In 1768 he decided to risk all by a bold stroke, crossed to London, and announced his candidature, first for London (where he was not elected) and then for Middlesex, where he was chosen M.P. by a heavy majority (Mar. 28). He then surrendered to his outlawry and was sentenced to the comparatively light penalty of £500 fine and a year's imprisonment, each, for the Essay *on* Woman and "No. 45." His popularity was immense, and crowds regularly assembled outside the prison gates (St. George's Fields). On May 10 a riotous crowd was dispersed with bloodshed and loss of life by Scottish soldiery, who were congratulated by the Government. Wilkes published the government instructions which had led to this, with some bitter comments, in the St. James' Chronicle; he also presented to the Commons a petition raising the whole question of the illegality of the proceedings against him. (Subsequent investigations show that in the case of the Essay these included actual forgery.) He had ignored private promises that he would be left undisturbed if he remained quiet; he reaped the reward of his temerity (Feb. 4, 1769) by being expelled again from the House of Commons, this time with hardly a shred of excuse. He now, by his resentment of a patronizing defence by George Grenville, lost his last wealthy patron (Temple) and was nearly £20,000 in debt. But the arbitrary proceedings of the ministry (instigated by the King) brought him power and, through the subscriptions of wealthy admirers to a "Society of the Supporters of the Bill of Rights," even solvency. He was immediately (Feb. 16) re-elected by the Middlesex electors and once more expelled. Again he was elected (Mar. 16) and again expelled. The Court then secured a bravo named Colonel H. L. Luttrell to stand against Wilkes at the next election (April 13); the figures were Wilkes 1,143, Luttrell 296; but the enraged Commons declared that Luttrell ought to have been elected and actually seated him for Middlesex.

These audacious proceedings had stirred up tremendous excitement in which for the first time for years the artisans and lower middle class felt acutely their disfranchisement. "One of your supporters has turned his coat," Wilkes was told. "Impossible, not one has a coat to turn," he answered. They avenged themselves by rioting and strikes, by scrawling "45" on every door and forcing the court followers to cheer for "Wilkes and Liberty." More effectively, Serjeant Glynn, his colleague for Middlesex, and after his release Wilkes himself, organized, by the medium of public meetings, support from the electors as far distant as Truro, for a "Wilkite" programme which till about 1780 was the standard of a political party. Its chief points were the radical reform of Parliament (to include enfranchisement of the "lower orders" and the suppression of rotten boroughs) and the protection of individual liberty against Ministerial or Parliamentary attack. Wilkes also entered into relations, not fully explored yet, with the American malcontents and seems to have acted as an inspirer of their subsequent action and as English representative of the Boston "Sons of Liberty." His greatest successes, however, were won in the City of London where he triumphantly fought his way through to the Lord Mayoralty in 1774. As Sheriff and Alderman he had welded the powerful City interests with a single block of opposition to the Court and Ministry, achieving his most remarkable victory in the Wheble case, when the City's judicial powers mere successfully used to prevent the arrest of printers who reported the House of Commons debates. After the election of 1774, when the Court no longer found it wise to prevent him taking his seat in Parliament, he had a "tail" of about a dozen M.P.'s. He presented (1776) a bill for the radical reform of Parliament. During the American Revolution Wilkes championed the colonial cause. He delivered, in the House of Commons, ten set speeches in which he advocated the immediate cessation of hostilities with America. Lord Shelburne, in concert with John Horne (see TOOKE, JOHN HORNE) was able to shake his influence for a short while in the City, but Wilkes more than recovered his position, and in 1779 he was elected Chamberlain of the City, a lucrative office which he filled with absolute scrupulousness till his death. But the violence of his popularity was necessarily waning when in 1780 the Gordon riots broke out (see GORDON, LORD GEORGE). Wilkes, despite his turbulence, had never encouraged mob violence, and religious persecution he had always fought. Though all the "lower orders" and even such old allies as Alderman Frederick Bull were deeply implicated in the burning and looting, Wilkes hesitated only a day or two before he practically took matters out of the hands of the complaisant city authorities, secured a draft of troops, and took a prominent part in crushing the disturbance. His own supporters he had to jail—in one case committing his printer Moore for an attack on the house of the judge, Mansfield, who had condemned him.

From this moment, honourable though his motives were, his political career was made impossible. He could no longer drive the rich London merchants and the lower orders in harness together. He had broken violently with the latter and with his own principles (for six years before he had replied to Horne, not necessarily insincerely, that he really believed the voice of the people, when he could ascertain it, to be "the voice of God") and the former had therefore less need for his services. Moreover, they and all well-to-do reformers were attracted by the more respectable reform movement started in the previous year by the Yorkshire M P.'s. This, based on Rockingham's "Oeconomical reform," substituted triennial for annual Parliaments and the addition of 100 M.P.'s to London and the counties for universal suffrage and redistribution of seats; it was rapidly adopted by a dozen or more counties at general meetings of electors.

Wilkes' energies declined as did his popularity. After he had secured (May 3, 1782) the expunging from the Commons of all record of his expulsions he took little part in politics. In 1790 he did not seek re-election, but retired into private life, dying in 1797. Characteristically enough, he was found to be insolvent, but quite unaware of the fact. An obelisk in Ludgate Circus commemorates him.

Wilkes was above the middle height, exceedingly ugly, with a startling squint that is given all its value in Hogarth's celebrated cartoon, but with a charm of manner and wit which few could resist. Some of his jests have passed into history—as for example his rejoinder to an elector who answered his canvass by saying he would sooner vote for the Devil than Wilkes: "And if your friend is not standing?" To an offer of snuff he answered, "No thank you, I have no small vices." To Sandwich, who told him he would either die on the gallows or of venereal disease, "That depends, my lord, on whether I embrace your principles or your mistress." His character, largely through his own fault, has been subject to exaggerated attacks which may be generally traced to Lord Brougham (see BROUGHAM AND VAUX, LORD) or to Horace Walpole, whom he was unwise enough to offend. His conversation was indecent, he was entirely incapable of continence in regard to women, though temperate in other ways, and like almost every other public man of his century, he was extravagant. His cynical tongue ruined his reputation with the Victorians: he never did a good thing without giving a bad reason. But dishonesty, cruelty, cowardice or hypocrisy were unknown to him; public money passed untouched through his hands when he was "in want of a guinea"; his political principles were honestly and to all appearances firmly held up till the deadlock of the Gordon riots, described above. He secured the great reforms of the abolition of general warrants, the freeing of the press and freedom of choice for the electors; his nonsuccess in securing parliamentary reform or justice for America can hardly be counted against him.

See H. Bleackley, *John Wilkes,* with bibliography (1917); R. W. Postgate, *That Devil Wilkes* (1929). (R. W. P.)

WILKES-BARRE, a city of northeastern Pennsylvania, U.S., and seat of Luzerne county, lies in the Wyoming valley on the north branch of the Susquehanna river, 94 mi. N.N.W. of Philadelphia and 111 mi. N.W. of New York city. On the western fringe of the Pocono mountains, Wilkes-Barre has been noted as a centre of the anthracite industry in the northern field.

Permanent settlement by colonists from Connecticut, under grants issued by the Susquehanna company, dates from 1769. Maj. John Durkee led the early group and named the town in honour of John Wilkes and Isaac Barré, defenders of the American colonies in the British parliament. The frontier community survived two major threats to its existence: (1) a series of wars (known as the Pennamite-Yankee wars) fought over conflicting land claims between Pennsylvania and Connecticut settlers from 1769 to 1784 *(see* WYOMING VALLEY); and (2) during the American Revolution, Tory and Iroquois Indian attacks which culminated in the battle and massacre of Wyoming, July 3, 1778. The subsequent expedition of 1779, led by Gen. John Sullivan (*q.v.*) against the Iroquois, was formed at Wilkes-Barre.

The major force in the history of Wilkes-Barre was the development of the coal industry. It brought adequate transportation; it created the need for auxiliary and complementary industries; and it attracted workers from England, Wales, Ireland, Russia, Poland, Lithuania, Italy and other European countries. Upon the decline in the use of anthracite as a domestic fuel, the city faced unemployment problems; greater diversification of industry was achieved, however, with the development of garment, shoe, textile, tobacco, pencil, wire-goods, electronic and power-equipment manufacturing.

Wilkes-Barre is the trade, transportation and financial centre of the Wyoming valley and the central city of the standard metropolitan statistical area of Luzerne county (pop. 1960, 346,972), which includes Hazleton (*q.v.*). In the decade 1940–50, the population of Wilkes-Barre decreased almost 10,000—from 86,236 to 76,826—and over 13,000 or 17.3% in the following ten years (pop., 1960, 63,551). (For comparative population figures, *see* table in PENNSYLVANIA: Population.)

A symphony orchestra, art and historical societies, ballet guild and numerous choral groups provide cultural resources. King's college (Roman Catholic), a liberal arts school enrolling over 1,000 men in the 1960s, was chartered in 1946. Wilkes college (private control) was chartered as a four-year coeducational school in 1947; it also enrolled over 1,000 students. Recreational facilities near the city include several state parks, Harvey's lake and resorts in the Pocono mountains.

See O. J. Harvey, *A History of Wilkes-Barre and Wyoming Valley* (1909). (R. D. WI.)

WILKIE, SIR DAVID (1785–1841), Scottish genre and portrait painter, was born in Cults, Fife, on Nov. 18, 1785. In 1805 he entered the Royal Academy schools, exhibiting at the Royal Academy from 1806. His first exhibit was "Village Politicians," a genre picture in the Dutch manner, recalling Adriaen van Ostade and David Teniers, a style which he practised with great success for about 20 years. Wilkie was elected associate of the Royal Academy in 1809 and royal academician in 1811; he succeeded Sir Thomas Lawrence as painter to the king in 1830 and was knighted in 1836. In 1814 he visited Paris with his friend B. R. Haydon (*q.v.*), and in 1816 he went to the Netherlands. For reasons of health he spent the years 1825–28 in Italy, Germany, Switzerland and Spain, and his experience of Italian and Spanish art caused him to adopt a broader and richer style. He also painted Spanish subjects and some portraits. Returning from a journey to the near east, he died at sea, off Gibraltar, on June 1, 1841.

Examples of his earlier and later styles include "The Blind Fiddler" (1806), "Village Festival" (1811), "The Parish Beadle" (1823), "John Knox Preaching" (1832), "The First Earring" (1835) and "Peep-0'-Day Boy's Cabin" (1836); "Pitlessie Fair" (his first important picture, 1804), "The Bride's Toilet" (1838) and "The Irish Whiskey-still" (1840), are all in the National Gallery of Scotland, Edinburgh. The royal collection includes "Blind Man's Buff" (1812), "The Penny Wedding" (1818) and several portraits. The Wellington museum, London, has "Chelsea Pensioners Reading the Waterloo Gazette" (1822), and other pictures are in the Wallace collection, London, and in New York (Metropolitan Museum of Art), Munich and at the town hall, Cupar, Fife. *See* A. Cunningham's *Life* (1843). (P. J. MY.)

WILKINS, SIR GEORGE HUBERT (1888–1958), British explorer who greatly increased the use of the airplane in polar research, was born at Mount Bryan East, South Australia, on Oct. 31, 1888. Having studied at the Adelaide School of Mines, he learned flying in 1910–12 and was official photographer to the Turkish army during the Balkan War of 1912. From 1913 to 1916 he was photographer with the Canadian arctic expedition of Vilhjalmur Stefansson. Wilkins joined the Australian flying corps in 1917 and was seconded to the military history department in France as official photographer, winning the military cross and bar. From 1920 to 1921 he was second in command of a British expedition to Graham Land (Palmer peninsula) in the antarctic, and from 1921 to 1922 was naturalist on the last antarctic expedition of Sir Ernest Shackleton. He led a British museum biological expedition to tropical Australia in 1923–25.

In 1926 he began a series of trial flights to explore by air the unknown area of the arctic north of Point Barrow, Alaska, with C. B. Eielson as copilot. On April 16, 1928, Wilkins and Eielson flew from Point Barrow to Spitsbergen in 20½ hours, a distance of 2,100 mi. over unknown seas. For this feat Wilkins was knighted. In Dec. 1928 he and Eielson flew from Deception island, 600 mi. south across Graham Land, discovering several new islands. In 1931 Wilkins captained the "Nautilus" submarine and navigated it under the Arctic ocean to latitude 82°, 15′ N. From 1933 to 1939 he was manager of the Ellsworth antarctic expeditions and from 1942 to 1952 was consultant to the U.S. army military planning division. He was geographer to the research and development command of the department of defense from 1953. Wilkins died at Framingham, Mass., on Dec. 1, 1958. (H. G. KG.)

WILKINS, MARY ELEANOR: *see* FREEMAN, MARY ELEANOR WILKINS.

WILKINSBURG, a borough of Allegheny county in southwestern Pennsylvania, U.S., is contiguous to Pittsburgh (*q.v.*) to the east and is a part of that standard metropolitan statistical area. Settled about 1798 and early known as McNairsville (after its founder, Col. Dunning McNair) and then as Rippeyville, Wilkinsburg was renamed in 1840 in honour of William Wilkins, a prominent Pennsylvania politician of the time. It was incorporated as a borough in 1887. It is primarily residential; its employment has been basically in the services, although some small manufacturing businesses have been established there. For comparative population figures *see* table in PENNSYLVANIA: Population. (P. R. J.)

WILKINSON, JAMES (1757–1825), U.S. soldier and adventurer, was born in Calvert county, Md., in 1757. He served in the American Revolution and, in 1784, settled near Louisville, Ky.. where he became a merchant, farmer and man of influence. He took an active part in the movement for separate statehood for Kentucky, and in 1787 took an oath of allegiance to Spain and began to intrigue with his fellow Kentuckians to detach the western settlements from the union and bring them under the influence of the Louisiana authorities. For services he received until 1800 a substantial pension from the Spanish authorities, being officially known as "Number Thirteen." At the same time he worked actively against the Spanish authorities, especially through Philip Nolan. Wilkinson's ventures were not so lucrative as he hoped for, and in Oct. 1791 he was given a lieutenant colonel's commission in the regular army, possibly to keep him out of mischief. In 1803 Wilkinson was one of the commissioners to receive Louisiana from France, and in 1805 became governor of that portion of the purchase above the 33rd parallel, with headquarters at St. Louis. In his double capacity as governor of the territory and commanding officer of the army, he attempted to conquer the Mexican provinces of Spain. For this purpose in 1805 he entered into an agreement with Aaron Burr, and in 1806 sent Z. M. Pike to explore the most favourable route for the conquest of the southwest. Before his agent returned, however, he had betrayed his colleague's plans to Jefferson, formed the Neutral Ground agreement with the Spanish commander of the Texas frontier, placed New Orleans under martial law and apprehended Burr and some of his alleged accomplices. In the ensuing trial the prisoners were released for lack of evidence and Wilkinson emerged with a damaged reputation. He was then subjected to courts-martial and congressional investigations, but succeeded in hiding his duplicity. In 1812 he resumed his command at New Orleans and in 1813 was promoted to major general and took possession of Mobile. Later in that year, by making a miserable fiasco of the campaign against Montreal, he finally brought his military career to a dishonourable end. He died at Mexico City on Dec. 28, 1825. (I. J. C.; X.)

WILKINSON, JOHN (1728–1808), "the great Staffordshire ironmaster," was born at Clifton, Cumberland, where his father was overlooker in an iron furnace. A box iron, patented by his father but said to have been invented by the son, which helped laundresses to gratify the frilled taste of the dandies of the day, was the beginning of their fortunes. This they made at Blackbarrow, near Furness. When he was about 20, John moved to Stafiordshire and built, at Bilston, the first iurnace there. After many experiments he succeeded in utilizing coal instead of wood charcoal in the puddling and smelting of iron. The father, who then had works at Bersham, near Chester, was again joined by his son, who constructed a new boring machine, of an accuracy theretofore unequaled. James Watt found that the work of this machine exactly filled his requirements ior his "fire engine" for cylinders bored with greater precision. Wilkinson then started the manufacture of wrought iron on a large scale at Broseley and used the first steam engine made by Boulton and Watt to blow the bellows there. Great care was taken in its manufacture, and Watt himself set it up early in 1776. In 1786 he was making 32-pounders, howitzers, swivels, mortars and shells for the government. The difficulty of getting barges to carry his war material down the Severn led him, in 1787. to construct the first iron barge. Wilkinson taught the French the art of boring cannon from the solid and cast all the tubes, cylinders and ironwork required for the Paris waterworks. He also erected the first steam engine in France. Wilkinson also designed and cast the first iron bridge, which connected Broseley and Madeley, across the Severn. He died on July 14, 1808.

WILL or TESTAMENT is the legal transaction by which an owner of property disposes of his assets in the event of his death. The terms are also applied to the instrument in writing in which the testator's dispositions are expressed. While in modern usage the two terms "will" and "testament!' are interchangeable, down to the 19th century in Anglo-American lam will referred to the disposition of real. and testament to that of personal property.

In the strict terminology of the older Anglo-American law. a disposition of real property is called devise and its beneficiary devisee. By a bequest or legacy, on the other hand, a disposition of personal property is made in favour of a legatee.

In modern society, the freedom to dispose of property by will is regarded as an essential element of individual freedom in general. The power of an owner of property by his own free will to determine who is to have it upon his death is thought to stimulate economic activity; it is also regarded as important that a property owner can modify the rigid rules of descent and distribution of the intestacy laws so as to adapt them to the particular situation of his family by preferring, for instance, a crippled child over one of proven capacity to take care of himself; the freedom to disinherit a child may be used to induce filial obedience, but freedom of testation also implies the freedom of making provision for charity. The possibility of abuse for ends of spite, arbitrariness or whimsy is the price society has to pay for such power.

History.––In a primitive or archaic society in which property is owned by the kinship or neighbourhood group rather than by individuals, freedom of testation cannot, of course, exist. Transition from group to individual ownership has rarely if ever occurred in one single step. In many primitive societies, utensils of individual use (*e.g.,* weapons, pieces of adornment, horses or even slaves) were destroyed upon the death of the owner or buried with him. As to land. even when its use was regarded as rightfully belonging to an individual, free alienation by sale or gift, and even more so by will, would for long periods be hedged in by superior rights of the kinship group, the village or the feudal lord. Transition to free alienation has been frequently achieved by means of subterfuge, such as the adoption of the "purchaser" or "devisee" as a son; or, once free alienation had become possible inter *vivos* (between living persons) but not yet upon death. by fictitious sale or gift to a middleman who would promise to let the grantor keep the property as long as he should live and upon his death to deal with it as directed by the grantor. Such use of adoption occurred in ancient Babylonia. China, Japan, India and other societies of an archaic-patriarchalic order. In ancient Greece, effects similar to those of a will would be achieved by gift to take effect upon the death of the donor or, where the only child of the family was a daughter, by giving her in marriage together with the estate. Transfer by use of a middleman became possible among the Germanic peoples who succeeded the Roman empire both on the European continent and in England.

In ancient Rome the institution of the will appeared at an early stage of cultural development, but there, too, it seems to have been preceded by a stage in which its effects could be achieved only by indirection. The so-called will made in assembly (*testamentum comitiis* calatis) seems in truth to have been the approval by the assembly of the adoption of a son by the childless chief of an aristocratic house so that the house and the worship of its gods would be perpetuated.

By the 5th century B.C., it seems to have become possible for the head of a Roman family during his lifetime to achieve the purposes of a testamentary transaction by fictitious sale to a middleman, *familiae emptor* ("buyer of the family property"). In the period of the early principate (1st century A.D.), the testament was fully recognized in its proper sense. In the mature form in which it is dealt with in the Corpus *Juris* (6th century A.D.), it became in the late Middle Ages the model for continental Europe.

Among the Germanic peoples by whom the Roman empire had been overrun, *e.g.* the Anglo-Saxons, land was subject to ties of the kinship group and, later, of feudalism. so that there was no place for disposition by will. Chattels were more freely alienable, however. In establishing freedom of testation, a prominent role was played by the Church. which desired thereby to obtain funds for its activities. which extended far beyond those directly concerned with divine worship and included the bulk of medieval education. charity and cultivation of the arts.

In England. the Church succeeded shortly after the Norman Conquest in establishing the jurisdiction of its courts for matters concerning succession upon death to personal property. Through the Church. the will of the Roman pattern became firmly institutionalized. but a testator still had to leave a "reasonable part of the estate" (ordinarily at least one-third), to his wife and children.

Once the alienation of real property again had become possible by gift or sale. there grew up all over Europe that same practice of indirectly achieving the effects of a will by fictitious sale to a middleman (German: *Salman,* "sale man"; English: feoffee to uses) which in analogous circumstances had grown up at other times and places. On the continent. the will as such became again available when Roman law was rediscovered and "received." which occurred from the 12th century first in Italy and then north of the Alps. In France and Germany, the will of the Roman pattern was fully recognized in the late 1jth century. Just about that time, however, the enfeoffment to uses, which had been popular in England, was abolished there by Henry VIII's Statute of Uses in 1535. The king wished to restore to the crown its prospects of escheat (*q.v.*) and of certain feudal duties which could be evaded by the alienation to uses. Public indignation was so strong, however, that five years later the king found it advisable, by the enactment of the Statute of Wills, to open the way for true testamentary disposition of land. Restrictions limiting devises of those lands of which ownership was connected with the duty of rendering military service were abolished shortly after the Restoration by the Military Tenures act. 1662. In Scotland, testamentary disposition of land remained precarious until the enactment of the Land Titles Consolidation act, 1868. and its amendment in 1871.

Limits of Freedom of Testation.— Freedom of testation never has been absolutely unlimited. Nowhere is a testamentary provision valid where its enforcement would be shocking to public morals. Where a testamentary gift is conditioned upon an act of the beneficiary ahich in good morals should not be so conditioned, the gift is either invalid or valid unconditionally as. for instance, a gift conditioned upon the beneficiary's changing his religion. Generally, property given by testament cannot be tied up by the testator for an indefinite future. While a testator may leave property to a person for life and upon the first taker's death to some other person, under the rule against perpetuities as developed in England and commonly applied in the United States, the last "remainder" must "vest" not later than, roughly speaking, one generation after the testator's death. In the civil law countries of the German system, the freedom to provide for substitutions is limited in a similar way, and in those of the French system even more strictly.

Provisions Against *Disinheritance.*—A testator's freedom to disinherit his surviving spouse. children or other heirs has been more extensive in ancient Roman and modern Anglo-American law than in the modern civil law countries, but it never has been without any limits at all. In republican Rome a testator had the power to disinherit his wife and'children, but if he wished to do this, he had to say so expressly in the will. In the period of the principate (27 B.C.–A.D. 284), it became particularly necessary to state the reasons, because a will disinheriting a close member of the family without reasonable and honest cause mas in danger of being declared invalid. In the late Roman empire the descendants and later on, the parents, too, were given the right to a compulsory share in the estate (pars legitima, legitim), of which none of them could be deprived except upon serious cause stated in the will. When after the fall of the Roman empire testamentary disposition came to be recognized again in the later Middle Ages, custom generally required that some minimum share, frequently one-third, be left to the surviving spouse or the descendants or both. Upon the revival of Roman law on the European continent and in Scotland, these customs were in various ways combined with the rules of the Corpus *Juris*.

In the modern civil law, two systems are used to provide protection against disinheritance. (1) Under the French system, a testator who is survived by descendants, parents or (in some countries) brothers. sisters or even other close relatives cannot dispose at all of the "reserved portion" of his estate, the size of which depends upon the number and degree of nearness of relationship .of the surviving "forced heirs." Under the civil code of Louisiana, for instance. donations inter vivos or ntortis causa ("by cause of death") cannot exceed two-thirds of the property of the disposer, if he leaves at his decease a legitimate child; one-half: if he leaves two children; and one-third, if he leaves three or a greater number. The indisposable share is two-thirds of the property, if the disposer, having no children, leave a father, mother or both. (2) Under the system of the German civil code, the surviving spouse, a descendant or, if there are no descendants, a parent can claim to be paid in money one-half the value of the share which would have been his in the case of intestate succession.

In England, those customs which required a minimum share in the personal property to be left to the surviving spouse and descendants disappeared in the 17th and 18th centuries. The interests of dower and curtesy which guaranteed life estates to the surviving spouse in the real estate of the predeceasing, were abolished by the Dower act, 1834. At the turn of the 20th century, freedom of testation was complete in England as well as in the dominions and colonies, but not in Scotland, where the legitim (children's share) can still be claimed by the children, and the terce (widow's share) and the *jus relictae* or *relicti* (*q.v.; i.e.* right of the relict) by the surviving spouse. In 19th-century England itself, freedom of testation, while unlimited by law, was kept within narrow limits, however, by the custom prevailing among the families of wealth, to prevent the splitting up or alienation of the family wealth by means of a so-called strict settlement. In each generation, the head of the family would so settle the estate upon his eldest son that it would descend to him undivided, but subject to a generous life estate for the widow and provisions for the daughters, younger sons and other needy relatives. In the different social climate of New Zealand, a new device for protecting needy family members against disinheritance was invented with the enactment in 1900 of a statute which empowers the court to order adequate provision for the maintenance out of the estate of any testator who had not made such provisions for his or her spouse or a needy child. Family provision acts nf this kind have since been enacted in Australia, Canada and even in England itself.

Under the English act, 1938, as amended by the Intestates' Estates act. 1952, the court may, contrary not only to the testator's will but also to the general rules of intestacy, order that in case of need. provision be made out of the income and under certain circumstances even out of the capital, for the benefit of the surviving spouse, an unmarried daughter. a minor son or any child, male or female, who is incapable of maintaining himself or herself because of physical or mental inability.

In the United States: the surviving spouse is protected against complete disinheritance in every state. As to lands, dower (which no longer exists in England) has in one form or another been preserved in the majority of the states. Under this system, each spouse has an "estate" in the lands of the other, which. as to a portion thereof, continues beyond the death of the predeceasing spouse until the death of the surviving spouse. and of which he cannot be deprived without his consent by will or by sale, gift, mortgage or any other kind of transaction. Under the system of the indefeasible share, the surviving spouse cannot be completely disinherited, but he is not protected against the other spouse's giving away or using up his property before he dies. In most states the two systems are combined, but New York and other states in the eastern part of the country as well as a few others, followed the example of England and abolished dower and curtesy, because their existence in a state renders it necessary in every case of intended purchase of land to investigate whether the title might not be encumbered with dower and curtesy rights which are not readily discoverable from the abstract or the title deeds.

In those jurisdictions which adopted the so-called community property system (Louisiana, Texas, New Mexico! Arizona. California, Washington, Idaho, Nevada and Puerto Rico) an indefeasible share in the family wealth is secured to the surviving spouse by his or her being entitled to one-half of the community property, which generally consists of the property which was acquired during the marriage by the gainful activities of either spouse. Varying systems of community property also exist in numerous European and Latin-American countries. In the countries of the French system, community property law applies unless it has been expressly contracted out by the parties to the marriage. Under the German system, the assets of husband and wife remain separate, but upon the termination of the marriage the acquests are distributed among them. Protection of the surviving spouse can, furthermore, be achieved through homestead laws and those laws which guarantee to the widow or, frequently now, to the surviving spouse, an award of income payable out of the estate for a few months immediately following the death of the other spouse. Both types of laws are common in the United States.

The only jurisdictions in the United States which protect descendants against disinheritance by giving them indefeasible shares are Louisiana and Puerto Rico, whose legal systems are not derived from the common law. In the other states, the descendants are protected either not at all or only indirectly and incompletely by (1) so-called pretermitted heir statutes which! like early Roman law, require the testator to state the disinheritance of a descendant expressly in the will; (2) after-born heir statutes, under which a child born after the making of the will is to receive his intestate share unless a contrary provision is stated in the will; (3) "charity begins at home" statutes, under which no more than a certain fraction (*e.g.*, one-half) of the estate may be given to charity by a testator who is survived by certain close relatives; (4) "hell fire" statutes, which declare ineffective a testamentary provision for charitable purposes made by the testator upon his deathbed, in his last illness or within a certain fixed period immediately preceding his death.

In the U.S.S.R., the family is protected by the limited scope to which freedom of testation exists. With the exception of savings accounts, which may be disposed of freely, testamentary power is limited to modifying the shares to which family members are entitled under the rules of intestacy.

Formalities **of** Wills.—In order to secure proof, impress the testator with the importance of the transaction and to prevent fraud and forgery, a will must regularly be declared in an instrument in writing. However, a nuncupative (orally declared will) is exceptionally admitted in some countries in such emergency situations as those of the soldier on active war duty. the sailor on board ship. or a person finding himself in immediate danger of death.

In their rules establishing the requirements of the execution of a regular testamentary instrument, the legal systems of the modern world usually follow one or more of three forms: (1) the witnessed will as developed in England, especially through the Statute of Frauds, 1677; (2) the unwitnessed holographic will as developed in French customary law; (3) the notarial will as developed in the late Roman empire. Under the system of the witnessed will, which prevails throughout the United States, and in all common law parts of the British Commonwealth. the instrument, which may be typed or written by anyone, must be subscribed by the testator and his signature must be attested to by two or, especially in the New England states, three witnesses, who must also sign their names to the instrument. Under the system of the holographic will, which is available not only in most civil law countries but also in numerous states of the south and the west in the United States, the entire instrument must be exclusively in the testator's own handwriting and must also be signed by him; witnesses are not required. The notarial will. which is available in most civil law countries, is executed so that the testator either dictates his provisions to the notary or hands him an instrument declaring that it contains his mill. The entire transaction is recorded by the notary in a public instrument so that its proof upon the testator's death is greatly facilitated. In civil law countries, a notary is, of course, not a layman but a highly respected member of the legal profession who is experienced in matters of drafting wills, estate planning the conveyancing.

Drafting. — The proper drafting of a will can be difficult. In the United States the law is complicated not only by its diversity from state to state but also by the fact that (unless different provisions have been stated in the will expressly) rules. which are in many respects obsolete, apply to such questions as: (1) how to apportion the burden of death taxes among the beneficiaries; (2) in which order creditors ought to be paid; (3) assets to be used for the payment of debts; (4) legacies to be abated in the case of insufficiency of the estate to pay them all in full; and (j) what to do when a beneficiary has predeceased the testator. Unless the testator has given special powers to his executor, it will be necessary for the latter in his administration to observe cumbersome and expensive formalities. In the United States a will thus tends to be lengthy and complicated, and it appears unwise ever to draft one without expert legal advice. Also, in order to keep up not only with the changing circumstances of the testator's family circle and of his property but also to keep abreast of the frequent changes in the tax laws and thus to avoid unnecessary taxes, it is advisable ior a testator to have his will regularly checked by a lawyer.

Invalidity. — A testamentary disposition is not valid if at the time of its execution the testator was mentally incompetent or if he acted under "undue influence"; *i.e.,* coercion, or under fraud. It is difficult, however, to break a will upon any such ground. In the case of an attack upon the ground of incompetency, the courts, especially those of the Anglo-American system, demand strict proof that the testator, when he made the provision, was mentally unable to know what he owned or who were his relatives, and that he was also unable to form a reasonable plan for the disposition of his property. The mere fact that the testator laboured under some insane delusion will not affect the validity of his will unless it is proved that it actually constituted the motive for the disposition made by him. Coaxing and persuasion are generally not held to constitute undue influence unless there were actual threats. A testator may be led. but he may not be pushed. Undue influence may be held to exist, however, where a testamentary disposition was brought about by a person upon whom the testator was dependent or whom he was likely to obey blindly.

The statutory formalities prescribed for the execution of a will must be observed meticulously. An unwitnessed holographic will may fail because the instrument contained a printed letterhead or some other words, figures or signs in print, rubber stamp or another person's handwriting. A witnessed will may fail because a witness signed outside of the testator's line of sight, or because the witnesses were not told that the instrument was the testator's will or because a blank space was left between the end of the text and the signature of the testator. The witnesses must be absolutely disinterested; *i.e.,* persons who derive no direct or indirect benefit from any of the provisions of the instrument. A witness may be held to be benefited indirectly if her husband is appointed in the will as executor and thus given the opportunity to earn the fees of that office. Ordinarily, attestation of a will by such a disqualified witness will not result. however, in the invalidity of the entire instrument, but only of the provision from which the witness would have benefited.

Revocation. — Since a will is ambulatory (of no effect until the testator's death), it can be revoked or changed by him at any time. Revocation is effected either by the testator's physically destroying the instrument. or by executing a new testamentary instrument the provisions of which are incompatible with those of the earlier one, or in which it is simply declared that the will is revoked. In many states of the United States a will is also revoked automatically if the testator marries after its execution. Attempts by contractual promise to limit one's freedom of changing or revoking his will are without any effect in those legal systems which follow the pattern of the French civil code. But under the system of the German civil code, a disposition *causa mortis* is irrevocable if it is expressed in an hereditary pact (Erbvertrag) made with a beneficiary or even a third person. In Anglo-American law the will remains revocable even if the testator has promised that he will not revoke it; but if he does, his estate will be treated as if the testator had lived up to his promise. In practical effect, a testator may thus bind himself not to revoke the will by which he has made a disposition in favour of the person who has promised to take care of him in old age, or in which a husband and his wife have mutually promised each other that upon the death of the one dying first. his property is to be enjoyed by the survivor, and upon the latter's death is to belong to the children, or certain relatives or charities.

Probate and Administration. — In common law countries, it is usual for the testator in his will not only to direct who is to have his property and under what terms. but also to appoint an executor by whom the estate is to be settled. If no executor has been appointed in the will, or if the person so appointed does not qualify or is unwilling to act, an administrator with the will annexed (administrator cum *testamento* annexo or administrator *c.t.a.*) will be appointed by the court. If the executor cannot complete the administration, the court will appoint another (administrator de bonis *non* or *administrator d.b.n.*), as his successor.

In the countries of Anglo-American law, a will cannot be used for any legal purpose until it has been admitted to probate by the proper court, which means that its genuineness and validity has been judicially ascertained. In numerous states in the United States, a will contest may be raised within a certain period even after the instrument has been admitted to probate. If the testator has failed to express himself with full clarity, it may become necessary to have the will "construed" judicially.

In most civil law countries. a mill is effective upon the testator's death without formal admission to probate. The heir or executor is rarely able, however, to collect the testator's bank account. sell his land or in other nays make practical use of his rights until he can identify himself as heir or executor by a certificate of heirship or some similar paper issued to him by a court, notary or other public agency.

Will Substitutes. — In order to avoid costs and pitfalls really or supposedly connected with will making, there have evolved several kinds of transactions which are meant, in a less expensive and less awesome may, to take care of the transfer of property from one generation to the next. Among these will substitutes, life insurance plays the most important role. Also of considerable significance are: (1) the revocable inter *vivos* trust; (2) the nomination of a third party beneficiary in a government savings bond; (3) the creation of a joint tenancy with the incident of survivorship in a piece of land, a bank account or some other asset; and (4) the so-called tentative or Totten trust, which is the designation by the depositor in a bank of a person who is to be entitled to withdraw whatever may be left in the account at the time of the depositor's death. This "poor man's will" is popular in the state of New York, but its legal effectiveness has not been firmly determined in all other states. The frequent resort in the United States to such will substitutes perhaps indicates the desirability of a thorough-going revision of the overcomplicated U.S. law of wills. Reliable statistics as to the proportion of property owners dying testate and intestate respectively, would be desirable, but these were almost completely lacking in the 1950s. While the majority of adult persons seemed to die intestate, it was also probable that of the considerably smaller group of those leaving net estates of some size. nills were made by a majority, which nas greater in the United States than in other countries in which the intestacy laws were more in accord with the intentions of the average citizen.

WILLARD, EMMA (HART) (1787–1870), U.S. educator whose efforts in behalf of women's education had great influence, was born at Berlin, Conn., Feb. 23. 1787. and began teaching at age 16. In 1807 she became principal of a girls' academy at Middlebury, Vt., and there, in 1809, she married John Willard. Her son. John Hart Willard, was born in 1810. In 1814 Mrs. Willard opened a boarding school of her own. Her *Plan for Improving Female Education* (1819), first addressed to the New York state legislature, was an appeal for state aid in founding schools for girls and for educational advantages for women equal to those for men. It was rejected by the legislature but found favour with Gov. DeWitt Clinton, who invited her to move her school to Waterford, N.Y. Two years later (1821) it was moved to Troy as the Troy Female seminary. In 1845–47 Mrs. Willard traveled 8,000 mi. throughout the south and west, counseling in educational matters. In 1854, with Henry Barnard, she represented the United States at the World's Educational convention in London. She wrote several textbooks, which passed through many editions and were widely used, and also a volume of poems. of which the best known is "Rocked in the Cradle of the Deep." Her second marriage, to Christopher Yates, which took place in 1838 after the death of her first husband in 1825, ended in divorce. Her death occurred at Troy. N.Y., on April 15, 1870.

See A. Lutz, *Emma Willard: Daughter of Democracy* (Boston, 1929).

WILLARD, FRANCES ELIZABETH CAROLINE (1839–1898), U.S. educator, reformer and temperance advocate, was born at Churchville, Monroe county, N.Y., Sept. 28, 1839. She became a teacher upon graduation from the North-Western Female college at Evanston, Ill., in 1859. In 1871 she accepted the presidency of the newly organized Evanston College for Ladies. When it merged with Northwestern university in 1873, she was appointed dean of women. She resigned this post in 1874 to become corresponding secretary of the National Woman's Christian Temperance union. In 1879 she was elected president and held that office until her death. In 1883 she organized the World's Woman's Christian Temperance union and was its first president. The organizations in which she was active were committed to temperance reform, woman suffrage and improved industrial codes for women. In recognition of her work, she was chosen president of the National Council of Women in 1888.

Her work ior reform led her into politics. She joined the national Prohibition party and in the 1880s exerted influence in its executive council. She was an excellent speaker, a successful lobbyist and an expert in public opinion and pressure politics. She participated in the Industrial conference, forerunner of the Populist party, held in St. Louis, Mo., in Feb. 1892. She died in New York city on Feb. 1S, 1898. (M. E. DN.; X.)

With Mary A. Livermore she edited *A Woman of the Century* (Buffalo. 1893), which includes a sketch of her life; and she published *Nineteen Beautiful Years* (1864), a life of her sister; *How to Win: a Book for Girls* (1886); *Glimpses of Fifty Years* (1889); and, in collaboration with others, *Occupations for Women* (1897).

See A. A. Gordon, *Thr Beautiful Life of Frances E. Wzllard* (Chicago, 1898), with an introduction by Lady Henry Somerset; W. M. Thayer, *Women Who Win* (1896).

WILLCOCKS, SIR WILLIAM (1852–1932), British engineer. was born in India and educated at Roorkee college. India. From 1872 to 1897 he was engaged successively in the Indian and Egyptian public works departments. He designed and carried through the Aswan dam in 1898. His most important undertaking, however. was the irrigation of 3,500,000 ac. in Mesopotamia, begun in 1911.

His works include: *Egyptian Irrigation* (1889); *The Irrigation of Mesopotamia* (1905); *From the Garden of Eden to the Crossing of Jordan* (1918).

WILLEMITE, a mineral consisting of zinc orthosilicate. Found near Liège, it was named after William I of the Netherlands. It occurs at Sterling Hill and Franklin in New Jersey, where it is associated with other zinc ores (franklinite and zincite) in crystalline limestone. and at a few other places. After more than 100 years of production the Franklin mine was closed in 1954 because of exhaustion of ore reserves. A variety of willemite containing much manganese replacing zinc is called troostite. Under ultraviolet radiation willemite fluoresces with a brilliant green colour, a characteristic used in separating it from other minerals and that led to its use in the manufacture of early television tubes. Its formula is Zn_2SiO_4. It crystallizes in the rhombohedra1 system. Crystals have the form of hexagonal prisms terminated by rhombohedral planes; there are distinct cleavages parallel to the prism faces and to the base. Granular and cleavage masses are of commoner occurrence. It varies considerably in colour, being colourless. white, greenish-yellow, apple-green, flesh-red. etc. The hardness is $5\frac{1}{2}$ and the specific gravity ranges from 3.9 to 4.2. (CL. F.)

WILLESDEN, a municipal (1933) and parliamentary borough (returning two members) of Middlesex, Eng.. 6 mi. N.W. of Charing Cross, London. Pop. (1961) 170,835. Area 7.2 sq.mi. It extends southwestward from Watling street (Edgware road) to Acton, and northwestward from Hammersmith and Paddington to Wembley and Edgware. Although ten manors in Neasden-cum-Willesden were granted to the canons of St. Paul's in 940 and St. Mary's parish church has Norman features, the town is almost entirely of modern growth. In the 15th century the church was a place of pilgrimage for people seeking cures at the shrine of Our Lady of Willesden, but by the middle of the following century the shrine had been suppressed. In 1835–39 the Brent reservoir (known as the Welsh Harp) was built, on the northern boundary. to feed the Grand Junction canal; there is an annual regatta held on it. The population of A'illesden in 1875 was only 15,500; by 1895 it had become a residential suburb with a population of 58,000; World War I brought munitions factories; and the opening of the North Circular road in 1924 increased the industries, especially on the trading estates of Park Royal and North Cricklewood, and at Kilburn and Church End. Motor accessories, water heaters, paper and shoe cream are made; food and beverages are processed.

WILLET, a conspicuous North American wading bird (*Catoptrophorus semipalmatus*), about 15 in. long, and to be recognized by its black primaries with a broad white band and white upper tail coverts. The willet breeds as far north as New Jersey and Manitoba, wintering from southern United States south. The western willet (*C. s. inornatus*) is paler and slightly larger.

WILLETTE, ADOLPHE LÉON (1857–1926), French caricaturist and illustrator, was an effective moral and political satirist. He was born at Châlons-sur-Marne, April 30, 1857. He contributed freely to *Le Courrier français* and *Le Chat noir*. His drawings were often *risqué* and sometimes horrific. He exploited the cardinal sins and the struggle between virtue and vice; his frail but lovable character "Mimi Pinson" became immensely popular. In *Pauvre Pierrot* and other similar publications he made use of the pathetic and ironical element of the *comédie italienne* with the figure of Death in the background. In this method of counterpointing levity with an astringent wryness he came close to Félicien Rops (*q.v.*), though lacking the latter's powers of draftsmanship. He died at Paris, Feb. 4, 1926.

See E. Bayard, *La Caricature et les caricaturistes*, pp. 239–259 (Paris, 1900); A. Willette, *Oeuvres Choisies* (Paris, 1901).

WILLIAM (c. 1130–*c.* 1190), archhishop of Tyre and chronicler, belonged to a noble French family and was probably born in Palestine about 1130. This, however. is only an inference; unfortunately the chapter (xix, 12) which relates to his early life has been excised or omitted from every extant manuscript- of his *Historia.* William was still pursuing his studies in Europe when Amalric I became king of Jerusalem in 1162, but he returned to Palestine toward the close of 1166, or early in 1167, and was appointed archdeacon of Tyre at the request of Amalric in Aug. 1167. In 1168 he was sent on an embassy, the forerunner of several others, to the emperor Manuel I at Constantinople, and in 1169, at the time of the disastrous campaign against Damietta, he was obliged to take refuge in Rome from the "unmerited anger" of his archbishop. But he was soon in Palestine again, and about 1170 he was appointed tutor to Amalric's son, Baldwin, afterward King Baldwin IV. Toward the end of 1174, soon after Baldwin's accession to the throne, he was made chancellor of the kingdom of Jerusalem, an office which he held until 1183, and less than a year later (May 1175) he was consecrated archbishop of Tyre. He was bne of those who went to negotiate with Philip I, count of Flanders, in 1177, and in 1179 he was one of the bishops who represented the Latin Church of the East at the Lateran council in Rome. On his return to Palestine he stayed seven months at Constantinople with Manuel. This is William's last appearance in history, but he mas writing his history in 1181, and this breaks off abruptly at the end of 1183 or early in 1184. He died probably between 1187 and 1190.

William of Tyre is among the greatest of medieval historians. His *Historia rerum in partibus transmarinis gestarum*, or *Historia Hierosolymitana* or *Belli sacri historia*, covers the period between 1095 and 1184, and is the main authority for the history of the Latin kingdom of Jerusalem between 1127, where Fulcher of Chartres leaves off, and 1183 or 1184, where Ernoul takes up the narrative. It was translated into French in the 13th century, or possibly before the end of the 12th, and this translation. known as the *Chronique d'outremer,* or *Livre d'Eracles* or *Livre du conquest,* is quoted by Jean de Joinville, and increased **by** various continuations! in the standard account of the exploits of the French warriors in the east. William's work consists of 22 books and a fragment of another book; it extends from the preaching of the first crusade by Peter the Hermit and Pope Urban II to the end of 1183 or the beginning of 1184.

As *Belli sacri historia* the *Historia rerum* was first published in 1549 at Basel. Later editions are in J. P. Migne's *Patrologia Lafina,* vol. cci, and in the "Recueil des historiens des croisades," *Hist. occid.* i (Paris, 1844). An English translation was made for the Early English Text Society by M. Pi. Colvin (London, 1893).

WILLIAM I (1027 or 1028–1087), king of England, surnamed the Conqueror, was born in 1027 or 1028. He was the bastard son of Robert the Devil, duke of Normandy, by Arletta, the daughter of a tanner at Falaise. In 1034 Robert resolved on a pilgrimage to Jerusalem. Having no legitimate son he induced the Norman barons to acknowledge William as his successor. They kept their engagement when Robert died on his journey (1035), though the young duke elect was a mere boy. But the next 12 years was a period of the wildest anarchy. Three. of William's guardians were murdered; and for some time he mas kept in strict concealment **by** his relatives, who feared that he might experience the same fate. Trained in a hard school, he showed a precocious aptitude for mar and government. He was only 20 years old when he stamped out, with the help of his overlord, Henry I of France, a serious rising in the districts of the Bessin and Cotentin, the object of which was to put in his place his kinsman, Guy of Brionne. Accompanied by King Henry, he met and overthrew the rebels at Val-des-Dunes near Caen (1047). It mas by no means his last encounter with Norman traitors, hut for the moment the victory gave him an assured position. Next pear he joined Henry in attacking their common enemy, Geoffrey Martel, count of Anjou. Geoffrey occupied the border fortress of Alençon with the good will of the inhabitants. But the duke recovered the place after a severe siege, and inflicted a terrible vengeance on the defenders, who had taunted him with his base birth; he also captured the castle of Domfront from the Angevins (1049).

In 1051 the duke visited England. and probably received from his kinsman, Edward the Confessor, a promise of the English succession. Two years later he strengthened the claims mhich he had thus established by marrying Matilda, a daughter of Baldwin V of Flanders, who traced her descent in the female line from Alfred the Great. This union took place in defiance of a prohibition mhich had been promulgated, in 1049, by the papal council of Reims. Pope Nicholas II at length granted the needful dispensation (1059). By way of penance William and his wife founded the abbeys of St. Stephen and the Holy Trinity at Caen. The political difficulties caused by the marriage were more serious. Alarmed at the close connection of Piormandy with Flanders, Henry I joined forces with Geoffrey Martel in order to crush the duke, and Normandy was twice invaded by the allies. In each case William decided the campaign by a signal victory. The invasion of 1054 was checked by the battle of Mortemer; in 1058 the French rear guard was cut to pieces at Varaville on the Dive, in the act of crossing the stream. Between these two mars William aggrandized his power at the expense of Anjou by annexing Mayenne. Soon after the campaign of Varaville both Henry I and Geoffrey Martel died. He at once recovered Maine from the Angevins, nominally in the interest of Count Herbert II, on whose death (1062) Maine was formally annexed to Normandy.

Conquest of England.— About 1064 the accidentai visit of Harold II (*q.v.*) to the Norman court added another link to William's connection. It seems clear that the earl made a promise to support the claims of William upon the English succession. This promise he was invited to fulfill in 1066, after the Confessor's death and his own coronation. William had some difficulty in securing the help of his barons for his proposed invasion of England; it was necessary to convince them individually by threats and persuasions. Otherwise conditions mere favourable. William secured the benevolent neutrality of the emperor Henry IV; and the expedition had the solemn approval of Pope Alexander II. With Tostig, the banished brother of Harold, William formed a useful alliance; the duke and his Kormans were enabled, by Tostig's invasion of northern England, to land unmolested at Pevensey on Sept. 28. 1066. On Oct. 14 a crushing defeat was inflicted on Harold at the battle of Senlac or Hastings; and on Christmas day William was crowned at Westminster.

Five years more were to elapse before he became master of the west and north. Early in 1067 he made a progress through parts of the south, receiving submissions, disposing of the lands of those who had fought against him and ordering castles to be built; he then crossed the channel to celebrate his triumph in Normandy. Disturbances at once occurred in Northumbria, on the Welsh marches and in Kent; and he was compelled to return in December. The year 1068 was spent in military expeditions against Exeter and York, in both of which the adherents of Harold had found a welcome. In 1069 Robert of Comines, a Norman to whom William had given the earldom of Northumberland, was murdered by the English at Durham; the north declared for Edgar Atheling, the last male representative of the West Saxon dynasty; and Sweyn Estrithson of Denmark sent a fleet to aid the rebels. Joining forces, the Danes and English captured York, although it was defended by two Norman castles. Marching rapidly on York. William drove the Danes to their ships, and the city was then reduced by a blockade. The king ravaged the country as far north as Durham with such completeness that traces of devastation were still to be seen 60 years later. But the English leaders were treated with politic clemency. and the Danish leader, Jarl Osbiorn, was bribed to withdraw his fleet. Early in 1070 the reduction of the north was completed by a march over the moors to Chester, which was now placed under an earl of William's choice. From this point we hear no more of general rebellions against the foreign rule.

Administration.— Of the measures which William took to consolidate his authority we have many details; but the chronological order of his proceedings is obscure. The redistribution of land appears to have proceeded *pari passu* with the reduction of the country; and at every stage of the conquest each important follower received a new reward Thus were formed the vast but straggling fiefs which are lecorded in Domesday. The great earldoms of the West Saxon period mere allowed to lapse; the new earls, for the most part closely connected with William by the ties of blood or friendship, were lords of single shires; and only on the marches of the kingdom was the whole of the royal jurisdiction delegated to such feudatbries. William's writs show that he kept intact the old system of governing through the sheriffs and the courts of shire and hundred. Those whom he enfeoffed with land held it according to the lam of Norman feudalism, and were thus brought into close personal relations with the king. But he forced the most powerful of them to acknowledge the jurisdiction of the ancient local courts; and the old fyrd-system was maintained in order that the crown might not be wholly dependent on feudal levies. Though his forest laws and his heavy taxation caused bitter complaints, William won the respect of his English subjects. They appear to have accepted him as the lawful heir of the Confessor; and they regarded him as their natural protector against feudal oppression. This is to be explained by his regard for legal forms, by his confirmation of the "laws of Edward" and by the support which he received from the church. Domesday Book shows that in his confiscations he can have paid little attention to abstract justice. Almost every English landholder of importance was dispossessed, though only those who had actually borne arms against William should have been so treated. As far as possible Englishmen mere excluded from all responsible positions both in church and state. After 1071 our accounts of William's doings become jejune and disconnected. Much of his attention must have been engrossed by the work of administration, carried on without the help of those elaborate institutions, judicial and financial, which were perfected by Henry I and Henry II. William had few ministers of note. William Fitz Osbern, earl of Hereford, who had been his right-hand man in Normandy, fell in the civil wars of Flanders (1071). Odo, bishop of Bayeux, William's half-brother, lost favour and was finally thrown into prison on a charge of disloyalty (1082). Another half-brother, Robert of Mortain, earl of Cornwall, showed little capacity. Of the king's sons Robert, though titular count of Maine, was kept in leading strings; and even William Rufus, who was in constant attendance on his father, never held a public office. The Conqueror reposed much confidence in two prelates, Lanfranc of Canterbury and Geoffrey of Coutances. They took an active part in the civil no less than the ecclesiastical government. But the king himself worked hard in hearing lawsuits, in holding councils and ceremonious courts, and finally in conducting military operations.

In 1072 he undertook a campaign against Malcolm, king of Scots, who had married Margaret, the sister of Edgar Atheling. and was Inclined to promote English rebellions. When William reached the Forth his adversary submitted, did homage as a vassal and consented to expel Edgar Atheling, who mas subsequently endowed with an English estate and admitted to William's favour. From Scotland the king turned to Maine, which had profited by the troubles of 1069 to expel the Norman garrisons. William had no difficulty in reducing the country, even though Le Mans mas assisted by Fulk of Anjou (1073). A conspiracy of the earls of Hereford and Norfolk, in which the Englishman Waltheof, earl of Northampton, was to some extent implicated, was defeated by Lanfranc in the king's absence; but William returned to settle the difficult question of their punishment, and to stamp out the last sparks of disaffection. The execution of Waltheof, though strictly in accordance with the English law of treason, he only sanctioned after long hesitation, and this severity to a man who was generally thought innocent is one of the dark stains on his career. In 1076 he invaded Brittany to get possession of the fugitive earl of Norfolk; hut Philip of France came to the aid of the Bretons, and William gave way beiore his suzerain. The next few years were troubled by a quarrel between the king and his eldest son, Robert (*q.v.*). In the years 1083–85 there was a second rising in Maine. In 1085 news arrived that Cnut the Saint, king of Denmark, was preparing to assert the claims of his house in England. The project fell through, but gave occasion for the famous moot at Salisbury in which William took an oath of direct allegiance from "all the land-sitting men that were in England" (1086).

While the danger was still impending he took in hand (1085) the compilation of Domesday Book (*q.v.*). In 1087 he invaded the French Vexin to retaliate on the garrison of Mantes for raids committed on his territory. He sacked and burned the town. But as he rode out to view the ruins his horse plunged on the burning cinders and inflicted on him an internal injury. He was carried in great suffering to Rouen and there died on Sept. 9, 1087. He was buried in St. Stephen's at Caen. A plain slab still marks the place of his tomb, before the high altar; but his bones were scattered by the Huguenots in 1562.

Character. — In a profligate age William was distinguished by the purity of his married life, by temperate habits and by a sincere piety. His most severe measures mere taken in cold blood, as part of his general policy; but his natural disposition mas averse to unnecessary bloodshed or cruelty. His one act of wanton devastation, the clearing of the New Forest, has been grossly exaggerated. He was avaricious, but his church policy (*see* article ENGLISH HISTORY) shows a disinterestedness as rare as it was honourable. In personal appearance he was tall and corpulent, of a dignified presence and extremely powerful physique, with a bald forehead, close-cropped hair and short moustaches.

By Matilda (d. 1083) William had four sons, Robert, duke of Normandy, Richard (killed while hunting), the iuture kings William II and Henry I and five or six daughters including Adela, who married Stephen, count of Blois.

Of the original authorities the most important are the *Gesta Willelmi* by William of Poitiers, ed. by A. Duchesne in *Historiae Normannorum scriptores* (Paris, 1619); the Winchester, Worcester and Peterborough texts of the *Anglo-Saxon Chronicle,* ed. by B. Thorpe, "Rolls Series," 2 vol. (1861), and also C. Plummer, 2 vol. (Oxford, 1892–99); William of Malmesbury, *De gestis regum,* ed. by W. Stubbs, "Rolls Series," 2 vol. (1887–89); William of Jumièges, *Historia Normannorum,* ed. by A. Duchesne, *op. cit.;* Ordericus Vitalis, *Historia ecclrsiastica,* ed. by A. le Prévost, *Soc. de l'histoire de France,* 5 vol. (Paris, 1838–55). Of modern works the most elaborate is E. A. Freeman, *History of the Norman Conquest,* vol. iii–v (Oxford, 1870–76). Domesday Book was edited in 1783–1816 by H. Farley and Sir H. Ellis in 4 vol. Of commentaries the following are important: *Domesday Studies,* ed. by P. E. Dove, 2 vol. (1888–91); J. H. Round, *Feudal England* (1895); F. W. Maitland, *Domesday Book and Beyond* (Cambridge, 1897); P. Vinogradoff, *English Society in the Eleventh Century* (Oxford, 1908). *See* also F. M. Stenton, *William the Conqueror* (1908); R. Francis, *William the Conqueror* (1915); S. H. Benton, *From Coronet to Crown* (1926).

(H. W. C. D.)

WILLIAM 11 (*c.* 1056–1100), king of England, surnamed Rufus, was the third son of William I by his queen Matilda of Flanders. He seems to have been his father's favourite son. and constantly appears in the Conqueror's company, although like his brothers he was carefully excluded from any share in the government. A squabble with Rufus was the immediate cause of Robert's first rupture with the Conqueror; in the ensuing civil war we find Rufus bearing arms on the royal side (1077–80). On his deathbed the Conqueror was inclined to disinherit his eldest son in favour of Rufus. who by the early death of Prince Richard was now left second in the order of succession. But Normandy was bequeathed to Robert, while Rufus was designated as king of England. Rufus was crowned at Westminster on Sept. 26, 1087, 15 days after the death of his father.

Domestic Administration. — In his domestic administration we can trace a certain continuity of purpose, and in his dealings with the Welsh and Scots he proceeded, though intermittently, along the broad lines of policy which his father had marked out. Beyond the channel he busied himself with schemes, first for the reunion of England and Normandy, then for the aggrandizement of Normandy at the expense of France. But the violence, the irregularity, the shamelessness of his private life are faithfully reflected in his public career. Even in cases where his general purpose could be justified. his methods of execution were crudely conceived, brutal and shortsighted. Rufus was not without valour or glimmerings of chivalry. but perfidious to his equals, oppressive to his subjects, contemptuous of religion, with no sense of his responsibilities and determined to exact the last farthing of his rights. The baronage took up arms for Robert in the name of the hereditary principle, but with the secret design of substituting a weak and indolent for a ruthless and energetic sovereign. Local risings in Norfolk. Somerset and the Welsh marches were easily repressed. The castles of Kent and Sussex offered a more formidable resistance, since their lords were in direct communication with Robert of Normandy, and were led by the able Odo of Bayeux (*q.v.*), the king's uncle, who had been released from prison at the opening of the reign. Rufus secured the help of the native English, by promises (never fulfilled), of good laws, the abolition of unjust taxes and redress for those who had suffered by the afforestments of the former king. Aided by large contingents of the national militia he subdued the rebels. Odo of Bayeux left England under a safe-conduct to sow fresh seeds of discord in Normandy. But Rufus resolved to take vengeance on his brother, and in 1089 he invaded eastern Normandy. In 1091 a treaty was hastily patched up. Rufus retained the eastern marches of the duchy, and also received certain seaports. In return he undertook to aid Robert in reducing the rebellious county of Maine. and in recovering the Cotentin from their younger brother, Henry Beauclerk, to whom it had been pledged by the impecunious duke. The last part of the agreement was duly executed. Rufus then recrossed the channel to chastise the Scots, who in his absence had raided the north country. Malcolm III of Scotland prudently purchased his withdrawal by doing homage (Aug. 1091) on the same terms which William I had imposed in 1072. Next year Rufus broke the treaty by seizing the stronghold of Carlisle and the other lands held or claimed by Malcolm in Cumberland and Westmorland. Malcolm in vain demanded satisfaction; while attempting reprisals on Northumberland he was slain in an obscure skirmish (1093). Rufus immediately put forward a candidate for the vacant throne; and this policy, though at first unsuccessful, finally resulted in the accession of Edgar (1097), a son of Malcolm, who had acknowledged the English overlordship. Carlisle remained an English possession; in the next reign Cumberland and Westmorland appear as shires in the accounts of the exchequer.

Norman Policy. — Rufus resumed his designs on Normandy at the first opportunity. Robert reproached his brother with nonfulfillment of the terms arranged in 1091; and Rufus seized the excuse for a second invasion of the duchy (1094). But Robert resolved to go upon a crusade and, to obtain the necessary funds, gave Normandy in pledge to his brother (1096). The interests of Normandy at once became the first consideration of Rufus' policy. In 1098–99 he recovered Maine, and commenced operations for the recovery of the Vexin. Early in 1100 he accepted a proposal, made by William IX of Aquitaine, that he should take over that duchy on terms similar to those arranged in the case of Normandy. Contemporaries were startled at the rapid progress of the king's ambitions, and saw the direct interposition of heaven in the fate which cut them short. On Aug. 2, 1100, Rufus fell, in the New Forest, the victim of an arrow from an unknown hand. The common story names Walter Tirel, who was certainly close at hand and fled the country without venturing to abide the issue of a trial. But a certain Ralph of Aix was also accused; and Tirel, from a safe distance. solemnly protested his innocence.

It remains to notice the main features of the domestic administration which made the names of William and his minister, Ralph Flambard, infamous. We are told that the "moots" all over England were "driven" in the interests of the king; which perhaps means that aids were extorted from the shire courts. We also learn that the forest laws were rigorously administered;

that the king revived, for certain offenses, the death penalty which his father had abolished; that all men were vexed by unjust gelds and the feudal classes by unscrupulous misinterpretations of the customs relating to the incidents of wardship, marriage and relief. On one occasion the militia were summoned in considerable numbers for a Norman expedition, which was no part of their duty; but when they arrived at the seacoast they were bidden to hand over their journey money and go home. The incident is not uninstructive as a sidelight on the king's finance. As to the oppression of the church we are more fully informed; after allowing for exaggeration there still remains evidence enough to prove that the ecclesiastical policy of Rufus was unscrupulously venal.

In appearance William II was unattractive: bullnecked, with sloping shoulders. extremely corpulent and awkward in his gait. His long locks and clean-shaven face marked his predilection for the newfangled fashions which contemporary ecclesiastics were never weary of denouncing. His features were strongly marked and coarse, his eyes gray and deeply set; he owed his nickname to the fiery hue of his complexion. He stuttered violently and in moments of passion was almost inarticulate. His familiar conversation was witty and blasphemous. He was surrounded by a circle of vicious parasites, and no semblance of decorum was maintained in his household. His character was assailed by the darkest rumours which he never attempted to confute. He died unmarried and without issue.

The main authorities for the reign are the *Peterborough Chronicle,* ed. by C. Plummer, 2 vol. (Oxford, 1892–99) ; Eadmer, *Vita Anselmi* and *Historia Novorum,* ed. by *M*. Rule, "Rolls Series" (1884); William of Malmesbury, *De gestis regum,* ed. by *W*. Stubbs, "Rolls Series," 2 vol. (1887–89) ; Orderic Vitalis, *Historia ecclesiastica,* ed. *by A*. le Prévost, 5 vol. (Paris, 1838–55). Of modern works the most exhaustive is by E. A. Freeman, *Reign of William Rufus,* 2 vol. (Oxford, 1882). *See* also J. *H*. Round, *Feudal England* (1895).

WILLIAM III (1650–1702), prince of Orange, who was also (1689–1702) William III. king of England, and William II. king of Scotland, was born at The Hague on Nov. 4, **1650.** eight days after the death of his father. As he was the only child of William II he was prince of Orange from his birth; but his position was nevertheless far from enviable, for his hereditary principality, on the Rhône a few miles north of Avignon, was small and in constant peril of absorption by France, while the authority which his ancestors had long enjoyed as leading officials in the United Provinces of the Ketherlands seemed in danger of being lost forever. Shortly before his death William II had made an unsuccessful attempt to increase that authority by a military coup *d'état,* with the result that the republican oligarchy which was especially strong in the powerful province of Holland and the great city of Amsterdam had become bitterly hostile to the house of Orange, and was prepared to exclude it altogether from office.

In **1654.** under the direction of the famous grand pensionary of Holland, John de Witt (*q.v.*), an act was adopted which debarred William and his descendants forever from the stadtholdership or chief magistracy of Holland and from the position of captain general or commander in chief of the armed forces of the United Provinces.

For ten years William III was brought up under the direction of his mother, Mary, the eldest daughter of Charles I. king of England; but on Dec. 24, **1660,** Mary died of smallpox while on a visit to her newly restored brother, Charles II, and William came under the care of his paternal grandmother, Amalia, countess of Solms-Braunsfeld, and his uncle by marriage, Frederick William the Great Elector of Brandenburg. Over all these mutually jealous individuals an increasingly watchful eye was kept by the government of the United Provinces, ever distrustful of the autocratic tendencies of the house of Orange and fearful of its popularity with the multitude. William's boyhood and early manhood, in consequence, were spent in an atmosphere of jealousy, suspicion and intrigue, which early taught him how to conceal his purposes, repress his feelings and present to the world that cold, impassive exterior which later was to make such an unfavourable impression in England. His more formal education was obtained at the University of Leyden, which he entered at the age of nine, and left with some knowledge of mathematics, geography and history, and an unusually wide acquaintance with the languages of contemporary Europe.

Nevertheless as he grew older his position steadily improved. In May **1660** the restoration of his uncle Charles II to the English throne gave indirect encouragement to his many partisans among the nobility, clergy and commons, and enabled them to secure the repeal of the Act of Exclusion. During the war of 1664–67 between England and the United Provinces there was an increased demand that he should be entrusted with part of the authority of his ancestors, and in **1668** a compromise was reached by which he was to be accepted as captain general on attaining the age of 22, but while holding that post was to be debarred from the office of stadtholder. De Witt, indeed, was maintaining his position with difficulty, for the burgher oligarchy which he controlled was only a small, though powerful, minority and was distracted by serious dissensions within its own ranks.

The crisis which eventually brought William to the front arose in the spring of **1672.** England and France. united in the secret treaty of Dover, made a sudden and unprovoked attack on the Dutch republic with the object of seizing its territory and dividing it between them. At sea the Dutch put up a skillful and heroic defense, which was successful in preventing any English invasion; but on land their armed forces, which had been suspected of favouring the house of Orange and had therefore been neglected, proved both inadequate and halfhearted and gave way at every point. A large part of the United Provinces was rapidly overrun by the French, riots broke out, and on July **8. 1672,** the burgher oligarchy was forced to accept William's appointment as stadtholder and captain general for life. By ruthless determination he infused new vigour into the defense; but although the cutting of the dikes and the flooding of the surrounding country saved Amsterdam, no immediate improvement in the situation was visible, and on Aug. 20 the mob at The Hague, filled with unreasoning fury at what they interpreted as treachery on the part of their former governors, fell upon John de Witt and his brother and brutally murdered them. William was in no sense responsible for this crime, but it is typical of his whole character that he neither took precautions to prevent it nor endeavoured to punish the perpetrators.

As a military commander William never rose above the second rank, and he became renowned for his skill in making the best of defeats rather than for any capacity for winning victories. Entrusted with the direction of armies while scarcely of age, he had to learn from his own mistakes, and while he soon mastered the art of planning on a large scale he remained inadequately equipped with that knowledge of detail which early experience in subordinate posts would have given him. His strategy to begin with was of necessity defensive, but in Aug. **1674** he risked his first major engagement at Seneffe, and was defeated. Three years later he was again defeated at St. Omer, and on Aug. **14, 1678,** he suffered a third defeat near Mons.

William excelled in diplomacy and in the formation of great international combinations. As early as Oct. **1672** he had induced the emperor Leopold and the Great Elector to come to his assistance, and so had eased the pressure on the Dutch. In Aug. 1673 he enlisted the support of Spain, and a few months later that of Denmark. In Feb. **1674.** partly by concessions and partly by intrigues with the English opponents of Charles II, he procured the withdrawal of England from its alliance with France. Left thus almost alone to face the chief powers of western Europe Louis XIV had to abandon his conquests in the United Provinces, and William's services were recognized by the Dutch, making the stadtholdership hereditary in his family. Nevertheless the French remained successful in the field, and William could see no prospect of decisive victory except through engaging England on his side. This he tried to accomplish by his marriage on Kov. 4, **1677,** to Mary, eldest daughter of James! duke of York. the brother of Charles II; but the English king could not be prevailed upon to do more than make a pretense of hostility to France, and as war weariness increased on both sides no course remained open but to acquiesce in the indecisive settlement at Nijmegen in Aug. **1678.**

William then endeavoured to form a new coalition against Louis XIV, who continued even in time of nominal peace to absorb, bit by bit, territory to which he declared himself entitled. From this attempt emerged in 1686 the league of Augsburg, which would have had a fair prospect of checking Louis but for the uncertain attitude of England, now under James II, who showed signs of throwing in his lot with France. William therefore devoted renewed attention to the affairs of England, to the throne of which his wife was heiress presumptive, and on receiving an invitation from the opponents of James's Catholic and autocratic policy undertook to bring an army to their assistance. Landing at Torbay on Nov. 5, 1688, he advanced upon London, being joined by numbers of James's discontented subjects and even of his armed forces. James in foolish panic fled to France, and a specially summoned convention parliament, on the ground that by doing so he had "abdicated the government," and on the wholly unwarranted assumption that his recently born son was supposititious, conferred the crown jointly on William and Mary, with the exercise of the royal authority in the former. On Feb. 13, 1689, they were proclaimed, and on April 11, they were crowned.

William's recognition as king was followed by the dispatch of an English force to assist his allies on the continent, where war had already broken out.. But in order that English intervention against Louis might be genuinely effective it was necessary that he should establish himself securely in the outlying kingdoms of the British Isles. In Scotland there was little difficulty; William and Mary were accepted as sovereigns on April 11, 1689, and after the defeat of William's forces at Killiecrankie on July 27 his fortunes were restored by the success of William Cleland at Dunkeld on Aug. 21. In Catholic Ireland, on the other hand, opposition was very bitter and was encouraged by the arrival of James II, with French money, munitions and men, at Kinsale on March 12. The relief of Londonderry on July 30, however, brought hope to the Protestants in Ireland, and on July 1, 1690, William restored their ascendancy by his own victory at the Boyne, a victory of European significance, as it enabled him in the following spring, after nearly three years' absence, to turn his personal attention to the main struggle in Flanders.

In that area and at sea his fortunes pursued much the same course as in his previous contest with France. On June 30, 1690, the English and Dutch fleets were defeated off Beachy head, and England was momentarily thrown open to invasion. In April 1691 William in person failed to prevent the fall of the important fortress of Mons. In June 1692 he lost the yet more important fortress of Namur, and on Aug. 3 was defeated at Steinkirk. In July 1693 he was again defeated at Neerwinden. It is true that the position at sea was restored in May 1692 by the English and Dutch victory at La Hogue (*q.v.*); but it was not until 1695 that the fortune of war on land turned with William's recovery of Namur. and by that time both sides were thoroughly weary of the struggle. In 1697 an indecisive peace treaty was concluded at Ryswick, by which, however, Louis XIV formally recognized William's title to the English throne.

In domestic affairs William's reign was one of the most important in the history of England. It witnessed the passing of the Bill of Rights and the Act of Settlement; the acceptance of the idea that parliament should meet regularly once a year, and should exercise some control not merely over legislation and finance but also over administration and the army; the establishment of the freedom of the press and the recognition of the principle of religious toleration; the foundation of the Bank of England and of the national debt. But these achievements were William's only in a very negative sense. Of some he approved; to others he was indifferent or even hostile; but in all he acquiesced with a view to securing the support of a united England in the continental struggle.

No sooner had the treaty of Ryswick been signed, however, than the divergent outlook of king and people, the one intent only on foreign and the other on domestic affairs, became a cause of serious trouble. With the vast possessions of the dying Charles II of Spain about to be disputed by the powers of Europe, William recognized that the contest with France had only died down, and that a supreme crisis was approaching. The people of England, on the other hand, accepted the treaty as a permanent settlement. William insisted on the need for maintaining a large standing army, and parliament refused the legislation and supplies necessary for it. William then endeavoured to avert the crisis by two successive treaties with France for the peaceful partition of the Spanish empire, and parliament condemned not merely the treaties but also the fact that they had been concluded without its knowledge.

In Nov. 1700 Charles II died, leaving his inheritance by will to Philip of Anjou, grandson of the French king. Even then English public opinion was but faintly stirred. But Louis XIV's conduct in treating the Spanish dominions as if they were now his own, and still more his reckless breach of faith in acknowledging the son of James II as king of England, led to an immediate revulsion of feeling which swept England into an alliance with the coalition already built up by William on the continent. For some time William had been associating John Churchill, earl of Marlborough, whom he had previously distrusted, more and more with his work, and Marlborough, a greater soldier than he and as great a diplomatist, now stood ready to take over from him. On March 8, 1702, William, whose health had never been robust and who had for several months been visibly declining, died of pleurisy, fortunate in this, that he had practically ensured the success of his life's work though he did not live to complete it.

BIBLIOGRAPHY.—The story of William's life between 1672 and 1702 is scarcely distinguishable from the history of Europe, and all the major authorities for the period throw light upon it. William's own correspondence has been largely preserved and has been made available mainly in Dutch official publications, of which the most important are *Archives ou Correspondance inédite de la Maison d'Orange-Nassau,* ser. 2, 1584–1688, ed. G. Groen van Prinsterer, 5 vol. (Utrecht, 1857–62); ser. 3, 1689–1702, ed. F. J. L. Kramer, 3 vol. (Leyden, 1907–09); and *Correspondentie van Willem III en van Hans Willem Bentinck,* ed. N. Japikse, 5 vol. (The Hague, 1927–37). Of considerable importance also is *Letters of William III and Louis XIV and of their Ministers,* ed. Paul Grimblot, 2 vol. (London, 1848). There is no adequate biography of William in English, but useful sketches are available by H. D. Traill (London, 1888), G. J. Renier (London, 1932; New York, 1933) and David Ogg (London, New York, 1956), and an account of the early part of his career in Marjorie Bowen, [pseud.], *William, Prince of Orange, 1650–1673* (London, New York, 1928). The best biography in Dutch is N. Japikse, *Prins Willem III. de Stadhouder-Konine.* 2 vol. (Amsterdam, 1930–33). (A. Bc.)

WILLIAM **IV.** (1765–1837), king of England, third son of George III., was born at Buckingham Palace on Aug. 21, 1765. In 1779 he was sent to sea and became a midshipman under Admiral Digby. Next year he sailed under Rodney and took part in the action off Cape St. Vincent (Jan. 16, 1780). During the rest of the war the young prince sa plenty of service, for which he had a strong liking, and so laid the foundation of his popularity. On the conclusion of the war he travelled in Germany, visiting Hanover and Berlin, where he was entertained by Frederick the Great. In 1785 he passed for lieutenant; next year he was made captain and stationed in the West Indies.

In 1789 he mas made duke of Clarence. When war was declared against the French republic in 1793, he could obtain no command. He amused or revenged himself by joining the prince of Wales and the duke of York in their opposition to the king. He took his seat in the House of Lords, where he defended the extravagances of the prince of Wales, spoke on the Divorce Bill, and vehemently opposed the emancipation of slaves. Meanwhile he formed a connection with Mrs. Jordan, the actress, with whom he lived on terms of mutual affection and fidelity for nearly twenty years. The death of Princess Charlotte in 1817 compelled him to break with Mrs. Jordan, and to marry (1818) Adelaide of Saxe-Meiningen, who obtained great influence over her husband. On the death of the duke of York in 1827 the duke of Clarence became heir to the throne, and in the same year he was appointed lord high admiral. He endeavoured to assume independent control of naval affairs. although his patent precluded him from acting without the advice of two members of his council. This involved him in a quarrel with Sir George Cockburn, in which he had to give way. As he still continued to act in defiance of rules, the king was at length obliged to call upon him to resign.

On June 26, 1830, the death of George IV. placed him on the throne. During the first two years of his reign England underwent an agitation more violent than any from which it had suffered since 1688. William IV. was well-meaning and conscientious; but his timidity and irresolution drove ministers to despair, while his anxiety to avoid extremes and his want of insight into affairs prolonged a dangerous crisis and brought the country to the verge of revolution. The July revolution in France gave a great impulse to the reform movement in England. Within a fortnight of the opening of parliament the Tory ministry were beaten on a motion for the reform of the civil list, and resigned. Lord Grey undertook to form a ministry, with the avowed intention of bringing in a large measure of reform. This was not in itself displeasing to the king, who had liberal tendencies, and a few years before had supported Catholic emancipation. But when the government were beaten in committee, and offered to resign, the king declined to accept their resignation, but at the same time was unwilling to dissolve. He was only forced to it (April 1831) by the action of the opposition. After a protracted political crisis (*see* GREY, CHARLES GREY, 2nd earl) the king was compelled to consent to create a sufficient number of new peers to carry the Second Reform bill, and the threat was successful in bringing about the passing of the act in 1832.

During the rest of his reign William IV. had not much opportunity of active political interference, but on one other occasion he made an unjustifiable use of his prerogative. This was in Nov. 1834 when he suddenly dismissed the Melbourne ministry on a mere pretext, but in reality because he disapproved of their Irish Church policy, and summoned Sir Robert Peel. The formation of the Peel ministry was immediately followed by a dissolution, and, beaten on Lord John Russell's motion respecting the Irish Church (3rd of April, 1835), Peel resigned and Melbourne again came into power. Under him the Whigs retained the lead during the remainder of the reign. This *coup d'ktat* of Nov. 1834 was the last occasion on which an English sovereign attempted to impose an unpopular ministry on the majority in parliament.

In May 1837 the king began to show signs of debility, and died from an affection of the heart on June 20, leaving behind him the memory of a genial, frank, warm-hearted man, but a blundering, though well-intentioned prince. He was succeeded by his niece Queen Victoria.

WILLIAM I. (1797–1888), king of Prussia and German emperor, second son of Frederick William III. of Prussia and Louise, a princess of Mecklenburg-Strelitz, was born at Berlin on March 22, 1797, and received the names of Wilhelm Friedrich Ludwig. After the battle of Jena he spent three years at Konigsberg and Memel. On Jan. 1, 1807 he received an officer's patent, and on Oct. 30, 1813 was appointed a captain. William accompanied his father in the campaign of 1814, and early in 1815, received the iron cross for personal bravery shown at Bar-sur-Aube. He took part in the entry into Paris on March 31, 1814, and afterwards visited London, He joined the Prussian army in the final campaign of the Napoleonic wars, and again entered Paris. He was made a colonel and member of the permanent military commission at 20, a major-general at 21, and commander of a division in 1820. During the following nine years he mastered the Prussian military system and studied closely those of the other European States. In 1825 he was promoted lieutenant-general, and commander of the corps of guards. On June 11, 1829 he married Augusta (d. Jan. 1, 1890), daughter of Charles Frederick, grand duke of Saxe-Weimar, a lady of liberal tendencies and Catholic sympathies, whose considerable influence at court was generally exerted against that of Bismarck. By this lady William had two children: the crown prince Frederick William (b. 1831) who succeeded him as Frederick III. (*q.v.*) and the Princess Louise (b. 1838) who in 1850 married the grand duke of Baden.

On the death of his father in 1840—the new king, Frederick William IV., being childless—Prince William, as heir presumptive to the throne, received the title of prince of Prussia. He was also made lieutenant-governor of Pomerania and appointed a general of infantry. In politics he was decidedly conservative. On the outbreak of the revolution of 1848 he saw that some concessions were necessary, but urged that order should first be restored. Generally held responsible for the bloodshed in Berlin on March 18 (and hence nicknamed the "Cartridge Prince," although actually no longer in command of the guards), William was so hated for his supposed reactionary views that the king entreated him to leave the country for some time. He went to London, where he formed intimate personal relations with the leading English statesmen. Returning to Berlin, on June 8 he took his seat in the Prussian national assembly, and spoke expressing belief in constitutional principles. In 1849 he conducted the army which crushed the revolutionary movement in Baden. At the beginning of the campaign an unsuccessful attempt was made on his life. In Oct. 1849 he was appointed military governor of the Rhineland and Westphalia. In 1854 he was promoted field-marshal and made governor of the fortress of Mainz. On Oct. 7, 1858 he became regent for his brother, succeeding him on Jan. 2, 1861.

Political events of William's regency and reign are told elsewhere. (See GERMANY: The Growth *of Prussia.*) William was not a ruler of the intellectual type of Frederick the Great; but he believed in the "God of battles" and in his divine right as the viceregent of God so conceived. He believed also in the ultimate union of Germany and in the destiny of Prussia as its instrument; and held that whoever aspired to rule Germany must seize it for himself. But an attitude so alien to the Liberal temper of contemporary Germany was tempered by shrewd common sense, and wisdom in his choice of advisers. Thus as regent he called the Liberals into office on Bismarck's advice, though later he did not hesitate to override the Constitution when parliament refused supplies for the new armaments. From Sept. 1862, when Bismarck took office as minister president, William's personality tends to be obscured by that of his masterful servant. Yet he was no cipher. His prejudices, indeed, were apt to run athwart the minister's plans; as in the Schleswig-Holstein question, when the king's conscience regarding the claims of the Augustenburg prince threatened to wreck Bismarck's combinations. But, as Bismarck put it, the annexation of the duchies gave him "a taste for conquest," and in the campaign of 1866 the difficulty was to restrain the king, who wished to enter Vienna in triumph.

In 1870–71 again it was Bismarck and not the king that gave the determining impulse. King William's attitude was strictly correct; and the excitement which it aroused in France was due to Bismarck's editing of the Ems telegram. On the French declaration of war all Germany rallied round the king of Prussia, and when, on July 31, he quitted Berlin to join his army, he knew that he had the support of a united nation. It was during the siege of Paris, at his headquarters in Versailles, that he was proclaimed German emperor (Jan. 18, 1871). On March 21, he opened the first imperial parliament of Germany; on June 16, he entered Berlin at the head of his troops.

After that period the emperor left the destinies of Germany almost entirely in the hands of Bismarck. In his personal history the most notable events were two attempts upon his life in 1878, on the second of which he was seriously wounded. Until within a few days of his death the emperor's health was remarkably robust; he died at Berlin, March 9, 1888.

William I.'s military writings were published in 2 vols. at Berlin in 1897. Of his letters and speeches several collections have appeared: *Politische Korrespondenz Kaiser Wilhelms I.* (1890); *Kaiser Wilhelms des Grossen Briefe, Reden und Schriften* (2 vols., 1905), and his correspondence with Bismarck (ed. Penzler, Leipzig, 1900). A large number of biographies have appeared in German, of which may be mentioned L. Schneider's *Aus dem Leben Kaiser Wilhelms* (3 vols., 1888; Fr. trans., 1888); Oncken, *Das Zeitalter Kaiser Wilhelms* (2 vols., 1890–92); F. Delbrück, *Die Jugend des Königs Friedrich Wilhelm IV. von Preussen und des Kaisers u. Königs Wilhelm I., Tagebuckblatter* (1907); *E.* Marcks, *Kaiser Wilhelm I.* (Leipzig, 1897; 5th ed. 1905). In English have appeared *William of Germany*, by Archibald Forbes (1888), a translation of Edouard Simon's *The Emperor William and his Reign* (2 vols., 1886). *See* also GERMANY.

WILLIAM II. (1859–1941), German emperor, was born on Jan. 27, 1859, eldest son of Prince Frederick William of Prussia and Princess Victoria of England. Even as a young prince he had to feel the conflict of opinions then swaying Germany. His mother always remained at heart a foreigner there; deeply convinced of the excellence of English institutions, she regarded her new home as a backward country; in particular, she always looked on her father-in-law's minister, Bismarck, as a personal antagonist—a view which he returned with interest. Clever, but imperious and essentially cold, Princess Victoria was never able to win the heart of her son. The Crown Prince Frederick William had grown up in an age when the ideas of liberalism had become general among the educated classes of Germany, and was himself deeply influenced by them. He was often accused of lacking initiative, and despite occasional revolts, of being too much influenced by his wife's stronger will. As a soldier he did his duty in the great wars of 1866 and 1870, and, with the assistance of expert advisers, won great successes on the battle-field; but he was never primarily a soldier. His diaries show a wide range of interests, but little serious occupation with any one definite subject. His whole nature and views seemed un-Prussian to the old Emperor William I. and his circle. He was kept wholly outside official business, and thus up to the 60th year of his life he was obliged to stand beside the throne in the part of a critic without influence.

Education and Character.—His eldest son grew up in a different spiritual atmosphere. The great victories over Austria and France, the foundation of a new German empire and the winning of the German Crown by the Hohenzollerns were the dominating impressions of his boyhood years. He shared the enthusiasm felt by his generation for Bismarck and for the glorious German army. Thus from an early age he was really at variance with the spirit reigning in his parents' house. His father and mother wished to train him in other ways by giving him a middle-class education, quite contrary to the traditions of the Hohenzollern dynasty. They sent him to the gymnasium in Kassel. But although nominally a student like all the rest, yet for teachers and comrades alike he still remained always the prince and future emperor. None the less, these school years had an important effect on his intellectual development; all the solid knowledge he ever had was acquired in this period. He always retained a great devotion and respect for Professor Hinzpeter, the head of the Kassel gymnasium. In Jan. 1877 the young prince passed his final examination in Kassel. He was then sent for six months to serve in the first regiment of Guards, and afterwards to the University of Bonn, where he studied constitutional law and political economy. He passed two years at Bonn, but here again failed to come into really close contact either with his teachers or with the students.

After the autumn of 1879 military training definitely took the first place; the prince spent the next years chiefly in Potsdam, and although he was introduced by the chief president of the Province of Brandenburg into the secrets of civil administration, this was only a secondary occupation. His years with the corps in Potsdam again brought him into touch almost exclusively with the views predominant among Prussian nobles and corps of officers. The veneratior paid him here suited his wilful and imperious nature better than the spirit of the middle class school or of his parents' house. Sustained work was never demanded of him, and consequently he never learnt to perform it. In Feb. 1881 he married Princess Augusta Victoria of Schleswig Holstein-Augustenburg. daughter of the Prince Frederick who in 1864 had crossed Bismarck's plans by aspiring to the throne of Schleswig-Holstein. The prince had been for long a personal friend of the Crown Prince Frederick William. The old emperor and Bismarck approved of this marriage, as tending to bring about a reconciliation with those elements in Schleswig-Holstein which still maintained the rights of the Augustenburgs. The young princess had been brought up very simply and piously; she had no great intellectual powers. Six sons and a daughter were born of the marriage Prince William had come little before the eyes of the public, when his father's sudden death on June 15, 1888, brought him to the throne.

The new emperor was certainly a man of intellectual gifts above the average. He had a quick apprehension which enabled him to form in a short time a general view of matters which interested him, but which also seduced him into satisfying himself with these quick, superficial impressions and thinking it unnecessary to penetrate more deeply into the heart of a problem. He also possessed an extraordinarily happy turn of speech, equally effective in intimate conversation and in dealing with large audiences. His oratorical gifts, often, indeed, led him, particularly when he was speaking in public, into saying more than he really meant. He often found himself carried away, by his own inner excitement and by the admiring astonishment of his listeners, into ill-considered remarks afterwards turned against him on the battle-ground of politics. He was most profoundly persuaded of the importance of his imperial office, and of his duty to maintain his authority as monarch. Never doubting that the monarchy was a divine institution, he believed firmly that God, who had set him in this place, would also show him the right way in the exercise of his sovereign duties.

In a letter to Bismarck written two years before his death, William's father had complained of his eldest son's immaturity and inexperience, which was coupled with an inclination to over-estimate his own powers. This was, indeed, a just criticism of very important traits in William's character. He was unready and unripe in mind when he ascended the throne at the age of twenty-nine. He never attained that spiritual maturity which comes only through heartfelt co-operation in great tasks and earnest consideration of the problems of the world and of life. His personality lacked the solid background of a definite philosophy of life; thus he always remained dependent on the impressions of his immediate surroundings and on the influences of those persons who knew how to win his ear and flatter his vanity. Nor had he any definite religious convictions which might have given him this inner firmness; for although he believed in the basic dogmas of Christianity, yet he was as strongly affected by the confusing influence of the modern technical and intellectual culture and really never knew at heart how far he could give way to it without violating the traditional religious beliefs so essential for his monarchic sentiments.

He has often been compared with Frederick William IV., and there were certainly many points of resemblance between him and his great-uncle; but the deep difference between them lay in the fact that Frederick William's whole nature was rooted in a definite philosophy of the world which always turned the scale at the critical moments of his life, despite all wavering in points of detail, while this firm basis was lacking in William II. Consequently he was never free from a feeling of inner uncertainty, which he tried to hide from the outward world under a pompous manner and by big words. As soon as he showed himself in public he put on the mask of the emperor. When he laid it aside there remained a man of fine talents, but of moderate education and weak character, vain and wilful through excess of self-consciousness, who felt himself most at home in amusements of a very common sort, and liked to surround himself with subservient people who suffered his not always tactful jokes with becoming respect. A great and increasing part of his time was taken up with journeys, with official appearances, with parades and shows, while real work receded more and more into the background.

When he became emperor he knew very little of the details of foreign policy. He had only a few definite principles, to which he always remained true. First among these came the maintenance of his own monarchic status at home and of Germany's international position. This in his opinion required not only a strong army, which Germany already possessed, but also a strong fleet, which he set about forming. The big increase of military forces was intended not only to enable Germany to defend herself against possible attack, but also to increase her prestige and to ensure her her share in the partition of the world's territories which was proceeding rapidly. He believed that the likelihood of ever having to make serious use of these armaments would decrease in inverse proportion to the strength of them. He never had any warlike intentions or ambitions; he certainly always felt at heart that he was lacking in the military gifts requisite for command in a great modern war. On the other hand, he felt that his duty to himself as monarch forbade him to leave the control to others.

William's Relations with his Ministers.—When the new emperor mounted the throne, Bismarck was still in charge. While still a prince, William had often assured him of his admiration, although there had, indeed, already been several small disagreements, the story of which Bismarck has told in the third volume of his *Gedanken und Erinnerungen.* But it was in any case hardly likely that a young man of so lively a temperament and so keen an ambition to bring affairs under his personal control could agree for long with a minister who had conducted the Government according to his own principles for a generation, and who was not inclined to subordinate himself to the wishes of a young and inexperienced monarch. Bismarck felt from the first that in the personality of the emperor were inherent grave dangers for Germany's peaceful development and for the settlement of her international relations, and thought himself bound to confine the emperor's influence on policy within the narrowest limits possible. In these circumstances a collision was inevitable, and the occasion which finally led to the split was of comparatively minor importance. The repeated great strikes in the Rhenish Westphalian coal fields had inclined the emperor to listen to the counsels of his former teacher, Hinzpeter, who urged that his duty was to meet the wishes of the workmen half way and to remove their discontent by a wide measure of social reiorm. He demanded suddenly an announcement of such measures on the occasion of his coming birthday.

The friction began when Bismarck, in view of the great importance of such a proclamation, demanded close scrutiny and preparation in detail. It was increased by differences of opinion with regard to the prolongation of the state of emergency against the Social Democrats, and led to personal conflicts of increasing violence. Bismarck had undoubtedly determined to remain in office even against the emperor's will, and attempted to persuade the other ministers to declare themselves one with him. At last, on the strength of a cabinet order of 1850, he forbade the individual ministers to report to the emperor except in his presence; the emperor saw in this an attempt to eliminate his influence and demanded that this cabinet order be revoked. Bismarck refused to give the order, and the emperor then sent word that he expected the chancellor to tender his resignation. This Bismarck did on March 18, 1890, and it was immediately accepted by the emperor.

After Bismarck's dismissal the emperor announced that the course of the ship of State was to remain the same, even though the steersman had been changed. He proposed to take over command of the ship himself, and called to the leading posts men wholly unacquainted with the duties which they were to assume, in order to secure himself from supervision by experts. General von Caprivi became imperial chancellor and Freiherr von Marschall, a former lawyer, secretary of State for foreign affairs. Such men were meant only to be channels for executing William's will. Indeed, the emperor believed up to the end of his reign that he himself was the real guiding force of all German policy. If, however, we consider more closely the system of government which developed after Bismarck's dismissal, we find that the emperor's influence was not nearly so great as most of his contemporaries assumed. The right which he enjoyed of nominating at his personal discretion the imperial chancellor, the secretaries of State and the Prussian ministers naturally gave him great influence.

Yet the emperor could not lay down a consistent line of policy, if only for the reason that he himself possessed no solid views, based on definite convictions, in the main questions, and that he had neither the will nor the perseverance to help with hard, sustained work on the big issues. This was apparent even in foreign affairs, which attracted his chief interest. The emperor read a great part of the despatches from the ministers abroad and added notes to them, mostly expressing his views at the moment, but seldom containing real political directions. Reports were rendered to him verbally or in writing on important questions and his decisions were put away in the files. He also often had political conversations with the representatives of foreign powers and made a rule of reporting all these in detail to the Foreign Office. When he was travelling, which was often the case, he was accompanied by a member of the diplomatic service who saw to communications between him and the Foreign Office.

Very often, and particularly in important questions, he let himself be persuaded by his ministers into decisions altogether contrary to his own views. For example, immediately after Bismarck's dismissal, he allowed Caprivi and Holstein tc dissuade him from renewing the re-insurance treaty with Russia, although he personally wished, and had, indeed, already consented to renew it. Later he always disapproved at heart of Holstein's and Biilow's policy in Morocco, but allowed himself time and again to be persuaded into approving of the measures proposed by his advisers. On the whole, William II. did not so much exercise a real, lasting control, as produce confusion by sudden and impulsive interierence.

In foreign policy, after Bismarck's dismissal, as the new chancellor and the new secretary of State had absolutely no experience in this field, the actual control fell into the hands of Baron von Holstein, chief of the political department in the Foreign Office, a mistrustful and misanthropic eccentric who shrank from any sort of public appearance, never reported to the emperor or appeared in parliament, but provided the ministers with his information from the seclusion of his office. He always regarded the emperor's personality and inclination to personal interference with the greatest mistrust. When the chancellor and secretary of State, out of loyalty to their sovereign—a feeling very little developed in Holstein—put up too weak an opposition to the emperor, he tried by every kind of intrigue to egg them on or else to turn them out, and had them attacked in the press with which he was connected. Consequently during the decade after Bismarck's dismissal there was a continual feeling of crisis which might at any moment have led to grave conflicts.

The events of William II.'s reign will be found elsewhere. (*See* GERMANY.) Here we can only attempt to indicate the emperor's personal share in the most important decisions of this time, beginning with foreign policy.

Foreign Policy.—Although the non-renewal of the re-insurance treaty was contrary to the emperor's wish, the *rapprochement* with England which began with the conclusion of the Heligoland treaty, undoubtedly accorded at the time with his personal wishes. He was anxious to create a counterpoise to the pressure of the incipient Franco-Russian *rapprochement* by strengthening relations between the Triple Alliance and England. But he very soon experienced bitter disappointments; the interests of Germany and England clashed violently in Africa, and England, after the outbreak of the Chinese-Japanese War (1894) followed the opposite policy to Germany in the Far East. Germany's intervention in this struggle against Japan and on the side of France and Russia was essentially the work of Baron von Holstein. The emperor had at first shown great personal sympathies for the military efficiency of Japan, but skilful working on his Christian sentiments and his fear of the "yellow peril," persuaded him to fall in with Holstein's advice; especially as this coincided with his personal ambition to seize the occasion to secure for Germany a naval base in the Far East. He then promised the tsar of Russia support if the latter's Far Eastern policy led him into difficulties, the tsar, in return, consenting on Russia's behalf to Germany's occupying a Chinese port.

After these events had brought about a coldness between Germany and England, the emperor devoted his chief attention to strengthening the German war fleet, in which he had always felt a strong personal interest. He used every opportunity, public and private, to advocate this move, because he was convinced that Germany would only be able to follow a policy independent from England if she was covered against attack from the sea by a strong navy of her own. Throughout his entire reign, the expansion of German sea power remained one of the unaltered principles of his policy; from 1897 on he found in Admiral von Tirpitz, the secretary of State for naval affairs, an enthusiastic assistant in these plans, who was capable of giving them practical form and of defending them against statesmen and parliament.

If the emperor's naval policy already showed a deep mistrust of England, this was intensified by British policy towards the Boers. When Jameson made his raid into the Transvaal in 1896, the emperor seriously thought of breaking off diplomatic relations with the British Government if it countenanced Jameson's conduct. He even planned a military intervention in favour of the Boers; his advisers only restrained him from doing so, with difficulty, by proposing instead the despatch of the notorious telegram to President Kruger. The growing tension of relations with England made the emperor increasingly ready to adopt the idea, originally put forward by Holstein and afterwards also repeatedly advocated by Biilow, of seeking *rapprochement* with France via St. Petersburg (Leningrad) in order to create a counterpoise to the threatening increase of British power through an alliance of all the great European continental States, the so-called Continental Alliance. It may, however, be doubted whether all these efforts were not only meant to serve to bring England to change her policy and enter into closer relations with Germany. For the emperor always retained a lively sympathy for England, which was expressed in particularly vivid fashion in the reports which he sent to the German Foreign Office on his frequent'visits to that country. On the other hand, he also felt himself attracted to Russia by old family traditions and by the consciousness of common monarchic interests, and probably never really made up his own mind which of these two countries would prove the more valuable ally for Germany. Holstein and Biilow, who thought Germany would do best to bind herself to neither of these two Powers, but to sell her support to the one or the other, as the case arose, for concrete concessions, took advantage of the emperor's uncertainty to restrain him from entering into any binding engagements on one side or the other. Biilow flattered his vanity by representing to him that he would then become the arbiter of the world. Nevertheless, when England began in the spring of 1898, at Chamberlain's instigation, to sound Germany regarding a German-English alliance, William II. showed a real inclination to accept this offer, and all his advisers' cunning and precautions were needed to keep him in the path which they considered desirable.

After the failure of these negotiations, when England first drew closer to France and Russia and the path was cleared for the Entente, Berlin began to grow apprehensive. Holstein and Biilow thought it their duty to show the world, in the Morocco question, that France and England were not to be allowed to dictate the partition of the world's remaining colonial territories without reference to Germany, especially as Russia was at the time completely immobilized by her severe struggle with Japan. The emperor, whose personal view it was that German interests in Morocco were not large enough to justify such an attitude, and who only a short while previously had told the king of Spain that Germany demanded nothing for herself in Morocco, was utterly opposed to such interference. Biilow needed all his art of persuasion to persuade him to land in Tangier on his Mediterranean voyage in March 1905. Up to the last moment he hesitated whether to do this. Here he certainly showed more political wisdom than his advisers, but once again he was too weak to carry his point against them. The result of Germany's action here was not only to make her relations with France more strained, but also to confirm the Franco-British entente. It is well-known that the agreements between these two Powers for military and naval co-operation in case of war were a result of the Morocco crisis.

Another reason why the emperor viewed the increasing tension of Franco-German relations with alarm was because, after the failure of the negotiations for an alliance with England, he had resumed with new zest the idea of a Continental Alliance. Biilow prevented him from intervening during the delicate negotiations with Paris on the preparations for the Algeciras conference, but only by concealing from him altogether the offer made by Rouvier, the French minister-president, for a general understanding with Germany. He consented, however, that the emperor should take advantage of his meeting with the tsar in Finland to conclude with him a treaty, to which France should afterwards be asked to adhere. The emperor in fact succeeded at the meeting in Bjorko (July 23, 190j) in persuading the tsar Nicholas to sign an offensive and defensive alliance. He believed that he had won a great success, and wrote to Biilow that the meeting had been a turning point in the history of the world. This, however, soon proved to be a complete error; when the tsar returned to St. Petersburg his ministers persuaded him to demand a revision of the treaty, as in its existing form it was irreconcilable with the provisions of the Franco-Russian treaty. As the alterations proposed by Russia would have deprived the treaty of its whole value for Germany, it was thought best to drop the whole affair and the Björkö treaty was buried for good and all.

Germany's situation now grew increasingly dangerous; Russia's adhesion to the Franco-British entente (1907) was followed by growing tension between Germany and England, due principally to the fears aroused in England by the German naval programme. Various early attempts by England to reach an understanding with Germany on the naval armaments of the two Powers broke down because the emperor, in agreement with Admiral von Tirpitz, maintained that any engagement of this sort was dishonourable to Germany. On this point Biilow disagreed with the emperor. He would willingly have negotiated with England on a limitation of armaments; but when King Edward visited Friedrichshof in Aug. 1908, the emperor told the British official, Hardinge, most abruptly, that he would not agree to any negotiations of the sort, and Bulow thought it better not to press his own view any further at present, hoping to be able to convert the emperor gradually. In the autumn of 1907 the emperor visited England, and made remarks which, in his opinion, were calculated to remove the apprehension aroused in England by the German naval programme. Soon after, these remarks were published as an interview with the *Daily Telegraph*, but produced exactly the opposite effect to that which had been intended. They were looked on in England as an attempt by a foreign monarch to interfere in England's private affairs. In Germany also the publication evoked lively disapproval and led to a question in the Reichstag and to an excited debate on the emperor's personal conduct of affairs. The emperor was obliged to make a declaration (Oct. 31, 1908), that he would in the future undertake no political step of importance without the chancellor's advice.

The first conflict between the Triple Alliance and the Entente arose over Austria's annexation of Bosnia in the autumn of 1908, in consequence of the Young Turk revolution. Serbia protested against the annexation, and as Russia supported her, a severe crisis broke out. Here again the emperor and Bulow differed. The emperor was shocked by Austria's action, which she had taken without previously informing Germany. He accused Vienna of duplicity and said that he personally felt himself most deeply wounded in his sentiments as an ally. Biilow, however, fearing that Germany would lose her last reliable ally, thought it right to support Austria at all costs.

Soon afterwards, Bulow, having been defeated in the Reichstag on the question of financial reform, again offered his resignation, which was this time immediately accepted by the emperor. The chancellor had long enjoyed his particular favour; but their relations had become increasingly unhappy for some time past. This was due partly to differences on points of policy, but even more to the emperor's feeling that Biilow had deceived him and left him in the lurch over the *Daily Telegraph* affair. Bethmann-Hollweg was now appointed imperial chancellor; but the emperor never really trusted him. Bethmann-Hollweg's earlier career had been passed in the internal administrative service and he himself realized his own lack of experience in foreign affairs; he therefore insisted on the appointment of Kiderlen-Wachter, formerly minister in Bucharest, as secretary of State. Kiderlen-Wachter enjoyed a reputation for unusual skill and energy, but more than ten years previously he had incurred the emperor's personal dislike in a private matter. He was primarily responsible for the new collision with France which arose in 1911 when the French began to bring Morocco under their rule altogether. Here again the emperor was against letting a fresh quarrel between Germany and France arise over Morocco. At his instigation, a treaty with France had been concluded in Feb. 1909, while Biilow was still in office, allowing France an exceptional position in Morocco. Kiderlen, however, believed that France would be prepared to cede the French Congo wholly or in part to Germany in return for a free hand in Morocco; he succeeded in making the emperor believe that this could be reached at the cost of a little pressure. Here again William yielded against his own better judgment to pressure from his advisers and agreed to the despatch of the "Panther," a small ship of war, to the Moroccan coast. Kiderlen did, indeed, obtain some of his demands, but the resentment in France now grew increasingly serious, and Germany's relations with England, who felt herself particularly pledged to support France over Morocco, deteriorated correspondingly.

Nevertheless one more opportunity for a German-English *rapprochement* seemed to offer itself, when the peace of Europe was dangerously threatened by the outbreak of the Balkan Wars. Relations seemed to have become really happy when Lord Haldane, the British War Minister, visited Berlin in Feb. 1912 on an official mission, and held personal conversations with the emperor, Tirpitz and Bethmann-Hollweg. The emperor in his sanguine fashion believed that his interview with Haldane had resulted in a complete understanding, but failed to see that the limitation of Germany's naval armament was still the British *sine* qua *non;* whereas he himself and Tirpitz were just engaged in drafting a new bill for increasing the rate of naval construction. This attempted *rapprochement* thus led to renewed coolness.

When the murder of the heir to the Austrian throne precipitated a crisis which led to the World War, the emperor was determined from the start to help Austria to get satisfaction from Serbia. Real difficulties could only arise if Russia took Serbia's part. The emperor, however, reckoned firmly on the community of monarchical interests, which he believed would prevent the tsar from coming forward as protector to the murderers of a prince. He failed to see that the final decision in Russia did not really lie with the weak tsar at all. The emperor himself did not at first imagine that any danger of war could arise. He started off on his Baltic cruise, without making any preparations; the alleged "Crown council" in Potsdam never took place. He did not return till after the Austrian Note to Belgrade had already been delivered; and he personally thought the Serbian answer quite fitting to form a basis for future negotiations. He disapproved when, despite this answer, Austria mobilized and declared war on Serbia, and he undoubtedly approved of Bethmann-Hollweg's eleventh-hour attempt to persuade the Austrians to hold their hand and to negotiate directly with Russia. He also sent a number of personal telegrams to the tsar Nicholas to try to restrain him from the mobilization which finally led to the outbreak of the war, and to offer him his mediation. All these endeavours to maintain peace proved, however, unsuccessful. The idea that the emperor wished for a war in order to found a German world empire, or to make any conquests at all, though widely current during the war, is, in the opinion of the writer, incorrect.

Interference in Internal Policy.—The emperor's interventions in German internal policy were also irregular. The first occasion was when he called on Bismarck to proclaim a far-reaching social and political reform. Only a small fraction of this was carried out during the first years of his reign. As these measures had not the desired effect of winning the mass of the workers from Social Democracy, a feeling of disappointment overcame the emperor. He always looked upon Social Democracy, which was republican on principle, as the irreconcilable enemy of the whole existing order, and particularly of the monarchy, and held it to be his duty to fight against it with all the means in his power. The murder of the French president, Carnot, seemed to him to be a sign of the increasing effect of international social propaganda, and after the autumn of 1894 he pleaded repeatedly in his speeches that the revolutionary movement must be fought, and called on his ministers to bring in fresh emergency legislation penalizing all attempts to overthrow the social order and any agitation in favour of class hatred with penal servitude. It was the differences which this bill evoked among the emperor's advisers that led to the dismissal of Caprivi in Oct. 1894 and the appointment of Prince Hohenlohe as imperial chancellor. Hohenlohe brought in a bill, which was rejected by the Reichstag in May 1895. The emperor, however, returned again and again to the idea but was never able to carry it through.

Another matter which caused him anxiety was the increasing influence of the Centre Party in the Reichstag and in the Prussian diet. Himself a Protestant, he resented the growing power of the Catholic elements. He intervened personally when the Centre allied itself with the Conservatives and attempted to pass a primary education act for Prussia, which would have increased the influence of the Church in the schools to an extraordinary degree. Being hostile both to Social Democracy and to the Centre party, the emperor naturally looked with sympathy on the idea of for ing a working majority in parliament by a coalition between the Conservative and Liberal parties. Prince Biilow, who had become Imperial Chancellor in 1899, attempted to put this idea into practice, his own feelings agreeing here with the emperor's. The elections of Jan. 1907, which brought the so-called "Bloc Parties" a considerable majority, seemed to the emperor to be a personal victory for himself. Bulow's inability to form a permanent coalition between the Bloc Parties, and to carry through the urgent financial reform by their help, seemed to the emperor a proof that the chancellor was incapable of carrying through his principles in domestic policy and strengthened him in his decision to accept his resignation.

The emperor did not openly rebel against the constitutional form of government which he found on his accession, since he saw the impossibility of altering it, but at heart he always disliked it, and his dislike increased in proportion to the numerical growth of Social Democracy and of the Centre in the parliaments. He looked on parliament as a necessary evil, and always considered the monarch to be the true vessel of sovereign power, appointed thereto by God. The opposition raised by the Reichstag to the emergency legislation which he desired, and the difficulties which had to be overcome over every increase of the army or the fleet led him on many occasions into bitter remarks about the people's representative. The emperor never had any new and constructive ideas on matters of domestic policy.

The World War.--On the outbreak of the World War, the emperor himself felt his own inability to take over the supreme command of the military operations. During the first years of the war an appearance was kept up of referring the last decisions to the imperial headquarters; but William was increasingly reduced to the position of a mere onlooker. The choice of leaders lay, indeed, in his hand, and here he did not always show the best judgment. He only agreed with reluctance, and under the pressure of emergency, to make Hindenburg commander-in-chief and to leave the real decisions to him and Ludendorff. The inaction of the German fleet during the first years of the war is also to be attributed to the emperor's personal wish, and involved him in a sharp difference with Admiral von Tirpitz.

After Aug. 1918 it became ever clearer that the existing situation was growing untenable; and now the emperor proved himself once again incapable of a firm decision. He was driven forward step by step by events and by individual advisers who managed to win his ear. A Crown Council under his presidency resolved to initiate peace negotiations; yet he allowed so much time to be wasted before this decision was executed, that in the meantime the military situation took a turn fatal for Germany. At the same time the signs of discontent in the population and in parliament increased, and he let himself be persuaded to appoint Prince Max of Baden imperial chancellor in Oct. 1918, although the prince was looked on as an advocate of the parliamentary methods which the emperor hated in his heart. After this, when President Wilson in his proclamations showed clearly that he considered the person of the emperor to be a real obstacle to the conclusion of peace, Prince Max, in agreement with the majority of the Reichstag, called upon the emperor to abdicate, a step which was not at first thought to involve the removal of the Hohenzollern dynasty. The outbreak of the revolution at the beginning of Nov. 1918 and its rapid growth made an immediate decision urgently necessary. As the emperor hesitated, Prince Max acted on his own authority, and on Nov. 9, proclaimed that the emperor would renounce the throne and the crown prince the succession, and that a regency was to be formed. The victorious Socialist party, however, was no longer satisfied with these concessions but proclaimed a republic.

The emperor, who was at that time on the western front, was now confronted with a very difficult decision. He might have ventured an attempt to overthrow the revolution by force by detaching a portion of the army on the western front, whose loyalty to the sovereign was not yet shaken. It was, however, doubtful whether the remainder of this army would be able, meanwhile, to defend Germany's western frontiers against the increasingly violent attacks of the enemy. Or again. he might have placed himself at the head of his army and sought death on the field of battle. Both these mere courses which only a strong and confident personality could have taken. William II. preferred to abandon the army, steal quietly away from the territory of his former empire, and escape to Holland on Nov. 10. His action dealt a fatal blow to the monarchist cause in Germany. The minor princes now saw no issue but to capitulate and to abdicate before the revolution.

On arrival in neutral Holland, William was interned. The castle of Doorn was given him as a residence and he lived henceforth in complete retirement from the world. During the peace negotiations the idea arose from time to time among Germany's enemies of demanding his extradition and punishing him for initiating the war, of which he was unjustly accused. Finally, however, this idea was abandoned. The most important change in William's circumstances during these last years was his second marriage, after the death of the Empress Augusta Victoria, with the widowed Princess Hermine of Schonaich-Carolath. He died at Doorn June 4, 1941 and was buried there. A military funeral was ordered by Adolf Hitler. (E. BRA.)

WILLIAM I. (1772–1844), king of the Netherlands, born at The Hague on Aug. 24, 1772, was the son of William V., prince of Orange and hereditary stadtholder of the United Netherlands by Sophia Wilhelmina, princess of Prussia. In 1791 he married Frederica Wilhelmina, daughter of Frederick William II., king of Prussia. thus cementing very closely the relations between the houses of Orange-Nassau and Hohenzollern. After the outbreak of war with the French republic in 1793, he distinguished himself in the struggle against the revolutionary army under Dumouriez by the capture of Landrecies and the relief of Charleroi. By the victories of Pichegru the stadtholder and all his family were, however, compelled to leave Holland and seek refuge in England, where the palace of Hampton Court was set apart for their use. He afterwards made Berlin his residence. and took an active part in the unfortunate campaign under the duke of York for the reconquest of the Netherlands. After the peace of Amiens he had an interview with Napoleon at Paris, and received some territory adjoining the hereditary domains of the house of Nassau in Westphalia as a compensation for the abandonment of the stadtholderate and the domains of his house William refused, however. in 1806, in which year by the death of his father he became prince of Orange, to separate his interests from those of his Prussian relatives, and fought bravely at Jena. He was therefore despoiled by Napoleon of all his possessions. In 1809 he accepted a command in the Austrian army under the archduke Charles and was wounded at the battle of Wagram. When Holland rose in revolt against French domination in 1813, after eighteen years of exile he landed at Scheveningen (on Nov. 19) and was on Dec. 3. proclaimed prince sovereign of the Netherlands. His assumption in 1814 of the title of king of the Netherlands was recognized by the Powers, and by the Treaty of Paris his sovereignty was extended over the southern as well as the northern Netherlands, Belgium being added to Holland "as an increase of territory." After the battle of Waterloo, in which Dutch and Belgian troops fought side by side under his command, the congress of Vienna further aggrandized him by making him sovereign of the territory of Luxembourg with the title of grand duke.

William failed to realise that religious, racial and other differences made the union of the Netherlands and Belgium difficult. He drew up a constitution, which was accepted unanimously by the Dutch, but was rejected by the Belgians, because it contained provisions for liberty of worship. The king, however, by a subterfuge declared that the fundamental law had been approved. The new constitution, therefore, started badly, and it was soon evident that William intended to make his will prevail, and to carry out his projects for what he conceived the social, industrial and educational welfare of the kingdom regardless of the opposition of Belgian public opinion. For the discontent which culminated in the revolt of 1830 *see* BELGIUM: *History*. The Dutch were almost without striking a blow expelled from the country, the strongly fortified seaport of Antwerp alone remaining in their hands. Had the king consented at once to the administrative autonomy of Belgium, and appointed the prince of Orange governor of the southern Netherlands, the revolt might perhaps have been appeased. William, however, was too proud and too obstinate to lend himself to such a course. He appealed to the Powers, who had, in 1815, created and guaranteed the independence of the kingdom of the Netherlands. By the treaty of the eighteen articles, however, concluded at London on June 29, 1831, the kingdom of Belgium was recognized, and Leopold of Saxe-Coburg was elected king. William refused his assent, and in August suddenly invaded Belgium. The Belgian forces were dispersed, and the Dutch would have entered Brussels in triumph but for the intervention of the French. Still, however, William declined to recognize the new throne, and he had behind him the unanimous support of Dutch public opinion. For nine years he maintained this attitude, and resolutely refused to append his signature to the treaty of 1831. His subjects at length grew weary of the heavy expense of maintaining a large military force on the Belgian frontier and in 1839 the king gave way. He did so, however, on favourable terms and was able to insist on the Belgians yielding up their possession of portions of Limburg and Luxembourg which they had occupied since 1830.

A cry now arose in Holland for a revision of the fundamental law and for more liberal institutions; ministerial responsibility was introduced, and the royal control over finance diminished. William, however, disliked these changes, and finding further that his proposed marriage with the countess d'Oultremont, a Belgian and a Roman Catholic, was very unpopular, he suddenly abdicated on Oct. 7, 1840. After his abdication he married the countess and spent the rest of his life in quiet retirement upon his private estate in Silesia. He died in 1844.

WILLIAM II. (1792–1849), king of the Netherlands, son of William I., was born at The Hague on Dec. 6, 1792. When he was three years old his family was driven out of Holland by the French republican armies, and lived in exile until 1813. He was educated at the military school at Berlin and afterwards at the University of Oxford. He entered the English army, and in 1811, as *aide-de-camp* to the duke of Wellington, took part in several campaigns of the Peninsular War. In 1815 he commanded the Dutch and Belgian contingents, and won high commendations for his courage and conduct at the battles of Quatre Bras and Waterloo, at the latter of which he was wounded. The prince of Orange married in 1816 the grand duchess Anna Pavlovna, sister of the tsar Alexander I. In 1830, on the outbreak of the Belgian revolution, he went to Brussels, and tried to bring about a peaceable settlement on the basis of the administrative autonomy of the southern provinces under the house of Orange. His father had given him powers to treat, but afterwards threw him over and rejected the terms of accommodation that he had proposed. He withdrew on this to England and resided there for several months. In April 1831 William took the command of a Dutch army for the invasion of Belgium, and in a ten-days' campaign defeated and dispersed the Belgian forces under Leopold I. after a sharp fight near Louvain. His victorious advance was stayed by the intervention of the French. In 1840, on the abdication of his father, he ascended the throne as William II. The peace of 1839 had settled all differences between Holland and Belgium, and the new king found himself confronted with the task of the reorganization of the finances, and the necessity of meeting the popular demand for a revision of the fundamental law, and the establishment of the electoral franchise on a wider basis. He acted with good sense and moderation, and, although by no means a believer in democratic ideas, he saw the necessity of satisfying public opinion and frankly gave his support to larger measures of reform. The fundamental law was altered in 1848 and the Dutch monarchy, from being autocratic, became henceforth constitutional. The king's attitude secured for him the good will and affection of a people, loyal by tradition to the house of Orange, and the revolutionary disturbances of 1848 found no echo in Holland. William died suddenly on March 17, 1849.

WILLIAM III. (1817–1890), king of the Netherlands, son of William II., was born at Brussels on Feb. 19, 1817. He married in 1839 Sophia, daughter of William I., king of Wiirttemberg. The marriage was an unhappy one, and ended in complete estrangement. William had no sympathy with political liberalism, but throughout his long reign of forty-two years, with a constant interchange of ministries and many ministerial crises, he never had a serious conflict with the states-general. He was economical, and gave up a third of his civil list in order to help forward the task of establishing an equilibrium in the annual budget, and he used his large private fortune to forward schemes of social and industrial progress.

William's two sons by his marriage with Sophia of Württemberg, William (1841–1879) and Alexander (1843–1884), died unmarried. By his second marriage in 1879, with the princess Emma of Waldeck-Pyrmont, he had a daughter, Wilhelmina (*q.v.*), who succeeded him. William died at the Loo, on Nov. 23, 1890.

See J. A. Bruijne, *Geschiedenis van Nederland in onzen tijd.* (5 vols., Schiedam, 1889–1906); P. Blok, *Geschiedenis der Nederlandsche Volk* (Leiden, 1908), vol. viii.; and G. L. Keppers, *De regeering van Koning Willem III.* (Groningen, 1887).

WILLIAM (1227–1256), king of the Romans and count of Holland, was the son of Count Floris IV. and his wife Matilda, daughter of Henry, duke of Brabant. He was about six years of age at his father's death, but his long minority, under the guardianship of his two paternal uncles, was peaceful. In 1247 William allowed Pope Innocent IV. to proclaim him king of the Romans in opposition to the excommunicated Frederick II., and having taken Aix-la-Chapelle, was crowned there on All Saints' Day, 1248. He thus became the recognized head of the Guelph party, but even after Frederick's death he had gained few adherents, when he was killed on Jan. 28, 1256. He was more successful in asserting the rights of John of Avennes, who had married his sister Aleidis, to the county of Hainaut against John's mother, Margaret, whom he defeated decisively at West Kappel in 1253.

See A. Ulrich, *Geschichte des römischen Königs, Wilhelm von Holland* (Hanover, 1882).

WILLIAM (1143–1214), king of Scotland, surnamed "the Lion," was the second son of Henry, earl of Huntingdon (d. 1152), a son of King David I., and became king of Scotland on the death of his brother, Malcolm IV., in Dec. 1165, being crowned at Scone during the same month. After his accession to the throne William spent some time at the court of the English king, Henry II.; then, quarrelling with Henry, he arranged in 1168 the first definite treaty of alliance between France and Scotland, and with Louis VII. of France assisted Henry's sons in their revolt against their father in 1173. In return for this aid the younger Henry granted to William the earldom of Northumberland, a possession which the latter had vainly sought from the English king, and which was possibly the cause of their first estrangement. However, when ravaging the country near Alnwick, William was taken prisoner in July 1174, and after a short captivity at Richmond was carried to Normandy, where he purchased his release by assenting in Dec. 1174 to the Treaty of Falaise. By this arrangement the king and his nobles, clerical and lay, undertook to do homage to Henry and his son; this and other provisions placing both the church and state of Scotland thoroughly under the suzerainty of England. William's next quarrel was with Pope Alexander III., and arose out of a double choice for the vacant bishopric of St. Andrews. But in 1188 William secured a papal bull which declared that the Church of Scotland was directly subject only to the see of Rome, thus rejecting the claims to supremacy put forward by the English archbishop. This step was followed by the temporal independence of Scotland, which was one result of the continual poverty of Richard I. In Dec. 1189, by the Treaty of Canterbury, Richard gave up all claim to suzerainty over Scotland in return for 10,000 marks, the Treaty of Falaise being thus definitely annulled.

In 1186 at Woodstock William married Ermengarde de Beaumont, a cousin of Henry II., and peace with England being assured three years later, he turned his arms with success against the turbulent chiefs in the north and west. Soon after John's accession in 1199 the Scottish king asked for the earldom of Northumberland, which John, like his predecessors, refused; but the threatened war did not take place, and in 1200 William did homage to the English king at Lincoln with the ambiguous phrase "saving his own rights." War again became imminent in 1209; but a peace was made at Norham, and about three years later another amicable arrangement was reached. William died at Stirling on Dec. 4, 1214, and was buried at Arbroath. He left one son, his successor Alexander II., and two daughters, Margaret and Isabella, who were sent to England after the treaty of 1209, and who both married English nobles, Margaret becoming the wife of Hubert de Burgh. He also left some illegitimate children.

See E. W. Robertson, *Scotland under her Early Kings* (Edinburgh, 1862); Lord Hailes, *Annals of Scotland* (Edinburgh, 1819); A. Lang, *History of Scotland*, vol. i. (1900); also SCOTLAND: *History*.

WILLIAM I. (d. 1166), king of Sicily, son of King Roger II. by Elvira of Castile, succeeded in 1154. His title "the Bad" probably expresses the bias of the historian Falcandus and the baronial class against the king and the official class by whom he was guided. William was far inferior in character and energy to his father, however, and the real power in the kingdom was at first exercised by Maio of Bari, whose title *ammiratus ammiratorum* was the highest in the realm. Maio continued Roger's policy of excluding the nobles from the administration, and sought also to curtail the liberties of the towns. The barons were encouraged to revolt by Pope Adrian IV., whose recognition William had not yet sought, by the emperor Manuel and the emperor Frederick II. At the end of 1155 Greek troops recovered Bari and began to besiege Brindisi.

William, however, destroyed the Greek fleet and army at Brindisi (May 28, 1156) and recovered Bari Adrian came to terms at Benevento (June 18, 1156), abandoned the rebels and confirmed William as king, and in 1158 peace was made with the Greeks. These diplomatic successes were probably due to Maio; on the other hand, the African dominions were lost to the Almohads (1156–1160). The policy of the minister led to a general conspiracy, and in November 1160 he was murdered in Palermo by Matthew Bonello, leader of the Sicilian nobles. For a while the king was in the hands of the conspirators, but the people and the army rallied round him; he recovered power, crushed the Sicilian rebels, and in a short campaign reduced the rest of the Regno. Thus freed from feudal revolts, William confided the government to men trained in Maio's school, such as the grand notary, Matthew d'Agello. He was the champion of the true pope against the emperor, and Alexander III. was installed in the Lateran in November 1165 by a guard of Normans. William died on May 7, 1166.

WILLIAM II. (d. 1189), king of Sicily, was only thirteen years old at the death of his father William I. when he was placed under the regency of his mother, Marguerite of Navarre. Until 1171 the government was controlled first by the chancellor Stephen of Perche (1166–1168), and then by Walter Ophamil, archbishop of Palermo, and Matthew d'Ajello, the vice-chancellor. William's character is indistinct; yet his reign is marked by an ambitious foreign policy and a vigorous diplomacy. Champion of the papacy and in secret league with the Lombard cities he defied the common enemy, Frederick II. In 1174 and 1175 he made treaties with Genoa and Venice and in February 1177 he married Joan, daughter of Henry II. of England. To secure peace with the emperor he sanctioned the marriage of his aunt Constance, daughter of Roger II., with Frederick's son Henry, afterwards the emperor Henry VI., causing a general oath to be taken to her as his successor in case of his death without heirs. This step, fatal to the Norman kingdom, was possibly taken that William might devote himself to foreign conquests. He now attacked Egypt, but Saladin's arrival before Alexandria, forced the Sicilians to re-embark in disorder. On the death of Manuel Comnenus (1180), William took up the old design and feud against Constantinople. Durazzo was captured (June 11, 1185), Thessalonica surrendered in August, and the troops then marched upon the capital; but were overthrown on the banks of the Strymon (Sept. 7, 1185). Thessalonica was abandoned and in 1189 William made peace with Isaac, abandoning all the conquests. He now planned to induce the crusading armies of the West to pass through his territories, and seemed about to play a leading part in the third Crusade. His admiral Margarito kept the eastern Mediterranean open for the Franks, and forced Saladin to retire from before Tripoli in the spring of 1188. In November 1189 William died, childless.

WILLIAM I. [FRIEDRICH KARL] (1781–1864), king of Wiirttemberg, son of Frederick, afterwards King Frederick I. of Wiirttemberg, was born at Luben, Silesia, on Sept. 27, 1781. In early years he took no part in public life owing to a quarrel with his father whose deference to Napoleon displeased him; but in 1814–15 commanded an army corps in the Wars of Liberation with distinction. On his accession in 1816 he realized the expectations formed of him as a liberal-minded ruler by promulgating a constitution (1819), under which serf dom and obsolete class privileges were swept away, and by issuing ordinances which greatly assisted the financial and industrial development and the educational progress of his country. In 1848 he issued further liberal decrees; but his relations with the legislature having become hopelessly strained over questions of Germanic policy, William repudiated the enactments of 1848–49 and summoned a packed parliament (1851), which re-enforced the code of 1819.

William encountered similar difficulties as a champion of Germanic union and of the rights of the Middle Germanic States against encroachments by Austria and Prussia. In 1820–23 he protested against Metternich's treatment of the minor German States and in 1848–49 opposed the proposals for a Germanic union made by the Frankfort Diet, for fear of granting Prussia excessive preponderance. Thus he gradually became the ally of Austria against Prussia. Nevertheless his devotion to the cause of Germanic union is proved by the eagerness with which he helped the formation of the Zollverein (1828–1830), and in spite of his conflicts with his chambers he achieved unusual popularity with his subjects.

William died on June 25, 1864.

See Nick, *Wilhelm I., Konig von Württemberg, und seine Regierung* (Stuttgart, 1864).

WILLIAM (FRIEDRICH-WILHELM-VICTOR-AUGUST-ERNST VON HOHENZOLLERN) (1882–1951), crown prince of Germany, eldest child of William II of Germany, was born in the Marble palace, Potsdam. on May 6, 1882 He received a commission in the 1st Foot Guards in 1900. On June 6. 1905, he married Cecilia, daughter of the grand duke Frederick-Francis III of Mecklenburg-Schwerin. There were five children, four sons and one daughter, of the marriage. His interventions in public affairs gave some trouble in the years preceding World War I; *e.g.,* in 1913, during the Saverne incident.

On the outbreak of World War I the crown prince was appointed to the command of the 5th army in the west. He received the command of an army group in 1915 and was nominally in charge of the German operations against Verdun. His flight to the Netherlands followed that of the kaiser in Nov. 1918, and he went to Wieringen. an island in the Zuider Zee. He formally renounced. on Dec. 1, 1918, his rights of succession to the crowns of Prussia and the German empire His wife and children, however, continued to reside at Potsdam.

His sudden return to his Silesian estate at Oels in Nov. 1923 caused considerable anxiety among the Allied powers. which was allayed, however, by assurances that he would take no part in politics. Yet he encouraged Berlin to vote for Hitler in 1932 and joined the Nazi motorized corps the following year. In 1944 he moved from Oels to the Cecilienhof in Potsdam; but with the end of World War II he fled to Lindau in Bavaria and was eventually captured by French troops. He died at Hechingen in Württemberg on July 20. 1951.

His *Erinnerungen* were published at Stuttgart in 1922.

WILLIAM (1533–1584), surnamed the Silent, count of Nassau and prince of Orange, was born at the castle of Dillenburg in Nassau on April 25, 1533, eldest of the five sons of William count of Nassau and Juliana of Stolberg (see NASSAU). The boy's father had decided leanings towards Lutheranism, his mother was a convinced adherent of the new faith. So it was not without hesitation that the emperor sanctioned an arrangement by which the great heritage of the Nassau family in his Netherlands dominions and the princedom of Orange would fall to their son, and when he did sanction it, it was on condition that the old count should surrender all claims to the guardianship and that the boy should be educated in the Netherlands, with a household of Netherlanders, and as a Catholic. To this arrangement the father consented.

William of Orange thus grew up, at Brussels and at Breda, a great Netherlands nobleman, marked out for a career in the service of the ruler. In 1551 he married Anna van Buren, an heiress of the Egmont family, adding estates in Holland to his already extensive possessions. Charles V. distinguished him with his favour. Philip II., too, began by creating Orange a member of the Brussels Council of State, and before he left the Netherlands for Spain, 1559, he made him his governor (Stadtholder) in the provinces of Holland, Zeeland and Utrecht.

If William of Orange's career was soon so startlingly to deviate from the lines of tradition laid down for him by his predecessors, it was due in the first place to the different relationships in which, in his time, the monarchy had come to stand with respect to the Netherlands. The creation of a united Netherlands state had been the historical task of the Burgundian dynasty. By successive marriages of Mary, daughter of Charles the Bold, with Maximilian of Habsburg, and of their son, Philip the Fair, with Johanna of Spain, that state had become connected with an empire with which it had few interests in common. Under Charles V. already this had created many difficulties, while his son Philip II. looked upon the Netherlands merely as an outpost of the Spanish imperialist policy.

The high nobility of the Netherlands were quick to resent the anti-national tendencies of Philip's government at Brussels. After the king's departure it was carried on by his half-sister, Margaret of Parma, as his regent, but the real force behind her was the bishop of Arras, later archbishop of Mechlin and cardinal, the Franc-Comtois Granvelle, who was made president of the Council of State. Between that zealous and docile minister and the proud, unruly nobles a bitter struggle was soon in progress, in which Orange, with the counts of Egmont and Horn and others, played a conspicuous part. When Orange and Egmont stayed away from the Council of State as a protest against Granvelle's presence there the public realized that grave issues had been raised. In 1564 Philip gave way and ordered Granvelle to depart, whereupon the Regent tried to govern with the noblemen of the Council of

State. It was a victory for the national cause, but at the same time it was a victory for class interests.

One question, which aggravated the difficulties between the ruler and the Netherlands people considerably, had suddenly become of paramount importance when the dismissal of the cardinal seemed to indicate a slackening of purpose on the part of the distant king. All through Charles V.'s reign Lutheranism had been severely kept under. To the Lutheran heresy Calvinism, spreading northward from France, was now added. Public opinion in the Netherlands was generally averse from the savage methods of suppression imposed on the government by Philip. William of Orange never was a very devout Catholic. He had maintained close relations with his Lutheran kinsmen in Germany. His brother Louis, particularly, who spent much of his time at Orange's court at Brussels or Breda, had great influence over him. In 1561, Anna van Buren having died in 1558, the prince had contracted a matrimonial alliance with German Protestantism in the person of Anna of Saxony, daughter of the late Elector Maurice, the betrayer and victor of Charles V. In order to gain the present elector's consent, as well as to quiet the objections and suspicions of Philip II.'s Government, Orange had secretly given to both sides flatly contradictory assurances. The episode shows his character on its least attractive side. But at any rate his position helped him to realize how impossible it was, in the Netherlands, surrounded by countries where Protestantism had in some form or other achieved some sort of recognition, and always open to influences from outside, to enforce a rigid Catholic supremacy. He said so boldly in the Council of State, but it was in vain that he and his friends urged the king to concede some degree of toleration. When Philip, after long delay, by the famous letters from Legovia, ordered more relentless persecution than ever, Orange, realizing the impotence of the Council of State, countenanced the action of his brother Louis, and Hendrik van Brederode, who organized the lower nobility to petition the governess for liberty of conscience. The question was thus brought before the public and excitement raised to fever pitch.

Most of the petitioners were undoubtedly good Catholics, but suddenly there now occurred the outbreak by extreme Calvinists, known as the Breaking of the Images, which brought about a violent reaction. While the nobles lately in opposition ranged themselves behind Margaret of Parma to restore order, Philip prepared to send to the Netherlands an army under the duke of Alva to chastise them and to introduce absolutism. In the interval before the arrival of the terrible duke there was much talk of organizing resistance. The prince of Orange was in doubt as to the régime to be expected, yet he shrank from co-operating with the only party ready to throw themselves into the fight, the Calvinists. As viscount of Antwerp he prevented the Antwerp Calvinists from going to the assistance of a little army of their co-religionists that was cut to pieces by Margaret of Parma's troops under the walls of the town (March 1567).

The first period of Orange's career ended in failure. After the encouragement he had given to the national opposition movement his conduct at the moment of crisis is disconcerting. To understand it one has to remember that the Calvinists still were a tiny minority, suspected and hated as a menace to society no less than to the Church. A movement in which they took the lead had, at that moment, little chance of becoming truly national, and William of Orange, who was not yet personally in sympathy with Calvinism, was then and always concerned before everything else with preserving national unity.

From Germany, where he had retired, the prince kept in touch with adherents in the Netherlands, and with money collected from them and raised in his Nassau lands, he brought together an army with which he attempted to deliver the Netherlands from Alva's tyranny (1568). The attempt failed miserably. The Netherlands, cowed, did not rise, and the army had, for lack of money, soon to be disbanded. Help, as Orange realized, could only come from outside, and nothing was to be expected from German Lutheranism. He now entered into close relations with the French Huguenot leaders, for some years taking part in their campaigns against the French Government. At La Rochelle Louis of Nassau organized the forces of the Sea Beggars, whose booty went to swell the prince's war chest. New hope was born when after the peace of St. Germain (Aug. 1570) they seemed to win influence at the court of France. Louis of Nassau and Coligny inspired Charles IX. with plans of war and conquest against Spain, and it was in the expectation of French help that Orange in 1572 repeated the attempt of 1568 and invaded the Netherlands with an army collected in Germany. The St. Bartholomew's massacre, which overthrew Huguenot influence at court dashed his hopes. Again he had to disband his army and to leave Alva in possession.

But this time there had been a response to his invasion. Not the central province of Brabant, kept quiet by the presence of Alva's army, but a number of towns in the outlying northern provinces had risen against the Spaniards. The surprise capture of the Brill by a fleet of Sea Beggars had started the movement. Now that his great plans in conjunction with France had come to nothing, the prince decided to join the Holland and Zeeland rebels, who had proclaimed him as their Stadtholder again. It seemed a forlorn hope. Compared with Flanders and Brabant, Holland and Zeeland at that time seemed poor and distant regions.

The decision was one of the great moments of his career. For four heroic years he shared the anxieties and distress of the two maritime provinces, stubbornly holding out against the Spanish army sent to subdue them. The States assemblies of Holland and Zeeland, which were almost entirely composed of burghers and of Calvinists, placed complete confidence in the great nobleman who had lost his fortune and his position for the national cause. In 1573 the prince himself joined the Reformed Church. Meanwhile he led the desperate resistance against the Spaniards. The relief of Leyden in 1574 was to a large extent due to his untiring efforts. Yet in 1576, with the Spaniards at Haarlem and Amsterdam as well as at Middelburg and Zieriksee, the two provinces were near succumbing, when the situation underwent a dramatic change.

The Spanish governor, who had succeeded Alva in 1574, Requesens, unexpectedly died. The Spanish soldiery, long unpaid, mutinied. They evacuated their hard-won posts in Holland and Zeeland and came south to live on the riches of Brabant. The Spanish Government in the Netherlands practically broke down. The States of Brabant summoned a meeting of the States-General to Brussels, and negotiations between this nominally loyal body and the two rebel provinces were started at Ghent for the purpose of combining against the Spanish soldiers. The conclusion of the Pacification of Ghent (Nov. 8, 1576) seemed to restore the unity of the Netherlands, threatened since the separate rebellion of Holland and Zeeland.

But an ominous rift threatened that unity. The Pacification, while suspending the edicts against heresy, had safeguarded the supremacy of Catholicism in all the provinces save Holland and Zeeland. Calvinist refugees were now flocking back to the towns of Flanders and Brabant, and they were not content with toleration, they wanted the same position of supremacy which their co-religionists in the two rebel provinces, in the stress of revolution and under the immediate menace of foreign attack, had managed to secure. This irritated the nohility, who in the south had greater power and were everywhere slow to embrace Calvinism, while the French-speaking provinces, like Hainaut, or Lille, Orchies and Douai, were now almost solidly Catholic. Orange was fully alive to the danger of these elements gravitating back to the king.

But in many respects his position was a thoroughly false one. Circumstances had ever since 1567 conspired to drive him into closer association with Calvinism. The Calvinists who had obtained control in the provinces of Holland and Zeeland did not dream of sacrificing any of their local supremacy to the national compromises elaborated at Brussels. Yet those two provinces continued to afford to the prince his firmest *point d'appui* in the shifting conditions of Netherlands polities. Early in 1579, the Walloon provinces, incensed at the aggressiveness of the Flemish Calvinists, had deserted the national cause and at Arras had made their peace with the king's new governor, the duke of Parma, who could now from that foothold in the south set about re-conquering the rest of the Netherlands. Did not the event, which was followed by the loss of the north-eastern province of Groningen, go to prave that the Calvinists were the only party who could be counted on to hold out against all the blandishments of Parma? When Orange tried once more to enlist the help of France, and the Catholic duke of Anjou was clothed with the sovereignty of the Netherlands from which in 1581 the States-General solemnly deposed Philip II., the prince's particular connection with the two maritime provinces was expressly safeguarded. And however earnestly he deplored and tried to restrain the intolerant fanaticism of the Calvinists in Flanders and Brabant, all the time he saw himself forced underhand to work with them, thereby adding to the grievances of the Catholics, although at the same time Calvinist ministers denounced him as a godless timeserver.

The last years of William the Silent's life were a tragic struggle against overpowering circumstances. The unity of the Netherlands was broken beyond repair, and the area supporting the national cause kept crumbling away, The States-General had to leave Brussels in 1578, they stayed at Antwerp for a short while, then moved behind the waters to Middelburg, and finally to Delft, where William the Silent resided from 1583 onwards. His main efforts throughout those years were directed towards preserving the southern provinces, until then the principal provinces of the Netherlands, and of which Brabant had such close associations with him personally, and towards obtaining foreign help. The conclusion of the Union of Utrecht in 1579 met with his disapproval, as it seemed to be, on the part of the more easily defensible regions north of the rivers, an abandonment of the wider union of the Pacification. He had soon, nevertheless, to fall back upon it, and then did his best to make it comprehensive, nor were his efforts without success, for in the course of that year and the next all the towns of Flanders and several of those of Brabant entered it.

In 1581 Philip II. had promulgated a ban against William of Orange, by which a high reward was promised to anyone who would deliver the world of this traitor. A year later a serious attempt was made on his life, but it was only in 1584 that the ban achieved its purpose. On July 9, Balthazar Gérard, a Burgundian, shot the prince at Delft. William was 51 years of age.

Some years after the prince's death, owing to the assistance given by England and to Philip's injudicious interference in the French civil war, the turn came in the tide of Netherlands affairs, and although of the country south of the rivers little was recovered, at least the country north of them was secured and blossomed out into the republic of the Seven United Provinces. Of that state William the Silent is truly called the father. Yet it should not be forgotten that this was not the object which he had in view and that the split of the Netherlands means that his life's work was not accomplished. Apart from his success and failure in Netherlands politics, William the Silent will always be hocoured as a man who nobly struggled and suffered for the cause of liberty of conscience. His personality, genial and humane, was fully worthy of the great part he played. There is something exceptionally attractive in his evolution from a frivolous courtier into the frugal and hard-working leader of a seemingly hopeless revolt, harassed but patient, courageous in the face of accumulating disaster, while the steadfastness with which at a time of furious religious fanaticism he preached moderation and forbearance has a heroic quality that is not disposed of by observing that his outlook was secular. His correspondence proves that in his later years religion was a real thing to him, and his attachment to the Reformed Church was sincere.

WILLIAM II. (1626–1650), prince of Orange, born at The Hague on May 27, 1626, was the son of Frederick Henry, prince of Orange, and his wife Amalia von Solms, and grandson of William the Silent. By the act of survivance passed in 1631 the offices and dignities held by Frederick Henry were made hereditary in his family. On May 12, 1641 William married, in the royal chapel at Whitehall, Mary, princess royal of England, eldest daughter of King Charles I. At the time of the wedding the bridegroom was not yet fifteen years old, the bride was five years younger. William from his early youth accompanied his father in his campaigns, and already in 1643 highly distinguished himself in a brilliant cavalry fight at Burgerhout (Sept. 5). On the death of Frederick Henry William succeeded him. At the moment of his accession to power the negotiations for a separate treaty of peace with Spain were almost concluded, and peace was actually signed at Munster on Jan. 30, 1648. By this treaty Spain recognized the independence of the United Netherlands and made large concessions to the Dutch. William did his utmost to prevent the ratification, but failed. He opened secret negotiations with France in the hope of securing the armed assistance for a war of aggrandisement against the Spanish Netherlands and of a restoration of his brother-in-law, Charles II., to the throne of England. The states of Holland, on the other hand, were determined to thwart any attempts for a renewal of war, and insisted, in defiance of the authority of the captain-general supported by the states-general, in virtue of their claim to be a sovereign province, in disbanding a large part of the regiments in their pay.

A prolonged controversy arose, which ended in the states-general in June 1650 commissioning the prince of Orange to visit the towns of Holland and secure a recognition of their authority. The mission was unsuccessful. Amsterdam refused any hearing at all. William resolved therefore to use force and crush resistance. On July 30 six leading members of the states of Holland were seized and imprisoned in the castle of Loevestein. On the same day an attempt was made to occupy Amsterdam with troops. The citizens were, however, warned in time, and the gates closed. William's triumph was nevertheless complete. The states of Holland submitted. The prince entered into fresh negotiations with the French government, and a draft treaty was drawn up. But William died of small-pox on Nov. 6, 1650. A week after his death his widow gave birth to a son, who was one day to become William III., king of England.

WILLIAM IV., landgrave of Hesse (1532–1592), was the son and successor of the landgrave Philip the Magnanimous. He took a leading part in safeguarding the results of the Reformation, endeavouring to unite all sections of Protestantism against the Catholic reaction. As ruler he displayed common-sense and tolerance; patronized art and science; placed the finances of his country on a sound basis and secured it against subdivision by a law of primogeniture. He was chiefly famous, however, as a pioneer in astronomical research.

See R. Wolf, "Astronomische Mittheilungen," No. 45 (*Vierteljahrsschrift der naturforschenden Gesellschaft in Zürich,* 1878).

WILLIAM [Frederick Henry], Prince of Wied (1876–), born at Neuwied on March 26, 1876, was 3rd son of William Prince of Wied and Mary Princess of Holland, grand-nephew of the emperor William I. and nephew of Queen Elizabeth of Rumania. An able soldier, he became a captain of the general staff in 1911, and in 1913 commanded a squadron of the 3rd Uhlans of the Guards. He married in 1906 Sophie, Princess of Schoenburg-Waldenburg, and had two children, Princess Marie Eleonor (1909) and Prince Charles Victor (1913). In Feb. 1914, inspired by idealism rather than ambition, he accepted the Albanian throne against the Kaiser's advice, and landed on March 7. Italy, France, Russia, Greece, Montenegro, Serbia, Turkey and Essad Pasha intrigued against him. Essad possessed troops, and the Mbreti (King), who had none, felt obliged to conciliate him with the Ministries of War and Interior. While the Greeks ravaged southern Albania an insurrection confined the Mbreti to Durazzo Essad was exiled in May; but foreign agents, protected by the Capitulations, paralysed the royalists. In Aug. 1914 Austria abandoned him because he determined to preserve neutrality. Besieged, and without resources, he reluctantly left Albania on Sept. 3. He did not abdicate. Early in 1915 the insurgents, finding they had been victims of intrigue, asked him to return, but this Austria prevented. He was attached as an Albanian and foreigner to a German divisional staff in Poland during the World War. On the accession of Ahmed Zogu in 1928 Prince William declared that he would not return unless unanimously invited. (J. Sw.)

WILLIAM OF MALMESBURY (c. 1090–c. 1143), the foremost historian of his time, was born about 1090 in the southwest of England. He was educated at Malmesbury abbey and became a monk there, assisting Godfrey, abbot from 1081 to 1105, in collecting a library for the use of the community. His education included some logic and physics, but his principal studies were moral philosophy and history. He made a collection of the histories of foreign countries, and decided to write a popular account of English history, modeled on Bede's great work. He produced the first edition of his *Gesta regum Anglorum* in c. 1125: the first edition of the *Gesta pontificum Anglorum* followed shortly afterward. Two later editions of the *Gesta regum* (1135–40) were dedicated to Robert, earl of Gloucester: another patron was Henry, bishop of Winchester. William was a candidate for the abbacy of Malmesbury in 1140, but cheerfully yielded to his friend John. In 1141 he attended the council of Winchester, at which the clergy declared for the empress Matilda. At about this date he undertook to write the *Historia novella,* giving an account of events after 1126. This work breaks off abruptly at the end of 1142; presumably William died before he could finish it.

William's contempt for the annalistic form adopted by other chroniclers makes him at times careless in his chronology and arbitrary in his method of arranging his material, but he has preserved much valuable information, as for the reign of King Athelstan, and is an authority for the period after 1066. His pages contain many entertaining and telling anecdotes, many shrewd judgments on persons and events, and his style is vivid and powerful.

The standard edition of the *Gesta regum* and the *Historia novella* is that by W. Stubbs, "Rolls Series," 1 vol. in 2 (1887–89); the second part contains a valuable introduction on William's sources and value as a chronicler. There is also an edition of the *Historia novella* by *K. R.* Potter (1955). The *Gesta pontificum* was ed. for the "Rolls Series" by N. E. S. A. Hamilton (1870) from a manuscript which he was the first to identify as the archetype. Another work *De antiquitate Glastoniensis ecclesia* (A.D. 63–1126) is printed in vol. 1 of T. Hearne's *Adam of Domerham* (1727) and discussed by J. Armitage Robinson in *Somerset Historical Essays* (1921). His *Vita Wulfstani,* an amplified translation of an Anglo-Saxon biography, was ed. by R. R. Darlington, Royal Historical society, "Camden Series" XL (1928). Stubbs, in his *Memorials of St. Dunstan,* "Rolls Series" (1874) prints a *Vita S. Dunstani* written about 1126. (H. W. C. D.; R. H. C. D.)

WILLIAM OF NEWBURGH (d. c. 1198), or, as he is sometimes styled, Guilielmus Parvus, English ecclesiastic and chronicler, was a canon of the Augustinian priory of Newburgh in the North Riding of Yorkshire. He was born about 1136, and lived at Newburgh from his boyhood. Shortly before 1196 he began his *Historia rerum Anglicarum.* This work, divided into five books, covers the period 1066–1198. A great part of it is derived from known sources, especially from Henry of Huntingdon, Jordan Fantosme, the *Itinerarium regis Ricardi,* or its French original, and a lost account, by Anselm the chaplain, of the captivity of Richard I. The value of Newburgh's work lies in his estimates of men and situations. His political insight and his impartiality entitle him to a high place among the historians of the 12th century. (H. W. C. D.)

WILLIAM OF WYKEHAM (1323?–1404), English lord chancellor and bishop of Winchester. William Wykeham was born at Wickham, Hants, in 1323 or 1324. He was educated at Winchester, probably at the grammar school there, and became undernotary to the constable of Winchester castle, probably Robert of Popham, who was appointed in 1340. He was transferred to the king's court in 1343. In 1350 he appears to have been keeper of the manor of Rochford, Hants. His name appears in various other transactions in the county during the next few years; in 1356 he is first recorded as being directly employed by the king as clerk of the works to the manors of Henley and Easthampstead. In October he was appointed to the same office at Windsor, which he held until 1361.

Wykeham was already receiving wages as king's clerk in 1357, and he was richly rewarded for his various services by a series of benefices. He received the rectory of Pulham, Norfolk, in 1357, a canonry and prebend at Lichfield in 1359, though he did not obtain actual possession in either case without a struggle. In 1359 also, after the French raid on Winchelsea, he was placed in charge of the repair of the castles on the Kent coast and of many manors.

Meanwhile he had been appointed a clerk of the exchequer (Oct. 1361) and keeper of the forests south of the Trent. In 1364 he became privy seal. On Oct. 13, 1366, Wykeham was named bishop of Winchester. He was consecrated in Oct. 1367, and enthroned in 1368. Meanwhile he had been made (Sept. 17, 1367), chancellor of the kingdom. Parliament was inclined to lay the blame of the disasters of the French war on the clerical advisers of the Crown, and in 1372 Wykeham resigned the chancellorship.

Wykeham must have amassed a large fortune by his various employments and benefices; his application of that fortune has made him revered by successive generations of "Wykehamists." He began buying lands for the endowment of his great foundations of Winchester college, Winchester, and of New college, Oxford, in 1367. In 1373 he entered into an agreement with the master, Richard of Herton, "Grammaticus," for ten years faithfully to teach and instruct the poor scholars whom the bishop maintained at his own cost, in the art of grammar, and to provide an usher to help him. He was diverted from his foundations by public affairs, being named by the Commons one of the eight peers to discuss with them the state of the realm.

Lord Latimer and Alice Perrers, the king's mistress, were impeached (1376), and Wykeham took a leading part against Latimer. At the dissolution of parliament a council of nine, of whom Wykeham was one, was appointed to assist the king. But on June 8, the Black Prince died. Alice Perrers returned. John of Gaunt called a council (Oct. 16) to impeach Wykeham on articles which alleged misapplication of the revenues, oppressive fines on the leaders of the free companies, taking bribes for the release of the royal French prisoners, especially of the duke of Bourbon, who helped to make him bishop, failing to send relief to Ponthieu and making illegal profits by buying up Crown debts cheap. He was condemned on one only, that of halving a fine of £80 paid by Sir John Grey of Rotherfield for licence to alienate lands, and tampering with the rolls of chancery to conceal the transaction. Wykeham's answer was that he had reduced the fine because it was too large, and that he had received nothing for doing so. Skipworth, a judge of the common pleas, cited a statute under which for any erasure in the rolls to the deceit of the king 100 marks fine was imposed for every penny, and so Wykeham owed 960,000 marks. Wykeham was convicted, his revenues were seized and bestowed (1377) on the young prince Richard.

On June 21, 1377, Edward III. died. Wykeham received full pardon, and at once took an active part in the financial affairs of the new king, giving security for his debts and himself lending 500 marks, afterwards secured on the customs (Pat. 4 Rich. II. pt. i. m. 4). He then set to work to buy endowments for Winchester and New colleges. On Nov. 26 he issued his charter of foundation of "Seynt Marie College of Wynchestre in Oxenford" for a warden and 70 scholars to study theology, canon and civil law and arts, who were temporarily housed in various old halls. On March 5, 1380, the first stone was laid of the present buildings, which were entered on by the college on April 14, 1386. The foundation of Winchester was begun with a bull of Pope Urban VI. on June 1, 1378, enabling Wykeham to found "a certain college he proposed to establish for 70 poor scholars, clerks, who should live college-wise and study in grammaticals near the city of Winchester," and appropriate to it Downton rectory, one of the richest livings belonging to his bishopric. The bull says that the bishop "had, as he asserts, for several years administered the necessaries of life to scholars studying grammar in the same city." On Oct. 20, 1382, "Seinte Marie College of Wynchestre by Wynchestre" was founded for a warden and "70 pore and needy scholars studying and becoming proficient in grammaticals or the art and science of grammar." The first stone of the buildings was laid on March 26, 1388, and they were entered by the scholars on March 28, 1394, not, as supposed at the quincentenary celebration in 1893, in 1393. While the new buildings were being erected, the college remained in the parish of "St. John the Baptist on the Hill" of St. Giles, supplying scholars to New college then as since. The foundation was on the model of Merton and Queen's colleges at Oxford, to which grammar schools were attached by their founders, while fellows of Merton were the first wardens of both of Wykeham's colleges. The severance of the school which was to feed the college exclusively, placing it not at Oxford, but at Winchester, and constituting it a separate college, was a new departure of great importance in the history of English education. Ten fellows and 16 choristers were added in 1394 to the 70 scholars, the choristers attending the school like the scholars, and being generally, during the first three centuries of the foundation, promoted to be scholars. The original statutes have not come down to us. Those which governed the colleges until 1857 were made in 1400. They state that the colleges were provided to repair the ravages caused by the Black Death in the ranks of the clergy, and for the benefit of those whose parents could not without help maintain them at the universities.

The time which elapsed between the foundation and completion of the colleges may be attributed to Wykeham's preoccupation with politics in the disturbed state of affairs, due to the papal schism begun in 1379, in which England adhered to Urban VI. and France to Clement VII., to the rising of the Commons in 1381, and the wars with France, Scotland and Spain during John of Gaunt's ascendancy. Then followed the constitutional revolution of the lords appellant'in 1388. When Richard II. took power on himself on May 3, 1389. he at once made Wykeham chancellor, with Brantingham of Exeter again as treasurer.

On Sept. 27, 1391, Wykeham finally resigned the chancellorship. For three years after there are no minutes of the council. On Nov. 24. 1394, Wykeham lent the king the sum of £1,000, which same sum or another £1,000 he promised on Peb. 21. 1395, to repay by midsummer. and did so. Wykeham was clearly against the assumption by Richard of absolute power. He excused himself from convocation in 1397. and from the subservient parliament at Shrewsbury in 1398. Possibly he took part in the revolution of Henry IV. He appeared in the privy council four times at the beginning of Henry's reign. There are records of loans by him to Henry IV. in the first years of his reign. Meanwhile, on Sept. 29. 1394, he had begun the recasting of the nave of the cathedral with William Wynford, the architect of the college, as chief mason. and Simon Membury, an old Wykehamist, as clerk of the works. He died on Sept. 27, 1404, aged 80.

Kirby, *Annals of Winchester College* (1892); G. H. Moberly, *Life of Wykeham* (1887); A. F. Leach, *History of Winchester College* (1899); and the *Calendars of Patent and Close Rolls, Edward III. and Richard II.*

WILLIAMS, JOHN (1582–1650), English archbishop and lord keeper, son of Edmund Williams of Conway, was born in March 1582 and educated at St. John's College, Cambridge. He received rapid promotion in the Church, and, on the fall of Bacon (1621), was appointed lord keeper, and was at the same time made bishop of Lincoln, retaining also the deanery of Westminster. Williams took the popular side in condemning arbitrary imprisonment by the sovereign. A case was preferred against him in the Star Chamber of revealing state secrets, to which was added in 1635 a charge of subornation of perjury, of which he had undoubtedly been guilty and for which he was condemned in 1637 to pay a fine of £10,000, to be deprived of the temporalities of all his benefices, and to be imprisoned during the king's pleasure. He was sent to the Tower. In 1639 he was again condemned by the Star Chamber for libelling Laud, a further heavy fine being imposed for this offence. In 1641 he recovered his liberty on the demand of the House of Lords, who maintained that as a peer he was entitled to be summoned to parliament. In December 1641 the king, anxious to conciliate public opinion, appointed Williams archbishop of York. In the same month he was one of the twelve bishops impeached by the Commons for high treason and committed to the Tower. Released on an undertaking not to go to Yorkshire, a promise which he did not observe, the archbishop was enthroned in York Minster in June 1642. On the outbreak of the Civil War, after visiting Conway in the Royalist interest, he joined the king at Oxford; he then returned to Wales, and finding that Sir John Owen, acting on Charles's orders, had seized certain property in Conway Castle that had been deposited with the archbishop for safe-keeping, he went over to the Parliamentary side and assisted in the recapture of Conway Castle in November 1646. Williams, who was a generous benefactor of St. John's College, Cambridge, died on March 25, 1650.

WILLIAMS, JOHN (1796–1839), English Nonconformist missionary, was born at Tottenham near London on June 29, 1796. He was sent by the London Missionary Society in 1816 to Eimeo, in the Society Islands, where he rapidly acquired a knowledge of the native language. After staying there for a short time, he finally settled at Raiatea, which became his permanent headquarters. His success was remarkable. The people rapidly became Christianized and adopted many of the habits of civilization. Williams travelled unceasingly among the various island groups, planting stations and settling native missionaries whom he himself had trained. From the Society Islands he visited the Hervey group, where he discovered, and stayed for a considerable time on, the island of Rarotonga. Besides establishing Christianity and civilization among the people, he also, at their own request, helped them to draw up a code of laws for civil administration upon the basis of the new religion. While at Rarotonga he, with the help of the natives, built himself a 60-ft. ship, "The Messenger of Peace," within about four months; with this he returned to Raiatea, and made voyages among other island groups, including Samoa and the neighbouring islands. Williams returned to England in 1834 (having previously visited New South Wales in 1821); and during his four years' stay at home he had the New Testament, which he had translated into Rarotongan, printed. Returning in 1838 to the Pacific, he visited the stations already established by him, as well as several fresh groups. He went as far west as the h'ew Hebrides, and, while visiting Eromanga, one of the group, was murdered by cannibal natives Nov. 20, 1839.

His *Narrative of Missionary Enterprises in the South Sea Islands* was published in 1837, and formed an important contribution to our knowledge of the islands with which the author was acquainted. See *Memoir of John Williams,* by Ehenezer Prout (London, 1843); C. S. Horne, *The Story of the L.M.S.* (1908), pp. 41–54.

WILLIAMS, ROGER (1603?–1683), founder of the colony of Rhode Island and pioneer of religious liberty, was the son of a London merchant tailor. As a boy he attracted the attention of Sir Edward Coke, who employed him as a shorthand clerk in official proceedings and saw him through his schooling at Charterhouse (1621–24). He then attended Pembroke hall, Cambridge, as a pensioner, graduating in 1627.

Cambridge during Williams' residence was a centre of Puritan activity, and the young scholar joined the ranks of those who accepted the theology of John Calvin and promoted political measures which would bring an end to episcopacy in the Church of England. In 1628 he became chaplain to the household of Sir William Masham at Otes, Essex. where he was surrounded by such politically active Puritans as Oliver Cromwell, John Winthrop, John Cotton and Thomas Hooker (*qq.v.*) During his chaplaincy Williams became a complete nonconformist and, upon the organization of the Massachusetts Bay colony, left his post to pursue his religious ideals in h'ew England.

When he arrived in Boston early in 1631, however, he showed himself to be more reformed than those who had preceded him, for he rejected an invitation to become temporary pastor at Boston on the grounds that he "durst not officiate to an unseparated people." He insisted upon the open repudiation of the Church of England instead of holding the prevailing rationale that although the Bay churches did not conform with the "corrupt" practices of the national church, they were, nevertheless, a part of it. Williams accepted appointment as teacher of the church at Salem, but there, too, he was uneasy at what he believed to be halfway measures, and in 1632 went to Plymouth colony where the congregation was avowedly separatist.

In 1633, however, Williams was back in Salem, having come to open disagreement with Plymouth on his insistence that the king's patent was invalid and that only direct purchase from the Indians gave a just title to the land. Although the Salem church invited him to become pastor in 1634, the civil authorities of Massachusetts Bay were opposed to his residence, for in addition to his notions about land rights. other of his views were unpopular: he claimed that magistrates had no right to interfere in matters of religion, and that they could not administer oaths to the unregenerate because this constituted an act of religious communion with them. For these views he was banished from Massachusetts Bay, and in Jan. 1636. set out on foot for Narragansett bay.

In the spring of 1636, Roger Williams stepped from his canoe onto the western bank of the Seekonk river. and there on land which he had purchased from the Indians founded the town of Providence and the colony of Rhode Island. As news spread of his radical tenet that "none bee accounted a Delinquent for *Doctrine,*" Providence grew, filling with those whose religious beliefs could find no public expression in the English-speaking world. notably Anabaptists and Quakers. Williams himself had a brief period as an Anabaptist, but thereafter (1639) declared himself a Seeker, recognizing no church as the true one and ministering to no set congregation. Although he staunchly defended the right of all to worship as they pleased he himself cleaved steadfastly to the theology of John Calvin and opposed Quaker doctrines even while offering the Quakers residence during the years of their persecution elsewhere.

Because the identity of Rhode Island was constantly threatened by internal differences and the distrust and ambition of its neighbours. Williams went to England in 1643 to secure a charter for the colony from the parliament (granted on March 14. 1644), and again in 1651–54 to have the charter confirmed. During these visits. he successfully drew upon the acquaintances he had made while serving in the Masham household; on his second visit he became the friend of John Milton. He was the first president of Rhode Island under its charter and until his death always held some public office. In spite of his differences with the theocratic neighbouring colonies. he was of constant service to all as a peacemaker with the Narragansett Indians whose language he knew and whose trust he had earned. When King Philip's War came; however, the aged Williams served as captain of the handful who remained to defend Providence against the Indians. From 1636 tc his death sometime between Jan. 27 and March 15. he supported himself by farming and trading; since he financed his trips to England from his own income he was often in reduced circumstances.

Williams' advocacy of the separation of church and state and the toleration of all religions did not stem from "modern" notions that there are many roads to heaven. but rather from a conviction that so strait was the path that no community could possibly be made up entirely of true believers, and therefore, the best policy was not to mix church and state. His passionate defense of liberty of conscience found physical form in the institutions of Rhode Island, which showed the way to the other states, and lasting expression in his greatest book. *The Bloudy Tenent of Persecution* (1644).

See also RHODE ISLAND: *History.*

Williams was a vigorous controversialist, and published. chiefly during his two visits to England, *A Key Into the Language of America,* written at sea on his first voyage to England (1643); it was reprinted in vol. i of the *Collections of the Rhode Island Historical Society* (1827), and in series i, vol. iii of the *Massachusetts Historical Society Collections; Mr. Cotton's Letter Lately Printed, Examined and Answered* (1644); *The Bloudy Tenent of Persecution for the Cause of Conscience* (1644); *Christenings Make Not Christians* (1645); *Queries of Highest Consideration* (1644); *The Bloudy Tenent Yet More Bloudy* (1652); *Experiments of Spiritual Life und Health and Their Preservatives* (1652); *The Hireling Ministry None of Christ's* (1652); *George Fox Digg'd Out of His Burrows* (1676); and *Something in Answer to a Letter . . . of John Leverat Governor of Boston . . .* (1678).

His writings were republished in the *Publications of the Narragnnsrtt Club* (1866–74). *Letters and Papers of Roger Williams, 1629–82* (limited to 18 copies, photostatic reproductions, 1924) contained manuscripts discovered later.

BIBLIOGRAPHY.—The best recent biographies are those by S. H. Brockunier (1940) and O. E. Winslow (1957). . Recommended also are biographies by J. D. Knowles (1834), W. Gammell (1846), R. Elton (1857), O. Straus (1894), E. J. Carpenter (1909), M. E. Hall (1917), E. Easton (1930), J. E. Ernst (1937) and C. S. Longacre (1940). Outstanding studies of special aspects of Williams' career are M. C. Tyler, *History of American Literature 1607–1765* (1878) ; C. M. Andrews, *The Colonial Period of American History,* II (1936); H. M. Dexter, *As to Roger Williams and His "Banishment" From the Massachusetts Plantation* (1876). (L. Z.)

WILLIAMS, TENNESSEE (THOMAS LANIEX) (1914–), U.S. author who achieved his principal success as a dramatist, was born March 26, 1914, in Columbus, Miss. During his boyhood, his family moved to St. Louis; he later attended the University of Missouri and Washington university in St. Louis and received a B.A. degree from the University of Iowa in 1938. Williams began writing in childhood and tried fiction, poetry and drama; his first public recognition came in 1945 with the successful Broadway production of *The Glass Menagerie.* He won the New York Drama Critics' Circle award three times—for *The Glass Menagerie, A Streetcar Named Desire* (1947), and *Cat on a Hot Tin Roof* (1955)—and the Pulitzer prize for the latter two.

His characters, always theatrically exciting, range from the pretentiously genteel to the crude and ruthless, from poor to rich, but their varied surfaces cover thinly what Williams finds common beneath all mankind's pretenses—the violent beast driving man to destroy his fellow man and himself. Williams' characters are all psychologically sick, entrapped in a world indifferent to them and uncomprehended by them. For such characters, no hope can be offered, for they can only react, not act. What Williams with his poetic language does afford them—and the rest of mankind—is not anger, but compassion for man's desperate plight.

See Nadine Dony, "Tennessee Williams: 4 Selected Bibliography," *Modern Drama,* I, pp. 181–191 (Dec. 1958). (Js. T. N.)

WILLIAMS, WILLIAM CARLOS (1883–), one of the most original poetic voices of the United States in the 20th century, was born on Sept. 17, 1883, in Rutherford, N.J.

After he won his M.D. from the Cniversity of Pennsylvania in 1906. and after internship in New York and graduate study in pediatrics in Leipzig, he returned in 1910 to a lifetime of poetry and medical practice in Rutherford.

