsaw. In 1657 he invaded Jutland and in 1658 passed over the ice into the islands and took Kronborg. In 1657 he was appointed admiral and in *1664* general of the realm, and as such he was a member of the regency during the minority of Charles XI. But his last campaign was unfortunate. Commanding, ineffectively owing to his broken health, in the war against Brandenburg, he was recalled after his stepbrother Waldemar, Freiherr von Wrangel (1647–1676), had been defeated at Fehrbellin. He died at Riigen on July 5, *1676*.

WRANGEL, PETER NICHOLAIEVICH, BARON (1878–1928), Russian general, was born at St. Petersburg (Leningrad) on Aug. 15, 1878, of a noble family of Swedish descent. After experience in the ranks of the horse guards and as a mining engineer in Siberia, he served as an officer in a Cossack regiment, transferring after the Russo-Japanese War to the horse guards as a captain. During the World War he commanded successively a squadron, a regiment and a division of Cossacks. He was one of the first officers to join Kaledin against the Bolsheviks. After Kaledin's suicide Wrangel allied himself to Alexeyev and Denikin, distinguishing himself particularly by his defence of Tsaricsyn in the summer of 1919. On April *4*, *1920*, after Denikin's retreat, Wrangel was appointed commander-in-chief of the volunteer army. He was in Constantinople when the summons came. He arrived in the Crimea to find a force completely disorganized. In a very short space of time he had turned it into an effective force with which he held the Bolsheviks in check, and indeed made some advance. But after the signing of a peace treaty between Poland and the Bolsheviks the tide turned. On Nov. *1 j* Sebastopol was lost and the evacuation of the army carried out. Wrangel embarked with about 130,000 refugees, who were dispersed in the Balkans and other parts of Europe. He kept a staff for some time in Belgrade, from which centre he tried to organize the settlement of his soldiers. After a time he took a post as mining engineer in Brussels, where he died on April 25, *1928*.

WRANGEL ISLAND, in the Arctic sea, *85* m. N.E. of Cape Billings, eastern Siberia, extends between 176° W. and 179° E. in about 71° N. It is *80* m. long and *18–30* m. wide and has an area of about 2,000 sq.miles. The mountainous interior rises to *2,500* ft. in Berry Peak, but there is much low land on the south and north. Shoals and sandspits project to sea on the north and south-west. The west and east coasts are steep and lofty. The small Rodgers harbour is on the south-east. There are no true glaciers. Tundra covers many parts. Polar bears and foxes are numerous. Walrus and seals frequent the shores. In summer there are duck, geese, gulls and other birds. Driftwood is abundant. Mammoth tusks have been found. No minerals of value occur. Herald island lies *40* m. E. of Wrangel island. It is 5 m. long and 900 ft. high. The shores are mostly steep. There are no resources. Both islands are generally surrounded by pack-ice. Hunters do not visit them and there has never been a native population. Reports of land seen to the north by natives of eastern Siberia were investigated by F. von Wrangel in 1824, but he failed to reach the island. In *1849* Captain H. Kellett, R.N., discovered and landed on Herald island, from which he reported lands to the west, Plover and Kellett's Lands, thought to be parts of an Arctic continent. Commander J. Rodgers, U.S.N., landed on Herald island in 1855, and the American whaler T. Long sailed along the south of Wrangel island and gave it its name in *1867*. The first certain record of landing is by Capt. C. L. Hooper, U.S.N., in *1881*. The same year Captain R. M. Berry, U.S.N., explored the island and dispelled the idea of extensive land in that region. Russians first landed in 1911 when the "Taimir" and "Vaigach" erected a beacon. The survivors of V. Stefansson's "Karluk" lived on the island from March to Sept. 1914 (*see* ARCTIC REGIONS); in *1921* Stefansson sent another party of five under A. Crawford to establish a Canadian claim by occupation in view of the use of the island as a base in transpolar aerial trade routes. The party perished through accident with the exception of the Eskimo seamstress. In 1923 a party of Eskimos under an Alaskan trapper was established with the same end in view, but Russia, laying stress on a claim made in *1916*, removed the colony in Aug. 1924 and shortly afterwards brought 50 Chuckhee to form a settlement under Soviet officials. The Soviet flag was also hoisted on Herald island in 1926. The colony was visited by Russian aeroplanes in 1927. These claims were not officially disputed by Britain, Canada or the United States.

(R. *N*. *R*. B.)

WRASSE, a name given to the fishes of the family Labridae. They are abundant in the tropical zone, less so in the temperate, and disappear altogether in the Arctic and Antarctic. Their body is compressed, like that of a carp, and covered with smooth scales; they possess one dorsal fin only, the anterior portion of which consists of numerous spines. Many wrasses are recognized by their thick lips, the inside of which is sometimes curiously folded. The dentition consists of strong conical teeth, of which some are larger than others. But the principal organs with which they crush shell-fish, and other hard substances are the solid and strongly-toothed pharyngeal bones, of which the lower are coalesced into a single flat triangular plate. All wrasses are surface fishes. Rocky parts of the coast overgrown with seaweed are their favourite haunts in the temperate, and coral-reefs in the tropical seas. Some 450 species of wrasses (including parrot-fish, *q.v.*) are known, chiefly from the tropics.

Of the British wrasses the ballan wrasse *(Labrus maculatus)* and the striped or red or cook wrasse (L. *mixtus)* are the most common. The goldsinny or corkwing *(Crenilabrus melops)* is much more frequent on the southern coasts of England and Ireland than farther north. It rarely exceeds 10 in. in length. The commonest temperate American species is the tautog.

WRECK, a term which in its widest sense means anything without an apparent owner that is afloat upon, sunk in, or cast ashore by the sea; in legal phraseology, it has a narrower meaning. Formerly an appreciable source of revenue to the Crown, afterwards a valuable addition to the income of a landowner on the sea-coast, wreck has almost within modern times ceased to be a perquisite of either, or to enrich the casual finder at the expense of its rightful owner.

History. — The general rule in the civilized maritime countries of Europe was that the right to wreck belonged to the sovereign, and formed part of the royal revenue. This was so under the Roman, French and feudal law; and in England the common law set out in the statute *De praerogativa regis (17* Edw. II., 1324) provided that the king has wreck of the sea, whales and sturgeons taken in the sea and elsewhere within the kingdom, except in certain places privileged by the king. This right, which it is said had for its object the prevention of the practice of destroying the property of the shipwrecked, was, however, gradually relaxed; and the owner of wreck was allowed to recover it if he made claim to it, and gave proof of his ownership within a certain time —fixed at a year or a year and a day alike by a decree of Antonine the Great, the feudal law, the general maritime law, the law of France and English law. Early in the 15th or at the close of the 14th century, it became usual for the Crown to grant to the lord-admiral by his patent of appointment, amongst other *proficua et commoditates* appertaining to his office, wreck of the sea; and when, early in the reign of Henry VIII., vice-admirals of the coast were created, the lord-admiral by patent under his own hand delegated to them his rights and duties in the several counties, including those in connection with wreck. He did not, however, part with the whole of his emoluments; his vice-admirals were required to render an account of the proceeds of wreck, and to hand over to him a part, usually one-half, of their gains. This system lasted until *1846* when an act (9 & 10 Vict. c. *99)* was passed forbidding the vice-admirals to intermeddle with wreck, and it required the receivers of droits of admiralty to receive all wreck from the finders and to detain it for 12 calendar months; at the end of that period it was to be sold and the proceeds carried to the credit of the consolidated fund. The ancient law by which the unfortunate owner was deprived of his property, if no living thing escaped from the wreck, had during the 16th and 17th centuries been gradually but tacitly relaxed; it required, however, a decision of Lord Mansfield and the king's bench in 1771 to settle the law definitely that, whether or no any living creature escaped, the property in a wreck remains in the owner. In Scotland it seems that the same law had been laid down in 172j, and there are indications that upon the continent of Europe there had before this date been a relaxation of the old law in the same direction. In the 17th century working salvors established the right to a lien upon property saved as a security for adequate remuneration of their exertions in saving it; and if the vice-admirals restored to its owners wreck that had come to their hands, they did so only upon payment of extravagant demands for salvage, storage, and often legal expenses. Stories of wilful wrecking of ships and of even more evil deeds are probably exaggerations, but modern research has authenticated sufficient abuses to show that further legislation was necessary to regulate the taking possession of wreck and ships in distress by "sea-coasters." Previously to the passing of the Act of 1846 the only substantial protection against plunder which owners of a wrecked ship could get was to apply to the admiralty judge for a commission enabling them or their agents to take possession of what came ashore, but to obtain such a commission took time and cost money, and before the commissioners arrived at the scene of the wreck a valuable cargo would have disappeared and been dispersed through the country. Plunder of wrecks was common, and the crowds that collected for the purpose set law at defiance. The vice-admirals, even if they had been able, did little to protect the ship wrecked. Many of the vice-admirals' accounts of the 17th and following centuries are extant. Most of them are for trifling sums, but occasionally the amounts are considerable. At the close of the 17th century the vice-admirals were required to make affidavits as to the amount of their gains; in 1709 20 of them swore that their office was worth less than £50 in the year.

The right of the warden of the Cinque Ports to wreck was derived from charters granted to the ports by Edward I. and his successors; many other seaports enjoyed a similar right under early charters. It would seem that these rights were of some value, for in 1829 the little towns of Dunwich and Southwold litigated at a cost of £1,000 the question whether a tub of whisky picked up at sea belonged to the admiralty jurisdiction of the one town or the other; and the town of Yarmouth is said to have spent no less than £7,000 upon a similar question. The Municipal Corporations Act of 1835 put an end to all dealings with wreck by local admiralty courts, except those of the Cinque Ports.

Grants of wreck to individuals are earlier than those to towns. Even before the Conquest it seems to have been not unusual for grantees from the Crown of lands adjoining the sea to get the franchise of wreck included in their grants. The lords of counties palatine had *wreccum maris* within their areas as part of their jura regalia, but yet inferior lords might prescribe for wreck belonging to their several manors within a county palatine.

From early times a distinction was made in English law between wreck cast ashore and wreck that is floating or sunken below low-water mark. Wreck proper, or common law wreck, *ejectum maris,* is what is cast by the sea upon the shore; for "nothing shall be said to be *wreccum maris,* but such goods as are cast or left upon the land" (Sir H. Constable's Case, 1599, 5 Rep. 106), and this belonged to the king jure coronae, and was dealt with by the common law. Floating and sunken wreck belonged to the Crown as *inter* regalia, but was granted to the lord-admiral *jure regis.* Even when the office of lord high admiral is in abeyance, and the duties are performed by commissioners, as now, these rights are distinguished from the other royal revenues as belonging to the Crown in its office of admiralty, or, as they are commonly known, droits (*q.v.*) of the Admiralty. From early times the lord-admiral tried to usurp, and there are several instances of his actually usurping jurisdiction over wreck proper; and in the reign of Richard II. special statutes (which were only declaratory of the common law) were passed for the purpose of confining his jurisdiction to its proper limits. Droits are flotsam, jetsam, lagan, derelict. In Lord Coke's words, flotsam is "when a ship sinks or otherwise perishes, and the goods float on the sea"; jetsam is "when goods are cast out of a ship to lighten her when in danger of sinking, and afterwards the ship perishes"; and ligan, or lagan, is "when heavy goods are, to lighten the ship, cast out and sunk in the sea tied to a buoy or cork, or something that will not sink, in order that they may be found again and recovered." Derelict is a ship or cargo, or part of it, abandoned by its master and crew sine *spe recuperandi* et sine animo *revertendi.* "None of these goods," adds Coke, "which are so called, are called wreck so long as they remain in or upon the sea; but if any of them by the sea be put upon the land then they shall be said to be wreck" (Sir H. *Constable's* Case, 1599, 5 Rep. 106; and 2 Inst. 167). Contrary to the opinion of Hale, Lord Stowell held that what is found anywhere derelict on the seas is acquired beneficially for the sovereign, if no owner shall appear. It seems that this was also Coke's view (2 Inst. 168).

The provisions of the Merchant Shipping Act, 1894, mentioned below, upon the subject of droits of admiralty are not clear. In practice the only droits of the admiralty that are commonly dealt with are anchors that have been slipped or parted from in heavy weather. In the Downs and other roadsteads these are "swept" for by creepers towed over the sea bottom, and in former days sweeping for anchors was a common industry. In the Downs large sums have been made after gales in this way. In the 17th century it became customary to obtain from the Crown grants of the right to fish for sunken wreck and treasure not only upon English coasts but all over the world.

The method of dealing with wreck outside territorial waters (which does not come within the scope of the act) is governed by the previous general law relating to droits of admiralty. The Board of Trade, and receiver-general, in its instructions to receivers, directs that wreck picked up at sea out of the limits of Great Britain, or brought to it by British ships, is to be taken possession of by the receiver and held by him on behalf of the owners, or, if the owners do not claim it, on behalf of the Crown. Derelict ships picked up at sea outside territorial limits and brought into British ports must be delivered to the receiver and kept by him until the owner can be found (but not longer than a year and a day). Wreck picked up out of territorial limits by a foreign ship need not be interfered with by the receiver, unless upon application by a party interested.

Although a ship on board which, or by means of which a man was killed, might be a deodand (*q.v.*), yet qua wreck she was not subject to forefeiture as deodand

Present British Law.—The Merchant Shipping Act, 1894, contains the whole of the existing statute law upon the subject of wreck within the territorial waters of Great Britain, and under the Sea Fisheries Act, 1883, it applies to fishing boats. For its purposes wreck includes jetsam, flotsam, lagan and derelict, found in or on the shores of the sea or any tidal water. The term does not extend to a barge adrift in the Thames, nor a raft of timber adrift; it must be the hull, cargo or appurtenances of a vessel.

The provisions of the Merchant Shipping Act dealing with wreck are of a detailed and administrative character and are concerned with the duties of the Board of Trade, receivers of wreck, finders of wreck and other matters. They will be found in part IX. of the act and are included in ss. 510–537.

The owner of a wrecked ship, sunk by his negligence in a navigable highway, so as to be an obstruction to navigation, if he retains the ownership of her, is liable in damages to the owner of any other ship which without negligence runs into her, unless he has taken steps to indicate her position, or the harbour authority at his request has undertaken to do so. He may, however (whether the sinking was due to his negligence or not), abandon the ship, and can thus free himself from any further liability in respect of her. If he abandons her to any other person—*e.g.*, an underwriter—who pays for her as for a total loss, that person does not become liable for her unless he takes possession or control in any way. Harbour authorities generally have under the Merchant Shipping Act, 1894, or by local statute, as they have by the general Harbours, Docks and Piers Clauses Act, 1847 (if incorporated in their own act), the power of removing the wreck in such a case, and recouping themselves for their expenses from its proceeds. The general act also gives a personal right of action against the owner for any balance of expense over the value of the wreck; but if the owner has abandoned it, and no one else has taken it, neither he nor anyone else is liable. A particular or local act (as *e.g.*, one of the State of Victoria) may, however, fasten this liability on the person who is owner at the time when the ship is wrecked, and then he cannot free himself of it. A harbour authority is not obliged to remove a wreck because it has power to do so, unless it takes dues from vessels using the harbour where the wreck lies, or in some way warrants that the harbour is safe for navigation, in which case it is under an obligation to do so. Further statutory provision is now made in this respect by the Merchant Shipping Act, which empowers harbour authorities to raise, remove or destroy (and meantime buoy or light), or to sell and reimburse themselves out of the proceeds of any vessel or part of a vessel, her tackle, cargo, equipment and stores, sunk, stranded or abandoned in any water under their control, or any approach thereto, which is an obstruction or danger to navigation or lifeboat service. They must first give due notice of such intention, and must allow the owner to have the wreck on his paying the fair market value. The act gives similar powers to lighthouse authorities, with a provision that any dispute between a harbour and lighthouse authority in this respect is to be determined finally by the Board of Trade.

By an Act of 1896 it is now the duty of the master of a British ship to report to Lloyd's agent, or to the secretary of Lloyd's, any floating derelict ship which he may fall in with at sea. By the Merchant Shipping Convention Act, 1914, a master must on finding a wreck communicate with the shore. But the operation of the act was suspended by order in council till Jan. 1, 1929. It will supersede previous acts when it comes into force. Under the Merchant Shipping Act it is a felony to take wreck found in territorial limits to a foreign port, and it is punishable by fine to interfere with a wreck. The receiver has power, by means of a search warrant from a justice, to search for wreck which he has reason to believe is concealed. By the law of Scotland plundering wreck is punishable at common law; and in England and Ireland it is a felony to plunder or steal any wreck or part thereof, to destroy any wreck or part thereof, to prevent or impede any person on board a wreck from saving himself, and to exhibit any false signal with the intent of endangering any ship, or to do anything tending to the immediate loss or destruction of a ship for which no other punishment is provided.

WREN, SIR CHRISTOPHER (1632–1723), English architect and scientist. designer of St. Paul's cathedral and many other notable buildings of London, was born at East Knoyle, Wiltshire, on Oct. 20, 1632, the son of a clergyman. He attended Westminster school, London, until 1646. He showed an early interest in the sciences and continued his studies in this direction at Oxford where he took his M.A. degree in 1653, and in the same year was elected. a fellow of All Souls college. Four years later he was appointed professor of astronomy at Gresham college, London, a position that he exchanged in 1661 for the Savilian professorship of astronomy at Oxford. Among other scientific achievements Wren evolved a hypothesis concerning comets, studied Saturn and its rings, made a model of the moon and discovered a graphic method of computing eclipses. His interest in astronomy and the sciences never ceased, although architecture eventually became his main pursuit; Newton and Pascal thought highly of him and he was one of the founders of the Royal society, becoming its president, 1681–83. Wren was also a member of the Council of the Hudson's Bay company. and twice a member of parliament. He is said to have been a Freemason.

Wren's architectural career began with two commissions that came to him through his family connections and academic position: at Cambridge he designed the chapel of Pembroke college, 1663–65, for his uncle, Bishop Matthew Wren, and at Oxford he built the new "theatre," 1664–69, to serve for academic ceremonies, for Archbishop Sheldon. Both buildings are derived from Roman models.

When Wren undertook a journey to France in 1665—the year of the Great Plague in London—this, his only trip abroad. was made in pursuit of scientific interests and for architectural studies. Wren met Bernini in Paris. He observed the great building works of Louis XIV and his court in and around the capital and these impressions remained momentous for the rest of his career.

After his return to England, Wren prepared a scheme to remodel St. Paul's cathedral but soon afterward the Great Fire of London, 1666, made it necessary to consider an entirely new building, in addition to replanning the City and most of its parish churches. Wren presented a plan for the rebuilding of London a few days after the fire had been extinguished and although it was not implemented, he was made one of the six members of the commission for rebuilding. In his capacity as surveyor general, from 1669, he also dealt with matters of town planning and designed a unified monumental piazza around St. Paul's which again was never executed.

In 1670 work was begun on more than 50 City churches which had to be rebuilt after the fire. In their design, English traditions of church building and the demands of Anglican liturgy were of prime importance but Wren also tried to link up with the work of his great predecessor, Inigo Jones (*q.v*), and there are similarities with some churches in Calvinist Holland. Wren created a great variety of types, from buildings with a single nave to three-aisled and centrally planned structures. Among them St. Stephen (Walbrook) is the most successful solution: it integrates a dome and a longitudinal nave convincingly into a completely new and yet coherent design. Other City churches worth special mention are: St. Benet (Thames street), St. Lawrence (Jewry). St. Bride's (Fleet street), St. Magnus (London bridge), Christ Church (Newgate street) and St. Martin (Ludgate). Unfortunately the City churches suffered heavy damage during World War II. The church exteriors show a typically English predilection for simple cubic shapes combined with a delight in elaborate spires which are extremely varied in treatment. Compositions such as at St. Mary-le-Bow (Cheapside), St. James Garlickhithe (Garlick hill) and St. Vedast (Foster lane) represent a level of achievement in design that is equal to the best solutions of similar problems in continental Europe at that period.

The long and involved story of Wren's successive designs for St. Paul's cathedral can best be summed up in terms of continuous attempts on the part of the architect to reconcile medieval precedent, preferred by the clergy, with his own ideals that had been evolved in emulation of the great domed churches he had seen in Paris and their Italian prototypes. Several models illustrated different stages in this process; one of them is still preserved intact and represents the architect's favourite design. It is the Great Model which dates from 1673, the year Wren was knighted. Here a large domed space over a Greek cross plan with curves in the re-entrant angles is connected to a smaller vestibule, equally crowned by a cupola, at its west end. From this splendid combination of centralized and directional space a volumetric treatment ensues which is unusually rich in its modeled effects. The Great Model design was, however, rejected by the authorities and Wren had to work out another solution adhering more closely to the prototype of an English medieval cathedral and the formal vocabulary of Inigo Jones. This design was approved in 1675, but it was modified so substantially during the long years of construction that it changed practically beyond recognition. The choir of the new cathedral was consecrated in 1697 but the final shapes of the dome, lantern and western towers were not settled until a decade later and the work was not officially declared completed t i 1711. St. Paul's was the last great cathedral to be built in Europe before the era of 19th-century eclecticism; structurally and aesthetically its triple dome represents a remarkable achievement.

Wren's secular architecture can be roughly divided into buildings for academic purposes, buildings for the crown and domestic work. In a selection from his many executed buildings and designs the first group might be represented best by Trinity college library, Cambridge. 1676–84. Its reading room is one of the architect's finest interiors and the whole building has a quiet dignity that is typical of many Wren buildings and well exemplified in another instance at Chelsea hospital. 1682–91. At Hampton court. 1689–94, and Kensington palace, 1689–1702, Wren was able to realize large scale complexes, including splendid gardens and exquisite interior decoration. In these and in his last great secular work, Greenwich hospital (begun 1696, finished after his death), Wren as surveyor general was aided by the other officers of the office of works and during the later years of his activity their influence sometimes may be traced clearly. This may account for apparent discrepancies in his last style, such as the contrast between the truly baroque exuberance in some steeples and the severe classicism of Marlborough house, 1709–11.

Wren nominally retained his surveyorship until April 26. 1718, when he mas dismissed through court intrigues after having served for half a century under five sovereigns. He died on Feb. 25, 1723, and was buried in St Paul's where his well-known epitaph reads. *Si monumentum requiris, circumspice* ("If you seek a monument, look about you").

Wren's architecture never conceals the predominantly intellectual synthetic character of its process of origin: order and clarity result but also a certain monotony. Interiors are generally regular and simple to grasp. Plastic effects through modeling are rarely sought. Because of all this and because he favoured composition by addition rather than by subdivision, it is not always easy to recognize the baroque criteria in Wren's work. It is in his dome of St Paul's and the steeples of his City churches that Wren made a contribution of more than national importance and achieved European stature.

BIBLIOGRAPHY.—S. Wren, *Parentalia* (1750); *Wren Society* (1924–43); J. Summerson, *Architecture in Britain 1530–1830* (1953); E. F. Sekler, *Wren and His Place in European Architecture* (1956) has a bibliography which surveys the extensive literature on Wren. (E. F. SR.)

WREN, the popular name for birds of the Passerine family Troglodytidae, of which the best known is *Troglodytes troglodytes,* the little brown bird with its vigorous song and its short tail cocked on high that braves the winter of the British Isles and even of the European continent. and figures largely in folklore. In St. Kilda isolation has brought about the evolution of a distinct subspecies. The better known forms in the Cnited States are the house wren. common in the eastern states but in bad odor for its egg-eating proclivities; the winter wren. remarkable for its resonant and brilliant song: the Carolina wren, also a fine singer; and the marsh wren, besides the cactus wrens and the cañon wrens of the western states.

Wrens have the bill slender and arched: their food consists of insects, larvae and spiders, but they will also take any small creatures. such as worms and snails, and occasionally eat seeds. The note is shrill. The nest is usually a domed structure of ferns, grass, moss and leaves, lined with hair or feathers, and from three to nine eggs are produced, in most of the species white. The headquarters of the wrens are in tropical America. but they reach Greenland in the north and the Falkland Islands in the south.

Some genera are confined to the hills of tropical Asia, but *Tuoglodytes,* the best known, ranges over North and South Xmerica, Asia and Europe.

The Troglodytidae by no means contain all the birds to which the name wren is applied. Several of the Sylviidae bear it, especially the little golden-crested wren (*see* GOLDCREST) and the group forming the genus *Phylloscopus* (*see* WARBLER), habitual summer visitants. The largest. P. *sibilatrix,* is called the wood wren. The willow wren, P. *trochilus,* is in many parts of Great Britain the commonest summer bird. and is the most generally dispersed. The third species, P. *collybita,* is the chiffchaff.

WRESTLING is one of the most primitive and universal of sports. It is a contest in which two persons strive to throw each other to the ground. Upon tbe walls of the temple-tombs of Beni Hasan, near the Nile, are sculptured many hundreds of scenes from wrestling matches, depicting practically all the holds and falls known at the present day, thus proving that wrestling was a highly developed sport at least 3,000 years before the Christian era. The description of the bout between Odysseus and Ajax in the 23rd book of the *Iliad,* and the evolutions of the classic Greek wrestlers, tally with the sculptures of Beni Hasan and Nineveh. The sport. in an organized and scientific form, may have been introduced into Greece from Egypt or Asia, though Greek tradition .ascribed its invention and original rules to the legendary hero Theseus. In Homer's celebrated description of the match between Ajax and Odysseus the two champions wore only a girdle, which was. however, not used in the classic Greek games. Neither Homer nor Eustathius, who also minutely depicted the battle between Ajax and Odysseus, mentions the use of oil, which, however, was invariably used at the Olympic games, where wrestling was introduced during the 18th Olympiad (about 704 B.C.). Wrestling contests for boys were added later. The Greek wrestlers, after the application of the oil! were rubbed with fine sand, to afford a better hold.

Wrestling was an important branch of athletics in ancient Greece. There were two principal varieties: upright wrestling and the pancratium (*pankration,* literally "all-strength"; cf. modern "all-in"). Upright wrestling was one of the five events of the pentathlon in the games at Olympia (*see* GAMES, CLASSICAL). The winner was the first to throw his opponent to the ground three times. the holds allowed being similar to those of the modern catch-as-catch-can style; tripping was allowed. but it is uncertain whether leg holds were forbidden or merely infrequently used. The pancratium was a much more savage type of wrestling, in which hitting, kicking, twisting of the limbs, strangling and struggling on the ground were all allowed, the only recognized fouls being biting and gouging; the contest lasted until one of the wrestlers acknowledged defeat. The pancratium was a feature of the Olympic meetings. but was not the style of wrestling admitted in the pentathlon. (For a full account, with illustrations. *see* E. N. Gardiner, *Athletics in the Ancient World* [Oxford, 1930].)

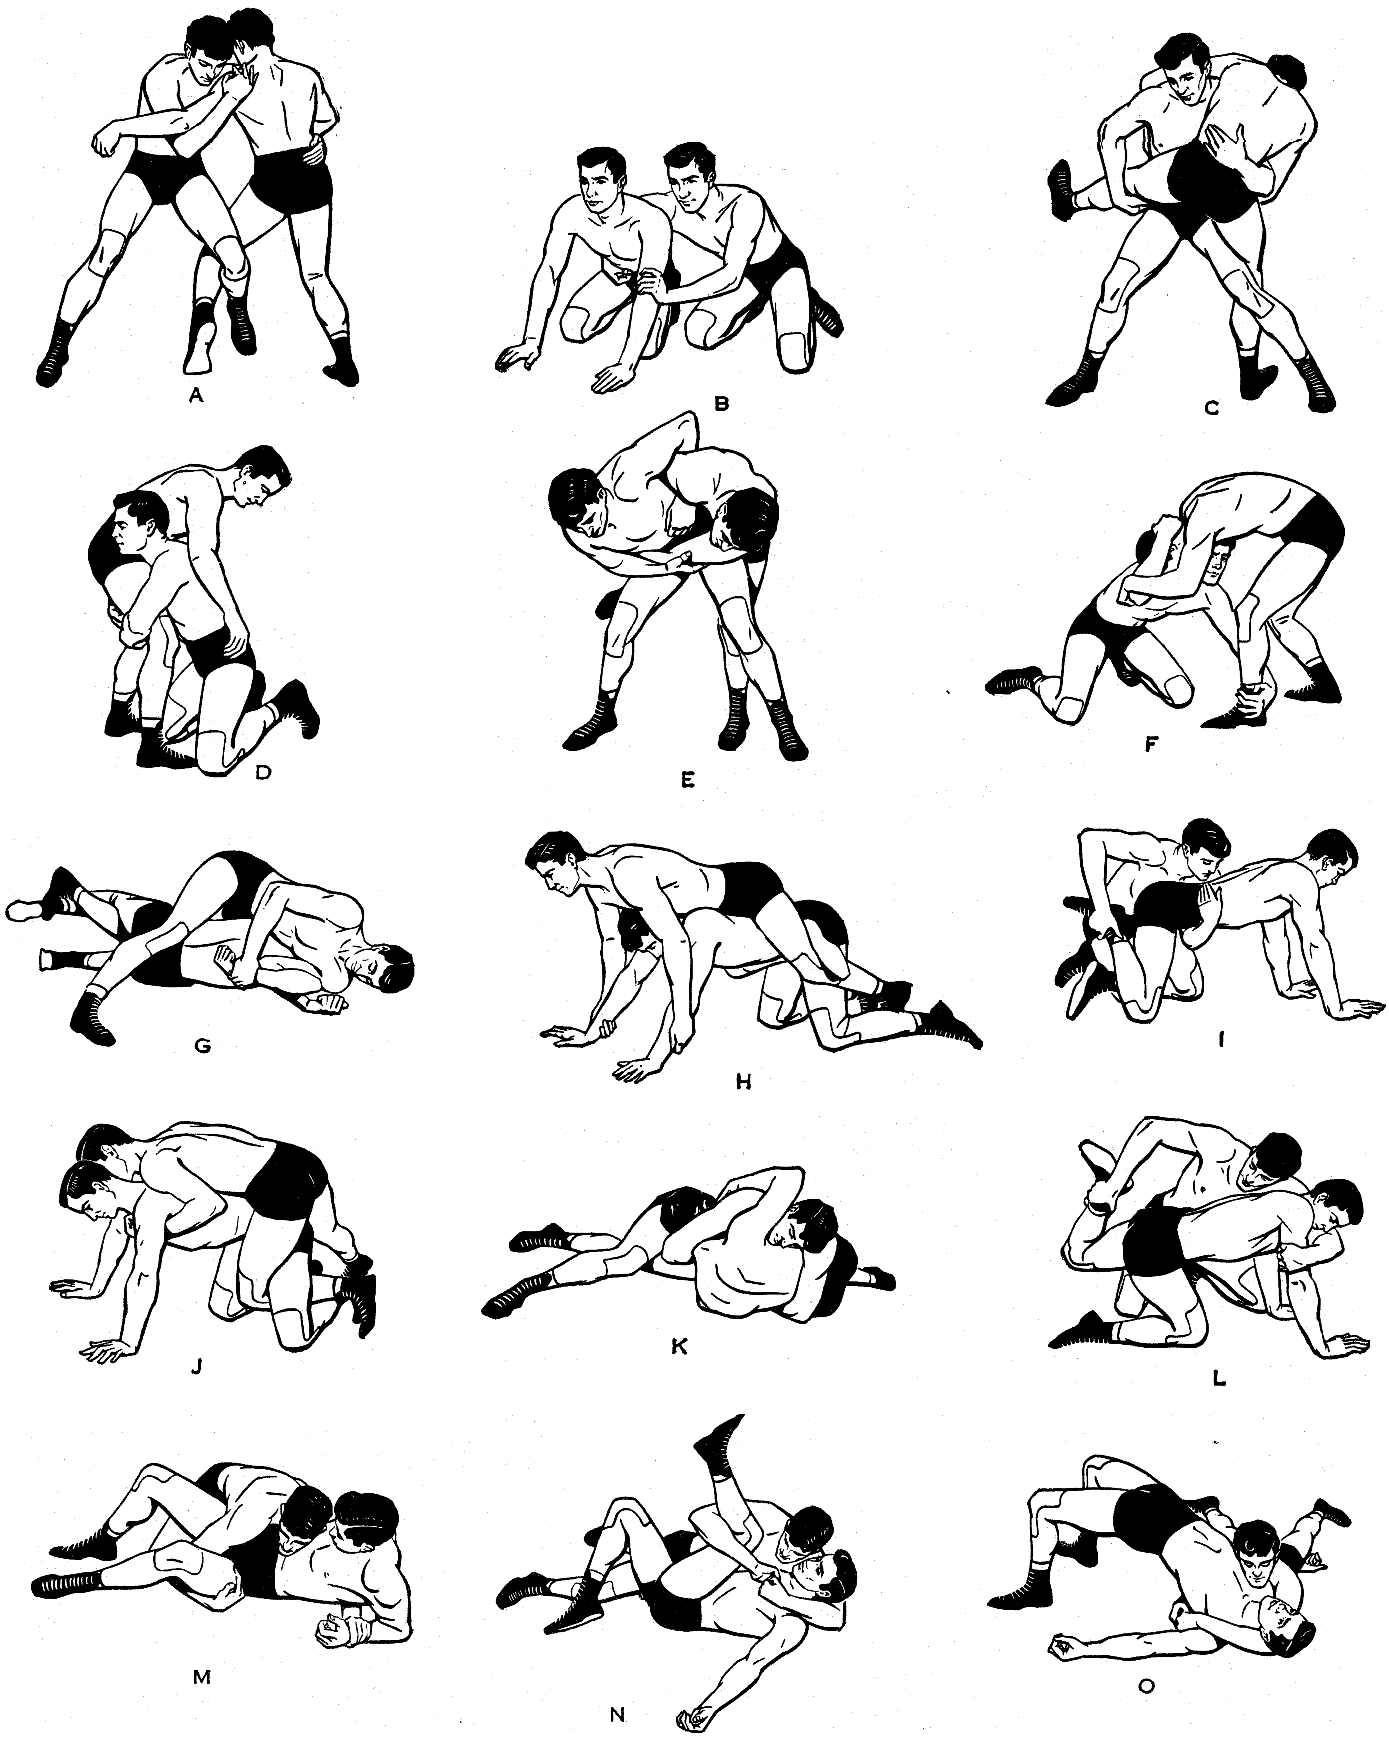
Other varieties of wrestling existed in the different Greek states. The most celebrated wrestler of ancient times was Milo of Croton (*c.* 520 B.c.). who scored 32 victories in the different national games, 6 of them at Olympia. Greek athletic sports were introduced into Rome in the last quarter of the 2nd century B.C.. but they never attained to the popularity they had enjoyed in Greece.

Wrestling is widely practised by Asian peoples, ranging in extent from Mongolia to the South Pacific islands. In general. the style, with minor exceptions. is of the catch-as-catch-can variety (*see* below) and a contest is terminated when a combatant is thrown to the ground or touches the ground with any part of his body other than the feet. In some countries it is permissible to touch the ground with one hand to avoid a complete overthrow.

Among the Mongolian peoples especially,. wrestling is a prominent feature of some religious festivals. There are no divisions into weight classes and the wrestlers are distinguished by enormous bulk and weight, poundages up to 300 being by no means uncommon, as with the *Sumo* contestants of Japan. Such ponderousness is common also among the Indian professional wrestlers. This excessive weight by no means produces slowness of movement, some attacks being made with surprising rapidity, the unexpected quickness ending a spell of near immobility.

Great reliance is placed upon the power of the arms and particularly of the hands. and among the Chinese—with whom wrestling events are frequently a feature of religious festivals—the abnormal strength of the hands and arms is obtained by the daily practice of closing the fingers tightly upon handfuls of wet sand, relaxing, and repeating the process again and again.

The popularity of wrestling has survived in many Asiatic countries, particularly in Japan, where the first match recorded took place in 23 B.c., the victor being Sukune, who has ever since been regarded as the tutelary deity of wrestlers. In the 8th century the emperor Shomu made wrestling one of the features of the annual harvest "festival of the Five Grains," the victor being appointed official referee and presented with a fan bearing the legend, "Prince of Lions." In 8j8 the throne of Japan was



Some of the holds used in wrestling

(A) Standing backheel. (B) Referee's position (collegiate only). (C) One-leg pickup and inside trip. (D) Leg drop. (E) Hip lock. (F) Cross-leg pull. (G) Cross-scissors ride with reverse arm lock. (H) Figure-four scissors. (I) Waist and ankle hold down. (J) Cross-scissors ride. (K) Half nelson and body chancery. (L) Near ankle and cross face. (M) Over-and-under. (N) Reverse nelson and cradle hold. (0) Double bar arm from side wrestled for by the two sons of the emperor Buntoku, and the victor. Koreshito, succeeded his father under the name of Seiwa. Imperial patronage of wrestling ceased in 1175, after the war which resulted in the establishment of the shogunate, but continued to be a part of the training of the samurai, or military caste. About 1600 professional wrestling again rose to importance, the best men being in the employ of the great daimios or feudal nobles. It was, nevertheless: still kept up by the samurai, and eventually developed into two separate systems. the national style called *Sumo*, and that peculiar and scientific combination of wrestling and self-defense known as jujitsu (see JU-JUTSU), the purpose of which is to disable an adversary. The national championships were re-established in 1624, when the celebrated Shiganosuke won the honour, arid have continued to the present day. The Japanese (*Sumo*) wrestlers place great reliance upon weight, some of the chainpions scaling 300 lh. or more; and as a result of highly specialized methods of physical training. they are generally of huge bulk and great strength. although surprisingly light on their feet. They form a guild which is divided into several ranks, the highest being composed of the *joshiyori*, or elders, in whose hands the superintendence of the wrestling schools and tournaments lies. The badges of the three highest ranks are damask aprons richly embroidered. The wrestling takes place within a ring 12 ft. in diameter, the wrestlers being naked but for a loincloth: and each contest is preceded by certain preliminaries of a quasi-religious significance. At the command of the referee the wrestlers crouch with their hands on the ground and watch for an opening. The contests are usually of brief duration. The method is very similar to that of the modern catch-as-catch-can style. except that touching the ground with any part of the person, the feet excepted, after the first hold has been taken, loses the bout. To step or be forced outside the actual wrestling circle is equivalent to losing a fall.

Indian wrestling resembles that of Japan in the great size of its champions and the number and subtlety of its attacks, called *penches*. It is of the "loose" order, the men facing each other nude. except for a loincloth, called *chaddi*, and maneuvering warily for a hold. Both shoulders placed on the ground simultaneously constitute a fall, which is seldom gained without much ground wrestling. It is highly scientific, though including many tricks that western rules exclude as "fouls."

In Switzerland and some of the Tirolese valleys a style of wrestling flourishes under the name of *schwingen* ("swinging"). The wrestlers n-ear *schwinghosen* or wrestling breeches, with stout belts. on which the holds are taken. Lifting and tripping are prevalent, and the first man down loses the bout. In Styria wrestlers stand firmly on both feet with right hands clasped. When the word is given, each tries to pull or push the other from his stance. the slightest movement of a foot constituting a defeat. In Russia belt wrestling, and in Iceland the glima are popular styles. Both require the wearing of a kind of harness about the loins and thighs. and otherwise are similar to schwingen. In the Balkan states the favourite style is catch-as-catch-can.

In Great Britain wrestling was cultivated at a very early age, both Saxons and Celts having always been addicted to it, with the men of Cornwall always holding a special eminence, and English literature is full of references to the sport. On St. James's and St. Bartholomew's days special matches took place throughout England, those in London being held in St. Giles's field! whence they were afterward transferred to Clerkenwell. The lord mayor and his sheriffs were often present on these occasions, but the frequent brawls among the spectators eventually brought these public matches into disrepute. English monarchs have not disdained to patronize the sport, and Henry VIII is known to have been a powerful wrestler.

Cumberland Style.—This style prevails chiefly in the north of England (except south Lancashire) and in the south of Scotland. In this the wrestlers stand chest to chest, each grasping the other with locked hands around the body. each one's chin on the other's right shoulder. The right arm is below and the left above the adversary's. When the hold has been firmly taken the umpire gives the word and the bout proceeds until one man touches the ground with any part of his person except his feet, or he fails to retain his hold, in either of which cases he loses. If both fall together, the one who is underneath, or first touches the ground, loses. If both fall simultaneously side by side, it is a dogfall, and the bout begins anew. The different maneuvers used to throw the adversary are called chips, the most important being the backheel, in which a wrestler gets a heel behind his opponent's opposite heel, from the outside, and forces him over backward; the outside stroke. in which, after a sudden twist of his body to one side. the opponent is struck with the edge of the opposite foot on the outside of the ankle; the hank, or locking a leg and lifting the opponent with a sudden turn to the right. so that both fall together. but with the opponent underneath; the inside click, the locking ot an opposite leg applied after jerking the opponent forward, the pressure then being straight back; the outside click: a backheel applied by the defender as he is on the point of being lifted from the ground—it prevents this and often results in oversetting the opponent; the cross-buttock, executed by turning the left hip under the opponent's body, throwing the leg across both his and striking backward, while partially lifting and throwing him forward; the buttock, in which the hip is thrust still farther under the opponent. who by the action of the arms is thrown right over one's back; the hipe or hype. executed by lifting the opponent off his feet, and while carrying him to the right or left, placing the opposite knee under one of his legs and raising it as high as possible before throwing him sideways to the ground; the swinging hype. in which the opponent is lifted and swung nearly or quite round before the knee stroke is made; and the breast stroke. which is a sudden powerful twist, first to one side, then the other, followed by a throw. There is but a single foul—direct kicking.

West Country Style.—In the Cornwall and Devon or west country style the wrestlers wear stout, loose canvas jackets. the hold being anywhere above the waist or by any part of the jacket. though any manipulation of the jacket collar to strangle an opponent is forbidden. A fall is gained when both hips and a shoulder or both shoulders and a hip (three points) touch the ground simultaneously. A throw that does not secure a fall is a hitch. Ground wrestling is forbidden. and a man, when he feels himself falling. will try to turn and land on his side or chest. Many of the chips used by Cumberland and Westmorland wrestlers are possible in this style, with slight differences of execution required by the different method of taking hold and under other names—forehip (cross-buttock); inside lock (hank), etc. More distinctive throws are the heave. and the flying mare: a chip of universal use in which the opponent's wrist is grasped mith the opposite hand. the upper part of the same arm by the other hand, the back turned and the captured limb drawn across a shoulder, over which the opponent is vigorously shot forward. Until comparatively recently there was a difference between the styles of Cornwall and Devon, the wrestlers of the latter county having worn heavily soled shoes, with which it was legitimate to kick the adversary's shins.

Catch-as-catch-can.—The Lancashire style. generally known as catch-as-catch-can. is practised in Lancashire, throughout Great Britain generally, and is the most popular style in the United States. Canada, Australia. Switzerland and some other countries. It is the legitimate descendant of the ancient Greek upright wrestling combined mith ground struggling. but minus the all-in freedom the Greeks permitted, and undoubtedly is representative of the wrestling of the middle ages. It allows a great amount of action, which includes struggling on the mat, tripping, catching hold of legs and similar tactics. At the beginning of a wrestling match the two opponents face each other, and at the signal to begin each tries to. secure a hold that will enable him to throw his opponent to the mat in an advantageous position.

A fall is gained when both shoulders of one wrestler touch the ground together, and very seldom are falls registered from standing throws. This necessitates most contests being completed while struggling on the mat. Much of this down wrestling is admittedly very skillful. No kicking, striking or other foul practices are permitted. Strangle holds or others designed to cut off an opponent's breathing and grips or forms of attack causing acute pain or in-

THE JAPANESE SUMO, ANCIENT FORM OF WRESTLING

Top left: A champion wrestler in richly decorated apron during the intermission ceremony of the Sumo

Top right: The sprinkling of salt, a symbol of purification, is part of the traditional formalities before a match

Centre left: Stance of a wrestler before a match begins. Champions are generally about 6 ft. tall and weigh 350 lb.

Centre right: Wrestlers, with fists touching the platform, watching for their first chance to attack. Both contestants must rise for a match at the same moment

Bottom left: The initial hold. The method of wrestling is similar to the modern catch-as-catch-can style

Bottom right: The referee watches closely as a champion throws his rival. A contestant wins a match when he forces his opponent out of the ring, or causes him to touch the ground with any part of his body, except the soles of his feet tended to force the defender to roll on his shoulders to avoid injury by dislocation or fracture are considered illegal holds. The style contains practically all the maneuvers known to other methods with many peculiar to itself; and because of its freedom and opportunity for the display of strategy. skill and strength is, when upstanding wrestling and tripping — the very essence of wrestling — are not neglected. the most preferable.

In Scotland a combination of the Cumberland and Westmorland and catch-as-catch-can style is sometimes practised. In Ireland, the national style is called collar and elbow.

Graeco-Roman Style. — The style chiefly affected by the continental European wrestlers is the Graeco-Roman (so-called. though it bears almost no resemblance to classic wrestling), which arose about 1860. and is a product of the French wrestling schools. It is a very restricted style. neither tripping nor any hold below the hips being allowed. the result being that the bouts consist chiefly of ground struggling. When no time limit is enforced. contests are usually tediously long. British and American wrestlers, accustomed to their own freer styles. seldom compete under Graeco-Roman rules. In Olympic competition the Scandinavian countries won a large number of championships. Sweden was the foremost of these, with strong showings in the games from 1912 to 1948. In the 1950s the Russian team won points in every division. capturing the unofficial team title. For individual records, see OLYMPIC GAMES.

UNITED STATES

Amateur wrestling in the U.S. antedates the professional sport, although records show that professional wrestling was popular between 1870 and 1880. William Muldoon, the first world's professional champion. was followed after 1900 by Farmer Burns. Tom Jenkins and Frank Gotch. who defended his title against all comers for many years and retired undefeated. Ben F. Roller of Seattle held the world's title from 1913 to 191j when he was defeated by Ed ("Strangler") Lewis. who was finally beaten by Wayne Munn (192j) in Kansas City. During the 1920s interest in professional wrestling was at its peak. Besides Lewis and Munn (top contenders) were Earl Caddock. Stanislaus Zbyszko and Joe Stecher. Lewis regained the crown in St. Louis (1928'1 by defeating Joe Stecher who had previously taken the title from Munn. In Jan. 1929 Gus Sonnenberg. Dartmouth college football star, won a world's championship match in Boston by defeating Lewis, to become the last undisputed titleholder. Professional wrestling by the late 1950s was largely a mixture of showmanship and acrobatics, although its scientific side mas well known to such television practitioners as "Whipper Billy" Watson, Lou Thesz. Antonio Rocca. Verne Gagne. Wladek Kowalski and Edouard Carpentier.

Amateur wrestling during the early colonial days was influenced by various forms predominant in England. The free style used widely in the U.S. was an outgrowth of the Lancashire style. The adaptability of wrestling to the rugged life of the period is reflected in much of the frontier literature. Abraham Lincoln became a well-known competitor by defeating Jack Armstrong, champion of Sangamon county. Ill. The American free style developed gradually, largely as a feature of country fairs and carnivals.

Amateur wrestling is regulated by the Amateur Athletic union. The A.A.U. has principal jurisdiction over wrestling conducted in athletic clubs and Y.M.C.A.'s, but the sport has received its greatest impetus in colleges and high schools.

As far back as 1780 wrestling was a popular intramural sport at Harvard. but the first real effort to promote it on an intercollegiate basis did not come until 1904, when the Eastern Intercollegiate Wrestling association was formed. A tournament was held in 190j and Tale won the first team championship. competing against Columbia, Pennsylvania and Princeton. The E.I.W.A. expanded to 16 competing members, the largest and oldest conference of its kind in the country.

At the national A.A.U. championships held in 1927 it was noted that 103 of 135 participants were college wrestlers, so it was decided that a national collegiate tournament was in order. The National Rules committee of the N.C.A.A. sponsored the first collegiate tourney at Xmes. Ia.. in 1928. Oklahoma A. and M. college (now Oklahoma State university) won the team title and dominated the college scene thereafter. Edward Clark Gallagher (1887–1940) was largely responsible for the amazing success of the Aggies. his teams winning 70 consecutive dual meets and 11 of 13 national titles from 1921 to 1932.

There are major differencesbetween A.A.U. and collegiate rules. The A.A.U. uses international rules in which strength is the important factor. College rules favour speed and maneuverability. The essence of college wrestling is control, and while a wrestler is on top he is scoring points. The man underneath must get out of his predicament and can score points for escaping or reversing the position of advantage. In both systems a fall terminates the bout. In A.A.U. rules a fall is declared when both shoulders touch the mat simultaneously, but in college rules a fall occurs only when both shoulders are held to the mat for a two-second count. (C. M. SL.)

WREXHAM (Welsh GWRECSAM, in the Anglo-Saxon Chronicle WRIGHTESHAM), a market town and municipal borough in the Wrexham parliamentary division of Denbighshire, Wales, 12 mi S.W. of Chester by road. Pop. (1961) 35,427. Area 4 6 sq.mi. It was given (with Bromfield and Yale, or Iâl) by Edward I to Earl Warenne St Giles's church was finished in 1472, replacing the church destroyed by fire in 1457 The paneled tower bears the date 1506: the interior is Decorated. West of the toner is the tomb of Elihu Yale (1721) first donor of Yale university whose father emigrated to America from the ancestral home of Plas-yn-Iâl, near Corwen. 21 mi from Wrexham. The Wrexham tower in the memorial quadrangle at Yale is a copy of the church tower. Wrexham is the seat of the Roman Catholic bishop of Menevia, whose diocese includes all Wales except Glamorganshire The town grew with the development of the north Wales coal field in the 19th century and after World War II a trading estate with about 30 different industries, including rayon and chemicals. was created Wrexham was incorporated in 1857.

WRIGHT, SIR ALMROTH EDWARD (1861–1947), British bacteriologist, whose most valuable work was that on bacterial infection and in measuring the protective matter of human blood. was born at Rliddleton Tyas. Yorkshire, on Aug. 10. 1861. Educated at Dublin university, he later obtained his scientific and medical training at the universities of Leipzig, Strasbourg and Marburg. He became a demonstrator of pathology at Cambridge (1887), a lecturer in physiology at Sydney (1889). was professor at the army medical school at Netley (1892–1902) and professor of experimental pathology in the University of London (1902–47). He was knighted and elected fellow of the Royal society in 1906.

Wright's work included research in parasitic diseases. He introduced antityphoid inoculation and did much work on the preparing of other vaccines and toxins. In 1918 he was created knight of the British empire. He received the gold medal of the Royal Society of Medicine in 1920. .Among his numerous scientific publications are *Studies in Immunisation* (1909) and *Pathology and Treatment of War Wounds* (1942). He died on April 30, 1947.

WRIGHT, BENJAMIN (1770–1842), chief engineer for the construction of the Erie canal, was born Oct. 10, 1770, in Wethersfield. Conn. As a youth he studied surveying, and after his family moved to the vicinity of Rome, N.Y. in 1789, Wright surveyed aboht 500,000 ac. of land for farmers who were settling the land. Because of his wide acquaintanceship and high standing in the community, Wright was elected county judge in 1813 and to several terms in the state legislature.

In 1811, Wright was hired by the New York state canal commission to propose a route between Rome and Waterford for what was to become known as the Erie canal. Construction of the canal was started in 1817 and completed in 1825, with Wright directing work on the middle and eastern divisions. Because Wright trained many young engineers on the project, he has been called the "father of American engineering."

Wright resigned from the Erie canal project in 1827 and served as chief engineer of the Chesapeake & Ohio canal in 1828–31 and the St. Lawrence canal in 1833. During his career he also was consulting engineer to the Welland. Chesapeake & Delaware. Delaware & Hudson and other canals in Connecticut and Rhode Island. He also made land surveys for railroads in New York, Illinois: Virginia and Cuba.

He died in New York city on Aug. 24, 1842. (W. E. HD.)

WRIGHT, CARROLL DAVIDSON (1840–19091, U.S. statistician whose principal efforts were devoted to the development and improvement of labour statistics was born at Dunbarton, N.H., July 25, 1840, and was educated in the public schools. During the Civil War he served in the Union army; after the war he was admitted to the bar and practised law in Massachusetts for several years. In 1873 he was appointed chief of the Massachusetts bureau of statistics of labour and in 1885 he became the first U.S. commissioner of labour, in which capacity he served until 1905. He was responsible for many early inquiries into economic conditions affecting labour and was an advocate of the principle of collective bargaining and of various then new systems of wage determination. He became president of Clark college in Worcester, Mass., in 1902, serving additionally as professor of statistics and social economics from 1904 until his death there, on Feb. 20, 1909. (FK. L. K.)

WRIGHT, FRANK LLOYD (1869–1959), U.S. architect who became world famous as creator and expounder of "organic architecture." his phrase indicating buildings that harmonize with users and environment. Though a sharp critic of society, Wright won probably more official honours at home and abroad and erected more structures than any other individual architect of his time.

Wright was born June 8. 1869. in Richland Center, Wis. After nearly completing a course in civil engineering at the University of Wisconsin. Madison. he went to Chicago. where he worked under Louis Sullivan from 1888 to 1893. In 1893 he began independent practice. Shunning the artificial revivals then dominant in architecture. he evolved unorthodox forms suited to modern living and to new structural methods and materials. Unlike other leading modernists of the 20th century he retained throughout his career the use of ornamental detail. earthy colours and rich textures. Wright's sensitive use of materials helped to perfect and control his dynamic expression of space. which he called "the reality of the building." His command of space, opening a new area to architectural advance, was probably his greatest achievement.

By 1900 his "prairie style" house was a recognized accomplishment. A Wright residence of those years (*e.g.*, the Coonley house, Riverside, Ill., 1908) showed a wide, low roof over continuous window bands that turned corners, defying conventional boxy structure; main rooms flowed together in uninterrupted space that was, in effect. continued outside. This simple but hard-won form eventually became the basis of 20th-century residential design.

Wright also pioneered in commercial architecture. In 1904 at Buffalo, N.Y., he built for the Larkin company the first mechanically ventilated, steel-furnished office building (demolished 1950). In 1912 he projected the first "slab" skyscraper. a narrow block ,(see the RCA building in New York); and in 1920–24 the lightweight wall of glass and metal later to become common on tall buildings.

In 1929 Wright designed floors cantilevered from a tall central mast. later used in his Johnson laboratory tower (1949), Racine, Wis., and his Price tower (1956), Bartlesville. Okla.

In 1915 the imperial household of Japan invited Wright to build the great Imperial hotel at Tokyo (1916–22); due to its revolutionary, floating cantilever construction, it was the only large building that offered safety in the violent earthquake of 1923. In California. Wright developed a closed, cubical architecture and an inexpensive technique oi reinforced concrete blocks, both being well adapted to the region (*e.g.*, the Millard house. Pasadena, 1923)

The next decade of Wright's career included financial difficulties intensified by the depression of the 1930s and grandiose architectural projects containing the seeds of many of his later accomplishments. These included the dispersal of the roaf plane, executed at the Johnson administration building, Racine (1936–39); triangularly moduled. asymmetric plans, seen in the Hanna house. Palo Alto, Calif. (1937); the spiral, spatial continuity of the Guggenheim museum, New York (1943); and symmetrical, angular forms, 1926 (Beth Sholem synagogue. Philadelphia, 1955).

Wright wrote his lively Autobiography (1932; rev. 1943), initiated a training program for architectural apprentices and developed his ideal regional plan, Broadacre city in the 1930s.

His period of greatest fulfillment began in 1936 and included, besides the six works already mentioned, his most famous residence, Fallingwater, Bear Run. Pa. (1936) ; his own winter quarters and workshop. Taliesin West, near Phoenix, Ariz. (1938) ; Florida Southern college, Lakeland (1938) ; and the First Unitarian church. Madison (1952).

Wright's other books include *An* Organic Architecture (1939); An *American* Architecture (1955); and A Testament (1957).

He died in Phoenix on April 9, 1959.

WRIGHT, JOSEPH (1855–1930) English comparative philologist, whose great achievement was the six-volume English Dialect Dictionary, was born on Oct. 31, 1855 at the Yorkshire village of Thackley. From the age of 7 until he was 21 he worked at a woolen factory. He attended evening classes at the Mechanics' institute at Bradford and went to Heidelberg to learn German. After 1876. he taught school in Bradford for three years and studied at the Yorkshire College of Science, forerunner of the present Cniversity of Leeds. In 1877 he matriculated, as an external student. at the University of London; and in 1882 at Heidelberg (Ph.D. 1885). supporting himself by teaching and writing or translating textbooks for students of modern European languages.

From 1887 to 1924 he was at Oxford, at first as a teacher of English and German to women students, and after 1901 as professor of comparative philology. He wrote numerous historical grammars, in part in collaboration with his wife, Elizabeth Mary Lea. whom he married in 1896.

Wright died at Oxford on Feb. 27, 1930.

See the Life of Joseph Wright by Elizabeth M. Wright, 2 vol. (1932) ; an appreciation by J. Whatmough, *Word* Study, xxix, no. 2, pp. 1–4 (Dec. 1953). (J. WH.)

WRIGHT, ORVILLE (1871–1948), U.S. inventor, was born at Dayton, O., on Aug. 19, 1871. He early became associated with his brother: Wilbur (*q.v.*), in the bicycle repair business, and from the first shared his interest in mechanical flight. Shop experiments led to the development of a power-driven heavier-than-air machine which was piloted by Orville Wright on its first successful flight made on Dec. 17, 1903, at Kitty Hawk, N.C. Further experiments led to the development of an airplane which established a new record on Sept. 12, 1908, by remaining in the air 1 hr. 15 min. An accident on Sept. 17 terminated his experiments for that year, but on July 27 and 30, 1909, his demonstrations at Fort Myer, Va., satisfied the tests and secured the acceptance of his machine by the U.S. government. Numerous demonstrations made in Europe during 1908 and 1909 caused many honours to be bestowed on the two brothers. Orville Wright spent much of the rest of his life in research. Wright died on Jan. 30. 1948, at Dayton. See also WRIGHT. WILBUR.

WRIGHT, PATIENCE LOVELL (1725–1786), U.S. wax modeler and Revolutionary War spy, was born in Bordentown, N.J.. in 1725. In 1748 she married Joseph Wright, and at his death in 1769 she opened a waxworks museum in New York city. In 1772 she took her waxworks to London. where she acted as a secret agent for the Americans during the Revolution. She died in London on March 23. 1786. Her son Joseph Wright (1756–93) became a portrait painter, wax modeler and engraver. (A. T. G.)

WRIGHT, SILAS (1795–1847), U.S. senator and state governor, was born at Amherst, Mass., on May 24, 1795. He graduated from Middlebury college, Vermont, in 1815 and was admitted to the bar in 1819. He was a member of the national house of representatives in 1827–29, U.S. senator in 1833–44 and governor of New York in 1844–46.

During his public life Wright became a leader of the Democratic party in New York, Martin Van Buren being his closest associate. He was an influential member of the so-called "Albany regency." a group of Democrats in New York who for many years virtually controlled their party within the state. When Van Buren was elected president in 1836, Wright became his chief lieutenant in the senate. After serving one term as governor of New York state he was renominated, but did not gain re-election in 1846; he then retired to private life. He died at Canton, N.Y., on Aug. 27, 1847. *See* also NEW YORK (STATE): *History.*

The best biography is that by J. D. Hammond, *Life and Times of Silas Wright* (1848), which was republished as vol. iii of that author's *Political History of New York.*

WRIGHT, WILBUR (1867–1912), U.S. inventor, was born near Millville, Ind., on April 16, 1867. In 1890 he joined his brother Orville in publishing a weekly newspaper.

Experiments in Gliding.—Reading of the experiments of Otto Lilienthal in Germany, Wilbur and his brother became intensely interested in gliding as a sport. Lilienthal had balanced his machine by shifting the weight of his body. The brothers, believing this method incapable of expansion to meet the requirements of flight. developed a system in which the centre of gravity remained constant and the equilibrium was maintained by varying the air pressures on different parts of the machine through adjustments of the angles of the wings and auxiliary surfaces. This system. patented by them. is now generally known as aileron control. Having found in their experiments that the existing scientific data was almost altogether untrustworthy, they began investigations of their own. In 1901 they set up a small wind tunnel in their workshop at Dayton, O., in which they experimented with the aerodynamic properties of various airfoils.

The First Motor-driven Airplane.—With these data in their possession they began the design of a motor-driven airplane in Oct. 1902. Tested at Kitty Hawk, N.C., on Dec. 17, 1903, the machine, carrying a man, made four sustained free flights. This machine was exhibited in the Science museum at South Kensington, London, for 20 years. On Dec. 17, 1948, the 45th anniversary of its flight, the plane was formally installed in the Smithsonian Institution in Washington, D.C.

Experiments were continued and on Oct. 5, 1905, Wilbur Wright flew for 38 minutes over a small circular course covering a distance of 24 mi. Believing the machine now to be developed to a stage of practical usefulness, the Wrights spent several years in finding a market for the invention. Wilbur Wright went to Europe in 1908 to make the tests required in the sale of the French rights to a syndicate. While there, his flights at Le Mans and Pau, France, and at Rome attracted world-wide attention. In recognition of his pioneer work he received many honours and medals in European countries and in America.

During the last three years of his life he served as president of the Wright company. Much of this time he devoted to upholding the Wright airplane patents. He died of typhoid fever at Dayton on May 30, 1912. (O. W.; X.)

WRIGLEY, WILLIAM, JR. (1861–1932), U.S. chewing gum manufacturer, was born in Philadelphia, Pa., Sept. 30. 1861. He began work in his father's soap factory at an early age and traveled as a soap salesman. In 1891 he went to Chicago and entered the soap business with $5,000 borrowed from an uncle. His firm, later to become the William Wrigley. Jr., Co., transferred to the manufacture of chewing gum and by 1908 had become the world's leading producer of that product. R'rigley was the owner of several baseball clubs, including the Chicago Cubs of the National league, and he purchased and developed Santa Catalina Island (off California) as a resort. He died Jan. 26, 1932 at his winter home near Phoenix, Ariz. (H. J. SG.)

WRIST, in anatomy, the carpus or carpal articulation in man, the joint by which the hand is articulated with the forearm. *See* JOINTS AND LIGAMENTS; SKELETON, VERTEBRATE: *Appendicular Skeleton.*

WRIT, in law, is a species of formal order from the Crown or a delegated officer to an inferior officer or to a private person. enjoining some act or omission. The word represents the Latin *brevis* or *breve* (sometimes Englished into "brief" in the older authorities), so called from its "shortly" expressing the intention of the framer *(quia breviter et paucis verbis intentionem proferentis exponit).*

History.—The writ in English law still occupies a very important position, which can scarcely be understood without a sketch of its history. The whole theory of pleading depended in the last resort upon the writ, the plaintiff's claim simply expanding its terms.

The *breve* can be traced back as far as Paulus (about A.D 220), who wrote a work *Ad edictum de brevibus,* cited in the Vatican Fragments, § 310. In the *Corpus iuris* the word generally means a note-book or list. The *interdictum* of Roman law sometimes represents the writ of English law; *e.g.,* there is considerable likeness between the Roman *interdictum de libero homine exhibendo* and the English writs of *habeas corpus* and *de homine replegiando.* From Roman lam the *breve* passed into the *Liber feudorum* and the canon law, in both in a sense differing from that at present borne by the writ of English law. The *breve testatum* of the *Liber jeudorum* was an instrument in writing evidencing the transfer of land.

The *breve testatum* in England developed into the deed of grant; in Scotland into the charter, and later into the disposition. In canon law *breve* or *brevilegium* denoted a letter from the pope, sealed with the seal of the fisherman and less formal than a bull. In old English ecclesiastical law a brief—still named in one of the rubrics of the Book of Common Prayer—meant letters patent to church-wardens or other officers for the collection of alms. (For counsel's brief *see* BRIEF.)

The origin of the writ is disputed, but its development was clearly influenced by both Anglo-Saxon and Norman law before the Conquest. The Anglo-Saxon contribution appears in the shape of diffuse royal charters, which were used to express the king's commands or wishes. Next, the form of these charters was infected by royal letters employed primarily for the publication of new laws, which were communicated by such letters to the shire-moots and, presumably, to the hundred-moots and important persons. These documents, cross-bred between charter and writ, show progress, but fall far short of the pure writ, which was concise, secular, practical and implicit with power. Writ-charters similar to those in England existed in Normandy before the Conquest. After that event, the chancery, or royal office which in England framed the king's orders, had some counterpart in Normandy, which did the like. The exact stages by which the writ disembarrassed itself of the charter element are not certain, but at any rate the process was a rapid one. The distinction between the two is known to have existed as early as 1071. The growth of a more robust Central Government hastened the separation, and in Glanvill's book (1187–89) not only are many writs included, but the idea has become so common that the author does not take the trouble to explain it. The writ, as thus developed, was of supreme importance in the growth of law and government. From the latter part of the 13th century to the early 18th century, if a man had no legal remedy he had no legal right. Without a writ he could not, in general, begin an action, and if there were no writ that covered his complaint he had no remedy. Nor was the writ confined to the initiation of litigation. It was also a machine for hosts of executive acts which never passed to the law courts at all. The chancery from which writs were issued was styled *officina brevium,* or "writ-shop." Writs had to be paid for, though occasionally poor men might get them free. Nor did Magna Carta c. 40, make any difference in this respect, except to forbid prohibitive charges for writs in common form ("de cursu," or "of course"). At first new writs could be used freely, but in the Provisions of Oxford, 1258, the chancellor swore that he would seal no writs except those "of course" without the command of the king and his council; and the statute of Westminster II, 1285, while it recognized the power of the chancery clerks to make writs for cases similar *(in consimili casu)* to those already covered by existing writs, impliedly forbade them to create new writs, that being the province of parliament. But this statute did not seriously hamper the chancery, for the clerks showed great dexterity in varying existing writs to meet new circumstances.

Collections of writs were made at an early period. They were entitled *Registra Brevium,* and the oldest one extant is dated 1227. These collections were unofficial, though of course the writs embodied in them originated in the chancery. For three centuries *Registrum Brevium* continuously multiplied in copies and swelled in bulk. The mss. of it are at present beyond computation. Their number and increasing length testify to the industry of the chancery and to the striking import of the writ as one of the modes of keeping law and government reasonably abreast of the needs of the community. *Registrum Brevium* was first printed in 1531. After that it practically ceased to grow, for it was being outgrown by the law itself, which needed something more elastic.

The chief reason why the writ fell into the background as an agency in the growth of our law is that the centre of gravity in legal procedure shifted from the writ to the plaintiff's written "declaration," which specified the details of his claim. It was this rather than the writ which came to determine the form of action. The correct form of action was vital to success in litigation. If the plaintiff chose the urong one, he was, in general, without a remedy. True, a selection of the wrong writ was, even till the 19th century, equally disastrous, but then, in most cases, it had ceased to be compulsory on a plaintiff to begin his action by an original writ, though its existence was always assumed. There were many other ways in which litigation could be begun, and there is reason to think that they were usually preferred to the original writ, which was neither cheap nor convenient. The transference of energy from the writ to the declaration was a gradual process. So long as the pleadings in an action were oral, the writ must of necessity have attracted to itself all the weight which the written word carries as against the spoken word. But by degrees litigants adopted the practice of exchanging written pleadings. This was well recognized in the 16th and 17th centuries, though the seeds of it are traceable some time before. The multiplicity of writs and of other devices for commencing a common law action was remedied with respect to personal actions by the Uniformity of Process in Personal Actions Act, 1832 (2 Will IV. c. 39), which substituted for these methods a simple, uniiorm, writ of summons. Further amendments were made in 1833, by 3 and 4 Will. IV. c. 27, s. 36, which abolished writs in real actions with the exception of those relating to dower, *quare impedit,* and ejectment, and by 3 and 4 Will. IV. c. 42, in connection with the writs of debt and of detinue. The Common Law Procedure Act, 1852, s. 3, dispensed with the need of mentioning any form of action in the writ on a personal action, and the Judicature Acts, 1873–75, contain the complete remodelling of procedure under which English civil law is administered in the Supreme Court of Judicature. The Rules of the Supreme Court, 1883, made in pursuance of this legislation, now require every action in the High Court to be commenced by a writ of summons, indorsed with a statement of the nature of the claim made, or of the relief or remedy required in the action. The writ, therefore, nowadays differs considerably in form from its ancient predecessor. And an equally striking distinction is to be found in its much narrower scope as compared with the writs of *Registrunt Brevium.* They dealt with almost every conceivable matter of executive government as well as with legal procedure. But now the province of writs has shrunk to the institution of litigation except in the realm of constitutional law, where writs still issue for the election of members to the House of Commons and for the attendance of individual members in the House of Lords. Elsewhere, more convenient methods of expressing the will of the executive have ousted the writ; such are Orders in Council, Royal Proclamations, Letters Patent, and regulations made by various Government departments.

The writ, though issuing from the king's chancery, did not, where it was concerned with litigation, necessarily direct the trial of the question in the king's court. In whatever court it was returnable, it frequently called in the aid of the sheriff as executive officer. In such cases, it was either addressed to him or, if addressed to the party alleged to be in default, it concluded with a threat of constraint by the sheriff in the event of disobedience, generally in these terms, *et, nisi feceris, vicecomes de N. faciat ne amplius clamorem audiamus pro defectu iustitiae.* If the writ was returnable in the county court or the lord's court, the sheriff or the lord sat as the deputy of the king; he did not sit by virtue of his own inherent jurisdiction. The writ was not necessary for the initiation of proceedings there or before the justices in eyre.

There are several divisions of writs (excluding those purely financial and political), the most important being that into original and judicial, the former (tested in the name of the king) issued to bring a suit before the proper court, the latter (tested in the name of a judge) issued during the progress of a suit or to enforce judgment. The nature of a third class, *magistralia,* is an unsolved puzzle. Bracton regarded them as writs which were capable of variation in order to meet the plaintiff's grievance; Coke considered them to be a variety of original writs which generated actions upon the case. Possibly the later writers attached more technicality to Bracton's expressions than they were meant to bear, and in any event the use of *magistralia* for purposes of classification was of little import by the time that *Registrum Brevium* was printed, for the primary division there is only twofold, original and judicial.

No ms. register known to the author of this article contains even this twofold division. Coke and other authorities rnention numerous other divisions, but those which have been named appear to be the principal, of writs.

Writs of Historical Interest.—A great number of the older writs are now obsolete. The details relating to them can be found in the printed *Registrum Brevium* and in Sir Anthony Fitzherbert's "New Natura Brevium," a work of the highest authority which ran into 18 editions, or reprints, between 1534 and 1794. Some of these ancient writs had such a great influence on the history of English law that they need brief descriptions here. The *prerogative writs* are treated in the paragraph on "Writs at the present day"; historically they had a large share in securing the administration of justice, and the personal freedom of the subject. In the domain of private law, the *writ of right (breve de recto)* was styled by Fitzherbert "the highest writ in law," and *Registra Brevium* invariably commence with it. It was employed for the recovery of real estate. The principle that no man need answer for his freehold without a royal writ was laid down in Henry II.'s reign. This compelled everyone who demanded freehold land from another person to obtain a writ, in effect the writ of right, if he were asserting title to the land. The insistence on the writ of right had political significance, for it furthered the centralization of justice. The procedure upon it became intolerably clumsy and tedious, and this led first to its disuse and finally to its abolition. No writ had wider effect than the *writ of trespass.* In origin, the word "trespass" covered nearly every wrongful act or default, whether it be what we should now call a crime or a tort. In that sense, it is traceable as early as John's reign, but the writ of trespass did not become a writ "of course" until the latter part of Henry III.'s reign, just after the conclusion of the Barons' war. Very likely it was one of the agencies in clearing up the litter of disorder left by civil strife. The action which the writ of trespass *vi et armis* originated was quasi-criminal. It was aimed at serious and forcible breaches of the king's peace. Though it was begun by the injured individual, it ended in the punishment of the defendant as well as in compensation to the plaintiff. It was more popular than the "appeal of felony" because the same precision in pleading was not required and the trial was not by the detested method of battle. Its scope was also wider, and damages were obtainable. Later, trespass developed on one side into misdemeanours (now one branch of criminal law) and on the other into the law of torts, or civil injuries. In the 14th and 15th centuries, statutes often fixed the action of trespass as an appropriate remedy for the offences created by them, because criminal "appeals" were falling into disuse, there was no organized police, the judges were often corrupt, except in the central courts, and were not always pure even there. The three chief kinds of the writ of trespass *vi et armis,* were for assault and battery, for injury to land *(quare clausum fregit),* and for taking away goods *(de bonis asportatis).* The writ could therefore be employed by any landholder for the recovery of damages done to his possession, but not, at first, for the recovery of possession itself. This extension was not recognized till the middle of the 15th century, and it resulted in the writ of trespass, *de ejectione firmae,* which appears first as a remedy enabling the termor, or lessee for years, to sue anyone who had ejected him, whether his lessor or another person, and then becomes the best remedy of the ejected freeholder. He borrowed this "action of ejectment" from the termor, because his own proprietary and possessory remedies had become so inadequate. A cloud of legal fictions veiled the borrowing, but in spite of the duration of some of these till the Common Law Procedure Act, 1852, the action of ejectment was greatly superior to the dilatory remedies which it thrust in the background. The law of torts, as it is now called, also owes a heavy debt historically to writs of *trespass upon the case,* which were adaptations of the writ of trespass made to meet special cases. The same object was achieved by means of the statute of Westminster II, 1285 *(supra),* for the clerks of the chancery were required by it to issue modified writs *in consimili casu.* It is not clear whether writs of trespass upon the case ought, as a matter of history, to be regarded as springing from this statute or as of independent origin. Certainly, in later law, the sources seem to be distinct. However that may be, trespass upon the case, or "case," was an excellent machine for redressing most civil injuries, nor have judges ceased to speak of "action on the case" even at the present day. Nor was its influence confined to the law of torts. The most notable offshoot of "case" was the variety of it styled *assumpsit,* which became the general form of action by which damages could be recovered for breach of a contract not made under seal. If one undertook (*assumpsit*) to do something and did it ill, he was liable. Gradually it was held that even if he did nothing, he was still liable. This was recognized very early in the 16th century, and the shaping of this action of *assumpsit* by the judges of this and the succeeding century resulted in the curious spectacle of an action upon contract modelled upon an action of pure tort.

Freedom from unwarrantable arrest or imprisonment of the person was secured by the writs *de odio et atia, de homine replegiando, de manucaptione* and *mainprise.* These have long been superseded by the more efficient writs of *habeas corpus,* though, it may be added, these latter also are themselves of very ancient origin.

Writs at the Present Day.—The vast majority of writs at the present day deal with the initiation, progress, or results of litigation; but purely administrative writs still exist, such as those for summoning representatives to parliament, or for assembling an ecclesiastical convocation. Writs are now issued from the central office of the Supreme Court, which was created by the Supreme Court of Judicature (Officers) Act, 1879, and thereby absorbed the Crown office of the Queen's Bench Division. The Crown office is an institution of the greatest antiquity. and the clerk of the Crown in Chancery has important duties relating to parliamentary writs, which are noticed below. Some writs require the Great Seal, *e.g.,* those for summoning new parliaments; writs of summons in actions are under the seal of the court, and are tested in the name of the lord chancellor, but writs issuing from the Crown office side are tested in the name of the lord chief justice of England. Instead of the Great Seal, the Crown Office Act, 1877, allows wafer great seals made on embossed paper, wax, wafer, or any other material, in accordance with rules drawn up by a committee of the Privy Council, to be attached to documents authorized by such rules to be thus validated. As to writs connected with litigation, the commonest type is the writ of summons which originates a civil action in the High Court of Justice. Indeed, it is now the only way in which such an action can be commenced. It is a formal document by which the king commands the defendant to "enter an appearance" within eight days, if he wishes to dispute the plaintiff's claim, and notifying him that, in default, judgment will be signed against him. It must be indorsed with a statement of the nature of the claim made. It may be issued either from the central office of the Supreme Court in London, or from one of the district registries which exist in many of the large provincial towns. Issue consists in taking two copies of the proposed writ to the writ department of the central office or to a district registry, signing one copy and paying 30s., whereupon the official impresses a 30s. stamp on the signed copy, files it, stamps the other with a "seal," and hands it back to the applicant. This then becomes the writ in the action. Technical defects in the writ are no longer fatal, for the plaintiff can amend them with the leave of the practice master in the King's Bench Division or of the chief clerk of the writ in the Chancery Division. Bracton's statement nearly 700 years ago, *non potest quis sine brevi agere,* is true of procedure in the High Court even now, but the great difference between the writs of his day and those of our own is the elasticity of claim which the latter allow. We are not limited to a certain number of actions, each with its appropriate writ, to be chosen rightly at the plaintiff's peril; the writ is always the same except for its indorsement, and, in effect, any claim which it is probable that the courts will enforce can be indorsed on it. If the plaintiff lose his case, it will be either because he has not evidence to support it, or because he fails to satisfy the requirements of the substantive law, and not because he has selected the wrong form of writ. After issue of the writ, it must be served on the defendant. This is done by showing him, or his solicitor, the original, and then leaving with either of them a correct copy of it. As a rule, the writ cannot be served on a Sunday. The entry of appearance by the defendant does not involve his personal presence. This, and all other proceedings on the writ, prior to the trial of the action, can be, and usually are, conducted on behalf of the parties by their respective solicitors. The officials who deal with these preliminary proceedings are the masters of the Supreme Court. No leave for the issue of the writ is necessary, unless the defendant be out of England, or the plaintiff seek to join on his writ causes of action for the joinder of which leave is required. Proceedings in the county court, in which most civil actions for claims of small amount are tried, are begun by the entry of a plaint, followed by a summons to the defendant.

Besides the writ commencing an action, there are others which facilitate it, or give effect to its result. Attendance of witnesses is secured by the writ of *subpoena.* Redress for conrempt of court may be effected by writ of *attachment.* The writs employed for the execution of judgment against an unsuccessful defendant are *fieri facias* against his goods, *elegit* against his lands, *possession* for the recovery of land adjudged to be the plaintiff's, and *delivery* or *attachment,* or *sequestration* for the recovery of any property other than land or money. The writ of attachment also applies where a judgment directs the performance of any specific act other than the payment of money, *e.g.,* the removal of a nuisance, or requires anyone to abstain from doing a thing; and the writ of sequestration also extends to cases in which a person wilfully disobeys an order or judgment which directs him to pay money into court or to do any other act within a limited time; the writ enables his property to be seized.

The *prerogative wits* deserve special notice both for their historical interest and their practical utility. They are extraordinary remedies issued upon cause shown in circumstances where the ordinary legal remedies are inapplicable or inadequate. The most important of those now in use are *certiorari, habeas corpus,, mandamus, procedendo,* and *prohibition.* They usually issue from the Crown office side of the central office of the Supreme Court, and, in general, they are not obtainable as a matter of course. Some probable cause must be shown why such extraordinary remedies should be invoked. A rule *nisi* is issued in the first instance by the court calling upon the party to whom the writ is addressed to show cause why he should not comply with the writ. If he shows sufficient cause, the rule is discharged, otherwise it is made absolute and the party must obey the writ. But in urgent cases, the rule may be made absolute from the first in some of the writs, *e.g., habeas corpus.* The writ of *certiorari* proceeds from a superior court and directs an inferior court, whether civil or criminal, to transmit to the superior court the record of proceedings pending before the inferior court, in order to ensure speedier and better justice to the applicant for the writ. Its object is to give relief against inconvenience arising from the likelihood that the lower court will not dispose of the case as effectually as will the superior. The procedure by this writ must be distinguished from appeals by dissatisfied litigants. These come after judgment, whereas *certiorari* generally deals with cases still pending and, even where it is used for the purpose of getting a conviction quashed, it does not enable the superior court to review the case on its merits, but to deal with some matter like lack of jurisdiction. There are several writs of *habeas corpus,* but the best known variety is the *habeas corpus ad subiiciendum,* which provides for the personal freedom of the subject. *(See* HABEAS CORPUS.) *Mandamus* directs a person, a corporation, or an inferior court of judicature, within the king's dominions, to do some particular thing which appertains to the office or duty of any of them. *(See* PRACTICE AND PROCEDURE.) The writ of *procedendo* is a possible sequel to *certiorari,* for it applies where the superior court considers it expedient or necessary to restore the record to the inferior court whose proceedings are in question. The writ commands the lower court to proceed with the case. The writ of *prohibition* forbids an ecclesiastical or inferior temporal court to continue proceedings therein in excess of its jurisdiction or in contravention of the laws of the land. *(See* PROHIBITION.) Another prerogative writ has taken the place of the writ *de excommunicato capiendo;* this is *de contumace capiendo* for compelling persons duly cited to appear in the ecclesiastical courts and for enforcing compliance with their orders and punishing contempts in the face of such courts. As to writs relating to the assembly of parliament, the king, on the advice of the Privy Council, issues a proclamation expressing the royal pleasure to call a new parliament and announcing an Order in Council to the lord chancellor to issue the necessary writs on the authority of the proclamation. In practice, the clerk of the Crown in Chancery does not receive direct authority from the chancellor for the issue of the writs, but regards the proclamation itself as sufficient for that purpose. Parliament must meet at any time not less than 20 clear days after the proclamation. Individual writs of summons are sent to those who are entitled to sit in the House of Lords; but for the election of members to the House of Commons the writs are sent to the returning officers of the various constituencies. The writs of summons issued to peers of the United Kingdom are of historical note, for adjudication of disputed peerage claims has often centred in the validity or scope of the writ. Even now, though such a peerage is invariably created by letters patent, these are accompanied by a writ of summons, and it rests with the committee for privileges of the House of Lords to decide whether the writ is valid, or indeed whether it can be issued at all; a familiar instance was their refusal to issue the writ to a peeress in her own right *(Viscountess Rhondda's Claim*, Law Reports [1922] 2 Appeal Cases, 339).

Scotland.—"Writ" is a more extensive term than in England. Writs are either judicial or extrajudicial, the latter including deeds and other instruments—as, for instance, in the Lord Clerk Register (Scotland) Act, 1879, and in the common use of the phrase "oath or writ" as a means of proof. In the narrower English sense both "writ" and "brieve" are used. The brieve was as indispensable a part of the old procedure as it was in England, and many forms are given in *Regiam Maiestatem* and *Quoniam Attachiamenta.* It was a command issued in the king's name, addressed to a judge, and ordering trial of a question stated therein. It was drawn by the writers to the signet, originally clerks in the office of the secretary of State. Its conclusion was the will of the summons. In some cases, proceedings which were by writ in England took another form in Scotland. For instance, the writ of attaint was not known in Scotland, but a similar end was reached by trial of the jury for wilful error. Most proceedings by brieve, being addressed to the sheriff, became obsolete after the institution of the court of session, when the sheriffs lost much of that judicial power which they had enjoyed to a greater extent than the English sheriff. *(See* SHERIFF.) An English writ of execution is represented in Scotland by diligence, chiefly by means of warrants to messengers-at-arms under the authority of signet letters in the name of the king. The only brieves in practical use are those for serving a tutor-at-law, for kenning to the terce, and for cognition of insane persons. The two former are rare; the third was substituted by the Court of Session (Scotland) Act, 1868, for the old brieves of furiosity and idiotry. Other kinds of brieve have been superseded by simpler procedure, *e.g.,* the brieve of service of heirs, representing the older *breve de morte antecessoris,* by *a* petition to the sheriff under the Titles to Land Consolidation (Scotland) Act, 1868, and the brieve of perambulation by action of declarator. Writs *eo nomine* have been the subject of much modern legislation. The writs of *capias, habeas, certiorari* and extent were replaced by other proceedings by the Exchequer Court Act, 1856. The writs of *clare constat,* resignation and confirmation (whether granted by the Crown or a subject superior) were regulated by the Titles to Land Act *(supra).* By the same act Crown writs are to be in the English language and registered in the register of Crown writs. Writs need not be sealed unless at the instance of the party against whom they are issued. Writs of progress (except Crown writs, writs of *clare constat* and writs of acknowledgment) were abolished by the Conveyancing (Scotland) Act, 1874. The *clare constat* writ is one granted by the Crown or a subject superior for the purpose of completing title of a vassal's heirs to lands held by the deceased vassal.

(P. H. W.)

United States.—The system of original writs seems never to have obtained in the United States. From the earliest colonial times actions were begun by the issuance of a writ of summons directed to a sheriff or constable, briefly setting forth the character of the claim, and directing that official to summon the defendant. This writ of summons as distinguished from the early English chancery writs was a judicial and not an executive writ. Its issuance was simply a means for securing the presence of the defendant before the court, not as in England giving the court jurisdiction to hear the particular claim. The form of the writ of summons followed in the main the old English writ, briefly stating the cause of action. Probably because of this similarity, despite the absence of original writs, the common law forms of action continued to survive in the United States. Until the adoption of procedural reforms by the codes during the middle of the 19th century, they persisted with all their common law vigour. Under the codes there is usually but one form of action, which is begun by the issuance of a summons prepared by the plaintiff's attorney and served by any one not a party to the suit. The summons is brief, does not disclose the nature of the action, though a copy is commonly attached to and served with the summons.

Writs in the Federal courts are by Act of Congress to be tested in the name of the chief justice of the United States. By State law writs in the State courts are generally bound to be in the name of the people of the State, in the English language, and tested in the name of the chief justice of the State. The common law prerogative writs such as *mandamus,* prohibition, *certiorari, quo warranto* and *habeas corpus* are well known in the United States. The Constitutions or statutes of the several States confer upon their courts power to issue these writs. The cases in which they may issue are generally governed by statute, and the courts issue them as a matter of sound discretion and not as a matter of right. In trying questions of title to real property, writs of entry and other real actions, which before the settlement of the colonies had become nearly obsolete in England, were until the middle of the 19th century the common remedies in the U.S. courts. They were, however, stripped of the cumbrous feudal appendages which made them intolerable in England. The action of ejectment begun by summons in the manner of any personal action has now supplanted them. Two prerogative writs have much importance in the Federal courts. These are the writ of error (now abolished in England) and the writ of *certiorari.* From 1879 until 1914, writ of error was the only means by which a decision of a State court could be reviewed in the Supreme Court of the United States. In that year *certiorari* was added as another method for review, having been available since 1891 as a method for reviewing decisions of the inferior Federal courts in the Supreme Court. In 1928 the writ of error was abolished and appeal substituted in its place. The writ of assistance has its interest in constitutional history. Before the War of Independence it was issued to revenue officers to search premises for smuggled goods. It was on this writ that it was first contended in 1761 that a colonial court had jurisdiction to examine the constitutionality of a legislative Act authorizing the issue of the writ. *(See Quincy's Massachusetts Rep.,* app., *I. 520.)* (J. M. La.)

Bibliography.—For the history of the writ see *Registrum Brevium* and Sir Anthony Fitzherbert, *La nouvelle Natura Brevium* (1534 or 1537; Eng. trans., 1652, 9th ed., 1794), both noticed above; *Natura Brevium,* which changed its name to *Old Natura Brevium* after Fitzherbert's book was published; it exists in a great number of editions, the earliest of which is about 1516, the last 1584; *Novae narrationes; Articuli ad novas narrationes; Returna Brevium;* Simon Theloall, *Le digest des briefs originals* (1579); *Thesaurus brevium* (*c.* 1661); R. Brownlow, *Brevia judicialia* (1662); *Officina brevium* (1679); Sir E. Coke, *Institutes* (1628, many later editions); C. Dufresne du Cange, "Brevis" in *Glossarium* (Leyden, 1688; best ed. Henschel 1840–1850); G. Booth, *Real Actions* (1701); *W.* Tidd, *Practice* (1790–97); *H.* J. Stephen, *Pleadittgs* (1824; 7th ed., 1868); R. J. and A. B. Corner, *Practice of the Crown Side* (1844); M. M. Bigelow, *History of Procedure in England* (1880); *F.* Pollock and F. W. Maitland, *History of English Law Before the Time of Edward I* (1895); W. S. Holdsworth, *History of English Law* (1903 *et seq.* especially vol. ii and iii); W. S. McKechnie, *Magna Carta* (1905; 2nd ed., 1914); T. A. Street, *Foundations of Legal Liability,* vol. iii (1907); F. W. Maitland, *Equity, Also the Forms of Action at Common Law* (edit. *A. H.* Chaytor and W. J. Whittaker, 1909); also *Collected Papers,* vol. ii (edit. H. A. L. Fisher, 1911); W. Stubbs, *Select Charters* (9th ed., 1913); P. H. Winfield, *Chief Sources of English Legal History* (1925); and E. Jenks on "Prerogative Writs" in *The Yale Law Journal* (April 1923).

For current law, there is no book which deals with writs both exclusively and completely. Taken in the aggregate, the following books cover the topic: *The Annual Practice;* W. G. Clay, *The Law and Practice Relating to Writs of Summons* (1894); F. H. Short and F. H. Mellor, *Practice on the Crown Side of the King's Bench Division* (2nd ed., 1908); E. R. Daniell, *Chancery Practice* (8th ed., S. E. Williams and F. Guthrie Smith, 1914), and *Chancery Forms* (6th ed., *R.* White, F. E. W. Nicholls and H. G. Garrett, 1914); T. E. May, Baron Farnborough, *Parliamentary Practice* (13th ed., T. L. Webster, 1921); W. B. Odgers, *Pleading and Practice* (10th ed., 1926); Alduson, *Judicial Writs and Process* (1895); and *see* "Writ" in index to the Earl of Halsbury, *The Laws of England* (31 vol., 1907–17, with supplement, 1910 *et seq.).* (P. H. W.)

WRITING, in the widest sense, is a system of human intercommunication by means of visible conventional markings. The earliest and most universal means of communication available to human beings is speech and gesture. These have two features in common: (1) They are of momentary duration and are therefore restricted as to time; as soon as the word is uttered, or the gesture made, it is gone and cannot be revived except by repetition (2) They can be used only in communication between persons more or less in proximity to each other and are therefore restricted as to space.

The need for finding a may to convey thoughts and feelings in a form not limited by time or space led to the development of methods of communication by means of (1) objects and (2) markings on objects.

Systems of mnemonic signs to keep accounts are known throughout the world. The simplest, commonest ways of keeping records of cattle are with so-called counting sticks—simple wooden sticks with carved notches corresponding to the number of cattle in the custody of a shepherd—and with pebbles in a sack. More complicated is the use, among the Peruvian Incas, of quipu writing, in which accounts concerning objects and beings were recorded by means of strings and knots of various length and color. Reports of the use of the quipu for recording chronicles and historical events are fantasy. Neither the Peruvian nor the modern knot writings in South America and on the Riukiu Islands near Japan have any other aim than to record simple statistical facts. Similar is the use of wampum (*q.v.*) by North American Indians; strings of shell beads, frequently tied together in belts, served as money, ornaments and also as a means of communication. The impracticability of using objects prevented the development of any full system, and such primitive devices are restricted to small geographical areas.

Writing is expressed not by objects themselves but by markings on objects. Writing began when man learned how to communicate his thoughts and feelings by means of visible signs, understandable not only to himself but also to all other persons initiated into the particular system. The relationship between writing and speech was at first very loose, inasmuch as the written message did not correspond to an exact utterance. A message had one meaning and could be interpreted by the reader in only one way, but it could be read, that is, put into words, in several different mays and even in several different languages.

In later periods, systematic phonetization enabled man to express his ideas in a form which corresponded exactly to the spoken units. From that time writing gradually lost its character as an independent mode of expressing ideas and became a tool of language.

While the elements of language include phrases or sentences, words, syllables, distinctive sounds or phonemes and prosodic features, writing systems are concerned chiefly with the visual representation of words, syllables and single sounds. Signs for phrases are rarely found in popular writings, though they form an integral part of all stenographic systems. Of prosodic features, such as quantity, accent, tone and pauses, only the latter are partially expressed in writing by word division and punctuation marks. Commonly, writing fails to indicate adequately the prosodic features. Thus, in a sentence such as "Are you going home?" the interrogation is indicated by the question mark, but it is left to the reader to decide whether the emphasis is on the first, second, third or fourth word. By contrast, phonetic transliterations frequently employ special signs to denote characteristics of prosodic nature, by means of diacritical marks or numbers, as in the writing of *dḗmos* (ˊ denotes quantity and stress), or ku_3 ($_3$ denotes tone). A full indication of tone or pitch has been developed only in the system of musical notation. Table I shows in chart form the various ways of writing linguistic elements.

Table *I.—Ways of Writing Linguistic Elements*

Elements	Written sign	System of signs
[Phrase . . .	Phraseogram or phrase sign	Phraseography or phrase writing]
Word	Logogram or word sign	Logography or word writing
Syllable . . .	Syllabogram or syllabic sign	Syllabary or syllabic writing
Single sound . .	Letter or alphabetic sign	Alphabet or alphabetic writing
[Prosodic feature .	Prosodic sign or mark	Prosodic writing]

The various stages of the development of writing are shown in chart form in Table II. Absurd as it may appear at first glance to designate the three main stages of writing as No Writing, Forerunners of Writing and Full Writing, there are good reasons for this division. A full discussion follows the chart.

Archaic devices from an older period and innovations ahead of the accepted development may be found in a system of writing at any period. Hence in the representation (below), it is impossible to take account of all minor divergences. A long and complicated terminology would only tend to obscure the issue. For this reason, the terminology used in the chart is meant to define only the major characteristics of a writing. English writing, like Latin, is called alphabetic, even though it contains some word signs, as in "3 lb." or "£3" for "three pounds." Many more word signs are used with the Elamite syllabary and the Pahlavi alphabet. The Hittite hieroglyphic syllabary contains a few signs of the type tra, *ara,* outside of the normal development. The Carian alphabet consists of alphabetic signs borrowed from Greek with a number of syllabic signs borrowed from another system of local (Anatolian) origin. In all phonographic ariting, especially in Chinese, are found elements which are normally included under the semasiographic stage of writing.

TABLE 11.—Stages of the Development of Writing

No Writing: Pictures					
Forerunners of Writing: Semasiography 1. Descriptive-representational device 2. Identifying-mnemonic device					
Full Writing. Phonography					
1. Word-syllabic	Sumerian (Akkadian)	Egyptian	Cretan	Hittite	Chinese
2. Syllabic.	Elamite Hurrian	West Semitic (Phoenician) (Hebrew) (Aramaic)	Linear A Linear B Cypro-Minoan Cypriote Phaistos' Byblos?		Japanese
3. Alphabetic .		Greek Aramaic (vocalized) Hebrew (vocalized) Latin Indic			

Pictures.—The fact that pictures are mentioned as the first stage, called No Writing, implies: (1) that what are normally understood as pictures do not fall under the category of writing; but (2) that writing had its origin in simple pictures. There is, however, a very close connection between pictures and writing, for a natural way of communicating ideas by means of visible markings is achieved by pictures. To primitive man a picture in a crude nay takes care of the needs fulfilled in modern times by writing. In time the picture developed in two directions: (1) pictorial art, in which pictures continued to reproduce more or less faithfully the objects and events of the surrounding world in a form independent of language; and (2) writing, in which signs, whether they retained their pictorial form or not, ultimately became symbols for linguistic elements.

Semasiography.—Under Forerunners of Writing are included the various devices by which man first attempted to convey his thoughts and feelings. An all-inclusive term which may be coined for these devices is "semasiography" (Gr. *sēmasía*, "signification," and *graphē*, "writing"). This is the stage in which pictures convey the general meaning intended by the writer. In this stage, visible draan forms—somewhat like gesture language—express meaning directly without an intervening linguistic form. In place of the term semasiography used here, most scholars prefer the terms pictography or ideography.

Primitive communication with visible symbols was achieved by descriptive-representational and identifying-mnemonic devices. As the two devices frequently overlap, it is difficult to assign some primitive writings rigorously to one or the other category.

Descriptive-representational devices are similar to drawings but differ in that they contain only what is important for communication and lack aesthetic embellishment. In the identifying-mnemonic device a symbol is used to depict a person, an animal or an object for the purpose of identifying it individually, or of recording articulate utterances such as proverbs or songs. An illustration of the identifying device is a drawing of a nhite hawk, to represent a man named White Hawk. Mnemonic devices are exemplified by the symbols used to record proverbs among the Ewe Negroes of Togoland, such as a picture of a threaded needle and of a piece of cloth, representing the proverb, "The needle sews great cloth," meaning that small things can achieve greatness. The descriptive-representational device may seem the more developed because it seems to communicate better than identifying-mnemonic devices. A drawing depicting a battle by the descriptive-representational device for instance, tells the story better than one or two identifying-mnemonic signs. It is not the descriptive-representational device, however, which leads to fully developed writing. Pictures drawn for this purpose are bound by the conventions of art, which limit and hinder them as vehicles of human intercommunication.

Identifying-mnemonic devices are also drawn; their aim, however, is not to describe but to help the reader remember and identify an event, object or being. Thus, a complete correspondence is established and gradually conventionalized between certain symbols and certain objects or beings. Since these objects and beings have names in the oral language, the correspondence is further established between the written symbols and their spoken counterparts. Once it was discovered that words could be expressed in written symbols, a new and much better method of human visual communication was established. It was no longer necessary to record an event such as a man killing a lion by drawing the man, spear in hand. killing the lion. Instead, the spoken sentence, "man killed lion," could be recorded by three conventional symbols representing the words "man," "killed" and "lion." Accordingly, "five sheep" could be expressed by two symbols corresponding to two words instead of by the five separate pictures of sheep required in the descriptive-representational device. The introduction in the identifying device of strict order in the signs, following the order of the spoken words, is in direct contrast to the method of the descriptive device and of the picture, in which the meaning is conveyed by the totality of little drawings without any convention as to the beginning of the message or the order in which it should be interpreted.

A device in which individual signs express individual words should naturally lead to a complete system of word signs, that is, word writing or logography. Such a fully developed system has never existed, either in antiquity or in modern times. To create and memorize signs for thousands of words and names is so impracticable that logographic writing either can be used as a limited system or must find new ways to overcome the difficulties.

Primitive logographic writing can develop into a full system only if a sign acquires a phonetic value independent of the meaning of the sign as a word. This is phonetization, the most important single step in the history of writing. In modern usage this step is exemplified by rebus writing, in which the drawing of an eye and of a saw express the phrase "I saw," or that of a man and a date express the word "mandate." Phonetization and its subsequent systematization made possible complete systems of writing in which linguistic forms could be expressed by symbols with conventional syllabic values. Thus full writing originated.

Phonography.—Word-Syllabic *Systems.*—The Sumerians took the important step leading to fully developed writing. The Sumerian state and economy required records of goods transferred from the country to the cities and vice versa. Records were kept in concise ledger form, of the type "five sheep" or, with a personal name, "ten bows, X." The use of one sign for one word resulted in the origin of a logographic system which soon expanded into a phonographic system through the necessity of expressing personal names in an exact way to prevent confusion in the records. The greatness of this achievement lies in the fact that, in creating a full word-syllabic system from the old identifying-mnemonic device, the Sumerians were able to break away entirely from the conventions of the descriptive-representational device. The writing developed into the word-syllabic system, while the identifying-mnemonic device continued undisturbed on seals.

There are seven ancient Oriental systems of writing, of which the oldest is the Sumerian, first attested in southern Mesopotamia around 3100 B.C. From there the main principles of Sumerian writing may have spread eastward, first to the neighbouring Proto-Elamites and then, perhaps via the Proto-Elamites, to the Proto-Indians in the valley of the Indus; one of the Near Eastern writings may, in turn, have been the stimulus leading to the creation of Chinese writing. Around 3000 B.C. Sumerian influence presumably uorked its way westward to Egypt; Egyptian influence, in turn, spread toward the Aegean where, about 2000 B.C., Cretan writing originated, and a few centuries later, Hittite hieroglyphic writing in Anatolia.

Since of the seven systems three—Proto-Elamite, Proto-Indic and Cretan—are undeciphered, the principles of writing can be discussed only as they are found in the remaining four—namely, Sumerian, Egyptian, Hittite and Chinese.

As far as the basic principles of writing are concerned, the unifying characteristics of the four systems are that they are all phonographic almost from the very beginning of their development and that they all contain signs of these three classes: word signs or logograms. syllabic signs and auxiliary signs.

The formation of word signs is identical or very similar in all four systems. One sign or a combination of signs expresses one word or a combination of words. Also the principles of using auxiliary signs, such as determinatives or punctuation marks. are identical, although the various systems may differ in form. Only in the use of syllabic signs are the differences so prominent as to permit classification by types.

Type I.—Sumerian, Akkadian: monosyllables ending in a vowel or consonant: ta, ti, te, tu; at, it, et, ut; tarn, *tim, tem, tum;* and very rarely also dissyllables like ata, *tama.*

'Type 11. — Egyptian: monosyllables and dissyllables ending in a vowel, with differences in vowels not indicated: t^x, $t^x m^x$.

Type 111. — Hittite, and almost certainly Cretan: monosyllables ending in a vowel: ta, ti, te, *tu.*

Type IV.—Chinese: monosyllables ending in a vowel or consonant: ta, ti, te, tu, to; at, it, et, ut, ot; tam, *tim, tem, tum,* tom.

Syllabic *Systems.*—Four types of syllabic systems developed from the four word-syllabic systems discussed above: cuneiform syllabaries, such as Elamite and Hurrian, from Mesopotamian cuneiform; West Semitic syllabaries, such as Sinaitic, Proto-Palestinian, Phoenician, Old Hebrew, Old Aramaic, from Egyptian hieroglyphic; Aegean syllabaries, such as the Cretan and Mycenean Linear A and Linear B (see MINOAN LINEAR SCRIPTS), Cypro-Rfinoan and Cypriote and perhaps the little known Phaistos (Crete) and Byblos (Syria) writings, from Cretan; and, finally, the Japanese syllabary from Chinese.

Of all systems of writing the syllabic is the easiest to evaluate from the point of view of the development of writing: for all syllabic writings are either identical with, or simplified from, the respective syllabaries of the word-syllabic writings from which they are derived. Syllabic writings exhibit the following four types:

Type I.—Elamite and Hurrian cuneiform: monosyllables ending in a vowel or consonant: ta, ti, te, tu; at, it, et, ut; tam, *tim,* tern, *tum.*

Type 11. — West Semitic: monosyllables ending in a vowel, with differences in vowels not indicated: t^x.

Type 111. — Linear A, B and Cypriote: monosyllables ending in a vowel: In, ti, te, tu, to.

Type IV.—Japanese: monosyllables ending in a vowel: ta, ti, te, tu, to; *(da,* di, de, *du,* do).

Only two of the four types here mentioned employ syllabic signs exclusively, namely the West Semitic and the Cypriote. The derived cuneiform syllabaries, and most of the Aegean syllabaries, carry with them a limited number of word signs borrowed from the Mesopotamian cuneiform and Cretan hieroglyphic respectively; the Japanese syllabic system (kana) is used normally side by side with a number of word signs derived from Chinese (*kanji*).

Alphabetic *Systems.*—If by the word "alphabet" is understood a writing which expresses the single sounds of a language. then the first alphabet was formed by the Greeks. Although throughout the second millennium B.C. several attempts were made to indicate vowels in syllabaries of the Egyptian-Semitic type, none developed into a full vocalic system. The usual way was to add phonetic indicators as helps in reading the vowels, which normally were left unindicated in the Semitic systems of writing. But while the Semites sparingly employed these *matres lectionis,* as they are called, as in the case of m^a-l^a-$k^{(a)}$-t^i-$\underset{\frown}{i}^i$ for *malaktī* "I reigned," the Greeks used them systematically after each syllabic (*i.e.,* consonantal) sign. Thus, following the principle of reduction, it was seen that in t^i-$\underset{\frown}{i}^i$ since the second sign did not stand for a separate syllable $\underset{\frown}{i}^i$ but for a vowel i, the first sign must stand for a consonant t and not for a syllable t^i.

The Greeks, therefore, having accepted in full the forms of the West Semitic syllabary, evolved a system of vowel signs which, attached to the syllabic signs, reduced the value of these syllabic signs to simple consonants and thus for the first time created a full alphabetic system of writing. From the Greeks the Semites in turn learned the systematic use of vowel marks and consequently developed their own alphabets.

There are three types of alphabets in use, characterized by three different methods of indicating vowels:

Type I. — Greek, Latin: vowels indicated by separate signs: t-a, *t-i,* t-e, t-u, t-o.

Type 11. — Aramaic, Hebrew, Arabic: vowels indicated by separate diacritical marks: $\underline{t}$, *t*, t, t, *t*, or the like.

Type III.—Indic, Ethiopic: vowels indicated by diacritical marks attached to the sign or by internal modification.

During the last 2,500 years alphabets have reached to the farthest corners of the earth but the principles of writing have not changed. Hundreds of alphabets throughout the world, different as they may be in outer form, use the principles first and last established in Greek writing.

See ALPHABET: BOUSTROPHEDON; CALLIGRAPHY; CUNEIFORM; HANDWRITING: HIEROGLYPHS; INSCRIPTIOSS; PALAEOGRAPHY; PICTOGRAPHY; RUNE. See also Index references under "Writing" in the Index volume. (I. J. G.)

WROCLAW (Old Polish WRACISLAW, German BRESLAU), a city of southwestern Poland, chief town of Lower Silesia and the see of a Roman Catholic bishopric, is situated 394 ft. above sea level in a wide and fertile plain on both banks of the navigable Oder (Odra), 352 mi. from its mouth. Administrative area 86.9 sq.mi. Pop. (May 1939 census) 615,006; (1950 census) 308,-925; (1960 census) 429,200.

The oldest part of the city, which existed in the 10th century, is situated on two islands, the bigger Cathedral Island and the much smaller Sand Island, lying between two arms of the Oder which there flows in a westerly direction. This old town, destroyed by the Tatars in 1241, was later rebuilt, but in the meantime a new town had grown up on the left bank round a Market square from which main streets radiated north, east, south and west. The new town received its municipal autonomy in 1261 and in 1327 it absorbed the old town. A semicircle of moats and walls was built and these city defenses were kept until 1807. Their demolition on Napoleon's order favoured the city's extension, which became particularly rapid after 1871. In 1910 the city's administrative area was almost 19 sq.mi. with a population of 512,105, including 303.378 Protestants, 183,542 Roman Catholics and 20,212 Jews. On the eve of World War II it was four times larger and its east-west axis was 15.5 mi. long. It was destroyed in 1945 to the extent of 68%, some outer sections being reduced to rubble. In Wroclaw the Germans defended themselves for three months, demolishing many blocks of houses in the old town in order to build an emergency airstrip; the Russian heavy artillery did the rest.

In the old town are several medieval buildings of great interest. The cathedral, dedicated to St. John the Baptist, was built in Romanesque style in 1158–80 on an older foundation. The present Gothic cathedral, incorporating some of the former, was begun in 1234 and completed in the 15th century. Destroyed at the beginning of 1943 to the extent of 70%, it was carefully rebuilt in 1946–51. The Gothic church of the Holy Cross nearby (dating from 1288) and that of Our Lady of the Sand (1334–1412) were both heavily damaged in 1945 and have been rebuilt since. The most remarkable Gothic churches of the new town are St. Elizabeth and St. Mary Magdalen, near the Market square; both date from the 13th century. were damaged in 1935 and have been rebuilt since. The town hall. which stands in the middle of the Market square, is a Gothic building dating from the 13th century and rebuilt in the 15th century; it now houses the Historical museum. In front of it stands the monument of Count Alexander Fredro, transferred there from Lwow. Two Renaissance houses in the same square and several baroque houses scattered through the old town escaped destruction in World War II. The university, a baroque building facing the Oder, was built in 1728–36 as a Jesuit college. Damaged in 1035 and repaired since, it contains a magnificent hall (Aula Leopoldina), richly ornamented with frescoes. Besides the university. Wroclaw had in the 1950s seven other institutions of higher education, an opera house (a 19th-century neoclassic building) and three other permanent theatres. There are many public parks and gardens, including a botanical and a zoological garden, all situated on the outskirts of the city.

Wroclaw has the largest railway carriage plant in Poland; machine tools, electrical equipment, chemicals and many processed foodstuffs are manufactured there. More than a half of the population is employed in industry.

Wroclaw is an important communication centre. It is linked by rail with Cracow, Berlin, Szczecin and Danzig (through Poznan), and the main Warsaw-Prague international line passes through the city. It has three railway stations and large river ports. It is linked by an airline with Warsaw, Danzig and Lodz, the airport, Maly Gadow, being $2\frac{1}{2}$ mi. from the city.

History.—From the end of the 10th century Wroclaw was part of Poland. It was an administrative and commercial centre (a mint existed there in the 11th century) and a fortified town. In A.D. 1000 King Boleslaw I the Brave founded a bishopric there, subject to the archbishopric of Gniezno. When Boleslaw III Wrymouth died in 1138 he divided the kingdom among his four sons. Wladyslaw, his eldest son, inherited Silesia. with the overlordship of the whole. and became the head of the Silesian line of the Piast dynasty. Wroclaw was first the capital of the whole of Silesia, but as a result of further subdivisions among the members of this prolific line, it became in the 14th century the chief town of a small principality of Wroclaw, without losing, however, its leading economic importance. Henry VI, prince of Wroclaw (1311–35), left his principality to the Bohemian crown. In 1526 it passed, with all Bohemia, to the Habsburgs, although all the Piast Silesian princes were left the status of *principes* Poloniae (princes of Poland). In 1742 Wroclaw, with the major part of Silesia, mas incorporated with Prussia. At that time the town's population was bilingual, but the Germans exercised the political and economic control. In 1821 a concordat between Prussia and the Holy See subjected the bishopric of Wroclaw directly to the pope. By the end of the 19th century the city was completely German. On May 7, 1945, Wroclaw was conquered by the Soviet army. Soon after the Potsdam agreement of Aug. 2, 1945, the Soviet military authorities transferred the city to Polish administration. As all the Germans left the city its population, quickly rising, was almost exclusively Polish. In March 1957 the German minority comprised 2,776 (0.7%).

WROUGHT IRON: see IRON AND STEEL.

WRYNECK (Jynx torquilla), a bird, so called from its way of writhing its head and neck. It summers in most parts of Europe, generally arriving a few days before the cuckoo, and is often known as "cuckoo's leader" and "cuckoo's mate." Its ninter habitat is the Mediterranean area.

The unmistakable note of the wryneck is merely a repetition of what may be syllabled *que,* que, que, many times in succession, rapidly uttered at first, but gradually slowing and in a continually falling key. This is only heard during a few weeks, and for the rest of the bird's stay in Europe it seems to be mute. It feeds mainly on insects on the ground, especially on ants. It is larger than a sparrow with beautifully variegated plumage of black, brown, buff and gray. The wryneck lays its translucent white eggs on the bare wood of a hole in a tree and it is one of the few wild birds that can be induced to go on laying by removing its eggs day after day, and thus more than 40 have been taken from a single hole—but the proper complement is from 6 to 10. When disturbed on the nest. the female writhes and hisses like a snake. In Great Britain, the bird is most common in the southeast, its numbers decreasing rapidly toward the west and north. Other species of the genus are found in various parts of Africa. The wrynecks form a subfamily Jynginae of the Picidae, a family which includes piculets and woodpeckers. They differ from other members of this family in coloration and in not having stiffened tail quills, nhich serve as props for the climbers.

WRYNECK (TORTICOLLIS), a congenital or acquired deformity characterized by the affected side of the head's being drawn downward tow-ard the shoulder together with deviation of the face toward the sound side. There are various forms, including the congenital, caused by a lesion of the sternomastoid muscle; the rheumatic, caused by exposure to a draft or cold and commonly known as stiffneck; and the nervous or spasmodic, the result of irritation of the spinal accessory nerve or its roots. Many cases are the result of hysteria and some of spinal caries. (F. L. A.)

WU-CH'ANG, a member city of the tri-city conurbation of Wu-han on the right bank of the Yangtze at the mouth of the Han river in Hupeh province, China. It was merged in 1950 with the adjacent cities of Han-yang and Hankow to form the single metropolis of Wu-han. See WU-HAN.

WUCHOW (WU-CHOU, TS'ANG-WU), former treaty port in eastern Kwangsi province, China, on the north bank of the Hsi Chiang (West river) at its junction with the Kuei Chiang. It is 220 mi. above Canton and can be reached all year by vessels of 8-ft. draft, and in high water, of 15-ft. draft. During summer floods the water pent up by the downstream gorges rises 50–60 ft. Because of its location, Wuchow was long the principal trade focus of the Kwangsi basin and western Kwangtung, shipping out large cargoes of tung oil (for which the city is named), timber, spices, sugar, hides and matting. The city mas the site of a U.S. air base and repeatedly was bombed during World War II; it was occupied briefly by the Japanese late in 1944. Its trade dominance over southwest China may be threatened or greatly reoriented with the operation since 1955 of the railway from Li-t'ang to Chan-chiang farther west. Pop. (1953) 110.800. (TE. H.)

WU-HAN, the greatest metropolis of central China and capital of Hupeh province. It is a tri-city conurbation comprising Hankow, Han-yang and Wu-ch'ang. Hankow (Han-k'ou) lies on the north side of the Yangtze at the mouth of the Han Shui (Hankow means "mouth of the Han"). Immediately opposite, in the angle of junction, is the older city of Han-yang and a little below the confluence, on the south bank of the Yangtze, is the ancient metropolis of Wu-ch'ang. Under the Communist regime in 1950 the three cities were merged into a single city called Wu-han. Pop. (1953) 1,427,300; (1957) 2,146,000.

Communications.—This triple city of Wu-han has an almost unrivaled geographical centrality which gives its site immense commercial significance. The Hupeh basin in which it lies is preeminently the central basin of China, the very heart of the country, and the converging point of routes from every point of the compass. If a line is drawn connecting the chief emporia along the periphery of China proper, (Peking, Sian, Chengtu, K'un-ming, Canton, Shanghai) there is a roughly circular area with Wu-han nearly in the centre. The Yangtze (*q.v.*), the greatest of China's arterial waterways, is navigable for large ocean-going vessels, except during the winter dry season, up to the site of Hankow which can therefore be considered as the head of ocean navigation, although 600 mi. from the coast. Upstream betneen Hankow and I-ch'ang, at the outlet of the Yangtze gorges, it is navigable for vessels of considerable size, and midway in this stretch, at Yoyang, (Yueh-yang), the river is the outlet for the large Tung-ting lake into which the Hsiang Chiang, the main artery of Hunan flows from the south, and from the southwest the Yuan Chiang, affording the water route to Kweichow and southwest China generally. To the east, the P'o-yang lake, strictly analogous to the Tung-ting lake, receives the waters of the Kan Chiang, the second of the two great river routes to the south through the south China highlands. Chiu-chiang, at the Yangtze outlet of this system, may be regarded largely as a feeder of Wu-han uhich is centrally placed in relation to the twin basins of Tung-ting and P'o-yang.

To the west of the Hupeh basin is the trough of the Yangtze gorges. difficult to navigate, but the only practicable route by which the Yuan Chiang or Red river basin of Szechwan can be brought into relation with the heart of China and the ocean. The construction of special steamers for negotiating the gorges even during the dry season formerly greatly facilitated trade between Chungking and Hankow. From the northwest comes the Han Chiang, navigable for 300 mi. above Hankow and the chief water route to Sian and northwest China.

The importance of this convergence of river routes was increased by the fact that the main north-south trunk railroad of China, the line linking Peking and Canton, intersected the Yangtze there. The railway was at first in two sections: the northern section from Peking to Hankow, and the southern section from Wu-ch'ang to Canton. Under the Communist regime, in 1957, a double-decker rail-and-road bridge was completed between the north and south banks of the Yangtze river, thus providing for the first time direct through traffic along the trunk railway. The importance of the Wu-han cities as a railroad hub was further increased since the southern section of the main line had branches leading eastward to Hangchow and southwest to Kwangsi province and North Vietnam. As the meeting point of maritime, river and rail transportation, Wu-han has almost unique advantages as a collecting and distributing centre, a position comparable to that of Chicago in the Cnited States. Wu-han is connected by regular steamer services with Shanghai, Chungking and other river ports and is the focus of an active junk traffic. It is the chief entrepôt for the central Yangtze provinces and for west and southwest China, particularly for tea, cotton, silk, timber (from western Hunan by the Yuan Chiang), tung oil and hides.

Industries. — Hankow was one of the first inland cities of China to be opened to foreign trade (1858) and its development as a port in close contact with Europe brought it early under the influence of western industrialism. Concessions were once held by Great Britain, France, Germany, Russia and Japan. Han-yang was selected by the viceroy Chang Chih-tung in 1891 as the site of the first modern steel plant in China. In 1908, the plant became the property of the Han-yeh-ping Iron and Steel company, which was named for the Han-yang plant, and the Ta-yeh iron mines and Ping-hsiang coal mines that supplied the steel plant with raw materials. The company was largely financed by Japanese loans. After World War I, Japanese interests obtained a share in the management of the company, closed down the steel furnaces and concentrated on shipping iron ore and pig iron to Japan. After 1925 the pig iron output gradually ceased. In 1938, during the Chinese-Japanese War, the Han-yang plant was dismantled and removed by Yangtze river junks to Chungking. The steel industry of the Wu-han area was gradually revived under the Communist regime after 1949. A medium-sized steel plant was built in the early 1950s on the basis of former Japanese installations at Huang-shih, downstream from Wu-han. In the tri-city area itself which has become a major industrial complex of China, construction of a large steel plant began in the mid-1950s on the south bank of the Yangtze and 15 mi. east of Wu-ch'ang. The first large blast furnace of this plant was in operation in the late 1950s.

Wu-han mas also an important centre of textile manufactures, although ranking far behind Shanghai. The cloths produced were mainly plain cloths, including woolen and cotton mixtures, and fancy cloths, including artificial silk and brocades, the demand for which was increasing. Dependent on this industry were a large number of dye works, the dyers in the majority of cases being weavers as well. American varieties of cotton yielded much better results in the Hupeh basin than in the Yangtze delta and the area under cotton in the region surrounding Wu-han was steadily increasing.

Another large industry based on local production was represented by the rice mills, employing modern machinery. In addition there were several oil mills, utilizing the large local supplies of beans. and many important refineries of wood or tung oil, which, as a substitute for linseed and other oils, had a large American and European market. There were also flour mills, cement works, soap and albumen factories, distilleries and a large number of miscellaneous industries. Hankow was also a great banking centre.

Prior to the political disturbances of 1926–27, the rapid increase in Hankow's foreign trade was remarkable, and after the settlement of the political issues described below Hankow retained its position as one of the leading Chinese trade centres.

History.—Wu-ch'ang, the oldest of the Wu-han cities, dates from several centuries B.C. It was capital of both the Chou (300 B.C.) and Wu (A.D. 300) kingdoms. An ancient cultural centre, it is the seat of Wu-han university and location of various commercial, industrial and art institutes, including those of medicine, agriculture and technology.

Both because of its intrinsic importance and its situation in relation to the chief routes, the Wu-han group of cities figured prominently in the troubled political history of modern China. The revolution of 1911 broke out in the barracks at Wu-ch'ang; the low ridges, particularly the Serpents' ridge, which there cross the marshy basin, mere of great strategic importance in the subsequent fighting. The line of heights overlooking the Han Shui was the scene of the principal struggle between the imperial and revolutionary troops, the main objective being the government arsenal at Han-yang. The capture of Hankow by the Nationalist armies, advancing northward from Kwangtung (Dec. 1926), marked the extension of Nationalist power to the middle Yangtze. It was followed by a serious mob onslaught on the British concession, the charge of which passed into the hands of the Chinese, and for a time business was completely suspended. Finally an agreement was concluded providing for the dissolution of the British municipal council and the setting up of a Chinese municipality modeled on that already set up for the former German concession in Hankow but Chinese-British in composition. After the fall of Nanking in 1937 the Chinese government withdrew temporarily to Hankow which became the base of Chinese resistance, defended by several "booms" on the Yangtze and strong fortifications and troop concentrations. The battle for Hankow started June 12 and ended with a final Japanese breakthrough north of the city which caused the evacuation on Oct. 12 and the fall of the city on Oct. 25, 1938. Japan occupied Wu-han until 1945. Control of the Chinese Nationalist government after World War II was short lived, however, and the cities fell to Chinese Communist troops in 1949. (T. SD.)

WU HOU (WU TSE T'IEN) (A.D. 625–705), empress of China in the T'ang dynasty was born in 625. She entered the palace at the age of 14 as a concubine to the Emperor T'ai Tsung and at his death in 649 obtained from his successor, Kao Tsung, who was deeply in love with her, the right to remain in the palace. After bearing the emperor a son she obtained the rank of empress. At Kao Tsung's death in 683 the empress, who had dominated the court for 30 years, deposed her son Chung Tsung. after a month's reign, and had herself enthroned (in 690) as empress and sovereign, a position never held before by a woman in China. She died in 705. Ruthless, cruel and ambitious, she had great ability and ruled well. The consolidation of the dynasty and empire were due to her.

See C. P. Fitzgerald, ***Empress Wu*** (1956). (C. P. F.)

WU-HU, an important port in Anhwei province, China, on the east bank of the Yangtze about 50 mi. S.W. of Nanking. East from Wu-hu the Yangtze delta is predominantly flat land, lakes and canals. The city mas a treaty port, 1877–1943, and is freely reached by deep-draft shipping carrying out the rice, silk, cotton, tea, wheat, feathers and eggs brought in via the network of canals. Wu-hu is a leading market for rice which is shipped regularly to the lower Yangtze and Canton areas. The city is connected by road, rail and river to Nanking. Across the river is Yu-ch'i-k'ou, a rail terminus with connections to Ho-fei and the Hwainan coal mines. Wu-hu has a large modern cotton-spinning factory and a power and light morks. Pop. (1953) 242.100. (TE. H.)

WULFENITE, a mineral consisting of lead molybdate. has been a minor source of molybdenum. Crystals usually have the form of thin square plates, sometimes beveled by pyramidal planes. They have a resinous to adamantine lustre, and are usually yellow to orange in colour. It crystallizes in the tetragonal pyramidal class of the tetragonal system, and the formula is $PbMoO_4$. The hardness is 3, and the specific gravity about 6.8, being lower when there is replacement of lead by calcium, and higher nith replacement of molybdenum by tungsten. It occurs in the oxidized zone of lead and molybdenum deposits. Fine crystals have been found at Pribram, Bohemia, and brilliant orange-red crystals in Yuma county, Ariz. (L. S. RL.; X.)

WULFHERE (d 675), king of the Mercians, a younger son of King Penda. was concealed for some time after his father's death in 655, but in 658 or 659, when the Mercians threw off the supremacy of Oswy, king of Korthumbria, Wulfhere became king. He did much to spread Christianity inside and outside his kingdom.

In 657 R'ulihere gained Lindsey from Northumbria, and he was successful against Wessex, extending his borders in all directions. Wulfhere married Eormenhild, a daughter of Erconberht, king of Kent, and was succeeded by his brother Ethelred. His only son, Coenred, became king in 704, in succession to Ethelred, and his daughter. St. Werburga or Werburh, was abbess of Ely.

WULFSTAN, ST. (*c.* 1012–1095), bishop of Worcester, born at Little Itchington near Warwick and educated in the monastic schools of Evesham and Peterborough, became a monk at Worcester and schoolmaster and prior in the cathedral monastery there.

Chosen bishop of Worcester in 1062, Wulfstan accepted with some reluctance, and was consecrated at York in September. He submitted to William the Conqueror, and helped to check the rebellious barons during the revolt of 1075. He was equally loyal to William II in his struggle mith the Welsh. Wulfstan's relations with his ecclesiastical superiors were not so harmonious, and at one time both Lanfranc of Canterbury and Thomas of York unsuccessfully demanded his removal.

Wulfstan died on Jan. 18, 1095. In 1203 he was canonized by Pope Innocent III.

WULFSTAN (d. 1023), bishop of London. 996–1002, archbishop of York, 1002–23, and bishop of Worcester, 1002–16, the author of many Old English homilies. treatises and law codes. He sometimes used the nom de plume Lupus. He was a product of the Benedictine revival and probably had some early connection with one of the Fenland abbeys, but nothing is known of him mith certainty before he became a bishop.

Wulfstan wrote in a distinctive style, which has enabled the canon of his work to be established. From 1008 he drafted the laws of Ethelred and those of Canute, and it was probably he who inspired the latter to reign as a Christian king and thus prevented the Danish conquest from being a disaster to Anglo-Saxon civilization. He was interested in problems of government and the arrangement of society. as is shown by the work known as *Institutes of Polity* and some short legal compilations made by him. He was also deeply concerned with the reform of the church. He studied canonical literature, asked Aelfric to write two pastoral letters for him and was himself the author of the text known as *The Canons of Edgar.*

His most famous work, the *Sermo Lupi ad Anglos,* is an impassioned appeal to call his countrymen to repentance and reform in 1014, after Ethelred had been driven out by Swegn's invasion. He interpreted his country's misfortunes as retribution for sin, and in a passage which illustrates his emphatic style as well as his zeal as reformer and preacher, claims that

> Things have not gone well now for a long time at home or abroad, but there has been devastation and famine, burning and bloodshed in every district again and again; and stealing and killing, sedition and pestilence, murrain and disease, malice and hate and spoliation by robbers have harmed us very grievously, and monstrous taxes have afflicted us greatly, and bad seasons have very often caused us failure of crops . . . Lo, what is there in all these events except God's anger clear and visible over this people?

Of his other homilies, some are denunciatory, some eschatological, some straightforward instruction in the Christian faith. He had a wide acquaintance with Latin writers, especially with Frankish authorities, and also with Gregory and other fathers, with the *Benedictine Rule,* with Bede, Aldhelm, Alcuin and the various ecclesiastical documents of the English church. Several surviving manuscripts of Latin writings derive from collections made by or for him.

Wulfstan's style is distinguishable in some entries in the northern recension of the Anglo-Saxon Chronicle, and in an Old English version of the Benedictine office. He died at York on May 28, 1023, and was buried at Ely.

A. Napier's edition of Wulfstan's homilies (1883) includes many not by him. Dorothy Bethurum's edition of the genuine homilies (1957) has a full bibliography, pp. 106–112. *See* also *Sermo Lupi* ad *Anglos,* edited by *D.* Whitelock, Methuen's Old English Library, 2nd ed. (1952); James M. Ure, *The Benedictine Office* (1957). *Institutes of Polity* was edited by Benjamin Thorpe, in *Ancient Laws and Institutes of England,* vol. ii, pp. 304–341 (1840). (D. WK.)

WUNDT, WILHELM MAX (*1832–1920*), German philosopher and psychologist, the father of experimental psychology and founder of the first psychological laboratory, was born in Neckarau, a suburb of Mannheim in Baden, on Aug. 16, 1832.

The son of a Lutheran pastor, he was privately tutored and prepared for the Gymnasium. He was a studious and sober youth, had no childhood friends and never developed any habits of play or interest in games. After completing his preparatory study, he went in 1851 to Tübingen from which after one year he transferred to Heidelberg to study medicine. Though little interested in the art of healing, Wundt soon became deeply interested in the medical sciences, particularly physiology. He obtained his M.D. degree in 1856 and, after spending the spring semester of that year at Berlin studying with Johannes Müller, he returned to Heidelberg for his habilitation as a *Privatdocent* in physiology. Even by that time he was showing signs of his future productivity: he had published two papers during his student days and three during the year following his graduation. In 1858 he published his first book, *Lehre von den Muskelbewegungen,* and the first section, the one on touch, of *Beiträge zur Theorie der Sinneswahrnehmung.*

In the autumn of 1858 Wundt was appointed assistant to Hermann von Helmholtz (*q.v.*) and placed in charge of the laboratory course in physiology. He held this position until 1864, when he was appointed assistant professor in physiology. In 1861 the section of his *Beitriige* appeared; in 1862 the last two sections, with a reprinting of the first two and the addition of an introduction, were published in a single volume. This book, particularly the introduction, foreshadows the program of Wundt's life work. During the same year he offered a new course on psychology from the point of view of the natural sciences, and published the lectures in 1863 under the title *Vorlesungen über die Menschen- und Thierseele.* With this record behind him, he was Helmholtz' logical successor at Heidelberg when the latter left in 1871 for Berlin, but did not receive the appointment. Spurred by this disappointment, he applied himself to the writing of his *Grundzuge der physiologischen Psychologie* (1873–74), a two-volume work that turned out to be one of the most important in the history of psychology. This book, which went through six revised and greatly enlarged editions was responsible for the call that Wundt received from Zürich in the autumn of 1874. He accepted but remained there only for one year; he then went to Leipzig to a chair in philosophy, a position he retained until he retired in 1917.

In 1879, carrying out the program outlined in his *Beitrage,* Wundt established at Leipzig a psychological laboratory, the first in the world. To meet the publication needs of the laboratory, Wundt founded in 1881 the *Philosophische Studien,* the first journal in the world devoted to psychology. The last two of the 20 volumes (1902, 1903) constitute a *Festschrift* prepared by his former students for the occasion of his 70th birthday. After one year without it, he founded the *Psychologische Studien* (1905–18), and carried it through ten volumes until after his retirement.

During the decade of the 1880s, Wundt's writings were chiefly philosophical. He published three huge encyclopaedic books during this period: *Logik* (1880), *Ethik* (1886) and *System der Philosophie* (1889), each of which went through three revised and enlarged editions. It was also during this period (1889) that he served as rector of the university. Revising his earlier books became by the 1890s a major task. Despite its magnitude, he did this and continued to bring out new books, the most important of which are: *Grundriss der Psychologie* (1896); *Völkerpsychologie* (1900–20), a ten-volume work upon which he concentrated his energies during the final years of his life; *Einleitung in die Philosophie* (1901); and *Einfuhrung in die Psychologie* (1911). Wundt's output in publication was tremendous. His bibliography contains over 500 titles.

Wundt regarded description as the problem of science, hence of scientific psychology, and observation as its method. He mas consequently concerned with observables and with the contents of consciousness and not with the act or functions that cannot be observed but only inferred. His psychology. therefore, has been designated as the content school in contradistinction to the schools that concern themselves with the acts or functions of consciousness. He died at Crossbothen, a village near Leipzig, on

Aug. 31, 1920, two weeks after his 88th birthday.

BIBLIOGRAPHY.—*See* the biographical sketch by E. B. Titchener in *Amer. J. Psychol.* 32:161 ff. (1921); Wundt's autobiography, *Erlebtes und Erkanntes* (1920). WU PEI-FU (1873–1939), Chinese general, was horn in Shantung. He joined the 3rd army division, commanded by Tsao Kun, distinguished himself in several minor campaigns, and was rewarded by Tsao Kun in 1916 with the command of a division. By 1917 he was the Peking government's chief bulwark against the monarchists, Sun Yat-sen's independent republic at Canton and the ambitions of Marshal Chang Tso-lin, the governor general of Manchuria. Sun Tat-sen was not in a position to take the offensive, but Chang Tso-lin invaded Chihli in the spring of 1922 and. being defeated by the forces of Wu Pei-fu, launched another attack in 1924. Wu Pei-fu was defeated in a great battle near Tientsin in October and fled, after which he remained in retirement at Yochow.

WUPPERTAL, a town in the *Land* North Rhine-Westphalia, Germany. lies in a valley among the hills northeast of Düsseldorf and about 20 mi. S. of Essen and the Ruhr valley. It extends for a distance of 10 mi. along both banks of the Wupper river, a small right-bank tributary that joins the Rhine between Düsseldorf and Cologne. Pop. (1950) 363,224; (1959 est.) 410,255.

Formed by the amalgamation (in 1929) of several towns and communities, Wuppertal has remained a place of contrasts. Its special character lies in the proximity of the countryside which, seen from the hills above. seems to penetrate to its centre. The high narrow houses are built on the slopes of the valley in parallel terraces which are connected by flights of steps. A monorail suspension railway, built at the turn of the 20th century, is the only one of its kind in the world. An opera house is one of the town's modern buildings and there are good sports facilities. There are several colleges for specialized study including theological and technical colleges. a teachers' training college and advanced schools in engineering. industrial design, etc.

Communications and Industry.— The layout of the town with its many flights of steps presents serious traffic problems, but external communications are by a main arterial road through the valley and by roads connecting Wuppertal with the Cologne-Kamen and Cologne-Ruhr *Autobahnen.* Manufactures include machines. vehicles. tools and electrical equipment. The pharmaceutical and rubber factories are world famous. and the town has breweries. printing works and publishing houses. Wuppertal is the textile centre ior the region; artificial silk. ribbons. braid and lace are made.

History.—Wuppertal was created on Aug. 1. 1929, under the name of Barmen-Elberfeld, these being the names of two previously independent towns which now form the eastern and central sections respectively. First mentioned in the 11th and 12th centuries, Barmen and Elberfeld jointly received in 1527 the monopoly in yarn bleaching for the *Bergische Land.* (This monopoly was repealed under the French civil code in 1810.) The introduction of silk weaving (1760) and red dyeing (1785) gave an added impetus to the textile industries which rose to their greatest heights in the 19th century when Barmen textiles became famous. In both Barmen and Elberfeld during the Napoleonic War local government on the French pattern took the place of the existing form of municipal government. In 1815 both towns reverted to Prussia. The system of civic poor relief introduced in Elberfeld in 1853 was long regarded as a model throughout the world. In 1929 the towns of Vohwinkel, Ronsdorf, Beyenburg and Cronenberg were united with Barmen and Elberfeld to form Barmen-Elberfeld. The name was changed to Wuppertal in 1930. The town suffered severe bomb damage during World War II.

(GD. H.; E. G. WR.)

WURTTEMBERG, a former state of Germany. forming a compact mass in the southwest angle of the country. In the south it was cleft by the long narrow territory of Hohenzollern, belonging to Prussia: and it enclosed several small enclaves of Baden and Hohenzollern, while it owned some small exclaves within the limits of these two states. Its total area was 7,530 sq.mi. It was hounded on the east by Bavaria, and on the other three sides by Baden, with the exception of short distances on the south. where it touched Hohenzollern and Lake Constance.

In 1945 Württemberg was divided into Württemberg-Baden, comprised of northern Württemberg and part of Baden (in the U.S. zone of occupation) and Württemberg-Hohenzollern (formerly southern Wiirttemherg and Hohenzollern in the French zone). The two *Länder* joined the German Federal Republic in 1949; in March 1952 they were combined with the *Land* of Eaden, in accordance with a plebiscite in Dec. 1951, to form the new southwestern state (*land*) of Baden-Württemberg. Area 13,803 sq.mi.; pop. (1950) 6,430,225, (1959 est.) 7,505,900.

The chiei mountains are the Black Forest (*q.v.*) on the west, the Swabian Jura or Rauhe Alb stretching across the middle of the country from southwest to northeast and the Adelegg mountains in the extreme southeast, adjoining the Algäu Alps in Bavaria. The Rauhe Alb or Alp slopes gradually down into the plateau on its south side. but on the north it is sometimes rugged and steep, its line broken by isolated projecting hills. The highest summits arc in the southwest, viz., the Lemberg (3,330 ft.), Ober-Hohenberg (3,317 ft.) and Plettenberg (3,287 ft.). South of the Rauhe Alb the plateau of Upper Swabia stretches to Lake Constance and eastward across the Iller into Bavaria. Between the Alb and the Black Forest in the northwest are the fertile terraces of Lower Swabia, continued on the northeast by those of Franconia.

The principal river is the Neckar, which flows northward to join the Rhine, and with its tributaries the Kerns. Kocher, Jagst, Ens, etc., drains much of the country. The Danube flows from southwest to northeast across the south half of former Württemberg, a distance of 65 mi. Just above Ulm it is joined by the Iller, forming the boundary between Bavaria and Württemberg for about 35 mi. The Tauber in the northeast joins the Slain; the Argen and Schussen in the south enter Lake Constance. The lakes of Württemberg, with the exception of those in the Black Forest, all lie south of the Danube. The largest is the Federsee (1 sq.mi.) near Huchau. Mineral springs are abundant; one of the most famous spas is Wildbad, in the Black Forest.

The climate is temperate. and colder among the mountains in the south than in the north. The mean temperature varies at different points from 43° to 50° F. The abundant forests induce much rain, most of which falls in the summer.

Tomns include Stuttgart (capital of the former kingdom of Württemberg and of Baden-Württemberg), Karlsruhe, Ulm, Heilbronn, Esslingen, Reutlingen, Ludwigsburg, Göppingen, Gmund, Tübingen, Tuttlingen and Ravensburg.

Württemberg was essentially an agricultural state. 64% of its total area was under cultivation and 31% was under forest. There are rich meadowlands, cornfields, orchards, gardens and hills covered with vines. The chief agricultural products include oats. spelt, rye. wheat, barley, hops. To these must be added wine (mostly of excellent quality). peas and beans, maize, fruit, chiefly cherries and apples, beets and tobacco and garden and dairy produce. Oi livestock, cattle, sheep and pigs are reared and attention has been paid to horse breeding.

After World War II industrial production increased, and by the mid-1950s about 40% of the population depended on it and only 20% on agriculture and forestry.

The salt industry was developed at the beginning of the 19th century. The iron industry is of great antiquity but was hampered by the absence of coal. Other products are granite, limestone, ironstone and fire clay. Linen, woolen and cotton fabrics are made at Esslingen and Göppingen, and paper at Ravensburg, Heilbronn and other places in Lower Swabia. The manufacturing industries assisted by the government developed rapidly during the later years of the 19th century, notably metalworking, especially such branches of it as require exact and delicate workmanship. Of particular importance are iron and steel goods, locomotives, machinery, motorcars, bicycles, small arms, all kinds of scientific and artistic appliances. pianos, organs and other musical instruments. photographic apparatus, clocks (in the Black Forest), electrical apparatus and gold and silver goods. There are also extensive chemical works. potteries, cabinetmaking workshops, sugar factories, breweries and distilleries. Water power and gasoline largely compensate for the lack of coal.

The Neckar, the Schussen and Lake Constance are all navigable for boats; the Danube begins to be navigable at Ulm. The oldest roads of Württemberg are Roman.

There are various tourist attractions in the area, including the Swabian and Black Forest rerions, the university town oi Heidelberg in the Neckar valley and famous spas. The iederal supreme and constitutional courts of the German Federal Republic sit in Karlsruhe.

HISTORY

Origins.—The origin of the name Württemberg is uncertain. Early forms of it are Wirtenberg, Wirtembenc, Wirtenberc, Wirtemberg and Wirtemberg. In 1806 Württemberg was adopted as the official spelling. As far as we know, the first inhabitants of the country were the

Celts, and then the Suebi. In the 1st century A.D. the Romans included it in the area defended by the *Limes Germanicus* (*q.v.*). Early in the 3rd century the Alamanni drove the Romans beyond the Rhine and the Danube, but in their turn they were conquered by the Franks under Clovis, the decisive battle being iought in 496. In the 9th century it was incorporated with the German duchy of Smabia.

The duchy oi Swabia mas ruled by the Hohenstaufen family until the death of Conradin in 1268, when a considerable part of it fell to the count oi Württemberg, the representative of a family first mentioned about 1080, a certain Conrad von Beutelsbach, having called himself after his ancestral castle of Wurttemberg. The earliest count about whom anything is known is Ulrich, who ruled from 1241 to 1265. Under his sons, Ulrich II and Eberhard I, and their successors the power of the family grew steadily. Eberhard (d. 1325) doubled the area of his county and transferred his residence from Württemberg to Stuttgart. His successors all added something to the area of Württemberg. The lands of the iamily mere several times divided, but in 1482 they were declared indivisible and were united under Count Eberhard V. In 1495 the county was raised to the rank of duchy.

The long reign (1498–1jjo) of Duke Ulrich I, who succeeded to the duchy while he was still only a child, was a most eventful period for the country. His extortions excited a rising known as that of the *arme Konrad* (poor Conrad) and in 1514 by the treaty of Tübingen the people undertook to pay the duke's debts in return ior various political privileges, which in effect laid the foundation of the constitutional liberties of the country. A few years later Ulrich quarreled with the Swabian league, and its forces expelled him and sold his duchy to the emperor Charles V. Charles handed over Wurttemberg to his brother, the German king Ferdinand I, but discontent caused by the oppressive Austrian rule, disturbances in Germany leading to the Peasants' War and commotions aroused by the Reformation gave Ulrich an opportunity to recover it. Aided by Philip, landgrave of Hesse, and other Protestant princes, he fought a victorious battle against Ferdinand's troops at Lauffen in May 1534, and then by the treaty of Cadan he mas again recognized as duke, but was forced to accept his duchy as an Austrian fief. He now introduced the reformed doctrines and proceeded to endow Protestant churches and schools throughout his land. Ulrich's connection with the League of Schmalkalden led to another expulsion, but in 1547 he was reinstated by Charles V, although on somewhat onerous terms.

Ulrich's son and successor, Christopher (1515–68), completed the work of converting his subjects to the reformed iaith. He introduced the system oi church government known as the *Grosse Kirchenordnung*. Frederick I (1557–1608), by paying a large sum of money, induced the emperor Rudolph II in 1599 to free the duchy from the suzerainty of Austria. Thus once again Wurttemberg became a direct fief of the empire. Under the reign of the next duke, John Frederick (1582–1628), Wurttemberg suffered severely from the Thirty Years' War. His son and successor Eberhard III (1614–74) plunged into the war as an ally of France and Sweden in 1633, but after the battle of Nordlingen in 1634 the duchy was occupied by the imperialists and he himself was for several years an exile. He was restored by the peace of Westphalia to a depopulated and impoverished country. During the reign of Eberhard IV (1676–1733),Wurttemberg suffered from French invasions.

Alexander, who became duke in 1733, embraced the Roman Catholic faith. His favourite adviser was the Jew Suss Oppenheimer, and it was thought that master and servant were aiming at the suppression of the diet and the introduction oi the Roman Catholic religion. The sudden death of Charles Alexander in March 1737 put an abrupt end to these plans, and the regent. Charles Rudolph, had Oppenheimer hanged.

Frederick Eugene (d. 1797) educated his children in the Protestant faith. Thus when his son Frederick II became duke in 1797, the ruler of Wiirttemberg was again a Protestant and the royal house adhered to that iaith thereafter. During Frederick Eugene's short reign the French invaded Wiirttemberg, compelled the duke to withdraw his troops from the imperial army and to pay a sum of money.

French Wars.— Frederick II (1754–1816) took part in the war against France against the wishes of his people, and when the French again invaded and devastated the country he retired to Erlangen, where he remained until after the conclusion of the peace of Lunéville in 1801. By a private treaty with France (March 1802) he ceded his possessions on the left bank of the Rhine, receiving in return nine imperial towns, among them Reutlingen and Heilbronn, and some other territories, amounting altogether to about 850 sq.mi. and containing about 124,000 inhabitants. He also accepted from Kapoleon the title of elector. In 1805 Wurttemberg took up arms on the side of France, and by the peace of Pressburg in Dec. 1805 the elector was rewarded with various Austrian possessions in Swabia and with other lands in the neighbourhood. On Jan. 1, 1806, Frederick assumed the title of king and abrogated the constitution.

In 1806 he joined the confederation of the Rhine and received further additions of territory containing 160,000 inhabitants; a little later, by the peace of Vienna in Oct. 1809, about 110,000 more persons were placed under his rule. In return for these favours Frederick joined Napoleon in his campaigns against Prussia, Austria and Russia. After the battle of Leipzig he deserted the French emperor, and by a treaty made with Metternich at Fulda in Kov. 1813 secured the confirmation of his royal title and of his recent acquisitions of territory, while his troops marched with those oi the allies into France. In 1815 the king joined the Germanic confederation. He died on Oct. 30, 1816.

The new king, William I, granted a new constitution in Sept. 1819. A democratic constitution, proclaimed during the revolution of 1848, was abrogated as soon as the movement had spent its force and the constitution of 1819 was restored.

Charles I (1823–91) succeeded his father William as king in July 1864. In 1866 Wurttemberg took up arms on behalf of Austria, but three weeks aiter the battle of Königgrätz its troops were decisively beaten at Tauberbischoisheim, and the country was at the mercy of Prussia. The Prussians occupied the northern part of Wurttemberg and peace was made in Aug. 1866; Wurttemberg paid an indemnity of 8,000,000 gulden and concluded a secret offensive and defensive treaty with Austria's conqueror.

On the outbreak of the Franco-Prussian War in 1870 its troops took a creditable part in the battle of Worth and in other operations of the war. In 1871 Wurttemberg became a member of the new German empire, but retained control of its own post office, telegraphs and railways. It had also certain special privileges with regard to taxation and the army. On Oct. 6, 1891, King Charles died suddenly, and was succeeded by his cousin William II (b. 1848), who continued the policy of his predecessor. The reform of the constitution continued to be discussed. and the election of 1895 was memorable because of the return of a poweriul party of democrats.

20th Century.— Between 1900 and 1910 the political history of Wurttemberg centred round the settlement of the constitutional question. The constitution was revised in 1906. No further changes were made until Oct. 1918, when the Weizsacker ministry, which held office during World War I, resigned, and revolution broke out on Nov. 9. On Nov. 11 a coalition was formed, from which the Spartacists were excluded, and representatives of the bourgeois parties admitted. The king abdicated on Nov. 30. The Spartacist rising of Jan. 1919 had its echo in Wurttemberg chiefly in the form of industrial disturbances, after which the Independent Social Democrats left the ministry. A new republican constitution was adopted in 1919, but this mas superseded in 1933 by a national socialist regime.

Wurttemberg mas occupied by Allied troops in 1945. For subsequent political changes, *see* above.

WURTZ, CHARLES ADOLPHE (1817–1884), French chemist, is credited with making the very significant discovery of the amines and subsequently the compound ureas. Born at Rolfisheim, near Strasbourg, on Nov. 26. 1817. he studied medicine and in 1839 was appointed *chef des travaux chimiques* at the Strasbourg faculty of medicine. In 1842 he studied at Giessen under Justus von Liebig (*q.v.*). He graduated in medicine in 1843. In 1844 he went to Paris and after a period under Antoine Balard, he became assistant in 1845 to J. B. A. Dumas (*q.v.*) at the École de Médecine. In 1852 Wurtz was appointed to the combined chairs of organic chemistry and of mineral chemistry and toxicology at the faculty of medicine as successor to Dumas. In 1875 he became the first occupant of the chair of organic chemistry at the Sorbonne. He died in Paris on May 12, 1884.

Wurtz's first published paper was on hypophosphorous acid (1842), and the continuation of his work on the acids of phosphorus (1845) resulted in the discovery of phosphorus oxychloride, as well as of copper hydride. Investigation of the alkyl isocyanates (1848) led him to the discovery of the amines (1849), and later (1851) the compound ureas. In 185j he showed that the combination between two hydrocarbon radicals could be brought about by the action of sodium on the alkyl iodides; this important reaction is known by his name. Electrolysis of mixed salts of aliphatic acids produced new simple and mixed radicals. About the same time he reached the conclusion that glycerol is a body of alcoholic nature formed on the type of three molecules of water. as common alcohol is on that of one! and was thus led (1856) to the study of the glycols, compounds related to both glycerol and alcohol. By oxidation of the glycols he produced homologues of lactic acid.

WÜRZBURG, a university town and episcopal see of Bavaria, Germany. capital of the province of Lower Franconia, situated on the Main, 60 mi. by rail S.E. from Frankfurt and at the junction of main lines to Bamberg and Nuremberg. Pop. (1950) 78.443. The site of the Leistenberg was occupied by a Koman fort, and was probably fortified early in the 13th century. Wircebirgum is the old Latin form of the name of the town; Herbipolis ("herb town") first appears in the 12th century. The bishopric was probably founded in 741, but the town appears to have existed in the previous century. About the 12th century the bishops had ducal authority in eastern Franconia. Quarrels broke, out between the bishops and the citizens, and, after long struggles, the citizens. submitted in 1400. Several imperial diets were held in Wurzburg, chief among these being the one of 1180 when Henry the Lion was placed under the ban. By the peace of Lunéville the bishopric was secularized, and in 1803 Wurzburg passed to Bavaria. The peace of Pressburg in 1805 transferred it to Ferdinand, formerly grand-duke of Tuscany, who joined the confederation of the Rhine and took the title of grand-duke of Würzburg. In 1815 the congress of Vienna restored Wiirzburg to Bavaria. The bishopric of Wurzburg at one time embraced an area of about 1,900 sq.m. and had about 250,000 inhabitants. A new bishopric of Würzburg was created in 1817.

An ancient stone bridge (1474–1607), 650 ft. long and adorned with statues of saints, and two modern bridges connect the two parts of the town on each side of the river. On the Leistenberg stands the fortress of Marienberg, which from 1261 to 1720 was the residence of the bishops. Many of the houses are interesting specimens of mediaeval architecture; and the numerous old churches recall the fact that it was long the capital of an ecclesiastical principality. The principal church is the imposing Romanesque cathedral, a basilica with transeptg, begun in 1042 and consecrated in 1189. The four towers, however, date from 1240, the (rococo) façade from 1711–19, and the dome from 1731. The transepts terminate in apses. The exterior was restored in 1882–83. Other interesting buildings are the Marienkapelle, the Haugerstifts church, the Neumunster church, the church of St. Burkhard, the palace, formerly the residence of the bishops and grand-dukes of Wurzburg, and the Julius hospital, and the town hall dates in part from 1456. Walter von der Vogelweide is buried in the cloisters adjoining the Neumunster church.

A university was founded at Würzburg in 1403, but it only existed for a few years. The present university was founded by Bishop Julius in 1582. There W. K. Rontgen discovered the "Rontgen rays" in 1896. Wurzburg was long the Jesuit stronghold in Germany, and the Roman Catholic theological faculty attracted large numbers.

Würzburg is surrounded by vineyards. Its principal industries are the manufacture of tobacco, furniture. machinery, scientific instruments and railway carriages. It has also breweries. and produces bricks, marmalade: pianos, sugar, malt and chocolate.

WURZEN, a town of Germany in the district of Leipzig. on the Mulde. 15½ mi. E. of the city of Leipzig by rail on the main line (via Riesa) to Dresden. Pop. (1950) 26.456. Wurzen was founded by the Sorbs, and was a town early in the 12th century. when the bishop of Meissen founded a monastery there. In 1581 it passed to the elector of Saxony. It has a 12th-century cathedral and a castle. at one time a residence of the bishops of Meissen and now utilized as law courts.

WYANDOTTE, a city of Wayne county, Mich., U.S., 10 mi. S. of Detroit on the Detroit river. The city was named for the Wyandots, a branch of the Huron tribe which fled from Ontario to Michigan in the early 18th century. It was at the Indian village Monguaga on the present site of Wyandotte that Pontiac, the famous Ottawa chief, planned a surprise attack on Detroit in 1763. His plans. however, were discovered and the plot failed. Settled in 1820. Wyandotte was incorporated as a village in 1854 and as a city in 1867. Ironworks and rolling mills were established in 1853 and in 1864 the first Bessemer steel in the United States was made there. Shipbuilding developed also and in 1887 vast salt beds were discovered under the city, assuring the development of chemical industries. Manufactures. in addition to chemicals, include cleaning products! gaskets, toys, paints, cement and screw machine products. Wyandotte is part of the Detroit standard metropolitan statistical area. For comparative population figures see table in MICHIGAN: *Population.* (P. P. M.)

WYANDOTTE CAVE, a cave in Crawford county, southern Indiana. It is but one of the many caves of southern Indiana dissolved and eroded in the relatively pure, massive, horizontally bedded Mississippian limestones that extend southward into the cavebearing regions of Kentucky and Tennessee. Like Mammoth cave, Ky., Wyandotte cave owes its early history to the demand for nitre for gunpowder in the War of 1812, the nitrate industry beginning in that year and terminating in 1817. The entrance is about 200 ft. above the Blue river. The "old cave" constitutes that portion of the cave discovered before 1850. In that year a new cave was discovered, a long extension with many passages and chambers. The mouth of the old .cave is 20 ft. wide and 6 ft. high. One hundred feet within the entrance the gallery widens into a spacious corridor known as Faneuil Hall, from which issues the Columbian Arch, a semicylindrical tunnel 75 ft. long, which in turn opens into Washington Avenue, a grand passageway, 275 ft. long, 30 ft. wide, and 40 ft. high. This passage terminates in a low gallery which expands into Banditti Hall, the common entry into both the old and new caves. The old cave ends in the Senate Chamber, an imposing rotunda like, but not quite so large as, Rothrock's cathedral with its magnificent Wallace's Grand Dome rising above Monument mountain, beyond Rothrock's Straits in the new cave.

The Senate Chamber is a vast elliptical amphitheatre, 145 ft. long and 56 ft. wide, converging upward to a gigantic dome. In the centre of the chamber a mass of fallen rock constitutes Capitol Hill, 32 ft. high, out of the centre of which rises the massive, fluted column of satin spar, or calcite, known as the "Pillar of the Constitution." Quite cylindrical, 25 ft. in diameter, this majestic column extends to the centre of the dome far above. A relatively sparse cave fauna and a few evidences of Indian activity are found in the cave. (W. E. E.)

WYANT, ALEXANDER HELWIG (1836–1892), U.S. painter, whose landscapes evolved from the tight realism of the Hudson River school to the subjectivism of the Barbizon school, was born at Port Washington, O., on Jan. 11, 1836. He studied with Hans Gude in Karlsruhe, and traveled in England and Ireland before returning to the United States. A trip with a government exploring expedition in the far west in 1873 left him with a physical infirmity that restricted his activity and in his later years nearly immobilized him.

Wyant died in New York city on Nov. 29, 1892.

Wyant's early landscapes, of which the best is "The Mohawk Valley" (1866; Metropolitan Museum of Art, New York city); were characterized by their near-photographic faithfulness to the subject, romanticism and a wide, panoramic effect. His mature art is marked by considerably more freedom and shows his relationship to Corot. This may be seen in "Moonlight and Frost" (Brooklyn museum) and "Landscape in the Adirondacks" (Metropolitan).

WYAT, SIR THOMAS (1503–1542), English poet and statesman, elder son of Henry Wyat, or Wiat, afterwards knighted, and his wife Anne, daughter of John Skinner of Reigate, Surrey, was born at Allington Castle, near Maidstone, Kent, in 1503. His father (1460–1537) belonged to a Yorkshire family, but bought Allington about 1493. He was an adherent of the Lancastrian party, and was imprisoned and put to the torture by Richard III. The family records (in the possession of the earl of Romney) relate that during his imprisonment he was saved from starvation by a cat that brought him pigeons. At the accession of Henry VIII he became knight of the Bath (1509), knight banneret (1513) and held various offices at court. His son, Thomas Wyat, was admitted at St. John's College, Cambridge, when about twelve years of age, took his B.A. degree in 1518, and proceeded M.A. in 1522. An early marriage with Elizabeth Brooke, daughter of Lord Cobham, proved unhappy, for a letter from the Spanish ambassador Chapuys to Charles V. (Feb. 9, 1542) speaks of her having been repudiated by her husband. As early as 1516 Wyat was server extraordinary to the king, and in 1524 he was at court as keeper of the king's jewels. He was one of the champions in the Christmas tournament of 1525. His father had been associated with Sir Thomas Boleyn as constable of Norwich Castle, and he had thus been early acquainted with Anne Boleyn. He appears to have been generally regarded as her lover. He was employed on missions to Francis I. (1526), to the papal court (1527), and from Rome was sent to Venice. From 1528 to 1530 he was acting as high marshal at Calais.

During the following years he was constantly employed in Henry's service, and was apparently high in his favour. He was, however, sent to the Tower in 1536, perhaps because it was desired that he should incriminate the queen. His father's correspondence with Cromwell does not suggest that his arrest had anything to do with the proceedings against Anne Boleyn, but the connection is assumed *(Letters and Papers of Henry VIII.* vol. x. No. 919) in the letters of John Hussey to Lord Lisle, deputy of Calais. Nicholas Harpsfield makes a circumstantial statement *(Pretended Divorce . . .* Camden Soc. p. 253) that Wyat had confessed his intimacy with Anne to Henry VIII. and warned him against marrying her; but this, in view of his continued favour, seems highly improbable. He was released after a month's imprisonment, and in the autumn of that year took part in the suppression of the Lincolnshire rising. In March 1537 he was knighted, and a month later was sent abroad as ambassador to Charles V. In 1j38 he was joined by Edmund Bonner, then a simple priest, who wrote to Cromwell (2nd Sept. 1538) a long letter (Petyt MS. 47, Middle Temple; first printed in the *Gentleman's Magazine,* June 1850) in which he accused Wyat of disloyalty to the king's interests, and of many personal slights to himself. So long as Cromwell ruled no notice was taken of Bonner's allegations. He was recalled in April 1539, but later in the same year he was employed on another embassy to the emperor. After Cromwell's death Wyat's enemies renewed their attacks, and he was imprisoned (Jan. 17, 1541) in the Tower on the old charges, with the additional accusation of treasonable correspondence with Cardinal Reginald Pole. He was released at the intercession of the queen, Catherine Howard, on condition that he confessed his guilt and took back his wife, from whom he had been separated for fifteen years, on pain of death if he were thenceforth untrue to her *(see* Chapuys to Charles V., March 1541). He received a formal pardon on March 21, and received during the year substantial marks of the king's favour. In the summer of the next year he was sent to Falmouth to meet the ambassadors of the emperor. The heat brought on a fever to which he succumbed at Sherborne, Dorset, on Oct. 11. A Latin elegy on his death was written by his friend John Leland. "Naenia in mortem Thomae Viati equitis incomparabilis"; and Henry Howard, earl of Surrey, celebrated his memory in some well-known lines beginning "Wyat resteth here, that quick could never rest," and in two sonnets.

Wyat's work falls readily into two divisions: the sonnets. rondeaus, and lyric poems dealing with love; and the satires and the version of the penitential psalms. The love poems probably date from before his first imprisonment. A large number were published in 1jjj in *Songes and Sonettes (Tottel's Miscellany).* Wyat's contributions number 96 out of a total of 310. These have been supplemented from mss. He was the pioneer of the sonnet in England. Wyat wrote in all thirty-one sonnets, ten of which are direct translations of Petrarch. The sentiment is strained and artificial. Wyat shows to greater advantage in his lyrical metres, in his epigrams and songs, especially in those written for music[1], where he is less hampered by the conventions of the Petrarchan tradition, to which his singularly robust and frank nature was ill-fitted. Wyat wrote three excellent satires—"On the mean and sure estate," dedicated to John Poins, "Of the Courtier's Life," to the same, and "How to use the court and himself." They are written in *terza rima* and in form and matter owe much to Luigi Alamanni. In the "Penitential Psalms" each is preceded by a prologue describing the circumstances under which the psalmist wrote, and the psalms themselves are very freely paraphrased, with much original matter from the author. They were published in 1549 by Thomas Raynald and John Harrington as *Certayne Psalmes . . . drawen into English meter by Sir Thomas Wyat Knyght.*

None of Wyat's other poems were printed until fifteen years after his death, in *Songes and Sonettes.* There are editions of his *Works* by *G. F.* Nott (1816); of the *Songes and Sonnettes* by *E.* Xrber (1870); and of the *Poems* (2 vols.) by A. K. Foxwell (1913). *See A.* K. Foxwell, *Study of Wyat's Poems* (1911). *See* also Brewer and Gardiner, *Letters and Papers of Henry VIII.* (especially from 1534 to 1542).

[1] One of the most musical of the pieces printed in his works, however, "The Lover complayneth the unkindnes of his Love," beginning "My lute, awake," is sometimes attributed to George Boleyn, Lord Rochford *(see* E. Bapst, *Deux Gentilshommes poètes de la cour de Henri VIII.,* p. 142).

WYAT, SIR THOMAS (THE YOUNGER) (d. 1554), English conspirator, son of the preceding. led a rebellion against Queen Mary. He was over 21 in 1543, but the date of his birth is uncertain. Somewhat wild in his youth. he was imprisoned with the young earl of Surrey for breaking Londoners' windows (1543). He fought at Boulogne (1544) and then served abroad till 1550. In 1542 he inherited the family property of Xllington castle and Boxley abbey in Kent on the death of his iather.

In 1554 he joined with the conspirators who combined to prevent the marriage of Queen Mary with Philip, the prince of Spain. On Jan. 22. 1j54, he summoned a meeting of his friends at his castle of Allington, and the 25th was fixed for the rising. On the 26th Wyat occupied Rochester, and issued a proclamation to the county. Lord Abergavenny and Sir Robert Southwell. the sherifi of Kent. were deserted by their men. who either disbanded or went over to Wyat. A detachment of the London trainbands sent against him by Queen Mary, under the command of the duke of Norfolk, followed their example. The rising now seemed so formidable that a deputation was sent to Wyat by the queen and council to ask his terms. He insisted that the Tower should be surrendered to him, and the queen put under his charge. The insolence of these demands caused a reaction in London. where the reformers were strong and were at first in sympathy with him. When he reached Southwark on Feb. 3, he found London bridge occupied in force, and was unable to penetrate into the city. He was driven from Southwark by the threats of Sir John Brydges (or Bruges; afterward Lord Chandos), lieutenant of the Tower, who was prepared to fire on the suburb with the guns of the Tower. Wyat then marched up the river to Kingston. where he crossed the Thames, and made his way to Ludgate with a part of his following. Some of his men were cut off. Others lost heart and deserted. His only hope was that a rising would take place, but the loyal forces kept order, and after attempting to force the gate Wyat surrendered. He was brought to trial on March 15, and could make no defense. Execution was delayed. in the hope that in order to save his life he would compromise the queen's sister, the princess Elizabeth. He was executed on April 11. and on the scaffold expressly cleared the princess of all complicity in the rising. His estates were afterward partly restored to his son George. the father of the Sir Francis Wyat (d. 1644) who was governor of Virginia during 1621–26 and 1639–42.

WYATT, JAMES (1746–1813). English architect of country houses and designer of the Pantheon, London, was born at Burton Constable. Staffordshire. on Aug. 3, 1746. In 1762 he went to Italy, where he remained six years. The opening of the Pantheon in 1772 (burned 1792, rebuilt, remodeled three times and finally demolished 1937), designed by him as a "\Tinter Ranelagh," made him one of the most fashionable architects in England almost overnight. Although he succeeded Sir William Chambers as surveyor general he is chiefly remembered for his domestic architecture. In point of originality his classical works were surpassed by his Gothic. among which Lee Priory, Kent. Fonthill Abbey, Wiltshire, and Ashridge Park, Hertfordshire, were the most notable. He was killed in a coach accident near Marlborough on Sept. 4, 1813. and is buried in Westminster abbey.

See A. Dale, *James Wyatt* (1956). (Ms. W.)

WYCHERLEY, WILLIAM (c. 1640–1716), English dramatist. was born about 1640 at Clive, near Shrewsbury, where for several generations his family had been settled on a moderate estate of about £600 a year. Like Vanbrugh, Wycherley spent his early years in France. whither, at the age of fifteen, he was sent to be educated in the very heart of the "precious" circle of Mme. de Montausier. on the banks of the Charente. This lady effected the first of his successive conversions from Protestantism to Catholicism. Later at Oxford. Bishop Barlow reclaimed him. and under James II. he returned to Catholicism once more. In fact. the deity he worshipped was the deity of the "polite world" of his time—gentility. Moreover. as a professional fine gentleman, at a period when, as the genial Major Pack says. "the amours of Britain would furnish as diverting memoirs, if well related, as those of France published by Rabutin, or those of Nero's court writ by I'etronius," Wycherley was obliged to be a loose liver.

As a fellow-commoner of Queen's College, Oxford, Wycherley lived (according to Wood) in the provost's lodgings, being entered as "Philosophiae Studiosus" in July 1660. And he does not seem to have matriculated or to have taken a degree. He left Oxford and settled in the Inner Temple; but not, naturally, to engage seriously in the study of the law. Pleasure and the stage were alone open to him, and probably early in 1671 was produced, at the Theatre Royal, Love in a Wood. It was published the next year. With regard to this comedy Wycherley told Pope that he wrote it the year before he went to Oxford. But we need not believe him: the worst witness against a man is mostly himself. To pose as the wicked boy of genius has been the foolish ambition of many writers, but on inquiry it will generally be found that these inkhorn Lotharios are not nearly so wicked as they would have us believe. It is not so much that, as Macaulay insists, "the whole air and spirit of the piece belong to a period subsequent to that mentioned by Wycherley," but that "the whole air and spirit of the piece" belong to a man—an experienced and hardened young man of the world—and not to a boy who would fain pose as an experienced and hardened young man of the world. The real defence of Rycherley against his foolish impeachment of himself is this, that Love *in* a *Wood,* howsoever inferior in structure and in all the artistic economies to The Country *Wife* and The Plain Dealer, contains scenes which, not for moral hardness merely, but often for real dramatic ripeness, are almost the strongest to be found amongst his four plays. The play was dedicated to Charles II.'s mistress, the duchess of Cleveland, whose favours Wycherley forthwith enjoyed. His fortune as a dramatist was made. Voltaire (in his Letters on the *English Nation*) has a picturesque description of the duchess's visits to Wycherley's chambers in the Temple.

Whether Wycherley's experiences as a naval officer, which he alludes to in his lines "On a Sea Fight which the Author was in betwixt the English and the Dutch," occurred before or after the production of Love in a Wood is a point upon which opinions differ, but on the whole we are inclined to agree with Macaulay, against Leigh Hunt, that these experiences took place not only after the production of *Love* in a *Wood* but after the production of The Gentleman Dancing Master, in 1673. We also think, with Macaulay, that he went to sea simply because it was the "polite" thing to do so—simply because, as he says in the epilogue to The Gentleman Dancing Master "all gentlemen must pack to sea."

This second comedy was published in 1673, but was probably acted late in 1671. It is inferior to Love *in* a Wood. In *The* Relapse the artistic mistake of blending comedy and farce damages a splendid play, but leaves it a splendid play still. In The Gentleman Dancing *Master* this mingling of discordant elements destroys a play that would never in any circumstances have been strong—a play nevertheless which abounds in animal spirits, and is luminous here and there with true dramatic points.

It is, however, on his two last comedies—The Country Wife and The Plain Dealer—that must rest Wycherley's fame as a master of that comedy of repartee which, inaugurated by Etheredge, and afterwards brought to perfection by Congreve and Vanbrugh, supplanted the humoristic comedy of the Elizabethans. *The* Country Wife, produced in 1672 or 1673 and published in 1675, is so full of wit, ingenuity, animal spirits and conventional humour that, had it not been for its motive, it would probably have survived as long as the acted drama remained a literary form in England. So strong, indeed, is the hand that could draw such a character as Marjory Pinchwife (the undoubted original not only of Congreve's Miss Prue but of Vanbrugh's Hoyden), such a character as Sparkish (the undoubted original of Congreve's Tattle), such a character as Horner (the undoubted original of all those cool impudent rakes with whom our stage has since been familiar), that Wycherley is certainly entitled to a place alongside Congreve and Vanbrugh.

Scarcely inferior to *The* Country *Wife* is The Plain Dealer, produced probably early in 1674 and published three years later,—a play of which Voltaire said, "Je ne connais point de comédie chez les anciens ni chez les moderns où il y ait autant d'esprit." This comedy had an immense influence, as regards manipulation of dialogue, upon all subsequent English comedies of repartee, and he who wants to trace the ancestry of Tony Lumpkin and Mrs. Hardcastle has only to turn to Jerry Blackacre and his mother, while Manly (for whom Wycherley's early patron, the duke of Montausier, sat), though he is perhaps overdone, has dominated this kind of stage character ever since.

It was after the success of The Plain Dealer that the turning-point came in Wycherley's career. The great dream of all the men about town in Charles's time, as Wycherley's plays all show, was to marry a widow, young and handsome, a peer's daughter if possible—but in any event rich, and spend her money upon wine and women. While talking to a friend in a bookseller's shop at Tunbridge, Wycherley heard The Plain Dealer asked for by a lady who, in the person of the countess of Drogheda, answered all the requirements. An introduction ensued, then love-making, then marriage—a secret marriage, probably in 1680, for, fearing to lose the king's patronage and the income therefrom, Wycherley still thought it politic to pass as a bachelor. But the news reached the royal ear, and Wycherley lost the royal favour for ever. He never had an opportunity of regaining it, for the countess seems to have really loved him, and Love in a Wood had proclaimed the writer to be the kind of husband whose virtue prospers best when closely guarded at the domestic hearth. Wherever he went the countess followed him, and when she did allow him to meet his boon companions it was in a tavern in Bow Street opposite to his own house, and even there under certain protective conditions. In summer or in winter he was obliged to sit with the window open and the blinds up, so that his wife might see that the party included no member of a sex for which her husband's plays had advertised his partiality. She died, however, in the year after her marriage and left him the whole of her fortune. But the title to the property was disputed; the costs of the litigation were heavy—so heavy that his father was unable (or else he was unwilling) to come to his aid; and the result of his marrying the rich, beautiful and titled widow was that the poet was thrown into the Fleet prison. There he remained for seven years, being finally released by the liberality of James 11.—a liberality which, incredible as it seems, is too well authenticated to be challenged. James had been so much gratified by seeing The *Plain* Dealer acted that, finding a parallel between Manly's "manliness" and his own, such as no spectator had before discovered, he paid off Wycherley's execution creditor and settled on him a pension of £200 a year. Other debts still troubled Rycherley, however, and he never was released from his embarrassments, not even after succeeding to a life estate in the family property. In coming to Wycherley's death, we come to the worst allegation that has ever been made against him as a man and as a gentleman. At the age of seventy-five he married a young girl. and is said to have done so in order to spite his nephew, the next in succession.

Wycherley wrote verses, and, when quite an old man, prepared them for the press by the aid of Alexander Pope, then not much more than a boy. But, notwithstanding all Pope's tinkering, they remain contemptible. Pope's published correspondence with the dramatist was probably edited by him with a view to giving an impression of his own precocity. The friendship between the two cooled, according to Pope's account, because Wycherley took offence at the numerous corrections on his verses. It seems more likely that Wycherley discovered that Pope, while still professing friendship and admiration, satirized his friend in the Essay on Criticism. Wycherley died on Jan. 1, 1716, and was buried in the vault of the church in Covent Garden.

Wycherley's complete works were edited by M. Summers in 4 vols. (Nonesuch Press, 1924). See C. Perromat, *William* Wycherley, *sa vie,* son oeuvre **(1921).** (T. W.-D.; X.)

WYCLIFFE (or WYCLIF), **JOHN** (*c.* 1320–1384), English reformer, was born, according to John Leland, at Ipreswel (evidently Hipswell), in Yorkshire[1]. The Wycliffes were connected

[1] The form of spelling of the name Wycliffe adopted in this article is that of the village Wycliffe-on-Tees, from which Leland says that he "drew his origin" (*Collectanea* ii. 329); it is also preferred by the editors of the Wycliffe Bible, by Milman and by Stubbs. "Wyclif" has the support of Shirley, of T. Arnold and of the Wyclif Society; **while "Wiclif"** is the popular form in Germany.

with Balliol College, Oxford, which had been founded by their neighbours, the Balliols of Barnard Castle; John Wycliffe went there, and some time after 1356 was elected master. Confusion with contemporaries makes it not easy to trace his Oxford life; it has been said that he was a fellow of Merton College in 1356. In 1361 he accepted the living of Fillingham in Lincolnshire. In the same year a "John de Wyclif of the diocese of York, M.A." was a suppliant to the Roman Curia for a provision to a prebend, canonry and dignity at York (Cal. of Entries in the *Papal* Registries, ed. Bliss, Petitions, i. 390). This was not granted, but Wycliffe received instead the prebend of Aust in the collegiate church of Westbury-on-Trym. In 1365 one "John de Wyclif" was appointed by Simon Islip, archbishop of Canterbury, to the wardenship of Canterbury Hall, which the archbishop founded for a mixed body of monks and secular clergy, and then filled exclusively with the latter. In 1367, his successor, Simon Langham, replaced the intruded seculars by monks. The displaced warden and fellows appealed to Rome, and in 1371 judgment was given against them. The question of the identity of the warden of Canterbury Hall with the reformer is still a matter of dispute. It may have been referred to by Wycliffe himself (De *ecclesia,* cap. xvi. pp. 370 sq.), and was assumed by the contemporary monk of St. Albans (Chron. Angl. "Rolls" ser. p. 115) and by Wycliffe's opponent William Woodford (Fasc. *Zizan.* p. 517), who found in Wycliffe's resentment at this treatment the motive for his attacks on the religious orders; it has likewise been assumed by a series of modern scholars, including Loserth (*Realencyklopädie,* 1908 ed., vol. xxi. p. 228, § 35), who only denies the deductions that Woodford drew from it. Dr. Rashdall, following Shirley, brings evidence to show that the Wycliffe of Canterhury Hall was the same person as the fellow of Merton, this being the strongest argument against the identification of the latter with the reformer.

Long before Wycliffe had become a power outside Oxford his fame was established in the university. He was acknowledged supreme in the philosophical disputations of the schools, and his lectures were crowded, but it was not until he was drawn into the arena of the politico-ecclesiastical conflicts of the day that Wycliffe became of world-importance. It has been assumed that this happened first in 1366, and that Wycliffe published his Determinatio quaedam de *dominio* supporting parliament in refusing the tribute demanded by Pope Grban V.; but Loserth has shown that this work must be assigned to a date some eight years later. Wycliffe, in fact, for some years to come had the reputation of a good "curialist." Had it been otherwise, the pope would scarcely have granted him (January 1373) a license to keep his Westbury prebend even after he should have obtained one at Lincoln (Cal. *Papal* Letters, ed. Bliss and Twemlow, iv. 193). Moreover, it is uniformly asserted that Wycliffe fell into heresy after his admission to the degree of doctor (*Fasc. Ziz.* p. 2), and the papal document above quoted shows that he had only just become a doctor of theology, that is in 1372.

But Wycliffe's tendencies may already have called attention to him in high places as a possibly useful instrument for the antipapal policy of John of Gaunt and his party. On the 7th of April 1374, he was presented by the crown to the rectory of Lutterworth in Leicestershire, which he held until his death; and on the 26th of July he was nominated one of the royal envoys to Bruges to confer with the papal representatives on the long vexed question of "provisions" (*q.v.*). He may have been attached to this mission as theologian—a proof that he was not yet considered a persona *ingrata* at the Curia. His name stands second, next after that of the bishop of Bangor, and he was paid at the princely rate of twenty shillings a day. The commission was appointed because of repeated complaints from the Commons; but the king was interested in keeping up the papal system of provisions and reservations, and the negotiations were practically fruitless.

After his return Wycliffe lived chiefly at Lutterworth and Oxford, making prolonged visits to London, where his fame as a popular preacher was established. It is from this period that dates the development of his systematic attack on the established order in the church. It was not at first the dogmatic, but the political elements in the papal system that provoked his censure. The negotiations at Bruges had strengthened his sympathy with the anti-curial tendencies in English politics from Edward I.'s time onwards, and a final impulse was given by the attitude of the "Good Parliament" in 1376; in the autumn of that year he was reading his treatise on civil lordship (De *civili* dominio) to his students at Oxford. Of Its propositions some, according to Loserth, were taken bodily from the 140 titles of the bill dealing with ecclesiastical abuses introduced in the parliament; but it may perhaps be that Wycliffe inspired the bill rather than the bill Wycliffe. For the first time he now publicly proclaimed the doctrine that righteousness is the sole indefeasible title to dominion and to property, that an unrighteous clergy has no such title, and that the decision as to whether or no the property of ecclesiastics should be taken away rests with the civil power.

If the position at which Wycliffe had now arrived was originally inspired, as Loserth asserts, by his sympathy with the legislation of Edward I., *i.e.,* by political rather than theological considerations, the necessity for giving to it a philosophical and religious basis led him to criticism of the doctrinal standpoint of the church. As a philosopher Wycliffe was no more than the last of the conspicuous Oxford scholastics, and his philosophy is important in so far as it determined his doctrine of *dominium,* and the direction in which his political and religious views were to develop. In the controversy between Realism and Nominalism he was on the side of the former, though his doctrine of universals showed the influence of Ockham and the nominalists. To Wycliffe the doctrine of arbitrary divine decrees was anathema. The will of God is his essential and eternal nature, by which all his acts are determined; God created all things in their primordial causes, as genera and species, or else in their material essences, *secundum* rationes *absconditas seminales* (ibid. p. 66). The world is therefore not merely one among an infinity of alternatives, but is the only possible world; it is, moreover, not in the nature of an eternal emanation from God, but was created at a given moment of time—to think otherwise would be to admit its absolute necessity, which would destroy free-will and merit. Since, however, all things came into being in this way, it follows that the creature can produce nothing save what God has already created. This leads to predestination and free-will. Wycliffe takes a middle position. God does not will sin, for He only wills that which has being, and sin is the negation of being; He necessitates men to perform actions which only become right or wrong through man's free agency. All human lordship is derived from the supreme overlordship of God and is inseparable from it, since whatever God gives is part of himself. But, in giving, God does not part with the lordship of the thing given; whatever lordship the creature may possess is held subject to due service to the supreme overlord. Thus, as in feudalism, lordship is distinguished from possession. Property is the result of sin; Christ and his apostles had none. The service by which lordship is held of God is righteousness and its works; it follows that the unrighteous forfeit their right to exercise it, and may be deprived of their possessions by competent authority.

The question follows as to what this authority is, and this Wycliffe sets out to answer in the Determinatio quaedam de dominio and the De *civili* dominio. Briefly, his argument is that the church has no concern with temporal matters at all, that for the clergy to hold property is sinful, and that it is lawful for statesmen (*politici*)—who are God's stewards in temporals—to take away the goods of such of the clergy as no longer render the service by which they hold them. That the church was actually in a condition to deserve spoliation he refused to affirm; but his theories fitted in too well with the notorious aims of the duke of Lancaster not to rouse the bitter hostility of the endowed clergy.

Hitherto Wycliffe had made no open attack on the doctrinal system of the church. Early in 1377, however, Archbishop Sudbury summoned him to appear before the bishop of London, and on Feb. 19 Wycliffe made his appearance at St. Paul's, accompanied by the duke of Lancaster, by Lord Percy, marshal of England, and by four doctors of the four mendicant orders. Before Wycliffe could open his mouth, the court was broken up by a rude brawl between his protectors and Bishop Courtenay, the affair developing into a general riot.

Wycliffe had escaped for the time, but probably before this his enemies had set their case before the pope; and on the 22nd of May five bulls were issued by Gregory XI., condemning eighteen of Wycliffe's "conclusions." All the articles but one are taken from his *De civili dominio*. The bulls truly stated Wycliffe's intellectual lineage; he was following in the error of Marsilius of Padua; and the articles laid against him are concerned entirely with questions as to how far ecclesiastical censures could lawfully affect a man's civil position, and whether the church had a right to hold temporal endowments. The bulls were addressed to the archbishop of Canterbury and the bishop of London, the university of Oxford, and the king. The university was to send Wycliffe to the prelates, who were to examine the truth of the charges and to report to the pope, Wycliffe being meanwhile kept in confinement. The execution of the papal bulls was impeded by three separate causes—the king's death on the 21st of June, the tardy action of the bishops, who enjoined the university to make a report; and the unwillingness of the university to admit the pope's right to order the imprisonment of any man in England. The convocation of the university merely directed Wycliffe to keep uithin his lodgings at Black Hall for a time.

As soon as parliament met in the autumn of 1377, Wycliffe was consulted by it as to the lawfulness of prohibiting that treasure should pass out of the country in obedience to the pope's demand. Wycliffe's affirmative judgment is contained in a state paper still extant; and its tone is plain proof that his views on the main question of church and state had the support of the nation He had laid before this same parliament his answer to the pope's bulls, with a defence of the soundness of his opinions. His university, moreover, confirmed his argument; his tenets, it said, were orthodox though their expression might admit of a wrong interpretation. Early in 1378 Wycliffe appeared at Lambcth Palace to clear himself before the prelates who had summoned him. A more cautiously worded defence was laid before the council; but its session was rudely interrupted, not only by a crowd of citizens, but also by a messenger from the princess of Males enjoining them not to pass judgment against IVycliffe; and thus a second time he escaped. Meanwhile his "protestatio" was sent on to Rome, but before any further step could be taken Gregory XI. died.

In the autumn of this year IVycliffe was once more called upon to prove his loyalty to John of Gaunt, who had violated the sanctuary of Westminster by sending armed men to seize two squires who had taken refuge there. One of them was murdered, together with a servant of the church. The bishop of London excommunicated all concerned in the crime (except only the king, his mother and his uncle), and preached against the culprits at Paul's Cross. At the parliament held at Gloucester in October, in the presence of the legates of Pope Urban VI, Wycliffe read an apology for the duke's action, pleading that the men were killed in resisting legal arrest. The paper, which forms part of the *De ecclesia,* maintains the right of the civil power to invade the sanctuary to bring escaped prisoners to justice.

The schism in the papacy, owing to the election of Clement YII in opposition to Urban VI, accentuated Wycliffe's hostility to the Holy See and its claims. He did not object to a visible head of the church so long as this head possessed the essential qualification of righteousness. It was later that Wycliffe definitely branded the pope, *qua* pope, as Antichrist. (*See* vol. ii. of the *Sermones*. Book iii of his *Opus evangelicum* is entitled *De Antichristo.*) Wycliffe's criticism of the established order and of the accepted doctrines he now determined to carry into the streets. Tor this purpose he instituted "simple" priests to preach his doctrines throughout the country; and, secondly, he translated the Vulgate into English. with the aid of his friends Nicholas Hereford and John Purvey (*see* BIBLE, TRANSLATIONS OF). This version of the Bible. and his numerous sermons and tract>,established Wycliffe's position as the founder of English prose.

Wycliffe had been on good terms with the friars, whose ideal of poverty appealed to him but he had come to recognize that all organized societies within the church were liable to the same corruption, while he objected fundamentally to a special standard of morality for the "religious." His itinerant preachers were meant to supplement the services of the church by religious instruction in the vernacular, and among them were men who held or had held respectable positions at Oxford. The common people were rejoiced by their plain and homely doctrine which dwelt chiefly on the simple "law" of the gospel, while they no doubt relished the denunciation of existing evils in the church. The feeling of disaffection against the rich and careless clergy, monks and friars was widespread but undefined. Wycliffe turned it into a definite channel.

In addition, Wycliffe was appealing to the world of learning in a series of Latin treatises, which followed each other in rapid succession, and collectively form his *summa theologiae.* J. Loserth, in his paper "Die Genesis von Wiclifs Summa Theologiae" (*Sitzungsber. der k. Akad. dcr Wissensch.,* Vienna, 1908, vol. 156) gives proofs that the *Summa* was written to provide weapons in the controversies of the time. During the years 1378 and 1379 Wycliffe produced his works on the truth of Holy Scripture, on the church, on the office of king, on the papal power. The *De officio regis* is practically a declaration of war against the papal monarchy, an anticipation of the theocratic conception of national kingship as estabiished later by the Reformation. (See *De officio regis* ed. A. W. Pollard and Charles Sayle, from Vienna mss. 4514, 3933, Wyclif Soc. 1887—cap. vi. p. 119.) Wycliffe now passed from an assailant of the papal to an assailant of the sacerdotal power. In 1379 or 1380 Wycliffe began a formal public attack on what he calls the "new" doctrine in a set of theses on the Eucharist propounded at Oxford. (1381 is the date given in Shirley's edition of the *Fasciculi Zizaniorum*. F. D. Matthew. in the *Eng. Hist. Rev.* for April 1890, v. 328, proves that the date must have been 1379 or 1380.) There followed sermons, tracts, and, in 1381, his great treatise *De eucharistia.* Finally, at the close of his life, he summed up his doctrine in the *Trialogus*.

The language in which he denounced transubstantiation anticipated that of the Protestant reformers; it is a "blasphemous folly," philosophically it is nonsense, since it presupposes the possibility of an accident existing without its substance; it overthrows the very nature of a sacrament. Yet the consecrated bread and wine are the body and blood of Christ, for Christ himself says so (*Fasc. Zizan.* p. 115); we do not, however, corporeally touch and break the Lord's body, which is present only *sacramentaliter, spiritualiter et virtualiter*—as the soul is present in the body. The real presence is not denied; what Wycliffe "dares not affirm" is that the bread is after consecration "essentially, substantially, corporeally and identically" the body of Christ. His doctrine approximates to the Lutheran doctrine of consubstantiation, as distinguished from the Zwinglian teaching accepted in the xxviii, Article of Religion of the Church of England.

The theologians of the university were at once aroused. The chancellor, William Barton, sat with twelve doctors (six of whom were friars), and solemnly condemned the theses. Wycliffe appealed, not to the pope, but to the king. But the lay magnates, who u-ere perfectly ready to help the church to attain to the ideal of apostolic poverty, shrank from the responsibility of supporting obscure propositions, which involved undoubted heresy and the pains of hell. John of Gaunt hastily sent a messenger enjoining the reformer to keep silence. The rift thus created between Wycliffe and his patrons in high places was widened by the Peasants' Revolt of 1381, the result of which was to draw the conservative elements in church and state together.

With the Peasants' Revolt it has been supposed that Wycliffe had something to do. One of its leaders, John Ball, when condemned, confessed that he learned his subversive doctrines from Wycliffe. We have, however, not only the repeated testimony of Knyghton that he was a "precursor" of Wycliffe, but also documentary evidence that he was excommunicated in 1366, long before Wycliffe exposed himself to ecclesiastical censure. Wycliffe's communistic views are theoretical and confined to his Latin scholastic writings. They could not reach the people directly. Possibly his followers translated them in their popular discourses, and thus fed the flame that burst forth in the rebellion.

In the spring after the Revolt his old enemy, William Courtenay, who had succeeded the murdered archbishop Sudbury as archbishop of Canterbury, resolved to stamp out Wycliffe's crowning heresy. He called a court of bishops, theologians and canonists at the Blackfriars' convent. This proceeding was met by a manifestation of university feeling on Wycliffe's side. The chancellor, Robert Rygge, though he had joined in the condemnation of the theses, stood by him, as did also both the proctors. The Council decided that out of 24 articles extracted from Wycliffe's works, ten were heretical and fourteen erroneous. The reply of the chancellor was to deny the archbishop's jurisdiction within the university, and to allow Philip Repington, disciple of Wycliffe, to preach before the university. The chancellor and proctors were now summoned to appear before the Blackfriars' court on the 12th of June. Though they were, with the majority of regent masters at Oxford, on the side of Wycliffe, the main question was for them one of philosophy rather than faith, and they made formal submission to the authority of the Church.

Wycliffe himself remained at large and unmolested. That his strength among the laity was undiminished is shown by the fact that an ordinance passed by the House of Lords alone, in May 1382, against the itinerant preachers was annulled on the petition of the Commons in the following autumn. The reformer, however, was growing old and now occupied himself in writing numerous tracts and two of his most important works. The *Trialogus* is a summing up of his arguments and conclusions on philosophy and doctrine. It was the most influential of all Wycliffe's works, and was the first to be printed (1525). All the only four known complete mss. of the work, preserved in the Imperial Library at Vienna, are of Hussite origin. The note of both the *Trialogus* and of the unfinished *Opus evangelicum,* Wycliffe's last work, is their insistence on the "sufficiency of Holy Scripture."

In 1382, or early in 1383, Wycliffe was seized with a paralytic stroke. On the 28th of December 1384, he had a final stroke, from the effects of which he died on the New Year's eve. He was buried at Lutterworth; but by a decree of the council of Constance, May 4, 1415, his remains were ordered to be dug up and burned, an order which was carried out, at the command of Pope Martin V., by Bishop Fleming in 1428.

A sober study of Wycliffe's life and works justifies a conviction of his complete sincerity and earnest striving after what he believed to be right. When he conceives the Church as consisting exclusively of the righteous, he may seem to have gone the whole length of the most radical reformers of the 16th century. And yet, powerful as was his influence in England, his doctrines in his own country were doomed to become for a century and a half the creed only of obscure sectaries. *(See* LOLLARDS.) It was otherwise in Bohemia, whither his works had been carried by the scholars who came to England in the train of Richard II.'s queen, Anne of Bohemia. Here his writings were eagerly read and multiplied, and here his disciple, John Huss (*q.v.*) raised Wycliffe's doctrine to the dignity of a national religion. Extracts from the *De ecclesia* and the *De potestate Papae* of the English reformer made up the greater part of the *De ecclesia* of Huss, *a* work for centuries ascribed solely to the Bohemian divine, and for which he was condemned and burnt. It was Wycliffe's *De sufficientia legis Christi* that Huss carried with him to convert the council of Constance; of the fiery discourses now included in the published. edition of Wycliffe's *Sermones* many were likewise long attributed to Huss. Finally, it was from the *De eucharistia* that the Taborites derived their doctrine of the Lord's Supper, with the exception of the granting of the chalice to the laity. To Huss, Luther and other continental reformers owed much, and thus the spirit of the English reformer had its influence on the reformed churches of Europe.

BIBLIOGRAPHY.—The documentary materials for Wycliffe's biography are to be found in John Lewis's *Life and Sufferings of J. Wiclif* (new ed., Oxford, 1820), which contains a valuable appendix; Foxe's *Acts and Monuments,* vol. iii., ed. 1855, with app.; Forshall and Madden's preface to the Wycliffe Bible, p. vii. note, Oxford, 1851; W. W. Shirley's edition of the *Fasciculi Zizaniorum,* a collection of contemporary documents (1858); and H. T. Riley's notices in the appendices to the *Second* and *Fourth Reports* of the Historical Manuscripts Commission. The narrative of a monk of St. Albans published under the title of *Chronicon Angliae,* by Sir *E.* Maunde Thompson (1874), and in a modified version in Walsingham's *Historia Anglicana* (ed. *H.* T. Riley, 1863, 1864). Knyghton's chronology in *De eventibw Angliae* is faulty (ed. J. R. Lumby, 1889–95). There are valuable notices in the *Eulogium historiarum* (vol. iii., ed. F. S. Haydon, 1863), in the *Chronicle* of Adam of Usk (ed. E. M. Thompson, 1876), and in the continuations of Higden. The controversial works of Wodeford and Walden are important, but must be used with caution.

Of modern biographies that by G. V. Lechler *(Johann von Wiclif und die Vorgeschichte der Reformation,* 2 vols., Leipzig, 1873; partial Eng. trans., by P. Lorimer, 1878, 1881 and 1884) is by far the most comprehensive. Shirley's introduction to the *Fasciculi Zizaniorum,* and F. D. Matthew's to his edition of *English Works of Wyclif hitherto unprinted* (1880), as well as Creighton's *History of the Papacy,* vol. i., 1882, and Sir H. C. Maxwell Lyte's account in his *History of the University of Oxford* (1886), contain valuable criticism. *See* also Mr. R. L. Poole, *(Illustrations of the History of Mediaeval Thought,* 1884); *J.* Loserth (*Hus und Wiclif,* Prague, 1884; also Eng. trans.). G. M. Trevelyan, *England in the Age of Wycliffe* (London, 1899); Oman, *History of England 1377–1485* (London, 1906); W. W. Capes, "History of the English Church in the 14th and 15th Centuries," in *Hist. of the Eng. Church,* ed. Stephen and Hunt (London, 1900); J. Loserth's article "Wiclif," in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1908), xxi., pp. 225–227; H. B. Workman, *John Wyclif* (1926).

Wycliffe's works are enumerated in a *Catalogue* by Shirley (Oxford, 1865). Of his Latin works only two had been published previous to 1880, the *De officio pastorali,* ed. *G.V.* Lechler (Leipzig, 1863) and the *Trialogus,* ed. Lechler (Oxford, 1869). Under the auspices of the Wyclif Society the following have been published.—Polemical *Tracts,* ed. R. Buddensieg (2 vols., 1883); *De civili dominio,* vol. i. ed. R. L. Poole, vols. ii.–iv., ed. J. Loserth (1885–1905); *De composicione hominis,* ed. *R.* Beer (1884); *De Ecclesia,* ed. Loserth (1886); *Dialogus sive speculum ecclesiae militantis,* ed. *A.* W. Pollard (1886); *Sermones,* ed. Loserth, vols. i.–iv. (1887–90); *De oficio regis,* ed. A. W. Pollard and C. Sayle (1887); *De apostasia,* ed. M. Dziewicki (1889); *De dominio divino,* ed R. L. Poole (1890); *Quaestiones. De ente praedicamentali,* ed. R. Beer (1891); *De eucharistia tractatus major,* ed. Loserth (1893); *De blasphemia,* ed. Dziewicki (1894); *Logica* (3 vols., ed. Dziewicki, 1895–99); *Opus evangelicum,* ed. Loserth (4 vols., 1898), parts iii. and iv. also bear the title *De Antichristo; De Simonia,* ed. Herzberg-Frankel and Dziewicki (1898); *De veritatae sacrae scripturae,* ed. R. Buddensieg (3 vols., 1905); *Miscellanea philosophica,* ed. Dziewicki (2 vols., 1905) (vol. i. has an introduction on Wycliffe's philosophy); *De potestate papae,* ed. Loserth (1907).

For his works in English see *Select English Works,* ed. *T.* Arnold (3 vols., 1869–71), and *English Works hitherto unprinted,* ed. F. *D.* Matthew (1880). *The Wicket* (Nuremberg, 1546; reprinted at Oxford, 1828) is not included in either of these collections. (R. L. P.; X.)

WYE, a river of Wales and England, famous for its scenery. It rises on the eastern slope of Plynlimmon, close to the source of the Severn, Its length is 130 mi. Running at first S.E. it passes Rhayader and receives the Elan, in the basin of which are the Birmingham reservoirs. At Pipton, 12 mi. S.E. of Builth Wells, it turns to flow N.E. and after Hay reaches a level of 250 ft.. 55 mi. from its source. 2,000 ft. high. As it enters Herefordshire it bends S.E.. flows through Hereford, receives the Lugg from the north and turns S.E. when the course becomes sinuous. winding in big curves. *e.g.*, at Symonds Yat (*q.v.*). The valley narrows into a gorge, often wooded and often overhung with great crags of mountain limestone. This reach of the river, from Ross to Chepstow. has made the Wye famous for its beauty. It passes Monmouth, where it receives the Monnow on the right Tintern and finally Chepstow. 2 mi. above its junction with the Severn estuary. The Wye valley, with border castles at Hereford, Monmouth and Chepstow, has long been the main route from mid-Wales into England. The high tides of the Severn estuary are experienced to just above Chepstow.

The name of Wye belongs also to two smaller English rivers—a tributary of the Derbyshire Derwent and a tributary of the Thames.

WYLIE, ELINOR MORTON (1885–1928), U.S. poet and novelist, whose polished intense poems matched her own beauty and life, was born in Somerville. N.J., on Sept. 7, 1885. Educated at private schools in Bryn Mawr, Pa.. and Washington, D.C., where her father Henry Hoyt went in 1903 as solicitor general, she married Philip Hichborn in 1905, but in 1910 eloped with Horace Wylie, 15 years her senior. They lived in England until 1915. Her literary life began when they moved to New York city in 1921. In 1923 she divorced Wylie and married William Rose Benét. She wrote four novels: *Jenifer Lorn: a Sedate Extravaganza* (1923), *The Venetian Glass Nephew* (1925), *The Orphan Angel,* published as *Mortal Image* in England (1926), and *Mr. Hodge and Mr. Hazard* (1928). Four volumes of poems published between 1921 and 1928 were republished as *Collected Poems* edited with a foreword by W. R. Benét (1932).

She died in New York city on Dec. 16, 1928. *Last Poems* was published in 1943.

WYMAN, JEFFRIES (1814–1874), U.S. scientist notable for the wide range of his studies and for his pioneer work on museums, was born in Chelmsford, Mass., on Aug. 11, 1814. He graduated at Harvard in 1833, and in 1837 also received his medical degree there. He began medical practice in Boston and became a demonstrator of anatomy at Harvard, subsequently going to Europe for a short period of study in London and Paris. Upon his return he was for four years professor of anatomy and physiology at Hamptbn-Sidney college, Richmond, Va., and was then recalled (1847) to Harvard as Hersey professor in anatomy. He began the task of building a museum of comparative anatomy at Harvard, one of the first in the United States, and traveled widely in search of specimens, his trips ranging along the Atlantic coast from Labrador to Florida, and including expeditions to Europe, to Guiana and, notably, up the La Plata. Uruguay and Parana rivers and across the pampas and Andes to Santiago, Chile. In 1866 he was made a trustee of the museum of archaeology and professor of archaeology and ethnology on the George Peabody foundation. Wyman's scientific papers embrace a wide range of studies, including human, comparative and microscopic anatomy, physiology, paleontology and ethnology. Especially notable were his papers on "Observations on the Crania" *(Proceedings,* Boston Society of Natural History, 1868); on the nervous system of the bullfrog and the changes undergone during metamorphosis *(Contrtbutions,* Smithsonian institution, 1852); the first account of the osteology of the gorilla *(Memoirs,* Boston Society of Natural History, 1847); and "Unusual Methods of Gestation in Certain Fishes" (*Silliman's Journal).* He died at Bethlehem, N.H., on Sept. 4, 1874.

There is a memoir and complete bibliography of his writings in the *Biographical Memoirs,* National Academy of Sciences, vol. ii (1886). His colleague, Oliver Wendell Holmes, wrote a biographical sketch in the *Atlantic Monthly* (Nov. 1874).

WYMONDHAM, an urban district in the South Norfolk parliamentary division of Norfolk, Eng., 9 mi. S.W. of Norwich. Pop. (1951) 5,665. Area 17.1 sq.mi.

A Benedictine priory, founded in the 12th century as a cell of St. Albans abbey by William d'Albini, became an independent abbey in 1448. The abbey church of SS. Mary and Thomas possesses a 12th-century east tower and a west tower which was added by the townspeople when they were allotted the nave about 1448. The 1 jth-century St. Thomas a Becket chapel is a public library. In the centre of the town is a market cross (1618) with an octagonal half-timbered upper chamber on posts. The chief industry is brush making.

WYNAAD, a highland plateau, 60 mi. long and 30 mi. broad, partially in Mysore and partially occupied by a subdivision of the same name in the Malabar division of Madras state, Republic of India; chief town. Manantoddy.

The plateau, set back from the Arabian sea by a 25-mi.-wide plain, has an average elevation of 3,000 ft., but in places rises to 6,000 ft. The chief rivers are the Kabbani and Rampur, tributaries of the Cauvery (*q.v.*).

The annual rainfall is 130 in. The principal crops include tea, coffee, pepper, rice and cardamoms. The forests contain teak and blackwood.

WYNDHAM, SIR CHARLES (CHARLES CULVERWELL) (1837–1919), English actor, whose association and business partnership with his wife was an important one, was born in Liverpool on March 23, 1837, the son of a doctor. He was intended for medicine, but went on the stage, appearing in London in 1862. In that year he went to the United States and served as brigade surgeon in the Federal army. resigning in 1864 and appearing on the stage in New York. He returned to the London stage in 1866 as Sir Arthur Lascelles in *All that Glitters Is Not Gold.* His first big success was in F. C. Burnand's burlesque of *Black-Eyed Susan,* as Hatchett (with dance). At the St. James's theatre he appeared with Henry Irving and with Ellen Terry and also in *Still Waters Run Deep.* He made a great success as Charles Surface in Sheridan's *School for Scandal.* In 1876 he took control of the Criterion theatre, running it successfully for many years and producing and playing in many notable plays. From 1885 onward his leading lady was Mary Moore, whom he subsequently married Between them they built and opened Wyndham's theatre in 1899—with a revival of *David Garrick,* his most famous part—and the New theatre in 1903. Wyndham was knighted in 1902 and died in London on Jan. 12, 1919. (W. J. M.-P.)

WYNDHAM, GEORGE (1863–1913), British politician and man of letters, was born Aug. 29, 1863, the eldest son of Percy Scawen Wyndham, and grandson of the first Lord Leconfield. His mother was Madeline Caroline Frances Eden, daughter of Sir Guy Campbell, bart., and through her he was great-grandson of Lord Edward Fitzgerald, the Irish rebel. He was educated at Eton and Sandhurst, obtained a commission in the Coldstream Guards in 1883, and served through the Suakin campaign of 1885. He left the army in 1887, married Sibell Mary, daughter of the 9th Earl of Scarborough, widow of Earl Grosvenor. He became private secretary to A. J. Balfour, at the time Irish Secretary, and in 1889 entered Parliament as Conservative member for Dover, a seat which he retained till his death.

After serving, from 1898–1900, as financial secretary to the war office, he was appointed in 1900 chief secretary for Ireland. His early work in Ireland met with general approval. He developed enormously the Conservative policy of land purchase; and the act which he carried in 1903 for that end was the most comprehensive measure of the kind ever submitted to Parliament. He hoped to arrange a form of local government which should sufficiently meet Nationalist demands, and with this in view appointed in 1902 an eminent Anglo-Indian, Sir Antony (afterwards Lord) MacDonnell to the under-secretaryship. The Unionist party, both in Ireland and in England, became suspicious of the tendencies of his administration, and he was driven in 1905 to resignation. He never held office again, but was active in support of tariff reform and woman suffrage; he was a keen critic of Haldane's army reforms, and threw himself vigorously into the "Diehard" campaign against the Parliament Bill in 1911.

He was also a man of letters. Here his genius was stimulated by his friendship for W. E. Henley, who dedicated a book to "George Wyndham, soldier, courtier, scholar." His principal published work was an edition of *Shakespeare's Poems* (1898); but he wrote also on North's *Plutarch* and *Ronsard.* The Admirable Crichton of his day, handsome and debonair, he was keen alike on field sports and the arts, a working railway director and an efficient colonel of yeomanry, the pet of society and the recipient of honorary distinctions from several universities. On June 8, 1913, at the comparatively early age of 50, he died in Paris.

See his *Life and Letters,* ed. J. W. Mackail and Guy Wyndham (2 vols., 1925).

WYNDHAM, SIR WILLIAM, BART. (1687–1740), English politician, was the only son of Sir Edward Wyndham, Bart., and a grandson of William Wyndham (d. 1683) of Orchard Wyndham, Somerset, who was created a baronet in 1661. Educated at Eton and at Christ Church, Oxford, he entered parliament in 1710 and became secretary-at-war in the Tory ministry in 1712 and chancellor of the exchequer in 1713. He was closely associated with Lord Bolingbroke, and he was privy to the attempts made to bring about a Jacobite restoration on the death of Queen Anne; when these failed he was dismissed from office. In 1715 the failure of a Jacobite movement led to his imprisonment, but he was soon set at liberty. Under George I. Wyndham was the leader of the opposition in the House of Commons, fighting for his High Church and Tory principles against Sir Robert Walpole. He was in constant communication with the exiled Bolingbroke, and after 1723 the two were actively associated in abortive plans for the overthrow of Walpole. He died at Wells on June 17, 1740. Wyndham's first wife was Catherine, daughter of Charles Seymour, 6th duke of Somerset. By her he had two sons, Charles, who became 2nd earl of Egremont in 1750, and Percy, who took the name of O'Brien and was created earl of Thomond in 1756.

The Wyndham Family.—Sir John Wyndham, a Norfolk man, was knighted after the battle of Stoke in 1487 and beheaded for high treason on May 2, 1502. He married Margaret, daughter of John Howard, duke of Norfolk, and his son Sir Thomas Wyndham (d. 1521), of Felbrigg, Norfolk, was vice-admiral of England under Henry VIII. By his first wife Sir Thomas was the father of Sir John Wyndham, who married Elizabeth, daughter of John Sydenham of Orchard, Somerset, and founded the Somerset branch of the family, and also of Sir Edmund Wyndham of Eelbrigg, who was sheriff of Norfolk at the time of Robert Ket's rebellion. By his second wife Sir Thomas was the father of the seaman Thomas Wyndham (c. 1510–53), an account of whose voyage to Morocco in 1552 is printed in Richard Hakluyt's Voyages.

WYNTOUN, ANDREW OF (?1350–?1420), author of a long metrical history of Scotland, called the *Orygynale Cronykil* of Scotland, was a canon regular of St. Andrews, and prior of St. Serf's in Lochleven. He wrote the *Chronicle* at the request of his patron, Sir John of Wemyss, whose family, at Wemyss castle, Fifeshire, retained possession of the oldest extant manuscript of the work. The subject is the history of Scotland from the mythical period (hence the epithet "original") down to the accession of James I in 1406. The earlier books are of no historical value, but the later have in all outstanding matters stood the test of comparison with contemporary records. The philological interest is great, for few works of this date, and no other of like magnitude, are extant in the vernacular.

The test is preserved in eight manuscripts, of which three are in the British museum, the Royal (17 D. xx), the Cottonian (Nero D. xi) and the Lansdowne (197); two in the Advocates' library, Edinburgh (19, 2, 3 and 19, 2, 4), one at Wemyss castle (*u.s.*); one in the university library at St. Andrews, and one, formerly in the possession of the Boswells of Auchinleck, now the property of John Ferguson, Duns, Berwickshire. The first edition of the *Chronicle* (based on the Royal manuscript) was published by David Macpherson in 1795; the second by David Laing, in the series of "Scottish Historians" (Edinburgh, 1872). Both are superseded by the elaborate edition by Amours for the Scottish Text society (1906).

WYOMING, popularly known as the "Equality state," is one of the central western states of the United States. It is bounded north by Montana, east by South Dakota and Nebraska, south by Colorado and Utah and west by Utah, Idaho and Montana. Including Yellowstone National park (over which the federal government has exclusive jurisdiction and control; area 3,186 sq.mi.), Wyoming has an area of 97,914 sq.mi., of which 503 sq.mi. are water surface; among the states it ranks ninth in size. East and west the state has an extreme length of 355 mi., and north and south an extreme breadth of 277 mi. In shape it is an exact rectangle. The name "Wyoming," originally bestowed upon the Wyoming valley in Pennsylvania, is a corruption of a word of the Delaware Indians meaning "upon the great plain"; it is not known who first applied it to the state. The nickname "Equality state" derives from the fact that Wyoming was the pioneer in woman suffrage. Wyoming was admitted to the union in 1890 as the 43th state. The state flower is the Indian paintbrush (*Castilleja linariaefolia*), the state bird: the meadow lark (*Sturnella neglecta*). The flag has a blue field bordered in white and in red; the field bears a white silhouetted buffalo on which is represented the great seal of the state. The capital of Wyoming is at Cheyenne.

PHYSICAL GEOGRAPHY

Physical **Features.**—Wyoming is situated between approximately 104° 3' and 111° 3' W. and 41° and 45° N. The Great Plains. with an elevation of from 5,000 to 6,000 ft. over much of the state, consist of flat or gently rolling country, barren of tree growth but often covered with nutritious grasses and possessing a soil rich in the mineral elements necessary for plant life which it produces abundantly when it receives sufficient moisture. Erosion buttes and mesas occasionally rise as picturesque monuments above the general level of the plains, and in the vicinity of the mountains the plains strata, elsewhere nearly horizontal, are bent sharply upward and carved by erosion into hogback ridges. These features are well developed about the Bighorn mountains (*q.v.*), an outlying range of the Rockies which boldly interrupts the continuity of the plains in north central Wyoming.

Notwithstanding high elevations in both the northern and southern portions of the state: the low central portion makes a distinct break in the continuity of the northern and southern ranges of the Rockies, giving a broad. relatively low pass through which went the Oregon and Overland trails in the early pioneer days and later the Union Pacific railroad. In this central region the plains are interrupted by minor mountain groups, volcanic buttes and lava flows. In the northeast are outlying spurs of the Black hills (*q.v.*), the Little Missouri buttes and the Devils Tower. the latter a prominent erosion remnant of volcanic intrusion. The higher levels of the Bighorn range have been modified by local glaciation, giving glacial cirques, alpine peaks and many mountain lakes and waterfalls. Several small glaciers still remain about the shoulders of Cloud peak (13,165 ft.), the highest summit in the range.

The various ranges in the northwestern part of the state form some of its most magnificent scenery. A vast portion of this has been set aside as Yellowstone National park, but areas in the Absarokas. east of the park, are also beautiful. Just south of the park, the Teton mountains rise abruptly from Jackson Hole to elevations of 12,000 and 13.000 ft. In the Wind River range, farther southeast, are Gannett peak (13,785 ft.), the highest point in the state. and Fremont peak (13,730 ft.).

In addition to the hot springs of the Yellowstone region, mention should be made of large hot springs (temperature about 135° F.) at Thermopolis and Saratoga.

About two-thirds of Wyoming is drained by branches of the Missouri river, the most important being the Yellowstone, Bighorn and Powder rivers, flowing north, and the Cheyenne and North Platte, flowing east. The Green river, a branch of the Colorado. drains the southwestern part of the state. The Snake river, flowing into the Columbia, heads in the southern part of Yellowstone National park and flows southwest through the beautiful valley known as Jackson Hole into Idaho. Along the western border the Bear river takes its course a short distance, draining ultimately into the Great Divide basin. Southwest of the centre of the state is an area with no outward drainage, the streams emptying into desert lakes.

Wyoming soils are thin but fertile when irrigated. Gray or brown arid-region soils predominate. More than one-third of the state is organized in soil-conservation districts. There is some overgrazing in drought years but otherwise grazing is well controlled in the state.

Climate.—It is difficult to generalize about Wyoming's climate, since the varied and rugged topography makes corresponding local variations. Precipitation for the state averages 14.79 in. annually, but it varies from about 6 in. in the lower Bighorn basin, Sweetwater county and lower Wind river valley, the driest portions, to 35 in. in the mountains bordering on Yellowstone National park. In the agricultural region of the southeastern counties the average annual rainfall is 13.99 in. East of the continental divide about 70% of the precipitation occurs between April and September. The cool summer months of the mountain regions lower the average temperature of the state materially. The annual mean for the valleys is 46° F. and for the mountains, 36°. The average of 243 weather stations, well distributed over the state, gives a day average for July of 83° and a night average of 50°: for Tanuary the averages are, respectively, 31° and 6°. The portion of the state west of the divide has a lower average and longer winters than that east of the divide. The cold spells are not severe, since their chilling effect is modified by the normally low humidity.

Vegetation and Animal Life.—On the treeless plains there are short, tough grasses of many varieties. In drier areas sagebrush, greasewood and other shrubs are found.

Wyoming still abounds in game animals, most of them (except the antelope) concentrated in the forested areas. The game population of the state is estimated at nearly 300.000, including 35.000 elk, 125,000 mule deer, 5,000 white-tailed deer, 110,000 antelope

PARKS AND MOUNTAINS IN WYOMING

Top left: Old Faithful geyser in Yellowstone National Park, so-called because of the regularity of the eruptions which occur at intervals averaging 65 minutes

Top right: Stacking oats at Kelly, the Grand Teton mountains in the background

Centre *right:* Cowboys' saddle horses graze on mountain pastures

Bottom *left:* Fort Bridger, founded in 1842 by Jim Bridger, mountain guide and pioneer, was later a stagecoach stop and military station. The Post Trader's store now is a museum and the site a state park

Bottom right: Independence rock, a gray-brown granite monolith on the north bank of the Sweetwater river. Pioneers traveling westward inscribed their names upon the rock and thousands of these names remain clearly readable (pronghorn), 5,000 moose, 10,000 black bears, 80 grizzly bears and 3.000 mountain sheep. Streams and lakes in all sections of the state have excellent trout fishing, principal varieties being the native cutthroat, brook, rainbow, brown, Mackinaw and golden. Warm-water species, such as bass, crappie, sunfish and catfish, also are available in certain waters. The sage grouse is the state's most widely distributed game bird. Several other species of grouse inhabit the mountains, and pheasant, chukar, Hungarian partridge and wild turkey have been introduced. Among small mammals, ground squirrels, grasshopper mice, wood rats, pocket gophers, kangaroo rats, ferrets and moles are common in the sagebrush and greasewood flats; cottontails, jack rabbits and prairie dogs are found in the plains area.

Parks, Historic Sites and Recreation.—One-fourth of Wyoming's area is given over to national parks and forests and the Wind River Indian reservation. Yellowstone and Grand Teton National parks and Devils Tower National monument are perhaps the greatest tourist attractions in the state, but its history is reflected in many other monuments. Ft. Laramie. a fur-trading (1834–49) and military post (1849–90), located in the eastern part of the state, 80 mi. N. of Cheyenne, has been restored by the national park service since it was made a national monument in 1938. Ft. Bridger, where the mountain man Jim Bridger erected a trading post in 1843, is now a state park with a museum in southwestern Wyoming. Independence rock is located in the central part of the state. 55 mi. S.W. of Casper; on this landmark many Oregon trail travelers carved their initials, as they did on Register cliff. near Guernsey. South pass, the great gateway to the west, in west central Wyoming, is crossed by a good paved highway.

What is usually recognized as the first dude ranch in the west uas established by the Eaton brothers west of Sheridan in 1904. Thereafter, dude ranches, specializing in the entertainment of paying guests, multiplied. Many residents of the state gain a livelihood by catering to the requirements of dudes or the multitude of other tourists who visit the state every summer. The rodeo (*q.v.*) is a favourite state sporting event, the most famous being that held at the annual Frontier days celebration in Cheyenne.

HISTORY

Wyoming contains land from all four of the principal annexations nhich made up the territory of the U.S. west of the Mississippi river. Except for a small portion in Sweetwater and Carbon counties. the land east of the continental divide was acquired from France by the Louisiana Purchase of 1803. The remaining portion came from Mexico in 1848 and Texas in 1845 and 1850. The northwestern corner of the state, drained by the Snake river into the Columbia, formed a part of the old "Oregon country." held jointly by the U.S. and Great Britain until the British relinquished their claims in the treaty of 1846. The portion of the state drained southwest into the Colorado river or into the Great Divide basin was secured by the Mexican cession of 1848.

Exploration and Fur Trade.—There are legends of Spanish exploration of Wyoming, but so far they are unconfirmed by documentary evidence. The Verendrye brothers traveled southwest from the Mandan villages in 1742–43 and may have reached the Bighorn mountains, but the vagueness of their journals makes it impossible to determine the fact with certainty. John Colter, a member of the Lewis and Clark expedition (1804–06) who left that body on their homeward trip and plunged back into the wilderness as a free trapper, is the first white man known definitely to have entered the state. Doubtless there mere other wanderers before him whose tales are forever lost. Colter trappd to the east and south of Yellowstone National park, and finally, in 1807, crossed that wonderland itself and brought to the norld the first news of its strange phenomena. Four years later an expedition of more than 50 men, commanded by Wilson Price Hunt and bound overland to the mouth of the Columbia to begin the American fur trade in that region, entered northeastern Wyoming, proceeded south and west around the Bighorn mountains, across the continental divide through Union pass and on by the Snake river valley into Idaho. In 1812 several of the same party, led by Robert Stuart, returned over a more southerly route, passing near if not actually through South pass before striking the Sweetwater and continuing eastward along the North Platte river.

In the following years a number of free trappers and employees of the various St. Louis fur companies trapped in eastern Wyoming, but not until the spring of 1824 was the continental divide again crossed, this time by Thomas Fitzpatrick, leading a detachment of William Henry Ashley's fur traders across to new grounds. Fitzpatrick is often given the credit for the discovery of South pass, and he was the first to make it knonn. In the period 1825–40. the era of the mountain men, a fur-trade rendezvous was held each year at a predetermined place in Wyoming, Utah or Idaho. Twelve of these assemblies were held in the neighbourhood of South pass in Wyoming. The rendezvous was a gathering of Indians, fur traders and company employees for the purpose of meeting the pack trains of the company and exchanging the furs for next year's supplies. Hundreds of tents and tepees would dot the river bottoms during the frontier's one great social event. In 1834 Ft Laramie was built by the traders at the confluence of the Laramie and North Platte rivers in eastern Wyoming, and it served as a centre for the fur trade until 1849 when the U S. government purchased it to use as a military post for the protection of emigrants.

Overland Emigration and Railways.—Overland emigration through Wyoming began in 1841 when the first train of settlers passed over the Oregon trail (*q.v.*). Movements increased steadily during the next few years, and in 1847 they were swelled by the Mormon emigration, which followed the Oregon trail over the pass and then branched southwest past Ft. Bridger, built by Jim Bridger on Black's fork of the Green river.

The first rush to California came in 1849, the forty-niners following the Oregon trail through Wyoming and branching southnest after they entered Idaho. The first stagecoach line over this route, a monthly service to Salt Lake City, started in 1851. In 1858 a daily line from Atchison to San Francisco was traveling the trail. In 1860 the pony express (*q.v.*) was established, and in the folloning year the first telegraph line to the Pacific was constructed across Wyoming along this route.

By 1862. however, Shoshone and Sioux depredations were so constant that it became necessary to move the stage line to a southern route nearly parallel with the present Union Pacific railroad. Government troops were detailed to protect the stage stations, emigrant trains and freighting trains. Indian hostilities increased thereafter, reaching a climax in 1865 and 1866. In the latter year troops were sent north of Ft. Laramie to establish garrisons for the purpose of keeping open the Bozeman road to the Montana gold mines. The garrisons at Ft. Reno, Ft. Phil Kearny and Ft. C. F. Smith were in the hunting ground of the Sioux. In Dec. 1866 Col. William J. Fetterman and 81 men were ambushed and killed near Ft. Phil Kearny. War continued with the Sioux until a precarious peace was made in 1868 with their chief, Red Cloud. At that time garrisons were withdrawn from the Bozeman road, and few whites ventured into northern Q'yoming until the army campaigns of 1876 made the area safe.

The Union Pacific railroad began to build across the state in 1867 and pushed rapidly forward. Cheyenne and Laramie (*qq.v.*) were founded at this time.

Territory and State.—In order to protect and govern new settlements along the railway the territory of Wyoming was organized, including parts of the Dakota territory, Utah and Idaho. The Wyoming Organic act was approved July 25, 1868, but the territorial government was not formally inaugurated until April 15, 1869, when the governor and secretary took the oaths of office. Cheyenne was designated the territorial capital.

For years most of the people of the territory lived in towns along the Union Pacific railroad in southern Wyoming, and the only sizable community, other than Indian, at a distance from the railroad was in the South pass region where gold discoveries in 1867 and 1868 served as a magnet to settlers. The first land office was opened in Cheyenne in 1870, and the first homestead entry was completed in 1871.

The Wyoming constitutional convention met at Cheyenne in Sept. 1889 and drew up the constitution that was subsequently adopted at a special election on Nov. 5, 1889. On July 10, 1890, Wyoming was admitted to the union as the 44th state in spite of its deficiency of population (only 62,500).

Range Wars.—Wyoming did not at first prove attractive to homesteaders except in the best valleys along the Union Pacific. Instead it was discovered that the bunch and buffalo grass of the plains made excellent feed for cattle. Not only did they fatten on it in the summer, but the thick ripe bunches, retaining all their nutritious food elements, penetrated the thin snows of the windswept plains, enabling the herds to live and thrive all winter without extra food or care. Also. cattle could be grazed at a distance from the railroad and, when ready for market, transported themselves. Soon great herds mere on the way north from the overstocked ranges of Texas, cowboys driving them up the "long trail" to the tune of

Whoopee ti yi yo, git along little dogies,
For you know Wyoming will be your new home,

and other trail songs. By the early 1880s the ranges of Wyoming were well stocked. Herds increased rapidly and almost without expense. Only a "home ranch" for headquarters was necessary, and the herds ranged far and wide on the public domain.

The cattle industry then entered an era of troubles. The range became overstocked. Market prices dropped. Thieves, called rustlers, made inroads on the herds. The latecomers—many of them Englishmen, Scots and Americans from the eastern seaboard—found their expectations of profit unrealized. Absentee ownership spread. Then came the worst blow of all: during the dreadful winter of 1886–87, one-sixth of the 'cattle perished from lack of water and feed. When those cattlemen who were not bankrupt began to rebuild the industry, they proceeded more cautiously.

The territorial governor, Thomas Moonlight (1887–89), insisted that the open range be broken up into small farms. Though he could not force the legislature, which was still dominated by the cattlemen, to legislate on this, many small settlers accumulated in northern Wyoming, particularly in Johnson county. Many of these small settlers, or nesters, had come before the winter of 1886–87, needing no invitation from a sympathetic governor. Cattlemen who had herds in Johnson county attributed part of their losses to rustling by some of the small settlers. Unable to secure convictions in the local courts, the cattlemen in 1892 dispatched an expedition of more than 50 armed men from Cheyenne to the trouble area, carrying a list of names of men who were to be murdered. After two of the "rustlers" had been killed. however, the cattlemen's party was besieged by a numerically superior Johnson county force led by the sheriff. Hostilities were terminated abruptly by the arrival of U.S. troops. Thereafter the cattlemen, as a group, permitted the constituted authorities to control rustling, although a few, as individuals, hired the notorious Tom Horn to shoot down intruders on cattle ranges.

With the decline of cattle raising, sheep raising began to increase. The first large herds reached the state in the late 1880s. A long feud mas also waged between the cattlemen and the sheepmen, for the sheepmen tried to force their way into ranges already occupied. Cattlemen claimed that cattle would not go where sheep had grazed, and that the sheep destroyed the range and polluted the water holes. An imaginary "dead line" was drawn by the cattlemen beyond which sheep must not go. Herders violated this arbitrary law at their own peril; the annals of Wyoming record several cases in which wagons were burned, herders killed and sheep scattered or killed. After five cattlemen were convicted and sent to the penitentiary in 1909 for killing two sheepmen and a herder in the Tensleep raid, the attacks upon sheepmen ceased.

Federal Lands.—Spokesmen for the cattlemen and sheepmen early found a common enemy in officials of the federal government, although their hostility never involved violence. Public-land policies of the federal government annoyed the livestock men. In particular the government was alleged to be too arbitrary and too niggardly in its distribution of permits for grazing on the public lands. Fear that grazing privileges would be lost was one of several iactors in the bitter opposition to Pres. Franklin D. Roosevelt's creation of the Jackson Hole National monument of 221,610 ac. in 1943. The controversy was settled by compromise in 1950 when most of the land in dispute was added by congressional action to the Grand Teton National park and grazing use of federal lands within the park was permitted.

Politics.—Except during the New Deal era of the 1930s. Republicans usually have dominated Wyoming state politics but in the 1958 elections the Democrats recaptured control of the statehouse for the first time in 20 years. In presidential elections from 1896 on the voters supported the winner, whether Republican or Democrat, except in 1944 when they preferred Thomas Dewey to Franklin D. Roosevelt and 1960 when they chose Richard M. Nixon over John F. Kennedy. Voters of the state often have been ready to support the man rather than the party. Despite changing fortunes of the two major parties the state was represented in the U.S. senate by Francis E. Warren (Republican) for 37 years before he died in 1929; by John B. Kendrick (Democrat) from 1917 until his death in 1933; and by Joseph C. O'Mahoney (Democrat), 1934–53, 1955–61.

GOVERNMENT

Wyoming is governed under the constitution approved in 1889, as amended. Every citizen over 21 years of age who has lived in Wyoming one year, in the county where he is to vote 60 days and in the election district 10 days, who can read the constitution of the state and who is not insane, an idiot or a person convicted of infamous crimes (unless restored to his civil rights) has the right of suffrage.

At the first territorial legislature, held in Cheyenne in Dec. 1869, women of Wyoming mere given the right to vote at all elections. This right was confirmed by an equal suffrage clause in the state constitution. Wyoming thus was the first state to grant full woman suffrage. Congressional approval of the constitutional provision recognized the success of the experiment that had been carried on for 21 years in the territory and that had attracted widespread attention. Wyoming's pioneering in woman suffrage has been attributed variously to the determined efforts of Esther Hobart Morris, to the legislative leadership of Col. W. H. Bright, to a desire for free publicity for the territory and to the scarcity of women.

Executive Branch.—The chief executive officer is the governor. Other elective executive officers are the secretary of state, auditor, treasurer and superintendent of public instruction. All hold office for four years. Not only do they direct their own departments but, together with appointed officers, they also serve on many executive boards, such as the state board of land commissioners, state board of pardons, board of state supplies, state farm loan and fiscal board and state historical board. A number of executive officers are appointed by the governor and are responsible to him.

Legislature.—The legislature is composed of a senate of 27 members and a house of representatives of 56 members. Four of the 23 counties have two senators, the others one. The number of representatives in the lower house varies from one to six per county, Laramie and Natrona counties having six. The state constitution makes reapportionment mandatory after each decennial census, but no reapportionment bill was passed in the 1940s or 1950s. Consequently rural areas were overrepresented.

The regular sessions of the legislature meet in Cheyenne on the second Tuesday in January every odd-numbered year and may continue 40 days. The governor has the power to veto any bill, but if upon reconsideration it is repassed by a two-thirds majority in each-house it becomes a law without the governor's signature. The governor may veto any item in the appropriations bill. Special laws are not to be passed where a general one may be made applicable.

Judiciary.—The supreme court of Wyoming has four justices, elected by the voters for terms of eight years. Two terms of the supreme court are held annually, one in April and the other in October. A special term can be held when two justices so vote. There are seven judicial districts and 11 district judges, four districts having 2 judges each. Regular terms are held in each district. Each of the district judges is elected by his district for a six-year term. The counties are also divided by the county commissioner into judicial districts for which the voters of the district elect a justice of the peace. Incorporated towns and cities have municipal courts and police justices.

Finance.—Chief sources of government revenue in Wyoming are sales and use taxes (the 2% excise tax on retail sales was introduced in 1935), liquor commission revenues from liquor wholesaling, and state property taxes. Each person betneen the ages of 21 and 50 is subject to a $2 school poll tax. A state tax of four cents per gallon is levied on all gasoline used or sold for domestic consumption. Of the state's bonded debt a large proportion represents bonds issued for construction of buildings at the University of Wyoming; it nas planned that these would be retired from building revenues and from oil royalties from federal lands in the state.

POPULATION

The population of Wyoming in 1870 was 9.118; in 1890 it was 62,555; in 1910, 145.965; in 1940, 250.742: in 1950, 290.529; and in 1960, 330,066. This last figure represented an increase of 13.6% over the population in 1950. The population per square mile in 1960 was 3.4, as compared with 3.0 in 1950 and 2.6 in 1940, and with 49.6 for the U.S. in 1960.

*Wyoming: Places of 5,000 or More Population (1960 Census)**

Place	Population				
	1960	1950	1940	1920	1900
Total state	330,066	290,529	250,742	194,402	92,531
Casper	38,930	23,673	17,964	11,447	883
Cheyenne	43,505	31,935	22,474	13,829	14,087
Laramie	17,520	15,581	10,627	6,301	8,207
Rawlins	8,968	7,415	5,531	3,969	2,317
Riverton	6,815	4,142	2,540	2,023	—
Rock Springs	10,371	10,857	9,827	6,456	4,363
Sheridan	11,651	11,500	10,529	9,175	1,559
Worland	5,806	4,202	2,710	1,225	—

*Populations are reported as constituted at date of each census.
Sote: Dash indicates place did not exist during reported census, or data not available.

Of the 1960 population. 187.551 or 56.8% lived in incorporated places of 2.500 or more, as compared with 49.8% in 1950 and 37.3% in 1910.

The number of occupied dwelling units (or households) in 1960 was approximately 99,187, as compared with 84,000 in 1950 and 69,000 in 1940. The average population per household had declined from 3.6 in 1940 to 3.5 in 1950 and to 3.3 in 1960.

The population of the state was distributed by colour and nativity in 1950 as follows: 97.8% white; and 2.2% nonwhite, mainly Indians. There were 113.4 males per 100 females in the white population; 6.3% of the population was 65 years old or over. Of the total number of employed males in 1950, 24.6% were engaged in agriculture, 10% in mining, 10.6% in construction, 7% in manufacturing, 14.9% in transportation, etc., and 14% in wholesale and retail trade.

In mid-19th century many Sioux: Cheyenne, Arapaho. Crow and Shoshone Indians still lived in the Wyoming country. Only the eastern Shoshone and the northern Arapaho remain. These two tribes share the Wind River reservation in the west central part of the state. In 1956 there were 1,652 Shoshone and 2,040 Arapaho on the reservation.

EDUCATION

Public Schools.—In territorial Wyoming the great distances, small population and meagre resources meant slow development for education. There were few children, the greater part of the population consisting of unmarried males. The first territorial legislature provided for school districts and school boards, and in 187i school attendance for at least three months each year was made compulsory. In outlying districts the schoolhouse became the community social centre. The teacher was often a young woman from the east who was courted by cowboys of the neighbourhood. Few women teachers in either town or country remained long unmarried.

In the territorial period, first the auditor and later the librarian served as exofficio superintendent of public instruction. After statehood, the department of education was headed by an elective superintendent of public instruction (generally a woman) who appoints, with the approval of the governor, a state board of education of six members who serve without salary for six-year terms. Two are appointed in each odd-numbered year. The superintendent also appoints three assistant superintendents, for instruction, administration and special services, who supervise the work of the three divisions of the department.

A school-district reorganization law was enacted in 1947 which permitted county committees to arrange for redistricting. In 1948 the electorate passed a constitutional amendment permitting a property-tax levy for the support of public schools. The legislature in 1955. in order to raise standards and to aid poorer school districts, established a Foundation program, which equalizes educational opportunity, both assets and expenses being considered in the formula for distributing state aid. The fund from which money is distributed includes money from oil royalties and from the state's levy for public schools.

In 1959 the legislature passed an enabling act permitting the acceptance of National Defense Education act funds, stipulating, however. that the federal aid could be accepted only if the state board of education resolved that there nas need for federal funds that could not be met in the state, and if the federal government budget was in balance for the year concerned.

The cost of education per child in Wyoming is fourth highest in the nation; school cost per adult is second. By the late 1950s about 75,000 children were enrolled annually in the public schools.

Higher Education.—The University of Wyoming (established in 1886), the only four-year institution of higher learning in the state, is at Laramie. Its eight colleges are agriculture, arts and sciences, commerce and industry, education, engineering, law. pharmacy and nursing. The university registers about 4,000 students annually and has a full-time faculty of more than 250. The main library has 300,000 volumes, exclusive of documents. After World War II an extensive building program was carried on at the Laramie campus.

Five junior colleges were established after World War II, at Casper, Sheridan. Powell. Torrington and Rock Springs. They became community colleges, supported mainly by local school districts, nith some additional funds derived from state legislative appropriation.

HEALTH, WELFARE AND CORRECTIONS

The state board of charities and reform, composed of the five elective officials of the state government, supervises the state institutions: a penitentiary at Rawlins, training school for delinquent boys at Worland, training school for delinquent girls at Sheridan. hospital for the mentally ill at Evanston, hospital for the mentally deficient and epileptic at Lander, sanatorium for the tubercular at Basin. home for the aged at Thermopolis, home for dependent children at Casper and soldiers' and sailors' home at Buffalo. There is also a small prison farm at Riverton, and the legislature in 1959 established a state school for the deaf at Casper. The blind are cared for at state expense in schools of neighbouring states.

The state department of public welfare, also made up of the five elective state officials, disburses funds for all public-welfare programs, almost one-half of the money going for old-age assistance.

THE ECONOMY

Agriculture.—One-half of Wyoming, or about 31,000.000 ac., is classed as ranch and farm land; less than 10% of this is crop-producing, the remainder being grazing land. Scanty rainfall and limited irrigation-nater resources preclude any considerable increase in cropland. Of the 3,000,000 ac. of cropland, about 2,000,000 ac. have the benefit of irrigation; the balance is dry-farmed. Dry-land farming is carried on mainly in the eastern part of the state. while production of irrigated crops occurs in many small areas scattered over the state along the river systems. Chief crops are hay. wheat, oats. barley, potatoes, rye and corn.

The extensive grazing lands of Wyoming, with insufficient rainfall for profitable cultivation, favoured livestock raising from territorial days (see *History*, above). Until the disastrous winter of 1886–87 cattle were most important: there were about

2,000,000 cattle in the territory in 1886, a total never approached since that time. On the other hand the number of sheep increased from approximately 500,000 in 1886 to about 6,000,000 in 1909, peak for sheep in Wyoming history. In 1909 there mere approximately 765,000 cattle. In the half century after 1909 labour shortages and less promise of profit in sheep caused a preference for cattle most of the time. In the early 1960s there were about 1,000,000 cattle and calves and 2,250.000 sheep and lambs. Not much of the old antagonism between sheepmen and cattlemen remained, and some leading stockmen had both cattle and sheep, or moved from one to the other with changing price patterns.

Wyoming has long ranked among the leading states in wool production, usually being second only to Texas. Some sections of the state, notably the Red desert in the south central part. provide excellent forage for sheep but are not suitable for cattle. The state made strenuous efforts after World War II to obtain wool-processing industries, which would stimulate wool growing, but these efforts failed.

Hogs have never been numerous in Wyoming; there were only about 45,000 in the late 1950s, at which time there were 50,000 horses and mules (the smallest number in recent history) and 450,000 chickens. Turkeys, which were numerous in the 1920s and 1930s, virtually disappeared thereafter. Marketing problems and the high price of feed restricted the expansion of dairying; there were only about 40,000 milk animals in the state in the late 1950s. Goshen county in the eastern part of the state and Star valley in Lincoln county in the western part stress the dairying industry; there are, of course, small dairy herds in the vicinity of every town.

The average size of Wyoming farms and ranches is over 3,000 ac.

Mining. — Spurred on by rich discoveries in neighbouring territories, prospectors searched Wyoming thoroughly for gold and silver in the 19th century. They found barely enough to keep their hopes alive. Their greatest success was in the South pass region where gold valued at $2,000,000 was produced in the boom period 1867–73. Wyoming's principal mineral resources proved to be petroleum and coal, and petroleum came to be of most importance.

The presence of oil was recognized long before the name Wyoming was applied to the area. Oil springs were noted by Capt. Benjamin Bonneville in 1832, and not many years thereafter travelers on the Oregon trail were scraping up some of this oil and mixing it with flour to make axle grease. Not until 1883 was a well drilled. Marketing difficulties held the industry back until World War I when a boom developed that lasted until 1923. Output reached a peak of 44,785,000 bbl. in that year, with the greatest activity in the Salt Creek field in Natrona county north of Wyoming's "oil capital," Casper. Subsequently production dropped off to 13,650,000 bbl. in 1935. In the 1940s higher prices and more favourable government leasing policies stimulated the industry. Intensive geophysical search and widespread wildcatting brought many new discoveries. A second peak in production was attained with 115,393,000 bbl. in 1958, highest on record. Wyoming geologists had concentrated on the search for domes, but in the 1940s it was learned that much Wyoming oil lay trapped under diverse geological conditions, and fields were developed on the ends of domes in areas long rejected by geologists; also, traps formed by variations in sands were located. Deep drilling became an important factor. A well producing from a depth below 10,000 ft. was drilled in 1946, and many other deep-producing wells were drilled thereafter; one produces at 15,920 ft. in the West Poison Spider field. By 1958, 21 of the state's 23 counties were producing oil, the leading counties, in order, being Park, Hot Springs, Fremont, Big Horn and Natrona. The state's cumulative production to 1959 was 1,659,232,000 bbl. of oil. and proved underground reserves totaled 1,499,000,000 bbl. in that year; in the latter respect Wyoming ranks fifth among the states.

Part of Wyoming's crude oil is processed in refineries within the state, and part is piped to refineries in other states. Various abortive attempts were made beginning in 1924 to establish a severance tax. Such a tax proposal was a principal issue in the gubernatorial campaign in 1950, and legislators regularly considered but rejected severance-tax bills thereafter.

Oil-shale reserves occur in southwestern Wyoming and neighbouring states At the end of World War II the U S bureau of mines built a $500,000 oil-shale laboratory at Laramie where experiments were begun on the extraction of oil from shale.

Next to petroleum. coal has been the most important mineral in Wyoming. The U.S. geological survey in 1950 reported that Wyoming was first among the states in coal reserves with 121,000.000.000 tons, including 13,000,000,000 tons of soft coal and 108,000,000,000 tons of subbituminous coal. Production of coal declined, however, after World War II.

Other minerals produced in Wyoming include uranium, iron ore, trona and bentonite. Minerals such as gold and silver. which stirred the imagination of many people in Wyoming's early history, were not produced in the second half of the 20th century. Mines in the Encampment area had produced copper to the value of $2,000.000 in the first years of the 20th century, but no copper was produced in the late 1950s. Wyoming ranks second among the states in uranium ore reserves, and its production from these reserves is expected to increase.

Forests and Lumber. — One-seventh of Wyoming's area is in nine national forests: Bighorn, Bridger, Medicine Bow, Shoshone, Teton, Black Hills, Caribou, Targhee and Wasatch. The first five named forests lie entirely within Wyoming, the other four only partly.

About 60% of the timber is lodgepole pine. The next most abundant varieties are Engelmann spruce and alpine fir. which displace lodgepole pine at between 6.000 and 9,000 ft. above sea level. In addition to these main types are Douglas fir and limber pine, both restricted in their distribution to favoured localities, the Douglas fir between the lodgepole pine and spruce line, especially on moist north slopes, and the limber pine on exposed rocky sites rising toward the timber line. where it usually takes the frontier stand Little timber is cut except in the national forests, where lumbering is supervised by the U.S. forest service. Under permits, ranchers pasture cattle, horses, sheep and goats in the national forests.

Industry. — Except for petroleum refining, manufactures are of little importance in Wyoming, most of them being local in character and dependent on local products for their raw material. Many efforts have been made since territorial days to bring manufacturing industries to the state, with little success. There are 12 oil refineries which employ more than one-third of the persons employed in manufacturing and pay more than half the wages and salaries so earned. Other manuiactures include food and kindred products. dairy products, lumber and products, printing and publishing and stone, clay and glass products.

Transportation and Communication.—Wyoming's early development was caused by the Union Pacific railroad. which was laid across the territory in the years 1867–69. Various lines were built thereafter. but north-and-south railway transportation remained inadequate, with no prospect for any extension. The two most important systems are the Union Pacific and the Chicago, Burlington and Quincy.

In the late 1950s there were more than 33,000 mi. of roads and highways in the state, of nhich about 5,725 mi. were surfaced. Nearly 1,000 mi. of Wyoming highways mere included in the 41,000-mi. national system of interstate and defense routes.

Cheyenne aspired to national prominence as an air terminal in the 1920s but lost its early leadership. Two local air lines provide limited service for most of the larger communities of the state. The state has 10 daily and 34 weekly newspapers, and there are television stations in Cheyenne, Casper and Thermopolis.

Bibliography.—The most important official state reports are the biennial reports of the treasurer, secretary of state, state geologist, Board of Equalization, Public Service commission, Highway commission, department of public meliare, Board of Charities and Reform, department of education and Game and Fish commission. The Wyoming Cooperative Crop and Livestock Reporting service issues many reports; the University of Wyoming offers a variety of publications; the Wyoming State Historical department publishes the *Annals of Wyoming* twice a year. *See* also the bulletins of the state geologist, bulletin no. 17 being a *Bibliography and Index of Wyoming Geology 1823–1916* and bulletin no. 45 being Frank W. Osterwald and Doris B. Osterwald, *Wyoming Mineral Resources.* Miscellaneous circular no. 28

of the U.S. department of agriculture deals with the *National Forests of Wyoming* (1927).

History and government: H. H. Bancroft, *History of Nevada, Colorado and Wyoming* (1890); C. G. Coutant, *History of Wyoming* (1899); I. S. Bartlett (ed.), *History of Wyoming* (1918); Ernest S. Osgood, *The Day of the Cattleman* (1929); Charles Lindsay, *The Big Horn Basin* (1932); F. Beard (ed.), *Wyoming from Territorial Days to the Present* (1933); Writers' Program, *Wyoming* in the "American Guide Series" (1941); Marie H. Erwin, *Wyoming Historical Blue Book* (1946); Velma Linford, *Wyoming: Frontier State* (1947); Herman H. Trachsel and Ralph M. Wade, *The Government and Administration of Wyoming* (1953); Maurice Frink, *Cow Country Cavalcade* (1954); T. A. Larson, *Wyoming's War Years, 1941–1945* (1954). Current statistics on production, employment, industry, etc., may be obtained from the pertinent state departments; the principal figures, together with the current history, are summarized annually in the *Britannica Book of the Year*, American edition. (T. A. Ln.)

WYOMING VALLEY, a valley on the north branch of the Susquehanna river in Luzerne county, Pa., that was the scene of land disputes from colonial times until the end of the 18th century. The area was small, only about $3\frac{1}{2}$ mi. wide and 25 mi. long. Seeds for a boundary dispute were planted when Charles II approved the colonial charters of Connecticut in 1662 and Pennsylvania in 1681. The Connecticut charter, with the South sea (Pacific ocean) as the western limit, placed the southern boundary of the colony at 41° N. latitude. Yet Charles II recognized 42° N. latitude as the northern boundary of William Penn's proprietorship. Thus, when the Connecticut grant was extended westward, it overlapped territory placed under Penn's control.

In 1754 a group of Connecticut land promoters (the Susquehanna Land company) obtained title to the Wyoming valley from the Six Nations (Iroquois). The French and Indian War interfered with settlement for a number of years. In spite of protests by the Penn proprietors against the invasion of their charter rights, Connecticut settlers moved into the valley in 1762. They were driven out by an Indian attack in Oct. 1763.

The Iroquois repudiated the 1754 agreement with the Connecticut company and in 1768 resold their rights to the Penns. From 1765 to 1786 there were frequent clashes between Connecticut settlers and groups representing Penn interests, the most serious being the first and second Pennamite-Yankee Wars of 1769–1771 and 1775.

An even more devastating and tragic event in the history of the valley came in July 1778, during the American Revolution, when the Tory leader Col. John Butler and his Indian allies attacked the settlers and perpetrated the Wyoming massacre.

Near the end of the war with England a congressional commission convened to examine the Connecticut-Pennsylvania dispute. It rejected Connecticut's charter claim and on Dec. 30, 1782, unanimously upheld the Pennsylvania claim. Pennsylvania extended political jurisdiction over the area but refused to recognize the land titles of the Connecticut settlers, thus bringing on the third Pennamite-Yankee War in 1784. In 1787, and again in later years, the Pennsylvania legislature passed laws confirming the land titles; settlement thereafter went ahead and the economic resources of the valley were rapidly developed.

In addition to agriculture the Wyoming valley became the scene of extensive coal-mining operations in the 19th century.

(H. I. Be.)

WYRE FOREST, the remains of an ancient forest in southeastern Shropshire and northwestern Worcestershire, Eng. It lies on high ground west of Bewdley and the Severn river and contains some fine scenery. It covers the southern portion of the Severn valley coal fields and was an early centre of development for the midland iron industry.

WYSPIAŃSKI, STANISLAW (1869–1907), Polish painter and dramatist, was born in Cracow in 1869. His paintings reveal a genius for dramatic construction, but the loss of the use of his hand forced him to turn to writing. *Wesele* (*The Wedding*) is usually regarded as his greatest work and has a high place in Polish literature. The three tragedies *A Warsaw Song, Lelewel* and *November Night* constitute a vivid and powerful portrayal of the November revolution of 1830. In these plays and in *The Legion, Deliverance* and *The Acropolis* he gives voice to the national aspirations of his countrymen and concentrates on the causes of weakness in his nation which put off the hour of its delivery. *The Curse* and *The Judges* are concerned with the lot of the peasants, their ignorance and passions and the pathos of their lives. They adapt the form of the Greek tragedies, the people of the village forming the chorus which comments on the actions of the principal characters. *Boleslas the Bold, The Church on the Rock, King Casimir* are historical dramas. Wyspianski seems to have felt prophetically the approach of a stormy era of war and sacrifice which his people must prepare to meet. World War I greatly increased his influence and Polish drama of recent times has remained under his spell.

WYSS, JOHANN RUDOLF (1782–1830), Swiss writer, famous for his connection with *The Swiss Family Robinson*, was born March 13, 1782, at Berne, where in 1805 he became professor of philosophy at the academy and later chief librarian of the municipal library.

He was a collector of Swiss tales and folklore, writing *Idyllen, Volkssagen, Legenden und Erzählungen aus der Schweiz* (1815) and editing the *Alpenrosen* almanac (1811–30) with the collaboration of the best Swiss writers of his time. He completed and edited *Der schweizerische Robinson* (1812–27), a manuscript originally written by his father, Johann David Wyss (1743–1818), a pastor attached to the minister in Berne, for and with his four sons. The book was translated into English (*The Swiss Family Robinson*, 1820) and other languages and was still popular in the 20th century.

J. R. Wyss was also the author of the Swiss national anthem, "Rufst du, mein Vaterland" (1811). He died at Berne on March 21, 1830. (A. Bx.)

WYTHE, GEORGE (1726–1806), American jurist, a signer of the Declaration of Independence and pioneer professor of law, among whose students were Thomas Jefferson, John Marshall and Henry Clay. Born in the county of Elizabeth City, Va., in 1726, he was elected to the house of burgesses in 1758. In 1764 he was placed on a committee to prepare a petition to the king and remonstrances to both houses of parliament against the Stamp act. Wythe drew up the remonstrance to the house of commons in such strong language that it required considerable modification before it could be sent. In 1775 he was sent to the Continental Congress, where he remained to sign the Declaration of Independence. In 1776 he was appointed, with Jefferson and Edmund Pendleton, to revise the laws of Virginia to make them more appropriate for an independent state. He was an important member of the Constitutional Convention in 1787, and in the following year, of the Virginia convention which ratified it. In 1778 Wythe was appointed a judge of the court of chancery. He was one of the first U.S. judges to lay down the principle (*Commonwealth v. Caton*, 1782) that a court can annul a law deemed to conflict with the constitution.

Wythe is perhaps best remembered as a teacher of law. Jefferson studied in his chambers at Williamsburg. In 1779 — through the influence of Jefferson, then governor of the commonwealth and a member of the board of visitors of the College of William and Mary—Wythe was appointed "professor of law and police," the first chair of municipal law in any college in the nation. He held this position for ten years, teaching principally from the English texts, but introducing into the course a series of moot courts and moot legislatures held by the students and judged by the faculty. Among his pupils during this period was John Marshall, later chief justice of the United States. In 1788 Wythe became sole chancellor of Virginia, and in 1789 the burdens of this position made it necessary for him to resign from the college faculty and move to Richmond. The move did not, however, end his teaching career, for he opened a private school of law in Richmond. Among his pupils in Richmond, and clerk of his court, was Henry Clay.

Wythe died in Richmond on June 8, 1806, from poison, under circumstances which led to the arrest and trial for murder of his grandnephew, the residual legatee under his will. The trial resulted in an acquittal by the jury.

See Thomas Jefferson, *Writings*, Monticello ed., vol. i (1904); L. S. Herrink, "George Wythe" in *John P. Branch Historical Papers*, vol. iii (1912). (J. D. Ls.)

WYTTENBACH, DANIEL ALBERT (1746–1820), German-Swiss classical scholar. was born at Berne on Aug. 7, 1746. He studied Greek under Heyne at Gottingen, and dedicated his first work to Ruhnken, who wrote that he had not expected to find in Germany such knowledge of Greek and such critical powers. Heyne recommended him to Ruhnken and Valckenaer, and in 1770 he went to Leyden. He obtained a professorship in 1771, and began his *Bibliotheca Critica,* which continued to appear for about 30 years. He became professor of Greek at the Athenaeum at Amsterdam in 1785. He edited the *Moralia* of Plutarch for the Clarendon Press, the second portion of which underwent strange adventures during the war between Holland and Great Britain. and was eventually found at Hamburg. The book was finished in 1805. He went to Amsterdam in 1799 on Burmann's death and published his charming *Vita Ruhnkenii* (Leyden. 1799). During his last years he became nearly blind. His only important work was his edition of the *Phaedo.* He died of apoplexy on Jan. 17, 1820.

Hemsterhuis, Valckenaer, Ruhnken and Wyttenbach, more than any others after Bentley, laid the foundations of modern Greek scholarship. The precise study of grammar, syntax and style, and the careful criticism of texts by the light of the best manuscript evidence, were upheld by these scholars in the Netherlands when they were almost entirely neglected elsewhere on the continent, and were only pursued with partial success in England.

X This letter has no prototype in the Semitic alphabet. where; however, a letter of the same shape was the source of Greek T. X first appears after the differentiation of the Greek alphabet into eastern and western types, and its divergent use is one of the most striking marks of difference between them. In the eastern alphabets it represented a voiceless velar aspirate (*ch* or *kh*), and with essentially this value it became part of the Ionic alphabet of later classical Greek, whence it passed into both the later Greek and the Cyrillic alphabets. With its value as standing for the combination ks it passed from the western Greek into the Etruscan and Latin alphabets. Meanwhile the east Greek alphabet used a sign Ξ for *ks*, while the west Greek alphabet used Ψ or Y for the velar aspirate. The western use of X as *ks* may have originated in part through shortening of the combination Xϟ, which was used with this value in early inscriptions of several localities.

Initial *x*, the occurrence of which in English is almost entirely limited to words of Greek origin, is pronounced like *z* (*e.g.*, xylophone). See also ALPHABET. (J W. P.)

XANTHINE: see PURIKES.

XANTHUS (mod. GÜNÜK), an ancient city of Lycia, on the Xanthus river (Eshen Chai) about 8 mi. above its mouth. It was besieged by the Persian general Harpagus (546 B.C.), when the acropolis was burned and all the inhabitants perished. The city was rebuilt; and in 42 B.C. it was beseiged by the Romans under M. Junius Brutus. It was taken by storm and set on fire. and the inhabitants perished in the flames. The well-preserved theatre is remarkable for a break in the curve of its auditorium. which has been constructed so as not to interfere with a sarcophagus on a pedestal and with the "Harpy monument." In front of the theatre stands the famous stele of Xanthus inscribed on all four sides in Lycian and Greek. Behind the theatre is a terrace on which probably the temple of either the Xanthian Apollo or Sarpedon stood. (D. G. H.)

XAUEN (CHAUEN), a town of northern Morocco. lies 31 mi. S. of Tetuán on the main road to Melilla. Pop. (1950) 12.302. It stands 1.970 ft. above sea level in a picturesque setting at the foot of precipitous cliffs of the Djebel Tissouka (6.890 ft.). Its white houses are roofed with the round tiles familiar in southern European countries but rare in Morocco. From the square in the town's centre the 15th-century kasbah raises its red battlemented walls. Below the native town is a new quarter laid out on a geometrical plan by the Spanish. An abundant and constant spring flows from the foot of the mountain in the old city and provides water for the channels which run through the town and its rich gardens. A holy city. founded at the end of the 15th century by a sherif of Djebel Alam to resist the Portuguese, and peopled by Moors expelled from Granada. it still contains a dozen mosques. Xauen was long closed to non-Moslems and was not occupied by the Spanish until 1920. After Moroccan independence (1956) the town was for two years the headquarters of a province with a governor, but in 1958 all administrative services were transferred to the province of Tetuán. Other spellings are Xexauen. Chechaouene and Shishawen. (G. . M.)

XAVIER, SAINT FRANCIS (FRANCISCO DE YASU Y XAVIER) (1506–1552) Jesuit missionary, styled the "Apostle of the Indies," was the youngest son of Juan de Yasu, a high official of the kingdom of Navarre and of his wife, Maria Aznarez de Sada. Xavier y Azpilcueta. Francis was born on April 7, 1506, at the castle of Xavier in Kavarre and received his early education from the castle's chaplain. Meanwhile, in the struggle between France and Spain for the mastery of Navarre, the Xaviers. who had espoused the cause of the French, came upon evil days. In 1515 Francis' father died of sorrow over the destruction of the kingdom and his elder brothers Juan and Miguel were branded as traitors. The prudent mother was able to save but little from the wreck of the family fortunes.

Francis, cadet (younger son) of a noble family, was destined for the church and early received the tonsure. He was naturally inclined to study, and learning was a way to honours and wealth. His father had received the doctor's degree at Bologna while his uncle Martin de Azpilcueta (1493–1586) was already making a name for himself in canon law and moral theology. Francis determined to follow this example and in 1525 he matriculated at the University of Paris, taking quarters at the Collège de Ste. Barbe, then under the protection of the King of Portugal and frequented especially by Spanish and Portuguese students. Soon after his arrival Xavier made a friend of Peter Favre, a Savoyard, and they became roommates. In 1530 the friends finished their philosophical course and received the title of *magister*, roughly the equivalent of the 20th century Ph. D. In October of that year Xavier began his theological studies, at the same time lecturing on Aristotle to the students of the Collège de Dormans-Beauvais.

In 1528 there had arrived at Paris a man who was destined to change the whole outlook of Xavier and his friend Favre. This was the ex-soldier Ignatius Loyola (see LOYOLA, IGNATIUS OF). Xavier and Favre were among his first permanent disciples. Ignatius did not win Xavier without a struggle and he afterward stated that Xavier was the stiffest clay he had ever moulded. But by 1533 Ignatius had won Xavier completely to the service of Christ. He was among the six first companions of Ignatius who on Aug. 15, 1534, pronounced vows and formed a union which was to result in the foundation of the Society of Jesus six years later. Xavier remained in Paris until the end of 1536 and during this period he made the "Spiritual Exercises" under the guidance of Loyola. In Jan. 1537 the companions met in Venice, hoping to be able to make a pilgrimage to the Holy Land. During the following spring they went to Rome where Paul III received them with kindness, blessed their plan of pilgrimage, and authorized the ordination of those who were not already priests. Xavier was ordained at Venice on June 24, 1537. While waiting for an opportunity to sail to Palestine, Ignatius and his companions led a life of poverty, self-denial and zealous apostolic endeavour in the cities of Italy. Xavier laboured in Venice, Monselice near Padua, Vicenza and Bologna. At the close of 1538 Ignatius concluded that it was vain to wait any longer for an opportunity to make the pilgrimage which they had vowed. He accordingly summoned the companions to Rome to deliberate about their future. Xavier took an active part in the conferences which led to the foundation of the Society of Jesus, of which he was the first secretary. At the same time he showed himself active in works of zeal among the Romans. When, however, Paul III formally approved the Society of Jesus in Sept. 1540, Xavier was no longer at Rome.

John III of Portugal on the advice of the rector of the Collège de Ste. Barbe had asked the pope for six companions of Ignatius for work in the immense Portuguese colonial empire in the East. Paul III granted the request but reduced the number to two. Ignatius assigned Rodrigues and Bobadilla to the mission. When Bobadilla fell sick, Xavier was named to replace him. Two days later on March 16, 1540, Xavier took leave of Ignatius and set out for Portugal. While waiting at Lisbon for transportation to the east, Xavier and Rodrigues laboured with so much spiritual success that John III wished to retain both in Portugal and actually succeeded in retaining Rodrigues.

Mission in the Portuguese East Indies: — On his 35th birthday, April 7, 1541, Francis Xavier set sail from Lisbon and, after wintering in Mozambique where he was seriously ill of fever, arrived at Goa, capital of the Portuguese Indian Empire on May 6, 1542. His first act was to present himself to the bishop, the Franciscan Juan de Albuquerque, and show his credentials, among which was a papal brief, obtained by John III, and appointing Xavier papal legate for the Indies. Xavier promised to make use of these powers according to the directions of the bishop. Dominicans and Augustinians, as well as Franciscans.

were already at work in the vast mission field and Xavier looked upon himself as their collaborator. Goa was to be his headquarters and was the scene of his first labours in the east. For five months he devoted himself exclusively to the welfare of the Portuguese and their servants in the capital. He went into the streets and gathered a crowd about him by ringing a small bell. Children, workingmen and slaves would gather sometimes to the number of 300. Xavier would lead them to the principal church and give them instruction in Christian doctrine. By this and other means he sought to rouse the consciences of the Christians of Goa.

In Oct. 1542, Xavier went to the southern tip of the peninsula to work among the Paravas of the Fishery coast. These pearl fishers had accepted Portuguese protection against the Moslem and with it baptism. Much remained to be done, however, to make them a truly Christian people. For two years, 1542–44, Xavier was principally occupied, assisted by some priests, catechists and interpreters, in completing the instruction of the baptised, building churches and chapels, settling disputes among the villages, organizing the defense against, and making peace with, external enemies. At the same time he preached to crowds and baptised thousands. In the last month of 1544 he baptised ten thousand fisher folk of Macua in the neighbouring kingdom of Travancore, writing that his arm had grown lame from pouring the baptismal waters. Schurhammer estimates that in all he baptised about 30,000 in southern India.

In 1545 after visiting Cochin, San Thomé near Madras (with its shrine of St. Thomas the Apostle) and Ceylon, Xavier set out for the east, arriving in September at Malacca. Here he worked to revive the faith of the Portuguese while he planned a voyage to the Spice Islands. On Jan. 1, 1546 Xavier sailed for Amboina where he passed the spring. The summer was spent at Ternate. Later Halmahera and Morotai were visited. In May 1547 Xavier left the Moluccas and returned to Malacca.

Mission to Japan.—In Malacca Xavier was presented to Hachiro (Yajiro, Anjiro), a native of newly discovered Japan. What he learned from this Japanese and from the Portuguese who had visited the island empire filled the heart of Xavier with joy. The simple fisher folk of southern India and the barbarous natives of the Moluccas seemed incapable of being the foundation stones of the church in the far east. But Japan was a populous country with an ancient culture and its inhabitants, could they be won for Christianity, would probably afford ideal material for the development of Christianity. Xavier felt that he was called by God to evangelize Japan and accordingly began his preparations. Hachiro and two other Japanese were despatched to Goa for instruction and baptism. Xavier himself also returned to India, visiting Ceylon, Cochin and the Fishery coast as well as Goa, and all the time preparing for the Japanese expedition.

In 1549, accompanied by three Japanese and two other Jesuits, Xavier set out on the long hazardous voyage to Japan. On Aug. 15, 1549 the little expedition landed at Kagoshima, the country of Hachiro. Xavier was the first Christian missionary to Japan of whom there is any record. The *daimyo* of Kagoshima received the party in a friendly manner and converts were made. Until Nov. 20, 1551, Xavier remained in the country preaching at Hirado, Kyoto, the capital, Yamaguchi and Bungo, as well as at Kagoshima. During this time he baptised about two thousand; most of them were members of the lower classes but some, particularly in Yamaguchi, belonged to the military caste. Actual converts were the least part of Xavier's work in Japan. He explored and organized a new field of missionary labour, which was destined to show tremendous results. The spiritual quality of the Japanese promised a brilliant future for Christianity in Japan, a promise which was, however, obliterated in blood at the turn of the century.

Voyage to China.—On his way to Japan Xavier had touched at Canton. In Japan he had met Chinese and had formed a high opinion of their capabilities. He knew that no pagan land could be compared to China in population and wealth. He saw that the Japanese esteemed Chinese culture. It was inevitable then that Xavier should make an attempt to penetrate into the Chinese empire, then closed to foreigners.

But other business had to be despatched first. Xavier learned at Malacca that Ignatius Loyola, as general of the Society of Jesus, had separated India and the east from the jurisdiction of the Provincial of Portugal and formed it into a new "province" of the society. The first provincial was to be Xavier himself. It is probable that Loyola had taken this step to free the great missionary from fetters imposed by nationalistic feeling among the Portuguese. Studying the reports from the missions he had inaugurated, Xavier learned that his companions and successors on the Fishery coast, in Thana near Bassein, in Quilon, at San Thomé, in Ternate and the Moluccas (except Amboina) and finally in Ormuz were struggling heroically to advance the work against great difficulties. Almost everywhere progress was reported. Xavier was finally able to make satisfactory arrangements in the College at Goa, which was destined to furnish native priests for the missions. This task occupied Xavier until April 1552.

When his duties as provincial had been attended to, Xavier turned toward China. In India he elaborated a plan for an embassy to the Emperor of China by which he hoped to negotiate an alliance between Portugal and China and so be enabled to begin a Christian mission among the Chinese.

At Malacca the Commandant Alvaro de Ataide firmly refused to allow the embassy, which he considered an infringement of his rights, to depart. Xavier then decided to go alone. He sailed to Sancian (Shang Ch'uan) an island off the south coast of China not far from Canton. Here he arrived during the last days of Aug. 1552 and for more than three months tried in vain to obtain passage to the mainland. Toward the end of November, Xavier, who was practically abandoned, fell seriously ill.

On Dec. 3, 1552 (not Nov. 27) he died before the closed doors of the great empire he longed to convert. Xavier deserves to be ranked as one of the greatest Christian missionaries with Patrick, Boniface, Columba and Anskar. The first Jesuit missionary and founder of the Christian mission to the Japanese, he was a pioneer of modern missionary method by his careful examination and occupation of the mission field. He favoured the study of the languages, religions and customs of the natives, made use of native collaborators, endeavoured to create a mission literature in the vernacular and strove to organize his missions thoroughly. Xavier was canonized in 1622.

Bibliography.—H. Coleridge, *The Life and Letters of St. Francis Xavier*, 2 vol. (London, 1872); L. J.-M. Cros, *Saint François de Xavier, sa vie et ses lettres*, 2 vol. (Toulouse, 1900); A. Brou, *Saint François Xavier, 1506–1552*, 2 vol. (Paris, 1912), with an extensive bibliography. The old biography by H. Tursellinus, *De vita Francisci Xaverii libri sex* (Antwerp, 1596) was translated into English. Edith A. Stewart, *Life of St. Francis Xavier* (London, 1917) and C. J. Stranks, *The Apostle of the Indies* (London, 1933) are sympathetic studies in English by Protestants. Rev. Georg Schurhammer, S.J., published scores of important books and studies on St. Francis Xavier. His pictorial life of Xavier was translated into nearly a score of languages, including English. He also wrote a life of Xavier according to his letters: *Franz Xaver nach seinen Briefen* (1926); James Brodrick in his *The Origin of the Jesuits* (London, 1941) interestingly describes Xavier's career in the framework of Jesuit history. (E. A. R.)

XENOCRATES (396/395–314/313 B.C.), Greek philosopher, the successor of Speusippus as head of the Greek Academy (*see* Academy, Greek), was a pupil of Plato. After Plato's death he left Athens (in the company of Aristotle). He was elected head of the Academy in 339 or 338.

Xenocrates' writings are lost except for fragments. His doctrines were closely related to those of Plato as reported by Aristotle. Among them is the "derivation" (a kind of timeless emanation) of all reality, sensible and suprasensible, from the interaction of two opposite principles, "the One" and "the indeterminate dyad," responsible for the presence of unity and multiplicity, the determinate and the indeterminate, good and evil, rest and motion, etc., in the universe, with numbers (equated with Plato's ideas) and geometrical magnitudes as the first products of this derivation (*see* Speusippus). Xenocrates also dissected all reality into three spheres: (1) the sphere of sensibles, objects of sensation; (2) the sphere of intelligibles and of the prime principles, objects of true knowledge—specifically of wisdom—and "transcelestial" (just as Plato's ideas or Aristotle's gods in *On the Heavens*); and (3) mediating between them, the sphere of the heavens with its bodies. objects of sensation on one hand and of knowledge (namely astronomy) on the other and so. in this dual capacity, termed by Xenocrates objects of "opinion."

This tripartite division seems to express a tendency of the Academy toward bridging the gap. characteristic of some works of Plato. between ideas and sensibles ancl the attendant two modes of cognition. The same tendency seems to underlie Xenocrates' definition of the soul as a self-changing (self-moving) number, a definition closely related to the doctrine of the genesis of the soul in Plato's *Timaeus* (which, together with its cosmogony. Xenocrates interpreted as a mere didactic device explaining the timeless structure of the world).

Another threefold division was that into gods, men and "demons," the last named representing semihuman, semidivine beings, some good. others evil. To these demons Xenocrates attributed much of what popular religion attributed to gods; and rites. mysteries. etc.. were actually instituted to propitiate them. especially the evil ones. Though it is uncertain how literally Xenocrates took it (he may have used it to promote a more spiritual concept of the gods), this demonology had great influence; *cf.* the identification of pagan deities with evil demons by early Christian writers.

Whether the triple distinction of mind, soul and body, with the attendant doctrine of a first and a second death (the latter taking place on the moon and consisting in the mind's separating froin the. soul to ascend to the sun). belongs to Xenocrates or to the Stoic Poseidonius is controversial. Xenocrates' division of gods into Titanic and Olympic ones has a Neoplatonic flavour. His identification (or assimilation) of abstract principles (e.g., "the One" and "the dyad"), parts of the spatial universe, elements, etc., with some deity also show his theological interests, whatever their ultimate meaning.

The "atomism" of Xenocrates was perhaps a reaction to the "paradoxes of the continuum" revealed by the Eleatics. The five elements and even mathematical magnitudes are supposed to consist of indivisible units: lines, for instance, consist of indivisible lines.

In the field of acoustics he traced this atomism (what we perceive as one sound actually consists of discrete sounds) to Pythagoras—an example of the Pythagorizing tendencies of the old Plato. shared by the Academy.

Xenocrates said that philosophy (which he divided into logic, physics and ethics) origiriated in man's desire to resolve his anxieties; this implies the primacy of ethics over speculation. Happiness Xenocrates defined as the acquisition of the perfection peculiar or proper to inan, so that he can enjoy things natural to him. This doctrine foreshadows the Stoic derivation of the ethical norm from nature; and it is possible that Zeno the Stoic attended Xenocrates' lectures. Xenocrates. however. admitted, as the Stoics never did, that external goods are important for happiness. His definition of the (Platonicj idea as the paradigmatic cause of what is natural might point in the same direction as his definition of happiness.

(PP. M.)

XENON, an inert and extremely rare gaseous element represented by the symbol Xe and classed as the fifth member of the helium family or Group 0 of the periodic system. It has an atomic number of 54 and an atomic weight of 131.3. Its isotopes. listed in the order of decreasing abundance. have the mass numbers 132. 129. 131. 134 136. 130. 128, 124 and 126.

Radioactive isotopes produced by the fission of uranium and by other nuclear reactions are also known In the normal state of the atom there are eight electrons ($5s^2$, $5p^6$) in its outermost level.

Xenon occurs in slight traces in gases within the earth and it is present to an extent of about 0.0000085 by volume in dry air. It is produced on a small commercial scale by the fractional distillation of air (*see* NEON) and is the most expensive of the inert gases of the atmosphere. The element was discovered in 1898 by Sir William Ramsay and RI. W. Travers.

The following physical constants for the element have been selected from the technical literature: density of the gas at 0° C. and 1 atrn. pressure. 5.896 g. per litre; density of the liquid at $-109.1°$ C., 3.06 g. per millilitre; melting point, $-112.0°$ C.; normal boiling point. $-108.06°$ C.; critical temperature, 16.6° C.: critical pressure. 58.2 atm.; heat of vaporization at $-108°$ C.. 23.0 cal. per gram: ionization potential. 11.5 v.; solubility in water at O' C. and 1 atm.. 0.242 ml. of gas per millilitre of water; ratio of specific heat at constant pressure to specific heat at constant volume, 1.666 at 19° C. Solid xenon belongs to the face-centred cubic system and one edge of the unit cell has a length of 6.24×10^{-8} cm. at 88° K. This means that the monatomic molecules behave in the solid as would spheres of 2.206×10^{-8} cm. radius when packed together as closely as possible.

The element is used to a small extent in gaseous tube lighting and in negative glow lamps. It is also used in lamps which produce flashes of light of extremely short duration such as are desired for high-speed photography.

During f orld War II xenon was utilized in rectifiers in place of mercury. At the low temperatures encountered in the North Atlantic. mercury-vapour rectifiers did not always operate efficiently, but xenon-filled tubes worked nicely.

While xenon is highly inert cheniically, it forms a few crystalline compounds in which the xenon atoms are bound by the weak type of attraction called van der Waal's forces. Notable among these compounds are a hydrate, $Xe.nH_2O$ (n is about 5 or 6), and a compound with phenol, $Xe.2C_6H_5OH$. The decomposition temperatures of these substances under 1 atm. pressure are $-1.3°$ C. and 4° C., respectively. Such compounds of the helium family gases increase in stability with increasing atomic weight of the elements.

Xenon is recognized qualitatively by its characteristic spectrum. It may be determined quantitatively by concentrating the gas by fractional adsorption on activated charcoal followed by spectroscopic quantitative determination of the element in the concentrate.

For bibliographical references, *see* the articles, NEON and KRYPTON.

(G. H. CA.)

XENOPHANES (6th–5th century B.C.), Greek religious thinker and poet, the reputed founder of the Eleatic school (*q.v.*) of philosophy, was probably born about 570 B.C., a native of Colophon in Ionia. An exile from home, he resided for a time in Sicily (at Zancle and at Catana) and then settled. it is said, at Elea in southern Italy. In one of the extant fragments of his poems (no. 8 in the edition by H. Diels and W. Kranz), he speaks of himself as having begun his wanderings 67 years before, when he was 25 years of age; so that he must be taken to have been not less than 92 when he died. His teaching found expression in poems, which he recited rhapsodically in the course of his travels. In the more considerable of the elegiac fragments. he ridicules the doctrine of the transmigration of souls (no. 7); asserts the claims of wisdom against the prevalent athleticism, which seemed to him to conduce neither to the good government of states nor to their material prosperity (no. 2); reprobates the introduction of Lydian luxury into Colophon (no. 3): and recommends the reasonable enjoyment of social pleasures (no. 1). Of the epic fragments, the more important are those in which he attacks contemporary anthropomorphism and the acceptance of Hotneric mythology. Xccording to Aristotle (*Metaphysics,* A5), "the first of the Eleatics was careful not to say whether the unity that he postulated was finite or infinite; but, contemplating the whole firmament. declared that the One is God." It must remain open to dispute whether Xenophanes was a monotheist whose assertion of the unity of God suggested to Parmenides (*q.v.*) the doctrine of the unity of being; or a pantheist whose assertion of the unity of God was also an assertion of that of being, in which case he anticipated Parmenides; or a polytheist whose "one God" was only the supreme god among others.

Other fragments may be classified as dealing (1) with theology, (2) with cosmology and (3) with theory of knowledge:

1. "There is one God, greatest among gods and men, who neither

in shape nor in thought resembles mortals. . . He is all sight. all mind. all ear [*i.e.,* not a composite organism] . . . Without effort he shakes all things by thought. . . I-Ie abides ever in the same place motionless, and it does not befit him to wander hither and thither. . . Yet men imagine gods to be born and to have raiment and voice and body. like themselves. . . Even so the gods of the Ethiopians are swarthy and flat-nosed, the gods of the Thracians fair-haired and blue-eyed. . . Even so Homer and Hesiod attributed to the gods all that is a shame and a reproach among men—theft. adultery. deceit and other lawless acts. . . Even so oxen, lions and horses. if they had hands wherewith to grave images. would fashion gods after their own shapes and make them bodies like to their own."

2. "From earth all things are and to earth all things return. . . From earth and water come all of us. . . The sea is the a-ell whence water springs. . . Here at our feet is the end of the earth where it reaches unto air, but, below. its foundations are without end. . . The rainbow which men call Iris, is a cloud that is purple and red and yellow."

3. "No man has perceived certainty. nor shall anyone perceive it, about the gods and all whereof I speak; for, however perfect what he says may be. yet he does not know it; all things are matters of opinion. . . What I say is opinion resembling truth. . . The gods did not reveal all things to mortals in the beginning; but in long searching man finds that which is better."

There is little secondary evidence to record. "The Eleatic school." says the Stranger in Plato's *Sophist, 242D,* "beginning with Xenophanes and even earlier, starts from the principle of the unity of all things." Aristotle's testimony has already been cited. Theophrastus (in Simplicius, *Ad Physica,* 5) sums up Xenophanes' teaching as "the all is one and the one is God." Timon (in Sextus Enipiricus. *Hypotyposes,* i, 224), ignoring Xenophanes' theology, makes him resolve all things into one and the same unity.

The demonstrations of the unity and the attributes of God. with which the treatise De *Melisso, Xenophane* et Gorgia accredits Xenophanes. are plainly framed on rather later Eleatic proofs of the unity and the attributes of reality.

Xenophanes was primarily neither a philosopher nor a natural philosopher (in the sense of looking. as Anaximander or Parmenides did. for abstract principles underlying natural change). He was a poet and a religious reformer who applied to popular notions of God more or less philosophical and scientific conceptions. As such he must be counted a pioneer in the Greek development of monotheism and of theology itsclf. His doctrine here was chiefly negative, as he was concerned to deny attributes which he considered unbefitting to divinity.

While he vaguely distinguishes between knowledge of nature and knowledge of the divine; his attitude to nature was one of empiricism combined, so far as we can tell, with an uncritical acceptance of popular writings; when he is sceptical this does not seem to follow from any philosophical principle. The "wisdom" that he recommended appears to be further from the sophisticated Eleatic philosophy of appearance and reality than the later Greek tradition supposed.

(A. C. LD.)

XENOPHBN (c. 430 B.C.–after 355 B.C.). Greek historian arid man of letters, author of the famous *Anabasis,* was born in Athens, the son of Gryllus, a wealthy and well-born Athenian citizen. Oi his boyhood and youth nothing is known; it is inferred that he early fell under the two influences that most shaped his life and works, war and Socrates. These years saw Athens and Sparta at grips in their struggle for supremacy: they saw in Athens itsclf Socrates at the height of his powers, to the young who conversed with him an intellectual stimulus of a rare order. Perhaps it needed such a stimulus to make a writer of Xenophon, for though he wrote much he wrote no single work that conclusively ansners the question, why he ever wrote at all. He gives the impression of a man of action and a country gentleman who by some accident wrote books

Xenophon probably saw active service in some of the war's later campaigns, but his great chance came when he was invited in 401 to join the expedition of the younger Cyrus in rebellion against his brother Artaxerxes II of Persia. The circle of Socrates in Xthens was by then under a cloud, and Athens no longer a great poner. Xenophon was one of the "Ten Thousand" Greeks who nent to Asia to seek their fortune, unaware, till it mas too late to withdraw, that Cyrus meant to win the Persian empire by a blow directed deep into its heart.

The story of the expedition Xenophon told in his *Anabasis* ("Upcountry March"). When the plan of Cyrus miscarried at Cunaxa (401), the Greeks. isolated in hfesopotamia and deprived by treachery of all their original commanders except one, elected new ones, and among them Xenophon, nho did most (according to his own account) to rally the troops and enable them to meet the perils of the retreat northward up the Tigris making for the Black sea. Harassed first by the Persian cavalry and later by hostile tribesmen through the mountains of Kurdistan and Armenia, they reached the Greek colony of Trapezus (Trebizond) after a five months' march, a triumph of discipline and improvization for which there is no reason to doubt that Senophon was in great part responsible. The return to civilization presented difficulties of its own. Xenophon would have liked to found a new colony on that coast, but he could not win the necessary support from the army. and after vicissitudes the survivors, including himself, took service first with the Thracian king Seuthes and presently with Sparta, then at war with Persia and commencing operations in Asia Minor (399).

In this campaign Xenophon really did manage to make his fortune (by holding to ransom a rich nobleman and his family). but it cost him his Athenian citizenship, for in his absence decree of exile was passed upon him as a friend of Sparta. It was about this time that he married Philesia, who gave him two sons. Gryllus and Diodorus. His meeting with the Spartan king Agesilaus (396) was decisive for his future. When Agesilaus was recalled to Greece (394) Xenophon accompanied him, and settled at Scillus in Elis, near Olympia, on an estate provided by the Spartan government.

There he lived until 371. when the collapse of Spartan power after the battle of Leuctra enabled the Eleans to resume possession of the lands at Scillus. The Athenians, now allies of Sparta (369), repealed the decree of exile, and his son Gryllus was killed fighting for Athens in 362. Xenophon himself lived for some years at Corinth. and whether he ever returned to Athens is not certain; but indications in book vii of the *Hellenica,* and especially the subject and treatment of his last work on the revenues of Athens, make it likely that he did, perhaps in 365. His death may be presumed not long after the completion of this work (355).

Principal Works.—The *Anabasis,* written at Scillus and published first under a pseudonym (Themistogenes of Syracuse); is deservedly the most popular of Xenophon's writings. Its first two-thirds is an entertaining narrative with few occasions for reflection or analysis (in which Xenophon does not shine). but lively, practical and full of detail both colourful and exact. He must certainly have kept a diary at the time. The last third contains signs of self-justification which may be in reply to a published account of these events that he considered unfair! and which may have been added later. It was the *Anabasis* that prompted J. B. Bury to write of Xenophon that he would have made his fortune as a war correspondent.

The *Cyropaedia,* a sort of historical novel with a moral and political purpose, describes not only the boyhood and training of Cyrus the Great but his whole career and thus contains the story of the founding of the Persian empire. Into a narrative framework is interwoven much material that represents Xenophon's views on government and education for government. The book was written quite late in Xenophon's life. Plainly discernible are elements of the Spartan institutions and system, but its high moral standards could derive from Socrates. if not from Xenophon himself. If it was also a deliberate reaction against the intellectual approach and method of Plato's *Republic,* the form was the only one of which its author was capable, for he was no philosopher. The *Cyropaedia* might be called a philistine's alternative to philosophy, on these subjects.

The Hellenica (history of Greece from 411 to 362 B.C.) is invaluable as the only surviving history of this period by a contemporary, except for the fragment (Hellenica *Oxyrrhynchia*) by an unidentified author. Comparison of the two where they cover the same ground is not to Xenophon's advantage. His work was clearly undertaken to continue and conclude the unfinished History of Thucydides. Books i–ii retain in a modified form Thucydides' annalistic scheme: they cover the years 411–403: and may even have been written before Xenophon's departure to Asia in 401. Books iii–v. 3 were written much later, at Scillus, and books vi and vii probably in the last years of his life, when additions were made also to the earlier parts. Xenophon had few of the qualities of a good historian, except that of being readable. The theme of the *Hellenica,* the hegemony in Greece first of Sparta and then of Thebes, is disfigured by his propensity to accept the Spartans at their own valuation, and even by his neglect of the duty to seek out information from all available sources. And what shall be said of the historian who omitted to record the most important single development of his period, the founding of the Second Athenian confederacy, presumably because he did not like it? Even the fall of Sparta, which he came to admit was deserved, he explains in terms more theological than historical (v. 4.1). Not all the pleasing writing, the spirited speeches, the mastery (usually j of military affairs can make up for the inability even to recognize the elements of a historian's task.

The *Memorabilia* ("Recollections of Socrates'!) were held in antiquity to be based upon notes taken by Xenophon of Socratic conversations at which he was present in his youth; but modern opinion doubts this. Of the four "books" the first two, written probably in the Scillus period, open as a defense of Socrates against his accusers (in particular, it is thought, the sophist Polycrates) both at his trial and after his death; but they digress into questions of mainly private morals! and they could have been designed primarily for the edification of his two young sons. The last two books were written, to judge by internal evidence, right at the end of Xenophon's life: they contain much that is reminiscent of passages in his earlier works, and are concerned primarily with the state of Athens and its improvement. One suspects that the whole work reveals more of Xenophon than of Socrates.

Minor Works.—Of Xenophon's minor writings, the *Apologia Socratis* ("Defense of Socrates") has often been adjudged spurious, but it is probably genuine, written at Scillus, and the earliest of his Socratic works. The severe judgment on Anytus may be intended as a corrective to the favourable picture in Plato's *Meno.*

The *Oeconomicus* deals with household and estate management, and gives a charming glimpse of the married life of fairly well-to-do Greeks, and especially of the wife's duties and status. It is in the form of a Socratic dialogue, but is a unique one in that it shows Socrates not only displaying interest in things of the countryside, but in the end actually prepared to listen while his companion does nearly all the talking.

The *Symposium* ("Banquet") is a brilliant little dialogue in which Socrates is the main figure. He is represented at a lively Athenian supper party, at which there is much drinking, with flute-playing and a dancing-girl from Syracuse, who amuses the guests with the feats of a professional conjuror. The table talk of Socrates includes a serious disquisition on the superiority of heavenly to earthly love.

In the essays on horsemanship. *Hippike* (De *re equestri*), and hunting (*Cynegeticus*), Xenophon deals with matters of which he had a thorough practical knowledge. He writes with the zest of an enthusiastic sportsman, and observes that those nations whose upper classes have a taste for field sports will be most likely to be successful in war. The strange epilogue (*Cynegeticus,* ch. 13) in which he finds fault with the sophists (academic intellectuals), their methods of education and their values, seems out of place, but is suggested perhaps by the contrasting practical and physical side of education which hunting fosters. Both these treatises may still be read with interest.

The *Hipparchicus* explains the duties of a cavalry officer, dwelling on the moral qualities needed and the necessity for attention to religion. It is not, according to modern ideas, a very scientific treatment, and it shows that the art of war was but imperfectly developed and that the cavalry operations of the Greeks were on a somewhat petty scale.

The *Agesilaus* is a brief panegyric, written presumably at the time of his death, of the Spartan king who was Xenophon's personal friend and benefactor, and to some extent his hero.

The Hieron, a dialogue between Hieron I of Syracuse and the poet Simonides, is an entertaining and readable debate on autocratic rule; as it affects the happiness first of the ruler and secondarily of his subjects.

The short essay on the constitution of the Lacedaemonians gives an interesting if unsystematic account of Spartan institutions and customs as seen by an admiring observer. In chapter 14, however, presumably written in a time of disillusion, Xenophon emphasizes the failure of the Spartans to observe their own admirable laws, with consequences disastrous to themselves.

The essay on the constitution of Athens is not the work of Xenophon, but of an Athenian oligarch who wrote while Xenophon was still a boy.

The essay on the revenues of Athens (De *vectigalibus*) written in 355 at a time of financial stringency, contains practical suggestions for relieving it and improving the city's position by permanently increasing the revenues and by promoting a foreign policy more in keeping with its resources. The work's genuineness has been questioned, but without good cause.

Status. — In antiquity Xenophon owed his high reputation to his pure Attic style, which found admirers and imitators in the so-called Attic revival of the Roman period. To the moderns, everything that he wrote seems deficient in intellectual quality, and consequently his successes (and most notably the *Anabasis*) are deemed to succeed by virtue of other qualities. His wide interests and curiosity and his versatility will commend him to all save those who find him in everything a bore. As a man, he was orthodox, pious, a little old-fashioned, honest to all appearances and yet capable of intellectual dishonesty, with a very good opinion (one suspects) of himself and of all his works: in spite of his faults Xenophon was a very likeable man—and in spite of some of his virtues.

BIBLIOGRAPHY.—*Editions:* Complete works in Oxford classical texts by E. C. Marchant (1900–20); in the "Teubner Series": *Scripta minora,* fascicle i, by T. Thalheim (1910), fascicle ii, by F. Ruehl (1912), *Cyropaedia,* by G. Gemoll (1912), *Respublica Atheniensium,* by E. Kalinka (1914) and Anabasis, Hellenica and *Memorabilia,* by C. Hude (1930–34); in the "Budé Series": Anabasis, by P. Masqueray (1930–31). *Hellenica,* by J. Hatzfeld (1936–39) and *Oeconomicus,* by P. Chantraine (1949).

raphy but does not include editions, etc. (1957). (G. T. Gh.)

XERXES (the Greek form of the Pers. *Khshayārshā;* Old Testament Ahasverus, *Akhashverosh—i.e.,* Ahasuerus [*q.v.*]—with wrong vocalization and substitution of y for v, instead of *Akhshavarsh;* in Aramaic inscriptions and papyri from Egypt the name is written Khshai'arsh), the name of two Persian kings of the Achaemenid dynasty.

1. Xerxes I, son of Darius I and Atossa, the daughter of Cyrus the Great, and thereiore appointed successor to his father in preference to his eldest half-brothers, who were born before Darius had become king (Herod. vii. 2 f.). After his accession in 486 B.C. he suppressed the revolt that had broken out in Egypt, appointed his brother Achaemenes as satrap and "brought Egypt under a much heavier yoke than it had been before" (Herod. vii. 7). His predecessors, especially Darius, had not been successful in their attempts to conciliate the ancient civilizations. This probably was the reason why Xerxes in 484 abolished the "kingdom of Babel" and took away the golden statue of Bel (Marduk, Merodach), the hands of which the legitimate king of Babel had to seize on the first day of each year, and killed the priest who tried to hinder him[1]. Therefore Xerxes does not bear the title of "King of Babel" in the Babylonian documents dated from his reign, but "King of Persia and Media," or simply "King of countries" (*i.e.,* of the world). This proceeding led to two rebellions, probably in 484 and 479; in the Babylonian documents occur the names of two ephemeral kings, Shamash-irbā and Tarziya, who belong to this time. One of these rebellions was suppressed by Megabyzus, son of Zopyrus, the satrap whom the Babylonians had slain[2].

Darius had left to his son the task of punishing the Greeks for their interference in the Ionian rebellion and the victory of Marathon. From 483 Xerxes prepared his expedition with great care: a channel was dug through the isthmus of the peninsula of Mount Athos; provisions were stored in the stations on the road through Thrace; two bridges were thrown across the Hellespont. Xerxes concluded an alliance with Carthage, and thus deprived Greece of the support of the powerful monarchs of Syracuse and Agrigentum. Many smaller Greek states, moreover, took the side of the Persians ("Medized"), especially Thessaly, Thebes and Argos. A large fleet and a numerous army were gathered. In the spring of 480 Xerxes set out from Sardis. At first Xerxes was victorious everywhere. The Greek fleet was beaten at Artemisium, Thermopylae stormed, Athens conquered, the Greeks driven back to their last line of defence at the Isthmus of Corinth and in the Bay of Salamis. But Xerxes was induced by the astute message of Themistocles (against the advice of Artemisia of Halicarnassus) to attack the Greek fleet under unfavourable conditions, instead of sending a part of his ships to the Peloponnesus and awaiting the dissolution of the Greek armament[3]. The battle of Salamis (Sept. 28, 480) decided the war. (*See* Salamis.) Having lost his communication by sea with Asia, Xerxes was forced to retire to Sardis; the army which he left in Greece under Mardonius was in 479 beaten at Plataea (*q.v.*). The defeat of the Persians at Mycale roused the Greek cities of Asia.

Of the later years of Xerxes little is known. He sent out Sataspes to attempt the circumnavigation of Africa (Herod. iv. 143), but the victory of the Greeks threw the empire into a state of languid torpor, from which it could not rise again. The king himself became involved in intrigues of the harem (*cf.* Herod. ix. 108 ff.—compare the late Jewish novel of *Esther,* in which a remembrance of the true character of the king is retained) and was much dependent upon courtiers and eunuchs. He left inscriptions at Persepolis, where he added a new palace to that of Darius, at Van in Armenia, and on Mount Elvend near Ecbatana; in these texts he merely copies the words of his father. In 465 he was murdered by his vizier Artabanus (*q.v.*) who raised Artaxerxes I to the throne.

2. Xerxes II, son and successor of Artaxerxes I, mas assassinated in 424 after a reign of forty-five days by his brother Secydianus or Sogdianus, who in his turn was murdered by Darius II (*q.v.*).

See Ctesias, *Pers.* 44; Diod. xii., 64, 71, and the chronographers; neither of the two ephemeral kings is mentioned in the canon of Ptolemy nor in the dates of Babylonian contracts of this time.

The name Xerxes was also borne by a king of Armenia, killed about 212 B.C. by Antiochus the Great (Polyb. viii. 25; Johannes Antiochenus, p. 53; his name occurs on copper coins); and by a son of Mithradates the Great of Pontus (Appian, *Mithr.* 108, 117). (Ed. M.)

[1]Herod. i. 183, by Ctesias changed into a plundering of the tomb of Belitanas or Belus: *cf.* Aelian, *Var. Hist.* 13, 3; Aristobulus *ap.* Arrian vii. 17, 2, and Strabo xvi., p. 738.

[2]Ctesias, *Pers.* 22; his legendary history is transferred by Herodotus, iii. 150 ff., to the former rebellion against Darius.

XINCA, a group of about 10,000 Indians living in southern Guatemala along the Rio de los Esclavos, including most of the departments of Santa Rosa and Jutiapa. They were first encountered by the Spaniards under Pedro de Alvarado in 1524 and were finally subdued two years later by Pedro Portocarrero. On account of their stubborn resistance many of them were branded and sold as slaves, whence the name of the river that cuts their territory. The Xinca may be the remnants of an ancient population which preceded the Maya and Nahua. The Maya regarded the Xinca as barbarians, a feeling very generally entertained in Guatemala to-day.

See D. G. Brinton, On *the Xinca Indians* of *Guatemala* (American Philosophical Society, *Proceedings,* Philadelphia, 1884); Walther Lehmann, *Zentral-Amerika,* 1 Teil, ii. Band (1920).

XIPHILINUS, JOANNES, epitomator of Dio Cassius, lived at Constantinople during the latter half of the 11th century A.D. He was a monk and the nephew of the patriarch of Constantinople of the same name. (Migne, *Patrologia Graeca,* cxx.) The epitome (ἐκλογαί) of Dio which was prepared by order of Michael Parapinaces (1071–78), comprises books 36–80, the period included being from the times of Pompey and Caesar down to Alexander Severus. Book 70 appears to have been missing in his copy, while in books 78 and 79 a mutilated original must have been used. Xiphilinus divided the work into 'sections, each containing the life of an emperor. He omitted the name of the consuls and hence sometimes falls into chronological errors. The epitome is valuable as preserving the chief incidents of the period for which the authority of Dio is wanting.

See J. Melber's Dio in Teubner series; C. Wachsmuth, *Einleitung in das Studium der alten Geschichte* (1895); W. Christ, *Geschichte der griechischen Literatur* (1898).

XIPHOSURA, marine arthropods commonly known as king crabs or horseshoe crabs. Originally classified as crustacea, later placed as an order in the class Arachnida, the Xiphosura are now generally recognized as an independent class. Geologically an old group, already in existence in the Devonian, the Xiphosura are represented by only five species forming a single family Xiphosuridae. Formerly these five species were all reierred to a single genus *Limulus.* They are now divided among three genera and the old genus *Limulus* has been completely abolished. *Xiphosura polyphemus* is found along the Atlantic coast from Maine to Yucatan; *Carcinoscorpius rotundicauda,* in southern Japan; *Tachypleus gigas,* in Malaysia; *Tachypleus hoeveni,* in the Moluccas; and *Tachypleus tridentatus,* from north Borneo t~ China and southern Japan. King crabs live in shallow water; feed on worms and molluscs, reach the maximum size of about 60 cm. and are supposed to have a life spa!? of eight years. The females lay from 200 to 300 eggs which they bury deep in the sand. After three weeks of development little "trilobite"-laıvae emerge from the eggs. They have a relatively large abdomen and their tail or telson is quite small, so small that it does not project beyond the edge of the abdomen. The larva does not ingest any food, but lives at the expense of the embryonic yolk which fills its mid-gut. In a month the yolk is completely digested, the larva moults and assumes the appearance of a small, young "limulus." From now on the creatures are able to eat. They moult at more or less regular intervals, increasing in size with every moult.

External Anatomy.— The body of a king crab is clearly divided into a cephalothorax and an abdomen, the latter broadly and movably joined to the former and bearing a long, hard and pointed tail or telson. The dorsal surface of the cephalothorax is covered by a hard, convex, almost horseshoe shaped chitinous shield, the carapace, on which a pair of small, closely approximated simple eyes or ocelli and a pair of large, widely separated compound eyes are situated. The shield extends to the ventral surface where it becomes concave and protects the appendages, hiding them from view when the animal is moving in its normal position on the ground. The abdomen is also covered with a single, chitinous shield extending to its ventral surface. It has on each side a row of six movable spines representing the remnants of its original segmentation. The tail or telson is considerably longer than the abdomen to which it is movably joined. If the animal is turned on its back, it rights itself by stemming the end of the tail in the ground and lifting the end of the abdomen thus forming an appreciable angle between the body and the tail, trying at the same time to get hold of some object with the legs and swinging sideways until the edge of the carapace reaches the bottom.

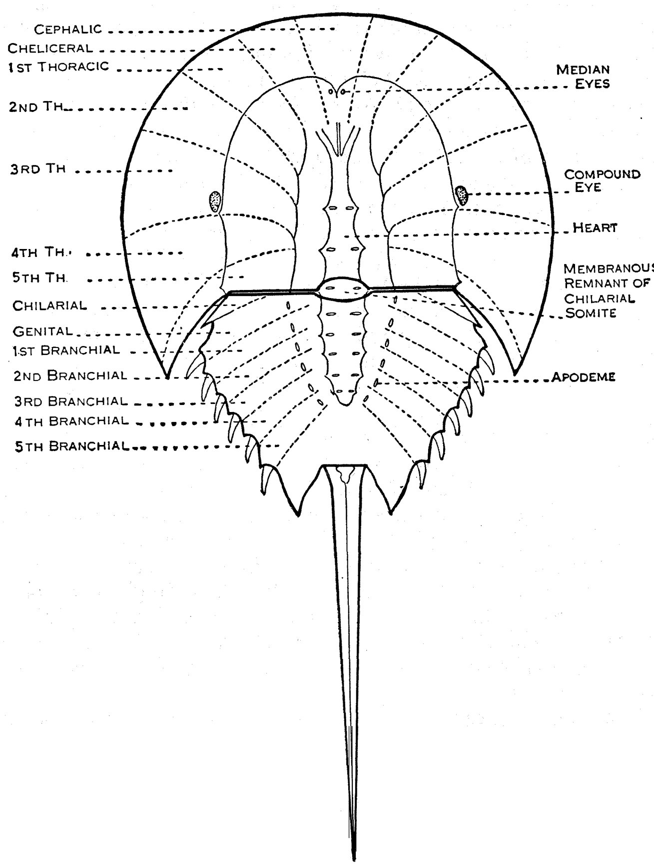

FIG. 1.— SEGMENTATION IN XIPHOSURA. DORSAL ASPECT

The dotted lines represent the limits between the somites. The heart is shown in the position in which it lies under the carapace

The middle portion of the ventral surface is occupied by the appendages. The first pair of these are the three-jointed, chelate chelicerae. The following five pairs of appendages are walking legs. They are six-jointed and except for minor differences are all built on the same plan. Their coxae (first segment of the leg nearest the body) have gnathobases and are used as mouth-parts. The legs of the first pair are undoubtedly homologous with the pedipalpi of Arachnida and are still often called that way, although they are in no way different from the following pair and like the latter end in a chela. The fifth legs alone are appreciably different from the other four pairs. Their basitarsus has four flat, spatulate, movable spines and their tarsus is considerably more slender and ends in a pair of pointed, movable spines. Moreover, the gnathobase is almost rudimentary and the coxa has a flat, movable flabellum interpreted as an exopodite. Furthermore, unlike the preceding appendages this pair has no chela and therefore cannot be used for grasping. Instead, they are used for removing sand from the underside of the carapace by spreading the four basitarsal spatulae and closing them over the grains of sand.

The knee in all five pairs of walking-legs is formed by the articulation between the femur and the tibia, but the latter is the result of a complete fusion of the patella with the tibia, as still evidenced by the articulation line which remains visible in all but the first pair.

The last pair of cephalothoracic appendages are single-jointed and are called the chilaria. Embryologically representing the first pair of abdominal appendages, the chilaria become later incorporated in the cephalothorax and are situated in the adult between the coxae of the fifth pair of legs. Their function is not clear.

The ventral depression of the abdomen is occupied by six flat plates representing as many pairs of appendages grown together in the middle line. The first pair form the genital operculum, the following five are gill-books. Each anterior gill-book overlaps the following one almost completely while the operculum covers the whole lot of them and protects them from injury.

There are six openings on the ventral side of the animal, but only two of these can be easily seen: the mouth, situated between the coxae of the second and third .pairs of legs and the anus opening to the outside at the end of the abdomen, immediately in front of the telson. A pair of excretory openings of the so-called coxal glands are near the base of the fifth pair of coxae, and a pair of genital openings are on the posterior surface of the operculum, facing the body.

Segmentation.— The segmentation of the adult king crab does not correspond exactly with the original segmentation of the developing embryo, even if one disregards the later fusion of the body into an undivided cephalothorax and an equally undivided abdomen and considers only the appendages. Nor does our present knowledge, especially our knowledge of the nervous system and embryology of the king crab as well as of other arthropods, support the interpretation still found in the majority of textbooks. It is now definitely known that the portion of the brain called the deutocerebrutn is wanting in Xiphosura as in Arachnida and must have been lost at an early period of their evolutionary history. It is also known that the nerves supplying the upper lip or rostrum (camerostome), and formerly interpreted as belonging to a neuromere of their own and representing a lost segment, do not have that significance. On the other hand the absence of the deutocerebrum clearly indicates the disappearance of the corresponding segment because the deutocerebrum persists in other arthropods and the tritocerebrum of the king crab is identical with the tritocerebrum of those arthropods. The cephalic portion of the cephalothorax is therefore composed of at least three somites, possibly even four, if the median ocelli and the compound eyes represent separate somites and if the deutocerebrum is included in the count. Moreover, this count includes also the somite represented by the tritocerebrum the nerves of which supply the chelicerae. These appendages are clearly preoral in adult arachnids and king crabs, the mouth in all cases moving backward during embryological development, in Xiphosura even farther backward than in Arachnida. Yet the tritocerebrum of Arachnida forms a part of the brain proper, while in Xiphosura it still belongs to the ventral portion of the nerve ring and forms the first neuromere of the suboesophageal ganglionic mass.

There has already been mentioned the incorporation of the chilarial segment in the cephalothorax although the chilaria represent embryologically the first abdominal somite. On the dorsal surface of the embryo this somite is restricted to a small, lens-shaped area retained in the adult as a soft membrane between the cephalothoracic and the abdominal shields. The second abdominal somite of the embryo becomes the anterior portion of the adult abdomen and is represented by the genital operculum on the ventral side, by the first pair of movable spines on the sides of the abdomen and by a narrow strip across the abdominal dorsal surface, including the first pair of apodemes. Next follow five branchial somites represented by the gill-books on the ventral side, by five pairs of movable spines and dorsal apodemes. The rest of the abdomen shows no traces of segmentation even in the embryo. Whether it represents five somites, bringing the total number of abdominal somites up to 12 as in Arachnida, must be left unanswered at the present state of our knowledge.

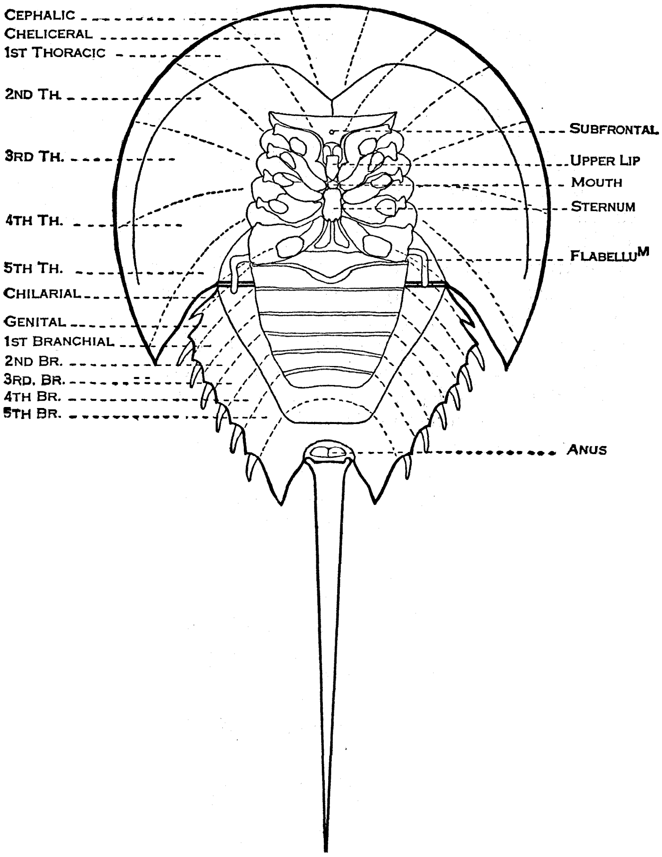

FIG. 2.— SEGMENTATION IN XIPHOSURA. VENTRAL ASPECT

The appendages are omitted so as not to obscure the rest of the body. Only their coxae are shown. The gills are also omitted, only their attachment to the ventral abdominal wall represented. The dotted lines represent the limits between the somites

It is clear that segmentation in Xiphosura has many features in common with Arachnida, yet presents unmistakable and important differences. The original number of cephalothoracic appendages is the same, and both the Arachnida and the Xiphosura exhibit a tendency of the first abdominal somite to considerable reduction in size. In spiders it forms the slender petiolus by which the abdomen is attached to the cephalothorax. In scorpions it disappears completely during development, so that the broad juncture of the abdomen to the cephalothorax is accomplished by the second abdominal somite which now appears as the first abdominal segment. In Xiphosura the first abdominal somite fuses with the cephalothorax and is represented by the chilaria, *i.e.*, by a pair of appendages which have no homologous counterpart in Arachnida. The shape of the cephalothorax is also very different from that of any known arachnid, recent or fossil, and has a counterpart only among Trilobita and some lower crustacea, such as *Apus*. It cannot possibly be regarded either as homologous with or ancestral to the arachnid cephalothorax.

Endoskeleton.—The endoskeleton consists of a complex mesodermal connective tissue plate suspended in the cephalothorax between the oesophagus and the mid-gut and known as the endosternite; six endochondrites in a median row on the floor of the abdomen, and seven pairs of ectodermal apodemes or endapophyses, formed as invaginations and serving for the attachment of muscles. The first pair of the apodemes arises from the posterior edge of the carapace, and the muscles attached to these apodemes help to keep the endosternite in suspension. These apodemes are, therefore, not homologous with the mid-dorsal apodeme of the Arachnida to which the dorsal dilators of the gizzard are attached. They belong to the chilarial somite, that is, are not really cephalothoracic, but primarily abdominal and only secundarily incorporated in the cephalothorax. The following six pairs are abdominal and are invaginations of the dorsal wall of the abdomen. Several muscles are attached to each of these apodemes.

Muscular System.—This system is very complicated in Xiphosura, differing in many respects from the corresponding system of Arachnida. It consists of many dozens of paired and single muscles. The muscles holding the endosternite in suspension were already mentioned. There are several pairs of them. The muscles moving the cephalothoracic appendages arise some from processes of the endosternite, others from the carapace. Six pairs of branchiothoracic muscles also arise from the carapace, run downward and backward and are attached to the abdominal ventral apodemes. Other branchial muscles situated in the abdomen, help to move the gill-books. Several powerful muscles situated in the posterior portion of the abdomen move the telson up and down and to a lesser degree laterally.

Digestive System.—Except for the tremendous development of the cephalothoracic, endodermal digestive glands usually called "the liver," the digestive system is comparatively simple. The mouth opens immediately behind the upper lip, called camerostome or rostrum, about two-thirds from the anterior edge of the cephalothorax, has the shape of a slit, and extends posteriorly to the fifth pair of coxae. The mouth leads directly into the oesophagus. A pharynx. such as is present in all arachnids, is wanting. The oesophagus runs forward and opens into the large, muscular gizzard. Here the ingested food is broken up into smaller particles. A valve separates the gizzard from the mid-gut which runs as a straight tube backward above the endosternite until it reaches almost the end of the abdomen. A short rectum opens with an anus situated ventrally at the end of the abdomen. A pair of immense digestive glands, already mentioned, occupy the free space in the cephalothorax, extending to the very edge of the carapace. These glands open by means of two pairs of short ducts into the mid-gut behind its anterior third and close to its dorsal surface. Fine food particles passed from the gizzard into the mid-gut are subjected here to the action of several enzymes, namely a proteinase, a carboxypolypeptidase, an amylase and a lipase at the optimum pH 8.0. The chyle is now passed into the digestive gland where it is subjected to further action of a dipeptidase. Interstitial tissue holding together the individual ampullae of the digestive gland serve as storage place for fat, protein and glycogen. Undigested remnants are returned to the mid-gut where they are enveloped in slime and finally emptied as excretory cylinders.

Excretory System.—The excretory system is represented by a pair of coxal glands which are situated in the cephalothorax. They are modified nephridia, consist of a sacculus into which four urinary glands open, a labyrinth and a terminal duct. The two ducts open to the outside at the base of the coxae of the last walking leg. Preceding the embryonic development of the coxal glands, six pairs of coelomic sacs are formed, corresponding to the original six cephalothoracic somites. The first and sixth pair disappear, the fifth pair forms the two sacculi, while the second, third and fourth pair give rise to the urinary glands and the labyrinths. In life the coxal glands are brick-red.

Circulatory System.—This system in Xiphosura is distinguished by many peculiarities not found in any other arthropods. As in higher crustacea it consists of both arteries and veins, but the similarity is upset by the many peculiarities. The arterial system reminds more that of Arachnida, but here, too, the similarity is upset by features lacking in Arachnida. Moreover, Arachnids have no veinous system.

The heart is a muscular tube situated partly in the abdomen, partly in the cephalothorax. Its posterior end is blind. Laterally it is perforated by eight pairs of dorsoventral slits, called ostia and serving as valves. The first and second pair of ostia are in that portion of the heart which extends into the cephalothorax and which has rather thin walls. The abdominal portion of the heart with its five pairs of ostia has much thicker muscular walls. The entire heart is surrounded by a pericardium into which six pairs of veins open. Anteriorly the heart forms an aorta which splits almost immediately into three vessels, a median anterior artery and a pair of aortic arches. The median artery runs to the edge of the carapace, divides here into a right and left branch which fuse with corresponding branches of the second lateral arteries, thus forming the so-called marginal arteries. The two aortic arches turn ventrally at the sides of the gut and open into the sinus-ring of the ventral arterial sinus inside which the entire nervous system lies enclosed. The arteries leading into all cephalothoracic appendages arise from the ring-sinus. That portion of the sinus which extends into the abdomen in the shape of a vessel is known as the ventral artery and gives off five pairs of branchial arteries supplying the gills. One of the most characteristic features of the arterial system in Xiphosura is the presence of a pair of longitudinal collateral arteries connected with the heart by short. transverse vessels and united behind the heart into a single, median dorsal abdominal artery which runs to the very end of the telson. The lateral arteries which supply with blood the organs situated in the cephalothorax and in the abdomen arise from the collateral arteries. We have already mentioned the branch of the second artery, which forms with the branch of the median dorsal artery the marginal artery. An inner branch of the same second artery runs forward on the corresponding side of the heart to the digestive gland, which it supplies with blood, and is known as the hepatic artery.

The veinous system consists of a pair of anterior and a pair of posterior hepatic veins opening into a pair of large. longitudinal ventral veins which give off branchial veins carrying the blood to the gills. Five pairs of branchio-cardiac veins carry the blood from the gills to the pericardium, from which it enters the heart through the ostia. The blood is propelled by the heart forward and a counterflow is prevented by a cardio-aortic valve.

Although the veinous system is highly developed, the circulatory system of Xiphosura is an open one as in all arthropods, both the arterioles and the venules opening directly into the body cavity.

The blood is a slightly bluish, milky fluid containing a considerable quantity of haemocyanin in solution and blood-corpuscles of the leucocyte type in suspension.

Body Cavity.—The body cavity of Xiphosura, in which the various organs are situated and which extends into all appendages, is a haemocoele. It is at least in part derived from the confluent cavities of several coelomic pouches, is bounded on the outside by the basal membrane of the hypodermis—except where muscles are attached to the body mall—and seems, therefore, to be what is now appropriately called a "myxocoele." The cavity is fully occupied by the organs. A diaphragm, such as found in scorpions, does not exist in king crabs.

Respiratory System.—Respiration in Xiphosura is strictly of the aquatic type. The appendages of the third to seventh abdominal somites of the embryo become modified and function as gills from the earliest larval stage and throughout the life of the animal. The appendicular nature of the gills is clearly visible even in the adult. Each pair of appendages grown together in the median line, forms a plate on the posterior surface of which the right and left gill-books are situated Each gill-book is composed of up to one hundred and fifty lamellae, The gill-books are regarded as being homologous to the lung-books of Arachnida, but the attempt of Verluys and Demoll to derive the gill-books from the lung-books, instead of vice-versa, has nothing to recommend it and remains only as an example of futile speculation.

Nervous System.—This system in Xiphosura is characterized by two peculiarities. The first of these, namely the absence of a deutocerebrum in the adult, it shares with other Chelicerata. The second peculiarity, that the entire nervous system is enclosed in the ventral sinus, is restricted to the Xiphosura. Owing to the shape of the body the brain lies not above, but on the same level with the suboesophageal ganglionic mass with which it forms a compact ring perforated by the oesophagus and surrounded by the ring-sinus. The brain is formed only by the protocerebrum. It gives rise to the following nerves: a median optic nerve leading to the ocelli and originating by a pair of roots; a pair of ventral nerves supplying the ventral body wall; a pair of originally ventral eye nerves which later serve as olfactory nerves and finally a pair of optic nerves leading to the compound

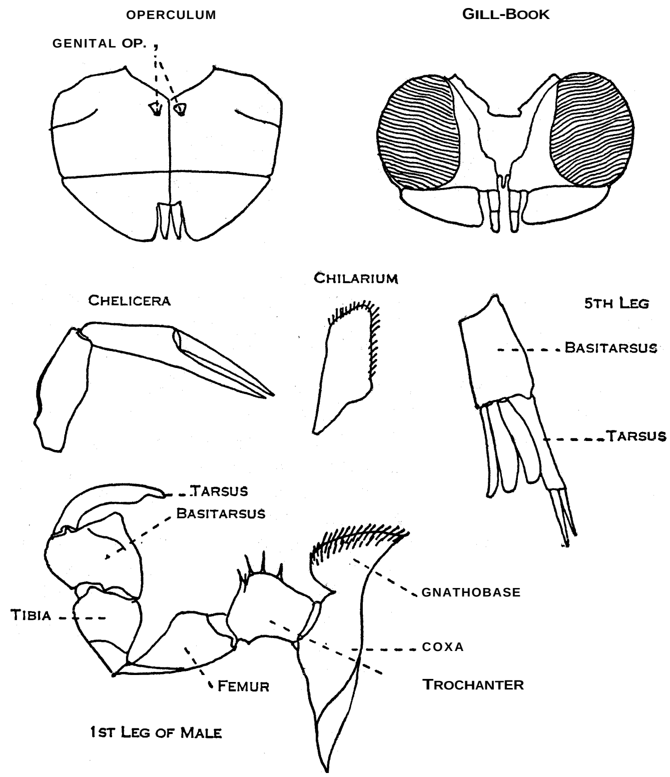

FIG. 3.—APPENDAGES OF XIPHOSURA POLYPHEMUS

The genital opercuium and the gill-book are drawn in their posterior aspect

eyes. The postoral portion of the nerve ring, *i.e.,* the suboesophageal ganglionic mass is composed of eight neuromeres. The first of these corresponds to the tritocerebrum of other arthropods and gives off the cheliceral nerves, the following five pairs supply with nerves the thoracic appendages, the seventh neuromere gives off the chilarial nerves and the eighth the opercular (genital) nerves. Posteriorly, the nerve ring forms the ventral nerve cord enclosed in the longitudinal sinus (ventral artery). The cord presents four pairs of ganglia followed by a ganglionic mass composed of three pairs of fused ganglia. Each ganglion gives off two nerves, an anterior motor and a posterior sensory nerve.

Sense Organs.—King crabs possess a pair of median ocelli, a rudimentary ocellus. a pair of compound eyes. a rudimentary compound eye and a ventral rudimentary eye which is later replaced by the olfactory lobe. Supposed organs of taste have been described on the gnathobases of the appendages.

Reproductive System.—The sexes are separate, and the plan of structure of the reproductive organs is the same in both. The originally paired reproductive glands form a network between the lobes of the digestive gland. A pair of ducts—vasa deferentia in the male. oviducts in the female—open to the outside on the posterior surface of the genital operculum. The males are easily distinguished by the swollen appearance of the basitarsus of their first pair of legs, but copulatory organs of any kind are wanting. The spermatozoa have a tail. The eggs are globular, rich in yolk. from 2 to 3 millimetres in diameter. They are inseminated by the male sitting on the back of the female while she lays them in a batch of 200 or 300 in a hole in the ground.

Paleontology.—Fossil remains of Xiphosura occur already in the Devonian, where they are represented by the family Belinuridae. Representatives of this same family are known also from the Carboniferous of Europe and Pennsylvanian of North America. An aberrant family Cyclidae is found in the Carboniferous. Representatives of the family Xiphosuridae (formerly called Limulidae) first appear in the lower strata of the Triassic. Supposed relatives of the Xiphosura belonging to the orders Syn-

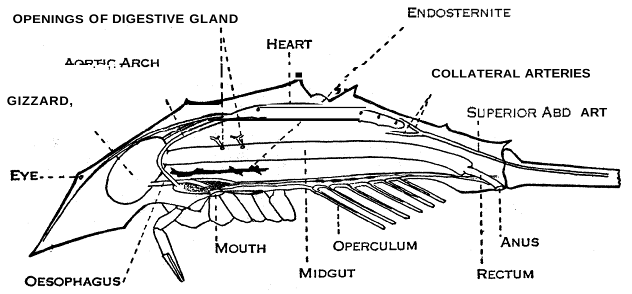

FIG. 4.—DIAGRAMMATIC LONGITUDINAL SECTION THROUGH XIPHOSURA POLYPHEMUS, SHOWING THE RELATIVE POSITION OF THE DIGESTIVE ORGANS. HEART. VENTRAL SINUS AND NERVOUS SYSTEM

xiphosura and Limulava appear already in the Cambrian. These orders together with the Xiphosura and Eurypterida are often united by palaeontologists in a single Class Merostomata. Their affinities are however, disputed by other investigators and, in absence of all knowledge of their internal anatomy, it seems safer to leave the Xiphosura in a separate class.

Characters of the Class.—In view of the persistent tendency on the part of some zoologists to follow Ray Lankester's interpretation of Limulus as an Arachnid those characters of Xiphosura which are peculiar to them and are not found in Arachnida may be summarized here.

Xiphosura differ from Arachnida in that:

1. Their segmentation is different, the first abdominal somite having been incorporated in and forming an integral part of the cephalothorax.
2. Their entire central nervous system is enclosed in the ventral blood-sinus.
3. Their brain is formed only by the protocerebrum, the tritocerebrum forming the first neuromere of the suboesophageal ganglionic mass.
4. They possess a venous system.
5. Their heart ends blindly behind.
6. They possess a pair of longitudinal collateral arteries from which lateral arteries arise and which unite posteriorly to form the posterior median artery.
7. Their organs of respiration are aquatic gill-books.
8. Their genital openings are paired.
9. They have a "trilobite" larval stage.
10. They have a pair of compound eyes.

XOSA, a group of Bantu-speaking peoples occupying the eastern half of the Cape Colony. Their subsistence is derived from a combination of cattle-keeping with agriculture. Socially they are organized into patrilineal exogamous clans. Marriage is polygamous and involves the payment of a bride price; and both the sororate and the levirate are practised. Ancestor worship is the main form of religious cult.

X-RAYS are a form of electromagnetic radiation, produced by the discharge of a stream of electrons against a target in a tube in which the enclosed air or gas has been reduced to a near vacuum. In this process, electrons within the atoms of the target are disturbed by the bombarding electrons so as to cause the atoms to emit certain nell-defined wave lengths in the X-ray spectrum characteristic of those atoms Most of the X-radiation, however, the so-called continuous spectrum. is caused by the sudden stopping of the bombarding electrons as they collide with the heavy atomic nuclei in the target. The rays have the power of penetrating solid substances to varying degrees. They have almost the shortest wave length in the electromagnetic spectrum, of the order of 250,000,000 or more naves to the inch, as compared with 50,000 to the inch for waves of visible light.

The discovery of X-rays pointed the way for the exploration of the structure of the atom. The relationship of X-rays to the problem of the nature of matter is discussed in this article under *Particle-Wave Dualzty*. Their place in applied science is described below under *Modern Industrial Applications*.

I. HISTORICAL BACKGROUND

Few events in the history of science have had so powerful an impact as the news of the discovery of the X-ray by Wilhelm Conrad Rontgen, a professor of physics at the University of Würzburg. Within a year after the first announcement, 49 books and pamphlets had been published on the subject, and over 1,000 articles had appeared in various journals.

In a paper published in the *American Journal of Physics* in commemoration of the 50th anniversary of the discovery, G. E. M. Jauncey pointed out: "November 8, 1895 [the date of the discovery] may be taken as the date of a new era in physics. Before this notable date, it may be said, physicists were living in the classical era. . . . All physicists were clinging for dear life to the classical ideas of the existence of the luminiferous ether and the nonexistence of anything smaller in mass than the hydrogen atom or ion. A great jolt was needed to shake the minds of physicists loose from these ideas."

Rontgen's achievement was the outgrowth of experiments with highly evacuated tubes excited by induction coils. When the tubes are so activated, cathode rays (so called because the electric discharge emanates from the cathode, or negative terminal) are produced.

Cathode ray experiments had long been familiar when Rontgen entered the field. However, the existence of X-rays, which are produced by cathode rays but have diiferent properties, was unsuspected.

As early as 1858. Julius Plucker reported that a part of the glass wall of the discharge tube became phosphorescent during the discharge, and that the location of the phosphorescence could be changed by a magnet. Sir William Crookes devised an improved tube, and in 1878 published a mass of experimental data on the physical properties of cathode rays. He described the rays as streams of molecules in flight; they are now known to be streams of electrons. In 1892, Heinrich Hertz demonstrated that cathode rays could penetrate thin metallic foils. In 1894, Philipp Lenard constructed a discharge tube equipped with a thin aluminum window. He found that the penetration of cathode rays was slight; they were diffused in a few centimetres of free air.

Rontgen's contribution began with a repetition of the experiments of his predecessors. A detailed account of this work is given in Dr. W. C. *Röntgen,* by Otto Glasser (2nd ed., Springfield, Ill., Charles C. Thomas, 1958) Glasser tells that Rontgen's interest was first turned to cathode ray experiments in June: 1894: that he became absorbed in these; and, some time in Oct. 1895, decided to devote all his laboratory time to them.

When Rontgen began, it was already known that a screen painted with barium platinocyanide would become fluorescent if placed very close to a Lenard tube. This phenomenon had not been observed in experiments with heavier-walled Hittorf-Crookes tubes. However, says Glasser, Rontgen suspected that the fluorescence "might possibly be obscured by the strong luminescence of the excited tube. This idea fascinated Rontgen. . . . he determined to test the ability of a Hittorf-Crookes tube, that is, an all glass tube without a thin window, to produce fluorescence on the barium platinocyanide screen. Selecting a pear-shaped tube from the rack, he covered it with pieces of black cardboard. carefully cut and pasted together to make a jacket similar to the one used previously on the Lenard tube, and then hooked the tube onto the electrodes of the Ruhmkorff coil. After darkening the room in order to test the opacity of the black paper cover, he started the induction coil and passed a high tension discharge through the tube. To his satisfaction no light penetrated the cardboard cover.

"He was prepared to interrupt the current to set up the screen for the crucial experiment when suddenly. about a yard from the tube, he saw a weak light that shimmered on a little bench he knew was located nearby. It was as though a ray of light or a faint spark from the induction coil had been reflected by a mirror. Not believing this possible, he passed another series of discharges through the tube, and again the same fluorescence appeared. this time looking like faint green clouds moving in unison with the fluctuating discharges of the coil. Highly excited, Rontgen lit a match and to his great surprise discovered that the source of the mysterious light was the little barium platinocyanide screen lying on the bench."

Rontgen realized that he was contending with a new phenomenon, since he had verified the fact that cathode rays could not penetrate beyond a few centimetres of air. "Then in succeeding weeks of feverish activity, he devoted himself exclusively to identifying more properties of the emanation."

Rontgen called the newly discovered rays X-rays, to indicate that their nature was unknown.

In his first historic report, dated Dec. 28, 1895, Rontgen was able to describe accurately most of the basic qualitative properties of X-rays:

1. All substances were more or less transparent to X-rays. Named in order of decreasing transparency were, for example, wood, aluminum and lead glass.

2. Many substances beside barium platinocyanide, such as calcium compounds, uranium glass and rock salt, emitted light (fluoresced) when exposed to X-rays.

3. Photographic emulsions were found susceptible to X-rays.

4. Reflection and refraction of X-rays were investigated with negative result (these effects are slight and difficult to reveal) and Rontgen concluded, therefore, X-rays could not be concentrated with lenses.

5. By means of pinhole photographs, X-rays were shown to travel in straight lines and to be undeflected by magnetic fields.

6. X-rays were shown to discharge electrified bodies independent of the sign of the charge (through ionization of the surrounding air which thereby becomes an electrical conductor). (This effect was independently discovered and explained by Sir. J. J. Thomson in 1896. who pointed out its importance as a quantitative measure of X-ray intensity. Time has not diminished this importance.)

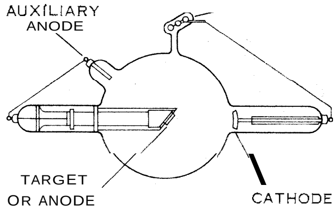

FIG. 1.—ORDINARY GAS X-RAY TUBE
Shown are concave focusing cathode, metal target and regulator for liberating gas by electrical discharge when, after prolonged use, the tube becomes too hard through gradual absorption of residual gas

7. X-rays, Rontgen showed, were generated wherever and whenever the cathode rays of the discharge tube struck any solid body as a target. A heavy element, such as platinum, when so used as a target, was found to yield X-rays more efficiently than a light element such as aluminum. The Crookes tube was soon replaced by one in which the cathode rays were focused to bombard a metallic anticathode or target (invented by Sir Herbert Jackson and shown in fig. 1).

1. Scattering.— Although X-rays are riot reflected specularly by ordinary mirrors, they are scattered diffusely. when they encounter a material scattering body. to different degrees depending on the angle of scattering, measured between the forward directions of incident and scattered rays.

In 1906, Charles Barkla and C. A. Sadler, by measuring the scattering coefficient of carbon for X-rays, correctly determined the number of electrons in the carbon atom as six. The determination was based on a theory of J. J. Thomson which yields a quantitative value of the X-ray scattering coefficient for a single free electron under certain assumptions which happened fortuitously to be approximately fulfilled in the Barkla-Sadler experiment (see below).

Barkla's work formed a strong support for the supposition that X-rays were of the same nature as other known electromagnetic radiations, especially as J. J. Thomson had found the same number of electrons (in the carbon atom) by a quite independent method using β-rays (fast bombarding electrons from naturally radioactive substances).

2. Polarization.— At about the same time. Barkla showed by scattering a beam of X-rays twice in succession. each time through 90° scattering angle, that this radiation, like light. could be polarized. at least partially, and that it was therefore. in all probability. a transverse wave propagation similar to other electromagnetic radiations.

3. Fluorescence.— Barkla and his co-workers over a period (1908–12) observed in their scattering experiments that certain X-radiations characteristic of the scatterer and of less penetrating quality than the primary X-radiation were emitted from the scattering body. more especially when heavier elements. such as silver, were used as scatterers. The scattering body thus becomes a secondary emitter of X-rays. By ingenious experiments in which the penetrating power of these characteristic X-rays n-as studied for different secondary emitting substances and with absorbing screens of different materials the existence of a spectrum of X-rays and of their undulatory properties was distinctly foreshadowed.

4. Undulatory Nature of X-Rays.— Numerous attempts were made to reveal an undulatory nature in X-rays and to estimate tiie wave length by searching for diffraction fringes (similar to those observed with visible light) when a beam of X-rays passed through a narrow slit. In 1902 H. Haga and C. H. Wind showed a slight broadening of the image formed by the narrow end of a tapering

slit. A careful repetition of this experiment in 1908 by B. Walter and R. W. Pohl led these investigators at first to conclude no such effect existed, but careful photometric measurements about four years later by P. P. Koch on Walter's and Pohl's plates showed that with softer X-rays the blackening of the photographic slit image fell off more gradually than for hard X-rays A. Sommerfeld at Munich in 1912 estimated from these results an average wave length (from a medical X-ray tube) of the order of 0.4×10^{-8} cm.

At this time Max von Laue, then in Munich, was profoundly interested in these results and searched in his mind for a method of revealing and measuring with greater certainty the wave lengths of X-rays. Something like the diffraction gratings used for visible light but on a much finer scale was needed. Coming one day for a talk with A. Sommerfeld he found him discussing with P. P. Ewald the theoretical work the latter was doing on the transmission of light waves through a molecular lattice. Von Laue here heard for the first time the hypothesis that crystals were regular latticework atomic structures with a spacing between atoms of the order of 10^{-8} cm. Here were the gratings needed for X-ray diffraction ready-made by nature herself, and Von Laue, realizing this, in great excitement lost no time in suggesting to his associates, W. Friedrich and P. Knipping, what proved to be an epoch-making experiment, for it (1) revealed the nature and structure of crystals as three-dimensional latticework patterns of atoms; and (2) led to the study of X-ray spectra which unlocked the secrets of atomic structure. Von Laue suggested that a fine pencil of X-rays collimated by passage through pinholes in two lead screens be allowed to fall on a crystal of zinc sulfide. A photographic plate. placed a short distance behind the crystal, received the original X-ray beam which had passed directly through the crystal and in addition after a long exposure, there was found on the plate a regular pattern of spots coming from subsidiary X-ray beams reflected to the plate by the structure of the crystal at considerable angles to the primary beam.

The analytical explanation of these spots by Von Laue became much easier to understand intuitively after the work of William Bragg in England in the next year. (Von Laue showed in a later paper the identity of the two modes of description, Bragg's being the common-sense intuitive one but Von Laue's being the more rigorous and general method of treatment. Still more elaborate treatments have been made of the physical optics of X-rays in crystal lattices by C. G. Darwin, P. P. Ewald and Von Laue himself.) Bragg's work suggested to Von Laue that the atomic lattice planes in the crystal were the agents which reflected the X-rays to form the Laue spots. Fig. 2 shows how these spots appeared on the Von Laue photograph. Moreover, in a crystal. each such plane, be it horizontal, vertical or oblique, will be a member of a large family of such planes, all of the same orientation, all equidistant and rigorously parallel to each other like a geological stratification, and each studded with atoms in the same pattern and density. These in a crystal are the atomic lattice planes. Fig. 3 should help the reader to imagine them.

FIG. 3.— THE (100); THE (110); AND THE (111) PLANES OF A CUBIC CRYSTAL

The three parenthetical digits are Miller indices. They are proportional to the reciprocals of the intercepts of the plane on the three principal axes of the crystal

X-rays are not reflected from ordinary mirrors. On the minute scale of X-ray wave lengths, ordinary polished surfaces are insufficiently flat, smooth and uniform in properties. In the case of a single atomic crystal plane the fraction of an incident beam of X-rays specularly reflected therefrom is very minute indeed, and were it not for the fact that in a crystal such planes, whatever their direction: occur in myriads of parallel uniformly spaced duplicates, the reflections would probably be too weak to be observed. The atomic lattice planes approach perfect flatness much closer than any polished mirror but it is the uniformity of interplanar spacing which is the especially favourable factor. Actually, out of a heterogeneous primary X-ray beam, containing a continuous spectral distribution of wave lengths, only one extremely small spectral region of these wave lengths is selectively reflected by a given family of planes of specified common interplanar spacing, d, but this reflection is extremely efficient because of constructive interference between the reflections from the different planes when the wave length and the angle of reflection are properly related, as Sir William Bragg showed immediately after the experiment of Von Laue. Friedrich and Knipping.

5. Selective Reflection, the X-Ray Spectrometer.—Sir William Bragg showed, in 1912. that if the wave length λ of the X-radiation, the interplanar spacing d, and the angle θ of reflection (or its equal the angle of incidence) measured between the beam and the crystal plane satisfied the relationship

$$n\lambda = 2d\sin\theta \qquad (1)$$

wherein n is a smaller integer known as the order number, a very strong reinforcement of reflection through constructive interference was to be expected. This is known as the Bragg law and it forms the foundation upon which all X-ray crystal spectrometers are dependent. (For further details, see SPECTROSCOPY, X-RAY). It soon became evident through X-ray spectroscopy that the radiation from ordinary X-ray tubes was of two types, a continuous spectrum and a line spectrum, the latter characteristic of the target material in the tube.

From measurements of the diffraction angles θ Bragg was able to compute with moderate quantitative accuracy the wave lengths in centimetres of the X-ray lines in the spectra he formed by crystal diffraction. The key to this was the value of, d, the interplanar atomic spacing in the crystal used for forming the spectra according to equation (1). This spacing he was able to compute from (1) the newly obtained knowledge of the geometry of the crystal lattice; (2) the measured density of the crystal; and (3) the absolute weight (in grams) of a single atom. (The word weight is strictly incorrect since mass is really meant. Chemical usage, however, has followed this error when atomic weights, really the relative scale of masses of atoms, are spoken of.) The last quantity was, even at that time, known with moderate accuracy from (1) studies of the Brownian motion (Perrin); and (2) the famous oil-drop measurement of the elementary unit of electricity, the electron, by Robert Millikan (1909). Either of these experiments yields the Avogadro number ($N = 6.023 \times 10^{23}$), the absolute number of atoms in one gram-atomic-weight of any element, a universal constant. The absolute weight of any atom is merely the quotient of its chemical atomic weight divided by N.

From such considerations as these, Rragg was able to assign absolute as well as relative values to the wave lengths of all of his X-ray spectral lines. The absolute scale of X-ray wave lengths was later established with very much higher precision by diffraction of X-rays from artificial ruled gratings used in grazing incidence (J. A. Bearden, E. Backlin, A. H. Compton, J. Thibaud) so that by a reversal of the process the most precisely reliable values of the electronic charge and of Avogadro's number have been calculated. This use of ruled gratings is difficult, however, and natural crystals still remain the best agents for general X-ray spectroscopy.

6. Moseley's Law. — In 1914, H. G. J. Moseley, in two classic papers, presented a systematic study of the characteristic line spectra emitted by targets of various metals when excited by cathode-ray bombardment in an X-ray tube of special construction which permitted rapid substitution of several different target materials. Unlike optical spectra the X-ray characteristic spectra are relatively simple, consisting, for a given element, of widely spaced groups of but a few lines. Following the original nomenclature of Barkla, the groups of spectral lines for each element are designated in order of their increasing wave length location in the spectrum as K, L, M, etc. The pattern of lines in each group is very similar for a wide range of elements save for the actual wave-length position in the spectrum and it is of extreme significance that as we pass from element to element in the so-called periodic table of the elements (arranged in increasing order of atomic weight) the wave length of a given homologous spectrum line (such as $K\alpha_1$), observed successively in the spectrum of each element, varies in a uniform way, if it is plotted not as a function of the atomic weight of the atom which characteristically emits it but as a function of an ordinal number Z (the atomic number, as Moseley called it) of the atom in the periodic or Ylendeleyev table. Moseley showed that if the square root of the frequency v of a given identifiable X-ray line, as we examine it from element to element, is plotted against the atomic number Z of that element, a linear relationship is obtained over a wide range of frequencies and atomic numbers (Z = 13 to $Z = 30$) whereas no such linearity exists when the atomic weight is used as the parameter for plotting (see fig. 4). The importance of the atomic number, which actually turns out to be nothing more nor less than the number of fundamental units of positive electricity possessed by the nucleus of the atom, was thus for the first time brought to light. Moseley assigned atomic numbers as follows: H-1, He-2, Li-3, Be-4, B-j, C-6, N-7, O-8, F-9, Ne-10, Na-11, Mg-12, Al-13, Si-14, P-1j, S-16, Cl-17, Ar-18, K-19, Ca-20, etc., to Zn-30. This assignment actually requires in some cases a reversal of the general order of increasing atomic weights.

FIG. 4. — MOSELEY'S CURVE ILLUSTRATING THE MORE REGULAR DEPENDENCE OF $\sqrt{\nu}$ ON ATOMIC NUMBER AS CONTRASTED TO ATOMIC WEIGHT, FOR ELEMENTS $Z = 13$ TO $Z = 30$

7. The **Rutherford-Bohr** Atom. — Sir Ernest Rutherford had shown from his experiments on the scattering of alpha particles passing through thin foils that the atom must consist of an extremely tiny, heavy, positively charged nucleus, about 10^{-12} cm. in diameter (in which the great bulk of the weight of the atom resided), surrounded by a swarm of relatively light negatively charged electrons presumably executing orbits in the central field of attraction of the nucleus somewhat like the planets about the sun. In the normal electrically neutral atom from which none of the electrons have been lost the number of attendant negative electrons is just equal to the number of elementary positive charges on the nucleus, in short the atomic number, Z. (The positive and negative elementary units of which electricity consists are exactly equal, but opposite in sign, though they are, in the electron and the proton, associated with very different masses. The numerical value of this elementary charge is about 4.803×10^{10} electrostatic units [E.S.U.]. The mass of the electron is about 0.91×10^{-27} g, while the mass of the proton is 1.836 times larger. See ELECTRON for the methods whereby its charge and mass were determined.) Rutherford's experiments had further shown that the nuclear charge for a given atom is approximately half its atomic weight; and Barkla had shonn from experiments on the scattering of X-rays, mentioned earlier, that the number of electrons surrounding the nucleus is also approximately half the atomic weight. It was these considerations which guided Moseley. In 1913, Niels Bohr had proposed a quantitative model of the hydrogen atom based on Rutherford's general model with certain additional hypotheses drawn from the existing rudimentary quantum theory and from an effort to explain the regularities in the characteristic spectral lines emitted by the simplest of all atoms, hydrogen (atomic number Z = 1). Bohr's theory predicted that the frequency ν of a spectral line should obey the formula

$$\nu = Z^2 \frac{2\pi^2 me^4}{h^3} \left\{ \frac{1}{n_2^2} - \frac{1}{n_1^2} \right\}$$

In this formula Z is the atomic number; m, the mass of the electron; e, the elementary electrical charge unit; and h, Planck's constant, all of which quantities were known with reasonable accuracy at the time (1913). The numbers n_1 and n_2 are simply small integers which Bohr called quantum numbers.

Now the really astonishing success of Moseley's investigation (and of Bohr's theory) was that whereas Moseley's plot of the square roots of the frecluencies, $\sqrt{\nu}$, of spectral lines against the atomic numbers of the elements emitting them, gave the numerical relation for elements from Z = 13 to Z = 30,

$$\nu_{K\alpha} = 0.248 \times 10^{16} (Z - 1)^2 \qquad (3)$$

the entirely theoretical formula of Bohr, yielded upon substitution of the known values of m, e, h and the integers $n_2 = 1, n_1 = 2$

$$\nu = 0.246 \times 10^{16} Z^2 \qquad (4)$$

Even the discrepancy between Z in one expression and $Z - 1$ in the other had a perfectly logical explanation, as we shall see.

Bohr's picture of the atom contained a new and revolutionary idea. It seemed a safe guess at the time that the swarm of electrons about the nucleus must be in rapid motion, for a mathematical theorem developed much earlier by S. Earnshaw gave convincing proof that no system of point charges could ever be in static equilibrium under the action of their own fields. On the other hand, according to the electromagnetic theory of radiation propounded by C. Maxwell and extended by H. A. Lorentz, any such system of moving charged electrons must, according to the then known macroscopic laws of electricity and magnetism, radiate electromagnetic waves with attendant loss of energy at the expense of their motion until the electrons would eventually fall into the nucleus just as planets would fall into the sun if their total orbital energies could be sufficiently reduced. After such a catastrophe, were it possible! very little of the atom that could be detected would remain. That this does not happen is obvious since the sizes of atoms, the space they occupy in crystals, for example, never change, and there is every evidence that it is the size or extent of the electron swarm about the nucleus that defines the space an atom must occupy among its neighbours. Bohr's revolutionary new concept asserted that for the orbital electrons there were certain orbits, and total electron energies associated therewith, which he called permitted or stationary states. He laid down a precisely definite mathematical condition defining such states or orbits. In any one of these, for some then mysterious reason, the electron might play forever without radiating its energy. For such orbits or states the classical laws of electromagnetism were somehow abrogated. Only when the electron passed from one such stationary state to another of lesser total energy did it emit electromagnetic radiation and the quantum of energy thus emitted was just the difference in energy between the two stationary states. The integers, n_1 and n_2 in Bohr's formula referred to the tno states, initial and final from which and to which the atom passed in the transition.

For the simple mathematical reasoning leading to Bohr's derivation of formula (2) above, see ATOM: *Bohr's Atomic Theory.* At the time, the justification for his entirely mysterious postulate was the dazzling success with which it explained (1) the exact frequencies of lines in the spectrum of hydrogen; and (2) the frequencies of the lines in X-ray spectra of higher atomic number elements. The latter success was of the unforeseen variety, hence doubly convincing. After 1913, the meaning of Bohr's nonradiating orbits or stationary states became much clearer.

II. BASIC THEORY

The spectrum of electromagnetic radiation is subdivided into about seven regions which, named in order of decreasing wave length (or increasing frequency) are: radio waves; radiant heat; infrared radiation; visible light; ultraviolet light; the far ultraviolet or Millikan region; X-rays; and gamma rays. These are all manifestations of identical basic nature, the difference being only one of wave length λ, or frequency $v = c/\lambda$. Here, c is the velocity of light *in vacuo,* very nearly 2.998×10^{10} cm. per second. The spectrum extends over the range from radio waves, thousands of metres in length, down to gamma rays much less than 10^{-9} cm. (0.000,000,001 of a centimetre). An octave is that range which separates two wave lengths (or frequencies) which stand in the ratio 2:1, and the complete electromagnetic spectrum contains well over 50 octaves. (The choice of gamma ray wave lengths as the upper limit of the electromagnetic spectrum is completely arbitrary. If we wish to include electromagnetic radiations associated with cosmic rays, there is no known upper limit.) The relatively minute portion of this spectrum which is visible to the human eye is a little less than one octave in extent, ranging through wave lengths which give the subjective effectsof the colours, red, orange, yellow, green, blue and violet. or from h = $7{,}000 \times 10^{-8}$ cm. to $\lambda = 4{,}000 \times 10^{-8}$ cm. The X-ray region may perhaps be said to start at wave lengths of about $\lambda = 1{,}000 \times 10^{-8}$ cm. and to extend down to wave lengths of about $\lambda = 0.1 \times 10^{-8}$ cm., a stretch, therefore, of about 14 octaves, commencing about 2 octaves shorter in wave length than the visible region. The X-ray wave lengths in common use for the diagnostic examination of the human body are of the order of $\lambda = 0.2 \times 10^{-8}$ cm. to $\lambda = 0.1 \times 10^{-8}$ cm. (The frequently used unit of length, 10^{-8} cm. or 0.000,000,01 cm. is called an ångstrom, while the $\frac{1}{1{,}000}$ part of this or 10^{-11} cm. is approximately an x-unit.)

If a source of high-voltage direct current is connected to the terminals in a glass bulb, fig. 5, known as a Crookes tube (the cathode negative), and the tube is then evacuated to progressively lower air pressures, one observes the following effects: Around 0.0013 atm. the tube is filled with an almost uniform pink glow. At lower pressure a dark space appears in the neighbourhood of the cathode. Between 0.00013 and 0.000,001,3 atm. a bluish beam is seen extending from the cathode. This is the beam of cathode rays, a stream of electrons, the ultimate indivisible negative charges of electricity made visible by the excitation of the air molecules with which they collide. At still lower pressure the cathode rays, though still present, fade from view. except where they strike the walls of the tube, because their collisions with air molecules become infrequent. The glass wall at the end of the tube opposite the cathode now becomes luminescent with a brilliant apple-green light. Upon introducing a metal obstacle at some distance in front of the cathode, its shadow formed by obstruction of the invisible cathode rays can be clearly seen in the midst of the apple-green luminescence, showing that the rays move away from the cathode. This proves them to be negatively charged particles and this can be shown also by the bending of the cathode rays in a magnetic field. By the degree of bending in a magnetic field of known strength the ratio of the charge to the mass of the electrons can be measured.

If a fluorescent screen of barium platinocyanide is held near the Crookes tube, operating at the stage just described. X-rays will be found to be coming from the glass walls wherever they are bombarded with the cathode rays. as evidenced by luminescence in the barium platinocyanide crystals. It will be found necessary to increase the voltage applied to the terminals of the tube in order to maintain the discharge as the pressure is reduced. With improving vacuum and increasing voltage applied to the tube the X-rays, at first described as soft, become more and more penetrating until with a potential of 100,000 v. even the bones in the hand cast only a faint shadow on the fluorescent screen. The rays are now described as hard. Heavy materials such as barium, lead, gold or platinum when used as screens are found to absorb the X-rays much more than light materials such as carbon or aluminum. The glass wall of the Crookes tube where the electrons strike and from which the X-rays come will be found to be hot and may in this way easily be melted. The impact of the electrons heats the glass just as heat is generated by the blows of a hammer upon an anvil. For this reason a metal target was soon introduced to replace the glass wall as the point of electron impact. Such targets can readily be brought to incandescence by the bombardment unless they are provided with ducts for coolants.

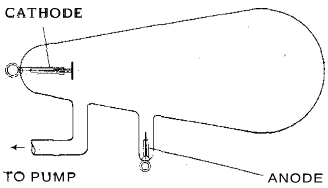

FIG. 5.—A CROOKES TUBE, THE TYPE OF VACUUM TUBE WITH WHICH RONTGEN DISCOVERED X-RAYS

Below 4×10^{-7} atm pressure it is no longer possible with voltages usually available to pass a discharge through the tube, and the X-rays consequently cease. However, if the cold metal cathode is replaced by an incandescent filament, electrons will be emitted from this and we have the pure electron discharge tube of Coolidge nhich with appropriate design can be operated at 1,000,000 v. and higher. The current is readily controlled by varying the temperature of the incandescent cathode.

It is the very abrupt stoppage of a certain small fraction of the bombarding electrons in the close vicinity of the nuclei which produces the bulk of the X-radiation. the so-called continuous spectrum. It is a fundamental law of the electromagnetic field, well known to radio engineers, that when an electrical charge experiences an acceleration or a deceleration, it radiates energy in the form of electromagnetic waves. Targets of heavy materials are more efficient in producing them. Targets also emit a characteristic X-ray line spectrum of different origin.

The quality of the X-rays, that is to say their varying degrees of penetrating power for material screens starting with soft X-rays emitted at operating voltages from 1.000 to 20,000 v. and passing on to medium hard X-rays from tubes operating at 20,000 to 50,000 v. and hard X-rays for voltages in the hundreds of thousands or even up to 1,000,000 v., has been shown to be associated on the one hand with the wave lengths (or frequencies) of the X-radiation and on the other hand with the quantum energy of the photons associated with these wave lengths about which we are to be here much concerned. The penetrating power of soft X-rays is so low that X-ray tubes must be provided with special windows of very thin glass or of very light materials such as beryllium in order to let them out. *See* Table I.

1. Danger From Exposure to X-Rays.—Mention should be made here of the great danger from overexposure of living tissues to X-rays. The photoelectron., (see below) ejected (from atoms of the tissue) with energies of thousands of volts destroy the structure of tissue cells in flesh, bone and blood. producing a general effect on the organism and a local effect of at first erythema, then severe lesion very difficult to heal, like a burn. The danger to the reproductive cells is an even greater hazard. No X-ray equipment should ever be operated by uninstructed or unskilled persons.

2. Particle-Wave Duality.—Chiefly because of the rectilinear propagation of visible light, Isaac Newton in 1675 proposed the. hypothesis that light consisted of tiny particles projected from the luminous source into the eye of the observer. His contemporaries, Christiaan Huygens and Robert Hooke, on the contrary, believed light to be undulatory in nature. The wave theory of light, through the work of Thomas Young, Augustin Jean Fresnel and many others. held undisputed suay throughout the 19th century. One of the most astonishing results of 20th-century scientific research is that both points of view, contradictory as they may at first seem, turn out to be complementary aspects of the same phenomenon. Not only do light and all electromagnetic radiations exhibit this duality (of particles and waves)—it has been found to be also a general property of all the elementary particles of nature, a universal duality applicable to all forms of energy-matter. It is not for us to rebel against this weirdness merely because the gross behaviour of familiar objects furnishes nothing analogous to help our understanding. Rather we must remember that the behaviour of familiar things is only to be understood in terms of this duality which we must accept as fundamental, a stubborn fact of observation.

It was the unique distinction of X-rays to be the tool which (1) first unlocked the secrets of atomic theory; (2) revealed the family relationship between the chemical elements and the quantized nature of their atomic dynamics; and (3) brought into accented relief (through the Compton effect) the mysterious particle-wave duality principle. This story, unfolding from 1895 over a half century, is one of the most exciting chapters in the whole of human intellectual progress.

The nature of X-rays is so closely associated with the nature of the atoms which emit and absorb them that it is impossible to explain one without the other. We can never examine radiation in transit. Assumptions regarding that which is propagated through empty space from the atoms ahich emit radiation to the atoms in the photographic plate. the retina of the eye or the X-ray ionization chamber are merely convenient models which help us to understand radiant phenomena by analogy with grosser and more familiar phenomena (such as bullets and nater waves).

For the present, let us picture radiation, including X-rays, in terms of both particles and waves, the waves guiding the particles to their appropriate destinations. Light, the quantum theory has taught us, always acts as though its energy were in bundles (quanta) whose sizes are proportional to the frequency v of the light. The constant of proportionality $h = 6.62 \times 10^{-27}$ erg seconds was first measured at the opening of the 20th century by Max Planck who, from the laws of black body radiation, inferred and proposed the famous law of light quanta which bears his name,

$$W = h\nu \qquad (5)$$

wherein W is the energy of a light quantum (or photon) in ergs for the case of light of frequency v cycles per second (or $\lambda = c/\nu$ cm. wave length in *vacuo*). At that time, however, it was not yet known that the energy of each quantum frequently appears to be extremely localized in space. Instead of spreading out in all directions from the source. as the energy associated with water ripples would do, a photon of light frequently makes all of its energy manifest in its action on a single atom, be that atom 1 cm. or 1,000,000 light-years distant from the source. In connection with this strange phenomenon, Sir William Bragg commented: "It is as if one dropped a plank into the sea from a height of 100 feet, and found that the spreading ripple mas able, after travelling 1,000 miles and becoming infinitesimal in comparison with its original amount, to act upon a wooden ship in such a way that a plank of that ship flew out of its place to a height of 100 feet."

In the case of radiation this is no wild stretch of the imagination; it is an event which the physicist or the astronomer can reproduce at will. Nevertheless, it is incorrect to reject the spreading wave picture of radiation. The interference of light waves forbids such a simplification. The simplest case occurs when monochromatic light from a source passes through two closely adjacent fine slits and then farther on, falls upon a screen. At certain points on the screen where the light waves which have traversed the two paths differ in phase (upon arrival at the screen) by exactly one-half cycle, the superposition of the two lights produces darkness At intermediate points between these dark fringes there is brilliant reinforcement of the light, ascribed to the arrival of light by the two paths in phase coincidence. Such regions of destructive and constructive interference can readily be observed by anyone.if water ripples are made to pass through small uniformly spaced adjacent openings in a barrier dividing the surface of a quiet pool. In the case of electromagnetic radiation the photons manifest their energy, hv, upon an absorbing atom of the screen only at the bright fringes of constructive interference. Thus the wave aspect of light forces itself upon our acceptance. The waves guide the particles to their correct destinations but when the energy is made manifest by absorption in an atom it appears localized at one point, not spread out over the entire wave front.

III. X-RAYS AND WAVE MECHANICS

1. De **Broglie's** Wave Electrons.—In 1923 Louis de Broglie made a bold suggestion regarding electrons, namely, that they might also possess undulatory properties, exhibiting thus the same duality as the photons of radiation. It has turned out that a particle moving from free space down a potential gradient into a field of (attractive) force and a wave propagating from empty space into a region of greater refractive index are two complementary aspects of the same phenomenon; there is a quantitative equivalence principle between field of force and change of refrac-

*The law of X-ray absorption is such that if the thicknesses given above are doubled the intensity will be halved a second time; *i.e.*, reduced to one-quarter of its original value, if n thicknesses are used the reduction factor is $(\frac{1}{2})^n$.

tive index. De Broglie arrived at a quantitative formulation of his ideas by applying a famous principle from the theory of relativity.

Albert Einstein had asserted, as a consequence of his relativity theory, that mass and energy are equivalents according to the law

$$W = mc^2 \tag{6}$$

w

in which W is the energy in ergs, m the mass equivalent to that energy in grams and c the velocity of light in *vacuo.* According to this law a small amount of mass, m, could be conceivably annihilated, as such, and converted (for example) into radiation of energy $W = mc^2$ (one gram thus yielding 25,000,000 kw.hr.). (The conversion of mass into energy need not necessarily take the form of radiation. The law of equivalence of mass and energy is a very general one and the conversion may be to energy in any of its forms or manifestations.) (See also RELATIVITY.)

On a huge scale in the form of the atomic bomb first used in 1945 the partial control of this conversion of mass into energy no yields a stupendous source of energy which also promises possibilities of great practical utility. De Broglie made the daring assumption for that time that the total energy equivalent (mc^2) of the electronic mass m was associated with a frequency of vibration v according to the quantum law $h\nu = mc^2$. The vibration or pulsation (of what, he left undefined) was supposed, for a stationary electron, to occur in the same phase throughout all space or at least in an undefined region in the vicinity of the electron. Applying the laws of the Lorentz-Einstein relativity transformation to such a state of affairs to see how it would appear when in motion, he arrived very simply at the result that the electron vibration would appear as a set of plane waves[1] normal to the direction of motion of the electron corpuscle and of wave length λ given by the formula

$$\lambda = h/(mv) \tag{7}$$

in which mv is simply the momentum of the moving electron. These waves would travel with a phase velocity, u, greater than light velocity while their group velocity, less than light velocity, was to be identified with v the particle velocity of the electron: v and u were related by the equation

$$uv = c^2 \tag{8}$$

De Broglie's superlative insight (like Einstein's) was regarded as idle fantasy—but not for long. Four years later, at the American Bell Telephone laboratories, C. J. Davisson and L. H. Germer discovered that electrons, when reflected from the clean surface of a crystal (nickel), exhibit selective reflection from the atomic planes of the crystal lattice in complete analogy to the behaviour of the waves of X-rays observed earlier by Von Laue and Bragg. The wave lengths of electrons thus determined, with an appropriate small correction for the index of refraction of the electrons inside the force field of the crystal, were found to depend on the velocity of the electrons in complete quantitative confirmation of the De Broglie law, $\lambda = h/(mv)$. Moreover, it was later shown that the principle is a perfectly general one including all the fundamental particles of nature, such as protons or neutrons, and O. Stern and his collaborators demonstrated (1930) that such a complex particle as a helium atom is undulatory and obeys the De Broglie law completely. But no particle ever exhibits both the particle and the wave characteristics in the same experiment; we cannot see both sides of the coin at once.

It was Louis de Broglie's original suggestion that the stationary or nonradiating orbits of Bohr's atom model were those around which the electron waves according to the above formula could just fit with an exactly integral number of them in one circumference, in analogy to the standing waves set up on a violin string, or in still closer analogy to a ring of some sonorous metal excited by a blow to vibrate in its characteristic modes. These analogies fail only to the extent that they exhibit some dissipation of the wave energy whereas the electron in its nonradiating orbit loses no energy whatever. The quantum numbers of Bohr (n_1 and n_2 in formula 2) were supposed to correspond to the number of these complete waves in one circumference for the electron in the initial and final states of a radiative transition. The idea was almost right but it needed a little refinement which was supplied by Erwin Schrödinger who laid down the general wave equation for an electron in a potential field and gave the highly successful wave mechanical solution of the hydrogen atom.

Schrodinger's wave equation mas an approximate one formulated only to describe electrons moving at nonrelativistic speeds. P. A, M. Dirac in 1928 succeeded in fusing the principles of relativity and quantum mechanics into a more general wave-mechanical description with the result that three distinct experimentally observable phenomena became co-ordinated. These were (1) the property of electron spin first suggested earlier by G. E. Uhlenbeck and S. Goudsmit to explain certain fine structure effects in atomic spectra; (2) the existence of a positively charged counterpart of the negative electron (in this case not discovered till four years later in 1932 by C. D. Anderson; and (3) the possibility of the creation and annihilation of matter in the form of pairs of positive and negative electrons by conversion from or into radiant energy, processes which are now firmly established facts.

As a consequence of the third phenomenon just named, Dirac's contribution in its turn has been shown, on a still higher level of precision, to be a slightly inadequate description through the discovery of the Lamb shift (Willis Lamb, Jr.. and R. C. Retherford, c. 1949) and its theoretical interpretation in terms of the modern quantum electrodynamics of R. Feynman, S. Tomonaga, J. Schwinger and others. None of these improvements invalidate the approximate applicability of the earlier interpretations within their limited fields of applicability, however.

2. Atomic Structure.—As the result of extensive investigations in nuclear physics there is strong evidence that the nuclei of atoms consist of only two kinds of heavy particles, protons and neutrons, sticking tightly together in a tiny droplet not more than 10^{-12} cm. in diameter. Protons and neutrons have almost exactly the same mass, about 1.66×10^{-24} grams, but the neutron as its name implies exhibits no electrical charge, while the proton has one fundamental unit of positive charge (4.802×10^{-10} E.S.U. in magnitude). Hydrogen, the lightest atom of all, then has a nucleus consisting of just one proton with one attendant outer negative electron (if the atom is neutral or unionized as are by far the great majority under ordinary terrestrial conditions). Helium has two protons and two neutrons in its nucleus, hence a positive nuclear charge of two units but a mass equal to about four protons. Neutral helium atoms then have two attendant outer electrons. Lithium nuclei consist of three protons and four neutrons, hence have a charge of three units and a mass equal to about seven protons. Three electrons, therefore, form the outer structure of neutral lithium. In this way we can proceed up the atomic table to the heaviest natural atom, uranium, with 92 protons and 146 neutrons tightly packed in its nucleus and hence with a nuclear charge of 92 units and with 92 negative electrons undulating in its outer structure when neutral. We must here omit many interesting details such as isotopes and changes in the total mass of a nucleus ascribable to its energy of formation from its constituent particles. The important thing for us is the regular progression in steps of one unit of the nuclear charge (atomic number Z) as we pass from element to element, attended with the addition of one more outer electron at each step. The characteristic X-rays emitted by these elements come from changes in this outer electronic structure. How do these electrons arrange themselves as we pile more and more of them around the nucleus in going to higher and higher atomic numbers?

The interesting answer is that they arrange themselves in shells, that is to say groups of electrons such that the members of a group are all at about the same radial distance from the nucleus, differing rather widely from the radial distances of other groups. (The radial distance has, of course, the indefiniteness of a wave function but we refer to the radial distance of greatest density.) More important still, the energy of extraction of the electrons in the different groups or shells is about (but not ab-

[1]De Rroglie waves should not be confused with their offspring, electromagnetic radiation.

BY COURTESY OF THE AMERICAN ROLLING MILL CO.

X-RAY DIFFRACTION OF IRON AS IT PROGRESSES FROM THE INGOT TO ONE OF THE FINAL PROCESSES IN MANUFACTURE

1. Piece of ingot of typical cast structure photographed by the usual Laue procedure. The grains are quite large and have been very much strained in cooling
2. Thin bar from the continuous mill showing a considerable reduction in grain size, and amount of strain, as evidenced by the smaller and more uniform spots. The fine radial streaks near the center show the presence of some fragmentation of grains. The slight tendency towards the appearance of groups of spots on the central band indicates the beginnings of a preferred orientation of grains
3. Very fine grained structure of nicely oriented crystals in highly cold rolled iron. The absence of individual spots proves the smallness of the crystals, while the large spots on the various rings show the cubic iron crystals to be, to a very considerable extent, arranged in the sheet with a cube face parallel to the surface of the sheet and a face diagonal parallel to the rolling direction
4. The thoroughly annealed sheet, heat treated after the severe cold roll, is shown completely re-crystallized into slightly strained grains of quite uniform size. No crystal fragments are present and the preferred crystal orientation caused by the cold rolling has completely disappeared, leaving a structure with practically no directional properties

COURTESY OF (1, 2) JESSE W. M DUMOND

1. Spectra of molybdenum K-lines scattered by carbon at three different scattering angles θ illustrating both the Compton shift and the DuMond-Kirkpatrick broadening in their dependence on θ. The unmodified α_1, α_2 and β_1 lines of the molybdenum K spectrum are clearly visible and testify by their sharpness to the high resolving power. The broad shifted β and shifted α lines show increasing shift and increasing breadth as the scattering angle increases in complete quantitative accord with the theory as photometric measurements show. The broadening is evidence of the motion in the atom of the electrons which are the scattering agents. The shifted α line is a superposition of the shifted α_1 and shifted α_2 lines and is therefore a little broader than the shifted β_1 line

2. Spectra of scattered X-rays of three different wave-lengths λ scattered by carbon at about 155 degrees scattering angle θ illustrating both the Compton shift and the DuMond-Kirkpatrick broadening in their dependence on λ. The wave-lengths in x-units are shown on the scales. The unmodified β and α lines can be clearly seen in the first (molybdenum) spectrum but with diminishing primary wave-length the unmodified scattering becomes too faint to be seen so that reference lines have been made on the edge of the tungsten spectrum by means of an auxiliary exposure with direct radiation to establish their positions. The broadened and shifted β and α lines of the scattered spectrum can be seen in all three cases. The constant shift and the diminishing broadening (in wave-length units) can be clearly seen and photometric measurements show both effects to be in good accord with the theory of the scattering process and of the motion of the scattering electrons in the atoms of the scattering substance

COURTESY OF (3, 4) CARL D. ANDERSON

3. A photograph of great historical interest made by C. D. Anderson in 1933 with the Wilson cloud chamber provided with a strong magnetic field capable of deflecting fast electrons. He inserted a 6-mm. thick lead septum horizontally across the chamber. In this picture the track is one left by a positron. This positron possessed an energy of 63,000,000 electron volts before entering the lead plate from below as shown by its curvature in the known magnetic field. After penetrating the plate its curvature shows that it proceeded with an energy of 23,000,000 electron volts. The change of energy, in good accord with the loss to be expected for such an electron in 6 mm. of lead, proves definitely the direction of motion of the particle and, therefore, with the kncwn direction of the magnetic field enforces the conclusion that it is positively charged. The low specific ionization as attested by the density of the track and also the low energy loss in the lead exclude the possibility that the particle could be a proton. This was one of the first clinching evidences for the positron. This photograph is reproduced from Anderson's Nobel Prize lecture

4. The creation of an electron-positron pair in a lead plate by hard gamma rays from Th C'' shown in a Wilson cloud chamber photograph by C. D. Anderson. This photograph is reproduced from Anderson's Nobel Prize lecture. The two particles responsible for these tracks produce equal specific ionizations as judged by the track density and hence have the same mass. From the known direction and intensity of the magnetic field in which the chamber was operated (800 gauss) one concludes that the track of greater curvature was made by a negative electron of about 0.7 million electron volts energy while the track of lesser curvature was made by a positron of 0.8 million eiectron volts energy. Anderson and Neddermeyer have photographed thousands of similar examples of the same process wherein the hard gamma rays from Th C'' (of known quantum energy, $h\nu=2.62$ M.E.V.) falling on lead, aluminum or carbon produced the same result. In no case did the aggregate kinetic energies of pairs so produced exceed 1.6 M.E.V. thus leaving just the required margin of energy (1.02 M.E.V.) for the creation of the two masses. in this photograph the direct image is at the left; the right hand reversed image, taken with a mirror, is for stereoscopic observation. Stereoscopic viewing shows that the third track near the bottom of the picture is of entirely independent origin

solutely) the same for all electrons in a shell but differs widely for the different shells. By the energy of extraction me mean the energy which must be supplied from outside sources to remove one of the electrons completely from the atomic structure so that it is just free but possessed of no kinetic energy in that free state. Unlike the radial distances: very sharply determinate, experimentally measured values can be assigned to the energies of extraction. They can be plotted as a diagram of different energy levels. Following the original terminology of Barkla, the shells, named in order of increasing radial distance from the nucleus and decreasing energy of extraction of their electrons. are called K, L. M, N, O, P and Q. As we pass from element to element toward increasing atomic numbers Z, each new electron is (usually) added in the outermost shell (though quite frequently the addition may be to the penultimate shell) until a limiting number, the capacity as it were of that shell, is reached and then a new shell is started.[1] The number of electrons needed to complete a shell. named in shell order, K, L, M, N, etc., are 2, 8, 18, 32. In the elements above $Z = 36$ there are also O and P shells and in radium. actinium. thorium: protactinium and uranium ($Z = 88$ to 92) there is even a Q shell. The highest number of electrons observed in these shells occurs for uranium, namely 18, 12, and 2 in O, P and Q respectively but it can be said with certainty that some of these might be increased if the table went higher. It does not do so in the natural elements because of some sort of nuclear instability when Z exceeds 92. Artificial transuranic elements have been produced by transmutation.

An atomic structure from which an electron in some specified shell has been extracted, has had work done on it (the work of extraction) and is, by just that amount, at a higher total energy level than before. It is now momentarily an ionized atom. not neutral, because of the absence of one electron. There is in this condition a very strong tendency for an electron from some shell of larger radius than the ionized one to fall down and occupy the vacancy. In doing so the atom as a whole passes to a lower energy level and the difference in energy is radiated in the form of a photon of frequency ν according to the equation

$$W_1 - W_2 = h\nu \tag{9}$$

wherein $W_1 - W_2$ is the difference between the initial and final energy levels of the atom and h is Planck's constant. It is worthy of note here that P. Auger has shown by experiments nith the Wilson cloud chamber that this is not the only mechanism whereby the downward atomic energy transitions (of an atom ionized in an inner shell) can expend their energy. The atom may choose to emit not a photon but another one of its electrons, in which case the available energy is expended on this electron in part to do its work of extraction W_e and the remainder to give it kinetic energy W_{kin} in the free state. The equation of energy balance is

$$W_1 - W_2 = W_{kin} + W_e \tag{10}$$

This is called the Auger effect, first revealed in 1925 by P. huger.

3. The Exclusion Principle.—XI1 we have said implies that save for its outermost shell there is a close-packed quality about the structure of a neutral many-electron atom in its lowest energy state. In spite of the grouping of electrons in rather widely separated shells the entire structure is as dense as its wave-mechanical quantum laws permit. These laws require the formation of the wide intershell spacings (in both radius and energy), and their essence is summed up in what is known as Pauli's principle of exclusion, which in one of its forms asserts that for no two electrons in an atomic structure can all of the quantum numbers required to describe their states be identical. Since space does not here permit a discussion of the detailed significance of the different quantum numbers, this form of Pauli's principle will be less significant to the reader than another one which has been used with great success by Fermi, Thomas and others when the electron swarm has to be treated statistically without detailed knowledge of the complicated force fields in which the electrons find themselves (their own fields and those of the nuclei). This statistical form of the statement must be made in terms of a phase space (a concept due to the U.S. physicist Josiah Willard Gibbs) of six dimensions: three, the position co-ordinates x, y, z of an electron; the other three, its momentum co-ordinates, p_x, p_y, p_z. Pauli's principle asserts that in such a space a small cell of volume $\Delta x\Delta y\Delta z\Delta p_x\Delta p_y\Delta p_z = h^3$ at the point x, y, z, p_x, p_y, p_z cannot contain more than two electrons (and this only if their spins are in opposite directions). The exclusion principle lays no restriction on the shape of the exclusion cell, only on its volume. The shapes are determined by the detailed mechanics of each particular case. The cell of volume h^3 is made up of the product of two factors, an ordinary and familiar spatial volume $\Delta x\Delta y\Delta z$, inside which the pair of electrons is supposed to be situated, and a momentum volume $\Delta p_x\Delta p_y\Delta p_z$ within which they also lie; meaning that the momentum arrow for that electron pair has its point inside the momentum cell in question so that its three momentum co-ordinates lie between p_x and $p_x + \Delta p_x$, p_y and $p_y + \Delta p_y$, p_z and $p_z + \Delta p_z$ respectively. (This somewhat over-simplified language of cartesian co-ordinates implies that the cells are rectangular boxes, but no such restriction exists—their shapes are here undefined. In reality x, y, z, p_x, p_y, and p_z should be regarded as generalized co-ordinates appropriate to the mechanics of the case.) The presence of the position vector of the electron pair inside the first cell and the momentum vector inside the second cell excludes all other electrons from having their positions and momenta so located. Since the product of the volumes of the two cells is a universal constant, h^3, this means, in rough language, that if electrons are very densely packed in space they must be spread wider apart in momentum and vice versa, since their number density in the phase space is a constant.

4. Origin of Optical and X-ray Spectra Contrasted.—All the characteristic spectral lines emitted when atoms give off electromagnetic radiation are due to transitions of atomic electrons between the different initial and final stable electronic states. (Certain very faint lines known as satellites are an exception to this statement. These however are accounted for by a similar but more complicated mechanism in atoms which have lost two or more electrons.) In the case of optical lines, an outer electron (one in the outermost shell) has been, by additional energy supplied from some external source, raised to a quantum-mechanically-permitted (but not ordinarily occupied) energy level of value sharply defined by the wave-mechanical requirements. (The atom is said to be "excited.") Its "fall" from this energy level W_1 to the normal one W_2 is then accompanied by emission of a photon of radiation whose energy $h\nu$ just accounts for the difference $W_1 - W_2$

$$W_1 - W_2 = h\nu \tag{11}$$

In the case of X-ray lines the atom is said to be excited when an electron in some inner shell is ejected completely from the atomic structure (by a supply from some external source of energy in amount equal to or greater than the energy of extraction). The atom is now left with a hole in its previously dense inner structure. The characteristic X-ray spectral line is then emitted when an electron from some shell outside the excited one falls into the hole or vacancy. Since it is the change in the total energy state of the entire atom which must be held accountable for the emission of the photon it turns out to be distinctly preferable to say that the hole in the structure has traveled upward to a new shell rather than to say that an electron from the new shell has fallen into the hole. (For clarity and brevity we shall use both descriptions in what follows as convenience dictates.) This process may occur in several steps before the hole reaches the outer surface. Eventually an electron from some external source will be picked up in the final vacancy and the atom will have returned to normal. In the process, characteristic spectral lines will have been emitted with definite frequencies determined by equations of the type of (11) for each of the discrete steps of readjustment.

[1]This statement is only roughly true. A new shell is quite frequently started at somewhat earlier Z than the completion of its predecessor. The entire rare earth series is formed by the successive addition of electrons in an $N_{vi\,vii}$ sheil, which process starts 21 atomic numbers later than the O shell outside it. Also with increasing Z, electrons are sometimes removed from outer shells and added to inner ones.

FIG. 6.— TYPICAL ARRANGEMENT OF THE HIGHER X-RAY ENERGY LEVELS OF AN ATOM

The vertical lines indicate the transitions or jumps between pairs of these levels which account for some of the stronger X-ray spectral lines as designated. Only K and L series lines are shown and by no means all of these. The magnitudes of the transitions are not shown to scale

Note that in the X-ray case the initial state of the atom, required for emission of a line, is one of ionization, creation of a hole. Now associated with this initial state there is a whole series of possible lines corresponding to electrons falling from different outer shells into that one vacancy. The most energetic of these lines (those of highest frequency) will be those that come from the remotest outer shells, those nearest the periphery of the atom. Such lines will approach in energy, hv, the energy of extraction of the electron removed when the hole was formed. The aggregate of all lines formed by such electron transitions from say the L, M, N, etc. shells into one ionized shell, say the K shell, is called a series, the K series. The initial state of the atom characterizes the X-ray series. In optical spectra on the contrary it is the final state of the atom which characterizes a series of lines. Note, however, that in both cases if we think in terms of the jump the electron executes when the line is emitted, then it is the final level on which the electron lands which characterizes the series designation.

5. X-Ray Energy-Level Diagrams and X-Ray Spectra.— As we have already indicated, the extraction energy is not quite identical for all electrons in the same shell, the energy levels of the shells being said to have a fine structure. For the detailed explanation of this the reader must consult more extended works. The accompanying diagram, fig. 6, shows three principal atomic energy levels corresponding to an atom which has lost one electron from its K, L, or M shell. Since more energy is required to ionize a K electron than an L or M electron the K level is plotted at the top. In such a diagram an electron falling from the L shell into the K shell appears to move upward but this is merely due to the convention used in plotting. It will be noted on this diagram that there is but one K level while the L levels are split into a triple fine structure and the M shell has five distinct sub-levels. It is the transitions of electrons as indicated by the lengths of the vertical lines which account for all of the frequencies of the characteristic spectral X-ray lines. (Except for certain very weak lines called satellites which are the result of multiply ionized atoms, about which space does not permit us to elaborate.) Not all possible transitions occur with equal probability and some are so improbable as to have earned the name forbidden. These transition probabilities control the relative intensities with which the various X-ray spectral lines are observed, for spectra must always come from a great multitude of excited atoms so that the probability of a radiative transition is statistically translated into the intensity of a line.

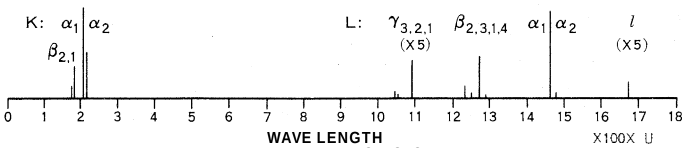
As a result of the spacing of the energy levels, large from K to L, relatively much less from L to M, relatively much less than the latter from M to N, etc.[1], the spectral lines of a given X-ray series form a rather compact group quite isolated from those of neighbouring series in the spectrum. As an example, we show in fig. 7 the K series and the L series lines of the spectrum of a tungsten target plotted against wave length, with the heights of the lines drawn to indicate roughly the relative intensities. If the value of hv for the shortest wave length or highest frequency line in each group is computed, it is found to correspond almost exactly (but not quite) to the extraction energy of the electron whose expulsion created the hole characterizing that series of lines. (Such extraction energies can be readily measured directly in a number of different ways, as we shall see.)

We owe our first insight into atomic structure and the complexity of spectra in general to the simplicity of X-ray spectra, paucity and compactness of lines in a series; absence of overlapping of series; etc., as well as to the fact that the frequencies of the K series, the one first studied by Moseley, are chiefly determined by the energy levels of the K shells, those nearest the nucleus, as we pass from atom to atom. The K electrons are in the full attractive field of the nucleus itself with minimum screening by negatively charged electrons of the full nuclear positive charge Ze. It is this screening effect which accounts for the factor $(Z-1)^2$ instead of Z^2 in Moseley's equation (3) above. After excitation by removal of one K electron, the electrons of the outer structure (L, M, etc., shells) find themselves in the field of a nuclear charge Ze screened by one K electron, hence effectively $(Z-1)e$.

IV. EXCITATION OF X-RAYS

Atoms can be excited to emit their characteristic X-rays (by expulsion of deep-lying electrons) in a number of ways as follows:

1. Electron Bombardment.— In this case the atom is ionized by collisions of fast electrons. (Of far greater total energy than the line spectrum from an X-ray tube, however, is the continuous spectrum generated directly by the impacts of the cathode electrons on the target, as explained below.) This is the method used in all X-ray tubes. As shown by experiments of W. Duane and F. L. Hunt and also of D. L. Webster, it is necessary that the colliding fast electrons have energy greater than the electron extraction energy W_e, the energy level of the series of X-ray lines to be excited. If V is the steady (D.C.) voltage applied in the tube to accelerate the electrons and e the electronic charge, then eV must equal or exceed W_e. The K series lines of silver, for example, just begin to make their appearance in the X-rays coming from



REDRAWN FROM RICHTMYER AND KENNARD, "INTRODUCTION TO MODERN PHYSICS" (MCGRAW-HILL BOOK CO.)

FIG. 7.— PLOT OF THE PRINCIPAL K AND L SERIES LINES OF TUNGSTEN AGAINST WAVE LENGTH

The relative intensities of the lines are indicated roughly by their heights save that the Lγ and l lines are so weak that they are here magnified fivefold. The same line designations have been used as in fig. 6. Note the compactness of the pattern lines of a given group (K or L) and the wide separation of groups

the electronically bombarded silver target when, as we increase the voltage, we reach a value of 25,600 v. although the L series lines of silver are already strongly in evidence. At the critical voltage, all the K series lines appear at once. It is such behaviour that so strongly confirms the picture we have given of the atomic X-ray emission process. This critical value, 25,600 v., is the extraction or ionization energy of silver K electrons expressed in electron volts. The electron volt is a convenient unit of energy much used by physicists. It is equal to the energy possessed by one electron which has fallen through a difference of potential of one volt and is equal to about 1.601×10^{-12} ergs. A quantum hv of radiation having this energy has a frequency of 242,000,000,000,000 cycles per second and a wave length $\lambda = 1.24 \times 10^{-4}$ cm. Energy, in quantum physics, can thus be expressed in ergs, volts, cycles per second, or wave length units. Convenient conversion relations from electron volts, V, to wave length A in centimetres

[1] The reason for this rapidly decreasing energy level spacing is implicit in Bohr's original formula for the individual permitted energy levels of his orbits (cf. Eq. 2). His permitted energy levels were given by

$$W_{nz} = \frac{2\pi^2 me^4}{h^2}\frac{Z^2}{n^2}$$

In an atom such as silver (Z=47), for example, the two K electrons are in a nuclear field of about 47 units, while the shielding of these places, the eight L electrons (also somewhat shielded by each other), in a field of somewhat less than 45 units. Also and more important, the quantum number $n=1$, applies to the K while $n=2$ applies to the L electrons. Similar reasoning applied to the M, N, etc., shells will convince the reader of the rapid decrease in energy-level spacing.

and frequency v in cycles per second are

$$\lambda = \frac{1.2398 \times 10^{-4}}{V}; \quad \nu = 2.4181 \times 10^{14} V \qquad (12, 13)$$

The original Crookes tube of fig. 5 used by Rontgen and the gas discharge tube of Sir Herbert Jackson. fig. 1, have been replaced by various forms of the pure electron discharge tube or hard vacuum tube invented by W. D. Coolidge of the American General Electric company in 1913, of which an early example is pictured in fig. 8. The electrically heated incandescent cathode

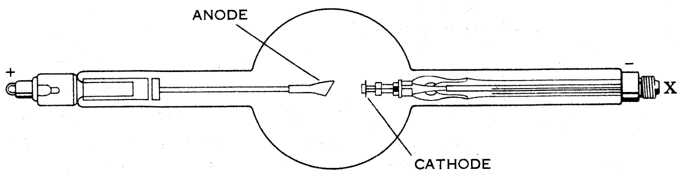


FIG. 8.— DIAGRAM OF THE STANDARD COOLIDGE X-RAY TUBE

Earlier tubes needed residual gas to sustain the electrical discharge but in the Coolidge tube the electrons forming the cathode rays are supplied by thermionic emission from an incandescent cathode

emits electrons by a process analogous to the boiling of vapour from a liquid. The target or anode may also be permitted to become incandescent, through the bombardment (this is not permissible however unless the tube is operated on a rectified supply so that the cathode is always negative); or if its substance is too easily melted. it may be kept cool by a supply of coolant circulating in its interior. Such a tube must be evacuated of gas in the space surrounding cathode and anode to such an attenuation that the chance of an electron in the bombarding stream colliding with and ionizing an atom of the gas in its path from cathode to anode is very low indeed. We say the mean-free-path for electron collisions must be much longer than the cathode-anode separation. Pressures as low as of the order of 10^{-6} (0.000,001) millimetre of mercury (or about 0.000,000,001 of an atmosphere) are required.

In another tube known as Metalix, developed at the Philips laboratories, Eindhoven, Neth., and pictured in fig. 9, the disposition of the metal anode and cathode together with a cylindrical metallic section in the envelope of the tube is such that X-rays can only emerge through a small window thus obviating the necessity for large complicated and expensive external protective shielding.