Williams' largely imitative *Poems* (1909) was followed by experimental volumes; gradually he developed an individualistic method and style in collections culminating with *Sour Grapes* (1921) and *Spring and All* (1922). His frequently anthologized poems "Light-Hearted William," "By the Road to the Contagious Hospital" and "The Red Wheelbarrow" characteristically proffer a fresh, direct impression of the sensuous world. The first book of Williams' most ambitious poem, *Paterson,* appeared in 1946, and subsequent parts in 1948, 1949 and 1951. The epic scope became clear: Williams was dramatizing Paterson, N.J., to evoke a complex vision of America and modern man. Although Williams' work defies neat classification, his poetry seems closer to the free, loose affirmations of Walt Whitman than to the rigidly controlled negations of T. S. Eliot. Williams was also a prolific writer of prose. Three novels form a trilogy dealing with a single family—*White Mule* (1937), *In the Money* (1940) and *The Build-up* (1952). His short stories, brief but deep glimpses into strange facets of human behaviour, were collected in 1950 as *Make Light of It.* Other works include his *Autobiography* (1951), *Selected Essays* (1954) and *Selected Letters* (1957).

For a critical evaluation *see* Vivienne Koch, *William Carlos Williams (1950).* (J. E. MR.)

WILLIAMSBURG, a city of southeastern Virginia, U.S., on the peninsula between the James and York rivers, 50 mi. S.E. of Richmond; the capital of Virginia. 1699–1780, and seat of James City county. It is the site of the Coiiege of William and Mary, Eastern State hospital and Colonial R'illiamsburg.

In 1698 fire destroyed the statehouse at Jamestown, Virginia's first capital. The following year the general assembly enacted legislation to move the seat of government to Middle Plantation, first settled in 1633, the scene in 1676 of episodes in Eacon's rebellion, and the site chosen in 1693 for the newly chartered College of William and Mary. The act set aside 220 ac. at Middle Plantation for a town, to be named Williamsburg in honour of William III. and directed the construction of a capitol to house the general assembly and the general court.

In the 18th century, Williamsburg's resident population never exceeded 2,000, but, as the political and cultural centre of Great Britain's largest and wealthiest continental colony, the little city was as important as any in British North America. Twice a year, in April and October, the general court met. Visitors flocked to the capital, swelling its population to over 5,000 during these "public times," to transact business and attend balls, fairs and races. To a lesser degree, other public events were the occasions for similar scenes.

A number of important episodes leading to the American Revolution took place in Williamsburg. In 1765 Patrick Henry (*q.v.*) presented his strongly worded resolutions against the Stamp act to the house of burgesses and defended them in a famous, fiery speech. Nine years later the burgesses, in extralegal session at the Raleigh tavern, were among the leaders in proposing the first Continental Congress. And it was in Williamsburg, in May of 1776, that the Virginia convention instructed its delegates to the Continental Congress to move for independence.

In 1780 the capital was moved to Richmond. Overnight, Williamsburg became a small tountry town; little remained but the college and the public hospital. In the post-Revolutionary War years the college suffered losses of revenue but by 1836 it had recovered. Twice closed by the Civil War and its aftermath, in 1906 William and Mary became a state institution and in 1918 was made coeducational. The modern college has over 20 departments, and branches at Richmond and Norfolk. The public hospital, now Eastern State hospital, was the country's first hospital devoted exclusively to the care of the mentally ill. Opened in 1773, it has served the state continuously ever since.

During the Civil War, Union forces advancing on Richmond clashed with the Confederate rear guard just east of Williamsburg. After a day of heavy fighting (May 5, 1862), the Confederates withdrew, and Williarnsburg remained in Union hands for the remainder of the war.

Modern Williamsburg is famous as the site of Colonial Williamsburg, a restoration of the colonial capital of Virginia. William A. R. Goodwin, rector of Bruton Parish church, conceived the idea of preserving and restoring the colonial buildings that survived. In 1926 he interested John D. Rockefeller, Jr., in the project and Rockefeller agreed to provide the funds, which ultimately totaled more than $62,000,000.

An area of 130 ac., comprising the important part of the colonial city, was restored to its former appearance, and more than 3.000 additional acres were acquired to protect the restored area. In the course of the work, 700 modern structures were torn down or removed; 83 existing, original buildings were restored; and 413 buildings were reconstructed on their original foundations. The exhibition buildings, which include the capitol and the governor's palace, are furnished as they were in the 18th century, and the entire area has been landscaped to recover its colonial appearance. From its inception, the restoration has been based upon intensive and continuous architectural, archaeological and historical research. To give visitors a brief experience in 18th-century Iife, Colonial Williamsburg carries out a vigorous interpretive program. An information centre, located just outside the restoration. introduces visitors to the history and importance of Williamsburg; within the restored area costumed hostesses, craftsmen, militiamen and attendants give the city a flavour of living history.

For comparative population figures *see* table in VIRGINIA: *Population.*

WILLIAMSON, WILLIAM CRAWFORD (1816–1895), English naturalist, one of the founders of modern paleobotany, was born at Scarborough, Yorkshire, on Nov. 24, 1816. He early acquired a knowledge of geology and natural history. Successively an apprentice apothecary, medical student, museum curator and physician, he was appointed professor of natural history at Owens college, Manchester, in 1851, where he taught until 1892. Williamson died at Clapham Common, London, on June 23, 1895.

Among Williamson's earlier works are accounts of *Volvox* (1851–52) and Foraminifera (1858). He had meanwhile begun the serious study of fossil plants; his paleobotanical researches culminated in the 19 memoirs under the title *On the Organisation of the Fossil Plants of the Coal Measures* (1872–94) that established Williamson as a leader in the field. These studies continued in three memoirs (1895–96) written with D. H. Scott (*q.v.*). Notable also are Williamson's papers on *Sphenophyllum, Lepidodendron* and *"Stigmaria,"* and his work on isolated seeds. He rightly maintained that certain fossils containing secondary wood—then considered a phanerogamic characteristic—were in reality cryptogams.

Williamson's *Reminiscences of a Yorkshire Naturalist* (1896) contains an approximate list of his more than 150 publications. (J. W. TT.)

WILLIAMSPORT, a city in north-central Pennsylvania, U.S., and seat of Lycoming county, is on the north bank of the west branch of the Susquehanna river, 85 mi. N. of Harrisburg.

Founded in 1795 near the site of a Revolutionary War Indian massacre, Williamsport became the seat for the new Lycoming county, the largest county (1,215 sq mi.) in Pennsylvania. Chartered as a borough in 1806, it became a city in 1866. In the 1860s the U.S lumber industry was centred there as logs were floated down the upper tributaries of the Susquehanna. In 1871 a "sawdust war" developed during a wage strike by lumber workers. As the forests disappeared, and new forests were opened in the west, the lumber industry dwindled. With more diversified industry in the second half of the 20th century, the city's major industries concerned metal products, including aircraft engines, boilers, wire rope. fire hydrants and valves. Textile mills made broad silks, braids, clothing, hosiery and shirts. Hardwood flooring, furniture and leather products continued in importance.

A Methodist academy founded in 1812 later became Williamsport-Dickinson junior college and in 1948 Lycoming college. Williamsport Technical institute is a trade school. Four city parks have an area of about 250 ac. Williamsport is the home of Little league baseball and the annual world series are held in the city. The weekly newspaper *Grit* is distributed nationally. For comparative population figures, *see* table in PENNSYLVANIA: *Population.* (W. A. C.)

WILLIAMSTOWN (VICTORIA) : *see* under MELBOURNE.

WILLIBRORD (WILBRORD), **SAINT** (d. 738), English missionary, "the apostle of the Frisians," was born about 657. His father, Wilgils, an Angle or, as Alcuin styles him, a Saxon, of Northumbria, withdrew from the world and constructed for himself a little oratory dedicated to St. Andrew. The king and nobles of the district endowed him with estates till he was at last able to build a church, over which Alcuin afterward ruled. Willibrord, almost as soon as he was weaned, was sent to be brought up at Ripon, where he must doubtless have come under the influence of Wilfrid. About the age of 20 the desire of increasing his stock of knowledge (*c.* 679) drew him to Ireland, which had so long been the headquarters of learning in western Europe. Here he stayed for 12 years, enjoying the society of Ecgberht and Wihtberht. Ecgberht commissioned him as a missionary to the North German tribes.

In his 33rd year (*c.* 690) he started with 12 companions for the mouth of the Rhine. These districts were then occupied by the Frisians under their king, Rathbod, who gave allegiance to Pippin of Herstal. Pippin befriended Willibrord and sent him to Rome, where he aas consecrated archbishop (with the name Clemens) by Pope Sergius on St. Cecilia's day 696. Bede says that when he returned to Frisia his see was fixed in Ultrajectum (Utrecht). He spent several years in founding churches and evangelizing, till his success tempted him to pass into other districts From Denmark he carried away 30 boys to he brought up among the Franks. When Pippin died, Willibrord iound a supporter in his son Charles Martel. He was assisted for three years in his missionary work by St. Boniface (719–722).

He was still living when Bede wrote in 731. A passage in one of Boniiace's letters to Stephen III speaks of his preaching to the Frisians for 50 years, apparently reckoning from the time of his consecration. This would fix the date oi his death in 738; and, as Alcuin reports he was 81 years old when he died, it may be inferred that he was born in

657. The day of his death was Nov. 6.

WILLIS, ROBERT (1800–1875), British professor distinguished for his teaching and research in applied mechanics and for his contributions to architectural archaeology, was born in London, Feb. 27, 1800. Educated at Caius college, Cambridge, he was elected a fellow in 1826 and ordained the following year. He worked for some time on the phenomena of sound, being elected to the Royal society in 1830, and in 1837 he became Jacksonian professor of experimental philosophy, confining his attention particularly to applied mechanics and mechanisms. An original member of the British Association for the Advancement of Science. he was president in 1862 and contributed important papers on gear teeth (1837) and on the effect of moving loads on bridges (1849), the result of his researches for the royal commission on the application of iron to railway structures.

Willis was also an antiquary and a student of architecture and wrote many papers on the history and construction of English cathedrals. However, his most lasting memorial is the professorship of mechanism and applied mechanics and the university department of engineering, which were established at Cambridge on his death there, Feb. 28, 1875. (J. F. Br.)

WILLIS, THOMAS (1621–1675), English anatomist and physician, was born on Jan. 27, 1621, the son of a well-educated landowner who lived near Oxford. He attended Christ Church college, Oxford, graduating in 1639. Despite his military service on the royalist side during the Civil War, he was able to continue his studies and established a scientific reputation through his publication entitled *Of Fermentation, of Feavers, and of Urines.* He became Sedleian professor of natural philosophy at Oxford in 1660. While holding this position, Willis published his most important work, *Cerebri anatome nervorumque descriptio et usus* (1664), in which he described what is still known in the anatomy of the brain as the circle of Willis.

In 1667 he moved to London to practise medicine. Although he carried on the largest fashionable practice of his time, he continued to study and to write extensively. He was the author of the first important treatise on diabetes to be translated from Latin into English; this appeared in a chapter of *Pharmaceutice Rationalis—Shewing the Signs, Causes and Cures of Most Distempers.* He described the typical symptoms of diabetes, including the thirst, increased urination and sweetness of the urine, "as if there had been Sugar or Honey in it." Willis' career was terminated prematurely by his death from pleurisy and pneumonia on Nov. 11, 1675.

See Frank N. Allan, "The Writings of Thomas Willis, M.D.: Diabetes Three Hundred Years Ago," *Diabetes,* 2:74–73 (Jan.–Feb. 1953).
(F. N. A.)

WILLISTON, SAMUEL WENDELL (1852–1918), paleontologist and entomologist who became the leading U.S. authority of his time on fossil reptiles and amphibians, was born in Boston. Mass., on July 10, 1852, but was reared in Manhattan, Kan.. where he graduated from Kansas State Agricultural college (later Kansas State College of Agriculture and Applied Science) in 1872. Having successfully participated in a fossil-collecting trip on behalf of O. C. Marsh of Yale university, he was invited in 1876 to go to New Haven as an assistant to Marsh. He served in this capacity for much of the time for the next nine years, meanwhile earning both the M D. and Ph.D. at Yale. Dissatisfied, Williston finally broke with Marsh in 1855. After some years spent in teaching and the practice of medicine in New Haven, he went in 1890 to the University of Kansas, where, during the next 12 years. he was professor of geology and of anatomy and later dean of the school of medicine. In 1902 he was called to The University of Chicago as professor of vertebrate paleontology. Forbidden under Marsh to publish on fossils, Williston early took up the study of entomology and became an authority on the Diptera. His main interest. however, continued to be fossil vertebrates. At Kansas, his researches lay mainly in the abundant marine reptiles of the chalk deposits of that state. At Chicago his interests turned to the Permian red beds of Texas and New Mexico, from which, with the assistance of the veteran collector Paul C. Miller, he described a great series of early tetrapods. His most important work was the posthumous *Osteology of the Reptiles* (1925), setting forth his mature conclusions on reptilian classification and phylogeny. Williston died at Chicago, Aug. 18, 1918.
(A. S. Rr.)

WILLKIE, WENDELL LEWIS (1892–1944), U.S. businessman and presidential candidate, was born Feb. 18, 1892, in Elwood. Ind. His father mas a lawyer and judge. and his mother was Indiana's first woman attorney. Willkie attended Culver Military academy and Indiana university (B.A., 1913; LL.B., 1916). and practised law with his father before entering the U.S. army in World War I. In Jan. 1918 he married Edith Wilk of Rushville, Ind. After the war, Willkie spent a year with the Firestone Tire and Rubber company before joining the law firm of Mather and Newbitt in Akron, O. In 1929 he moved to New York to handle legal work for Commonwealth and Southern corporation, a utilities holding company. Four years later, he became president of Commonwealth and Southern.

After 1933 Willkie engaged in a public feud with the federal government over competition from the Tennessee Valley authority (TVA), climaxed in July 1939 by the sale of Commonwealth and Southern's Tennessee holdings to TVA for $78,600,000. Although he had been a Democrat. Willkie's effective criticism of the New Deal and his widely circulated article in *Fortune* (April 1940) entitled "We, the People" made him a dark horse candidate for the Republican party. Despite a late start limited organization and opposition of the Republican party leadership. Willkie performed a miracle of modern politics. To chants of "We Want Willkie!" from the galleries in Philadelphia, he was nominated on the sixth ballot. Willkie carried only 10 states and was defeated by an electoral vote of 449 to 82; but he polled 22,305.198 to Roosevelt's 27,244,160, more popular votes than any previous Republican candidate.

Long before the attack on Pearl Harbor, Willkie advocated giving aid to the Allies. He went to England in 1941 and to the middle east, the Soviet Union and China in 1942. In the latter year he was named chairman of the board of Twentieth Century-Fox Film corporation His book *One World* (1943) was largely an outgrowth of his travels and was a strong plea for postwar international co-operation.

Support of Roosevelt's war policies brought considerable opposition to Willkie's renomination in 1944; and, after his defeat in the Wisconsin primary, he withdrew from the race. He died in New York city on Oct. 8, 1944. (*G.* Wo.)

WILLOW ***(Salix),*** a genus of plants constituting, with the poplar (*Populus*), the family Salicaceae. Willows are trees or shrubs, varying in height from a few inches, like the small British *S. herbacea* and arctic species generally, to 120 ft.. and occurring most abundantly in cold or temperate climates in both hemispheres, and generally in moist situations. Their leaves are deciduous. alternate, simple and generally much longer than broad, whence the term willow-leaved has become proverbial. At their base they are provided with stipules, which are also modified to form the scales investing the winter buds.

The floners are borne in catkins. which are on one tree male (staminate) only. on another female (pistillate). Each staminate flower is borne in the axil of a small scale or bract, and consists usually of two but sometimes of more stamens In addition there are one or two small glandular organs. the nectaries. The pistillate flowers are equally simple and also arise in the axil of a bract; they show a very short stalk, surmounted by two carpels adherent one to the other for their nhole length, except that the upper ends of the styles are separated into two stigmas; nectaries are present in these flowers also. When ripe the two carpels separate in the form of two valves and liberate a large number of seeds, each provided at the base with a tuft of silky hairs. The flowers appear generally before the leaves and are thus rendered more conspicuous, while transport of pollen by the wind is facilitated. Fertilization is effected by insects. especially by bees; but some pollen must also be transported by the wind to the pistillate flowers, especially in arctic species which, in spite of the poverty of insect life. set abundant fruit. The tuft of hairs at the base facilitates rapid dispersion of the seed.

Although the limitations of the genus are well marked, and its recognition in consequence easy, it is otherwise with regard to the species. The greatest difference of opinion exists among botanists as to their number and the bounds to be assigned to each; and the extensive cross-fertilization that takes place between the species, resulting in numerous hybrid forms, intensifies the difficulty.

Species and Distribution.— N. J. Andersson, a Swede, who spent nearly 25 years in their investigation, published a monograph on the genus. He admitted about 100 species. C. S. Sargent (*Silva of North America*) suggested 160 to 170 as the number of distinguishable species. In North America upward of 70 native species occur, together with numerous varieties and natural hybrid forms. Some botanists have enumerated 80 species from Great Britain, while others count only 12 or 15. Buchanan White, who made a special study of the British willows, grouped them under 17 species with numerous varieties and hybrids.

Of the North American species about 25 attain the stature of trees. The black willow *(S. nigra)*, the largest and most conspicuous willow of eastern North America, reaches a height of 120 ft., with a trunk 3 ft. in diameter. Other well-known willow trees found east of the Rocky mountains are the peach-leaved willow *(S. amygdaloides)*, sometimes 70 ft. high; the pussy willow *(S. discolor)*, 10 ft. to 25 ft. high; the shining willow *(S. lucida)*, occasionally 20 ft. high; the beaked willow (*S. bebbiana*), rarely 25 ft. high; and the sandbar willow *(S. interior)*. Some of the foregoing range northward and westward to British Columbia, Alaska and the Arctic circle. Interesting shrubby species found chiefly east of the Rocky mountains are the autumn willow *(S. serissima)*, with fruit maturing in the autumn; the broad-leaved willow *(S. glaucophylla)*, found on sand dunes; the furry willow *(S. adenophylla)*, of lake and river shores; the silky willow *(S. sericea)*, with silky leaves; the hoary willow *(S. candida)*, with sagelike foliage; and the prairie willow *(S. humilis)* and the dwarf pussy willow *(S. tristis)*, both low slender shrubs.

ROCHE

BLACK WILLOW (SALIX NIGRA) CATKINS

Among noteworthy willows found in the Pacific states and northward are the western black willow *(S. lasiandra)*, sometimes 45 ft. high; the red willow *(S. laevigata)*, 20 ft. to 50 ft. high; the California white willow or arroyo willow *(S. lasiolepis)*, 8 ft. to 20 ft. high; and the Sitka or velvet willow *(S. sitchensis)*, sometimes 30 ft. high, which grows from California to Alaska.

Several old world willows, widely planted for ornament and other purposes in eastern North America, have become extensively naturalized, especially the white willow *(S. alba)*, the yellow willow *(S. vitellina)*, the weeping willow *(S. babylonica)*, the brittle or crack willow *(S. fragilis)* and the purple willow *(S. purpurea)*. The basket willow (*S. viminalis*), the bay willow *(S. pentandra)* and the goat willow or sallow *(S. caprea)* have become sparingly naturalized.

Economic Value.—As timber trees many of the species are valuable for their rapidity of growth and for the production of light durable wood, serviceable for many purposes. Among the best trees of this kind are *S. fragilis*, the crack willow, and *S. alba*, the white or Huntingdon willow. These trees are usually found growing by riverbanks or in other moist situations, and are generally pollarded for the purpose of securing a crop of straight poles. The wood of *S. alba* var. *calva* is used for cricket bats; there is a great difference in the value for this purpose of timber from different soils; and wood of the pistillate tree is said to be preferable to that of the staminate. *S. caprea*, a hedgerow tree, generally grows in drier situations. It is a useful timber tree, and its wood, like that of *S. alba*, is prized in the manufacture of charcoal. Its catkins are collected in celebration of Palm Sunday, the bright-coloured flowers being available in early spring. Certain types of willow are largely used for basketmaking and wickerwork. The species employed for this purpose are known under the collective name of osiers. *(See* OSIER.) *S. acuminata* and other species do well by the seaside, and are serviceable as windscreens, nurse trees and hedges. *S. daphnoides*, *S. repens* and other dwarf kinds are useful for binding heathy or sandy soil. In addition to their use for timber or basketmaking, willows contain a large quantity of tannin in their bark. A medicinal glucoside named salicin *(q.v.)* is also extracted from the bark. The wood, especially of *S. alba*, is used for paper pulp. As ornamental trees some willows also take a high rank. The white willow is a great favourite, while the drooping habit of the weeping willow renders it very attractive. Though named *S. babylonica*, it is really a native of China, from which it has been widely spread by man; the willow of the Euphrates (Ps. cxxxvii) is in all probability *Populus euphratica*. *S. repens* var. *rosmarinifolia* is remarkable for its very narrow leaves—purplish above, silvery beneath.

WILLOW HERB, the popular name for species of *Epilobium*, a genus (of the evening primrose family, Onagraceae) of often tall herbaceous plants. The genus embraces upwards of 200 species. The slender stems bear narrow leaves and pink or purple flowers, which in the great willow herb *(E. angustifolium)* are one inch in diameter and form showy spikes; this is one of the fireweeds found throughout the north temperate zone, especially after forest fires. The hairy willow herb, E. *hirsutum*, found by sides of ditches and rivers, is popularly known in the United States as apple pie, and in England as codlins and cream. In North America willow herbs are common; E. *angustifolium* is native across the continent, and E. *hirsutum* is extensively naturalized in the eastern states and Canada. The spread of both species is facilitated by copious, tufted seeds. (N. TR.)

WILLSTÄTTER, RICHARD (1872–1942), German organic chemist whose studies of the structure of chlorophyll *(q.v.)*, demonstrating the central magnesium atom, the pyrrole rings and the presence of phytol won him the Nobel prize in 1915, was born at Karlsruhe, Aug. 13, 1872. These and similar researches on the pigments of the blood formed the basis for the later work of Hans Fischer who was named Nobel laureate in 1930 for his complete synthesis of hemin.

Willstatter studied at Munich under Adolf von Baeyer, *(q.v.)*, obtaining his doctorate in 1894. In 1905 he became professor at Zurich. He was director of the Kaiser Wilhelm institute in Berlin (1912–16) and then succeeded his old teacher Baeyer at the University of Munich. He resigned because of anti-Jewish pressure in 1925, but continued his work privately, first in Munich, and later in Switzerland.

Willstatter began his career with an investigation of plant alkaloids, determining (1898) the structures of tropine, atropine and cocaine, and synthesizing several alkaloids including tropine. There followed a penetrating study of the quinones, culminating in the determination of the structure of aniline black. Next came the work on blood pigments and chlorophyll, leading to further investigations which revealed the structures of many of the pigments of flowers and fruits.

In his later years, Willstatter took up the study of enzymes and of catalytic hydrogenation, particularly in the presence of oxygen. His work on the degradation of cellulose was used as the basis for the process for obtaining glucose from wood. He also investigated the phenomenon of fermentation, and was a pioneer in the use of hydrogels for absorption.

It was characteristic of Willstatter that he attempted only difficult problems, remarking that the greatest joy in research came from overcoming obstacles. He also stated that the highest goal of science is the improvement of the lot of humanity, and he was particularly proud of his syntheses of hypnotics and narcotics, which included cocaine and Avertin.

He died in forced exile at Locarno, Switz., on Aug. 3, 1942. His autobiography, *Aus meinem Leben*, was published in 1949.

For additional biographical details *see* R. Adams, *J. Amer. Chem. Soc.*, 65:127 (1943); F. Haber *et al., Naturwissenschaften*, 20:601 (1932).

WILLUGHBY, FRANCIS (1635–1672), English naturalist, ornithologist and ichthyologist, born at Middleton, Warwickshire, was the pupil, friend and patron, as well as the active and original co-worker, of John Ray (*q.v.*), and hence to be reckoned as one of the most important precursors of Linnaeus. His connection with Ray dated from his studies at Trinity college, Cambridge (1653–59), and he made an extensive continental tour with Ray in 1663–64. The specimens, figures and notes they accumulated were in great part elaborated into Willughby's *Ornithologia*, posthumously published in 1676 and translated by Ray as *The Ornithology of Francis Willughby* (1678); the same friend published his *Historia Piscium* (1686). In Ray's preface to the *Ornithology* he gives Willughby much of the credit usually assigned to himself, both as critic and systematist. Willughby was an original fellow 'of the Royal society, organized in 1663. He died at Middleton hall on July 3, 1672.

WILEYS, JOHN NORTH (1873–1935), early U.S. automobile manufacturer, was born in Canandaigua, N.Y., on Oct. 25, 1873. In 1898 he organized the Elmira Arms Co. and then turned to the production of bicycles. Willys also acted as dealer for the Overland automobile, and he bought the company when it was in financial difficulties during the panic of 1907, changing its name to Willys-Overland. In 1909 he purchased the plant of the Pope-Toledo company and expanded the Willys-Overland operation. By 1916 only the Ford outsold the Willys-Overland. Willys was appointed Cnited States ambassador to Poland in 1930. He resigned in 1932 and resumed control of the Willys-Overland company, which was in financial trouble. The firm went into receivership in 1933. Willys died on Aug. 26, 1935. (M. J. Bi.)

WIEMETTE, a residential village of Cook county, in northeastern Illinois, U.S., is 14 mi. N. of downtown Chicago and borders Lake Michigan on the east and Evanston on the south. Public beach, park and other recreational facilities are among the best on the North Shore, a residential area comprising suburbs north of Chicago. There is a U.S. coast guard station at the lake harbour, which provides mooring for pleasure craft.

The name is derived from Antoine Ouilmette, a French fur trader who lived there. The village was founded in 1869 and incorporated in 1872; it established council-manager government in 1930. A tourist attraction is the Baha'i temple, a house of worship of the Baha'i faith (*q.v.*). For comparative population figures see table in ILLINOIS: *Population.* (H. H. Gr.)

WILMINGTON, a city in Delaware, U.S., and seat of New Castle county, is at the confluence of the Christina river and the Delaware; the city extends along both banks of the Christina and of Brandywine creek, which joins the Christina just above its mouth. Pop. (1960) city 95,827; standard metropolitan statistical area (New Castle county in Delaware and Salem county in New Jersey) 366,157. The oldest permanent settlement in the Delaware River valley, Wilmington was founded in 1638 by Swedish settlers under the leadership of Peter. Minuit (see DELAWARE: *History*). Then called Ft. Christina, it was captured by the Dutch under Peter Stuyvesant in 1655 after a short siege by land and water. In turn the Dutch, who had named the town Altena, were conquered by the English in 1664.

For its first 100 years the settlement was a small agricultural hamlet. In the 1730s enterprising Quakers moved there from Pennsylvania and developed it into a prosperous port and market town. They secured a borough charter from Thomas Penn, the proprietor, who named the town for his friend Spencer Compton, earl of Wilmington (1673–1743), who had no other connection with it.

By the time of the American Revolution: Wilmington, though still small, was the largest town in Delaware. Its growth was due to facilities for transportation afforded by the Christina and to the fertility of neighbouring farmlands. Farmers in Lancaster county, Pennsylvania, brought their goods to Wilmington to be sent on by water to Philadelphia, farther to the east and north. Mills on neighbouring streams processed wheat and corn for market. The Brandywine, just north of Wilmington, was a miller's paradise, remarkable for its steady flow and numerous millsites. Sawmills, grist mills, textile mills and paper mills were built on its banks and by the 1790s its flour mills were the largest in the United States. In 1802 a French immigrant, Eleuthère Irénée du Pont de Nemours, established a powder mill, the beginning of the most famous business in Delaware.

In the 1830s Wilmington began to develop rapidly as a manufacturing centre. It received a city charter in 1832, and in 1837 the Philadelphia, Wilmington and Baltimore railroad (now part of the Pennsylvania system) was completed, giving Wilmington easy rail connection with all the principal cities of the east coast. The characteristic of its manufacturing in the next century was variety, with iron-hulled ships, leather. textiles, iron and steel goods, and vulcanized fibre among the chief products.

In the 20th century, three Wilmington powder companies, the Hercules Powder company, the Atlas Powder company and especially E. I. du Pont de Nemours and company, expanded into the chemical industry and the city became the centre of their administration and experimentation, but of only a small part of their manufacturing. Therefore in Wilmington's fourth century, beginning in the 1930s, it continued to be a manufacturing city and port but was also a white-collar centre and the home of many business executives, scientists and technologists, particularly those connected with the chemical industry. In the same period, its growth overleaped the city boundaries, and housing, industrial establishments and shopping centres began moving into the neighbouring countryside. The population of Wilmington is changing very little within the city boundaries, but the remainder of New Castle county experienced its most rapid growth in history after World War I In 1920 Wilmington included over half the population of the entire state; 40 years later there were more people in the suburbs than in the city.

Transportation facilities include the Wilmington Marine terminal on the Christina, which serves ocean-going ships; the New Castle county airport; and railroad passenger and freight service. Recreational facilities include the Playhouse theatre in the Du Pont building, and public parks, the largest of which are those on both shores of the Brandywine. Historic sites and museums include Fort Christina State park, Old Swedes church. Historical Society of Delaware (Old Town hall), the Hagley museum (of industrial history) on the Brandywine and the Henry Francis du Pont Winterthur museum. For comparative population figures *see* table in DELAWARE: *Population.*

Lincoln, *Wilmington, Delaware: Three Centuries under Four Flags, 1609–1937* (1937); Elizabeth Montgomery, *Reminiscences of Wilmington (1851).* (J. A. Mu.)

WILMINGTON, the chief seaport of North Carolina. U.S., a port of entry and seat of New Hanover county, is in the southeastern part of the state on Cape Fear river. 30 mi. above its entrance and 115 mi. S.E. of Raleigh. Connected with the ocean by a 34-ft. river channel, its spacious fresh-water harbour has public and private shipping accommodations. An important distribution point for its major imports, petroleum and its derivatives, it also imports fertilizer materials and numerous other products. The principal exports are wood pulp, pulpwood and scrap metal. Wilmington is the trading centre of a thriving truck-, tobacco- and flower-growing area; its industry includes textiles. wearing apparel, wood and wood products, commercial boilers and fertilizer. It is also the centre of a resort and sports fishing area.

In the early 1730s adjacent settlements known as New Liverpool and New Carthage were laid out; the whole soon became known as New Town (Newton) to distinguish it from the older town of Brunsmick, formerly located downstream. In 1730 it was incorporated as a town and renamed in honour of the English political leader Spencer Compton, earl of Wilmington. Wilmington was the centre of violent resistance to the Stamp act in 1765–66. and nearby, in Feb. 1776. a British effort to conquer the colonies by division was frustrated at the battle of Moore's Creek Bridge. In the spring of 1781 it was occupied for several weeks by Cornwallis. A centre of Civil War blockade running and the last Confederate port to close, it was open until Jan. 15, 1865, when Ft. Fisher (22 mi. S.) fell before a land and sea attack. It was incorporated as a city in 1866 and adopted a council-manager government in 1941. For comparative population figures *see* table in NORTH CAROLINA: *Population.* (E. L. LE.)

WILMOT, DAVID (1814–1868), U.S. political leader, born at Bethany, Pa., Jan. 20, 1814. He was admitted to the bar in 1834 and practised law in Towanda. He entered politics as a Democrat, served in the national house of representatives (1845–51), and, although he favoured the Walker tariff, the Mexican War and other party measures, he opposed the extension of slavery. On Aug. 8, 1846, on behalf of advocates of the restriction of slavery he offered an amendment to a bill appropriating $2,000,000 to settle the U.S. boundary with Mexico by purchase of land if necessary, to the effect that "neither slavery nor involuntary servitude shall ever exist in any part of the said territory" acquired from Mexico. The bill including the Wilmot proviso, as the amendment was called, passed the house, but was defeated by the senate's adjournment. Although the Wilmot proviso failed again in 1847, it was revived in the house again and again in the two years following. Out of the efforts of the Democrats and Whigs to subordinate this issue grew the Republican party that definitely accepted the principle of the proviso. Wilmot supported Martin Van Buren in 1848 and entered the Republican party at the time of its formation. Wilmot was president judge of the 13th judicial district of Pennsylvania in 1853–61, U.S. senator in 1861–63 and judge of the U.S. court of claims in 1863–68. He died at Towanda, Pa., March 16, 1868.

WILSON, ALEXANDER (1766–1813), Scottish-American ornithologist and poet, author of *American Ornithology,* a pioneer work on North American birds, was born in Paisley, Renfrewshire, Scot., on July 6, 1766. At 13 he was apprenticed to a weaver, but in 1789 he rebelled and became a peddler; traveling throughout eastern Scotland, he composed numerous dialect poems treating his lot or depicting with broad humour the life and poverty of the common folk. The most famous of these productions, *Watty and Meg,* published as a penny chapbook, is said to have sold to the number of 100,000 copies within a few weeks and to have been praised by Robert Burns. In the labour troubles which arose at this time Wilson's sympathies were naturally with the oppressed weavers. He published a number of lampoons in verse, for which he was convicted of libel and compelled to burn his satires at the town cross; later, unable to pay a fine, he was imprisoned. Beset by these events Wilson, with his nephew William Duncan, emigrated as a deck passenger in 1794 to America, landing with only a gun and the clothes on his back. His years of poverty and hardship were not over, but a turning point came when, in 1802, as a village schoolmaster near Philadelphia, he met William Bartram, the naturalist, who encouraged him in his drawing and collecting "of all the birds in this part of North America." In 1807 he obtained the assistant editorship of the American edition of Abraham Rees's *Cyclopaedia,* and thus acquired more means and leisure for his great work, *American Ornithology,* the first volume of which appeared in 1808. By 1813 seven volumes had appeared. Wilson died at Philadelphia on Aug. 23, 1813.

Wilson's poems and literary prose were edited with a memoir by A. B. Grosart in 1876, a statue being erected to him in Paisley the same year. The eighth and ninth volumes of the *American Ornithology* were edited after his death by his friend George Ord, who published an early *Sketch of the Life of Alexander Wilson,* and the work was continued by Lucien Bonaparte. The complete *Ornithology* has been republished several times.

WILSON, CHARLES THOMSON REES (1869–1959), Scottish physicist who made the paths of electrically charged particles visible by means of the so-called "Wilson cloud chamber," for which work he was awarded the Nobel prize for physics in 1927, jointly with A. H. Compton (*q.v.*). He was born on Feb. 14, 1869, at Glencorse, near Edinburgh, Scot., and was educated at Owens college, Manchester, and Sidney Sussex college, Cambridge. He was Clerk Maxwell student in the Cavendish laboratory, Cambridge, and in 1900 he was appointed lecturer in physics and elected a fellow of the Royal society. From 1925 to 1934 he was Jacksonian professor of natural philosophy at Cambridge. He studied the formation of clouds and mists as well as atmospheric electricity for many years and between 1895 and 1911 he applied his knowledge of the condensation of water vapour in his work on the Wilson cloud chamber. These researches on the paths of electrically charged particles were based on the observation that the sudden expansion of moist air above certain limits led to the condensation of droplets of water even in the absence of dust particles. Wilson concluded that in dust-free air the nuclei effecting condensation were electrically charged particles or ions, and demonstrated the correctness of this inference by experiments with a variety of ionizing rays. He then realized that it should be possible to photograph the track of an ionizing particle passing through moisture saturated air, suddenly and adequately expanded, because minute water droplets would condense on the ions produced by the particle along its path through the moisture saturated air. The first test was made with X rays and it revealed the track of the electrons ejected by the rays. Similarly, the tracks of alpha particles were photographed; and this ingenious method proved of the greatest advantage in the study of the subatomic particles, as, for instance, in the determination of the fundamental electronic charge, *e*, and in the study of cosmic rays, while it led also to the discovery of the positron *(see* CLOUD CHAMBERS). He died Nov. 15, 1959, near Edinburgh. (D. McK.)

WILSON, EDMUND BEECHER (1856–1939), U.S. biologist. an outstanding investigator of the structure and physiology of cells. as well as the early stages of development in animals, was born at Geneva. Ill.. on Oct. 19. 1856. He received a Ph.B. degree from the Sheffield scientific school, Yale university, in 1878, and his Ph.D. at Johns Hopkins university, Baltimore, Md., in 1881. This was followed by an extended period of study in Europe, chiefly at the universities of Cambridge and Leipzig, as well as the zoological station at Naples. It was during this period that he formed close friendships with such men as Anton Dohrn and T. Boveri, who like himself were to wield an immense influence in the growth of biology.

Starting in 1883, Wilson held positions successively at Williams college. Williamstown, Mass., Massachusetts Institute of Technology, Cambridge, and Bryn Mawr college. Bryn Mawr, Pa. In 1891 he joined the department of zoology at Columbia university, where, after serving as adjunct professor and professor, he became Da Costa professor and chairman of the department At Columbia he attained international fame and many honours for his researches He died on March 3, 1939.

Wilson's studies were first concerned with the early stages in the embryology of animals, special emphasis being laid on tracing the formation of the different types of tissues from certain, individual cells. This work on "cell lineage" led him to problems presented in the internal organization of the cell. and this was signalized in 1896 by the publication of his *The Cell in Development and Inheritance,* a book which was to have a profound effect on the trend of biological thought. On the rediscovery of G. J. Mendel's earlier findings in 1900, Wilson at once recognized their far-reaching significance, and this recognition was to have much influence in preparing the way for the great genetical discoveries made in his department at Columbia by T. H. Morgan and his associates. In 1905 Wilson published his first paper on the relation of chromosomes to the determination of sex; this. as well as a series of brilliant studies on the same subject that were published during the following eight years, represents the crowning achievement of his research activities. Much of his later endeavour was directed to the preparation of the famous third edition (1925) of *The Cell,* a comprehensive treatise on the great developments that had occurred in the field to which he had contributed so much.

Sci., 21* 315–342 (1940), contains list of Wilson's publications, H J Muller, "Edmund B Wilson—an Appreciation," *Amer. Nat.,* 77:5–37 and 142–172 (1943); Franz Schrader, "Edmund Beecher Wilson—Scientist," *Columbia Univ. Quart.* (Sept 1939).
(F. SR.)

WILSON, GEORGE GRAFTON (1863–1951), U.S. international lawyer, known particularly for his contribution to the laws of naval warfare and the rules for insurgents, mas born March 29, 1863, at Plainfield, Conn. Educated at Brown university where he received his Ph.D. degree (1889) and where he was professor of political science (1894–1910), he was professor of international law at Harvard university (1910–36) and at the U.S. Naval War college (1900–37). Wilson was a U.S. delegate to the London Naval conference, 1909; counselor, American legation, The Hague, 1914; editor in chief, *American Journal of International Law*, 1924–43; and also noted as author of *International Law Situations* (36 vol., 1902–37) prepared for the Naval War college. In those volumes and in *International Law* (with George F. Tucker, 1901; 10th ed., 1937) Wilson stressed the importance of the laws of war and of sovereign consent as basic for international law's binding character. He died April 30, 1951, at Cambridge. Mass. (P. S. W.)

WILSON, HAROLD ALBERT (1874–), Anglo-American physicist. best known for his experiments bearing on the theories of Maxwell. Lorentz and Einstein. was born in York, England, Dec. 1. 1874. Educated at the universities of Leeds (1893–97), Cambridge (1897–99 and 1900–05) and Berlin (1899–1900), he held professorships at King's college, University of London (1905–09); McGill university, at Montreal (1909–12); University of Glasgow, Scot. (1924–25), and in 1912 he became professor of physics at the opening of the Rice institute in Houston) Tex., where he remained until his retirement in 1947. He became a naturalized American citizen in Nov. 1931.

Wilson was at the Cavendish laboratory in Cambridge during the years 1897–1905 at the time when J. J. Thomson's work on electrons and positive rays had made it a centre for the study of the newly emerging field of the electrical nature of matter. The impetus created by his study at Cambridge continued unabated through the rest of his active life. and led to a steady stream of research results. Wilson published papers on electrical effects in gases and flames, on the emission of electrons by hot bodies: on the electronic charge and on the electromotive force in insulators moving in a magnetic field.

Wilson was elected a fellow of the Royal society (1906) and of the American Philosophical society (1914). He wrote four books: *The Electrical Properties of Flames and Incandescent Solids* (1912). *Experimental Physics* (1915), *Modern Physics* (1928) and *The Mystcries of the Atom* (1934). (W. V. H.)

WILSON, HENRY (1812–1875), U.S. vice-president, 1873–75. was born at Farmington, N.H., on Feb. 16. 1512. His original name, Jeremiah Jones Colbath, was changed by legislative act to Henry Wilson when he was 21. He was an indentured farm labourer as a youth, then learned shoemaking at Natick, Mass., and became a small-scale ,shoe manufacturer. Largely self-educated, he attracted attention as a stump speaker and was elected to the Massachusetts house of representatives in 1840 as a Whig. He served in the Xlassachusetts house and senate for several terms. Disappointed at the Whig party's stand on slavery. he helped form the Free-Soil party in 1848, and presided over its national convention in 1852. He joined the Know-Nothing party in 1854. an act that caused him some embarrassment later, but which secured him election to the U.S. senate in Jan. 1855.

Wilson served in the senate until 1873. His pronounced anti-slavery views soon converted him into an uncoinpromising Republican. He became chairman of the committee on military affairs and was responsible for much wartime legislation. He opposed President Johnson and supported extreme reconstruction measures. After being defeated for vice-president at the Republican convention of 1868 he was nominated in 1872 and elected for Grant's second term. He died in office from a paralytic stroke, Nov. 22, 1875.

Wilson was a shrewd political organizer and was always a defender of the underdog. He wrote three volumes on the accomplishments of the American Civil War and reconstruction congresses. but is best known for his *History of tlze Rise and Fall of the Slave Power in America* (3 vol., 1872–77).

See Elias Nason and Thomas Russell, *Life and Public Services* of *Henry Wilson* (1876). (E. H Ro)

WILSON, SIR HENRY HUGHES (1864–1922). British soldier, who did great constructive work for the British army and was, as much as any man in Great Britain, the builder, though not the architect, of the entente with France. was born at Edgeworthstown, County Longford, Ire., on March 5. 1864, and educated at Marlborough and Sandhurst. His earliest experience of active service mas in Burma between 1886 and 1888. He served in the South African War and before that war ended in 1902 was brought back to the war office. where in the newly formed staff-duties directorate It was his task to study and to apply the lessons which were learned in South Africa—of which the chief perhaps was the necessity of organizing the British army and establishing a general staff for the study and application of the principles of war. In the work of reform Henry Wilson played a great. if still subordinate, part and in 1906 he was appointed as commandant of the Staff college at Camberley. An inspiring teacher. he gathered around him a group of young officers upon whom he impressed his own views and his own system. He became impressed with an almost overpowering sense of the imminence of war between France and Germany. The entente was already in existence. and if it were to mean anything. must carry with it grave military responsibilities. Wilson, therefore, established close relations with the French Staff college, and particularly a close personal friendship with its commandant, Ferdinand Foch. Cnder his influence Wilson became convinced of the danger which was threatening Europe and made himself acquainted with the Franco-German frontier.

In 1910 he left the Staff college to succeed Sir W. Robertson as director of military operations. Wilson concentrated the labours of his directorate upon what he believed to be the vital field of operations. He was one of Lord Roberts' most ardent supporters in his campaign for national training. Thus, while British statesmen were striving for peace, Wilson, acting under the chief of the imperial general stafi. was step by step perfecting the nation's preparations for war. Hence, in Aug. 1914 the British war office was in a position to bring off a strategical surprise. Mobilization was rapid and the British expeditionary force was landed in France without the loss of a man or a horse. complete in every detail. In France Wilson was deputy chief of the general staff. It was therefore natural that he should be appointed principal liaison officer with the French field headquarters.

Although deeply interested in the life and welfare of the private soldier, he never really made his mark as a commancler. Early in 1917 he left the field armies and accompanied Lord Milner's mission to Russia. In Nov. 1917 he went to Versailles as British military representative on the newly established Supreme War council. Three months later he became chief of the imperial general staff. He supported Lloyd George in his efforts to secure unity of command on the western front and strongly pressed for the appointment of Foch as the commander in chief of the Allied forces in France.

Wilson belonged to what became known as the eastern school of thought rather than to the western, and when the German advance was checked he worked hard to re-establish that eastern front which was shaken by the Russian Revolution, When the Armistice was declared on Nov. 11. 1918, he had attained the rank of general, and in the final honours for the war he was promoted field marshal and was given a baronetcy and a grant of £10,000. As chief. of the general staff he was military adviser of the government during the prolonged negotiations at Versailles, and subsequently at numerous conferences.

Political Career.—Immediately after World War I the troubles in Ireland came to a head. His position as chief of the imperial general staff, under a government with whose policy in Ireland he could not agree, became extremely difficult. Cordial relations became strained and old friendships were broken. When. in Feh. 1922, his tenure at the war office came to an end, he entered parliament as member for North Down and placed his military experience at the disposal of the government of Xorthern Ireland. In the house of commons he quickly established himself as the most outspoken critic of those colleagues with whom in his military capacity he had worked so long. and in so doing he drew upon himself the hatred of his fellow countrymen in the 26 Irish counties.

He was shot on his doorstep in Eaton place, London, June 22, 1922, by two Sinn Feiners. (N. MA.)

WILSON, HENRY MAITLAND WILSON, 1ST BARON (1881–), British field marshal, a leading figure of World War II, was born in London on Sept. 5, 1881, and educated at Eton. After service in the South African War and World War I, he was sent in 1939 to command British troops in Egypt. With Generals Wavell and O'Connor he was largely responsible for the rout of the Italian army in the western desert in the winter of 1940–41. Thereafter he held a succession of high commands in the middle east, including those of the expedition to Greece in March 1941 and of the mixed force of British commonwealth and Free French troops which wrested Syria from the control of the Vichy government in the summer of that year. In 1944 he became supreme Allied commander in the Mediterranean. Wilson maintained excellent relations between the British and U.S. forces, being, in Gen. Dwight D. Eisenhower's words, "affectionately known as 'Jumbo' throughout the Allied forces," and he was a natural choice to succeed Sir John Dill as head of the British joint staff mission at Washington (1945–47). In this capacity he attended the Yalta and Potsdam conferences. He was created a baron in 1946. Lord Wilson's book, *Eight Years Overseas, 1939–1947,* was published in 1950. (J. R. M. B.)

WILSON, JAMES (1742–1798), U.S. constitutional lawyer, political theorist, politician and jurist. He was born on Sept. 14, 1742, on his father's farm in the little village of Carskerdy in the shire of Fife, Scot. Wilson attended nearby St. Andrews university, which was alive with the spirit of the Scottish Renaissance. Forced to cut short his formal education when his father died, he tried tutoring and bookkeeping before abandoning Scotland for America in 1765. He arrived in Philadelphia during the exciting Stamp act days and began anew by teaching Greek and rhetoric in the College of Philadelphia. He soon turned with relief to law, his true métier, and for a year studied under John Dickinson, leader of the Pennsylvania bar and famous spokesman for colonial liberties. He left Philadelphia for Reading in 1767 to start his law practice, but in 1770 moved to Carlisle where he married Rachel Bird in 1771. By 1774 his training and his talents, both of which were of a high order, had carried him to the top of his profession in the colony. The publication in that year of his treatise (written in 1768), *Considerations on the Nature and Extent of the Legislative Authority of the British Parliament,* in which he set out a scheme of empire to give the British colonies the equivalent of dominion status, spread his fame beyond the bounds of Pennsylvania. In the power and acuteness of his intelligence he was the peer of John Adams and Thomas Jefferson, both of whom chose this time to publish schemes similar to Wilson's and thus anticipating the British Commonwealth of the future.

Wilson took his place in the forefront of the revolutionary movement in Pennsylvania at the outset when he became in 1774 a member of the committee of correspondence in Cumberland county and one of the county's delegates to the first continental congress at Philadelphia. His varied activities during the ensuing decade represented a valuable contribution to the revolutionary cause and made him a leader of the emerging nation. More important, they prepared Wilson himself for the great work of his career at the federal Constitutional Convention in 1787. He was a dominant figure in the second continental congress from May 1775, to Sept. 1777, and signed the Declaration of Independence. He opposed the radical champions of the strange Pennsylvania state constitution of 1776. As a Philadelphia lawyer he adopted conservative views that led to an unsuccessful attack on his home by a Philadelphia mob in 1779. In that year he was appointed advocate general for France and represented that country in cases arising out of its alliance with the American colonies. He also became a champion of the Bank of North America and an associate of Robert Morris in his struggle for currency reform after 1781. He served as an agent representing Pennsylvania in its dispute with Connecticut over the Wyoming valley in 1782. As a member of congress in 1783 and 1785–86 he pressed for an amendment to the Articles of Confederation to permit congress to levy a general tax. In all of these experiences he was led to think deeply again and again about the whole problem of government.

Before coming to the Constitutional Convention at Philadelphia in 1787. Wilson had penetrated to the heart of the great question that had perplexed Britain and the American colonies for a generation: how to establish viable central authority so necessary if the union were to endure and at the same time preserve the local rights that Americans insisted upon. During the convention he worked effectively to produce the answer found in the federal constitution. *(See* CONSTITUTION AND CONSTITUTIONAL LAW: *United States.)* Wilson followed up his work in the federal convention by leading the fight for ratification in Pennsylvania. In 1790 he engineered the drafting of a new constitution for the state and delivered a series of lectures which are landmarks in the evolution of American jurisprudence. An associate justice of the first U.S. supreme court, he participated in all of its important decisions after 1790 including his notable decision in *Chisholm* v. *Georgia.*

In the winter of 1796–97 long-impending financial ruin brought on by his reckless land speculations shattered his health and ended his career. He died a broken man, at Edenton, N.C., Aug. 21, 1798.

See the standard biography and guide to pertinent sources, Charles Page Smith, *James Wilson: Founding Father, 1742–1798* (1956). (W. W. A.)

WILSON, JOHN (1595–1674), English composer of songs from Shakespeare plays who may have been the Jacke Wilson mentioned in the stage direction of the first folio edition of Shakespeare (1623). Wilson became one of the King's musicians in 1635, went to Oxford with the court in the Civil War and after the surrender retired to the country for some years. He was professor of music at Oxford from 1656 to 1661. He published "Psalterium Carolinum" in 1657 and "Cheerfull Ayres" in 1660. He went back to his post as one of the King's musicians at the Restoration and died in London on Feb. 22, 1674.

WILSON, JOHN (CHRISTOPHER NORTH) (1785–1854), Scottish writer, principal contributor to *Blackwood's Magazine* in its early days, where his work appeared under the pseudonym Christopher North, was born at Paisley on May 18, 1785, the son of a wealthy manufacturer. He mas educated at Glasgow and Oxford universities, entering Magdalen college as a gentleman commoner in 1803. After receiving his B.A. in 1807 he lived at Elleray, his estate on Windermere. Noted for athletic prowess, he also cultivated literature, was friendly with Wordsworth and published in 1812 a volume of poems, *The Isle of Palms.* He married in 1811 and began to read for the Scottish bar in 1813, moving to Edinburgh with his family after losing his fortune in 1815. In 1817 he began to write for the newly founded *Blackwood's Magazine,* helping to ensure its success after a doubtful start, and, as its chief contributor, influenced its development, though never officially editor. The famous series of symposia, *Noctes Ambrosianae,* begun in 1822. was after 1825 mainly Wilson's work.

In 1820, largely through political influence, he became professor of moral philosophy at Edinburgh university. He continued, however, a voluminous contributor to *Blackwood's,* especially of sketches and miscellaneous and critical essays. He also wrote fiction of a sentimental and moral cast. Not an original thinker, Wilson relied much, both as teacher and essayist, on the ideas of his friend Alexander Blair (professor of rhetoric and belles-lettres at the new London university from 1831–34), clothing them with his own imaginative and often rhapsodic eloquence. His critical views were lively and sometimes penetrating, though erratic and often inconsistent.

He died at Edinburgh, April 3, 1854, after three years' retirement on a civil list pension.

WILSON, RICHARD (1714–1782), one of the earliest major British painters of landscapes, was born at Penegoes, Montgomeryshire, on Aug. 1, 1714, the son of a clergyman. Sent to

London in 1729, he studied portraiture under Thomas Wright and worked on his own from about 1735, being among those who presented works to the Foundling hospital in 1746. These and his "View of Dover" (National Museum of Wales, Cardiff). probably dating from 1747, show a growing interest in landscape which soon after his arrival in Italy late in 1750 became almost exclusive. Staying at first in Venice he studied the works of Titian, meeting the painter F. Zuccarelli and the British collector-consul Joseph Smith. Early in 1752 he went to Rome with William Lock of Norbury, one of the influential art circle which Wilson joined there and which included the painters C. J. Vernet and A R. Mengs. He remained until 1757, working much for aristocratic English tourists and producing not only large landscapes in the manner of the Poussins, Salvator Rosa and Claude, but numerous drauings of Roman sites and buildings which he used in composing Italianate landscapes after his return home. The finest of these is a set made for Lord Dartmouth and dated 1754. An oil painting of 1753, "Rome From the Villa Madama," still, like the drawings in the Dartmouth collection, shows how Wilson tempered his delicate observation of light and distance with the classical discipline of the 17th century. Returning to London probably in 1757, he became influential as a teacher, and after 1760 as an exhibitor with the Society of Artists and the Royal Academy of which in 1768 he was a founder-member and from 1776 librarian, a post he took to relieve his poverty.

Though continuing to produce Italian landscapes such as the "Lake Nemi" (Ford collection, London), dated 1768, Wilson now turned to his own country, especially to Wales and the then park-like environs of London. The order and clarity, rather than the classical apparatus, of Italy survive, but U'ilson's exact and tranquil recording of clear or suffused air, of distance and varied lights, predominates. Works of this class were vital in their influence on J. M. W. Turner, John Constable and John Crome, and later ones such as "Minchinden House" (Lord Leigh) tend to abandon formal composition, using tonal methods of recording space. Many works ascribed to him, especially late ones, are partly the work of his many pupils. He died near Llanberis, Caernarvonshire, on May 12, 1782. *See* also PAINTING: *Great Britain.*

WILSON, ROBERT (d. 1600), English actor and playwright, was a comedian in the earl of Leicester's company in 1572, 1574 and 1581, and from 1583 until about 1588 in the Queen's. He then probably gave up acting for writing. He wrote several morality plays. The *Three Ladies of London* (1584), *Three Lords of London* (1590) and *The Cobbler's Prophecy* (1594) are generally ascribed to him. *Three Ladies of London* contains the episode of the attempt of the Jew to recover his debt, afterward adapted by Shakespeare in *The Merchant of Venice.* ROBERT WILSON (1579–1610), supposed to be his son, was one of Philip Henslowe's dramatic hack writers.

WILSON, (THOMAS) WOODROW (1856–1924), 28th president of the United States, was born in Staunton, Va., Dec. 28. 1856. He had two older sisters, Marion and Anne, and a younger brother, Joseph. The Scottish strain predominated in his ancestry. His paternal grandfather migrated to the United States from Ulster in 1807. His maternal grandfather, Thomas Woodrow, brought up in the little town of Paisley, near Glasgow, and a graduate of Glasgow university, gave distinguished service as pastor at Carlisle. Eng., before moving to the United States in 1835. The stern Presbyterianism of Woodrow's father, Joseph Ruggles Wilson, a minister of indomitable character and theological distinction, left an indelible impression upon the character of the future president.

Wilson's early years were spent in Georgia and South Carolina. where he was deeply affected by the ravages of the Civil War and the sufferingof the south during the Reconstruction period. After a brief experience at Davidson college in North Carolina he entered Princeton university in 1875 and graduated four years later. His scholastic record placed him high in his class but not at the top. He took a prominent part in debating and literary activities and also participated in the administration of student athletics. His most notable achievement as an undergraduate was the publication in the *International Review* during his senior year of an article which analyzed critically and skilfully the committee system of the U.S. congress. In the essay may be discovered the basis of his more mature political principles. After graduating from Princeton he studied law at the University of Virginia but poor health cut short his residence. Following an unsuccessful attempt at legal practice in Atlanta, Ga., he decided to pursue advanced studies in government and history at Johns Hopkins university, Baltimore, Md. There, in 1886, he received the Ph D. degree.

Wilson's doctoral dissertation, published in 1885 under the title of *Congressional Government,* developed his attack upon the controls exercised by congressional committees in the legislative process. Clear and felicitous in expression, its scholarly quality received general recognition. In that same year he married Ellen Louise Axson of Savannah, Ga., and began his teaching career at Bryn Mawr college as associate professor of history and political economy.

In 1888 he became professor of the same subject at Connecticut Wesleyan university, and two years later joined the Princeton faculty as professor of jurisprudence and political economy. He served in this capacity until 1902 when he was chosen president of the university. His academic lectures, like his public addresses and published writings. were characterized by clarity of presentation and brilliance of phrasing. His tastes led him to elucidation and generalization rather than profound scholarship; after the publication of his thesis his most successful literary efforts were in essay form.

As president of Princeton, Wilson devoted himself to basic reform of the educational framework of the institution and to attempts at reshaping the intellectual life of the undergraduates. In 1905 he inaugurated the preceptorial system, designed to stimulate intimate and lively intellectual contacts between teachers and students. His attempt to democratize the social customs of the undergraduates aroused heated controversy among alumni, faculty and trustees. He was not without enthusiastic supporters but he met determined opposition in influential circles. Wilson was not adept in diplomatic handling of those who opposed him. Further difficulties developed from personal disagreement with the dean of the graduate school. It is noteworthy that both Harvard and Yale later adopted in essence the plans he proposed for undergraduate life in quadrangles and the principles of his preceptorial plan have been generally approved by U.S. colleges.

As professor and as president at Princeton, Wilson achieved a national reputation by his addresses and articles on political questions of the day. Discussion of his availability as a candidate for the governorship of New Jersey in the election of 1910 was widespread. In September of that year he was offered the Democratic nomination. The offer came at a moment when prospects for the success of his policies at Princeton seemed most discouraging and he readily accepted. After resigning the presidency of the university, he conducted a dynamic and fearless campaign. He won the support of progressive elements throughout the state and in November was elected by a plurality of 49,000 votes.

As governor of New Jersey, Wilson at once made it plain that he intended to fulfill his liberal pledges regardless of protests from the machine politicians who had fostered his nomination. Under the pressure of his active personal leadership the legislature successfully carried through a series of reform measures. Of these the most significant were: a Direct Primaries act which, supplemented by an effective Corrupt Practices act, did much to purify the political atmosphere of New Jersey; an Employers' Liability act; the creation of a public utilities commission; and reforms which made possible the commission form of municipal government. His leadership was threatened by the election of 1911 when the Republicans won a majority in both houses of the legislature. Although he was no longer in a position to dictate, Wilson was able to provide the impetus necessary for enactment of a series of bills. known as the Seven Sisters, that were directed toward the protection of the public from exploitation by trusts. It constituted a triumph on the eve of the approaching campaign for the presidential nomination.

Wilson's rapid and resounding success in New Jersey brought him clearly into the arena of national politics. He was not slow to develop an active campaign. But when the Democratic national convention in June 1912 met at Baltimore to select a candidate for president, Wilson's chances were not highly favoured as compared with those of the leading candidate, Champ Clark. The contest was prolonged, but on the 14th ballot William Jennings Bryan threw his support to Wilson and the tide began to run strongly in his direction. On the 46th ballot he received the necessary two-thirds vote and was nominated, July 2, 1912.

In the presidential campaign that followed, the clarity and positive quality of Wilson's domestic program soon won for him the leadership of the Democratic party and of the entire progressive movement throughout the nation. He called for expanded exercise of federal authority not so much for the regulation of industrial enterprise as for its emancipation from the control of privileged groups. He rejected Roosevelt's New Nationalism, which implied active government intervention on behalf of social justice and the economic welfare of the underprivileged. The purpose of his program, the New Freedom as he called it, was to restore unfettered opportunity for individual action. By its emphasis upon the idea of liberation the New Freedom appeared as a revival of traditional Democratic principles; but it redefined those principles to meet 20th-century social and economic conditions.

In the November election Wilson received 435 electoral votes as against 88 for Roosevelt and 8 for Taft. His popular vote was 1,000,000 less than that of his two chief opponents combined, and in only 14 states (all of them in the south) did he receive a clear majority. But the election, because of the division of Republican votes, put both houses of congress under Democratic control and in the nation at large Wilson could reasonably expect support from the Progressives for his legislative program of reform.

Once in the White House the president proceeded with amazing vigour to initiate and carry through the major items of legislation he had advocated in his campaign. In this process he rapidly established his personal ascendancy. He delivered his first message to congress in person, renewing the custom that had lapsed since the administration of John Adams. In this session and later he intervened constantly to influence individual senators and representatives on behalf of the program in which he was especially interested.

The record of legislative accomplishment in the first two years of Wilson's presidency is impressive. He dealt with crucial and contentious issues and he achieved extraordinary success. His first major victory was passage of the Underwood Tariff act (signed Oct. 3, 1913) over the bitter opposition of varied industrial interests. To counterbalance the downward revision of tariff rates, the act levied a federal income tax, under authority of the recently approved 16th amendment. The new tariff act was followed by a broad measure of currency reform, the Federal Reserve act, signed Dec. 23, 1913. Designed to supplant so-called dictatorship of private banking institutions by a public board (the Federal Reserve board) which mould control the expansion and contraction of the currency, it was destined to become the pediment of the national financial structure. (See FEDERAL RESERVE SYSTEM, THE.) The establishment of the Federal Trade commission (*q.v.*) in 1914 provided for the use of federal powers to assure competitive conditions in trade. In the same year the Clayton Anti-Trust act met the demands of labour by prohibiting injunctions in labour disputes unless necessary to prevent irreparable damage and by proclaiming that strikes and boycotts were not violations of federal law. (See LABOUR LAW: United States.) The achievement of such far-flung legislation in these four fields went far toward creating a new social and economic atmosphere.

Wilson's foreign policy, in contrast to his domestic policy, was by no means clear cut. It was characterized, at least in principle, by a refusal to exert the material power of the United States against weaker nations and by a studied respect for the rights and interests of small nations. Steps were taken, for example, to prepare the Filipinos for self-government. The so-called "dollar diplomacy" of the preceding administration was repudiated and U.S. bankers were effectively discouraged from participating in the international Chinese loans. At the urgent request of the president. congress repealed the la that exempted U.S. coastwise shipping from Panama canal tolls, thereby greatly relieving tension with the British. But conditions in the Caribbean continued to be disturbed and the controlling vigilance of the United States was necessarily tightened. By a treaty signed Sept. 16. 1915, a virtual protectorate over Haiti was assumed by the United States. In Santo Domingo precautionary visits of United States cruisers were followed in the summer of 1915 by the landing of U.S. marines and in November of that year by the proclamation of a military government under U.S. auspices.

In revolutionary Mexico, President Wilson was confronted with a dangerously chaotic situation. Following his failure to secure the elimination of Gen. Victoriano Huerta from the dictatorship which he had assumed, Wilson resigned himself to what he called a policy of "watchful waiting." He stoutly opposed formal intervention as urged upon him by U.S. and European business interests. But in April 1914, following affronts to U.S. sailors for which no apology was forthcoming. and also to prevent the landing of munitions from a German ship, a U.S. naval force seized the terminal facilities of Veracruz. The danger of war with Mexico became obvious.

The proffered mediation of Argentina. Brazil and Chile was gladly accepted by Wilson but the resulting protocol of Niagara Falls (June 24, 1914) provided no practical basis for peace and order. The overthrow of Huerta brought no settlement of the civil war, which continued to threaten U.S. business interests. Wilson's recognition of the government of Venustiano Carranza, in Oct. 1915, did not end complications. The raids of the guerrilla leader Pancho Villa into U.S. territory in March 1916 led Wilson to authorize a punitive expedition under Gen. John J. Pershing. To the end of his administration, Wilson was plagued by Mexican anarchy. (See also MEXICO: Independent Mexico.)

After July 1914 U.S. foreign affairs were naturally dominated by the European war and by the efforts of President Wilson to protect the rights of the United States as a neutral. His formal proclamation of neutrality (Aug. 4, 1914) was emphasized by a more personal appeal of Aug. 18, in which he adjured the American people to remain impartial in thought as well as in behaviour. Meanwhile his offer of mediation evoked no favourable response from the belligerents, and his attempts to initiate secret peace negotiations failed. Almost immediately Wilson and his secretary of state, William Jennings Bryan, discovered the difficulties involved in protecting the neutral position of the United States from infringement by one side or the other. The British sought to establish a virtual blockade of German ports through the utilization of their maritime control: they extended the doctrine of continuous voyage, enlarged contraband schedules, brought neutral ships into British ports and detained neutral cargoes. American opinion was inflamed by such disregard of traditional maritime rules in time of war and active controversy developed.

The dispute was thrown into the background almost immediately by a more critical altercation with Germany. On Feb. 4, 1915, the Berlin government declared the waters around the British Isles a war zone, threatened to sink all belligerent ships met within that zone and gave warning that neutral ships might also be sunk. To this Wilson replied with a vigorous note on Feb. 10 admonishing the German government that it would be held to "strict accountability" for the lawless acts of submarine commanders. Destruction of an American vessel or of American lives, the president stated, would be regarded as an "indefensible violation of neutral rights." But the Germans nevertheless maintained their position. On May 7 the British liner "Lusitania" was sunk by a German submarine without warning; more than 1,000 persons were drowned, among them 128 Americans. From this moment the issue was clarified in Wilson's mind, never to be altered. The Germans must not use the submarine against merchant ships except according to recognized rules that called for warning and provision for the safety of passengers and crews.

Wilson was determined to avoid war and displayed long-suffering patience in the negotiations of the ensuing weeks. "There is such a thing as a nation being too proud to fight," he declared in a public address shortly after the sinking of the "Lusitania." He spoke in no mood of cowardice and his will to compel Germany to abide by the established rules of cruiser warfare was unshakable. His protest to Germany was, in fact, so strongly worded that Secretary of State Bryan resigned rather than sign it. Following the sinking of the "Arabic" in Aug. 1915, the German government promised that liners would not be attacked without warning. In the spring of 1916 when a rupture with Germany again became imminent because of the torpedoing of the channel steamer "Sussex," Wilson protested in terms that amounted to an ultimatum and finally drew from Berlin a more comprehensive pledge to abandon the ruthless submarine campaign altogether. For the next seven months relations with Germany were less disturbed.

This diplomatic victory not only postponed American intervention in the war, but proved of political value to Wilson in the presidential campaign of 1916 in which he was the Democratic candidate. It gave strength to the argument that he had vindicated the rights of the United States successfully and at the same time had "kept us out of war." The slogan made a strong popular appeal, especially west of the Mississippi. The Republicans, who nominated Charles Evans Hughes, denounced the president as hesitating and cowardly, both in his dealing with Germany and in his handling of the Mexican problem. They criticized his legislative reforms as demagogic and cited the Adamson act, which Wilson had urged upon congress to avert a railroad strike, as an untimely surrender to labour. On the eastern seaboard and in most of the industrial centres of the middle west, the reunited Republican party could count on success, but in the farming districts west of the Mississippi and on the Pacific coast, Wilson showed great strength; he drew largely from the Progressives, who refused to follow Theodore Roosevelt back into the Republican fold. The result of the election held on Nov. 8 was so close that for 12 hours a Republican victory was generally conceded. Only as returns from the west came in was it determined that Wilson had been re-elected by 277 electoral votes to 254 for Hughes and with a popular plurality of 9,129,606 to 8,538,221.

Wilson's victory was generally ascribed to the support of the pacifists; he lost no time in preparing to justify their confidence by a determined move for peace. Earlier in the year he had authorized Col. Edward M. House to suggest to the British foreign secretary, Sir Edward Grey, that the president "on hearing from France and Britain that the moment was opportune" was ready to propose a conference to end the war. "Should the Allies accept this proposal and should Germany refuse it, the United States would probably enter the war against Germany." A memorandum embodying such an agreement was drafted by House and Grey, Feb. 22, 1916. It received the rather guarded approval of Wilson, but Great Britain and France made no move to take advantage of this plan to restore peace. In Germany, the chancellor was himself determined to avoid war with the United States. But by early summer he became convinced that unless conversations pointing toward an immediate peace were opened, the German military and naval leaders would force resumption of the unrestricted submarine campaign An invitation to Wilson to take the initiative in the starting of negotiations was drafted in September by the kaiser himself. It was secretly passed on to the president through Colonel House.

Wilson delayed any move until the result of the election was certain and for a month thereafter. Wearied of waiting for him, the Germans themselves, on Dec. 12, issued a statement of their willingness to enter peace negotiations. Six days later, Wilson published his own note asking the belligerents to state the terms they would accept. The replies to the president's appeal were not encouraging, but they gave him the opportunity to expound his own conception of what would serve as the basis of an enduring peace. This he did in an address to the U.S. senate, Jan. 22, 1917. Better than any of his war speeches, because it was composed while the United States was still neutral, it set forth Wilson's basic principles. Peace must be organized by the major force of mankind under the protection of a League of Nations (*q.v.*). No nation should extend its policy over another; no one power should dominate the land or the sea. There must be a limitation of armaments. As a guarantee of future peace and justice, the ending of the existing war must not result in the violation of the rights of one side or the other. It must be "a peace without victory."

Wilson's drive for peace negotiations was frustrated almost immediately by the German decision to renew the unrestricted submarine campaign, a decision that had been taken at the Council of Pless on Jan. 9, 1917. The German ambassador in Washington, D.C., Count von Bernstorff, gave clear warning to his government that such a step would bring the United States into the war. But Berlin had lost hope of Wilson's creating an opportunity for them to enter peace negotiations on favourable conditions. German military and naval leaders assured the chancellor that if they could operate without hampering restrictions the submarines would rapidly achieve victory and Germany could shortly dictate terms of peace. Von Bernstorff was informed of the decision on Jan. 19. On Jan. 31, according to his orders, he delivered the fateful German note.

As he had foreseen, the German ambassador was immediately given his papers, but President Wilson refused to believe that the diplomatic rupture meant war—"only actual overt acts" would persuade him that the Germans were determined to carry their threats into effect, He was willing to negotiate everything except the sinking without warning of passenger and merchant ships. But the Germans showed no sign of weakening. "If Wilson wants war," wrote the kaiser. "let him make it and let him then have it." Opinion in the United States was exasperated, not only by the formal declaration of the renewal of the submarine warfare, but especially by the virtual blockade of cargoes in U.S. ports held there by fear of submarine attacks; it was infuriated by the publication of the Zimmermann telegram which suggested a German-Mexican-Japanese alliance and a Mexican reconquest of Texas, New Mexico and Arizona; it was deeply shocked by the sinking of the "Laconia" with the loss of American lives. On April 2, unable longer to resist the pressure of events and public opinion, the president appeared before congress to ask a declaration that a state of war with Germany existed. The resolution passed the senate on April 4 and the house of representatives on April 6, in each case by an overwhelming majority.

The United States was ill prepared for war, a condition for which Wilson carried a heavy share of responsibility. But once in the war he displayed outstanding qualities of leadership. Through his speeches he created a national consciousness of common effort; he made the people feel that the conflict was a people's war, one in which every citizen should be glad to make his individual sacrifice. He guaranteed full authority and steady support to the men selected for the vital military and administrative positions. The president's leadership brought the nation to accept emergency measures that were distasteful but essential to victory. These measures included a selective draft of manpower, supervision and control exercised by the War Industries board and the Food and Fuel administration, and national administration of railways. Wilson's leadership further ensured a ready response to appeals for a popular financing of the war effort through the Liberty Loans. To the secretary of war, Newton D. Baker, he gave the authority that enabled him to proceed methodically and with ultimate success to the organization of a national service of supply that met the needs of an overseas force which finally numbered more than 2,000.000 men. In France. Gen. John J. Pershing was granted a free hand in the development of this force into a unified army. In no war previously waged by the United States was the opportunity for dishonest profit so nearly eliminated and partisan political influence so effectively minimized.

Wilson's leadership in the war effort was enlarged and enforced by his appreciation of the value of moral as well as military weapons. He strengthened the nation's determination by emphasizing that the war was a crusade on behalf of freedom. He weakened the enemy's determination by his reiteration that this crusade implied not merely the overthrow of the German government but also the liberation of the German nation. It was, he insisted, a "war for freedom and justice and self-government amongst all the nations of the world . . . the German people themselves included." These principles he re-emphasized in the more important of his war speeches, notably that on Jan. 8, 1918, in which he enumerated the Fourteen Points (*q.v.*) which he regarded as an essential basis of a just and lasting peace. These principles he elaborated in the course of the following eight months. It was natural that when the Germans faced complete defeat in early Oct. 1918, they should turn to Wilson and offer to accept his Fourteen Points and later speeches as the basis of peace.

The British and French were by no means prepared to accept Wilson as arbiter of peace conditions and were slow to recognize his speeches of 1918 as an adequate foundation for the peace treaties. They yielded, however, to the persuasive diplomacy of Colonel House, who represented the United States in the Supreme War council during the armistice conferences. Upon his insistence, the Fourteen Points (with certain exceptions) were accepted by the Allied chiefs and Germany as the basis of the forthcoming settlement. This strategic advantage to Wilson in the coming peace negotiations was offset by a serious political handicap which was laid upon him at home. Wilson's appeal for a Democratic majority in the campaign for the congressional elections in Nov. 1918 was denied by the voters. Substantial reverses were sustained by his party, which thereby lost control of the senate in the new congress. The president's prestige suffered both at home and abroad; he also had to face the fact that the vitally important senate foreign relations committee was henceforth to be controlled by his personal and political adversaries.

Wilson was determined to go to the peace conference at Paris and to lead the battle for the principles he had been advocdting. These principles constituted a threefold and interlocking concept: the liberation of peoples; justice alike to friend and enemy; and the assurance of peace through the establishment of a League of Nations. Such an organized system, he insisted, was essential to the maintenance of an international regime of freedom and justice. Wilson summarized his principles in compelling phraseology: "a universal dominion of right by such a concert of free peoples as shall bring peace and safety to all nations and make the world itself at last free." The president sailed for France on Dec. 4, 1918, on the "George Washington," arriving at Brest on Dec. 13. He was received in France, England and Italy with tumultuous enthusiasm, but his prestige rested upon a precarious footing and it inevitably became clouded when he confronted the nationalistic aspirations of individual peoples.

The president achieved an early triumph at the conference in winning acceptance of the principle that a League of Nations should be an integral part of the treaties of peace. This was emphasized by his success in leading the commission on the League to agreement upon a preliminary draft of a convenant for the League, which was unanimously adopted in plenary session by the peace conference on Feb. 14. A two-weeks visit to the United States convinced Wilson of the necessity of inserting certain amendments in the covenant in order to satisfy U.S. sentiment. These he was able to secure upon his return to Paris, but not without meeting the demand that he should himself show a correspondingly benevolent appreciation of the interests of European states. On April 28 he won unanimous approval by the conference of the final draft of the covenant.

Wilson's success in the establishment of the League as the main foundation of the treaties was to some extent obscured by the concessions he was forced to make to national territorial and economic demands. The peace of reconciliation which he had preached was not achieved. On every debatable issue, the defeated enemy got the worst of it. Much against his own feelings, Wilson yielded to Japanese claims in Shantung at the expense of China. The unilateral disarmament imposed on Germany made a mockery of the program he had outlined in the Fourteen Points. The problem of reparations was left for final decision to a reparations commission and what amounted to a blank check was exacted from Germany. But the over-all settlement, if it could actually be carried into effect, promised the security that everyone demanded. It recognized the claims of the smaller nationalities to a degree that had never hitherto been approached. It provided for a working partnership of the new world with the old. On June 28, 1919, the Versailles treaty (*q.v.*) with Germany was signed. The following day Wilson sailed for the United States.

The strain of the peace conference had told upon the president's physical and nervous strength. He was thus not well equipped to carry on successfully the contest with his Republican opponents in the senate that developed upon his presentation of the treaty. It was at once obvious that reservations would be presented by the foreign relations committee. Ratification of the treaty would depend upon conciliation of the Republican "mild reservationists" in such numbers as would compel the chairman, Sen. Henry Cabot Lodge, to accept ratification. Wilson could not bring himself to make the necessary concessions. In search of popular support that would overwhelm the senate, he set forth upon a crusade in behalf of the treaty and the League. The enthusiasm of the west matched the lukewarmness of the east, but his physical strength was drained. In Colorado, Sept. 25, 1919, after 34 major addresses and scores of interviews, parades and rear platform talks, he was compelled to give up his tour and return to Washington in a state of complete collapse. On Oct. 2, he suffered a thrombosis that impaired the control of the brain over the left side of his body.

The physical prostration of the president left him isolated from men and affairs. Entirely apart from the confusion that was thus occasioned in the conduct of public business, it shattered hopes of a speedy ratification of the treaty. No one else was capable of leading the fight for ratification or possessed enough authority to arrange a compromise. On Nov. 13, the senate approved reservations uhich, from his sickroom, the president denounced as providing "not for ratification but rather for the nullification of the treaty. . . . I sincerely hope," he added. "that the friends and supporters of the treaty will vote against the Lodge resolution of ratification." Party discipline held. On Nov. 19, the two-thirds vote needed for ratification was blocked by a combination of Republican irreconcilables and Democrats personally loyal to Wilson.

Efforts to arrange a compromise during the succeeding weeks proved fruitless. With something of his physical health regained, with his niind nervously active, but with his grasp of affairs unrealistic, the president drafted a farfetched plan for submitting the issue to popular vote at a special election. Recognizing the practical difficulties of such a plan, he insisted that the only way out was to "give the next election in the coming November the form of a great and solemn referendum." Wilson thus excluded the possibility of immediate compromise with Senator Lodge. Efforts to achieve agreement were made in a bipartisan conference of the senate, but they foundered upon the bitter-end opposition of Republican irreconcilables. On March 19, 1920, the final vote was taken on the ratifying resolution which again contained a reservation on article x—the article that provided for collective security—strong enough to evoke Wilson's condemnation. Once more lie urged his followers to vote against ratification and 23 of them did so. The vote on the resolution was 49 for and 35 against, 7 votes short of the necessary two-thirds. The United States was thus kept out of the League of Nations at the behest of the man who had done more than any other to create it.

Wilson's physical condition, despite some improvement in the spring and summer of 1920, was such as to prevent his taking an active role in the presidential campaign of that year. His hope that the election would serve as a popular referendum settling the issues drawn between himself and Senator Lodge was not fulfilled. Indeed, many ardent and influential advocates of the League supported the Republican candidate, Warren G. Harding, and the election proved to be an overwhelming victory for the Republicans. The bitterness of Wilson's disappointment at the result of the election was to some extent alleviated by the 1919 Nobel peace prize awarded him in Dec. 1920. His annual message to congress, while it sounded the note of national duty, made no reference to what always lay nearest his heart—the League of Nations. This reticence on world affairs he maintained until the end of his administration, March 4, 1921.

Upon his retirement from office, Wilson lived quietly in Washington, D.C., refraining from political comments and avoiding political contacts. The legal and the literary activities which he had anticipated lay beyond his waning physical powers. On Armistice day, 1923, he appeared on the porch of his house on S street to greet his admirers with a short speech. Thereafter, he failed steadily. On Feb. 3, 1924, he died in his sleep.

Woodrow Wilson was qualified in the highest degree for a career in public affairs by his personal and mental qualities and especially by his sense of responsibility to the public welfare. To those who worked sympathetically with him and under him, he displayed a magnetic personality. He was genial, humorous, considerate and had broad cultural interests. From his subordinates he evoked admiration and affection, but in dealing with men whom he did not like or trust he could not capitalize upon his personal assets. The depth of his idealistic fervour gave force to his political leadership, which was further strengthened by his outstanding oratorical capacity. But the intensity of that fervour crippled his ability for effective compromise. He was impatient of partisan opposition and there was much of the intolerant Calvinist in his refusal to temporize or deviate from the path which he believed himself appointed by providence to tread. His illusion that the nobility of ideals would suffice to obliterate the stubborn facts of political life took his international policy down the road to bankruptcy. A great leader, he lacked the political intuition and deftness which might have saved him at Princeton, strengthened his contribution to the peace conference and brought the United States into the League of Nations.

That failure should not blind us to the impressive success of Wilson in earlier years. He brought an educational ideal to the college world which was to serve as an active and permanent force in the revival of literary and intellectual interest on the U.S. campus. The legislative reforms of his first two years as president of the United States accomplished a far-reaching and permanent transformation of American social and economic mores. He led the nation to complete triumph in the greatest war that until then mankind had ever waged.

The magnitude of the almost unbroken success which he attained in every enterprise of his political career up to the final test heightens the tragedy of his defeat at the hand of the senators. His claim to high rank as a statesman is inevitably weakened by the collapse of his ultimate effort to bring the United States into the League of Nations, for which he himself was largely responsible. But his rank as outstanding political prophet is nonetheless assured. The clarity and eloquence of his appeals on behalf of freedom and justice are unmatched. The wisdom that informed his insistent demand for international organization obtained almost universal recognition in the years that followed the next world war 20 years after his death. *See* also Index references under "Wilson, (Thomas) Woodrow" in the Index volume.

The following are the most important writings of President Wilson: *Congressional Government: a Study in American Politics* (1885); *The State: Elements of Historical and Practical Politics* (1889); *Division and Reunion 1829–1889* (1893); *An Old Master and Other Political Essays* (1893); *Mere Literature and Other Essays* (1896); *Leaders of Men* (ed. by T. H. V. Motter, 1952); *George Washington* (1897); *A History of the American People* (1902); *Constitutional Government in the United States* (1908); *The New Freedom* (1913); *On Being Human* (1916); *International Ideals* (1919).

Bibliography.—The authorized edition of Wilson's state papers and addresses is *The Public Papers*, ed. by Ray Stannard Baker and William E. Dodd (1925). For his campaign speeches of 1912 outlining the principles of the New Freedom, *see* John W. Davidson, *A Crossroads of Freedom* (1956). The authorized biography is Ray S. Baker, *Woodrow Wilson, Life and Letters* (1927–39). This work, comprising eight volumes, of which the last two are essentially summarized chronology, concludes with the Armistice of Nov. 1918. Arthur Walworth, *Woodrow Wilson, American Prophet; Woodrow Wilson, World Prophet,* 2 vol. (1958) is comprehensive. thoroughly documented and carefully balanced. Arthur S. Link, *Wilson, the Road to the White House* (1947), *Wilson,* vol. 2, *The New Freedom* (1956), covering Wilson's political career in detail until Nov. 1914 and *Wilson,* vol. 3, *The Struggle for Neutrality,* 1914–1915 (1960) are the opening volumes of what promises to be a complete and authoritative biography. A more compressed political survey by the same author is *Woodrow Wilson and the Progressive Era, 1910–1917* (1954). Herbert C. F. Bell. *Woodrow Wilson and the People* (1945) is a brief but critically interpretive study. A documented exposition of Wilson's character and policies as president of the United States is found in *The Intimate Papers of Colonel House,* arranged as a narrative by Charles Seymour, 4 vol. (1926–28). Aspects of Wilson's conduct of foreign relations: Harley Notter, *The Origins of the Foreign Policy of Woodrow Wilson* (1937); Edward H. Buehrig (ed.), *Wilson's Foreign Policy in Perspective* (1957); Arno Mayer, *Political Origins of the New Diplomacy,* 1917–1918 (1959); Charles Seymour, *American Diplomacy During the World War* (1934); Charles C. Tansill, *America Goes to War* (1938); George F. Kennan, *Soviet-American Relations, 1917–1920,* 2 vol. (1956–58); Thomas A. Bailey, *Woodrow Wilson and the Lost Peace* (1944). Wilson at the peace conference is favourably presented by Ray S. Baker, *Woodrow Wilson and World Settlement,* 3 vol. (1922). (C. Sey.)

WILSON, a city of North Carolina. U.S.. 46 mi. E.S.E. of Raleigh; the seat of Wilson county. Incorporated in 1819, long after the establishment of most other cities in the North Carolina coastal plain, Wilson soon became an important trading centre, with emphasis on tobacco. Since the first Wilson tobacco auction was held in 1890, the tobacco warehouse facilities have expanded until the combined area of the auction floors is approximately 2,000,000 sq.ft., and it has become one of the largest bright-leaf tobacco markets in the world.

Though tobacco is the key to Wilson's economy, diversification is provided by a number of small manufacturing plants. a major meat packing plant and grain and feed mills. Atlantic Christian college, a four-year co-educational institution related to the Christian (Disciples of Christ) Church, was established in Wilson in 1902. The city has a council-manager form of government, in effect since 1933.

For comparative population figures *see* table in North Carolina: *Population.* (Da. St.)

WILSON CLOUD CHAMBER: *see* Cloud Chambers.

WILTON, a municipal borough in the Salisbury parliamentary division of Wiltshire. Eng., 3 mi. W.S.W. of Salisbury. Pop. (1951) 2,858. On the site of the present Wilton house a priory was established by Egbert in the 8th century which became an abbey under Alfred the Great. At the Dissolution the abbey was given to William Herbert. 1st earl of Pembroke by the second creation. The gardens, with ancient cedars. lawns 200 years old and a Palladian bridge. were mostly laid out in the 18th century. Wilton became a residence of the Wessex kings; and in 871 Alfred was defeated there by the Danes. It was burned in 1003 by Sweyn, the Danish king. It obtained its first charter in 1100. The church of St. Nicholas and Mary (19th century! is in the Lombardic style and has a campanile. Wilton carpets. Brussels and Axminster carpets are made there. The Royal Carpet factory dates from 1655. Felts and agricultural machinery are also produced. Wilton. anciently a centre of the sheep trade, has four annual sheep fairs.

WILTSHIRE, a county of England, bounded north by Gloucestershire. east by Berkshire and Hampshire, south by Hampshire and Dorset and west by Somerset and Gloucestershire.

Physical Features.—About two-thirds of the county is chalk upland and the remainder is a series of clay plains and scarps bordering it on the northwest. The uplands consist of the broad western end of the Kennet syncline with drainage eastward of the Marlborough downs (400–900 ft.): the narrow anticlines of Ham and of the Vale of Pewsey (200–400 ft.) with drainage eastward to the head streams of the Salisbury Avon and westward to tributaries of the Bristol Avon; the wide-rolling Salisbury plain (400–800 ft.) dipping to the southeast. though rising in Cranborne Chase on the south to 500–600 ft.. and drained by the Salisbury Avon, the Wylye, the Nadder, the Ebble and the Bourne, all of which unite at or near Salisbury. Savernake forest, famous for its beeches, covers about 20 sq.mi. on the eastern edge of the uplands.

The Tertiary rocks of the Hampshire basin rest upon the chalk uplands in the extreme southeastern corner of the county. Reading Beds and London Clay east of Downton and on the Clarendon hills; these are covered by Bagshot Sands at Alderbury. Grimstead and Hamptworth common; Tertiaries of the London basin appear as outliers southeast of Marlborough, Reading Beds and London Clay occurring round Great Bedwyn. 'The edge of the chalk uplands forms a scarp to the northwest, from beneath which outcrops a fringe of Upper Greensand and Gault — the former is well exposed in the Yale of Pewsey and forms an elevated tract from Mere through Stourton to Warminster. Lower Greensand appears from beneath the Gault at Poulshot and follows the same line of outcrop northward. At Dinton in the Vale of Wardour the Wealden formation appears. The rest of the northwestern area is occupied by 'Jurassic rocks. Beyond the Lower Gr'eensand lies a narrow belt of Gimeridge Clay.

Beyond the plain rises the irregular scarp of the Corallian Oolitic limestones and marls, and again beyond this, the Oxford Clay and Kellaways Beds of the Middle Oolite. forming a broad. low plain (known at its northeastern end as the Vale of White Horse, draining northeastward to the Thames) on which stand Trowbridge, Melksham, Chippenham and Cricklade, and which is drained by the Upper Bristol Xvon flowing southwest. This is succeeded farther west by the Great Oolite series which includes the building stones of Bath, quarried at Winsley down, near Bradford. and at Box. Corsham down and elsewhere. Above the freestones near Bradford comes the Bradford Clay (with fossil *Apiocrinus*) followed by the Forest Marble Limestones and Clays. Still farther west follows a rim of Inferior Oolite and fuller's earth giving place to Upper Lias in the valley of a tributary of the Avon near Box. (X.)

Archaeology. — In Neolithic and later prehistoric times Wiltshire was one of the most populous areas of England, and it is correspondingly rich in prehistoric remains. Stonehenge (*q.v.*), which is the most famous of these, stands about 7 mi. N.N.W. of Salisbury and 2 mi. W. of Amesbury and is. in its present form, the latest of a class of religious buildings or earthworks which date back to Neolithic times and which are known to archaeologists as "henges." In the north of the county Avebury (*q.v.*), a vast circle of stones enclosing two smaller circles and surrounded by a ditch and external bank. and the "Sanctuary," to which it was connected by an avenue of stones. are well known. Silbury hill. an enormous artificial mound to the south of Avebury, is of comparable date but of unknown purpose. It is possible that the Mount at Marlborough was a similar monument. In the south the earthwork known as Durrington walls, and the structure immediately south of it known as Woodhenge, are both within a short distance of Stonehenge, nhich itself had more than one antecedent on or near the same site, and various earthworks known as the Avenue. the Cursus and the Lesser Cursus were intimately connecied with one or another phase of its construction. The long barrows, clan or family burial chambers. also belong to the Neolithic period. In the south of the county they are usually made of chalk, with a flanking ditch on each side, but in the north they are faithful copies of their prototypes in the Cotswolds, containing stone-lined passages and usually four chambers. Ritual ceremonies have been suggested in connection with the long barrows which may have some relation to the religion of the "henge" monuments. Of a purely domestic nature are the causewayed camps, which may have been cattle enclosures, best known at Windmill hill near Avebury (a fine series of Neolithic pottery from this site is in the museum at Avebury) and Robin Hood Ball in the parish of Netheravon.

Field works of the Early and Middle Bronze Ages are notoriously lacking except for their burial mounds. the round barrows of various forms which are still to be seen on'most of the chalk downs in the county though plowing has taken a heavy toll. Impressive groups of these barrows in the neighbourhood of Stonehenge, such as the Winterbourne Stoke group, are an indication of the late survival of Stonehenge as a religious centre. For the Late Bronze Age one can point to rectangular field systems in various parts of the county and rarely. as on Thorny down, traces of a village site.

The Early Iron Age must have been a period of many wars, since to it belong the numerous hill forts, sometimes consisting of a single bank and ditch as at Clearbury. Figsbury ring and Ogbury in the Salisbury region, and sometimes strengthened at a later date with additional ramparts and complicated entrances. Of this type are Yarnbury near Wylye and Battlesbury near Warminster, to mention only two out of an imposing number. Many village sites or farmsteads of this date have also been found, but their remains are seldom visible at ground level. An exception is Stockton earthworks, which survived well into the Roman period.

Old Sarum, a modified Iron Age hill fort. became Sorviodunum in Roman times. and has been regarded as a military "station" but. though situated at the crossing of two military roads, little evidence of Roman occupation has so far been discovered. There was a villa at Downton, but apart from native villages and small country houses there can have been little settlement by official classes in south Wiltshire, and the more important villas are found on the line of the London to Bath road which passes through Cunetio (Mildenhall) and Verlucio (Sandy Lane). In the south of the county Bokerly dike was a defensive work thrown across the Dorchester road in the 4th century to protect Dorset from invaders who had presumably penetrated Wiltshire and, though the road was opened again, the danger recurred and the road was cut for good. Wansdyke (Woden's dike) which runs from a point east of Savernake forest for nearly 60 mi. toward the Bristol channel, facing north, was probably intended to oppose a Saxon thrust up the Thames valley. (H. DE S. S.)

History. — Settlements on the Greensand consist of small scattered homesteads; on the Chalk there are compact villages along spring lines, and parishes lie in long narrow strips across the scarp so as to include hill pasture and valley arable or meadow. Parishes originally in forest clearings seem to be characterized by churches placed centrally with roads radiating from them. The valleys also suggest downward migration of settlement from Chalk ridgeway to hillside road and, later. to lowland routes. Cynric's victory at Old Sarum (552) began the conquest of the present Wiltshire; his victory at Barbury hill in jj6 extended the West Saxon kingdom to the Marlborough downs. At this period the district south of the Avon and the Nadder was dense woodland, of which Cranborne Chase survives, and at first West Saxon colonization was chiefly confined to the valleys of the Avon and the Wylye. There was a definite administrative and territorial organization in the 9th century, Weohstan, ealdorman of the Wilsaetas, being mentioned as repelling a Mercian invasion (802). Wiltunscire is mentioned by Asser (878) and in that year the Danes established their headquarters at Chippenham. The white horse in the turf on the downs near Westbury was possibly cut in celebration of Alfred's victory over the Danes later in the same year, though it has been modified since. In Edgar's time there were mints at Malmesbury and Wilton, and at Cricklade, Old Sarum and Warminster by the reign of Ethelred. After the Conquest more than two-fifths of the county fell to the church and one-fifth to the crown.

In 1086, after the completion of Domesday Book. Salisbury was the scene of a great council, in which all the landholders took oaths of allegiance to the king, and a similar council assembled at Salisbury in 1116. At Clarendon in 1166 was drawn up the assize which remodeled the provincial administration of justice. Parliaments were held at Marlborough in 1267 and at Salisbury in 1328 and 1384. In 1139 Stephen wrested the castles of Salisbury, Devizes and Malmesbury from Roger, bishop of Salisbury, having become suspicious of his loyalty. In 1216 Marlborough castle was surrendered to Louis the dauphin by Hugh de Neville. Hubert de Burgh escaped in 1233 from Devizes castle. In the Great Rebellion, Wiltshire supported the parliamentary cause, displaying a spirit of violent anti-Catholicism; nevertheless, in the earlystages of the struggle the royalists had some success. In 164j the "Clubmen" of Dorset and Wiltshire were organized to punish any member of either partydiscovered plundering. Devizes, the last stronghold of the royalists, was captured by Cromwell in 1645. In 1655 a rising organized on behalf of the king at Salisbury was dispersed.

At the time of the Domesday survey Wiltshire was almost exclusively agricultural; 390 mills are mentioned, and vineyards at Tollard, Wilcot, Tisbury and Lacock. Under the Cistercians, sheep farming developed, and in the 13th and 14th centuries the monastery of Stanley exported wool to the Florentine and Flemish markets. Wiltshire was among the chief of the clothing counties, the principal centres being Bradford; Malmesbury, Trowbridge, Devizes and Chippenham. In the 16th century Devizes was noted for its blankets, Warminster for its corn market and north Wiltshire for cheese. During the 17th century the clothing trade went through a period of depression, partly because of the constant outbreaks of plague. Amesbury was well known for its tobacco pipes.

Architecture. — Among the monastic buildings are the ruined abbeys of Malmesbury and of Lacock near Melksham. There are traces of the hospital for leprous women (afterward an Austin priory) at Maiden Bradley. Monkton Farleigh had its Cluniac priory, founded as a cell of Lewes in the 12th century. A college for a warden and five other priests, afterward a monastery of Bonhommes, was founded in 1351 at Edington. The church, Decorated and Perpendicular, resembles a cathedral in size and beauty. The finest churches of Wiltshire, generally Perpendicular, were built in districts of good stone. In the chalk region flint was used. Small wooden steeples and pyramidal bell turrets are not uncommon; the church of Purton has two towers, one of which is surmounted by a spire, and that at Wanborough has a tower and a lantern. St. Lawrence's at Bradford-on-Avon is one of the most perfect Saxon churches in England and there is a so-called chapel on the 13th-century bridge. Three arches in the nave of Britford church, within a mile of Salisbury, the east end of the chancel at Burcombe and parts of the churches at Avebury, Alton Barnes, Bremhill and Manningford Bruce in the Vale of Pewsey are Saxon. Norman work is found in the churches of Devizes, Preshute, Ditteridge or Ditcheridge, Netheravon and Great Durnford. Early English is illustrated by Salisbury cathedral, its purest and most beautiful example; and. on a smaller scale, at Amesbury, Bishops Cannings, Boyton, Collingbourne Kingston, Downton and Potterne. Bishopstone has the finest Decorated church in the county with incorporated work of Norman date. Mere has a Perpendicular church, with a medieval chantry chapel, used as a schoolhouse by William Barnes, the Dorset poet.

The castles of Wiltshire have almost disappeared. At Old Sarum. Marlborough and Devizes only a few vestiges are left. The ruins of Wardour castle (14th century) consist of a high hexagonal outer wall, enclosing an open court. The 18th-century castle, one mile distant, was once noteworthy for its collection of paintings, and for the "Glastonbury cup," said to be made of wood from the celebrated thorn (see GLASTONBURY: *St. Joseph of Arimathaea).* Place house, in Tisbury, and Barton farm, at Bradford, date from the 14th century. Fifteenth-century work is best exemplified in the manor houses of Norrington (Vale of Chalk); Teffont Evias (Vale of Nadder); Potterne; Great Chalfield near Monkton Farleigh; and South Wrexall, the seat of the Lords Long. The great early Renaissance house of Longleat, near Warminster (*q.v.*), is the seat of the marquess of Bath; and Wilton (*q.v.*) house, Salisbury, the seat of the earl of Pembroke and Montgomery, is a fine example of the work of Inigo Jones. Longford, built in the form of a Trinity symbol in Elizabethan times, contains, like Wilton, many works of art, and belongs to the earls of Radnor. At the Tudor mansion of Lacock abbey, near Melksham, built round the remains of a 13th century abbey, W. H. Fox-Talbot invented his photographic process. Lydiard park, Purton, dates from medieval times but was reconstructed in 1743–49. Corsham court, Chippenham, is Elizabethan and Georgian.

Agriculture, Industries and Communications. — The downs of the uplands are mostly covered with coarse grass and support sheep (more than 90,000 in the late 1950s). The valleys are fertile and well wooded. The lowlands and clay plains are mostly under grass for dairying purposes and in the late 1950s about 48% of the total area of the county was under grass. The principal crops are wheat, oats and barley, which together covered nearly 158,500 ac. at that time.

Three ancient forests remain: Savernake, south of Marlborough; Cranborne Chase (partly in Dorset); and No Man's Land and Hamptworth common, which are outlying parts of the New forest (Hampshire). The National trust owned 6,168 ac. in Wilts in 1957 and one-seventh was in use by the services. Many hands are employed in the railway locomotive works at Swindon (*q.v.*) and there are large engineering and tobacco works at Devizes. Cloth is woven, especially at Trowbridge; boots and shoes are made at Salisbury; rope and sacking at Melksham; rubber at Melksham and Bradford-on-Avon; bacon at Calne; processed milk, railway signals and brakes at Chippenham; and gloves—an ancient industry—at Westbury. Wilton carpets are known the world over. Portland and Bath stone are quarried. The main London-Bath railway line crosses the county in the north; the line from London to the west passes through Salisbury. Swindon, Salisbury and Westbury are big junctions. The Avon is navigable as far as Salisbury. The Thames and Severn canal passes through the northeast of the county and the Kennet and Avon canal traverses the Vale of Pewsey.

Population and Administration. — The area of the administrative county is 1,344.7 sq.mi. with a population (1951) of 386,692. The municipal boroughs are: Calne (pop., 1951, 5,5531, Chippenham (11,851), Devizes (7,897), Malmesbury (2,510), Marlborough (4,557), Salisbury, a cathedral city (32,911), Swindon (68,953), Wilton (2,858). The county is in the western circuit and assizes are held at Salisbury and Devizes. It has one court of quarter sessions and is divided into 16 petty sessional divisions. The boroughs of Salisbury and Devizes have separate courts of quarter sessions and commissions of the peace and Swindon also has a separate commission of the peace. There are 5 urban and 12 rural districts. Wiltshire has no county town, Trowbridge being the administrative centre and Salisbury the diocesan centre. Most of Wiltshire is in the diocese of Salisbury but there is a large part in that of Bristol and smaller parts in those of Gloucester, Oxford, and Bath and Wells. The four county constituencies are Chippenham, Devizes, Salisbury and Westbury; Swindon is a borough constituency.

WILUNA, a mining district and settlement in Western Australia. situated in the Central division about an equal distance (approximately 120 mi.) east of Meekatharra and north by east of Sandstone. Wiluna has been linked with Meekatharra by railway (Meekatharra–Perth: 600 mi.; Sandstone–Perth: 575; Meekatharra–Geraldton: 334; Sandstone–Geraldton: 309 mi, by rail.) Auriferous deposits of large extent have been discovered there and the area is under vigorous development. It is the chief town of the East Murchison gold field, which, however. ranks behind Kalgoorlie, Meekatharra, Laverton and Menzies as a gold producer. Pop. (1954) 367 for the locality.

WIMBLEDON, a municipal borough (1905) of Surrey, Eng., and a residential suburb of London, 8 mi. S.W. of Charing Cross. Pop. (1951) 58,141. Area 5 sq.mi. Wimbledon common covers more than 1,000 ac. Wimbledon is famous for the annual lawn tennis championships played at the All-England Lawn Tennis and Croquet club since 1877 *(see* LAWN TENNIS AND TENNIS). It is supposed to be the site of the battle of Wibbandune (568) between Ceawlin, king of Wessex, and Aethelbert, king of Kent, in which the latter was defeated. An earthwork on the common is known as Caesar's camp. There are the John Evelyn museum and several large schools and colleges.

WIMBORNE MINSTER, a market town and urban district in the North Dorset parliamentary division of Dorset, Eng., 22 mi. E.N.E. of Dorchester by road. Pop. (1951) 4,487. Area 1 sq.mi. It is on the river Allen (formerly the Wim) near its confluence with the Stour, and a few miles S.E. of Badbury Rings, an Iron Age earthwork. Cuthburgha and Cwenburh, sisters of Ine, king of Wessex, founded a nunnery there in 718. The present minster, reputedly built on the site of that nunnery, is called St. Cuthburgha and dates from 1120. It contains a chained library and an astronomical clock, possibly made by Peter Lightfoot in

1320. In 871 King Ethelred was mortally wounded in a nearby battle with the Danes and brought to Wimborne for burial. The minster contains his grave slab (with 14th-century brass inserted). In the early 11th century Wimborne, with its convent and church, was completely destroyed by the Danes. In place of the convent a college of secular canons was established by Edward the Confessor; later it became a royal free chapel. In 1496 Margaret, countess of Richmond and mother of Henry VII. founded a chantry and seminary which, although dissolved with the college in 1547, was re-established as a grammar school with 12 governors under a royal charter of Elizabeth I. This Peculiar Jurisdiction lasted until 1846, but the 12 lay governors are still patrons of the benefice. St. Margaret's hospital (13th century) now used as almshouses, was originally a leper hospital. The town's industries are market and nursery gardening and fruitgrowing.

WINBURG, the first capital of the Orange Free State, Union of South Africa, was laid out in 1836 and is the oldest township in the province. It is 71 mi. from Bloemfontein on the Cape Town-Johannesburg national road. Pop. (1951) 3,944, including 1,502 Europeans, 2,268 natives and 174 coloured. The town has broad streets, beautiful gardens and a modern town hall. It is in close proximity to the Vet river and Laaispruit, which have magnificent mimosas and willows on their banks and offer excellent bathing and fishing. A progressive and attractive town, Winburg is also the trading centre of a large grain and pastoral district.

WINCHCOMBE, a town in Gloucestershire, Eng., 7 mi. N.E. of Cheltenham by road, on the edge of the Cotswold hills, in the valley of the river Isbourne. Pop. of parish (1951) 2,781. Area 8.5 sq.mi. The town originated in a mitred abbey founded for Benedictines in the 8th century by Kenulf, king of Mercia, and burned down by the Danes. Twice rebuilt, the abbey was dissolved by Henry VIII. The parish church of St. Peter, which is Perpendicular, was built by the parishioners, with the help of Lord Seymour of Sudely (*q.v.*), on the site of a former church. The galleried George inn (1583) was one of the pilgrim inns.

Sudely castle (½ mi. S.E.) belonged to Lord Seymour of Sudely whose wife, Catherine Parr, is buried in the chapel. He demolished Winchcombe abbey in 1539 and also the Cistercian abbey at Hailes (National trust property, 2 mi. N.E.) founded in 1246 by Richard, earl of Cornwall (brother of Henry III), who is buried there with his wife Sanchia. On the hills southeast of Winchcombe is Belas Knap, an important (restored) Stone Age burial mound.

WINCHELSEA, ROBERT DE (d. 1313), archbishop of Canterbury, was probably born at Old Winchelsea. He studied in Paris, and was rector of the university at some period before 1267; he then taught at Oxford, where he became chancellor of the university in 1288. He held prebendal stalls in the cathedrals of Lincoln and St. Paul's, and was made archdeacon of Essex about 1283. In 1293, he succeeded Peckham as archbishop of Canterbury. His consecration, which took place at Aquila in Sept. 1294, was delayed as a result of the vacancy in the papacy, but he found no difficulty in obtaining the temporalities of the see from King Edward I. Winchelsea is chiefly renowned as a strenuous upholder of the privileges of the clergy and the authority of the pope, and as a fearless opponent of Edward I. He assisted the barons in their struggle with Edward II by a frequent use of spiritual weapons, and took part in the proceedings against the Templars. He died at Otford on May 11, 1313. Miracles were said to have been worked at his tomb in Canterbury cathedral, but extensive efforts to procure his canonization all proved unavailing.

BIBLIOGRAPHY.—*See* his *Registrum*, ed. by R. Graham (London, 1917–): S. Birchington in *Anglia Sacra*, ed. by H. Wharton (London, 1691); W. Stubbs, *Constitutional History*, vol. ii, 4th ed. (Oxford, 1896).

WINCHELSEA, an unreformed prescriptive borough in the Battle rural district of the Rye parliamentary division of Sussex, Eng., 11½ mi. N.E. of Hastings by road. Pop. (1951) 173. Winchelsea is old, but the site of a still older town lies out to sea, about 3 mi. to the southeast. It is reputed to have had 700 householders, 50 inns and many churches, but it stood on low ground and in 1297 it was overwhelmed by the sea. To replace it Edward I built a great town of which the present Winchelsea is the lovely remnant. It stands on an abrupt hill spur rising above flat lowlands which form a southward continuation of Romney marsh. Two gates, one of the time of Edward I, the other early 15th century, overlook the marshes which until the 15th century were a great inlet of the sea. The silting up of this inlet marked the end of Winchelsea's days as a large port. A third gate stands some way to the west, its position pointing the contrast between the extent of the ancient town and that of the village of today. The town was laid out with regular streets intersecting at right angles; in the centre stands the church of St. Thomas a Becket. This comprises only the chancel and aisles of a building which, if entire, would rank as one of the finest parish churches in England. As it stands it is of great interest, showing Decorated work, windows of unusual design and a magnificent series of canopied tombs.

The "ancient towns" of Winchelsea and Rye had become members of the Cinque Ports by the time of Henry II. Winchelsea is governed by 12 jurats, including the mayor. It returned two members to parliament from 1368 till 1832, when it was disfranchised. Winchelsea was once a great resort for smugglers when the vaults originally constructed for the Gascon wine trade were used for storing contraband.

WINCHESTER, a city and municipal borough in the Winchester parliamentary division of the county of Southampton, Eng., 64 mi. W.S.W. from London by road. Pop. (1951) 25,721. Area 6.1 sq.mi. It occupies a hilly and picturesque site in and above the well-wooded valley of the Itchen, lying principally on the left bank. The surrounding hills are chalk down.

The Cathedral.— The erection of Winchester into an episcopal see may be placed early in the second half of the 7th century, though it cannot be dated exactly. The West Saxon see was removed there from Dorchester on the Thame, and the first bishop of Winchester was Hedda (d. 705). The modern diocese including nearly the whole of Hampshire, part of Surrey and small portions of Wiltshire, Dorsetshire and Sussex, was found to be too unwieldy and in 1927 was divided into the dioceses of Winchester, Guildford and Portsmouth, the first including the greater part of Hampshire together with the Channel Isles. St. Swithun (852–862), known through the connection of his feast day (July 15) with the superstition that weather conditions thereon determine those of the next 40 days, is considered to have enlarged the cathedral, as are Ethelwold (963–984) and Alphege (984–1005). The history of the Saxon building, however, is very slight, and as usual, its place was taken by a Norman one, erected by Bishop Walkelin (1070–98). The cathedral church of St. Swithun lies in the lower part of the city in a wide and beautiful walled close. It is not very conspicuous from a distance, a low central tower alone rising above the general level of the roof. It consists of a nave, transepts, choir and retrochoir, all with aisles, and a Lady chapel forms the eastward termination. The work of the exterior, of whatever date, is severely plain.

The cathedral, however, is the longest in England, and indeed exceeds any other church of its character in length, which is close upon 556 ft. Within, the effect of this feature is very fine. The magnificent Perpendicular nave is the work of Bishop Edington (1346–66) and the famous William of Wykeham (1367–1404), by whom only the skeleton of Walkelin's work was retained. The massive Norman work of the original building, however, remains comparatively intact in both transepts. The central tower is Norman, but later than Walkelin's structure. The choir is largely Edington's work, though the clerestory is later, and the eastern part of the cathedral shows construction of several dates. There appears the fine Early English construction of Bishop de Lucy (1189–1204) in the retrochoir and the Lady chapel, though this was considerably altered later. The square font of black marble is a fine example of Norman art, its sides sculptured with scenes from the life of St. Nicholas of Myra. The magnificent reredos behind the high altar must have been erected late in the 15th century. Under many of the arches of the nave and choir are a number of very elaborate chantry chapels, each containing the tomb of its founder. The most notable are the monuments of Bishops Edington, Wykeham, Waynflete, Cardinal Beaufort, Langton and Fox. The door of iron grilles, of beautiful design, now in the north nave aisle. is considered to be the oldest work of its character in England; its date is placed in the 11th or 12th century. The mortuary chests in the presbytery contain the bones of Saxon kings who were buried there. The remains were collected in this manner by Bishop Henry de Blois (1129–71), and again after they had been scattered by the soldiers of Cromwell. The choir stalls furnish a magnificent example of Decorated woodwork, and much stained glass of the Decorated and Perpendicular periods remains in fragmentary form. The library contains a Yulgate of the 12th century, a finely ornamented manuscript on vellum. In 1905 the cathedral fabric showed serious signs of weakness, and it was found that a large part of the foundation was insecure, being laid on piles, or tree trunks set flat, in soft and watery soil. Extensive works of restoration, including the underpinning of the foundations with cement concrete, were carried out between 1906 and 1912. Much of this work was done by one man. William Walker the diver. who for months worked submerged in liquid mud. where he could work by touch alone. Each year on St. Swithun's day he is remembered by name in the cathedral among the benefactors.

The Minster and Hyde Abbey.— King Alfred founded a minster immediately north of the present site of the cathedral. and there he and other Saxon kings were buried. The house, known as Hyde abbey, was removed (as was Alfred's bodyj to a point outside the walls. considerably north of the cathedral, during the reign of Henry I. There foundations may be traced. and a gateway remains. To the east of the cathedral are ruins of Wolvesey castle, a foundation of Henry de Blois, where the bishops resided. They now live in a wing of the adjacent Wolvesey palace. built by Wren. The rest of the palace was pulled down in 1800. On the southern outskirts of the city. in the pleasant water meadows by the Itchen, is the Hospital of St. Cross. This also was founded by Henry de Blois, in 1136. whose wish was to provide board and lodging for 13 poor men and a daily dinner for 100 others. It was reformed by William of Wykeham and enlarged and mostly rebuilt by Cardinal Beaufort (1405–47). The buildings form three sides of a quadrangle. with a lawn and sundial in its midst. while the fourth side is partly open and partly formed by the magnificent cruciform church. The earliest parts of this building are late or transitional Norman, but other parts are Early English or Decorated. The work throughout is very rich and massive. St. Cross is a unique example of a medieval almshouse, and its picturesqueness is enhanced by the curious costume of its inmates. It is still customary to provide a dole of bread and beer to all who desire it. King's gate and Westgate alone remain of the gates in the walls which formerly surrounded the city. The Westgate is a fine structure of the 13th century. In the High street stands the graceful Perpendicular city cross. The great hall is all that remains of the castle begun by William the Conqueror and finished by Henry III in 1235. In it is preserved the so-called King Arthur's Round Table which is thought to be a 13th-century table repainted in the reign of Henry VII. The county council offices of Castle hill were opened in 1911. The Stanmore housing estate was developed after World War I as part of a district planning scheme covering 80 sq.mi., including the city.

Winchester is famous as an educational centre. and in addition to Winchester college and St. Swithun's girls' public school there are several modern preparatory schools. Winchester college. the proper name of which is the College of St. Mary, lying to the south of the cathedral close, is one of the greatest of English public schools. While a monastic school was in existence there from very early times, the college was originated in 1387 by William of Wykeham, whose famous scheme of education embraced this foundation and that of New college. Oxford. The buildings were completed about 1395. The quadrangles, with the fine chapel, toner, hall and cloister, are noteworthy.

HISTORY

The history of the earliest Winchester (Winton. Wynton) is lost in legend; earthworks and relics show that the downs above the Itchen valley were occupied by Celts, and it is certain from its position at the centre of six Roman roads and from the Roman relics found there that the Caer Gwent (White City) of the Celts was, under the name of Venta Belgarum, an important Romano-British country town. The Romans had a clothmaking industry there, and later one of the first weavers' guilds was established. Hardly any traces of this survive, but mosaic pavements. coins, etc., have been discovered on the south side of High street. The name of Winchester is indissolubly linked with that of King Arthur and his knights, but its historical greatness begins when, after the conquest of the present Hampshire by the Gewissas. it became the capital of Wessex. When the kings of M'essex became kings of all England. Winchester became: in a sense, the capital of England, though it always had a formidable rival in London, which was more central in position and possessed greater commercial advantages. Under Alfred it became a centre of learning and education, to which distinguished strangers resorted. It was the seat of Canute's government; many of the kings. including Ecgbert, Alfred. Edward the Elder and Canute. were buried there.

Winchester was very prosperous after the Conquest, and its omission. together with London, from Domesday Book is probably an indication of its peculiar position and importance; its proximity to the New forest commended it to the Norman kings, and Southampton, only 12 mi. distant, was one of the chief ports for the continent. The Conqueror wore his crown in state in Winchester every Easter. as he wore it at Westminster at Whitsuntide and at Gloucester at Christmas. The royal treasure continued to be stored there as it had been in Anglo-Saxon times, and was there seized by William Rufus. who, after his father's death, "rode to Winchester and opened the Treasure House."

Under the Norman kings Winchester was of great commercial importance; it was one of the earliest seats of the woolen trade, which in its different branches was the chief industry of the town, although the evidence furnished by the *Liber Winton* (temp. Henry I and Stephen) indicates also a varied industrial life.

The Merchants' guild of Winchester claims an Anglo-Saxon origin. but the first authentic reference to it is in one of the charters granted to the city by Henry II. The *Libcr Winton* speaks of a "cnihts' gild." which certainly existed in the time of the Confessor. The prosperity of Winchester was increased by the St. Giles's fair. originally granted by Rufus to Bishop Walkelin. It was held on St. Giles's hill up to the 19th century. and in the middle ages was one of the chief commercial events of the year.

From the time of the Conqueror until their expulsion by Edward I. Winchester was the home of a large colony of Jews. whose quarter in the city is marked to the present day by Jewry street; Winchester is called by Richard of Devizes "the Jerusalem of England" on account of its kind treatment of its Jews. and there alone no anti-Jewish riots broke out after the coronation of Richard I.

Winchester seems to have reached its zenith of prosperity at the beginning of the 12th century; the first check was given during the civil wars of Stephen's reign. when the city was burned. However, the last entry concerning it in the Anglo-Saxon Chronicle says that Henry Plantagenet, after the treaty of Wallingford, was received with "great worship" in Winchester and London. thus recognizing the equality of the two cities; but the latter was rising at Winchester's expense, and at the second coronation of Richard I (1194) the citizens of Winchester had the significant mortification of seeing in their own city the citizens of London take their place as cupbearers to the king. The loss of Normandy further favoured the rise of London by depriving Winchester of the advantages it had enjoyed from its proximity to the continent.

During the Great Rebellion the city suffered much for its loyalty to Charles I and lost its ancient castle founded by William I. After the Restoration a scheme was started to restore trade by making the Itchen navigable to Southampton. but without success. Charles II, intending to make Winchester again a royal residence, began a palace there, which, being unfinished at his death. n-as used eventually as barracks. It was burned down in 1894 and rebuilt in 1901. Xorthgate and Southgate were pulled down in 1781, Eastgate ten years later. Westgate still stands at the top of High street. The guard room was formerly used as a debtors' prison, now as a museum.

Winchester sent two members to parliament from 1295 to 1885, when the representation was reduced to one, and since 1918 it has been included in the county division which bears its name.

Apart from its famous single buildings, such as the cathedral or St. Cross, the Winchester of today contains visible relics of every phase of its long history and almost every disaster or good fortune it has experienced through the centuries.

WINCHESTER, the seat of Frederick county, Va., U.S., at the northern end of the Shenandoah valley, 9 mi. from the West Virginia line and 68 mi. N W. of Washington. D.C. Noted for its annual Shenandoah apple blossom festival, Winchester also has many historic buildings. Founded in 1744 by Col James Wood, the town was named for Winchester, Eng. George Washington maintained an office there while surveying the land west of the Blue Ridge mountains for Lord Fairfax. Following Gen. Edward Braddock's defeat in 1755 Washington built Ft Loudoun, the first of a series of forts stretching south to the Carolinas The city was the site of three important battles during the Civil War and changed hands many times (*see* SHENANDOAH VALLEY CAMPAIGNS) It served as headquarters for Generals "Stonewall" Jackson and Philip Sheridan.

Located in the heart of a fertile apple growing region, Winchester has huge cold storage houses and is a large export msrket for bulk apples Numerous apple products, rubber goods, plastics. steel conveyers, tin cans and woolen goods are produced there.

Winchester pioneered in the field of municipal services. Its modified form of council-manager government (introduced in 1915) won recognition for work in sanitary engineering. The public high school and large public library were endowed by Judge John Handley, a Pennsylvanian. Gen. Daniel Morgan, Revolutionary officer. and Adm. Richard E. Byrd, the polar explorer, lived in Winchester.

For comparative population figures *see* table in VIRGINIA: *Population.* (G. M BE)

WINCHILSEA, ANNE FINCH, COUNTESS OF (1661–1720), English author, daughter of Sir William Kingsmill of Sidmonton, near Southampton. was born in April 1661. In 1683 Anne was one of the maids of honour of Mary of Modena, duchess of York.

In 1684 she married Col. Heneage Finch, who in 1712, on the death of his nephew Charles, became the 4th earl of Winchilsea The countess of Winchilsea died in London on Aug. 5, 1720

A poet, at her best poignant and graceful, but uneven in accomplishment, she nrote on manners (satirically), on nature (lyrically) and on themes of morality, piety and ardent sentiment (devotion to her husband. to fallen royalty and to friends) Much of her poetry nas published in her lifetime, notably "The Spleen" in Charles Gildon's *New Miscellany* (1701); and many pieces. including her Arcadian tragedy, *Aristomenes*, in her own *Miscellany Poems on Several Occasions Written by a Lady* (1713; acknowledged in the second issue, 1714). Wordsworth gave her poems foremost place in a manuscript anthology made for Lady Mary Lowther (1819; published 1905)

Most of the countess of Winchilsea's verse was edited by Myra Reynolds, with a substantial introduction, from early editions then known and manuscripts belonging to the earl of Winchilsea and Edmund Gosse. *The Poems of Anne Countess of Winchilsea* (1903). Edward Dowden, in *Essays Modern and Elizabethan* (1910), quotes unpublished poetry from another manuscript in his possession. *See* also selections in J. Middleton Murry (ed), *Poems by Anne Countess of Winchilsea* (1928), and H. I'A. Fausset (ed.), *Minor Poets of the Eighteenth Century* (1930). (M M LS)

WINCKELMANN, JOHANN JOACHIM (1717–1768), German archaeologist, was born at Stendal, Prussian Saxony, on Dec. 9, 1717. Winckelmann's study of ancient literature had inspired him with a desire to visit Rome. He became librarian to Cardinal Passionei in 1754 and embraced Catholicism

In 1755, before leaving for Rome, Winckelmann published his *Gedanken über die Nachahnung der griechischen Werke in Malerei und Bildhauerkunst* ("Thoughts on the Imitation of Greek Works in Painting and Sculpture"), followed by a pretended attack on the work and a defense of its principles, nominally by an impartial critic.

He gradually acquired an unrivaled knowledge of ancient art. In 1760 appeared his *Description des pierres gravées du feu Baron de Stosch;* in 1762 his *Anmerkungen uber die Baukunst der Alten* ("Observations on the Architecture of the Ancients"), including an account of the temples at Paestum. In 1758 and 1762 he visited Naples, and from his *Sendschreiben von den herculanischen Entdeckungen* (1762) and his *Nachricht von den neuesten herculanischen Entdeckungen* (1764) scholars obtained their first real information about the treasures excavated at Pompeii and Herculaneum.

His masterpiece, the *Geschichte der Kunst des Alterthums* ("History of Ancient Art"), issued in 1764, was soon recognized as a permanent contribution to European literature. In this work Winckelmann sets forth both the history of Greek art and the principles on which it seemed to him to be based. Many of his conclusions based on the inadequate evidence of Roman copies have been modified or reversed by subsequent research, but the fine enthusiasm of the work, its strong and yet graceful style, and its descriptions of works of art give it enduring value. It was read with intense interest by Lessing, who had found in Winckelmann's earliest works the starting point for his *Laocoon.*

In 1768 Winckelmann went to Vienna, where he was received with honour by Maria Theresa. At Trieste on his way back he was murdered by a man named Arcangeli to whom he had shown some coins presented by Maria Theresa (June 8, 1768).

WIND. Winds are classified according to whether they are general or local. General winds include those that stretch thousands of miles over the earth's surface, following semipermanent directional patterns both near the earth and in the atmosphere. Within the great wind currents move some local winds, *e.g* , the cool squalls that accompany thunderstorms. Other local winds are characteristic of particular geographical regions, such as coast lines and mountains. Local winds exert a pronounced influence on local climate and at the same time are themselves influenced by local weather conditions.

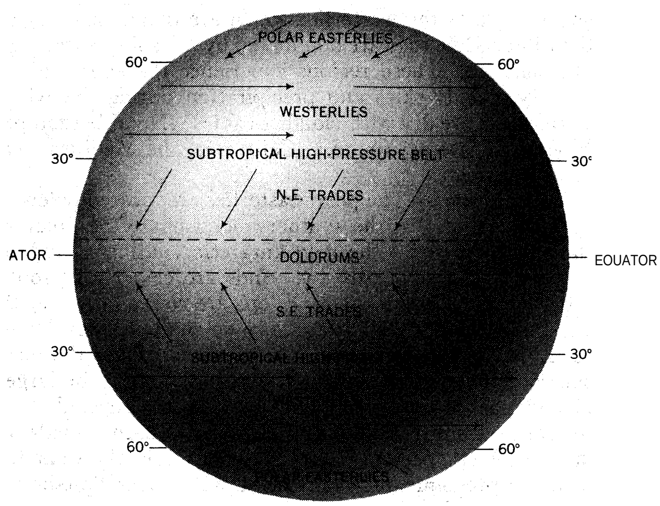
GENERAL WINDS

The pattern of the general circulation is primarily determined by the unequal heating of the atmosphere at different latitudes and altitudes and by the effects of the earth's rotation (*see* METEOROLOGY). The distribution of the winds is closely related to that of atmospheric pressure, and both must be discussed together.

In general, the pressure distribution gives a good indication of the prevailing winds, the latter generally following Buys Ballot's law. According to this law the wind in the northern hemisphere blows in such a manner that an observer facing downwind has the lower pressure to his left, the higher pressure to his right. In the southern hemisphere the lower pressure is to the right of the observer, the higher pressure to the left. In both hemispheres the wind near the ground does not flow exactly parallel to the isobars but has a component toward lower pressure because of surface friction. Near the equator where the change in direction from one hemisphere to the other takes place, this rule does not hold, and the winds are more irregular and more subject to local influences. Even at higher latitudes the topography of the earth's surface and changing atmospheric conditions often modify the wind direction so that Buys Ballot's law is not always well satisfied.

General Circulation, Schematic. — Schematically, the general circulation near the earth's surface can be described as follows (*see* diagram): between roughly latitude 30° N. and 30° S., easterly winds prevail (note that winds are named after the direction from which they are blowing) with components toward the equator, the northeast trades of the northern hemisphere and the southeast trades of the southern hemisphere. These winds blow toward an equatorial zone of light winds or calms, the doldrum belt, in which the pressure is low. On the poleward side the trade-wind belts are followed by the subtropical high-pressure belts in which calms or light winds prevail and in which precipitation and cloudiness are on the whole light. In the days of sailing ships the doldrums and the subtropical high-pressure belts were often difficult to cross, and the latter zones received the name "horse latitudes." The explanation given for this name is that ships aith cargoes of horses were often becalmed in these regions and ran out of water, so that the horses had to be disposed of. Poleward, beyond the horse latitudes, are the zones of the westerlies which extend roughly from latitude 35° to 65°. These zones are the regions of interaction between cold and warm air masses and of migrating centres of high and low pressure. In connection with the moving pressure systems, winds from directions other than west are frequently observed in these zones. Poleward from the regions of the westerlies the polar easterlies with components toward lower latitudes are found. However, the predominance of the easterly direction over the others is not pronounced, and other wind directions occur frequently.

Seasonal Variation, Effects of Land and Water.—The actual distribution of pressure and mind over the globe is considerably more complicated than indicated by this schematic description. Seasonal variations of position and intensity of these wind belts are produced by the annual march of the sun, and further complications are caused by the physical differences between water and land. Before entering into a detailed discussion of these



SCHEMATIC DIAGRAM OF THE WIND SYSTEMS OF THE EARTH

modifications, the disturbing effects of the continents will be considered in general. During the summer the land is warmer than the water because the sun's heat is distributed to a greater depth in the turbulent ocean than it is in the solid ground. Further. as a rule, more heat is used for evaporation over water than over land. In minter the ocean surface is warmer than the land because the cold surface water is mixed nith the warmer water from below. The air tends to assume the temperature of the surface. so that in summer the air is warmer over land, in minter over nater. Since cold air is in general heavier than narm air, the pressure over the land in winter is higher than over water, and an anticyclonic circulation develops. This circulation is clockwise in the northern hemisphere, counterclocknise in the southern hemisphere with a component outward from the high pressure because of surface friction. For instance, on the east coast of a continent in the northern hemisphere a northmest wind will be observed, nhile in the southern hemisphere a southwest wind would result in the same location. During the summer the land is heated more strongly than the water so that a low pressure develops over the land. The resulting cyclonic circulation is counterclockwise in the northern hemisphere, and clockwise in the southern hemisphere, both with a component of inflow toward the centre of low pressure. Hence on the east coast of a continent in the northern hemisphere, for instance. the wind would be southeast, in the southern hemisphere northeast. When the wind direction varies as much as 180° as in the example quoted here, one speaks of a monsoon (from the Arabic word for season). Typical monsoon winds are found along the east coast of Asia where cold and dry northwest winds from the interior prevail during the winter, warm and moist southeast ninds from the Pacific during the summer. However, in most regions in temperate latitudes the shift of the prevailing wind direction from summer to ninter is not so large, and it is rarely possible to discover a monsoonal tendency in the wind shift. For instance, on the east coast of North America the prevailing wind direction changes from northwest during winter to southwest during summer, through 90° only.

Description of the Wind Belts.—In order to consider the wind distribution and its seasonal modifications in detail the various wind and pressure zones will now be discussed separately.

The Zone of Doldrums.—Near the equator the earth is surrounded by the doldrum belt where the pressure is lower than farther north or south. The winds in this zone are, as a rule, light and irregular in direction with frequent calms. The effect of the earth's rotation on the air flow being negligible, the winds at the equator do not obey Buys Ballot's law. Instead. the air can move across the isobars so that any existing large pressure differences mould be destroyed quickly During January, which may be taken as a typical month for conditions during the northern minter. the belt of highest temperature is at or slightly south of the equator, nith larger displacements south over the continents where the temperature maxima extend considerably farther south than over the oceans. Consequently the doldrums during January are consistently near the equator over the oceans. Only over the warm land masses of South America and Africa and over the East Indies is their position farther south, at about 15° latitude. The northerly displacement of the zone of maximum temperature during the northern summer is much larger than the comparable displacement during the southern summer into the southern hemisphere because the large continental masses of the northern hemisphere become very hot in the northern summer. Consequently, the zone of doldrums too is displaced far northward. In July, for instance, the doldrum belt is considerably north of the equator, especially over Central America. north Africa and Asia. In the latter region, especially over India, the name doldrum belt is, however, hardly appropriate, since this is one of the regions where the monsoon is well developed.

The width of the doldrum belt is very variable from day to day and from place to place. This zone represents the region toward which the northeast trades of the northern hemisphere and the southeast trades of the southern hemisphere converge. These two wind systems meet often directly without being separated by a zone of calms. The line along which the two trades meet is called the intertropical front, a name which is frequently applied to the zone of doldrums even if a sharp front is absent. The convergence of the two trade-wind systems produces ascent and cooling of the air, and thus precipitation. Because of the seasonal motion of the doldrum zone there are few regions which are under its regime throughout the whole year.

The Trade-Wind Zones.—The trade winds, northeast in the northern hemisphere. southeast in the southern hemisphere, blow betneen the subtropical high-pressure belts and the zone of doldrums. They are characterized by the steadiness of their direction and speed, especially over the oceans. Variations occur. of course, in the trade-nind zones, but they are much smaller than the variations in other wind belts. The average speed of the northeast trades over the Atlantic has been estimated to be about 11 m.p.h.; that of the southeast trades to be about 14 m.p.h. There is an annual period of the wind speed and direction. The direction of the trade winds is not uniform throughout the whole trade-wind region. On the east side of the subtropical highs, that is, near the west coasts of the continents, the component toward the equator is developed best, and the trade-wind zones reach farthest north and south in these locations. Toward the nest the easterly component of the trades becomes more pronounced. The average limits of the trade winds and doldrums over the Atlantic and the Pacific are shown in the table after Hann-Suring (*Lehrbuch* der *Meteorologie*, 4th ed., Leipzig, 1929). The months shown are those when these zones have their extreme positions. In conjunc-

	March		September	
	Atlantic	Pacific	Atlantic	Pacific
N. E. trade	26°–3° N.	25°–5° N.	35°–11° N.	30°–10° N.
Doldrums	3° N.–0°	5°–3° N.	11°–3° N.	10°–7° N.
S. E. trade	0°–25° S.	3° N.–28° S.	3° N.–25° S.	7° N.–20° S.

tion with the displacement of the doldrum belt into one or the other hemisphere, the trade winds cross the equator in some regions. In this case they change their direction because of the different effects of the earth's rotation on air currents in the two hemispheres. Near the west coast of Africa, for instance, the southeast trades cross the equator into the northern hemisphere and become southwest winds blowing into the African low-pressure trough. This deflection is particularly well developed during the northern summer when the pressure is low over the hot Sahara. Another example is found in the Pacific during winter where the northeast trades become northwest winds after crossing the equator and blowing toward the Australian low-pressure centre.

Monsoon *Circulations*.—Over the large continental mass of Asia the changes in pressure distribution from summer to winter are very pronounced. Hence a typical monsoon regime is established along the east coast of Asia as well as over India and the adjoining countries to the west where the southwest monsoon blows during the summer season, the northeast monsoon during the winter season. During the regime of the southwest monsoon a continuous flow of air takes place from the subtropical high of the south Indian ocean toward the low pressure over Asia. Thus, the southeast trades cross the equator and become the southwest winds of the summer monsoon, demonstrating the change of the deflecting effect of the earth's rotation from one hemisphere to the other. The Indian monsoon is strongly affected by the Himalayas so that the summer monsoon blows from southwest over the Indian peninsula, from south into the Bay of Bengal and from southeast up the Ganges valley. The speed of the southwest monsoon varies from place to place. Over the Arabian sea between 5°–15° N. and 50°–60° E., its speed during June and July is, on the average, 20 to 25 m.p.h.; over Bombay, 14 m.p.h. The speed of the northeast monsoon is not much more than half the speed of the southwest monsoon. The southwest monsoon blows with great steadiness compared with the winds of other regions but its onset is often delayed for a considerable period, resulting in drought and famine in India. In no other region is the monsoon so strong as in Asia, although the north coast of Australia shows well-developed monsoon tendencies. Monsoonal tendencies in the seasonal wind variation are found also along the east coast of the United States and along the Guinea coast of Africa.

The *Subtropical* High-Pressure Belts.—During the northern summer the high-pressure belt of the northern hemisphere is not continuous but is interrupted by thermal lows over Africa-Asia and over h'orth America. In the southern hemisphere, on the other hand, which then has winter, the continents are cold, and the high-pressure belt surrounds the earth without interruption. During the northern winter conditions are reversed. The southern hemisphere then has summer, and the pressure is low over the continents, while in the northern hemisphere the pressure is high over the continents. However, the North American high is not a very permanent feature, as the daily weather maps show. In the first place, the continent is not so large as Asia; secondly, there is no barrier like the Himalayas preventing warmer air from invading the continent, and consequently cold anticyclones are often replaced by cyclones which derive their energy from the warm, moist air. The Asiatic high, on the other hand, is very pronounced and has a high persistence during the cold season.

The Westerlies.—On the poleward sides of the subtropical high-pressure belts are the regions of the westerlies which extend approximately from 40° latitude to the polar circles. While the prevailing ninds in the westerlies are from the west or southwest, the wind direction is much less steady than that of the trades because in the uesterlies the main frontal and cyclonic activity takes place. Hence in these belts a steady succession of migrating cyclones occurs, causing frequent changes of wind direction. Conditions in the westerlies are more complicated in the northern hemisphere than in the southern because of the disturbances produced by the large land masses of North America and Asia. The continental areas of the southern hemisphere are very small. There the belt of westerlies, the roaring 40s, is one of the stormiest regions throughout the year. In the northern hemisphere during the winter, high-pressure centres are found over North America and Asia and centres of low pressure near Iceland and the Aleutians. The Asiatic anticyclone is very strong so that the westerlies and the cyclone paths lie along the northern margin of the continent. Cyclones penetrate occasionally into the region under the regime of the Asiatic anticyclone, but their frequency here is much smaller than over western Europe and especially over the North Atlantic which during the winter often has winds of gale force. Since over North America the high-pressure centre is much less permanent than over Asia the westerlies with their succession of cyclones can cross the western mountains and the whole width of the continent alternating with migrating highs produced by the cold polar continental air. In summer the Icelandic low is much less intense while the Aleutian low has completely disappeared from the mean pressure map. This indicates that the strength of the westerlies and the cyclone frequency are much reduced during the warmer season in the northern hemisphere.

Since the subtropical high-pressure belt, the equatorial limit of the westerlies, shifts with the seasons, there are marginal zones on the equatorial side of the westerlies which are under their regime during the winter while they are dominated by the subtropical highs during the summer. These regions experience the effects of cyclonic activity, cloudy skies and precipitation during the winter while the summers are dry with cloudless skies. h'otable examples of this type of climate are found in California, the Mediterranean lands and south Africa.

The Polar Easterlies.—The polar easterlies are located poleward beyond the westerlies. In the southern hemisphere the polar region is largely covered by the cold antarctic continent, and the pressure is high. Consequently the winds are easterly or southeasterly, but local topographical variations are common. Over the high antarctic plateau the winds conform to the upper-level pressure pattern rather than to the sea-level isobars. Over the north polar zone conditions are complicated by the fact that the largest glaciated land mass in this region, Greenland, is not centred at the pole, and that in winter northern Siberia and northern Canada are colder than the Arctic ocean. Thus, the winds over the Canadian archipelago are predominantly northwest while over Spitsbergen and Franz Josef Land winds uith an easterly component are more frequent although changes in the wind direction occur often. During the summer the pressure gradients in the north-polar region are weak, and the winds are light and variable. (B. Hz.)

Winds in **the** Upper Atmosphere.—The pressure decreases more rapidly with height in cold air than in warm air, so that at altitudes of several miles above sea level the lowest pressure is located where the coldest air is found, and the highest pressure is associated with the warmest air. At these altitudes, then, the lowest pressures are found in the arctic and antarctic regions and the highest pressures are normally found in regions close to the equator instead of near 30°. In accordance with Buys Ballot's law, the easterly trade winds decrease in speed with height, and at heights of several miles become westerly winds, so that winds from a westerly direction prevail over almost all of the globe at these heights. The strongest west winds are still found in middle latitudes, however, where they are frequently concentrated into a narrow current, the so-called "jet stream." Maximum speeds of 100 to 200 m.p.h. are observed in the centre of this current in winter, when it is most developed and when it may be found at latitudes as low as 30°. In summer the jet stream is weaker and is normally found only poleward of 40°.

The jet stream and the weaker winds surrounding it do not always blow from due west but frequently have some poleward or equatorward component as well, appearing as a northwest wind at some longitudes and as a southwest wind at other longitudes. These deviations are caused partly by the disturbing influence of the continents (especially in the northern hemisphere) and partly by the large traveling centres of high and low pressure at sea level which effect the day-to-day changes in middle latitude weather. In January, for example, the coldest air in the northern hemisphere is usually located over the Canadian archipelago and over northeastern Siberia, so that the upper-level winds usually blow from west-southnest over the Atlantic and Pacific oceans, and from the west-northwest over the North American and Eurasian continents. Similar effects exist in summer when the air over the southern parts of the continents is very warm. The continents seem to have very little influence in the southern hemisphere. so the wind directions there are much more westerly in all seasons.

The westerlies increase in strength up to the height of the tropopause. seven or eight miles above sea level. Above this height, in the stratosphere, the air is normally narmer at high latitudes than at low latitudes, so the trend to an increasing pressure difference between equator and pole is reversed. The westerlies therefore begin to decrease in speed above this height, and at sufficiently high altitudes may even become easterly. (N. A. P.)

LOCAL WINDS

Local winds may be classified as slope winds, coast winds and mountain winds, and will be considered accordingly, noting that many winds do not always fit readily into any simple classification.

Slope Winds. — Perhaps the most familiar of all local winds are the gentle doanslope winds which occur inland on clear nights during quiet weather. They represent the slow drainage into the valleys of air which has been chilled by contact with the cool ground, the ground having lost heat by radiation into the clear sky. This chilling causes the air on the slopes to become denser than the air at the same level over the valley floor. and consequently a slow overturning motion develops in which the air close to the slopes sinks into the valley bottoms and an extremely gentle lifting in the free air above the valley floor takes place. The cool slope minds have speeds of up to two or three miles per hour and are very shallow, usually becoming inappreciable 50 ft. above the slopes. Honever, in valleys flanked by mountains the cold air flood may accumulate to a depth of several hundred feet and reach a speed near the ground of five or even ten miles per hour. Winds of this type are well known in the Swiss alpine valleys: one is the "Wisper wind" which flows in the Wisper valley opening into the Rhine. In mountainous country downslope winds occasionally occur in intermittent sudden rushes. The reasons for this have not been clearly established.

Even in cloudy weather a glacier chills the air over it, and consequently a cool downslope wind often occurs over large glaciers. The effect is intensified during the day when surrounding rocky areas warm the free air. Aii which descends along the glacier is continually cooled, and maximum speeds of about ten miles per hour are reached a few feet above the glacier surface. This "glacier wind" rapidly dies away as it spreads out beyond the foot of the glacier.

Sea and Land Breezes. — Everyone who has enjoyed a stay at the seaside is familiar with the sea breeze and if he has bathed in the sea appreciates the cause: during the day the land becomes considerably warmer than the sea. Offshore the heat of the sun is mixed to a considerable depth by the restless motion of the sea, and so causes hardly any temperature change. whereas on land the heat is absorbed in a layer only a few inches deep, and so raises the surface temperature very considerably. Consequently, by midafternoon on fine days the temperature of the air near the ground a fen miles inland is commonly as much as 5° and sometimes more than 10° C. higher than that of the air just above the sea. At higher levels the temperature difference is smaller and usually it has almost disappeared at a height of 2,000 or 3.000 ft. Above this level, the atmosphere and its winds are practically undisturbed The expansion due to heating of the lower layer of air over land reduces the air density, causing the pressure at the ground (the weight of the atmosphere above) to fall. The fall is only slight: perhaps a millibar, or about $\frac{1}{10}$ of 1%. Nevertheless the resulting pressure gradient, directed from the sea toward the land, is sufficient to generate a fresh breeze in that direction. On occasions when there is a strong general wind the differential heating of the land air may be less marked and the resulting pressure change may barely modify the existing pressure gradients. This situation will prevent the sea breeze from becoming well developed.

In more settled weather the breeze from the sea sets in near the coast by about midmorning and then steadily strengthens and penetrates farther inland. Its leading edge may be very well defined, so that within a minute or two a wind of ten miles per hour may replace light airs, bringing a sudden rise of humidity and a fall of temperature amounting to a few degrees. The sea breeze reaches its maximum strength in the early afternoon and usually persists into the evening before dying away. The depth of the sea breeze varies considerably: similar minds near the shores of moderately large lakes may be only a few hundred feet deep, nhereas the sea breeze near tropical coasts sometimes extends as high as 6.000 ft. The breeze similarly penetrates a very variable distance inland, but in temperate latitudes often extends 20–30 mi in from the coast by late afternoon, and in the tropics is said to reach as far as 50 mi. into the interior. At the time of maximum development the breeze is present at distances of at least several miles out to sea, but good observations of its seaward extent have not been made. By evening it often blows not directly from the sea but more nearly parallel to the coast in the same sense as a geostrophic wind (*q.v.*); *i.e.,* with a westerly component near a southern shore (in the northern hemisphere).

Usually the sea breeze air is cloud free, in contrast to the air farther inland. which often contains cumulus clouds. When the leading edge of the sea breeze is sharply defined, it often has above it a belt of well-developed cumulus clouds, produced where the land air is ascending over the cool sea air. so that the sea breeze can be said to have a "front" possessing some of the characteristics of a cold front. In thunderstorm weather the first cumulo-nimbus clouds to grow inland are sometimes in regions where there is a pronounced sea breeze front. The great frequency of thunderstorms in Florida is thought to be associated with the strong low level convergence produced by the flow inland of sea breezes from the opposite coasts of the peninsula.

Theoretical studies of the sea breeze, such as that made by R. P. Pearce, have approached a quantitative explanation of most of the observed characteristics. including the much weaker seaward drift of land air just above the cool current from the sea, which completes the sea-breeze circulation. It has not yet been possible, however. to account satisfactorily for the formation of a sea-breeze front, and it seems likely that this will not be done until more refined models are tested. Such models would need to take into account the effect of friction, which is difficult to measure and has thus far been neglected.

During quiet nights the air close to the ground inland cools below the sea temperature, and a land breeze develops. Because only a shallow layer of air is cooled, the land breeze is feebler than the sea breeze. The land breeze extends a few miles out to sea, carrying the scents of vegetation. Sailboat fishermen take advantage of the land breeze to sail to fishing grounds in the early morning; they return on the sea breeze in the afternoon.

Coastal Slope Winds (**Bora**).—Strong winds develop over coasts nhen cold unstable air masses flow into regions where high snow-covered plateaus or mountains descend steeply into relatively very warm seas. Convection occurs predominantly or only over the sea, so that there the air becomes considerably warmer in the first few thousand feet than it is inland. Particularly when the resulting offshore breeze reinforces a general flow, the mind over the sea near the coast may become very strong, or even a squally gale. and a danger to shipping. An example is the notorious bora which affects the northern shores of the Adriatic; in the winter season this wind is strongly influenced by the general pressure distribution and cannot be ascribed to purely local causes. Its direction is usually from the northeast or east-northeast, rather than from the north as its name implies (Boreas = north uind). In fine weather it does not extend more than about ten miles out from the coast, although it may be violent and raise a very rough sea; in stormy weather ahead of a cyclone near southern Italy it may extend over the whole of the Adriatic. Winds like the bora occur elsewhere in the Mediterranean and in other parts of the world where the meteorological and topographical situation is favourable. Notable examples occur on the north Caucasian shore of the Black sea, on some arctic coasts and in southern California, where a wind known as the Santa Ana blows down the mountain passes and out to sea for a distance of up to 50 mi.

Mountain-Gap Winds (Mistral). — Another well-known wind is the dry, cold northerly mistral which blows down the Rhône valley and into the warm waters of the Gulf of Lyons. This wind has some of the character of the bora but is associated with the breakthrough of cold air masses from the north, whose path into the Mediterranean is restricted by the massive barriers of the Alps and the Pyrenees. It is an example of a mountain-gap wind but of much larger scale than the very local strong winds which are often encountered in mountain passes. Unlike winds produced solely by temperature gradients in the lowest few thousand feet it may be a very deep current; on occasions when it becomes very strong there is usually a fall of pressure in the lee of the Alps, and a depression forms in the Gulf of Genoa. It often blows persistently for days on end and in Provence is one of life's hardships.

The Strait of Gibraltar is an important gap in the arc formed by the Atlas mountains of north Africa and the extensive high plateau of Spain. The winds in the strait tend to be either westerly or easterly. Shallow cold air masses which invade the western Mediterranean from the north often stream through the strait as an easterly wind which is very strong in the lowest 2,000 or 3,000 ft. Such a wind is known locally as a levanter. It may reach very high speeds a few hundred feet above the sea in the narrows of the strait, where it is said to have brought eastward-traveling Catalina flying boats practically to a standstill.

Similar strong winds occur in other parts of the world where cold air streams break through mountain-chain gaps.

Winds in the Lee of Mountains (Foehn). — In all mountainous regions the winds which blow from the ridges into the leeward loalands are characterized by their warmth and dryness. They are known by various local names, but are known generally by the term foehn (fohn), which comes from the European Alps where these winds were first studied, and where they are very pronounced. In North America the foehn winds strongly influence the climate in a broad belt lying east of the Rocky mountains and are known as chinook winds. Near the Andes in the Argentine they are known as *zonda* winds. Local winds with foehn characteristics are also well known wherever prevailing winds cross a mountain chain, as those in Japan, New Zealand, central and eastern Asia and in Scandinavia.

The foehn occurs at all seasons; it is a gusty wind accompanied by unusually good visibility and often by well-broken or clear skies. The upper slopes of the mountains and their peaks are obscured by clouds, in which there is often rain or snow. This bank of cloud is called the foehn wall. In the lee of the mountain peaks, often extending in ranks far out over the lowlands, are elongated, lens-shaped clouds (lenticularis) revealing wave-like disturbances in the air stream set up during its passage over the mountains. Although the winds may be strong, the waves and their clouds are almost stationary, condensation occurring continuously on the windward sides and evaporation on the lee sides of the clouds.

The unusual warmth of the foehn wind is associated with the fall of rain or snow from the air which is passing over the upper slopes of the mountain. During its ascent on the windward slopes the air is chilled, but the cooling is diminished by the release of latent heat from condensing water vapour; during descent down the leeward slopes the air is warmed and the cloud evaporates, reclaiming its latent heat: but since some water was lost as rain or snow less latent heat is reclaimed than was liberated, and the air arrives at its original level warmer than before. During the winter this great increase of temperature often causes a rapid melting of snow at low levels. It is said that some persons are prone to ills or malaise during spells of foehn, but if the association is real its explanation is not known.

The Helm Wind. — The wavelike disturbances in the air stream which are sometimes set up when a wind current flows over a ridge may be accompanied by notable changes in the nature of the surface wind in the lee of the ridge. Under the crest of the first lee wave the wind close to the ground may be very light, or even reversed in direction. flowing toward the hills, while over the lee hill slopes the wind may blow with abnormal force, more appropriate to the strength in the free air at the level of the hilltops. Such peculiarities are often notable near rather small hill ranges nith smoothly falling hill slopes, rather than near precipitous mountains. A well-known example is the helm wind, a steady gale which blows down the western slopes and for some distance over the lowlands in the lee of the northern Pennines when moderate easterly winds prevail over northern England.

Local Names for Winds. — In some regions with strongly varied relief, winds from particular quarters bring characteristic kinds of weather and have popular names but are not, strictly speaking, local winds in the sense defined in the first paragraph of this section. The densely populated Mediterranean area abounds in these specially named winds. The central and southern Mediterranean are subject to very warm southerly winds which bring air from the hot desert interior of northern Africa. These winds are abnormally dry and hazy and are most prominent in the spring when cyclonic winds are common and the sea is much cooler than the desert. They bring oppressive weather and often damage to vegetation. The general name for these winds is sirocco, but locally they are known as khamsin (in Malta and Egypt), leste (Madeira and north Africa), simoom (northeast Africa and Arabia) and leveche (in southeast Spain). They arrive in the northern Mediterranean with somewhat reduced surface temperatures, but passage over the sea makes the air moist and muggy, and there may be dense clouds and rain near the north Mediterranean coasts. Near the Gulf of Lyons a strong, warm southerly or southeasterly wind is called a marin.

Near the northern shores of the Mediterranean the striking winds are cold winds, especially in the winter, such as the already described mistral and bora. In northern Italy a cold northerly wind is called a maestrale, arid the maestro is a cool northwesterly wind in Sardinia and Corsica. In the Mediterranean sea a strong northeasterly wind is called a gregale or Euroclydon, while in Italy cool northeasterly winds are often referred to as *tramontana*. The persistent northerly winds which are a feature of the summer season in the northeast Mediterranean and near Greece are called the etesian winds. Even when they reach gale force they are usually accompanied by cloudless skies.

Two other widely known names are pampero (used in the coastal plains of the Argentine) and southerly burster (of New South Wales). These refer to the strong cool squalls which occur during the passage of some cold fronts and are often accompanied by heavy rain and thunder. In southern Australia similar winds from the desert interior are known as brickfielders, a name said to have come originally from squalls which raised much dust from brickfields near Sidney. See also Index references under "Wind" in the Index volume.

WINDAUS, ADOLF (1876–1959), German organic chemist. winner of the 1928 Nobel prize in chemistry for research on the constitution of the sterols and their relation to certain vitamins, was born in Berlin, Dec. 25, 1876. He was professor and head of the chemical institute at Gottingen (1915–44) after earlier appointments at Freiberg (1901–13) and Innsbruck (1913–15). His work establishing the structure of cholesterol was begun in 1901 and completed in 1932. Paralleling this work was his investigation of compounds with antirachitic activity, the so-called sunshine vitamin D compounds, and how they are formed from certain sterols by light. Besides these major achievements Windaus contributed to the spatial chemistry of condensed ring systems, discovered histamine through synthesis, showed that vitamin B_1

contained sulfur and contributed to the structural chemistry of colchinine, the cardiac glycosides and other naturally occurring compounds. Motivated by theoretical considerations, his work had tremendous practical significance. He died at Gottingen on June 9, 1959. (W. H. SN.)

WIND BRACES, in architecture. diagonal braces to tie the rafters of a roof together and prevent "racking." In many medieval roofs they are arched and run from the principal rafters to catch the purlins. In modern steel construction. wind bracing is necessary in the wall and floor framing of high buildings to withstand the diagonal stresses set up by the wind pressure on a side wall; the wind braces take the form either of diagonal tension rods. of diagonal angle, channel or I-beam bracing at the corners or of enlarged web or gusset plates at the intersections of framing members. See ROOF.

WINDBREAK (SHELTERBELT), rows of trees and shrubs ,planted to serve as a barrier to break the force of dust storms, winds and snon-storms. Windbreaks are of two kinds: those planted to protect the farmstead and those planted to protect field crops and conserve top soil.

A good farmstead windbreak consists of from five to eight rows of shrubs and trees. one or more shrub rows being planted on the windward side facing the prevailing winds. Behind these rows are planted fast-growing trees and the next two or more rows consist of hardy, long-lived, tall hardwoods with a few rows of conifers on the inside or leeward side. The hardwoods protect, from dust storms and dry winds in summer and in winter serve to break up wind gusts and prevent snow from drifting. The conifers. with their year-round foliage and with branches from the ground up, provide a nearly impenetrable barrier.

Farmstead windbreaks may be established in any region where climatic conditions are severe. In the U.S. prairie and plains areas, where prevailing storm winds come from the northwest, windbreaks are located on the north and west sides of a farmstead. The number of tree rows required depends upon wind velocity and the character of seasonal storms. Choice of tree species and planting

cially important to crop growth.

In sandy regions. field windbreaks reduce losses caused by drifting and blasting sand that otherwise might cover growing crops and cut down standing grain.

Field windbreaks planted at designated intervals across fields may consist of from one to three rows of trees depending upon protective needs. Climatic conditions, altitude and topography and the type of soil determine more specifically the location of windbreaks.

Information as to establishing windbreaks or shelterbelts in regions of the United States can be obtained from state colleges of agriculture. or state and federal forest service agencies. See also FARMSTEAD ARRANGEMENT. U.S. (P. O. A.)

WIND CAVE NATIONAL PARK, in the Black hills of South Dakota. U.S., was established on Jan. 9, 1903. Boundary changes were made in March 1931, June 1935 and Aug. 1946. Acreage, most of which is owned by the federal government, totals more than 28.000. A current of wind intermittently passes through Wind Cave. flowing inward when the barometer falls and outward when it rises. The cave contains limestone caverns. with beautiful formations called boxwood. tipped with white crystals. These formations, which are comprised of crystal fins in a honeycomb pattern, differ from the stalactite and stalagmite formations found in most large caves.

Above the cave a game sanctuary was established. Buffalo herds, breeding stocks of which were placed there in 1912 by the American Bison society, were permitted to roam throughout the area. Other animals placed on the preserve include the antelope, elk and deer. In addition to various deciduous trees found in the valleys, ponderosa pine and Rocky mountain cedar grow there.

WINDERMERE, the largest lake in England, is in the south-eastern part of the Lake district (*q.v.*), in the county of Westmorland. The boundary with Lancashire runs along the western shore, round the foot and northward along about one-third of the eastern shore. The lake is 10½ mi. long and 1 mi. wide; area 5.69 sq.mi. The shores are generally steep, beautifully wooded and fretted with numerous little sheltered bays. The hills immediately surrounding the lake rarely reach 1,000 ft., but the distant views of the mountains to the north and west contrast finely with the sylvan beauty of the lake itself. Immediately. opposite Bowness is a group of islands (Belle Isle, Tommy Holme, the Lilies and others) which divide the lake into two basins. The greatest depth sounded in the northern basin is 219 ft., and in the southern 134. The lake receives the Rothay and Brathay streams at the head; Trout Beck also flows into the northern basin, and Cunsey Beck from Esthwaite into the southern. The lake is drained by the Leven. Steamers ply on Windermere during the summer, the chief stations being Lake Side (south), Ferry (west), Bowness (east) and Waterhead, for Ambleside (north). The lake contains perch, pike, trout and char; there are several large hotels at Bowness and elsewhere on its shores.

The town of WINDERMERE, above the eastern shore adjacent to Bowness-on-Windermere, is an urban district lying in woods about three quarters of a mile from the lake by footpath. Pop. (1951)

WIND EROSION AND DEPOSITION. The movement of sand and dust by wind is an important geologic process, particularly in desert regions, and produces highly distinctive landscape features and sedimentary deposits of widespread occurrence. The process comprises three stages: erosion, transportation and deposition. Erosion involves the picking up and blowing away of loose, fine-grained material. This occurs wherever dry sandy or dusty surfaces, unprotected by vegetation, are exposed to strong winds. The coarser material, of sand size, is carried along close to the ground, transported by a combination of rolling and leaping of the individual grains. Where the sand is abundant and the wind is very strong, the net effect may be described as having the appearance of "streaming" and a sandstorm results, so that the air seems to be filled with flying sand up to a height of several feet. As this sand is driven along before the wind, it exerts an abrasive effect on rocks and other materials in its path, thus continuing the work of erosion and carving out uniquely sculptured surfaces. Movement of the sand continues until the velocity of the wind slackens or until some obstacle is encountered and the sand accumulates to form heaps, mounds or ridges known as dunes, highly varied in size and shape. Finer material, a powdery dust classified technically as silt, when set in motion by the wind, is quickly carried upward, sometimes to great heights, by turbulent air currents, and is transported in suspension. Under suitable conditions this may result in dust storms, and the dust may be carried long distances. Sooner or later, however, it settles, and if this is continued long enough a characteristic deposit known as loess (*q.v.*) is formed.

The fine-grained material, or ash, from volcanic eruptions is transported in similar fashion, and forms characteristic deposits of a different type (*see* TUFF). Each of the above aspects of wind action is discussed more fully below. For meteorological aspects of sand and dust movement by wind *see* DUST: *Dust Storms*. For agricultural aspects *see* DRY FARMING; LAND RECLAMATION; SOIL EROSION AND CONSERVATION.

EROSION BY THE WIND

Wind erosion takes place partly by deflation, the simple blowing away of loose. fine-grained material, and partly by abrasion, the gradual wearing away of hard material through the continued impact of wind-driven sand. In general, the effects of deflation are important only on soil and on unconsolidated materials, while the marks of abrasion are retained only on rock and other resistant materials.

Erosion of Soil and Unconsolidated Deposits.—The effects of deflation are illustrated on dry, unprotected soil, such as occurred on a widespread scale in the western Great Plains of the United States during the middle 1930s. As a result of extreme drought, repeated crop failures and continued pulverization by farm implements, the soil became loose and powdery over wide areas. This material was easily picked up by the strong prevailing winds. The coarser material drifted along close to the ground, to be piled up along fences, hedges, farm buildings and other obstacles.

BY COURTESY OF H T U SMITH

HEDGEROW DUNE FORMED BY THE ACCUMULATION OF SAND AND SOIL BLOWN FROM A CULTIVATED FIELD

The finer material was swept up into the air, giving rise to blinding, destructive dust storms, described below. In places, many inches of topsoil were removed. Wind erosion of soil became a major economic problem of the region and remained so until increased rainfall brought relief. Meanwhile, much study was given to methods of controlling or alleviating erosion by conservation of available water, improved methods of cultivation and better planning of land use.

Under natural conditions, deflation occurs mainly in desert basins and along stream beds which are dry during a part of the year. It works primarily on material previously prepared by weathering and running water. Frequently the erosive effects of the wind are canceled out by the washing in of new material. In many situations the layer removed is so thin, and the area from which it is removed is so broad, that erosive effects are imperceptible. In certain locations, however, where rainfall is nearly zero, erosive effects are more concentrated and result in a gradual lowering of the surface, producing topographic forms ranging from small shallow depressions to broad basins hundreds of feet in depth. Examples on a relatively small scale are found in the High Plains and western deserts of the United States, and on a larger scale in the deserts of Peru, Mongolia and north Africa. The Quattara depression of the Libyan desert is a major example, with a length of roughly 175 mi., a width of up to nearly 80 mi., and a maximum depth of approximately 436 ft. below sea level. In the excavation of the larger basins, however, it is believed that the work of running water during cyclic episodes of greater rainfall, alternates with wind action.

Another effect of deflation in some places is the formation of desert pavement, a thin layer of pebbles, which occurs where the material originally exposed to the wind consisted of a mixture of pebbles and finer material. Gradual removal of the latter by the wind leads to a residual accumulation of the pebbles, tending to retard or inhibit further wind attack.

Wind Erosion on Rock.—Blown sand acts as a powerful abrasive agent. Under artificial conditions it is used to clean the masonry surfaces on buildings and etch designs on monumental stone. Under natural conditions, its effects quickly become evident on objects of glass, metal and wood. Bits of glass lying on the surface in windy, sandy areas soon lose their lustre and take on a dull, frosted appearance. Automobiles caught in severe sand storms have had their paint removed and their windshields frosted to translucency in a short time. The effect on rock surfaces, continuously exposed to natural sandblasting for long periods of time, is far greater. Individual pebbles and rock fragments are etched, faceted, smoothed or eroded in more irregular patterns, commonly assuming ridged, pyramidal or fluted forms known collectively as ventifacts. Larger masses of rock and bedrock surfaces are grooved, fluted and pitted on a larger scale, taking on an appearance unlike that produced by any other erosive agent. Under exceptional conditions, the bedrock is eroded into alternating ridges and furrows known as yardang, with a relief ranging from a few-feet to a few tens of feet and with unconnected hollows and other irregular shapes.

BY COURTESY OF H. T. U. SMITH

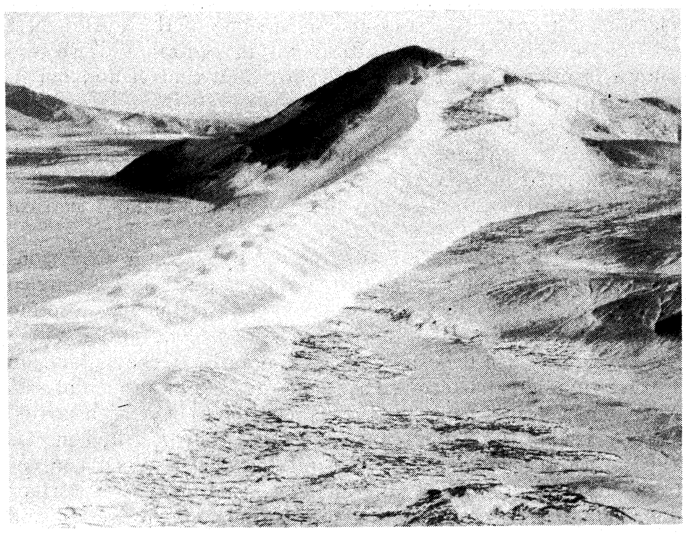
WIND EROSION ON A WOODEN POLE USED AS A BUFFER TO PROTECT THE POLE BEHIND IT

Ventifacts and wind-eroded rocks are known to occur in some places where sand is no longer blown about and where vegetation is now well established. In such circumstances, they serve as indicators of past climatic conditions much different from those of the present.

SAND DUNES

Sand dunes are perhaps the best-known and most striking result of wind action, and are of world-wide occurrence. They cover great areas in the deserts of Africa, Asia and Arabia, and lesser areas in the deserts of North and South America. They are prominent features also along many sea coasts and some lake shores and, in inactive form, are found in various interior areas of the United States, Germany, Poland, Hungary and other countries.

Dunes, in general, may be classified as being either active or stabilized. The active dunes—those still being built up, shaped or moved by the wind—may be subdivided into those with and those without vegetation, the forms of the two being distinctively different. In the absence of vegetation, sand blown from beaches, river beds or ancient stream deposits moves freely, much like drifting snow, until some obstacle or resistance causes accumulation. Topographic obstacles, such as hills or cliffs, may serve to trap sand and initiate dune building. Small hills may develop "attached" dunes on the downwind side, and, if the sand supply is abundant and the winds strong and constant in direction, these may develop into narrow, elongated ridges hundreds or thousands of



BY COURTESY OF H T U SMITH

SAND RIDGE LYING PARALLEL TO WIND DIRECTION ON THE LEEWARD SIDE OF A HILL IN THE PERUVIAN COASTAL DESERT. SAND IS BLOWN FROM THE SHORE BEHIND THE HILL

feet, or even miles, in length. Larger hills may give rise to sand drifts or sheets of more irregular shape, on one or more sides of the hill. Cliffs facing the mind may cause the sand to bank up and form "climbing" dunes, which in favoured localities reach heights of many hundred of feet. Cliffs facing away from the wind allow the sand to drop over into sheltered zones, and thus develop "falling" dunes.

In many places, dunes develop on relatively flat surfaces in the absence of any distinguishable obstacles. Here the dunes commonly are either crescentic or ridged in form and display remarkable regularity in their characteristics. Crescentic dunes, known as barchans, have their tips pointing downwind, and are markedly asymmetrical in cross section, with a gentle slope facing toward the n-ind and a much steeper slope facing away from the wind. These dunes gradually migrate with the wind as a result of erosion on the windward side and deposition on the leeward side. The rare of movement ranges from a few feet to a few hundred feet per year.

Ridged dunes are of two general types, asymmetrical and symmetrical. The asymmetrical type extends more or less at right angles to the direction of the sand-moving winds, and is thus commonly referred to as a transverse dune. Like the barchan, it has a gentle slope on the windward side and a steep slope on the leeward side, and migrates with the wind. In many places barchans and transverse dunes occur side by side, and transitional forms between the two are common.

Generally the transverse dunes occur in closely spaced groups, and together present the appearance of huge waves of sand. Individual ridges may be up to several hundred feet in height. Symmetrical dune ridges are of many varieties, and range widely in size and in detailed characteristics. It is believed by some that they are formed parallel to the dominant wind direction, and by others that they represent the action of convergent winds; possibly different varieties are developed in different ways.