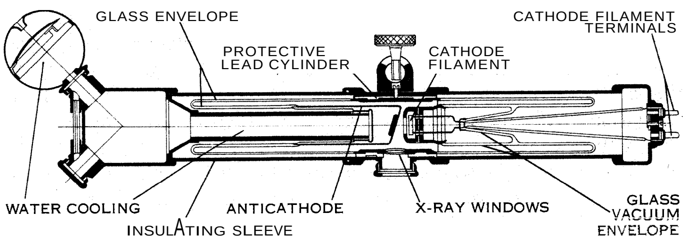

FIG. 9.— DIAGRAMOF THE METALIX X-RAY TUBE OF PHILIPS, SHOWING THE WATER-COOLED ANTICATHODE, THE TUBULAR METAL WAISTLINE WITH A THIN GLASS WINDOW AND THE OUTER PROTECTIVE LEAD JACKET

Since about 1945 the so-called shockproof X-ray tube has come into general use. In this the glass envelope of the tube itself is often completely immersed in oil contained in a compact, grounded metal envelope into which high-tension cables with grounded external sheaths conduct the electrical power. The arrangement is such that no high voltage is accessible anywhere on the exterior surface of the apparatus.

2. Fluorescent Excitation of Characteristic X-Rays.—The second method whereby atoms can be excited to emit their characteristic X-rays consists in using radiation to supply the energy needed to extract one of the deeper electrons. In order for this to take place the photons of the exciting radiation (like the electrons in the previous methodj must have energies, $h\nu$, equal to or greater than the work of extraction of the atomic electron whose removal accounts for the series of X-ray lines to be excited. Thus, in order to excite by fluorescence a sheet of silver to emit its K series lines when exposed to a beam of monochromatic X-rays. it is necessary that the frequency of the X-ray beam exceed 6.2×10^{18} cycles per second (or, what is equivalent, that its wave length be less than 0.48×10^{-8} cm). Both these figures are simply the quantum equivalents (computed from the formulas [12, 13]) of the extraction energy, 25,600 ev. for the K electrons of silver This is a striking example of the quantum or particle-like behaviour of X-radiation. Consider in detail how the event must take place:

A beam of X-rays from which has been selected a small bundle of monochromatic radiation of the required critical wave length either by reflection at a definite angle from a crystal surface or by diffraction from an artificial ruled grating or in any other way, falls on a sheet of silver No matter how much the intensity of this beam is attenuated. either by distance of transmission. or by absorption in matter before reaching the silver, its photons will always possess the property of being able to eject K electrons from the silver (the ejected K electrons can be observed by appropriate means) and of exciting the silver sheet to emit the silver K spectrum of lines (easily observable by means of an X-ray crystal spectrometer). Weakening the intensity of the beam does not reduce the energy of the photons, it merely diminishes their number.

Fluorescent excitation is being increasingly used for the production of characteristic X-rays. This method of chemical analysis was first applied with great success by G. Hevesy who, with D Coster, in 1923 discovered the ne element ($Z = 72$) hafnium by means of its characteristic X-rays.

Maurice de Broglie was the first to show that there is a class of photoelectrons ejected by X-rays of frequency v whose kinetic energy, W_{kin}, accurately satisfies the equation

$$W_{kin} = h\nu - h\nu_q \qquad (14)$$

wherein hv, is the characteristic energy of extraction of some level of the irradiated matter.

3. The Continuous **X-Ray** Spectrum.— X-ray tubes emit also a smoothly spread. continuous spectrum of X-rays upon which the lines are superposed. The lines are very narrow. though they do have a finite measured nidth in wave length or frequency units and a very definite structure or profile which has been carefully studied. The X-ray energy in a section of continuous spectrum the same width as a line is much smaller, even in the most intense regions, than that in the stronger spectral lines. Nevertheless the lines are so narrow and the gaps between them so large that the total energy in the continuous spectrum far outweighs that in the lines. The bulk of the X-ray output of the tube is therefore in its continuous spectrum. Because of this it is chiefly the continuous spectrum which does the work in medical diagnosis and therapy.

The continuous spectrum has a sharp upper frequency limit beyond which it is absent altogether and which constitutes its most striking feature. If the X-ray tube is excited with a steady (D.C.) voltage I' so that all electrons (of charge e) impinging on the target have the same energy eV at all times then this highest frequency emitted, ν_{max}, satisfies the equation

$$h\nu_{max} = eV \qquad (15)$$

wherein h is Planck's constant. This important law, first observed about 1915 by D. L. Webster working in Duane's laboratory is usually called the Duane-Hunt law. It furnishes one of the important methods of measuring the ratio h/e from which, knowing e from other sources. Planck's constant h can be computed. The law asserts that no X-ray photon can be emitted from the X-ray tube with energy $h\nu$ greater than that of the impinging electrons which excite the X-rays. Such processes may be likened in classical analogy to sudden stoppages of the cathode-ray electrons striking nearly head-on blows at the nuclei of the atoms of the target, accompanied with complete radiative loss of their energy.

The continuous spectrum frorn an X-ray tube is usually found to be partially polarized with its electric vector parallel to the direction of motion of the electrons impinging upon the target. The effect is more pronounced in thin targets and as one approaches the short wave-length limit of the spectrum.

At moderate electron voltages the direction of strongest emission is nearly at right angles to the direction of the impinging electrons but as we pass to higher voltages the maximum inclines toward the forward direction of the impinging electrons. At 24 000 v. the maximum emission is at about 70° to the forward direction of the cathode rays, at 38,000 v. it is at 64° while at 1,000,000 v. it is at about 25° only.

Targets of high atomic number are much more efficient emitters of the continuous X-ray spectrum, E. Wagner and H. Kuhlenkampff have shown that, plotted per unit frequency increment, the intensity in the continuous spectrum from a massive target falls off practically linearly with frequency down to the Duane-Hunt limit, with some steepening there. As a result of their studies as well as those of R. T. Beatty and others, the total X-ray energy output of an X-ray tube target divided by the cathode ray energy input (therefore the'efficiency ϵ of X-ray production) has been shown to be given by the approximate formula: $\epsilon = kZV$, wherein Z'is the atomic number of the target material, V the voltage and k a constant probably about 1.1×10^{-9} according to S. K. Allison. (Elaborate theoretical calculations in 1945 by P. Kirkpatrick and L. Wiedmann indicate $k = 1.4 \times 10^{-9}$. The formula obviously must fail long before $\epsilon = 100\%$.) Thus a tungsten target (Z = 74) bombarded at 100,000 v. would emit in all X-ray wave lengths about 0.8% of the electrical energy input. The other 99.2% of input energy is converted into heat.

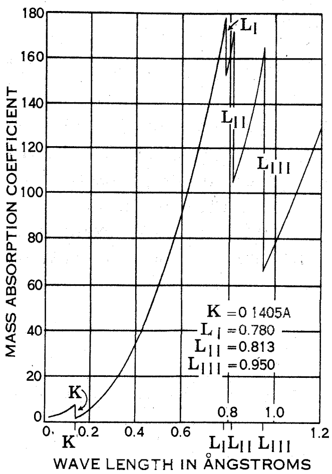
V. INTERACTIONS OF X-RAYS WITH MATTER

1. Photoelectric Absorption; the Effects Upon the Radiation.—When a pencil of X-rays passes through a material-absorbing screen its intensity is reduced as an exponential function of the path length in the screen according to the law

$$I_x = I_0 e^{-\tau x} \qquad (16)$$

Here I, is the intensity after passage through x centimetres of screen, I_0 the initial intensity and τ is called the total linear absorption coefficient per centimetre. It is clear that this law implies that each additional increment Δx of screen thickness removes the same fraction of intensity from the beam. This removal occurs partly by scattering of the X-rays into other directions than the forward one and partly by absorption of the X-rays and conversion into other forms of energy. Thus τ can be split into two components $\tau = \sigma + \mu$ where σ is the linear scattering coefficient and μ is the linear true absorption coefficient. We are at present only concerned with the true absorption coefficient μ. This differs widely for different materials. A more significant coefficient however is μ/ρ where p is the density (in grams per cubic centimetre) of the screen material. This is called its mass absorption coefficient. Of still more fundamental significance is the atomic absorption coefficient, $\mu_{At} = (\mu/\rho)(A/N)$ wherein A is the atomic weight of the absorbing material and N is Avogadro's number. The quantity μ_{At} is the fraction of X-rays removed from an X-ray beam one square centimetre in cross section by each atom placed therein. It may be regarded as a cross section, the equivalent stopping area of the atom for the X-rays in question.

When μ/ρ or μ_{At} for a given absorbing screen is plotted as a function of λ, the wave length of a monochromatic beam of X-rays whose absorption coefficient is under investigation, certain very abrupt discontinuities are observed at well-defined values of λ which depend on the material of the screen. Such a curve is shown in fig. 10 as an example for the mass absorption coefficient of a lead absorbing screen. The first, or K, discontinuity occurs at a wave length λ_K or frequency ν_K, for which the quantum energy (photon energy) of the radiation is just sufficient to eject K electrons from lead. There are three L discontinuities at wave lengths λ_L (or frequencies ν_L) such that the radiation just has the quantum energy to eject L electrons from the three different L levels of the lead atom. The sudden increase in absorption as the wave length is shortened in crossing one of these critical values, say the K, is caused by the fact that a new group of electrons in the lead atom (the K electrons), previously inactive, are now taking



REDRAWN FROM RICHTMYER AND KENNARD, INTRODUCTION TO MODERN PHYSICS, (MC GRAW HILL BOOK CO)

FIG 10.—MASS ABSORPTION COEFFICIENT CURVE OF LEAD IN THE WAVE LENGTH REGION OF THE K AND ALSO OF THE THREE L ABSORPTION DISCONTINUITIES

The sudden increase in absorption at each discontinuity as one passes toward shorter wave lengths λ or higher frequencies $\gamma (= c/\lambda)$ is due to the fact that the quantum energy of the radiation has become sufficient to eject a new class of electrons, previously taking no part in the absorption process

some extra energy from the beam (by being ejected from their atoms). Let us call the critical wave length values, λ_K, λ_L, etc.

In 1914 W. H. Bragg and S. E. Pierce showed that apart from the discontinuities, the coefficient μ/ρ approximately followed a law of the form

$$\frac{\mu}{\rho} = C\lambda^3 Z^3 \qquad (17)$$

Z being the atomic number of the absorber. The coefficient C assumes a new value at each discontinuity. If we consider the absorption per atom. C is replaced by a constant, A' and the exponent of Z becomes 4 (since A is approximately proportional to Z).

$$\mu_{At} = A' \lambda^3 Z^4 \qquad (18)$$

F. K. Richtmyer finds for the region $\lambda < \lambda_K$ that $A' = 2.25 \times 10^{-2}$ and for the region $\lambda_K < \lambda < \lambda_L$, $A' = 0.33 \times 10^{-2}$ when in both cases λ is in centimetres. B. Walter (1927) gives the following results which may be slightly more reliable than Richtmyer's: $\lambda < \lambda_K$, $\mu_{At} = 2.64 \times 10^{-2} Z^{3.94} \lambda^3$; $\lambda_K < \lambda < \lambda_L$, $\mu_{At} = 8.52 \times 10^{-4} Z^{4.30} \lambda^3$; where, again, λ is in centimetres in each case.

The absorption discontinuities taken together with the characteristic X-rays emitted by the absorber give a complete verification of the picture we have formed of the absorption process and of the structure of atoms. As we diminish the wave length incident on the absorber, for example, in the range $\lambda_K < \lambda < \lambda_L$, the L series of lines is strongly emitted by the absorber but the K series is absent. But as soon as the wave length of the incident beam becomes shorter than λ_K, the entire K series makes its appearance. All the K series lines are on the long wave length side of the K edge, etc., because, to use rough figurative language, no energy of transition of an electron from a higher to a lower atomic level can exceed the work required to raise an electron from the lower of the two levels completely out of the atomic structure in the act of ionization, the essential preparation for the former transition. All this furnishes highly satisfactory confirmation of the picture we have formed of the atomic processes of absorption of radiation quanta when these have sufficient energy to eject a given class of electrons, and the concomitant process of emission of characteristic lines from the absorbing atom after the hole has been created by ejecting one of these electrons. The absorption edges furnish one of the best ways of determining the atomic extraction energies or energy levels. All the prominent X-ray spectral lines can be accounted for, as to their frequencies (photon energies hv), as the difference between two of these levels. Thus for example the $K\alpha_1$ line satisfies the equation

$$h\nu_{K\alpha_1} = h\nu_K - h\nu_{L111} \qquad (19)$$

wherein ν_K and ν_{L111} are the frequencies of the K and the third L absorption discontinuities. Moseley diagrams for the critical absorption frequencies (plotted between $\sqrt{\nu_A}$ and Z) are even more convincing than for the emission lines.

2. Photoelectric Absorption; Effects Upon the Absorbing Atoms.—If we wish a rough classical analogue to the true fluorescent absorption process we must think of the electric,vector of the incident electromagnetic waves as acting simultaneously on two members of an electric dipole, the positive consisting of the heavy nucleus and all but one of its attendant electrons, the negative consisting of one electron only of the outer structure, setting the latter (the lighter member of this dipole) into forced vibrations of increasing amplitude until practically the entire quantum energy of the incident photon has been transferred to the electron and the latter is ejected from the atom, moving away as a free photoelectron with kinetic energy equal to the photon energy less the work of ejection just necessary to free it. The momentum given the photoelectron is balanced by an equal and opposite momentum given the heavy nucleus (and also the rest of its attendant electronic structure) which experiences a recoil like that of a gun when a bullet is fired. As might be expected from this picture, cloud chamber experiments with polarized radiation show that the ejected photoelectrons are most numerous in the direction of the electric vector of the radiation.

The X-ray ionization of gases and the effects of X-rays on living tissues have been shown to be due not to the direct action of the X-rays but to the photoelectrons which the X-rays eject from atoms of the gas or the tissue. These photoelectrons may, as we have explained, have energies (in volts) ranging practically all the way up to the energies of the electrons in the cathode ray stream of the X-ray tube where the radiation was generated. As the photoelectrons plow through a gas (or living tissue) they ionize many thousands of atoms in their paths. the average energy expended in ionizing an atom of air for example being only about 30 to 35 v. The process is made indubitably clear in the Wilson cloud chamber Of profound biological significance is the action of the photoelectrons in inducing mutations of the genes in living cells. It has been shown by M. Delbriick in such X-ray studies that the size of the molecular structure of a gene, the carrier throughout the ages of hereditary traits of amazing permanence, is of the order of that of a cube (or sphere) having only ten atoms in its linear dimensions!

3. The Scattering of **X-Rays.**—The tremendously significant work of Arthur Compton dating from his discovery in 1923 of modified scattering, followed by the work of a long list of other investigators, has established that there are two important ways in which X-rays are scattered (deflected from their original paths) by atoms. called respectively modified and unmodified scattering. It was in this field that the particlelike behaviour of the photons of radiation was first driven home with telling force. As in the photoelectric process, here again there are two experimental aspects —the effect on the radiation and the effect on the atoms which scatter it.

It is the electrons in the atomic structure which are responsible for scattering X-rays. In unmodified scattering, which occurs the more frequently (for radiation of specified quantum energy) the higher the binding energy of the scattering electrons, the radiation is not changed in wave length at all by the scattering process—it is merely deflected into a new direction. Such unmodified scattering accounts for all of the selective diffraction phenomena in crystals and on ruled gratings which result in the formation of spectral lines. Each atom of the periodic structure reradiates the incident radiation without change of wave length in definite phase relationship to the primary exciting radiation. Since the photons lose none of their quantum energy $h\nu$ in the process, no net work is done on the atom, no electrons are removed or disturbed. and the final state of the atom is exactly like the initial state. It is as though all the electrons had co-operated in the reradiating process. each absorbing and re-emitting its share of the total $h\nu$. (The electrons must not be extracted by the radiation, their final energy states must be the same as their initial energy states before scattering the radiation in order that the latter shall not be modified in frequency. There is a finite chance according to ideas first enunciated by A. Smekal that this can occur even if the quantum energy $h\nu$ exceeds the energy of extraction. One may perhaps think of the electron as momentarily ejected and then immediately falling back to its original state.) For certain wave lengths and atomic numbers the amount of radiation thus scattered per electron approximates the amount predicted by J. J. Thomson's classical formula

$$I'_\phi = \frac{I}{r^2}\frac{e^4}{m^2c^4}\frac{1+\cos^2\phi}{2} \qquad (20)$$

for the intensity I'_ϕ of X-rays scattered per free electron at an angle ϕ from the direction of the incident beam of intensity **I**, r being the distance from the scattering electron to the point of observation of I'_ϕ. The total scattering in all directions given by the above formula leads to a scattering coefficient per electron

$$\sigma_e = \frac{8\pi}{3}\frac{e^4}{m^2c^4} = 6.66 \times 10^{-25}\ \text{cm}^2. \qquad (21)$$

corresponding to an absorption cross section, that of a circle of radius 4.6×10^{-13} cm. When however the wave length of the radiation is long compared with the size of the atomic electron swarm there is a constructive interference of the radiation scattered by the individual electrons so that n of them instead of scattering n times the amount σ_e behave (in the limiting case of very long wave lengths) as though the charge e (raised to the fourth po er in the formula) were first multiplied by n so that ten electrons become equivalent to $10^4 = 10{,}000$ independently scattering electrons. The presence of m^2 in the denominator. however. reduces the ratio by the divisor $10^2 = 100$ so that the net effect of 10 electrons is 100-fold that of 1. All this is fairly reasonable according to classical concepts.

It has been possible, by study of the intensity of unmodified X-ray scattering as a function of scattering angle for gaseous atoms and also for atoms in crystal lattices, to learn a very great amount about the statistics of the spatial distribution of electrons around the atomic nuclei both in single atoms and in solid crystals, to reveal the sizes of the cloudlike electron shells and to map the regions of periodically varying electron density in crystals.

It is as the wave length becomes short, however, that our classical ideas of scattering break down completely and the scattering becomes very much lower than Thomson's formula predicts. The Compton effect here becomes pronounced.

4. The Compton Effect.—It had been observed by J. A. Gray (1920) that short wave-length radiation. after scattering from carbon and other low atomic number atoms, was somewhat more absorbable than the primary radiation. It is a simply demonstrable consequence of Maxwell's electromagnetic theory of radiation that when any quantity of radiant energy W is absorbed by a charged particle there will be exerted upon the latter an impulse (or quantity of momentum) in the direction of propagation, of magnitude Wlc where c is the velocity of light in *vacuo*. Thus a photon of energy $h\nu$ should carry with it the ability, if completely absorbed, to exert a momentum $h\nu/c$ on an electron (or any other charged particle). In 1923 Arthur Compton and, simultaneously. Peter Debye proposed the daring hypothesis that a photon of X-rays might be regarded as a small projectile able to hit one and only one electron in the scattering atom (actually their initial theory envisaged as a first approximation only a free electron). The idea was that the photon bouncing off the electron (in the direction of scattering that was being studied) would deliver a blow giving, at the expense of some of its energy, a recoil velocity and a recoil energy to the electron in accord with the familiar laws of conservation of energy and momentum applicable to larger colliding masses. The energy so lost by the photon, initially of energy $h\nu$,, would result in a new lowered frequency ν_θ corresponding to a lesser quantum energy, $h\nu_\theta$. Clearly the loss of energy should increase nith increasing angle of scattering θ. The accompanying fig. 11 shows the simple vector momentum diagram with the help of which, together with the conservation of energy, it was possible for Compton and Debye to compute that the modified photon should exhibit a shift toward longer wave lengths relative to the primary wave length and independent of the value of the latter given bv

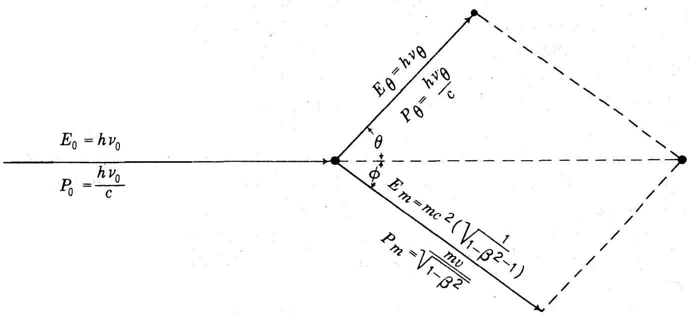
$$\lambda_\theta - \lambda_0 = (h/mc)(1-\cos\theta) = 0.0242 \times 10^{-8}(1-\cos\theta)\ \text{cm}. \qquad (22)$$

Compton outdid Debye in that he immediately and quantitatively demonstrated this shift in wave length in the laboratory together with its dependence on the scattering angle 19. The theory shows that the recoiling electron must have a forward velocity in an obvious well-specified direction and an energy E_r given by

$$E, = h\nu_0\,\frac{\xi(1-\cos\theta)}{1+\xi(1-\cos\theta)} \text{ wherein } \xi = \frac{h\nu_0}{mc^2} \qquad (23)$$

Immediately following Compton's prediction of their existence, these recoil electrons were discovered in the laboratory by C. Wilson and by W. Bothe. Compton and Alfred W. Simon (1925) showed with fair quantitative accuracy in the Wilson cloud chamber that both the scattered photon and the recoil electron obey the required laws in individual scattering processes and A. A. Bless has checked their energy accurately by the method of the magnetic spectrograph.

E. Schrodinger (1927) proposed an alternate theory of the



REDRAWN FROM RICHTMYER AND KENNARD, "INTRODUCTION TO MODERN PHYSICS," (MCGRAW-HILL BOOK CO.)

FIG. 11.— VECTOR DIAGRAM SHOWING THE CONSERVATION OF MOMENTUM IN ITS TRANSFER FROM PHOTON TO ELECTRON IN THE COMPTON EFFECT

P_m is the momentum received by the recoiling electron. P_0 and P_θ are the momenta of incident and scattered photons. θ is the scattering angle through which the photon is deviated. Formulas for the energies E_0, E_θ and E_m are also given. The fundamental law of conservation of momentum requires that the vector sum of P_θ and P_m after the collision, that is to say the dotted diagonal of the parallelogram, shall be equal in magnitude and direction to the initial momentum of the radiation P_0 before the collision

Compton effect based entirely on a wave picture in which the initially free recoiling electron must be replaced by its train of De Broglie waves, completely unlocalized in space, which act to reflect the X-radiation like the atomic layers in a crystal. The change in wave length. in this picture of the process, is to be ascribed to a Doppler effect caused by the velocity of recoil of the reflector. No basis for preference can be shown for either viewpoint, and we have here a striking example of the dual aspect of all nature. N. Bohr, after very painstaking study of the entire duality principle! resumed his work in what he called the two principles of complementarity and renunciation, *i.e.*, the wave and the particle concepts are complementary aspects of the same phenomena (like the two sides of a coin which cannot both be seen at once) and we must renounce further efforts to reject either one or to harmonize them.

5. Evidence for Motion of Atomic Electrons.—The scattering electron in the original Compton-Debye theory was assumed free and initially at rest. P. A. Ross proposed and G. E. M. Jauncey. J. W. ill. DuMond and H. Kirkpatrick have each analyzed the case where the electron possesses an initial velocity before the scattering process takes place. Thus not only does the photon deliver a blow upon the electron but the electron (like a baseball bat) may (1) either happen to hit back, thus decreasing somewhat the loss of photon energy; or (2) may recede as it receives the blow (as in bunting) so as to increase the loss of photon energy. Now there is no such thing as a supply of free stationary electrons in nature to use as a scattering agent. All the electrons in sufficient numbers for this purpose are in the atoms of solids, liquids or gases. In monatomic gases the electrons may be expected to be in motion (to have momenta) quite rigorously as the wave mechanics predicts for single atoms. In solids or liquids, on the other hand, the electronic momenta will not be quite the same as for free atoms because of the perturbing effect of neighbouring atoms. In the case of metallic solids, conductors of electricity. a theory of A. Sommerfeld proposes as a first approximation that about one electron per atom in the metal crystal lattice is substantially unattached to any particular atom and wanders about freely so that the totality of all such electrons forms a free electron gas in the interspaces of the lattice. The quantum theory (principle of exclusion in phase explained above) requires the electrons of this degenerate gas to be in a state of extremely rapid motion at velocities on the average substantially higher than they would have as outer electrons in a free atom. (They are crowded into less volume in the crystal lattice than in the free atom and hence they must occupy more momentum space.) These electron velocities required by Sommerfeld's theory and the corresponding electronic energies are enormously greater at terrestrial temperatures, or even at 0° Kelvin, than an equipartition of the ordinary thermal energy between the atoms and the electrons can alone account for.

These ideas would lead us to expect a considerable broadening of the Compton modified line as a statistical result of the individual shifted scattering processes from electrons rapidly moving in every conceivable direction, and exactly this was observed by DuMond and Kirkpatrick both with solid and with gaseous scatterers. The structure and width of the broadened modified line is in complete accord with the magnitude and distribution of electron velocities predicted not only for single atoms and molecules (helium and hydrogen gases as scatterers) but also for the free electron gas in a solid electrically conducting crystal. We thus have quantitative experimental verification of the high velocity free electron degenerate gas in a conductor predicted by Sommerfeld. at least as concerns the velocities and the approximate number of electrons which belong to the class. and a refutation of the older statistical idea that such free electrons should on the average possess only the same energy as that associated with the thermal vibration of the atoms of the crystal lattice. The breadth of the modified line in wave-length units should diminish with decreasing scattering angle and also with decreasing primary wave length in a definite way and DuMond and Kirkpatrick have shown experimentally that it does, thus confirming the validity of the entire picture. Two illustrations (see Pl. III, fig. 1, 2) are shown giving the spectra of (1) the K lines of molybdenum after scattering at three different angles from a block of graphite; and (2) the K lines of molybdenum, silver and tungsten respectively each after scattering from graphite at about the same angle. In these spectra the modified α line is very clear but the modified β line can also be seen with less intensity. The sharp unmodified α and β lines formed by the unmodified scattering process are also clearly visible. (The modified lines in the picture are designated α, and β_c while the c is omitted in the subscript for the unmodified lines.) These figures obviously not only illustrate the effect of the broadening of the Compton line by the electronic motions and the variations of the breadth with scattering angle and primary wave length; they also clearly illustrate the Compton shift itself, its variation with scattering angle and its independence of primary wave length, all in perfect accord with the theoretical picture of the process.

In modified scattering the light pressure may be thought of as the agent which ejects the electron from the atom with the energy of recoil. The fact that the electron is initially bound to the atomic nucleus, which therefore shares slightly in the momentum transfer. introduces a slight correction to the Compton shift (in wave length). This correction, computed by F. Bloch, was verified in very careful and ingenious work by Ross and Kirkpatrick.

If photons can be used as projectiles or probes to study the velocities of the electrons in matter, why not electrons? A. L. Hughes has done exactly this. Certain classes of electrons after scattering from gas atoms exhibit modifications of their energies and momenta (or De Broglie wave lengths if we prefer) which yield information as to the atomic electron velocity or momentum distributions in completely satisfactory accord with the X-ray results of DuMond and Kirkpatrick.

In further research work done about 1937–38, DuMond and Kirkpatrick, using gaseous helium and hydrogen as X-ray scattering agents, were able to obtain very accurate spectral profiles of the broadened, modified and scattered lines. These profiles were compared with calculated expectations based on the electron momentum distributions to be expected from quantum mechanical theory ior atomic helium and molecular hydrogen. The complete agreement between the theoretical and experimental profiles was excellent. These two atomic species were chosen for two reasons: (1) The simplicity of their electronic structures indicated them at the time as almost the only ones whose electronic momentum distributions could be calculated with the necessary reliability;

and (2) the perturbing effects of the proximity of neighbouring atoms on the calculated distributions for the case of a free atom are serious effects in the solid and liquid state, but are absent for the gaseous state. The broadening of the Compton line may be said to have established beyond doubt the dynamic (as opposed to static) character of the electronic structure of the atom. This is in good accord with quantum mechanics.

6. The Bohr-Heisenberg Uncertainty Principle.—From this evidence that both radiation and matter act like particles, combined with the equally good proof that they have the characteristics of waves, there flows a consequence of the deepest philosophical and physical significance. This consequence is that there is a definite and fundamental limit placed upon the precision of prediction of the future actions of any object or system as based upon observations made with any form of radiation or matter. Space is not available to give here the interesting chain of reasoning leading to this conclusion. (See UNCERTAINTY PRINCIPLE.) This principle asserts that no physical experiment of any present known type can be devised which will simultaneously measure the momentum p_x and the position q_x of a system to precisions of order Δp_x and Δq_x respectively greater than the limits prescribed by the inequality

$$\Delta p_x \Delta q_x > h. \tag{24}$$

A sufficient relaxation of precision in either factor, momentum or position, will permit any desired degree of precision in the other but the product of their uncertainties cannot be less than the constant, h. The role which x-ray research has played in bringing to light the Bohr-Heisenberg Uncertainty Principle is perhaps its most significant achievement. (J. W. M. D.)

VI. USE IN MEDICINE

The extraordinary value of Rontgen's discovery has been nowhere more in evidence than in medicine, and for a full discussion of the use of X-ray in medicine, *see* RADIOLOGY.

VII. MODERN INDUSTRIAL APPLICATIONS

The foundations of the industrial applications of X-rays, at least industrial radiography and uses dependent upon differential absorption in matter, were laid in the experiments of Rontgen in 1895, along with the beginnings of the medical and physical areas of a radiation science which later became so remarkably versatile and diversified. But in those early years there was no general acceptance and no recognition of the potentialities of the Rontgen rays, for their nature was still unknown. It remained for the discovery in 1912 by von Laue of diffraction by crystals, proving the electromagnetic nature of X-rays, identical with light except for much shorter wave lengths; of the Bragg law and the spectrometer by the famous father-son team of Sir William Henry and Sir William Lawrence Bragg in 1913; of the Coolidge X-ray tube in 1914; of powder diffraction and nondestructive X-ray analysis of solids by Hull in a U.S. industrial laboratory, simultaneously with Debye and Scherrer in Europe; and of rapidly improving equipment at the hands of electrical engineers and physicists even to this very day—all of these and many other advances—were needed to give the real impetus to a vision of a new applied industrial science.

The United States government in 1921 was among the first to recognize that ordnance should be tested by X-rays, and this work began at the Watertown arsenal under the leadership of H. H. Lester. His success with radiographic inspection led to the acceptance of nondestructive testing of welded pressure vessels, castings and fabricated units of all sizes by some progressive foundries and machine works. An X-ray research laboratory for the investigation of a wide range of industrial problems was established at the Massachusetts Institute of Technology in 1924. Thus began and gradually developed in academic laboratories, and one by one in the laboratories of industries, an industrial Rontgen science, concurrent and integrated with the development of the pure science of spectrometry and atomic structure, of the fundamental laws of absorption and scattering, of radiation physics, chemistry and biology, of the unique derivation of crystalline and molecular structures by the most advanced mathematical computations from X-ray diffraction patterns of single crystals.

X-ray instrumentation in modern testing and research laboratories is as appropriate and common as the older and wider range of optical apparatus. But in many respects we are still in the early stages of development, since only comparatively recently has electronics come to the aid of Rontgen science in the design and construction of ever more sensitive, powerful, automatic, quantitative X-ray apparatus. Now commercially produced are tubes to generate radiation at millions of volts to penetrate 20 or more inches of steel; extraordinarily efficient power plants of minimum size and weight for portability; detectors and quantitative intensity and dosage measuring devices far transcending the always indispensable photographic film and the ionization chambers—Geiger, proportional and scintillation counters. It is such instrumentation that meets the requirements of industry in the saving of time and manpower so that the original investment, which may be sizable, may be rationally and economically amortized; and that satisfies the demand for dependability and sensitivity to handle microquantities and trace analyses.

The industrial applications of X-rays comprise almost 12 categories. This versatility and wide scope are partly responsible for the increasing interest in laboratory and plant installations to meet specific needs of a given industry. Without attempting to describe in detail modern equipment, techniques or interpretations, which are covered in many papers, books and manufacturers' bulletins, a brief survey of actual accomplishments is presented in the following sections.

1. Characteristic Emission Spectrometry.—This technique, long known for qualitative and quantitative elementary analysis (now almost exclusively by fluorescent radiation), came into its own as a practical and useful analytical tool at about mid-20th century. X-ray spectrometry provides a method of rapid, nondestructive chemical analysis which in many instances parallels optical emission spectrography. In brief, a beam of intense primary X-rays from a permanently installed, sealed-off tube (such as the familiar Machlett AEG-50 tube with beryllium windows) is directed upon any specimen, gas, liquid, solution or solid. This primary radiation excites in the specimen secondary fluorescent X-rays whose wave lengths are characteristic for each chemical element. This radiation is spread out into a spectrum and analyzed by means of a crystal spectrometer in accordance with the Bragg law, $n\lambda = 2d \sin \theta$, where n is an integer, the order of the spectrum; λ is the wave length of a sharp emission line; d is the grating constant of the crystal analyzer; and θ is the angle of incidence of the collimated X-ray beam on the specific set of parallel planes in the crystal from which the beam is diffracted. The experimental measurement is actually that of 2θ, the angle of diffraction measured on the spectrum, which is registered as sharp lines (in series) on a photographic film, or as sharp peaks on a chart automatically recorded in modern installations for the response of Geiger, proportional or scintillation counters with attendant electronic circuits. The wave lengths of the characteristic lines in emission spectra of course have been accurately measured, and are tabulated in readily available handbooks and reference works, for almost all the chemical elements from hydrogen (element 1) to nobelium (102), or may readily be calculated from the relationship between wave length and atomic number discovered by Moseley in 1914. Thus qualitative analysis of the elementary composition of any specimen is directly possible, and can be extended to highly sensitive and accurate quantitative analysis from the evaluation and calibration of intensities of the spectrum lines.

Commercial equipment is available for point-by-point X-ray spectrometric analysis, that is, chemical analysis of very small individual areas such as the grains in aggregates which constitute the usual texture of metals and alloys. Extremely fine electron beams collimated by magnetic lenses, as in electron microscopes, generate primary characteristic rays of all the chemical elements in each minute area upon which the beam impinges, identification being made with a sensitive crystal spectrometer.

The chief disadvantage in X-ray emission spectrometry lies in the fact that elements of low atomic number generate long wave-length rays which are easily absorbed even by air. This difficulty is overcome in spectacular fashion by means of helium or vacuum tunnels through which beams pass, and with flowing proportional counters with extremely thin windows. The cement industry analyzes magnesium (12) in slags as routine procedure, and there is every hope of reaching down to carbon (6). The tremendous advantages of the simplicity of X-ray spectra in comparison with optical spectra, nondestruction of the specimen, multiple analyses simultaneously by dispersive and nondispersive methods, and the dependability of quantitative analyses, when carried out intelligently with and without internal standards, are now recognized. A list of industries using these methods, and of routine and research investigation on raw materials and finished products, would run to formidable length. The growing numbers of technical papers and books on this technique are indications of interest in analyses of alloys of every description, minerals and ores (especially those containing uranium, thorium and other atomic energy elements for which classical methods of analysis are very unsatisfactory and laborious), lead and bromine in ethyl fluid, sulfur and other elements in petroleum, elements such as iron in hazardous dusts, additives in lubricants, catalysts and catalyst poisoning, thickness of multilayer electrodeposits, metallic elements in foods and biological materials—to mention only a few. Truly the progress made since the earlier days of primary emission spectrograph~involving laborious pasting of specimens onto targets of demountable X-ray tubes, followed by evacuation to the requisite very low gas pressure, is clear indication of persistent effort and faith in the practical utility of this method.

2. Absorptiometry (Absorption Photometry).—The value in industrial testing and research of optical spectrophotometry from ultraviolet to infrared is accepted as a matter of course. The extension to the measurement of absorption of radiation in the spectrum below the ultraviolet in the X-ray range was logical and has been increasingly utilized for analyses of gases, liquids, solutions and solids with commercially produced equipment. This equipment consists of a source of monochromatic or polychromatic X-rays which may be made to pass through either a standard known material, such as a pure solvent, or an unknown dissolved in this solvent, for example, and then impinge upon a phosphor and multiplier phototube. Usually a calibrated wedge is interposed in one path until there is exact balance in the intensities of the radiation after passage through standard and unknown.

The analysis of gasoline for ethyl fluid and sulfur (providing a check on the spectrometric method) is common practice. One industrial laboratory ingeniously developed a method for sulfur analysis utilizing X-rays of constant quality emitted from manganese-by K-capture, a process in which an external electron in the atom is captured by the nucleus and, as the vacancy is filled from higher energy levels, X-rays are emitted. The percentage of bromine and the rate of vapour phase bromination of organic compounds is a routine procedure, as is the determination of the concentration of uranium salt solutions; glass composition, adsorption of gases andliquids on activated charcoal and other absorbents and catalysts, and flow from nozzles are but a few industrial examples. Automatic control of the thickness of rolled metals was made possible by multiplier phototubes. The porosity of many materials, such as storage battery plates and separators, is not only accurately measured by X-ray absorption, but controlled in manufacture, as is the packing of tobacco in cigarettes, filling of containers and other processes.

3. Industrial Radiography.—This special case of absorptiometry is the oldest and most familiar of all branches of applied X-ray science, parallel with medical diagnostic radiography. It dates from Rontgen's original photographs in 1895 of weights in a box and wood coated with lead paint. It is well to remember that radiography is the production of a shadow picture by passage of X-rays through, and differential absorption in, any object in close contact with a photographic film. The heavier the chemical element in a specimen the greater its absorbing power for X-rays. It follows that an internal flaw in a metal casting—blowhole, porosity, crack, inclusion of lighter elements—will disclose itself on a radiograph as a darkened area in comparison with the sound metal of given thickness; or like the bones in a diagnostic radiograph, denser portions will appear as lighter areas on the photographic negative. This method of inspection, therefore, not only assures safety in performance of any casting, but also the success of subsequent expensive machining operations; and of course the development, step by step, of the best foundry practice to assure soundness on a continuing production basis depends upon radiographic inspection as a guide.

Penetration and differential absorption of X-rays also depend upon the wave length of the X-ray beam (the shorter being the more penetrating), and the wave length in turn depends upon the voltage applied to the X-ray generator. Thus a minimum wave length of 10 Å (ångstrom unit = 10^{-8} cm.) is generated at 1,240 v., 1 Å at 12,400 v., 0.1 Å at 124,000 v., 0.01 Å at 1,240,000 v. and so on. In the last case the energy of the X-ray beam is expressed as 1.24 Mev (million electron volts). Herein lies the basis for the development of resonance transformers, Van de Graaff electrostatic generators and betatrons and other types of electron accelerators for the generation of X-rays with energies of millions or billions of electron volts and a penetrating power for detecting flaws in thicknesses of solid steel up to feet instead of inches or fractions. For example, it became routine procedure to test every inch of the automatic welds in the hulls of the U.S. atomic-powered submarines; to examine for soundness giant castings, forgings and welds for permanent engineering structures such as dams and pipe lines; to test the assembly of the smallest fabricated objects such as electron tubes; to study ballistics and armour penetration by shells in radiographs made in 0.000,001 sec. with X-ray beams of enormous intensity from surge generators; and to study motion by cineradiography, and every detail of internal motions and wearing in internal-combustion engines by stroboradiography. Radiography became one of the principal methods of nondestructive quality control for an almost endless variety of products including foods, fresh and packaged; gems; packages and baggage for customs inspection; coal; automobile tires; wire and cable insulation; boiler tubes; fitting of screw threads; and many other raw materials and finished articles. It is not surprising that rigid specifications of quality have been established based upon radiographic inspection by carefully prescribed techniques by many official agencies, so that the user or consumer is assured of satisfactory performance, especially where the safety of life and property is of vital significance.

In a field closely related to industrial radiography, art galleries and museums all over the world are equipped with X-ray laboratories for the examination of art objects and the establishment of authenticity of masterpieces. To cite a single example, even one of the most famous paintings in America, Thomas Gainsborough's "Blue Boy" in the Henry E. Huntington art gallery, San Marino, Calif., has not escaped X-ray scrutiny. When an area above the head appeared to have a peculiar light reflection, described by painters as a pentimento, radiographic examination, entirely without damage to the masterpiece, disclosed the figure of a man over which the "Blue Boy" had been painted. The pentimento corresponded with the white stock around the neck of this underlying figure on a canvas which had been cut down for the "Blue Boy." Differential absorption of the rays by the various mineral pigments makes possible this fascinating contribution of science to art. The positive identification of the pigments in crystalline form is an entirely different application of X-ray techniques discussed below under *Powder Diffraction Analysis*.

4. Industrial **Fluoroscopy**.—Radiographic images, in addition to photographic registration, may also appear on fluorescent screens as brilliantly luminescent shadow pictures. While applications in industry have been secondary to those in medical diagnosis, the use of fluoroscopy grew rapidly since following the introduction of electronic intensification of images, which resulted in greatly increased safety for the operators against overexposure. Safety considerations were a prohibitive factor in earlier attempts to use the fluoroscope for rapid continuous inspection of products and raw materials, but by utilizing electronic devices, the images formed by very weak beams of X-rays are intensified on television screens far removed from radiation exposure.

Processes of mixing, diffusion, precipitation and other reactions in chemical industries within opaque vessels are continuously observed and controlled. The viscosity of tooth pastes and cosmetic creams and other similar substances can be measured by fluoroscopic observation of the rate of fall of metal balls through the substance.

5. Microradiography and X-Ray Microscopy.—There has been gradual progress in the acceptance by industry of the potentialities of enlarged radiographic images of small specimens, to supplement the familiar optical photomicrography of surfaces and thin sections. The penetration of X-rays through a small specimen of finite thickness in close contact with a fine-grained photographic emulsion provides an image which may be enlarged by several hundred diameters until graininess in the film interferes with sharp definition.

The greatest usefulness of microradiography has been in depicting the phase structure of alloys, which may be resolved even for very complex alloys by using several different wave lengths for which absorption coefficients change in characteristic fashion. Wood, sawdust, laminated sheets with binders, fine-grained minerals, vulcanized rubber and plastics with fillers or unwanted foreign inclusions are a few of the industrial materials that may be tested successfully by this simple micromethod.

Inevitably commercial equipment was bound to be developed to provide a true point source of X-rays, resulting from the extremely fine collimation, by means of magnetic lenses, of the beam of electrons impinging on a target, thus providing an image without aberrations or loss of detail. This equipment also provides inherent enlargement of images by placing the photographic film at various distances from the specimen instead of in immediate contact as in the older microradiography. This, then, is a true X-ray microscope in which are enlarged images of alloy phases, textiles and fine-textured products of all kinds are directly recorded.

6. Chemical Changes Produced by X-Rays.—Radiation chemistry seemed to be one area well contained within a pure science, with immediate extensions to possible radiation dosimeters and correlations with biological changes. But it developed also an industrial process for modifying and improving by irradiation the properties of synthetic polymers produced by the millions of tons. Cross-linking of giant molecular chains occurs upon exposure to radiation, with a consequent decrease in solubility and increase in tensile strength together with modification of other properties. Electrical insulation may be irradiated on a production basis to improve mechanical and insulating properties. A latent image may be formed on a piece of polyethylene or polyvinyl sheet in a microradiographic exposure which is converted into a relief image by differential solubility in organic solvents depending on the degree of exposure. This relief image may be replicated by the various methods familiar in electron microscopy, so that the replica of the original specimen may be enlarged in the electron microscope up to 200,000 diameters, with no interference from graininess. Of course there are recognized definite signs of damage to materials by radiation, especially with very high energies from atomic piles. Atoms are driven from their normal positions in crystal lattices, thus creating vacancies and defects and abnormally high energies. By this means a crystal of graphite can be made into a storage battery of energy, and the energy may be recovered by heating so that misplaced carbon atoms return to their normal locations. But science is only at the threshold of detecting and utilizing radiation effects on chemical and physical properties to reach potentially valuable ends. There has been great industrial interest in at least five processes involving choices of irradiation by X-rays, y-rays from radioactive isotopes, and electron beams: sterilization of foods, chlorination of benzene, polymerization of monomers. cross-linking of polyethylene and cold vulcanization of rubber. The energies required per pound are known, and intensive investigations have been directed to determination of the minimum cost of irradiation as an industrial process.

7. Biological Changes Produced by X-Rays.—Here again the preponderant knowledge and application of a wide range of biological effects, generally damaging or unfavourable to living organisms, would seem to be limited to medical therapy and genetics. Since 1896 there have been attempts to sterilize food products on an industrial scale. The necessity for enormous doses, and therefore much time and expense, to kill spores, bacteria and viruses discouraged the development of continuous processes until the advent of X-ray and electron sources of very high intensities. Electron (β-ray) beams have been most successful because of their complete absorption in thin layers of materials. A 24-Mev electron accelerator has been used by the quartermaster corps of the U.S. army for food sterilization. Agriculturalists continue an intensive study to develop new species from genetic mutations induced by X-rays. At Michigan State university vine peas were converted into a more disease-resistant bush variety. In Sweden three field crops widely grown are the results of radiogenetics. The pharmaceutical industry has conducted intensive research on creating mutations in the molds which synthesize antibiotics.

8. Single-Crystal Structure Research.—The best evidence of the growth of industrial interest in X-ray techniques was the effortby the larger industrial research laboratories to employ crystallographers who were expert in the advanced stages of single-crystal analysis by X-ray diffraction, leading to the derivation of molecular configurations particularly of organic compounds. The Fourier synthesis of electron density contour maps with the aid of electronic computers was until recently a matter of academic research of the purest type. The door was opened most dramatically in the early stages of World War II by the necessity of knowing exactly the complex molecular configuration of penicillin, before steps could be taken to synthesize it on an industrial scale. The usual methods of organic and physical chemistry were not quite adequate for this urgent task. The three-dimensional analysis of this molecule by Dorothy Crowfoot Hodgkin and her associates at Oxford and elsewhere in England, together with contributions from the X-ray laboratory at the University of Illinois, giving an unequivocal answer, was one of the great discoveries which had positive industrial overtones. Other antibiotics, strychnine, sugars, amino acids and other pharmaceutical and biochemical agents followed as a result of industrially sponsored research. It was only natural that the General Electric company should turn to X-ray diffraction analysis and identification for synthetic diamonds and the new cubic form of boron nitride which showed promise of supplanting diamonds in industrial uses such as drilling.

The most significant single-crystal achievement in industry was the X-ray diffraction control of the cutting of quartz crystals into slabs for the control of oscillation frequencies for radio, radar and television. Special single-crystal diffraction apparatus, commercially produced, formed the essential foundations of this industry, which later was extended to the determination and control of orientations of crystals in rods of germanium and silicon in the process of manufacturing transistors.

9. Powder **Diffraction Analysis.**—Outstripping all other analytical techniques utilizing X-rays in industry, this method of analysis of solids became generally accepted as indispensable. Literally thousands of diffraction patterns of powders and aggregates, each one a characteristic "fingerprint" of a particular crystal structure of a particular chemical element or compound, have been registered daily on film or on charts in Geiger and proportional counter diffractometers, on every conceivable kind of natural and manufactured product exactly as it exists in a specimen. More than 100 known examples of industrial applications have been listed, roughly classified under mineralogical and geological, petroleum exploration and production, petroleum refining and catalysis, water purification for power-plant boilers and turbine deposits, rubber, storage batteries, dry cells, paints and pigments, cement and fertilizer manufacture, countless metallurgical applications, phosphors and electronic parts, organic, biochemical and pharmaceutical compounds, ceramics and refractories, welding, electroplating, corrosion-resistant coatings, internal-combustion engine deposits, public health hazards from industrial and mining dusts, agricultural products, soils and clays, asbestos, paper, wood, textiles, plastics. Among many industrial products and processes which have depended in large measure on X-ray studies may be mentioned magnetic tape for tape recorders, wax-polyethylene blends for paper coating and a wide variety of new chemicals.

So important in industrial testing and research is powder diffractometry that there is generous international support of the American Society for Testing Materials (A.S.T.M.) card index (originally the Hanawalt tables of the Dow Chemical company) for thousands of pure crystalline compounds of the characteristic spacings and intensities of lines in powder patterns. With punched cards it is possible rapidly to identify qualitatively any unknown sample whose constituents are represented in the index. Line shifts disclose solid solutions, or crystal lattice compressive or tensile strains. Quantitative analyses of crystalline species in a mixture depend upon evaluation of diffraction interference intensities with proper calibration from internal standards.

10. Texture From X-Ray Diffraction Patterns. — Many of the foregoing illustrations involve not only nondestructive chemical identification of solids and analysis of mixtures but also the important matter of textures, which are determinative factors in performance of materials. By texture is meant random or preferred orientation (fibring); degree of crystallinity and amorphous phases; grain sizes and shapes in microscopic and colloidal ranges; strain, distortion and imperfections in crystal lattices; and of course changes which may occur in any or all of these with various manufacturing procedures such as heat treatment. Among a large number of examples may be cited the correlation of carbon black primary particle size and shape with abrasion resistance in rubber tires, otherwise impossible even from electron microscope observations; the correlation of percentage of amorphous phase in mood pulps with densities and with tensile strength of paper sheets made from the pulps; the degradation of structure by fine grinding of graphite and the effect on lubricating qualities. Even low-angle scattering, developed in a highly theoretical approach to particle size measurement by Guinier, Debye and others, came to be used as a highly valuable tool in industrial specifications, in some instances supplementing the electron microscope.

11. Fibre Structure. — A special case of composition and texture investigations encompasses the vast range of natural and manufactured materials constituted of small crystal grains, or crystallites, oriented not at random but in preferred directions as the result of natural or artificial aligning forces. A fibre diffraction pattern is much richer in the information which it affords than that from grains at random, for in one, two or three directions the fibre pattern approximates a single crystal rotation pattern around particular axes. The wet strength of rayon fibres and of catgut surgical sutures was vastly improved simply by pulling cellulose and protein crystallites into better parallel alignment by stretching in plastic condition. Native rubber on stretching actually crystallizes into a fibre; this pattern was the criterion of final successful synthesis in the laboratory of native rubber at the end of 1955. It would be difficult to guess where the textile, rubber, starch and plastics industries would be without X-ray diffraction patterns to offer clues and signposts. (G. L. CK.)

X-RAY TREATMENT: see RADIOLOGY.

XYLENE (XYLOL), the name given to certain hydrocarbons, the dimethylbenzenes, which occur in the light oil fraction of the coal-tar distillate. Three forms exist with the same formula, $C_6H_4(CH_3)_2$ (see ISOMERISM). Xylenes are also obtained during the aromatization of high-boiling-point petroleum fractions for conversion to motor fuel with the aid of catalysts such as chromium oxide or molybdenum oxide retained on aluminum and magnesium oxides. Xylene-rich fractions are used as charging stock for aviation fuel because of their high octane rating. Commercial xylene is a mixture of the three isomers, comprising 50% to 60% by volume of metaxylene, the remainder being made up by orthoxylene and paraxylene in about equal proportions. The mixture is a colourless, mobile, flammable liquid, with a density of 0.86, insoluble in water but miscible with many organic liquids. It dissolves many organic substances and is used in making lacquers and rubber cements. The three xylenes cannot be separated by fractional distillation because of the closeness of their boiling points (137° to 144° C.). The mixture may be separated by shaking with sulfuric acid, whereupon the ortho and meta compounds are sulfonated, the para compound remaining unattacked. The ortho and meta acids may then be separated by fractional crystallization of their salts, after which desulfonation is usually accomplished by treatment with superheated steam. Metaxylene is successively nitrated and reduced to m-xylidine (4-amino-1,3-xylene). From paraxylene a similar base, *p*-xylidine (2-amino-1,4-xylene), is prepared. Both xylidines are employed in dyemaking. Metaxylene is also used in making artificial or xylene musk which is trinitro-tertiary-butyl-m-xylene. The three xylenes are oxidized by nitric acid to the corresponding toluic acids. Further oxidation leads to ortho, meta (iso) and para (tere) phthalic acids. (See PHTHALIC ANHYDRIDE AND PHTHALIC ACIDS.) The wide acclaim and commercial success of polyester fibres (Dacron or Terylene) and film (Mylar) based on terephthalic acid gave the xylenes a new importance as chemical raw materials. In the late 1950s annual production of terephthalic acid approximated 90,000,000 lbs. in the U.S. alone.

(P. G. SR.)

XYLOPHONE, a musical instrument consisting, in its simplest form, of a series of wooden bars of varying size which when struck, usually with hammers or mallets held in the player's hands, produce a range of tones.

In Africa and southeast Asia the history of the xylophone dates to ancient times. One of its primitive forms was that of the leg xylophone in which the wooden bars are laid across the player's legs and struck with clubs. Later, the bars were laid across logs or over pits dug in the earth to provide a resonating chamber. The Bantu tribes attached a gourd to each bar to increase resonance and sound. This arrangement was a forerunner of the modern marimba in which the resonator is a cedar block or a metal tube. Eventually the bars were attached to a supporting frame either suspended from the neck or fixed as a table.

The earliest trace of the xylophone in Europe dates to 1525 (Holbein's *Dance of Death*), although it is mentioned in *Spiegel der Orgelmacher und Organisten* by Arnold Schlick in 1511. In 1836 Felix Mendelssohn heard a xylophone played by a Russian, J. Gusikov, which consisted of bars lying in a bed of straw. The first concert use of the xylophone was by Hans Christian Lumbye in *Traumbilder* and by Camille Saint-Saëns in Danse *Macabre* in which the hollow sound of the instrument effectively imitated the rattling of skeleton bones. Other composers of the late 19th century used the xylophone similarly to produce new and unusual tonal effects. In the 20th century it became popular among jazz musicians who accented speed and versatility in their use of it.

Descendants of the xylophone are the metallophones, or saron, of the Javanese in which bronze replaces wood as the resonating material; the modern vibraphone or vibraharp. In this latter instrument metal bars are used, each of which is equipped with a tubular resonating chamber and an electrically driven fan used to set in motion the column of air. Vibraphones are used principally in dance or jazz orchestras.

XYSTUS, Greek term for the covered portico of a gymnasium.

X Y Z CORRESPONDENCE, the letters which when made public in 1798 nearly involved France and the U.S. in war. By orders of the French Directory fully 1,000 U.S. vessels had been stopped on the high seas for examination. Pres. John Adams sent three commissioners, C. C. Pinckney, John Marshall and Elbridge Gerry, to France to negotiate a treaty which would do away with this annoyance.

The commissioners were met in France by three agents who demanded a large sum of money before the Directory would receive the commission and also notified the commission that France would expect a loan from the United States if satisfaction of any other kind was to be given. The commissioners upon rejecting these overtures were ordered out of France. Their report was published immediately in the United States and in it the French agents were labeled X, Y and Z, from which the correspondence took its name.

The United States increased its army and navy, and hostilities were actually begun when Talieyrand disavowed any connection with the agents and agreed to receive any minister the United States might send.

Y THE 25th letter of the modern alphabet dates only from Roman days in its present position. The Latin alphabet as adapted from the Chalcidic and Etruscan ended nith **X**. The two final letters **Y** and **Z** were introduced after the conquest of Greece for use in Greek words transliterated and borrowed. **Y** was the form taken by the letter *upsilon* in the Ionic alphabet, which by the time of the Roman conquest had become generally used in Greece.

The letter in the western alphabet was in the form **V** in which form it had passed into Latin nith the vocalic value of *u* and the consonantal value of modern English w. In the common post-classical Greek based upon Attic the letter **Y** had the value of French *u* or German *u*. This sound was unknown in the Latin language, and if pronounced in borrowed Greek words passed quickly into that of i

In Old English and Middle English the letter was frequently used in place of *i* (*e.g.*, in words such as cyng). In modern English its value is identical with that of *i* both long and short, its most frequent use being perhaps as final in the adverbial termination (*e.g.*, "nidely," "strongly") When initial it represents a palatal semivowel; e g , in "yacht." "yoke," "young." See also ALPHABET.
(B. F C A.; J. W. P.)

YABLONOI or YABLONOVY ("Apple Mountains"), known to the Mongols as Dynze-Daban, a range of the eastern part of Asiatic Russia. The range is really the eastern slope of a narrow north-northeast extension of the Malkan horst. which rises from eruptive rocks near Kiakhta. The Ingoda river flows along the foot of the range, the highest point being Mt. Kusotui (5,512 ft.), near the Mongolian frontier. The descent of the Yablonoi to the trough of the Ingoda is 800 to 1.000 ft and the slope is mainly rocky debris. nith scattered patches of forest. The scarp cuts across the Archaean rocks, which strike to the east-northeast; all the horsts and ridges lying to the east of the Yablonoi are thus cut through by the Ingoda-Shilka valley, their waters Aoning across the grain of the country in their course toward the Khingan range. The Yablonoi slope is part of the watershed between the Arctic-flowing and the Pacific-flowing streams and it also forms the boundary betneen the Siberian and the Daurian flora. The trans-Baikal railway crosses the range at 3.137 ft above sea level.

YACHT, a sail- or power-driven vessel. usually light and comparatively small, used for racing purposes or for pleasure exclusively. Boats propelled by paddles, oars or outboard motors are not considered as yachts. After the decade 1840–50, when steam began to replace sail in commercial vessels, this type of power, and later the internal-combustion engine, was increasingly used in pleasure vessels. Large power yachts were developed to a high degree and long-distance cruising became a favourite pastime of the rich. The earliest power yachts were paddle-wheel boats which in turn gave way to the completely submerged screw or propeller type of propulsion.

As in the case of naval and merchant vessels, auxiliaries carrying both sail and power were the yacht fashion for many years. By the second half of the 20th century many yachts were still auxiliaries, but the majority were exclusively power yachts using gasoline or diesel engines.

During the last decade of the 19th century there was a boom in the construction of large steam yachts. Conspicuous among these was the "Mayflower" (1897) of 2,690 tons, triple-expansion engines. twin screws. compartmented iron hull and manned by a crew of more than 150. The "Mayflower," purchased by the United States navy in 1898. mas the official yacht of the president of the United States until 1929 and saw active service during World War II.

As larger and more reliable internal-combustion engines were produced. good sized yachts began using them for power. The development of the diesel engine, using heavy oil for fuel, advanced during World War I, and in the decade that followed large power yacht building flourished and reached its climax in the "Orion" (1930), 3,097 tons. During that period the largest auxiliary yacht built mas the four-masted steel barque-rigged "Sea Cloud" (1931), 2,323 tons.

The building of large power yachts declined after 1932, and the trend thereafter was toward smaller, less expensive, class boats of uniform design. After World War II. many small naval vessels were sold to private owners for conversion to yachts. By mid-20th century yachting had become a widespread popular sport enjoyed by thousands of yachtsmen personally manning and keeping up their own small pleasure craft. (J. B. HN.)

YACHTING is considered here as the sport of racing and cruising in sailing craft.

UNITED STATES

Although sailing for pleasure was a popular diversion in the American colonies at an early time) the first boat known to be built exclusively for that purpose was the "Fancy," owned by Col. Lewis Morris of New York (1717). The next boat to be built as a yacht was the 22-ton sloop "Jefferson," built in 1801 for Capt. George Crowninshield, a wealthy shipmaster, of Salem, Mass. In 1815 Captain Crowninshield had the schooner "Cleopatra's Barge" built by Retire Becket and sailed her to the Mediterranean, where he cruised extensively. "Cleopatra's Barge" was 83 ft. long on the water line and 23-ft. beam. She was furnished with great luxury and was the first large U.S. yacht.

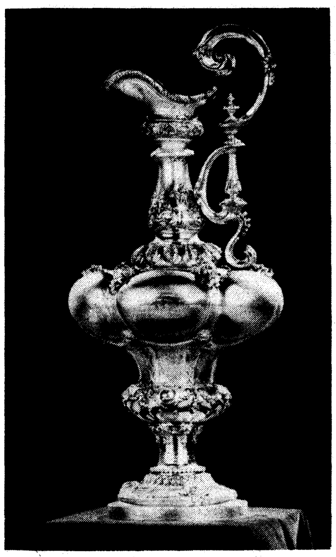
Living in Hoboken, N.J., on the banks of the Hudson river across from New York city, was the Stevens family, after whom Stevens Institute of Technology was named. John C. Stevens and his brother Edwin A. were the first prominent yachtsmen in the New York area. In 1809 they built the 20-ft. sailboat "Diver," in 1816 the 56-ft. "Trouble" and in 1820 the catamaran "Double Trouble." This is believed to be the first catamaran built in the U.S. In 1832 they built the 65-ft. schooner "Wave," in 1839 the 91-ft. waterline schooner "Onkahie" and in 1844 the 49-ft. waterline schooner "Gimcrack." The latter had the distinction of being the yacht aboard which was organized the New York Yacht club (N.Y.Y.C.), on June 30, 1844. A brother, Robert L. Stevens, in 1846 designed the 88-ft. waterline sloop "Maria," which incorporated certain features to be found in modern yachts, such as a hollow boom and crosscut sails. By this time there were a number of yachts racing on New York harbour, and the archives of the N.Y.Y.C. show that there were eight yachts enrolled in their fleet in 1844.

The yachts of that date tended to follow the models which had been developed for commercial purposes and most of them were schooner-rigged, following the lead of the fast and weatherly New York pilot schooners, although the "Maria" resembled more closely the Hudson river sloops which carried cargo between New York city and Albany at the headwaters of the Hudson river.

Beginnings of Organized **Yachting.**—Although the Knickerbocker Boat club of New York was founded in 1811, it was disbanded the following year and organized yachting can be regarded as dating from the founding of the N.Y.Y.C. in 1844. Some of the country's more important early yacht clubs and their dates of organization follow: Southern Yacht club. New Orleans. La. (1859); Detroit Yacht club (1865); Boston Yacht club (1866); San Francisco Yacht club (1869); Eastern Yacht club, Marblehead, Mass. (1870); Seawanhaka-Corinthian Yacht club, Oyster Bay, N.Y. (1871); Chicago Yacht club (1875); and Larchmont Yacht club (1880). Active yacht clubs in the United States in the late 1950s totaled approximately 800, many of which were located on fresh water, and the number was increasing yearly as the federal government expanded its program of building artificial lakes for irrigation and power purposes. The greatest concentration, however, was still in the New York area, where about 140 clubs are located.

The Yacht "America."—Probably the greatest single stimulant to the early development of American yachting was the victory of the schooner "America" in a 53-mi. race around the Isle of Wight against a large fleet of British yachts in 1851 (see *America's Cup,* below). Designed and built by George Steers of New Tork. the 100-ft., 170-ton schooner followed in general characteristics the pilot schooners for which Steers was famous. She was financed by a syndicate consisting of John C. Stevens, Edwin A. Stevens. George L. Schuyler. Col. James A. Hamilton, Hamilton Wilkes and J. K. B. Finlay. Her cost was $30.000. The "America" crossed the Atlantic on her own bottom, setting sail on June 21, 1851, from New Tork and arriving at Le Havre, France, a month later. In the Royal Yacht squadron race around the Isle of Wight she was captained by "Dick" Brown, a famous Sandy Hook pilot. After being owned by a succession of yachtsmen, she ended her active career in 1901 in a N.Y.Y.C. regatta, 50 years after her famous victory. After many vicissitudes she was restored by a group of patriotic citizens and presented to the C.S. Naval academy at Annapolis. Md., where she ended her days. She was finally broken up in 1946.

The America's Cup.—This 100-guinea cup was offered in 1851 by the Royal Yacht squadron for a 53-mi. race around the Isle of Wight, and was won by the visiting schooner "America.'! In 1857 the syndicate which had built "America" gave the cup (thereafter known as the "America's" cup) to the N.Y.Y.C. as a perpetual challenge trophy to be raced for by yachts of foreign countries. Between 1870 and 1937 U.S. yachts successfully defended the trophy against challengers, two of uhich were Canadian and five Irish.



WIDE WORLD

FIG 1.—THE AMERICA'S CUP

The original deed of gift imposed disadvantages on challenging yachts, but a mutual consent clause ironed out several difficulties and subsequent modifications of the original deed during the lifetime of the donors further improved the challengers' chances. Finally, on Dec. 18, 1956, at the request of the N.Y.Y.C. the New York state supreme court eliminated a clause requiring the challenger to sail on her own bottom to the scene of the contest. At the same time the permissible waterline length for a single-masted vessel was reduced from 65 to 44 ft. The effect of these changes was to permit a challenger of 12-m. size to be tuned up in her home water (an advantage hitherto enjoyed only by the defender) and shipped for final prerace trials. Cnder these conditions. a challenge from the Royal Yacht squadron nas accepted for a series of races in 1958, and the U.S.12-m. yacht "Columbia" successfully defended the trophy against the British challenger "Sceptre."

The America's cup races enjoyed the greatest public fame of all international yachting contests. As sporting events. however. they frequently proved less successful, becoming battles of wits and complicated legislation as much as sailing, and a source of discords that at times were inflated into minor international incidents. Among such were: the defending club's early refusal to permit the challenging yacht to race against only one defender; Lord Dunraven's allegations in 1895 that his "Valkyrie III" had been fouled by the U.S. yacht "Defender" and that the spectator fleet's crowding had endangered him; and in 1934 the club's contention that a protest could not be entertained because T. O. M. Sopwith's "Endeavour" had not "promptly" shown a protest flag. In the late 1890s ruffled feelings were smoothed by the genial tea magnate Sir Thomas Lipton, who was thereafter so much in the public eye with his "Shamrocks" and five challenges between 1899 and 1930 that the famous cup was often thought of erroneously as the Lipton cup. In 1937 Harold S. Vanderbilt's "Ranger" proved to be the fastest J-boat ever built and won four consecutive races from Sopwith's "Endeavour II" without untoward incident.

The contests exerted great influence in the matter of design. Initially, they brought together two opposed ideas: the beamy, shallow-draft, centreboard American type and the deep-keeled, plank-on-edge vessel of the British tradition. In 1855 the opposing types were well exemplified in the "Puritan" and the "Genesta"; but the four matches of the next decade witnessed a gradual merging of the two conceptions, until in 1895 the British challenger was actually the beamier of the two boats. Subsequently the enormous sums spent on cup yachts raised the science and art of design to a level of exceptional refinement.

Many causes can be found for the unvarying failure of the challengers. So long as defenders were lightly built the ocean voyage, and the strength it necessitated, further handicapped the challenger. But after 1920 rules governing the construction of the yachts ensured that challenger and defender alike should be of reasonable strength, and the most persistent cause of the challenger's failure was probably inferior organization and handling. The defenders created in the course of the years a new standard of syndicated ownership, organization and racing seamanship. Of the former, the administrative thoroughness of the three defenses conducted in 1930, 1934 and 1937 by Harold S. Vanderbilt are examples. Of the latter, an example is the contest of 1893 when in the last race the defender "Vigilant" daringly sent men aloft to shake a reef out of her enormous mainsail in a strong wind without for a moment allowing the sail to stop drawing.

TABLE *I.—America's Cup Race Results, 1851–1958*

Year	Winning Yacht	Onner	Challenger	Owner
1851	America	J. C. Stephens	—	
1870	Magic	F. Osgood	Cambria	J Ashbury
1871	Columbia Sappho	F Osgood W. P. Douglas	Livonia	J. Ashbury
1876	Madeleine	J. Dickerson	Countess of Dufferin	C Gifford
1881	Mischief	J. Busk	Atalanta	A. Cuthbert
1885	Puritan	J. Forbes	Genesta	Sir R. Sutton
1886	Mayflower	Gen. C. J. Paine	Galatea	Lieut W. Henn
1887	Volunteer	Gen. C. J. Paine	Thistle	J. Bell
1893	Vigilant	C. Iselin & syndicate	Valkyrie II	Lord Dunraven
1895	Defender	C. Iselin & syndicate	Valkyrie III	Lord Dunraven
1899	Columbia	C. Iselin & syndicate	Shamrock	Sir T. Lipton
1901	Columbia	J. P. Morgan	Shamrock II	Sir T. Lipton
1903	Reliance	C. Iselin & syndicate	Shamrock III	Sir T. Lipton
1920	Resolute	C. Vanderbilt & syndicate	Shamrock IV	Sir T. Lipton
1930	Enterprise	H. Vanderbilt & syndicate	Shamrock V	Sir T. Lipton
1934	Rainbow	H. Vanderbilt & syndicate	Endeavour	T. Sopwith
1937	Ranger	H. Vanderbilt	Endeavour II	T. Sopwith
1958	Columbia*	H. Sears & syndicate	Sceptre*	H. Goodson & syndicate

*12-metre yachts.

Development of Design.—Before 1870 yachts were usually turned out by local builders by rule of thumb. each builder having his favourite type. Usually the hulls were "modeled"; *i.e.,* a half model was whittled out by the builder prior to setting up the frames for the full-sized boat. The type most in favour along the Atlantic seaboard was a broad-of-beam, shoal-draft, centreboard craft with great initial stability, carrying a large spread of canvas with a relatively small amount of inside ballast. They were usually fast in smooth water but were not particularly good sea boats. An adaptation of the leeboards which had been used for centuries in Holland, the centreboard was housed in a "trunk" located on the centre line of the yacht and was lowered through a slot in the keel in order to give the boat sufficient lateral plane to work to windward. Even quite large yachts were built on this model. The sloop "Maria," 94 ft. over-all, 26-ft. 6-in. beam, had a draft of only 5 ft. 2 in. with her centreboard up.

At this time the so-called "cod's head and mackerel tail" form was in favour. That is, hulls were given a full bow and a long easy run, a type which had been in general use for naval and commercial vessels for centuries. It is generally believed that George

Steers, designer of the yacht "America," was the one who introduced the fine entry in designing his pilot schooners, the form which was also given to the "America." Steers's boats caused a revolution in yacht design, but it was not until 1870 that A Cary Smith laid down the lines of the cutter "Vindex" on paper—the first American yacht to be so designed.

A disaster in 1876 to the yacht "Mohawk" caused the advocates of beamy, shoal-draft centreboarders to take stock of type. This 140-ft. schooner capsized at anchor in a squall uith sails set and sheeted home, drowning her owner and several guests Thereafter Smith designed the so-called compromise sloop "Mischief." She was a 67-ft iron centreboarder, but had a slightly deeper hull than the old skimming dishes, and relied not only on beam but also on the placement of her ballast lower in the hull for stability. "Mischief" successfully defended the America's cup in 1881 against the Canadian challenger "Atalanta," also a centreboarder.

In that year the 46-ft. cutter "Madge," designed by George L. Watson and owned by James Coats, arrived in America from her native Scotland. During her first summer she won most of her races boat-for-boat against the best centreboarders. Her phenomenal success greatly influenced Edward Burgess whose compromise cutter "Puritan" defended the America's cup against the Watson-designed "Genesta" in 1885.

The success of "Puritan" made Burgess the most popular U S designer, and the Burgess hull soon became the accepted U S standard. He subsequently designed two more successful America's cup defenders, "Mayflower" and "Volunteer."

In 1891 Nathanael G. Herreshoff, of Bristol, R I.. turned out a yacht that was destined to again revolutionize yacht design. This yacht mas "Gloriana," in nhich "Mr. Nat" boldly cut away the yacht's forefoot so that her profile showed an easy sweep from the stem head to the bottom of the keel.

When the next challenge for the America's cup (1893) was received from the Royal Yacht squadron, Herreshoff designed the successful defender. the sloop "Vigilant" While a keelboat she also carried a centreboard nhich worked through a slot in the lead keel. After the "Vigilant," Herreshoff designed the successive defenders up to and including the 1920 contest, when "Resolute" successfully defended and Herreshoff was recognized as the foremost yacht designer in America. By 1930 nhen Sir Thomas Lipton made his last challenge with "Shamrock V," Herreshoff had retired and "Enterprise," the defender of that year, was designed by Ednard Burgess' son W. Starling Burgess.

The "Rainbow," defender in the 1934 race, nas also from his drafting board and in 1937 he collaborated with the young designer Olin Stephens in the design of "Ranger." During the long period from 1887 to 1937 the designers of the ten British challengers were George L. Watson, William Fife and Charles E. Nicholson.

Rig Development.—Probably no one factor has contributed more to the speed of yachts than the development of modern rigs. After 1920 the science of aerodynamics was applied by naval architects to the design of sail plans, resulting in a revolutionary change in yacht rigs. Tall, narrow sail plans with a long, efficient leading edge replaced the older gaff rig where the base was longer than the perpendicular.

The new mainsails were triangular (called Marconi. Bermudian or jib-headed) and were set on tall masts with a ratio of hoist to foot (aspect ratio) of 2.1 or 24.1. In the case of the class J yachts (America's cup class), masts were as high as 165 ft. on a waterline length of 80 ft Large fore-triangles and overlapping head sails folloned as a natural consequence and tremendous jibs, overlapping the mainsail by as much as one-third the length of the main boom and cut flat so as to be used on the wind, came into use. These were called Genoa jibs because the first one used was on a yacht racing off Genoa, Italy. So efficient were the new rigs that yachts carrying from 25% to 40% less sail area than formerly had as much or more speed as with the old, larger sail spread The new rigs were also easier to handle and a smaller crew sufficed. while the elimination of the gaff and the topmast, with its fittings saved weight aloft.

Large. full spinnakers, cut much like a parachute, also replaced the old, smaller. flatter spinnakers and had much greater pulling power. As an example of the efficiency of the new rigs, the 1937 America's cup yacht "Ranger" carried only 7.500 sq ft. of sail, as

against the 16,000 sq.ft. of the "Reliance" (1903), yet her average speed around a course bettered that of the larger yacht.

Rating Rules.—Before 1905 the length-and-sail-area rule

$$\frac{\text{L.W.L.} + \sqrt{\text{S.A.}}}{2} = \text{rating}$$

was in use in the United States; in the formula L.W.L. is length at water line and S.A. is sail area. In the United States, however, the same tendency mas apparent as in England—to develop flat-bodied hulls with long overhangs and light displacement, producing an extreme skimming-dish type. This reached its extreme limit in the America's cup defender "Reliance" (1903), which had overhangs totaling 55 ft. 4 in. on a waterline length of 89 ft. 8 in. Following this match a conference of yachting organizations under the lead of the N.Y.Y.C. adopted (1905) a rule which, while retaining length and sail area as the chief factors, also used displacement in the formula and controlled overhangs, draft, freeboard, etc . by imposing penalties. This was called the Universal rule. It produced a more nholesome vessel and, while amended several times, it remained in use in the United States, and the America's cup matches after 1930 were sailed under it. The formula is 18% of the product of length times the square root of the sail area, divided by the cube root of displacement, equals the rating.

Smaller and One-Design Classes.—There was almost no yacht building during World War I but shortly thereafter there was a boom—particularly in the smaller classes. During that period the P class (31 rating). Q class (25 rating), R class (20 rating) and numerous one-design classes, all small by comparison with prewar yachts, came to the fore. This was partly attributable to the great increase in postwar costs but also because interest in yachting was spreading and many owners preferred sailing their own boats to employing professionals. In the late 1920s several international rule classes became popular, including the 6-, 8- and 12-m.. the "sixes" being most numerous. A number of international races were held in this popular class in which British, Scottish, Swedish, Italian and other yachtsmen participated.

Because theoretically identical yachts are supposed to be a better test of the relative abilities of their skippers to win races and also because they are more economical to build, the "one-design" idea was developed as far back as the 1890s. At that time Herreshoff turned out the Newport-30s and the 70-ft. class, the latter being large sloops.

The first popular one-design class, the Stars, developed from the 17-ft. Bug class, were promoted by George A. Corry and designed by William Gardner. In 1910 the design was modified, increasing the over-all length to 22 ft. 8½ in., and the larger boat was christened "Star." The Star Class Association of America was formed in 1915 and in 1923 the International Star Class Yacht Racing association replaced the original organization. By the second half of the 20th century the class was world-wide in scope and numbered more than 3,900 boats. Competition in the class is very keen. and international as well as national and regional contests are staged annually. There are hundreds of one-design classes For some of the most popular, see fig. 3 and Table II.

The Scow Type and Seawanhaka Cup.—On certain waters of Canada and on lakes and Barnegat bay in the United States where conditions are not suited to keelboats, the Universal rule is not applied, and in such localities the scow type has been highly developed These boats are extremely flat, draw only a few inches, have two bilge boards (instead of one centreboard), double rudders and are sailed without fixed ballast. On a reach they are exceedingly fast, reputedly reaching speeds of 20 m.p.h. Contests for the Seawanhaka cup, first held in 1895, did much toward the development of the scow type. The trophy was offered by the Seawanhaka-Corinthian Yacht club of Oyster Bay, N.Y., for international competition among small yachts. Thereafter there aas a long series of races for the prize, with fleets from the United States, Canada, Great Britain, Norway and other countries taking part.

TABLE 11.—Some Popular One-Design Classes

Class	Length over all	Designer
Penguin	11 ft. 6 in.	P. L. Rhodes
Blue Jay	13 ft	Sparkman & Stephens
Snipe	15 ft. 6 in.	W. F. Crosby
Comet	16 ft.	Lowndes Johnson
Bull Dog	16 ft.	N. G. Herreshoff
Thistle	17 ft.	Gordon K. Douglass
Lightning	19 ft.	Sparkman & Stephens
Star	22 ft. 8½ in.	Wm. Gardner (Sweisguth)
S class	27 ft. 6 in.	N. G. Herreshoff
Atlantic	30 ft.	Burgess & Morgan
Pa.ific Coast One-Design	32 ft.	G. W. Kettenburg, Jr.
International	33 ft. 2 in.	B. J. Aas (Norway)
New York Yacht Club 32-ft.	45 ft. 4 in.	Sparkman & Stephens

The North American Yacht Racing Union.—Regulations affecting yacht racing and measurement rules, up to about 1900, had been in the hands of individual yacht clubs or local yacht-racing associations composed of clubs in the same locality. There was thus lack of uniformity in different sections of the country. At the time of the agitation for a new measurement rule to supersede the length-and-sail-area rule. the N.Y.Y.C. called a conference of yachting organizations of the Atlantic coast and the Great Lakes to determine what was wanted and to bring about uniformity by persuading the other sections to adopt the Universal rule then being formulated. This was a step forward, but after the conference there still was no real governing body for yachting affairs in the United States. To remedy this situation, there was formed in 1925 a union of most of the local yacht-racing associations and a number of yacht clubs, the guiding spirits in the movement being Clifford D. Mallory and W. A. W. Stewart. This organization, called the North American Yacht Racing union (N.A.Y.R.U.), was the first permanent legislative and governing body of national scope in the United States, and through it both the racing and measurement rules were standardized and an appeals board for its members was formed. In 1927 delegates from this union met with delegates of the International Yacht Racing union in London to bring about closer international co-operation. Realizing the value to the sport of international racing, the union recognized (in addition to the Universal rule) the International rule used in European countries, with the result that several international classes such as the 6-m., 8-m. and 12-m. were built and became popular in the United States. International Yacht Racing association meetings have been held annually, with the N.X.T.R.C. frequently participating, to the benefit of the sport.

Ocean Racing.—The first transatlantic yacht race (Sandy Hook, N.J., to England) took place between three American schooners in Dec. 1866. Contestants were the "Henrietta," "Fleetwing" and "Vesta." The "Henrietta," James Gordon Bennett, Jr.. owner: won: her time, 13 days 21 hr. 45 min.

Two transatlantic match races (between "Cainbria" and "Dauntless" from Daunt Rock, Ire., to Sandy Hook in 1870. and between "Coronet" and "Dauntless" from Sandy Hook to the Lizard in 1887) were held before, in 1905, 11 yachts raced from Sandy Hook to the Lizard, a prominent headland in the English channel. The winner, "Atlantic,'! a three-masted schooner owned by Wilson Marshall, covered the 3,031 mi. in 12 days 4 hr. 1 min., establishing the record for all types of sailing vessels for the course and distance. Her best day's run of 341 mi. remained a record for yachts into the second half of the 20th century.

Again in 1928, under the ownership of Gerard B. Lambert. "Atlantic" made a try for transatlantic honours, but was defeated by the schooner "Elena," William B. Bell, owner, in a race to Santander, Spain. for the Ring of Spain's cup. In a concurrent race for the Queen's cup, which marked the debut of small craft in transatlantic racing, the 50-ft. schooner "Niña," owned by Paul Hammond and Elihu Root, Jr., won from three competitors—one of which. the schooner "Rofa," sank without loss of life. "Niña" cruised from Spain to England where, sailed by Sherman Hoyt with the owners not on board, she became the first U.S. yacht to win the Fastnet. Other transatlantic races for small craft were held later.

Rafael Posso, life commodore of the Havana Yacht club, promoted in 1951 a 4.200-mi. transatlantic race from Havana to San Sebastian, Spain. Sailed in June and July, the U.S. ketch "Malabar XIII," Kennon Jewett, owner, won from three competitors. In 1955 the race from Havana to San Sebastian was again held and was won by the Spanish yawl "Mare Nostrum," Enrique Urrutia, owner, from U.S., Cuban and Argentine entries. In the same year a transatlantic race was sponsored by the N.Y.Y.C. and the Royal Swedish Yacht club. It was sailed from Newport to Marstrand, Sweden: and was won by the 53-ft. yawl "Carina," designed by Philip L. Rhodes and owned and sailed by Richard S. Nye. She sailed 3,467 mi. in the good time of 20 days 9 hr. 17 min., averaging about 7 knots for the course. Another American, a Norwegian and four German yachts competed. Two years later the N.Y.Y.C. sponsored another transatlantic race, this time in partnership with the Royal Santander Yacht club and the Havana Yacht club. Again "Carina" was the winner, covering the 3.000 mi. between Newport and Santander. Spain. in a corrected time of 18 days 2 hr. 14 min. There were seven entries.

In 1960 the 47½-ft. yawl "Figaro," William T. Snaith, owner, won a 3,370-mi. race from Bermuda to the Skaw lightvessel in the Skagerrak, from a record transatlantic entry list of 17 yachts. The U.S., England, Sweden and Germany mere represented. The 72-ft. yawl "Escapade," Baldwin M. Baldwin. owner. a Californian entry. finished first in the fast time of 19 days 1 hr. 32 min.

In South America ocean racing made its debut in 1947 when the Argentine and the Rio de Janeiro yacht clubs collaborated in a 1,200-mi. race from Buenos Aires to Rio. It was sailed triannually in the 1950s, and included among its participants yachts from Argentina, Uruguay, Brazil, Great Britain, Germany, Portugal and the U.S. It was won in 1959 by the Argentine 38½-ft. yawl "Tango," Raul G. Decker. owner.

The Bermuda, Honolulu and Other Distance Races.—In 1906 Thomas Fleming Day. to demonstrate that small yachts if properly designed, built and handled, could go to sea with safety, promoted a race from New York to Bermuda in which there were three starters, the winner being "Tamerlane," a 38-ft. yawl. Later, races for power cruisers were also run to Bermuda and Havana. But after five years, interest in the Bermuda race died our.

In 1922 a group of cruising yachtsmen organized the Cruising Club of America (C.C.A.). Among this group were several who felt that ocean racing would be beneficial to the development of both yachts and yachtsmen. Accordingly, under the leadership of Herbert L. Stone: a committee was formed (not under C.C.A. auspices, however) to revive the race to Bermuda. Thus in 1923, after a lapse of 13 years. a race was run from New London: Conn., to Bermuda (660 nautical miles). There were 22 entries; the winner was "Malabar IV," designed, owned and skippered by John G. Alden. Subsequent races were run thereafter in even years by the C.C.A. (1924 race was under auspices of the New Rochelle Yacht club) except during World War II. The start of the 1932 race was shifted to Montauk Point. L.I. (distance 628 mi.), and the 1938 and subsequent races were started from Newport (635 mi.). A record of 71 hr. 35 min. 53 sec., established in 1932 by the cutter "Highland Light," under charter to her designer, Frank C. Paine, was finally broken in 1956 by Sven Salen's Swedish-owned yawl "Bolero" with a time of 70 hr. 11 min. 40 sec. Winner that year in the record-breaking corrected time of exactly 64 hr. was the keel-centreboard 38½-ft. yawl "Finisterre," Carleton Mitchell, owner. He won again with the same boat in 1958 and in 1960—an unparalleled achievement. All Bermuda race finishes were handled by the Royal Bermuda Yacht club.

As a result of the interest in this race architects commenced to design to the measurement rule then in use, which was a simple one. It soon became apparent that, to equalize the chances of divergent types and promote sound design, a more restrictive measurement rule was required. Accordingly, in 1940 Wells Lippincott drew up a scientific rule, called the cruising-club rule. The basic rule—which fills a small book and is far too technical to be given here—has been modified from time to time as experience dictated, and is the basis for measurement rules for nearly all important long-distance races in the United States. Under it such events as the Chicago-Mackinac, the Port Huron-Mackinac and the Rochester races are held in the Great Lakes. Established annual ocean races include the St. Petersburg. Fla.-Havana, Cuba, the Miami-Nassau, and the Newport Harbor, Calif.-Ensenada, Mex., races. In May 1960. the 125-mi. Ensenada race brought a record number of 356 yachts to the starting line. A 1,400-mi, race from San Diego, Calif., to Acapulco. Mex., was sailed in 1953 and 1954, becoming a biennial in 1956. A biennial previously sailed from Newport, R.I., or New London, Conn., to Annapolis, Md., was reversed in 1957 and sailed to Nemport.

The 2,225-mi. race from San Pedro, Calif., to Diamond Head, Oahu, Hawaii (formerly sailed also from the California harbours of Santa Barbara, Balboa, Santa Monica and San Francisco) ranks with the Bermuda race in age, importance and total number of races sailed. First held in 1906 and repeated at irregular intervals, it was in 1928 embraced by the newly organized Transpacific Yacht club and in 1939 was made a biennial to alternate with the Bermuda race. There being no limitation on over-all length (the largest yacht to sail the course having been the 161-ft. schooner "Goodwill") and the course being predominantly down wind, the race is notable for the good speeds sustained. Thus in 1949 the 98-ft. schooner "Morning Star," Richard S. Rheem, owner, covered the distance in 10 days 10 hr. 13 min., and in 1955 when rerigged as a ketch reduced her previous time to 9 days 15 hr. 5 min. for an average speed of 9.69 knots for 2,225 mi.

Noteworthy also in the Honolulu race is the required use of the radio for morning position reports and the daily dissemination by an accompanying coast guard cutter (or other vessel) of current meteorological data gathered from weather ships and other reliable sources. For the history of sail and other vessels: *see* SHIP.

GREAT BRITAIN

From their royal introduction into Britain at the Restoration until the coronation of Victoria, racing and pleasure sailing mere esoteric pastimes rather than national sports; and though there was a Cork Harbour Water club in 1720 (now the Royal Cork Yacht club) and a Cumberland fleet in 1775 (of which the Royal Thames Yacht club is the descendant), yachting of the kind that this article covers did not appear until the three decades following the establishment of the Yacht club (now the Royal Yacht squadron) at Cowes, Isle of Wight. in 1812. The sport was encouraged by the royal and official patronage naturally extended to it in a seafaring nation. During these decades there was energetic founding of yacht clubs at points on the coast where the local conditions suggested the pleasures of sailing; and a national institution was born.

Early English Yachts.—Among the earliest English yachts of uhich there is any record were the "Pearl." 95 tons, built in 1820 at Wyvenhoe, Essex, and the "Arrow," 84 tons. built in 1822, which for 58 years was one of the most successful cutters afloat: while one of the largest, the "Alarm." was built by Inman of Lymington, Hampshire, in 1830 for Joseph Weld, from the lines of a famous smuggler captured off the Isle of Wight. Some yachtsmen at this time preferred still bigger vessels and owned square-top-sail schooners and craft resembling the contemporary naval brigs Of such vessels were the "Waterwitch," built at Cones in 1832, while Lord Yarborough's second "Falcon" was a full rig ship of 351 tons, pierced for ten guns a side and nith a crew under naval discipline It was a quaint, buccaneering phase of yachting.

The working craft of Great Britain and Europe in the last days of sail, and the yachts nhich evolved from them, embodied in their shape one of the earliest theories of naval architecture—the fish form—according to which it mas assumed that the shape of a fish was a natural guide to the ideal form of ship. Hence originated the wide. bluff bows of the early yachts, with their greatest breadth at about one-third of their length from forward, and long "streamline" after bodies. A change of type was foreshadowed many years before it became general. J Scott Russell, in the mid-19th century, was advancing his wave-line theory which was not, as it happens, a hydrodynamically valid argument. But by emphasizing the importance of finer lines forward it helped to discredit the excessively bluff bows affected by the boatbuilders. Two yachts, the "Mosquito," 50 tons, and the "Volante," 59 tons, embodied the new shape but had no great influence. It was the "America," sailing across from the United States in 1851 and winning a cup offered by the Royal Yacht squadron in that year, which decisively tipped the scales against the older tradition (see *United States,* above). This was not wholly logical, for her success was as much due to her sails and her handling as to her hull shape; but thereafter the form of yachts changed, and bluff bows with an angle of entrance of about 30° were replaced by hollow bows with an angle of less than 20°.

There now appeared yacht designers of high technical ability and rare artistic gifts, such as G. L. Watson, W. Fife and, later, C. E. Nicholson, who established yacht design as a distinct branch of naval architecture. The evidence of contemporary scientific researches in ship design was applied to the shaping of yachts and led. after 1874, to a second fundamental change in design—the reduction of wetted surface. The "Jullanar" of 1874 originated the trend. that reached maturity in the "Britannia" of 1892. of combining the minimum of wetted surface with the maximum of sailing length in a hull of moderate displacement. Incidental to this evolution was a return toward the fuller bows of the pre-"America" period, but in yachts of a very different type.

Organization and Rules.—The Yacht Racing association (Y.R.A.) was founded in 1875 with the object of providing a set of rules governing regatta sailing, and by 1881 most of the important clubs were members of the association. The prince of Wales (afterward Edward VII) was its president. He was also commodore of the Royal Thames Yacht club and of the Royal Yacht squadron, and during these years the influence of the Y.R.A. was established. The sailing rules, governing the handling of yachts, were codified in 1875. The collision in 1894 between the "Satanita" and the "Valkyrie" at the start of a race on the Clyde river, Scotland, led to a lawsuit passing through three courts, the house of lords finally upholding the legality of these rules, which differed materially from the Merchant Shipping act. They were adopted internationally in Europe (1907) and the United States (1929); but after World War II the United States introduced a new code, and complete international uniformity remained to be achieved after mid-20th century.

The Y.R.A. rules governing yacht measurement were initially less successful. The influence exerted on design by rules of measurement used to assess speed potentiality was not yet recognized and a series of tonnage rules, the precise implication of whose mathematics the rulemakers failed to appreciate, put such a crushing penalty on beam that there appeared a new type of craft having no parallel in history. They were of extreme depth and narrowness—a trend in design made possible by the use of the external ballast keel—and in 1887 the vice-president of the Institution of Naval Architects said that it was ". . . lamentable . . . to find that the Yacht Racing association had encouraged . . . the worst type of vessel it is possible to conceive."

The association. however, had in 1887 introduced a new system of measurement. the length-and-sail-area rule of Dixon Kemp. It was as dangerous mathematically as those it superseded, but the fact that it encouraged an opposed though equally vicious type of vessel and had as its natural conclusion yachts shaped like saucers, allowed design to pass, in its swing from extreme to extreme. through a period of yachts producing the one classical form in the shifting art of yacht design. The "Thistle" appeared in 1887. the "Petronilla" in 1888. Lord Dunraven's first "Valkyrie" in 1889, the "Ivernia" in 1890, all improvements on the old, misshapen boats. Then in 1892, in an unprecedented burst of new construction, came the "Valkyrie II," a challenger for the America's cup. the "Britannia," a near sister to this yacht, built for the prince of Wales, the "Calluna" and the "Satanita." By the end of 1893 nine first-class new cutters had appeared and were stimulating interest in all classes. There had never previously been such activity in the yacht yards.

The Linear and International Rating **Rules.**—By 1895 yachts were becoming skimming dishes with little internal space and unreasonably light scantlings. The swing from one extreme type to another under the influence of measurement formulas reflected the inadequacy of the rules in the face of clever naval architecture and growing scientific knowledge open to designers. There was need for a new system of measurement which, without offensively curbing the freedom of designers in their pursuit of speed—the essence of their art—exercized a tighter control over the shape of yachts. The First and Second Linear rules (1896 and 1901) devised by R. E. Froude, a naval architect and nephew of the historian, were more complex formulations than those hitherto used for measurement and were intended to encourage reasonably full-bodied yachts with good accommodation for their size and well-proportioned hulls according with the idealized conception of a yacht as a vessel combining speed, beauty and comfort.

In 1906, on the initiative of B. Heckstall-Smith, conferences of European yachtsmen led to the production of an international rating rule. similar in form but significantly modified in detail compared with the Second Linear rule. The International Yacht Racing union was also founded. Eleven racing classes were built to the First International rule, ranging in size between the 5-m. and a class for yachts exceeding 23-m.. one of which was the kaiser's "Meteor IV." The sailing of small boats was by the beginning of the 20th century one of the strongest branches of yachting, and the popular small rater classes produced by Dixon Kemp's length-and-sail-area rule found their success repeated in the 6-m. of the new international rule. 328 of which were built between 1907 and 1914.

With the resumption of racing after World War I the Second International rule was formulated. It was similar in structure to the first. but with sail area more heavily penalized and excessive fullness of body discouraged The object of the alterations was to produce yachts that combined speed habitability and beauty but which had lighter hulls capable of being driven under smaller sail areas and manned by fener hands.

The rule was in tno parts, the second being a slightly modified form of the first and applicable to yachts above 12-m in rating. This latter came into force in 1928 and produced three magnificent big cutters, "Astra," "Cambria" and "Candida"; then in 1931 the American Universal rule was adopted for yachts rating above $14\frac{1}{2}$-m. It was to this rule that the last three challengers for the America's cup were built. In 1933 the Third International rule was produced: it was fundamentally similar to the second, which had proved extremely successful. Essentially rating consisted as in the First International rule, of the sum of the length and the square root of the sail area modified by factors controlling the shape of the overhangs and the fullness of the body, the latter control being augmented by a displacement limitation based on waterline length. The Second and Third International rules produced in the 12-, 8- and 6-m. classes the finest inshore racing yachts in the history of the sport. The hulls were of beautiful, moderate and seaworthy proportions—if we overlook the undue narrowness which appeared in the later 6-m boats—and the rules were successful in restraining sail area. Within each class the years produced a slight increase in the hull size and reduction in the proportion of rated sail area to length.

The major change in yacht design after 1925 was the almost universal replacement of the traditional gaff rig by the Bermudian or Bermuda rig (*q.v.*). The change, foreshadowed in the "Nyria" in 1912, nas inspired by the nen knowledge of aerodynamics and encouraged by the international rule's heavy penalty on sail area (see *United States: Rig Development,* above).

International Racing.—Although public interest in international yachting was confined to the few America's cup contests (see above), the highest competition in design and sailing during the 1920s and 1930s was in the international 6-m. class. The British-American cup team races were inaugurated in 1921 and sailed annually between 1921 and 1924. Three out of four British victories gave the cup outright to Britain. Thereafter the races became biennial and fell into three series. two of which were won outright by the United States while the first three races for the fourth cup nere non by the United States in the 1950s. This is a story of an initial British superiority in design and sailing followed by an unvaried inferiority. A similar pattern of events appeared in the Seananhaka trophy races contested betneen two 6-m.—except in 1929 and 1931 when the 8-m. were used. In the Scandinavian Gold cup honours have been shared by Great Britain, Sweden, the United States and Norway.

Cruising.—Though many people have made voyages in small craft since Samuel Pepys found in it "great content," the powerful body of amateur seamen in existence by 1930 was a product of the previous 50 years. The Cruising club was founded in 1880 and granted the prefix "Royal" in 1902. It gained a unique position in the world of yachting by the publication of charts especially prepared for use in small craft and the award of challenge cups for cruises in which excellent seamanship, navigation and pilotage. and the collection of information on the lesser-known coasts and harbours, were distinctive features. The Cruising association was formed in 1908 nith the principal objects of providing a central reference library, organizing local representatives and boatmen in as many ports as practicable and issuing handbooks of sailing directions. The work of these organizations and others, such as the Little Ship club, with its publications and lectures. the Clyde Cruising club and the Irish Cruising club, bred a race of amateur seamen with a breadth of knowledge hitherto unknown.

The favoured cruising grounds were widespread, extending to the Baltic, the Spanish coast and the Scilly Isles. The south coast of England, particularly from the Solent to the west country, raised a thick population of cruising yachts. The rivers and creeks intersecting the islands of Essex, the sandbanks and swatchways of the Thames river and the richly wooded coast of Suffolk were near enough to the centres of population to become the most popular cruising waters. The Clyde river and west coast of Scotland, where among the islands of Islay, Jura. Bute and Kintyre overnhelming hillsides drop to the waters of firth and loch, have been claimed to be the loveliest cruising ground knonn to yachting. By 1935 the coast of Brittany from the Tréguier river to the Morbihan *département* had become as frequented by British cruising yachts as the waters nearer home were in the late 19th century.

The need for seaworthiness in cruising yachts led to the favouring of craft that were converted from, or modeled on the lines of, various types of working boat—notably the pilot cutters. trawlers, Falmouth quay punts, Morecambe bay prawners and Itchen ferry boats. These had the further advantage of being cheap for their size. The meticulous studies by Claud Worth of seamanship and cruising yachts led to a refinement in design that was seen in his own yachts "Tern III" of 1913, "Tern IV" of 1923 and "Bittern" of 1936; and his influence was furthered by such amateur designers as Albert Strange and T. Harrison Butler. whose work closed the gap left by professional designers whose main interest nas in larger racing craft.

Racing is a forcing house of design and when the current racing craft were of good type they favourably influenced the design of cruisers Thus, during the period 1925–35, the benefits of the short underwater profile and the outside ballast keel with the minimum of internal ballast. moderate length of overhang and Bermudian rig—features once strongly deprecated in seagoing yachts—were adopted and proved offshore as a result of their testing in the international rating classes.

This process was hastened by the growth of ocean racing. The hard driving of boats on offshore courses, with the need for maintaining speed day and night. often in bad conditions, was a harder test of boats than even long cruises; it also led to a greater concentration of professional designing talent on seagoing yachts than hitherto.

Ocean Racing.—The Royal Ocean Racing club (R O R.C.) was founded by E. G. Martin. Weston Martyr and others as the Ocean Racing club in 1925 nith the principal objects of encouraging long-distance yacht racing and the building and navigation of sailing vessels in nhich speed and seaworthiness were combined. In the same year a race was sailed from Ryde. Isle of Wight around the Fastnet rock (off the southnest coast of Ireland), and back to Plymouth. Devon. A race around the Fastnet was held annually betneen 1925 and 1931 and thenceforward every other year in alternation with the American Bermuda race. In 1928 an

English channel race was inaugurated with a 251-mi. course from Cowes. around the Royal Sovereign light vessel and Cherbourg breakwater, and back to Cowes. This was held annually thereafter, with the exception of the World War II years, the Le Havre light vessel being substituted for the Cherbourg breakwater in 1930 (distance. 225 mi.). In 1929 a first race was sailed to Santander, Spain. and in 1930 the Cowes-Dinard (France) race originated thereafter becoming an annual event. In 1931, apart from the Fastnet. Channel. Dinard and the North sea Maas and Haak races. there mas a transatlantic race. "Maitenes II" was the one British boat to figure in the prize list. The years 1932 and 1933 were unsuccessful, honever, with small entries for all the races, and it would at that time have been difficult to augur the predominant position in yachting that ocean racing was shortly to assume.

Offshore racing is organized on a handicap basis with time allowance derived from rating. In 1933 a formula devised by Malden Heckstall-Smith was devised to approximate the immersed bulk of the boat by means of simple internal measurements capable of being made with the yacht afloat; for it was considered essential to the purpose of the rule that it should be possible to measure rating without access to scale drawings or the necessity of slipping a boat. Apart from the basic formula the rule comprised clauses by which bonuses or penalties in rating were derived in accordance mith the characteristics of yachts' rigs and constructions. In the second half of the 20th century the formula was still unchanged, but a process of trial and error during the years had produced modifications in the measurements and allowances.

A growing interest in offshore racing after 1933 shoxed that the R.O.R.C. and its rule was to become the most vital force molding yacht design. The early British ocean racers were drawn from the first-class cruising yachts of their day. "Jolie Brise," winner of the Fastnet in 1925. 1929 and 1930, was a converted Havre pilot boat; "Tally Ho," winner in 1927. was a refinement of a Falmouth quay punt; "Saladin," which won a place in three out of the first five Fastnet races. was a Bristol channel pilot cutter; "Flame," the only British yacht to gain a place in 1933, was a fast cruiser with the impress of the 19th century strong on her. The decade 1929–39 saw the development of a new type of seagoing yacht nhich profoundly influenced the design of the cruising yacht and which, in the years following World War II, was destined to replace the international classes of inshore racing yacht as the principal repository of designing talent and popular interest.

The offshore racing yacht evolved during these years mas the derivative of the international rule craft. whose fundamental seaworthiness was proved in offshore racing. Encouraging the development were such American yachts as "Dorade," winner of the Fastnet in 1931 and 1933, and "Stormy Weather," winner in 1935; but as early as the second Fastnet race in 1926 a precursor of the new type appeared in the Fife-designed "Hallowe'en," nhich nas of the genre of the international rule 12-m. but suitably modified for offshore sailing. The "Maid of Malham" and "Ortac" of 1936 epitomized the new type of seagoing racing yacht in which the speed of the international rule boats was blended with the robustness of the earlier cruisers to produce a new and exceptionally versatile type of yacht. Yet in 1947 in the first post-World War II Fastnet, the "Myth of Malham," a high-sided, straight-sheered light-displacement sloop which defied the tenets of both beauty and convention, won from her conservative competitors. Duplicating her performance in a hard chance in 1949, "Myth" was laid aside for some years, but was still able and fast enough to win in her class in 1957.

The Royal Yachting Association and Lloyd's Register.—In April 1948 it was arranged that Lloyd's Register of Shipping, in consultation with the Y.R.A., should prepare revised scantling tables for the constructional requirements of yachts classified by Lloyd's. These were to be based on the principle of a general reduction in the society's requirements, which experience had indicated to be excessive. As a result the 1929 rules were replaced in 1950 for yachts of all but the largest sizes by revised rules, and experience in the following years led to further modifications in these and brought them up to date with modern practices in construction.

Immediately after World War II the need for a national representative body for yachting, competent to deal with the trade, with port, harbour and other authorities. and with the government, became evident. The Y.R.A., which was financially supported by the yacht clubs, was a basis for such an organization and steps were taken to broaden its activities. A general purposes committee was founded to deal nith yachting matters as a whole. These included such diverse questions as that of a projected purchase tax on yachts, the municipal rating of yachts' moorings, the siting of oil refineries and bombing ranges in unspoiled coastal areas and the pollution of coastal and estuary water. To express the enlarged functions of the association, which now took more time than its purely racing activities. its name was changed early in 1952 to that of the Yachting association. Later in the same year the prefix "Royal" was granted.

The International Yacht Racing Union.—The Third International rule was replaced in 1950 by the Cruiser-Racer rule, framed to produce more economical yachts of greater versatility and of a less purely racing character than the prewar 8- and 12-m. classes. This rule nas different in form from the previous international rules, but like them retained as the basis of rating the length and sail area, with minimum displacement limitations based on length The other factors in the rule consisted of credits or penalties derived from the standard of a basic hull form of good but not necessarily ideal proportions.

The principle was accepted that the rating rule used to govern small racing craft without accommodation should be separate and of a different type from that employed for the bigger vessels. To replace the prewar 6-m. class a rule devised by Malden Heckstall-Smith. already well tested in model yachting. was adopted. The formula produces a linear variation betneen length, sail area and displacement, and approximately 3 in. of length costs 7 sq.ft. of sail area. and 64 lb. of displacement earns about 2 sq.ft. of sail area The limits of variation in these elements is specified by the rule and nithin these the designer has to select the balance of length, displacement and sail area best suited to the racing conditions. A typical 5 5-m has an over-all length of about 33 ft. and on the water line of 22.5 ft. They are smaller, lighter boats than the 6-m. that they replaced and are more economical to build and race. But nhile the 5.5-m. gained a footing and the importance as a result of their selection as one of the classes for the Olympic games yachting in 1952 and 1956, the older 6-m.. though expensive, retained adherents and continued to be the class in which the British-American cup and Seawanhaka trophy were contested.

The trend of yachting after World War II was epitomized in the progress of the Dragon class of small racer which nas given official international status by the International Yacht Racing union (I Y.R U) in 1949. having already achieved a certain international popularity. Designed by the Norwegian naval architect Johan Anker as inexpensive cruiser-racers in 1929, Dragons appeared in Great Britain by 1935 and after World War II they became a premier racing class. International status expedited their transformation from cheap cruiser-racers into a pure racing yacht of the first class, expensive for their size but capable of replacing

1959	Anitra	Sven Hansen	Sweden

the older, larger racing craft whose price had become exorbitant.

Later History. — The principal features of yachting after World War II were a downward trend in the size of yachts accompanied by an upward trend in their numbers; the almost complete elimination of professional hands concurrent with the attainment of a high level of ability by amateurs; a wave of enthusiasm for ocean voyaging in small craft; and the formation of many new clubs. The period was characterized by a growing strength, supported by ever-spreading roots, of yachting as an institution and this may be attributed at least partially to the knowledge of the sea gained by many men during the war. The late 1940s were a period of yachting development comparable with the 1840s.

Before 1914 a 40-tonner was considered a small yacht; by 1938 a 20-tonner might have been classed as small in the major yachting centres, though nowhere else; by 1955 a 20-tonner found herself among the larger yachts anywhere. The pure racing yachts of large size, such as the international 12-m., were replaced by smaller. more versatile craft represented internationally in the cruiser-racer classes, but found in much greater numbers in the unclassed cruiser-racers which were primarily cruising homes afloat, yet with good sailing ability. The popularity of this type of yacht--a type evolved from the experience gained between the wars by the R.0.R.C.--encouraged the growth of handicap racing over regatta courses, or ones slightly longer, and this form of racing — one of the oldest known to the sport — reached a popularity shown most vividly in races around the Isle of Wight.

The offshore racing over longer courses, which by 1938 had become so firmly established, gained in strength, the entries for the races of the R.O.R.C. increasing and also the number of events organized in the course of a season. these ranging from transatlantic races to the annual Cowes-Dinard race and including the biennial Fastnet race. The chief development in design was the appearance of the light-displacement yacht with high freeboard, short overhanging length and containing good accommodation. None of these characteristics was new to yacht design but the combinations were original. The appearance of the type was initially due to a flaw in the R.O.R.C. rating rule, whose depth measurement, when this was associated with considerable height of freeboard, allowed a light-displacement, easily driven hull to gain the benefits in rating that were intended to accrue to heavier, slower craft. This type of yacht was latent in preuar design and appeared explicitly in the "Myth of Malham" of 1947. The rating rule was modified to prevent this type of vessel gaining undue advantage under handicap. but the type persisted on its architectural merits and proved its seaworthiness. The combination of light displacement, high freeboard (attained possibly with the help of a convex curve in the sheerline) and short overhangs made possible a small yacht of economical type which was also seaworthy and provided serviceable accommodation.

The most impressive support gained by yachting appeared with dinghy sailing, which became a powerful interest between the wars and continued to appeal to some of the most expert helmsmen in the world, nhich did not prevent its remaining an accessible sport at a modest expense. By the second half of the 20th century the racing of small craft, which was already popular in the Solent of the 1890s, had spread over all practicablesailing waters in Great Britain.

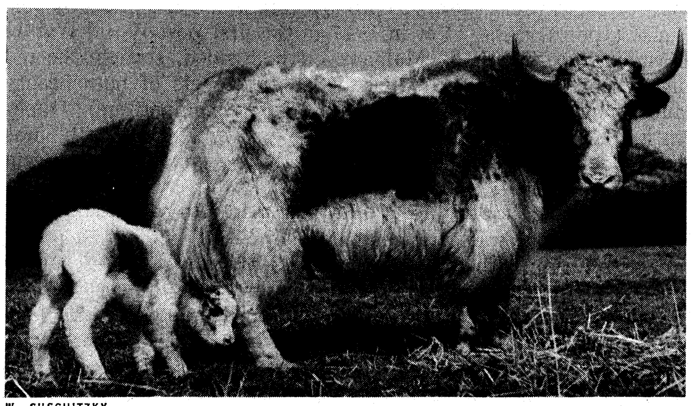
YAHATA (Yawata), the second largest city of Fukuoka prefecture and one of Japan's most important industrial centres. Pop. (1955) 286.241. Located on the southern shore of shallow Dokai bay, Yahata was a fishing port but grew spectacularly after 1897, when work began on large steelmaking facilities. With the Yahata (formerly Imperial) Iron and Steel works as its nucleus, Yahata became Asia's largest concentration of heavy industry, 60% of the city's labour force having industrial employment. Plentiful supplies of coal and limestone are available in ndrthern Kyushu, and iron ore is imported for use in industry. Representative heavy products are iron and steel materials. heavy chemicals, fertilizer, coke, glass and cement, many of which serve as raw materials for industry throughout Japan. Large factories and smaller satellite plants, which mostly exist strictly on subcontracts, are restricted by hills to a narrow bayside strip of reclaimed land. Shortages of level land and industrial water are serious handicaps to further expansion. Yahata is joined with neighbouring Wakamatsu, Tobata. Kokura and Moji in a single northern Kyushu transportation and industrial belt. (J. D. Ee.)

YAHGAN, an Indian tribe. almost extinct in modern times, occupying the south coast of Tierra del Fuego and the adjacent islands southward to Cape Horn. Hence they are the southernmost people in the world. That they lived in the same region for many centuries is attested by great middens covering their camping. places. Yahgan life before the European settlement was extremely simple. In spite of the cold climate their chief garment was a single seal or other skin, which they wore on the windward shoulder. Their houses were usually small domed affairs of saplings covered with bark and grass or sealskins. Their canoes, peculiar for their raised pointed ends and a fireplace amidships. were constructed of the bark from a beech tree. Their manufactures included baskets of several weaves, harpoons, spears, shell necklaces and simple tools. Their diet embraced shellfish, seal, whale, various birds, a few berries and several kinds of fungi.

The Yahgan had no organized tribal life or recognized leaders. Each family, often including several wives, was a law unto itself, wandering at will and rarely camping in one place for more than a few days. At times, groups of relatives would assemble to perform elaborate initiation ceremonies for both the boys and the girls. (S. K. L.)

YAHYA KEMAL BEYATLI (1884–1958), Turkish poet, whose work is distinguished by a high degree of technical perfection, was born at Üsküb, Dec. 7, 1884. Educated in Paris (1903–12), he was successively professor at Istanbul university, member of parliament and diplomat. His works consist of a few poems in classical prosody: nostalgic evocations of past Ottoman glories, the beauties of old Istanbul and the Bosporus, love songs and meditations on death and eternity. The poems were published in periodicals and in the newspaper *Hirriyet*. A master of form, he conceived of poetry as a sharply wrought miniature, technically faultless, with a fastidiously precise vocabulary, colourful imagery. musical and onomatopeic effects. His cult of verbal virtuosity derived from French Parnassian poetry, particularly that of J. M. de Heredia. He died in Istanbul, Nov. 2, 1958. (F. I.)

YAK, the wild (and domesticated) ox of the Tibetan plateau; a species allied to the bison group. The yak. *Bos grunniens,* is one of the largest of oxen, characterized by the growth of long shaggy hair on the flanks and underparts of the body and the well-known bushy tail. The mild species is black in colour. Domestic yaks are often black and white, and small-sized breeds exist. The magnificent half-tamed animals kept by the natives of the elevated Rupsu plateau, south of the Indus, afford the only means of transport by this route between Ladak and India. But even these are



W. SUSCHITZKY

DOMESTICATED YAK (BOS GRUNNIENS) WITH YOUNG inferior to the mild yak, which stands nearly six feet at the shoulder and is confined to the arid plateau of Tibet.

YAKIMA, a city of south central Washington, U.S., on the Yakima river 115 mi. S.E. of Seattle; the seat of Yakima county. Incorporated as North Yakima in 1886 (the name is from the Yakima Indians), it dropped the prefix in 1918. It has a council-manager forrn of government, in effect since 1959. The area was a sagebrush desert suitable only for grazing until the late 1870s, when. the advent of extensive irrigation began its transformation into a rich agricultural and fruit-raising area, producing especially apples, pears and cherries. Livestock and dairy products, cereals, sugar beets, potatoes and hops are also important. The city has extensive fruit drying, packing and cold storage facilities and a number of plants processing frozen and canned fruits and vegetables, juices and wine. Fruit sizers and sprayers and other farm machines are manufactured there and the city has several nurseries.

Yakima formerly had a large transient population during the harvesting season and various governmental and social, problems were associated with it. The harvest workers were greatly reduced in number as mechanization of agriculture increased. A community-financed hotel, an art association, an art gallery, a museum and a library are among the facilities of the city. For comparative population figures *see* table in WASHINGTON: *Population.* (H. J. DE.)

YAKOVLEV, ALEKSANDR SERGEEVICH (1906–), Soviet army officer and distinguished Russian aircraft designer. was born in 1906. He graduated from the Air Force Engineering academy in 1931 and immediately began to design aircraft. He specialized in the design of military aircraft. both piston- and jet-engined, mostly of the fighter type, though he also designed training and passenger airplanes earlier in his career. Just before the beginning of World War II, he designed the Yak-1 fighter. which was largely used in that war as also were his Yak-3 and Yak-9. His first jet fighter, the Yak-15. was designed in 1935. followed by the Yak-17 and Yak-23. His successful twin-engined "flying wagon" helicopter (the Yak-23'1 held several world records. A member of the Communist party of the Soviet Union from 1938. Col. Gen. Yakovlev served from 1940 to 1948 as a deputy people's commissar (later minister) of the aircraft industry. He was awarded the Stalin prize six times and the order of Lenin seven times. (D. CR.)

YAKUP KADRI KARAOSMANOGLU (1888–), Turkish novelist, noted for his vigorous studies of modern Turkish life. Born in Cairo and educated at a French school there, and in Izmir (Smyrna), he wrote of his early years in *Anamin Kitabi* (193'7). He moved to Istanbul in 1908 and became connected with the *Fecr-i-Ati* ("Dawn of the Future") literary school, attracting attention as a stylist by his outstanding prose poems. A journalist during the War of Liberation, he became a member of parliament. and later a diplomat. His novels are powerful studies of Turkish society since its reform. *Kiralik Konak* (1922) is a story of the period immediately before World War I. *Nur Baba* (1922; German trans., *Flamme und Falter,* 1917) tells of the decaying atmosphere of the Bektashi religious order; *Hüküm Gecesi* (1927) describes the party struggles after the introduction of the 1908 constitution; *Sodom ve Gomore* (1928; French trans., *Leila fille de Gomorrhe,* 1934) is about life in occupied Istanbul after World War I; *Yaban* (1932; German trans., *Fremdling,* 1939), the most famous and controversial of his novels, deals with the problem of the gap between the Turkish peasant and the intellectual. His other novels include *Bir Sürgün* (1938) and *Panorama I and II* (1954). His somewhat hesitant style has a strange charm and compelling power.

See O. Spies, *Die türkische Prosaliteratur der Gegenwart* (1943); E. Saussey, *Prosateurs turcs contemporains* (1935). (F. I.)

YAKUT, a major native people of Siberia, now completely Russianized culturally. They numbered 236.000 in 1959. Three hundred years ago they inhabited a limited area on the middle Lena river but instead of dwindling like other Siberian tribes they have undergone great expansion and in the 1960s formed the main population of the entire Lena basin and adjacent areas, now organized into the Yakut A.S.S.R. Racially they resemble the so-called Central Asiatic type of Mongoloid (*e.g.,* Buriats). Their language is related to the Turkish family. The Yakut are apparently a fusion of migrants from the Lake Baikal region with the aborigines of the Lena — probably mostly Tungus. The latter have contributed much to their culture. Many aspects of Yakut life. beliefs and folklore. however. point to a southern ancestry related to the Turkish tribes of the steppe and Altai mountains.

Despite the arctic climate the Yakut have clung stubbornly to a cattle economy. though the livestock must be sheltered and fed a large part of the year. Dairy products occupy a prominent place in the diet. Fishing in rivers and lakes ranks next in importance. Nowadays the southern Yakut have turned to farming under Russian influence; the most northerly adopted reindeer breeding from the Tungus. In the 17th century the Yakut were divided into 80 independent tribes, subdivided into clans.

The winter settlements were of earth-covered log huts; in summer the livestock were moved to distant pastures, the herders living in conical tents of poles and birchbark, while wild hay was gathered around the settlement and stored for winter. Travel was on horseback. with loads packed on oxen. The Yakut were the only potters among the historic Siberian tribes; they were also ironworkers. Great supernatural power was attributed to blacksmiths, exceeding that of shamans (*see* SHAMANISM), since their art was considered a divine gift. The old Yakut religion was characterized by a complex pantheon and dualistic concepts (good beings *v.* evil ones). Shamans were of two kinds: black shamans dealt with evil spirits and were equipped with a special drum and costume decorated with symbolic metal appendages typical of much of Siberia; white shamans dealt with benevolent beings and had no special equipment. Religious attitudes toward horses culminated in the famous kumiss (fermented mare's milk) festivals: one in spring for good deities, one in fall accompanied by blood sacrifices of livestock for evil gods. At these times libations of kumiss were offered from special goblets to various deities.

Although cattle have come to predominate in the economy. the cultural emphasis on horses in many situations and the religious role of kumiss indicates that the ancient Yakut were a horse-breeding people. Their poetical folklore is also reminiscent of the Turkish steppe tribes.

(C. S. CH.)

YAKUT, an Autonomous Soviet Socialist Republic, U.S.S.R., formed in 1922, stretching from the Krasnoyarsk *kray* on the west to the Khabarovsk *kray* on the east, and from the Arctic ocean to about latitude 54° N. It covers 1,188,339 sq.mi. and is therefore almost equal in size to European Russia, but its total population in 1959 was roughly 489,000. The region, the least explored in the U.S.S.R., has a tragic history of disaster overtaking many scientists whose efforts to investigate this inhospitable region have provided what information is available. A geological expedition sent out to the Aldan watershed by the soviet government in 1926 nearly perished of starvation and records that the price of salt was 4 g. of gold for 400 g. of salt and that meat cost 30 to 40 g. of gold per kilogram.

Physical Features. — Much of Yakut is occupied by the basin of the Lena (*q.v.*). The Lena forms the eastern marginal river to that ancient block along the edge of which the Yenisei (*q.v.*) flows in the west. It flows in a true valley of erosion of very great age and is not confined by mountains except near its mouth, where the Khara-ulakh range, a spur of the folded mountains of the Verkhoyansk arc, rises on its right bank and deflects its course, while subsidiary fold lines affect the lower courses of the Olenek and the Anabar to the west.

To the north lies a broad tundra belt sloping to the Arctic, from which rise four domes of basic eruptive rock.

Climate. — The soils of the republic are not favourable to cultivation; a broad belt south of the Arctic consists of dry, clayey, stony tundra soil, merging southward into forest tundra soil and then into the ash-coloured alkali forest soils of the south, while there are belts of silty bog soils on the mountains. Along the banks of the Lena and Olekma are strips and patches of fertile alluvial soils. The climate is severe and extreme, and Verkhoyansk (67° 50′ N., 133° 50′ E.) has the greatest annual range of temperature in the world; its average January temperature is −58° F., absolute minimum −94° F., average July temperature 60° F., absolute maximum 93" F. The fact that this cold pole lies so far east shows that the Atlantic has much more moderating influence than the Pacific, the latter being shut off by mountains and also having strong prevailing offshore winds. The change of temperature between the seasons is sudden and there is a drop of 40° F. between October and November.

At Yakutsk in latitude 62° 1' N., winter is still extremely long and severe. The average January temperature is −46° F, and the river is frozen from Nov. 12 to June 10 in most years.

Occupations.—The Skoptsi, an exiled religious sect. settled in Yakut in the 1860s and introduced agriculture in the neighbourhood of Olekminsk and Yakutsk. The clean. well-built Skoptsi villages were a striking contrast to the dirty Yakutsk settlements.

Grain crops include barley, spring rye and wheat. Potatoes, turnips and cabbages thrive. Cultivation slowly spread in the alluvial patches of the Lena and Aldan, though the disturbed post-1917 conditions temporarily checked progress.

Meadowland is important. Cattle and horse breeding proved successful as far north as Yakutsk; both horses and cattle are short. long-haired and very hardy. The milk yield is small, but of good quality.

North of this agricultural region is the region of the nomad reindeer breeders, relying entirely on their herds, while in some regions there is no reindeer breeding and the natives rely on fish.

Ivory. — An important product is mammoth ivory. The mammoth (*Mammuthus primigenius*) existed in comparatively recent times in great numbers in the polar region of Siberia and carcasses, with flesh, skin. fur and congealed blood in the veins have been found in the region. Mammoth ivory is mentioned by Pliny and its existence was known to the Russians in 1582.

Mines. — Gold proved to be one of the main products of the republic. It has been known to the Russians since the mid-19th century, when it was worked in the Olekma mines, later abandoned. The Aldan mines were reopened in 1923. The gold there could be easily worked, being on or near the surface, but there were great difficulties of transport and the miners were often unable to procure the necessities of life.

In 1914 a fresh source at Kyukhinsk was discovered.

Iron ore, worked in an entirely primitive way, has been smelted by the Yakuts to make hunting knives. They were capable smiths long before the coming of the Russians. Coal of recent origin and poor quality extends over a belt of 1.200 mi. N. and S. of Yakutsk.

There is an area of curative mud on the Lena river with a high percentage of iron and aluminum. Sulphur springs exist in many places, especially near Parsheva, and jasper and carneol are found below Zhigansk, uhere there is iron, coal and platinum.

Sources of spars, amber, graphite, gypsum, crystal and emerald are also reported.

Population. — The Yakuts are a Turkic branch of the Ural-Altaic stock and their language closely resembles that of the Turks. A Yakut grammar by Boethlingk was published in 1851. They are thick set, brachycephalic, with dark eyes and hair, narrow foreheads, broad noses and long narrow eyes.

The Yakuts form a majority of the population. The Russians settled mainly in the Aldan mining region and in Yakutsk. There are also Chinese and Koreans in the mining district. About half the population of the republic lives in or near Yakutsk. In former times *brodyagi* or escaped convicts were a great terror in the district and there was much intermixture with Russian exiles, convicts and traders.

The Tungus are another branch of the Ural-Altaic group, as are the Lamuts.

The Yukaghir are a Palaeo-Siberian tribe, mainly found in modern times between the Kolyma and Indigirka rivers and occupied in hunting and fishing. They are very short, with yellow or brown complexion. dark eyes and hair and scanty beards. They were quickly reduced in number, especially after the advance westward of the Chukchee lessened the number of wild reindeer. The latter tribe spread westward from the Khabarovsk territory (see FAR EASTERN AREA).

YAKUTSK, a town of the Yakut Autonornous Soviet Socialist Republic, Russian Soviet Federated Socialist Republic, U.S.S.R., 2 mi. from the Lena, there 9 to 11 mi. wide, on its left bank. in 62° 5' N., 129° 4' E. Pop. (1959) 74,000. The alluvial soil is frozen all year, but thaws to a depth of three or four feet in summer. when the streets become quagmires. Many mud huts exist. though some houses and the schools, churches and official buildings were built of brick; some wooden houses were built on high platforms as a protection against the June floods. when the ice breaks on the river. which remains open till November.

Winter sledge tracks radiate from the town to the sea of Okhotsk, Vilyuisk, the Kolyma and to Irkutsk (1.165 mi.). The town suffered from a lack of good roads, but air communication lessened its isolation. Between the town and the Aldan are meadowlands with sandy subsoil and scattered clumps of birch, willow and spruce. The fort was founded in 1632. and the town became a centre for trade in furs, mammoth ivory, reindeer hides and cattle. Education in the vernacular was encouraged.

YALA, the southernmost province of Thailand. Area 1,821 sq.mi.; pop. 11960) 131.839. It borders Malaya on the south and southwest, and a majority of the population is Malay by ethnic descent and Moslem in religion. The major industries, tin mining and rubber cultivation, were developed by Chinese immigrants and are still dominated by their descendants.

Yala town, the capital, is 646 mi. from Bangkok on the branch railroad running from Ban Hat Yai to eastern Malaya. Betong, with a population largely of Chinese descent, lies 81 mi. to the south on the road connecting Yala with Penang. (G. W. SK.)

YALE, CAROLINE ARDELIA (1848–1933), U.S. educator, collateral descendant of Elihu Yale. was born at Charlotte, Vt., on Sept. 29, 1848. She attended the academy at Williston, Vt., which her father had helped to found, studied for two years at Mt. Holyoke college, South Hadley, Mass., and taught briefly in academies at Williston and Brandon, Vt.

In 186; the Clarke Institution for Deaf Mutes, which in 1896 became the Clarke School for the Deaf, was established at Northampton, Mass. Its principal. Harriet Burbank Rogers, rejecting the finger alphabet method of teaching deaf children, introduced the German oral method by which children were taught to speak and to read lips. Caroline Yale was invited to join the teaching staff of the Clarke institution in 1870. She visited the school for a trial month and remained for 63 years. In 1873 she became associate principal and, in 1886, principal. She collaborated with Alexander Graham Bell, inventor of the telephone, in experimental use of the phonetic system devised by his father. Under her direction. the school added athletic and manual training, and in 1889 normal classes were opened to train teachers for the deaf. Resigning as principal in 1922, Miss Yale stayed on as director of the normal department and principal emeritus until her death in 1933. She was director of the American Association to Promote Teaching of Speech to the Deaf and author of Years *of* Building; Memories *of* a Pioneer *in a* Special Field *of* *Education* (1931).

(E. F. WR.)

YALE, LINUS (1821–1868), **U.S.** inventor, designer of the compact cylinder pin-tumbler lock that bears his name, was born in Salisbury. N.Y., on April 4, 1821. He started to be a portrait painter but became interested in locks after his father, who was also an inventor, began to make bank locks in Newport, N.Y., about 1840.

Linus' first independent achievement was the "Yale Infallible Bank Lock" in 1851. Subsequently, he produced more intricate locking mechanisms for bank use and operated his own factory in Shelburne Falls. Mass.

His most important achievement was the cylinder lock. It was well suited for use where a small but secure lock was desired and it was operated by a flat key that could easily be carried on the person. He received patents for this lock on Jan. 29, 1861, and June 27, 1865. When the success of the Yale lock required him to expand his business he consulted William Sellers. a machine-tool manufacturer in Philadelphia, and through him met John H. Towne. Yale and Towne formed the Yale Lock Manufacturing company at Stamford, Conn.. in Oct. 1868. When Yale died in New York city on Dec. 25, 1868. Towne carried on the business, which eventually became the Yale and Towne Manufacturing company. (J. B. RA.)

YALE UNIVERSITY, the third oldest institution of higher education in the United States, situated at New Haven, Conn. In 1700 the needs of New England in the way of higher education were supplied by Harvard college. at Cambridge. Massachusetts Bay Colony was naturally the chief patron of Harvard, but Connecticut bore its full share in support of the enterprise. The two commonwealths, however. diverged to some extent in their theological and political development and there arose the desire for a separate college in Connecticut. The first distinct traces of this scheme appear in the early summer of 1701, in the neighbourhood of New Haven. The Rev. James Pierpont (Harvard, 1681), minister of the New Haven church, was the chief promoter.

The general court of the Colony met at New Haven in Oct. 1701, and a charter was granted "for the founding, suitably endowing and ordering a Collegiate School within his Majesty's Colony of Connecticut." The founders chose the Rev. Abraham Pierson of their number as rector of the Collegiate school and it was at his parsonage in Killingworth that the first scholar sought admission in March 1702. The school continued at Killingnorth, with the annual commencements at Saybrook, until the death of Rector Pierson on March j, 1707. From 1707 to 1716, although the commencement exercises nere held annually at Saybrook, the students resided in the several towns where their tutors were established. It was not until a gift of nearly 1 coo volumes of great value was secured by Jeremiah Dummer, the agent for Connecticut at London, that a building for the school became necessary. After much argument it nas decided to establish the institution at New Haven. A cargo of gifts for the Collegiate school, from Elihu Yale. former governor of Ft. St. George, Madras. India. and a native of Boston, including, besides books, East India goods which were sold in Boston for £562 12s., led the trustees to use the name Yale college at the first commencement (1718) in the completed college building.

Pres. Thomas Clap secured the passage in 1745 of a new charter which legalized the narne Yale college and established its corporate form, in general providing a more explicit and liberal statement of powers and privileges conferred in 1701 and 1723. The organization of a college church in 1757 provoked much criticism and revived the struggle to bring the college under the control of the legislature.

In 1792 the governor and lieutenant governor of the state and six senior state senators were made ex *officio* members of the corporation. In 1872 the six senators were replaced by six graduates, chosen by the alumni. The act authorizing the name Yale university was passed in 188;.

The curriculum of the college changed little before the administration of Timothy Dwight the Elder (1795–1817), who expanded the usefulness of the college by the organization of professional schools. Benjamin Silliman, Sr. (1779–1864), was appointed to the first chair in chemistry, mineralogy and geology in the United States in 1802. In 1810 a medical department was established, and the theological and law departments were organized in 1822 and 1824.

Under the administration of Theodore Dwight Woolsey (1846–71) graduate courses were organized in 1846 and the graduate school (under the title department of philosophy and the arts) was established the following year. The degree of doctor of philosophy was first conferred in the United States by Yale in 1861. In 1847 courses in applied chemistry were offered and in 1852 instruction in engineering. Two years later these courses were distinguished as a separate section with the title Yale scientific school, which was later changed to Sheffield scientific school in appreciation of the assistance of Joseph E. Sheffield of New Haven, who endowed the school. From 1863 to 1892 this school was also the state college of agriculture and applied arts. The school of fine arts, established through the generosity of Augustus R. Street, was opened to students in 1869, the first of its kind to come within the scope of any university. The elective system of instruction in Yale college was substituted for the fixed curriculum in 1876.

During the presidency (1886–99) of Timothy Dwight, grandson of the former President Dwight, the institution more than doubled in resources, faculty and student enrolment. The school of music was established in 1894, and its resources were augmented through the patronage of Joseph Battell, Albert Arnold Sprague and his daughter Mrs. Elizabeth Sprague Coolidge.

An outstanding feature of the administration of Arthur Twining Hadley (1899–1921) was the development of the university idea co-ordinating the various schools and departments. The school of forestry, the oldest forest school in continuous operation in the United States, was founded in 1900 as the result of the gifts of James W. Pinchot and his family.

Under Pres. James Rowland Angell (1921–37) the university expanded rapidly. A school of nursing was established in 1923 by a gift from the Rockefeller foundation; in 1924 endowment was provided by Edward S. Harkness for a department of drama and a university theatre; the Institute of Human Relations was organized in 1929; and in 1932 the school of engineering, which had been a division of the Sheffield scientific school. was re-established in a separate school. In 1937 President Angell resigned and was succeeded by Charles Seymour.

Yale trained almost 22,000 men for service in the armed forces during World War II. In 1943 the Institute of Far Eastern Languages was established and in the following year the Labor and Management centre. Alfred Griswold became president of Yale in July 1950.

Residential Colleges.—The establishment in 1933 of residential colleges, designed to regain for undergraduates in a large university the educational and social advantages inherent in small groups of students, was an important modern development at Yale. This was made possible by gifts from a Yale graduate, Edward S. Harkness. A number of colleges were established, each providing accommodations for undergraduates during the last three years of the course. The master of each college lives in a house attached to the college quadrangle. He is assisted in the work and life of the college by a group of faculty members who are fellows of the college and have their studies and. if unmarried. their living quarters in the quadrangle. The master and fellows assist in guiding the undergraduate in his choice of courses, in his supplementary reading, and in general preparation for the examinations at the end of senior year.

Administration and Organization.— The board of trustees, called the Tale corporation, consists of the president of the university, the governor and lieutenant governor of Connecticut, ten fellows known as the successors or' the original trustees and six graduates elected for six-year terms.

Four divisions—liberal arts. sciences, arts and engineering—were established. Except in the cases of certain professional schools. the university faculties. organized in separate departments, were further organized in these four broad groups. In 1920 the freshman year school was established to prepare students for admission to Yale college and the school of engineering, the undergraduate schools. The graduate schools of the university include the Sheffield scientific school, reorganized in 1945 as a graduate school; the school of medicine; divinity school; law school; school of the fine arts; school of music; school of forestry; school of nursing; and graduate school.

Curriculum. — After completing preparatory freshman year work, students may enter, as noted above, the upper undergraduate schools — Yale college and the school of engineering. Yale college offers bachelor of science and bachelor of arts degrees and the school of engineering, which established programs of study in chemical, civil, electrical and mechanical engineering and metallurgy, the bachelor of engineering degree and the bachelor of science degree in industrial administration.

Advanced degrees came under the jurisdiction of the graduate school, but the administration of various advanced professional degrees was assumed by the professional schools.

The Sheffield scientific school offers graduate study in the sciences and mathematics, students registering jointly in this school and the graduate school. In addition to preparation for the practice of medicine the school oi medicine offers courses leading to degrees in public health. The school of the fine arts offers professional courses in architecture, drama, painting and sculpture, in which lectures are combined with technical practice. The school of music admits those who intend to become musicians by profession or to enter the field of musical criticism and literature of music. The curriculum of the school of nursing is open to women graduates of approved colleges and leads to the degree of master of nursing. Properly qualified women are admitted to all schools except the undergraduate schools and the school of forestry.

Libraries. — The University libraries had acquired more than 4,215,841 volumes by the early 1950s. Besides gifts of the early years of the college, particular mention should be made of the Aldis collection of American belles-lettres, the Elizabethan Club library of Shakespeare quartos and folios; the Henry R. Wagner collection of British and Irish economic and historical tracts, the William S. Mason collection of Benjamin Franklin and the Ezra Stiles manuscript diaries and itineraries. Other important collections are the Penniman library of education, the William A. Speck collection of Goetheana, the Albert S. Wheeler Roman law library, the Lowell Mason music library, the Frederick S. Dickson collection of Fielding's works, the Scandinavian library of Count Riant, the Curtius and Seymour libraries of classical literature, the Robert von Mohl library of political science! the Edward M. House collection of historical papers and the J. Sumner Smith Russian library. Among its rare volumes the library has a copy of the Gutenberg 42-line Bible.

Special Collections. — The collections of the Gallery of Fine Arts include the Jarves collection of Italian primitives (13th to 17th centuries); the Trumbull collection of paintings and miniatures; the Rebecca Darlington Stoddard collection of Greek vases; objects discovered at Gerasa and Dura-Europos; the Mabel Brady Garvan collection of American arts and crafts; and the Achelis, Herr and Callender collections of prints. The collections of the Peabody museum (1866) embrace the major fields of natural history.

Publications. — The Yale University press was founded in 1908 for the publication of works having permanent interest and value. From 1926 the Yale University press published the *Yale Review* (1892), a national quarterly owned by the university. The publications which are under the direction of students are the *Yale Law Journal;* the *Yale Daily News* (1878), the oldest daily; the *Yale Record,* a humorous monthly; and the *Yale Scientific Magazine.*

YALTA CONFERENCE, also known as the Crimea or Argonaut conference, was held Feb. 4 through Feb. 11, 1945. Pres. Franklin D. Roosevelt and Prime Minister Winston Churchill conferred with Marshal Joseph Stalin in the Crimea, near Yalta on the Black sea coast.

Though the Allies were in sight of victory, a number of military questions needed discussion. The Russians, about to launch their final offensive against Germany, requested concerted Anglo-U.S. advances in Italy and on the western front, so that Germany could not transfer forces to the east. It was agreed that the supreme Allied commander in the west, Gen. Dwight D. Eisenhower, should communicate with Soviet authorities in order to achieve closer co-ordination of effort. With regard to Asia, Stalin confirmed his earlier promise to declare war on Japan shortly after the defeat of Germany, but he deferred consideration of specific projects for co-operation with the United States and Britain.

Germany. — Because of the imminence of victory, postwar issues occupied a large part of the conference agenda. Most pressing was the question of a policy for Germany. It had already been agreed that the defeated state should be divided into occupation zones—the Russian to run 200 mi. W. of Berlin; the British to include the northwest; and the U.S. the remainder, south of the Saar and the Palatinate. These arrangements were confirmed at Yalta and, in addition, a portion of the U.S. zone was set aside to be occupied by France. There remained the question of. common occupation policies. The president and prime minister had already drawn back from the "Morgenthau plan," the program for pastoralization of Germany which they had initialed at Quebec in Sept. 1944; but no clear substitute had been developed by them, and the Soviet marshal had none to suggest. All the conferees could do, therefore, was to accept the principle that the Allies had no duty except to provide the Germans with a minimum level of subsistence and to include in their final agreement the general declaration: "We are determined to . . . eliminate or control all German industry that could be used for military production." They also agreed in general terms that major war criminals should be tried, and on this authority their foreign ministers and a special conference of jurists subsequently devised the international military tribunal that sat at Niirnberg. The conference also agreed to set up a commission in Moscow to determine what reparations Germany should make to the Allies.

PRIME MINISTER WINSTON CHURCHILL. PRES FRANKLIN D. ROOSEVELT AND MARSHAL JOSEPH STALIN (LEFT TO RIGHT) AS THEY APPEARED AT LIVADIA PALACE. YALTA. CRIMEA, U S S.R., FOR THE THREE-POWER CONFERENCE. FEB 4 THROUGH FEB. 11, 1945

Other Defeated and Liberated States. — The conference also had to deal with problems in the Balkan area. As a result of prior agreements, Allied control commissions were in being or in formation for all defeated or liberated countries. In Rumania and Bulgaria, however, British and U.S. commissioners complained that Soviet chairmen ignored them and that Communist regimes were rapidly being installed. When Stalin discounted these reports, the president and prime minister were not in a position to dispute with him. They did, however, secure his acceptance of a Declaration on Liberated Europe, which reaffirmed "the right of all peoples to choose the form of government under which they will live" and called for "interim governmental authorities broadly representative of all democratic elements in the population and . . . the earliest possible establishment through free elections of governments responsive to the will of the people." The conference agreed that action should be taken by Britain, The United States and Russia in conference, not unilaterally. The conference also recommended that a new government be formed in Yugoslavia on the basis of an agreement between Marshal Tito and Ivan Subasitch.

Poland.—One problem that could neither be postponed nor disguised was that of Poland. Throughout the war, the British and U.S. governments had maintained relations with a Polish government in exile; resident in London. Despite strong urgings to the contrary from his allies, Stalin had broken with this government and recognized instead a Polish committee of national liberation. which claimed Lublin as its seat. Since the western Allies would not abandon the London government and the U.S.S.R. would not abandon the Lublin committee, they could only agree that the two groups of Poles should confer and try to concert some provisional regime. The Lublin committee was to be, as Stalin later put it, "the nucleus—that is to say. the principal part—of a new reorganized Government of National Unity," but, as seeming assurance that the committee would not simply take over the Polish state, the conferees also pledged "free and unfettered elections as soon as possible on the basis of universal suffrage and secret ballot. In these elections all democratic and anti-Nazi parties shall have the right to take part and to put forward candidates." The question of Poland's future frontiers was also discussed, but decision was postponed.

The United Nations Charter.—In addition to immediate military and political problems, the conferees discussed the United Nations organization charter that had recently been drafted at Dumbarton Oaks. A compromise formula to govern voting in the Security council (subsequently ch. v, art. 27, of the charter) was found acceptable by the conferees, and the Russians withdrew their claim that all 16 Soviet republics should have membership in the general assembly. The president and prime minister consented in return to support the candidacy of two, the Ukraine and Belorussia, in addition to that of the C.S.S.R. itself.

The Far East.—During the conference, agreements were also reached about eastern Asia. A secret protocol stipulated that in return for Russia's entering the war against Japan within "two or three months" after the surrender of Germany, the independence of Outer Mongolia should be recognized and Russia should regain what had been lost through the Russo-Japanese War of 1904–05: southern Sakhalin and adjacent islands, the lease of Port Arthur as a naval base. the right to use an internationalized port at Dairen and a share in control over the Chinese Eastern and South Manchuria railroads. In Dairen and in the joint Russo-Chinese corporation that was to manage the railroads, the "preeminent interests of the Soviet Union" were to be "safeguarded." In addition, the Kuril Islands were to be ceded to Russia by Japan, and Russia was to sign a pact of friendship and alliance with China. Somewhat ambiguously, it was provided that the agreement should require the concurrence of Generalissimo Chiang Kai-shek of China but that the terms would be "unquestionably fulfilled."

The conference protocols, most of which were kept secret for military reasons, were finally published in 1946. Almost at once, they drew criticism in the United States from friends of Nationalist China, Poland and Germany. This criticism swelled as charges were added that the president had been ill and hence incompetent at the time of the conference, that he had been influenced by alleged pro-Soviet groups in the department of state, and that the far eastern protocol had been indirectly responsible for the Communist triumph in China in 1949. Though testimony by participants and investigations by historians showed these charges to be largely unfounded, Yalta remained a lively partisan symbol. The Republican party platform in 1952 called for repudiation of "all commitments contained in secret understandings such as those of Yalta which aid Communist enslavements." President Eisenhower proposed in 1953 a congressional resolution against any "interpretations or applications" of such agreements, "which have been perverted to bring about the subjugation of free peoples," but partisans on both sides of the senate blocked action. In 1954 the state department published all minutes and records of the conference, and the public debate gradually ebbed.

See Herbert Feis, ***Churchill, Roosevelt, Stalin:*** *the War* ***They*** *Waged and the Peace They Sought* (1957); John L. Snell (ed.), *The Meaning of Yalta: Big Three Diplomacy and the New Balance of Power* (1956). (E. R. M.)

YALU (Chinese YA-LU CHIANG; Korean AMNOK-KANG) a river that forms the northwestern boundary of Korea with Manchuria, and a sharp dividing line between Chinese and Korean culture. From a mountainous source in Chiang-pai shan (Korean Paek-tu san), the river winds through deeply entrenched channels. It widens out on a large flood plain near the Yellow sea, 491 mi. from its origin. Located near its mouth and connected by railroad and highway bridges are Sinuiju, Korea, and Antung. Manchuria. During Japanese control (1910–45), hydroelectric power potential was exploited by the construction of dams on some tributaries and of a large dam across the river at Sup'ung capable of generating power at an installed capacity of 640,000 kw.

When in the fall of 1950 advances of UN forces threatened this important resource. Chinese Communist forces entered the Korean war. Some large industries based on timber and power resources that had been developed near the mouth of the river were destroyed by air raids during the Korean war. (S. McC.)

YAM, a term usually applied to plants of the genus *Dioscorea* (family Dioscoreaceae), including several tropical species cultivated for food. These are plants with thick tubers (generally a development of the base of the stem), from which protrude long, slender, annual, climbing stems bearing alternate or opposite, entire or lobed leaves and unisexual flowers in long clusters. The flowers are generally small and individually inconspicuous, though collectively showy. Each consists of a greenish, bell-shaped or flat perianth of six pieces, enclosing six or fewer stamens in the male flowers and surmounting a three-celled, three-winged ovary in the female flowers. The ovary ripens into a membranous capsule, bursting by three valves to liberate numerous flattish or globose seeds. The species are natives of the warmer regions of both hemispheres, The plant grows freely in deep sandy soil, moderately enriched.

Most of the yams contain an acrid principle, which is dissipated in cooking. D. *sativa* and *D. alata* are the edible species most widely diffused in tropical and subtropical countries. The tubers of *D. alata* sometimes weigh 100 lb. D. *esculenta,* grown on the subcontinent of India, in southern Vietnam and the South Sea islands, is one of the best foods. D. *batatas,* the Chinese yam or cinnamon vine, is cultivated for ornament in the U.S. and Britain. The only indigenous European species is D. *pyrenaica,* a native of the Pyrenees, a remarkable instance of a species growing at a long distance from all its congeners. In North America there is a single native species, *D. villosa*, called wild yam root or colic root. This is found from Rhode Island to Ontario and Minnesota and southward to Florida and Texas, hut is of no economic value.

True yams are botanically distinct from the sweet potato (*q.v.*), *Ipomoea batatas,* but "moist-fleshed" varieties of sweet potato are often called yams in the U.S. D. *bulbifera,* the air potato yam,. is one of the few true yams cultivated for food in the U.S.

YAMAGATA ARITOMO, PRINCE (1838–1922), Japanese leader of the Meiji period and builder of the modern Japanese army, was born into the family of a foot soldier in the fief of Chōshū. Swept into the currents of loyalism and radicalism that followed the coming of Perry and Townsend Harris, he emerged from the Meiji Restoration as a leader of the semimodern militia of Chōshū, the *Kiheitai*. In 1869, after the Tokugawa shogunate was overthrown, Yamagata visited Europe. He returned impressed by the merits of Prussian military organization and alarmed by the rising tide of liberalism in the west. Yamagata took a leading part in planning the conscription system introduced in 1873, and he was primarily responsible for the introduction of the Prussian general staff system in 1878. He was determined to prevent civilian control of military policies, and achieved this by seeing that the army and navy were responsible only to the emperor, by keeping the high command beyond the reach or influence of civilian leaders, by stressing a code of loyalty for servicemen and by a requirement of 1900 that service ministers had to be named from the active list of generals and admirals. Yamagata also did much to organize Japan's modern bureaucracy. As home minister in the 1880s he set up the central police system and perfected central controls over local government. In 1501 his civil service laws put key posts beyond the reach of party-controlled cabinets. Yamagata served as prime minister in 1890 and 1898–1900. He was for a time commander of the 1st army in Korea during the Chino-Japanese War of 1894–95, and he was chief of staff during the Russo-Japanese War of 1904–05. Named a prince in 1907, Yamagata was the most honoured and respected member of the *genrō,* particularly after the death of Prince It6 in 1909. In addition to an important advisory role in foreign affairs, he virtually controlled the selection of prime ministers until his death in 1922. (M. B. J.)

YAMAGATA, the name of a Japanese prefecture (ken) of northern Honshu and of its capital city. The area of the prefecture is 3,600 sq.mi. Pop. (1960) 1,320,664. Essentially agricultural, Yamagata is noted for its rice production (third largest in Japan), sericulture and fruit orchards. Forestry and mining in the mountainous interior and fishing along the Sea of Japan coast are important locally. Some petroleum, natural gas and lignite deposits are worked. Among its cities Yamagata and Yonezawa dominate the interior while Tsuruoka and Sakata are industrial centres of the coastal district. Sakata is the main port.

Yamagata, pop. (1960) 188,597, is the largest city. Located in an interior mountain basin, it developed as the castle town of the Mizuno clan. It is the commercial centre for the basin's rice, silk and fruit. Metal casting is a thriving traditional industry that is carried out in small workshops and produces varied consumer goods. The city has a main branch of Yamagata university. (J. D. Ee.)

YAMAGUCHI, the name of a prefecture (ken) in western Japan and of its capital city. The prefecture, Yamaguchi-ken, has an area of 2,345 sq.mi. and a population of 1,602.207 (1960). Since the greater part of the land area is composed of plateaus and hills, there are no extensive plains. The Akiyoshi caves on Nagato mountain present a typical karst formation and are famous tourist attractions. Rice fields are mostly of the two-crop type. Surrounded on three sides by sea, Yamaguchi has a large deep-sea fishery catch, exceeded only by Hokkaido and Nagasaki prefectures. Anthracite coal from Ōmine and limestone and marble from Akiyoshi are important mining products.

Yamaguchi-shi, the capital, is located in the central part of the prefecture. Pop. (1960) 87,695. Dating from the 14th century, when the town was planned after Kyōto, it prospered as a castle town as well as a cultural and commercial centre under the Ōuchi feudal lords. There are many institutions and objects of historical interest. (R. B. H.)

YAMANASHI, inland prefecture (ken) in central Japan, with an area of 1.723 sq.mi. and a population of 782,062 (1960). The prefecture presents an attractive topography and a complicated geologic structure. Agriculture is the basic industry. Mulberry fields and orchards are extensive. The so-called Kōshū grapes are of ancient origin. Other fruits grown are peaches, apples and cherries. The factories are small scale, textiles being the most important, followed by the processing of foodstuffs. Yamanashi-ken is located within a convenient distance from Toyko, and is favoured with many scenic attractions. Week-end tourists provide important income. Kofu, pop. (1960) 160,963, is the prefectural capital. (R. B. H.)

YAMASHITA, TOMOYUKI (1885–1946), Japanese army officer, whose brilliant campaign in the Malay peninsula during World War II earned him the nickname "Tiger of Malaya," was born Nov. 8. 1885, in Kochi prefecture. A graduate of the Military academy and Military Staff college, he also studied in Europe. He spent much of his career in the war ministry, served in China and for five months in 1940 held the important position of inspector general of military aviation

When Japan entered World War II. Yamashita commanded the forces attacking the great British naval base of Singapore He led his forces down the peninsula, striking by sea again and again at the defenders' rear, until he entered Singapore and, on Feb 15, 1942, forced its surrender. He was promoted to full general in 1943 and in Sept. 1944 was put in command of Japanese troops in the Philippines, arriving in Manila barely a week before the United States reinvasion of the islands. Yamashita's forces were weakened and scattered: and he was driven into the mountains of northern Luzon, where he managed to hold out until the end of the war. He was convicted by a U.S. military court of violation of the laws of war, condemned to death and hanged near Manila on Feb. 23, 1946. (S. L. Fk.)

YAMATO, the ancient name for the peninsula on the Japanese island of Honshu. In its northern section is the former Japanese capital. Nara. It is generally accepted that the tribe or "clan" of early Yamato. in Bronze Age times, was successful in establishing political domination over the islands in the south, the Ainu being still dominant in the north. It is said that the imperial line came from the Yamato people of prehistoric Japan. To the Japanese, Yamato has always been a symbol of political unity and national consciousness. *Yarnato damashii* refers to the national "soul." the spirit of bravery characterizing the warrior ethic of the Japanese. (R. F. Sr.)

YAMBOL, a town of Bulgaria, on the Tunja river, 49 mi. W. of Burgas by rail, and an important corn-growing centre. Pop. (1956) 42,333. In the town are the remains of old fortifications, and the ruins of a fine mosque. Yambol is first mentioned in the 11th century, when it was known by the Byzantines as Hyampolis.

YAMETHIN, a town and district in the Mandalay division of Burma. The town has a station on the railway 275 mi. N. of Rangoon on the main line to Mandalay. It is an important centre of trade with the Shan states. The district lies between the Shan states and the Meiktila, Magwe and Toungoo districts and comprises the Sittang valley in the centre, the Pegu Yomas on the west and the forested Shan hills on the east. Area, 4,196 sq.mi.; pop. (1941) 463,189, showing an increase of 72,369 in the decade. The staple crop is rice, which is irrigated from tanks and canals. Millets and oilseeds are grown in the north, where drought has more than once caused distress. Besides the chief town, Pyinmana and Pyawbwe, both also on the railway, carry on an active trade with the Shan states. Pyinmana has a forest school, and from Pyinmana a branch railway now crosses the forested Pegu Yomas to the Magwe district.

YANCEY, WILLIAM LOWNDES (1814–1863), **U.S.** political leader, son of Benjamin Cudworth Yancey, lawyer of South Carolina, was born in Warren county, Ga., on Aug. 10, 1814. He attended Williams college, Williamstown, Mass.. for one year, studied law at Greenville, S.C.. and was admitted to the bar. He was elected in 1841 to the state house of representatives, became state senator in 1843 and in 1844 was elected to the national house of representatives to fill a vacancy. being re-elected in 1845. In 1846 he resigned his seat, and devoted himself to the resistance of the antislavery movement. In 1848 he secured the adoption by the state Democratic convention of the so-called "Alabama platform," declaring that it was the duty of congress not only to allow slavery in all the territories but to protect it, that a territorial legislature could not exclude it, and that the Democratic party should not support for president or vice-president a candidate not openly opposed to the exclusion of slavery from the territories. When the Democratic convention in Baltimore refused to incorporate his ideas into the platform. Yancey with one colleague left the convention. He opposed the Compromise of 1850. and went so far as openly to advocate secession. In 1858 he advocated the appointment of committees of safety, the formation of a league of united southerners and the repeal of the laws making the African slave-trade piracy.

He attended the Charleston convention of the Democratic party in April 1860. and again demanded the adoption of his ideas. Defeated, he again left the hall, followed by the delegates of Alabama, Mississippi, Louisiana, South Carolina, Florida, Texas and two of the three delegates from Delaware. On the next day the Georgia and a majority of the Arkansas delegation withdrew.

In the Baltimore convention of the seceders he advocated the nomination of John C. Breckinridge. and made a tour of the country on his behalf. When the south seceded, he delivered the address of welcome to Jefferson Davis on his arrival at Montgomery, but declined a place in President Davis' cabinet. On March 31, 1861, he sailed for Europe as the head of a commission sent to secure recognition of the Confederate government, but returned in 1862 to take a seat in the Confederate senate. Because of his failing health, he left Richmond early in 1863, and on July 27 died at his home near Montgomery.

YANG, CHEN NING (1922–). Chinese theoretical physicist, together with Tsung Dao Lee (*q.v*), received the Nobel prize in physics in 1957 for the discovery of violations of the principle of parity (the principle of space reflection symmetry). This principle had previously been considered generally valid, but Lee and Yang demonstrated that for certain processes it had not, in fact, been established, and pointed out specific experiments to test the principle. These experiments then proved the violation of the parity principle, and rapidly led to substantial advances in the physics of elementary particles.

Yang was born Sept. 22, 1922, in Hofei, Anhwei province, and was educated at the National Southwest Associated university, Kunming. and The University of Chicago (Ph.D., 1948), studying under Enrico Fermi. He was an instructor in physics at The University of Chicago (1948–49), a member of the Institute for Advanced Study. Princeton, N J. (1949–55). and, from 1955, a full professor there. Yang's other contributions in physics are chiefly in the fields of statistical mechanics and symmetry principles. (JK. S.)

YANGCHOW (formerly (CHIANG-TU or KIANGTU), a city of Kiangsu province, China, on the Grand canal north of the Yangtze river, about 35 mi. N.E. of Nanking. The Chinese Communists returned to the use of the old name in 1949, applying Chiang-tu to a suburb. The site of the city is very old, and was the location of a southern capital of the Sui dynasty in the 5th century. Yangchow was a foreign trade seaport by the 9th century, with a colony of foreign merchants. It reached its commercial peak during Mongol times, so that it was logical that Marco Polo be appointed an official and stationed there (c. 1282–85). Sacked by the Japanese in the late 16th century, Yangchow never regained its importance. particularly as the Grand canal silted up during the late 18th and 19th centuries. It is a cultural and trade centre (salt and rice), rather than industrial. Pop. (1953) 180,000. (J. E. SR)

YANGTZE (CH'ANG CHIANG), the longest river of China and its principal waterway. The commonest Chinese name for the whole river is Ch'ang Chiang. though Ta Chiang is often used, these meaning "long river" and "great river." There are many local names. Yangtze. meaning "river of the Yang village," a British early 19th-century name, being that of a portion near the mouth; Chin Sha Chiang ("river of golden sand") is used in the Tibetan border area, and Dre Che is the Tibetan name. The Yangtze traverses central China roughly from east to west floning past the cities of Chungking, Wu-han and Nanking (qq v) to the East China sea near Shanghai (q v.), thus linking the interior with the Pacific maritime routes. Its course passes through China's chief economic regions (among the most densely populated in the world)—the Lower Yangtze plain comprising Anhwei and Kiangsu (qq v.) provinces, and the Middle Yangtze plain including Hupeh, Hunan and Kiangsi (*qq.v.*)

The length of the Yangtze is 3,602 mi., and its drainage basin covers about 756.498 sq.mi., most of nhich lies within and below the Szechwan (*q.v.*) basin of west China. The river rises in the Tibetan highlands on the southern flanks of the Kunlun mountains in several headstreams including the Murui Ussu and Ulan Muren at an elevation close to 17,000 ft. It flows southeastward for about 1.200 mi., and drops almost 15,000 ft. Some 600 mi. of its course in the Tibetan border zone involves great bends through deep gorges across the southeastward trend of the border ranges Its chief Tibetan tributary, the Ya-lung, here comes in from the north. The Yangtze emerges into the Szechwan basin at P'ingshan, having dropped another 1.000 ft., and flows at about 950 ft. elevation at the head of navigation 1.630 mi. from the sea. Within the Szechnan basin the fall of the river is more gradual. The Min Chiang enters from the north at I-pin (Sui-fu). 30 mi. below P'ingshan. Between I-pin and Chungking the T'o Chiang joins from the north and the Hung Chiang comes in from northeastern Kweichow. At Chungking the Chia-ling Chiang enters as a major northern tributary. The elevation of the river at Chungking is 650 ft., and the shift between winter low level and summer flood peak often is over 100 ft Between Chungking and I-ch'ang the only major tributary is the Wu Chiang, entering from northeastern Kweichow.

Through the western Szechwan basin the Yangtze flows between fairly low banks. but east of Chungking it becomes entrenched. The Szechnan-Hupeh mountain border is strongly folded and faulted. and stands nell above the level of the Szechwan basin. Just below Wan-hsien the river turns eastward and plunges into the spectacular Yangtze gorges. For about 200 mi. these are a succession of narrow, steep-sided to vertical-walled, canyons broken by short reaches where tributaries have cut deep side canyons. In several places hard rock ledges in the river bed cause rapids, and other rapids are caused by landslides from the canyon walls. In summer flood the river often rises 200 ft., during which time the rapids cause little hazard for shipping, though the swift current can be troublesome. During winter low water the reaches are quiet, but the rapids are beset with violent whirlpools and narrow swift races in which the water velocity may exceed 13 m p h. A tow path runs through the gorges on the left bank, often cut out of solid rock, by which large gangs of men, known as "trackers," pull native craft over the rapids, using half-mile long bamboo ropes. Modern ships require powerful engines to cope with the treacherous river. It is within this section that hydroelectric sites present superabundant power potentials, but cost of development would be tremendous.

The Yangtze emerges from the gorges at I-ch'ang, at 131 ft. elevation, 1 000 mi from the sea. For the next 400 mi. the river drops about 90 ft.. nith Wu-han, 600 mi. from the sea. standing at 40 ft. elevation. In this section the river meanders. and its bed is well above the lake level of Tung-t'ing Hu which gathers the drainage of the Hunan rivers to join the Yangtze. from the south, slightly west of Wu-han Historically this section long has presented major diking problems; nhen the main river is in flood it often breaks through into the lake, which serves to detain the flood waters. The Chinese Communists in 1953 diked off a 356 sq.mi. sector of the lake basin as a flood reservoir.

From the northwest the long Han Shui enters the Yangtze at Hankow where flood level stands 55 ft. above low water, and well above the city. There, completed in 1957. is the only bridge across the Yangtze, a 3,762-ft. double-decked road and rail bridge.

Below Wu-han the river gradient is slight, and the channel crosses structural lines of old mountain blocks, as it winds its course between major hill bastions. From the south the last major tributary stream system. of nhich the Kan Chiang is the chief river. gathers behind P'o-yang (*q.v*) in Kiangsi. to enter the Yangtze at Chiu-chiang (Kiukiang). Below Wu-hu is the estuarial-delta portion of the river, nith tidal effects reaching that city. Here begins a broad and flat, but watery, flood plain-delta which merges on the north with the southern north China plain Shanghai, the natural outlet for the huge Yangtze basin, situated on a tidal flat, is linked to the river by the Whangpoo (Huang-p'u Chiang). It is estimated that the Yangtze is building its delta outward at the rate of more than a mile per century.

Belon I-ch'ang much of the river is diked, the Han and the Kan also being partly diked, so that the total length of main dikes exceeds 2.000 mi. In the Hupeh plain sector the main dikes now exceed 50 ft. in height. There are nearly 7.000 sq.mi. of lake surface in the Yangtze system below I-ch'ang, providing flood reservoir space. Low water normally occurs from December to March throughout the whole river system. Flood season in the Kan river basin in Kiangsi normally is in late May, that of the Hunan tributaries is in early June, the Han river flood peak is mid-to-late June, and for the Szechwan basin the peak period normally is in early July. When heavy rains flood only one major sector of the

Yangtze system at a time. there seldom is serious flooding throughout, but in those years in which the whole basin receives torrential rains at the same time, disaster results. In 1931 about 34.000 sq.mi. in the Yangtze and the Huai Ho (*q.v.*) were inundated, and in 1954 the worst flood in known history hit the same region. The mean volume of water discharged into the sea is estimated at about 700,000 cu.ft. per second, but the 1931 peak flood was close to 3,000,000 cu.ft per second, well over the safe level for the dikes of that year. The annual sediment discharge is close to 1,000,000,000 tons per year, with heavy flood seasons exceeding that figure.

The Yangtze river system forms one of the world's best commercial highways and to the Chinese has always been important as a means of intercommunication. Marco Polo. who visited central China in the 13th century, was impressed by the volume of river traffic. In summer, ships up to 10.000 tons can reach Hankow, 4,000-ton ships can make I-ch'ang. and powerful 1,000-ton ships can navigate to Chungking. About 2,000 mi. of tributary courses are open to steam launches in summer. About 25.000 mi. of main river and tributary channels can be navigated by native junks and rafts during summer periods. The long flow period of the Yangtze is notable, so that much of the system is navigable for almost eight months of the year.

In the past the Yangtze valley as a political term indicated the sphere of influence or development assigned to Great Britain by international agreement. Subsequently more than 1.000 mi. of the river were held by the Japanese during the Chinese-Japanese War (1937–45). The Yangtze was the scene in 1949 of a famous naval exploit: in April the British frigate H.M S. "Amethyst" was attacked and detained by Chinese Communist artillery for nearly three months while proceeding to Nanking on a humanitarian mission on behalf of the foreign community. Unable to obtain a safe-conduct guarantee, the warship navigated downstream for 140 mi., at times under heavy fire, and arrived at the mouth with only a few hours of fuel remaining. (J. E. Sr.)

YANKEE, a word of uncertain origin (perhaps from Dutch Janke, Little John), applied in the 18th century to New Englanders, first by British soldiers as a contemptuous nickname, then as merely descriptive, finally as a respectable designation, still acceptable in New England. Yankee was the given name of a Negro slave offered for sale in Carolina in 1725. Toward the close of the 18th century, Britons began to use Yankee for all United States citizens and continued to do so until well into the 20th century. This usage was encouraged in World War I, when, in the United States as well as in Europe, members of the U.S. armed forces were often called Yanks. During and after the Civil War, southerners spoke of northerners as Yankees. (A. McQ.)

YAO (of Africa), a Bantu-Negroid people inhabiting the region between the Rovuma and Lugenda rivers in Mozambique, who spread into Tanganyika and Nyasaland after 1850. Their culture is similar to that of the Makonde and Makua-Lomwe peoples. They have matrilineal clans, matrilocal marriage, annual initiation ceremonies for boys and girls. They had a form of ancestor worship but are now mainly Moslems. They were slave traders until subdued by the British in 1896.

Bibliography.—J. C. Mitchell, "Modern Political Organization Among the Yao of Southern Nyasaland," *African Studies*, vol viii (1949), "The Yao of Southern Nyasaland," *Seven Tribes of British Central Africa*, ed by E. Colson and M. Gluckman (1951), H. S. Stannus, "The Wa Yao of Nyasaland," *Harvard African Studies*, iii (1922). (M. M Ds.)

YAO (of China), a mountain-dwelling Mon-Khmer ethnic group in south China that once roamed much of the hill lands south of the Yangtze river and east of Szechwan and still are found in small groups in many southern provinces Traditionally, they have led a semimigratory life of shifting cultivation, clearing and fertilizing the mountain slopes for cultivation by burning the forest and brush. Tribal organization has been poorly developed, although a strong patrilineal clan society existed. Features of the traditional culture included sexual freedom before marriage and marriage by free choice of the partners after a child is born. A type of shamanism also was practised together with the ancestral cult of the dog-god P'an-hu, a legendary dog that delivered the head of an enemy to a monarch and was awarded a princess for a wife. The Yao claim descendance from this union.

Conflicting theories variously speak of the Yao as a branch of the Miao in western Szechwan, or as having evolved in southeast China independently of the Miao and speaking a paleo-Austronesian language modified by T'ai. Miao and Chinese contacts. The Tao now are largely concentrated in Kwangtung and Kwangsi provinces. Some groups of Yao have migrated into northwest Vietnam and Laos. The Shê people of Chekiang and Fukien provinces are considered related to the Yao, as are the Li tribes of Hainan Island. All of these groups combined may number between 600.000 and 1,000,000 people.

At intervals during the centuries of the extension of Han Chinese settlement into the south China hills, oppression of the Yao or the taking of Yao land by the Chinese have brought fierce and large-scale uprisings. It is recorded that during the great Yao rebellions of the 16th century in Kwangsi, several hundred thousand Chinese troops were required to subdue them. Since then, only sporadic small-scale revolts have occurred.

After 1953 the five hill areas in which the Yao predominated were organized by the Communist regime into five so-called "autonomous districts." Two of these lie in the Nan Ling range between Hunan and Kwangsi, one lies in northwest Kwangtung, one in central Kwangsi and one in southwest Kwangsi.

Stuebel, "The Yao of the Province of Kwangtung," *Mon Serica*, vol. iii, pp 345–384 (1938); Harold H Hinton, "The National Minorities in China," *Far Eastern Economic Review*, pp 322–325, 367–372 (Sept. 15–22, 1955). (H J. Ws)

YAP, the largest island in an archipelago of that name, is the headquarters of a district of the U.S. Trust Territory of the Pacific Islands in the western Carolines. The district includes 16 coral atolls to the east and southeast. The other main islands of the archipelago are Tomil, Map and Rumung; the coral atolls nearest to the archipelago are Ulithi, Fais and Ngulu.

The archipelago has an area of approximately 39 sq.mi. and a population of 3.176 (1958 est.), only one-fifth of what it was early in the 20th century. The Yapese, of Malay origin, have distinct racial and linguistic characteristics that distinguish them from other peoples of the Carolines. The total population of Yap district is 5,459 (1958 est.).

The mean monthly temperature of Yap is 81.6° F., and the average annual rainfall, 122 in. Tropical hurricanes are frequent from June through December. The soils, mostly lateritic, are derived from ancient volcanic and sedimentary rocks much weathered by the high temperatures and heavy rainfall of the tropics. Yap Island has a series of hills, the highest Mt. Tabiwo1.570 ft., that divide the east coast from the west.

The natives of the archipelago have a surplus of Polynesian chestnuts, bananas, coconuts and taro that they send to some of the coral atolls. They also raise yams, sweet potatoes, pepper, cloves and tobacco. Livestock include cattle, swine and poultry. The district also produces copra and there is some fishing. Yap Island has small amounts of phosphate and bauxite. Men and women share the agricultural labour, women cutting grass for fertilizer and weeding gardens, and men clearing stumps, cutting brush and doing other heavy work. Women's taro lands. separate from those of the men, are tended entirely by the women themselves. Women make their own skirts — the only garments they wear — of various grasses, leaves and long fibres of the hibiscus plant; men wear cotton loincloths. In a caste system that has economic significance, the three highest ranking villages in the archipelago of Yap are Gatchapar. Teeb and Balabat. Ninety per cent of the native houses of the district are constructed of wood, bamboo and thatch; the remainder have roofs of corrugated iron.

The Tapese experienced three foreign governments before the trusteeship administration was established in 1947: Spanish (nominally to 1399). German (before World War I) (1899–1919) and Japanese (1920–47). To facilitate their government, the Germans divided the islands into ten administrative districts that remained after German rule. Each district is headed by an elected magistrate. Together the magistrates form a counci! to advise the district administrator who is appointed by the high ccmmissioner of the trust territory. Administrative problems arise from the conservative nature of the natives, who resent education for their children or any action that makes for change in their traditional social order. Ceremonial dancing plays an important part in their culture. Native systems of land tenure and of rights to use and enjoy the products of land are complicated as they are on most islands in Micronesia. In the second half of the 20th century there were 21 public elementary schools, 1 private (mission) elementary school and 1 public secondary school in Yap district with more than 6jo students. About half the deaths in the islands are due to tuberculosis. Infant mortality is 11%.

See J. W. Coulter, *The Pacific Dependencies of the United States* (1957). (J. W. Cr.)

YAPOCK: *see* WATER-OPOSSUM.

YAʿQUBI (AHMAD IBN ABI YAʻQUB IBN JAʻFAR IBN WAHB IBN WADIH) (9th century). Arab historian and geographer. was a great-grandson of Wadih, the freedman of the caliph Mansur. Until 873 he lived in Armenia and Khurasan; and later he traveled in India. Egypt and the Maghrib, where he died in 891. His history is divided into two parts. In the first he gives a comprehensive account of the pre-Mohammedan and non-Mohammedan peoples, especially of their religion and literature. For the time of the patriarchs his source is now seen to be the Syriac work published by C. Bezold as *Dze Schatzhöhle.* In his account of India he is the first to give an account of the stories of Kalila and Dimna, and of Sindibad (Sinbad). When treating of Greece he gives many extracts from the philosophers (*cf.* M. Klamroth in the *Zeitschrift der deutschen morgenländischen Gesellschaft,* vol. xl and xli). The second part contains Mohammedan history up to 872, and is neither extreme nor unfair, although he inherited Shi'ite leanings from his great-grandfather.

Edition by T. Houtsma, 2 vol. (1883). Yaʻqubi's geography, the *Kitāb ul-Buldān,* contains a full account of the larger cities and much topographical and political information (ed. by M. de Goeje, 1892; French trans. by G. Wiet, 1937). (G. W. T.)

YAQUT (YAKUT; YAQUT IBN 'ABDALLAH AR-RUMI) (1179–1229), Arab geographer and biographer, was born in Greece of Greek parentage but in his boyhood became the slave of a merchant of Hamah (Hamath), who trained him for commercial traveling and sent him two or three times to Kish on the Persian gulf. After his master's death he became a bookseller, and he traveled in Persia, Syria. Egypt and visited Merv, Balkh, Mosul and Aleppo. About 1222 he settled in Mosul and worked on his geography, the first draft of which was ready in 1224. After a journey to Alexandria in 1227 he went to Aleppo, where he died in 1229. In his large geography, the *Muʻjam ul-Buldān* (ed. by F. Wüstenfeld, 6 vol., 1866–73), the places mentioned in the literature or the stories of the Arabs are given in alphabetical order, with the correct vocalization of the names, an indication whether they are Arabic or foreign and their locality. A sketch of their history and of their monuments follows.

The parts of this work relating to Persia have been translated by C. A. C. Barbier de Meynard under the title *Dictionnaire géographique, historique et littéraire de la Perse* (1861). Yaqut wrote a dictionary of geographical homonyms, the *Mushtarik,* ed. by F. Wüstenfeld (1846). Yaqut also wrote an important dictionary of learned men, the *Muʻjam ul-Udabāʻ;* it has been edited by D. S. Margoliouth, *Irshād al Arib ilā Marifat al Adīb* (1908–26).

YARACUY is one of the northern states of Venezuela; area 2,741 sq.mi.; pop. (1950) 132,436. Its climate is tropical, the rainy season extending from June to December. Within the state is the fertile, productive and important Yaracuy valley, which separates the great Andine spur on the west from the coastal area on the east. The valley is important for its agriculture, producing bananas, cacao, corn, cotton, rice, sugar cane, tobacco and yuca and, at the higher elevations, coffee. Several minerals are to be found in the state—coal, copper, iron pyrites, lead and platinum. San Felipe is the capital. The excellent Pan-American highway traverses the heart of the state, connecting San Felipe with the neighbouring cities of Puerto Cabello to the east and Barquisimeto to the west. (L. WE.)

YARKAND (Chinese SO-CH'E) is the largest town in one of the two chief oases of the Tarim basin in the Sinkiang Uigur Autonomous Region, 38° 25' N. and 77° 16' E., 3,900 ft. above sea level. The oasis lies along several rivers of the southwest part of the Tarim basin and, as these streams come from the glaciers of the high Pamirs, they are strong and give a good water supply. The Kashgar oasis lies to the northwest and the Khotan oasis (across a desert belt) to the southeast. In the Yarkand oasis irrigation is highly developed and the soil at the foot of the mountains is largely fertile loess, on which wheat, barley, rice, beans and oil plants are grown. while there are also many fruit orchards. Among the mountains there is good pasture and large herds of camels, yaks, goats, sheep and cattle are kept. Cotton and silk (mulberry) are cultivated to some extent.

Marco Polo visited Yarkand between 1271 and 1275 and Goes went there in 1603. Schlagintweit passed through Yarkand a few days before he was killed at Kashgar in 1857.

The town is surrounded by a great earth wall with towers of Chinese type and has mosques and madrasas (colleges) of great fame, though less well known than those of Bukhara and Samarkand. The city is a centre of caravan trade along routes from Cadakh, Khotan, Kansu and trans-Caspian regions, as well as India and the U.S.S.R. generally. Horses, cotton, skins and leather and leather goods, carpets, silk, etc., are dealt in. and carpets as well as woven stuffs in silk, cotton and wool are made. Pop. (1953) 80,000.

YARKAND, a headstream of the Tarim river in Sinkiang Uigur Autonomous Region, China. The Yarkand. which is 600 mi. long, rises in the Karakorum pass of the Karakorum range of northern Kashmir. In its upper course it forms part of the undefined border between Kashmir and Sinkiang, as it cuts a deeply incised valley through the mountain ranges of the Kunlun system. Upon emerging from the Kunlun gorges, the Yarkand loses the characteristics of a raging mountain torrent and spreads out in many branches over an alluvial fan to irrigate the Yarkand oasis. The oasis, one of the largest in Sinkiang, contains the towns of Yarkand (So-ch'e) and Tse-p'u (Posgam). Upon leaving the Yarkand oasis, the river flows north past Mai-kai-t'i (Merket-Bazar) and then northeast around the eastern margins of the Takla Makan desert. South of the Aksu oasis it joins the Kashgar, Aksu and Khotan rivers to form the Tarim. Unlike the other headstreams of the Tarim, the Yarkand carries water all year round and is regarded as the main source stream of the Tarim. The Yarkand derives most of its water from melting snou and glaciers in the Karakorum and Kunlun systems. Its volume is therefore greatest in the summer and lowest in the winter. Most of its water is used for irrigation or is absorbed by desert sands. (T. SD.)

YARMOUTH, a historic little port on the northwest shore of the Isle of Wight, Eng. Pop. (1951) 953. A ferry service to Lymington brings summer visitors. The town hall (rebuilt 1763) contains charters of 1135, 1280, 1335, 1440, 1465 and 1560. Yarmouth castle was built in 1537 after the town had suffered many attacks and been burned twice (1377 and 1524).

YARMOUTH (GREAT YARMOUTH), a municipal, county and parliamentary borough and seaport in Norfolk, Eng., 20 mi. E. of Norwich by road. Pop. (1951) 51,105. Area j.8 sq.mi. It is situated where Breydon water (the combined waters of the Yare, Waveney and Bure) makes to enter the North sea but is turned southward for about 3 mi. by the sandy spit on which the town is built. The estuary of the rivers forms the harbour which can accommodate ships up to 300 ft. in length. Yarmouth is a popular seaside resort and a centre for boating on the Norfolk Broads.

Yarmouth is one of the largest herring-fishery ports in the world; the trade used to be carried on at an annual fair between Michaelmas and Martinmas. Industries include electrical and marine engineering, foodstuff processing, brewing and the manufacture of textiles, shoes, boxes and pulp. There is a big open-air market and the Easter fair is of ancient origin. When the Romans built Gariannonum (Burgh castle, now 4 mi. W. of Yarmouth) it stood close to the seashore, but the discovery of a cemetery of 7th-century date or earlier shows that the sandbank on which Yarmouth (Gernemutha Magna) now stands was habitable by then. By the 14th century the sandbank had extended south for about 8 mi but later it was cut through several times for purposes of navigation. The present entrance to the harbour was made by Joost Jansen, a Dutch engineer, in 1567, and affords a depth at the bar of 12 ft. at low water. Fishermen were attracted to Yarmouth from the Cinque Ports and at the time of the Conquest there was a settlement of 70 burgesses which Henry I placed under the rule of a reeve. The charter of King John (1208), which gave his burgesses of Yarmouth general liberties according to the customs of Oxford, a guild merchant and weekly hustings, was amplified by several later charters asserting the rights of the borough. In 1552 Elizabeth I granted a charter of admiralty jurisdiction, afterward confirmed and extended by James I. In 1668 Charles II incorporated Little Yarmouth by a charter which, with one brief exception, remained in force till 1703, when Anne replaced the two bailiffs by a mayor. The council now comprises 12 aldermen and 36 councillors. Yarmouth returned two members to parliament from 1300 to 1868 and one after 1885.

Old Yarmouth, built along the eastern bank of the Yare and enclosed within flint-faced walls in 1260, has extended beyond its ancient walls to the seashore. Unique features of the town are the very narrow streets called "rows," with their small houses, leading down to the river. The town suffered greatly from air raids during World War II and damage from gales and floods in Jan.–Feb. 1953. The parish church of St. Nicholas, built of flint ornamented with limestone, was founded in 1101 by Herbert Losinga and was completely gutted in 1941. It was the largest Anglican parish church in England.

YARN. The derivation of this word from *"garn,"* a word common to the Scandinavian languages, meaning "guts," is interesting since today "cat-gut," which may be the drawn-out "guts" of the silk-worm, is a well-known commodity; and the same "guts" spun by the silk-worm itself into a fine filament are the basis of the best silk yarn produced. The silk-worm, however, in its "spinning" simply thins-out the silk fluid to a double microscopic strand some 500 to 1,000 yards long, several of which are combined by mechanical means to form a yarn; while the human spinner usually combines a number of much shorter fibres or filaments, also by mechanical means, into a continuous strand often much longer than the 1,000 yards filament of the silk-worm; and this also is spoken of as a yarn.

Materials. — The materials from which yarns are constructed or spun markedly influence the processes of production. In the case of the best silk yarn the worm itself does what is termed the spinning and the later running-together of several of the long silk filaments is not spoken of as spinning but as "throwing." In the case of a typical short fibre — say the cotton fibre ½″–2″ long — the spinning process is the binding together of many thousands of cotton fibres into a fine regular, continuous thread — usually spoken of as "yarn." Two or more of these threads or single yarns may be combined together by "twisting" to produce a thicker. stronger yarn.

Of the true long fibres there are only two types, the natural silk reeled from the cultivated silk-cocoon and the synthetic fibres such as nylon.

Of the short fibres there are many classes. The longest are the waste silks just mentioned; then come the animal fibres including hairs and wools up to 18" long, short wools down to, say, 2" long and broken-up wool fibres (variously termed shoddy, mungo, extract, flocks, etc., according to their source and manner of breaking up from the virgin wool clothes, knitted garments, etc.) which (it is popularly said) can be spun into yarn if they possess two ends; next come the "stem-fibres" such as flax (producing linen yarn), hemp, jute and china-grass which may vary in length from several inches down to fractions of an inch; lastly come the cotton fibres and cotton wastes often under one inch in length along with which should perhaps be ranked the mineral fibre asbestos, which may be spun into a yarn from which fireproof cloths are woven.

Structures. — Yarn structures may be considered from two points of view. In the first case particular fibres lend themselves only to particular "fibre combinations." Thus long silk filaments can only be "thrown" together with or without "twist." But the twisting of silk filaments is an art in itself. Thus several filaments may be reeled together from separate cocoons and these given a suitable "combining-twist" to produce what is known as singles; then several of these singles may be thrown together with little twist to produce almost a "paralleled-fibre" thread termed "tram," the most lustrous yarn known, or with much twist to produce a strong, fairly lustrous yarn termed "organzine" which is employed as "warp." On the other hand one inch cotton fibres after being drawn into a fairly fine "paralleled sliver" termed a "roving" can only be spun out into a fine thread by means of "supporting twist" which no doubt binds the fibres more or less concentrically in the thread or yarn: this is said to be the true form of spinning — draft (that is, drawing-out thinner) against twist.

Fancy Twists. — These naturally group themselves into three classes, viz., structural twists; colour twists; and structural-and-colour twists. Of the first class the two most important are the knop yarn — in which knops are formed at any required intervals on an otherwise level thread by holding one thread tightly and allowing the second thread to run in slackly to form knops of the required size, after which equal delivery of the two threads for the required length is followed again by the varied delivery to form the knop; and the curl yarn — in which a knop yam is first formed and then this two-fold yarn twisted, in the opposite direction, with a third thread, this opening out the knops into loops which may be produced at more or less regular intervals or "spaced," *i.e.,* a length of the thread without loops and then a series of loops, which in turn are followed by a length of the thread without loops. Of fancy colour twists the simplest is the corkscrew twist which is formed by first twisting, say, a dark and a light thread in the normal manner and then twisting this two-fold yarn in the reverse direction, with a third dark thread, this producing the special appearance which gives its name to the yarn.

Other Fancy Yarns. — Fancy yarns of an effective character may also be produced with simple modification in the normal carding and spinning processes. Thus "knicker yarns" are produced by throwing little bits of highly coloured material into the last cylinders of the card so that instead of being broken up by carding they are carried forward as "knickers" into the spun thread. "Random yarns" are produced by feeding the card with alternate stripes of dark and light material and taking the condensed slivers off with a zig-zag or moving-laterally doffer which takes sections of the lengths of its slivers from first one and then the other stripes. "Marl yarns" are produced by running two differently coloured slivers together on the roving frame just prior to the worsted spinning process, so that the colours are "regularly irregularly" mixed together.

If on the other hand a very level mixture effect is required dark and light coloured tops are mixed together in the worsted drawing processes, or, better still, the "tops" are printed the required colours in bands and then passed through the worsted drawing processes this producing the extraordinary level mixture effect termed a "melange." Of the simple twofold yarns the best known is the "granderelle" in which a dark and light thread — usually of similar material, but not necessarily so — are finely twisted together as perfectly as possible. Another twofold twist termed a "spiral yarn" is formed by two single threads twisted in opposite directions being combined with twofold twist which necessarily shortens one of the threads by adding twist and markedly lengthens the other by taking out twist. Thus the slack thread "spirals" round the tight thread.

Yarn Effects and Special Properties. — The effects which may be produced by suitable selection of materials and yarn structure may be grouped into three classes, viz., light-reflective effects; form effects, and colour effects. Light reflection from the surface of a woven fabric depends upon the material or materials employed, upon the fibre arrangement in the thread, upon the thread interlacings and upon such modifications as may be introduced in the finishing processes. Thus some wools are lustrous — the Wensleydale wool, for example — and some are opaque and dull — the Down wools. Ordinary cotton is dull, mercerized cotton is lustrous. A lightly twisted net silk yarn ("tram") is the most lustrous yarn known, while a specially hard twisted net silk yarn (crepe) is the dullest yarn produced. Tram silk yarn interlaced on the "satin" principle produces the most lustrous fabric and crepe silk yarn interlaced on the "crepe" principle produces the dullest fabric known.

Merino wool spun on the woolen principle when woven into a normal fabric gives a dull surface but if the fibres are "raised" from the surface and laid parallel in the "finishing" processes then a brighter fabric may result than that produced from a merino wool spun on the worsted principle in which the fibres are laid parallel in the thread structure only.

The "form" effects will have been appreciated from the descriptions already given of knop, curl, spiral, etc., yarns. These yarns specially coloured as already described offer the designer the opportunity of producing a never-ending array of novel fabrics. Should specially white fabrics be required a "bleached" yarn is employed but it is more usual to bleach the material in the fabric state. Should a yarn which may be spun white but later — either in the yarn or cloth state — dyed two distinct colours be sought for, cotton may be blended with wool in the carding or in the drawing processes, or strands of wool and of cotton may be twisted together and dyed distinctive colours later.

Yarn Counting and Numbering. — The numbering or counts of yarns—30s, 40s, 80s, etc.—may be explained best by the counting of woolen yarns. The basic weight is the "wartern" of 6 lb., the "quartern" of the old 24-lb. stone. This appears to have been a convenient weight for the spinners to take away to their homes for hand or jenny spinning. If this weight was spun in 1.536 yd.—that is each dram spun out to 1 yd.—it was termed one skeins. If one dram was spun to 2 yd., it was termed 2 skeins; if to 20 yd., it was 20 skeins. Later it was found more convenient to deal with the unit weight of one pound, so that it has come to be usual to reckon the woolen skein as 256 yd. and the number of skeins to which a pound of this material is drawn out as the counts, spoken of as skeins in the woolen districts. Thus if one pound is drawn out to 5,120 yd. (256 × 20) the yarn is a 20 skeins. Unfortunately the woolen industry was spread over the whole of the known world before the unifying mechanical era dawned with the result that not only each country but each manufacturing district has adopted its own system of woolen yarn counting. Thus 200-, 300-, 420-yd. skeins are to be found and there is a still further complication in the United States where in one case the length is fixed and the count or skeins is given by the number of times the unit weight (the grain) is contained in this unit length. This method is that natural to the net silk industry in which the drams per 1,000 yd. or the deniers (or $\frac{1}{2}$ decigram) per 450 m. gives the count spoken of as the deniers.

The cotton-spinning industry which started from England adopted from the first a hank (or skein) of 840 yd. and the hanks per pound as the count and this has obtained world-wide acceptance. The worsted industry, apparently an offshoot of the cotton industry, taking a yard instead of a $1\frac{1}{2}$-yd. reel, has adopted a hank of 560 yd. and the hanks per pound give the count. The kilogram and the kilometre (or gram and metre) are the universal bases for everything excepting thrown silk and synthetic yarns for which a base length of 500 m. is used and the weight of this in decigrams give the deniers or count.

The yards to which one pound of material may be spun naturally vary with the fineness and nature of the material. Thus cotton has been spun on a commercial basis to 588,000 yd. per pound, linen to 180,000 pd., worsted yarn to 56,000 yd. and woolen yarn to 15,000 yd.; while net silk yarns, if required, may even be thrown finer than the finest cotton.

Sometimes to obtain a fine, straight-fibred thread, wool is spun or twisted with cotton and later the cotton is "carbonized" by acid treatment. The reverse process may also be employed. Special note should be made that in twisting threads together the count number of the yarn will be lessened in proportion to the added weight of the thread or threads. Thus two threads of a 40s count twofolded give a 20s count — written 2/40s. There is, however, an exception to this in spun-silk yarn in which a 2/40s yarn (often written 40/2) is a 40s but twofold; *i.e.*, two threads of 80s are twisted together giving a folded yarn with 40 hanks (each 840 yd.) to the pound. The twisting of varied count numbers is really simple but mystifying to the uninitiated. Thus a 10s count twisted with a 40s count does not give an intermediate count number (say 25s) but naturally a thicker count than 10s and consequently a lower count number, viz.. 8s count; and this is true in whatever denomination the count may be stated — cotton, linen, woolen, worsted, etc. (A. F. B.)

YAROSLAVL, an oblast of the Russian Soviet Federated Socialist Republic, surrounded by those of Kalinin, Vologda, Gorky (Nizhegorod), Ivanovo and Moscow. Area 14,286 sq.mi. Pop. (1956 est.) 1,371,000 (urban 757,000).

Thick deposits of boulder clay, remains of the bottom moraine of the icecap of the Glacial period, cover the Jurassic clays, and patches of Triassic variegated marls outcrop in some places, while Upper Carboniferous limestones crop out only in the northwest and toward the east. Coniferous forest, with firs predominating, occupies 39% of the region, and marshes are extensive, especially between the Sheksna and Mologa. and in the Rostov district. Dwarf birch, the arctic raspberry (*Rubus* arcticus) and *Linnaea borealis* are widespread.

The climate is severe, the rivers being frozen 118 to 183 days per annum, average January temperature 6.5° F., average July 61.5° F. The prevailing southwest and west winds make the rainfall heavier than in central Russia.

Of the land free from forest and marsh, only 25% is under plow culture, with rye, oats and flax. Potatoes, barley, grass, vegetables, chicory and herbs are grown, the latter especially in the Rostov district. Meadow and grassland prevail and the region has a flourishing dairy industry, with exports of butter and cheese. Bog iron ores, copper sulfate and pottery clay are obtained and there are salt and mineral springs.

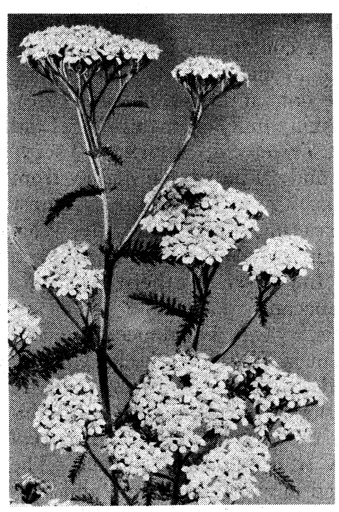
The principal river is the Volga, which is connected with the Neva by the Mariinsk and Tikhvinsk canals through its tributaries the Sheksna and the Mologa. The Kotorost, flowing from Lake Nero to the Volga, is navigable in spring, and the Kostroma, flowing along the northeastern boundary, is a channel for the export of timber and peat fuel. Of the rivers, 39% are available for navigation. Yaroslavl and Rybinsk (*q.v.*) are the chief towns

YAROSLAVL. the chief town of the above oblast on the right bank of the Volga, at its confluence with the Kotorost, in 57° 38' N.. 39° 50′ E. Pop. (1956 est.), 374,000.

It is a productive centre with textile factories, and tobacco, leather and lacquer industries. Founded in 1026–36, it was the chief town of the principality from 1218 to 1417, when it was annexed by Moscow. The Uspenskiy cathedral was begun in 1215 and rebuilt 1646–48, and there are remains of 15th- and 17th-century monasteries.

YARROW, river and parish of Selkirkshire, Scot. Yarrow water, after issuing from St. Mary's loch, flows for $14\frac{1}{2}$ mi. in a northeasterly direction through Ettrick forest to join Ettrick water 2 mi. below Selkirk. The stream and vale are famous in poetry and song.

Population of the parish was 402 in 1951.



ROCHE

YARROW (ACHILLEA MILLEFOLIUM) FLOWERS

YARROW (*Achillea millefolium*), a plant of the family Compositae, also called milfoil, native or naturalized throughout the northern hemisphere. It has white or, rarely, rose-red flowers, borne in flat-topped clusters, and very finely divided leaves. Legend ascribes the discovery of its healing virtues to Achilles, in whose honour it was named. The leaves were in ancient times in great repute for use in the treatment of wounds.

In lawns yarrow sometimes makes a solid turf, being more resistant to drought than most lawn grasses. The closely allied *A. ptarmica,* the sneezewort or sneezewort yarrow?so named because of the use of the root for snuff, native to Europe and northern Asia and found in the British Isles. is naturalized in eastern North America.

YATES, RICHARD (1818–1873), U.S. political leader. born at Warsaw, Ky., Jan. 18, 1818. He graduated at the Illinois college at Jacksonville in 1838. was admitted to the bar and entered politics as a Whig. From 1842 to 1845 and again in 1849 he served in the state house of representatives. He was a representative in congress in 1851–55, but. having become a Republican, was defeated for a third term. From 1861 to 186j he was governor of Illinois, and was successful in enlisting troops and in checking the strong pro-Southern sentiment in the state. He was a member of the United States senate in 1865–71, and was prominent in Reconstruction legislation. He died at St. Louis, Mo., on Nov. 2j, 1873.

His son Richard (b. 1860) was governor of Illinois from 1901 to 1905.

YAUCO, a town near the southwestern coast of Puerto Rico. Pop. (1960) 9,024. The town is located on the highway which connects the cities of Ponce and Mayagüez. Ten miles east at Guayanilla is one of the large oil refineries of Puerto Rico. Ten miles west of Yauco is the port of Guanica where one of the largest sugar-cane factories on the island is located. This port was the first landing place of the U.S. troops commanded by Gen. Nelson A. Miles on July 25, 1898, during the Spanish-American War. In the mountains to the north of Yauco is the island's largest coffee-producing centre. (T. G. Ms.)

YAUPON (*Ilex* vomitoria), a holly shrub of the southern United States. also known as cassina. It grows up to 15 ft. high and bears scarlet berries. A tea brewed from the leaves contains from 1% to 2% caffeine and acts as an emetic.

See HOLLY.

YAVOROV, PEYO KRACHOLOV (1877–1914), Bulgarian poet and dramatist, the founder of the Symbolist movement in Bulgarian poetry, was born at Chirpan, May 6, 1877. Passionately interested in the Macedonian question, he took part in the preparation of the ill-fated Ilinden uprising (Aug. 1903), edited revolutionary papers and crossed twice into Macedonia with partisan bands. He committed suicide at Sofia, Jan. 20. 1914.

Until 1900 he wrote mainly poetry of a social-political character, inspired by compassion for the peasantry, the struggles of the Macedonians and the suffering of the Armenian exiles. Disillusionment with radicalism led him then to abandon realism for introspection and Symbolism. Besides several collections oi poems—*Stihotvorenia* (1901); *Bessanitsi* (1907); Podir *Senkite na Oblatsite* (1910)—his works include the plays *V Polite na Vitosha* (1911) and Kogato Gram *Udari* (1912); a biography of the hlacedonian leader Gotse Delchev; and a book of reminiscences of his fighting days. Naidushki *Kopnenia.* (L. BY.)

YAWS (FRAMBOESIA, PIAN) is a contagious disease with an initial cutaneous papule at the site of inoculation. followed by multiple cauliflower eruptions of the skin: and later, in some cases, by mutilating destruction of the skin. mucous membranes and bones. The agent is a spirochaete, Treponema *pertenue,* discovered by Aldo Castellani in 1905, and is indistinguishable from T. *pallidum,* which causes syphilis. Yaws is confined almost exclusively to the warm moist tropics, including Africa, the West Indies, central and northern South America, Burma, Malaya, Siam. Indochina, the Philippines, Indonesia, northern Australia and the southwest and south Pacific ocean.

Epidemiology.— Unlike syphilis, yaws is innocently contracted. The spirochaetes are present in the serous discharge from the centre of the cracked elevated crust of the lesion and are transferred on direct contact to the abraded skin of an uninfected person. Moreover, filth flies which feed on open sores may transmit the infection mechanically from person to person. The disease is most frequently contracted in early childhood. and considerable immunity to subsequent infection is acquired. In contrast with syphilis yaws is more strictly rural. principally in primitive peoples. Some syphilologists contend that yaws is merely a tropical rural form of syphilis, but epidemiologically and clinically the two diseases are different. Yaws is not congenital and the peculiar characteristic of notched teeth and other signs of congenital syphilis are lacking. Moreover, yaws is usually milder and rarely involves the aorta or central nervous system. The primary yaws sore is characterized by a wartlike thickening of the epidermis. which becomes fibrous, cracks open, bleeds easily and allows the discharge of a serous fluid.

Usually the yaws sores are relatively painless unless they develop in calloused regions, such as the palms of the hands while grasping objects, the soles of the feet while walking and the buttocks while sitting down. They may cause severe itching. The period from inoculation until the "mother yaw," or yaws, appears is three to four weeks. A month or more later, when the first lesion may have disappeared except for a scar, multiple eruptions of the same type characteristically develop, often at mucocutaneous junctions, as around the mouth, nose and anus, or on the perineal skin, neck, arms, legs and buttocks. These lesions, whether initial or secondary, are yellowish red and are somewhat like a raspberry (hence the name "framboesia"). Later the disease may subside, leaving only superficial scarring, but in some instances there may be deforming tertiary yaws, involving the nose (eroding type, "gangosa"; bulbous type, "goundou"), long bones ("boomerang leg" of Australia) and rarely the spleen, brain and great blood vessels.

The primary and secondary lesions, especially in endemic areas, are not readily confused with other eruptive diseases. but at times those on the face must be differentiated from mucocutaneous leishmaniasis and American blastomycosis. The Wassermann and Kahn reactions are usually positive. With early recognition and specific treatment the prognosis is excellent. Arsenicals, particularly mapharsen, are specific against yaws, while some physicians employ bismuth as an adjuvant. Penicillin is rapidly effective in killing the causal agent and in healing the yaws. Prevention consists in isolation and prompt treatment of cases to reduce exposure, and in personal and group hygiene. All abrasions and sores of the skin and mucous membranes should be treated with appropriate antiseptics and covered with clean dressings. and all clothing in contact with yaws lesions should be sterilized to prevent its serving as a vehicle for disseminating the disease.

See G. C. Shattuck, *Diseases of the* Tropics (1951). (E. C. F.)

YAZDEGERD ("made by God." Izdegerdes), the name of three Sassanid kings of Persia. (1) YAZDEGEKD I. son of Shapur III. 399–421, called "the sinner" by the Persians. was a highly intelligent ruler, who tried to emancipate himself from the dominion of the magnates and the Magian priests. He punished the nobles severely when they attempted oppression: he stopped the persecution of the Christians and granted them their own organization. With the Roman empire he lived in peace and friendship, and is therefore as much praised by the Byzantine authors (Procop., Pers., i. 2; Agath., iv, 26) as he is blamed by the Persians. After a reign of 20 years he appears to have been murdered in Khurasan. (2) YAZDEGERD II was the son of Bahram V Gor, 438–457. He persecuted the Christians and Jews, and had a short war with Rome in 441. He tried to extend his kingdom in the east and fought against the Kushans and Kidarites (or Huns). (3) YAZDEGERD III, a grandson of Chosroes II, who had been murdered by his son Kavadh II in 628, was raised to the throne in 632 after a series of internal conflicts. He was a mere child and never really ruled; in his first year the Arabic invasion began, and in 637 the battle of Kadisiya decided the fate of the empire. Ctesiphon was occupied by the Arabs, and the king fled into Media. Yazdegerd fled from one district to another, till at last he was murdered at Merv in 651. The Parsees, who use the old Persian calendar, continue to count the years from his accession (era of Yazdegerd, beginning June 16, A.D. 632). (ED. M.)

YEARBOOK, a term applied to annual summaries either of events throughout the world during the previous year or of general or local progress in some one department of administration, art, science or industry. Examples are the Britannica Book of *the Year, the Statesman's* Year-Book, *Annual* Register, Whitaker's *Almanack,* the World Almanac, Information Please Almanac, biographical records such as the various *Who's Who*, genealogical records such as those of Debrett and Burke and the continental *Almanach de Gotha,* a scientific and scholastic publication of the type of the *Index Generalis,* and the innumerable specialized economic and industrial publications. The English legal *Year Books,* described by Pollock as "our glory. for no other country has anything like them," are reports of cases covering the period 1292 to 1534, written in provincial French. Abridgments of these *Year Books* were made by Sir Anthony Fitzherbert in 1516 and by Sir Robert Brooke in 1568. The first systematic printer of them was Richard Pynson, from 1510; the principal publisher, from 1553, was Richard Tottell. In 1863 A. J. Horwood was commissioned by the then master of the rolls to edit the unpublished *Year Books* of Edward I. This Rolls Series was continued by L. O. Pike and supplemented by Maitland and others working for the Selden society.

The most convenient brief discussions of the *Year Books* are in *Holdsworth's History of English Law,* vol. ii, pp. 444–462 (1903–09), and W. C. Bolland's *The Year Books* (1921).

YEAST. The botanist and microbiologist apply the term yeast to a group of plants, many of which exhibit a marked ability to change sugar into alcohol and carbon dioxide. The characteristics of the group, which includes hundreds of species, are quite restricted. To the layman, untrained in botany, the term yeast suggests the cakes of pressed yeast available in almost every hamlet. The ability of certain yeasts to form carbon dioxide from sugar has caused some of them to be used for leavening bread. For centuries, other species have been used in the making of wine, alcohol, beer, etc. *(See* also FERMENTATION; FCNGI.)

Yeasts probably have as early origin as the bacteria. Grüss examined some fossil remains of Devonian plants and obtained striking evidence of the existence of budding fungi in this early age. This same investigator on examination of the sediment from a beer jar in a Theban tomb of the 11th dynasty (2000 B.C.) isolated a yeast which was named *Saccharomyces winlocki.* Examination of "beer bread" found among the offerings in other tombs also yielded the same yeast. It is now known that yeasts are widely distributed in nature and that those species concerned in fermentation pass the winter in the soil. They are disseminated by bees, dust and other agents in the spring.

The use of yeast in such fermentations as that of bread has made it convenient to have a constant supply of fresh active yeast, While in former days the by-product of certain fermentation industries was used, pressed (or compressed) yeast is now available to those who desire it. To this end the organism is grown in suitable media and the crop harvested when a sufficient crop of cells has appeared. The medium, according to an older method, consists of wort prepared from grains mashed in water. The mash prepared from grains is inoculated with lactic acid bacteria to "sour" it; the acid prevents putrefaction and also serves as food for the yeasts. The clear wort is passed into fermenters where it receives the seed yeast. The temperature is kept constant and rapid growth takes place. The yeast cells are then separated from the fluid in which they have grown by filter presses. They are mixed with starch and pressed into large cakes. These are sent to distributing centres, where they are cut and wrapped in the small size package commonly used in the home. In more recent times, yeast has been cultivated in mineral salt-sugar solutions instead of the wort described above. The cells are also incorporated in corn meal which is pressed into cakes.

Besides the application of yeasts in fermentology, they have been widely heralded as therapeutic agents. Their application to the cure of disease goes back to very early times. Many of the statements on the use of yeasts in this manner rest upon uncontrolled experiments, if indeed they may be called experiments. We are told that the monks used yeast for curing plague and that Hippocrates advised its use in leucorrhea. (F. W. TA.)

YEATS, WILLIAM BUTLER (1865–1939), Irish poet, dramatist and critic, one of the greatest poets of the 20th century, was born at Sandymount, a suburb of Dublin, on June 13, 1865. His father, J. B. Yeats, was a painter of some distinction, whose friendship with Henry Irving, and with the later members of the Pre-Raphaelite school of painters, was to be of importance in his son's work. His mother was of the Pollexfen family of County Sligo; through both parents he claimed kinship with various Anglo-Irish Protestant families who are mentioned in his work.

Soon after his birth 'I-eats's parents moved to London, and he went to school in Hammersmith, but much of his boyhood, and his school holidays, were spent in Sligo, where he stayed with his grandparents. This county, its scenery, folklore and supernatural legend, colours much of his work, providing many and complex emotions, and certain symbols, which are afterward recollected in varying degrees of tranquillity or emotion. A second, and equally important, influence of place was to come later when, after enjoying for long periods the hospitality of Lady Gregory at Coole in Galway, he bought a ruined Norman castle in that neighbourhood, Thoor Ballylee—the Tower which becomes a dominant symbol in much of his latest and best work.

For a short time he studied painting, and retained throughout his life a passionate love and understanding of that art. But while he was still young, his father (always a profound influence upon him) introduced him to two prominent literary figures! Edward Dowden and John Todhunter, of Trinity college, Dublin; and through Dowden's encouragement some of Yeats's earliest poetry was published. But, having returned to Dublin in 1881, his parents again moved to London in 1887, and Yeats became engaged as a professional writer. An early work, *John Sherman and Dhoya* (1891), contains certain biographical elements; but his first success came with *The Wanderings of Oisin* (1889), which the critics compared favourably with Tennyson's "The Voyage of Maeldune." He quickly became involved in the literary life of London of the 1890s: as a founder of the Rhymers' club, a friend of William Morris and W. E. Henley, Lionel Johnson and Arthur Symons. The story of those years is told in *The Tragic Generation,* which, together with *Reveries Over Childhood and Youth,* form part of *Autobiographies* (1926). In 1892 his first play, *The Countess Cathleen,* was published, having for its heroine the beautiful Maud Gonne, who had been attracted to his friendship by the earlier *Oisin,* and who remained a constant source of inspiration (often under the symbol of Helen of Troy) for the remainder of his life.

During this decade other important influences can be seen at work upon the poet's mind. In collaboration with E. J. Ellis he edited *The Poetic Works of William Blake* (1893); and this led him to the study of Blake's thought and its sources in Swedenborg, Boehme and the Neoplatonists. Esoteric reading was widened by his membership in The Order of the Golden Dawn, the Theosophical society and by his friendship with Madame Blavatsky. He knew and admired the work of Aubrey Beardsley and Oscar Wilde (the latter's *Salome* is of some importance as a later influence). Out of the current of the time he drew some knowledge of French literature: Mallarmé, Baudelaire and, above all, Balzac; his friendship with the Indian Purohit Swami led him to Indian theology, and long afterward he was to assist with a translation of the Upanishads. Fruits of this esoteric reading appear in *The Secret Rose, The Tables of the Law* and *The Adoration of the Magi* (all 1897) which, together with *Per Arnica Silentia Lunae* (1918), are important documents for the study of his thought. An earlier volume of essays, *The Celtic Twilight* (1893), indicates another line of development, toward Irish nationalism; he became the first president of the Irish Literary society. In 1897 a series of fortunate meetings, and the financial support of Annie Elizabeth Horniman, resulted in the evolution of the Irish Literary theatre, which gave its first performance (with English actors) in Dublin in 1899. To the end of his life Yeats remained a director of the theatre; in the crucial period 1899–1907—the Abbey theatre was founded in 1904—he managed its affairs, found and encouraged its playwrights (notably J. M. Synge) and contributed many of his own plays. This "time of drudgery" was astonishingly prolific. There is much dramatic criticism, both general and in relation to the ideals of the Irish theatre; essays of major importance on Blake, Shelley, Morris, Spenser (he had made a selection of the poems of Spenser in 1906); essays on Shakespeare, symbolism, painting. This prose has not been collected and edited; much of it is available in *Ideas of Good and Evil* (1903), *The Cutting of an Agate* (1912), *Plays and Controversies* (1923), *Dramatis Per-*

sonae (1936) and in *Essays* (1924). Among the plays which became part of the Abbey theatre's repertoire are *The Land of Heart's Desire* (1894), *The Shadowy Waters* (1900), *Cathleen ni Houlihan* (1902), *The Hour Glass* (1903), *On Baile's Strand* (1905), *The King's Threshold* (1904) and *Deirdre* (1907). Of poetry there is a succession of work, from *The Wind Among the Reeds* (1899) to the collected editions of 1906 and 1908 onward; much of their contents undergoing extensive revision, then and afterward, before their final appearance in the posthumous *Collected Poems* (1949).

The years 1909–14 may be said to mark a decisive change in Teats's life and art. For the previous decade there had been a slow discarding of Pre-Raphaelite rhythms and colours and of certain Celtic and esoteric influences; now the remaking of himself and his style became more definite. Many reasons may be suggested: the quarrel over the production of Synge's *The Playboy of the Western World;* the death of Synge; a loosening of the ties with the Abbey; bitterness over his involvement in Irish politics, as in the affairs of the Municipal gallery and the Lane pictures; his friendship with Ezra Pound, and a new range of study. particularly of metaphysical poetry under the stimulus of Sir Herbert Grierson's edition of *Donne*. All these are reflected in *Poems Written in Discouragement* (1913) and in *Responsibilities* (1914); a tightening and hardening of the verse, a more sparse and pregnant imagery, and perhaps a hatred of "man, woman and event." But now events "came upon him like waves." providing an almost unlimited mass of poetic subject matter. The Easter rising of 1916, later to be refracted with a mythologema and aligned with the legend of Cuchulain, was perceived at first as an emblem of triumphant nationalism ("Easter 1916," "The Rose Tree"); thereafter (with characteristic ambivalence) as that which was to destroy the Anglo-Irish civilization in which he had found an ideal of aristocracy. World War I left little direct mark upon his writing, save for three major poems celebrating the death of Maj. Robert Gregory. Of these the most famous is "An Irish Airman Foresees His Death," the mood of which is denied by a later poem, "Reprisals" (not in *Collected Poems),* which is the outcome of the "war" between the English and the Irish Republican army during 1918–21. In 1917 he published *Tlze W'ild Swans at Coole,* married. lived for a lime at Thoor Ballylee, moved to Oxford and began to read vigorously and widely. From then onward he reached the height of his achievement, a renewal of inspiration and a perfecting of technique that is without parallel in the history of English poetry. *The Tower* was published in 1928, *The Winding Stair* in the United States in 1929. Both use, as dominant subjects and symbols, the Irish rising and civil war, his own Norman tower. the Byzantine empire and its mosaics; Plato, Plotinus and Porphyry; his interest in the philosophy of G. E. Moore and contemporary psychical research. The scaffolding of his "philosophy" or "system" is contained in the prose work, *A Vision* (1925, revised extensively in 1937); it contains, often in deliberately veiled statement, a theory of history and of the human soul and personality which. whatever disagreement it may provoke. is indispensable to the serious student of his work. In 1936 he edited, with a long prefabory essay. *The Oxford Book of Modern Verse,* a selection which was sufficiently unorthodox (since it reflected to a certain degree his own tastes and friendships) to arouse hostile criticism. At the same time he wrote a number of important plays; the Nō theatre, to which Pound had introduced him, provided a framework drama designed for a small audience of initiates; stylized, intimate, capable of using to the full the resources of mask, mime. dance and song, and of conveying—in contrast to the public theatre—his own recondite symbolism. So we have *Four Plays for Dancers* (1921), *Calvary* (1930) and *The Resurrection* (1931); in more normal technique. *The Cat and the Moon* (1924), *The Words Upon the Window Pane* (published 1934); the translation of Sophocles' *Oedipus Rex* (1928). These were followed in 1934 by two versions of *A Full Moon in March,* together with some important poems related both to the Irish political scene and to his renewed interest in Indian philosophy, as evidenced by his part translation of *The Ten Principal Upanishads* (1937).

In 1922 Yeats was elected a senator of the Irish Free State. and became (as he to some extent remained) the "sixty-year old smiling public man." In 1923 he was awarded the Nobel prize for literature) which he celebrated in the essay "The Bounty of Sweden." Thenceforward may be traced an increasing disillusionment with the Irish scene. Lady Gregory. who had been for nearly 40 years his friend, patron and co-worker, died in 1932; Coole park. where so much of his poetry was written. became desolate. An increasing preoccupation (like that of his master Swift) with the problem of the One and the Many culminated at the last in the pamphlet called *On the Boiler* (1939) of which the setting is Sligo quay. In *Last Poems* (1939) many previous themes are gathered up, rehandled, with an immense technical range; using (in particular) ballad rhythms and dialogue structure. with an undiminished energy. as he approached his 70th year; and culminating in *Under Ben Bulben* and his own Epitaph. Of drama there are the complex and many leveled play *The Herne's Egg* (rejected. typically, by the Dublin stage for religious reasons); the mysterious *Deatlz of Cuchulain;* and the brief but important *Purgatory,* which T. S. Eliot has recognized as among the most important contributions to the verse drama of the 20th century. It is noteworthy that one of the *Last* Poems—"Cuchulain Comforted"—was dictated a few hours before his death, which took place at Roquebrune in the south of France on Jan. 28. 1939. The body lay in a cemetery there during World War II. until (in accordance with his wishes) it was brought back for burial in the churchyard at Drumcliff. near Sligo, under the shadow of Ben Bulben.

Had Teats ceased to write at the age of 40, it is probable that we should value him as a minor poet, writing in the dying Pre-Raphaelite tradition that had drawn for a time renewed beauty and poignancy from the Celtic revival. There is no precedent in literary history for a poet who produces his greatest work between the ages of jo and 7j. The work of this period takes its core of being from his long and dedicated apprenticeship to poetry, so that, finally "words obey my call"; from his experiments in a wide range of forms of poetry, drama, prose; from the consolidation of his own spiritual growth and physical experience. into the framework of his own mythology. This last. from which arises the distilled symbolism of his great period. is not always easy to understand; nor did Yeats intend its full meaning to be apparent except to those who had followed his thought and who were conscious of the tradition in which he worked. His own cyclic view of history suggested a recurrence and convergence of images, so that they become multiple and enriched; and this progressive enrichment (which involves the consideration of his work as a unity) may be traced throughout his life. Among such dominant images are Leda and the Swan. Helen and the burning of Troy; the Tower in its many forms; Byzantium and its mosaics; sun and moon; the burning house; cave, thorn tree and well; eagle, heron, sea gull, hawk; blind man, lame man and beggar; unicorn and phoenix; horses, hound and boar. Yet, though traditional, these images are continually certified, validated, by their alignment with his own experience, and it is this that gives them their peculiar vital quality. In the verse they are often shaped into a strong and proud rhetoric. that "high breeding" of style. or into the many poetic tones of which he was master. All are informed by the two qualities which he valued and retained in old age, "passion"—"cold passion —and "joy."

Bibliography.—The bibliography of Yeats is vast and complicated, and is best studied through Allan Wade's *A Bibliography of the Writings of W. B. Yeats* (London, 1951; New York, 1952). Since his poems (and on occasions his plays) were often meticulously and repeatedly revised between the date of their first appearance and their progress through successive editions—and these revisions are an index to the growth of his mind—reierence should be made to the *Variorum Edition* of the poems, ed. by P. Allt and R. K. Alspach (New York, 1957; London, 1958). Various collections of *Letters* are indispensable; notably Allan Wade's edition of the *Letters* (London, Toronto, 1954), *Letters on Poetry to Dorothy Wellesley* (Oxford, New York, 1940), J. B. Seats's *Letters to His Son,* ed. by J. M. Hone (London, 1944; Sew York, 1946). The amount of critical literature is considerable, and is increasing yearly; *see* the *Cantbridge Bibliography of English Literature;* J. M. Hone, *W. B. Yeats, 1865–1939* (London, 1942; New York, 1943); L. MacNeice, *The Poetry of W. B. Yeats* (London, New York, 1941); Graham Hough, *The Last Romantics* (London, 1949; New York,

1950); R. Ellmann, *Yeats, the Man and the Masks* (New York, 1948; London, 1949), *The Identity of Yeats* (New York, London, 1954); A. Norman Jeffares, W. B. *Yeats: Man and Poet* (London, New Haven, Conn., 1949); T. R. Henn, *The Lonely Tower: Studies in the Poetry of W. B. Yeats* (London, 1950; New York, 1952); J. Hall and M. Steinmann (eds.), *The Permanence of Yeats* (New York, 1950); F. Kermode, *The Dancer* (London, 1957); F. A. C. Wilson, W. B. *Yeats and Tradition* (London, 1958). (T. R. HN.)

YELLOWBIRD, a name applied in the United States to the American goldfinch (Astragalinus tristis) and to the yellow warbler (Dendroica petechia). See GOLDFINCH, WARBLER.

YELLOW FEVER is an acute infectious disease of tropical and subtropical regions that is capable of devastating invasions of the temperate zones. The disease is caused by one of the smaller viruses (*q.v.*), which is also infective to all species of monkeys and to certain species of galagos, opossums and rodents. The virus is transmitted among susceptible hosts by any of several species of mosquitoes.

History and Distribution. — There is considerable uncertainty concerning the origin of yellow fever. Although West Africa has been regarded as the home of the virus, there is no account of an outbreak suggesting yellow fever along the west coast of Africa until well over a century after the Columbian voyages. On the other hand, the early Spanish explorers to the new world reported a highly fatal epidemic disease characterized by bloody vomiting. That the disease had long been known in Central America and the coastal regions of the adjacent South American continent is suggested by the Maya chronicles, which speak of an outbreak of bloody vomiting (xekik) that ravaged Yucatan in 1484. Similar outbreaks (matlazahuatl) in southern Mexico appear to have wiped out coastal settlements in pre-Columbian times.

For more than 200 years yellow fever was one of the great plagues of the world. The tropical and subtropical regions of America were subjected to devastating epidemics, while serious outbreaks occurred as far north as Boston and as far away from the endemic centres as Spain, France, England and Italy. During this period, appalling epidemics swept repeatedly over the West Indies, Central America and the southern United States, decimating populations, paralyzing industry and trade and holding the people of these regions in a state of perpetual dread.

Philadelphia suffered 20 epidemics, New York city 15, Boston 8 and Baltimore 7. The last outbreak in the United States occurred in 1905, when New Orleans was invaded as were other ports of the south.

There are known to be two substantially different patterns of transmission of the virus. They are: (1) urban or classical yellow fever, in which the transmission is from man to man by the *Aëdes* aegypti mosquito; and (2) jungle yellow fever, in which man may become involved incidentally in a forest cycle in which the mammalian host is usually a monkey and the transmitting mosquito may be one of a number of forest-living species. Until well into the 20th century, urban yellow fever was the only cycle known. Carlos Finlay of Havana, Cuba, in 1881 advanced the thesis that the infectious agent was transmitted by the mosquito now known as Aedes aegypti (then called *Stegomyia* fasciata). Proof of this was established in 1900 by the Yellow Fever commission of the U.S. army under Maj. Walter Reed (*q.v.*) by experiments using human volunteers including the members of the commission. In 1932 unquestionable yellow fever in the absence of Aedes aegypti was encountered in Espirito Santo, Braz.

It was then recognized that a similar situation had long existed in various parts of Colombia. Studies in both Brazil and Colombia demonstrated the second type of cycle in the tropical forest involving animals and forest mosquitoes and not requiring the presence of man.

With the discovery of the jungle habitat of the virus, it became apparent that it was constantly present over a huge area of South America, which could be described roughly as the drainage areas of the great rivers Magdalena, Orinoco and Amazon, and extending up the eastern slopes of the Andes mountains to about 1,500 m. of elevation and as far south as Bolivia.

Later it was found that the virus was established in the forests of tropical Africa save in regions at high altitude. Again, the river systems delineate most of the endemic region: the Volta, Niger, Cross, Congo and Zambezi rivers and the upper portion of the Nile.

Because of the effective campaigns for the eradication of *Aëdes* aegypti throughout South and Central America, only sporadic cases infected in the forest have been encountered in Latin America since 1934. In Africa, however, a case of jungle origin rarely is recognized because of the vast preponderance of Aedes aegypti transmissions in the villages.

An important exception is the Republic of the Congo, where suppression of Aedes aegypti and an effective diagnostic system (viscerotomy) have permitted the identification of many cases of true jungle yellow fever.

Urban outbreaks have not been seen along the east coast of Africa. and the disease is unknown in India and the countries of the far east.

The Virus. — The yellow fever virus multiplies in the living cells of certain species of animals and mosquitoes. Extraordinarily large concentrations of virus may occur in the blood of some mammalian hosts. Not only may the virus multiply in the intact animal or insect, but it generally grows excellently in embryonic cells in tissue culture.

While Walter Reed had shown that yellow fever mas caused by a virus, experimental work awaited a susceptible animal. The West African Yellow Fever commission found that the rhesus monkey from India would become fatally ill from the West African yellow fever virus. Later the white mouse was also shown to be susceptible, permitting the development of practical methods for demonstrating immunity.

Clinical Features. — After the bite of the infecting mosquito, there is an incubation period of several days while virus is multiplying within the body. The onset of symptoms is characteristically abrupt, with headache, severe backache, rapidly rising fever, nausea and vomiting. In severe cases there is hemorrhage into the mucous membranes, so that vomiting of dark, altered blood is one of the classical manifestations. Because the virus injures and destroys liver cells, jaundice is common, and is reflected in the name of the disease.

The course of the disease is rapid. Convalescence is prolonged, but recovery, when it occurs, is remarkably complete and accompanied by a lifelong immunity. Mortality varies greatly, depending upon the strain of virus and to some extent upon race.

There is no specific treatment for yellow fever. Good nursing and supportive care are important in maintaining comfort and reducing mortality.

Epidemiology. — Free yellow fever virus may be found circulating in the blood stream during the first four to six days of the illness. The mosquito vector must feed during this period if it is to receive an infective dose. Thereafter, about 12 days must pass before the virus has multiplied in the mosquito so that the salivary glands of the insect have become infective. Henceforward, it will discharge a small amount of virus through its proboscis each time it takes a new blood meal. If the animal or man that is bitten is susceptible, a new case of yellow fever virus infection results and the cycle begins again.

Classical or urban yellow fever involves only man and Aedes aegypti. Concentrations of population, a house-loving mosquito vector and the introduction of the virus furnish the necessary conditions for an epidemic. In the tropical forest. similarly, the spread and maintenance of the virus is dependent upon the density of susceptible animals and the efficiency of the transmitting mosquitoes.

Migration of the virus may occur through travel of either the infected animal or man or the virus-carrying mosquitoes. The direct flight of mosquitoes is generally limited, but winds may carry them long distances. Mosquitoes, like man, may also enjoy the facilities of the airplane. In nature, speeds are more moderate. For example. in the Central American outbreak that began in 1948, the progression northward as shown by both human and monkey infections was at an average speed of 13 mi. per month.

In South America, the chief vector mosquito in the forest belongs to the genus *Haemagogus*. The species most frequently implicated in the Amazon and Orinoco watersheds is H. *spegazzinii* *falco.* From the central portion of Colombia northward the genus is complex, and more than the one species may participate in the transmission. There are a few other forest mosquitoes in tropical America that under certain conditions appear to be able to spread the virus of yellow fever.

The forest mosquito of tropical Africa that fills the role of *Haemagogus* in tropical America is *Aedes africanus.* Like its American counterpart, it breeds in tree holes and exhibits a marked preference for the forest canopy. Unlike *Haemagogus,* which bites only by day, *A. africanus* becomes active at dusk and may bite through the night. These biological differences are of the greatest importance; the forest infections of man are acquired during daylight where *Haemagogus* is the vector, but, because there is little human contact with the forest after dark in tropical Africa, transmission of yellow fever to man by *Aedes africanus* must be rare.

Another mosquito, *Aedes simpsoni,* has been found to predominate in carrying the virus from monkeys to. man. especially in the eastern portion of equatorial Africa.

In South and Central America, some of the monkey species. but especially the howlers *(Alouattaj,* exhibit high mortality. Generally, the other susceptible animals show a similar ease of infection with the virus but do not become appreciably ill. The African monkeys generally behave as the *Cebus* of South America in that they may be readily infected and circulate virus adequate to infect mosquitoes without showing signs of illness. A notable exception is the bush baby *(Galago),* some of uhich show high fatality with yellow fever virus infections.

As a generality, all the mammals that are susceptible to the virus produce antibodies and, if they survive the acute disease. are thereafter immune for life. The monkey behaviour thus has many parallels with the human case, and careful study of the blood antibodies of animals may serve to reconstruct the past history of a forest region with respect to the passage of yellow fever virus through the area.

Prevention.—Yellow fever is an outstanding example of a completely preventable disease. Originally, the control of *Aëdes aegypti* mosquitoes was the only preventive procedure available. The success of the campaign against these mosquitoes made possible the Panama canal Later it appeared more economical to eradicate the mosquito than merely to control it. and all of South and Central America and Mexico have been freed from this dangerous mosquito.

Live virus vaccines, capable of producing active immunity without clinical illness, are the second great preventive measure. French workers hdve used an attenuated neurotropic virus in mouse brain for the successful immunization of millions of persons, especially in Africa. In the United States, workers of the Rockefeller foundation produced the 17-D vaccine strain by prolonged cultivation of the Asibi strain in embryonic chick tissues. The vaccine made from growing the 17-D virus in chick embryos has been employed for the immunization of millions oi people all over the world.

Eradication of the *Aedes aegypti* mosquito gives effective protection to the populace of cities. Where people must travel or live in regions where the forest cycle of the virus is maintained. then individual immunization is necessary. In jungle yellow fever areas, human cases will continue as long as there remain unimmunized persons, for there is no known practical way of eliminating the virus of yellow fever from the vast tropical forests of South America and Africa.

Strode (1951); Rockefeller Foundation *Annual Reports* (1918–50) (*J.* C. BU)

YELLOW POPLAR: *see* TULIP TREE.

YELLOW RIVER: *see* HWANG-HO.

YELLOWROOT, a small North American shrub (*Xanthorhiza simplirissima)* of the crowfoot family (Ranunculaceae, *q.v.*), found in woods from western New York to Kentucky and Florida. It has smooth stems, one to two feet high, with yellow wood, long yellow roots. parsleylike leaves and small purplish flowers in slender drooping clusters. It is sparingly planted for ornament. Yellowroot is also applied to the goldenseal *(Hydrastis canadensis)* and goldthread *(Coptis trifolia).*

YELLOW SEA (HUANG HAI), a large inlet of the Pacific ocean (area about 180.000 sq.mi.) lying between Korea and China. The Strait of Chihli between the Liaotung and Shantung peninsulas links the Yellow sea on the northwest with the Gulf of Chihli (Po Hai) and the Gulf of Liaotung. To the south the Yellow sea merges with the East China sea along a goo-mi. line between the southwestern tip of Korea and the coast of Kiangsu province south of the Shantung peninsula. The Yellow sea is shallow with a maximum depth of about 250 ft., lying entirely above the continental shelf.

Although some warm, saline water from the Japanese (Kuroshio) current enters the Yellow sea. water temperature and salinity are highly variable and strongly influenced by an inflow of fresh, silt-laden water from major rivers. Of these: the Yellow river (Huang Ho). flowing into the Gulf of Chihli. is the most important. One of the most heavily silt-laden of the world's major rivers, the Yellow discharges an estimated 15,000,000,000 cu.yd. of sediment per year, hence the name for both river and sea. The Huai river reaches the Yellow sea south of the Shantung peninsula, a course also followed by the Yellow river at various periods during the past and most recently during the years 1938–47. To tht north other important rivers are the Pai, the Liao and the Yalu in China and the Taedong and Han in Korea.

None of these rivers is important for water transport, and port development is handicapped along much of the shore line by silting and the substantial tidal fluctuations. However, the areas adjacent to the Yellow sea are densely populated and agriculturally productive. Mineral and manufacturing industries were being rapidly expanded in the second half of the 20th century, especially in north and northeast China. with a consequent potential for substantial import-export traffic through the Yellow sea. Ports such as Tsingtao. Chefoo, Tientsin, Hulutao, Port Arthur, Dairen and Inchon are signiiicant for both coastal and overseas commerce.

Although statistics are lacking, fishing is of undoubted importance in view of the population pressure in the adjacent areas and the abundance of fish in the waters above the continental shelf. Fishing villages dot the hilly, indented coasts of the Shantung and Liaotung peninsulas. Also Korea is an important fishing nation, with its major concentrations of population in the area facing the Yellow Sea. (T. R. S.)

YELLOW SPRINGS, a village of Ohio, U.S., is located in Greene county 9 mi. S. of Springfield, 9 mi. N. of Nenia and 18 mi. E. of Dayton, in the Dayton metropolitan area. The village. which was incorporated in 1856, was named after a local spring originally the site of a resort and health spa during the period 1820–80. Antioch college, a private, nonsectarian, coeducational. liberal arts institution was founded there in 1852 with Horace Mann (*q.v.*) as its first president. Over the years, the college became known for its high academic standards. its pioneering leadership in the field of education, its alternating work-study program and the affiliated research organizations of the Charles F. Kettering foundation and Fels Research institute for the study of human development. The teaching and research faculty numbers about 125 and over 1.200 students are enrolled representing 44 states and 13 foreign countries.

The local industries are diverse, producing aluminurn castings. molded rubber products, electronic equipment. stained glass. granite surface plates. bronze art casting and most of the nation's bookplates. The national headquarters of the American Humanist association as well as Community Service Inc. are located there. (J. F. LY.)

YELLOWSTONE NATIONAL PARK, oldest and best known of the United States national parks, uas established by congress March 1, 1872, as the first extensive land area set aside and preserved by any government for the benefit and enjoyment of the people for all time to come.

The park includes 2,221,773 ac.. including 8 566 ac. of nonfederal land, and is surrounded by national forests — the Gallatin on the north, Shoshone on the east; Teton and Targhee to the south and the Targhee and Gallatin on the west. The park is bordered on the east and south by Wyoming, on the west by Idaho and Montana and on the north by Montana.

Volcanic plateaus. with an average elevation of 8,000 ft.. compose most of the park. High rugged mountains flank and protrude into it on the northwest, north and east. The peaks along the northwest are the Gallatin range. with the 10,992-ft. crest of Electric peak being the park's second highest. The majestic Absaroka range forms an unbroken barrier along the eastern side, and many of its rugged peaks and canyon-grooved mountain masses lie within the park. Eagle peak, elevation 11,360 ft., the park's highest point, is in the southern section of this range. The Snow mountains stretch their snow-capped summits across the north — just beyond the park. The Teton range. one of the most spectacular features of the northern Rockies, looms high upon the park's southern horizon, and its northern foothills approach the park.

Tellowstone has unusual geologic phenomena. Outstanding among these are fossil forests, eroded basaltic lava flows, Obsidian cliff—a, black glass mountain — spectacular deep valleys. unique landslides. vast bisected plateaus and odd erosional forms.

Yellowstone's 10,000 hot springs find surface expression as steam vents; fumaroles. colourful hot pools, mud caldrons. paint pots! hot springs and terraces, hot rivers and geysers. Of its 200 geysers, many erupt to heights in excess of 100 ft. Outstanding thermal zones are: the Upper, Midway, Lower. Norris. Rest Thumb, Heart lake and Shoshone lake geyser basins, the Mud Volcano area and the Mammoth Hot Spring terraces.

Old Faithful geyser. with its graceful and beautiful column of hot water and steam vapour. was named by Gen. Henry D. Washburn in 1870. Its average eruption interval is 64.j minutes — intervals vary from 33 to 93 minutes. Eruptions'last 2½ to j minutes — 10,000 to 12,000 gal. of water are discharged. Eruption heights average 150 ft. Although eclipsed in size by other geysers, Old Faithful remains the most popular.

Hot pools of great magnitude provide brilliant splashes of colour on the white sinter plains of the geyser basins. Their names suggest their gemlike beauty — Turquoise. Emerald. Jewel, Sapphire, Beryl, Grand Prismatic, Opal and others equally expressive.

Hundreds of miles of clear streams flow from the park's mountains and plateaus. Large rivers are the Yellowstone, Snake, Madison. Lamar. Falls. Bechler. Firehole. Gallatin, Gardner and Gibbon. A pattern of creeks, tributary to these rivers, spreads to the crests of the mountain ranges. Beautiful waterfalls occur along the stream courses. Lakes and ponds dot the forested plateaus. Yellowstone lake's maximum depth is 320 ft.. surface 139 sq.mi., length 20 mi.. width 14 mi., shore line 110 mi. and mean surface elevation 7,731 it. Unexcelled as a place of beauty, it is a sapphire in a jade green forest surrounded by snow-capped mountains. Other large park lakes of unusual beauty are Shoshone, Lewis, Heart and Grebe.

The Grand Canyon of the Yellowstone, sculptured from decomposed rhyolite lava rock, is a colourful gorge 19 mi. long. Its greatest depth is 1,540 ft., and its widest point 3,500 ft. It is a remarkable display of the work of water, wind, weathering and other erosive forces. The brilliant multicoloured walls of red, pink, yellow. buff. lavender. white and a thousand combinations of these colours are its crowning glory. The rugged pinnacles, ridges, spires, sinuous river. white cascades and emerald green waters enhance its spectacular character. Two majestic waterfalls grace it with their beauty — the Upper falls drops 109 ft., the Lower falls 319 ft.

The park's verdant plant covering varies from microscopic algae in hot-spring runoffs to forest trees. The park is 90% forested, and 90% of this is lodgepole pine. The park's eight evergreen species are: lodgepole pine, Engelmann's spruce, Douglas fir. subalpine fir, limber pine, nhitebark pine, Rocky mountain juniper and mountain common juniper. Cottonnoods grow along streams and aspen stands occur in many sections. Intermontane meadows abound, and vqst alpine tundra areas occur above timber line. In season, wild flowers splash the landscape nith colour. Colourful flowers include geraniums, lupines, phacelias, sunflowers, balsamroot, fringed gentians, cinquefoils, pedicularis and many more. Dainty, rare and less conspicuous plants bloom in secretive woodland environments. Small lakes harbour aquatic plants — their surfaces covered with bright yellow wokas blossoms.

The park fauna, typifying the native animals of the Rocky mountain region, runs the gamut from microorganisms to American bison. Large mammals — elk, mule deer, moose, bighorn, antelope, bison, black bear and grizzly bear — and coyotes are common. Wolves, fisher! cougar, white-tailed deer and wolverines are extinct or rare transients. Smaller mammals, otter. mink, badger, weasel. marten, beaver. skunk. marmot and many small rodents are commonly seen. The bird list includes 237 species as permanent residents and seasonal migrants. Waterfowl are especially abundant on the lakes and streams. Reptiles and amphibians are not abundant. The park waters are stocked with a variety of fishes,, and the native black-spotted trout is eagerly sought by fishermen.

John Colter in 1808 first described the Yellowstone country. Daniel T. Potts, July 8, 1827, wrote a vivid description of West Thumb geyser basin. James Bridger, Joseph Meek, Osborne Russell and other trappers told of the canyon, lake and geysers. Warren Angus Ferris prepared a comprehensive map of the countryside in 1836. In 1859 an official government party, commanded by Capt. W. F. Raynolds, failed to reach the fabled area. The well-planned expedition of 1870, led by General Washburn and Lieut. Gustavus C. Doane, explored the area and forcefully promoted the establishment of Yellowstone National park.

YELLOWSTONE RIVER, U.S., most productive tributary of the Missouri river. is an interstate stream draining southeast Montana, north central Wyoming and a small, northwest area of North Dakota. The river and all its principal tributaries — Clarks Fork. Bighorn, Tongue and Powder rivers — originate in and receive most of their water from the Absaroka, Wind River and Bighorn mountains. Rising on the slopes of Younts peak in Wyoming, the river enters Yellowstone National park and feeds into Yellowstone lake via the southeast arm. Below the lake it plunges 422 ft. in two spectacular waterfalls and enters one of the most magnificent of all river gorges, the Grand Canyon of the Yellowstone. Leaving the park at Gardiner, Mont., the river turns north to Livingston, thence northeast past Billings, Miles City and Glendive. crosses the Montana state line and joins the Missouri near Buford, N.D. The river system is used primarily for irrigation. Its lower reaches are generally silt laden but its headwaters are clear, snow-fed streams, originating in heavily forested, mountainous areas with abundant recreational, fishing and hunting resources.

The Yellowstone was unexplored until 1806 when Lieut. William Clark sailed down the river on his return journey from the Pacific. Manuel Lisa. Indian trader, accompanied by John Colter, established the first trading post on the Yellowstone at the mouth of the Bighorn river in 1807. In connection with this endeavour, Colter visited the Indian tribes south of the river, which, in turn, led to his becoming the first white man to see the geysers of Yellowstone park. (G. V. Sk.)

YELLOWTHROAT, the name given to a species. with several subspecies, of North American birds of the passerine family Mniotiltidae, the American wood warblers. The best known is the Maryland yellowthroat (*Geothlypis trichas*) which ranges over the greater part of the United States and southern Canada.

About five inches long. this bird is olive green above. yellow below. with black forehead and cheeks in the male. Its subspecies the tule yellowthroat (G. t. *scirpicola)* is resident in southern California.

The western yellowthroat (G. *t. occidentalis*) is found in southeastern California and southwestern Arizona.

YELLOWWOOD, AMERICAN (Cladrastis *lutea*), a handsome North American tree of the family Leguminosae, called also yellow locust. gopherwood and virgilia. Though somewhat rare in the wild state! being found only locally in rich soils, chiefly along mountain streams. from North Carolina to Missouri, it is widely cultivated for ornament. The tree has a short trunk branching into a graceful crown, sometimes rising 50 ft., with smooth bark, pinnate leaves and fragrant, pealike white flowers, 1 in. long, borne in loose drooping clusters, 10 in. to 20 in. long, blossoming in June. The hard strong wood yields a yellow dye.

YEMEN (YAMAN), a kingdom in the southwestern coastal region of the Arabian peninsula, bounded northwest and northeast by Saudi Arabia, southeast by Aden and southwest by the Red sea. Area 75,290 sq.mi.; population (1953) about 4,500,000. The capital is Sana (*q.v.;* pop. about 50,000).

Ptolemy and the ancient geographers in general include the whole peninsula under the name of Arabia Felix (eudaimon), in which sense they translate the Arabic *Yaman,* literally "right hand," for all Arabia south of the Gulf of Aqaba was to the right from their standpoint of Alexandria; the Moslem geographers, however, viewing it from Mecca, confine the term to the regions south of Hejaz, including Asir, Hadhramaut, Oman and part of southern Nejd.

Yemen occupies the uptilted edge of a block of ancient land forming Arabia. This edge is known as the Jibal or highlands of Yemen (average height 9,000 ft., highest measured point 12.336 ft.). The principal town of the Jibal is Ta'iz (pop. about 12,000), formerly a large city, in the centre of a comparatively fertile district and at the junction of several trade routes. About 30 mi. farther north are the small towns of Ibb (6,700 ft.) and Jibla, about 5 mi. apart, typical hill towns with their high stone-built houses and paved streets. Manakha produces the best coffee in Yemen. Still farther north, in the mountain mass between the Wadi Maur and Wadi Laja, the strongholds of Dhafir, Afar, Haja and Kaukaban have long been known for their independence. The last-named was once a city of 20,000 inhabitants and the capital of a small principality which preserved its independence during the earlier Turkish occupation between 1536 and 1630. The lowland strip of Yemen, from 20 to 30 mi. wide, is known as the Tihama and is hot and generally sterile. There are oases, however, near the foot of the mountains, fertilized and irrigated by hill streams and supporting many large villages and towns. The most important of these are Zaidiya, Bait al Faqih and Zabid in the western Tihama, the latter a town of 20,000 inhabitants. Hodeida (*q.v.*) is the only port of commercial importance. while Mokha is the old centre of the coffee trade. Beyond the crest of the Jibal stretches the third natural region of Yemen — the great desert. As it lies entirely to the east of the high crest, it has a smaller rainfall than the Jibal. Its general character is that of a steppe increasing in aridity toward the east where it merges in the desert, but broken in places by rocky ranges. some of which rise 2,000 ft. above the general level and which in the Hamdan district north of Sana show evidence of volcanic action. 'This desert is intersected by several wadi systems, of which the principal are: in the north those uniting to form the Wadi Najran; in the centre the Wadi Kharid and Shibwan running to the Jauf; and in the south the Wadi Bana and its affluents draining to the Gulf of Aden. The plateau has a gradual fall from the watershed near Yarim. 8,500 ft. above sea level, to less than 4,000 ft. at the edge of the desert.

The northern part nearly down to the latitude of Sana is the territory of the Hashid and Baqil tribes. which never submitted to the Turks. Sada is an important town on the old pilgrim road 120 mi. S. of Sana, Khaiwan and Khamr. To the northeast, bordering on the desert. lies the district of Najran, now in Saudi Arabia, a mountainous country with several fertile valleys including the Wadi Najran, Badr and Habuna. all probably draining northeast to the Rub' al Khali. Farther south is the oasis of Jauf, a hollow or depression, as its name signifies, containing many villages. It was the focus of the old Minaean and Sabaean kingdoms, known to the ancients through their control of the frankincense trade of south Arabia. Ma'in, identified by Halévy as the seat of the former, is on a hilltop surrounded by walls still well preserved. Marib, the Sabaean capital, had a great dam to whose breaking between A.D. 542 and 570 tradition ascribes the final decay of Yemen. The city was abandoned. probably because oi the deterioration of the country through desiccation, which forced the settled population farther westward, where Sana became the centre of the later Himyaritic kingdom. The Arhab district drained by the Wadi Kharid and Shibwan between Sana and the Jauf is covered with Himyaritic ruins. showing that the land formerly supported a large settled population. Throughout Yemen is found the *mijal*—a cemented well for the storing of water. These wells have associations with Persian influence in the 6th century A.D. South of the territory described above are Amran and Shibam on the road leading north from the capital Sana; Dhamar (the seat of an ancient university) and Yarim are on the road leading south to Aden; and two days' journey to the east is Rada'.

The inhabitants of Yemen are settled and for the most part occupied in agriculture and trade. The people may be considered under four groups: (1) the Saiyids or Xshraf. descendants of the Prophet. forming a religious aristocracy; (2) the Qabail or tribesmen, belonging to the Qahtanic or original south Arabian stock, who form the bulk of the population; (3) the trading class; and (4) a mixed group mostly of African descent. A Jewish minority of 50,000 emigrated to Israel in 1949.

The kingdom of the Yemen, founded by a revolt against the Ottoman empire led by the imam Yahya ibn Mohammed ibn Yahya Hamid ud-Din in 1904. achieved its full independence in 1918. In 1933 it lost its northern province Asir to Saudi Arabia.

The imam Yahya, inurdered in Feb. 1938. was succeeded by his eldest son. Xhrned ibn Yahya ibn Mohammed Hamid ed-Din. The government is patriarchal. An Anglo-Yemeni agreement of 1951 established diplomatic relations between Great Britain and Yemen. However, throughout the mid-1950s there were clashes on the frontier between Yemen and the West Aden protectorate which the Yemeni government claimed as part of its territory. In 1955 a G.S. company secured the first oil and mineral concession ever granted by Yemen. In the same year Yemen established diplomatic relations with the C.S.S.R.. and a trade agreement was later concluded between the two countries. During 1957 arms were imported in some quantity from the Soviet Union and Czechoslovakia.

The federation of Yemen with the United Arab Republic (formed March 8, 1958. and known as the United Arab States) was dissolved in Dec. 1961. See also ARABIA.

(P. K. H.; X.)

YEN, the monetary unit of the Japanese empire, is divided into 100 sen and 1,000 rin.. Under the Gold Standard law of 1897 the yen has a theoretical gold content of 750 mg. of fine gold. but Japan's gold reserves are valued under the Gold Reserve Revaluation law of 1937 on the basis of a gold content of 290 mg. per yen. The obligation of the Bank of Japan to convert its notes into gold was suspended by the Gold embargo of Dec. 13. 1931, and repealed by the Law of the Bank of Japan of 1942. From 1936 on, the extension of Japanese domination to parts of China and southeast Asia brought under the control of the Bank of Japan (*q.v.*) the various currencies of the "Greater East Asia Co-prosperity Sphere." and resulted in the formation of a "yen monetary bloc." At the time of its largest expansion, in 1944, the yen bloc included the currencies of Manchoukuo, Mongolia, northern China, central and southern China, Indochina. Malay, Thailand. Burma, the Philippines and the East Indies. The Japanese authorities followed a policy of bringing about a uniform value (1:1) between the various local currencies and the yen through strict control of all movements of funds and goods between countries of the yen bloc.

After World War II the Bank of Japan was reorganized. the responsibility for setting money policies being assumed by a new policy board, comprised of the president oi the bank and representatives of various financial interests. In Jan. 1950 a new 1,000-yen bank note was introduced. The official value of the yen in 1957 was 360 to the U.S. dollar. (F. M. T.; X.)

YENISEI, a river of central Siberia, U.S.S.R., is one of the largest in the world. with a length of 2.538 mi. Its drainage area is 1,003,485 sq.mi. The Yenisei is formed by the union of the Bolshoi Yenisei, or Bii-Rhem, and the Maly Yenisei, or Ka-Khem. These two headstreams rise in the Tuva Autonomous Soviet Socialist Republic and flow westward through tectonic basins to meet at Kyzyl. Thereafter the Yenisei flows west past Shagonar and turns sharply north to cut through the western Sayan mountains in a narrow gorge, in places less than 100 yd. wide. In this stretch are many rapids. notably those of Bolshoi Porog. The river emerges from the western Sayans into another broad, tectonic basin. that of Minusinsk in Krasnoyarsk *krai.* There the Yenisei receives its first large tributaries, the Abakan on the left and the Tuba on the right. and becomes nearly 1.000 yd. broad and braided. As the Yenisei cuts across the northern end of the eastern Sayans, it is once more confined in a single bed, between high granite banks. On this section, immediately above Krasnoyarsk, the construction of a huge barrage and hydroelectric station was begun in 1956. The station was planned to have a capacity of 4.000.000 kw. and the reservoir to hold 105,000,000,000 cu.yd.

At Krasnoyarsk, the largest town on the Yenisei, the river is crossed by the Trans-Siberian railway and transshipment is important.

Below Krasnoyarsk the river follows a north-by-west course to its estuary, along the western edge of the Central Siberian plateau. which rises steeply from the right bank. This long. relatively straight course is joined by the largest tributaries. the Angara. Podkamennaya Tunguska and Nizhnyaya Tunguska. The Yenisei gradually widens from 1.500 yd. to 3 mi. At Osinovo, at the northern end of the Yenisei ridge. rock outcrops narrow the river and cause rapids. which impede navigation. Below Dudinka, the Yenisei turns west and north into a series of distributaries which enter the long, narrow Yenisei gulf of the Kara sea. The gulf represents the drowned lower valley of the Yenisei.

The outstanding feature of the basin of the Yenisei is its extreme asymmetry. Apart from the Abakan in the upper course! there are no left-bank tributaries of any size and in many places the Ob basin extends to within 50 mi. of the Yenisei itself and at one point to within 6 mi. On the right bank the tributaries are large and drain Lake Baikal. much of Transbaikalia and the greater part of the Central Siberian plateau. The Yenisei carries the largest volume of water of any river in the C.S.S.R., with an average annual discharge of 614,477 cu.ft. per second. As with most Russian rivers there is a very marked spring maximum, with more than half the annual flow. The maximum recorded flow at Dudinka was 4.661.547 cu.ft. per second and the minimum 88,287. Freeze-up on the Yenisei begins in early October in the lower course and mid-October in the upper, but because of the volume of warmer water which it brings from the south it freezes later than its tributaries. Ice cover is established by the end of October in the north and in early November in the upper reaches. Some rapids do not freeze at all. The ice breakup begins in early May on the upper river, but not until a month later in the lower reaches. This delay causes huge and impressive ice jams, which may do extensive damage to riverside installations and cause widespread flooding.

Since 1952, when the Bolshoi Porog was made passable, the Yenisei has been navigable during the ice-free months for its entire length to Kyzyl. Below Teniseisk the river is the only line of communication other than winter trails. A length of railway connects the Yenisei at Dudinka to the mining region of Norilsk. The chief ireight is timber, rafted to Igarka on the lower course. Igarka is a major sawmilling centre and second only to Archangel as a timber-exporting port of the U.S.S.R. For the most part the Yenisei basin is very thinly peopled tundra or taiga, but in the steppes around Krasnoyarsk and Minusinsk population density is much greater and economic activity, especially mining and agriculture, is well developed.

YEOMAN, a term meaning, first, a class of holders of land and second. a retainer, guard, attendant or subordinate official. The word appears in M E as *ʒeman, ʒoman* and *yeman;* it does not appear in O E. It is generally accepted that the first part is the same word as the German *Gau,* district, province, and probably occurs in O E. as *gēa* in *Súðri-géa,* Surrey; i *e.,* southern district. and other place names. Yeoman thus meant a countryman, a man of the district, and it is this sense which has survived in the special use of the word for a class of landholders.

The extent of the class covered by the word "yeoman" in England has never been very exactly defined. One of the earliest pictures of a yeoman is that given by Chaucer in the Prologue to the *Canterbury Tales.* Here, represented as a forester, he follows the esquire as a retainer or dependant. The yeomen of later ages, however, are practically all occupied in cultivating the land, although, doubtless from its younger sons. the class furnished retainers for the great lords, men-at-arms and archers for the wars. and tradesmen for the towns. Medley *(Eng. Const. Hist.)* describes the yeomen of the 15th century as representing on the whole "the small freeholders of the feudal manor." Holinshed, in his *Chronicle,* following Sir T. Smyth *(De republica Anglorum),* and W. Harrison *(Description of England),* describes them as having free land worth £6 annually, and in times past 40*s*., and as not entitled to bear arms. They formed the intermediate class between the gentry and the labourers and artisans.

YEOMANRY, the name given to the volunteer mounted troops which, together with the militia (*q.v.*), supplemented the armed forces of Great Britain in times of national emergency. These bands of cavalry were first formed as the result of the Jacobite rising of 1745: the duke of Montagu and other local magnates hastened to raise volunteer mounted troops, such as the Northampton association and the royal regiment of hunters enrolled by the landowners of Yorkshire. The landed gentry were the officers of the force; the tenant farmers served in the ranks; and all provided their own mounts. This constituted the organization envisaged by the Militia acts of 1757 and 1763 and adopted in 1794. The Provisional Cavalry act rendered every owner of ten horses, either personally or in a group, responsible for furnishing one trooper; but this was later amended to clear the way for voluntary enlistment, sweetened by generous bounties. The threat of a French invasion in 1803 greatly stimulated recruiting, both for the county yeomanry and the urban light horse volunteers, and the opportunity was therefore taken to abolish the limitations on the place of service within Great Britain. Despite the diminished threat of invasion, the yeomanry remained under arms, subsequently supporting the civil power in such disturbances as the Peterloo tumult of 1819 and the Chartist riots.

From 1849 to the outbreak of the South African War in 1899, houever, the yeomanry declined in strength and enthusiasm (save for a brief period during the French war scare of 1852), the total of the force shrinking from 44,000 to 10.000. The call for mounted troops, capable of shock action with the sword and missile action with the rifle, to take the field against the Boers, met with an instant response from the yeomanry. In all, more than 34,000 volunteered and were accepted for service. for whom the standing yeomanry organization furnished the cadres and training. Yeomanry hill, near Nooitgedacht on the Megaliesburg range, commemorates one of the corps' more notable exploits during the war.

In 1901, William Brodrick, as secretary for war, remodeled the yeomanry on the basis of four squadrons to a regiment, legislating for a total force of 35,000. In 1907, with Richard Haldane's reorganization of the volunteers, the yeomanry became an integral part of the new territorial force.

With the outbreak of World War I in 1914, 53 regiments of yeomanry mobilized, four regiments being brigaded with the regulars of the cavalry corps. The first to see action were the Oxfordshire hussars, who accompanied the Royal Naval division in the brief holding action during the siege of Antwerp. The trench warfare in France and Flanders and in Gallipoli, however, temporarily ruled out the use of mounted troops, so that the Scottish horse and Lovat's scouts served as infantry against the Turks on the peninsula of Gallipoli It was not until Gen. Sir Edmund Allenby revitalized the campaign in Palestine that the yeomanry could be employed in the work for which they had trained, and 14 regiments, including some survivors from Gallipoli, were distributed over the divisions making up the desert mounted corps. Following the third battle of Gaza the yeomanry, without any support from the regular cavalry, scored heavily in the actions of Huj and El Mughaiyir with classic attacks in the best tradition of open warfare. In Nov. 1917 the yeomanry led the assault against the Turkish centre at Kauwaka and assisted in the capture of the enemy railhead at Sharia. Opportunities for mounted action, however, were infrequent, and by early 1917 a complete infantry division, the 74th. had been improvised out of 18 yeomanry regiments, many of which had already had experience of ground combat. It was first engaged as a division at the second battle of Gaza and later participated in the capture of Jerusalem. In the spring of 1918 it mas transferred to the western front, where eight yeomanry formations had been grouped into machine gun units.

With the postwar reduction in the regular cavalry, the greater portion of the yeomanry was mechanized, 8 regiments being converted to armoured car companies and 25 transformed into artillery units. It was therefore in these and several other capacities that the yeomanry, which had ceased to be of a uniform character, served throughout World War II, winning particularly warm cominendation for its versatile work in the western desert. With universal mechanization and the threat of tactical atomic weapons, the traditional functions of the yeomanry became irrelevant to modern warfare, although every effort was made to maintain the localized, close-knit family relationship and traditions. (*See* also TERRITORIAL ARMY.) (R. C. H.)

YEOMEN OF THE GUARD, originally "Yeomen of the Guard of (the body of) our Lord the King"—"Valecti garde (corporis) *domini* Regis"—the title maintained with but a slight variation since their institution in 1485, of a permanent military corps in attendance on the sovereign of England, as part of the royal household, whose duties, now purely ceremonial, were originally those of the sovereign's personal bodyguard. They are the oldest existing body of the kind. The first warrants to individual "Yeoman of the Guard" date from Sept. 16, 1485, immediately after the victory of Henry VII. at Bosworth (Aug. 22).

The first official recorded appearance of the king's bodyguard of the Yeomen of the Guard was at the coronation of its founder Henry VII. at Westminster Abbey on Oct. 31, 1485, when it numbered 50 members. That number was rapidly increased, for there is an authentic roll of 126 attending the king's funeral in 1509. Henry VIII. raised the strength of the Guard to 600 when he took it to visit Francis I. of France at the Field of Cloth of Gold (*q.v.*). In Queen Elizabeth's reign it numbered 200. The corps was originally officered by a captain (a post long associated with that of vice-chamberlain), an ensign (or standard-bearer), a clerk of the cheque (or chequer roll, his duty being to keep the roll of every one connected with the household), besides petty officers, captains, sergeants or ushers. In 1669 Charles II. reorganized the Guard and gave it a fixed establishment of 100 yeomen, officered by a captain, a lieutenant, an ensign, a clerk of the cheque and four corporals, which is the present organization and strength. The captaincy is now a ministerial appointment filled by a nobleman of distinction under the lord chamberlain, and the old rank of "corporals" has been changed to "exon," a title derived from "exempt," *i.e.,* exempted from regular regimental duty for employment on the staff. Formerly officers on the active list were given these appointments in addition to their own.

The original duties of the Guard were of the most comprehensive nature. They were the king's personal attendants day and night at home and abroad. They were responsible for his safety not only on journeys and on the battlefield, but also within the precincts of the palace itself. In Tudor times the Yeomen of the Guard alone were entrusted with the elaborate formality of making the king's bed. Another of their duties still retained is the searching of the vaults of the houses of parliament at the opening of each session, dating from the "Gunpowder plot," in 1605, when the Yeomen of the Guard seized Guy Fawkes and his fellow-traitors and conveyed them to the Tower.

The dress worn by the Yeomen of the Guard is in its most striking characteristics the same as it was in Tudor times. It has consisted from the first of a royal red tunic with purple facings and stripes and gold lace ornaments. Sometimes the sleeves have been fuller and the skirts longer. Red knee-breeches and red stockings (white in Georgian period only), flat hat, and black shoes with red, white, and blue rosettes are worn. Queen Elizabeth added the ruff. The Stuarts replaced the ruff and round hats with fancy lace and plumed hats. Queen Anne discarded both the ruff and the lace. The Georges reintroduced the ruff, and it has ever since been part of the permanent dress. Up to 1830 the officers of the Guard wore the same Tudor dress as the non-commissioned officers and men, but under William IV. the officers were given the dress of a field officer of the Peninsular period. The weapons of the Guard are a steel gilt halberd with a tassel of red and gold and an ornamental sword.

The real fighting days of the Guard ended with the Tudor period, but it was only with the final appearance of an English King in battle (Dettingen 1743) that the Guard's function of attending a sovereign on the battlefield ceased. For a brief period during the Georgian era the Guard lost to a certain extent its distinctive military character and a custom crept in of filling vacancies with civilians, who bought their places for considerable sums, the appointments being of great value. William IV. put a stop to the practice, the last civilian retired in 1848, and the Guard regained its original military character. Every officer (except the captain), non-commissioned officer and yeoman must have served in the Home or Indian army or Royal Marines. They are selected for distinguished conduct in the field, and their pay is looked upon as a pension.

The nickname "Beef-eaters," which is sometimes associated with the Yeomen of the Guard, had its origin in 1669, when Count Cosimo, grand duke of Tuscany, was in England, and, writing of the size and stature of this magnificent Guard, said, "They are great. eaters of beef, of which a very large ration is given them daily at the court, and they might be called 'Beef-eaters.' "

In 1509, Henry VIII., envying the magnificence of the bodyguard of Francis I. of France, decided to have a noble guard of his own, which he accordingly instituted and called "The Gentlemen Speers." It was composed of young nobles gorgeously attired. In 1539 the guard was reorganized and called "Gentlemen Pensioners." That title it retained till William IV.'s reign, when the corps regained its military character and received their present designation, "The Honourable Corps of Gentlemen-at-Arms."

See *The History of the King's Body Guard of the Yeomen of the Guard, by* Colonel Sir Reginald Hennell, D.S.O., Lieutenant of the Yeomen of the Guard (1904).

YEOTMAL, a town and district in Bombay state. India. The town, 85 mi. S.W. of Nagpur, stands on an elevated plain at about 1,400 ft. The population in 1951 was 35,980. It was formerly the headquarters of the Wun district but in 1905 the new district of Yeotmal was established, the old Wun district being renamed, with additions from the district of Basim. Cotton ginning and pressing are the main industries. The town is also the chief trading centre of the district, being connected by a road, 29 mi. long, with Dhamangaon on the Central railway, while a narrow-gauge line connects it through Darhwa and Karinja with Murtizapur on the main line.

YEOTMAL DISTRICT has an area of 5,246 sq.mi. Yeotmal is a large cotton-producing district, but its upland is less fertile than the average of this region. The greater part of the district is drained by the Penganga river, which joins the Wardha in the southeast corner. There are large forest reserves in the south and southeast in which game abounds. There is a considerable aboriginal element of Gonds and Kalams in the wilder portions. The (1961) population was 1,097,973. There is coal at Pisgaon in Wun *taluka* near the Wardha river. The climate in the uplands is cool and the rainfall (41 in.) plentiful.

YEOVIL, a market town and municipal borough (1854) in the Yeovil parliamentary division of Somerset, Eng., 26 mi. E.S.E. of Taunton by road, standing by the river Yeo and near the Dorset border. Pop. (1061) 24,552. Area 3.5 sq.mi. A road centre in the middle of a large agricultural area, Yeovil also has industries including the long-established gloving and leather dressing trades; processed food. and light engineering, especially the making of aircraft such as helicopters. The parish church dates from c. 1380 and is known as the "lantern of the west."

YERBA BUENA (*Micromeria* chamissonis). a pleasantly aromatic North American herb of the mint family (Labiatae, *q.v.*), found in woods from British Columbia to southern California. It is a slender perennial. with trailing stems six inches to two feet in length, roundish, short-stalked leaves, one-half to one inch broad. and delicate, two-lipped, white flowers, borne on hairlike stalks usually singly in the leaf axils.

YERBA MANSA (*Anemopsis californica*), a North American herb of the lizard's-tail family (Saururaceae), found in wet saline places from western Texas to central California and southward to Mexico. It is a perennial with upright stems, six inches to two feet high. springing from aromatic, creeping rootstalks, and astringent, slightly spicy foliage. The flowers are borne in terminal spikes, ½ to 1½ in. long, surrounded at the base by a circle of conspicuous white bracts; the fruit is a capsule, splitting open from the top. The Spanish settlers in California used the plant medicinally.

YERBA MATÉ: see MATÉ.

YERBA SANTA (*Eriodictyon californicum*), a North American balsamic shrub of the waterleaf family (Hydrophyllaceae), native to dry slopes and mountain ridges from south central California to southern Oregon. It grows from two to eight feet high. bearing narrowly lanceolate leaves. which are very glutinous-resinous above and densely white-woolly below. and bluish or white flowers in loose clusters. The Indians and early Spanish settlers made extensive medicinal use of the bitter-aromatic leaves; the Indians also chewed and smoked them.

YEREVAN (formerly EREVAN, ERIVAN), the capital of the Armenian Soviet Socialist Republic, U.S.S.R., is located on the Razdan (or Zanga) river: a tributary of the Aras, 14 mi. from the Turkish frontier and 110 mi. S. of Tbilisi. Pop. (1959) 509,340. The twin peaks of Mt. Ararat across the frontier and Mt. Aragats and Xzhdaak to the northwest and northeast form a striking setting to the city. which has an attractive appearance with its tree-lined streets and squares. In addition to its administrative function Yerevan is an important industrial centre. Its chemical industry manufactures synthetic rubber and plastics; engineering products include electric machinery (such as mobile generators) and lamps, cables. compressors, turbines and machine tools. Clocks, textiles and clothing, shoes, wines and foodstuffs are also produced. Power for the city comes from the "cascade" of hydroelectric plants on the Razdan, one of which is located at Yerevan. The city is also the cultural centre of the republic, with an academy of sciences founded in 1943, a state university founded in 1920, a music conservatory and pedagogic, agricultural. medical, veterinary and polytechnic institutes. There are theatres of Armenian opera and ballet. of Armenian drama and of Russian drama, and the Armenian state museum. The Matenadaran archives hold a rich collection of ancient Armenian manuscripts, such as the Lazarus Gospel of 887 and fragments of even earlier date. Among notable buildings is the 16th-century Turkish fortress: now in ruins. which dominates the city. Many of the modern government buildings, designed by the Armenian architect Tamanyan and his pupils, have adapted traditional Armenian features. Yerevan is joined by a branch railway to the line which runs northward to Leninakan and Tbilisi and southward to Nakhichevan and into Iran. There are motor roads to Tbilisi. Leninakan and Baku, to Dzhulfa on the Iranian border and into Turkey.

Yerevan is one of the oldest towns of the Soviet Union, archaeological evidence indicating that the fortress of Yerbuni stood there in the 8th century B.C. From the 6th century B.C. it formed part of the Armenian kingdom. As it was a main focus of caravan routes across Transcaucasia and the centre of the fertile plain of Ararat: its history has been one of constant siege and storm in the struggle for possession of the area by the Romans, Parthians, Arabs, Mongols, Turks, Persians, Georgians and Russians. In 1582 it fell to the Turks. in 1604 to the Persians and in 1827 to the Russians under Gen. I. F. Paskevich. In 1920 it became capital of the Armenian S.S.R. and grew rapidly. (R. A. F.)

YERKES, ROBERT MEARNS (1876–1956), U.S. psychobiologist, authority on the great apes and especially on the chimpanzee, was born in Breadysville. Bucks county, Pa., on May 26, 1876. After graduation from Ursinus college he took a Ph.D. degree at Harvard. remaining on the faculty there until the U.S. entered World War I in 1917. At Harvard he established the Laboratory of Comparative (Animal) Psychology. During the war he was in charge of the psychological testing of 1,726,000 men who entered the U.S. army. From 1924 until his death he was associated with Yale.

In 1930 Yerkes established at Orange Park, Fla., the Yale Laboratories of Primate Biology (in 1942 renamed in his honour the Yerkes laboratories). a unique centre for the study of the neural and physiological basis of behaviour. He assisted in establishing the National Research council in Washington. D.C.. and gave important service to a number of scientific societies and academies. Among his published books and papers, the most significant perhaps are *The Great* Apes: a *Study* of *Anthropoid* Life, with Ada W. Yerkes (1929), and *Chimpanzees: a* Laboratory Colony (1943). He died Feb. 3, 1956, in New Haven, Conn. (L. CAR.)

YERSIN, ALEXANDRE ÉMILE JOHN (1863–1943), Swiss bacteriologist, was born at Aubonne on Sept. 22, 1863, and studied at Lausanne, Marburg and Paris. He was associated with Pierre Roux (*q.v.*) in his researches on the diphtheria serum at the Pasteur institute. With Roux he made fundamental studies in which they discovered the existence of diphtheria toxin (1889–90), and continued his researches in China and French Indochina. The plague bacillus was discovered by him in Hong Kong in 1894, S. Kitasato (*q.v.*) simultaneously making the same discovery. In 1895 Yersin prepared a serum to combat the disease. Under Chinese government auspices he founded a branch of the Pasteur institute at Canton. Yersin also established a similar institution at Nha Trang, Annam, of which he became director. He was awarded the Grand Prix Leconte by the Paris Académie des Sciences in 1927. He died in French Indochina, March 2, 1943.

YERWA-MAIDUGURI (commonly MAIDUGURI), capital of Bornu province, Northern Region, Nigeria, lies on the banks of the seasonal river Alo in savanna country about 1,160 ft. above sea level and about 70 mi. S.W. of Lake Chad. Pop. (1953) 56,740; (1959) 60,000. Founded in 1907 as a British military station, Maiduguri grew rapidly and replaced the old Bornu capital, Kanem. It is spacious and modern in plan, but with architecture typical of the Kanuri and the Shuwa Arabs who make up most of the population. The palace of the shehu of Bornu (completed 1954), in Moslem style, dominates the town and its modern trading establishments. There are a general hospital, schools, a training centre for women teachers, a government craft school and the offices of the Native authority (1958).

Astride the historic pilgrim route from Senegal to Mecca, Maiduguri is linked by road eastward to Fort Lamy; southward to Yola and the Southern Cameroons; and westward to Kano (373 mi.), Kaduna (573 mi.) and Lagos (1,043 mi.). The airport, 5½ mi. W., is used by internal services. Yerwa, derived from the Arabic expression of grateful pleasure, refers to the fertility of the region. The town is the principal market for Bornu; the peanut (groundnut) crop is exported by road, but merchants of the Northern Region assemble annually to buy the corn crop. The principal industry is the preparation of skins of crocodiles from Lake Chad for the typical leatherwork of northern Nigeria. In centuries-old fashion Shuwa Arabs ride their oxen to the town's Monday market. The old kingdom of Bornu (*q.v.*) once stretched to the Nile, and al-Azhar Moslem university at Cairo has, since the 15th century, had a college for Bornu students. whose religious learning and probity are recognized. The *shehu* of Bornu and the emir of Dikwa (now part of Bornu province) are direct descendants of Sheik al-Amin al-Kanemi who, in the 19th century, rallied the Kanuri to resist Fulani expansion. (W. H. I.)

YEVPATORIYA, a town of the Crimean oblast of the Ukrainian Soviet Socialist Republic. U.S.S.R., stands on the west coast of the Crimea at the head of Kalamitski gulf. Pop. (1959)

57,000. It was founded in the 1st century B.C. and named Eupatoria after Mithradates VI Eupator (*see* MITHRADATES). Yevpatoriya came in turn under the kingdom of Bosporus (*q.v.*), the Venetians, the Genoese and the Tatars of the Crimean khanate, who themselves owed suzerainty to Turkey. It passed to Russia with the annexation of the Crimea in 1783. The allied armies landed nearby during the Crimean War. The town is renowned for the finest beaches of the Crimea and is a popular resort. There are many sanatoriums, especially for children. Salt is obtained from nearby Lake Sasyk and limestone is quarried locally. Weaving and furniture making are carried on. Yevpatoriya is a fishing centre and port for coastwise traffic. A railway links it with the main line to Sevastopol. (R. A. F.)

YEW, an attractive evergreen tree of the genus *Taxus,* of the Taxaceae family. The fruiting structure is a solitary seed set in a red, fleshy cup (aril) one-fourth to one-half inch deep in contrast to the woody cone occurring in the Pinaceae family (pines and spruces). The aril is edible but insipid, and the seeds and foliage are poisonous if eaten. The poisonous alkaloid of the foliage, mentioned by such ancient writers as Caesar, Livy and Virgil, may be injurious and sometimes fatal to horses and cattle. There are seven species and many named varieties of yew irregularly distributed in the northern hemisphere. All are evergreen, two always shrubby, but the others, *T. baccata, T. brevifolia, T. floridana, T. cuspidata* and *T. chinensis,* are regularly trees or have arborescent forms. The branches are erect or spreading, and closely covered with flattened, linear leaves one-fourth to one inch long, attached in spirals but because of a twist at their bases appearing two-ranked. The yews are dioecious, *i.e.,* have separate male and female plants, the former bearing globose staminate catkins and the latter the carpellate structures. Each inflorescence is borne in the axil of a leaf, and consists of several thin scales. In the carpellate structure the scales surround the cup or aril, which at first is thin and green but becomes thick and red when ripe. Each aril normally contains a single seed, but two may occur in a cup.

JOHN MARKHAM

ENGLISH YEW (TAXUS BACCATA) BRANCH WITH CARPELLATE FLOWERS

Yew lumber has been used for cabinetwork, implements requiring strength and durability, and particularly for making the English longbow. The demand was greater than the supply! so little yew wood is available. Trees of the Pacific yew, T. *brevifolia,* native from southern Alaska to the central Coast ranges in California and eastward to Montana, was cut so intensively for bow staves that by 1940 few trees over four to six inches in diameter were left standing.

The most widely distributed yew is the English yew (*T. baccata*), which occurs wild in Great Britain, extends eastward across Eurasia to Amur and the Himalayas and south into Africa. Fossils indicate that yews were once more abundant and more widely distributed than they have been in historical times.

The best known yews native in North America are the American yew or ground hemlock (*T. canadensis*), which is a spreading shrub under five feet tall in the forests from Newfoundland to Manitoba, Iowa and Virginia; and the western yew (2'. *brevifolia*). Yew wood is hard, fine grained, and heavy, with white or creamy sapwood and amber to brown heartwood. It was used by the Indians to make bows and by the white settlers for tool handles, small containers, furniture and other household articles.

Yew shrubs and trees are popular ornamental evergreens and several varieties of the European and Japanese yews are used as single specimens, for planting in small groups, and set closely to form dense hedges. The columnar form of the European yew, called "Irish yew," is particularly esteemed where upright, slender growth is desired. Yew trees grow slowly but are long-lived and only moderately susceptible to attacks by pests.

Yew trees long have been associated with religious rites and cemeteries.

YEZD (YAZD), a former province (*ostan*) of Iran, included in the *ostan* of Isfahan. Much silk is produced in this district, but not sufficient for the requirements of the looms of Yezd, and quantities are imported from Gilan. Other products are opium, madder, almonds and grain, of which last, however, only one-third of the supply required for local consumption is grown, the surplus requirements being brought from the adjacent *ostan* of Khurasan. The eastern part of the former province bordering on the Dasht-i-Lut (desert) is much exposed to moving sands.

Yezd, the chief town of the former province, is at 31° 54′ N. and 54° 22′ E. at an elevation of 4,390 ft., 162 mi. S.E. of Isfahan and 192 mi. N.W. of Kerman; pop. (1956) 66,484. When the Arabs invaded Persia, many of the Zoroastrians fled toward Yezd and Kerman where they remained. The highest and lowest temperatures are respectively 106° F. in July and 20° in December. Commercially, Yezd occupies an important central position in Iran, whence a number of routes radiate: to Isfahan to Meshed on the N.E. via Tabas and the desert and to Kerman on the west and Zahidan on the S.E. connecting with the Indian railhead. There is also an important direct caravan track to Bandar Abbas.

Since Sassanian times Yezd has been famous for beautiful silk textiles, rivalled in later periods only by Kashan and Isfahan. It is still the most productive centre of silk weaving, with approximately 8,000 weavers. Besides part of the imposing city wall, built in the 12th and 14th centuries, the most interesting mediaeval fortifications surviving in Iran, there are many important mosques and mausolea, dating from the Duwaz dah Imam (1035). The Masjid-i-Jami (cathedral or Friday mosque) is distinguished by the highest minarets in Iran, mosaic fai'ence, a superb mihrab dated 1375, and two oratories, Gothic in appearance, with deep transverse vaults. Some of the other mosques and mausolea are decorated with extremely delicate and rich stucco relief or are polychromed with tones of pale blue, rose and yellow. The sky line is picturesque, with minarets and many tall towers devised to bring moving air down to the many small chambers which are a necessary refuge from the intense heat of summer.

Browne, *A Year amongst the Persians* (1893 and 1926); *Survey of Persian Art* (1938), for the monuments especially vol. iv, Pls. 273, 4; 438, 449 and vol. ii *passim.* Textiles, vol. iii, pp. 1995–2220 *passim,* and vol. vi, Pls. 1032–1106 *passim.* (P. Z. C.; X.)

YEZIDIS, a religious sect, numbering about 50,000 persons, dwelling chiefly in the neighbourhood of Mosul. Their own name for themselves is Dasni, but they are called by their neighbours Yezidi; the origin of both names is uncertain, but the latter is probably derived from the Persian *Yazdān,* God. Their religion was probably originally an offshoot of Mazdaism, but it has absorbed elements from Christianity and Islam, for they regard Christ as an angel in human form and recognize Mohammed as a prophet with Abraham and the other prophets, and practise circumcision and baptism. They regard the devil as the creative agent of the Supreme God, and seek to propitiate him as the author of evil: they avoid mentioning his name and represent him by the peacock. Their sacred books have been translated by F. Nau, *Recueil de textes et de documents sur les Yézidis* (1918).

YEZO: *see* HOKKAIDO; JAPAN.

YGGDRASIL, in Scandinavian mythology the mystical ash tree which symbolizes existence: binds together earth, heaven and hell and is the tree of life, knowledge, fate, time and space. Its three roots go down into the realms (1) of death, where, in the well Hvergelmer, the dragon Nidhug (Niðhöggr) and his brood are ever gnawing it; (2) of the giants; and (3) of the gods, Asgard.

Its stem upholds the earth, its branches overshadow the world and reach up beyond the heavens. Honeydew falls from the tree. and on its topmost bough sits an eagle. G. Vigfusson and York Powell saw in Yggdrasil not a primitive Norse idea, but one due to early contact with Christianity.

YI, a term used by the Chinese to designate what they formerly called the Lolo (*q.v.*), or Wu-man ethnic group of Austroasiatic origin numbering several millions, inhabiting the mountains of southwest China and speaking a Tibeto-Burman language. Their traditional culture include a primitive hoe-type agriculture, goat. yak and sheep herding and hunting. Relics of a possible matriarchal system appear in the significant status of women in their traditional society. Sorcery and belief in animism are prevalent. The dead are cremated. In the pre-Communist society, a caste system divided the Yi into two groups. The Blackbone Yi were the ruling group representing the descendants of people that appear to have originated in northwest China. The far more numerous Whitebone Yi were derived from people including many Chinese ohce subjugated or enslaved by the Blackbones. The fiercely independent Blackbones often harassed Chinese 'settlers entering their domain. The Whitebones, especially, have spread over the highlands of Yünnan and Kweichow, whereas the heartland of the Blackbones lies in the Great and Lesser Liang mcuntains southwest of the Ssu-ch'uan basin. The latter were constituted the Liang-Shan Yi Autonomous district by the Communist regime in 1953 when eight other so-called autonomous districts for Yi tribes were organized. (H. J. Ws.)

YIDDISH LANGUAGE AND LITERATURE. The origins of Tiddish, the Jewish idiom whose name is related to the modern German *Jüdisch,* can be traced as far back as the 10th century. At that time Jews from France and northern Italy began to settle in considerable numbers in western Germany, mainly in the Rhineland, superimposing the language of their new environment. Middle High German, on their Romance dialects saturated with Semitic elements. both Hebrew and Aramaic. Henceforth. the evolution of the Yiddish language. rendered in Hebrew characters. followed the fortunes of the people. From the 14th century onward. the bulk of the Yiddish-speaking and Yiddish-writing Jews were. through migration, transplanted to Poland and adjacent countries, the domain of Slavonic languages. The ties between Yiddish and German were thus loosened and the vernacular of the isolated Jewish enclave gained the freedom of independent development. In the process of this uninterrupted consolidation (from the 15th to the 18th century). the vocabulary and the grammar of Yiddish absorbed and assimilated a great many Slavonic elements which could not, however. impair the specific character of a language so intimately connected with the singular. essentially religious. Jewish way of life.

From the beginning of the 19th century, as a result of the migration of eastern European Jews to all parts of the globe, Yiddish became the *lingua franca* of world Jewry. On the eve of World War II. more than half of the 16.000.000 Jews of the world spoke or at least understood Yiddish. As in the past. the Yiddish-speaking Jews continued to enrich their ianguage by absorbing and assimilating new elements in the lands of their resettlement. Along with the older dialects of the Yiddish language. *e.g.,* the Polish, Lithuanian. or White Russian, there appeared the Anglo-American and the Spanish varieties.

The expansion of Yiddish came to an abrupt end with the destruction of millions of Yiddish-speaking Jews during World War II. A further setback was caused by compulsory assimilation in the U.S.S.R. In addition, the rise of Hebreiv in the wake of the re-establishment of the state of Israel put Yiddish on the defensive. Nevertheless, concentrated efforts in many parts of the world seemed to secure a new lease of life for the almost thousand-years-old language. The Yiddish Scientific institute in New York. known as YIVO, published in 1950 a *Thesaurus of the Yiddish Language* and in addition a *Great Dictionary* was being prepared Apart frorn this. out of the 20 volumes of the *General Encyclopaedia in Yiddish,* 9 had appeared by 1953.

LITERATURE

Earlier **Stages.**—While except in the strictly religious sphere colloquial Yiddish met with practically no rivals within Jewish life. Yiddish literature. ever since it emerged in the 13th century, had to assert itself against the authority of a mighty literary tradition. This tradition was rooted in the Hebrew Bible, the Aramaic Talmud and in the vast post-Talmudic Rabbinical literature inspired by the ancient sources and written in mediaeval Hebrew. Under such conditions, the literature in Yiddish was bound to remain a marginal phenomenon for a long period. The narrow field which the new literature was allowed to cultivate was restricted to themes of 3 secular character and to the popularization of the traditional values among the lesser educated, especially the women. Notwithstanding the unfavourable conditions, a great variety of literary forms—from the heroic epic to fables and fairy tales, and from Bible translations and paraphrases to elaborate guides of moral and ritual behaviour—steadily gained new ground through the medium of Yiddish. Some of these creations like the bulky Bible commentary for women *Tzeenah u'Reenah* ("Go forth, o ye daughters of Zion, and behold!" Song of Songs, 3. 11). compiled in the 16th century. still retain their appeal. The singular devotion of the Jewish woman to Yiddish literature accounts for the description of Yiddish itself as the "mother's tongue," in contrast to Hebrew. the tongue of the learned father.

Period of Crisis.—With the spreading of "enlightenment" in the 18th century (in Hebrew *Haskalah*) from west to east. Yiddish and its literature came under heavy attack. The exponents of Haskalah, the *Maskilim,* looked down on Yiddish as on illegitimate slang and preached its replacement by Hebrew or the language of the country concerned. However. to secure the people's support for the envisaged reform they had to use the people's tongue. and so inadvertently helped build the bridge from traditional to modern Yiddish literature.

The satirical stories, novels, comedies and pamphlets of Israel Axenield (1787–1866), I. M. Dick (1807–1893), I. B. Levinsohn (1788–1860) and others, which exposed the dark side of contemporary Jewish life and tried to discredit the outgrowths of the new *Hasidism* (*i.e.,* pietism), made the Jewish reader familiar with the main forms of modern prose and became the fountainhead of a broad secular streain in Yiddish literature.

The Classics.—By the middle of the 19th century, especially in Russia, where literature had become a paramount factor of political and social progress, the stage was set for the unfolding of outstanding artistic talent by means of the Yiddish word. In close succession there appeared on the scene Mendele Mocher Seforim, pseudonym of S. J. Abramowitsch (1836–1917), I. L. Peretz (1852–1915) and Sholem Aleichem, pseudonym of Solomon Rabinowitz (1859–1916) who together set the standard of both artistic expression and the author's duty to serve the cause of the people.

The oldest of the three is known to posterity as the grandfather of modern Yiddish literature. His novels, such as *Fichke the Lame, The Mare,* etc.. revealed the tragic discrepancy between the intrinsic moral quality of the average man and woman and the humiliating conditions of their social life. Peretz and Sholem Aleichem went a step farther in the same direction. Influenced by modern romanticism Peretz succeeded in vindicating. in a long series of masterly short stories. *e.g., Perhaps Even Higher,* as well as in symbolic drama (*The Golden Chain,* etc.), the mysticism and otherworldliness of the plain Jewish believer, thus bridging the gulf between the broad mass of the adherents of Hasidic pietism and the westernized Jewish intelligentsia. Sholem Aleichem transforined the humour inseparable from Yiddish speech into a subtle artistic instrument and lightened the darkest corners of Jewish life with his bright benevolent smile. The heroes of his stories and novels—Menachem Mendl, the Jack-of-all-trades constantly pursued by ill-luck, and Sheyne-Sheyndl, his quarrelsome-loving wife, or the entirely ignorant and yet miraculously wise dairyman, Tobias (*Tevye der Milchiker*)—were adopted by the people as kith and kin and became the ancestors of a large family of literary types.

New Developments.— Along with the classics, a group of gifted authors, including I. J. Linetski (1839–1915), J. Dinesohn (1856–1919) and M. Spector (1858–1925), maintained the flow of literary production. The future of Yiddish was further safeguarded by the division, after the 1880s, of its mainstream into two branches, the European and American, which, however, remained intertwined through close contacts.

The new conditions of life of the Yiddish-speaking immigrants in the United States found thcir characteristic reflection in poetry inspired by the ideals of social justice and human liberty by such worker-poets as Morris Vinchevsky (1856–1933), Morris Rosenfeld (1862–1923) and David Edelstadt (1866–1892). These beginnings later influenced many Yiddish poets both in the United States and Europe, *e.g.*, David Einhorn (1886–), and laid the ioundation of a Yiddish school of lyric expression. The Yiddish press which sprang up in the United States at the turn of the 19th century soon outstripped its European forerunners and gave Yiddish writers ample opportunity of bringing their writings, in prose and verse, to the notice of a rapidly growing public. An array of brilliant essayists and journalists, such as A. Cahan (1860–1951), C. Zhitlowsky (1865–1943), A. Liesin (1872–1938) etc., vied successfully with their colleagues in Europe. In 1953, the *Jewish Press of thr World* recorded 801 periodicals of which 117, including 12 dailies, were in Yiddish.

At the same time. marked progress was made in the United States by the Yiddish theatre, mainly thanks to the dramatists S. Libin (1872–1955), L. Kobrin (1872–1946) and J. Gordin (1853–1909), who were later joined by D. Pinski (1872–1959), P. Hirschbein (1880–1948) and H. Leivick (1888–), the great lyrical poet and seeker after universal truth.

The 20th Century.— Meanwhile the impulse given to Yiddish literature by the classics brought iorth in thcir own native land a new generation of authors excelling in every literary genre. In the first quarter of the century the total number of Yiddish writers rose over the thousand mark. The union between Hebrew and Yiddish literature, personified by the classics, proved beneficial to both, while the translation of masterpieces from the major literatures taught the Yiddish writer to see his own world in a universalistic perspective. He was greatly helped also by the emergence of a literary critique guided by the highest standards of aesthetic evaluation, set up by Baal Machshoves (1873–1924), S. Niger (1883–1955) and others.

Against this background Sholem Asch (1880–1957) built up his life's work which began with the idealization of the typical Jewish homestead in Poland and reached its peak in the historical novel *Moses* (1951). To the same category oi prose belongs the novcl, *In the Polish Forests* (1921), of J. Opatoshu (1887–1954). Their fellow-countryman, M. Boraisha, created *The Wayfarer,* a novel in verse, original in the music of its alternating rhythms and abounding in the wisdom of ages. All three reached maturity in the United States, where new roots were struck also by A. Reisen (1876–1953), the "Yiddish Heine" from Russia, and by A. Leyelles, pseudonym of A. Glanz (1880–), whose poetry was shaped by half-a-dozen European literatures. The outstanding versatility of the secular Yiddish writers explains the fact that no trend in modern literature, from simple naturalism to the most extravagant expressionism, remained uurepresented in Yiddish literature. However, despite this differentiation of taste and attitude, the Yiddish writers, with the exception of some in the Soviet Union. were always united in the beliei that they cultivated a literary tradition ultimately rooted in the Hebrew Bible.

Parallel with the development of Yiddish *belles-lettres* an ever-growing number of original works on philology, history, economics, etc., appeared in Yiddish. Particularly noteworthy was the new "Churban" literature dealing with the catastrophe of 1933–45.

YIEWSLEY AND WEST DRAYTON, an urban district in the Uxbridge parliamentary division of Middlesex, Eng., 14 mi. W. of Charing Cross by road. Pop. (1961) 23.968. Area 8.2 sq.mi. The area was largely agricultural until the beginning of the 20th century, but was significantly placed on many lines of communication with London. The Bath road and the Grand Union canal pass through the district, and the former Great Western railway line to the west, passing through West Drayton, was opened in 1838. But the most important development in communications was the opening in 1946 at Heathrow of London airport. Agriculture is still carried on, but there are several engineering firms and factories making colour film, coach bodies and wax polish. A colonnaded Iron Age temple was discovered when the airport was being constructed.

YLANG-YLANG (*Cananga odorata*), a medium-sized tree of the custard-apple family (Annonaceae, *q.v.*), found in southern India. Java and the Philippines and planted in warm regions for its exceedingly fragrant flowers, which yield the widely prized perfume of the Pacific islands, known as ylang-ylang among the Malays. The tree has somewhat drooping branches; large, ovate, sharp-pointed leaves; numerous greenish or yellowish flowers, about two inches long, and oblong, greenish fruits about one inch long. It has been sparingly cultivated in southern Florida.

YODEL, a peculiar kind of singing consisting of alternations of high falsetto notes with ordinary chest tones. It is practised by the Swiss and Tirolese in the singing of their native melodies.

YOGA, originally one of the six system5 of Indian philosophy (*q v*) The classical form of Yoga, based on the text ascribed to Patanjali, became knonn in the middle ages as Raja Yoga. or "royal Yoga"; other forms of Toga also developed, which might be followed together with or independently of the classical Yoga Among these the practices of Hatha Yoga, or "the Yoga of force," have become famous throughout the world, and the term Toga is often used to denote them. Hatha Yoga seems to be a late development in Hinduism, and the earliest texts on the subject date from little before the Muslim invasion. It is closely connected with Tantrism, though many of its practitioners are not Tantrists.

Hatha Yoga is based on a fantastic physiological theory. teaching the existence of a dormant divine potency, called *kundalini,* "the serpent power." at the base of the spine. A vein, known as *sushumna,* runs through the backbone. linking the *kundalini,* by way of six psychic centres (called *chakras*, or "wheels") with the supremecentre of psychic power, at the top of the skull, called *sahasrara,* and described as a lotus with a thousand petals. The aim of the Yogi. according to this system. should be to raise the feminine *kundalini* through the vein *sushumna* from one chukra to another until at last it unites with the masculine *sahasrara,* when full salvation is achieved. This requires an intense development of the will. so that all the automatic processes of the body are brought fully under the control of the mind. and the Yogi can control the rhythm of his heart beats at will, live for days without food and water, and survive for an appreciable length of time even without breathing. Despite exaggerated claims there is ample evidence that some Yogis have achieved an almost superhuman control over their bodies. Yogic practices, in their less extreme forms, are believed to be conducive to health, clarity of intellect and long life; many Indians and some westerners perform Yoga exercises without any specially religious purpose.

See M. Eliade, *Yoga, Immortality and Freedom* (1958). (A. L. BA.)

YOGURT (YOGHURT, YOHOURT, etc.) is a dairy product resulting from the biochemical changes in milk produced by the yogurt bacteria *Lactobacillus bulgaricus, Streptococcus lactis, Thermobacterium yoghurti* (Orla-Jensen) and certain types of yeasts. Unfortunately these bacteria cannot be permanently implanted in the intestinal tract of man. They ferment lactose (milk sugar) to lactic acid. and break down casein, lactalbumin and globulin (milk proteins) to peptones and amino acids. With the exception of the tubercle and anthrax bacilli, all the pathogenic bacteria and *Endameba histolytica* are killed in yogurt within 24 hours. The bactericidal factor is diffusable, filtrable, relatively thermostable and is inactivated with alkalis.

Yogurt is prepared by inoculating milk which is previously boiled and cooled to body temperature either with a laboratory culture of yogurt bacteria or yogurt from a previous batch. It is then incubated at 110 to 112° F. for three to four hours or overnight at room temperature. It should then be kept in a refrigerator.

Yogurt is rich in vitamin B complex. Although an important article in diet, there is no proof that yogurt cures any disease or prevents intestinal intoxication. (H. T. A. S.)

YOKKAICHI, a commercial city on the northwest shore of Ise bay in Mie prefecture, south Honshu, in central Japan. Pop. (1960) 195,974. Yokkaichi was originally a small farming and fishing village. It developed into a market town about the middle of the 11th century. During the Tokugawa period it was an important post town on the Takaido highway. By 1897 it was the 6th largest port of Japan. By mid-20th century Tokkaichi was largely supported by its production of cotton textiles, vegetable oil, chemicals, tea and banko ware (a kind of porcelain). (R. B. H.)

YOKOHAMA, the capital of Kanagawa prefecture on the island of Honshu, Japan. It is an international seaport on the west shore of Tokyo bay. It stands on a plain shut in by hills. one of which, toward the southeast, terminates in a promontory called Hommoku-misaki, or Treaty point. The city is traversed by a network of canals. The cold in winter is severe because of north winds, while the heat is great in summer, though tempered by southwest sea breezes. The rainfall is about 70 in, annually. Pop. (1960) 1,375,710. Area 157.9 sq.mi.

In 1859, when the neighbouring town of Kanagawa was opened to foreigners under the treaty with the United States, Yokohama was an insignificant fishing village *(see* JAPAN: *History)* The Japanese government shortly afterward chose the latter place as the foreign settlement. This settlement, uhich developed under the administration of foreign residents enjoying extraterritorial rights until 1899. formed the nucleus of a flourishing city. prospering with the gronth of Japan's foreign trade and shipping. The harbour is commodious. It is somewhat exposed, but enclosed by two substantial breaknaters. The city was almost obliterated by an earthquake in 1923 when 80% of its houses were destroyed and thousands of its inhabitants were killed, mostly by fire. It nas rebuilt under a comprehensive government plan, and the docks and waterfront area, formerly known as the Bund, were much improved. Little remained of the old settlement.

Yokohama depended for its growth upon foreign trade and shipping, particularly the silk trade. The decline of silk in Japan's exports, together with a rapid gronth of manufactures and foreign trade ın other centres, notably Kobe, Nagoya, Osaka and Tokyo, tended to diminish the relative importance of Yokohama, and the city showed sıgns of depression before World War II.

The greater part of the city was destroyed in World War II. Yokohama was slow in recovering but during the late 1950s was rehabilitated. In 1954 Yokohama's exports were only 19% of the total exports of Japan while Kōbe's were 41.7% of the national total. Each port accounted for about 24% of Japan's imports. The United States was the destination for most of Yokohama's exports and the source of most of its imports. (R. B. H.)

YOKOSUKA, a seaport on the west shore of Tokyo bay, Japan, in Kanagawa prefecture. Pop. (1960) 287,309. The port is sheltered by hills and affords anchorage. The site was occupied by a small fishing village until 1865, when the shogun's government established a shipyard there. In 1884 it was made a first-class naval station by the Japanese government. After World War II it became a base for the U.S. navy and a station for the Japanese National Safety agency. The city has been reborn as one of Japan's important trade and fishing ports In the eastern part of the city are two fine harbours, Yokosuka and Nagaura. The latter is a base for ships engaged in whaling operations in the antarctic. Shipbuilding accounts for 49% of the city's employees. Yokosuka is also a residential district for commuters to the Tokyo-Yokohama area. (R. B. H.)

YOKUTS, a linguistic stock of Californian Indians, speaking Yokuts (a Penutian language), who inhabited the San Joaquin valley and adjacent foothills. Formerly about 18,000 in number and organized as individual tribes, *e.g.,* the Wükchamni and Tachi, each had its own dialect, territory, hereditary chief, and major village with grass-thatched or mat-covered dwellings and a men s sweat house. Game and fish were taken with arrows, throwing sticks, traps, nets and harpoons; acorn flour and seeds provided starchy foods. Women made coiled and twined baskets for cooking, serving, storage and ceremonious gifts; some also made crude, plain pottery. Men wore buckskin breechcloths, women buckskin or fibre aprons; both sexes used rabbit fur mantles. Water transportation was on huge tule rafts. Shell disk beads had monetary value. Shamans controlled sickness, the weather, bears and rattlesnakes through supernatural power, and religious dreams were induced by decoctions of wild tobacco or Jimson weed. Hundreds of Yokuts congregated to weep, dance and feast at annual mourning ceremonies.

See A. L. Kroeber, *Handbook* of *the Indians of California,* ch. 32–35, Bureau of American Ethnology bulletin 78 (1925); A. H. Gaytnn, Yokuts *and Western Mono Ethnography,* Anthrop. Rec. Univ. Calif., vol. 10 (1945). (A. H. GA.)

YOM KIPPUR: *see* JEWISH HOLIDAYS.

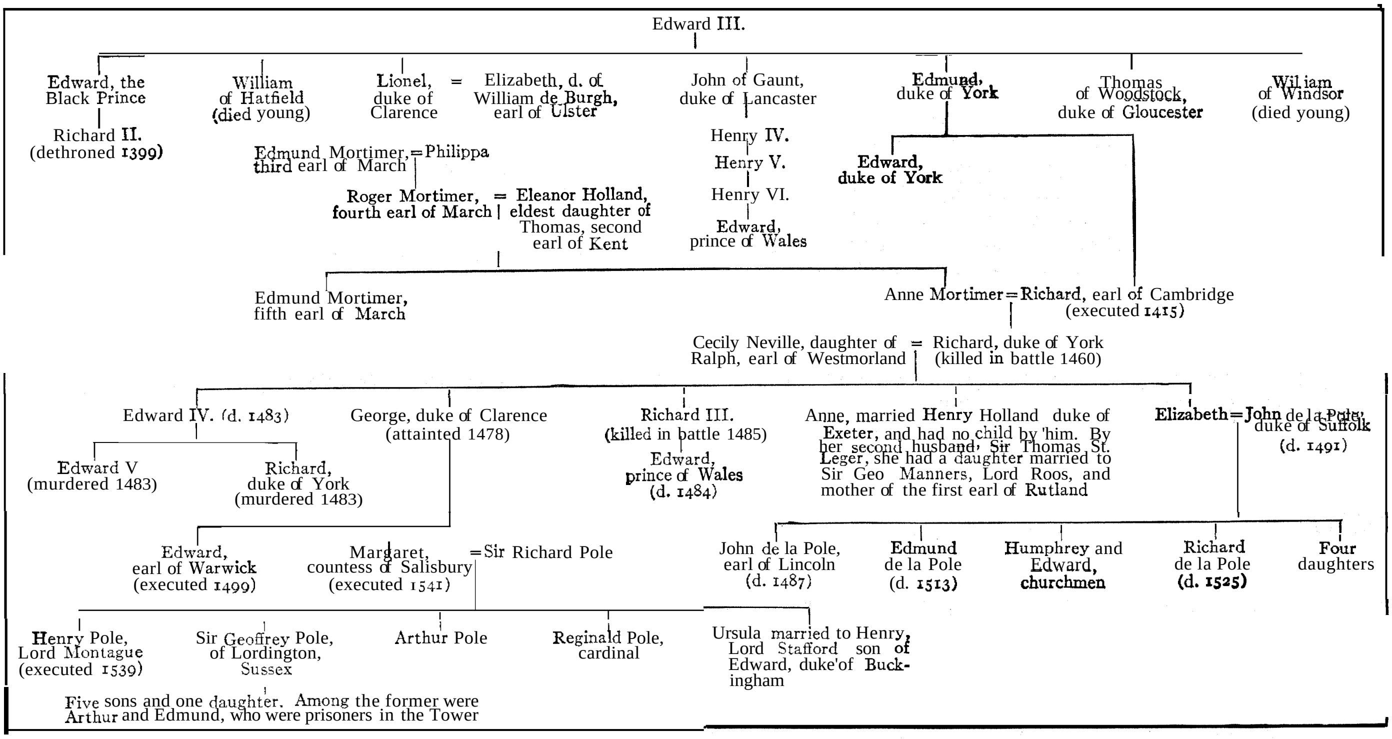
YONGE, CHARLOTTE MARY (1823–1901), English novelist and writer on religious and educational subjects, was born Aug. 11, 1823, at Otterbourne, Hants. She was one of the most prolific writers of the Victorian era. Her first success was attained with *The Heir of Redclyffe* (1853). *The Daisy Chain* (1856, reprinted 1911) continued the success. Other popular books include *Heartsease* (1854), *Dynevor Terrace* (1857), *The Young Stepmother* (1861), *The Trial* (1864) and *The Clever Woman of the Family* (1865). She wrote over 120 volumes, including novels, tales, school manuals and biographies, and was for more than 30 years editor of the *Monthly Packet.* She died at Otterbourne on March 24, 1901.

YONKERS, a city of Westchester county, N.Y., U.S., 15 mi. from Grand Central terminal in New York city, is located on the east shore of the Hudson river directly north of the borough of the Bronx, New Tork city. It is known as the "Terrace City" because of its many hills. Pop. (1960) 190,634. (For comparative population figures *see* table in NEW YORK: *Population.*)

Nappeckamack, the capital village of the Manhattes Indians, a Mohican tribe, stood upon the site of the present Philipse Manor hall in Yonkers. In 1639 the Dutch West India company acquired the area in the Keskeskeck purchase and in 1646 included it as part of a grant made to Adriaen van der Donck, the first lawyer in the colony. In 1652 this grant was enlarged to a patroonship known as Colendonck—the only one made within present Westchester county—extending irom Spuyten Duyvil creek to the northern part of Yonkers and from the Hudson to the Bronx rivers. Cultured, educated and a courageous foe of Gov. Peter Stuyvesant's administrative tyranny, Van der Donck was widely known as the young gentleman, or "jonkheer" in Dutch, from which the name of the city evolved. In a series of purchases between 1672 and 1692, Frederick Philipse, a prominent and wealthy merchant, speculator and officeholder, acquired the estate and the land beyond, northward to the Croton river. In 1682 he commenced the construction of his famed home, a gem of colonial architecture, which was eievated to the status of a manor hall when Philipse received a royal charter on June 12, 1693, combining his lands into the Manor of Philipsburgh. The manor was confiscated by the state in 1779 because the founder's great-grandson espoused the Tory cause during the American Revolution, and it was broken up and sold in 1786 under a writ of attainder. The manor house was sold to Yonkers in 1868 and was used as a village and city hall successively until it was acquired by the state in 1908. It is now maintained as a historic shrine and is open to the public. Although no major military action took place there during the American Revolution, Washington's army at one time occupied Yonkers. There was much skirmishing, raiding by Hessians and harassment of the area by irregulars and outlaws of both sides..

Yonkers was incorporated as a village in 1855 and chartered as a city in 1872. In 1874 the southern portion of old Yonkers was annexed to what was later to become the borough of the Bronx in New York city. Yonkers has more than 250 major industries. Chief products include elevators, escalators and hoisting machinery, aerosoi valves. sirups and sugars, copper wire and cables, chemicals, machines and tools, dairy products and paper products. The city has a council-manager form of government, in effect since 1940. (M. D. HH.)

GENEALOGICAL TABLE OF THE HOUSE OF YORK



YONNE, a department of central France, formed partly from the province of Champagne proper (with its dependencies, Sénonais and Tonnerroisj, partly from Burgundy proper (with its dependencies, the county of Auxerre and Avallonnais) and partly from Gâtinais (Orleanais and Île-de-France). It is bounded by Aube on the northeast. Côte-d'Or on the southeast, Nièvre on the south. Loiret on the west and Seine-et-Marne on the northwest. Pop. (1946) 266.014. Area 2,881 sq.mi. The highest elevation (2,000 ft.) is in the granitic highlands of Morvan. The department belongs to the basin of the Seine. except a small district in the southwest (Puisaye), which belongs to that of the Loire. The Yonne river flows through it from south to north-northwest. receiving on the right bank the Cure, the Serein and the Armançon, which water the southeast of the department. Farther north it is joined by the Vanne.

The department is served chiefly by the P.L.M. railway. The canal of Burgundy. which follows the valley of the Armançon, has a length of 57 mi. in the department, that of Nivernais. following the valley of the Yonne, a length of 33 mi. The department constitutes the archiepiscopal diocese of Sens, has its court of appeal in Paris, its educational centre at Dijon and belongs to the district of the VIII army corps. It is divided into 3 arrondissements (3; cantons. 48j communesj, of which the capitals are Auxerre, also capital of the department. Avallon and Sens; these with Chablis. Vézelay (*qq.v.*) and St. Florentin are its chief towns. Pontigny has a Cistercian abbey, where Thomas a Becket spent two years of his exile. with a 12th-century church. Druyes has a 12th-century château. Villeneuve-sur-Tonne has a mediaeval keep and gateways and a church of the 13th and 16th centuries. The Renaissance châteaux of Fleurigny, Xncy-le-France. Tanlay and the château of St. Fargeau, of the 13th century, rebuilt by Mademoiselle de Montpensier under Louis XIV, are all noteworthy. At St. Moré there are remains of the Roman road from Lyons to Gallia Belgica and of a Roman fortified post. There are many megalithic monuments in the department.

YORCK VON WARTENBURG, HANS DAVID LUDWIG, COUNT (1759–1830), Prussian general field marshal, was of English ancestry. He entered the Prussian army in 1772, but in 1779 was cashiered for disobedience. Entering the Dutch service. he took part in the operations of 1783–84 in the East Indies as captain. Returning to Prussia in 1785 he was. on the death of Frederick the Great, reinstated in his old service, and in 1794 took part in the operations in Poland. Five years afterwards Yorck began to make a name as commander of a light infantry regiment, being one of the first to give prominence to the training of skirmishers. In 1805 he was appointed to an infantry brigade, and in the Jena campaign played a successful part as a rearguard commander, especially at Altenzaun. He was taken prisoner, severely wounded, at Liibeck. In the reorganization of the Prussian army after the peace of Tilsit, Yorck took a leading part. At first major-general commanding the West Prussian brigade, afterwards inspector-general of light infantry, he was finally appointed second in command to General Grawert, the leader of the auxiliary corps which Prussia was compelled to send to the Russian War of 1812, succeeding to the command on Grawert's retirement. He conducted the advance on Riga with great skill; but his conviction that the French army was doomed led him at last, to neutralize the Prussian army by the Convention of Tauroggen (Dec. 30). The step was intensely popular, and although it was officially proposed to court-martial Yorck, he was absolved when the Treaty of Kalisch ranged Prussia with the Allies. During 1813–14 Yorck led his veterans with success at Bautzen, Katzbach, Wartenburg (Oct. 4) and Leipzig (Oct. 18). In France, he distinguished himself at Montmirail and Laon. The storm of Paris was his last fight. In 1821 he was created general field-marshal. He had been made Count Yorck von Wartenburg in 1814. He died at his estate of Klein-Ols, the gift of the king, on Oct. 4, 1830.

See Seydlitz, *Tagebuch des Preussischen Armee Korps 1812* **(1823)**; Droysen, *Leben des G. F. M. Grafen Yorck von Wartenburg* **(1851)**.

YORK (HOUSE OF), a royal line in England, founded by Richard, duke of York (*q.v.*), who claimed the crown in opposition to Henry VI. His claim was, perhaps rightly, barred by prescription, the house of Lancaster having then occupied the throne for three generations; it was really owing to the misgovernment of Margaret of Anjou that it was advanced at all. The duke was descended from Lionel, the third son of Edward III., while the house of Lancaster came of John of Gaunt, the fourth son. The claim was derived (*see* the Table) through females; but this could not reasonably have been objected to after Edward III.'s claim to the crown of France; and the duke's claim was probably supported by the fact that he was descended from Edward III. both through his father and through his mother. (See Table.) The earldom of Ulster, the old inheritance of the De Burghs, had descended to him from Lionel;

the earldom of March came from the Mortimers, and the dukedom of York and the earldom of Cambridge from his paternal ancestry. Moreover, his own marriage with Cecily Neville, though she was but the youngest daughter of Ralph, 1st earl of Westmorland, allied him to a powerful family in the north of England, to whose support both he and his son were indebted.

The reasons why the claims of the line of Clarence had been so long forborne are not difficult to explain. Roger Mortimer, 4th earl of March, was designated by Richard II. as his successor; but he died the year before Richard was dethroned, and his son Edmund, the 5th earl, was a child at Henry IV.'s usurpation. Henry took care to secure his person; but the claims of the family troubled the whole of his own and the beginning of his son's reign. It was an uncle of this Edmund who took part with Owen Glendower and the Percies; and for advocating the cause of Edmund Archbishop Scrope was put to death. And it was to put the crown on Edmund's head that his brother-in-law Richard, earl of Cambridge, conspired against Henry V. soon after his accession. The plot was detected, being revealed, it is said, by the earl of March himself, who does not appear to have given it any encouragement; the earl of Cambridge was beheaded.

The popularity gained by Henry V. in his French campaigns secured the weak title of the house of Lancaster against further attack for forty years.

Richard, duke of York, seems to have taken warning by his father's fate; but, after seeking for many years to correct by other means the weakness of Henry VI.'s government, he first took up arms against the ill advisers who were his own personal enemies, and at length claimed the crown in parliament as his right. The Lords, or such of them as did not purposely stay away from the House, admitted that his claim was unimpeachable, but suggested as a compromise that Henry should retain the crown for life, and the duke and his heirs succeed after his death. This was accepted by the duke, and an act to that effect received Henry's own assent. But the act was repudiated by Margaret of Anjou and her followers, and the duke was slain at Wakefield fighting against them. In little more than two months, however, his son was proclaimed king at London by the title of Edward IV., and the bloody victory of Towton immediately after drove his enemies into exile and paved the way for his coronation.

After his recovery of the throne in 1471 he had little more to fear from the rivalry of the house of Lancaster. But the seeds of distrust had already been sown among the members of his own family, and in 1478 his brother Clarence was put to death—secretly, indeed, within the Tower, but still by his authority and that of parliament—as a traitor. In 1483 Edward himself died; and his eldest son, Edward V., after a nominal reign of two months and a half, was put aside by his uncle, the duke of Gloucester, who became Richard III. and then caused him and his brother Richard, duke of York, to be murdered.

But in little more than two years Richard was slain at Bosworth by the earl of Richmond, who, being proclaimed king as Henry VII., shortly afterwards fulfilled his pledge to marry the eldest daughter of Edward IV. and so unite the houses of York and Lancaster.

Here the dynastic history of the house of York ends. But a host of debatable questions and pretexts for rebellion remained. The legitimacy of Edward IV.'s children had been denied by Richard III. and, though the act was denounced as scandalous, the slander might still be reasserted. The duke of Clarence had left two children and the attainder of their father could not be a greater bar to the crown than the attainder of Henry VII. himself. Seeing this, Henry had kept Edward, earl of Warwick, a prisoner in the Tower of London. Yet a rebellion was raised in his behalf by means of Lambert Simnel, who was defeated and taken prisoner at the battle of Stoke in 1487. The earl of Warwick lived for 12 years later in confinement, and was ultimately put to death in 1499.

His sister Margaret married Sir Richard Pole (or Poole), and could give no trouble, so that Henry VIII. treated her with kindness. He made her countess of Salisbury. reversed her brother's attainder, created her eldest son, Henry, Lord Montague, and had one of her younger sons, Reginald, carefully educated. *(See* POLE, REGINALD and POLE, FAMILY.)

YORK, EDMUND OF LANGLEY, DUKE OF (1341–1402), fifth son of Edward III., was born at King's Langley in Hertfordshire on June 5, 1341. He accompanied his father on a campaign in France in 1359, was created earl of Cambridge in 1362, and took part in expeditions to France and Spain. After marrying Isabella (d. 1393), daughter of Peter the Cruel, king of Castile, he was appointed one of the English lieutenants in Brittany, whither he led an army in 1375. A second campaign in Brittany was followed in 1381 by an expedition under his leadership to aid Ferdinand, king of Portugal, against John I., king of Castile; but Edmund shortly returned to England as Ferdinand had concluded an independent peace with John. Accompanying Richard II. on his march into Scotland, he was created duke of York in Aug. 1385, and subsequently on three occasions acted as regent of England.

York held a parliament in 1395, and he was again serving as regent when Henry of Lancaster landed in England in 1399. After a feeble attempt to defend the interests of the absent king, York joined the victorious invader; but soon retired from public life.

York died at King's Langley on Aug. 1, 1402.

YORK, EDWARD PLANTAGENET, DUKE OF (c. 1373–1415), elder son of the preceding (Edmund of Langley), was created earl of Rutland in 1390. Being a friend of his cousin, Richard II, he became admiral of the fleet, constable of the tower of London and warden of the Cinque Ports. He accompanied the king to Ireland in 1394 and was made earl of Cork; arranged Richard's marriage with Isabella, daughter of Charles VI of France; and was one of the king's helpers in the proceedings against the "lords appellant" in 1397. He became constable of England and obtained the lands in Holderness previously belonging to Thomas of Woodstock, duke of Gloucester, together with other estates and the title of duke of Aumerle or Albemarle. He deserted Richard in 1399, and in Henry IV's first parliament he was denounced as the murderer of Gloucester. He was reduced to his former rank as earl of Rutland, and deprived of his recent acquisitions of land. It is uncertain what share Rutland had in the conspiracy against Henry IV in Jan. 1400, but he was probably not seriously involved. He served as royal lieutenant in Aquitaine and in Wales and became duke of York on his father's death in 1402. He was concerned in the scheme, concocted in 1405 by his sister Constance, for seizing the young earl of March and his brother Roger Mortimer and carrying them into Wales, and he was imprisoned in Pevensey castle. Released a few months later, he was restored to the privy council and regained his estates. York led one division of the English army at Agincourt, where, on Oct. 25, 1415, he was killed by "much hete and thronggid." He was buried in Fotheringhay church.

YORK, RICHARD, DUKE OF (1411–1460), was born on Sept. 21, 1411, the son of Richard, earl of Cambridge. He became duke of York in 1415, and inherited the great possessions of the Mortimer family on the death of his maternal uncle, Edmund, earl of March, in 1425. He had been kindly treated by Henry V and his name appears at the head of the knights made by Henry VI at Leicester on May 19, 1426. York served in France (1430–31), and in 1432 he obtained livery of his lands and later went over to Ireland to take possession of his estates there. In Jan. 1436 he was appointed lieutenant general of France and Normandy. Me showed vigour and capacity. and recovered Fecamp and other places in Normandy. Dissatisfied with the support given him by the English government, York applied to be recalled in 1437, and returned home in the autumn. From this time he attached himself to Humphrey of Gloucester's party, in opposition to the government under Cardinal Beaufort. Marriage with Cecily, sister of the earl of Salisbury, allied York with his most powerful supporters, the rising family of the Nevilles.

On July 2, 1440, York was again appointed to the French command. His previous experience made him stipulate for full powers and a sufficient revenue. He did not go to Rouen until June 1441 During his second governorship York maintained the English position in Normandy. Distrusted by the court circle, he was recalled when his term of office expired in 1445.

The death of Humphrey of Gloucester in 1447 made York the first prince of the blood. Suffolk, now Henry's chief minister, found a convenient banishment for a dangerous rival by appointing York lieutenant of Ireland for ten years (Sept. 29. 1447). Tork, however, put off his departure for nearly two years.

During his absence Jack Cade's rebellion occurred. In Sept. 1450 York landed in Wales, came to London with an armed retinue and forced himself into the king's presence. He declared that he desired only justice and good government. In March 1452 York's first bid for power proved a failure; he came once more in arms to London, and endeavoured to obtain Somerset's dismissal. On a promise that his rival would be held in custody he disbanded his men and. thus outwitted, found himself virtually a prisoner. However, a nominal agreement was concluded, and York obtained the king's pardon. The situation was changed by the king's illness in Aug. 1453; York secured his recognition as protector on March 27, 1454. But the birth of a prince of Wales, in Oct. 1453, had removed York's chances of peaceful succession to the throne, and at the end of 1454 the king's sudden recovery brought the protectorate to an end.

The restoration of Somerset's ascendancy over the king made York and his friends take up arms, but, even when the two armies met at St. Albans. York endeavoured to treat for settlement. The issue was decided by the defeat and death of Somerset on May 22, 1455. Tork used his success with moderation. He became constable of England, and his friends obtained office. In Oct. 1455 a return of the king's illness made Pork again, for a brief space, protector. Henry recovered in Feb. 1456 and at Coventry, in October. the Yorkist ministers were dismissed. York mould not again accept honourable banishment to Ireland. Still there was no open breach and on March 25, 1458, a ceremony of reconciliation was held at St. Paul's. In Sept. 1459 both parties were once more in arms but York protested that he acted only in self-defense. The desertion of his best soldiers at Ludlow on Oct. 12. when the king advanced in person, left him helpless. With a few followers he escaped to Ireland, where his position as lord lieutenant was confirmed by an Irish parliament, and he ruled in full defiance of the English government. In June 1460 the earl of Warwick invaded England from Calais, and on July 10 their victory at Northampton gave the Torkists control of the king. York landed in England on Sept. 8, and marched on London. On reaching Westminster, he took up his residence in the royal palace, and formally asserted his claim to the throne in parliament. A compromise was arranged; Henry was to retain the crown for life. but Richard was to succeed him. On Nov. 8 he was accordingly proclaimed heir apparent. Early in December Richard went north with a small force. On Dec. 30 he was hemmed in by a Lancastrian army at Wakefield. Declaring that he had never kept castle in the face of the enemy, Richard rashly offered battle, and was defeated and slain. His enemies had his head cut off, and set it up on the walls of York adorned with a paper crown.

Richard of York was not a great statesman, but he was no mere pretender to a throne. He had ability and a genuine love of justice and might have made a good king. His widow, Cecily. survived until 1495; they had three daughters and four sons who survived infancy. Edmund, earl of Rutland, his second son, was killed at Wakefield. The other three were Edward IV, George duke of Clarence and Richard III.

Williams in *Cambridge Medieval History,* vol. viii (Cambridge, 1936).

YORK, a city, county and parliamentary borough, seat of the archbishop of York. the county town of Torkshire and a county in itself, 194 mi. N.N.W. of London by road and 202 mi. S.E. of Edinburgh by the coast road. Pop. (1951) 105,371. Area 10 sq.mi. Lying in the vale of York at the junction of the rivers Ouse and Foss, with natural ways through the higher land to east and west, it is a big communications centre.

The Romans, realizing its strategic importance, built the military fortress of Eburacum (c. A.D. 71–74) for the 9th legion, with a *colonia* on the west bank of the Ouse. Of this fortress there remain the Multangular tower at the western corner, and the eastern corner tower. which was uncovered by excavation in 1925–27. The emperor Hadrian visited Uork; Severus and Constantius Chlorus died there; and Constantine the Great was proclaimed emperor in the city. The Roman occupation ended *c.* A.D. 400 and little more is known of York's history until 62j when Paulinus became the first archbishop. Edwin, king of Northumbria. was baptized there and founded the first minster in 627. About this date York became the northern ecclesiastical capital and by the 8th century had become famous throughout the Christian world as a centre of learning under Xlcuin.

In 867 the Danes captured the city and retained it as the capital of Northumbria. The name York, from the Danish Torvick, and some of the street names date from this period. Later the city was subjugated by the West Saxon kings after a long struggle. In 1066 it was captured by Tostig, aided by Harold Hardraade, king of Norway. Harold of England defeated them at Stamford bridge, a few miles from York. and was in the city when the Normans invaded. Under the Conqueror York suffered severely. It was the key position in the subduing of the rebellious north, and two castles were built for the purpose. A section of the city was demolished and land flooded to increase the defenses. Much of what was done may be learned from the Domesday survey.

In the medieval period York achieved great prosperity. Its merchants traded from the Baltic down to the French coast and the city became an important inland port. Wool was the chief commodity, York becoming a staple town. It was well fortified with walls, and the cathedral and many religious houses were built, notably the Benedictine abbey of St. Mary and St. Leonard's hospital. There were about 40 parish churches. as well as friaries, monasteries and other foundations. Craft guilds flourished and annually presented at the festival of Corpus Christi the still-surviving cycle of 48 mystery plays. The city's wealth and traditions established it as the northern capital.

Cnder the Tudors York remained ecclesiastically and politically important although economically it declined. largely because of keener competition with London merchants in overseas trade. the increased sizes of ships, which meant that fewer seagoing vessels reached the city, and constant demands for defense against the Scots and French. Matters were made worse by the dissolution of the monasteries after which the citizens had to provide for the sick, aged and poor who had previously been the care of the religious houses. During the Great Rebellion York was besieged and captured in 1644. Earlier Charles's northern headquarters, it was a royalist stronghold. It was not harshly treated. however. by the parliamentarians, largely through the good offices of Lord Fairfax, himself a Porkshireman. By the end of the century the wool trade had moved entirely to the West Riding and the city's population declined. But its geographical location saved York because of its importance for coaching routes, and during the 18th century it became a place of fashionable resort. Country gentry built houses there and a new prosperity came to the city. The 19th century saw the rise of commercial Tork. chiefly because of George Hudson, the "railway king," whose activities developed it as a railway centre. The consequent influx of workers and their families brought cheap labour, which benefited the new industries then coming into being.

The government of the city was laid down in its charters. The earliest extant is one of Henry II confirming one of Henry I. In this the citizens are granted a merchant guild and free customs. In 1189 Richard I granted exemption from tolls throughout the kingdom. In 1212 John granted the city to the citizens at a fee-farm rent of £160 annually. In 1396 Richard II made the city a county of itself, free of the Ridings, with power to appoint two sheriffs. Henry VI in 1449 confirmed the previous charters which were later all confirmed by Charles II in 1663, and James II in 168j. Parliaments and councils were held in York in the 13th and 14th centuries, and from 1482 to 1641 the city was the headquarters of the Council of the North. After the Pilgrimage of Grace failed, Henry VIII extended the council's powers. Between 1660 and 1664 abortive attempts were made to revive the council.

The Cathedral. — Dedicated to St. Peter and commonly called the "Minster," the cathedral was a secular foundation. It is cruciform in shape and occupies the site of the church founded by Edwin and destroyed at the Conquest. Between 1070 and 1154 another church was built, remains of which can be seen in the crypt of the present building. which took from the 13th to the 15th centuries to build. The transepts are 13th century, the "Five Sisters" window in the north transept being completed about 12jj. The nave and chapter house were built in the late 13th and early 14th centuries. The west, front was finished in 1338 The central tower, west towers and choir screen are ijth century. Two great fires have damaged the building. The first, in 1829, caused by Jonathan Martin, destroyed the choir woodwork. and the second, in 1840. damaged the southwest tower. The stained glass. much of it 14th century, was replaced after World War II, having been removed for safety in 1939.

Some of the parish churches also possess old glass. notably All Saints', North street, and St. Michael's: Spurriergate.

The City. — The walls surrounding the city are $2\frac{1}{2}$ mi. in circuit and date from the 14th century. They are pierced by four great gates or "bars" — Micklegate. Bootham, Monk and Walmgate, the latter still retaining its barbican. During the 18th century the walls fell into decay and proposals were made to demolish the bars. Some prominent citizens campaigned against the scheme and the walls were restored by public subscription. Prominent in the struggle was William Etty, the painter, who, like John Flaxman, the sculptor. was a York man.

Of some of the city's historical buildings, Clifford's tower (13th century) is quatrefoil in shape and stands on the artificial mound where the Conqueror built a castle which. in 1190. witnessed a massacre of York Jews; in 1684 an explosion destroyed the roof. The Merchant Adventurers' hall (1387) is still the home of the Merchant Adventurers' company; originally the Mercers' company it received its present style by royal charter in 1580. The guildhall (1446–48) was destroyed in an air raid in April 1942, as was the medieval church of St. Martin-le-Grand, Coney street. St. Anthony's hall (1446–53), formerly the hall of the minor guilds of the city. was the bluecoat boys' school from 170j to 1947. Now restored, it houses the Borthwick Institute of Historical Research, which was opened in 19j3. The Merchant Taylors' hall (late 14th-century and now restored) has been continuously the headquarters of the Merchant Taylors' company. St. William's college (1453), originally a college for chantry priests, has since its restoration at the beginning of the 20th century been the meeting place of the northern convocation. The Treasurer's house (National trust property) was the house of the treasurer of York minster until the office ceased at the Dissolution; the building passed into secular hands and was later divided into two parts, the other portion being known as Gray's court. The King's manor, the house of the abbot of St. Mary's until the Dissolution, later became the official residence of the president of the Council of the North. Since 1837 it has been the Yorkshire School for the Blind. The Assembly rooms were built in 1736 from designs by the earl of Burlington. The Mansion house (1725–26), the official residence of the lord mayor, contains the valuable collection of civic regalia and plate.

York contains rich material for students of history, its archive collections being particularly important. The city, merchant guiids, dean and chapter and College of Vicars Choral of York minster possess large accumulations. Archbishop Cyril Garbett (1875–1955) made available to students the vast series of diocesan records. which is housed at the Borthwick Institute of Historical Research.

The city also possesses several fine museums. The Yorkshire Philosophical society's museum includes, besides antiquities and natural history specimens, a fine Roman museum and a museum of medieval sculpture. Much of this latter comes from St. Mary's abbey, the ruins of which stand in the society's grounds. The society is the parent of the British Association for the Advancement of Science. The world-famous Castle museum, opened in 1938. contains the Kirk collection of bygones and is housed in the old female prison, built in 1780 by the York architect, John Carr. Its most striking feature is an old cobbled "street" with "shops" representing various trades. In the adjacent debtors' prison is the Military museum, as well as exhibits illustrating different crafts. The castle area in which these buildings stand, together with assize courts, although within the city boundary, has always been crown property and outside the city's jurisdiction. The Railway museum contains both small exhibits and rolling stock, including, among several famous locomotives. the "City of Truro," the first in England (in 1904) to travel at more than 100 m.p.h.

Although York retains much of architectural and historical interest it is also a thriving modern city. Chief of its many industries are the manufacture of cocoa and confectionery, and the railway with its passenger and freight car shops. Other industries include printing; scientific instrument. button and glass and furniture making: and the manufacture of hydraulic pumping.machinery. as well as many branches of light engineering. Sugar refining, brewing and the manufacture of artificial fertilizers are also carried on, The river provides a cheap means of transporting materials to and from the city. The first all-electric signaling system in the world was installed at York railway station. The increase in population had necessitated extensive building outside the old city with several boundary extensions. Some idea of this increase is gained from the following figures: 1801, 16,000; 1901, 77,793; 1951, 105.371. Inside the city boundary, areas of common land called "strays" serve as "lungs" for York. On one of these is the Knavesmire with its famous racecourse.

The city is an important centre for the marketing of agricultural produce and cattle. It is the headquarters of the northern command.

From 129j to 1918, when the number was reduced to one, two members were returned to parliament. From about 1450 to 1835 the area to the southwest of the city, known as the "Ainsty," was under the city's jurisdiction; its administration then passed to the West Riding. With the growth of the three county administrative areas York's position has declined as a civil capital but it has now become an important centre for tourists. The medieval hospital of St.. Leonard catered for the wayfarer, and the city council in 1951 restored and converted the 13th-century ruins into an information centre for travelers.

YORK, a town (township) of York county, Maine, U.S., 40 mi. S.W. of Portland, comprised of York village, Uork Beach, York Harbor and Cape Neddick. It was settled in 1624 on a site called Agamenticus by Capt. John Smith,' who had explored the area in 1614. The community became the first English city on the American, continent when Sir Ferdinando Gorges (*q.v.*) endowed it with a city charter and government under the name of Georgeana in 1641. The Massachusetts Bay company took over the Gorges property in 1652, revoked the city charter and changed the name to York, after the English town.

The community was almost wiped out Feb. 2, 1692, in a raid by 150 Abenaki Indians; 80 residents were killed and 100 kidnapped in the worst massacre of its kind in New England. York was the shiretown of the province from 1716 to 1735 and of the county from 1760 to 1832, when the courts were moved to Alfred. With snug harbours, sandy beaches and rocky shores, the town is an attraction for photographers and artists. Its year-round population oi about 3,000 is multiplied several times during the vacation season. (A. K. GL.)

YORK, a city of southeastern Pennsylvania, U.S., 90 mi. W. of Philadelphia and 28 mi. S.S.E. of Harrisburg; the seat of York county. Pop. (1960) city 54,504, a decrease of 9.1% since 1950; standard metropolitan statistical area (York county) 238,336, an increase of 14.9%. (For comparative population figures for the city see table in PENNSYLVANIA: Population.)

York was the first permanent settlement in Pennsylvania west of the Susquehanna. It was laid out in 1741 in the centre of Springettsbury manor, a tract of 64,000 ac. granted to Springett Penn (a grandson of William Penn) in 1722, and was named for the English city. The first settlers were chiefly Germans from the Rhenish Palatinate (Lutherans, Reformed, Mennonites and Moravians), with some English Quakers and Scotch-Irish. The village was on the Monocacy road, the main route to the south and the southwest, and soon grew rapidly. When York county was established in 1749 the village of York was made the county seat, and by 1754 it had 210 houses and 1,000 inhabitants. In 1777, when the British approached Philadelphia, the Continental Congress left the city, and after holding one day's session in Lancaster, crossed the Susquehanna to York and made it the national capital from Sept. 30, 1777, to June 27, 1778.

In the old county courthouse (built 1754–56 and torn down in 1849) the congress passed the Articles of Confederation, received the news of Burgoyne's surrender, issued the first national Thanksgiving proclamation, received word from Franklin in Paris that France would aid with money, ships and men, received Von Steuben and Lafayette and commissioned them as major generals. It was in York that the Conway cabal, an attempt led by the Irish adventurer Thomas Conway to deprive George Washington of the command of the American army, was frustrated by Lafayette. There $1,500,000 in silver, lent by France, was brought in Sept. 1778, and there Benjamin Franklin's printing press, moved from Philadelphia, issued $10,000,000 of Continental money. During the Civil War Confederate troops entered the town on June 28, 1863, and a small Federal force retreated before them.

York is the commercial centre of a rich agricultural region and also has many large and diversified manufacturing industries. The city's area is closely built up and there are populous industrial districts just outside the corporate limits in several directions. Manufactures include refrigerating and air-conditioning equipment, hydraulic turbines, farm equipment, building materials, wall and roofing paper, tire chains and bakers' machinery.

York was incorporated as a borough in 1787 and as a city in 1887. Points of interest include the Quaker meetinghouse, erected in 1765; several old burying grounds; the building used by Gen. Anthony Wayne for his headquarters while recruiting his brigade for the march on Yorktown; and, in Farquhar park, a model of the provincial courthouse in which the Continental Congress held its sessions. (R. E. AT.)

YORK AND ALBANY, FREDERICK, DUKE OF (1763–1827), second son of George III, who as commander in chief of the British army introduced much-needed administrative reforms, was born in London on Aug. 16, 1763.

In Feb. 1764, through his father's influence as elector of Hanover, he was elected to the wealthy bishopric of Osnabriick, and retained that position until 1803. Entering the army in 1780, he received his military education in Hanover (1781–87) and was promoted to lieutenant general in 1784. A few weeks later he was created duke of York and Albany, and took his seat in the house of lords on his return home. In 1791 he married Princess Frederica (b. 1767), daughter of Frederick William II of Prussia, but the marriage was childless and not happy; a separation took place, and she died on Aug. 6, 1820.

In 1793 the king appointed the duke of York to command the English army sent to Flanders to co-operate with the Austrians. His personal bravery could not compensate for his inexperience and although his incompetence as a commander has been exaggerated, he must be held at least partly responsible for the defeats of 1794–95. In 1795 he was made a field marshal, and in 1798 commander in chief. His expedition to Holland in 1799 was even less successful, and he never again commanded in the field. He had to resign in 1809, being implicated in the scandals associated with his mistress, Mrs. Mary Anne Clarke (*q.v.*), but the house of commons acquitted him by 278 votes to 196 of having received bribes in return for military promotions. In May 1811 the prince regent replaced him at the head of the army.

Like his father, the duke owed much of his popularity to his hostility to the Catholic claims. His speech on that subject in 182j to the house of lords was printed on blue satin in letters of gold. During his last years he tried to organize an anti-Catholic party distinct from the ministerial. and in Nov. 1816 he tried unsuccessfully to induce his brother to dismiss George Canning, the leading advocate of Catholic emancipation. The duke's death on Jan. j, 1827, was a great blow to the opponents of Catholic relief, for the new heir presumptive, his brother the duke of Clarence, was at heart favourable to that cause. The long-continued irregularities of the duke of York's private life did nothing to diminish his popularity; indeed, it was suggested that in these failings "there was nothing that was un-English, nothing that was unprincely." He was an excellent commander in chief, applying himself with energy and devotion to the task of improving the welfare of the soldiers and eliminating administrative abuses.

See A. H. Burne, *The* Noble *Dube* of York (London, 1949); R. Fulford, *The* Royal Dukes (London, Sew York, 1949). (A. AL.)

YORKE, CHARLES (1722–1770), English jurist and politician, second son of Philip Yorke, Lord Chancellor Hardwicke, was born in London on Dec. 30, 1722, and educated at Corpus Christi college, Cambridge. In 1745 he published a treatise on the law of forfeiture for high treason and the next year was called to the bar.

In 1747 he gained a sinecure appointment in the court of chancery and entered politics as member for Reigate. In 1751 he became counsel to the East India company. His first political office was that of solicitor general under William Pitt (1756–61). He served as attorney general under John Stuart Bute (1762–63) and in the Wilkes cases condemned the principle of general warrants but maintained that parliamentary privilege did not extend to cases of libel.

As attorney general under the Rockingham administration Yorke maintained, in the dispute with the American colonies, that the Stamp act should be repealed but a Declaratory act should be simultaneously passed. He drew up the constitution for Quebec, which was later largely embodied in the Quebec act of 1774. He resigned office in 1767 and pledged himself not to accept office under the duke of Grafton. But when Grafton. in 1;70, invited him to accept the coveted office of lord chancellor, he at last yielded to the king's entreaties. Then, immediately overwhelmed with remorse, he fled to his own house and died there three days later, on Jan. 20, 1770. His last act was to refuse his official sanction to the patent raising himself to the peerage as Baron Morden. (D. TN.)

YORKSHIRE, the largest county of England, nearly spanning the country in its northeastern part. Bounded eastward by the North sea and southward by the Humber estuary with parts of Lincolnshire, Nottinghamshire, Derbyshire and Cheshire, on the west it is divided from Lancashire and Westmorland by a serpentine line drawn through and over the Pennine chain, approaching at one point within 8 mi. of the western shore. Northward the boundary against County Durham is the Tees. The total area (geographical county) is 6,100.6 sq.mi., distributed between the East (1,172.5), North (2,127.8) and West (2,790.3) Ridings and the City of York (10 sq.mi.)

Physical Features. — The county's geography is dominated by its western mountain wall: 95 mi. of the Pennine chain, which, boldly carved in the Ice Ages, presents rounded moorland crests, such as Mickle Fell, Whernside. Ingleborough, Buckden Pike and Penyghent, their flanks falling into the characteristic western dales, large scree slopes which have become hill meadows and broad alluvial floors traversed by rivers now relatively small (see PENNINES). Such are Upper Teesdale, Swaledale. Wensleydale, Nidderdale, Wharfedale and Ribblesdale, all north of Airedale ("the Aire gap"), the only low-level pass through the Yorkshire Pennines and a point where the geological exposures alter. The northern massif is of Carboniferous Limestone and Yoredale Beds, capped by Millstone Grit. South of the Aire, the prominent rock is the Millstone Grit, which has been arched upward approximately along the county boundary and has the Coal Measures preserved along either flank. The uplands again are bleak grouse moors. Under the eastern slopes of the Pennines, the county is traversed from north to south by a belt of Magnesian Limestone which produces a rich soil with luxuriant vegetation.

The remainder of Torkshire is a great tract of lower ground. North and south runs the broad central plain, parts of which are called the Vale of Mowbray and Vale of York; eastward to the sea extend Lower Teesdale, the Vale of Pickering and, in the south, the flats of the Ouse-Trent-Humber complex. Between these depressions, the northern hill mass is the tilted tableland of Jurassic limestones. rising nearly to 1,500 ft., now called the North Yorkshire Moors National park, but known for centuries as Blackamoor or Blakeymoor. Its majestic northwestern scarp dominates Cleveland (Cliffland) and the neoindustrial area of "Tees-side" or Lower Teesdale; while. apart from the Esk. which flows east to the sea at Whitby, all its major streams trend south into the Yale of Pickering and so by Derwent and Ouse into the Humber. The valleys of Eskdale. Ryedale, Farndale. Newtondale. etc.. sheltered and wooded. present much lovely scenery. South of Pickering vale rise the chalk Yorkshire wolds, similarly scarped to the northwest and dipping southeasterly. so that beyond Flamborough head the sea cliffs end and the chalk disappears under the flat, drift-covered promontory of Holderness which is subject to severe, and constant erosion by the sea.

Of coastal holiday resorts the principal are. from north to south, Redcar. Saltburn. Whitby, Robin Hood's Bay. Scarborough, Filey, Bridlington. Hornsea and Withernsea. Harrogate. with its mineral springs, is the chiei inland health resort.

Minerals. — Coal has long been the principal product and the Yorkshire Coal Measures are worked chiefly in the southwestern part of the county. Associated with the Upper Coal Measures are important nodular iron ores. Brick. pottery and fire clay are also found. besides gannister and oil shale. Farther north, some Pennine foothills are closely pocked with the shallow pits of the old-time coal miners. who likewise worked westward at Ingleborough and eastward in the Estuarine Lias of Cleveland. Lead ore (usually galena in calcite) was widely worked in the western dales irom, perhaps, pre-Roman times until the Nevada boom in silver-lead. Many of the limestones and sandstones provide excellent building material, though the most famous architectural quarries are in the Magnesian Limestone, while from the Lower Coal Measures come the smooth-faced Yorkshire paving and roofing flags. In the east. jet and Rimmeridge shale were worked from pre-historic times. Along the northeastern coast the production of alum prospered in the 17th and 18th centuries and deep deposits of potassium salts await development.

Archaeology. — From the Mesolithic period, Tardenoisian flints occur along the Pennines. notably near Huddersfield. while finds of stray Maglemose harpoons from Holderness were followed in 1949–51 by the excavation of a classic site, Star Carr, Seamer, near Scarborough, at the seaward end of the Vale of Pickering; a winter camp of hunter-fisher folk earlier than the best Maglemose sites on the continent and dated by radioactive carbon (C^{14}) technique about jooo B.C. For all periods between the Neolithic and Early Iron Age B—as also for the Anglo-Saxon — evidence lies thickest on the chalk wolds. East of Bridlington have been found concentrations of fine flint implements with long and round barrows, including many of the Beaker folk. Notable Megalithic monuments elsewhere are the 20-ft. standing stones called the Devil's Arrows at Boroughbridge. A great ceremonial centre is marked by three large earthen circles at Thornbrough. Cup-and-ring-marked stones near Ilkley could belong to the Middle Bronze Age, like some of the numerous running earthworks. Arras and Hessleskew farms near Market Weighton are famous for their chariot burials of chieftains of the immediately pre-Roman Iron Age and it is significant that among other deposits of this class! one was found in 1844 at Stanwick. where in 1951–52 Sir R. E. Mortimer Wheeler identified an 8 jo-ac. complex of earthworks as the last stronghold of the Brigantian king, Venutius, who revolted against the Romans in A.D. 69.

History. — Before the tide of Roman occupation rolled over it between A.D. 70 and 80. a part of the present East Riding was held by the Parisi. All the rest of modern Yorkshire belonged to the Brigantes. most numerous of the British tribes, according to Tacitus. Of Roman towns the principal and strategic centre was Eburacum (York, *q.v.*), garrisoned first by the hapless 9th legion Hispana and from A.D. 122 until the final withdrawal by the 6th Victrix. On the western fringe of the Ouse basin one great road ran from south to north by Bawtry, Doncaster, Castleford and Tadcaster to Isurium Brigantum (Aldborough by Boroughbridge) and so, under the modern Great North road to Cataractonium (Catterick Bridge) and the fork at Scotch Corner for Lavatrae (Bowes) or Vinovia (Binchester. County Durhamj. The complementary eastern road began at the port and river crossing of Petuaria (Brough on Humber) and followed a parallel course up the Yale of York. with a fork to Derventio (Malton j. York was linked to both of these by the great transverse road from Deva (Chester) to Bridlington.

In the 6th century an Anglian invasion of the wolds and Holderness led to the development of the kingdom of Deira. Ella (or Aella), its first king. extended his territory north to the Wear and his son Edwin conquered western districts roughly equivalent to Yorkshire. The defeat of Edwin at Hatfield in 633 was followed by a succession of struggles between Mercia and Northumbria for the supremacy over Deira. After the Danish conquest of Deira, Guthrum in 875 apportioned the district among his followers, under whose lordship the English retained their lands. Cleveland came under strong Scandinavian influence, and it was probably about this date that Yorkshire was divided into thrydings (Ridings, thirds). which in turn were subdivided into wapentakes. The bounds of the three Ridings were so settled as to meet at York, the administrative centre which by A.D. 1000 had a population of over 30.000. At the battle of Stamford bridge in 1066 Harold Hardraade, who had seized York, was defeated and slain by Harold of England.

The name Yorkshire was taken from the city of York which in pre-Roman times was supposed to have been called Eboracon.

On the redistribution of estates aiter the Norman conquest, Alan Rufus, founder of Richmond castle, received the honour of Richmond, and Ilbert de Lacy the honour of Pontefract. Earl Harold's estate at Conisbrough passed to William de Warenne. earl of Surrey, together with Sandal castle. which in the 14th century was bestowed on Edmund Langley. duke of York. Other Domesday landholders were William de Percy, refounder of Whitby abbey; Robert de Bruce. ancestor of the royal line in Scotland. and Roger de Busli. The archbishop of Tork enjoyed the great lordship of Sherburn. and Howdenshire was a liberty of the bishop of Durham, whose predecessors had held Crayke from the 7th century and who received from William Rufus the manor and soke of Northallerton.

In 1138 David of Scotland was defeated near Northallerton in the battle of the Standard. Robert Bruce in 1318 destroyed Northallerton. Boroughbridge, Scarborough and Skipton. The forces of Edward II defeated the rebel barons in 1322 at the battle of Boroughbridge. The forces of the rebellious earl of Northumberland in 1408 were defeated at Bramham moor near Tadcaster. A skirmish at Stamford bridge in 1453 was an early event of the struggle between the houses of York and Lancaster. In 1460 the duke of York was defeated and killed at Wakefield, and next year the Lancastrians were defeated at Towton. The suppression of the monasteries roused deep resentment in Yorkshire. and the inhabitants flocked to join the Pilgrimage of Grace. The northern rebellion of 1j69 was largely enacted in northern Yorkshire. Sir William Savile captured Leeds and Wakefield for the king in 1642, and in 1643 the duke of Newcastle, having defeated the Fairfaxes at Adwalton Moor, held all Yorkshire except Hull. In 1644. however, the Fairfaxes secured the East and West Ridings. while Cromwell's victory of Marston Moor was followed by the capture of York and in the next year of Pontefract and Scarborough.

In the 13th century the diocese of York included in this county the archdeaconries of York, Cleveland. East Riding and Richmond. The latter archdeaconry was transferred in 1541 to Henry VIII's new diocese of Chester, but its Yorkshire deaneries were given to the Ripon see when that was created in 1836. In 1888 the area of the Ripon diocese was reduced by creation, of the see of Wakefield. now consisting of the archdeaconries of Halifax and Pontefract; whiie the diocese of Ripon consists of the archdeaconries of Richmond (within Yorkshire) and Leeds. York diocese comprises the iirchdeaconries of Tork and West Riding. East Riding and Cleveland. The bishoprics of Sheffield and Bradford were created in 1914 and 1919 respectively, the former containing the archdeaconries of Sheffield and Doncaster, the latter those of Craven and Bradford. The first archbishop of York was Ecgbert. a disciple of Bede, who was raised to archiepiscopal status by Gregory III in 735.

The woolen industry developed after the Conquest, and historical details may be found in the articles on the separate towns *(see* LEEDS, BRADFORD, etc.). The time of the American Revolution marked the gradual absorption by Yorkshire of the clothing trade from the eastern counties. Coal appears to have been used in Yorkshire by the Romans, and was dug at Leeds in the 13th century. The early fame of Sheffield (*q.v.*) as a centre of the cutlery and iron trade is demonstrated by a line in Chaucer. Forges of the 13th century are mentioned at Rosedale and at Gisburn. In the 16th century limestone was dug in many parts of Elmet, and Huddlestone. Hesselwood and Tadcaster had famous quarries; Pontefract was known for its licorice, Aberford for pins and Whitby for jet. Kolton market was an important distributive centre in the 17th century, and in 1787 there were 11 cotton mills in the county.

Architecture. — As a county which has always been prosperous, Yorkshire is naturally endowed with a great wealth of monumental and architectural antiquities. Of castles, the fine ruins at Knaresborough, Pickering, Pontefract. Richmond, Scarborough and Skipton are described under their respective headings. Barden tower, picturesquely situated in upper Wharfedale, was built by Henry de Clifford (d, 1523). Bolton castle in Wensleydale, built in Richard II's time by Richard Scrope, was besieged in 1645, but remains impressive and partially habitable. The unique Conisbrough castle, with its massive cylindrical keep reinforced by solid buttresstoners! stands by the Don between Rotherham and Doncaster. Middleham castle, within sight of Bolton, is well cared for by the ministry of works. like Bowes, where only the square keep remains. Cawood castle, near Selby, retains its gateway tower of Henry VI's time. Helmsley castle, of the late 12th century, is still interesting although much of its curtain wall has gone into the building of the town, and Sheriri Hutton, which once resembled Bolton, has been similarly mutilated since the 18th century. Harewood castle in lower Wharfedale has no portion earlier than the reign of Edward III. Snape is a 15th-century castle partly ruined, partly inhabited. Other remains deserving notice are Mulgrave, Ravensworth. Spofforth, Tickhill, Whorlton, Wressell and Sandal.

At :he time of the Dissolution there were in 1'0rkshire 28 abbeys; 26 priories, 23 nunneries, 30 friaries, 13 cells, 4 commanderies of Knights Hospitallers and 4 preceptories of Knights Templars. The principal monastic ruins are Bolton abbey (*q.v.*), properly a priory, of Augustinian canons; Fountains, finest and most complete of the ruined abbeys in England (see MONASTERY). Rievaulx (*q.v.*), perhaps the most beautiful, and Jervaulx. all Cistercian; Kirkstall near Leeds, also Cistercian; and the Benedictine abbey of St. Mary in York (*q.v.*). Also notable are the Premonstratensian abbey of Coverham and other important remains at Bridlington, Guisborough, Malton. Whitby, Easby (Richmond), Kirkham near Malton. Monk Bretton near Barnsley and Mount Grace near Northallerton. Byland abbey, of the early 12th century. is still handsome and like the Premonstratensian abbey oi Egglestone on the Tees has benefited by official custodianship. Reference must be made to the Cistercian foundations of Meaux in Holderness, Roche near Rotherham and Sawley in Ribblesdale; the Benedictine nunneries of Marrick and Rosedale; and the Gilbertine house of Watton in Holderness. Beverley (*q.v.*) minster is a magnificent mainly Perpendicular building; it was originally founded as a college of secular canons in the 7th century.

Scattered about the county is a great quantity of Anglian, Anglo-Danish and Anglo-Norse carved stones which collectively illustrate local arts and the vigour of the Christian faith betneen the 8th and 11th centuries Of these. W G Collingwood's *Northumbrian Crosses* of *the Pre-Norman Age* (London 1927) is a masterly study From many place names the presence of 8th–9th century crosses may be noted at Collingham Dewsbury, Northallerton and Otley. In Masham churchyard is the weathered loner part of a superb Anglian stone rood Brompton by Northallerton in the 10th century was a centre of such work some of its crosses and "hogback" grave covers remain in its church.

As the Yorkshire countryside varies so widely, from sheer sea cliffs and flat sandy shores, through reclaimed fens and sheltered levels, up windswept dales to the bald mountaintops; so its architecture varies with location and materials formerly available. Stone was used for the most ancient buildings that survive, the Saxon crypt under Ripon cathedral, the early-Norman aisled and apsed crypt (intended for a cell of Whitby abbey) under Lastingham church. Of notable churches this brief selection incidentally names some of the most attractive villages and small towns: Bedale, Birkin, Bolton, Cox\\-old. Easby by Richmond. Flamborough, Hirckness, Kirklington, North Newbald, Patrick Brompton, Patrington. Pickering. Romaldkirk. Skipwith, Snaith, South Skirlaugh. Stillingfleet, Swine! Thirsk and West Tanfield.

Of domestic architecture the earliest survivals are a Norman manor house associated with the great Inigo Jones mansion of Burton Agnes, a few medieval timber-framed dwellings and many small stone manor houses, usually with flagged roofs. In the Bradford-Halifax district is a group of broad. low-browed stone houses built by the 16th-century clothiers. Fountains hall, built in 1610 out of materials from the adjacent abbey, is an outstanding example of its type and period. Kiplin hall (1616), the home of Lord Baltimore. is still furnished, and Honsham is a school but other famous 17th-century houses have perished or been rebuilt. Of the vast 18th-century country houses. Harewood (home of the earls of Harewood) is fully maintained; Castle Howard, designed by Sir John Vanbrugh, was damaged by fire but retains much of its state; Wentworth Woodhouse has suffered many indignities; East Riddlesden hall. Nostell and Sunnington have passed to the National trust; others to municipalities.

Agriculture, Industries and Communications. — The North and East Ridings are mainly agricultural; in the West Riding there are mixed farms even in the areas chiefly devoted to steel! coal and wool; but in both the West and Sorth Ridings the extensive fells and moors, with their dales. are the homes of prosperous dairy and sheep farming. Almost all the chicory and licorice (this mainly around Pontefractj and nearly a third of the flax used in England are grown in Yorkshire and enormous quantities of rhubarb are raised in the Leeds-Wakefield area. Grain growing is chiefly in the East Riding. Selby is the centre of a leading potato-growing district, and beet sugar is grown in several areas.

Of greatest importance are the textile and steel areas of the West Riding, both now based on the equally significant coal area centred on Barnsley. In the North Riding is the iron and steel industry based on Middlesbrough and Tees-side; in the East Riding, Hull, a busy deepwater port and base for the northern-seas cod fishery, is fast developing as an industrial centre; other industries in the East Riding include aircraft manufacture at Brough and oil-cake and flour milling at Barlby, by Selby.

About three-quarters of all the workers in Great Britain's woolen trade are found in the West Riding, mostly in the area bounded by Keighley, Leeds, Wakefield and Colne and Holme valleys. The worsted industry dominates the area in the northwest, around Bradford, Keighley and Halifax, woolens being more important in the southeast toward Wakefield. Dewsbury, Batley and Ossett are centres of shoddy manufacture; Halifax makes carpets, Bradford is a dyeing town. Leeds is Britain's busiest centre for ready-made clothing, but like other Yorkshire cities has many different industries. Todrnorden and Hebden Bridge are the two biggest cotton centres; silk is spun at Brighouse. The steel industry is mainly based upon Sheffield, but has spread through Rotherham into the Don valley, Doncaster itself having become a considerable manufacturing town. The coal area extends from south of

Leeds and Bradford to Sheffield, Barnsley being a notable centre. The iron and steel working area of Middlesbrough was developed and brought to great prosperity upon ore from the neighbouring hills, but is now increasingly dependent on ores brought from a distance. Between Middlesbrough and the mouth of the Tees in the mid-20th century new major industries concerned with new chemical processes, the production of synthetic fibres and fabrics, etc., were being established. York. too, long famed for its railway works and chocolate manufacture, has many other industries and is a thriving business centre.

Industry is aided by the fact that the main road and rail routes from London to northeastern England and Scotland pass through Yorkshire. The Aire and Calder navigation was designed to link industrial Yorkshire and Lancashire respectively with the Mersey and the Humber, Goole being a transshipment port on the latter waterway. Hull and Middlesbrough are Yorkshire's chief ports for ocean-going vessels.

Population and Administration. — The population of the three Ridings of Yorkshire at the 1951 census was as follows:

Riding	Administrative county	Geographical county (*i.e.*, inc. county boroughs)
	211,799	
	378,209	510,904
West	1,589,118	3,586,274
Total	2,179,126	4,622,659

The population of the city of York in 1951 was 105,371. Within the geographical boundaries of the East Riding (which has its county council officesat Beverley) are the city and county borough of Kingston upon Hull; the municipal boroughs of Beverley, Bridlington and Hedon; six urban districts and eight rural districts. The North Riding (county council offices at Northallerton) has one county borough, Middlesbrough; four municipal boroughs, Redcar, Richmond, Scarborough and Thornaby-on-Tees; 10 urban and 20 rural districts. The West Riding (county council offices at Wakefield) has 10 county boroughs, Barnsley, Dewsbury, Doncaster, Halifax, Huddersfield, Rotherham and the four cities of Bradford, Leeds, Sheffield and Wakefield; 13 municipal boroughs including the city of Ripon; 55 urban and 21 rural districts.

Although Vorkshire has only one sheriff, the three Ridings have been separate administrative units from, probably, the 9th century; each has had its own court of quarter sessions since the 14th century. its own lord lieutenant for several centuries, and its own county council since 1889. The present petty sessional divisions in many cases approximate the ancient wapentakes and use the names of the latter. The county and boroughs of Yorkshire in 1956 returned a total of 56 members to parliament. The National trust owned 8,653 ac. in Yorkshire in 1956; 241 ac. were protected.

Education is headed by the universities of Leeds (1904), Sheffield (1905) and Hull (1954). Technical colleges are devoted primarily to the study of subjects related to the various Vorkshire industries. There are many famous schools, Nonconformist colleges and other denominational schools such as the school of the Society of Friends at Great Ayton and the Roman Catholic college of Ampleforth run by Benedictine monks.

The people of industrial Yorkshire are noted for their singing, the Leeds festival being one of the greatest in England. Also centred on Leeds is the County Cricket club—a game for which Yorkshiremen have enthusiasm and talent.

(C. K. C. A.)

YORKTOWN, a town in the tidewater area of eastern Virginia. U.S., site of the concluding engagement of the American Revolution, is on the York river 10 mi. from its mouth and 60 mi. S.E. of Richmond; the seat of York county. The town was established in 1691 and there began almost immediately a steady 'prosperous growth which continued until the Revolution. Possessing an excellent deepwater harbour, Yorktown became in the 18th century a tobacco port of first importance and around 1750 had a population between 2.000 and 3,000. Yorktown's economic decline began with the outbreak of the American Revolution; the siege of the town in 1781, which gave it a permanent place in history, completed its decline.

The events which led up to the siege of Yorktown were connected with the attempts of the British after 1778 to subdue the southern colonies. By the spring of 1781 this task was still not accomplished, and one of the reasons was that Virginia was serving as an important source of men and supplies for the Continental army. Consequently, in May 1781, Lord Cornwallis, the British commander, moved his forces into Virginia. After some sparring with the patriot forces under the marquis de Lafayette, Cornwallis moved to Yorktown on Aug. 7, to be in close communication with the British army at New York. It was then that Gen. George Washington and the comte de Kochambeau combined their American and French armies in the north and marched rapidly to Virginia. With the aid of a French fleet under the comte de Grasse (see AMERICAN REVOLUTION, THE: The War at Sea) and additional French infantry they joined Lafayette and laid siege to Yorktown on Sept. 28. Cornwallis, after an unsuccessful attempt to escape, surrendered on Oct. 19, bringing to an end, for all practical purposes, the war in America.

In the 20th century Yorktown regained a measure of prosperity. There are several naval establishments nearby, and there is a marked movement of industry into the area. A national monument was established there in 1930 and in 1936 the area was designated as Colonial National Historical park. Among the colonial edifices still standing in Yorktown is the magnificent Georgian home of Thomas Nelson, Jr., signer of the Declaration of Independence, governor of Virginia after Thomas Jefferson and commander of the Virginia militia during the siege.

Trudell, *Colonial Yorktown* (1938).

(E. G. Ev.)

YORO, inland department in northern Honduras. Area 3,065 sq.mi.; pop. (1950) 98,700, about 80% rural, is concentrated mostly in Aguan lowlands in the east-central part and in Comayagua-Cuyamapa-Sulaco lowlands in the west and adjacent mountain valleys. Twenty per cent of the area is farm land, of which more than half is either cultivated or in pasture. The department produces bananas for export in the western and eastern lowlands which are served by railways, and coffee is grown in the southern mountains, served only by pack and cart transportation. Other products include rice, corn, potatoes, cattle, swine and poultry.

The departmental capital, Yoro (pop. [1950] 2,078), set in a primitive highland region, is the home of the Jicaque Indians and can be reached by air or mule. (C. F. J.)

YORUBA, an African people numbering over 5,000,000 who inhabit the southwestern corner of Nigeria and a small area in eastern Dahomey, largely concentrated in the Ibadan, Ondo, Oyo, Abeokuta, Colony and Ijebu provinces of the Western region and in the Ilorin and Kabba provinces of the Northern region of Nigeria. The Yoruba city of Ibadan, with a population of over 450,000, is the largest Negro city in Africa. Five other Yoruba cities had over 100.000 inhabitants and six others over 40,000 at the 1952 census. Despite a tradition of urban life, their economy is' based on farming, with yams and maize as the main food crops, and on handicrafts and trade. They produce over 90% of Nigeria's cocoa as a cash crop for export.

According to Yoruba traditions, the earth was created at Ife, where beautiful portrait heads in brass and terra cotta have been excavated. Odudua, the deity who spread earth on the primeval water, had 16 sons from whom Yoruba kings claim descent. Leaving the Oni as ruler of Ife, the others went out to found their own kingdoms: Oyo the largest and most powerful under the Alafin, Ijebu-Ode under the Awujale, Ondo under the Oshemowe, Ilesha under the Owa, and others. Descent was patrilineal, a king's successor being chosen from among the members of the royal lineage. Although the kings had great authority in theory, in practice they were advised by court councilors, and if overly oppressive they were invited to commit suicide or escape to exile. Under British administration, after 1893, many provincial and town chiefs claimed the right to wear a beaded crown, assuming the status of traditional kings.

Yoruba religion centred in the worship of a pantheon of deities including Obatala. god of whiteness: Ogun, god of iron: Shango, god of lightning; Yemaja, Oshun and Oya, goddesses of the rivers Ogun Oshun and Niger; Shopona or Obaluaiye, god of smallpox; Ifa, god of divination; and Eshu. a trickster who serves as the gods' messenger. The worship of these deities continues in the Americas where many Yoruba were taken as slaves, especially in Brazil and Cuba.

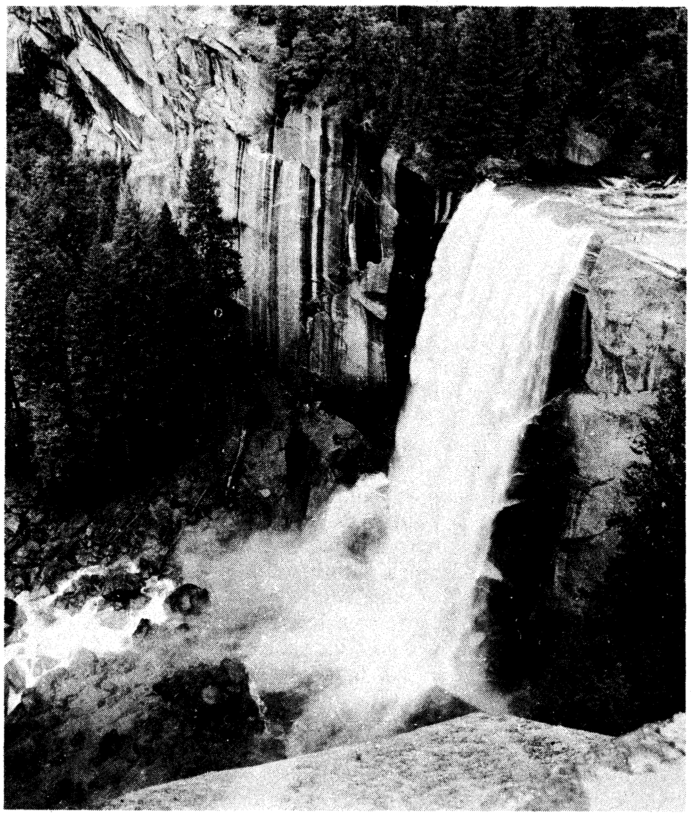
YOSEMITE NATIONAL PARK, a deep valley of the Merced river, tributary to the San Joaquin, in central California. It was established with the Mariposa Grove of Big Trees as a state park by an act of congress in 1864 which described it as "the Cleft, or Gorge, in the Granite Peak of the Sierra Nevada Mountains." From its floor at approximately 4,000 ft. above sea level the walls rise abruptly 3,000 to 4,000 ft. to a rolling plateau region culminating in mountain peaks 10,000 to 13,000 ft. high. The valley itself is about 7 mi. long and from ½ to 1 mi. wide. It presents a rare combination of unique form, enormous monolithic granite cliffs and domes, foaming waterfalls and the enchanting loveliness of woods and flowering meadows.

Principal features are the majestic rock forms—among them El Capitan, Cathedral Rocks, Cathedral Spires, Glacier Point, North Dome and the superb Half Dome, which dominates the head of the valley. Many sparkling waterfalls leap into the valley or drift down its granite cliffs in spring and early summer—Bridalveil, Ribbon, Yosemite, Illilouette, Vernal and Nevada. The Upper Yosemite fall has a drop of 1,430 ft.; from its lip to the foot of the Lower Yosemite fall the drop is 2,425 ft., making it the second highest fall in the world.

History.—Captain Reddeford Walker's party of trappers in 1833 may have looked either into Yosemite valley or Hetch Hetchy valley to the northwest. Apparently William Penn Abrams, a miner. saw Yosemite from Inspiration Point in 1849. Its existence was made known to the world in 1851, when Maj. James D. Savage and members of his Mariposa battalion pursued marauding Indians into their secret refuge. Lafayette Bunnell, a young physician, appears to have been the only one of the group impressed with the magnificent scenery; he gave names to many of the falls and rocks. He learned from Indians that the valley was called after the tribe occupying it—a name which Bunnell understood to be *Yo-sem-it-y*, meaning "grizzly bear." That name soon became established in its present form. The Yosemite Indians, still dwellers in the Stone Age, were of southern Miwok stock and were known among the settlers, along with other tribes, as "Diggers," because they lived largely on roots and acorns. Disease and intermarriage with the settlers diminished the original strain until scarcely a trace of Yosemite Indian blood remains.

The first party to enter Yosemite valley solely for the purpose of viewing its marvels and enjoying its beauties was led by James Hutchings in 1855. For more than 30 years he was identified with the valley as pablicizer, hotelkeeper and official guardian. An artist, Thomas Ayres, accompanied the original party. Lithographs based on his sketches were published by Hutchings and helped tb spread the fame of the valley throughout the world. Until 1874 access to Yosemite was by horseback or on foot over rough, steep trails. In that year the Big Oak Flat and Coulterville roads were completed into the valley on the north side and in 1875 the Wawona road was brought in from the south. In 1907 the Yosemite Valley railroad was completed up the Merced river as far as El Portal, at the edge of the park; it was discontinued in 1945. Although the first automobile entered the valley in 1900, motor travel was not authorized until 1913. Airplanes have, on a few occasions, landed and taken off from the valley floor, but this practice mas prohibited.

By 1885 visitors had reached an annual maximum of 3.000 (and even in those days a lady complained to the commissioners that crowds were ruining Yosemite). In 1908, the first year of rail travel to El Portal, the figure rose to 8,850. By 1922 visitors topped 100,000 and in 1927, after completion of the all-year highway from Merced, the figure jumped to 490,000. In 1954 it exceeded 1,000,000 for the first time. The great majority of visitors come in private automobiles, but regular bus schedules connect



BY COURTESY OF UNION PACIFIC RAILROAD COMPANY

VERNAL FALLS. YOSEMITE NATIONAL PARK

daily with the main railroad lines. In summer a stage connects Yosemite with Lake Tahoe and with the Owens Valley stage lines by way of the Tioga road across the Sierra Nevada. Lodges, camps and the Ah ahnee hotel (an Indian name meaning "deep, grassy valley") provide a variety of public accommodations. With year-round accessibility, winter travel increased substantially, both for the beauties of the winter scene and for skiing. Badger pass, on the Glacier Point road, at 7,300 ft., was established as the ski centre in 1936.

Geologic History.—The striking evidence of enormous dynamic forces of nature everywhere visible in Yosemite valley invariably prompts the question: How was the valley formed? Josiah Dwight Whitney, head of the first California geological survey, proposed the theory of a vast cataclysm in which "the bottom of the valley sank down to an unknown depth." *(The Yosemite Guidebook,* 1869.) At a time when Whitney and his pupil, Clarence King, were declaring there was no proof that glaciers had ever entered the valley, a young naturalist, John Muir, who had recently come to California and become enamoured of the orderly and pure beauty of the Yosemite and its surroundings, proclaimed with enthusiasm that glacial erosion was the key to the whole process. Subsequently Muir's views gained support as others elaborated upon them and modified them. Geologists emphasized the importance of the rock structure and the slowness of the erosive process. Francois E. Matthes, of the U.S. geological survey. summarized the theory in 1930 as follows: "The story of the evolution of the Yosemite Valley, then, is a story of several chapters—of successive periods of valley and canyon cutting by the Merced river, induced by successive uplifts of the Sierra Nevada; of vigorous glaciation, several times repeated, during the ice age, the quarrying action of the ice being controlled and guided locally by the varying structure of the granite rocks and giving rise to exceptionally bold, clean-cut sculptural effects; and finally oi a period of dismantling, resulting in greater detail and intricacy of sculpture, the production of slopes of rock waste, and the formation of level valley floors." *(Geologic History of the Yosemite Valley*, 1930.)

The Yosemite museum has an excellent geological exhibit to demonstrate this theory of the valley's formation in various stages. (It also gives an answer to such queries as that most frequent one, "What became of the other half of Half Dome?")

Yosemite National Park.—In 1864 congress enacted a law, signed by Pres. Abraham Lincoln, by which Yosemite valley and the Mariposa Big Tree Grove were granted to the state of California with the stipulation that "the premises shall be held for public use, resort and recreation . . . inalienable for all time." In 1890 congress responded to the fervent pleas of John Muir, Robert Underwood Johnson of *Century Magazine* and others; it reserved and withdrew from settlement a large area of forested and mountainous land surrounding the Yosemite valley grant. The divided authority and conflicts inherent in this anomaly of a national park enclosing a state park within its boundaries continued until 1906. when congress accepted the recession of the state grant by the California legislature. Since then the entire area has constituted the Yosemite National park, which embraces about 1,200 sq.mi. From 1891 to 1914 the park was administered during the summer by troops of the U.S. cavalry. The national park service is charged with maintaining the park, protecting its vegetation and wildlife and making available to the public opportunities for wholesome recreation and for education in natural history and science. *(See* NATIONAL PARK *SYSTEM,* THE.)

Most of Yosemite National park lies within the basins of the Merced and Tuolumne rivers. Outstanding features. in addition to Yosemite valley, are Little Yosemite, Merced and Washburn lakes at the head of the Merced river; Tuolumne meadows, Benson and Tilden lakes and Jack Main canyon, the canyon of the Tuolumne river with its Waterwheel falls: the Hetch Hetchy valley, source of water and hydroelectric power for San Francisco by special act of congress in 1913; the Mariposa Grove of Big Trees with its giant sequoias. one of which (the Wawona tree) is pictured in every child's geography as the Tunnel Tree and the much smaller Merced and Tuolumne groves.

Among the vegetation of Yosemite there are more than 1.000 species and varieties, changing markedly from its lower borders to the bleak alpine conditions of the high mountains. In addition to the Big Tree groves, the park is notable for its forests; from the dry foothills with their Digger pine and blue oak the traveler climbs to the valley floor, where black oak. maple and dogwood edge streams and meadows, with tall yellow pines, cedars and Douglas spruce rising behind them. Along the Wawona and Big Oak Flat roads are fine stands of stately sugar pine; at higher levels noble forests of red fir are succeeded, on the Tioga road, by mountain hemlock interspersed with lodgepole, until at Tioga pass. near timberline, the weatherbeaten white-bark pine makes its spectacular appearance. The grizzly bear for which Yosemite was named is no longer found, but mule deer and the California black bear are abundant.

A galaxy of mountain peaks carries the crest of the Sierra Nevada through the park; Lyell (13,090), Dana (13,050), Conness (12,556), Clark (11,506), Hoffmann (10,921), Cathedral Peak (10,933) and others. The Tioga road, originally built as a wagon route for access to mines, has been regraded as a mountain highway and crosses the Sierra Nevada from Crane Flat on the Big Oak Flat road to Mono lake. In a circle from Tuolumne meadows on the Tioga road a few High Sierra camps provide food and shelter in summer. To the north of the Tioga road is a superb wilderness of lakes and deep canyons traversed only by trails, as is also the lofty southeastern corner of the park. The John Muir-High Sierra route starts from the Yosemite valley over the Sunrise trail to Tuolumne meadows and thence by Donohue pass on its mountain-studded way to Sequoia National park nearly 200 mi. south.

(F. P. F.; M. C. T.)

YOSHIHITO (1879–1926), 123rd emperor of Japan, known posthumously as emperor Taisho. Third son of Emperor Meiji, he was born in Tokyo on Aug. 31, 1879, and was proclaimed crown prince on Nov. 3, 1889; the emperor's two elder sons had died in infancy. He married Sada-Ko, daughter of Prince Kujo in 1900, and had four sons: Hirohito (who succeeded to the throne in Dec. 1926), Yasuhito (Prince Chichibu, who died in 1953), Nobuhito (Prince Takamatsu) and Takahito (Prince Sumi). He ascended the throne on the death of his father on July 30. 1912, and, like him, was invested as a knight of the garter by Prince Arthur of Connaught. As the ally of Great Britain his envoys sat with representatives of the other victorious powers at the Versailles peace conference after World War I; he had been appointed a field-marshal of the British army in 1918. On his death in 1926 a special service was held in Westminster abbey, the first occasion when so signal a mark of respect had been paid to the head of a state who was not of the Christian faith.

During the last five years of his life the emperor lived in seclusion. He had always been of a delicate constitution and increasing ill-health necessitated a regency in 1921 under the crown prince, shortly after the latter's return from a visit to Great Britain and Europe. Yoshihito's reign did not compare in length or achievement with that of his father, but his country took part with the Allies in World War I; and the period of Taisho (Great Righteousness) was one of steady growth in military. economic and cultural fields. The throne retained the affectionate reverence of the people, a unique relationship contributing in no small degree to the strength of Japan. (F. S. G. P.)

YOUGHAL, a seaport and aatering place of County Cork, Ire., on the west side of the Blackwater estuary. 31 mi E.N.E. of Cork by road. Pop (1956) 4.841. Youghal was a settlement of the Northmen in the 9th century, and was incorporated by King John in 1209. The Franciscan monastery, founded there by Maurice FitzGerald in 1224, was the earliest house of that order in Ireland Sir Walter Raleigh was mayor of Youghal in 1588–89, and is said to have cultivated the first potato in Europe, and smoked the first tobacco, there The wide bridge which connects the counties of Cork and Waterford across the river Blackwater is a main link in the road communications of southern Ireland.

YOUNG, ARTHUR (1741–1820), English agricultural writer, was born in London on Sept. 11. He lived through the period when British agriculture was changing from its medieval to its modern form, and fen men did more to assist the change. After unsuccessful efforts at trade and journalism he started farming his deceased father's small estate at Bradfield, Suffolk, in 1763, but failed. Nevertheless, in 1767 he published his *Farmer's Letters to the People of England*—an act which he afterward described as "a sin of the blackest dye . . . nothing but ignorance, folly, presumption and rascality." But he quickly made ample amends. In the same year he began the series of agricultural *Tours* which not only gave the best accounts of the farming of England. Ireland and France, but uere of great educational value to farmers. First came *A Szx Weeks' Tour Through the Southern Countzes of Eng-*

land and Wales (1768), then *A Six Months' Tour Through the North of England* (1770) and the *Farmer's Tour Through the East of England* (1771). Nine years later he published his *Tour in Ireland* and later still (1792) his *Travels in France.* His *Farmer's Calendar* (first published in 1771) went through at least 20 editions. In 1784 he started his *Annals of Agriculture,* a monthly journal which he continued until 1809; it served a useful purpose in raising the standards of farming. Even George III wrote for it under the name of his Windsor shepherd, Ralph Robinson.

When William Pitt established the board of agriculture in 1793, Young was appointed secretary and, with the president Sir John Sinclair, organized the production and publication of valuable reports on the agriculture of the counties of Great Britain, he himself writing those for Suffolk (1794, 1797), Lincoln (1799), Norfolk (1804), Oxfordshire (1804) and Essex (1807). No such comprehensive series has since been prepared and it is frequently easier to obtain information about the agriculture of a particular county in the period 1780–1820 than at any subsequent time. Young was an attraceive writer with a vigorous style. His closing years were saddened by the death of his young daughter and by the loss of his eyesight, and he became afflicted with religious melancholia. He wrote a voluminous autobiography which M. Betham-Edwards published in a shortened version in 1898.

(E. J. R.)

YOUNG, BRIGHAM (1801–1877), U.S. Mormon leader, born at Whitingham, Vt., June 1, 1801. He moved to Mendon, N.'., in 1829, and three years later joined the newly organized Mormon Church. (*See* LATTER-DAY SAINTS.) He was appointed an apostle in 1835, played a leading role in the removal of the Mormons from Missouri to Illinois, and in 1840 was sent to Liverpool to direct Mormon missionary work in England. There he organized branch missions, established emigrating agencies and began publication of the *Millennial Star*. He returned to the U.S. two months after the death of the prophet, Joseph Smith (*q.v.*), to take over the leadership of the church. The people of Illinois having demanded the removal of the Mormons. Young was faced with the Herculean task of leading them to a new country where they would be free from interference. After organizing the groups and planning every move in detail, the migration of nearly 5,000 persons was gotten under way in 1846. In July 1847 Young, leading the advance band, reached the valley of Great Salt lake, and there decided to settle. He founded Salt Lake City, began the cultivation of crops by irrigation and directed the dispersal of the emigrant trains as they arrived. Both in moral and economic realms his word was law and he laid down the policies of the settlement. When the Territory of Utah was organized in 1850 he was appointed governor by Pres. Millard Fillmore and reappointed in 1854 Though not appointed again in 1858 because of his defiance of the United States in the so-called Mormon War, he continued to be the supreme power of the territory. He encouraged agriculture, developed natural resources, established manufactures, founded Deseret university at Salt Lake City and Brigham Young academy at Provo, built the Salt Lake theatre, laid the foundations of the Mormon temple, and created the Zion's Co-operative Mercantile institution which grew into the largest institution of its kind in the west. His genius as a leader is generally recognized, the settlement of Utah being one of the best examples of organic colonization in history. He followed the doctrine of plural marriage and at his death at Salt Lake City Aug. 29, 1877, was survived by 17 wives and 47 children.

For bibliography, *see* LATTER-DAY SAINTS, CHURCH OF JESUS CHRIST OF.

YOUNG, EDWARD (1683–1765), English poet, author of *Night Thoughts,* son of Edward Young, afterward dean of Salisbury, was born at his father's rectory at Upham, near Winchester, and was baptized on July 3, 1683. He was educated at Winchester college, New college and Corpus Christi, Oxford. His first publication was an *Epistle to . . . Lord Lansdoune* (1713). It was followed by a *Poem on the Last Day* (1713), dedicated to Queen Anne; *The Force of Religion: or Vanquish'd Love* (1714), a poem on the execution of Lady Jane Grey and her husband, dedicated to the countess of Salisbury; and an epistle to Addison, *On the Late Queen's Death and His Majesty's Accession to the Throne* (1714), in which he made indecent haste to praise the new king. About this time began his connection with Philip, duke of Wharton, whom he accompanied to Dublin in 1717, and with whom he had a lawsuit in 1740; the upshot was that Young was awarded an annuity of £100, but failed to secure a sum of £600 which he claimed.

Meanwhile, his plays, *Busiris* and *The Revenge,* were produced at Drury Lane in 1719 and 1721. Between 1725 and 1725 Young published a series of seven satires on *Love of Fame, the Universal Passion.*

Young was nearly 50 when he decided to take holy orders. In 1728 he was made one of the royal chaplains, and in 1730 was presented to the college living of Welwyn, Hertfordshire. He married in 1731 Lady Elizabeth Lee, daughter of the 1st earl of Lichfield. *The Complaint,* or *Night Thoughts on Life, Death and Immortality,* was published in 1742, and was followed by other "Nights." He died at Welwyn on April 5, 1765.

Other works by Young are: *Thr Instalment* (to Sir R. Walpole, 1726); *Cynthio* (1727); *A Vindication of Providence . . .* (1728), a sermon; *An Apology for Punch* (1729), a sermon; *Imperium Pelagi, a Naval Lyrick . . .* (1730); *Two Epistles to Mr. Pope Concerning the Authors of the Age* (1730); *A Sea-Piece . . .* (1733); *The Foreign Address, or The Best Argument for Peace* (1734); *The Centaw not Fabulous; in Five Letters to a Friend* (1755); *An Argument . . . for the Truth of His* [Christ's] *Religion* (1758), a sermon preached before the king; *Conjectures on Original Composition . . .* (1759), addressed to Samuel Richardson; and *Resignation . . .* (1762), a poem.

YOUNG, MAHONRI MACKINTOSH (1877–1957), U.S. sculptor, painter, etcher and art teacher, best known for his statuettes of figures of pugilists, labourers and cowboys, was born in Salt Lake City, Utah, on Aug. 9, 1877. He was a grandson of the Mormon leader, Brigham Young. He studied with J. T. Harwood, Salt Lake City, at the Art Students' league in New York city and at the Julian, Colarossi and Delacluse academies in Paris. His work was characterized by simplicity and dignity. Young's contemporary themes and realistic approach gave him much in common with such painters as John Sloan and George Bellows. Among his best known works are his bronzes, "Man With a Pick" and "Stevedore" at the Metropolitan Museum of Art, Hopi and Apache groups in the American Museum of Natural History, New York city, "Right to the Jaw" at the Brooklyn museum. "Bovet Arthur—a Laborer" and "The Rigger" at the Newark museum, the gull monument to the Mormon leaders in Salt Lake City, the statue of his grandfather in the U.S. Capitol, Washington, D.C., and "Monument to the Dead" (with Bertram Goodhue) in Paris. He taught sculpture, painting, printmaking and illustration at the Art Students! league and was a member of the National Academy of Design, the National Sculpture society and the Society of American Etchers. In 1947 he was elected a member of the American Academy of Arts and Letters. He died at Norwalk, Conn., on Nov. 2, 1957. (W. H. Gs.)

YOUNG, OWEN D. (1874–), U.S. lawyer and businessman, was born at Van Hornesville, N.Y., Oct. 27, 1874. He was educated at St. Lawrence university, Canton, N.Y., and at Boston university law school. He practised law in Boston until 1912 and then became general counsel for the General Electric company. Ten years later he became chairman of the General Electric board of directors, a position he held until 1939. Meanwhile, in 1919, he had organized the Radio Corporation of America and later became honorary chairman of its board of directors. Young was also a director of several other private and quasi-public corporations. He served in a number of public capacities, notably as a member of the first committee of experts appointed to advise the Reparations commission concerning the stabilization of the German currency after World War I. He was chairman of the second committee of experts that drafted a permanent plan generally known as the Young plan, for the settlement of reparations, and established the Bank for International Settlements. From 1942 to 1944 he emerged from retirement to help speed the war production program of the General Electric company. (FK. L. K.)

YOUNG, THOMAS (1773–1829), English physicist and physician, best known for his work in physical optics, was born at Milverton, Somerset, June 13, 1773. In 1799 he established himself as a physician in London; from 1801 to 1803 he was proiessor of physics at the Royal institution and from 1802 to 1829 foreign secretary of the Royal society, of which he had been elected a fellow in 1794. He died in London on May 10, 1829.