The basic types of dunes discussed above are subject to countless modifications and complications, both in form and in pattern, and in addition there are other more complex forms in certain regions, reflecting different combinations of wind conditions and other factors.

The question remains as to what causes the accumulation of sand in dunes where no topographic obstacles are seen. An answer has been provided by experimental and observational studies on the mechanics of sand movement. In brief, it has been found that any accumulation of sand is in itself a partial obstacle, offering greater resistance to sand movement than sand-free surfaces adjacent.

Fortuitous accumulations with small beginnings, started perhaps by minor topographic irregularities, thus tend to be more or less self-perpetuating, arresting more and more sand and growing larger and larger until other factors intervene. Thus initiated, subsequent molding and progression become a matter of aerodynamics, controlled by changes in wind velocity and direction, and by interaction with other dunes and other features in surrounding areas.

Where vegetation is present in significant degree, dune building progresses differently, and the resulting forms have their own individuality. When sand is blown from some bare area, like a sandy beach, to a bordering zone with vegetation, the latter serves to check sand movement. Certain varieties of plants thrive in blowing sand, and their continued upward growth progressively traps more sand, deveioping a well-defined mound or ridge. Dune building then is essentially a contest betn-een drifting sand and growing vegetation. Where the sand overpowers the vegetation, the accumulation moves forward. Where the vegetation retains control, the accumulation grows upward. As the sand accumulation grows larger, variations in the resistance offered by vegetation at different points commonly leads to relative forward movement at some places, and once well started these may channel the wind and perpetuate themselves. Ultimately, a U-shaped dune, open toward the wind, may develop. Such dunes, in fact, are characteristic of vegetated areas; although having some resemblance to barchans, they differ in having the relatively steep slope on the convex side, and in having this side facing away from the wind. Variations and combinations in dune form under the above conditions may be described as \--shaped, Y-shaped, fork-shaped, hairpin-shaped and rake-shaped.

It is seen above that the normal processes of dune development commonly involve either forward movement of the mass as a n-hole, or gradual extension of some part of the mass in a downwind direction. From the human standpoint, this may be a destructive process. Fields, forests, buildings, roads and even villages have been known to be overwhelmed and obliterated. To check such effects, various means have been devised to stabilize dunes or control sand movement. In some places the planting of suitable grasses, shrubs or trees is effective. In other places various types of mechanical barriers or protective coatings have been used.

Active dunes sometimes become stabilized or fixed naturally by the growth of a continuous cover of vegetation, due primarily to changed climatic conditions. Extensive areas of such "dead" dunes occur in the central United States and in various European countries. If the vegetative cover on such stabilized dunes is destroyed locally, wind action readily starts anew, developing "blowouts," saucer-, bowl- or trough-shaped hollows with bordering heaps of sand.

Dune building has been widely distributed in time as well as in space. Many sandstone formations, some dating back to very early periods of geologic time, have been identified as ancient dune sands, since consolidated. Some of these formations are of con-

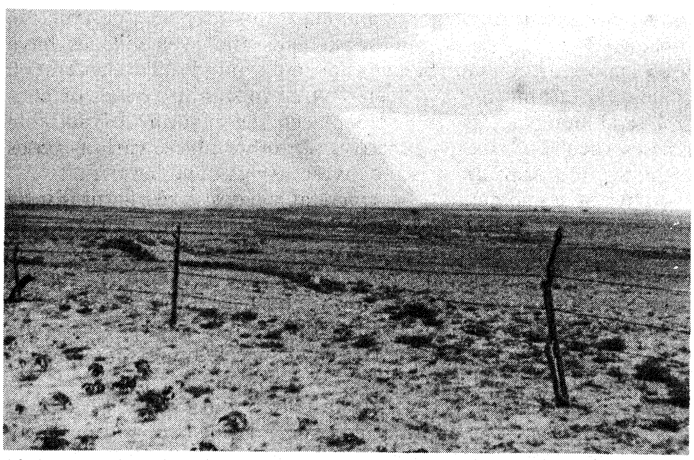
siderable extent and thickness, and serve as evidence of former deserts.

Wind-blown sand is characterized by physical properties different from those of other types of sand deposits. and thus is helpful in the identification of ancient dune sands which have lost their distinctive topographic form. The sand is particularly well sorted. and a major proportion of the grains are generally between $\frac{1}{2}$ and $\frac{1}{8}$ mm. in diameter. Well-rounded grains are relatively abundant, and grain surfaces typically display a frosted appearance. Cross bedding of a distinctive type is also present in many deposits. *See* also DUNE.

DUST STORMS AND DUST DEPOSITS

Severe dust storms are one of the more spectacular manifestations of wind action. Deflation supplies the material and atmospheric turbulence, together with convection currents, and carries it aloft for the wind to move along. When the amount of dust in the air reaches a high concentration, it may give rise to a dense, dark cloud of swirling dust with a steeply sloping, sharply defined front, hundreds of feet high, rolling irresistibly across the countryside. Frequently visibility is reduced to a few feet, and human activities come to a halt. As the storm moves along for tens and sometimes hundreds of miles, its vigour is gradually dissipated, dust settles out and the dust cloud gives way to a dry fog, which thins with increasing distance.

Dust storms are a common phenomenon where strong winds blow across desert areas, either natural or man-made, or across the temporarily dry beds of streams fed by glaciers. The man-made desert conditions of the central United States, in the 1930s, gave rise to dust storms nearly as severe as any on record. One storm, in 1933, was traced for a .distance of 1,300 mi., to northern New York. Around deserts such as the Sahara, dust storms have been known for centuries, leading to falls of reddish dust over much of southern Europe and occasionally even as far as England. A single storm, in 1901, was reported to have deposited from 3 to 30 tons of dust per square mile over an area of at least 300,000 sq.mi.—a total of about 2,000,000 tons of dust in Europe alone.



BY COURTESY OF H. T. U. SMITH

DUST STORM IN EASTERN COLORADO

The dust which settles to the ground may be held in place by vegetation and become a part of the soil. Ordinarily individual dust layers are too thin to retain their identity. But if dust storms recur with sufficient frequency over a long enough period of time, in places near the source area the accumulated dust gradually builds up a distinctive deposit, blanketing broad areas to depths of from a few inches to many feet. This is currently happening near the glaciers of Greenland and Alaska *(see* also GLACIER). The material so deposited, known as loess, is distinguished from other types of sedimentary deposits by its lack of distinct layering or bedding, by its occurrence on hills and valleys alike, and by its homogeneity and excellent sorting, with grains from $\frac{1}{16}$ to $\frac{1}{32}$ mm. in diameter generally predominant.

Loess deposits dating back to the Pleistocene epoch (*q.v.*) are widespread in many countries and form some of the world's best agricultural soil. Examples are found in central and western Europe. southern South America, China and central and northwestern United States.

In the Missouri-Mississippi drainage basin, thickness of the loess is up to more than 100 ft., and in China it is reported to reach several hundred feet. Where thick loess is exposed along valley sides. it commonly forms steep bluffs with conspicuous vertical cracks.

The dust, or ash, blasted into the air by volcanic explosions reaches much greater heights than ordinary dust, and is carried farther and deposited in greater thickness. After the eruption of Mt. Ratmai, in Alaska, in 1912, an area of about 2,000 sq.mi. was covered by ash deposits a foot or more in thickness, and an area ten times greater received at least a quarter of an inch of ash. After some volcanic explosions. ash is reported to have been carried halfway around the world. In many areas ash deposited in this way constitutes an important natural fertilizer. When concentrated in sufficient quantity and thickness, it provides an important source of material for scouring powder, ceramic processes and other uses *(see* VOLCANISM; VOLCANO). *See* also GEOLOGY: *Physical* Geology; SEDIMENTARY ROCKS.

(H. T. U. S.)

WINDHOEK, the capital of South-\Vest Africa, is situated in the central part of the country at an altitude of 5,534 ft., about 400 mi. N. of the mouth of the Orange river and 900 mi. N. of Cape Town. Pop. (1961) 35,916.

The karakul (Persian lamb) industry has brought considerable prosperity to Windhoek which has become the buying centre. Local industries include meat canning, brewing, cold storage and bone meal manufacture. The mineral wealth and consequent development of mining in South-West Africa has added to Windhoek's commercial importance. As the capital of German South-West Africa, the town was called Windhuk; it was occupied by south African forces when the country surrendered to the Union of South Africa on July 9, 1915. (H. M. BE.)

WIND INSTRUMENTS may be loosely defined as those sound-producing instruments, generally for musical use, in which the sound is produced by blowing with the human lungs or with artificial bellows. By a closer definition, which excludes instruments of the "free reed" class (*e.g.*, accordion, harmonium, *qq.v.*), wind instruments are those in which sound is produced by a partially enclosed body of air that is caused to vibrate through some kind of primary vibrator or generator activated by wind from the lungs or bellows. Among these, three main classes are usually recognized, distinguished by the nature of the generator employed: flutes. reed instruments and trumpets.

Flutes. — The generator is here the eddy formation which occurs when the wind. issuing from a slit, strikes a solid edge cut in the wall of the instrument and open to its interior. The eddies. forming alternately above and below the edge. set up a rapid pressure oscillation which causes the air in the instrument to vibrate in a sound-emitting "stationary wave."

The ordinary flute (*q.v.*) is a transverse (*i.e.,* side-blown) flute, the slit formed and controlled by the player's lips, and the edge provided by the farther side of the mouth hole in the side of the instrument. With the near-eastern flute (*e.g.*, the Balkan *kaval*)—a so-called vertical flute—the top end of the pipe is open and put to the lips. its opposite rim providing the edge. Elsenhere. as in China. South America and Africa, sound generation at the open end is often facilitated by cutting a deep notch in the rim (the notched flute). With flageolets (*q.v.*). including the recorder (and also with organ flue pipes). an artificial slit directs the wind on to a beveled edge. While these are all tubular pipes. ocarinas and primitive gourd-flutes exemplify globular flutes; their pitch depends upon the volume of enclosed air and upon the sum area of apertures opened to the exterior at any moment while playing.

With a tubular flute, the pitch depends upon the length of the air column. which may be altered by uncovering the finger holes to make the basic scale. The air column may be further induced, generally by increased wind speed, to vibrate in half and other fractional lengths (overblowing), the scale then sounding at harmonic frequencies at the octave (second harmonic). twelfth (third harmonic), double octave (fourth harmonic), etc.. above the fundamentals. thereby adding upper registers to the compass. Most flutes have six or more holes, giving a diatonic scale. other semitones being obtained by "cross-fingering" (departures from the direct sequence in uncovering the holes! or. in modern western flutes. by key mechanism (*see* below). Severtheless, well over an octave can be obtained with only three holes by beginning the scale with the second harmonics (say. C, D. E. F j and continuing in third harmonics ((>. A. B. C). etc.: the vertical flute of ancient Egypt was typically three-holed, and this number is preserved in the pipe and tabor (*q.v.*), known in Europe from the 13th century: the pipe is played with one hand only, the other hand beating the tabor (drum).

A flute which is stopped at the end opposite to that at which it is blown gives a fundamental pitch approximately an octave deeper than an open flute and possesses a distinctive tone-quality through the absence of even-numbered harmonics among the overtone.;. Finger holes, though present in many primitive stopped flutes. cannot of course give a scale of stopped notes, and the best-known musical use of stopped flutes is therefore in unpierced sets with a different flute for each note of the scale. either combined as Panpipes or in a stopped-pipe organ register. or handed out separately to a group of players as in South African flute bands. The sliding stopper of the Swanee whistle shows an alternative expedient. An interesting variety of further applications of the flute principle is found among other whistles. paleolithic, primitive and modern (*e.g.*, cracker whistles and birdcalls).

Reed Instruments. — The wind here causes a "reed" to vibrate and so to engender a stationary wave within the pipe. (,There are, however. "reed horns." as. for instance. motor horns and reed hunting horns. in which the small pipe is unable to engage effectively with the powerful metal reed, and serves merely as an amplifier. the pitch being determined by the reed alone as with the free-reed instruments mentioned at the beginning.)

Reeds are single or double. The ancient form of single reed is made by cutting a vibrating tongue in the side of a piece of narrow cane or elderwood closed at the tip. This is widely used with peasant reed pipes and hornpipes in Europe and Asia. also among bagpipes (*q.v.*). The single reed was scarcely known in cultivated western music before the end of the 17th century, when the *chalumeau* appeared. at first little different from the peasant reed pipe and a toy for amateurs.

Other single reeds in folk instruments have a separate blade of cane. wood. etc., tied over an opening at the end of the pipe (cf. the metal reeds of organ reed stops). This idea was adopted with later *chalumeaux* and has become famous through the clarinet (*q.v.*). In all these instruments the single reed is associated with a ,cylindrical pipe, a combination which behaves acoustically like a stopped flute in that it yields deep-pitched fundamentals and only the odd-numbered overtones (rarely. however. practicable in overblowing except on the clarinet). It is the reed end of the pipe which is. in this analogy. stopped, the lower end being open, and hence finger holes present no problem.

The ancient double reed was made by pinching together one end of a piece of fresh-cut plant stem to give a narrow aperture which widened and contracted while the reed was blon-n. Such was the reed for the Greek *aulos* (*q.v.*). For the medieval (or possibly late classical) conical pipe or shawm (*q.v.*) and its successors. the double reed is mounted on a short metal tube or "staple": for Asiatic shawms it is again made by pinching one end of the material. but for European varieties—shawm. western bagpipe chanter. oboe. etc.—a strip of cane is folded over upon itself and bound to the staple (*see* OBOE) or to a temporary mandrel (*e.g.*, for the bassoon. *q.v.*). These conical pipes yield similar harmonics to those of open flutes and may be readily overblown to second and third harmonics. The 16th century contributed various fresh double-reed instruments in which the bore was cylindrical, and the acoustic behaviour that of the single-reed pipes described above. The crumhorn was the most important of these. The rest, all short-lived. included the *sordone,* with the bore doubled back in bassoon fashion. and the rackett, with a bore of about seven short tubes connected in series to sound a very deep compass with minimum over-all size. The opposite combination of single reed with conical pipe, is found among reed pipes of bird bone and Bulgarian bagpipe chanters; also in the saxophone (*q.v.*) and the *tárogató*, a popular folk instrument of Hungary and Rumania (historically a redesigned shawm) recalling a soprano saxophone in shape but of wood and with smaller tone holes. These both overblow to the octave, like an oboe. (The Sarrusophone, named after its French inventor, Sarrus. who designed it in 1856. has a saxophonelike bore and keywork but a tubalike shape and a bassoonlike reed; in contrabass form it has been used in French and other bands and—as a contrabassoon—in orchestras, but is now almost obsolete.)

Trumpets. — Inthe general classificatory sense, these are instruments in which the player's lips are tensed across an aperture in the instrument in order to vibrate under breath pressure. Conch shells. perforated gourds and hollowed branches are among primitive types. followed by animal horns blown in various ways and sometimes pierced with finger holes (*see* HORN; MUSICAL INSTRUMENTS). Most of these were signalling or ritual instruments sounding one note. though a tuned set may be used by a group of players, as in Uganda and in the Russian "horn bands" of the early 19th century. Bronze trumpets began historically with the Danish *lur* of mammoth-tusk shape followed by Irish examples. the Celtic animal-belled *carnyx,* the Roman trumpets (*tuba*, straight; *lituus,* hook-belled; and *cornu,* hooped) and also possibly by wooden versions (*see* ALPHORN). It is not known whether players cf these early instruments exploited the wide range of natural harmonics which tubes of such lengths will readily sound (they are the same as for an open flute; *see* TRUMPET) hut specimens of *lur* and *cornu* show remarkably kvell-developed cup-shaped mouthpieces for the lips. closely anticipating those used with later and modern brass instruments. Among these. trumpets and trombones (*qq.v.*) are distinguished by mainly cylindrical tubing. A wide conical bore without bell flare, deriving from the medieval cow horn, was retained in 16th-century wooden instruments with cup mouthpiece and finger holes: the cornett (see CORNET) and the serpent. The latter. a bass version named from its shape, was revived in the 16th century as a bass for wind bands, to give rise to numerous modifications built in a handier bassoon shape (bass horn, Russian bassoon, serpent Forveille, etc.). all used in early 19th-century bands before their replacement by large-bore brass instruments with keys (ophicleide, *q.v.*) or valves (tubas, saxhorns, *qq.v.*), these being partly descended from the bugle (*q.v.*), in which the old wide horn bore was developed in metal. A group of brass instruments with a narrow conical bore, reaching back to Renaissance hunting and post horns, now includes the post horn (straight in England, circular on the continent) with its valved derivative the cornet, and the French circular *trompe* de chasse (hunting horn) with its valved version the French horn (see HORN) ; though every bore is necessarily cylindrical through valve mechanism (see below), the smooth sound imparted by bore taper and deep mouthpiece cup is nevertheless preserved with these modern instruments, to contrast with the brighter sonorities of the trumpet group.

Technique. — Modern wind playing rests upon cultivation of "embouchure," breathing and tonguing, as well as upon fingering and interpretation. The term embouchure covers the physical contact with the player's mouth, including position of the lips and use of the facial muscles. Breathing is from the diaphragm. Tonguing by which the playing is articulated on all wind instruments except bagpipes and organs, is basically a tongue movement similar to pronunciation of the letter "T," made against the upper teeth in playing flutes and most brass instruments, but against the tip of the reed in playing reed instruments. For very quick articulation this mav be alternated with a "K" made with the back of the tongue ("double tonguing").

Tuning.—Modern wind instruments are built to the standard pitch of A = 430 vibrations per second; all except the conical-bore reed instruments are provided with a tuning slide or socket for temperature adjustment during performance. Many instruments built to other pitches formerly in use survive, especially in Great Britain; those built to "high pitch" (A = 452) are virtually useless, except for the brass instruments, which can be lowered by a lengthened tuning slide.

Mechanism. — For discussion of the mechanism of wind instruments the customary orchestral headings of woodwind (flutes and reed instruments — whether in fact made of wood or of metal), and brass may be followed. (See also ORGAN: General *Description.*)

Woodwind *Instruments.*—Woodwind mechanism or keywork began with a lever key fitted to larger shawms in *c.* 1400 to cover the lowest tone hole; it was termed in France a *clef* "key," and was sprung to rest in the open position. This open key in its modern form (*e.g.,* on large recorders), well illustrates the technological advance in keywork achieved in the first half of the 19th century: keys were formerly simple levers pivoted on pins held in the wood, sprung with a leaf spring and padded with strip leather; on modern instruments they are soldered to an axle or "barrel," turning on steel screws held in metal pillars screwed into the mood, and have a stuffed pad and generally a steel needle-spring bearing on the axle's rotation. Keys sprung to rest in the closed position were first employed for obtaining semitones outside the finger hole scale in the French bagpipe *musette,* about 1600. Modern instruments using only closed keys are the simple band flutes or fifes, preserving the system of the later 18th-century flute. Only the smallest possible number of keys, open or closed, were fitted to reed instruments before the 19th century. Ring keys or rings, though not Theobald Boehm's idea in the first place, appeared in their modern form in his 1832 conical flute; familiar on modern clarinets and many oboes, they enable one or more fingers independently to turn an axle to actuate a key in the same movement as covering a hole. Shortly after this, the saxophone and Boehm's cylindrical flute required larger holes than finger tips could cover, and therefore padded keys or plates for each finger were introduced. These necessitated in many cases the mechanical articulation (*e.g.,* by small cork-adjusted clutches) of the devices operated on other instruments by the rings, to allow one of two plates to be lowered without automatically lowering the other. (Clutches or equivalent devices are also needed when two rings or plates on one axle are to operate two separate mechanisms.)

The term articulation, however, is most used in keywork for instances where a closed key is arranged to rise when one lever is pressed and then, while the finger still presses this lever, to be closed by another lever. This involves fitting springs of two different strengths, the key being normally kept closed by the stronger spring of the first lever. The arrangement is used to facilitate various trills, and also in the automatic octave-key mechanisms of oboes and saxophones.

Brass Instruments. — The mechanism of nearly all brass instruments, namely, their valves, was invented in Berlin about 1815 and patented jointly by H. Stolzel and F. Blühmel in 1818. Valves enable the player momentarily to add to the total tube length in order to lower the pitch. The first valve is depressed by the first finger to deflect the air column through a small loop of tubing which lowers the pitch of the instrument by a whole tone; the second valve similarly lowers by a semitone; both together lower by a minor third. To the two original valves mas soon added the third valve, which by itself lowers by a minor third but is chiefly used in combination with the others to lower over larger intervals down to a diminished fifth.

The example shows how part of the chromatic scale is ordinarily fingered on the trumpet, the open notes (made without the valves) being indicated by white notes and the valves numbered 1, 2 and 3:

Trumpet, **valved scale**

The valves most commonly employed are of the piston type, sprung to resume their raised positions; they are E. F. Périnet's improvement (Paris, 1839) upon an earlier Berlin pattern in which the main tubing led through the bottoms of the valves (so-called Stölzel valves). The rotary valves employed in Germany, and with the German type of French horn now used in most countries, have rotors with the valve ports cut in them, turned against a spring by a system of levers. Many of the larger brass instruments have a fourth valve which transposes the instrument a fourth lower, mainly in order to complete the scale down to the fundamental open note (which in the example would be the C four lines below the stave, though in fact the fundamentals are musically useful only in instruments with large bore or wide mouthpieces, or, as in tubas, both). Though each valve can be tuned to its correct lowering interval by means of its own tuning slide, notes made with combinations of valves are by nature too sharp, especially those involving the third valve. For example, this valve tuned to lower an open note (say, G) to E would require, by proportion, longer valve-tubing to lower a first-valve note (say, F) by the same musical interval to D. The player has therefore to correct such notes with ear and lip, though the trumpet's first or third valve slide is often arranged to move easily for momentary extension to counteract sharpness. In combinations with a fourth valve, the sharpness becomes by nature very acute. A partial remedy is to provide a fifth valve tuned to a wider semitone than the second valve. More efficient but more expensive is D. J. Blaikley's compensating system (London, 1874), used on many British tubas: the tubing of the fourth valve actually runs through the three normal valves in such a way as to add small extra loops when any of them is depressed while the fourth valve is also depressed.

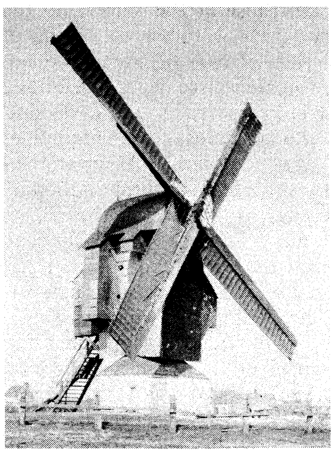
(A. C. BA.)

WINDLASS, a large cylinder, conventionally termed the wheel, turning a smaller cylinder or barrel termed the axle, the difference in size giving a gain of power. Like the lever, the increased applied force for the windlass is proportional to the ratio of the radii of the barrel and the axle. A rope. partly coiled around the axle, is attached to the load. In some cases the wheel is turned by means of a rope coiled around it, *e.g.,* light hand cranes, but in many hoists and cranes the function of the wheel is taken by a winch handle, and in other cases by a toothed wheel driven from a pinion, hand or motor driven. The Chinese windlass gives a great gain of power by the use of axles of two diameters. A ship windlass is a more complicated apparatus, hand. steam or electrically driven, with chain wheels by means of which the anchor chain is hoisted and let out. Powerful brakes, and often coned warping drums for whipping purposes, are fitted. (L. E. G.)

WINDMILL. The utilization of an uncontrollable source of power to produce work is the problem overcome by man in building windmills. Their use was increasingly widespread in Europe for 650 years from the 12th century until the early 19th century. Their slow decline, due to the development of steam power, lasted for a further 100 years. Their rapid demise, except in the Netherlands, began after World War I with the development of the internal-combustion engine and the spread of electric power: but from that time on electrical generation by wind power has been the subject of more and more experiments.

History. — The earliest-known references to windmills are to a Persian millwright in A.D. 644 and to windmills in Seistan, Persia, in A.D. 915. These windmills are of the "horizontal mill" type, with sails radiating from a vertical axis standing in a fixed building, which has openings for the inlet and outlet of the wind diametrically opposite to each other. Each mill drives a single pair of stones direct, without the use of gears, and the design is derived from the earliest water mills. Persian mill\\-rights, taken prisoner of the forces of Jenghiz Khan, were sent to China to instruct in the building of windmills; their use for irrigation there has lasted ever since: but the mills are freestanding with feathering sails. The horizontal windmill was used in the Crimea and has been re-invented and used, though not extensively. in most of the western European countries and in the United States. Its limitations are considerable and its most satisfactory manifestation is in the S-rotor of S. J. Savonius of Finland.



REX WAILES

FIG. 1.—POST MILL WITH FOUR "COMMON SAILS." THE CLOTHS OF WHICH ARE FULLY SET. AT MARCKE. PAS DE CALAIS. FRANCE

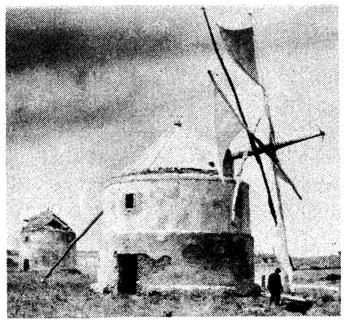
The "vertical windmill," with sails on a horizontal axis, derives directly from the Roman water mill with its right-angle drive to the stones through a single pair of gears, although the actual idea of utilizing wind power may have been brought back from the east by crusaders. and the first European references are to one in France about 1180 and in England in 1187.

The first detailed description from which a windmill could be built was published in France in 1702, and the first satisfactory working drawings were published in the Setherlands in 1727.

Development.—The earliest form of vertical mill is known as the '(post mill." It has a boxlike body containing the gearing, millstones and machinery and carrying the sails. It is mounted on a well-supported wooden post socketed into a horizontal beam on the level of the second floor of the mill body. On this it can be turned so that the sails can be faced into the wind; access to the mill body is by a ladder at the tail of the mill. Usually the post and its substructure are above ground; but sometimes they are buried in a mound and the mill is then known as a "sunk post mill." The substructure is often protected by a "roundhouse," which is simply a storeroom.

The next development was to place the stones and gearing in a fixed tower. This has a movable top or "cap," which carries the sails and can be turned around on a track or "curb" on top of the tower. Brick and stone towers are usually round; timber towers are usually octagonal and tapering and are known in England as "smock mills." The earliest-known illustration of a tower mill is dated about 1420. Both post and tower mills were to be found throughout Europe and were also built by the British, Dutch, French and other settlers in America.

At first both post and tower mills drove a single pair of stones for grinding grain through single-stage gearing. By 1430, however. the Low Countries needed more than just animal and man power for draining the land; the Dutch therefore invented the "hollow post mill." An upright shaft takes the drive through the hollow post of the mill and drives a "scoop wheel," resembling a paddle wheel, which scoops the water up from a lower to a higher level. Two pairs of gears were used. at the top and bottom of the upright shaft respectively, and this opened the way for the larger tower mills with several pairs of stones and ancillary machinery.



REX WAILES

FIG. 2.—STONE TOWER MILL WITH EIGHT JIB SAILS OF WHICH FOUR ARE SET. THE CAP, ONCE THATCHED. HAS BEEN COVERED WITH GALVANIZED IRON. IN MOLINO CATALINA, VEJER DE LA FRONTERA. SPAIN

To work efficiently, the sails of a windmill must face squarely into the wind, and in the early mills the turning of the post-mill body, or the tower-mill cap, was done by hand by means of a long "tailpole" stretching down to the ground. Later a series of posts were placed around the mill, a winch fixed to the lower end of the tailpole and a chain run out from the winch to one of the posts. Winches were also placed in the caps of tower mills and operated from inside or from an endless chain from the ground.

In 1745 Edmund Lee in England invented the automatic "fantail." This consists of a set of five to eight vanes mounted on the tailpole or the ladder of a post mill at right angles to the sails and connected by gearing to wheels running on a track around the mill. When the wind veers it strikes the sides of the vanes, turns them and hence the track wheels also, which turn the mill body until the sails are again square into the wind. The fantail is also fitted to the caps of tower mills, driving down to a geared rack on the curb.

Sails. — The sails of a mill are mounted on an axle or "windshaft" inclined upward at an angle of from 5° to 15° to the horizontal. On this shaft, inside the mill, is the first geared wheel known as the "brake wheel" because a contracting brake acts on its rim. The first mill sails were wooden frames on which sailcloth was spread; each sail was set individually with the mill at rest. The early sails were flat planes inclined at a constant angle to the direction of rotation; later they were built with a twist like that of an airplane propeller.

In 1772 Andrew Meikle, a Scot, invented his "spring sail," substituting hinged shutters, like those of a Venetian blind, for sailcloths and controlling them by a connecting bar and a spring on each sail. Each spring had to be adjusted individually with the mill at rest according to the power required; the sails were then, within limits, self-regulating.

In 1789 Stephen Hooper in England utilized roller blinds instead of shutters and devised a remote control to enable all the blinds to be adjusted simultaneously while the mill was at work. In 1807 Sir William Cubitt invented his "patent sail" combining Meikle's hinged shutters with Hooper's remote control by chain from the ground via a rod passing through a hole drilled through the windshaft; the operation was comparable to opening and closing an umbrella, and by varying the \\-eights hung on the chain the sails were made self-regulating. Patent sails and fantail: widespread in England, were also adopted in Denmark, Germany and the Netherlands.

In 1860 R Catchpole, in England, successfully applied air brakes to patent sails; the idea was revived in the Netherlands after the application of airfoils to the leading edges of mill sails was initiated by A. J. Dekker, advised by 4. G. von Baumhauer, in 1927. Others followed and greatly increased the output of mills by enabling them to do useful work in lighter winds. First L. Burne in England, then K. Bilau in Germany and later G. ten Have and others in the Netherlands produced sails hinged longitudinally with the same object. Of other varieties of sail the most common are triangular jib sails wrapped around poles which are braced to a bowsprit extending from the front of the windshaft. These sails are found in the Iberian peninsula, the Azores, the Mediterranean islands, Greece and Turkey; from 8 to 12 sails are used.

The normal number of sails for a windmill is four. John Smeaton in England in 1759 was the first to investigate windmill sails scientifically. He preferred five sails, however; six- and eight-sailed mills were also built. He and others in England first used cast iron in mill work at this time. At this time, too, the windmill was put to a wide variety of uses by the Dutch in addition to corn grinding and water raising by scoop wheel, Archimedean screw and a chain of pots. The most important of these uses were sawing timber, pressing oil from seeds and paper making. The centrifugal governor was applied to corn mills in England by Thomas Mead in 1787 and was used for maintaining constant the gap between the stones and hence the fineness of grinding. Wind power mas used to drive the sack hoist to raise the grain into bins and so feed the hoppers of the stones by gravity, and automatic bell alarms were provided to give warning when the hoppers needed replenishing.

Wind Pumps.—The annular-sailed wind pump was brought out in the United States by Daniel Hallady in 1854, and its production in steel by Stuart Perry in 1883 led to world-wide adoption, for although inefficient it is cheap and reliable. The design consists of a number of small vanes set radially in a wheel. Governing is automatic: of yaw by tail vane, and of torque by setting the wheel off-centre with respect to the vertical yaw axis. Thus as the wind increases the mill turns on its vertical axis, reducing the effective area and therefore the speed.

Electrical Generation.—The windmill has been used as a source of electrical power since P. La Cour's mill, built in Denmark in 1890 with patent sails and twin fantails on a steel toner. After World War I experiments were carried out with windmills having three sails of airfoil section like the blades of an airplane propeller, notably by G. Darrieus in France; and in 1931 a windmill of this type was built in the Crimea and the power generated fed into the low tension side of the local supply. Experimental twin-bladed mills were built and run in the United States in the 1940s and in France and England in the 1950s; but the most successful generator mas developed in Denmark under J. Juul with three blades braced to each other and to a bowsprit on the front of the windshaft.

FIG. 3.—TOWER MILL WITH FIVE SELF-REGULATING PATENT SAILS. IN WEINBOHLA. DRESDEN DISTRICT. GER.

In the meantime in the Netherlands three old-fashioned corn mills had been adapted to use surplus energy to generate electricity. An asynchronous motor is used, which can drive the mill or be driven by it as a generator; the gearing incorporates an overrunning clutch so that the motor will not drive the mill sails. The cap is turned by a servomotor controlled by a wind vane.

(R. WA.)

WINDOW, an opening in the wall of a building, for the admission of light and air. A window that opens on hinges is called a casement. Fenestration (*q.v.*) is an architectural term pertaining to the arrangement of windows as an element of the exterior decoration of a building. For the historical development of houses from earliest times in all parts of the world, *see* HOUSE. For discussions of the factors determining the design of windows in contemporary dwellings. *see* HOUSE DESIGN; ORIENTATION; INTERIOR DECORATION. *See* also SHOP FRONT DESIGN; ROSE WINDOW.

(X.)

Early History.—Windows are obviously a very ancient invention, probably almost coincident with the development of fixed and enclosed houses, particularly in those parts of the world in which courtyards were of little importance. Representations of windows occur alike in early wall paintings in Egypt, reliefs from Assyria and terra-cotta plaques from Crete. The Egyptian examples show openings in house walls covered with mattings, like the doors, as in the jth-dynasty tomb of Ti. Well-known examples of Egyptian windows also exist in the hypostyle hall of the great temple at Karnak, built by Seti I and Rameses II, and in the so-called pavilion at Medinet Abu, nearby. In the hypostyle hall the central aisles have much higher columns than those at the sides, and the space between is filled by clerestory (*q.v.*) windows consisting of huge granite slabs pierced with two tiers of narrow, vertical openings. In the pavilion at Medinet Abu there are several windows consisting of simple rectangular openings with a small. decorative frame. These were probably originally closed by hangings of matting or cloth. (*See* EGYPTIAN ARCHITECTURE.) Assyrian windows are almost always wider than they are high, and subdivided by little colonnettes. Many such openings are shown in the palace reliefs of the 9th and 8th centuries B.C. They are generally high in the wall. Cretan plaques show many house fronts; in these there are indications of several tiers of windows, as though the houses were two or three stories high, and in the windows themselves representations of frames, dividing the large opening into four smaller ones by means of a central mullion and a horizontal transom bar. (See PRE-HELLENIC ARCHITECTURE.)

Greek and Roman.—The devotion of the Greeks to the house built around a court led to an almost total disappearance of windows. and such remains as those of Delos, although they are principally of Alexandrian and Hellenistic date: show scanty signs of windows. each room being lighted only by a door to the central, colonnaded court. In temples. also, windows are usually lacking, and the interior was lighted only by what light entered through the door or percolated dimly through the marble tiles of the roof. In exceptional cases, however. windows of very marked architectural character occurred. In the Erechtheum (*q.v.*), for instance, although the windows in the western wall date from a Roman reconstruction, the great eastern door was, from the beginning, flanked by window openings, with an architrave band around and a cornice above, and the existence of such highly developed window forms in the 5th century B.C. would seem to indicate that similar forms had long been well known. (*See* GREEK ARCHITECTURE.)

In Roman imperial times the glazed window first definitely appeared, and fragments of glass in a bronze frame have been found in Pompeii, as well as many other fragments of glass in the remains of Roman villas in England. Moreover, it is obvious that the great windows in the baths (*q.v.*) of Rome must have been enclosed in some way, in order to retain the heat. The general hypothesis is that these great segmental-headed clerestory openings, whose shape is perfectly preserved to the present day in the tepidarium of the baths of Diocletian at Rome, now the church of Sta. Maria degli Angeli, were filled. originally, with frames of bronze which subdivided the whole into small areas, each of which held a pane of glass. There is much debate as to how common glass was during the early empire, and whether the *speculares* which Pliny refers to, in his letter (no. 217) describing his villa at Laurentum, were glazed windows or not; they, without doubt refer to transparent or translucent windows. In addition to glass, the Romans are known to have used thin sheets of translucent marble, panes of mica, shells and horn. (See ROMAN ARCHITECTURE.)

Byzantine church windows were glazed from an early period. Thus it is known that from the beginning, the windows of Hagia Sophia at Constantinople (begun 532) were filled with pierced, marble frames enclosing panes of glass, and it is possible that some of the glass still existing may be the original glazing. (See BYZANTINE ARCHITECTURE.)

Islamic builders copied this Byzantine technique of inserted, small pieces of glass, in a masonry frame, and by substituting cement for marble, obtained great freedom and richness in pattern design, so that with the use of different colours of glass in the small openings. brilliant effects were produced. In addition to the mosque windows which followed Byzantine prototypes, the Islamic builders of Egypt and Syria developed an extremely rich type of domestic window which was usually unglazed. This consisted of a projecting, bracketed, framework of wood with its sides entirely filled by intricate grillwork formed by carved, turned, wooden spindles. (See ISLAMIC ARCHITECTCRE.)

Medieval.—It was probably also during .the Byzantine period that windows covered by a complete arch superseded the segmental and square heads common in Roman work, and it is the arched window that became the governing form throughout medieval Europe, at least for masonry buildings. The history of the window in the domestic architecture of the early middle ages is difficult to trace. From existing reliefs, representing early Romanesque houses, it appears that semicircular, arched windows were the rule in masonry town houses, and square-headed windows in timber-built country work. From an early period, however, the tendency appeared to use square-headed openings in masonry houses. Thus in the *hôtel* de *ville* at St. Antonin. France (12th century). the main hall is lighted by 12 little square-headed openings in groups of four, forming practically an open loggia. There are indications that these openings n-ere closed by shutters. The rooms above, however. have semicircular windows in pairs. With the gradual introduction of the glazed sash in secular work. which apparently began during the 12th century. the tendency toward the use of rectangular openings was much increased, due to the ease with which sash could be framed in them. During the late 12th century. transitional forms were found; especially in south France: in which arch-headed openings were divided by a heavy frame member at the spring, so that at least the lower part of the window could have a rectangular sash, as in the 12th century house at Monpazier, illustrated by Viollet-le-Duc, *Dictionnaire raisonné*. The 12th-century Jew's house in Lincoln. Eng., preserves traces of original arch-headed windows, which were later altered to square heads. From the middle of the 13th century on, the square head became almost universal, even in masonry buildings, although traces of the arch tradition remained in the arch forms often carved upon the stone lintels. (See ROMANESQUE ARCHITECTURE.)

The desire for light and air increased continuously with the growing cheapness of glass, but the necessity for small sashes remained: the inevitable result was the development of the mullioned and transomed window, generally rectangular in shape in which the entire opening is subdivided into convenient sizes by vertical bars known as mullions and horizontal bars known as transom bars. The climax of the development appears in France in such 15th-century work as the Cluny museum at Paris and the house of Jacques Coeur at Bourges; in England. in countless Tudor and Jacobean houses. In some of these, as in Sutton place, Surrey (1525), the small, rectangular sections made by the mullions and transoms are decorated with cusped arches. The glazing of these medieval. secular windows was probably originally done by assembling many small pieces of glass in a wooden framework or sash. There was a great use of roundels. Later, leading was introduced, although the whole leaded sash was set in a wooden frame. The leading was usually in panes, either rectangular. with the long dimension vertical, or in diamonds. Toward the end of the period, especially in England, metal sashes began to be introduced.

The development of ecclesiastical windows was quite different, for two reasons: first, the necessity for large size, which rendered the arch head inevitable; and second, the development of stained glass (*q.v.*). The combination of these two elements, together with the general use of stone, vaulted forms, in church architecture, led to, first, the grouping of several small windows in one composition; as in much early English Gothic work, and later, during the early 13th century, the evolution of tracery (*q.v.*). The leaded glass in these windows was inserted in a groove cut in the inside edge of the jamb and held in place by iron bars or an iron framework. A characteristic feature of almost all medieval windows is the splaying of the jambs on the interior, so that the opening on the inside face of the wall is much larger than that on the outside. In this manner the illumination was increased and the large openings inside offered great opportunities for decorative richness. (*See* GOTHIC ARCHITECTURE.)

Renaissance. — Early Renaissance palace windows in Italy show many attempts at compromise between the arched and mullioned windows of Gothic tradition and the classic feeling that the rectangular opening was more dignified. Thus most of the 15th-century Florentine palaces had twin, arched windows under a single enclosing arch; in many cases the opening itself was square topped and the arches above mere panels. During the High Renaissance period, the rectangular window was the most popular form. It was frequently decorated with an architrave, and a cornice and pediment. Pilasters and columns were often added at the sides. During the baroque period these decorative window enclosures were often elaborately scrolled and ornamented with fantastic cartouches, consoles, masks and human figures. Arched windows appeared spasmodically throughout the Renaissance, usually in churches or enclosed loggias. The general system of glazing in Renaissance Italy was the use of wooden-hinged frames subdivided by small wooden bars known as muntins; the tendency was continuous toward the use of larger and larger panes of glass.

In the countries north of Italy, the persistence of medieval window forms into the Renaissance was marked. In France. for instance. debased Flamboyant tracery forms occurred in churches well into the reign of Henry II (1547–59), as in the church of Notre Dame at Grand Andely, and mullioned and transomed windows were a distinctive feature of the châteaux of the time of Francis I. Similarly in England, rectangular, mullioned windows, with hinged sashes and leaded glass, and occasionally decorated with cusped arches, were built particularly in the collegiate buildings at Oxford and Cambridge, well into the 17th century.

The later Renaissance in France produced and developed the type of large casement window that has remained the accepted form on the continent of Europe ever since — popularly known as the French window. In this type the opening is high and comparatively narrow, frequently extending down to the floor and is glazed with two large, hinged, wooden sashes, arranged to swing in, each subdivided into three or more lights of comparatively large size. An iron railing or stone balustrade is built on the outside for safety. It is largely the use of such windows that has given the stimulus to the extensive use of balconies in modern continental apartment houses. In England the late Renaissance development was determined by the common use of the type of window known as "double hung," which during the late 17th and 18th centuries almost superseded the swinging casement. In this the window is divided into two sashes, horizontally, the lower one on a plane slightly inside the upper one. By lowering the upper sash and raising the lower, any desired amount of ventilation up to half the area of the entire opening can be produced. In the cruder kinds of double hung window. the sashes are supported in position by pegs or spring cams, or elbows. The more developed type, now universal. has the sash hung on ropes or chains, which pass over pulleys and are connected at the other end to counter weights concealed in the window frame or box. (T. F. H.)

Modern. — The impact of industry on many processes of contemporary building has led to the use of metal frames for windows in most residential construction. These metal window frames are constructed of stock shapes that are either rolled (stainless or ordinary steel) or extruded (aluminum and bronze). The window itself has tended to become larger, often wall to wall and floor to ceiling, and frequently when the building is air-conditioned no longer has opening sash members. Shop windows and other similar large glass areas are, in fact. both wall and window, and to ithstand wind pressures must be of a prescribed thickness per square foot of exposed area. Vertical supporting members, called mullions, which transfer the wind forces to the structural frame, also vary in thickness and depth in accordance with the glass area they stiffen.

The glass itself may also be designed to perform a specific function such as "Thermopane" (two panes of glass with a hermetically sealed dry air space between)—used to restrict the heat lost through a window, and "heat absorbent" green glass—used to restrict the passage of heat producing infrared rays of the sun. (See MODERN ARCHITECTURE.) (H. MN.)

Oriental.—A great difference in window design between the orient and the west is due to the almost total lack of window glass in oriental countries. In China and Japan windows are usually covered with paper. cloth or shell. All of these require a large amount of subdivision of the window area; shell, because of the small size of the elements, the other materials because of their fragility. Japanese windows are usually arranged to slide horizontally. Ordinarily the whole opening is of great width in relation to its height, and is subdivided into a number of small sashes! each sliding in a different plane, and all arranged so as to slide back into a pocket or case, bracketed out from the outside face of the wall. The patterns of Japanese window subdivisions are more limited than those of China and are universally based on the subtle relationships of rectangular shapes. with their long dimensions horizontal. *See* CHINESE ARCHITECTURE; JAPANESE ARCHITECTURE ; INDIAN ARCHITECTURE ; see also references under "Window" in the Index volume. (T. F. H.)

WINDOW TAX, a tax first levied in England in the year 1696 for the purpose of defraying the expenses and making up the deficiency arising from clipped and defaced coin in the recoinage of silver during the reign of William III. All houses inhabited save those not paying Church or Poor rates were assessed two shillings a year. An added tax was laid according to the number of windows—on 10 to 19 windows the additional tax was 4/-.

In its first year the tax raised £1,200,000. It was increased six times between 1747 and 1808, but was reduced in 1823. After a strong agitation in the ninter of 1850–51, it was repealed on July 24, 1851, and replaced by a tax on inhabited houses.

WINDPIPE (TRACHEA), the tube that carries air between the larynx and the bronchi of the lungs; the windpipe lies partly in the neck and partly in the chest. See RESPIRATORY SYSTEM, ANATOMY OF.

WIND RIVER RANGE in west-central Wyoming is one of the highest ranges of the central Rockies. The 100-mi. northwest-southeast axis of the range is located on the water divide between the Gulf of Mexico and the Pacific. The elongated range. lifts 4.000 to 5,000 ft. above the surrounding Wyoming basin; it contains the highest point in Wyoming, namely, Gannett peak (13,-785 ft. above sea level). The huge anticlinal fold exposes Pre-Cambrian rocks along the axis with younger upturned sedimentary rocks on the flanks. At the southern end of the range is historic South pass. (H. B. HA.)

WINDSOR, DUKE OF: see EDWARD VIII.

WINDSOR, HOUSE OF: see GEORGE V.

WINDSOR, a city and port of entry in Essex county, Ontario, Can., on the left bank of the Detroit river opposite Detroit, Mich., U.S., and 230 mi. S.W. of Toronto. Pop. (1961) 111.367; metropolitan area 193.365. In 1701 the French founded a fort at Detroit and soon settlement spread lo the Canadian side of the river. The survey pattern was French Canadian: long. narrow farms. stretching back from the river banks. In 1748 Jesuits established a mission for the Huron Indians. The French settlers remained after the fort became British in 1763; in the latter part of the 20th century about 20% oi the population was of French origin. The hamlet was known as "the Ferry"; during the War of 1812 it was occupied by U.S. forces. Later it was called Richmond and after 1836. Windsor (for Windsor, Eng.). Because of its strategic location opposite the heart of Detroit, Windsor became an important railway terminal: U.S. railroads used the short cut through southern Ontario between Buffalo, N.Y., and Detroit. Windsor was incorporated as a village in 1854, as a town in 1858 and as a city in 1892. At the close of the 19th century, when tariff agreements gave Canada preferential treatment in British markets, it became an attractive site for U.S. branch plants. Between 1908 and 1928 the population of Windsor and adjacent towns grew from 20,760 to 105,200; this rapid growth was caused largely by the expanding automotive industry. In 1935 East Windsor, Walkerville and Sandwich were amalgamated with Windsor into the city of Windsor. In the 1950s R'indsor embarked upon extensive redevelopment of the river front: the program included a park with the Hiram Walker museum nearby. a civic auditorium and convention hall and a new city hall. The city is governed by a mayor. ten aldermen and a city manager. Windsor is the commercial centre for a rich farming area producing fruits, vegetables, corn, soybeans. grain, tobacco and potatoes. The chief industries are transportation equipment, medicinal and pharmaceutical preparations, industrial machinery and other iron and steel products. Large salt deposits sustain important salt and chemical works. Railroads connect Windsor with the United States by means of a tunnel and large car ferries; vehicular traffic uses the Ambassador bridge, with a suspension span of 1,850 ft.. and also a tunnel of 5,160 ft. South of the city there is a modern airport, a main terminus of Trans-Canada Air Lines. Windsor is the site of Assumption university, a Roman Catholic institution founded as a college in 1857, and the Western Ontario Institute of Technology, founded in 1958. (JB. S.)

WINDSOR (properly NEW WINDSOR), a municipal borough in the R'indsor parliamentary division of Berkshire. Eng. Pop. (1961) 27,126. Area 7.2 sq.mi. The town, famous for its royal castle, lies on the south bank of the Thames. 21 mi. W. of London by road. There the Thames makes a loop adjoining Eton college playing fields.

Windsor Castle.—The castle lies at the northeastern edge of the town, on a slight but commanding eminence made by the projection of the underlying chalk through the clays and gravels which cover the rest of the district. The massive round tower in the centre, on its artificial mound, is conspicuous from far over the flat land surrounding it. The site of the castle, an irregular parallelogram. occupies 13 ac. On the west the walls enclosing the lower ward with the Curfew, Garter and Salisbury towers overlook Thames street, from which the "hundred steps" give access to the ward on the north. with the Henry VIII gateway opening from Castle hill on the south. This ward contains St: George's chapel in the centre, with the Albert Memorial chapel on the east and the Horseshoe cloisters on the west. To the north are the deanery and the canons' residences and to the south the guardroom and the houses of the military knights. The round tower occupies the middle ward; on its flag turret the royal standard or Union Jack is hoisted according to the sovereign's presence or absence. The buildings in the upper ward, east of this. form three sides of the quadrangle; the state apartments on the north. the private apartments on the east and the visitors' apartments on the south.

Along the north side of the castle extends the north terrace commanding, from its position above a steep slope, splendid views across the river to Eton on the Buckinghamshire side, and far over the valley. The east terrace continuing the north overlooks the gardens in front of the private apartments, and the south terrace continues farther, as far as the George IV gateway. The Home park lies adjacent to the castle, on the south, east and north. The Great park extends south of Windsor, where the land. rising gently. is magnificently timbered with the remnants of the old royal forest.

In Saxon times a royal residence of some importance existed at Windsor. a few miles from the site of the present castle. This latter site. a chalk hill overlooking the river. formed almost a natural fortress within a day's march of London and was convenient for hunting in Windsor forest. Attracted by it. William the Conqueror obtained the land by exchange from Westminster abbey to which Edward the Confessor had given it On the highest point of the escarpment he constructed a mound, upon which he built some form of wooden stockade about 1070. This structure was replaced by Henry II in 1180 uith the stone "Round touer," the walls of which were heightened by George IV, in whose reign the flag turret was added Henry II also added the outer walls of the castle to the north, east and south His nork was finished by his grandson Henry III, who completed the western end of the lower ward on the same plan as that of his grandfather. The interesting difference is that by this time the towers had assumed the D shape which the advance of military architecture had substituted for the square towers customary before the Third Crusade. Little else of Henry III's work inside the castle remains, but a portion is preserved at the east end of St. George's chapel behind the altar and in the south wall of the beautiful little dean's cloister, forming the north wall of the Albert Memorial chapel, which stands on the site of the chapel built by Henry III It was this latter chapel which Edward III made the centre of the newly formed Order of the Garter in 1348. The order included a dean, canons, minor canons, choristers and the Poor Knights. known after 1833 as the Military Knights of Windsor, nho live in the lower uard opposite the south side of the chapel. The deanery, adjoining the dean's cloister, is dated 1500, but the chapter library and Horseshoe cloisters, to the uest of St. George's chapel, are earlier. The latter uere restored by Sir Gilbert Scott in 1870, and again in 1953 by Lord Mottistone.

Edward III was also responsible for the conversion to residential apartments of the fortresslike buildings in the upper ward. It is evident that by this time the chief purpose of the castle as a fortress was subordinated to the need for comfort in the royal quarters, and indeed the castle was only twice besieged throughout its history. In connection with these extensive works Edward III employed William of Wykeham, founder of Winchester and of New college, Oxford, as his clerk of works. The Winchester tower, to the northeast of the deanery, and the so-called Norman gate, dividing the upper nard from the rest of the castle and protecting the keep. date from this reign The poet Chaucer figures as clerk of works m the following reign.

The rebuilding of the royal apartments in the upper ward and the continuation of the north terrace (built first in wood by Henry VIII and later reconstructed in stone by Elizabeth I) around the upper ward on the east and south were among the achievements of Charles II's reign. His equestrian statue is a feature of the quadrangle. The state apartments include St. George's hall, the audience and presence chambers and the grand reception room, adorned with Gobelins tapestries, and the guardroom with armour. All these rooms also contain splendid pictures and other objects of art; but most notable in this connection are the picture gallery, the Rubens room and the magnificent Van Dyck room. Three of the rooms retain their original ceilings by Antonio Verrio and there is some beautiful carving by Grinling Gibbons. In the royal library is a famous collection of drawings by old masters. including important examples of Leonardo da Vinci. Michelangelo and Raphael. There also is a magnificent series of Holbein portrait drawings representing the chief personages of the court of Henry VIII.

But the greatest restoration was carried out by George IV, the whole of the work being under the supervision of Sir Jeffery Wyatville; his work has been criticized, but there is no doubt that he transformed the castle into a comfortable sovereign's residence.

St George's Chapel.—This was designed to be the chapel of the Order of the Garter and was begun by Edward IV. It is one of the finest examples of Perpendicular architecture in England. The chapel was built in two stages, the choir and its aisles being completed and roofed by 1483, the nave by 1496, but the stone vaulting u-as not finished until 1528. Later, cracks appeared in the fabric and in 1681 Sir Christopher Wren was invited to make a survey. But little was done until Sir Harold Brakspear undertook a complete restoration between 1921 and 1930 when the uhole roof was removed, repaired. cleaned and reassembled Above the dark oak stalls hang the insignia of the Knights of the Garter, their swords, helmets and banners. to the backs of the stalls are affixed their heraldic stall plates. forming a notable assemblage of heraldry from medieval times. The large nest window with its fine late 15th-century glass, and the painted roof bosses are among other remarkable features of the chapel.

The chapel ranks next to Westminster abbey as a royal mausoleum, and it became customary for royal funerals to take place there. Edward IV and his predecessor Henry VI. whose bones mere removed from Chertsey, are buried here The former's tomb is enclosed by the most remarkable piece of ironwork of its type in England. wrought in 1483 by John Tresilian. In the middle of the choir floor a vault contains the bodies of Henry VIII and his third wife Jane Seymour, and of Charles I, who was once a prisoner in the castle walls. Edward VII and Queen Alexandra are buried on the right-hand side of the high altar, their effigies being the work of Sir Bertram Mackennal. Those of George V and Queen Mary. by Sir William Reid Dick, are to be seen in the nave. When George VI died it was decided that his tomb should lie between the nesternmost pillars on the south flank of the nave.

Albert *Memorial* Clzapel—This chapel, to the east of St. George's, was designed by Henry VII as a royal tomb house. and at one time intended by Wolsey as his onn tomb. It was restored by Queen Victoria in memory of Prince Albert, whose cenotaph stands before the altar. In the crypt beneath it are buried George III and members of his family, including George IV and William IV.

The Parks.—South of the castle, beside the Home park, is the royal mews. Within the bounds of the park is Frogmore, in the gardens of which stands the mausoleum of Queen Victoria and Prince Albert. and the home farm and kitchen gardens. An oak tree marks the supposed site of Herne's oak, said to be haunted by the ghost of Herne the Hunter. a keeper who figures in Shakespeare's Merry *Wives of Windsor* and in Ainsworth's *Windsor* Castle. The Long walk, a three-mile avenue leading into the Great park, was planted by Charles II in 168j; it consisted of 1,650 elms. but these became dangerously large and were cut down and replaced by young plane trees and horse chestnuts in 1945. Another fine straight avenue is Queen Anne's ride, planted in 1707. Among various buildings within the Great park is Royal lodge, once a favourite residence of George IV, but after 1932 remodeled as the private residence of the royal family. At the southern boundary of the park is a beautiful artificial lake called Virginia water.

Windsor Town.—A few old houses remain in the town of Windsor. including Nell Gwynn's, but the greater part is modernized. The parish church of St. John the Baptist was rebuilt in 1822, but contains fine examples of Grinling Gibbons' woodcarving. The town hall was completed in 1686 by Sir Christopher Wren, son of a dean of Windsor and for a short time the borough's representative in parliament. His plans were thought unsafe, and he had to promise to insert pillars to support the floor above the corn market: these he arranged so that they did not touch the beams, as may still be seen.

History.—Windsor (Wyndeshour, Wyndsore, Windlesore), perhaps a variant of "winding shore." was probably the site of a Roman settlement. Two Roman tombs mere discovered at Tyle-Place farm in 1865. while various Roman antiquities were unearthed at St. Leonard's hill in 1705. The early history of Windsor centres round the later unimportant village of Old Windsor, which was a royal residence under Edward the Confessor. By the Confessor it was granted to Westminster abbey but was restored in exchange for other manors by William I, who erected the castle about 2 mi. northwest of the village and within the manor of Clewer, around which the important town of New Windsor grew up. The earliest existing charter of New Windsor is that from Edward I in 1277. This constituted it a free borough, granted to it a gild merchant and other privileges and finally separated Kew and Old Windsor. Further confirmations of existing privileges were granted by later monarchs, and a fresh charter granted by James I in 1603 was renewed by Charles II and remained the governing charter until the Municipal Corporation's act in 1835. New Windsor sent two members to parliament from 1302 to 1335 and again from 1446 to 1865, omitting the parliaments of 1654 and

1656. By the act of 186; it lost one member. and by the 1918 act was included in the Windsor division of Berkshire. In 1922 it became a "royal borough," an honour shared with only four other English towns.

WIND TUNNEL. A wind tunnel is a device for producing a carefully controlled stream of air in which the reactions of the air on scale models of airplanes or their component parts or any other such objects that involve movement through air can be studied experimentally.

The wind tunnel has played a major role throughout the history of aviation, helping man to a better understanding of the mechanism of flight and providing experimental data essential to the successful development of every new aircraft. The first wind tunnel was designed in 1871 by Francis Herbert Wenham in England.

The nature of the flow over a body and, consequently, the forces and pressures developed on the body are similar whether the body is moving through still air or is held stationary in moving air. This flow similarity forms the fundamental principle of the mind tunnel, for in the wind tunnel a stationary model is suspended in a stream of air of known velocity, pressure and temperature such that an accurate determination may be made of the pressures and forces acting on the model.

The requirements of a carefully controlled air stream and devices for both supporting the model and measuring its reactions under different test conditions constitute the basis for design, construction and operation of most wind tunnels.

Design.—In its simplest form the wind tunnel consists of a straight, open-ended duct of varying cross-sectional area through which air is drawn by a fan. The duct is large at its entrance but reduces abruptly to a much smaller area at the beginning of the model test section. Beyond the test section the duct expands gradually back to a large size. The fan is often located just past the expanding portion of the duct.

The air travels slowly through the large part of the duct ahead of the test section. As it moves into the contracted area or nozzle the air speeds up rapidly. It remains at a high speed over the entire length of the test section. Once past the test section the air is brought back to a low velocity in the expanding region or diffuser and then continues on through the fan and out the duct exit. The open-ended tunnel is known as an open-circuit tunnel. for the air which is drawn through the system has no passage to guide it back to the inlet. Very little control can be maintained over the pressure, temperature and humidity of the air since the ends of the tunnel circuit are open to the atmosphere.

The disadvantages of the open-circuit are largely overcome by connecting the inlet and outlet with a return passage. The system is then classed as a closed-circuit tunnel, the most common of all wind-tunnel designs. Typical form of the closed-circuit wind tunnel is shown in fig. 1.

The return passage permits the same air to be circulated continuously around the tunnel, making it relatively easy to control

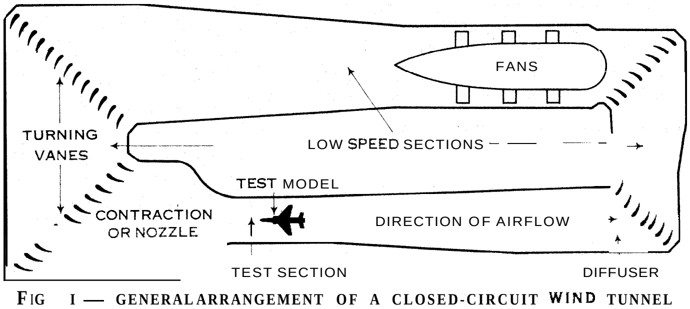

FIG 1 — GENERAL ARRANGEMENT OF A CLOSED-CIRCUIT WIND TUNNEL

Air flows slowly through the low-speed sections, speeds up in the test section and slows down again in the diffuser. Fans provide power to move air through the tunnel, and turning vanes guide the air smoothly around sharp corners. Measurements are made on the model supported in the test section

the conditions of the air. The closed-circuit tunnel has a further advantage in that the pressure in the tunnel can be varied to produce different levels of air density.

The tunnel shell is usually circular although rectangular and square shapes have been incorporated in some low-speed atmospheric pressure tunnels. The majority of the variable pressure tunnels have circular shells to carry the high loads imposed on the structure. Test-section shapes are somewhat arbitrary, although the selection often depends upon the special test requirements of the tunnel. These shapes may be square, circular, oval: rectangular or rectangular with beveled corners.

The air velocity in the tunnel is controlled either by changing the rotating speed of the fans or by adjusting the angle at which the individual fan blades are set relative to the rotating axis of the fans.

Fan system designs vary all the way from simple two-bladed propellers for small, low-speed tunnels to multibladed devices requiring thousands of horsepower and moving large quantities of air through the 10- to 20-ft. wide test sections of high-speed, high-pressure wind tunnels. Reliability and operating ease make the electric motor a usual choice for fan-drive systems.

The energy which the wind-tunnel fans impart to the air stream causes a rise in air temperature. In tunnels of low power, the heating of the air is not severe enough to require special cooling. However, to remove excess heat from tunnels whose energy input is numbered in thousands of horsepower, cold water is pumped through cooling radiators, not unlike automobile radiators, that span clear across the low-speed section.

Wind tunnels are placed in a number of categories depending upon their speed range, specialized testing capabilities and general design. Low-speed tunnels include performance to several hundred miles per hour. Subsonic or high-speed tunnels cover speeds just short of the velocity of sound (about 760 m.p.h. at sea level). Transonic tunnels, as the name implies, bridge the gap across the speed of sound. Supersonic tunnels go to around five times the speed of sound. The range beyond is covered by hypersonic tunnels.

Among the more specialized tunnels are the vertical spin tunnels in which scale models are suspended freely in a vertical column of air to study their spinning characteristics.

Construction.—Many different materials and methods are employed in wind-tunnel construction. The shells or ducts of low-speed tunnels that operate at or near atmospheric pressure are often made of wood. Concrete shells have been used successfully on very large, low-speed atmospheric tunnels where wood is impractical and steel too costly. Welded steel construction is necessary in tunnels designed for high pressures. Regardless of the type

FIG. 3.—EXTERIOR VIEW OF 7 × 10-FT. SUBSONIC WIND TUNNEL

of structure, the interior surface of the tunnel shell must be quite smooth, particularly in the test section where any roughness on the walls would disturb the air flow. The steel test-section walls of tunnels that operate at many thousands of miles per hour are ground and polished to a mirror finish.

Operation.—Since the primary objective of the typical wind tunnel test is to measure the various reactions imposed upon the model by the moving air under conditions that most closely duplicate those of actual flight, the basic operating principles and procedures of the tunnel centre on accurate control of the air stream, proper positioning of the model relative to the air stream, and the measurement of the forces and pressures on the model itself.

From the velocity, pressure and temperature of the air, the engineer can determine the test Reynolds number, the criterion for similarity of flow between the tunnel and flight. Reynolds number is the product of the air velocity, air density and a characteristic length of the model (usually the wing chord) divided by the air viscosity. If the test Reynolds number is equal to the Reynolds number of the full-scale airplane in flight, then the nature of the flow over the model and, consequently, the reactions of the air on the model will correctly represent full-scale values.

The forces acting upon the model and the moments or torques that these forces produce about a point in the model (usually its centre of gravity) are measured by the weighing system or "balance" upon which the model is supported in the tunnel.

The behaviour of the airplane under such conditions as diving, climbing, turning or rolling can be examined in the tunnel by moving the model about its supporting structure and recording the forces and pressures on the model at each different position. Thus, for example, to determine how the lifting force on a wing will vary with its angle of attack (angle between the wing chord and relative wind) the engineer need only set the wind tunnel at the proper air velocity and measure the lift on the wing each time he has moved it to a different angle of attack.

Research Uses.—The wind tunnel finds broad application in the solution of many aerodynamic problems, ranging all the way from fundamental work on the flow around bodies to routine tests on new airplane designs.

Much of the basic research on the flow about bodies involves study of the boundary layer, the slow moving layer of air adjacent to the body surface. Notable contributions to a better understanding of boundary layer flow and its influence upon the aerodynamic behaviour of the airplane have come from wind tunnel experiments.

The evaluation of new airplane designs touches upon nearly every useful application of the wind tunnel. Selection of wing and body shapes; location of the wings and tails on the body; orientation of the tail surfaces and control effectiveness of ailerons, rudders, elevators, flaps and dive brakes are but some of the design problems that receive thorough attention in the wind tunnel.

In the structural design of aircraft it is extremely important that the engineer not only know what total loads will be imposed upon the wings, tail, fuselage and other components but also know how these loads are distributed over the surface. Here the wind tunnel plays an important role. Measurements of the air pressure at many points on the model yield information about the way in which the total load is spread over the surface. These same pressure data, when reduced to velocity measurements, are very useful in a detailed study of the flow over the various parts of the airplane.

The nature of the flow may be studied further by introducing smoke or other visible compounds into the air stream ahead of the model. These compounds visibly trace the exact path of the air as it flows around the test model.

The success of the wind tunnel as a research tool has not been restricted solely to the aeronautical field. Aerodynamic studies on automobiles, boats and trains, as well as the effects of wind pressure on buildings and bridges, attest further to the wind tunnel's versatility in scientific research.

See Alan Pope, *Wind-Tunnel Testing* (1954); R. C. Pankhurst and D. W. Holder, *Wind-Tunnel Technique* (1952). (R. S. K.)

WINDWARD ISLANDS, an island group in the West Indies, consisting of the British islands of St. Lucia, St. Vincent, Grenada and Dominica, along with the Grenadines (*q.v.*) chain. Geographically, the name Windwards applies to the chain of islands between but not including Dominica and Trinidad. (L. W. BE.)

WINE is the fermented juice of the grape (*q.v.*). Of the grape genus, Vitis, one species, V. vinifera, is used almost exclusively, the exception to this being the use of species native to North America in the eastern U.S.

From V. vinifera comes the enormous variety of grape types used in making wine. The culture of wine is known from the earliest records of man and has developed a multitude of tastes, all distinct to the palate.

Wine types have specific correspondences with specific foods; thus the choice of wine for drinking at meals is closely related to gastronomic art.

The excellence and the proper gastronomic use of wine is known best by the name of the region or even more specific locale where it is produced; for the diversity of wine results from the unique character given wine by the climate, soil and topography of particular vineyard areas and by the techniques peculiar to individual vintners or to their communities. A vine producing a certain wine type in one region will, if planted elsewhere, give wine of a quite different nature.

After a consideration of the classification of wines, grape varieties, the terminology of wine tasting, the relations of wines and foods, and defects of wine, this article is concerned with the history of wine, classification of wines by region in France, Germany, elsewhere in Europe and in the world, and the chemistry of wine.

See also the separate articles on individual wines; MADEIRA; MALMSEY; MÉDOC; MOSELLE; PORT WINE; RHINE WINE; and SHERRY.

Classification. — Place of origin, however, is not sufficient to classify wines. A primary classification is that of (1) still or natural wines, called also beverage or table wines; (2) fortified wines; and (3) sparkling wines. This classification depends on the technique of production, called vinification. Table wines are made from juice pressed from the grape, called must, which is allowed to ferment naturally, perhaps only with the addition of controlled amounts of a yeast, sugar or a very small amount of sulfur. Fortified wines receive a dosage of alcohol, usually a grape brandy, at some time during their vinification; controlled interferences with natural fermentation typify the production of and characterize fortified wines as vermouths, sherry, Marsala, Madeira or port. The alcoholic content of fortified wines is high, from 15% to 22% by volume. Natural wines range from 10% to 15%, for fermentation stops when alcohol concentration is higher. Sparkling wines, the type exemplified by champagne, go through a double fermentation, the second fermentation taking place in the bottle. Some natural wines have a slight effervescence, called *pétillement* but this effervescence is slight and is not the result of interference with the fermentation process.

Another essential classification of wine is that into red, white, and. of lesser importance, *rose'*, or wine of a pink colour. Red wine is made from black grapes only. The colour comes from the skins; the must is left in contact with them until a desired quality is attained. White wines may be made from either grapes of greenish colour or from black grapes; if white wines are made from black grapes, the must is separated immediately from the skins. White wines are greenish or yellowish, these colours being sometimes quite pronounced. *Rosé* is made by leaving the skins in contact with the must for a short time.

Whether a wine is sweet or dry is of great importance to its gastronomic use. The term dry is the only acceptable opposite of sweet in wines, sour wine being bad wine. Dryness describes taste, which may vary due to other elements in a wine; wines are sometimes said to have a dry finish, meaning that the aftertaste removes the effect of sweetness.

Grape Varieties. — The precise variety of grape determines the nature and quality of n-ine; however. the production of a grape variety varies greatly n-ith soil and climate. A high quality yield in one soil, or a yield of a certain character, may not be so in another; hence the significance of a mine named by the grape variety is not a criterion unless the locale is specified.

Wine Tasting. — Wine tasting is an old and honoured profession and has developed a vocabulary to describe the effects of wine as it is experienced in drinking. This vocabulary is quite diversified, seemingly imprecise, yet meaningful. The term body describes the impression of substance in wine. a full-bodied wine giving more of this impression than a light-bodied wine. The term balance describes the relation of such elements as alcoholic content, flavour and body. Balance is an essential; but a light or heavy-bodied wine has its proper place, and thus both may be esteemed. Flavours are spoken of as rich, round; nines as robust or thin. Bouquet, or scent. colour and taste are criteria of evaluation.

Gastronomy. — The classifications given above suffice to classify generally the uses of nine. Fortified wines are not served with main dishes; such wines are *apéritifs,* served before or at the beginning of a meal, or dessert wines. Typical *apéritifs* are dry sherry or dry Madeira, and vermouth. either dry or sweet; these should be served chilled. Among dessert wines are the sweeter sherries. Madeira, port and Marsala. A dryish champagne may be served throughout the meal; other sparkling wines are generally too sweet. Of table wines the following combinations are usual: dry wines or *rosé* with appetizers. hors d'oeuvres; Chablis or other dry whites with oysters; with shellfish, fish. light fowl, dry whites; turkey with light reds, as Bordeaux; with pork or veal, dry white or *rose';* roasts with lighter reds; ham with *rose';* heavy-flavoured meats or game with heavy red nines; salads nith dry whites; cheese with most wines; desserts with sweet whites, as sauternes.

These accompaniments of wine and food have been historically stable and not greatly changed by fashion. Wines and foods are so varied in character and preparation that many exceptions are possible according to taste; however, traditional accompaniments are given high value among gastronomes.

White and *rose'* wines are served chilled; reds at room temperature. Ice should not he put in glasses, as it dilutes the wine, enfeebling its character. Red wines should not be suddenly warmed; the practice is to withdraw the cork an hour or so before serving, thus allowing the bouquet to volatilize. Various shapes of glasses are conventional; they should be colourless, in order for the wine to be seen, and with a cup that narrows toward the top so as to retain the bouquet.

Defects of Wine. — Acidity caused by immaturity is recognizable by a taste of tartar; this defect may be remedied by further aging. Acidity caused by bad vinification is recognizable by a vinegar taste and cannot be remedied. A wine aged past its prime degenerates and is recognized by a change in colour and a watery taste. A nauseating flavour appears for a period in red wines mainly, shortly after bottling; this is called bottle sickness and will disappear within a few weeks or months. A mildewy taste, called corked, is caused by a bad cork and is irremediable.

History. — Wine had a history by the time the Old Testament was written; in Genesis ix. 20, it is ascribed to Noah. In ancient Greece wine was dark and usually drunk with water (to drink it unmixed was riotous); a four-year-old wine was venerable as Theocritus testifies. It was kept in casks. goatskins or earthenware amphorae and stoppered with oil or a greasy rag; effectively, air was working on it all the time. There was little change in Roman days, though with greater wealth there came an approach to connoisseurship. Horace shows us that Falernian wine was famous, and one vintage year (42 B.C., *consule Planco,* the consulate of L. hlunatius Plancus) is known. But the full maturing of wine was impossible until the bottle and the cork were generally used. Wine in the wood commonly reaches its maturity in about three years; retained longer it may not improve and may deteriorate. Hocks were indeed kept in cask for as long as 20 years until the end of the 18th century and considered to improve; but the habit has long been abandoned and what virtues connoisseurs found in it is a matter for speculation.

During the dark ages. the production and quality of wine, so far as can be ascertained, fell steadily from classical days. The Romans had planted vines wherever the climate would tolerate it, in north Africa. Spain. Gaul, Britain and Illyria in particular. Their cultivation continued for local consumption, and because of the need of wine for the communion service the care of the vineyards was particularly an ecclesiastical preoccupation. The reappearance of good wines and famous vineyards invariably resulted from the efiorts of monks or of monarchs distinguished by their devotion to the church. Much of the wine thus locally made was of bad quality and in areas now found to be too northerly; the *vin de Suresnes* outside Paris became a byword for thinness. Wine was made at Glastonbury and elsewhere in England, and until late in the 19th century there was even some Welsh champagne from near Cardiff.

The planting of vines in some of the most famous Rhenish and Burgundian vineyards is traditionally ascribed to Charlemagne, but it was not until the 12th century that the great winegrowing areas were planted and found a larger market. Due to the limits of medieval transport vineyards had to he by riversides; and the most famous wines came from the Rhine, the Garonne and the Loire, of n-hich the last was the least important. Gascony wine came either from St. Emilion (where the Château Xusone claimed to date from the Roman poet Ausonius) or from the uplands beyond. Sack was a name of disputed or vague meaning. used for a dryish n-ine — sherris sack from Spain, Canary sack from the Canaries. Malvoisie or malmsey nas a rich wine made from the malvasia grape. originally coming from the Venetian-controlled part of Greece and later from Madeira. where vines were planted soon after 1420. Rhenish meant any Rhine wine. Hippocras was spiced and sweetened wine.

Use of wine bottles and corks as it is known in modern times seems to have become common toward the end of the 17th century, the development of both resulting largely from the work of Dom Pierre Pérignon of Hautvilliers, the father of the champagne trade. Another important change was the discovery, by accident in the year 1775 in the Rheingau, that grapes left to rot on the vines produced a sweetness and bouquet unobtainable otherwise. This *pourriture noble* is caused by the presence of a special mycoderm that alone makes possible the great hocks and sauternes. In the middle 1750s the Sladeira shippers first began scientifically fortifying their wines by adding a proportion of brandy to them, a process essential for the manufacture and maturing of all dessert wines except those few which make naturally nearly 20° of alcohol. The fortune of the port-wine trade was made by this and by the Anglo-French wars of the 18th century. as the latter led to the Methuen treaties from 1703 onward, by which Portuguese wines were admitted to Great Britain at one-eighth of the duty on French. This discrimination was ended in 1862, by W. E. Gladstone, when claret and Burgundy regained some of their old markets.

European vineyards were visited by a disaster that threatened at one time to wipe them out completely when in 1863 there was accidentally imported an American louse called Phylloxera (*q.v.*) which fed upon the roots of vines. Large winegrowing areas were devastated as the pest spread; 2,500.000 ac. were reckoned to have been ruined in France; and in Madeira and the Canaries wine production ceased completely. The ravages were checked eventually by the importation of louse-resisting stocks from California. on which the older vines were grafted. Pre-Phylloxera vines are now extremely rare except in countries such as Chile, which have never been visited by the pest. The only comparable disaster was the enactment of prohibition by the United States in 1919, whereby a large market was destroyed and a promising industry ruined.

REGIONAL CLASSIFICATIONS OF WINE

Wine producing regions of the world are in the south and north temperate zones. In volume the greatest wine-producing nations are France, Italy. Spain, Algeria. Argentina and Portugal. France is the greatest producer, and also is the greatest importer. Historically, France is the centre of wine culture in the modern era; France has produced most of the table wines of great excellence and the greatest variety of wine types. Only Germany, in its Rhine and Moselle wines. has contributed wines of such character.

Regions of France and Appellations **d'Origine.**—Six regions of France produce its finest wines and major wine types. These are Bordeaux, Burgundy, Champagne, Côtes du Rhône, the Loire valley and Alsace. The quality of these wines, as well as of those of many lesser regions, is maintained by a codification first instituted by commissions of the wine industry, and later largely guaranteed by French statutes, known as the laws of Appellations *d'Origine*. Wines so codified, and only those, may use the names of the wines of the region, district, or even specific vineyard and are labeled Appellation controlke.

The difference between blended and unblended wines must be appreciated before the sense of these codes can be fully seen. A wine is a blend if it is composed of wines from different years, called vintages, or if it is composed of wines from the same year but from different vineyards. By extension, if wines typical of a certain region are mixed with wine from another, the typicality of the wine is destroyed. The quality of wine being extremely sensitive to differences in soil and season, unblended wines are generally superior to blended wines. Wine from a specific vineyard, if it has character, is superior to a blend of wines from the vineyards of the district surrounding. The practice, known in France as *coupage*, of blending a good regional type wine, Burgundy for example, with an inferior wine such as ordinary Algerian, and labeling it Burgundy, is a fraud that all wine-producing countries have experienced. The French classifications and statutes were instituted to prevent such mislabeling and to guarantee the authenticity of their best wines. The mine trade and governments of wine-producing nations, with the exception of Germany, have tended to follow the practice of France, though with less exactitude.

Laws of Appellation *d'Origine* define many other characteristics of wine: the vine and care of it, alcoholic content, acidity, time of harvest of the grapes, amount of tannin, soil and undersoil and topography of the vineyards, days of sun in the growing season, bouquet of the new wine and its bouquet when aged, and others depending on regional peculiarities.

Bordeaux. — Claret is the traditional English name for the mine of the region surrounding the city of Bordeaux, France. Bordeaux has a long history in wine culture; like Burgundy and the Rhine region it was known in Roman times. During the English occupation of Bordeaux a charter was granted, first by Richard I and second by John in 1199, to the still-functioning jurade, a controlling body dating originally from the 12th century, which in its ceremonies still observes its medieval ritual and uses its traditional robes of the St. Emilion district for the supervision of wine making. Claret meant in those days a pale wine made by mixing reds and whites; the word claret is not used in modern French.

The modern Bordeaux region is the most important region making fine wines in the world. It is divided by the Bordeaux wine classification into 36 districts, which in turn are divided into communes. Within these communes, again, are certain individual vineyards, called chbteaux in this region, that produce the finest wines. The chbteaux bottle their own wine and label it under their names, thus guaranteeing it is not a blend. The chlteau-bottled wines rated best are classified as *crus* classes, which in turn have five categories called growths. These five growths are not altogether based on excellence, which in fine wines remains always a matter of taste to some degree; other criteria, such as market price, exportation and fame also formed these ratings. Rated in 1855, this classification is also somewhat outdated; nevertheless it has held up well over the years. After these cru classes are crus *exceptionnels,* comprising a half dozen wines, and several hundred wines named crus bourgeois and crus artisans or *paysans*. The last two categories are largely obsolete due to the growth of cooperative wineries, which have enabled small proprietor~to use up-to-date wineries managed by expert vintners, thus raising the quality of less expensive wine in Bordeaux and elsewhere. Although strict labeling is in force in Bordeaux chbteau-bottled wines, inferior wines are still sold as Bordeaux. Further, as a poor year produces wine of inferior quality, such wines must be known by vintage as well.

Wines of the Bordeaux region are labeled Bordeaux. Wines from specific districts of Bordeaux are usually of specific type and have more interest; they are labeled with the district name, as Médoc, or St. Emilion. Within the districts are communes, of specific wine type and of superior character; these are labeled with the name of the commune, St. Julien, or St. Esthphe. Of the 36 districts in Bordeaux, Médoc, Sauternes, Graves, St. Emilion and Pomerol are best known. Médoc, Sauternes and Barsac were classified in 1855, Graves in 1953, and St. Emilion in 1955.

Médoc.—These wines are red, generally of light body and strong flavour. Médoc, 50 mi. long and 3 to 7 mi. wide, has a dozen communes each possessing soil that produces wine of particular quality; Pauillac, Margaux, St. Julien, Cantenac, St. Esthphe are of these. Of the 62 red wines classified crus classes in 1855, all but one were from Médoc. First growth chbteaux are Lafite-Rothschild, Margaux and Latour; other crus classes number among them Mouton Rothschild and Kirwan.

Graves. — The genera1 reputation of Graves is for white wine, rich in taste and not too sweet. Actually Graves produces as much red as white. These balanced, fine-coloured and rather fruity reds are sometimes rated finer than the whites. Chbteau Haut-Brion was classified first growth in 1855; it is one of the 13 classified red wines of Graves in the 1953 official classification of Graves. Five chlteaux were selected as classified white wines of Graves in 1953.

Sauternes and Barsac. — The natural sweet wines, fruity with enduring rich flavour, of this district are usually considered the world's finest. To achieve their quality the grapes are left till overripe on the vines before harvesting, thus producing the ripeness known as *pourriture* noble, which leaves an abundance of sugar in the grape, sweetening the wine and producing a high alcoholic content. A label of Haut-Sauternes is also allowed for wines of this district, although no such area exists. Wines from the village area of Barsac, similar to Sauternes, are allowed the label of Sauternes or Barsac. Château d' Yquem is classified first superior growth, and 24 other chbteaux are classed in the first and second growths.

St. *Emilion.*—Sometimes called masculine wines, St. Emilions are full-bodied and of darker colour than Médocs. The 1955 classification listed 12 called first great growths of St. Emilion, among which are Chbteau Cheval Blanc and Chbteau Ausone, of long standing reputation. There were 63 chbteaux rated as great growths. These classes, like those of Graves, are peculiar to these districts, not part of the 1855 Médoc classification.

Other Bordeaux Districts. — White wines come from Sainte Foy, Entre-Deux-Mers, Langoiran. At their best the whites of Ste. Croix-du-Mont, Loupiac and Cérons have characteristics of Sauternes. Good red and white wines are produced in Bourg, Blaye, Cadillac and Camblanes-et-Meynac.

Vintages. — Some wines prosper in generally bad years or fail in good years. Thus vintage charts are not a certain guide. For Bordeaux reds 1957–55–53–49 were excellent and 1948 a little less so, 1952–50 good. For whites. 1955–53–52 were good years.

Age. — Bordeaux reds are at their peak 8 to 23 years after vintage. They are long-lived, however, and full-bodied reds will last 50 years, sometimes more. Dry whites may be ready to drink in 1 to 2 years, but age faster than reds or sweet whites, fading sometimes after 7 years. Sweet whites may be drunk about 3 years after vintage, will be at their peak at 10 years and may last 30 years.

Burgundy. — Burgundy extends from about 100 mi. S.E. of Paris, near Auxerre, through the *département* of Yonne, Côte-d'Or, Saône-et-Laire and RhBne, a length of about 230 mi. Beginning with the Chablis district, its vineyards include those of the Côtes de Nuits just south of Dijon, the area around Beaune and Mâcon, and end in Beaujolais just north of Lyons. It is a region of varied wines, rather than of a type. Its white wines are usually dry, its reds velvety and full-bodied. Burgundy-type wines made in other countries such as Italy, Spain, Chile or California imitate, with varying success, some wine of the region of Burgundy.

The best Burgundy wines are codified under the Appellations *d'Origine*. The use of the names of the districts, as Côte de Beaune, is controlled, as well as the names of communes, villages and individual vineyards. The last produce the finest wines; wines bottled on their properties are known as estate bottled, the counterpart of chateau bottled in Bordeaux.

Burgundy mines were known by the Romans and have a continuous history. The planting of some vineyards is ascribed to Charlemagne. By the 12th century great areas were planted and had found a market.

Wine properties in Burgundy are small and the tendency had been until the 20th century for growers to turn over their production for shippers to bottle. In the 1930s a classification of Burgundy wines was undertaken; the success of this and its guarantee by the *Appellations d'Origine* promoted another tendency for growers to bottle their own wine under a protected label showing their name and property.

Yonne.—This district produces mainly white wines. The famous Chablis is a very dry wine, light and with subtle bouquet; only wines from delimited areas in Yonne are allowed the name Chablis.

Côte-d'Or.—This district is divided in two parts, the Côte de Nuits just south of Dijon and the Côte de Beaune farther south. In the CBte de Nuits red wines are produced almost exclusively. Villages that have given their names to famous wines are Gevrey-Chambertin, Morey-St. Denis, Chambolle-Musigny, Vougeot, Vosne-Romanée and Nuits-St. Georges. Formerly these villages were simply Gevrey, Morey, Chambolle etc.; but as their mines, as Chambertin from Gevrey, became celebrated the villages adopted hyphenated names, the former village name first and the wine name last. Wines labeled with such hyphenated names are not the same as the original, though; the wine Gevrey-Chambertin is not the same as Chambertin. Well-known are the Chambertins, Clos St. Denis, Clos de la Roche, Musigny, Clos de Vougeot, Grands Echezeaux, Romanée-Conti, Richebourg, Nuits-St. Georges.

In Côte de Beaune both red and white wines, including most of the best white Burgundies, are produced. The important communes are Aloxe-Corton, Savigny, Beaune, Pommard, Volnay, Meursault, Puligny-Montrachet, Chassagne-Montrachet and Santeny.

Saône-et-Loire.—In this district are prolific but less distinguished vineyards. Mercurey and Givry are esteemed red wines. Around Mâcon are whites of good quality, notably Rully, Montagny and also Pouilly-Fuissé, a dry, heady wine with much bouquet.

Rhône.—Beaujolais, a tasty and fruity wine, is notable. It is made from the Gamay grape, which in other areas produces a large but low quality yield. It is drunk young.

The vintage wines of Juliénas, Fleurie, and Moulin-à-Vent have also the quality of aging well.

Côtes du Rhône.—South of Burgundy to the Avignon area is this region, typically producing full. strong red wines. Such fine wines are found as Côte Rotie, Hermitage and Chbteauneuf-du-Pape, the last being probably the most robust French wine of distinction. On the west side of the RhBne are the vineyards of Tavel, one of the few *rosés* of character.

Loire Valley. — Wines of this extended region are typically white. The vineyards follow the Loire from its source to the Atlantic at Nantes. Major districts are Muscadet, Anjou, Saumur, Touraine, Quincy, Reuilly, Sancerre, Pouilly. Muscadet is pale, delicate, sometimes showing pe'tillement, as with Vouvray, of fine quality and fruity. Saumur is a semidry white; this region and Anjou are often known by their rose's. The white wines of Sancerre, Quincy, Blancs Fumes of Pouilly and Reuilly are highly rated among French wines.

Alsace.—Alsatian wines are usually named according to the vine: Riesling, Traminer, Gewürztraminer, Sylvaner, Zwicker. Showing some similarity to the great Rhine wines of Germany, Alsatians are lighter and sometimes tend to become thin. The place of origin, including the vineyard, is usually shown on the bottle.

Other French Regions. — Most production of the champagne district is of the sparkling wine, but some still wine with a hard "flinty" taste is very worthy. In the Jura, near Switzerland, are red and white Arbois and a white wine. Chbteau-Chalon of a light sherry taste and highly esteemed. In Languedoc and the Midi, in the south and west from the Rhône, is a huge production of undistinguished but good vin ordinaire, the staple drink of the French worker and peasant.

Along the slopes, however, there are wines of superior quality classified by the Appellations *d'Origine*. The Pyrenees area produces estimable wines. East of Marseilles along the coast are the wines of Côte de Provence, and smaller districts of good quality such as Bandol and Cassis.

Germany. — German wine production is not large, but its great white nines are world famous. The major regions are along the Rhine and its tributary, the Moselle, whose mines were known by the Romans. The still-famous vineyards of Johannisberg and Steinberg were planted in 1106 and 1131. These wines have been known as hock or Rhenish; the trend no adays is to name Rhine as the type and to consider Moselle under that heading. Rhine and Moselle wines have similarities of taste and fragrance, often with a flowery bouquet. Rhine nines proper have greater body, and more vinosity as they age, and are the finest wines. The four main wine-growing districts of the Rhine are the Rheingau, Palatinate (Ger. Pfalz), Rheinhessen, and Nahe valley. The very best are from the Rheingau with such celebrated names as Rudesheim, Geisenheim, Johannisberg, Oestrich, Steinberg, Marcobrunn, Erbach, Rauenthal and many others The Palatinate produces much ordinary wine, but some of its specimens rival in generosity and fruity quality those of the Rheingau; famous names are Durkheimer, Wachenheimer, Forster, Deidesheimer, Ruppertsberger. These wines do not keep so well as the Rheingau wines, however. Rheinhessen is a large district and produces much good, robust wine. Especially in good years the wines of such places as Nackenheim, Bodenheim, Nierstein. Oppenheim equal the best of the other districts. Liebfraumilch, which means today a wine of soft, good quality, had its origin in Rheinhessen. Wines somewhat more elegant and not so full-bodied as those of Rheinhessen come from the Nahe valley, the best under such names as Schloss Bockelheim, Niederhausen, and Kreuznach.

Rhine wines are grand; Moselles are graceful. Moselles have low alcoholic content, some small but agreeable acidity, and a floweriness similar to Rhines. Some of the best-known varieties are Enkirch, Zeltingen, M'ehlen, Bernkastel, Brauneberg, Piesport, Dhron. Very similar wines are of the Saar and Ruwer, such as Scharzhofberg, Wiltingen, Ayl, Cassel, Grunhaus.

The quality and permanence of German wines have been strictly maintained by the industry and German wine law. The proportion of overripe grapes used and the selection of only the best grapes is indicated by the following categories, labeled on the better uines: Spatlese, picked late; *Auslese,* selected bunches; *Beeren-*

Auslese, from selected berries; *Trockenbeeren Auslese,* selected grapes picked when almost dried. Special selections such as these can only be made with a fine harvest, however, and the cost of such products is high.

Other European Wines. — Italy is the second largest producer of wine, in some years equaling the quantity of France. Many good wines are of Italian vintage, but none to rival the great wines of France and Germany. In the north is the red wine of the area of Barolo, the fine red. Valpolicella, and an excellent dry white Soave, the last two from the area of Verona. Other red wines of the north are Nebbiolo, Grignolino. Freisa and Barbera; these are names of grapes that. when used in specified locales, such as Nebbiolo in Barbaresco, Barolo or the Valtellina, produce excellent wines. Chianti, from Tuscany, is most widely known as an agreeable but undistinguished red wine sold in straw-covered flasks; this type is always drunk young. There is a much superior type called vecchio or stravecchio, that ages and comes in standard bottles. Farther south are Vesuvio, a dry white grown on Vesuvius. Capri, dry white from Capri and Ischia; and Lacrima Cristi, usually white but sometimes red.

Spain is third in world wine production. In the north is Rioja, a district producing Spain's best red and white wines. Good reds and whites from the central regions are Valdepeñas and Alicante. Portugal produces some very acceptable table wines; dry reds and whites are Collares, Torres Vedras, Dao, and sweet whites are Setubal and Bucellas. Switzerland produces a small quantity of good white wine, as Johannisberg and Neuchâtel. The great Tokay of Hungary, nor any wine approaching it under that name, was not available to western Europe in the second half of the 20th century; however, Hungarian production remained at pre-World War II levels for wines in general. Greek wines labeled retsina are spoiled for western taste by being heavily flavoured with resin. The Dalmatian coast, in Yugoslavia, has produced red nines and good aromatic whites, Rumania heavy reds. The U.S.S.R. produces a complete range of wines, particularly from Georgia and the Crimea.

Non-European Wines. — Wine culture followed the expansion of European empires. British plantings in North America date from 1617, Spanish in Central and South America even earlier, Dutch in south Africa from 1653 and French in Algeria, reversing the destruction of vines by Islam, from 1830.

Algeria. — A century of French planting has made Algeria the fourth largest wine-producing country. Its wines generally supplement the *vin* ordinaire of France, although some fine wines were being made in the second half of the 20th century.

South Africa. — By the early 1800s Cape reds and whites had good sales in London. After a drop in quality in the later 19th century the Co-operative Winegrowers' association was formed in 1917. It now includes most south African producers, has eliminated bad wines, standardized others and occasionally, as aith Nederburg wines or those from Constantia, has developed wines of character.

Australia. — Australian reds have had the reputation of being full, and ferruginous due to a generally high iron content. In fact, there is much good wine, often with no iron taste. The whites are clean and fresh. The Hunter river area is best known.

South America. — Wine is produced in all countries south of the equator, Argentina ranking generally fifth in world production. South American wine is generally undistinguished, except in Chile, where excellent wines come from such vineyards as Santa Rita, Tarapaca, Undurraga and Vial.

The United States. — Most wine of North America comes from the United States. Prohibition from 1919–33 destroyed an industry that was becoming respected even in Europe. Carefully chosen vines and locations were grubbed up or returned to wilderness. Establishing vineyards is a lengthy process; hence the first products after prohibition were usually coarse and heady and marketed under such names as Chablis or Sauterne to which they had no right and which showed the proprietors' lack of pride in origin. After World War II production began to recover and by the 1950s compared with Portugal in quantity. Great improvements in quality were made and selling of wines with labels showing place of origin and grapes used increased. Most states produce wines, but California is far ahead of the others. The best wines are chiefly from the San Francisco area, in the districts of Napa valley, Sonoma, Livermore and Santa Clara valley; some of these compare with Europe's, but there are as yet no great wines. The best established districts in the east are the Erie islands area near Sandusky, Ohio and upper New York state where interesting projects with native vines not of the V. vinifera were being carried on.

FORTIFIED AND AROMATIC WINES

Sherry. — Veritable sherry comes from the province of Jerez de la Frontera in Spain, "sherry" being an anglicization of "Jerez." A distinguished and venerable wine, sherry results from the soil and grapes of Jerez and a unique vinification. Essential is the action of *flor,* a mildewlike growth encouraged by a slight exposure to air after fermentation. Also unique is the Solera system of blending wines of many vintage years, maturing the newer mines and maintaining the historical continuity of a type. As ape'ritifs, four main types are: Manzanilla, Fino, Amontillado, and Vino de *Pasto.* All are dry and pale, descending in order named to vino de *Pasto*, sometimes characterized "not dry," and of a golden colour. Sweeter, heavier sherries are used as dessert wines; the usual types are Oloroso, Amoroso, Golden, all somewhat dry; and Cream, Brown and East Indian, all sweet and darker. Sherry-type wines are made in south Africa, Australia and the United States. No satisfactory duplication of the Spanish process has been achieved, though recent use of *flor* and Palomino grapes in California has resulted in a few wines comparable to some good Spanish sherries.

Madeira. — From the Portuguese island of Madeira, this wine is, like sherry, the result of a unique vinification and aging. The must is fermented and either before or after fortification heated in cask for weeks, then agitated artificially. This last operation attempts to reproduce the agitation of Atlantic voyages of the 17th century, which evidently contributed to the quality of Madeira. The result is an individual, dark brown, sweet wine with a hard undertaste. Apart from the wine of Camara de Lobos, the best Madeiras are classified according to vine. Lightest, and most dry, are rainwater, sercial and verdelho. Bual is a full, typical Madeira; Malmsey, or Malvasia, is rich and sweet. As with sherry, the range of types in Madeira permits their use as ape'ritifs or dessert wines and with certain foods.

Port. — Port, perhaps the most popular dessert wine, is produced within a region that is delimited by Portuguese law. Soil and grapes, and the skill of Oporto vintners in blending produce wines of remarkable character, with types running through a series of flavours. Vintage port, the finest, is not blended; but harvests deemed worthy to produce it are rare. The full richness of the port taste is found in dark vintage and vintage character ports; these types are taken from the cask after two or three years and complete their aging in the bottle. Vintage character port is a blend of best wines, sometimes called crusted port because, as with vintage port, it forms a crust within the bottle. Ruby port is a blend of younger wines. Tawny port is blended and matures in cask, changing its colour. Peculiar to the vinification of port is a large dosage of brandy given to the still fermenting must, by which the character of the wine is greatly changed. Much time is needed for the maturing of ports; in 1950, 1912 port was still excellent. There is some white port, usually made from white grapes, but it is not of equal distinction. The name "port" has been appropriated by certain wines of other countries, sometimes not aged, often not from the same grapes. There are, however, some acceptable American ports.

Marsala and **Malaga.**—These fortified wines have a world reputation. Marsala, from Sicily, is dark and sweet with a burnt taste; Malaga, from southern Spain, is a very heavy, sweet wine.

Aromatic Wines. — Vermouths are white wines, sweetened, fortified and infused with herbs. The French type is drier an'd paler, the Italian sweetish and brown in colour.

A number of drinks styled *apéritifs* in France are made by adding quinine and other ingredients to sweet heavy wines. They are marketed under brand names. such as Dubonnet, Byrrh. St. Raphael, Plessis, Lillet. Italy offers "Cin," Campari and Punt e Mes.

SPARKLING WINES

Champagne. — The premier sparkling wine is champagne, taking its name from a province of the *ancien régime.* The Champagne district today is defined as certain parishes in the *départements* of Marne. Aube and Aisne. The best champagne comes from vineyards along the Marne from Château-Thierry to Épernay and a belt to the south, called the Côte des Blancs. and those on a plateau called Montagne de Reims. It is made from only three wines: Pinot and Meunier. both black, and Chardonnay. white. Characteristic of champagne is a crisp. flinty taste, sometimes ascribed to the chalky soil. A small amount made from green grapes only is called *blanc des blancs.* Pink champagne is made by adding a little red wine.

Champagne first ferments in cask, but when fermentation stops temporarily in the first winter it is transferred to strong bottles. Just before bottling the wine is blended by experienced tasters, the artists of champagne. The wine now goes through a second fermentation in the bottle. making it naturally sparkline. If the year has been excellent, only wines of that year are used and the product is vintage champagne; if not, a blend with wines of different years will be made, improving and strengthening the wine and producing a nonvintage champagne. For the first three months in the bottle the wine is gradually moved and tipped by hand until the bottles are upside down and the impurities have fallen onto the bottom of the cork. The bottles are stood upside down for six months or perhaps years; when the wine is mature and ready for the market the cork is released and the sediment shot off with it. Next a small amount of sirup melted in old champagne is added and the wine recorked. Champagne to which little or none of this sugar is added is labeled *brut* or extra dry, somewhat sweeter is *sec,* and wine with larger quantities *demi-sec* and *doux.* All of these are sweeter than the words indicate. The second fermentation of wine to produce sparkling champagne is ascribed to Dom Pierre Pérignon, a Benedictine monk of the late 17th century.

Others. — Other sparkling n-ines are made throughout the world. In France such wines outside the champagne area are called *mousseux;* such wines are those of Saumur, the *blanquette* of Limoux and white, red and rose Burgundies. These wines. and their counterparts elsewhere. do not have the flinty taste of champagne and tend to lose their individual bouquets. Asti Spumante is the favourite Italian sparkling wine. At one time Rhine and Moselle sparkling wines of good quality were produced, not to be confused with the cheap imitation champagne, *Sekt.* In south Africa, Australia and the United States sparkling wines sometimes take the name champagne. an inaccurate designation. The prices these wines secure are below champagne, but their prices are high due to high taxes on them in non-Latin countries.

CHEMISTRY

The main change taking place in the fermentation of grape must is the conversion of the sugars glucose and fructose into alcohol and carbon dioxide. This can be represented by the equation $C_6H_{12}O_6 = 2C_2H_5OH + 2CO_2$, but the reaction is complicated (*see* FERMENTATION), and small amounts of glycerol. acetic and succinic acids and traces of higher alcohols are also formed.

The surfaces of ripe grapes are covered nith large numbers of yeasts, molds and bacteria, including the true nine yeast *Saccharomyces ellipsoideus* Grape juice would ferment with the aid of the wild yeasts but it is usually inoculated nith a selected strain of wine yeast after adding sulfur dioxide to suppress the other organisms.

In making white nine the juice is separated from the crushed grapes before fermentation begins; for red wine part of the fermentation is conducted in presence of the skins of the grapes, when tannins and colouring matter are extracted. the "free-run wine" being drann off and fermentation completed in a closed vat. Red wine fermentation usually takes place at a higher temperature than nhite. In either case artificial cooling may have to be applied since heat is evolved by the fermentation and too high a temperature is undesirable. The main fermentation takes a few days but it continues at a slower rate for some time In dry nines only about 0 15% of sugar is left at the end of the fermentation The maximum strength of alcohol that can be formed is about 15% by volume. the yeast being inhibited at this concentration (although special strains of yeast can tolerate higher amounts).

When fermentation is complete the wine is racked off. or separated from the lees or sediment. This contains precipitated organic matter, yeast and acid potassium tartrate (cream of tartar), which is less soluble in presence of alcohol. Racking may be repeated several times at intervals, the wine being stored in wooden vats where aging takes place. During aging changes occur including reduction of acidity, ester formation and oxidation of tannin and alcohols by the small amounts of oxygen absorbed through the wood. The wine is cleared before bottling. Fining agents such as isinglass. gelatin or bentonite clay are used, assisted by processes such as heat treatment. refrigeration and filtration.

Wine is subject to a number of infections. The most important is the action of acetic bacteria and of the wild yeast *Mycoderma vini.* which convert alcohol to the volatile acetic acid. These organisms cannot act in absence of air and are inhibited by sulfur dioxide. Tourne disease is caused by a bacterium that can grow in absence of air and produces lactic acid, giving the wine a silky cloudiness and off flavours. The bacterium can be inhibited by sulfur dioxide and destroyed by pasteurization.

WING, a term used in the air forces of both the British commonwealth and the United States to denote an integral part of the air force that is adapted functionally to any one of a number of purposes. It is often compared with a division in army organization or to the Soviet air division. Although the term has become less applicable as rocket weaponry has modified concepts of organizations (*e.g.,* the missile squadron), it still remains more or less valid for units employing aircraft.

In the British commonwealth air forces: a wing is either a mobile tactical unit roughly equivalent to a combat wing of the U.S. air force. or one of the major organizational divisions at an R.A.F. station, *i.e.,* an administrative wing, a technical wing or a flying wing. In some instances, a training unit for apprentice airmen is also called a wing.

In the U.S. navy a fleet air wing is a basic mobile administrative unit for naval aviation. Tenders and aircraft squadrons are assigned to it for administrative control.

In the U.S. air force a wing is a more or less self-sufficient unit with all necessary equipment assigned, organized for combat, training, transport, or service. and normally made up of a headquarters and four groups. In a combat wing, for example, the primary mission group (*i.e.,* its aircrews. aircraft and armament) performs the combat; the direct support group provides maintenance and supply; the air base group provides administration and housekeeping; and the medical group provides medical services. Such a wing is usually at a level of command below a numbered air force. The wing concept in the U.S. air force! however, is adapted to other organizational structures. and provides the basic pattern for flexible control and operation of training stations: air depots and air bases, as well as of combat air forces.

(WD. A. H.)

WINGATE, SIR FRANCIS REGINALD (1861–1953). British general and administrator in the Sudan, was born at Broadfield. Renfrewshire. on June 25, 1861. He was educated at the Royal Military academy, Woolwich. and became a lieutenant

WINE MAKING

BY COURTESY OF (TOP LEFT, CENTRE RIGHT) THE CHAMPAGNE PRODUCERS OF FRANCE; (TOP RIGHT, CENTRE LEFT, BOTTOM RIGHT) HOLIDAY MAGAZINE, PHOTOGRAPHS BY ROSA HARVAN; (CENTRE) PORTUGUESE STATE OFFICE, LONDON; (BOTTOM LEFT) FRENCH GOVERNMENT TOURIST OFFICE in the royal artillery in 1880. He served in India and Aden from 1881 till 1883, when he joined the Egyptian army, and in the Gordon relief expedition of 1884–85 was aide-de-camp and military secretary to Sir Evelyn Wood. He took part in the operations on the Sudan frontier in 1889 and 1891. In 1894 he was governor oi Suakin. His principal work was in the intelligence of which he became director in 1892. He mas a master of Arabic. He published in 1889 *Mahdiism and the Egyptian Sudan*, an account of the rise of the mahdi and of subsequent events in the Sudan. He helped Father Ohrwalder and two nuns to escape from Omdurman in 1891. Wingate also arranged for the escape of Slatin Pasha in 1895. He translated Father Ohrwalder's narrative, *Ten Years' Captivity in the Mahdi's Camp* (1891), and Slatin's book. *Fire and Sword in the Sudan* (18951.

As director of military intelligence, he served in the campaigns of 1896–98 which resulted in the reconquest of the Sudan. Wingate led an expeditionary force which in Nov. 1899 deieated the remnant of the Dervish host at Om Dehreikat, Kordofan. In December, on Lord Kitchener being summoned to south Xirica, Wingate succeeded him as governor general of the Sudan and sirdar of the Egyptian army. In 1909 Wingate undertook a special mission to Somaliland to report on the military situation. In Dec. 1916 he relinquished the governorship of the Anglo-Egyptian Sudan, and mas high commissioner for Egypt until Oct. 1919. He died in Dunbar, East Lothian, Jan. 28, 1933.

WINGATE, ORDE CHARLES (1903–1944), British army officer. leader of the "Chindits" who harassed the Japanese in the Burmese jungle in World War II. was born at Naini Tal, India. on Feb. *26. 1903.* Educated at Charterhouse and the Royal Military academy. Woolwich. he was commissioned in the royal artillery in 1923, serving in the Sudan and making some exploration of the Libyan desert *(1928–33).*

In 1936 he went to Palestine as an intelligence officer, being awarded the distinguished service order for his part in organizing and leading guerrilla forces during the Arab revolt. In *1940–41* he organized and led Ethiopian and Sudanese forces on an advance from the west against the Italians at Addis Ababa and was given a bar to his D.S.O. In *1942* he commanded a mixed brigade of British. Gurkha and Burmese guerrillas in Burma. later known as the "Chindits" or "Wingate's raiders." Supplied from the air, his small force was able to penetrate and remain for weeks a long way behind the Japanese lines. For this brilliant work he was promoted to acting major general and awarded a second bar to his D.S.O. In *1944* Wingate was appointed to command the air-borne force which carried out the invasion of central Burma, but at the opening of the campaign. on March *24.* this most unorthodox but extremely successful commander was killed in an air crash.

See C J. Rolo, *Wingate's Raiders* (1944); *L.* O. Mosley, *Gideon Goes to War* (1955). (E. B. BN.)

WINKELRIED, ARNOLD VON. The incident with which this name is connected is. after the feat of William Tell, the best known and most popular in the early history of the Swiss confederation. We are told how. at a critical moment in the great battle of Sempach, when the Swiss had failed to break the serried ranks of the Austrian knights, a man of Unterwalden, Arnold von Winkelried by name, came to the rescue.

Commending his wife and children to the care of his comrades, he rushed toward the Austrians. gathered a number of their spears together against his breast and fell pierced through and through, having opened a way into the hostile ranks ior his countrymen.

The earliest known mention of the incident is found in a Zürich chronicle (discovered in 1862), which is a copy, made in 1476, of a chronicle written about 30 years earlier; it occurs also in De *Helvetiae origine,* written in 1538 by Rudolph Gwalther. In both the hero is nameless.

Finally. one reads the full story in Giles Tschudi's chronicle (1564), where the hero becomes "a man of Unterwalden, Arnold von Winckelried by name." K. Bürkli *(Der wahre Winkelried,—die Taktik der alten Urschweizer,* Zurich. 1886) concluded that the phalanx formation of the Austrians, as well as the name and act of Winkelried, have been transierred to Sempach from the fight of Bicocca, near Milan (April 27, 1522), where a real leader of the Swiss mercenaries in the pay of France. Arnold Winkelried, met his death in much the same way.

WINNEBAGO, a Siouan-speaking tribe of North American Indians. They lived in what is now eastern Wisconsin when first encountered by Jean Nicolet in *1634.* Archaeologically they show relationships with the cultures of the lower Mississippi valley. but in historic times, they more closely resembled their Xlgonkian neighbours such as the Menominee and Fox Indians *(qq.v.)* rather than their prehistoric antecedents or their closest linguistic affiliates. the Iowa. Oto and Missouri. In response to the fur trade the Winnebago began a westerly expansion during the mid-17th century. By the early 19th century they claimed most of southwestern Wisconsin and the northwestern corner of Illinois. This land was ceded to the U.S. government in three parcels by treaties in *1829, 1832* and *1837.* The Winnebago considered the *1837* treaty to have been signed under duress and, therefore. not valid. However, part of the tribe submitted to its terms and were moved to a series of reservations; they were finally settled in 1865 on their present reservation in northeastern Nebraska where about *1,000* were enrolled in the *1960s.* The rest of the tribe resisted the terms of the *1837* treaty and despite forcible removals persisted in returning to their homeland. In 1875 they were permitted to take up homesteads in Wisconsin where about 1,500 resided in the 1960s. Winnebago in the Wisconsin and Nebraska enclaves recognize their common ancestry and frequent visiting occurs between the two groups. The Nebraskans are somewhat more acculturated in that English is rapidly replacing the Winnebago tongue. Also. the Nebraskans are nominally Christian, being about evenly divided between the quasi-Christian peyote religion (see PEYOTISM) and white Christian denominations. In Wisconsin. Winnebago is commonly spoken and about a third of the group adheres to traditional pre-Christian religious practices. *See* also SIOUAN INDIANS. (N. O. L.)

WINNETKA, a village of Cook county in northeastern Illinois. U.S., *17* mi. N. of downtown Chicago on Lake Michigan, is one of several North Shore residential suburbs of Chicago *(q.v.).* Incorporated under a special charter in *1869.* it established a council-manager plan of government in 1915. The municipality operates and owns water and electric utilities. Its public schools are nationally recognized for their experiments in teaching, with emphasis on individual progress. New Trier Township high school is there. as is the North Shore Country Day school (private), and the Hadley School for the Blind. a privately supported institution (incorporated in *1922* j which teaches by mail.

For comparative population figures see table in ILLINOIS: *Population.* (H. H. GR.)

WINNIPEG, the fourth city of Canada and the capital of Manitoba, is situated at the confluence of the Red and Assiniboine rivers. *60* mi. N. of the U.S. border. Pop. *(1961)* city *265.429;* metropolitan area *475,989,* including the adjoining city of St. Boniface *(q.v.)* and the city of St. James *(33.977);* Winnipeg sends *4* members to the federal parliament and *12* to the Manitoba legislature. The name is from the Cree Indian words win, "muddy," and *nipee,* "water."

Winnipeg owes its origin and growth to its geographical position in relation to communications. Its early development as a fur-trading post (Fort Rouge established by Pierre de la Vérendrye, *1738;* Fort Gibraltar built by the Northwest company. *1804:* Fort Garry. by the Hudson's Bay company. *1821)* was due to its location where the westward route following the Assiniboine joined with the north-south course of the Red river. The fertility of the Red river valley led Lord Selkirk to plant a Scottish colony there in *1812* which survived the hostility of the fur traders and was joined by European immigrants *(see* RED RIVER SETTLEMENT). Numerous French-speaking half-breeds. or métis, also inhabited the district. Further development of the area was handicapped by the difficult access route across northern Canada from Hudson's bay. This isolation was ended in *1859* by steamboats from the U.S. on the Red river and by a railway from Minnesota in 1878.

The formation of the dominion of Canada as a "coast to coast" nation (1867–71), followed by the building of the Canadian Pacific railway across the country (1885), enhanced the importance of Winnipeg's position: the rugged terrain of the Canadian shield there approaches close to the U.S. border. so that east-west routes across Canada are compelled to converge. Settlers began to arrive from the east in the late 1860s and by *1570* the little village of Winnipeg had grown up half a mile north of Fort Garry; it was incorporated in *1873* with a population of 1,869, and in *1576* began to ship wheat eastward.

As the prairie was opened up. more and more wheat moved into the city until Winnipeg became the largest grain market in North America. Manufactured goods from eastern Canada and the U.S.

were distributed throughout the Canadian west and this, together with a large mail-order business serving the rural communities of the prairies, remains a prime function of the city. Growth was rapid until the agricultural depression of the 1930s, the population rising from 42,430 in 1901 to 221,960 in 1931. The 1950s saw renewed expansion, mainly in the suburban areas. Increased mining activity made Winnipeg an important supply centre for the northland and it retains its original function as a fur market. The air age added to the city's function as a communications centre; the airport, located 4 mi. W. of the city centre, is one of the busiest in Canada.

Cheap and plentiful supplies of hydroelectric power, natural gas (after 1958), and soft water, favour industrial development. The leading industries are slaughtering and meat packing flour milling, clothing, printing, brewing, baking and food processing.

Extensive railway freight yards, branch lines and the rivers divide the city into separate parts; the rivers have necessitated several long bridges. The streets, arranged on a rectangular plan. are wide. The city centre, where the commercial and financial buildings are located, is formed by the junction of Main street, which follows the Red river, and Portage avenue, which was originally a trail to the northwest. Most of the imposing buildings are on Broadway: the parliament building, the law courts and the Fort Garry hotel. The post office (1958) is particularly noteworthy. Many older wooden houses in the centre have been pulled down, leaving open spaces used as car parks. The chief public parks are Assiniboine park, on the banks of the river of that name (300 ac.) and Kildonan park on the Red river (98 ac.).

Winnipeg is cosmopolitan; although the British element prevails. there are large French. Jewish, Ukrainian, Polish. German and Scandinavian groups. An active cultural life finds expression in the Royal Winnipeg ballet, a symphony orchestra, a musical festival and various societies. The University of Manitoba is situated south of the city in the suburb of Fort Garry. (W. H PR.)

WINNIPEG, LAKE AND RIVER, a water system of Manitoba, Can. The lake has an area of 9,094 sq.mi., is at an altitude of 713 ft., is 264 mi. long, 25 to 68 mi. wide, and has several islands, including Reindeer (55 sq.mi.). The lake has an average depth of 40 to 60 ft. and is navigable its entire length for sizable boats. Its shores on the south are extremely marshy. It receives the drainage from a large part of the Great Plains, including waters from the Red and Saskatchewan rivers from the south and west and Winnipeg river on the east. The lake is drained to the north by the Nelson river into Hudson bay. The fisheries of Lake Winnipeg, operating out of Gimli, are of considerable commercial importance. Winnipeg beach on the southwest shore is a popular summer resort.

Winnipeg river drains an area of 48,880 sq.mi. from the Lake of the Woods to Lake Winnipeg It was discovered about 1733 by Pierre de la Vérendrye and Christophe de la Jémeraye and for many years was on the route of the explorers and fur traders from Lake Superior to the west The falls and rapids of its lower course, which earlier made travel difficult, supply most of the electrical power used in Manitoba There are power plants at Seven Sisters and Great Falls. Pointe du Bois and Slave Falls, Pine Falls and McArthur Falls. (F. A. CK)

WINNIPEGOSIS, LAKE, in western Manitoba, Can.; its greatest length is 152 mi.; greatest width, 32 mi.; shore line. 570 mi.; and area. exclusive of islands, 2,086 sq.mi. Its greatest depth has been ascertained at 59 ft. and mean altitude. 831 ft. above sea level; it is navigable for vessels drawing 10 ft. The name means "Little Winnipeg"

The lake was discovered by Pierre de la Vérendrye in 1739 and in early fur trade days was an integral part of the western voyageur route. Rail service reaches the lake at the village of Winnipegosis The lake drains through Waterhen river into Lake Manitoba and thence by the Dauphin river into Lake Winnipeg. (F. A. CK)

WINONA, a city of southeastern Minnesota, U.S., and seat of Winona county, is picturesquely situated beneath steep bluffs along the Mississippi river about 100 mi. S.E of St. Paul. It was founded in 1851 by New England settlers followed by Polish and German immigrants. When the town was platted in 1352 it was named Montezuma (for the Aztec emperor) but was soon renamed Winona, an application of the Indian Wenona, a name commonly given by Sioux families to girls who were first-born. It was chartered in 1857. Winona is located on a wide shelf of level land easily accessible from the farming regions to the west. This made the city an important river port and it became a great wheat shipping centre. Giant sawmills were established and were fed by logs rafted down the Mississippi. Business leaders accumulated large fortunes and Winona was once reputed to have had 20 millionaires.

When the booms in wheat and lumber ended, other industries arose. About 40% of Winona's workers are employed in manufacturing. Medicines, cosmetics, flour, appliances, metal goods, lubricating equipment and fertilizers are the leading products. River shipments to Winona have increased steadily and in 1958 a new barge dock was opened. There are numerous boat shelters for the growing number of pleasure craft on the river.

About one-half the population is Protestant and one-half Roman Catholic. Winona State college (1858), St. Mary's college (Roman Catholic; 1913) and the College of St. Teresa (Roman Catholic; 1907) are located in the city.

For comparative population figures *see* table in MINNESOTA: *Population.* (H. T. H.)

WINSLOW, EDWARD (1595–1655), a founder of the Plymouth colony, was born in Droitwich, Eng., on Oct. 18, 1595. In 1617 Winslow moved to Leyden, united with John Robinson's church, and in 1620 was one of the "Mayflower" Pilgrims. His first wife, Elizabeth (Barker) Winslow, died soon after their arrival. He married, in May 1621, Mrs. Susannah White, the mother of Peregrine White (1620–1704), the first white child born in New England. This was the first marriage in the New England colonies. Winslow was one of the assistants from 1624 to 1647, except in 1633–34, 1636–37 and 1644–45 when he was governor of the colony. In 1643 he was one of the commissioners of the United Colonies of New England. On several occasions he was sent to England in the interests of Plymouth and Massachusetts bay. He left on his last mission as the agent of Massachusetts bay, Oct. 1646, and spent nine years in England, where he held minor offices under Cromwell. Winslow's portrait, the only authentic likeness of any of the "Mayflower" Pilgrims, was preserved in the gallery of the Pilgrim society at Plymouth, Mass. His writings, though fragmentary, are of great value to the historian of the Plymouth colony. Some of them were reprinted in Alexander Young's *Chronicles of the Pilgrims* (1841)

WINSOR, JUSTIN (1831–1897), U.S. historian, was born in Boston, Mass., on Jan. 2, 1831. As a student at Harvard he wrote historical and literary articles and for a number of years thereafter continued his newspaper and periodical work. He found his true vocation, however, when his success as temporary superintendent of the Boston Public library caused him to receive the permanent appointment and when in 1877 Prcs. Charles Eliot took him to Harvard as librarian. He edited *The Narrative and Critical History of America,* 8 vol. (1884–89), a mammoth co-operative work, for the rich bibliographical and historical notes of which he was largely responsible; he also wrote histories: *Christopher Columbus* (1891), *Cartier to Frontenac* (1894), *The Mississippi Basin* (1895) and *The Westward Movement* (1897). He died in Cambridge, Mass., on Oct. 22, 1897.

WINSTON-SALEM, a city of western North Carolina, U.S., located about 35 mi. S. of the Virginia boundary in the north central piedmont; the seat of Forsyth county. Pop. (1960): city 111,135, an increase of 26.6% in the decade; standard metropolitan statistical area (Forsyth county) 189,428, an increase of 29.6%. (For comparative population figures for the city *see* table in NORTH CAROLINA: *Population.)*

Winston-Salem is a union of two towns representing respectively the new south and the colonial period. Salem was founded in 1766 by Moravians *(see* MORAVIAN CHURCH) and remained under Moravian control until 1849. In 1856 land was first sold to outsiders and the town was incorporated. Many of the original buildings are still standing. Old Salem, Incorporated has begun a major effort to restore the colonial town, and a museum is maintained. The Moravian Easter sunrise service annually attracts thousands of worshipers from all over the United States.

Winston, to the north of Salem, was founded in 1849 as the seat of Forsyth county and was named in 1851 for Maj. Joseph Winston, one of the heroes of the battle of Kings Mountain. The two towns were originally about a mile apart but they gradually grew together and in 1913 they united. Winston-Salem became a centre of the tobacco industry in the nation; other important industries include nylon hosiery, men's and boys' underwear. electric communication equipment, woolen blankets, furniture, textiles and dairy products.

Four-year colleges in the city are Winston-Salem Teachers college, a state-supported institution established in 1892; Wake Forest college (Baptist; chartered in 1833) and its affiliated Bowman Gray Medical college (1902); and Salem college (Moravian; founded 1772). The city has hospitals, parks, a city-county library and an art council. It is the economic centre of about 15 surrounding counties. Winston-Salem has a council-manager form of government, in effect since 1948. (D. J. WR.)

WINTER, JOHANN WILHELM DE (1761–1812), Dutch admiral distinguished in the French Revolutionary and Napoleonic wars, was born at Kampen. He entered the naval service at the age of 12 and had reached the rank of lieutenant when in 1787 the "Patriot" party to which he belonged was overthrown. He fled to France and on the outbreak of the revolution there joined the army and was soon promoted to brigadier general. When Charles Pichegru overran the Dutch republic in 1795, De Winter returned with the French army to his native country. The new Dutch government decided to use his experience for reorganizing the navy. In 1796 he was appointed vice-admiral and commander in chief of the fleet. On Oct. 11, 1797, he encountered the British fleet under Admiral Duncan off Camperdown. After an obstinate struggle the Dutch were defeated and he was taken prisoner. Liberated by exchange in December, he was Dutch ambassador to the French republic from 1798 to 1802 and was again appointed commander of the fleet. Sent with a strong squadron to the Mediterranean to repress the Tripoli piracies, he negotiated a treaty of peace with Tripoli. He enjoyed Louis Bonaparte's confidence while the latter was king of Holland and Napoleon's after the annexation of Holland to the French empire. Napoleon appointed him inspector general of the northern coasts and, in 1811, commander of the fleet gathered at the Texel. Soon afterward De Winter became ill and moved to Paris where he died on June 2, 1812. (E. H. K.)

WINTERBERRY, the name of several deciduous shrubs of the holly genus (Ilex), but particularly applying to Virginia winterberry (I. verticillata), a large arborescent shrub of moist lands from Nova Scotia to Florida and west to Missouri. It is also called black alder for the elliptical to obovate leaves that turn black in the fall. The winterberry is dioecious, bearing small, unisexual flowers in axillary clusters. The persistent berries, usually red but occasionally varying to yellow, are liked by birds. An attractive landscape border plant, its berried twigs are used for winter decorations. Propagation is by softwood cuttings or seed. Smooth winterberry (I. laevigata) bears single, orange-red fruits. Mountain winterberry (I. montana) is native to mountain slopes. (F. C. G.)

WINTER FAT (Eurotia lanata), a small North American shrub of the goosefoot family (Chenopodiaceae), native to subalkaline soils from Saskatchewan to Washington and south to Texas and California. It is a low white-woolly shrub, one to two feet high. with many slender branches, narrow leaves and small flowers in axillary clusters, the fruiting involucres bearing tufts of silvery-white hairs. It is a valued winter forage for cattle.

WINTERGREEN (Gaultheria procumbens), a member of the heath family (Ericaceae; *q.v.*), a small. creeping. evergreen, herblike shrub with numerous short, erect branches bearing in the upper part shortly stalked, oval, thick, smooth, shining leaves with a sharp-toothed edge. The flowers are borne singly in the leaf axils and are pendulous, with a pale pink waxy-looking urn-shaped corolla. The bright crimson-red subglobular, berrylike fruit consists of the much-enlarged fleshy calyx which surrounds the small, thin-walled, many-seeded capsule. The plant is a native of shady moods on sandy soil, especially in mountainous districts, in the northern United States and southern Canada; it is quite hardy in England. The leaves are sharply astringent and have a peculiar aromatic smell and taste due to a volatile oil known as oil of wintergreen, which is used in medicine in the treatment of muscular aches and pains. Oil of wintergreen is chiefly a synthetic product. An infusion of the leaves was used, under the name mountain tea, in some parts of North America as a substitute for tea, and the fruits are eaten under the name of deerberries. Other names for the plant are teaberry, checkerberry, boxberry, spiceberry and ground holly. Its counterpart on the Pacific coast is the salal or shallon (G. shallon), a slender shrub, one to six feet high, with black berries; it is found in the coastal redwood belt of California and northward to British Columbia. The name is also applied to the pipsissewa (*q.v.*).

WINTERHALTER, FRANZ XAVER (1806–1873), German portrait painter of the French second empire, was born at Menzenschwand, Black Forest, April zo, 1806. In 1823 he went to Munich to study under Stieler, and later he established himself in Karlsruhe, where he became a protégé of Grand Duke Leopold. Winterhalter excelled in the representation of elegant ladies, and his portraits include those of Louis Philippe (Calais), Prince Albert (National Portrait gallery, London), Queen Victoria, Napoleon III and others. Probably the best known is that of "Empress Eugénie and Her Ladies." He died at Frankfurt on July 8, 1873.

WINTER'S BARK, the bark of Drimys *winteri,* an evergreen tree belonging to the magnolia (*q.v.*) family (Magnoliaceae). It was formerly officinal in Europe, and is still held in esteem in Brazil and other parts of South America as a popular remedy for scurvy and other diseases. The plant is a native to mountains and highlands from Mexico to southern Chile.

WINTER SPORTS. Throughout the world nearly every country with sufficient snow and freezing conditions has some form of winter sport. Though there are many, the major winter sports are generally considered to include skiing, skating, tobogganing, coasting, ice hockey, curling and ice yachting. (This article deals with the history of winter sports in general and briefly with each of the major sports, all of which are covered in detail in separate articles; *e.g.,* ICE HOCKEY, ICE SKATING, SKIING, etc.)

The date of origin of each winter sport is obscure. Many centuries were required for the development of the first crude paraphernalia for moving over snow and ice. Man's early need for a means of travelling and for conveying goods in winter gave birth to the original skis, snowshoes, toboggans or sledges, and skates. The first skis, according to authorities of the Djugarden museum at Stockholm. Swed., may be traced to a period several thousand years in advance of the Christian era. Some ethnologists claim that the first skis date back to the Stone Age, citing certain carvings as evidence. There are many early references, to some type of snowshoes or skis used by the Mongols of northwestern Asia, the inhabitants of the Scandinavian countries and northern Europe. There are also references to several types of skates, which like the early skis and snowshoes were fashioned from the bones of animals, bound on the feet with strips of leather and used for sliding on ice surfaces. Bone skates appeared in Sweden sometime between the 8th and 10th centuries and elsewhere in Europe at a later date. The Dutch versions. which were to become commonplace on the many frozen canals and waterways, are mentioned in the 16th century.

In the United States and Canada the Indians used several types of snowshoes and possibly some type of ski when the first colonists appeared. It seems likely that in the other countries with a snow belt the first skis and other early types of sleds and skates were introduced at a much later time, and only after considerable development of various forms of sport, as distinguished from practical applications. Japan. Australia. New Zealand and certain mountainous regions of South America are examples.

It was only after continuous usage throughout many centuries ior practical purposes of conveyance and travel. and many modifications from bone to wood to metal, that skis, sledges and skates were adapted to the first simple forms of winter sports. Man's fascination with snow coupled with competitive spirit and a desire for recreation brought the development of each winter sport in their present recognizable forms by the 18th and 19th centuries. As late as this. however. winter sport was still little more than informal play on snow and ice. except for occasional organized competition. Equipment used in the various winter sports, even at the beginning of the 20th century. was relatively crude and non-standardized. Modern inventiveness, improvements in fabrication and manufacturing and the adaptation of steel and other light metals were necessary to help standardize the equipment. At the same time basic rules of play were evolving on a limited scale. This concept of forming rules led toward the standardization of certain sports. such as ski jumping and cross-country ski races. The first official Norwegian contests, held at Holmenkollen in 1892. aroused popular interest. and the award of the king's cup helped make skiing a national sport in Norway.

Speed skating gained earlier recognition when. in 1814, the first skating competition in England was recorded Only a few years later. Nemburgh. N.Y., became the US. headquarters for speed skating Tobogganing might be said to have come of age in 1884, when the construction of the famous Cresta run was begun at St. Moritz Switz. With the formation of the Amateur Curling club of Scotland in 1834 and the Grand Caledonian Curling club in 1838, curling was well on its way to becoming the national sport of Scotland. In the middle 1800s ice hockey was also beginning to emerge as a team sport in Canada: although it should be noted that a simple form of the game was played in Europe during the middle ages. Ice yachting. which probably originated in the Netherlands, was recognized as a sport by the mid-I700s.

Winter sports, nevertheless, were plaved with few exceptions under local rules until the late 1800s. National and international competitions'on a grand scale were infrequent until the 20th century. when they started to gain stature and recognition. Norway had already given skiing events a national status. A small group of outstanding speed skaters and bobsledders had crossed national boundaries to gain international recognition. The concept of team sports, as in the case of hockey, curling and. in a sense, ice yachting, was responsible for attracting both participants and spectators.

Important factors which influenced and encouraged the growth of winter sports were improved means of communication and travelling, so that both players and ideas moved faster. The national presses and international news services gradually began to record a few of the winter sports contests and speed records. The decision of the delegates to an international athletic congress in 1894 to hold the first modern Olympic games in Athens, in 1896, was another important factor in the growth of winter sports. Though the Olympics of 1908 included only an ice skating program, it was inevitable that ainter games would eventually be included in the world championships. (See OLYMPIC GAMES.)

Other factors which influenced the growth of winter sports in general were the increased standards of living in the 20th century and more leisure time. Club organizations stimulated the development of basic rules and formal codes, which in turn led to competitive meets between individuals and teams. National pride, coupled with the rebirth of the Olympics. seemed to further interest in sports in general More countries became known as "sporting countries." Physical fitness and prowess began to take on the importance attached to it centuries ago when the first Olympiads were held in ancient Greece. Winter sports were to profit greatly from the general interest in sports. A report of a downhill ski racer attaining speeds in excess of 60 m.p.h over a measured course dramatically drew attention. News of an ice yacht racing a steam-driven railroad train was enthusiastically received. And the idea of a ski jumper spectacularly flying through the air for more than 100 ft. excited tremendous acclaim and interest.

Motion pictures. in addition to accounts in newspaper and sporting periodicals, also did much to focus attention on winter sports and promoted further interest and participation.

Skiing. — An outstanding individual sport, skiing grew in popularity at an astounding pace after the winter Olympic games at Chamonix, Fr., in 1924, and the founding of the Federation Internationale de Ski in the same year. Modern skiing could be said to date back to that time, for previously there was little standardization of equipment. basic techniques were only beginning to take form and teaching methods were still to be developed. The sport of skiing flourished thereafter and by the end of World War II skis the world over had become more or less uniform in length, width and general conformation. Whereas formerly they had been made of many kinds of wood, maple, ash, pine and hickory. the latter became the wide choice. Selected hickory, exported from southern U S. and usually laminated, became a standard material. Many manufacturers made skis of magnesium. aluminum, Fiberglas, or of combinations of wood laminates with metal alloys. In every case, good skis have hard steel edges to ensure better control. Length, width and weight of skis vary according to the height and weight of the skier, his proficiency, the kind of skiing terrain and purpose; *i.e.,* for downhill, slalom or cross-country skiing or for jumping. Downhill and slalom skis usually have one groove in the centre of the bottom running from the heel (or back) up to the shovel (or start of the upturned tip at the front), though some designs have a multigrooved base. Cross-country skis are longer and narrower, and jumping skis are heavier and have several grooves in the base. Plastic soles, for protection and wear resistance, are common, although many types of lacquer bases on conventional wood skis accomplish the same purpose

There are many types of ski bindings, varying according to purpose; *i.e.,* downhill. cross-country or jumping. And for each purpose there are many different designs, especially in the case of downhill bindings. The binding, in any case, is the device fitted on the top of the ski, which receives the boot and marries the skier to his skis. Little vertical movement and no lateral movement of the boot is allowed. Cross-country and touring bindings are designed to allow considerable vertical movement of the heel in order to increase mobility and freedom of movement in a more normal walking-sliding manoeuvre and to facilitate climbing. Relatively new "safety" bindings are of still different designs. Though many of the safety release devices vary radically, their purpose is common—to release the boot and skier from the skis in the type of fall which might otherwise result in a bone-shattering accident. Though many skiers continued to use the older, conventional bindings, the trend among average skiers was toward the use of safety bindings. Many experts and most racers steadfastly clung to the "long-thong" binding, which literally straps the boot, and hence the skier, to his skies. Experience and skill, in this case, is counted on to outweigh accident prevention.

Poles, roughly varying in length from 4 to 5 ft., are made for the most part from steel and tonkin. The purpose of the poles, carried in each hand, is to assist in propelling the skier forward by employing them in a rhythmic pushing motion and as an aid in climbing. They also help to give added balance and can be employed in other manoeuvres such as pole-jumps. Boots are an important part of the skiing equipment. Most of them have double lacings or "inner boots" and are reinforced with steel shanks in the soles to allow for greater stability and support.

The idea of the ski school was originated by a number of skiing pioneers. Sondre Norheim, Mikkel Hemmestvedt, C. C. T. Bjerknes, O. Kjelsberg and others are credited with contributing the Norwegian concept of skiing, which spread to central Europe and other parts of the world. In central Europe, Wilhelm Paulke and Henry Hoek of Germany, Col. Christopher Islin of Switzerland, Mathias Zdarsky, Col. Georg Bilgeri and Hannes Schneider of Austria, Sir Arnold Lunn of Great Britain and Émile Allais of France, along with many others, contributed much to the development of modern skiing and teaching methods. The so-called Norwegian, Swiss, French and the Arlberg schools evolved basic techniques which, along with modifications and adaptations in the United States. Canada and elsewhere in the snow-covered regions of the world, are taught regularly in ski schools.

Each school or technique is by no means confined within national boundaries. The fimile Allais technique, for instance, was officially adopted by the French Ski federation as the French method in 1937, but soon spread to many other countries to be taught as one of several popularly accepted techniques. WORLD-WIDE PARTICIPATION IN WINTER SPORTS

1. Ice hockey match at Davos, Switzerland
2. General view of chair lift on Mt. Tremblant, Quebec
3. Ice sailing at St. Moritz, Switzerland
4. A skier at Adelboden in the Bernese Oberland, Switzerland
5. Tom Murstad, Norwegian skier, in single pole jump turn
6. Mlle. Melitta Brunner in a fawn leap on Lake Placid Club rink
7. American four-man team at the famous sunny corner of bobsleigh run at St. Moritz, Switzerland
8. Dave Cruickshank and W. C. Capes skate sailing on Lake Hopatcong, N. J.
9. International speed skating contest on the rink at Davos, in the Grisons, Switzerland
10. Hiram Mason, Jr., in dog-sled derby at Lake Placid, N. Y.

Alpine method, fathered by Zardsky and Bilgeri, was perfected and transformed into the Xrlberg method. notably by Schneider. It was the Xrlberg method which was to have tremendous influence. on U.S. and Canadian skiing and, in turn. to reach other parts of the world. The Swiss Ski school, founded by Christian Rubi, Fritz Steuri and Rudolf Rominger, also remains one of the most solidly based techniques. The modern school of Norwegian skiing owes much of its free-style design to Eric Horn, Einer Bergsland and Jacob Rytter Kielland.

These schools. then, provided the basic systems. Other national skiing groups were free to adopt one or another. or to take certain parts of one system and combine it with another. Eventually. the streamlined Arlberg technique evolved in the United States and Canada: the Canadian Ski alliance developed its own technique, borrowing for the most part from several of the original systems. Similarly, in Italy. Sweden, Chile, Japan, Australia. New Zealand and in other countries are found an officially adopted technique or a choice of several.

In a broad sense. it should be recalled that the Scandinavian countries. particularly Norway and Sweden. contributed the concept of cross-country skiing and jumping, but in the Alpine countries of central Europe ski-mountaineering and downhill and slalom skiing were developed and refined. The credit for the concept of controlled downhill running goes to the Austrians. Swiss. Germans and French for the most part. Though the word "slalom" originated in Norway and the technique was developed there in simple form, the main credit for the concept of modern slalom racing belongs to an outstanding group of British ski pioneers, led by Sir Arnold Lunn, the inventor of the modern slalom.

Much of the growth and popularity of modern skiing may be attributed to ski clubs and associations. Though not the earliest, the Ski Club of Great Britain, founded in 1903, is typical of a number of clubs which played a vital role in bringing about unification and standardization and the acceptance of rules and procedures for racing events. Other important clubs include the Kandahar Ski club (Switz.), the Ski Club Munich, the Downhill-only club (Wengen, Switz.), the Norwegian Ski association. the Swiss Ski club (Glarus), the National Ski association (U.S.), the French Ski federation and the Canadian Amateur Ski association.

Pressures brought from certain of these great ski clubs in part resulted in the formation of the Federation Internationale de Ski (F.I.S.) in 1924. with a membership of 26 countries. This first world-wide governing body assumed responsibility for world championship competitions in downhill, slalom! jumping and cross-country.

The inclusion of several Scandinavian events at the first winter Olympic games at Chamonix, Fr., in 1924 was a milestone for skiing. It required the so-called Kandahar revolution, and the insistence of many prominent European sportsmen, to gain recognition of the Alpine events, downhill and slalom. by the International Olympic committee. finally accomplished at the 1936 Olympic games in Garmisch-Partenkirchen. Ger. Special mention should be made of the founding of the Kandahar Ski club in 1924 in Murren. Switz., for it presaged the advent of several "unofficial world championships" in downhill and slalom racing. such as the Arlberg-Kandahar which followed in 1928. Some observers felt that the Xlpine forms of competitive and pleasure skiing supplanted in popularity the classic Scandinavian events, cross-country and jumping. In Scandinavian countries. however, these time-honoured events continued. with undiminished popularity. to hold public interest and enthusiasm. (See SKIING.)

Ice Yachting. — Sometimes called iceboating, ice yachting is primarily a racing sport. It apparently originated in the Baltic countries and the Netherlands. The earliest designs, dating back to about 1768. show that a conventional sailboat, usually sloop-rigged, was converted into an ice yacht simply by fastening a strong cross plank. with runners on each end, to the hull near the bow. The same rudder with an iron shoe attached to the bottom became the steering mechanism. The speed of these boats over the ice was comparatively slow.

In 1928 a group of European ice yachtsmen met in Riga. Latvia, and organized the Europnischen Eissegel union for the purpose of promoting international competitions. By 1933 Sweden, Latvia, Lithuania, Estonia, Germany and Austria were represented in the union. Their annual competitions were confined to several classes, including a one-design class similar to the American Class C.

Typical European iceboats are steered by wheel from a partially enclosed cockpit fitted into a fuselage-type hull or "backbone." usually carry a "cat," or Marconi rigged single sail (with full-length battens). and have a streamlined pivoting mast. Some designs allow for one passenger in addition to the pilot.

Ice yachting in the United States and Canada was centred on the Great Lakes area. as well as in New York and New Jersey. The early history of racing competitions and speed demonstrations is colourful. X number of famous Hudson river families provided the classic "big yachts" characteristic of the late 1800s and the early years of the 20th century. Though the ice yachts were very fast, they gave way rapidly to the trend toward smaller. less expensive craft. Their design was superseded by Starke Meyer's invention of a bow-steered boat in Milwaukee, Wis., about 1931. Thereafter the size of the boats and the sail area continued to be reduced. By the 1950s the single-seater skeeter (75 sq.ft.) class and the Yankee two-seater were among the most popular craft. The fast, lighter, trimmer and more manoeuvrable iceboat promised to widen the appeal of this winter sport. Nearly four times the speed of the available wind could be reached (providing over-the-ice speeds oi as high as 140 m.p.h.). In the United States many active clubs were listed by the Eastern Ice Yachting association and the Northwestern Ice Yachting association. (See ICE YACHTING.)

Ice Hockey. — Ice hockey is a fast and rigorous game. Played by teams of men exclusively. the game has attracted an increasingly large and enthusiastic following, especially in Canada, where it became the national sport.

The development of the modern game of ice hockey is credited to that country. The Royal Canadian Rifles. of Kingston, Ont., claim the first recorded ice hockey activity as early as 18jj. At McGill university in Montreal. the first ice hockey match played under a formal set of rules was held about 187j. In early contests, as many as 1j players on a side were allowed. Shiny sticks, or crude bent branches. were used. The 1j-man sides soon proved unwieldy and the number of players on a team was reduced to 7 and eventually to 6. After 1926 six was the universally accepted number for teams.

By 1885 popular acclaim for the sport resulted in the organization of the first ice hockey league in Kingston, Ont. The sport soon spread throughout Canada. In the eariy 1890s a group of visiting U.S. college students witnessed, and played in, a few games in Canada. After their return to the U.S. the game was introduced at Yale and Johns Hopkins universities and a number of colleges. Amateur clubs were formed and soon stimulated enough interest in the sport to warrant the growth of professional play.

By 1891 international matches were taking place in Europe. In that year the Bandy association was formed in England and a contest was held with a team from Holland. At about the same time Norway, Sweden. Denmark and Switzerland were beginning to organize the sport. During these years, however, Canada, and the United States to a lesser extent. took the lead, and new amateur and professional teams continued to appear. The presentation of the Stanley cup to the team winning the championship of Canada in 1893 set a precedent for an award which still marks world supremacy among the professional ranks. The National Hockey league, comprised of U.S. and Canadian teams, was formed originally as a Canadian league in 1917.

Internationally. amateur teams are controlled by the Ligue Internationale de Hockey sur Glace. In modern Olympic games Canada proved the most consistent winner. (For rules of the game and technique of play, see ICE HOCKEY.)

Bobsledding.—After the introduction of the automobile, the old sport of coasting or sledding down hilly roads covered with snon· or ice declined in popularity. Although many still enjoy riding sleds or toboggans. the most organized form of coasting came to be knon·n as bobsledding.

The toboggan (forerunner of the bobsled) was originally a utility vehicle, used for the most part to carry supplies. In fact, the toboggan is still used in many parts of the world for practical purposes. But the toboggan, made of narrow strips of wood fitted together and curved in the front, has for many centuries lent itself to the sport of coasting. It can be pulled or allowed to run freely and guided down almost any snow- or ice-covered incline.

In 1884 a group of vacationers in Switzerland laid out a toboggan run near St. Moritz. The thrill of the new sport was immediately apparent, both for participants and spectators. The Toboggan club at St. Moritz was formed soon after. Some of the avid thrill-seekers devised a method of fastening sledlike runners on the toboggan frame to provide a much faster and more dangerous run. However, the addition of ballast on a heavier designed frame produced a more acceptable sled, called a bobsleigh, and a new club was organized, named the St. Moritz Bobsleigh club. It was the design, laid out by this club, that called for the building of the famous Cresta run.

Bobsledding continued to gain in popularity, and by the time of the first winter Olympics, in 1924, there were a number of well-designed runs in Europe. At these games a Swiss four-man team won the event, marking the first recognized international championship. Organized in 1923, the Fédération Internationale de Bobsleigh et Tobogganning (F.I.B.T.) became the official organization of the sport.

By the beginning of World War II there were about 60 recognized runs in Germany, France, Italy. Austria, Switzerland. Norway and Sweden. A U.S. run. the Mount Van Hoevenberg, was built near Lake Placid, N.Y. In Canada there are a number of well-maintained toboggan chutes or runs.

The bobsled went through many stages of design and improvement. When the U.S. team came to the 1936 winter Olympics with an extremely sharp V-type edge bobsled the F.I.B.T. disqualified it, for it mas discovered that, while increasing speed greatly, the sled also damaged the runs. Thereafter, a less sharp runner mas adopted, approved and standardized. The wooden plank forming the body between the front and rear runners gave way to a steel plank, affording more flexibility. Push-handles were introduced to give faster starts, closely followed by independent knee-action on each runner to allow more speed through reduction of friction. These innovations were ultimately followed by streamlining of the cowl which resulted in a functional design for high speed.

The recognized events call for the skeleton (one-man), t o-man and four-man teams. In competition, speeds reaching close to 90 m.p.h. are attained; thus the sport demands great skill. judgment, split-second precision of manoeuvring and co-ordination of effort. Especially is this true in the four-man event. where the driver, number 1 and number 2 man. and the brakeman must "bob" to gain speed, *i.e.,* thrust their combined weight forward with exact timing. (See also BOBSLEDDING.)

Curling. — Curling is a winter sport of great antiquity. A curling stone with the date "1551" etched'upon it was found in the bottom of a pond near Dunblane. Scot.. in the 1880s. Though its exact place of origin is disputed. curling, it is generally conceded, was developed primarily by the Scots.

Curling, often referred to as "the ageless game," seems to possess endless fascination. Although less spectacular than certain other winter sports. there is a spirited atmosphere attached to it and even the most hotly contested game is traditionally played with a feeling of warmth and friendliness.

The oldest curling club extant is the Dudingston Curling society, founded in Edinburgh in 179j. The Amateur Curling club of Scotland was formed in 1834 but did not survive. The Grand Caledonian Curling club. organized in 1838, upon receiving royal approval in 1842 officially changed its name to the Royal Caledonian Curling club. Much of the growth of the sport can be attributed to the more than 1.000 member-clubs who hold allegiance to their "mother club." the Royal Caledonian.

Switzerland. France, Germany. Belgium, the Netherlands. the Scandinavian countries. Canada and the United States adopted the sport. In Canada alone there were more than 1.500 clubs in the latter 1950s.

Since curling was first played outdoors, it was often necessary to clear snow off the ice and then clean it. From that came the idea of using a broom, which is still an important piece of equipment for the modern game. Brooms are not only used to clear frost in front of the moving stone but as a designator in the hands of the "skip," or captain, for directing the plays. (For equipment, rules of the game, technique of play, glossary, etc., see CURLING.)

Skating. — The first skating club was organized in Edinburgh in 1642. By that time the wooden-bladed skate had been superseded by the iron skate. Iron skates were used in Canada and the United States before the 19th century. It was not until 1850, however, that steel-bladed skates appeared. They were invented by E. W. Bushnell. of Philadelphia. Pa. With this radical improvement, skating began to make more progress toward becoming an accepted sport.

Modern figure skating was developed by a U.S. ballet master, Jackson Haines. While he was in Vienna in 1864, Haines discovered that the more-or-less aimless fashion of skating needed only to be put to waltz music to transform it into precise. rhythmic movements. The result was the first concept of figure skating, sometimes called fancy skating. His innovation soon spread throughout Europe, the United States and Canada.

Many skating clubs and organizations undertodk the responsibility of setting the standards and prescribing rules. Their recommendations and rulings transformed a somewhat haphazard recreation into a highly developed sport. The International Skating union of Europe, the National Skating association of Great Britain, the U.S. Figure Skating association, the Canadian and the U.S. Amateur Skating unions played an important role in its development.

The introduction of artificial skating rinks (indoor as well as outdoor) was important for figure skating. Built in heavily populated areas and at many of the famous resorts, and making precise control of ice conditions possible. such rinks encouraged the promotion of ice carnivals and public demonstrations. Outstanding individual performers, notably Sonja Henie, captured public attention, an outgrowth of which was numerous highly successful ice shows. As in the case of figure skating, speed skating also profited greatly from the building of artificial rinks.

From the first winter Olympics in 1924, skating races became an important part of the program. (See ICE SKATING; OLYMPIC GAMES.) (J. D. O'R.)

WINTERTHUR, a flourishing industrial town in the Toss valley, canton of Ziirich, Switz., and by rail 17 mi. N.E. of Zurich. It is 1,450 ft. above sea level and has a rapidly increasing population (in 1870, 19.496; in 1880, 25,924; in 1900, 40.961; in 1920, 49.969; in 1930, 53,925; in 1941, 59,192; and in 1950, 66,925), nearly all Gernian-speaking and two-thirds Protestants.

The Roman settlement of *Vitudurum* (Celtic *dur,* water) was a little northeast of the present town, at the place now known as Ober Winterthur. It was refounded in the valley in 1180 by the counts of Kyburg (their castle rises on a hill, 4 mi. to the south of the town). who granted it great liberties and privileges, making it the seat of their district court for the Thurgau. In 1264 the town passed with the rest of the Kyburg inheritance to the Habsburgs. who showed very great favour to it and thus secured its unswerving loyalty. It was a Habsburg stronghold for two centuries; but after the conquest of the Thurgau by the Swiss Confederates (1460–61) it was sold to the town of Zurich (1467), its rights and liberties being reserved, and its history after that was that of the other lands ruled by Ziirich.

Winterthur is the point of junction of several railway lines.

WINTHER, CHRISTIAN (1796–1876). Danish lyrical poet. was born on July 29, 1796, at Fensmark. Praesto. He went to the University of Copenhagen in 1815 and studied theology, taking his degree in 1824. He began to publish verses in 1819, but no collected volume appeared until 1828. In 1851 he received a pension from the state, and for the next quarter 'of a century he resided mainly in Paris. In addition to nine or ten volumes of lyrical verse, Winther published *The Stag's* Flight (185j), an epical romance in verse; In *the Year* of *Grace* (1874), a novel; and other works in prose. He died in Paris on Dec. 30, 1876, but was buried in Denmark in the heart of the woods.

WINTHROP, JOHN (1588–1649), Puritan leader and first governor of Massachusetts, was born in Edwardston, Suffolk, Eng., Jan. 12 (old style), 1588. In 1602 he matriculated at Trinity college, Cambridge, but he did not graduate. He next practised law and achieved considerable success, being appointed, about 1633, an attorney in the court of wards and liveries, and also being engaged in the drafting of parliamentary bills. His income rose to the sum of £700 a year, when, for reasons now unknown, he suddenly in 1629 lost his appointment. A Puritan, he had made wide acquaintance among the leaders of the Puritan party. On Aug. 26, 1629, he joined in the "Cambridge agreement." by which he and his associates pledged themselves to move to New England, provided the government and patent of the Massachusetts colony should be removed there. On Oct. 20, 1629, he was chosen governor of the "Governor and Company of the Blassachusetts Bay in New England," and sailed in the "Arbella" in March 1630, reaching Salem, Mass.; June 12 (old style). accompanied by a large party of Puritan immigrants. After a brief sojourn in Charlestown, Winthrop and many of his immediate associates settled in Boston in the autumn of 1630. There he lived until his death on March 26 (old style), 1649.

Winthrop's history in New England was largely that of the Massachusetts colony, of which he was 12 times chosen governor by annual election, serving in 1629–34, 1637–40, 1642–44 and 1646–49, and dying in office. He was usually deputy governor and always assistant when not actually governor. He gave all his strength, devotion and fortune to the colonies. He was conservative and somewhat aristocratic, but just and magnanimous in his political guidance even under circumstances of great difficulty. In 1634–35 he was a leader in putting the colony in a state of defense against possible coercion by the English government. We opposed the majority of his fellow-townsmen in the so-called "Antinomian Controversy" of 1636–37 (*see* HUTCHINSON, ANNE). He was the first president of the Commissioners of the Cnited Colonies of New England organized in 1643. He defended Massachusetts against threatened parliamentary interference once more in 1645–46. The colony's early success was due largely to his skill and wisdom.

Winthrop's *Journal*, an invaluable record of early Massachusetts history, was printed in part in Hartford in 1790; the whole in Boston, edited with valuable notes by James Savage, as *The History of New England from 1630–1649*, in 1825–26, and again in 1853; and in New York, edited by James K. Hosmer, in 1908. Many letters to him are iound in the *Winthrop Papers* published by the Massachusetts Historical Society (*Collections*, series 4, vol. vi and vii; series 5, vol. i, 1863–71). His biography was written by Robert C. Winthrop, *Life and Letters of John Winthrop* (1864, new ed. 1869); and by Joseph H. Twichell, *John Winthrop* (1892). *See* also Mrs. Alice M. Earle, *Margaret Winthrop* (1895).

WINTHROP, JOHN (1606–1676), known as John Winthrop the Younger, son of the preceding, born at Groton, formerly a small rural village lying about midway between Wadleigh and Sudbury in Suffolk. Eng., Feb. 12, 1606. He attended the Bury St. Edmunds grammar school and Trinity college, Dublin, studied law for a short time after 1624 at the Inner Temple, London, accompanied the expedition of the duke of Buckingham for the relief of the Protestants of La Rochelle. In 1631 he followed his father to Massachusetts and was an "assistant" in 1635, 1640, 1641 and from 1644 to 1649. He was the chief founder of Agawam (now Ipswich), Mass., in 1633; went to England in 1634 and returned the following year as governor (for one year) of Connecticut, under the Saye and Sele patent, sending out the party which built the fort at Saybrook. He was again in England in 1641–43, and on his return to Massachusetts established ironworks at Lynn and Braintree. He became magistrate of Connecticut in 1651; in 1657–58 was governor of the colony; and in 1659 again became governor, and was annually re-elected until his death in Boston on April 5, 1676. In 1662 he obtained in England the charter uniting the colonies of Connecticut and New Haven. In 1675 Winthrop was further honoured by being chosen a commissioner of the United Colonies of New England. In England he was elected to membership in the newly organized Royal Society.

His correspondence with the Royal Society was published in series 1 vol. xvi of the *Massachusetts Historical Society's Proceedings*. *See* T. F. Waters' *Sketch of the Life of John Winthrop the Younger* (Ipswich, Mass., 1899); *John Winthrop* by E. T. James (London, 1925); *John Winthrop, Jr.* by F. J. Kingsbury—Amer. Antiq. Soc. (Worcester, 1898).

WINTHROP, ROBERT CHARLES (1809–1894), U.S. orator and political leader, a descendant of Gov. John Winthrop (1588–1649), was born in Boston. Mass., on May 12, 1809. He graduated at Harvard in 1828, studied law with Daniel Webster and in 1831 was admitted to the bar. He was a member of the Massachusetts house of representatives in 1834–40—for the last three years as speaker.

From 1840 to 1850, except for a short intermission (April–Dec. 1842), he was a representative in the lower house in congress. He soon became prominent and was speaker of the 30th congress (1847–49), though his conservatism on slavery and kindred questions displeased extremists, north and south, who prevented his re-election as speaker of the 31st congress. In July 1850 he was appointed to the seat in the U.S. senate left vacant by Daniel Webster's resignation, but was defeated in the regular election held in the following year by a coalition of Democrats and Free Soilers.

In the same year (1851) he was defeated for governor of Massachusetts by the same coalition. Thereafter he was never a candidate for political office. With the breaking up of the Whig party he became an independent, and supported Millard Fillmore in 1856, John Bell in 1860 and Gen. George B. McClellan in 1864. He was president of the Massachusetts Historical society from 1855 to 1885.

He died in Boston, on Nov. 16, 1894.

Among his publications were *Addresses and Speeches* (1852–86); *Life and Letters of John Winthrop* (1864–67); and *Washington, Bowdoin and Franklin* (1876).

See Robert C. Winthrop, Jr., *Memoir of R. C. Winthrop* (1897); C. F. Adams, Jr., *Theodore Lyman and Robert Charles Winthrop, Jr.* (1906).

WINWOOD, SIR RALPH (c. 1563–1617), English politician, was notable for his hearty dislike of Spain. He was born at Aynhoe in Northamptonshire and educated at St. John's college, Oxford.

He was a fellow of Magdalen college, 1582–1601. In 1599 he became secretary to Sir Henry Neville (c. 1564–1615), the English ambassador in France, and he succeeded Neville in this position two years later, retaining it until 1603. In that year Winwood was sent to The Hague as agent to the states general of the United Provinces, and as the English member of the Dutch council of state according to the 1585 treaty.

He was anxious to see a continuance of the war between Spain and the United Netherlands, and he expressed both his own views and those of the English government at the time when he wrote, "how convenient this war would be for the good of His Majesty's realms, if it might be maintained without his charge." In June 1608 Winwood signed a new treaty between England and the United Provinces, and he was in Holland when the trouble over the succession to the duchies of Jiilich and Cleves threatened to cause a European war. In this matter he negotiated with the Protestant princes of Germany on behalf of James I.

Having returned to England, Sir Ralph became secretary of state in March 1614 and a member of parliament. In the house of commons he defended the king's right to levy impositions, and other events of his secretaryship were the inquiry into the murder of Sir Thomas Overbury (*q.v.*) and the release of Sir Walter Raleigh (*q.v.*) from the Tower in 1616. Raleigh was urged by Winwood to attack the Spanish Aeet and the Spanish settlements in South America, and the secretary's share in this undertaking was the subject of complaints on the part of the representatives of Spain. In the midst of these complex activities he died in London on Oct. 27, 1617.

Winwood's official correspondence and other papers were published by the Historical Manuscripts Commission, *Buccleugh MSS. at Montagu House*, i (1899).

See Edmund Sawyer (ed.), *Memvrials of Affairs of State*, 3 vol. (1725).

WINZET, NINIAN (1518–1592), Scottish Catholic controversialist and author of polemical tracts in the vernacular, was born in Renfrew in 1518 and was probably educated at the University of Glasgow. He taught in the grammar school at Linlithgow, but was "expellit and schott out" from this office in 1561 because of his opposition to the Reformation. He escaped to the continent, lectured at the University of Paris, studied at Douai, visited Rome and in 1577 was appointed abbot of the Benedictine monastery of St. James at Regensburg. where he remained until his death on Sept. 21, 1592.

Winzet's polemical tracts *(Certane Tractatis for Reformatioun of Doctryne and Maneris,* 1562; *The Last Blast of the Trompet of Godis Worde,* 1562; *The Buke of Fourscoir-thre Questzons,* 1563) are of some historical value, and his determined use of "auld plane Scottis" is interesting at a time when many prose writers in Scotland were turning to English.

His vernacular writings were edited by J. K. Hewison (2 vol., 1888–90) for the Scottish Text society.

See A. C. Southern, *Elizabethan Recusant Prose (1950).*

(E. G. M.)

WIRE. The first known writing relating to wire and its manufacture appears in the Bible (Ex. xxxix, 3): "And they did beat the gold into thin plates, and cut it into wires. . . ." When round wire was required, the plates probably were cut into narrow strips. which were then hammered and filed to form threads or wire. Since these wires were very short, it was necessary to braze or hammer several pieces together to make longer lengths. Later, instead of hammering and filing to shape. the narrow strips were pulled through shaped holes in dies made of a harder material, the strips taking the shape of the hole through which they were pulled. It is believed that the first such dies were made of stone. since no other explanation has been accepted for the perforated stones found in ancient sites. Eventually wire-drawing dies were made of metal, usually hard iron.

For several centuries wire was drawn through such dies by manual labour, and always in short lengths. The section to be drawn was first pointed; *i.e.*, the end of the section was hammered down to a diameter smaller than that of the hole through which it was to be drawn. This end was pushed through the hole in the die. The wiredrawer grasped it with his hands, or with tongs, and pulled it through the die, the amount of reduction being limited by the strength of the wiredrawer.

Various means were used to augment his strength, such as seating him in a hanging chair so that by bracing his legs against the die-holding structure he could pull with his arms and push with his legs, thus having more pulling power. Again, however, the amount of wire he could draw at each pull was limited by the length of his arms and legs. He pulled out as much as he could and then grasped the remaining wire close to the die and repeated the operation until the length was completed.

There were a number of modifications of this method in use, but all depended on the strength of the wiredrawer. Consequently, except for very soft metals, no large-diameter wire could be drawn. Larger wire had to be made by hammering or rolling or both.

Water power for wire-drawing machinery was used first in Germany about the middle of the 14th century. in England in 156j and in the United States about 16j0 and. together with the advent of the steam engine in 1769, eliminated the manual-drawing practice. Wire was produced thereafter in somewhat larger sections and longer lengths, but it was still relatively small in section and short in length.

It was not until the demand for wire rope about 1840 and the development of the telegraph beginning in 1844 that the requirements for larger tonnages and longer lengths of both steel and copper wire became acute. Thereafter the invention of the telephone. barbed wire and wire fencing and a greater use of wire nails and other wire products all added to the demand for enormous tonnages of wire.

The invention of the Bessemer steelmaking process in 1856 and the Siemens-Martin (open-hearth) process in 1867 and the invention of new machinery and methods of rolling rods about 1880, along with improvements in machinery and methods for the manufacture of wire, made it possible to produce wire in large tonnages and greater lengths.

WIRE MANUFACTURE

Wire is made from various metals and alloys, such as brass, bronze. copper. aluminum and zinc, as well as steel and the precious metals. gold, silver and platinum. The description of wire manufacture which follows. however, is limited to steel, since the process used for the other metals is fundamentally the same.

TABLE I.—*Comparison of Wire Gauge Systems*

Gauge number	Steel Wire dec. inch	American or B. & S. dec. inch	Birmingham or Stubbs dec. inch	British Imperial dec. inch	Music or Piano Wire Cec. inch

Gauges. — The wire gauge almost universally used is the steel wire gauge. The Birmingham gauge, the only gauge recognized in the United States by an act of congress. is used for gauging imported wire. It is practically obsolete for any other use in the United States or England.

The American or B. & S. (Brown & Sharpe) gauge is used for copper wire and other nonferrous wire. By the 1950s all wire gauges were gradually passing out of use, being replaced by decimal or circular mil designations.

Rods.—Wire is drawn from a hot-rolled section of steel, called a rod. (For some of the softer metals, rods may be formed by extrusion or casting instead of rolling.) The size of the rod to be drawn into wire varies from the smallest size, 5 gauge, $\frac{7}{32}$ in. (nominal 0.218 in. diameter), to the largest size, $\frac{47}{64}$ in. (0.734 in, diameter).

When the rods leave the last pass in the rod mill they are coiled into bundles weighing from 300 lb. in some mills to 450, 600 and 1,000 lb. in others. Since rods are rolled and finished at high temperatures. about 2,000° F.. a hard oxide of iron, called scale, forms on the rod surface. This scale is very abrasive and must be removed before the wire can be drann: if not removed. it will cut the wire-drawing die during the drawing operation and also cause the wire to break.

Cleaning. — The removal of scale is known as the cleaning process. There are several methods for doing this. The most widely used method is to immerse the rods in a 3% to 10% solution of sulfuric acid and water heated to about 150" F. The acid treatment is called pickling. The acid also contains an inhibitor, an organic compound used to prevent the acid from attacking the metal after the scale has been removed.

Other acids, such as hydrochloric, nitric and hydrofluoric, are also used, depending on the material being pickled. Scale may also be removed by subjecting the rods to the action of a molten salt bath, such as sodium hydride, or to the action of mechanical descalers which break the scale from the rod by means of a deforming action. Metallic grit blasting is sometimes used to clean spring wire.

After the rods have been cleaned in the sulfuric acid bath, they are washed with water to remove the acid and are immersed in a coating solution which may be a lime emulsion, a phosphate base solution or some other.

If lime is used, the coated rods are transferred to an oven, called a baker, and heated to from 250° to 450° F., the time of heating varying from about ten minutes to several hours, depending on the kind of steel and the purpose for which it is to be used. If borax or phosphate solutions are used, baking is not always necessary. These coatings, especially the lime coating, not only help neutralize any remaining traces of acid on the rods but also act as a lubricant carrier in the subsequent wire-drawing operations. After this last step, the rods are ready for the wire-drawing operation.

Wire *Drawing.*— Either before the rods are cleaned or after they are removed from the baker, several bundles of rods are placed on holders called pins or flippers. Electric resistance butt welders are used to weld the back end of the front bundle on the pin to the front end of the next bundle and so on for the entire pin. This permits the use of long lengths of rods for mire drawing.

The wire-drawing process consists of three steps: (1) pointing the rod; (2) threading the pointed end of the rod through the die; (3) attaching the end to the drawing block.

Wire Dies.— The wire die (see fig. 1) is made from a very hard material. usually tungsten carbide, although other materials such as tantalum carbide, hard chrome steels and chilled iron may be used. For very fine wire, e g., 0.010 in. in diameter and smaller, diamond dies may be used.

The hole in the tungsten carbide die, through which the wire is drawn, is actually a taper at the entrance end and a reverse taper at the exit end, with a small surface between having the exact shape and size of the wire being drawn. There are four zones in the carbide die, the first being the cone-shaped entrance end, designed so that the rod or wire entering the die will pull in with it some of the lubricant. The second zone, which is also tapered, is the working and shaping part of the die, and it is in this section that the actual reduction takes place. The angle of this taper is an important part of the reduction in size of the rod or wire. the degree of angularity depending on the kind of steel, the amount of reduction of area required and the kind of lubricant used. Then comes a very short cylindrical zone known as the bearing. There the actual roundness and size of the wire is formed. This is followed by the exit, or reverse taper, which strengthens the exit end of the die and prevents the end of the bearing from spalling.

Since tungsten carbide is very brittle and, used by itself. would not have enough strength to be used as a wire-drawing die. a steel case is shrunk around the carbide nib to act as a reinforcing member.

Because of the heat generated by the draning process, it is usually necessary to water-cool the dies, as shown in fig. 1.