Young was the author of a series of researches which did much to establish the wave theory of light, and in 1301 he discovered the principle of interference of light. He gave the word "energy" its scientific significance and gave his name to Young's modulus. In 1793 he explained the mode in which the eye accommodates itself to vision at different distances; in 1801 he described the defect known as astigmatism; and in his lectures he put forward the hypothesis, afterward developed by H. von Helmholtz, that colour perception depends on the presence in the retina of three kinds of nerve fibres which respond respectively to red, green and violet light. In another field he was one of the first successful workers at the deciphering of Egyptian hieroglyphic inscriptions.

See Alexander Wood, *Thomas Young* (1954).

YOUNGBERRY, a vigorous, thorny vine of hybrid origin bearing dark purple berries of the blackberry type that turn black when thoroughly ripe. The fruit, which has a pleasant subacid flavour and ships well, is produced over a period of several months. The plant was developed in the United States in Louisiana and became popular as a garden and market fruit in parts of the south. (J. M. BL.)

YOUNGHUSBAND, SIR FRANCIS EDWARD (1863–1942), British soldier, explorer, writer and mystic whose travels, mainly in northern India and Tibet, yielded major contributions to geographical research, was born at Murree, India, on May 31, 1863. Educated at Clifton and Sandhurst, he entered the army in 1882 and in 1886–87 traversed central Asia from Peking to Yarkand and thence to India, crossing the Karakoram range by the long-disused Muztagh pass. He discovered the Aghil mountains and proved the Great Karakoram to be the water divide between India and Turkistan. On two later journeys beyond the Karakoram he traced the course of the Shaksgam to its junction with the Yarkand river and explored the Pamirs. In 1890 he transferred to the Indian political department and, after serving in northwest frontier stations and visiting South Africa (1896), he led the British mission to Lhasa which resulted in the Anglo-Tibetan treaty of Sept. 7, 1904. For this service he was, in the same year, created knight commander of the Indian empire. In 1905 he returned to England and became Rede lecturer at Cambridge, but a year later he went back to Kashmir as resident (1906–09). In 1917 he was created knight commander of the Star of India. In 1891 he had been given the gold medal of the Royal Geographical society and in 1919, after his retirement, he became its president and formed, and became chairman of, the Mt. Everest committee. He died at Lytchett Minster, Dorset, on July 31, 1942.

Deeply religious, Younghusband's view of the universe as a spiritual creation and his love of living things inspired him to acquire a wide knowledge of the various branches of natural science. Though intensely patriotic and a convinced imperialist, he recognized and welcomed the desire of India for self-government. His understanding of different religions and his belief that the same mystical experience, though variously expressed, is the root of them all led to his founding of the World Congress of Faiths (1936), and this he considered to be his highest achievement.

He expounded his beliefs in *Life in the Stars* (1928) and *The Living Universe* (1933). His other works include *Heart of a Continent* (1896), *South Africa of Today* (1898), *India and Tibet: Within* (1912) and *Modern Mystics* (1935).

See G. Seaver, *Francis Younghusband* (1953). (K. M.)

YOUNG MEN'S CHRISTIAN ASSOCIATION was founded in London in 1844 by George Williams and a group of associates who were employed in a drapery firm. The movement spread rapidly to other countries and by its semicentennial in 1894 had spread around the world. On this occasion, George Williams, who had become an outstanding business leader, mas knighted by Queen Victoria. In 1955 the World Alliance of Y.M.C.A.'s observed its centennial with a series of conferences held in Paris. These conferences were attended by about 8,000 delegates representing more than 4,000,000 members in 76 countries and territories. The first associations in North America were founded in 1851, one group organizing in Montreal, Can , and another in Boston, Mass. By the mid-1950s there were 1,916 associations in North America with a membership totaling more than 2,325,700. These Y M.C A.'s operate in large and small cities. rural areas, railroad and industrial centres, colleges and high schools. ·

Throughout its history the Y.M.C.A. has sought to develop high standards of Christian character through group activity and citizenship training. Its program includes sports and physical education, camping, counseling, formal and informal education, public affairs and citizenship activities. Such programs are designed to meet the needs of younger children, teen-agers and adults.

Y.M.C.A.'s of the U.S. served men in uniform during four wars, beginning with the American Civil War. During World War I it saw service among soldiers of many nations as well as among 6,000,000 prisoners of war. In World War II the Y.M.C.A., one of the six founding members of the United Service organization (U.S O.), helped to provide recreational programs among U.S. troops and conducted religious services for prisoners of war. Since 1889 the North American associations have sent trained leadership into 38 countries and have given material assistance to associations which suffered the effects of war and other disasters. Decisions were made in the mid-1950s to expand and intensify these efforts so that Y M.C.A.'s in other countries would be better able to meet the growing demands for their services. (C. M. CY.)

YOUNGSTOWN, a city of northeastern Ohio, U.S., and seat of Mahoning county, lies on both sides of the Mahoning river and is equidistant (65 mi.) from Cleveland and Pittsburgh. It is the industrial heart of the Youngstown-Warren standard metropolitan statistical area, listed as the fourth-ranking steel producing district in the nation in the 1960s. This area comprises Mahoning and Trumbull counties and includes the steel-mill cities of Warren (*q.v.*), Niles, Campbell, Struthers and Girard. The population of Youngstown was 166,689 in 1960. a decrease of 1% since 1950; however, the population of the standard metropolitan statistical area (Youngstown-Warren) was 509,006, an increase of 22.2%.

Northeastern Ohio was part of the Connecticut Western Reserve when John Young, after surveying in the area in 1796, purchased a tract of land in 1797 from the Connecticut Land company. In 1802 he laid out a town plat (Young's town) on the north side of the Mahoning river which still is the "public square." Col. James Hillman, a local trader, settled in the new village and remained a leader in its affairs. By 1805 the manufacture of iron was started by James and Daniel Heaton, who set up a crude smelter at Yellow Creek. Later the discovery that locally mined block coal could be used directly for iron smelting was a distinct advantage. Youngstown and the U.S. iron and steel industry grew together. Early production was based on available raw materials and local markets, served by the Pennsylvania and Ohio canal, opened in 1839. Shortly thereafter, in 1855, the Sault Ste. Marie canal around the falls of the St. Marys river was opened making available the rich ores from the upper lakes. To transport the millions of tons of raw materials required by the blast furnaces, four main railroad lines and four branch lines serve Youngstown. Because of the high demands by the steel industry for water, several reservoirs were constructed in the surrounding glaciated region.

Youngstown was incorporated in 1859 and replaced Canfield as seat for Mahoning county in 1876. The population grew slowly from 2,759 in 1860 to 44.885 in 1900; then, mainly due to an influx of Slovaks, Slovenians, Poles and Italians attracted by the steel industry, rapidly increased to 132,358 in 1920 and to 170,002 in 1930. The economic trend of the nation was reflected clearly in Youngstown's increasing blast furnace output from 2,604,344 tons in 1900 to 7,548,000 tons in 1920. The economic picture in the 1960s, however, showed greater diversity in industry which included aluminum extrusions, electric lamps, plastics, office furniture, coal-tar products, rolling-mill equipment, paperboard boxes and envelopes. Aircraft and automotive parts, awnings, conveyer belting, rubber hoses, storm windows and doors, crushed limestone, nonferrous castings and clothing were manufactured among the other products.

The Youngstown park and recreation system, along with Mill Creek park which is a natural gorge in the southwestern part of the city, covers more than 3,000 ac.

Youngstown university (established as a night school in 1888) offers both liberal arts and professional courses. The public library system has several branches in Youngstown and Mahoning county as well as a mobile service. Local culture is reflected in the Butler Institute of American Art, the Community playhouse and the Youngstown Philharmonic orchestra. (S. A. B.)

YOUNG WOMEN'S CHRISTIAN ASSOCIATION, an organization founded in 1855 by two ladies simultaneously. In the south of England Miss Emma Robarts started a prayer union with a purely spiritual-aim, and in London Lady Kinnaird commenced the practical work of opening homes and institutes for young women in business. In 1887 the two branches united in the Young Women's Christian association, which seeks to promote the all-round welfare of young women by means of residential and holiday homes, club and rest rooms, classes and lectures, and other useful departments. The association has spread all over the world, and the total membership is over half a million.

YOVKOV, YORDAN (1880–1937), Bulgarian writer whose mastery of prose is shown especially in his short stories, was born in Jheravna, a village in the Balkans, on Nov. 9, 1880. The region is rich in stories about the exploits of the *haiduks* (outlaws), which Yovkov used as background material for his famous *Staroplaninskiey Legendi* ("Balkan Legends," 1927). He grew up in the Dobruja where his father owned land and, after studying in Sofia, returned there as a village teacher. He later worked for a time in the press section of the Bulgarian legation in Bucharest. He died at Sofia on Oct. 15, 1937.

Yovkov's stories of village life are set mainly in the Dobruja, as is his novel *Chiflikat krai granitsata* ("The Farm by the Frontier," 1933). His experiences as an officer in the first Balkan War and World War I inspired some of his best stories. His gift for narrative and for realistic dialogue, his romantic imagination and his stylistic refinement make him a master of Bulgarian prose. His plays include *Albena* (1930), *Boryana* (1932) and a comedy, *Milionerat* ("The Millionaire," 1930). Some of his stories were translated in *The White Swallow and Other Short Stories* (1947).

(L. BY.)

YPRES, JOHN DENTON PINKSTONE FRENCH, 1ST EARL OF (1852–1925), British soldier, was born at Ripple, Kent, on Sept. 28, 1852. The son of a naval officer, he entered the Royal Navy, in which he served as cadet and midshipman from 1866 to 1870. Joining the militia he passed from this into the army in 1874 and was gazetted to the 19th Hussars. He served in the Nile expedition in 1884–85, and commanded his regiment from 1889 to 1893. After two years on the war office staff he commanded a cavalry brigade (1897–99), and on the mobilization of the expeditionary force for s. Africa in 1899 he was chosen to command the cavalry division and was promoted major general. Pending the assembly of this he served in Natal where he commanded the troops on the field at Elandslaagte and took part in the early combats near Ladysmith, but he proceeded to Cape Colony just before the place was invested. After a few weeks in charge of the force at Colesburg, he led the cavalry during Lord Roberts' advance from Cape Colony, relieved Kimberley, cut off the retreat of Cronje's army, and occupied Bloemfontein. During the subsequent advance into the Transvaal he was in command of the left wing, and at a later stage of the victorious campaign he played a prominent part in the move from Pretoria to Komati Poort. For these services he was given the K.C.B. During most of the second phase of the struggle he was in command of the forces operating against the enemy in Cape Colony, and he was on the conclusion of hostilities promoted lieutenant general and was given the K.C.M.G.

He commanded at Aldershot from 1902 to 1907, in which year he was promoted general, and he then became inspector general of the forces for five years. He was appointed chief of the imperial general staff in 1912 and was promoted field marshal in 1913. In April 1914 he vacated the post of C.I.G.S., owing to military troubles in Ireland in connection with Ulster, but four months later be was chosen to take charge of the expeditionary force on the outbreak of World War I, and he commanded the British army on the western front from the outset of the struggle until the end of 1915. The terribly costly and somewhat fruitless advances of this year, culminating in Loos, provoked criticism at the time, and controversy has raged over French's share in them since. He certainly failed signally to harmonize with Kitchener at the war office. He resigned in December of that year, Sir D. Haig taking his place, and he returned to England, to be raised to the peerage as Viscount French of Ypres and High Lake. Me then became commander in chief in the United Kingdom, and he held that appointment unfil May 1918, when he was selected to be lord lieutenant of Ireland. This position he occupied under most trying conditions until early in 1921. On resigning he was rewarded with an earldom. He died on May 22, 1925, at Deal Castle, Kent At the end of the war, Lord French published his personal narrative under the title. *"1914."*

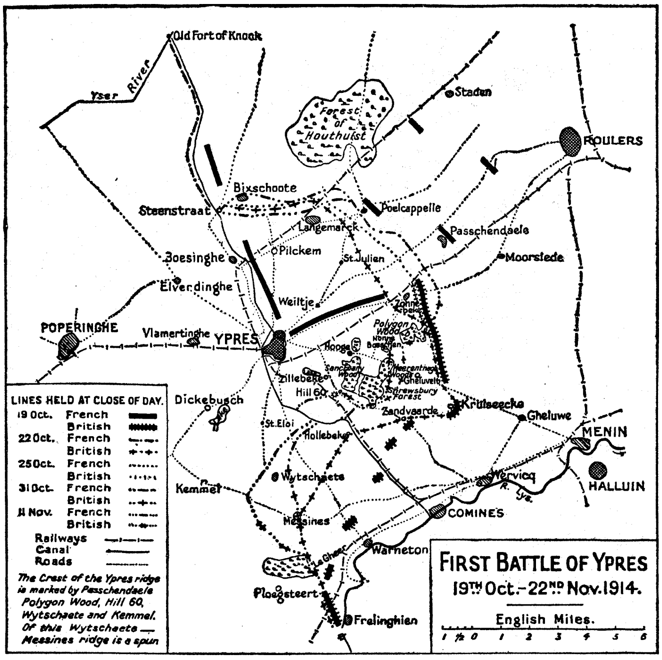
YPRES (Flemish *Yperen),* a town of Belgium in West Flanders, of which it was formerly considered the capital. Pop. (1955 est.) 17,159. It is situated 35 mi. S. of Ostend and 12 mi. W. of Courtrai, on the Yperlée, a small river flowing into the Yser, both of which have been canalized. In the 14th century it ranked with Bruges and Ghent. Its fine Halles or cloth market, with a façade of over 150 yd., was begun in 1201, completed in 1304, and reduced to ruins in World War I. The cathedral of St Martin dated from the 13th century, with a tower of the 15th century and was also ruined in 1914–18. Jansen, bishop of Ypres and the founder of the Jansenist school, is buried in the cathedral.

YPRES, THE BATTLE OF, 1914, is the name given to the heavy but indecisive fighting near Ypres at the close of the "race to the sea" (Oct. 19 to Nov. 22, 1914). It is commonly spoken of as the First Battle of Ypres.

Genesis of the Battle. — When in Oct. 1914 the British Expeditionary Force under F.M. Sir John French left the Aisne front to be transferred to Flanders, its various corps, as they arrived in succession on the left of the Allied line, at once came into contact with the enemy, for each of the two belligerent forces was simultaneously extending its front northwards. Thus the II. Corps (Smith-Dorrien) on Oct. 10 began the "battle of La Bassée," and the III. Corps (Pulteney) and the Cavalry Corps (the 1st and 2nd Cavalry Divisions under Allenby), on Oct. 12–13, the battles of "Armentières" and "Messines." On Oct. 14–15 the IV. Corps (Rawlinson), the Belgian army and a French Marine brigade, falling back from Antwerp, and de Mitry's cavalry corps and two French Territorial divisions, coming up from the west between Ypres and the Belgians, completed the Allied line to the sea. Of this line, the British held the portion from the La Bassée canal to Langemarck, north of Ypres. The general plan now was for the British, supported by the French and Belgians, to advance from the neighbourhood of Ypres, break through the enemy's front, cut off any Germans between the gaps thus made and the sea, and turn southward to roll up the German line.

The Opening of the Battle. — On Oct. 19, on the arrival behind Ypres of the I. Corps (Haig), Sir J. French sent forward Rawlinson's corps (consisting only of the 7th Division and the 3rd Cavalry Division) towards Menin, and directed Pulteney's and Allenby's corps to move down the Lys on both banks in the same direction. But on the day previous, the 18th, the enemy, with a general plan similar to that of the Allies, had also begun an advance, with a new IV. Army under Duke Albert of Württemberg, on a front from the Ypres-Gheluvelt (Menin) road to the sea. This army consisted of the new XXIT., XXIII., XXVI. and XXVII. Reserve Corps composed of young volunteers with 25% of old soldiers and the III. Reserve Corps of three divisions which had besieged Antwerp. Thus, as the German VI. Army, under Crown Prince Rupprecht of Bavaria, south of the IV. Army, also attacked, battle was engaged on the 19th on the whole front from La Bassée to the sea. In the sector between the river Lys and the sea, the German XIX. Corps attacked the left wing of Wilson's division (4th) of Pulteney's corps; four German cavalry corps advanced against Allenby's two cavalry divisions; whilst of the 11 divisions of the German IV. Army, four were sent against Capper's division (7th) and Byng's cavalry division of Rawlinson's corps, two and one-half against the French north of Ypres, and four and one-half against the Belgians.

On Oct. 21, just as Haig's corps, which had been put in on the left of Rawlinson's, was making good progress towards Langemarck, the French on its left fell back before the enemy to the Ypres canal. Haig, with his flank thus exposed to the attack of the XXIII. Reserve Corps, whilst engaged with the XXVI, on his front, had to use his reserve to cover his left, and his advance, thus deprived of any fresh impetus, came to an end. Elsewhere, the British were opposed to at least double their numbers: Capper's division to the XXVII. Reserve Corps, the three British cavalry divisions to eight German, and Wilson's division to the XIX. Corps. Nevertheless, they managed to hold their line unbroken on the 21st and 22nd. When on Oct. 23 the French IX. Corps (Gen. Dubois) reached Ypres and took over the Zonnebeke–Langemarck sector from Lomax's 1st Division of Haig's corps, a further slight advance was made; but the enemy was in superior numbers and had too much heavy artillery for any decisive success to be obtained. On the 24th Duke Albrecht equally abandoned any hope of a break-through until he could be reinforced; but desultory fighting continued, and on the 26th Capper's division lost the Kruiseecke salient, south-east of Gheluvelt. Meantime, the Belgians had been hard put to it and on Oct. 27 let in the sea at Nieuport to form an inundation in front of their line along the Yser.



The Second German Offensive.--On the same day, the 27th, Gen. von Falkenhayn, the chief of the German general staff, issued instructions for a new attack with increased forces. Six fresh divisions, brought from quiet parts of the line, to form under Gen. von Fabeck, the right of the VI. Army, were on the 30th to take the place of the four cavalry corps and attack Ypres from the south-east for the purpose of breaking through on the front Messines—Gheluvelt, which was held by two of the three cavalry divisions, now all united under Allenby's command, and Capper's division. At the same time, all the German troops north of the La Bassée canal were ordered to make a general attack. The addition of six divisions to the Ypres front gave, excluding cavalry, the Germans 15½ to the French and British six and one-half; but their artillery was even more overwhelming, for Fabeck, apart from what the other German commanders before Ypres possessed, was allotted over 250 heavy and super-heavy guns and howitzers, to which the Allies could only oppose 50, and of these more than half were of old and obsolete patterns.

There was some preliminary fighting on the 29th, when the British lost a little ground near Menin road. On this date, the eve of the second German offensive at Tpres, the line was held from the Lys to Zonnebeke by part of Wilson's division, the cavalry corps and the 7th, 1st and 2nd Divisions, all three since the 27th under Haig, who henceforward commanded in front of Ypres. Thence Dubois's IX. Corps and de Mitry's cavalry corps carried it on to the canal. The greater part of the Allied front maintained its ground on the 30th, but, under the heavy pressure of the six fresh German divisions, Allenby's cavalry divisions and Capper's division were forced back to the Messines-Wytschaete ridge, losing Zandvoorde and Hollebeke. Further danger in this sector was averted by Gen. Dubois, at Haig's request, sending his own reserve of four battalions and three batteries to the assistance of the British cavalry, and Gen. Haig himself despatching first two battalions and later three more, under Maj.-gen. E. Bulfin.

Gheluvelt, Oct. 31.—Matters, however, became more serious on the 31st, when, after a heavy bombardment, a convergent attack of five German divisions and three brigades on Haig's three divisions broke the line on a two battalion front at Gheluvelt, despite the desperate resistance of the 1st Battalion of the Queen's, which was annihilated. Elsewhere the front held, but at Messines part of the village was lost, and immediately south of the Menin road the line was pushed back. The situation was critical, and just at this time the staffs of Lomax's and Monro's divisions of Haig's corps were nearly all killed or disabled by a shell that struck Hooge Chateau.

A counter-attack ordered by Brig.-gen. H. Landon (3rd Brigade) drove back the Germans who had advanced from Gheluvelt along the Menin road; the village itself was recovered owing to the stout defence of the 1st South Wales Borderers north of the break, who held on to the park and chateau to the north of the village until a determined counter-attack of the 2nd Worcestershires initiated by Brig.-gen. C. Fitzclarence (1st Brigade) recaptured it; whilst south of the road a third counter-attack by the 2nd Royal Sussex, 1st Northamptonshire, and 2nd Gordon Highlanders, under the orders of Maj.-gen. E. Bulfin, regained all the ground that had been lost there, and more. At night, however, a retirement was made to a selected line east of Gheluvelt.

French Reinforcements.—On Nov. 1 the Germans continued to attack, and Messines was lost by Allenby's cavalry corps, but the French XVI. Corps (32nd, 39th and 43rd Divisions under Gen. Grossetti) arriving to relieve the cavalry, greatly strengthened the defence. Wytschaete and the rest of the ridge, however, were lost by the French next day. The Allied line was now held by the British and French alternately: from the Lys to opposite Messines by the British; thence as far as the Ypres-Comines railway by the French; thence along the front of Shrewsbury forest and Polygon wood to Zonnebeke by Haig's three divisions; and thence to the canal, by the French again; and this remained the distribution until the end of the battle. During Nov 3, 4 and 5 the German attacks somewhat died down; a composite division of Smith-Dorrien's II. Corps (under Maj.-gen. F. W. D. Wing) and the French 11th Division reinforced the Allies. But this assistance was counter-balanced by three out of five German divisions on the Belgian front being brought down against Ypres.

The Final German Effort.—The German supreme command now decided to attack the haunches of the Allied salient round Ypres from the north-east and south-east. Four more divisions, including a composite one of the Guard Corps, and the 4th (Pomeranian), one of the best in the whole army, were despatched to the sector with more heavy artillery. On the 4th, Crown Prince Rupprecht was given a definite order to break through south-east of Ypres, and whilst this offensive was in preparation to continue attacks all along the line, and the Duke of Wiirttemberg was ordered to move against the north-east part of Ypres. During the 6th, 7th, 8th and 9th the Germans managed to make a little progress at several points; they gained Le Gheer on the edge of Ploegsteert wood, and Zwarteleen near Hill 60, barely 2m. from Ypres; but elsewhere they were repulsed with heavy loss, and Grossetti's corps recovered ground lost between Wytschaete and St. Eloi. On the 10th, after a long and desperate defence, Dixmude (13m. north of Ypres) was lost by the Belgians, and a very heavy attack was deiivered against the French on the north-east and north of Ypres which gained a small amount of ground.

The Prussian Guard Attack on Nov. 11.—On Nov. 11 at 6:30 A.M., on a dark and misty morning, the Gennan artillery opened a terrific fire, increasing in intensity as 9 A.M. approached, at which hour the German infantry, under cover of the mist, advanced to the assault on the Lys-Polygon wood front. The British were weary with three weeks' continuous fighting without reliefs, the French nearly as tired. But, in spite of the German numerical superiority—23 divisions to 9½, with cavalry in about the same proportion—the Allied line resisted the enemy's repeated assaults except at two places—lust north of the Menin canal, where a detachment of Dubois's IX. Corps was driven back, and just north of the Menin road. South of and across this road, where the German 4th Division and Winckler's Guard Division attacked, a front of about 2m., stood Wing's composite division of Smith-Dorrien's II. Corps, its battalions so weak that it was about the strength of a brigade, the 2nd K. O. Scottish Borderers on the right, then the 2nd R. Irish Rifles, 1st Gordon Highlanders, 1st Cheshire, 2nd Bedfordshire, 1st Lincolnshire, 1st Northumberland Fusiliers, 4th Royal Eusiliers, and 2nd Duke of Wellington's. North of the road was Fitzclarence's brigade of the 1st Division (the 1st Scots Guards, 2nd Cameron Highlanders and 1st Black Watch), 800 men in all, with the 1st King's of Monro's division in Polygon wood beyond them. By the mere weight of the advance of the German 2nd Guards Brigade (six battalions of the 1st and 3rd Foot Guards Regiments), the front and support lines of Fitzclarence's three Scots battalions were overwhelmed. The attack passed over them, but fire from the 1st King's in Polygon wood, from three strong points (small defended posts with all-round defence) which formed Fitzclarence's third line of defence, and from various battalion headquarters in farms put in a state of defence, then held the Germans up and took heavy toll of them. About 400 or 500, however, pressed on into the Nonne Bosschen (wood), only to be met by the point-blank fire of Haig's field artillery in action beyond it; and the rifle-fire of some artillery men and engineers, including cooks and grooms, hastily collected. The final discomfiture of the German Guards was completed by a counter-attack of the 2nd Oxfordshire and Buckinghamshire through the Nonne Bosschen.

The Close of the Battle.—On the next day, Nov. 12, the weather began to break and become wintry; nevertheless, on this and the following days the Germans made several further attacks against the French in the Wytschaete area and against Wing's division south of the Menin road. These did not alter the situation, and the fighting then died down, and both sides set about completing their defences. With the end of the First Battle of Ypres, on the 22nd, open warfare ceased, and the operations of siege warfare, so-called trench warfare, begun on the Aisne in September, prevailed along the whole western front.

Opposed to more than double its own numbers, the British Expeditionary Force had held its own by sheer good shooting and superior training, and the skilful use by Gen. Sir Douglas Haig of his very small reserve. But such heavy losses had been incurred in the five weeks' battle and in the fighting at La Bassée and Armentières, which went on during the same period, that of the original British Expeditionary Force of fully trained officers and men very few remained, and for the future the empire was dependent on three divisions from overseas garrisons, on Territorial and New Army divisions, and dominion troops.

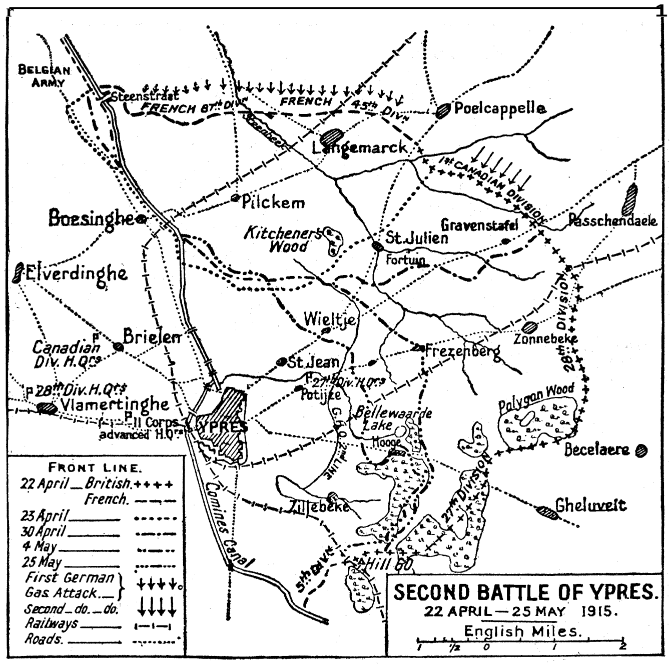
YPRES, THE BATTLES OF, 1915, commonly called the second battle of Ypres, comprise the period of severe fighting that took place in front of Ypres beginning on April 22 with the first gas attack and continuing to May 25, 1915. It resulted in heavy casualties and considerable loss of ground round the town of Ypres, the base of the Allied salient, measured along the Ypres canal, being reduced from 8m. to 5½m., and its maximum depth from 6m. to 2½ miles.

Phases of the Battle.—For the purposes of general description, the battle is best divided into five phases (see sketch map): (1) the first German attack on April 22 against the French, resulting in the loss of the Pilckem area; (2) the second attack on April 24 against the Canadian Division, resulting in the loss of the St. Julien-Gravenstafel area; (3) the fruitless British counter-attacks; (4) the British withdrawal to the Frezenberg line, abandoning the Zonnebeke area; and (5) the renewed German attacks (Frezenberg-Bellewaarde), resulting in further loss by the British of a narrow belt of ground.

The Situation Before the Battle.—During the winter of 1914–15 the German Supreme Command had decided to carry out an offensive against Russia in 1915, and to stand on the defensive in the western theatre, leaving only sufficient troops there to hold the line. No general attack at Ypres was contemplated. It was, however, desired to try a new weapon, gas, thoroughly in the field, and the Ypres front was selected for the purpose on the advice of the German meteorological experts. Duke Albrecht of Wiirttemberg commanding the IV. Army, which held the sector from the Comines-Ypres canal to the coast, proposed to turn the use of gas to local advantage, to improve his position. If he could obliterate the Ypres salient and drive the Allies beyond the canal, he would deprive them of a bridgehead which gave them facilities for attack. The duke's forces consisted of the XV. Corps, the four new Reserve Corps, XXVII., XXVI., XXIII. and XXII., and two *Ersatz* and two *Landwehr* brigades which had fought at the first battle of Ypres. The Marine Division guarded the Belgian coast.



SECOND BATTLE OF YPRES. 22 APRIL—25 MAY 1915.

The Allied line from the Comines canal northward was held by part of the 5th Division (Morland), as far as Hill 60; the 27th Division (Snow); the 28th Division (Bulfin); and the 1st Canadian Division (Alderson). The last three formed the II. Corps (Plumer) of the II. Army (Smith-Dorrien). The 27th and 28th Divisions had been formed of troops from Indian and overseas garrisons, but, having suffered heavily from the winter conditions in Flanders, contained in April a considerable proportion of partially trained reinforcements. The Canadian Division had reached England in Oct. 1914, and had embarked for France in Feb. 1915. After being in the line at Neuve Chapelle, it had, between April 15 and 17, relieved French troops covering Ypres. The front defences taken over by the II. Corps were poor, but there was a well-developed back line known as "the G.H.Q. Line." The left of the Canadians extended as far as the Ypres—St. Julien—Poelcappelle road, beyond which were two French divisions under Gen. Putz: the 45th Division, which had arrived on April 16, containing nine newly raised Zouave battalions and three battalions of African natives, these latter being in the line; and the 87th Territorial Division, a division of elderly reservists.

The First Gas Attack.—On April 22, after an afternoon of comparative quiet, suddenly at 5 P.M. a yellowish cloud—now known to have proceeded from chlorine gas released from cylinders in the trenches—was seen to form on the German front opposite the African troops and French Territorials. It blew slowly towards them, whilst the German artillery opened with every kind of gun, firing on the French troops with shrapnel and bombarding all the villages in the salient and the town of Ypres with high-explosive shell. The French infantry in the line fled beyond the canal, leaving their artillery to be captured. abandoning a large area of ground and entirely exposing the British left flank (*see* sketch map). Fortunately for the Allies, the enemy had begun his attack so late in the afternoon that in the dusk he did not discover his immense success. Content with having secured Pilckem ridge and establishing outposts beyond it, about 7.30 P.M., according to plan, as it is asserted, but more probably in consequence of the stout defence put up by various small Canadian detachments, the Germans ceased any attempt to push into the gap, except at Steenstraat.

Gen. Plumer and his divisional commanders hurried what available troops they had to cover the gap, and when Gen. Putz in the course of the evening informed Gen. Smith-Dorrien that he meant to counter-attack at 4.30 A.M., and requested that the British should assist, arrangements were made to co-operate. But no movement of the French took place, nor were they in the succeeding days able to make any serious effort to recover the ground they had lost on the eastern bank of the canal.

Several counter-attacks were made by the British on April 23 to regain the ground lost by the French. They were carried out by the Canadians, the 13th Infantry Brigade, and Geddes's detachment—a temporary formation composed of six battalions of the 27th and 28th Divisions—without avail. The forces were too small, and there was not sufficient artillery or ammunition to support them. The Germans did no more than repel the counter-attacks on the 23rd, but from the 24th onward proceeded to follow two objectives: first to roll up the flank of the British line, aiming to get behind the troops still in position; secondly, to increase their gains across the canal near Steenstraat and separate the Belgians from the French and British. By the division of their forces, they failed to achieve either purpose.

The Second Gas Attack.--On April 24, at 4 A.M., the enemy released gas against the front of the 2nd and 3rd Canadian Brigades. In spire of having only extemporized means of protection (handkerchiefs, linen bandoliers, etc., dipped in water), they held fast for a time, but the enemy, after breaking in at one place, enlarged his gains, and the 3rd Canadian Brigade was gradually forced back, involving in the retirement through St. Julien the troops on the new left flank that had been built up. Gen. Snow, the only divisional general who had his headquarters east of the canal, at Potijze, took charge of the defence, and such reserves as could be hurried up were eventually placed by Gen. Plumer under his command, as communication across the canal between the headquarter? of the other commanders and their troops was constantly interrupted. Although the Germans were driven out of St Julien by a counter-attack of two battalions of the York and Durham Infantry Brigade of the Northumbrian (Territorial) Division. another large piece of the salient was lost, and after further German attacks on the 25th, Gravenstavel was abandoned, and the British line ran from the original left of the 28th Division past St. Julien, almost due west to the canal.

The British Counter-Attacks. — Counter-attack after counter-attack was now made by fresh troops hurried up to Ypres, the 11th Infantry Brigade (4th Division), the Lahore Division and the h'orthumberland Infantry Brigade (Northumbrian Division) with assistance on the left from the French. All were without success; they found the enemy well entrenched, and their only result was heavy casualties. In the operations of April 26, when some of the French 45th Division co-operated on the left of the Lahore Division, the Germans opened a few gas cylinders in defence, and broke the attack; whilst on the 27th gas shelling alarmed the African natives and caused them a second time to retreat in panic.

The position of the British troops in the narrow salient, projecting 6m. in front of Ypres and only some 3m. across was obviously untenable, as it was surrounded on three sides by the enemy and subject to constant bombardment. Gen. Smith-Dorrien proposed to withdraw to a line nearer Ypres. In consequence, however, of Gen. Foch's protests and promises that the French would regain the ground they had lost, and of the political desirability of not abandoning any more Belgian territory if it could be avoided, Sir John French agreed to leave his troops in their exposed position for some days longer. Gen. Joffre, having in preparation his great offensive which was to begin on May g, near Arras, was not disposed to allow Gen. Foch to employ any more troops near Ypres; and the French attacks languished.

The Withdrawal from the Apex of the **Salient.**—When on May 1 the French infantry in a projected attack failed to leave their trenches, all hope of their recovering ground came to an end, and Sir John French directed Gen. Plumer, who by his orders was now in special charge of the operations near Ypres, to begin the retirement to the Frezenberg line, abandoning a zone some 2m. deep. This retirement was carried out with complete success by the infantry brigades of the 27th, 28th and 4th (which had replaced the Canadian) Divisions in the line on the nights of May 1–2, 2–3, and 3–4. The French now held the $1\frac{1}{2}$m. of the left of the new semicircle round Ypres.

The Renewed German Attacks. — All hope of obtaining victory by gas attacks having disappeared, as the Allies were prepared for them, the Germans now tried by sheer weight of artillery to drive the British off their new position. After finally getting possession of Hill 60 on May 5–6, they made carefully prepared attacks on May 8 and on May 24. In spite of splendid defence and desperate British counter-attacks. in which the 4th, 27th, 28th, and Northumbrian Divisions and the Cavalry Corps troops were engaged, the enemy, dominating the situation with heavy artillery, gained a small amount of ground. Meanwhile, on the night of May 1j–16, he had been compelled by the French to abandon his position on the western bank of the canal. On May 25, after the II. Corps had established itself on a strong line, the Germans brought the battle to a close.

The total British losses in the Ypres and Hill 60 fighting were 2,150 officers and 57,125 other ranks, the total killed being 10,519. The German losses on the Allied front were returned at 860 officers and 34,073 other ranks.

See "Military Operations, France and Belgium, 1915," *History of the Great War based on Official Documents,* vol. i., with a bibliography (1927); Palat, *Grande Guerre sur le front Occidental*, vol. ix. (1922); M. Schwarte, *Der deutsche Landkrieg*, vol. ii. (1923). The French and German official accounts are not yet available, but official information furnished in advance is included in the British account. (J. E. E.)

YPRES, BATTLES OF 1917. Almost continuous fighting took place in the Ypres-Yser region during many weeks in the summer and autumn of 1917, but the operations as a whole may be said to have consisted of two distinct phases. First came the brilliantly successful combat, lasting a few hours, which has come to be known as the battle of Messines. Then, after a lull. there came to be launched immediately north of the scene of the Messines victory a series of attacks at short intervals which lasted four months. This was not a battle, but rather a campaign, with the fighting more defined than the purpose—of the nature familiar in the military annals of Flanders and the Low Countries generally. Like its German forerunners of 1914 and 1915, it achieved little except loss—in which, again, it repeated the earlier history of this theatre of war. So fruitless in its results, so depressing in its direction was this 1917 offensive, that "Passchendaele" has come to be, like Walcheren a century before, a name of ill-omen and a synonym for military barrenness.

An offensive in this sector had formed part of Haig's original contribution to the Allied plan for 1917. Its actual inauguration had been postponed by the unfortunate turn of events elsewhere. When the ill-success of the opening offensive in the spring at Arras (*q.v.*) and in Champagne was followed by the threatened collapse of the French army as a fighting force. Haig's "first-aid" treatment was to allow the British offensive at Arras by the III. Army to continue for some weeks longer, with the general object of keeping the Germans occupied, and with the local object of reaching a good defensive line. When successive thrusts, against an enemy now fully warned and strengthened, failed to reach this line, Haig decided to transfer the main weight of this effort northward to Flanders, as he had originally intended. His loyalty to his Allies and his acute sense of the common interest, inspired him to press on with an offensive policy.

It is right to emphasise that in May Haig's opinion of the policy to pursue was reinforced by the Prime Minister, Lloyd George, who, having committed himself to the Nivelle gamble for victory.

was equally ardent to continue the offensive. It is true, however, that on cooler reflection he subsequently tried in vain to check the policy which he had countenanced.

British Objectives. — The aim was the occupation of the whole of the belt of high ground which extends from a point about three miles north of Armentières, to near Dixmude. It rises some 100 to 150 ft. above the great Flanders plain, and reaches a height of over zoo ft. at some points. In the spring of 1917 its southern portion enclosed to a great extent the Ypres salient, although the Allies' trenches gave them possession of the lower slopes of their side of the high ground. Farther to the north the enemy held the whole of the high ground. The general plan of operations was to begin at the southern end and to work thence northwards. The capture of the high ground was to be followed by an advance in the coast district. But the axis of the attack diverged from, instead of converging on, the German main communications, so that an advance could not vitally endanger the security of the enemy's position in France.

But, worse still, the Ypres offensive was doomed before it began—by its own destruction of the intricate drainage system in this part of Flanders. The High Command had persevered for over two years with the method of a prolonged preparatory bombardment, believing that quantity of shells was the key to success. The offensive at Ypres, which was finally submerged in the swamps of Passchendaele in October, threw into stronger relief than ever before the fact that such a bombardment blocked the advance for which it was intended to pave the way—because it made the ground impassable.

THE BATTLE OF MESSINES

The preliminary move is known as the Battle of Messines, and its purpose was to gain the high ground about Messines and Wytschaete as a flank bastion for the subsequent advance from Ypres. For while in German possession it gave the enemy complete observation of the British trenches and forward battery positions, enabled them to command the British communications up to the Ypres salient, and to take in enfilade, or even in reverse, the trench positions therein. General Plumer and his II. Army, who had been acting as wardens of the Ypres front for two years, had been selected to carry out this operation, while the V. Army under General Gough had been transferred from the Somme to hold the line north of the II. Army. Preparations for the undertaking had begun nearly a year before although their real development dated from the winter. Thus when Haig asked Plumer, on hlay 7, when he would be ready to deliver the attack Plumer was able to say, "a month from to-day," and to keep his promise.

Messines was to be a strict siege operation, the capture of a fortified salient at the minimum cost of lives by the maximum substitution of mind (care in preparation) and material for man-power. Mines, artillery, gas and tanks all contributed. But a contrary wind curtailed most of the scheme of gas projection, and the effect of the mines and artillery was so overwhelming that the tanks were hardly needed. On the centre corps front alone, of about three miles, a total of 718 guns and howitzers, 192 trench mortars, and 198 machine-guns was concentrated.

For the defence of this salient the Germans depended on two separate trench systems coinciding in trace with its arc, the more advanced one pushed down the forward slope of the high ground while the rear one followed its crest; they had also constructed two chord positions, stretching along the base of the salient on the reverse slope. The troops of the II. Army detailed for the enterprise were, from right to left, the II. Anzac Corps, with the Australian 4th Division in support, the IX. Corps with the 11th Division in support, and the X. Corps with the 24th Division in support. There were thus nine divisions in front line and three in support. The fact that the attack would converge against a salient increased its chances, but it complicated the staff, troop, and artillery organization of the attack. For the sectors of each attacking corps were of varying depths, and contracted more and more in width up to the final objective which was the chord of the arc forming the salient. As, however, it was a siege operation, without any attempt at exploitation or a break-through, it was easier to avoid the congestion which had occurred at Arras (*q.v.*). The problem was further simplified by the plan of allotting sectors so that five of the divisions had sectors of equal breadth from front to rear, while the four which filled the interstices had smaller tasks. Further, when the main ridge was captured, fresh troops were to "leap-frog" through to gain the final Oosttaverne line across the base of the salient. The first bombardment and "wire-cutting" began on May 21, were developed on May 28 and culminated in a seven days' intense bombardment, mingled with practice barrages to test the arrangements. The loss of surprise did not matter at Messines as it was a purely "limited" attack.

At 3.10 A.M. on June 7 the nineteen mines—one only had previously been blown by the enemy—were exploded, wrecking large portions of the Germans' front trenches. Simultaneously the barrage fell. When the débris and shock of the mines subsided, the infantry advanced and within a few minutes the whole of the enemy's front line system was overrun, almost without opposition. Resistance stiffened as the penetration was deepened, but the training of the infantry and the efficiency of the barrage enabled continuous progress to be made, and within three hours the whole crest of the ridge was secured.

The New Zealand Division had cleared the intricate fortifications of Messines itself—here the pace of the barrage was regulated to 100 yards in fifteen minutes instead of the general pace of 100 yards in three minutes. The garrisons of Wytschaete and the White Chateau held out for a time, but the first village was captured after a fierce struggle by troops of the 36th (Ulster) and 16th (Irish) Divisions in a combined effort—a feat of symbolical significance. Perhaps the most difficult sector was that of the 47th (London) Division, which had not only to overcome the highly fortified position of the White Chateau but had the Ypres-Comines canal as an oblique interruption across its line of advance. The Londoners, however, overcame both and by 10 A.M. the objective of the first phase was reached along the whole attacking line. While it was being consolidated, over forty batteries were moved forward to support the next pounce.

At 3.10 P.M. the reserve divisions and tanks "leap-frogged" through and within an hour almost the whole of the final objective was captured. Some 7,000 prisoners had been taken, apart from dead and wounded. The success had been so complete that only feeble counter-attacks were attempted that day. When the expected general counter-attack was launched on the whole front on the morrow, it failed everywhere against defences that had been rapidly and firmly organized, and in the recoil yielded the British still more ground.

THE MAIN OFFENSIVE

A long pause now occurred while preparations for carrying out the rest of Haig's programme were being completed. Although Plumer's victory of June 7 had put an end to the enemy overlooking Ypres from the south, the Germans still, in a measure, dominated the place from the east, from the north-east and from the north. Thus the preparations could not be concealed and the Germans knew that they were being made. The plan at the outset was that, while the II. Army stood fast, the V. Army under Gough on its left with the French I. Army still further to the left, should attack the enemy front from near Hooge to north of Steenstraat on the Yser canal.

Nearly two months passed before the preparations for the main advance were completed. This gave the Germans, amply warned, time to make counter-preparations of characteristic thoroughness and ingenuity. Having learnt by experience that a continuous system of trenches did not offer a satisfactory form of defence unless there was abundant underground cover, and realizing that the waterlogged soil of Flanders handicapped the creation of subterranean galleries, they had established a system of numerous disconnected trenches and strong points, arranged in depth rather than in breadth, together with numbers of concrete blockhouses armed with machine-guns. As their front line near Ypres had been in existence since 1915, they trusted to the old system to meet the first shock of attack, and it was rather in the later offensive operations that the Allies found themselves confronted with these new defensive devices. A further new asset. was the introduction of mustard gas which the Germans used to cause serious interference with the attackers' artillery.

On July 22 the bombardment opened, by 2,300 guns, to continue for ten days, until on July 31 the infantry advanced on a fifteen-mile front to the accompaniment of torrential rain. On the left substantial progress was made, Bixschoote, St. Julien, and the Pilckem Ridge being gained, and the line of the Steenbeke reached. But in the more vital sector round the Menin road the attack was repulsed.

The second blow, on Aug. 16, was a diminished replica of the first in its results. The left wing was again advanced across the shallow depression formed by the little valley of the Steenbeke and past the ruins of what had been Langemarck. But on the right, where alone an advance might have a strategic effect, a heavy price was paid for nought, and even the tally of prisoners shrank to a mere two thousand. Nor did men feel that the enemy's skilful resistance and the mud were the sole explanation of their fruitless sacrifice. Severe complaints against the direction and staff work were general, and their justness seemed to receive recognition when Haig extended the II. Army's front northward to include the Menin road sector, and thereby entrusted to Plumer the direction of the main advance towards the ridge east of Ypres.

It was a thankless task at the best, for the experience of war attested the futility of pressing on in places where failure had already become established, and it seemed heavy odds that the laurels earned by Messines must become submerged in the swamps beyond Ypres. Yet, in the outcome, the reputation of Plumer and the II. Army staff, headed by Harington, was enhanced—less because of what was achieved in scale than because so much more was achieved than could reasonably have been expected.

Bad weather and the need for preparation delayed the resumption of the offensive until Sept. 20, but that morning the II. Army attack, on a four-mile front, achieved success in the area of previous failure—on either side of the Menin Road. Fractions of six divisions, the 19th, 39th, 41st, 23rd, 1st and 2nd Australian advanced at 5.40 A.M.; by 6.1j A.M. the first objective was gained almost unopposed, and, with the exception of one or two strong points, the third and last objective was gained soon after midday, and the counter-attacks were repulsed by fire. A fresh spring on Sept. 26, and another on Oct. a—the last a larger one on a six-mile front, by troops of the 37th, 5th, 21st, and 7th Divisions, the 1st, 2nd, and 3rd Australian Divisions, and the New Zealand Division—gained possession of the main ridge east of I'pres, with Gheluvelt, Polygon Wood, and Broodseinde, despite torrents of rain, which made the battlefield a worse morass than ever. On each occasion the majority of the counter-attacks had broken down under the British fire, a result which owed much to the good observation work of the Royal Flying Corps and the quick response of the artillery. Some 10,000 prisoners were swallowed in the three bites, and this frightened the enemy into modifying his elastic tactics and strengthening his forward troops—to their increased loss.

As a result of the operations begun on June 7 the crest of the long belt of high ground overlooking the Flanders plain had now, after four months of intermittent fighting, been secured from Messines northwards to within a few hundred yards of the Ypres-Roulers railway. And yet. regarding this Flanders offensive as a whole, the work was in reality only begun. The Houthulst forest, with the long line of high ground forming the quadrant of a circle beyond it, was still in the enemy's hands Until the ridge had been secured to the vicinity of Staden it would be premature to embark upon the second part of the general scheme of operations—an attack on the German positions along the coast between Nieuport and Ostend, for which the IV. Army under General Rawlinson had been assembled on the extreme left.

Unhappily, the Higher Command decided to continue the pointless offensive during the few remaining weeks before the winter, and thereby used up reserves which might have saved the belated experiment of Cambrai (see CAMBRAI, BATTLE OF) from bankruptcy. Having wasted the summer and strength in the mud, where tanks foundered and infantry floundered, they turned in November to dry ground—where a decisive success went begging for lack of reserves.

At Ypres minor attacks on Oct. g and 12 advanced the line a trifle, and then, after an interval, a combined attack by the V. Army and the French was tried, with small result, on Oct. 22. On Oct. 26 the II. Army, in torrents of rain, as usual, made a fresh effort, which was less successful than before, owing to the exhaustion caused by pushing forward over a morass and to the fact that the mud not only got into and jammed rifles and machine-guns but nullified the effect of the shell-bursts. The trials of the attackers were augmented by the enemy's increasing use of mustard gas, and by his renewed adoption of his tactics of holding the bulk of his troops well back for counter-attack. Thus when, on Nov. 4, a sudden advance by the 1st Division and 2nd Canadian Division gained the empty satisfaction of occupying the site of Passchendaele village, the curtain was at last rung down on the pitiful tragedy of "Third Ypres." It was the long-overdue close of a campaign which had brought the British armies to the verge of exhaustion, one in which had been enacted the most doleful scenes in their history, and for which the only justification evoked the reply that, in order to absorb the enemy's attention and forces the Higher Command had chosen the spot most difficult for the defender and least vital for the attacker.

(R. H. L. H)

YPSILANTI or HYPSILANTI, the name of a family of Phanariot Greeks claiming descent from the Comneni. ALEXANDER YPSILANTI (1725–1805) was dragoman of the Porte, and from 1774 to 1782 hospodar of Wallachia. He was again appointed hospodar just before the outbreak of the war with Austria and Russia in 1790. He allowed himself to be taken prisoner by the Austrians, and was interned at Briinn till 1792. Returning to Constantinople, he fell under the suspicion of the sultan and was executed in 1805. His son CONSTANTINE (d. 1816), who had joined in a conspiracy to liberate Greece and, on its discovery, fled to Vienna, had been pardoned by the sultan and in 1799 appointed by him hospodar of Moldavia. Deposed in 1805, he escaped to St. Petersburg, and in 1806, at the head of some 20.000 Russians, returned to Bucharest, where he set to work on a fresh attempt to liberate Greece. His plans were ruined by the peace of Tilsit; he retired to Russia, and died at Kiev. He left five sons, of whom two played a conspicuous part in the Greek war of independence.

ALEXANDER YPSILANTI (1792–1828), eldest son of Constantine Ypsilanti, accompanied his father in 1805 to St. Petersburg, and in 1809 received a commission' in the Imperial Guard. He fought with distinction in 1812 and 181;. losing an arm at the battle of Dresden. He was one of Alexander's adjutants at the congress of Vienna. In 1820, on the refusal of Capo d'Istria to accept the post of president of the Greek Hetairia *Philike,* Ypsilanti was elected, and in 1821 he placed himself at the head of the insurrection against the Turks in the Danubian principalities. With ocher Greek officers in the Russian service he crossed the Pruth on March 6, announcing that he had the support of a "great power." There followed a series of humiliating defeats, culminating in that of Dragashan on June 19 Eventually he crossed the frontier into Austria in the hope of finding an asylum. He was immediately thrown into prison, where he remained for seven years.

He died at Vienna on Jan. 31. 1828.

DEMETRIOS YPSILANTI (1793–1832), second son of Prince Constantine. fought as a Russian officer in the campaign of 1814, and in the spring of 1821 went to Morea, where the war of Greek Independence had just broken out. In January 1822 he was elected president of the legislative assembly; but retired early in 1823. In 1828 he was appointed by Capo d'Istria commander of the troops in East Hellas. He succeeded, on Sept. 25, 1829, in forcing the Turkish commander Aslan Bey to capitulate at the Pass of Petra, which ended the active operations of the war.

Ypsilanti died at Vienna on Jan. 3. 1832.

YSALGUIER, ANSELME D' (?*fl.* 1380–1420), French traveler. sometimes considered the first European to have seen the Niger river. According to the *Historia chronologica parlamentorum patriae occitanae* attributed to Guillaume Bardin he mas a member of a noble family of Toulouse; he reached Gao in 1405 married a native Moslem princess there then returned to Toulouse with his wife. their daughter, their two sons and some slaves (among them a physician who cured Charles VII of an illness). The *abbe'* Tricaud who, in his *Essnis de littérature pour la connaisance des livres* (1702). records this story, adds that D'Ysalguier wrote an account of his travels and produced a dictionary in Arabic Tuareg and Songhai. The whole episode is considered as true by C de la Roncikre in *La Découverte de l'Afrique au moyen âge,* vol. iii (1927). But it was later demonstrated that Tricaud copied the *Annales de Toulouse* of Lafaille (1687), an extremely unreliable nork. nhich embellished the *Historia chronologica* (itself a forgery). hloreover, a thorough study of the vast documentation concerning the family Ysalguier did not reveal the slightest hint about Anselme.

See F. Galabert, "Le Toulousian Anselme Ysalguier est-il allé au Niger au XV^e^ siècle?" Mém. Acad *Toulouse* (1933); *P.* Wolff, "Une Famille du XIII^e^ au XVI^e^ siècle, les Ysalguier de Toulouse," *Mélanges d'histoire sociale* (1942). (P. Wo.)

YSAYE, EUGÈNE (1858–1931), Belgian violinist, conductor and composer who was the main interpreter of the string works of the French and Belgian composers of his time. Born at Liège, July 16, 1858, he studied at the Liège conservatory and later with H. Vieuxtemps and H. Wieniawski in Brussels. After a year as leader of an orchestra in Berlin, he toured Norway, Russia and France.

Ysaÿe's early style was influenced by the violin sonata of César Franck. dedicated to him on his marriage in 1886. and he later inspired works by the principal French composers of his time. including Saint-Saens. Vincent d'Indy, Faure and Debussy. In 1894 he conducted the Ysaÿe orchestral concerts in Brussels and also visited the United States. From 1918 to 1922 he was conductor at Cincinnati, 0. Ysaÿe's playing was known for intensive use of vibrato.

His best works were his six sonatas for unaccompanied violin, containing novel chordal and pizzicato effects.

He died at Brussels. May 12, 1931.

YSER, a small coastal river. 48 mi. long, of which 31 mi. are in Belgian territory. It is famous as marking the point. in World War I (1914–18), at which the German advance towards Calais and the English coast was checked. On Oct. 10, 1914, the Belgian army, after being forced to evacuate Antwerp and Ghent, retreated on the Yser; on the 16th the battle of the User began, and the Allied troops fought desperately for 1; days. Eventually, assisted by the floods which, beginning on Oct. 29, reached Dixmude by Nov. 2, the allies succeeded in establishing themselves in an impregnable position on the left bank of the Yser.

YSER, BATTLE OF THE. On Oct. 10, 1914, the Belgian field army encamped on the west bank of the Ghent-Terneuzen canal. The British Naval Division. which had embarked at St. Gilles-Waes. regained Dunkirk except two battalions. which were cut off. and passed into Holland; the French Fusilier Marine Brigade, half of the British 7th Division and the 4th Belgian Brigade were holding Ghent and had repulsed an attack on that city by the 1st Res. Ersatz Brigade.

Information had been received that a Bavarian cavalry division had advanced towards Deynze exploring between the Schclde and the Lys; that a column of 20.000 men had passed through Courtrai and Menin and that the German IV. Cavalry Corps was holding the region Tourcoing-Ypres-Poperinghe. The only way for the Belgian army to baffle the threat of envelopment on a iarge scale was an immediate march to the coast. It was decided to transport all the forces without delay to the region of Ostend-Thourout-Dixmude-Furnes, the infantry by rail, the artillery and transport by road, under the protection of all the cavalry and Rawlinson's Corps.

Plans of Opposing Commanders.—The "race to the sea" had in the menntime caused the Western Front to extend to La Bassée. The British army had been withdrawn from the region of the Aisne and was beginning to detrain west of Lille. A few French divisions, taken from other sectors, were given the same destination. It seemed to Gen. Joffre that the moment had come for bringing about the much-desired envelopment of the German right wing by a concentric offensive against Lille. The British army, the Belgian army and some French reinforcements would constitute, it was believed, under the high command of Gen. Foch, an *ensemble* capable of securing a decisive victory. Unfortunately, the assembling of the Allied troops by means of the Paris-Calais and Paris-Hazebrouck railways would take time. On the other hand, it was necessary to take in account that the Beseler Army Group would not fail to follow the Belgians.

The mission of the Belgian army was once again that of gaining time. The king, anxious to keep his left wing resting on the sea, and to preserve at all costs a fragment of national territory from invasion, thought best to entrench the army on the river Yser and the 1'pres canal.

Events soon proved the wisdom of this decision. The British II. and III. and Cavalry Corps were stopped at the Lys by the German IV., VII. and XIII. Corps; Rawlinson's Corps found Menin in the hands of the XIX. Corps. Beseler's troops now entered Bruges and Ostend. It was known that numerous detrainments were taking place west of Brussels and that a new German IV. Army had installed its headquarters at Ghent. In fact Falkenhayn, the new chief of the German general staff, had anticipated the Allies' projects and like them, considered the moment for a decisive victory to have arrived.

With four new army corps, composed mainly of volunteers, the XXII., XXIII, XXVI. and XXVII. Res. Corps, Beseler's group and the artillery park from the siege of Antwerp, Prince Albert of Württemberg was charged to proceed to the Yser with his right resting on the sea, in order to attack in flank and in rear the Allied left, whose front the VI. Army was engaging between Arras and Armentières. Falkenf ayn considered that: "The conquest of the coast was the sole means of frustrating the war of blockade which England contemplated and of retaliating through our destroyers, submarines, aeroplanes and Zepplins. . . . If we succeeded in driving the enemy out of the Yser valley and pursuing him at the point of the sword, there was no doubt that, having replenished our ranks and our stores, we should be in a condition to overthrow the western front."

Thus the Belgian army, which had only just moved into position in the general Allied line, found itself in focus for a new battle. It occupied a front of 40 km., from the sea to Boesinghe, with $4\frac{1}{2}$ divisions and $1\frac{1}{2}$ divisions in reserve behind the centre. The cavalry division was operating with de Mitry's French Cavalry Corps, east of the forest of Houthulst. On the army's right a French territorial division extended as far as Ypres and Rawlinson's Corps had entrenched itself along the line Passchendaele-Gheluvelt.

Opening of the Battle.—The battle commenced on the 18th with an attack by Beseler's corps (4th Ersatz and 5th and 6th Reserve Divisions) between the sea and Keyem. The Belgian outposts were only driven back after desperate fighting and the enemy did not even reach the Yser. On the morning of the 19th Ronarćh's Marine Brigade and the 5th Division debouched from Dixmude on the flank of the III. Res. Corps. Beerst and Vladsloo were retaken; but the intervention of the XXII. Corps, coming from Thourout, and the XXIII. coming from Cortemarck, foiled the counter-attack. By the 20th the fighting had become general all the way from the sea to Gheluvelt between the Duke of Württemberg's $5\frac{1}{2}$ divisions on the one hand and the Belgian army, de Mitry's Cavalry Corps and Rawlinson's Corps on the other. After 48 hours of obstinate fighting the Belgian positions remained practically unchanged.

The attack of the 4th Ersatz Division on Nieuport had failed, partly on account of the flanking fire from Admiral Hood's flotilla; while that of the XXII. Corps against the bridgehead at Dixmude had been checked by Meiser's Brigade. But in the night of the 21st–22nd the 6th Reserve Division made a surprise crossing of the Yser in the Tervaete salient and threw over $2\frac{1}{2}$ battalions to the west bank. Concentrated artillery fire prevented the division from making any progress on the 22nd, but a gallant counter-attack broke down completely under their machine-gun fire, owing to the exposed nature of the ground. The following night the Germans passed a second regiment into the bend without, however, extending their ground.

On the 24th, the whole of the III. Reserve Corps and half of the 43th Reserve Division, covered by a bombardment, broke through the front at St. Georges-Tervaete, only to find the Belgians deployed behind the Nieuport-Dixmude railway embankment, together with the French 42nd Division which had arrived in the meantime.

Finding themselves checked in this direction, the Germans renewed their attack on Dixmude. In spite of a threefold attempt it was completely repulsed b~ the 12th Belgian Regiment, assisted by some French companies of marines. A new attack on the night of the 25th–26th met with the same fate

Opening of the Nieuport Sluices.—On the 26th and 27th all the pioneers were set to stop up the 22 culverts of the Nieuport-Dixmude railway embankmrnt so as to prevent the liberating tide from invading the Belgian positions. On the 27th at damn a first attempt by the sluice of the Furnes canal, at high tide, failed to yield an effective result. Fresh attempts on the 28th and 29th proved that the inflow of water from this canal was too slight and too slow. Actually, another sluice, that of the Noordvaart, promised a larger delivery but as it lay in No Man's Land its utilization appeared hazardous. During the nirht of the 29th, however, a party of pioneers opened the Noordvaart sluice under the noses of the enemy. Driven by a strong gale the sea water rushed through in a flood. At dawn on the 30th, the three divisions of Beseler's corps attacked along the line of the railway, taking possession finally of Ramscapelle and Pervyse; but the drains were now overflowing; the flooded meadows soon made it impossible for the Germans to advance or even to stay; no alternative was left to them but a hasty retreat.

Checked along the coast line, the Germans moved the weight of their attack farther inland and made their assault on Ypres. *(See* also YPRES, THE BATTLE OF, 1914.) (R. VAN O.; X.)

YTTERBIUM is a rare metallic element belonging to the rare earth group. Its compounds were first separated by J. C. G. Marignac in 1878. Later (1907), G. Urbain found ytterbium to be composed of two elements which he called lutecium and neoytterbium. Neoytterbium later was called ytterbium; it has also sometimes been called aldebaraniuni. Ytterhium occurs in very small amounts in rare earth-containing minerals such as gadolinite, polycrase, bloinstrandine, etc. The common oxide, Yb_2O_3, is colourless and dissolves readily in acid to form colourless solutions of trivalent salts, which are paramagnetic. Ytterbium also forms a series of divalent compounds which were first prepared by W. Klemm and W. Schuth (1929) by hydrogen reduction of anhydrous ytterbium trichloride. They can also be prepared in a very pure form by electrolytic reduction of the trivalent salts. The divalent salts are soluble in water, but react slowly with it liberating hydrogen; they react rapidly with increased hydrogen ion concentration. The divalent solutions have a grayish colour.

Ytterbium is best separated iroin the other rare earths by taking advantage of its divalent state, and can be absorbed irom the other rare earths by extracting in sodium amalgam. It can also be separated in its trivalent form by ion-exchange methods. Thr metal is best produced by distillation. A mixture of Yb_2O_3 and lanthanum metal is heated in a vacuum and the ytterbium distilled out. It is a silvery, very soft metal which melts at 824° C. It has an appreciable vapor pressure at its melting point. The metal crystallizes on the face-centered cubic system, a = 5.4862 A, and has a calculated density of 6.959. Ytterbium's symbol is Yb, atomic number 70, atomic weight 173.04, stable isotopes Yb^{168} (0.140%), Yb^{170} (3.03%), Yb^{171} (14.31%), Yb^{172} (21.82%), Yb^{173} (16.13%), Yb^{174} (31.84%), Yb^{176} (12.73%). (*See* RARE EARTHS.) (F. H. SF.)

YTTRIUM (symbol Y), a metallic element usually associated and classed with the rare earths (*q.v.*), which it closely resembles in properties and from which it can be separated only with great difficulty. Its ore was discovered by J. Gadolin in 1794 at Ytterby, Swed. (whence it gets its name), and obtained in a more pure form by C. G. Mosander in 1843. It is a common ingredient of the minerals gadolinite, xenotime and euxenite.

Prior to 1945 yttrium was separated from other rare earths by fractional crystallization, usually of bromate salts. This process required many fractionation methods to obtain reasonably pure salts. Later, separation was achieved by ion-exchange methods and accompanied by eluting a long baud of mixed rare earths down a synthetic cation-exchange resin. Extremely pure yttrium can be obtained by this method.

The pure metal is produced commercially by the reduction of yttrium fluoride (YF_3) with calcium and is used for alloying purposes as a "getter" for oxygen and negative impurities in other metals. It shows promise of use in atomic reactor construction because of its low nuclear cross section. The spark spectrum of yttrium is very characteristic and strong.

Yttrium forms a white oxide (Y_2O_3) which dissolves in acids to form solutions of trivalent yttrium salts; these are colourless diamagnetic and possess no characteristic absorption spectra. Yttrium has an atomic number 39, atomic weight 88.92, stable isotope Y^{89} (100%), is hexagonal close-packed, $a = 3.647°$ K., $c = 5.713°$ K. and has a calculated density of 4.472. It melts at about 1,550° C. and boils in the neighbourhood of 3,500° C.

YUAN SHIH-K'AI (1859–1916), Chinese statesman, was born at Hsiang Cheng, a member of a family belonging to the smaller landed gentry of the province of Honan. His first important post was in Korea, where, as Imperial Resident and the trusted lieutenant of the Viceroy Li Hung-chang, he strove by adroit diplomacy to preserve China's shadowy suzerainty over the Hermit Kingdom and to check the steadiiy increasing ascendancy of Japan. After the Chino-Japanese war (1894–95) he held office as judicial commissioner, with military functions, under ihe viceroy Li, in Chihli, where he brought the troops to a remarkable standard of efficiency.

In Aug. 1898, the emperor Kuang Hsü, hoping to secure Yuan's services in support of his scheme to seize and imprison the empress dowager, summoned him to a special audience at the Summer Palace. The subsequent coup *d'état* by the empress dowager, which removed the emperor irom the throne and replaced him under severe tutelage, owed its success to Yuan's betrayal of the emperors confidence and to his active support of the conservative Manchu party. To the end of his unhappy career, the emperor never forgave Tuan s treachery, and on his death-bed (Nov. 1908) bade his brother, Prince Chun, see to it that he should not go unpunished.

Tuan received from the empress dowager the governorship of Shantung as reward for his services. In the summer of 1900, on the outbreak of the Boxer rising, he maintained order and protected foreigners throughout his jurisdiction. He had no sympathy with the empress dowager's anti-foreign policy, After the signature of the peace protocol (Peking 1901), as the aged Li Hung-chang desired to be relieved of further duty, Yuan was appointed to act in his place as viceroy of Chihli. At Li's death (Dec. 1901) the appointment was made substantive. Yuan now held the highest office in the gift of the Throne; at the same time he was made a Junior Guardian of the heir apparent. A month later the Yellow Jacket was conferred upon him, together with the appointments of consulting minister to the Government council and director general of the northern railway. In the following year he became a minister of the army reorganization council. During the five years of his viceroyalty, he raised and equipped six divisions of troops, greatly superior in every way to those of the Peking field force or the best provincial levies. But his rapid rise to place and power aroused much jealousy, and, in 1907, a cabal against him, led by his old rival, the ex-Boxer Tatar general Tieh Liang, persuaded the empress dowager to transfer him from the Tientsin viceroyalty to the capitai. He was made grand councillor and president of the Board of Foreign Affairs, which post hc held until the death of the dowager and the emperor in Nov. 1908.

For a month after the death of the "Old Buddha," rumours were rife in the north concerning the regent's, I'rince Chun's, vindictive intentions with regard to Tuan. But he merely deprived Yuan of office (Jan. 2, 1909) and ordered him into retirement at his native place in Honan. But on the outbreak of the revolution the regent, by an edict of Nov. 14, 1911, appointed him viceroy of Hunan and Hupeh, with a mandate to proceed south with his foreign-drilled troops and put an end to the insurrection. Yuan clearly foresaw and declared that if the monarchy were overthrown, the result would be chaos, "amidst which all interests would suffer and for several decades there would be no peace." Thus his avowed policy was to preserve a limited monarchy, pledged to systematic and practical reforms. Had he been loyally served by his representative, Tang Shao-yi, in the negotiations with the revolutionary leaders at Shanghai, above all, had he received the support which he was entitled to expect in the shape of a foreign loan, he might have won. As it was, he continued to fight on, practically singlehanded, against the forces of disruption. until Feb. 1912 when the terrified Manchu court decided to abdicate. Within two days of the issue of the abdication edict (Feb. 12), the southern revolutionaries, on the initiative of Sun Yat-Sen, exemplified the "unbroken continuity of immemorial tradition" in China by inviting him to stand for the presidency of the republic.

Yuan made a virtue of necessity, and on March 12 took the oath of office as president. Nevertheless, he continued to uphold the principles which he had publicly proclaimed in justification of his defense of the monarchy, and to insist upon maintenance of the continuity of the classical tradition of 'government and the preservation of the Confucian system. He was willing for a time to pay lip service to the republican formulas, but his actions proved clearly that he had no sympathy with Canton.

In the summer of 1913, a "war to punish Yuan" was started in the south by Sun Yat-Sen. Huang Hsing and other malcontents; but Yuan. having by this time secured a foreign loan and the moral support of the powers. had no difficulty in retaining the venal "loyalty" of the chief military commanders in the provinces; the Cantonese insurrection came. therefore, to a swift and inglorious end. But Yuan dissolved and proscribed the Kuomintang, and with it made an end of its farce of parliamentary government and representative institutions.

The movement for the restoration of the throne organized by Yuan's adherents: began to take shape in the autumn of 1915. The leaders of the movement failed especially to perceive the danger created by Japan's 21 demands (May 1915), and to realize that the active opposition of the Japanese government would in all probability be fatal to Yuan's ambitions. In October the state council referred the question of the monarchy to the provinces. The result (a foregone conclusion) was a practically unanimous vote in favour of Yuan's accession. Meanwhile. however, the Japanese minister at Peking, supported by his British and Russian colleagues, had made friendly representations to the Chinese foreign office, deprecating the restoration of the monarchical system at this juncture. But on Dec. 12 the monarchy was proclaimed and the enthronement ceremony fixed for Feb. 9, 1916. A week after this announcement, an insurrection, led by one of Yuan's own nominees! broke out in Yunnan. The movement spread rapidly, one province after another declaring its independence. On Jan. 22 Yuan announced the postponement and the establishment of the monarchy. Toward the end of April he consented, while retaining the presidency, to surrender all civil authority to the cabinet, under the premiership of Tuan Chi-jui. He died on June 6, 1916. With him passed the last of the great viceroys of the old regime.

YUCATÁN, a state in Mexico situated in the north of the Yucatán peninsula. Area 14,868 sq.mi.; pop. (1950) 516,899, (1960) 612.047.

Yucatán became a state in 1824. In 1902 the territory of Quintana Roo (*q.v.*) was sliced off, and in 1917 Campeche (*q.v.*) was similarly lost. In the early 1920s the governor of Yucatán, Felipe Carrillo Puerto, strove to break up the large hehequen plantations. He became a great popular hero, but in the Huerta counter-revolution the governor and three of his brothers were killed. The plantations were eventually expropriated and many of them subdivided into co-operative ejidos.

In the 1950s a program was begun to drain the swamp areas and to introduce a diversity of crops. Tourism became important with improved air services, and many old Mayan centres. hitherto inaccessible became popular excursion spots, notably the wooded region around Chichén Itzá. There is a modern hotel there and also one at Uxmal. The rural inhabitants are Maya and speak little Spanish.

The state capital, Mérida (*q.v.*) is a commercial centre which also serves as a tourist base for the Mayan ruins. Its seaport, Progreso, on the Gulf of Mexico, 24 mi. inland, is the chief port and point of entry by steamer for Yucatán. (J. A. Cw.)

YUCATAN PENINSULA (PENÍNSULA DE YUCATÁN), a northeastern projection of Central America lying between the Gulf of Mexico and the Caribbean sea. It includes in its area of 55,400 sq.mi. the Mexican states of Campeche and Yucatin (*qq.v.*) and the sparsely settled territory of Quintana Roo (*q.v.*), plus large parts of British Honduras and Guatemala. The peninsula has a mean breadth of about 200 mi.. and a coast line of 700 mi.

Geography. — The coast on the north and west is low, sandy and semibarren. There are a number of openings through the outer bank upon which several small towns or ports were built. The eastern coast consists of bluffs, indented with bays and bordered by several islands, the largest being Cozumel. There is good fishing all along the coasts and there are many excellent beaches.

The peninsula is almost wholly composed of a bed of coraline and porous limestone rocks, forming a low tableland, which rises gradually toward the south. It is covered with a layer of thin, dry soil, through the slow weathering of the coral rocks. Where the rocky surface is perforated there are natural wells (*cenotes*) and caverns (cavernas) around which the ancient Mayas built their centres. In the 20th century many windmills replaced old wells.

The climate of northern Yucatin is hot and dry, and the absence of high mountainous ridges to intercept the moisture-bearing clouds from the Atlantic, gives it a limited rainfall. Toward the south. moisture increases from 18 in, to a maximum of 80 in. a year, and the scrub forest gives way to tall trees. The temperature ranges from 75° to 98° F. in the shade. but the heat is modified by cool sea winds which prevail day and night throughout the greater part of the year. The atmosphere is also purified by the fierce *temporales*, or northers, which occasionally sweep across this open region. The dry season lasts from Dec. to May, and the hottest months are in May and June. Most of the peninsula receives adequate rainfall throughout the year, and the agricultural potential is great.

The regions toward Tabasco and British Honduras enjoy sufficient rainfall to support forests containing mahogany, sapodilla, several valuable cabinet woods, vanilla, logwood and other dyewoods. Logwood forests fringe all the lagoons and many parts of the seaboard, which are flooded during the rainy season. Oil was discovered in several parts of the peninsula. The chief cultivated plants are maize, sugar cane, tobacco, cotton, coffee and especially henequen (for sisal hemp). In 1502 Columbus wrote of meeting canoes manned by Indians whose gear was tied with henequen ropes. but it was not until 1811 that sisal was first produced commercially for export. After that, with the invention of cordage machines: the trade: including the making of hammocks. grew rapidly.

Animal life includes deer! jaguars, wild boars and monkeys; among the reptiles are big boas (harmless to man), rattlesnakes and iguanas; bird life abounds, especially turkeys, quails and parrots.

History. — The modern history of Yucatán, called Mayapán by the Mexicans for many years, begins with the expedition of Francisco Hernández de Córdoba, a Spanish adventurer from Cuba, who discovered the east coast of Yucatán in Feb. 1517, when on a slave-hunting expedition. In 1518 Juan de Grijalva followed the same route. In 1519 a third expedition, under Hernán Cortés, clashed with the natives of Cozumel Island. In 1525 the inland part of the peninsula was traversed by Cortés during an expedition to Honduras.

The conquest of the peninsula was undertaken in 1527 by Francisco de Montejo, who encountered a more vigorous opposition than Cortés had on the high plateau of Anáhuac. In 1549 Montejo succeeded in establishing Spanish rule over barely one-half of the peninsula, and it was never extended further. The Spaniards discovered the remains of a high aboriginal civilization which had already entered its decline. There were deserted cities falling into ruins. and others, like Chichén Itzá. Uxmal and Tulum. which were still inhabited by remnants of their former Maya populations.

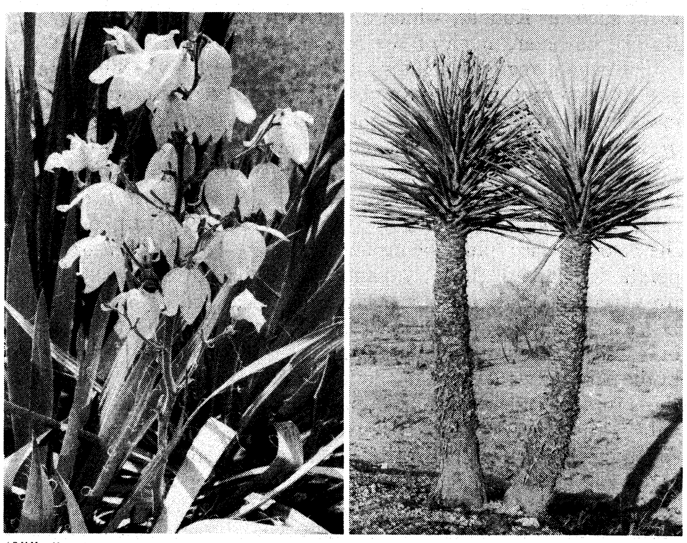
During the colonial period Yucatan remained a remote and unimportant part of the viceroyalty. Since the Spanish conquest, the rebellious Mayas clung to the inland rural areas of the peninsula. They seceded in 1839 and maintained their independence until 1843 In 1847 another revolt followed. and the Indians were practically independent throughout most of the peninsula until near the beginning of the administration of Jose de la Cruz Porfirio Diaz. In 1910 there was another revolt uith some initial successes, after which the Indians withdrew to the unknown fastness of Quintana Roo.

Population. — The population of Yucatán varies considerably in both density and racial composition Around Mérida (*q v*) large rural areas have a density of 125 or more persons per square mile. The population there and down to British Honduras is mostly Maya Indian and mestizo, with a few whites in the cities. In the territory of Quintana Roo the density declines to about 1 3 inhabitants per square mile. The regions around and including British Honduras have a population that is about 48% Negro and mulatto 24% Maya Indian and 28% mestizo dnd nhite.

The Economy. — The logging and chicle industries of the southern portions of the peninsula (and also of the states of Campeche and Tabasco) are carried on by roving workers who form no permanent settlements in the tropical rain forests.

In the Mexican and Guatemalan portions of Yucatán the language of the rural areas is Maya, and the majority of the natives speak little or no Spanish. Until the 20th century Yucatán was more closely connected with Europe than with the rest of Mexico. There was no railway linking the peninsula with Mexico until 1949 and there are still no highway connections. Not until 1957 was the narrow-gauge rail line of 1949 nidened to the standard width, thus facilitating the entrance and export of heavy freight However a network of airways connects all the important centres of the peninsula with Mexico and the outside world. (J. A. Cw.)

YUCCA, a genus of the family Liliaceae (*q.v.*), containing about 30 species. The plants occur in greatest frequency in Mexico and the southwest United States, extending also into Central America. and occurring in such numbers in some places as to form straggling forests. They have a woody or fibrous stem. sometimes short, and in other cases attaining a height of 30 to 40 ft., and branching at the top into a series of forks. The leaves are crowded in tufts at the ends of the stem or branches. and are generally stiff and sword-shaped, with a sharp point, sometimes flaccid and in other cases fibrous at the edges. The numerous flowers are usually white, bell-shaped and pendulous, and are borne in much-branched terminal panicles The three-celled ovary is surmounted by a short thick style, dividing above into three stigmas, and ripens into a succulent berry in some of the species, and into a dry three-valved capsule in others. The flowers are fertilized entirely through the agency of certain moths. *See* POLLINATION and YUCCA MOTH.



JOHN H. GERARD

DATIL YUCCA (Y BACCATA), LEFT. A SHRUB WITH A SHORT. PROSTRATE STEM AND TRECUL YUCCA (Y TRECULEANA) RIGHT A TREE USUALLY UNDER 15 FT.

A coarse fibre is obtained by the Mexicans from the stem and foliage, which they utilize for cordage, and in the southeast United States the leaves of some species, under the name bear grass, are used for seating chairs, etc. The fruits of some species are cooked as food, and the roots of others contain a saponaceous matter used in place of soap.

Some 15 species of yucca are native to the United States; of these nine attain the stature of small trees. Among the best known are the Spanish bayonet or aloe yucca (Y. *aloifolia*), the mound lily (Y. gloriosa), and the bear grass or Adam's-needle (Y. *filamentosa*), of the south Atlantic and Gulf coast, all of which are planted for ornament. Among the most conspicuous are the Joshua tree (Y. *brevifolia*), sometimes 35 ft. high, and the Mohave yucca (Y. *schidigera*), 8 to 15 ft. high. An almost stemless species (Y. *Whipplei*), called desert candle and Quixote plant, which rears a stout flower-stalk, 12 ft. to 15 ft. high, bearing an immense cluster. 3 ft. to 6 ft. long, of fragrant, creamy white, drooping bell-shaped flowers, is a strikingly handsome plant of the southern California chaparral (*q.v.*). The western Datil yucca (Y. baccata), found from New Mexico to California, bears a dark purple edible fruit.

YUCCA MOTH, the name given to a genus of moths. Tegeticula, the various species of which are each adapted to a separate species of the yucca (*q.v.*).

The moth emerges at the time of opening of the yucca flowers, which frequently remain open only for a single night. The female moth rolls together a ball of pollen. flies to another flower, lays four or five eggs in the pistil and inserts the pollen mass in the opening thus formed. Each larva, on hatching from the egg, requires about 20 seeds of the yucca plant as food. As the plant produces some 200 ovules, this leaves about 100 seeds over to perpetuate the plant. The yucca can be fertilized by no other insect.

YUCHI, an Indian tribe, formerly on the Savannah river in Georgia and South Carolina. constituting a separate linguistic stock. They gradually joined the Creek confederacy and, mixed with white and Negro blood. survive in the Creek area in Oklahoma. Their culture was marked by traits of Muskogi type.

YUDENICH, NIKOLAI NIKOLAEVICH (1862–1933), Russian soldier, was born July 18. 1862. He entered the army in 1879. and from 1887 to 1902 served on the general staff. In 1902 he became a regimental commander, in 1905 a general, an assistant chief of staff in 1907 and a chief of staff in 1913. At the beginning of World War I he commanded the II. Turkistan Corps. and was soon placed in command of all the military forces in the Caucasus, a post which he held till the arrival of the Grand Duke Nicholas in 191j. In March 1917 he resumed command, but further advance mas rendered impossible by the increasing disorganization of the Russian army. In 1919 Yudcnich led anti-Bolshevik forces in an attempt against Petrograd (Leningrad). This venture was a failure, and Yudenich retired.

YUE-CHI or **YUEH-CHIH,** the Chinese name of a central Asiatic tribe who ruled in Bactria and India, are also known as Kushans (from one of their subdivisions) and Indo-Scythians (*q.v.*). They appear to have been a nomad tribe, inhabiting part of the present Chinese province of Kan-suh, and to have been driven W. by Hiung-nu (*q.v.*) tribes of the same stock. They conquered a tribe called the Wusun, who lived in the basin of the Ili river, and settled for some time in their territory (*c.* 175–140 B.C.). They then attacked another tribe known as Sakas (*q.v.*) and drove them to Persia and India. For about twenty years it would seem that the Yue-Chi were settled in the country between the rivers Chu and Syr-Darya, but here they were attacked again by the Hiung-nu, their old enemies, with whom was the son of the defeated Wusun chieftain. The Yue-Chi then occupied Bactria (*q.v.*), and little is heard of them for a hundred years. During this period they became a united people, having previously been a confederacy of five tribes, the principal of which, the Kushans (or Kwei-Shwang), supplied the new national name.

The chronology of this invasion and of the history of the

Kushans in India is uncertain; available evidence seems to show that a king called Kozulokadphises, Kujulakasa or Kieu-tsieu-k'io (? A.D. 45–85) united the five tribes, conquered the Kabul valley and annihilated the remnants of Greek dominion. He was succeeded, possibly after an interval, by Ooemokadphises (Himakapisa or Yen-kao-tsin-tai), who completed the annexation of north India. Then followed Kanishka (?*c.* A.D. 123–53), who is celebrated throughout eastern Asia as a patron of the Buddhist church and convener of the third Buddhist council. He is also said to have conquered Kashgar, Yarkand and Khotan. His successors were Huvishka and then Vasudeva, who may have died *c.* A.D. 225. After Vasudeva's reign the power of the Kushans gradually decayed, and they were driven back into the valley of the Indus and northeast Afghanistan. There, according to Chinese authorities, their royal family was supplanted by a dynasty called Ki-to-lo (Kidara), who were also of Yue-Chi stock, but belonged to one of the tribes who had remained in Bactria when the Kushans marched to India. The subsequent migration of the Kitolo south of the Hindu Kush was a result of the movements of the Jwen-Jwen, who advanced west from the Chinese frontier. Under this dynasty a state known as the Little Kushan kingdom flourished in Gandhâra (east Afghanistan) about A.D. 430, but was broken up by the attacks of the Hunas.

YUGOSLAVIA, a republic of southeastern Europe; formerly the kingdom of the Serbs, Croats and Slovenes (*Kraljevina* Srba, Hrvata i Slovenaca), proclaimed on Dec. 1, 1918, after the union of the kingdom of Serbia, Crna Gora or Montenegro and the South Slav (*i.e.,* Yugoslav) territories of Austria-Hungary; it changed its official name on Oct. 3, 1929, to Kingdom of Yugoslavia (Kraljevina Jugoslavija); on Nov. 29, 1945, it became a federal people's republic (Federativna Narodna Republika Jugoslavija). Having an area of 98,766 sq.mi. (255.804 sq.km.), it is the largest country in the Balkan peninsula. bounded by seven other states: on the north by Austria and Hungary, on the northeast by Rumania, on the east by Bulgaria, on the south by Greece, on the southwest by Albania and the Adriatic sea and on the west by Italy. Its population is overwhelmingly Slavonic and Christian (roughly, one-half Orthodox and two-fifths Roman Catholic).

NATURAL REGIONS

Geographically Yugoslavia presents a zonal pattern throughout almost its whole area, with trend lines running from northwest to southeast. This can be seen in its geological structure, its surface relief and drainage, its climate and its agricultural products. Only in the extreme northwest and in northeast Serbia are east-west trends shown in the Alpine ridge and valley country and the Balkan mountains respectively. The major zones are: (1) the Pannonian lowland, (2) the Slovene Alps, (3) the Morava-Vardar depression, (4) the coastal belt and (5) the Dinaric mountain belt.

Though Yugoslavia is physically a part of the Balkan peninsula and as such has been regarded as a Mediterranean land, it has much in common with the central European countries. Its severe snowy winters and hot rainy summers have produced a vegetation and forced upon the inhabitants a pattern of living very unlike those of Italy or Spain or even Greece. Again, though it has a long coastline on the Adriatic and though the Aegean port of Salonika is within a short distance of its frontiers, the main direction of its commerce is northwest; *i.e.,* toward Vienna and Trieste.

The Dinaric coastal belt enjoys a truly Mediterranean climate but this changes to a central European type as the Pannonian lowland is approached. Deciduous trees such as oak and chestnut form an important part of the forest vegetation. The production of food grains provides a surplus in the northeast but is insufficient over all the western mountain zone. Maize is more widely grown than wheat and yields a greater total crop. Cattle and sheep are reared in all parts, but the former are most numerous and the latter least so in the Alpine regions of Slovenia. Swine are generally important but much more numerous in the more heavily cultivated north and northeast.

1. The Pannonian Lowland.—This obtains its name from the old Roman province of Pannonia, the name being applied by geologists to a great depression between the Alps on the west and the Transylvanian mountains on the east which was flooded by water during the Tertiary period. The water was finally drained off by the Danube as it cut its way through the encircling mountain rim by the gorge which forms the Iron Gate. Northward the plain left by the ebbing of the waters extends far beyond the limits of Yugoslavia; southward, beyond the plain which fringes the Sava-Danube, it gives place to an undulating platform which seems to represent the shore of the old lake. This hill country forms part of northern Bosnia and Serbia, extending in the latter country southward to the hills west of Nis (Nish), notably the Jastrebac and Kopaonik ranges.

That part of this productive Tertiary hill country which extends eastward from the Kolubara to the Morava and is bounded to the south by the valley of the Western Morava forms the Sumadija of the Serbs and constituted the heart of modern Serbia. Originally thickly forested—*šum* means forest—the woods have been largely cleared except on the islandlike mountains of older rock, such as Rudnik, which rise from the general surface. In Bosnia, however, much of the original woodland remains.

The whole region, including plains, river valleys, hill country and isolated mountains and uplands, constitutes economically the most important part of the state and has a considerable variety of resources. In Serbia the characteristic occupation is mixed farming carried on by peasants on small holdings. The cereals include maize, wheat, barley and oats. A great variety of vegetables is grown for local use, and there are numerous orchards, the characteristic plum being accompanied by all the usual temperate fruit trees. Local advantages of climate and soil account for certain special crops, such as tobacco (especially near Titovo Uzice in the valley of the Djetinja); the vine for table grapes or wine in the more sheltered areas, especially near Smederevo in the Morava valley and in the lower Timok valley; sugar beet in the Morava valley; flax, especially in the Drina and Kolubara valleys; mulberry for silkworm-rearing in the Morava valley, and so on. Of stock animals the pig is particularly important but cattle and horses are reared, with many sheep on the uplands.

In the Vojvodina (*i.e.,* a province lying north of the Sava-Danube line), conditions are broadly similar, but cereal production, especially of wheat, is more important, and the farming is of a more advanced type. There is a correspondingly greater development of the industries using local raw material, such as flour milling, sugar extraction, brewing and distilling, ropemaking from local hemp, the making of linen and silk goods. etc., and as a consequence tonns are more numerous and larger. The greater variety of the surface in Croatia brings certain modifications. Orchards are numerous. and to the plums, grapes, apples. pears, etc., of Serbia are added walnuts and chestnuts. Stock rearing is extensively practised, and the fact that there are large forested areas results in a great development of industries based on wood and wood products.

The part of Bosnia included within the region may be said to resemble a more backward Serbia. Maize is the most important cereal, and since there has been less clearing for agriculture there, extensive and valuable forests remain. As in Serbia the plum is by far the most important fruit tree.

2. The Slovene Alps.—This includes east-west ranges of the Alpine zone and parts of the upper Drava and Sava valleys. Because of the limited amount of arable land, not only is there no surplus of cereals, such as is found in the Pannonian lowland, but there is an actual deficiency, so that additional supplies have to be obtained from Croatia and Vojvodina. On the other hand, the 1%-ell-organized dairying industry permits a considerable export of dairy products. Ljubljana and Maribor are not only centres of this trade but also of a number of minor industries similarly dependent on the extensive rearing of livestock, such as meat-packing, the making of margarine, soap, candles and so forth. Further, the valleys and the margins of the basins yield fruit, including walnuts, chestnuts and grapes, especially in the Drava valley where Maribor carries on a considerable trade in wine of good quality, as well as small fruits.

Forests are not only extensive but include both conifers and such hardwoods as beech, oak. chestnut, etc., and industries dealing with timber are important. Since water power is abundant and coal also occurs, and the forests are widely distributed, many of the industries are of old standing and of the small. scattered type rather than commercialized undertakings. The products, notably furniture, show the influence of localized skill and tradition. Minerals, in addition to coal. are of some importance.

3. The Morava-Vardar Depression.—This not very appropriate name may be given to the region which extends from the southern margin of the Sumadija to the Greek frontier. It is traversed by a series of basins strung along the Morava and Vardar systems and affording a continuous route from north to south. Structurally the region is remarkably complex, for it represents the zone of weakness where the fold mountains of the west and northeast abut upon the central crust block of the peninsula. Instead of the continuous and extensive depression which gave rise to the Pannonian basin to the north, earth movements were limited and localized, producing numerous small basins, originally flooded by water but now largely drained by river action. These basins are floored by soft deposits and are in consequence fertile, containing arable land. With them alternate great mountain masses such as the Kopaonik, Golija. Sar and Crna Gora (north of Skoplje). The two last-named, with the Kacanik pass between them, mark the frontier between Kosovo-Metohija to the north and Macedonia to the south.

Among the more important rivers may be noted the Nisava, a right-bank tributary of the Southern Morava which allows the passage of the railway from Nis to Sofia and Istanbul. The Toplica, a left-bank tributary of the Southern Morava. drains a fertile valley. The long stream of the Ibar has a small headstream, the Sitnica, which drains a part of the productive Kosovo Polje, or plain of the blackbirds, with the town of Pristina. The Ibar itself passes through a wide valley containing the towns of Mitrovica and Raska and enters the Western Morava at Kraljevo (renamed Rankovicevo). In a side valley to the west lies the town of Novi Pazar, which has a large Moslem element.

As regards resources the arable plains and basins produce a considerable variety of crops. becoming more and more southern in type as the Greek frontier is approached. The mountains and uplands allow for a notable development of the livestock industry. Finally the mineral resources are considerable, especially around Skoplje, Veles and Kumanovo. Coal, copper, silver-lead, chrome ore, iron and antimony all occur.

Among the products of the livestock industry is wool of good quality, particularly from the sheep reared on the eastern uplands. This forms the basis of the celebrated carpet industry of Pirot, in the upper Nisava valley, the carpets being noted for their excellent colours and designs.

The crops of Old Serbia or Raska are generally similar to those of the Sumadija, but in Macedonia they are more varied. Thus the Bregalnica valley near Kocani is famous for its rice fields and, near Stip, for opium poppy yielding a high percentage of opium, exported from Salonika. In the Strumica valley farther south, cotton. rice, sesame, tobacco, with much fruit and a variety of other crops, all occur. Gevgelija, the frontier station on the Skoplje-Salonika line, is famous for its silk production and silk factories.

4. The Coastal Belt.—The general geographical interest of this region far exceeds its economic one. Even the name is somewhat deceptive, for parts of the coast are as barren and arid as the karst lands of the interior. Characteristic Dalmatian landscapes are best seen in such areas as the Riviera of the Seven Castles, which stretches from Split to Trogir. forming a narrow, fertile strip about 10 mi. in length, watered by short, spring-fed streams and backed and sheltered by bare and waterless limestone hills; or around Dubrovnik, one of the most perfect examples of the Mediterranean city-state in miniature. The olive grows around Split, but olive oil is imported from Italy.

The coastal belt is for the most part unsuited to cereals, which are grown in the *poljen* of the interior. But the marshy area around the mouth of the river Neretva forms an exception to the general statement. Wine is made and exported. Special products of some interest are the liqueur maraschino, distilled from cherries at Split, Sibenik and Zadar; insect powder made from locally grown and wild pyrethrum, and a variety of substances obtained from the aromatic plants of the maquis. Among the last, rosemary (especially from the islands of Hvar and Vis), sage and noble laurel may be named. Apart from the shrubs, wood is rare.

Minerals are not important. but large beds of cement stones occur near Split and form the basis of a considerable industry using the water power of the short river Jadar, which gushes out of the limestone near by. The water power of the river Krka near Sibenik and of the river Cetina near Omis is also used for such industries as the making of calcium carbide and cyanamide. Fishing is of some importance, especially on the islands, where Vis has a canning industry. The catch includes tunny, sardines, mackerel and crabs and lobsters.

5. The **Dinaric** Karst and Mountain Region.—If the coast of Dalmatia is likely to be estimated too highly, precisely the reverse is true of this region which is less unproductive than it appears at first sight. From the human standpoint the contrasts are striking, for if Dubrovnik and Split are western, with many evidences of a great past, towns like Sarajevo, Mostar and Trebinje are thoroughly eastern in appearance, and the rural population is in many ways highly primitive and backward.

Crna Gora or Montenegro is particularly well fitted for livestock rearing because of the appearance of schists in the mountain belt which lies east of the Zeta valley. There is a better and more permanent water supply and a richer growth of grass there. Cereals, especially maize, with wheat and barley, tobacco and wine are produced in the depressions of the mountain region.

HISTORY

For the history from the earliest times down to 1919 of the countries comprised within Yugoslavia and of the formation of the state itself, consult the following articles: SERBIA; CROATIA-SLAVONIA; BOSNIA AND HERCEGOVINA; MONTENEGRO; MACEDONIA; DALMATIA; ILLYRIA; and BALKAN PENINSULA. The present article deals with the united state, after 1919.

The Parties, 1919–21.—The new state of Yugoslavia emerged from World War I weak and disunited. War casualties had been far higher in Serbia than in the other provinces, but economic hardships had affected all. Countries that not only had different histories, but possessed different currencies and different legal and administrative systems, had to be fitted together. The spirit of social revolt was widespread among the peasants, and the myth of the Russian revolution appealed to workers and intellectuals. The non-Serbian nationalities were at best bewildered, at worst hostile. The only forces that could be relied on to maintain public order were the Serbian army and police, and their actions in many cases increased both social and national discontent. But the forces of revolt were scattered and without leadership. By the end of 1919 the government had established relative stability. By this time, too, a number of political groups could be clearly distinguished.

First were the Serbian parties. The strongest were the Radicals, led by the veteran Nikola Pasic. They still stood in principle for parliamentary democracy, with a certain emphasis on peasant interests. In practice they reflected the interests of the rising middle class rather than those of the peasants, and they stressed above all the interests of state unity. The Radicals were centralists and Serbian nationalists, opposed to all demands of the non-Serbs for autonomy or federalism. They were the party of bureaucracy and of "strong government." The second party were the Democrats, a combination of the Independent Radicals of prewar Serbia led by Ljubomir Davidovic and of the Serbs of former Austro-Hungarian territories led by Svetozar Pribicevic. In principle the policy of the Democrats differed little from that of the Radicals; in practice their emphasis was on liberalism rather than on Serbian nationalism. The two sections of the party were not always agreed; Davidovic was essentially a liberal, while Pribicevic at this time was nearer to Pasic in his conception of a strong united state. The third party, the Agrarians, was the smallest. Its formal program was similar to the other two, but its practical emphasis was on the social interests of the peasants.

In the second category were the non-Serb national groups. Of these, far the most important was the Croatian Peasant party, led by Stjepan Radic. This turbulent and inconsistent man was at this time a champion of the peasant against the towns and the bureaucracy, a republican and an antimilitarist. He believed in unity of all South Slavs, even including in this notion the Bulgarians. He was thus not opposed to the formation of a Yugoslav state; he objected only to the existing state, because it was a monarchy and based on the Serbian army. Among the Slovenes of the northwest, the most culturally advanced of all the Slav subjects of the new state, the strongest group was the People's party led by Msgr. Anton Korosec. Though reserved toward the Belgrade politicians, the Slovenes welcomed the new state as a defense against Italy. The Moslem Slavs of Bosnia formed a group of their own The German minority in Vojvodina and the Albanian minority in the southwest also had their organizations.

The third category was the Communist party. Formed in 1919 by a majority at a congress of Socialist parties of all the territories united in the new state, the Communist party was able to exploit social antagonisms, national discontents and the tendency of the South Slavs—especially of the Serbs—to put their hopes in the U.S.S.R. During 1919 the Communists had strong support among the railway men and in the municipalities of Belgrade and Zagreb.

At the election to the constituent assembly in Nov. 1920, the Democrats won 92 seats, Radicals 91, Communists 58, Croatian Peasant party 50, the rest 128. Radicals, Democrats and Moslems supported a centralist constitution. The Croatian Peasant party refused to take part in the assembly. The centralist draft proposed by the government was carried in June 1921 by 223 votes, with 35 against and 161 abstentions. In the following July the Communist party was banned, after a Communist had assassinated the minister of the interior, Milorad Draskovic. Thereafter the Communists suffered from police repression and also lost the support of those who had earlier placed their hopes in them. In particular, the nationalist discontent in Macedonia, Montenegro and Croatia, which had been an important factor in Communist successes in 1919–20, was exploited by specifically nationalist parties and groups.

Alexander I (*q.v.*), who had been prince-regent of the Serbs, Croats and Slovenes since Dec. 1, 1918, became king on Aug. 16, 1921, at the death of his father, King Peter I of Serbia.

Parliamentary Politics, 1922–28.—The most important issue of Yugoslav internal politics during the period of parliamentary government, which lasted until the end of 1928, was the opposition of the Croats to the centralist constitution. Radic was for a time in prison and then went abroad, first to western Europe and then to the U.S.S.R. His party, which at the parliamentary election of 1923 increased its seats to 70, continued to abstain. Pasic and the Radicals stayed in power with the support of the German and Albanian minority groups. In 1924 Radic and his party returned to parliament, thereby putting Pasic in a minority. For a few months in the second half of 1924 the Serbian Democrat leader Davidovic was premier, and there was some hope both of more liberal government and of an understanding with the Croats. But Davidovic made himself powerful enemies by seriously attempting to investigate corrupt practices of the preceding period. In Nov. 1924 he was dismissed by King Alexander, and Pasic and Pribicevic—who had broken with Davidovic and formed his own party—together continued the centralist policy. In July 1925 Radic suddenly announced his conversion to the monarchy and his admiration for Pasic. A Pasic-Radic government was formed. Real agreement could not be made, however, and in April 1926 this unnatural alliance was dissolved. Soon after this Pasic died, but the Radical party remained in power, with the support of Democrats, Slovenes and Moslems. In 1927 there was another sensational change when the arch-centralist Pribicevic was reconciled with Radic, and their two parties formed a close alliance in opposition.

Thus the two really important issues that underlay Yugoslav politics—the conflicts between Serbian centralism and Croatian federalism and between bureaucratic despotism and democratic government—were confused by the rivalries and maneuvers of the chief personalities. The rivalries were not necessarily petty or ignoble; Pasic was sincerely convinced that only centralism and strong methods could hold the state together; Radic, for all his sudden changes of tactics, was sincerely devoted to the interests of the Croatian peasants and commanded their devoted loyalty; Pribicevic became convinced, by the experience of himself and others, that centralism was the wrong policy and, having made his peace with Radic in 1927, never again swerved from a policy of federalism and of democratic liberties. But the forces were too evenly balanced, and the Democrats, who could have decided the issue if they had joined Radic and Pribicevic, could not choose between their democratic principles and their Serbian nationalism. During 1927 and the first half of 1928 the deadlock continued.

The crisis came on June 20, 1928, when, during a debate in the house, Punisa Racic, a Montenegrin member, shot two Croatian members dead and mortally wounded Radic himself. The Croatian Peasant party and the Independent Democratic party of Pribicevic then left the parliament, and the breach between Croatia and Serbia was complete.

The only person who could hope to bridge the gulf was King Alexander himself. On Jan. 5, 1929, he consulted Radic's successor Vladko Macek and Pribicevic. They proposed a reorganization of the state into seven federal units. This would not only have given the Croats the home rule that they demanded, but would also have separated from Serbia the lands of Vojvodina, Montenegro, Bosnia and Macedonia, which most Serbs regarded as Serbian lands. Finding these proposals unacceptable and having no confidence in the majority of Serbian politicians, the king decided to take all responsibility into his own hands and on Jan. 6, 1929, proclaimed a royal dictatorship.

Foreign Policy, 1919–29.—The most important of Yugoslavia's neighbours was Italy. The withdrawal from Balkan politics of Germany and the U.S.S.R. encouraged Italy to take upon itself the role of chief power in southeastern Europe. The major obstacle in its path was Yugoslavia, successor on the eastern shore of the Adriatic to the vanished Austrian empire. The treaty of Rapallo (Nov. 12, 1920) fixed a frontier which left several hundred thousand Slovenes and Croats under Italian rule in Istria and in the district of Gorizia. The status of Fiume (Rijeka) was another cause of friction until it was settled by a further agreement in Rome in 1924. Italo-Yugoslav rivalry was also fierce in Albania. In 1924 the Albanian exile Ahmed Zogu returned from Yugoslav soil with an army and seized power. But once master of Albania, Zogu showed himself ungrateful to his former patrons and accommodating to their rivals. In 1926 and 1927 he made treaties with Italy which placed Albania in the position of an Italian satellite. Mussolini also gave some support to the extreme Bulgarian nationalists, who had designs on Macedonia and supported the Macedonian terrorist organization on Yugoslav soil—the Internal Macedonian Revolutionary organization (I.M.R.O.). *(See* BULGARIA.) The overthrow of Aleksandr Stamboliski's Agrarian government in Bulgaria in June 1923 had strengthened the influence of the extremists. Mussolini also made himself the patron of Hungarian revisionism, one of whose aims was the recovery of the province of Vojvodina, in which about one-third of the population was Hungarian. The essence of Mussolini's Balkan policy was the encirclement and disruption of Yugoslavia. His final object being Italian domination of the whole Mediterranean, he had first to dominate the Adriatic, and this required the destruction of Yugoslavia, which, though not a great power, was a state strong enough to be a nuisance to Italy, especially if, as was at this time the case, it had friendly relations with Italy's chief European rival, France.

Yugoslavia formed with Czechoslovakia and Rumania, by treaties signed in 1920 and 1921, the alliance known as the little entente, which was directed against Hungary. As Yugoslavia had also a treaty of friendship with France, concluded in Paris on Nov. 11, 1927, it was generally regarded as a member of the French system. The little entente (*q.v.*), however, merely united against one small and demilitarized state three larger and armed states, any one of which could, with little difficulty, have defeated it in the event of aggression; but it offered no defense against any of the three great powers that represented real dangers to the contracting parties as Germany did to Czechoslovakia, Italy to Yugoslavia and the U.S.S.R. to Rumania.

King Alexander's Dictatorship, 1929–34.—Alexander changed the official name of the country from Kingdom of Serbs, Croats and Slovenes to Yugoslavia. He was determined that Serbian, Croatian or Slovene nationalism should give place to a wider loyalty, Yugoslav patriotism. He disliked Serbian nationalism as much as Croatian nationalism and wished to protect the interests of the people, which he believed that he understood better than the politicians. Unfortunately neither of these high aims was achieved; his regime perpetuated the hegemony of Serbia and increased all the abuses of bureaucracy and police repression.

The administrative reorganization of Oct. 1929, which created nine provinces (banovine), with boundaries designed to break up the historic regional divisions, operated to the disadvantage more of the non-Serbs than of the Serbs. The abolition of political parties of a religious or regional nature crippled all political parties, Serb and non-Serb alike. In his choice of political collaborators, Alexander tried to enlist persons of all nationalities. In practice, however, he was unable to detach Croats of any importance irom the Croatian Peasant party, which now assembled under its banners almost the whole Croatian nation; but he was able to recruit individual Serbs of some standing. The result was that Serbian opposition to his regime, though widespread and bitter, was political—the opposition of democrats against dictatorship—while Croatian opposition was national—the opposition of the Croatian nation against Belgrade. The Croatian Peasant party lost much of its original character; it became less a social movement of the peasantry than a nationalist movement in which middle-class lawyers and intellectuals played a larger part than peasants.

The king's first premier, Gen. Petar Zivkovic, quickly resorted to traditional Balkan methods of military and police despotism. A Law for the Deiense of the Realm, which imposed drastic penalties for terrorism, sedition and the propagation of Communism, was so interpreted as to justify arrests and maltreatment of the government's critics. The Communist bogey became the favourite excuse for abuses of power. The dictatorship also dissolved elected local authorities and suspended the irremovability of judges. A law of Jan. 1930 abolished the self-governing bodies of the Moslem religious community in Bosnia. The replacement of Zivkovic by a civilian in April 1932 brought no improvement. The new constitution introduced in Sept. 1931 provided a legal façade for the dictatorship. It was accompanied by an electoral lam which, in conjunction with the ban on religious and regional parties, ensured a large governmental majority.

Opposition to the regime was partly silenced, but was not destroyed. It was most effective, because most united, in Croatia. The misdeeds in Croatia of the gendarmerie—staffed by Serbs—created bitter hatred which was exploited by a group of extreme separatists led by the exiled Ante Pavelic, who received support irom the Italian and Hungarian governments. The great majority of Croats, however, followed Macek and the Croatian Peasant party, with which Pribicevic's Independent Democratic party was still firmly allied. In Nov. 1932 the leaders of the two parties met in Zagreb and published a resolution denouncing the hegemony of old Serbia and demanding that the state be reorganized, the situation of Oct. 1918 being taken as the starting point, so as to ensure that no single nation of Yugoslavia should dominate the others. The principles of the resolution were later approved by representatives of the Serbs of Vojvodina, of the Slovenes and of the Moslems of Bosnia. The government's reply was to intern the Slovene and Moslem leaders and to put Macek on trial under the Law for the Defense of the Realm. He was condemned in April 1933 to five years' imprisonment.

In Serbia the regime was no more popular than in Croatia. The Serbian democratic leaders expressed their sympathy with the demands of the Croats ior democratic liberties. They were divided, however, on the question of Serbian hegemony. Some supported the Croatian proposal for a federal reorganization; others feared that this would cause the state to disintegrate. Even those who accepted federation found it hard to agree with the Croats on the status, in a federal state, of Vojvodina and Bosnia. No Serbian political leader could envisage autonomy for Macedonia.

Throughout the years between World Wars I and II Macedonia was subject to a special regime. The Macedonian dialect could not be used in public, and no Macedonian political party could operate, even before 1929. Under the surface, extremist trends, both Communist and Fascist—the latter supported irom Bulgaria and Italy—had a substantial following.

Under the royal dictatorship Yugoslavia's foreign policy changed little; Italy was still the main danger, France and the little entente were the best iriends. The main difference was a growing friendship for Germany. The Yugoslav-German trade treaty of 1934 was of great advantage to Yugoslavia, whose grain exports could not easily find a market during the slump years 1930–32. As tension grew between Germany and Austria, Yugoslavia showed greater sympathy ior Germany In Belgrade a restoration of the Habsburg dynasty in Vienna was considered a greater danger than an *Anschluss* between Austria and Germany The Balkan entente (*q v.*), with Greece, Rumania and Turkey guaranteeing Balkan frontiers, was created in 1934.

On Oct. 9, 1934, Alexander mas assassinated at Marseilles, France, together with the French foreign minister, Louis Barthou, by a Macedonian terrorist who had connections with Pavelic and with the Italian and Hungarian authorities.

The Regency, 1935–41.—On behalf of Alexander's young son King Peter, the country was ruled by three regents, the first of whom was the former king's cousin Prince Paul. In May 1935 a parliamentary election was held in conditions of greater freedom. Macek had been previously released irom prison. His list of candidates was supported by most of the Serbian opposition. Though the government was able, by familiar methods, to win almost all seats in Serbia, Macek's list had an overwhelming victory in Croatia. Impressed by this evidence, Prince Paul entrusted the premiership to Milan Stojadinovic, a Serbian banker with international connections, who was believed to favour conciliation with the Croats. In Sept. 1935 Stojadinovic formed a new party, the Yugoslav Radical Union (J.R.Z.), composed of a section of the Serbian Radicals, the Slovene People's party and the Bosnian Moslems.

During the two years from the summer of 1935 to the summer of 1937 Macek had sporadic contacts with Prince Paul, with Stojadinovic and with the Serbian democratic parties. Macek believed in the good will of Prince Paul, but distrusted Stojadinovic. In the summer of 1937 a government proposal for a concordat with the Vatican, whose main sponsor was the Slovene leader Korosec, aroused a storm of opposition in Serbia. The Serbian Orthodox Church felt itself threatened and rallied around itself a heterogeneous company. There were Serbian nationalists who feared that through the Catholic Church the Croats would gain a commanding position in the country; there were Serbian democrats who aimed at agreement with the Croats but were glad of any opportunity to attack the government; even the Communists took a hand in the agitation. Since the 7th congress of the Comintern (summer, 1935), the Yugoslav Communists had adopted the policy of a popular front, which in the Yugoslav context meant an alliance of all groups which were against the dictatorship and against Fascism, at home or abroad. This policy had the advantage of coinciding with the feelings of most Yugoslavs. In these years the Communists, who since 1921 had ceased to count except in the negative sense of a bogey to be exploited by the police, recovered ground, not so much among the workers as among the intelligentsia and especially among the students of Belgrade university.

The demonstration by the anticoncordat agitation of the government's unpopularity in Serbia warned Macek that if he made an agreement with Stojadinovic this might later be disowned by the Serbian people. He therefore came to terms with the Serbian democrats and formed with them in Oct. 1937 a United Opposition. This alliance reached the height of its popularity in Aug. 1938, when Macek visited Belgrade and rvas welcomed by great crowds of Serbian townsmen and peasants. It now seemed that only the ill will oi the dictatorship stood in the way of a firm friendship between the Serbian and Croatian peoples. These high hopes mere defeated by international developments.

Under the regency, German influence, first economic and then political, grew in Belgrade. It was partly responsible for the Yugoslav-Bulgarian treaty of Jan. 1937. In May 1934 Damian Velchev's coup *d'état* in Sofia had offered promise of a reconciliation between the two states, but the overthrow of the Velchev group by King Boris and the murder of King Alexander had postponed this hope. Now it received formal fulfillment. But this was no reconciliation between two nations; it was an arrangement between two unpopular and weak dictatorships, made with the blessing of Germany and Italy and valid only so long as Germany and Italy would wish it so. In March 1937 came an Italo-Yugoslav treaty, which represented a temporary reversal of Italy's traditional policy of encirclement and disruption and mas also a concession to Germany. German policy was not to disrupt Yugoslavia but to keep it whole and to make this largest of the Balkan states a dependency of Germany. The Italo-Yugoslav treaty for a time was a real factor in European politics It was cemented by a personal friendship between Stojadinovic and Count Ciano and by Stojadinovic's increasing sympathy for Fascist forms and methods of government. Its most important result was the abandonment in all but name of the little entente Stoiadinovic welcomed the German annexation of Austria in Feb 1938 and made clear to the axis governments during the summer of 1938 that he had no objection to the destruction of Czechoslovakia.

Stojadinovic fancied himself as the Fuhrer of Yugoslavia, and believed himself master of the country But the power really lay with Prince Paul. A parliamentary election in Dec. 1938 gave the governmental J R.Z 54% of the votes and the United Opposition 44% In Croatia Macek was again triumphant. As the danger of mar approached, Prince Paul felt it essential to solve the Croatian question and understood that Stojadinovic mas an insuperable obstacle In Feb. 1939 he replaced him as premier with Dragisa Cvetkovic. The Italian invasion of Albania in April was a further warning. After some setbacks, an agreement with the Croats was achieved before war broke out. The Cvetkovic-Macek compromise of Aug. 1939 set up a single Croatian *banovina,* which included most territories of Croatian population. The administration of this area was placed in the hands of Macek and his party, which was also represented in the central government. The agreement had an uncertain reception in both Serbia and Croatia; the Serbian democrats felt betrayed by Macek, who appeared to have made a deal with the dictatorship at the expense of the Serbian people; and on the Croatian side, though the majority accepted the arrangement, a powerful minority remained implacably opposed to Yugoslavia and hoped that the triumph of German arms and Fascist ideas would enable them to set up an independent Croatian state under their control. The axis powers, distrusting Prince Paul as an Anglophile, renewed their interest in the exiled Pavelic.

World War II.—The Italian invasion of Greece in Oct. 1940 brought war to Yugoslavia's frontiers. Prince Paul, whose sympathies lay with Great Britain, wished to preserve neutrality but decided that he could not withstand axis pressure. On March 25, 1941, Cvetkovic and his foreign minister Aleksandar Cincar-Markovic signed the axis three-power pact. Two days later the government was overthrown by a conspiracy led by officers of the air force. A new government was formed of representatives of the Serbian opposition parties, under Gen. Dusan Simovic. The Croatian and Slovene ministers of the old cabinet remained in the new. Though the sympathies of the new leaders were undoubtedly with Great Britain, they did not want war and tried to convince the axis powers of their loyalty to the pact. But Hitler, who had already had one big disappointment in Yugoslavia when Stojadinovic was dismissed in Feb. 1939 and who now saw the government that after so much trouble he had at last brought into line thrown out in its turn, was not prepared to take any more chances. On April 6 the Germans invaded Yugoslavia from Hungary, Bulgaria and Rumania. In a few days the Yugoslav army, badly led and organized and incompletely mobilized, was routed. The victors carved up the defeated country. Germany and Italy divided Slovenia between them. Italy took part of Dalmatia on its own behalf and the Kosovo district and western Macedonia on behalf of Albania and set up a protectorate over Montenegro. Bulgaria annexed most of Macedonia, Hungary the western half of Vojvodina (Backa) and some small districts on the Croatian border. Pavelic was presented by his patrons with the control of an Independent State of Croatia; this included all Bosnia but not all Dalmatia and was nominally a kingdom, with Aimone, duke of Spoleto, second son of the duke of Aosta, as its absentee sovereign. The rump of Serbia was placed under German military occupation and was allowed from Aug. 1941 to have a puppet government of its own under Gen. Milan Nedic. The eastern half of Vojvodina (Banat) had a separate German military administration, in which members of the local German minority played the chief part.

Armed resistance to the occupation began in Bosnia, and there the Croatian Fascists began a massacre of Serbs which, in the whole annals of World War II, was surpassed for savagery only by the mass extermination of Polish Jews. The Serbs took to the hills and forests to defend themselves. In Serbia itself a force led by the regular army colonel, Dragoljub (Draza) Mihajlovic, fought Germans in the early summer. After Hitler attacked Russia, the Yugoslav Communists, who had already made military preparations, took the field in Serbia and Montenegro. By September a large part of both these lands was liberated by these two forces, which at first helped each other but then came to blows. In November the Germans drove all resistance forces out of Serbia and massacred thousands of people in reprisal.

In the following three years the Communist forces grew, while the forces of Mihajlovic lost ground. One reason was that Mihajlovic came to depend on the support of various Serbian armed units in Italian-occupied territory which fought under Italian command against the Communist partisans. Another was that the partisans attracted thousands to their ranks by their slogan of unity of all Yugoslav nations against the invaders and the traitors. This slogan provided the only alternative to the fratricidal massacres, first of Serbs by Pavelic's Croatian Fascists and then of Croats and Moslems by Serbian nationalist *četnici* (Chetniks) owing allegiance to Mihajlovic. In their liberated territory the Communists, led by Josip Broz, known as Tito, a Croat, built not only an army but a crude civil administration, enlisting local persons of ability and initiative who had played no part in political life under the old regime and now had the opportunity to make careers. The administrative organizations were called people's committees. Though enlisting persons of various political opinions or of none, they were firmly controlled at the top by the Communists. In Nov. 1942 the Communists announced the creation of a provisional legislative body, the Anti-Fascist Council of National Liberation of Yugoslavia (A.V.N.O.J.), and, a year later, of a provisional government.

From the summer of 1943 the British Mediterranean command had had liaison missions with the partisans, and the British and U.S. governments now made efforts to reconcile Tito's authorities with the Yugoslav government and king in exile. In Jan. 1942 the exiled government had appointed Mihajlovic its war minister. Reconciliation between Tito and the exiles would have required the abandonment of Mihajlovic, with whom Tito was engaged in a civil war no less bitter than his national war against the invaders. The exiles refused to abandon Mihajlovic until June 1944, when Ivan Subasic, who had been governor of the Croatian *banovina* from 1939 to 1941, was appointed premier by the king The entry of the Soviet army into Serbia in Oct. 1944 and the increasingly arrogant tone of Tito toward the western powers made it clear that there would be no reconciliation but only a surrender by the western powers to Tito. Formal respectability was given to the surrender by the formation in Jan. 1945 of a regency, to which King Peter transferred his powers, and by the return to Yugoslavia of Subasic and some other exiled political leaders.

Communist Yugoslavia.—The new government ruled in the name of the People's Front, the political body created during the resistance and allegedly representing all social classes and shades of political opinion. In fact all power was held by the Communists, among whose leaders the former university students of the 1930s were numerous. Army and police were firmly held by the Communists, and a totalitarian dictatorship was extended to the whole country. The returning democratic exiles had no power within the cabinet and had no choice but to resign. By Nov. 1945 they were deprived of any means of public expression of their views. The election to a constituent assembly, on Nov. 11, was of the Soviet one-list type. The subservient assembly proclaimed a republic on Nov. 29, 1945, and passed the new constitution on Jan. 31, 1946. Its main feature was the creation of six constituent republics: Serbia, Croatia, Slovenia, Bosnia-Hercegovina, Montenegro and Macedonia. Vojvodina and the Albanian-inhabited Kosovo-Metohija district were autonomous provinces within the Serbian republic. This was not a federal regime, for the republics were subordinated in all matters to the central government, as under the Stalin constitution of 1936 for the U S.S.R., of which the Yugoslav document was a faithful copy. Decentralization in matters of language and personnel was accompanied by the extreme centralization of the state bureaucracy and of the Communist party which controlled it. Of the six republics, the one that gained most was certainly Macedonia, whose people were for the first time allowed to use their language in public and to call themselves Macedonians.

Tito's foreign policy was one of extreme subservience to the U S.S.R. and extreme hostility to the western powers, not only on account of Trieste—which was occupied by western troops and which Tito wished to annex—but also on general ideological grounds. Relations with the Vatican became extremely strained when, on Oct. 11, 1946, the Roman Catholic archbishop of Zagreb, Aloysius Stepinac, was sentenced to 16 years' imprisonment for having collaborated with Pavelic during the war. Relations with the eastern and northern neighbours, whose countries were occupied by the Soviet army, were outwardly good. This was especially the case with Bulgaria, with whom the ancient dispute about Macedonia was declared to be solved.

In June 1948, however, the Cominform denounced Tito for various heresies, and this excommunication was followed by violent propaganda campaigns from Moscow and the Soviet satellite capitals and by a commercial boycott, which became complete in the summer of 1949. The underlying cause of the breach was the fact that, in contrast to those of the neighbouring satellite states, the army and civil bureaucracy of Yugoslavia had been created not by emissaries of Moscow but by the Yugoslav Communists themselves during the national and civil war and were therefore considered in Moscow to be unreliable This was also the cause of the regime's survival; the first loyalty of army officers and civil bureaucrats was to Tito, not to Moscow

The Soviet boycott caused Tito to seek economic aid from the United States and from western Europe. This led to some modification of his economic policy and to a certain mildness in the political regime itself. Economic management and even political administration were decentralized, and elected workers' councils were given large powers. In 1952 a new constitution was prepared (see *Government, Administration and Defense).* All political and economic hierarchies continued to he controlled by the Communist party, which was as rigidly centralized as ever (G. H. N S.-W.)

Tito's state visit to Great Britain in March 1953 was followed by similar visits to Turkey in April 1954 and to Greece in June 1954, resulting in the signature of the Balkan alliance between the three countries on Aug. 9 at Bled, Yugos. The signature in London, on Oct. 5, 1954, of the Italo-Yugoslav agreement on Trieste removed the main obstacle to co-operation between the two Adriatic states.

The year 1955 was eventful because on May 26, N A Bulganin, the Soviet prime minister, and N. S. Khrushchev, the first secretary of the Communist Party of the Soviet Union, arrived in Belgrade to improve their country's relations with Yugoslavia, and a joint statement affirmed the principle of coexistence. On Nov 6, 1955, John Foster Dulles, the U S. secretary of state, visited Tito at Rrioni In June 1956 Tito paid an official visit to the Soviet Union Yugoslav-Soviet relations did not, however, develop satisfactorily, so Khrushchev visited Belgrade again on Sept. 19, and Tito flew back with him to the Crimea on Sept 27 But the Hungarian revolution strained Yugoslav-Soviet relations once more. Moscow decided to delay for five years the credit of $110,000,000 promised in Jan 1956; a joint Soviet-Eastern German credit of $175,000,000 promised in Aug. 1956 was also "postponed" (see *Industrialization).*

In Sept 1957 Wladyslaw Gomulka, first secretary of the Polish United Workers' (Communist) party, visited Yugoslavia and on this occasion the Yugoslav government recognized the Oder-Neisse line as the "only possible frontier between Poland and Germany." In September Yugoslavia recognized the German Democratic Republic. This caused the German Federal Republic to sever its diplomatic relations with Yugoslavia. In Nov. 1957 Tito was absent irom the celebrations of the 40th anniversary of the Communist revolution in Moscow and the Yugoslav delegation declined to sign the declaration of the 12 Communist parties representing the Communist states.

In Jan. 1935 Milovan Djilas and Vladimir Dedijer, two of Tito's innermost circle since 1941, were tried for hostile propaganda against the state. In 1954 Djilas' writings had been repudiated and Dedijer, who had come to his deiense, was dismissed from his post as editor of the daily newspaper *Borba*. Both men received suspended sentences, but after Djilas had praised the Hungarian revolution in an article in the U.S. weekly *New* Leader in Oct. 1956 he was sentenced to three years' imprisonment. Following the publication of his book The *New* Class in New York in Aug. 1957, he was tried again and sentenced to an additional seven years.

Elections were held on March 23, 1958, ior a new iederal people's assembly which, on April 17, re-elected Tito as president of the republic. From April 22 to 26 the 7th congress oi the League oi Communists was held at Llubljana. It was criticized in the Soviet and Chinese press as being revisionist of hlarxist-Leninist doctrine. Tito was again in disgrace with Moscow because Yugoslavia refused to join the Warsaw treaty powers and to follow Soviet leadership.

TERRITORY AND POPULATION

Yugoslavia is divided into six iederal republics. These are listed in Table I with their areas and populations. (See also separate articles.)

TABLE I.—Areas and *Populations*

Federal republics	Area (sq. mi.)	Population		
		1931	1953	1961
Serbia*	34,116	5,795,724	6,979,154	7,629,113
Croatia	21,829	3,360,459	3,941,817	4,148,122
Slovenia†	7,819	1,144,298	1,505,425	1,584,368
Bosnia-Hercegovina	19,741	2,323,555	2,817,790	3,274,886
Macedonia	9,928	949,958	1 , 3 0 5	1,404,883
Crna Gora (Montenegro)	5,333	360,044	119,873	471,133
Total	98,766	13,934,038	16,998,573	18,512,805

*Including the autonomous province of Vojvodina (area, 8,303 sq.mi.; pop. [1961] 1,851,448) and the autonomous region of Kosovo-Metohija (area, 4,203 sq.mi.; pop. [1961] 963,565). †Including Zone B of the former Free Territory of Trieste.

Between World Wars I and II Yugoslavia occupied an area of 95,446 sq.mi. The country was enlarged by 3,623 sq.mi. by the peace treaty between the Allies and Italy signed in Paris on Feb. 10, 1947, the increase including the acquired territory oi the Julian March, the Italian enclave oi Zadar (Zara), and the islands of Cres (Cherso), Losinj (Lussin), Lastovo (Lagosta) and Palagruza (Pelagosa), After the partition of the Free Territory of Trieste between Italy and Yugoslavia on Oct. 5, 1954, a iurther area of 202 sq.mi. was added to Yugoslavia. The population was 11,984,911 in 1921 and rose to about 15,703,000 by Jan. 1940. It was estimated that 1,700,000 oi the population was lost during World War II. Nevertheless the 1948 census revealed a total of 15,372,098. The 1953 census showed the population to be 16,998,573, and by 1961 the number had risen to 18,512,805. The birth rate was 25.7 per thousand in 1956, that is, almost the same as in 1939 (25.9 per thousand), but the death rate decreased from 14.9 per thousand in 1939 to 11.1 per thousand in 1956. The average annual natural population increase during the period 1952–56 was 16.4 per thousand, after Poland the second highest in Europe.

Serbia.— Together with the autonomous regions of Vojvodina and Kosovo-Metohija, Serbia is the largest iederal republic and its capital, Belgrade, is also the capital of Yugoslavia. The Serbian republic proper is, in fact, the kingdom of Serbia within the irontiers of 1878 with the addition oi the province oi Kovi Pazar, which was Turkish until 1912. With the exception oi a Rumanian-speaking minority of about 30,000 in the northeastern corner of the country and about 60,000 Bulgars in the Pirot area, the population oi the republic is purely Serbian; almost all its inhabitants are Orthodox.

Vojvodina is a province composed of parts of territories which were Hungarian beiore 1918: Backa between the Danube and Tisza rivers, the western part oi the Banat and Srem lying between the Danube and the Sava rivers. The majority of the population (1,712,619 in 1953) are Serbs and are either Orthodox or Roman Catholic. About 500,000 Magyars comprise the strongest national minority, and there are also about 50,000 Germans (one-sixth oi the prewar number); both are mainly Roman Catholic, but there is also a Protestant minority. The Rumanians, who inhabit the Yugoslav region of the Banat, number about 34,000 and are Orthodox.

Four out of the 18 towns of Yugoslavia with a population of more than 40,000 (see Table II) are in Vojvodina: Novi Sad, the provincial capital, Subotica, Pančevo and Zrenjanin.

The autonomous region of Kosovo-Metohija (pop. [1961] 963,565), with its capital Pristina (pop. 40,071), has a mixed population in which the Albanians outnumber the Serbs by three to one. The Serbs are Orthodox, the Albanians are mainly Moslem.

Croatia.— This iederal republic is composed of Croatia proper, which until 1918 was attached to the kingdom of Hungary; of Dalmatia,

TABLE 11.—Towns *of More* Than 40,000 Inhabitants

Town	1931	1961	Town	1931	1961
Belgrade	266,849	587,899	Niš	35,465	81,076
Zagreb	185,581	427,319	Subotica	100,058	74,433
Skoplje	68,334	161,983	Osijek	40,337	71,843
Sarajevo	78,173	142 423	Banja Luka	22,165	50,463
Ljubljana	59,767	133,386	Bitola	33,024	49,101
Novi bad	63,985	102,385	Zrenjanin†	32,831	48,956
Rijeka*	....	100,339	Kragujevac	27,208	44,271
Split	43,711	99,462	Pančevo	22,089	40,740
Maribor	33,331	82,387	Priština	....	40,071

*Before World War II Rijeka (Fiume) was part of Italy (pop [1936] 53,896); Susak, a suburb of Rijeka, was part of Yugoslavia (pop. [1931] 16,111). †Formerly Nagybecskerek, Veliki Beckerek or Petrovgrad.

which was part of the empire of Austria, and of the greater part of Istria, Austrian until 1918, and Italian between World Wars I and II and assigned to Yugoslavia in 1947. The population is Croatian and Roman Catholic. Serbs and Croats share the same language, described by linguists as Serbo-Croatian; the Croats use the Latin alphabet, but the Serbs use Cyrillic. The capital oi Croatia is Zagreb; other important cities are Rijeka, Osijek, Split and Dubrovnik (pop. [1961] 22,961).

Slovenia.— The population of the republic of Slovenia is predominantly Roman Catholic and highly westernized, but the Slovene language, also using the Latin alphabet, differs irom the Serbo-Croatian. Occupying an area subjected to German and Italian political and cultural pressure, great numbers of Slovenes were germanized in Carinthia and Styria, italianized in the Julian March and even magyarized north of the Mur river. Prekmurje, a small area until 1918 part of Hungary, was attached to Slovenia in 1920. In 1954 Zone B and a iew villages of Zone A of the iormer Free Territory oi Trieste were incorporated into Slovenia. The capital of the republic is Ljubljana; other important cities are Maribor and Celje (pop. 119611 16,487).

Bosnia-Hercegovina.— Nominally Turkish until its annexation by the Habsburg monarchy in 1908. Bosnia-Hercegovina was administered by the Austro-Hungarian government aiter 1878. Bosnia-Hercegovina is the only one of the six component republics which is not established on a dominant nationality basis. The population is mostly of pure Slavonic stock: about two-fifths are Moslems. The remaininn three-fiiths are Christians in the proportion roughly oi two Orthodox to one Roman Catholic At the 1948 census, 1,136,116 inhabitants (44 3%) declared themselves as Serbs, 614,123 (24%) as Croats and 788,403 (30 7%) as Moslems The capital of Bosnia-Hercegovina is Sarajevo, where a new university was founded in 1946, and other important towns are (pop 1961): Banja Luka (50,463), Mostar (35,242), Tuzla (37,673) and Zenica (33.271)

Crna Gora (Montenegro).— This is the smallest of the federal republics both in area and population, with the lowest number of inhabitants per square mile. Until 1918 it was an independent kingdom Although its population is Serbian and Orthodox, its incorporation into Yugoslavia in 1918 would have been more difficult than it was, had not the last king, Kikola Petrovic-Kjegos, attempted to negotiate with Austria-Hungary during World War I In 1945 the town and the fjord of Kotor were incorporated into the territory of Crna Gora Its capital was transferred irom hardly accessible Cetinje to Titograd (iormerly Podgorica; pop. [1961] 29,100), which was later linked by a narrow-gauge railway via Niksic with Dubrovnik and Sarajevo

Macedonia.— The most successful results of Yugoslav iederalism are to be iound in Macedonia. Liberated irom Turkish rule in 1912–13, it was partitioned between Serbia, Greece and Bulgaria With the exception of the district of Strumica, which Bulgaria ceded to Yugoslavia in 1919, the 1913 partition remained and was confirmed by the 1947 settlement In Yugoslav Macedonia the population is mixed, but the Macedonians are in the majority (about 850.000 in 1953); there were also about 180,000 Albanians and 150,000 Turks.

In 1945 Macedonia became one of the six constituent republics of iederal Yugoslavia Its national language is Macedonian, akin to Bulearian and Serbian and written ın the Cyrillic alphabet In 1946 a hlacedonian university was founded in Skoplje, the capital (in Macedonian, Skopje).

Nationalities.— Before World War II the kingdom of Yugoslavia was ruled bv the Serbs as a kind of Greater Serbia. Official statistics described the Macedonians as southern Serbs and there was a difference of opinion between the Serbs and the Croats as to the nationality of the Bosnian Moslems. During World War II, when Bosnia was part of the Croatian state backed by the Axis powers. Croats and Serbs engaged there in a fratricidal war. The Yugoslav iederal system introduced in 1945 smothered those embers of racial and religious hatred.

The official 1953 analysis of national minorities grouped in Table III under "others" was as iollows: Albanians 754,245; Magyars 502,-175; Turks 259,j3j; other Slavs (Slovaks, Bulgars, Czechs, Ukrainians, Russians and Poles) 235,992; other non-Slavs (Italians, Germans, Vlachs, Rumanians, Gypsies and Jews) 287,076; undeclared 4,550; other 6,389

Religion.— According to the 1931 census religious divisions mere as follows Orthodox 6,785,301 (48 7%); Roman Catholic 5,217,847 (37.45%); Protestant 231,169 (1.66%), other Christian 68,152 (0.49%); Moslem 1,561,166 (11.2%); and others 70,203 (0.5%). No

TABLE III.—*Nationalities* in Yugoslavia

Groups	1931*		1948		1953	
Serbs	5,574,000	40.0%	6,547,117	41.5%	7,065,923	41.8%

*Estimate based on 1921 census. †Mainly Bosnian Moslems in 1931 and 1948, "Yugoslavs" in 1953.

Sources: Royaume de Yougoslavie, Statistique Générale d'État, *Résultats définitifs du recensement de la population du 31 mars 1931*, vol. i-ii (Belgrade, 1937–38); F.P.R. of Yugoslavia, Federal Statistical Office, *Population. by Ethnic Nationality, 1948* (Belgrade, 1954); *Statisticki Godisnjak F.N.R.J., 1957*.

questions about religion were asked at the 1948 census, but the following semiofficial estimate was published in 1954: Orthodox 49.53%; Roman Catholic 36.7%; other Christian 1.14%; Moslem 12.52%; Jewish 0.04%; other 0.07%. In the 1953 census to the inquiry as to religion 13.6% of the population declared that they had none.

Equality of status is granted to all recognized religions, and the churches are separated from the state. Although church revenues are provided by the state, the Communist attitude is that, as the churches are reactionary, a struggle against them is inevitable.

The self-governing Serbian Orthodox Church is ruled by a patriarch and a holy synod. Established in 1346, the Serbian patriarchate, after suppression by the Turks in 1766, was reconstituted on Sept. 12, 1920. The seat of the patriarch is in Belgrade. By 1940 there were 21 bishoprics (the bishops of Cetinje, Sarajevo, Skoplje and Zagreb having the rank of metropolitan), 3,021 parishes and 206 monasteries. In 1950 the Orthodox Church of Macedonia was made independent of the Serbian patriarchate.

The Roman Catholic Church is divided into three provinces: Belgrade with two suffragan sees, Sarajevo with two and Zagreb with four and jurisdiction over the Uniate bishop of Krizevci. In 1940 there were 1,971 parishes and 349 monasteries or convents.

The Moslem Religious union is headed by a *reis-ul-ulema* whose seat is at Sarajevo.

Education.—The Communist regime proclaimed the raising of the general education level as one of its major concerns. The constitution provides for compulsory elementary education at the expense of the state; schools are separated irom the churches and private schools are prohibited.

The system of education is propagandist in character, and emphasis is on technical rather than humanistic training. With these reservations in mind, it must be recognized that considerable progress was made in the first nine years after the liberation. The proportion of illiterates (48.6% in 1921 and 44.6% in 1931) was reduced to 24.9% in 1953.

TABLE IV.—*Education, 1938–39* and *1955–56*

Schools	1938–39			1955–56		
	No	Pupils	Teachers	No.	Pupils	Teachers

There were universities at Belgrade, Zagreb, Ljubljana, Skoplje and Sarajevo.

GOVERNMENT, ADMINISTRATION AND DEFENSE

The kingdom of the Serbs, Croats and Slovenes, formed on Dec 1, 1918, received its constitution on May 12, 1921. Modeled on that oi Belgium, this provided that laws passed by the unicameral legislature, the *skupština,* were not subject to the crown veto. Deputies elected on a basis of proportional representation served for four years. Because oi the illiteracy of hali the population, the prevalence of local patriotisms and the absence of a tradition of democratic participation in the government, the constitution proved unworkable.

A new constitution, promulgated on Sept. 3, 1931, reserved to the king the right to suspend it whenever public order was threatened. The king became commander in chief oi the armed forces, appointed and dismissed ministers, promulgated laws and safeguarded the unity of the state. A bicameral legislature was introduced. The members of the senate were elected for six years, hali of them being re-elected every three years; the king had the right to nominate a number of senators equal to the number elected. The members of the *skupština* were elected for four-year terms on the basis oi universal suffrage by open ballot. The new constitution failed to stabilize the situation; the Croats in particular continued to press for political equality and the decentralization of Yugoslavia into a federal state.

A third constitution was promulgated on Jan. 31, 1946, by a constituent assembly elected on Nov. 11, 1945, in which the Communist-controlled People's Front had an overwhelming majority. Yugoslavia became a iederal people's republic with a federal people's assembly (*savezna narodna skupština*) consisting of two chambers, the iederal council (*savezno veće*) representing the interests of all citizens and the council oi nationalities (*veće* naroda) representing the interests of each federal unit. The real power was vested in a supreme presidium of 39 members, headed by a chairman. Justice mas administered by people's courts, from whose verdict there was no appeal excent to the supreme presidium.

On Jan. 13, 1953, both houses of the national assembly adopted by acclamation the fourth constitution. This, is was claimed, was based on a return to original Marxist teachings in order to avoid a reversion to state capitalism, as had happened in the Soviet Union.

The federal national assembly remained bicameral. The iederal council of 352 deputies (instead oi 405) was composed of two kinds oi members: 282 were elected by secret, universal suffrage; in addition, 60 were elected to the federal council by the republican councils of the six republics, 6 by the provincial council of Vojvodina and 4 by the regional council oi Kosovo-Metohija. If legislation were to be introduced affecting relations between the republics as laid down in the constitution, the last-named 70 deputies might segregate themselves and sit as the council oi nationalities. An innovation was the producers' council (vete *proizvodača*), the new second chamber of 202 members elected by organized industrial workers, artisans and peasants in proportion to each group's contribution to the country's total production. Both chambers mere elected ior four years.

No political organizations existed other than the Socialist Alliance of Working People and the League of Communists of Yugoslavia, but under the electoral law promulgated in May 1953 it mas theoretically possible for individuals of independent views to be elected. The League of Communists was the name for the Communist party adopted at its 6th congress held at Zagreb in Nov. 1952. Between 1952 and 1956 its membership fell from 779,382 to 624,806. In April 1958 it rose again to 755,055.

The presidium of the national assembly was superseded by the federal executive council of 37 members elected from the ranks of the iederal council; it was the assembly's supreme executive organ and the seat of political government. On the national assembly rested responsibility ior electing a president of the republic who mould preside at meetings of the executive council and assume direction of the armed forces as commander in chief. There mas no cabinet or council of ministers, and federal administration consisted of the five state secretariats of foreign affairs, defense, internal affairs, national economy and the budget.

The internal administration of six federal republics and two autonomous units was not defined in the new constitution, which, however, stated that these would be organized according to the basic principle of the government of the federation.

Defense.— Yugoslavia before 1941 was divided into six army commands (Novi Sad, Sarajevo, Skoplje, Zagreb, Nis and Mostar) with 16 infantry and 2 cavalry divisions. The peacetime strength of the army in 1938 was 9,245 officers, 9,883 senior noncommissioned officers and 115,000 corporals and other ranks. The air force had a total of 535 first-line aircraft. The navy comprised one small cruiser serving as training Lip, one flotilla leader, sir torpedo boats, eight motor torpedo boats and four submarines. The total active service strength of the navy comprised 580 officers and 7,200 men. Even had it been adequately armed. the royal Yugoslav army would have had no chance in face of-the attack on April 6, 1941, by the Germans advancing from Austria, Hunrary and Bulgaria and bv the Italians invading Dalmatia. It disintegrated in ten days.

A new armv, controlled bv the Yugoslav Communist party, was born of the resistance. With British and US. help in war matériel and with weapons seized from the Italians after the events of July–Sept 1943, Marshal Tito was able to build a national liberation army which by May 1945 had grown to 51 Soviet-type divisions.

After the war a new peacetime army of 30 infantry and 2 armoured divisions was formed. In 1958 there were four army commands (Belgrade, Zagreb, Sarajevo and Skoplje). The standing army comprised 2j infantry divisions, 3 armoured divisions and 4 armoured brigades, 4 mountain brigades and 1 parachute brigade, the total effectives amounting to 253,000. The air force had about 600 aircrait, part of them U S. jets. The navy had 2 destroyers, 4 frigates, 2 submarines and about 60 small craft. The total effectives of the armed forces, including the security troops, mere estimated at about 400,000. The League of Communists controls the armed forces, and almost 90% of the officers and 70% of other ranks were party members.

Even before the crisis of June 1948, supplies of tanks, modern artillery and aircraft from the Soviet government were inadequate. The economic blockade started in 1948 by the Soviet Union and its satellites made difficult the creation of a Yugoslav armament industry. Nevertheless, in March 1951, Col. Gen. Ivan Gosnjak, secretary of state oi national defense, announced that the country had about 47 armament factories

On Nov. 14, 1951, an agreement provided that the United States would supply Yugoslavia with mar matériel. Great Britain, too, was supplying military equipment. On Dec. 16, 1957, a joint communiqué announced that the U.S. military aid to Yugoslavia was terminated. It was disclosed at the same time that from 1950, excluding the economic aid (see Foreign Trade below), the United States had given Yugoslavia about $1,000,000,000 worth of military matériel including cannon, tanks, aircraft and engineering equipment. The defense budget for 1956 was reported at 157,457,000,000 dinars, or 44% of the total expenditure.

NATIONAL ECONOMY

Not without reason the leaders of Yugoslavia aiter World War II described their country's prewar national economy as among the most backward in Europe. They embarked on a policy of collectivization of agriculture and of industrialization. Comparison 12 years later with Yugoslavia's prewar national economy showed that the social structure of the population had considerably changed, that the mining and manufacturing industries had made great progress, but that agriculture had remained at a standstill and crops were even less than before the war.

The total population of the country rose between 1939 and 1957 by about 2,500,000. The number of persons employed in the economy, excluding agriculture, rose from 652,000 in 1946 to 2,171,000 in 1956.

Agriculture.— Prewar Yugoslavia was a land of small peasant property. Out of 1,986,000 holdings only 6,800 exceeded 50 ha. and these occupied 7% of all agricultural land. Of the holdings 68% averaged about 2.2 ha., which did not offer the minimum conditions for subsistence. As well as 1,348,000 holdings with insufficient land, there were 490,000 families of landless agricultural workers. The 1945 land reform abolished all the large estates and limited peasant holdings to a maximum of 4; ha. of agricultural land, including from 25 ha. to 35 ha. of arable land. About 797,400 ha. were distributed. In view of the fact that in 1945 there were 106 inhabitants for every 100 ha. of agricultural land, no agrarian reform could solve the problem of the population surplus in the countryside. Industrialization opened vast possibilities for employment, but, at the same time, much damage was done to agricultural production by enforced collectivization. Under its 1947–51 five-year plan the government intended to collectivize 50% of the land.

In 1951 there were 6,694 producers' co-operatives (zadruga, pl. zadruge) in which were grouped 429,784 peasant holdings totaling 2,595,000 ha. Including the state farms (*državna* dobra), collectivized land covered 36.1% of the total agricultural land. But, as the peasants resisted collectivization, the sown area mas on an average 237,000 ha. less during 1949–53 than before 1939.

By a series of decrees the government revised its agrarian policy. In 1951 it authorized the dissolution of the zadruge where conditions were unsuitable for collective farming. In 1953 it abolished the compulsory annual purchase by the state of cereals from the peasants. Individual peasants and *zadrugari* were thereafter entitled to dispose of their produce on the free market. In 1953 a decree permitted the liquidation of any zadruga where the majority desired it. In 1953, in order to save its face, the government promulgated a new land reform laying down an upper limit of 10 ha. for private holdings. After abandoning the policp of collectivization, the government decided in 195; to raise the price of bread, fats and tobacco as part of a program of incentives to farmers.

In 1956 all agricultural land was estimated at 15,000,000 ha., including 12,057,000 ha. of cultivable land and about 7,600,000 ha. of arable land. At the end of 1956 only 3.2% of cultivable land was included in three categories of *zadruge*. In addition, 5.8% of cultivable land belonged to three categories of state farms. (See Table V.)

TABLE V.—Agricultural Holdings, *1956*

	No.	Area (in ha.)
Collectivized sector:		
State farms	914	586,000
Farms of agricultural institutions and schools	456	110,000

Industrialization.— Yugoslavia's natural resources offer great possibilities of industrialization. After Norway, it has the greatest unexploited reserves of hydroenergy in Europe. A considerable electrification program was drawn up in 1946.

Large deposits of coal and lignite occur in many parts of the country, but until World War II it was believed that there was no coking coal. The discovery of a coke-producing process for medium-hard and brown coal enabled the government to build two coking plants, one of which started production in 1952. Since iron ore of good quality also occurs in vast quantities near the suriace at Vares and Ljubija in Bosnia and at Topusko in Croatia, a sound basis was available for a national iron and steel industry.

There are deposits of crude oil in Croatia and Bosnia. Extraction started on a small scale beiore World War II, and by 1957 it had reached 394,000 tons.

Nonferrous ores assure Yugoslavia of a prominent place among European producers. It is one of the richest countries in deposits of high-quality bauxite, mainly in Dalmatia and Hercegovina. An aluminum foundry at Strnisce started production in 1953. Bor, in northeast Serbia, has the largest copper mine and foundry in Europe, and four-fifths of the Yugoslav lead output comes from Trepca in Kosovo-Metohija province.

The ambitious five-year plan 1947–51 had to be abandoned when the Soviet government started the economic boycott of Yugoslavia. A new five-year plan 1957–61 was adopted by the federal people's assembly on Dec. 4, 1957. It provided for raising agricultural production by 42.7% and industrial production by 68%; employment in the economy, excluding agriculture, would be brought to 2,880,000. (*See* Table VIII.)

Among many new projects the 1957–61 plan foresaw the construction of a synthetic nitrogen plant, a superphosphate factory, a thermal power station of 100,000 kw. installed capacity, as well as modernization of three existing coal mines. On Jan. 12, 1956, the U.S.S.R. assumed the obligation to supply the necessary equipment for these projects to the amount of $110,000,000. Another project was the construction of a large aluminum plant. On Aug. 1, 1956, the Soviet and German Democratic governments jointly undertook to equip this plant and granted to this effect a credit of $175,000,000. On May 27, 1958, however, the U.S.S.R. iniormed Yugoslavia that both credits had to be "postponed" for five years.

Foreign Trade.—As a result of a Soviet and satellite blockade of Yugoslavia, all trade with this part of the world ceased in 1949, but the aid supplied by the United States, the United Kingdom and France helped bridge the gap. As can be seen from Table IX, the total deficit in Yugoslavia's foreign trade for the years 1951–54 amounted to $975,107,000, of which $698,553,000 or 71.6% was covered by foreign aid (mainly U.S.).

The main sources of Yugoslav imports in 1956 were: United States (27.3%), U.S.S.R. (14.9%) and the German Federal Republic (10%). The main destinations of exports were: the German Federal Republic

(15.3%), Italy (14.2%) and Rumania (13.1%). In 1956, 31.8% of Yugoslav imports mas represented by foodstuffs, 19.9% by machinery and transport equipment, 15.9% by raw materials (mainly textile fibres) and 9.9% by mineral fuels and lubricants. Exports consisted of manufactured goods (27.6%), foodstuffs (25.7%), raw materials (23.7%), and beverages and tobacco (8.1%).

Transport and Communications.— The contour of the land and the distribution of cultivated land and consequently of population explain the fact that communications are satisfactory only in the north of the country. In 1939 there were 9,647 km. of railway; in 1956 there were 11,735 km., including 2,909 km. of narrow-gauge track. The most important lines built after World War II were the Samac-Sarajevo standard-gauge line and the Trebinje-Niksic-Titograd narrow-gauge line. Highways in 1955 totaled 81,681 km., including 3.359 km of concrete or asphalt and 48,389 km. of macadamized roads. In 1956 there were 14,664 motor cars, 21,112 trucks and 2,705 buses.

In Jan. 1957 the Yugoslav merchant marine had 222 vessels totaling 325,373 gross registered tons, as compared with 410,000 g.r.t. in 1939 and 137,800 g.r.t. in 1945. Among the Yugoslav seaports Rijeka is the largest: in 1956 its turnover of merchandise was 3,693,000 metric tons, including 746,000 tons in exports.

Air transport figures (Yugoslav airways only) in 1956 were (1939 in parentheses): flights 7,084 (2,776); km. flown 3,101,000 (623,000); passengers carried 93,914 (12,687); passenger-km. 47,574,000 (3,627,-000); freight. ton-km. 779,000 (70,000).

In 1956 Yugoslavia had 160,609 telephone subscribers and 710,694 licensed radio receiving sets.

Finance and Banking.— After liberation in 1944-45, there were seven legal currencies: Serbia had its dinars, Croatia its kunas, while in the areas annexed by greater Germany, Italy, Hungary, Bulgaria and Albania there were reichsmarks, lire, pengos, levas and leks. Under the conversion scheme put into force between April and June 1945 a new dinar was introduced and exchanged at 20 old dinars for 1 new; Croatian kunas were converted at 40 to 1 and later at 100 to 1; 100 lire were exchanged ior 30 new dinars, pengos at 1 to 1 and leks at 2 to 1 dinar.

The total value of old currencies exchanged amounted to more than 250,000,000,000 old dinars, as compared with a total circulation of 13,834,000,000 in 1940. The maximum amount which could be paid out in cash to any one holder was fixed at 5,000 new dinars, the balance being blocked for three months and subjected to a special graduated levy. The amount of new notes issued as the result of conversion was about 6,000,000,000 dinars. The official exchange rate was fixed at 50 dinars to the U.S. dollar. By Dec. 1951 the currency circulation amounted to 39,640,000,000 dinars, and on Jan. 1, 1952, the dinar mas devalued to one-sixth of its rate. This raised the exchange rate in Yugoslavia of the U.S. dollar to 300 dinars and of the pound sterling to 840.

In Dec. 1957 currency circulation was 126,000,000,000 dinars and deposit money 244,000,000,000 dinars.

YUKAWA, HIDEKI (1907–), Japanese physicist who won the Nobel prize for physics in 1949 for investigations in theoretical physics, especially the theory of elementary particles (*see* PARTICLES. ELEMENTARY: *Breakdown of Electrodynamics; Mesons*). He was born Jan. 23, 1907, in Tokyo. He graduated from Kyoto university in 1929. In 1935, while a lecturer at Osaka university: he proposed a new theory of nuclear forces in which he predicted the existence of mesons. or particles that have masses between those of the electron and the proton.

The discovery of one type of mesons among cosmic rays by U.S. physicists in 1937 suddenly established Yukawa's fame as the founder of meson theory, which later became an important part of nuclear and high energy physics. After devoting himself to the development of meson theory, he started work in 1947 on a more comprehensive theory of elementary particles based on his idea of the "nonlocal field."

Yukawa was professor of theoretical physics at Kyoto from 1939 to 1950 when he became emeritus, and in 1953 he was made director of the newly created Research Institute for Fundamental Physics there.

He was visiting professor at the Institute for Advanced Study, Princeton. N.J., 1948–49, and at Columbia university, New York city. 1949–53.

In 1946 Yukawa founded a new journal in English, *Progress of Theoretical Physics.* (Y. N.)

YUKON RNER. The headwaters of the Yukon river gather in a group of lakes on the border between the Yukon Territory and British Columbia in Canada. Its length of 1,979 mi. makes it the fifth longest river system in North America. For about 700 mi. of its length it crosses southern and western Yukon Territory; it then flows across central Alaska to empty into the Bering sea.

Atlin lake, with 308 sq.mi., at an elevation of 2.200 ft., is the largest of the headwater lakes. It drains into long and narrow Tagish lake (138 sq.mi.), and combined with smaller Lake Bennett to the westward, they form the headwaters of the Yukon river. Boats that floated down the Yukon river in the gold rush days at the end of the 19th century used Lake Bennett as a starting point for river traffic, since it lies directly north of White pass which crossed the Coast mountains. The present White Pass and Tukon railway, with its southern terminal at Skagway, Alaska. runs along the steep and scenic shores of Lake Bennett on the way to the Yukon capital of Whitehorse.

The cold. glacier-fed waters of these several headwater lakes come together in the area between the villages of Carcross and Teslin. and then broaden out once more into Marsh lake. The outlet of Marsh lake is the real beginning of the Yukon river itself. South of Whitehorse the water rushes rapidly between the steep walls of Miles canyon and tumbles over rocky ledges in the Whitehorse rapids. This section was dammed in 1958 to produce hydroelectric power. Although most maps showed this section of the river under the name Lewes river, locally it was always known as the Yukon river. The Canadian government recognized local usage by changing the name after World War II.

North of Whitehorse, the Yukon river is navigable for a distance estimated at 1.775 mi., to Bering sea. Because of numerous sand bars, shifting channels, and some fast water, the boats which used the Yukon river were always shallow-draft vessels drawing only four or five feet. The navigation season used to start in about mid-May, after the ice broke up in Lake Laberge (87 sq.mi.), and would continue into early October. With the improvement in air transport after World War II. and the completion of an all-season gravel road between Whitehorse, Mayo and Dawson. water transport on the Tukon river ceased in some years.

North of Whitehorse the Takhini river, which flows through a broad valley along which the Alaska highway was built, is the first major west bank tributary. North of Lake Laberge. Teslin river joins the Tukon from the southeast. As the Yukon plateau, or interior basin. broadens to the northward numerous other tributaries such as the Big Salmon. Nordenskiold and the Pelly add their waters to the Yukon. The Yukon river valley is broad and well-forested across central Yukon Territory. and the river itself meanders back and forth between islands and sand bars in the valley bottom. The only serious rapids in the river are found about 25 mi. N. of Carmacks where Five Finger rapid is caused by rocky islands in the channel; 6 mi. beyond, Rink rapids tumble over submerged ledges.

At the village of Minto, the Mayo highway bends to the north and crosses Pelly river. The small trading post of Selkirk is located at the junction of the Yukon and Pelly rivers. West and north of this junction the Yukon is a clear and gentle river, frequently flowing between high gravel banks, and having numerous islands in the river course. Silt-laden White river comes in from the west, draining from the glaciers of the St. Elias mountains in southwestern Yukon; and a few miles northward, the largest eastern tributary. the Stewart, adds its waters.

At Dawson the Klondike river enters from the east. It was along the Klondike, and particularly its south bank tributaries such as Bonanza, Eldorado and Hunker creeks, that gold was discovered in the fabulous days of the 1897–98 gold rush.

It is about 320 mi. from Dawson to the next large tributary, the Porcupine, which joins the Yukon at the village of Fort Yukon, Alaska. In Alaska, the Yukon river valley becomes very broad, and hills are sometimes 5 to 15 mi. from the river; the braided river has many channels which entwine through numerous low islands and sand bars. The flats end at the Ramparts, where the river cuts through a low mountain barrier and once more flows between steep banks.

At Tanana another main tributary, the Tanana river, comes in from the southeast. The Alaska highway follows the Tanana river west of Yukon Territory, terminating at the city of Fairbanks, on the north bank of the river. Beyond Tanana it is about 800 mi. to the broad, swampy and lake-covered delta of the Yukon river. Low mountains rise north of the river, and the last large north bank tributary, the Koyakuk, drains out of the rugged mountains of Brooks range. Near its delta mouth the Yukon bends sharply north to empty into Norton sound, an arm of Bering sea. Apoon channel, the easternmost of many branching channels in the low delta, is the usual navigation route. Although the Yukon river was important as a transport route during the gold rush days at the turn of the 19th century, it has been mostly replaced by road, rail and air routes to the main towns along its course. (J. L. R.)

YUKON TERRITORY is located in northwestern Canada, lying north of the province of British Columbia and east of the U.S. state of Alaska. Its southern boundary is the 60th parallel of latitude and its western boundary is drawn along the 141st meridian of longitude. The territory extends northward to the Beaufort sea and its eastern boundary mainly follows the drainage divide between tributaries of the Yukon river and the hlackenzie river .of the Northwest Territories. The territory occupies a strategic position in northwestern North America, being on the Great Circle airline routes between the central United States and the orient and eastern Soviet Gnion. Area 207,076 sq.mi., of which 1.730 sq.mi. are inland lakes. Pop. (1961) 14.628. The administrative capital is in the largest town, Whitehorse, pop. (1961) 5,031.

PHYSICAL GEOGRAPHY

Physiography.— The I'ukon is a mountainous region. The west central part of the territory is occupied by an interior basin or dissected plateau. which slopes down toward Alaska. The Yukon river and its numerous branching tributaries flow in broad valleys below the general upland level of the flat-topped hills. These rivers drain the surrounding, higher, rugged mountains. To the southwest rise the jagged, ice-capped peaks of the St. Elias mountains, which are partly in Alaska. Seven peaks there are above 15,000 ft. and the range is crowned by the highest mountain in Canada, Mt. Logan, 19,850 ft. To the southward the Coast and Cassiar mountains of British Columbia terminate in low mountains just north of the Yukon border. Eastward the jagged peaks and linear ranges of the Mackenzie and Selwyn mountains form a little-known barrier between the Yukon and Northwest Territories. Many peaks are above 7,000 ft. The barren. rounded peaks of the Ogilvie mountains rise along the northern rim of the central Yukon plateau.

In addition to the central Yukon basin, there are smaller basins or lowlands in the southeast and north. In the southeast the Liard river lowland is a gap between the Rocky and Mackenzie mountains and is traversed by the Alaska highway. To the north the Porcupine river basin and Peel river plateau lie between the Ogilvie mountains and the northern Richardson and British mountains. A narrow, emergent coastal plain faces ice-covered Beaufort sea and extends from the Mackenzie river delta westward into Alaska

Climate.— In the valleys and basins the climate is subarctic, but in the mountains and uplands arctic climates prevail. There are only a few scattered weather stations in the Yukon and these are all located in settlements in the sheltered valleys so that their data do not describe directly much of the mountainous Yukon. There are no climate records for the northern half of the Territory.

Average uinter temperatures are extremely cold over most of the Yukon but are somewhat milder in the southern sections which receive an occasional warm air mass from the Pacific ocean. The rest of the Yukon lies under a cold high-pressure system much of the winter or is crossed by a flow of cold, relatively moist air from the northwest sources of the Arctic ocean or Bering sea. January average mean temperatures are below $-20°$ F. at Dawson and $-10°$ to $-15°$ at Mayo but at Whitehorse in the south are close to $0°$. These latter averages indicate southern Yukon winters are about the same as those of southern Manitoba. At some time in nearly every winter temperatures have dropped below $-50°$ F and in some winters extremes of $-65°$ have occurred. In 1947 the airport at Snag, in western Yukon, recorded $-81°$ F.

Summer temperatures are warm in the Yukon valleys. July average mean temperatures at Dawson are 60° F.. equal to average summer conditions in the agricultural regions of the clay belt of northeastern Ontario. Every summer has extreme temperatures above 80° F. and occasional extremes above 90° F. have been recorded.

Average annual precipitation is low, as it is in other parts of northwestern Canada and adjoining Alaska. Between 10 to 15 in. of precipitation is recorded at the weather stations in the southern and central valleys; about 40% to 50% of it falls as rain during the four summer months.

Vegetation and Animal Life.—The valleys of the Yukon are clothed in a coniferous forest of the Canadian boreal forest. White spruce is dominant on the valley floors, and black spruce grows in the poorly drained areas; alpine fir and lodgepole pine are found along the Alaska highway across southern Yukon. Potentially commercial forests grow only on the lower slopes. up to about 3.500 ft. altitude. and the upper tree line is at about 4.500 to 5,000 ft. The uplands and upper mountains of much of the Yukon are therefore barren and treeless. For several decades wood was cut along the banks of the Yukon river for the wood-burning river boats and wood is still the common local fuel in winter. The largest stands of potentially commercial forest are in the Liard vallev of southeastern Yukon.

A great variety of wild animal life roams the forests. The larger mammals include black, brown and grizzly bears; caribou, deer and moose; mountain goats and sheep. Timber wolves are common. The usual game birds are found. notably grouse and ptarmigan, and waterfowl include a wide range of geese, swans and ducks. The common fur-bearers trapped by the Indian population include muskrat, mink. marten, lynx, weasel, fox and fisher. Great numbers of squirrels are also taken.

HISTORY

The Yukon was the last major land mass area of Canada to be explored. Robert Campbell of the Hudson's Bay company explored the Liard and Pelly rivers and headwaters of the Yukon in 1840–48 and established fur-trading posts to deal with the local

Indians. At the same time John Bell. of the same fur-trading company, crossed from the Mackenzie river delta to the Porcupine river of northern Yukon and established a trading post at Fort Yukon. in what is now Alaska Because of hostility of the Indians the trading posts in southern Yukon were abandoned in the 1850s. When the United States bought Alaska from Russia in 1867 the Hudson's Bay company moved its trading post eastward along the Porcupine river to near Rampart House: nhen a boundary surrey indicated that the post nas still in Alaska it was abandoned.

After the gold rushes to central and northern British Columbia in the 1860s and 1870s, prospectors began to penetrate northnard into the Yukon in the 1870s and 1880s. Alluvial gold was being obtained in good quantities on the Lewes. Stewart and lower Yukon rivers in the late 1880s and a few stores were opened to supply the increasing mining population. River steamers began to operate from the mouth of the Yukon river. bringing prospectors from Alaska. The fabulous Klondike gold rush began in 1897 after gold was discovered in the gravels of several tributaries of the Klondike river. Dan-son City arose at the junction of the Klondike and Yukon rivers to supply and entertain the miners in the surrounding area. The boom town had a population estimated at 10.000 in 1900, nith about 22.000 in the nearby valleys. It has been estimated that about $100 000 000 north of gold was obtained from the rich placer deposits of the Klondike region between 1897 and 1904. Prior to 1895 the Yukon had been part of the unorganized Northwest Territories, but in that year it nas made an organized district and a detachment of the Royal North West Mounted Police was placed at the Fortymile Creek mining centre. In 1898 it nas made a separate territory.

The economy of Yukon Territory nas at its height at the turn of the 20th century River steamers to Dawson operated on both the upper and lower Yukon river. The White Pass and Yukon railway was completed in 1900, connecting the Alaskan port of Skagway with the head of water transportation at Whitehorse. Early in the 20th century, however, the easily worked gravels of the Klondike area were depleted and miners began to drift away. The official Canadian census of 1901 reported 27 219 people in the territory but by the next census. in 1911. the population had dropped to 8,512. There was a revival of mining after 1913 when lode deposits of rich silver-lead ores were shipped out of the Mayo region. About the same time gold production revived a little in the Dawson area folloning the introduction of dredges and the consolidation of claims. The trend in population and mining was downward. hon ever, despite another revival in 1932 when drilling in the Klondike discovered some underground gravels rich in alluvial gold.

In 1941 the Yukon population was only 4.914 when wartime activity brought another boom. The construction of airports for the northwest staging route to Alaska and the service road between the airports (which was to become knonn as the Alaska highway) brought a population of about 15,000 persons to Whitehorse. This boom collapsed at the end of the war but the Yukon was no longer as isolated as it had been during the Klondike period and by 1951 the population of the territory had fallen only to 9,096. After that time an increased tempo of transportation development and mining exploration slowly increased the local population.

GOVERNMENT

When the Yukon act created a separate territory in 1898 it also gave local government under a commissioner and an appointed legislative council. In later years the numbers in the council were increased and some were made elective. In 1919 the council nas reduced to three elected members holding a three-year term of office but after 1952 there nere five elected councilors. The commissioner administers the territory under the jurisdiction of the department of northern affairs and national resources in Ottawa. The Yukon territorial council operates in a manner similar to that of the provincial governments but on a smaller scale. It passes ordinances related to local civil government. licences and business. The federal government from Ottana still controls matters related to the sale of lands and resource development. The enforcement of lan and order is the responsibility of the Royal Canadian Mounted Police. The federal cabinet approved the transfer of the seat of local government from Dawson to Whitehorse in 1951 but the first session in the new capital did not take place until April 1953. 4 federal government order-in-council of May 1955 confirmed the establishment of the Yukon local capital at Whitehorse.

POPULATION AND SETTLEMENT

As has been indicated, the population of the Yukon has fluctuated greatly. The largest share of the white population is urban. living in several small settlement's along the southern and central river valleys. Whitehorse, pop. (1961) 5.031. is the largest to n and chief transportation centre. It is the northern terminal of rail connections to the Pacific coast and the southern terminal of highways leading north to Mayo, Dawson and beyond. The east-west Alaska highway passes through Whitehorse and it is the chief airport of northwestern Canada.

Dawson. pop. (1961) 846, is a shadow of its former glory but still attracts some summer tourist visitors. Gold dredges operating in the nearby Klondike river are the main economic support of the tonn. The village of Mayo, (1961) pop 332. is the supply and transport centre for the nearby Keno Hill mine. Other villages such as Carcross. Carmacks and Selkirk are primarily trading posts Along the Alaska highway supply centres such as Watson Lake Teslin and Burwash have grown up around a few stores and service stations.

The native Indian population of Yukon Territory has probably never been very large and totaled only 1,868 in 1959. The Indians of central and northern Yukon are part of the Dene or Athabascan tribe. which roamed over much of northwestern Canada. The Loucheux group follow a hunting and trapping life in the drainage basin of the Porcupine and Peel rivers and have their largest village at Old Crow. The Kutchin group live in the Yukon river basin and have been more modified by continuous contact with whites. A different tribe. the Tlingits, occupy the headwaters of southern and southwestern Yukon, having pushed in from their former homes on the Pacific coast of adjoining Alaska. Although trapping is still carried on in winter, most of the southern Indians work as labourers or in some form of transportation during the summer.

From time to time a few Eskimos are recorded in the Yukon census These have been occasional Eskimo families who lived in temporary camps on the arctic coast or in a semipermanent settlement on Herschel Island in Beaufort sea.

NATURAL RESOURCES

Mineral Resources. — These have been the main support of the Yukon population and economy throughout the 20th century. Despite the decline in the producrion of gold, it is significant that the Klondike placers have produced for more than 60 years and are among the world's leading gold fields Although most of the alluvial gold comes from the dredges of the Dawson area, gold has also been produced in smaller quantities intermittently from streams across southern Yukon.

With the decline in gold values. the rich silver-lead ores of Keno Hill became the most valuable mineral resource of the Yukon Development of the mine was assisted by the construction of an all-season gravel road from Whitehorse to Mayo about 1950: formerly the concentrates had to be moved by barge on the Stewart and Yukon rivers in the short summer season. Transportation costs were still high, however, because the concentrates had to be carried by truck, rail. boat and rail again to the smelter at Trail in southeastern British Columbia.

Other mineral resources of the Yukon have been produced intermittently Small amounts of Mesozoic bituminous coal have been mined near Carmacks for local heating. Copper was mined near Whitehorse until 1920 and other marginal copper deposits are knonn in several places across southern Yukon. Tin and tungsten placers yielded some wealth occasionally. Nickel mineralization has been reported near Kluane lake and nickel and base metals are known in southeastern Yukon near the former Canol road. Asbestos deposits have been investigated northwest of Dawson.

Agriculture and Forestry.—Despite its northern latitude and climatic hazards hardy grain and vegetable crops can grow in the Yukon but the lack of a local market does not make agriculture profitable. The 1956 census reported a farm population of 40 persons, only 16 farms in the whole territory and less than 1,000 ac. under cultivation. Gardening is common at all of the settlements, however, and a good supply of local vegetables and small fruits are produced during the long days of the summer. Reconnaissance soil surveys indicate that there are at least 100,000 ac. of arable land along the Alaska highway west of Whitehorse and probably 60,000 ac. in small patches along the terraces of the Yukon river.

Forestry resources are of similar potential value rather than of immediate use. Estimates indicate that 40% of the Yukon is covered with forests and that 20% can be classed as productive and potentially commercial. Small sawmills supply local lumber to Whitehorse, Dawson and Mayo but the annual cut of forest products is small. (See also *Physical* Geography: Vegetation and Animal Life, above.)

Animal Resources.—The search for furs led to the first settlements in the Yukon in the middle of the 19th century. Since that time furs have been trapped by the small Indian population and by a few hundred white residents, but the annual catch of the Yukon is a very small portion of the Canadian total. The most valuable pelts sent from the Yukon are squirrel, beaver, marten, lynx, mink and weasel.

The hunting of game animals is permitted for all local residents who obtain a licence for a nominal fee and game meat makes up a large part of the local food requirements. Nonresidents, or visitors, may also hunt or fish upon the payment of a larger fee for a licence.

Other Resources.—The Yukon is well supplied with water power. Most of the potential power is widespread in the headwaters of the many tributaries of the Yukon, Liard, Peel and Porcupine rivers but is troubled by variations in seasonal flow. A diversion of the Klondike river supplies hydroelectric power for the mining industry and homes in Dawson and a dam across the Yukon river at Miles canyon, south of Whitehorse, supplies the capital.

TRANSPORTATION AND COMMUNICATION

Until the middle part of the 20th century, water transport was the chief means of personal travel and freight movement in the Yukon; even in winter snow-covered trails connected with the frozen rivers to form transport lines. Air service, which had just started prior to World War II, was expanded during the war, because of the territory's strategic location. Roads were also constructed, notably the Alaska highway and a road along the Canol pipeline from Whitehorse through the Mackenzie mountains to Norman Wells, Northwest Territories. The road to Norman Wells was abandoned for about a decade after the war but the western end was then improved and some bridges restored. With the improvements in roads and air service the water transport system lost freight and passengers and gradually declined. In some years there were no steamers operating on the Yukon river.

A government telegraph system serves the Alaska highway and the highway to Dawson. The department of national defense and department of transport maintain radio stations for radio-telegraph at many points throughout southern Yukon and most immediate communication is by radio. Bus service operates along the Alaska highway from Edmonton to Fairbanks; a railway connects Whitehorse to Skagway and Pacific coastal steamers.

See Department of Northern Affairs and National Resources, Northern Affairs Administration, "Yukon Territory—History, Administration, Resources and Development" and D. F. Putnam (ed.), "The Canadian Northland," Canadian Regions, a *Geography* of Canada, ch. 22 (1952). Both publications list additional references. (J. L. R.)

YUMA, a city in the southwestern corner of Arizona, U.S., on the Colorado river at the mouth of the Gila; the seat of Yuma county. It is the centre of large irrigation districts which have created rich farming land from the desert. With a year-round growing season, agricultural products include lettuce, citrus fruits, cantaloupes and alfalfa. Manufactures include water softeners, fertilizer and building materials. The tourist trade is also important. Always a strategic river crossing, the site was probably first visited by the Spaniard Alarqon in 1540. Several Spanish settlements in the area failed and it was not until 1854 that the town was laid out. Known as Colorado City and Arizona City in its early years, Yuma was incorporated in 1871. Two years later a dispute with California over which state the city belonged to was settled in Arizona's favour. For comparative population figures see table in ARIZONA: Population. (W. F. H.)

YUMA DESERT (also known as the Sonoran desert and in part as the Colorado desert) is an arid region of northwestern Mexico and southwestern United States. It extends from about the 34th parallel (Blythe and Banning, Calif.) to the 26th (Topolobampo, Sinaloa); and from the mountains of southern California and Lower California east ard to the Sierra Madre Occidental of Mexico and the mountains of central Arizona.

Its scanty rainfall (less than ten inches per year, often under five) comes partly as summer thunderstorms and partly as winter frontal rain. Summers are exceedingly hot (maxima usually over 110° F.); winters are warm (maxima 60° F. to 70° F., minima 40° F. to 50° F.). Frosts occur, but are neither common nor severe.

The area has typical mountain-and-basin topography: steep, rugged mountains rise abruptly above broad basins floored smoothly with gravel and sand. The northwestern extremity—the Coachella-Imperial valley—is an exceptional basin with its floor far below sea level. It and a few other basins have central salt lakes or playas; but most of the area drains to the sea. The few permanent streams (the Gila, Salt, Colorado, Yaqui and Fuerte) all have their sources in distant mountain areas.

Despite the desert conditions, vegetation is surprisingly varied. Along dry stream courses, trees and tall brush are common. In the north, basin areas have only scattered low shrubs, especially creosote bush (Larrea tridentata) and bur sage (*Franseria deltoidea*), but on the rocky hillsides, cacti are plentiful, including the giant saguaro (Cereus gigantea). In Sonora, surprisingly thick growths of tall brush and cacti cover the entire landscape.

A few primitive hunting and gathering Indians (Pima and Papago in Arizona and Papago, Seri and Yaqui in Sonora) still roam vast tracts. Modern irrigation permits commercial agriculture in the Coachella, Imperial, Colorado, Gila and Salt valleys (winter vegetables, cotton, flax, citrus fruits, dates and alfalfa) and in the Sonora, Yaqui and Fuerte valleys (wheat and cotton). The warm winters attract vacationers to resort cities like Palm Springs, Tucson and Phoenix, to scattered dude ranches and to the reservoirs along the Colorado river. See also MOJAVE DESERT.

See Edmund Jaeger, North *American* Deserts (1957). (R. F. LN.)

YUMAN, a speech stock of American Indians, named from the Yuma tribe, living about the lower Colorado river and occupying a distinctly desert habitat. The groups that belong are the Havasupai, Walapai and Yavapai of the mountains of western Arizona; the Mohave (*q.v.*), Yuma, Kamia and Cocopa (*q.v.*) in the Colorado river bottomlands; the Maricopa (*q.v.*), Halchidhoma, Kohuana, Halyikwamai, once on the river but driven out and the remnants, except the Maricopa, lost to tribal identity; the Diegueño to the rear of San Diego in California; and the Akwa'ala, Yukiliwa, Cochimi and other groups known under varying local names in Mexican California. Of these tribes, the most advanced were those on the Colorado, who have changed little since their discovery by Hernando de Alarqon in 1540. They have always been warlike and turbulent, but chiefly among one another. They are agricultural, marking the northwestern frontier in the continent of native maize farming. They make pottery but no basketry. They are divided into totemic patrilineal clans.

YÜ-MEN, an ancient oasis town in northwest Kansu province, China, at the foot of the Nan Shan, watered by the Su-lo Ho (Shuleh river), and a station on the old Kansu corridor caravan road. Yu-men, meaning "jade gate," was named for the nearby ancient "gate" at the end of the Great Wall.

Oil production began at Lao-chun-miao, situated 40 mi. S.E. of Yü-men, in 1939 in one field of a 700-mi.-long petroliferous zone. Refineries were built, and until reached by the Sinkiang railroad from Lan-chou in 1956, petroleum products were moved eastward *and westward by truck tanker fleets. Expansion of the original field began in 1949. and a new field began production in 1957. Irrigation systems expanded agriculture, and Yü-men. in the early 1960s, was rapidly growing into a transport and petroleum centre, with refineries. by-product plants, and oil-well machinery plants.* (J. E. Sr.)

YUNG LO (*Chc Ti or Ch'eng Tsu*) (1360–1424), *third emperor of the Ming dynasty (see* China: *History). His actual name was Chu Ti Hung Wu's fourth son. He was granted the title prince of Yen in 1370; his seat of power was at Peking (Peiping). When Hung W u named his grandson Chu Yün-wen the heir designate upon the death of his eldest son Chu Pioa in 1392, the prince plotted actively for the usurpation of the throne. By making alliances with imperial officialsin the north and with court eunuchs the prince began his rebellion after the death of his father, in 1398. The march toward Nanking nas a triumphal one, although great sections of the north were devastated. Nanking was captured in 1402.*

Once on the throne, the usurper brought the Ming dynasty to the zenith of its power. Annam was reincorporated into the empire in 1407; Japanunder Xshikaga Yoshimitsu paid tribute; campaigns were continued against the Mongols; for anhile the Chinese controlled the caravan route into Sinkiang; and Shahrukh (1404–47), Timur's fourth son who ruled at Herat in central Asia. sent an embassy to the Ming court. Great naval expeditions, seven altogether. were sent between the years 1403 and 1433 to southeast Asia and as far anay as Aden and the Somali coast of Africa.

Yung Lo had no love for Nanking, and in 1421 he moved the imperial capital to Peking. which was rebuilt; the Forbidden city was completed in 1422. Another accomplishment was the compilation of the Yung-lo ta-tien, a great compendium ordered in 1403 and completed in 1408. Its 22.877 chapters in 11,095 volumes contained excerpts and entire works pertaining to practically all subjects. (*D. B. Ch.*)

YUNG-NING: *see* Nan-ning.

YUNNAN (Yün-nan *Sheng*). *a mountainous plateau province of southwest China averaging about 6.000 ft. altitude. but with its western half (inaccessible and sparsely settled) comprising deep longitudinal gorges separated by ridges rising to over 18,000 ft. in the north. Area 154.054 sq.mi.; pop. (1953) 17.472,-737. The Salween (Nu chiang). Mekong (Lan-ts'ang chiang) and upper Yangtze (Chin-sha chiang) rivers enter the province in the northwest. the former two flowing southward through Yunnan, and the latter looping eastward through northern Yunnan into Szechwan. In the eastern half, the Red river (Yuan chiang) runs southwest into Vietnam, and tributaries of the Tangtze and Hsi chiang of south China cut the plateau. A number of lake basins in the central sections form the agricultural and politico-cultural heart of the province dominated by the provincial seat at K'unming (q.v.). Climatically, the southerly latitudes, together with the high altitudes, provide a mild, springlike climate most of the year. with altitudinal zonation from tropical lowland valleys in the south to alpine heights in the north. Rainfall. which is heaviest in summer, averages from 50–60 in. in the southwest and south to under 40 in. in the area south of K'un-ming and parts of the north. Winters are dry, sunny and mild. In the late 1950s there were about 7,000,000 ac. under cultivation, comprising only about 6.7% of the total provincial area. Paddy rice is the dominant summer crop. Other food crops include winter wheat, barley, corn, kaoliang, sweet potatoes and sugar cane. Industrial crops include cotton, hemp, tobacco and tree crops such as tea, tung oil nut, walnut, fruits and mulberry, the latter for silkworm culture. Opium and medicinal herbs also are produced. Extensive coffee tree planting was begun in the late 1950s. Numerous livestock such as yellow cattle and mules, as well as pigs are raised and Yunnan ham is famous in China.*

Yunnan has a variety of mineral resources: including the country's largest reserves of tin and nonferrous metals. Coal is found in several areas, including Kuang-t'ung (formerly I-p'ing-lang) west of K'un-ming, and eastern Yunnan where an estimated 1,500,-000,000 ton deposit was found. Tin is mainly mined south of K'un-ming at Ku-ch'iu, Shih-p'ing and Meng-tzu, while large lead and zinc mines are at T'ung-ch'uan in northeastern Yiinnan. Narrow-gauge railroads connect the tin and coal mines with K'unming. while the line northward to Szechwan is partially constructed. K'un-ming is the important industrial centre. with two small steel plants and numerous light industries such as textiles and machinery.

The provincial area was the site of the early Nan-chao and Ta-li kingdoms. It was completely conquered by Kublai Khan in the 14th century, and became part of the empire in the 17th century. A Turkish governor from Hsin Chiang initiated the conversion of hundreds of thousands of west Yunnan people to Islam, who revolted against Chinese oppression from 1855–73 (Panthay Rebellion) and maintained an independent state in the west around Ta-li. During World War II the Burma road lifeline leading to Szechwan was maintained through Yiinnan.

After 1949 thousands of Nationalist troops and adherents fled to southwestern Yunnan frontiers and for years afterward harassed the Chinese Communist government, often from Burmese territory. About 60% of the population are composed of more than 50 minority ethnic tribes differing from the Chinese who form the largest single group. Many areas are organized into so-called minority autonomous districts. Yunnan's western borders nith northern Burma are unsettled. (H. J. Ws.)

YUNUS EMRE (*d.* 1320), *Turkish poet and mystic, who has exercised a powerful influence on Turkish literature, was born in Anatolia. Though legend obscures the facts of his life he seems to have traveled extensively, meeting other great mystics of the time, and becoming an ardent follower of Jalal ud-din Rumi and a leading representative of the mystic movement in Anatolia. He nas venerated as a saint after his death. His poems, which are mainly devoted to the themes of divine love and human destiny. are characterized by deep religious feeling. In striking contrast to the divan poets, he wrote in a straightforward, almost austere. stvle and mainlv in the traditional svllabic metre of folk poetry. His work had a profound influence on later mystics and inspired the poets of the Turkish renaissance of national poetry after 1910.*

See A. Golpinarli, Yunus Emre Divani, 3 vol. (1943–1948) ; *E. Rossi,* "Il *poeta mistico turco Yunus* Emre," *Oriente Moderno, vol. 20 (1940).* (F. I.)

YUROK, *a tribe on the lower Klamath river, asserted but also disputed to be of Algonkin speech lineage, is perhaps the nuclear group of the northwest California Indian culture. principal others being the Hokan Karok upstream, the Athabascan Hupa (q.v.) of Trinity, the Chilula of Redwood, the Tolowa of Smith river, and the Algonkin (?) Wiyot of Humboldt bay. The Yurok once numbered about 2,400 in over 50 villages; 500 remain.*

YURUCAREAN, *a small group of tribes of South American Indians, constituting an independent linguistic stock. The Yurucares live in Bolivia on the eastern slopes of the Andes and the lowlands along the Chaparé, Isiboro and Securé rivers, tributaries of the Mamoré. They are a tall, well-built folk, slightly lighter in colour than the Quechua of the highlands, who gave them the name by which they are known. signifying "white men." Their dress consisted of a poncholike garment. without sleeves, of bast, decorated nith geometric patterns printed by means of large wooden dies. The Yurucares are sedentary agriculturalists and hunters. living in open thatched shelters.*

See A. D'Orbigny, *L'Homme Americain (1839); L. E. Miller, "The Yurucare Indians of Eastern Bolivia," Geog. Review, pp. 450–464 (1917).*

YUSAFZAI, *a large group of Pathan tribes. originally immigrants from the neighbourhood of Kandahar, nhich includes those of the Black mountain, the Bunerwals, the Swatis. the people of Dir and the Panjkora valley, and also the inhabitants of the Yusafzai plain in Peshawar district of the Northwest Frontier province of India. Three sections of the tribe, the Hassanzais, Akazais and Chagarzais, inhabit the western slopes of the Black mountain, and the Yusafzai country extends to the Utman Khel territory.*

YUST, WALTER (1894–1960), *editor of Encyclopædia Britannica, was born in Philadelphia, Pa., on May 16, 1894. After* graduating from the University of Pennsylvania. Philadelphia. in 1917. he worked for the *Philadelphia Evening Ledges* and later for newspapers jn New Orleans and for other publications. He became literary editor of the *Philadelphia Public Ledges* in 1926. In 1929, upon writing a review of the 14th edition of *Encyclopedia Britannica*, Yust came to the attention of its president. William Cox. The following year he was named advertising manager for the encyclopaedia. He became associate editor in 1932 and in succession to Franklin H. Hooper was editor in chief of all Britannica publications from 1938 until his retirement in 1960—longer than any of his predecessors. He died in Evanston. Ill., on Feb. 29, 1960.

Under his direction. Encyclopædia Britannica. Inc., issued a number of important reference publications, and the company developed and expanded its editorial program of continuous revision. The editorial department expanded from a small group who had worked on the 1929 edition to an organization of 250 staff members in Chicago and London, and 150 consultants and advisers in all parts of the world. *See* ENCYCLOPAEDIA. (J. V. D.)

YVES, SAINT, OF BRITTANY (1253–1303), was born in 1253 at Kermartin. near Tréguier, Brittany. His father was Hkloury, seigneur of Kermartin, and his mother Azou de Quenquis. In 1267 he went to Paris to study law, and ten years later to Orleans to study canon law. On returning to Brittany he was appointed ecclesiastical judge under the archdeacon of Rennes. In 1285 he was ordained priest and appointed first to the parish of Trkdrez and afterward to Louannec. where he died on May 19. 1303. He was buried in the cathedral of Tréguier. and was canonized by Clement VI in 1347. As a lawyer and judge he was famed for his rectitude and wisdom and for his zeal in defending the cause of widows and orphans. His feast is celebrated on May 19. Me is the patron saint of lawyers for he was "*advocatus et non latro, res miranda populo*" (a lawyer and not a thief, a marvel to the people).

Z This letter together with Y was adapted by the Romans from the Greek alphabet after the conquest of Greece for use in Greek words borrowed or transliterated. It mas the seventh letter of the Greek alphabet and had the form I or Z. It was present in the Etruscan, Oscan, and Umbrian alphabets, and according to a tradition unsupported by actual inscriptional evidence it had at one time been present in the Latin alphabet also, probably with the value of the voiced *s* which must have been an intermediate stage in the change of intervocalic *s* to *r*. Its place in the alphabet was filled by the letter G adapted from *C* to represent the voiced velar stop. The letter corresponded to Semitic I (zayin).

The minuscule letter has generally retain$ the form of the majuscule, though in certain hands the form ʒ has developed.

The sound represented by the letter in Greek is not precisely known. It mas, at least in certain cases, a double sound and probably varied in separate dialects as well as in different words between *z, ž, zd, dz* or *d;*. In Latin it was probably the voiced sibilant corresponding to *s* and this value it has retained till modern times. (B., F. C. A.; J. W.P.)

ZABRZE: *see* HINDENBURG.

ZACATECAS, a state of Mexico. Area 28.125 sq.mi.; pop. (1960) 798.232. It belongs wholly to the great central plateau, with an average elevation of about 7.700 ft. The state is traversed in the west by lateral ranges of the Sierra Madre Occidental, and by numerous isolated ranges in other parts. There are no large rivers. The climate is dry and generally healthful, warm in the valleys and temperate in the mountains.

The agricultural products are cereals. sugar and maguey; the first depends on the rainfall which often fails altogether, the second on irrigation in the lower valleys and the third doing best in a dry climate on a calcareous soil with water not far beneath the surface.

Mining for silver, gold, mercury, copper, iron, zinc, lead. bismuth, antimony and salt is carried on. The state's mineral wealth was discovered soon after the conquest, and some of its mines are among the most famous of Mexico, dating from 1546. Manufactures are limited chiefly to the reduction of mineral ores; extraction of rubber from guayule; making of sugar, rum, mescal, pulque, woolen and cotton fabrics; and some minor industries of the state capital, Zacatecas. Other principal towns are: Fresnillo (*q.v.*), a silver and copper mining centre, Sombrerete, Concepción del Oro, and Tlaltenango.

The state is traversed by rail, highway and air routes. Its principal attractions are the many ultrabaroque churches of the colonial period, paid for by the torrent of silver which rich men gave as they vied with each other in trying to erect the most lavish monument possible. (J. A. Cw.)

ZACATECAS, capital of the state of Zacatecas. Mex.. 442 mi. by rail from Mexico City. Pop. (1960) 28.473. The city. a mining and agricultural centre. lies in a deep narrow ravine and has an elevation of 7,377 ft., although the surrounding table lands rise above 8,000 ft. The high altitude and severe winds make the climate one of the least healthful in the republic.

Zacatecas was founded in 1538, following the discovery of silver-bearing veins in the area in 1546 by Juan de Tolosa, and made a city in 1585 by Phillip II. The *real de minas* (mining district) of Zacatecas is credited with having yielded a fifth of the world's silver before the 19th century. . Its name is apparently derived from the Zacatec Indians and the Aztec *Zacatlán* (country where the Zacate grass grows.)