Tungsten carbide dies are made in single units— only one hole in each die. The hole may be any shape desired, round, flat hexagonal, half-round, rectangular, etc. When the tungsten carbide dies used for round wire wear out on their original size, they may be opened up for a larger size until the ultimate strength of the carbide nib is reached.

Lubricants — Bare rods or wire cannot be drawn through dies, since heat generated by friction would cause the metals to seize, or the wire would be scratched and the die worn and the wire uould eventually be off-gauge or break, or both. Many lubricants are used for wire drawing, depending on whether dry drawing or wet drawing is used.

For dry drawing the lubricants used are soap powders, usually sodium soaps, metallic stearates, lime and greases, lime and tallow, or some combination of these. For wet drawing, soap solutions, soluble oils and the like are used. The wire may be coated with copper, brass or bronze by displacement from salt solutions of these metals prior to wet drawing.

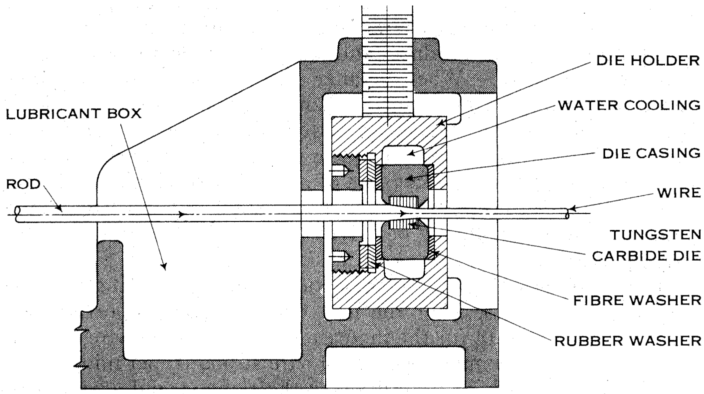

FIG. I.— CROSSSECTION OF A WIRE DIE

Wet drawing is usually associated with fine-wire drawing, but is used for coarser wire in some cases when special clean, smooth surfaces are required. The dry lubricant is carried in the lubricant box shown in fig. 1. For wet drawing the lubricant may flow on the wire in the lubricant box or it may be used inside a wire-drawing machine designed for that purpose.

Drawing Operation.—\$'ire drawing may be carried out on a single-block, single-draft unit, or on a multiple-block multiple-draft machine, depending upon the amount of reduction required.

A single-block unit is shown in fig. 2. The rod is first pointed by means of reciprocating rolls or a swager so that the pointed end of the rod can be threaded through the die and fastened to the cylindrical block.

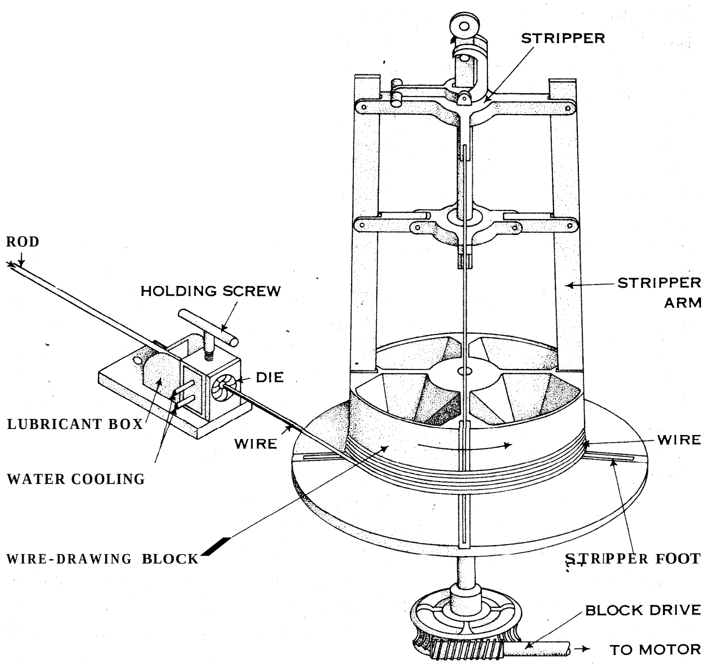

FIG. 2.— SINGLE-BLOCK WIRE-DRAWING UNIT AND STRIPPER

The block, driven by an electric motor, is revolved and pulls the rod through the die. thus reducing the rod in diameter and increasing its length in the form of wire.

The wire as it coils around the bottom of the block keeps pushing the strands up until the top of the stripper, shown in fig. 2. is reached. The block is then stopped, the wire cut, a crane lifts the stripper with the drawn wire from the block, the stripper is again collapsed and the wire deposited on a truck or other conveyance. The stripper is then replaced on the block, the wire fastened and the block again rotated.

The block, depending on the kind of wire being drawn, may be air- or water-cooled, this function taking place out of direct contact with the wire.

There is a limit to the amount of reduction the wire may be given at each draft, depending upon the tensile strength of the wire and other physical characteristics, because the drawing operation increases the hardness and stiffness and decreases the ductility of the wire. When smaller sizes of wire are required. therefore, and since the reduction cannot be performed in a single draft, a number of drafts are required. When several drafts are necessary a multiple-block machine is used. In substance. this type of wire-drawing machine consists of a number of single-block machines built together in one unit. Each block may be driven by a separate motor, or all may be driven by one motor having suitable driving gears for each block on a single shaft.

The wire. as it is reduced in section. increases in length. The speed of each block after the first one must he proportionately faster to compensate for the increase in length of the wire. so that while the first hlock may he drawing wire at 600 ft. per minute. the final finishing block may be drawing the same strand at 1,500 ft. per minute.

The first block in the multiple machine may be a double block! that is. one block superimposed on the other. In this case, the wire passes through the first die and around the top of the two blocks. the latter being. in effect. a short cylinder or spool. The wire is given a few wraps around this spool. then pointed. passed through the bottom die to the bottom hlock and then for each single block of the series to the stripper block.

As a rule. the wire-drawing luliricnnt is required only for the first draft. since enough will be carried over on the wire to finish the entire drawing. If. for some reason. more lubricant is required. it can be added at any of the subsequent drafts.

For wet drawing fine n-ire. the same principles are used, hut the wire-drawing machinery is different. The blocks, instead of being vertical. are usually horizontal and are revolved in the drawing solution. Or the blocks may consist of two step-down cones, parallel in position and opposite each other.

The wire passes from one cone to the other and back again alternately. and passes through a die between each reversal until the wire reaches the final hlock. which is usually vertical and on the outside of the machine. The cone blocks and the dies which are enclosed within the wire-drawing machine are kept constantly drenched with lubricant. Instead of coiling on the final hlock. the wire may he wound directly on a removable spool, or it may be given a few turns around the finishing hlock before passing to the spooler.

Annealing and Heaf *Treating.*—Wire cannot always be finished directly from the rod since the steel becomes so hard before the finished size is reached that unless softened it will break. Softening is accomplished by heating the wire to a point below the critical range for a period of time long enough to relieve the drawing strains. This operation, while not true annealing (softeningj, is suitable for the subsequent drawing operation. In some cases, especially for high-carbon or alloy-steel nire, several annealings may be necessary. each at a different step of the wire-drawing process. This is known as process annealing.

In some cases, such as for certain cold-heading stock, rope wire or spring wire, the rods are given a special heat treatment called patenting before the drawing operation. Or, for stock to be subjected to cold heading, or similar operations, the rods or wire may be spheroidized.

MANUFACTURERS' WIRE

This type of nire is used for the manufacture of wire products. such as merchant wire, which is used to make fence wire, barbed wire. bale ties, wire nails. wire for concrete reinforcing, stucco mesh. etc.

Manufacturers' wire is finished as bright wire, bright basic wire, annealed or othernise heat-treated wire, mire requiring highly finished surfaces, such as that used for electroplating; rope wire, spring wire, bolt and screw wire, telephone and telegraph wire, music wire. box nire, florists' wire, cotton-pin wire, welding wire and wire for many other purposes.

Wire can be made in almost any shape desired and to any analysis. and with specified physical characteristics, although it is not customary to specify both chemical and physical requirements for the same wire.

Some of the products made from this wire are not new. In England in 1565, for example. mire was used to make "knitting needles, nayles, pack-needles, chaynes, burde caiges, mouse trappes, buckles, iron rings, and like iron wyre wares."

The steel for manufacturers' mire may be made by the basic or acid open-hearth process, basic or acid electric-furnace process, the Bessemer process or a modified Bessemer process. It may be made from low-. medium- or high-carbon steel or one of the many alloy steels. It may be wet drawn, dry drawn or drawn and rolled, as is the case with some shaped nire.

It may be hard, soft, medium hard or tempered to suit specific requirements. The coils of wire may be pot annealed. strand annealed through molten lead or molten salt, sull finished, liquor finished (copper, brass or bronze-colour finish), galvanized (zinc coated), tin coated, lead coated or aluminum coated.

FENCING AND NETTING

Kinds of Fences.— Landed property formerly was marked out by stones or posts, set up so as to ascertain the division of family estates. Later, fences or enclosures were built either from stones, hedge, sod, turf, wood or other easily available materials. The building of fences from most of these materials involved the clearing of the land and other backbreaking labour.

What was true for the labour required for rail fences was also true for stone, turf, stump and other types of fences. Hedge fences, of course. were a product of the soil. being principally prickly pear or Osage orange. They required a long time to grow and it took a great deal of time and labour to maintain them. Furthermore. they would not afford adequate protection from animals. Many of these fences are still in use. however. though they occupy space which could be used for crop production.

Plain wire was used for fences in England as far back as 1840, and galvanized wire was used for the same purpose in 1851 (woven wire ience, except netting, n-as not manufactured at that time).

That n-as the situation until 1874, when barbed wire made its appearance. It was developed principally as a result of the invention of improved machincry for its manufacture. Barbed wire was thought to be the last word in fencing and. to a certain extent. that was true, since a practical loom for weaving woven wire fence had not yet been built. A number of styles of woven wire fencing were developed between 18;; and 1909, but it was not until the early 1890s that practical looms for weaving fence fabric were introduced.

Woven Wire Fencing and Netting.— There are several kinds of woven mire fence, each adapted more or less to a particular use.

Farm, Field and Poultry Fence.—This is made up of horizontal wires. called line wires. and vertical wires called stay wires. The vertical and horizontal wires are held together at their respective intersections by joint.; called ties or knots or by welds or twists.

There are three types: (1) the stiff-stay fence. which uses a staple-tie knot or welded joint. and whose stay wires are one piece froni top to bottom; (2) cut-stay fence, which uses a wrapped joint or knot. known as the hinge joint. which has a separate stay wire between each pair of line nires: (3) tn-ist-stay fence. which is also a cut-stay type. Wire for all of these fences is usually zinc coated (galvanized). although it may be coated with lead. aluminum. enamel or plastic.

These types of fence are made from various gauges of wire. 9 gauge being the heaviest used except for sonic railroad right-of-way fence. for which 7-gauge top and bottom wires are used The lightest gauge used is 20 gauge for some types of poultry fence and for netting.

Chain-link fence is essentially an industrial fence, although it is widely used for other purposes such as for enclosing large estates, playgrounds, athletic fields and cemeteries. This fence is made from wire pickets spirally wound and interwoven in the form of a continuous link fabric, without knots or ties except at the top and bottom of the fence where it is twisted (barbed) or folded over in a single interlock (knuckled). This fence is usually galvanized after it is woven: although a small amount is made from galvanized wire. It is made from 6-, 9- or 11-gauge wire, only one gauge to a fence, which is not always the case with woven wire fence.

Ornamental fence is sometimes called lawn fence. It gets its name from its appearance which is both ornamental and decorative. It did not come into widespread use until about 1920; prior to that time automatic looms for weaving this fence had not been invented.

It is made of crimped stay wires, called pickets, which have their tops formed into semicircles, with the short end of each picket tied into the top line wire (called cable, if the top wire is formed of two longitudinal wires twisted together). The line wires are locked in the crimp of each picket and the picket ends are locked into the cables by means of the cable twist. Sometimes the twist is not used and the wires are welded together at their respective intersections.

Variations of the structures described are principally in the number of wires used and the method of interlocking.

Wire netting is the oldest of woven wire fences and was first made in England in 1844 by Charles Barnard. The first netting was made by hand twisting on a wooden machine. In 1855 Barnard built a power-driven machine which made netting having meshes of $1\frac{5}{8}$ in. Most of the netting made at that time, either galvanized or varnished, was sold to Australian stockmen and farmers.

Woven wire netting is made in either diamond mesh or hexagonal mesh, with 1-, $1\frac{1}{2}$- or 2-in. mesh size. It is usually made from 17-, 18- or 19-gauge wire and from galvanized wire, or it may be galvanized after it is woven. This netting is also known as poultry netting or chicken wire.

Barbed Wire.—This wire is made up of two longitudinal wires twisted together to form a cable and having wire barbs wound around either one or both of the cable wires at regular spaced intervals. The barbs are made from round, half-round or flat wire, and are spaced four or five inches apart; for certain special barbed wire the barbs are spaced three or six inches apart. The cables are made from $12\frac{1}{2}$-, $13\frac{1}{2}$-, 14-, 15%-or 16-gauge wire, and the barbs from 12-, $12\frac{1}{2}$-, 14- or 163-gauge wire.

The gauge of the half-round or flat barbs is determined from the round wire from which the barbs are rolled. The barbs are diagonally cut in order to provide sharper points, and unless otherwise specified are one inch in length from tip to tip. The barbs have either two or four points, depending upon whether the barbs are formed from one wire or two mires.

Prior to the introduction of barbed wire it was customary to use 9-gauge round or oval wire or flat mire having serrated edges. However, this wire was easily broken since it would not stand the pressure of cattle running into or even leaning against it. Furthermore. expansion of the wire in hot weather and contraction in cold weather caused the wire to break. This mas the reason for the use of two wires twisted together in the later barbed wire, since it permitted contraction and expansion without breakage.

TABLE 11.— Standard Types of Barbed Wire

Number of points	Approximate spacing of barbs (in.)	Nominal Diameter		Shape of barbs
		Cable Wire gauge	Barbs gauge	
4	4	12	14	Round
2	4	12%	14	Round
2	4	14	16	Round
4	5	$12\frac{1}{2}$	14	Round
4	5	12%	14	Half-round
2	4	12%	$12\frac{1}{2}$	Flat

The first patents on barbed wire were taken out in 1867 in the United States, but it was not until 1874. when Joseph Glidden of De Kalb, Ill., invented a practical machine for the manufacture of barbed mire, that the industry began to be developed on a large scale.

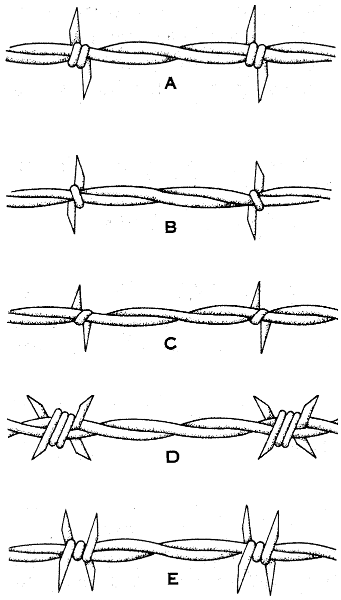

FIG. 3.—BARBED WIRE WINDINGS

(A) two-point round barbs wrapped around one cable wire; (B) two-point half-round barbs wrapped around both cable wires; (C) two-point flat-wire barbs wrapped around one cable wire; (D) four-point round barbs, one wire of each barb wrapped around one cable wire, second wire wrapped around both cable wires; (E) four-point half-round barbs wrapped around both cable wires

Barbed wire machines are fundamentally alike. The cable wires feed through the machine longitudinally and the wire for the two-point type of barb feeds into the machine at right angles to the cable wires, from one side of the machine; for four-point barbed wire, one wire from each side of the machine. The wire for the barbs feeds into a spinner head which revolves around one or both of the cable wires, depending upon the type of barbed wire being made. The spinner twists the barbs around one or both wires of the cable and cutoff knives cut the barbs to length and point.

The cables are then moved the proper distance from the barb spacing and the process is repeated, all of this being performed automatically.

In the meantime, the finished barbed wire is coiled on a reel, usually made of wire, into lengths of 80 rods or weights of 100 or 112 lb. The finished coil of barbed wire is removed from the machine manually, a new reel inserted and the operation repeated. Barbed wire is usually made of galvanized wire but, for use with galvanized-after-weaving chain-link fence, it is galvanized after fabrication.

WIRE ROPE

Uses.—This product requires wire made from steel, having a carbon content varying from 0.50% to 0.90%. although lower-carbon wire may be used for specific purposes. Wire rope is designated by the names cast steel, mild plow steel, plow steel and improved plow steel.

Wire rope is made in a wide variety of designs based on the purpose for which it is to be used. The wire may be plain or galvanized. this also being determined by the use. Wire rope is used for hoisting, elevators. hawsers, guys, oil-well drilling, power transmission, suspension bridges and many other purposes.

History.— The first wire rope was made by tying together single strands of straight wire and then grouping and tying several of these units together to form a rope of the diameter required. Such ropes were unsatisfactory; because the tie wires slipped and did not remain in position; there was too much variance in the physical characteristics of the individual wires; the straight wires were too stiff; and the rope lacked flexibility.

Furthermore, until about 1880 it was not possible to produce uniform grades of steel in suitable lengths to manufacture sound rope wire, although heat-treated steel (patented) wire had been produced since 1854.

The origin of the modern wire rope is highly controversial. An Englishman named Wilson claimed to have made wire rope in 1832, but a German, A. Albert: produced wire rope in 1834 which was used at a German mine, and some rope is still known as Albert lay.

Albert's rope was laid by hand. In 1840 a patent was issued in England to Robert Stirling Newall for the first wire-ropemaking machine. It is certain. however, that until the invention of the Bessemer and Siemens-Martin (open-hearth) processes for steelmaking and the development of the rod mill about 1580 it was not possible to make suitable steel and produce it in the long lengths and with the uniform chemical and physical properties required for rope wire.

Classes and Constructions.—?%'ire rope is made of a group of individual wires twisted together helically with a uniform twist (pitch) and direction around a hemp or mire core to form a strand. Several of these strands are then similarly grouped (laid) to form wire rope, although for rope to be used for guys or bracing only a single strand may be used.

As mentioned previously there are four classes of wire rope: cast steel, a low-carbon product; mild plow steel, with a carbon content ranging from 0.40% to 0.70%; plow steel, with a carbon content from 0.65% to 0.80%; and improved plow steel. with a carbon content from 0.70% to 0.90%. This range, of course, may vary somewhat between different manufacturers.

There are four standard constructions of wire rope: 6 x 7, 6 x 19. 6 x 37 and 8 X 19. This meansthat the rope is made up of 6 strands of 7 wires each. 6 strands of 19 wires each, etc. While these constructions are considered more or less standard, there are many other constructions used by the various wire rope manufacturers to meet specific requirements.

Ropemaking.—Rods to be used for rope wire are subjected to a heat treatment: called patenting, by which the rods are strand heated to a temperature above the critical range of the steel, and cooled through a selected range at a relatively rapid rate.

There are three methods for doing this. One is to heat the rods to the proper temperature in a furnace and cool them directly in air. By the second process, the rods are cooled in molten lead held at the proper temperature, depending upon the carbon content of the rods.

The third method involves heating in one bath of molten lead and cooling in another molten lead bath, the second bath carried at a much lower temperature than the Erst bath. Molten salt baths may be used instead of the molten lead.

The object of patenting is to produce a structure having a fine grain, with the iron carbide distributed through the ferrite in a finely divided form. This structure is metallurgically known as sorbite and makes a grain structure having good wire-drawing properties.

At different stages of the wire-drawing process, when necessary, the rope wire may be subjected to the patenting operation one or more times. and must be cleaned, coated and baked after each patenting operation.

The finished wire must be carefully tested, depending upon its ultimate use. Usually this requires gauge; tensile strength and torsion tests, but others may be required.

Fine wire for ropemaking is usually coiled on spools in the wire mill, or in coils for larger wire, and the coils later spooled on separate machines.

The spools are placed in the cradles of the stranding machine in such a manner as to prevent twisting of the wires. There the wires are led to the front of the machine where they are mechanically laid around a core wire at the point where the wires converge and the strand is then wound on drums. The drums are placed in another machine. called a closer, where they are subjected to the same process as in the strander, to form the finished rope. which is coiled on reels for shipment.

Rope is furnished in several types of lay. In the regular lay. the strands of the rope are laid in an opposite direction to that of the wires in the strands. The Lang (sometimes called Albert) lay has the wires in the strand, and the strands of the rope twisted in the same direction.

The preformed lay has the wires preformed before laying. The lay may be left lay or right lay.

In general, stiffness. tensile strength and surface wearing increase with the carbon content of the wire and the size of the individual wires. Flexibility is obtained by increasing the number of wires in the strand, the number of strands in the rope. or both.

Reverse bends are highly detrimental to the life of a rope, so the rope should travel and bend in the same direction in order to get the most effective life.

WIRE SPRINGS

There are countless uses for wire springs, varying from the fine spring for precision instruments to the large wire springs used for upholstery, mattresses. automobiles and heavy machinery.

Wire springs may be made of low-, medium- or high-carbon or alloy steels, as well as nonferrous alloys, and in many shapes, such as round. flat or rectangular. They may be used as drawn, or they may be heat treated. Wire springs may be classified as extension, compression and torsion and may be helical, spiral and some other shape.

Small coiled helical springs are made from hard-drawn steel wire having a carbon content from 0.45% to 0.75% and a manganese content ranging from 0.60% to 1.20%, or from music wire containing from 0.70% to 1.00%, and manganese from 0.20% to 0.60%. Some wire springs. such as valve springs, may be made from carbon steels or alloy steels.

The steels for valve springs will contain 0.60% to 0.70% carbon if straight carbon steel, or from 0.45% to 0.55% carbon with chromium content 0.80% to 1.10%, vanadium 0.15% minimum if chrome-vanadium steel. Another steel used is from 0.55% to 0.65% carbon with a silicon content of 1.80% to 2.20%.

The tensile strength of spring wire ranges from 150,000 lb. per square inch to 350.000 lb. per square inch.

Hard-drawn wire for spring steels is process annealed and not heat treated after drawing. This type of steel is used principally for springs not subjected to severe stress or duty.

Oil-tempered spring wire is tempered by a continuous process, first heating the wire to a temperature, depending upon the carbon content. but usually in the range 1,450" to 1,525" F.,then quenching in oil held at a temperature between 110° F. and 145° F. and coiling. It is more suitable for precision forming and coiling operations than hard-drawn wire.

Music wire used for springs is heat treated by patenting, in which the wire is heated above the critical range and tempered in molten lead. molten salt, or air cooled. Usually this wire is given no further heat treatment except to relieve coiling strains by heating the coiled springs to from 350° F. to 750° F. Annealed wire may be coiled into springs and then heat treated.

The wire used for high-grade springs must be exceptionally free of physical. surface or internal defects.

WIREWORM, a popular name for certain slender, hard-skinned grubs or larvae of the click beetles or Elateridae, a family of the Coleoptera. These larvae pass a long life (up to six years) in the soil, feeding on the roots of plants. and they often cause much damage to farm crops. A wireworm may be known by its broad, quadrate head and cylindrical or somewhat fattened body, with firm, sclerotized cuticle. The subterranean habits of wireworms make it hard to exterminate them when they have once begun to attack a crop. and the most hopeful practice is, by rotation and by proper treatment of the land, to clear it of the insects before seed is sown.

See Beetle; Entomology: *Principles of Insect Control.*

WIRT, WILLIAM (1772–1834), U.S. lawyer and author, was born at Bladensburg, Md., on Nov. 8, 1772, and began the study of law in 1790. After the death of his first wife, whom he had married in 1795, Wirt moved to Richmond. where he was elected clerk of the Virginia house of delegates and in 1802 was named a chancellor of the state. His literary career began in Aug. 1803 with the publication of the first of "The Letters of the British Spy" in the *Argus* of Richmond. These essays, containing the reactions of a hypothetical English visitor to southern life, were well received, and the following year he published a second series, *The Rainbow*. About this time, too, he began work on a biography of Patrick Henry, which was published in 1817 as *Sketches of the Life and Character of Patrick Henry*.

In 1807 Wirt had attracted considerable public attention with his eloquent prosecution of Aaron Burr at Richmond. The next year he was elected to the house of delegates, and in 1816 Pres. James Madison appointed him U.S. attorney for the district of Richmond. On Nov. 13, 1817, Pres. James Monroe appointed him attorney general of the United States. He administered this office with such efficiency that John Quincy Adams persuaded him to retain it for another term in 1825. Wirt retired in 1829 upon the election of Andrew Jackson to the presidency, except for a brief time in 1832 when he himself was nominated for the presidency by the Anti-Masonic party. He died Feb. 18, 1834.

WIRTH, KARL JOSEPH (1879–1956), German politician who supported Germany's collaboration with the U.S.S.R. after World Wars I and II, was born at Freiburg im Breisgau, Baden, on Sept. 6, 1879, the son of a foreman mechanic. Educated at Freiburg university, he became in 1908 a master of science at a boys' high school in Freiburg. In 1914, as a member of the Centre (Roman Catholic) party, he was elected to the *Reichstag* and in 1919 to the Weimar national assembly. In March 1920 he succeeded Matthias Erzberger as minister of finance. In May 1921 he became chancellor, with an avowed policy of the fulfillment of treaty obligations. In Aug. and Sept. 1921 he came into conflict with A. R. von Kahr, the Bavarian premier, who refused to apply to Bavaria the state of national emergency which Wirth had proclaimed consequent on the murder of Erzberger. Wirth stood his ground, and Kahr was compelled to resign. The decision on the partition of Upper Silesia between Germany and Poland (Oct. 20, 1921) increased the opposition to the policy of fulfillment. Wirth resigned on Oct. 22, 1921, but resumed office four days later. He then sought to establish a "great coalition" which should include all but the Nationalists and the Communists, but failed to secure the support of both the Socialists and the Conservatives (Volkspartei), the latter objecting to the appointment of Walther Rathenau as foreign minister. Wirth and Rathenau represented Germany at the Genoa Economic conference, and on that occasion they concluded the German-Soviet treaty of friendship at Rapallo (April 16, 1922). Unable to carry out the necessary financial measures to stop the depreciation of the mark, Wirth resigned in Nov. 1922. He remained several years in the background. In 1929–30 he served as minister for the provinces occupied by the Allies. In 1930 he became minister of the interior. Wirth retired in Oct. 1931, returning to Freiburg. After Hitler came to power he went to Paris and afterward to Switzerland.

Returning to Germany in 1948, he opposed the policy of rearming the German Federal Republic and its joining NATO. supporting instead the policy of a reunited but neutral Germany. He visited Moscow, Dec. 1953 and Feb. 1954. In Dec. 1955 he was awarded the Stalin Peace prize. He died at Freiburg on Jan. 3, 1956.

WIRTH, LOUIS (1897–1952), U.S. sociologist well known for his studies of urban problems, was born in Gemiinden, Ger., on Aug. 28, 1897. Brought to the United States in 1911, he was naturalized in 1924 and earned his Ph.D. in sociology at The University of Chicago in 1926. In the same year he joined its sociology faculty on which, except for brief periods, he remained throughout his career.

As a theorist, critic and empirical investigator, and as an inspiring teacher and academic statesman, Wirth greatly influenced the development of sociology. In his main areas of activity—sociological theory, studies of the city, "urbanism as a way of life" and the minority group—he provided a good demonstration of the interplay between theory and empirical study. As president of the American Sociological society (1947) and as the first president of the International Sociological association (1949–52) he contributed materially to the emergence of sociology as a profession. Through numerous radio and platform appearances he was widely known to national audiences as an influential participant in public affairs. He died at Buffalo, N.Y., on May 3, 1952.

Wirth left a long list of distinguished writings. These include *The Ghetto* (1928) and *Community Life and Social Policy* (1956). The latter, a posthumous collection of his more important papers, contains his full bibliography. (P. M. HA.)

WISBECH, a market town, port and municipal borough in the Isle of Ely parliamentary division of Cambridgeshire, Eng., 43 mi. N. of Cambridge by road and on the river Nene 11 mi. from its outlet on the Wash. Pop. (1951) 17,432. Area 7.2 sq.mi. Georgian houses line the "Brinks" along the Nene, one of which is Peckover house (National Trust) with its rococo interior. The church of SS. Peter and Paul has a double nave and dates from Norman times. In the museum are manuscripts, including that of Charles Dickens' *Great Expectations,* and an archaeological collection. The town is predominantly agricultural with a cattle market, canning works for the locally grown fruit and vegetables, and engineering, brewing, printing and metal-box and basketmaking. Bulbs and other flowers are extensively grown, and timber, potatoes and fertilizers are exported. There is a technical college and school of horticulture—the first of its kind in England.

WISCONSIN, popularly called the "Badger state," is one of the north-central states of the United States. It is bounded north by Lake Superior and the upper peninsula of Michigan, east by Lake Michigan, south by Illinois and west by Iowa and Minnesota. The greater part of the western boundary is formed by the St. Croix and Mississippi rivers flowing southward. From south to north (approximately 42° 30' to 47° 3' N.) the greatest length of the state is 305 mi., and from east to west (approximately 86° 49' to 92° 54' W.) its extreme breadth is 253 mi. The lake shore boundaries on the north and east are more than 500 mi. in length. In area the state totals 56,154 sq.mi., of which 1,449 are water surface. In addition, the state includes 10,062 sq.mi. of boundary water in Lakes Superior and Michigan. It ranks 26th in size among the states (21st when the boundary waters are included). It ranks 15th among the states in population. Wisconsin was admitted to the union May 29, 1848, the 30th state. The capital is at Madison. The state flower is the wood violet, the state bird is the robin and the state tree is the sugar maple. Its slogan is "America's dairyland."

PHYSICAL GEOGRAPHY

Physical Features and Soil.—The surface of Wisconsin is generally of a rolling or undulating character, interrupted only by the sharper ridges of changing geological strata, the bluff lands along the Wisconsin and Mississippi rivers, and isolated hills and ridges of older rocks, which, especially in the north-central part of the state, have thrust themselves up through the younger sedimentary rocks. The Baraboo hills, a range in the south-central part of the state, are of the latter character. Sugar Bush hill (1,939.30 ft.), near Laona in the northeast, is the highest ground elevation; Rib mountain (1,940.76 ft.), near Wausau, has the highest point on the highest rock. The lowest part of the state is along the shore of Lake Michigan (579.76 ft. above sea level). The mean elevation is 1,050 ft. The divides which form the watersheds between Lake Superior, Lake Michigan and the valley of the Mississippi river and its tributaries—the three main drainage areas—are very slight. Of these areas, that of Lake Superior is much the smallest. Its short, rapid streams seldom rise more than 30 mi. S. of the lake shore.

Of the streams flowing into Lake Michigan the Fox river (175 mi.) is the most important. Rising in the south-central part of the state it flows north and east by a circuitous route through Lake Winnebago, and thence into Green bay. In its upper course it is joined from the north by Wolf river, an important tributary. The Menominee and Oconto are smaller rivers also flowing into

Green bay, while farther south the Sheboygan and Milwaukee rivers empty directly into the lake. The harbours along Lake Michigan are mainly enlarged mouths of rivers.

The largest by far of the drainage areas is that whose waters flow into the Mississippi river. The Wisconsin river, the principal tributary, rises on the upper Michigan border and flows south and west for 430 mi. through the heart of the state to join the Mississippi near Prairie du Chien. It is navigable for light craft as far as Portage, 200 mi. from its mouth. At this point the Fox river, flowing into Lake Michigan, is only one mile to the east across low, marshy ground. The proximity of the two rivers made this a frequent route for early explorers and fur traders traveling by canoe from the lake to the Mississippi; a canal later connected them. North of the mouth of the Wisconsin the Mississippi receives several rivers of considerable length, the most important of which are the Black, Chippewa and St. Croix, the latter forming the Wisconsin–Minnesota boundary line for 135 mi. The southern part of the state is drained by a number of streams, which find their way to the Mississippi after passing into Illinois. The largest of these are the Rock and Fox (of the Illinois) rivers.

The bedrock in the northern highland consists of crystalline rocks; in the central plain the bedrock is sandstone, underlain by granite and other crystalline rocks. A soft sandstone in the western upland is capped with limestone; in the east is limestone, of which a very striking feature is the Niagara escarpment bordering the eastern shore of Lake Winnebago and extending to the tip of Door county. Glacial ice sheets covered all but the southwestern quarter of Wisconsin and greatly influenced the topography and soils. They leveled the hills, filled in the valleys and ground and mixed the soils. In the terminal moraines invaluable sand and gravel deposits were left.

The glacial ice was further responsible for nearly 9,000 lakes, which help control the water flow of the rivers and prevent floods, and are sought increasingly as summer resorts. The largest is Lake Winnebago with an extreme length of 30 mi. and breadth of 10 mi. On its banks are several important manufacturing cities. In the southern and eastern parts of the state the lakes are beautiful, clear bodies of water with sandy or gravelly shores and frequently high, heavily wooded banks. Among them are Green lake, the "four lakes" near Madison and chains of lakes in Walworth, Waukesha and Waupaca counties. A second group of hundreds of lakes is found in the highland district of northern Wisconsin, chiefly in Vilas, Oneida and Iron counties. Many of these are small, but there are few parts of the world where so large a proportion (39%) of the total area is occupied by lakes. A third group, also consisting of hundreds of small lakes, is in northwestern Wisconsin, especially in Washburn, Burnett, Polk, Barron and Sawyer counties. In all parts of the state, except the driftless area of the southwest, numerous large and small marshes are to be found, many of them representing filled in or drained lake beds. The driftless area is rugged and without natural lakes. Within its limits much of the most attractive scenery of the state is to be found. Between the Wisconsin and Mississippi valleys is the western upland, a plateau about 1,200 ft. in elevation but dissected in every direction by tributaries of the two rivers into a succession of ridges and coulees. The bluffs are wooded and often capped by picturesque limestone cliffs.

Climate. — The climate of Wisconsin is influenced by storms which move eastward along the Canadian border and by those which move northmard up the Mississippi valley; that of the eastern and northern sections is moderated by the Great Lakes. The mean annual temperature varies from 48° F. in the extreme southern part to 39° in the north. Most of the north averages from 110 to 135 frost-free days, while in the south the growing season ranges from 135 to about 160 days, and along the southern border of Lake Michigan to about 175 days. The mean precipitation is about 31 in., most of the rainfall coming during the growing season from May through August. In the far north some sections average 55 to 60 in. of snowfall; the extreme south averages about 30 in.

Plant and Animal Life. — Originally about 85% of Wisconsin was covered with forests, with natural prairies occurring chiefly in the south and west. Across the north stretched a heavy growth of white and red (Norway) pine, interspersed with jack pine, spruce, balsam fir and hardwood. In the south and extending inland from Lake Michigan hardwood trees predominated, mainly oak, elm, hickory, maple, basswood, poplar and birch. Ruthless cutting of timber and forest fires rapidly depleted this immense natural resource. The 20th century has seen great strides in reforestation of the cutover area. Forest crop laws of 1927–29 have encouraged private owners and counties to put well over 2,000,000 ac. back into forests. Industry has added almost another 1,000,000 ac. as industrial forests.

There are about 1,500,000 ac. of federal forests in Wisconsin and about 374,000 ac. of state forests. Such measures as rural zoning laws, a forest fire control service and a program of education and information are designed to forestall further depletion of the timber supply. In addition to producing recurring forest crops for commercial use and stabilizing watersheds and stream flow, Wisconsin's state forests provide scenic attractions, outdoor recreation and facilities for hunting and fishing.

Wildlife has aluays been abundant in Wisconsin. The heavy forest cover, the alternation of open space and uplands, the numerous lakes and streams provided an ideal habitat for a variety of species of mammals, birds and fish. However, the white man with his rifle and trap, his ax, his plow and his cow changed the landscape and the wildlife community. Species continue to fluctuate in number and habitat with droughts, drainage, timber cutting, reforestation and hunting regulations. Pheasants, prairie chickens, quails, woodcocks, bears and otters are still found; ducks, geese. grouse, rabbits, squirrels, woodchucks, skunks, raccoons, muskrats, beavers, minks, foxes. coyotes and deer are still numerous. The impact of man on his environment has produced changes in the fish population but the quantity is believed to remain fairly constant. Of the approximately 150 species there, the muskellunge is regarded as the prize game fish

Parks and Historic Sites. — State parks encompass more than 19,000 ac. and, together nith the state forests, offer almost 393,000 ac. devoted to conservation and to the preservation of outstanding unique. scenic or historic places, and the provision of arras for public recreation. Chequamegon National forest and Nicolet National forest provide numerous additional recreational facilities, including several winter sports areas The larger state scenic parks include Copper Falls (1,400 ac.), Devil's Lake (2.500 ac), Peninsula (3,600 ac.) and Wyalusing (1,600 ac.). State historical-memorial parks include Aztalan, site of an ancient Indian village; Copper Culture mounds, preserving the remains of a prehistoric village; Cushing Memorial, a monument to William Barker Cushing (q v.) and his two brothers, American Civil War heroes; First Capitol, site of the territorial capital (1836), restored; Lizard mound, restorations of a number of Indian mounds; Lost Dauphin, home of Eleazer Williams, reputed Lost Dauphin of France; Nelson Deaey, home of Wisconsin's first governor; Old Wade house, restoration of an early stagecoach inn; and Tower Hill, site of historic shot toner. In addition there are a number of roadside parks with camping facilities, ranging in size from about 50 to more than 350 ac.

HISTORY

Exploration and Settlement. — The French from Canada were the first white men to reach the Wisconsin area. Impelled by such motives as the search for a "northwest passage," the lure of the fur trade, rumours of copper deposits or missionary zeal, they followed the Ottawa river and Lake Nipissing route from Montreal or ascended the St. Lawrence river and the Great Lakes to the unexplored west. 'They found a region inhabited by numerous Indian tribes, who frequently made war with one another and with the incoming whites and thwarted France's ambitions of strengthening its dominion in North America through a chain of posts betneen Canada and Louisiana.

Jean Nicolet is believed to be the first Frenchman to reach the Wisconsin region; he landed on Green bay in 1634. In 1654–56 Médard Chouart, sieur des Groseilliers, and an unidentified French companion explored Green bay and the region south and west. Des Groseilliers and Pierre Esprit Radisson spent the winter of

1659–60 on the south side of Lake Superior, making expeditions southward to Ottawa Indian villages and westward to the Sioux and Cree. Seven traders went to Chequamegon bay on Lake Superior in 1660, accompanied by the Jesuit Father René Ménard, the first missionary in Wisconsin. In 1665 other traders went to Chequamegon bay, taking Father Claude Allouez, who established a mission there and remained until 1669. In succeeding years Jesuit priests opened several missions around Green bay, including St. François Xavier at the present De Pere, which became one of their most successful western missions. Father Jacques Marquette, who succeeded Allouez at Chequamegon bay, was forced to abandon the mission in 1671, and in 1673 he accompanied Louis Jolliet on an exploratory trip across the Fox-Wisconsin waterway. On June 17 they "discovered" the upper Mississippi. Between 1679 and 1689 Daniel Greysolon, sieur Dulhut (Duluth), explored the western Lake Superior area and some tributaries of the Mississippi. Nicolas Perrot, too, explored in that area, extended French influence over the Indians, built posts, and in 1689 took formal possession of the upper Mississippi territory in the name of the king of France. By that date the Wisconsin region was occupied with strategically placed posts and missions and was regarded as an integral part of the French empire in North America.

The outbreak of wars between France and Great Britain and among Indian tribes foreshadowed the end of French supremacy. In 1712 the slaughter of a band of Foxes by Indian allies of the French near Detroit was the signal for hostilities which lasted almost continuously until 1740 and at one time or another involved every tribe in the Wisconsin country. The French and Indian War (1754–63) soon followed, bringing the overthrow of French dominion in continental North America. Britain's occupation of its newly won territory was briefly threatened by an Indian conspiracy led by Chief Pontiac, but the outbreak was crushed in 1765, and British traders, appropriating French posts, methods and personnel, took over the fur trade. In the American Revolution that broke out in 1776 most of the traders remained loyal to the British. The mixed-blood Charles Michel de Langlade, who had led a force of Wisconsin Frenchmen and Indians against the British in the earlier war, led his men against American frontier communities west of the Alleghenies. The treaty of 1783 made the Wisconsin region a part of the new United States, but British traders from Montreal continued to exploit the rich fur trade on both sides of the international boundary. Although Britain evacuated American military posts in 1796, its traders monopolized the western trade until the close of the War of 1812.

After the war a new era began for the region between Lake Michigan and the Mississippi. In 1816 military garrisons were established at Ft. Howard (Green Bay) and Ft. Crawford (Prairie du Chien) and, in 1828, after a brief Winnebago Indian uprising, at Ft. Winnebago near Portage. Beginning in 1818 civil government was administered from the Michigan territorial capital at Detroit. A part of the old Northwest territory, the Wisconsin region had been nominally attached to Indiana from 1800 to 1809, to Illinois from 1809 to 1818, and thereafter to Michigan until 1836. Gov. Lewis Cass of Michigan promptly established counties west of Lake Michigan, appointed local officials and, in 1820, made a long canoe voyage of inspection. In 1823 James D. Doty took office as federal judge over western Michigan and after 1824 Wisconsin representatives attended legislative sessions at Detroit. Conflicting Indian claims to the area were defined in three treaties in 1825, 1826 and 1827, and between 1829 and 1848 eleven treaties of cession extinguished Indian title to Wisconsin.

A law in 1816 excluded foreigners from the fur trade and enabled the American Fur company to rise to wealth and power. Exploitation of another of Wisconsin's natural resources, the lead deposits, brought a flood of miners into the southwestern area, reaching an estimated 2,500 by 1830. The influx was briefly halted by the Black Hawk War in 1832, but the war broke the Indian power in Wisconsin. It also widely advertised the attractions of the new country. Except for small private land grants to retired traders around the posts, no land could be legally owned until the public land offices opened, in Mineral Point in 1834 and Green Bay in 1835. Sales were large at first, totaling 878,014 ac. by the end of 1836. Most of the purchasers came from eastern states, occupying lands in the southeast and founding Milwaukee and other cities along the Lake Michigan shore.

Wisconsin Territory and Statehood.— In 1836 Wisconsin became a separate territory, with its western boundary at the Missouri river until 1838. The vigorous and populous mining area assumed control in organizing the territory. Henry Dodge, hero of the Black Hawk War, received the appointment as governor. The first legislature met in Old Belmont, now Leslie, in Lafayette county, but after a spirited contest selected Madison as the permanent capital. For a time such matters as banks, canals, roads and river and harbour improvements occupied the attention of the settlers. They also started newspapers, built churches, schools and colleges and laid the foundation for free public education. A great stream of immigration set in and as the population grew, agitation for statehood developed and on Aug. 10, 1846, a congressional enabling act permitted a call for a constitutional convention. The first constitution drafted by the convention was rejected because of liberal provisions relating to the rights of married women, prohibition of banks, an elective judiciary, etc. A second constitution which eliminated the objectionable features was approved by the electorate and on May 29, 1848, Wisconsin was admitted to the union with its present boundaries. Nelson Dewey of Cassville was elected the first governor.

The first years of statehood were a time of great social, economic and political activity. The population reached 305,000 by 1850; of these, over 36% were foreign-born, with Germans predominating. The temperance crusade, the nativist, or Know-Nothing, movement, and antislavery agitation sweeping the north found strong support in Wisconsin. Wheat became the first commercial crop and in 1860 Wisconsin produced the greatest wheat crop in its history. Lumbering ranked next to agriculture in importance, the industry spreading rapidly up the river valleys and along the eastern lake shore. Water power sites became flour mill and sawmill cities; Mississippi river and Lake Michigan harbours became flourishing commercial ports. A referendum in 1852 ended the ban on banks. Although want of capital delayed progress in railroad building, a short line began operation in 1851 and by 1858 two roads crossed the state from Milwaukee to the Mississippi. Strongly Democratic at the time of admission, Wisconsin gradually shifted its political faith. In passing on the case of an escaped Negro slave the state supreme court declared the Fugitive Slave law unconstitutional and void in Wisconsin. A protest meeting at Ripon in March 1854 proposed that a new party be formed, to be called the Republican party. A state organization was effected that July and in 1856 a Republican governor took office. Wisconsin helped elect Lincoln in 1860 and supported his administration during the Civil War. Out of a population of 775,881 in 1860, the state furnished over 91,000 men to the northern armies and suffered over 12,000 war casualties.

In the business boom that followed the war railroads expanded rapidly and small lines were consolidated into a few powerful companies. The postwar years saw the enormous expansion of the lumber business, which reached a peak in the decade 1890–1900. The uncontrolled power of the railroads and the fall of farm prices in the panic of 1873 turned numbers of voters to a political coalition which elected a Democratic governor in 1873 and enacted the Potter law, pioneer legislation to regulate railway rates, which was soon repealed. Noting diminishing returns from wheat crops, farmers began to turn to diversified farming and dairying.

The Wisconsin Idea — The decade of the 1890s saw a four-year reversal of the long Republican rule. The Democratic vote was largely a protest against national measures, accentuated in Wisconsin by the Bennett law, providing for the enforcement of the teaching of English in all public and parochial schools, which many foreign-born citizens regarded as a move to outlaw parochial schools. Dissension was brewing within the Republican party, dominated by lumber barons and railroad magnates. Against their rule Robert M. La Follette led a reformist revolt and won the governorship in 1900. Through a close working relationship with social scientists at the University of Wisconsin known as the "Wisconsin idea," the progressive faction instituted a number of reforms: equitable taxation of railroads, the direct primary and civil service, and in later years a stringent corrupt practices act, workmen's compensation, state income tax and industrial commission, and other pioneer social and economic measures. After 1905 La Follette continued his reform crusade in the U.S. senate, where he served as a leader of the progressive wing of the Republican party until his death in 1925. His long continuance in office mas remarkable in view of his open opposition to the declaration of war against Germany in 1916 and to the League of Nations. Although Wisconsin citizens, too, mere divided regarding war aims. they united in prosecution of the mar, sending nearly 125,000 men into service. The 32nd, or Red Arrow, division won glory in France. Later, in World War II, the division reinforced its gallant reputation in the Pacific. In the second war over 352,000 Wisconsin citizens served in the armed forces; the reported dead and missing totaled 7,083, three times the casualties in the earlier conflict.

Pattern of Modern Development. — The census of 1930 revealed that Wisconsin had become predominantly urban. By this time the pattern of modern development had been set. Wisconsin was an industrial state, with manufacturing concentrated on the Lake Michigan shore and in river basin areas. Industrialization brought problems connected with metropolitan life and demands of a labour population for recognition. Farms and farmers decreased in number, but farm production rose with the advance of scientific agriculture. The dairy cow still symbolized Wisconsin's pride. In politics the state maintained its liberal traditions but spread its party votes. A Republican, Alexander Wiley, mas elected to the U.S. senate in 1938 and re-elected in 1944. 1950 and 1956. Two La Follette sons held the offices of governor and U.S. senator for 6 years and 21 years respectively; each was succeeded by a conservative Republican. In 1934 the progressive wing formally set up a separate party but united with the Republicans in 1946. In national politics Wisconsin gave its electoral vote to the Democrats in 1932, 1936. 1940 and 1948. Joseph McCarthy, a conservative Republican, served in the U.S. senate from 1947 until his death in 1957. A Democrat, E. William Proxinire, followed him in office and was re-elected in 1958 when the Democrats won control of the lower house of the legislature and all but one state office.

GOVERNMENT

The original constitution of the state, adopted in 1848, is still in force, though a number of amendments have been made. An amendment may be proposed by either house of the legislature, and if passed by a majority of the members of each house in two successive legislatures, it must be submitted for ratification by a majority vote of the people.

A constitutional convention may be called if the proposal is adopted by a majority of the senate and assembly and voted upon favourably by the people at the following election. The legislature, composed of the senate and assembly, meets biennially in January of odd-numbered years. It may also be called into special session by the governor, but only to transact the specific business named in the governor's call. There are 100 assemblymen and 33 senators, the former chosen for two-year terms, the latter for four years. A joint legislative council of 15 members studies problems of government, prepares bills and introduces them in the legislature.

Executive power is vested in a governor and a lieutenant governor, both elected for two years. The governor has a veto on legislation ahich may be overridden by a two-thirds vote of the members present in each house. The lieutenant governor is president of the senate and is entitled to cast a vote only in the case of a tie. The administrative officers, a secretary of state, treasurer and attorney general, are elected for two years and in ex officio capacity act also as commissioners of public lands. A state superintendent of public instruction is elected for a four-year term. Some important governing commissions have been established, the chief ones being the industrial commission, with authority in matters involving relations between management and labour, and the public service commission, which has jurisdiction over the rates and service of railways and other public utilities. Other important commissions and departments are: the state highway, conservation and building commissions; the departments of agriculture, audit, banking, budget and accounts, motor vehicle, public welfare and taxation; the bureaus of engineering and of personnel; and the boards of health and of vocational and adult education.

The judicial power of the state is vested in a supreme and circuit courts. The supreme court has seven members, each elected for a term of ten years. The court has original jurisdiction in a limited number of cases of state-wide concern and appellate jurisdiction in all other cases. It holds one term, beginning in August, and is in session virtually continuously until July. Circuit courts have original jurisdiction in all other matters and appellate jurisdiction from justices of the peace and from some municipal courts. Wisconsin has 25 judicial circuits, some of which have more than one judge. Circuit judges are elected for six-year terms. Terms of circuit court are held at least once each year in every county of the circuit.

The New Englanders and New Yorkers who settled in eastern Wisconsin set up the town government system there, whereas the lead miners from the lower Mississippi areas who settled in the southwestern part of the state established the county form familiar to them. Eventually the New England town system prevailed and is now universal throughout the state.

Finance. — The assessed valuation of all tangible property for state tax purposes in 1929 was almost $6,000,000,000. It declined during the depression until in 1934 it stood at about $4,000,000,000, but by 1960 had risen to more than $9,000,000,000.

Tax receipts account for more than one-half the state's revenue; other income comes from federal aids, licenses and various lesser sources. The general property tax is the main reliance of local governments and school districts, while the state government depends primarily on income tax (of which it retains 40%, distributing the remainder to local governments), an ad valorem tax on certain public utilities and railroads, and certain gross receipts taxes and selective sales taxes on special commodities such as cigarettes, liquor, gasoline, and others. The various taxes produce income in the following order: income tax, taxes on public utilities and transportation companies, tax on insurance premiums, liquor taxes, cigarette tax and inheritance and estate taxes.

There are about 550 banks in Wisconsin, of nhich approximately 100 are national banks. In the 1950s the number of credit unions increased from fewer than 600 to more than 700, while membership grew from under 200,000 to more than 300,000 and assets rose from about $35,000,000 to almost $54,000,000.

POPULATION

The population of Wisconsin in 1840 was 30.945; in 1870 it was 1,054,670; in 1910, 2,333,860; in 1950, 3,434,575; and in 1960. 3,951,771. This last figure represented an increase of 15.1% over the population in 1950. The population per square mile in 1960 was 70.4, as compared with 61.2 in 1950. and with 49.9 for the U.S. in 1950.

Of the 1960 population, 2,449,532, or 62%, lived in incorporated places of 2.500 or more, as compared with 55.5% in 1950, when these places constituted the urban area. The entire urban population, which included also the thickly settled suburban area, or "urban fringe," adjacent to Milwaukee, Madison and Racine, and four unincorporated places of 2,500 or more outside this fringe, amounted to 2,522,179 or 63.8% of the state total.

The number of households in 1950 was 968.253, as compared with 827,207 in 1940. The average population per household had declined from 3.8 in 1940 to 3.5 in 1950.

The population of the state was distributed by colour and nativity in 1950 as follows: 92.4% native white; 6.4% foreign-born white; and 1.2% nonwhite. Of the foreign-born mhite population, 26.8% were born in Germany, 11.2% in Poland and 6.7% in Norway.

In 1950 there were 101.1 males per 100 females in the native mhite population and 115.8 in the foreign-born; 9% of the population was 65 years old or over; and 54.7% of the population 14 years old and over was in the labour force. Of the total number

EDUCATION

The free public-school system was established in 1848 and the first provision for free high schools was made in 1875. School attendance nas made compulsory for children between the ages of 7 and 15 in 1879, for those between the ages of 7 and 14 in 1903 and between 6 and 16 in 1949. The first kindergarten in the United States officially connected mith a state normal school (teachers college) was opened at Oshkosh in 1880. In the second half of the 20th century total annual expenditures for public schools amounted to about $280 per capita for elementary and almost $400 for secondary schools, as compared with the national median, for all schools, of about $330. Following the national trend toward consolidation, the number of school districts was reduced from 6.000 to 4,000 in a ten-year period following World War II.

It is estimated that more than 25% of all elementary pupils and somewhat less than 15% of all high school pupils attend private or parochial schools, mainly those supported by the Roman Catholic and Lutheran churches.

The public-school system is under the supervision of the state department of public instruction, headed by a state superintendent of public instruction. With rare exceptions the public elementary and secondary schools are operated by local school districts under the supervision of the state. The state department supervises the education and training of the physically and mentally handicapped under 16 years of age, including those at the state school for the blind at Janesville and for the deaf at Delavan. The 23 county teachers colleges, with an enrollment of about 1,200, are also under the jurisdiction of the state superintendent. Handicapped children over 16 (except for those who are institutionalized) are the responsibility of the rehabilitation division of the state board of vocational education, as part of its extensive program of vocational and adult education which annually enrolls over 100.000 persons.

Higher Education. — Public higher education is provided by the University of Wisconsin and nine state colleges. The state university and land-grant college, established at Madison in 1848 and supported largely by the state as a part of the public educational system. occupies a beautiful site extending for a mile along the shores of Lake Mendota. The University of Wisconsin—Milwaukee resulted from the merger of Milwaukee State college mith the university in 1956. The university includes a college of letters and science and the related schools of commerce, education, journalism, library science, music and pharmacy; a college of agriculture and a related school of home economics; a college of engineering; a law school; a medical school with a school of nursing; a graduate school; and an extension division which, in addition to offering adult education, group and community service programs, includes centres at Green Bay, Kenosha, Manitoxvoc, Marinette, Menasha, Racine. Sheboygan and Wausau where the first two years of university work are offered. Several scientific institutions are associated with the university, including the U.S. forest products laboratory, the U.S. weather bureau, the Washburn observatory, the Wisconsin psychiatric institute, the Wisconsin geological and natural history survey, the university hospitals, the state historical society, the Wisconsin Academy of Sciences, Arts and Letters, and the state laboratory of hygiene.

Stout institute, at Menomonie (a training school for teachers of vocational subjects, established in 1903), became Stout State college in 1955. Wisconsin State College and Institute of Technology, at Platteville, was founded in 1866, the name being changed from Wisconsin State Teachers college at Platteville in 1959 when it was combined with the Wisconsin Institute of Technology (1907). The other state colleges, nith their founding dates, are at Whitewater (1868), Oshkosh (1871), River Falls (1874), Superior.(1893), Stevens Point (1894), La Crosse (1909) and Eau Claire (1915) The state colleges provide teachers training and liberal arts education and grant the bachelor's degree. A law of 1955 created a co-ordinating committee for higher education composed of members of the boards of regents of the university and of the state colleges with broad powers over the finances, properties and programs of these institutions. County teachers colleges, schools of vocational and adult education, and private colleges in the state nork co-operatively with this committee.

Private institutions of higher learning in the state include Alverno (1936), Cardinal Stritch (1937) and Mount Mary (1872) colleges and Marquette university (1857), all Roman Catholic, at Milwaukee; Beloit college (1846). related to the Congregational and Presbyterian Churches. at Beloit; Carroll college (1840), affiliated with the United Presbyterian Church, at Waukesha; Lawrence college (1847). nonsectarian, and its affiliated Institute of Paper Chemistry (1929). at Appleton; Northland college (1892), affiliated nith the Congregational Church, at Ashland; Ripon college (1850), nonsectarian, at Ripon; St. Norbert college

(1898), Roman Catholic, at West De Pere; and Viterbo (1931), Roman Catholic, at La Crosse.

HEALTH AND WELFARE

Public Health. — Since 1876 Wisconsin has been officially concerned with the health of its people. Beginning with attempts to control communicable diseases through sanitation and quarantine, the state board of health has constantly expanded its responsibilities and its control over measures relating to public health. It maintains the state bureau of vital statistics and (in co-operation with the University of Wisconsin) a state laboratory of hygiene. It provides education in maternal and child health, in dental hygiene and in general health measures; administers hospital and nursing home licensure; and regulates the licensing of and inspects barbershops, beauty salons, public eating houses and funeral establishments. It co-ordinates the work on control of infectious and chronic diseases and serves as a channel of communication among all health agencies, local, private and state. A section on environmental sanitation supervises public water supplies, milk. refuse disposal, plumbing and similar safeguards to public health.

Public Welfare. — A department of public welfare is responsible for most of the state charitable, curative, correctional and penal institutions. It administers laws pertaining to the welfare of children and youths, including licensing and supervising private child welfare agencies and advising county agencies and juvenile courts. It supervises the state correctional institutions as well as prison farms and camps, the probation and parole system, the psychiatric field services and the program of correctional education. It also supervises the state hospitals for the mentally ill and defective and inspects county mental hospitals. A division of public assistance supervises the administration of aids to the aged, the blind, the disabled, and state dependents, administers programs of relief to needy Indians and to the blind, and supervises distribution of state relief monies.

In the second half of the 20th century 13 state institutions were under the supervision or operation of this department. The correctional institutions were the home for women at Taycheedah, the school for boys at Waukesha. the school for girls at Oregon, the state prison at R'aupun and the state reformatory (for males) at Green Eay. The mental institutions mere the Central State hospital at Waupun, the Central Colony and Training school at Madison. the Mendota State hospital at Madison, the Northern Wisconsin Colony and Training school at Chippewa Falls, the Southern Wisconsin Colony and Training school at Union Grove, the state hospital at Winnebago and the diagnostic centre at Madison. Finally, there was the child care institution at Sparta.

An interagency committee on human welfare studies conditions of health and public welfare in Wisconsin and recommends needed legislative measures to the legislative council.

THE ECONOMY

Agriculture. — Wisconsin is one of the leading agricultural states of the United States. In the 1950s 64% of the land area, or about 22,500,000 ac., was farm land, representing a decrease of about 3% in the ten-year period following World War II. Of this, 12,500,000 ac. were classified as crop land, 8,500,000 as pasture. The number of farms was 150,000 as compared with 175,003 after the war. During the same years the average size of farms increased from 117 to 146 ac. and the average value per acre from $53 to $100. The highest land values mere in the southern and eastern counties. The total value of all farm land and buildings was more than $2,250~000,000. Livestock was valued at about $500,-000,000 after the war and at $600,000,000 in the 1950s.

Annual cash farm income exceeds $1,000,000,000, of which more than $800,000,000 is from the sale of livestock products and the balance from crops. The chief crops, by acreage harvested, are hay, oats: corn, peas, barley, wheat, rye, potatoes and tobacco.

A small proportion of Wisconsin's crop is marketed directly; a greater amount, however, is fed to livestock on the farms, and the farmers receive their income chiefly from livestock production. Wisconsin ranks first in the nation in value of dairy products. Early Swiss, German and Danish settlers, producing the famous cheeses of their native lands, established and fostered the cheese-making industry. At the close of World War II Wisconsin produced almost 50% of all the cheese made in the United States, and was the nation's Swiss cheese capital. By 1955 the state supplied only 33% of the Swiss cheese, the decrease being due largely to the introduction of the rindless block type technique which was quickly adopted by other areas. Normally, more than 33% of the milk produced in Wisconsin is used for cheese, about 25% for butter, 12.5% is shipped to other states and the remainder is used for evaporated and condensed milk, home consumption and other purposes.

In addition to dairy herds Wisconsin produces cattle for beef and raises swine, sheep and lambs. and chickens. Horses and mules still are raised but declined from more than 500,000 annually before World War II to fewer than 100,000 by the 1950s.

In addition to the more standardized farm products, Wisconsin produces some unusual crops. The state ranked high in the trees tapped for maple sap and in production of maple sirup. It produces about 110,000 tons of sugar beets annually. A relatively new industry is peppermint culture, begun in 1943. The domestic culture of fur-bearing animals has become an important source of revenue; more than 1,400 mink ranches annually produce about $30.000.000 worth of pelts.

Industry.—Manufacturing, increasing rapidly in the 20th century, became the chief industry in the state. The value of its products rose from $360,000,000 in 1900 to almost $700,000,000 in 1914 and to more than $2,000,000,000 in 1929. The depression reduced it to less than $1,000,000,000 in 1933 but World War II brought revival and by the end of the nar it was again more than $2,000,000,000 and before 1960 exceeded $3,000,000,000, ranking Wisconsin 11th among the states in the value of its manufactured products.

Wisconsin's chief branch of manufacture is that connected with its dairying industry, in which it leads the states The industry is nidely diffused, with many of the cheese factories being small and close to the supply of raw material. Next to the dairy industry in the value of its product is the paper and pulp industry. Other major manufactures are transportation equipment, malt and malt liquors, foundries, machine-shop products, printing and publishing, electrical machinery, apparatus and supplies, leather, meat products, canned vegetables and fruits, textiles, clothing, furniture and lumber and lumber products.

In 1910 Milwaukee was responsible for more than one-third of the state's manufacturing output and thereafter remained the chief industrial centre of the state. After 1914, however, other cities developed considerable manufactures, especially Kenosha, Racine and Janesville. Racine and Janesville are famous producers of farm implements. Important enterprises are also located at West Allis, Illadison, Oshkosh. Sheboygan, Beloit, Green Bay, Superior, La Crosse, Manitowoc, Fond du Lac, Eau Claire and Appleton. Madison, Beloit and Janesville are all in the Rock river valley, which is the route for two of the leading railroads from Chicago to the northwest. A more notable concentration of manufacturing cities is in the Fox river valley, including the shores of Lake Winnebago. Here are Oshkosh, Fond du Lac, Appleton and Green Bay. Their location makes them the centre for the papermaking and woodworking industries. This is also the region of greatest development in water power. It is noticeable that only one of the important cities, La Crosse, is on the Mississippi river, and one only, Superior, on Lake Superior.

Mines and **Quarries.**—Wisconsin's mineral products are varied and though in value they fall far below the farm, forest and factory products of the state, they nevertheless amount to considerable sums each year. During the decade 1920–30 the annual production ranged close to $20.000.000 and in 1929 exceeded $24,000,000. Mining activity, however, diminished in 1930 and subsequent years until 1933. when production stood at the low mark of $7,154,000. Thereafter, a slow recovery began, and with the added stimulus of World War II the state's mineral output again reached $20,-000,000 during the war and rose to $40,000,000 by 1950 and to $60,000,000 by 1960. Other important minerals include granite,

SCENES IN WISCONSIN

Top *left:* The state capitol, Madison, built of white granite, 1904–14

Top *dght:* Bascom hall, University of Wisconsin, Madison, overlooks a memorial terrace and bronze statue of Abraham Lincoln

Centre right: Wisconsin Holstein cattle and cornfields. The state is the nation's leader in dairying; corn is one of Wisconsin's largest crops

Bottom left: An excursion boat on the Wisconsin river near Wisconsin Dells

Bottom right: A cargo ship loading grain at Superior, one of the finest natural harbours in the world. With its sister city, Duluth, Minn., it ranks high among U.S. ports in the amount of commercial cargo handled limestone (dolomite), clay and sand and gravel. Another important resource of the state is its mineral waters.

The lead mines of southwestern Wisconsin were the earliest developed, and they reached a peak production in the decade 1840–50, after which they slowly declined. In 1918 there were produced 4.533 short tons. In 1938 production was down to 320 short tons. After World War II most of the lead was only a by-product of zinc mining. which has become of main importance in the same region, with annual production fluctuating between about 500 and 2,000 tons. The zinc-bearing ores are chiefly found below the water level, and their production was not stimulated greatly until the rise in price of zinc about 1900. The production of this metal fluctuates with widely varying prices. It amounted to 27.285 tons in 1920, 10,052 in 1922 and 26,800 in 1926. After World War II it ranged from about 5,000 to 20.000 tons. Whereas early lead mining was largely carried on by individuals in shallow mines, the deeper zinc ores are mined almost exclusively by large companies using modern power machinery for mining and milling.

Of the great Lake Superior iron-producing district shared by Minnesota, Wisconsin and Michigan, Wisconsin possesses the smallest part. Two producing ranges extend into north Wisconsin, but the richer portions of each are in the upper peninsula of Michigan. 'The Wisconsin portion of the Penokee-Gogebic range is in Iron county, where most of the ore is mined. The chief mineral output of Wisconsin, formerly building and ornamental stone. is sand and gravel and crushed stone for highway and building construction. Granite of many different colours is also quarried. At hundreds of places in the state, clay deposits suitable for making brick and tile are to be found.

Forests and Lumbering.— Originally all Wisconsin, except a few thousand square miles of prairie region in the south, mas covered with forests (see *Plant and Animal Life,* above). The great age of lumbering in Wisconsin was from 1890 to 1905, for the last five years of which Wisconsin was the leading lumber-producing state of the United States. Production reached nearly 3,500,000,000 bd.ft. annually. The cut of lumber steadily declined after 1900 to about 300,000,000 bd.ft. a year in the second half of the 20th century. In contrast to the decline in lumber production, wood pulp production reached its peak after 1950, exceeding 1,000,000 tons annually.

Transportation.— In Lake Superior, Lake Michigan and the Mississippi river, Wisconsin is supplied upon three sides by unusual facilities for water shipping. In addition to their actual commerce, these waterways are of great importance because of the continual check they supply upon iand transport rates. Each year the navigahle channel of the Mississippi transports nearly 700,-000 tons of coal, petroleum and other bulk products to or from Wisconsin ports. Wisconsin has 12 major and 10 minor ports on Lakes Superior and Michigan. By far the largest is its share in the port of Superior-Duluth. which handles more than 65,000,000 tons of freight a year, mostly iron ore, with coal and grain as leading secondary products. The other chief lake ports, all on Lake Michigan, are Milwaukee, Green Bay and Ashland.

The first railways were built east and west with the idea of connecting the waterways as quickly as possible, but as the railways grew more independent the main lines were built in a general northwest and southeast direction so as to connect Chicago and Milwaukee with the cities of St. Paul and hlinneapolis by lines as direct as possible. Other lines run from Milwaukee northwest to Ashland, Superior and Duluth. The railway mileage in the state, which reached more than 7,500 mi. in the 1920s. declined to about 6.000 mi. in the second half of the 20th century. There is a network of motorbus lines connecting the chief cities, and the state has over 70 publicly owned airports. There are more than 85.000 mi. of rural roads, of which about 88% are surfaced. The state highway system encompasses an additional 11.000 mi.

Tourist Trade.— The tourist trade is a major contributor to Wisconsin's economy. Attracted by the scenery, the climate, water sports, hunting game birds and animals, and forms of recreation provided in public parks and private resorts. uncounted numbers of tourists enter Wisconsin at all seasons. The Conservation commission, the Northern Great Lakes Area council and numerous private agencies encourage this so-called industry, which produces an annual revenue estimated as high as $300,000.000.

WISDOM, BOOK OF (titled WISDOM OF SOLOMON in Greek manuscripts). a book established in the Vulgate canon of the Bible by the Council of Trent (1546); Protestant editions of the Bible include it among the Old Testament apocrypha; it is not included in the Jewish canon. It belongs to the class of literature known as wisdom writings. of which Job, Proverbs, Ecclesiastes and Ecclesiasticus are earlier examples (see WISDOM LITERATURE).

The work may be divided into three sections: (1) ch. i–v deal with the problem of the oppression of the righteous by the unrighteous; (2) ch. vi–ix purport to be an oration delivered by Solomon in praise of Wisdom (regarded as a personified divine attribute); (3) ch. x–xix are a recital of Israel's history with a view to showing Wisdom as the defender of the righteous and the judge of God's enemies. The final section includes a lengthy digression (xiii–xv) condemning idolatry.

The book was produced at a time when pious adherents of Judaism rr-ere suffering under the domination of Gentile rulers and high-placed Jewish renegades. The author hoped to encourage the oppressed and bring about the reconversion of the apostates. The extensive treatment of Wisdom's protection of Israel and punishment of Egypt in ancient times (ch. x–xix) probably was intended as a warning against the writer's Alexandrian contemporaries. The recurrent theme is that Wisdom, the associate of God (ix, 4), is the only source of good, and that to know her is to gain life.

The name "Solomon" in the title is a pseudonym. The writer's good command of Greek and acquaintance with Hellenistic philosophy identify him as a member of the Diaspora. Whether the author incorporated earlier written sources in his book is a debated question. Scholarly opinion is all but unanimous in rejecting theories of Hebrew originals behind parts of the book.

Since the writer relied on the Septuagint version of Isaiah. a date of composition later than 150 B.C. is necessary. The probable use of the book by Paul and in the Epistle to the Hebrews requires a date prior to A.D. 50. Some scholars find a reference to full-fledged persecution in ii, 12–20, and place the writing of the book shortly after the anti-Semitic disorders in A.D. 38. Others favour a date in the 1st century B.C.

In any case, the book is an example of modification of Jewish thought by Alexandrian Greek philosophy. While "Solomon" probably had no formal philosophical education, he was imbued with Hellenistic culture. He accepted the Platonic doctrine of the pre-existence of the soul (viii, 19–20). He spoke of the creation of the world out of formless matter (xi, 18) and regarded the body as evil (ix. 15). His doctrine of the immanence of Wisdom in all things (i, 7; vii, 24) was taken from the Stoics.

Yet, his appropriation of Hellenistic ideas was not indiscriminate. He had no sympathy for any "love of wisdom" which was not expressed by the "keeping of her laws" (vi, 17–20). In i–v he inveighed against apostates who had accepted the Epicurean doctrine that men are born by chance and had adopted an ethic of greedy hedonism (ii, 2–11). In vi–ix he asserted that wisdom comes only as a gift of God (viii, 21); even the understanding of the sciences is divinely given (vii, 17–22).

His loyalty to his ancestral faith is apparent. Earlier nisdom writings were known to and echoed by "Solomon" repeatedly; his personification of Wisdom was rooted in such passages as Prov. viii and Job xxviii; his picture of the suffering but victorious son of God (ii, 10–v) was drawn from Isaiah. His account of Hebrew history (x–xix) is distinctive both in the freedom nith which he embellished the narrative and in his exaltation of Wisdom (= Spirit: i, 6–7; ix, 17) as the instrument of redemption; but the recital itself is evidence of his grounding in the faith of Israel.

"Solomon" had not yet achieved the level of assimilation of Greek philosophy to the Law found in Philo. Hellenistic and Jewish ideas sometimes occur side by side in an unrecognized tension. He polemized against idolatry like a Hebrew prophet (xiii–xv), but he adopted Euhemerus' theory of the origin of the gods (xiv, 15–21 He described a judgment scene in language that belonged to Jewish eschatology (iii, 7 ff.), but he obviously believed in the immortality of the soul (iii, 1–4).

It is important, however, that he found the two ways of thought compatible. In his work we recognize Wisdom as a bridge between philosophy and the Bible, and that bridge was crossed by Philo, the rabbis and the Fathers of the Church.

(M. J. SU.)

WISDOM LITERATURE is the title given to certain writings of the ancient orient, of which those of the Hebrews are most widely known. The books of Proverbs, Job and Ecclesiastes (*qq.v.*), along with some Psalms (notably i, xlix and Ixxiii) and a few other brief passages, comprise the wisdom literature of the Old Testament. In the apocrypha the great wisdom books are the Book of Wisdom (Wisdom of Solomon) and Ecclesiasticus (*qq.v.*). The word "wisdom" was a technical term that covered much that is included under the modern usage but had a wider connotation as mell.

Wisdom is first heard of in Egypt soon after 3000 B.C. About 600 years later a vizier by the name of Ptah-hotep attained high repute for his wisdom. His precepts, in the form of a collection of proverbial sayings, were preserved and are claimed to be the oldest book in the world. They comprise a sort of ethical treatise that assumes the nature of the good life and undertakes to tell how this can be realized by the special group for whom it was written. Through the following 15 or more centuries many other wise men arose in Egypt. Some of them left bodies of proverbs, but others were led by circumstances to consider more deeply the worth and meaning of human life; in other words, they were compelled to think about metaphysical problems. Wisdom speculation arose also in Babylonia, where other writers composed bodies of proverbs or pessimistic writings that denied any value in life. This intellectual activity could not have been confined to a few favoured lands. Even uncivilized peoples ask and answer questions about the nature of the world and the meaning of human life, and such speculation is universal among more advanced cultures. And so wisdom was pervasive through the ancient east. The little land of Edom was famous for its wise men, and apparently there was a wisdom movement among the Canaanites before the Hebrews entered Palestine.

It is no accident that the Greek word "philosophy" means "love of wisdom." The full measure of Greece's debt to the orient has never been determined, but in any case Greek philosophy was heir to and in some measure disciple of the age-old speculation of the east. Yet wisdom was both more and less than philosophy. Much that is now included under the term had not then risen above the intellectual horizon, but also much that then was wisdom later attained an independent position. The practical shrewdness of the businessman and administrator, incipient science, general knowledge, reflection upon known facts and much else of the sort, as well as more strictly philosophic speculation, went into the total of wisdom. The educated man, particularly if he gave thought to human conduct and its ends, was the wise man. Wisdom was the total of the intellectual culture of the age.

It would seem that Israel was introduced to wisdom by the Canaanites, to whose culture it was deeply indebted. This explains its early appearance: even in the days of the Judges (about 1200–1050 B.C.) devices of the wise men, such as the fable and the riddle, were familiar. In David's time there were professional wise persons (II Sam. xiv, 2–20; xx, 16–22); interestingly enough, those who are mentioned were women. Solomon's wisdom became proverbial, although its true nature is widely misunderstood.

Through the following centuries the wise men were at times the object of stern rebuke by the prophets, who disliked their pragmatic realism. But the exile brought a change in Hebrew wisdom, as in much else of the nation's character. Wisdom became deeply religious. The wise men were convinced that religion alone possessed the key to life's highest values.

It was this mood that dominated the final shaping of the Hebrew wisdom literature. Though dependent on older materials and in part incorporating documents from before the exile, the wisdom books as they are now known were produced from approximately 400 B.C. to the beginning of Christian times. True to the character of the wisdom activity, the influence of foreign thought is evident in much of their total.

As literature the books are of varying worth. Ecclesiastes contains much of high quality; Job is freely recognized to be a classic. The maxims in Proverbs attempt no literary merit, but ch. i–ix are poetry that attains considerable excellence in parts. This section is the latest portion of the book and contains some of the most profound thinking of the Old Testament. It speaks of a reality pervasive through the world, indeed existent before the world, through which the world was made. This reality, which is wisdom, proceeded from God and is the expression of God's activity in all created things. In particular it operates in human life as the impelling force that insistently and unceasingly leads men to higher things.

This great thinker was an optimist. But the Book of Job is down among the bitter facts of experience. Its problem is that of the divine government of a world in which injustice is rampant. The book is composite; many thinkers have contributed their views. But the great author of the Dialogue, which is the core of the book, was also an optimist: he had an answer of faith and hope. Ecclesiastes was again different. Its author found no worth in life; all that remains is for each individual to find what enjoyment he can in his work and in the simple pleasures of the passing days. But Ecclesiasticus and the Book of Wisdom were in the succession of Prov. 1–9; the transcendent wisdom is the supreme fact of human experience. (W. A. I.)

WISE, HENRY ALEXANDER (1806–1876), U.S. politician and Confederate general, was born at Accomac Court House, Va., Dec. 3, 1806. After graduating with honours from Washington college (now Washington and Jefferson), Washington, Pa., in 1825, he studied law and opened an office in Nashville, Tenn., in 1828, but returned to Accomac in 1830. In 1832 he was elected to the U.S. house of representatives as a Jacksonian Democrat, but broke with his party on the bank question and served as a Whig until he followed President Tyler out of that camp. In Jan. 1844 he was appointed minister to Brazil, returning in 1847 to practise law in Accomac.

In 1855 Wise, as a Democratic candidate, was elected governor of Virginia and was a delegate to the secession convention of 1861. In May 1861 he was commissioned brigadier general in the Confederate army and served until the war ended at Appomattox. After the war he practised law in Richmond, and in 1872 published his *Seven Decades of the Union.*

Wise died at Richmond on Sept. 12, 1876.

See Barton Wise, *The Life of Henry A. Wise* (1899), and John S. Wise, *The End of an Era* (1899). (T. P. A.)

WISE, ISAAC MAYER (1819–1900) U.S. rabbi. America's greatest organizer of Liberal (Reform) Jewish institutions, all of which became prototypes for similar organizations of American Conservative and Orthodox Jews, was born in Bohemia on March 29, 1819. In his long career as rabbi after his arrival in the United States in 1846 he wrote many volumes of history, theology, polemics. novels, plays and hymns, of which only his *Reminiscences* will endure. After a brief stay as rabbi in Albany, N.Y., where he evolved his philosophy of moderate, gradualistic reform, he moved to Cincinnati, O. (1854), where he remained for the rest of his life the most influential rabbi of the Ohio and Mississippi valleys. Kindly, able, energetic, an astute politician, Wise gained a huge following through his English weekly the *American Israelite,* through his German paper *Die Deborah,* through his prayer book *Minhag America* and through his willingness to go almost anywhere to dedicate new synagogues. His goal in life was to bring about a united American Jewry. Thus, as chairman of a national committee to protest the treaty between the U.S. and Switzerland which discriminated against American Jews, he headed the first organized effort of American Jews to fight for their civil liberties. Because of his talents for leadership and his sense of realism, he was able to bring effective guidance in the adjustment of Judaism to American life. An excellent organizer, he created three basic American Jewish institutions: the Union of American Hebrew Congregations (1873), at first a union only of synagogues in the middle west and south; the Hebrew Union college (1875), a rabbinical school; and the Central Conference of American Rabbis (1889), an association of Reform rabbis. Firmly believing in the ultimate triumph of the liberal-universalistic approach of Reform Judaism, he frowned upon a Jewish national political state in Palestine, and he bitterly opposed the Zionist movement.

Wise died at Cincinnati on March 26, 1900.

WISE, JOHN (1652–1725), American clergyman and pamphleteer in support of democratic government and liberty, was born at Roxbury, Mass., in Aug. 1652. He was graduated from Harvard university in 1673; and after studying theology, he preached at Branford, Conn., 1675–76, and at Hatfield, Mass., 1677–78. He was ordained in 1683 as minister of Chebacco, a parish of Ipsmich, Mass., where he remained until his death. Wise led the citizens of Ipswich to resist the efforts of Gov. Edmund Andros to levy a province tax, and in Oct. 1687 he was tried and convicted, fined, deprived of his clerical office and put under peace bonds. Andros later reversed that part of the court's judgment that prohibited him from acting as a minister. Wise brought an action against Joseph Dudley, who had presided over the court that convicted him, for refusing to grant him the right of habeas corpus, and it is said that he was awarded damages.

In 1705 Increase Mather published a pamphlet called *Questions and Proposals,* which outlined a plan to establish an organization of ministers in Massachusetts that would exercise the authority then invested in the individual churches. Fearing that this marked the beginning of a reactionary movement, Wise opposed the plan and in 1710 published the pamphlet *The Churches Quarrel Espoused.* In this he eloquently attacked the proposals of Mather, and the movement was completely defeated. In 1717 Wise published *A Vindication of the Government of New-England Churches,* a pamphlet examining the principles of both civil and religious government. His essays were reprinted in 1772 and in 1860. In support of the project of many liberal groups to establish a monetary system based on paper money, he published a pamphlet in 1721 entitled *A Word of Conzfort to a Melancholy Country.* He died in Ipswich on April 8, 1725.

WISE, STEPHEN SAMUEL (1874–1949), U.S. rabbi, for many years a leader of American Judaism and of the Zionist cause, was born March 17, 1874, in Budapest, Hung., and was taken to the United States in 1875, by his father, Rabbi Aaron Wise. He received his Ph.D. at Columbia university in 1901, and his rabbinical training from private teachers, among them Rabbi Gustav Gottheil. After serving as rabbi to Congregation B'nai Jeshurun, New York city (1893–1900), and Temple Beth Israel, Portland, Ore. (1900–06), he was invited to become rabbi of Temple Emanu-El, New York city, but not receiving adequate assurances of free speech in the pulpit, he declined the call, founding instead the Free Synagogue of New York city in 1907. Wise fought for civic morality and helped bring about the downfall of Richard ("Boss") Croker, and later, with John Haynes Holmes in the Civic Affairs committee, of Mayor James J. Walker. At Basel, Switz., in 1898 he was English secretary at the second Zionist congress, and thereafter became one of the foremost Zionist leaders. In 1915–16 Wise was associated with Louis D. Brandeis and others in the American Jewish congress; later he became president of the permanent American Jewish congress and the World Jewish congress. He helped represent the Jewish cause at the Versailles peace conference in 1919 and was the outstanding figure in mobilizing U.S. public opinion against Hitlerism in the 1930s. In 1922 he founded the Jewish Institute of Religion and ordained many leading American rabbis. He was a founder and editor of the magazine *Opinion,* author of *The Improvement of the Moral Qualities* (1902) and other works. For many years he conducted Sunday morning services at Carnegie hall, attracting great throngs of non-Jews and Jews. His work in synagogue social service and child adoption (in co-operation with his wife, Louise Waterman Wise) endures. Wise was of striking appearance, had a voice of remarkable resonance, and during his lifetime his name was a household word throughout the country. He died April 19, 1949.

See *Challenging Years,* his posthumously published autobiography (1949); *American Jewish Year Book, 1950,* pp. 515–518, 525–526; *Universal Jewish Encyclopedia,* vol. x, pp. 543–544. (L. I. N.)

WISEMAN, NICHOLAS PATRICK STEPHEN (1802–1865), English cardinal, was born at Seville on Aug. 2, 1802, the child of Anglo-Irish parents recently settled in Spain for business purposes. On his father's death in 1805 he was brought to Waterford. He was educated at Ushaw college, near Durham, and at the English college in Rome, of which he became vice-rector in 1827 and rector in 1828. He held the rectorship for 12 years. From the first a devoted student and antiquary, he studied the oriental manuscripts in the Vatican library, and a first volume. entitled *Horae Syriacae,* published in 1827, gave promise of a great scholar. Leo XII appointed him curator of the Arabic manuscripts in the Vatican and professor of oriental languages in the Roman university. His student life was broken by the pope's command to preach to the English in Rome; he visited England in 1835–36, and delivered lectures on the principles and main doctrines of Roman Catholicism in the Sardinian chapel, Lincoln's Inn Fields, and in the church at Moorfields, later pulled down. In 1836 he founded the *Dublin Review.*

In 1840 he was consecrated bishop, and sent to England as coadjutor to Bishop Walsh, vicar apostolic of the Central district, and was also appointed president of Oscott college near Birmingham. Oscott, under his presidency, became a centre for English

Catholics. The Oxford converts (1845 and later) added considerably to Wiseman's responsibilities. It was by his advice that Newman and his companions spent some time in Rome before undertaking clerical work in England. Shortly after the accession of Pius IX Wiseman was appointed temporarily vicar apostolic of the London district, the appointment becoming permanent in Feb. 1849. On his arrival from Rome in 1847 he acted as informal diplomatic envoy from the pope, to ascertain from the government what support England was likely to give in carrying out the liberal policy with which Pius inaugurated his reign. In response Lord Minto was sent to Rome as "an authentic organ of the British government," but the policy in question proved abortive. Wiseman threw himself into his new duties with many-sided activity. He was zealous for the establishment of religious communities, both of men and women, and for the holding of retreats and missions.

The progress of Catholicism was undeniable, but yet Wiseman found himself steadily opposed by a minority among his own clergy, who disliked his ultramontane ideas, his "Romanizing and innovating zeal." In July 1850 he heard of the pope's intention to create him a cardinal, and expected to be permanently recalled to Rome. But on his arrival there he Ascertained that a part of the pope's plan for restoring a diocesan hierarchy in England was that he himself should return to England as cardinal and archbishop of Westminster. When he reached London (Nov. 11) the whole country was ablaze with indignation at the "papal aggression," which was misunderstood to imply a new and unjustifiable claim to territorial rule. But Wiseman wrote an admirable *Appeal to the English People* in which he explained the nature of the pope's action, and argued that the admitted principle of toleration included leave to establish a diocesan hierarchy.

Two years later Manning was appointed provost of Westminster and he established in Bayswater his community of the "Oblates of St. Charles."

The last two years of his life were troubled by illness and by controversies in which he found himself, under Manning's influence, compelled to adopt a policy less liberal than that which had been his in earlier years. Thus he had to condemn the Association for the Promotion of the Unity of Christendom, with which he had shown some sympathy in its inception in 1857, and to forbid Catholic parents to send their sons to Oxford or Cambridge. though at an earlier date he had hoped (with Newman) that at Oxford at least a college or hall might be assigned to them. Wiseman died on Feb. 16, 1865. Wiseman was one of the most learned men of his time. He combined with the principles known as ultramontane liberality of view in matters ecclesiastical. He insisted on a poetical interpretation of the church's liturgy; and while strenuously maintaining its divine commission to teach faith and morals, he regarded the church as in other respects a learner; and he advocated a policy of conciliation.

(A. W. Hu.; X.)

WISHART, GEORGE (*c.* 1513–1546), Scottish reformer, was accused of heresy in 1538, and fled to England, where a similar charge was brought against him at Bristol in the following year. In 1539 or 1540 he started for Germany and Switzerland, and returning to England became a member of Corpus Christi college, Cambridge.

In 1543 he went to Scotland in the train of a returning embassy. Wishart began to preach in 1544, at Perth, Edinburgh, Leith and Haddington. At Ormiston, in Dec. 1545, he was seized by the earl of Bothwell, and transferred by order of the privy council to Edinburgh castle on Jan. 19. 1546 Thence he was handed over to David Cardinal Beaton, who had him burned at St. Andrews on March 1.

See Knox's *Hist.;* Reg. P. C. Scotland; Foxe's *Acts and Monuments;* Hay Fleming's *Martyrs and Confessors of St. Andrews;* Cramond's *Truth about Wishart (1898)*; and *Dictionary of National Biography,* vol. lxii.

WISLICENUS, JOHANNES (1835–1902), German chemist, who did pioneer research on isomers, was born on June 24, 1835, at Klein-Eichstedt in Thuringia and emigrated in 1853 to the U.S. with his father. He was assistant at Harvard to Eben Horsford, and in 1855 was appointed lecturer at the Mechanics' institute in New York. Returning to Europe in 1856 he continued his studies at Halle and Ziirich, where he was subsequently professor of chemistry (1864). He then obtained the chairs of chemistry at Wdrzburg (1872) and Leipzig (1885). He died at Leipzig on Dec. 5 1902.

Wislicenus' work on lactic acid resulted in the discovery of two substances differing in physical properties though possessing a structure of proved chemical identity. He maintained (1873), before publication of the doctrine of Jacobus H. van't Hoff and J. A. Le Bel, that the ordinary formulas did not afford an adequate explanation of certain carbon compounds, and suggested that account must be taken of the differing spatial arrangement of their atoms. He is also known for his uork on acetoacetic ester and its application as a synthetical agent and for his syntheses in the pentamethylene series.

WISMAR, a seaport town in the district of Rostock, Ger., in the former *Land* of Mecklenburg, at the southern end of the Bay of Wismar, one of the best harbours on the Baltic, 20 mi. N. by rail of Schwerin. Pop. (1950) 47,786. Wismar is said to have received civic rights in 1229 and came into the possession of Mecklenburg in 1301. In the 13th and 14th centuries it was a flourishing Hanse town, with important woolen factories. A plague carried off 10,000 of the inhabitants in 1376. By the peace of Westphalia in 1648 it passed to Sweden, and in 1815 to Mecklenburg. It was severely bombed in World War II.

WISSEMBOURG (Weissenburg), a town of France, capital of an *arrondissement* in the *département* of Bas-Rhin. on the Lauter, at the foot of the eastern slope of the Vosges mountains, 42 mi. N.E. of Strasbourg by the railway Basle-Strasbourg-Mannheim. Pop. (1954) 4.555. It grew up around a Benedictine abbey, founded in the 7th century by Dagobert II, and became the seat of a famous school. There Otfrid, a native of the district, completed (*c.* 868) his Old High German Gospel book. (*See* German Literature.) The town became a free imperial city in 1305. It has been the scene of two memorable battles. In Oct 1793 the Prussians and Saxons under the Austrian general Count D. S. von Wurmser stormed the "Weissenbourg lines." On Aug 4, 1870, the Germans, under the crown prince of Prussia, gained there the first victory of the Franco-German War (*q.v.*).

WISSLER, CLARK (1870–1947), **U.S.** anthropologist, best known as author of the standard book *The American Indian* (1917), for developing the culture-area concept and as discoverer of the universal culture pattern, was born Sept. 18, 1870, in Wayne county, Ind. In exhibiting the collections of material culture from the Indian tribes of North America at the American Museum of Natural History, New York city, where he directed the research and exhibits programs in anthropology for nearly 40 years, he divided the continent into geographical provinces, each of which was conceived as the home of a distinct type of culture and of a typical tribe. This classification made it possible to treat the American continents ethnographically and promoted discussion of culture centres and their problems.

Educated in the public schools of his home county, he taught in rural communities and attended the state university (B.A., 1897; M.A., 1899). In 1901 he received the Ph.D. in psychology under James McKeen Cattell at Columbia university, being one of the last professional anthropologists to be trained in another discipline. It was a natural progress from studies of mental differences to measurements of child development. And just as Franz Boas (*q.v.*) concentrated on developing anthropology as an academic discipline at Columbia, so Wissler became its leader in the museum world.

The preface to Robert and Helen Lynd's important sociological study *Middletown* (1937) attests his influence on the social sciences. He became a leading authority on the Dakota and Blackfoot tribes and wrote five books and more than 200 scientific and popular articles, chiefly on the North American Indians and related anthropological subjects. After 1924 he was also a professor in the Institute of Human Relations at Yale university and a leader in the scientific councils of the nation. He died in New York city on Aug. 25, 1947.

In addition to *The American Indian*, some of Wissler's more important works are: *North American Indians of the Plains* (1912); *Man and Culture* (1923); *The Relation of Nature to Man in Aboriginal America* (1926); *Introduction to Social Anthropology* (1929); and *Indians of the United States* (1940). He also edited about 40 numbers of the *Anthropological Papers* of the American Museum of Natural History.

Antiq.*, 13:244–247, for family history and museum career (1948); R. H. Lowie, *Amer. Anthrop.*, 51:527–528, with supplementary facts. (W. N. F.)

WISTER, OWEN (1860–1938), U.S. writer, whose novel *The Virginian* helped establish the cowboy as a U.S. folk hero and stock fictional character, was born in Philadelphia, Pa., July 14, 1860. He was a favourite grandson of the English actress Fanny Kemble (*see* KEMBLE [family]). On graduating from Harvard in 1882, he intended to devote himself to music and for two years studied composition in Paris. Ill-health forced his return to the United States; and he spent the summer of 1885 in Wyoming, on the advice of the physician-novelist S. Weir Mitchell (*q.v.*). In the fall Wister entered the Harvard law school, graduating in 1888, and, after being admitted to the bar in 1889, practised for two years in Philadelphia. He continued spending his summers in the west, and in 1891, after the enthusiastic acceptance by *Harper's* of two of his western sketches, he devoted himself to a literary career. He died at North Kingstown, R.I., July 21, 1938.

His novel *The Virginian* (1902), a humorous account of the misadventures of an easterner in Wyoming, was a great popular success and did as much to shape the romantic conception of the cowboy west as any other single work. Two earlier books, *Red Men and White* (1896) and *Lin McLean* (1898), also contributed to the legends of the cunning horse thief, the chivalrous rancher and the vanishing red man. *Philosophy 4* (1903), a diverting college story, and *Lady Baltimore* (1906), a romance of old Charleston, were also popular. Wister's other works include: *The Dragon of Wantley* (1892), a novel; *Ulysses S. Grant* (1900); *The Seven Ages of Washington* (1907); *Roosevelt: the Story of a Friendship, 1880–1919* (1930), concerning his long acquaintance with Theodore Roosevelt, a Harvard classmate; and two politico-social works on Anglo-American relations, *The Pentecost of Calamity* (1915) and *Neighbors Henceforth* (1922). He also wrote a number of books for children. Wister's collected writings were published in 11 volumes in 1928. His journals and letters from 1885 to 1895 were published in *Owen Wister Out West*, edited by Fanny Kemble Wister (1958).

ROCHE

WISTERIA BLOSSOMS (WISTARIA)

WISTERIA, a genus of high-climbing woody vines (named after Caspar Wistar, distinguished U.S. physician and scientist, and later spelled *Wistaria*), of the pea family (Leguminosae), inhabiting China, Japan and eastern North America. The garden wisterias are mostly *W. sinensis* of China and *W. floribunda* of Japan; their violet-blue spring-blooming flowers, borne in long drooping racemes, are effective floral decorations against a house wall or on trelliswork. Varieties of these two species provide a wide range of colours from white through shades of pink, to red and purple. The North American species *W. frutescens*, found in southern states, has lilac-purple, fragrant flowers, and *W. macrostachya* of the central U.S. has much longer racemes of similar colour. Wisterias, propagated by seed, division, layering and cuttings, thrive in deep rich soil. They are hardy in mild climates of the northern U.S. and southern England. By pruning of the Asiatic species it is possible to make floriferous standards.

WITAN or WITENAGEMOT, the council of the Anglo-Saxon kings. It was in no sense a popular assembly, and its composition was determined by the king's pleasure. He would naturally wish to consult his greater nobles and his bishops, and such men were normally found in attendance at his councils. The ecclesiastical element was sometimes reinforced by the abbots of important monasteries. The king's household officers were usually present, and the council generally included a varying number of thegns without specific duties at court. The general character of the council underwent little change throughout the Old English period, though it inevitably tended to become a larger body as the king of Wessex developed into a king of all England. Its essential duty was to advise the king on all matters touching which he chose to ask its opinion. It attested his grants of land to churches or laymen, it consented to his issue of new laws or new statements of ancient custom, and it helped him to deal with rebels and persons suspected of disaffection. King Alfred asked its advice about the testamentary disposition of his private inheritance. In late Old English times the witan had ceremonial functions. It attended the king when he received ambassadors, and in the 11th century, if not earlier, joined him in public feasting at Easter, Whitsuntide and Christmas, commonly meeting for this purpose at Winchester, Westminster and Gloucester. At other times the king would summon his witan to attend him wherever he might choose. Important meetings of king and council were held in royal manors such as Wantage in Berkshire, Calne in Wiltshire and Andover in Hampshire. In its composition and duties the witan closely resembled its successor, the *Commune Concilium* of the Anglo-Norman kings, the fundamental difference between these bodies being the feudal tie which connected the baronial councillors of the Norman time with the king. (F. M. S.)

WITCHCRAFT. The actual meaning of this word appears to be the art or craft of the wise, as the word "witch" is allied with "wit," *to know*. From about the 15th century the word has been almost exclusively applied to workers of magic, whether male or female. Magicians and sorcerers are known in all parts of the world; among savage communities they are usually credited with supernatural powers by their fellow tribesmen (*see* MAGIC). Divination (*q.v.*) or foretelling the future is one of the commonest forms of witchcraft; when this is done in the name of the deity of one of the established religions it is called prophecy; when, however, the divination is in the name of a pagan god it is mere witchcraft. This distinction is very clear in the account of the contest between Moses and pharaoh's magicians as given in Exodus; but in the demotic story, which appears to give the Egyptian version of the incident, the wise priest of Egypt defeats the miserable foreign sorcerer whom he had saved from the water when a child.

Mediaeval Witches.—In England the legal definition of a witch is, according to Lord Coke, "a person who hath conference with the Devil to consult with him or to do some act."

The word "devil" (*q.v.*) is a diminutive from the root "div," from which we also get the word "divine." It merely means "little god." It is a well-known fact that when a new religion is established in any country, the god or gods of the old religion becomes the devil of the new.

When examining the records of the mediaeval witches, we are dealing with the remains of a pagan religion which survived, in England at least, till the 18th century, 1,200 years after the introduction of Christianity. The practices of this ancient faith can be found in France at the present day, though with the name of the deity changed; and in Italy *la vecchia religione* still numbers many followers in spite of the efforts of the Christian Church.

The number of the witches put to death by the inquisitors and other persecutors in the 16th and 17th centuries is a proof of the obstinate paganism of Europe. Whole villages followed the belicfs of their ancestors; and in many cases the priests, drawn from the peasant class, were only outwardly Christian and carried on the ancient rites; even the bishops and other high ecclesiastics took part. As civilization increased and Christianity becdme more firmly rooted, the old religion retreated to the less frequented parts of the country and was practised by the more ignorant members of the community. This is very noticeable in the innumerable trials of the 15th to the 18th centuries.

The Witch-cult. — The religion consisted of a belief in a god incarnate in a human being or an animal, and thus resembled in many ways the religions of numerous primitive peoples of the present day. This god, who was always called the Devil by the Christian recorders of the trials, appeared to his worshippers disguised in various animal forms or dressed inconspicuously in black. The earliest form of the animal disguise is the figure of the man clothed in a stag's skin with antlers on his head, which is among the palaeolithic paintings in a cave in Ariège in southern France. Another early example is carved on a slate palette of the prehistoric period of Egypt, in this case the man is disguised as a jackal. The goat disguise is not found in Great Britain though common in France and Germany, where it is probably the survival of the god Cernunnos. In the British Isles the usual forms were the bull, the dog and the cat.

The rites with which this god was worshipped are known to all students of primitive or savage religions, ancient and modern. The sacred dances, the feasts, the chants in honour of the god, the liturgical ritual, and above all the ceremonies to promote fertility, occurred at public assemblies as now in the islands of the Pacific or in Africa. The fertility rites attracted the special attention of the recorders of the legal trials. But to the followers of the old god these rites were as holy as the sacred marriage was to the ancient Greeks; to them, as to the Greeks, it was the outward and visible sign of the fertility of crops and herds which should bring comfort and wealth and life itself.

The assemblies or "Sabbaths" took place four times a year; on Feb. 2 (Candlemas), May-eve (known later as Roodmas), Aug. 1 (Lammas), and November-eve (All Hallow E'en). To these joyous meetings came all the worshippers, from far and near, to the number of many hundreds, old and young, men, women and children, till the scene was like a great fair with dancing and singing and feasting. The celebrations began in the evening, lasted all night, and ended at dawn. These were the great Sabbaths, and the dates show that the year was divided at May and November. This division shows that the religion dates back to a primitive period, probably before the introduction of agriculture though after the domestication of animals, for the festivals emphasize the seasons of the breeding of animals. There were, however, smaller meetings (known in France as *"esbats")*, which took place weekly or at short irregular intervals. To these came the principal members of the cult, who held a position analogous to the priesthood There were in each district a band of such persons, in number 13, *i.e.,* a chief or "devil" and 12 members. This band was known as a "Coven." They celebrated the religious rites, they practised as healers under the leadership and instruction of their divine master, and were the consultants in all cases where "witchcraft" was required. The earliest record of a Coven is in the *Handlyng Synne,* a work of the early 14th century, in which the (Christian) priest's daughter and 12 "fools" danced in the churchyard as a *coueyne*. The next record is in the 15th century in the trial of Gilles de Rais, where it is apparent that he and his associates were 13 in number in the practice of their rites. In the later trials the word Coven is continually used, and the number in a Coven is always 13.

One of the most impressive and important rites was the sacrifice of the god, which took place at intervals of seven or nine years. The accounts suggest that the sacrifice was by fire (for similar sacrifices see Frazer's Golden *Bough*).

The Familiars. — There are two kinds of familiars, the divining familiar and the domestic familiar. The divining familiar is common to the whole of Europe and is found in all records of the trials. In ancient Rome divination by animals, especially by birds, was known as "Augury," and was considered a legitimate means of learning the future, but when it was practised by "witches" in the 16th and 17th centuries their persecutors claimed that they were inspired by the Devil. As a rule the witches were instructed by their chief in the method of divining by animals, and he usually appointed the class of animal which each witch was to use. Thus Agnes Sampson of North Berwick divined by dogs, so also did Elizabeth Style in Somerset; John Walsh of Netherberry in Dorset had "a gray blackish culver," and Alexander Hamilton in Lothian divined by a "corbie" ar a cat. In France the familiar was always a toad, which was consulted before going on a journey or undertaking any enterprise.

Spells and Charms. — Forms of words with manual gestures are used in all countries and in all periods to produce results which cannot be obtained by physical means. They may be used for good or evil purposes, for the benefit of the user or for the benefit of someone else. A good harvest, a good catch of fish, a favourable wind for a ship, victory over an enemy, could all be obtained by formulae of words addressed to the appropriate power. But as the power was always incomprehensible, not to say freakish, it was necessary that it should be approached by those who knew the right methods. Sacrifice *(q.v.)* in the temples of the ancient civilization was among the means to propitiate the god and render him favournble to the petitions of his worshippers. When, however, there was more than one god, it is obvious that if a prayer were ineffectualin one temple nothing could be easier than to petition another deity.

Among the ritual methods to destroy an enemy one of the most ancient as well as the most dramatic was the making of an image, generally in wax, to represent the enemy, and gradually destroying it. The earliest recortl of this charm is in the trial of some women and officers of the harem of Rameses III. in Egypt, about 1100 B.C. They made wax images of the Pharaoh with magical incantations. but unfortunately the record gives only the outline of the trial without details.

Transformation into Animals (see LYCANTHROPY).—The belief that certain persons can transform themselves into animals is common to all parts of the world. The power belongs to the *shaman* or priest. A wound inflicted on a human being when in animal shape is believed to be visible when the person resumes his human form. The method of transformation was by putting on the skin of the animal, as did Sigmund the Volsung when he became a wolf. This being the case, it is obvious that the wounds received by the transformed person must certainly have remained when he returned to his proper shape.

The Suppression of Witchcraft. — In comparing the witches and witch-cult of the middle ages with the rites and beliefs of pagan religions, whether ancient or modern, it becomes abundantly clear that in Europe traces of the ancient heathenism survived the adoption of Christianity. It was only when the new religion had gained sufficient strength that it ventured to try conclusions with the old. Backed by the civil law, it overcame the old religion, not only by persuasion but by the use of force, just as it destroyed the ancient religion of Egypt and in later times the religion of the Aztecs. That the old religion mas not an ordinary heresy is clearly shown by the fact that in England. Scotland. France. Germany. Italy, Switzerland, the Netherlands and in New England in the days of Cotton Mather, the clergy as well as the laity hunted down and hrought to trial and death persons suspected of witchcraft. For particulars of the Salem witchcraft delusion. *see* SALEM.

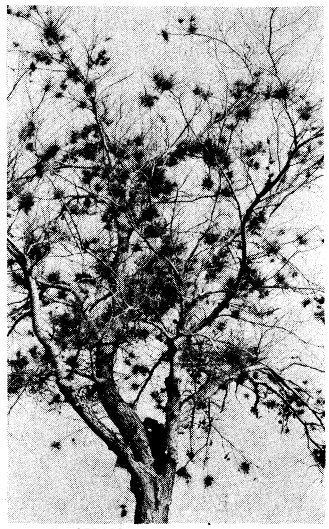
WITCHES'-BROOM (HEXENBESEN), the name applied to peculiar broomlike outgrowths on the branches of a number of trees. They consist of a closely set cluster of fine slender branches. generally arranged more or less parallel to each other and often originating from an enlarged axis.

The growths may be caused by the attack of a mite (*Eriophyes rudis)* associated with species of the fungus *Taphrina* but in most cases are due to a plant parasite alone, either a fungus or one of the scaly or dwarf mistletoes (*Arceuthobium*) found especially on pine, larch and fir.

Some witches'-brooms caused by fungi are *Taphrina laurencia* on ferns (*Pteris*), *Taphrina cerasi* on cherry and three other species affecting birch, alder and ironwood.



JOHN H. GERARD

WITCHES'-BROOM CLUSTERS ON A HACKBERRY TREE

WITCH HAZEL, the common name for a North American shrub, *Hamamelis virginiana* (family Hamamelidaceae). native to low woods from Nova Scotia to Minnesota and south to Florida and Texas. It grows from 10 to 25 ft. high, with smooth. wavy-toothed leaves, somewhat unequal at the base. The showy bright-yellow flowers, borne in profuse axillary clusters, appear in autumn as the leaves are falling. The fruit, a hard, woody capsule that matures during the ensuing summer, contains two black shining seeds, which are forcibly ejected mhen the fruit is ripe. A fluid extract, prepared from the leaves: is used as a tonic and as an astringent lotion. The name witch hazel is derived from the use of the twigs as divining rods, just as hazel twigs were used in England. The North American witch hazel is occasionally planted for ornament, as are the allied H. *japonica* of Japan and *H. mollis* of China. *H. macrophylla,* with leaves roughened by persistent tubercles, is a small tree of the southern Gulf states of the U.S.

See E. J. Fulling, "American Witch Hazel: History, Nomenclature and Modern Utilization," *Econ. Bot.*, *7*:359–381 (1953).

WITCHWEED, any plant of the genus *Strign* in the figwort family, including about jo species of the old-world tropics and one species introduced into the southeastern United States. About ten species are destructive as parasites on such crops as maize, sorghum. rice, sugar cane and tobacco. Witchweeds are branched herbs, six inches to two and one-half feet tall, with opposite or alternate. usually narrow and rough or sometimes scalelike leaves. The two-lipped flowers. solitary in axils of upper leaves, are red. yellow, purplish, bluish or white. Witchweed seeds, minute and produced in great numbers, germinate when in contact with a host root. Roots of the parasite establish and maintain connection with the host.

The first four to six weeks of the life cycle are spent underground. where the young plant is entirely dependent upon its host. After emergence, the plant can photosynthesize its own food but takes water and minerals from the host. The parasite dies when its seeds mature or when the host is harvested. Host plants appear stunted and chlorotic, often showing signs of wilting; they may not yield at all, or their yield may be sharply reduced. Severe infestation may kill the host.

Control measures include the use of herbicides and the growing of catch crops (in this case, host plants that are plowed under before the witchweeds can mature seeds, thereby killing both host and parasite) or trap crops (plants that stimulate witchweed germination but do not serve as satisfactory hosts). The growing of catch or trap crops over several years can almost eliminate witchweeds from an area. Among certain crop plants, especially sorghum, witchweed-resistant varieties have been developed.

Members of the genus *Alectra* (also in the figwort family), some of which parasitize legumes and tobacco in Africa and sugar cane in tropical America, are sometimes called witchweeds. *See* also SCROPHULARIACEAE.

See Hilda McGrath *et al.*, *Witchweed (Striga Asiatica), a New Parasitic Plant in the United States,* U.S. Department of Agriculture, Agricultural Research Service, Plant Disease Epidemics and Identification Section, Special Publication no. 10 (May 15, 1957). (J. W. TT.)

WITHER, GEORGE (1588–1667), English poet and satirist, son of George Wither, of Hampshire, was born at Bentworth, near Alton, June 11, 1588. He went to Magdalen college, Oxford. He wrote an elegy (1612) on the death of Prince Henry, and a volume of gratulatory poems (1613) on the marriage of Princess Elizabeth. but his uncompromising character soon got him into trouble. In 1611 he published *Abuses Stript and Whipt,* 20 satires against revenge, ambition, lust and other abstractions. In 1613 five editions appeared, and he was lodged in Marshalsea prison. The influence of Princess Elizabeth, supported by a loyal "Satyre" to the king, secured his release after a few months. He had figured as one of the interlocutors, "Roget," in his friend William Browne's *Shepherd's Pipe,* with which were bound up eclogues by other poets, among them one by Wither, and during his imprisonment he wrote what may be regarded as a continuation of Browne's work, *The Shepherd's Hunting* (printed 161*j*), eclogues in which the two poets appear as "Willie" and "Roget" (in later editions "Philarete"). The fourth of these eclogues contains a famous passage in praise of poetry. After his release he was admitted (161j) to Lincoln's Inn, and in the same year he printed privately *Fidelia,* a love elegy, of which there is a unique copy in the Bodleian. Other editions of this book, which contained the lyric "Shall I, wasting in despair," appeared in 1617 and 1619. In 1621 he returned to the satiric vein with *Wither's Motto. Nec habeo, nec careo, nec curo.* Over 30,000 copies of this poem were sold. according to his own account, within a few months. Like his earlier invective, it was said to be libelous, and Wither was again imprisoned, but shortly afterward released without formal trial on the plea that the book had been duly licensed. In 1622 appeared his *Faire-Virtue,* The *Mistress of Phil' Arete.*

Wither began as a moderate in politics and religion, but from this time his Puritan leanings became more and more pronounced, and his later work consists of religious poetry, and of controversial and political tracts. His *Hymnes and Songs of the Church* (1622–23) were issued under a patent (later disallowed) of King James I ordaining that they should be bound up with every copy of the authorized metrical psalms offered for sale. *(See* HYMNS.) Wither was in London during the plague of 1625, and in 1628 published *Britain's Remembrancer,* a voluminous poem on the subject, which he had to print with his own hand in consequence of his quarrel with the Stationers' company. In 1635 he was employed by Henry Taunton, a London publisher. to write English verses illustrative of the allegorical plates of Crispin van Passe, originally designed for Gabriel Rollenhagen's *Nucleus emblematum selectissimorum* (1610–1613). The book was published as a *Collection of Emblemes, Ancient and Moderne,* of which the only perfect copy known is in the British museum. The best of Wither's religious poetry is contained in *Heleluiah: or Britain's Second Remembrancer,* printed in Holland in 1641. Besides hymns proper, the book contains songs of singular beauty. especially the cradle song ("Sleep. baby, sleep, what ails my dear").

Wither had served as captain of horse in 1639 in the expedition of Charles I against the Scottish Covenanters. but three years after the Scottish expedition, at the outbreak of the Great Rebellion, he definitely sided with the parliament. He sold his estate to raise a troop of horse, and was placed by a parliamentary committee in command of Farnham castle. After a few days' occupation he left the place undefended. and marched to London. His own house near Farnham was plundered. and he himself was captured by a troop of Royalist horse, owing his life to the intervention of Sir John Denham on the ground that so long as Wither lived he himself could not be accounted the worst poet in England. After this episode he was promoted to the rank of major. He was present at the siege of Gloucester (1643) and at Naseby (1645). He had been deprived in 1643 of his nominal command, and of his commission as justice of the peace, in consequence of an attack upon Sir Richard Onslow, who was, he maintained, responsible for the Farnham disaster. In the same year parliament made him a grant of £2,000 for the loss of his property, but he apparently never received the full amount. An order was made to settle a yearly income of £150 on Wither, chargeable on Sir John Denham's sequestrated estate: but there is no evidence that he ever received it. A small place given him by the protector was forfeited "by declaring unto him (Cromwell) those truths which he was not willing to hear of." At the Restoration he was arrested, and remained in prison for three years. He died in London on May 2, 1667.

His extant writings, catalogued in Park's *British Bibliographer,* number over a hundred. Sir S. E. Brydges published *The Shepherd's Hunting* (1814), *Fidelia* (1815) and *Fair Virtye* (1818), and a selection appeared in Stanford's *Works of the British Poets,* vol. v (1619). Most of Wither's works were edited in 20 volumes for the Spenser Society (1871–82); a selection was included by Henry Morley in his *Companion Poets* (1891); *Fidelia* and *Fair Virtue* are included in Edward Arber's *English Garner* (vol. iv, 1882; vol. vi, 1883) and an excellent edition of *The Poetry of George Wither* was edited by F. Sidgwick in 1902.

WITHERITE, a mineral consisting of barium carbonate! was named after W. Withering. who (in 1784) recognized it to be chemically distinct from barite. Although barite is the principal source of barium, witherite is a favoured material for the preparation of other barium compounds because of its solubility in common acids. It is used in the casehardening process to introduce carbon into the surface of steel; in sugar refining; in the manufacture of heavy clay products, enameled iron and glass; and as a paint filler.

The formula is $BaCO_3$, and the mineral crystallizes in the orthorhombic system. The crystals are invariably twinned together. giving rise to pseudohexagonal forms; the faces are usually rough and striated horizontally. The mineral is colourless to dull white or grayish. The hardness is 3–3.5; the specific gravity, 4.29. Witherite occurs in low-temperature hydrothermal veins associated with barite and ores of lead and silver. The deposits in Scotland and Northumberland, Eng., have been mined commercially.

(D. L. G.)

WITHERSPOON, JOHN (1723–1794), Scottish-American Presbyterian minister and president of the College of New Jersey (now Princeton university), was born at Gifford, Scot., probably on Feb. 5, 1722 or 1723. He was educated at the Haddington grammar school and the University of Edinburgh (M.A., 1739), where he completed his theological studies in 1743. He was called to the parish of Beith in 1745 and in 1757 became pastor at Paisley. His militant tendencies, which later made him a prominent figure during the American Revolution, manifested themselves at the invasion of the Young Pretender and in his ecclesiastical controversies.

These he waged by sermon, debate, pamphlet and essay, revealing himself as a keen dialectician, an effective satirist and a convincing and entertaining speaker. Among his chief publications of this period are *Ecclesiastical Characteristics* (1753), *Essay on Justification* (1756) and a three-volume collection of his essays and doctrinal sermons (1764).

Witherspoon's popularity as a preacher is shown by his refusal of calls to Dundee, Dublin and Rotterdam; but his acceptance of a second call to the presidency of Princeton in 1768 marked a turning point in his career. Thereafter, although he was received warmly by the American Presbyterian Church and although he took a prominent part in the meetings of the synod and was first moderator of the general assembly which he had advocated, he was more distinguished as an educator and as a statesman than as a clergyman.

He seems to have brought to the struggling little college centred in Nassau hall a vision of its potentialities as a cultural agency as well as a training school for ministers. He opened a grammar school, announced graduate courses, encouraged the undergraduate societies, added Hebrew and French to the curriculum, provided scientific equipment and set out immediately on a quest for more money and more students.

From his arrival he was an enthusiast about America. He encouraged Scottish immigration, and in the dispute with the mother country ranged himself uncompromisingly on the side of the colonists. The loyalism of the Scots Regulators in the Carolinas especially troubled him. He presided over the Somerset county committee of correspondence in 1775–76; was a member of two provincial congresses; and in 1776–79 and 1780–82 he was a member of the Continental Congress.

He was the only clergyman to sign the Declaration of Independence; and in general he played a creditable part in the congressional body both in debate and on committees. He was especially distinguished for the soundness of his financial views, some of which were published later in his *Essay on Money* (1786). He died on his farm, Tusculum, near Princeton, Nov. 15, 1794.

The first edition of Witherspoon's Works was published in four volumes in Philadelphia in 1800 with a biographical account by John Rodgers. A nine-volume edition was published in Edinburgh in 1804–05.

See his *Lectures on Moral Philosophy* (1912), ed. by V. L. Collins, and the biography *President Witherspoon* by the latter, 2 vol. (1925).

WITNESS, in law, a person who is able from his knowledge or experience to make statements relevant to matters of fact in dispute in a court of justice. The relevancy and probative effect of the statements which he makes belong to the law of evidence (*q.v.*). In the present article it is only proposed to deal with matters concerning the position of the witness himself. In England, in the earlier stages of the common law, the jurors seem to have been the witnesses, for they were originally chosen for their knowledge or presumed knowledge of the facts in dispute, and they could (and can) be challenged and excluded from the jury if related to the parties or otherwise likely to show bias.

Competency.—Modern views as to the persons competent to give evidence are very different from those of Roman law and the systems derived from it. In Roman law the testimony of many persons was not admissible without the application of torture, and a large body of possible witnesses was excluded for reasons which have now ceased to be considered expedient, and witnesses were subject to rules which have long become obsolete. Witnesses must be *idonei* or duly qualified. Minors, certain heretics, infamous persons (such as women convicted of adultery), and those interested in the result of the trial were inadmissible. Parents and children could not testify against one another, nor could slaves against their masters, nor those at enmity with the party against whom their evidence was offered. Women and slaves could not act as witnesses to a will. There were also some hard and fast rules as to number. Seven witnesses were necessary for a will, five for a *mancipatio* or manumission, or to determine the question whether a person were free or a slave As under the Mosaic law, two witnesses were generally necessary as a minimum to prove any fact. *Unius responsio testis omnino non nudiatur* are the words of a constitution of Constantine. The evidence of a single witness was simply *semi-plena probatio,* to be supplemented in default of a second witness, by torture or reference to oath. The canon law followed the Roman law as to competence, but extended the disabilities to excommunicated persons and to a layman in a criminal charge against a clerk, unless he were actually the prosecutor. The evidence of a notary was generally equivalent to that of two ordinary witnesses. The evidence of the pope and that of a witness who simply proved baptism or heresy (according to some authorities) are perhaps the only other cases in which canon law dispensed with confirmatory evidence. It is probable that the incompetence of Jews as witnesses in Spain in the 14th and 15th centuries was based on what is termed "want of religion," *i.e.,* heresy or unwillingness to take the Christian oath on the gospels. But in England until their expulsion they were on the status of slaves (*captivi*) of the king, A policy similar to that of the Roman law was followed for centuries in England by excluding the testimony of parties or persons interested, of witnesses for a prisoner, and of infamous persons, such as those who had been attainted or had been vanquished in the trial by battle, or had stood in the pillory. All these were said *vocem non habere.* In the days of trial by battle a party could render a witness against him incompetent by challenging and defeating him in the judicial combat. Women were generally regarded as wholly or partially incompetent. English law had also certain rules as to the number of witnesses necessary. Thus under a statute of 1383 (6 Rich. II. st. 2 c, 5) the number of compurgators necessary to free an accused person from complicity in the peasant revolt was fixed at three or four. Five was the number necessary under the *Liber feudorum* for proving ingratitude to the lord.

In the course of the gradual development of the law of evidence, which is in a sense peculiar to the English system, the fetters of the Roman rules as to witnesses were gradually shaken off. In civil cases all disabilities by interest, relationship, sex or crime have been swept away. The witness need not be *idoneous* in the Roman sense, and objections which in Roman law went to his competence, in English law go to his credibility. The only general test of competency is now understanding. It excludes lunatics, idiots, dotards and children of tender years; a person convicted of perjury is said to be competent if convicted at common law, but incompetent if convicted under the act of Elizabeth. No trial ever takes place now under this act, and on this point the act seems to have been virtually repealed by Lord Denman's act (1843; 6 and 7 Vict. c. 85). The disqualification is not absolute as to lunatics; as to children it is sometimes made to depend on whether they are able to understand the nature of the witness's oath. And in certain cases within the Criminal Law Amendment Act, 1885, and the Prevention of Cruelty to Children Act, 1904, the unsworn evidence of children of tender years is admissible but needs corroboration.

Non-judicial witnesses are those who attest an act of unusual importance, for the due execution of which evidence may afterwards be required. They are either made necessary by law, as the witnesses to marriages and wills, or used by general custom, as the witnesses to deeds. In some cases the attestation has become a mere form, such as the attestation of the lord chancellor to a writ of summons. *(See* WRIT.)

Number.—The rule of English law as to the number of witnesses necessary is expressed in the phrase *testes ponderantur non numerantur.* But there are certain exceptions, all statutory. Two witnesses are necessary to make a will valid; two are required to be present at a marriage and to attest the entry in the marriage register; and in the case of blasphemy, perjury, personation and most forms of treason, two or more witnesses are necessary to justify conviction. Witnesses to bills of sale under the Bills of Sale Act, 1882, and witnesses on a charge of personation at elections, are required to be "credible." And in the case of dishonour of a foreign bill of exchange the evidence of a notary public is required, probably a survival from the law merchant or a concession to Continental practice. A warrant of attorney must be attested by a solicitor, and certain conveyances of property held on charitable uses must be attested by two solicitors. In certain civil cases the evidence of a single witness is not sufficient unless corroborated in some material particular—not necessarily by another witness—*e.g.,* in actions of breach of promise of marriage, or affiliation proceedings and matrimonial causes, or where unsworn evidence of children is admissible. In practice, but not in strict law, the evidence of an accomplice is required to be corroborated.

In criminal cases an accused person could not formerly be sworn as a witness or examined by the court, though he was free to make statements. The origin of this rule is by some traced to the maxim *nemo tenetur prodere seipsum,* by others to the theory that the petty jury were the prisoner's witnesses. Moreover, witnesses for the defence could not be examined on oath in cases of treason and felony until 1702 in England, 1711 in Ireland and 1735 in Scotland The husband or wife of the accused could not be examined on oath as a witness either for the prosecution or the defence except in prosecutions for treason or for personal injuries done by one spouse to the other. This exclusion was in accord with the disqualification of parties to civil causes; but there was a lack of reciprocity, for the prosecutor was a competent witness because the Crown is the nominal prosecutor. The rule had to a certain extent a beneficial effect for the defence, in saving the accused from cross-examination, which in certain periods and in political trials would have ied to abuse. On the abolition of other disqualifications that of the accused was left. This inconsistency led to much legal discussion and to piecemeal and, ultimately, complete change in the law. Between 1872 and 1897 some 26 acts were passed rendering accused persons and their wives or husbands competent (but not in general compellable) witnesses in particular criminal cases; and finally, by the Criminal Evidence Act, 1898, which abrogates the common law rule above, and in practice supersedes, but does not repeal, the particular statutes just mentioned, and does not apply to Ireland, every person charged with an offence, whether solely or jointly, and the wife or husband of such person is rendered a competent witness for the defence, subject to certain specified conditions. For these conditions, and for the rules regulating the attendance, oaths, examination, and privileges of witnesses, *see* EVIDENCE.

The attestation of documents out of courts of justice is ordinarily not on oath; but where the documents have to be proved in court the attesting witnesses are sworn like others, and the only judicial exception is that of witnesses ordered to produce documents (called in Scotland "havers") who are not sworn unless they have to verify the documents produced. Questions as to competence (including questions of the right to affirm instead of swearing or as to the proper form of oath) are settled by examination by the court without oath on what is termed the *voir dire.* The evidences of judicial witnesses is taken *viva voce* at the trial, except in interlocutory proceedings and in certain matters in the chancery division and in bankruptcy courts Where the witness cannot attend the court or is abroad his evidence may be taken in writing by a commissioner delegated by the court, or by a foreign tribunal under letters of request issued by the court in which the cause is pending. The depositions are returned by the delegated authority to the court of trial. Under English law evidence must be taken *viva voce* in a criminal trial, with a few exceptions, *e.g.,* where a witness who has made a deposition before a magistrate at an earlier stage in the case is dead or unable to travel, or in certain cases within the Merchant Shipping Acts, or of offences in India or by Crown officials out of England In Europe *commissions vogatoires* are freely used to obtain written depositions for the purpose of criminal trials, and are allowed to be executed in England.

On charges of treason lists of the witnesses to be called by the Crown must be supplied to the accused. In ordinary indictable cases there is no such obligation, but the names of the witnesses for the Crown are written on the back of the indictment; and where the witnesses have not been examined at the preliminary enquiry it is now established practice to require notice to the accused of their names, and a précis of what they will be called to prove. In Scotland, in all indictable cases, a list of witnesses must be served on the accused (the panel) (1887, c. 35), and the same rule is observed in France. In the United States the same course is adopted where a capital offence is charged.

(W F C.; S L PH)

WITNEY, a market town and urban district in the Banbury parliamentary division of Oxfordshire Eng on the Windrush river, a tributary of the Thames 12 mi N W of Oxford by road Pop (1951) 6 j54 Area a o sq mi Witney, partly due to its position in the Cotswolds (*q v*) where vast numbers of sheep were formerly raised is the seat of an old-established industry in blanket making, and gloves and other noollen goods are also made The great church of St Mary is cruciform with a lofty central tower and spire (Early English) and a Norman porch Among the gray stone buildings are the grammar school (founded in 1663) the butter cross (1683) and the old blanket hall (1; 21).

The manor of Witney was held by the see of Winchester before the Conquest In the middle of the 18th century it was leased by the bishop of Winchester to the duke of Marlborough Witney was a borough by prescription at least as early as 1278 and sent representatives to parliament fairly regularly from 1311–12 to 1359–60

There is reference to a fulling mill in a charter of King Edgar dated 909. In 1641 the blanket weavers petitioned the crown against vexatious trade regulations; in 1673 the town is described as "driving a good trade for blankets and rugs." In 1710 the blanket weavers obtained a charter making them into a company, consisting of a master. assistants, two wardens and a commonalty.

See J. A. Giles, *History of Witney* (1852); W. J. Monk, *History oj Witney* (1894).

WITOWT or WITOLD (1350–1430), grand-duke of Lithuania, son of Kiejstut, prince of Samogitia, first appears prominently in 1382, when the Teutonic Order set him up as a candidate for the throne of Lithuania in opposition to his cousin Jagiello (see WLADISLAUS), who had treacherously murdered Witowt's father and seized his estates. Witowt, however, convinced himself that the German knights were far more dangerous than his Lithuanian rival; he accepted pacific overtures from Jagiello and became his ally. When Jagiello ascended the throne of Poland as Wladislaus II. in 1386, Witowt was at first content with the principality of Grodno; but jealousy of Skirgiello, one of Jagiello's brothers, to whom Jagiello committed the government of Lithuania, induced Witowt to ally himself once more with the Teutonic Order (treaty of Konigsberg, May 24, 1390). He strengthened his position by giving his daughter Sophia in marriage to Vasily, grand-duke of Muscovy; but he never felt secure beneath the wing of the Teutonic Order, and when Jagiello removed Skirgiello from the government of Lithuania and offered it to Witowt, the compact of Ostrow (5th of August 1392) settled all differences between them.

Nevertheless, subsequent attempts on the part of Poland to subordinate Lithuania drove Witowt for the third time into the arms of the Order, and by the treaty of Salin in 1398, Witowt, who now styled himself *Supremus* Dux *Lithuaniae,* ceded his ancestral province of Samogitia to the knights, and formed an alliance with them for the conquest and partition of Pskov and Great Novgorod. He nourished the grandiose idea of driving out the hordes of Tamerlane, freeing all Russia from the Tatar yoke, and proclaiming himself emperor of the North and East. This dream of empire was dissipated by his terrible defeat on the Lower Dnieper by the Tatars on Aug. 12, 1399. He was now convinced that the true policy of Lithuania was the closest possible alliance with Poland A union between the two countries was effected at Vilna on Jan. 18, 1401, and was confirmed and extended by subsequent treaties. Witowt was to reign over Lithuania as an independent grand-duke, but the two states were to be indissolubly united by a common policy. The result was a whole series of wars with the Teutonic Order. which now acknowledged Swidrygiello, another brother of Jagiello, as grand-duke of Lithuania; and though Swidrygiello was defeated and driven out by Witowt. the Order retained possession of Samogitia. and their barbarous methods of "converting" the wretched inhabitants finally induced Witowt to rescue his fellow-countrymen at any cost from the tender mercies of the knights.

In the beginning of 1409 Witowt concluded a treaty with Jagiello at Novogrudok for the purpose, and on July 19, 1410, the combined Polish-Lithuanian forces. reinforced by Hussite auxiliaries. crossed the Prussian border. The rival forces encountered at Grünewald. or Tannenberg, and there on July 14 or 15, 1410, was fought one of the decisive battles of the world, for the Teutonic Knights suffered a crushing blow from which they never recovered. After this battle Poland-Lithuania began to be regarded in the west as a great power, and Witowt stood in high favour with the Roman curia. In 1429 Witowt revived his claim to a kingly crown, and Jagiello reluctantly consented to his cousin's coronation; but before it could be accomplished Witowt died at Troki, on Oct. 27, 1430. (R. N. B.)

WITT, CORNELIS DE (1623–1672), Dutch statesman, brother of Johan de Witt, with whose policies he was closely associated, was born at Dordrecht in 1623. He became an alderman of that town in 1648. After the victory of the so-called States party and the death of William II of Orange in 1650 he was able, because of the ascendancy of his brother, the grand pensionary, to acquire much power, being appointed governor of the Land of Putten. As alderman and later as burgomaster (1666 and 1667) of Dordrecht, he became a deputy to the states of Holland, in which capacity he accompanied De Ruyter on his famous expedition against Chatham in 1667 and took part in the great naval fight against the united English and French fleets at Southwold bay in 1672. Compelled by illness to leave the fleet, De Witt found on his return to Dordrecht that the Orange party was in the ascendant and that he and his brother were being vehemently criticized. For an account of his subsequent imprisonment, trial and death, see WITT, JOHAN DE. (E. H. K.)

WITT, JOHAN DE (1625–1672), Dutch statesman who was grand pensionary of Holland from 1653 to 1672, was born at Dordrecht on Sept. 24, 1625, of one of the ruling families of the urban patriciate. His father, Jacob, six times burgomaster of Dordrecht and for many years one of the town's representatives in the states of Holland, mas a strenuous adherent of the so-called States party (see HOLLAND: History).

In 1650 Johan was appointed pensionary of Dordrecht, which made him the leader of the town's deputation to the states of Holland at the time when the states came into conflict with the youthful prince of Orange, William II, over the question of the disbanding of troops. William, who found himself supported by the army and by some of the other provinces, seized six of the leaders of the States party and imprisoned them in Loevestein castle; among these was Jacob de Witt. The sudden death of William II in Nov. 1650 led to a reaction. He left only a posthumous child, afterward William III of Orange, and the principles of the states triumphed.

It was his father's position which gave Johan his opportunity, but his own eloquence, wisdom and business ability caused him to be appointed grand pensionary of Holland on July 23, 1653, at 28. He was re-elected in 1658, 1663 and 1668 and held office until just before his death in 1672. His first years of office were among his most difficult because the first Anglo-Dutch war (see DUTCH WARS) had taken the Dutch unprepared and made them suffer severely through the loss of their carrying trade. Yet the peace concluded in 1654, although advantageous to England, was a compromise. The peace treaty included a secret article by which the province of Holland pledged itself never to appoint in future a stadholder or a captain general. This act of exclusion was aimed at the young prince of Orange. De Witt, although he himself favoured the exclusion, resigned himself only reluctantly to declaring it on the occasion of the Anglo-Dutch peace treaty and at the request of Cromwell.

The policy of De R'itt after the peace of 1654 was mainly successful. He restored the public finances and extended Dutch commercial supremacy in the East Indies. In 1658–60 he sustained Denmark against Sweden. Relations with England, however, remained strained. The restoration of King Charles II did not alter. the situation (although the act of exclusion was rescinded) and war broke out again in 1665. The grand pensionary went to sea with the fleet and inspired all by his calmness in danger, energy in action and inflexible strength of will. It mas due quite as much to De Witt's organizing ability and diplomacy as to De Ruyter's brilliant seamanship that the treaty of Breda (July 1667) was so honourable to the United Provinces. In the same year De Witt made the states of Holland promulgate the Eternal edict which abolished the function of stadholder of Holland and declared the functions of stadholder of any province and captain general to be incompatible.

In 1668 De Witt was forced by the diplomacy of Charles II to sign with England and Sweden the Triple alliance which checked Louis XIV's attempt to take possession of the Spanish Netherlands for France. He rightly foresaw that this would make the French king an enemy of the Dutch. Louis managed to detach Charles from the Dutch, and in 1672 France and England declared war on the United Provinces. Louis himself headed the splendid French army which invaded the republic and conquered the larger part of the country. This was the signal for the Orangist party to overthrow De Witt and his supporters. Johan's brother Cornelis was arrested (July 24) on an improbable charge of conspiring against the prince of Orange.

On Aug. 4, Johan de Witt resigned the post of grand pensionary. Cornelis was put to the torture and, on Aug. 20, sentenced to deprivation of his offices and banishment. On the same day Johan went to visit him in the Gevangenpoort at The Hague. A vast crowd. hearing this, collected outside and finally burst in, seized the two brothers and tore them to pieces. William III, who had become stadholder of Holland in July, made no move to have the mob dispersed or the murderers punished.

There are editions of Johan de Witt's correspondence by R. Fruin and others, 4 vol. (1906-13) and 2 vol. (1919-22).

WITTE, SERGE JULIEVICH, COUNT (1849–1915), Russian statesman, was born at Tiflis. He entered the service of the Odessa State railway in 1877 and facilitated the transport of troops to Turkey in 1877–78. He became general traffic manager of the South-Western railway of Russia and member of an imperial commission to study railway construction and management. Vishnegradski, minister of finance, recognized his ability and made him head of the railway department in the finance ministry. In 1892 he was promoted to minister of ways of communication, and in 1893 he succeeded Vishnegradski.

Witte was an ardent disciple of Friedrich List and sought to develop home industries by means of moderate protection and the introduction of foreign capital for industrial purposes. At the same time he succeeded by drastic measures in putting a stop to the great fluctuations in the value of the paper currency and in resuming specie payments. The rapid extension of the railway system was also largely due to his energy and financial ingenuity. In foreign policy he extended Russian influence in northern China and Persia. Witte struggled for what he considered the liberation of his country from the economic bondage of foreign nations. During his ten years' tenure of the finance ministry he nearly doubled the revenues of the empire, but he made for himself a host of enemies. He was transferred, therefore. in 1903 from the influential post of finance minister to the ornamental position of president of the committee of ministers.

The disasters of the war with Japan, and the rising tide of revolutionary agitation, compelled the government to think of appeasing popular discontent by granting administrative reforms, and the reform projects were revised and amended by the body over which Witte presided. But the Witte reforms were obstructed by the other departments, especially by the police. Naturally the influence of a strong man made itself felt, and the president became virtually prime minister; but he did not advance very far in this legislative work, and later he was transformed into a diplomatist and sent to Portsmouth, N.H., U.S., in Aug. 1905, to negotiate terms of peace with the Japanese delegates. In these negotiations he showed great energy and decision, and contributed largely to bringing about the peace. On his return to St. Petersburg he had to deal. as president of the first ministry under the new constitutional regime, with a very difficult political situation (see RUSSIA: *History)*; he was no longer able to obtain support, and early in 1906 he was dismissed. His last service to the emperor had been to raise a large loan in France which made the government practically independent of the Duma. He died at St. Petersburg on March 12, 1915.

WITTELSBACH, the name of an important German family, taken from the castle of Wittelsbach, which formerly stood near Aichach on the Paar in Bavaria. In 1124, Otto V. count of Scheyern (d. 115j). moved the residence of his family to Wittelsbach, and called himself by this name. His descendants bore simply the title of counts of Scheyern until about 1116. when the emperor Henry V recognized Count Otto V as count palatine in Bavaria. His son, Count Otto VI, who succeeded his father in 11jj, accompanied the German king Frederick I to Italy in 1154, where he distinguished himself by his courage, and later rendered valuable assistance to Frederick in Germany. When Henry the Lion, duke of Saxony and Bavaria, was placed under the imperial ban in 1180, Otto's services were rewarded by the investiture of the dukedom of Bavaria at Altenburg. Bavaria was ruled by the Wittelsbachs from that time onward until the revolution of 1918, and the history of the house is closely connected with the history of Bavaria (*q* v.). The ancestral castle of Wittelsbach was destroyed in 1208.

In 1329 the most important of various divisions of the Wittelsbach lands took place. By the treaty of Pavia in that year, Louis IV. German king, formerly duke of Bavaria, granted the Palatinate of the Rhine and the upper Palatinate of Bavaria to his brother's sons. Rudolph II (d. 1353) and Rupert I. Rupert, who from 1353 to 1390 was sole ruler, gained the electoral dignity for the Palatinate of the Rhine in 1356 by a grant of some lands in upper Bavaria to the emperor Charles IV. It had been exercised from the division of 1329 by both branches in turn. The descendants of Louis IV retained the rest of Bavaria, but made several divisions of their territory, the most important of which mas in 1392, when the branches of Ingoldstadt. Munich and Landshut were founded. These were reunited under Albert IV. duke of Bavaria-Munich (1447–1508), and the upper Palatinate was added to them in 1628. Albert's descendants ruled over a united Bavaria, until the death of Duke Maximilian III in 1777, when it passed to the elector palatine Charles Theodore. The Palatinate of the Rhine. after the death of Rupert I in 1390, passed to his nephew. Rupert II, and in 1398 to his son, Rupert III, who was German king from 1400 to 1410. On his death it was divided into four branches. Three of these had died out by 1559, and their possessions were inherited by the fourth. or Simmern, line, among whom the Palatinate (*q v*) was again divided.

In 1742, after the extinction of the two senior lines of this family. the Sulzbach branch became the senior line, and its head, the elector Charles Theodore, inherited Bavaria in 1777. He died in 1799, and Maximilian Joseph, the head of the Zweibrucken branch. inherited Bavaria and the Palatinate. He took the title of king as Maximilian I. The Wittelsbachs gave three kings to Germany, Louis IV, Rupert and Charles VII. Members of the family were also margraves of Brandenburg from 1323 to 1373, and kings of Sweden from 1654 to 1718

WITTENBERG, a town in Halle district, Ger., on the Elbe, 59 mi. S.W. of Berlin. Pop. (1950) 49 852.

Wittenberg is mentioned as early as 1180. It mas the capital of the little duchy of Saxe-Wittenberg, the rulers of which afterward became electors of Saxony. The Capitulation of Wittenberg (1547) is the name given to the treaty by which John Frederick the Magnanimous was compelled to resign the electoral dignity and most of his territory to the Albertine branch of the Saxon family. It was occupied by the French in 1806, and refortified in 1813 by command of Napoleon; but in 1814 it was stormed by the Prussians. Its defenses were dismantled in 1873.

Part of the Augustinian monastery in which Luther dwelled has been fitted up as a Luther museum. The Augusteum was built in 1564–83 on the site of the monastery The Schlosskirche, to the doors of which Luther nailed his famous 95 theses in 1517, dates from 1439–99; it was, however, seriously damaged by fire during the bombardment of 1760, was practically rebuilt, and has since been restored. The old wooden doors, burned in 1760, were replaced in 1858 by bronze doors, bearing the Latin text of the theses. In the interior of the church are the tombs of Luther and Melanchthon. The parish church, in which Luther often preached, was built in the 14th century, but has been much altered. The University of Wittenberg, founded in 1502, was merged in the University of Halle in 181j Luther was appointed professor of philosophy there in 1508; and the new university rapidly acquired a considerable reputation from its connection with the early Reformers. In opposition to the strict Lutheran orthodoxy of Jena it represented the more moderate doctrines of Melanchthon The ancient electoral palace is another of the buildings that suffered severely in 1760; it now contains archives. Melanchthon's house and the house of Lucas Cranach the elder (1472–1jj3) who mas burgomaster of Wittenberg. are also pointed out. The spot. outside the Elster gate, where Luther publicly burned the papal bull in 1520, is marked by an oak tree.

WITTGENSTEIN, LUDWIG (JOSEF JOHANN) (1889–1951), the philosopher whose work was a major factor in the rise of the several schools of logical positivism, linguistic analysis and semantics in the second quarter of the 20th century, was born in Vienna on April 26, 1889; his family was of Jewish descent Wittgenstein studied engineering at Berlin and at Manchester and, from 1912, logic and philosophy at Cambridge. He fought in the Austrian army in World War I and was a prisoner in Italy from 1918 to 1919. After working as a schoolmaster in lower Austria (1920–26) and as an architect in Vienna (1926–28), he returned to Cambridge in 1929, becoming Ph.D. in the same year. Subsequently he was fellow of Trinity college (1930–36), lecturer (1930–35) and professor of philosophy (1939–47). In 1938 he became a naturalized British subject. He died in Cambridge on April 29, 1951.

The only book that Wittgenstein published in his lifetime was the *Tractatus logico-philosophicus* (German original, 1921; German-English parallel text. 1922). Posthumous publications include *Philosophische Untersuchungen* (Eng. trans.. *Philosophical Investigations,* 1953) and *Bemerkungen über die Grundlagen der Mathematik* (Eng. trans., *Remarks on the Foundations of Mathematics,* 1956). He wrote in a simple. nontechnical and occasionally aphoristic prose of high stylistic merits.

In his *Tractatus* Wittgenstein taught that the world consists of "things" (simples) which are configurated to "atomic facts." Things in the world are represented by names in language. In the "elementary proposition" names are configurated to a "picture" of a possible state of affairs. Language, thus, is a picture of reality. Significant propositions, which are not elementary, are "truth-functions" of elementary propositions. Among truth-functions a singular position is held by tautologies. Tautologies are true, regardless of the truth or falsehood of elementary propositions. All truth which is a priori or logical, as distinct from experiential or factual, is, according to the *Tractatus,* tautological truth. hfetaphysical and ethical propositions in Wittgenstein's view, cannot be expressed in language. Philosophy is none of the sciences. It is an activity, the objective of which is to make us see what cannot be said—the limits of language—through clearly displaying the logical grammar of propositions.

The *Tractatus* profoundly affected logical positivism (*q.v.*) The idea that all meaningful propositions are truth-functions of elementary propositions which stand in a picturing relation to reality was interpreted by the logical positivists as requiring the dependence of meaning upon verifiability through sense experience. This interpretation, however, has no ground in Wittgenstein's work.

Later. Wittgenstein's thought underwent great changes. But the problem of language remained central in his work. In *Phzlosophical Investigations* he studies "language games" or simplified linguistic situations in which the actual working of language is perspicuously displayed. When a great variety of such language games is presented, it becomes clear that there is no general form of proposition or "essence" of symbolism. The mutual interrelatedness of the various language games, mhich together constitute all the variety of linguistic usage, is a family resemblance. Any member of the family resembles some other member But there is no single pervading feature marking them all as members of the same family.

The family character mhich belongs to the concept of language is also true of other concepts, such as "name," "meaning," "number," "proof" and "consciousness," in the nature or essence of which philosophy has traditionally been interested. The moral taught by the study of language games, in which such concepts are used, is thus that the philosopher's quest for essences is an uneasiness of the mind that originates from a misunderstanding of our ordinary use of words and can be allayed by a perspicuous presentation of the linguistic situation. In his later work, moreover, Wittgenstein regards philosophy as a logical clarification of thought through a "critique of language," not as a theory about the foundations of knowledge or the nature of reality.

Much of what has become known under the names of "analytic," "linguistic" or "semantic" philosophy is inspired by Wittgenstein's teaching at Cambridge in the 1930s and 1940s or by his published work. Wittgenstein tended, however, to repudiate the results of his influence and was probably justified in thinking that his ideas were usually misunderstood and distorted even by those who professed to be his disciples.

See G. H von Wright, "Ludwig Wittgenstein, a Biographical Sketch," *Philosophical Review,* 64 527–545 (Oct. 1955). (*G.* H. v. W)

WITU, formerly a rebel state on the east African coast opposite Lamu Island and stretching from Kipini (2° 30' S.) to Manda bay (2° S.). It was founded in 1856 by Ahmed Fumo Luti, nicknamed Simba ("the Lion"). who was nominally a subject of the sultan of Zanzibar. In 1885 the German government in its anxiety to forestall British expansion in east Africa induced Ahmed to accept German protection. In 1890, however, the protectorate was transferred to Britain as a result of the Anglo-German agreement of that year. The administration was undertaken by the Imperial British East Africa company, but after continuous trouble between the company and Ahmed's successors the protectorate was placed under sovereignty of the sultan of Zanzibar. In 1895 Witu came directly under the control of the British foreign office and now forms part of the Lamu district of Kenya colony. The construction of the Uganda railway in the late 1890s drew away many people, and this, together with the abolition of slavery, and, in 1907, of the status of slavery, caused much of the area to revert to bush. (K. I.)

WITZ, KONRAD (*c.* 1400–*c.* 1445), painter, active in Basel, one of the first masters of modern realism and one of the first landscape painters, but a painter of the monumental not the narrative Dutch style, was born *c.* 1400 in Rottweil. Wiirttemberg. In 1435 he acquired citizenship of Basel, having entered the painters' guild in 1434. The panels for three altars have been preserved: the Heilsspiegelaltar (Mirror of Salvation altar; Basel, Berlin, Dijon). in which he created thickset, monumental figures; the altar from Geneva cathedral (museum), dated 1444, where in the course of illustrating Peter's draught of fishes he presented a wide landscape of Lake Geneva; and some panels of the Virgin (Basel, Xurnberg, Strasbourg) as well as small pictures (Berlin, Naples). In these late works he prepared the way for the perspective drawing of modern art.

See W. Uberwasser, *Konrad Witz* (1938) ; J. Gantner, *Konrad Witz* (1942). (A. SE.)

WIVALLIUS, LARS (1605–1669), Swedish poet and adventurer, whose lyrics show a feeling for the beauties of nature new to Swedish poetry, was born at Wivalla in 1605. He studied at Uppsala and in 1625 left Sweden to travel in Germany, France, Italy and England. Frequently posing as a nobleman, he swindled his way across Europe, being imprisoned for a time in Nürnberg. Back in Sweden (1629), by false pretenses he succeeded in marrying the daughter of a nobleman, but was found out and again imprisoned. In 1634 he mas deported to Kajaneborg, northern Finland, where he spent seven years of severe hardship. Subsequently he became an advocate in Stockholm, where he died on April 6, 1669.

Unscrupulous and antisocial, in his youth Wivallius was full of gaiety. Of his many ballads. written mainly in prison, the best are those inspired by longing for freedom (for example, "Ack libertas," an ode to liberty) and love of nature, in which, with grace and feeling, he sings of the creatures of field and forest, of May rain and of wanderings under the stars.

Wivallius' collected works were published, with a life, by H. Schiick, 2 vol. (1893–95).

See S. Ek, *Studier i Wivalliusvisornas kronologi* (1921) and *Lars Wioallius oisdiktning* (1930). (*S.* H. L.)

WIVELISCOMBE, a small market town in the Taunton parliamentary division of Somerset, Eng., 11 mi. W.N.W. of Taunton by road. Pop. (1951) 1,218. An urban district from 1894 to 1933, it is now a parish in the rural district of Wellington. Remains of prehistoric earthworks exist in the hills near the town and several hoards of Roman coins have been found. The town is probably Saxon in origin and for centuries was a manor and an occasional residence of the bishops of Bath and Wells. A centre of the west country cloth industry until the 19th century, the town became principally an agricultural and brewing centre. The church, completely rebuilt in 1829, is a remarkably interesting structure. (T. J. HT.)

WLADISLAUS (WLADISLAW), the name of four kings of Poland and two Polish kings of Hungary[1].

WLADISLAUS I. (1260–1333), king of Poland, called Lokietek, or "Span-long," from his diminutive stature, was the re-creator of the Polish realm, which at the end of the 13th century had split up into 14 independent principalities, and become an easy prey to her neighbours, Bohemia, Lithuania and the Teutonic Order. In 1296 the gentry of Great Poland elected Wladislaus, then prince of Cujavia, to reign over them; but later changing their minds, placed themselves under the protection of Wenceslaus, king of Bohemia, who was crowned at Gnesen in 1300. Wladislaus obtained the support of Pope Boniface VIII., and on the death of Wenceslaus in 1305 Wladislaus succeeded in uniting beneath his sway the principalities of Little and Great Poland. He had a long struggle with the towns and the prelates headed by Muskata, bishop of Cracow. He managed to suppress the magistrates of Cracow, but had to invoke the aid of the Teutonic Order to save Danzig from the margraves of Brandenburg; whereupon the Order not only proceeded to treat Danzig as a conquered city, but claimed possession of the whole of Pomerania. Wladislaus appealed to Pope John XXII. (1317) and ultimately (Feb. 9, 1321) obtained locally a judgment with costs against the Order, which however, appealed to Rome and got the judgment reversed. The result was a six years' war (1327–33) between Poland and the Order, in which all the princes of Central Europe took part, Hungary and Lithuania siding with Wladislaus, and Bohemia, Masovia and Silesia with the Order. It was early on Sept. 27, 1332, that Wladislaus, with his Hungarian allies, inflicted upon the knights their first serious reverse, at Plowce. In March 1333 he died. He had laid the foundations of a strong Polish monarchy, and with the consent of the pope revived the royal dignity, being crowned king of Poland at Cracow on Jan. 20, 1320.

See Max Perlbach, *Preussisch-polnische Studien zur Geschichte des Mittelalters* (Halle, 1886); Julius A. G. von Pflugk-Harttung, *Der deutsche Orden im Kampfe Ludwigs des Bayern mit der Kurie* (1900).

WLADISLAUS II., JAGIELLO (1350–1434), king of Poland, was one of the 12 sons of Olgierd, grand-duke of Lithuania, whom he succeeded in 1377. From the first Jagiello was involved in disputes with the Teutonic Order, and with his uncle, Kiejstut, who ruled Samogitia independently. By the Treaty of Dawidyszek (June 1, 1380) he contracted an alliance with the knights, and two years later, enticed Kiejstut and his consort to Krewo and there treacherously murdered them (Aug. 15, 1382). This foul deed naturally drove Witowt (*q.v.*), the son of Kiejstut, into alliance with the Order. But the two soon made common cause against the knights and invaded Prussian territory. In search of allies, Wladislaus in 1384 offered his hand to Jadwiga, the young queen of Poland, on condition they shared the Polish crown. Jadwiga renounced her previous fiancé, William of Austria. Jagiello was elected king of Poland as Wladislaus II.; on Feb. 15, 1386, he adopted the Catholic faith, and on Feb. 18 he married Jadwiga. He at once proceeded to convert Lithuania to his new faith. At Vilna, on Feb. 17, 1387, a stately concourse of nobles and prelates, headed by the king, proceeded to the grove of secular oaks beneath which stood the statue of Perkunos and other idols, and in the presence of an immense multitude hewed down the oaks, destroyed the idols, extinguished the sacred fire and elevated the cross on the desecrated heathen altars, 30,000 Lithuanians receiving Christian baptism. A Catholic hierarchy was immediately set up. Ruthenia with its capital Lemberg was persuaded to acknowledge the dominion of Poland; and there on Sept. 27, 1387, the hospodars of Walachia and Moldavia submitted voluntarily to Polish suzerainty.

[1]In Hungarian history the Polish Wladislaus (Mag. Ulászló) is distinguished from the Hungarian Ladislaus (László). They are reckoned separately for purposes of numbering. Besides the Wladislaus kings of Poland, there were three earlier dukes of this name: Wladislaus I. (d. 1102), Wladislaus II. (of Cracow, d. 1163) and Wladislaus III., duke of Great Poland and Cracow (d. 1231). By some historians these are included in the numbering of the Polish sovereigns, King Wladislaus I. being thus IV. and so on.

The knights endeavoured to re-establish their position by sowing dissensions between Poland and Lithuania. In this for a time they succeeded (see WITOWT); but in 1401 Jagiello recognized Witowt as independent grand-duke of Lithuania (union of Vilna, Jan. 18, 1401), and their union was cemented in the battle of Grünewald, which shook the fabric of the Order to its foundations.

Jagiello was married four times. At the dying request of the childless Jadwiga he espoused a Styrian lady, Maria Cillei, who bore him a daughter, also called Jadwiga. His third wife, Elizabeth Grabowska, died without issue, and in 1422 Jagiello married Sonia, princess of Vyazma, a Russian lady rechristened Sophia, who bore him two sons, Wladislaus and Casimir, both of whom ultimately succeeded him. Jagiello died at Grodko near Lemberg in 1434. During his reign Poland had risen to the rank of a great power, a position she was to retain for nearly 200 years.

WLADISLAUS III. (1424–1444), king of Poland and Hungary, the eldest son of Wladislaus II., Jagiello, by his fourth wife, Sophia of Vyazma, was born at Cracow, Oct. 31, 1424, succeeding to the throne in his tenth year. He had a turbulent minority; but Poland was wisely controlled by Zbigniew Olesnicki, while Wladislaus himself defeated the arch-traitor Spytek of Melztyn at Grotnik on May 4, 1439. On the sudden death of the emperor Albert, who was also king of Bohemia and Hungary, the Hungarians elected Wladislaus king, and he was crowned at Buda in July 1440. For three years, however, he had to fight against the partisans of the widowed Empress Elizabeth, till Pope Eugenius IV. mediated between them to enable Wladislaus to lead a crusade against the Turks. At the head of 40,000 men, mostly Magyars, and with Hunyadi commanding under him, Wladislaus made a glorious campaign in the Balkans in 1443, and by the Peace of Szeged (July 1, 1444), the Sultan Murad II., engaged to surrender Serbia, Albania and whatever territory the Ottomans had ever conquered from Hungary, including 24 fortresses, besides paying an indemnity of 100,000 florins in gold. After swearing to observe the treaty, however, Wladislaus broke it two days later in the name of religion, and invaded the Balkans a second time, losing his life and more than a fourth of his army at Varna on Nov. 10, 1444. (See also POLAND.)

WLADISLAUS IV. (1595–1648), king of Poland, son of Sigismund III., king of Poland, and Anne of Austria, succeeded his father on the throne in 1632. He had already served with distinction under Zolkiewski in the Muscovite campaigns of 1610–12, and under Chodkiewicz in 1617–18; and his first official act was to march against the Muscovites, who had declared war against Poland immediately after Sigismund's death, forcing the Muscovite general, after bloody engagements (Aug. 7–22, 1632), to raise the siege of Smolensk and surrender (March 1, 1634). Wladislaus then concluded peace (May 28), conceding the title of tsar to Michael Romanov, who renounced all his claims upon Livonia, Estonia and Courland, besides paying a war indemnity of 200,000 rubles. Wladislaus then marched to Lemberg, and under threat of invasion the Porte offered terms, which were accepted in October, whereby each Power engaged to keep its borderers, the Cossacks and Tatars, in order, and divide between them the suzerainty of Moldavia and Walachia, the sultan binding himself always to place philo-Polish hospodars on those thrones. In the following year the long-pending differences with Sweden were settled, very much to the advantage of Poland, by the truce of Stumdorf (Sept. 12, 1635). Thus externally Poland was everywhere triumphant. Internally, however, things were in their usual deplorable state owing to the suspicion, jealousy and parsimony of the estates. When Danzig rebelled openly against dues lawfully imposed by the king, and a Danish admiral broke the blockade and almost destroyed the flotilla Wladislaus had sent against the rebellious city, the *Sejm* connived at the destruction of the national navy and the depletion of the treasury, "lest warships should make the crown too powerful." For some years after this humiliation, Wladislaus sank into a sort of apathy; but the birth of his son Sigismund (by his first wife, Cecilia Renata of Austria, in 1640) gave him fresh hopes and energy. With the aim of bringing about a royalist reaction, he founded the Order of the Immaculate Conception, consisting of 72 young noblemen who swore a special oath of allegiance to the Crown, and were to form the nucleus of a patriotic movement antagonistic to the constant usurpations of the diet. After the *Sejm* had frustrated this attempt. Wladislaus, assisted by the grand hetman of the Crown, Stanislaw Koniecpolski, tried to use the Cossacks, who were deeply attached to him, to chastise the *szlachta,* at the same time forcing a war with Turkey, which would make his military genius indispensable to the republic. Simultaneously Wladislaus contracted an offensive and defensive alliance with Venice against the Porte, a treaty directly contrary, indeed, to the *pacta conventa* he had sworn to observe. The ill-prepared enterprise fell through; and the king. worn out, disillusioned and broken-hearted at the death of his son (by his second wife, Marie Ludwika of Angoulême, Wladislaus had no issue), died at Merecz on May 20, 1648.

See W. Czermak, *The Plans of the Turkish Wars of Wladislaus IV.* (Pol.) (Cracow, 1895); V. V. Volk-Karachevsky, *The Struggle of Poland with the Cossacks* (Rus.) (Kiev, 1899); *Letters and other Writings of Wladislaus IV.* (Pol.) (Cracow, 1845).

WLOCLAWEK, a town of Poland in Bydgoszcz province. Pop. (1931) 56.277; (1946) 48,126; (1950) 51.800. Situated on the left bank of the Vistula about 100 mi. below Warsaw, Wloclawek has always been an important city, being the capital of the Wloclawski district and the seat of one of the ancient Catholic bishoprics.

The medieval cathedral, built in the Vistula Gothic style, still exists. The region suffered much in the 14th century from the invasions of the Teutonic Knights. The diocese of the bishops included all eastern Pomerania.

Germany occupied the town in 1939 but it was returned to Poland in 1945.

WLODIMIERZ-WOLYNSKI (VLADIMIR-VOLYNSKI), formerly a town of Poland, it was incorporated in the Ckrainian Soviet Socialist Republic, U.S.S.R., after World War II. The town is the ancient capital of Volhynia, but it soon declined in importance on the rise of Luck and other towns. Near the town are the ruins of a church supposed to have been built by Vladimir, grand prince of Kiev, in 973. It became the capital of the independent princes of Volhynia.

Its name was Latinized as Lodomeria by the Austrians when they occupied it. It was occupied by the U.S.S.R. in 1939, by Germany in 1941.

WOBURN, a city of Middlesex county. in northeastern Massachusetts. C.S., is 10 mi. N.W. of Boston and within the Boston standard metropolitan statistical area. Set off from Charlestown (*q.v.*) and incorporated as a town in 1642, Woburn was chartered as a city in 1888.

Woburn's historical attractions include the old burial ground. which includes the graves of the ancestors of four presidents (Cleveland, Harrison. Pierce and Garfield), and a number of colonial houses. among which are the birthplace of Sir Benjamin Thompson (*q.v.*, also known as Count von Rumford) (erected 1714) and the Baldwin mansion (1661), home of Laommi Baldwin, the engineer. The latter, popularly remembered as the originator of the Baldwin apple, was largely responsible for the old Middlesex canal (built 1803; its dried up channels are still traceable), which gave impetus to the town's economic development.

The principal modern manufactures include pharmaceutical. chemical and photographic supplies, leather goods and processed foods.

For comparative population figures *see* table in MASSACHUSETTS: *Population.* (L. G. H.)

WODEHOUSE, PELHAM GRENVILLE (1881–), English author of humorous novels whose works are signed P. G. Wodehouse, was born in Guildford, Eng., on Oct. 15, 1881. He was educated at Dulwich college. London, and in 1903 began to write a humour column for the *London Globe.* He also published books for children, including *The Pothunters* (1902) and *A Prefect's Uncle* (1903), a collection of short stories.

He first won wide recognition with his humorous series of Psmith stories, including the novels *Psmith in the City* (1910), *Psmith, Journalist* (1915) and *Leave It to Psmith* (1923; later rewritten as a play nith Ian Hay, 1930).

Wodehouse became well known as the creator of the character Jeeves, a gentleman's gentleman aho deftly extricates his young master from various difficulties. The obsequious but competent valet appears in many novels; among the titles are *The Inimitable Jeeves* (1924), *Very Good, Jeeves* (1930), *The Return of Jeeves* (1954) and *Bertie Woostev Sees It Through* (19jj). Other characters were introduced in *Ukridge* (1924) (Stanley Featherstone Ukridge); *Meet Mr. Mulliner* (short stories, 1927); and *Blandings Castle* (1935) (Lord Emsworth and others).

Critical opinion on the value of Wodehouse's contributions as a humorist nas divided, but a popular demand for his books continued year after year. A prolific author, he also wrote plays and lyrics for musical comedies, many of which were produced in the United States. With Guy Bolton, who often collaborated with him, Wodehouse published *Bring on the Girls!* ("the improbable story of our life in musical comedy, with pictures to prove it") in 1953. His stories are characterized by intricate plots dealing nith common foibles and complex situations and often by incongruous anticlimaxes.

Wodehouse lived in both the United States and France for many years and during World War II nas interned by Germany. He later settled in Remsenburg. N.Y. His *Perfornting Flea: a Self-Portrait in Letters* was published in 1953 and *America, I Like You* in 1956.

WODEN, a deity of the Anglo-Saxons, the name being the Anglo-Saxon counterpart of the Scandinavian Odin (*q.v.*). In German he mas Wodan or Wuotan. Information is lacking as to how far the character and adventures attributed to Odin were known to other Teutonic peoples. Clearly, however, the god was credited nith special skill in magic, both in England and Germany, and was also represented as the dispenser of victory. By the Romans he nas early identified with Mercurius; "Wednesday" (Woden's day) is *dies Mercurii.*

WOFFINGTON, MARGARET (PEG) (1714?–1760), Irish actress, was born at Dublin, of poor parents, on Oct. 18, probably in 1714. As a child of ten she played Polly Peachum in a Lilliputian presentation of *The Beggar's Opera,* and danced and acted in Dublin theatres until 1740, when her success as Sir Harry Wildair in *The Constant Couple* secured her a London engagement. In this, and as Sylvia in George Farquhar's *The Recruiting Officer,* she had a great success. being unapproachable in "breeches parts." Also among her best impersonations were the elegant women of fashion, like Lady Betty Modish and Lady Townley. Her morals were notoriously sketchy, but her heart was warm. She built and endowed almshouses at Teddington, nhere she lived after her retirement in 17j7. She died there on March 28, 1760.

See Austin Dobson's introduction to Charles Reade's novel *Peg Woffington* (London, 1899), and Augustin Daly's *Woffington: a Trzbute to the Actress and the Woman* (Philadelphia, 1888). (W. A. DN.)

WÖHLER, FRIEDRICH (1800–1882), German chemist, nas born at Eschersheim, near Frankfurt-am-Main, on July 31, 1800 In 1820 he entered Marburg university, and next year removed to Heidelberg, where he worked in Leopold Gmelin's (1788–1853) laboratory. Gmelin advised him not to attend the lectures in chemistry, because for him they would be a waste of time. Intending to practise as a physician. he took his degree in medicine and surgery (1823) but was persuaded by Gmelin to devote himself to chemistry. He studied in Jons Jakob Berzelius' laboratory at Stockholm for a year. and there began a lifelong friendship with the Swedish chemist. Their correspondence was published in 1901. He then taught in the technical schools of Berlin (1825–31) and Cassel (1831–36). In 1836 he was appointed to the chair of chemistry in the medical faculty at Göttingen. He brought the department to a high rank, and many prominent chemist5 from all over the world were trained there. An imposing statue was unveiled in 1890. This professorship he held until his death on Sept. 23, 1882, although he had retired from active teaching long before.

In 1827 Wohler first obtained metallic aluminum by heating the chloride with potassium, and he prepared many of the salts from the metal. In the following year he isolated beryllium by the same method. His great contribution to the development of chemistry was the synthesis of the natural product urea (*q.v.*) in 1828. This aided greatly in the overthrow of the vitalistic doctrine, which distinguished organic from inorganic materials. He worked with Justus von Liebig (*q.v.*) in a number of important investigations.

One of the earliest was the investigation, published in 1830, which proved the polymerism of cyanic and cyanuric acid. The most famous was their study on the oil of bitter almonds (benzaldehyde) and the radicle benzoyl (1832), which Berzelius said could be regarded as the dawn of a new day. The investigation of uric acid (1837) was likewise of fundamental importance in the history of organic chemistry.

The correspondence of these lifelong friends was published in 1888 by A. W. Hofmann (*q.v.*). Most of Wohler's work, however, lay in the field of inorganic chemistry. He isolated boron and silicon and prepared silicon nitride and hydride. He prepared phosphorus by the modern method, discovered calcium carbide and showed that it could be used to prepare acetylene. He showed the analogy between the compounds of carbon and silicon. He discovered quinone, hydroquinone and quinhydrone. He just missed the discovery, of vanadium and niobium. His studies touched practically every known element. He also obtained pure titanium and showed the similarity between this element and silicon and carbon.

The Royal society's *Catalogue* enumerates 276 separate memoirs written by Wöhler apart from 43 in which he collaborated with others. (R. E. O.)

WOHLGEMUTH (WOLGEMUT), **MICHAEL** (MICHEL) (1434–1519), the leading painter of Niirnberg in the late 15th century, is best remembered as the master of Albrecht Diirer (1486–90), who later painted his portrait (1516; Munich). After an obscure early period he laid the foundations of his modest fortunes by marrying (1472) Barbara, widow of the Niirnberg painter Hans Pleydenwurff, and in the next 40 years produced a series of large altarpieces, rich with carving and gilding, as well as portraits and book illustrations.

The altarpiece of St. Jacob, Straubing, is attributed to the beginning of this activity (*c.* 1475–76), and those of the Marienkirche. Zwickau (1476–79), the Stiftskirche, Feuchtwangen (1484), the Heiligkreuzkirche, Niirnberg (1486), and of Schwabach church (1506–08) are all documented products of his workshop.