The cathedral, which is noted for its highly carved portico, was begun in 1612 and completed in 1752. It contained rich paintings from Europe and elaborate silver and gold work until the reforms of the 1850s and 1860s, when most of them were confiscated. The extensive Indian ruins of Chicomostoc. as yet largely unrestored, are 28 mi. N.W. of Zacatecas. (J. J. J.)

ZACCONI, LUDOVICO, Italian musical theorist. was born about the middle of the 16th century at Pesaro. the years of his birth and death being unknown. He made his home in Venice, where he became an Augustine monk and was appointed *maestro di cappella* at the church of his order. After a short time spent in the service of Wilhelm. duke of Bavaria in 1592. and a longer period in Vienna with the archduke Charles, he returned in 1619 to Venice. Zacconi's fame is based on a single monumental work, the *Prattica di musica utile et necessaria si al compositore . . . si anco al cantore* (2 pt., Venice, 1596 and 1619). It is one of three standard theoretical works of the Polyphonic period, the others being the *Dodecachordon* of Glareanus and the *Musicae activae Micrologus* of Ornithoparcus; Zacconi's work, being the latest of the three, treats of the methods of the ripest period of the Polyphonic school.

ZACHARIÄ VON LINGENTHAL, KARL SALOMO (1769–1843), German jurist and politician who was distinguished both in the practical and academic fields, was born on Sept. 14, 1769, at Meissen in Saxony, the son of a lawyer, and was educated there and at Leipzig university. He was professor of law at Wittenberg (1798), and at Heidelberg from 1807 till his death there on March 27, 1833. From 1820 to 1829 he mas a strongly Conservative member of the new parliament of Baden. and it was the growth of liberalism that induced him to retire in 1829 and thereafter devote himself entirely to juridical work. The German universities still had their old jurisdiction in legal questions of international importance, and Zacharia had referred to him such points as the claim of Sir Augustus d'Este to the dukedom of Sussex, and the dispute about debts due to the elector of Hesse-Cassel, confiscated by Napoleon. He was ennobled in 1842.

His writings deal with almost every branch of jurisprudence, and relate to Roman, Canon, German, French and English law. The first book of much consequence which he published was *Die Einheit des Staats und der Kirche mit Rücksicht auf die Deutsche Reichsverfassung* (1797). a work on the relations of church and state, with special reference to the constitution of the empire. In 1806 appeared *Die Wissenschaft der Gesetzbung*, an attempt to find a new theoretical basis for society in place of the opportunist politics which had led to the French Revolution. This basis he seemed to discover in something resembling Jeremy Bentham's utilitarianism. Zacharia's last work of importance was *Vierzig Bücher vom Staate* (1839–43), to which his admirers point as his enduring monument.

BIBLIOGRAPHY.—*Allgemeine Deutsche Biographie*, vol. 44 (1898); F. von Holtzendorff-Vietmansdorf, *Encyclopädie der Rechtswissenschaft* (1870–71); R. von Mohl, *Die Geschichte und Literatur der Staatswissenschaften* (1855–58); C. Brocher, K. S. *Zachariae, sa vie et ses œuvres* (1870).

His only son, KARL EDUARD ZACHARIÄ (1812–1894). also an eminent jurist, was born in Heidelberg on Dec. 24, 1812. and studied at Leipzig, Berlin and Heidelberg. He made Roman and Byzantine law his special study and traveled abroad extensively in his researches, visiting St. Petersburg, Copenhagen, London and Oxford. His *Jus Graeco Romanorum* (1856–84) and the *Geschichte des griechisch-römischen Rechtes* (1856–64) are of the greatest importance in the field of the history of Byzantine law, especially for his views on the Farmer's law (*nomos gcorgikos*), although A. A. Vasiliev criticized his work for overemphasizing the impact of the Slavs upon the internal customs of the Byzantine empire (see *Bibliography*). He was professor at Heidelberg university from 1832 to 1845, when he retired and lived thereafter on his estate in Saxony. There he died on June 3, 1894.

For a list of Zacharia's works, see *Allgemeine Deutsche Biographie*, vol. 44 (1898) and the bibliography in A. A. Vasiliev's *History of the Byzantine Empire* (1952). (J. F. LR.)

ZACHARIAS, SAINT (d. 752), pope from 741 to 752, was a Greek by birth and appears to have been on intimate terms with

Gregory III, whom he succeeded in Nov. or Dec. 741. Contemporary history dwells chiefly on his personal influence with the Lombard kings Liutprand and Rachis. It was due largely to his tact in dealing with these princes in a variety of emergencies that the exarchate of Ravenna (*q.v.*) was rescued from becoming part of the Lombard kingdom. The correspondence between Zacharias and Boniface. the apostle of Germany, shows how great was the influence of the pope on the events then passing in the Frankish kingdoms. In 751 he gave his moral support to the deposition of Childeric III, the last Merovingian king, and authorized Boniface to anoint Pippin as king of the Franks. The action of Zacharias in the transference of the royal crown to the house of Pippin (Carolingians) established a precedent that was of the greatest significance in the future relations between pope and emperor, and was of extreme importance to the theorists and controversialists at the time of the Investiture (*q.v.*) controversy. Zacharias is known in the east for his translation of the *Dialogues* of Gregory the Great and for his Catholic attitude toward the Iconoclastic controversy.

He died on March 14 or 22, 752. He is commemorated in the Roman martyrology on March 22. (R. E. McN.)

ZADAR, in Italian called ZARA, a town on the Dalmatian coast of Yugoslavia. 72 mi. N.W. of Split, stands on the northwestern end of a low-lying peninsula separated by the Zadar channel from the islands Ugljan and Pasman. The inlet between this peninsula and the adjacent mainland forms a natural, deep-water harbour. The Venetians made the town still more secure by digging a deep ditch on the landward side. Zadar and its suburbs cover 35½ sq.mi., of which the inner town occupies nearly 9 sq.mi.

The ancient Liburnian town of Iader became Roman in 100 B.C. Spared in the Avar and Slav invasion of Dalmatia (*c.* A.D. 600), the town became the capital of Dalmatia under the existing Byzantine administration and remained Byzantine till 882, after which it had to pay to Croatia 110 ducats yearly for possessions on Croatian territory. It became a Croatian protectorate in 923 but fell under the Venetian doge at the end of the century. There followed a long struggle for Dalmatia between Venice. Croatia and Byzantium, the chief prize being Zadar, which came under Croatian rule for a short time at the end of the 11th century but then reverted to Venice; and wars for Zadar between Venice and Croatia went on for 300 more years. Finally sold to Venice by the Croat-Hungarian king in 1409, it remained Venetian till the end of the republic (1797). Zadar was then ceded to Austria, but passed temporarily into French possession and formed part of the kingdom of Illyria until 1813, when the French were driven out. Austria retained Zadar until in 1918 Italian troops entered the town, which was ceded to Italy by the treaty of Rapallo (1920). Its transference. when the rest of Dalmatia became Yugoslav, was based on the London treaty of 1915 and justified by the large population and by the continuity of Latin culture and speech. After Italy's capitulation in World War II, Zadar was occupied by the Germans. Liberated by the Yugoslavs, on Nov. 1, 1944, it was subsequently incorporated in Yugoslavia. During the mar Zadar had suffered damage from Anglo-American bombing, 75% of its buildings bring destroyed. The population, which amounted to 22,844 in 1936, was reported as 25,132 in 1961.

The secularized church of S. Donato probably dates from the early 9th century. The cathedral is oi the 13th century and possesses some fine Dalmatian silver work.

Zadar has well-developed industries: shipbuilding. distilleries, processed food (particularly tinned fish), fishing equipment, etc. In 1935 a university was founded.

See G. Dainelli, *La Dalmazia,* with atlas (Novara, 1918), V. Brunelli, *Storia della citta di Zara* (Zara, 1913), A. Nani, *Notizie storiche della città di Zara* (Zara, 1883).

ZAGAZIG (Zaķāzīk), a town of Lower Egypt, capital of the province of Sharkia. Pop. (1957 mun.) 109.939. It is built on a branch of the Fresh Water or Ismailia canal, and on the Al-Mo'izz canal (the ancient Tanitic channel of the Nile), and is 47 mi. N.N.E. of Cairo by rail. Situated on the Delta in the midst of a fertile district. Zagazig is a great centre of the cotton and grain trade of Egypt. It has large cotton factories and the offices of numerous European merchants. About a mile south of the town are the ruins of Bubastis (*q.v.*).

ZAGHAWA: see NUBA.

ZAGHLUL, SAAD (1860–1927), Egyptian patriot, came of fellahin stock in the district of Ibian, Gharbia province. He was educated at the village school and at the university of El Azhar, in Cairo. In 1880. he became editor of the *Official Journal.* Later he was nominated a Moawin under the Ministry of the Interior and eventually became chief of the Contentieux for the province of Giza. Involved in the Arabi revolt, he was one of the ,many notables detained on the occupation of Egypt by British troops in 1882. In 1884 he began to practise at the bar, and in 1893 became a judge in the native court of appeal. He became minister of education in 1906, and in 1910 minister of justice. At the ministry of justice he made a charge of corruption against the khedive Abbas Hilmi, and was asked (1912) by Lord Kitchener to resign. Zaghlul's evidence was insufficient, but he mas thought to have been fundamentally justified, and his fierce opposition to British domination was undisguised irom that time. He then became vice-president of the legislative assembly.

On the signing of the Armistice (Nov. 1918) Zaghlul, who had for long been considered the principal spokesman of the Nationalist party, appealed to the residency in Cairo ior the recognition of Egyptian independence, basing his demand on Pres. Woodrow Wilson's self-determination policy and the British proclamation defining the status of the other countries liberated from Turkish rule by World War I. His proposal that he, with other representative Nationalists, should visit London to press their views was refused by the government, and his attitude was so hostile that he and three others were arrested on March 8, 1919, and deported to Malta. This mas the signal for a murderous outbreak in Egypt and serious disturbances (*see* EGYPT: *History: Modern Period*). Zaghlul and his friends were later released by Lord Allenby, and a special mission under Viscount Milner was sent to Egypt in Nov. 1919 to report on the situation.

Zaghlul returned to Egypt early in 1921, where he represented the extreme Nationalist party in opposition to the more moderate ministry under the presidency of Adly Pasha. At the end of the year, when trouble again broke out in Egypt, Zaghlul was arrested once more and deported, first to Aden and then to the Seychelles. In Sept. 1922 he was transferred to Gibraltar, whence he was released on April 4, 1923, on the grounds of ill-health. After the promulgation of the new constitution, martial law was abolished and Zaghlul was free to return to Egypt. He was enthusiastically received, and in the elections of Jan. 1924 his supporters gained an overwhelming majority. Yehia Ibrahim Pasha resigned and Zaghlul formed a ministry. Conversations to secure a settlement between England and Egypt took place in London (Sept. 25–Oct. 3) between Zaghlul and Ramsay Macdonald; Zaghlul refused to modify his intransigent attitude, and no agreement was reached. On Nov. 19, 1924, Sir Lee Stack, the sirdar, was assassinated and Zaghlul was forced to resign. Nevertheless he became president of the new chamber of deputies. From that time the history of Zaghlul Pasha is the history of Egypt (*q.v.*).

Zaghlul died at Cairo on Aug. 23, 1927. His health had long been failing, hut he was to the end the life and soul of Egyptian nationalism.

ZAGREB, the capital of the Republic of Croatia in the federal people's republic of Yugoslavia. and the seat of a Roman Catholic archbishop. is situated between the slopes of the Medvęđica hills to the north and the Sava river to the south. Pop. (1961) 327,319.

The old town is composed of the two settlements, Gradac and the Kaptol. The new town was extended toward the south after the 17th century and its growth became particularly rapid during 1860–1914. Between 1807 and 1910 the population rose from 7,706 to 74,703. The city continued to grow between World Wars I and II. and after 1945 it spread on to the right bank of the Sava which there flows in an easterly direction, The centre of the new town is the Trg Republike (Square of the Republic). From there radiate main streets and avenues with their modern buildings. The city is most attractive. with many open squares and parks (Zrinjevac, Botanical gardens, Tuskanac. Maksimir).

Zagreb is the cultural centre of Croatia. It is the seat of the Yugoslav Academy of Science and Arts. There are a large university library, several picture galleries with old and modern paintings and a collection of engravings. various museums, a university, and academies of arts, music and theatrical art; an astronomic observatory and a nuclear energy institute named after Rudjer Boskovic (*see* BOSCOVICH, RUGGIERO GIUSEPPE).

The city is an important junction of roads and railways from western and central Europe to the Adriatic sea and southeastern Europe. It is connected by airlines with many European capitals from the airport at Lucko, 10 mi. from the town. Zagreb is one of the most important industrial and .manufacturing centres of

Yugoslavia. About 43% of the population is employed in industry, chiefly in the manufacture of machines. metal and electrotechnical products. textiles, chemicals, printing, leather and food. The Zagreb fair has an international character.

History. — Zagreb was first mentioned in the documents of 1093, when Ladislas I, king of Hungary and Croatia, established the Roman Catholic bishopric there. Of the settlements that previously existed on the site, the most important were Gradac (now the upper town) and the Kaptol, between whom a bitter feud raged for centuries. After the Tatar invasion in 1242 Bela IV, king of Hungary and Croatia, proclaimed Gradac a free and royal town. Then began the building of fortifications of which the towers of Lotrscak. Popov Toranj and Kamenita Vrata have survived. The upper town contains among its notable buildings the Gothic church of St. Marcus. the baroque church of St. Catherine, the palaces Zrinski and Orsic, a former Jesuit monastery and the neoclassic Draskovic palace. The Kaptol, fortified after 1466, has a Gothic cathedral (13th–I jth century) in the sacristy of which is a fresco of the 13th century; the cathedral was restored at the end of the 19th century. Near the cathedral is the archbishop's baroque palace with a chapel of St. Stephen (mid-13th century).

As a political centre, Zagreb played an important role in the history of Croatia, especially in the 1830s, the date of the Croatian national revival. It was also the centre of a strong Yugoslav movement of which Bishop J. G. Strossmayer (*q.v.*) was the intellectual inspirer. He was among the founders of the Southern Slav academy (1867) and of the Zagreb university (1874).

On Oct. 29, 1918, a national assembly met in Zagreb and decided that all links with the Austrian empire and the kingdom of Hungary should be severed, proclaiming Croatia, Slavonia and Dalmatia (with Rjeka) an independent state. On Nov. 24 the national council proposed to proclaim the unification of Croatia with Serbia and Slovenia. In 1921 the city's administrative area was increased to 27 sq.mi. and its population reached 108,338. Soon after the creation of a Yugoslav state serious differences arose between Croatian national aspirations for autonomy and Serbian tendencies to ard centralization. Zagreb became the centre of an autonomous movement. In April 1941, during World War II, Zagreb became the capital of the newly created independent Croatia. In April 1945 it was liberated from the axis powers by the Yugoslav partisan forces of Marshal Josip Broz (Tito) and became the capital of Croatia, one of the six component parts of the new federal people's republic of Yugoslavia. (See also YUGOSLAVIA: History.) (K. Š.-Š.; Mo. Š.)

ZAHARIAS, BABE (MILDRED ELLA) **DIDRIKSON** (1914–1956), U.S. athlete, one of the greatest of the first half of the 20th century, was a champion performer in basketball, track and field, and golf. Born June 26, 1914, at Port Arthur, Tex., she was a record breaker while still a high-school student. She was an All-American basketball player in 1930; won eight events and tied for a ninth in women's national track and field championships from 1930 to 1932 (1930, baseball and javelin throws; 1931, 80-m. hurdles, broad jump and baseball throw; 1932, 80-m. hurdles, javelin and baseball throws, and tied for the high-jump title), and captured two events in the 1932 Olympic games (q v., for her records there), setting a new record in winning the javelin event and establishing a new U.S. outdoor mark in the 80-m. hurdles. Miss Didrikson turned professional in the mid-1930s and gave athletic exhibitions throughout the country. In 1935 she began playing golf (with amateur standing) and soon became the leading woman golfer in the U.S. In 1947 she won 17 straight golf titles, including the British Women's Amateur, of which she was the first U.S. winner. She later became a professional golfer. In 1953 she underwent a cancer operation and appeared to be recovered when she later won the U.S. National Open and All-American Open in 1954. In 1956 she again submitted to cancer surgery and died Sept. 27, 1956, at Galveston, Tex. She married George Zaharias, the wrestler, in 1938. Her autobiography, This Life I've Led (1955), reveals her as a delightful and courageous woman as well as a great athlete. (D. SR.)

ZAHAROFF, SIR BASIL (1849–1936), financier and politician, was born in Mughla, Anatolia, of Greek parents, on Oct. 6, 1849. He was reputed to be one of the world's richest men. his fortune being built up from munitions plants, shipbuilding, oil and other enterprises. He exerted a strong if indirect influence during World War I and at the Paris conference, being a close friend and political adviser of Lloyd George, Venizelos, Clemenceau and Briand. During this period he extended very considerable financial aid to the British and French governments, and later was honoured by these countries for his war services. He is said to have given Greece $2,500,000 a year during the Balkan War, and half that sum during World War I. To the American Near East Relief fund for refugee relief projects in Greece he contributed several thousand pounds and he gave 1,000,000 fr. to France for the "save the franc fund." He established chairs of aviation at the universities of Paris, Petrograd and London, and endowed the Marshal Foch professorship of French literature at Oxford university and the Field-Marshal Haig chair of English literature at Paris university. He died Nov. 27. 1936.

ZAHN, ERNST (1867–1952), Swiss novelist and poet, was born at Zurich on Jan. 24. 1867. Long associated with his father in the management of the railway restaurant at Goschenen, at the entrance to the St. Gotthard tunnel, he became in turn councilor, judge and president of the diet of Canton Uri; but he later devoted himself wholly to literature. His first book was *Kämpfe* (1893), a romance; his most popular novel was Lukas *Hoch*strassers *Haus* (1907). Other notable volumes are *Blancheflur* (1923), Frau *Sixta* (1926), and two collections of short stories, Helden des *Alltags* (1906) and Das Licht (1912). *Herrgottsfäden* (1901), dealing with the St. Gotthard tunnel, was translated into English under the title of Golden Threads (1908). He died on Feb. 22, 19j2, at Zurich.

See a study by H. Spiero, *Ernst* Zahn (1927).

ZAISAN ("Noble"). (1) A lake of the Kazakh Soviet Socialist Republic. U.S.S.R., situated in a valley between the Altai range on the northeast and the Tarbagatai on the south, at an altitude of 1,266 ft. Its area is 707 sq.mi., and its surface is dotted with islands; it is 60 to 65 mi. long and 10 to 20 mi. wide and receives the drainage of ten rivers, including the Black Irtish and the Kendyrlyk; the White Irtish forms the northwestern outlet of the lake Roach, perch, carp, trout, nyelma and sterlet abound during the fishing season, May to August. The lake has a depth of 50 ft. and is navigable for steamers; and barges ascend the Black Irtish into Mongolia. (2) A town in the Kazakh Soviet Socialist Republic, U.S.S.R., in 47° 32′ N., 84° 56′ E., situated on a route into Mongolia, at an altitude of 2,200 ft. It lies southeast of Lake Zaisan and south of the Black Irtish. Pop. 8,130. Its tanning and leather industry is important and it is a centre for trade between Kazakhstan and Mongolia. Topolni Mis, on Lake Zaisan, acts as a port for it.

ZAKOPANE, a town of Poland in Krakow province, situated amid superb scenery in the heart of the Tatra mountains; a health resort both in summer and winter; the most frequented holiday resort of Polish tourists and rock climbers. It has important thermal springs. The town lies 1,000 m. above sea level and has an alpine climate. Pop. (1950) 20,600.

Zakopane was occupied by Germany in Sept. 1939, but was returned to Poland in 1945.

ZALEUCUS, of Locri Epizephyrii in Magna Graecia (fl. c. 660 B.C.), Greek lawgiver, is said to have been the author of the first written code of laws among the Greeks. The story has some familiar features. The Locrians were distressed at their own lawlessness; they commissioned Zaleucus, a slave, to draw up a code and he did so under divine inspiration. The code was a severe one of the Draconian type which remained unchanged for centuries. The story ends with the episode of the lawgiver committing suicide on discovering that he had inadvertently broken one of his own laws.

ZALMOXIS or ZAMOLXIS, a semimythical social and religious reformer, regarded as the only true god by the Thracian Getae. According to Herodotus (iv, 94), the Getae, who believed in the immortality of the soul, looked upon death merely as going to Zalmoxis. It is probable that Zalmoxis is Sabazius, the Thracian Dionysus or Zeus; Mnaseas of Patrae identified him with Cronus. In Plato *(Charmides,* 158 B) he is mentioned with Abaris as skilled in the arts of incantation. No satisfactory etymology of the name has been suggested.

ZAMA, BATTLE OF, 202 B.C. One of the most decisive battles in military history in its military result. Zama ranks above any, save perhaps Waterloo, for its decisive effect on the course of world history. For the defeat of Hannibal. the first and only true defeat in his career. left Carthage naked, and her surrender put an end to the long struggle between Rome and Carthage *(see* PUNIC WARS) for the mastery of the Mediterranean world.

The prologue to Zama had been the invasion of Africa by Scipio (*q.v.*), almost in defiance of the Roman senate nhich wished him instead to attack Hannibal, who still stood unconquerable in Southern Italy. In Africa Scipio's brilliant series of victories over less formidable generals had forced Carthage to sue for peace before Hannibal could answer the summons of recall. But while the peace negotiations were being conducted in Rome, Hannibal landed at Leptis, whereupon the Carthaginians broke the truce, and Scipio's military position was gravely compromised—isolated on hostile soil and with part of his force detached to assist his ally Masinissa in securing his new kingdom of Numidia. Instead of awaiting Hannibal near Carthage, Scipio cut himself off from his base and marched on a divergent path into the interior. Security lies often in calculated audacity, and an analysis of the military problems makes it highly probable that his march inland up the Bagradas valley was aimed, by its menace to the rich interior on which Carthage depended for supplies, to force Hannibal to push west to meet him instead of north to Carthage. By this clever move he threatened the economic base of Carthage and protected his own, also luring Hannibal away from his military base—Carthage. A complementary purpose was that this line of movement brought him progressively nearer to Numidia, shortening the distance which Masinissa would have to traverse with his expected reinforcement of strength.

It had the intended effect, for the Carthaginians sent urgent appeals to Hannibal to advance towards Scipio and bring him to battle, and within a few days he marched west, and arrived by forced marches at Zama. He then sent out scouts to discover the Roman camp and its dispositions for defence—it lay some miles farther west. Almost coincidently Masinissa arrived with 6,000 horse and 4,000 foot, and Scipio then broke up his camp and moved to a fresh site near the town of Narragara, his position being well chosen tactically, and having water "within a javelin's throw." Hannibal also moved his camp forward to meet him.

A parley between the two commanders led to no result, and both thereupon prepared to decide the issue by arms. The dispositions made by the rival leaders have several features of note. Scipio placed his heavy Roman foot—he had probably two legions—in the centre; Laelius with the Italian cavalry on the left wing; and on the right wing Masinissa with the whole of the Numidians, horse and foot. The heavy infantry were drawn up in the normal three lines: first, the *hastati;* then the *principes;* and finally, the *triarii.* But instead of adopting the usual chequer formation, with the maniples of the second line opposite to and covering the intervals between the maniples of the first line, he ranged the maniples forming the rear lines directly behind the respective maniples of the first line—thus forming wide lanes between each two cohorts.

The Carthaginian had eighty elephants, more than in any previous battle, and in order to terrify the enemy he placed them in front of his line. Supporting them, in the first line, were the Ligurian and Gallic mercenaries, intermixed with Balearic and Moorish light troops. In the second line were the Carthaginian and African levies, their combined strength probably exceeding that of the first line. Finally, Hannibal's own troops from Italy formed the third line, held back more than zoo yards distant from the others, in order evidently to keep it as an intact reserve. On the wings Hannibal disposed his cavalry, the Numidian allies on the left and the Carthaginian horse on the right. His total force was probably in excess of 50,000, perhaps 55,000. The Roman strength is less certain, but if we assume that each of Scipio's two legions was duplicated by an equal body of Italian allies, and add Masinissa's 10,000, the complete strength would be about 36,000.

The battle opened, after preliminary skirmishing, with Hannibal's order to the drivers of the elephants to charge the Roman line. Scipio promptly countered by a blast of trumpets along the whole line. The strident clamour so startled and terrified the elephants that many of them at once turned back on their own troops. This was especially the case on the left wing, where they threw the Numidians, Hannibal's best cavalry wing, into disorder just as they were advancing to the attack. Masinissa seized this golden opportunity to launch a counter-stroke, which inevitably overthrew the disorganized opponents. With Masinissa in hot pursuit, they were driven from the field, and so left the Carthaginian left wing exposed. The remainder of the elephants wrought much havoc among Scipio's *velites,* caught by their charge in front of the Roman line. But the foresight that had provided the "lanes" and laid down the method of withdrawal was justified by its results. For the elephants took the line of least resistance, penetrating into the lanes rather than facing the firm-knit ranks of the heavy infantry maniples. Once in these lanes the *oelites* who had retired into the lateral passages, between the lines, bombarded them with darts from both sides. Their reception was far too warm for them to linger when the door of escape was held wide open. While some of the elephants rushed right through, harmlessly, and out to the open in rear of the Roman army, others were driven back out of the lanes, and fled towards the Carthaginian right wing. "It was at this moment that Laelius, availing himself of the disturbance created by the elephants, charged the Carthaginian cavalry, and forced them to headlong flight. He pressed the pursuit closely, as likewise did Masinissa." Both Hannibal's flanks were thus stripped bare.

In the meantime the infantry of both armies had slowly advanced on each other, except that Hannibal kept his third line back. At first the Gauls and Ligurians had the balance of advantage, through their personal skill in skirmishing and more rapid movement. But the Roman line remained unbroken, and the weight of their compact formation pushed the enemy back despite losses. Another factor told, for while the leading Romans were encouraged by the shouts from the rear lines, coming on to back them up, Hannibal's second line—the Carthaginians—failed to support the Gauls, but hung back in order to keep their ranks firm. Forced steadily back, and feeling they had been left in the lurch by their own side, the Gauls turned about and fled. When they tried to seek shelter in the second line they were repulsed by the Carthaginians, who deemed it essential to avoid any disarray which might enable the Romans to penetrate their line. In a short time the relics of the first line had dispersed completely, or disappeared round the flanks of the second line. The latter, however, showed their fighting quality by thrusting back the Roman first line—the *hastati.* In this they were helped by a human obstacle, the ground encumbered with corpses and slippery with blood, which disordered the ranks of the attacking Romans. Even the *principes* had begun to waver when they saw the first line driven back so decisively, but their officers rallied them, and led them forward in the nick of time to restore the situation. This reinforcement was decisive. Hemmed in, because the Roman formation produced a longer frontage and so overlapped their line, the Carthaginians were steadily cut to pieces. The survivors fled back on the relatively distant third line, but Hannibal continued his policy of refusing to allow the fugitives to mix with and disturb an ordered line.

The curtain now rose on what was practically a fresh battle. The Romans "had penetrated to their real antagonists, men equal to them in the nature of their arms, in their experience of war, in the fame of their achievements. . . ." Livy's tribute is borne out by the fierceness and the long uncertain issue of the subsequent conflict, which refutes the suggestion that Hannibal's "Old Guard" was but a shadow of its former power—in the days of Trasimenus and Cannae. The Romans had the moral advantage of having routed two successive lines, as well as the cavalry and elephants, but they had now to face a compact and fresh body of probably 24,000 veterans, under the direct inspiration of Hannibal. And no man in history has shown a more dynamic personality in infusing his own determination in his troops. The Romans, too, had at last a numerical advantage, not large, however—the forces were "nearly equal in numbers" according to Polybius—and in reality still less than it appeared. For while all Hannibal's third line were fresh, on Scipio's side only the *triarii* had not been engaged, and these represented but half the strength of the *hastati* or *principes*. Further, the *velites* had been so badly mauled that they had to be relegated to the reserve, and the cavalry were off the field, engaged in the pursuit. Thus it is improbable that Scipio had at his disposal for this final blow more than 18,000 or 20,000 infantry, less the casualties these had already suffered.

His next step is characteristic of the man—of his cool calculation even in the heart of a battle crisis. He sounded the recall to his leading troops, and then, in face of an enemy at hardly more than a bow-shot distance, he not only reorganized his troops but reconstructed his dispositions. His problem was this: against the first two enemy lines the Roman formation, shallower than the Carthaginian phalanx and with intervals, had occupied a wider frontage, and so enabled him to overlap theirs. Now, against a body double the strength, his frontage was no longer, and perhaps less, than Hannibal's. His appreciation evidently took in this factor, and with it two others. First, that in order to concentrate his missile shockpower for the final effort it would be wise to make his line as solid as possible and this could be done because there was no longer need for or advantage in retaining intervals between the maniples. Second, that as his cavalry would be returning any moment there was no advantage in keeping the orthodox formation in depth and using the *principes* and *triarii* as a direct support and reinforcement to his front line. The blow should be as concentrated as possible in time and as wide as possible in striking force rather than a series of efforts. He, therefore, made his hastati close up to form a compact centre without intervals. Similarly he closed each half of his *principes* and *triarii* outwards, and moved them forward to extend the flank on either wing. He now once more overlapped the hostile front. The rôle of Scipio's infantry in the final phase was to fix Hannibal's force ready for the decisive manoeuvre to be delivered by the cavalry. For this rôle violence and wideness of onslaught was more important than sustenance. Scipio made his redistribution deliberately and unhurriedly—the longer he could delay the final tussle, the more time he gained for the return of his cavalry. It is not unlikely that Masinissa and Laelius pressed the pursuit rather too far, and so caused an unnecessary strain on the Roman infantry and on Scipio's plan. For Polybius tells us that when the rival infantries met, "the contest was for long doubtful, the men falling where they stood out of determination, until Masinissa and Laelius arrived providentially at the proper moment." Their charge, in the enemy's rear, clinched the decision, and though most of Hannibal's men fought grimly to the end, they were cut down in their ranks. Of those who took to flight few escaped.

The completeness of the victory left no room for a strategic pursuit, but Scipio did not linger in developing the moral exploitation of his victory. An immediate move on Carthage achieved its object, a bloodless capitulation.

ZAMBEZI, the fourth in size of the rivers of Africa, and the largest of those flowing eastward to the Indian ocean. Its length (taking all curves into consideration) is about 2,200 mi. The area of its basin, according to Dr. Bludau, is 513,500 sq.mi., or rather less than half that of the Nile. The main channel is clearly marked from beginning to end. The river takes its rise in 11° 21' 3" S., 24° 22' E. The source lies in British territory in a depression of an undulating country 5,000 ft. above the sea, covered with bracken and open forest. The water, like that of all the rivers of the neighbourhood, issues from a black marshy bog. Eastward of the source the water parting between the Congo and Zambezi basins is a well-marked belt of high ground, falling abruptly north and south, and running nearly east and west between 11° and 12° S.

The Upper River.—The infant Zambezi, after pursuing a southwesterly course for about 150 mi., turns more directly south and receives on either side numerous small tributaries. A few miles above Kakengi (in 12° 24′ S.), the Zambezi, narrow, picturesque and tortuous, suddenly widens from 100 to 350 yd. Below Kakengi are a number of rapids ending (13° 7 S.) in the Suapuma cataracts. At this point the river flows tumultuously through a rocky fissure,

The first of its large tributaries to enter the Zambezi is the Kabompo, a left-hand affluent. It joins the main stream in 14" 26' S. A little lower down (14" 18' S.) the Zambezi receives from the west the waters of a much larger stream than the Kabompo, namely, the Lungwebungu. The land, from 5,000 ft. at the source, falls gradually to 3,600 ft. at Kakengi—a distance of 220 mi. From this point until the Victoria falls are reached—500 mi.—the level of the Zambezi basin is very uniform, the fall being in this distance 600 ft. only. Twenty miles below the confluence of the Lungwebungu the country becomes flat, and in the rainy seasons is largely covered by floods. From the east the Zambezi continues to receive numerous small streams, but on the west is without tributaries for 150 mi., when the great river formerly misnamed the Chobe, but known to the natives as Kwando or Linyante, joins it (17° 47′ S.).

The Middle **Zambezi.**—The Victoria falls (*q.v.*) are reached some 60 mi. below the Kwando confluence. The surrounding country is formed of horizontal flows of basic lavas, which are traversed by two well-marked sets of joints. Along these the river has eroded a great canyon. The middle course of the river may be said to extend for 800 mi. below the Victoria falls to the Kebrabasa rapids, where the Zambezi crosses the great East African escarpment, and enters the coastal belt.

The Lower **River.**—The lower Zambezi—400 mi. from Kebrabasa rapids to the sea—presents no obstacles to navigation save the shallowness of the stream in many places in the dry season. This shallowness arises from the different character of the river basin. Instead of, as in the case of the middle Zambezi, flowing mainly through hilly country with well-defined banks, the river traverses a broad valley and spreads out over a large area. Only at one point, the Lupata gorge, 200 mi. from its mouth, is the river confined between high hills. There it is scarcely 200 yd. wide. Elsewhere it is from 3 to 5 mi. wide, flowing gently in many streams. The river bed is sandy, the banks are low and reed-fringed. At places, however, and especially in the rainy season, the streams unite into one broad swift-flowing river. About 100 mi. from the sea the Zambezi receives the drainage of Lake Nyasa through the river Shiré. On approaching the ocean, which it reaches in 18° 50′ S., the Zambezi splits up into a number of branches and forms a wide delta. Each of the four principal mouths—Milambe, Kongone, Luabo and Timbwe—is obstructed by a sand bar.

Mileage of Navigable Water.—Zambezi, like all other large African rivers, suffers because of the bar at its mouth, the shallowness of its stream, and the rapids and cataracts which interrupt its course. Nevertheless, it is navigable (1) from the sea to the Kebrabasa rapids, 400 mi.; (2) from Chikoá (above Kebrabasa) to within 140 mi. of the Victoria falls, 700 mi.; (3) from the rapids above the Victoria falls to the Katima Molilo rapids, 100 mi.; (4) above the Gonye falls to the Supuma cataract, 300 mi.; (5) above the Supuma cataract, 120 mi.

Several of the Zambezi affluents are also navigable; the sum of such navigable reaches within the Zambezi basin is nearly 4,000 mi.

Exploration of the River.—The Zambezi region was known to the medieval geographers as the empire of Monomotapa and the course of the river, as well as the position of lakes Ngami and Nyasa, were filled in with a rude approximation to accuracy in the earlier maps. These were probably constructed from Arab information. The first European to visit the upper Zambezi was David Livingstone in his exploration from Bechuanaland between 1851 and 1853. Two or three years later he descended the Zambezi to its mouth and in the course of this journey discovered the Victoria falls. During 1858–60, accompanied by John (later Sir John) Kirk, Livingstone ascended the river by the Kongone mouth as far as the falls, besides tracing the course of its tributary, the Shiré, and discovering Lake Nyasa.

See David and Charles Livingstone, *Narrative of an Expedition to the Zambesi and its Tributaries* (1865); A. de Serpa Pinto, *How I Crossed Africa* (1881). (*F. R. C.*)

ZAMBOANGA, a former province of the Philippine Islands, now divided into the provinces of Zamboanga del Norte (pop. [1959 est.] 205,443) and Zamboanga del Sur (pop. 433,967). The total population has increased by more than 70% since 1939. Together these provinces occupy the major part of the Zamboanga peninsula on the western side of the island of Mindanao. The border between the provinces is marked by a range of mountains, which culminates in Mt. Dapiak (8,586 ft.) in the northeast. Major stands of high-grade Philippine mahogany and other hardnoods are found here. Rice, corn and coconuts are leading crops while cassava and tropical fruits are secondary; in the late 1950s the cultivation of coffee and cacao mas developing. Gold, long known in Zamboanga del Sur. has not been produced commercially since 1941. Coal. both soft and hard, is mined in limited quantities near Malangas, Zamboanga del Sur. Dipolog, a trading and fishing centre on the north coast, and Pagadian on the south coast are the respective provincial capitals. After 1948 there were substantial movements of pioneer settlers from northern islands to these provinces, especially to the central portion of Zamboanga del Sur. (R. E. HE.)

ZAMBOANGA, CITY OF, a chartered city on the southwestern tip of Mindanao Island, Republic of the Philippines. The city is actually an extensive area that comprises 3 municipalities and 37 barrios (villages) in addition to the administrative centre (población). The population (1959 est.) of the city was 126.570, with about 22,000 in Zamboanga población. The city has a good port on Basilan strait, protected by Basilan Island; its large T wharf accommodates interisland and ocean-going vessels. Zamboanga exports Philippine mahogany and other fine hardwood; it is also a centre for processing and exporting copra.

A native settlement had long existed on the site when the Spanish town was founded in 1635. Fort San Pedro, which protected the harbour and was a centre for expeditions against the Moros both under the Spanish and the American regimes. stands as a national monument. The beauty of the población with its Spanish-style buildings, two fine hotels, excellent beaches, mountainous backdrop and a climate cooler and less rainy than Manila's make this a favourite tourist spot. It is a centre for Moro handicrafts, a collecting point for shells (exported or used locally for button manufacture) and a modest fishing port. (R. E. HE.)

ZAMIA, a genus of cycads that comprises about 30 species of small fernlike plants, native to tropical and subtropical America. They have a turniplilre, mostly underground stem surmounted by a crown of leaves, one to two feet long, surrounding large fruiting cones. The crushed stems yield starch used for food, after washing to extract an alkaloid. Two species, *Z. floridana* and *Z. pumila,* known as coontie or comfortroot, occur in southern Florida.

ZAMORA, an inland province of Spain, one of the three into which the former province of León was divided in 1833; bounded W. by Portugal and Orense, N. by León, E by Valladolid. S. by Salamanca. Pop. (1950) 316,493; area 4,082 sq.mi. Zamora is traversed from east to west by the river Duero or Douro (*q.v.*); the Tormes also skirts the southwestern boundary for about 25 mi. Except in the northwest, where it is entered by two outlying ridges of the Cantabrian mountains, the Sierra de la Culebra and Sierra de Peña Negra, the surface is a level or slightly undulating plateau; its lowest point is 1.070 ft. Its plains, especially the valley of the Esla, yield much grain and pulse; wine and flax are also produced; and on the higher grounds many merino sheep and goats are reared.

ZAMORA, an episcopal city, and the capital of the Spanish province of Zamora; on the right bank of the river Duero (Douro). Pop. (1950) 35,392. In the early period of the Christian reconquest Zamora was a place of considerable strategic importance. Ferdinand I of Castile and Leon in 1061 gave it to his daughter Doña Urraca. After his death in 1065 his son Sancho II disputed. possession with Urraca and laid siege to the city, but without success, although the famous Cid Ruy Diaz de Bivar mas among his warriors. Zamora became subject to Alphonso VI in 1073. Zamora occupies a rocky height overlooking the Duero, a little below its confluence with the Valderaduey. The river is crossed by a fine 14th-century bridge of sixteen pointed arches. The citadel of Zamora dates from the 8th century. The small but beautiful Romanesque cathedral, one of four 12th-century churches, was completed about 1175.

ZAMOYSKI, JAN (1541–1605), Polish statesman, was the son of Stanislaw, Castellan of Chelm. and Anna Herburtowna, a noble Polish lady. After completing his education at Paris. Strasbourg and at Padua, where as rector of the academy he composed his celebrated work *De senatu romano* (Venice, 1563), he returned home in 1565, one of the most consummate scholars and jurists in Europe, and at once entered politics. He played a leading part, after the death of Sigismund II. in remodeling the Polish constitution and procuring the election of Henry of Valois. After the flight of that prince Zamoyski seems to have aimed at the throne himself, but quickly changed his mind and supported Stephen Báthory, whose election he prepared and uhose foremost counselor he became. Appointed chancellor on May 1, 1576, immediately after the coronation. as *wielki hetman,* commander-in-chief, in 1580, Zamoyski strenuously supported Stephen during his long struggle with Ivan the Terrible. He also enabled the king in 1585 to bring the traitorous Samuel Zborowski to the scaffold. On the death of Stephen, the Zborowski recovered their influence and did their utmost to keep Zamoyski in the background. At the election diet of July 9, 1587, however, Zamoyski triumphed over his rivals, and rejecting an offer from the Habsburgs of the title of prince, with the Golden Fleece and 20,000 ducats, procured the election of Sigismund of Sweden, son of Catherine Jagiellonica (Aug. 19). The opposite party immediately elected the Austrian archduke Maximilian, but Zamoyski routed and captured the archduke at Byczyna (Jan. 24, 1588).

From the first there was a certain coldness between the new king and the chancellor, Sigismund desiring an alliance with the Habsburgs, which Zamoyski feared. Friction became acute when Sigismund appointed an opponent of Zamoyski vice-chancellor, and made other ministerial changes which limited his authority; though ultimately, with the aid of his partisans and the adoption of such desperate expedients as the summoning of a confederation to annul the royal decrees in 1592, Zamoyski recovered his full authority In 1595 Zamoyski, in his capacity of commander-in-chief, at the head of 8,000 veterans, dethroned the anti-Polish hospodar of Moldavia and installed in his stead a Catholic convert, George Mohila. On his return he successfully sustained in his camp at Cecora a siege by the Tatar khan. Five years later (Oct. 20, 1600) he won his greatest victory at Tirgoviste, over Michael the Brave, hospodar of Walachia and Moldavia. But beyond securing the Polish frontier Zamoyski would never go. He refused to wage war with Turkey even under the most favourable circumstances, nor could he be drawn into the Holy league against the Ottomans in 1600, making conditions for Poland's co-operation which its allies could not possibly accept. Statesman though he was, Zamoyski cannot, with all his genius and valour, be called a true patriot. Sigismund was undoubtedly right when he attempted to reform the Polish constitution in 1605 by strengthening the royal power and deciding all measures in the future by a majority of the diet. These reforms Zamoyski strenuously opposed. His last speech was in favour of the anarchic principle of free election. He died suddenly at Zamosć, June 3, 1605.

ZAMUCAN, a group of tribes of South American Indians constituting an independent linguistic stock and occupying an area lying west of the Paraguay river in the Paraguayan and Bolivian Chaco. The most important tribes are the Zamuco proper (from whom the name Zamucan derives), the Guaraiioca, the Chamacoco, the Tsirakua and the Moro. Living in a subdesert area, they are seminomadic hunting people, only a few of whom practise agriculture. They construct flimsy temporary huts made of mats and, like all Chaco tribes, make bags and clothing from the fibres of the Bromelia plant. They are divided into limited bands consisting of a few families under the loose authority of a chief. The Chamacoco are the only tribe whose religious life is known. They have a cult devoted to the worship of a Supreme Goddess, mother of the universe, and propitiate the spirits by singing and dancing. At the close of the initiation ceremonies for young men, masked men impersonate spirits at a great feast. Women are not allowed to observe these rites lest they die. Diseases are treated by shamans who are in close touch with the supernatural world.

The ancient Zamucos have disappeared. Chamacoco who have come under the influence of white men have lost their aboriginal culture and are dwindling in number. The Tsirakua and the Moro of the northern Chaco and of Chiquitos (Bolivia) have remained hostile to whites and are practically unknown. See also INDIAN, LATIN-AMERICAN.

See G. Boggiani, "I Ciamacoco," *Bolletino della Società geografica italiana,* ser. 3, vol. 7, pp. 466–510 (1894) ; A. Métraux, "Ethnography of the Chaco," *Handbook of South American Indians,* vol. i (1946). (A. Mx.)

ZANESVILLE, a city of southeastern Ohio, U.S., 55 mi. E. of Columbus at the confluence of the Muskingum and Licking rivers; the seat of Muskingum county. Zanesville's outstanding landmark is a Y-shaped concrete bridge completed in 1902 to connect the east bank of the Muskingum with both sides of the Licking on the west bank. The site was on the route of Zane's trace, a road from Wheeling, W.Va., to the Ohio river opposite the town of Limestone, now Maysville, Ky., cleared by Ebenezer Zane under act of congress of 1796. Zane, who received land in payment for opening the road (later a part of the old national road), staked out a section at the present city but later sold it to his son-in-law John McIntire who, seeing the advantages of the water power and transportation facilities, laid out the town in 1799 and named it in honour of Zane. Through McIntire's efforts it became the county seat in 1804 and from 1810 to 1812 was also capital of Ohio. It was incorporated as a city in 1850 and has a council-manager form of government, in effect since 1958.

From the early 19th-century stoneware industry grew several pottery and tile plants that made Zanesville "the clay city" from 1890 to 1930. After World War II its industry became more diversified, including not only a large tile plant but also plants for the manufacture of glass, electrical equipment, sheet metal, alloy steel, batteries, farm machinery and cement. Zanesville also has a branch of Ohio university (see OHIO: *Education*); Muskingum, a Presbyterian college chartered in 1827, is located 16 mi. E. at New Concord. The city has a municipal auditorium and stadium, radio and television stations and an art institute. As a result of the 1913 flood in the Muskingum valley, congress authorized a network of 14 reservoirs which was completed in 1938; the Dillon dam and reservoir, 4 mi. N. of Zanesville on the Licking river, was completed in 1960.

The novelist Zane Grey (*q.v.*), a descendant of Ebenezer Zane, was born in Zanesville. For comparative population figures see table in OHIO: Population. (N. F. S.)

ZANGWILL, ISRAEL (1864–1926), Jewish man of letters, was born in London on Feb. 14, 1864. His early childhood was spent in Plymouth and at Bristol. When he was nine his parents settled in Spitalfields, and he entered the Jews' Free school, where eventually he became a teacher while working for his university degree. He soon gave up teaching for journalism, however.

He made his literary reputation with a novel, The Children of the Ghetto (1892), followed by Ghetto Tragedies (1893); Dreamers *of* the Ghetto (1898); and other tales and novels of great interest dealing with Jewish life. The Children *of* the Ghetto was produced as a play in New York city with success in 1899, and was later extensively played both in English and Yiddish.

He was greater as a playwright than as a novelist, and was a skilful painter of Jewish ideals and problems. Merely *Mary* Ann (1903) and Too Much Money (1918) represent his lighter gift; The *Melting* Pot (1908), The War God (1911) and others deal with serious social questions. Zangwill was an outstanding personality in the Jewish world. He was at one time president of the Jewish Territorial Organization for the Settlement of Jews Within the British Empire, and later a fervent supporter of the Zionist movement. He died on Aug. 1, 1926.

ZANTE (ZÁKYNTHOS; anc. ZACYNTHUS), southernmost of the Ionian Islands, west of Greece, 25 mi. long, about 12 mi. broad and 64 mi. around, with an area of 154 sq.mi. and a population in 1951 of 38,054. Zante lies 8 mi. S. of Cephalonia (Kefallinia), forming with it, Leucas (Leukas) and Ithaca (Ithake) a crescent-shaped group, the crest of a submerged limestone ridge facing the Gulf of Patras. Zante is of somewhat irregular oval shape, indented by a deep inlet at its south end. A wide fertile central plain is skirted on the west by bare limestone hills 1,000 to 1,200 ft. high, which fall gently landward, but with steep sea cliffs culminating northward in Mt. Skopos (anc. Elatos, 2,461 ft.). On the east the plain is also limited by a low ridge. These hills are still densely clothed to the summit with olives, figs, myrtles, laurels, oranges, aloes, vines and other subtropical plants. The central plain is an almost continuous stretch of gardens and vineyards, with a few cornfields and pastures. The peculiar dwarf vine, the currant (from Corinth) of commerce, is the staple export of Zante, as of the neighbouring mainland. It grows to 3 ft., begins to yield in seven years and lasts a century. Earthquakes are frequent and at times disastrous. Other volcanic indications are the oil springs on the coast and in the bed of the sea near Cape Skinari on the north. and especially the bituminous wells in a swamp near the coast village of Chieri.

Zante, capital and seaport, on the east side, with a population (1951) of 11,126, occupies the site of ancient Zacynthus, said to have been founded, like the neighbouring citadel of Psophis, by Zacynthus, son of Dardanus, a legendary Arcadian chief.

Traditionally Zacynthus belonged to Ulysses, king of Ithaca, and was peopled by settlers from Achaea or Arcadia. It figures occasionally in history as a base for belligerents. Thus during the Peloponnesian War and again in 374 B.C. the Athenians used it; in 357 it was the headquarters of Dion on his expedition against Syracuse; in 217 it was seized by Philip V of Macedon. The Romans captured it in 211 but restored it temporarily to Philip; in 191, to keep it out of the hands of Greek powers, they annexed it themselves. Under the Roman empire, Zante was included in the province of Epirus. In the 11th century it passed to the Norman kings of Sicily; after the fourth crusade it belonged at various times to the despots of Epirus, the emperors of Constantinople and the Orsini counts of Cephalonia. After remaining from 1357 to 1482 in the hands of the Tocco family it became a Venetian possession. In 1797 it was ceded to France, and after a short occupation by the Russians was brought under British protection; in 1864 it was ceded with the other Ionian Islands to Greece. During World War II, it was occupied by Italy.

ZANZIBAR, a sultanate and British protectorate of east Africa. The sultanate, formerly of a much larger extent (see History), is now reduced to the islands of Zanzibar and Pemba, some adjacent islets and the nominal sovereignty of a strip of coast line—10 mi. deep—forming the protectorate of Kenya (see KENYA). The collective area of the sultanate (Zanzibar and Pemba) is 1,020 sq.mi.

Topography. — The island of Zanzibar is situated in 6" S. latitude and 39° E. longitude, and is separated from the mainland of Africa by a channel 22½ mi. across at its narrowest part. It is the largest coralline island on the east coast of Africa and forms part of a coralline reef extending from Pemba (*q.v.*) to the north down to Mafia in the south and constituting a sort of outer coast line to the main continent. The island of Zanzibar is about 52 mi. long and approximately 27 mi. broad (maximum measurements) and has an area of 640 sq.mi. About 4 mi. off the northwest coast of Zanzibar and forming part of the coral reef is the densely wooded island of Tumbatu. The island of Zanzibar is not exclusively of coralline formation; in the central parts of the island there are a number of gently sloping heights of reddish ferruginous clay, the highest of these being the Mazingini ridge (390 ft.).

The seasons are well defined. From December to March the northeast monsoon blows and the climate is hot and comparatively dry. Heavy rains fall during April and May. The coolest and driest period of the year is from June to October, when the southwest monsoon is blowing. The lesser rains fall in November and December. Normal annual rainfall is about 58 in., the precipitation in the western part of the island being heavier than in the eastern. The climate is tropical, but throughout most of the year the heat is tempered by sea breezes which blow with great regularity except daring the period of the change of the monsoons.

Flora and Fauna.— Very little now remains of the extensive forests which formerly covered the island. The western part has been cleared for cultivation and the eastern part is mostly covered with low scrub.

Among cereals rice is the most ubiquitous crop, both the swamp and the hill varieties being planted. The next most important are maize, sorghum and millet. Vegetables include cassava, sweet potatoes, pumpkins and various kinds of beans and peas. Sugar cane is still popular, though not cultivated as extensively as formerly. Zanzibar also enjoys a great variety of tropical fruits. Though clearances for clove and coconut plantations have in the past led to much disafforestation, a number of solitary giant trees have been left and also a few small forest belts. The largest of these is at Jozani, in the southern portion of the island and is about 2½ sq.mi. in area.

Among the mammals of Zanzibar are a few species of monkey, including the Colobus *kirkii*, now virtually extinct. Two species of lemur are quite common. The African bush pig is found in the less populated districts. The carnivora include the leopard (still to be found in the more remote areas), the civet cat, genet cat and the mongoose. Rodents are not numerous, the most common being the squirrel and giant rat as well as the ubiquitous house rat and mouse. Insectivora include the elephant shrew (first found in Zanzibar) and the shrewmouse. Among the birds are many beautifully coloured tropical forms; game birds are not common. There are very few poisonous snakes but pythons are common, and a few specimens of cobra and adder have been found. The lizards include the giant monitor.

HISTORY

The past history of Zanzibar has been to a very large extent shaped by two things, namely: (1) the monsoons; and (2) its close proximity to the main continent. The regular annual recurrence of the monsoons has made possible its close connection with India and the countries bordering the Red sea and the Persian gulf. The close proximity of the island to the continent has made it a suitable jumping-off point for trading and exploring ventures not only along the coast of east Africa but also into the interior of the continent.

Though the first references to Zanzibar occur only after the rise of Islam. there would appear to be little doubt that its close connection with southern Arabia and the countries bordering the Persian gulf began long before the Christian era. It is possible that it is the island of Menuthias which is mentioned in the Greek treatise known as the *Periplus* and written about A.D. 60. Zanzibar is first mentioned in the 11th century when one of the Persian rulers of Kilwa fled before some invaders and took refuge in Zanzibar. A Kufic inscription at Kisimkazi at the south end of the island records the founding of a mosque by a local ruler in A.H. 500 (A.D. 1107). Writing at the beginning of the 13th century, the Arab geographer Yakut records that in his time the people of Lenguja (viz., Unguja, the Swahili name for Zanzibar) had taken refuge from their enemies on Tumbatu, the inhabitants of which mere Moslems. At the close of the 15th century sultans ruling in Zanzibar more than once intervened in disputes as to the succession to the sultanate of Kilwa. Native traditions go to show that at this date there was more than one ruler in the southern portion of Zanzibar Island and that the northern portion thereof was ruled by a Sheha living on Tumbatu.

In 1503 Zanzibar Island was attacked and made tributary by the Portuguese and appears to have remained in that condition for about a quarter of a century, though the Portuguese frequently found great difficulty in collecting their dues. Thereafter the relations between the rulers of Zanzibar and the Portuguese seem to have been those of allies, the people of Zanzibar more than once co-operating with the Portuguese in attacks upon Mombasa. In 1571 the then "king" of Zanzibar, in gratitude for Portuguese assistance in expelling certain African invaders, donated the island to his allies, but the donation was never implemented. A Portuguese trading factory and an Augustinian mission were established on the site of the modem city of Zanzibar and a few Portuguese appear also to have settled as agriculturists in different parts of the island. When the Arabs captured Mombasa in 1698 all these settlements were abandoned and (except for a brief Portuguese reoccupation in 1728) the island came under the domination of the rulers of Oman. For more than a century those rulers left the government of Zanzibar to local hakims (governors). The first sultan to take up his residence in Zanzibar was Said bin Sultan, who arrived there in 1828 and subsequently greatly extended his influence along the whole of the east African coast from Mogadishu as far south as Cape Delgado. On Said's death in 1856 his son Majid succeeded to his African dominions, while another son, Thuwaini, succeeded to Oman.

As the result of an award made in 1861 by Lord Canning, governor general of India, the former African dominions of Said were declared to be independent of Oman. Majid died in 1870 and was succeeded by his brother Barghash (Burgash). Toward the end of the latter's reign the mainland dominions of the sultans of Zanzibar suffered dismemberment. The coastal territories were divided among the European powers. Barghash died in 1888. Both he and Majid had acted largely under the influence of Sir John Kirk (*q.v.*), who was British consular representative at Zanzibar from 1866 to 1887. It was by Kirk's efforts that Barghash consented in 1873 to a treaty for the suppression of the slave trade throughout his dominions. Had an offer made by Barghash in 1877 been accepted, the whole of his mainland territories would at that date have been leased to a British company.

British Protectorate.— In 1890 what was left of the sultanate was proclaimed a British protectorate, in conformity with conventions whereby France and Germany recognized the supremacy of British interests in Zanzibar and the British government agreed to renounce all claims to Madagascar in favour of France and ceded Heligoland to Germany. In the same year a constitutional government was instituted under British auspices with Sir Lloyd Mathews as first minister. In Aug. 1896, on the death of the then sultan, Hamad bin Thuwaini, the royal palace at Zanzibar was seized by Khalid, a son of Sultan Barghash, who proclaimed himself as sultan. The British government disapproved this claim, and, as he refused to submit, the palace was bombarded by British warships. Khalid escaped and took refuge at the German consulate, whence he was conveyed to German East Africa. Hamud bin Mohammed was then installed as sultan (Aug. 27, 1896). In 1897 the legal status of slavery was finally abolished, compensation being given to the slave owners, who were mostly Arabs and had mainly employed slave labour on their clove and coconut plantations.

In 1913 the control of the protectorate passed from the foreign office to the colonial office,when the posts of consul general and first minister were merged in that of British resident, who was appointed subject to the control of the governor of the British East Africa protectorate as high commissioner. At the same time a protectorate council was constituted as an advisory body. In 1925 the post of high commissioner was abolished and the British resident was made directly responsible to the colonial office. At the same time the advisory council was replaced by nominated executive and legislative councils.

Khalifa bin Harub (b. 1879) became sultan in 1911. As the leading Moslem prince in east Africa his moderating influence did much to steady Moslem opinion in that part of Africa at times of political crisis, especially during the two world wars. During World War I the most dramatic incident for Zanzibar was the sinking on Sept. 20, 1914, of the British cruiser "Pegasus," while it lay at anchor in Zanzibar roadstead undergoing repairs, by the German cruiser "Königsberg." Though Zanzibar was never a theatre of operations during World War II, many of its inhabitants served with the forces in East Africa and Burma.

SOCIAL CONDITIONS, ADMINISTRATION AND ECONOMY

Population.— The southern and eastern portions of the island are mainly populated by a Bantu-speaking people known as the Wahadimu; the northern part of Zanzibar Island and the adjacent Tumbatu Island are peopled by another Bantu-speaking people known as the Watumbatu. These two groups represent the earliest arrivals in Zanzibar. Throughout the 19th century and after, they have been expropriated from the western and more fertile parts of the island by later arrivals and still tend to keep aloof from the rest of the inhabitants. They are for the most part fishermen. Cattle raising was formerly one of their industries, but of recent years their herds have greatiy diminished. Ropemaking (from coir) is carried on extensively by the Wahadimu women in the southern villages of the island. The remainder of the population is of a very heterogeneous character, including Arabs, Indians, Goans, Europeans, Swahili and representatives of tribes from many parts of east Africa. The census of 1948 showed a population in Zanzibar and Pemba of 264,162, the Arabs 44.560, the Indians 15,892, the Goans less than 700 and the Europeans under 300. The population of Zanzibar Island was 149,575 and that of Pemba 114,587. The only large town is the city of Zanzibar itself, with a population of 45,284.

Education.—During 1950 there were in the protectorate 41 government primary schools. 13 grant-aided schools, two government secondary schools (one for boys and one for girls), one rural middle school (junior secondary), one male teaching-training centre for secondary teachers and two other teaching-training centres for primary schools (one for men and one for women). There are also four small independent schools—the Comorian school and three catering for younger children of various Indian sects. In addition there are several hundred nongovernment Koran schools scattered throughout the island, each a one-teacher one-class school giving purely religious instruction. Girls' schools were not organized until 1927 and at the present time boys attending schools outnumber girls by about 5 to 1. The grant-aided schools include schools managed by the Christian missions operating in the island (the Universities Mission to Central Africa, the Society of the Holy Ghost and the Friends' Industrial).

Administration.—In Sept. 1956 important changes were made in the constitution. A privy council was constituted, which, when so requested by the sultan, tenders advice to him in relation to the exercise of any powers vested in him and the performance of any of his duties, and also performs such other functions as may be prescribed by any law. The privy council consists of the British resident, chief secretary and attorney general and not more than three other persons appointed by the sultan. There is also an executive council presided over by the British resident and comprising four ex-officio members, three nominated official members and three representative members. The legislative council is also presided over by the British resident and comprises 4 ex-officio members, 9 nominated official members and 12 representative members. In May 1957 another change in the constitution provided for six representative members to be elected. The first election was held in July 1957 on a qualitative, all-male franchise, and 90% of the 40,000 voters went to the polls.

In civil matters fundamental law is Moslem law except in so far as the same may be modified or repealed by any law in force Legislation consists of decrees of the sultan, orders in council of the British sovereign and certain English statutes of general application. The sultan's decrees are binding upon all persons when countersigned by the British resident.

Economic Conditions.—The modern development of Zanzibar began at about the time of the first arrival of Said bin Sultan in 1828. Clove cultivation began a few years before that date, but owed its expansion largely to the example and encouragement of Said. In addition the contemporaneous opening up of the interior of Africa provided Zanzibar with a considerable trade in ivory, slaves, cotton goods and rice. Many merchants from India settled in Zanzibar and—apart from the traffic carried on in dhows with Arabia—the trade fell very largely into their hands. Many Arabs who owned clove and other shambas (plantations) failed to adapt themselves to the changed conditions resulting from the abolition of slavery with the result that their shambas passed into other hands. Clove cultivation is at the present time carried on by Africans and Indians as well as Arabs. The protectorate produces more than 80% of the world's supply of cloves, the yearly average export of which for the years 1952–56 amounted to 204,000 centals (100 lb), the area under clove cultivation being about 50,000 ac. The coconut industry ranks next in importance, copra products such as coconut oil, soap and oil cake forming some of the protectorate's main exports. Chilies, coil tobacco, citrus and other fruits also form part of the export trade. Rice is grown on a fairly extensive scale for local consumption. The principal imports are grains, grain products and cotton piece goods. In 1952–56 the yearly average value of imports was £5,272,469 and the yearly average value of exports was £5,242,749. The East African Currency board shilling (of 100 cents) became the standard coin in 1936, replacing the Indian rupee. Indian and South African banks have branches in Zanzibar. Total revenue amounted in 1956 to £2,350,871, including £1,699,628 from customs; total expenditure in the same year was £2,429,044.

Communications.—The port of Zanzibar is well served by British and other European and American shipping companies. The Zanzibar government also maintains a regular steamship service with Pemba and Dar es Salaam Cable service is provided by Cable and Wireless, Ltd., with Europe and southern and eastern Africa. Scheduled air services are operated to and from Zanzibar from and to other places in east Africa. These services connect with such international terminals as Nairobi and Entebbe. There are no railways in the island, but there are 200 mi of road, of which 150 mi. have a bituminous surface.

Coupland, *East Africa and Its Invaders* (New York and London, 1938), and *The Exploitation of East Africa* (London and Toronto, 1939) ; G M Stockley, *Report on the Geology of the Zanzibar Protectorate* (1928); *Colonial Reports, A Guide to Zanzibar* (H.M S.O., London, 1949). (J. M. GY.)

ZANZIBAR, an east African seaport, capital of the island and sultanate of the same name. Pop. (1948 census) 45,284. The town is situated on the western side of the island, 26 mi. N.E. of the mainland port of Bagamoyo. Zanzibar is built on a triangular peninsula. about 1½ mi. long, which runs from east to west, forming a safe and spacious roadstead, with a minimum depth of water exceeding five fathoms. In addition to this anchorage, there is a concrete wharf 800 ft. long, capable of berthing ships up to 400 ft. The architecture is mainly Arabic with narrow winding streets, open-fronted shops and many mosques. Characteristic are the massive carved and brass-studded wooden doors, whose blackness contrasts with the white stone of the houses and the bright red of the acacias in the garden enclosures. The Anglican cathedral (built 1873–79), a semi-Gothic coral building, occupies the site of the old slave market, which was closed in 1873 The Roman Catholic cathedral is a fine building in the Renaissance style.

The motley population of Zanzibar—the chief elements are African. Arab and Indian—is indicative of the commercial importance of the city. Its geographical position made it the key of east Africa from Cape Guardafui to Delagoa bay. "When you play on the flute at Zanzibar" (says an Arab proverb) "all Africa as far the lakes dances." The Americans were the first among white merchants to realize the possibilities of the port, and a United States consulate was established as early as 1836.

ZAPARAN, a group of tribes of South American Indians forming an independent linguistic stock. The Zaparos live in the region of the Peruvian-Ecuadorian border, on the Curaray and Napo rivers and the lower Aguarico. They are a tall, robust people. rather light in skin colour, with prominent noses and are said sometimes to have blue eyes. The men wear a tree-bast poncholike garment, ornamented with painted designs. The women wear only a small fringed apron. Their houses are merely thatched shelters with no sides. Their weapons are bows, spears and blowguns, poison being used on the darts for the latter and for their arrows. They depend mainly on hunting and fishing for food, although growing some sweet potatoes and bananas.

ZAPOROZHE (formerly ALEXANDROVSK), a town of the Ukrainian Soviet Socialist Republic, in 47° 51′ N., 35° 10′ E., on the left bank of the Dnieper river. Pop. (1956 est.) 381,000. Its name means "beyond the rapids," and it is situated south of the falls on which the Dnepropetrovsk hydraulic station was constructed. Factories produce agricultural machinery; the town is also a railway junction.

Zaporozhe is opposite to Khortitsa Island, a former camp of the Zaporozhian Cossacks and kurgans (tumuli) are numerous in the district. Zaporozhe was captured by Germany in 1941 and was retaken by Soviet troops in 1943.

ZARAGOZA, an inland province of northern Spain, one of the three into which Aragon was divided in 1833; bounded on the north by Logrofio and Navarre, northeast and east by Huesca, southeast by Lérida and Tarragona, south by Teruel and Guadalajara and west by Soria. Pop. (1950) 609,393; area, 6,608 sq.mi. Zaragoza belongs wholly to the basin of the Ebro (*q.v.*). The main valley is bounded on the southwest by the Sierra de Moncayo (with the highest elevation 7,707 ft.).

Zaragoza is traversed by the Ebro Valley railway, which connects Miranda with Lérida, Barcelona and Tarragona, and has a branch to Huesca; it also communicates via Calatayud with Madrid and Sagunto; and there are local lines to Carifiena (southwest from Saragossa) and to Tarazona and Borja (near the right bank of the Ebro). The only towns with over 5,000 inhabitants (mun. pop. 1950) are Saragossa (*q.v.*) (244,015); Calatayud (18.318); Tarazona (11,988). an episcopal see. with a curious 13th-century cathedral; Caspe (10,128); Ejea (8,729); Tauste (6,565); Épila (5.462); and Alagón (5,484). *See* also ARAGON.

ZARATHUSTRA: *see* ZOROASTER.

ZARIA, a province occupying a central position in the Northern region of Nigeria. It has an area of 17,642 sq mi and a population (1960 est.) of 1,000,505. The greater part of the province is open savanna or orchard bush which becomes denser in the south. The gently rolling landscape is broken by massive outcroppings of rock. It is drained by the Kaduna river and its tributaries. The rainy season lasts from May until the end of October, with the average rainfall being about 45 in.

The chief town is the old walled city of Zaria (pop. [1960 est.] 37,400 Africans), the capital of the province. Outside the remains of the walls of the old city has grown up a new town housing a trading area and settlers from other parts of Nigeria. Another town of growing importance is Zonkwa from which the southern part of the province is administered. The province consists of an emirate and four small independent districts. The emir rules through district heads and is advised by a native council and a British resident. Most of the people are Hausa-speaking farmers. Kaduna, the capital of the Northern region, was made a separate enclave in 1956 and is administered separately.

The principal crops are guinea corn, millets, ginger, cotton and peanuts. Tobacco is on the increase and there is a flourishing sugar-crushing industry. There is tin mining at Xnchau in the east and at Kwoi and Kagoro in the southeast.

Zaria has become the centre for many of the regional educational institutions such as the Institute of Administration, the pharmacy school, the agricultural school and the North Regional Literature agency. The Nigeria College of Arts, Science and Technology has been built near the city, and the imposing offices of the Gaskiya corporation, founded to supply educational reading matter to the Northern peoples, lie outside the walls.

The ancient state of Zaria, called Zazau or Zegzeg by the historians of the middle ages, was one of the original seven Hausa states. At later periods it submitted in turn to Kano, Sonrhai (Songhai) and Bornu. At the end of the 18th century it was an independent state under its own Habe Mohammedan rulers but like the rest of northern Hausaland it was conquered by the Fulani during their jihad and a Fulani emir was installed in 1804. Zaria was brought under British administration in 1902.

ZARLINO, GIOSEFFO (1517–1590), Italian musical theorist, surnamed from his birthplace ZARLINUS CLODIENSIS. was born at Chioggia, Venetia, in 1517. Studying in his youth for the church, he was admitted to the minor orders in 1539 and ordained deacon in 1541 at Venice; but he soon devoted himself entirely to the study of music under the guidance of Adrian Willaert. then choirmaster at St. Mark's. Though remembered chiefly as the earliest advocate of a system of equal temperament for fretted and keyed instruments and for his invaluable contributions to the theory of music. he was both a practical musician and a composer. His printed works consisted of a volume entitled *Modulationes Sex Vocum* (1j66) and a few motets and madrigals scattered through the collections of Scotto and other contemporary publishers, but he also produced and superintended the public performance of some important pieces in the service of the republic. The only extant example of his compositions on a grand scale is a manuscript mass for four voices. He died at Venice on Feb. 14, or, according to some, Feb. 4, 1590.

Zarlino's first theoretical work was the *Istitutioni Armoniche* (1558). This was followed by the *Dimostrationi Armoniche* (1571) and by the *Sopplimenti Musicali* (1588). Finally, in a complete edition of his works published shortly before his death Zarlino reprinted these three treatises, accompanied by a *Tract on Patience*, a *Discourse on the True Date of the Crucifixion of Our Lord*, an essay on *The Origin of the Capuchins*, and the *Resolution of Some Doubts Concerning the Correction of the Julian Calendar* (1589).

The *Istitutioni* and *Dimostrationi Armoniche* deal, like most other theoretical works of the period, with the whole science of music as it was understood in the 16th century. The earlier chapters, treating chiefly of the arithmetical foundations of the science, differ but little in their line of argument from the principles laid down by Pietro Aron, Zacconi and other early writers of the Boeotian school; but in book ii of the *Istitutioni* Zarlino boldly attacks the false system of tonality to which the proportions of the Pythagorean tetrachord, if strictly carried out in practice, must inevitably lead. Again. Zarlino was in advance of his age in his classification of the ecclesiastical modes. These scales were not wholly abolished in favour of modern tonality in the 17th century. Eight of them, it is true, fell into disuse; but the medieval Ionian and Hypoionian modes are absolutely identical with the modem natural scale of C; and the Aeolian and Hypoaeolian modes differ from the minor scale, not in constitution, but in treatment only. Medieval composers, however, regarded the Ionian mode as the least perfect of the series and placed it last in order. Zarlino thought differently and made it the first mode, changing all the others to accord with it. His numerical table, therefore, differs from all others made before or since, prophetically assigning the place of honour to the one ancient scale now recognized as the foundation of the modern tonal system.

These innovations were violently opposed by the apostles of the monodic school. Vincenzo Galilei led the attack in a tract entitled *Discorso Intorno alle Opere di Messer Gioseffe Zarlino*, and followed it up in his famous *Dialogo*, defending the Pythagorean system in very unmeasured language. It was in answer to these strictures that Zarlino published his *Sopplementi*.

ZAUSCHNERIA, a genus of North American plants of the evening-primrose family (Onagraceae, *q.v.*), comprising several species native to California and adjacent Mexico. They are low, slightly shrubby perennials, with small narrow or ovate leaves and large, scarlet, fuchsialike flowers. *Z. californica*, known as California fuchsia and Mexican balsamea, is planted in flower gardens.

ZEALAND (Dan. *Sjaelland*), the largest island of the kingdom of Denmark 2,709 sq.mi. in area, lying between Fyn (11 mi. distant) on the west, and southern Sweden (only 3 mi. distant at the sound) on the east. The surface is undulating, but little above sea level, and the outline very irregular. On the island are the old cathedral city of Roskilde, the Danish capital, Copenhagen, and the historic port of Helsingor (Elsinore).

Pop. (1960) 1,771,537. *See* DENMARK.

ZEAMI (SEAMI) **MOTOKIYO** (1363–1443), the greatest playaright, critic and actor of the Japanese nō theatre. The son of the almost equally celebrated dramatist KANAMI KIYOTSUGU (1333–84), he first attracted attention when at the age of 11 he performed before the shogun Yoshimitsu at the Imakumano shrine in Kyōto. Yoshimitsu was so captivated by the youthful Zeami that he extended his patronage to the nō, and this shogunate connection (which was maintained for 500 years) enabled the no to shake off the crudities of its past and to develop as a complex and aristocratic theatre.

After his father's death in 1384, Zeami became the chief figure in the nō. He not only continued to perform brilliantly but wrote about 200 plays, 124 of which have remained in the nō repertory. In his later years Zeami's concern over the future of the nō moved him to write for the guidance of later men a number of treatises on the "secrets" of the medium. His old age was darkened by the death of his son and intended successor. and by his exile to the island of Sado imposed in 1434 (for reasons now unknown) by the tyrannous shogun Toshinori. Zeami returned to Kyoto at the end of his life, probably after Yoshinori's death in 1441.

Zeami's success as a dramatist was closely linked to his career on the stage. The rigorous discipline he later prescribed for nō actors in such works as Kadensho (1400–02) and *Shikadōsho* ("Book of the Way of the Highest Flower." 1420) doubtless reflects the 'training he himself received. The actor, Zeami said. must master three basic roles — the warrior, the woman and the old person, including the singing and dancing appropriate to each. The proper training can enable him to display high and higher "flowers" of acting artistry, until he reaches complete mastery. The two main elements in nō acting were *monomane* and *yūgen. Monomane* meant "an imitation of things" and was the representational aspect of the nō. An actor portraying a demon, for example, had to seem convincingly demoniacal. Honever, *yūgen,* the symbolic aspect of the nō, not only took precedence over the requirements of *monomane,* but became the touchstone of excellence in the nō. Zeami wrote, "The essence of *yūgen* is true beauty and gentleness." He described in various essays how these might be achieved, but the final object of *yūgen* was not mere outward beauty. It had to suggest behind the text of the plays and the noble gestures of the actors a world impossible to define yet ultimately real. Such plays as the lovely *Matsukaze* have a mysterious stillness that seems to envelop the visible or audible parts of the work. In others of Zeami's dramas there is less *yūgen* and more action, and occasionally even realism.

Zeami wrote his plays bearing in mind the ability of the actors of his day and the tastes of his audiences. On occasion he would freely revise his father's or his own earlier works to make them fit changed conditions. However, so great did Zeami's prestige become that later actors hesitated to alter a word of his texts, resulting in the fossilized state of the nō in later centuries.

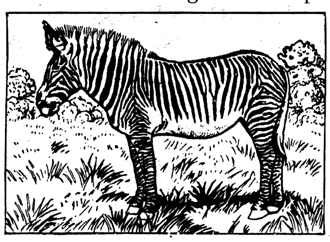
ZEBRA, the name for the African striped members of the horse tribe. The true or mountain zebra (*Equus* zebra) maintains a precarious foothold in the mountainous region of Cape Colony and also inhabits Angola. It stands about 4 ft. at the shoulder. with fairly long ears, a tail scantily clothed with hair, and a short mane. The ground colour is white and the stripes, absent only on the abdomen and inside of the thighs, are black. The lower part of the face is brown. The stripes on the haunch do not reach the median dorsal stripe and there are a number of transverse short stripes on each side of the midline. These are absent in Burchell's zebra (E. *burchelli*), which has broader stripes, often with shadow stripes between them. The typical race is extinct. but other races of this species are common from the Transvaal to Uganda. The ground colour is pale buff. the stripes, which in the southern race do not extend to the lower limbs. dark brown or black.



Grevy's zebra (Equus grevyi) distinguished by its numerous stripes and asslike ears

The East African race (*E.b. boemi*) has the lower parts striped and shadow stripes are usually lacking. The closely related quagga (*q.v.*) is extinct. Grévy's zebra (E. *grevyi*) of Somaliland. northern Kenya and parts of Ethiopia. is distinguished by its long head, large ears and numerous narrow stripes. Zebras occur in large herds and are preyed upon chiefly by lions. They have been crossed with the domestic horse but the resultant hybrid is not as valuable as the horse, mule and ass.

Fossil horses. with teeth closely resembling those of zebras, have been found in the Pleistocene of North America. (*See* Horse; Equidae.) (J. E. Hl.)

ZEBU (Bos *indicus*), an Indian species of ox, characterized by light colour and a hump. The sacred bulls of India belong to this species. which is used for draught work, and supplies milk. In many places it is crossed with domestic cattle.

(See Cattle.)

ZEBULUN (Zebulon; in the Douai version of the Bible, Zabulon), a tribe of Israel, named after the sixth son borne by Leah to Jacob (Gen. xxx. 20). The fertile territory occupied by the tribe lay roughly northeast of the plain of Jezreel. The somewhat obscure text of Gen. xlix, 13 seems to imply that at one time Zebulun extended to the seacoast and marched with Phoenician territory. The tribe appears to have furnished valiant warriors, and receives special mention in the Song of Deborah for its martial exploits (Judg. v, 14, 18).

See Twelve Tribes of Israel.

ZECHARIAH, the eleventh in order of the minor prophets of the Old Testament. He was associated with Haggai (*q.v.*) in stimulating the rebuilding of the temple at Jerusalem, begun in 520 (Ezra iv, 24) and completed in 516. A previous attempt made by returned exiles in 537 seems to have been checked by local opposition and not renewed because of economic pressure.

In 520, however. the political disturbances of the Persian empire (of which the Jewish community in Palestine was a negligible part) were interpreted by these two prophets as a sign that the Messianic expectations were now to be realized. and that the "Day of Yahweh" was at hand. Haggai gave the first impulse to the new attempt; two months later! Zechariah joined him in encouraging the fainthearted. His prophecies, exactly dated in 520 (i, 1. 7) and 518 (vii. 1), are to be found in the first eight chapters of the book now bearing his name.

Their central feature is a series of night visions (i, 8. iv. 1), intended to show Yahweh's immediate and effective intervention on behalf of His people. They are arranged with literary art in connected sequence, beginning with the vision of horsemen who report that the expected Messianic crisis has not yet come (i, 11. *cf.* Hagg. ii, 21 seq.), and culminating in the vision of Yahweh's war chariots dispatched to execute His vengeance upon the heathen, especially on Babylonia (vi, 8).

The six intervening visions (all the eight are ascribed to a single night) reveal in succession four horns, representing the heathen powers of the four quarters of the earth, cast down by four craftsmen (i. 18–21), a man with a measuring line, whose narrow ideas of the future city are replaced by the conception of a city without walls because of its great extent, to which Yahweh's protection will be a wall of fire (ii, 1–5), the formal acquittal and restoration of Joshua the high priest, representing the community (iii. 1 seq.), the seven-branched lampstand, representing Yahweh's watchful eyes. with two olive trees! representing Joshua and Zerubbabel (iv, 1–14, but see the commentaries), the flying roll which brings its ubiquitous curse on evildoers (thieves and false swearers), and so cleanses the land of moral evil (v, 1–4), the woman carried off in an ephah, representing the removal of guilt (v, 5–11).

These visions are then prefaced by a call to repentance and the promise of forgiveness (i, 2–6), in which Zechariah's appeal to "the former prophets" (like the detail of an interpreting angel in the visions themselves) reminds us that the great prophetic period (8th–6th centuries) lies in the past, and that the conception of revelation itself has lost something of its original simplicity and spontaneity.

The night visions are followed, two years later (vii, 1), by a divine oracle which directs that the fasts kept throughout the exile should now become festivals (viii, 18 seq.). The enquiry which led to the oracle (vii, 3) is made the occasion of warning against the externality of fasting. of appeal for true conduct, and of an idyllic picture of the happiness of the coming Messianic age. In this happy future the prophet expected that Zerubbabel would be the Messiah, and the bringing of an offering of gold and silver from Jews in Babylon led Zechariah to crown him symbolically in the name of Yahweh.

The darkness that falls on Jewish history with the completion of the second temple suggests that these words and deeds may have thrust Zerubbabel into a dangerous political prominence, leading to his removal by the Persian authorities, and the eclipse of Alessianic expectations.

The remainder of the present book of Zechariah (ix–xiv) is of an altogether different character, and is generally admitted to belong to a period later than the Persian (as indeed the direct reference to Greece in ix, 13 implies). This portion of the book is divided by the titles in ix, 1, xii, 1. ("The burden of the word of Yahweh"). into two distinct collections, each of which it seems necessary to divide again, so that there are four groups of prophecies, distinguished by their subject matter.

The first (ix–xi. 3) deals nith the recovery of Palestine by Yahweh's victories over Syria, Phoenicia and Philistia (ix, 1–8), the coming of the Messianic king to the restored and victorious Israel (ix. 9–17), the overthrow of the (foreign) "shepherds" or rulers, and the gathering of exiled Israelites (x, 1–12), closing nith a figurative dirge over the fall of these "shepherds" (xi, 1–3). The second group (xi. 4–17. nith the misplaced xiii. 7–9) describes the rejection of the prophet, representing a worthy shepherd, and the accursed doom of a worthless one, a purified third of the people alone remaining. The third (xii, xiii. 1–6) pictures an attack of the nations upon Jerusalem, in which Judah is first a foe and then a victorious friend to the mother city; this is follovved by elaborate mourning for an unnamed martyr (xii, 10. R. V mg), and the cleansing of Jerusalem from idolatry and prophecy. The fourth division (xiv) describes the delivery of Jerusalem from the heathen, that it may become the metropolis of religion for all the world. The last two of these divisions are of a markedly eschatological character, and even the first two could be so regarded (so Sellin).

These nritings are perhaps the most obscure of the Old Testament, chiefly because there is no sufficient clue to the historical allusions, such as the cutting off of three shepherds in one month (xi. 8), the pierced martyr (xii, 10) and the antagonism of Judah and Jerusalem (xii, 2. xiv, 14). By some scholars these chapters have been brought down as late as the Maccabean age, the events of which are supposed to explain these and other allusions. But the fact is that we are almost nholly ignorant of Jewish history during the earlier part of the Greek period (from 331 B C), to which these writings might equally well belong.

ZEDEKIAH (Hebrew, "righteous is Yah[weh]"), the name of four figures in the Old Testament, of whom only one, the last king of Judah, is important.

Zedekiah, son of Josiah, succeeded his older brothers Jehoahaz II and Jehoiakim and his nephew Jehoiachin in 598 B.C. (events related in II Kings xxiv, 17–xxv, 26; Jer. xxxix, 4–8, and lii, 1–11; and II Chron. xxxvi, 10–21). The Babylonian Chronicle (see BABYLONIA AND ASSYRIA), which relates the main political and religious events of the 7th and 6th centuries from the Babylonian viewpoint, records the siege of Jerusalem in the 7th year of Nebuchadrezzar (598 B.C.) and the capture of the city in the 2nd day of Adar (March 16) of that year. Its king, Jehoiachin, was captured and carried to Babylon, where he was maintained as a hostage, and Nebuchadrezzar set up in his place Mattaniah, his uncle, with the throne name Zedekiah. Zedekiah held his position as a vassal under an oath of allegiance. but under local pressure he began an intrigue with Moab, Edom, Ammon, Tyre and Sidon which the prophet Jeremiah vigorously denounced (Jer. xxvii et seq.; Ezek. xvii, 11–21).

In the 9th year of Zedekiah, as a result of his conspiracy with Egypt to revolt against the Babylonians, a Babylonian army lay siege to Jerusalem. An Egyptian army came to assist Zedekiah, and there was a temporary withdrawal of the Babylonians, but with the retreat of the Egyptians the siege was renewed. During the siege Jeremiah constantly urged patient submission to the dominion of the Babylonians, which he regarded as an expression of the will of God, but the royal officials and Jewish notables denounced him and demanded his execution for his bad influence on the morale of the people (Jer. xxxviii, 4).

Some Jews deserted to the Babylonians during the siege, and Jeremiah, accused of desertion, was imprisoned. King Zedekiah, though he surreptitiously sought the advice of Jeremiah (Jer. xxxvii, 3 et *seq.*), did not follow the advice because he feared the princes.

After six months of siege a breach was made in the city walls, and Zedekiah and his men fled by night toward the Jordan river, but they were soon captured in the Jordan valley. He and his leaders were taken before King Nebuchadrezzar at Riblah, in Syria, where Zedekiah's sons were slain in his presence, and he, a disloyal vassal, was blinded and carried in chains to Babylon, where he was imprisoned until his death. The walls and houses of unfaithful Jerusalem were destroyed, its temple was sacked and burned and the people, except for the poorest of the land, were deported to Babylon. Judah lost its status as a kingdom and became a Babylonian province under the governor Gedaliah, with a new capital at Mizpah (probably modern Tell en-Nasbeh). (RD. A. B.; X.)

ZEELAND, the most southerly maritime province of the Netherlands, has a remarkable geographical structure. It consists of Zeeuwsch-Vlaanderen. a strip of the Flanders mainland, south of the Westerschelde, bordered by Belgium, and further of six islands: Schouwen-Duiveland, Tholen, North Beveland, Walcheren, South Beveland and St. Philipsland. The latter three are in fact no longer islands but peninsulas since South Beveland and St. Philipsland have been connected with the province of North Brabant, and Walcheren with South Beveland, by dams.

The map of Zeeland has changed continuously. In the middle ages each island consisted of a number of smaller islands. which were gradually increased by alluvial deposition and united by dikes. In the course of the ages there were many inundations, some of which took away substantial areas Significant names are those of the Verdronken (Drowned) Land of South Beveland and of Saaftinge (Refuge) at the eastern ends of the Oosterschelde and Westerschelde respectively. The history of this province is more than that of any of the other ten Dutch provinces marked by the permanent struggle against the waves, which is indicated by the heraldic device of Zeeland: Luctor et *emergo* ("I struggle and I emerge").

With the exception of small parts of the western coast, which have dunes, all the isles and also Zeeuwsch-Vlaanderen—for the greater part lying below sea level—are protected against the sea by artificial dikes, with a total length of about 250 mi. In spite of that the province was struck very seriously by the big flood disaster of Feb. 1, 1953, which caused the death of more than 1,800 people and enormous material damage. In order to avoid a repetition of the disaster in the future the Dutch government started the execution of the Delta plan (see LAND RECLAMATION), that included the construction of big enclosing dams of the sea channels Haringvliet, Brounershavensche Gat and Oosterschelde. By this big project not only the geographical structure of Zeeland would change again, but also the economic and social conditions would be influenced considerably as the construction of the new dikes mould make it possible to trace new roads from central Holland (especially from Rotterdam) to the isles that were rather isolated before.

Zeeland is 653 sq.mi. in area, the smallest Dutch province but one. With regard to the number of inhabitants (1957 est.) it is the smallest. There were not many industries, no large towns. Municipal estimates (1957) made Vlissingen (Flushing), with 28,148 inhabitants, the largest; it had an important shipbuilding industry. The capital of the province is Middelburg (pop. 21,968). Goes (14,353), chief town of South Beveland, with its well-known. horticultural auction, was developing rapidly into an important centre of trade and commerce. Tholen (3,289) and the old town of Zierikzee (7,223) are the market centres of Tholen and Schouwen-Duiveland respectively. Terneuzen (14,666), in Zeeuwsch-Vlaanderen at the end of the canal from Ghent to the Westerschelde, was a growing industrial centre. In this part of Zeeland there were also glass, metal and chemical industries at Sas van Gent (4,114). The textile industry should be mentioned especially for the eastern part of Zeeuwsch-Vlaanderen with Hulst

(4,930) as the main seat.

Agriculture in Zeeland is important. Of the cultivated land, mainly consisting of sea-clay soils, the greater part (73%) is used for arable farming, 23% for grassland and 4% for horticulture. In general the farmers are far advanced with mechanization and methods for manuring and weed control. Yields per acre are high. A large variety of crops is grown: cereals (wheat, barley, oats), potatoes (for both consumption and seed), sugar beet and other cash crops, such as flax (especially in Zeeuwsch-Vlaanderen), rape seed, maw seed, caraway, etc. An intensive kind of crop growing is that of onions. Well known are the strong horses of Zeeland used in agriculture. Pedigree draft-horse breeding is held in esteem.

Fruit farming is of great importance in particular on South Beveland, known as "Zeeland's fruit garden."

Considerable changes occurred in the islands of Walcheren and Schouwen-Duiveland after the inundation of World War II and by the flood disaster of 1953. In both areas, after the repairing of the dikes, a total rural reconstruction was carried out. An extensive land reallocation scheme was applied, new roads were laid, destroyed farmhouses were rebuilt at more adequate spots near the farmland and drainage systems were improved. A number of farmers from Zeeland settled in the Northeastern Polder of the Zuider Zee reclamation scheme; the land they left was used to enlarge other small farms. The result of all these measures was that agriculture on these two islands was thoroughly rationalized.

As regards fisheries, the oyster breeding and mussel culture should be mentioned in the first place. The chief centre is Yerseke. This means of subsistence was seriously threatened by the Delta plan, since the sea channels where the mollusks had been bred would contain fresh water after the execution of the plan. Other fishing villages are Bruinisse, Philippine, Terneuzen and Hontenisse. Seaside resorts with pleasant surroundings in the dunes are Renesse, Haamstede and Burgh on Schouwen, Domburg on Walcheren and Cadzand in Zeeuwsch-Vlaanderen. The only railway in Zeeland runs from Roosendaal (North Brabant) through South Beveland to Middelburg and Flushing on Walcheren. Ferry-boats connect many different parts of Zeeland.

Archaic customs and costumes as well as a conservative religious outlook are preserved. (C. A. P. T.)

ZEEMAN, PIETER (1865–1943), Dutch physicist awarded the Nobel prize for physics in 1902 with Hendrik Antoon Lorentz for work on the influence of magnetism on radiation, was born at Zonnemaire, Zeeland, on May 25, 1865. He studied at Leiden, where he taught from 1890 to 1900. In 1900 he was appointed professor of physics at Amsterdam, and in 1908 director of the Physical institute in that city.

Zeeman's best-known work in physics is the so-called Zeeman effect (*q.v.*), the splitting up of spectral lines in a magnetic field, which he discovered in 1896. The theoretical explanation was first given by Lorentz soon after the effect was observed. This phenomenon was used by astronomers for the detection of magnetic effects at the surface of the sun. Later Zeeman worked on the propagation of light in moving media, making observations in water, quartz and flint.

Zeeman died in Amsterdam on Oct. 9, 1943.

ZEEMAN EFFECT is the phenomenon observed in spectroscopy (*q v.*) when light sources are operated in magnetic fields. In 1896 Pieter Zeeman (*q.v.*) placed a sodium flame between the poles of a powerful electromagnet and observed in a large grating spectroscope that the bright yellow, lines were broadened when the magnet was animated. H. A. Lorentz immediately predicted from his electron theory of matter and radiation that the light should be polarized by the magnetic field. and Zeeman found that the outside edges of the widened images were indeed polarized. According to the simple classical theory an observer receiving light perpendicular to the field of force sees a central component polarized parallel to the field and on either side a component polarized perpendicular to the field (Lorentz triplet, fig. 1b); whereas if he looks along the field through a hole bored in one of the poles, the central image vanishes and the two lateral components are circularly polarized in opposite directions (fig. 1c).

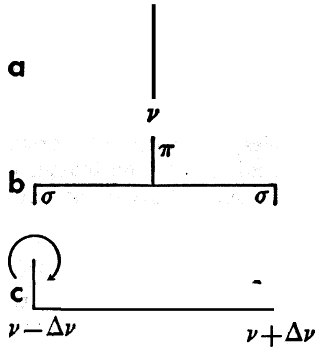

FIG. 1.—NORMAL ZEEMAN EFFECT. (A) UNDISPLACED SPECTRAL LINE: (B) TRANSVERSE ZEEMAN EFFECT, π = PARALLEL POLARIZATION, σ = PERPENDICULAR POLARIZATION; (C) LONGITUDINAL ZEEMAN EFFECT, CIRCULAR POLARIZATION

Observation perpendicular to the field is preferred since this shows all the components and avoids distortion of the magnetic field which occurs when a pole piece is drilled. Without an analyzer the two kinds of plane polarized components are indistinguishable, but with a Nicol (calcite) prism between the source and the spectroscope either kind may be transmitted separately, and with a M'ollaston (quartz) prism both can be viewed simultaneously, vertically separated. The components having electric vectors parallel to the magnetic field are called a components, and those with electric vectors perpendicular to the field are called a components (from senkrecht).

In a Lorentz triplet the frequency displacement Av of either a component from the π component, or from the no-field position of the spectral line, is proportional to the strength of the magnetic field, and in frequency units it is

$$\Delta\nu=\frac{e}{m}\cdot\frac{H}{4\pi c}$$

where e is the electronic charge (in electrostatic units), m is the mass of the electron (grams), c is the velocity of light (centimetres per second) and H is the magnetic force in oersteds. Since spectroscopists work with wave lengths λ, and convert these to wave numbers ($\text{cm.}^{-1}=\frac{1}{\lambda_{\text{vac}}}$) rather than to frequencies v, and since $\frac{1}{\lambda_{\text{vac}}}=\frac{\nu}{c}$, this displacement expressed in wave numbers equals $\frac{e}{m}\cdot\frac{H}{4\pi c^2}=4.67\times10^{-5}H\ \text{cm.}^{-1}=\text{L}\ \text{cm.}^{-1}$, which is called the Lorentz unit.

Simple Lorentz triplets were promptly observed in the spectra of cadmium and zinc; their measurement, together with a determination of H, yielded a value for the ratio of electronic charge to mass e/m in agreement with that obtained from the deflection of cathode rays, and indicated that atomic spectral radiation involved the motion of negatively charged electrons.

However, within a year, further experiments by Zeeman and others disclosed that the Zeeman effect was much more complicated than was first assumed. Relatively few spectral lines (only those arising from transitions between singlet spectral terms) were found to exhibit the simple Lorentz triplet; all others had either greater or smaller displacements and usually a larger number of components. For example, the sodium lines, 5890 A and 5896 A, which Zeeman first observed as widened by magnetic force, when fully resolved showed six and four components, respectively. The first class (Lorentz triplet) was said to exemplify the normal Zeeman effect, and the second class the anomalous Zeeman effect. Typical magnetic splittings of spectral lines are shown in fig. 2 in conventional manner with π components above a horizontal line and a components below, the lengths of the vertical lines being proportional to the intensities. All attempts to account for the anomalous Zecman effect by classical electromagnetic theory failed, and a quarter of a century passed before an explanation was found in quantum theory.

In the meantime the discovery of two empirical rules (T. Preston's and C D T Runge's) concerning types and structures of Zeeman patterns contributed toward a solution of the problem. In 1898 T Preston found that two lines exhibit the same Zeeman pattern if they belong to the same spectral series, or if they are members of different series (*e.g.*, principal and sharp) which arise from similar term combinations. or if they belong to analogous series occurring in different spectra. For instance. any $^2S_{\frac{1}{2}}-{}^2P^\circ_{\frac{3}{2}}$

line of sodium shows the same Zeeman pattern as any $^2P^\circ_{\frac{3}{2}}-{}^2S_{\frac{1}{2}}$ line of sodium or of any other one-electron spectrum. In terms of the vector model of the atom (see SPECTROSCOPY) Preston's rule means that the Zeeman type is a function of the L, S and J vectors of the two combining terms, but not of the principal quantum number n (shell) nor of the inner electron groups or atomic number Z.

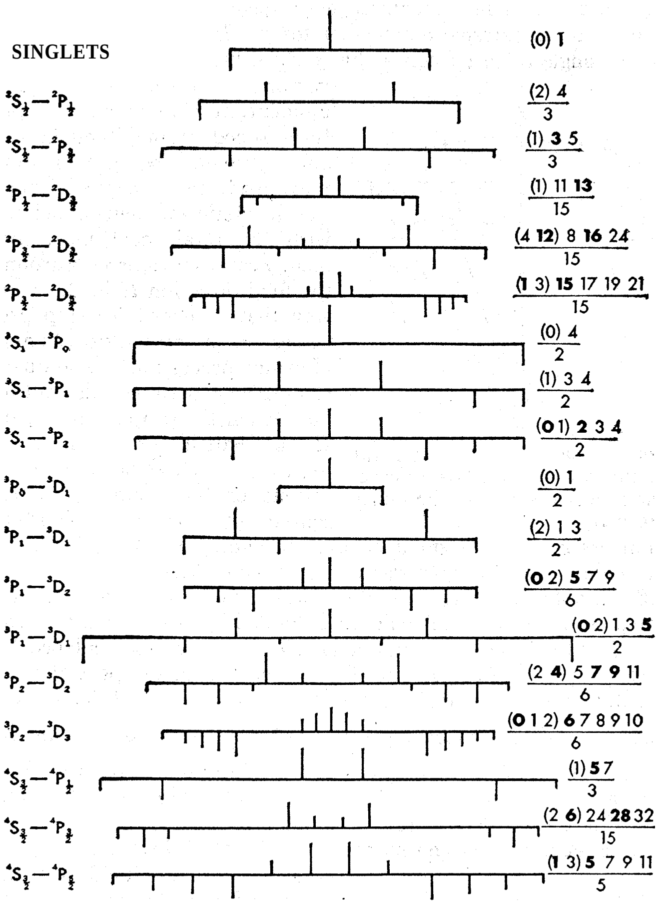

FIG. 2.—TYPICAL ZEEMAN PATTERNS OF SINGLET, DOUBLET. TRIPLET AND OUARTET COMBINATIONS

Because the displacements of the Zeeman components depend on the strength of the magnetic field, they are conveniently expressed in Lorentz units which vary with the field. In 1907 C. Runge expressed anomalous Zeeman patterns in Lorentz units and announced that all known patterns could be represented as rational multiples of the normal triplet separations. Thus, the observed displacements of the n- and σ components are, respectively, $+\$$ and $+^{*}$ Lorentz unit for $^2S_{\frac{1}{2}}-{}^2P^\circ_{\frac{1}{2}}$ (*e.g.*, sodium 5,896 A), whereas they are $\pm\frac{1}{3}$ and $\pm\frac{3}{3}$, $\pm\frac{5}{3}$ Lorentz unit for $^2S_{\frac{1}{2}}-{}^2P^\circ_{\frac{3}{2}}$ (*e.g.*, sodium 5,890 A). The conventional abbreviations for these patterns are $\frac{(2)\ 4}{3}$ and $\frac{(1)\ \mathbf{3},\ 5}{3}$ Lorentz unit (*see* fig. 2). Examples of other Zeeman types with their proper Runge fractions are shown in fig. 2, the n- components being enclosed in parentheses and the strongest components printed boldface. Runge's and Preston's rules had great heuristic value In that they permitted a comparison of the anomalous patterns nith each other and a correlation with spectral-term quantum numbers, thus leading to the discovery of simple relationships.

Since the multiplet structure of atomic spectra was ascribed to a splitting of spectral terms (*see* SPECTROSCOPY), it was natural to assume that Zeeman patterns represented a magnetic splitting of atomic energy levels. In order to distinguish the individual magnetic levels it was necessary to invent a magnetic quantum number M, analogous to the inner quantum number J which differentiates the levels of polyfold spectral terms. Successive values of M were assumed to'differ by unity and to range from $-J$ to $+J$. The same selection rule was assumed to govern combinations of M as govern those of J ; viz., $\Delta M=0, \pm 1$ (barring o to o). Finally, combinations $\Delta M=0$ always represent n-components and $\Delta M=\pm 1$ yield u components. Having these simple rules in mind, A. Landé saw how any Zeeman pattern could be arithmetically derived from the magnetic quantum numbers M, and the magnetic splitting factors g, appropriate to each type of atomic energy level. For example, if $g=2$ for $^2S_{\frac{1}{2}}$ and $g=\frac{4}{3}$ for $^2P^\circ_{\frac{3}{2}}$ the Zeeman pattern for $^2S_{\frac{1}{2}}-{}^2P^\circ_{\frac{3}{2}}$ is derived directly from the vertical and diagonal differences of gM products as follows:

M values	$-\frac{3}{2}$	$-\frac{1}{2}$	$\frac{1}{2}$	$\frac{3}{2}$
gM for $^2S_{\frac{1}{2}}$		-1	1	
gM for $^2P^\circ_{\frac{3}{2}}$	$-\frac{6}{3}$	$-\frac{2}{3}$	$\frac{2}{3}$	$\frac{6}{3}$
Zeeman components	$-\frac{5}{3}$ $-\frac{3}{3}$ $(-\frac{1}{3})$		$(\frac{1}{3})$ $\frac{3}{3}$ $\frac{5}{3}$	
Zeeman type	$\frac{(1)\ \mathbf{3},\ 5}{3}$			

Similarly, if $g=\frac{3}{2}$ for $^3P_2$ and $g=\frac{7}{6}$ for $^3D_2$, the empirical rules yield the observed Zeeman pattern for $^3P_2-{}^3D_2$:

M values	-2	-1	0	1	2
gM for	$-\frac{6}{2}$	$-\frac{3}{2}$	0	$\frac{3}{2}$	$\frac{6}{2}$
gM for $^3D_2$	$-\frac{14}{6}$	$-\frac{7}{6}$	0	$\frac{7}{6}$	$\frac{14}{6}$
Zeeman components	$-\frac{11}{6}$ $-\frac{9}{6}$ $-\frac{7}{6}$ $-\frac{5}{6}$ $(-\frac{4}{6})$ $(-\frac{2}{6})$ $(\frac{2}{6})$ $(\frac{4}{6})$ $\frac{5}{6}$ $\frac{7}{6}$ $\frac{9}{6}$ $\frac{11}{6}$				
Zeeman type	$\frac{(2,\ \mathbf{4})\ 5,\ \mathbf{7},\ \mathbf{9},\ 11}{6}$				

A comparison of such arrow schemes with observed Zeeman patterns led Landé to the following qualitative intensity rules for Zeeman components. If the J values of the combining terms are unequal, the vertical differences in the middle of the scheme and the diagonal differences at the ends give, respectively, the strongest π and σ components. If the J values are equal, the vertical differences at the end of the scheme and the diagonal differences at the centre give, respectively, the strongest π and σ components, except that for terms of odd multiplicity the intensity is zero for the transition $M=0$ to $M=0$. (*See* fig. 2.)

By an inductive process based upon empirical g values of certain terms Landé found a general formula expressing g as a function of the quantum numbers that specify spectral terms. This formula was found to hold for all types and multiplicities (assuming LS coupling of electrons); expressed in standardized notation it is

$$g = 1 + \frac{J(J+1) + S(S+1) - L(L+1)}{2J(J+1)}$$

Some g values characteristic of atomic energy levels are shown in Table I. Instead of showing the simplest form in every case, the fractions in each vertical column have all been converted to the same common denominator for the reason that inspection of this table shows simple progressive differences between the numerators and denominators of the g's in vertical. horizontal and diagonal rows, thus facilitating extension of the table to larger L values (up to 12 are possible) and to higher multiplicities (up to 11 are possible) without recourse to the formula.

The g formula makes g indeterminate when $J=0$ but gM is actually zero in these cases since $M=0$. The transition $^5D_0-{}^5F_1$ is of special interest since g=o for both levels and consequently spectral lines resulting from this combination are unique in being unaffected by a magnetic field. This empirical formulation of the Zeeman effect by Landé in 1923 arbitrarily required half-integral J values for levels of even multiplicity, and indicated (except for singlets) $g=2$ for all S terms. In 1925 S. Goudsmit and G E. Uhlenbeck showed that these requirements could be explained by postulating that an electron possessed a mechanical

TABLE I.—*Magnetic Splitting Factors (g) of Spectral Terms*

L \ J	0	1	2	3	4	5	6	$\frac{1}{2}$	$\frac{3}{2}$	$\frac{5}{2}$	$\frac{7}{2}$	$\frac{9}{2}$	$\frac{11}{2}$	Term

TABLE II —*Basic Types of Zeeman Patterns*

Type	Multiplicity	J and g	Appearance
1	odd	$J_x>J_y$, $g_x<g_y$	2	odd	$J_x>J_y$, $g_x>g_y$	3	odd	$J_x=J_y$, $g_x\neq g_y$	4	even	$J_x>J_y$, $g_x<g_y$	5	even	$J_x>J_y$, $g_x>g_y$	6	even	$J_x=J_y$, $g_x\neq g_y$	7a	odd	$J_x>J_y$, $g_x \gtrless g_y$			$J_y=0$	limiting case of types 1 and 2
7b	odd or even	$g_x=g_y$	limiting case of types 1, 2, 3, 4, 5, 6

moment of $\frac{1}{2}h/2\pi$ and a magnetic moment of $-\frac{e}{2mc}\cdot h/2\pi$; *i.e.*, twice that given by classical theory. These results were thereupon derived theoretically from quantum mechanics.

At first sight it appears that the variety of g values corresponding to J and L values in systems of different multiplicity would entail almost an infinite variety of Zeeman patterns. However, Back and Landé showed that on the basis of intensity relations among n and *a* components all Zeeman patterns could be reduced to seven basic types which are summarized in Table II, where x and y distinguish the two combining spectral terms.

According to the elementary principles of quantum mechanics (*q.v*), an atom in a magnetic field behaves like a spinning top subject to an external moment of force. In the case of an atom with a single valence electron, fig. 3, the orbital angular momentum vector l and the axial angular momentum s precess with uniform speed around their resultant vector j. When this atom finds itself in a magnetic field, the magnetic moment associated with the total mechanical moment j causes it to precess around the field direction H in the same way that a mechanical top precesses in a gravitational field (Larmor precession). The quantum theory permits this motion only when the projection of j on H takes half-integral values from $-j$ to $+j$. These discrete orientations of the atom are represented by magnetic quantum numbers m, and the small changes in energy resulting from the magnetic precession give rise to the various Zeeman levels. The difficulty of visualizing the motions when two or more electrons are collaborating can be conveniently removed by postulating that the l, s, j and m vectors of individual electrons may be replaced by their resultants. L, S, J and M. For each type of spectral term the permitted number of Zeeman levels, $2J+1$, is always determined by the total mechanical moment $J\frac{h}{2\pi}$ of the atom, but the separation of these Zeeman levels is determined by the field strength H and the magnetic moment which are implicitly contained in the Landé g factor. (See fig. 4.)

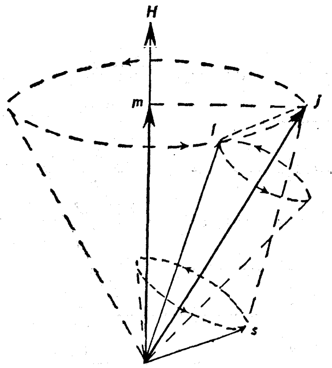

FIG. 3.— PRECESSION OF THE TOTAL ANGULAR MOMENTUM j OF AN ELECTRON IN AN EXTERNAL MAGNETIC FIELD H

The Zeeman effect (normal or anomalous) is observed when the external magnetic field is weak compared with the internal fields because of the spins and orbital motions of the electrons. When the external field is much greater than these internal fields the internal motions are greatly perturbed and the Zeeman effect is transformed into the Paschen-Back effect. The latter effect was discovered experimentally in *1912* by F. Paschen and E. Back who found that close doublets and triplets which were expected to exhibit the anomalous Zeeman effect actually gave normal (Lorentz) triplets in strong magnetic fields.

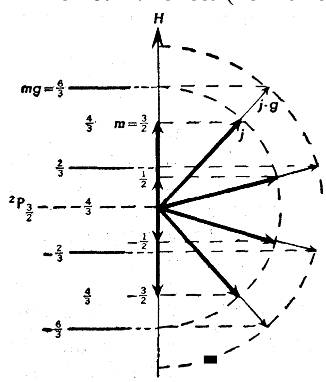

FIG 4.— QUANTIZED VECTOR DIAGRAM OF AN ATOM SHOWING HOW A MAGNETIC FIELD H SPLITS THE $^2P_{\frac{3}{2}}$ LEVEL INTO FOUR ($=2J+1$) ZEEMAN LEVELS, mg, SEPARATED BY $\frac{4}{3}$ LORENTZ UNIT

Just as the multiplet fine-structure separations (caused by electron spin) are a measure of the frequency with which L and S precess around their resultant J, so the Zeeman separations of the individual energy levels (J values) in a weak magnetic field are a measure of the frequency with which J precesses around H. For the Zeeman effect the first precession is much farter than the second, but when the second becomes much faster than the first, L and S are uncoupled, J becomes meaningless and the Paschen-Back effect is produced. In other words, the Paschen-Back triplet replaces the anomalous Zeeman effect of lines composing a multiplet when the magnetic splitting is much greater than the no-field fine structure in a spectrum. External fields of magnetic force must not be regarded as weak or strong in the absolute sense, but only relative to internal fields of the atom. The external field is weak if the Zeeman splitting is small compared with the multiplet (*e.g.,* doublet, triplet, etc) structure in question. and strong if large compared with such structure. When a multiplet arises from two polyfold terms for one of which the external field is strong, but weak for the other, a partial Paschen-Back effect is observed.

Most of the experimental work on the Zeeman effect has been done with magnetic fields between 20.000 and 40.000 oersteds conveniently obtained with yoke-type electromagnets fed by currents of the order of 100 amp. Such magnets combined with the best diffraction gratings permit a resolution of components separated by $\frac{1}{10}$ Lorentz unit. G. R. Harrison in 1939 succeeded in resolving $\frac{1}{20}$ Lorentz unit in complex spectra by placing the light source in the axis of a water-cooled copper solenoid carrying 8,000–10.000 amp. and thus producing fields of 80,000–100,000 oersteds. Momentary fields up to 320.000 oersteds were produced in 1938 by P. Kapitza who short-circuited a large generator uith a coil and studied the Zeeman and Paschen-Back effects for several spectral lines.

Recalling that a Lorentz unit is $4.67 \times 10^{-5}H$ cm.$^{-1}$, a field of 30,000 oersteds produces a spectral displacement of 1.4 cm.$^{-1}$, 100,000 oersteds gives 4.7 cm.$^{-1}$ and 320,000 oersteds gives 15.0 cm.$^{-1}$. Since the spin-doubling separation of the ^{2}P levels from which the first principal series doublet originates is 0.31 cm.$^{-1}$ for lithium and 17.2 cm.$^{-1}$ for sodium, it is obvious nhy the Paschen-Back effect has been observed for the former but not for the latter. Except for hyperfine structures and a relatively small number of narrow multiplets the complete Paschen-Back effect cannot be attained in other spectral lines (multiplets) because of experimental difficulties in generating magnetic fields of sufficient strength. In the great majority of spectra the J levels of terms are separated by hundreds or even by thousands of cm.$^{-1}$, and in most of these cases the Paschen-Back effect is inappreciable. This is most fortunate since othernise the Zeeman effect would have little practical value. Both the normal Zeeman effect and the complete Paschen-Back effect are ambiguous with regard to J and do not differentiate g. On the other hand, the resolved anomalous Zeeman effect definitely discloses, for both combining levels, the J values (in the number of components) and the g values (in the separations of the components). It is this feature of the Zeeman effect that has made it the most powerful aid in the analysis of spectral structure and in the positive determination of the electronic structure of atoms and ions (*see* SPECTROSCOPY). The Zeeman effect has also revealed some interesting magnetic properties of the stars. (W. F. M.)

ZEISS, CARL (1816–1888), German industrialist, a leading manufacturer of optical instruments, was born in Weimar on Sept. 11, 1816. In 1846 he opened at Jena a workshop for microscopes and other optical instruments. Having the foresight to recognize early that progress in building better microscopes would depend on a better scientific foundation, he engaged as research worker Ernst Abbe (*q.v.*), professor of physics and mathematics at the University of Jena. Subsequently Abbe became a partner in the firm. Xbbe and Zeiss engaged Otto Schott, a glass chemist who, in the years 1882 and following, invented and developed about 100 new kinds of optical glasses and new types of heat-resisting glasses After the death of Zeiss in Jena on Dec. 3, 1888, Xbbe, then sole onner of the Carl Zeiss firm, donated his firm and his share in the glassworks to the Carl Zeiss foundation. In 1923 Schott joined his share to the foundation. In 1945, after World War II, the board of management and about 100 scientists and technicians of the Carl Zeiss firm of Jena mere evacuated to west Germany by U.S. forces. They re-established in west Germany the Carl Zeiss foundation at Heidenheim. with the Carl Zeiss factory at nearby Oberkochen and the Schott glassworks at Mainz, independent of the Jena works in the communist-controlled zone of east Germany. (K. A. BA.)

ZEITZ, a town in the district of Halle. Ger., on the Weisse Elster. 28 mi. S.S.W. of Leipzig. Pop. (1959 est.) 45,142. Zeitz is an ancient place of Slavonic origin. From 968 until 1028 it was the seat of a bishopric, afterward removed to Naumburg, and styled Naumburg-Zeitz. From 1653 to 1718 Zeitz was the capital of the dukes of Saxe-Zeitz and remained in the possession of the electors of Saxony until 1815, when it passed to Prussia.

ZELAYA, JOSÉ SANTOS (1853–1919), Nicaraguan politician who governed the country with an iron hand for 16 years, 1893–1909. He is best remembered for his efforts to unite Central America by force, and as an unscrupulous dictator whose actions provoked U.S. Secretary of State Philander C. Knox to denounce him as a "blot on the history" of Nicaragua. In 1893 Zelaya came to power through a successful Liberal revolt which ended a prolonged period of Conservative dominance and earned a reputation as the troublemaker of Central America. In 1907 he helped oust the government of neighbouring Honduras and installed his ally, Miguel Dávila, as president there. His subsequent efforts to foment a revolution in El Salvador brought the area to the verge of war and led to the Washington conference of 1907. Zelaya's unwillingness to recognize the right of the United States to intervene in Central American affairs and his continued efforts to exert his hegemony over his neighbours led to a progressive worsening of U.S.-Nicaraguan relations. When in 1909 Zelaya executed two U.S. soldiers of fortune who held commissions in a revolutionary army, the United States broke off diplomatic relations. Zelaya resigned in favour of a fellow Liberal and left the country, dying in exile in New York city on May 17, 1919. (R. M. Sc.)

ZELAYA, a large department (comprising nearly 38% of the total national area) in Nicaragua. It embraces the Caribbean lowlands, most of the eastern slopes of the central highlands and the Corn Islands. Area 21,616 sq.mi., pop. (1959 est.) 71,196, of which two-thirds was rural. The region has most of the country's timber, principally mahogany, pine, cedar, dyewood and lignum vitae, which are cut and floated down rivers for domestic use and export. Western Zelaya has many gold and silver mines, two of which (Bonanza and Siuna mines, served only by air transportation) produce half of the nation's gold. The departmental capital Bluefields is the principal port on the Caribbean. Located near the mouth of the Escondido river, which is navigable for 60 mi. to Rama. Bluefields is connected by a modern highway with Managua, 175 mi. away. (C. F. J.)

ZEMARCHUS (fl. 568), Byzantine general and traveler. The Turks, by their conquest of Sogdiana in the middle of the 6th century. gained control of the silk trade which then passed through central Asia into Persia. But the Persian king Chosroes Nushirvan refused to allow the old commerce to continue, and the Turks in 568 sent an embassy to Constantinople to form an alliance with the Byzantines and "transfer the sale of silk to them." The offer was accepted by Justin II, and in Aug. 568 Zemarchus the Cilician, left Byzantium for Sogdiana. On reaching the Sogdian territories the travelers proceeded to the camp of Dizabul (or rather of Dizabul's successor, he having just died) apparently in some locality of the Altai. They found the khan and accompanied him some way on his march against Persia, passing through Talas or Turkistan in the Syr-Darya valley.

Near the river Oekh (Syr-Darya?) he was sent back to Constantinople \\-ith a Turkish embassy and with envoys from various tribes subject to the Turks. Halting by the "vast, wide lagoon" (of the Aral sea?), Zemarchus sent a messenger to announce his return to the emperor; marched 12 days; crossed the Emba, Ural, Volga and Kuban; and arrived safely at Trebizond and Constantinople. For several years this Turkish alliance subsisted but from 579 the friendship rapidly began to cool. (C. R. B.)

ZEN (CH'AN in Chinese, abbreviated from *ch'an-na,* a transcribed form of dhyana in Sanskrit) is a school of Buddhism claiming to transmit the spirit or essence of Buddhism, which consists in experiencing the enlightenment (*bodhi*) Buddha possessed. Zen thus refuses to follow blindly the instructions or teachings given by the Buddha during his long years of peregrination. Zen regards words or letters as merely indicative of the goal where the Buddhist life starts and ends.

Zen is legendarily thought to have originated in India and to have been taken to China in a finished form by Bodhidharma early in the 6th century A.D. Its actual origin was in China beginning with Hui-neng (d. 713), regarded as the 6th Chinese patriarch. It was he who strongly upheld the awakening of *prajna* against the idea of the all-importance of *dhyana* and this fact marks the beginning of Zen as it has been understood since. The practice of *dhyana* may finally bring out *prajna* but it is not to be thought of as the goal of Zen; what Zen proposes is the awakening of *prajna* from the depths of consciousness where it ordinarily lies dormant.

Prajna stands against *vijnana*. If *vijnana* is taken to mean relatively limited human knowledge, *prajna* corresponds to an intuition of the highest order. Hui-neng emphasized the awakening of *prajna* as opposed to the one-sided mental absorption in the tranquilizing practice of *dhyana* that was the prevailing tendency in his day. Hui-neng thus caused a revolutionary movement in the history of Chinese Buddhism.

In Indian philosophical thought Nagarjuna's Madhyamika school points out the significance of *prajna,* which sees into the abyss of *sunyata* ("emptiness"). What most conspicuously distinguishes Chinese Zen from all the types of philosophical thought originating in India is its complete lack of concern with abstract metaphysical speculations wandering far away from the concrete world of finites. Zen demonstrates this characteristic feature in the form of questions and answers (*mondo*). These *mondo* are refreshing and full of vivacity because they spring from life itself and deal with it directly without any intermediary agent such as intellection or symbolization.

There are no references in the *mondo* to any of the subjects usually considered religious or spiritual, such as God, salvation, revelation, sin or guilt, forgiveness, etc. The absence is singularly noticeable. What meaning has the awakening of *prajna* for daily life, not to mention one's highest spiritual aspirations? Does Zen find salvation in washing dishes, in cultivating the ground or in peddling articles? Is there any revelation in looking at the flowers or in exchanging greetings? Is there some kind of emancipation in uttering an unintelligible cry as sometimes given out by the Zen master? Zen disavows arguing, theorizing, sermonizing or trying to explain. Zen, on the contrary, urges its follower to find in himself the answer to any question raised from within himself because the answer is where the question is. The Zen master would say, "My words are mine and not yours and do not belong to you. All must come out of your own being."

When Zen emphasizes the awakening of *prajna* in oneself this does not mean that Zen repudiates Buddhism as a whole, as is sometimes imagined. On the contrary, Zen lives within the framework of Buddhist teaching, which consists of two factors: *prajna* ("wisdom") and *karuna* ("love"). Thus Zen also upholds the *karuna* aspect of the Buddhist experience, *i.e.,* the creating agent that produces all kinds of contrivances to help fellow beings to come to the realization of *prajna*.

A monk asked the master, "What kind of person is one before he experiences enlightenment?" "He is an ordinary man just as we all are." he was told. "What then after the enlightenment?" asked the questioner. "His head is covered with ashes and his face smeared with mud." The monk further asked, "What does all this finally amount to?" The answer was, "Not much, just so."

"The head covered with ashes and the face smeared with mud" is typical Zen phraseology. It means that a Zennist works hard in every walk of life for the general welfare of humanity. "Have a cup of tea" is another popular Zen expression symbolizing the Zennist's social concern. In Zen, as in all other schools of Buddhism, *karuna* and *prajna* co-operate like the two wheels of a cart.

A monk taking leave of Hsueh-feng (822–908) visited Ling-yun and asked, "How was the world before Buddha appeared?" Ling-yun raised the *hossu* (an instrument originally used to brush away insects, now a kind of religious implement). "How is the world after Buddha's appearance?" the monk demanded. Ling-yun raised the *hossu* as before. The monk went back to Hsueh-feng, who asked him, +'Why do you come back so soon?" The monk told the master all about his encounter with Ling-yun, adding that he altogether failed to understand the latter. Hsueh-feng said, "You ask me and I'll tell you." When the monk repeated the first question Hsueh-feng also raised the *hossu*. When the second one was asked Hsueh-feng threw the *hossu* down. Thereupon the monk bowed and the master struck him. In this incident the use of the *hossu* is *prajna,* whereas the master's striking is *karuna*.

Zen flourished best in China in the T'ang (618–906) and Sung (960–1279) periods and began to show signs of decline in the Ming (1368–1644). Considerable interest in Zen was seen in the west during the decades immediately following World War II, perhaps in part reflecting a general awakening of interest in Japanese life and culture. Only in Japan is Zen still a living force; there its adherents in the late 1950s numbered approximately 4,500,000. *See* also BUDDHISM; MAHAYANA. (D. T. SU.)

ZENAGA, a Berber tribe of southern Morocco who gave their name to Senegal, once their tribal home. With other tribes under Yusef bin Tashfin, they crossed the Sahara and gave the Almoravide dynasty to Morocco and Spain. The Zeirid dynasty which supplanted the Fatimites in the Maghrib and founded the city of Algiers was also of Zenaga origin.

ZENATA or ZANATA, a Berber tribe of Morocco in the central Atlas district. Their tribal home seems to have been south of Oran in Algeria, and they early claimed an Arab origin, though the Arabs called them descendants of Goliath; *i.e.,* Philistines or Phoenicians.

The Beni Marin and Wattasi dynasties, of Zenata origin, reigned in Morocco from 1213 to 1548.

ZENGER, JOHN PETER (1697–1746), American colonial printer, was the defendant in the famous case that established the first important victory for freedom of the press in the colonies Born in Germany in 1697. he nent to New York in 1710, and from 1711 to 1719 served an apprenticeship with the printer William Bradford. In 1720–22 he lived in Chestertown, Md. later he worked in partnership with Bradford, and in 1726 Zenger established his own printing business.

On Nov. 5, 1733, he published the first issue of the *New-York Weekly Journal,* the political organ of a group of New Yorkers who opposed the policies of the colonial governor. William Cosby. For a year the paper continued scathing attacks on the governor until, in Nov. 1734, Cosby issued a proclamation condemning the "divers scandalous, virulent, false and seditious reflections" and offering a reward for the apprehension of their author. On Nov 17, 1734, Zenger was arrested for libel and until the following August remained in prison, continuing to edit the *Journal* from his cell. When his case finally came to trial on Aug. 4, 1735, he was defended by a noted Philadelphia lawyer, Andrew Hamilton. Hamilton offered to prove the truth of the statements in Zenger's paper but, in accordance aith English law, the judge, a supporter of the administration, refused to allow that procedure; instead he instructed the jury simply to decide whether the statements in question had actually been printed and to leave the decision as to whether they uere libelous to the court. Hamilton, honever, urged the jury to consider itself competent to make that decision and stated Zenger's cause so eloquently that it returned a verdict of not guilty. This early recognition of the right of juries to decide whether statements said to be libelous actually were libelous was an important step toward the freedom of the press from censorship by a biased judiciary. although for many years the principle was not established as a legal precedent

Zenger subsequently served as public printer in both New York and New Jersey. His account of the trial was published in 1736 in the *Journal* and was aidely circulated both in the United States and in England He died July 28, 1746.

See Vincent Buranelli (ed.), *The Trial of Peter Zenger* (Sew York, 1957).

ZENITH TELESCOPE, a form of telescope specially devised for the accurate determination of latitude. It is used in geodetic surveys and, at fixed stations, for measuring the variation of latitude.

The usual form of the instrument consists of a telescope which is free to move in the plane of the meridian about a horizontal east-west axis. The telescope can be clamped to this axis, which can be rotated, end for end, about a vertical axis. Thus, if the telescope points to a certain distance north of the zenith it will point to the same distance south of the zenith after reversal. A sensitive level is used for finding the difference in inclination of the telescope to the vertical in the two positions.

Two stars of known declination δ_1 and δ_2 are chosen which transit within a few minutes of one another, one north and the other south of the zenith at nearly equal zenith distances. If ϕ is the latitude. the respective zenith distances are $\delta_1 - \phi$ north and $\phi - \delta_2$ south. so that the small difference between them is $\delta_1 + \delta_2 - 2\phi$. Settings of a micrometer wire are made on each star in turn. the telescope being rotated from the north to the south direction between the two observations. The distance that the wire has to be moved measures the quantity $\delta_1 + \delta_2 - 24$ and hence determines ϕ.

The method described is generally known as the method of Andrew Talcott. who used it in boundary surveys (1834). It is characteristic of the Talcott method that the derived latitude depends upon the accuracy of the level: of the micrometer and of the assumed star positions. but is independent of a precisely graduated circle. The correction for refraction is nearly zero because the north and south measures are made at nearly the same altitude.

The floating zenith telescope, designed by B. Cookson, employs a basin of mercury for rotating the telescope and for fixing the position with respect to the vertical. Trails of a pair of stars are obtained close together on a photographic plate.

The photographic zenith tube. which is used at a number of observatories, makes use of a reflecting basin of mercury to define the vertical. Exposures made in two positions of the lens and photographic plate determine the zenith distance and the latitude. *(See* TIME MEASUREMENT: *Practical Determination of Rotational Time: Photographic Zenith Tube.)* (W. Mz.)

ZENO, East Roman emperor from *474* to 491, was an Isaurian of noble birth. Of his early life nothing is known; after his marriage to Ariadne, daughter of Leo I, in *468* he became patrician and commander of the imperial guard and of the armies in the east. In 474 Leo I died after appointing as his successor Leo, the son of Zeno and Ariadne; Zeno, however. succeeded in getting himself crowned also, and on the death of his son in the same year became sole emperor. In the following year, in consequence of a revolt fomented by Verina in favour of her brother Basiliscus, he was compelled to take refuge in Isauria. The growing misgovernment of Basiliscus ultimately enabled Zeno to re-enter Constantinople unopposed (476); his rival was banished- to Phrygia, n-here he died soon afterward. The remainder of Zeno's reign was disturbed by numerous other less formidable revolts. Since 472 the aggressions of the two Ostrogoth leaders. both named Theodoric. had been a constant source of danger. In 487 Zeno induced Theodoric. son of Theodemir, to invade Italy and establish his new kingdom. In ecclesiastical history the name of Zeno is associated with the *Henoticon* or instrument of union. promulgated by him and signed by all the eastern bishops, with the design of terminating the Monophysite controversy.

See J. B. Bury, *The Later Roman Empire* (1889), i, pp. 250–274; E. W. Brooks in the English *Historical Review* (1893), pp. 209–238; W. Barth. *Der Kaiser Zeno* (Basel, 1894).

ZENO (OF ELEA) ib. probably *c.* 500 B.C.), Greek philosopher. regarded as the inventor of "dialectic" in virtue of his method of indirect argumentation. was famous for the paradoxes whereby, in order to recommend the Parmenidean doctrine of the existence of "the one" (*i.e.,* indivisible reality). he 'sought to controvert the common-sense belief in the existence of "the many" (*i.e.,* distinguishable qualities and things capable of motion). Zeno was the son of a certain Teleutagoras and the pupil and friend of Parmenides. In Plato's *Parmenides,* Socrates, "then very young," converses with Parmenides and Zeno, "a man of about forty"; but it may be doubted whether such a meeting was chronologically possible. Plato's account of Zeno's purpose (*Parmenides,* 128 *et seq.*), however. is presumably accurate. In reply to those who thought that Parmenides' theory or' the existence of "the one" involved inconsistencies. Zeno tried to show that the assumption of the existence of a plurality of things in time and space carried nith it more serious inconsistencies In early youth he collected his arguments in a book. which. according to Plato. nas put into circulation without his knowledge.

Of the paradoxes used by Zeno to discredit the belief in plurality and motion. eight survive in the writings of Aristotle and Simplicius. They are commonly stated as follows:

1. If the existent is many, it must be at once infinitely small and infinitely great—infinitely small, because its parts must be indivisible and therefore without magnitude; infinitely great, because, for any part having magnitude to be separate from any other part. the intervention of a third part having magnitude is necessary, and, ior this third part to be separate from the other two, the intervention of other parts having magnitude is necessary, and so on ad infinitum.

2. Likewise, the many must be numerically both finite and infinite—numerically finite. because there are as many things as there are, neither more nor less; numerically infinite, because! for any two things to be separate. the intervention of a third thing is necessary, and so on ad infinitum. (An alternative interpretation of either or both of these arguments would have Zcno referring to the intervention of a part *within* rather than *between* each part.)

3. If all that is is in space, space itself must be in space, and so on ad'infinitum.

4. Ii a bushel of corn turned out upon the floor makes a noise, each grain and each part of each grain must make a noise likewise; but, in fact, it is not so.

5. Before a body in motion can reach a given point, it must first traverse the half of the distance; before it can traverse the half, it must first traverse the quarter; and so on ad infinitum. Hence, ior a body to pass irom one point to another, it must traverse an infinite number of divisions. But an infinite distance (which the paradox does not distinguish from a finite distance infinitely divided) cannot be traversed in a finite time. Consequently, the goal can never be reached.

6. If the tortoise has the start of Achilles, Achilles can never come up with the tortoise; for, while Achilles traverses the distance from his starting point to the starting point of the tortoise, the tortoise advances a certain distance, and while Achilles traverses this distance, the tortoise makes a further advance, and so on ad infinitum. Consequently, Achilles may run ad infinitum without overtaking the tortoise. (This paradox is virtually identical with the preceding one, the only difference being that there are two bodies instead of one moving toward a limit. The "infinity" of the premiss is an infinity of subdivisions of a distance which is finite: the "infinity" of the conclusion is an infinity oi distance.)

7. So long as anything is in a space equal to itself, it is at rest, An arrow is in a space equal to itself at every moment of its flight and therefore also during the whole of its flight. Thus the flying arrow is at rest.

8. Two bodies moving with equal speed traverse equal spaces in equal time. But, when two bodies move with equal speed in opposite directions, the one passes the other in half the time in which it passes a body of equal length. which is at rest. (The concealed point is. almost certainly, that the actual division of an instant is implied.)

It will be seen that Zeno made use of three premisses: first. that any unit has magnitude: second, that it is infinitely divisible: and third. that it is indivisible. Yet he incorporated arguments for each: for the first premiss. he argued that that which added to or subtracted from something else does not increase or decrease the second thing is nothing; for the second. that a unit, being one. is homogeneous and that therefore, if divisible, it cannot be divisible at one point rather than another; for the third, that a unit, if divisible. is divisible either into extended minima, which contradicts the second premiss or. because of the first premiss, into nothing. He had in his hands a very powerful complex argument in the form of a dilemma, one horn of n-hich supposed indivisibility. the other infinite divisibility, both leading to a contradiction of the original hypothesis. Thus. in refuting the hypothesis of motion, paradoxes *5* and 6 postulated infinitely divisible stretches, paradoxes 7 and *8* indivisible stretches. His method had great influence and may be summarized as follows: he continued Parmenides' abstract, analytic manner. but started from his opponents' theses and refuted them by *reductio ad absurdum.* It was probably the tn-o latter characteristics which Aristotle had in mind when he called him the inventor of dialectic.

Zeno may have been arguing against actual opponents. Pythagoreans who believed in a plurality composed of numbers that were thought of as extended units. This is controversial. It is not likely that any mathematical implications (*e.g.,* doubts about using infinitesimals in geometry) received attention in his lifetime. But in fact the logical problems which his paradoxes raise about a mathematical continuum are serious. fundamental and inadequately solved by Aristotle.

By Plato's time. at least. Zeno's paradoxes had been applied to another problem which was to be of much importance in philosophy. This was the problem of predication. In the *Parmenides* we are told that the first argument of Zeno's book reduced "the many" to absurdity by showing that they are simultaneously "like and unlike." Socrates claims that this is a commonplace in the case of changing particulars (as the *Phaedo* had pointed out. the same individual is. relatively, both tall and short); what would be a marvel. he suggests, would be to show that it held in the case of universals—if unity. say. were many or plurality one. This leads in the *Sophist* to the doctrine of the communion or mingling of the Platonic forms. which amounts to tackling the problem of class-inclusion instead of class-membership. At the same time both dialogues can turn the tables on Eleatic monism. For when Zeno had argued that the "unit" of the pluralists was self-contradictory, he had referred to the units into which total reality was supposed to be divided. Plato (following the lead of Gorgias) simply uses the same arguments against the unitary reality itself. Since this now contains differences. the "not-being" which Parmenides had asserted to be impossible finds a place as "difference": "*A* is-not *B*" means "*A* is different from, or other than. *B*."

ZENO (THE STOIC) (*c.* 320–*c.* 250 B.C.), sometimes also called ZENO THE PHOENICIAN, founder of the Stoic philosophy, was a native of Citium in Cyprus. who came to Athens as a youth and, although refusing an offer of citizenship, remained there until his death. After studying under Crates the Cynic, under Stilpo the Megarian and in the Old Academy, he began to teach in the *Stoa poikile* ("painted stoa" or "porch"). His *Life* by Diogenes Laërtius (vii, 1) contains an outline of his teaching which was dogmatic, prophetic and paradoxical rather than philosophical in the manner of his Greek predecessors. Dividing philosophy into logic, physics and ethics and taking as his criterion of truth the *kataleptike phantasia* ("indubitable impression"), he made ethics central and taught that happiness lies in conforming the to the divine reason which governs the universe. None of his many treatises on logic, physics, ethics and rhetoric, written in harsh but forceful Greek: is extant save in fragmentary quotations.

ZENOBIA, queen of Palmyra, one of the heroines of antiquity. Her native name was Septimia Bathzabbai. This remarkable woman was well fitted to be the consort of Odainatti (*see* ODAENATHUS) in his proud position as Dux Orientis; during his lifetime she actively seconded his policy, and after his death in A.D. 266–67 she determined to surpass his position and make Palmyra ruler of the Roman empire in the east. Wahab-allath or Athenodorus (as the name was Grecized), her son by Odainath, being still a boy, she took the reins of government into her own hands. Under her general in chief Zabda, the Palmyrenes occupied Egypt in A.D. 270 under the pretext of restoring it to Rome; and Wahab-allath governed Egypt in the reign of Claudius as joint ruler. In Asia Minor Palmyrene garrisons were established as far west as Ancyra in Galatia and Chalcedon opposite Byzantium. When Aurelian became emperor in 270 he quickly realized that the policy of the Palmyrene queen was endangering the unity of the empire and instantly took measures; Egypt was recovered for the empire by Probus (270), and the emperor himself prepared a great expedition into Asia Minor and Syria. Toward the end of 271 he marched through Asia Minor and, overthrowing the Palmyrene garrisons in Chalcedon, Ancyra and Tyana, he reached Antioch, where the main Palmyrene army under Zabda and Zabbai, with Zenobia herself, attempted unsuccessfully to oppose his may. The queen was defeated at Emesa (Homs) and fell back upon Palmyra, where Aurelian followed her and laid siege to the city. The queen and her son fled to seek help from the Persian king, but were captured on the bank of the Euphrates, and the Palmyrenes, losing heart, capitulated (A.D. 272). Zenobia probably retired at Tibur, where she lived the life of a Roman matron with her sons. A few months after her fall Palmyra revolted again; Aurelian unexpectedly returned and destroyed the city.

Among the traditions relating to Zenobia may be mentioned that of her discussions with the Archbishop Paul of Samosata on matters of religion. It is probable that she treated the Jews in Palmyra with favour; she is referred to in the Talmud as protecting Jewish rabbis (Talm. Jer. *Ter.* viii, 46 b).

The well-known account of Zenobia by Gibbon (*Decline and Fall*, i, pp. 302–312, Bury's edition) is based upon the imperial biographers (*Historia Augusta*) and cannot be regarded as strictly historical in detail. *See* further PALMYRA. (G. A. C.; X.)

ZENODOTUS OF EPHESUS (fl. *c.* 280 B.C.), Greek grammarian who made the first critical edition of Homer, lived in the reigns of the first two Ptolemies. He was a pupil of Philetas of Cos, and the first superintendent of the famous library at Alexandria: where he arranged the work of the epic and perhaps of the lyric poets. After comparing different manuscripts of Homer, he obelized (deleted) doubtful lines, transposed others and made emendations. His edition, knowledge of which is derived almost entirely from later scholia on Homer, was severely criticized by Aristarchus, but had some influence on the poetry of Zenodotus' younger contemporaries, Callimachus and Apollonius Rhodius. It was he who divided the *Iliad* and the *Odyssey* into 24 books each. He compiled a Homeric glossary, and besides editing the *Theogony* of Hesiod he published studies of Pindar, traces of which survive in a papyrus from Oxyrhyncus (no. 841). He is also said to have written epic poetry.

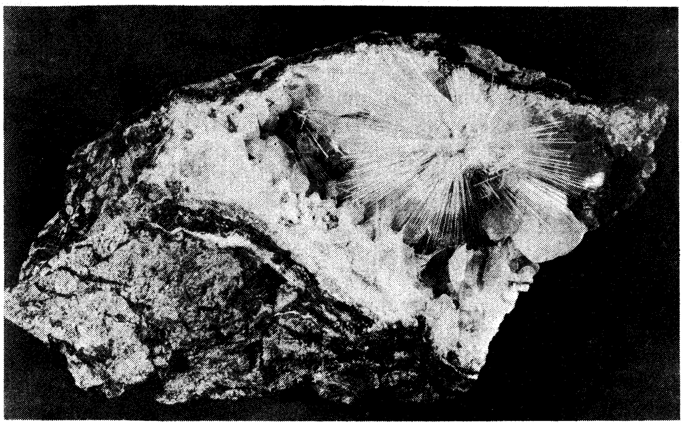
ZEOLITE, a numerous and complex family of hydrous aluminum silicate minerals containing one or more of the alkali and alkaline earth metals. Natural and synthetic zeolites have been much used as water softeners, and occasionally as absorbent materials (see *Base Exchange*, below) with increasing application in industrial sieving processes as molecular sieves to separate molecules of different sizes (as various hydrocarbons) and molecules of the same size but different electrical properties (as water and natural gas). The name is derived from the Greek words for "to boil" and "stone" in allusion to the distinctive property of appearing to boil when heated. The effect is a consequence of the easy fusibility and, at the same time, loss of considerable amounts of water of crystallization.

Species.—The most important species belonging to the family are identified in the accompanying table.

Zeolite Family

Group	Species	System of crystallization	Formula
Natrolite group	Natrolite	Orthorhombic	$Na_2Al_2Si_3O_{10} \cdot 2H_2O$
	Mesolite	Monoclinic	$Na_2Ca_2[Al_2Si_3O_{10}]_3 \cdot 8H_2O$
	Thomsonite	Orthorhombic	$NaCa_2[Al_2Si_2(Al,Si)O_{10}]_2 \cdot 5H_2O$
	Gonnardite	Orthorhombic	$(Ca,Na)_3[(Al,Si)_5O_{10}]_2 \cdot 6H_2O$
	Scolecite	Monoclinic	$CaAl_2Si_3O_{10} \cdot 3H_2O$
	Edingtonite	Tetragonal	$BaAl_2Si_3O_{10} \cdot 3H_2O$
Heulandite-stilbite group	Heulandite	Monoclinic	$CaAl_2Si_7O_{18} \cdot 7H_2O$
	Stilbite / Epistilbite	Monoclinic / Monoclinic	$CaAl_2Si_6O_{16} \cdot 5H_2O$
	Brewsterite	Monoclinic	$(Sr,Ba,Ca)Al_2Si_6O_{16} \cdot 5H_2O$
Laumontite group	Laumontite	Monoclinic	$Ca[AlSi_2O_6]_2 \cdot 4H_2O$
	Gismondite	Orthorhombic	$CaAl_2Si_2O_8 \cdot 4H_2O$
	Mordenite	Orthorhombic	$(Ca,K_2,Na_2)[AlSi_5O_{12}]_2 \cdot 7H_2O$
Phillipsite group	Phillipsite	Monoclinic	$KCaAl_3Si_5O_{16} \cdot 6H_2O$
	Harmotome	Monoclinic	$BaAl_2Si_6O_{16} \cdot 6H_2O$
Chabazite group	Gmelinite	Hexagonal	$(Na_2,Ca)Al_2Si_4O_{12} \cdot 6H_2O$
	Chabazite	Hexagonal	$(Ca,Na_2)Al_2Si_4O_{12} \cdot 6H_2O$
	Levynite	Hexagonal	$CaAl_2Si_4O_{12} \cdot 6H_2O$
	Faujasite	Cubic	$Na_2Ca[Al_2Si_4O_{12}]_2 \cdot 16H_2O$

The similar mineral analcite (*q.v.*), $NaAlSi_2O_6.H_2O$, sometimes classified as a member of the zeolite family, in this article is regarded as a feldspathoid (*q.v.*). Identification of the different species of zeolite commonly requires careful measurements of their optical properties, and in the case of many fine-grained types, the use of X-ray diffraction. Zeolites in many localities exhibit strikingly developed crystals; whereas they occur in nondescript granular masses or as disseminated grains in many other localities. Most varieties are translucent to white in colour, although a few range through flesh tints, brown, yellow and red. The refractive indices, birefringence, specific gravity (2.0–2.4), and hardness are all relatively low. The zeolites are further distinguished by the fact that they are readily decomposed in hydrochloric acid with the separation of silica.



BY COURTESY OF AMERICAN MUSEUM OF NATURAL HISTORY
RADIATING GROUP OF NATROLITE CRYSTALS FOUND IN WEST PATERSON, N.J.

Crystal Structure. — Several striking features of the zeolites are directly controlled by the crystalline make-up. The essential structural scheme for all species is a rather open but tightly linked framework of the silicate [SiO_4] and aluminate [AlO_4] tetrahedral groups or clusters of atoms *(see* MINERALOGY). However, the metal ions, such as sodium or calcium, and the water molecules are relatively loosely bound within the large voids in the frameworks. In most zeolites the voids are interconnected so as to yield well-defined channels on an atomic scale through the crystals. Thus, the low specific gravities are explained by this structural porosity, which also accounts for their ability to serve as molecular sieves.

Zeolitic Dehydration. — The behaviour of the crystal water of zeolites is so distinctive it is commonly referred to as zeolitic dehydration. The amount of water contained in a zeolite depends upon the humidity and temperature of the environment, as well as upon its own composition and structure. At temperatures below about zoo" C. most zeolites lose and regain water reversibly with little or no change in the essential aluminosilicate framework. Most other hydrated crystalline substances, on the other hand, do not exhibit this reversibility and for many the fundamental structure is destroyed if the water is lost.

Base Exchange. — Zeolites also have the property of base exchange. If, for example, a sodium zeolite is placed in a calcium-rich solution the loosely bound sodium atoms tend to diffuse through the zeolitic channels into the solution. Calcium ions tend to diffuse into the crystal. The process is reversible and the original zeolite may be regenerated by replacing the calcium solution by one of sodium. Many other bases such as potassium, strontium. barium, lithium, ammonium, silver and copper are also exchangeable. It is by reason of this property of base exchange that zeolites have been used as water softeners in the permutite process, and as absorbent materials. *(See* also COLLOID: *Ion* Exchange or *Base Exchange;* WATER; WATER SUPPLY AND PURIFICATION: *Softening.*)

Occurrence.—Zeolites apparently are stable under a wide range of conditions in hydrous environments. They are abundantly found as alteration products in igneous and metamorphic rocks, associated mith ore deposits, and in ancient and recent sediments. Zeolites have been made artificially up to very high temperatures and pressures if sufficient water is present. The most notable occurrences of zeolite are the beautifully crystallized cavity linings in basalt and diabase, as at Bergen hill, New Jersey; Westfield, Mass.; and the Lake Superior copper district. Abundant granular zeolites also occur dispersed in such rocks as alterations of feldspar. 'They occur also in feldspathoidal syenites, gneisses and some granites. *See* also CHABAZITE; HEULANDITE; NATROLITE; PHILLIPSITE; SCOLECITE; STILBITE. (D. M. H.)

ZEPHANIAH, the ninth of the minor prophets in the Bible. His 'ancestry is traced to his great-grandfather Hezekiah, who may, in spite of 2 Kings xx. 1S, xxi. 1, be the well-known king of Judah (c. 720–690). This would agree fairly with the title (i. 1) which makes the prophet a contemporary of King Josiah (c. 637), and this in turn appears to agree *(a)* with the internal conditions (i. 4–6, cf. 2 Kings xxiii. 4, 5, 12) which, it is held, are evidently earlier than Josiah's reforms (621); (b) with the denunciation of the royal household, but not of the (young) king himself (i. 8, iii. 3); (c) with the apparent allusion in ch. i. to the invasion of the Scythians (perhaps *c.* 626), and (d) with the anticipated downfall of Assyria and Nineveh (ii. 13, 612 B.C.).

Although one single leading motive runs through the book of Zephaniah there are abrupt transitions which do not depend on modern subjective considerations of logical or smooth thought, but are material and organic changes representing different groups of ideas. The instruments of Yahweh's anger (ch. i.) are not so real or prominent on the political horizon as, for example, in Isaiah, Jeremiah or Habakkuk. The Scythian inroad and its results for Judah and Philistia are less important when it is observed that the doom upon Philistia, the vengeance upon Moab and Ammon, and the promises for Judah (ch. ii.), belong to a large group of prophecies against certain historic enemies (Edom included) who are denounced for their contempt. hostility and intrusion. The prophecies are in large measure associated traditionally with the fall of Jerusalem, and to some such calamity, and not to the inroad of the Scythians, the references to the "remnant" and the "captivity" refer. The anticipation of future events is of course conceivable in itself; but the promises (in ch. ii.) *presuppose* events other and later than those with which the Scythians were connected. On the other hand, a prophecy relating to Scythians may have been re-shaped to apply to later conditions, and on this view it is explicable why the indefinite political convulsions should be adjusted to the exile and why the gloom should be relieved by the promise of a territory extending from the Mediterranean to the Syrian desert (ii. 7, 9). After a period of punishment (cf. book of Lamentations) Yahweh's jealousy against the semi-heathen Judah has become a jealousy for his people, and we appear to move in the thought of Haggai and Zechariah, where the remnant are comforted by Yahweh's return and the dispersed exiles are to be brought back (*cf.* Zech. i. 14–17, viii. 2–17). But in ch. iii. other ideas are maniiest. Israel's enemies have been destroyed, her own God Yahweh has proved *his* loyalty and has iulfilled his promises, but the city remains polluted (*vv.* 1–7, cf. Isa. lviii. seq.; Malachi). Once more doom is threatened, and once more me pass over into a later stage where Yahweh has vindicated his supremacy and Zion is glorified. Instead of the realities of history me have the apocalyptical feature of the gathering of the nations (*v.* 8); the thought may be illustrated irom Zech. xii. 1.–xiii. 6. where Jerusalem is attacked. purged and delivered, and from Zech. xiv. where the city is actually captured and hali the people are removed into captivity (cf. Zeph. iii. 11 purging. 15 removal oi the enemy, 18–20 return of the captivity). The goal is the vindication of Israel and of Israel's God and the establishment of universal monotheism (ii. 11, iii. 9 seq.). The foe which threatened Judah has become the chastiser of Ethiopia and Assyria (ii.) and the prelude to the golden ape (iii., cf. Ezek. xxxviii. seq.).

If Jer. iv. 5–vi. 30 originally reierred to the Scythians, it has been revised to reier to the Chaldeans; also in Ezek. xxxviii. seq. a northern ioe becomes associated mith the great world-judgment. Also, in Isaiah and Zechariah, notably, older and later groups of prophecies are preserved. whereas here the new preludes and new sequels suggest that the original nucleus has passed through the hands oi writers in touch with those vicissitudes of thought which can be studied more completely elsewhere. It is not to be supposed that the elimination of all later passages and traces of revision will give us Zephaniah's prophecies in their original extent. In iact the internal religious and social conditions in i. 4–6 or iii. 1–4 do not compel a date before Josiah's reiorms. The doom of Cush is still in the iuture in Ezek. xxx. 4; and if the impending fall of Nineveh (ii. 13) implies an early date, yet it is found in writings which have later additions (Nahum), or which are essentially later (Jonah, *cf.* Tob. xiv. 4 [LXX.], 8, 10. 15); *cf.* also the use of Xssyria ior Babylon (Ezra vi. 22) or Syria (Zech. x. 10). Historical reierences in prophecies are not always decisive (Ezek. xxxii., ior example. looks upon Edom and Sidon as dead), and while the continued revision of the hook allows the presumption that the tradition ascribing its inception to the time of Josiah may be authentic, it is doubtful how much oi the original nucleus can be safely recognized.

BIBLIOGRAPHY.—*See* the commentaries on (all or portions of) the Minor Prophets by A. B. Davidson (*Cambridge Bible,* 1896); G. A. Smith (1928); W. Nowack (1903); K. Marti (1904; especially valuable); S. R. Driver *(Century Bible,* 1906); Van Hoonacker (1908). (S. A. C.)

ZEPHYRINUS, ST., bishop of Rome from about 198 to 217, succeeded Victor I. The controversies on doctrine and discipline that marked his pontificate are associated with the names of Hippolytus and of Calixtus, his principal adviser and afterwards his successor.

ZEPHYRUS, in Greek mythology, the west wind, son of the Titan Astraeus and Eos, the dawn. He was the husband of Chloris, the goddess of flowers, by whom he had a son, Carpus, the pod of fruit (Ovid. *Fasti,* v. 197).

See also FLORA; HARPIES: HYACINTHUS.

ZEPPELIN, FERDINAND, COUNT VON (1838–1917), German airship inventor, was born at Constance. Baden, on July 8. 1838. He served in the Federal army during the American Civil War and while in America made his first balloon ascent. Returning to Germany he saw active service in the Austrian War of 1866 and in the Franco-German War of 1870. In 1891 he retired from the army and devoted his energies to aeronautics.

In 1900 he built an airship. which rose from the ground and remained in the air for 20 minutes, but was wrecked in landing. In 1906 he made two successful flights at a speed of 30 mi. an hour. and in 1907 attained a speed of 36 mi. From that time onward his airship construction made steady progress and many Zeppelin airships took part in World War I. though with heavy losses under attack. *(See* AIRSHIP.) He died at Charlottenburg on March 8. 1917.

See *Eine Festgabe zu seinem 75. Geburtstag von Luftschiffbau Zeppelin* (Stuttgart, 1913).

ZERMATT, a mountain village (5,315 ft. above sea level) at the head of the Visp valley and at the foot of the Matterhorn, in the canton of Valais, Switz. It has (1960) 2.731 permanent inhabitants, German-speaking and Roman Catholics.

Formerly Zermatt was called "Praborgne," and this name is mentioned in the Swiss census of 1888. Its originally Romance population seems to have been Teutonized in the course of the 15th century, the name "Matt" (now written "Zermatt," *i.e.,* the village on the meadows) first occurring in that century.

ZERNIKE, FRITS (1888–), Dutch physicist. awarded the 1953 Nobel prize for physics for his outstanding contributions to optics, and especially for his introduction of the method of phase-contrast microscopy *(see* MICROSCOPE: *Phase Contrast).* He was born in Amsterdam on July 16, 1888. He was educated in the University of Amsterdam, and obtained his doctorate there in 1915. He then worked in the department of astronomy in the University of Groningen as professor extraordinarius of mathematical physics and theoretical mechanics, becoming full professor in 1920. His researches contributed to optics and to other branches of physics. His earliest work in optics was concerned with problems relating to astronomical telescopes. and in 1934 he published a diffraction theory of the Foucault knife-edge test for the figure of telescopic mirrors, this work being notable for the discovery of the so-called polynomials of the phase-contrast method. He quickly realized that this method could be applied to the microscope and its use in microscopy led to revolutionary advances. proving most valuable in medical and biological research. In 1952 Zernike was awarded the Rumford medal of the Royal society. (D. McK.)

ZERO, the figure o in the Arabic notation for numbers meaning nought, or cipher. The Sanskrit name for the figure was *śūnya* (void), and this term passed over into Arabic as *aṣ-ṣifr,* or *ṣṣifr.* The old Latin writers on arithmetic translated or transliterated the Arabic word as *zephyrum;* this in Ital. took on such forms as *zeuero, zepiro,* and became contracted to *zero,* borrowed by F. *zéro,* whence it came late into English. The Spanish form *cifra,* more closely resembling the original Arabic, gave O.Fr. *cifre,* mod. *chiffre,* also used in the sense of monogram, and English "cipher" which is thus a doublet. Although no character for zero is found in India before the 9th century, there is literary evidence for the belief that it was known much earlier. In the Maya inscriptions in Central America there appears a character for zero, but only in connection with the calendar.

ZEROMSKI, STEPHEN (1864–1925), Polish novelist, poet and dramatist, was born at Strawczyn on Nov. 14, 1864. Banished from Poland by the Russian Government early in his life, he first attracted attention by a collection of tragic tales entitled *The Ravens and the Crows are Picking us to Pieces* (1895, Eng. trans. 1906). In the publication of *The Homeless* (1900) Zeromski supplied a generic name for all his Polish heroes. His pessimistic philosophy finds expression in the novel *Aryman takes Revenge* (1904), while the triumph of evil over good is vividly treated in *The Story of Sin* (2 vol., 1906) describing the slow and terrible downfall of a woman of culture. In his epic poem *Ashes* (2 vol., 1904) he delineates the minds of the Polish people after the Partition and their efforts to liberate their country by serving in the Napoleonic legions. During World War I Zeromski published his great trilogy *The Fight with Satan — The Conversion of Judas* (1916), *The Blizzard* (1918), *Charitas* (1919)—a kind of epilogue and synthesis of his previous work and at the same time an autobiography of his own life. After the achievement of national independence, Zeromski wrote his drama, *The Broken Spell* (1924) in which the hero dedicates himself to the services of a resuscitated Poland. He died on Nov. 20, 1925.

See S. Brzozowski, *O Stefan Zeromski* (Warsaw, 1905); W. Jampolski, *Stefan Zeromski, the Spiritual Leader of the Race* (Lwów, 1918).

ZETKIN, KLARA (1857–1933), German communist. was born on June 5, 1857, at Wiederan, Saxony, and educated at the University of Paris, becoming a schoolteacher. She presently became editor of *Gleichheit,* the organ of the Social Democratic party for women. Klara Zetkin was a member of the Communist party from its foundation in 1919 and was one of its most fiery orators. She became a member of the *Reichstag* in 1920.

ZETLAND, 2ND MARQUESS OF: *see* RONALDSHAY, LAWRENCE JOHN LUMLEY DUNDAS.

ZEUS was the sky- and weather-god of the ancient Greeks whose name and functions correspond to those of the Latin Iuppiter (Jupiter) and of the Sanskrit Dyaus-(pitar). Although the ancients did not guess at the etymology of the two names, they recognized the former of these equations. Hence also Zeus was assimilated to the sky-gods of ioreign peoples, and, though he himself was definitely of the weather-sky alone, these other gods included solar deities. This fact accounts, for example, for the repeated assertion that the Egyptians worshiped him—their own god Amon-Re is meant. It is curious that Zeus seems hardly to have been identified at any time with the Hebrew Yahweh, whom he really resembles in many ways, both in his original functions and in his later moral development. (For one or two exceptions, *see* A. B. Cook. *Zeus,* vol. ii, pp. 889. 1197.) Zeus is the one god whom the Greeks certainly brought with them into Greece *(see* GREEK RELIGION*).* It is highly likely that he was their chief god from the beginning, before he became the consort of Hera. or entered the varied pantheon familiar from Homer onward. His original partner. if he had a partner, may have been Dione *(see* DODONA*).* Certainly in Homer he is the father, *i.e.,* the natural ruler, of gods and men alike (the word "father" has no necessary connotation of physical relationship). This position he never loses, at least in theory, although in a given district he is often overshadowed by locally important deities—at Delphi and at Delos, for example, by Xpollo.

Development.—As a sky-god, Zeus develops two principal spheres of activity, one physical, the other moral. As regards his material operations, all meteorological phenomena lie within his province. He is naturally the sender of thunder and lightning, and his traditional weapon is the thunderbolt, that imaginary missile by which the effects of lightning were explained before the nature of electricity was known. He also sends rain and winds and, consequently, calm and fine weather, for like all Greek gods he is bivalent. There was a time when he had no very marked personality. 'Traces of this period are to be found in the occasional cult of a Zeus *Kappotas* ("flown down") or *Kataibates* ("descended"); in other words of a meteoric stone in which the power or mana of the sky was embodied (see H. J. Rose, "The Wiro Sky-god," in Custom is King, 1936). As a rule, however, Zeus is a definite person who can be seen "gathering the clouds" on the hilltops. But Greek thought concerning the gods was not a logical system; thus, other and generally lesser deities are often said to control. or even to be, the winds, or to make the sea stormy, and so forth. But it is around the person of Zeus that his rich mythology gathers. There are especially the many tales of his love affairs, which are but variants of the immemorial theme of the union of Father Sky with Mother Earth, though in the final form of the stories not all his consorts are earth-goddesses. It is thus natural that among his many titles is that of Farmer (Georgos), for obviously the farmer is dependent upon the weather for his crops. It is no less natural that a considerable part of Zeus's ritual has to do with weather magic. His holy place on Mt. Lykaion in Xrcadia, which among other signs of great antiquity retained at least traces of human sacrifice, possessed a spring whose water his priest used to stir with an oak branch in time of drought. (The oak was Zeus's sacred tree; see DODONA.) It is alleged by Pausanias that when this rite was performed with the proper accompaniment of prayer and sacrifice, a mist arose from the spring, became a cloud and sent the desired rain. This idea perhaps also explains why Zeus seems occasionally to quit the sky altogether and visit the earth. He is *Katachthonios*, "subterranean," from Homer onward, and so tends to be identified to some extent with his brother Hades. In Athenian cult his most ancient festival is the Diasia. at which. on Anthesterion 23 (*i.e.*, about March), a pig was sacrificed and the god had the euphemistic title Meilichios. This title, whose approximate meaning is "easily entreated," appears in Ozolian Locris as applied to a group of gods otherwise unnamed who, according to Pausanias. aere worshiped at night. Zeus himself is represented on several monuments in the form of a large snake, a typically underworld creature. Plainly this cult was connected with the fertility of the soil, which. incidentally, explains why it was a feast day. Given that the propitiation of the power in question was properly carried out. good results might reasonably be expected; therefore it was fitting to make merry with one's kin and to give the children little presents. Whatever the original relation between Zeus and Meilichios. their identification brought Zeus a step nearer to becoming a universal god, although he never completely achieved this.

ALINARI

ZEUS REPRESENTED IN ANTIQUE SCULPTURE AS THE ENTHRONED MONARCH WITH AN EAGLE PERCHED ATOP HIS SCEPTRE. IN THE VATICAN MUSEUM, ROME, ITALY

Zeus's moral development, too, was in part the result of his celestial nature. in part, also of his position as head of the divine family. It is characteristic of the sky-gods of many peoples to develop an interest in the conduct of mankind, which they are able to observe from their exalted position, somewhat as a man with good eyesight can observe much that goes on over a fairly aide area if he stands on a hilltop. Sky-gods are besides often credited with prodigiously acute vision involving the possession of multiple eyes and the like; they often also have supernatural powers of hearing. (See R. Pettazzoni, The All-Knowing God, 1956, for examples of this from all over the world.) Zeus shares these powers and characteristics. Now and again he has more than the normal number of eyes; Pausanias testifies to a very old image of him at Argos which had three, two normally placed and the third in the middle of the forehead. But such symbolism is rare, for Greek taste disliked monstrosities, and especially monstrous gods.

In general the Greeks simply state that Zeus sees everything, sees and governs all, beholds and notes all that men do, and the like; or that he has innumerable spies to go about the earth and bring him word of what happens there, or that his daughter Justice (Dike) performs a similar office, reporting misdoings to her father, who punishes the guilty. The earliest and most characteristic form of Zeus's vengeance on the ungodly is to send bad weather, as sky-gods regularly do. Often he hurls a thunderbolt at an offender, thus incidentally furnishing the skeptical with an argument against divine intervention in human affairs, for lightning strikes objects incapable of any wickedness. On occasion, as in Hesiod (Works and Days, 243) he sends an epidemic to punish an erring community. Such an act might still be connected with his weather functions, if the very common ancient idea that disease was caused by certain atmospheric conditions may be supposed to have been already current in the 8th century B.C. But the conception of Zeus as a god who is interested in morality, rewarding good conduct and punishing evil, is of early and rapid development, and surpasses the original, comparatively narrow idea of the god's nature and powers.

By the time of Aeschylus, Zeus is the sternly righteous governor of the world. Aeschylus himself, one of the deepest thinkers of his age, admits the god's name to be conventional, and claims that it is he "who guides men to wisdom, who establishes the law that by what we undergo we shall learn," and is incomparable, like no one but himself (Agamemnon, 176–178; 163–165, see note by H. J. Rose). The Stoics, especially, used the name Zeus to denote the chief god of their system, who alone is unaffected by the recurrent ekpyroseis ("conflagrations") which destroy all else, is immanent in everything, and is to be found everywhere in the universe save in "what the evil do in their folly." These speculations are the nearest purely Greek approach to monotheism; for what may be called exclusive monotheism, that which denies the name of "God" to any but one Being, is foreign to Greek and indeed to all native European thought. Therefore the Greeks continued to worship other gods besides Zeus, although to the most thoughtful minds these tended strongly to become the subordinates of their "father." Indeed, already in Homer's time, Zeus's superiority is so marked that, in the poet's somewhat nai've figure, if there were a tug of war between Zeus and the rest, all the other deities could not with their combined strengths pull him down from heaven, whereas he could pull all of them up to him, and earth and sea with them.

It need hardly be said that such lofty ideas as those involved in monotheistic speculation did not belong either to mythology or to ordinary cult. It is true that in the former Zeus is often a dignified figure. He intervenes in human affairs to guide them according to his will, overa es the lesser gods with his superior power. and is even the author of individual destinies (see FATE). He is also, however, the central character of numerous stories of a kind very little to his credit, for he is involved in innumerable love affairs. These tales anciently reflected a cosmic union of Sky and Earth or a ritual sacred marriage, but their meaning had apparently been forgotten quite early, and this for two reasons. In the first place, the earlier tellers of the myths felt that the gods were not subject to the same rules of conduct as mortals, just as nobles were free from the restrictions applied to commoners. Later storytellers, such as the Alexandrians and their Latin followers. believed in the traditional gods and their doings hardly more than modern Europeans do, and so were unhampered by moral scruples such as those of Pindar, for example. who refuses credence to certain legends which, he feels, attribute unworthy conduct to the gods.

Political Importance.— It is but natural that the "father," "lord" and "king" of the gods should share in the government of human communities. and Zeus is in fact concerned in the organization of every collectivity, from the smallest and simplest to the largest. He, with his consort Hera, is deity of marriage, under the title of Teleios (*i.e.*, "Accomplisher"; feminine form, *Teleia*). Zeus is also worshiped in various capacities as a household god.

In some of these cults, it is likely that he had displaced a less-known deity. Distinct traces of an ancient clan organization survive in classical Greece in the phratry (*phratria,* literally "brotherhood") into which all legitimate children were admitted and which had a common cult of Zeus *Phratrios*. As *Patroios*, Zeus was claimed as an actual ancestor by various groups of real or alleged kin. The title *patroios*, however, is not peculiar to him; it was shared by many gods, notably by Apollo, who is the *patroios* of all Athenians. They. being the ancestors of the Ionians, claimed descent from Ion, son of Apollo. The term *patroios* has another sense, however, in which it is attached especially to Zeus as guardian of the rights of kinship and especially of parentage.

Plato would have any citizen who does not interfere to prevent an assault on a parent or grandparent fall under the curse of Zeus in this capacity. Certain rights of property, also, are under the protection of Zeus as *Klarios* ("He of the estate") and *Horios* ("He of the boundary"); to larger communities he is likewise often *Polieus; i.e.*, god of the city-state. He is, indeed, the patron of several states, including Olympia, but is not the only god to hold such an office. His widest function in this respect is expressed by the title *Panhellenios*, or god of all Greeks. Early evidence for this title is lacking, however, for the most conspicuous temple of Zeus's worship under that epithet dates from the time of the Roman emperor Hadrian, although the hill called Panhellenion on the island of Aegina (Aigina) had an old shrine said to have been founded by Zeus's son Aeacus, ruler of Aegina. Zeus was worshiped as *Bulaios* ("He of the council") in many places, including Athens, where he shared the title with Athena. Finally, as *Horkios* ("He of the oath"), he mas commonly invoked in solemn asseverations. Plainly, some at least of these functions are not without significance for his moral development.

Identifications. — As well as being equated with various foreign sky-gods, Zeus is sometimes found in unexpected conjunction with other types of non-Greek deity. The most remarkable instance of this is the development of the so-called Zeus of Crete. According to all the evidence, this deity should be a god of normal Minoan type; *i.e.*, a sort of embodiment of the year and of its changing vegetation. annually born, growing and dying in order to be reborn the next year. No being less like the immortal weather-god could well be imagined, and how the two came to be identified is a puzzle. (*See* M. P. Nilsson, *The Minoan-Mycenaean Religion*, 2nd ed., pp. 534 ff., 1950.) A minor oddity is the compound deity Zeno-poseidon (*i.e.*, Zeus-Poseidon), worshiped at Mylasa (Milas) in Caria (*see* A. B. Cook, *Zeus*, vol. ii, pp. 582 ff.). He is one of the very few deities in whom a foreign god is equated with more than one Greek divinity.

Zeus in Art. — If certain featureless objects connected with his cult are left out of account, the earliest surviving type of Zeus in art (7th century B.C.) depicts a bearded man, naked, in a striding attitude. his uplifted right hand holding a thunderbolt, while on the extended left arm is perched an eagle, the bird of Zeus. Two chief characteristics are always his in art. He is regularly of human form, a mature man of stalwart build, and his usual, though by no means his only, symbols are the thunderbolt and the eagle. Later (from about 500 B.C.) he is shown now and then in full armour. This does not mean that he was imagined as a war-god, but rather that, being a king, he is on occasion a commander in battle.

But perhaps the most characteristic statues and other representations of Zeus show him seated, holding a sceptre in one hand, often, but not always, his thunderbolt in the other, and regularly with the eagle in attendance. This was the pose on which Phidias based his great chryselephantine statue at Olympia. Pausanias describes this famous image as seated, crowned with an olive wreath, with the personification of Victory in the' right hand and a sceptre with the eagle in the left. In this attitude, of which there were numerous minor variations, Zeus is definitely the enthroned monarch.

ZEUSS, JOHANN KASPAR (1806–1856), German philologist, who wrote the basic systematic grammar of early Welsh, Cornish, Breton and Irish, was born in Vogtendorf, Upper Franconia, on July 22, 1806, and educated at Munich. His first book, the enduring *Die Deutschen und die Nachbarstämme* (1837), a critical source book of German history, illustrates his great erudition and scholarly judgment.

As a result of his outspoken writings, Zeuss was frustrated in his repeated attempts to secure a university position and turned from Germanic history to Celtic philology. Beginning about 1843 by excerpting and analyzing the oldest Celtic documents, Zeuss produced singlehanded, his masterpiece *Grammatica celtica* (1853).

He died on Nov. 10, 1856.

See F. Shaw, *Studies, an Irish Quarterly Review*, 43:194–206 (1954).
(E. P. H.)

ZEUXIS (fl. near end of 5th century B.C.), one of the best-known Greek painters, described himself as a native of Heraclea, probably the town in south Italy. He was, according to one account, a pupil of Demophilus of Himera in Sicily, the other statement being that he was a pupil of Neseus of Thasos. Afterward he appears to have resided in Ephesus. His recorded works are of the following subjects: Zeus surrounded by deities; Eros crowned with roses; Marsyas bound; Pan; Centaur family; infant Heracles strangling the serpents in presence of his parents, Alcmena and Amphitryon; Alcmena, possibly identical with the previous subject; Helen; Penelope; Menelaus; athlete; old woman; boy with grapes; grapes, not identical with the previous subject. There are also references to someone looking like "a Boreas or a Triton such as Zeuxis drew," and to monochromes and plastic works in clay by him.

In ancient records it is said that Zeuxis, following the initiative of Apollodorus, used shading, as opposed to the older method of outline, with flat washes of colour, such as had been practised by Polygnotus and others of the great fresco painters. The effect would appear strongly realistic, as compared with the older method, and to this was probably due the origin of such stories as the contest in which Zeuxis painted a bunch of grapes so like reality that birds flew toward it. He seems to have been a panel rather than a wall painter, preferring small compositions: often a single figure. (C. M. Rn.)

ZHIKATSE (SHIGATSE), second largest town in Tibet, next in importance to Lhasa. The town, which is a trading centre near the confluence of the Nyang Chhu (Nienchu) and the Brahmaputra (Tsangpo) rivers is the centre of a small farming area. It had an estimated population in 1953 of 20,000 (exclusive of priests). It is about $\frac{3}{4}$ mi. long and $\frac{1}{2}$ mi. broad. Zhikatse was the capital of the Tsang district. administered by a high political officer. North of the town was the self-contained religious-political centre, Trashi Lhiimpo, a large monastery with about 3,300 lamas. The head of the monastery was the panchen lama, sometimes called the Tashi lama, who prior to Chinese military domination and the flight of the dalai lama into India, wielded equal spiritual authority with the dalai, but not temporal power. (*See* TIBET.) A wall surrounds Trashi Lhiimpo and within the enclosure are many temples and dormitories. The former are decorated with gilded roofs and spires, and the images are adorned with jewels and precious metals. A highway joining Zhikatse with Gyangtse and Lhasa was completed in Nov. 1955 and another with Nyanam on the Nepalese border is under construction.

Eight miles northwest of Zhikatse is Nartang, an old cultural centre of Tibet. Its temple is one of three places where the Tibetan Buddhist scripture was printed. The Nartang edition of the Buddhist scripture, printed from wooden blocks, is generally considered more complete than the Lhasa Potala edition.
(T.-L. S.)

ZHITOMIR (JITOMIR), a town in the Ukrainian Soviet Socialist Republic, U.S.S.R.. in 50° 19′ N., 28° 40′ E., on the Teterev river. a left bank tributary of the Dnieper, and at the terminus of a branch railway from Berdichev (1959) 53,000. Pop. (1959) 105,000. There are iron-smelting works and a brewing industry, in connection with which a hop fair is held in early September. Its position on the road west from Kiev gave it early importance and it dates back to the time of the Scandinavian expansion (9th century). The Tatars plundered it in the 13th, 14th and 17th centuries. In 1320 it became part of Lithuania, but was afterward annexed by Poland, and when the Cossacks rose against their chief Bogdan Chmielnicki (1648) they sacked the town. Russia occupied it, along with the rest of the Ukraine, in 1778. During World War II Zhitomir was captured by the Germans in 1941 but was subsequently reoccupied by Soviet troops in 1943.

ZHOB, a river, valley and district in the Quetta division of West Pakistan. The Zhob flows from the hills about 20 mi. N.W. of Ziarat, first eastward then northeastward, until it meets the Gomal river at Khajuri Kach in South Waziristan. The valley is important as the shortest route between Quetta and the northwest frontier districts—? route now followed as far northeast as Fort Sandeman by a narrow-gauge branch of the North-Western railway. Before the Zhob valley expedition of 1884 it was practically unknown to Europeans. In 1889 the Zhob valley and the Gomal valley were taken under British control. and in 1890 the former was the scene of a further punitive expedition.

Zhob District (area 10,478 sq.mi.; pop., 1951, 65,470, mostly Pathans of the Kakar tribe) was formed in 1890 with headquarters at Fort Sandeman (pop., 1951, 6,001). It was much disturbed during the third Afghan war (1919).

Bibliography.—A. W. C. McFall, *With the Zhob Field Force* (1895); R. Bruce. *Forward Policy* (1900); T. H. Holdich, *Indian Borderland* (1901); *Zhob District Gazetteer.*

ZHUKOV, GEORGI KONSTANTINOVICH (1896–), Soviet army officer and public official, was born near Moscow in 1896. Conscripted into the tsarist army in World War I. Zhukov joined the Red army upon its formation in 1918 and served as a cavalry commander during the Russian civil war.

Zhukov specialized in armoured operations at Frunze military academy after the civil war and also studied military science in Germany. He won recognition as an expert in the employment of armour during the Soviet-Japanese clashes on the Mongolian-hlanchurian border during the late 1930s.

Appointed chief of the Red army general staff shortly before World War II, Zhukov was relieved to conduct the defense of Moscow. He became the ranking member of Stalin's personal supreme headquarters and figured prominently in the planning or command phase of nearly every major engagement of the war. Zhukov personally commanded the final assault on Berlin and remained in Germany as commander of Soviet occupation forces and Soviet representative on the quadripartite allied control commission for Germany.

Shortly after his triumphal return to Moscow in 1946, Marshal Zhukov was banished by Stalin to a series of regional commands. He returned to prominence as a first deputy defense minister following Stalin's death in 1953, and became defense minister in Feb. 1955. With his election in July 1957 as a full member of the presidium of the Communist party central committee (he had been an alternate member from Feb. 1956), Zhukov attained the highest level of personal authority ever permitted an active Soviet career officer. His political success was short-lived, however; his dismissal as defense minister was announced on Oct. 26. 1957, and he lost his presidium post seven days later. (H. E. Kh.)

ZHUKOVSKY, VASILI ANDREYEVICH (1783–1852), Russian poet, born in the government of Tula. on Jan. 29. 1783, was the earliest of the Russian poets of the golden age of Russian poetry. and a precursor of Pushkin. The volume of his original work is small, consisting of a few beautiful lyrics and elegies. His greatest work was the opening up of the knowledge of English and German poetry in Russia by a series of translations. Briickner (*Gesch. v. Russ. Lit.*) calls him "the most original translator in the world's literature." He began by a translation of Gray's *Elegy;* he went on to the more famous poems of the English romanticists. and it has been asserted that in some cases his versions have greater poetic power than their originals. He turned Fouque's *Undine* into Russian verse. His last great work was a version of the *Odyssey* (1847). Zhukovsky was tutor to Alexander II, and he used his favour at court to help both Pushkin and Gogol. His last years were spent in Germany, and he died at Baden-Baden in 1852.

ZIEGFELD, FLORENZ (1869–1932), U.S. theatrical producer, was born in Chicago. Ill., on March 21, 1869. the son of Florenz Ziegfeld. founder of the Chicago Musical college. He first became active in the entertainment field during the Chicago World's Columbian Exposition of 1893. and later managed Sandow, a famous strongman.

In 1896 he turned to theatrical management. One of his first promotional campaigns was on behalf of a European beauty, Anna Held. Ziegfeld's publicity about Miss Held's milk baths catapulted her to fame and set a pattern of star-making through publicity. In 1907 he produced his first "review." called *The Follies of 1907.* Its combination of seminudity, pageantry and comedy was repeated successfully for more than 20 years. Among the stars developed by Ziegfeld were Marilyn Miller. Will Rogers. Leon Errol. Bert Williams and Eddie Cantor. In addition to the *Follies,* Ziegfeld also produced *Salty* (1920), *Show Boat* (1927), *Rio Rita* (1927) and *Bitter Sweet* (1929).

Ziegfeld married Anna Held in 1897, and after their divorce in 1913 married the actress Billie Burke. He died in Hollywood, Calif., on July 22, 1932. (S. W. H.)

ZIEM, FÉLIX FRANÇOIS GEORGE PHILIBERT (1821–1911), Erench painter, notable for his handling of light and colour, was born at Beaune, Côte d'Or, on Feb. 26, 1821. He studied at Dijon. In 1838 he went to Rome and from 1845 to 1848 traveled in the south of France, Italy and the east. Many of his paintings are in U.S. collections, but two of his finest, "The Doge's Palace in Venice" (1852) and a marine painting, are in Luxembourg, and a "View of Quai St. Jean, Marseilles" at Marseilles. He died in Paris, Nov. 10, 1911.

ZIGABENUS, EUTHYMIUS (fl. 11th/12th century), Byzantine theologian and author of polemical and exegetical works, was a monk of the Peribleptos monastery in Constantinople who was active under Alexius I Comnenus (1081–1118). He wrote commentaries on the Psalms, the Gospels and the Pauline epistles, drawing largely on earlier patristic exegesis. His best known treatise, the *Panoplia dogmatica* against heresies. written at Alexius' request, contains a chapter which is an important source for the history of the Bogomils (*q.v.*).

Bibliography.—Works in J. P. Migne, *Patrologia Graeca,* vol. 128–131 (1864–65), except the commentary on the Pauline epistles which was edited by Nicolas Kalogeras, 2 vol. (1887). *See* also K. Krumbacher, *Geschichte der byzantinischen Litteratur,* 2nd ed., pp. 82–85 (1897); H.-G. Beck, *Kirche und theologische Literatur im byzantinischen Reich* (1959); M. Jugie in A. Vacant (ed.), *Dictionnaire de théologie catholique,* vol. 5, col. 1577–82 (1913); D. Obolensky, *The Bogomils* (1948). (J. M. Hy.)

ZIGGURAT, in architecture, a common temple form in Chaldea and ancient Babylonia and Assyria, which consists either of a stepped pyramid or of a somewhat similar shape in which the flat terraces of the ordinary stepped pyramid are replaced by an inclined plane ascending spirally from the ground to the summit. Ziggurats were usually great mounds of sun-dried brick with the exterior walls faced with a coating of burned, glazed brick or tile. On the summit there was frequently a shrine to the deity to whom the temple was erected. It is probable that the ziggurat form originated in the attempt to obtain high observatories from which the stars, so important in Chaldean religion and magic, might be observed.

ZIMBABWE, an anglicized form of the Shona word *dzimbahme* (literally "stone houses," modern meaning "chiefs' graves") usually used for the stone ruins about 17 mi. S.E. of Fort Victoria, Southern Rhodesia. More than 100 similar ruins are known from the granite areas of Southern Rhodesia and adjoining areas of Bechuanaland and the Union of South Africa. Every Shona chieftainship has its *dzimbahwe,* a venerated place where tribal representatives gather for intercession with the ancestral spirits. Zimbabwe ruins are in two parts. The floor of a valley is covered with a maze of stone walls about 8 ft. high. At the highest point stands the so-called temple, roughly elliptical and surrounded by a stone wall whose greatest height is 32 ft. and which is 17 ft. thick in places; like all Zimbabwe walling it was built dry without foundations although the ground was leveled before building. Within the temple is the conical tower, a truncated cone of dry stonework, apparently solid, about 18 ft. in diameter at the base and 31 ft. high. Secondly, there are the "acropolis" ruins on the top of a granite hill about 230 ft. high and about ½ mi. N. of the temple. The form of building is determined by the shape of the hill; in effect it is a series of enclosures set end to end along the axis of the hill. The penultimate enclosure eastward is at the foot of boulders 60–70 ft. high, forming a small but impressive natural theatre. This place, according to the son of a chief who lived there in 1890, is the only one properly called Zimbabwe and it was there that the famous soapstone figures of birds (now in museums at Cape Town, Bulawayo, Salisbury and Berlin) stood. They may have been memorials of dead chiefs.

There is little doubt that Zimbabwe was the mast important *dzimbahwe* in the country before the invasion of warlike bands from Zululand in the early 19th century destroyed the Shona confederation. In consequence, Zimbabwe was not spoken of among the Shona and it is almost impossible to obtain any traditional information about the place. Although Portuguese writers of the 16th and 17th centuries mention various places called Zimbaoe, it is very doubtful if any of these refer to Zimbabwe. Zimbabwe must therefore be treated as an archaeological problem, but the disturbances made by treasure seekers in the 1890s added greatly to its complexity. Being but the greatest of many Rhodesian ruins, the general problem can be examined on a broad scale.

Although the ruins were described by C. Mauch in 1874 and investigated by T. Bent in 1891, the first archaeological investigation on modern lines was made by D. Randall-MacIver in 1905. In 1929 G. Caton-Thompson made detailed excavations and from 1947 onward systematic archaeological work mas done on Rhodesian ruins, culminating in excavations at Zimbabwe itself in 1958. The various excavators have shown convincingly that the stone walls at Zimbabwe were often adjuncts to huts built of local clays. so that much of the area was given over to dwellings. In the western enclosure on the "acropolis" the 1958 excavations disclosed layers of huts built one above the ruins of another and overlying still earlier occupation floors. The eastern enclosure of the "acropolis" seems to have had a religious aspect.

Among relics excavated are objects made of talc schist—an easily carved local stone—in the form of bowls, eaglelike birds on tall pillars and stylized human figurines. Of great chronological importance are a few shards of imported wares—Ming Celadon and Nankin porcelain, Persian faïence and Arab glass. Many varieties of imported glass beads were also found. The vast majority of relics were, however, locally made: pottery, copper wire ornaments, iron tools and weapons as well as gold objects.

From the beads Caton-Thompson was able to infer a date for the place as a whole of about the 9th century A.D., which was confirmed by a radiocarbon test on a piece of wood. In 1958 the temple was shown to be much later than other parts—possibly 17th–18th century. Everyone from MacIver onward agreed that these ruins are the product of an African culture and in 1958 some of the later buildings, including the temple, were ascribed to the Rozwi, the tribe under whose hegemony the Shona confederacy flourished in the 18th century. *See* also AFRICA: *Archaeology.*

ZIMMERMANN, ARTHUR (1859–1940), German diplomat was born May 8, 1859, at Frankenstein. After having been vice-consul at Shanghai and acting consul in 1900 at Tientsin, he entered the foreign office in 1902 and rose by 1910 to be a director of the political section. In 1911 he was appointed under-secretary, and in Nov. 1916 secretary of state in succession to Von Jagow. In this capacity he addressed to America the note of Jan. 31, 1917, on the subject of U-boat warfare. He was also the author of the invitation of Jan. 19. 1917, to Mexico to enter into alliance with Germany and to sound Japan as to her willingness to co-operate. For Mexico the price of this alliance was to be the American States of New Mexico. Texas and Arizona. This proposal. which was sent through the medium of Von Eckhardt. the German minister to Mexico, was intercepted, and Pres. Woodrow Wilson was in a position to publish it on March 1, 1917. The disclosure was one of the primary causes resulting in America's declaration of war upon Germany. Zimmermann retired on Aug. 5, 1917, shortly after the resignation of Bethmann-Hollweg.

ZINC, a metallic element (symbol Zn, atomic number 30, atomic weight 65.38). Zinc was known in Roman times in combination with copper forming the alloy brass, but the individual metal was not isolated until much later. The earliest authenticated use of the word "zinc" to describe the metal is by Paracelsus (*c.* 1490–1541), who described it as a bastard form of copper. In *De re metallica* Georgius Agricola (1494–1555) apparently refers to zinc metal under the name "contrefey" but in other works he uses "zincum" to refer to an ore found in Silesia. The term "spelter," previously employed for commercial grades of zinc, came into use in 1661; it was derived from, the Dutch word *spiauter,* which meant both zinc and pewter.

Occurrence.—Zinc in the metallic state is not known to occur in nature, but zinc minerals are found in quantities economically feasible for mining in many parts of the earth's surface. Among the elements composing the earth's crust, zinc is estimated to rank 24th in order of abundance. The chief ore of zinc is zinc blende or sphalerite (ZnS) and this ore is the source of at least 90% of the metallic zinc produced today. Most commercial deposits of zinc ore occur in limestones and dolomites and are considered to have been formed as cavity fillings or replacements deposited by hydrothermal solutions of igneous origin. Sphalerite is almost always accompanied by galena, the sulfide of lead. It may also be found in association with copper or other base metal sulfides. Oxidation products of sphalerite, smithsonite or calamine ($ZnCO_3$) and hemimorphite ($Zn, [OH]_2SiO_3$), occur in many deposits; and in certain areas, such as north Africa, are worked commercially. Zincite (ZnO), willemite (Zn_2SiO_4) and franklinite ($[Fe, Zn, Mn]O, [FeMn]_2O_3$) are found, but have little economic significance, except at Ogdensburg, N.J., where they form a unique but important commercial deposit. The United States is the main producer of zinc ore, followed fairly closely by Canada. Mexico, Australia and the U.S.S.R. are next in order of importance. Other important sources of supply occur in Peru, Belgian Congo. Poland. Japan, Italy, the German Federal Republic. Spain. Yugoslavia and Sweden. Up to the 1950s small quantities of blende were mined in the United Kingdom, but afterward commercial production practically ceased.

Production.—The established methods of metallic zinc production have relatively heavy treatment costs. In consequence, zinc metal producers demand that the concentrates they treat should be of high grade. After mining. therefore, sphalerite deposits are crushed and concentrated in flotation circuits often of considerable complexity, and every effort is made to separate lead, copper and any other values as separate concentrates. The zinc concentrate finally produced must contain at least 50% zinc, or else it is heavily penalized.

The metallurgy of zinc and hence its history is dominated by the fact that its oxide is not reduced by carbon below the boiling point of the metal. In consequence the metal could not be made in either blast or reverberatory furnaces, the conventional equipment used to produce most other major metals. Until these difficulties were overcome at the beginning of the 18th century, zinc metal as such was unknown in commercial quantities.

Alloyed with copper, in the form of brass, zinc was developed by the Romans. Biblical allusions to brass in the Old Testament are in error and refer to bronze. the alloy of copper and tin. The method the Romans used to produce brass was to heat a mixture of zinc and copper oxides or metallic copper, with carbon in a closed crucible. The zinc vapour produced during the reduction dissolved immediately in the metallic copper present and did not exist separately for any appreciable length of time. This method was used for producing brass in Europe until the beginning of the 18th century.

Credit, as the first European to produce metallic zinc as a separate entity in commercial quantities, must go to William Champion, who in 1738 obtained patent protection for a furnace fitted with an external condenser. He built a small plant at

Warmley, near Bristol, Eng., which eventually contained 31 of these furnaces and, in 1760, produced over 200 tons per year of metallic zinc. Where Champion obtained his initial knowledge is not known. There is evidence that in both China and India the need for an external condenser was recognized, and metallic zinc was produced in quantity prior to the 17th century. The "Malabar tin" described by Libavius in 1597 was apparently zinc. Detailed knowledge of the furnaces used is not available. It is also not known whether Champion obtained his knowledge directly or indirectly from the east. To Champion, therefore, must be given the credit for the first published details of a commercial furnace capable of producing metallic zinc. His furnace consisted of a relatively large crucible fitted with a vertical pipe leading downward to a separate crucible below. Roasted zinc carbonate ore mixed with carbon was heated in the upper crucible. When the temperature was sufficiently high for the reduction of zinc oxide by carbon to take place, zinc vapour was formed and passed down the central tube to condense in the cooler crucible below. This method, termed distillation per *descensum*, was known as the English method. It was used in Great Britain until the middle of the 19th century, when it was displaced by the horizontal retort process developed in Silesia and modified in Belgium, which used less fuel and made less exacting demands on the operating labour. In this process, pipes made of refractory clays, usually oval in section and sealed at one end, are used instead of crucibles. These pipes or retorts are built in horizontal rows in a furnace. In the mouths of the retorts, which protrude through the furnace wall, clay condensers are fitted, which are sufficiently cool to condense the zinc in the vapour leaving the retorts. At the end of each distillation period, usually of 24 hours' duration, the condensers are removed from the mouths of the retorts. The spent charge is pulled out of the retorts. A fresh charge is introduced, the condensers are replaced and the distillation cycle is repeated.

Until about 1880, smithsonite (calamine) was the source of practically all the zinc produced, but then zinc blende began to be used, the sulfide being roasted to oxide before being charged to the retorts. Although zinc sulfide is the most plentiful zinc mineral, in most deposits it is so intimately mixed with other sulfides, particularly galena, that the classical methods of mechanical separation failed to separate the zinc blende. This problem was finally solved by the technique of froth flotation, a process that requires the ore to be first crushed to very fine particles. The froth flotation process depends upon the fact that the minerals—the valuable constituents in an ore—tend to resist wetting by water. The gangue, or earthy constituents, are wetted much more readily. Consequently, when crushed ore is strongly agitated in a suspension of small air bubbles in water, the mineral portion tends to cling to the bubbles and to rise to the surface as a froth. The earthy constituents are wetted and sink to the bottom. Thus a most valuable concentration of the mineral constituents can be made. Most of the commercial zinc concentrates are now produced by this flotation process.

Ordinary hearth roasting of these flotation concentrates produces a very fine calcine, which gives rise to difficulties when treated in horizontal retorts. It was therefore found necessary to agglomerate the roasted product by a sintering process. An alternative procedure sometimes adopted, since 1933, is to roast the concentrates on a moving grate under such conditions that a sintered product is obtained directly.

A large fraction of the world's zinc is still produced from hand-charged horizontal retorts; one furnace may contain hundreds of retorts. Improvements have been made in the furnace construction and methods of firing, and mechanical charging has been introduced at some plants. The process essentially involves, however, a large amount of arduous labour. It produces the zinc in batches and is intermittent in operation.

The construction and operation of large continuously operated retorts offered considerable difficulties, but these were successfully overcome in New Jersey, U.S., where, by 1929, vertical retorts had been developed constructed of silicon-carbide bricks; the charge consisted of briquets made of a mixture of zinc oxide material and bituminous coal.

Another continuous method was perfected in 1931, and a plant was built, based on electrothermic reduction using a novel condenser in which the retort vapours were sucked through molten zinc. A powerful competitor to thermal reduction methods, which is now firmly established, is the electrolytic process by which zinc is deposited from highly purified zinc sulfate solutions. This process has been widely adopted where power is cheap and plentiful, conditions that are essential since the power requirement of the process is considerable. To produce one ton of zinc electrolytically requires a power consumption of approximately 4,500 kw.hr. The rate of increase in use of the electrolytic process can be gauged from the fact that in 1953, 38% of the world's consumption of primary zinc was produced by this method, and 62% by the retort processes. A later advance made in Avonmouth, Eng., has solved the problem of condensing zinc from low tenor gases. This enables blast furnaces to be employed for metallic zinc production for the first time. These furnaces differ from conventional blast furnaces in that the zinc metal is not tapped in the liquid state from the bottom of the furnace, but is obtained by condensation from the gases leaving the top of the furnace.

As with zinc mining, the production of zinc metal is found in many parts of the world. In 1953, 75 smelters and electrolytic plants producing zinc were listed in 21 different countries. The production of the principal zinc-producing countries is listed in Table I.

The application of zinc metal has widened considerably, due to the production of high-purity zinc. This is one of the purest metals produced on a commercial scale and contains over 99.99% zinc. It was first produced electrolytically, and is now made by a number of companies using the electrolytic process and taking precautions to purify the zinc sulfate solution used and to avoid the entrainment of lead by using anodes of a lead-silver alloy giving reduced corrodibility. In 1929 a redistillation method was developed. The furnace consisted essentially of two columns built of silicon-carbide trays placed vertically one above the other. The lower part of the first column is heated. Impure zinc is fed continuously into the upper part of the column and is vaporized as it flows down through the heated trays below. The volatile elements zinc and cadmium are vaporized whereas the less volatile impurities such as iron, lead and copper are run off from the bottom of the column. After a certain amount of further purification by refluxing in the upper, unheated part of the column the vapour, consisting of the zinc now freed from the less volatile impurities but still containing any cadmium present, is passed into a condenser. The metal is fed from this into the upper part of a similarly constructed column. There all the cadmium, since it has a lower boiling point than the zinc, is driven off; and zinc of 99.99% purity is condensed and tapped from the bottom of the column. Furnaces producing 60 tons per day of high-purity metal are in operation in the United States and Europe.

TABLE I.—*World Smelter Production of Zinc*
(in metric tons)

Country	Average 1935–39	Average 1946–50	1956
United States	473,628	774,041	961,474

Ionization potentials	1st electron 9.36 v.						
	and electron 17.89 v.						
	3rd electron 40.0 v.						
Electrode potential	$Zn = Zn^{++} + 2e^-$	$E^\circ = 0.7620$ v.					

As a result of these varied methods of production. zinc is commercially available in the grades listed in Table II.

Properties.— Freshly cast zinc has a bright silver-blue surface. but on storage in air it becomes grayish oning to the formation of a film of oxide which. being impervious and tenacious, protects the metal from further oxidation. Zinc crystallizes in the hexagonal system. High purity zinc is ductile and can be rolled into sheets and thin foil. Metal of prime western grade is not ductile when cold. but at temperatures above 100° C. it can be rolled into sheets which are flexible at ordinary temperatures. Some of zinc s atomic and physical properties are shown in Table III.

Because of the relatively high electrode potential of zinc. it is anodic to iron. Thus, if iron and zinc in contact are exposed in most corrosive media, the zinc tends to be attacked preferentially and sacrificially. This, coupled with the fact that under atmospheric conditions zinc corrodes far less rapidly than iron, forms the basis for one of the greatest uses of the metal. the protection of steelwork in galvanizing and other protective industries. Commercial zinc of high purity. 99 99+%, is neither attacked by dilute sulfuric or hydrochloric acids nor by boiling water. The other, less pure, grades are attacked by these acids to a degree which increases with increasing impurity content. Boiling water attacks slightly these less pure grades by evolving hydrogen and forming zinc hydroxide ($Zn[OH]_2$). Cold dilute nitric acid dissolves zinc as nitrate with evolution of oxides of nitrogen. Zinc is also soluble in sodium hydroxide and potassium hydroxide solution, but not in ammonium hydroxide.

Applications.— The largest single use for zinc is for the protection of steel against atmospheric corrosion. This use consumes over 40% of the metal made. In the hot-dip process advantage is taken of the readiness with which zinc will alloy with iron. In this process sheets of steel or other steel articles are cleaned and then immersed in a bath of molten zinc. After removal. the steel is covered with a layer of zinc which gives extended protection against atmospheric corrosion. For the same purpose. zinc coatings can be applied by spraying or can be deposited electrolytically. With such coatings, the protective action of the zinc is primarily due to its coherent oxide layer which protects it against further oxidation. This same property is used when zinc sheets are used for roofing and other building purposes. Zinc's ability to protect ferrous materials against corrosion is reinforced by electrolytic action. Zinc is electropositive with respect to iron; therefore, when a galvanized article is subject to atmospheric corrosion, the zinc tends to corrode sacrificially. This principle is also utilized when zinc plates acting as anodes are connected to ships' hulls or underground tanks or pipelines which then are protected cathodically.

The next largest use for zinc is for die-casting alloy. In the die-casting process molten metal is injected. under pressure, into a steel die. In this die. the metal solidifies almost instantaneously, and the die can be opened and the casting ejected with great rapidity. The whole sequence can be operated automatically; therefore the process lends itself to the rapid production of very complicated parts. Zinc forms the basis for one of the best alloys for die-casting when alloyed with 4% aluminum and 0.05% magnesium. It is essential in the formulation of this alloy that only high-purity zinc (99.99+%) is used. and care is taken to prevent contamination by low melting-point metals such as lead or tin; othernise the castings are subject to intercrystalline corrosion. Such an alloy melts easily, is very fluid and does not attack the steel dies into which it is injected. Its shrinkage on solidification is low so that it reproduces with precision the shape of the most complicated dies. The cast parts have good mechanical properties and can be plated or lacquered with little difficulty. For these reasons the automobile industry uses large quantities of zinc die castings, for radiator grills, carburetors, fuel pump and shock absorber bodies. door handles, instrument panels and many other applications. Zinc die castings are also used extensively in electrical appliances, business and light machines, tools. building hardware and toys.

Alloyed with copper. zinc forms the important group of alloys known as the brasses. With variation in the proportion of copper to zinc. these alloys offer a wide choice in physical properties. With copper at 70% and zinc at 30% the structure consists of a single metallographic phase. This material is very ductile, easily fabricated and capable of taking a highly polished finish. As the zinc content is increased a second phase becomes visible in the metallographic structure, and stronger. more rigid alloys can be produced.

Although. in a number of fields, brass is being displaced to some extent by aluminum alloys, it still continues to rank as one of the most important commercial alloys.

Zinc can be readily rolled into sheet and in this form is used in building construction, giving long service at reasonable cost. With slight alloying additions it is used in the form of strip produced in continuous mills, for weather strips and jar caps, but probably the most important use of rolled zinc is in the production of dry battery cans. These cans form the container and one electrode of the Leclanché type of cell. which is the unit upon which most portable dry batteries are based.

Zinc dust is made either by rapidly chilling zinc vapour or by atomizing molten zinc and is used as a reducing agent, in chemical reactions. Apart from its direct application in the manufacture of dyestuffs and other chemicals, it is used in the manufacture of sodium hydrosulfite, which is then used as a reducing agent. Other important uses for zinc dust are in the precipitation of gold from cyanide solutions and. in sprayed form, in protective coating and in paints.

Chemistry.— In addition to its metallic state. zinc exists in the +2 oxidation state in which it forms compounds with the common anions. It is chemically related to cadmium and mercury, the resemblance to cadmium being especially well marked. Zinc is capable of isomorphously replacing many of the bivalent metals (*e.g.*, magnesium. manganese, iron. nickel, cobalt and cadium) in certain salts. The ion Zn^{++} is colourless and has an ionic radius of 0.74A It exists in a hydrated form in neutral and acidic aqueous solutions; but the hydroxide is precipitated in alkaline solution. With excess base the hydroxide redissolves to form zincate ion ZnO_2^{--}. The zinc ion forms many complex ions in aqueous solutions such as $Zn(NH_3)_4^{++}$ and $Zn(CN)_4^{--}$ as well as others.

Zinc oxzde is a white pigment of considerable industrial importance. It is made by two processes, which produce oxides differing somewhat in physical properties. In the direct process a controlled draft of air is passed through a heated bed of mixed roasted ore and coal. This mixture is sometimes in briquet form. Zinc vapour evolves in the bed and is oxidized above the charge by a second current of air. The oxide so formed is caught in filters formed by cotton or woolen bags. In the indirect process metallic zinc is boiled in heated retorts and the vapour issuing from the retorts is burned in a current of air. Oxide from the indirect process usually has better colour and texture although the covering power, when the oxide is used in paint, is not superior to that of the best direct oxide. Pigmentary zinc oxide is crystalline and occurs generally in the form of spherical particles.

By controlling the conditions of production acicular crystals can be produced which give improved brushing characteristics to zinc oxide paint.

Because of its relatively low cost, zinc oxide is widely used as a pigment for both indoor and outdoor application. It has a pigmentary strength somewhat superior to white lead, and has the added advantage of being nonpoisonous and is not discoloured by hydrogen sulfide. It is also used in ceramics, cosmetics, pharmaceuticals and floor coverings.

The rubber industry also consumes considerable quantities of zinc oxide. where it fills a number of uses, particularly in the manufacture of motor car tires. where it provides high thermal conductivity and heat capacity, good adhesive characteristics and resistance to deterioration by sunlight.

The average size of the particles can be controlled by varying the conditions under which the oxide is produced. Normal material has a particle size of 0.2μ. With fine material this may be reduced to 0.1μ. Such material finds application in the rubber industry when fast curing is required. On the other hand, a grade of large particle size ZnO (average particle size 0.4μ) is produced when a slow curing rate is desirable.

A distinctive property of zinc oxide is that when strongly heated it turns yellow, but regains its whiteness on cooling. In the laboratory, it can be readily prepared by heating the nitrate or by heating the chloride in a current of steam. It is insoluble in water, but dissolves readily in all aqueous acids with formation of salts. It also dissolves in aqueous caustic alkalies including ammonia, thus forming zincates (*e.g.*, $Zn[OH]_2$).

Zinc hydroxide, $Zn(OH)_2$, is prepared as a gelatinous precipitate by adding a base to an aqueous solution of zinc chloride. When dried, it is a white powder insoluble in water but soluble in excess of alkali and in acids.

Zinc peroxide is a compound of indefinite composition which contains hydroxide as well as peroxide. It is formed by the addition of hydrogen peroxide to a suspension of zinc hydroxide. It is a valuable antiseptic, being odourless and nonirritant. and is much used in the treatment of skin complaints.

Zinc chloride, $ZnCl_2$, is produced by heating metallic zinc in dry chlorine gas or by heating a mixture of zinc sulfate and sodium chloride. Zinc chloride condenses as a white translucent mass and boils at about 700° C. Its vapour density at goo° C. corresponds to the formula $ZnCl_2$. It is extremely hygroscopic and dissolves readily in water. A solution of zinc chloride is easily produced from the metal and hydrochloric acid; it cannot be evaporated to dryness without considerable decomposition of the hydrated salt into oxychloride and hydrochloric acid, but it may be crystallized as $ZnCl_2.H_2O$. A concentrated solution of zinc chloride dissolves starch, cellulose and a great many other organic substances; hence the application of the fused salt as a caustic in surgery and the impossibility of filtering a strong $ZnCl_2$ solution through paper. Fused zinc chloride has the property of dissolving oxides of many metals, and is thus the basis of a number of fluxes used in metallurgy. For the same reason strong solutions of zinc chloride are used as a flux in soldering. The facility with which zinc chloride dissolves oxides to form oxychlorides is utilized in the manufacture of cements and in the preparation of fillings in dentistry. A solution of the oxide in the chloride has the property of dissolving silk, and hence is employed for removing this fibre from wool in the reprocessing of fabrics. Used alone or with phenol or chromium salts added, zinc chloride is used to preserve and fireproof timber.

Zinc sulfide, ZnS, occurs in nature as blende (*see* SPHALERITE) and is artificially prepared as a white precipitate by adding ammonium or alkali sulfides or hydrogen sulfide to a solution of a zinc salt. It dissolves in mineral acids but is insoluble in acetic acid.

Due to its high refractive index, zinc sulfide forms the pigmentary basis of the white zinc sulfide pigments known as lithopones. which contain up to 60% zinc sulfide and a balance of barium sulfate. These pigments have superior pigmentary strength to zinc oxides and white lead, are nontoxic and do not discolour in the presence of hydrogen sulfide. The grade of lithopone most used contains 28%/30% zinc sulfide with a balance of barium sulfate. It is formed by precipitation at the same time of purified zinc sulfate and barium sulfide solutions followed by calcination of the precipitate at temperatures in excess of 600° C. This calcination causes a growth in particle size to about o 5 mm. and a corresponding development in pigmentary strength. While lithopone, in all its forms, has been superseded in many applications, particularly by titanium dioxide, there are a number of fields such as that of water paints where it is pre-eminent.

Luminescent zinc sulfide can be prepared by heating to high temperatures pure zinc sulfide with small controlled additions of other metals, such as copper or silver.

Zinc sulfate, $ZnSO_4.7H_2O$, or white vitriol, is prepared by dissolving the metallic zinc in dilute sulfuric acid, and then concentrating and cooling the solution. On a commercial scale it is prepared by leaching roasted zinc ore or other zinc-containing materials such as galvanizers' skimmings with sulfuric acid. Insoluble material is removed by filtering. Iron is precipitated by oxidation in neutral solutions. Metals such as copper and cadmium are removed by adding zinc dust. After filtering, the clean purified liquor is concentrated by evaporation and then allowed to crystallize. The hydrated salt crystallizes as colourless orthorhombic prisms which are usually small and needle-shaped. They are stable in air and very soluble in water. On heating, the heptahydrate loses water molecules in successive stages to form finally anhydrous zinc sulfate, which, on further heating above a red heat, is converted into zinc oxide. Zinc sulfate, like magnesium sulfate, unites with the sulfates of the potassium-group metals and of ammonium, to form crystalline double salts $ZnSO_4.R_2SO_4.6H_2O$, which are isomorphous with each other and the magnesium salts.

The main application of zinc sulfate is in the manufacture of rayon where it is used to promote corrugation of the fibre. Another use which is gaining in importance is in agriculture. It is added. when required. to fertilizers for the treatment of soils which are deficient in zinc. As a spray, it is used to control certain plant diseases, particularly those in the citrus industry. Other uses include wood preservation, flotation, as well as uses in the paint and varnish industries.

Zinc carbonate, $ZnCO_3$, occurs in nature as the mineral calamine. The normal carbonate can be prepared by the action of excess carbon dioxide on freshly precipitated zinc hydroxide, but the addition of sodium carbonate to a solution of zinc salts in general produces a white basic carbonate. The basic carbonate is used as a pigment and in the manufacture of porcelain and pottery.

Analysis.—Zinc is precipitated from a neutral solution of its salts, by hydrogen sulfide as the sulfide ZnS, a white precipitate, soluble with difficulty in dilute mineral acids but insoluble in acetic acid. In the case of the acetate, precipitation is quite complete; from a sulfate or chloride solution the greater part of the metal goes into the precipitate; in the presence of a sufficiency of free HCl the metal remains in solution; sulfide of ammonium precipitates the metal completely even in the presence of ammonium salts and free ammonia. The precipitate when heated in air is converted to the oxide. which is yellow when hot and white after cooling; if it is moistened nith cobalt nitrate solution and reheated it exhibits a green colour after cooling.

Zinc can be quantitatively estimated by precipitating it in a formic acid solution containing ammonium formate and ammonium citrate. By this means zinc can be separated from such metals as iron, aluminum and manganese. The precipitated zinc sulfide may then be dried and ignited to form zinc oxide for gravimetric estimation. Zinc may also be precipitated as zinc ammonium phosphate (NH_4ZnPO_4), which is then filtered on a Gooch crucible and dried to a constant neight at 105° C., or ignited and weighed as the pyrophosphate $Zn_2P_2O_7$. Small amounts of zinc may be precipitated as zinc mercuric thiocyanate and weighed as such. Zinc may be determined volumetrically by titration in a dilute mineral acid solution with a standard potassium ferrocyanide solution, using either uranyl acetate as an external indicator or dimethyl naphthidine as an internal indicator.

Various methods, colorimetric, polarographic and spectrographic, are available for determining small quantities of zinc. These three physical methods have largely replaced the standard chemical methods for the routine determination of the small amounts of impurities in zinc metal.

Pharmacology and Therapeutics.—Zinc is used in medicine in the form of various salts, most of which are antiseptic, astringent, irritant. caustic or toxic. Some of the less irritating salts are used as emetics, but, for the most part, internal use of the zinc salts should be avoided except upon a doctor's advice. Zinc preparations are used locally in alcoholic or watery solutions. as washes for eyes, ears, wounds or ulcers. For these purposes zinc sulfate is, as a rule, in dilute solutions of 1% or less. Ointments and dusting powders are made commonly with zinc oxide or stearate. Zinc chloride is made in hard pencils by mixing it with plaster of Paris. These are caustic and are used for the destruction of various abnormal tissues and also for such purposes as destroying horn growth in calves.

The irritant and caustic salts of zinc are very dangerous if taken internally and, unless removed immediately, may cause death or irreparable damage. If taken by mouth in poisonous doses vomiting should be induced immediately by the use of warm oil or soapy water, and, after emesis. lard, butter, oleomargarine, raw eggs, milk, cream, or oil such as is used in salads, should be given. Immediate treatment is essential and a doctor should be summoned without delay.

Zinc is used in medicine in combination with other therapeutic agents or in their preparation. An example is its use in insulin therapy for diabetics.

ZINCITE, a mineral consisting of zinc oxide, is usually found in platy or granular masses. Its blood-red colour and orange-yellow streak are characteristic, as is also its common association with black franklinite and white calcite. It occurs principally at Franklin and Sterling hill, near Ogdensburg, N.J. (*see* Zinc). Zincite, ZnO, crystallizes in the dihexagonal pyramidal class of the hexagonal system. Distinct crystals are rare; they are hemimorphic and consist of a single basal plane and a hexagonal pyramid. There may be a perfect basal parting. The hardness is 4 to 4.5 and the specific gravity 5.7 Manganese may partially replace zinc. (L. S. Rl.; X.)

ZINDER, a town and former capital of Niger, in former French West Africa. Its ruler was formerly subordinate to Bornu, but with the decline of that kingdom he shook off the yoke of the sultan and on the conquest of that country by Rabah (*q.v.*) seems to have maintained his independence. The country, known as Damerghu, is semifertile and supports horses. sheep and camels. By the Anglo-French agreement of June 1898 it was included in the French sphere. The town was occupied in July 1899. A French post (named Fort Cazemajou) was built outside the town on a mound of huge granite blocks. Subsequently Commandant Gadel mapped and pacified the surrounding region and sent out columns of meharitstes (camel corps) which occupied the oasis of Air and Bilma in 1906. Zinder is surrounded with high earther walls. pierced with seven gates. Pop. (1959) 14.891.

ZINGARELLI, NICCOLO (1752–1837), Italian composer, was horn at Naples on April 4, 1752. His first dramatic work, *I quattro Pazzi,* was produced at the conservatorio in 1768. He gave violin lessons for a time. but in 1781 produced his first opera, *Montesuma,* at the San Carlo and afterwards in Vienna, where it was highly commended by Haydn. He finally settled in Milan, with introductions to the viceregal court, and over a period of 11 years produced a series of operas for La Scala, an oratorio of the Passion, and several cantatas. In 1789 he went to Paris to write an opera for the Académie royale de musique. This work, *L'Antigone,* for which Marmontel provided the libretto, was performed on April 30, 1790, but Paris was no place for Zingarelli during the Revolution, and he fled into Switzerland and returned to Milan early in 1791.

In 1792 he won the appointment, by open competition, of master of the chapel at the cathedral. He first achieved an international reputation by a series of comic operas, beginning with *La secchia rapita* in 1793. His finest work was, however, *Guilietta e Romeo,* played at La Scala in 1796. From 1794–1804 Zingarelli was master of the chapel at Loreto, and during this time, although he also wrote operas, he was chiefly inspired to compose sacred music, contributing largely to the enormous collection of manuscript works, the property of the church, known as the *Annuale di Loreto.* In 1804 he went to Rome as master (*maestro di capella*) of the Sistine chapel and in 1805 produced one of his most successful works, *La distruzione di Gerusalemme,* which held the stage for five years. His last opera, *Berenice,* received a hundred consecutive performances.

At the "king of Rome" celebrations, when Napoleon ordered a *Te Deum* to be sung in Rome. Zingarelli's principles did not allow him to undertake the performance, and on his refusal he was arrested and brought before the emperor in Paris. But Napoleon at once released him and provided him with a pension. Zingarelli's post in Rome had been taken by Fioravanti, but in 1813 he was appointed director of the Real Collegio di Musica at Naples and in 1816 *maestro di cappella* at the cathedral.

ZINGIBERACEAE, the ginger family: a group of tropical plants, including important spices and condiments, mostly native to eastern Asia. The various parts of the plants are usually more or less aromatic. Forty genera and about 900 species are recognized. Among the economic species are ginger (*q.v.; Zingiber officinale*), cardamoms (*q.v.; Elettaria cardamomum* and *Amomum cardamomum*) Melegueta pepper (*Aframomum; see* Grains of Paradise) and turmeric (*q.v.; Curcuma longa*), the latter used in making curry powder. Various species of *Alpinia, Hedychium, Phaeomeria* and other genera are cultivated for ornamental purposes.

ZINNIA, a genus of the family Compositae, containing about 12 species of tender annual or perennial herbs or undershrubs, found wild from the southern United States and Mexico to Chile. The numerous single and double garden forms are mostly derived from *Zinnia elegans* and grow about 2 ft. high, producing flowers of various colours, the double ones being about the size of asters and very handsome. The colours include white, yellow. orange, scarlet, crimson and purple. Zinnias do best in a rich deep loamy soil, in a sunny position. They should be sown on a gentle hotbed at the end of March and planted out only after settled warm weather.

ZINOVIEV, GRIGORI EVSEEVICH (1883–1936), Russian politician, was born in Sept. 1883 at Elisavetgrad (Zinovievsk). He studied chemistry and later law at Berne. He was a revolutionary before he was 20 and in 1903 met Lenin. He was head of the Bolshevik party in Berne and during 1903–4 started Bolshevik propaganda in south Russia. Apart from his activities abroad, he came into prominence in Russia during 1906–8 as a member of the Bolshevik St. Petersburg committee of the Russian Social Democratic party by his organization of the attempted Kronstadt rising after the dispersal of the first Duma, his editorship of the Bolshevik paper *Vpered* ("Forward") and of *The Sociul Democrat,* the central organ of the party. In 1908 he was arrested and imprisoned but was released. He went abroad and did not return until the Revolution in 1917. During these nine years Zinoviev worked hard for his party. He was a member of the central committee, co-editor of the principal Bolshevik publications and representative of the party at the Copenhagen congress of the International. In 1912 he went with Lenin to Galicia to control from the nearest possible point the growing labour movement in Russia. In Galicia he founded the foreign bureau of the central committee, which guided the party work in Russia and the activities of the Bolshevik group in the Duma. Zinoviev edited with Lenin *Against the Tide,* a work of propaganda against World War I; and at the Zimmerwald conference (1915) they began to organize the Communist International. On the outbreak of the March revolution (1917) they returned to Russia and began to prepare the way for the Revolution. Zinoviev was co-editor of *Pravda* and, aiter its suppression, of *The Proletarian* and *The Worker*. He thus became one of the leading figures in Russia. In 1919 he was elected president of the Communist International and after the death of Lenin in 1924 was one of the most zealous upholders of pure "Leninism." But in 1926 he was expelled from the political bureau and in 192; from the Communist party. He was readmitted in 1929; but in Jan. 1935 he and Kamenev (q *v*) were exiled for counterrevolutionary activities. On Aug. 25, 1936, convicted of high treason, he was shot.

ZINZENDORF, NICOLAUS LUDWIG, Count of Zinzendorf and Pottendorf (1700–1760), German religious and social reformer, was born on May 26, 1700, at Dresden. Both his parents belonged to the Pietist circle, and the lad had Philipp Jakob Spener for his godfather. His school days were spent at Halle amid Pietist surroundings, and in 1716 he went to the University of Wittenberg. During a lengthened visit at Castell he fell in love with his cousin Theodora, but her mother objected to the marriage and Theodora married Count Henry of Reuss. Zinzendorf took this rebuff as a call to special work for God, and he now resolved to settle down as a Christian landowner, spending his life on behalf of his tenantry at Berthelsdorf. His intention was to carry into practice the Pietist ideas of Spener.

The "band of four brothers" (Rothe, pastor at Berthelsdorf; Melchior Schaffer, pastor at Gorlitz; Francis von Watteville, a friend from boyhood; and himself) set themselves to create a revival of religion. From the printinghouse at Ebersdorf large quantities of books and tracts, catechisms, collections of hymns and inexpensive Bibles were issued; and a translation of Johann Arndt's *True Christianity* was published for circulation in France. Zinzendorf seems to have doubted the wisdom of Spener's plan of not separating from the Lutheran Church, and began to think that true Christianity could be best promoted by free associations of Christians, which in course of time might grow into churches with no state connection.

Zinzendorf offered an asylum to a number of persecuted wanderers from Moravia and built for them the village of Herrnhut on a corner of his estate of Berthelsdorf. The refugees who came to this asylum (between 1722 and 1732 — the first detachment under christian David) from various regions where persecution raged, belonged to more than one Protestant organization. Zinzendorf devoted himself to them.

Gradually Zinzendorf was able to organize his refugees into something like a *militia Christi,* based not on monastic but on family life. He established a common order of worship in 1727 and soon afterward a common organization. which has been described in the article Moravian Church. He traveled widely on behalf of the Moravians, visiting America in 1741–42 and spending a long time in London in 1750. Missionary colonies had by this time been settled in the West Indies (1732), in Greenland (1733), among the North American Indians (1735); and before Zinzendorf's death the Brethren had sent from Herrnhut missionary colonies to Livonia and the northern shores of the Baltic, to the slaves of North Carolina. to Surinam, to the Negro slaves in several parts of South America. to Travancore in the East Indies, to the Copts in Egypt and to South Africa.

ZION, in the Old Testament a topographical designation of the eastern hill of the two hills of ancient Jerusalem (*q.v.*), the site of the Jebusite city captured by David (II Sam. v, 6–93 and established as his royal capital. Some scholars believe that the name of Zion also belonged to the "stronghold of Zion" taken by David (II Sam. v, 7), which may have been the citadel of the city of Jerusalem. The temple of Solomon was built on the hill north of the city. Josephus in the 1st century A.D. identified Zion with the western hill of Jerusalem, where most of the city lay in his day, and this transfer of the name was retained until modern times. The eastern hill (the modern Ophel) was not included in the walls of the 16th-century fortifications and is still covered with fields and vineyards. It was not until the late 19th and early 20th centuries that the correct identification of the site of Zion was recovered and generally accepted.

Zion appears in the Old Testament 152 times as a title of Jerusalem; over half of these occurrences appear in two books, Isaiah (46 times) and Psalms (38 times). Zion appears seven times in the New Testament; of these occurrences five appear in quotations from the Old Testament. Zion does not appear in the books from Genesis to I Samuel inclusive, Ezra, Nehemiah, Esther, Job. Proverbs, Ecclesiastes, Ezekiel, Hosea, Jonah, Nahum, Habakkuk, Haggai and Malachi. It occurs in the Apocrypha or deuterocanonical Greek books four times in Sirach, three times in Baruch and eight times in I Maccabees.

The name is overwhelmingly a prophetic and poetic designation infrequently used in ordinary prose. It usually has emotional and religious overtones and is rarely neutral. It is not clear why the name Zion rather than the name Jerusalem should carry these overtones, although the name Jerusalem itself is highly charged also. It is possible that the name Zion was a familiar name used by the people of Jerusalem and Judah; central cities sometimes acquire nicknames which connote feeling. "Zion," "the dweller of Zion!" "the sons and daughters of Zion" designate the population of the city and sometimes the entire population of Judah.

The etymology and meaning of the name are obscure. It appears to be a pre-Israelite Canaanite topographical name of the hill upon which Jerusalem was built; the name "mountain of Zion" is common. In biblical usage. however, "Mount Zion" often means the city rather than the hill itself.

The religious and emotional quality of the name arises from the importance of Jerusalem as the royal city and the city of the temple. The city recapitulated in itself several of the basic themes of Israelite belief. Mount Zion is the place where Yahweh dwells (Isa. viii. 18; Ps. lxxiv, 2), the place where He is king (Isa. xxiv, 23; Mic. iv, 7). It is His holy mountain upon which He has installed His king, David (Ps. ii, 6). It is the place where His name is (Isa. xviii, 7), which He has loved (Ps. lxxviii, 68). It is therefore the seat of the action of Yahweh in history. He founded Zion (Isa. xiv, 32), treats Zion kindly (Ps. li, 18), delivers it (Ps. lxix, 35), chose it (Ps. cxxxii, 13), loves its gates (Ps. lxxxvii, 2), has mercy on it (Ps. cii, 13), builds it (Ps. cii, 16), appears on Zion (Ps. lxxxiv, 7), is jealous for it (Zech. viii, 2), blesses from it (Ps. cxxviii, 5; cxxxiv, 3), roars against His enemies from it (Amos i, 2; Joel iii, 16). The deliverance of Israel comes from Zion (Ps. liii, 6). Yahweh's fire, the fire of His anger and judgment, burns on Zion (Isa. xxxi, 9).

The city of Jerusalem is personified as a woman and addressed or spoken of as "the daughter of Zion." This title is always used in a context charged nith feeling. The feeling is aroused by either of two ideas which stand in opposition to each other; the destruction of Jerusalem or its deliverance. The daughter of Zion is left like a booth in a vineyard (Isa. i, 8). Jeremiah hears a shriek of panic; it is the voice of the daughter of Jerusalem crying that she dies at the hands of murderers (Jer. iv, 31). The title appears six times in the second poem of Lamentations (Lam. ii, 1, 4. 8, 10, 13, 18); Yahweh has disgraced the daughter of Zion, she is invited to cry and wail at her downfall, and she is addressed by the pathetic title "virgin daughter of Zion." But it is by the same title that Jerusalem is addressed when her deliverance is announced (Isa. lxii, 11). She scoffs at the Assyrian when he attacks (Isa. xxxvii, 22; II Kings xix, 21). Micah invites her to arise and thresh her enemies (Mic. iv, 13), and Zephaniah calls on her to cry out with joy at her deliverance (Zeph. iii. 14). Zechariah invites her to rejoice that Yahweh is coming to resume His dwelling with her (Zech. ii, 10) and to exult that her king comes to her (Zech ix, 9).

Mount Zion is identified with "the recesses of the north," the mountain of Canaanite mythology where the gods dwell (Ps. xlviii, 2). It is on Zion that Yahneh will "finish His work," His deeds of judgment and salvation (Isa. x, 12), and where He will establish His glory as a protecting canopy (Isa. iv, 5). Hence Mount Zion is a place of security. The nations which attack Mount Zion will be scattered (Isa. xxix, 8) and those on Mount Zion will escape disaster (Isa. xxxvii, 32; II Kings xix, 31; Joel ii, 32; Obad. 17). Those who trust in Yahweh are, like Mount Zion, immovable (Psa. cxxv, 1).

Zion is an object of threat to the pre-exilic prophets. Micah calls it a city built with blood and predicts that it will be plowed like a field (Mic. iii, 10–12), and the oracle was remembered in the time of Jeremiah (Jer. xxvi, 18). The attack upon Jerusalem related in Jer. xxvi shows that in his time Jerusalem and Zion were regarded as inviolable not only from attack but also from the judgment of Yahweh. This superstitious sense of security was shattered by the destruction of Jerusalem by the Babylonians in 586 B.C., and the spiritual crisis of the disaster is reflected in the sadness of Ps. cxxxvii. But, as this Psalm avows, the Israelites could not forget Zion, and in postexilic prophecy it is the scene of Yahweh's messianic salvation. Zion seemed to be a place sought by none (Jer. xxx, 17), and it could say that Yahweh had abandoned it (Isa. xlix, 21). But it is to Zion that the exiles shall be restored (Jer. iii, 14), and there they will find Yahweh (Jer. xxxi, 6). The "Zion songs" of Deutero-Isaiah (xlix, 14–1, 3; li, l–lii, 12) assure the exiles of the restoration of Zion, and the poems of Trito-Isaiah (lx–lxi) describe the glory of the city in almost mythological language. Zion is invited to rouse itself, to put on strength (1 1 1–2). It is in Zion that Yahweh places salvation (Isa. xlvi, 13). Zion is redeemed in judgment (Isa. i, 27), it is filled with judgment and righteousness (Isa. xxxiii, 5). The restored Zion is once again the city of Yahweh, the Zion of the Holy One of Israel (Isa. lx, 14). In a passage attributed to both Isa. (ii, 1–4) and Mic. (iv, 1–3) Zion becomes the highest of all mountains, a place to which all the peoples of the earth throng as to a source of revelation; for instruction comes out of Zion, and the word of Yahweh from Jerusalem.

While the name of Zion is rare in the New Testament, it has been very frequently used in Christian literature and hymns as a designation of the heavenly city or of the earthly city of Christian faith and fraternity. Since the 19th century Zionism is the name given to the movement to establish a national home for the Jews in Palestine, a movement which issued in the establishment of the state of Israel. *See* also JERUSALEM.

BIBLIOGRAPHY.—Michel Join-Lambert, *Jerusalem* (1958); J. Simons, *Jerusalem in the Old Testament* (1952); H. Vincent and A. M. Stève, *Jérusalem de l'Ancien Testament* (1954–56). (J. L. McK.)

ZIONISM, is a Jewish national movement with the goal of creating a Jewish national state in Palestine, the ancient homeland of the Jews (*q.v.*), which is called in Hebrew *Eretz Israel,* ("the Land of Israel"). Though Zionism originated in eastern and central Europe in the later part of the 19th century, it is in many ways a continuation of the deep-felt nationalist attachment of the Jews and of the Jewish religion to Palestine, the land promised by God to the Jews. This attachment to Zion inspired the Jews throughout the middle ages and found its expression in many important parts of their liturgy.

Early History. — At the end of the middle ages a number of "messiahs" came forward with the claim to lead the Jews back to Palestine, and they were generally received with great enthusiasm by their fellow Jews. The most important of these messiahs were David Reubeni and his disciple Solomon Molcho in the first part of the 16th century and above all in the 17th century Sabbatai Sebi (*see* SABBATAI ZEBI), who proclaimed himself the Messiah in Turkey in 1648. Most European Jews believed in Sabbatai's mission and many continued to do so even after he had become a Moslem.

The age of the Enlightenment in the second half of the 18th century, with its growth of religious toleration and its general universal and liberal ideas, laid the foundations in western Europe and North America for the emancipation of the Jews and their participation as citizens in the life of the nations in the midst of which they lived and whose members they became. The consequence was less emphasis among the Jews on traditional religious attitudes and more on assimilation of western secular culture. This movement emerged also in Germany where Moses Mendelssohn (1729–86), a philosopher and a friend of the great German writer Lessing, emphasized the spiritual and universal aspects of Judaism. He and a group of like-minded fellow Jews, most of them residents of Berlin and Königsberg in Prussia, wished to win the Jews over to modern western civilization. The younger Jewish generation gladly seized the opportunity of intellectual enrichment and civic freedom which the new movement, originally called by the Hebrew name *Haskala* ("enlightenment"), offered to them. Many went the way of complete assimilation, including the abandonment of the faith of their fathers. Others found their place as citizens of the Jewish faith in the new liberal and equalitarian societies emerging in the 19th century in western Europe and North America. Still others applied the new scholarship learned from western civilization to a study of the Jewish past and produced, especially in Germany, works of lasting value in the rediscovery and reinterpretation of the ancient heritage. Some wealthy Jews—among them Sir Moses Montefiore and the Rothschild family—tried to help their coreligionists in less fortunate lands, especially in eastern Europe and in the middle east, by establishing schools for them and by introducing them to agriculture and to various trades. For reasons of religious piety, a small number of Jews, supported by donations from outside, settled in Palestine.

The interest in a return of the Jews to Palestine was kept alive in the first part of the 19th century more by Christian millenarians, especially in Great Britain, than by Jews themselves. Among the few Jews pleading then for a Jewish settlement or state was the American Mordecai Manuel Noah (1785–1851), who in 1813 became U.S. consul in Tunis and later high sheriff and surveyor of the port of New York. In 1825 he acquired Grand Island in the Niagara river and invited the Jews of the whole world to create a Jewish state, Ararat, there. In 1844 he pleaded with the Christian world, in *Discourse on the Restoration of the Jews* to help the Jews resettle in Palestine. More important but not more successful were the attempts by Lord Shaftesbury, Sir Laurence Oliphant and other British individuals to create a Jewish state in Palestine. Some political writers thought of a Jewish state in the Holy Land as a means of assuring the overland route to India. Others were inspired by religious or mystic ideas, "anxious to fulfil the prophecies and bring about the end of the world," as was the eccentric Oliphant, who was accompanied on one of his visits to the middle east by Naftali Herz Imber (1856–1909), a Hebrew poet of Polish origin, famous in the history of Zionism as the author of "Hatikwa" ("The Hope"), which became the Zionist national anthem, and of "Mishmar Hajarden" ("The Watch on the Jordan"), a popular nationalist song.

These early sympathies with the return to Zion in the English-speaking world found their best literary portrayal in George Eliot's novel *Daniel Deronda* (1876). A German socialist, Moses Hess (1812–75), influenced by the example set by the unification of Italy, gave the first theoretical expression to Zionism among Jews, *Rome and Jerusalem* (1862; Eng. trans., 1918). This short book, which contained many thoughts later widely accepted by Jewish nationalists, combined ethical socialism, fervent nationalism and religious conservatism. Hess believed that the historical ideal of the Jewish people could be realized only in their own historic homeland. He insisted that a moral and spiritual regeneration must precede the settlement there. He hoped that France, which he venerated as the home of the Revolution, would protect the Jewish settlement because it would wish to see the bridge across the middle east held by a friendly people. Hess's book attracted no attention when it appeared. Only decades later was it rediscovered by the Zionist movement, which had by then developed in eastern and central Europe.

The Love of Zion Movement. — Whereas in western Europe the Jews became in the 19th century an integral part of the nations whose citizens they were and fully adopted their language and culture, the Jews in eastern Europe, then identical with the Russian empire, lived as a separate community with their own language, Yiddish, their own civilization and their own and distinct economic structure. They did not enjoy political or legal equality with the Russians. Further, under the reactionary regime which set in after the reform age of Tsar Alexander II (18;;–81) all hopes for Jewish emancipation were dashed. A wave of bloody pogroms, instigated or tolerated by the government, threatened Jewish lives and property. As a result large-scale emigration to western Europe and to the United States started. A very small trickle of Jewish youth from Russia also went to Palestine and founded there the first agricultural settlements. In 1882 Leo Pinsker (1821–91), a physician in Odessa, published *Auto-emancipation* (Eng. trans., 1891), an appeal in German to the western European Jews to save the Jewish people from persecution and misery of dispersion. He applied the ideas of 19th-century European nationalism and secularism to the Jews and propagated the necessity of concentrating them territorially, in Palestine or elsewhere. He found no echo among the western European Jews. But in Russia a small group, which took the name *Hovevei* Zion ("Lovers of Zion"), gathered around him and formed a committee in Odessa to promote the settlement of Jewish farmers and artisans in Palestine. Though these early settlements were able to survive only with the help of Baron Edmond de Rothschild of Paris, they laid the loundations of practical Jewish colonization in Palestine,

The most prominent among these early Zionists was Asher Ginzberg (1856–192j), whose essays written under the pen name Ahad Ha-am ("One of the People"), became classics of the modern Hebrew language which they helped to create. Ahad Ha-am denied that the majority of the Jewish people could be settled in Palestine, the smallness of the country and the fact that it was inhabited by a large native population seeming to him to he insurmountable obstacles. But though Palestine according to him could not become a Jewish state, he believed in the creation of a Jewish cultural centre there, a place for the regeneration of Judaism, from which spiritual influences would radiate into all the many lands where Jews continued to live and which would awaken in their hearts a true "love of Zion."

This early Hebrew renaissance in Russia also produced several great Zionist poets: among them Chaim Nachman Bialik (*q.v.*) and Saul Tchernihovsky (18; 5–1943). At the same time the Yiddish language, an eastern European derivation from medieval German not to be confused with the ancient Semitic Hebrew tongue, was raised from a people's vernacular to a medium of art by a number of writers, the first of whom was S. J. Abramowitsch (1835–191j), who wrote under the pen name Mendele Mocher Sforim ("Mendele the bookseller"). (See YIDDISH LANGUAGE AND LITERATURE.)

Political Zionism.—A new impetus was given to Zionism by Theodor Herzl (*q.v.*), an Austrian journalist. In the multinational pre-World War I empire of the Habsburgs with its violent nationality struggles the Jews found themselves in a difficult position. Except for eastern Europe, anti-Semitism (*q.v.*) was nowhere as strong as among the Austrian Germans, especially in Vienna where Herzl lived. The Dreyfus affair of the '90s and its attendant outburst of anti-Semitism (see FRANCE: *History*) which he witnessed in 1895 as a newspaper correspondent in Paris caused him to write a pamphlet, "Der Judenstaat" ("The Jewish State," 1896). He regarded assimilation as most desirable but, in view of anti-Semitism. impossible of realization. Against their own wishes, he believed, the Jews were forced by pressure from outside to form a nation. As such they could lead a normal existence only through concentration in one territory. Herzl had no living ties with Jewish and Hebrew traditional values. He never desired the rebirth of Hebrew as the Jewish national language. In his novel *Altneuland* (1914) he depicted the future Jewish life in Palestine in terms of life as he had known it among the liberal assimilated central European Jews. In this novel, his testament to the movement, he rejected all narrow nationalism and demanded above all brotherly consideration for, and closest co-operation with, the Palestinian natives in a common homeland.

Herzl molded Zionism into a political movement of world-wide signiiicance. He became its indefatigable organizer, propagandist and diplomat. He convened in Aug. 1897 the first Zionist congress at Basel, Switz., which drew up a constitution for the movement. His friend Max Nordau (q.3.) participated in drawing up the "Basel program" of the movement which proclaimed that "Zionism strives to create for the Jewish people a home in Palestine secured by public law." To that end the movement was to promote on suitable lines the colonization of Palestine by Jewish rural and industrial workers; to organize the whole of Jewry by means of appropriate local and international institutions, in accordance with the laws of each country; to strengthen and foster Jewish national sentiment; and to obtain government consent where necessary to the attainment of the Zionist aims.

The centre of the movement was established in Vienna, where Herzl published the official weekly *Die* Welt ("The World"). The congresses met every year until 1901 and then every two years. Meanwhile Herzl entered into negotiations with the Turkish government in order to receive a charter establishing Palestine's autonomy, but the Turkish government rejected the proposals. Only in England did Herzl find sympathy, and for that reason he established the financial instruments of the movement in London. In 1903 the British government offered an area of 6,000 sq.mi. to the Zionist organization in the uninhabited highlands of Uganda. This offer led to violent controversy and even a split in Zionist ranks. A minority under the leadership of Israel Zangwill (*q.v.*) was willing to accept the offer. Members of this minority founded in 1905 the Jewish Territorial organization with the aim of finding an autonomous territory for those Jews who could not or did not wish to remain in the countries in which they lived. The majority of the Zionists, most of them from Russia, insisted on Palestine as the only field of activity for Zionism, and the seventh Zionist congress in 1905 rejected any colonization outside Palestine and its neighbouring countries. In 1904 in the midst of this bitter debate Herzl, only 44 years old, died.

Pre-World **War I Zionism.**—With the death of Herzl the leadership moved from Vienna to Germany, first to Cdlogne then to Berlin. Austrian and German Jews led the movement, but its mass strength came from Russia. At that time only a very small minority of the Jews were organized in the Zionist movement. There mas much opposition to Zionism in Jewish ranks, based partly on the conviction that the Jews had to become, or were already, an integral part of the nations among whom they lived and to which they belonged, partly on religious orthodoxy which expected the return to Palestine only under divine guidance and the strict application of traditional religious laws and partly on the conviction that the Jewish people could exist as a distinct national group in the Diaspora, especially in countries of Jewish mass settlement and Yiddish folk culture. Among the last group was the Bund, a Jewish socialist party: founded in Russia in 1897. Jewish socialists were also organized as Zionists under the name of *Poale* Zion ("Workers of Zion"). Their first world conference was held in The Hague in 1907.

Of greater importance was the question of the position of traditional orthodoxy in the Zionist movement. In 1902 a number of Russian Zionists founded Mizrachi as the party of religiously orthodox Zionists who insisted on the strict observance of Jewish religious laws in Palestinian Jewish life. The ideal of Herzl, on the other hand, had been a modern secular movement. The Zionist organization declared itself neutral in matters of religion, but from time to time the insistence of the religious groups upon observance of Jewish religious precepts caused conflicts within the movement.

Though Zionism represented only a minority of Jews, and in the western lands only a small minority, it was the only world-wide democratically organized part of Jewry. It developed an active propaganda through orators and pamphlets, created its own newspapers in many languages and gave an impetus to what was called a "Jewish renaissance" in letters and the arts. (See HEBREW LITERATURE.) At the same time the failure of the Russian revolution of 1905 and the wave of pogroms and the repressive measures which followed it disillusioned many in regard to Jewish emancipation in eastern Europe. Again as in 1882, but now in growing numbers, Russian Jewish youth emigrated to Palestine to live there as pioneers in newly founded agricultural settlements in which they hoped to realize their nationalist and socialist ideals. They fought against the employment of "foreign" (Arab) labour and insisted on the use of Hebrew as the spoken language.

The growth of the Jewish settlement in Palestine was due to the "practical" Zionists; who were opposed by the "political" Zionists who insisted on the granting of a charter as an essential prerequisite for colonization. With the growing strength of the Young Turk nationalist movement in Turkey, especially after 1908, the prospects of obtaining a charter dimmed considerably. Hut in spite of small financial means, urban development and agricultural settlement among the Jews in Palestine made steady progress. In 1914 there were about 90,000 Jews in Palestine, where the large majority of the population was Arabian. There were 43 Jewish agricultural settlements with 13,000 settlers, many of them supported by Baron Rothschild.

The situation changed with the outbreak of World War I. Zionist work in Palestine came to a standstill. Turkey and Britain were at war. An opportunity offered itself for "political" Zionism to reassert itself and to combine the old British sympathies for Zionism with the opportunities of political warfare. As a result the centre of the Zionist movement shifted from Germany, Turkey's ally. to London. The leadership passed to Jews of Russian origin living in London—among them Chaim Weizmann (*q.v.*) and Nahum Sokolow (*q.v.*). As a result of the Bolshevik Revolution of Nov. 1917 and of the consequent civil war with its pogroms perpetrated by the White armies and because of the intensified nationalism of the various succession states of post-World War I Europe, great misery spread nmong eastern European Jews. From then on the financial and economic strength of Zionism came from Jews in the United States, and the masses of its adherents from 1920 to 1938 came from Poland.

The Balfour **Declaration.**—Chaim Weizmann was instrumental in bringing about a letter written by Arthur James Balfour, then British foreign secretary. to Lord Rothschild on Nov. 2, 1917. declaring that "His Majesty's Government view with favour the establishment in Palestine of a national home for the Jewish people. and will use their best endeavours to facilitate the achievement of this object, it being clearly understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine. or the rights and political status enjoyed by Jews in any other country."

The British government hoped that a declaration in favour of Zionism would help to rally Jewish opinion, especially in the United States. to the side of the Allies, and that the settlement in Palestine of a Jewish population attached to Britain by ties of sentiment and interest might help to protect the approaches to the Suez canal and the road to India. The Balfour declaration fell short of the expectations of the Zionists. who had asked for the reconstitution of Palestine as "the" Jewish national home. Instead, the Balfour declaration envisaged only the establishment "in" Palestine of "a" national home for the Jewish people. Nevertheless the declaration aroused enthusiastic hopes among Zionists and seemed the fulfillment of Herzl's hopes. It was endorsed by the principal Allied powers, and through its acceptance by the conference of San Remo in 1920 it became an instrument of British and international policy. The council of the League of Nations approved on July 24, 1922, a British mandate over Palestine which included the Balfour declaration in the preamble and various provisions dealing with facilitating Jewish immigration. The mandate had been officially interpreted in a statement of June 3, 1922, in which Winston Churchill, the British colonial secretary, announced that the declaration did not mean "the imposition of a Jewish nationality upon the inhabitants of Palestine as a whole, but the further development of the existing Jewish community, with the assistance of Jews of other parts of the world, in order that it may become a centre in which the Jewish people as a whole may take. on grounds of religion and race. an interest and a pride." His majesty's government, he announced, had not contemplated at any time: as appeared to be feared by the Arabs, "the disappearance or the subordinntion of the Arabic population, language. or culture in Palestine."

From World War I to World War 11.—In the years after 1920 Zionism increasingly concentrated upon building up Jewish urban and rural settlements in Palestine, perfecting autonomous organizations there and solidifying and intensifying Jewish cultural life and Hebrew education. Thus the basis was laid for a full-fledged national life. In March 1925 the Jewish population in Palestine was officially estimated at 108,000 and it was about 300,000 by the end of 193j. The area of land in Jewish possession rose from 177 sq.mi. in 1914 to 500 sq.mi. in 1935, much of it acquired by the Jewish National fund ***(Keren** Kayemeth)* as the perpetual and inalienable property of the Jewish people. More rapid even than the rural expansion was the urban growth. Tel Aviv, founded originally in 1909 as a suburb of Jaffa, had in 1935 a population of more than 100,000 and was a modern purely Jewish city which was also the centre of industrial development made possible by the influx of Jewish capital. The educational system was crowned by the opening of a Hebrew university in Jerusalem and of the institute of technology in Haifa in 1925.

In spite of this growth, Jewish immigration into Palestine remained relatively small until the rise and spread of Hitlerism in Europe. There seemed no prospect of a Jewish majority in Palestine. The birth rate of the Arabs in most years before 1933 was larger than the annual Jewish immigration. Nevertheless the Arab population of Palestine feared a future transformation of Palestine into a Jewish state which would either relegate the Arabs in their own homeland to the position of a minority of second-class citizens or drive them out. Responsible Zionist leaders tried to allay the Arab fears and declared that Zionism did not intend to deprive any Arab or Palestinian of his rights and properties. Some Zionists such as Arthur Ruppin and J. L. Magnes emphasized the necessity of winning the co-operation of the Arabs and hoped for the creation of a binational Palestine which would be the common homeland of both Palestinian Arabs and Jews. Only an extreme nationalist group called revisionists, under the leadership of Vladimir Jabotinsky. demanded the transformation of the whole of Palestine within its largest historical frontiers into a purely Jewish state with an Arab minority. The revisionists agitated also for the creation of Jewish armed forces to fight for the creation of the Jewish state.

From the beginning the Arabs in Palestine bitterly resisted Zionism and the British policy supporting it. Several times they rose in revolt, especially in 1929 and in 1936–39, claiming the right of national self-determination, as they represented the large majority of the inhabitants. and demanding the preservation of Palestine as an Xrab homeland. Therein they were supported by all the other .Arabs. The British repressed the Arab rising for independence: but recognized the genuine character of Arab nationalism and Arab fears. The British government sent various commissions of inquiry and devised various schemes, culminating in the White Paper of May 17, 1939, to reconcile the irreconcilable demands of the Arab population and Zionism for the control of Palestine.

World **War II and** Its **Consequences.**—Hitlerism and the large-scale extermination of European Jews led many Jews: above all in the United States, to embrace Zionism. In 1942 a Zionist conference in New York city demanded the establishment of a Jewish state in the whole of Palestine and unlimited Jewish immigration. This program was endorsed by the Zionist organization. At the same time Xrab nationalists throughout the middle east intensified their demands for Arab rights. Britain submitted the case of Palestine first to Anglo-U.S. discussion for solution and later to the United Nations. which proposed on Nov. 29, 1947, partition of the country into an Arab and a Jewish state and the internationalization of Jerusalem. But the decision came through force of arms in a war between Zionists and Arabs. The state of Israel was proclaimed on May 14, 1948, and immediately recognized by the United States. Armistice lines were negotiated under UN auspices giving Israel more territory than provided by the UN resolution. Thus half a century after the first Zionist congress and 30 years after the Balfour declaration Zionism achieved its aim of establishing a Jewish state in Palestine.

The establishment of the state left several problems unsolved: its boundaries, its economic viability, its relationship to world Jewry, the settlement of the Arab refugees from its territory. its accommodation with the Arab world. The immigration of central

European Jews brought to Palestine many talents, which gave a great impulse to the cultural and artistic life and to the modernization of economy. On the other hand after 1950 most immigrants came from non-European countries and the question arose whether the Jewish people of Israel would be predominantly of a European or of an oriental character. The economic existence of Israel was made possible by the yearly influx of hundreds of millions of dollars, supplied mostly by donations from Jews in the U.S., grants from the U.S. government and German reparation payments. Opposition to Zionism among Jews continued. In the U.S. it found its organized expression in the American Council for Judaism, founded in 1943. But most Jews sympathized with and actively supported Israel, though they rejected the theory propagated by many Jews in Israel that the Jews outside Israel were living in "exile" and could live a full life only in Israel. Meantime the Arabs had in no way accepted the loss of their Palestinian lands. In spite of all these difficulties Israel made rapid progress in the resurrection of a Jewish nation in its ancient homeland. See also PALESTINE; ISRAEL.

ZION NATIONAL PARK, southwestern Ctah, U.S., was established in 1919 to protect Zion canyon from commercial encroachment The canyon was named by Mormon settlers in the 1850s and explored by them in 1862. In 1937, the almost equally scenic Kolob canyon area adjoining the park on the west and north, was established as Zion National monument. In 1957 the monument. 48.640 ac., was added to the park, bringing the total area to 147.035 ac.

The canyon walls are of sedimentary origin. They grade from rust red at lower elevations to nearly white at the summits. For more than 200,000,000 years the region, of which the park is but a part, has gone through many climatic changes. The rock shows it nas periodically submerged under a shallow sea or lake, then raised and eroded by rivers. At other times desert conditions prevailed. Fossils of fish, shells, dinosaur bones and plant material, as nell as animal tracks, have been found embedded and imprinted in the sandstone. There is also evidence that prehistoric cave dwellers lived in the area.

Zion canyon was carved by the Virgin river. Its floor is approximately 4,000 ft. above sea level and 3,802 ft. below the park's highest point at the top of West Temple. The Great White Throne, a giant monolith which stands close to the river, rises sheer to a height of 2,394 ft.

Mule deer are more in evidence than most other mammals, but the park also provides sanctuary for mountain lions, bobcats, coyotes, marmots and gray foxes. More than 150 species of birds have been recorded in the area. Cottonwood, willow and box elder are dominant trees of the canyon floor, with Utah juniper and pinyon pine in the middle elevations and ponderosa pine and Rocky Mountain juniper dominating at higher levels. (Dx. B.)

ZIRCON, a mineral with the composition zirconium silicate, is a principal source of zirconium. For uses of zircon, see ZIRCONIUM: Uses. It is believed that the name comes from the Arabic *zargun,* and is essentially the same as jargon, the name given to one of the varieties of zircon. Zircon is usually brown, reddish or gray, but may be colourless, blue, green or yellow; sometimes zoned. Common zircon is opaque, but gem varieties are transparent. The high refractive index and the high dispersion cause zircon to approach the diamond in fire and brilliance. A colourless type has been called Matura diamond. Hyacinth or jacinth includes the clear transparent red, orange and yellow varieties, mhile jargon includes the remaining colours. In some cases the colour may be removed by heating coloured stones under oxidizing conditions, mhile heating under reducing conditions may give an attractive blue colour. The gem varieties are found in stream gravels and detrital deposits, especially in Indochina and Ceylon; they are also found in Burma, New South Wales and New Zealand. Common zircon is obtained from beach sands in the United States along the east coast of Florida, and in Australia and French West Africa. It is an accessory constituent of acid igneous rocks and forms an important part of the zircon syenite of southern Norway. It occurs in large crystals in Renfrew county, Que.

Zircon. $ZrSiO_4$ is isomorphous with thorite, $ThSiO_4$. It crystallizes in the tetragonal system, generally in combinations of a simple prism and bipyramid (see CRYSTALLOGRAPHY), and sometimes comes in knee-shaped twins. There is no distinct cleavage. and the fracture is conchoidal. Normally zircon has well-developed crystals and has a hardness of 7.5 and a specific gravity of 4.7. The refractive indexes for normal zircon are $O = 1.93$ and $e = 1.99$. A rare type of zircon is isotropic and amorphous, has lower indexes of refraction, a lower hardness, 6. and the specific gravity may be as low as 3.94. This type is said to be in a metamict condition, that is the loss of crystallinity is attributed to breakdown of the structure, possibly by radioactive bombardment from uranium or thorium impurities. Upon heating, this type may glow nith an orange luminescence and may become crystalline. Because of the lower hardness, it is usually found in rounded grains and pebbles. Intermediate or gradational types of zircon are quite common.

ZIRCONIUM (symbol Zr) is considered one of the "new" metals. Actually, metallic zirconium, probably an impure product. was made by J. J. Berzelius in 1824, but the next important advance did not come until 1925 when massive, ductile metal was made by two Dutch scientists, A. E. van Arkel and J. H. de Boer. Although the initial market for it was very limited, zirconium in massive form may be considered to have become commercial not long after 1923'. In the middle 1940s, W. J. Kroll developed a cheaper process for making the metal. However, despite its interesting properties, zirconium probably would have remained of minor importance for some years had not its use in nuclear reactors developed shortly before 1950.

Ores. — Although new, zirconium actually is more plentiful than copper and several other common metals. It is obtained principally from two minerals: zircon, a zirconium silicate with the composition $ZrO_2\ SiO_2$ and baddeleyite (brazilite), an oxide mith the formula ZrO_2.

Zircon is found in beach sands in many parts of the world, particularly in the United States, Australia, India and Brazil. Baddeleyite exists in quantity in Brazil. but no other important deposits are known. A mixture of zircon and baddeleyite known commercially as "zirkite" is also shipped from Brazil.

One characteristic of all zirconium ores, regardless of mineral or locality, is that they contain from about 0.7% to several per cent of hafnium, a metal similar in many nays to zirconium. In processing, hafnium (*q.v.*) usually moves mith the zirconium and is found in the metal in about the same proportion as in the ore. It must be removed from zirconium intended for nuclear uses but is seldom objectionable when zirconium is used for other purposes.

Production of Metallic Zirconium. — The steps from ore to metal can be given in outline only. Zircon will be used for illustration of the early stages. The grains containing zircon must be separated from the non-zircon grains of sand by ore-treating equipment such as Wilfley tables, Humphreys spirals and magnetic or electrostatic separators. The zircon portion is then mixed nith carbon and heated in an arc furnace. In this step, the zirconium in the zircon is converted to zirconium carbide and much of the silicon is lost by volatilization. The carbide is then heated in a stream of chlorine and is converted to the tetrachloride, $ZrCl_4$. The $ZrCl_4$ passes out of the chlorinator as a vapour and collects as a white powder in a condenser. The silicon chloride formed from the silicon remaining in the carbide is so volatile that it passes on through the condenser and escapes.

Kroll Process. — The Kroll process of making zirconium is based on the reduction of $ZrCl_4$ with magnesium. A simple apparatus for performing the reduction appears in fig. 1. The largest item is a cylindrical stainless steel vessel on the outside of which are wound several electrical heating units. Inside the vessel are two steel pots, A and B, and baffles that serve as a thermal shield between them. In preparation for a reduction, A is filled with zirconium tetrachloride and B with magnesium. The lower part of the furnace is heated sufficiently to melt the magnesium and the upper part is brought to a temperature that gives a suitable pressure of $ZrCl_4$ vapour. As the vapour from the subliming $ZrCl_4$ fills the vessel: it passes downward and comes in contact with the molten magnesium. The result is the reaction

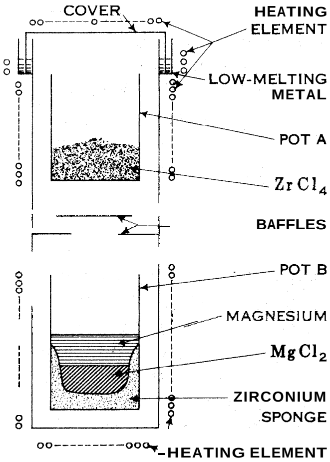

FIG. 1.—KROLL PROCESS FOR MAKING ZIRCONIUM

$$ZrCl_4 + 2Mg \longrightarrow Zr + 2MgCl_2$$

Gradually, the magnesium is converted to $MgCl_2$ and the zirconium formed sinks to the bottom of the pot.

The top of the furnace is not attached tightly but is provided with a skirt that rests in molten metal in a circular channel extending around the top of the vessel. If the internal pressure exceeds atmospheric value. the lid rises and a little vapour escapes. If the internal pressure falls, as when the $ZrCl_4$ supply is exhausted, helium enters automatically from a side container to build up the pressure so the molten metal will not be sucked in.

At the end of the run and after the equipment has cooled, the metal in the annular channel is heated to the melting point, the vessel opened and pot B transferred to another vessel where it is placed in an inverted position. The second vessel is evacuated and then heated so that the magnesium and $MgCl_2$ will drain out of the pot and also be eliminated by volatilization.

Iodide Process.—The iodide deposition process developed by van Arkel and de Boer is essentially a refining operation that is capable of converting impure and often brittle zirconium into ductile metal that can be fabricated readily. The process will be described briefly on the basis of a glass-containing vessel although industrial production usually is carried out in metal containers.

Fig. 2 shows a simple apparatus. The zirconium to be refined is placed between the outside wall and a cylinder of perforated molybdenum sheet. The wire on which the metal is to be deposited is suspended from tungsten electrodes entering through the top. After the charge of impure zirconium has been put in place and the top sealed, the vessel is evacuated and heated for removal of gases. The connecting tube to the pump is then sealed off at A. Next, the iodine, which has been immersed in liquid nitrogen, is heated and driven over into the deposition bulb after which the connecting tube is sealed off at B and the side arm removed completely.

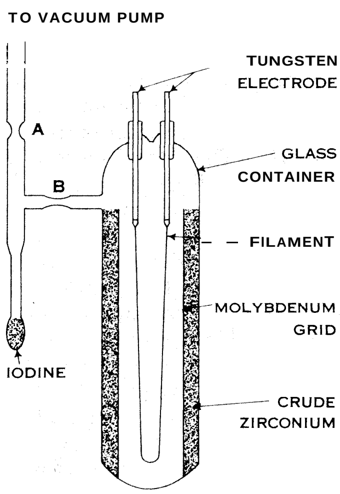

FIG. 2.— IODIDE DEPOSITION PROCESS

The apparatus being ready for operation, the vessel is heated to about 275° C. and the filament to about 1,300" C. Two reactions occur simultaneously: (1) iodine vapour unites with the zirconium charge to form ZrI_4, which is also gaseous; and (2) molecules of ZrI_4 are decomposed on the hot filament with the result that the zirconium atoms attach themselves to the wire and the iodine atoms drift back to the zirconium charge and combine to form more ZrI_4. As the reactions continue, the filament grows into a bar of the desired size. Because of its crystalline appearance. the bar is called a "crystal bar." To remove it, the operator must cut open the glass container.

Other processes for producing zirconium have been used, but, in general, they produce finely divided or granular metal.

Melting and Fabricating.— Zirconium made as described above usually is melted before it is fabricated. In one type of operation, the sponge or crystal bar is formed into a thick bar that acts as one electrode of an arc melting furnace. The other electrode is the water-cooled copper crucible into which the zirconium bar is melted. The arc plays between the bar and the pool of molten metal in the crucible. This method is called "consumable electrode melting." The furnace shell is tight and contains helium, argon or a mixture of these two inert gases at a reduced pressure.

Forging, rolling and most other fabricating processes may be performed on zirconium without difficulty. Ingots are often worked hot in the initial stages. If the temperature does not exceed 700° C. and if the outer layer is subsequently to be removed, the metal may be worked bare. Sometimes pieces to be worked hot are enclosed in a tight envelope of steel or other metal that is removed after the operation. Trouble may be encountered in drawing zirconium into tubes, rods or wire because of its tendency to seize in the dies. Special lubricants have been developed for avoiding this trouble.

Physical, Mechanical, Chemical **Properties.**—Many properties of zirconium are affected in some degree by the presence of contaminating elements. Hydrogen, oxygen and nitrogen are very effective in this respect and all three can he absorbed by zirconium in astonishing amounts. Hafnium has only a minor effect on many properties, but it is extremely detrimental in zirconium that is to be used in construction of nuclear reactors. Other elements also influence the properties of zirconium, but reasonable care during processing will prevent contamination by them.

Some of the more common physical properties are listed below (see Table) ; two properties deserve special mention. One is the change of atomic arrangement at approximately 860° C. Below this temperature, zirconium is hexagonal close-packed with a = 3.231 Å and c = 5.147 Å; above it. the structure is body-centred cubic with a = 3.60 Å. Many properties change value abruptly as zirconium passes through this temperature. For example. the electrical resistance decreases by about 15%. The property that is most important in nuclear uses is the capacity for capturing thermal (slowly moving) neutrons. Zirconium has an absorption cross section of only 0.18 barns (10^{24} barns = 1 $cm.^2$) for thermal neutrons and, accordingly, belongs in the very limited group of metals that have low cross sections and hence are suitable for use in nuclear reactors. However, as hafnium has a much larger cross section of 115 barns, a relatively small contamination with this element can raise the total cross section of zirconium above an acceptable value.

Zirconium has a number of interesting chemical properties. Its high capacity for absorbing several gases has been mentioned. At

Physical and Mechanical Properties of Zirconium*

Density	6.50 $g./cm.^3$

*Mechanical values should be considered only as illustrative, since reported measurements vary considerably.

1,000" C., it will absorb oxygen until its volume has increased visibly. Beyond the solubility limit, zirconium combines with oxygen to form ZrO_2. It has such a strong affinity for oxygen that it will attack refractory crucible materials like MgO, Be0 and

ThO_2 by taking their oxygen from them. For this reason, zirconium must be melted in cooled metal crucibles. Although oxygen leaves zirconium untarnished at room temperature, it produces a dark coating at temperatures of a few hundred degrees. Zirconium sponge may react explosively with moisture. The reactions of zirconium with nitrogen are similar but less spectacular. With hydrogen. zirconium reacts rapidly at 800° C. to form the brittle ZrH_2. As a result of the reaction, massive zirconium is converted to a granular condition. The granules can be ground to powder and, if desired. the hydrogen may be pumped off to leave a product suitable for powdered metallurgy processes.

Zirconium has excellent resistance to nitric acid, even at 100° C., and withstands relatively high concentrations of other inorganic acids at room temperature. It is attacked by aqua regia and by moist chlorine and bromine gases. It is almost completely resistant to all but a few organic acids. Its resistance to high-pressure water at 300° C. and above is good if the metal is pure. But some contaminating substances, especially small proportions of nitrogen, reduce its resistance seriously. The addition of 2% or 3% of tin compensates for the bad effect of nitrogen almost completely. Resistance to high-pressure water is important in pressurized water reactors such as the one used in the U.S. submarine *Nautilus*. In general, molten metals attack zirconium, but pure molten sodium has no etiect on it at 500° C. or higher.

Knowledge of the chemical compounds of zirconium has been obtained, perhaps principally, from investigations of methods for making it in the pure state. Besides the Kroll process, several metallothermic reactions have been used for reducing compounds to metal. They are illustrated by the reactions

$$ZrO_2 + 2Ca \longrightarrow Zr + 2CaO$$
$$ZrCl_4 + 4Na \longrightarrow Zr + 4NaCl$$
$$Na_5Zr_2F_{13} + 8Na \longrightarrow 2Zr + 13NaF$$

An excess of reductant metal is used in all three reactions and all three produce zirconium in a powder or granular form. The second reaction has been used particularly for making zirconium to be refined by the iodide deposition method.

Uses.—The most important use for zirconium is in nuclear reactors for jackets for uranium fuel rods and for alloying with uranium. In the sodium-graphite reactor. it has been used as a jacket around the graphite moderator blocks. A much smaller but important use, mainly as a powder, is as a getter for cleaning up residual gases in vacuum tubes. It has minor uses also in the electrical industry.

As an alloying element, zirconium is important in the production of magnesium alloys and is used to a smaller degree as an addition agent to steel.

Two uses of zirconium oxide are as a packed-in electrical insulating material and as an opacifier to reduce the transparency of glazes on ceramic objects and of enamels on metals.

A small amount of oxide is used for crucibles and for laboratory ware.

ZIRKEL, FERDINAND (1838–1912), German pioneer in microscopic petrography. born in Bonn, May 20. 1838. Trained as a mining engineer, in 1863 he became professor of mineralogy at Lemberg. His famous *Lehrbuch der Petrographie,* first published in 1366. was written before he had learned the technique of microscopic petrography: which H. C. Sorby was developing in England, but when in 1868 he revisited the British Isles he became acquainted n·ith Sorby. who demonstrated the new technique to him. Returning to Germany. Zirkel busied himself in making thin sections of rocks. In 1870 he published an important work on the microscopic characters of basalts, dedicating it to Sorby.

Named tu the chair of mineralogy in Leipzig in 1870. Zirkel continued his studies in microscopic petrography and in 1873 his *Mikroskopische Beschaffenheit der Mineralien und Gesteine* made the new method of study available to all. Zirkel was engaged by Clarence King to describe the rocks collected on the survey of the 40th parallel in western U.S. Zirkel wrote the fourth volume (1876) of the report of the survey, thus introducing microscopic petrography in the U.S. During his long tenure of the Leipzig chair, Zirkel rewrote his *Lehrbuch* completely and it became one of the classics of geology, reappearing in three large volumes in 1894. Zirkel retired in 1909 and died in Bonn, June 12, 1912.

ZITHER, a name applied to the ancient cithara, to the cittern (*q.v.*) and to a derived instrument which is a kind of psaltery, consisting of a shallow. horizontal sound chest with from 30 to 42 strings stretched above it which are plucked and thrummed, with plectrum and fingers, by the performer. (*See* illustration.) Zithers. which are made in various sizes. are the favourite instruments of the peasants in the Swiss and Bavarian highlands. and are sometimes heard also in the concert halls in Germany. The *Streichzither,* or bowed zither, is another variety of the instrument. There are four strings corresponding to those of the violin or viola. but the tone is nasal and glassy. *See* Lyre. (D. T.)

THE ZITHER, OR CITHARA, A MUSICAL INSTRUMENT HAVING 36, 38 OR 42 STRINGS

ZITTAU, a town of Germany. in the district of Dresden, on the left bank of the Mandau near its confluence with the Neisse. by rail 48 mi. E.S.E. of the city of Dresden and at the junction of lines to Reichenberg, Hermsdorf. Gorlitz. Oybin and Löbau. Pop. (1959 est.) 43.743. Zittau is of Wendish origin (Chytawa is its Wendish name), and was made a town by Ottocar II of Bohemia. It was one of the six towns of the Lusatian league (1346). at which period it belonged to Bohemia. It suffered severely in the Hussite wars and in the Thirty Years' War.

ZITTEL, KARL ALFRED, Ritter von (1839–1904). German paleontologist who proved that the Sahara desert had been land during the Pleistocene Ice Age, was born at Bahlingen. Baden, on Sept. 25, 1839. Educated at Heidelberg, Paris and Vienna: in 1863 he was appointed assistant in the royal mineral cabinet of Yienna and became professor of mineralogy, geognosy and paleontology at the Polytechnic school, Karlsruhe. In 1866 he was made professor of paleontology at Munich, later becoming professor of geology and conservator of the geological collections until his death at Munich on Jan. 5, 1904.

Zittel's first research dealt with minerals and petrography. In 1873–74 he was geologist of an expedition to Libya, during which he collected material for his proof about the Sahara. His first paleontologic paper appeared in 1861; later he accepted evolution and led in applying it to paleontology, especially in his studies of ammonites. He did not write extensively on theory, however, nor did he accept the neo-Lamarckian doctrines of Alpheus Hyatt and Edward Cope. In 1876 he began his studies of fossil sponges, which established their classification and laid a basis for that of modern forms. His principal contributions to vertebrate paleontology dealt with turtles and pterodactyls of the Bavarian lithographic limestones. One of Zittel's best-known works is the *Geschichte der Geologie und Paläontologie* (1899; Eng. trans., 1901). (C. L. Fe.; M. A. F.; X.)

ŽIŽKA, JOHN (c. 1376–1424), Bohemian general and Hussite leader, was born at Trocnov in Bohemia. He lost an eye in the civil wars under Wenceslaus IY. Connected with the court from his youth, he held the office of chamberlain to Queen Sophia. The Hussite movement first brought him into prominence. When a temporary armistice was concluded between the partisans of King Sigismund and the citizens of Prague, Žižka joined the advanced Hussites at Tabor, helped to organize the new military community and became one of the four "captains of the people" (*hejtmane*) at its head. On receiving an appeal from the citizens of Prague to help against Sigismund, king of the Germans and king of Hungary, who had invaded Bohemia, claiming the crown as the heir of his brother Wenceslaus, the Taborites marched to Prague and on July 14, 1420, largely through Žižka's heroism, repulsed an attack by Sigismund's forces on their position on the Vitkov hill where the suburb of Žižkov now stands, forcing Sigismund to raise the siege. On Aug. 22, 1420, the Taborites left Prague and returned to Tabor.

Žižka was now engaged in constant, and invariably successful, warfare with the partisans of Sigismund, particularly with the powerful Romanist, Ulrich of Rosenberg. At the meeting of the estates of Bohemia and Moravia at Caslav (June 1, 1421), Žižka was elected member for Tabor to the provisional government. He summarily suppressed some disturbances by the Adamite sect, continued his campaigns against the Romanists and adherents of Sigismund, and, having captured a small castle near Litoměřice (Leitmeritz), retained possession of it—the only reward for his great services that he ever received or claimed. According to Hussite custom, he gave the biblical name of "Chalice" to this new possession, and henceforth adopted the signature of "Žižka of the Chalice." In 1421, while besieging the castle of Rbbi, he lost the use of his remaining eye. Though now totally blind, he retained his command, and on Jan. 6, 1422, severely defeated Sigismund at Nebovid, Kutna Hora, and again at Německy Brod (Deutschbrod) on Jan. 10. Early in 1423 internal dissensions among the Hussites led to civil war. Žižka, as leader of the Taborites, defeated the men of Prague and the Utraquist nobles at Hořic on April 27, and when the armistice of Konopist (June 24) was followed by renewed civil war, he once again defeated the Utraquists, under Borek, at Strachov, near Králové Hradec (Aug. 4, 1423).

Žižka now made a brilliant, although unsuccessful attempt to invade Hungary, which was under the rule of his old enemy King Sigismund. In 1424, civil war having again broken out in Bohemia, Žižka decisively defeated the Praguers and Utraquist nobles at Skalic (Jan. 6), and at Malesov (June 7). In September he marched on Prague, but on the 14th of that month peace was concluded between the Hussite parties who agreed to make a combined attack on Moravia, part of which was still held by Sigismund's followers. Žižka was given the command, but before reaching the frontier, he died of the plague at Pribyslav (Oct. 11, 1424).

See Count Lützow, *Bohemia: an Historical Sketch (1896)*; Louis Léger, *Jean Žižka* in *"Nouvelles études Slaves," deuxième série (1886).*

ZLATOUST, a town in the Chelyabinsk *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., 1,925 ft. above sea level on the Ai, a tributary of the Cia, in 55° 10′ N., 59° 40′ E., on the Ufa-Chelyabinsk railway. Pop. (1959) 161,000. The town has smelting works and manufactures machinery; there is a meteorological and magnetic observatory.

ZLOTY, post-war monetary unit of Poland. Following the collapse of the Polish mark, instituted immediately after World War I, the zloty was substituted in 1924. It was then made equivalent to the gold franc, at a parity of 25.22 zlotys to the pound sterling, and was backed partly by gold and gold exchange, and partly by other forms of security. Events soon showed that the new currency had been introduced before the country was ready to support it, and during 1925 and 1926 renewed depreciation set in. In 1927 a second attempt at stabilization was made. A foreign stabilization loan was issued, and the proceeds used to give a gold exchange backing to the new zloty, the value of which was fixed at 43.38 to the £1 sterling; in 1938 it fluctuated between $24\frac{1}{4}$ and $26\frac{3}{4}$ to the £1. In 1950 the Zloty was greatly devalued and put on a par with the Russian ruble. (See CURRENCY.)

ZNOJMO (Znaim), in Brno region, Czech. A settlement is believed to have existed here from prehistoric time. The present town was founded in 1226 on the site of the old capital, destroyed in 1145. Lying at the junction of old granites and tertiary strata Znojmo manufactures clay products and stoneware. It is also famous for its extensive fruit and vegetable farms, which supply bottling factories. Among its old buildings are a 12th century Romanesque castle chapel (the Heiden-Tempel), a 14th century Gothic church and a 1jth century town hall with Gothic tower (250 ft.). Population (1950) 21,696.

ZOBEIR RAHAMA (1830–1913), Egyptian pasha and Sudanese governor, came of the Gemaab section of the Jaalin, and was a member of a family which claims descent from the Koreish tribe through Abbas, uncle of Mohammed. He was the most energetic and intelligent of the Arab ivory and slave traders who about 1860 established themselves on the White Nile and in the Bahr-el-Ghazal. Nominally a subject of Egypt, he raised an army of several thousand well-armed blacks and became a dangerous rival to the Egyptian authorities. At the height of his power Zobeir was visited (1871) by Georg Schweinfurth, who found him "surrounded with a court which was little less than princely in its details" (Heart of Africa, vol. ii, chap. xv). In 1869 an expedition sent from Khartum into the Bahr-el-Ghazal was attacked by Zobeir and completely defeated, its commander being slain. Zobeir represented that he was blameless in this matter, received a "pardon," and was himself appointed governor of the Bahr-el-Ghazal, where he was practically independent. In 1873 he attacked the sultan of Darfur, and the khedive Ismail gave him the rank of bey and sent troops to co-operate. After he had conquered Darfur (1874), Zobeir was made a pasha, but he demanded the governor-generalship of the new province, and went to Cairo in the spring of 1876 to press his title. The Egyptian authorities prevented his return, though he was allowed to go to Constantinople at the outbreak of the Russo-Turkish War. In 1878, however, his son Suleiman, having got possession of the Bahr-el-Ghazal, defied the authority of General Gordon, the new governor-general. Gordon sent Romolo Gessi against Suleiman and his ally Rabah (*q.v.*). Suleiman was subdued after an arduous campaign and executed.

During the campaign Zobeir offered, if he were allowed to return to the Sudan, to restore order and to pay a revenue of £25,000 a year to the khedive. Gordon declined this help, and subsequently, for his instigation of the revolt, Zobeir was condemned to death, but the trial was a farce, the sentence was remitted, and he remained at Cairo, now in high favour with the khedival court. In March 1884, Gordon, who had been sent to Khartum to effect, if possible, the relief of the Egyptian garrisons in the Sudan, astonished Europe by requesting that Zobeir, whose son he had overthrown and whose trade he had ruined, should be sent to Khartum as his successor. Zobeir, described by Sir Reginald Wingate, who knew him well, as "a quiet, far-seeing, thoughtful man of iron will—a born ruler of men" (*Mahdiism and the* Egyptian *Sudan,* book v.), might have been able to stem the mahdist movement. But to reinstate the notorious slave-dealer was regarded in London as too perilous an expedient, even in the extreme circumstances then existing, although Colonel Stewart (Gordon's companion in Khartum), Sir Evelyn Baring and Nubar Pasha in Cairo, and Queen Victoria and Mr. Gladstone, all favoured such a course. In March 1885 Zobeir was arrested in Cairo by order of the British government for treasonable correspondence with the mahdi and other enemies of Egypt, and was interned at Gibraltar. In August 1887 he was allowed to return to Cairo, and after the reconquest of the Sudan was permitted (1899) to settle in his native country. He established himself on his estates at Geili, some 30 m. N. of Khartum, where he died on Jan. 5, 1913.

See GORDON, CHARLES GEORGE, and the authorities there cited.

ZODIAC, in astronomy and astrology a zone of the heavens within which lie the paths of the sun, moon and principal planets. Since the orbits of the planets deviate only slightly from a common plane, an observer on earth sees these celestial bodies moving in a narrow zone of the celestial sphere. The various configurations of the fixed stars were grouped at least as early as 3.000 B C. in Mesopotamia into constellations representing certain objects or animals like the raven, serpent, goat, etc. Since the majority of the constellations which were crossed by the paths of the planets represented animals, the Greeks called this zone *zōdiakos* kyklos, "circle of animals," or *ta zōdia,* "the little animals "

Originally neither the boundaries nor the number of the "zodiacal" constellations was accurately fixed. Some time before the Hellenistic period the development of a mathematical astronomy in Mesopotamia resulted in accurate definitions. The "zodiacal signs," numbering 12, became equal arcs of the apparent orbital circle of the sun, the ecliptic. Their names, taken from the neighbouring constellations, are

Aries, the Ram	♈	Libra, the Balance	♎
Taurus, the Bull	♉	Scorpio, the Scorpion	♏
Gemini, the Twins	♊	Sagittarius, the Archer	♐
Cancer, the Crab	♋	Capricornus, the Goat	♑
Leo, the Lion	♌	Aquarius, the Water Carrier	♒
Virgo, the Virgin	♍	Pisces, the Fishes	♓

The history of the symbols is unknown; they seem to appear first in Greek manuscripts of the late middle ages.

In Babylonian astronomy the boundaries of these 12 signs were defined in such a fashion that the vernal equinox fell in the tenth or in the eighth degree of the first sign. Greek astronomers, however, changed these definitions. Eudoxus of Cnidus (about 360 B.C.) supposedly placed the equinoxes in the middle of the signs. Hipparchus (about 150 B.C.) placed them at the beginning and this practice remains standard in mathematical astronomy: celestial longitudes are counted from the "first of Aries" (0° Aries) eastward. This point is defined by the intersection of ecliptic and equator. Since precession moves this point slowly westward: 'the zodiacal signs counted from the vernal point lost more and more their original relation to the constellations. At present the first of Aries lies in the constellation of Pisces.

The concept of the zodiac and its pictorial representation reached Egypt early under Greek domination (3rd century B.C.). Here it amalgamated with the native sequence of constellations, the so-called 36 decans, each of which came to mean exactly one-third of a zodiacal sign. At about the same time there occurred the rapid development of astrological doctrines which combined Babylonian, Egyptian and Greek elements into one gigantic system of theories about powers of the celestial bodies and their mutual relations to the parts of the zodiac. In this Hellenistic form, the astrological concepts related to the zodiac spread to Rome. then to Byzantium and India. from where they returned, often with new additions, to the Islamic and Christian West. Their role in art and literature became particularly great in the Italian Renaissance. See ASTROLOGY; ASTRONOMY: *Ancient Astronomy: Mesopotamia; Modern* Descriptive *Astronomy*: The *Seasons*. (O. E. N.)

ZODIACAL LIGHT, a band of light in the night sky concentrated along the zodiacal circle referred to by astronomers as the ecliptic. It is seen in the west after twilight and in the east before dawn. It is easily visible in the tropics where the ecliptic is approximately vertical to the horizon. In mid-northern latitudes. it is best seen in the evening in February and March and in the morning in September and October.

The zodiacal light can be followed visually along the ecliptic from a point 30° from the sun to about 90°. Photometric measurements indicate that the band continues along the ecliptic to the region opposite the sun where a slight enhancement called the gegenschein (*q.v.*), or counterglow, is again visible. It is now known that there is some zodiacal light in all parts of the sky, even at the poles of the ecliptic; a part of the coronal light during a solar eclipse is actually the inner part of the zodiacal light. One degree from the limb of the sun its intensity is about 10.000 times as bright as the brightest region observable after twilight, but this intense coronal zodiacal light cannot be observed in the daytime because it is overwhelmed by the scattered light in the day sky. Outside the earth's atmosphere, the zodiacal light would be visible nearly to the surface of the sun.

Zodiacal light probably is the reflection of sunlight from a swarm of meteoric particles concentrated in the plane of the ecliptic. Its measurement at angles greater than 90° from the sun indicates that the swarm extends beyond the earth's orbit. A small part of the zodiacal light is thought to be due to an electron cloud which has a concentration of about 1,000 electrons per cubic centimetre near the earth. The general physical picture suggested is that of a spindle-shaped swarm of meteoric particles concentrated near the fundamental plane of the solar system. Such particles would melt close to the sun and so the concentration probably starts at about $\frac{1}{10}$ astronomical unit. Very small dust particles. smaller than 0.001 mm. in diameter, are blown out of the solar system by radiation pressure; for larger particles. there is a spiraling in toward the sun which in astronomical time would sweep the region free. To maintain the particle swarm against the depletion of radiation pressure and loss by spiraling requires the addition of approximately one ton of dust per second. Possible sources of the dust are the fragmentation of asteroids by collision and the disintegration of comets. (F. E. R.)

ZOFFANY (ZOFFANJI or ZAFFANII, perhaps originally ZAUFFELY), **JOHN** (JOHANN) (1734–1810), Anglo-German painter of portraits, conversation pieces and theatrical scenes, was born in Frankfurt-on-Main and studied in Italy. He went to England about 1761, exhibiting at the Society of Artists from 1762 to 1769 and at the Royal Academy (of which he became a founder-member) from 1770 to 1800. In 1772, at the expense of George III, he went to Florence, returning to England in 1779. From 1783 to 1789 he was in India, where he painted many portraits. His first success was "Garrick in 'The Farmer's Return' " (1762), as a result of mhich he painted a number of scenes of the theatre, many including portraits of David Garrick. The invention of this genre may be due to Zoffany, following a lead given by William Hogarth (*q.v.*).

Among his best-known works are "Queen Charlotte and the Two Eldest Princes" (*c.* 1766), "The Members of the Royal Academy" (1772) and "The Tribuna of the Uffizi Gallery, Florence" (1772–80), all in the royal collection; "Mrs. Oswald" (*c.* 1770). a life-size full-length portrait (exceptional for Zoffany) in the National gallery. London; "Charles Towneley Among His Marbles" (1790) in Burnley (Lancashire) art gallery. Others are in the National Portrait gallery, London, at Edinburgh, Glasgow, Birmingham, Oxford. in the Garrick club, London. and elsewhere. Zoffany died at Strand-on-the-Green, Middlesex, on Nov. 11. 1810.

See Lady Victoria Manners and G. C. Williamson, John *Zoffany* (1920) ; E. K. Waterhouse, *Painting* in *Britain* 1530–1790, ch. 24 (1953). (P. J. MY.)

ZOG I (AHMED BEY ZOGU) (1895–1961), king of the Albanians from 1928 to 1939. was head of the Zogolli, one of the four ruling families of the Mati district. Born in the castle of Burgajet on Oct. 8, 1895. the son of Jemal Pasha. he was educated at a military school at Monastir (Bitola) and in Constantinople. He first distinguished himself as a supporter of the prince of Wied in 1914. During World War I he fought for the Austrians. He became minister of the interior (Jan.–Nov. 1920) and organized resistance to the Yugoslav incursions during the autumn. He was commander in chief of the national forces under the "Sacred Union" cabinet (Oct.–Dec. 1921). and again distinguished himself against the Yugoslavs. As minister of the interior in Jafer Ypi's cabinet (Dec. 1921–Dec. 1922), he suppressed a serious insurrectionary movement in March 1922 and disarmed the lowlanders. Becoming prime minister in Dec. 1922, he governed with ability, pursuing a sound anti-irredentist and constructive policy. Toward the end of 1923 he was accused by the Democratic party of obstructing various progressive and agrarian reforms. After an attempt on his life. he resigned in Feb. 1924. but his influence remained. A revolt against him and his colleagues took place in June, and he sought refuge in Yugoslavia. But skilfully turning Yugoslav policy to his own advantage. he returned to Albania in Dec. 1924 and ousted his successor. Bishop Fan Koli. His election as president of the Albanian republic on Feb. 1, 1925. ushered in a period of internal tranquillity. He was proclaimed king at Tirane on Sept. 1. 1928. On April 27. 1938. he married Countess Geraldine Apponyi of Hungary. A son. Leka. was born to them on April 5. 1939. Three days later, on the Italian occupation of Albania, the king and queen became exiles in Greece. Later they went to France and in 1940 to Great Britain. From London Zog encouraged a national underground movement in Albania. but his hopes mere dashed by the establishment of a people's republic by Enver Hoxha. Zog left London for Cairo in Feb. 1946. He next moved to New York and later to Cannes, France. He died in Paris on April 9, 1961.

ZOÏLUS (*c.* 400–320 B.C.), Greek grammarian of Amphipolis in Macedonia. Zoïlus appears to have been at one time a follower of Isocrates, but subsequently a pupil of Polycrates.

Zoi'lus was chiefly known for the acerbity of his attacks on Homer (which gained him the name of Homeromastix, "scourge of Homer"), chiefly directed against the fabulous element in the Homeric poems. Zoïlus also wrote against Isocrates and Plato, who had attacked the style of Lysias of which he approved.

ZOISITE, a rock-forming mineral of the epidote (*q.v.*) group, composed of calcium aluminum silicate, is a characteristic product of metamorphism, and of hydrothermal alteration of igneous rocks. In rocks rich in plagioclase, such alteration may produce saussurite, a mixture in which zoisite is the predominant mineral and which is characteristic of gabbro (*q.v.*). The usual colour is white or gray, the hardness is 6.j and the specific gravity 3.3. The formula is $Ca_2Al_3(OH)(SiO_4)_3$, and it crystallizes in the orthorhombic system. Crystals are usually prismatic, deeply striated parallel to their length, and have a perfect cleavage [010]. Normal zoisite has the optic plane parallel to the cleavage, while in zoisite containing more than 5% of iron replacing aluminum, a marked change in optical properties occurs. The optic plane becomes [001] and the refractive indices and the birefringence are higher. Substitution of manganese lowers the indices and gives the variety thulite. pink in colour and strongly dichroic. Thulite occurs at Telemark, Nor., and in the Piedmont region, Italy. Zoisite is not so common as clinozoisite and epidote. Its close relationship to these two monoclinic minerals of the epidote group is revealed if the crystallographic orientation of zoisite is changed so that the cleavage is basal [001] and the prism zone made parallel to the *b* axis. (L. S. RL.; X.)

ZOLA, ÉMILE ÉDOUARD CHARLES ANTOINE (1840–1902), French novelist, was born in Paris on April 2, 1840, his father being an engineer, part Italian and part Greek; and his mother a Frenchwoman. The father seems to have been an energetic, visionary man, who, dying while his only son was a little lad, left to his family no better provision than a lawsuit against the municipality of the town of Aix. It was at Aix, which figures as Plassans in so many of his novels, that the boy received the first part of his education. Thence he proceeded, in 1858, to Paris. His first book, *Contes à Ninon,* appeared on Oct. 24, 1864, and attracted some attention, and in Jan. 1866 he determined to abandon clerking and take to literature. Vigorous and aggressive as a critic, his articles on literature and art in Villemessant's paper *L'Événement* created a good deal of interest. So did the gruesome but powerful novel, *Thérèse Raquin* (1867). Meanwhile, with characteristic energy, Zola was projecting something more important: the creation of a world of his own, like that of Balzac's *Comédie Humaine*—the history of a family in its various ramifications during the Second Empire. The history of this family, the Rougon-Macquart, was to be told in a series of novels containing a scientific study of heredity—science was always Zola's *ignis fatuus*—and a picture of French life and society. The first novel of the series, *La Fortune des Rougon,* appeared in book form at the end of 1871. It was followed by *La Curée* (1874), *Le Ventre de Paris* (1874), *La Conquête de Plassans* (1875), *La Faute de l'Abbé Mouret* (1875), *Son Excellence Eugène Rougon* (1876)—all books unquestionably of immense ability, and in a measure successful, but not great popular successes. Then came *L'Assommoir* (1878?), the epic of drink, and the author's fortune was made. Edition followed edition. He became the most discussed, the most read, the most bought novelist in France—the sale of *L'Assommoir* being even exceeded by that of *Nana* (1880) and *La Débâcle* (1892). From the *Fortune des Rougon* to the *Docteur Pascal* (1893) there are some 20 novels in the *Rougon-Macquart* series, the second half of which includes the powerful novels *Germinal* (1885) and *La Terre* (1888). In 1888 Zola departed from his usual vein in the idyllic story of *Le Rêve*. Zola also wrote a series of three romances on cities. *Lourdes, Rome, Paris* (1894–98), novels on the "gospels" of population (*Fécondité*) and work (*Travail*), a volume of plays, and several volumes of criticism.

Zola played a very important part in the Dreyfus affair, which convulsed French politics and social life at the end of the 19th century. At an early stage he came to the conclusion that Dreyfus was the innocent victim of a nefarious conspiracy, and on Jan. 13, 1898. with his usual intrepidity, he published in the *Aurore* newspaper, in the form of a letter beginning with the words *J'accuse,* a terrible denunciation of all those who had had a hand in hounding down that unfortunate officer.

Zola's object was a prosecution for libel, and a judicial inquiry into the whole *affaire,* and at the trial, nhich took place in Paris in February, a fierce flood of light was thrown on the case. The chiefs of the army put forth all their power, and Zola was condemned. He appealed. On April 2, the Cour de Cassation quashed the proceedings.

A second trial took place at Versailles, on July 18, and without awaiting the result Zola, by the advice of his counsel and friends, and for reasons of legal strategy, abruptly left France and took refuge in England. Here he remained in hiding, writing *Fécondité,* until June 4, 1899, when, immediately on hearing that there was to be a revision of the first Dreyfus trial, he returned to Paris.

On the morning of Sept. 29, 1902, Zola was found dead in the bedroom of his Paris house, having been accidentally asphyxiated by the fumes from a defective flue. He received a public funeral, at which Captain Dreyfus was present. Anatole France delivered an impassioned oration at the grave. At the time of his death Zola had just completed a novel, *Vérité,* dealing with the incidents of the Dreyfus trial. A sequel, *Justice,* had been planned, but not executed. Zola's literary position would have more than qualified him for the French academy. He was several times a candidate in vain. (F. T. M.)

ZOLLVEREIN: *see* ECONOMIC UNION; TARIFFS and GERMAN~:*History*.

ZOMBA, the capital of Nyasaland protectorate, was established in 1885 on the lower slopes of Zomba mountain, 3,141 ft. above sea level. near the great slave route which ran from the southern end of Lake Nyasa to the Mozambique coast. The wet season, which follows the hottest months (maximum temperature 97° F.), is from November until March and the coldest months are May, June and July, when the temperature may fall to 40° F. Pop. (1956) 9,331, of which 5,270 were employed African, 800 European and 530 Asian. Area 2.72 sq.mi. Shortly after its establishment, Zomba became the recognized seat of the government. It was proclaimed a township in 1900, lost this status in 1932 and was reconstituted as a township in 1934. The old residency, completed in 1887, was designed to provide fortification against attack by slave raiders. It still stands by the Mulungusi river on the perimeter of the botanical gardens and is used as a hostel for government officers. Adjacent are the government secretariat (rebuilt in 1922) and the legislative council building (1957). There are a European kindergarten school and African and European hospitals. Zomba lies 42 mi. by tarred road northeast of Blantyre and its nearest railway station is at Limbe, about 37 mi. to the southwest. There is also a small airfield about g mi. from Zomba. Most of the town's inhabitants are employed by the government, but many work on the dairy farms and tobacco plantations in the surrounding district,

ZONARAS, JOHN (fl. 1st half of the 12th century), Byzantine historian who provides valuable information on the 11th century. After holding high office in Constantinople under Alexius I Comnenus, he became a monk and retired to a remote island. His world history extends from the creation to 1118. He drew on a rich collection of sources, of which some, notably the first 21 books of Dio Cassius' history, are preserved only through him. A *Lexicon* and theological writings are also attributed to him.

ZONING. Zoning is the legislative method of controlling the use of land through establishment of standards and requirements concerning the use of land and buildings, the proportion of the lot to be covered by them and the density of population. Primarily applied in urban areas, it is accomplished by division of the city or county land area into zoning districts, each having specific conditions under which land and buildings may be legally developed and used. Inspired by architectural and urban-design controls introduced in European cities toward the end of the 19th century, it has grown in breadth and evolved to become a major arm of the general process of city planning in the United States.

Zoning of this kind is perhaps more widely accepted in the cities of the United States than elsewhere. Its acceptance has come about through constitutionally based interpretation of the state's police power—the power of regulation in the interests of protecting public health, safety and general welfare. The evolution of zoning in the United States has been away from strict architectural and site-planning controls toward regulation of the social functions to which land and buildings are put. Another important development has been toward the establishment of a rational balance between amounts of land for various urban activities, and their distribution in relation to market forces and systems of transportation and vehicular circulation, in the interests of a more comprehensive and creative approach to city planning. While not alone an answer to urban growth problems, it is, combined with other city-planning techniques, a major instrument for gaining greater physical order in cities.

Zoning in European Cities.—In accordance with long-established municipal powers, German and Swedish cities applied zoning regulations about 1875 to new land being urbanized around the older city cores, as a way of controlling the heights and concentrations of buildings to avoid problems of congestion. The German laws were particularly rigid and widespread. and led to a greater spaciousness and uniformity of development than would have occurred under earlier, more primitive building regulations. Much of the orderliness of German and Swedish cities, and the consistent quality of building line and height which is so apparent in contrast with typical U.S. cities, is due to the early establishment of detailed zoning regulations and their widespread application at the time of major building activity growing out of the Industrial Revolution. The detailed site planning by public agencies in advance of development that is typical of northern European cities tends to obviate the need for the kind of zoning legislation developed in the United States.

England.— England's development of zoning regulations stems from the passage of the Town Planning act in 1909, which had for its general object the control of urbanization of new land. Relating almost solely to new building development, and coming at a later date than in Germany, the English law was not as effective in achieving architectural control in the more centrally located sections of cities. The emphasis in the restrictions imposed in the 1909 law, as stated in the original act, was on "securing the amenity of the area," in addition to regulating space, height or character of buildings. These early British zoning regulations, while somewhat effective in controlling industrial locations and in establishing standards for residential development, have been supplanted by more direct government action in new towns and public housing construction and control of development rights.

Latin America.— Few Latin-American cities passed zoning laws based on early European experience. The strong cultural ties with Spain discouraged a flow from other countries of practices related to urban affairs. and Spain, lacking the widespread urban expansion of northern European countries, had only limited experience with zoning. Latin-American cities, on the other hand. were undergoing tremendous growth about the turn of the 20th century. and could well have profited by the German and British experience. During the 1920s, however, many of the larger cities in Latin America began city-planning programs and introduced limited regulations on building height and intensity. patterned somewhat after those of Europe. Thereafter. city growth continued at such a pace and on such a wide scale that the early ordinances primarily governing building design proved insufficient to provide the necessary control over land and building uses. Generally speaking. Latin-American cities in the latter 1950s still had not adopted zoning ordinances that adequately met their particular problems of urban development.

The United States.— In the United States, particularly in California, the need for regulating urban activities that under certain conditions were nuisances, such as the operation of commercial laundries or brickyards, first motivated the early ordinances around the turn of the 20th century. Two cases involving these businesses came before the courts in 1911 and 1915, and out of them grew the acceptance of municipal control over the location of nuisance-creating activities. Meanwhile, in New York city, problems directly related to the height and form of buildings and extent of land coverage gave rise to the passage in 1916 of the first comprehensive zoning ordinance. The New York ordinance went far beyond this "nuisance theory" of zoning, adding to it the idea of architectural control of building form to assure that skyscrapers did not usurp their neighbour's light and air. It also established the basic principle underlying contemporary zoning throughout the United States—the "planning concept of zoning," which views zoning as a positive means of promoting the welfare of the community by guiding physical growth along orderly lines. Accordingly, zoning regulations should be provided consistently throughout all areas of a city and covering all possible types of land uses. In this sense zoning has become a major instrument in the guidance of physical development of private land and the implementation of long-range municipal policies.

An important step in furthering comprehensive zoning was the appointment of the Advisory Committee on Zoning in 1921 by the then secretary of commerce. Herbert Hoover; the model zoning ordinance drafted by this committee was widely adapted. Many states followed its and New York's example. and passed enabling acts to permit cities to establish such zoning ordinances. Among early significant court decisions upholding the ordinances in specific lawsuits brought against the cities by individuals who were affected were the *Lincoln Trust Co. v. Williams Building Corp.* decision. which upheld in 1920 the New York ordinance applying the "nuisance theory"; the case of *Carter v. Harper*, in 1923 in Wisconsin, which clearly set forth a concept of planning behind zoning; and the *Village of Euclid v. Ambler Realty Co.* case in 1926, which was the first decision of the U.S. supreme court on the constitutionality of a comprehensive zoning ordinance.

Accepted almost universally in the United States are the following objectives of zoning: reduction of fire hazards, control of congestion in houses and neighbourhoods, assurance of light and air for comfort and health. conservation of stability of property values, consolidation of commercial districts, provision for off-street parking, control of height and bulk of buildings. position on the lot and. indirectly. control of density of population. Areas of control in which there was experimentation in the latter 1950s included zoning for exclusive agricultural and related land uses to prevent urban sprawl. refinements of proportioning and locating land uses in relation to market forces. greater flexibility to relieve the hardships and monotony caused by some of the earlier arbitrary zoning patterns and restrictions. provision for combining various related land uses in planned unit developments, the offering of incentives for better site design and development standards through award of bonus allowances for floor area in relation to lot size. the concept of zoning by performance standards rather than strictly by permitting or excluding certain specified types of activities and possibilities of zoning for improving the appearance of cities.

Zoning has inherent in it certain limitations. It cannot shape new areas or reshape old ones without other instruments for carrying out official general plans, such as urban redevelopment, subdivision regulations, capital improvement programing and the design and construction of influential public works. Yet, it is an instrument of great potentiality in systematizing urban development, providing a better functional and aesthetic order and, particularly, in carrying out general plans for cities in all parts of the world. *(See* also HOUSING; CITY PLANNING.)

ZOO: *see* ZOOLOGICAL GARDENS.

ZOOGEOGRAPHY is the study of the geographical distribution of animals. It is concerned with where different animals are on the earth, how they got where they are, how and why geographical patterns have been formed, and what the patterns mean. The study is important since patterns of animal distribution suggest, among other things, fundamental concepts about evolution, about the distribution of land and water and sometimes about climates thousands or even millions of years ago.

A distinction should be made between the zoogeographical and ecological approaches to animal distribution. Zoogeography is concerned with broad geographical patterns; ecology, with local details of distribution and with animals' relations to their environments *(see* ECOLOGY, ANIMAL; ANIMALS, DISTRIBUTION OF). For example, grazing mammals occur in Africa and Australia (as well as elsewhere). How they are adapted for eating grass, and how the distribution of grasses limits the distribution of the different grass eaters in different places are concerns of ecology. But in Africa the grass eaters are zebras and antelopes. etc., and in Australia they are kangaroos; these facts and their explanation are concerns of zoogeography. Although zoogeographers understand the importance of the environment, they usually consider it in a rather general way, in terms of climatic zones and broad areas of forests and deserts; ecologists, on the other hand, are more concerned with local factors and "microclimates." Ultimately, zoogeography utilizes ecology; however, it draws on ecological principles more than on details.

This article is divided into the following sections:

I. HISTORY

Historically, men always have been interested in the distribution of animals they hunted or feared. Zoologists of the 18th and early 19th centuries worked out the broad patterns of distribution of conspicuous vertebrates; however, explanation of the patterns was not possible until Darwin's proof of evolution. In 1858, the year before Darwin published the *Origin of Species*, P. L. Sclater accurately described and analyzed the distribution of birds and divided the world into faunal regions that are still recognized *(see* below), but he thought the regions represented separate "centres of creation." Darwin supplied the true explanation of them, based on evolution.

Geologic Column and Scale of Time Since Triassic

(Ages increase from top downward, as in a sequence of sedimentary rocks)

System and Period	Series and Epoch	Distinctive Records of Life	1000 Years*
		CENOZOIC ERA	
Quaternary	Recent	Modern man	*11*
			>44
	Pleistocene	Early man	1,000
Tertiary	Pliocene	Large carnivores	
	Miocene	Whales, apes, grazing forms	(21,000)
	Oligocene	Large browsing mammals	
	Eocene	Rise of flowering plants	(58,000)
	Paleocene	First placental mammals	70,000
		MESOZOIC ERA	
Cretaceous		Extinction of dinosaurs, floras with modern aspects	130,000
Jurassic		Dinosaurs' zenith, primitive birds, first small mammals.	160,000
Triassic		Appearance of dinosaurs	200,000

*Italicized figures are from radiocarbon analyses; figures in parentheses are reliable values from radioactive minerals found in rocks that belong in time divisions indicated; plain figures give estimated dates at start of corresponding time units.

Zoogeography and the discovery and proof of evolution are very closely connected. During the voyage of the "Beagle," Darwin found at different localities and in different habitats in South America species of animals which, though different, were basically alike, as if they had evolved in different parts of South America from common ancestors (as of course they had). And on the Galapagos Darwin found species different from but basically similar to South American species, as if the Galapagos species had evolved from South American ancestors; he also found slightly different species on different islands of the Galapagos archipelago, as if evolution had made many local modifications of a few original stocks. It was these observations more than anything else (although he had other evidence) that first convinced Darwin himself that species had evolved.

Later, having proved the fact of evolution partly by patterns of distribution of animals, Darwin was able to explain the patterns. He showed that they were made by evolution of different animals in different places, and by some of the animals spreading from the places where they first evolved into other parts of the world. Darwin's two chapters on "Geographical Distribution" in the *Origin of Species* are not only historically important but are still pertinent and fascinating essays on zoogeography.

Alfred Russel Wallace, the co-discoverer with Darwin of evolution by natural selection, also deduced the fact of evolution primarily from what he saw of animal distribution, especially in the Malay archipelago. Wallace is recognized as the great zoogeographer. He formally organized the subject in a two volume work, *The Geographical Distribution of Animals*, in 1876. Darwin and Wallace laid the foundations of the subject. Since their time much has been added to the body of facts, but little has been added to the original principles, though zoogeographers are still confirming and extending them.

Zoogeography is of necessity concerned primarily with vertebrates, because they are the best-known animals and because some of them have left revealing fossil records. Therefore, the principles of zoogeography have been worked out primarily by vertebrate evidence. Once formulated, the principles can then be re-examined and tentatively extended to invertebrates, though this has not been done extensively. Since fresh-water fishes, amphibians and mammals have sharply defined and very informative patterns of distribution (mammals especially have an unequaled fossil record), these classes of vertebrates will be specially stressed. Reptiles and birds will be treated more briefly. Distribution on land and in fresh water will be considered first, then distribution in the sea.

The facts of animal distribution can be presented in two ways. The distributions of different groups of animals, (fishes, amphibians, reptiles, etc.) can be treated separately; Wallace called this "geographical zoology." On the other hand, the world can be divided into regions according to animal distribution, and the regions can be treated separately; Wallace called this "zoological geography." It is logical to begin with the distributions and histories of separate groups, and then to divide the world into faunal regions and consider the compositions and histories of the different regional faunas. In the following discussion, the phrase "the main part of the world" is synonymous with the realm Megagea (see Faunal Regions below), which includes Africa, tropical Asia (with adjacent islands), Eurasia and most of North America (except tropical Mexico).

II. THE DISTRIBUTION OF ANIMAL GROUPS

1. Fresh-Water Fishes. — For zoogeographic purposes, fishes that occur in fresh water are placed in three divisions, according to G. S. Myers (1938) : primary, secondary and peripheral.

The primary division consists of families or other groups of fishes that are strictly confined to fresh water. that ordinarily cannot or do not enter the sea, and that have probably been confined to fresh water so long that their present distributions are wholly the result of dispersal through fresh water.

The secondary division consists of families or other groups of fishes that are found chiefly in fresh water but that can enter the sea and survive there for a limited time, or are recently descended from fishes that could do so, so that their distributions may be partly the result of dispersal along coasts or across narrow ocean gaps.

The peripheral division consists of families or other groups that, although found in fresh water, enter the sea freely or have been so recently derived from marine ancestors that their distributions may be largely the result of dispersal through the sea.

Fresh-water fishes of the primary division are as closely confined to land masses as any animals and are therefore very significant in zoogeography.

Existing primary-division fishes are bichirs (Polypteridae), in Africa; paddlefish (Polyodontidae), in China and eastern North America; bowfin (Amiidae), in eastern North America; lungfish (Ceratodontidae), in Australia and (Lepidosirenidae) in Africa and South America (the fishes listed thus far are relicts of old, nonteleost groups): Isospondyli (of half a dozen families) in Africa, mooneyes (Hiodontidae) in eastern North America, and Osteoglossidae widely scattered in the tropics (the osteoglossids are placed in the primary division with doubt) ; Ostariophysi (see below), dominant on all continents except Australia; mud minnows (Umbridae), blackfish (Dalliidae), and pikes and pickerels (Esocidae) in temperate Eurasia and North America; trout perches (Percopsidae) and pirate perches (Aphredoderidae) in North America; and (of spiny-rayed teleosts) fresh-water basses (Centrarchidae) in North America, true perches (Percidae) in temperate Eurasia and North America, Nandidae widely scattered in the tropics, Pristolepidae in tropical Asia, and three families of labyrinth fishes (Anabantoidea) and the spiny eels (Mastacembelidae) in tropical Asia and Africa.

Existing secondary-division fishes are gar pikes (Lepisosteidae) in eastern North America and Central America; top minnows and viviparous minnows (Cyprinodontes, several families) in the warmer parts of Eurasia, Africa and especially the Americas; and Cichlidae in Africa, etc., and tropical and subtropical America.

Peripheral fresh-water fishes include lampreys (Petromyzonidae), sturgeons (Acipenseridae), salmon and trout (Salmonidae), fresh-water eels (Anguillidae) and sticklebacks (Gasterosteidae), all of which occur in temperate Eurasia and North America (some of them elsewhere too) ; and other groups too numerous to list, in all parts of the world.

2. Distribution **of** Fresh-Water Fishes. — Fresh-water fishes of the primary division are virtually confined to the great continents and islands that have recently been connected to the continents. Few or none of these fishes reach old or remote islands (in this article Australia is considered an island). A species of lungfish is localized in southern Queensland, but it is a relict of a very old group, whose unknown remote ancestors may have reached Australia through the sea. One other Australian fish (an osteoglossid) has been placed in the primary division, but it may be derived from a salt-toleranc ancestor that reached Australia more recently through the sea. All other Australian fresh-water fishes are certainly derived from marine or salt-tolerant ancestors that have entered Australian rivers from the sea.

The geographical limits of primary-division fish faunas are very sharply defined. Many Asiatic primary-division fishes reach Sumatra, Java and Borneo (which were attached to Asia during relatively recent geologic time), but none extends across Makassar strait to Celebes (except two or three species probably carried by man), and only a few, mostly small, perhaps slightly salt-tolerant forms extend east of Java (to the Lesser Sunda Islands) or east and north of Borneo (to the southern Philippines). Elsewhere in the world, many primary-division fishes reach the British Isles, Ceylon, Formosa, Japan and (off the northeast coast of South America) Trinidad; these are all recent continental islands which were separated from adjacent continents probably not more than 10,000 years ago.

Although primary-division fishes are numerous in Africa, none occurs on Madagascar, and although they are numerous in both North and South America, none occurs on the West Indies proper (zoogeographically, Trinidad is part of South America, not one of the West Indies). Madagascar and the West Indies as well as the islands from Celebes to Australia have evidently not been connected to the great continents during the dispersal of most existing primary-division fishes.

Secondary-division fishes, which have enough salt tolerance to cross narrow ocean barriers, do reach Madagascar, some of the West Indies and Celebes. Moreover, secondary-division fishes are relatively numerous in Central America, where primary-division fishes are relatively few. This fact suggests that Central America was either an island or a peninsula difficult for fresh-water fishes to reach not long ago.

Although salt-water barriers determine the final limits of distribution of true fresh-water fishes, climate is an additional limiting factor for many groups. Some great groups of fresh-water (as well as marine) fishes are confined to the tropical zone or nearly so. Characins, for example, are primary-division freshwater fishes (including the carnivorous piranhas and many small aquarium fishes) which are numerous in tropical Africa and South America. They scarcely enter the north temperate zone (one extends north to the Rio Grande in North America) and do not even reach the northern edge of the south temperate zone of Africa and South America (below the tropics). Fresh-water (primary division) catfishes, composing another chiefly tropical group, are abundant in the tropics of Asia, Africa and America, and relatively sparse in the temperate zones. Some catfishes do occur in eastern North America — there are nearly 20 species in the Mississippi — but this is exceptional. Most temperate regions have few species or none, whereas (for comparison) more than 450 species are known from the Amazon.

Some other fresh-water fishes (and some marine fishes) are confined to the north temperate zone or nearly so. The pikes and pickerels and the true fresh-water perches are strictly freshwater families which are widely distributed across temperate Eurasia and North America but do not enter the tropics. The distribution of salmon and trout shows the limiting effect of zonal climate even more plainly. Salmonids, which occur in numbers in cool fresh waters around the north temperate zone, extend south to the southern edge of the temperate zone in Africa and in the northwestern corner of Mexico but do not enter the tropics. Since they are peripheral fishes, many of which spend parts of their lives in the sea, they are clearly limited by zonal climate rather than by physical barriers.

Besides salt-water barriers and zonation of climate, one other thing has had a profound effect on the present pattern of distribution of fresh-water fishes, and that is the evolution and dispersal of dominant groups. About seven-eighths of all existing primary-division fresh-water fishes belong to one dominant order, Ostariophysi. This order is divided into two suborders. Cyprinoidea or carplike fishes and Siluroidea or catfishes. The cyprinoids in turn are divided into two principal superfamilies: Characiformes, the characins (see above) and their allies; and Cypriniformes, which include the suckers (Catostomidae), carps and most fresh-water minnows (Cyprinidae) and allied families.

The Ostariophysi as a whole are now dominant in fresh water on all continents except Australia (some catfishes occur in Australian rivers, but they are derived from stocks that have entered, and still occur in, the sea and that have re-entered fresh water in Australia and other isolated places). However the Ostariophysi of different continents are very different, and the differences seem to reflect two main periods of evolution and dispersal.

Ostariophysi apparently originated in the old-world tropics, presumably during the Cretaceous period. Primitive Ostariophysi (characins and catfishes) may then have spread through the fresh waters of at least the warmer parts of all the continents except Australia. They reached South America and radiated there. Then, later. but perhaps still in the Cretaceous, cypriniforms began a second period of evolution and dispersal. They probably originated (from characins) in tropical Asia, and have spread from there in all directions that continuity of land has allowed. They have diversified and multiplied especially in tropical Asia and have spread in numbers to temperate Asia and Europe. apparently replacing most older fishes in these places. The cypriniforms have reached Africa and North Xmerica, where, although they have become numerous. they have not yet replaced other fishes to the extent that they have in Eurasia. These forms have not reached South America. where the older characins and catfishes are still dominant, and of course they have not reached Australia (except as introduced by man).

Salt-water barriers, zonation of climate and evolution and spread — first of primitive Ostariophysi from the old-world tropics and then of cypriniforms from tropical Asia — seem to have been the principal factors that determine the main, existing, world-wide pattern of distribution of fresh-water fishes. The dispersal of successive dominant groups seems to have been most important of all. Because of it, the fresh-water fish faunas of the world form a pattern of concentric but very irregular zones (fig. 1). At the centre of the pattern, in Eurasia, is a zone of cypriniform

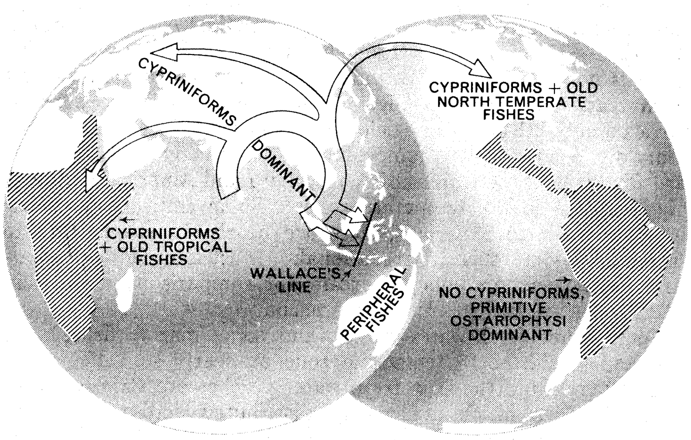

FIG. I.— DISTRIBUTIONOF DOMINANT FRESH-WATER FISHES. ARC AND ARROWS SHOW PLACE OF ORIGIN AND DIRECTIONS OF DISPERSAL OF CYPRINIFORMS: CROSSHATCHING SHOWS PRESENT DISTRIBUTION OF CHARACINS

dominance. Next to the centre, in Africa and North America, is a zone of mixed dominance, where cypriniiorms occur with many other fishes. Farther away, in South America, is a zone which cypriniforms have not reached and which is dominated by more primitive Ostariophysi. And finally Australia. New Guinea and nearby islands (west to and including the Celebes). Zlladagascar, the West Indies (except Trinidad). and all other old or remote islands, lie in a zone which, though not more distant from the dispersal centre than is South Xmerica, is cut off from the centre by salt-water barriers impassable for strictly fresh-water fishes. In this zone the dominant fishes belong to peripheral groups.

The South American lungfish, placed in the same family as the Airican lungfish (the Australian lungfish represents a different, older family), and most other primary-division groups of fishes in South America seem to be related to existing African fishes. Superficially. this fact suggests a former physical union and subsequent separation of the land masses of South America and Africa. But analysis shows that the South American fishes do not represent the whole African fish fauna or any simple part of it; particularly. they do not represent a very ancient part, for. although a lungfish is present in South America, the ancient bichirs (polypterids) and some other presumably old African groups are absent in South America. In fact. South American fresh-water fishes represent fractions of the African fish fauna that are diverse in probable geological age and in ecological requirements. This is not what would be expected if South America and Africa were formerly in contact. but rather what might result if a few fishes reached South America with difficulty, at different times and perhaps in different ways. Nowhere else in the world does the distribution of fresh-water fishes suggest continental drift: there is no relationship between the strictly fresh-water fishes of South America and Australia, or of Africa and Australia, and no indication (from fish fauna) that Madagascar has been connected with any continent. (Small fishes of the family Galaxiidae occur in fresh water in southern South America, southern Australia and the southern tip of Africa, as well as on New Zealand and some other islands. but some of them enter or even breed in salt water, and the family has probably dispersed through the sea.) The distribution of fresh-water fishes, though not consistent with continental drift, is consistent with the history of dispersal of successive dominant groups of Ostariophysi from the old-world tropics outlined above (see fig. 1).

3. Amphibians. — Existing amphibians belong to three orders, all of which are very old (Early Mesozoic or pre-Mesozoic in origin). However, the distributions of the existing forms are probably products of more recent periods, perhaps Late Cretaceous and Tertiary.

Caecilians (order Apoda or Gymnophiona) are wormlike. land-burrowing or aquatic amphibians. They occur in tropical Africa (but not Madagascar); on the Seychelles Islands in the Indian ocean; in tropical Asia, Sumatra, Java, Borneo and the southern Philippines (but not the Australian region); and in tropical America from southern Mexico to northern Argentina. Their geographical history is unknown.

Salamanders and Newts (order Caudata or Urodela) are found principally in the north temperate zone. A few occur in the edge of the tropics in southeastern Asia, and one stock of the northern family Plethodontidae extends through Central America into northern South America south to the Amazon region, but otherwise salamanders are absent in the tropics; they do not occur in the southern hemisphere or on any islands except recent continental ones.

In the north temperate zone, salamanders are very unevenly distributed. Most are concentrated in four separate areas: (1) Europe with adjacent parts of Africa (north of the Atlas mountains) and southwestern Asia; (2) eastern Asia and Japan; (3) western and (4) eastern North America. The geographical relationships of different species of salamanders run in every possible direction in these four areas. Some occur both in Europe and eastern Asia; the plethodontid *Hydromantes,* in Europe and western North America; the family Proteidae, in Europe and eastern North America; one group of *Triturus,* in eastern Asia and western North America; the family Cryptobranchidae, in eastern Asia and eastern North America; and *Ambystoma* and certain members of the family Plethodontidae, in western and eastern North America. The geographical pattern called a relict pattern is formed when an old and diverse, widespread group of animals is depleted and survives in restricted areas. It has two main characteristics. The first is discontinuity: related forms tend to occur in widely separated areas: and fossils may occur far outside the ranges of the living forms (as is the case in some groups of salamanders). The second is diversity of geographical relationships: the geographical ties of surviving forms tend to be diverse and confused. reflecting extinctions and survivals rather than directions of dispersal.

The geographical history of salamanders is unknown, but their relict pattern of distribution shows clearly that they are mainly a declining group. Nevertheless plethodontids have evidently spread into Central and South America in recent geologic time.

Frogs and Toads (order Salientia or Anura) are the dominant existing amphibians. They are almost world-wide in distribution, being absent only in the most extreme arctic regions and on remote islands. That they have reached Australia and many not too remote islands shons that they get across narrow salt-water barriers better than do strictly fresh-water fishes. Islands reached by frogs include not only obviously continental islands but also the West Indies; Madagascar; the Seychelles; all the Malay archipelago. including the Philippines; the Solomon Islands; New Zealand: and perhaps the Fiji Islands.

Although frogs and toads as a group are almost world-wide in distribution. the separate families are more limited. The most primitive existing frogs are *Ascaphus* (one species). in cold brooks in northwestern North America; and *Leiopelma* (two or three species), on New Zealand. These two genera are thought to be the last survivors of an old family that was probably once widely distributed over most of the world. Less primitive but still probably rather old families are Discoglossidae (fire-bellied toads). in Europe and eastern Asia; Pipidae (aquatic-clan ed frogs), in Africa and South America; *Rhinophrynus,* in southern Mexico and Central America; and Pelobatidae (including spadefoot toads). with three subfamilies. in (1) southeastern Asia. Sumatra, Java. Borneo and some of the Philippine Islands; (2) Europe and North America; and (3) the Seychelles Islands.

The distributions of higher families of frogs are significantly interrelated. The ground-living families form one ,geographical series; tree frogs, another. Of primarily ground-living frogs, Leptodactylidae (fig. 2) are numerous only in Australia and tropical America, but one doubtful (relict?) genus occurs in South Africa. and the family is fossil in India. Ranidae are numerous only in Africa, in Eurasia and adjacent islands, and in North America; some species reach New Guinea and the northern edge of Australia, a few reach Central America and one species extends into northern South America; even so, ranids have not yet become dominant in these places. The distributions of these fami-

FIG. 2.— DISTRIBUTION OF FROGS OF FAMILY LEPTODACTYLIDAE

lies suggest that Leptodactylidae were once world-wide but have been replaced by ranids in the main part of the world, leaving the leptodactylids discontinuously distributed, in Australia and South America (fig. 3). Most ranids are confined to the old-world tropics. The single predominant genus *Rana* (which includes most northern common frogs) presumably originated there but species have spread through the whole of Africa, tropical and temperate Eurasia (and into the arctic), North America, and south to the limits given above.

Of other primarily ground-living frogs and toads, atelopodids (Atelopodidae) are mostly in tropical America; brevicipitids (Brevicipitidae) are widely scattered in the warmer parts of the world (often occurring in hidden places, as if withdrawing from open competition nith other frogs); and *Bufo* species (common toads) have spread apparently from the old-world tropics (their

FIG 3 — DIAGRAM OF (HYPOTHETICAL) SUCCESSIVE DISPERSALS OF THREE FAMILIES OF FROGS

Leiopelmidae, surviving only in New Zeaiand and localized in western North America; Leptodactylidae, surviving principally in Australia and South America; Ranidae, dominant throughout the world and reaching the Australian and Neotropical regions

relatives are in tropical Africa and the Malay region) over all Africa, Eurasia. North and South America, but not Australia. These additional families further complicate the geographical pattern of the leptodactylids and ranids, serving to reinforce it.

Tree frogs belong to two principal families, Hylidae and Rhacophoridae. Hylids, including the genus Hyla, are very numerous in tropical America and extend northward in smaller numbers through temperate North America almost to the arctic. A few Hyla species (perhaps forms of a single species) occur across temperate Asia and Europe and south to North Africa, southern Arabia and Indo-China; they occur again in numbers in New Guinea and tropical and south temperate Australia. However, hylids are absent or nearly so (there are one or two doubtful records) in Africa south of the Sahara and in most of tropical Asia and the western Malay archipelago.

The second group of tree frogs. the rhacophorids, are abundant in the main part of the old-world tropics; they are almost confined to the gap in the range of hylids. These distributions suggest that the family Hylidae or at least Hyla was once world-wide but has been replaced by rhacophorids in the main part of the old-world tropics, leaving the hylids discontinuously distributed.

The obvious old relationship between the fresh-water fishes of Africa and South America (see above)—which seems to be the result of complex changes in fish distributions rather than of a direct land connection—is repeated in one family of frogs. Pipidae, and since pipids are aquatic frogs, they may have had the same geographic history as the fishes. Leptodactylids and hylids now occur chiefly in South America and Australia, but this pattern too seems to be the result of changes in the animals' distribution rather than of direct land connections.

4. Reptiles.— Reptiles are primarily tropical animals. Only one species of lizard and one of snake cross the Arctic circle in northern Europe; elsewhere, reptiles do not reach the arctic, and they are few even in cool north temperate areas. Likewise, they decrease south of the tropics; of the many reptiles in tropical South America, only one genus of lizard reaches the cool southern tip of the continent. On the other hand, reptiles, especially lizards, are more widely distributed on islands than are any other flightless land vertebrates. Snakes occur on some islands too, within the limits of distribution of lizards, and giant land tortoises are noted for their occurrence on islands (see below).

Alligators *and* Crocodiles.—Of existing reptiles, most crocodilians are tropical, but true alligators (genus Alligator) are confined to warm temperate areas: the two existing kinds of alligators are in the southeastern United States and the lower Yangtze valley in China, but fossil species are found in western North America.

Turtles. — Turtles are primarily tropical but extend irregularly into temperate areas; they are rather numerous in eastern North America, fewer elsewhere north of the tropics, and absent in the interior of Asia and in the British Isles. Southward, turtles reach southern Australia but not Tasmania, and northern Argentina.

Among fresh-water and amphibious groups, side-necked turtles occur in Africa, South America and Australia; common turtles (family Emydidae), mostly in Eurasia and North America. One of the two side-necked families, Pelomedusidae, is confined to Africa, Madagascar and South America but has fossil forms in Eurasia and North America (where it may have been replaced by common turtles). One genus of pelomedusids. *Podocnemis,* is now confined to Madagascar and South America. but has fossil forms in Africa as well as in Eurasia and North America. The other side-necked family, Chelydidae, is confined to South America and Australia (including New Guinea) and is not represented by fossils elsewhere. These turtles are aquatic and may have reached Australia from South America through the sea.

The only important existing group of land turtles is the family Testudinidae, of which the principal genus is *Testudo.* Testudinids probably originated in southern Asia early in the Tertiary. Testudo spread over all continents except Australia, disappeared in North America (fossils are present there from the Eocene to the Pleistocene) and survives in Africa and Madagascar, in southern Eurasia and adjacent islands, and in South America. This genus reached South America during the Miocene, while the continent was still cut off from North America, and it has reached many islands. Gigantic species of Testudo still exist, or did so within historic times, on many islands in the Indian ocean (the Seychelles, Mascarenes, etc.) and on the Galapagos; they are present as fossils on some islands of the West Indies and of the Canaries. Some of these turtles, although adapted to live entirely on land, have evidently crossed ocean barriers hundreds of miles wide.

Tuatara.—The tuatara (*Sphenodon*), confined to the remote island of New Zealand, is the last survivor of the order Rhynchocephalia, which was widely distributed in the Early and Middle Mesozoic but is unknown as a fossil later than the Lower Cretaceous (about 135,000,000 years ago).

Lizards.—Existing lizards and snakes (see below) are so numerous that only a few selected families can be mentioned. Lizards reach the following islands beyond the limits of distribution of amphibians: the Mascarene Islands, in the Indian ocean; Fiji, the Tongas, New Caledonia and Samoa, in the western Pacific; New Zealand (where there are at least three stocks of reptiles against one of amphibians); the Galapagos Islands, in the eastern Pacific; and, in the Atlantic, not only all the West Indies (where reptiles are much more diverse than amphibians) hut also Bermuda, the Canaries, Madeira and the Cape Verde Islands. Small lizards occur beyond these limits on still more remote islands, but they have probably been carried there by man.

Lizards of the family Gekkonidae (geckos), abundant throughout the tropics, do not extend far into temperate areas. They show how strictly climate can limit even a dominant group of reptiles. Scincid lizards (skinks) are very numerous in the warmer part of the old world and several old-world genera extend to America, as if the family is invading the new from the old world. Lizards of the family Iguanidae are numerous in the Americas, and two genera occur on Madagascar and one on Fiji, but the family is now absent on the continents of the old world, where the related family Agamidae occurs. This pattern suggests that iguanids were once world-wide and have been replaced by agamids on old-world continents.

Snakes. — The giant constricting snakes (with their smaller relatives) form the family Boidae. The boas proper (subfamily Boinae).are confined to America; pythons (subfamily Pythoninae), to the old world except Madagascar. The Madagascan forms resemble boas but are not really related to them and are placed in a third subfamily (Sanziniinae). Most existing snakes belong to the family Colubridae (common snakes). Colubrids are numerous on all continents except Australia. A few Asian colubrids have reached northeastern Australia in recent geologic time (their distributions show this); they are not numerous there, and much of Australia is still without colubrids. The common Australian snakes are elapids (family Elapidae), which, although poisonous, include many small and inoffensive species as well as some large and dangerous ones. (Outside Australia, elapids are represented by cobras and coral snakes.) This geographical pattern suggests that colubrids are now invading Australia and will perhaps replace most elapids there.

Of the vipers (family Viperidae) true vipers (subfamily Viperinae) are widely distributed in Africa and Eurasia; pit vipers (subfamily Crotalinae), derived from true vipers, have evidently spread from Asia (where they still occur) to America.

These fragments of the recent history of reptiles do not seem to follow any simple pattern, unless possibly one of evolution in the main part of the old world (Europe, Asia, Africa) and movement toward America and Australia.

Extinct Reptiles.—Of ancient, extinct reptiles, dinosaurs are the most significant zoogeographically. They originated early in the Mesozoic era, and both carnivorous and plant-eating groups soon reached all the continents including South America and Australia. Some reached Madagascar, but none is known to have reached New Zealand or Antarctica. Late in the Mesozoic (the Cretaceous period) the plant-eating groups formed a zonal pattern of distribution: sauropods, which were apparently amphibious and adapted to eat only soft water plants, occurred mostly in what is now the tropical zone; and ornithischians. which were more terrestrial and adapted to eat coarser land plants, occurred mostly north of the tropics. These facts suggest that all the habitable continents were accessible in the Mesozoic, as they are now for animals that can cross narrow salt-water barriers, and that climate zones were oriented, at least in the Cretaceous, as they are now.

5. Birds. — Birds are warm-blooded feathered flyers that live in the coldest arctic as well as the hottest tropics; some have reached the most remote islands. Nevertheless, climate and salt-water barriers determine the main pattern of distribution of birds. Birds are much more numerous and diverse in the tropics than elsenhere. It has been estimated that 85% of bird species occur in the tropics (or in the tropics and the south temperate zone); many families are confined to the tropics while very few are confined to north temperate regions.

In the arctic, land birds are few (only 14 species breed in Greenland), although many migratory water birds breed there. On islands, although land birds decrease in numbers uith distance from the continents, a few small land birds have reached even such remote islands as Hawaii or Tristan da Cunha in the South Atlantic. Nevertheless, even comparatively narrow water gaps sometimes separate different major bird faunas. The present narrow water gaps in the Malay archipelago (fewer and narrower in the Pleistocene) allowed many genera and even species of birds to move from Asia to Australia. Nevertheless, the bird faunas of southern Asia and of New Guinea and Australia are in general very different.

Most of the birds of southern Asia belong to families that are more or less widely distributed elsewhere in the world. Some of these families reach Australia, but others (*e.g.,* woodpeckers and true finches) do not. New Guinea and Australia possess other families that are poorly represented or not represented anywhere else: cassowaries (mostly in New Guinea) and emus (Australia), megapodes, frogmouths, lyrebirds (eastern Australia), Australian warblers, honey eaters, bowerbirds and birds of paradise (mostly in New Guinea). New Guinea and Australia also have more than their share of parrots and pigeons, of which several important groups have either evolved in Australia or survived there in partial isolation. South America, which was an island continent through most of the Tertiary, possesses a still larger number of endemic or relict families of birds.

Birds are so numerous, and so widely and complexly dispersed over the world, that their geographical history cannot be treated in detail, but something can be said of the distribution of flightless birds. Various large flightless birds that occur (or have occurred)

FIG. 4.—DISTRIBUTION OF FLIGHTLESS (RATITE) BIRDS; ELEUTHERORNIS. POSSIBLE FOSSIL ANCESTOR OF OSTRICHES; AND FLYING TINAMOUS, POSSIBLE RELATIVE OF RHEAS

on different continents and islands were formerly grouped together as "Ratites" (fig. 4), and it was thought that they represented a primarily flightless group that dispersed over old land connections. Further study, however, suggested that these birds were products of convergent evolution. They seem to represent at least five separate groups. derived from different winged ancestors. which independently became flightless and attained large size: (1) the ostrich in Africa (fossils are found across southern Eurasia); (2) extinct elephant birds on Madagascar: (3) cassowaries. emus and their extinct relatives in Australia and New Guinea; (4) extinct moas and existing kiwis on New Zealand; and (5) rheas in South America.

A possible winged ancestor of the ostriches has been found as a fossil in Europe. and the winged tinamous in South and Central America may represent the group from which the rheas were derived. Other smaller flightless birds. derived from a number of different flying ancestors, occur or have occurred (many are extinct) on many islands. but not on continents. New Zealand has had the largest number: not only moas and kiwis but also several flightless rails! a flightless goose, a flightless parrot and an apparently flightless perching bird.

The Mascarene Islands too are notable for their extinct flightless birds. Mauritius had the dodo. and related species were on Reunion and Rodriguez; these birds were derived from a ground-feeding pigeon which presumably lost its power of flight after it reached the different islands. One or more flightless rails occurred on each of the Mascarenes; a supposedly flightless heron was on Rodriguez. an "almost flightless" one on Reunion; and a supposedly flightless parrot was on Mauritius. On other islands the only flightless land birds are rails; they are very widely scattered, having occurred on islands in the Indian ocean, on the Malay archipelago, in the South Pacific and in the South Atlantic (and perhaps on Puerto Rico). In all, 25 or 30 different rails seem to have lost the power of flight on these various islands. Rails in different places are undergoing a process of multiple or convergent wing atrophy like that which probably formerly produced the "Ratites."

6. **Mammals.**—Mammals are warm-blooded animals, some of which can withstand great cold. Nevertheless, zonation of climate profoundly affects their distribution. Mammal faunas are largest and most diverse in the tropics. diminishing northward and southward. Tropical Asia (with Sumatra. Java and Borneo) has between 450 and 500 species of land mammals, including bats; an equal area of temperate eastern Asia, about 250 species; and the Taimyr peninsula of arctic Asia (a smaller area), only 8 species. The tropical fauna includes representatives of many more families than does the temperate fauna. A comparable decrease of mammals from the tropics northward occurs in North America, and from the tropics southward in South America.

Mammals are numerous on recent continental islands, but few reach old or remote islands. Madagascar has a limited fauna of land mammals derived from few ancestors; bats are numerous there. and bats are the only land mammals native to the Seychelles and Mascarene islands. The rich mammal fauna of tropical Asia extends to Sumatra, Java and Borneo: small fractions of it reach Bali, the Celebes and the southern Philippines; but little of it goes farther. except murid rodents and bats. Most placental mammals on the islands between Celebes and Australia may have been carried there by man. Australia has been reached by at least one monotreme, one or more marsupials. several murid rodents and many bats; however. there are no placental mammals except murids and bats (the dingo and "wild" pigs were probably introduced by primitive man). One arboreal genus of marsupials (*Phalanger*) and several rodents have reached the Solomons. but farther east on islands in the western Pacific are only rats probably carried by man, and bats. One group of American rats and one bat are native on the Galapagos Islands. The West Indies have or have had two groups of insectivores, one or two of ground sloths, a few other terrestrial mammals of doubtful history, a number of rodents and many bats. Only bats have reached more remote islands, including New Zealand. the Hawaiian Islands and the Azores. Evidently mammals sometimes cross narrow ocean barriers, but most of them do so with difficulty; rodents get across more often than most mammals; bats, still more often.

Below are summarized the distributions and apparent geographic histories of the principal groups of land mammals. Some minor and inadequately known groups are omitted.

Monotremes (Egg-Laying *Mammals*).—Of monotremes, the platypus occurs in eastern Australia (including Tasmania), and echidnas in Australia (with Tasmania) and New Guinea. These animals have fossil representatives in Australia from the Pleistocene; being unknown before that time in Australia. There is no record of monotremes outside the Australian region at any time. Their geographic history is therefore unknown.

Marsupials (*Pouched Mammals*).—Marsupials (fig. 5) are now almost confined to the Australian region and to South and Central America. with an opossum (*Didelphis*) extending into eastern North America. However, primitive marsupials, apparently suitable to be ancestors of all living ones, are found as fossils in Eurasia and North America in the Late Cretaceous and/or Early Tertiary. It is probable that they reached Australia and South America from Asia and North America respectively and radiated separately on the isolated continents. Some of the products of this radial spread—especially certain wolflike carnivorous marsupials, thylacines in Australia and (fossil) borhyaenids in South America—were superficially similar, apparently as the result of evolutionary convergence of separate mammal lines, rather than direct exchange of animals across a land bridge between Australia and South America.

FIG. 5.— DISTRIBUTION OF MARSUPIALS

Crosshatching shows principal areas inhabited by marsupials; small arrows, extensions of *Phalanger* west of New Guinea and of *Didelphis* into eastern North America; circles, areas where marsupials are fossils in Late Cretaceous and Early Tertiary periods; large arrows, probable directions of dispersal of early marsupials

Insectivores.—Insectivores date from the Upper Cretaceous and have radiated in a complex manner in Africa, Eurasia and North America but have never reached Australia and only one (a shrew) reached South America in recent geologic time. Of existing insectivores, tenrecoids include the family Solenodontidae in the West Indies (Cuba and Hispaniola), Tenrecidae on Madagascar, and the otter shrew in west Africa; these animals are survivors of a group that was widely distributed early in the Tertiary. Shrews proper occur throughout Africa, Eurasia and North America, and a few reach Central America and northern South America. Moles are almost confined to temperate Eurasia and North America. Other existing insectivores are found in Africa and Eurasia.

Primates.--Primates were probably derived from something like tree shrews (which are now confined to tropical Asia, etc.), and they, from something like elephant shrews (which are now confined to Africa). Primitive primates (lemurs and tarsiers) are found as fossils in Eurasia and North America (and presumably occurred elsewhere in the main part of the world) early in the Tertiary. One of them may have reached South America giving rise to the American monkeys, paralleling the evolution of monkeys in the old world; on the other hand, American monkeys may be derived from a more monkeylike ancestor that came from the old world at a later time. In any case American monkeys are very distinct from those of the old world and have evidently been geographically isolated from them for a long time. In the old world, lemurs (or perhaps just one lemur) reached Madagascar and radiated there, producing a variety of lemuroids, many of which still exist on Madagascar. Elsewhere, primitive primates declined. In North America they may not have survived beyond the Eocene. In the old world some still survive in restricted areas in Africa and tropical Asia, etc. But higher monkeys, apes and finally man dispersed and redispersed in a complex manner in Africa and Eurasia during the Middle and Late Tertiary and Pleistocene. Their movements were probably mostly within the tropics, where most of the surviving forms occur.

There was a land connection between northeastern Asia and North America at times in the Tertiary, and higher primates would probably have crossed it if they had extended far into the north temperate zone, but none did cross it until man did so, late in the Pleistocene.

Edentutes ("Toothless" *Mammals*).—Edentates have been confined to South America through almost their whole history, though their ancestor probably came from North America (in the Paleocene). A dominant order in the mammal fauna during the Tertiary of South America, they included gigantic ground sloths and glyptodonts as well as existing groups. When South America became connected to North America at the end of the Tertiary, several stocks of ground sloths and glyptodonts as well as armadillos spread into North America, but the ground sloths and glyptodonts then died out not only in North but in South America as well. Existing edentates — anteaters, tree sloths and armadillos— are again almost confined to South and Central America; only one armadillo extends north to the southern United States.

Carnivores.—The flesh eaters (order Carnivora) have had a long and complex geographical history in the main part of the world since early in the Tertiary, but they have not reached Australia (except as brought by man), and they did not reach South America until the Miocene (the raccoon family) or Late Pliocene and Pleistocene (other families). Some formerly widely distributed groups of Carnivora are now extinct. Today, canids (foxes, dogs, wolves, etc.), mustelids (weasels, otters, etc.) and felids (cats) are well represented on all continents except Australia.

Viverrids (civets and mongooses) are confined to Africa and Madagascar, southern Eurasia, and islands as far as the Philippines and Celebes and perhaps beyond, but not including Australia; they have existed in the warmer part of the old world at least since the Lower Oligocene but have never reached America. Bears now occur in tropical and temperate Eurasia (but not Africa) and North and South (but not Central) America. Other existing families of Carnivora are more restricted in range.

Ungulates (Hoofed *Mammals*) —Hoofed mammals have had a long and complex geographical history on all continents except Australia. Ancestral forms were nidely distributed early in the Tertiary, when one or more of them got to South America. Then. through most of the Tertiary, the ungulates in the main part of the world and in South America evolved separately. Not all the many groups that have existed can be mentioned here.

Horses and their relatives (family Equidae) are derived from primitive ancestors that have fossils in the Lower Eocene of Europe and North America. Their later, complex evolution occurred almost entirely in North America. The existing genus *Equus* originated in North America in the Pliocene, spread to Eurasia and Africa in one direction and South America in another, and then became extinct in the Americas, leaving (all in the genus *Equus*) wild horses in temperate Eurasia, asses in parts of Eurasia and Africa. and zebras in Africa.

Tapirs have existed in Eurasia and North America through much of the Tertiary. They apparently never reached Africa but did reach South America in the Pleistocene. They still existed in Europe, Asia and North as well as South America in the Pleistocene. when they extended into cool climates. Since then, they have been reduced to one species in the Malay region and three in Central and South America. Rhinoceroses have had a complex geographical history in Africa, Eurasia and North America, but they apparently never reached South America. In the Pleistocene they occurred in cold northern regions as well as in the tropics. Now they are reduced to two genera in Africa and two others in tropical Asia, etc.

True pigs (family Suidae) are, and always have been (except as carried by man), confined to Africa, Eurasia and certain southwest Pacific islands; they are not native to America or the Australian region. Peccaries (family Tayassuidae), though probably derived from a Eurasian ancestor and formerly widely distributed in North America, reached South America in the Pleistocene and now occur mainly in tropical America, with one species reaching southern United States.

Existing hippopotamuses in Africa are the last survivors of a superfamily (Anthracotherioidea) that mas widely distributed in Africa, Eurasia and North America during part of the Tertiary. Camelids were confined to North America through most of their long history. In the Pleistocene they spread to Eurasia, etc , and South America and then disappeared in North America. They now survive only in parts of Asia and North Africa (camels) and South America (llamas, etc.). Traguloids (chevrotains, etc.) were numerous in Eurasia and perhaps in Africa in the Middle Tertiary, with relatives in North America; later, they were reduced to *Hyemoschus* in west Africa and *Tragulus* in tropical Asia, etc.

Deer (family Cervidae) have had a complex geographical history probably beginning in Eurasia in the Oligocene but soon extending to North America. They have not reached the main part of Africa but did reach South America in the Pleistocene. They are still numerous in temperate and tropical Eurasia and the Americas. To some extent giraffids have paralleled deer in the old-world tropics. They were once numerous in Asia as well as Africa, and several reached eastern Europe in the Lower Pliocene; later, they were reduced to the giraffe in the more open parts of Africa and the okapi in heavy forests in west Africa. The pronghorn is the last survivor of a family that since its origin in the Miocene has always been confined to North America, chiefly the west.

The Bovidae (antelopes, sheep, goats, cattle) is one of the most recent families of mammals to evolve and disperse. Bovids have had a very complex geographical history in Africa and Eurasia, and a few (including the musk ox, bison. and rocky mountain sheep and goat) reached North America in the Pleistocene or later, but none has reached South America.

Ungulates in South America through most of the Tertiary were entirely different from those elsewhere in the world. They were very numerous and diverse. Known fossil forms are placed in 5 orders, with about 18 families and more than 150 genera. They varied in size, adaptations and probable habits from rodentlike to horse-, camel-, rhinoceros- and elephantlike, though they mere not directly related to any of these animals. But these comparisons are somewhat inexact. Many of the old South American ungulates were not much like anything now alive. All of them are now extinct. having been replaced by ungulates that reached South .America from other parts of the world in the Late Pliocene and I'leistocene.

Proboscideans (Elephants and Fossil Relatives).—Proboscideans originated in Africa early in the Tertiary and extended their area of complex evolution to Eurasia in the Middle Tertiary. From Asia, at least a dozen stocks of them reached North America from the Miocene to the Pleistocene, and three or four reached South America in the Late Pliocene and Pleistocene. In the Pleistocene, proboscideans were still widely distributed on all continents except .Australia, and some extended into cold climates; however, in the short time since then they have been reduced to the two existing elephants, one species in Africa and one in tropical Asia.

Rabbits and Rodents.—Of gnawing mammals, rabbits and their allies (order Lagomorpha) have spread throughout Xfrica. Eurasia and North America since early in the Tertiary, and *Sylvilagus* (American cottontails) reached South America in the I'leistocene. The geographical history of rodents (order Rodentia) has occurred in three partly separate areas. Many different families have dispersed and redispersed in Africa, Eurasia and North America since early in the Tertiary. About five different stocks of mice and rats of one family (Muridae) reached Australia in the Late Tertiary and Pleistocene, and gave rise to the existing Australian rodent fauna, A special suborder of rodents, Hystricomorpha, radiated separately in South America during much of the Tertiary. At the end of the Tertiary, when a land bridge was formed between North and South America, a few South American rodents reached North America. but the only one that survives is the porcupine which, in spite of its tropical American ancestry. found a special niche in northern forests. At the same time cricetid mice and rats (family Cricetidae), squirrels (family Sciuridae) and a few other rodents from Eurasia and North America invaded South America. Cricetids have become very numerous in South America and have probably replaced some hystricomorphs.

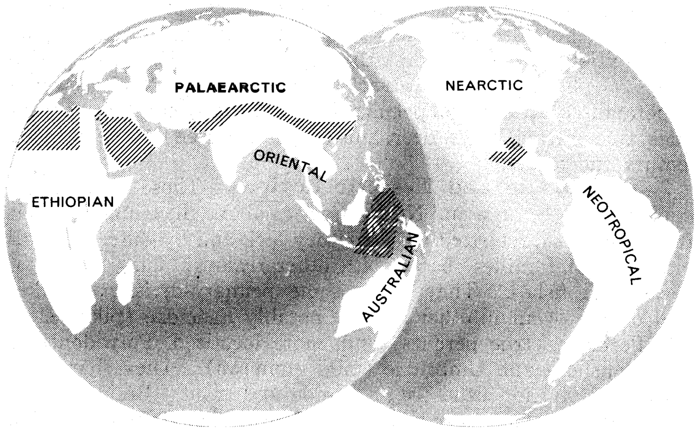
Bats.—Of bats, inegachiropterans (fruit bats) have existed at least since the Oligocene and have had a complex geographical history throughout the warmer part of the old world and Australia. They have considerable powers of dispersal and have reached many islands in the Indian and western Pacific oceans, but they have not reached America. Other bats, however, have dispersed in a complex manner over the whole world.

7. Summary of the Distribution of Mammals.— This completes the geographical histories of the principal groups of land mammals. Most major groups except some carnivores (dogs, weasels and cats), a few families of hoofed mammals (pigs, deer. cattle. etc.) and some. rodents and bats have apparently declined since the Miocene or Pliocene. Many large mammals have declined or disappeared in many parts of the world since the Pleistocene. (Man may have been responsible for many of the later disappearances but not for the earlier ones.) These disappearances have created many discontinuities in the distribution of existing mammals.

Although the geographical history of mammals has been very complex, a simple main pattern is evident. At the beginning of the Tertiary. when mammals became dominant. there were two principal groups of mammals ready to radiate: protoinsectivores (placentals) and didelphoids (marsupials). All existing mammals except probably the Australian monotremes. are derived from these two groups. During the Tertiary mammals evolved. more or less separately. in three principal areas. The protoinsectivores produced a diversity of placentals which dispersed in Africa. Eurasia and North America. Marsupials reached Xustralia and radiated separately there. Further, marsupials and a few selected placentals reached and radiated together in South America. Two misconceptions have existed about the native mammal faunas of Australia and South America. One is that they are older than the mammal fauna of the rest of the world, that Australian marsupials, for example, date from a time when marsupials were dominant over the entire world, before the rise of placentals. This is not correct. Placentals are apparently as old in origin as marsupials. The mammal faunas of the different continents evolved at the same time in separate places, not at separate times. The other misconception is that early mammals must have reached Xustralia and South America across (different) land connections. This is at least doubtful. The Australian and South American mammal faunas are not derived from the whole of any known world-wide faunas but from small fractions of the early Tertiary fauna of other parts of the world, and the fractions may have reached the isolated continents across water gaps that the whole faunas could not cross.

III. FAUNAL REGIONS

The continental areas of the world can be divided into regions according to the present distribution of animals. These regions do not. however. represent a common pattern which the distributions of many different animals fit exactly. Different groups of animals (for example. the classes of vertebrates discussed above) are very differently distributed. Together. however. their distributions form an average pattern. The system of faunal regions



FROM P. J. DARLINGTON, "ZOOGEOGRAPHY," (1957); REPRODUCED BY PERMISSION OF JOHN WILEY & SONS, INC.

FIG. 6.— SIX CONTINENTAL FAUNAL REGIONS. CROSSHATCHING SHOWS APPROXIMATE BOUNDARIES AND PRINCIPAL TRANSITION AREAS

corresponds to this pattern. and is the truest simple diagram of animal distribution that zoogeographers have been able to devise.

As mentioned earlier, many groups of animals are spread over Xfrica, temperate and tropical Eurasia and North America but are absent in South .America or Australia or both. Furthermore, South America (with Central America) and Australia (with New Guinea) not only lack the otherwise widely distributed groups but each of these isolated continents has other. important. peculiar groups of its own. Africa. Eurasia and North America are therefore placed in one "realm"; South America and adjacent islands in another; and Xustralia and nearby islands in yet another. The usually accepted realms and regions are these (see fig. 6):

Realm Megagea (Arctogea)

Ethiopian region: Airica below the Sahara, with part of southern Arabia

Oriental region: tropical Asia, with the associated continental islands of Ceylon, Sumatra, Java, Borneo, Formosa and some adjacent smaller islands

Palaearctic region: Eurasia above the tropics. with the temperate northern corner of Africa north of the Atlas mountains

Nearctic region: North America, except the tropical part of Mexico. (The two northern regions [Palaearctic and Nearctic] arc sometimes combined as the Holarctic region or Holarctica)

Realm Neogea

Neotropical region: South and Central America, with the tropical part of Mexico

Realm Notogea

Australian region: Australia and New Guinea, with closely associated smaller islands

1. Ethiopian and Oriental Regions.— These areas. the tno main regions of the old-world tropics, have faunas characterized

by richness and diversity of groups. The faunas are alike in many ways, different in others: they share catfishes and labyrinth fishes; but Africa (the Ethiopian region) alone has bichirs, lungfishes and characins. and the oriental region has more and more diverse cypriniform fishes. In general, Africa seems to have a geologically old fresh-water fish fauna; the orient, a more recent one. Africa and the orient share caecilians and several families of frogs, including rhacophorids; but Africa, and not the orient, has pipids; the orient, and not Africa, pelobatids. Both have crocodiles. land tortoises, soft-shelled turtles and many of the same families of lizards and snakes, including pythons, cobras, true vipers, etc. But of these two regions Africa alone has side-necked turtles; the orient, many emydid turtles; Africa! many chameleons and cordplid and amphisbaenid lizards; the orient, aniliid snakes, many subfamilies of colubrids, and pit vipers. Generally, Africa has more lizards; the orient, more snakes.

Both regions are rich in birds. They share many, often widely distributed families. but there are inequalities: Africa has (for example) more honey guides. true shrikes and sunbirds; the orient, more pheasants, pittas and timalines. Africa has half a dozen endemic families (ostriches, guinea fowls, etc.), whereas the orient has only one (fairy bluebirds). These two regions share also many families of mammals, not only old-world monkeys, apes, big cats, elephants, rhinoceroses, buffalos, antelopes and big fruit bats, but also many less conspicuous groups. Each region has additional mammals that the other lacks: Africa has golden moles, elephant shrews, aardvarks, hyraxes, equids (zebras), hippopotamuses, giraffes and peculiar rodents; the orient, hairy hedgehogs, tree shrews, bears, deer, and (more localized) tarsiers, flying lemurs and tapirs.

2. Palaearctic and Nearctic Regions. — These regions are equivalent to Eurasia and North America above the tropics. Their faunas are characterized by what they lack and by different combinations of families shared with other regions. They are most distinct in fishes. They share some primary-division families that do not occur in other regions, notably Esocidae (pikes, etc.) and Percidae (true perches) and, more localized, Polyodontidae (paddlefishes) and Cmbridae (mud minnows). They share also peripheral-division fishes; *e.g.,* salmon and trout. Besides these, the Palaearctic has many cyprinids but few other primary-division fishes (except some tropical oriental groups that extend into eastern Asia); the Nearctic has fewer cyprinids but has important additional groups especially east of the rockies. Of amphibians. both regions lack caecilians and have many salamanders (a primarily north temperate order) and many species of the widely distributed salientian genera *Rana* (frogs), *Bufo* (toads) and (especially in the Nearctic) Hyla (tree frogs). Additional salientians occur in both regions, *e.g.,* spadefoot toads, but they are numerically unimportant, localized or discontinuously distributed relicts or representatives of tropical families that extend into eastern Asia from the orient or into southern North America from the American tropics.

Of reptiles, birds and mammals, the Palaearctic and Nearctic regions have (compared to the tropics) few species; the species represent few families (most of which are widely distributed in the tropics, too). Many species and genera of birds and some families are strictly Holarctic. Prunellidae (hedge sparrows, 12 species, Palaearctic only); Certhiidae (creepers, 6 species); and subfamilies Tetraoninae (grouse: 18 species) and Bombycillinae (waxwings, 3 species). Mammals confined to north temperate areas are moles (a strictly Holarctic family, except for a slight extension into tropical eastern Asia), pronghorns (one species, in western North America) and several small families of rodents. There are perhaps no families of reptiles which are strictly confined to the north temperate zone.

It is misleading to emphasize the few peculiar families in characterizing the Palaearctic and Nearctic regions. What should be emphasized are the forms absent. The reptile. bird and mammal faunas of these regions are essentially tropical faunas from which much has been subtracted and little added. The Palaearctic and Nearctic faunas are most impoverished and most alike (with many species in common) in the far north; they become progressively richer and more dissimilar southward toward the tropics. They are perhaps most dissimilar in fishes and some amphibians, and in lizards and small migratory, insectivorous birds, of which the Palaearctic forms belong to old-world tropical families and the Nearctic ones to tropical American families.

3. Neotropical Region. — This region has a rich and distinct vertebrate fauna of which the older elements show diverse geographical relationships or have no relationships at all with existing animals elsewhere. Most Neotropical fishes have old African relationships: the fresh-water fishes are dominated by primitive Ostariophysi (characins and catfishes). and include a lungfish. Neotropical amphibians are caecilians, a few plethodontid salamanders and many frogs (of which some are related to frogs now living in Africa, the oriental region and Australia, as well as North America). Neotropical reptiles include crocodiles, caymans, etc.; two families of side-necked turtles (shared with Africa and Australia respectively); common turtles of North American families; giant land tortoises; and many lizards and snakes. Neotropical birds are numerous and include many groups confined to the region, among them toucans, motmots and cotingas. Xeotropical mammals are a mixture of old South American groups (marsupials, edentates, American monkeys and hystricomorph rodents) and new groups received from or through North America and for the most part still existing there (the tapirs and camelids—otherwise "wild" only in Asia—are exceptions). The Neotropical vertebrate fauna is concentrated in South America. Many parts of it extend through Central America to southern Mexico, where there is progressive mixture with Nearctic elements.

4. Australian Region. — The vertebrate fauna of the Australian region (including New Guinea, a recent continental island which was connected to Australia in the Pleistocene), though less rich than the Neotropical fauna is very distinct. Fresh-water fishes are few and of marine origin, except perhaps the lungfish and one osteoglossid. The only amphibians are frogs: only two families of them in the main part of Australia, which are now best represented elsewhere in tropical America; additional families in New Guinea are Asian or old-world tropical. Reptiles are numerous; most have oriental relationships: a few. Neotropical, and perhaps Ethiopian ties. Birds are moderately numerous and diverse; they include unique families as well as families with Asian relationships, but few or no birds show direct relationships with African or South American birds. The mammals are a few monotremes, many marsupials, moderate numbers of murid rodents and bats. Australian marsupials have radiated extraordinarily and now occupy many of the niches filled elsewhere by placental mammals. Different Australian marsupials resemble shrews, weasels, wolverines, wolves, moles. anteaters! rabbits, mice and squirrels. Also present are the large rodentlike wombats and somewhat slothlike koalas. The kangaroos, though superficially unique. are grazing and browsing animals which take the place of hoofed mammals of other regions.

5. Transitional Areas. — Wherever regional faunas meet, there is a transition. In most cases some elements of both faunas stop at an approximately common boundary, whereas various other elements of each fauna extend across the boundary, in opposite directions and for varying distances. For example. many strictly Nearctic and Neotropical animals stop where the temperate plateau of Mexico meets the tropical Mexican lonlands, but other primarily Nearctic animals extend across the boundary into Central or even South America, and some primarily Neotropical animals extend into southern North America. In the Malay archipelago many oriental vertebrates reach a common boundary at the water gap that runs between Bali and Lombok. betneen Borneo and Celebes. and between the Philippines and Moluccas. This common boundary is called Wallace's line (see fig. 1). Wallace thought this line separated the oriental and Australian regions, but in fact. it marks the limit of the full-scale oriental fauna and the beginning of a strikingly impoverished fauna and obvious transition. Another line a little nest of New Guinea (west of the Aru Islands. Misoöl, Waigeo, etc) marks the limit of the nearly pure Australian fauna. Between these lines is a region, now called Wallacea, where the fringes of the oriental and Aus-

tralian faunas meet in complex transition.

IV. ANIMALS ON ISLANDS AND IN SEAS

1. Distribution on Islands.— Wallace recognized only two kinds of islands: continental islands. which he defined as detached fragments of continents, consisting of complex continental rocks and always inhabited by some terrestrial mammals and amphibians; and oceanic islands. which he defined as having originated in the ocean. consisting of volcanic rock and coral and lacking terrestrial mammals and amphibians. Islands and island faunas are, however, much more diverse than this.

Recent continental islands do exist: examples are the British Isles! Japan, Ceylon, Formosa, Sumatra, Java, Borneo, New Guinea. Tasmania and Trinidad. All these islands have recently been detached from adjacent continents. and their faunas include amphibians, terrestrial mammals and (except in Tasmania) strictly fresh-water fishes. (Newfoundland, Greenland and Tierra del Fuego are also continental islands, but their faunas have been limited by cold.) Purely oceanic islands exist too: for example, the volcanic and coral Hawaiian Islands, which have no native terrestrial vertebrates except birds and a bat.

But between these extremes are many islands which are more complex zoogeographically. A significant fact not understood by Wallace is that no old islands have continental faunas. This is true not only of such islands as Madagascar, New Caledonia and New Zealand, but also of the old-island continents. Australia and Tertiary South America. None has. or (so far as is known) ever has had, a fauna that was simply a detached part of the fauna of a larger land mass. Either the old islands have never been attached to continents or, if they were attached, their old continental faunas have been replaced. Madagascar, for example. which during the Mesozoic possessed dinosaurs, has so far as it can be dated, a more recent fauna; *e.g.,* existing Madagascan mammals are descended from a few Tertiary ancestors that evidently reached Madagascar across water. Leiopelmid frogs and *Sphenodon* on New Zealand are Mesozoic animals, but they do not constitute a Mesozoic continental fauna; along with them on New Zealand are two stocks of presumably more recent lizards. All these animals may have reached New Zealand, at different times; from across water.

Certain other islands, *e.g.,* the Philippines and West Indies, form fringing archipelagos that'are not simply of recent continental attachment but that lie close to continents. Vertebrates have reached these archipelagos in proportion to their ability to cross salt water: true fresh-water fishes are very few or absent; amphibians and terrestrial mammals are limited in basic stocks (but some have radiated on the islands) and rodents make up more than the usual proportion of the mammals; lizards are disproportionately numerous; and bats and birds are abundant. Moreover, the animals are distributed in an orderly way, along what seem to be routes of immigration into the archipelagos; old relicts are the exception and not the rule. This and other evidence leads to the general conclusion that, although there are a few old relict vertebrates on some islands, the faunas of all islands (except obviously recent continental ones) have been derived partly if not wholly from across water.

There seems to have been a flow—a broad directional movement—of vertebrates from all the continents to islands, the details of the movement deoending on the widths of water gaps, on the sizes and natures of different islands and on the relative water-crossing ability (not the geological age) of different vertebrates. Flightless land vertebrates presumably cross water mostly by "rafting," i e., by riding on floating islands or on trees or debris carried out to sea by rivers, especially in the tropics.

2. Distribution of **Marine** Animals.— The distribution of marine animals is exceedingly complex, partly because it occurs in three dimensions.

Vertical Distribution.—Where the oceans are deep, faunas are stratified. One great fauna lives in the surface water as far down as light permits the existence of green plants (about 40 fathoms). Another fauna inhabits the mid-waters (roughly 40–2,000 fathomsj, living in darkness and depending ultimately for food on the remains of dead animals and plants falling from the surface. Still another fauna lives on the ocean bottom; it, too, exists in darkness and receives food from the water above.

The surface, or pelagic, fauna includes many delicate: transparent animals. It includes many protozoa such as *Globigerina* and radiolarians; these minute animals are so numerous that their skeletons, falling to the ocean bottom. form deep layers of ooze over great areas. There are also many dinoflagellates (some brilliantly phosphorescent). jellyfishes and polychaete worms. Pelagic crustaceans include immense numbers of copepods. many of which are very small forms subsisting on diatoms. Pelagic mollusks are largely pteropods and cephalopods (squids, etc.). Tunicates (sea squirts, etc.) are abundant. Pelagic fishes include many herrings and allied forms, many mackerels and flying fishes.

The mid-water fauna is necessarily composed of free-swimming animals. It includes certain radiolarians and jellyfishes. Among the crustaceans are many prawns, often bright red in colour. Mollusks include pteropods and squids. Fishes are abundant; many of them have very large eyes; others, very small ones. Many of these fishes have light-producing organs.

The bottom-living or abyssal fauna includes representatives of most of the phyla of animals. Primitive glass sponges (hexactinellids) are nearly confined to this habitat. Many other animals are peculiar in structure and more or less restricted to deep water: the fishes (angler fishes, etc.) are extraordinarily modified. In this fauna. too. light-producing organs are common.

Horizontal Distribution.—The horizontal (true geographical) distribution of marine animals is also ecologically complex. A distinction must be made between the faunas of the deep sea and those of shallow coastal water. The distribution of coastal faunas is influenced by local features such as the nature of the bottom, the salinity and acidity of the water, temperature. currents. etc.

The broadest patterns of distribution of marine animals are determined by temperature and by certain physical barriers. The temperature zones are of course complexly modified by ocean currents; in general, the following zones can be recognized by their faunas (at least in the upper strata of the sea and along coasts): tropical, north and south temperate, and arctic and antarctic. The faunas of great depths are probably much less zoned because the water is almost uniformly cold. The fauna of the tropical zone is interrupted by barriers. The Americas form a continuous barrier of land across the tropical oceans; however. the barrier has less eifect on present distributions than might be expected, Many rather closely related marine animals occur on opposite sides of Central America; evidently, many of them were able to pass through the ocean gap that, until geologically recently, separated North from South America. The deep and wide Pacific ocean has been a more important barrier for shallow-water animals. The reefs and coastal waters between southern Asia and Australia, and eastward into the western Pacific, have an enormously rich fauna, which is much richer than, and in many ways different from! the corresponding fauna of the west coast of North America; evidently the central Pacific made crossings unlikely. Africa now separates the Indo-Pacific fauna from the Xtlantic. Fossils show, however, that much of this fauna once extended through the former Tethys sea from the Indian ocean to the Mediterranean and that the absence of large parts of this fauna from the Xtlantic is the result of progressive extinction and impoverishment during the climatic changes of the Tertiarv.

V. PATTERN OF DISTRIBUTION

1. Factors Directing Distribution.— The present main pattern of distribution of land animals. expressed in the system of realms and faunal regions, has exidently been produced by one main process limited and modified by two phqsical factors. The process has been the evolution of different groups of animals in different places, and the spread of successive dominant groups over part or all of the world. Each new group tended to replace earlier ones which often became discontinuously distributed before they became extinct. Comparatively simple examples of this among fresh-water fishes and frogs have been discussed above (*see* figs. 1, 2, 3). The process among some other vertebrates, including many mammals, has been kaleidoscopically complex. The principal physical factors that have limited and modified the pattern are zonation of climate and barriers of salt water. These factors have affected the distribution of all classes of vertebrates The distribution even of narm-blooded vertebrates is profoundly influenced by climatic zones; and the spread even of flying birds. by water barriers.

2. The Existing Pattern and Its Meaning.— The existing main pattern of distribution of land animals has been determined by modern climates and barriers. not by ancient situations. The existing pattern has evidently been formed by very complex movements of animals over the world approximately as it is now, not over extraordinary land bridges or drifting continents. Nevertheless, properly interpreted, the distributions of animals now and in the past (as shown by fossils) reveal important things about the distribution of climate and land in the past. The distributions of existing animals can reveal only rather recent situations and events. A time limit is set by the ages not of the animals themselves but of their distributions. A group of animals that dates from the Rlesozoic may have redispersed many times since then, and its present distribution may be geologically very recent. with no trace of a Mesozoic pattern left. Strictly fresh-water fishes disperse over land more slowly than any other vertebrates. Their present distribution may still reflect Cretaceous geography: it is doubtful whether the present distributions of any animals reflect a period more ancient than this.

More than 100 years ago Edward Forbes and Darwin showed how the advance and retreat of continental ice sheets during the Pleistocene alternately drove arctic animals southward and then allowed them to return northward again, leaving relict populations of arctic insects. mice. etc., on cold mountain tops in the temperate zone: *e.g.,* on the Alps in Europe and on Mt. Washington in New Hampshire. The existence of these arctic relicts on mountains is one of many details of the present distribution of animals that contribute to the reconstruction of the history of the Pleistocene ice age. The occurrence on islands in many parts of the world of faunas of continental type proves that the islands were recently connected to the continents and is part of the proof of a world-wide lowering of sea level during Pleistocene glaciation. Darwin also deduced, from the present occurrence of related species of plants and animals in temperate Eurasia and North America, that before the Pleistocene the northern parts of the world were warmer than now and that there was probably a land connection between Asia and North America, across Bering strait. Later zoogeographers have confirmed this. G. G. Simpson showed (1947), by comparing successive fossil mammal faunas of Europe, Asia and North Xmerica and finding when exchanges have occurred. not only that the Bering connection existed during much of the Tertiary and Pleistocene but that it was broken and remade at specific times. He showed further that many mammals crossed the connection early in the Tertiary but that fewer and fewer did so in successive epochs; this is part of the evidence that there was a gradual rather than sudden cooling of northern climates before Pleistocene glaciation.

The distribution of mammals now and in the past reveals the Tertiary history of South Xmerica and Australia. There is a good fossil record of mammals in southern South Xmerica through most of the Tertiary. During most of this time South American mammals were so different from those on other continents that South America must have been isolated by water barriers. Almost at the end of the Tertiary, however, numbers of North American mammals suddenly appear in the fossil record in South America, and South American mammals appear in North America. This indicates that South America was an island through most of the Tertiary and that the existing connection with North Xmerica was completed in the Late Pliocene. Australia has yielded almost no record of its Tertiary vertebrates. However, its present lack of placental mammals, except rather récent rodents and bats, and the abundance of fossils of placentals in other parts of the world (including South America) since the beginning of the Tertiary. proves that Australia has been an island at least since then. These facts dispose once and for all of any paleogeographic theory that connects South America or Australia to other continents or to each other during the Tertiary. Zoogeographic evidence of the state of the world before the Tertiary is less decisive. Known facts can be reconciled with a pattern of continents and climatic zones in the Mesozoic arranged as now (with only details different). The facts. however. leave a possibility (not a probability) of a fundamentally different pattern of land, possibly even continental drift, early in the Mesozoic. or before.

Animal distribution gives evidence that evolution has occurred and also indicates where and how it occurs most effectively. Dominant animals: the great groups that evolve and spread and replace older groups, seem to evolve primarily on the great continents and spread to smaller continents and islands. The flow of animals from continents to islands is part of the confirmation. There is certainly a correlation between area and evolution: the larger the area, the more effective the evolution of dominant animals. There is probably a correlation also between climate and evolution of dominant animals, although zoogeographers disagree as to whether dominant groups evolve more in the tropics or in the north temperate zone. Area and climate are correlated with size of faunas, size of populations and structure (at least density) of populations. Zoogeographers hope to use these correlations to discover fundamental things about the evolutionary process and about the situations and population structures that influence it.

ZOOLOGICAL COLLECTING. The professional collector. who has developed special techniques of animal procurement and preservation will find little information in this article, which is a general treatise directed at the beginning collector and the amateur naturalist.

Land and Fresh-Water Animals.— In the pioneer 18th century, zoological collecting was so much focused on birds and mammals and large reptiles that the early manuals of taxidermy all include the collection of museum specimens of fishes and insects as a matter of course. and refer to the preparation of mammals and birds as mounted specimens as a part of museum collecting.

The nature of the museum specimens used in the study of birds and mammals brings their preparation more directly into the field of taxidermy. and the museum taxidermist may be charged with collecting such specimens as well as specimens required for exhibition. It will fall to the province of museum taxidermists to aid in the preparation, repair and conservation of the bird and mammal skins preserved for study (see TAXIDERMY).

The accumulation of private collections of bird skins is discouraged by the necessary protection of songbirds from indiscriminate and wanton killing. Certain birds, however, like the English sparrow and starling and the various game birds, which can be hunted under legal restrictions, serve for the amateur who wishes to learn to make a study skin. The use of borax as a preservative avoids the necessity of using the dangerous white arsenic.

The essential requirement for such skins is accuracy of record —the locality. date, collector's name, colours of eye. bill, any bare skin, feet, breeding condition and any other notes that contribute to the natural history of the species. The essential data are placed on a label attached to the skin; a good collector will keep a catalogue record of his specimens with additional notes. A considerable series of specimens of each species of bird is a necessity, as the plumages of male and female vary with age and with the season. Nestlings, if collected, should be preserved in alcohol; they should never be collected unless positively identified as to species.

Birds' eggs were formerly greatly in vogue for private collections. All migratory birds in the United States and Canada are now strictly protected by state and federal laws against the collecting of their eggs, which may be taken only by special permit for scientific purposes. Even with such permits. egg collecting is to be discouraged, since large collections exist in almost every museum, and additional specimens are not required for scientific studies.

No restrictions apply to the collecting of small mammals such as mice, gophers, moles and shrews; and the larger game mammals and the fur hearers can also be collected during the legal season for hunting them. which varies from state to state. The study specimen of a mammal includes the cleaned skull with the prepared study skin, and a system of numbered tags required to identify the associated skulls and skins properly. In the study of mammals. specimens preserved in alcohol or formalin may supplement the dry skin and skull, and such specimens are especially important in the bat group. in which the peculiar skin characters of the head and wing membranes are largely lost in drying. Juvenile specimens. especially the newborn young, should be similarly preserved rather than skinned. Skeletons also form a desirable supplement for any adequate study of a species of mammal. and are essential for the use of the taxidermist in the preparation of a mounted specimen. Thus an adequate representation of a single species of mammal. as for birds. will require a considerable series of specimens. For small mammals and birds, powdered borax, liberally applied to the inside of the skin while skinning. will be sufficient as a preservative.

The collecting of mammals involves a great variety of techniques of hunting and trapping. For all small forms the ordinary spring mousetrap is the most essential equipment, but it is essential to use the oversize "museum special." as the ordinary trap is quite certain to strike the animal across the skull and ruin this most essential part of the specimen. Shooting. snaring, capture in live traps, pitfalls and other methods, limited only by the ingenuity of the hunter. will be required for the collection of mammals of different sizes and varying habits.

Fishes, amphibians and reptiles collected for study, except for skeletal material (and except for very large specimens), are preserved by placing the entire animal in alcohol or formalin. For permanent storage it is essential that all formalin specimens be transferred to alcohol. Labeling may consist of numbered tags of metal (pure tin or aluminum), of special waterproof paper or of parchment. Such numbers must be accompanied by a carefully kept catalogue for the corresponding information about locality, etc. Field labels written with soft pencil on slips of bond paper, if wrapped with the specimens so that they cannot rub, are satisfactory. The principal attention required for good preservation of such specimens is that the body cavity and thick muscular parts of the body must either be injected with the preservative. with a large hypodermic needle. or must be opened by means of ample cuts to permit the fluid to enter. Specimens immersed in preservative must be examined for the first few days until they are firm; any portion that remains soft will require further opening or transfer to fresh preservative.

Skulls and skeletons of such large creatures as crocodiles and alligators. large turtles and of large reptiles in general are especially desired by museums. For field collecting such material needs only to have most of the flesh removed. the brains extracted from the skull and the roughed-out skeleton or skull dried. Protection from flies and from offensive decay is accomplished by rapid drying. but in wet climates thorough soaking in horax solution or rubbing with dry borax. drying over fire and packing into sealed containers may be essential. Paper labels for such material must be protected from rubbing.

See *Handbook of Instructions for Collectors*, British Museum *(1921)*; R. M. Anderson, *Methods of Collecting and Preserving Vertebrate Animals*, 2nd ed. *(1948)*. (K. P. S.; X.)

Marine Animals. — Marine collecting presents special problems because of the vastness oi the sea. the great depth at which many of the animals live and the difficulty of caring properly for many of the delicate forms while in the field. The marine collecting area comprises about 71% of the earth's surface, and most parts can be reached only by seagoing vessels. About 77% of the bottom area is covered by water over 9.800 ft. (nearly two miles) in depth, and the greatest depth is over six miles. Animal life is found not only on the bottom but also to some extent throughout the entire water mass, hence collecting on the high seas must be adapted to all of these circumstances, and it is therefore an undertaking for specially organized and equipped expeditions. However, a most important part of marine collecting can be done with simple equipment in the intertidal zone or in shallow coastal waters. Fortunately, also. it is there that the greatest abundance and variety of plant and animal life is produced. The great depths are relatively barren.

The earliest large-scale marine collecting expedition was that of H.M.S. "Challenger," 1873–76. during which time vast areas of the Atlantic and Pacific were explored. Since then much marine collecting has been done by research ships of various nations, and animal life has been collected and studied from many positions in all oceans. but vast coastal and oceanic areas are still unexplored by collectors. In all of these expeditions the collecting has usually not been an end in itself hut rather a necessary part in gathering data of importance to fisheries or to general marine biology (*q.v.*).

Methods and Gear Used in Collecting. — Intertidal and shallow-water collecting for butturn-living animals requires only simple equipment. Where the bottom is composed of mud and sand. a long-handled shovel or rake is needed for digging out the burrowing forms and a screen ior sieving out the smaller animals from the loose material. A mixture of mud and sand usually yields more animals than does a beach of pure sand. The latter. however. is not without its characteristic type of life and sometimes in surprising numbers, especially certain worms (*Thoracophalia*, for example). the little sand crabs (*Emerita*, etc.). the wedge shells *Donax* and. at high-tide level. the sand hoppers. The animals that are found on mud-sand bottoms are numerous and varied. Commonly they are of the burrowing types. such as clams and worms, and their presence is revealed to the collector by little characteristic mounds, holes or markings on the surface of the mud. The best collecting for variety of forms is, however, on rocky or coral reefs. There a strong chisel-edged bar is useful for prying loose limpets, mussels, sea stars and many other forms that are attached to the rocks. or for breaking up old coral and shell encrustations or for rolling over rocks to expose retreats that usually teem with life.

The tide pools left by the receding tide yield many additional forms including nudibranchs. fishes and cephalopods. The attached algal plants should be searched for the many animals that attach to or hide among their fronds. Eel-grass (*Zostera*) beds in shallow water are favorite collecting places. There attached to or living among the leaves can be found an abundance of hydroids, bryozoa and skeleton shrimp, as well as such characteristic eel-grass inhabitants as the sea anemone *Epiactis* and the sessile jellyfish *Haliclystus*. Dip nets or hand seines drawn through .the eel grass are sure to capture a variety of small fish and invertebrates.

Among the more profitable collecting places are the submerged portions of wharf piles or floats where fouling organisms and the animals associated with them can be scraped off with rakes or dip nets. There the wood too should be examined for the destructive wood-boring forms such as the shipworm *Teredo* and the gribble *Limnoria*.

Shallow-water benthic animals are often cast up on the beach by action of waves during storms. and sometimes also pelagic forms normally found only on the high seas are drifted ashore in this way. The collector takes advantage of this and also watches for the many small animals that he can find among the rootlike holdfasts of deep-growing seaweeds that have been torn loose from the bottom and drifted onto the beach.

Deepwater collecting for benthic animals requires special equipment operated from boats provided with winches for reeling in line. The standard equipment includes dredges or trawls. The dredge consists of a strong iron frame to which a bag or net of strong web or wire screen such as hardware cloth is attached. This bag retains the animals that are scooped up from the bottom by the edge of the dredge frame as it is dragged forward over the bottom by a long wire cable or rope operated from a winch aboard a slowly moving ship. The edge of the frame may be constructed with flares or teeth to dig into the bottom. Usually the frame is rectangular and is about two to five feet in length, depending upon the size of boat and winch facilities. The trawl, a modification of the dredge, is designed to fish free in the water or to skim over the bottom rather than to dig into it. There are three main types: the beam, the Agassiz and the otter trawls. In the beam trawl the mouth of the net is held open by a beam of iron or wood so arranged as to glide over the bottom on sledlike runners, while a lead line holds the lower lip of the net in contact with the bottom. The Agassiz trawl is a modification of the beam trawl. In it the mouth of the net has both upper and lower lead lines, hence it fishes properly no matter which side of the trawl is applied to the bottom. For scientific collecting a 10- or 1j-ft. beam is ample but for commercial fishing the beam may be much longer. In the otter trawl the mouth of the net is held open by means of otter boards so arranged that they are forced apart by the water when being towed forward by a line attached to each.

The collecting of pelagic animals may be considered in two parts: (1) the floating animals (zooplankton) and (2) the strong-swimming animals (nekton).

The zooplankton, composed mainly of such feeble snimmers as copepods, euphausiids, chaetognaths, various larvae and the dinoflagellates, is collected in various ways all of which utilize some type of screening device, such as the plankton tow net. In simple form the tow net consists of a ring to which is attached a conical bag of gauze, usually of silk bolting cloth which is so woven that the screening apertures are uniform and not readily changed in size. When the net is drawn through the water, the organisms are screened out and concentrated in a bottle or jar fastened into the apex of the net. There is a great range in-size of plankton organisms, hence the fineness of the net used is determined by the minimum size of the animals to be caught. For general zooplankton collecting a no. 8 type bolting cloth with screening apertures of about 0.205 mm. is practicable, though many of the smallest organisms escape. Some protozoan iorms, for example the smaller ciliates and dinoflagellates, pass through the finest nets. To obtain a quantitative estimate of these small members of the plankton, it is necessary to collect them by means of centrifuging a known quantity of sea water.

For collecting planktonic animals from subsurface levels, closing nets are used. These can be lowered to the desired depth and there opened by means of a special mechanism operated by a "messenger" which glides down the towing wire. When the tow is completed the net can again be similarly closed to prevent any further fishing while it is being hoisted to the surface.

For collecting fishes and other nektonic animals, nets, seines, hooks and harpoon; are used, hut these are best considered under fisheries (*q.v.*), nets and seining.

The use of lights ior attracting and collecting sn-imming animals at night sometimes yields many forms not readily collected during thr daytime. Even some bottom-living forms may swim to the suriace where they can be scooped up with hand nets.

Care of Material Collected.—A definite part of the task of collecting is the care of the material while in the field or en route to its destination in the laboratory, museum or aquarium. Unless means are available for a steady or frequent change of fresh sea water in which to keep the animals, most of them soon die. Benthic animals when crowded into a bucket, as is often done! usually survive best ii covered with wet seaweed rather than with water which soon becomes warm and exhausted of its oxygen or charged with metabolic wastes. If the animals are of a flabby type and need the support of water, a quantity of sea lettuce (*Ulva*) kept in the bucket with them is oi aid. Intertidal and tide-pool animals are the hardiest and should be collected for aquarium specimens in preference t the more delicate forms oi deep water. On expeditions or on long collecting trips most or all of the material will need to be preserved in a manner consistent with its iuture use ior study or display. Alcohol, 70%, is the best general preservative, but formalin is more economical and serves as well where some hardening of the tissues is not deleterious. Five parts formalin to 95 parts sea water is suitable to preserve most small animals. Basic formalin may be used for organisms such as the foraminifera and echinoderm larvae with delicate calcareous skeletons if alcohol is not available.

See H. U. Sverdrup *et al.*, *The Oceans: Their Physics, Chemistry, and General Biology* (1944). (W. J.; X.)

ZOOLOGICAL GARDENS (Zoos), institutions in which live animals are kept in captivity. Zoological collections were in the latter part of the 20th century favourite places of entertainment, relaxation and education with city dwellers in many countries of the world. Usually featured were the more exotic animals, and sometimes birds and fish (see AVIARY AND AVICULTURE and AQUARIUM). As urban children became more and more cut off from natural surroundings, however, and began to think of milk as coming from a bottle and knew the word "lamb" only as a Sunday roast, it became general practice also to display the more common types of domestic animals.

An innovation to many zoos was the children's zoo, a collection of small and tame animals available to juvenile visitors to play with and to feed. These children's zoos usually have one or more attendants, and adults are not allowed to enter without having children with them.

Roadside zoos also became very popular in the 1950s. These were available! along major highways! to motorists for rest and recreation, some of them being very extensive. One game farm at Catskill, N.Y., for instance, exhibited 1,700 animals, including monkeys, giraffes and a large group of kangaroos. Hoofed stock numbered more than 1,000 animals, many of which were hand-raised and could be petted by visitors.

At the same time, zoos in general were growing and increasing. There were no less than 30 in the United States, and such remote regions as Khatmandu in Nepal and Lahore, Pak., were making notable improvements. Attendance and interest also increased. Some zoos, such as those at Tokyo, Japan; Washington, D.C.; and Lincoln park, Chicago, had 4,000,000 or more visitors a year.

History.— The custom of keeping collections of living wild animals is as old as recorded history. In ancient China, Wen, the first king of the Chou dynasty, in the early part of the 12th century B.C. maintained near his palace a "garden of intelligence" in which were exhibited specimens from the various provinces in the empire. In ancient Egypt menageries were kept as adjuncts to the temples, but the Empress Hatasu in the 18th dynasty had a "garden of acclimation" and sent a fleet to the land of Punt (the first expedition for live animals), that brought back dogs, monkeys, leopards and giraffes. An obelisk in the British museum describes the capture of animals by Xshur Akbar, one oi the early kings of Nineveh. The animals were brought to the capital and "by each animal was placed its name." Solomon had his monkeys and peacocks, and Nebuchadrezzar his lions.

Ancient Greeks maintained collections of birds, and later, of mammals; Xristotle kept a collection of live things secured for him by the men of Alexander's army. The Romans had collections far exceeding in numbers anything of today, with hundreds of lions, tigers and leopards. Most of these were used in the arenas in gladiatorial and other combats. In 29 B.C. Octavius Augustus, quite an amateur of natural history, maintained a collection of 420 tigers, 260 lions, 600 African animals including cheetahs, panthers and other carnivores, 1 rhinoceros, 1 hippopotamus, several seals, bears, elephants, eagles, 36 crocodiles and "1 serpent 2j metres long." During medieval times zoos were again restored, sometimes as civic institutions, as in Florence, but more often as private menageries of the nobility. In 797 the caliph of Baghdad, Haroun el Raschid, sent an elephant and some monkeys to the emperor Charlemagne. In the 13th century Marco Polo reported the collection of lions, tigers, leopards, hippopotamus and wild asses in Kubla Khan's palace at Xanadu, and another menagerie with stables for elephants and rhinoceros. Henry I (1100–35) established a royal menagerie at Woodstock, Oxfordshire, Eng. Later this was transferred to the Tower of London. In 1829 the animals were taken over by the Royal Zoological society, and this collection was the origin of the famous zoo at Regent's park, London. Rulers in continental Europe maintained royal menageries at Madrid, Vienna, Versailles and elsewhere. Pope Leo X had a menagerie in the Vatican. Monkeys and civet cats are listed, and he received an elephant as a present from Manuel I of Portugal. Zoos were established in 1554 by the elector Augustus I at Dresden, by Frederick William in 1640 at Potsdam, by Prince Eugene of Savoy at Belvedere, Aus., in 1716; and in 1752 the imperial menagerie was founded at Schönbrunn, Vienna. Louis XIV appropriated £5,400 a year for the upkeep of his menagerie at Versailles, which received presents of animals from numerous French emissaries abroad. Louis XV had little interest in the zoo, although in 1770 a two-horned rhinoceros arrived, the first seen in Europe since Roman times. In 1793 the Jardin des Plantes was established in Paris in connection with the museum of natural history. In the 19th century, zoos were established in numbers throughout the world.