With his stepson Wilhelm Pleydenwurff, Wohlgemuth completed the designs for the 650 woodcuts of Hartmann Schedel's *Weltchronik* in 1492 and the woodcuts of *Schatzbehalter der wahren Reichtümer des Heils* (1491); several other books of the period are evidently theirs.

No powerful, artistic personality emerges from these works. As a painter, Wohlgemuth was a competent technician, adapting current Flemish styles to local taste, but his search for expression leads often to insipidity or violence. His designs for woodcut extended the range of that medium, but were rapidly surpassed by Diirer and others. (D. KG.)

WOJCIECHOWSKI, STANISLAW (1869–1953), second president of the Polish republic, was born on March 1, 1869, at Kalisz, then a city of Russian Poland.

While a student at Warsaw university, he took part in the Polish Socialist movement which was also a struggle for Polish independence. Arrested in 1891 he was released the following year and went to Paris, where he was again arrested in 1893. Set free, he went to London where he helped to print the Polish Socialist periodical *Przedświt* (The Dawn). At that time Wojciechowski and Josef Pilsudski were friends. Meanwhile, Wojciechowski studied the co-operative system. On returning to Poland (1906), he devoted himself chiefly to developing co-operative societies.

During World War I he saw Germany as Poland's main enemy. In 1915 he went to Moscow where in 1917 he was elected president of the Council of Polish Parties' union. He returned to Warsaw in 1918. From Jan. 17, 1919 to July 24, 1920, he served as minister of the interior in three successive cabinets. Elected to the *sejm* (chamber of deputies) as a member of the Polish Peasant party in Nov. 1922, he was chosen to succeed the assassinated Gabriel Narutowicz as president of the republic on Dec. 20, 1922.

Wojciechowski and Marshal Pilsudski were henceforth friends no more. the former supporting parliamentary government, while the latter recommended a more authoritarian regime. In May 1926 Pilsudski staged a successful *coup d'état* and on May 14 Wojciechowski resigned. He took no further part in politics. He died at Golabki, near Warsaw, on April 9, 1953.

WOKING, a town and urban district in the Woking parliamentary division of Surrey, Eng., 25 mi. S.W. of London by road, in the valley of the Wey, amid extensive heathlands and pine woods. Pop. (1951) 47.596. Area 24.5 sq.mi. The parish church has an original Norman door. The Shah Jehan mosque. built in 1889, is the headquarters of the Muslim Society in Great Britain. Woking's development as a residential area dates from 1838 when the railway connected it with London; the Basingstoke canal also runs through the district. In 1885 Woking crematorium was built—the first in England. Besides numerous nursery gardens there are printing, rubber and packing works.

WOLCOT, JOHN (1738–1819), English satirist and poet, known under the pseudonym of PETER PINDAR, was baptized at Dodbrooke. Devonshire, on May 9, 1738. He was apprenticed to his uncle. John Wolcot, a surgeon at Fowey, and he took his degree of M.D. at Aberdeen in 1767. In 1769 he was ordained, and went to Jamaica with Sir William Trelawny, the governor. In 1772 he became incumbent of Vere, Jamaica, but on the death of his patron (1772) he returned to England, and settled as a physician at Truro. In 1781 Wolcot went to London, and took with him the young Cornish artist. John Opie, whose talents in painting he had been the first to recognize. He soon achieved fame by a succession of pungent satires on George III. Two of Wolcot's happiest satires on the "farmer king" depicted the royal survey of Whitbread's brewery and the king's naive wonder how the apples got into the dumplings. He had a broad sense of humour, a keen eye for the ridiculous and great felicity of imagery and expression. Some of his serious pieces—his rendering of Thomas Warton's epigram on *Sleep* and his *Lord Gregory*, for example—reveal an unexpected fund of genuine tenderness. He died at Latham Place, Somers Town, London, on Jan. 14, 1819, and was buried near Samuel Butler, the author of *Hudibras*, in St. Paul's, Covent Garden.

Polwhele, the Cornish historian, was well acquainted with Wolcot in his early life, and the best account of his residence in the west is found in vol. i of Polwhele's *Traditions* and in Polwhele's *Biographical Sketches*, vol. ii. Cyrus Redding was a frequent visitor at the old man's house, and has described Wolcot's later days in his *Past Celebrities*, vol. i, and his *Fifty Years' Recollections*, vol. i and ii.

WOLCOTT, ROGER (1679–1767), American administrator, was born in Windsor, Conn., Jan. 4. 1679, the son of Simon Wolcott (d. 1687). He was a grandson of Henry Wolcott (1578–1655), who emigrated to New England in 1628; assisted John Mason and others to found Windsor, Conn., in 1635; and was a member of the first general assembly of Connecticut in 1637 and of the house of magistrates from 1643 to his death. (Henry Wolcott the younger [d. 1680] was one of the patentees of Connecticut under the charter of 1662.) Roger Wolcott was a member of the Connecticut general assembly in 1709, one of the bench of justices in 1710, commissary of the Connecticut forces in the expedition of 1711 against Canada, a member of the council in 1714, judge of the county court in 1721 and of the superior court in 1732 and deputy governor and chief justice of the superior court in 1741. He was second in command to Sir William Pepperrell. with rank of major general in the expedition (1745) against Louisbourg, and was governor of Connecticut in 1751–54. He died in what is now East Windsor on May 17, 1767.

He wrote *Poetical Meditations* (1725), an epic on *The Agency of the Honourable John Winthrop in the Court of King Charles the Second* (printed in vol. iv, series 1, *Collections* of Massachusetts Historical society). His *Journal at the Siege of Louisbourg* is printed in pp. 131–161 of vol. i (1860) of the *Collections* of the Connecticut Historical society.

His son OLIVER WOLCOTT (1726–97) was graduated from Yale in 1747 and studied medicine with his brother Alexander (1712–95). In 1751 he was made sheriff of the newly established Litchfield county and practised law in Litchfield He was a member of the council in 1774–86 and of the Continental Congress in 1775–76, 1778 and 1780–84, and a commissioner of Indian affairs for the northern department in 1775. During the War of Independence he was active in raising militia in Connecticut. He was one of the signers of the Declaration of Independence; commanded Connecticut militia that helped to defend New York city in Aug. 1776; in 1777 organized more Connecticut volunteers and took part in the campaign against Gen. John Burgoyne; and in 1779 commanded the militia during the British invasion of Connecticut. In 1784. as one of the commissioners of Indian affairs for the northern department, he negotiated the treaty of Ft. Stanwix (Oct. 22) settling the boundaries of the Six Nations. In 1786–96 he was lieutenant governor of Connecticut, and in Nov. 1787 mas a member of the Connecticut convention which ratified the federal constitution. He became governor in 1796 upon the death (Jan. 1j) of Samuel Huntington, and served until his death on Dec. 1, 1797.

His son Oliver wrote a sketch of him in Sanderson's *Biography of the Signers of the Declaration of Independence* (Philadelphia, 1820–27).

Oliver's son, OLIVER WOLCOTT, JR. (1760–1833), was graduated from Yale in 1778. studied law in Litchfield and was admitted to the bar in 1781. With Oliver Ellsworth he was appointed (May 1784) a commissioner to adjust the claims of Connecticut against the United States. He mas controller of public accounts of Connecticut and auditor of the federal treasury. In June 1791 he became controller of the treasury, and in Feb. 1795 succeeded Alexander Hamilton as secretary of the treasury. At the end of 1800 he resigned after a bitter attack by the press. He re-entered politics as a leader of the "Toleration Republicans." and in 1817 presided over the state convention which adopted a new constitution, and in the same year was elected governor, serving until 1827. He died in New York city, June 1, 1833.

His grandson George Gibbs (1815–73) in 1846 edited *Memoirs of the Administration of Washington and John Adams . . . From the Papers of Oliver Wolcott, Secretary of the Treasury*. Wolcott write *British Influence on the Affairs of the United States Proved and Explained* (1804).

WOLF, FRIEDRICH AUGUST (1759–1824), German philologist and critic, was born on Feb. 1;. 1759, at Hainrode in the province of Hanover. He was educated at Nordhausen grammar school and Gottingen university. There he chose philology as his faculty. which then had no existence, and succeeded in carrying his point. He was dissatisfied with Heyne's treatment of Homer. and the two fell out. Later his edition of the *Symposium* obtained for hirn a chair at Halle. The moment was a critical one in the history of education. The literary impulse of the Renaissance was almost spent; scholarship had become dry and trivial. A new school, that of Locke and Rousseau, sought to make teaching more modern and more human, but at the sacrifice of mental discipline and scientific aim. Wolf was eager to throw himself into the contest on the side of antiquity. In Halle (1783–1807), by the force of his will and the enlightened aid of the ministers of Frederick the Great, he was able to carry out his long-cherished ideas and found the science of philology.

During his time at Halle Wolf published his commentary on the *Leptines* of Demosthenes (1789) and a little later the celebrated *Prolegomena* to Homer (1795). This book, the work with which his name is chiefly associated, was thrown off in comparative haste to meet an immediate need. It has all the merits of a great piece of oral teaching — command of method, suggestiveness, breadth of view. From it originated the great Homeric controversy and Wolf's main points, oral tradition, deliberate revision after reduction to writing and plurality of authorship, are still the crucial questions. The French invasion swept away the university, and the rest of his life was spent at Berlin, where he had another professorship. His most finished work, the *Davstellung der Altertumswissenschaft,* though published *at* Berlin (1807), belongs essentially to the Halle time. At length his health gave may. He was advised to try the south of France. He got as far as Marseilles, and died there on Aug. 8. 1824.

Mark Pattison wrote an admirable sketch of Wolf's life and work in the *North British Review* (June 1865), reproduced in his *Essays* (1889); *see* also J.E Sandys, *Hist. of Class Schol*, iii, pp 51–60 (1908). Wolf's *Kleine Schriften* mere edited *by* G. Bernhardy (Halle, 1869) Works not included are the *Prolegomena*, the *Letters to Heyne* (1797), the commentary on the *Leptines* (Halle, 1789) and a translation of the *Clouds* of Aristophanes (1811).

WOLF, HUGO (1860–1903), Austrian composer of songs, was born at Windischgraz in Styria, the son of a leather merchant from whom he inherited his musical talent and received his first instruction. He did not get on well at school. nor at the Vienna conservatory to nhich he nent in 187j and which he left under a cloud in 1877; he made enemies in the musical world of Vienna, which was not, hen-ever, a difficult thing to do in the foolish partisan warfare then raging over Liszt, Wagner and the "music of the future." and he ended his days in a madhouse. On the other side of the account are to be set the story of his friendships, the genius of his compositions and the enthusiasm generated by the combination of these two together that resulted in the establishment. during his lifetime. of Wolf societies (Hugo-Wolf-Verein) for the propagation of his music in Berlin, in Vienna and in other cities.

In 1878 he fell in love and had his first burst of inspired creative activity — he spoke of these eruptions as "days of Lodi." Resemblance to Schumann is to be found not only in this conjunction of events but in the music of the early songs. In 1884 he became music critic of the *Wiener Salonblatt.* The juvenilia composed between these dates include a string quartet in D minor, a symphonic poem, *Penthesilea,* some choral as well as solo settings of Nikolaus Lenau and Goethe. During his four years as a critic he attacked Brahms and the conservatives and supported Wagner, whom he idolized as man and artist. Wagner's artistic tenets became Wolf's own creed and were applied, with the necessary modifications, to song writing. In 1888 he published the 53 *Mörike Lieder* and a group of 20 songs to poems of Joseph von Eichendorff. Under this same creative impulse he began his settings of Goethe, of which there are 51 in all. After a brief interval the *Spanisches Liederbuch* of 44 songs followed, from poems translated by Paul Heyse and Emanuel Geibel. Then came some lean years before the discovery of a libretto for an opera, such as he had long desired to write, set free the flood of creation once more *Der Corregidor* mas composed during 1895. In 1896 he published the second part of the *Italienisches Liederbuch* of Heyse, the first part having been completed in 1891. Work on a second opera was broken off in 1897 by his first bout of insanity. After a year there was a recovery but no further production — his last songs were three settings of Michelangelo in 1897—and in 1898 he became permanently insane for the remaining five years of his life.

Apart from the delightful *Italienische Serenade,* which exists in two forms, for string quartet and chamber orchestra, Wolf's fame depends entirely on his songs, of nhich the chief characteristic is the subtle interplay of words and music. He insisted that they were songs for voice and piano — the piano part was not an accompaniment — although he actually scored a number of them for orchestra subsequently. All song writers. certainly the German *Lieder* uriters, may be placed on a scale which has pure poetry and pure music for its logical extremities. Wolf's place is near the literary end—so much so that his method and influence have been described by one critic in the phrase "the Poetic Supremacy Act, 1887." It is not only that he is punctilious about verbal rhythm and vocal inflections, it is a delicacy of psychological insight which makes a song by Wolf a reincarnation of the poem in another medium Wolf's songs do not sing themselves with the melodic spontaneity of Schubert or Brahms. composers nearer to the musical end of the musicopoetic scale, but they represent the most complete integration of the two arts ever achieved.

A few of his songs have achieved popularity; among these "Verborgenheit," "Anakreons Grab" and "Der Rattenfaenger" may be instanced.

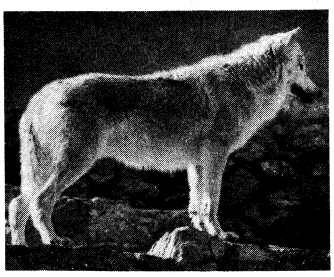
WOLF, MAX (MAXIMILLIAN FRANZ JOSEPH CORNELIUS) (1863–1932), German astronomer whose survey of the Milky Way showed its true structure for the first time, was born at Heidelberg on June 21, 1863. Educated at Heidelberg university, where he attained distinction as a mathematician. he was given the position of *Privatdocent* in the university in 1890 and in 1893 was appointed to a special professorship in astrophysics and made director of the new observatory at Konigstuhl, near Heidelberg. In 1902 he was elected to the chair of astronomy in Heidelberg university, a position. together with the directorship of the observatory, which he retained until his death in Heidelberg on Oct. 3. 1932. Wolf was an observational astronomer of the first rank and was especially active in the application of photography to the discovery of asteroids, spectroscopy and photography of nebulae both galactic and extragalactic, and the application of the stereocomparator to the discovery of stars with large proper motion. (O. J. E.)

WOLF, the typical wild species of the dog family. The gray or timber wolf. *Canis lupus,* is the commonest and most aidespread species. Excluding certain domestic breeds of dogs, it is the largest living canid. A large northern male may measure 7 ft. in length including the bushy, 2-ft tail. Females are smaller than males; southern races. smaller than northern. The fur is dense, long and soft and, although usually gray, may be brown. reddish, black or almost white. The gray wolf is a powerful animal with a broad head, robust limbs, large feet and deep but narrow chest. Once gray wolves were widely distributed over North America and Eurasia. In North America they are still common from Alaska through northern Canada to the northern plains states, making rare appearances in the Rockies. They are extinct in the British Isles and, except for occasional wanderers in the winter, are not found in west-central Europe. They may occur as far south as India.

The gray wolf is a savage and fearless predator quite capable of bringing down an elk, bison or horse. Wolves usually hunt in small groups, rarely in large packs, catching larger prey—deer, caribou, bighorn, moose—by a chase during which they display both speed and endurance. Nonetheless, their diet consists mainly of small animals such as rodents, rabbits and hares. Wolves are prodigious eaters and when ample food is available will gorge themselves. They will return to an old kill to eat even after it has become putrid although fresh meat is preferred. Wolves perform an important function of controlling the numbers of large herbivores and removing the old, maimed and unhealthy individuals which are most easily caught. Unfortunately they display a liking for domestic livestock and have thus earned persecution by man. They are much hunted and trapped, and survivors become exceedingly elusive and wary. Gray wolves are truly nilderness animals and inhabit both open and timbered areas. Near human habitation they tend to stay in dense timber and thickets.



R VAN NOSTRAND FROM THE NATIONAL AUDUBON SOCIETY

NORTH AMERICAN TIMBER OR GRAY WOLF (CANIS LUPUS)

Gray wolves mature sexually in two or three years and until then, and often thereafter. remain with the family group. Wolves often mate for life. Breeding occurs between December and April and 4 to 14 pups are born 63 days later. The female prefers to appropriate the den of another animal—fox or woodchuck—enlarging it as necessary. The usual site is a bank or rocky crevice that affords a good view and sunny exposure. Members of a family group are friendly to each other but rarely accept an interloper; more often he is driven off or killed. All members of the group solicitously care for the young.

The red wolf, C. niger, of the southeastern United States, is a smaller species and may be tawny, reddish or black. Structurally it resembles the coyote The Antarctic wolf (Dusicyon) is a foxlike canid from the Falkland Islands; the maned wolf is a South American canid of the genus *Chrysocyon;* the aardwolf of Africa (Proteles) is a relative of the hyena; the Tasmanian wolf is a marsupial.

The largest known wolf, the now extinct dire wolf, seems to have been common in western North America during the Pleistocene period; its body length was about 6 ft.

WOLFDIETRICH, German hero of romance. The tale of Wolfdietrich is connected with the Merovingian princes, Theodoric and Theodebert, son and grandson of Clovis; hut in the Middle High German poems of Ortnit and *Wolfdietrich* in the *Heldenbuch* (*q.v.*) Wolfdietrich appears as the son of Hugdietrich, emperor of Constantinople. He was repudiated by his father, who mistakenly believed him to be illegitimate, and was brought up by the emperor's faithful retainer, Berchtung von Meran. After Hugdietrich's death Wolfdietrich was driven from his inheritance by his own brothers. Berchtung and his 16 sons stood by Wolfdietrich. 6 being slain and the other 10 imprisoned. After a long exile in Lombardy at the court of King Ortnit (q v.), the hero returned to liberate his friends and regain his kingdom. Wolfdietrich's exile and return suggested a parallel with the history of Dietrich von Bern (*q* v.), with whom he was indeed often actually identified. Among the exploits of Wolfdietrich was the slaughter of the dragon which had slain Ortnit. He thus took the place of Hardheri, the original hero of this feat. The myth attached itself to the family of Clovis, around which epic tradition rapidly gathered. Some critics believe Hugdietrich to be the epic counterpart of Theodoric (Dietrich: the name might be a Latinized form of Hugo Theodericus), eldest son of Clovis. Wolfdietrich represents his son Theodebert (d. 548), whose succession was disputed by his uncles. But father and son are merged by a process of epic fusion, so that Wolfdietrich appears to be the counterpart sometimes of Theodoric and sometimes of Theodebert.

The story of how Hugdietrich won his bride Hildburg, daughter of the king of Salonika, forms in one manuscript version a separate introduction to the Wolfdietrich romance.

WOLFE, CHARLES (1791–1823), Irish poet, son of Theobald Wolfe of Blackhall. County Kildare, was born on Dec. 14, 1791. He was educated at English schools and at Trinity college, Dublin. where he matriculated in 1809 and graduated in 1814. He was ordained priest in 1817, and obtained the curacy of Ballyclog, County Tyrone, which he shortly exchanged for that of Donoughmore in the same county. He died at Cork on Feb. 21, 1823, in his 32nd year. Wolfe is remembered solely by his stirring stanzas on the "Burial of Sir John Moore." written in 1816 in the rooms of Samuel O'Sullivan, a college friend, and printed in the *Newry Telegraph.*

WOLFE, JAMES (1727–1759), mas born at Westerham, Kent. Eng. on Jan. 2. 1727. He nas the elder son of Lieut. Col. Edward Wolfe. an experienced soldier, nho afterward rose to the rank of lieutenant general. and of Henrietta, daughter of Edward Thompson, of Long Marston, Yorkshire. He received his brief education at private schools. the first at Westerham, the second at Greenwich. From his earliest years he was determined to be a soldier, despite his weak health, which just prevented him from sailing as a volunteer with the ill-fated Cartagena expedition of 1740. In 1741 he received a commission in the marines. but, having transferred into the line. he was sent to Flanders in the spring of 1742 as an ensign in the 12th foot. Until the close of the War of the Austrian Succession, he was continuously on active service, being present at the battles of Dettingen. Falkirk, Culloden and Laffeldt, uhere he was wounded. His zeal, intelligence and gallantry won him the regard of his superiors, notably the duke of Cumberland. In 1743 he was appointed adjutant of the 12th; next year he received a captain's commission in the 4th; in 1745 and 1747 he served as brigade major; while in Scotland he was aide-de-camp to General Hawley.

In 1749 Wolfe, with the rank of major, was appointed acting commander of the 20th foot, whose lieutenant colonel he became in the following year. He was with this regiment for eight years, during which it was stationed at several towns in Scotland and, from 1753, at various places in the south of England.

In 1757 Wolfe was appointed quartermaster general in Ireland, but before entering upon his duties he was chosen by Pitt for the same position in the expedition against Rochefort. Though the enterprise failed utterly, Pitt and the English public had substantial grounds for their belief that it would have succeeded if plans for landing suggested by Wolfe had been acted upon by the commanders in chief. Wolfe was consequently selected to serve as brigadier under Amherst in the force which was to attempt the capture of Cape Breton and Quebec in 1758. At the siege of Louisburg he played a conspicuous and brilliant part.

Meanwhile, Wolfe had been made colonel of the 67th, but soon after his return home Pitt gave him the command of the expedition which was to renew the attempt to take Quebec. He was to have the local rank of major general, and, though technically under Amherst, to enjoy full discretion in his conduct of operations. Leaving England in Feb. 1759, Wolfe mustered his troops, rather more than 9,000 in number, at Louisburg; and thanks to the marvellous seamanship and the unselfish co-operation of Admiral Saunders, they arrived without mishap before Quebec in the last week of June. Wolfe's first intention was to land above, though near, the town, so as to attack the weak fortifications from the plains of Abraham; but the plan was abandoned, probably because of the misgivings of Saunders. The British, however, seized the heights on the south shore of the St. Lawrence, opposite Quebec, which they were thus able to bombard, and established a camp at the mouth of the Montmorency river, between which and the city Montcalm had entrenched nearly all his army. Perplexed by Montcalm's deliberate inactivity, Wolfe, on July 31, made an ill-conceived, unsuccessful and costly assault on the French lines. Wolfe, at this crisis, felt it his duty to consult his three brigadiers. When they counseled a landing to the west of Quebec, he readily concurred, and in a few days more than 3,000 men were transferred to ships above the town. Instead, however, of landing above Quebec, he resolved to take a force downstream and disembark it secretly at the Anse du Foulon, a cove only 1½ mi. from the city. This operation he successfully carried out in the early hours of Sept. 13. Montcalm was constrained to make a precipitate attack, and the British musketry decided the issue in a few minutes. Wolfe, however, was mortally wounded by a musket ball, and died after the French gave way.

WOLFE, THOMAS CLAYTON (1900–1938), U.S. novelist, was born on Oct. 3, 1900, at Asheville, N.C., the locale of much of his best writing. His father, William Oliver Wolfe, the "Old Gant" of his novels, was a stonecutter of Pennsylvania descent, while his mother, Julia Elizabeth Westall Wolfe, the "Eliza" of the early novels, came from a family prominent in Appalachian North Carolina affairs. Educated privately, he entered the University of North Carolina; Chapel Hill, in 1916, where he became interested in the theatre and wrote and acted in several one-act plays. In the fall of 1920 he enrolled in George Pierce Baker's 47 Workshop at Harvard university, intending to become a playwright, and studied for several years with Baker, John Livingston Lowes and others. Several of his plays were produced at Harvard, including "Welcome to Our City" (1923). It was there, too, that he began the play known as *Mannerhouse* (published 1948), which was never produced during his lifetime.

In 1923 Wolfe left Harvard for New York city where, except for trips to Europe and elsewhere, he resided until his death. Still intending to be a playwright, he earned a livelihood by teaching at the Washington Square college of New York university, described in several of his novels. It was in 1926, while abroad, that he began work on the novel that eventually became *Look Homeward, Angel* (1929), in which he recounted the growth of an autobiographical protagonist, "Eugene Gant," in the mountain town of Altamont. During the late 1920s he was the close associate of the theatrical designer Aline Bernstein, who appears as "Esther Jack" in his last two novels.

After publication of *Look Homeward, Angel,* Wolfe resigned his teaching position to devote full time to his writing. Not for six years, however, did he produce another book. In 1935 appeared *Of Time and the River*, perhaps the most turbulent of his books, and a collection of shorter pieces, *From Death to Morning.* The events of those years are described in his memoir, *The Story of a Novel* (1936).

Wolfe did not publish another novel during his lifetime, though when he died in Baltimore, Md., on Sept. 15, 1938, he left a prodigious quantity of manuscript, from which were extracted two more novels, *The Web and the Rock* (1939) and *You Can't Go Home Again* (1940), and a collection of shorter pieces and chapters of an uncompleted novel, *The Hills Beyond* (1941). Wolfe's *Letters to His Mother* (1943) were also published, as well as his *Selected Letters* (1956).

Gifted as he was with the faculty of almost total recall, Wolfe's fiction is characterized by an intense consciousness of scene and place, together with what is often an extraordinary lyrical power. Though he denied it, his fiction was almost literally autobiographical. Indeed, publication of his first novel caused a great furor in Asheville. Subsequent books depicted the struggles of a young writer to become established in the metropolis, and his first experiences with literary fame. Always intensely conscious of time and memory, Wolfe in his best work drew on his early environment and family memories to produce fiction rich, in his own words, "in space and color and in time." Though his later books contain episodes and sequences of great vividness and interest, they are too often uncontrolled in their form, and his most successful novel is probably his first, *Look Homeward, Angel,* which bids fair to become an American classic.

WOLFENBÜTTEL, a town of Germany, in the *Land* of Lower Saxony, situated on both banks of the Oker, 7 mi. S. of Brunswick on the railway to Harzburg. Pop. (1950) 34,401. The library is rich in Bibles and books of the early Reformation period, and contains some fragments of the Gothic Bible of Ulfilas.

A castle is said to have been founded on the site of Wolfenbüttel by a margrave of Meissen about 1046. When this began in 1267 to be the residence of the early Brunswick or Wolfenbüttel line of counts, a town gradually grew up around it. The town passed into possession of the Brunswick-Wolfenbüttel family in 1671 and for nearly 100 years was the ducal capital.

WOLFF (less correctly **Wolf**), **CHRISTIAN** (1679–1754), German philosopher and mathematician, the son of a tanner, was born at Breslau on Jan. 24, 1679. At the University of Jena he studied first mathematics and physics, to which he soon added philosophy. In 1703 he qualified as *Privatdozent* (official but unpaid lecturer) in the University of Leipzig, where he lectured till 1706, when he became professor of mathematics and natural philosophy at Halle through the influence of Leibniz, of whose philosophy his own system is a modification. In Halle Wolff limited himself at first to mathematics, but presently added physics, and eventually all the main philosophical disciplines. But the claims which Wolff advanced on behalf of the philosophic reason (*see* Rationalism) appeared impious to his theological colleagues. Halle was the headquarters of Pietism, which, after a long struggle against Lutheran dogmatism. had itself assumed the characteristics of a new orthodoxy. Wolff's professed ideal was to base theological truths on evidence of mathematical certitude, and strife with the Pietists broke out openly in 1721 when Wolff. on the occasion of laying down the office of prorector, delivered an oration "On the Practical Philosophy of the Chinese" (Eng. trans.: 1750), in which he instanced the moral precepts of Confucius as evidence of the power of human reason to attain by its own efforts to moral truth. For ten years' Wolff was subjected to attack, until in a fit of exasperation he appealed to the court for protection. His enemies, however, told Frederick William I that. if Wolff's determinism were recognized, no soldier who deserted could be punished. since he would only have acted as it was predetermined that he should. Wolff was at once deprived of office and ordered to leave Prussia on pain of death. He crossed over into Saxony, where the landgrave of Hesse received him with every mark of distinction, and the circumstances of his expulsion drew universal attention to his teaching at Marburg, where he was now established. Over zoo books and pamphlets appeared lor or against Wolff's doctrine before 1737, not reckoning the systematic treatises of Wolff and his followers. One of the first acts of Frederick the Great was to recall Wolff (1740) to Halle. In 1743 he became chancellor of the university, and in 1745 he received the title of *Freiherr* from the elector of Bavaria. But his matter was no longer fresh. he had outlived his power of attracting students. and his classrooms remained empty. He died on April 9, 1754.

Wolff's most important works are as follows: *Anfangsgründe aller mathematischen Wissenschaften* (1710; in Latin. *Elementa matheseos universae,* 1713–15); *Vernünftige Gedanken von den Kräften des menschlichen Verstandes* (1712; Eng. trans.. 1770); *Vern. Ged. von Gott, der Welt und der Seele des Menschen* (1719); *Vern. Ged. von der Menschen Thun und Lassen* (1720); *Vern. Gcd. von dem gesellschaftlichen Leben der Menschen* (1; 21); *Vern. Ged. von den Wirkungen der Natur* (1723); *Vern. Ged. von den Absichten der natürlichen Dinge* (1724): *Vern. Ged. von dem Gebrauche der Theile in Menschen, Thieren und Pflanzen* (1725) (the last seven may be described briefly as treatises on logic, metaphysics, moral philosophy. political philosophy. theoretical physics, teleology, physiology); *Philosophia rationalis, size logica* (1728); *Philosophia prima, sive Ontologia* (1729); *Cosmologia generalis* (1731); *Psychologia empirica* (1732); *Psychologia rationalis* (1734); *Theologia naturalis* (1736–37); *Philosophia practica universalis* (1738–39); *Jus naturae* and *Jus Gentium* (1740–49); *Philosophia moralis* (1750–53). His *Kleine philosophische Schriften* have been collected and edited by G. F. Hagen (1736–40).

In addition to Wolff's autobiography (*Eigene Lebensbeschreibung*, ed. by H. Wuttke. 1841) and the usual histories of philosophy, *see* C. G. Ludovici, *Ausführlicher Entwurf einer vollständigen Historie der Wolff'schen Philosophia* (1736–38); J. Deschamps, *Cours abrégé de la philosophie wolffienne* (1743); F. W. Kluge, *Christian won Wolff der Philosoph* (1831); W. Arnsperger, *Christian Wolffs Verhältnis zu Leibniz* (1897); H. Pichler, *Über Christian Wolffs Ontologie* (Leipzig, 1910); H. Ostertag. *Der philosophische Gchalt des Wolff-Manteuffelschen Briefwechsels* (Leipzig, 1910).

WOLF-FERRARI, ERMANNO (1876–1948). Italian composer. was born at Venice on Jan. 12. 1876. his father being a distinguished German painter and his mother an Italian. He studied with Joseph Rheinberger at Munich, and on his return to Venice brought out his oratorio La *Sulamite*. He then went to Germany and revised his early opera *Cinderella* for production at Bremen in 1902. This was followed by *Le donne curiose* and *I quattro rusteghi* (1906), both of which were performed at Munich. His first great success came with *Il segreto di Susanna*, ***a*** one-act comedy. first given at Munich in 1909. Still more popular was *The Jewels of the Madonna* (Berlin, 1911), which gave him an international reputation. He also wrote a chamber symphony *Rispetti* for soprano. op. 11. and a pianoforte quintet (1920). From 1y02 to 1y12 Wolf-Ferrari was director of the Liceo Benedetto Marcello in Venice. He died on Jan. 21, 1948, in Venice.

WOLF FISH (SEA WOLF, SEA CAT) (*Anarrhichas*), a marine fish, the largest of the blenny group (*see* BLENNY). The body is long, subcylindrical in front, compressed in the tail region, smooth and slippery, with rudimentary scales embedded in the skin. An even dorsal fin exten is the whole length of the back and a similar fin from the vent to the caudal fin, as in blennies. The pectorals are large and rounded, the pelvic fins entirely absent. Both jaws are armed in front with strong conical teeth, and on the sides with two series of large molars, a double band of similar molars occupying the middle of the palate. By these teeth the wolf fish is able to crush the hard shells of the crustaceans and mollusks on which it feeds.

The wolf fish probably does not deserve the character of ferocity often attributed to it.

Wolf fish inhabit the northern seas of both hemispheres, one (*A. lupus*) being common on the coasts of Scandinavia and northern Britain and two in the seas around Iceland and Greenland. Two others occur in corresponding latitudes in the North Pacific. They attain a length of over 6 ft. and in the north are esteemed as food, both fresh and preserved.

WOLFRAMITE or WOLFRAM, the chief ore of the metal tungsten, which is used as a constituent of high-speed and other special steels, as well as certain nonferrous alloys; for the filaments of electric lamps; and for various other technical uses, often as sodium tungstate. Tungsten carbide is widely used in metal-working tools and. in place of tungsten steel alloys. as cutting edges and points of wear in machinery.

Wolframite is commonly associated with tin ore in lodes and veins in and around granites. This form occurs in Cornwall; northwest Spain and north Portugal; Saxony; lower Burma; the Malay peninsula; and Queensland and Tasmania in Australia. In the United States the largest production comes from Colorado, Idaho and North Carolina.

Wolframite consists of an isomorphous mixture in varying proportions of the tungstates of iron and manganese, $FeWO_4$ and $MnWO_4$. Varieties with dominant iron are often called ferberite, with dominant manganese. hiibnerite, but since iron and manganese have nearly the same atomic weight the percentage of tungsten trioxide (WO_3), about 76%, shows little variation and the difference is not of commercial importance. Wolframite crystallizes in the monoclinic system. usually in prismatic forms. and there is a perfect cleavage. The colour is brown to black. with a sub-metallic to metallic lustre, especially on cleavage faces. Hardness is 5 to j.j and density 7.0 to 7.j. For material on the mining and processing of wolframite and for bibliography *see* TUNGSTEN.

(CL. F.)

WOLFRAM VON ESCHENBACH (*fl.* early 13th century), one of the greatest medieval German poets. He belonged to a Bavarian family of the lower nobility and apparently served a succession of Franconian lords: Abenberg, Wildenberg and Wertheim are among the places he names in his works. and he also knew the court of Hermann of Thuringia at the famous castle of the Wartburg. It is not known exactly when he died. but since in his epic poem *Willehalm* he laments the death of Hermann of Thuringia (1217). and since *Willehalm* was followed by *Titurel*, his last work. he may be assumed to have died shortly after 1220.

The corpus of Wolfram's literary work. as it has come down to us. consists of eight lyric poems (five of them *Tagelieder*, or "dawn songs"), the epics *Parzival* and *Willehalm* (the latter unfinished) and short fragments of a further epic. the so-called *Titurel*, which elaborates the story of Parzival and Sigune in book iii of *Parzival*. The dawn songs are a natural complement to Wolfram's epic art in that the scenes they describe are like "stills" from an epic narrative. experienced and depicted as intense dramatic moments in a broad span of human action; the intensity and originality of Wolfram's imagination are, indeed, almost too great for the medium of medieval lyric poetry.

Parzival, probably written between 1200 and 1210, is one of the great literary works of the middle ages, distinguished alike by elevation of purpose and moral tone, and by power of poetic inspiration. The problem of the sources of the work is still unsolved. for although much of the story corresponds to Chrétien de Troyes' *Perceval* (*c.* 1180), Chrétien's poem is unfinished and also lacks the Gahmuret sequence at the beginning of Wolfram's work. The content of *Parzival*, books i and ii and books xiii to xvi, must therefore derive from another, as yet unknown source; Chrétien's is. in any case, not the first French version of the story of the Holy Grail, while Wolfram's acknowledgments in his poem to an unidentified and possibly quite fictitious Provençal poet called Kyot (Guiot) have only led to further inconclusive speculation. All that can be said with certainty is that *Parzival* is based on Chrétien together with other romance sources, and that at the same time it contains much material invented, or at least completely transformed. by Wolfram.

The cycles of action in this vast work (it totals about 25.000 lines) revolve around three points of attraction: the Grail, Parzival and King Arthur. The Grail motif is of Christian origin, and is widely treated in medieval French literature from about 1176 onward; the story of Parzival, "the guileless fool," who through his innocence and artlessness reaches a goal denied to wiser men and becomes king of the Grail, goes back to a popular fairy tale motif; from the Celtic background of Arthurian legend stems the ideal of chivalric virtue, together with the adventures of Gamain, Arthur's nephew, to which books viii to xiii of *Parzival* are predominantly devoted.

In the *Bildungsroman* of Parzival's career Wolfram presents his ideal picture of spiritual education and development. Where Hartmann von Aue extols the virtues of moderation in human conduct, and Gottfried von Strassburg proclaims the satisfaction of worldly happiness, Wolfram preaches the moral gospel of otherworldly values and leads from the empirical and the temporal to the ideal and the divine. The kaleidoscope of Parzival's adventures, with their culmination in the temple of the Grail, is a symbol of chivalric life at its highest, in which the demands of the world and of God are brought together in a single ethico-religious principle. In a nider context the story is an allegory of man's history—his innocent happiness as a child in God, his estrangement from his divine home through the enticements of the world, and his return to God after his reconciliation of the warring claims of the flesh and the spirit. The profundity of Wolfram's theme is matched by his language, which, in all his epics, is rhetorical and complex; his trains of thought. too, are often original to the point of obscurity. *(See* also GRAIL, *THE* HOLY; PERCEVAL)

Willehalm, written after *Parzival,* is a religious epic based on a *chanson de geste* entitled *La bataille d'Aliscans,* and tells the history of the famous crusader William of Toulouse. It is nritten for the edification of Christian knights, and sets before them an example both of religious devotion and of worldly honour.

Wolfram's influence on later poets was profound, and he joins Hartmann von Aue and Gottfried von Strassburg in the great triumvirate of Middle High German epic poets.

Dilthey, *Von deutscher Dichtung und Musik,* pp. 107–130 (1933) ; M. F. Richey, *Studies of Wolfram of Eschenbach* (1957) ; G. Weber, Der *Gottesbegriff des Parzival* (1935). There is an English translation of *Parzival* by E. H. Zeydel (1951). (RD. J. T.)

WOLLASTON, WILLIAM (1659–1724), English moralist whose ethical doctrine of "conformity to the truth" in several ways foreshadows philosophical views current in the 20th century, was born at Coton-Clanford on March 26, 1659, of an old Staffordshire family. Having studied at Sidney Sussex college. Cambridge, from 1674 to 1681, he took a post as a schoolteacher in Birmingham in 1682 and was subsequently ordained priest. In 1688, however, he inherited the greater part of the family fortune from his cousin William Wollaston of Shenton (Leicestershire). This enabled him to set up house in London, to marry (1689) and to devote the rest of his life to scholarship and to philosophy. He died on Oct. 29, 1724.

Wollaston was affable to his few intimates and believed strongly in private charity, but suffered from headaches and lived a secluded life. He had 11 children. some of whom died in infancy. He wrote much, but destroyed many of his manuscripts, apparently from fastidiousness of taste. He published a verse paraphrase of part of Ecclesiastes in 1690 and had a Latin grammar privately printed in 1703. His major work, *The Religion of Nature Delineated,* of which a few copies were circulated in 1722 ("as a *private monument* of one that meant well"), was published in 1724. An autobiographical memoir that he had composed in 1709 was printed by J. Nichols. *History and Antiquities of the County of Leicester,* iv, part 2 (London, 1811).

The Religion of Nature Delineated, which is remarkable for its literary elegance, is divided into nine sections. In the first, Wollaston propounds his fundamental maxim *"That whoever acts as if things were so, or nof so, doth by his acts declare, that they are so, or not so"* and makes "the formal ratio of moral good and evil . . . to consist in a conformity of men's acts to the truth." "Truth is but conformity to nature." which is tolerated. if not wholly approved, by God, so that to reject it is rebellion against God. To distinguish between acts of greater or lesser immorality, a principle of degree is introduced, whereby such acts are assessed according to the "importance" or the number of truths violated. Sec. ii deals with hedonism: "The way to happiness and the practice of truth incur the one into the other." Sec. iii puts forward a rationalist theory of knowledge of the truth and defines natural religion as "The pursuit of happiness by the practice of truth and reason." Sec. iv contains a pragmatic dismissal of arguments about free will: if me doubt our capacity to act conformably to the truth, "the short way of knowing this certainly is to try." Sec. v–viii comprise a statement of the usual arguments of theism; an account of miracles as effects of divine providence; a demonstration of the necessity of a future state because God is reasonable; a defense of oral and public prayer, not for God but *"upon our own account* and to make our adorations as compleat as we are able" (language is held to be almost indispensable to thought) ; and an exposition of the natural law in terms of conformity to truth, with particular reference to political and social organization and to family life. Sec. ix deals with the individual soul as "the subject or *supposition* of self-consciousness," nonmaterial and immortal; it is "their different degrees and habits of reasonableness or unreasonableness" that determine the station that souls will find in the future world.

Wollaston's natural religion is theistic but not necessarily Christian; it was sometimes ignorantly confused with Thomas Woolston's deism. His ethical system was attacked, notably by Jeremy Bentham, as reducing all immorality to telling a lie. It can be maintained, however, that he related virtue to truthtelling rather by way of analogy than by strict identification.

See Clifford G. Thompson, *The Ethics of William Wollaston* (Boston, 1922).

WOLLASTON, WILLIAM HYDE (1766–1828). English chemist and natural philosopher who proved the identity of frictional and voltaic electricity and made other important discoveries, was born at East Dereham. Norfolk, Aug. 6, 1766. Wollaston was educated at Charterhouse, and afterward at Caius college, Cambridge. He received his medical degree in 1793 and practised for several years. He was elected a fellow of the Royal society in 1793 and became its secretary in 1804, serving until 1816. He died in London Dec. 22, 1828.

Most of Wollaston's original work deals more or less directly with chemical subjects, but diverges on all sides into other specialties. In chemistry he discovered *(c.* 1804) how to work platinum on a practical scale and he made a fortune of about £30,000 from his secret process.

Wollaston was the first to detect the metals palladium and rhodium *(qq.v.)* in crude platinum (1804–05). In 1808 he discovered instances of multiple proportions among the alkali oxalates, sulfates and carbonates. Anticipating Jacobus van't Hoff and Joseph Le Bel, he predicted the necessity of acquiring a three-dimensional geometrical conception of the relative arrangement of the elementary atoms. He discovered cystine (1810). In 1809 he proved the elementary character of columbium (niobium) and titanium. In 1801 he gave experimental proof of the identity of frictional and voltaic electricity.

In optics he was the first (1802) to observe dark (Fraunhofer) lines in the solar spectrum. He described the reflecting goniometer in 1809 which permitted measurement of the angle formed by rays of light reflected from crystal facets allowing angles of even minute crystals to be measured accurately. The camera lucida

(1807) greatly aided microscopists and others who had to make accurate drawings of very small objects.

He provided microscopists with the "Wollaston doublet." and applied concavo-convex lenses to the purposes of the oculist. His cryophorus was described in 1813 in a paper "On a Method of Freezing at a Distance."

In 1821, after Hans C. Oersted (17jj–1851) had shown that a magnetic needle is deflected by an electric current. Wollaston unsuccessfully attempted to transform that deflection into a continuous rotation. When Michael Faraday (*q.v.*) who overheard a portion of his conversation with Humphry Davy on the subject. was subsequently more successful, Wollaston asserted his own priority, which Farraday would not admit.

He was a member of the royal commission which opposed adoption of the decimal system of weights and measures (1819). He proposed the imperial gallon measure adopted by parliament in 1824. He endowed the fund in the Geological Society of London from the proceeds of which is granted the Wollaston prize. The mineral wollastonite (*q.v.*) was named after him.

An appreciative essay on Wollaston will be found in George Wilson. *Religio Chemici* (1862). *See* also *E.* Ferguson, *Journal of Chemical Education* (1941). (R. E. O.; X.)

WOLLASTONITE, a mineral named after William Hyde Wollaston and consisting of calcium silicate, is used in many ceramic products, including floor and wall tiles. electrical insulators and porcelain fixtures, in welding rod coatings and as a paint extender.

Wollastonite is mined in Essex county, New York. It commonly occurs as white tablets. short prismatic crystals or cleavable masses in metamorphosed limestones. The formula is $CaSiO_3$, and it crystallizes in the triclinic system. Three cleavage traces in the zone perpendicular to the b axis (one perfect, one less perfect and one poor), forming angles approximately 84° and 32°, are commonly present and serve to distinguish wollastonite from similar-appearing white pyroxenes and amphiboles.

Wollastonite commonly occurs with other calcium-containing silicates such as diopside (a pyroxene), tremolite (an amphibole). garnet and epidote and is thought to represent the reaction of calcite with quartz:

$$CaCO_3 + SiO_2 \rightarrow CaSiO_3 + CO_2$$

This reaction is sensitive to temperature and carbon dioxide pressure and occurs at 450° C. at one atmosphere carbon dioxide pressure with the temperature increasing with increasing gas pres-, sure. Therefore, ii the gas pressure can be estimated, the formation of wollastonite could serve as a temperature indicator and vice versa.

The crystal structure of wollastonite adopts the single chain structure of the pyroxenes but with a different arrangement for the relative positions of the unshared oxygen atoms between the SiO_4 tetrahedra (see PYROXENE). Because of an over-all similarity to the pyroxenes, considerable amounts of iron. magnesium and manganese can be taken into solid solution in the mineral.

A monoclinic modification of wollastonite called parawollastonite has almost identical physical properties and geologic occurrence. The two minerals have been found to occur together in limestone inclusions in volcanic rocks at Monte Somma, Italy. Wollastonite float from Riverside county. California. is used as an ornamental stone because of its resemblance to driftwood.

(G. W. DEV.)

WOLLIN or WOLIN, an island formerly in the Prussian province of Pomerania and after World War II in Szczecin province. Pol.. the more easterly of the islands at the mouth of the Oder which separate the Stettinisches Haff from the Baltic sea. It is divided from the mainland on the east by the Dievenow channel. and from Usedom on the west by the Sn-ine. It has an area of 95 sq.mi. Heath and sand alternate with swamps, lakes and forest on its surface. which is flat except for low hills in the southwest. Cattle rearing and fishing are the chief resources of the inhabitants. Some of the villages are summer bathing resorts. Wollin (Wolin), the only town. is situated on the Dievenow, and carries on the industries of a small seaport. Pop. (1950) 1,361.

Near the modern town once stood the ancient and opulent Wendish city of Wolin or Jumne. called Julin by the Danes, and Winetha or Vineta (*i.e.*, Wendish town) by the Germans. The Northmen made a settlement there about 970, and built a fortress on the "silver hill." called Jomsburg. which is often mentioned in the sagas. The stronghold of Jomsburg was destroyed in 1098 by King hfagnus Barfod of Norway. This is probably the origin of the legend that Vineta was overthrown by a storm or earthquake and overwhelmed by the sea. Some submarine granite rocks near Damerow in Usedom are still popularly regarded as its ruins. The town of Wollin became in 1140 the seat of the Pomeranian bishopric. which was transferred to Kammin about 1170. Wollin was burned by Canute VI of Denmark in 1183. and was taken by the Swedes in 1630 and 1759 and by the Brandenburgers in 1659 and 1675.

WOLLONGONG, industrial city in New South Wales, Austr. Greater Wollongong (pop.: 1954, 90.852) extends from Waterfall in the north to Macquarie rivulet in the south and includes numerous ton-nships. Tectonic and erosional processes have produced a narrow strip of lowlands backed by steep and often precipitous scarp. Wollongong is in the centre of the most productive part of the Bulli coal measures, and coal seams outcrop all along the coastal plains and hillsides. The lowlands with their mild and equable climate, hilly terrain, fertile soils and favourable position made this one of the earliest and leading dairying districts of Australia. Industry has made rapid inroads into the agricultural areas. particularly since 1926 when the steel industry was established. Other industries produce rolled sheet steel. galvanized iron. copper. brass and other nonferrous tubes, copper wire and strand. aerial cables and covered wires, sulfuric acid and superphosphate, bricks and machinery. The shipping harbour. formed by a breakwater, is at Port Kembla and accommodates interstate and overseas vessels.

WOLSELEY, GARNET JOSEPH WOLSELEY, 1ST VISCOUNT (1833–1913), British field marshal and a decisive figure in the creation of the modern British army, was born at Golden Bridge. County Dublin. on June 4. 1833. Educated at a Dublin day school. he was commissioned in the 12th foot in March 1852, and was transferred to the 80th foot, with which he served in the second Burmese War. Promoted lieutenant and invalided home, he exchanged into the 90th light infantry, then in Dublin. and went on service with it to the Crimea. After the fall of Sevastopol, Wolseley was employed on the quartermaster general's staff and was there given an insight he never forgot into the total inadequacy of the British army's supply services. After home duty in 1856–57, he went with the 90th again to join the punitive expedition to China, but his transport "Transit" foundered off Sumatra. The rescued troops, beached at Singapore, were sent at once to Calcutta to help cope with the Indian mutiny. Wolseley served under Sir Colin Campbell at Lucknow (Nov. 1857), at the Alambagh with Sir James Outram—one of his heroes, along with C. G. ("Chinese", Gordon and Robert E. Lee—and ultimately in March 1858 at the final siege and capture of Lucknow. He was then appointed deputy assistant quartermaster general, in the place of Sir Frederick Roberts, another celebrated soldier of the late Victorian era, on Sir Hope Grant's staff. In that position he saw out the entire Indian campaign. By 1859 Wolseley was a lieutenant colonel, having served in four campaigns, been four times wounded and nine times mentioned in dispatches. When Grant took command of the British troops in the Anglo-French expedition to China in 1560. Wolseley was again his deputy assistant quartermaster general. In 1861 he was appointed assistant quartermaster general in Canada, becoming deputy quartermaster general six years later. In Canada he wrote his *Narrative* of the *War With China* in *1860*, reorganized the Canadian militia, studied past and present military tactics and put together his The Soldier's Pocket-Book for Field Service, published in 1869 and revised five times subsequently; modern Field Service *Regulations* still derive much from Wolseley's vade mecum. In 1870 he commanded an expedition that marched 1,188 mi. to the Red river to put down Louis Riel's rebellion (see CANADA: The First Riel Rebellion).

Appointed knight commander of St. Michael and St. George and companion of the Bath, he became assistant adjutant general at the war office in May 1871 and worked with Edward Cardwell to further army reform, so beginning what was to be a 30 years' war of his own on the British military system, "bow-and-arrow generals" and the commander in chief, the duke oi Cambridge. In 1873 he commanded a punitive expedition into Ashanti and, having chosen a staff "ring" that included H. E. Wood, R. H. Buller (*qq.v.*), G. P. Colley, F. B. Maurice and Henry Brackenbury, with their aid and 2,500 white troops completed in two months a successful tropical campaign, culminating (Feb. 4, 1874) with the burning of the Ashanti capital, Kumasi. Ashanti made Wolseley famous: he was W. S..Gilbert's "modern major-general" in *The Pirates of Penzance*, and Henry Labouchère, in an article in the *Daily News* in 1875, called him "the long arm of the British empire." Parliament voted him £25,000, he was appointed knight commander of the Bath and knight grand cross of St. Michael and St. George and promoted major general at the age oi 40. After a term as inspector general of auxiliary forces at home. he left to go to Natal as governor and general commanding. This was a political post in which he was neither happy nor remarkably skilled. He was the first high commissioner in Cyprus in 1878, but returned to South Africa in 1879 to take over from Lord Chelmsford. who had mishandled the Zulu War, and from Sir Bartle Frere (*q.v.*), whose actions as high commissioner had divided Lord Beaconsfield's cabinet. Wolseley settled Zulu affairs for a time and went to the Transvaal where he reorganized the administration and assured everyone that British rule was there to stay. Home again in May 1880. he was appointed quartermaster general.

In 1882 he became adjutant general. somewhat to the queen's dismay. That August he took command of the army corps that was sent to Egypt to put down Ahmed Arabi's nationalist rising. Wolseley seized the Suez canal—thus alarming the powers and setting on foot negotiations that led to the convention of 1888—and after a well-planned campaign defeated Arabi at Tel-el-Kebir (Sept. 13). Promoted to general, granted £30,000 and created a baron, Wolseley was back in Cairo by Sept. 1884, commanding the expedition to relieve Gordon in the Sudan. His force reached Khartoum on Jan. 28, 1885, two days after Cordon's death. The expedition was withdrawn and Wolseley, now a viscount, returned to the war office as adjutant general. There he founded the intelligence department, encouraged the staff college and suggested (in vain) that both a ministry of defense and a general staff should be created: "war is a serious business which has to be prepared for."

After commanding in Ireland (1890–94), Wolseley was promoted to field marshal, and became commander in chief in 1895 The powers of the office were now limited by the secretary of state; Wolseley described himself as "vice-chairman of a debating society." but saw to it that there was an efficientmobilization of the army in 1899 for South African service. He resirned his office to Lord Roberts in 1901.

Wolseley died'at Menton, France, on March 25, 1913, and was buried in St. Paul's cathedral, London. His unwearying efforts to make the British army an effirient instrument remain his best monument.

See Sir George Arthur, *Life and Letters of Lord and Lady Wolseley* (London, 1912); Sir F. Maurice and Sir George Arthur, *Life of Lord Wolseley* (London. New York, 1924). (A. P. T.)

WOLSEY, *THOMAS* (*c.* 1473–1530), English cardinal and statesman, was the son of Robert Wolsey of Ipswich and his wife Joan. He was educated at Magdalen college. Oxford. According to his servant, George Cavendish. he took his B.A. at the age of 15; but his earliest appearance in the records is in 1498. when he mas ordained priest and became junior bursar of the college. of which he was already a fellow. The next year he was senior bursar. and the story goes that he had to resign this office in 1joo for spending college revenues without proper authority on completing the great tower. He was also master of Magdalen college school. There he had charge of three sons of Thomas Grey. 1st marquess of Dorset. who in 1500 presented him to the rectory of Limington in Somerset. At Limington, Cavendish tells us. the sheriff; Sir Xmias Paulet. once put him in the stocks. Wolsey taking his revenge long afterward by confining Paulet to his chambers in the Middle Temple. In 1501 Wolsey obtained a dispensation to hold two other livings and also became chaplain to Archbishop Deane. In 1503 he became chaplain to Sir Richard Nanfan, deputy lieutenant of Calais, who recommended Wolsey to Henry VII. The king made Wolsey his own chaplain and also employed him on minor diplomatic missions to Scotland and the Netherlands. Although the story of his accomplishing a mission to Flanders and back in three days is inaccurate, he did impress the king by his ability and was rewarded by further ecclesiastical preferments, culminating in the deanery of Lincoln.

Henry VII's death momentarily clouded Wolsey's prospects. But in Nov. 1509 he mas appointed âlmoner to Henry VIII and by 1511, though still holding no other office in the state, he had become one of the young king's most influential counselors. Against the pacific advice of Archbishop Warham and Bishop Foxe (*qq.v.*), he encouraged Henry to join the pope's "holy league" against France, and the war which followed gave him the chance to prove his extraordinary organizing ability. The campaign of 1512 was a failure, but after the victories over the French at the battle of the Spurs and over the Scots at Flodden in 1513, he arranged the "perpetual peace" of 1514 and the marriage of Henry's sister Mary to Louis XII of France. His own immediate rewards were the bishoprics of Lincoln and Tournai and then (Sept. 1514) the archbishopric of York. Next year he became involved in the quarrels between the clergy and the house of commons about an act of 1512, due for renewal in 1515, which denied benefit of clergy to men in minor orders who committed murder. In 1514 the pope had declared that laymen had no jurisdiction over churchmen, and the clergy therefore prepared to fight its renewal. The situation was exacerbated by the case of Richard Hunne, a London citizen who was found hanged while imprisoned by the bishop of London on a charge of heresy and of whose murder the bishop's chancellor was accused. The bishop appealed to Wolsey to intervene with the king; Henry. meanwhile. was persuaded that the pope's pronouncement infringed his rights and he took the part of Henry Standish. a Franciscan friar whose public defense oi the action of the court and of the 1512 act led to his being summoned before convocation. As a result. convocation was declared guilty of praemunire (*q.v.*). and Wolsey, on behalf of the church. made a partial submission to the king. With Warham and Foxe he begged the king not to let parliament meddle with the liberties of the church and at the same time he pressed the pope to appoint him legate *a latere* with commission to reform the particular abuses of which the commons complained. The pope did make him a cardinal (Sept. 1515), but would not yet grant the legatine commission. Henry. however, at length dissolved parliament and on the same day (Dec. 22) appointed Wolsey lord chancellor.

It was as chancellor that Wolsey made his greatest mark on English history. As chancellor he presided over the public sessions in the Star Chamber at which the king's council normally exercised its jurisdiction in semicriminal causes. That jurisdiction had been less vigorously exercised in the early years of Henry VIII's reign and a weakening in the enforcement of law and order had been the result. Wolsey now used it for all it was worth. By it. as the chronicler Edward Hall says. "he punished lords. knights, and men of all sorts for riots, bearing, and maintenance in their countries, so that the poor men lived quietly." The young marquess of Dorset. the earls of Northumberland and Surrey and many knights. sheriffs and royal accountants were thus taught what Wolsey called "the new law of the star chamber." His activity there was also extended to deal with perjury. forgery, fraud, slander. enclosures. food prices and supplies and any other potential causes of disorder and breach of the peace. In this way he helped to enforce law and order and to reassert the authority of the central government. The persistency and vigour with which he used this jurisdiction also did much to give the sessions of the council in the Star Chamber the appearance of a regular and distinct court (see STAR CHAMBER). A similar result followed from the vigour with which Wolsey wielded the equity jurisdiction in civil suits between subject and subject that in the 15th century had devolved upon the chancellor (*see* ENGLISH LAW: *The* Growth *of Equity*). He also showed himself sympathetic to the poor. drawing to himself, after Foxe's retirement in 1516, that jurisdiction in their suits which hitherto had been associated rather with the lord privy seal and various councilors acting as masters of requests than with the chancellor. However, the growing popularity of these jurisdictions with suitors and Wolsey's own growing preoccupation with foreign affairs caused him to delegate more and more of this judicial work. Many of the commissions that he issued were temporary appointments of particular persons to deal with individual cases. Others. however, were of a more general and lasting character. such as the 1517 commission to hear and determine piracy cases. which prepared the way lor the establishment of separate admiralty courts; the four commissions of c. 1518 for poor men's causes. which emerged in the 1530s as the court of requests (*q.v.*); the delegation from the Star Chamber in 152j of northern and Welsh cases to the resuscitated local councils at York and Ludlow; and the final, short-lived delegation of chancery cases to commissioners in June 1529. These more general commissions helped further to hasten the evolution of these various aspects of conciliar jurisdiction into separate courts, operating as normal parts of the machinery for the administration of justice.

Meanwhile, Wolsey had obtained by his diplomacy a position in the church matching his position in the state. After failing in 1515–16 to organize effective resistance to the invasion of Italy by the new king Francis I of France. he managed to play a leading part in the general pacification of 1j18. As his reward he at last extorted from the papacy his own appointment as legate a *latere*. At first he had to share his commission with Cardinal Campeggio, and its scope was limited to the preparations for a crusade against the Turks. But a-hen Campeggio returned the next year to Rome, Wolsey retained his own commission. and by taking advantage of papal necessities he was able to get its scope and duration repeatedly extended until in 1524 he became legate a *latere* for life and with unusually wide powers. He thus gained an ecclesiastical authority overriding that of Archbishop Warham and a supremacy, under the pope. over the church in England parallel to the preeminence which as chancellor he already possessed, under the king. in the state. Here, too. he asserted his authority n-ith unusual vigour, though the confusion between his actions as legate and as chancellor encouraged chancery to encroach upon the jurisdiction of the ecclesiastical courts just as it did upon the courts of common law. Yet. despite this plenitude of power, Wolsey did very little to reform the abuses in the church which had already provoked the anger of the commons. He did dissolve certain monastic houses and use their endowments for his new college—later Christ Church—at Oxford and his new grammar school at Ipswich. But he himself was almost the pattern of a worldly prelate. loving pomp and display. lavish in dress, extravagant in entertainment. He was, too, a shameless pluralist and absentee. He held. besides his see of York. the rich abbey of St. Albans and the bishoprics first of Bath and Wells. then of Durham and finally of Winchester. His own morals were lax. and he endowed his son before he was 18 with a deanery. four archdeaconeries, five prebends and a chancellorship. He thus added considerably to the mass of ecclesiastical abuse for whose reform he pretended that his legatine powers were required. At the same time. by overriding the local ecclesiastical jurisdictions and privileges in virtue of the legatine authority that Rome had granted him. he helped to n-eaken the English clergy's affection toward papal power. And the concentration of so much secular and spiritual jurisdiction in the single hands of the chancellor-legate made acceptance of the royal supremacy all the easier in the 1530s. Wolsey, indeed, "as legate a *latere* of the pope rode papal jurisdiction in England to its death" (A. F. Pollard; see *Bibliography*).

The chief reason for Wolsey's failure to reform the church in England. and for his increasing delegation of secular jurisdiction. was probahly that from 1519 onward he became more and more absorbed in foreign affairs. Here he was much less his own master. For his power, great as it was, all depended upon royal favour, and Henry VIII, though he might leave the routine of administration and justice to his chancellor, always took a lively interest in and asserted an increasing control over foreign policy. It is not therefore easy to assess Wolsey's work in this field, though it is clear that he sought to make his own profit by persuading the king's allies to secure his own election as pope—a hope twice disappointed (1522 and 1523) because of the failure of the emperor Charles V to perform his promises. Nevertheless, it was his share in foreign policy that first made Wolsey generally hated and that finally lost him the king's confidence. It was he who extracted the forced loans of 1522 to finance the campaigns in northern France. It was he who tried in vain to browbeat the commons into granting £800,000 in 1523 and who was most blamed for the "amicable grant" of £500,000 from the laiety which Henry demanded in 1525 to help to destroy France and which brought the country to the verge of rebellion. Yet all this failed either to regain England's lost lands in France or to hold Charles V—even after his great victory over the French at Pavia (1525)—loyal to the English alliance (concluded by the treaty of Windsor, 1522) and to his promise to marry Henry's only daughter Mary.

Charles's repudiation of Mary brought to the fore the question of the succession to the throne and, very soon. the problem of Henry VIII's "divorce" from Catherine of Aragon. To secure the necessary papal authorization of the divorce was no easy matter, for since Pavia (and more still after the sack of Rome by the imperial army in 1527) Pope Clement VII mas virtually in the power of Catherine's nephew, the emperor. Wolsey was thus driven to expedients more and more desperate. In Xug. 1527 he concluded an unpopular French alliance and in 1528 began a brief but still more unpopular war with the emperor in order to remove the pope from Charles's clutches. For a time French arms prospered in Italy and Clement's concessions matched their progress. But his legate Campeggio. to whom at one point he gave full powers to settle the case, had hardly set out for England when the tide turned.

The French defeat in Italy, completed in 1529, compelled the pope to come to terms with Charles V (the peace of Cambrai, Aug. 1529j. and in July Campeggio was recalled.

Thereafter. Wolsey's fall was certain. He had long ago gained the hatred of rhe nobility; he had lost the support of the clergy: he had alienated the rest of the nation by his taxation. Now he had failed the king in a matter of vital and personal concern and through Anne Boleyn his enemies had ready access to Henry's ear. for Wolsey had advocated Henry's remarriage, not to Anne, but to a French princess. On Oct. 9. 1529, he was indicted for praemunire in the king's bench and. although he was allowed to keep the archbishopric of York and a yearly pension of 1,000 marks from the see of Winchester. he had to surrender all his other offices and preferments. Early in the next month parliament met, and a bill of attainder passed the lords but was rejected in the commons—probably with the king's good will, for he n-as not yet prepared to break the cardinal utterly. Wolsey himself had not yet lost all hope of regaining the royal favour and soon entered into dangerous secret correspondence with the French and imperial ambassadors and with Rome. He stayed near London until April 1530 when, under pressure from the council. he journeyed slowly north to visit for the first time the province of which he had been archbishop for nearly 1j years. At length, however, his intention to be publicly enthroned at York on Nov. j and his summoning of the northern convocation to meet him there seem to have alarmed the king. who had become aware that he was corresponding with foreign powers. So, on Nov. 4, 1530, he was arrested at Cawood and carried back toward London. On the way he died at Leicester abbey (Nov. 29), where he was buried.

See George Cavendish, *Life of Cardinal Wolsey*, 2 vol., ed. by S. W. Singer (London, 1815; first printed 1541). The best modern account is A. F. Pollard, *Wolsey*, new ed. (London. New York, 1953).

(R. B. Wm.)

WOLVERHAMPTON, a municipal and county borough, Staffordshire, Eng., 13 mi. N.W. of Birmingham by road. Pop. (1961) 150,385. Area 11.3 sq.mi. It stands on a sandstone hill at the northwestern edge of the group of great manufacturing towns extending to Birmingham. but there are residential suburbs to the west. where the country is well wooded. The town's original interests ti-ere mainly agricultural. but with the development of the South Staffordshire coal and ironstone deposits it rapidly became known for its metal manufactures. There are enormous iron and steel foundries and the town manufactures a wide range of goods, including railway cars and road vehicles, locks (for which it was famous in 1751), tools, bicycles, enamel and galvanized ware, rubber tires! artificial silk, chemicals, paints and varnishes. The church of St. Peter, dedicated in 994 and several times rebuilt, is a fine cruciform building with some 13th-century work. A grammar school, founded in 1512–15 by Sir Stephen Jermyns, occupies modern buildings (1875). There are a bluecoat school (1710), a college of art and a technical college.

The town of Wolverhampton (Handone, Wolvernehamptone, Wollernehampton) grew up round the church of St. Mary. probably founded in 996 by Wulfruna, who endowed it with extensive lands. which are enumerated in Domesday. In 1204 John granted the manor of Wolverhampton to the church, and at the Reformation it was held by the dean of the collegiate body; in 1553 Edward VI granted the college and manor to Dudley, duke of Northumberland, but Mary refounded the college and restored its property. Henry III (12j8) granted the Wednesday market. which is still held, and a fair for eight days, beginning on June 29. In 1848 the borough was incorporated and became a county borough in 1888. It was first represented in parliament in 1832, sending two members; from 1885 to 1948 it sent three after which it sent two. The boundaries of the borough were extended in 1927 and 1933.

WOLVERINE: see GLUTTON.

WOLVERTON, an urban district of Buckinghamshire, Eng., in the Buckingham parliamentary division, 11 mi. S.E. of Buckingham by road. Pop. (1951) 13,421. Area 7.3 sq.mi. Its modern growth was the result of the establishment of carriage works by the railway company. The technical college (1926) is important. There are large printing works.

WOMBAT, the typical representative of the marsupial family Vombatidae (see MARSUPIALIA). All the teeth are of continuous growth, having persistent pulps. The incisors are large and chisel-like. as in rodents. The body is broad and depressed. the neck short, the head large and flat, the eyes small and the tail vestigial. The limbs are equal, stout and short. The feet have broad, naked soles; the forefeet have five toes, each with a long nail. The hind feet have a short nailless first toe; the second, third and fourth toes partially united by skin, the fifth distinct and shorter; these four with long nails. The wombat of Tasmania (*Vombatus ursinus*) and the similar but larger *V. platyrhinus* of southern Australia belong to the typical group of the genus. with short ears, coarse fur and naked muzzle. On the other hand, in the hairy-nosed wombat (*Lasiorhinus latifrons*) of South Australia, the fur is silky. the ears more pointed, and the muzzle hairy.

BROAD-NOSED WOMBAT (VOMBATUS PLATYRHINUS), AUSTRALIA

In form and action wombats resemble small bears, having a similar shuffling walk, but they are shorter in the legs and have broader backs. They live on the ground, or in burrows or holes among rocks, and feed on grass. roots and other vegetable substances. They sleep during the day but wander forth at night in search of food. They are shy and gentle, though they bite strongly when provoked. The prevailing colour is brownish gray. The large wombat of the mainland is variable in colour, some individuals being pale yellowish brown, others dark gray and some black. The length of the head and body is about 3 ft. Fossil wombats. some of larger size than any now existing. have been found in the Pleistocene of Australia.

WOMBWELL, an urban district in the Dearne Valley parliamentary division of the West Riding of Yorkshire, Eng., 42 mi. S.W. of York by road. Pop. (1951) 18.837. Area 6 sq.mi. The population is employed chiefly in the extensive collieries, but there are also engineering works and glass manufacture. Wombwell is mentioned in Domesday Book as Wamballa and the district now includes the villages of Jump, Hemingfield and Broomhill. The Roman Catholic church of St. Michael was opened in 1953. Margaret Wombwell (d. 1776) of Wombwell hall (traditionally associated with the kings of Northumbria) married Anthony St. Leger after whom the race (founded *1776* at Doncaster, *12* mi. E.) was named.

WOMEN, DISEASES OF: see GYNAECOLOGY.

WOMEN, EDUCATION OF. The 19th and 20th centuries brought a revolution in the status and education of women, first sweeping Europe and the United States. then the orient, and reversing ancient judgments of women's aptitudes.

Factors of Change. — Hebraic-Christian ethics elevated woman morally. The Renaissance gave upper-class women Greek and Latin classics. The Reformation stressed reading the Bible in the vernacular, and joined with rising nationalism to prepare the way for universal basic education. The technological revolution displaced age-old domestic crafts with factory production, took women outside their four malls and gave them cash instead of "keep." A rising middle class, growing affluent through commerce and industry. gave daughters an education of accomplishments, and occasionally something more substantial.

In the 19th century, seminary, college and university provided pragmatic proof that girls, like boys, could master the known and explore the unknown. New sciences. notably biology, psychology, anthropology and a naturalistic philosophy of education, shed fresh light on likenesses and differences of male and female, but offered no confirmation of the alleged inferiority of women. Political liberalism, resting on a naturalistic premise, opened the way to participation in government. World wars and ensuing revolutions augmented changes already in progress, broadened the scope and accelerated the tempo.

Early Cultures. — The original source of woman's restricted sphere of activity and dependence lay in her biological function and a less agile. smaller and weaker body. Bound by a shorter tether, she shared the labour of primitive societies. but hers was near at hand while man's took him far afield. The societies of the great river valleys of the east and those of the Mediterranean exhibit, similarly, a differentiation of roles of men and women; but, although women of the lower orders laboured as had their primitive sisters. wealth and class structures and functions facilitated a degree of seclusion and subjection of upper-class women which generally left them without significant labour or public function. Such women had little education, save that befitting their narrowed sphere; being unlettered, they seemed to have inferior minds. When man began to philosophize, he explained the inferiority of woman: "A woman without ability is normal," said the Chinese. Hindus considered "infidelity, violence, deceit, envy. extreme avarice. a total want of good qualities, with impurity" the natural faults of woman. Aristotle saw women's virtue in obeying, being less complete. less courageous, weaker, more impulsive than men. There were exceptions — a few educated women in China. India, Greece, Rome; *e.g.,* Lady Tsao, Rama, Aspasia, Cornelia. In theory, too. views differed. Plato thought some women could be philosophers; he admitted a few to his academy. Musonius and Seneca believed women talented. even for philosophy. But learning opened no office or respected profession to women.

Christian Influence. — Christianity credited women with souls equal, in the sight of God. to those of men. The full benefit of this moral status was long deferred, however, for Christian ascetics waged war against worldly aesthetic, intellectual and physical culture, and for maximum discipline of the soul fled to monastery and nunnery. The restricted education of girls was described by St. Jerome. Although limited, and though one must leave normal life to win it. nunneries opened for women (*e.g.,* Hilda of Whitby, Hrosvitha, Elizabeth of Schönau) a path to letters: and administrative posts as abbesses. England had about 140 nunneries in the late middle ages, exclusive of "double houses." But nuns were only a small fraction of the female population, and came chiefly from the upper classes. Lower-class women carried on the world's work with men. High social status, in Europe as elsewhere, kept women from the world of labour. Cathedral school and university, the highest institutions of the middle ages, led to the supreme profession, theology — closed to women. Had not St. Paul advised women to be silent in church?

The Classical Revival. — The "New Life," of which Dante was spokesman and forerunner, brought learning from the cloister to the court, broadened its range and gave it worldly character and colour. Women of courtly circles. profiting from the change, drank from classic springs. as witness Ginevra Nogarola, Isotta, Lady Jane Grey. Vittorino da Feltre. Guarino da Verona. Roger Ascham taught gentlewomen of the world. Erasrnus of Rotterdam ridiculed the ignorant abbot who argued that "books destroy women's brains . . . it is not safe for a woman to know Latin." Juan Luis Vives wrote *The Instruction of a Christian Woman*, and Sir Thomas Elyot, *The Defence of Good Women.* Richard Mulcaster advocated education for girls, but not in grammar schools or universities. But theory outran practice: German *Gymnasien,* English public schools, French *lycées* and American Latin grammar schools did not fulfil the promise of early humanists. These schools became subservient to universities which. save for a few in Italy and Spain where women taught. did not admit women. Not till college and university broadened their scope and became fully identified with secular life did women generally find a place in them.

Developments in England and on the Continent.—Reaction set in after the 16th century, but the idea of girls' education was kept alive by C. B. Barksdale's *Learned Maid* (1659), a translation of a work by Anna van Schurman, Bathsua Makin's *Essay to Revive the Antient Education of Gentlewomen* (1673). Mary Astell's *A Serious Pi-oposal to the Ladies* (1694), Daniel Defoe's essay on *An Academy for Women* (1698). More significant were Mary Wollstonecraft's *A Vindication of the Rights of Woman* (1792), Erasmus Darwin's *Plan for the Conduct of Female Education in Boarding Schools* (1797), Hannah More's *Strictures on the Modern System of Female Education* (1799), Emily Shirreff's *Intellectual Education* (1858), Emily Davies' *The Higher Education of Women* (1866) and John Stuart Mill's *On the Subjection of Women* (1869).

This literature reflected a keen concern for the education of girls, a critical appraisal of errors. Education was filtering down to daughters of the middle class. By the mid-18th century many boarding schools for young ladies, in London and other cities, offered chiefly accomplishments. A century later a royal commission (1864) found that lack of "organization," "thoroughness," "attention to rudiments," too much "slovenliness" and "showy superficiality" characterized girls' schools.

Remedies were urged, The Kational Union for Improving the Education of Women of All Classes, promoted by Lady Stanley of Alderley, Emily Shirreff, Mary Gurney and Mrs. William Grey, was founded in 1871. The Girls' Public Day School company (1872) sought to give girls an education equal to that of boys in public schools. The first school opened at Chelsea in 1873; by 1900 there were 33. Collegiate education also gained attention.

Amelia Murray sought to promote courses in "all branches of female learning." a project encouraged by F. D. Maurice and others at King's college, London. which culminated in Queen's college, 1848. Bedford college followed in 1849. These were scarcely better than secondary schools. Cambridge admitted girls to local examinations. Girton (Hitchin), opened in 1869, thanks to Emily Davies. and Newnham (1871) were recognized as colleges in the university in 1948. Women at British universities (1948–49) numbered 20,005; men. 80,996.

In France the education of girls lagged behind that of boys, as in England. Louis XIV founded St, Cyr (1686) for daughters of nobles. Madame de blaintenon, François Fénelon. Alfred Nettement and Madame Albertine Kecker de Saussure represent trends of French thought on girls' education. Napoleon, wanting "women who believe . . . not women who reason." provided at Écouen (1807) education of daughters and sisters of Legion of Honor men and at St. Denis (1809) for daughters of higher officers. Convents held a prominent place in French girls' education. A commission (1844) investigated private girls' schools, but with slight effect. Jules Simon judged girls' education "futile and incomplete." Following Jean Victor Duruy's suggestion (1867), an Association for Girls' Secondary Courses was formed. By 1887 there mere 69 courses. A law, passed in 1880 despite clerical opposition, provided secondary schools for girls. The first *lycée* opened at Montpellier in 1881. The Higher Normal school at Sèvres (1881) prepared women for secondary school positions. The Collège de Sèvigné (Paris, 1880) opened university work to women. There were 3.830 women at French universities in 1910; in 1950 they constituted 35% of the enrolment.

In Germany, following Luther, Hamburg (1526) and Brunswick (1528, 1534) provided elementary schools for girls. Ursulines and Hieronymians were active in Catholic localities. The late 18th century saw the opening of secondary schools, Elizabeth school at Berlin (1748), Frankfurt-on-Main (1749), a *Töchterschule* at Breslau (1767) and at Dessau (1786). Following a reform movement (1865). an official rescript (1894) established a curriculum for *höhere Mädchenschulen.* Private efforts at Berlin and Karlsruhe prepared girls for the *Abitur* in 1893; Leipzig followed in 1894. Victoria lyceum. Humboldt academy and *Realkurse* under the scientific *Zentralverein,* Berlin, also prepared women for this examination, giving entrance to universities. There were 4,057 regular women students by 1914; 8,761 in 1923. After World Wat II, women constituted a fourth to a third of university students.

The United States: Origins—Though colonial New England generally excluded girls from town schools, their entrance being considered "improper and inconsistent," dame schools received them. A few towns specifically admitted girls. The 18th century saw a change. Boston provided for both sexes in 1789. In the central colonies churches generally gave elementary education to both sexes. Latin grammar schools were not for girls. Private schools developed in the 18th century, however, notably in Philadelphia. New York city and Boston. Their proprietors, men and women, taught whatever anyone, male or female, wanted to learn. Most of them taught girls accomplishments; others, venturing upon solid subjects, gained public esteem. John Poor's school (Philadelphia), offering reading, writing, arithmetic, English grammar, composition, rhetoric and geography, was chartered on Jan. 9, 1792. The Ursuline convent. New Orleans, La. (1727), a Moravian school (1742)—later Bethlehem seminary, Bethlehem, Pa. (1749)—Linden Hall, Lititz. Pa. (1794), Leicester academy, Leicester, Mass. (1784), Westford academy. Westford, Mass. (1793) and Westtown Boarding school, Westtown, Pa. (1799)—the last three admitting both sexes—gained renown: Public high schools began (Worcester, Mass., 1824) the slow process of making secondary education free; an end not widely realized till after 1870. By 1900 girls in public high schools numbered 317,146; boys 224,584. Girls totalled 3,327,000, slightly less than boys, in 1950.

Collegiate Education of Women.—From 1825 to 1875 many efforts were made to found women's colleges. Certain better seminaries—Troy Female seminary, Troy, N.Y., founded by Emma Willard (1821), Mount Holyoke. South Hadley, Mass., begun by Mary Lyon (1837), and Milwaukee Female seminary (later Milwaukee-Downer college), Milwaukee, Wis. (1851)—later became colleges. Georgia Female college, Macon, Ga. (1839), Mary Sharp, Winchester, Tenn. (1851), Elmira, Elmira, N.Y. (1855), and Vassar, Poughkeepsie, N.Y. (1865), laid serious claim to collegiate rank. Elmira and Vassar fully merited the name; only Vassar had generous support. When Smith college, Northampton, Mass., and Wellesley college, Wellesley, Mass., opened (1875), success of collegiate experiments was established. Coeducation began on the college level at Oberlin college, Oberlin. O., where women entered college courses in 1837. Antioch college, Yellow Springs, O. (1852), gave women equal opportunities with men "in the same studies, and classes, and by the same instructors." Women were to be teachers as well as students. In state universities coeducation was the rule initially or soon became so. The State University of Iowa, Iowa City (1856), was coeducational. The University of Wisconsin, Madison (1850), proposed a normal department, opened to women and men, first attended by women in 1860; collegiate coeducation was realized after 1872. The University of Michigan, Ann Arbor, admitted women in 1870. Forty years after Oberlin opened, 8,141 women were in coeducational institutions, 2,519 doing college work. Affiliated colleges—H. Sophie Newcomb, New Orleans, La. (1887), Barnard, New York city (1889), the Women's college (later Pembroke), Providence. R.I. (1891), Radcliffe, Cambridge, Mass. (1894), Jackson, Medford, Mass. (1910), associated with Tulane, Columbia, Brown, Harvard and Tufts, respectively—did not significantly alter the pattern of women's education; but they gave women certain facilities and the services of faculties previously denied them. By 1900 there were 26,728 women college students, 8,104 graduates; in 1950, 103,217 women graduates and 328,841 men.

Fear had been felt that women were too weak to stand the strain of serious mental labour. College and seminary demonstrated that they could master Euclid, Greek and Latin without losing their health or their minds. Another fear—college for women would mean race suicide, they would not marry or, if they did, would not have children—was soon laid. Thorough study showed marriage and fecundity were conditioned by wealth and social status rather than by classics and mathematics.

Professional Education.—Entrance to higher professions was as difficult as getting into college—or more so. Teaching was the first profession to admit women. Women were too weak to handle discipline, it was said; and they were, as long as schools were ruled by the rod. But the common schools demanded more teachers, and women were the readiest source. From seminaries, then from normal schools (a private experiment, 1823, and state institution, 1839), women went rapidly into a profession, highly praised, poorly paid. Women in teacher-preparatory schools (1900) numbered 42,290; men, 21,112. In 1950 there were 96,906 women and 116,321 men in teachers colleges, excluding summer schools.

Entrance to medicine, law and theology was more difficult than teaching. If one could get training, medical societies, bar associations, churches and the public were hostile to women practitioners. In medicine a minor step was taken in Philadelphia (1765) when William Shippen, Jr., gave lectures on midwifery "to women who had virtue enough to own their ignorance." Almost a century later Elizabeth Blackwell sought in vain to enter first-class medical schools. Accepted, finally, at Geneva college, Geneva, N.Y. (1847), she took a degree (1849) and finished her medical preparation abroad.

As old institutions refused admission, special schools for women developed. Encouraged by friendly doctors and the Female Medical society, lectures began (1848) in Boston at the New England Female Medical college (1852) which later became part of Boston university. The Female Medical College of Pennsylvania, Philadelphia, incorporated March 11, 1850, was the first institution so recognized in the United States. Progress was slow. Women studying medicine (1891) numbered 1,302; men, 18,514. In 1950 women won 584 M.D. degrees, men, 5,028; in medical sciences there were 729 and 2,495 degrees, respectively.

The law offered many obstacles, since training was generally in private offices. Growth of law schools benefited women. Lemma Barkaloo studied law in Washington university, St. Louis, Mo., in 1869. Ada Kepley received a degree from Union Law college, Chicago, in 1870. The University of Pennsylvania, Philadelphia, admitted women in 1881. Law schools almost doubled from 1870 to 1890; by 1900 there were 94, with 151 women and 12,365 men; in 1920 there were 19,821 men, 1,171 women. In 1950 women won 421 degrees in law; men, 13,891. After a strenuous fight Myra Bradwell won the right to practise when Illinois (1872) forbade disbarment from any profession, other than military, on grounds of sex. Bella Lockwood, admitted to the supreme court of the District of Columbia (1873), was refused admission to the United States court of claims and the United States supreme court. Finally, a bill (1879) enabled women to practise before the highest tribunal.

Postgraduate study met little opposition. Graduate schools, being new, generally welcomed both sexes, though a belief prevailed that women, while they could master the known, would not be capable of original investigation. By 1900 women in graduate departments numbered 1,-982, men. 4,883; in 1950, there were 65,047 and 172,161, respectively.

Recent Developments.—Having found that women could master traditional college studies, a concern arose as to what the higher education of women really should be. Do traditional studies suffice? Causes of the query lay in economic pressures, specialization dictated by scientific and technological development and decline of faith in the mental discipline once credited to Greek, Latin, mathematics and science. Some women's colleges sought to hold fast to the ancient disciplines; most of them, however, revealed the influence of vocational demands. Two, Sarah Lawrence college, Bronxville, N.Y. (1928), and Bennington college, Bennington, Vt. (1932), broke boldly with tradition, giving first place to development of persons according to interests and needs—an application of John Dewey's philosophy.

Great progress has been made in many lands in the past generation, but education is still less accessible to women than to men, except in primary schools. Fifty nations (1952) had about equal numbers of girls and boys in primary schools. The proportion of girls to boys in secondary schools in 43 lands ranged from less than 10% (Egypt and Honduras) to more than 50% in Chile, Denmark, Finland, Scotland, Sweden and the United States. In 47 countries the proportion of women to. men in higher education ranged from 0% (Cambodia and Saudi Arabia), 1.08% (Honduras), 2.73% (Persia), 4.79% (India), 6.45% (Egypt), to 43.82% (Panamá), 40.70% (Scotland) and 40% (Poland). Women constituted 30% of the enrolment in the United States: The Soviet Union had 44% women in universities (1926); 57% in 1941.

WOMEN, LEGAL POSITION OF. This article describes, as well as the present legal position of women, something of the process whereby the rights of men and women have tended to become equal in British and United States law.

GREAT BRITAIN

Only in comparatively modern times did the women of Great Britain emerge from a complex of legal disabilities within which they had remained for long centuries. The three main landmarks of their modern emancipation were the Married Women's Property act of 1882; their admission to the parliamentary electorate by the Representation of the People act of 1918 (see WOMEN'S SUFFRAGE); and the Sex Disqualification (Removal) act of 1919, which opened public functions and many professions hitherto closed to them.

The Norman Conquest placed England as a conquered land under a feudal law more oppressive and thorough than that of other northern or western European nations. Reaching the lower ranks, feudalism clothed even the humblest husband with "more than the authority of a feudal lord," and merged the wife's existence completely in that of her husband. Whatever property rights the pre-Conquest wife had possessed disappeared; and, as marriage was indissoluble, not until a woman became a widow did she come into her sole remaining property right, her dower. This was rather the creation of the church than of the common law.

Right of Women to the Crown.—After 1066 the regnal position of women monarchs was ill-defined. The attempt of Henry I to leave the crown to his only surviving child, Matilda, resulted in a civil war of uncertain issue. The matter was not set at rest until a statute of the first year of Mary Tudor's reign declared a woman to be as capable as a man of full regnal power. Thereafter four other female sovereigns ascended the throne, enjoying equal regnal rights. But female succession to the crown is not yet in full parallelism with male, for the senior son of any issue surviving the sovereign succeeds in preference to a daughter, although she be his senior by birth.

Women Peers, Privy Councillors and officers of State.—Although certain women of rank were summoned to the Saxon witenagemot, the Norman era ushered in a state of things whereby peerages were conferred usually upon males. Often the peerage as a dignity was expressed to be heritable by women. But its enjoyment did not connote any obligation upon the crown to summon the woman peer to "seat, voice and place" in the house of lords; *i.e.*, when that house was summoned in the full parliamentary sense. King John at a meeting in the Temple summoned among others certain *abbatissae*, and Edward III summoned about 11 women peers to a gathering before undertaking a fresh war. Until 1870 a woman peer possessed at any rate a theoretical right to nominate a deputy to represent her peerage. Lady Rhondda in 1922 raised the issue directly by petitioning for "seat, voice and place" in the house of lords, and her petition was heard by a committee of privileges. Unfortunately, the petition was based upon the Sex Disqualification (Removal) act, 1919, which proved too frail a legal foundation for the claim. However, under the Life Peerages act, 1958, life peeresses might be created and would be entitled to sit in the house of lords. The queen created the first four such peeresses on July 24, 1958.

The privy council has functioned under varying nomenclature since the earliest days, and the idea of excluding women as such apparently never arose, the only question being what women, if any, were important enough.

In the reign of George V it became necessary to swear in Margaret Bondfield as a member, on her nomination as minister of labour, for the cabinet is historically and technically a subcommittee of the whole privy council. Later Edith Summerskill and Florence Horsbrugh similarly achieved privy councillorship as cabinet ministers. Queen Mary, consort of George V, had already been sworn of his privy council.

Public office was often inherited by women. and if their lands were associated with public office, the woman holder had either to perform the duties of such office or provide for their fulfilment. For instance, Ela, countess of Salisbury, in the reign of John held the earldom of Salisbury together with the government of the castle of Sarum and also inherited the sheriffdom of the county of Wiltshire. Nicolaa de la Haye, wife of Gerard de Camville, was sheriff of Lincoln under John.

But under the Stuart dynasty opportunities open to women became fewer, and Mary Astell in 1694 was protesting. in her work *A Serious Proposal to the Ladies,* that the decline in the higher education of women underlay their diminished general position—"since there are no accounts in history of so many great women in any one age as are between 1500 and 1600." She therefore proposed the foundation of an institution for the better education of women. Nothing resulted.

In 1792 Mary Wollstonecraft pleaded in her *Vindication of the Rights of Woman:* "Let us consider women in the grand light of human creatures, who in common with men, are placed on this earth to unfold their faculties." She asked for their parliamentary representation. Again, little resulted.

Progress had to be made upon three parallel paths—the right to property, the right to political enfranchisement and the right to enter all professions, trades and callings.

The Right to Hold Property.—The demand for property rights for wives, entirely disallowed by the common-law concept of coverture, proceeded concurrently with the demand for parliamentary suffrage. It is perhaps more logical to consider property first because it is hard to see how even the later peaceful propaganda for the vote could have been financed by moneyless wives. Furthermore, the property act of 1882 antedated the franchise act of 1918 by 36 years.

It must always be remembered that the women of the aristocracy and the moneyed mercantile classes received protection from the chancery courts. This process began to rise into importance about the time of Henry VIII.

Property began to be held to the "use" of another than the original owner, and the fruits arising from its ownership had to be paid to a beneficiary who became in equity the owner, while the bare legal estate was held by a trustee or trustees, who passed on to the equitable owner whatever profits arose.

But the ordinary wife who was simply a woman of the people had normally no lands or money safely settled upon her and therefore no equitable rights protected by the court of chancery. Except in the City of London a married woman had not even the right to money she earned by her own labour inside or outside the matrimonial home. A husband could, if he liked, collect the profits arising from his wife's literary work or, from a theatrical manager, her remuneration as an actress; and in poorer classes the profits made by the mangle, the sewing machine or the charing done in the house of another could be collected by the husband, and without the wife's having any recourse to them if that husband drank or gambled them away and left her and her children starving. Even if his conduct had forced her to leave the matrimonial home or he had deserted her, the legal payment made by the employer was the one he made to the husband, and if he risked paying first to the wife who had earned the money, her receipt would not protect him'in law if the husband sued.

When parliament in 1857 first set up a court empowered to grant dissolutions of marriage and judicial separations. the 1857 Matrimonial Causes act did at least secure to the deserted or separated wife the right to her own earnings. The ordinary wife still living with her husband was not so protected. The Married Women's Property act of 1870 took that necessary step.

The vital section of the 1870 act is s. xi which runs: "A married woman may maintain an action in her own name for the recovery of any wages, earnings, money, and property by this Act declared to be her separate property, or of any property belonging to her before marriage . . . and she shall have in her own name the same remedies, both civil and criminal, against all persons whomsoever for the protection and security of such wages, earnings, money and property purchased or obtained by means thereof for her own use, as if such wages, earnings. money, chattels, and property belonged to her as an unmarried woman; and in any indictment or other proceeding it shall be sufficient to allege such wages, earnings, money, chattels and property to be her property."

The Married Women's Property Act (1870) Amendment act, 1874. dealt mainly with points of detail and extended considerable and no doubt necessary protection to husbands with regard to their wives' prenuptial debts. torts, assets, etc.

The Married Women's Property act of 1882 operated from Jan. 1, 1883. and enacted that: "A married woman shall in accordance with the provisions of this Act be capable of acquiring, holding and disposing by will of any real or personal property as her separate property in the same manner as if she were a feme sole (spinster or widow) without the intervention of any trustee." It was also provided that a married woman "shall be capable of entering into and rendering herself liable in respect of and to the extent of her separate property on any contract" (i, s. 2). By a further Married Women's Property act of 1893 it was enacted that "every contract hereafter entered into by a married woman otherwise than as an agent . . . shall bind all separate property which she may at that time or thereafter be possessed of or entitled to." The 1893 act came into force on Dec. 5, 1893. It will be observed that the tone of these various enactments sounds rather minatory than emancipatory. The freedom to own and to contract at once added liability to wives. Suffice it to say that without such liabilities no sane person would enter into contract with the wife exempt as such from the necessary burdens of the law. All these rights were granted in the U.S. in 1848.

Women in Parliament and Other Public Offices.—A special statute to render possible the election of women members of parliament was necessary. The Qualification of Women act, 1919, was therefore enacted and proclaimed that "a woman shall not be disqualified by sex or marriage from being elected to or voting as a member of the Commons House of Parliament." The first woman to be elected to the British house of commons was the Countess Markiewicz, an Irish lady, who did not sit; but the next one elected, the Viscountess Astor, became the first woman to serve fully as an active member of parliament.

Membership of various bodies associated with local government, *e.g.,* school boards, boards of guardians, etc., began to be opened to women in the reign of Victoria. But they had not been appointed (normally) for centuries as justices of the peace, nor upon the police force, nor indeed in various other public capacities until the passage of the Sex Disqualification (Removal) act, 1919. Women were under the same statute made liable to jury service.

Right to Practise in the Professions.—The inns of court had refused at least three women applicants, and the Law society had obtained a queen's bench judgment protecting the solicitors' profession from their entry. It was therefore thought advisable to enact a generally qualifying statute, viz., the Sex Disqualification (Removal) act, 1919, throwing open the exercise of all professions. The chief ones immediately attained were the legal profession in both branches; *i.e.,* barristers and solicitors; chartered (and other) accountancy; veterinary surgery; and certain other perhaps rather unexpected callings such as marine engineering. One very important reservation was made by order in council promulgated under the Sex Disqualification (Removal) act, 1919, namely that the diplomatic and consular services and certain higher civil service appointments were reserved to men. However. in 1946 a special commission appointed to consider this matter duly reported favourably and the barrier was removed. In the diplomatic and consular services up to 1953 about 16 women had been appointed to some of the higher positions, although not the highest of all.

King George V created certain Canadian women barristers silks, the first two being H. A. Kinnear (later Judge Kinnear) and M. P. Hyndman. In 1941 George VI gave silk to Frances E. Moran of the Southern Irish bar. In 1948 he created M. H. Kidd of the Scottish bar a silk and in 1949 similarly honoured Helena Normanton and Rose Heilbron, both of the English bar.

Nationality of Married Women.—By an act of 1844 alien women who married British subjects automatically acquired British nationality. This in some cases led to abuses in connection with prostitution, as undesirable foreign women obtained easy entry. Instead of dealing with that, parliament by the Naturalization act of 1870 deprived of her British nationality any British woman who married a man of foreign nationality. During World War I difficulties arose. British-born women technically aliens became subject to vexatious regulations—sometimes even to internment. In took 34 years of hard work for British women to obtain remedial legislation which took shape as the British Nationality of Women act, 1948.

By this act a British woman received the right to retain British nationality on marriage to a foreigner, and the act conferred automatic restoration of British nationality to those who had lost it. It also ended the right of alien women to acquire automatic British nationality when marrying British subjects. Such a woman must now make application to the secretary of state for home affairs for registration and must take an oath of allegiance to the British crown.

Testacy and Intestacy of Married Women.—The Married Women's Property act of 1882 confirmed and extended such rights as wives had formerly enjoyed. The Law Reform (Married Women and Tortfeasors') act, 1935, consolidated and completed sex equality by empowering a married woman to dispose by will of all her property, real or personal, as if she were a feme sole; and such will disposes of all property to which she was entitled or held at the date of her decease.

The liability of the male under the Law of Intestate (Succession) act of 1953 has been equated absolutely with that of the female; and by that act reforms have been made almost revolutionary in effect. Considering the small amount left in fact by the average British subject, in the majority of cases the surviving spouse will stand to benefit far more under an intestacy than when a normal will has been made; and the issue of the marriage will benefit *pro tanto* far less.

The widow or widower will take the chattels and the first £5,000 of the total estate. After that, further pecuniary benefits to a spouse are balanceable against the various provisions made by the act for children, brothers and sisters and surviving parents or grandparents. The surviving spouse has the first option of purchasing the matrimonial residence at its market value and also may commute a life income for its actuarial value. The act also enlarges reliefs obtainable by dependants deprived of support, etc., under unjust mills.

Criminal Law and Women.—Two vestiges of the old common-law theory of the merger of the wife's person in that of her husband still modify criminal law. One is that, as a conspiracy still needs at least two persons, a joint plan by husband and wife to commit a crime is not indictable as a conspiracy; and the tendency is for the wife to escape through that loophole. This legal fiction is however not deemed to hold good in the case of treason. The other instance is that if a wife commits a crime in the presence of her husband she may raise the defense that she in fact committed the crime under his marital coercion.

A wife cannot be charged with harbouring a husband after he has committed a crime, *i.e.,* as an accessory after the fact, for she is not compelled to "discover" his crimes.

Formerly, as husbands by marriage *ipso facto* acquired the total property of a wife (other than any protected by equity) he had to pay any damages awarded by the courts to the person aggrieved by any tort committed by the wife. By the Law Reform (Married Women and Tortfeasors) act, 1935. husbands were released from the onerous liability of paying for the torts of wives who were living with them.

Husbands and wives who are living together cannot proceed against each other in tort.

Rights of Women to Dissolution of Marriage.—Prior to the Matrimonial Causes act, 1857, the church exercised general control over marriage, effectuating it validly, or per contra pronouncing as to questions of invalidity. Broadly speaking, pre-Reformation doctrine as to invalid marriages prevailed, and those purported marriages which had never under ecclesiastical law been real marriages were annulled by one or other of the ecclesiastical courts of the country. Such courts could also grant separations "from bed and board"—which did not confer upon either separated party any right to remarry a third person, as would a decree of annulment.

After the Reformation, parliament took power to grant parliamentary divorces, which were *a vinculo, i* e., from the matrimonial bond itself, and did entitle the former spouses to remarry if they so desired. But the great difficulty and expense of these limited them in effect to the aristocracy and even so they were indeed few in number. It is believed that not one was in fact granted to a wife. The normal preliminary was a civil action brought by the husband against the male adulterer for criminal conversation. The wife being no party to the action had no right of representation at the trial, so her reputation could easily enough be demolished by perjured testimony. The Matrimonial Causes act, 1857, boldly transferred the whole processes of dissolution of marriage to a lay tribunal by setting up a division of the high court empowered to annul marriages, grant judicial separations and dissolve the actual bond of marriage, or, in popular phraseology: grant divorces.

Substantially, the ground upon which a husband could obtain a divorce was the adultery of the wife. Substantially, the grounds upon which a wife could obtain dissolution were much graver—certainly more onerous, for a husband's adultery alone did not suffice. There had to be in addition incest or bigamy coupled with the adultery; or grave cruelty; or causeless desertion of her against her will for more than two years; or the commission of sodomy; or an act of bestiality. Separation orders were granted more easily and could include orders protecting the deserted wife's earnings, which she might receive and expend without control by her separated husband.

One serious inequality of ground operated against the husband. Although: as above, the mife could proceed against a husband who had committed sodomy or bestiality, the husband was granted no redress—not even a judicial separation—against a wife addicted to unnatural sexual practices with other women, a male disability still forming part of matrimonial law. But a husband was empowered to claim damages from the male corespondent to the petition, while the wife was granted no parallel right..

A presumption of law underlay and complicated the whole process of matrimonial litigation, namely, that the husband's domicile was and is automatically the wife's domicile, in other words that her only forum of jurisdiction was whatever forum was the husband's, whether his original one or one that he had newly acquired. If, therefore, a husband had legally and finally settled in some land which did not grant divorces as part of its law, no matter how bad his conduct the wife lost her right to launch any matrimonial litigation against him.

The Matrimonial Causes act, 1923, took one step in equalizing the position of women by making it possible for a wife to obtain a divorce upon the sole ground of her husband's adultery, to which cruelty or desertion no longer had to be coupled. The Matrimonial Causes act of 1937 as consolidated in the Matrimonial Causes act, 1950, effected great changes. It made separate grounds of the following acts so that a husband or wife could obtain a decree of divorce for adultery, cruelty, desertion or insanity, proved strictly by five years' detention in an institution for the treatment of insanity. The inequality as to unnatural sexual conduct described above was left untouched. So was the inequality as to damages.

This act provided some other useful remedies for certain sad states of affairs; *e.g.,* after a total disappearance of one spouse from the other without any news for seven years a petition might be presented asking for a presumption of death and for dissolution of the marriage, and this once granted, the petitioner could remarry without fearing any legal proceedings for bigamy and could contract a further legal marriage after decree absolute. A marriage can now be annulled if a woman at the time of its celebration has concealed her pregnancy by a man other than her husband.

A novelty in English law was introduced in the 1937 act. whereby the subject was deprived of recourse to the courts for a period of three years after the celebration of the marriage unless the petitioner could obtain a preliminary decision from the court on the ground that the other spouse had been guilty of exceptionally depraved conduct or on the ground of exceptional hardship; upon this decision leave to proceed for dissolution could be granted. The difficulty as to domicile was left untouched by this act. Whatever criticisms may fairly be made upon its provisions, there has been a large increase in the number of decrees of absolute dissolution of marriage since its enactment. There have been some useful modifications of the presumption of domicile since the 1937 act, notably one of 1948. which enabled aggrieved wartime wives to obtain decrees more readily.

The whole matrimonial law was to some extent codified by the Matrimonial Causes act, 1950. There remains outstanding, however, a grave complex of all that has happened to the matrimonial jurisdiction of the summary courts. Discrepancies of various natures have arisen, making probable the necessity for codification to assimilate and embody these two sometimes conflicting systems of law.

Married Women's Rights in Connection With Children.—Under the old common law the father alone was the parent of his child, subject to an overriding presumption that the sovereign was *parens patriae.* A father could transfer even a tiny infant from its mother's arms to the care of a mistress if he chose. or to anyone else, and the mother had no right to any information as to the child's whereabouts and might not go to see it nithout the father's permission. Children were sometimes most callously used to force a wife to submit to a husband's will.

The first mother to protest publicly against this kind of thing was Caroline Norton whose unremitting work led to the first step to help the mother, namely an Access to Children bill in 1838 Under this a mother could petition the chancellor for an order giving her access to her own children upon filing an affidavit to prove that she was of unblemished moral conduct.

Further provisions as to access were made under the various Matrimonial Causes acts but the mother as such was mainly helped by the Guardianship of Infants act, 1925. Its governing principle is that the welfare of the infant is paramount—a principle which enables the court to review the whole set of circumstances affecting the child—money. maintenance, religious differences of parents, quarrels concerning education. training, residence, morals, cruelty and everything else. Proceedings usually begin in a magistrate's court and appeals are determinable in the chancery division of the high court. Apart from the paramountcy of the infant's welfare, the parents are placed in this act upon a footing of presumed equality. so that the reign of tyranny of the father has ceased.

In the case of the dissolution of a marriage where there is issue of the marriage under the age of 16. the court usually considers what order to make as to the custody of such children. The making of an order giving custody to one parent frequently connotes the desirability of granting access to the other parent. The great principles now applied are that primarily the party who is not morally guilty has the greater probability of obtaining custody, but that other considerations may outweigh that prima-facie preferability. For instance it would be most improbable that the court would take away even from a guilty mother the custody of a very young child still needing constant maternal care. The prospect of consigning a child to the care of a corespondent stepfather is not altogether enticing although it is a course that often has to be tacitly sanctioned for practical reasons. At 16. the boy or girl can make an individual decision where to reside; *i.e.,* with either or neither aarent.

The court makes suitable orders for maintaining children in accordance with the possibilities of the case. Such maintenance orders are a constant feature of the matrimonial jurisdiction of the magistrates' courts. Obedience to such can be ordered on pain of imprisonment.

Nomenclature of Married Women.—By the act of marriage a woman *ipso facto* acquires the right to assume and bear her husband's surname. but she is not thereby under any obligation to do so. That marriage itself does not operate to change her surname is proved by the fact that she signs the register after the ceremony still in her maiden name. In Scotland the assumption and use of a husband's surname does not operate to extinguish and determine the maiden surname and in criminal indictments a married woman will be cited by both surnames (X or Y) and even upon wives' tombstones the use of the maiden surname is frequent. In England there is apparently a cesser of the maiden surname if the husband's surname is assumed. There is nothing in law to prevent a wife who so desires, a widow or a divorcee from resuming a maiden surname. A divorced woman may continue to bear the matrimonial surname if she so desires.

English courts have no jurisdiction over surnames until and unless the question arises in a definite context; *e.g.,* as under a will or settlement. Husbands frequently assume or add wives' surnames. The children of a marriage can use the surname of father or mother or both as they choose, with the sole exception that it is not legal for anyone to assume a surname for the purpose of effecting fraud or crime. Special rules and customs govern usage as to surnames in titled classes.

One frequent present-day usage is, however, most undesirable from the legal point of view, namely the use by a wife of her own surname in certain circumstances; *e.g.,* in a trade or profession, alternating with the use of her husband's surname socially. The use of a surname is to ensure identification of a given personality and a wavering between the two surnames makes this a fluid and unsettled matter. For example it makes a dubious document of a passport. Clauses frequently occur in wills and settlements requiring a husband to assume the names and arms of the wife's family in order to govern a bequest or demise of property. Before settling the relevant documents it is highly desirable to ascertain the view of the husband concerned upon this matter as he cannot be compelled to assume these against his own will however desirable a testator or settler may feel to be the perpetuation of an old and honoured patronymic. This lam is gathered from a series of case law reports extending over many centuries.

The Law in Scotland and Northern Ireland.—The main legal difference between the women of Northern Ireland and those of England and Scotland has hitherto been that divorce in Northern Ireland was until the Matrimonial Causes act, 1939, obtainable only by the difficult and expensive process of parliamentary legislation; under this act the law on divorce has been assimilated to that of England.

The tendency of English and Scots law has been for them broadly speaking to approximate although it must be remembered always that Scotland has its own legal system *(see* SCOTS LAW) while English law has developed differently and mainly internally. Vast inroads have been made in recent years on English common law but it still covers an immense field in the national life.

UNITED STATES

When the United States acquired its independence. the prevailing body of jurisprudence governing the political, economic and social status of women was the common law of England at the time of separation. Under that law women enjoyed very little in the way of legally enforceable rights. In the political sphere, they were not permitted to vote, to hold public office, to serve on juries or to act in other public capacities. In the economic realm, they were limited in the range of employment in which they were permitted to engage. Married women were under disabilities to enter into independent contracts and in their own right to hold and dispose of property. In the words of Blackstone, "The husband and wife are one and that one is the husband." Socially, married women were amenable to the discipline of the male head of the household.

With the common-law disabilities, as one might expect, were coupled certain common-law protections consistent with the view of women as "the weaker sex." For example, where a wife committed a crime in the presence of her husband, there was a conclusive presumption that she was under coercion.

The strong tendency throughout the history of the United States has been toward a gradual disappearance of both the disabilities endured and the protections enjoyed by the American woman of 1776. The process has been one of ceaseless effort on the part of determined and ambitious groups of women who have worked with great energy and enthusiasm toward the goal of equal treatment under law.

Since most of the states adopted the common law, either through direct inclusion in their new constitutions of articles to that effect or through judicial interpretation, the evolution in the legal position of women has necessarily taken place through a state-by-state fight for corrective legislation and constitutional amendment.

Right of Women to Vote.—In the United States, as in England, there was a long and at times bitter controversy concerning the right of suffrage for women. *(See* WOMEN'S SUFFRAGE.) The right of women to vote was firmly established, however, by the adoption in 1920 of the 19th amendment to the constitution of the United States. This amendment provided that "The right of the citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex."

Right to **Hold Office.**—Women hold the most exalted public offices. They have been governors of several states, members of the United States senate and house of representatives, members of the president's cabinet and judges in both the federal courts and the courts of many of the states. Indeed there is no legal obstacle to the election of a woman as president or vice-president of the United States. The last substantial limitation on the right of women to hold office was the provision in the constitution of Oklahoma barring women from such offices as governor, lieutenant governor and attorney general. This provision was repealed in 1942. By statute until 1943 women were barred from holding positions as employees of the state legislature in Wisconsin. Since the repeal of these provisions the right of women to hold public office in the United States has been unlimited.

Right of Married Women To **Own** Property and **Make** Contracts.—Through constitutional amendment and appropriate statutory enactments in the several states the common-law disabilities of married women with regard to the independent ownership of property largely disappeared, and in this area American married women came to enjoy substantially the same rights as their husbands.

With regard to the rights of women in property acquired during marriage, however, there is a split of authority. It should be remembered that while the 13 original states were created from British territory, many of the states which subsequently became members of the union were created from land which had never been under the rule of Great Britain. It is not surprising, then, that some of those states carved from the territories in which the civil rather than common-law tradition prevailed should have adopted some of the aspects of their parent systems of jurisprudence.

An example of this variation from the common-law norm is seen in the states of Arizona. California. Idaho, Louisiana, New Mexico, Nevada, Texas and Washington, which have adopted the institution of community property.

"The general principle underlying the system of community property is that all property acquired during mamage by the industry and labor of either the husband or the wife or both, together with the produce and increase thereof, belongs beneficially to both during the continuance of the marriage relation" (41 C.J.S., Husband and Wife, sec. 462). The obvious effect of this system is to create a partnership relation between husband and wife as to property acquired after marriage. There is a great volume of legislation by which this institution has been modified and adapted to modern conditions. In community property states the property of married persons is divided into: (1) The separate property of the wife; (2) the separate property of the husband; (3) the community property in which both spouses have certain defined rights.

Generally speaking, each spouse has ownership of and control over his or her separate estate. In the several community property states there are substantial differences in the relative rights of husband and wife as to this joint estate known as the community property. In general, both husband and wife have beneficial interests in such property. The husband's rights, however, are active while those of the wife are passive. The wife's interest remains in abeyance until the termination of this relationship. As a result of this general principle the husband has the general management and control of the community property. He may lease, mortgage or sell it subject to the obligation that he must not defraud the wife in her interests. Of course, the proceeds of such lease, mortgage or sale will continue to be community property. Either spouse may dispose by will of his or her interest in the community property.

It will be seen that there is a substantial difference between the rights of husband and wife in the community property states and those in which the institution does not exist. On the one hand, the system favours the wife because it recognizes marriage as a quasi partnership in which the wife has an equal beneficial interest although she has not the same power of disposition. On the other hand, the husband is recognized as the head and master of the community property with the attendant rights to manage and dispose of such property, having due regard to the interests of the wife. There has been much discussion as to the origin of this system. On this subject it has been said:

"The origin of the community property system has never been satisfactorily determined. . . . It apparently was not derived from Roman law. Intermediately it has been certainly traced to the laws of France and Spain. . . . It was unknown to the common law" (31 C.J.S., Husband and Wife, Community Property, sec. 1073).

It was said by Chief Justice Edward White on this subject in the case of *Garrozi* v. *Dastas,* 204 U.S. 64–78:

"We need not consider whether the community was derived from the Roman law, from an express provision of the early Saxon law, or from the ancient customary law of the Continent. For, however derived, the very foundation of the community and its efficacious existence depend on the power of the husband, during the marriage. over the community, and his right, in the absence of fraud or express legislative restriction, to deal with the community and its assets as the owner thereof. The purpose of the community, as expounded from the earliest times, whilst securing to the wife on the dissolution of the marriage an equal portion of the net results of the common industry, common economy and common sacrifice, was yet, as a matter of necessity, during the existence of the community, not to render the community inept and valueless to both parties by weakening the marital power of the husband as to his expenditures and contracts, so as to cause him to be a mere limited and consequently inefficient agent."

He goes on to say:

"The rights of the wife are dormant during the marriage, because the husband is charged to watch over and conduct the affairs of the conjugal society. But this right, which is inert, as long as the husband is at the head of the affairs of the community, becomes active when the marital authority ceases to exist. The wife is like a silent partner, whose rights arise and reveal themselves when the partnership ceases." (Troplong. *Contrat de Mariage, id,* p. 79)

Jury Service.—After the suffrage battle had been won one of the most intensive women's rights campaigns centred around the right to serve on juries. This campaign was largely successful, and by the 1950s women had become eligible for jury service in all but a few states, located chiefly in the southeastern section of the country. In some of the states which amended their constitutions or statutes to provide for women jurors, however, their service is made optional.

Civil Professions. — In all the states there has been legislation permitting women to engage in civil professions and occupations.

Legal Position Under the Criminal Law. — There is no longer the conclusive presumption that a crime committed by a married woman in the presence of her husband or under his compulsion is coercion. There remained. however, a presumption of coercion by him in cases where a wife commits a crime in her husband's presence. The burden of proof is then on the prosecution to prove the absence of coercion. This presumption, however, does not apply in cases of the most serious crimes such as murder or treason. Moreover. the presumption can always be rebutted by evidence. If it can be proved that the crime was committed independently by the wife and that as a matter of fact there was no coercion, she can be convicted alone upon an offense committed in the presence of her husband.

Divorce and Custody of Children. — The changes in these areas by statute in the United States have been substantially the same as those occurring in the United Kingdom. Absolute divorce is recognized in all the states, and the right of the wife to divorce admitted, although there are in some states discriminations as to the grounds for divorce, the law being more favourable to the husband than to the wife.

Also the rigorous rule of the common law which gave absolute control and custody of the children to the father has been very largely abolished. In most of the states the law provides that in these matters of custody and control regard must be had only to the welfare of the child; the right of neither parent is paramount. The courts will consider all the circumstances and will make such decree as will best serve the interests of the child.

Legal Status as **Employees.**—Women in the United States are generally accorded the full benefits of labour legislation. They are permitted to join unions and along with male workers are protected by law in the exercise of the rights and privileges of such membership. They enjoy also the protections of fair labour standards legislation, minimum wage laws, unemployment insurance, workmen's compensation, old-age and survivors insurance, union and industrial pension plans and the full range of whatever legislation controls in general the relationship between employer and employee.

In addition to sharing with men the protection and benefits of laws and regulations adopted for the benefit of workers at large, women in the United States have traditionally been protected further by statutes which limit the hours during mhich they may work in certain industries and at certain occupations. by statutes establishing minimum wages without corresponding regulations as to men and laws regulating working conditions, rest periods and the like.

These statutes, usually supported as protections necessary to prevent the exploitation of women, have been attacked by women's rights groups as discriminatory and harmful to the progress of women in industry. These groups point out that by a legal requirement of preferential treatment for women workers legislators have made it less likely that women will be hired. Some have gone so far as to suggest that the motive behind such legislation is as often the consideration of eliminating competition as it is an honest concern over the welfare of women.

This point of view was adopted by the supreme court of the United States in *Adkins* v. *Children's Hospital*, 261 U.S. 52j (1922), a case arising in the District of Columbia and involving a statute establishing a minimum legal wage for women. Justice George Sutherland, speaking for the court, said:

"But the ancient inequality of the sexes otherwise than physical, as suggested in the Muller case (p. 421) has continued with diminishing intensity. In view of the great — not to say revolutionary — changes which have taken place since that utterance, in the contractual. political and civil status of women, culminating in the 19th Amendment, it is not unreasonable to say that these differences have now come almost if not quite to the vanishing point. In this aspect of the matter, while the physical differences must be recognized in appropriate cases, and as legislation fixing hours or conditions of work may properly take them into account, we cannot accept the doctrine that women of mature age, *sui juris*, require or may be subjected to restrictions upon their liberty of contract mhich could not lawfully be imposed in the case of men under similar circumstances. To do so would be to ignore all the implications to be drawn from the present-day trend of legislation, as well as that of common thought and usage, by which woman is accorded emancipation from the old doctrine that she must be given special protection or be subjected to special restraint in her contractual and civil relationships" (id. p. 554).

The Xdkins case (above), though bitterly criticized at the time as a restrictive view of the power of society to protect its weaker members from exploitation and though reversed in terms in 1937 by *West Coast Hotel Company* v. *Parish*, 300 U.S.279, was later hailed by leaders in the women's rights movement as a major step in the direction of true equality of the sexes.

Equal Rights Amendment. — Although women's rights groups were still active in the 1950s in support of state legislation designed to further their goal of complete equality under the law, the major energies of such groups were now concentrated on the adoption of a proposed amendment to the constitution of the United States. This proposed amendment, popularly referred to as the "Equal Rights amendment," reads:

(Article

Section 1. Equality of rights under the law shall not be denied or abridged by the United States or by any State on account of sex. Congress and the several states shall have power, within their respective jurisdictions, to enforce this article by appropriate legislation.

Sections 2 and 3 provide for mode of ratification and time of taking effect.

A similar proposal, before every congress from 1923, had reached a vote only once, in the senate in July 1946. At that time the vote was 38 in favour and 35 against, a majority of those voting but short of the two-thirds vote required on a proposed amendment to the constitution. (G. G. B.; J. D. Ls.)

WOMEN'S CLUBS, GENERAL FEDERATION OF. The General Federation of Women's Clubs is a national (U.S.) and international organization to promote interest in education, philanthropy. public welfare. moral values and the arts. It is open to any women's club or organization which requires no sectarian or political test for membership and which, in its concepts. conforms to state and national laws. The membership of the General Federation of Women's Clubs in the 1950s was approximately 11,000,000, but exact figures are difficult to give because of overlapping. Approximately half these members were in the United States, with 815,000 women paying per capita dues and providing the main financial support of the organization. Other members belonged to affiliated organizations in the United States or to organizations in 39 other countries.

The G.F.W.C. was organized and a constitution adopted on April 24, 1890, after a preliminary meeting of women's clubs held in New York city in 1889. It was incorporated under the laws of New Jersey in 1895, and a charter was granted by congress in 1901. Officers are elected by delegates from member clubs at a biennial convention. At intervening conventions and annual meetings of the board of directors, organizational policy is established. Before action is taken on controversial issues, the General federation makes every effort to disseminate information on both sides.

The work of the General federation is carried on through departments arid subdivisions of these departments. Department and division chairmen are appointed by the G.F.W.C. president. Club membership is contacted through the official organ, *The Celteral Federation Clubwoman* magazine, printed programs, bulletins issued by department and division chairmen and periodic communications from the president to club leaders.

WOMEN'S RELIGIOUS ORDERS. The history of the part played by dedicated women in the life of prayer and charitable works in the Western Church is one of continuous development and expansion from the simplest beginnings to a multiplicity of world-wide organizations. The life of vowed virginity or widowhood, often accompanied by charitable work, is as old as Christianity and is assumed as familiar, in some churches at least, by St. Paul who gives explicit approval. These women, pledged to a life of chastity and prayer, were early recognized as a "state" by the church; they were numerous in the centuries before Constantine I, as can be seen from allusions and inscriptions, and from the writings of Tertullian and St. Cyprian; they were bound by a private vow of chastity, but a subsequent change of mind in favour of marriage was for long not regarded as deserving of ecclesiastical censure, and there is no clear evidence of community life. A change took place when Christianity became the official religion of the Roman empire, and the subsequent history of religious women may, for convenience's sake, be divided into four periods: from the rise of monasticism to the 11th century; from the 11th century to the Reformation; from the Reformation to the French Revolution; and since the Revolution.

ROMAN CATHOLIC ORDERS

4th to 11th Centuries.— When, early in the 4th century, monasticism became common in Egypt and Syria, communities of women and women anchorites were also found, though in smaller numbers than the monks. The message of the desert gradually made its way among women of the west, and small groups were formed privately; perhaps the first instance in higher society is that of the noble Roman ladies Marcella, Paula and Eustochium in their retreat on the Aventine directed by St. Jerome and in their following him to the east, where they were established at Bethlehem c. 386. A few decades later, St. Augustine of Hippo was directing a community of women, for whom he wrote the letter of instruction that became known as his rule.

Thenceforth. wherever monks were found there were almost always houses of religious women or nuns with similar customs and practices; the bestowal of the veil and the consecration of a virgin by the bishop became normal features in the ceremony of reception in many regions. and the beautiful rite of consecration, still practised in certain older orders, takes shape first in the Gelasian sacramentary (6th century). Scholastica, sister of St. Benedict of Nursia, lived as a nun near Monte Cassino, and the rule of St. Benedict has been followed by women from the earliest times (for the rule, see BENEDICT, SAINT).

All the communities of women in the early middle ages lived a life of liturgical prayer, reading and work, such as spinning and weaving, retired from the world and under vow, though not necessarily strictly enclosed. Meanwhile, in cities and towns the practice of private dedication to a life of virginity continued, and persons so dedicated often assisted the clergy in various works of charity and mercy. When Christianity spread to Brittany and the British Isles, communities of women soon appeared, and an original departure was made with the so-called "double" monasteries of Gaul, Ireland and England. These seem to have arisen first in Gaul In Ireland they were family or clan establishments. Their distinguishing feature was the supremacy of the abbess, who governed two communities of men and of women, even when the latter were strictly enclosed. Many of the most celebrated early English monasteries were of this kind, such as Ely. Minster in Thanet and, above all. Whitby. The abbesses were often royal or noble ladies, such as St. Etheldreda at Ely, St. Mildred at Thanet and St. Hilda at Whitby, who exercised an influence on the life of their time which has no later parallel.

Generally speaking, however, by the 10th and 11th centuries the only type of nunnery was Benedictine, either Cluniac or independent, recruited principally from the landed class. Domestic work was done by servants; there was as yet no class of "lay sisters." and the nuns, often highly cultured, followed exactly the life of the monks.

11th Century to the Reformation.— From the middle of the 11th century the multiplication of new orders of men was followed in almost every case, often after a time lag of 20 years or so, by a corresponding sisterhood. Thus there were, and still are, houses of Camaldolese and Carthusian nuns. The Cistercians, though reluctant, were at last compelled to admit houses of nuns to affiliation. and St. Norbert founded a Premonstratensian nunnery as early as 1121. With the multiplication of nunneries the need for spiritual direction became pressing, and several orders were founded with a small quota of priests to act as chaplains, confessors and administrators to the nuns. Among these were the strict French order of Fontevrault (1100) and the English order of St. Gilbert of Sempringham (c. 1089–1189). with its four tiers of nuns, lay sisters, canons and lay brethren. The Gilbertines flourished in northeast England, but never spread outside Britain. It was in this period that women began to stand out as examples and expounders of the mystical life, among the earliest and most celebrated being the German Benedictines Hildegarde, Mechtild and the two Gertrudes.

When the friars came, both St. Dominic and St. Francis founded "second orders" of nuns, and later women of the "third order" living in the world grouped themselves in communities under vow. The Franciscan nuns, with St. Clare of Assisi as their first abbess, became the Poor Clares, an austere, strictly enclosed body with an illustrious history; in 1417 St. Colette established a reformed branch, the Colettines, which still exists (see FRANCISCANS: Second Order). The Dominican nuns, founded by St. Dominic at Prouille in the south of France, spread rapidly to Italy and south Germany. where their convents were distinguished by an intense mystical life inspired by the teaching of Meister Eckhart and J. Tauler (see DOMINICANS: Second Order). In Italy St. Catherine of Siena was a Dominican tertiary. Later, St. Bridget of Sweden composed a rule for an order of nuns, directed by a group of priests. who came to be known as Brigittines (*q.v.*) and flourished in Scandinavia and Germany, with a celebrated abbey (Syon), founded in 1415 by Henry V of England. Throughout this period the Augustinian canonesses, another 12th-century creation. continued to make fresh foundations. Nuns, however. were never as numerous as men religious in the middle ages, and the law of enclosure, though often disregarded in practice, prevented the establishment of what were later called the "active" orders. Finally. mention must be made of the numerous individuals who, with a bishop's permission, were enclosed as anchoresses in small houses alongside a church or chapel; a celebrated English instance is provided by the mystic Juliana of Norwich.

From the Reformation to the French Revolution.— The nuns shared the fate of the monks in the countries of northern Europe in the mid-16th century. In the world of the Counter-Reformation the most important name is that of St. Teresa, who in 1562 initiated a "discalced" (barefooted) branch of the Carmelite order at Avila in Castile (see CARMELITES). St. Teresa at the same time provided a body of ascetical and mystical doctrine which, completed by that of her ally St. John of the Cross. has been accepted as the classical exposition of the contemplative life. The Teresan reform was carried to Belgium by Anne of Jesus and to France (1604) by Mme.Acarie.

Meanwhile, the success of the Jesuits inspired admirers to imitate their methods with an active, unenclosed order of women. Among these was the Englishwoman Mary Ward, a pioneer whose work, misunderstood and thwarted by authority, nevertheless lived on and throve, particularly in central Europe, as a great and populous educational institute. that of the Englische *Fräulein* (founded 1609). In time, a small group returned to England (York, 1686) and thence, in the 19th century, as the Institute of the Blessed Virgin Mary, spread throughout Canada and the United States.

A similar aim inspired St. Francis of Sales and his disciple St. Jane Frances de Chantal in their foundation of Annecy (1618) of the Order of the Visitation to care for the sick and poor. but here once again the sisterhood reverted to type and became an enclosed, quasi-contemplative order, of which St. Margaret Mary Alacoque was a member.

It was reserved to St. Vincent de Paul and his associate St. Louise de Marillac to provide the institute, unenclosed and devoted to active work, toward which others had been groping. The Sisters of Charity, dedicated to nursing the poor in hospitals, and later to the teaching of children, came to being in 1614 (see CHARITY OF ST. VINCENT DE PAUL, SISTERS OF). Meanwhile, an older order, that of the Ursulines, founded at Brescia in 1535 by St. Angela Merici for the religious education of girls, but subsequently standardized as an enclosed order by St. Charles Borromeo. entered upon a great vogue in France and Germany; led to Quebec by Marie de l'Incarnation. Ursulines formed the first community of women in North America (see URSULINES).

The 18th century, though it showed few new enterprises, was one of prosperity for the religious orders of women, both contemplative and active, in France and throughout the German-speaking lands.

Since **the** French **Revolution.- he** women religious, though notably more faithful to their vocation than the men, shared in the general debacle of the French Revolution and Napoleonic conquests. They shared also. indeed they led. the remarkable revival that followed, especially in France. and it is noteworthy that several of the most influential of the new orders were founded by those who had heard their call during the decades of stress and apparent desolation in the church.

Of the multitudinous organizations that came into being almost yearly, only a few can be mentioned. Pre-eminent among them was the Society of the Sacred Heart, founded in 1800 by St Madeleine Sophie Barat (*q* v.) and formally recognized in 1840. Akin in spirit to the Jesuits, though without formal connection these nuns, in this also like the Jesuits, have been associated with Catholic higher education all over the world, and entered the United States (Louisiana) under Blessed Philippine Duchesne (*q v*).

The Sisters of Mercy were founded in Dublin in 1827 by Catharine McAuley (*q v.*) for the practice of works of mercy toward poor women and children

The contemporary Sisters of Our Lady of Charity of the Good Shepherd. founded at Angers in 1833 by St Marie Euphrasia Pelletier (as an offshoot of the Sisters of Our Lady of Charity of the Refuge. founded by St. John Eudes in 1641) for the rescue and protection of fallen and penitent women has been distinguished by a union of selfless devotion with many of the features of a Carmelite vocation.

The Little Sisters of the Poor (*q.v.*), originating in Brittany in 1840, are pledged to the succour of the destitute and aged, for whom they beg alms. The religious of Perpetual Adoration of the Blessed Sacrament (Rome, 1867) and those of Marie Reparatrice (Paris 1854) are enclosed nuns maintaining ceaseless prayer in the presence of Christ in the exposed Host for the conversion of sinners and in reparation for the world's ingratitude toward the Redeemer Two world-wide orders are English in origin: the Society of the Holy Child Jesus, founded at Derby by the American Cornelia Connelly (*q.v*) for the higher education of girls, with a head house at Mayfield (Sussex); and the Poor Servants of the Mother of God founded in 1868 by Mother Magdalen Taylor with the help of Lady Georgiana Fullerton, who also introduced the Sisters of Charity to England

Alongside these new orders, the older bodies enjoyed an equally impressive growth, and many of them spread overseas into the British and French possesrions and into North and South America. The Carmelite nuns in particular, always an elite of hidden fervour, after 50 years of expansion in France in the 20th century made foundations far and wide, from Iceland to Australia. from Africa and China to India and Peru, and gave to the church, among other mistresses of the spiritual life St Teresa of the Child Jesus and Elizaheth of the Trinity The Dominican nuns are equally numerous In Europe and America the Passionist nuns in their two branches, contemplative and teaching the Redemptorist nuns (contemplative) and the Servites (teaching) are widely spread. Finally. almost all the active orders of men, and in particular the missionary congregations and societies. have associated with themselves sisterhoods following a similar or auxiliary vocation.

Nevertheless. many of the orders are undoubtedly passing through something of a crisis in the rapidly changing conditions of the 20th century. The nuns, in common with the male religious and indeed with many who are neither members of religious orders nor priests. have been exiled from the countries of eastern Europe and from China and other parts of the east, and have felt the consequences of the colonial recession of England, France and the Netherlands in several continents of the world. At the same time, the world-wide emancipation of women and their entry into every kind of employment and society, while removing many unnecessary conventions and disabilities from the lives of the active orders, equally have brought problems of formal and spiritual discipline into prominence. The Holy See has encouraged many institutes of women to adapt their clothing and some of their customs to the practical needs of the modern world. and to take part in some interests previously deemed unsuitable. but it cannot be said that a final equilibrium has been reached between the demands of modern times and the inviolable principles of the life of Christian perfection. On the other hand, the attractions and economic independence offered to women by the modern world have undoubtedly led, since World War II, to a slackening of recruitment; this is particularly noticeable in the class of lay sisters, upon whom the majority of the orders depend for the maintenance and service of their houses and active works.

Yet the nuns have shown remarkable flexibility in adapting themselves to modern skills and techniques as teachers, medical women, nurses and social workers. The world population of religious women far exceeds that of medieval Christendom, and in the spheres of nursing. education and social welfare they have filled a distinguished and often a pioneering role both among the western nations and among backward and primitive peoples in the mission field. Every social class has taken its part in all the varieties of vocation. Several of the modern orders have had as foundress one who began life in domestic service or unskilled lahour, while on the other hand no reader of religious history can fail to be impressed by the long list of names of women. sprung from the noblest and most ancient families of Europe, who have dedicated their lives to contemplative austerity or to the service of the sick and distressed in the cities of Europe and America or in the mission fields of Asia and Africa. (M. D. K.)

PROTESTANT ORDERS

Anglican. — The revival of religious communities for women throughout the Anglican Communion. and in the first place in the Church of England itself was one of the most remarkable consequences of the 19th-century Oxford Movement. From the time of the Reformation, when all the communities of women mere dissolved at the same time as those of men, until 1845, there were no communities either of contemplative nuns or of active sisters within the Church of England. At various times during the 17th and 18th centuries tentative proposals were made for the foundation of "a Protestant nunnery." but it was only after the teaching of E. B Pusey. J. Keble and J. H. Newman that such communities actually came into being

The first community, the Sisterhood of the Holy Cross, was founded in London at Park Village. near Regents park, in 1845. In the following ten years the Society of the Most Holy Trinity at Devonport (1848). the Community of St. Mary the Virgin at Wantage Berkshire (1848), the Community of St. John the Baptist at Clewer near Windsor (1851; both near Oxford), the Community of All Saints, London Colney. Hertfordshire (1851) and the Society of St Margaret at East Grinstead, Sussex (1855) were founded. Notable among later 19th-century foundations are the Community of the Holy Name, Malvern Link. Worcestershire (1865), the Sisters of Bethany, London (1866), the Sisters of the Church. London (1570) and the Community of the Epiphany, Truro (1883). This movement grew up spontaneously in response to pressing practical needs and to the desire to lead a dedicated life. Almost all of the sisterhoods combined an active life (teaching. nursing. helping in parishes, etc.) with a life of prayer and worship. They based their manner of life fairly closely on Roman Catholic patterns and made use of the breviary offices in English. along with, or in place of the services of the Book of Common Prayer.

Communities of women during the 19th century were much more numerous than communities of men, a fact which may be related to the beginning of the emancipation of women. Anglican sisters were among those who accompanied Florence Nightingale to the Crimea, and took part in the work of raising the standards and status of the nursing profession. Similarly, in various forms of social and educational work the Anglican sisterhoods offered opportunities of service, which were not easily to be found in mid-19th century England. But the religious motive predominated in the revival.

Many English sisterhoods opened branch houses abroad, and in many provinces of the Anglican Communion independent communities were founded. For example, in the United States the oldest surviving sisterhood is the Community of St. Mary at Peekskill. N.Y. (1865); in Canada there is the Sisterhood of St. John the Divine (1884) at Willowdale, Ont., and in Australia the Community of the Holy Name (1886) at Melbourne.

During the 20th century, the foundation of new communities has continued, though at a slower rate. A number of enclosed communities of contemplative nuns have been established, both in England and in the United States; *e.g.*, the Sisters of the Love of God (1907) at Oxford, the Benedictine nuns at West Malling in Kent (1916) and the Poor Clares of Reparation and Adoration, Mount Sinai, Long Island. N.Y. (1922). A flourishing active community is the Order of the Holy Paraclete at Whitby, Yorkshire (1917).

The sisterhoods at first had to fight against a greal deal of misunderstanding and suspicion, which occasionally flared up in acts of open hostility Neither public opinion nor the authorities of the church was prepared for this sudden revival within the Church of England. and for some time the sisterhoods' relations nith the bishops were difficult. By the end of the 19th century however, this situation was altering; in 1890 the English convocations gave recognition to the sisterhoods and the bishops began to acknowledge the sisters' right to bind themselves to their calling by life vows. In 1935 an advisory council was established in the provinces of Canterbury and York. which advises both bishops and communities on matters of importance and supervises the formation of new communities.

Most of the Anglican sisterhoods are small; the most numerous contains about 300 members. But by the pioneering character of their works and by the quality of their liturgical and spiritual lives, they have exercised a considerable influence on the development of Anglicanism.

Other Protestant Churches. — During the 19th century a parallel movement took place on the continent of Europe, in the development of deaconess orders. Beginning at Kaiserswerth in 1836 under the inspiration of Theodor Fliedner, they spread rapidly, especially in Lutheran and Pietist circles However, the deaconess orders do not fully correspond with religious communities in the traditional sense. They lay more stress on the works to be done than on the life of the community, and their members do not take life vows (See also DEACONESS.)

It was not until the mid-20th century, and particularly after World War II. that a tendency appeared in the Protestant churches of Europe toward the recovery of the full life of prayer and worship in religious communities. Considerable communities of women have been established in both the Lutheran and the Reformed traditions. Prominent among them are the Oekumenische Marienschwesternschaft at Darmstadt, the Christus Bruderschaft at Selbitz (which includes both men and women) and the community at Grandchamp in Switzerland, which is closely linked with the parallel community at Taizé near Cluny in France. Other smaller communities of women exist in France, Germany and Scandinavia.

As in the Church of England in the 19th century, so on the continent of Europe in the 20th century the revival of forms of life unknown since the Reformation is carried on not without difficulty and hesitation. The development undoubtedly forms one strand in the much larger movement of liturgical and theological renewal and of ever-growing concern for Christian unity.

WOMEN'S SERVICES, MILITARY. Since World War I women have played an increasingly important role in the military services of all major powers. They have been enrolled as regular members of the various land, sea and air forces, have been issued distinctive uniforms and have been made eligible for all the rights and privileges of their male colleagues. In most countries women have not been trained for combat but have been employed in non-combat assignments suited to their abilities and have thus freed men for combat duty. For women as nurses with the armed forces, see NURSING; for women's uniforms, see UNIFORMS.

UNITED STATES

Many reports tell of women serving in the United States armed forces in the tradition of Molly Pitcher (*q.v.*) during the American Revolution. but none appears to be well confirmed. The truth seems to be that throughout the 18th and 19th centuries women served with the armed forces only in a civilian status as nurses, laundresses, cooks. clerks, etc. In 1901, following the Spanish-American War, congress opened a new chapter by establishing the Army Nurse corps to solve some of the problems encountered earlier in maintaining an organization of civilian female nurses within a military organization. The U.S. Navy Nurse corps was created in 1908. During World War I the U.S. navy and marine corps. in spite of grave doubts as to the legality of the move, recruited nearly 13.000 women as yeomen, the first women to be admitted to full military rank and status in the U.S. services.

Women in the Army. — The Women's Army corps (WAC), originally created as the Women's Army Auxiliary corps on May 14, 1942, became a part of the army of the United States on July 1, 1943. Mrs. Oveta Culp Hobby was named first director with rank equivalent to that of colonel — the first U.S. woman to hold such rank.

The basic WAC military training program was similar to that given for the first six weeks to men, except that it was not of a combat nature. After training, members were assigned to non-combat military duties in which women were found to be as adept as men. Many of these duties, such as typing. had civilian counterparts, whereas others required special military training. In some instances women were trained in the use of weapons so they could qualify for specific duties such as that of disbursing officer. At peak strength of about 100.000 (6.600 officers and 93.000 enlisted women), members of the WAC mere serving at more than 400 installations in the United States and in all theatres of military operntion. Women were subject to all army regulations and shared all privileges; they were also entitled to benefits under the Soldier's and Sailor's Relief act and the G.I Rill of Rights and were eligible for National Service life insurance. After World War II the WAC was greatly reduced in strength but was made a permanent part of the U S army when the Women's Armed Services Integration act was passed in June 1948. During the Korean war (1950–53) the strength of the WAC rose to more than 14 000, then declined to about 8,000.

Women in the Navy. — The women's reserve of the U S. naval reserve known as the WAVES (Women Accepted for Volunteer Emergency Service), was established on July 30, 1942 Its members had the same military status as male officers or enlisted men but until 1944 they were restricted by law to service in continental United States, Alaska and Hawaii. Mildred H. McAfee (later Mrs. Douglas Horton) was sworn in as first director on Aug. 3, 1942. serving as lieutenant commander and later captain until Feb. 1946 Peak strength of personnel was reached shortly after V-J day in Sept. 1945. with 8,000 officers and 78.000 enlisted women on active duty in the United States and Hawaii. At that time the WAVES comprised 18% of the total naval personnel assigned to shore establishments in the U.S. They released 50,500 men for duty afloat or overseas and took over 27,000 other jobs in the expanded naval shore establishment.

The largest group of enlisted women were seamen; they filled a variety of billets ranging from general office workers to film projectionists and chauffeurs. Thirty-eight ratings were open to enlisted women, with about 14,500 WAVES serving as yeomen. Others included storekeepers, telegraphers, electrician's mates, cooks, bakers and printers. After World War II the WAVES became an integral part of the U.S. navy when the Women's Armed Services Integration act was passed in 1948.

Women Marines. — The women's reserve of the U.S. marine corps mas set up on Feb. 13. 1943, with an announced quota of 1,000 officers and 18,000 enlisted women—a quota which was reached in June 1944. At the surrender of Japan, personnel numbered 831 officers and 17,714 enlisted women. The reserve helped in the training. processing and supply of combat units and in camp administration. Col. Ruth Cheney Streeter, the first director, continued in active service until Dec. 7. 1945. After passage of the 1948 act mentioned above, women continued to serve in the marine corps both as regulars and reservists.

Women in the Coast Guard.—On Nov. 23, 1942, congress approved formation of the women's reserve of the U.S. coast guard. This reserve came to be known as the SPARS, derived from the coast guard motto. *Semper Paratus*.

Women in the Air Force.—During World War II, when the air force was part of the army, women in the air force were members of the WAC. A few women pilots were enlisted in the Women's Auxiliary Ferrying squadron (WAFS) under Nancy Harkness Love. or in the group headed by Jacqueline Cochran known as Women Auxiliary Service pilots (WASP). In June 1948; less than a year after establishment of the U.S. air force as an independent service, the WAF (Women in the Air Force) was created as an integral part of the air force. Single women between the ages of 18 and 34 were accepted for enlistment in the WAF and performed a wide range of noncombat duties during World War II and the Korean war.

GREAT BRITAIN AND COMMONWEALTH COUNTRIES

Aside from nursing, the first British service to be formed for women was the Women's Army Auxiliary corps in 1917. followed by the Women's Royal Naval service and the Women's Royal Air Force. all of which were disbanded by 1921.

World War 11.—Before war broke out in Europe in Sept. 1939, Great Britain had revived the women's services on the same basis as those of World War I. but the women's army and air force organizations were renamed the Auxiliary Territorial service and the Women's Auxiliary air force, respectively. Members were uniformed and had their own code of discipline which was administered on the same lines as the navy. army and air force but was founded on a voluntary code incorporated in terms of enrollment rather than on any legal sanction. In peacetime the members' services were voluntary and unpaid. although they were clothed at the public expense and received grants to defray expenses. At the outbreak of war. however, they were enrolled for full-time service: they were paid, but were not trained to carry arms.

In the majority of commonwealth countries women joined voluntary organizations to serve the armed forces after the outbreak of war. but it was not until after the fall of France in 1940 that they were organized on the same lines as the women's services of Great Britain which. at the same time. were greatly expanded. The naval services retained their voluntary status. hut those of the army and the air force were made liable to a modified form of military law and their officers were granted a special form of emergency commission. The next significant change that took place was in Canada in 1942, when members of the Canadian women's army corps were made subject to the Army act in the same way as men (but with certain special provisions). The women's auxiliary air force was reorganized on the same lines and renamed the Royal Canadian air force (women's division).

The original purpose of women's military services was to replace men in certain nonoperational units in their native country. As the war progressed. women were introduced as plotters into the operation rooms of all three services, into many signal units and into intelligence work. The number of trades in which they were employed rose to three figures. One-third of the women in the British army served with antiaircraft command where they operated the instruments controlling the guns. With the exception of Australia, women were liable for service overseas and most of them were sent to the middle east; eventually Australia found it necessary to appeal for volunteers to serve in New Guinea. At their greatest strength the three British services alone reached a peak of nearly 500 000; those of the commonwealth brought the total up to nearly 600,000.

Great Britain After World War 11.—On Feh. 1. 1949, the British women's services were included in the permanent establishments of the navy. army and air force and were also included in the reserve and auxiliary services. Once again the titles of the army and air force services were changed, becoming the Women's Royal Army corps and the Women's Royal Air Force. They were not trained to carry arms.

Although not subject to the Naval Discipline act of 1922. the Women's Royal Naval service (W.R.N.S.) is an integral part of the naval organization and has its own similar disciplinary code. Its members serve in naval shore establishments in the United Kingdom, in Malta and with the North Atlantic Treaty organization in Oslo Norway, and in Germany. Their duties range from radio and air mechanics, range assessors. plotters, meteorologists and cinema operators to cooks and stewards.

The Women's Royal Army corps is a corps of the regular army, commanded and administered by its own officers who hold regular commissions. The other ranks are enlisted. Although generally organized in separate units, there are some mixed operational establishments with a male commanding officer and a female second-in-command who is responsible for the women's discipline. Most of the women serve in domestic categories but there are some highly skilled trades of which the experimental assistants gunnery (equivalent to the range assessors of the W.R N.S.) call for the highest standard of education. A high percentage of the total strength serves overseas in every command in which British troops are included.

Officers of the Women's Royal Air Force (W.R.A.F.) hold regular commissions in the air force; the other ranks are enlisted. They are in every sense integrated with the Royal Air Force (R.A.F.) and there is no separate force within a force, no independent W.R.A.F. chain of command. All officers and enlisted personnel belong to one or another of the R.A.F. branches or trades with which they work throughout their service. They work either on the ground or in the air; it has been proved that they can be employed in 18 out of the 22 trades. Although the normal administrative channels are the same for men and women. W.R.A.F. officers are often asked to undertake certain welfare and administrative duties in addition to their normal work. The bulk of the women serve at home, but some go overseas.

The British Commonwealth After World War 11.—After the women's services of Great Britain came into line with those of Canada, few differences existed between the two countries. In Australia and New Zealand. although they were established on a peacetime basis. they still sought recognition as permanent services at the beginning of the 1960s. Their officers! including those of the Women's Royal Australian Naval service. are given only short service commissions. Members of the W.R.A.A.C. and W.R.A.A.F. are governed by regulations made under the provisions of the Army and Air Force acts, which operate in the same way as did those of the Eritish services during World War 11.

The women's army corps (India) was disbanded when India and Pakistan gained independence in 1947. After that time, Pakistan formed a women's national guard and a women's naval reserve to train women for employment in an emergency. Other part-time services included a small but active unit in Singapore which formed part of a mixed antiaircraft regiment of the Singapore defense force. The Hong Kong women's army corps. also on a part-time basis, trained under active service conditions with the Royal Hong Kong defense force.

OTHER COUNTRIES

Before World War 11.—In the Scandinavian countries part-time military service for women was based originally on the Finnish *Lottekorps*, named after Lotte the heroine of an 18th-century saga. It provided financial support for the militia by raising money through entertainments. bazaars and other means. A different type of military service for women existed principally in

Communist countries. It was integrated with the armed forces and looked for its early traditions to the women of the Russian Revolution who fought side by side with their menfolk in the defense of Petrograd in 1917. At the outbreak of war in 1939, the Soviet Union had no women's services but in that year passed a conscription law that provided for the inclusion of women in the armed forces in peace and war. Certain specialists and technicians were made liable for registration and conscription in an emergency. Although plans were drawn up for a German corps of women in 1918, the war ended before they could be implemented.

During World War 11.—Women who remained in the occupied countries of Europe played their part in resistance movements, while those who had taken refuge in Great Britain were organized as part of the contingents of foreign nationals formed on the same lines as the British services. by whom they were clothed and trained. When the U.S.S.R. was invaded by Germany in 1941 the women who were liable for conscription were called up for duty behind the lines. As the Germans overran thousands of miles of their homeland, many volunteered and were accepted for fighting at the front. In this way women served with the Russian armies in two capacities: all were trained to carry arms but the conscripts mere not called upon to use them except for guard duty in rear areas; a woman in a fighting unit, on the other hand. lived and fought along with the men and was treated as one of them. No aomen's service was planned by Nazi Germany, which relegated women to a subordinate position.

After World War 11.—In Communist countries, the employment of women generally followed the Soviet pattern. Women were armed and included in fighting units, although in the U S S R. and China they generally carried out only administrative duties. There was no conscription for full-time service. but boys and girls in China received the same military training in schools. Afterward the girls served in the reserves where their training was kept up to date by attending camp and, they were liable to serve in an emergency. A few women were known to hold the rank of major general, unlike those of Great Britain where ordinarily the highest rank held was that of brigadier. As examples of forces employing women in roles after the Russian pattern, such irregular armies as the Freedom Fighters of Tibet and rebel forces in Latin America may perhaps be mentioned.

The only full-time women's service in Europe was that of France. It was under the discipline of and closely integrated with the army and the air force; there were no separate units or senior officers; all ranks usually lived out of barracks. except with the army of occupation in Germany, and were not accepted by the men with whom they worked in the same way as in the British commonwealth. Of the part-time women's services in Europe. the Finnish *Lottekorps* was disbanded under one of the clauses of the Finnish treaty with Russia in 1944, but after 1945 similar organizations were established in Norway. Denmark and the Netherlands There were no women's services in the Federal Republic of Germany.

The only Asian country outside the commonwealth in which a women's corps existed was that of Thailand where the army was modeled after that of the United States. In the middle east, Israel became the first country in the world to conscript women in peacetime. Women were included in the army where they were employed largely as instructors in the Hebrew language, but they also carried arms; one-third of the militia on which the defense of the country depends was made up of women.

Another country known to have introduced women into its regular forces is Turkey. In 1955 women were permitted for the first time to enter the sea, land and air mar schools as officer cadets. Some were commissioned in 1957 and they carried out the normal duties of their rank. It was intended to enlist other ranks as soon as there were sufficient women officers to command them.

WOMEN'S SUFFRAGE. In England women's suffrage was first mooted by Mary Wollstonecraft in her work *A Vindication of the Rights of Woman* (1792) and was first revived—but also quelled—in the Chartist movement of the 1840s; but independently it was again raised by Richard Cobden, by Disraeli (perhaps not too seriously), by Joseph Hume, M.P., and with a permanent and magnificent devotion by Jacob Bright, M.P. R. M. Pankhurst followed them in Manchester, where the first women's suffrage committee was formed in 186j. Its honorary secretary was Elizabeth Wolstoneholme Elmy, a woman who had already rendered splendid service to the Married Women's Property committee. On Mrs. Elmy's removal from Manchester, Lydia Becker succeeded her as salaried secretary. She earnestly desired that agitation for further reform concerning married women's property should be abandoned in favour of concentration on suffrage alone. Pankhurst and Jacob Bright successfully opposed a plan which would have necessitated wives fighting the suffrage campaign without control of their own money.

Meanwhile, a later-formed London Suffrage committee had been stirred by the election of John Stuart Mill to parliament in 1865 to collect 1,449 signatures to a petition which Mill presented to parliament in 1867. In 1868 a general election took place, in which Mill lost his seat. In 1869 he published his famous work *On the Subjection of Women.* Societies were organized in many large towns, and parliament in the next decade received petitions containing in all 2,953,563 signatures.

The long succeeding years saw the gradual deterioration of the parliamentary position, evidenced by the loss of every suffrage bill brought forward; this resulted from the steady hostility of Gladstone, alternating with the insincere lip service of Disraeli; nor did either statesman care to affront the implacable enmity of Queen Victoria to the women's movement. It was a political deterioration which ran parallel with the increasing determination of Englishwomen to attain their enfranchisement.

In 1867 a Reform bill giving increased rights to male voters had reached the statute book, and the women's societies determined to ascertain whether it enfranchised them or not. Two test cases were brought before the court of common pleas, viz., *Chorlton* v. *Lings* (1866) and *Chorlton* v. *Kessler,* Sir William Bovill, the lord chief justice, presiding. He contemptuously ignored all former mediaeval precedents showing that women anciently exercised voting rights when county members were elected and decided against the principle of women's suffrage in the first (Lings) case and harshly refused to hear the second case (Kessler) at all, although Pankhurst, with Sir John D. Coleridge, Q.C. (afterward lord chief justice), had been briefed to argue the case. Pankhurst drafted a Women's Disabilities Removal bill and Jacob Bright introduced it; but Gladstone insisted on its defeat. In 1871 Bright again introduced it, but again Gladstone implacably opposed. Bright lost his seat and Lydia Becker passed the bill over to a member of parliament named Forsyth. She also concurred in his addition to it of a clause excluding wives from the suffrage, to which the disheartened Manchester committee gloomily assented, and the London one more readily. This bill was lost—happily.

The Married Women's Property bill drafted by Pankhurst became law in 1882. Pankhurst stood as candidate for Manchester in 1883, Lydia Becker and her suffrage organization refusing their support, but for various other reasons he was defeated. Dissension in the suffrage camp on wives' votes was practically endemic, and under Lydia Becker's secretaryship the newly formed Society for Women's Suffrage continued to back the principle of enfranchising widows and spinsters only. Consequently there was a secession. Mrs. W. Elmy, Josephine Butler, Pankhurst, Jacob Bright, Mrs. Pankhurst, Ursula Bright and others of the original suffrage pioneers formed the new Women's Franchise league. This organization soon received considerable support and adopted Pankhurst's original Disabilities bill. However the Local Government act of 1894 dealt a deathblow to the exclusion of wives, for under it they received the local franchise. The passage of this act resulted largely from the effortsof the Women's Franchise league. The act closed that gap within suffragist ranks.

In 1892 J. Keir Hardie was elected to parliament and the women's cause gained one of its doughtiest and noblest warriors, almost solitary for many years but later on joined by Philip Snowden and George Lansbury.

In 1884 the suffragists had high hopes of inclusion in the Reform bill of that year, but Gladstone again ensured their defeat. A period of frustration ensued.

In 1897 the various suffrage societies united into one National Union of Women's Suffrage Societies under the presidency of Millicent Garrett (Mrs. Henry) Fawcett, who introduced much more coherence, harmony and good organization. Women owe her a great debt.

In 1898 occurred the death of the veteran pioneer Pankhurst, but his widow, Emmeline Pankhurst, carried on his work and in 1903 started the Women's Social and Political union in Manchester. In 1904 her daughter Christabel graduated with honours in law. Her training made her see that the old N.U.W.S.S. policy of adding together the number of private members' declarations of support and then presenting private members' hills would never achieve success but that enfranchisement could only follow the coming into power of a cabinet resolved upon women's suffrage as a policy of the government. A general election was due for 1906 and it was therefore vital to ascertain what would be the policy of the Liberals if returned to power—as in fact they were. These different policies—counting heads or demanding cabinet policy—proved the true watershed between the W.S.P.U. and the N.U.W.S.S.

The match which ignited the flame of so-called "militancy" was touched off in 1905 at a Manchester Liberal meeting, addressed by Sir Edward Grey, whose purpose was to declare the official Liberal policy if that party returned to power. Christabel Pankhurst and Annie Renney rose to put a question upon the future government's policy. The two were seized by stewards, their arms were twisted, they were kicked down the gallery stairs and were thrown outside. There, in attempting to address the crowd, they were arrested for obstruction. Next day they were fined but chose the alternative—to serve a prison sentence. This aroused attention all over the country and indeed in the world.

After the return of the Liberals in 1906 the succeeding years saw the defeat of seven suffrage bills. Concurrently, acute militancy in the form of women's reprisals by damage to property constantly increased in gravity. The women militants mere sent to prison and continued their protests there by hunger-striking. Forcible feeding brought some of them near death. Under the "Cat and Mouse" act, as the Prisoners (Temporary Discharge for Ill-Health) act was called, they were (sometimes several times) released and then rearrested when just well enough to resume imprisonment. At the same time the militants consistently opposed every government candidate at every by-election. often aiding defeat. Public support grew in volume and sums aggregating hundreds of thousands of pounds were contributed. Public demonstrations, exhibitions and processions were carried out by both W.S.P.U. and N.U.W.S.S., and the Women's Freedom league organized many useful protests unaccompanied by violence. such as picketing of every exit of the house of commons for weeks. In 1913 one militant, Emily Davidson. gave her life by throwing herself before the horses in the Derby race.

In 1913 also came the nadir of parliamentary process. H. H. Asquith. the prime minister. had launched a reform bill to give more votes to men and announced that it would be open to women's suffrage amendments. When tabled, the speaker ruled that such amendment altered the character of the original bill too profoundly for it to proceed. It mas abandoned, and the suffragettes and even suffragists were aroused to fury. In Aug. 1914 World War I supervened and the S.U.R.S.S. and the W.S.P.U. alike devoted their efforts solely to aiding the national cause.

By the midst of 1918 when victory was in sight David Lloyd George. the premier who had superseded Asquith. announced the formation of a speaker's all-party conference to settle the principles of a new reform bill. Women's suffrage formed one recommendation, and in the resulting Representation of the People act, 1918, married women. women householders and women university graduates of 30 and over received the franchise. An act to enable women to sit in the house of commons was enacted shortly afterward. In 1928 the age of women electors was lowered to 21 to place the woman voter on an equality with male voters.

THE UNITED STATES

During the colonial period, the vote was very closely restricted to the members of certain specified churches and to those vhose names nere on the tax list. nhile in some cases a slight educational requirement was made. Women, even though qualified, were almost universally excluded.

After the Revolutionary War when the convention met in Philadelphia to draft the constitution. no question aroused such vehement discussion as that of the suffrage. It was so long continued that finally the only solution possible was to omit the subject from the national constitution and leave each state free to make its own qualifications for voting.

Meanwhile women were receiving the rudiments of an education and slowly acquiring a voice in public affairs. By 1832 the anti-slavery question was becoming acute. Women were intensely interested and were developing so much power as public speakers that the question of allowing them on its platform had divided the Anti-Slavery association, the Garrison-Phillips branch standing by Lucretia Mott and her contemporaries. Among these were the Quakers who always had recognized the equal rights of women. In later years Elizabeth Cady Stanton. of Revolutionary ancestry. joined the antislavery forces and she and Lucretia Mott decided that the rights of women as well as those of the Negro slave needed redressing. In July 1848, at a Friends' Yearly Meeting in western New York. they issued a call for the first woman's rights convention in history. It met in Seneca Falls. Mrs. Stanton's home, on July 19, and after a two-day session adjourned to Rochester.

This may be regarded as the beginning of the movement for women's suffrage in the United States. It received wide publicity in the New *York Tribune* under Horace Greeley and was followed in 1850 by a convention in Worcester, Mass., under the auspices of Lucy Stone and a distinguished group of eastern suffragists. The movement, however, still lacked the dynamic force which was to put it into effective action. This was soon supplied by Susan B. Anthony. In 1851 she first met Mrs. Stanton and the friendship began which remained unbroken for more than 50 years. Miss Anthony attended her first women's rights convention in Syracuse, N.Y., in 1852, her last in Baltimore, Md., in 1906, one month before her death.

At first no way of extending suffrage was known except through amendments to state constitutions, which required the consent of a majority of the male voters. The first attempt was made in Kansas in 1867, immediately after the close of the Civil War. An amendment was submitted at the same time to enfranchise the newly liberated male slaves. who had flocked into that state. Both were defeated but the latter received a much larger vote in its favour. All the states had the word "white" in the suffrage clause of their constitutions, and legislatures in a number of them submitted amendments to take it out. They were defeated and it was evident that some other method must be found if the Negro men were to vote. which the Republican party was very desirous that they should do. A measure was decided on that had not been attempted since the early days of the republic, the submission of an amendment to the national constitution.

As soon as this intention was announced Miss Anthony and some of the women's suffrage leaders demanded that the proposed amendment should enfranchise not only Negroes but all women as well. Most of the men who had been the strongest advocates of women's suffrage opposed this demand and they were supported by some of the women who feared that it would imperil the success of the amendment. Women were not included in this 14th amendment and, later, when a 15th was found necessary to strengthen it, they were also excluded.

The women's suffrage leaders, however, perceived a new method, which did not seem so utterly hopeless as amending the constitution of every state by consent of a majority of the voters. In New York city in 1869, at the close of the May anniversary of the Equal Rights association, which had been formed soon after the war to protect the Negro men, a National Woman Suffrage association was organized. Representatives from 19 states uere present and its object was declared by resolution to be to secure the ballot for women by a 16th amendment to the federal constitution. Mrs Stanton was elected president and Miss Anthony chairman of the executive committee. This organization held a national convention every year thereafter for 50 years and went before committees of every congress asking for the amendment. Its leaders soon learned that pressure from the states on their representatives in the congress would be absolutely necessary and, therefore, began to organize women in the states to mork on the legislatures until every state was so organized In the autumn of 1869 another distinguished group. headed by Lucy Stone, organized a national association called the American, solely for this purpose. In 1890 the tuo organizations united under the name of National American, which worked for both objects for almost 30 years. After the deaths of Mrs. Stanton, Miss Anthony and their contemporaries. their work was continued by Anna Howard Shaw and Mrs Carrie Chapman Catt, who headed an organization eventually increased to many thousands. Individual states began to yield and enfranchise their women and each one increased the members of congress elected partly by women, nho were thus obliged to vote for an amendment to the national constitution. The revenues increased annually. $120,000 being subscribed in 1919 to the work of the National association, exclusive of the amounts raised by the various states for their own work.

It was found that legislatures could give women the vote for presidential electors and in some states the municipal and various forms of local franchise. Those of Arkansas and Texas gave the primary suffrage. equivalent to a full vote. Meanwhile campaigns were being vigorously conducted to persuade the legislatures to submit to the voters amendments to the state constitutions conferring the full suffrage in state affairs. This was accomplished in New York in 1917 and was the greatest victory yet achieved. By 1918 women had thus acquired equal suffrage with men in 15 states, offering the only instance in the world where the voters themselves gave the franchise to women.

Meanwhile other national associations had been formed The Federal association was organized in 1892. The Rev. Olympia Brown was president for 17 years and many prominent men and women were members. Its object was the passage of a law by the congress authorizing women to vote for members of the lower house, which would have been constitutional. The College Equal Suffrage league was organized in 1908 with M. Cary Thomas. president of Bryn Mawr college, at its head during the nine years of its existence, and it co-operated with the National American association. This was true also of the Friends' (Quakers') association. Mississippi Valley conferences were organized in 1912 and Southern Women's conferences the following year, which did effective work in their sections as auxiliaries of the National American. A Congressional union was formed in Washington in the spring of 1913 to support the work of the association's congressional committee, but in December it became an independent organization with headquarters in Washington and Alice Paul as its head. Its object was a federal amendment, which it attempted to secure by aggressive methods never before employed in the United States. At the time of the national Republican convention in 1916 it adopted the name National Woman's party. In 1911 a National Men's League for Woman Suffrage was organized.

World War I, and the part taken therein by U.S. women, broke down the barriers of the opposition. All the political parties were committed to their enfranchisement, but there was still enough opposition in congress to delay the final vote of both houses to submit the amendment to the legislatures until June 1919. The task then remained of securing the ratification of three-fourths of the legislatures in time for the women to vote at the presidential election of Nov. 1920. Most of them had adjourned and this would have to be done by special sessions. It was accomplished and the last certificate, that of Tennessee, was delivered to Secretary of State Bainbridge Colby at 4 o'clock in the morning on Aug. 26, 1920. At 9 o'clock he issued the official proclamation that the 19th amendment having been duly ratified by 36 state legislatures "has become valid to all intents and purposes as a part of the Constitution of the United States." It reads as follows: "The right of citizens of the United States to vote shall not be denied or abridged by the United States or by any State on account of sex."

WŎNSAN (Japanese pronunciation, *Gensan)*, a city and seaport of Democratic People's Republic of Korea (North Korea), the capital of Kangwon province. is on the Sea of Japan about 80 mi. E. of the North Korean capital of P'yŏngyang. Protected by two promontories and by islands. Wŏnsan has the best natural harbour along the east coast of Korea. It was opened as a commercial port in 1891. The major railroad for northeastern Korea led inland from Wdnsan southwest to Seoul. Branch lines were later built north and south along the coast and, in the 1940s. a line to the west connected this region with P'yŏngyang. As it became a focal point for an important railroad network, railroad workshops and transshipment yards were developed. During Japanese control (1910–1945) oil refining and distribution plants based on imports were built. largely with foreign capital, and a considerable fishing fleet was based there. Oil refineries, port facilities and urban centres were heavily damaged through aerial attacks during the Korean War. Industry has been rehabilitated somewhat. The estimated population (1958) is 200.000. (S. McC.)

WOOD, ANTHONY À (1632–1695), English antiquarian and historian of Oxford, whose *Athenae Oxonienses* is a valuable source of biographical information, was born on Dec. 17, 1632, in Merton street. Oxford. He spent his life within a stone's throw of Merton college, where he matriculated and in the chapel of which he was buried, but he was never a fellow of the college. Inspired by Sir William Dugdale's *Warwickshire* (1656). Wood devoted his life to collecting and publishing the "antiquities" of the city, the university and the colleges of Oxford. His mork on the city did not appear in his lifetime; but, assisted by John Fell, dean of Christ Church, he published his account of the university, *Historia et antiquitates universitatis Oxoniensis*, at the university press in two large folios in 1674. Wood then turned (with financial assistance from his patron Ralph Sheldon and the help of materials supplied by John Aubrey [*q.v.*] and others) to the compilation of a vast biographical dictionary of Oxford writers and ecclesiastics. which appeared (also in two folio volumes) in 1691–92, under the title *Athenae Oxonienses*. Apart from antiquarian excursions, mainly in the neighbourhood of Oxford. Wood lived the life of a recluse, devoting all his time and his resources to research. He never married. He was deaf, bitter and suspicious, and quarreled with his family: his patrons and the fellows of his college. His biographical sketches contain many spiteful criticisms of his contemporaries, which reflect his own bitterness and that of his correspondents, and one such passage (supplied him by Aubrey), accusing the 1st Lord Clarendon of corruption, led to his prosecution for libel in the vice-chancellor's court at Oxford. Wood was convicted, mulcted in costs and expelled from the university. an experience which still further embittered his attitude toward his Oxford contemporaries. He died at Oxford on Nov. 29, 1695.

Wood left to the Ashmolean library a vast collection of papers, mainly in manuscript, including, besides correspondence, an autobiography and diaries. His manuscripts have proved a gold mine for subsequent historians of Oxford, and they afford a uniquely detailed and human picture of university life in the second half of the 17th century. Wood's place in Oxford historiography was not long left vacant: a few weeks after his death there took place the matriculation of Thomas Hearne (*q.v.*), whose voluminous *Collections* continue over the first quarter of the 18th century that day-to-day chronicle of university happenings which Wood provided for an earlier generation.

The English text of Wood's *History and Antiquities* was edited by John Gutch in two volumes (1786–90) and a scholarly edition of his *Athenae* was published by Philip Bliss, four volumes (1813–20). His autobiography and diaries were admirably edited for the Oxford Historical society in five volumes by Andrew Clark (1891–1900) under the title *The Life and Times of Anthony Wood*. (J. SP.)