Africa.—In Egypt, the zoological garden at Giza. Cairo, consists of a beautiful park and a large collection, chiefly of African mammals, maintained by the government. The zoological garden at Khartoum. Sudan, is maintained by the municipality and is one of the few old-world zoos to which admission is not charged. The game department of the Sudan controls the collection and from time to time supplies fine specimens to other institutions. The large zoo at Pretoria. U. of S. Af., is supported by the government, and there is an excellent collection also at Johannesburg. After World War II zoos were established at Leopoldville, Stanleyville and Elisabethville in the Belgian Congo.

North America.—Many of the zoos in Mexico, Canada and the Cnited States are of considerable size. In Canada, the Quebec Zoological society exhibits a collection made up chiefly of Canadian species; Toronto includes numerous exotic species. and at the annual Toronto exposition a children's zoo is one of the most attractive features. In Mexico, kings of the Aztecs had zoological collections before the Spanish conquest, and a zoo is still maintained at Chapultepec. There is a new and excellent collection in Havana, Cuba, and a modern zoo in Ciudad Trujillo, Dominican Republic.

In the United States, nearly all large cities have zoological gardens, the first of these. at Philadelphia. having been founded in 1859 and opened to the public in 1874; Cincinnati followed. Some of the larger zoos are in the Bronx (New York city), St. Louis, Detroit, Chicago—one in Lincoln park and a magnificent display at Brookfield—and San Diego. These exhibit some of their collections in open-air, barless pits of the type originated by the Hagenbecks at Stellingen, Ger. These zoos are supported by grants from their respective cities and from funds of local zoological societies. Some charge admission, the proceeds of which are devoted to the institution. The profits from refreshment stands are sometimes used for the purchase of animals. The National Zoological park in Washington, D.C., was established in 1890 by congress "for the advancement of science and the education and recreation of the people," and is supported by the U.S. government. The park itself consists of 17j ac. of hills and woods with Rock creek flowing through. It contains several modern buildings and a large collection of specimens.

South America.—At Buenos Aires there is an extensive collection maintained by the federal district. There are other notable zoos in Chile and a small but beautiful zoological-botanical garden at Belém, Para; Braz., specializing in Amazonian birds and animals, supplements the National zoo in Rio de Janeiro.

Asia.—The zoo at Alipore, Calcutta, was established in 1875 by the government of Bengal and is the largest in India. There is an outstanding zoo at Bombay, and an excellent one at Karachi, Pak.; and many of the princes maintain private collections. Singapore, Batavia and especially Surabaja have interesting zoos. There is a good collection at Johore Bahru. Most of the Asiatic zoos destroyed by bombing in World War II were restored and some were improved after the war. In Japan there are three dozen zoological collections, large and small, as well as numerous private aviaries. Notable ones are at Tokyo, Nagoya; Kyoto, Osaka and Kobe; the last-named is situated on a hill overlooking the city and harbour.

Australia and New Zealand.—There are large zoological gardens at Sydney, Melbourne, Adelaide and Perth in Australia; smaller ones at Brisbane (Austr.) and at Wellington and Auckland in New Zealand. The one at Wellington has a well-selected group of New Zealand fauna.

Europe.—Zoological gardens are favourite public institutions in many cities of Europe. In France a modern and model zoo was built at Vincennes for the Paris exposition in 1937. The Jardin d'Acclimatation was founded in 1858 in the Bois de Boulogne. The old Jardin des Plantes in Paris was improved between 1918 and 1939, with some new buildings and an outstanding vivarium for the smaller creatures. Switzerland has three zoos, at Basle, at Berne and at Zurich; the last is attractively arranged in a series of terraces. In Germany. in the years between World Wars I and II, a great deal of development was done in approximately 20 zoos. The larger ones are at Berlin. Frankfurt-on-Main. Munich (the Geo-Zoo, so-called because the animals were grouped according to continent of origin), Dresden, Leipzig and Cologne. The Hagenbeck Garden at Stellingen became an outstanding show place and animal distributing centre. Smaller but attractive zoos are at Dusseldorf. Wuppertal and Hanover. Several of these were destroyed by bombs during World War II but all were restored, and some improved, after the war, except Dusseldorf. Vienna boasts of the Schonbrunn. the oldest zoo in Europe. Budapest maintained an attractive collection with especially fine groups of European birds. At Antwerp a large menagerie was founded by the Royal Zoological society in 1843. In England the most notable zoo is the garden of the London Zoological society in Regent's park. The park is small but the collection has always been one of the finest. The society also has a large open-air zoo at Whipsnade, where herds are maintained rather than individual specimens. Manchester, Bristol, Chester and Paignton have smaller zoological parks. The Edinburgh zoo, beautifully situated in hilly terrain, is famous for its extensive collection of penguins. The zoo in Dublin is famous for its lions—more than 100 were born there during the 19th century. In both Amsterdam and Rotterdam important zoological gardens were established. the former being larger and with a magnificent collection from the East Indies, as well as a fine aquarium. The Skansen zoo in Stockholm is built on an elevated area reached by an escalator. and limits its exhibits to the fauna of northern Europe. At Moscow is the largest of the 25 zoos in the U S S R., with superb collections of northern animals and a good representation also of exotic species. This zoo is divided into two parts, one of small enclosures, and the other with large paddocks for herds of ruminants. Most of the cities and large towns in Europe have some sort of zoological collection maintained by the cities, by local societies or sometimes as commercial enterprises. In Rome there is a large and very popular zoo with a number of barless pits. Lisbon has a zoo, specializing in the animals of Angola and Mozambique. There are zoos in Spain at Barcelona and Jerez de la Frontera, while in Madrid remain parts of the original royal menagerie.

Management of Zoos.—The first object of a zoological garden is the exhibition of its collection to the public. A few animals well shown are immensely more attractive than great numbers inadequately housed and cared for. Considerable research has been done on conditions leading to the welfare of these animals. Studies in diet, ventilation, lighting, heating. artificial sunlight, glass penetrated by ultraviolet rays, and air conditioning have improved conditions in many zoos. Some maintain biological laboratories for research on various phases of animal life and diseases of animals in captivity, and many volumes of natural history have been based on studies made in zoos. As the welfare of animals depends in general upon the same conditions as the welfare of human beings, some of these studies are of value to medical science. A great deal of work has been done in zoos on experimental animal behaviour. Some zoos are associated with museums that preserve animals which die in the zoo. Many species new to science have been described from captive specimens.

Hediger, *Wild Animals in Captivity*, Eng. trans. by G Sircom (1950) and *Psychology of Animals in Zoos and Circuses*, Eng. trans. by G. Sircom (1955); R. Bigalke, *National Zoological Gardens of South Africa* (1954); P. Street, *London Zoo* (1956); G. Schomberg, *British Zoos* (1957); *International Zoo News* (bimonthly magazine). Guidebooks are published by nearly all zoos.

(W. M. Mn.)

ZOOLOGICAL NOMENCLATURE is the system by which names in Latin form are applied to the various divisions of the animal kingdom, especially those of genera and species. Names of higher groups, such as orders, classes and phyla, are relatively few in number and are often determined by common consent rather than strict rules. Although essentially the same in principle and largely in practice, zoological nomenclature is independent of botanical nomenclature. Therefore. the use of a name in botany does not preclude the acceptance of the same name in zoology. The system is binary and (with rare exceptions) binomial, following its first consistent use by Linnaeus in the 10th edition (1758) of his *Systema Naturae*. Prior to that date animals were designated by single words or by descriptive phrases, the so-called polynomials. The advantages of a two-name system were at once recognized; one name for the genus and one for the species. Thus the genus ***Felis*** included various kinds of cats, such as ***Felis leo, Felis tigris,*** etc. With increased knowledge and refinements of classification, a third name was approved, that of the subspecies or variety to indicate a subdivision (usually geographic) of a species. This produced the trinomial, as ***Felis leo*** *senegalensis*.

In spite of the apparent simplicity of the Linnaean system there was much confusion in its early use, and in 1842 there was issued a set of rules (Stricklandian code) sponsored by the British Association of Science. This laid down certain principles which were still followed in 1945, but complications arose and practice was far from uniform. Other codes appeared, notably those of the Sociéte Zoologique de France and the American Ornithologists' union, the last extensively followed in the United States. The Americans fixed the date 1758 (Linnaeus, 10th ed.) as the beginning of nomenclature, whereas the British used 1766 (12th ed.), thus causing a lack of uniformity.

The need for world-wide agreement was seriously considered at the first International Congress of Zoology (Paris, 1889), but it was not until 1902 that an international code of zoological nomenclature was adopted and published by the congress, following the unanimous recommendation of a commission which had been appointed, consisting of 15 members (later increased to 18) representing ten different nations. The president of the original commission was the French zoologist, R. Blanchard, and the secretary the American, C. W. Stiles. The code was something of a compromise, and power to alter it was restricted to the congress with the commission limited mainly to recommendation and interpretation, but various congresses down to that at Lisbon (1935) made a few amendments, and the powers of the commission were somewhat increased. Zoologists of all countries supported the code and followed its rules so far as possible, but many cases proved so equivocal that they were submitted to the commission, which began to issue a series of "Opinions" (more than 150 by 1945), most of which were accepted and given the force of law. In special cases, the commission was empowered to make arbitrary decisions, and it began the compilation of an *official* list of generic names which was to be inviolate. A serious difficulty was the delay in obtaining decisions because of the infrequency of meetings of the congress.

The basis of the rules is the law of priority: "The name of a genus or species can only be that name under which it was first designated." With the re-examination of literature and the changing concepts of zoological groupings, the rigid application of this law has been difficult and elimination of long current names has often been necessary. However, it has been the spirit of the rules that no name be changed except upon convincing evidence. Personal opinion or preference has been largely outlawed and it has been necessary to disregard inferences as to an author's intention and to make judgment solely on his printed record.

The law of priority is not strictly applied to family names, but they are always formed by adding *idae* to the root of the name of the typical genus, and subfamily names by adding *inae,* as Felidae and Felinae from *Felis*. A subgeneric name is governed by the same rules as those applying to generic names! but when written is enclosed in parentheses after the generic name, *e.g., Felis (Lynx) canadensis.*

A proper name following a specific name is that of the authority or first proposer of the specific name; if his name be in parentheses it indicates that the species was originally described under a generic name different from the one now combined with it; *e.g., Psittacus linnaei* (Wagler *j*.

(W. H. O.)

ZOOLOGICAL SOCIETIES. International congresses of zoology, entomology and ornithology meet at irregular intervals and at different places. The first International Congress of Zoology met in Paris in 1889; subsequent meeting places were Moscow, 1892; Leiden, 1895; Cambridge, Eng., 1898; Berlin, 1901; Berne, 1904; Boston, 1907; Graz, 1910; Monaco, 1913; Budapest, 1927; Padua, 1930; Lisbon, 1935; Paris, 1948; and Copenhagen (the 14th), 1953. All published one or more volumes of proceedings. The International Congresses of Zoology maintain the International Commission on Zoological Nomenclature as one of their principal functions. The first International Congress of Ornithology was held at Vienna in 1884, with succeeding congresses at Budapest, 1891; Paris, 1900; London, 1905; Berlin, 1910; Copenhagen, 1926; Amsterdam, 1930; Oxford, 1934; Rouen, 1938; and Uppsala, 1950, with published volumes of proceedings. The International Congresses of Entomology began with one in 1910 in Brussels, followed by those of Oxford, 1912; Ziirich, 1925; Ithaca, N.Y., 1928; Paris, 1932; Madrid, 1935; Berlin, 1938; Stockholm, 1948; and Amsterdam, 1951, each with one or more volumes of published proceedings.

Among regional and local zoological societies, those formed to maintain zoological gardens and public aquariums form a unique, though not necessarily exclusive, category. Such societies may have only a minority of zoologists in their membership (or even none at all). Zoological gardens and aquariums, however, form two of the important focuses alike of zoological education and research. Zoological gardens are maintained by the Zoological Society of London at Regent's park and Whipsnade, with an aquarium in Regent's park. The New York Zoological society, with zoological gardens in the Bronx, long maintained an aquarium in lower Manhattan. Examples of other societies maintaining zoological gardens are: Zoological Society of Scotland, with gardens in Edinburgh; Zoological Society of Ireland, with gardens in Dublin; Zoological Society of India, with gardens at Alipore; Zoological Society of Amsterdam; and in the United States, the zoological societies of Philadelphia, San Diego and Chicago. The number of such societies is large.

The more essentially scientific zoological societies fall into two sharply distinguished categories. The first is specifically local, as in London or New York city. These societies may be quite informal groups of local naturalists, like the Baird club of Washington, D.C., or the Kennicott club of Chicago; or they may be well established in buildings of their own, with libraries, museums or zoological gardens and often with a publication, or even with several scientific journals (the Zoological Society of London publishes the invaluable *Zoological Record*).

The second type of zoological society is an association of specialists in a given field, national or international in scope, that changes its address with every change of administration. These societies are frequently formed in order to establish and carry on a journal, often the principal journal in the special field. Such societies do not ordinarily maintain libraries. Examples are the American Ornithologists' union, publishing the Auk, the British Ornithologists' union, with the *Ibis,* and the American Society of Mammalogists, with the *Journal* of *Mammalogy.* National societies for zoology in general are represented by the American Society of Zoologists; the Deutsche Zoologische Gesellschaft; the SociCtC Zoologique de France; the SociCtC Royale Zoologique de Belgique; the Nederlandsche Dierkundige Vereeniging; and the Zoological Society of Japan, all with important journals.

A further category of zoological associations is represented by the acclimatization societies, some of which maintain zoological gardens, like the Royal Zoological and Acclimatization Society of Victoria (Austr.), or a journal, like the Société National d'Acclimatation de France with its *Bulletin,* published since 1854. The acclimatization societies of Australia and New Zealand played an extraordinary role in the establishment of foreign species of animals in those countries, often with the most unexpected and disastrous results. Many such societies were transformed in part into societies for the protection of native animals. Some societies exist for a single species of animal, like the International Society for the Preservation of the Wisent. Others devoted especially to conservation are partly or mainly zoological in their interests.

Ornithological societies are extremely numerous. In addition to the national organizations like the British Ornithologists' union and the American Ornithologists' union, with corresponding societies for most nations of the world, there are state and regional societies, many with publications. Notable among these in North America are the Wilson Ornithological club, which publishes the *Wilson Bulletin,* and the Cooper Ornithological club. with the *Condor*. The National Association of Audubon Societies, with headquarters in New York city, publishes the *Audubon Magazine,* the prototype of many popular or semipopular journals for amateur ornithologists. Among the ornithological groups there are further various avicultural societies, with such notable journals as the *Avicultural Magazine,* published since 1894 by the British Avicultural society.

The nature of the study of insects. with its great initial emphasis on collecting, on the building up of individual collections, and thus on exchanges, has especially favoured the growth of the entomological societies. Entomology, in turn, has been greatly furthered by the societies, especially by their provision of journals as outlets for publication. Some of the principal entomological societies of English-speaking countries, with the dates of their organization, are as follows: the Royal Entomological Society of London (1833); the South London Entomological and Natural History society (1872); the Canadian Entomological society (1868); the Entomological Society of America (1907); the American Entomological society (1859); the Brooklyn Entomological society (1872); the Cambridge Entomological club (1874); the American Association of Economic Entomologists (1889); the Pacific Coast Entomological society (1901); and the Hawaiian Entomological society (1904).

Among the principal German entomological societies are: Deutsche Entomologische Gesellschaft (1855); Entomologischer Verein zu Bremen (1912); Verein fiir Schlesische Insektenkunde (1847); Entomologischer Verein "Iris" (1862); the Internationaler Entomologischer Verein (Frankfurt, 1886); Entomologische Gesellschaft. Halle (1907); Entomologische Gesellschaft fiir Hamburg-Xltona (1899); Entomologische Gesellschaft, Leipzig (1875); Münchner Entomologische Gesellschaft (1905); Deutsche Gesellschaft fiir Angewandte Entomologie (1913); and Entomologischer Verein zu Stettin (1838), the oldest of the entomological societies of Germany. Entomological societies have flourished in France from an early date; the Société Entomologique de France (1832) publishes its *Annales* (from 1832), a *Bulletin* (1896), and continues *L'Abbeille* (1890). All of the remaining countries of Europe support one or more societies devoted to the study of insects: and South America adds several important societies to the list.

Societies for the study of invertebrate animals other than insects are especially those for malacology. like the Xmerican Malacological union (1931); the Conchological Society of Great Britain and Ireland (1876); the Malacological Society of London (1893); the Deutsche Malacologische Gesellschaft (1868); and the Société Irfalacologique de France (1884–90).

There are relatively few societies for invertebrate groups other than insects and mollusks which reflects a general neglect of invertebrate zoology. In the United States there are the American Society of Parasitologists (1914); the Helminthological Society of Washington (1910); and the American Society of Protozoologists (1950).

A nearly complete list of the zoological societies publishing journals, with the libraries where these may be found, is given in the *Cnion List of Serials* (K. P. S.)

ZOOLOGY (ARTICLES ON). The article ZOOLOGY outlines the series of discoveries on which the systematic study of animal life is based. and the methods by which multitudes of species are arrayed into larger, more inclusive evolutionary patterns. Authorities differ in their methods of arranging these groups because of emphasis on different types of evidence. and classifications are subject to change as new findings are made in the laboratory and in the field. However. these working classifications have been an important stimulus to this research, and have brought the relationships between animal groups into increasingly clear focus.

Each of the phyla into which the animal kingdom is divided in ZOOLOGY is discussed in a separate article, and other surveys deal with major subdivisions. To illustrate the method of arrangement, following are examples of articles on the CHORDATE phylum:

The major division of the chordates is treated in VERTEBRATE. Among the articles on vertebrate groups is MAMMALIA. and among the articles on mammalian groups are PRIMATES, which describes the structures that man shares with his arboreal kin, and MAN. EVOLUTION OF. Individual species of primates are treated in BABOON; CHIMPANZEE; GIBBON; GORILLA; LEMUR; MANDRILL; ORANGUTAN; etc.

The flesh-eating mammals are described in CARNIVORE. and individual species in BADGER; FOX; JAGUAR; LION; RACCOON: WALRUS; WEASEL; etc. Similarly, MARSUPIALIA is supplemented by BANDICOOT; KANGAROO; OPOSSUM; WOMBAT; etc.; PROBOSCIDEA by ELEPHANT; MAMMOTH; MASTODON; etc.; RODENTIA by CHINCHILLA; GUINEA PIG: MOUSE; LEMMING; PORCUPINE: etc.: and RUMINANT by ANTELOPE; DEER; GIRAFFE; GOAT; SHEEP. etc. An order of flying mammals is described in BAT.

BIRD, a general survey of the biology of this large division of the vertebrates, is supplemented by SONGBIRD and individual articles on important species. Techniques of bird study and their history are outlined in ORNITHOLOGY. Related articles include AVIARY AND AVICULTURE; BIRD WATCHING; FLIGHT (NATURAL); MIGRATION, BIRD; NEST; WILDLIFE CONSERVATION; etc.

Another major division of the vertebrates is surveyed in FISH and treated in detail in articles on species and genera. such as CHAR; COD; FLATFISH; FLYING FISH; HERRING; PERCH: PILCHARD: SALMON; SALMONIDAE; etc. RAY and SHARK describe these cartilaginous fishes belonging to the class outlined in CHONDRICHTHYES. Related articles include AQUARIUM; FISH CULTURE: FISHERIES; FISHING; ICHTHYOSAUR; OCEAN AND OCEANOGRAPHY: *Biological Oceanography;* etc. REPTILES surveys the group of vertebrates that includes lizard, crocodile, snake and turtle. The group of vertebrates in which the frog, salamander. toad, etc. are included is outlined in AMPHIBIA.

Following is an example of a group of articles from another phylum: ANT surveys the biology of this family of insects, and refers the reader to HYMENOPTERA. a survey of the order that includes the bees. wasps and allied families as well as the ants. One of the references in this article is to SOCIAL INSECTS. which describes the communal organization of certain insect societies. The progression is to INSECT. which outlines the structures by which the various orders of insects are identified. and discusses phenomena and patterns of behaviour. ENTOMOLOGY summarizes the obiectives and methods of the svstematic study of insect life. The phylum to which the insects belong is outlined in ARTHROPODA.

The articles cited in the above paragraphs represent only a fraction of those dealing with two of the phyla, plus a selection of those of general interest. Further examples are given in ANATOMY (ARTICLES ON); BIOLOGY (ARTICLES ON); GEOLOGY (ARTICLES ON); and PHYSIOLOGY (ARTICLES ON).

Since the topic of evolution encompasses the entire world of animal and plant life, it is viewed from various perspectives The evolutionary clues contributed by fossils are discussed. in nontechnical terms, in a section of PALAEONTOLOGY. Another simple introduction, from the point of view of organisms as a whole, is given in a section of BIOLOGY. A comprehensive survey of evolutionary theories. from pre-Darwinian insights to current interpretations, will be found in EVOLUTION, ORGANIC. The contributions of Darain and his successors are outlined against their scientific and social background in DARWINISM. The history of the scientifically obsolete but politically important doctrine of the inheritance of acquired characters is given in LAMARCKISM.

Ecology, the science devoted to examining the interaction between organisms and their environment, is represented by ECOLOGY. ANIMAL and POPULATION ECOLOGY. The contributions of ecological factors to the dynamics of evolution are illustrated in ANIMALS, DISTRIBUTION OF and ZOOGEOGRAPHY. Also, articles on continents, nations and other major areas contain descriptions of animal life.

ANIMAL BEHAVIOUR discusses the study of action patterns, with reference to sensory capacity, inherited responses, intelligence, etc. Related articles include COURTSHIP. ANIMAL; HIBERNATION AND ESTIVATION; INSTINCT; MIGRATION. ANIMAL; PLAY, ANIMAL; PSYCHOLOGY, COMPARATIVE; and SOCIOLOGY, ANIMAL.

GESTATION PERIOD and LIFE SPAN, ANIMAL discuss the dominant biological factors involved, and give statistical tables.

Biographical articles throw light on the backgrounds against which the theories of DARWIN, HAECKEL, HUXLEY, WALLACE and other trail blazers were developed.

The following articles and sections of articles are recommended as a minimal reading list for an introduction to the elementary principles of zoology: ANIMALS. DISTRIBUTION OF; BIOLOGY: ECOLOGY. ANIMAL: *Basic Requirements* of *Animals;* EVOLUTION. ORGANIC; PALAEONTOLOGY: *Evolutionary Evidence;* ZOOGEOGRAPHY; and ZOOLOGY.

The technical terms of zoology need not discourage the general reader; they are essentially devices for compressing a great deal of description into the space of a single word. Even articles that seem at first glance to be overly technical will be found to contain explanations of the elementary principles in nontechnical terms. Whether the reader's objective is extensive study or a quick confirmation of fact, the Index will prove helpful; it shows the heading under which the topic is treated. and lists sections of articles as well as complete ones.

ZOOLOGY, the study of animals. The science of zoology embraces all conceivable modes of study, not only of individual animals but of entire faunas and of the relations of animals with one another, with plants, and with the nonliving environment. Because of its vast scope, zoology is usually broken up into several subsidiary subjects of which the chief ones are: morphology or anatomy, histology and cytology, embryology, paleontology, taxonomy or systematics, genetics and evolution, ecology and physiology. As special articles under these names will be found in the encyclopaedia, only a brief survey can be attempted here of the main findings in the various fields of zoology. with special emphasis on morphology and classification. (See *Organ Systems*, below; PHYSIOLOGY, COMPARATIVE.)

The article is divided into eight main sections, as follows:

I. Morphology
II. Classification
III. The Phyla of the Animal Kingdom
IV. Embryology and Homology of the Germ Layers
V. Embryology and the Theory of Recapitulation
VI. Variation, Heredity and Evolution
VII. Ecology
VIII. Economic Zoology

I. MORPHOLOGY

The study of zoology undoubtedly had its origin from the observation that there are many different kinds of animals. The more obvious and easily discovered characters that distinguish animals from one another are the external ones: differences in body shape, size and colour, character of the skin and its derivatives as scales, hair and feathers, presence of prominent sense organs, such as eyes and ears, and presence of legs or other appendages. But it soon became clear to zoologists that external appearances alone would not provide understanding of the animal kingdom; thus they were driven to a study of internal structure. Anatomical investigations were carried out at first entirely by dissection of the animal's carcass with knives, scissors and other instruments, a technique that, in skillful hands. can yield an astonishing amount of accurate information but which is necessarily incapable of revealing many structures, either because they are too small to be seen or are otherwise undiscoverable. Progress in anatomical investigation, therefore, had to await the introduction of the microscope, toward the end of the 16th century. The possibility of magnifying an animal greatly extended the scope of zoology, since it enabled the structure of very small animals to be investigated and, indeed, revealed the existence of an immense variety of microscopic animals previously unknown because they were too small to be seen with the unaided eye.

Cellular Structure of Animals.— The most important revelation of microscopical study was the discovery. through the efforts of a number of workers toward the end of the 18th century and during the first half of the 19th, that animals (and plants) do not consist of a continuous mass of material. but that their substance is partitioned off by walls and membranes into an immense number of minute units, the cells. The cells of an animal are not all alike: but occur as a number of different kinds with appropriate functions, a condition known as differentiation. Cells also do not in general occur singly; but many of one kind are united in masses or sheets termed tissues. Organs such as the stomach or liver consist of two or more kinds of tissues closely associated. Thus, the body of an animal consists of cells combined to form tissues and organs.

During the last half of the 19th century great progress was made in the study of cells. It was discovered that cells have affinities for dyes similar to those used in dyeing cloth. and that with the aid of such dyes the details of cell structure may be accentuated. Because only very thin objects can be studied with the microscope. a machine! the microtome. was devised by which small animals or pieces of larger ones could be sliced into a series of exceedingly thin sections, and these mounted serially on glass plates for microscopic examination. By the application of such microscopic techniques an understanding was attained of the internal structure of a great variety of animals. That branch of zoology which concerns itself with tissues is termed histology (*q.v.*), and that which studies the fine details of cell structure is called cytology (*q.v.*).

The discovery and study of the cellular structure of animals and plants resulted in the last half of the 19th century in a philosophy termed the cell theory. This theory exaggerated the importance of cells and considered them to be the vital units in which were vested all of the phenomena of life. An animal was regarded not as a functioning whole but merely as a collection of cells and its properties merely as the sum of the properties of the cells. Following a wide acceptance, this theory began to be questioned and discarded by the leading thinkers among zoologists, and is being replaced by the organismal conception. which maintains that the cells are simply constituent parts of an animal and that such phenomena as growth, form. reproduction, development, heredity and evolution are clearly manifestations of the animal as a whole, and cannot be understood merely by studying its cells.

Grades of Structure.— All combined methods of studying the structure of animals show that animals exist in several grades of structure ranging from simple to complex. Such arrangements are, of course, more or less artificial but they assist in enabling one to understand the animal kingdom.

In the first place it was soon discovered that animals are divisible into two great groups, those that are made of cells and those that are not.' The latter group comprises a host of microscopic animals. known as Protozoa, whose substance is not partitioned into cells, and which are thus regarded simply as consisting of one cell. In reality: they are not equivalent to a single cell of other animals but constitute complete little organisms capable of all the functions that distinguish larger animals. Their bodies may be far more elaborately organized than any of the cells of higher animals and may contain contractile and neuroid fibrils, supporting plates and fibres of a skeletal nature, and elaborate food-catching mechanisms. Although sexual processes also occur among the Protozoa. practically all of them can reproduce simply by dividing into two or more parts.

All other animals are composed of cells; although in some cases the cell walls may more or less disappear as the animal matures. These multicellular animals are termed Metazoa. They are not only composed of cells, but their cells are differentiated into a number of different kinds and are associated into tissues and organs for the performance of different functions. A metazoan animal is an individual. a unit whose cells are subordinated to the whole and are not in general capable of an independent existence or of performing all of the necessary functions.

It follows! as a necessary concomitant of the cellular differentiation of the metazoan body. that all such animals must undergo a process of development (see EMBRYOLOGY) during which this complication gradually arises. Although there are a number of cases among the Metazoa in which reproduction occurs by division or budding, much as in Protozoa, the Metazoa generally reproduce sexually. giving rise to female sex cells or eggs; and male sex cells or sperm. The egg is large, provided with food supplies in varying amounts and nonmotile. The spermatozonn is relatively very small and slender and provided with a locomotory apparatus for reaching the egg. When the egg is fertilized by a spermatozoan, *i.e.*, fuses with it, it starts upon a process of development during which it divides to make many cells, and these undergo differentiation. However, many Protozoa also produce eggs and sperm and undergo some degree of development so that the contrast between Protozoa and Metazoa is not as great as assumed during the heyday of the cell theory. There are, further, types of colonial Protozoa that approach the metazoan condition.

Among the Metazoa it is customary to set off one group, the sponges or Porifera, from the others because of their lowly grade of organization and many peculiarities of structure. Sponges are little more than loose aggregations of cells covered over by an epithelium (*q.v.*). Although the cells of sponges show some degree of differentiation, they are mostly variants of amoeboid types and each can perform a number of different functions. Furthermore, sponges have no mouth or proper digestive cavity; they are permeated by systems of canals through which a continuous water current is maintained. On these grounds sponges are separated as a branch Parazoa from other metazoans which are then called Eumetazoa or Metazoa proper.

The Eumetazoa all have a proper mouth and digestive tube; they present many grades of structural complexity of which the lowest is represented by the group Cnidaria (see COELENTERATA). The Cnidaria illustrate the structural plan on which the Eumetazoa are based and from which the more complex members can be theoretically derived. The cnidarians are composed essentially of tissues; *i.e.*, they represent a tissue grade of construction. They consist of two epithelia back to back with some sort of cement or connective tissue between. The outer epithelium! the ectoderm, or better, epidermis. has protective, nervous and sensory functions, and the inner epithelium, the entoderm, or better, gastrodermis, forms a primitive digestive tube. Epidermis and gastrodermis meet at the mouth. Both epithelia may give off muscle fibres that lend the animal a considerable degree of motility. It is characteristic of animals of the tissue grade of construction that they are built on the plan of radial symmetry or some variant thereof (see MORPHOLOGY). Consequently they may be termed radiate animals or Kadiata.

All other Eumetazoa are constructed on the plan of bilateral symmetry, and hence may be collectively termed Bilateria. They show definite differentiation into anterior and posterior ends, and dorsal and ventral suriaces (see MORPHOLOGY). Their tissues are also more or less aggregated into organs so that they may be considered to be of the organ-system grade of construction. Between their outer or ectodermal epithelium and inner or entodermal epithelium they have a mass of mesodermal tissue that gives rise to muscles, connective tissues: and reproductive, circulatory and excretory systems (see EMBRYOLOGY).

It is customary to group the Bilateria on the basis of the number and kinds of internal cavities. The lowest Bilateria, the Platyhelminthes or flatworms, have the same solid construction as the Cnidaria; *i.e.*, there is only one internal cavity, the digestive cavity. In the flatworms the space between epidermis and digestive epithelium is filied with tissues and organs of mesodermal origin. Bilateria having this kind of solid construction are called acoelomate. The remaining Bilateria have an extra space between the digestive tube and the body wall, but it appears that this space is not necessarily the same as to embryonic origin in different groups. When this space is formed by the parting of the mesoderm so that it has mesoderm on both sides of it, the space is considered a true coelom. When, however, this space is a remnant of the blastocoel (see EMBRYOLOGY) and has mesoderm on only one side or on neither side of it, it is considered a false coelom or pseudocoelom. The Bilateria. therefore, exist in acoelomate, pseudocoelomate and coelomate grades.

It is likewise characteristic of all Bilateria, except the Platyhelminthes, that the digestive tube has a rear opening, the anus. The presence of an anus greatly increases the efficiency of the digestive tube, for there is then no mixing of food in various stages of digestion as must be the case where the digestive tube has but one opening, serving for both ingestion of food and ejection of indigestible remnants. Further, in coelomate animals part of the mesoderm attaches to the digestive epithelium, furnishing muscle layers to the latter and conferring motility upon the digestive tube. A feature seen in three groups of higher Bilateria (Annelida, Arthropoda and Chordata) is the segmentation of the body, *i.e.*, the division of the body along its main axis into a series of equal joints or segments, each of which contains a representative of the various body systems (see MORPHOLOGY).

Organ Systems.—As already intimated all of the Bilateria are provided with organ systems; *i.e.*, associations of organs for the performance of specific functions. The organ systems of the higher Bilateria are the following: integumentary, muscular, skeletal, nervous, sensory. digestive, excretory, reproductive, circulatory. respiratory and hormonal. These systems appear gradually in the lower Metazoa and attain their full complexity and functional specialization only in the higher ones.

The integumentary system comprises the skin and its derivatives such as cuticle: scales, feathers, hair and armour (exoskeleton). The essential purpose of this system is protection against the external world and against drying out of internal parts.

The muscular system consists primitively of a layer of muscle fibres running in two or more directions situated just beneath the external covering. Such a system is incapable of complicated movements but serves to shorten and extend the animal and to allow it to bend in various directions. In higher animals the muscle fibres aggregate into definite bundles or muscles that permit much more varied and exact movements.

The skeletal system is closely associated with the muscular system. being in fact derived from the same embryonic source, and functions chiefly as a support for the musculature. The skeleton. properly speaking, is an internal structure and is best illustrated in the vertebrates with their internal assemblage of cartilage and bones. Among the invertebrates, skeletal structures such as the shells of mollusks are chiefly external and, therefore, really belong to the integumentary system. Such exoskeleton also serves for muscle attachment as well as for protection.

The nervous system is a derivative of the surface covering (epidermis) and functions for the correlation of body activities by means of its power of rapid transmission. It consists essentially of nervous tissue aggregated into masses (ganglia) and strands (nerves,). It is characteristic of the nervous system of vertebrates that it is dorsal and hollow whereas that of invertebrates is ventral and solid. In the evolution of animals the nervous system gradually shifts from a superficial position immediately under the epidermis to a deeper position, to the inner side of the muscle layer.

The sensory system is that part of the nervous system that responds to external factors and transmits these responses to the central nervous system where appropriate action is initiated. The sensory system consists of a variety of nerve endings and sensory organs designed to be affected by particular external factors such as light. sound waves, odours, temperature, etc. Whereas the essential sensory part is microscopic. numbers of such parts may be aggregated with accessory structures to form conspicuous organs such as the eye, ear, etc.

The digestive system in its earliest form: as seen in cnidarians, consists simply of the inner epithelial tube, and it has only one opening, the mouth. In the metazoan series, the digestive tube becomes separated from the body wall by the formation of either a pseudocoelomic or a coelomic cavity and at the same time acquires a rear opening. the anus. In coelomate animals part of the mesoderm attaches to the digestive tube, forming muscle layers for the latter which then becomes capable of motility. Various functional regions become differentiated along the digestive tube in different animals, as a crop for storing food, gizzard for grinding hard food. stomach for the main processes of digestion, intestine for absorption, etc.; glands that secrete digestive enzymes or other substances involved in digestion occur either in the wall of the digestive tube or attached to it. Among vertebrates the liver and pancreas are conspicuous glands that embryologically are formed from the lining epithelium of the digestive tube.

The foregoing systems occur in all the Eumetazoa, but the following ones are found only in the Bilateria. The excretory system has the function of regulating the water content of the body and secondarily of removing the useless products of body chemistry, especially nitrogenous products. It consists primitively of secretory tubules the inner ends of mhich may be closed or may open into body spaces. At first the tubules obtain their excretory material directly from body spaces but with the increasing size and complexity of the animal they obtain it from the blood and the internal openings then close up. In vertebrates the tubules are aggregated into organs known as kidneys.

Although sex cells occur in all groups of animals. including some Protozoa, a definite reproductive system n·ith ducts and other differentiated parts is first seen in the lowest Bilateria (flatworms) and is characteristic of the Bilateria in general. Although very simple reproductive systems are seen in many Bilateria, in others the system reaches inexplicable complexity. The complexity is associated with internal fertilization. *i.e.*, the passage of sperm from the male to the female, and seems to indicate that such fertilization is more desirable than the mere shedding of sex cells into the water.

The circulatory system consists of a set of tubes for distributing respiratory gases and food and collecting waste materials; one or more pumping organs usually aid the process. Such a system is obviously necessary only to animals of some size and complexity because in small animals physical diffusion is adequate. Hence, the circulatory system is found only in the larger and higher Bilateria and reaches a complex development only in the vertebrates. It is filled with a fluid. the blood. which may or may not be red, and which travels in a circuit passing through respiratory organs for the exchange of gases and close to the excretory organs for the emission of wastes. The red colouring matter found in vertebrate (and some invertebrate) bloods is concerned with the exchange of gases (*see* RESPIRATION).

The respiratory system is concerned with the exchange of respiratory gases and also occurs only in the larger and more complex Bilateria since such exchange takes place by diffusion in smaller forms. Animals obtain energy for their life processes by means of oxidation; therefore. they must continually absorb oxygen or die. Carbon dioxide is emitted as a result of the oxidation process. A respiratory system is a device for facilitating the absorption of oxygen and the emission of carbon dioxide. Its essential features are a large exposure of surface to the gases and thin walls to permit easy passage of gases. Hence, a respiratory organ is a greatly folded structure of spongy, feathery or booklike appearance. It may project to the outside and is then known as a gill, or it may project into the interior, forming a lung. Gills get their gases from the surrounding medium, usually water, and lungs get theirs from the air. There are often accessory mechanisms for causing water to flow over the gills or for causing air to pass into and out of the lungs. These mechanisms are concerned with external respiration, not to be confused with the true process of respiration, mhich consists of the utilization of oxygen by the body cells.

The hormonal system consists of a number of glands or glandlike bodies that have no ducts and secrete their products. called hormones, directly into the blood. Thus they are called endocrine glands or glands of internal secretion. They are best known in vertebrates where they include the pituitary body of the brain, the thyroid, parathyroid, the islets of Langerhans in the pancreas, the adrenal glands near the kidneys and the sex glands. The secretions of these glands are necessary for the normal growth and health and for the initiation and maintenance of sexual reproduction.

The study of hormone-secreting structures in invertebrates and the role of such hormones in their biology has become in recent years an intensive field of research. In crustaceans, hormones from secretory cells in the central nervous system have been proved to control colour changes, molting and growth and probably reproductive activity. In insects, similar hormones of nervous origin control growth, molting and metamorphosis from larva to pupa and pupa to adult. Histologically similar neurosecretory cells occur in annelids and other invertebrates. *See* HORMONES, INVERTEBRATE.

II. CLASSIFICATION

The knowledge gained through anatomic and microscopic studies, plus the results accumulated in the fields of embryology (*q.v.*) and paleontology (*q.v.*), has enabled zoologists to classify the animal kingdom. Classifications were of course attempted long before the necessary knowledge was available, but only after 1850 was considerable agreement reached about the main subdivisions of the animal kingdom. classification consists essentially of grouping together animals of like structure. Although seemingly simple in principle, zoological classification is exceedingly difficult in actual practice and depends largely on the personal judgment of zoologists. The usual difficulty consists in deciding when a degree of difference is sufficient to justify the making of a different category. The classification of so-called aberrant forms, *i.e.*, individuals or small groups of animals that do not seem to fit into any of the established groups, also raises great difficulty. As a consequence, no two zoologists or zoological texts agree in all details on the scheme of classification. although a considerable amount of agreement will be found. The branch of zoology that deals especially with classification is termed taxonomy (*q.v.*) or systematics but so vast is the number of animals (probably approaching 2,000,000) that any one zoologist must limit himself to the taxonomy of a single group.

The Species.—Classification begins by separating animals into different kinds. Thus. anyone can see that the common horse is very much alike throughout the world and that it is different from the cow. This difference is expressed by regarding the entire population of horses as constituting one category, termed the species; the same is done for cows, and for other animals. Although an exact definition of the species concept has given zoologists much trouble, for practical purposes a species may be defined as a population or populations of animals that are alike in the details of their structure within close but variable limits, and that breed together, or can do so.

In the early days of classification when relatively few specimens were available for study, species seemed to be easily distinguishable from each other. But as more and more specimens were collected. and as zoologists began to study actual populations as they exist in nature, it became apparent that the majority of species do not constitute a' uniform population, but comprise a number of geographically distributed populations that differ from each other in minor details. Thus, the species in many cases really consists of a few too many geographic races or variants, usually termed varieties or subspecies, many of which were formerly considered distinct species because of insufficient collecting. It is therefore evident that to determine the content of a species and to distinguish species from each other, extensive collecting over the entire range of distribution is necessary. The interbreeding test should be applied when possible, although it is often obviously impractical. The breeding test is not. however, conclusive since individuals belonging to what taxonomists regard as distinct species do sometimes interbreed in nature.

It is believed by most zoologists (although denied by some) that the geographical variants of a species represent incipient species, and that they will become distinct species whenever they cease to breed together either because of morphological divergence of their copulatory organs or because of behaviouristic divergence.

The Genus.—The next taxonomic category above the species, referred to as the genus, embraces a number of species of sufficiently similar morphology. In short, after the species are defined and delimited they are grouped together according to similarity and each group of similar species constitutes a genus. It is clear that whereas the species has a real existence in nature, the genus is a more or less arbitrary conception. How much species must resemble each other to justify their grouping into one genus and how much they must differ to justify separating them into different genera are obviously matters of judgment on the part of the taxonomist. As a result, there is a continuous process in taxonomy of transferring species from one genus to another.

The Scientific Name.— Since the days of Linnaeus, who invented the system, it has become obligatory upon zoologists to combine the generic with the specific name to form the accepted' scientific name of the animal. This procedure is termed the binomial system of nomenclature. The generic name is capitalized; the specific name begins with a small letter. For instance, some of the cats have the generic name *Felis*, from the Latin word for cat. The different cats then each have a specific name. thus, *Felis leo*, the lion; *Felis tigris*, the tiger; *Felis pardus*, the leopard; *Felis domesticus*, the domestic cat; etc. The scientific name is constructed in Latinized form and hence is understandable throughout the world, whereas common names are confusing and inexact. and vary with language. The scientific name is, therefore, a very useful tool, since each scientific name can designate only one kind of animal; what is meant by that name is apparent to zoologists throughout the world.

Higher Taxonomic Categories.— By using more and more important characters as a basis for deciding resemblance, larger and larger taxonomic divisions can be constructed. The most important ones in common use are family, order, class and phylum. A family is composed of those genera having certain characters in common; an order is made up of families of similar construction. etc. If it is considered desirable in any particular case, these categories can be subdivided to form subfamilies. suborders, etc., or grouped as superfamilies. etc. Like the scientific name, the names of all taxonomic categories are constructed in Latinized form, usually from Greek and Latin roots. The names of families and subfamilies must be constructed from the name of their principal genus and must end in *idae* and *inae*, respectively. No rules govern the formation of names higher than family although they generally terminate in *a*.

The Phylum.——The highest taxonomic category of all is termed the phylum. which thus constitutes the primary division of the animal kingdom. Each phylum is sharply characterized by a plan of structure in the adult peculiar to it and differing from that of other phyla in such ways that in general phyla are not derivable from each other. As all animals are related to each other by descent (*see* EVOLUTION, ORGANIC), it is evident that at some time in its past history each phylum must have been derived from some pre-existing phylum. and one of the favourite armchair occupations of zoologists, especially in the past, was the surveying of available evidence for indications of phyletic relationships, a field of zoology termed phylogeny. The evidence most useful in such phylogenetic speculation is that drawn from embryology (*q.v.*) and paleontology (*see* PALAEONTOLOGY). The facts. however. arc so scanty that the various schemes of interphyletic relationships that have been advanced must be regarded merely as suggestive. At the present time in the earth's history the different phyla of animals are widely separated from each other in structural plan, and no intermediates between phyla are known except in the case of the phyla Annelida and Arthropoda.

Identification of Animals.— Through his knowledge of the structural characters on which the taxonomic divisions are based, a zoologist when confronted with an unknown animal can usually place it at least to order after a brief examination. However, the determination of the genus and species to which an animal belongs is generally a matter that calls for prolonged study, often with the aid of microscopic examination. because the characters that separate genera and species are usually minute and detailed. In general, only a specialist in the group to which the animal belongs is competent to identify it to genus and species. and identifications should not be attempted by others. The correct identification of an animal is of great importance in zoological research so that zoologists all over the world may know what animal is under discussion. Very often in the history of zoology, heated arguments have arisen over differing research results that in reality were caused by the fact that different species were being used. Experience has shown that results obtained with one species cannot safely be assumed to be applicable to another even closely related. species. Correct identification is also of great importance in the economic relations of zoology, being the first necessary step in the understanding and control of pests and parasites, and in the encouragement of useful animals.

III. THE PHYLA OF THE ANIMAL KINGDOM

The question of the division of the animal kingdom into phyla is one of the greatest importance to the zoologist because such division really expresses the state of his knowledge of animal structure. development and relationships. In the beginning of the era of modern zoology, roughly from the times of Linnaeus, the divisions proposed were highly erroneous, being based chiefly on external appearances. As discussed above, a correct knowledge of animal structure is attained only through dissection and microscopic examination. Embryological studies also are of the greatest importance (*see* below). As knowledge from these sources accumulated. the phyletic arrangement was continuously altered by a succession of zoologists. and cannot be said to have attained a stable condition even to this day. The reasons for this are. first that embryological and morphological information is still far frorn complete, and, second, that opinions differ as to what characters are the most important in defining phyla. Some zoologists tend to lump groups together so as to make a few very inclusive phyla and others tend to separate off various small groups as independent phyla. Consequently any published arrangement of phyla must be understood to represent merely some zoologist's opinion.

The following scheme leans toward the separation of small groups as independent phyla. It is based on the grades of structure discussed above. presence or absence of an anus, kind and number of body spaces, etc. Wholly extinct classes are omitted.

KINGDOM ANIMALIA

Subkingdom I. Protozoa. Animals consisting of one cell or of colonies of like cells.
- Phylum 1. Protozoa
  - Subphylum 1. Flagellata
    - Class 1. Phytomastigophora
    - Class 2. Zoomastigophora
  - Subphylum 2. Sarcodina
    - Class 1. Rhizopoda
    - Class 2. Actinopoda
  - Subphylum 3. Sporozoa
    - Class 1. Telosporidia
    - Class 2. Acnidosporidia
    - Class 3. Cnidosporidia
  - Subphylum 4. Ciliata or Ciliophora
    - Class 1. Holotricha
    - Class 2. Spirotricha

Subkingdom II. Metazoa. Animals composed of unlike cells that may lose their boundaries in the adult state

Branch A. Mesozoa. Parasitic animals composed of a surface layer of epithelial cells enclosing reproductive cells
- Phylum 2. Mesozoa

Branch B. Parazoa. Animals composed of several kinds of differentiated cells somewhat arranged in tissues; without organ systems or mouth; porous
- Phylum 3. Poriiera, the sponges
  - Class 1. Calcarca
  - Class 2. Hexactinellida
  - Class 3. Demospongiae

Branch C. Eumetazoa. Metazoa with cells arranged in tissues; usually also with organ systems; with mouth and digestive tract except when lost by parasitic degeneration; not porous

Grade 1. Radiata. With primary radial symmetry; of the tissue grade of construction
- Phylum 4. Cnidaria or Coelenterata, the coelenterates. Kadiata with nematocysts; no ciliated plates
  - Class 1. Hydrozoa
  - Class 2. Scyphozoa
  - Class 3. Anthozoa
- Phylum 5. Ctenophora, the comb jellies. Without nematocysts; with eight rows of ciliated plates
  - Class 1. Tentaculata
  - Class 2. Nuda

Grade II. Bilateria. Eumetazoa with bilateral symmetry or secondary radial symmetry; with organ systems

Section a. Acoelomata. No space between digestive tube and body wall

Phylum 6. Platyhelminthes, the flatworms. No anus
- Class 1. Turbellaria
- Class 2. Trematoda
- Class 3. Cestoda

Phylum 7. Nemertina or Rhynchocoela, the nemertine worms. With anus; with a protrusible proboscis above the digestive system

Section b. Pseudocoelomata. With pseudocoelom between digestive tract and body wall; usually with anus; body clothed with cuticle

Phylum 8. Acanthocephala, the spiny-headed worms. Parasitic worms with spiny protrusible anterior end; without mouth or digestive tract

Phylum 9. Aschelminthes. Without spiny proboscis, or if so, not parasitic; nearly always with mouth and digestive tract
- Class 1. Rotifera, the rotifers
- Class 2. Gastrotricha
- Class 3. Kinorhyncha or Echinoderida
- Class 4. Priapulida, the priapulid worms
- Class 5. Nematoda, the roundworms
- Class 6. Nematomorpha or Gordiacea, the gordian worms

Phylum 10. Entoprocta. Anterior end bears circle of ciliated tentacles, enclosing mouth and anus

Section c. Eucoelomata. With true coelom; with anus and organ systems

1. With a lophophore, a variously shaped ridge, mostly circular or crescentic, bearing a single row of ciliated tentacles and embracing the mouth but not the anus

Phylum 11. Phoronida. Wormlike

Phylum 12. Ectoprocta (old phylum Bryozoa in large part), the moss animals. Colonial with gelatinous, chitinous, or calcareous encasements.

Phylum 13. Brachiopoda, the lamp shells. Enclosed in a bivalved shell, valves dorsal and ventral.

2. Without a lophophore; coelom a schizocoel, formed by a mesodermal split

a. Body not segmented

Phylum 14. Mollusca. Visceral mass covered by a body fold, the mantle, that secretes an external shell of one or more pieces; coelom usually reduced
- Class 1. Xplacophora
- Class 2. Polyplacophora
- Class 3. Monoplacophora
- Class 4. Gastropoda
- Class 5. Scaphopoda
- Class 6. Pelecypoda
- Class 7. Cephalopoda

Phylum 15. Sipunculida. Wormlike with introversible anterior part; anus anterior, dorsal.

b. Segmented

Phylum 16. Annelida, the annelids. Worms, with long jointed bodies, but without jointed appendages
- Class 1. Archiannelida
- Class 2. Polychaeta
- Class 3. Clitellata
- Class 4. Echiurida

Phylum 17. Arthropoda, the arthropods. Mostly not wormlike, body bears jointed appendages
- Class 1. Onychophora
- Class 2. Tardigrada
- Class 3. Crustacea
- Class 4. Arachnida
- Class 5. Pentastomida or Linguatulida
- Class 6. Pycnogonida or Pantopoda
- Class 7. Pauropoda
- Class 8. Diplopoda
- Class 9. Symphyla
- Class 10. Chilopoda
- Class 11. Insecta

3. Without a lophophore; coelom an enterocoel, formed by outpouchings of the digestive tube

a. With secondary, usually pentamerous radial symmetry; with a water-vascular system

Phylum 18. Echinodermata, the echinoderms
- Class 1. Crinoidea
- Class 2. Holothuroidea
- Class 3. Echinoidea
- Class 4. Asteroidea
- Class 5. Ophiuroidea

b. Bilateral symmetry retained throughout life

Phylum 19. Chaetognatha, the arrow worms. Transparent, pelagic wormlike animals, with grasping spines, without gill slits or endoskeleton.

Phylum 20. Hemichordata. Wormlike, not transparent or pelagic, without grasping spines
- Class 1. Enteropneusta. With gill slits, without tentaculated arms.
- Class 2. Pterobranchia. With or without gill slits, with a pair of tentaculated arms.

Phylum 21. Chordata. Not wormlike, adults with gill slits or vertebral column or both
- Subphylum 1. Urochordata or Tunicata
- Subphylum 2. Cephalochordata or Acrania
- Subphylum 3. Vertebrata or Craniata
  - Class 1. Agnatha
  - Class 2. Placodermi
  - Class 3. Chondiichthyes
  - Class 4. Osteichthyes
  - Class 5. Amphibia
  - Class 6. Reptilia
  - Class 7. Aves
  - Class 8. Mammalia

The systematic position of the three groups, Tardigrada, Onychophora and Pentastomida, here placed under Arthropoda, is still unsettled. By many these groups are considered independent phyla. others would dispose of them as subphyla under Xrthropoda. For further information about the phyla, special articles in the encyclopaedia should be consulted.

IV. EMBRYOLOGY AND THE HOMOLOGY OF THE GERM LAYERS

Animals in general develop from a single cell, the egg, which, after being stimulated by fusion with a sperm, enters upon a remarkable process of embryonic development in which the definitive characters gradually make their appearance. When this process was studied in many diverse animals, zoologists began to realize that certain similarities obtain throughout the animal kingdom. First the egg undergoes cleavage, dividing up into a ball of many cells. A two-layered condition, the gastrula, follows, in which the embryo consists of an outer epithelium, the ectoderm, and an inner epithelium or, in some cases, a solid mass: the entoderm. The manner of origin of the entoderm is varied, but great importance has been attributed by some zoologists, notably Ernst Haeckel, to one particular method. that of invagination, or the bending inward of the outer epithelium. Haeckel, and after him most zoological texts, considered invagination to be the original and primary method and other methods derived and secondary. This proposition is open to grave doubt, but it is probably impractical to ascertain what was the original method of entoderm formation.

Following the establishment of the gastrula stage, the next general step in development is the formation of a tissue between the ectoderm and the entoderm, termed the mesoderm. Here again varied modes of formation of mesoderm are seen in different animal embryos, but most prominence was given in zoological theory to one particular method, the enterocoelous method, in which the mesoderm arises by the outpushing of pockets from the entoderm. Again the primary nature of the enterocoelous method may be seriously questioned, but the determination of the original mode of mesoderm formation is probably an impossibility.

Ectoderm, entoderm and mesoderm are known as the germ layers, and from them all of the tissues and organs of the adult animal are derived, chiefly by processes of folding and migration. Their role in the production of adult structure is generally much the same throughout the animal kingdom. The ectoderm furnishes .the surface covering of the animal (epidermis), and also the nervous system and the nervous part of the sense organs. The entoderm furnishes the lining epithelium (gastrodermis) of the digestive tract and the epithelial cells of various outgrowths of the digestive tract, such as the liver, pancreas and other glands. All the tissues and organs between the epidermis and gastrodermis are of mesodermal origin; *i.e.*, the muscles and connective tissues, the bones and cartilages of the skeleton, and the circulatory, excretory and reproductive systems. In coelomate animals; the mesoderm separates into a somatic part, which furnishes the muscles of the body wall and also the skeleton, and a splanchnic part, which attaches to the viscera and provides their muscular layers. The space between the somatic and splanchnic mesoderm is the coelom.

These facts are certainly very striking and have led to an important zoological theory termed the homology of the germ layers. This theory states that development by means of germ layers is fundamental throughout the multicellular animals; that the germ layers were originally (if not now) formed in the same way throughout the Metazoa; that each of them produces the same organs wherever found; and that in short there is complete morphological correspondence between the same germ layers in different animals. Different grades of construction are regarded as representing different stages in germ-layer formation. The coelenterate or tissue grade corresponds to the gastrula or two-layered stage of development; the acoelomate or flatworm stage corresponds to the stage after the mesoderm has arisen but has not yet divided into somatic and splanchnic layers. etc.

Germ-layer theory prevails in embryological teaching to the present time and certainly constitutes an orderly method of presentation of the subject. The theory has, however, been subject to severe criticism in recent years; and it is not yet clear to what extent it will survive. In regard to early embryonic stages, it must be admitted that the actual modes of formation of the germ layers and the processes of early development are extremely varied, and it is impossible on the available facts either to affirm or deny some original uniform method of germ-layer formation. There is, however, undoubtedly, a marked similarity in the later developmental stages and the manner of formation of many organs among the Bilateria.

The main criticisms of the germ-layer theory come from the field of experimental embryology (*q.v.*). Transplantation experiments hare shown that in early embryonic stages of many animals, pieces of germ layers when transplanted into appropriate sites may be caused to develop into organs that would normally come from some other germ layer. As development proceeds, this is no longer possible, for the fate of embryonic regions becomes more and more fixed and in the case of some animals is fixed at very early stages. These experiments cannot, therefore, be regarded as overthrowing the germ-layer theory. They confirm what observation had shown, namely, that the early stages are labile and do not conform in different animals but that the later stages do show the uniformity of development demanded by the theory. It therefore seems probable that the germ-layer theory in its broader aspects will remain a permanent part of zoological science.

V. EMBRYOLOGY AND THE THEORY OF RECAPITULATION

The similarity of embryological processes throughout the Bilateria suggests some underlying principle! and this principle is to be found in the phenomenon of evolution (*see* EVOLUTION, ORGANIC). The resemblance between lower animals and the embryos of higher ones had, however, been noted long before Charles Darwin enunciated the theory of evolution in 1859, especially by J. F. Meckel. 1821, A. E. R. A. Serres, 1842, and Karl Ernst von Baer. 1828. Baer formulated his observations on development in four "laws," of which the fourth one states that the young stages of higher animals resemble the young stages of lower ones. Following the publication of Darwin's book, *The Origin of Species*, the concept of evolution as an explanation of the embryonic stages through which higher animals pass was first advanced by Fritz Müller, 1864, and advocated by Haeckel, beginning in 1866. Haeckel had a gift for trenchant phrases, and zoology became thoroughly imbued with his formulations of the relation between evolution and development. Haeckel's generalization is, in effect! that an animal in its development passes through stages representing the ancestors it had during its evolution from lower animals. This doctrine is termed recapitulation or the biogenetic law. and was epitomized by Haeckel in such phrases as "ontogeny repeats phylogeny," and "phylogeny is the mechanical cause of ontogeny," etc.

As already noted, the general resemblance of enibryonic stages among animals is not to be doubted, and is particularly marked among the members of a given phylum; neither is it to be doubted that evolution: *i.e.*, descent from a common ancestor, is the explanation. However. there has'been a great deal of argument as to the correctness of Haeckel's theory; *i.e.*, as to whether or not it is true that embryonic stages represent adult ancestors. The accumulated facts and arguments indicate that the relation between evolution and embryology does not follow any one rule but is a combination of several different kinds of rules. In some cases development follows ancestral stages up to a very late period. then adds on a new stage that makes the animal different from its ancestors. This type of development most nearly conforms to Haeckel's recapitulation. In many other cases. however, the development diverges from the ancestral pattern at an earlier time, sometimes very early in development. Or, ancestral stages may be omitted at the end or in the middle or even very early in development. The order of development may also be altered so that events may occur in a different order in the descendant than they did in the ancestor. Finally, many embryos exhibit adaptive structures that have no relation to any ancestor but are concerned with embryonic life.

It appears clear enough that Haeckel's formulation was altogether too narrow, and it is probable that no embryonic stage ever represents an exact duplication of an adult ancestor! although very considerable resemblance may obtain in some cases. It is more common for embryonic stages of the descendant to resemble embryonic stages of the ancestor. Phylogeny is not the cause of ontogeny but rather phylogenetic progress, *i.e.*, the evolution of new types, is brought about by deviation from the ancestral pattern during the course of embryonic development.

Ancestral reminiscence during development is then a general zoological principle; commonly this reminiscence concerns the embryonic or larval stages of the ancestor rather than the ancestor itself. Ancestral reminiscence has been of the greatest value in working out relationships especially among the invertebrates. In vertebrates there is an extensive fossil record and fossil findings have given zoologists a fairly complete story of the evolution of the main vertebrate groups. But invertebrates often have no hard parts preservable as fossils and in general paleontology has been of little value in determining relationships among them. Hence. embryology is the chief tool for elucidating phylogenetic problems in the invertebrates. It is in fact a truism that a group is not understood in its relations to other invertebrate groups until the embryology of several members has been thoroughly worked out. Many examples could be cited of the solving of the taxonomic position of aberrant forms by means of their embryology. Thus *Sacculina* and related forms are very degenerate parasites of crustaceans, being reduced in the adult state to a nearly structureless sac with rootlike extensions into the host's tissue. It would be impossible to determine the taxonomic position of these parasites by study of their anatomy;. but when it is found that their development closely follows that of barnacles, no doubt remains that they are degenerate barnacles.

VI. VARIATION, HEREDITY, AND EVOLUTION

As seen above, hereditary factors play an important role in embryonic development; but as shown by the work in experimental embryology (*q.v.*), environmental influences are also operative. The study of the roles of heredity and environment in the production of the characters of the species and the mechanism of such production constitutes one of the most important branches of zoology, generally termed genetics. Its end and aim may be stated to be an understanding of the mechanism of heredity (*q.v.*) under specific conditions, and thereby of evolution (*see* EVOLUTION, ORGANIC).

Variation. — So two animals, even belonging to the same brood: are alike; although exhibiting a close similarity to their parents and to one another, each mill differ from all others to a small extent or sometimes they may vary considerably in one or many respects. Such differences between individuals of the same species or variety is termed variation and the investigation of the nature and causes of these variations and of the manner and the extent to which they are passed on from one generation to the next is the main subject matter of genetics. The inheritance of variations is studied by breeding experiments; variation as it exists in a given population is studied by mathematical methods of the type known as hiometrical. Measurements are made of various characters in a large number of individuals of a population and the data so obtained are tabulated to show the number of individuals exhibiting each of certain measurements. Such tabulations can then be graphed and a curve obtained. This curve of variation usually conforms to a definite symmetrical shape, rising to a peak and descending again. Such a normal curve of variation means that most of the individuals of a population fall n-ithin certain measurements, as length, for instance, and that especially long or short individuals are fen. in number. The normal curve of variation implies that the variations it records are due to chance events. Deviation from such a normal curve indicates that some factor is operative to distort the curve, or that the population being studied is not uniform but consists of tn-o or more groups. Such studies of animal populations, termed biometry, are of great value in both pure and applied science.

Types of Variation. — It is necessary for the geneticist and the systematist to evaluate properly the variations within a population and to differentiate those associated with age, sex or habitat from hereditary variations that occur by chance without relation to obvious factors. There are in general two sorts of variation: those that do not involve an hereditary alteration, termed phenotypic variation, and those that result from hereditary alteration. termed genotypic.

Phenotypic Variation. — This may concern various stages in the life cycle, seasonal variations in the same individuals and changes impressed on the individual during its life by environmental conditions. Examples of these may be given. Many animals at birth or hatching bear little resemblance to their parents, and in the past were often regarded as distinct species until the life history of the animal in question was worked out and the juvenile or larval form traced to the adult condition. For instance. the common fresh-water eel. *Anguilla*, passes through a transparent ribbonlike oceanic stage termed Leptocephalus. Leptocephalus was considered to be a distinct kind of fish, whose relationship to eels was not suspected, until Johannes Schmidt of Denmark discovered that Leptocephalus is a juvenile stage of *Anguilla*. Crawling caterpillars bear no resemblance to the butterflies or moths into which we know they develop. Parasitic worms may have as many as four different juvenile stages in different hosts. As these juveniles bear no or little resemblance to the adults, mere study of them does not suffice to determine to what adults they belong and such information is assembled only by laborious isolation studies and feeding of juveniles to appropriate parasite-free hosts.

The colours and colour patterns of many animals change with age and sexual maturity. The soft down of feathers or hair at birth or hatching gives way first to the juvenile and later to the adult plumage or pelage, differently coloured or patterned. Some plumage or pelage colour changes result from the wearing off of feather or hair tips. Many male animals assume a resplendent nuptial dress during their breeding season and may also develop structural features that are lost again in the off season, as the horns of some mammals and thickened skin areas termed pearl organs of fishes.

Seasonal changes in colours and shape are of common occurrence. Where several broods are born within a year, as in insects, broods produced at different seasons may differ so much as to be originally regarded as distinct species. Many small animals of open waters have summer and winter forms of different shape; commonly the summer form shows increased body surface as compared to volume and the winter form shows the reverse effect. Thus, water fleas such as *Daphnia* and *Bosmina* tend to develop taller shapes with longer spines in summer, more rounded heads and shorter spines in winter. The factors operative are believed to be quantity of food. and changes in the density and viscosity of the water, requiring new shapes to insure body stability. Seasonal colour changes are well known in arctic animals, such as the varying hare, ermine, ptarmigan and arctic fox that are white in winter, brownish during the summer. Much seasonal variation is related to temperature. Thus the Himalayan rabbit is white except for black ears, feet and tail. If hair is plucked from the white parts and the animal placed in the cold while the new fur is growing out. this comes out black, not white. Conversely. hair plucked from the black parts grows out white if these parts are kept warm by bandages. It is known that fishes tend to have more vertebrae and more scales along the lateral line in the colder parts of their range. The experiments of Mordecai Gabriel demonstrated that if the eggs of the fish *Fundulus* from the same batch are reared at different temperatures, the number of vertebrae formed is greater the lower the temperature. This result probably comes from a slowing down of development by the cold at a critical time.

Members of the same species may show much variation throughout their range as a result of local conditions. This is very true of corals, for instance. since the same species may grow into tall branching shapes in still water, massive rounded shapes in surf. Rlollusks also show great variation of shell form in different environments. These variants, termed ecophenotypes, were formerly regarded as of taxonomic worth and often very many scientific names were created for what are now known to be merely phenotypic variants of the same species.

In the above examples identity of genetic constitution is assumed. The changes recorded are phenotypic changes of the same genotype, that is, of the same hereditary constitution. Whether a given change is phenotypic or not can, however, be determined only by breeding experiments under varieties of environment.

Genotypic Variation; Mendelian **Inheritance.**—Genotypic variations are new alterations that are inheritable. Whether a given variation is genotypic or not cannot be determined by mere inspection of the animal but only by painstaking breeding experiments under controlled environmental conditions. Years of intensive breeding experiments on various plants and animals led to the conclusion that hereditary characters are vested in the chromosomes of the nucleus, in the submicroscopic particles termed genes of which these chromosomes are constituted (*see* HEREDITY). It is these genes that are directly transmitted to the offspring in the nuclei of the egg and the sperm whose fusion begins the new individual. The characters that are represented by these genes are inherited, but they do not come to expression unless the environmental conditions are right for their appearance. Among the better known inheritable characteristics of animals transmitted by genes are eye colour, hair colour, hair shape, skin colour. body form and proportions, length of limbs, hands, feet, tail, and various diseases and defects, as well as varying degrees of immunity to disease.

The manner of inheritance of such characters and of ,genotypic variations in general is that termed Mendelian because it was first formulated by Gregor Mendel, an abbot of Briinn. Aus., in 1865 as a result of his experiments in crossing garden plants in the garden of the monastery. His experiments remained unappreciated until 1900 when they were simultaneously repeated by several biologists. Thereafter an enormous amount of work was done on Mendelian inheritance, for the details of which *see* the articles HEREDITY; VARIATION.

A very striking part of the Mendelian work was the elucidation of the mechanism of sex differentiation. It was found that there is a chromosomal difference between the sexes. In some animals two kinds of eggs and in others two kinds of sperm, as to their chromosomal content, are produced, and whether a given fertilization will result in a male or a female offspring is determined at the time of fertilization by whatever chromosomal combination happens to ensue (for complete explanation *see* articles CYTOLOGY: SEX).

Bisexual reproduction is of the greatest importance in increasing the variability within populations. Geneticists are agreed that nearly all genetic factors are located in the chromosomes and that normal individuals 'of sexually reproducing species have two chromosome sets, one from each parent; *i.e.*, each chromosome occurs in duplicate as a result of the fertilization process. During the formation of the sex cells of an individual the duplicate chromosomes and duplicate genes become segregated in a chance manner into the sex cells, for these have only one chromosome set (*see* CYTOLOGY). Thus an indefinite number of gene combinations is possible. In reference to man with his two sets of 24 chromosomes it is said that exactly the same genic constitution has never appeared in two individuals, except in the case of identical twins that come from one egg.

Heredity and **Environment.**—Every character of an organism is the product equally of its inheritance and of the environment under which the character develops and matures. Some characters reappear regularly in successive generations because the stimuli necessary for their appearance are always operative in their environment. Often certain temperatures are required for the appearance of both phenotypic and genotypic characters. What is really transmitted is the ability to respond to given environmental factors; but the specific response that occurs in a given case is determined by the hereditary constitution.

For exact studies of environmental effects in the individual's life it is necessary to start with material of identical genetic constitution. Some of the best information on the heredity *v.* environment question was accumulated by the study of identical human twins reared apart from early life. Identical human twins come from the same fertilized egg, hence have the same genic constitution. Data were collected by H. H. Newman of The University of Chicago on jo pairs of identical twins reared together and 20 pairs reared apart. Twins reared apart were, on the average, no more different in measurable physical characters than those reared together, except for body weight which was found to depend on food, health and amount of physical exercise. However, the average difference in the I.Q. of twins reared together was 5.3 points and for twins reared apart 8.2 points: an excess of nearly 3 points. The average difference in scholastic achievement for twins reared apart was more than twice as great as for twins reared together, an indication that achievement tests register differences in schooling more accurately than do ability tests. Newman found much evidence that differing environments had resulted in marked personality differences despite identical genetic constitution. These results, although only preliminary, give great encouragement in the direction of human improvement through education and environment.

Inheritance of Acquired Characters.—Since ancient times there has been a general popular belief in the theory that characters acquired during the lifetime of an individual can be inherited. and that thereby an improvement or alteration in a desired direction is possible. This theory is termed Lamarckism because it was expounded particularly by Lamarck in 181j, although it was not exactly original with him. Lamarckism states that every animal tends to change its structure and habits during its individual existence in such ways that it becomes better fitted for life under the conditions to which it is subjected. If the characters so acquired be transmitted to offspring which in turn become modified in the same direction. there will in time arise a group of individuals differing from the original progenitor and better adapted than it was for the conditions in question. The theory thus particularly seeks to explain the origin of adaptive characters. Adaptation is certainly an outstanding phenomenon of nature; that environment can alter the structure and habits of animals within their lifetime is also an established fact and comes under the head of phenotypic variation discussed above. The difficulty of the theory centres around the possibility of the inheritance of such environmentally induced alterations. At the present time such inheritance is believed to be impossible; therefore, the theory of the inheritance of acquired characters has been abandoned by practically all biologists.

Despite the unanirnous rejection by western geneticists of the inheritance of acquired characters from a simple inability to find any evidence in favour of it, the inheritance of acquired characters mas accepted by fiat in the Soviet Union and its satellites after World War II. Mendelian genetics, as developed by western scientists, was officially rejected because of an alleged conflict between it and Marxist teachings. Later it appeared that this extreme position was being somewhat modified (*see* HEREDITY: *Soviet Genetics*). For accounts of the state of genetics in the Soviet Union in the 1950s, see *Death of a Science in Russia*, edited by Conway Zirkle, and *Heredity, East and West*, by Julian Huxley.

Mutations.—Inheritable alteration is now believed to be entirely of the nature of mutation, which is another name for genotypic variation. Mutations, in the present sense of the word, are caused by change, probably chemical, in a single gene, or by chromosomal changes such as losses, multiplications, rearrangements of genes. recombinations, etc. Mutations occur in all degrees from those so slight as to be unnoticeable in ordinary genetic work to conspicuous variations. The cause of mutation is not known, although mutations have been induced by the action of X-rays and other radiations on organisms at critical periods in the ripening of their germ cells. It is firmly believed by geneticists that mutations are of chance nature and have no direct relation to environmental factors. (*See* further VARIATION.)

Evolution; Natural Selection.—The principle of evolution is the most important contribution of zoology to general science and to civilization. Evolution is the doctrine that all organisms are related to each other through common descent and that the differences that now exist between the many species of animals and plants have arisen through hereditary alteration of pre-existing forms. Evolution is defined by Theodore Dobzhansky as a change in the genetic composition of populations so that dissimilarities develop between the ancestral and the descendant populations. Evolution as a constant process of nature is supported by such innumerable facts that it is unanimously accepted by biologists as a fundamental principle of biological science. The principle of evolutionary change has also been incorporated into almost every field of human thought and endeavour, and everywhere has acted as a clariiying leaven. It is necessary to distinguish clearly between evolution as a phenomenon of nature and the mechanism by which evolution takes place. Too often there is confusion in the popular mind between these two matters. Evolution is regarded by biologists as an established fact, but the mechanism by which it occurs is still under investigation.

Although the idea of evolution has been expressed by a long chain of his predecessors, it was first clearly expounded by Darwin in 1859 in his book *The Origin of Species*. Darwin was concerned primarily with finding a mechanism by means of which evolution could occur and. by analogy with selection practised by man in breeding domestic animals. Darwin postulated a selective action of nature. Darwin based his theory of evolution by natural selection on the observed facts of variation and of excessive reproduction in nature. As already noted every species tends to vary within limits; also, every species tries to reproduce in unlimited numbers so that if unchecked. even slowly reproducing animals would in a relatively short time populate the earth. As this does not occur, there must be factors limiting the survival of offspring, and these factors consist of competition for food and space. depletion by enemies and parasites. etc. In this struggle for existence it seemed to Darn-in that variations, even slight ones. might play a decisive role in preserving some individuals while others perished. Any (genotypic) variation that is at all advantageous will have survival value and the individual possessing it will have more chance to live and to pass on its advantageous variation to its offspring than will individuals lacking such variation. In this way there is an accumulation of variations, and this eventually leads to the establishment of new varieties and species. providing isolation occurs to prevent the wiping out of the new characters by crossbreeding with the old population. By isolation is meant any factor that prevents crossbreeding. Such isolation may consist of physiographical features such as mountains or water courses that form barriers against interbreeding; or it may consist of variations in the sexual apparatus or in sexual behaviour that make mating physically or psychologically impossible.

After the theory of evolution by natural selection had suffered some decline, selection again came into promirience as a factor in evolution. Acceptable evidence was found of the actual operation of natural selection in wild populations. Natural selection operating on chance genotypic variations remains the best explanation of adaptation. The modem view of evolution holds that it is the joint product of mutation and selection plus isolating mechanisms (ecological, geographical or sexual) that prevent the new gene patterns from being swamped by interbreeding nith the old. Population size has also been shown to be an important factor. and restricted populations appear to be most favourable for progressive evolution. The study of population dynamics is becoming of increasing interest and importance in the fields of genetics and evolution. See further EVOLUTION, ORGANIC.

VII. ECOLOGY

What is generally termed natural history or observation of the habits and behaviour of animals in nature has undoubtedly interested man from the dawn of civilization. But toward the end of the 19th century this type of zoological study more or less fell into disrepute as not sufficiently scientific. Zoologists were more or less divided into two camps: those that studied morphology and taxonomy, and those that were experimentalists subjecting animals or their parts to laboratory study. The latter increased rapidly at the expense of the former and neither left much room for natural history in its old form. At the beginning of the 20th century there emerged, however, ecology (also called bionomics), which has been defined as scientific natural history and which has progressively increased in importance. (See ECOLOGY. ANIMAL; POPULATION ECOLOGY.) Ecology is the study of animals as they exist in their natural environment. The subject naturally divides itself into two parts: the study of the environment and the study of the animal in its environment.

Environments. — Evidently the complete study of environments is a complicated matter, depending in many cases on the availability of appropriate methods and apparatus. The environment is composed of physical, chemical, geological, geographical and meteorological factors as well as biological factors in the form of other plants and animals and their products. These factors require to be studied not only at any one time but also through daily. seasonal and annual cycles.

Environments are broadly classifiable into marine, fresh-water and terrestrial; each of these of course comprises numerous subsidiary environments. The study of the marine environment has reached the status of a branch of zoology, termed oceanography (see OCEAN AND OCEANOGRAPHY). It involves such matters as currents and circulation, depths and bottom contours. types of bottom, temperature at various regions and depths. penetration of light with reference to depth. dissolved gases at various depths. salinity and chemical composition in general and variations of organic substances or material produced by biological action. Many of these changes need to be followed through daily, seasonal and annual cycles. The animal life of the ocean is divisible into the pelagic forms living free in the water and the benthonic forms inhabiting the bottom. Each of these is again subdivisible on the basis of depth. Thus the pelagic animals fall into epipelagic, inhabiting surface waters to moderate depths, and bathypelagic, or deepwater, categories. The ocean bottom is usually divided into the littoral zone (shore to 200 m.), the archibenthal (200 to 1,000 m.), and the abyssal zone or deep bottom.

Brackish water or water of lowered salinity at the mouths of rivers offers special ecological problems. Animals inhabiting such areas must be able to endure great changes of salinity and osmotic pressure. Study of the mechanism of such adjustment may throw light on how marine animals mere able to enter fresh waters and establish themselves therein.

Fresh-water habitats are of two general types, standing or lentic waters and running or lotic waters. The former embraces the large lake, small lake! pond, swamp, pool series: and the latter the brook, stream, river series. Here, too, of course, there are numerous localized environments as a rapids in a stream. Seasonal changes are of particular importance in the lentic series and many fresh-water animals show marked annual cycles that contrast with the uniformity of existence in the sea.

Terrestrial environments are more varied and present more difficult conditions for animals than do aquatic environments, and vegetation plays a predominant role in them. In fact, the subdivisions of land faunas practically coincide with those of the flora, and the latter in turn depend upon climatic and physiographical features, notably temperature. rainfall and quality of the soil. Land habitats vary from bare areas such as sand dunes. rock outcrops, snow fields and glaciers, the Arctic and Antarctic circles and alpine summits, through areas of scant vegetation such as deserts, subalpine zones, high latitudes and treeless areas (grasslands, prairies. plains, steppes), to regions of small trees (thornbush, etc.) and forests. Each terrestrial habitat is of course zoned horizontally into such strata as the air, taller vegetation, shorter vegetation, ground surface and subterranean stratum.

Faunas. — The sum total of the animals inhabiting an area is termed the fauna. The ocean has the richest and most varied fauna, presumably because of the uniformity of conditions therein. The ocean fauna is broadly characterized by an inability to withstand extreme changes of conditions. by the lack of protective devices against exposure, such as cysts, by the frequency, especially among pelagic animals, of a delicate. transparent construction, and by the frequent production of free larval stages. Fresh-water animals must be able to withstand much greater ranges of conditions than do marine animals, especially temperature, evaporation, and alterations of acidity and alkalinity. Further, the fresh-water medium has a lower osmotic pressure than that of the body fluids of fresh-water animals, and means must be present to prevent excessive hydration of the body. Fresh-water animals provide against extremes of temperature and drought by protective devices such as encystment or production of hard-shelled eggs or other reproductive bodies, or by habits of hibernation or estivation; free larval stages are in general absent. Air-breathing types are common among fresh-water animals but rare in the ocean. Fresh-water animals also are subjected to greater turbidity and more concentrated organic decay than are marine fauna. and many are adapted for living in muck practically devoid of oxygen. Conditions encountered by land fauna are even more difficult, despite the advantage of abundant oxygen. The great danger is that of water loss so that land animals. unless they live in very humid places, must be protected against evaporation; hence the characteristic coverings of scales, hairs, fur. etc., or the hardened exterior as in insects. They must also be adjusted to a wide range of temperature or else have developed a mechanism for maintaining constant body temperature; habits of hibernation and estivation also play a role here. Lacking the support of water, terrestrial animals must have a generally stronger build than aquatic ones, and they are also capable of efficient types of locomotion depending upon stronger build, such as walking. running, leaping and flight. Although the terrestrial fauna is less rich in species and groups than are aquatic faunas, it displays a much greater variety of associations, many strikingly adapted.

Animal Communities. — The fauna of a restricted area throughout which very similar conditions prevail, such as a meadow or a pond, forms an animal community or association. Such an association usually consists of large numbers of individuals of one or a few species that form the dominant animals, and small numbers of a considerable number of other species. Many of the animals of an association show striking structural and behaviouristic adaptations to the conditions of the habitat. Very complex relations generally obtain between the members of a community. These are usually in the nature of food relationships. and in general every community contains herbivorous, carnivorous and scavenging animals. In a community each species generally occupies a particular part of the habitat and of the food chain; such a position in the community is termed an ecological niche.

The animals of the same kind of habitat are usually of different species or are even quite difierent taxonomically in different parts of the world. but they generally show ecological similarity; *i.e.,* structural and behaviouristic resemblance. Such corresponding forms have been termed ecotypes. Thus, the animals of steppes and prairies are generally long-legged, swift-running types, as the bison and pronghorn of the Great Plains of North America, the zebras and various kinds of antelopes of the African plains and the deer of the Argentine pampas.

Ecological Succession. — The old adage that nothing is permanent except change is peculiarly applicable to ecological study because environments change and with them the flora and fauna. Under ordinary conditions, these changes follow an orderly arrangement. termed ecological succession. Succession is naturally chiefly a phenomenon of fresh-water and land habitats and the littoral zone of the ocean. Thus, ponds fill and become meadow, meadow becomes invaded by shrubs and eventually trees, and finally a forest occupies the site of the original pond. In general all fresh-water and land habitats tend toward a certain floral association termed the climax. The climax formation varies in different areas of the earth, primarily in association with rainfall and temperature.

Animal **Behaviour.**—The reactions and activities of an animal in its environment is termed animal behaviour. This field at first was part of the subject of psychology, and experiments on animal behaviour were carried out chiefly in psychological laboratories. The setups employed in these laboratories mere mostly without relation to the natural habitat of the animal and the object was more or less anthropomorphic—to discover the learning abilities, intelligence and reasoning power of the lower animals, chiefly birds and mammals other than man, and the effect upon these powers on the central nervous system. The animal was frequently set to solve problems remote from its normal life. At the same time ecologists were studying the behaviour of animals, chiefly invertebrates and cold-blooded vertebrates, from a different angle, that of subjecting the animal in turn to single factors of its environment such as light, temperature, etc. This procedure usually made use of a gradient tank or box in which the intensity of the factor being investigated was uniformly graded from one end to the other of the apparatus. Animals were placed in the apparatus and the part of the gradient in which the majority of the animals came to rest after random wanderings was considered to represent the intensity of the factor most suitable to the animal, and the one affecting its distribution in nature.

Although valuable results were yielded by both types of inquiry, their artificial nature has gradually become recognized, and there is a decided return at present to studies of the type of the old natural history but more exact. critical and better controlled. Especially in Europe after the early 1950s, under the leadership of K. Lorenz and N. Tinbergen, there was an immense revival of interest in animal behaviour and many students throughout the western world were attracted to this field of zoology. An outstanding concept developed by the Lorenz-Tinbergen school is that of the innate releasing mechanism. By field observations and laboratory experiments under conditions simulating the natural environment, they discovered that each behavioural act of the type usually called instinctive is evoked by a specific stimulus or combination of stimuli that they called the releaser or sign stimulus. For instance a large dark moving object on the edge of the nest (in nature one of the parents) causes baby birds to erect their head and gape for food and this reaction can be evoked by an inanimate object with the same characteristics. These workers also showed that bright and conspicuous colour patches on male fishes and birds are sign stimuli that evoke fighting behaviour in other males and that crude models bearing the colour patch evoke fighting behaviour equally well. In addition to such instinctive behaviour evoked by sign stimuli there is of course also learned behaviour such as the well-known conditioned type in which, for instance. an animal can be taught to come to food by the sound of a bell. There is further increased interest: partly as bearing on man in mass behaviour and social relations, in the behaviour of individuals in a herd or flock with reference to each other. (See SOCIOLOGY, ANIMAL: Social *Instinct.)*

Limiting Factors.—The study of animal behaviour by means of the gradient setup mentioned above showed that a given animal tends to avoid certain intensities of surrounding factors and to seek others. The distribution of a given animal in nature is therefore limited by responses of this type. Thus, an animal that avoids bright light and dryness may be expected to occur in nature in dark humid places as under stones or logs. Such an animal will obviously be limited in its distribution by the availability of this kind of habitat. By these reactions of avoidance animals come to occupy and to remain in certain small niches of a given environment.

Zoological Distribution.——.As noted above, animals of similar but geographically separated ecological regions exhibit similarity of appearance and behaviour but are usually taxonomically different. This suggests that the fauna of each part of the world is peculiar to that region and that it might be possible to divide up the world into zoological regions, each with its own set of species. Various attempts of this sort have been made of which the most accepted scheme recognizes the following regions: palearctic, including Europe, most of Asia. and Africa north of the Sahara; nearctic, comprising North America; neotropical, comprising South and Central America and the West Indies; Ethiopian. Africa south of the Sahara and Madagascar; oriental, southern Asia, Malay archipelago and some islands of Indonesia; and Australian, including Australia: New Zealand and the rest of Indonesia. Each of these areas does in fact have a characteristic fauna. As is well known, the Australian region is characterized by its primitive mammals, such as the duckbill! kangaroo and other marsupials, and curious birds like the kiwi, emu and cassowary, none of which is found elsewhere. However, many facts of animal distribution are not explained on the basis that each part of the world has its own peculiar constellation of species, for the reason that animals have not necessarily evolved in the region that they now occupy. Although isolation or inability to emigrate because of water or other barriers accounts for some facts of distribution like the peculiarities of the Australian fauna, emigrations, both recent and in past geological ages, are also an important factor in explaining present distribution. In fact, the distribution of animals constitutes important evidence for the existence of land connections in the past that later vanished. Emigrations over land bridges later eliminated by geologic change account for the occurrence of closely related animals in distant parts of the earth with no representatives in the intervening area. Such facts can also be explained on the assumption of an originally wide distribution with the wiping out of relatives in intermediate areas through geologic and climatic changes. (See also ZOOGEOGRAPHY.)

Animal Interrelationships.—Study of the relationships between animals constitutes an important part of ecological research. Such relationships within a species vary all the way from the relation of sexual pairs in courtship, mating and rearing of young to studies of populations. Here belongs also competition between the individuals of a species for mates, living and breeding places, and food. Relationships between animals of different species, apart from such general matters as competition for food and space, mostly fall into three categories: relationships of predator and prey. relations of mutual assistance and relations of one-sided benefit. Many animals are provided with protective or defensive devices, such as armour, horns, hoofs, stings, spines, venoms, or exhibit protective behaviour, as hiding, burrowing, rolling up into a ball or playing dead, as a means of avoiding being captured and eaten by carnivorous animals; conversely. the predator often has special structural devices or exhibits special behaviour enabling it to capture other animals as food, often specific animals. One common mode of avoiding capture is through resemblance to surroundings (protective resemblance) or through resemblance to some other animal that is distasteful (mimicry). Volumes have been written on whether protective resemblance or mimicry actually protect and how they have come about. It now appears quite certain that they do have protective value, and natural selection acting on chance variations is the accepted explanation of their origin.

Associations of animals of different species with mutual benefit is termed mutualism. Many examples of such relationship, often intimate, are known. Thus, ants protect and care for aphids and in return get a sweet fluid secreted by the aphids. Hermit crabs carry anemones on their backs, securing the protection afforded by the stinging bodies of the anemone and furnishing the latter with free transport and better oxygenation. Many such relationships are extremely intimate, in that one partner may live inside the other, as in the case of the termites and their intestinal Protozoa; the former protect the latter and the protozoans digest cellulose for the termites.

Relations of one-sided benefit range from harmless association (commensalism) to parasitism. Small animals may habitually live in or on or near larger ones or accompany them, for protection or to obtain bits of food. Anthills and other types of burrows frequently harbour other animals, usually of specific kinds, termed inquilines or guests; these get protection and steal bits of the host's food, but are probably otherwise harmless. Such habits, however, gradually lead to parasitism, a relation in which one animal benefits and the other is harmed. Parasites are divisible into ectoparasites such as lice, mites and ticks, that live on the surface of animal bodies! eating hair, feathers, or bits of skin or sucking blood; and entoparasites, including worms of various kinds and protozoans, that inhabit interior organs, sucking blood or body fluids or devouring cells, or, in case they lack a digestive tract, imbibing nutriment through the surface. Parasitism leads to extensive structural changes in the parasite: reduction of sense organs and the nervous system; loss of locomotory organs; reduction and eventual loss of mouth and digestive system; development of clinging organs such as hooks and suckers: excessive development of the reproductive system with production of immense numbers of eggs; and complicated life cycles involving some stage adapted for spreading the parasite.

VIII. ECONOMIC ZOOLOGY

This name is applied to the utilization of zoology in the interests of human welfare. The breeding of domestic animals is a great industry that has been extraordinarily successful in producing breeds of sheep, cattle, horses, dogs, poultry, etc., fitted for all contiitions and uses. Practised in the past mainly by empirical methods, animal breeding came to be greatly advanced by the application of modern genetics. Among recent trends is the practice of artificial insemination by which the semen of fine male horses; cattle. etc., may be shipped considerable distances for the improvement of stock. Fisheries present numerous complex problems falling within the province of the zoologist, such as the study of variations of the catch from season to season. depletions of breeding stock, development of new fishing grounds and the improvement of pisciculture. Work of this type involves fishes and other aquatic food animals such as oysters, shrimp and lobsters.

The damage that animal pests, especially insects, do to crops is tremendous; these ravages can be controlled only by methods laid down by zoologists. The establishment of these methods depends on a full investigation of the life history and habits of the pest, and of all the factors in its surroundings that influence it. such as climatic conditions, alternative sources of food, the efficiency and mode of application of poisons. parasites and diseases of the pest and the discovery of animals that prey upon it. Some of the greatest triumphs of economic entomology have been achieved through finding a suitable predator to prey upon a particular insect pest. (See ENTOMOLOGY.)

The investigation and control of animal-borne diseases of man. such as malaria, yellow fever! etc., is a zoological matter as is also the study of the animal parasites of man.

A present important trend in economic zoology concerns conservation which aims toward the preservation of animals beneficial to man and in general toward restoring the balance of nature that has been upset by human activities. Through ignorance and greed man has succeeded in destroying many useful animals and in seriously depleting the stocks of others. The destruction of any one species may have far-reaching effects because of the complicated interrelationships of animals, especially as regards food cycles. These food cycles always involve plants, so that a whole train of evil consequences may result. Thus, elimination of predators such as the mountain lion or birds of prey permits the excessive increase of herbivorous animals that serve as their prey and are normally kept in check by them: and this results in overgrazing oi grasslands and forests. Only intensive studies of plant and animal interrelationships can teach man how to avoid wholesale destruction and interference with natural balance that, if continued, will also destroy him.

ZORACH, WILLIAM (1887–). U.S. sculptor, whose figure compositions have a formal, monumental character, was born in Eurburg, Lithuania, on Feb. 28, 1887. At an early age he was taken to the U.S., his large, poor family settling eventually in Cleveland. O. Zorach intermittently attended public school, worked and helped his father collect and sell junk. He early exhibited an aptitude for art, and at 15 began to learn lithography, studying evenings at the Cleveland School of Art. He later studied at the National Academy of Design, New York city, and in Paris. At first a painter, he won prizes for his water colours. as well as his sculpture. "The Dance," cast in aluminum. was placed in Radio City Music hall, New York city, and his later "Head of Christ" in black granite in the Museum of Modern Art, New York city. Zorach was a strong advocate of direct carving. In 1947 he published a popular account of sculpture techniques. *Zorach Explains Sculpture*.

See Paul S. Wingert, *The Sculpture of William Zorach* (1938).

ZORN, ANDERS LEONARD (1860–1920), a popular Swedish painter, etcher and sculptor, was born at Utmeland, near Mora. on Feb. 18, 1860. He entered the Stockholm academy to study sculpture, but soon turned to water-colour painting. In the 1880s he traveled widely in Europe, north Africa and the near east. In 1882–85 he was in London, learning the technique of etching from his fellow countryman Axel Haig. In 1887–88 he lived at St. Ives. Cornwall, where he made his first oil paintings. Zorn settled in Paris in 1888. His style, an amalgam of Manet, Degas and Spanish painting, was very acceptable to popular taste, and Zorn quickly won considerable but ephemeral success. He was well known as a portrait painter, especially in the United States, which he frequently visited. From 1896 until his death on Aug. 22, 1920, Zorn lived at Mora, painting nudes and peasant subjects in a sentimental, loosely handled, realist manner.

See K. Asplund, *Anders Zorn: His Life and Work* (1921). (A. Bs.)

ZOROASTER, the founder of the national religion of the Iranian people from the time of the Achaemenidae to the close of the Sassanian period. The name (Ζωροάστρης) is the corrupt Greek form of the Iranian Zavathustra (new Persian, Zardushi). Its signification is obscure. Zoroaster was famous in antiquity as the iounder of the wisdom of the Magi. His name occurs first in a fragment of Xanthus (29), and in the *Alcibiades* of Plato (i, p. 122), who calls him the son of Oromazdes. Occidental writers sometimes call him a Bactrian, sometimes a Median or

Persian (*cf.* Jackson, Zoroaster, 186). According to Pliny (*Nat. Hist.* vii. 1 j), he laughed on the very day of his birth—a statement found also in the *Zardusht-Nāma*—and lived in the wilderness upon cheese (xi. 97). Plutarch speaks of his intercourse with the deity, and compares him with Lycurgus and Numa (*Numa,* 4). Dio Chrysostom, Plutarch's contemporary, declares that neither Homer nor Hesiod sang of the chariot and horses of Zeus so worthily as Zoroaster, of whom the Persians tell that, out of love to wisdom and righteousness, he withdrew himself from men, and lived in solitude upon a mountain. The mountain was consumed by fire, but Zoroaster escaped uninjured and spoke to the multitude (vol. ii. p. 60). Plutarch, drauing partly on Theopompus, speaks of his religion in his *Isis and Osiris* (cc. 46–47). He gives a faithful sketch of the doctrines, mythology and dualistic system of the Magian Zoroaster.

Agathias remarks (ii. 24), with truth, that it is no longer possible to determine with any certainty when he lived and legislated. "The Persians," he adds, "say that Zoroaster lived under Hystaspes, but do not make it clear mhether by this name they mean the father of Darius or another Hystaspes. But. whatever his date, he was their teacher and instructor in the Magian religion, modified their former religious customs, and introduced a variegated and composite belief."

He is nowhere mentioned in the cuneiform inscriptions of the Achaemenidae, although Darius and his successors were Zoroastrians. The Avesta, our principal source for the doctrine of Zoroaster. is comparatively reticent; on the subject of his person and his life with regard to his date it is, naturally enough, absolutely silent. The 13th section, or Spend *Nask*, which was mainly consecrated to the description of his life, has perished; while the biographies founded upon it in the 7th book of the Dinkard (9th century A D), the *Shāh-Nāma,* and the *Zardusht-Nāma* (13th century) are full of wonders and fabulous histories and miraculous deliverances.

The personality of Zoroaster is historic, but in the later Avesta. and in writings of more recent date, he is presented in a legendary light and endowed with superhuman powers. At his appearing all nature rejoices (Yasht, 13, 93); he enters into conflict with the demons and rids the earth of their presence (*Yasht,* 17, 19); Satan approaches him as tempter to make him renounce his faith (*Vendidad,* 19, 6).

The Gāthās alone within the Avesta claim to be the *ipsissima* verba of the prophet, and are expressly called "the Gāthās of the holy Zoroaster" (Yasna, 57, 8), his actual expressions in presence of the assembled congregation, the last genuine survivals of the doctrinal discourses with which—as the promulgator of a new religion—he appeared at the court of King Vīshtāspa.

The person of the Zoroaster in these hymns is a mere man, standing always on the solid ground of reality, whose only arms are trust in his God and the protection of his powerful allies He had to face forms of outward opposition, the unbelief and lukewarmness of adherents. even his own misgivings as to the truth and final victory of his cause. The range of the emotions which find their immediate expression in these hymns is wide and the whole breathes originality, is psychologically accurate and just. so that in the Gāthās we have the beginnings of the Zoroastrian religion. They give no historical account of the life and teaching of their prophet, but are general admonitions, asseverations. solemn prophecies, directed to the faithful or to the princes, and are generally dialogues with God and the arch-angels, whom he repeatedly invokes as witnesses to his veracity with many allusions to personal events which later generations have forgotten. Their extent is limited and their meaning is frequently dubious and obscure

The Person of the **Prophet.**—As to his birthplace the testimonies are conflicting According to the Avesta (*Yasna,* 9, 17), Airyanem Vaējō, on the river Dāitya, the old sacred country of the gods. was the home of Zoroaster. There on the river Dāreja, if the passage (Vend. 19, 4) is correctly interpreted. stood the house of his father; and the *Bundahish* (20, 32 and 24, 1 j) says expressly that the river Dāreja lay in Airan Vej. on its bank was the dwelling of his father, and that there Zoroaster was born. According to the Bundahish (29, 12), Airan Vej was situated in the direction of Atropatene, and consequently Airyanem Vaējō is generally identified with the district of Arrān on the river Aras (Araxes), close by the north-western frontier of Media. Other traditions make him a native of Rai (Ragha, Ῥάγαι). According to Yasna, 19. 18, the *zarathushtrōtema,* or supreme head of the Zoroastrian priesthood lived in Sassanian times, in Ragha. The Arabic writer Shahrastānī endeavours to reconcile the two traditions by the theory that his father lived at Atropatene, while the mother was from Rai. In his home he is said to have enjoyed the celestial visions and the conversations with the arch-angels and Ormazd mentioned in the Gāthās. There, too, according to Yasht, j, 105, he prayed that he might convert King Vīshtāspa. He then appears to have quitted his native district. On this point the Avesta is wholly silent; an obscure passage (Vasne, 53, 9) intimates that he found an ill reception in Rai. Finally, in the person of Vīshtāspa, a prince resident in east Iran, he gained the pomerful protector and faithful disciple of the new religion whom he desired—after almost superhuman dangers and difficulties, which the later books depict in lively colours. In the epic legend, Vīshtāspa was king of Bactria; in the later Avesta he became a half-mythical figure, the last in the series of heroes of east Iranian legend. In the Gāthās he appears as a quite historical personage; to his power and good example the prophet is indebted for his success. In *Yasna,* j3, 2, he is spoken of as a pioneer of the doctrine revealed by Ormazd. In the relation between Zoroaster and Vīshtāspa lies the germ of the state church which afterwards became subservient to the dynasty and sought its protection from it.

Among the grandees of the court of Vīshtāspa were two brothers, Frashaoshtra and Jāmāspa, both. according to the later legend, vizirs of Vīshtāspa. Zoroaster's wife, Hvōvi, was the daughter of Frashaoshtra, and the husband of his daughter, Pourucista, was Jāmāspa. The rôle of intermediary was played by the pious queen Hutaosa. Apart from this, the new prophet relies especially upon his own kindred (*hvaētush*). His first disciple, Maidhyōimāongha, was his cousin: his father was, according to the later Avesta, Pourushaspa, his mother Dughdōvā, his great-grandfather Haēcataspa, and the ancestor of the whole family Spitama, for which reason Zarathushtra usually bears this surname His sons and daughters are repeatedly spoken of. His death is nowhere mentioned in the Avesta; in the *Shāh-Nāma* he is said to have been murdered at the altar by the Turanians in the storming of Balkh.

As to the date of Zoroaster; King Vishtaspa has no place in any historical chronology, and the Gāthās give no hint on the subject. According to the Arda Vīrāf, 1, 2, Zoroaster taught some 300 years before the invasion of Alexander. Assyrian inscriptions relegate him to a more ancient period. Eduard Meyer (see Ancient Persia). conjecturally puts the date of Zoroaster at 1000 B C., with Duncker (Geschichte des *Altertums,* 4, 78). This may be too high: but, in any case, Zoroaster belongs to a prehistoric era. Probably he belonged to the old school of Median Magi, and appeared first in Media as the prophet of a new faith, but met with sacerdotal opposition. and turned his steps eastward. In the east of Iran the novel creed first acquired a solid footing, and subsequently reacted with success upon the West.

Zoroastrianism.—Zoroaster taught a new religion rooted in the old Iranian—or Aryan—folk-religion, of which me can form some representation by comparison with the religion of the Veda. The Aryan folk-religion was polytheistic. Worship was paid to popular divinities, such as the war-god and dragon-slayer Indra, to natural forces and elements such as fire, but the Aryans also believed in the ruling of moral powers and of an eternal law in nature. On solemn occasions the inspiring drink soma (*haoma*) was consumed by the devout. Numerous coincidences with the Indian religion survive in Zoroastrianism, side by side with astonishing diversities.

In the Avesta the evil spirits are called *daēva* (Modern Persian *dīv*), while the Aryans of India gave the name of *dēva* to their good spirits, the spirits of light. An alternative designation for deity in the *Rig-Veda* is *asura.* In the later hymns of the Rig-

Veda and in later India, only evil spirits are called *asuras,* while in Iran the corresponding word ahura was, and is, the designation of God the Lord. *Ahura* indicates the more sublime and awful divine character, for which man entertains reverence and fear: *daēva* denotes the kind gods of light, the anthropomorphic deities. Zoroaster elevated the conception of the *Ahura,* and he degraded the daivas (*daēvas*) to the rank of malicious powers and devils. In one *Ahura,* he concentrated the whole of the divine character; and conferred upon it the epithet of "the wise" (*mazdāo*). The Wise Lord (*Ahurō Mazdāo*—later *Ormazd*) is the primaeval spiritual being, the All-father, who was existent before ever the world arose, From him that world has emanated, and its course is governed by his foreseeing eye. His guiding spirit is the Holy Spirit, which wills the good: yet it is not free, but restricted, in this temporal epoch, by its antagonist and own twin-brother (*Yasna,* 30, 3), the Evil Spirit (*angrō mainyush,* Ahriman), who in the beginning was banished by the Good Spirit by means of the famous ban contained in Yasna, 45, 2, and since then drags out his existence in the darkness of Hell as the principle of ill. In the Gāthās the Good Spirit of Mazda and the Evil Spirit are the two great opposing forces in the world, and Ormazd himself is to a certain extent placed above them both. Later the Holy Spirit is made directly equivalent to Ormazd; and then the great watchword is: "Here Ormazd, there Ahriman!" The very *daēvas* are only the inferior instruments, the corrupted children of Ahriman, from whom come all that is evil in the world. The *daēvas,* attacked by Zoroaster as the enemies of mankind, are still, in the Gāthās, the perfectly definite gods of old popular belief—the idols of the people. Zoroaster regarded them as spurious deities, and their priests and votaries as idolaters and heretics. In the later, developed, system the *daēvas* are the evil spirits in general, and their number has increased to millions. Some have names; and among them the old Aryan divinities emerge here and there, *e.g.,* Indra and Nāonhaitya. With some, of course, such as the god of fire—the connection with the good deity was indissoluble. Other powers of light, such as Mitra the god of day (Iranian Mithra), survived in popular belief till the later system incorporated them in the angelic body. The authentic doctrine of the Gāthās had no room either for the cult of Mithra or for that of the Haoma. Beyond the Lord and his Fire, the Gāthās only recognize the archangels and certain ministers of Ormazd, who are personifications of abstract ideas. The essence of Ormazd is Truth and Law (*asha*=Vedic *rta*): this quality he embodies, and its personification (though conceived as sexless) is always his constant companion. The essence of the wicked spirit is falsehood: and falsehood, as the embodiment of the evil principle, is more frequently mentioned in the Gāthās than Ahriman himself.

Zoroaster says that he had received from God a commission to purify religion (Yasna, 44, g) from the grossly sensual elements of *daēva* worship. This self-contained theory of the universe and logical dualistic principle were destined to terminate in monotheism. Later sects sought to rise from it to a higher unity in other ways. Thus the Zarvanites represented Ormazd and Ahriman as twin sons proceeding from the fundamental principle of all—*Zrvana Akarana,* or limitless time.

Ethically, too, the new doctrine stands on a higher plane, and represents, in its moral laws, a superior civilization. It is the religion of the settled grazier and the peasant, while the ruder *daēva*-cult holds its ground among the uncivilized nomadic tribes, who sacrificed the cow, the gift of Ormazd to man, a sacred animal.

The Doctrine ot Zoroaster may be summarized as follows:—At the beginning of things there existed the two spirits who represented good and evil (Yasna, 30, 3). Both spirits possess creative power, which manifests itself positively in the one and negatively in the other. Ormazd is light and life, and creates all that is pure and good—in the ethical world of law, order and truth. His antithesis is darkness, filth, death and produces all that is evil in the world. Until then the two spirits had counterbalanced one another. The ultimate triumph of the good spirit is an ethical demand of the religious consciousness and the quintessence of Zoroaster's religion.

The evil spirit with his wicked hosts appears in the Gāthās much less endowed with the attributes of personality and individuality than does Ahura Mazda. Within the world of the good Ormazd is Lord and God alone. In this sense Zoroastrianism is often referred to as the faith of Ormazd or as Mazdaism. Ormazd in his exalted majesty, the ideal figure of an Oriental king. has in conjunction uith himself a number of genii—for the most part personifications of ethical ideas. These are his creatures, his instruments, servants and assistants. They are comprehended under the general name of *ameshā* spent5 ("immortal holy ones") and are the prototypes of the seven *amshaspands* of a later date. These are—(I) Vohu Manō (εὔνοια), good sense, *i.e.,* the good principle, the idea of the good, the principle that works in man inclining him to what is good; (2) Ashem, afterwords Ashem Vahishtem (Plutarch's ἀλήθεια), the genius of truth and the embodiment of all that is true, good and right, upright law and rule—ideas practically identical for Zoroaster; (3) Khshathrem, afterwards Khshathrem Vairīm (εὐνομία), the power and kingdom of Ormazd, which have subsisted from the first but not in integral completeness, the evil having crept in like tares among the wheat: the time is yet to come when it shall be fully manifested in all its unclouded majesty; (4) Ārmaiti (θοψία), due reverence for the divine, verecundia, spoken of as daughter of Ormazd and regarded as having her abode upon the earth; (5) Haurvatāt (πλοῦτος), perfection; (6) Ameretāt, immortality. Other ministering angels are Gēush Urvan ("the genius and defender of animals"), and Sraosha, the genius of obedience.

As soon as the two separate spirits (cf. Bundahish, 1, 4) encounter one another, their creative activity and at the same time their permanent conflict begin. The history of this conflict is the history of the world All creation divides itself into that which is Ahura's and that which is Ahriman's.

In the soul of man is the object of the war. Man is a creation of Ormazd, who therefore has the right to call him to account. But Ormazd created him free in his determinations and in his actions, wherefore he is accessible to the influences of the evil Powers. Man takes part in this conflict by all his life and activity in the world. By a true confession of faith, by every good deed, word and thought, by continually keeping pure his body and his soul, he impairs the power of Satan and strengthens the might of goodness, and establishes a claim for reward upon Ormazd; by a false confession, by every evil deed, word and thought and defilement, he increases the evil and renders service to Satan.

The life of man falls into two parts—its earthly portion and that shich is lived after death. The lot assigned to him after death is the result and consequence of his life upon earth. On the works of men here below a strict reckoning will he held in heaven (according to later representations, by Rashnu, the genius of justice, and Mithra). All the thoughts, words and deeds of each are entered in the book of life as separate items—all the evil works, etc., as debts. Wicked actions cannot be undone, but in the heavenly account can be counterbalanced by a surplus of good works. Only in this sense can an evil deed be atoned for by a good deed. Of a real remission of sins the old doctrine of Zoroaster knows nothing, whilst the later Zoroastrian Church admits repentance, expiation and remission. After death the soul arrives at the *cinvatō peretu,* or accountant's bridge, over which lies the way to heaven. Here the statement of his life account is made out. If he has a balance of good works in his favour, he passes forthwith into paradise (Gar6 *demāna*) and the blessed life. If his evil works outweigh his good, he falls finally under the power of Satan, and the pains of hell are his portion for ever. Should the evil and the good be equally balanced, the soul passes into an intermediary stage of existence (the *Hamēstakāns* of the Pahlavi books) and its final lot is not decided until the last judgment. This court of reckoning is called *ākā.* The course of law cannot be turned aside by sacrifi'ce, nor by the grace of God.

In the Gāthās Zoroaster speaks usually in general terms of the divine commands and of good and evil uorks, of the renunciation of Satan, adoration of Ormazd, purity of soul and body, and care of the cow. Ceremonial worship is hardly mentioned The Gāthās contain revelations concerning the last things and the future lot, whether bliss or woe, of human souls, promises for true believers, threatenings for misbelievers, and Zoroaster's firm confidence as to the future triumph of the good.

Zoroaster believed that the calling of a prophet took place precisely when it did with special reason. It was, he held, the final appeal of Ormazd to mankind at large. The fulness of time was near, the kingdom of heaven was at hand. Through the whole of the Gāthās runs the pious hope that the end of the present world is not far distant. He himself hopes, with his followers, to live to see the decisive turn of things, the dawn of the new and better aeon. Ormazd will summon together all his powers for a final decisive struggle and break the power of evil for ever; by his help the faithful will achieve the victory over their detested enemies, the *daēva* worshippers. Thereupon Ormazd will hold a general ordeal. Forthwith begins the one undivided kingdom of God in heaven and on earth. This is called, sometimes the good kingdom, sometimes simply the kingdom. Here the sun will for ever shine, and all the pious and faithful will live a happy life, which no evil power can disturb, in the eternal fellowship of Ormazd and his angels. Every believer will receive as his guerdon the inexhaustible cow and the gracious gifts of the Vohu Manō.

Later Development. — For most of the people Zoroaster's doctrine was too abstract. In the later Avesta are Mithra and popular divinities like the angel of victory, Verethraghna, Anāhita (Anāitis), the goddess of the water, Tishrya (Sirius). and other heavenly bodies, invoked with special preference. The Gāthās know nothing of the belief in the *Fravashi*, or guardian angels of the faithful. *Fravashi* properly means "coniession of faith," and when personified comes to be regarded as a protecting spirit. With the new teaching arose a widely spread priesthood (*āthravanō*) who systematized its doctrines, organized and carried on its worship, and laid down the minutely elaborate laws of the Vendidad for the purifying and keeping clean of soul and body, such as the numerous ablutions, bodily chastisements, love of truth, beneficial works, support of comrades in the faith, alms, chastity, improvement of the land, arboriculture, breeding of cattle, agriculture, protection of useful animals, as the dog, the destruction of noxious animals, and the prohibition either to burn or to bury the dead. These are to be left on the appointed places (*dakhmas*) and exposed to the vultures and wild dogs. In the worship the drink prepared from the *haoma* (Indian *soma*) plant had a prominent place. Worship in the Zoroastrian Church was devoid of pomp; it was independent of temples. Its centre was the holy fire on the altar. The fire altars afterwards developed to fire temples. In the sanctuary of these temples the various sacrifices and high and low masses were celebrated. As offerings meat, milk, show-bread, fruits, flowers and consecrated water were used. The priests were the privileged keepers and teachers of religion. They only performed the sacrifices (Herodotus, i. 132), educated the young clergy, imposed the penances; they in person executed the ceremonies of purification and exercised a spiritual guardianship and pastoral care of the laymen. Every young believer in Mazda, after haling been received into the religious community by being girt with the holy lace, chose a spiritual guide (*ratu*).

In eschatology a change took place. The last things and the end of the world are relegated to the close of a long period of time (3,000 years after Zoroaster), when a new Saoshyant is to be born of the seed of the prophet, the dead come to life, and a new incorruptible world begins.

Zoroastrianism was the national religion of Iran, and was professed by Turanians as well. The worship of the Persian gods spread to Armenia and Cappadocia and over the whole of the Near East (Strabo, xv. 3, 14; xi. 8, 4; 14, 76). Of the Zoroastrian Church under the Achaemenides and Aeracides little is known. After the overthrow of the dynasty of the Achaemenides a period of decay set in. Yet the Aeracides and the Indo-Scythian kings as well as the Achaemenides were believers in Mazda. The national restoration of the Sassanides brought new life to the Zoroastrian religion and long-lasting sway to the Church. Protected by this dynasty, the priesthood developed into a completely organized state church, which employed the power of the state in enforcing strict compliance with the religious law-book hitherto enjoined by their unaided efforts only. The head of the Church (Zarathushtrōtema) had his seat at Rai in Media and was the first person in the state next to the king. The formation of sects was at this period not infrequent (*cf.* MANICHAEISM). The Mohammedan invasion (636), with the persecutions of the following centuries. was the death-blow of Zoroastrianism. In Iran itself only a few followers of Zoroaster are now found (in Kerman and Yezd). The PARSEES (*q.v.*) in and around Bombay hold by Zoroaster as their prophet and by the ancient religious usages, but their doctrine is a pure monotheism.

ZORRILLA, JOSE (1817–1893), Spanish poet and dramatist, was born at Valladolid and read law at the University of Toledo, but after a year of idleness there, he fled to Madrid and started a paper which was suppressed by the Government. He then fell into great poverty, but was brought into notice by an elegiac poem, declaimed at Larra's funeral in Feb. 1837. His *Cantos del trooador* (1841), a collection of national legends versified with infinite spirit, secured for the author the place next to Espronceda in popular esteem. National legends also supply the themes of his dramas, though in this department Zorrilla somewhat compromised his reputation for originality by adapting older plays which had fallen out of fashion. For example, in El *Zapatcro y el Rey* he recasts *El montañés Juan Pascual* by Juan de la Hoz y Mota; in *Don Juan Tenorio* he adapts from Zamora's *S o hay dezrda que no se pague, y Convidado de piedra,* and from the elder Dumas's *Dolt Juan de Marana* (which itself derives from *Les âmes* du *purgatoire* of Prosper Mérimée). But his rearrangements usually contain original elements, and in *Sancho Garcia,* El *Rey loco,* and *El Alcalde Ronquillo* he apparently owes little to any predecessor. In 1855 he emigrated to Mexico where he was protected by the Emperor Maximilian. He returned in 1366 to find himself a half-forgotten classic. His old fertility was gone, and new standards of taste were coming into fashion. He was always poor, and for some 12 years after 1871 he was in the direst straits. A small pension secured him from actual want in his old age, and the reaction in his favour became an apotheosis. In 1889 he was publicly crowned at Granada as the national laureate.

ZOSIMUS, SAINT (d. 418), pope from 417 to 418. a Greek by birth. succeeded Innocent I on March 18. 417. His designation of Bishop Patroclus of Arles as papal vicar touched off dissatisfaction in Gaul. while his entertaining an appeal by the Pelagian Celestius led to debate with the African hierarchy and a definitive papal judgment against Pelagianism in 418. Zosimus died Dec. 26, 418. and his feast is celebrated on the anniversary.

See E. Amann in *Dictionnaire de Théologie Catholique,* vol. xv, pt. 2, col. 3708–16 (1950); P. Paschini, in *Enciclopedia Cattolica,* vol. xii, col. 1823 ff. (1954). (H. G. J. B.)

ZOSTEROPS, a genus of birds inhabiting various parts of the old world and especially common in Australia and New Zealand. In New Zealand. the most familiar species (*Z. caerulescens*) is called white eye or blightbird, the last an allusion to its clearing the fruit trees from blight.

ZOUAVE, the name given to certain infantry regiments in the French army. The corps was first raised in Algeria in 1831 with one and later two battalions, and recruited solely from the Zouaves. a tribe of Berbers, dwelling in the mountains of the Jurjura range (*see* KABYLES). In 1838 a third battalion was raised and the regiment thus formed was commanded by Lamoricière (*q.v.*). Shortly afterward the formation of the *Tirailleurs algériens*, the Turcos, as the corps for natives, changed the enlistment for the Zouave battalions, and they became, as they remained. a purely French body. Three regiments were formed in 1852. and a fourth, the Zouaves of the imperial guard, in 1854. The Crimean War was the first service the regiments saw outside Algeria. The Zouaves were noted for their strict discipline. fighting ability and exotic, oriental costumes.

In 1859 Elmer E. Ellsworth (1837–61) organized and trained in Chicago. Ill., a volunteer militia company patterned after the original Zouaves. On the outbreak of the Civil War. Ellsworth recruited a regiment of New York firemen which was mustered into the Union service in May 1861 as the 1st New York Fire Zouaves. Thereafter various Zouave regiments were organized. but the disadvantages of their colourful uniforms in battle were apparent. and were abandoned.

In 1860 the Papal Zouaves were formed in defense of the papal states by Lamoricière, who had been banished from France. After the occupation of Rome by Victor Emmanuel II in 1870. the Papal Zouaves served the government of national defense in France during the Franco-Prussian War, and were disbanded during the siege of Paris.

ZOUCHE, RICHARD (1590–1661). English jurist. one of the founder3 of modern international Ian-. was born at Ansty in Wiltshire. He became regius professor of civil law at Oxford. where he took part in drafting the Laudian statutes of the university in 1620. and practised successfully in London. being appointed a judge of the court of admiralty in 1641. He was tn-ice returned as member of parliament for Hythe. A royalist and a negotiator of the surrender of Oxford to the Commonwealth forces in 1616. he was deprived of his judgeship in 1649. but retained his professorship. In 1654 he sat on a special tribunal which tried Don Pantaleone Sa, the brother of the Portuguese ambassador. for murder. He was reappointed to his judgeship after the Restoration. but died one month later. on March 1. 1661.

Zouche i remembered for his treatise *Juris et Judicii fecialis sive Juris inter gentes explicatio* (1650). the first scientific manual covering the whole field of international law. Giving a far larger place to custom and modern precedents than did earlier writers. Zouche may fairly claim to he the hrit of the positivists. Though he did not coin the phrase *jus inter gentes* for international law he first adopted it as an npter title for the subject than *jus gentium* (*see* ROMAN LAW). Finally, he first placed the law of peace before that of war. (C. H. M. W.)

ZOYSIA are warm-season, perennial turf grasses with strong rhizomes, used on lawns. golf courses. parks, highways and recreational areas. Three main species exist in the United States: (1) Japanese lawn grass (*Z. japonica*), coarse. fibrous. winter-hardy into Canada; (2) Manila grass (*Z. matrella*), fine-bladed, semitropics!. not winter-hardy north of Washington, D.C.; (3) Mascarene grass (*Z. tenuifolia*), extremely fine-bladed, tropical. exotic. Zoysia respond to good care but tolerate neglect, drought. low fertility, insects and diseases. Under good treatment they are permanent and virtually weed free. They lose colour after hard frosts but retain a dense resilient turf. Improved types are planted vegetatively by plugs, sprigs or sods. (F. V. G.)

ZRINYI, MIKLÓS (1620–1664), Hungarian statesman. military leader and author of a famous Hungarian epic. was born at Csákvár, on Jan. 5. 1620. into an extremely wealthy aristocratic family. His chief concern was the driving out of the Turkish conquerors, the unification of the dismembered country and the organization of a modern absolutist state. He was appointed *bán*, or viceroy, of Croatia in 1647. Spending all his life in fighting the Turks. he became the outstanding Hungarian military leader of his century. He wanted to see his country free not only from Turkish but also from Habshurg rule. In 1664 he started laying the foundations of a far-reaching anti-Habsburg organization, but on Nov. 18 of the same year he was killed by a wild boar.

His chief literary work is *Szigeti Veszedelem* (1635–46)—the first and finest epic in Hungarian literature—which deals with the heroic deiense of the iortress of Szigetvár (1566) against the armies of the sultan Suleiman II. The commander of the fortress, the central figure of the epic, is the poet's great-grandfather. who fell during the siege. This historical event was projected by the poet against the background of the world-wide conflict of Christians and Turks. He used elements belonging to the heroic epic tradition and also the heroic lays of the Hungarian and Croatian peoples. The work excels in its poetic form and the characterization of its heroes.

Zrinyi's prose essays on military science and on political questions are also of great value: *Vitéz Hadnagy* ("The Brave Commander." 1650–53); *Mátyás Király* ("King Matthias," 1656–57); *Török áfium elleni orvosság* ("Remedy Against the Turkish Opium." 1660–61), are an application of Machiavelli's ideas to contemporary Hungarian conditions. These works are remarkable not only for their content, but also for their style; they are outstanding examples of Hungarian didactic and scientific prose.

ZSIGMONDY, RICHARD (1865–1929), Austrian chemist awarded the Nobel prize in chemistry in 1925 for fundamental work in colloid chemistry, was born on April 1. 1865. in Vienna. Receiving his Ph.D. from Munich in 1889. he became a research assistant in Berlin and Graz. In 1898 he was employed in the Schott and Genossen glassworks at Jena where his interest in the ruby glass produced by colloidal gold led to his discovery of water suspensions or sols of gold which were submicroscopic in size. His belief that the suspended particles were kept apart by means of electric charges which they carried was generally accepted. With H. Siedentopf of the Zeiss works at Jena. Zsigmondy developed the ultramicroscope for the detection of particles of a diameter of three millimicrons. Zsigmondy was able to count these particles in a given volume and to estimate their magnitude indirectly. This began the systematic investigation of colloids as a subdivision of matter. a study of theoretical and practical benefit to the understanding of all sols. smokes. fogs, foams and films. The dependence of colours of a solution upon the size of the solute. protective colloids and coagulation of colloids by electrolytes were examined by Zsigmondy, the acknowledged leader in this field for 30 years. His conclusions clarified problems in biochemistry. bacteriology and soil physics. Zsigmondy n-rote an account of his life work in a volume entitled *Zur Erkenntnis der Kolloide.* From 1908 to 1929 he was professor of inorganic chemistry at Göttingen, where he died Sept. 23. 1029. (V. BW.)

ZUCCARELLI, FRANCESCO (1702–1788), Italian painter, who influenced markedly English landscape painting. was born at Pitigliano, Tuscany, on Aug. 15, 1702. He seems to have begun his artistic training very early under Paolo Anesi and later worked in Rome under G. Morandi and his pupil P. Nelli. After returning briefly to Florence he moved to Venice in about 1732 and was thenceforward associated with the Venetian school. The pastoral character of his conventional Arcadian landscapes made an especial appeal to the English, and through the instrumentality of Joseph Smith, British consul at Venice, he twice visited England. He arrived for the first time at the end of 1752 and remained for ten years. practising as a landscape painter with great success. During his second visit (1765–71) he was elected a foundation member of the Royal Academy (1768) and became one of George III's favourite painters. He had been elected to the Venetian academy in 1763 and became its president in 1772. In addition to doing much work at Bergamo, he was for a time in Paris. and in the last two years of his life he returned to Rome, and afternard to Tuscany, dying at Florence on Dec. 30, 1788. He executed innumerable drawings, a few religious paintings. engravings and tapestry designs. About 1750 he is said to have persuaded Richard Wilson to abandon figure painting for landscape painting.

ZUCCARO (ZUCCHERO, ZUCCARI), the name of two Italian painters, brothers. leaders of the Roman Mannerist school. Their father was an obscure painter, Ottaviano Zuccaro.

TADDEO ZUCCARO (1529–66) was born at S. Angelo in Vado, near Urbino. on Sept. 1, 1929. Largely self-trained at Rome, from the early 1550s he executed many decorative frescoes for façades and interiors of palaces and a few religious works. From 1559 until his death (in Rome, on Sept. 1 or 2. 1566) he was in charge of his greatest commission. the frescoes and stucco decorations of the Palazzo Farnese at Caprarola, still the most splendid ornamented rooms of their time. Other frescoes are in the Villa di Papa Giulio, Rome, and the Sala Regia at the Vatican.

FEDERIGO ZUCCARO (1539/43–1609) was the younger brother and, from 1550, helper and pupil of Taddeo. His independent work began in 1561. He visited Venice. 1563–65, and worked under Giorgio Vasari in Florence in 1565. He became the central figure of the Roman Mannerist school, and after Titian's death (1576) was perhaps the most famous painter in Europe. He codified the theory of Mannerism in *L'Idea de' pittori, scultori, ed avchitetfi* (1607) and in a series of frescoes in his own house in Rome. In 1593 he became first president of the Academy of St. Luke in Rome, which is to some extent the parent body of modern art academies. He completed some of Taddeo's work at Caprarola and traveled through France and the Netherlands in 1574.

He spent a few months in England in 1575, where he painted portraits of Queen Elizabeth I and the earl of Leicester (and probably no one else). His chief later commissions were the painting of the dome of Florence cathedral (1575–79), a large work in the Doges' palace at Venice in 1582 and much work for the Escorial in Spain (1585–88). His latest paintings are much quieter and less mannered in style, and he lived to see Mannerism extinct. He died at Ancona on July 20, 1609. His drawings seem much more lively today than his enormous machines, which have outlived their reputation. but his historical importance remains. The hundreds of portraits which bear his name in English houses are ascribed n·ithout foundation. (E. K. WE.)

ZUG, the smallest undivided canton of Switzerland, is centrally situated. Of its 92 sq.mi., 83.6% are productive, forests covering 20.1 sq.mi. Of the unproductive area, 12.6 sq.mi. are covered by lakes, 2.8 by the Aegeri See (wholly within the canton) and the balance by part of the Lake of Zug. The pear-shaped Rossberg mass. with its central summit (Wildspitz, 5,197 ft.). thrusts its pointed end (Zugerberg. 3.255 ft.) north-northwest into the canton. Its steep western flanks fall to the Lake of Zug, the less steep eastern slopes descend to the basin and waters of the Aegeri See. Still eastward. the land rises to the Hohe Rone mass (4.042 ft.) near its eastern boundary. From Aegeri a gorge carries the river Lorze to the lowland at the north end of the Zugerberg, round which it curves to enter the lower end of the Lake of Zug. The Lorze leaves this lake slightly west of its point of entrance and flows north-northwest. over fertile lowlands. to its junction with the Reuss river—the latter stream forming the northwest boundary of the canton. East of the lake is Morgarten, the site of the great victory of the Confederates over the Habsburgs (1315). In 1950 the population was 42.239; in 1930, 34,395. After 1928 the canton formed part of the diocese of Basel. All to\\-us are small. Zug (pop. 14,488) is the largest: north of it is Baar, and west-northwest is Cham. which are merely large villages. The canton forms a single administrative district and contains 11 communes. By the constitution of 1814 the "Landsgemeinde," or primitive democratic assembly, which had existed since 1376, became an electoral body to choose a cantonal council. In 1848 the remaining functions of the Landsgemeinde were abolished.

The 1873–76 cantonal constitution was largely replaced by the present one in 1894.

The earlier history of the canton is closely linked with that of its capital. Zug (*see* below): subsequently violent disputes about the distribution of the French pensions took place (1728–38). In 1798 its inhabitants opposed the French, and during the period of the Helvetia republic it was one of the districts of the huge canton of the Waldstätten. hut became a separate canton again on the fall of the republic (1803). As one of the six Catholic cantons. it joined the Sonderbund (1845) and shared in the war of 1817. In 1848. and again in 1874. it voted against the acceptance of the proposed federal constitution.

ZUG, capital of the Swiss canton of that name. a picturesque little town at the northeast corner of the lake of Zug, and at the foot of the Zugerberg (3,255 ft.), which rises gradually, its lower slopes thickly covered with fruit trees.

Pop. (1950) 14.485.

The town, first mentioned in 1240, is called an *oppidum* in 1242 and a *castrum* in 1255. In 1273 it was bought by Rudolph of Habsburg from Anna, the heiress of Kyburg. After this it was governed by a bailiff. appointed by the Habsburgs. and a council, and was much favoured by that family. Several country districts (Baar, Menzingen and Aegerij had each its own "Landsgemeinde" but were governed by one bailiff, also appointed by the Habsburgs; these were known as the "Aeusser Amt." and were always favourably disposed to the Confederates. On June 27, 1352, both the town of Zug and the Aeusser Amt entered the Swiss Confederation; but in Sept. 1352, Zug had to acknowledge its own lords again, and in 1355 to break off its connection with the league. About 1364 the town and the Xeusser Xmt were recoverkd for the league by the men of Schwyz, and from this time Zug took part as a full member in all the acts of the league. In 1379 the German king Wenceslaus exempted Zug from all external jurisdictions, and in 1389 the Habsburgs renounced their claims, reserving only an annual payment of 20 silver marks, and this came to an end in 1415. In 1385 Zug joined the league of the Swabian cities against Leopold of Habsburg, and shared in the victory of Sempach. Between 1379 (Walchwil) and 1477 (Cham), Zug had acquired various districts in its own neighbourhood, principally to the north and the west. which were ruled till 1798 by the town alone as subject lands. At the time of the Reformation, Zug clung to the old faith and was a member of the "Christliche Vereinigung" of 1529. In 1jS6 it became a member of the Golden league.

ZUG, LAKE OF, one of the minor Swiss lakes, north of that of Lucerne. It is formed by the Aa. which enters the southern extremity of the lake. The Lorze enters at its northern end. but $1\frac{1}{4}$ mi. farther W. issues from the lake to pursue its course toward the Reuss. The lake has an area of about 1j sq.mi., is about 9 mi. long. $2\frac{1}{2}$ mi. wide and has a maximum depth of 650 ft., while its surface is 1,358 ft. above sea level. Most of the lake is in the canton of Zug. but $3\frac{3}{4}$ sq.mi. at the southern end is in Schwyz, while $\frac{3}{4}$ sq.mi. to the N. of Immensee is in Lucerne.

ZUHAIR (ZUHAIR IBN ABI SULMA RABI' A AL-MUZANI) (6th century), one of the six great Arabian pre-Islamic poets. Of his life practically nothing is known except that he belonged to a family of poetic power; his stepfather Aus ibn Hajar, his sister Khansa and his son Kab ibn Zuhair were all poets of eminence. He is said to have lived long. and at the age of 100 to have met Mohammed. His home was in the land of the Bani Ghatafan. His poems are characterized by their peaceful nature and a sententious moralizing. One of them is in the *Moallakat.*

All of his poems were published by W. Ahlwardt in The *Diwans* of *the Six Ancient Arabic* Poets (London, 1870); and with the commentary of al-Alam (d. 1083) by Count Landberg in his *Primeurs arabes* (Leyden, 1889). (G. W. T.)

ZUIDER ZEE, a shallow gulf. penetrating far into the northern Netherlands, communicating with the North sea but almost cut off irom it at low water by the Frisian Islands (Texel, etc.) and the sandbanks of the Waddenzee. It is probable that in the middle ages the coast line to the north of the Zuider Zee was an almost continuous series of dunes. but before the 14th century the Zuider Zee acquired something of its present form. The greater part of the water-covered area had a depth of less than 15 ft. at low water. An area of more than 12.000 ac. was reclaimed in the neighbourhood of Amsterdam, at the time of the building of the North sea ship canal. 1870–76, by the construction of a sea dike and locks cutting off Amsterdam from the Zuider Zce. Earliest plans for reclaiming the Zuider Zee date from the 17th century but it was not until 1918 that the sanction of the legislature was obtained for carrying out a vast scheme of reclamation commenced in 1920.

On the former sea area of 1.380 sq.mi., it was planned to convert about 560 sq.mi. into a fresh-water lake (IJssel lake) and 750 sq.mi. into rich polderland. The dike shutting out the North sea, $18\frac{1}{2}$ mi. long between north Holland and Friesland, was completed in 1932. Locks permit the passage of large Rhine barges. Occupation of the northwest polder began on completion of the dike. Work on the northeast polder started in 1936 and the first farms were occupied in 1947. The dam between the northwest polder and the lake was breached in World War II. but reclamation of the area was completed before the end of 1945. Work begun on the southeast polder in 1950 was completed in 1956. See also HOLLAND. (N. G. G.; T. HER.)

ZULOAGA (Y ZABALETA), IGNACIO (1870–1945), Spanish painter, was born at Eibar in the Basque province of Guipuzcoa on July 26, 1870. His earliest paintings were copies of works by El Greco and Velazquez in the Prado museum. Madrid. In 1889 he went to Rome, and later to Paris, where he exhibited at the Salon of 1890, describing himself as a pupil of his father (a well-known metalworker and damascener) and of Henri Gervex. Though he professed a distaste for modern art, he was obviously affected by current trends, from Impressionism to poster art and *art nouveau,* and was particularly influenced by Gauguin and Toulouse-Lautrec. He consciously sought inspiration from earlier Spanish painters—El Greco (whom he was one of the first to "rediscover"), Velazquez and Goya. He spent most of his life in Paris and Spain, and died in Madrid on Oct. 31, 1945.

It mas not until the 1920s, when the fame he had enjoyed abroad since the end of the 19th century was on the wane, that his fellow countrymen—who had criticized his art as unpatriotic—acclaimed him. His popularity abroad rested chiefly on his characteristic representations of Spanish subjects, satisfying a taste for the exotic—gypsies, dancers, bullfighters and other popular national types. He also painted landscapes, female nudes and fashionable portraits. The vigorous style of his maturity, with strong forms and vivid colours, gave his subjects a dramatic vitality; but it developed into a mannered formula in which realism was sacrificed to theatrical effect. Zuloaga is represented in many public galleries throughout the world. (E. Hs.)

ZULULAND, a region of southeastern Africa, forming the northeastern section of the province of Natal in the Union of South Africa. It was incorporated with Natal in Dec. 1897, from which time until the formation of the Union it was known as the province of Zululand. It lies between 26° 50′ and 29° 15′ S. and 30° 40′ and 33° E. and is bounded on the southeast by the Indian ocean, on the north and northeast by the Utrecht and Vryheid districts of Natal and by Swaziland. The region has an area of 10,362 sq.mi. including Amatongaland, Zaambauland and Ingwavuma district, territories not part of the former Zulu domains. Population (1951) 423,230, comprising 409.343 natives, 8,497 Europeans, 3,950 Asians and 1,440 coloured. European settlement was restricted by the prevalence of malaria and of the tsetse fly, which aerial spraying after 1945 substantially reduced. For an account of physical features, geology, climate, flora, fauna and general geography, see under NATAL and SOUTH AFRICA. UNION OF.

Crown reserves of land for native use, although considerably reduced, form about three-fifths of Zululand, 3,882,000 ac. having been set aside in 21 districts as the Zululand native trust. Large areas in Zululand have been planted with sugar cane. Completion of the Swazi border railway opened up much country for the cultivation of cotton. The completion of the Empangeni-Nkwaleni railroad began the opening up of large and fertile areas. The important irrigation scheme at Mkuzi was expected further to facilitate agriculture, as was also a similar project, estimated to cost £250,000, on the Pongola river. Coal deposits are believed to underlie much of the southern sections of Zululand.

History.—The Zulu are a tribe of the Nguni group of the Bantu people. It is not certain by what route or at what point in time the Nguni entered southeastern Africa, but Zulu legend. reinforced by travellers' tales. establishes that the Zulu were a separate tribe settled in the valley of the White Mfolosi river by the end of the 17th century. In 1756 they were described by shipwrecked Europeans as very proud, careful in the preparation of food, very cleanly in their person and jealous of their women. Though they were a distinct social group, the Zulu were at the beginning of the 19th century still an unimportant tribe numbering little more than 2.000. The dominant tribe in Zululund was that of the Mtetwa people, who lived northeast of the Tugela river round the St. Lucia lagoon. Their chief was Dingiswayo (1807–18) son of Jobe. It was probably Dingiswayo nho converted the erstwhile circumcision guilds (*ama Buto*) into the basis of a regimental system for military. as distinct from social. purposes. He began to convert the horned-crescent formation of the ceremonial hunting into a military tactic. while the introduction of the short stabbing assegai—possibly invented by the refugee Shaka—was to lead to the development of a primitive counterpart of a bayonet charge. As Dingiswayo opened up relations with Portuguese traders of Delagoa bay, he may be described as fumbling toward building a state. His was the example that Shaka followed.

Shaka.—It was in Mtetwaland that Shaka (or Chaka) the Zulu and Nandi his mother found refuge when they fled from the kraal of Shaka's father, Senzangakona (1757–1816). Shaka, enrolled in the izi-Cwe guild, won the admiration of Dingiswayo, nho is said to have contrived the death of Senzangakona and engineered the succession of Shaka to the Zulu throne, though he was not the rightful heir. The paramountcy of Dingiswayo, lord of 30 chiefs, was meantime threatened by Zwide, chief of the Ndwandwes of Zululand; Dingiswayo rvas caught by treachery and murdered. Shaka, moving up to his rescue, was warned in time and escaped Zwide's clutches. For a time the inevitable duel between Zwide and Shaka the Zulu was postponed. In the interim, Shaka built a royal kraal; impounded a choice herd of white cattle from Madlokovu of the Mfute; and imported cooks from Mtetwaland and expert brewers from the ema-Qungebeni. He assumed control over the drifting and divided Mtetwa, subdued several smaller tribes and perfected the military system of Dingiswayo. The rule of celibacy was ruthlessly imposed on the regiments (impis); the use of the stabbing assegai was made general; shields were improved, as too were the tactics of a highly mobile army (said to be able to cover as much as 40 mi. in a single day). Characteristic of Shaka's campaigns were the efficient use of spies and scouts, the use of decoys and what is best described as the scorched-earth retreat. In his first encounter with Zwide, Shaka narrowly escaped defeat. In 1819 Zwide attacked again; but, warned by his spies, Shaka retreated. burning up unconsumed supplies as he fled. When the Ndwandwes reached the Tugela they were starving and exhausted. In a three-day fight, Shaka overwhelmed them in the Mhlatuze valley, turning the flanks of the enemy by speedy moves of his young warriors. Zwide escaped, to die in exile. Those of his followers who mere not massacred were incorporated in Shaka's army.

It was not until 1821 that Shaka began systematically to conquer Natal and very largely to depopulate it. It is estimated that by forcible recruiting he had 1j regiments by 1824 and ruled over 50,000 people. That his foes were men of no mean calibre is proven by the careers of those who escaped his vengeance. To the north fled Mzilikazi (Umsilikazi, Mosilikatze). who colonized Matabeleland, and Soshangane of the Ndwandwes. who conquered Portuguese East Africa. For a generation their offshoots terrorized central Africa. The other main line of flight was southward: refugee Tembus and Fingoes fled via Pondoland. and on all of them Matiwane preyed until his power was broken by an expedition from the harassed Cape Colony. This shunting of tribes not only left Natal deserted but also dislocated the whole Cape frontier. By relentless cruelty erected into a system by ability of no mean order, Shaka the outcast had avenged the insults of his youth and built an empire. He was Africa's Attila.

Shaka first came into contact with Europeans in 1824, when he was visited by F. G. Farewell, H. F. Fynn and party. Fynn, who became a fluent linguist and who had some knowledge of medicine. treated Shaka for an assegai wound. Shaka, on his recovery, made a formal grant of Port Natal and its hinterland to Farewell and his assigns and, until his assassination, extended his erratic and exacting patronage to the traders. He wished to send an embassy to England, but the Cape government turned back his envoy. Again Shaka sent chiefs to Capetown, but before their arrival he had been murdered (Sept. 23, 1828) at a kraal on the Umvoti, about jo mi. from Port Natal. Shaka mas a victim to a conspiracy by his half-brothers Dingaan and Mhlangana, and a short time afterward

Dingaan murdered Mhlangana and made himself king.

Dingaan.—Bloodstained as had been Shaka's rule, that of Dingaan (Dingane) appears to have exceeded it in wanton cruelty. In 1835 Dingaan permitted the British settlers at Port Natal to establish missionary stations in the country in return for a promise made by the settlers not to harbour fugitives from his dominions. In 1836 American missionaries were also allowed to open stations; in Nov. 1837 Dingaan received Piet Retief, the leader of the first party of Boer immigrants to enter Natal. The story of Retief's mission, the massacre of the Boer leader and the fighting which followed is told in the article NATAL. In the result Dingaan's army mas totally defeated on Dec. 16, 1838 ("Dingaan's day"), by a Boer force under Andries Pretorius. A year later he was overthrown, the Boers in Natal (Jan. 1840) supporting his brother Mpande (usually called Panda) in rebellion against him. Dingaan passed into Swaziland in advance of his retreating forces and was there murdered, while Panda was crowned king of Zululand by the Boers.

Panda *and Cetewayo.*—When in 1843 the British succeeded the Boers as masters of Natal they entered into a treaty with Panda, who gave up to the British the country between the upper Tugela and the Buffalo rivers and also the district of St. Lucia bay (which, however, was not then occupied). Less warlike than Shaka and Dingaan, Panda remained throughout at peace with the government of Natal. Bishop Schreuder, a Norwegian missionary long resident in Zululand, gave Sir Bartle Frere the following estimate of the three brothers who successively reigned over the Zulu: "Chaka was a really great man, cruel and unscrupulous but with many great qualities. Dingaan was simply a beast on two legs. Panda was a weaker and less able man, but kindly and really grateful, a very rare quality among Zulus. He used to kill sometimes, but never wantonly or continuously." In 1856 war broke out between two of Panda's sons, Cetewayo (Cetshwayo) and Mbulazi, who were rival claimants for the succession. A battle was fought between them on the banks of the Tugela in Dec. 1856, in which Mbulazi and most of his followers were slain. The government of Natal in 1861 authorized Theophilus Shepstone to proclaim Cetewayo Panda's sole heir. Panda died in Oct. 1872 and Cetewayo (*q.v.*) was solemnly crowned by Shepstone.

Border disputes with the Transvaal Bders were fairly frequent during Panda's reign. The Boers had obtained from Panda in 1854 a cession of the Utrecht district: in 1860 they tried to get from the king a road to the sea at St. Lucia bay. In 1860 his brothers Mtonga and Mgidlana had escaped to the Transvaal when Cetewayo organized a roundup and murder of probable rivals. Cetewayo offered the Boers a strip of land if they would surrender hftonga. This they did on condition that Mtonga's life be spared. The Boers got a strip of land from Rorkesdrift to the Pongola river and beaconed it off in 1863. When, however, in 1865, Mtonga fled to Natal, Cetewayo declared that he had lost his part of the bargain, for he feared that Mtonga might be used to supplant him. He thereupon caused the boundary beacons to be removed and, on the ground that the Swazis were vassals of the Zulu and had no right to alienate, put forward a counterclaim to lands north of the Pongola that the Swazis had alienated to Lydenburg.

Such was the position when by his father's death Cetewayo became absolute ruler of the Zulu. As far as possible he revived the military methods of his uncle Shaka. His rule over his own people was tyrannous. By Bishop Schreuder he was described as "an able man, but for cold, selfish pride, cruelty and untruthfulness worse than any of his predecessors." The tension between Cetewayo and the Transvaal over border disputes continued and when in 1877 Great Britain annexed the Transvaal the disputes were transferred to the new owners of the country. A commission appointed by the lieutenant governor of Natal reported in July 1878 and found almost entirely in favour of the Zulu on the boundary disputes. But Sir Bartle Frere, the high commissioner, was convinced that, in the interests of Natal and of the Transvaal in particular and of South Africa in general, Cetewayo ought to be controlled. He accepted the report of the boundary commission but coupled with it demands for compensation for frontier incidents, together with political demands calculated to destroy the Zulu military system under the eye of a British resident. Presented on Dec. 11, the virtual ultimatum as to the structure of Zululand was to expire 30 days later.

The Zulu War.—Cetewayo returned no answer, and in Jan. 1879 a British force under Gen. Lord Chelmsford (F. A. Thesiger) invaded Zululand. Chelmsford had a force of 5,000 Europeans and 8,200 natives; Cetewayo an army of fully 40,000 men. Chelinsford divided his force into three columns — their entry was unopposed—which were to converge on Ulundi, the royal kraal. On Jan. 22 the centre column (1,600 Europeans, 2,500 natives), which had advanced from Rorkesdrift, was somen-hat casually encamped near Isandhlwana. It was neither entrenched nor in laager. On the morning of that day Chelmsford moved out with a small force to support a reconnoitring party. After he had left, the camp, in charge of Col. A. W. Durnford, was surprised by a Zulu army nearly 10,000 strong. The British were overwhelmed and almost every man killed, the casualties being 806 Europeans (more than half belonging to the 24th regiment) and 471 natives. The reconnoitring party returned to hnd the camp deserted: next day they retreated to Rorkesdrift, which had been the scene of a heroic and successful defense. After the victory at Isandhlwana, two impis oi the Zulu army had moved to the drift. The garrison stationed there, under Lieuts. J. R. M. Chard and G. Bromhead, numbered about 80 men of the 24th regiment, and they had in hospital betn-een 30 and 40 men. Late in the afternoon they were attacked. On six occasions the Zulus got within the entrenchments, to be driven track each time at bayonet's point. At dawn the Zulus withdrew, leaving 350 dead. The British loss was 17 killed and 10 wounded.

The other two columns merely held their ground. Col. C. K. Pearson was besieged at Eshowe until April, when, after a sharply contested victory at Ginginhlove, Chelmsford relieved Eshowe. In the northwest, Col. Evelyn Wood had evaded encirclement at Hlobane mountain, fallen back on fortified headquarters at Kambula and repulsed the pick of Cetewayo's army (March).

Kambula and Ginginhlove marked the turning point. Chelmsford could now afford to wait. When ample reinforcements were at hand, Chelmsford again ordered a general advance, designed, as in January, to focus on the royal kraal at Ulundi, though on this occasion the main thrust was made from the northwest. The death of the former prince imperial of the French, Napoleon III's son, while out with a reconnoitring party, was a tragic incident in a brilliant campaign. The White Mfolosi was crossed on July 4. With an estimated force of 4,200 Europeans and 100 natives and well-placed artillery, Lord Chelmsford fought and won a brilliant victory at Ulundi three days before Sir Garnet Wolseley arrived to supersede him.

Cetewayo's Downfall.—Ulundi broke the military resistance of the Zulus, and the fugitive Cetewayo was captured and exiled. Wolseley planned the reorganization of Zululand, dividing it into 13 artificial tribal units. A British resident was appointed, without adequate military or civil staff to control the situation, when the chiefs (known to Natalians as "Wolseley's Kilkenny cats") plunged into civil war. The main conflict was between the Usutu group (who were loyal to Cetewayo) and Zihebu (or Usibepu). The restoration of Cetewayo in Jan. 1883 made confusion worse confounded. The land between the Tugela and the Umlatusi, assigned by Wolseley to John Dunn (a white trader) and Hluhi (a Basuto refugee), was now set aside as a reserve, a haven and a buffer. But since Zibebu was installed as a counterpoise to Cetewayo, conflict was inevitable. In July 1883, assisted by white hunters and adventurers, Zibehu pounced on Cetewayo at Ulundi. Cetewayo, wounded and his power shattered, escaped to Eshowe, where he died in Feb. 1884.

Dinizulu and British Annexation.—Cetewayo's son Dinizulu turned to a group of Transvaal Boers for assistance, bartering territory against alliance. With their help he defeated Zibebu and drove him and his followers into the reserve. As reward for their support, the Boer surveyors claimed the whole of the northern territories (Vryheid district) together with a belt of land to St. Lucia bay, the only harbour between Durban and Lourenço Marques. Great Britain successfully contested this on the legal grounds of the treaty of 1843 with Panda (see above) but in 1886 recognized the new Republic of Vryheid—shorn, however, of its road to the coast. Two years later, Vryheid was incorporated in the Transvaal. (These northern districts of Zululand were to be retroceded to Natal after the South African War, without displacement of the then occupiers.)

The British government annexed Zululand to the crown in 1887 and placed it under a commissioner responsible to the governor of Natal. In the following year Dinizulu rebelled. After a sharp campaign (June–August, 1888), Dinizulu fled into the Transvaal. He surrendered to the British in November; in April 1889 he and two of his uncles were found guilty of high treason and were exiled to St. Helena.

Cnder the administration of the successive commissioners, Sir Melmoth Osborn and Sir Marshal Clarke and of the district magistrates, the Zulu became reconciled to British rule.

At the close of 1897 Zululand. in which Tongaland had been incorporated, was handed over by the imperial government to Natal. In 1898 Dinizulu was allowed to return and was made a "government induna." Officially one of several chiefs he was. in fact, regarded by most of the Zulu as the head of their nation.

The substitution of colonial for crown control in 1897 caused much uneasiness in Zululand, where lung sickness, rinderpest and east coast fever were killing cattle so rapidly that it looked as if the Zulu social structure was threatened. The taking of the first census and the appointment of a delimitation commission in 1902 contributed further to rumours and malaise. Word went round that the Zulu were to break their European cooking pots and to kill off all pigs and white fowl. This raised expectation of a general rising against the whites; and this expectation was fostered by alleged missionaries of the Ethiopian Church and by the rurnour (found as far north as central Africa) that a magic charm to make black men invulnerable to bullets had been discovered. Against this background of fact and fable, the imposition of the poll tax of 1905 precipitated rebellion when the tax fell due for collection in 1906. Tet it was in Natal (*q.v.*), not in Zululand. that armed resistance first occurred. The ringleader Bambata (of the Mpanza district) was, however, in touch with Dinizulu; it was into Zululand that he fled; and it was Lunyana, the keeper of Cetewayo's grave. who persuaded Sigananda to assist Bambata's revolt. Only prompt action by the colonial force averted what threatened to be a major rebellion with its racial and military hub in Zululand. The brief but exciting campaign was over by July 1906. In Dec. 1907 the Natal government felt justilied in charging Dinizulu with high treason. murder and other crimes. A military force entered Zululand and Dinizulu surrendered without opposition. He was brought to trial in Nov. 1908 and in March 1909 was found guilty of harbouring rebels. The more serious charges against him were not proved. Sentenced to four years imprisonment, he was released on the establishment of the Gnion in 1910 by Gen. Louis Botha. Dinizulu was settled on a farm in the Transvaal, where he died in Oct. 1913.

Administration.—While no major disturbance of public order occurred after 1906, many problems exposed by the South African Native Affairs commission (1903) and by the Natal Native Affairs commission (which followed the revolt) were nevertheless, by the niiddle of the 20th century, little nearer solution than they had been at the beginning. For purposes of administration, Zululand is an integral part of the province of Natal. It is divided into 11 magisterial districts. subdivided into tribal districts where chiefs exercise primary jurisdiction and assist the administration. At the head of the structure is the chief native commissioner, Natal. From the beginning, native law, where not repugnant to humanity or to public interest! has been recognized, at first on a customary basis and then by the extension of the Natal native code. In civil cases appeal lies to the native appeal court, northeast division, and in criminal cases to the native high court, Natal.

The radical problem in Zululand is the land question. The dclimitation commission, appointed in 1902, envisaged three types of land: an area set aside for European settlement; an area for native locations (reserves); and crown land to be broken up at a later date. Little of this was alienated, but in the course of the 20th century much was occupied by native squatters, whom some think to have a prescriptive claim. Proposals were made to break up crown land for development by white settlement. especially in the Ingwavuma corridor. But although, apart from some congestion in the districts of Eshowe, Nkandla and Nqutu, there was in Zululand more land per head for natives than elsewhere in the Lnion of South Africa. parts of that land were quite unsuitable for tillage and parts remained still malaria-ridden. The Zulu therefore were not overendowed. Since. moreover, the Cnion government did not attempt a thorough revision of Natal native administration (which, whenever possible. was based on tribal structures), it was considered that it would be unwise to cut down native lands either directly. by partition. or indirectly, by depriving an expanding population of an overflow into crown lands. For the Zulu tribal society, through which the administration worked, turned on the ownership of land and on the possession of cattle. But it was equally clear that the well-being of the Union as a mhole depended on the developing of scientific agriculture and on the maintenance of a labour supply both for rural and urban industries; and the Zululand system militated against this.

The Union government took two steps that were bound to change the position. It extended the drive (begun by the Natal Native trust) to improve native farming on a national scale through the appointment of agricultural officers and native demonstrators grouped under the district commissioners. In parts of Zululand considerable progress was clearly made. In 1953, modifying proposals put forward in 1934, the Cnion government proposed to substitute its own control for provincial control of native education. The avowed object, apart from financial and administrative convenience, was to provide increased facilities for native education as well as a new educational approach (neither mission schools nor provincial schools were numerically adequate, though devoted work had been done). As the periodical drift to the towns and to the mines had already weakened patriarchal control, systematic education on almost any plan could be expected to change the sociological and therefore the administrative pattern of Zululand. The South African government's Bantu Education act (1954) transferred the control of native education from all provincial administrations to the department of native affairs.

ZUMALACÁRREGUI Y DE IMAZ, TOMÁS DE (1788–1835), Spanish Carlist general, was born at Ormáiztegui, Guipuzcoa, Dec. 29, 1788. In his youth he served under Gaspar de Jáuregui, one of the minor guerrilla leaders. He then entered the army, but was disgraced for his support of Don Carlos.

Appointed commander in chief in Navarre by Don Carlos, he escaped from Paniplona on the night of Oct. 29. 1833, and took command the next day at Huarte-Araquil of the few hundred ill-armed and dispirited *guerrilleros* that constituted his whole force. In a few months Zumalacárregui had organized the Carlist forces into a regular ariny. Whether as a guerrilla leader or as a general conducting regular war in the mountains, he proved unconquerable. By July 1834 he had made it safe for Don Carlos to join his headquarters. The pretender, bigoted and narrow-minded. was afraid of Zumalacárregui's personal influence with the soldiers. and Zumalacárregui was hampered by the intrigues of the court. Yet by June 1835 he had made the Carlist cause triumphant to the north of the Ebro; had he been allowed to march on Madrid, he might well have put Don Carlos in possession of the capital. He reluctantly obeyed the order to besiege Bilbao, was wounded in the leg on June 15, 1835, attended by Don Carlos' physicians, and died on June 24, 1835, as a result of a quack's operation.

ZUÑI, an American Indian pueblo (*q.v.*), south of Gallup, N.M. In 1950 it had 2.563 inhabitants. The Zufii speak an independent language, and their origins and early history are unknown. Nor does mythology clarify these problems, for it pictures their ancestors as emerging from underground and wandering to their present location.

Zuñi was discovered in 1539 by Esteban, a Negro scout for Marcos de Niza, who preceded Coronado. The Indians were then living in Hawikuh, and five or six other towns. Collectively. these came to be called the Seven Cities of Cibola. After the Pueblo rebellion in 1680 the populace crowded into one multistoried masonry pueblo.

'Thirteen matrilineal clans comprise Zufii society, but the main officers are male. The principal masculine occupation is maize farming, although some men have become excellent silversmiths and turquoise workers. Basketry and pottery are the main feminine crafts.

Like other Pueblo Indians the Zufii are generally nonaggressive and deeply religious, with a complex ceremonial organization. Men often wear masks and costumes, in which they impersonate those gods or spirits called katcinas. One spectacular impersonation is Shalako, a gigantic katcina that appears annually in December. Under the impetus, primarily, of neighbours and returning veterans, native customs are rapidly changing to conform to white American ways. Nevertheless, much traditional Zuñi culture still remains.

ZUNZ, LEOPOLD (1794–1886), Jewish scholar, was born at Detmold, Ger., in 1794, and died in Berlin in 1886. He was the founder of what has been termed the "science of Judaism." the critical investigation of Jewish literature, hymnology and ritual. His *Gottesdienstliclze Vorträge dev Juden* lays down principles for the investigation of the rabbinic exegesis (Midrash, *q.v.*) and of the prayer book of the synagogue. Zunz's other principal works are *Synagogale Poesie des Mittelalters* (1855); and *Literaturgeschichte der Synagogalen Poesie* (1865; supp. vol., 1867).

ZURARA, GOMES EANES DE (*c.* 1410–1474), the second notable Portuguese chronicler in order of date (Fernão Lopes being the first), and the first to describe the Portuguese voyages of discovery which pioneered the overseas expansion of Europe. He entered the royal archives as assistant to Lopes (*q.v.*) and succeeded him as chief chronicler in 1454, His *Crónica da Tomada de Ceuta* ("Chronicle of the Capture of Ceuta"), a supplement to the *Crdnica de* D. *Joam* ("Chronicle of King John I") by Lopes, dates from 1450, and his *Crónica dos feitos de Guiné* ("Chronicles of the Deeds of Guinea"), more usually known as *Crónica do descobrimento* e *conquista de Guiné* ("Chronicle of the Discovery and Conquest of Guinea"), on which his reputation rests, was completed several years after the death of Prince Henry the Navigator in 1460. He also wrote a history of Tangier and other works. Modern research has disclosed that Zurara's accuracy in his *Crónica de Guiné* leaves much to be desired, the part played by Prince Henry being exaggerated at the expense of more important factors. His erudition is mainly secondhand, but with all its faults the *Crónica* remains the primary source for the subject. It is all the more regrettable that there is no adequate edition of the text in any language, the obsolescent translation by C. R. Beazley and E. Prestage for the Hakluyt society, 2 vol. (1896–98), being still the most useful.

ZURBARÁN, FRANCISCO DE (1598–1664), Spanish painter, was born at Fuente de Cantos, Badajoz province, Extremadura (baptized Nov. 7). He was apprenticed in 1614–16 to Pedro Diaz de Villanueva, a painter of images, in Seville, where he was also possibly a pupil of Juan de las Roelas.

Zurbarin's personal style, based on Caravaggesque naturalism and tenebrism. was already formed in Seville by 1629 ("St. Peter Nolasco," Prado; "St. Bonaventura," Louvre, etc.) and its development was probably stimulated by the early works of Velázquez and by the works of Jusepe de Ribera (*q.v.*). It was a style that lent itself well to portraiture and still life; but it found its most characteristic expression in his religious subjects. Indeed Zurbarán uses naturalism more convincingly than other exponents for the expression of intense religious devotion. He renders traditional personages—apostles, saints, monks—with portraitlike heads, with almost sculptural modeling and with emphasis on the minutiae of their dress, so as to impart verisimilitude to their miracles, visions and ecstasies. This distinctive combination of realism and religious sensibility relates the art of Zurbarán to the practical mysticism of the Jesuits. His art was popular with monastic orders in Seville and the neighbouring provinces and he had several followers, whose works have been confused with his. Of the many large cycles for which he received commissions the legends of St. Jerome and of Jeronymite monks (1638–39) that decorate the chapel and sacristy of the monastery at Guadalupe are the only ones that have remained *in situ*. Little is known of his production in the 1640s apart from the altarpiece at Zafra (1643–44) and records of a large number of paintings destined for Lima, Peru (1647). By 1658 both the style and the content of Zurbarán's paintings had suffered a change that can be attributed to the influence of Bartolomé Murillo (*q.v.*). In his late devotional pictures, like the "Holy Family" and "Immaculate Conception" (1659 and 1661, Budapest), the figures have become more idealized and less plastic in form; and their expression of religious emotion is tinged with sentimentality. Zurbarán died in Madrid on Aug. 27, 1664.

ZÜRICH, the canton of northeastern Switzerland which ranks officially first in the confederation. Its total area is 668 sq.mi., of which the high proportion of 90.4% is reckoned as "pro.. ductive" (forests, 184.9 sq.mi., and vineyards 4.6 sq.mi.). Of the rest, 27.8 sq.mi. are occupied by lake waters; chiefly part of the Lake of Zurich, but wholly within the canton are the Lakes of Greifen ($3\frac{1}{3}$ sq.mi.) and Pfaffikon ($1\frac{1}{4}$ sq.mi.). The canton joined the confederation in 1351. Its irregularity of shape arises from its continued growth, up to 1803, by the additions of acquisitions made by the capital. As far back as 1362 the whole of the lower part of the lake was added, and by the purchase of Winterthur (1467) from the Habsburgs, it reached the Rhine. Today it extends from its enclave in Baden, on the right bank of the Rhine (above the Thur junction to below the Töss junction) to some 8 mi. S.W. of Pfaffikon See. It consists of shallow river valleys draining toward the Rhine and separated from one another by northwest to southeast ridges. The most important valley is that of the Linth, which expands into the Lake by Zurich and is continued as the Limmat; the ridge to the east is low and then successively eastward are the valley of the river Aa-Glatt, which flows through the Greifen See; a higher ridge separating it from the more gorge-like Toss valley, and finally the highest ridge along the east boundary separating the Toss from the Toggenburg (*q.v.*). On the last ridge, Hornli reaches 3,717 ft. West of the Lake of Zurich is the strikinglj parallel valley of the Sihl, bounded farther west by the Albis range, with Albishorn (3,000 ft.) as its highest point. Pop. (1950) 777,002. The capital of the canton is Zurich (pop. 1950, 390,0201, but. Winterthur (66,925) is the only other considerable town. Uster (12,350), east of Greifen See, is an industrial town, while Thalwil (8,787), Horgen (10,118) and Wädenswil (10,155), all on the western shore of the Lake of Zurich, are of note as industrial centres. Though the land is highly cultivated, yet the canton is essentially a great manufacturing area, especially of machinery and railway rolling stock. Silk weaving and cotton weaving are widely spread, and the products of the former industry have a large foreign market. The canton is divided into 11 administrative districts containing 186 communes. In 1869 the cantonal constitution was revised. and no material changes have been made since. There is an executive (*regierungsrat*) of seven members and a legislature (*kantonsrat*) of 180 deputies (distributed among the electoral circles on a population basis, which varies from census to census). Each body holds office for four years and is elected by a method making use of the principle of proportional representation. The compulsory referendum exists, and all laws and all financial decisions involving a total sum over 250,000 Fr., or an annual sum of 20.000 Fr., must be submitted to a popular vote. Any 5,000 voters can employ the "initiative" to force the government to submit to the people any legislative or constitutional matter. (See SWITZERLAND.)

(W. E. WH.)

ZÜRICH, the capital of the Swiss canton of the same name and the largest town in Switzerland. is situated 1,345 ft. above sea level at the foot of Lake Zurich on both banks of the Limmat river and of its tributary, the Sihl. Although it is an industrial and commercial centre, it is one of Europe's most beautiful cities, ringed by wooded hills, with, on clear days, a panoramic view of the Alps at the southern end of the lake. The quays which line the lake and the river, the 16th- and 17th-century guildhouses on the river banks and the feeling of light. space and cleanliness of its modern streets all contribute to its charm. Pop. (1950) 390,020, (1956 est.) 422,012, of whom 261,751 were Protestant. 144.879 Roman Catholic and 6,075 Jewish, 11960) 440.170. German is the principal language spoken, sometimes in the dialect form known as "Schweizerdeutsch."

History. — The earliest, prehistoric inhabitants of the site of Ziirich were lake dwellers living in pile huts at the foot of the lake. (*See* LAKE DWELLINGS.) Later the Celtic Helvetii had a fortified settlement there and the name is probably derived from the Celtic *dur*, meaning water. In c. 58 B.C. the settlement fell to the Romans who adapted its name to Turicum and made it a customs station. It was fortified in the 4th century but was invaded by the Alamanni from the north and was later conquered by the Franks, who made it a royal residence. Charlemagne's grandson. Louis the German; established a Benedictine abbey and installed his daughter as abbess in 853. Subsequent abbesses acquired extensive rights and privileges. sharing administration of the town with the emperor's deputy. Side by side with this clerical and political development went the growth of the trading community. who settled there because of the town's position at the foot of the lake, at a river crossing, on the trade routes from France to eastern Europe and from Germany and the north to Italy. and who had acquired market rights by the year 1000. The town gained great prosperity from its silk industry and was for a long time one of the few silk centres north of the Alps.

In 1218 Zurich became a free imperial city and in 1351 joined the Swiss confederation under the leadership of the patrician burgomaster, Rudolf Brun, who in 1336 had given the city its first constitution, dividing government between the patricians and the guilds. It had acquired its independence of the abbey in the 13th century, and in 1400 bought its freedom from the emperor. Gradually the guilds acquired more and more power and the city became virtual ruler of considerable lands. This involved conflict with other city states. leading to the Old Zurich war (1436–50) between Zurich, supported by Austria, and the rest of the Swiss league, in which Zurich was defeated. The city gained leadership in the league. however, under the burgomaster Hans Waldmann (1436–89), who led the Swiss to victory in the Burgundian war (battle of Morat, 1476) but whose dictatorial internal policy caused a peasants' revolt, in which he was beheaded in 1489.

The city's character and importance were profoundly affected by the reformer Huldreich Zwingli (*q.v.*), a priest at the Grossmunster whose series of sermons there, begun on New Year's day, 1519, inaugurated the Swiss reformation. The history of the city's support for the Reformation belongs to the history of Switzerland and of Protestantism, but its internal effects were seen in the development of a plainer style of building in accordance with puritan principles, in the strengthening of a patriarchal system of government, with emphasis on almsgiving and the setting up of social services: and in the city's growing importance as a home of humanism. It provided a refuge for English Protestants persecuted by Mary Tudor, and later for French Huguenots. and in the 18th and 19th centuries became an intellectual centre for German-speaking Europe, and the home of such scholars and writers as J. J. Bodmer and J. J. Breitinger, Salomon Gessner, Gottfried Keller, C. F. Meyer. J. K. Lavater and Heinrich Pestalozzi. Despite the French occupation during the Revolutionary Wars (Massèna beat the Russians there in 1799), it continued to prosper, its success being largely due to its textile industry. From 1831 it acquired a more democratic constitution (completely liberalized in 1869) and during the 1830s the town walls and ramparts were destroyed by a town council intent on asserting the rights of the radical peasants against the conservative city governors. The foundation of the university in 1833, of the Federal Institute of Technology in 18jj (among whose famous pupils were Wilhelm Roentgen and Albert Einstein), and of the theatre, the Hottingen Literary circle and the concert hall soon after, were signs of the city's cultural growth, paralleled by the expansion into the surrounding countryside, the absorption of the outlying districts (1893 and 1934) and the increasing organization of its industry, all of which have made it a modern capital.

The Town. — Old Zurich may be said to have had three main centres: the twin-towered, Romanesque Grossmunster (cathedral), on the right bank of the Limmat, supposed to have been founded by Charlemagne. of which the present building dates from c. 1090–1180 and c. 1225–1300; the Fraumunster on the left bank founded as an abbey in 853, dating mainly from the 13th and 14th centuries; and the Lindenhof also on the left bank. a mound occupied successively by a Helvetian settlement, a Roman castrum and the imperial palace, now a public park with a good view over the city and the lake. With Zurich's expansion, however, the city's focal point has changed. so that the lake and the broad shopping street leading to it from the main railway station, which follows the line of the old western moat, have become the social centre.

The cathedral is dedicated to the 3rd-century Christian missionaries, SS. Felix, Regula and Exuperantius, patron saints of Ziirich, who are buried in one of its chapels. On the site of their martyrdom, between the cathedral and the river, is the Wasserkirche (1478–88), which was used as a city library from 1631 to 1917, but reopened as a church in 1942. Zurich's oldest church is the 13th-century St. Peter's, on the left bank; nearby is the Prediger-Kirche (13th–14th centuries) where the cantonal archives are kept. The oldest houses are in the narrow streets round the Grossmunster but old Zurich's special character depends more on the 17th- and 18th-century guildhouses (often now containing restaurantsj lining the quays, and on the beautifully proportioned 18th-century patricians' houses, some of which are now used for exhibitions and civic functions. Of the many bridges over the Limmat the oldest is the Rathausbrucke, at one end of which is one of the city's many 16th-century fountains. The Rathaus (1694–98) is a Renaissance building with much ornamentation showing baroque influence.

The Swiss National museum, opened in 1898, contains an excellent collection of Swiss historic objects and antiquities, art treasures, etc. It is the chief of many artistic and scientific collections. The Federal Institute of Technology occupies a commanding position on the site of the old ramparts, and the university (completed in 1914), dominated by a central tower, also stands on high ground. The university buildings and the art gallery (1911) are freely decorated with sculpture. Zurich has two theatres. a music school, a concert hall and modern hospitals. There are also a number of sports grounds and public gardens. Two great annual festivals take place: the *Sechseläuten*, on the third Monday in April. which culminates in a procession of the guilds and the burning of a snowman in front of the Stadttheater; and the *Knabenschiessen*, in September, when boys compete in rifle shooting. The suburbs spread across the whole valley and up the slopes of the Zürichberg (2,285 ft.) to the east and the Uettiberg to the southwest, two mountains which can be ascended by funicular railway.

Communications and Industry. — Zurich lies on a river crossing and at the meeting place of two great roads (see *History* above). It is also an important railway centre and is connected to most of the major towns of the world by airlines operating from Kloten airport, 7½ mi. outside the city.

As well as being the Swiss centre of banking and insurance, Zurich is the country's leading industrial town. Since the middle ages it has been a centre of the silk industry and this still holds true of textiles, but far outweighing anything else in importance are the heavy industries making electro-technical equipment, electric locomotives, machine tools, turbines, etc.

Hottinger, *The Stories of Basel, Berne and Zurich* (London, New York, 1933) ; A. Senti, H. Waser and P. Guyer, *Aus Zürichs Vergangenheit: Zeittafel zur Geschichte der Stadt Zurich* (Zurich, 1954).

ZURICH, LAKE OF, a Swiss lake, extending southeast of the town of Zurich. Its basin was formed by glacial erosion and it shows interesting phases of damming by moraines. The river Linth flows into it and the Limmat out of it. Its area is about 34 sq.mi., extreme length 2j mi., greatest breadth 2½ mi., greatest depth 469 ft., surface 1,332 ft. above sea level. The greater portion is in the canton of Zurich, but 8¾ sq.mi. S.E. is in Schwyz, and 4 sq.mi. N.E. in St. Gall. The great dam of masonry, carrying the railway line and motor road from Rapperswil to Pfäffikon. cuts off the extreme eastern part of the lake and is passed only by small boats; steamers do not go beyond the dam. as the part beyond is shallow. West of this dam is the island of Ufenau, where in 1j23 Ulrich von Hutten took refuge and died. Zurich stands at the north end of the lake. On the west shore are Thalwil, Horgen. Wädenswil, Richterswil. Pfaffikon and Lachen. On the opposite shore are Meilen (near which the first lake dwellings were discovered in 1853–54). Stafa and Rapperswil, the castle of which shelters a Polish museum. Schmerikon and Uznach are near the eastern end.

ZUTPHEN or ZUTFEN, a town in the province of Gelderland, Neth., on the right bank of the Ysel at the influx of the Berkel, and a junction station 18 mi. N.N.E. of Arnhem by rail. Pop. (1947) 21,915. In the middle ages it was the seat of a line of counts which became extinct in the 12th century. Having been fortified, the town stood several sieges, especially during the wars of freedom waged by the Dutch. the most celebrated fight under its walls being the one in Sept. 1586 when Sir Philip Sidney was mortally wounded. Taken by the Spaniards in 1587, Zutphen was recovered by Maurice, prince of Orange, in 1591, and except for two short periods, one in 1672 and the other during the French Revolutionary Wars. it then remained a part of the United Netherlands. German troops occupied it in World War II.

The most important building is the *Groote Kerk* of St. Walpurgis, which dates from the 12th century and contains monuments of the former counts of Zutphen, and other objects of interest. The chapter house contains a pre-Reformation library which includes some valuable mss. and *incunabula.* There are some remains of the old town walls. The place has an active trade, especially in grain and in the timber floated down from the Black forest by the Rhine and the Ysel; the industries include tanning, weaving and oil and paper manufactures. About 3 mi. to the north of Zutphen is the agricultural colony of Nederlandsch-Mettray, founded by a private benefactor for the education of poor friendless boys in 1851. At 3 mi. distance, in the picturesque "Achterhoek," are the mediaeval castles of Ruurloo and Vorden.

ZUTUHIL, an Indian tribe inhabiting the territory south of Lake Atitlan in Guatemala. Its tongue, one of the "metropolitan'.' Maya dialects, is spoken today in Atitlan. San Pedro la Laguna, San Lucas Tolimán and San Antonio Suchitepéquez. The Zutuhil number about 14,000.

The part the Zutuhil played in the wars with the Quiché and Cakchiquel is described in the annals of those tribes, which make it clear that the Zutuhil were only slightly less powerful than these enemy neighbours, and they appear never to have been completely subdued. The Zutuhil capital was picturesquely located above Lake Atitlan. Near by stood a strongly fortified position, reduced by the Spaniards under Pedro de Alvarado in 1525 only with the greatest difficulty. Today the Zutuhil work, often under a system of peonage, on the big coffee estates. Their costumes, of local cotton covered with embroidery, are noted for their brilliant colours.

ZWEIBRÜCKEN, a town of Germany, in the Rhineland Palatinate, on the Schwarzbach, and on the railway between Germersheim and Saarbrucken. Pop. (1950) 25,766.

Zweibrucken ("two bridges") is the Latin *Bipontinum;* it appears in early documents also as *Geminus Pons,* and was called by the French *Deux-Ponts.* The independent territory was at first a countship, half of which Count Eberhard sold in 1385 to the count palatine of the Rhine, holding the other half as his feudatory. Louis (d. 1489) founded the line of the dukes of Zweibrücken which became extinct in 1731, when the duchy passed to the Birkenfeld branch. At the peace of Lunéville Zweibrucken was ceded to France; on its reunion with Germany in 1814 the greater part of the territory was given to Bavaria, the remainder to Oldenburg and Prussia. Zweibrücken was known to scholars for its early editions of the Greek and Latin classics. Its war factories were bombed in World War II.

ZWICKAU, a town of Germany, in the Karl-Marx-Stadt district, situated on the left bank of the Zwickauer Mulde, 41 mi. S. of Leipzig and 20 mi. S.W. of Chemnitz on the main line of railway Dresden-Hof and at the junction of several other lines. Pop. (1950) 138,844.

Zwickau is of Slavonic origin, and is mentioned, in 1118 as a trading place. Zwickau was an imperial possession, but was pledged to Henry the Illustrious, margrave of Meissen. It passed to the electors of Saxony as successors of the margraves of Meissen. The discovery of silver in the Schneeberg in 1470 brought it much wealth. The Anabaptist movement of 1525 began at Zwickau under the inspiration of the "Zwickau prophets." Robert Schumann (*q.v.*) was born there.

Among the nine churches, the Gothic Church of St. Mary (1451–1536 and restored 1885–91) is remarkable. Other noteworthy buildings are the town hall of 1581, with the municipal archives, including documents dating back to the 13th century and an autograph ms. of the works of Hans Sachs, and the late Gothic *Gewandhaus* (cloth merchants' hall), built 1522-24 and now in part converted into a theatre. The manufactures of Zwickau include spinning and weaving, machinery, chemicals, porcelain, paper, glass, dyestuffs, wire goods, aluminum, lacquer, embroidery, stockings and curtains. The adjacent coalfield has been actively worked only since 1823, during which time the population has increased more than tenfold.

ZWINGLI, HULDREICH (1484–1531), Swiss reformer, was born on Jan. 1, 1484, at Wildhaus in the Toggenburg valley, St. Gall, Switzerland. He came of a free peasant stock, his father being *amtmann* of the village; his mother, Margaret Meili, was the sister of the abbot of Fischingen in Thurgau. His uncle, Bartholomew Zwingli, afterward *dekan* or *superintendent* of Wesen, had been elected parish priest of Wildhaus. He went to school at Wesen, then at Basle, and finally at Berne, where his master, Heinrich Wolflin, inspired him with an enthusiasm for the classics. In 1500 he was sent to the university of Vienna to study philosophy. He then returned to Basle, where he graduated in the university and taught classics in the school of St. Martin's church. At 22 Zwingli was ordained by the bishop of Constance and elected parish priest of Glarus. The ten years which Zwingli spent at Glarus laid the foundations of his work as a reformer. He there began the study of Greek that he might "learn the teaching of Christ from the original sources," and gave some attention to Hebrew. He read also the older church fathers and his skill in the classics led his friends to hail him as "the undoubted Cicero of our age." He entered into correspondence with Erasmus, and received a somewhat chilling patronage; whilst the brilliant humanist, Pico della Mirandola (1463–94), taught him to criticize Catholic doctrine. His first publications, which appeared as rhymed allegories, were political rather than religious; they were directed against the Swiss practice of hiring out mercenaries in the European wars. In 1521 he prevailed upon the authorities of the canton of Zurich to renounce the practice altogether. Especially did he oppose alliances with France; but the French party in Glarus was strong, and it retaliated so fiercely that in 1516 Zwingli was glad to accept the post of people's priest at Einsiedeln. He dated his arrival at evangelical truth from the three years (1516–19) which he spent in this place. There he studied the New Testament in the editions of Erasmus and began to found his preaching on "the Gospel," which he declared to be simple and easy to understand.

Reform Propaganda. — Zwingli began to preach "the Gospel" in 1516, but a contemporary says that he did it so cunningly (*listiglich*) that none could suspect his drift. He began his work without saying much about corruptions in the Roman Church, and it was his political denunciation of the fratricidal wars into which the pope, not less than others, was drawing his fellow-countrymen, that first led to rupture with the papal see. Three visits which he had paid to Italy as army chaplain opened his eyes to the worldly character of the papal rule, and he began to attack at Einsiedeln the superstitions which attended the great pilgrimages made to that place. Zwingli denounced the publication of plenary indulgence to all visitors to the shrine. When in August 1518 the Franciscan monk Bernardin Samson appeared in Switzerland with a commission to sell indulgences, Zwingli persuaded the council to forbid his entrance into Ziirich.

Zwingli now became (1518) people's priest at the Great Minster of Zurich. In the beginning of 1519 he began a series of discourses on St. Matthew's Gospel, the Acts of the Apostles, and the Pauline epistles; and with these it may be said that the Reformation was fairly begun in Zurich. His correspondence of this year shows him jealous of the growing influence of Luther. He claimed to have discovered the Gospel before ever Luther was heard of in Switzerland. Towards the end of September he fell ill with the plague; his illness sobered his spirit and brought into his message a deeper note than that merely moral and common-sense one with which, as a polite humanist, he had hitherto been content. He began to preach against fasting, saint worship and the celibacy of priests. People were found eating flesh in Lent, and the bishop of Constance accused them before the council of Zürich. Zwingli was heard in their defence and the accusation was abandoned. His first Reformation tract, April 1522, dealt with this subject: *Von Erkiesen und Fryheit der Spysen.* The matter of the celibacy of the clergy was more serious. Zwingli had joined in an address to the bishop of Constance calling on him no longer to endure the scandal of harlotry, but to allow the priests to marry wives, or, at least, to wink at their marriages. Pope Adrian VI. interfered and asked the Zurichers to abandon Zwingli, but the reformer persuaded the council to allow a public disputation (1523), when he produced sixty-seven theses and vindicated his position so strongly that the council decided to uphold their preacher and to separate the canton from the bishopric of Constance. Thus legal sanction was given in Zurich to the Reformation. In 1522 Zwingli produced his first considerable writing, the *Architeles*, "the beginning and the end," in which he sought by a single blow to win his spiritual freedom from the control of the bishops, and in a sermon of that year he contended that only the Holy Spirit is requisite to make the Word intelligible, and that there is no need of Church, council, or pope in the matter.

Victory of Reform.--There was a strong opposition to the Reformation, especially in the five Forest Cantons: Lucerne, Zug, Schwyz, Uri and Unterwalden; and the Ziirichers felt it necessary to form a league in its defence. They were especially anxious to gain Berne. and Zwingli challenged the Romanists to a public disputation in that city. The pleadings began on Jan. 2, 1523, and lasted nineteen days. Zwingli and his cornpanions undertook to defend the following propositions: —

(1) That the Holy Christian Church, of which Christ is the only Head, is born of the Word of God, abides therein, and does not listen to the voice of a stranger; (2) that this Church imposes no laws on the conscience of people without the sanction of the Word of God, and that the laws of the Church are binding only in so far as they agree with the Word; (3) that Christ alone is our righteousness and our salvation, and that to trust to any other merit or satisfaction is to deny Him; (4) that it cannot be proved from the Holy Scripture that the body and blood of Christ are corporeally present in the bread and in the wine of the Lord's Supper; (5) that the mass, in which Christ is offered to God the Father for the sins of the living and of the dead, is contrary to Scripture and a gross affront to the sacrifice and death of the Saviour; (6) that we should not pray to dead mediators and intercessors, but to Jesus Christ alone; (7) that there is no trace of purgatory in Scripture; (8) that to set up pictures and to adore them is also contrary to Scripture, and that images and pictures ought to be destroyed where there is danger of giving them adoration; (9) that marriage is lawful to all, to the clergy as well as to the laity; (10) that shameful living is more disgraceful among the clergy than among the laity.

The result of the discussion was that Berne was won over to the side of the reformer. He had maintained that the congregation, and not the hierarchy, was the representative of the Church; and he sought to reorganize the Swiss constitution on the principles of representative democracy so as to reduce the disproportionate voting power of the Forest Cantons.

On April 2, 1524 the marriage of Zwingli with Anna Reinhard was publicly celebrated in the cathedral. In August of that year Zwingli printed a pamphlet in which he set forth his views of the Eucharist. They proved the occasion of a conflict with Luther which was never settled, but more attention was attracted by Zwingli's denunciation of the worship of images and of the Roman doctrine of the mass. These points were discussed at a fresh congress where about 900 persons were present, and where Vadian (Joachim von Watt, the reformer of St. Gall) presided. It was decided that images are forbidden by Scripture and that the mass is not a sacrifice. Images were removed from the churches, and many ceremonies and festivals were abolished. Zurich was threatened with exclusion from the union, and she began to make preparations for war.

Divergence from Luther.——At this point the controversy between Luther and Zwingli became more serious. In March 1525 Zwingli brought out his *Commentary on the True and False Religion.* He declined to accept Luther's teaching that Christ's words of institution required the belief that the real flesh and blood of Christ co-exist in and with the natural elements. He declared that Luther was in a fog, and that Christ had proclaimed that by faith alone could His presence be received in a feast which He designed to be commemorative and symbolical. The landgrave of Hesse brought the two Reformers together in vain at Marburg in October 1529, and the whole Protestant movement broke into two camps. At home the long-felt strain between opposing cantons led at last to civil war. In February 1531 Zwingli himself urged the Evangelical Swiss to attack the Five Cantons, and on Oct. 10 there was fought at Kappel a battle, disastrous to the Protestant cause and fatal to its leader. Zwingli, who as chaplain was carrying the banner, was struck to the ground, and was later despatched in cold blood. His corpse was quartered by the public hangman, and burnt with dung by the soldiers. A great boulder, roughly squared, standing a little way off the road, marks the place where Zwingli fell. It is inscribed, "'They may kill the body but not the soul': so spoke on this spot Ulrich Zwingli, who for truth and the freedom of the Christian Church died a hero's death, Oct. 11, 1531."

Zwingli's theological views are expressed succinctly in the sixty-seven theses published at Ziirich in 1523, and at greater length in the *First Helaetic Confession,* compiled in 1536 by a number of his disciples[1]. They contain the elements of Reformed as distinguished from Lutheran doctrine. As opposed to Luther, Zwingli insisted more firmly on the supreme authority of Scripture, and broke more thoroughly and radically with the mediaeval Church. Luther was content with changes in one or two fundamental doctrines; Zwingli aimed at a reformation of government

[1]P. Schaff, *Creeds of the Evangelical Protestant Churches,* p. 211

and discipline as well as of theology. Zwingli held that there should be no government in the Church separate from the civil government which ruled the commonwealth. All rules and regulations about the public worship, doctrines and discipline of the Church were made in Zwingli's time, and with his consent, by the council of Ziirich, the supreme civil authority in the State. This was the ground of his quarrel with the Swiss Anabaptists, fnr the main idea in the minds of these greatly maligned men was the modern thought of a free Church in a free State. Like all the Reformers, he was strictly Augustinian in theology, but he dwelt chiefly on the positive side of predestination — the election to salvation — and he insisted upon the salvation of infants and of the pious heathen. His most distinctive doctrine is perhaps his theory of the sacrament, which involved him and his followers in a long and, on Luther's part, an acrimonious dispute. He held that the Eucharist was not the *repetition* of the sacrifice of Christ, but the faithful *remembrance* that that sacrifice had been made once for all. His theological opinions were set aside in Switzerland for the somewhat profounder views of Calvin. The publication of the Ziirich Consensus (*Consensus Tigurinus*) in 1549 marks the adherence of the Swiss to Calvinist theology.

Zwingli's most important writings are — Von *Erkiesen und Fryheit der Spysen* (April 1522); *De Canone Missae Epichiresis* (September 1523); *Commentarius de Vera et Falsa Religione* (1525); *Vonz Touf, vonz Wiedertouf, und vom Kindertouf* (152j); *Ein klare Unterrichtung vonz Nachtmal Chvisti* (1526); *De Providentia Dei* (1530); and *Christianae Fidei Expositio* (1531). For a full bibliography *see* G. Finsler, *Zwingli-Bibliographie* (Ziirich, 1897).

Works.—Collected editions, 4 vols. (Zurich, 1545, 1581); by M. Schuler and Joh. Schulthess, 8 vols. (Ziirich, 1828–42, with "supplementorum fasciculus," 1861); by E. Egli and G. Finsler in "Corpus Reformatorum" (Berlin, 1905 *sqq.*).

Lives. — 0. Myconius (1532); H. Bullinger's *Reformationsgeschichte* (ed. Hottinger and Voegli, 1838); J. M. Schuler (1818); R. Christoffel (1857, Enp. tr. by J. Cochran, Edinburgh, 1858); J. C. Moriköfer, 2 vols. (Leipzig, 1867–69); R. Stahelin, 2 vols. (Basle, 1895–97); S. M. Jackson in *Heroes of the Reformation* (New York and London, 1901); Prof. Egli's articles in Hauck-Herzog's *Realencyklopädie für prot. Theologie u. Kirche,* and *Zwingliana,* published at Zurich.

S. M. Jackson's book gives a chapter on Zwingli's Theology by Prof. F. H. Foster, and also full details of further information on the subject, together with a list of modern English translations of Zwingli's works.

ZWITTERION. In chemistry, a molecule containing both acidic and basic groups may be expected to neutralize itself with the production of an internal salt or, as it is commonly called, a zwitterion (from the German *Zwitter,* "hybrid" or "hermaphrodite," plus *ion*). Thus glycine may be expected not to have the amino acid structure I, with the acidic carboxyl group COOH and the basic amino group NH_2, but rather the zwitterionic structure II.

$$\underset{\text{I}}{H_2N.CH_2.COOH} \qquad\qquad \underset{\text{II}}{\overset{+}{H_3N}.CH_2.COO^-}$$

In general: amino acids and proteins (*q.v.*) at their isoelectric points, as well as betaines (*see* CHOLINE) exist largely if not entirely in the form of zwitterions.

ZWOLLE, the capital of the province of Overijssel, Netherlands, on the Zwarte Water, and a junction station $24\frac{1}{2}$ mi. N.E. of Harderwyk. Pop. (1957 est.) 54,087 (mun.). It is the centre of the whole northern and eastern canal systems, and by means of the short canal, the Willemsvaart, which joins the Zwarte water and the Ysel. has regular steamboat communication with Kampen and Amsterdam.

Three miles from Zwolle on the Agnietenberg, once stood the Augustinian convent in which Thomas a Kempis spent the greatest part of his life. Zwolle has a considerable trade by river, a large fish market and the most important cattle market in Holland after Rotterdam.

ZYGADENUS (ZIGADENUS), a genus of plants of the lily family (Liliaceae, *q.v.*), containing about 12 species. all North American except one found in Siberia. They are smooth perennial herbs, springing mostly from coated bulbs, with erect stems. usually six inches to four feet high, very narrow leaves and conspicuous flowers in terminal clusters. About ten species occur in the United States and Canada. Alkali grass (*Z. elegans*), with greenish flowers, is found from New Brunswick to Alaska and southward to New Mexico. The poisonous zygadene or death camass (*Z. venenosus*), with yellow flowers, occurs in the northwestern and Pacific states.

ZYGOPHYLLACEAE, a family of herbs, shrubs and trees, characteristic of the drier parts of temperate and tropical regions in both hemispheres. There are 26 genera and about 225 species. Large genera are *Fagonia,* with about 40 species in southern North America, Chile and Mediterranean countries; and *Zygophyllum,* with 80 species in the drier parts of Asia, Africa and Australia. *Guaiacum* of tropical America, produces the very hard wood known as lignum vitae, the resin of which is also used in the practice of medicine. The South American species of *Bulnesia* also yield a very hard wood. (E. D. ML.; X.)

ZYGOTE, the biological term for the fertilized egg or ovum. (*See* FERTILIZATION; EMBRYOLOGY.)