WOOD, GRANT (1892–1942), U.S. painter, one of the major exponents of the midwestern regionalism that flourished in U.S. art during the 1930s, was born Feb. 13, 1892, on a farm near Anamosa, Ia., on which his Quaker grandfather had been a pioneer settler in the 1860s. When Wood was ten his father died. and the family moved to Cedar Rapids, Ia. Even before this he had begun sketching with charcoal. After graduating from high school he studied for a summer under Ernest Batchelder at the Minneapolis School of Design and Handicraft. In 1913 he went to Chicago where he worked with jewelry at the Kalo silversmith shop and attended night classes at the Art institute. During World War I he did camouflage work in the army; following the war he taught art at a Cedar Rapids junior high school. In 1920 he went abroad for the summer and in 1923 spent a year at the Académie Julian in Paris. On his return to Iowa. David Turner, a mortician, gave him a garage for a studio and living quarters, becoming his first major patron.

In 1928 when Wood was commissioned to do a stained-glass window for the Cedar Rapids Memorial building of the American Legion, he went to Munich to seek craftsmen to assist him. While there he became fascinated by the work of the Flemish primitives, especially that of Hans Memling, and by the portraiture of Hans Holbein and Albrecht Diirer. He also admired the meticulously realistic peasant types of Wilhelm Leibl and the work of his contemporary Otto Dix. Wood's manner changed from his earlier pseudo-Impressionist style to the clean-cut realism generally associated with his name. A portrait of his mother, "Woman With Plants" (1929), did not attract attention, but in 1930 his "American Gothic" caused a sensation when it was exhibited in Chicago. The hard. cold realism of the technique displayed in this painting and the honest, direct, earthy quality of the subject were unusual in U.S. art. Iowa farmers, however, thinking that they were being ridiculed, were incensed. Actually Wood had used as models his sister Nan and his dentist. B. H. McKeeby, portraying them as a farmer-preacher and his daughter in front of their 19th-century Gothic revival farmhouse. symbols of the sober. hard-working and dependable people who were the backbone of the U.S.

Thus the trend toward regionalism, the American scene of the 1930s associated with the paintings of Wood. John Steuart Curry and Thomas Hart Benton, was set in motion. Wood's success increased. and his paintings mere eagerly sought. "Daughters of Revolution" caused a furor because of its biting satire. It was interpreted as a plea for democracy, a stab at smugness. In 1934 Wood was made assistant professor of fine arts at the University of Iowa. Iowa City, and busied himself with painting. lithography and teaching. He died in Iowa City, Feb. 12, 1942.

See Darrell Garwood, *Artist in Iowa; a Life of Grant Wood* (1944). (F. A. Sw.)

WOOD, MRS. HENRY (née ELLEN PRICE) (1814–1887), English novelist. was born at Worcester on Jan. 17, 1814. She married Henry Wood in 1836. and after her marriage lived for the most part in France. In 1860 she wrote a temperance tale, *Danesbury House*. Her first great success was made with *East Lynne* (1861) which was translated into several languages and was dramatized. Other novels followed. She became proprietor and editor of the *Argosy* magazine in 1867. She died on Feb. 20, 1887.

WOOD, SIR HENRY EVELYN (1838–1919), British field marshal whose organizing capacity led to notable improvements in British army administration, was born at Cressing. Essex, on Feb. 9, 1838. Educated at Marlborough, he entered the Royal Navy in 1852. Serving with the naval brigade at Inkerman, he discovered he preferred land warfare and transferred to the army. With the 17th Lancers, Wood served in the Indian mutiny and there gained his Victoria cross. There followed a succession of staff appointments in which his reputation grew. An intimate of Garnet Joseph Wolseley (*q.v.*) and a member of his staff "ring," his planning contributed much to the success of Wolseley's Ashanti campaign in 1873–74. Again with Wolseley in 1879 in Zululand, Wood greatly distinguished himself and was appointed knight commander of the Bath. After Sir George Colley's defeat and death at Majuba Hill. he negotiated with Gen. P. J. Joubert for the withdrawal of British forces from the Transvaal (March 21, 1881); this work was rewarded by his appointment as knight grand cross of St Michael and St. George.

After becoming major general and commanding at Chatham, Wood from Aug. 1882 served again with Wolseley; this time in Egypt, where he commanded a brigade and stayed to become first British sirdar of the Egyptian army. Returning to England in 1886, he thereafter served at home and when appointed to the senior command at Aldershot in 1889 put into practice Wolseley's theories of training and efficiency. Wood became quartermaster general in 1893, adjutant general in 1897, and reorganized the entire transport system of the army, equipping it in 1899 for speedy mobilization. In 1903 he was promoted field marshal. In retirement he put all his energies into the organization of Lord Haldane's territorial forces, not beloved at the war office. He died on Dec. 2. 1919. He wrote several books, including his autobiography. *From Midshipman to Field Marshal*. (A. P. T.)

WOOD, SIR HENRY JOSEPH (1869–1944), British conductor, was born in London on March 3, 1869. He received his first music lessons from his mother, and when he was ten acted as deputy organist at St. Mary's, Aldermanbury. In 1886 he went to the Royal Academy of Music where he studied composition, and by 1888 had written songs, light opera and cantatas. His first experience as conductor came in 1889, when he toured with the Rousbey company, and in 1890 he was engaged to rehearse Sir Arthur Sullivan's *Ivanhoe*, later becoming assistant conductor at the Savoy theatre. After several important appointments, including a tour with the Carl Rosa company (1891), a season of Italian opera in London, and the English *première* of Tschaikovsky's *Eugen Onegin* (1892), he was engaged in 1895 by Robert Newman to conduct a series of Promenade concerts at the Queen's hall. These proved so successful that they became an annual event, being continued in 1927 under the management of the British Broadcasting corporation. After the destruction of the Queen's hall during World War II they were moved to the Royal Albert hall. Wood also conducted at many festivals, both in England and abroad, acquiring a high international reputation. He was knighted in 1911. In 1938 he published his autobiography, *My Life of Music*.

WOOD, JOHN (1704–1754), British architect. known as Wood of Bath because his work established the 18th-century character of the city, was the son of George Wood, also an architect of Bath. After working in London as one of the principal builders on the Cavendish-Harley estate, he returned to Bath in 1727 and set about transforming the city. applying to the design of streets and groups of houses principles first tried out by other architects in the West End of London. His designs in Bath include Queen's square; Prior park, built for Ralph Allen; the Circus; and the royal crescent, designed by himself, but built under the direction of his son. The Bristol (1740–43) and Liverpool (1748–55) exchanges were also designed by Wood, and he restored Llandaff cathedral in Wales. His best work is, however, to be seen in Bath. He died on May 23, 1754. Many of his designs were carried out after his death by his son John (d. 1782), who also, in addition to many groups of houses, built the hot bath and the royal private baths. (Ms. W.; X)

WOOD, LEONARD (1860–1927), U S. soldier, was born at Winchester. N H , Oct 9, 1860. He graduated from the Harvard medical school in 1884. was appointed acting assistant surgeon, U.S army. in 1885, becoming assistant surgeon with the rank of first lieutenant in 1886, when he was assigned to Captain

Lawton's expedition against the Apaches in the southwest, resulting in the capture of Geronimo. For distinguished services he was awarded the medal of honour. In 1891 he was promoted captain and full surgeon, and later, while stationed in Washington, D.C., became the close friend of Theodore Roosevelt, then assistant secretary of the navy. On the outbreak of the Spanish-American War in 1898 Wood was commissioned colonel U.S. 1st volunteer cavalry (the famous Rough Riders) with Roosevelt as lieutenant colonel. For conduct at Las Guasimas and San Juan hill. Wood was promoted brigadier general, July 1898, and in December major general of volunteers. He was military governor of Cuba from 1899 to 1902, when the Cuban republic was established. He was appointed brigadier general U.S.A., Feb. 1901. In 1903 he was sent to the Philippines and appointed governor of the Moro province, being promoted major general in that year. In 1908 he returned to the U.S. as commander of the eastern department. In 1910 he was appointed chief of staff. U.S.A., serving until 1914, when he was again given command of the eastern department. General Wood as early as 1908 had urged preparedness. He was largely responsible for the establishment of a summer camp at Plattsburg for training civilian officers, which was taken as a model for other camps of the kind after the entrance of the U.S. into World War I. Just before the entrance of the U.S. into the war in 1917 he was assigned to the southeastern division but was later transferred to Camp Funston, where he trained the 89th division, N.A., the 10th division of the regular army and other troops. In 1919 he was put in command of the central department, with headquarters at Chicago. In 1920 he was a candidate for the presidential nomination at the Republican national convention. Warren G. Harding, a "dark horse," was nominated on the 10th ballot, with 692½ votes to 156 for General Wood. In 1921 General Wood was sent at the head of the Wood-Forbes mission to the Philippine Islands. Prior to leaving he was appointed head of the University of Pennsylvania, but did not assume charge because of the president's desire that he remain in the Philippines as governor general, a position which he held from Oct. 1921 until his death in Boston on Aug. 7, 1927. Wood was the author of lectures, *The Military Obligation of Citizenship* (1915).

WOOD, NICHOLAS (1795–1865), English mining engineer and pioneer in mine accident prevention, was born at Sourmires. County Durham, on April 4, 1795. He was trained as a viewer at the Killingworth colliery, where he became iriendly with the engineer George Stephenson (*q.v.*) and shared in the experiments that led to the modern locomotive and the first saiety lamp. Wood soon achieved prominence as both a mining engineer and geologist, and eventually became a colliery owner. Greater output and an increasing number of accidents, particularly the explosion at St. Hilda's colliery in 1839 with 50 fatalities. emphasized the need for inspection. Wood strongly supported introducing legislation to this end. and the first Inspection act became law in 1852. A society ior the prevention of accidents was formed, as he had urged, in 1852 as the North of England Institute of Mining Engineers, under his presidency. To this Institute he contributed many papers on safety lamps, ventilation. conveyance underground, sinking and mine explosions. Wood strenuously advocated, but without success, the establishment of courses of instruction in mining technology. He died in London on Dec. 19, 1865. (C. W. D.)

WOOD, ROBERT WILLIAMS (1868–1955), U.S. physicist who specialized in physical optics, was born May 2, 1868, in Concord, Mass. He graduated from Harvard in 1891 and later studied at Johns Hopkins university, Baltimore, Md., and the universities of Chicago and Berlin. From 1901 until his death he was at Johns Hopkins as professor and later research professor of experimental physics. In physical optics he made numerous fundamental discoveries in the fields of resonance radiation, fluorescence, absorption spectra and Raman spectra. The various improvements he introduced in the rule of diffraction gratings, *e.g.*, ruling of echelet gratings, and in other spectrometric methods opened entirely new possibilities for astrophysicists. Wood also made important contributions to the fields of supersonics and biophysics. His publications include *Physical Optics* (1905; new editions, 1911. 1934) and *Researches in Physical Optics* (2 vol.; 1913–19). His *How to Tell the Birds From the Flowers*, a book of nonsense verses with illustrations by the author, was first published in 1917 and went through many editions. Wood died Aug. 11, 1955, in Amityville, N.Y.

See William Seabrook, *Doctor Wood* (1941), which includes a bibliography of his scientific publications.

WOOD, botanically, the complex vascular tissue of plants called xylem, but more popularly, the hard fibrous xylem of shrubs and trees. In all plants more highly organized than mosses. wood runs continuously from the finest rootlets, through the stem and into the leaves and flowers of their equivalents. Wood performs two functions in the plant's life: first, it serves for the transport of water and contained salts, absorbed by the roots, to parts where this "raw sap" is needed and especially to the leaves; second, it gives mechanical strength to the plant.

In palms and bamboos the wood of the leaves is stringlike in form and is confined to the nerves or veins; from these the strings extend into the trunk or stem. where they descend but join one another at intervals thus producing a basketlike or loose luffalike complex, uhich is embedded in the general mass of tissue composing the rest of the trunk. Thus it is this linked netlike complex of woody strings that corresponds to the solid mass of wood.

Wood that has attained only slight thickness and accordingly cannot be termed timber is nevertheless utilized, for instance in the form of thin branches and twigs to make besoms and baskets. Even when wood attains greater thickness it is not always timber. since there are some woods so soft, light in weight, and weak that they have little or no value as structural material upon which there is a demand for strength; such wood supplies means of flotation for fishing nets and buoys, and insulation, while the lightest of all are pithlike and are the materials of which sun helmets are composed. *See* also TIMBER. (P. GM.)

WOOD ALCOHOL: *see* **METHYL** ALCOHOL.

WOODARD, NATHANIEL (1811–1891), Anglican priest and iounder of the Woodard schools, was born at Basildon, Essex, on March 21, 1811. After being educated privately. he graduated at Oxford in 1840 and was ordained priest in 1842. Woodard was not an outstanding scholar, but he possessed a genius for organization and for attracting funds for his foundations. He was impressed by the lack of good schools for the middle classes which combined Anglican teaching with the advantages of public schoql education at a moderate cost To supply this need he iounded the Corporation of St. Mary and St. Nicolas in 1848 and based his future foundations on regional centres. His first schools were St Nicolas, Lancing. for the upper middle class, St. John's, Hurstpierpoint. for the middle and St. Saviour's, Ardingly. for the lower middle class. These were followed by a number of boys' and girls' schools in different parts of the country. At his death at Henfield, Sussex, on April 25, 1891. his schemes were not completed. In the second half of the 20th century there were 18 Woodard schools and one associated school. In 1870 Woodard was appointed canon residentiary of Manchester. His tomb is in the chapel of Lancing college.

See Sir John L. Otter, *Nathaniel Woodard* (1925); K. E. Kirk, *The Story of the Woodard Schools* (1952). (S. J. C.)

WOODBINE, a plant name applied in North America to the Virginia creeper (*q.v*) and in England to the honeysuckle (*q.v.*).

WOODBRIDGE, an urban district in the Sudbury and Woodbridge parliamentary division of Suffolk, Eng., 8 mi. N.E. of Ipswich on the tidal River Deben. Pop. (1961) 5,927. Area 1.7 sq mi. Woodbridge is an old agricultural market town with nursery gardens and boatbuilding yards (since the 14th century). The annual horse show has developed from Lady fair. King Edgar gave the manor to the monks of Ely in 970. In 1564 a school was built on the site of the 12th-century Augustinian priory. Woodbridge school was originally the Seckford grammar school (1662), named after Thomas Seckford who built the shire hall (*c.* 1570) and almshouses. Across the river is Sutton Hoo, where excavations in 1938–39 yielded the ship burial of a Saxon chieftain.

WOOD CARVING, the process in which mood is shaped for aesthetic or decorative purposes with cutting tools held in the hand. The term includes sculpture, in relief or in the round, as well as the embellishment of furniture or architecture. (See also WOODCUTS AND WOOD ENGRAVING.)

I. PRIMITIVE

The greater part of primitive sculpture is in wood, since it is both plentiful in most of the regions inhabited by primitives and easily worked with tools made of natural materials (see SCULPTURE: *Primitive* Peoples). Because of its deterioration when exposed to the elements, few wooden pieces remain in good condition in their native environment for more than half a century.

Since wood in its natural state is a living substance, it had a special meaning in animistic cultures. The Iroquois Indians carved their dance masks from living trees in order that the indwelling spiritual force of the tree might be retained. The Maori of New Zealand conducted rituals of propitiation to the forest spirits before felling a tree, and never burned or even brushed away the chips while working, believing that they still were part of the spirit of the tree.

Wood carving tools were most often made of stone. The greenstone of New Zealand, for example, can be worked to an edge that is as effective as an iron tool. Shell was also used, and the teeth of some animals were found hard enough to cut stone. Stone adzes were used first to chop out the general form. and sometimes to finish the carvings, as in those of the northwest coast area of North America, where the adze marks were left in a regular pattern on the surface. African work was usually finished to a smooth surface with knives of stone or iron, polished with sand or sharkskin and rubbed with palm oil. Iron tools were made by the Bushongo tribes of the central Congo, who carved numerous wooden objects such as stools, neck rests, drums, bowls and boxes, and decorated them with their traditional designs. Some of the most intricate carvings were made with shell and stone tools, however, such as the New Ireland funerary figures which have deep undercuttings and lacy perforations, and the ceremonial paddles of the Austral Islands which are completely covered with minute and extremely precise geometric designs. However, the huge totem poles of British Columbia, some as high as 60 ft., were made with the metal tools of the white man.

In general, primitive carvers were not professional artists. In many societies all the men carved, as in the Marquesas Islands, and the most skillful were chosen to execute the ritual objects. Exceptions existed, as among the Maori of New Zealand, where the sculptors of ceremonial boards for the community houses were specialists, and also among the Bushongo of Africa, where the sculptors became members of the royal court. Little is known of the training of carvers in primitive societies. The Maori master sculptor was a craftsman-priest called the tohunga. who instructed his pupils in both the technique of carving and the proper magic rituals that were necessary in order to ensure good work. Sculptors among the Bushongo took apprentices, but in many other societies carving was learned simply by watching and practising.

II. ORIENTAL

Indian and Ceylonese.—Since all Indian architecture was once wood, it may be said that both the structural and carved elements of many ancient stone temples are reflections of early design in woodwork, Even in regions where stone abounds, domestic architecture remains nooden in the 20th century. The earliest example of the joiner's art is the wooden screen of the chaitya (Buddhist sanctuary) at Karli (*c.* 120 A.D.) and the wooden umbrella of its stupa, carved with concentric floral designs. The fragments of carved panels and a wooden pillar from Kashmir Smats in the British museum are the wooden counterparts of Gandhara sculpture. The most elaborate examples of later wood carving are architectural ornaments of buildings in Ceylon, south India, Gujurat. Kathiawar, Nepal and the Himalayan regions. Especially notable are the paneled doors used from the Punjab to south India, including early examples preserved at Ajmer. Balconies and window panes received a particularly rich surface decoration in western India. Perforated windows with floral designs were universally used. Some lattices with geometric patterns of Arabic character are found in northern India. Notable also are the paneled pine ceilings of Kashmir. Some distinction was achieved by the Singhalese artisans working at Kandy as late as the 19th century. A rather interesting Indo-Portuguese style of ornament is found on the chests carved in the 17th century.

Burmese.—Burmese wooden architecture undoubtedly reflects the magnificence of earlier temples and palaces. The flamboyant carving of the crockets and the immense teak columns of the monasteries of Mandalay and Amarapura are especially remarkable for their exuberance and floridity of style.

Siamese and **Indochinese.**—The nature of early wood carving in Siam (Thailand) and Indochina can best be studied in the decoration of stone monuments from the 6th to the 13th century, which reproduce lost originals in wood. In more modern periods the process was reversed, and wood carvers as late as the 20th century drew their inspiration from the forms of early stone carving at Angkor. For a time in the 17th and 18th centuries there was an imitation in Siam of the styles of Louis XIV and XVI.

Javanese.—Wood carving of a barbaric richness and fantasy survives in Java and Bali, not only in sculpture but in the ornamentation of litters, panels and musical instruments. This is a traditional design composed of indigenous, Chinese and Indian elements.

Central Asia.—The countless fragments of sculptured panels, architecture and furniture recovered in the excavations of sites in central Asia, dating from the 2nd to the 10th century A.D., reveal designs of mixed Classical. Indian and Chinese origin.

Chinese.—Wood carving is undoubtedly a craft of great antiquity in China. The earliest examples are lacquered fragments of the Chou dynasty (1122–249 B.C.) from Changsha. Wood carving for architectural decoration continued throughout the classical periods, although little prior to the Ming period has survived. Ceiling beams and supporting pillars are integrally carved with a profusion of ornament. generally in floral and geometric patterns. Also favoured for architectural carving were the monster masks or *t'ao-t'ieh,* the eight trigrams, as well as auspicious symbols appropriate to Buddhist. Taoist and Confucian usage. The carving on the furniture is generally restricted to the key or fret pattern. Chinese wood carving invariably reveals a laborious, even mechanical, execution. and especially in later periods it is evident that the virtuosity and intricacy of the performance is the only measure of artistic merit. Railings in houses and temples are frequently decorated with fretnork designs in the familiar key pattern. which found its way into the Chippendale style in Europe. Among the more imaginative and ornate examples of Chinese wood carving are the often very elaborate designs for window grills or lattices nhich comprise a very diversified traditional grammar of ornament. including emblems of happiness. abundance and longevity. Although these techniques are known only in examples of the Ming period (1368–1644), they are of great antiquity. (*See* CHINESE SCULPTURE.)

Japanese.—The earliest examples of Japanese wood carving are the phoenix and music-making angels adorning the canopy in the Kondo of Horyuji at Nara. These examples already display the delicacy of design and exquisite feeling for the medium, characterizing the Japanese wood carver's art in all periods. Preserved in the Shosoin, the imperial treasure house at Nara, are many wooden masks worn by dancers at the dedication of the Great Buddha of Todaiji in A.D. 752. These masks for the *gigaku* dance have the realism and vitality of the sculpture of the Tempyo or Nara period (710–794) in a grotesque vein. The wooden masks used in *bugaku,* a dance originally imported from China, are smaller and less fantastic than the gigaku masks. Some of the best examples were carved during the Kamakura period (1185–1392) and have something of the hardness, worldliness and exaggerated realism of the style of this time. The no masks, all carved in wood, first came into existence in the 16th century. They are more abstract and expressionless than earlier masks because the wearer himself gave them expression through his performance. (See MASKS.)

Whereas in the early periods wood carving was largely restricted to the decoration of temples and Buddhist paraphernalia. in the 16th century it came to be employed for ornamenting the mansions of the shoguns. Splendid examples may be seen at Kitano Jinja and Nishi Hongwanji in Kyoto. In the 17th century the mausoleums of the Tokugawa shoguns at Shiba. Tokyo and Nikko were richly decorated with carving both outside and inside. In domestic architecture the wood carver was generally restricted to the *ramma,* the vertical panel in the partition mall above the screens separating one room from another. Many of these wood carvings were conceived as pictures and, in some cases, they uere designed by famous artists. Although these panels are for the most part two-dimensional. the carving often assumes a really sculptural, three-dimensional character. The finest examples date from the Momoyama period (1568–1615). (*See* JAPANESE SCULPTURE.)

III. EUROPEAN AND AMERICAN

While the finest examples of mood carving in Europe are those associated with the ecclesiastical buildings of the medieval and renaissance periods. house embellishment also was not uncommon. But. in general. the churches have survived better. Besides the great buildings, decorative wood carving was common on furniture — chairs and chests. for example — and many small domestic articles were so ornamented This small woodenware, known as treen. included bowls for kitchen and dining room use, salts. nutcrackers, cups, tankards and chalices. stamps and molds, spoons. pipe cases and tobacco boxes, busks, chessmen, candlesticks and, in southern Europe. stirrups.

The figure carving in the round that decorated the churches of ancient days nas made with the intention of covering the wood with paint and gold. The traces of such painting still remain on much of the carving. Most of the paint disappeared so long ago. however, that it became the custom for other carvers to copy the figures as they saw them without decoration. The result is that they are often seen in such poor light that their lines or features cannot be properly distinguished. Wood has a way of disappearing into the shadow if the lighting is not strong enough, but the moment it is covered with gold and paint it reappears in all its details, even in a dark recess. Stalls or other church fittings which were liable to rubbing were never painted. (E. S D)

Such meagre fragments of woodnork as have come donn from the 11th and 12th centuries tend to show that the woodworker was following the stonenorker, who was paramount until about the 15th century. From that time onward it was the woodworker who became predominant. By that time he had found that wood should be treated in quite a different manner from stone, and, inspired by new ideas and nen motives, he invented new methods for the construction and embellishment of his work The wood carver, then. no longer followed the patterns and designs of the stone carver, but made them for himself in a manner to suit the material and tools he uorked with and in fact began to influence the stoneworkers in such a way as sometimes to divert them from their intrinsic principles.

Early Period. — The earliest extant examples of wood carving are Scandinavian remnants dating from the 9th and 10th centuries. They are carved framings of doorways made of thick planks of pinewood. The carving is in low relief. and it is always kept up to the surface of the material out of which it is made. The designs are of interlacing stems sometimes foliated, and often terminating in a monster's head. Invariably the space which is decorated is so much filled with pattern as to leave scarcely any ground showing.

Of the Norman period in England only a few isolated pieces remain. and these are only enriched with a row of molded arches, as in the tomb at Pitchford church, Shropshire. which has also a shield carved in oak in each arch of the arcaded side of the tomb. supporting the carved nood effigy of Sir John Pitchford. It may be conjectured that the characteristic feature of Norman wood carving was the rounded surface of most of the foliated forms, which appear to have avoided hollows. The leaves were often a series of lobes with a V-shaped sinking round the edge. Even in the moldings. beads or rounds preponderated over hollows, and in the grotesque beaked heads carved on the arches to many a doorway the surface treatment is generally a series of ribs or small rolls, rather than a succession of hollows or V cuts as in Byzantine ornament.

Gothic. — Of the Early English period, which began at the end of the 12th century, there is not a great deal of wood carving remaining, though there is sufficient to tell what it was like, even in elaborate wark, as in the stalls at Winchester cathedral. These however were executed at the very end of the 13th century. They are carved with the utmost care and skillfulness but the work follows the idiosyncrasies of the stonemason and carver, inasmuch as it is cut out of solid blocks of oak and the forms and designs are identical with that of stonework. Some of the designs for foliage follow the typical Early English forms, while others might be taken for the work of the next great divisional period of architecture which followed. The niiserere seat from the Priory church at Christchurch, Hampshire, is a good example of early English carving. Others may be found in Henry VII's chapel at Westminster, and at Exeter.

In the traditional carvings of the 13th century the curves of the foliage are very simple. The leaves start from a fairly thick stem which is generally cut very square in section. The variations of this form of foliage are wonderful and beautiful in the extreme. The building where this form of carving may best be studied in England is Wells cathedral. Toward the end of the 13th century the woodworkers were coming into greater prominence. There is an example of a groined roof with carved bosses at the junction of the ribs at Warmington, Northamptonshire, and of carved roof beams at Bradfield, Berkshire; and Rochester cathedral has a lean-to roof with molded beams.

Decorated Style. — The next phase is known in England as the Decorated style. It extended through the first three quarters of the 14th century. during which carving had more than one character. At first there was a tendency to follow more closely naturalistic forms. though treating them conventionally. but this is rather more apparent in the stone carver's work than in the wood carver's. This faithful portraying of natural forms does not appear to have lasted for more than 10 to 20 years. What succeeded was a very conventional and exaggerated treatment of the surface of foliage applied indiscriminately to leaves of every description.

The 15th Century.—The 15th century was productive of the finest quality and of the largest amount of decorative Gothic woodwork that the world has ever seen. Although there was a distinct style pervading the whole period, there was more variety in expressing it than had been the case in any of the previous developments in architecture. This period of work, known as the Perpendicular style. began in the last quarter of the 14th century and continued until the middle of the 16th century, after which it was practised in a debased form for another 100 years.

There was no difference in the style of building between domestic and ecclesiastical edifices, save that many houses were constructed of timber. Screens, pulpits and font covers were invariably prepared with gesso and sometimes minute decoration added to the faces of the buttresses, as at Southwold, and then gilded, and sprays of flowers painted on the broad hollows. The beadings were picked out with a chevron, or a twist of two or more colours like a barber's pole. The corner posts generally received a greater or less degree of carved ornamentation.

The most noticeable features of the work of this period are that carving became flatter; tracery was built up of several boards as one order was superimposed upon another and not cut out of one thick piece of oak as had formerly been done. In the emblems of SS. John and Matthew in the Victoria and Albert museum, London, the work is applied and a broad simple treatment is the outstanding characteristic of these vigorous carvings. In the latter half of the 15th century some of the carved foliage was composed almost entirely of hollows divided by a V cut to represent the stem of the leaf, or by a softly carved raised stem. The edges of the leaves were kept up and the serrations were produced by a vertical cut with a gouge at right angles to the edge of the leaf and a hollow cut with the same tool on the edge of the leaf, getting deeper until the chip fell out as the cut met the first incision. The inner edge of these gouge cuts formed the centre stems of the serrations. In a poppyhead at Walpole St. Peter, Norfolk. the carver's expression is very different from what it was when every serration was elaborately carved with a swelling in the middle and a hollow round it. One type of leaf which was invented, for there is nothing in nature like it, was that in which the corners of the leaf ended in a tightly rolled ball, as in the left-hand leaf on the miserere seat in Ripon cathedral, Yorkshire, on which Samson is shown carrying away the gates of Gaza.

The wealth of pattern and fanciful design in crestings, strings, bosses, tracery, poppyheads, bench ends, etc., is wonderful, and the rendering of fables and biblical stories in the miserere seats inimitable. The curves of tracery are never mechanical but are drawn freely, and great care was taken to get a breadth of effect. The hollows of the tracery are very flat, and not like the cast-iron effect produced by some revivalists who make the section of the hollow almost a quarter of a circle. In a few of the East Anglican churches an effect of great richness was produced by carving the back of the top rail of each bench with a simple band of ornament, as in Dennington church. Suffolk.

An extraordinary development took place at this period in the erection of timber roofs. The skill and imagination of the carpenter together with the conception of the figure and foliage carvers produced a wealth of grand architectural effects that has never been surpassed. The roof of Westminster hall, for example, will forever be a wonder for its construction and magnitude.

There is a great deal of beautiful oak carving of this period to be seen in France, Germany and Flanders. In St. Paul's church at Abbeville, France, there is a beautiful reredos which is Flemish in character, illustrating the lacelike effect so often found in French carvings. Perhaps the most striking piece of work on account of its vast amount. its completeness and its elaboration is the stalls at Amiens cathedral. which were begun in 1508 and completed in 1522. One characteristic feature of French Gothic tracery carving is that the section is often but little more than a chamfer, and when there is a double order it is often made by dividing the chamfer by a square incision. In German work the tendency was for the designs to be more intricate and to contain less breadth and freedom in the carving. Most of this work is very much undercut and the chief aim appears to have been definition of outline and strong shadows.

At the end of the 15th century Renaissance influence began to make its appearance. and although the structural parts of woodwork remained purely Gothic in design, it was in the carvings that the innovation first made its presence known. The four oak panels dated 1540 of Beauvais cathedral. Beauvais. France: indicate the effect the new style was beginning to have on the carver. The suggestion is that carvers were introduced from Flanders, with which there was constant intercourse in connection with the trade in wool, and it was from this source that the splendid traditions of the Gothic period were undermined. When the fashion for this new form of art took hold of the popular imagination, the end of Gothic was not far off; although tradition born of centuries is hard to kill: it was not quite dead until the middle of the 16th century. (L. A. T.; E. S. D.)

The Renaissance.—With the passing of the Gothic the symbolism that inspired the wood carver gave place to ornament almost devoid of ideas. Under the influence of the builders it functioned to give expression to proportion and structural design, and to convey something of the joy of life in those effects with which man delights to surround himself. When symbolism or aesthetic understanding is not guiding the decorative instinct, manipulative skill becomes easily a snare. hence. the styles of decoration which have arisen throughout Europe since the Renaissance have provoked a constant struggle between sincerity and technical dexterity. Especially has this been the case nith wood carving.

The wood carving of the Renaissance was chiefly in walnut, and is best understood if it be realized that the structural design of the woodwork was reminiscent of building and that structural features such as pilasters, capitals, etc., were employed decoratively. Further. the Renaissance being in essence the revival of classic motifs, familiarized by ancient examples in marble, which material was especially understood in Italy, it is not surprising that much of the work lacks a distinctive woodlike effect. Nevertheless the release from the domination of the middle ages with their limited symbolism brought a freedom and vitality into design that made the Italian carving the inspiration of the greater part of Europe for many centuries. and the inventiveness and opulence displayed have been rarely equaled elsewhere. Its motifs, taken freely from nature and treated naturalistically to an extent unknown in the classic prototypes on which the Renaissance was founded. were combined with arabesques, woven into designs by means of sinuous and scroll movements, and modeled to produce to the utmost a play of light and shade.

Toward the end of the 15th century, France felt the inspiration of the Renaissance. It was there welcomed avidly by the carvers, who had had the Gothic insight to a degree never attained by the Italians. Perhaps the highest beauty achieved by the Renaissance was in the admixture of the new details and Gothic structure so common in France, suggesting that it is during transitional periods in art that man is most vital and creative. French artisans understood the treatment of wood and although sometimes overlavish and small in detail. their technique was easy and unsophisticated, and in the designs of the best examples provision was made freely for surfaces broad enough to display the grain and beauty of the wood. Characteristic of the period are the doors of St. Maclou, Rouen, which are attributed to Jean Goujon, and if this work be compared with much of the stonenork of the time it would appear that stone nas influenced by wood.

The work of nearly the whole of Europe was gradually influenced by Italy either directly or through an intervening country. The influence nas too vital to incite mere reproduction, even had the means existed to make this possible, so that, except where the craftsman was imported, the expression of Renaissance ideas in each country had its distinctive idiom. The Plateresque of Spain was noteworthy for the exceptional profusion of small surface detail, sometimes of great refinement. In Germany, the Netherlands and England, Renaissance carving was associated with the development of strapwork, in some examples of which it scrolls vigorously while in others groups of fruit. grotesque masks and figures sculptured in high relief enrich it. At a later date the Baroque carving of large figures was in Germany remarkable for its skill and in Italy for its unrestrained application to its architectural setting.

Of great interest to the wood carver as further examples of his art when uncontrolled by architectural considerations are a number of the pulpits of Belgium. That by Henri Verbruggen. 1699, in St. Gudule. Brussels, is the most extravagant of the school.

The Eighteenth Century.— The most radical change in style after the Renaissance was the so-called Rococo of the reigns of Louis XIV and XV. It reflected the artificiality and extravagance of its time and was distinguished by its arrangements of "C" scrolls and attenuated foliage for structural as well as decorative purposes, and for the substitution of richly ornamented broken curved movements for straight horizontal lines. Its draftsmanship was superb, and for effect it relied upon the perfect technique of its some\\-hat fantastic designs.

The inception of the 18th century in England was singularly remarkable for the fertility of its designers and carvers. Grinling Gibbons fashioned wood with a freedom and delicacy unprecedented. His work has provoked controversy as to the suitability of wood for masses of fruit and flowers in such high relief and so freely undercut. The preservation of his work, in spite of the ravages of the woodworm, has permitted a later judgment that justifies the apparent liberties he took with his material and his freedom from the shackles of tradition; the variety of his designs and his sense of decoration proclaim him a great artist and craftsman. His most restrained work and probably his best was done in association with Sir Christopher Wren for the choir of St. Paul's cathedral, London.

In Italy and Germany the character of the French Rococo style was often interpreted with a crudeness that almost amounted to a burlesque; and only in England, notably in the hands of Chippendale, were its suggestions controlled by refinement and discretion. The swing of the pendulum led to the production of the ornament of Louis XVI in France. Biedermeier in Germany and the Adam brothers in England. These styles were a return to more severe classic ideals. and the enrichments involved the repetition of small patterns and motifs that had been exhausted in the past.

The United States.— In America during the late 18th and early 19th centuries there developed a handsome style of wood carving decoration associated with the architecture of the period. This was best exemplified by William Rush of Philadelphia, Samuel McIntire of Salem. Mass.. and John and Simeon Skillin of Boston. This carving consisted of sheaves of wheat, urns, medallions of classical scenes, and swags for mantels, doorways, stairways, panels. etc., based on classical motifs; as well as figures in the round for gardens and eagles to decorate public buildings. Some of the finest carving of this period was that done for ships' quarter galleries, transoms, trail boards and, best of all, the graceful figureheads and billetheads.

Decline of Wood Carving.— After the end of the 18th century, wood carving all over Europe and America was almost confined to the reproduction of the styles of the past without any regard for nationality or the expression of individuality. *L'art nouveau* of France toward the close of the 19th century had its repercussions elsewhere, but passed away rapidly because its tones were untrue to material, its wood carving conveying the impression of metal or modeled clay. The carver worked with the architect and furniture designer, and the tendencies of modern Europe influencing these in the direction of simplicity of structure and effect, his art languished.

IV. 20TH CENTURY

Europe.— The first half of the 20th century witnessed a considerable revival in Europe of the use of wood as a material for sculpture. Among the most important artists in this medium were Aristide Maillol (1861–1944), French; Jean (Hans) Arp (1887–), born in Strasbourg; and Constantin Brancusi (1876–1957), a Rumanian who spent most of his life in Paris. Maillol carved simplified. well-rounded figures of young girls. Arp carved abstract forms in wood. Brancusi also did abstract forms, many of them mounted on pedestals that were often as interesting in form and shape as the sculpture they supported. Brancusi was largely responsible for the renaissance of sculpture in wood and exercised great influence on artists of the 20th century. Ossip Zadkine (1890–), another sculptor of importance who worked in wood, was born in Smolensk, Russia, and lived in Paris. A German artist; Ernst Barlach (1870–1938), did a large part of his work in wood, much of it to be seen in the churches of his native land. He remained more under the Gothic influence than many of his contemporaries.

Working in England, Henry Moore (1898–) exerted a great influence on the younger sculptors of both Europe and America. His statues were often large, more than life-size, reclining figures, semiabstract or abstract forms suggested by the human body. At times Moore treated these forms by cutting holes through the wood, or adding strings, with effective results. He made use of many different types of wood—elm, lignum vitae, walnut, beech, ebony and boxwood. Another English sculptor, Barbara Hepworth (1903–), also used wood as a medium.

United States.— In the United States the art of wood carving was very much at a standstill about 1900, in spite of the earlier popular tradition exemplified in the beautiful ship figureheads. the wooden Indians used to advertise cigar stores and the wood figures and decorations often found in barrooms. Most of these had disappeared by the mid-20th century, except those which found a safe, important place in museums and private collections. This popular art was by no means exclusively American, even the wooden Indian being imported from England in the early 18th century.

For many years Robert Laurent (1890–) did wood sculpture exclusively, using mostly walnut and mahogany. An exhibition of his works in 1915 received important recognition. Another artist to exhibit wood carving at this time was Charles E. Prendergast (1868–1948), who carved reliefs. which he covered with gesso and then painted and gilded. William Zorach (1887–), who began his career as a painter, also exhibited wood carvings both in relief and in the round. Among his early pieces were interesting figures of his daughter and his son, done in 1921. Both Laurent and Zorach as instructors at the Art Student's league in New York city inspired many of their students to use wood as a medium and to exhibit their work. At one time Alexander Calder (1898–), later famous as a constructor of mobiles, carved figures of acrobats and animals in wood.

Among others who worked to a great extent in wood were Chaim Gross. Concetta Scaravaglione, Oronzio Maldarelli, Milton Hebald, John Rood. Raoul Hague and Carl Milles.

Bibliography.—J. P. Schnier, *Sculpture in Modern America* (Berkeley, Calif., Cambridge, 1948); A. C. Ritchie, *Sculpture of the Twentieth Century* (Sew York, 1953); C. L. Brummé (ed.), *Contemporary Anzerican Sculpture* (New York, 1948); H. S. Moore, *Sculpture and Drawings* (New York, London, 1957).

V. TECHNIQUE

The experienced artist will start with a solid block of wood, not necessarily squared off. often without any preconceived plan or idea, which develops as he works from the shape and grain of the material. The sculptor grasps his ideas as he cuts. This is the most exciting way, and the most successful, of doing wood sculpture. It is the most alive. For the inexperienced. however, it is not recommended. Without a sketch, in clay or plasticine, or a drawing, he would feel lost. Nearly all beginners need a model that they can follow.

Choice of Woods.— Most artists prefer hard and semihard woods, black walnut, lignum vitae, chestnut. teak, elm, ebony,

Bottom right: "Companions," a composition in two figures by Oronzio Maldarelli (1892–), U.S. Carved in rock maple

English oak or mahogany, all of which are fairly easy to obtain. The beginner will do well to practise on softer woods, yellow pine or white wood, which have good grains and are easy to cut.

Tools.—.Approximately two dozen carving tools are sufficient for the sculptor in wood; most useful are the straight chisels and gouges, varying in size from one-eighth of an inch to an inch or more according to the type and size of the work to be done. The tools should be sharpened every day after the day's work is done. using carborundum stones both smooth and rough, or Washita or Arkansas stones. The outside of the tool, which comes against the wood and has the longest bevel, is rubbed against the stone; when it has been sufficiently honed it can be rubbed on a piece of pig's hide to obtain a fine finish. The inside of the gouges should be rubbed on a very fine stone—a slip, either straight or round edge—to remove any steel burr that may have remained after the tool has been sharpened on the long beveled edge. The handles of chisels should be octagonal, for these provide a firmer grip for the hand than the smooth, round ones.

A necessary addition to the collection of carving tools are the wood files of various types, half-rounds (both large and small) and the regular wood rasps of the type made only in Europe.

On large pieces and with hard woods, the use of a mallet is necessary, the size and weight varying from 12 ounces to 3 pounds, depending on the individual and the type of work to be done. The best mallets are of lignum vitae and of hickory. After the work is blocked in, and the sculptor is close to the finished shape and surface, he may apply pressure only with the palm of the hand that is not holding the chisel. Working thus he has better control. and the palm of the hand soon gets hardened. The workman. at this point, may hold the lower part of the handle and a good part of the tool itself with one hand and with the other take a good grip on the handle. thus getting good control and more power and minimizing the danger of cutting himself. The experienced workman always cuts away from himself.

Finishing **Woods.**—One of the most satisfactory ways of finishing a wood carving is by using several coats of paste or liquid wax, well rubbed in. Some artists prefer to stain the raw wood, any color such as mahogany or walnut, and then apply the wax. Shellac or linseed oil may also be used as a first coat.

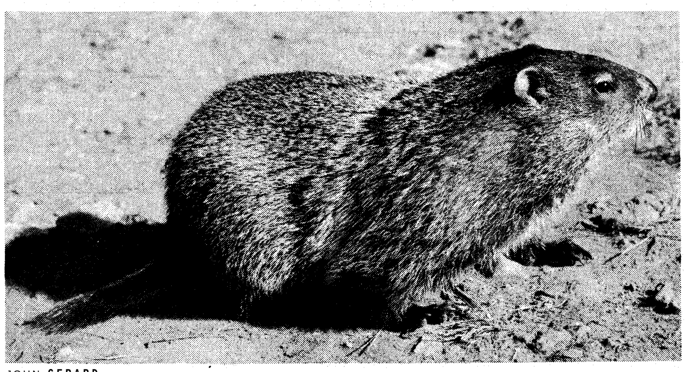
WOODCHUCK (*Marmota monax*), a large heavy-bodied burrowing rodent of the squirrel family (Sciuridae); it is also called ground hog. "Woodchuck" is also applied less often to the other species of North American marmots. They range from Alaska over Canada and the eastern United States. A large woodchuck measures about 22 in, long including a 6-in. tail. The body colour is reddish brown; the feet are almost black. Woodchucks inhabit the edges of meadows and forests and they prefer the rocky sites.

The den is usually dug in a hedge row, under a ledge of rock or in an open meadow, and has several chambers and galleries.



JOHN GERARD

WOODCHUCK (MARMOTA MONAX)

Mating takes place in the spring, shortly after the animals emerge from hibernation. At this time the males wander widely in search of a female and fight each other in the defense of their individual territories.

The two to nine young are born four weeks after mating. The male and female may live together in the spring but at other times are usually solitary. The young are playful but soon grow into slow, lumbering, methodical adults.

Woodchucks are active usually only during the day. When emerging to feed, they pause near the burrow entrance for a thorough inspection of their surroundings and often give vent to a piercing whistle. They eat green plant material and occasionally resort to cultivated crops, causing considerable damage. They may be controlled by fumigation of the burrows or poisoned bait. Woodchucks hibernate in a true torpor for as long as eight months each year.

See also GROUND-HOG DAY; MARMOT. (K. R. KN.)

WOODCOCK, a succulent game bird, in the family Scolopacidae, highly prized by sportsmen and epicures, famous for its erratic, whistling flight. It is chunky, short in neck and leg, and lives in wooded bottomlands and wet uplands. The sensitive, movable tip of the long bill is used to punch "borings" and probe for earthworms in moist earth. One American bird, weighing six ounces, ate half a pound of worms in 24 hours.

Large eyes are set high forward in the large head, and the bird is usually crepuscular or nocturnal. During bright daylight it sits close in brush, where its mottled brown plumage conceals it against dead leaves or nest. Three blackish bands across the pale buff rear-crown distinguish woodcocks from' snipe.

JOHN MARKHAM

EUROPEAN WOODCOCK (SCOLOPAX RUSTICOLA)

The sky dance is a remarkable courtship flight. With loud cries, usually at dawn, the male spirals over a wide area, high into the air, and zigzags back to earth.

Four buff eggs, blotched with brown. are laid—February to May in America. March to August in Europe—in a slight hollow in the ground, and incubated for 21 days. Downy young are carried in flight to the feeding ground. or removed from danger, between the mother's thighs. Reluctant to leave the nest, the mother feigns injury to mislead intruders.

The American woodcock (*Philohela minor*), 11 in. long, breeds from Nova Scotia to Florida, and Manitoba to Louisiana and Colorado, wintering in the southern half of its range. The European species (*Scolopax rusticola*). 14 in. long. breeds from Ireland to Japan, from the Arctic circle to the Azores and Canaries, Pyrenees, Alps and Himalayas; it winters in North Africa, Ceylon and southern China, and occurs occasionally from Labrador to Virginia.

A smaller, darker species (*S. saturata*) is found in the mountains of Sumatra, Java and New Guinea, while local species occur in the Celebes (*S. celebensis*) and on Obi in the Moluccas (*S. rochussenii*). (G. F. Ss.)

WOODCRAFT. Woodcraft is the knowledge of the wilderness conditions which enables one to enjoy and supply oneself with the crude necessities and comforts of life in unsettled and uninhabited areas, be it forest or prairie, mountain or swamp, lakeland or desert.

Primitive' man has always had to deal with nature in order to exist. However, it took centuries to bring knowledge of woodcraft to a point where it embraced comforts as well as necessities. The particulars of woodcraft vary with each country and area, but the requisites are always the same, good eyesight and hearing, good judgment and patience.

The first white settlers of North America learned much from the Indians who were masters of woodcraft. Life itself was a matter of woodcraft to the Indian, as it still is to many savage and semisavage people in Africa, South America. and the South Pacific islands.

One versed in woodcraft will have sufficient knowledge of mechanics and craftsmanship to enable him to improvise tools, weapons, shelters and clothing; to make rafts and to construct canoes of birch bark or skins. He will know the value of fire. and what can be done with it. For the dry wood or bark which is needed for his fire he will break dry branches from trees rather than use those found on the ground, or he will look for it in hollow logs or trees. He knows that resinous woods produce smoke while dry, non-resinous woods usually do not. For a quick fire the woodsman will use soft woods such as poplar or pine; for a hot fire such hard woods as oak, hickory or maple; and on his night fire he will use green logs since they will burn slower and keep a fire longer than dry logs. In rainy weather he often carries enough dry wood or birch bark in his pack to start a fire: and he dries out wood at each fire to carry with him to his next stopping place and he always carries extra matches in a waterproof match box. The woodsman never builds a fire without first clearing away all brush and inflammable matter to prevent a forest or grass fire and he always kills his fire before leaving it.

Woodcraft is the knowledge of where to find water fit to drink. The old timer knows that springs can often be found in low places or at the bases of hills and that they are as a rule safe to drink from, as are also swift-flowing streams away from human habitation. Many a woodsman in swampy country quenches his thirst by cutting off grapevines and drinking the sap as it drips from the ends. The desert prospector. on the other hand. will when necessary drink the water that is found in certain cactus: he will never drink alkali water or salty water, and when in doubt he knows that 10 or 15 minutes of boiling will make any but salt or alkali water fit for drinking or cooking.

The woodsman knows which berries and wild fruits are edible and will not eat those he knows nothing about. He knows that fresh greens are a necessary addition to a meat. diet, and that he can eat young stalks of milkweed: burdock and Solomon's-seal when they are boiled. He will eat roots of bulrushes also. when boiled, and young shoots of dandelion, dock, sorrel, wild mustard and watercress without cooking. He knows how to build caches of stone or poles to keep his food and belongings out of the reach of wild animals,. The expert in woodcraft knows how to read signs—that is, he can tell by telltale marks what animals have passed along a trail. He knows the marks left on trees by bear claws, raccoon or squirrel claws. and deer horns. He knows the footprints of animals and birds, and he can tell that a bit of fur on the bark of a tree or tn·ig has come from a bear or a deer, or a feather from a partridge or a blue jay.

He knows how to make cord and rope of basswood, elm: or cedar bark, strong enough to lash things together when nails are lacking. He is able to build a rainproof lean-to shelter with a few poles and a blanket or some brush. Here, in the reflected heat of a fire built a few feet from its open side, he can be comfortably warm in cold weather. The woodsman knows too that it is warmer sleeping on fir branches or dry grass on the ground than a raised platform or cot under which cold draughts circulate.

The true woodsman is seldom lost. If he hasn't the faculty of knowing directions at all times, he does know that moss usually grows thicker on the north side of a tree. providing the tree is not in a damp shady spot or in a densely wooded place. He can also, by chopping into the sides of a tree. find by careful observation which side has the thickest bark; this side, he knows, is north, but he must check on several trees. He also knows that the two stars at the end of the bowl farthest away from the handle in the Great Dipper point upward to the north star.

Woodcraft then, may be said to he a match of wits with nature, an attempt to be one jump ahead of it or at least to meet it on even terms. (W. B. HT.)

WOODCUT AND WOOD ENGRAVING are terms conventionally applied to pictorial designs printed from wood blocks cut by hand. The most usual method in earlier times was first to draw or trace the design on a specially prepared wood block. and then to cut away with the knife the surrounding parts of the wood surface between the lines so that the block. when inked and pressed on to paper, produced a print of the drawing in black line on a white ground. During the latter half of the 18th century, in Europe, it gradually became the practice to engrave the design on the wood block with an engraving tool, or burin, leaving the main surface of the block at its original level, so that the impression produced a picture in white line on a black ground. The former method is correctly described as woodcut. the latter as wood engraving. Both are essentially "relief" processes, since the parts to receive the printer's ink are left in relief.

HISTORY

Early History of Woodcut.—The art of woodcut was practiced in the Orient much earlier than in Europe. In China it arose out of the use of a wooden stamp to make decorative. ideographic and symbolic impressions in clay or wax. From this very ancient art came block printing, and the paper used for this was available in China at least by the early 2nd century A.D. Woodcut was brought to Japan from China in the wake of Buddhism in the 6th century A.D. and subsequently nurtured into a national art of great originality and splendour (see JAPANESE PAINTING AND PRINTS: *Wood-block Prints*).

In Europe the earliest printing from wood blocks was done on textiles: and pictorial designs printed in this way are known from the beginning of the 14th century. But the main development of the art of woodcut in the west hegan only when enough paper, which had been introduced into Spain from the east as early as the 11th century, began to be manufactured in France and Germany toward the end of the 14th century. The most primitive cuts, such as the "Christ before Herod" in the British museum, were probably made about 1400 or soon afterward. about 25 years before' the earliest line engraving; they have thick outlines and little or no shading, yet they often show a simple grandeur of design reminiscent of the figures in stained glass, and are sometimes more in accord with modern taste than the elaborate productions of a century later. The earliest credible date which occurs on any woodcut is 1323, on a "St. Christopher" of German origin in the John Rylands library at Rlanchester; but even there it is not quite certain that the cut was executed in that year, and in any case several undated examples seem to be somewhat earlier in style. National loyalties have led to disputes between French and German scholars as to the localization of the earliest woodcuts. But it is at least certain that the art developed most extensively in south Germany; and some very beautiful religious cuts. intended no doubt for domestic veneration in poorer houses. or to be sold to pilgrims. were produced in Bavaria and also in Austria and Bohemia, from the second or third decades of the 15th century. It seems likely also that playing cards were printed from wood blocks at this same early date, though no surviving examples can be dated before 1450.

Book Illustration and Block Books.—The art of woodcut was greatly encouraged by the invention of printing from movable type in the mid-15th century. After 1460 woodcut illustrations became more and more popular in Germany and the Netherlands; and a decade or so later also in Italy. where toward the end of the century some of the most beautiful illustrated books were produced in Florence and Venice. It is tempting to suppose that the immediate predecessors of these illustrated books. in which woodcuts were combined with text printed from movable type, were the so-called block books, such as the Apocalypse, the *Biblia Pauperum* and the *Ars Moriendi,* which were woodcut picture books, generally religious. with a short text. Both text and illustrations were cut by hand on the same block and printed as a page. Historically; however, this may not be exactly the case; for it is at least doubtful whether any of the editions of the fen· surviving block books, which are predominantly Netherlandish in origin, can be dated before the earliest illustrated books printed from movable type; most of them definitely belong to a period alter 1460. On the whole it seems likely that the block-book method developed independently about the mid-15th century, as a means of giving religious instruction to the illiterate, and then was gradually abandoned as literacy increased and a much less laborious method of providing the text became more and more popular.

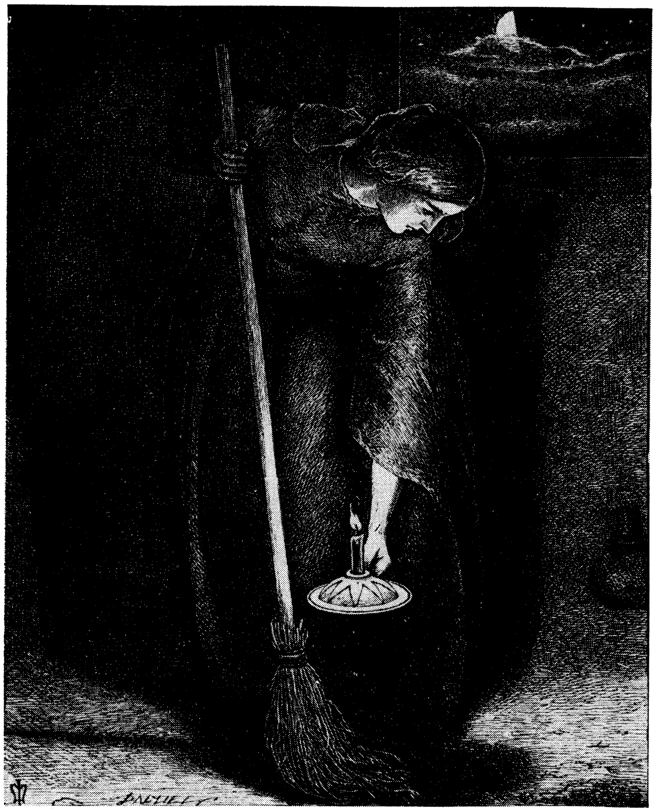
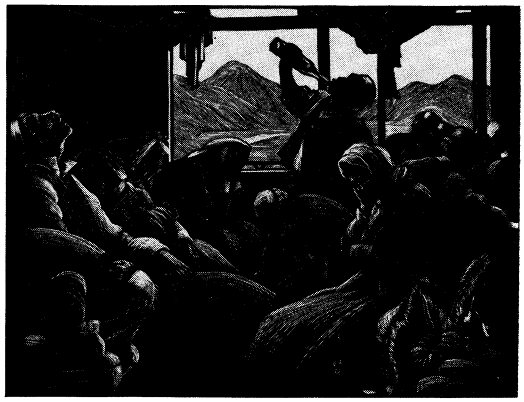
WOODCUT AND WOOD ENGRAVING



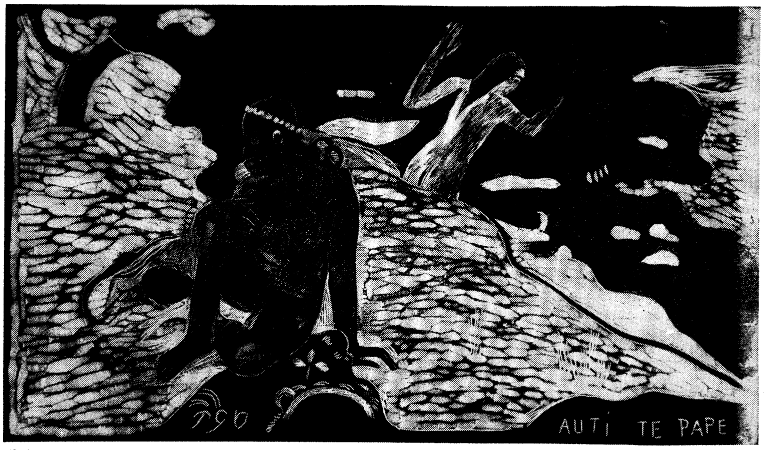
"Parable of the Lost Piece of Silver," engraving by Edward and George Dalziel (after J. E. Millais); English, 19th century

"The Kiss" woodcut by Edvard Munch (1863–1944), Norwegian

Engraving of an owl from *History of British Birds* by Thomas Bewick (1753–1828), English



"Dawn in the Train," engraving by Clare Leighton (1899–), English



"Women by the River," woodcut by Paul Gauguin (1848–1903); French 19th century

The "Pastorals," two of the wood engravings by William Blake (1757–1827) for Thornton's edition of Virgil

WOODCUTS AND WOOD ENGRAVINGS FROM THE LATE 18TH TO THE 20TH CENTURY

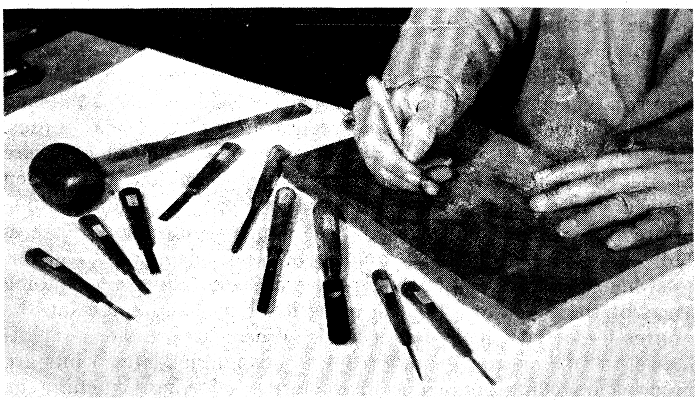
BY COURTESY OF (TOP LEFT, CENTRE RIGHT, BOTTOM RIGHT) MUSEUM OF FINE ARTS, BOSTON (TOP RIGHT, BOTTOM LEFT) THE ART INSTITUTE OF CHICAGO

The 16th Century.—The height of achievement in the art of the black-line woodcut was reached in Germany during the time of Albrecht Durer (1471–1528) and his followers in the first half of the 16th century. Apart from its value for book illustration, the woodcut was quickly recognized as a cheap method of propagating religious and political ideas among a much wider public than could otherwise be reached; the Reformation, for instance, inspired both at Wittenberg in the school of Lucas Cranach and at Niirnberg in the remoter following of Durer. a number of anticlerical prints, often crude and scurrilous, the equivalent of the modern newspaper cartoon. The exquisite designs of Durer himself (which are for the most part sincerely religious), of Hans Holbein the Younger in his famous "Dance of Death," and of other artists at Nurnberg, Augsburg and elsewhere, were cut on the block in the utmost detail by professional block cutters, some of whose names are recorded. The prints may be regarded as perfect facsimiles of the pen drawings which the artists themselves drew on the prepared block. In the Netherlands too, at this time, to some extent under Durer's influence, fine woodcuts were produced by Lucas van Leyden and others; while in north Italy are found cuts after important designs by Titian, and original designs in this medium by such artists as Jacopo de' Barbari and Domenico Campagnola. But it was in Germany that the art flourished. The emperor Maximilian I gave it great encouragement by planning extensive woodcut publications in his own honour: the "Triumphal Arch of Maximilian," largely designed by Durer, the "Triumphal Procession," chiefly by Hans Burgkmair, the "Great Triumphal Car," by Durer, and other illustrated books and series of woodcuts by various artists. Many of the original blocks for these have survived in Vienna. Other blocks of Durer's woodcuts are to be seen in the British museum and elsewhere. In the Basle print room there is a series of blocks with early illustrations by Durer for the comedies of Terence; some of the designs are merely drawn on the block and not yet cut, and some are completely cut and ready for printing.

The book in question was, of course, never published, but these and other surviving blocks give a clear insight into the procedure.

Change of Method to Wood Engraving in White Line.—After the mid-16th century the art of woodcut greatly declined in importance by comparison with line engraving and during the 17th century the attractive prints of Hendrik Goltzius and Jan Lievens in Holland were among the few original works in this medium. Nor were reproductive woodcuts, such as those of Christoffel Jegher after Rubens, any commoner. This situation persisted until the end of the 18th century, when the English engraver, Thomas Bewick of Newcastle, in his charming cuts of birds. animals and country subjects, was chiefly responsible for re-establishing the art by the development of a new method. Since most (though not quite all) of the earlier woodcuts were designed to print in black line on a white ground, which involved the cutting away of a large part of the block surface, the plank of the wood (cut in the direction of the grain) was used, and the cutting was done with a knife. The disadvzntage of this method is that since the plank is relatively soft, and the linens are isolated in relief, they tend to lose their sharpness, and eventually to break, in the process of repeated printing; this can be observed in late impressions of woodcuts of Durer's time. From Bewick onward, the hard end of the wood (cut across the grain) was generally used. and the design was engraved with a burin, so that most of it appears, when printed, in white line against a black background. Bewick was the chief popularizer of the white-line style, and in this he was followed by his contemporary, William Blake, in his small but beautiful illustrations for Thornton's Virgil.

In France it was not long before wood engraving, introduced by English engravers, superseded line engraving, etching and lithography as the most popular medium for book illustration. With facility and fidelity, the French engravers were able to render designs that were little short of the intentions of artists having the most personal and individual styles. What is known today as the "romantic illustrated book" emerged with its hundreds of wood-engraved vignettes, so delightfully placed and printed in the text These were books which were both deluxe editions and books for frequent reading and enjoyment. In 1835, the first of them made its appearance: the famous *Gil Blas*, published by Paulin, with about 800 cuts after the drawings of Jean Gigoux. This was folloned by a long train of handsome and readable volumes to which many notable artists, among them P. Gustave Doré, Tony Johannot, Paul Gavarni, Henri Monnier, Jean Meissonier, made lavish contributions.



CORRECT POSITION OF THE KNIFE FOR CUTTING ON THE FLAT SIDE OF A PLANK BLOCK. ON THE TABLE ARE VARIOUS SHAPED GOUGES AND FLAT CHISELS USED FOR REMOVING LARGE OR SMALL AREAS OF WOOD

Outstanding among them are Curmer's edition (1838) of *Paul et Virginie* (the masterpiece of the period), Balzac's *Les Contes drolatiques* (1855) with Doré's finest work. La *Grande Ville* (1842) and the numerous volumes which perpetuate the strange imagination of Grandville who has been claimed as an ancestor by the surrealists.

The first American woodcut—and also the first book illustration—by a known block cutter, was a portrait of Richard Mather by John Foster which must have been done about 1670, but a national school of engraving did not begin to form until Alexander Anderson, inspired by Bewick in the 1790s, began to engrave on wood. The medium proved to be one for which the Americans had a special flair and brilliant abilities. From about 20 professional wood engravers in the United States in 1838. the number increased to around 400 by 1870. Illustrated magazines, like *The Family Magazine*, *Harper's Monthly* and *Harper's Weekly*, and a great variety of illustrated books, enlisted the talents of prominent artists, among them Winslow Homer, Felix O. C. Darley, John LaFarge, Thomas Moran. Homer Martin. Thomas Nast, and engravers such as William Croome Henry W. Herrick, W. J. Linton, Henry Marsh, as well as a host of others whose technical resourcefulness and invention often obtained amazing results. About 1874 the "new school" appeared. headed by the gifted Timothy Cole. and the Society of American Engravers was formed. A portfolio of norks by 15 of these artists, published by Harper's in 1884, shows their methods brought to such a high degree of skill that not even the mechanical means which appeared about this time and nere soon to replace wood engraving as a reproductive medium can be said to outdo it, for the subtlety and dedication of these last practitioners could have no mechanical counterpart.

In England, for a short time in the mid-19th century. the black-line method was revived, chiefly for reproductive purposes In the 1860s the brothers Dalziel and others engraved admirable facsimiles. in books and periodicals of the pen drawings of the Pre-Raphaelites and of the pictorial reporters of the weekly papers. But there. as in the U.S , in the 1870s, this method of reproduction became obsolete by the introduction of photographic processes, and in spite of a revival of woodcut book illustration at the end of the 19th century (in the Kelmscott and Vale presses in England and in Lucien Pissarro's Eragny press in France), most original nork in black and white during the first half of the 20th century mas confined to engraving in white line Although photomechanical methods had rendered woodcut and nood engraving obsolete as reproductive media, they were to be revived in another realm of the graphic arts; that of the print as an independent .work which accomplishes its aim within itself. Paul Gauguin, during an 18 months' sojourn in France in 1893, following his first Tahitian trip, executed 10 blocks which may be said to have awakened the wood-block media to a new realization of their possibilities. Gauguin's methods were personal and complex. The blocks were of European boxwood which he engraved with fine lines, then gouged out certain portions in varying depths. The two-tone impression. taken from the same block in two different printings (for example: one in black, one in brown), slightly off register, was one of his innovations. Colour was often added by daubing areas of the block and then printing it, or by hand colouring the impression after it had been printed. When he returned to Tahiti he was compelled to use soft native woods and his later prints are much coarser and simpler in character. Following Gauguin, the Norwegian Edvard Munch gave stimulus and energy to what was fast becoming a tradition; he produced strong and haunting compositions. Felix Vallotton. a Swiss artist living in France, brought forth his arresting and amusing subjects in unusual dispositions of black and white. But it was under the influence of Munch that the expressionists of the 20th century employed the medium of the woodcut, sensing its resources so astutely that in many of the prints by Ernst Ludwig Kirchner, Emil Nolde, Christian Rohlfs, there is a return to the essential qualities of wood as a print medium that is the worthy furthering of much earlier traditions. These tendencies have been in key with the great changing movements in all art forms since the late 19th century and—as with painting—there has always been a group that also glorifies the medium by more sober and conservative means. In the 1920s and 1930s both woodcut and wood engraving were very popular: the widely circulated illustrations and block prints of the American. Rockwell Kent; the novels, narrated in woodcuts without text, by the Belgian Franz Masereel, the wood engravings and cuts of Eric Gill. Clare Leighton. Rudolf Ruzicka and Thomas Nason kept the media alive and new for a large public. Neither the woodcut nor wood engraving has lost vigour or its wealth of possibilities and both have strong attractions for young artists who, like the engraver Misch Kohn in the U.S., bring them understanding and technical mastery.

Colour and Chiaroscuro.—Primitive woodcuts in Europe, including book illustrations, were usually coloured by hand and seldom with much care of skill. From the early 16th century (the earliest dated example is by Hans Burgkmair in 1508) the line block was sometimes combined with one or more surface blocks printed in various shades of colour, partly superimposed. This method, which originated in Germany, became popular in the 16th century in Italy. where Ugo da Carpi (*c.* 1455–1523), working from designs by Parmigianino, Raphael and others, was the best known exponent of what is called the chiaroscuro woodcut. The aim of this method was to imitate a drawing in line and wash, and the emphasis was on variety of tone rather than colour. The method, which persisted to some extent through the 17th century, was revived in the 18th, notably in Venice by A. M. Zanetti the elder and the Englishman J. B. Jackson, both of whom published excellent chiaroscuro cuts. generally after drawings or paintings by earlier Italian masters. Experiments with the chiaroscuro medium have been made in the 20th century; but the modern tendency has been mostly in the direction of pure colour-wood-cuts, inspired by the Japanese.

TECHNICAL PROCESSES

Wood Blocks.—The side grain of soft wood, *e.g.*, cherry, American whitewood, pear. apple or lime. is suitable material for woodcutting. The end grain of boxwood is the only completely satisfactory surface for wood engraving. After seasoning, the blocks are planed level, surfaced and cut to a standard thickness of 0.916 in.; that is to say, they are type high and may be inked and printed with typeset matter. Under ordinary conditions of modern commercial production, however, direct printing from a wood block is rarely, if ever, attempted. Fear that the block will split under pressure obliges the use of electrotypes made from the wood surface.

Transferring the Design.—The design may be drawn directly on the block. or it may be prepared first on paper and then traced through a carbon sheet. If the drawing is direct, it may be made with a soft pencil, lightly used, or with a brush and black paint. If the drawing is traced. the rather slippery wood surface may be made more receptive with a thin coating of either white or black water-colour paint. Some craftsmen, particularly wood engravers, prefer a black surface because, as each stroke of the tool reveals the pale colour of the wood, they can watch the development of their work. Alternatively. the surface of the wood may be sensitized to receive a photographic image of the design. This method is especially helpful when the design is intricate or exacting. Furthermore. since all designs must be made in reverse—in order to print the right way—it is convenient to have the transposal made by the camera.

Woodcutting: Tools.—The tools used by the woodcutter are the knife, gouges, chisel and mallet.

Knife.—The knife is the principal cutting tool for defining all the lines and shapes of a design. There are several kinds, different in size and shape, with little to choose between them in usefulness. The woodcutting knife may be held like a pen, or grasped firmly with the whole fist. The handle, therefore, should be neither too unwieldy nor too slender; the blade should be rigid and fairly short.

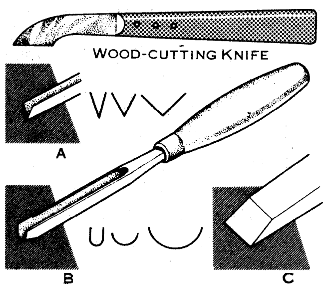

FIG. I.—TOOLS USED FOR WOOD-CUTTING. SHOWING THREE SIZES OF GOUGES: (A) V-GOUGE, (B) U-GOUGE, (C) CHISEL

Gouges.—Gouges are concave metal shafts, V-shaped and U-shaped in section, mounted in wooden handles. They are made in a number of sizes. Their purpose is to cut lines corresponding in width to their own section and to remove superfluous wood. A gouge's efficiency depends on its sharpness. Its cutting edge may be reset on a small sharpening stone, called a V-stone. The sides of the V-stone converge from a curved-back edge to an acute-angled front edge; the former is used for the U-tool, the latter for the V-tool.

Chisel and *Mallet.*—The chisel supports the work of the gouges in leveling down the larger nonprinting areas of the block. Both chisel and gouges may either be pushed by hand, or knocked gently with the wooden mallet.

Cutting technique.—To cut a white line, the knife is drawn toward the body to make two separate incisions. each so inclined toward the other as to cut a V-section in the block. If the incisions are made to meet at either end, the sliver can then be lifted from the surface. Alternatively, the line may be made in one stroke with the V-gouge. The latter method is obviously simpler, but for those parts of a woodcut which demand drawing, as distinct from clearing, the knife is more responsive and versatile.

Wood Engraving: Tools.—The wood engraver's tools are, by name, graver, spitsticker, tint tool. round scauper, square scauper and multiple tool. Each consists of a metal shaft fixed in a wooden handle. As a general rule, the depth of the tool's incision determines the width of the line that it makes. Yet wood engraving is a comparatively shallow process. The wood is hard; if the tool is buried too deep, it will stall. Therefore, so that it may be moved close and nearly parallel to the block's surface, the shaft of the tool is set at a slight upward angle, and the handle is half rounded with one flat side. Engraving tools must be kept very sharp. The edge of a blunt tool can be restored by laying its face absolutely flat on the surface of a hard Arkansas oil stone, and grinding it gently in a few drops of light oil.

Grazer.—The graver is sometimes known as the solid burin. It has a rhombic section, varying from narrow to square, and is made in a number of weights. Its acute point enters the wood very readily. The engraver can use it for a line of uniform width by sustaining a constant dcpth of cutting, or for a line of variable thickness by raising or lowering the angle of entry. A rich variety of stipples and textures may be made with the graver, but it is primarily a tool for straight lines.

Spitsticker.—The spitsticker is a tool for curved lines. In section, it is flat at the top with curved sides which meet keelwise at a point. Like the graver, it is made in several sizes, and the width of its line depends on the depth of its intrusion into the wood.

Tint Tool.—The thickness of the line made by the tint tool depends on the size of the tool; it is made in a number of widths. It has straight sides which converge gradually to a square cutting edge. As its name implies, its function is to lay tints composed of even lines.

Scaupers.—Scaupers, also called scorpers or scoopers, are clearing tools for lowering the surface of unwanted areas of wood. The sides of the round scauper converge to a curved base; the square scauper has straight sides and a square base. Each is made in a numher of widths. A wide size of round scauper is used for dealing with large areas, a narrow size for more delicate clearances around contours and between lines. The square scauper can be used to level off the ruts made by the round scauper, and it has a unique capacity of clearing right angles and corners in two strokes. A useful auxiliary to the scaupers is a chisel tool, which is simply a carpenter's chisel. set in the same handle as an engraving tool.

Multiple Toal.—&lost engravers agree that the multiple. or threading. tool is the last that should be acquired. Most engravers use it. notwithstanding. to a greater or less extent. Its performance of engraving two. three or more lines at once (according to its size) gives it the suspect character of a mechanica1 aid. Nevertheless. it has beautiful qualities when directed with reserve and discretion. Its unrestrained use tends to promote facile and showy execution.

Engraving Technique.—The way of holding tools may vary a little between one craftsinan and another. but the nature of wood-engraving imposes a certain uniformity. A conventional hold is to tuck the handle. flat side downward, between the crook of the little finger and the palm of the hand; then. with the tips of the other three fingers located on the shaft, the thuinb is advanced almost to the point of the tool. In such a position. pressure. exerted on the handle by the little finger and the palm. and steadied by the thumb's contact with the shaft can be as firm or light as required.

The block is placed on a small, heavy, leather sandbag, circular in plan. with a fiattened top and bottom. The weight of the sandbag makes it a rigid support; its height allows room for the left hand to hold the block and the right hand to manipulate the tool. Straight lines are engraved by pushing the tool into the wood surface and. as the shaft passes over the thumb, contracting the hand until the liinit of the stroke is reached. The point of the tool rests in the furrow while the thumb slides fornard again. and the movement is repeated until, by progressive stages. the line is completed At the end of an engraving stroke. the wood fragment is picked out nith a levering action of the tool. In this movenicnt, there is alnays a risk of cutting or bruising an adjacent area of the block with the heel of the tool; a piece of card, laid between the tool and the block. gives both protection and leverage. Curved lines are engraved by turning the block against the point of the tool. The right hand holds the tool steady. while the left hand controls the prcssure and directs the movement.

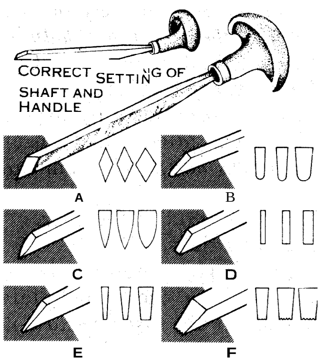

FIG 2—TOOLS USED FOR WOOD ENGRAVING SHOWN TO THE RIGHT OF EACH TOOL ARE THREE VARIETIES OF THE CUT PRODUCEO (A) SOLID BURIN OR GRAVER (B) ROUND SCAUPER. (C) SPITSTICKER (D) SQUARE SCAUPER. (E) TINT TOOL. (F) MULTIPLE TOOL

Printing.—Some craftsmen take prints of their work at an intermediate stage, others prefer to complete their cutting or engraving before inking the block. The ink. a fairly stiff letterpress printing ink, is spread out on a sheet of glass and reduced. by energetic work with a printer's small hand roller. to a silky consistency. Then the roller is passed over the block to cover it with a thin film. A sheet of paper is laid carefully on the inked surface, and a burnisher, or even a teaspoon. is rubbed smoothly all over the back of the sheet until the ink has been transferred evenly from block to paper. Wood blocks may also be printed on a hand press. This ensures an unvarying and desirable uniformity of impressions, but hand printing admits of more direct and sensitive control.

Paper.—For hand printing. Japanese and India papers are suitable; they are available in varied tones, weights and qualities. Printing by press, because it exerts a greater weight and force, allows a wider choice of appropriate papers.

Colour Prints.—The making of a colour print obliges the cutting or engraving of a separate block for each colour. Since the final print is a built-up sequence of impressions from several blocks, co-ordination depends, firstly, on precise fitting of the colour shapes and. secondly, on accurate placing of the paper when takirig each print. The first block to be completed acts as a key. For this purpose. the most pervasive colour in the design is likely to prove the most useful guide for ensuing printings. A wet impression. taken from the first block, is burnished, or offset. onto the uncut face of the second. The second colour may then be plotted in right relation to the first. This method of offsetting is repeated for each colour. The correct lay of the paper is ensured by devising identical register marks on each block. One way is to commit the design to outsize blocks. of equal measurements. and large enough to allow a uniform margin of at least an inch and a half around two adjacent sides of the design. On each block, the level of this marginal space is lowered—to avoid contact with the inking roller—except for a right angle in the top left-hand corner and a line in the top right-hand corner. The line and each arm of the right angle should be about two inches long and of precisely equal width, not less than half an inch. The outer walls of the two shapes are made by the sides of the block; the inner walls should be vertical planes. Then. the paper. provided its edges are square. may be laid on each block in turn. so that its top left-hand corner fits in the right angle, and its top edge lies along the raised line.

In assessing the required number of printings. consideration is given to all the possibilities offered by the overprinting of one colour on another; and. at the same time. because printing inks vary in opacity, the sequence of the impressions is an important decision. The technique of inking and printing is the same as that of the single colour block.

There is another method of printing in colour. appropriate only to woodcuts, which is based on Japanese practice. Instead of printing ink applied with a roller, powder colour, mixed with water and rice flour paste. is painted on the cut surface of each block with a flat brush. To retard absorption. the block is moistened first with a sponge. The impression is made on damped Japanese paper by rubbing the back of the sheet with a baren. a flat. hard pad sheathed in a bamboo leaf. Printing is not limited to fiat colours; differences in tone are effected by varying degrees of pressure. Using means of this sort. the Japanese achieved the most amazing standards of accomplishment in the 18th and 19th centuries. The drawing was made on thin paper by an artist and pasted on the wood. Cutting and printing were carried out by highly specialized craftsmen whose undeviating intention was to make faultless copies of the artist's original.

Nowadays, all the resources of modern photographic reproduction have canceled the need for disguising the colour print in the character of another medium. As a result, contemporary woodcuts and wood engravings. plain or coloured, are deliberately designed in terms of their own characteristic qualities. (F. W. W.-S.)

WOODFALL, family of printers and journalists. HENRY WOODFALL (d. 1769) was the printer of the *Public Advertiser* and the author of the ballad "Darby and Joan" (first printed in the *Gentleman's Magazine,* March 1735), for which his employer. John Darby, and his employer's wife are said to have been the originals.

HENRY SAMPSON WOODFALL (1739–1805), son of the above. controlled the *Public Advertiser* from 1758–93. The letters of Junius (*q.v.*) appeared in the *Advertiser* during these years.

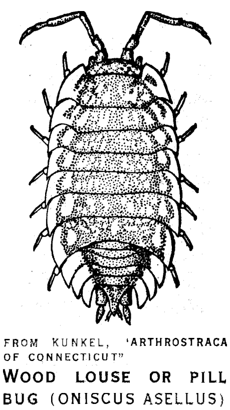
WILLIAM WOODFALL (1746–1803), younger brother of H. S. Woodfall, established in 1789 a daily paper called the *Diary* in which. for the first time, reports of parliamentary debates were published on the morning after they had taken place.

GEORGE WOODFALL (1767–1844), son of H. S. Woodfall, mas an esteemed typographer. He printed a notable edition of the letters of Junius in 1812.

WOODFORD: *see* WANSTEAD AND WOODFORD. England.

WOOD GREEN, a municipal (1933) and parliamentary borough of Middlesex, Eng., 7 mi. N. of St. Paul's cathedral. London. Pop. (1951) 52,228. Area 2.j sq.mi. It is mainly a residential area lying north of Hornsey and west of Tottenham of which borough it formed a part until 1888. It contains most of Alexandra park (154 ac.), with Alexandra palace (opened 1873, burned, reopened 187j) where the British Broadcasting corporation's television station was opened in 1936. the first transmission taking place on Aug. 26, though the B.B.C. had been making television broadcasts since Xug. 22. 1932. Fuller's almshouses, founded in 1592 in Shoreditch. were removed to Wood Green in 1933 and almshouses for fishmongers and printers were opened in 1849 and 1854. In 1609 the New river was constructed, 9 mi. of its course being through Wood Green.

WOOD LOUSE, a name commonly applied to certain terrestrial Isopoda (Crustacea) (*q.v.*), found in damp places, under stones or dead leaves, or among decaying wood. They form the tribe Oniscoidea and are distinguished from all other Isopoda by living on land and breathing air. and by the small size of the antennules and the absence of the mandibular palp. The head bears a pair of sessile compound eyes as well as the minute antennules and the longer antennae. Each of the seven thoracic segments carries a pair of walking legs. The appendages of the abdomen (except the last pair) are flat membranous plates and serve as organs of respiration. In many cases their outer branches have small cavities opening to the outside by slitlike apertures. and giving rise internally to a system of ramifying tubules filled with air somewhat similar to the air tubes or *tracheae* of insects and other air-breathing Arthropods.



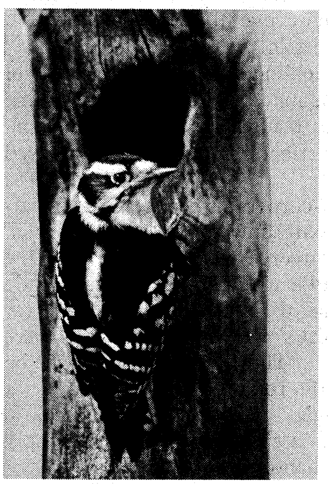
FROM KUNKEL, 'ARTHROSTRACA OF CONNECTICUT'

WOOD LOUSE OR PILL BUG (ONISCUS ASELLUS)

The female wood louse carries her eggs, after they are extruded from the body, in a pouch or "marsupium" which covers the under surface of the thorax and is formed by overlapping, plates attached to the bases of the first five pairs of legs. The young on leaving this pouch are like miniature adults except that they are without the last pair of legs. Some common garden forms, such as *Armadillidium vulgare, Porcellio scaber, Porcellionides pruinosis,* are practically cosmopolitan. often being carried about on introduced plants. (*See* MALACOSTRACA.) (W. T. C.; X.)

WOODPECKER, the name for a group of birds that, with piculets and wrynecks. form the family Picidae. Its relatives are such birds as barbets. honey guides and toucans. There are about 180 species of woodpeckers distributed over most of the world except in the Australian area; they are most numerous in the Americas and in southern Asia.

Typically woodpeckers spend their time climbing up tree trunks and branches. chiselling from the wood their food of insects and wood-boring larvae. These birds' adaptation for climbing include short, strong feet, two toes in front and one or two behind, with sharp, curved claws: and stiffened tail feathers that serve as a prop. For getting at wood-boring insects they have a stout chisel-shaped bill, a tuft of feathers over the nostrils that nould keep chips out of them. and a very long, extensible tongue with barbs near the tip. useful in extracting grubs from their burrows.



BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

THE DOWNY WOODPECKER (DRYOBATES PUBESCENS EMEDIANUS) OF NORTH AMERICA SHOWN AT THE ENTRANCE TO ITS NEST

Woodpeckers vary in size from that of a sparrow to that of a crow Their colour pattern is usually bold, including black and white or olive. Often there are areas of red on the head. Their flight is heavy and undulating.

Though most woodpeckers have loud voices and some are noisy, a tattoo beaten out by tapping with the bill on a resonant branch may take the place of a song. Courtship flights and displays are also used at mating time. The nest is usually an excavation chiselled in a tree trunk, in which cavity the pure white eggs are laid without the addition of nest material. The eggs are as few as two in number in some tropical species; elsewhere as many as 8 or 10 are sometimes laid. The young are hatched naked. Both parents share nest duties.

Many species are permanent residents, but some migrate, like the yellow-bellied sapsucker (*Sphyrapicus varius*) that migrates from northern Canada to winter in Central America.

There are a number of woodpeckers with nontypical habits. The green woodpecker (*Picus viridis*) of Europe and the flickers (*Colaptes*) of the Americas feed on insects on the ground, away from trees. and one South American species lives entirely in open country. feeding on the ground and making its nest in holes in banks. The South African ground woodpecker (*Geocolaptes olivaceus*) has similarly forsaken forests for open country.

Not all feed entirely on insects. The red-headed woodpecker (*Melanerpes erythrocephalus*) of the United States feeds much on seeds and grain. The California woodpecker (*Balanosphyra formicivora*) eats acorns and in the autumn stores quantities of them in tree trunks by drilling a little hole for each acorn into which it is fitted. In Central America one of the woodpeckers (*Centurus aurifrons*) commonly eats fruit and berries and punctures oranges, while in the north a sapsucker (*Sphyrapicus*) regularly digs through the bark of living trees to eat the inner layer and drink the sap.

The large, handsome ivory-billed woodpecker (*Campephilus principalis*) of the United States was hovering on the verge of extinction in the 1950s because its habitat, mature stands of timber, were being destroyed.

Woodpeckers are generally beneficial to man, with one exception — their drilling into and weakening electric power-line poles; this is often an important economic loss. (A. L. RD.)

WOOD PULP: *see* PAPER.

WOOD SORREL, the name of various herbs of the genus *Oxalis,* distributed in temperate zones of North and South America, Africa and Eurasia. The petals may be white, pink, yellow or purple. The white-blossomed common wood sorrel or wood shamrock (*Oxalis montana*) is found from Massachusetts to Minnesota. A few species of wood sorrel are cultivated.

See OXALIS.

WOODSTOCK, a municipal borough in Oxfordshire, Eng., in the Banbury parliamentary division, 8 mi. N.W. of Oxford. Pop. (1951) 1,715. The Glyme river divides the town. The church of St. Mary Magdalene is Norman but has later additions.

Woodstock was noted for its leather gloves as long ago as 1580; the industry still flourishes in the district.

Domesday Book describes Woodstock as a royal forest; it was a royal seat from early times and Aethelred is said to have held a council there. Henry I kept a menagerie in the park where lions, camels and a favourite porcupine are said to have been among the animals. The assize of Woodstock is the earliest surviving written law (1184) to preserve "the peace of the king's venison."

Woodstock was the scene of a council held by Henry II in 1163 and of his courtship of Rosamond Clifford ("Fair Rosamond"). Edward the Black Prince. sometimes known as Edward of Woodstock, mas born there in 1330. and there Elizabeth I was imprisoned for six months in the reign of her sister Mary (1554). It was a favourite royal residence until the Civil War, when the manor house was destroyed. After the battle of Blenheim the manor of Roodstock was bestowed in perpetuity on John, duke of Marlborough and Blenheim palace was erected for him by the queen and parliament in consideration of his military services, and especially his decisive victory at Blenheim. The palace was designed by Sir John Vanbrugh in late Renaissance style. On the hill stands a column commemorating the duke.

WOODWARDIA, a genus of rather large ferns of the Polypodiaceae family, commonly called chain fern because the sori occur in chainlike rows parallel to the secondary midribs. Two species are well known in eastern North America: W. areolata, found from Maine to Florida and Texas; and W. *virginica,* found from Nova Scotia to Michigan, Florida and Texas.

See FERN. (J. M. BL.)

WOODWORKING MACHINERY. Wood is man's oldest and one of his most useful natural resources, and from the earliest civilized times, it has been used for shelter. furniture, tools and many of man's other needs. Until the Industrial Revolution, most woodworking was done with hand tools. The fine woodwork on coaches, furniture and the interiors of homes, castles and churches was produced by skilled craftsmen using simple tools. However, during the early part of the 19th century, efforts were made to develop machines that would do the work faster and better. A circular saw had been produced in Holland as early as 1777, and a planing machine was patented in England at about the same time. Subsequently. many types of basic woodworking machines were developed. Wood is an easily worked material and a wide range of versatile machines were designed to shape it into useful products. The basic categories of woodworking machinery are described below.

Sawing Machines. — Sawing machines are used to cut wood into workable sizes. The four commonest types are the circular saw, radial-arm saw, band saw and jig saw.

Circular Saw. — This machine cuts wood with a thin circular blade with teeth around its edge. The machine consists of a base on which an arbor or axle to hold the blade and a table are mounted. The saw blade protrudes through an opening in the table, and the blade can be raised or lowered to make cuts of different depths. Most circular saws are made to hold only one blade at a time, but a few of the larger ones have a double arbor on nhich two blades can be mounted. When one blade is raised ready for use, the other is out of the way. A fence is provided to guide the material as it is fed into the saw and there is a miter gauge against uhich the wood can be held for crosscutting. The circular saw is used to rip (cut with the grain), bevel (cut with either blade or table tilted), crosscut (cut across the grain), miter (cut at an angle) and to make many cuts used in joinery. Circular saws are classified according to the diameter of the blade, ranging in size from a small 8-in. bench saw to the 14- and 16-in. sams used in lumber yards, furniture factories and other woodworking industries.

Radial-Arm Saw. — This machine does the same kind of cutting and uses the same kind of blade as a circular saw, but it is very different in design. In effect it is an inverted circular saw. nith the motor and blade suspended under an arm above the table and so mounted that they can be moved toward or away from the operator. The arm can be turned in a complete circle and the motor and blade can be turned through a complete horizontal circle and tilted in either direction, thus giving the saw three-dimensional movement. For crosscutting, mitering and many other cuts, the material is held firmly on the table while the blade is pulled into it (toward the operator). For ripping, the motor is locked in position and the lumber fed into the revolving blade.

Band Saw. — The band saw has a blade in the form of a continuous metal strip. with teeth along one edge, that runs around two large wheels. Though the band saw is capable of only a few operations, it is important because it can cut curves in any thickness of stock. It can also be used for resawing (cutting boards to thinner widths). Band saws with wheels from 14 to 36 in. in diameter are used for shop work, while larger saws, with wheels 84 in. or more in diameter, are used in saw mills for resawing or for sawing logs into standard sizes. The band saw has an advantage over circular saws in that its thinner blade produces a narrower kerf (the cut made by the saw) and less wood is wasted. Blades for the larger machines used in the lumbering industry may be as wide as 16 in. and as long as 50 ft. On many machines the band saw blade has teeth on both sides. Thus. when a log is mounted on a conveyer or carrier, it can be cut while traveling in either direction past the blade.

Jig Saw. — This machine does the same kind of cutting as the hand coping saw, making inside and outside irregular cuts. The blade is mounted between an overhead support and a driving mechanism that produces a reciprocating movement. The blade passes through an opening in a table upon which the work is manipulated.

Planers or Surfacers. — These are single-purpose machines for smoothing wood to an even thickness. The planer consists of a frame, a bed that can be moved up and down, feed rolls, a feeding mechanism and a cylindrical cutter head holding three or more knives that pare off the excess wood. Models range from the single planer. which smooths one surface of a board at a time, to machines that can finish all four surfaces simultaneously. Planer sizes are indicated by the width of work that can be accommodated, ranging from 18 to 50 in.

Jointers. — The jointer is designed to smooth the surface, edge or end of a board. It does the same work as the hand plane but cuts in a different manner. The jointer consists of a frame holding a front or infeed and a back or outfeed table, the difference in height of the tables governing the depth of cut. It has a round cutter head holding the cutting knives and a fence to guide the stock. The wood is pushed along the tables over the rotating cutter head. Jointers are rated according to the length of the cutting knives, the common sizes ranging from 6 to 24 in.

Shapers. — The shaper is used to cut moldings and the edge designs found on furniture, picture frames. etc. It consists of a table through which protrudes a rotating spindle carrying the cutting blades, which are shaped to produce the desired contour on the work. A vertical guide is provided against which the work is held as it is fed past the cutter. Larger shapers used in the production of moldings may have two or more cutters and are provided with automatic controls that feed material into the machine.

Routers. — Essentially, the router is an inverted shaper, with the cutter spindle suspended over the work table. It is used for such work as shaping the insides of bowls or trays and carving the openings on chair backs.

Lathes. — Long before any other woodworking machines were invented, the lathe was used to turn out cylindrical parts. It combines the power of the motor-driven machine with the skillful use of hand tools. One end of the length of wood to be turned is clamped in a "live" centre. rotated by the motor, while the other is held in a "dead" or nonrotating centre that is adjustable laterally to accommodate the work. A tool rest is provided against which the operator steadies the turning chisel. Lathes are classified according to the length of material they can accommodate, ranging from the 8- or 10- in. models found in home workshops to the 24-in. machines used by patternmakers. For commercial production, automatic lathes have been developed in which the cutting tool is guided by a stylus running against a pattern. (See also LATHE.)

Sanders.—Sanders are used to finish wood surfaces. Some of the common kinds are the belt sander, which has a continuous strip of sandpaper running over two rollers; the disk sander. which uses a piece of sandpaper fastened to a large metal disk; and the spindle sander, a cylindrical spindle around which a piece of sandpaper is fastened.

The drum bed sander is a large production machine used to finish doors, window frames and other large, flat surfaces. This machine looks and operates somewhat like a planer, having two to four large revolving cylinders that sand the stock as it is fed between them.

Mortisers and Tenoners.—A mortiser cuts the square opening for a mortise-and-tenon joint. The hollow-chisel mortiser is the commonest. It has a square chisel, enclosing a revolving bit. clamped to the motor housing. When the chisel and bit are forced into the wood. the bit bores a hole almost as large as the chisel and the sharp edges of the chisel cut out the corners to make a square opening. The hollow-chisel mortiser is made either as an upright or a horizontal machine. The chain-saw mortiser, used in sash and door manufacturing, has a continuous chain saw that cuts a rectangular opening with a rounded bottom.

A tenoner is used in volume production for cutting the tenon that fits into a mortise-and-tenon joint. Tenoners are either single, to cut a tenon on one end of a board at one time, or double, to cut both ends.

Boring Machines.—Boring machines are used to bore the holes for making dowel joints or assembling wood with dowels. The large production boring machines are very similar to the drill press, which in fact serves as a boring machine in small shop work. For industrial uses, the boring machine may be provided with a single boring tool or a gang tool that will bore several holes at the same time. In a small shop, a drill press with a mortising attachment can serve as a mortiser and it also may be provided with accessories to serve as a spindle sander, disk sander, shaper or router.

Multipurpose Machines.—The multipurpose machine is designed for home workshop or school use. It performs many standard woodworking operations. One type, basically a combination drill press and lathe, can be made to perform the functions of a circular saw, band saw, jig saw, jointer, sander, etc., by adding suitable attachments. Another type is basically a radial-arm saw but can also be altered to perform the work of other machines.

Portable Electric Tools.—Portable electric-powered tools are designed for convenience and ease of handling. They permit the machine to be brought to the work. The five commonest are the electric hand saw for straight cutting; the saber or jig saw for cutting irregular shapes; the portable router for making joints and shaping edges, grooves, etc.; the hand drill for boring holes; and the portable sander, of either the pad or belt type.

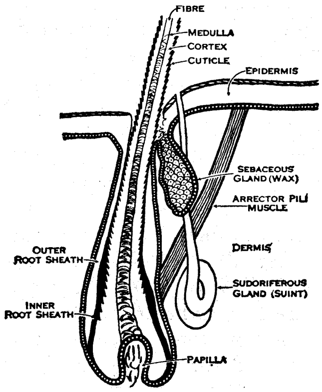
See also MACHINE TOOLS; GRINDING MACHINE; CARPENTRY; JOINERY. (J. L. F.)

WOOF. Another name for weft: *see* WARP AND WEFT.

WOOL. The thick covering or coat of the domestic sheep consists of a mass of specialized fibres called wool. Typically. it is unlike hair in that there are minute overlapping scales or plates extending lengthwise on the surface of the fibre which give it an entangling or felting characteristic. Wool is an outgrowth of the epidermis and is generally believed to represent the evolutionary development of the undercoat of the animal from which domestic sheep were derived. Whether as a vestigial remnant of the past or as a new development associated with certain conditions of environment, some sheep do grow some hair and kemp, particularly in subtropical areas.

Wool fibres, whether short or long, grow in tufts of as many as a dozen fibres. Density of fibre varies widely with the breed and from one part to another of the body of the individual sheep. Merino lambs have been credited with 20,000,000 fibres and the fleece of a full-grown Merino has been estimated to include up to 126,000,000 fibres; an average of about 30,000 to 50,000 per square inch is normal for the Merinos, with other breeds having moderately or sharply lower density.

The wool follicles of the sheep's skin are pits reaching into the dermis, formed by inturning epidermal layers. The follicles appear to be of two sorts, one provided with only the wax gland, the other, primary, with perspiration (suint) gland and *arrector pili* muscle as well as wax gland (see fig.). Growth of the fibre occurs as a continuing process, by multiplication of the soft cells of the papilla at the base of the follicle, which is bathed in a nutritive medium. It is the flow of this fluid which is much affected by the health of the sheep—by drought and poor forage, as well as disease.



FROM HIRSCH MUNZ THE AUSTRALIAN WOOL INDUSTRY BY COURTESY OF ANGUS AND ROBERTSON, LTD

DIAGRAM OF A WOOL FOLLICLE AND ITS ASSOCIATED GLANDS

Defective functioning of this process results in weak areas in the wool fibre, called in the trade "tender wool." The differentiation of the cells into the wool protein (keratin) of the cuticle and cortex occurs perhaps one-third of the distance above the base of the follicle, from which point the wool fibre is no longer living and growing. Wax and perspiration salts are added near the exit.

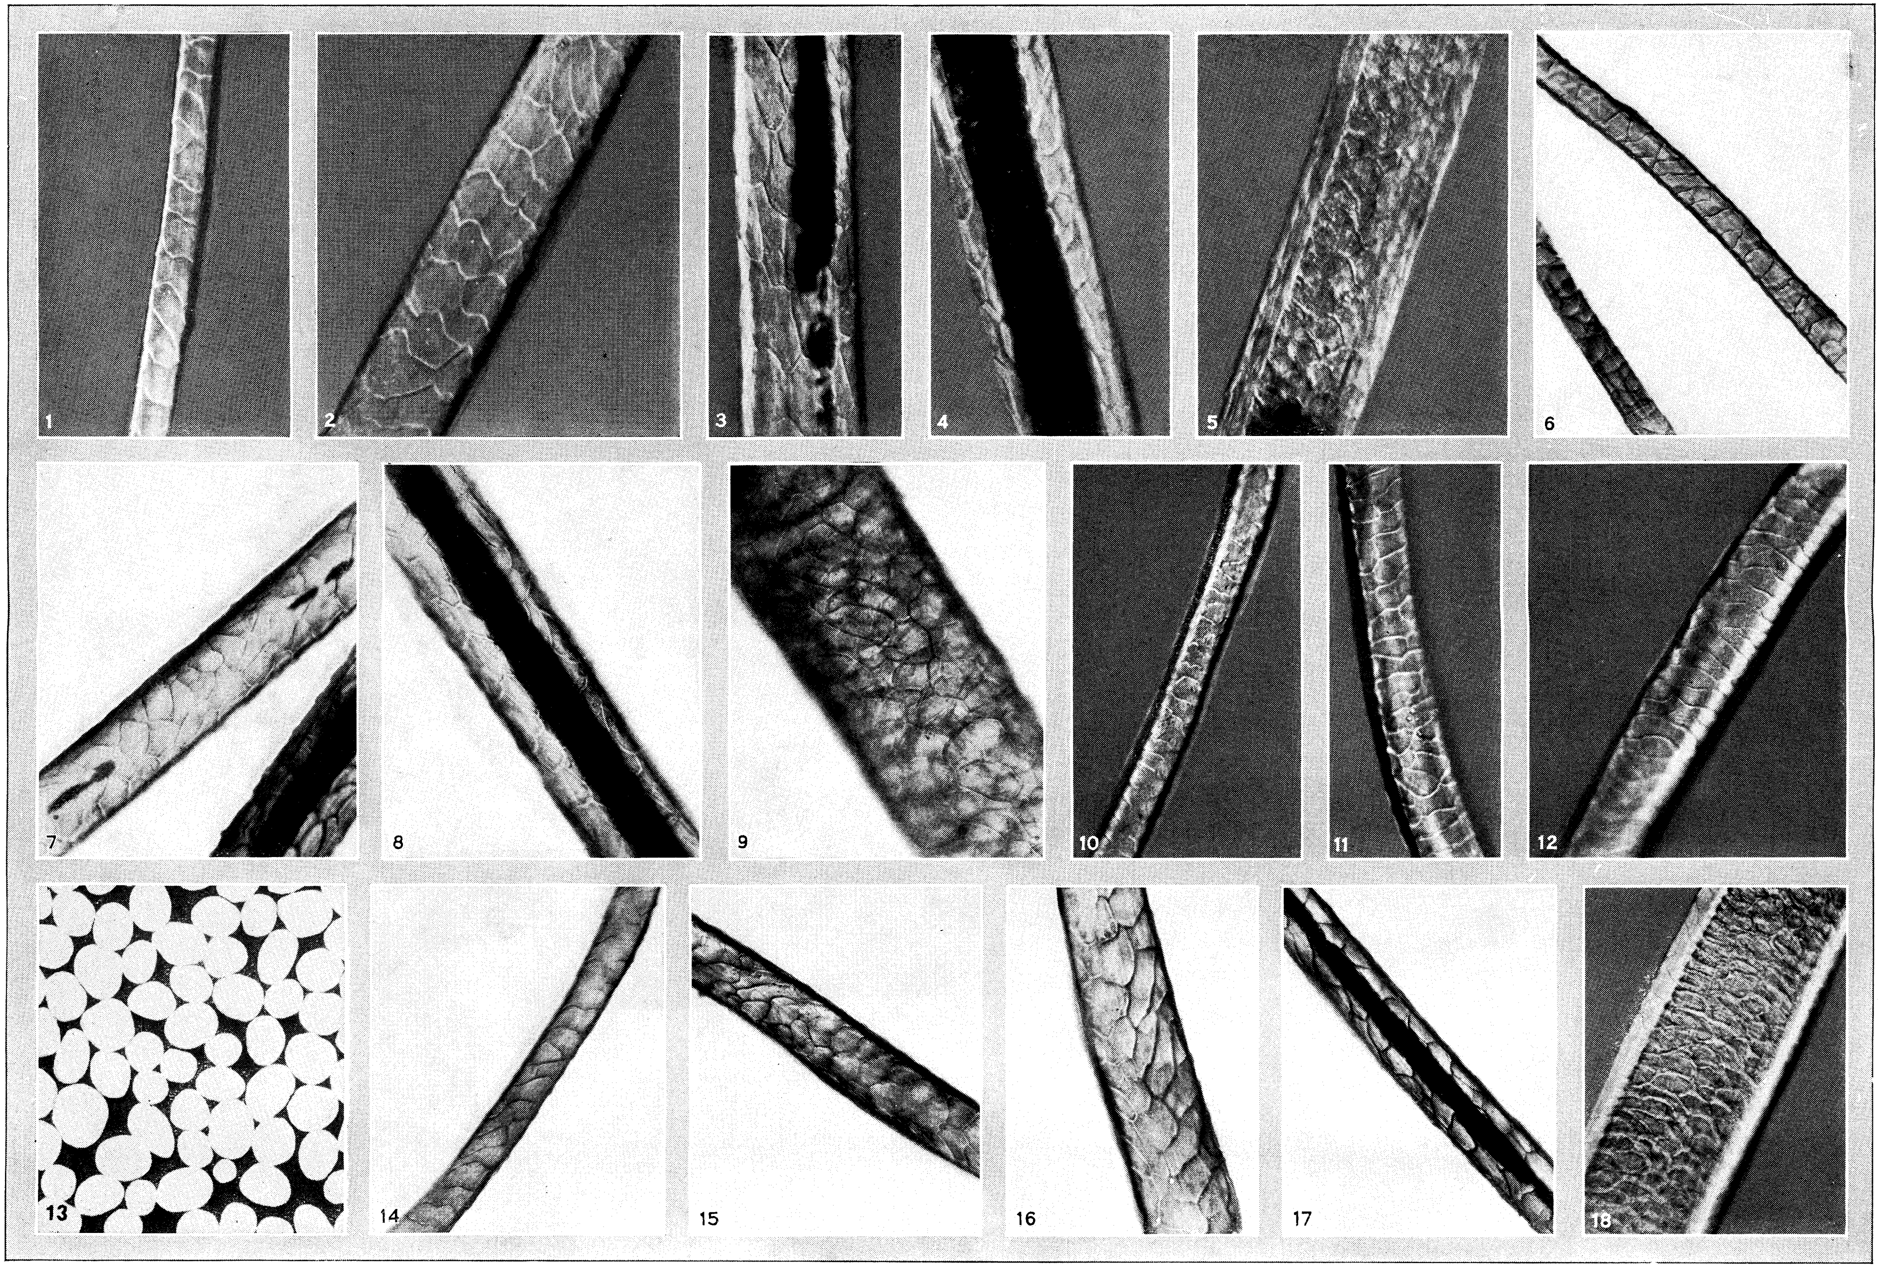
Grease wool, the form in which practically'all wool is marketed initially, is mostly obtained by clipping or cutting the coat or fleece of fibres from the live animal. Smaller amounts, called pulled wool, or sometimes skin or dead wool, are obtained from the skins or pelts of dead sheep. Such raw or grease wool contains perspiration or suint salts, which together with varying amounts of natural grease are sometimes referred to as yolk, plus wool fibres of one or more types and foreign material or dirt of varying sorts and amounts. all of which constitute a total of one-third to two-thirds but average about one-half of the total weight of the unprocessed fleece. It is the raw wool of history and commerce.

Characteristics.—Natural colour of wool varies from the prevailing white through gray, fawn, yellow and brown to black. Wool fibres, usually slightly elliptical, have an average diameter ranging between 8 and 60 μ or from more than $\frac{1}{400}$ in. to less than $\frac{1}{2,000}$ in. The range is associated largely with the breed of sheep but there may be considerable variability within the same fleece. Length of fibre, which depends not only on the kind of sheep but also on the time during which the fibre has been allowed to grow. ranges from a fraction of an inch to many inches. On occasions when sheep have missed shearing for two or three years, a wool growth of more than 40 in. has been recorded in crossbreds. The following are the average yearly growths of the more important breeds of sheep:

Black-faced	10" to 18"	Southdown	3" to 4"
Lincoln	12" to 18"	Clothing Merino	$1\frac{1}{2}$" to 3"
Romney	6" to 8"	Combing Merino	$2\frac{1}{2}$" to 5"
Shropshire	4" to 6"		

The first year's growth of wool, sheared from what are termed hog or teg sheep, is usually somewhat longer than indicated above, because the lambs are born from February to April and the shearing does not take place until the following May or June. Hog wool reveals itself in its pointed fibre tips.

In terms of structural arrangement, most of the finer wool fibres are described as nonmedullated continuous fibres; *i.e.*, solid fibres made up only of cuticle and cortex. However, some other types consisting of three layers, cuticle, cortex and medulla (pith), do occur, as well as mixed types—part medullated, part nonmedullated. In addition, there may be kemps, periodically shed fibres believed to be relics of the former outer coat. They are coarse and straight. often white and shiny, and mostly sharply pointed, consisting of an outer cuticle and an inner medulla of loosely packed cells. The crimp or wave of wool fibre varies generally with the average fineness from about 6 per inch in crossbred wool



BY COURTESY OF (1-12, 14-18) JANET BLYTH (13) U.S.D.A.

MAGNIFIED WOOLEN FIBRES

Top panel (1–5): typical fibres taken from Lincoln sheep. Both continuous and intermittent medullated fibres are seen

Second panel (6–9): wool fibres from the Swaledale (improved Blackface Scotch sheep) showing external structure of the kemp. Actual scale structure approaches Merino fibre

Third panel (10–13): there are no medullated fibres in this wool from a Southdown sheep, the best of the fine British breeds. (13) is a cross-section of Merino wool fibres

Bottom panel (14–18): demi-lustre class fibres taken from a Romney Marsh sheep, the wool of which makes good felting. Clearly defined external structure is probably dominant factor with reference to this quality

to about 24 crimps per inch in the very finest Merino fibres Apparently it is related to the period of the rotation or curl of the major axis of the ellipse as the fibre issues from the follicle. The overlapping scales of the cuticle point toward the outer tip of the fibre.

Some other important physical characteristics of wool are its lightness (a specific gravity of 1.3), and its resilience or springiness, which is related to its elasticity. It can be extended as much as 30% for short periods without permanent deformation, a factor which is important in its use for higher grade clothing. It is a poor conductor of electricity and will hold a charge of static electricity under some conditions. It is a warm fibre because its fabrics enclose much insulating air. Some wools have lustre. Severe drying fatigues the fibre by damaging the protein in some fashion.

Chemically, wool keratin is an animal protein not unlike hair, feathers and horn. A chemical analysis of wool shows that it is composed of five elements in the following approximate percentages: carbon, 50%; hydrogen, 7%; nitrogen, 17%; oxygen, 21%; and sulphur, 3%–4%. This last is rather unusual—wool is rich in the sulphur-containing amino acid cystine. Apparently the amino acids are arranged in chain bundles of large molecules, called polypeptide chains. In one subtype of keratin, these chains apparently take a folded form, whereas the other subtype is built from the same chains pulled into straightened forms. There is evidence of two types of linkage of these chains. The cystine or disulphide one may be altered by some chemical reagents, with consequent alteration or destruction of the physical structure of the fibre. The other or salt linkages can be readily broken, a fact which is utilized to advantage in some stages of processing. If wool is burned, it largely resolves itself into ammonia gas of characteristic odour.

Wool **in** History.—The use of wool for human clothing reaches far back into antiquity, if not indeed into prehistory. Its outstanding properties of resilience, wrinkle resistance, hygroscopic quality, felting property and low heat conductivity long ago gave it a high usefulness not only for human clothing, but for blankets, upholstery, floor coverings, etc. Though in general there was less need for the warming qualities of wool in the Mediterranean and near eastern regions than in northwestern Europe, such records as exist testify to the high esteem in which it was held. Witness the name Babylonia which some interpret as meaning "the land of wool." Also, the early trade of the Mediterranean area with the British Isles appears to have included wool cloth which the Phoenicians traded for the raw wool of Cornwall. The different kinds of wool and the cloth made from them in antiquity are described by Pliny and referred to by other writers. The sheep certainly was a domestic animal in Britain long before the period of the Roman occupation; and it is probable that use was made of sheepskins and of wool. The Romans established a wool factory whence the occupying army was supplied with clothing, and the value of the manufacture was soon recognized by the Britons. of whom Tacitus remarks, "Inde etiam habitus nostri honor et frequens toga" (*Agric.* c. 21). The product of the Winchester looms soon established a reputation abroad, it being remarked that "the wool of Britain is often spun so fine that it is in a manner comparable to the spider's thread." This reputation was maintained throughout the middle ages, and the fibre was in great demand in the Low Countries and other continental centres. There are many allusions to woollen manufactures in England in early times; but the native industry of the island could not rival the products of the continent.

In the time of William the Conqueror Flemish weavers settled under the protection of the queen at Carlisle, but later they were removed to Pembrokeshire. At various subsequent periods there were further immigrations of skilled Flemish weavers, who were planted at different places throughout the country. The cloth fair in the churchyard of the priory of St. Bartholomew was instituted by Henry II; guilds of weavers were established; and the exclusive privilege of exporting woollen cloth was granted to the City of London. Edward III made special efforts to encourage wool industries. He brought weavers, dyers and fullers from Flanders; he himself wore British cloth; but to stimulate native industry he prohibited, under pain of life and limb, the exportation of English wool. Previous to this time English wool had been in large demand on the continent, where it had a reputation exceeded only by the wool of Spain. The customs duties levied on the export of wool were an important source of the royal revenue. Edward III's prohibitory law was, however, found to be unworkable, and the utmost that both he and his successors were able to effect was to hamper the export trade by vexatious restrictions and to encourage much smuggling of wool.

Thus while Edward III limited the right of exporting to merchant strangers, Edward IV decreed that no alien should export wool and that denizens should export it only to Calais. Legislation of this kind prevailed till the reign of Elizabeth I, when the free exportation of English wool was permitted; and John Smith, in his *Memoirs of Wool*, points out that it was during this reign that the manufacture made the most rapid progress. In 1660 the absolute prohibition of the export of wool was again decreed, and it was not till 1825 that this law was finally repealed. The results of the prohibitory law were exceedingly detrimental; the production of wool far exceeded the consumption; the price of the raw material fell; wool running or smuggling became an organized traffic; and the whole industry became disorganized. Extraordinary expedients were resorted to for stimulating the demand for woollen manufactures. among which was an act passed in the reign of Charles II decreeing that all dead bodies should be buried in woollen shrouds—an enactment which remained in the statute book, if not in force, for a period of 120 years. On the opening up of the colonies, every effort was made to encourage the use of English cloth, and the manufacture was discouraged and even prohibited in Ireland.

Wool was "the flower and strength and revenue and blood of England," and till the development of the cotton trade, toward the end of the 18th century, the wool industries were, beyond comparison, the most important sources of wealth in the country. Toward the close of the 17th century the wool produced in England was estimated to be worth £2,000,000 yearly, furnishing £8,000,000 worth of manufactured goods, of which there was exported about £2,000,000 in value. In 1700 the official value of woollen goods exported was about £3,000,000, and in the third quarter of the century the exports had increased in value by about £500,000 only. In 1774 John Campbell *(Political Survey of Great Britain)* estimated the number of sheep in England at 10,000,000 or 12,000,000, the value of the wool produced yearly at £3,000,000 (or about 5*s.* per pound), the manufactured products at £12,000,000 and the exports at £3,000,000 to £4,000,000. He also reckoned that the industry then gave employment to 1,000,000 persons.

In 1800 the native crop of wool was estimated to amount to 96,000,000 lb.; and, import duty not being imposed till 1802, the quantity brought from abroad was 8,600,000 lb., 6,000,000 lb. of which came from Spain. In 1825 the importation of colonial wool became free, the duty leviable having been for several previous years as high as 6d. per pound, and in 1844 the duty was finally remitted on foreign wool also.

The major development in the history of wool during the 19th century was perhaps the opening up of vast new supplies of raw wool, partly from the western hemisphere, but with particular emphasis on the far reaches of the southern hemisphere. The world's wool was largely produced from sheep long known in Spain and the British Isles, or some mixture of those breeds. The common sheep of old Spain accompanied Coronado and later Juan de Oñate in Mexico and the southwest in the mid-16th century. English types were brought to eastern North America in the next century. So, too, sheep arrived in Australia in 1788, in South America and South Africa even earlier and in New Zealand before 1835.

But wool production did not really begin to flourish until the Merino sheep in one or more of its subtypes was imported into these newer areas. This was in 1797 in Australia, and in the South Island of New Zealand in the early 1840s, by way of Australia. Merino breeding stock arrived in the United States in considerable numbers between 1802 and 1810. The Rambouillet was brought to Argentina soon after 1842. The Merino was introduced into South Africa prior to introduction in Australia but did not thrive during that early period without periodic acquisition of fresh breeding stock from Europe (see Table I).

TABLE *I,—Trends in Wool Production by Major Producers*
(in 000,000 lb., greasy basis)

Year	Australia	South Africa	'New Zealand	Argentina	Uruguay	United States

*For Argentina and Uruguay, 1879. †1879.

The crossbred sheep with their fine and medium wools did not flourish until the 1880s and thereafter, at which time they expanded, mostly at the expense of the Merino, in all except the dryest, wettest and roughest areas of the sheep world.

Production and Harvesting of Wool.—The something more than 800,000,000 head of sheep in the floeks of the world produce an annual crop of about 4,300,000,000 lb. of grease wool, or an average of about 5 lb. per sheep. However, 10 lb. per animal is more standard among the better wool-producing flocks, and a yield of 15 or 20 or more pounds is not extraordinary for some animals. The harvest is annual, normally in middle or late spring or even early in the summer, to give the animal the full advantage of its warm coat during the cooler part of the year. The geography of the world's wool production, rather highly correlated of course with sheep distribution, is interesting. Its predominance in the southern hemisphere, with Oceania producing more than three times the European clip, with South America far above Europe and with New Zealand as well as South Africa producing considerably more than North America is sufficiently different from most agricultural patterns to call for brief explanation (see Table II).

TABLE *11.—World Wool Production by Areas and Major Countries*
(in 000,000 *lb.*, greasy basis)

Area	1936–40	1946–50	1951	1952	1953
Oceania	1,366	1,422	1,459	1,653	1,668
Australia	1,052	1,050	1,052	1,240	1,250
New Zealand	314	372	407	413	418
South America	639	735	737	743	759
Argentina	411	449	420	420	430
Uruguay	126	163	187	190	195
Europe	483	426	475	485	488
United kingdom	110	81	93	95	97
Spain	70	83	90	93	94
Western Europe (total)	379	344	383	393	396
Other Europe	104	82	92	92	92
North America	452	309	273	288	281
United States	425	285	251	266	260
U.S.S.R. (Europe and Asia)	310	312	—	—	—
Asia	344	356	375	394	395
China	88	75	—	—	—
India	73	52	52	58	57
Turkey	68	71	73	78	80
Africa	337	282	324	330	337
Union of South Africa	252	216	240	245	250
World total	3,930	3,840	4,020	4,290	4,330

Note: Totals are estimated and figures are rounded. For summary purposes wool produced mostly in the spring in the northern hemisphere is combined with that produced July 1 or Oct. 1 of the same year in the southern hemisphere. Pulled wool is included for most countries at its greasy equivalent.

Source: United States Department of Agriculture, *Foreign* Crops *and Markets*, pp. 530–531 (June 15, 1953).

In part, it appears to be related to the newness of the southern hemisphere areas in terms of stage of settlement: there is still plenty of room for extensive animal industries. More than that, wool is a compact and storable product, sufficiently valuable in relation to its weight that it can bear the cost and time involved in reaching distant markets. Even more, some of these areas are subhumid if not actually semiarid—alternative possibilities for economic utilization neither were nor are outstanding and the sheep, particularly the fine-woolled Merino, is apparently reasonably well able to survive and flourish under conditions of variable and seasonal forage growth, under the sparse herbage of warm dry areas as well as high and rough areas. In spite of trends in sheep numbers and some difficulties with natural disaster particularly drought in the southern hemisphere, wool production seldom varies as much as 5% above or below the crop of the previous year and very rarely more than 10%.

To harvest the wool crop, it is necessary to confine the sheep flock in close quarters so each animal may be caught and clipped. Such capture and confinement may be no small problem in rugged territory under primitive conditions. At an earlier period in some places the sheep were washed in clean water to remove as much of the perspiration salts and accumulated dust as possible, after which it was necessary to allow them to dry before shearing.

In shearing, whether with hand clippers or more modern power-driven clippers, the sheep is held by the man doing the shearing who at the same time clips the wool close to the body so as to leave the fleece essentially in one piece. Positions of the sheep and the order and rapidity with which various parts of the body are cleared vary somewhat with the worker, but no development has removed the work from the category of hot, fatiguing stoop-labour. Even so, a trained, skilled and enduring shearer can remove 100 to 200 fleeces per day.

The fleece, once removed from the sheep, is taken over in some areas by another who skirts and rolls it, after which it is classed, baled, pressed and branded. In other areas it is not skirted and each fleece is merely tied with paper twine in a not very compact bale or bundle, to be later classed or sorted. In careful operation, skirting is the process of removing and packing separately those inferior portions of the fleece, such as the short wool of the belly. Rough and coarse ends or dirty or stained wool, particularly from around the breech, are removed. Sweaty locks and burry sections from the neck and shoulder are removed. Then the remaining wool is so divided and rolled as to expose the rib and shoulder portions of the fleece to view.

Classification.—No single classification system for wool is in universal use. This might be expected in view of the differences in historical development and the multitude of different uses, but more especially as a result of the wide variety of dissimilar characteristics found even in wools from the same country. The British Government Purchase scheme recognized 1,500 classified types of Australian wools, 950 from New Zealand and 350 from South Africa, with relatively few types in any one clip common to the clip of another part of the commonwealth. Fineness or diameter of the fibre, length of fibre, uniformity, colour, lustre, elasticity, strength and suppleness vary with area and breed of sheep as well as with individual sheep and from one part to another of the same fleece. Classifying, in spite of all science has done, still belongs in the category of an art or value judgment.

Alternative systems are used in the United States to designate fineness or grade of shorn apparel wool. The "blood" system refers to the closeness of relationship to the Merino. The numerical or count system has reference to the worsted count which it is estimated the fibre will spin. That is, a 50s-count fibre should spin that many hanks of yarn each of 560-yd. length from one pound of combed wool.

Blood system	Count or numerical system (Bradford system)	World trade
Fine	64s, 70s, 80	Merinos
Half blood (½ blood)	60s, 62s	
Three-eighths blood (⅜ blood)	56s, 58s	Fine crossbreds
Quarter blood (¼ blood)	[illegible]	
Lon-quarter blood	46s	Medium crossbreds
Common	44s	
Braid	36s, 40s	Low crossbreds

Factors other than spinning quality based on fineness of fibre enter into classing. Soundness, *i.e.*, an absence of pronounced weak areas in the fibre resulting from periods of malnutrition or sickness while growth was in progress, is very important in combing wools. Good tensile strength which will enable the fibre to undergo the seven-pound pull of the comb without breaking is desired. That factor governs to a high degree the yield of valuable tops in relation to noils; "tender" wool gives up to 25% of the much less valuable noils. Combing wools must also be of good length. The condition of wool relates to the adhering wax, salts and moisture and these must be estimated to judge probable yield when scoured. Colour, sheen and lustre are important with respect to wool from English breeds and crossbreds, ranging from the rich glossy metallic sheen of the Lincoln and Leicester to the second demilustre of the Romney Marsh.

Classifying or grading of wool probably reached its fullest development in Australia. On the great Australian sheep stations, wool classing is one of the most important operations, largely taking the place of sorting in the wool trade of England and some other areas. Fleeces as taken from the sheep are skirted and trimmed at one table, then passed on to the classer, who places them in the 56s, 60s, 64s, 70s, 80s or 90s class, according to their fineness in relation to worsted counts or as superclothing, ordinary clothing, etc., if they are shorter wools more suited to the woollen industry.

Wool classes under the Australian procedure emphasize the requirements of one branch of manufacture or another. The details may be generalized into Merino combing wool of eight groups ranging from super through AAA, AA, A, combing, first and second to fleece. Merino clothing wool of four grades (super, first, clothing and fleece), comeback wool of six grades and crossbred wool of eight grades, including that of the long-woolled and short-woolled British breeds. Among Australian wools the Geelong wool of the Western district of Victoria and those from the New England tablelands of New South Wales are known with particular favour. This highly skilled grading and related operations have been of much assistance in marketing Australian wool of known quality.

Marketing, Trade and Prices.—Wool moves rather promptly to local, national and international markets. The major southern hemisphere producers use a relatively small part of their production domestically; year-end stocks in most years are less than 5% and rarely more than 10% of the annual output except in the case of New Zealand. It is normally one of the three or four most valuable raw materials moving in international commerce. For some of the major producers it constitutes a very significant or even the major export item. For Australia and South Africa it commonly represents more than one-third of their total exports by value.

Prior to World War I, the marketing of wool was still in private hands, with London the leading wool auction market in the world. The auction market puts emphasis on special quality characteristics of each individual lot of wool, an emphasis well adapted to wool sales in which quality characteristics vary so widely. Other markets also developed. Boston, Mass., was important as a spot market. Futures markets in wool tops were established in Antwerp, Belg., in Roubaix-Tourcoing, Fr., and in New York city. The New York market also provided a grease-wool futures contract, though never of major importance.

World War I not only resulted in wide fluctuations in wool prices but stimulated government bulk purchases. Raw wool remained uncontrolled during the first two years. But the British cabinet in 1916 became concerned about the developing scarcity of wool supplies, partly resulting from a drought in Australia, a reduction in the South American clip and heavy foreign purchases. In Nov. 1916, therefore, the Australian and New Zealand clips were acquired and in 1917 also the South African clip. Such bulk purchases continued in force until June 1919 for South Africa and June 1920 for Australia and New Zealand.

In the spring of 1919 government-owned supplies were sold in competition with wools from South Africa and South America and prices declined rather drastically. In Jan. 1921 the disposal of all stocks left in the hands of the British government was taken over by B.A.W.R.A. (British Australia Wool Realization association), a limited company owned by Australian wool growers. Its operations continued for several years.

Meanwhile, auction sales in the various parts of the British Commonwealth developed rapidly and the Sydney market surpdssed the volume of the London market. Other Australian, New Zealand and South African markets grew in importance and the wool produced in those countries was marketed almost entirely by public auctions at central marketing points. In North American and South American producing countries, as well as in the United Kingdom and on the continent, farmers for the most part continued to sell their wool individually at pnvate sale or at local auctions. An arrangement equivalent to bulk purchase was made in 1934 by the South African and British governments and was renewed each year until World War II.

With the arrival of World War II, control of apparel wools was quickly organized, with the British government agreeing to purchase the entire Australian and New Zealand clips for the duration of the war and one year thereafter, at an initial average price of 13.4*d* per pound in the grease, later increased to about 15.5*d*. This was carried out in Australia under the Central Wool committee appointed by the government and representative of all interests. A considerable amount of this Australian wool, though British owned, was stored in the United States, some of it re-exported as late as mid-1947.

The United States domestic clip was first guaranteed as to price and in 1943 actually taken over by the government. The Defense Supplies corporation also purchased some Australian wool from the British, as well as wool from South America, New Zealand and South Africa but disposed of its holdings by the end of 1945. South American wools continued to be sold in a free market, with much of the total export going to the United States.

On balance, wool consumed during the war could absorb only about two-thirds of current supply from the five main exporting countries and by the end of the war there was a large accumulation of apparel wools in the hands of the Joint Disposals organization. This organization, incorporated as a private registered company, included representatives of the governments of United Kingdom, Australia, New Zealand and South Africa, somewhat after the precedent of B.A.W.R.A. of the 1920s.

The holdings of the joint organization amounted to about a two years' supply, and it was estimated in 1946 that such stocks would need to be distributed over the next 13 years in order to move them into consumption without greatly disturbing the marketing of current production. To the surprise of many, world wool consumption in the early postwar period was very high and the stocks had been completely marketed by the 1951–52 season, at which time the outbreak of hostilities in Korea put a new strain on the wool market and available supplies.

The International Wool Study group was created by resolution adopted at the International Wool talks in London in Nov. 1946. In several meetings it reviewed the world wool situation and problems in connection with production, trade and the consumption of wool, in order to make recommendations to governments for action.

After the outbreak of the Korean war the Wool committee of the International Materials conference was convened in April 1951; it held frequent meetings to consider the world supply and demand situation, whether international action mas necessary and what control measures might be practicable. The upward trend in world raw wool production and a 1951–52 slump in wool textile industries eased the situation and the committee was terminated in Sept. 1952.

The United States as a significant producer of wool as well as a major importer and user has a long history of wool legislation. A U.S. tariff on wool was enacted as early as 1816. In 1922 a specific duty per pound of clean fibre content by grade of fineness was introduced. Under the Tariff act of 1930 all wools not finer than 40s were made duty free if used in the manufacture of floor coverings, press cloths, knit or felt boots, heavy-fulled socks, etc. For those wools finer than 44s the rates which became effective in Jan. 1948 under the General Agreement on Tariffs and Trade (G.A.T.T.) provided some variation depending on stage of processing: on the skin, 24 cents per pound clean content; in the grease or washed, $25\frac{1}{2}$ cents; sortings or matchings, not scoured. 26$ cents; scoured, $27\frac{3}{4}$ cents. If the fibre had been advanced beyond the washed or scoured condition, including tops, an additional factor of $6\frac{1}{4}\%$ to $12\frac{1}{2}\%$ is added to the $27\frac{3}{4}$ cents per pound. Wools not finer than 44s carry loner rates.

Price support or purchase programs for domestically produced wools became common in the late 1930s. In 1938 and 1939 nonrecourse loans were made, after which military demand absorbed the supply. A wool purchase program existed from 1943 to 1947 under which farmers sold on a permissive basis at ceiling prices directly or indirectly to the Commodity Credit corporation, which could not resell at less than parity price. Sizable stocks thus accumulated in government hands (see Table III).

*TABLE III.—United States Stocks of Apparel Wool**
(in 000,000 *lb.*, scoured basis as of April 1)

Year	Owned by dealers and mills		Owned by the United States government		Total reported stocks
	Domestic wool	Foreign wool	Domestic wool	Foreign wool	
1935–39 average	77	33	—	—	109
1942	67	104	—	113	284
1943	60	86	—	168	315
1944	32	134	83	158	408

1952	55	75	—	—	131†

*Includes wool on consignment, in process of manufacture up to carding and wool in bond. Wool held by growers is excluded. †Excludes wool held for the department of defense.

Althaugh one wool price support proposal was vetoed by Pres. Harry Truman in 1947, support operations by purchases at the 1946 price level were resumed in Aug. 1947 and continued through 1948, later extended through June 1950. The CCC was also authorized to sell wool at less than parity price. Until 1952, under the Agricultural act of 1949, which required that the price of wool be supported by loans, purchases or other operations at a level between 60% and 90% of parity as the secretary of agriculture determines necessary in order to encourage an annual production of 360,000,000 lb. of shorn wool, price support programs were announced but not utilized because of the sharp upturn in price accompanying Korean hostilities.

The marketing pattern and price structure for wool essentially breaks into two major categories of which apparel or clothing wool dominated production and trade after mid-19th century. Nearly three-fourths of the world's wool production falls in the apparel category of Merino and crossbred; *i.e.,* 60s or more for Merino and 58s to 40s for crossbred. Most of these fine wools are produced in the southern hemisphere. As may be seen in Table IV, the five main surplus countries—Australia, Argentina, New Zealand, South Africa and Uruguay—account for more than 70% of the production and for more than 90% of such wool entering international trade. The five main deficit countries—United States, United Kingdom, France, Germany and Canada—account for an additional 20% of the total production. Even in the United States where there has been emphasis on lamb production for meat, practically all of the wool is of the apparel type. More than 80% of the "territory" wool grown in the United States grades half blood or fine. Texas wools are mostly fine wools. The "fleece" wools from east of the Great Plains grade 70% or more three-eighths blood or coarser. Nearly 60% of the total U.S. production in 1946 consisted of fine and half-blood wool.

TABLE IV.—Apparel Wool Production
(in 000,000 lb., greasy basis)

Year	In five principal exporting countries	In seven principal importing countries	World production
1934–39 average	1,908	832*	2,991
1945–46	1,984	726	2,964
1946–47	2,048	697	2,982
1947–48	2,011	658	2,931
1948–49	2,066	648	2,965
1949–50	2,230	637	3,100
1950–51	2,235	656	3,115
1951–52	2,118		3,190

*1934–38.

As can be seen in Tables III and IV, much of apparel type wool moves from the southern hemisphere producing areas to the deficit areas, particularly to western Europe, but also in substantial amounts to the United States. Imports into the United States fluctuate widely with variable demand, domestic production making up a more nearly stable supply.

Carpet wools make up slightly less than one-fourth of the world's wool clip. Only about one-third of the carpet wool produced is exported as compared with an export of fully two-thirds of the apparel wools. Hence, carpet wools account for only about 15% of the international trade in wool. These are not very uniformly defined. The International Wool Study group considers as "carpet type" all wools coarser than 46s, although those coarser than 40s are more commonly so recognized in the United States. Carpet wool also can be considered to be wool from unimproved sheep such as Chinese, East Indian, Donskoi, Smyrna—that is to say, those without Merino or English blood. However, a substantial proportion of the production from coarse crossbred sheep of English breed is used in carpet manufacture.

With the introduction of meat refrigeration in ocean transportation near the end of the 19th century, there was an important switch to meat production in Argentina and New Zealand; the mutton or crossbred sheep in these areas produces wools of 58s to 37s quality, much of which is also suitable for apparel manufacture. However, the bulk of the Argentine production of this type and some of the coarser New Zealand wools are used in carpet manufacture. It is carpet wools from these areas which account for most of the carpet wools entering international trade. The major exporters are Argentina and New Zealand, with India, Pakistan and the near east in secondary positions. In Asia, eastern Europe and North Africa where sheep are generally of unimproved breeds and sheep rearing has to some extent a traditional rather than a commercial character, the wool is used largely in household or village industries, and even there, to a considerable extent, in carpet manufacture.

TABLE *V.—Carpet Wool Production*
(in 000,000 metric tons, greasy basis)

Source: Food and Agriculture Organization, "Carpet Wool," Commodity Reports, Fibers, no. 4 (Rome, Nov. 1952).

The chief carpet wool importing countries are the United States, the United Kingdom and the U.S.S.R. About half is consumed industrially, mainly in carpet manufacture; the other half is absorbed locally in household or village industries, mainly in the less well-developed areas.

During World War II. wool prices were so controlled and supplies so managed that the big rise did not occur until the postwar period, particularly the period after the outbreak of hostilities in Korea, at which time the large wartime stockpile accumulation had been disposed of.

Prices for carpet type wools lagged in the post-World War II period as compared with apparel types. This was partly the result of financial exchange difficulties but more largely of a less active demand in relation to supply, particularly as to the Argentine type wools. Competition with rayon and other man-made fibres also became an important factor.

Because wool supply is so inelastic from one year to the next, demand factors generally dominate the price situation. Wool prices are among the most volatile, particularly under situations of war and international tension.

Wool Processing **and** Use.—Though wool makes up only about 9% of the total fibre supply of the world, approximately all of it is put to apparel and household use. For those uses it must be processed.

The first stage or step in such processing is normally that of sorting. Even the bales of wool which have been carefully classed must be examined fleece by fleece. Each fleece is carefully spread out and examined by touch and sight, then pulled apart. The different qualities, known as matchings, are placed in separate baskets. This is a way of obtaining quality control, even if different qualities are later blended.

Sorting or stapling was formerly a distinct industry, and to some extent it is so still, though frequently the work is done on the premises of the comber or spinner. Clothing wools are separated and classed differently from combing wools, and in dealing with fleeces from different breeds. the classification of the sorter varies. In the woollen trade short-staple wool is separated into qualities, known. in descending series from the finest to the most worthless, as picklock. prime, choice, super, head, seconds. abb and breech, and the proportions in which the higher and lower qualities are present are determined by the class of the fleece. In the worsted trade the classification goes, also in descending series, from fine, blue, neat, brown, breech, downright seconds, to abb. for English wools. The last three are short and not commonly used in the worsted trade. The greater proportion of good English long wool will be classified as blue. neat and brown; it is only in exceptional cases that more than from 5% to 8% is fine on the one hand, or of lower quality than breech on the other. Generally speaking, the best portion of a fleece is from the shoulders and side of the animal. The quality decreases toward the tail end of the sheep, the "britch" being frequently long, strong and irregular. The belly wool is short, worn and dirty, as is also the front of the throat, while on the head and shins the product is short, stiff and straight, more like hair than wool, and is liable to contain gray hairs. The colonial wools come classed, and consequently are only as a rule sorted into three or four qualities. Thus a 60s fleece may be sorted into 56s, ordinary 60s, super 60s and skirtings.

Grease wool after sorting still contains the natural wax, the suint or perspiration salts and little or much foreign matter, dust. burs, etc., all of which must be removed before further processing takes place. The process of cleaning is called scouring. The qualities of the fibre may be seriously injured if this processing is not thoroughly and carefully done. If the wool is not perfectly cleansed it will dye unevenly and the manufacturing operations will be more or less unsatisfactory. Scrubbing in a series of tubs containing soap and soda in water is the long-established procedure still widely used. The water should be soft and pure, both to save soap and to avoid the formation of insoluble lime material which can be removed from the wool fibre only with much difficulty. A specially prepared potash soap has been the detergent principally used. Excess of uncombined alkali has to be guarded against and the soapy solution must not be too hot. The mechanical arrangements of the machines are such as to ensure the passage of the wool without undue lifting and "stringing"; to obviate the mixing of wool grease, sand. dirt, etc., once taken out of the wool with that wool again; to give time for the thorough action of the scouring agents. so that neither too strong a solution nor too great a heat be employed, and to allow of the ready cleansing of the machines so that there is no unnecessary waste of time. In England the recognized type of Merino wool-washing machine is the fork-frame bowl. Three to five of these machines are employed. The scour is strongest and hottest in the first bonl (unless this is used as a "steeper") as the wool at first is protected from the caustic by the wool fat, etc., present. The last bowl is simply a rinsing bonl. With modern nip rollers botany wool is sufficiently dry to be passed on directly—say by pneumatic conveyors—to the carding. This the worsted spinner does, thereby saving time and money. The woollen spinner, however, may require the wool for blending. and so may require it dry and in a fit state for oiling. For English and crossbred wools more agitation in the scouring bath may be desirable. If so. the eccentric fork action machine is employed, in which the agitation of the bath is satisfactorily controlled by the setting of the forks which propel the wool forward. An average wool will be in the scouring liquor about eight minutes, the temperature will vary from 120° F. to 110° F., and the length of bath through which it will have passed will be from 48 to 60 ft.

The main disadvantages of soap and soda scrubbing discussed above are slowness, some chemical damage to the wool by the alkaline solution and the difficulty of disposing of the wash water and the accompanying grease without violation of antipollution laws. Attempts to apply modern technology and research to the cleaning of wool have not been highly successful. Considerable wool is scoured by the so-called dry cleaning or solvent method, utilizing benzine perhaps, particularly in the United States. Recovery of the grease, however, is not easy; and sales of recovered grease have not sufficiently compensated for the solvent loss and distillation cost. A new method involving the use of water containing 3% alcohol in reaction with the suint salts has been found to emulsify the wool grease effectively, reducing it from the normal 12% prior to scouring to less than 1%. Moreover, the grease is recovered rather easily from the wash by raising the butyl alcohol concentration in the scouring water to 7%. This results in an upper layer of alcohol and grease which is removed. The grease and alcohol are separated by evaporating the alcohol. The liquid, which remains at 3% alcohol contraction, is reused. The advantages of the process are that the wool fibres are not in contact with an alkali and hence do not suffer deterioration. Moreover, the process is quicker and the equipment requires less space.

After scouring the wool is dried in one way or another by hot air, care being taken not to overheat the fibre in the process. If it should be in a matted condition it is put into a free and loose condition in a special machine of rotating cylinders and hooked teeth, called a Willey. If the wool contains adhering vegetable matter, as the heavily burred wools of interior Australia or Buenos Aires, that must be removed before further processing. Some mechanical devices are successful under some conditions but carbonization is more often utilized—immersing the wool for about 20 minutes in a bath of dilute sulphuric acid followed by draining and quick drying at about 250° F., after which the vegetable matter is sufficiently carbonized to be crushed and removed by a duster. Any acid remaining is neutralized and the wool mildly scoured and again dried.

Wool is a principal source of anthrax in humans, especially from contact with it prior to the weaving and finishing operations. Coarse wools originating from countries and districts where anthrax is a severe problem are the most likely sources. Grease wools are not so likely to be contaminated as pulled wools. Washing or scouring may result in the spread of the microorganism to previously uncontaminated material., But in general the danger diminishes considerably following scouring which reduces and perhaps germinates part of the spores as well as removes dirt and extraneous material. High temperatures of drying are perhaps lethal, and dyeing of raw wool eliminates the danger.

The United Kingdom sterilizes all wool from dangerous. sources. at a central sterilization plant' in Liverpool. It is washed for 10 minutes in 0.5% sodium carbonate solution at 37.8° C. This is followed by another washing in 3.5% soap solution for 10 minutes at 37.8° C. The third step is a ten-minute exposure to 2% formaldehyde at 37.8° C. This is follo ed by a second formaldehyde wash of 1.8% for 10 minutes. In between each two of these steps the wool is rolled out so as to remove as much of the previous wash water as possible. The fifth step is to rinse in a 0.25% formaldehyde solution at 37.8° C. Following this the wool is pressed out and dried in hot air at 110° C., the temperature dropping rapidly so that the wool will not be scorched. After the material is dried it is blown into baling presses.

WOOL, WAR CONTROL OF. Wool is an indispensable article in war. No fibre has yet been discovered, the properties of which can equal, for the clothing of armies, its hygienic and durable qualities; while for munition purposes, such as felt mashers, for shells, guns, submarine and aeroplane engines. torpedoes. tanks, etc. and other equipment such as water-bottle covers, wool is essential. A soldier's clothing and equipment consumes on a war basis from four to ten times the average wool consumption of a civilian in times of peace.

The question of wool supplies during the World War was in part met by each country from its domestic production, and by the utilisation of old woollens in the manufacture of new goods. By this latter method and by substitution by inferior materials, the German armies, in fact, maintained their military clothing supplies throughout the war on a level of efficiency adequate for their purpose, in spite of the Allied blockade which effectually prevented supplies of overseas wool from reaching Germany and her Allies. Germany achieved this, however, at the expense of her non-combatants, who had to rely largely upon inferior substitutes for all their textile requirements.

From the point of view of the Allies the importance of conserving supplies could not be minimised. It was true that 85% of the wool production of Australia consisted of the finer merino quality not specially required for military purposes. After some discussion, however, the British Government agreed in the autumn of 1916 to purchase the whole wool production, excluding local manufacturing requirements, of Australia and New Zealand on a f.o.b. basis of 55% over average pre war prices (1913–14) with the stipulation that this price should be maintained for all military and other Government requirements both of Great Britain and of her Allies, but that in respect of civil consumption the fullest possible price should be obtained, and any net profit resulting be divided equally between the Treasuries of the imperial Government and the Governments of the commonwealth and the dominion. The purchase was repeated in practically the same terms for the 1917–18 and 1918–19 seasons.

In 191j the French Government had requisitioned its domestic wool clip on a price basis 25% over pre war, in 1916 the British Government requisitioned the British domestic clip on a level of 35% over pre war prices. The latter was a gesture rather than a necessity. In 1917 the price paid for the British clip was raised to 50% over pre war prices and in 1918 to 60%.

Institution of Control.—Owing mainly to factors external to its own peculiar difficulties the War Office in the autumn of 1916 found itself launched on a huge wool purchase scheme and had immediately to devise ways and means of dealing with the raw wool which it now owned. In the first place, arrangements were made with the shipping authorities by which the wool was brought from Australasia by requisitioned shipping at Blue Book rates. Special storage and transport arrangements had to be improvised both in Australia and at British ports. In the previous spring an organisation had been set up by the War Office for the valuation, collection, and distribution of the British domestic clip, a relatively small matter of 120,000,000 lb. The Australian and New Zealand clips, amounting to about 1,000,000,000 Ib., were valued, collected, and brought to Australasian ports by a machinery set up by the selling brokers and other trade organisations under the supervision of their Governments, which worked amazingly well within a very short time. When it is realised that whilst the average price of Australian wool was 15½d. there were almost a thousand different prices in the schedules prepared, the detailed work of valuation alone will be appreciated.

The War Office then expanded its British wool purchase executive under a wool controller to deal with the supplies of colonial wool now coming forward. The distribution of wool and tops to manufacturers at fixed prices made it possible to fix also the prices at which the finished cloth was to be delivered. In making purchases of cloth and other textiles, the War Office contracts department up to the end of 1916 endeavoured to purchase within fixed prices, but owing to rising prices of raw material this method in practice broke down. Not only was wool now issued for military but also for civilian purposes, whilst control of the raw material gave automatically the opportunity of controlling the use to which machinery should be put and ensured the supply of finished war material at fixed prices. To cope with these difficult problems a department of wool textile production was set up. The shipping and political factors involved were not known by and could not, therefore, be justly appreciated by the trade. It seemed, indeed, to a vast majority of those in the wool textile industry that an unnecessary degree of State control and interference had been instituted and this was vigorously opposed. As a method of understanding, a board of control of the wool textile industries was set up consisting of Government officials, mainly brought in from the trade, employers' and also trade union representatives. This board in practice represented a buffer between the War Office and the trade, and under its auspices problems concerning the rationing and control of civilian trade were decentralised. The responsibility, however, for meeting the increasingly growing demands not only of the British military, naval, and air forces, but of the armies of Russia, Belgium, Serbia and to a certain extent of Italy and France, and later the entire equipment in Europe of the American troops, remained with the responsible officials. In addition they were responsible for supplies of essential public services, both voluntary and Government, throughout the empire, including the Red Cross and prisoners of war organisations, post office, police and municipal requirements at home and abroad, women's organisations, as well as such services as the Indian and Egyptian Government services, together with the initiation and control of standard clothing schemes for the civil population and for the needs of demobilisation after the war.

In March 1918, when the British armies lost large reserves of stores in France, and the demands of the Allies and America were rapidly increasing, the department had to extend its production by over one million yards of material per week. It did this without apparent difficulty. A costings department was set up to investigate and fix conversion costs at each stage of production, but owing to technical complications the fixing of these rates was a most difficult business. The practical workings of a central statistical and costings staff necessarily lacked the flexibility of the normal play of individual units in competition. The system inevitably tended to fix the recognised conversion rate in excess of average efficiency, for otherwise output suffered.

Success of the Scheme.—Viewed broadly the scheme achieved its object. It produced necessary supplies at a calculable price. To produce the varied and changing demands of peace at competitive prices, the system must have broken down, but to meet a fairly standardised demand, in which finance as the governing factor was absent, the system was satisfactory, and inevitable in the circumstances of war.

The wool purchase scheme was of special benefit to Australia and New Zealand. During the first year of the purchase the imperial Government paid to the commonwealth and dominion Governments £25,000,000 and received for sales £330,000. By June 1918, it had paid out over £100,000,000 and received not much more than £50,000,000 by the end of 1919. A year after the war the imperial Government had expended many millions sterling in the purchase of wool more than it had received and at the conclusion of hostilities it was responsible for about £75,000,000 of wool accumulated in Australasian ports owing to lack of shipping to transport it. In addition, an arrangement was entered into by the surveyor-general of supply, who had been appointed in 1917 to control all War Office supply services, by which one clear season's (1919–20) wool clip after the war was purchased by the imperial Government. During the war a large part of the South African clip was also purchased, on optional terms to growers, as well as that of the Falkland islands and of Iceland (from which country wool cargoes had been running the North sea blockade). East Indian wool was marketed at fixed levels of prices under a special scheme. Numerous proposals were from time to time put forward for the purchase of the wool clips of South America but were in turn all vetoed by the Treasury owing mainly to exchange difficulties.

In all 9,895,000 bales (approximately 3,250,000,000 lb. of wool) were purchased, for which approximately £300,000,000 was paid and a net profit of £70,000,000 was divided equally between the British and colonial Governments. The aggregate sales of British wool amounted to £40,000,000 on which a profit of £5,000,000 was made. Within one year of the war the whole organisation of the department of wool textile production was liquidated, but owing to the new arrangement made with regard to the further purchase, wool control was maintained, and a wool control board set up to advise the War Office and the liquidation commission concerning the various post-war questions which arose.

Government wool control continued until 1921, when its functions were taken over by a company, called the British Australian Wool Realisation Association, referred to as B.A.W.R.A. This rearrangement was made in order to avoid the restrictions and international complications which direct Government trading involved, and, incidentally, to minimise domestic political interference. During the post-war period the policy was followed of establishing price by the release of wool at auction at calculated quantities and at reserve prices based upon estimates prepared from centralised Government and other statistics, and this for a short time appeared very successful. The basing of potential consumption figures upon such estimates proved, however, within a short time unreliable. In spite of having at its command the fullest possible information, and in addition, being in the enormously strong position of the largest holder of wool stocks, the wool control was unable to make any estimate of a useful nature of future wool consumption, or to control the market, and as a result its predictions on price did not eventuate, and sudden and severe slumps overwhelmed the world wool trade both in 1920 and 1924. Apart, however, from this post-war experiment, which endeavoured somewhat unsuccessfully to control prices, it is generally conceded that the wool control exercised during the war was justified in the circumstances and by its results. (E. F. H.)

WOOL COMBING: *see* COMBING.

WOOLF, VIRGINIA (1882–1941), English writer, daughter of Sir Leslie Stephen, married in 1912 Leonard Woolf. They controlled the Hogarth Press, which published most of her books. Her first novel, *The Voyage Out* (1915), was realized to be a remarkable book, and its success was followed up with *Night and Day* (1919) and *Jacob's Room* (1922). Meanwhile, Mrs. Woolf had published several shorter experiments in a new method, which were collected in *Monday or Tuesday* (1921). In this new style were written her next novels, *Mrs. Dalloway* (1925), *To the Lighthouse* (1927), and, to a lesser extent. *Orlando,* a "biography" (1928). Among her later novels, *The Years* (1937) was especially acclaimed by critics (nith whom, incidentally, she was in constant argument). Instead of writing novels in which the thoughts of the characters are to be deduced from what they say and do, or in which the thoughts of individuals are recorded to show to what sort of person they belong, Mrs. Woolf chose to urite novels in which thought is so minutely revealed that words and actions lose much of their importance. The merit of her books lies partly in her understanding of those about whom she wrote, partly in the felicity with which she used words. These gifts placed her among the best literary critics of her time; she published critical essays, *The Common Reader* (1925) and *The Common Reader, Second Series* (1932).

Mrs. Woolf was drowned near Lewes, Sussex, March 28, 1941, and the coroner returned a verdict of suicide.

WOOLLEN MANUFACTURE. The processes described in the article WOOL are common to English, cross-bred and botany wools, whether intended for woollen or for worsted yarns. From this point, however, differentiation starts. Wool may be manipulated with the idea of converting it into felt (*q.v.*), "woollen" fabrics or "worsted" fabrics.

Woollen and Worsted.—In a general way it may be said that *woollen* yarns are those made from short wools usually possessed of high felting qualities. These are prepared for spinning by the process of *carding,* a process which so thoroughly blends or mixes the fibres—long and short, black and white or coloured, or even of different materials—that a homogeneous fibrous mass in broad film form is obtained, which is then divided up longitudinally, as it emerges from the carder, into a number of pith-like filaments. These filaments are then extended into finer filaments and twisted to form the woollen thread upon the mule or mule-frame.

On the other hand *worsted* yarns are generally made from the long lustrous varieties of wool; the fibres are so combed as to bring them as far as possible parallel to each other; the spinning is usually effected on the frame, and the yarn is spun into a compact, smooth and level thread, which, when woven into cloth, is not necessarily milled or felted. At all points, however, woollen and worsted yarns and cloths as thus defined overlap each other, some woollens being made from longer wool than certain worsteds, and some worsteds made from short staple wool, carded as well as combed. The most fundamental distinction between the two rests in the crossing and intercrossing of the fibres in preparing woollen yarn, while for worsted yarn the fibres are treated by processes designed to bring them into a smooth parallel relationship to each other.

Woollen Yarn Manufacture— Toobtain a sliver which can be satisfactorily spun into a typical woollen thread the following operations are necessary: willowing, oiling and blending, teasing, carding (two or three operations), condensing and possibly roving. Spinning upon the woollen mule or frame completes the series of operations all of which are designed to lead up to the desired result. Of the foregoing operations the carding is perhaps the most important as it is certainly one of the most interesting. At the same time it must be fully realized that deficiencies in any one of these operations will result in bad work at every subsequent process. For example, let an unsatisfactory combination of materials be blended together and there will be trouble in both carding and spinning. The roving operation included above is not always necessary. In the old days, if a really fine thread were required, roving was absolutely necessary, as the carder could not turn off a sliver fine enough to be spun at one operation. To-day, however, with the "tape" condensers, such fine slivers can be turned off the condenser that it is easy to spin directly to the required count.

Blending and Oiling.—At the beginning of the 19th century woollen cloths were made of wool—some of them of the very finest wool obtainable. To-day woollen cloths are made from any and every kind of material, of which the following are the most important: noils (botany, cross-bred, English, alpaca and mohair), mungo, shoddy, extract, flocks, fud (short mill waste), cotton sweeping, silk waste, etc.; in fact it is said that anything which has two ends to it can be incorporated into a woollen thread and cloth. It does not follow, however, that all woollen cloth is cheap and nasty. On the contrary the west of England still produces the finest woollen fabrics of really marvellous texture and beauty, and Batley, Dewsbury, etc., produce many fabrics which are certainly cheap and yet not cheap appearing. The first essential for blending is that the materials to be blended should be fairly opened out. This is effected by passing each material, if necessary, through the willow or through the "fearnaught'—a machine coming between the willow and card—prior to beginning the "blend-stack." Sometimes it may be that a blending of different colours of wools to obtain a definite "colour mixture" is necessary, more often it will be a blending of various materials, such as noils, mungo, cotton, etc., to obtain a cheap blend which may be spun into a satisfactory warp or weft yarn. The blender proceeds as follows: first a layer of No. 1 material—say wool—is spread over the required area on the floor; it is then lightly oiled. A layer of No. 2 material—say noils—is now added to the first layer; then another layer of wool with rather more oiling; then No. 2, then No. 1 with still more oil until all the material is built up into layers in the stack. The stack is now beaten down sideways with sticks or pulled, and then the more or less mixed mass is passed through the willow and fearnaught still further to mix it prior to carding, where the true and really fine mixing takes place. After passing through the fearnaught the material is sheeted and left to "mellow," this no doubt consisting in the oil applied distributing itself throughout the material. If wool and cotton are blended together the wool must be oiled first, or the blend will not work to the greatest advantage. The oil may be best Gallipoli olive oil—which should not turn rancid—but there are many good oils—and unfortunately many bad oils—placed on the market at a reasonable rate which the really skilled judge may use to advantage. The percentage of oil varies from 2% to 12%—this remark applies both to the woollen and worsted trades—and there is no guide as to the amount required, saving and excepting experience, observation and common sense. Automatic oiling arrangements have now been applied in the woollen trade with a considerable amount of success, the sprinkling of the oil by means of a watering-can on the stack, made as described above, still being much in favour. The oil serves to lubricate the fibres, and to render them more plastic and consequently more workable, and to hold the fibrous mass together and thus prevent "fly" during the passage through the cards.

Carding. — Carding was originally effected by hand, two flat boards with convenient handles, covered with teeth or card cloth-

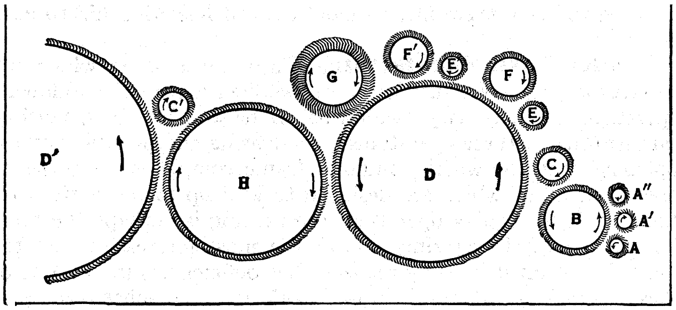

FIG. 1

ing, serving as a means of teasing out lock by lock, fibre by fibre, reversing root to tip and tip to root, so that a perfect mixing of the fibres resulted. It was but natural that, when an attempt was made to render the carding operation more mechanical, the operation should be converted into a continuous one through the adoption of rollers in place of flats. Flats combined with rollers still maintain their position in cotton carding, but in wool carding the pure roller card is employed. The factors of carding are size of rollers, speeds of rollers, inclination and shape of teeth and density of card clothing. Probably no operation in the textile industries is so little understood as carding. Thus the long wool carder would think a man an idiot who suggested the running of the teeth of the various cylinders actually into one another, while the short mungo carder regularly carries out this idea, and so on. The underlying principle of carding, however, is shown in fig. 1, in which a sectional drawing of part of a card is given. The wool is carried into the machine on a travelling lattice and delivered to the feed rollers A, A', A" of which A and A" in turn are stripped by the licker-in B working at a greater speed point to smooth side. This in turn is stripped by the angle stripper C again working at a greater speed point to smooth side, which in its turn is stripped by the breast D — the "carrying-forward" and swiftest carding cylinder in the machine. The swift carries the wool forward past the stripper E— which as a matter of fact is stripped by the swift still working point to smooth side — into the slowly retreating teeth of the first worker F, which, being set a fair distance from the swift, just allows well laid-down wool to pass, but catches any projecting and uncarded staples. The worker in its turn is stripped by the stripper E, which in turn is stripped by the swift as already described. The passage of the wool forward through the machine depends upon its being carried past each worker in turn. Thus from beginning to end of a machine the workers are set closer and closer to the swift, so that the last worker only allows completely carded wool to pass it. Immediately on passing the last worker F' the wool is brushed up on the surface of the swift by the "fancy" G—as a rule the only cylinder whose teeth actually work into the teeth of the swift and the only cylinder with a greater surface speed than the swift. The swift then throws its brushed-up coating of wool into the slowly retreating teeth of the doffer H, which carries it forward until angle stripper C strips the doffer, to be in its turn stripped by swift D' and so on. The speeds of the cylinders are in the first place obviously dependent upon the principle of carding adopted, the greater speed always stripping (save in the case of the fancy). As to whether the speed shall be obtained by actual revolutions or by a larger diameter of cylinder depends upon the nature of the wool to be carded (long or short), the part which each cylinder has to play in the card, and upon the question of wear of clothing and power consumed. As a rule the strippers are all driven from a smaller circumference of the swift to obtain conveniently the necessary reduction in speed, and the slowly revolving workers are chain driven from the doffer, which indirectly receives its motion from the swift. The principles involved in the relative inclinations of teeth are very apparent, but the principles involved in the relative densities of teeth on the respective cylinders are again much involved and little understood.

A complete scribbler or first card engine consists of a breast, or small swift, and two swifts with the accompanying workers, strippers, fancies, doffers, etc. The wool is stripped from this card as a thin film by means of the doffing comb. This film is sometimes weighed on to the next machine — whether intermediate or condenser—a given weight giving a definite count of condensed sliver. Should an intermediate carder be employed, there must be an automatic feed, taking the wool, as stripped from the last doffer of the intermediate, and cross-feeding it evenly on to the feed sheet of the condenser. It is now more usual to automatically weigh into the scribbler and automatically feed the condenser or, if an intermediate is employed, both the intermediate and condenser. The condenser is a one-swifted or two-swifted card, the only difference in principle being that, whereas the sliver comes out of the scribbler or intermediate in one broad film, it is broken up into a number of small continuous slivers or films as it issues from the condenser, each one of which will ultimately be drafted or drawn out and twisted into a more or less perfect thread. These slivers— which are delicate and pith-like in substance — are wound on to light bobbins, and these bobbins are placed on the mule for the roving, or final spinning operations. There are many forms of condensing mechanisms such as the single-doffer, the double-doffer and the tape-condensers, which cannot be described here.

Mule Spinning. — The principles involved in mule spinning are comparatively simple, but the necessary machinery is very complex; indeed it is questionable if a more ingenious machine than the mule exists. The pith-like slivers received from the card must be attenuated until the correct count of yarn is obtained; they must be twisted while this attenuation or drafting is in process, otherwise they would at once break; and after being attenuated to the required fineness the requisite number of turns must be inserted. Great stress must be laid on the effects of what is termed the "drafting-twist" noted above; it is probably this simultaneous drafting and twisting which develops the most pronounced characteristics of the woollen yarn and cloth, and differentiates it entirely from the worsted yarn and cloth. The mule (see fig. 2) consists fundamentally of the delivery cylinders A, upon which the sliver bobbins B from the condenser are placed, which deliver the slivers as required to the front delivery rollers C (these rollers controlling perfectly the delivery of sliver for each stretch of the carriage), and the carriage EE carrying the spindles which may be

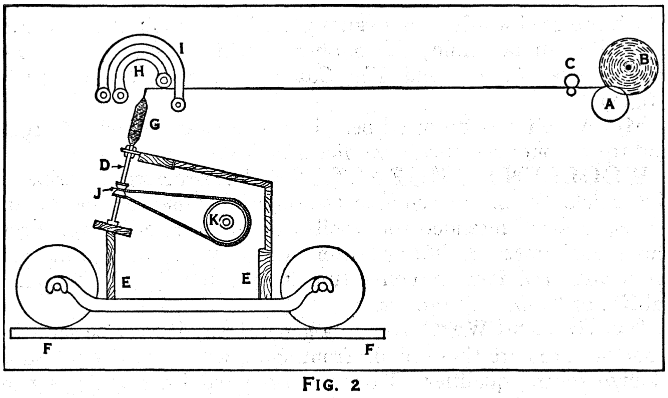

FIG. 2

run close up to the front delivery rollers and about two yards away from them to effect the "spin," which is of an intermittent character. The spindles D are turned by bands passing round a tin drum K in the carriage, but this motion, and every other motion in the mule, is controlled perfectly from the headstock. In brief, the operation of spinning is as follows: as the carriage begins to recede from the delivery rollers these rollers deliver condensed sliver at about the same rate as the carriage with its spindles moves out, the spindles putting in a little twist. When the carriage has perhaps completed half its traverse (say 36") away from the front rollers these suddenly stop delivering the condensed sliver, the carriage travelling more and more slowly outwards until it completes its traverse, drafting the sliver out to perhaps double the length. This drafting could not be effected but for the "drafting-twist," which, running into the thin parts of the yarn during drafting, strengthens them and thus from beginning to end equalizes the thread. Upon the completion of drafting the spindles are thrown on to "double speed" to complete the twisting of the 72″ of yarn just spun as rapidly as possible, the carriage being allowed to run inwards for a few inches, to allow for the take-up due to twisting. The mule now stops dead, backs-off the turns of yarn from the top of the spindle to the bottom, the faller H wire falls into position to guide the thread on to the spindle to form the required cop G, and the counter-faller I wire rises to maintain a nice tension on the yarn. The carriage now runs in, the spindles being revolved to wind up the yarn, and, in conjunction with the guiding on of the faller wire, builds up a firm cop or spool.

Woollen mules are made with several hundred spindles and of varying pitch to suit particular requirements. Thus if the mules are to follow a set of say three machines with a tape condenser, and are required to spin fine counts, the pitch of the spindles may be much finer than ordinarily, but a greater number will be required to work up the sliver delivered by the set of machines. There are many other details which require careful consideration; the inclination of the spindles, for example, must be suited to the material to be spun.

The mule-frame to which reference has been made is a ring-spinning frame arranged to spin condensed woollen slivers continuously, thus producing about double the weight per spindle as compared with the intermittent mule. Drafting-twist is introduced in this case between two pairs of drafting rollers by a "twizzler" which, however, only inserts false twist. The true twist is inserted later by the spindle and traveller. This method of spinning necessitates more twist than that necessary in mule spinning so that "frame" woollen yarn is most suitable for warp and is usually not soft enough for weft yarn.

The yarn as delivered by the mule is "single" and will serve as warp or weft for the great bulk of woollen cloths, warp being as a rule twisted harder than weft. Sometimes for strength, sometimes for colour, however, it will be necessary to twist two or more of these single strands together. This is best effected on a twisting frame of the ring type, which consists of delivery rollers, to deliver a specified length of yarn in relationship to the turns of the spindles, and the spindles, which serve to put in twist and to wind the yarn upon the bobbin or tube, which they effect by reason of the retarding action of the traveller. Fancy twists such as knops, loops, slubs, etc., may also be produced if the frame is fitted up with two pairs of delivery rollers and two or three special but simple appliances. (For woollen and worsted weaving, *see* WORSTED MANUFACTURE.) (A. F. B.)

WOOLLEY, MARY EMMA (1863–1947), U.S. educationist, was born at South Norwalk, Conn., on July 13, 1863. She was instructor at Wheaton college, Norton, Mass., 1886–91, before going to Brown university, where she was graduated in 1894. She was a teacher of biblical history in Wellesley college, 1895–98, becoming in the latter year professor and head of the department of biblical history and literature. From 1900 to 1937 she was president of Mount Holyoke college and became one of the most influential women educators in the United States. She died Sept. 5, 1947, at Westport, N.Y.

WOOLLY APPLE APHID, an American aphid (*Eriosoma lanigerum*), sometimes called the woolly root-louse of the apple. Although probably of American origin, this insect has become a cosmopolitan pest of the apple and pear. Making its appearance in England toward the close of the 18th century, it became known as the American blight; and either from England or from America it has been carried to many different parts of the world, probably on nursery stock. It is likely to have been an indigenous pest of *Crataegus* and to have established at an early date an alternate food plant in the American elm.

In the northern part of the United States and in general throughout its whole northern range, the insect lives almost entirely upon the roots of its host plants, causing swellings and other deformations and interfering seriously with the sap flow. In the southern part of its range it lives for the most part above ground, preferably upon suckers from the trunks but also upon normal twigs and even upon leaves. In south England and most parts of Europe, the aerial form predominates. This form is concentrated upon the tender growth and is conspicuous, the colonies appearing as whitish cottony masses beneath which are the reddish insects themselves. The winter eggs are laid in crevices of the bark on elm and occasionally on apple, and hatch in the spring. They develop parthenogenetically, winged forms appearing occasionally, by means of which the insect spreads. In the United States, the fourth generation is winged and migrates from elm to apple. There are usually seven generations each summer.

At present the insect is known in nearly all the European countries, in a number of South American countries, and also in Japan, Australia and New Zealand. Like all plant lice, it has many natural enemies among insects; its one specific parasite, *Aphelinus mali,* has been widely acclimatized. (L. O. H.)

WOOLMAN, JOHN (1720–1772), U.S. Quaker preacher whose *Journal* is recognized as one of the classic records of the inner life. was born on Oct. 19, 1720 at Ancocas in the present area of Burlington county, N.J. The son of a Quaker farmer. Woolman spent his youth working on his father's farm. At the age of 21 he moved into the town of Mount Holly. N.J., to enter trade and at this time made his first appearance in the ministry, a calling in which he learned, he said, "to watch the pure opening." In keeping with Quaker practice. Woolman exercised his ministry without financial remuneration; in 1743 he took up tailoring. which afforded a modest income, augmented at times by work as a surveyor, conveyancer and schoolmaster. From 1743 to his death on Oct. 7, 1772, at York, England, where he had gone to attend the quarterly meeting of the Society of Friends, he made frequent and often arduous preaching journeys, visiting, among other places, Maryland's east shore, where he carried to the owners his message against slaveholding; the Rhode Island coast. where he brought his antislavery doctrines to the attention of shipowners. because he recognized the north's interests in that institution. In Indian villages of the Pennsylvania frontier he supported Moravian missionary attempts, sought to curtail the sale of rum to the Indians and worked for a more just Indian land policy.

Woolman maintained a strict manner of life, making his trips on foot whenever possible, wearing undyed garments and abstaining from the use of any product connected with the slave trade. In his work against slavery he was successful in getting Quaker communities to go on record against that institution and in persuading many individuals to free their slaves. His *Journal,* published in 1774, was begun in his 36th year and continued until his death; it is a major document of American religious experience, written in a style of distinguished purity and simplicity. His other writings include *Some Considerations on the Keeping of Negroes* (pt. i, 1754; pt. ii, 1762); *Considerations on Pure Wisdom and Human Policy, on Labour, on Schools, on the Right Use of the Lord's Outward Gifts* (1758); *Considerations on the True Harmony of .$fankind, and How It Is to & Maintained* (1770); and *A Word of Remembrance and Caution to the Rich,* originally titled *A Plea for the Poor* (1793).

The Works of John Woolman (1774) is the major edition. The most complete edition of the *Journal* is that of A. M. Gummere (1922), and the best-known edition is that of John Greenleaf Whittier (1871).

BIBLIOGRAPHY.—For Woolman's life, *see* A. M. Gummere's introduction to the *Journal; see* also lives *by* W. T. Shore (1913); F. V. Morley (1926); J. Whitney (1942). His writings are considered in M. C. Tyler, *Literary History of the American Revolution* (1897). (L. Z.)

WOOLSACK, a sack stuffed with wool and covered with red cloth upon which the lord chancellor sits in the house of lords. Originally there were four woolsacks in the parliament chamber, upon which were seated the judges. barons of the exchequer. sergeants-at-law and masters in chancery. The uppermost woolsack now alone survives, but it is regarded as technically outside the precincts of the house.

WOOLSEY, THEODORE DWIGHT (1801–1889), U.S. educator, scholar, president of Yale and powerful leader in American higher education, was born in New York city, Oct. 31, 1801, a nephew of the "Hartford wits" Timothy and Theodore Dwight (*see* DWIGHT) and descendant of Jonathan Edwards. He graduated head of his class at Yale in 1820 and in 1831 was appointed professor of Greek there. Elected president of Yale in 1846, Woolsey bent his innovating forcefulness to the improvement of scholarly standards and to a foresighted university expansion. During his administration (1846–71) the scientific school was founded. the first American Ph.D. was awarded (1861), the first college school of fine arts was established, the law and divinity schools were rejuvenated, the corporation was reorganized and the "government of the faculty" was affirmed.

Woolsey's editions of the Greek tragedies brought the advanced methods of German scholarship to U.S. colleges, and his *Introduction to the Study of International Law* (1860) and *Essay on Divorce and Divorce Legislation* (1869) went through many editions. After retirement he wrote his *Political Science* (1877) and *Communism and Socialism* (1880), and headed the U.S. commission for revision of the New Testament. Woolsey died July 1, 1889.

His son, THEODORE SALISBURY WOOLSEY (1852–1929), was a jurist and professor of international law at Yale law school.

WOOLSTON, THOMAS (1670–1733), English deist, born at Northampton, entered Sidney Sussex college. Cambridge, in 1685 and was elected a fellow in 1691. After studying Origen, he devoted himself to the allegorical interpretation of Scripture and advocated its use in his first book, *The Old Apology for the Truth* of *the Christian Religion Against the Jews and Gentiles Revived* (1705). In 1720–21 Woolston's open challenges to the clergy brought him into trouble. It was reported that his mind was disordered and he lost his fellowship. From 1721 he lived in London, on an allowance of F30 a year from his brother and other presents. His influence on the deist controversy began with his book *The Moderator Between an Infidel and an Apostate* (1725). Woolston denied the proof from miracles. called in question the resurrection of Christ and other miracles of the New Testament and maintained that they must be interpreted as types of spiritual things In a series of *Discourses,* he applied his principles to the miracles in detail. The six *Discourses,* 30.000 copies of which were apparently sold, appeared between 1727 and 1730, and for these publications he was tried in 1729 and sentenced to pay a fine, with imprisonment until paid, and also to a year's imprisonment and to give security for his good behaviour during life He failed to find this security and remained in confinement until his death on Jan. 27, 1733. *See* also DEISM.

BIBLIOGRAPHY.—*Life* of Woolston prefixed to his *Works* in five volumes (1733), *Memoirs of the Life and Writings of Mr. William Whiston,* 2nd ed, pp. 231–235 (1749); J Cairns, *Unbelief in the Eighteenth Century* (1880); *E* Sayous. *Les Déistes anglais et le christianisme principalement depuis Toland jusqu'a Chubb, 1696–1738,* pp. 122–145 (1882).

WOOLWICH, a metropolitan and parliamentary borough of London. Eng., 10 mi. E.S.E. from the city. It is the easternmost borough of London and is bounded north by the Thames and Essex and east and south by Kent. Pop. (1951) 147,891. Area 12.9 sq.mi. The borough was formed in 1899 by the amalgamation of the parishes of Woolwich, Plumstead and Eltham. It returns two members to parliament, for Woolwich East and Woolwich West.

Woolwich is mentioned as Uuluuich in a legal document of 918. In Domesday Book the manor is mentioned as Hulviz ("a hill reach'!) and consisted of 63 ac. of land. The Roman Watling street crossed Shooter's hill, and a Roman cemetery and various fragments of pottery, etc., have been dug up. Early in the 16th century Woolwich rose into prominence as a dockyard and naval station. Ships were built there in the reign of Henry VII, but it was with the purchase by Henry VIII of two parcels of land in the manor, called Boughton's docks, that the foundation of the town's prosperity was laid. The building of the "Henry Grace à Dieu," or "Great Harry" (1,000 tons), in 1514 marked an epoch in its history. Woolwich remained the chief dockyard of the royal navy until the introduction of iron shipbuilding; the dockyard was closed in 1869 and the site taken over by the war office for storage purposes.

In 1667 Woolwich Warren was fortified against the Dutch fleet; by 1683 gun carriages were being broken down and the royal carriage factory had originated; in 1716 guns were first cast at Woolwich Warren and the royal gun factory had been started. Woolwich Warren was the headquarters of the royal artillery from 1716 until 1775 when it moved to Woolwich common, on the east side of which the Royal Military academy, founded in 1741 inside the arsenal, was moved to new quarters in 1806. It was planned to transfer the academy to Sandhurst (*q.v.*) in 1940, but because of World War II. the present academy (the result of the amalgamation of the Royal Military college and the Royal Military academy) did not come into being until 1947. In 1805 Woolwich Warren was renamed the royal arsenal. The Rotunda museum, presented to the royal military repository by the prince regent after 1815, contains arms, models of ships, etc.

North Woolwich, across the river, is connected with Woolwich by a ferry and a footway tunnel. It contains large telegraph and gas works, parts of the Royal Albert and King George V docks of the Port of London and the Royal Victoria gardens (ten acres).

Plumstead, embracing four medieval manors, is entirely a residential and shopping area.

At Eltham, the banqueting hall (15th century) of the royal palace (*c.* 1300), last lived in by James I, has been incorporated into Eltham hall, now used as an army school of education. Eltham was a royal manor at the time of Edward the Confessor and contains many 15th- and 16th-century houses. Eltham is a residential area.

WOOLWORTH, FRANK WINFIELD (1852–1919), U.S. merchant, was head of the chain of five-and-ten-cent stores bearing his name. Born near Rodman, N.Y, on April 13, 1852, he attended public schools and for a brief period a business college at Watertown, N.Y. After working as a clerk in various stores, he opened a "five-cent" store in Utica, N.Y.. in 1879 with the help of W. H Moore, one of his early employers. His idea was to sell a large variety of goods at one fixed price. Although that store was a failure, he established later in the same year a "five-and-ten-cent" store, with a larger selection of merchandise, in Lancaster, Pa. The second enterprise proved successful and was followed by other stores in various cities.

Woolworth's brother, C S. Woolworth, his cousin Seymour H Knox and his close friends F. M Kirby and E. P. Charlton, as well as his mentor Moore later all started similar stores of their onn. They in general refrained from competing with each other and managed independent units until 1912, uhen they were merged into the F. W Woolworth company. When Woolnorth died at Glen Cove, L.I., on April 8, 1919, his company was operating more than 1,000 stores and he had accumulated a personal fortune of many millions of dollars.

The Woolworth firm continued to expand after his death and hundreds of new stores were opened, not only in the United States but also in several other countries, including Canada, Great Britain, Germany and Cuba.

See John *K.* Winkler, *Five and Ten: The Fabulous Life of F. W. Woolworth* (1940).

WOONSOCKET, a city of Rhode Island. U.S., in Providence county, is on the Blackstone river 15 mi. N W. of Providence. Most of the city is densely settled with much multiple housing and many churches. More than 75% of the people are Roman Catholic and of French-Canadian descent. Woonsocket is a part of the Providence-Pawtucket standard metropolitan statistical area. (For comparative population figures *see* table in RHODE ISLAND: *Population.*)

The city is industrial with, in the 1960s, heavy but sharply declining dependence on textiles, principally woolens and worsteds. Other leading manufactures included rubber products, fabricated metals and machinery, and apparel.

The first structure in uhat is now Woonsocket was a sawmill built by Richard Arnold in 1666. Water poner attracted the earliest cotton-spinning mill about 1810, and the first plant for spinning and weaving wool was erected by Edward Harris in 1840. Woonsocket, which was once part of Cumberland and North Smithfield. was not a separate town until 1871. Its name is said to have derived from the Indian Miswosakit, meaning "at the very steep. hill" (Woonsocket hill in North Smithfield). In 1888 it was incorporated as a city and from 1953 had a "strong-mayor" form of government with a unicameral governing body. (V. H. WH.)

WORCESTER, EARLS AND MARQUESSES OF. Urso de Abitot, constable of Worcester castle and sheriff of Worcestershire, is erroneously said to have been created earl of Worcester in 1076. Waleran de Beaumont (1104–66), count of Meulan in France, a partisan of King Stephen in his war with the empress Matilda, was probably earl of Worcester from 1136 to 1145. He was deprived of his earldom, became a crusader and died a monk.

From 1397 to 1403 the earldom was held by Sir Thomas Percy (*c.* 1343–1403), who in 1403 joined the other Percys in their revolt; he was taken prisoner at Shrewsbury and subsequently beheaded, the earldom becoming extinct. The title of earl of Worcester was revived in 1421 in favour of Richard Beauchamp, Lord Abergavenny, but lapsed on his death in 1422. The next earl was John Tiptoft, or Tibetot, a noted Yorkist leader during the Wars of the Roses, who was executed in 1470. On the death of his son Edward in 1485 the earldom reverted to the crown.

In Feb. 1514 the earldom was bestowed by Henry VIII on CHARLES SOMERSET (c. 1460–1526), a bastard son of Henry Beaufort, duke of Somerset. Having married Elizabeth, daughter of William Herbert, earl of Huntingdon, he was styled Baron Herbert in right of his wife, and in 1506 he was created Baron Herbert of Ragland, Chepstom and Gower. He was chamberlain of the household to Henry VIII. His son HENRY. 2nd earl (*c.* 1495–1549), obtained Tintern abbey after the dissolution of the monasteries. The title descended in direct line to HENRY: the 5th earl (1577–1646). who advanced large sums of money to Charles I at the outbreak of the Great Rebellion and was created marquess of Worcester in 1643.

EDWARD SOMERSET, 2nd marquess of Worcester (1601–67), the inventor. was earlier known by the title of earl of Glamorgan, conferred somewhat irregularly by Charles I in 1644. The "Glamorgan treaties" negotiated by him with the Irish Catholics alarmed Protestant opinion. and under the Commonwealth he was formally banished from England and his estates were seized. At the Restoration his estates were restored, and he claimed the dukedom of Somerset promised to him by Charles I; but he did not obtain this, nor was his earldom of Glamorgan recognized. His *Century of the Names und Scantlings of Such Inventions as at Present I Can Call to Mind to Have Tried and Perfected* was published in 1663.

His only son HENRY (1629–1700), the 3rd marquess, abandoned the Roman Catholic religion and was a member of one of Cromwell's parliaments. But he was quietly loyal to Charles II, who in 1682 created him duke of Beaufort. As the defender of Bristol, the duke took a considerable part in checking the progress of the duke of Monmouth in 1685, but in 1658 he surrendered the city to William of Orange. He inherited Badminton, still the residence of the dukes of Beaufort. The Worcester title was henceforth merged in that of Beaufort. HENRY, the 7th duke (1792–1853), was one of the greatest sportsmen of his day, and the Badminton hunt owed much to him and his successors.

WORCESTER, WILLIAM (*c.* 1415–*c.* 1482), English chronicler. was a son of William of Worcester, a Bristol citizen, and is sometimes called William Botoner. his mother being a daughter of Thomas Botoner. He was educated at Oxford and became secretary to Sir John Fastolf. When the knight died in 1459, Worcester, although an executor. found that nothing had been bequeathed to him, and with a colleague. Sir William Yelverton. he disputed the will, obtaining some lands near Norwich and in Southwark. He died about 1482. His *Itinerarium* of England is of great value. Portions were printed by James Nasmith in 1778, and the part relating to Bristol is in James Dallaway's *Antiquities oj Bristowe* (Bristol, 1834).

Worcester also wrote *Annales rerum Anglicarum, a* work of some value for the history of England under Henry VI. This was published by T. Hearne in 1728, and by Joseph Stevenson for the "Rolls Series" with his *Letters and Papers Illustrative of the Wars of the English in France During the Reign of Henry VI* (1864). Stevenson also printed here collections of papers made by Worcester respecting the wars of the English in France and Normandy. Worcester's other writings include the last *Acta domini Juhannis Fastolf*. *See* the *Paston Letters* edited by J. Gairdner (1904); and F. A. Gasquet, *An Old English Bible and Other Essays* (1897).

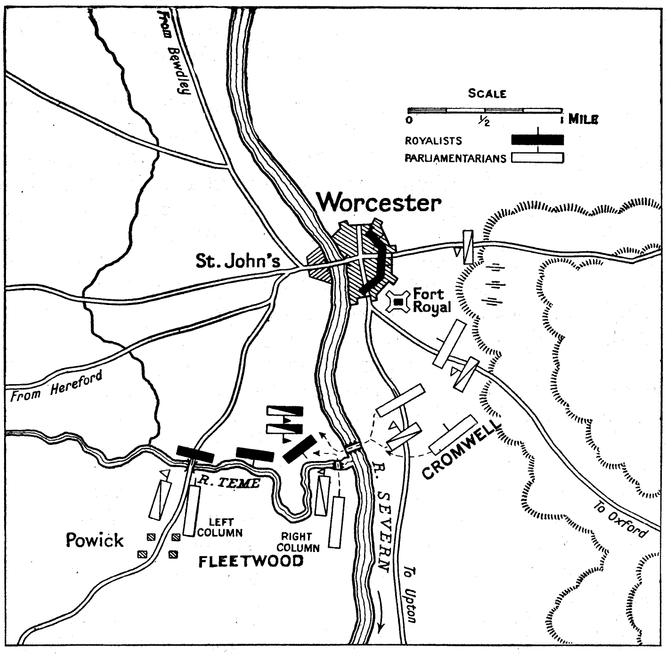
WORCESTER, a city, county and parliamentary borough and the principal and cathedral town of Worcestershire, Eng., 111 mi. N.W. of London by road. Pop. (1951) 59,703. Area 8.4 sq.mi. The town lies near the middle of the county on the Severn river, chiefly on its left bank, and the cathedral of pinkish-gray sandstone stands on a ridge above the river.

The first cathedral was the church of St. Peter built by missionaries before 680, in which year Bosel. a monk of Whitby, became its first bishop. In 969 Bishop Oswald (later St. Oswald) acquired St. Peter's for the Benedictine monastery of St. Mary; in 983 he completed a new cathedral dedicated to the Blessed Virgin Mary. The present building was begun by Bishop Wulstan (Wulfstan) in 1084 next to. and eventually superseding, the earlier ones. Little remains of the original besides the crypt. which inspired the building of the circular chapter house (about 1140) in which the great central pillar supports the roof. When St. Wulstan was canonized in 1203 pilgrims flocked to the cathedral, and in 1216 King John was buried there. After the fires of 1113, 1189 and 1202, when the city, castle and cathedral suffered much damage, the latter was restored (finished 1218) and rededicated to "St. Mary, Mother of God, and the Blessed Apostle St. Peter and the Holy Confessors Oswald and Wulstan." Bishop Blois built the Lady chapel in 1224 and rehuilt the choir, which was finished by Bishop Walter de Cantilupe. In 131; Bishop Thomas de Cobham began rebuilding the nave and erected the Jesus chapel as a chantry. The reconstruction of the tower was finished in 1374, and the following year Wakefield became bishop and began rebuilding the cloister and refectory (now the college hall for the Worcester Cathedral King's school). The misericords were carved in 1379, and with the building of the north porch in 1386 the cathedral was complete. In 1502 Prince Arthur's chantry was added, but in 1538 Henry VIII destroyed the shrines of the two saints Oswald and Wulstan before dissolving the monastery in 1540. In the charter for the new foundation (1541) the church is styled "The Cathedral Church of Christ and the Blessed Mary the Virgin, of Worcester." Twice the cathedral suffered terrible defacement, in 1551 after the publication of the new prayer book and during the Civil War when it was turned into stables, and books were burned and windows and carvings smashed. The outside was recased and the inside repaired in 1859.

The Queen Anne guild hall was built in 1721–23 and restored in 1877–80; the county or shire hall, in the Ionic style. stands next to the Victoria institute, which houses the technical and art schools, public library: museum and art gallery. There are many timber-framed houses still in existence, among them the Greyfriars (1480), built when Franciscans and Dominicans settled in the city. Much older (1085) is the Commandery, founded by St. Wulstan as a hospital and now in private hands; the hall was restored to its original condition in 1954. The oldest churches are St. Helen's (680). now occupied by the Y.M.C.A., and St. Alban's (8th-century), now the home of Toc H. St. John-in-Bedwardine is a 12th-century church and so was St. Andrew's, but all that remains of the latter is its tower and tall tapering spire ($245\frac{1}{2}$ ft.) standing overlooking the river opposite the county cricket ground. On the left bank, farther up, is Pitchcroft, the race course; there are several public parks.

Worcester was once an important wool town. Queen Elizabeth I in 1574 granted a charter to the Clothier's guild, a rich and powerful body which virtually ruled the city. The oldest trade is gloving (since the 13th century), and other varied industries include porcelain (since 1751), engineering, sauce (since 1845), hardware and carpets (since 1835) Worcester is also a market town lying in rich agricultural country with good transport connections by road, rail and water. For centuries there have been important markets and an annual hop fair, ram sale and horse fair.

History.—Wirecestre in Domesday Book, later Worcester, became an important tonn after the Synod of Whitby in 664 and the formation of a new see to serve the tribe of Huiccas by 679 Built where the Severn, which formed the boundary nith Wales, was forded. it was walled in Alfred's reign. One of the six remaining copies of the .Anglo-Saxon chronicle was made by the Benedictine monks there. In 1189 Richard I granted it its first charter, and it was made a county of itself in 1621. King John was a frequent visitor and was eventually buried in the cathedral between the shrines of the tno saints in 1216, and in 1502 Prince Arthur was buried there with magnificent ceremony. At the Dissolution the prior became the first dean of the cathedral; as part of the new foundation the Cathedral Grammar school (now the King's school) was opened in 1541, and as a result the much older school—now the Royal Grammar school—nas temporarily closed but revived when Queen Elizabeth I visited the city and cathedral in 1575. Samuel Butler was a pupil of the King's school, and Adam Lindsay Gordon, the national poet of Australia, of the Royal Grammar school The bishop of Worcester's register contains the two entries of 1582 concerning the marriage of William Shakespeare. The town was very important during the Civil War and was attacked four times nhile in royalist hands. The detached steeple of the cathedral, partly covered uith lead, was pulled down



PLAN OF THE BATTLE OF WORCESTER, SEPT. 3, 1651

and sold during those wars, and much damage was done in the city. The battle of Worcester took place in 1651.

By the beginning of the 18th century the cloth trade had died out, and this inspired John Wall in 1751 to start the making of porcelain. which became world famous.

The Three Choirs festival is held annually in Gloucester, Worcester and Hereford cathedrals in turn. Sir Edward Elgar was born at Broadheath. 2 mi. N.W. of Worcester, in 1857. (X.)

Battle of Worcester, **1651.**—This battle ended Charles II's attempt to regain his throne by Scottish arms. The Scottish army, after its defeat by Oliver Cromwell at Dunbar (Sept. 3, 1650), had taken up defensive positions around Stirling. In July 1651 Cromwell, who lacked the strength to storm these positions, moved over the Firth of Forth toward Perth to cut the Scots' supply lines to the north. By this move he deliberately left the road to England open, and Charles promptly marched south with 20.000 men, nearly all Scots. However, very few Englishmen proved willing to help the invaders: the militia everywhere turned out loyally at the Commonwealth's summons; Gen. John Lambert and Gen. Thomas Harrison's cavalry were soon at the king's heels, and Cromwell himself came up rapidly behind them. Moreover, the Scots. after marching about 300 mi. in three weeks, were reduced to a bare 16.000 men by the time they reached Worcester on Aug. 22. There, in the few days available. they did what they could to strengthen the city walls, which had been demolished in 1646 and only partially restored. They also threw up an earthwork, known as Fort Royal, outside the walls (see plan) and broke the bridge over the river Severn at Upton. But by Aug. 27 Cromwell's army was already concentrating at Evesham and on Aug. 28 Lambert brilliantly forced his way over the Severn at Upton. Cromwell, whose forces now outnumbered the king's by two to one, at once sent Gen. Charles Fleetwood across the river with about 11.000 men. He was to move up the west bank and force his way over the Teme river, which joins the Severn a mile or so below Worcester, while Cromwell with the main body and the artillery attacked the city from the east. Two bridges of boats were brought up, one to assist Fleetwood to cross the Teme close to its junction with the Severn, the other to be placed across the Severn just above its junction with the Teme. On Sept. 3. the anniversary of Dunbar, Fleetwood began to force his way over the Teme by his bridge of boats and by Powick bridge a little farther west. Both his columns met stiff resistance, and it was only when Cromwell led part of his own forces across the Severn by the second bridge of boats that the Scots along the line of the Teme were gradually forced back into Worcester. Charles, watching from the cathedral tower, sought to profit from Cromwell's move by leading an attack upon the troops left upon the hill to the east of the city. But after more stiff fighting this attempt, too. was repulsed. Cromwell was able to bring his own forces back over the Scvern in time to join in the concluding stages of the action. and the royalists were steadily pressed downhill into Worcester. The guns of Fort Royal. captured by a militia regiment. mere turned upon them, and men and horses. jammed together in the streets. were cut down and shot down until, as Harrison wrote, there was "such a nastiness that a man could hardly abide the town." Some horsemen escaped northward, only to be cut down or rounded up by Harrison's pursuing cavalry and other forces which Cromwell had posted to cut off their retreat. The infantry died or surrendered on the spot. and. though Charles himself after many adventures contrived to escape to France, his army was utterly destroyed. Eight thousand to 10.000 were prisoners, the rest slain or fugitives. For the Commonwealth it was, in Cromwell's phrase. "a crowning mercy." (R. B. WM.)

WORCESTER, a town in the Cape Province, U. of S.Af., near the Hex River mountains. Pop. (1951) 25,397 (9,202 white). It is the centre of a fruit growing area. The annual rainfall is less than 12 in., but irrigation is obtained from the Hex river. In 1954 a £1,250,000 water augmentation scheme was completed at Stettynskloof, 23 mi. S.W. of the town.

Wine and brandy are produced, and fresh and dried fruit exported. The largest industry is the manufacture of textiles.

WORCESTER, a city of central Massachusetts, U.S., the third largest in New England in the 1960s and seat of Worcester county, is located 40 mi. W. of Boston on Lake Quinsigamond. It is the centre of the Worcester standard metropolitan statistical area, which comprises part of Worcester county. The population of Worcester in 1960 was 186,587 (a decrease of 8.3% since 1950), of the metropolitan area 323,306 (an increase of 6.7% over 1950). (For comparative population figures see table in MASSACHUSETTS: Population.) The surrounding communities, in a region of low hills and valleys dotted with ponds, are primarily residential with a sprinkling of industry and orchards and general farming sections.

Two early attempts at settlement of Worcester (then called Quinsigamond but renamed later) in 1673 and 1684 were foiled within a few years by Indian attacks. Permanent settlement, pioneered by Jonas Rice and primarily agricultural in character, was finally effected in 1713. Industrialization was late in getting under way since there was little water power. With the coming of steam power the city became the manufacturing centre of central Massachusetts, a position it still held in the second half of the 20th century. Fewer than 6,000 people were living there in 1828 when the opening of the Blackstone canal linking the city with Providence, R.I., began a period of expansion and industrialization.

The building in the next quarter. century of railway connections with Boston, Norwich, Providence and Springfield developed further markets and sources of supply. In 1848 the town was incorporated as a city, and by 1870 its population had reached 25,000. During this period there were important local developments in the processing of wire, the production of grinding wheels and the invention by William Crompton of a revolutionary fancy textile loom. The first practical envelope-making machine resulted in a further mushrooming growth of industry so that by 1900 the population was almost 120,000, representing a twentyfold increase in seven decades. Thereafter, the city grew at a much slower rate. Worcester adopted a council-manager government in 1950.

The original Worcester population was almost wholly of British origin. Industrial growth brought first an influx of Irish (beginning around 1828), followed by Swedes and Canadian-French in the latter part of the 19th century. They were followed by Italians, Poles, Lithuanians, Greeks and in the 20th century an unusually large number of immigrants from the near east. All of these groups have added a distinctive character to the city's religious and cultural life and gravitated largely into the area's industries. By the 1960s almost 60% of the employed population was engaged in manufacturing. More than 600 firms produced a wide variety of products including machinery and machine tools, wire and other fabricated metals: primary metal products, grinding wheels, leather goods and textiles. Worcester's key position on arteries from New England to the west and to New York city, service by several airlines, railways and road transport facilities have helped to make it a regional wholesale and retail centre.

Worcester is a noted educational and cultural centre, and in addition to a number of junior colleges contains five institutions of higher education—the Jesuit College of the Holy Cross, founded 1843 and the oldest New England Catholic college; Clark university (1887), known for its graduate departments of psychology, chemistry and geography; Worcester Polytechnic institute (chartered 1865 as Worcester County Free Institute of Industrial Science), one of the oldest in the U.S.; Assumption college (Roman Catholic; 1904), which emphasizes the study of foreign languages and culture; and Worcester State Teachers' college (1874). Other institutions include the Worcester Art museum; the Library of the American Antiquarian society, containing a large collection of material printed in the U.S. before 1821; and a fine armour collection in the John Woodman Higgins armoury.

An annual music festival featuring symphonic and choral music was first held in 1859 and continued thereafter.

(M. H. Co.)

WORCESTERSHIRE, a midland county of England bounded by Staffordshire, Warwickshire, Gloucestershire, Herefordshire and Shropshire. Its geographical area is 699.5 sq.mi.

Physical Features.—Worcestershire covers a portion of the rich valleys of the Severn and Avon with their tributaries the Stour and the Teme. The Avon valley, known as the Vale of Evesham, lies on the Lias clays and provides an excellent soil for orchards and market gardening. The Jurassic escarpment of the Cotswold hills rises sharply from it in the southeast, the outlier of Bredon hill being a conspicuous spur. The Severn flows south by east to Worcester and then almost due south to Tewkesbury where the Avon joins it from the northeast. The Malvern hills, which run north and south forming part of the boundary with Herefordshire, rise from the flat vale of Worcester and reach a height of 1,395 ft. and 1,114 ft. in the Worcestershire and Herefordshire beacons. They are mostly built up of pre-Cambrian rocks, chiefly gneiss. The Malvern ridge is continued in the Abberley hills to the north. while east lies the great Midland plain where the earth is rich red marl. The Lickey hills (goo ft.), in which there are Silurian, Cambrian and Pre-Cambrian rocks. cross the northeast corner of the county. Their northern parts, the Clent hills (1,036 ft.), are formed of Permian breccias. Partly within the county are the sites of two ancient forests; that of the Wyre on the northern boundary retains some of its ancient character, but Malvern chase is hardly recognizable. Road metal is extensively quarried in the Malvern and the Lickey hills; lime is obtained from the Silurian limestones; coal is mined in portions of the forest of Wyre and those portions of the south Staffordshire coal fields which come within the county.

Early Settlement and History.—Worcestershire was largely wooded in early times and is consequently not rich in prehistoric remains, but some stone implements have been found on the surrounding hills and some bronze implements along the Severn. pointing to river communications or perhaps to occupation of the river banks. There are great Iron Age fortifications on the Malvern and the Bredon hills which have been dated to the last two centuries B.C., and there are others at Berrow hill above the Teme west of Worcester and at Round hill by Spetchley. A Saxon grave of considerable interest was discovered in Cpton Snodsbury, 6 mi. E. of Worcester, in the late 19th century.

The earliest English settlers were a tribe of the Hwiccas of Gloucestershire, who spread along the Severn and Avon valleys in the 6th century. By 679 the Hwiccan kingdom was formed into a separate diocese with its seat at Worcester, and the Hwiccas had made themselves masters of nearly the whole of the modern county. From this date the town of Worcester became not only a religious centre but the chief point of trading and military communication between England and Wales. The shire originated as an administrative area after the recovery of Mercia from the Danes. Worcester was destroyed by Hardicanute in 1041.

In no county has the monastic movement played a more important part. Foundations existed at Worcester, Evesham, Pershore and Fladbury in the 8th century; at Great Malvern in the 11th century, and in the 12th and 13th centuries at Little Malvern, Westwood, Bordesley, Whistones, Cookhill. Dudley. Halesowen and Astley. The cultivation of the Vale of Evesham for flowers, fruit and vegetables was begun by the monks of Evesham and Pershore. At the time of the Domesday survey more than half Worcestershire was in the hands of the church, and this prevented the rise of a local aristocracy. Dudley castle was a fortress belonging to William Fitz Ansculf; Worcester castle passed in the 12th century to the Beauchamps, who owned Elmley and Hanley castles. The possessions of William Fitz-Osbern in Doddingtree hundred and the Teme valley fell to the crown in 1074 and passed to the Mortimers. Three decisive battles of English history were fought in Worcestershire—at Evesham (*q.v.*) in 1265, Tewkesbury (*q.v.*) in 1471 and Jt'orcester (*q.v.*) in 1651. Simon de Montfort was killed at the battle of Evesham when the barons, whom he was leading, were defeated by the royalists. The Lancastrians were beaten at the battle of Tewkesbury. Though in the Civil War Worcestershire was conspicuously loyal, at the battle of Worcester Charles II was finally defeated. Worcester to this day is known as the "Faithful City."

The Droitwich salt industry was very important at the time of the Domesday survey. In the 13th and 14th centuries Bordesley monastery and the abbeys of Evesham and Pershore exported wool, and in the 16th century the Worcestershire clothing industry gave employment to 8,000, the centre of the trade being at Worcester; fruit culture with the manufacture of cider and perry, nailmaking and glassmaking also flourished, and scythe manufacture was carried on at Belbroughton near Stourbridge. The clothing industry declined in the 17th century; at Kidderminster it was replaced by carpet weaving which was introduced from Flanders in 1735. Coal and iron were mined at Dudley in the 13th century.

Architecture.—There are remains of Benedictine abbeys at Evesham and Pershore, a perfectly preserved priory church at Malvern and the ruins of a priory church of the 12th century at Dudley, in addition to the cathedral at Worcester and other monastic remains. The churches of Martley. Astley. Rous Lench. Bredon and Bockleton contain good Norman work. and the Early English churches of Kempsey and Ripple are noteworthy. Half-timbered buildings are numerous and include many "cruck" houses, some church towers, notably Pirton. Kington and Dormston. and the country houses of Birtsmorton court (a moated 16th-century house), Eastington hall. Salwarpe court. Lench court (partly Tudor), Pirton court. Shell manor and Huddington court and many others. In the south of the county half-timbering gives way to Cotswold stone, Broadway providirig fine examples. while Madresfield court embodies remains of an Elizabethan moated mansion.

Agriculture and Industries.— The climate is a factor of considerable importance as the Severn valley appears to act as a channel for warm air from the south which disperses on reaching the Clent and Lickey hills. The south is intensively cultivated for early market produce, and the Vale of Evesham is famous for fruit and vegetables. Hops are grown mainly west of the Severn, but dairy farming and permanent grass are predominant features generally. Other crops are wheat, barley. oats, potatoes. mangolds and sugar beets. In 1954 about 45% of the land was under cultivation; there were 23,617 ac. of orchards and 16,507 ac. of vegetables; *13,069* persons were engaged in agriculture. Salmon and lampreys are taken in the Severn, trout and grayling in the Teme.

There are four well-defined industrial areas: the northern boroughs of Oldbury, Halesowen and Stourbridge; Kidderminster and Stourport-on-Severn in the northwest; Redditch in the east; and Worcester city in the centre. The northern industries of ironworking, engineering and metal products. together with glass and chemical manufacture, owe their origin to the proximity of the fire clays and limestone to the coal measures: The Kiddenninster area is famous for carpets, but has increasing engineering and metal industries. Redditch produces needles. springs and fishing tackle, and metalwork is also increasing there, as it is in Worcester, where there are extensive engineering works and where porcelain. gloves and sauce are produced and railway repairs are carried out. Bromsgrove is another growing centre of heavy engineering activity. and important salt and chemical works are at Stoke Prior. near Droitwich. In 1951, 114,058 persons were engaged in industry, nearly 75% of them in the north.

Communications.— The county is served by two principal lines of railway, the Western Region line from London through Oxford to Worcester and Wolverhampton, and the London Midland Region line from Birmingham to Bristol. An important loop from Stoke Works to Abbotsnood enables London Midland trains to be routed through Droitwich and Worcester. The trend is for freight and passengers to be carried by road transport, and the administrative county is intersected by 1.894 mi. of roads, of which the most important are four trunk roads: the Exeter-Leeds, the east of Birmingham-Birkenhead. the Newport-Stafford and the Bath-Coventry-Lincoln. Both the Severn and the Avon are partly navigable. and the Lower Avon trust has done much to reopen the latter river. Canals are mainly in the north. but the Worcester-Birmingham canal is an important south-to-north waterway.

The Lickey hills provide a playground for Birmingham and the north of the county, the Malvern hills for the centre; while the Severn. Avon and Teme provide recreation for anglers and visitors from the industrial midlands.

Population and Administration.— The area of the geographical county is 699.*j* sq.mi. and the population (1951) *j22.846*, an increase of $24\frac{1}{2}$% since 1939. Several detached parts of the county existed till 1931 when adjustments were made with Warwickshire and Gloucestershire, leaving Dudley as the sole remaining "island"—surrounded by Staffordshire. The administrative county in 1951 had a population of *400.617* and an area of 684.7 sq.mi. The county town is Worcester and there are two county boroughs (Worcester and Dudley), seven municipal boroughs (Bewdley, Droitwich, Evesham, Halesowen, Kidderminster. Oldbury and Stourbridge), four urban districts (Bromsgrove, Malvern, Rèdditch and Stourport-on-Severn) and eight rural districts. The county is in the Oxford circuit and assizes are held at Worcester. The administrative county has one court of quarter sessions and there are *16* petty sessional divisions. The county boroughs of Worcester and Dudley have in addition separate courts of quarter sessions. The ancient county contained the hundreds of Halfshire. Blackenhurst. Doddingtree, Oswaldslow, Pershore, Cresselau, Fishborough, Clent, Esch and Came.

WORDEN, JOHN LORIMER (1818–1897), U.S. navai officer who was commander of the Unjon ironclad ship "Monitor," was born in Westchester county, N.Y., March *12, 1818*. He was appointed a midshipman in *1834*. and he received his early naval training with the Brazilian squadron between *1835* and *18.38*. He served on the Pacific coast during the Mexican War, and afterward was in both the Mediterranean and home fleets. In the spring of *1861* Worden was sent on a secret mission to Pensacola in an effort to get naval reinforcements to Ft. Pickens, but he was arrested by Confederate authorities and was not exchanged until Dec. *1861*. On Jan. 16, *1862*, he was appointed to command John Ericsson's experimental "Monitor." He took the cumbersome "cheese box on a raft" down the Atlantic coast in perilous stormy weather, and arrived in Hampton Roads. on the evening of the day that the Confederate ironclad "Virginia," the rebuilt steamship "Merrimack," had spread consternation among the Union forces by sinking two wooden sailing vessels. The next day, March 9, 1862, Worden sailed forth in the "Monitor" to battle the "Merrimack." The three-hour battle, in which ironclads fought for the first time, ended when both withdrew from the conflict. Worden. stationed in the pilothouse, forward of the turret, had been wounded in the face and nearly blinded when a shell exploded outside his sighthole. *(See "MONITOR" AND* "MERRIMACK," BATTLE OF.)

For the rest of the Civil War period Worden commanded monitors stationed with the South Atlantic blockading squadron, and participated in the attack on Ft. McAllister and in the unsuccessful attack on Charleston in *1863*. Worden was promoted to commodore in *1868* and to rear admiral in *1872*. He commanded the European squadron from *1875* to 1877 and was in the eastern Mediterranean during the Russo-Turkish War. Retiring on Dec. *23, 1886*, congress voted him full sea pay as rear admiral for life. He died in Washington, D.C., on Oct. *18, 1897*.

WORDSWORTH, CHARLES (1806–1892), Scottish bishop. son of Christopher Wordsworth, master of Trinity, was born in London on Aug. *22, 1806*. and educated at Harrow and Christ Church. Oxford. He was a brilliant classical scholar and a famous cricketer and athlete. He was tutor at Christ Church (1834–35) and then second master at Winchester. In *1839* he brought out his *Greek Grammar*, which had a great success. In *1847* he became warden of Trinity college, Glenalmond, the new Scottish Episcopal public school and divinity college, where his views on Scottish church questions brought him into opposition at some important points to W. E. Gladstone. In 1853 he was consecrated bishop of St. Andrews, Dunkeld and Dunblane. Wordsworth was a strong supporter of the establishment, but conciliatory toward the Free Churches. He was a voluminous writer and one of the company of revisers of the New Testament (1870–81), among whom he displayed a conservative tendency. He died at St. Andrews on Dec. *j*. 1892.

See his *Annals of My Early Life* (1891) and *Annals of* My *Life*, edited by W. Earl Hodgson (1893); also *The Episcopate of Charles Wordsworth*, by his nephew John, bishop of Salisbury (1899).

WORDSWORTH, CHRISTOPHER (1774–1846), youngest brother of the poet. was born on June *9*, 1774, and became a fellow of Trinity college. Cambridge, in 1798. He obtained preferments through the patronage of Manners Sutton, bishop of Norwich, afterward (1805) archbishop of Canterbury. In 1810 he published an *Ecclesiastical Biography* in six volumes. On the death of Bishop Mansel, in 1820, he was elected master of Trinity, and retained that position till *1841*. His proposal as vice-chancellor

(1821) for a Classical Tripos, though then rejected, was adopted in 1822. He died on Feb. 2, 1846, at Buxted. In his Who *wrote Ikon* Basilike? (1824), he advocated the authorship of Charles I.; and in 1836 he published, in 4 volumes, a work of Christian Institutes, selected from English divines. He married in 1804 Miss Priscilla Lloyd (d. 1815), a sister of Charles Lamb's friend Charles Lloyd; and he had three sons, John W. (1805–1839), Charles (*q.v.*) and Christopher (*q.v.*); the two latter both became bishops, and John, who became a classical lecturer at Trinity College, Cambridge, was an erudite scholar.

WORDSWORTH, CHRISTOPHER (1807–1885), English bishop and man of letters, was born in London on Oct. 30, 1807, and was educated at Winchester and Trinity, Cambridge. He, like his brother Charles, was distinguished as an athlete as well as for scholarship. He was public orator at Cambridge, Headmaster of Harrow from 1836–44, and bishop of Lincoln in 1869. He died on March 20, 1885. He married in 1838 Susanna Hartley; his eldest son was John, bishop of Salisbury, and author of Fragments of Early Latin (1874), and his daughter Elizabeth was first principal of Lady Margaret Hall, Oxford. As a scholar he is best known for his edition of the Greek New Testament (1856–60), and the Old Testament (1864–70), with commentaries; and for his Inscriptiones *Pompeianae* (1837).

His Life, by J. H. Overton and Elizabeth Wordsworth, was published in 1888:

WORDSWORTH, DOROTHY (1771–1855), English writer and diarist, the third child and only daughter of John Wordsworth, of Cockermouth, and his wife, Anne Cookson-Crackanthorpe, was born on Dec. 25, 1771, and, after her mother's death in 1778, lived chiefly at Halifax with a Mrs. Threlkeld, her mother's cousin. In 1787 she went to live with her maternal grand-parents in Penrith, where she was not very happy. From 1788–93 she stayed with an uncle at Forncett, in Norfolk. She and her brother William, the poet, who was a year older than Dorothy, were early drawn to one another; in 1794 they visited the Lakes together, and in the autumn of the following year they combined their small capitals and set up house at Racedown, in Dorsetshire, where they lived a frugal but ideally happy life. In 1797 they made the acquaintance of Coleridge, and in the same year moved to Alfoxden, on the northern slope of the Quantock hills, Coleridge about the same time settling near by in the town of Nether Stowey. On Jan. 20, 1798, Dorothy Wordsworth began her invaluable Journal, used by successive biographers of her brother, but first printed in its quasi-entirety by Prof. W. Knight in 1897. The Wordsworths, Coleridge and Chester, left England for Germany on Sept. 14, 1798; and of this journey also Dorothy Wordsworth preserved an account, portions of which were published in 1897. On May 14, 1800, she started another Journal at Dove cottage, Grasmere, which she kept very fully until Dec. 31 of the same year. She resumed it on Jan. 1, 1802, for another 12 months, closing on Jan. 11, 1803. These were printed first in 1889. She composed Recollections of a Tour in Scotland, in 1803, with her brother and Coleridge; this was first published in 1874. Her next contribution to the family history was her Journal of *a* Mountain Ramble, in Nov. 1805, an account of a walking tour in the Lake District with her brother. In July 1820 the Wordsworths made a tour on the Continent, of which Dorothy preserved a very careful record, portions of which were given to the world in 1884, the writer having refused to publish it in 1824 on the ground that her "object was not to make a book, but to leave to her niece a neatly-penned memorial of those few interesting months of our lives." Meanwhile, without her brother, but in the company of Joanna Hutchinson, Dorothy Wordsworth had travelled over Scotland in 1822, and had composed a Journal of that tour. In 1829 she had a serious nervous breakdown, from which she never recovered. For the last 26 years of her life her mind and body seemed broken; she died on Jan. 25, 1855, five years after William's death in 1850.

Dorothy Wordsworth claims a distinct place in the history of English prose as one of the very earliest writers who noted, in language delicately chosen, and with no other object than to preserve their fugitive beauty, the little picturesque phenomena of homely country life amid simple scenes and quiet people.

A *Life,* by E. Lee, was published in 1886; but it is only since 1897, when Prof. Knight collected and edited her scattered mss., that Dorothy Wordsworth has taken her independent place in literary history. The Journals of Dorothy Wordsworth, edit. by W. Knight, were republished in 1924; see also C. M. Maclean, Dorothy *and William* Wordsworth (Cambridge, 1927).

WORDSWORTH, WILLIAM (1770–1850), English poet, was born at Cockermouth, Cumberland, on April 7, 1770, the second son of John Wordsworth, attorney-at-law and agent to Sir James Lowther (afterwards first earl of Lonsdale). His mother was Anne, daughter of William Cookson, a Penrith mercer, and Dorothy, born Crackanthorp, "of the ancient family of that name, who from the time of Edward the Third had lived in Newbiggen Hall, Westmorland" (*Autobiographical* Memoranda). The Wordsworths were a Yorkshire family "settled at Peniston . . probably before the Norman Conquest" (ib.); the first of the family to settle in the Lake District was the poet's grandfather.

Wordsworth's mother died in 1778; and in that year he was sent to the ancient grammar school of Hawkshead, boarding in the village with Anne Tyson, at the cottage still known as "Wordsworth's cottage." His father died five years later — Wordsworth speaks of him as having "never recovered his usual cheerfulness" after the loss of his wife. The family were placed under the guardianship of two uncles, Richard Wordsworth and Christopher Crackanthorp. Beyond the claims which he had against the Lowther family (amounting to well over £4,000), claims which were the subject of protracted dispute, until they were acknowledged and discharged, in 1802, by the second earl of Lonsdale, the father had left small provision for his children. Wordsworth, however, was sent in 1787 to St. John's, Cambridge, of which college his uncle, William Cookson, had been a fellow. Already he had contracted both the habit of verse and the temperament of poetry. Among his published works are included two sets of verses written as early as 1786; and "I wrote," he says, "while yet a schoolboy, a long poem running upon my own adventures and the scenery of the country in which I was brought up": a poem containing "thoughts and images" most of which were used later in the poet's "other writings." He had been sufficiently well taught at Hawkshead, at least in mathematics, to have "a full twelve months' start" of the freshmen of his year at St. John's; and to this circumstance he attributes it that he "got into rather an idle way," "reading nothing but classic authors according to my fancy, and Italian poetry" (Autobiogr. Mem.). His Italian master was a man who had "been well acquainted with the poet Gray." During his freshman year he composed a large part of the Evening Walk, finishing it in 1789. Of his Cambridge friends the chief was Robert Jones, who subsequently took orders, with whom, in 1790, Wordsworth undertook the walking tour in France and Switzerland which is commemorated in Descriptive Sketches. Forty years later, Jones, "fat and roundabout and rosy, and puffing and panting" up very moderate hills, "looked back to that journey as the golden and sunny spot in his life" (Dorothy Wordsworth: Letters ii., 497).

In Jan. 1791 Wordsworth took his B.A. degree. It is clear from Books iii.–vi. of the Prelude that he conceived himself to have derived from his three years residence in Cambridge little intellectual profit; and "the manners of the young men," he wrote later, "were very frantic and dissolute at that time" (Letters, i., 162). His guardians had destined him for the Church. But the thought of "vegetating on a paltry curacy" made no strong appeal to him (ib. i., 33); and it is probable that already before he had taken his degree he had experienced some unsettlement both of religious and of moral belief. He pleaded for delay; and Re seems to have persuaded his guardians that the best preparation for the study of oriental languages (pressed upon him as a likely means of advancement) would be a year spent in learning French. He went to France at the end of Nov. 1791, and he remained there till the end of 1792, for the most part in Orleans and Blois. He took to France a keen sympathy with the principles of the revolution; and his faith in the revolutionary idea was deepened and intensified by the intimate friendship which he formed in Blois with Michel de Beaupuy, a captain (later general) in the republican army. The ninth book of the *Prelude* bears witness to the profound influence exercised upon his political thinking by Beaupuy. In Orleans he formed an attachment to Marie-Anne Vallon ("Annette"), a girl of royalist family, by whom he had a daughter, Anne-Caroline (baptised Dec. 15, 1792); and by whose marriage in 1816 with Jean Baptiste Martin Baudouin he has a number of French descendants. Of "Annette" the *Prelude* tells us nothing. Yet, as first sketched, it contained the story of *Vaudracour and Julia,* of which the earlier sections, at least, were not written without some thought of her. The amatory colouring of the second paragraph of the poem is unlike the Wordsworth whom we know best; and the third paragraph attempts (we must suppose) such justification of the "Annette" episode as Wordsworth felt to be possible. He felt himself to have been betrayed by a false philosophy, by his creed of nature and freedom:

tempted to decline
To perilous weakness, and entrust the cause
To nature, for a happy end of all.

During his sojourn in France he wrote the greater part of *Descriptive Sketches.* Isolated passages crudely expressed his revolutionary sympathies, his deep moral dejection; and even a mood of religious unbelief. Yet as late as May 1792, "it is at present my intention," he writes, "to take orders in the approaching winter or spring. My uncle the clergyman will furnish me with a title" *(Letters,* i., 42). "I should certainly have wished to defer the moment" *(Letters,* i., 42). The failure here, at once of religious and moral conviction, seems complete.

In Feb. 1793 Wordsworth published both *Descriptive Sketches* and *An Evening Walk.* Of both poems perhaps the principal interest resides in the conflict between style and substance: things freshly and romantically observed fight for expression within the limits of a diction which has all the faults of the worst 18th-century work. In the same month England declared war upon France —the first real shock, Wordsworth tells us, which his moral nature had received (*Prelude* x., 268 *et seq.).* At once he ranged himself on the side of his country's enemies. February 1793 was further notable in that it saw the publication of Godwin's *Political Justice.* Hitherto, Wordsworth had been content to take his philosophy from Rousseau, in ethics deifying "nature," and in politics making a gospel of "the general will." Under the influence of Godwin, he began now to deify Reason, the individual reason—collective reason being only another name for the general will, that is, for a tyranny.

The period 1793–96 is, in respect both of the external and of the internal biography of Wordsworth, still involved in considerable obscurity; an obscurity not much illumined by the rather confused account of his own development which he himself furnishes to us in Books xi.–xii. of the *Prelude.* Early in 1793 he wrote the "Letter to the Bishop of Llandaff . . . by a Republican," in which he is still the champion of the general will. The Letter attacks monarchy, the clergy and (here under Godwinian influence) the state penal code. For the bishop, a renegade liberal, Wordsworth entertains some such sentiments as, later, were felt for himself by Hazlitt and others. The Letter was not published until 1876. If its self-conscious loftiness of style and sentiment does not altogether lift it out of the commonplace, it is yet a composition which may be accounted, for the years from which it proceeded, remarkable. In the autumn of 1793, he began upon *Guilt and Sorrow,* his first considerable poem, in many parts of it distinctively "Godwinian." It was finished in 1794, and a portion of it, under the title of *The Female Vagrant* was printed in the *Lyrical Ballads* (1798); the whole saw the light (a good deal revised) in 1842. In 1795 he began, and in 1796 finished, *The Bordcrers: A Tragedy,* of which the gloomy perversities show him struggling out of the Godwinism in which he had been for two painful years involved. Sometime in 1795 he wrote his first truly characteristic piece, "Nay, Traveller, rest . . .", in which the victory over Godwinism is already complete.

For two years since his return from France Wordsworth had led a wandering life, making no attempt to find for himself a profession. In the early part of 1795 occurred the death of his friend Raisley Calvert, who left him a bequest of £900. He used the independence afforded to him to settle with his sister Dorothy at Racedown, Crewkerne. It was here that *The Borderers* was finished; and here (more important) *Margaret, or The Ruined Cottage* (incorporated, later, in Book i. of *The Excursion)* was begun. The poem was finished at Alfoxden, whither, in the summer of 1797, the Wordsworths moved, in order to be near Coleridge at Nether Stowey. In the *Prelude* Wordsworth traces the recovery of his moral, and poetical, health to the influence, first of his sister, and secondly of Coleridge. It was while these "three persons and one soul" were living in close conjunction in Somerset that the *Lyrical Ballads* were conceived and written.

The publication (September 1798) of the *Lyrical Ballads* constitutes the most important event in the history of English poetry after Milton. Of the genesis of the book Coleridge has given, in the first section of chap. xiv. of the *Biographia Literaria,* an account which may be summarised by saying that, while his own share in the work was directed towards illustrating (in *The Ancient Mariner)* the naturalness of the supernatural, Wordsworth's task was to point the supernatural meanings, the inner spirituality of actions and incidents the most natural conceivable. We are concerned here only with Wordsworth; and it is notable that the *Advertisement* to the *Lyrzcal Ballads* is concerned only with him (save for the excuses made, in its last section, for the diction of *The Ancient Mariner).* "It is the honourable characteristic of poetry"—says the opening sentence of the *Advertisement*—"that its materials are to be found in every subject which can interest the human mind." That is only to say that the natural, the ordinary, the obvious, has its poetry, its supernaturalness. It states the theme which, in Coleridge's account, it was Wordsworth's task to illustrate. But if poetry can draw its supernatural effects from natural objects and happenings, to what extent can it employ (its primary means being language) merely natural language? The *Ballads,* says the *Advertisement,* are an "experiment" to discover "how far the language of conversation . . . is adapted for the purposes of poetic pleasure." Perhaps the principal result of it was the discovery of a new blank verse—that of what Coleridge christened the "Conversation Poem." If we leave aside *The Anczent Marzner,* the best of the *Lyrical Ballads* of 1798 is that part for which blank verse is used; a biank verse neither Shakespearian nor Miltonic; domestic, but with a telling quality wanting to the domestic blank verse of Cowper; individual without eccentricity; attaining its perfection in *Tintern Abbey.* The same conversational triumph meets us in the second volume of the *Lyrical Ballads* (1800) in "There was a Boy . . .", *Michael* and *The Brothers;* and indeed, wherever in the two volumes blank verse is used, it is used to fine effect.

In the purely lyrical species Wordsworth is, in the 1798 volume, less successful. Perhaps, in this kind, only "It is the first mild day of March . . ." and "I heard a thousand blended notes . . ." have the perfect lyric quality which, two years later, he was to show in the Lucy Poems, *The Fountain, The Two April Mornings,* the *Poet's Epitaph.* Several of the lyrical experiments fail badly; e.g., *Goody Blake,* to which the *Advertisement* unhappily directed special attention. But the volumes of 1798 and 1800 contained, together, a sufficient number of lyrical successes to afford an overwhelming demonstration of the power of poetry to use natural language, even the "language of conversation." But Wordsworth had an affection for his failures; and in the preface of 1800 he threw after them many paradoxes of theory and much false history.

It is, however, neither a theory of diction nor the successful practice of a new diction which gives to the *Lyrical Ballads* the importance which they have in literary history. The greatness of the book may more truly be conceived to lie in the metaphysic of the imagination from which it proceeds (and from which. indeed, the theory of diction itself proceeds). The outlines of this metaphysic are hinted in Wordsworth's Prefaces and Notes, and in passages of the poems themselves (the *Prelude* being, in this connection, particularly valuable). The *Lyrical Ballads* owe their greatness to the power with which they revindicate for poetry the life of the senses. We are only poets in so far as we confide ourselves to the senses. We see into the life of things only when we receive the impressions of sense in a "wise passiveness," disconnecting ourselves from the tie of reason and custom, from "the meddling intellect[x] — the operation of which is only one of the effects of custom. The source of truth — poetic truth — is not reason, but the eyes and ears. What is the matter with the poetry of the Age of Reason is that it had lost the art of seeing and hearing, or of performing these acts *purely,* in a fashion, that is to say, not vitiated by custom or theory. It had lost, at the same time, the gift of pure expression, using a mere customary or conventional diction. It is the supreme achievement of the *Lyrical Ballads* to have brought back the glory and the freshness of the senses. The work is done with the greater power and convincingness from the circumstance that Wordsworth had won his way back to nature and the senses through the valley of the shadow, through the rationalism of Godwin. To say that he had come back from Godwin to Rousseau would be to misconceive him. Obviously he supposes his later naturalism to escape the perils of Rousseauism. Obviously also he believes his metaphysic of the imagination — which might easily be taken for a very bare philosophic "sensationalism" — to rise above the difficulties of the ordinary sensationalist creed. A logical demonstration of his metaphysic he nowhere essays. We may be content with that practical demonstration of it which his poetry furnishes.

The six months following the publication of the *Lyrical Ballads* Wordsworth spent in Germany. In Oct. 1799 he settled in Grasmere; and in that neighbourhood, save for occasional tours in Scotland and on the Continent, the rest of his life was spent. A new edition of the *Lyrical Ballads* was called for in 1800, and this edition Wordsworth enriched by the famous preface and by a second volume of poems — among them some of his best and most original pieces. A third edition appeared in 1802 (with the appendix on Poetic Diction), and a fourth in 1805. In 1804 he married Mary Hutchinson — in 1802 he had visited "Annette," and her story had been revealed to Mary.

In the year in which the first edition of the *Lyrical Ballads* appeared, Wordsworth had already begun upon the *Prelude* (de Selincourt, p. xxxi.); and in the year which saw the fourth edition of the Ballads he finished it. In this poem, "after *Paradise Lost* the greatest long poem in the language" (A. C. Bradley), he traces his spiritual autobiography, "the Growth of a Poet's Mind," from earliest childhood, from the first intimations which came to him of poetry and immortality, down to the date at which he took the resolution of devoting himself wholly to poetry. As a document of the romantic revival the book (not published until after his death) is of the first importance; and apart from this historical interest, it constitutes ? handbook of the imaginative life unique in subtlety and power. It was intended to be a preparation for "a philosophical poem, containing views of Man, Nature and Society," of which the *Excursion* was a part (the only part finished). Of the same poem another part is the impressive fragment of *The Recluse,* written in 1800 but only published some years after in 1888.

In 1807 Wordsworth published the *Poems in Two Volumes.* These show a wide extension of his poetical power. New life is given to the sonnet—used with fine effect to express lofty patriotic sentiment—and to the ode—here were printed for the first time the *Ode to Duty* and the immortal *Ode* on *Intimations of Immortality.* The volumes of 1800 and 1807 establish Wordsworth as one of the great inventors of poetical forms. But, form apart, these volumes, taken together with the *Prelude,* the *Recluse* fragment, *Margaret, or the Ruined Cottage* (all written before 1807), constitute a body of poetical work of which the compass and original power are such as to place him among the greatest poets. By 1807, in fact, his best work was done; not all his good work, but his best work. The death in 1805 of his brother John Wordsworth (of whom the *Happy Warrior* is, in part, a commemoration) had affected deeply a temperament to which melancholy was native, inducing in Wordsworth a regress upon religious orthodoxy, and upon orthodoxies less venial. By the end of the first decade of the nineteenth century his thinking, in religion and in politics, loses that speculative rebel quality from which it drew so much of its early strength; and his imagination, ever a miser of its memories, and now more so, tends to hoard barren incidents and trivial perceptions, to be the material of later poetry. It requires, henceforth, some cause in which his affections are passionately engaged to educe the old power. Perhaps he is, after 1808, most like himself, not in poetry, but in the noble prose of the tract upon the *Convention of Cintra* (1809). In 1814 appeared the *Excursion;*. "This will never do," said Jeffrey. Yet Keats thought it "one of the three things to rejoice at in this age." Even outside the two first books, which belong to the Somerset period, the poem has lofty and noble reaches. The general decline of power, however (especially if it be compared with the *Prelude),* is marked. In 1815 was published the first collected edition of the poet's works (with the *Essay Supplementary to the Preface);* in the same year the *White Doe of Rylstone;* in 1819 *Peter Bell* (written in 1798) and the *Wagoner;* in 1820 *The River Duddon,* and *Miscellaneous Poems.* A further decline of power is witnessed, in 1822, by the *Ecclesiastical Sketches* and the *Memorials of a Tour on the Continent.* To the last, however, it is unsafe to regard Wordsworth as negligible; at any moment the old power is apt to reassert itself. It is to the period of his decline that we owe, in the *Prelude,* the magic of the famous description of Newton's statue--

The marble index of a mind for ever
Voyaging through strange seas of thought alone.

Many, again, of his best sonnets come from the late period. Here and there, from the *Evening Voluntaries* (1835) the old greatness flashes out. After 1835 Wordsworth published nothing new in poetry.

"Up to 1820 the name of Wordsworth," said De Quincey, "was trampled under foot; from 1820 to 1830 it was militant; from 1830 to 1835 it has been triumphant." In 1839 Wordsworth received the honorary degree of D.C.L. from the University of Oxford: he was presented by Keble, and the ceremony showed how deep was the hold that his poetry now had on youpg and old alike. In 1842 he was awarded a civil list pension of £300 a year (resigning the Distributorship of Stamps which he had held since 1813, a sinecure which had brought on him many reproaches). In 1843 he was appointed poet laureate, in succession to Southey. He died on April 23, 1850; and is buried in the churchyard of Grasmere. His wife survived him by nine years. Of his five children, two had died in 1812; his daughter, Dora, wife of Edward Quillinan, had died in 1847. Two surviving sons, John and William, left children.

BIBLIOGRAPHY.—The authorised edition of the Poetical Works is that published by Moxon in 1849–50 (6 vol.); which, however, does not contain *The Prelude* (first printed in 1850) or *The Recluse* (1888, Macmillan). Of subsequent texts the principal are: W. Knight, 1882–86, 8 vols.; E. Dowden, 1892–93, 7 vols.; Nowell Smith, 1908, 3 vols.; and in one volume, J. Morley, 1888; T. Hutchinson, 1895. In 1926 E. de Selincourt published, from the original mss., Wordsworth's first version of- *The Prelude* (with the "authorised" text *vis-a-vis).* The Prose Works were collected by A. B. Grosart, 1876, 3 vols. (out of print), and are accessible in W. Knight's edition, 1896, 2 vols. *The Letters of the Wordsworth Family* were printed by W. Knight in 1907 (out of print); other letters of Wordsworth are in Edith Morley's *Correspondence of Crabb Robinson with the Wordszoorth Circle* (1927). Wordsworth's *Tract on the Convention of Cintra* was edited separately by A. V. Dicey in 1915; the *Guide to the Lakes* by E. de Selincourt in 1906; the *Poems and Extracts from the Works of Anne, Countess of Winchelsra* by J. R. Rees in 1905. *A Concordance to the Poenzs of W. W.* by Lane Cooper was published in 1911.

For the life of Wordsworth chief authorities are: *Memoirs of W. W.*, by Christopher Wordsworth, 1851 (with the poet's "Autobiographical Memoranda"); *Life of William Wordsworth* by W. Knight, 1889; *William Wordsworth, his Life, Works and Influence, by* G. M. Harper, rev. ed. (1920); *The Early Life of Wordsworth* by E. Legouis, E.T. (1897). New facts about Wordsworth were given in G. M. Harper's *Wordsworth's French Daughter,* 1921, and in E. Lepouis' *Wordsworth in a New Light* (1923). Among general interpretative studies of Wordsworth may be mentioned those of F. W. H. Myers, W. Raleigh, H. W. Garrod, O. Elton; among special studies E. Barstow, *Wordswovtk' Theory of Poetic Diction* (1917); W. Beatty, *William Wordsworth: his Doctrine and Art in their Historical Relations* (1927). Upon bibliographical questions *Two Lake Poets: a Catalogue,* etc., by T. J. Wise (1927) should be consulted. (H. W. GA.)

WORKHOUSE, THE (in Scotland known as the poorhouse)! a British institution for the maintenance of paupers. Administration in England and \Vales was placed under the board oi guardians (the parish council in Scotland), under regulations prescribed by a central authority; the ministry of health or the Scottish board of health. Destitute persons gained admittance to the workhouse by a written order of the board of guardians or the relieving officer, or in exceptional cases by the master or matron without an order. Inmates were made subject to strict discipline while remaining in the workhouse and, under ordinary circumstances. were not allowed to leave the institution without first giving "reasonable notice." usually held to mean not less than 24 hr. and in some situations as long as three days.

Primitive workhouses were set up here and there in the 17th century under the Poor Relief act of 1601, which directed the ox-erseers oi every parish, among other things, to raise funds "for providing a convenient stock of flax, hemp, wool,'thread, iron and other ware and stuff to set the poor on work." But in this early period the authorities were for the most part content with "houses of correction" for the chastisement of the vagabond.

The 18th century saw the establishment of workhouses in towns and rural parishes. The administration was either brutally hard or incredibly lax; they ranged. it has been said, from "houses of terror" to "houses of debauchery." In 1833 the modern system was introduced. The 15,000 parishes of England and Wales were organized into a few hundred poor law "unions," each of which was required to set up a "well-regulated workhouse." Only in this institution could an able-bodied man and his family get relief! and in order to deter him from coming, the regimen was purposely made repugnant.

The Workhouse Condemned. — In the course of the 19th century the strict principles of 1834 were generally relaxed, and in 1909 a royal commission found the state of the workhouses with few exceptions deplorable. and unanimously recommended their abolition. They were not abolished, but some improvement was effected under pressure from the central authority. In particular, a better classification of the inmates was enjoined. Married couples aged over 60 were not to be separated if they wished to live together, and children between the ages of 3 and 16 could not be maintained in the workhouse. Some boards of guardians, however, persisted in breaking this latter regulation.

An effort was also made to render the workhouse less repellent to the poor by calling it "the institution," but there was no popular enthusiasm over this, and the old name continued in general use. After World War I, with the general relaxation of the restrictions on outdoor relief, the workhouse became less than ever a place for "testing" the able-bodied by disagreeable tasks of work. The inmate population comprised chiefly aged and infirm.

(*See* POOR LAW.) (C. M. L.)

WORKING MEN'S CLUBS existed for workmen in England and Wales (a few were established in either Scotland or Northern Ireland) from the middle of the 19th century.

The majority mere organized in the Working Men's Club and Institute union, which was brought into'existence by the Rev. Henry Solly. a Unitarian minister. The union was founded at a meeting at which Lord Brougham presided, on June 14, 1862.

It was at first intended that such clubs should be teetotal, but apart from the abandonment of this policy their objects remain as in the beginning, being as follows:

(1) That working men's clubs and institutes are calculated not only to diminish excessive use of intoxicating liquors but also to promote self-culture and the growth of a healthful public spirit arnong the mass of people.

(2) That there are few social reforms of greater importance to this country than the substitution of clubs and institutes for public houses as places of resort for the recreation and business of the working classes.

Although the union did not become entirely independent of outside support until 1890 it had, under the guidance of Hodgson Pratt (1867–83), worked steadily to that end. In 1884 it became completely democratic in constitution. The union itself is non-political as are the majority of its clubs, but political clubs of all parties may be admitted to membership, providing they are democratically controlled by the members or a committee appointed by the members.

In the mid-1950s the union comprised about 3,400 clubs with a total membership of about 2,000,000 persons throughout Great Britain. The union maintains four convalescent homes, accommodating about 6,000 members yearly.

The union provides about 1,400 trophies for indoor and outdoor sports and games contests among its clubs, and organizes day schools each weekend as well as spring and summer schools at University college. Leicester. and at Ruskin college, Oxford.

WORKINGTON, a seaport and municipal borough in Cumberland. Eng.. 33 mi S.W. of Carlisle by road. Pop. (1951) 28.891. Area 7.9 sq.mi. It is at the mouth of the Derwent river where the Prince of Wales dock (4.4 ac.) was opened in 1927. Coal is mined and there are engineering, cloth, carpet and clothing works. Iron ore is imported and steel is made.

The town was incorporated in 1888 and is in the Workington parliamentary division. Workington hall, the seat of the Curwens since the 13th century, was given to the town in 1946 for a civic centre.

WORKMAN, FANNY BULLOCK (1859–1925). U.S. mountaineer, explorer and writer, was born on Jan. 8, 1859, in Worcester, Mass.. the daughter of Alexander Hamilton, n-ho was a governor of Massachusetts. In 1881 she married William Hunter Workman. Her husband gave up the practice of medicine in 1889 because of ill-health and thereafter they spent many years travelling in Europe. Asia and Africa.

Mrs. Workman achieved a world mountaineering record for women in 1906 on a Himalayan expedition. A recognized Alpinist, she was honoured by the French Alpine club with the Grand Medaille in 1904. She was the first U.S. woman to lecture beiore the Sorbonne in Paris.

With her husband she was the author of numerous publications describing their expeditions, including *Algerian Memories* (1895), *Sketches Awheel in Fin de Siècle Iberia* (1897). *In the Ice World of Himalaya* (1900), *Through Town and Jungle* (1904), *Ice-Bound Heights of the Mustagh* (1908), *Peaks and Glaciers of Nun Kun* (1909), *The Call of the Snowy Hispar* (1910), and *Two Summers in the Ice Wilds of the Eastern Karakoram* (1917). She spent the latter part of her life in France and died on Jan. 22, 1925, in Cannes.

WORKMEN'S COMPENSATION. Until 1880 the only remedy which the law of Great Britain provided for a workman who had suffered physical injury in the course of his employment was a common law action in which the plaintiff had to establish that his injury was caused by some personal fault in the employer, or that the employer had been guilty of personal negligence. or had knowingly employed an incompetent servant or had committed a breach of some statutory duty. Even if the expense uhich had to be incurred was not an insurmountable obstacle, the cases where a workman could hope to recover damages for his injury by means of a common law action were comparatively rare. In an action for negligence formidable defenses were available to the employer. Contributory negligence in the workman himself would be pleaded as a matter of course, and if it was established that the plaintiff could. by the exercise of ordinary care, have avoided the consequences of the defendant's negligence the action must fail. The doctrine of *volenti non fit injuria* might destroy the injured workman's right to damages on the ground that, knowing the risk he was running, he expressly or impliedly agreed to accept that risk.

There was also the deiense of "common'! employment, which deprived the plaintiff of his right to damages when his injury resulted from the negligence of a fellow workman. Moreover. the position of the dependents of a workman whose injuries had proved fatal was more desperate still. for the right of action was personal to the injured man and died with him. Lord Campbell's act of 1846 created an exception to this rule in favour of a wife, husband, parent or child of the deceased, and enabled an action to be brought for the benefit of that limited class of persons in respect of the workman's death as a result of another's wrongful act or negligence. But the defenses which were available in an action by the injured workman himself remained available as against the dependents of a workman whose injuries had proved fatal.

Thereafter two different currents of opinion as to the manner in which the unsatisfactory state of the law should be remedied are ybservable. On the one hand, there was the view that any remedial measure should fit into the framework of the existing common law rules, and that all that was necessary was that those rules should be modified to remedy particular grievances. This school of thought found expression in the Employers' Liability bill, introduced in 1893 by Asquith, who thus indicated its three vital principles: "The first is that it abolishes the doctrine of common employment; the second is that it prohibits contracts by a workman renouncing his statutory rights; and third, it simplifies the procedure by means of which the workman can seek his statutory remedy." The views of the opposing body of opinion were expressed in the amendment moved by Joseph Chamberlain when Asquith's bill was before the house of commons, "That no amendment of the law relating to employers' liability mill be final or satisfactory which does not provide compensation to workmen for all injuries sustained in the ordinary course of their employment and not caused by their own acts or default." The house of commons passed Asquith's bill, but abandoned it rather than accept an amendment of the house of lords, the purpose of which was the preservation of the principle of contracting-out, although subject to certain safeguards.

The British Workmen's Compensation Acts.—The Workmen's Compensation act, 1897, introduced a new principle into the law of the relationship between master and servant by imposing a liability on the employer to pay compensation to an injured workman, or, if his injury proved fatal. to his dependents, although there had been no wrongful act or omission on the part of the employer or of anyone employed by him. Liability was imposed no less upon the employer who was blameless than upon him who had been guilty of negligence. Contracting-out was forbidden, save where an equally advantageous scheme duly certified as such by the registrar of Friendly societies, was substituted for liability under the act.

The act of 1897 came up for review before a departmental committee appointed for the purpose in 1903. Many of the recommendations of that committee (Report of Departmental Committee on Compensation for Injuries to *Workmen,* 1904, Cmd. 2208) were embodied in the Workmen's Compensation act, 1906, by which the act of 1897 was repealed. In 1919 the departmental committee generally known as the Holman Gregory committee was appointed to report what alterations of the lam were required "to remedy defects which experience has disclosed"; and "whether it would be desirable to establish a system of accident assurance under the control or supervision of the state." The committee reported in 1920 (Report of *Departmental Committee on* Compensation for Injuries to *Workmen,* 1920, Cmd. 816; *Minutes* of Evidence, Cmd. 908 and 909). Postwar conditions were not favourable to the achievement of the whole of the scheme of reform recommended by the committee: but a good deal of it was embodied in the amending act of 1923. A consolidating act was passed in 192j.

From the first the remedy by way of the Workmen's Compensation acts was in Great Britain an alternative. and not an exclusive remedy. The injured workman or his representatives were not barred from bringing an action at common law or under the Employers' Liability act if the evidence necessary to support an action was forthcoming. But an employer could not be liable to pay compensation twice over in respect of the same accident.

Employments to Which the Acts Applied.—The Workmen's Compensation act of 1897 applied only to the more dangerous industries. But the Workmen's Compensation act. 1900, applied the 1897 act to "the employment of workmen in agriculture by any employer who habitually employs one or more workmen in such employment." Whereas the first Workmen's Compensation act excluded from its scope all norkmen not expressly included, the act of 1906 included all "workmen" except the few classes expressly excluded, namely nonmanual workers whose remuneration exceeded £250 a year (the limit was raised to £350 by the 1923 act); persons employed casually otherwise than for the purposes of the employer's trade or business; outworkers; members of the employer's family dwelling in his house. members of a police force and persons in the army and navy. With the specific exceptions mentioned, the expression "workman" was defined to include "any person who has entered into or works under a contract of service or apprenticeship with an employer whether by way of manual labour, clerical work or otherwise." The sweep of the act was thus widened in 1906 so as to include not only the coal miner and the engineer but also the clerk in the countinghouse, the shop assistant and the general servant.

Yet there were still workers excluded from the protection of the act. A seaman on a British ship meeting with an accident when abroad would be outside the acts; so with the crews of British aircraft. when outside Great Britain. Again. if the legal relationship between, say, a cab proprietor and his driver was that of bailor and bailee, the relationship, the basis of which is a contract of service, which was the fundamental test for inclusion in the acts, was absent. To bring such cases within the Workmen's Compensation acts specific enactment was accordingly necessary.

Operation of the Scheme.—It was open to the employer, and in some cases obligatory on him, to insure against his liability; it was for the workman to make his claim and to take steps to enforce it. if challenged, in the courts. Inevitably compensation thus became a disputable issue between the two parties or their representatives. This resulted in the growth of legal complexity and the emergence of certain unsatisfactory features; *i.e.,* the practice of paying. in full discharge of liability for what might prove to be a permanent or long contiriued loss of earnings, a lump sum which the employer might offer for the sake of simplicity and finality, and the workman accept for the same reason.

The Beveridge Plan.—In 1941 the Beveridge committee was appointed by the government to survey existing national schemes of social insurance and allied services. including workmen's compensation. Sir William Beveridge (later Lord Beveridge). in his report which was published in Nov. 1942, advised the abolition of the separate scheme of workmen's compensation. This recommendation followed the practice already operating in many foreign countries and in the dominions overseas. In Sept. 1944 the government announced its proposals in two white papers on social insurance. Part I dealt with social insurance generally (except for industrial injuries) and part II with social insurance for a new scheme of industrial injury allowance. Part I was embodied in the National Insurance act, 1946 (see SOCIAL SECURITY), and part II in the National Insurance (Industrial Injuries) act, 1946. Amending acts were passed in 1952 and 1954 to increase the benefits originally provided.

Basis of the New Scheme.—Under the Workmen's Compensation acts the benefits were related to the estimated loss of earning capacity. Under the new scheme benefits were made payable at flat rates, with supplements for family responsibilities. In the earlier weeks, while the workman is incapacitated for work, injury allowances were to be made at uniform rates. Afterward, if disablement continued, industrial pensions were to be based, not on loss of earning capacity. but upon the extent to which the workman has suffered disablement by the injury in comparison with a normal healthy person of the same age and sex. The pensions were not affected by any subsequent earnings of the workman and not replaced by lump sum payments.

There also were provided pensions for widows, parents and certain other dependents of those who died as the result of industriai injury. The basis of the scheme was similar in many respects to that of the war pensions scheme. It thus recognized a certain similarity between the position of the soldier wounded in battle and that of the man injured, each being comperisated for whatever he lost in health, strength and the power to enjoy life and not for loss of earning capacity.

The scheme covered broadly all persons working under a contract of service or apprenticeship and applied to personal injury by accident arising out of and in the course of employment, and to specified industrial diseases. It also covered accidents to persons engaged in rescue work and other specified classes of emergency work in connection with industrial undertakings generally. The scheme did not apply to members of the armed services nor to employment outside Great Britain except in the case of persons employed in British ships and aircraft. Married women were insurable if they were employed persons even though they might have chosen to contract out of the main National Insurance scheme. If it was proved that the injury was attributable to the serious and wilful misconduct of the workman. benefit would be not payable unless the injury resulted in death or serious and permanent disability.

Finance and Administration. — Financed from an Industrial Injury Insurance fund maintained by weekly contributions from employers and workmen together with a contribution from the exchequer, the scheme required weekly contributions each of the insured person and the employer of *4d.* for a man over the age of 18 years and *3d.* for a woman over that age with lower contributions for juveniles. Contributions were subsequently raised to *5d.* for an insured man and *6d.* for his employer, and to *4d.* for the employer of an insured woman. Under an amendment made by an act of 1953, special provision could be made for contributions being based on the amount of work done or remuneration received instead of being payable for each week during which the insured person was employed. This was to meet the special position of those engaged in employment of a casual or subsidiary nature.

The minister of national insurance was held responsible to parliament for the general administration of the scheme as for the main National Insurance scheme.

It was provided that all claims would be dealt with by a local industrial pensions officer, normally being met on an application by or on behalf of the workman and on confirmation of the injury by the employer. The pensions officer was given the right to require the applicant to submit to a medical examination. In cases of industrial disease a report by a specially appointed medical officer might be required The decision of the industrial pensions officer on questions of entitlement was made subject to appeal to a local appeal tribunal on which employers and workmen would be equally represented and presided over by an independent chairman nith legal qualifications. It was also open to the pensions officer to refer any such question to the tribunal without himself giving a decision. Provision was made for medical practitioners to serve on the tribunal in special cases. There were further rights of appeal to an industrial injury insurance commissioner if leave was given either by the chairman of the local appeal tribunal or by the commissioner on questions of law. The medical assessment for pension. when necessary, was made by a medical board with a right of appeal to a tribunal consisting of a chairman of a local appeal tribunal and two medical practitioners. An assessment might be either final or provisional and a final assessment could be made either for a limited period or for life.

Benefits. — An insured person was entitled in 1955 to an injury benefit of *67s.6d.* weekly (increased by acts of 1952 and 1954 from *45s.)* for an adult workman alone and *92s.6d.* (increased from *61s.*) for a married couple. As under the main National Insurance scheme there was an allowance of *11s.6d.* (increased from *10s.*) weekly in respect of an only or eldest child and an allowance of *3s.6d.* (increased from *2s.6d.*) for each additional child. The normal allowance for the second and other children was also payable under the Family Allowances scheme. The injury benefit was payable in respect of any day on which the injured person was, during a period of 26 weeks thereafter, incapable of work. Disablement benefit was payable where the injured person continued to be incapable of work after the injury benefit period expired. Under the original scheme this benefit could only be paid if the loss of physical or mental capacity resulting from the accident was substantial (*i.e.,* causing disablement assessed at 20% or more) or was likely to be permanent or in some circumstances both substantial and permanent. These limitations were revoked by the act of 1953 and disablement benefit became payable for any period during which the disablement was assessed at 1% or more whether or not it was likely to be permanent.

The rate of disablement benefit varied, according to the degree of disability, up to *67s.6d.* for 100% disablement. An increment of *25s.* (increased from *16s.*) was payable in respect of a wife, or in certain circumstances, any other adult dependent and *11s.6d.* for the first or only child. Death benefit, by way of widow's (or sometimes widower's) pension was, payable at the rate of *45s.* weekly (increased from *30s.*) when the widow was living with her husband at the date of his death, or in some cases *20s.* A higher pension of *55s.* was payable for the first 13 weeks after the husband's death.

Systems in Other Countries. — Workmen's compensation, or employment injuries schemes as they are generally called, providing for cash benefits and usually for medical care, were in many countries the first type of social security legislation to be enacted. In some systems the employer is required to insure; in others he is under obligation to provide the benefits specified by law but insurance is voluntary. In some countries insurance is arranged by private insurance companies or employers' mutual associations. In a few countries insurance is arranged either through private insurance companies or a public insurance fund. More recently there was a trend toward compulsory insurance administered exclusively by public agencies.

Many of the early workmen's compensation laws only covered disability resulting from accidents but later they often covered provision for disability resulting from occupational diseases also.

Some recent laws extended the notion of employment injury to accidents which occur on the way to and from work. Most schemes distinguish between temporary incapacity and permanent incapacity and some between total and partial incapacity. Employment injury benefit is commonly provided without qualifying period or means test. Unlike the practice in Great Britain, temporary benefit in other countries was usually related (subject to a maximum payment) to the previous earnings of the beneficiary or to the basic earnings of the category of workers to which he belonged. The percentage varied from a minimum of 42% to a maximum of 80% in the Netherlands and Switzerland; in the German Federal Republic it was 663%.

In some countries (Bulgaria, Norway and Czechoslovakia) the benefit was made the same as for sickness. Temporary incapacity benefit often continued to be paid until the injury was healed or the disease cured or until the injury, if of a permanent nature, was consolidated. In many countries, however, a time limit was prescribed after which permanent incapacity benefit became payable. When the temporary incapacity benefit ceased to be payable and incapacity for work was found to have become permanent the degree of such incapacity was assessed and a proportionate pension granted. Frequently the rate of pension for total incapacity was made the same as the temporary incapacity allowance, as in Australia, India and New Zealand. On the contrary, the pension was set lower than the temporary incapacity benefit in Denmark. In Czechoslovakia the pension was set at two-thirds of basic earnings for total incapacity but the rate of the temporary benefit varied for different classes of employment. In the Netherlands and Switzerland the pension was made 70% of earnings as against 80% for temporary incapacity. In Sweden, however, it was $91\frac{2}{3}$% as compared with 70% for temporary incapacity.

In most countries benefit is also payable in respect of partial permanent incapacity, the pension being such fraction of the full rate for total incapacity as corresponds to the degree of incapacity. In France, however, it was provided that the allowance would be relatively higher if the degree of incapacity exceeded 50%. In the case of injury entailing only a minor degree of incapacity and sometimes also when loss of a limb is suffered but no loss of earning capacity, a lump sum might be provided instead of periodical payments. A considerable number of schemes grant supplements to invalids who need constant attendance; such supplements may bring the benefit up to 100% of former earnings.

By mid-20th century schemes providing employment injury benefits were financed exclusively by employers in more than three-quarters of the countries which were state members of the International Labour organization. **A** small proportion were financed by employers and workmen and the remainder also partly by the state.

Australia and New Zealand. — In Australia the matter came under the jurisdiction of state laws and not by commonwealth legislation, the arrangements not being uniform although very similar. Normally a person would be covered if he were employed under a contract of service or apprenticeship, but there was usually exclusion if the person's earnings exceeded a specified figure. The benefit was based on a percentage of the person's earnings prescribed by the legislation of each state. This varied up to $66\frac{2}{3}\%$ and in some states there were also supplements for dependents. There was also an allowance for medical treatment and hospitnlization.

In Queensland the scheme came under the administration of the agency of a public department — the state insurance office—which levied upon employers compulsory contributions and itself assumed the liability to pay compensation. It was to the fund and not to the individual employer that the injured workman or his dependents must look for comaensation. In the other states of Australia intervention by the state was directed to the compulsory insurance of workmen's compensation risk coupled usually with the setting up of a state insurance office with which, however, insurance companies might compete. In South Australia, only private insurance companies were established. The settlement of claims is in some cases a matter ior the courts and in others for special magistrates or commissioners. In Victoria, the county court judges were made responsible for the administration, acting with a workers' compensation board consisting of representatives of workers and employers.

In New Zealand, the scheme covered all employed persons and was financed by the employers. The contribution rates, fixed by order in council, varied n-ith the degree of risk in the undertaking. Benefit was based on a proportion of earnings with an allowance at a lower rate for permanent disability. An additional allowance was payable for medical and other special treatment. Injury benefit was based on 75% of earnings for total incapacity subject to a prescribed minimum and maximum. Earlier, insurance could only be affected through the state fire and accident insurance office but by the latter 1950s it could be arranged also through private insurance companies, or a co-operative association. It was compulsory for each employer, unless specially exempted, to insure.

THE UNITED STATES

Historical Development. — In comparison with Europe, workmen's compensation came late in the United States. To be sure, the common law rules of employers' liability had scarcely been laid down by the courts before legislative attempts to modiiy them began. By 1910 practically every state had passed some sort oi employers' liability statute. But these lams merely mitigated the harshness of the common lam, Many applied only to railway accidents and none was adequate to assure pro\-ision for the disabled or the survivors of workers killed on the job. The essential basis of employers' responsibility remained tort liability.

The first acts to be based on the compensation principle of "liability without fault" were enacted by Maryland in 1902 and Montana in 1909. Both were held unconstitutional. But by this time public opinion was aroused. The peak of industrial injury rates was reached around 1907–10. Under such diverse leadership as represented by Theodore Roosevelt, John R. Commons of Wisconsin, and John B. Andrews of the American Association for Labor Legislation, three related and contemporaneous reform movements began — workmen's compensation, industrial safety and industrial hygiene.

In 32 states, 40 official commissions investigated and strongly condemned the existing legal situation and, with virtual unanimity, recommended adoption of laws based on "liability without fault." An important setback, however, resulted from a 1911 New York court of appeals decision which invalidated the New York law of 1910, the most comprehensive up to that time. Nevertheless, 30 compensation laws were enacted between 1910 and 1915. In 1917 the issue of constitutionality was permanently settled by the United States supreme court which declared the state police power an adequate basis ior all proposed types of compensation laws.

The New York ruling, though reversed, leit a heritage. Although seven states amended their constitutions to make certain that compensation would be legal, most laws were narrowed and restricted because of the decision. The resulting "elective" provisions and limited coverage of industries, occupations and injuries persisted in curtailing the effectiveness oi workmen's compensation. By 1920 all but six states had enacted legislation; slowly they joined the ranks also and by 1948, with the action of Mississippi, all states were covered. Federal jurisdictions were covered by the Federal Employees' Compensation act and the Longshoremen's and Harbor Workers' act.

Despite its wide spread, workmen's compensation never completely supplanted the common law and employers' liability legislation as remedies for occupational injury. The latter, especially, continued to remain a significant factor. By the mid-1950s, at least a fiith of U.S. workers were still not covered. Prominent among the omissions were interstate railway workers and merchant seamen who felt that their experience under special federal employers' liability legislation compared favourably with the state compensation systems. Other exclusions were caused by elective laws, exclusion oi certain types of employment (*e.g.*, small firms), and some types of injuries: particularly occupational diseases. Following World War II, injury coverage was greatly broadened through judicial expansion of the concept of causal relationship of injury to employment and the meaning of such terms as accidental injury.

Benefit Provisions. — There are three categories oi compensation benefits: cash, medical and rehabilitation, designed to indemnify the injured worker or his dependents for loss of wages, medical and hospital expenses, loss of occupational capacity and skills, and where possible to restore the latter.

Cash benefits vary in accordance with four types of injuries: temporary-total disability, permanent-total disability, permanent-partial and death. The basic benefit formula in all types of cases is similar, but complex. The factors involved are numerous: (1) a specified maximum percentage of the worker's normal wages; (2) a weekly dollar maximum and minimum; (3) a maximum total dollar amount; (4) a maximum amount of time ior which benefits may be paid; (5) variations according to dependents; (6) a waiting period, and (7) a formula by which normal wages are computed. The first of these was originally considered most important since the relation of benefits to wage loss was a theoretical foundation stone of workmen's compensation in the United States. Later, however, the specified percentage — usually 662% — was submerged by the other limitations, particularly the maximum dollar amounts. The general result was an approximation of a flat-sum system determined by the weekly maximums; in a typical year, average benefits did not replace more than a third oi wage loss.

Medical benefits had been, in some degree, universally included and probably represented the most significant quantitative advance in the program, accounting for about a third of all benefit payments. Qualitatively the results were less impressive. Medical administration was under attack, accused of not having become rehabilitation oriented.

Financing. — Compensation benefits in the United States are generally financed by employers, who must give assurance of their ability to meet such obligations. This may be done by insuring with a private carrier (the most common method), or with a state fund in certain states or by giving prooi of ability to carry one's own risk, called self-insurance. The annual cost to employers by the mid-1950s had increased to about $1.500.000.000. As a percentage of payroll, net costs had remained fairly constant — about 1% since the mid-1930s, declining during the 1940s, and rising again in the early 1950s. This national average concealed great variations among states, among industries and among individual employers, rising from negligible proportioris to 30% or more in the case of extra-hazardous industries in some states. Overhead costs — insurance, legal fees and administration — mere consuming about hali the total costs. Insurance remained the major factor.

Basic Issues. — These related to whether workmen's compensation was meeting its stated objectives and, more profoundly, whether the original objectives were enough for contemporary conditions. The disappointing level of benefits had raised the question of whether the program could be adequate as the injured worker's exclusive remedy. Increasingly, the issue had arisen as to whether it is practicable to separate occupational and nonoccupational disability. Most important, perhaps, was the challenge of modern rehabilitation techniques.

WORKS' COUNCILS: *see* INDUSTRIAL RELATIONS.

WORKSOP, a municipal borough in the Bassetlaw parliamentary division of Nottinghamshire, Eng., on the Chesterfield canal, $27\frac{1}{2}$ mi. N. of Nottingham by road. Pop. (1951) 31,034. Area

28.0 sq.mi. The borough contains 3,784 ac. of Sherwood forest, belonging to the National trust. The south door of the priory church possesses 12th- or 13th-century iron scrollwork, the oldest in England.

In 1296 a royal charter was granted for the holding of a market and fair. Worksop was incorporated in 1931. Coal mining has been the chief industry since 1859 and other industries include timber, glass, quarrying and the manufacture of bricks, nylon and hosiery. Worksop college was founded in 1890.

WORLD COUNCIL OF CHURCHES, THE, was constituted in 1948 as "a fellowship of Churches which accept Jesus Christ our Lord as God and Saviour." It consists of nearly 200 churches in all parts of the world which have accepted this basis, but these do not include the Roman Catholic Church. the Southern Baptists in the U.S. and some other large Evangelical bodies.

The controlling body of the World Council of Churches is the assembly. which meets at intervals of roughly five years (Amsterdam. Neth., 1948; Evanston. Ill., 1954; New Delhi, India, 1961). This appoints a central committee of 90 members and an executive committee of 12 members, as far as possible to represent all interests and to carry on the work of the council between assemblies. There are six presidents. The headquarters of the council in Geneva has a large staff under a general secretary. There are three main divisions of work: church relations; ecumenical study' and promotion; and interchurch aid and service to refugees. Under these are a number of groups and commissions, such as faith and order, the commission on the life and work of the laity in the church, and that on the co-operation of men and women in church and society. At the Château de Bossey, the ecumenical institute 15 mi. from Geneva, Switz., study conferences are in progress during most of the year.

The World Council is not a church, nor does it issue orders or directions to the churches. It works for the unity and renewal of the church and offers the churches an instrument by means of which they may talk together, pray together and work together in the spirit of tolerance and mutual understanding. In 1961 the World Council of Churches was united with the other great ecumenical body, the International Missionary council. See also ECUMENICAL MOVEMENT.

WORLD COURT: *see* INTERNATIONAL COURT OF JUSTICE.

WORLD GOVERNMENT MOVEMENTS. Various proposals to replace the system of sovereign nations with a world government arose out of the collapse of international order in 1939 and the advent of the atomic age in 1945. In contrast to earlier plans for a universal government and attempts at world empire, these proposals, known collectively as the "world government movement," had three distinctive features: (1) they received a degree of popular support and some consideration at the governmental level; (2) they were based upon the idea of a voluntary surrender or limitation of national sovereignty; and (3) they reflected a sense of urgency, maintaining that the social, economic and technological interdependence of the modern world had made the nation-state system obsolete, and that the prospects of nuclear warfare left mankind with catastrophe as the only alternative to the achievement of a common government. The United Nations was criticized, especially in its earlier years, on the ground that an association of sovereign states would be hopelessly inadequate to deal with the problem of war and peace in contemporary society.

Regional v. Universal Approach.—One of the proposals contemplated a federal union of the North Atlantic democracies as the nucleus of an eventual world government. On the eve of World War II, Clarence K. Streit had published *Union Now* (1939), expounding the view that a common federal government would greatly increase the strength of the democracies in relation to the dictatorships. Support for the idea continued after the war and in 1949 the Atlantic Union committee was organized under the leadership of Owen J. Roberts, formerly an associate justice of the U.S. supreme court. This committee had as its main purpose the calling of a convention to explore the possibilities of federal union among the North Atlantic countries.

Great emphasis was placed on freedom and democracy as the criterion for eligibility to membership. Unity to increase the power of the free democracies was the central purpose, and peace was to be achieved by strengthening the area of freedom. The functions and powers assigned to the federal union would be important ones, including a common citizenship and defense force, a customs-free economy and a common currency. The political and economic success of such a union was expected to attract additional members, thus bringing about a gradual expansion into a federal government of the entire world.

A different approach was that of the United World Federalists, who insisted that substantial universality of membership was an essential requirement from the beginning. This organization, formed in the United States after World War II, faced the dilemma of believing that world peace could be assured only within the jurisdiction of a common government, but that nations were not ready for a surrender of broad powers. The solution offered was the establishment of a world government that would be able to prevent war, but also would be so limited in functions and powers that interference in the domestic affairs of member nations would be precluded. Support for similar ideas in other countries was reflected in the World Movement for World Federal Government, organized at a conference held in Luxembourg in 1946. This group reached its peak membership of about 67,000 by 1949; of the total, almost two-thirds were in the United States and a majority of the remainder in Great Britain.

Proposed Powers.—The extent of the powers to be delegated was a central issue for advocates of a federal world government. Varying answers to this question were given by different groups, and the so-called maximalist-minimalist controversy resulted. The United World Federalists stressed both adequacy and limitation, but always in general terms. Another approach was to develop a detailed plan, which would specify exactly the limited powers to be transferred to a federal world government. The Citizens Committee for United Nations Reform, organized in 1946 by Ely Culbertson on the basis of an earlier and more ambitious plan, proposed to eliminate the veto in the UN Security council, provide for international control of armaments on the basis of an enforceable quota system and establish an effective international police force. Another plan, worked out in considerable detail by Grenville Clark and Louis Sohn, was strictly limited to the enforcement of complete and universal disarmament. The New Commonwealth plan in Great Britain advocated an equity tribunal to settle disputes and a police force to uphold international law and order.

The necessity of granting maximal powers to a world government was urged by the Committee to Frame a World Constitution, established at The University of Chicago in 1945. The committee assembled a research staff, exchanged ideas through memoranda and periodic meetings, and published its proposals in the form of a preliminary draft of a world constitution. The purpose of the draft was to serve as a basis for discussion, to focus attention on what a world government might look like and to help in the process of education toward a world community. The assumptions were that war must and can be outlawed, that world government is the only alternative to world destruction and is possible because it is necessary, and that world government must be based upon a universal community of justice. The proposal called for a world government with broad and extensive powers, a system of regional representation and a unique and complex structure. It would grant to the world authorities all the functions and powers needed to maintain peace and justice and to manage major segments of the world economy. Only this was considered sufficient to accomplish the purpose.

Another approach to solving the dilemma of broad versus limited powers was that of the British Parliamentary Group for World Government. In 1952 the group suggested alternative plans, one designed for early establishment of a world government and the other for strengthening the UN as an interim step.

A different type of world government proposal was that based on the concept of functionalism. The essential idea was that people working together on a common task can develop the appropriate methods and machinery as the need arises. Co-operation in dealing with problems of mutual concern was expected to produce better results than attempts to agree in advance on a plan of government. Some advocates of functionalism did, however, combine that principle with endorsement of movements to set up a world government structure. Other functionalists saw great possibilities in the gains which might result from expanded social and economic co-operation through the UN.

Post-Korean Developments. — The high tide of public and political interest in the world government movement was reached between 1948 and 1950. After the outbreak in 1950 of the Korean war and the Chinese Communist intervention, it was obvious that the mutual confidence required for world-wide participation in a common government did not exist. At the same time. the nations of the North Atlantic area continued to rely on an association of sovereign states, instead of forming a federal union among themselves. Most proponents of world federalism began to talk in terms of supporting and strengthening the United Nations as the best immediate hope. The Atlantic Union committee, for its part. placed emphasis upon co-operation through the North Atlantic Treaty organization (NATO) (*q.v.*) and other interim measures to increase unity among the North Atlantic democracies. Thus, proposals for the immediate establishment of a supranational federation were largely replaced by an effort to bring about conditions which might eventually permit the achievement of world government. It is true that a few countries made constitutional provision for a reciprocal modification of sovereignty and that some governmental proposals, notably in the case of atomic energy, applied the supranational principle to a limited functional area. Nevertheless, the pattern of world political organization remained on the basis of the voluntary association of sovereign states.

WORLD HEALTH ORGANIZATION. The World Health Organization (WHO), established in 1948, is a specialized agency of the United Nations designed to further international co-operation for improved health conditions throughout the world. The culmination of nearly a century of efforts to this end, WHO inherited from the Health organization of the former League of Nations, set up in 1923, and from the International Office of Public Health at Paris, dating from 1907, various international duties relative to epidemic control, quarantine measures and the standardization of drugs. Under its constitution, however, WHO is given a much broader mandate—to promote the attainment of "the highest possible level of health" by all peoples. Health is defined positively as "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity"; and good health is held to be fundamental to world peace and security.

Administration. — With administrative headquarters in Geneva, Switz.. WHO operates through three principal instrumentalities: the World Health assembly, meeting annually as the general policy-making body; an executive board of 18 health specialists elected for three-year terms by the assembly, and holding two sessions each year; and a secretariat, which had in the late 1950s a staff of about 1,300 persons representing over 50 different nationalities. The secretariat is headed by a director-general appointed for a five-year term by the assembly on nomination by the executive board. The first director-general, Brock Chisholm, a Canadian psychiatrist, served until 1953; M. G. Candau of Brazil succeeded him and was re-appointed in 1957.

To stimulate and co-ordinate WHO's work "at the grass roots." six regional offices were established in Alexandria, Egypt; Brazzaville, French Equatorial Africa; Copenhagen; New Delhi; Manila; and Washington. Each regional office is supervised by a committee of representatives of member states in the region concerned. The Washington office also serves as the headquarters of the Pan American Sanitary bureau (founded in 1902), which co-operates with WHO in the western hemisphere.

The membership of WHO consists of sovereign states and non-self-governing territories, their number growing from 26 in 1948 to 88 ten years later, 85 of which were independent states. The organization is financed primarily from annual contributions made by member governments on the basis of relative capacity to pay. The regular budget expanded in the first decade from $5,000,000 in 1949 to $15,000,000 for 1959, the largest contributor being the United States, which provided in the latter year approximately one third of the total. In addition, after 1951 WHO was allocated substantial resources from the expanded technical assistance program of the UN, amounting in 1958 to $5,500,000. Grants for special purposes were also made to WHO from time to time by private foundations and individual governments.

Functions. — The work of WHO embraces three fairly distinct categories of activities:

1. The provision of central "clearing house" and research services. As an example, information about the occurrence of pestilential disease anywhere in the world is broadcast over an international radio network to national health authorities, seaports, airports and ships at sea. In 1952 13 outdated international sanitary agreements were replaced by a codified set of international sanitary regulations designed to standardize quarantine measures without interfering unnecessarily with trade and air travel across national boundaries. These were subsequently accepted by most of the world's governments. Another WHO regulation (published in 1951) requires national health administrations to adopt a uniform system for reporting diseases and causes of death, thus facilitating the statistical study of world health trends. A closely related activity was the establishment of international pharmaceutical standards for some zoo drugs, intended to encourage the manufacture of drug products of uniform strength and quality. Scientific medical research is stimulated and the results disseminated by means of numerous WHO technical publications and the work of 30 advisory panels drawn from over 1,000 of the world's leading health specialists. The central WHO secretariat also keeps member countries informed of the latest developments in use of vaccines, cancer research, nutritional discoveries, control of drug addiction and health hazards of nuclear radiation.

2. Measures for the control of epidemic and endemic disease. This category consists chiefly of mass campaigns promoted by WHO against communicable diseases. These campaigns, some of them conducted with the co-operation of the United Nations Children's fund (UNICEF), have been dramatically successful in reducing the incidence of tuberculosis, malaria and venereal disease in the more backward regions of the globe. The organization launched a world-wide campaign for the complete eradication of malaria within five years—a program to which the United States made a special contribution of $7,000,000 in 1957. Considerable progress was likewise made by WHO in attacking such diseases as cholera, yellow fever, yaws and trachoma. Among the techniques employed in these campaigns are nationwide vaccination programs; instruction in the use of antibiotics and such insecticides as DDT; the improvement of laboratory and clinical facilities for early diagnosis and prevention; assistance in providing pure water supplies and sanitation systems; and health education for rural communities.

3. Efforts to strengthen and expand the public health administrations of member nations. As its program developed, WHO set as its most important task the strengthening of national and local health services. especially in Africa, Asia and Latin America. In furthering this vital objective, a wide variety of devices are utilized. The organization provides technical advice to governments on request in the preparatipn of long-term national health plans; sends out to the field international teams of experts to conduct surveys and demonstration projects; helps set up local health centres; offers aid in the development of national training institu-

tions for medical and nursing personnel; makes available teachers for on-the-spot short course training experiments; and makes traveling fellowship awards to doctors, public health administrators, nurses, sanitary inspectors and laboratory technicians. In the late 1950s over 5,000 individuals had benefited from these fellowships to study advanced techniques.

Participation in UN **Technical** Assistance Program.—After 1951 WHO's types of assistance were materially expanded with supplementary funds from the United Nations Expanded Technical Assistance program (ETAP), a program initially stimulated by Pres. Harry S. Truman's "point four" proposal of 1949. ETAP resources were used primarily to recruit experts from the more advanced countries for assignments of a few months up to two years in economically underdeveloped areas of the globe. By 1957 over 400 such experts (in addition to several hundred members of WHO's permanent staff) had served on field missions. During 1958, a typical year, WHO was involved in 700 health projects distributed among 112 countries and territories over the globe. To a limited extent ETAP funds were also drawn upon for supplies, drugs and apparatus required for training and demonstration undertakings. (See FOREIGN AID PROGRAMS.)

Compared with the staggeringly vast needs of the world's peoples for more and better-trained doctors, nurses and medical scientists, for more adequate public health services of all kinds and for additional medical schools, hospitals and clinics, WHO's financial and staff resources were decidedly limited. Yet it served as an increasingly important instrument, at the international level, in mankind's perennial battle against disease, squalor, infant mortality and ignorance of the elements of better health.

WORLD SOUL, in the history of philosophy, denotes the conception that there is in the world a universal spirit or soul which is related to the material world in a way that is similar or analogous to the relation of the human soul to the body. This view was taught by various Greek philosophers, notably by Plato and the Stoics. In modern times Schelling held a similar conception, and attributed to the world soul the function of acting as an organizing principle of the material world, which is thereby made into a coherent system. *See* PLATO; STOICS; SCHELLING, FRIEDRICH WILHELM JOSEPH VON.

WORLD WAR I. The aim of this article is to trace the main strategic currents of World War I, and also the conditions and ideas which guided them. The causes of the war are not within its scope. (For the political and diplomatic history of the struggle *see* the article EUROPE.) A process of 50 years had gone to make Europe inflammable, and a few days were enough to detonate it. To study the causes of the conflict on the German side we should have to trace the influence of Prussia on the creation of the Reich, the political conceptions of Bismarck, the German philosophical tendencies, her economic situation—a medley of factors which transmuted Germany's natural desire for commercial outlets, unhappily difficult to obtain, into a vision of world power. We should have to analyse that heterogeneous relic of the middle ages known as Austria-Hungary, appreciate her complex racial problems, the artificiality of her governing institutions, the superficial ambitions which overlay a haunting fear of internal disruption and frantically sought to postpone the inevitable end.

On the other side we should have to examine the strange mixture of ambition and idealism which swayed Russian policy; we should have to understand the constant and justifiable fear of fresh aggression which France had suffered since 1870, and follow the regrowth of confidence which fortified her to resist further threats; finally, we should have to trace Britain's gradual movement from a policy of isolation into membership of the European system and her slow awakening to the reality of German ambitions. Beside these fundamental causes the international "incidents" that took place between 1899 and 1914 are but symptoms.

This article is divided into the following sections:

Following this is a discussion of the part played by naval forces during World War I.

I. INTRODUCTION

The Armed Forces.—World War I may be briefly epitomized as a progress from convention through chaos to co-operation. The nations entered upon the conflict with the conventional outlook and system of the 18th century merely modified by the events of the 19th century. Politically, they conceived of it as a struggle between rival coalitions based on the traditional system of diplomatic alliances, and militarily as between professional armies—swollen, it is true, owing to the continental system of conscription, yet essentially fought out by soldiers while the mass of the people watched, from seats in the amphitheatre, the efforts of their champions. The Germans alone had a glimpse of the truth, but—one or two prophetic minds apart—the "Nation in Arms" theory evolved by them during the 19th century visualized the nation rather as a reservoir to pour its reinforcements into the army than as a mighty river in which are merged many tributary forces, of which the army is but one. Their conception was the "Nation in Arms," hardly the "Nation at War." Even after the war this truth had still to be grasped in its entirety and its full implications understood. Progressively throughout the years 1914–18 the warring nations enlisted the research of the scientist, the inventive powers and technical skill of the engineer, the manual labour of industry and the pen of the propagandist. For long this fusion of many forces tended to a chaotic maelstrom of forces; the old order had broken down, the new had not yet evolved. Only gradually did a working co-operation emerge, and it is a moot point whether even in the last phase co-operation of forces had attained to the higher level of co-ordination-direction by unity of diversity.

The German army of 1914 was born in the Napoleonic Wars, nursed in infancy by Gneisenau and Scharnhorst, and trained in adolescence by the elder Moltke and Roon. It reached maturity in the War of 1870, where it emerged triumphantly from a test against the long-service army of France. Every physically able citizen was liable to service, and the state took the number it desired, trained them to arms for a short period of full-time service, and then returned them to civil life. The feature, as also the object, of this system was the production of a huge reserve by which to expand the active army in war. A man served two or three years full-time, according to his branch of the service, followed by five or four years in the regular reserves. He then went into the Landwehr for 12 years, and finally passed into the Landsturm from 39 till 45. Further, an Ersatz reserve was formed of those who were not called on for service with the colours.

In this organization and the thoroughness of the training lay the secret of the first great surprise of the war, one which almost proved decisive. For instead of regarding their reservists as troops of doubtful quality, fit only for an auxiliary rôle or garrison duty, the Germans during mobilization were able to duplicate every first line army corps with a reserve corps—and had the courage, justified by events, to use them in the opening clash. This surprise upset the French calculations, as it dislocated their plan.

The Germans have been reproached for many miscalculations; less than justice has been done to the correctness of many of their intuitions. They alone realized what became an axiom—that, given a highly trained cadre of leaders, a military machine can be rapidly manufactured from the levies of the led, like molten liquid poured into a mould. The German mould was a long-service body of officers and n.c.o.s who in their standard of technical knowledge and skill had no equal in the world. But if the machine was manufactured by training, it gained its solidity from another process. The psychological element plays an even greater part in a "national" than in a professional army. Esprit de corps is not enough; the stimulus of a great moral impulse to action is necessary, a deep-rooted belief in the policy for which citizens are called on to fight. The leaders of Germany had worked for generations to inspire their people with a patriotic conviction of the grandeur of their country's destiny. And if their opponents went forth to battle in 1914 with as intense a belief in their country's cause, this flaming patriotism had not the time to consolidate such a disciplined combination as years of steady heat had produced in Germany. The German people had an intimacy with and a pride in their army, notwithstanding its severity of discipline, that was unknown elsewhere.

This unique instrument was handled by a general staff which, by rigour of selection and training, was unmatched for professional knowledge and skill, if subject to the mental "grooves" which characterize all professions. Executive skill is the fruit of practice; and constant practice, or repetition, tends inevitably to deaden originality and elasticity of mind. In a professional body, also, promotion by seniority is a rule difficult to avoid. The Germans, it is true, tended towards a system of staff control, which in practice frequently left the real power in the hands of youthful general staff officers. As war memoirs and documents reveal, the chiefs of staff of the various armies and corps often took momentous decisions with hardly a pretence of consulting their commanders. But such a system had grave objections, for such a happy combination as that of a Hindenburg and Ludendorff is rarely found, and from it came the grit in the wheels which not infrequently marred the otherwise well-oiled working of the German war-machine.

Tactically, the Germans began with two important material advantages. They alone had gauged the potentialities of the heavy howitzer, and had provided adequate numbers of this weapon. And if no army had fully realized that machine-guns were "concentrated essence of infantry," nor fully developed this preponderant source of fire-power, the Germans had studied it more than other armies, and by their method of grouping the machine-guns under regimental control, instead of distributing them among battalions, were able to exploit its inherent battlefield-dominating power sooner than other armies. Strategically, also, the Germans had brought the study and development of railway communications to a higher pitch than any of their rivals.

The Austro-Hungarian army, if patterned on the German model, was a vastly inferior instrument. Not only had it a tradition of defeat rather than of victory, but its racial mixture prevented the moral homogeneity that distinguished its ally. This being so, the replacement of the old professional army by one based on universal service lowered rather than raised its standard of effectiveness. The troops within the borders of the empire were often racially akin to those beyond, and this compelled her to a politically instead of a militarily based distribution of forces, so that kinsmen should not fight each other. And her human handicap was increased by a geographical one—the vast extent of frontier to be defended. Nor were her leaders, with rare exceptions, the professional equals of the Germans, and if common action was better than with the Entente Powers, Austria did not accept German direction gladly.

Yet despite all its evident weaknesses this loosely knit conglomeration of races withstood the shock and strain of war for four years, in a way that surprised and dismayed her opponents. The explanation is that this complex racial fabric was woven on a stout Germanic and Magyar framework.

From the Central we turn to the Entente Powers. France possessed but 60% of the potential man-power of Germany, and this debit balance had forced her to call on the services of practically every able-bodied male. A man was called up at 20. did three years' full-time service, then 11 in the reserve and finally two periods of seven years each in the Territorial Army and Territorial Reserve. This system gave France an initial war strength of some 4,000,000 men, equal to her German rival, but, in contrast, she placed little reliance on the fighting values of reservists. The French command counted only on the semi-professional troops of the first line, about 1,500,000 men, for the short and decisive campaign which they expected and prepared for. Moreover, they assumed a similar attitude on the part of their enemy—with dire result. But this initial surprise apart, a more profound handicap was the lesser capacity of France for expansion, in case of a long war, due to her smaller population—under 40,000,000 compared with Germany's 65 millions. Col. Mangin, later to become famous, had advocated tapping the resources in Africa, the raising of a huge native army, but the Government had considered the dangers to outweigh the advantages of such a policy.

The French general staff, if less technically perfect than that of Germany, had produced some of the ablest military thinkers in Europe, and its level of intelligence could well bear comparison. Unfortunately, in recent years a sharp division of thought had arisen, which did not make for combined action. Worse still the new French philosophy of war in its abstraction with the moral element had become more and more separated from the inseparable material factors. Abundance of will cannot compensate a definite inferiority of weapons, and the second factor, once realised, inevitably reacts on the first. In *matériel*, the French had one great asset in their quick-firing 75 mm. field gun, the best in the world, but its very value had led them to undue confidence in a war of movement and a consequent neglect of equipment and training for the type of warfare which came to pass.

Russia's assets were in the physical sphere, her defects in the mental or moral. If her initial war strength was no greater than that of Germany, her man-power resources were immense and the courage and endurance of her troops were famous. But corruption and incompetence permeated her leadership, her rank and file lacked the intelligence and initiative for scientific warfare—they formed an instrument of great solidity but little flexibility—and her manufacturing resources for equipment and munitions were far below those of the great industrial Powers. This handicap was made worse by her geographical situation, cut off from her allies by ice- or enemy-bound seas, and with immense land frontiers. Another radical defect was the poverty of her rail communications, the more essential as she relied for success on bringing into play the weight of her numbers. In the moral sphere Russia's condition was less clear. Her internal troubles were notorious and must be a brake on her efforts unless the cause was such as to prove a crusade-like appeal to her primitive and incoherent masses.

Between the military systems of Germany, Austria, France and Russia there was a close relation, differences of detail rather than of fundamental, and this similarity threw into greater contrast the system of the other great European Power—Britain. Throughout modern times she had been essentially a sea-power, intervening on land through a traditional policy of diplomatic and financial support to Allies, whose military efforts she reinforced with a leaven from her own professional army. This regular army was primarily maintained for the protection and control of the overseas dependencies—India in particular—and had always been kept down to the minimum strength for this purpose. The reason for the curious contrast between Britain's determination to maintain a supreme navy and her consistent neglect, indeed starvation of the army, lay partly in her insular position, which caused her to regard the sea as her essential life-line and main defence, and partly in a constitutional distrust of the army, an illogical prejudice, which had its almost forgotten source in the military government of Cromwell. Small as to size, it enjoyed a practical and varied experience of war without parallel among the Continental armies. Compared with them, its professional handicap was that the leaders, however skilled in handling small columns in colonial expeditions, had never directed large formations in la *grande guerre.*

Further, the foundations of a general staff had only been laid since the bitter lessons of the South African War, and the interval was too short, the distractions too great, for this to have been developed to the level of Germany and France. For the progress in organization in the years before 1914, the British army owed much to Lord Haldane, and to him also was due the creation of a second line of part-trained citizens — the Territorial Force. Lord Roberts had pleaded for compulsory military training, but the voluntary principle was too deeply embedded in the national mind for this course to be adopted, and Haldane wisely sought to develop Britain's military effectiveness within the bounds set by traditional policy. As a result, 1914 found England with an expeditionary force of some 160,000 men, the most highly trained striking force of any country — a rapier among scythes, and to maintain this at strength the old militia had been turned into a special reserve for drafting. Behind this first line stood the Territorial Force, which if only enlisted for home defence had a permanent fighting organization unlike the amorphous volunteer force which it superseded. The British army had no special outstanding asset in war armament, but it had developed a standard of rifle-shooting unique among the world's armies.

The reforms by which the army was brought into line with Continental models had one defect, which was accentuated by the close relations established between the British and French general staffs since the Entente. It induced a "Continental" habit of thought among the general staff, and predisposed them to the rôle, for which their slender strength was unsuited, of fighting alongside an Allied army. This obscured the British army's traditional employment in amphibious operations through which the mobility given by command of the sea was exploited. A small but highly trained force striking "out of the blue" at a vital spot could produce a strategical effect out of all proportion to its slight numbers.

The last argument brings us to a comparison of the naval situation, which turned on the balance between the fleets of Britain and Germany. Britain's sea supremacy, for long unquestioned, had in recent years been challenged by a Germany which had deduced that a powerful fleet was the key to that colonial empire which she desired as an outlet for her commerce and increasing population. To the spur of naval competition the British people eventually responded, determined at any cost to maintain their "two-power" standard. If this reaction was instinctive rather than reasoned, its subconscious wisdom had a better foundation than the catchwords with which it was justified, or even than the need of defence against invasion. The industrial development of the British Isles had left them dependent on overseas supplies for food, and on the secure flow of seaborne imports and exports for industrial existence. For the navy itself this competition was a refining agency, leading to a concentration on essentials. Gunnery was developed and less value attached to polished brasswork; warship design and armament were transformed — the "Dreadnought" ushering in a new era, of the all big-gun battleship. By 1914 Britain had 29 such capital ships and 13 building, to the 18 built and nine building, of Germany. Further, Britain's naval strength had been soundly distributed, the main concentration being in the North sea.

More open to criticism, in view of the forecasts of several naval authorities, was her comparative neglect of the potential menace of the submarine. Here German opinion was shown rather by the number building than those already in commission. It is to Germany's credit that though lacking a sea tradition, her fleet an artificial rather than a natural product, the technical skill of the German navy made it a formidable rival to the British ship for ship, and perhaps its superior in scientific gunnery.

But in the first stage of the struggle the balance of the naval forces would affect the issue far less than the balance on land. For a fleet suffers one inherent limitation — it is tied to the sea, and hence cannot strike direct at the hostile nation. The fundamental purpose of a navy is therefore to protect a nation's sea communications and sever those of the enemy, and, although victory in battle may be a necessary prelude, blockade is the ultimate purpose. And as blockade is a weapon slow to take effect, its influence could only be decisive if the armies failed to secure the speedy decision on land, upon which all counted.

The Economic Forces. — In this idea of a short war lay also the reason for the comparative disregard of economic forces. Few believed that a modern nation could endure for many months the strain of a large-scale conflict. The supply of food, of munitions and their manufacture, of funds, were problems only studied on brief estimates. Of belligerents, all could feed themselves save Britain and Germany, and Germany's deficit of home-grown supplies could only be serious in the event of a struggle of years. But Britain would starve in three months if her outside supplies were cut off.

In munitions and other war material Britain's industrial power was greatest of all, though conversion to war production was a necessary preliminary, and all, again, depended on the security of her sea communication. France was weak, and Russia weaker still, but the former, unlike the latter, could count on outside supplies so long as Britain held the seas. As Britain was the industrial pivot of the one alliance, so was Germany of the other. A great manufacturing nation, she had also a wealth of raw material, especially since the annexation of the Lorraine iron-fields after the 1870 war. But the stoppage of outside supplies must be a handicap in a long war, increasing with its duration, and serious from the outset in such tropical products as rubber. Moreover, Germany's main coal and iron fields lay dangerously close to her frontier, in Silesia on the east and in Westphalia and Lorraine on the west. Thus for the Central Alliance a quick decision and an offensive war were more vital than for the Entente.

Similarly, the financial resources were calculated on a short war basis, and all the Continental Powers relied mainly on large gold reserves accumulated specially for war purposes. Britain alone had no such mar chest, but she was to prove that the strength of her banking system and the wealth distributed among a great commercial people furnished the "sinews of war," in a way that few pre-war economists had realized.

The Psychological Forces. — If the economic forces were neglected in the war calculations of the Powers, the psychological forces were an unexplored region, except in their purely military aspect. And even here little study had been devoted to the moral element compared with the physical element. Ardant du Picq, a soldier-philosopher who fell in the 1870 war, had stripped battle of its aura of heroic fictions, portraying the reaction of normal men in the presence of danger. Several German critics had described from experience the reality of battle moral as shown in 1870, and had deduced how tactics should be based on the ever-present and balancing elements of fear and courage. At the close of the century a French military thinker, Col. Foch, had demonstrated how great was the influence of the moral element in the higher sphere of command. But only the fringe of the subject had been penetrated. Its civil aspects were untouched, and in the opening weeks of the conflict the general misunderstanding of national psychology was to be shown in the undue muzzling of the Press, followed by the equally stupid practice of issuing communiqués which so veiled the truth that public opinion became distrustful of all official news and rumour was loosed on its infinitely more damaging course. The true value of wisely calculated publicity and the true application of the propaganda weapon was only to be learnt after many blunders.

The Rival Plans. — In this survey the German plan justly takes priority, for not only was it the mainspring which set in motion the hands of the war clock in 1914, but it may even be said to have governed the course of the war thereafter. It is true that outwardly this course from the autumn of 1914 onwards seemed to be of the nature of a stupendous "siege" of the Central Powers, an idea which is incompatible with the terms we have used. But the conception of the Germanic alliance as a besieged party, although true of the economic sphere, suggests a passivity which their strategy contradicts. Although the initial German plan miscarried, even in its failure it dictated the general trend of operations thereafter. Tactically, most of the fighting resembled siege operations, but the actual strategy on land for long erred rather by its disregard of these tactical conditions than by its conformity with them.

The Germans were faced with the problem that the combined forces of themselves and Austria were decidedly inferior to those of France and Russia. To offset this adverse balance, however, they had a central position and the anticipation that Russia's mobilization would be too slow to allow her to exert serious pressure in the opening weeks. While this assumption might suggest a decisive blow at Russia before she was ready, it was equally probable that she would concentrate her main forces too far back for such a German blow to reach—and the experience of Napoleon was not an example to encourage an advance deep into the interior of Russia, with its vast distances and poor communications. The plan adopted by Germany was, therefore, a rapid offensive against France while holding the Russian advanced forces at bay, and later, when France was crushed, to deal with the Russian army.

But this plan, in turn, was complicated by the great natural and artificial barriers which the French frontier offered to an invader. It was narrow, only some 150 m. across, and so afforded little room for manoeuvre or even to deploy the masses that Germany planned to launch against her foe. At the south-eastern end it abutted on Switzerland, and after a short stretch of flat country known as the Gap of Belfort the frontier ran for 70 m. along the Vosges mountains. Thence the line was prolonged by an almost continuous fortress system, based on Epinal, Toul, Verdun and just beyond the last-named lay not only the frontiers of Luxembourg and Belgium but the difficult Ardennes country. Apart from the strongly defended avenues of advance by Belfort and Verdun, the only feasible gap in this barrier was the Trouée de Charmes between Epinal and Toul, left open originally as a strategic trap in which the Germans could be first caught and then crushed by a French counter-stroke.

Faced with such a mental and physical blank wall, the logical military course was to go round it—by a wide manoeuvre through Belgium. Graf von Schlieffen, chief of the German general staff from 1891 to 1906 conceived and developed from 1895 onwards the plan, by which the French armies were to be enveloped and a rapid decision gained, and as finally formulated it came into force in 1905. To attain its object Schlieffen's plan concentrated the mass of the German forces on the right wing for this gigantic wheel and designedly took risks by reducing the left wing, facing the French frontier, to the slenderest possible size. The swinging mass, pivoting on the fortified area Metz-Thionville, was to consist of 53 divisions, backed up as rapidly as possible by Landwehr and Ersatz formations, while the secondary army on the left wing comprised only nine divisions. Its very weakness promised to aid the main blow in a further way, for if a French offensive pressed them back towards the Rhine, the attack through Belgium on the French flank would be all the more difficult to parry. It mould be like a revolving-door—if a man pressed heavily on one side the other side would swing round and strike him in the back. The German enveloping mass was to sweep round through Belgium and northern France and, continuing to traverse a vast arc, would wheel gradually east. With its extreme right passing south of Paris and crossing the Seine near Rouen it would then press the French back towards the Moselle, where they would be hammered in rear on the anvil formed by the Lorraine fortresses and the Swiss frontier.

Schlieffen's plan allowed ten divisions to hold the Russians in check while the French were being crushed. It is a testimony to the vision of this remarkable man that he counted on the intervention of Britain, and allowed for an expeditionary force of 100,000 "operating in conjunction with the French." To him also was due the scheme for using the Landwehr and Ersatz troops in active operations and fusing the resources of the nation into the army. His dying words are reported to have been, "It must come to a fight. Only make the right wing strong."

Unhappily for Germany, if happily for the world, the younger Moltke, who succeeded him, lacked his moral courage and clear grasp of the principle of concentration. Moltke retained Schlieffen's plan, but he whittled away the essential idea. Of the nine new divisions which became available between 1905 and 1914 Moltke allotted eight to the left wing and only one to the right. True, he added another from the Russian front, but this trivial increase was purchased at a heavy price, for the Russian army of 1914 was a far more formidable menace than when Schlieffen's plan came into force. In the outcome two army corps were taken from the French theatre at the crisis of the August campaign, in order to reinforce the Eastern front.

If the fault of the final German plan was a lack of courage, that of the French plan was due to an excess. In their case, also, a miasma of confused thought seemed to creep over the leadership in the years just before the war. Since the disasters of 1870 the French command had planned an initial defensive, based on the frontier fortresses, followed by a decisive counter-stroke. To this end the great fortress system had been created, and gaps like the Trouée de Charmes left to "canalize" the invasion ready for the counter. But in the decade before 1914 a new school of thought had arisen, who argued that the offensive was more in tune with French character and tradition, that the possession of the "75"—a field gun unique in mobility and rapidity of fire—made it tactically possible, and that the alliance with Russia and Britain made it strategically possible. Forgetful of the lessons of 1870 they imagined that *élan* was proof against bullets. Napoleon's much quoted saying that "the moral is to the physical as three to one" has much to answer for; it has led soldiers to think that a division exists between the two, whereas each is dependent on the other. Weapons without courage are ineffective, but so also are the bravest troops without efficient weapons to protect them and their *moral*.

The outcome was disastrous. The new school found in Gen. Joffre, appointed chief of the general staff in 1912, a lever for their designs. Under the cloak of his authority, the advocates of the *offensive à outrance* gained control of the French military machine, and, throwing aside the old doctrine, formulated the now famous, or notorious, Plan XVII. It was based on a negation of historical experience—indeed, of common sense—and on a double miscalculation—of force and place, the latter more serious than the former. Accepting the possibility that the Government might employ their reserve formations at the outset, the strength of the Germany army in the West was estimated at a possible maximum of 68 infantry divisions. The Germans actually deployed the equivalent of $83\frac{1}{2}$, counting Landwehr and Ersatz divisions. But French opinion was and continued to be doubtful of this contingency, and during the crucial days when the rival armies were concentrating and moving forward the French Intelligence counted only the active divisions in its estimates of the enemy strength—a miscalculation by half! If the plan had been framed on a miscalculation less extreme, this recognition does not condone but rather increases its fundamental falsity, for history affords no vestige of justification for a plan by which a frontal offensive was to be launched with mere equality of force against an enemy who would have the support of his fortified frontier zone, while the attackers forswore any advantage from their own.

The second miscalculation, of place, was that although the possibility of a German move through Belgium was recognized, the wideness of its sweep was utterly misjudged. The Germans were expected complaisantly to take the difficult route through the Ardennes in order that the French might conveniently smite their communications! Based on the idea of an immediate and general offensive, the plan ordained a thrust by the 1st and 2nd Armies towards the Saar into Lorraine. On their left were the 3rd Army opposite Metz and the 5th Army facing the Ardennes, which were either to take up the offensive between Metz and Thionville, or, if the Germans came through Luxembourg and Belgium, to strike north at their flank. The 4th Army was held in strategic reserve near the centre and two groups of reserve divisions were disposed in rear of either flank—relegation to such a passive rôle expressing French opinion on the capacity of reserve formations.

Britain's share in this plan was settled less by calculation than by the "Europeanization" of her military organization during the previous decade. This Continental influence drew her insensibly into a tacit acceptance of the rôle of acting as an appendix to the French left wing, and away from her historic exploitation of the mobility given by sea-power. At the council of war on the outbreak, Lord Roberts, summoned from retirement, advocated the dispatch of the expeditionary force to Belgium—where it would have stiffened the Belgian resistance and threatened the flank of the wheeling German mass. But his was a voice crying in the wilderness, and in acy case the British general staff, through Gen. Wilson, had virtually pledged themselves to act in direct co-operation with the French. When the general staffs of the two countries conducted their informal negotiations between 1905 and 1914 they little realized that they were paving the way for a reversal of England's centuries-old policy, for a war effort such as no Englishman had ever conceived.

On the Eastern front, the plans of campaign were more fluid, less elaborately worked out and formulated—although they were to be as kaleidoscopic in their changes of fortune as in the Western theatre. The calculable condition was geographical; the main incalculable, Russia's rate of concentration. Russian Poland was a vast tongue of country projecting from Russia proper, and flanked on three sides by German or Austrian territory. On its northern flank lay East Prussia with the Baltic sea beyond. On its southern flank lay the Austrian province of Galicia with the Carpathian mountains beyond, guarding the approaches to the plain of Hungary. On the west lay Silesia. As the Germanic border provinces were provided with a network of strategic railways whilst Poland, as well as Russia itself, had only a sparse system of communications, the Germanic alliance had a vital advantage, in power of concentration, for countering a Russian advance. But if they took the offensive, the further they progressed into Poland or Russia proper the more would they lose this advantage. Hence their most profitable strategy was to lure the Russians on into position for a counter-stroke rather than to inaugurate an offensive themselves. The one drawback was that such a Punic strategy gave the Russians time to concentrate and set In motion their cumbrous and rusty machine.

From this arose an initial cleavage between German and Austrian opinion. Both agreed that the problem was to hold the Russians in check during the six weeks before the Germans, it was hoped, having crushed France, could switch their forces eastwards to join the Austrians in a decisive blow against the Russians. The difference of opinion was on the method. The Germans, intent on a decision against France, wished to leave a minimum force in the East, and only a political dislike of exposing national territory to invasion prevented them evacuating East Prussia and standing on the Vistula line. But the Austrians, under the influence of Conrad von Hötzendorf, chief of their general staff, were anxious to throw the Russian machine out of gear by an immediate offensive, and as this promised to keep the Russians fully occupied while the campaign in France was being decided Moltke fell in with this strategy. Conrad's plan was that of an offensive north-eastwards into Poland by two armies, protected by two more on their right, further east. Complementary to it, as originally designed, the Germans in East Prussia were to strike south-east, the two forces converging to cut off the Russian advanced forces in the Polish "tongue." But Conrad failed to induce Moltke to provide sufficient German troops for this offensive thrust.

On the opposing side, also, the desires of one ally vitally affected the strategy of the other. The Russian command, both for military and for racial motives, wished to concentrate first against Austria, while the latter was unsupported, and leave Germany alone until later, when the full strength of the Russian army would be mobilized. But the French, anxious to relieve the German pressure against themselves, urged the Russians to deliver a simultaneous attack against Germany, and got the Russians to consent to an extra offensive for which they were neither ready, in numbers, nor organized. On the south-western front two pairs of two armies each were to converge on the Austrian forces in Galicia; on the north-westem front two armies were to converge on the German forces in East Prussia. Russia, whose proverbial slowness and crude organization dictated a cautious strategy, was about to break with tradition and launch out on a gamble that only an army of high mobility and organization could have hoped to bring off.

II. THE CLASH IN THE WEST

The Detonation.—On June 28, 1914, the murder of the Austrian Archduke Francis Ferdinand at Sarajevo set light to a powder trail which within a brief span exploded the European magazine in a series of detonations. Exactly one month later Austria-Hungary declared war against Serbia, whose appeal to her ally and protector led Russia to order a partial mobilization on her southern front. The same day, July 29, an Imperial council at Potsdam decided on war against Russia, and, as a corollary, against France, although hoping to bargain for Britain's neutrality. While the chancelieries of Europe argued at cross-purposes, the military tide swept them off their feet. On July 31 Russia ordered a general mobilization and Germany, taking equivalent steps, sent a 12 hours' ultimatum. Austria, seeking belatedly to temporize, was dragged in the train of her more determined ally. By noon on Aug. 1 a state of war existed between Russia and Germany and next day German troops entered French territory. At 7 P.M. came Germany's ultimatum to Belgium, demanding an unopposed passage. On Aug. 3 Germany's formal declaration of war on France followed, and on Aug. 4 her troops crossed the Belgian frontier, for the sanctity of which England stood guarantor. At midnight, in reply, England also entered the war—while the Belgian populace, rising to resist the German invaders, sounded the death-knell of gladiatorial wars and inaugurated the new warfare of peoples. And coincidently, by Italy's declaration of her neutrality, her refusal to fulfil the alliance with her hereditary enemy—Austria—the artificiality of the political alliance system broke down before the new wave of national feeling which was to characterize the World War.

Invasion of Belgium.—The German advance into France was designed as a methodical sweep, so that unexpected checks should not upset its time-table. Confronted with the fact that the Belgians would resist, a detachment was formed under Gen. von Emmich to clear a passage through the Belgian plain north of the Ardennes, ready for the ordered advance of the main armies concentrating behind the German frontier. The ring fortress of Liége (*q.v.*) commanded this channel of advance, but, after an initial check, a German brigade penetrated between the forts and occupied the town. The interest of this feat is that it was due to the initiative of an attached staff officer, Ludendorff, whose name ere long was to be world-famous. The forts themselves offered a stubborn resistance and forced the Germans to await the arrival of their heavy howitzers, whose destructive power was to be the first tactical surprise of the World War.

The very success of the Belgians' early resistance cloaked the weight of the main German columns and misled the Allies' intelligence. The Belgian field army lay behind the Gette covering Brussels, and even before the Liége forts fell the advanced guards of the German 1st and 2nd Armies were pressing against this line. The Belgians, deprived of support owing to the mistaken French plan and British conformity with it, decided to preserve their army by falling back on the entrenched camp of Antwerp—where its location would at least make it a latent menace to the German communications. The Germans, their passage now clear, entered Brussels on Aug. 20, and on the same day appeared before Namur, the last fortress barring the Meuse route into France. It must be noted that despite the Belgian resistance the German advance was slightly ahead of its time-table.

French Offensive in Lorraine.—Meanwhile, away on the other flank, the French offensive had opened on Aug. 8 with the advance of a force under Gen. Pau into upper Alsace, a move intended partly as a military distraction and partly for its political effect. Soon brought to a halt, it was renewed on the 19th, only to meet with a fresh check. Thereafter the pressure of disasters elsewhere compelled the abandonment of the enterprise and the dissolution of the force—its units being dispatched westward as reinforcements. Meantime the main thrust into Lorraine by the French 1st (Dubail) and 2nd (de Castelnau) Armies, totalling 19 divisions, had begun on Aug. 14 and been shattered in the battle of Morhange-Sarrebourg, Aug. 20 (see FRONTIERS, BATTLES OF THE) where the French discovered that the material could subdue the moral, and that in their enthusiasm for the offensive they had blinded themselves to the defensive power of modern weapons, a condition which was to throw out of balance the whole mechanism of orthodox warfare. Yet it is but fair to add that this abortive French offensive had an indirect effect on the German plan, although this would hardly have been so if a Schlieffen or a Ludendorff had been in charge at German headquarters instead of the vacillating opportunist Moltke. The fact that Moltke had almost doubled the strength of his left, compared with Schlieffen's plan meant that it was unnecessarily strong for a yielding and "enticing" defensive such as Schlieffen had conceived, while lacking the superiority necessary for a crushing counter-offensive. But when the French attack in Lorraine developed and Moltke appreciated that the French were leaving their fortified barrier behind he was tempted momentarily to postpone the right wing sweep and instead seek a decision in Lorraine. This impulse led him to divert thither the six newly formed Ersatz divisions that should have been used to increase the weight of his right wing.

He had hardly conceived this new plan before he abandoned it and, on Aug. 16, reverted to Schlieffen's "swing-door" design. But the princely commanders in Lorraine were loath to forfeit this opportunity of personal glory. The Crown Prince Rupprecht of Bavaria, instead of continuing to fall back and draw the French on, halted his 6th Army on the 17th, ready to accept battle. Finding the French attack slow to develop, he planned to anticipate by one of his own. He struck on Aug. 20 in conjunction with the 7th Army on his left, but although the French were taken by surprise and rolled back from the line Morhange-Sarrebourg, the German counter-stroke had not the superiority of strength (the two armies now totalled 2 j divisions) or of strategic position to make it decisive. Thus its strategic result was merely to throw back the French onto a fortified barrier which both restored and augmented their power of resistance. Thus they were enabled to despatch troops to reinforce their western flank—a redistribution of strength which was to have far-reaching results in the decisive battle, on the Marne.

With similar disregard of superior authority, the German Crown Prince, commanding the pivotal 5th Army between Metz and Thionville, attacked when he had been ordered to stand on the defensive. The lack of what Col. Foch had termed "intellectual discipline" was to be a grave factor in Germany's failure, and for this the ambitions of "court" generals were to be largely responsible.

The North-West Frontier. — While this "see-saw" campaign in Lorraine was taking place, more decisive events were occurring to the north-west. The attack on Liége awakened Joffre to the reality of a German advance through Belgium, but not to the wideness of sweep. And the sturdy resistance of Liége confirmed him in the opinion that the German right would pass south of it, between the Meuse and the Ardennes. Plan XVII. had visualized such a move, and prepared a counter. Grasping once more at phantoms, the French command embraced this idea so fervently that they transformed the counter into an imaginary coup de *grâce*. Their 3rd Army (Ruffey) and the reserve 4th Army (de Langle de Cary) were to strike north-east through the Ardennes against the rear flank of the Germans advancing through Belgium. The left wing (5th) Army, under Lanrezac, was moved further to the north-west into the angle formed by the Sambre and Meuse between Givet and Charleroi. With the British expeditionary force coming up on its left, it was to deal with the enemy's forces north of the Meuse and to converge on the supposed German main forces in conjunction with the attack through the Ardennes. Here was a pretty picture—of the Allied pincers closing on the unconscious Germans! Curiously, the Germans had the same idea of a pincer-like manoeuvre, with rôles reversed, and with better reason.

The fundamental flaw in the French plan was that the Germans had deployed half as many troops again as the French Intelligence estimated, and for a vaster enveloping movement. The French 3rd and 4th Armies (23 divisions) pushing blindly into the Ardennes against a German centre supposedly denuded of troops, blundered against the German 4th and 5th Armies (20 divisions) and were heavily thrown back in encounter-battles around Virton-Neufchateau. Fortunately the Germans were also too vague as to the situation to exploit their opportunity.

But to the north-west the French 5th Army (13 divisions) and the British (four divisions) had, under Joffre's orders, put their head almost into the German noose. The German masses of the 1st and 2nd Armies were closing on them from the north, and the 3rd Army from the east—a total of 30 divisions. Lanrezac alone had an inkling of the hidden menace. All along he had suspected the wideness of the German manoeuvre, and it was through his insistence that his army had been permitted to move so far north-west. It was due to his caution in hesitating to advance across the Sambre, to the arrival of the British on his left unknown to the German Intelligence, and to the premature attack of the German 2nd Army, that the Allied forces fell back in time and escaped from the trap.

Retreat to the **Marne.**—The British, after concentrating near Maubeuge, had moved up to Mons on Aug. 22, ready to advance further into Belgium as part of the affensive of the Allied left wing. On arrival, however, Sir John French heard that Lanrezac had been attacked on the 21st and deprived of the crossings of the Sambre. Although thus placed in an exposed forward position, he agreed to stand at Mons to cover Lanrezac's left. But next day Lanrezac had word of the fall of Namur and of the appearance of the German 3rd Army (Hausen) on his exposed right flank near Dinant, on the Meuse. In consequence, he gave orders for a retreat that night. The British, after resisting the attacks of six German divisions during the day, fell back on the 24th in conformity with their allies. Not a moment too soon in view of the fact that the rest of the German 1st Army was marching still further westward to envelop their open left flank.

At last Joffre realized the truth and the utter collapse of Plan XVII. Resolution was his greatest asset, and with imperturbable coolness he formed a new plan out of the wreckage. He decided to swing back his centre and left, with Verdun as the pivot, while drawing troops from the right and forming a fresh 6th Army on his left to enable the retiring armies to return to the offensive.

The German Breakdown. — His optimism might have been again misplaced but for German mistakes. The first was Moltke's folly in detaching seven divisions to invest Maubeuge and Givet and watch Antwerp, instead of using Landwehr and Ersatz troops as Schlieffen had intended. More ominous still was his decision on Aug. 25 to send four divisions to check the Russian advance in East Prussia. All these were taken from the right wing, and the excuse afterwards given for this violation of the principle of concentration was that the German command thought that the decisive victory had already been won! Further, the German command lost touch with the advancing armies and the movements of these became disjointed. The British stand at Le Cateau and Lanrezac's riposte at Guise (see FRONTIER, BATTLES OF THE: *Le* Cateau; Guise) were also factors in checking the German enveloping wing, and each had still greater indirect effects. For Le Cateau apparently convinced the German 1st Army commander, Kluck, that the British army could be wiped from the slate, and Guise led Biilow (2nd Army) to call on the 1st Army for support, whereupon Kluck wheeled inwards, thinking to roll up the French left. The idea of a Sedan was an obsession with the Germans, and led them to pluck the fruit before it was ripe. This premature wheel before Paris had been reached was an abandonment of the Schlieffen plan, and exposed the German right to a counter-envelopment. One further factor must be mentioned, perhaps the most significant of all: the Germans had advanced so rapidly, out-running their time-table, that their supplies failed to keep pace.. Thus, in sum, so much grit had worked into the German machine that a slight jar would suffice to cause its breakdown. This was delivered in the battle of the Marne (*q.v.*).

III. THE CRISIS OF THE MARNE

The Abandoned Plan. — Let us trace the sequence of events. The first, highly coloured, reports from the army commands in the battles of the Frontiers had given the German supreme command the impression of **a** decisive victory. Then the comparatively small totals of prisoners raised doubts in Moltke's mind and led him to a more sober estimate of the situation. The new pessimism of Moltke combined with the renewed optimism of his army commanders to produce a fresh change of plan, which contained the seeds of disaster. When, on Aug. 26, the British left wing fell back southwards badly mauled from Le Cateau, Kluck had turned south-westwards again. If this direction was partly due to a misconception of the line of retreat taken by the British, it was also in accordance with his original rôle of a wide circling sweep. And by carrying him into the Amiens-Peronne area, where the first elements of the newly formed French 6th Army were just detraining after their "switch" from Alsace, it had the effect of dislocating Joffre's design for an early return to the offensive compelling the 6th Army to fall back hurriedly towards the shelter of the Paris defences.

But Kluck had hardly swung out to the south-west before he was induced to swing in again. For, in order to ease the pressure on the British, Joffre had ordered Lanrezac to halt and strike back against the pursuing Germans, and Bulow, shaken by the threat, called on Kluck for aid. Lanrezac's attack, on Aug. 29, was stopped before Bulow needed this, but he asked Kluck to wheel in nevertheless, in order to cut off Lanrezac's retreat. Before acceding Kluck referred to Moltke. The request came at a moment when Moltke was becoming perturbed in general over the way the French were slipping away from his embrace and, in particular, over a gap which had opened between his 2nd and 3rd Armies through the latter having already turned south, from south-west, to help the 4th Army, its neighbour on the other flank. Hence Moltke approved Kluck's change of direction—which meant the inevitable abandonment of the original wide sweep round the far side of Paris. Now the flank of the wheeling German line would pass the near side of Paris and across the face of the Paris defences. By this contraction of his frontage for the sake of security Moltke sacrificed the wider prospects inherent in the wide sweep of the Schlieffen plan. And, as it proved, instead of contracting the risk he contracted a fatal counterstroke.

The decision to abandon the original plan was definitely taken on Sept. 4, and in place of it Moltke substituted a narrower envelopment, of the French centre and right. The 4th and 5th Armies were to press south-east while the 6th and 7th Armies, striking south-westwards, sought to break through the fortified barrier between Toul and Epinal, the "jaws" thus closing inwards on either side of Verdun. Meantime the 1st and 2nd Armies were to turn outwards and, facing west, hold off any counter move which the French attempted from the neighbourhood of Paris.

The **Allied Counter.**—But such a counter move had begun before the new plan could take effect.

The opportunity was perceived, not by Joffre, who had ordered a continuance of the retreat, but by Galliéni, the military governor of Paris. On Sept. 3 Galliéni realized the meaning of Kluck's wheel inwards, directed Maunoury's 6th Army to be ready to strike at the exposed German right flank, and next day with some difficulty won Joffre's sanction. Once convinced, Joffre acted with decision. The whole left wing was ordered to turn about and return to a general offensive, beginning on Sept. 6. Maunoury was already off the mark on the 5th and as his pressure developed on the Germans' sensitive flank, Kluck was constrained to draw off first one part and then the remaining part of his army to support his threatened flank guard. Thereby a 30 m. gap was created between the 1st and 2nd German Armies, a gap covered only by a screen of cavalry. Kluck was emboldened to take the risk because of the rapid retreat of the British opposite, or rather with their backs, to this gaping sector. Even on the 5th, when the French on either flank were turning about, the British continued a further day's march to the south. But in this "disappearance" lay the unintentional cause of victory. For, when the British retraced their steps, it was the report of their columns advancing into the gap which, on Sept. 9, led Bulow to order the retreat of his 2nd Army. The temporary advantage which the 1st Army, already isolated by its own act, had gained over Maunoury was thereby nullified, and it fell back the same day. By the 11th the retreat had extended, independently or under orders from Moltke, to all the German armies. The attempt at a partial envelopment, pivotting on Verdun, had already failed, the jaw formed by the 6th and 7th Armies merely breaking its teeth on the defences of the French eastern frontier. The attack by Rupprecht's 6th Army on the Grand Couronné, covering Nancy, was a particularly costly failure. It is difficult to see how the German command could have reasonably pinned their faith on achieving as an improvised expedient the very task which in cool calculation before the war had appeared so hopeless as to lead them to take the momentous decision to advance through Belgium as the only feasible alternative.

Thus, in sum, the battle of the Marne was decided by a jar and a crack. The jar administered by Maunoury's attack on the German right flank causing a crack in a weak joint of the German line, and this physical crack in turn producing a moral crack in the German command.

The Pursuit Fails.—The result was a strategic but not a tactical defeat and the German right wing was able to re-knit and stand firmly on the line of the Aisne. That the Allies were not able to draw greater advantage from their victory was due in part to the comparative weakness of Maunoury's flank attack and in part to the failure of the British and the French 5th Army (now under Franchet d'Espérey) to drive rapidly through the gap while it was open. Their direction of advance was across a region intersected by frequent rivers, and this handicap was intensified by a want of impulsion on the part of their chiefs. It seems, too, that greater results might have come if more effort had been made as Galliéni urged, to strike at the German rear flank instead of the front, and to direct reinforcements to the north-west of Paris for this purpose. This view is strengthened by the sensitiveness shown by the German command to reports of landings on the Belgian coast, which might threaten their communications. The alarm caused by these reports had even led the German command to contemplate a withdrawal of their right wing before the battle of the Marne was launched. When the moral effect of these phantom forces is weighed with the material effect—the detention of German forces in Belgium—caused by fears of a Belgian sortie from Antwerp, the balance of judgment would seem to turn heavily in favour of the strategy which Lord Roberts had advocated in vain. By it the British expeditionary force might have had not merely an indirect but a direct influence on the struggle, and might have made the issue not merely negatively but positively decisive.

But, considering the battle of the Marne as it shaped, the fact that 27 Allied divisions were pitted against 13 German divisions on the decisive flank is evidence, first, of how completely Moltke had lapsed from Schlieffen's intention; second, of how well Joffre had re-concentrated his forces under severe pressure; third, of how such a large balance afforded scope for a wider envelopment than was actually attempted. The frontal pursuit was checked on the Aisne before Joffre, on Sept. 17, seeing that Maunoury's attempts to overlap the German flank were ineffectual, decided to form a fresh army under de Castelnau for a manoeuvre *round and behind* the German flank. By then the German armies had recovered cohesion and the German command was expecting and ready to meet such a manoeuvre, now the obvious course.

IV. THE SECOND CRISIS—STALEMATE

Centre of Gravity Shifts.—On the Aisne was re-emphasized the preponderant power of defence over attack, primitive as were the trench lines compared with those of later years. Then followed, as the only alternative, the successive attempts of either side to overlap and envelop the other's western flank, a phase known somewhat inaccurately as the "race to the sea." This common design brought out what was to be a new and dominatiiig strategical feature—the lateral switching of reserves by railway from one part of the front to another. Before it could reach its logical and lateral conclusion, a new factor intervened. Antwerp, with the Belgian field army, was still a thorn in the German side, and Falkenhayn, who had succeeded Moltke, determined to reduce it while a German cavalry force swept across to the Belgian coast as an extension of the enveloping wing in France.

Belgian Operations. — We must pause here to pick up the thread of operations in Belgium from the moment when the Belgian field army fell back to Antwerp, divergently from the main line of operations. On Aug. 24 the Belgians began a sortie against the rear of the German right wing to ease the pressure on the British and French left wing, then engaged in the opening battle at Mons and along the Sambre. The sortie was broken off on the 26th when news came of the Franco-British retreat into France, but the pressure of the Belgian army (six divisions) led the Germans to detach four reserve divisions, besides three Landwehr brigades, to hold it in check. On Sept. 7 the Belgian command learnt that the Germans were despatching part of this force to the front in France; in consequence King Albert launched a fresh sortie on Sept. 9—the crucial day of the battle on the Marne. The action was taken, unsolicited by Joffre, who seems to have shown curiously little interest in possibilities outside his immediate battle zone. The sortie led the Germans to cancel the despatch of one division and to delay that of two others to France, but the Belgians were soon thrown back. Nevertheless the news of its seems to have had a distinct moral effect on the German command, coinciding as it did with the initiation of the retreat of their 1st and 2nd Armies from the Marne. And the unpleasant reminder that Antwerp lay menacingly close to their communications induced the Germans to undertake, preliminary to any fresh attempt at a decisive battle, the reduction of the fortress and the seizure of potential English landing places along the Belgian coast.

A Strategic Key.—The menace to Britain, if the Channel ports fell into German hands, was obvious. It is a strange reflection that the British command should have neglected to guard against the danger hitherto, although the first lord of the Admiralty, Winston Churchill, had urged the necessity even before the battle of the Marne. When the German guns began the bombardment of Antwerp on Sept. 28 England awakened, and gave belated recognition to Churchill's strategic insight. He was allowed to send a brigade of marines and two newly-formed brigades of naval volunteers to reinforce the defenders, while a regular division and cavalry division, under Rawlinson, were landed at Ostend and Zeebrugge for an overland move to raise the siege. Eleven Territorial divisions were available in England, but, in contrast to the German attitude, Kitchener considered them still unfitted for an active rôle. The meagre reinforcement delayed, but could not prevent, the capitulation of Antwerp, Oct. 10, and Rawlinson's relieving force was too late to do more than cover the escape of the Belgian field army down the Flanders coast.

Yet, viewed in the perspective of history, this first and last effort in the West to make use of Britain's amphibious power applied a brake to the German advance down the coast which just stopped their second attempt to gain a decision in the West. It gained time for the arrival of the main British force, transferred from the Aisne to the new left of the Allied line, and if their heroic defence at Ypres, aided by the French and Belgians along the Yser to the sea, was the human barrier to the Germans, it succeeded by so narrow a margin that the Antwerp expedition must be adjudged the saving factor.

Second German Bid for Victory. — In the French theatre of operations, the month following the battle of the Marne was marked by an extremely obvious series of attempts by each side to turn the opponent's western flank. On the German side this pursuit of an opening was soon replaced by a subtler plan, but the French persevered with a straight forward obstinacy curiously akin to that of their original plan. By Sept. 24, de Castelnau's outflanking attempt had come to a stop on the Somme. Next a newly formed 10th Army under de Maudhuy tried a little further north, beginning on Oct. 2, but instead of being able to pass round the German flank soon found itself struggling desperately to hold Arras. The British expeditionary force was then in course of transfer northwards from the Aisne, in order to shorten its communications with England, and Joffre determined to use it as part of a third effort to turn the German flank. To co-ordinate this new manoeuvre he appointed Gen. Foch as his deputy in the north. Foch sought to induce the Belgians to form the left of this wheeling mass, but King Albert, with more caution, or more realism, declined to abandon the coastal district for an advance inland that he considered rash. It was. For on Oct. 14, four days after the fall of Antwerp, Falkenhayn planned a strategic trap for the next Allied outflanking manoeuvre which he foresaw would follow. One army, composed of troops transferred from Lorraine, was to hold the expected Allied offensive while another, composed of troops released by the fall of Antwerp and of four newly-raised corps, was to sweep down the Belgian coast and crush in the flank of the attacking Allies. He even held back the troops pursuing the Belgians in order not to alarm the Allied command prematurely.

Meanwhile, the new Allied advance was developing piecemeal, as corps detrained from the south and swung eastwards to form a progressively extended "scythe." The British expeditionary force, now three corps strong, deployed in turn between La Bassée and Ypres, where it effected a junction with Rawlinson's force. Beyond it the embryo of a new French 8th Army was taking shape, and the Belgians continued the line along the Yser to the sea. Although the British right and centre had already been held up, Sir John French, discounting even the underestimate of the German strength furnished by his Intelligence, ordered his left to begin the offensive from Ypres towards Menin. The effort was still-born, for it coincided with the opening of the German offensive, on Oct. 20, but for a day or two Sir John French persisted in the belief that he was attacking while his troops were barely holding their ground. With Foch the delusion persisted still longer, and this failure to grasp the situation was partly responsible for the fact that Ypres was essentially, like Inkerman, a "soldiers' battle." Already, since the 18th, the Belgians on the Yser had suffered growing pressure which threatened a disaster that was ultimately saved by the end of the month through the opening of the sluices and the flooding of the coastal area. At Ypres the crisis came later and was repeated, Oct, 31 and Nov. 11 marking the turning points of the struggle. That the Allied line, though battered and terribly strained, was in the end unbroken was due to the dogged resistance of the British and the timely arrival of French reinforcements. (See YPRES, BATTLE OF, 1914.)

This defence of Ypres is in a dual sense the supreme memorial to the British regular army, for here they showed the inestimable value of the disciplined morale and unique standard of musketry which were the fruit of long training, and here was their tombstone. "From failing hands they threw the torch" to the new national armies rising in England to the call of patriotism. With the Continental Powers the merging of conventional armies into national armies was a hardly perceptible process, because of their system of universal service. But with Britain it was clearly stamped as revolution, not evolution. While the little professional army sacrificed itself as the advanced guard of the nation, the truth of the new warfare of peoples was beginning to come home to the civilian population. Lord Kitchener, a national symbol because of his imperial achievements, had been summoned to the post of war minister, and with a supreme flash of vision had grasped, in contrast to Governments and general staffs alike, the probable duration of the struggle. The people of Britain responded to his call to arms, and like an ever-rising flood the "New Armies" came into being. By the end of the year nearly 1,000,000 men had enlisted, and the British empire had altogether some 2,000,000 under arms. Perhaps Kitchener was wrong in not basing this expansion, from a professional to a national scale, on the existing Territorial foundation. It must be remembered, however, that the Territorial Force was enlisted for home defence and that initially its members' acceptance of a wider role was voluntary. Perhaps, also, he was tardy in recognizing their military value.

The duplication of forces and of organization was undoubtedly a source of delay and waste of effort. Kitchener has also been reproached for his reluctance to replace the voluntary system by conscription, but this criticism overlooks how deeply rooted was the voluntary system in British institutions, and the slowness with which lasting changes can be effected in them. If Kitchener's method was characteristic of the man, it was characteristic of England. If it was unmethodical, it was calculated to impress most vividly on the British people the gulf between their "gladiatorial" wars of the past and the national war to which they were committed.

While a psychological landmark, the battle of Ypres is also a military landmark. For, with the repulse of the German attempt to break through, the trench barrier was consolidated from the Swiss frontier to the sea. The power of modern defence had triumphed over attack. and stalemate ensued. The military history of the Franco-British alliance during the next four years is a story of the attempts to upset this deadlock, either by forcing the barrier or by finding a way round.

On the Eastern front, however, the greater distances and the greater differences between the equipment of the armies ensured a fluidity which was lacking in the West. Trench lines might form, but they were no more than a hard crust covering a liquid expanse. To break the crust was not difficult, and once broken, mobile operations of the old style became possible. This freedom of action was denied to the Western Powers, but Germany, because of her central position, had an alternative choice, and from Nov. 1914 onwards her command adopted a defensive in France while seeking to cripple the power of Russia.

V. THE RUSSIAN FRONT

Invasion of East **Prussia.**—In the East the opening encounters had been marked by rapid changes of fortune rather than by any decisive advantage. The Austrian command, emulating their allies in violating the principle of concentration, detached part of their strength in an abortive attempt to crush Serbia. (See SERBIAN CAMPAIGNS.) And their plan for an initial offensive to cut off the Polish "tongue" was further crippled by the fact that the German part of the pincers did not operate. It was, indeed, being menaced by a Russian pair of pincers instead, for the Russian commander-in-chief, the Grand Duke Nicholas. had urged his 1st and 2nd Armies to invade East Prussia without waiting to complete their concentration, in order to ease the pressure on his French allies. As the Russians had more than a two-to-one superiority, a combined attack had every chance of crushing the Germans between the two armies. On Aug. 17, Rennenkampf's 1st Army (six and a half divisions and five cavalry divisions) crossed the East Prussian frontier, and on Aug. 19–20 met and threw back the bulk (seven divisions and one cavalry division) of Prittwitz's 8th Army at Gumbinnen. On Aug. 21 Prittwitz heard that the Russian 2nd Army (ten divisions and three cavalry divisions) under Samsonov had crossed the southern frontier of East Prussia in his rear, which was guarded by only three divisions. In panic Prittwitz momentarily spoke of falling back behind the Vistula, whereupon Moltke superseded him by a retired general, Hindenburg, to whom was appointed as chief of staff, Ludendorff, the hero of the Liège attack.

Developing a plan which, with the necessary movements, had been already initiated by Col. Hoffmann of the 8th Army staff, Ludendorff concentrated some six divisions against Samsonov's left wing. This force, inferior in strength to the Russians, could not have been decisive, but Ludendorff, finding that Rennenkampf was still near Gumbinnen, took the calculated risk of withdrawing the rest of the German troops, except the cavalry screen. from that front and rushing them back against Samsonov's right wing. This daring move was aided by the absence of communication between the two Russian commanders and the ease with which the Germans deciphered Samsonov's wireless orders to his corps. Under the converging blows Samsonov's flanks were crushed and his centre surrounded. The outcome of this military masterpiece, afterwards christened the battle of Tannenberg (*q.v.*), was the destruction of almost the whole of Samsonov's army. Then receiving two fresh army corps from the French front, the German commander turned on the slowly advancing Rennenkampf, whose lack of energy was partly due to his losses at Gumbinnen and subsequent lack of information, and drove him out of East Prussia. As a result of these battles Russia had lost a quarter of a million men and. what she could afford still less, much war material. But the invasion of East Prussia had at least. hy causing the despatch of two corps from the West. helped to make possible the French "come-back" on the Marne.

Galician Battles.—Away on the southern front, moreover, the scales had tilted against the Central Powers. The offensive of the Austrian 1st and 4th Armies into Poland had at first made progress, but this was nullified by the onslaught of the Russian 3rd and 8th Armies upon the weaker 2nd and 3rd Armies which were guarding the Austrian right flank. These armies were heavily defeated (Aug. 26–30), and driven back through Lemberg. The advance of the Russian left ning thus threatened the rear of the victorious Austrian left wing. Conrad tried to swing part of his left round, in turn, against the Russian flank, but this blow was parried and then, caught with his forces disorganized by the renewed advance of the Russian right wing, he was forced on Sept. 11 to extricate himself by a general retreat, falling back almost to Cracow by the end of September. (See LEMBERG, BATTLES OF.) Austria's plight compelled the Germans to send aid, and the bulk of the force in East Prussia was formed into a new 9th Army and switched south to the south-west corner of Poland, whence it advanced on Warsaw in combination with a renewed Austrian offensive. But the Russians were now approaching the full tide of their mobilized strength; regrouping their forces and counter-attacking, they drove back the advance and followed it up by a powerful effort to invade Silesia.

The Grand Duke Nicholas formed a huge phalanx of seven armies—three in the van and two protecting either flank. A further army, the 10th, had invaded the eastern corner of East Prussia and was engaging the weak German forces there. Allied hopes rose high as the much-heralded Russian "steam-roller" began its ponderous advance. To counter it the German eastern front was placed under Hindenburg and Ludendorfi, who devised yet another master-stroke, based on the system of lateral railways inside the German frontier. The 9th Army, retreating before the advancing Russians, slowed them down by a systematic destruction of the scanty communications in Poland. On reaching its own frontier, unpressed, it was first switched northward to the Posen-Thorn area, and then thrust south-east on Nov. 11, with its left flank on the Vistula, against the joint between the two armies guarding the Russian right flank The wedge, driven in by Ludendorff's mallet, sundered the two armies, forced the 1st back on Warsaw and almost effected another Tannenberg against the and, which was nearly surrounded at Lodz (*q.v.*), when the 5th Army from the van turned back to its rescue. As a result, part of the German enveloping force almost suffered the fate planned for the Russians, but managed to cut its way through to the main body. If the Germans were baulked of decisive tactical success, this rnanoeuvre had been a classic example of how a relatively small force, by using its mobility to strike at a vital point, can paralyse the advance of an enemy several times its strength. The Russian "steam-roller" was throun out of gear, and never again did it threaten German soil.

Within a week, four new German army corps arrived from the Western front, where the Ypres attack had now ended in failure, and although too late to clinch the missed chance of a decisive victory, Ludendorff was able to use them in pressing the Russians back by Dec. 15 to the Bzura-Ravka river line in front of Warsaw. This set-back and the drying up of his munition supplies decided the Grand Duke Nicholas to break off the see-saw fighting still in progress near Cracow and fall back on winter trench lines along the Nida and Dunajec rivers, leaking the end of the Polish "tongue" in the hands of the enemy. Thus, on the East as on the West, the trench stalemate had settled in, but the crust was less firm and the Russians had drained their stock of munitions to an extent that their poorly industrialized country could not make good.

The Beginning of Air Attack.—The same period witnessed the dawn of another new form of war which helped to drive home the new reality that the war of armies had become the war of peoples From Jan. 1915, Zeppelin raids began on the English coast and reached their peak in the following winter. to be succeeded by aeroplane raids. The difficulty of distinguishing from the air between military and civil objectives, smoothed the path for a development which. beginning with excuses, ended in a frank avowal that in a war for existence the will of the enemy nation, not merely the bodies of their soldiers, is the inevitable target.

The Psychological Situation. — The first psychological symptom of the World War, as it seemed to many, was an immeasurable sigh of relief. Had the peoples of Europe sat on the safety-valve too long? The war-weary mind of to-day cannot reconstruct the tension and anxiety, the strain and stress of hope and fear of the long years of the peace that was no peace and yet was not war. It may be read as a revolt of the spirit against the monotony and triviality of the everyday round, the completion of a psychological cycle when the memories of past war have faded, and paved the way for the emergence and revival of the primal "hunting" instinct in man.

This first phase of enthusiasm was succeeded by one of passion, the natural ferocity of war accentuated by a form of mob spirit which is developed by a "nation in arms." The British army was relatively immune because of its professional character, whereas in the German army, the most essentially "citizen," it gained scope because of the cold-blooded logic of the general staff theory of war. With the coming of autumn 1914, a third phase became manifest, more particularly among the combatants. This was a momentary growth of a spirit of tolerance, symbolized by the fraternization which took place on Christmas Day, but this in turn was to wane as the strain of the war became felt and the reality of the struggle for existence came home to the warring sides.

VI. THE EVENTS OF 1915

The Deadlock on Land. — Well before the end of 1914, the reality of the deadlock on the Western front was clear to the Governments and general staffs of the warring countries, and each was seeking a solution. The reaction varied in form and in nature according to the mental power and predisposition of the different authorities. With the Central Powers the opinion of Falkenhayn was the decisive factor, and the impression derived not merely from his critics but from his own account is that neither the opinion nor the direction was really clear as to its object. He was too obsessed with the principle of security at the expense of the principle of concentration, and in his failure to fulfil the second he undermined the foundations of the first.

On his appointment after the Marne reverse, he still adhered to the Schlieffen plan of seeking a decision in the West, but he did not follow the Schlieffen method of weakening his left wing in order to mass on the vital right wing. The October–November attack round Ypres was made largely with raw formations, while war-experienced troops lay almost idle between the Aisne and the Vosges. Col. Groner, chief of the field railways, even went so far as to submit a detailed plan to Falkenhayn for transferring six army corps to the right wing, but it was rejected. When we remember how close to breaking point was the Allied line at Ypres, it can only be said that for a second time the German supreme command saved the Allies. At this juncture, too, Ludendorff was pleading for reinforcements to make his wedge-blow at the Russian flank near Lodz decisive, but Falkenhayn missed the chance by delaying until the Ypres failure had passed from assurance to fact.

Convinced at last of the strength of the Allied trench-barrier, Falkenhayn took the momentous decision to stand on the defensive in the West. But his object in so doing seems to have been vague. His feeling that the war must ultimately be decided in France led him to distrust the value, as he doubted the possibility, of a decision against Russia. Hence while he realized that the Eastern front was the only practicable theatre for operations in the near future, he withheld the necessary reinforcements until forced to do so by the threatening situation of the Austro-Hungarian front. And even then he doled out reserves reluctantly and meagrely, enough to secure success but never in the quantity and the time for decisive victory.

It is to his credit, however, that he realized a long war was now inevitable, and that he set to work to develop Germany's resources for such a warfare of attrition. The technique of field entrenchment was carried to a higher pitch than with any other country, the military railways were expanded for the lateral movement of reserves, the supply of munitions and of the raw material for their manufacture was tackled so energetically and comprehensively, that an ample flow was ensured from the spring of 1915 onwards — a time when the British were only awakening to the problem. Here were laid the foundations of that economic organization and utilization of resources which was to be the secret of Germany's resisting power to the pressure of the British blockade. For the scientific grasp of the economic sphere in war Germany owed much to Dr. Walther Rathenau, a brilliant captain of industry. Germany also pioneered in the psychological sphere, for as early as the autumn of 1914, she launched a vast scheme of propaganda in Asia, to undermine British prestige and the loyalty of Britain's Mohammedan subjects. The defect of her propaganda, its crudeness, was less apparent when directed to primitive people than when applied to the civilized peoples of Europe and America.

The same period witnessed also the one great success for German diplomacy, the entry of Turkey into the war, although this was fundamentally due to a combination of pre-war causes with military events. Since 1909 the country had been under the control of the Young Turk party, to whom traditions, including that of friendship with Britain, were abhorrent. Germany, filled with her own dream of a Germanic Middle East—of which the Baghdad railway was the symbol, had skilfully exploited the opportunity to gain a dominating influence over the new rulers of Turkey. Their leader, Enver Pasha, had been military attaché in Berlin, German instructors permeated the Turkish army, and a definite understanding existed between Germany and the Young Turk leaders as to common military action — urged by the common bond of necessary safeguard against danger from Russia. The arrival of the "Goeben" and "Breslau" reinforced the moral pressure of Wangenheim, the German ambassador, and eventually on Oct. 29 the Turks committed definite acts of war, at Odessa against Russia, and in Sinai against Britain.

Falkenhayn has shown "the decisive importance of Turkey joining in the struggle" — first as a barrier across the channel of munition supply to Russia, and secondly as a distraction to the military strength of Britain and Russia. Under German dictation, Turkey struck as early as mid-December against the Russians in the Caucasus but Enver's over-ambitious plan ended in disaster at the battle of Sarikamish. Turkey was no more fortunate in her next venture; to cut Britain's Suez canal artery with the East. The Sinai desert was a check on an invasion in strength, and the two small detachments which got across were easily repulsed, at Ismailia and El Kantara, although allowed to make good their retreat But if both these offensives were tactical failures, they were of great strategic value to Germany by pinning down large Russian and British forces.

As an offset to Turkey joining the Central Powers, Italy definitely threw over the artificial ties of the old Triple Alliance and joined the Entente. On May 24 she declared war on Austria — her hereditary enemy — although avoiding an open breach with Germany. If her main object was to seize the chance of redeeming her kinsmen in Trieste and the Trentino from Austrian rule, there was also a spiritual desire to reassert her historic traditions. Militarily, however, her aid could not have an early or great effect on the situation, for her army was unready to deliver a prompt blow, and the Austrian frontier was a mountainous obstacle of great natural strength.

Franco-British Plans.—On the Entente side the reality of the trench deadlock produced different and diverse reactions. If the desire to hold on to her territorial gains swayed German strategy, the desire to recover her lost territory dominated French strategy. It is true that their mental and material concentration on the Western front, where lay the main armed force of the enemy, was justified by military tenets, but without any key to unlock the barrier they were merely knocking themselves to pieces Winter attacks in Artois, on the Aisne, in Champagne and the Woevre afforded costly proof, and against the Germans' skill in trench-fighting Joffre's "nibbling" was usually attrition on the wrong side of the balance sheet. As for any new key, the French were singularly lacking in fertility of idea

Britain's trouble was rather an excess of fertility, or rather an absence of concentration in choosing and bringing to fruition these mental seeds. Yet in great measure this failing was due to the obscurantism of professional opinion, whose attitude was that of blank opposition rather than expert guidance.

British-inspired solutions to the deadlock crystallized into two main groups, one tactical, the other strategical. The first was to unlock the trench barrier by producing a machine invulnerable to machine-guns and capable of crossing trenches, which would restore the tactical balance upset by the new preponderance of defensive over offensive power. The idea of such a machine was conceived by Col. Swinton in October 1914, was nourished and tended in infancy by Winston Churchill, then first lord of the Admiralty, and ultimately, after months of experiment hampered by official opposition, came to maturity in the tank of 1916.

The strategical solution was to go round the trench barrier. Its advocates—who became known as the "Eastern" in contrast to the "Western" school—argued that the enemy alliance should be viewed as a whole, and that modern developments had so changed conceptions of distance and powers of mobility, that a blow in some other theatre of war would correspond to the historic attack on an enemy's strategic flank. Further, such an operation would be in accordance with the traditional amphibious strategy of Britain, and would enable it to exploit the advantage of sea-power which had hitherto been neglected. In October 1914, Lord Fisher, recalled to the office of first sea lord, had urged a plan for a landing on the German coast. In Jan. 1915, Lord Kitchener advocated another, for severing Turkey's main line of eastward communication by a landing in the Gulf of Alexandretta. The post-war comments of Hindenburg and Enver show how this would have paralysed Turkey. It could not, however, have exercised a wider influence, and it was anticipated by another project—partly the result of Churchill's strategic insight and partly due to the pressure of circumstances.

This was the Dardanelles expedition, about which controversy has raged so hotly that the term just applied to Churchill may be disputed by some critics. This is answered by the verdict of Falkenhayn himself: "If the straits between the Mediterranean and the Black sea were not permanently closed to Entente traffic, all hopes of a successful course of the war would be very considerably diminished. Russia would have been freed from her significant isolation . . . which offered a safer guarantee than military successes . . . that sooner or later a crippling of the forces of this Titan must take place . . . automatically." The fault was not in the conception, but in the execution. Had the British used at the outset even a fair proportion of the forces they ultimately expended in driblets, it is clear from Turkish accounts that victory would have crowned their undertaking.

The cause of this piecemeal application of force and dissipation of opportunity lay in the opposition of Joffre and the French general staff, supported by Sir John French. Despite the evidence of the sequel to the Marne, of the German failure at Ypres, and subsequently of his own still more ineffectual attacks in December, Joffre was still confident of his power to achieve an early and decisive victory in France. His plan was that of converging blows from Artois and Champagne upon the great salient formed by the entrenched German front, to be followed by an offensive in Lorraine against the rear of the enemy armies. The idea was similar to that of Foch in 1918 but the vital difference lay in the conditions existing and the methods employed. A study of the documents conveys the impression that there has rarely been such a trinity of optimists in whom faith was divorced from reason as Joffre, Foch, his deputy in Flanders, and French—albeit the latter's outlook oscillated violently. In contrast the British Government considered that the trench-front in France was impregnable to frontal attacks, had strong objection to wasting the man-power of the new armies in a vain effort, and at the same time felt increasing concern over the danger of a Russian collapse. These views were common alike to Churchill, Lloyd George and Lord Kitchener, who on Jan. 2, 1915, wrote to Sir John French: "The German lines in France may be looked upon as a fortress that cannot be carried by assault and also that cannot be completely invested, with the result that the lines may be held by an investing force while operations proceed elsewhere."

Lloyd George advocated the transfer of the bulk of the British forces to the Balkans both to succour Serbia and to develop an attack on the rear of the hostile alliance. This view was shared by a section of French opinion and, in particular, by Galliéni, who proposed a landing at Salonika as a starting point for a march on Constantinople with an army strong enough to encourage Greece and Bulgaria to combine with the Entente. The capture of Constantinople was to be followed by an advance up the Danube into Austria-Hungary in conjunction with the Rumanians. But the commanders on the Western front, obsessed with the dream of an early break-through, argued vehemently against any alternative strategy, stressing the difficulties of transport and supply and insisting on the ease with which Germany could switch troops to meet the threat. If there was force in their contention, it tended to ignore the experience of military history that "the longest way round is often the shortest way there," and that the acceptance of topographical difficulties has constantly proved preferable to that of a direct attack on an opponent firmly posted and prepared to meet it.

The weight of military opinion bore down counter-proposals and the Balkan projects were relinquished in favour of a concentration of effort on the Western front. But misgivings were not silenced and at this juncture a situation arose which revived the near Eastern scheme in a new if attenuated form.

The Dardanelles **Expedition.**—On Jan. 2, 1915, Kitchener received an appeal from the Grand Duke Nicholas for a diversion which would relieve the Turkish pressure on Russia's army in the Caucasus. Kitchener felt unable to provide troops and suggested a naval demonstration against the Dardanelles, which Churchill, appreciating the wider strategic and economic issues, proposed to cohvert into an attempt to force the passage. His naval advisers, if not enthusiastic, did not oppose the proposal and in response to a telegram the admiral on the spot, Carden, submitted a plan for a methodical reduction of the forts and clearance of the mine-fields. Fisher, while clinging to his own North sea project, strongly advocated a combined naval and military expedition. On Jan. 13, the War Council decided for a naval expedition to "take the Gallipoli peninsula, with Constantinople as its objective." A naval force, mainly of obsolete vessels was got together with French aid, and after preliminary bombardment, entered the straits on March 18. Drift mines, however, caused the sinking of several ships, and the attempt was abandoned.

It is a moot point whether a prompt renewal of the advances would not have succeeded, for the Turkish ammunition was exhausted, and in such conditions the mine obstacle might have been overcome. But the new naval commander, Admiral de Robeck decided against it, unless military aid was forthcoming. Already, a month before, the War Council had determined on a joint attack, and began the despatch of a military force under Sir Ian Hamilton. (See DARDANELLES CAMPAIGN.) But as the authorities had drifted into the new scheme, so were they tardy in releasing the necessary troops, and even when sent in inadequate numbers, several more weeks' delay had to be incurred—at Alexandria—in order to redistribute the force in its transports suitably for tactical action. Worst of all, this fumbling policy had thrown away the chance of surprise, which was vital for a landing on an almost impregnable shore. When the preliminary bombardment took place in February only two Turkish divisions were at the straits; this was increased to four by the date of the naval attack, to six when Hamilton was at last able to attempt his landing. For this he had only four British divisions and one French division—actually inferior in strength to the enemy in a situation where the inherent preponderance of defensive over offensive power was multiplied by the natural difficulties of the terrain. His weakness of numbers and his mission of aiding the passage of the fleet compelled him to choose a landing on the Gallipoli peninsula in preference to one on the mainland or on the Asiatic shore; and the rocky coastline limited his possible landing places.

On April 25, he made his spring, at the southern tip of the peninsula near Cape Hellas and—with Australian and New Zealand troops—near Gaba Tepe, some 1 j m. up the Aegean coast; the French, as a diversion, made a temporary landing at Kum Kale on the Asiatic shore. The troops effected the impossible and made good their lodgment on beaches strewn with barbed wire and swept by machine-guns. But the momentary asset of tactical surprise had passed, the difficulties of supply were immense, while the Turks held the commanding heights and were able to bring up their reserves. The invaders managed to hold on to their two precarious footholds, but they could not expand them appreciably, and the stagnation of trench warfare set in. They could not go on, and national prestige forbade them to go back.

Ultimately, in July, the British Government decided to send a further five divisions to reinforce the seven by now on the peninsula. By the time they arrived the Turkish strength in the region had also risen to 1 j divisions. Hamilton decided on a double stroke—a reinforced blow from Gaba Tepe and a new landing at Suvla bay a few miles north—to sever the middle of the peninsula and secure the heights commanding the Narrows. He deceived the Turkish command and achieved surprise (Xug. 6), but the first blow failed and the second lost a splendid chance by the inexperience of the treops and still more the inertia and fumbling of the local commanders. For over 36 hours, before reserves arrived, only one and a half Turkish battalions barred the path. Energetic new commanders, for whom Hamilton had previously asked, were sent out when the opportunity had passed. The British were once more condemned to hang on to tenuous footholds, and with the autumn rains setting in their trials were increased. The Government had lost faith and were anxious to withdraw, but fear of the moral effect delayed their decision. Hamilton was asked for his opinion, however, and when he pronounced in favour of continuing—in which course he still had confidence—he was replaced by Sir Charles Monro, who immediately declared for evacuation. Kitchener was then sent out to investigate, and on his verdict a withdrawal was sanctioned and carried out from Suvla and Anzac on the night of Dec. 18–19 and from Hellas on that of Jan. 8–9. If the bloodless evacuation was an example of masterly organization and co-operation it was also a proof of the greater ease of such operations in modern warfare. Thus the curtain rang down on a sound and far-sighted conception marred by a chain of errors in execution almost unrivalled even in British history.

The Menace to **Russia.**—While the British were striving to unlock the back door to Russia, the Germanic Powers were hammering their Russian allies, whose resistance was collapsing in large measure from a lack of munitions which could only be made good by foreign supplies through that locked entrance, the Dardanelles. On the Eastern front, the campaign of 1914 had shown that a German.force could count on defeating any larger Russian force, but that when Russians and Austrians met on an equality victory rested with the Russians. Falkenhayn was forced, reluctantly, to despatch German reinforcements as a stiffening to the Austrians, and thus was dragged into an offensive in the East rather than adopting it as a clearly defined plan Ludendorff, in contrast, had his eyes firmly fixed on the ultimate object, and from now on advocated unceasingly a whole-hearted effort to break Russia. Ludendorff's was a strategy of decision, Falkenhayn's a strategy of attrition.

In the conflict of wills between these two men lies the clue to the resultant strategy of Germany—highly effective, yet not decisive. On the other side the fresh Russian plan embodied the lessons of experience and was soundly conceived, but the means were lacking and the instrument defective. The Grand Duke Nicholas aimed to secure both his flanks solidly before attempting a fresh blow towards Silesia. From January until April, under bitter winter conditions, the Russian forces on the southern flank of the Polish salient strove to gain possession of the Carpathians and the gateways into the Hungarian plain. But the Austrians, with a German infusion, parried their efforts, and the loss was disproportionate to the small gains The long-besieged fortress of Przemysl (see PRZEMYSL, SIEGES OF). however, at last fell into their hands on March 22. In northern Poland the Russians were preparing to strike upward at East Prussia, when they were forestalled by a fresh Ludendorff stroke eastward toward the frontier of Russia proper. The blow was launched on Feb. 7, over snow-buried roads and frozen swamps. and was distinguished by the envelopment of four Russian divisions in the Augustovo forests. Aforeover. it extracted the sting from the Russian attack further west.

These moves were, however, merely a "curtain-raiser" to the real drama of 1915. But before turning to this it is necessary to glance at events on the Western front, the importance of which is partly as a signpost to the future and partly because of their reaction on the Eastern front.

The Western Front.—While a way round the trench barrier was being sought in Gallipoli and experiments with a novel key were being carried out in England, the Allied commands in France were trying more orthodox solutions. The most significant was the British attack at Neuve Chapelle (*q.v.*) on March 10. Save as a pure experiment the attempt stood self-condemned. For it was an isolated attempt on a small front with inadequate resources. The arrival in France of several new regular divisions made up from foreign garrisons, of the Indian Corps, and the 1st Canadian Division had brought the British strength up to 13 divisions and 5 cavalry divisions, besides a number of selected territorial battalions. This increase enabled French to divide his fcrces into two armies and gradually to extend his share of the front. But Joffre was insistent that he should relieve the French of the Ypres salient, which they had taken over in November, and made the intended French attack contingent on this relief. Sir John French considered that he had not sufficient troops for both purposes, and so decided to carry out the attack single-handed. An additional motive was his resentment of the constant French criticisms that the British were not "pulling their weight."

In design, however, the attack, entrusted to Haig's 1st Army, was both original and well thought out. After an intense bombardment of 3; minutes duration on a 2,000 yd. frontage, the artillery lengthened their range and dropped a curtain of fire to prevent the reinforcement of the enemy's battered trenches, which were rapidly overrun by the infantry.

Complete surprise was attained and most of the first positions captured, but when in the second phase, the frontage was extended, the artillery support was inadequate. Further, owing to scanty information and to the two corps commanders waiting upon each other a long pause occurred which gave the Germans five clear hours to organize fresh resistance. Then, too late and mistakenly, the attack was ordered to be pushed "regardless of loss." And loss proved the only result. An underlying factor was that the narro ness of the attack sector made the breach more easy for the defenders to close, although this defect was unavoidable owing to the general shortage of munitions. The British had been slower than the Germans to awaken to the scale of ammunition supply required for this new warfare, and, even so, deliveries fell far behind contract, owing largely to the handicap imposed by trade union rules on the dilution of skilled labour. These could only be modified after long negotiation and the shortage of shells became so obvious in the spring of 191 j as to lead to a public outcry which culminated in the establishment of a Ministry of Munitions, under Lloyd George, to co-ordinate and develop both manufacture and the supply of raw materials. Apart from shells the crudeness and inferiority of all the British trench-warfare weapons compared with those of the Germans, made such a radical organization overdue, and its urgency was emphasized by the near approach of the time when Britain's new armies would take over the field. If the task was undertaken late, it was carried out with energy and thoroughness, and by 1916 the flow of munitions reached a volume, still expanding, which finally removed any material handicap on the strategy of the British leaders.

The tactical sequel of Neuve Chapelle was less fortunate. It was clear that the small-scale experiment had only missed success by a narrow margin and that there was scope for its development. But the Entente commands missed the true lesson, which was the surprise attainable by a short bombardment that compensated its brevity by its intensity. And only partially did they appreciate that the sector attacked must be sufficiently wide to prevent the defender's artillery commanding, or his reserves closing the breach. Instead, they drew the superficial deduction that mere volume of shell-fire was the key to success. Not until 1917 did they revert to the Neuve Chapelle method. It was left to the Germans to profit by the experience against the Russians in May.

But before that came, the Western front was destined to increase the tally of military blunders. In the first, it was the Germans' turn to find and misuse a new key to the trench deadlock. This was the introduction of gas, and, unlike the British introduction of tanks later, the chance, once forfeited, did not return, owing to the relative ease of providing an antidote. In a local attack in Poland on Jan. 31, the Germans had tried the use of gas-shells, but the experiment had been a failure owing to the nullifying effect of the intense cold. At the next attempt it was discharged from cylinders owing to the failure of the authorities to provide the inventor, Haber, with adequate facilities for the manufacture of shells. Further, the initial disappointment led the German command to place little trust in its value In consequence, when discharged against the French trenches at Ypres on April 22, there were no reserves at hand to pour through the wide breach it created. (See YPRES, BATTLES OF, 1915.) A strange green vapour, a surging mass of agonized fugitives, a 4 m. gap without a living defender—such was the sequence of events. But the heroic resistance of the Canadians on the flank of the breach and the prompt arrival of English and Indian reinforcements saved the situation in the absence of German reserves.

The chlorine gas originally used was undeniably cruel, but no worse than the frequent effect of shell or bayonet, and when it was succeeded by improved forms of gas both experience and statistics proved it the least inhumane of modern weapons. But it was novel and therefore labelled an atrocity by a world which condones abuses but detests innovations. Thus Germany incurred the moral odium which inevitably accompanies the use of a novel weapon without any compensating advantage. *(See* CHEMICAL **WARFARE.)**

On the Entente side, wisdom would have counselled a period of waiting until their munition supply had grown and the new British armies were ready, but the desire to regain lost territory and the duty of relieving the pressure on Russia, combined with ill-founded optimism to spur Jofire to premature offensives. The German losses were exaggerated, their skill and power in defence underrated, and a series of diffused and unconnected attacks were made. The chief was by the French between Lens and Arras, under Foch's direction, and the earlier experience of failure to make an effective breach in the trench barrier was repeated. The attack was launched on May 9 by d'Urbal's army on a four-mile frontage. It was quickly checked with murderous losses except on the front of Pétain's corps which, thanks to meticulous preparation, broke through to a depth of three miles. But the penetration was too narrow, reserves were late and inadequate and the gap closed. Foch, however, persevered with vain attacks which gained a few acres of ground at excessive loss. Meantime Haig's 1st Army had attacked towards Aubers Ridge simultaneously with the larger French attempt. The plan was to penetrate at two points north and south of Neuve Chapelle, 4 m. apart, the total frontage of the two being $2\frac{1}{4}$ m, and then to converge in exploiting the double penetration. But the Germans, profiting also from the experimental value of Neuve Chapelle, had developed their defences. Thus the attack died away quickly from a surfeit of German machine-guns and an insufficiency of British shells. Under pressure from Joffre the attack was renewed on May 15 on the Festubert sector south of Neuve Chapelle, and continued by small bites until May 27. The larger French offensive between Lens and Arras was not abandoned until June 18, when the French had lost 102,000 inen—rather more than double the defender's loss.

The effect of these attacks was. moreover, to convince even the dubious Falkenhayn of the strength of his Western line and of the remoteness of any real menace from the Franco-British forces. His offensive on the Eastern front had already opened. Tactically unlimited, its strategic object was at first only the limited one of relieving the pressure on the Austrian front and, concurrently, reducing Russia's offensive power. Conrad proposed and Falkenhayn'accepted a plan which aimed at a rupture of the Russian centre as the best means to this end, and in which the Dunajec sector between the upper Vistula and the Carpathians was selected as offering the fewest obstacles to an advance and best protection to the flanks of a penetration. The break-through was entrusted to Mackensen, whose force comprised the newly formed German 11th Army—strengthened by divisions from the West, and the 4th Austro-Hungarian Army. The Ypres gas attack and a large cavalry raid from East Prussia were initiated to cloak the concentration on the Dunajec river of 14 divisions and 1.500 guns against a front held by only six Russian divisions and lacking rear lines of trenches.

The **Dunajec** Break-through.—On May 2, after an intense bombardment had flattened the Russian trenches, the attack was launched and swept through with little opposition. The surprise was complete, the exploitation rapid, and despite a gallant stand on the Wisloka river, the whole line along the Carpathians was rolled up, until on May 14 the advance reached the San, 80 m. from its starting point. Defeat almost turned into disaster when this was forced at Jaroslav, but the impetus of the advance had momentarily spent itself and reserves were lacking. A new factor was introduced by Italy's declaration of war against Austria, but Falkenhayn persuaded the Austrian command, with some difficulty, not to move troops from the Russian front, and to maintain a strict defensive on their Italian frontier, which was secured by the mountain barrier. He realized that he had committed himself too far in Galicia to draw back, and that only by bringing more troops from France could he hope to fulfil his object of transferring troops back there, as this could only be possible when Russia's offensive power was crippled and her menace to Austria removed. Strengthened by these reinforcements, Mackensen attacked again in co-operation with the Austrians, retook Przemysl on June 3 and captured Lemberg on June 22, cutting the Russian front into two separated portions.

But the Russians, from their vast man-power resources had almost made good the loss of 400,000prisoners, and Falkenhayn's anxiety about the stability of his Austrian allies decided him to continue the offensive, although still with limited objects and with one eye on the situation in France. He changed its direction, however, from eastwards to northwards, between the Bug and Vistula, where lay the main Russian forces. In conjunction, Hindenburg was ordered to strike south-east from East Prussia, across the Naren (*q v*) and towards the Bug.

Ludendorff disliked the plan as being too much of a frontal attack; the Russians might be squeezed by the closing in of the two wings but their retreat would not be cut off. He urged once more his spring scheme for a wide enveloping manoeuvre through Kovno on Vilna and Minsk, but Falkenhayn rejected it, fearing that it nould mean more troops and a deeper commitment The result justified Ludendorff's expectation—the Grand Duke extricated his troops from the Warsaw salient before the German shears could close on him. Falkenhayn, on the other hand considered that Ludendorff had not put his full weight into the attack.

Nevertheless, 750,000 prisoners had been taken by the middle of August, Poland had been occupied, and Falkenhayn decided to break off large scale operations on the Eastern front. Bulgaria's entry into the war was now arranged and he wished to support the combined attack of Austria and Bulgaria against Serbia, as well as to transfer troops hack to meet the French offensive expected in September. Mackensen was sent to the Serbian front and Ludendorff was given a belated permission to carry out his Vilna scheme, with such resources as he had, but as an independent operation.

It began on Sept. 9, Below's Army of the Niemen and Eichhorn's 10th Army forming two great horns which gored their way into the Russian front, the one east towards Dvinsk and the other south-east towards Vilna. The Russians were driven back in divergent directions and the Germany cavalry advancing between the horns far overlapped Vilna and drew near the Minsk railway. But the German strength was slender, the Russians free to concentrate against this isolated menace, and in face of the stiffening resistance Ludendorff took the wise course of suspending operations. The crux of the situation was that the Russian armies had been allowed to draw back almost out of the net before the long delayed Vilna manoeuvre was attempted; the degree of success attained with such weak forces was confirmation of its practicability and of Ludendorff's claim that a powerful blow delivered while the Russians were deeply enmeshed in the Polish salient might have annihilated the armed force of Russia. She had been badly lamed, but not destroyed, and although never again a direct menace to Germany, she was able to delay the full concentration of German strength in the West for two years, until 1918. Falkenhayn's cautious strategy was to prove the most hazardous in the long run, and indeed to pave the way for Germany's bankruptcy.

Thus, at the end of September, the Russian retreat, after a nerve-racking series of escapes from the salients which the Germans systematically created and then sought to cut off, came to a definite halt on a straightened line, stretching from Riga on the Baltic to Czernomitz on the Rumanian frontier. But the Russian armies had gained this respite at a ruinous price, and their Western allies had effected little in repayment of Russia's sacrifice on their behalf in 1914.

Allied Offensive in the West.—For the Franco-British relief offensive of Sept. 25 had been no more fruitful than its predecessors. The main blow was launched by the French in Champagne, in conjunction with a Franco-British attack in Artois, on either side of Lens. One fault was that the sectors were too far apart to have a reaction on each other, but a worse was that the command tried to reconcile two irreconcilable factors—they aimed at a break-through but preceded it with a prolonged bombardment which gave away any chance of surprise. Joffre's plan was that the break-through in these two sectors was to be followed by a general offensive on the whole Franco-British front which would "compel the Germans to retreat beyond the Meuse and possibly end the war." The unquenchable optimist! The British attack at Loos (*q.v.*) was undertaken against the opinion of Haig, whose 1st Army had to carry it out. The British resources in artillery were still much less than those of the French, and Haig, after personal reconnaissance, reported that the sector was unsuitable for an attack. But Joffre, with the enchantment that distance lends, declared that it was "particularly favourable ground." Sir John French vacillated as usual, but finally ordered the attempt under pressure from Kitchener. The latter, in this reversal of his own previous attitude was apparently influenced by the grave situation in Russia, as well, perhaps, by his reaction from the disappointment at the Dardanelles. But as he had long since declared his view that the Western front was impassable, it is difficult to see how he could feel that a hopeless offensive there could bring fresh hope to the Russians. Both in Champagne and Artois the attacks penetrated the forward German positions without difficulty, but the delay in bringing reserves forward allowed the German reserves to close the gaps, a task simplified by the narrowness of the attack front: age. The slight gains of ground in no way compensated for the heavy price paid for them—the Allied loss was approximately 242,000 against 141,000 Germans. And if the Allied commands had gained more experience so had the Germans, in the art of defence. The British share in this offensive is, however. notable as marking the appearance in strength of the New Armies; at Loos they were "blooded" and if inexperience detracted from their effectiveness, their courage and driving force were an omen of Britain's power to improvise a national effort comparable with the long-created military machines of the Continent.

The direction of this effort inspired less confidence, and Sir John French gave place to Sir Douglas Haig as commander-in-chief, just as already in September the Russian command had been transferred from the Grand Duke Nicholas, nominally to the Tsar, as a moral symbol, but actually to a new commander-in-chief, Gen. Alexeiev, the newly appointed chief of staff.

The Italian Front, 1915.—Italy's military contribution to the Allied cause was handicapped not only by her unreadiness but by the awkward strategic position of her frontier, difficult for initiating an offensive and hardly more favourable for a secure defensive. The Italian frontier province of Venezia formed a salient pointing to Austria and flanked on the north by the Austrian Trentino, on the south by the Adriatic. Bordering on the Adriatic was a stretch of relatively low ground on the Isonzo front but the frontier then followed the Julian and Carnic Alps in a wide sweep round to the north-west. Any advance eastwards inevitably suffered the potential menace of an Austrian descent from the Trentino upon its rear.

Nevertheless, the eastern front, though difficult enough, seemed to offer more prospect of success, besides threatening a vital part of Austria, than an advance northward into the Alps. When Italy was preparing to enter the war Gen Cadorna, who assumed command, drew up his plan on this basis of an offensive eastwards and a defensive attitude in the north. The overhanging menace of the Trentino was mitigated by the expectation of simultaneous pressure upon Austria from Russia and Serbia. But on the eve of Italy's declaration of war this hope faded, the Russian armies falling back under Mackensen's blows, while the Serbs, despite requests from the Allies, failed to make even a demonstration. This enabled the Austrians to despatch five divisions to the Isonzo from the Serbian front, these being relieved by three newly formed German divisions. Even so there were only some eight divisions in all available to oppose the Italians, who had a numerical superiority of more than three to one.

In order to secure good covering positions on the north a limited advance was made into the Trentino, with success, but another into the north-east corner of the frontier salient—towards Tarvis in the Carnic Alps—was forestalled. This local failure was to have unfortunate results later for it left the Austrians with a good strategic sally port into the Tagliamento valley. Meantime the main Italian advance, by the 2nd and 3rd Armies, had begun at the end of May, but out of their total of 14 divisions only seven were ready. Bad weather increased the handicap, the Isonzo coming down in flood, and the initial advance soon came to a standstill. The Isonzo front crystallized, like the others, into trench warfare The Italian mobilization, however, was now complete and Cadorna mounted a deliberate attack, which opened on June 23. This first battle of the Isonzo continued until July 7 with little gain to show. A fresh series of efforts after a ten days' pause were hardly more effective, and the front then relapsed into the spasmodic bickering characteristic of trench warfare, while Cadorna made preparations for a new and larger effort in the autumn. When it was launched in October he had a two to one superiority in numbers but was weak in artillery. This defect coupled with the superior experience of the defender rendered the new offensive as barren as its predecessors. It was sustained perhaps too obstinately and when finally broken off on Dec. 5, the Italian loss in the six months' campaign totalled some 280,000—nearly twice that of the defenders, who had shown on this front a fierce resolution which was often lacking when they faced the Russians

The Conquest of Serbia, Oct., 1915.—While stalemate, although with marked changes beneath the surface, had once more settled in on both the Eastern and Western fronts, the latter months of 1915 witnessed fluid operations elsewhere which were to have an uncalculated influence on the war.

Austria had proved capable of holding the Italians on the Isonzo, and once the Russian danger began to fade under the pressure of the summer offensive, her command was anxious to deal with Serbia conclusively. Austria's attempted invasions in August and September 1914, and again in November, had been brusquely repulsed by Serbian counter-strokes, and it was not pleasant for a great Power, especially one with so many Slav subjects, to swallow such military rebuffs. Her impatience coincided with Falkenhayn's desire to gain direct railway communication with Turkey, hard pressed at the Dardanelles. Throughout the summer the rival coalitions had been bidding for Bulgaria's support, and in this bargaining the Entente suffered the moral handicap of military failure and the material handicap caused by Serbia's unwillingness to give up any part of Macedonia—of which she had despoiled Bulgaria in 1913. As Austria had no objection to offering territory that belonged to her enemy, Bulgaria accepted her bid. This accession of strength enhanced the chance of a decision against Serbia and in August Falkenhayn decided to reinforce Kovess's Austrian 3rd Army with Gallwitz's German 11th Army from the Russian front. In addition two Bulgarian armies were available. Mackensen was sent to direct the operations. To meet this new threat Serbia, apart from her own relatively small forces, had only a treaty guarantee of Greek aid and promises from the Entente Powers. The first disappeared with the fall of Venizelos, the pro-Ally Greek premier, and the second, as usual, was too late.

On Oct. 6, 1915 (*see* further, SERBIAN CAMPAIGNS) the Austro-German armies attacked southwards across the Danube, with a flanking movement across the Drina on the right. The sturdy resistance of the Serbs in delaying actions, and the natural difficulty of the mountainous country, checked the advance, but before Franco-British reinforcements could arrive, the Bulgarian armies struck westwards into southern Serbia, across the rear of the main Serbian armies. This drove a deep wedge between the Serbs and their allies, moving up from Salonika, and automatically loosened the props of the resistance in the north. With their line bent at both ends until it resembled a vast bow, threatened with a double envelopment, and with their retreat to the south cut off, the Serbian armies decided to retire west through the Albanian mountains. Those who survived the hardships of this mid-winter retreat were conveyed to the island of Corfu, and after being re-equipped and reorganized, joined the Entente force at Salonika in the spring of 1916. The conquest of Serbia, though not, as it proved, of Serbian military power, relieved Austria of danger on her southern frontier, and gave Germany free communication and control over a huge central belt from the North sea to the Tigris. For the Entente this campaign dug a military sump-pit which for three years was to drain their military resources, there to lie idle and ineffective. Yet ultimately that sump-pit was to overflow and wash away one of the props of the Central Alliance.

The Salonika Expedition.—When at the beginning of October the Entente Governments had awakened to Serbia's danger, British and French divisions had been despatched hurriedly from Gallipoli to Salonika, which was the only channel of aid to Serbia —by the railway to Uskub. The advanced guard of this relieving force—which was under the command of Gen. Sarrail—pressed up the Vardar and over the Serbian frontier, only to find that the Bulgarian wedge had cut it off from the Serbians, and it was forced to fall back on Salonika, pursued by the Bulgarians. On military grounds an evacuation of Salonika was indicated, but political reasons induced the Allies to remain. The Dardanelles failure had already diminished their prestige, and by convincing the Balkan States of German invincibility had induced Bulgaria to enter the war and Greece to break her treaty with Serbia. To evacuate Salonika would be a further loss of prestige, whereas by holding on the Allies could check German influence over Greece, and maintain a base of operations from which to aid Rumania, if, as expected, she entered the war on their side. To this end the Salonika force was augmented with fresh British and French divisions, as well as contingents from Italy and Russia, and there also the rebuilt Serbian army was brought. But apart from the capture of Monastir in Nov. 1916, and an abortive attack in April 1917, the Entente force made no serious offensive until the autumn of 1918. Its innocuousness was partly due to the natural difficulties of the country—the chain of mountain ridges which guarded the approach to the Balkans, partly to the feeling of the Allied Governments that it was a bad debt, and partly to the personality of Sarrail, whose conduct and reputation for political intrigues failed to command the confidence and co-operation essential if such a mixed force was to "pull its weight." On their side the Germans were content to leave it in passivity, under guard of the Bulgarians, while they steadilv withdrew their own forces for use elsewhere. With gentle sarcasm they termed Salonika their "largest internment camp," and with half a million Allied troops locked up there the jibe had some justification—until 1918. (*See* further SALONIKA CAMPAIGNS 1915–18.)

The Mesopotamia Expedition to the Fall of Kut.—Nor was Salonika the only "drain" opened in 1915. Mesopotamia was the site of a fresh diversion of force from the centre of military gravity, and one which could only be excused on purely political grounds. It was not, like Salonika and the Dardanelles, begun to relieve a hard-pressed ally, nor had it the justification of the Dardanelles expedition of being directed at the vital point of one of the enemy States The occupation of Mesopotamia might raise British prestige, and it might annoy Turkey, but it could not endanger her power of resistance. Although its origin was sound, its development was another example of "drift," due to the inherent faultiness of Britain's machinery for the conduct of war. (*See* further MESOPOTAMIA, OPERATIONS IN.)

The oilfields near the Persian gulf were of essential importance for Britain's oil supply, and thus when war with Turkey was imminent, a small Indian force, of one division, was despatched to safeguard them. To fulfil this mission effectively it was necessary to occupy the Basra vilayet at the head of the Persian gulf, in order to command the possible lines of approach.

On Nov. 21, 1914, Basra was captured, but the rising stream of Turkish reinforcements compelled the Indian Government to add a second division. The Turkish attacks in the spring of 1915 were repulsed, and the British commander, Gen. Nixon, judged it wise to expand his footing, for greater security. Townshend's division was pushed up the Tigris to Amara, gaining a brilliant little victory, and the other division up the Euphrates to Nasiriya. Southern Mesopotamia was a vast alluvial plain, roadless and railless, in which these two great rivers formed the only channels of communication. Thus a hold on Amara and Nasiriya covered the oilfields; but Nixon and the Indian Government, inspired by these successes, decided to push forward to Kut-al-Amara, a move which was 180 m. further into the interior but had a partial military justification in the fact that at Kut the Shatt-el-Hai, issuing from the Tigris, formed a link with the Euphrates by which Turkish reserves might be transferred from one river line to the other.

Townshend was sent forward in August, defeated the Turks near Kut, and his cavalry carried the pursuit to Aziziya, half way to Baghdad. Enthusiasm spread to the home Government, anxious for a moral counterpoise to their other failures, and Nixon received permission for Townshend to press on to Baghdad. But after an indecisive battle at Ctesiphon, the growing superiority of the Turkish strength compelled Townshend to retreat to Kut. Here, isolated far from help, he was urged to remain, as several fresh divisions were being sent to Mesopotamia. Kut was invested by the Turks on Dec. 8, 1915, and the relieving forces battered in vain against the Turkish lines covering the approach on either bank of the Tigris. The conditions were bad, the communications worse, the generalship faulty, and at last on April 29, 1916, Kut was forced to surrender. However unsound the strategy which despatched Townshend on this adventure, it is just to emphasize that the actual achievements of his small force in face of superior numbers, with inadequate equipment and primitive communications, and utterly isolated in the heart of an enemy country, wrote a glorious page of British history. When these handicaps are compared with the four to one superiority in number, and highly organized supply system of the force which ultimately took Baghdad, the comparison explains the awe in which Townshend and his men were held by the Turks.

The Home Front 1915.—Perhaps one of the most significant landmarks of the transition of the struggle from a "military" to a "national" war was the formation of a National Ministry in Britain which occurred in May 1915. For the prototype of Parliaments to abandon the deep-rooted party system and pool the direction of the war was proof of the psychological upheaval of traditions. The Liberal prime minister, Asquith, remained, but the real lead began to pass insensibly into other hands, notably those of Lloyd George. Churchill, whose vision had saved the menace to the Channel ports and made possible the future key to the deadlock, was shelved, as already had been Haldane, the creator of the expeditionary force.

Political chdnges were general in all countries, and were symptomatic of a readjustment of popular outlook. The early fervour had disappeared and been replaced by a dogged determination which, if natural to the British, was in strange contradiction to popular, if superficial, conceptions of the French temperament.

Economically, the strain had yet to be felt severely by any country. Finance had shown an unexpected power of accommodation, and neither the blockade nor the submarine campaign had seriously affected the food supply. If Germany was beginning to suffer some shortage, her people had more tangible omens of success to fortify their resolution than had their enemies.

VII. FROM VERDUN TO THE ENTRY OF AMERICA

Verdun, 1916.—In 1914 the centre of gravity of the World War had been on the Western front, in 191j it shifted to the Eastern front, and in 1916 once more moved back to France. Although the Entente had dissipated some of their strength in Salonika and Mesopotamia, the rising tide of England's new armies and of her munition supplies promised the power for an effort far larger in scale than before to break the trench deadlock. Measures had also been taken to keep these new divisions up to strength. By the end of 191j the British force in France had risen to 36 divisions through the entry into the field of "Kitchener's Army," as well as of the territorial divisions. Although the principle of voluntary enlistment had not yet been abandoned, the method was systematized and based on a national register. This scheme, launched in Oct. 191j, under the aegis of Lord Derby, aimed to reconcile the demands of the army with the needs of industry, calling up men by groups as they were wanted, and taking single men first. But the response among the latter was not adequate to preserve this graduated principle and in Jan. 1916, by the Military Service Act, the voluntary system—system is hardly the correct term—was replaced by conscription.

At the close of 191j the first serious effort to obtain unity of action between the Allies was made, and a conference of the leaders of the French, British, Belgian and Italian armies, with representatives present from the Russian and Japanese, was held at Joffre's headquarters in December. As a result they adopted the principle of a simultaneous general offensive in 1916 by France, Britain, Russia and Italy. In view of the rawness of the British troops, it was recognized that time must be allowed for training, and that the offensive could not begin before the summer of 1916, although it was hoped to carry out preliminary attacks to wear down the enemy's strength.

But German action was to dislocate this scheme, and only the British share came fully into operation, and not even that into full effect. Falkenhayn was about to fulfil his long-cherished plan for a Western offensive, but with characteristic limitations. Always a believer in the strategy of attrition, he now carried this ruling idea into tactics, and produced the new form of attack by methodical stages. each with a limited objective. In a memorandum to the German emperor at Christmas 1915 he argued that England was the staple of the enemy alliance. "The history of the English wars against the Netherlands, Spain, France and Napoleon is being repeated. Germany can expect no mercy from this enemy, so long as he still retains the slightest hope of achieving his object." Save by submarine warfare, however, England and her army were out of reach, for their sector of the front did not lend itself to offensive operations. "In view of our feelings for our arch-enemy in the war that is certainly distressing, but it can be endured if we realize that for England the campaign on the Continent . . . is at bottom a side-show. Her real weapons here are the French, Russian and Italian armies." He regarded Russia as already paralysed, and Italy's military achievements as unlikely to affect the situation. "Only France remains. France has almost arrived at the end of her military effort. If her people can be made to understand clearly that in a military sense they have nothing more to hope for, breaking-point would be reached, and England's best sword knocked out of her hand." He added that a break-through in mass was unnecessary, and that instead the Germans should aim to bleed France to death by choosing a point of attack "for the retention of which the French command would be compelled to throw in every man they have." Such objectives were either Belfort or Verdun, and Verdun was chosen, because it was a menace to the main German communications, because it offered a salient and so cramped the defender, and because of the moral effect if so renowned a place was lost to France.

The keynote of the tactical plan was a continuous series of limited advances which by their menace should draw the French reserves into the mincing-machine of the German artillery. And each of these advances was itself to be secured from loss by an intense artillery bombardment, brief for surprise and making up for its short duration by the number of batteries and their rapidity of fire. By this means the objective would be taken and consolidated before the enemy could move up his reserves for counter-attack. Although the French Intelligence branch at general headquarters gave early warning of the German preparations, the Operations branch were so full of their own offensive schemes that the warning fell on deaf ears. Further, the easy fall of the Belgian and Russian fortresses had led to a commonly held view that fortresses were obsolete, and Joffre, persuading the French Government to "declass" Verdun as a fortress, had denuded it of guns and troops. The forts were only used as shelters and the trench lines which took their place were inadequate and in poor repair. Yet in the outcome eight months' bombardment was to leave the forts almost undamaged!

At 7.15 A.M. on Feb. 21, the German bombardment began, on a front of 15 m., and progressively trenches and wire were flattened out or upheaved in a chaos of tumbled earth, giving to the countryside a weird resemblance to the surface of the moon. At 4.45 P.M. the German infantry advanced, although the first day only on a $2\frac{1}{2}$ m. front. From then until Feb. 24 the defenders' line east of the Meuse was crumbled away as by the erosion of the tide.

"Operations" still argued that it was only a feint, but Joffre decided to send de Castelnau to discover the true situation and with full powers to act. De Castelnau swung back the right flank but ordered the line of the forts to be held at all costs and entrusted the defence to Pétain, for whose use a reserve army was assembled. Pétain's first problem was not so much defence as supply—the German heavy guns had closed all avenues into the salient except one light railway and the Bar-le-Duc road. While gangs of territorial troops worked night and day to keep this in repair and widen it, Pétain organized the front into sectors and threw in repeated counter-attacks, which, helped by the narrowness of the front, at least slowed down the advance. Falkenhayn sought, somewhat late, to widen the front, and on March 6 the Germans extended the attack to the west bank of the Meuse. But the defence was now stiffening, the numbers balanced, and the immediate thrust to Verdun was checked.

A slight lull followed, and during it the Allies of France made efforts to relieve the pressure on her. The British took over the Arras front from the French 10th Army, their front becoming now continuous from the Yser to the Somme, the Italians made their fifth attack, though in vain, on the Isonzo front, and the Russians hurled untrained masses on the German front at Lake Narocz, near Vilna, once more striking prematurely and gallantly sacrificing themselves to help their Allies. The slight gains were soon lost through a counter-stroke. These efforts did not prevent Falkenhayn pursuing his attrition offensive at Verdun. (See further VERDUN, BATTLES OF.) The advances were slight but they were cumulative in effect, and the balance of loss turned definitely against the defenders. On June 7 Fort Vaux fell, and the German tide crept ever closer to Verdun, seeming to the anxious watchers to resemble the forces of nature rather than of men. And in the Asiago region. Conrad had launched his offensiveagainst Italy's Trentino flank.

Brusilov's Offensive.—Again Russia came to the rescue. In the spring of 1916 she had 130 divisions, but was woefully short of equipment, facing 46 German and 40 Austrian divisions. The preparation and reorganization for her intended share in the year's Allied offensive were cut short by the emergency at Verdun and in relief of her French allies she had launched a costly and obstinately prolonged attack at Lake Narocz in March. When it was at last broken off, the preparations for the main offensive were resumed. This was to begin in July, coincidently with the Somme offensive and Brusilov, commanding the south-western front, was ordered to prepare such attacks as he could stage from his own resources as a distraction of the enemy's attention from the main offensive. But the distraction was released prematurely, on June 4, in response to Italy's appeal to Russia to prevent the Austrians reinforcing their Trentino attack. Without warning, because without any special concentration of troops, Brusilov's troops advanced against the Austrian 4th Army near Luck (*q.v.*) and the Austrian 7th Army in the Bukovina, whose resistance collapsed at the first shock. In three days Brusilov took 200,000 prisoners. This last vital effort of the Russian army in the war had important consequences. It stopped the Austrian attack on Italy, already impaired by an Italian riposte. It compelled Falkenhayn to withdraw troops from the Western front, and so abandon his plan for a counter-stroke against the British offensive preparing on the Somme, as well as the hope of nourishing his Verdun attrition process. It led Rumania to take her fateful decision to enter the war on the Entente side, and caused the supersession of Falkenhayn in the supreme command and his replacement by Hindenburg — with Ludendorff, officially styled First Quartermaster-General, as the directing brain.

Although Rumania's entry was the ostensible reason, the underlying one was the fact that Falkenhayn's "limited" strategy in 1915 had made possible the Russian recovery which stultified the strategy of 1916. Falkenhayn was history's latest example of the folly of half-measures, the ablest and most scientific general — "penny wise, pound foolish" — who ever ruined his country by a refusal to take calculated risks. In 1916 he had turned back westwards to pursue his long cherished goal, and his strategy had faithfully fulfilled the canons of military orthodoxy by taking for its objective the enemy's strongest army and the strongest point of that army's position. It certainly achieved the object of compelling the French to pour their reserves into the Verdun "blood-bath," but did not effect any decisive strategic result. Falkenhayn had rejected Conrad's proposal for a concentration against Italy such as had previously overthrown Serbia. Conrad's reasons had been that such a blow against the "hereditary enemy" would act as a tonic to the Austro-Hungarian forces and that the theatre of war lent itself to decisive results by a thrust southwards from the Trentino against the rear of the Italian armies engaged on the Isonzo. The success attained by the relatively light blow of 1917—Caporetto—lends historical support to his contention. But Falkenhayn was dubious both of the feasibility and value of the plan and was unwilling even to lend the nine German divisions which Conrad asked for to relieve Austrian divisions in Galicia. In default of this aid Conrad persisted in attempting his design single-handed, taking some of his best divisions from Galicia, and thereby exposing their front to Brusilov's advance without obtaining adequate force to achieve his Italian front plan. Falkenhayn's smouldering resentment at this disregard of his views was fanned into flame by the Galician disaster, and he intervened in Vienna to procure the deposition of Conrad. His own fall followed hard on Conrad's heels.

Brusilov's offensive continued for three months with fair success, but reserves were not at hand for immediate exploitation, and before they could be moved down from the north the Germans were patching up the holes. His later efforts were never so dangerous, but they absorbed all the available Russian reserves, and their ultimate loss of 1,000,000 casualties completed the virtual ruin of Russia's military power.

The Somme.—Great as was the influence of Brusilov's offensive on German strategy, its effect on the Verdun situation was less immediate, and on June 23 the Germans almost reached the Belleville height, the last outwork of Verdun. Pétain made all ready for an evacuation of the east bank of the Meuse, though to his troops he showed no sign of anxiety, and ever repeated the now immortal phrase, "On les aura!"

But on July 1, the long-planned offensive on the Somme (*q.v.*) began, and from that day on the Germans at Verdun received no new divisions, and their advance died away from pure inanition. Nevertheless, although the Germans at Verdun had fallen short of their object, moral and material, they had so drained the French army that it could play but a slender part in the Allied plan for 1916. The British had now to take up the main burden of the struggle, and the consequence was to limit both the scope and effect of the Entente strategy.

On July 1, after a week's prolonged bombardment, the British 4th Army (recently created and placed under Kawlinson) attacked with 13 divisions on a front of 15 m. north of the Somme, and the French with five divisions on a front of 8 m., mainly south of the river, where the German defence system was less highly developed. The unconcealed preparations and the long bombardment had given away any chance of surprise, and in face of the German resistance, weak in numbers but strong in organization, the attack failed along most of the British front. Owing to the dense and rigid wave formations that were adopted the losses were appallingly heavy. Only on the south of the British front, near Fricourt and Montauban, did the attack gain a real footing in the German defences. The French, with slighter opposition, and being less expected, made a deeper advance.

This setback negatived the original idea of a fairly rapid penetration to Bapaume and Cambrai, and Haig adopted the attrition method of limited advances aimed to wear down the German strength. Rejecting Joffre's desire that he should again throw his troops frontally on the Thiepval defences, the attack was resumed on the southern British flank alone, and on July 14 the capture of the Germans' second position offered the chance of exploitation, which was not taken. From now onward a methodical but costly advance continued, and although little ground was gained the German resistance was seriously strained when the early onset of winter rains suspended operations in November. The effect, however, can be exaggerated, for it did not prevent the Germans withdrawing troops for the attack on Rumania. But in one respect the Somme shed a significant light on the future, for on Sept. 15 the first tanks (*q.v.*) appeared. Their early employment before large numbers were ready was a mistake; losing the chance of a great strategic surprise, and owing also to tactical mishandling and minor technical defects they only had a limited success. Although the higher military authorities lost faith in them, and some urged their abandonment, more discerning eyes realized that here was a key which, when properly used, would unlock the trench barrier. The Somme offensive had a further indirect effect, for its relief to the Verdun pressure enabled the French to prepare counter-strokes, carried out by Mangin's corps on Oct. 24 and Dec. 15, which regained most of the lost ground with small casualties. These economic successes were due to a revival of surprise, to a more elastic use of the limited objective method, and to a high concentration of artillery, with a minimum of infantry, to occupy the defences crushed by the guns.

The Conquest of Rumania. — Rumania, sympathetic to the Entente cause, had been waiting a favourable opportunity to enter the war on their side, and Brusilov's success encouraged her to take the plunge. Her command hoped that this success, combined with the Allied pressure on the Somme and at Salonika, would draw off the German reserves. She might have fared better and contributed more if she had taken the decision earlier, when Serbia was still an active force and Russia a real one. The two years of preparation had doubled the numbers of the Rumanian army, but in reality reduced its relative efficiency, for while other armies had developed with experience, Rumania's isolation and the incapacity of her military leadership had prevented the transformation of her army from a militia of "bayonet men" into a modern force. Her 10 active divisions had only a low proportion of machine-guns, 5 of the 13 newly formed divisions had none at all, the artillery was inadequate and the air force negligible. She had only six weeks' supply of ammunition at the start and her allies failed to fulfil their guarantees of supply. Moreover, her strategical situation was another source of weakness—her territory forming an "L" reversed with the bottom section, Wallachia, sandwiched between Transylvania and Bulgaria, while the length of the frontier was out of all proportion to the depth of the country, with a shortage of lateral railways snd the capital within 30 m. of the Bulgarian frontier. Further, she had in the Dobruja, on the other side of the Danube, a "back-yard" strip which offered an easy way of access.

These handicaps were accentuated by the divergent counsels of the Allies. While the British General Staff favoured a southward advance against Bulgaria which might have crushed the latter between the Rumanians and the Salonika army, the Russians urged a westward advance which would, in theory, be in closer co-operation with their own Bukovina advance. The political and moral advantages of a move into Transylvania led the Rumanians to adopt the second course. This has been much criticized, but without sufficient appreciation of the fact that the advance into Transylvania placed the Austro-German command in an awkward predicament, which might easily have been disastrous if the invasion had not been so sluggish. At the outset she had 23 divisions against 7 opposing her, but within a week the enemy would be, and were, able to raise this figure to 15.

The Rumanian advance began, on Aug. 27, with three main columns each of about 4 divisions, moving north-west through the Carpathian passes, the general conception being to pivot on the left and wheel the right up into line facing west when the Hungarian plain was reached. To guard the Danube three divisions were left and three more in the Dobruja, whither the Russians had promised to send two—Rumania's original stipulation had been that a force of 150,000 Russians should be sent.

The slow and cautious advance of the Rumanian columns, hampered by the poverty and destruction of communications, but not by resistance, withheld danger from the five weak Austrian divisions which covered the frontier and enabled their reinforcement by five German and two Austrian divisions. In fulfilment of the other half of the plan, made by Falkenhayn before his fall, four Bulgarian divisions with Austro-German technical troops were to be placed under Mackensen for the invasion of the Dobruja.

While the Rumanian columns were creeping westward into Transylvania, Mackensen stormed the Turtucaia bridgehead on Sept. 5, destroying the three Rumanian divisions which covered the Danube front, and then, with his flank secure, pressed eastwards into the Dobruja. This automatically drew away reserves from, and thereby halted the Rumanian offensivein Transylvania, while Falkenhayn had arrived to take charge. Finding that the Rumanian columns, now at a standstill were dispersed over a zoo-mile front, Falkenhayn concentrated against the southern column which had crossed the Rother Turm Pass, while using smaller forces to hold off the others. Having thrown this column back through the mountains by a convergent manoeuvre in which the Alpine Corps made a 50-mile march in three days, Falkenhayn then profited by the despatch of the Rumanian reserves against Mackensen to concentrate his forces against the Rumanian centre column at Brasov (Kronstadt). By Oct. 9 he had driven this back in turn but he missed his greater goal of encircling it, which would have opened for him a clear passage into Rumania. The mischance jeopardised the whole German plan and almost saved Rumania, for with all the passes still in their hands, her troops sturdily repulsed all efforts to press through on their heels. A prompt attempt by Falkenhayn to swing further south and force a way by the Vulcan and Szurduk passes was foiled and the beginning of the winter snows was on the point of blocking operations when a concentrated last-hour effort at the same point, Nov. 11–17, broke through. It was the signal for the next move in the German plan. Mackensen had switched his main forces westwards, and on Nov. 23 crossed the Danube close to Bucharest, on which both armies now converged. It fell on Dec. 6, and, despite belated Russian aid, the Rumanian forces were driven north into the upper section of the Rumanian "L." The brilliantly co-ordinated German strategy had crippled their new foe, gained possession of the bulk of Rumania, with its oil and wheat, and gave the Russians another 300 m. of front to hold. Sarrail, at Salonika, had not succeeded in detaining the Bulgarian reserves.

The Capture of Baghdad.—The only territorial success that the Entente could show for their year's campaign was away in Mesopotamia—the capture of Baghdad, and this moral token was seized on with an enthusiasm which, militarily, it hardly warranted. The bitter experience of the past had damped the ardour of the British Government, and Sir William Robertson, the new Chief of the Imperial General Staff, was opposed to any further commitments which drained the strength available for the Western front. But Maude, the new commander on the spot, by subtle, if unconscious, steps succeeded in changing this defensive policy into one of a fresh offensive. After thorough reorganization of the Mesopotamian force and its communications, he began on Dec. 12, 1916, a progressive right wheel and extension of his front on the west bank of the Tigris above and below Kut. These methodical trench-warfare operations had placed him ready for a spring across the Tigris at the Turks' line of retreat, which was thus parallel to his front. But despite his four-to-one superiority of force, the failure of his right to pin down the enemy and of his cavalry to cut off their retreat prevented a decisive success. But it led to permission for an advance on Baghdad, and he entered the Mesopotamian capital on March 11, 1917. A series of skilfully conducted operations then drove the Turks into divergent lines of retreat and secured the British hold on the province.

The Advance on Palestine.—Ever since the abortive Turkish attempt to invade Egypt early in 1915, the British had kept large forces there, even when the Dardanelles expedition was crying out for troops. When Gallipoli was evacuated, the release of the Turkish forces threatened a fresh move on Egypt. To anticipate this by gaining command of the Sinai desert, Sir Archibald Murray advanced in the spring of 1916, defeating the Turkish forces, freshly arrived, at Romani, Magdhaba and Rafa. The rate of advance was governed by the time taken in extending a railway and pipe-line (for water) across the desert. This new "Exodus" inspired the British Government to carry out an invasion of Palestine, at as cheap a cost in troops as possible. The towns of Gaza, on the coast, and Beersheba. 25 m. inland, guarded the approach to Palestine. Murray attacked Gaza on March 26, but the attempt fell short when on the brink of success. By nightfall Gaza was practically surrounded but the victorious position was given up bit by bit, not under enemy pressure but on the orders of the executive British commanders, through faulty information, misunderstandings and over-anxiety. Nor did the harm end there for Murray reported the action to the Government in terms of a victory, and without hint of the subsequent withdrawal, so that he was encouraged to attempt, without adequate reconnaissanct or fire support, a further attack on April 17–19 which proved a costlier failure against defences now strengthened. (See further PALESTINE, OPERATIONS IN)

The Capture of Gorizia.—The Austrian offensive in the Trentino had interrupted Cadorna's plans for a renewed effort on the Isonzo, but when the former was halted, Cadoma switched his reserves back to the Isonzo. In preparation for this offensive the whole sector from Monte Sabotino to the sea was entrusted to the Duke of Aosta's 3rd Army, under which 16 divisions mere concentrated, against six Austrian divisions. Following a preliminary feint near the sea on Aug. 4, the attack opened well two days later. North of Gorizia Capello's corps swept over the long impregnable Monte Sabotino, which guarded the approach to the river, and, crossing the river on the night of Aug. 8, occupied the town. This compelled an Austrian retreat on the Carso sector to the south, but attempts to exploit the success eastward failed against fresh positions of resistance Three more efforts were made in the autumn and if they imposed a wearing strain on the Austrians they caused greater loss to the attackers. During the year Italians had suffered some 483,000 casualties and inflicted 260,000.

The War at Sea, **1915–16.**—Germany's first submarine campaign—associated by Allied opinion with the name of Admiral von Tirpitz, the exponent of ruthlessness—had been a signal failure, both in its meagre results and the disproportionate ethical damage it did to Germany's cause. A series of Notes exchanged between the American and German Governments, culminated in April 1916 in a virtual ultimatum from President Wilson, and Germany abandoned her unrestricted campaign. The deprivation of this weapon spurred the German navy to its first, and last, attempt to carry out the initial plan on which it had begun the war. On May 30, 1916, the British Grand Fleet left its bases on one of its periodical sweeps through the North sea, but with reason to expect a possible encounter. On May 31, early in the morning, the German High Sea Fleet also put to sea, in the hope of destroying some isolated portion of the British fleet.

For such an encounter the British admiral, Jellicoe, had formulated an outline plan in the early mbnths of the war. Its basis was the cardinal necessity of maintaining the unimpaired supremacy of the Grand Fleet, which he viewed as an instrument not merely of battle but of grand strategy, the pivot of the Allies' action in all spheres, economic, moral and military. Hence while desirous of bringing the German fleet to battle under his own conditions he was determined not to be lured into mine and submarine infested waters.

Early in the afternoon of May 31, Beatty, with his battle-cruisers and a squadron of battleships, after a sweep to the south was turning north to rejoin Jellicoe, when he sighted the German battle-cruisers, five in number. In the initial engagement two of Beatty's six battlecruisers were hit in vital parts and sunk; when thus weakened he came upon the main German fleet under Admiral Scheer. He turned north to lure them into reach of Jellicoe, 50 m. distant, who raced to support him. To describe the intricate and much debated manoeuvres which followed is neither possible nor would it be just within the limits of this article, *a* strategical and not a tactical survey. Mist and failing light put an end to an indecisive action, which, however, left the British fleet between the German and its bases. During the night Scheer broke through the destroyer guard, and, although sighted, was not reported. Then he slipped safely through a net which Jellicoe dared not draw too close in view of his guiding principle and the danger of torpedo attack.

But if the battle of Jutland (*q.v.*) could be counted *a* tactical advantage to the Germans, it had no effect on their strategic position. Britain's command of the sea was intact, and the grip on the blockade on Germany unrelaxed. Once more she fell back on submarine warfare, and the first development was an extension of range. In July one of her new large submarine-cruisers appeared off the American coast and sank several neutral ships. In British and Mediterranean waters the pressure began seriously to affect the sea-borne trade and food supplies of the Entente. Various remedies were tried—the most effective being a system of sailing in convoys—but the only truly adequate measure, that of penning the Germans in their bases by close-in minefields, was debarred by Britain's failure to obtain a decisive battle success. But if Britain was feeling the strain of economic pressure, so also was Germany, and her leaders feared that the race between decisive success on land and economic collapse would end against her. The naval authorities declared that a renewal of the "unlimited" submarine campaign, which with her increased numbers could now be far more intense, would bring the Entente to their knees. Accepting this opinion, Ludendorff consented to a step which he had hitherto opposed, and on Feb. 1, 1917, it was inaugurated—with the full realization that it involved the weight of America being thrown into the scales against them.

VIII. THE PENULTIMATE YEAR

Despite incessant provocation for two years, since the "Lusitania" incident, President Wilson had held to his neutral policy, and if his excess of patience angered many of his own people it at least was the means of consolidating American opinion and reconciling it as a whole to intervention in the war. Meantime he strove by speech and by the agency of Col. House—his unofficial ambassador—to find a basis of peace on which the belligerents could agree. This effort was doomed to failure by its misunderstanding of the psychology of the warring peoples and of the fundamental objects for which they were fighting. He was still thinking in terms of traditional warfare, between governmental policies, while the conflict had long since passed into the wider sphere of the struggle of peoples dominated by the primitive instinct of self-preservation.

The declaration of the unlimited submarine campaign brought convincing proof of the futility of these peace hopes and of the reality of the German intentions, and when followed by the deliberate sinking of American ships and an attempt to instigate Mexico to action against the United States, President Wilson hesitated no longer, and on April 6, 1917, America entered the war against Germany.

Her potential force in man-power and material was illimitable but, even more unready than Britain in 1914, it must be long in exerting more than a moral influence, and Germany confidently anticipated that the submarine campaign would take decisive effect within a few months. How near her calculation came to fulfilment the record of 1917 and 1918 bears witness.

The Western Front Campaign of 1917.—The year 1916 closed in gloom for the Entente The simultaneous offensive on all fronts, planned a year before, had misfired, the French army was at a low ebb, the Russian still lower, the Somme had failed to produce visible results in any way proportional to its cost, and another fresh ally had been overrun. At sea the negativeness of Jutland was a disappointment, and although Germany's first submarine campaign had been abandoned a stronger one was threatened. To offset these debits, the Entente could only show the capture of distant Baghdad and the limited Italian success at Gorizia in August, whose value, however, was mainly as a moral tonic to Italy herself.

Among the Allied peoples and their political representatives there was a growing sense of depression. On the one hand it took the form of dissatisfaction with the conduct of the war and, on the other, of discouragement over the prospects of a victorious conclusion to the war, and a tendency to discuss the possibilities of a peace by negotiation. The first-named tendency was the first to come to a head and was signalized in London, the political mainspring of the Allies, by the replacement of Asquith's Government on Dec. 11 by one with Lloyd George as its chief. The order of precedence in events had a significant effect. For Lloyd George had come into power as the spokesman of a widespread demand for a more vigorous and more efficient prosecution of the war.

The second tendency received an impulse from the German peace move of Dec. 12, after the fall of Bucharest, which proposed an opening of peace discussions. This suggestion was rejected as insincere by the Allied Governments, but it afforded the opportunity of President Wilson, on whose behalf Col. House had long been sounding the belligerent Governments as to the prospects of mediation, to invite these to define their war aims as a preliminary to practical negotiation. The German reply was evasive, the Allied replies were considered by their opponents inacceptable as a basis of discussion, and the tentative peace moves subsided.

But while this wave of depression was surging on the "home-front," the Allied commanders continued optimistic. In November Joffre assembled, at Chantilly, a further conference of the commanders at which it was agreed that the Germans were in great difficulties on the Western front, and that the situation of the Allies was more favourable than it had ever been.

The fighting strength of the British army had grown to about 1,200,000 men, and was still growing. The fighting strength of the French army had been increased by the incorporation of native troops to some 2,600,000, so that, including the Belgians, it was estimated that the Allies disposed of about 3,900,000 men against about 2,500,000 Germans.

Joffre declared that the French army could maintain its strength for one more great battle, but that thereafter it must progressively decline, as France had no longer a sufficient number of men of military age to replace losses. He therefore warned Haig that during the coming year the burden must fall more and more upon the British army. It was also agreed that in view of these factors the relative superiority of the Allies on the Western front would be greater in the spring of 1917 than at any time which could be foreseen with certainty. In consequence it was decided to take the earliest opportunity of pressing the advantage gained on the Somme, and to continue the process of exhausting the enemy's reserves as preparation for an effort which should be decisive. An alternative proposal was made by Gen. Cadorna that the French and .British should co-operate in a combined thrust from the Italian front against Austria with the object of knocking this "weaker partner" out of the war. But it was rejected by the French and British commanders, despite Lloyd George's espousal of it at the Allied conference held in Rome in January. Their objection was that it involved a fresh diversion of strength away from the main front, where alone, they held, success could have decisive results.

The Entente plan for 1917 was soon to be complicated by changes in the command. French opinion had tired of the meagre results of Joffre's attrition strategy, and the method of the limited objective had fallen ints disfavour because of the unlimited losses on the wrong side, which accompanied it without apparent gain. They contrasted the dull course of his strategy with the brilliant results gained by Mangin at Verdun, in the autumn, under Nivelle's direction, and as a result Joffre gave place to Nivelle, who promised a real break-through. His confidence so inspired Lloyd George, the new British prime minister, that Haig was subordinated to him for the forthcoming operations—an arrangement which violated the axiom that a general cannot direct one force while exercising executive command of another. For carrying out a plan essentially audacious, Nivelle had two further handicaps; he failed to convert several of his subordinates to the idea, and he was given less rein by the Government than his predecessor. Again, while Joffre had intimated that the British must take the chief part, Nivelle changed this policy, and in his desire to conserve the glory for France overlooked how severely the French fighting power had been strained. Joffre's plan had been for a convergent attack on the great German salient Lens-Noyon-Reims, first against its west flank and then against its south—the British to attack north of the Somme, including but extending beyond the old battle ground, and the French south of it to the Oise. The attacks were to begin early in February and to be followed by a French main attack in Champagne. Kivelle's change was to ask the British to take over more of the front—south of the Somme—in order to release French troops for the Champagne blow, and as a result the start was postponed a month.

Before it could begin the Germans had dislocated it. Ludendorff's first step had been to set on foot a complete programme for the reorganization and expansion of German man-power, munitions and supplies. While this was developing, he intended to stand on the defensive, hoping that the new submarine campaign would either decide the issue or pave the way for a decisive blow on land when his new reserves of men and material were ready. Anticipating the renewal of the Entente advance on the Somme, he had a new line of defence. of great artificial strength, built across the chord of the arc Lens-Koyon-Reiins. Then after devastating the whole area inside the arc, he began a methodical retirement, by stages, to the new line called by the Germans the "Siegfried" and by the Allies the "Hindenburg" line. A consummate manoeuvre, if brutal in application, it showed that Ludendorff had the moral courage to give up territory if circumstances advised it. The British, confronted with a desert, were inevitably slow in pursuit, and their preparations for an attack on this front were thrown out of gear, limiting them to the sector around Arras (*q.v.*), where the front was unchanged.

On April 9 Allenby's 3rd Army opened the spring offensive at this point, taking the long-sought Vimy ridge, but failed to develop its initial success, and continued the attack too long after the resistance had hardened. This costly action was partly prolonged in order to take the pressure off the French. For the French blow between the Somme and the Oise had been stultified by the German retirement, and the main attack on April 16 east and west of Reims was a worse fiasco with a dangerous sequel. With a prolonged bombardment giving away any chance of surprise, and without first drdwing away the German reserves, the idea of a rapid break-through was doomed to fail. The high hopes that had been raised caused the greater reaction, and the troops were weary of being thrown against barbed wire and machine-guns to no apparent effect.

Accentuated by service grievances, mutinies broke out in the French armies, and no less than 16 corps were affected. In these circumstances Nivelle was replaced by Pétain, whose first concern was to restore the shaken morale of the French troops, and for the rest of the year the British bore the brunt of the campaign. Their strength in France was now at its highest—64 divisions, supplied with an abundance of artillery and ammunition. The strain, however, was increased by the failure of Russia to make any effective contribution to the pressure on Germany, owing to the revolution which broke out in March. Haig decided to keep the Germans occupied by carrying out the original plan for an offensive in Belgium, and if the principle was right the method and choice of site were open to criticism.

The initial move was an attack on the Messines ridge in order to straighten out the Ypres salient and attract the enemy's reserves. Carried out by the 2nd Army under Plumer, with Harington as chief of staff, it proved a model example of the "limited" attack with success economically gained by able staff work and co-operation between the arms.

It was followed on July 31 by the main attack at Ypres (*see* YPRES, BATTLES OF, 1917) which, hampered by the heavy rain, was foredoomed by its own destruction of the intricate drainage system of the area. The British command had persevered for two and a half years with the method of a prolonged preparatory bombardment, believing that quantity of shells was the key to success, and that, unlike all the great captains of history, they could disregard the element of surprise. The offensive at Ypres, which was finally submerged in the swamps of Passchendaele in early November, threw into stronger relief than ever before the fact that such a bombardment blocked the advance for which it was intended to pave the way—because it made the ground impassable. The discomfiture was increased by the new German method of defence, which Ludendorff introduced, of thinning the front defences and using the men so saved for prompt local counter-attacks The defence was built up of a framework of machine-guns distributed in concrete "pill-boxes" and disposed in great depth. On the British side the profitless toll of this struggle in the mud was to some extent mitigated by better staff work when the direction of the attack was handed over to Plumer's 2nd Army.

Three months of dreadful struggle came to an end with the British not appreciably nearer their immediate object of driving the Germans from their submarine bases in the Belgian ports, and if they had worn down the German strength they had worn down their own still more.

The Renaissance of Surprise at **Cambrai.**—The 1917 campaign in the West closed, however, on a note brighter in promise if not in accomplishment. Appreciating from the first days the futility of using tanks in these Flanders swamps, the Tank Corps headquarters looked around for an area where they could try out a new and different method. The chief general staff officer, Col. Fuller, drew up a project for a large scale raid to scour a canal-enclosed "pocket" near Cambrai (q *v.*), where the rolling downland lent itself to tank movement. The basic idea was the release of a swarm of tanks without any preparatory bombardment to give warning of the attack. When their hopes at Ypres waned, the British command adopted the scheme, retaining the basic idea, but transforming the operation into a definite offensive with far-reaching aims, for which they had not the resources because of the drain of Tpres. The operation was to be carried out by Byng's 3rd Army with six divisions, and the date was fixed for Nov. 20. Led by nearly 400 tanks, the attack came as a complete surprise, and despite minor checks achieved a penetration far deeper and at less cost than any past British offensive. But all the available troops and tanks were thrown into the first blow, and the higher command failed to give Byng the few reserves they still possessed in time to exploit the success. The cavalry, as always throughout the operations on the Western front, proved totally unable to carry out this important rôle.

Thus the advance died away, and on Nov. 30 the German army commander, Marwitz, launched a counter-stroke against the flanks of the salient created by the British advance. In the north it was parried, but in the south broke through, and a disaster was only averted by the superb counter-attack, first of the Guards Division and later of a tank brigade. But if Cambrai was a disappointment it revealed that surprise and the tank were the combination by which the trench barrier could be unlocked. Meanwhile Pétain, after overhauling his instrument, the French army, sought to test its readiness for 1918. In August a stroke by Guillaumat's army recovered all the remainder of the ground lost in 1916, and in October Maistre's army flattened the south-west corner of the German front, seizing the Chemin des Dames ridge.

The Collapse of Russia.—The temporary breakdown of the French fighting power was not the worst of the troubles which together crippled the Entente offensive in 1917. The collapse, first partial and then complete, of Russia was a loss which even the entry of America into the war could not possibly compensate for many months, and before the balance was restored the Western Allies were to be perilously near the brink of defeat. Russia's enormous losses, due to her own defective machine but incurred in sacrifice for her Allies, had undermined the morale even more than the material endurance of her forces. Revolution broke out in March, superficially against the corrupt entourage of the tsar, but with more deep-seated moral causes beneath. The tsar was forced to abdicate and a moderate Provisional Government climbed into the saddle, but without reins. This was only a makeshift, and in May another succeeded it, more Socialist in tendency and outwardly led by Kerensky. While clamouring for a general peace and undermining discipline by a system of committee control suitable to a trade union but not to the field of battle, Kerensky imagined he could send troops against the enemy by platform appeals.

Brusilov succeeded Alexeiev in the supreme command, and on July 1 the army gained some initial success against the Austrians, especially in the region of Stanislau, only to stop as soon as real resistance was met, and to crumble directly the Germans counter-attacked. By early August the Russians had been driven out of Galicia and the Bukovina, and it was only policy which halted the Austro-German forces on the frontiers of Russia itself. In September the Germans took the opportunity to practise their new method of attack intended for use in France, and this surprise attack, under Hutier's command, resulted in the capture of Riga. Next month the Bolsheviks under Lenin overthrew the wordy Kerensky, imposed their self-constituted rule on the Russian people and sought an armistice with Germany, which was concluded in December.

Italy's Caporetto Disaster.—The defection of Russia did not end the Entente tale of woe. Each autumn, with demoralizing regularity, Germany had seized an opportunity to eat up one of the weaker Allies. In 1915 it had been Serbia's fate, in 1916 Rumania's, and now it was Italy's turn, or so the Germans intended. Ludendorff's decision, taken in September, was determined by the appeals of the Austrian authorities, who felt that their troops could not endure the strain of another defensive battle on the Italian frontier. In May, Cadorna had attacked once more on the Isonzo front, but an Austrian counter-attack in the Carso sector had retaken part of the small gains. Losses, however, were more nearly balanced than formerly. The question of Allied co-operation on the Italian front was raised afresh without result, but Cadorna, nevertheless, initiated in August an "eleventh battle of the Isonzo." Capello's 2nd Army captured a large part of the Bainsizza plateau, north of Gorizia, but a long sustained effort brought no further success and Cadorna was forced to break off the offensive after four weeks' struggle. But it had so strained the Austrian resistance that, in Ludendorff's words, "it became necessary to decide for the attack on Italy in order to prevent the collapse of Austria-Hungary."

Ludendorff had a difficult problem to solve. Russia had not yet capitulated, the front there was already weakly held for its extent, and the British offensive in Flanders made impossible a large withdrawal of troops from France. All he could spare was his slender general reserve of six divisions, which had already been his instrument in countering the Kerensky offensive and in the Riga coup. His adviser in the strategic design of operations, Lt.-Col. Wetzell, was, however, of opinion that the application of even this small force at a "soft spot" such as was offered by the Tolmino-Caporetto sector, north of the Bainsizza plateau, would suffice to cripple the Italian menace. The result proved him right—the trouble was that it unduly exceeded the most sanguine expectations. On Aug. 29 Waldstatten, of the Austrian general staff, had brought to Ludendorff a scheme for a break-through at Tolmino, followed merely by rolling up the Isonzo front. But this plan was expanded into a more ambitious one without an increase of means. The Germans at Caporetto, like the British subsequently at Cambrai, were to provide an example of the profound strategic error of not "cutting your coat according to your cloth."

On hearing the Austrian proposals Ludendorff sent Gen. Krafft von Dellmensingen, an expert in mountain warfare and commander of the Alpine Corps in the Rumanian campaign, to reconnoitre the ground, and on receiving his report, approved the scheme. The six German divisions with nine Austrian formed the 14th German Army under Otto von Below, with Krafft as chief of staff and guiding brain. These troops were to penetrate the mountain barrier at the north-east corner of the Venetian salient, while Boroevic's two Austrian armies were to advance along the stretch of lower ground near the Adriatic shore. The organization and deployment of the attack in such mountainous country were difficult, but were ably overcome. Guns were brought up mostly by hand and at night; the infantry came up by night marches with all their ammunition and supplies on pack animals. Thanks to skilful precautions and the Italians' limited air reconnaissance, the concentration was undiscovered. On Oct. 24, after four hours' gas shell bombardment and one hour general, the blow was launched and pushed deep down the western slopes of the mountains, imperilling the Italian forces to both south and north. On Oct. 28 Below's van reached Udine, the former Italian general headquarters, and on Oct. 31 the Tagliamento.

Not the least significant feature of this offensive was the way it was prepared by a moral bombardment. Propaganda has been exploited for months as a means of sapping the Italian discipline and will to resist. But its effect can be exaggerated—the most formidable propaganda, as with the French in April, was that supplied by the attrition strategy of the Italian command, which had sickened the troops by its limited results at unlimited cost. Cadorna, too, offset undoubted ability by his lack of touch with and understanding of the fighting troops. Troops already too highly tried were kept too long without relief. Despite warnings of a hostile offensive, he had paid too little heed to Capello's complaints about the defensive suitability of the positions on which the Italian offensive had stopped, and had overruled his desire to forestall the enemy by a flank thrust northwards from the Bainsizza plateau.

But the result also surprised Ludendorff, who, with his slender forces, had not calculated on such distant objectives as were now possible of attainment. Boroevic was slow in following up the Italian right, and Ludendorff tried to switch part of his force to Conrad's army which flanked the north of the Venetian salient, but was foiled by the inadequacy of the rail communications. Even so, Cadorna, with his centre broken through, only saved his wings by a precipitate retreat to the line of the Piave, covering Venice, and on Nov. 9 the whole Italian army was behind this river, except for 250,000 prisoners in the enemy's hands, and nearly twice as many other casualties—killed, missing or sick. The same day Cadorna was superseded in supreme command by Diaz. Italy's allies had begun to rush reinforcements, a British and a French army corps, to her aid, and on Nov. 5 their political and military chiefs arrived at Rapallo for a conference, out of which sprang the Allied Council at Versailles, and ultimately a unified command.

The invaders had outrun their transport, and the resistance of the Italians, morally braced by the emergency, succeeded in holding the Piave (*q.v.*) in face of direct assaults and strenuous efforts by Conrad to turn their left flank from the Trentino. Here Cadorna's preparations for defence had been long initiated and were well matured. At the beginning of December the British and French, who had been waiting in reserve in case of a fresh break-through, moved forward to take over vulnerable sectors, but the attack was only renewed in the north, and on Dec. 19 it came to an end with the snows. If Caporetto seriously damaged Italy, it also purged her, and after an interval of recuperation she was to vindicate herself at Vittorio Veneto.

The Capture of Jerusalem.--Once more a distant theatre of war provided the sole triumph of the Entente cause during the year—this time in Palestine (*q.v.*). The second reverse at Gaza, in April 1917, had led to a change in command, Murray being succeeded by Allenby, who was strong enough and fortunate enough to obtain the adequate force for which Murray had asked in vain. The British Government was anxious for a spectacular success to offset the moral depression of the Nivelle failure and the decline of Russia, and the British general staff desired to dislocate the Turkish attempt to recapture Baghdad by drawing away their reserves.

Allenby took over in July and devoted the first three months to intensive preparations for an autumn offensive, when the season would be suitable. The command was reorganized, the communications developed, and his own headquarters moved forward from Cairo to the front. By complete secrecy and ruses he deceived the Turks as to the main point of attack. The defences of Gaza were bombarded from Oct. 20 onwards, and an attack followed on Nov. 1 to pin the enemy and draw in his reserves. Meanwhile, as a necessary preliminary to the real blow, the inland bastion of Beersheba was seized by a convergent manoeuvre on Oct. 31, a prelude to the decisive attack on Nov. 6, which broke through the enemy's weakened centre and into the plain of Philistia.

Falkenhayn, now in command at Aleppo, had also been planning an offensive, but the better communications of the British had decided the race, and although Falkenhayn tried to stem the tide by a counter-stroke against Beersheba, the breaking of his centre compelled a general retreat. The pursuit was hampered owing to lack of water, but, even so, by Nov. 14 the Turkish forces were driven apart in two divergent groups, the port of Jaffa was taken, and Allenby wheeled his main force to the right for an advance inland on Jerusalem. He gained the narrow hill passes before the Turks could block them, and after a necessary pause to improve his communications, brought up reserves for a fresh advance, which secured Jerusalem on Dec. 9. By the time the winter rains set in the British had expanded and consolidated their hold on the region. As a moral success the feat was valuable, yet viewed strategically, it seemed a long way round to the goal. If Turkey be pictured as a bent old man, the British, after missing their blow at his head—Constantinople—and omitting to strike at his heart—Alexandretta—had now resigned themselves to swallowing him from the feet upwards, like a python dragging its endless length across the desert.

The Conquest of East Africa.—The year 1917 witnessed another overseas success, the clearing of German East Africa, although not the close of the campaign. More than a year elapsed after the rebuff at Tanga before a serious attempt was made to subdue the last German stronghold on the African continent. To spare troops from the main theatres was difficult, and the solution was only made possible by the loyal co-operation of the South African Government. In Feb. 1916 Gen. Smuts was appointed to command the expedition, and formed the plan of a drive from north to south through the difficult interior, in order to avoid the fever-rampant plain on the coast. In conjunction with this central wedge, a Belgian force under Tombeur was to advance eastwards from Lake Tanganyika, and a small British force under Northey was to strike in from Nyasaland in the south-west. The Germans under Lettow-Vorbeck were weak in numbers but handled with masterly skill, and with all the advantages of an equatorial climate, a vast and trackless region—mountainous in parts and covered with dense bush and forest—to assist them in impeding the invader. From Dar-es Salaam on the coast to Ujiji on Lake Tanganyika ran the one real line of rail communication, across the centre of the colony. After driving the Germans back across the frontier and seizing the Kilimanjaro gap, Smuts moved direct on this railway at Morogoro, over 300 m. distant, while he dispatched a force under Van Deventer in a wide sweep to the west to cut the railway further inland and then converge on Morogoro. Lettow-Vorbeck delayed this manoeuvre by a concentration against Van Deventer, but Smuts's direct advance compelled him to hurry his force back, and thus enabled Van Deventer to get astride the railway.

However, Letto-Vorbeck evaded the attempt to cut him off and fell back in September on the Uluguru mountains to the south. The Belgians and Northey had cleared the west, and the net had been drawn steadily closer, confining Lettow-Vorbeck to the south-east quarter of the colony. Early in 1917 Smuts returned to England, and Van Deventer conducted the final operations which ended with Lettow-Vorbeck, avoiding envelopment to the end, slipping across the frontier into Portuguese Africa. Here he maintained a guerrilla campaign throughout 1918 until the general Armistice. With an original force of only 5,000, 5% being Europeans, he had caused the employment of 130,000 enemy troops and the expenditure of £72,000,000.

The Mastering of the Submarine.—The military side of 1917 is thrown into shadow by the naval, or more strictly the economic, side. The vital issue turned on the balance between Germany's submarine pressure and Britain's resistance. April was perhaps the most critical month. The Allies lost nearly a million tons of shipping, 60% British, and although the German navy's promise of victory by the end of the month was proved a miscalculation, it was clear that, ultimately, the continuance of such a ratio of loss must starve the civilian population and automatically prevent the maintenance of the armies. Britain, indeed, had only food enough to sustain her people for another six weeks. The British Government sought to counter the menace by the indirect means of rationing, increasing home production and the expansion of shipbuilding; by the direct means of the system of convoys with naval escorts, and a counter-offensive against the submarine. Aided by new devices to detect the presence of submarines and the use of thousands of patrol craft, this highly organized campaign exacted an ever-rising toll, and by the end of 1917 the menace, if not broken, was at least subdued. In this task America's aid became a potent factor long before her military assistance. It embraced her provision of light craft to reinforce the British anti-submarine fleet, her rapidly developed construction of new mercantile ships, and still more her financial aid. By July 1917 Britain had spent over £5,000,000,000, her daily expenditure had risen to £7,000,000, and the burden of financing her Allies as well as her own efforts was straining even her resources, when America's aid came to ease the pressure.

These were the defensive benefits; the offensive were at least as great. No longer was the grip of the naval blockade hampered by neutral quibbles, but instead, America's co-operation converted it into a strangle-hold under which the enemy must soon grow limp, since military power is based on economic endurance. As a party to the war, the United States, indeed, wielded the economic weapon with a determination, regardless of the remaining neutrals, far exceeding Britain's boldest claims in the past years of controversy over neutral rights. The submarine menace, crippled in 1917, was ended to all intents during the early months of 1918. To this conclusion the greatest single contribution was the laying of a mine-barrage by the American navy across the 250 m. wide passage between Norway and Scotland. This was a direct counter to the main submarine operations against the ocean-brought supplies of Great Britain. For the small submarines which carried out the shorter range operations the ports on the Belgian coast had afforded a base unpleasantly close to English shores, but these also were now closed by the daring attacks of Sir Roger Keyes's force on Zeebrugge and Ostend. Yet the removal of the menace should not lead to an underestimate of its powers for the future. The 1917 campaign was launched with only 148 submarines and from the most unfavourable strategic position. Great Britain lay like a huge breakwater across the sea approaches to northern Europe and the submarines had to get outside through narrow and closely-watchec! outlets before they could operate against the arteries of supply. And despite these handicaps they almost stopped the beat of England's heart.

The **Air** Offensive.—Another new form of action reached its crest at the same time as the submarine campaign. As the submarine was primarily an economic weapon, so was the aeroplane primarily a psychological weapon. The explosive bullet had virtually ended the Zeppelin raids in 1916, but from early in 1917 aeroplane raids on London grew in intensity until, by May 1918, the air defences were so thoroughly organized that the raiders thereafter abandoned London, as a target, for Paris. If the stoicism of the civil population took much of the sting from a weapon then in its infancy, the indirect effect was serious, interrupting business and checking output in industrial centres, as well as drawing off, for defence, many aircraft from the front. In reply the British formed an Independent Air Force, which carried out extensive raids into Germany during the closing months of the war, with marked effect on the declining morale of the "home front." To relate the action of aircraft in the military sphere is not possible, for it formed a thread running through and vitally influencing the whole course of operations, rather than a separate strategic feature.

The beginning of 1918 witnessed the development and thorough organization of another psychological weapon, when Lord Northcliffe was appointed director of propaganda in enemy countries, and for the first time the full scope of such a weapon was understood and exploited.

IX. GERMANY'S BID FOR VICTORY

On the Threshold **of** 1918.—The middle years of the World War had been, in a military sense, a tussle between a lean Hercules and a bulky Cerberus. The Germanic alliance mas weaker in numbers but directed by a single head, the Entente stronger in numbers but with too many heads. Owing to their own excessive losses, diffusion of effort and the collapse of Russia, the Entente, at the end of 1917, were faced with the grim fact that the numerical balance had been reversed, and months must elapse before the prospective stream of America's new divisions came to tilt the scales once more in their favour. The emergency paved the way for the creation of a unified command, but it still needed disaster to bring it into being.

At the conference at Rapallo in November, the formation of a Supreme War Council was decided upon, to be composed of the principal ministers of the Allies, with military representatives, and to sit permanently at Versailles. If the fundamental defect was that it merely substituted a formal for an informal committee, a further flaw was that the military representatives had no executive status. In the economic sphere, where deliberation rather than instant action was necessary, it led to a real improvement in the combination of shipping, food and munition resources. Militarily, it was futile, for it set up a dual advisorship—the Versailles representatives on the one hand and the chiefs of the national general staffs on the other. As the menace of the German attack grew closer and with it the need for common action, this advisory body was converted into a military executive committee to handle an inter-Allied general reserve, a fresh compromise which set up a dual control—the commanders-in-chief and the Versailles committee.

If concentration of control was lacking, so also was concentration of force. Since early in November the stream of German troop-trains from East to West had been steadily swelling. When the 1917 campaign opened there had been a proportion of nearly three Allies to two Germans—actually, in March 178 British, French and Belgian divisions against 129 German divisions. But now the Germans had a slight balance and the likelihood of bringing still more. But the Allied statesmen, recalling how often their own offensive had failed with equal or greater superiority of force, were slow to appreciate the gravity of the menace or to respond to the sudden fall in the temperature of military opinion. Nor could they agree to draw reinforcements from the other fronts. The Italians strove against any withdrawal of the Allied contingents from their front, and the French opposed any reduction of the Salonika force. Lloyd George went further and urged an offensive in Palestine, a scheme which was sanctioned on the understanding that no reinforcements went there from France, but which also meant that none came from there to France. Robertson, the chief of the imperial general staff, disagreed both with this Palestine plan and the creation of the Versailles executive committee, and resigned, being succeeded by Sir Henry Wilson. The position was still further weakened by the insistence of Clemenceau, the new French premier, that the British should extend their front south to the Oise. This meant that Gough's 5th Army was dangerously stretched out and took over ill-prepared defences on the very front that Ludendorff was about to strike. Meantime. the German strength had increased to 177 divisions by the end of January, with 30 more to come. The Allied strength, owing to the despatch of divisions to Italy and the breaking up of others owing to the French shortage of drafts, had fallen to the equivalent of 173—counting as double the four and one-half large size American divisions which had arrived. For the French and British had been constrained to follow the Germans in reducing their divisions from 12 to g battalions each.

The prolonged pouring of soldiers' lives into the swamps beyond Ypres had led Lloyd George and his cabinet to withhold reinforcements for fear of encouraging fresh squandering. This undoubtedly weakened Haig's initial power of resistance to the German onslaught, yet it is just to point out that it was weakened worse—in quality as well as quantity—by the 400,000 British casualties suffered in the offensive of the later part of 1917. Moreover, we should not forget that the Government had the heavy responsibility of being the trustees for the lives of the nation. The real ground of criticism is that it was not strong enough to make a change in, or place a check upon, a command which it did not trust, while supplying the reinforcements necessary for defence. And for this lack of moral strength the public must share the blame, for they had already shown themselves too easily swayed by clamour against political interference with the generals, and too prone to believe that the politician is invariably wrong on such occasions. The civilian public, indeed, is apt to trust soldiers too little in peace, and sometimes too much in war.

These political handicaps, and their accompanying tendency to work deviously towards what dared not be demanded openly, were also seen in the project for a unified command. The prime minister, indeed, had gone so far in December as to disclaim faith in his own long-sought cure. Instead he sought a palliative in an inter-Allied executive committee, under Foch's chairmanship, which should control a common general reserve of 30 divisions. This scheme was stillborn in face of the opposition of the respective commanders-in-chief, Haig and Pétain. The decisive act came from Haig, who, when called on by Foch for his contribution of seven divisions, replied that he could spare none. He and Pétain united in preferring an arrangement between themselves for mutual support.

When the test came, a week later, this broke down, and Haig then took a foremost part in hastening and facilitating the appointment of a generalissimo, which he had formerly opposed. For the actual breakdown the blame has been commonly thrown upon the French, and there is no question that Haig understood from Pétain on March 24 that if the Germans continued their rapid progress the French reserves would have to be used to cover Paris. But in fairness it is essential to add that, whereas the original compact had only pledged the aid of some six French divisions, Pétain actually sent nine by March 24, and 21 (including four of cavalry) by March 26. If these reinforcements were, perhaps, slower in coming into action than in despatch, it does not affect the fact that the original pledge was amply exceeded. Thus, the fundamental fault would seem to lie in trusting to an arrangement for such slender support by either Ally.

The German Plan.—On the German side the submarine panacea for victory had been replaced by a military panacea, and hopes were perhaps exaggerated by the unexpected collapse of Russia. But although Ludendorff promised victory in the field, he did not disguise that a Western offensive would be a far harder task than the conquests in the East. He realized also that it would be a race between the effect of Germany's blow and the arrival of American reinforcements, although he hoped to win the race. To secure the rear of his offensive, a definite peace was won from the Bolshevik Government of Russia by a military demonstration, and also forced on Rumania. And to secure if possible the economic base of his offensive the Ukraine was occupied, for its wheat supplies, with little resistance except from Czechoslovak troops, who had formerly been taken prisoners from the Austrian army.

Ludendorff's next problem was to decide his first point of attack. The sector between Arras and St. Quentin was chosen, on the western face of the great salient formed by the German front in France. The choice was governed by tactical reasons—this sector was the enemy's weakest point and the ground offered fewer difficulties than elsewhere—although Ludendorff had in mind the possibility of separating the Allied armies and driving the British back against the Channel coast, too closely penned in to evade the blows. From the experience of the vain Allied attacks Ludendorff had drawn the deduction that "Tactics had to be considered before purely strategical objects which it is futile to pursue unless tactical success is possible." Hence he formulated a strategical plan based on the principle of taking the tactical line of least resistance. Presumably he hoped by firm control to guide these tactical movements to a strategic destination. If so, he failed.

Where did the fault lie? The general view at the end of the war was that the tactical bias had led Ludendorff to change direction and dissipate his strength. That if the Franco-British command had previously erred by aiming at the strategically correct target without enough attention to the tactical difficulties, the German command had followed it with an equal if opposite error by concentrating on tactical success at the expense of the strategical goal. But a closer examination of the German documents since available, and of Ludendorff's own orders and instructions, throws a different light on the question. It would seem, indeed, that the real fault was that Ludendorff failed to carry out in practice the new principle he had adopted in theory; that he either did not grasp or shrank from the full implication of this new theory of strategy. He dissipated too large a part of his reserves in trying to redeem tactical failures and hesitated too long over the decision to exploit his tactical successes. Ludendorff's strategy in the East had been so masterly and so far-sighted that his indecision and short-sight in the West is difficult to explain. Perhaps he himself was feeling the strain of directing so many vast operations; perhaps it was that he missed the strategical insight and balanced view of Hoffmann who, after being at his side throughout the 1914–16 campaigns, had stayed in the East when Ludendorff went to the supreme command. The modern vice of seniority prevented Germany from making the fullest use of the man who perhaps approached nearer to military genius than any other military figure of the war.

In any case the campaign leaves the impression that Ludendorff had neither his former clearness as to the goal, nor quite the same grip on the changing situations. But in the organization of his attacks his powers were at their highest level. Surprise was to be the key by which a gate in the long-locked front was opened. In forging the key gas-shell was to be the main constituent, for Ludendorff had failed to grasp the significance of the tank and neglected to develop it in time. Only in Aug. 1918, when it was used to strike him a mortal blow did he put it in the "urgent" class of war material. The troops were trained in the new infiltration tactics already tested at Riga, and the most thorough arrangements were made for concealing and for exploiting the attacks. The assaulting divisions were to be brought up over night, the masses of artillery brought close to the front line in concealment, and their ranges obtained by methods which did away with preliminary "registration." The bombardment was to be brief but intense, and its surprise effect to be increased by lavish use of gas and smoke shell. Further, while Ludendorff had settled to strike first on the Somme sector, to which blow the code-name "Michael" was given, he also made preparations for successive attacks at other points, which besides being in readiness for the future helped to mystify the enemy. Two were on the British front and one on the French—"St. George I." against the Lys sector, "St. George II." against the Ypres sector and "Blücher" in Champagne.

The "Michael" attack was to be made by the German 17th, 2nd, and 18th Armies (62 divisions in all) on the 47 m. front Arras-St. Quentin-La Fere, but its main force was intended to be exerted north of the Somme, and after breaking through, the 17th and 2nd Armies were to wheel north-west and press the British army against the coast, while the river and the 18th Army guarded their flank. This plan was radically changed in execution because Ludendorff gained rapid success where he desired it little and failed to gain success where he wanted it most. The attack was launched on March 21 (see ST. QUENTIN, BATTLE OF 1918), and the surprise was helped by an early morning mist. But while the thrust broke through completely south of the Somme, where the defence—but also the attacking force—was thinnest, it was held up near Arras, a check which reacted on all the attack north of the river. Ludendorff, violating his new principle, spent the following days in trying to revive his attack against the strong, and strongly held bastion of Arras, maintaining this direction as his principal line of effort. Meantime he kept a tight rein on the 18th Army which was advancing in the south without serious check from its opponents. As late as March 26 he issued orders which restrained it from crossing the Avre and tied it to the pace of its neighbour, the 2nd, which in turn was held back by the very limited success of the 17th Army near Arras.

Thus we see that in reality Ludendorff was bent on breaking the British army by breaking down its strongest sector of resistance in a direct assault. And because of this obsession he failed, until too late, to throw the weight of his reserves along the line of least resistance south of the Somme. The intended wheel to the north-west might have come to pass if it had been made after passing the flank, and thus being directed against the rear, of the Arras bastion. On March 26 the attack north of the Somme (by the left wing of the 17th Army and the right of the 2nd Army) was visibly weakening as the price of its hard-earned gains. South of the Somme the left of the 2nd Army reached, and was now to be embarrassed by, the desert of the old Somme battlefields—a brake on progress and supply. The 18th Army alone was advancing with unslackened impetus. This situation led Ludendorff to adopt a new plan, but without relinquishing his old. He ordered for March 28 a fresh and direct attack on the high ground near Arras—by the right of the 17th Army and to be followed by a 6th Army attack just to the north between Vimy and La Bassée. But the promising situation south of the Somme led him to indicate Amiens as an additional main objective. Even so, he restrained the 18th Army from pushing across the Avre without further orders! On March 28 the fresh Arras attack was launched, unshielded by mist or surprise, and failed completely in face of the well prepared resistance of Byng's 3rd Army. Only then did Ludendorff abandon his original idea, and direct his main effort, and some of his remaining reserves, towards Amiens. By March 27 the advance had penetrated nearly 40 m. and reached Montdidier, cutting one railway to Paris; by March 30 the German flood was almost lapping the outworks of Amiens. Once the crust was broken, the very elaboration of the methods of control communication built up during three years of static warfare caused the greater flux behind the front. The extent of the retreat was primarily the measure of the loss of control by the British commanders.

Disaster had driven the Allies to an overdue step, and on Haig's appeal and Lord Milner's intervention Foch had been appointed on March 26 to "co-ordinate" the operations of the Allied armies. If he had fallen into disfavour owing to the heavy cost of his attacks in Artois during 1915 and the barren fruit of the Somme in 1916, his will-power and energy earned and created confidence. On April 14 he was definitely made commander-in-chief of the Allied armies. But before this a fresh German menace had developed—though not intended as such.

When Ludendorff decided to change his main line of attack to the sector south of the Somme, he diverted reserves thither. But meantime he ordered the 18th Army to mark time for two days. When the attack was renewed in force on March 30 it made little progress in face of a resistance that had been afforded time to harden, helped by the cement of French reserves which were now being poured into the breach. A further effort on April 4 had still less success and Ludendorff, rather than be drawn into an attrition struggle, suspended the attack towards Amiens. With a large part of his reserves holding the vast bulge south of the Somme, Ludendorff turned, if without much confidence and merely as a diversion, to release, on April g, his "St. George I." attack. (See LYS, BATTLE OF THE, 1918.) Its astonishing early success against a weakened front led him to convert it bit by bit into a major effort. The British were desperately close to the sea, but their resistance stopped the German tide after a 10 m. invasion just short of the important railway junction of Hazebrouck, and an attempt to widen the front towards Ypres was nullified by Haig's swinging his line back just before and by the gradual arrival of French reinforcements. Haig complained strongly that Foch was too slow in sending French reserves northward, but the event justified Foch's reluctance to commit himself thither and his seeming excess of optimism in declaring that the danger was past. Ludendorff had doled out reserves sparingly, usually too late and too few for real success; so apprehensive that his new bulge would become another sack, that after the capture of Kenmel Hill, when opportunity opened its arms, he stopped the exploitation for fear of a counter-stroke.

Thus Ludendorff had fallen short of strategic results; on the other hand he could claim huge tactical successes—the British casualties were over 300,000. The British lion had been badly mauled, and although fresh drafts to the number of 140,000 were hurried out from England and divisions brought back from Italy, Salonika and Palestine, months must elapse before it could recover its offensive power. Ten British divisions had to be broken up temporarily, while the German strength had now mounted to 208, of which 80 were still in reserve. A restgration of the balance, however, was now in sight. A dozen American divisions had arrived in France and, responding to the call, great efforts were being made to swell the stream. Further, Pershing, the American commander, had placed his troops at Foch's disposal for use wherever required. For Germany the sands were running out, and, realizing this, Ludendorff launched his "Blücher" attack between Soissons and Reims, on May 27. Falling by surprise with 15 divisions against seven, it swept over the Aisne and reached the Marne on May 30, where its impetus died away. (See CHEMIN-DES-DAMES, BATTLE OF THE, 1918.) This time the German superiority of force had not been so pronounced as before nor aided by nature's atmospheric cloak. It would seem that the extent of the opening success was due in part to the strategic surprise—the greater unexpectedness of the time and place of the blow—and in part to the folly of the local army command in insisting on the long-exploded and obsolete method of massing the defenders in the forward positions—there to be compressed cannon-fodder for the German bombardment. Pétain's recent instructions for a deep and elastic system of defence had been disregarded. This indeed, was an additional form of surprise, for the object of all surprise is the dislocation of the opponent's moral and mind and the effect is the same whether he be caught napping by deception or allows himself to be trapped with his eyes open. Further, the Germans' success on May 27, 1918, deserves study in comparison with their other offensives whose success was almost in mathematical ratio to their degree of surprise. This final year, indeed, read in the light of previous years, affords fresh proof that surprise—or, more scientifically, the dislocation of the enemy's balance—is essential to true success in every operation of war. At the bar of universal history, any commander who risks lives without seeking his preliminary guarantee stands condemned.

But once again Ludendorff had obtained a measure of success for which he was neither prepared nor desirous. The surpriser was himself surprised. The attack had been conceived merely as a diversion, to attract the Allied reserves thither preparatory to a final and decisive blow at the British front in Flanders. But its opening success attracted thither too large, yet not large enough, a proportion of their own reserves. Blocked frontally by the river, an attempt was made to push west, but it failed in face of Allied resistance—notable for the appearance of American divisions at Chateau-Thierry, where they gallantly counter-attacked.

Ludendorff had now created two huge bulges, and another smaller one, in the Allied front. His next attempt was to pinch out the Compihgne "tongue" which lay between the Amiens and Marne bulges. But this time there was no surprise, and the blow on the west side of the "tongue," June g, was too late to coincide with the pressure on the east. A month's pause followed. Ludendorff was anxious to strike his long-cherished decisive blow against the British in Belgium, but he considered that their reserves here were still too strong, and so again decided to take the line of least tactical resistance, hoping that a heavy blow in the south would draw off the British reserves. He had failed to pinch out the Compihgne "tongue" on the west of his Marne salient; he was now about to attempt the same method on the east, by attacking on either side of Reims. But he needed an interval for rest and preparation, and the delay was fatal, giving the British and French time to recuperate, and the Americans to gather strength. The British divisions previously broken up had now been reconstituted, and as a result of an urgent appeal made to President Wilson in the crisis of March, and the provision of extra shipping, American troops had been arriving at the rate of 300,000 a month since the end of April. The tactical success of his own blows had been Ludendorff's undoing; yielding to their influence, he had pressed each too far and too long, so using up his own reserves and causing an undue interval between each blow. He had driven in three great wedges, but none had penetrated far enough to sever a vital artery, and this strategic failure left the Germans with an indented front which invited flanking counter-strokes.

X. THE FINAL PHASE

The **Turning of** the Tide.—On July 15 Ludendorff launched his new attack, but its coming was no secret. East of Reims it was foiled by an elastic defence, and west of Reims the German penetration across the Marne merely enmeshed them more deeply to their downfall—for on July 18 Foch launched a long-prepared stroke against the other flank of the Marne salient. (See MARNE, SECOND BATTLE OF THE.) Here Pétain, who directed the operation, turned the key which Ludendorff lacked, using masses of light tanks to lead a surprise attack on the Cambrai method. The Germans managed to hold the gates of the salient open long enough to draw their forces back into safety and straighten their line. But their reserves were depleted, Ludendorff was forced to postpone if not yet to abandon the offensive in Flanders and the initiative definitely and finally passed to the Allies. Foch's first concern was to keep it, by giving the enemy no rest while his own reserves were accumulating. To this end he arranged with Haig, Pétain and Pershing for a series of local offensives, aimed to free the lateral railway communications and to improve the position of the front ready for further operations. To Haig he proposed an attack in the Lys sector, but Haig saw "no advantage in an advance over this flat and marshy region" and suggested instead the Somme area as more suitable and more strategically effective. Already, before the Marne counter-stroke Rawlinson, commanding the British 4th Army in front of Amiens (*q.v.*), had submitted to Haig a plan for a large surprise attack there, and Foch agreed to this in place of his own proposal. He also placed under Haig the French 1st Army (Debeney) to extend the attack to the south. Rawlinson's army was doubled, and by skilful precautions the enemy were kept in the dark until, on Aug. 8, the attack was delivered—led by 450 tanks. The blow had the maximum shock of surprise, falling on an opponent who had done nothing to strengthen his position by entrenchments, and south of the Somme the troops of the Australian and Canadian Corps rapidly overran and overwhelmed the German forward divisions. By Aug. 12 when the advance came to a halt through reaching the tangled wilderness of the old 1516 battlefields, if also through lack of reserves, the 4th Army had taken 21,000 prisoners at a cost of only 20,000 casualties. Great, if not fully exploited, as a material success, it was far greater as a moral one.

Ludendorff has said: "Aug. 8 was the black day of the German army in the history of the war. . . . It put the decline of our fighting power beyond all doubt. . . . The war must be ended." He informed the emperor and the political chiefs that peace negotiations ought to be opened before the situation became worse, as it must. After July 18 Ludendorff had by no means lost hope and as late as Aug. 2 was ordering preparations for four fresh attacks, including his cherished Flanders design, if on a reduced scale. But after Aug. 8 these dreams vanished. The conclusions reached at a Crown Council held at Spa were that "We can no longer hope to break the war-will of our enemies by military operations" and "the object of our strategy must be to paralyse the enemy's war-will gradually by a strategic defensive." In other words the German command had abandoned hope of victory or even holding their gains, and hoped only to avoid surrender—an insecure moral foundation.

On Aug. 10 Foch issued a fresh *directive* for the preparation of an "advance" by the British 3rd Army "in the general direction of Bapaume and Peronne." Meantime he wished Haig to continue the 4th Army's frontal pressure, but Haig demurred to it as a vain waste of life and gained his point. Economy of force was henceforth to be added to the advantages of the new strategy now evolved. Thus the momentum of the 4th Army had hardly waned, before the 3rd Army moved. From then on Foch beat a tattoo on the German front, a series of rapid blows at different points, each broken off as soon as its initial impetus waned, each so aimed as to pave the way for the next, and all close enough in time and space to react on each other. Thus Ludendorff's power of switching reserves to threatened spots was stopped, as his balance of reserves was drained.

On Aug. 10 the French 3rd Army had struck to the south; then on Aug. 17 the French 10th Army still farther south; next, on Aug. 21, the British 3rd Army, followed by the British 1st Army on Aug. 26. Ludendorff's order to the troops holding the Lys salient to retire was hastened in execution by the attacks of the reformed British 5th Army, and by the first week in September the Germans were back on their original starting line—the strong defences of the Hindenburg line. And on Sept. 12 Pershing completed the series of preliminary operations by erasing the St. Mihiel (q v) salient—the first feat of the Americans as an independent army. Pershing had originally intended to make this a stepping stone to an advance towards the Briey coalfields and the eastern end of the Germans' main lateral railway near Metz, but the project was abandoned for reasons that will be referred to later. Thus no exploitation of the success was attempted.

The clear evidence of the Germans' decline and Haig's assurance that he mould break the Hindenburg line where the German reserves were thickest, decided Foch to seek victory that autumn instead of postponing the attempt until 1919. All the Allied armies in the West were to combine in a simultaneous offensive.

The Collapse of Bulgaria.—But before it could develop an event occurred in the Balkans which. in the words of Ludendorff, "sealed the fate of the Quadruple Alliance" He had still hoped to hold fast in his strong lines in the West, falling back gradually to fresh lines if necessary, and with his strategic flanks in Macedonia and Italy covered, while the German Government was negotiating for a favourable peace. At the same time there was alarm as to the moral effect of the Western front defeats on the German people, their will-power already undermined by shortage of food, and perhaps also by propaganda.

But on Sept. 15 the Allied armies in Salonika (*q.v.*) attacked the Bulgarian front, which crumpled in a few days. Guillaumat, who had succeeded Sarrail in Dec. 1917, had prepared the plan for an offensive, and when recalled to France in the crisis of July as governor of Paris he won over the Allied Governments to consent to the attempt. His successor in Salonika, Franchet d'Esperey, concentrated a Franco-Serb striking force, under Michich, on the Sokol-Dobropolye sector, west of the Vardar, where the Bulgarians trusted to the strength of the mountain ridges and were weak in numbers. On Sept. 15 Michich attacked and while the British attack at Doiran pinned a large part of the Bulgarian reserves, he broke right through towards Uskub. With their army split into two parts the Bulgarians, already tired of the war, sought an armistice, which was signed on Sept. 29. Franchet d'Esperey's achievement not only knocked away the first prop of the Central Alliance but opened the way to an advance on Austria's rear.

The Collapse of Turkey.—The offensive planned for the spring in Palestine had been interrupted by the crisis in France and the consequent withdrawal of most of Allenby's British troops. The depletion was made up by reinforcements from India and Mesopotamia, and by September Allenby was again ready to take the offensive. (See PALESTINE, OPERATIONS IN.) He secretly concentrated, on the Mediterranean flank, the mass of his infantry, and behind them the cavalry. In this way he changed a two to one superiority on the general front into four to one at the decisive point. At dawn on Sept. 19 the western mass attacked, rolling the Turks back north-east towards the hilly interior—like a door on its hinges. Through the open doorway the cavalry passed, riding straight up the coastal corridor for 30 m., before swinging east to cut the Turkish communications and close all exits of retreat. Completely trapped, the main Turkish armies were rounded up, while the British cavalry exploited the victory of Megiddo by a swift and sustained pursuit which gained first Damascus and finally Aleppo. Defenceless, and threatened with a direct advance of Milne from Macedonia on Constantinople, Turkey capitulated on Oct. 30.

The First Peace Note.—The capitulation of Bulgaria, convinced Ludendorff that it was necessary to take a decisive step towards securing peace. While he was scraping together a paltry half dozen divisions to form a new front in Serbia, and arranging a meeting with the political chiefs, Foch's grand assaults fell on the Western defences, Sept. 26–28, and the line threatened to crack.

The German supreme command lost its nerve—only for a matter of days, but that was sufficient, and recovery too late. On Sept. 29 they took the precipitate decision to appeal for an armistice, saying that the collapse of the Bulgarian front had upset all their dispositions—"troops destined for the Western front had had to be despatched there." This had "fundamentally changed" the situation in view of the attacks then being launched on the Western front, for though these "had so far been beaten off their continuance must be reckoned with."

This remark refers to Foch's general offensive. The American attack in the Meuse-Argonne had begun on Sept. 26, but had come practically to a standstill by the 28th. A Franco-Belgo-British attack had opened in Flanders on the 28th, but if unpleasant did not look really menacing. But on the morning of the 29th Haig's main blow was falling on the Hindenburg line, and the early news was disquieting.

In this emergency Prince Max was called to be chancellor to negotiate a peace move, with his international reputation for moderation and honour as its covering pledge. To bargain effectively and without confession of defeat he needed, and asked, a breathing space "of ten, eight, even four days, before I have to appeal to the enemy." But Hindenburg merely reiterated that "the gravity of the military situation admits of no delay," and insisted that "a peace offer to our enemies be issued at once."

Hence on Oct. 3 the appeal for an immediate armistice went out to President Wilson. It was an open confession of defeat to the world, and even before this—on Oct. 1—the supreme command had undermined their own home front by communicating the same impression to a meeting of the leaders of all political parties.

Men who had so long been kept in the dark were blinded by the sudden light. All the forces of discord and pacifism received an immense impulse.

While the German Government was debating the conditions for an armistice and questioning Ludendorff as to the situation of the army for further resistance if the terms were unacceptable, Foch continued his military pressure.

The Final Advance.—The plan agreed upon between Foch and the Allied commanders had been for a series of convergent and practically simultaneous attacks:—

1 and 2. By the Americans west of the Meuse, and by the French west of the Argonne, both in the direction of Mezières—beginning on Sept. 26. *(See* MEUSE-ARGONNE OPERATION.)

3. By the British on the St. Quentin-Cambrai front in the general direction of Maubeuge—beginning on Sept. 27. *(See* HINDENBURG *LINE,* BATTLES OF, 1918.)

4. By the Belgian and Allied forces in the direction of Ghent—beginning on Sept. 28.

The general aspect was that of a pincer-like manoeuvre against the vast salient jutting out between Ypres and Verdun. The attack towards Mezibres would shepherd that part of the German armies towards the difficult country of the Ardennes and away from their natural line of retreat through Lorraine; it was also dangerously close to the hinge of the Antwerp-Meuse line which the Germans were preparing in rear. The attack towards Maubeuge would threaten the other main line of communication and retreat through the Libge gap, but it had further to go. In these attacks, the Americans had the hardest natural obstacle, the Argonne forest; the British had to face the strongest defences and the heaviest weight of enemy troops.

Pershing's attack, adding surprise to its five to one superiority in numbers, opened well, but lost impetus owing to the difficulties of supply and exploitation in such country. When it was eventually suspended on Oct. 14, after bitter fighting and severe losses, the American army was still far distant from the vital railway. A new force, it was suffering the growing pains which the British had passed through in 1915–16. Pershing's difficulties were enhanced by the fact that he had waived his own proposal for an exploitation of the St. Mihiel success towards Metz in view of Haig's objection to a move which, however promising in its ultimate aim, would diverge from the general direction of the other Allied attacks. Haig desired that Pershing's attack should converge towards his in order more immediately to ease the task of the British troops. Foch's original plan for the general offensive had accordingly been readjusted, and in consequence Pershing had not only a more difficult sector but a bare week in which to prepare his blow. The shortness of time led him to use untried divisions instead of switching the more experienced divisions used at St. Mihiel. But in the outcome, Haig's insistence was proved unnecessary, for the British attack broke through the Hindenburg line before the Meuse-Argonne attack had drawn away any German division from his front.

Haig, by pushing forward his left wing first, facilitated the attack of his right on the strongest section of the Hindenburg line—the Canal du Nord—and by Oct. 5 the British were through the German defence system, with open country beyond. But on this front the attackers were in actually inferior numbers to the defenders, their tanks were used up, and they could not press forward fast enough to endanger the German retreat.

Within a few days the supreme command became more cheerful, even optimistic when it saw that breaking into the Hindenburg line had not been followed by an actual break-through of the fighting front. More encouragement came from reports of a slackening in the force of the Allies' attacks, particularly in the exploitation of opportunities. Ludendorff still wanted an armistice, but only to give his troops a rest as a prelude to further resistance and to ensure a secure withdrawal to a shortened defensive line on the frontier. By Oct. 17 he even felt he could do it without a rest. It was less that the situation had changed as that his impression of it had been revised. It had never been quite so bad as he had pictured it on Sept. 29. But his first impression had now spread throughout the political circles and public of Germany—as the ripples spread when a pebble has been dropped in a pool.

The combined pressure of the Allied armies, and their steady advance, were loosening the will-power of the German Government and people. The conviction of ultimate defeat, slower to appeal to them than to the army chiefs, was the more forcible when it was realized. And the indirect moral effect of military and economic pressure was accentuated by the direct effect of peace propaganda, skilfully directed and intensively waged by Northcliffe. The "home front" began to crumble later but it crumbled quicker than the battle front.

The Collapse of Austria.—The last Austrian attempt at an offensive on the Italian front, in conjunction with the German assaults in France, had been repulsed on the Piave in June. Diaz waited until conditions were ripe for an offensive in return, until Austria's internal decay was spreading and she was without hope from Germany. On Oct. 24 Cavan's army moved to seize the crossings of the Piave and on Oct. 27 the main attack opened, driving towards Vittorio Veneto *(q.v.)* to divide the Austrians in the Adriatic plain from those in the mountains. By Oct. 30 the Austrian army was split in two and the retreat became a rout, and the same day Austria asked for an armistice, which was signed on Nov. 3.

The Curtain Falls on the Western Front.—Already on Oct. 23 President Wilson had replied to the German requests by a note which virtually required an unconditional surrender. Ludendorff wished to carry on the struggle in hopes that a successful defence of the German frontier might damp the determination of the Allies. But the situation had passed beyond his control, the nation's will-power was broken, and his advice was in discredit. On Oct. 26 he was forced to resign.

Then, for 36 hours, the chancellor lay in coma from an overdose of sleeping draught after influenza. When he returned to his office on the evening of Nov. 3, not only Turkey, but Austria, has capitulated. If the situation on the Western front was felt to be rather easier, Austrian territory and railways were now available as a base of operations against Germany. Several weeks before, military opinion had tended to regard such a contingency, then unrealized, "as decisive." Next day revolution broke out in Germany, and swept rapidly over the country. And in these last days of tremendous and diverse psychological strain the "reddening" glare behind was accentuated by a looming cloud on the Lorraine front—where the renewed American pressure, since Nov. 1, was on a point more sensitive than other parts, where "they must not be allowed to advance if the Antwerp-Meuse line was to be held any longer." If this continued the Rhine and not the frontier would have to be the next line of resistance.

But hourly the revolution was spreading, fanned as peace negotiations were delayed, by the Kaiser's reluctance to abdicate. Compromise with the revolutionaries was the only chance, and on Nov. 9 Prince Max resigned to the Socialist Ebert. Germany had become a republic in outward response to President Wilson's demand and in inward response to the uprising of the German people against the leaders who had led them into disaster. The German fleet had already mutinied when their commanders sought to send them out on a forlorn hope against the British.

On Nov. 6 the German delegates left Berlin to treat for an armistice. Their acceptance of the severe terms was hastened less by existing military events than by collapse of the "home front," coupled with the imminence of a fresh blow. The Allied advance was still continuing, in some parts seeming to gather pace in the last days, but the main German forces had escaped from the perilous salient, and their complete destruction of roads and railways made it impossible for supplies to keep pace with the advancing troops. A pause must come while these communications were being repaired, and thus the Germans would have breathing space to rally their resistance. The advance reached the line Pont à Mousson-Sedan-Mezières-Mons-Ghent by Nov.

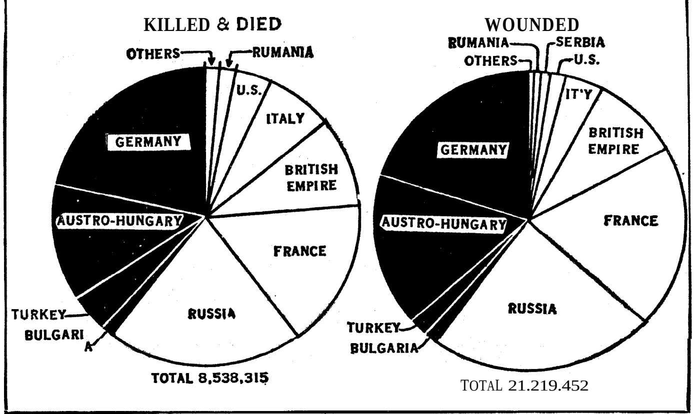
MILITARY CASUALTIES IN THE WORLD WAR, AS ESTIMATED BY THE UNITED STATES WAR DEPARTMENT



11—the line of the opening battles in 1914—but strategically it had come to a standstill.

To meet this situation Foch had concentrated a large Franco-American force, of 28 divisions and 600 tanks, to strike below Metz directly east into Lorraine. The general Allied advance had almost absorbed the enemy's reserves, and now this decisive manoeuvre was to fall on his bared flank. It promised the chance of turning the whole of his new line of defence and if rapidly successful might intercept his retreat. In addition Trenchard's Independent Air Force was about to bomb Berlin, on a scale hitherto unattempted in air warfare. And the number of American divisions in France had risen to 42. Whether this final thrust, intended for Kov. 14, would have solved the hitherto insoluble problem of maintaining the momentum of advance after an initial break-through can never be known. But the attempt was unnecessary. For with revolution at home and the gathering menace on their frontier, the German delegates had no option but to accept the drastic terms of the Armistice, which was signed in Foch's railway-carriage in the Forest of Compiègne at 5 A.M. on Nov. 11, and at 11 o'clock that morning the World War came to an end.

XI. EPILOGUE

Controversy has long raged as to what was the deciding act of the conflict, what were the causes of victory, and, even less profitably, which country won the war.

The truth is that no one act, still less one cause, was, or could be, decisive. The Western front, the Balkan front, the tank, the blockade and propaganda have all been claimed as the cause of victory. All claims are justified, none is wholly right. In this new warfare between nations victory is a cumulative effect, to which all weapons—military, economic, and psychological—contribute. Victory comes, and can only come, through the utilization of all the resources existing in a modern nation.

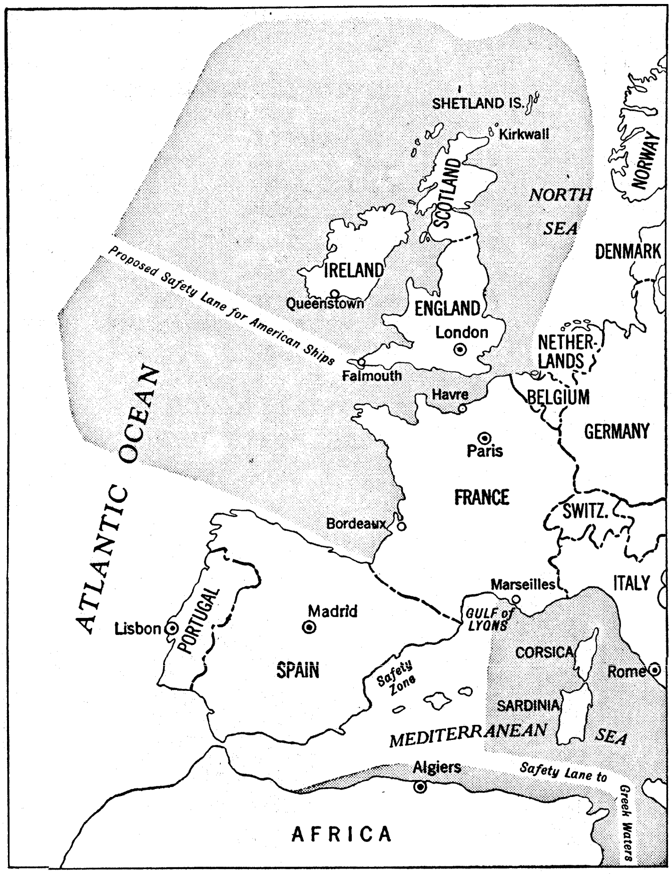
Among the fundamental causes of Germany's surrender the blockade, wielded by the British navy, is seen to assume larger and larger proportions as the fog of war disperses in the clearer light of these post-war years. It was a constructive hold which the Germans werepowerless to loosen. Helplessness induces hopelessness, and history attests that loss of hope and not loss of lives is what ultimately decides the issue of war. The intangible all-pervading factor of the blockade intrudes into every consideration of the military situation.

The naval factor again intervenes in the question whether Germany could have avoided capitulation in Nov. 1918 and whether, but for the revolution, her armies could have stood firm on their own frontiers. For even if the German people, roused to a supreme effort in visible defence of their own soil, could have held the Aliied armies at bay the end could only have been postponed—because of the grip of sea-power.

But in hastening the surrender, in preventing a continuance of the war into 1919 military action ranks foremost. Hence the success of the Allied armies is chief among the immediate causes of victory. That conclusion does not necessarily, or even naturally, imply that at the moment of the Armistice Germany's military power was broken or her armies decisively beaten. Nor that the Armistice was a mistaken concession. Rather does the record of the last "hundred days," when sifted, confirm the immemorial lesson that the true aim in war is the mind of the hostile rulers, not the bodies of their troops; that the balance between victory and defeat turns on mental impressions and only indirectly on physical blows. It was the shock of being surprised and the feeling that he was powerless to counter potential strategic moves which shook Ludendorff's nerve more than the loss of prisoners, guns, and acreage.

It is even more futile to ask which country won the war; France did not nin the war. but unless it had held the fort while the forces of Britain were preparing and those of the United States were still a dream the release of civilization from this nightmare of militarism would have been impossible.

Great Britain did not win the war, but without its command of the sea, its financial support and its army to take over the main



FROM CARLTON HAYES, "BRIEF HISTORY OF THE WORLD WAR (MACMILLAN)

SAFETY LANES FOR NEUTRALS IN MINE FIELDS

burden of the struggle from 1916 onward, defeat would have been inevitable.

The United States did not win the war, but without its economic aid to ease the strain. without the arrival of its troops to turn the numerical balance, and. above all, without the moral tonic which their coming gave, victory would have been impossible.

Finally, whatever be the verdict of history on its policy, unstinted tribute is due to the incomparable endurance and skill with which Germany more than held its own for four years against superior numbers, an epic of military and human achievement.

The development of the means and methods of warfare during the struggle are described in the following articles: AIR WARFARE; ARTILLERY; CAVALRY; INFANTRY; STRATEGY; TACTICS; TANK.

The campaigns and battles have received separate and detailed treatment in articles such as the following: CAMBRAI, BATTLE OF; CAPORETTO, BATTLE OF; DARDANELLES CAMPAIGN; FRONTIER. BATTLES OF THE; JUTLAND, BATTLE OF; LEMBERG, BATTLES OF; LUCK (LUTSK), BATTLES OF; MARNE, THE FIRST BATTLE OF THE; MARNE, SECOND BATTLE OF THE; NAREW, BATTLES OF THE; NAROCZ. BATTLE OF LAKE; PRZEMYSL, SIEGES OF; SALONIKA CAMPAIGNS, 1915–18; SERBIAN CAMPAIGNS (1914–1915); SOMME, BATTLES OF THE, 1916; VERDUN, BATTLES OF; VITTORIO VENETO, BATTLE OF; YPRES, THE BATTLE OF, 1914; YPRES, THE BATTLES OF, 1915; YPRES, BATTLES OF, 1917; YSER, BATTLE OF THE.

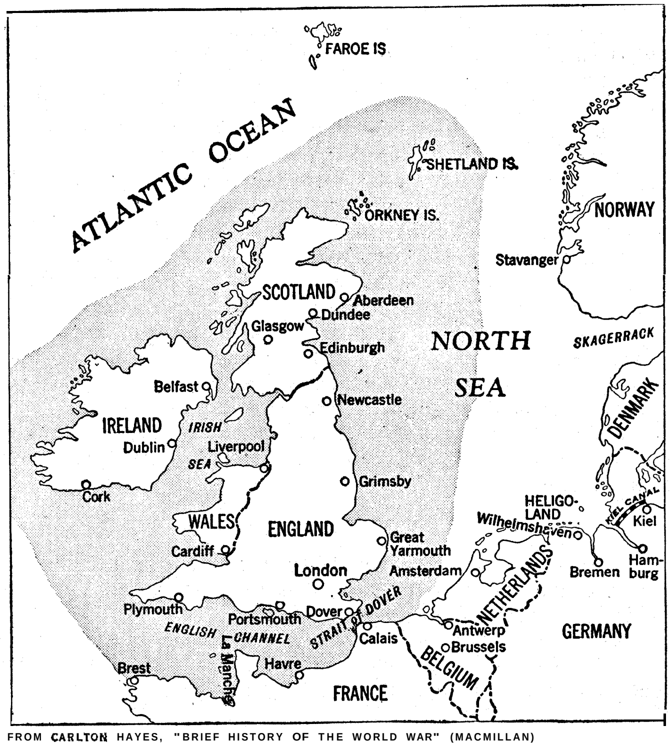
The mechanism of war, the organization of naval, military and air forces, and the scientific aspects of military machinery are also dealt with in such articles as those on ADMIRALTY; AIR FORCES; BALLISTICS; BRIDGING, MILITARY; CAMOUFLAGE; CHEMICAL WARFARE; FLAME THROWER; INTELLIGENCE, MILITARY AND POLITICAL; MINE, NAVAL; TRANSPORT, MILITARY; ORDNANCE; PARAVANE; RANGE FINDERS; SMALL ARMS, MILITARY; SUPPLY AND TRANSPORT, MILITARY. (B. H. L. H.)

NAVAL

To follow the world-wide ramifications of naval operations during World War I it is best to consider. year by year, the events in each area. At the outset they covered all the seas of the earth, but as the net was drawn around the Central Powers, the area of naval warfare was gradually reduced to European waters and to the seas around the British Isles. In addition to classical fleet and cruiser actions, commerce raiding and blockade tactics, all of which aided greatly in bringing the war to a close, World War I saw the emergence of the submarine as a potent naval weapon and brought about many of the earliest experiments concerned with the operation of aircraft from and against naval vessels.

Preliminary Moves.—In July 1914 in place of the usual summer manoeuvres, a test mobilization of the British fleet in home waters was carried out. The ships of the 2nd and 3rd fleets, their crews completed from the reserves, joined the 1st fleet at Portland on July 16th for exercises in the channel. On July 23, the day of the Austrian ultimatum to Serbia, the fleets were ordered to disperse. The ships of the 2nd and 3rd fleets returned to their home ports.

The 1st fleet remained at Portland, the defense flotillas were sent to their stations around the coast, and at the same time



FROM CARLTON HAYES, "BRIEF HISTORY OF THE WORLD WAR" (MACMILLAN)

GERMAN WAR ZONE, FEBRUARY 1915

the Mediterranean fleet was ordered to concentrate at Malta. On July 29 the 1st fleet left Portland for Scapa Flow, and, by Aug. 2 the 1st and 2nd fleets were at their war stations, the 3rd fleet was on the move, the defense flotillas were at their posts, and the organizations for taking up auxiliaries and for arming merchant liners were in force. On Aug. 1 the order for general mobilization was issued, followed next day by the calling up of the naval reserve. Because of the recent exercise the machinery of mobilisation worked smoothly and by the morning of Aug. 4 the state of naval readiness around the British Isles was such as to preclude the possibility of surprise before the outbreak of hostilities.

The German High Sea Fleet, which had been visiting Norwegian ports, was recalled. By July 30 all ships had returned to Wilhelmshaven and Kiel and no German ships were sighted by the British Fleet as it passed northward to its war stations.

Distribution of Fleets.—The following table shows the distribution of the British and German Fleets upon the outbreak of hostilities.

THE NORTH SEA AND CHANNEL 1914

The Commencement of Hostilities.—On the morning of Aug. 4 the Grand Fleet, commanded by Admiral Sir John Jellicoe, left Scapa Flow on the first of its many "sweeps" through the North Sea. Its object was to intercept any German commerce raiders that might put to sea before war was declared. At 11 P.M. that night all ships received the fateful wireless message to "commence hostilities against Germany." For three days the fleet cruised without seeing an enemy and on Aug. 7 returned to Scapa. The 10th Cruiser squadron, drawn from 3rd fleet cruisers, was not yet complete and this shortage of cruisers enabled one raider, the "Kaiser Wilhelm der Grosse," to escape through the cordon. Meanwhile the Harwich Force (Commodore Tyrwhitt) made a search of the Heligoland Bight, which resulted in the sinking of the minelayer "Konigin Luise" by the "Amphion." But the German mines had been laid and the "Amphion" ran into them on her return and was sunk. Thus early was first blood drawn upon both sides and Germany showed her intention to disregard, not only the customs of the sea, but her own signature to the Hague convention, by laying mines without warning, in international waters.

The Expeditionary Force.—The decision, on Aug. 5, to send the Expeditionary Force to France threw upon the navy the duty of safeguarding its passage. In the Channel were stationed the 5th, 7th and 8th Battle squadrons (eighteen pre-dreadnoughts) with one French and two British Cruiser squadrons. The Dover Straits were guarded by British and French destroyer and submarine flotillas, and an aerial patrol was established between the North Foreland and Ostend. Further north the Harwich Force patrolled the "Broad Fourteens" to the Dutch coast and the Grand Fleet took up a position in the centre of the North Sea, its cruisers and destroyers spread southward, ready to counter any move of the High Sea Fleet. Several unsuccessful submarine attacks were made upon ships of the Grand Fleet and on Aug. 9, "U. 15" was rammed and sunk by the cruiser "Birmingham" close to the fleet rendezvous. Regardless of the submarine risk, the fleet maintained its watch and from Aug. 15 to 17, when the bulk of the troops were afloat the Heligoland Bight was closely blockaded. Nothing was seen of the German fleet, whose inertness appeared surprising, it not then being realised that the policy of the German High Command was to preserve its fleet and to make only minor attacks with submarines and mines. By Aug. 18 the first four divisions were in France without the loss of a man and five days later the 5th Division was safely across. The enemy made their only appearance on Aug. 18, when two cruisers were sighted but escaped without being brought to action. The safe transport of the main body of troops being complete the Grand Fleet battleships withdrew to the west coast of Scotland, leaving two battlecruisers in the Humber to support the southern force.

Heligoland Bight Action.—To assist the Belgian army in creating a diversion on the German flank a brigade of Royal Marines was sent to Ostend: they landed with difficulty, in bad weather, on Aug. 27–28 from battleships of the Channel Fleet. This force being exposed to a sudden blow from the German Fleet, the Harwich flotillas, supported by battlecruisers and cruisers from the Grand Fleet, made an organised drive towards the German coast on the morning of Aug. 28. The outcome was the battle of the Heligoland Bight (*q.v.*) in which three German light cruisers and a destroyer were sunk and several other ships damaged, whilst the damage to British ships was small. This success in the first serious contact with the enemy at sea, did much to dispel the gloom cast by the retreat of the Allied armies before the German advance.

The shifting of the British army base from the Channel Ports to St. Nazaire, following the retreat from Mons threw a heavy burden upon the navy and especially upon the Admiralty transport service. Ships could no longer be spared for the Ostend diversion and the Royal Marine brigade was withdrawn on Aug. 31. The moving of the base began on Sept. 2 and was smoothly and rapidly completed.

In the last days of August, German mines, laid in the open sea off the Humber and Tyne caused the loss of several neutral ships and of the minesweeping gunboat "Speedy." Submarines were active in the North Sea and on Sept. 1, the report that one had entered Scapa Flow caused the Grand fleet to put hurriedly to sea. After sweeping in force to the Skaagerak the fleet returned on Sept. 5 to Loch Ewe to fuel and on that day the British navy suffered its first loss by submarine attack, when the scout "Pathfinder" was sunk by "U. 29."

On Sept. 10, in order to cover the passage of the 6th Division to France, a great sweep was made through the North Sea by the Grand Fleet supported by the Harwich Force and the Channel squadron. The Bight of Heligoland was searched but no German ships were seen excepting several submarines, one of which was rammed by the "Zealandia." On Sept. 12 the British submarines scored their first success when "E. 9" sank the cruiser "Hela" off Heligoland. The High Sea Fleet being known to be escorting troops in the Baltic, the opportunity was taken to give the Grand Fleet a few days rest, the first since war broke out. The fleet arrived at Loch Ewe on Sept. 13: its rest was but a short one for on the 17th it was again sweeping down the North Sea to the Horns Reef following the sinking of the "Cressy," "Hogue" and "Aboukir." These three cruisers were sunk within an hour by a single submarine ("U. 9"). They were steaming in line abreast on the "Broad Fourteens" patrol, having been deprived of their destroyer support by bad weather. The "Aboukir" was hit first and the other two were torpedoed in succession as they closed to pick up survivors. In this disaster 1,400 lives were lost: and orders were given that in future, heavy ships were not to stop to pick up survivors of consorts torpedoed by submarines, nor were armoured ships to be used for patrol or examining merchant ships in submarine waters.

The Fall of Antwerp.—In the closing days of September, the Belgian Government asked for assistance in the defence of Antwerp. Some naval guns were sent and a brigade of Royal Marines reached the city on Oct. 2, followed by two untrained brigades of the newly formed Royal Naval Division. On Oct. 2 the eastern approach to the Dover Straits was closed by a minefield, extending from the Goodwins to Ostend, every publicity being given to its limits. The 7th Division was landed at Zeebrugge on Oct. 7 without loss, in spite of a number of submarine attacks, but this desperate attempt to support the Belgian Army failed. Antwerp surrendered on Oct. 10 and the coast ports fell into the hands of the enemy as the Belgian Army retreated to the line of the Tser. One of the Naval Brigades, in the retreat, was forced across the Dutch frontier and interned. The German pursuit of the exhausted Belgian Army along the coast was stayed by the gallant work of a British flotilla under the command of Rear-Admiral Hood.

Meanwhile the Harwich Force watching for a move on the part of the Germans, obtained its reward on Oct. 16, when the "Undaunted" and four destroyers met and chased four German destroyers and sank them all. This was the only attempt, apart from submarine activities. by the German navy to interfere on the Belgian Coast at this phase.

Submarine Menace to the Grand Fleet.—The last days of September saw the Grand Fleet at Scapa Flow and from Oct. 2–12 the whole fleet was at sea engaged in safeguarding the passage of the Canadian convoy. On Oct. 7 a German submarine entered Loch Ewe, rendering that place unsafe as a fleet anchorage. The fleet returned to Scapa Flow, where a partial submarine obstruction was in place, on Oct. 12. At this time submarines were active in the vicinity of the northern bases and several attacks were made upon patrolling cruisers. On Oct. 15 the cruiser "Hawke" was sunk with heavy loss off the Aberdeen coast and the next day a submarine was again reported inside Scapa Flow. Knowing that the German fleet was still in the Baltic, Jellicoe decided to seek a safe anchorage to the westward until the submarine defences of Scapa Flow could be made secure. On Oct. 20 he took the fleet to Lough Swilly where it remained until the end of the month, resting and carrying out practices. Meanwhile three British "E" class submarines had entered the Baltic. They were not successful in attacking the German fleet, but their presence caused much anxiety and gave moral support to the Russian fleet.

Loss of the "Audacious."-On Oct. 26, whilst carrying out firing practices off Lough Swilly, the battleship "Audacious" struck a mine. In spite of endeavours to tow her into harbour, she sank some hours later, her crew being saved. The loss was a serious one and came at an unfortunate moment. On that day the Belgian army supported by Hood's flotilla were making their last grim stand upon the Yser and news of the Grand Fleet so far away might tempt the Germans to strike a blow at Hood before help could reach him. Also war with Turkey hung in the balance and news of a disaster to the Grand Fleet might have affected the issue Consequently the Government kept the loss secret until the necessity was past.

Lord Fisher.—On Oct. 29 Lord Fisher (*q.v.*) relieved the Marquis of Milford Haven as First Sea Lord. A conference was held at the Admiralty, which Admiral Jellicoe attended, to decide upon future naval policy. On Nov. 2 the British Government declared the whole of the North Sea a prohibited area and warned all neutrals that, unless they adhered to the routes prescribed by the British authorities, they used the area at their own risk. On Nov. 3 a German cruiser squadron appeared off the Suffolk coast in the morning mist, fired a few shells on to the beach at Gorleston and at the old gunboat "Hazard" and retired. The battle squadrons having left Lough Swilly on Nov. 2, remained in the north part of the North Sea whilst a search was made by the battlecruisers and light forces, and returned to Scapa Flow on Nov. 17. The German cruiser "Yorck," on her way home from the Gorleston raid, struck a mine off the Jade River and was sunk. The defences of Scapa Flow were now far enough advanced to give a certain sense of security to the fleet, but between Nov. 23–26, when the fleet was absent in support of aerial operations in the Heligoland Bight, six submarines were sighted close to the base and one ("U. 18") was sunk by the local defence flotilla. Nov. 26 was marked by the loss of the battleship "Bulwark," which blew up at Sheerness owing to accidental ignition of cordite and sank with great loss of life.

The Scarborough Raid.—The Grand Fleet returned to Scapa Flow on Nov. 27 and there followed a month of gales of exceptional violence which delayed the completion of the submarine defences. On Dec. 15 a German force was reported at sea and the 2nd battle squadron and battlecruisers were sent south. The weather was so heavy that some of the light cruisers and destroyers had to be left behind, and to this fact and to the mist, the German force that raided Scarborough and the Hartlepools on Dec. 16, owe their narrow escape. The two towns were bombarded, 120 civilians were killed and over 400 wounded and, after laying mines off the Yorkshire coast, the Germans retired. In the mist and heavy sea a short, indecisive fight took place between the light forces, but the heavy ships, although very close, did not sight one anpther. The Grand Fleet swept in full force into the Bight on that day and Dec. 17, but the enemy had retired behind his minefields. It returned to Scapa on Dec. 20 and on Christmas Day was again in the Heligoland Bight, supporting an air raid upon Cuxhaven, after which it returned to Scapa on Dec. 27 in a heavy gale.

THE TRADE ROUTES 1914

Germany's oceanic trade was brought to a standstill at the very outset of the war, the approaches to her Home Ports being closed by the British Fleet, and with the cutting of the German cables in the Dover Straits on Aug. 5, she was isolated from the ports of the world. At the outbreak of hostilities there were permanent British squadrons stationed in China, Australia, the East Indies, at the Cape and in the Mediterranean, while the Home fleet protected the all important trade routes of the Atlantic. In August 1914, there was one light cruiser in the South Atlantic and the 4th Cruiser squadron (Craddock), detached from the 1st fleet, was in the West Indies. The 5th Cruiser squadron (Stoddart) was at once dispatched to the mid-Atlantic, between Africa and Brazil. and the ships of the 6th Cruiser squadron were scattered on special escort duties on the Atlantic Routes. The 9th Cruiser squadron (de Robeck) operated between Finisterre-Azores-Madeira; the 10th Cruiser squadron (de Chair) formed the northern patrol with the Grand Fleet; the 11th Cruiser squadron was stationed off the west coast of Ireland and the 12th Cruiser squadron, supported by a French squadron, guarded the Channel approaches.

Germany was credited with the intention of arming merchant ships as commerce raiders and the small enterprise she displayed in this direction was one of the surprises of the early months of the war. Only five such ships appeared: the "Kaiser Wilhelm der Grosse," which evaded the Grand Fleet, the "Kronprinz Wilhelm" from New York, the "Cap Trafalgar" from the River Plate, the "Cormoran" and "Prince Eitel Friedrich" in China. The "Dresden" and "Karlsruhe," in the West Indies, were the only German cruisers in the Atlantic.

The British 11th and 12th Cruiser squadrons, besides protecting trade, were at first occupied in safeguarding the passage of the Expeditionary Force. De Robeck kept a close watch upon the Spanish ports where some of the 70 interned German ships were suspected of trying to get to sea and arm. None did so and on Aug. 26 the "Highflyer," of his squadron, found the "Kaiser Wilhelm der Grosse" coaling off the African Coast and sank her.

The North **Atlantic.**—The "Dresden" was at Port au Prince (Haiti) on July 26, and the "Karlsruhe" at Havana on July 28. Both sailed for unknown destinations and Craddock sent the "Berwick" and "Bristol" to locate them, following himself in the "Suffolk." On Aug. 6 the "Suffolk" came upon the "Karlsruhe" engaged in arming the "Kronprinz Wilhelm." The merchant ship made off and the "Suffolk" chased the "Karlsruhe" until dark, when she was headed off by the "Bristol." A short moonlight action ensued, but the German's superior speed enabled him to escape. The "Dresden's" whereabouts were unknown and Craddock, anxious for the safety of the North Atlantic trade, took his squadron to the northern area. Several German ships in New York were expected to attempt to get to sea and arm, but none ventured to move and by Aug. 13 the "Karlsruhe" had been located at Curaçoa and the "Dresden" off Pernambuco. The Admiralty on that day stated that British trade in the North Atlantic was proceeding as usual. Craddock, with his flag now in the "Good Hope," sailed south in search of the two German cruisers. Leaving two French cruisers to watch the West Indies, he searched the Pernambuco and mid-Atlantic areas and then joined hands with Stoddart. By the beginning of September, a number of armed merchant ships had joined the British Cruiser squadrons, which were also reinforced by four old battleships. By this time the North Atlantic was clear of enemy cruisers and owing to the movements of the squadron under von Spee, interest was transferred to the southern part of that ocean, to which Craddock's command was specially allocated.

The "Cap Trafalgar" which left the River Plate on Aug. 22 was found by the "Carmania" on Sept. 14 off Trinidada Island. After spirited action between the two armed merchant ships, the German ship sank and the damaged "Carmania" crawled back to Gibraltar for repairs. With the West Indian cruisers pre-occupied in matching the newly opened Panama Canal, the "Karlsruhe" was successful as a raider until she blew up at sea on Nov. 4; she had several narrow escapes and during her three months' career captured 17 ships.

THE FAR EAST AND PACIFIC 1914-15

When war was declared, Admiral Jerram was at Hongkong completing his mobilisation With his squadron concentrated on Aug. 12, he destroyed the German wireless station at Yap Island. By Aug. 20 he had established a close watch on Tsingtau. Admiral von Spee was at the Caroline Islands with the cruisers "Scharnhorst," "Gneisenau" and "Nurnberg." He left on Aug. 6 for Pagan Island, where he was joined on the 12th by the cruiser "Emden," which had slipped out of Tsingtau, on Aug. 7, with supply ships. At Pagan Island von Spee heard of the Japanese ultimatum to Germany. Japan commenced hostilities against Germany on Aug. 22 and Jerram was thus freed to co-operate with the Australian squadron (Admiral Patey) in preventing von Spee from breaking through to the Indian Ocean.

The Fall **of Tsingtau.**—The primary objective of the Japanese was the German stronghold at Tsingtau. As soon as war was declared the port was blockaded by the Japanese Fleet and H.M.S. "Triumph" and Japanese troops were landed on Sept. 2. By Sept. 21 the fortress was invested by land and sea and on the next day, British troops having joined the Japanese, the general attack commenced. Tsingtau held out until Nov. 7 when it surrendered.

The Pacific Expeditions.—The Australian squadron, under Admiral Patey concentrated at Port Moresby on Aug. 7 and, on the 9th, appeared off Rabaul, the government centre of German New Guinea. No German ships were present and after destroying telegraphic communication the squadron sailed to meet the New Zealand Samoa Expedition at Suva. Von Spee's whereabouts being unknown, the presence of the battlecruiser "Australia" with this expedition was necessary. Samoa surrendered on Aug. 30 and Patey sailed to escort the Australian expedition against Rabaul. Little resistance was made to the landings on Sept. 11 and German New Guinea, with the Bismarck Archipelago, capitulated on Sept. 15. Patey's force was thus freed to attend to the Australian and New Zealand convoys, as by this time it was certain that von Spee's destination was South America.

The "Emden."—On Aug. 28 the German light cruiser "Emden" entered the Indian Ocean by way of the Molucca Strait and after being nearly found by the British cruiser "Hampshire" on Sept. 4 she made her dramatic appearance off the River Hoogly on Sept. 14. She ranged the Bay of Bengal until Sept. 25, bombarding Madras on the 22nd. Then for a month she cruised in the western approaches to Ceylon, coaling at Diego Garcia. On Oct. 21, after a narrow escape from the "Hampshire" and the armed merchant cruiser "Empress of India," she crossed the Indian Ocean, appearing off Penang on the 28th. There she sank the Russian cruiser "Zhemchug" and the French destroyer "Mousquet," and doubled back round the north of Sumatra. Unable to find her storeships, which had been sunk by the "Yarmouth," she made for the Cocos Islands. There on Nov. 9th, she was brought to action and sunk by H.M.A.S. "Sydney," so ending her remarkably successful raiding career in which she had sunk 15 ships.

Von Spee in the Pacific.—With Japan's entry into the war, von Spee's position in Chinese waters became untenable, and he decided to make for South America. After despatching the "Emden" on her memorable cruise, he sailed east, passing through the Marshall Islands on Aug 22. Here he detached the "Nurnberg" to Honolulu and sailed himself for Christmas Island. Arriving on Sept. 6, the "Nurnberg" rejoined next day, having cut the British cables at Fanning Island. On Sept. 14 von Spee appeared off Samoa and finding the place already in British hands, again sailed east. By this date Craddock had taken over the command of the South Atlantic and was coming south in search of the "Dresden." Von Spee, after bombarding Tahiti on Sept. 22, visited the Marquesa Islands on Oct. 1 and arrived at Easter Island on Oct. 12. Here he was joined by the light cruisers "Leipzig" from North America and "Dresden" from the Atlantic. On Sept. 15 Craddock was ordered to concentrate his force upon the Falkland Islands and was promised reinforcements. He heard on Sept. 26 that the "Dresden" was off Chile and it was by then certain that South America was von Spee's destination. By Oct. 22 Craddock had collected his ships at the Falkland Islands and he then searched round the Horn, leaving the old and slow battleship "Canopus" to join him through the Magellan Straits. Meanwhile von Spee had arrived off Valparaiso and was cruising off the coast.

Coronel and the Falkland Islands **Battles.**—Craddock, after rounding the Horn, continued his search to the north and sent the light cruiser "Glasgow" into Coronel. Von Spee hearing of her at that port on Oct. 31, turned south to cut her off. Craddock, having heard the "Leipzig's" wireless, was searching for her on his way north. Neither admiral was aware of the proximity of the other until they met on the evening of Nov. 1, and the battle of Coronel (*q.v.*) was fought. The cruisers "Good Hope" and "Monmouth" were sunk and the other British ships made their escape and returned to the Falkland Islands. Von Spee, after his victory, paid a visit to Valparaiso and then sailed south to St. Quintin Bay, about 300 miles north of the Magellan Straits.

The news of the Coronel defeat created consternation in England and immediate steps were taken to retrieve the position. The battlecruisers "Invincible" and "Inflexible," from the Grand Fleet, were placed under the orders of Admiral Sturdee, who was given a wide commission to seek out and destroy von Spee, wherever he might be, in the South Atlantic or Pacific Oceans. Sturdee left Plymouth on Nov. 11 and concentrated his force at the Abrolhos Rocks on Kov. 26, the same day that von Spee left St. Quintin Bay for the Falkland Islands. Now that von Spee's position was better known four other squadrons were quickly concentrated in order to deal with him. Patey, in the battlecruiser "Australia," with a squadron of British and Japanese ships watched the middle Pacific; a Japanese squadron was concentrated at the Galapagos Islands and the Battlecruiser "Princess Royal" was sent to the West Indies, in case von Spee should attempt to pass the Panama Canal. De Robeck on the African Coast and Stoddart off Montevideo were reinforced with armoured ships, in case von Spee should escape Sturdee, who, after searching the South American Coast, arrived at Port Stanley on Dec. 7 Von Spee rounded the Horn on Dec. 2, delayed for three days to coal from a prize in the Beagle Channel, and arrived off Port Stanley on the morning of Dec. 8. Sturdee put to sea and there followed the battle of the Falkland Islands (*q.v.*) in which the German squadron was destroyed, only one ship, the "Dresden," escaping.

The End of **the** Cruiser Campaign.—Despite the incessant demands for the protection of troop convoys and support for military expeditions that had so hampered the Admirals in their first duty of commerce protection, the British Navy in the first eight months of the war cleared the German flag from the outer seas. By the end of 1914, only one of the thirteen German cruisers abroad was unaccounted for and of the five armed merchantships only two remained at large. The "Dresden," escaping from the Falkland Islands battle, was hunted and helpless until she was sunk by the "Glasgow" and "Kent" at Juan Fernandez on Mar. 14. The "Kronprinz Wilhelm" (April 8) and "Prinz Eitel Friedrich" (Mar. 12) were interned at Newport News, and the "Konigsberg," having been discovered in hiding in the Rufiji River was destroyed on July 11. By the end of Mar. 1915, the Canadian, Australian, New Zealand and Indian armies had been carried overseas, garrisons abroad had been replaced by territorial troops, without the loss of a troopship and naval support had been given to six considerable military operations. This was accomplished with the loss to the Navy upon the outer seas of three cruisers ("Good Hope," "Monmouth" and "Pegasus") and of 62 merchant ships. The German cruisers had caused a loss amounting to less than two thirds of 1% of British seaborne commerce during the period.

THE MEDITERRANEAN 1914

The Goeben and **Breslau.**—The first duty of the British Mediterranean squadron was to watch the movements of the German cruisers "Goeben" and "Breslau." On Aug. 3, their whereabouts being unknown, Admiral Milne stationed the 1st Cruiser squadron (Troubridge) with destroyers to prevent them entering the Adriatic and sent the battlecruisers "Indomitable" and "Indefatigable" towards Gibraltar to stop them interfering with the transport of Algerian troops or escaping into the Atlantic. At 10.30 A.M. on Aug. 4 the German cruisers, who that morning had bombarded Phillipville, were sighted by the British battlecruisers and were shadowed by them into Messina. On Aug. 5, the situation was complicated by the Italian declaration of neutrality and by Austria not yet being at war with Britain, while the information received by Milne was conflicting. Expecting the Germans to break westward, he placed his force to prevent them escaping from the north of Messina, leaving Troubridge to deny them the Adriatic. On the evening of Aug. 6th the Germans sailed from the south of the Straits, gallantly and skilfully shadowed by the "Gloucester." Troubridge did not bring them to action and when they passed Cape Matapan, the "Gloucester" was recalled from her precarious position. Milne followed into the Aegean on the 9th but was too late to prevent the two German ships entering the Dardanelles on Aug. 10. Their escape was unfortunate as it had a far-reaching effect upon subsequent events in the Near East.

After the safe passage of the Algerian troops the security of the Mediterranean was undertaken by the French fleet, which, using Malta as its base from Aug. 16, established a blockade of the Adriatic. Admiral Carden was appointed to command the reduced British force in the Mediterranean and with it he established a blockade of the Dardanelles. On Nov. 3rd, on Turkey declaring war, he bombarded the outer forts of the Dardanelles as a demonstration. The watch upon the Dardanelles was kept with few ships for the cruisers were called upon to guard the Malta–Port Said route during the passage of troop convoys. It was uneventful, except for the daring exploit of Submarine "B. 11," which on Dec. 13 dived through five rows of mines in the Dardanelles, torpedoed and sank the Turkish battleship "Messudieh" and returned safely.

OVERSEA CAMPAIGNS 1914–15

Togoland and the Cameroons.—A stroke by the Gold Coast forces on the outbreak of war led to the occupation of Togoland and the destruction of the important German wireless station at Kanima. Before the end of August the colony had surrendered and an attack was launched upon the German Cameroons. On Aug. 25 the British cruiser "Cumberland" and the gunboat "Dwarf" left Sierra Leone to attack Duala, followed by the cruiser "Challenger" and the Niger flotilla with a British and French military force. A base was established in the Cameroon estuary and after a month of flotilla warfare, in which the "Dwarf" played a prominent part, the river was cleared of mines and obstructions. The "Challenger" then entered and on Sept. 27 Duala surrendered to a combined naval and military attack. Nine large German steamers, a floating dock and two railway termini were captured. River warfare in support of the military advance inland then developed. The "Cumberland," "Challenger" and French cruiser "Bruix," being required elsewhere, were relieved by the cruiser "Astraea" from the Cape and with the arrival of the old cruiser "Sirius" and the sloop "Rinaldo" in April 1915 a blockade was established to prevent supplies reaching the enemy from the Spanish island of Fernando Po. The colony was, by this time, in Allied hands, but fighting in the hinterland continued for two years.

German South West Africa.—The attack upon this colony, started in Aug. 1914 by the South African Government, was delayed by the Boer revolt, but, the revolt having been suppressed, it was resumed early in 1915. The Union Army, escorted by the battleships "Albion," the "Astraea" and two armed merchant cruisers occupied Walfisch Bay and Swakopmund in January. The "Albion" was then sent to the Dardanelles and the "Astraea" to the Cameroons and, with the exception of some naval armoured cars the campaign became a purely military one. It was brought to a successful conclusion in July 1915 by the surrender of the colony.

German East Africa.—The German cruiser "Königsberg" was at sea on the outbreak of war and on Aug. 6 she made her only prize in the Gulf of Aden. Two days later, the "Astraea" and "Pegasus" appearing off Dar-es-Salam, the Germans blocked the entrance to the port, but agreed that the ships there should be considered British prizes, and the wireless station was destroyed. The "Königsberg," her base closed against her, was not heard of until Sept. 20, when she appeared off Zanzibar and finding the "Pegasus" with engines disabled in the roadstead, sank her at her moorings. Admiral Charlton, with the Cape squadron, was, by now, on the "Königsberg's" trail and she took refuge amidst the swamps of the Rufiji River, where she was located by the "Chatham." On Nov. 1 the East African Expeditionary Force, escorted by the battleship "Goliath" and cruiser "Fox," arrived from India. On Nov. 2 the troops landed at Tanga, under cover of the "Fox," but the attack made two days later was repulsed and the troops were re-embarked.

Following this reverse no serious military operations against the colony were undertaken until early in 1916. The 600 miles of coastline, with its many harbours, remained in the hands of the Germans and it was not until March 1915 that ships could be spared to establish an efficient blockade. Meanwhile a strict watch had to be kept upon the "Konigsberg" in the Rufiji River and several relief ships slipped through with arms and stores for the colony. On Dec. 14, boats sent in to Dar-es-Salaam to take possession of the prizes, were fired upon and the town was then bombarded and the ships sunk. In the Rufiji River a ship was sunk to block the "Konigsberg" in, but the cruiser was unapproachable until the arrival of shallow draught ships and aeroplanes. On June 3, 1915 the small monitors "Severn" and "Mersey" arrived with four seaplanes, and a month was occupied in preparing these craft for their work. On July 6 the first attack was made, the "Konigsberg" was damaged but the monitors were forced to retire. On July 11 the attack was renewed and pressed home by the monitors, and the "Konigsberg" was destroyed.

Persian Gulf and Mesopotamia. — An Indian Division, escorted by the "Ocean," and the sloops "Espiitgle" and "Odin" arrived at Bahrein late in October and on the 30th received orders to commence hostilities against Turkey. On Nov. 6, after bombarding Fort Fao at the entrance of the Shatt-al-Arab, the troops landed. Advancing against considerable opposition, supported by the "Espiegle" and "Odin," an entrenched position was established at Abadan by Nov. 10. The force pressed forward supported by the two sloops and Basra was entered on Nov. 22, and a further advance ended on Dec. 9, in the occupation of Kurnah, at the junction of the Tigris and Euphrates. By this rapid and well planned stroke the command of the Persian Gulf and of the outlet from the Persian oilfields was assured.

In December the "Ocean" was withdrawn to the Dardanelles and the flotilla consisted of the "Espiitgle" and "Odin," the vessels of the Royal Indian Marine and a number of armed river steamers and launches. In March of 1915 the "Clio" and four armed boats arrived from Egypt and in the late autumn the first of the new "Fly" class gunboats arrived from England.

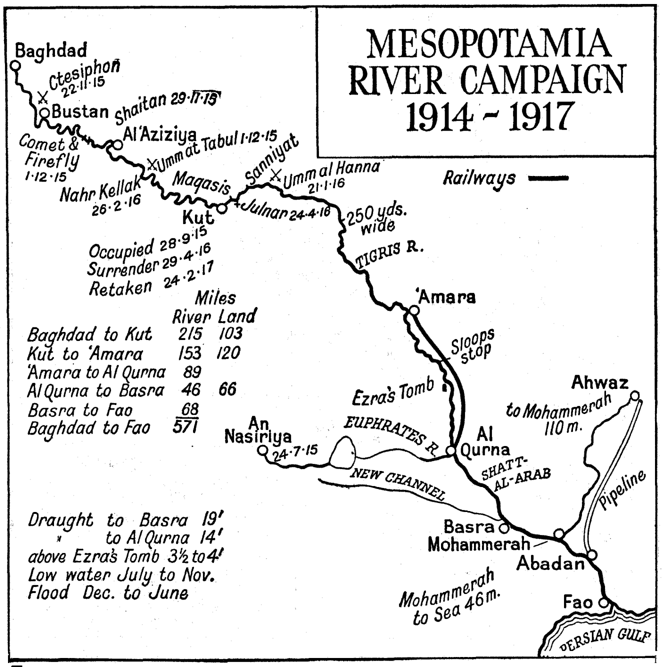

FIG. 1.— MESOPOTAMIA RIVER CAMPAIGN, ENDED ON MARCH 11, 1917

Throughout 1915 the flotilla formed the spearhead of the advance of the Army. It protected the oil pipe line by patrolling the Karun River and in April the Euphrates flotilla assisted in defeating the Turkish attack upon Basra. The remarkable amphibious battle north of Rurnah on May 31, was followed by the dash up the river by the flotilla after the retreating Turks, with General Townshend on board, and the capture of Amara. With the flotilla reinforced by four seaplanes from the Rufiji River, Townshend captured Kut and continued his pursuit of the Turks until he was brought up at Ctesiphon on Oct. 5. The political and military situation in the Near East then led to the illfated attempt upon Baghdad. The naval flotilla consisted of the gunboat "Firefly," the "Comet," two armed launches and four armed horse boats. After the repulse of the army at Ctesiphon, the withdrawal of the river transport was covered by the flotilla with the loss of "Firefly," "Comet" and "Shaitan," which grounded and were abandoned. Townshend reached Kut on Dec. 3, but by the 9th that place was invested and the flotilla was withdrawn down river.

Egypt. — By mid-November 1914, the careers of the "Emden" and "Konigsberg" being ended the Indian Ocean was secure. The British cruisers were ordered homewards and Admiral Peirse, in the battleship "Swiftsure," reached Suez on Dec. 1 and detained in the Canal enough ships to meet the threatened Turkish attack upon Egypt. During December the "Doris" and the Russian cruiser "Askold" made a series of successful raids in the Gulf of Iskanderun and. on the Syrian Coast. At the end of January 1915, when the Turkish attack developed, a strong naval force under Peirse's command took up its position in the Canal. The Turks made their attempt on the Canal on February 2 and 3 and were easily repulsed, the Canal traffic being but little interfered with. By Feb. 11, all threat to the Canal having disappeared, Peirse was able to send most of his ships to reinforce Carden's forces at the Dardanelles. A further threat to the Canal in April 1915 was frustrated by the presence of strong British and French naval forces.

HOME WATERS AND THE BALTIC 1915

The Battle of **the** Dogger Bank. — The year opened with the loss of the battleship "Formidable," which was torpedoed by "U. 24" off the Start on the morning of Jan. 1. In the North Sea the first weeks of January passed quietly, but on the 19th reports of German activity brought the British battlecruisers into the Heligoland Bight. Nothing was seen, but a Zeppelin raid on the East Coast indicated a repetition of the Scarborough raid. The battlecruisers remained concentrated in a position south of the Dogger Bank, supported by the Grand Fleet battleships to the northward. On the morning of the 24th the Germans were sighted and there followed the battle of the Dogger Bank (*q.v.*). The German squadron was driven back to its base with the loss of the cruiser "Bliicher" and two battlecruisers badly damaged. Beatty's flagship "Lion" was severely damaged but returned safely to Rosyth. After the Dogger Bank action a change was made in the command of the High Sea Fleet and a policy of extreme caution was initiated. The German fleet put to sea only to cover minelaying operations and always retired behind its minefields on the approach of the enemy. Four of these "one day out and one day back" sorties in March, April and May were threatened by the Grand Fleet in force and the Germans retired.

The Baltic. — In the Baltic the Russian fleet, assisted by a few British submarines, was successful in holding the older ships of the German fleet in check. In June a German attempt to land troops in Courland in support of their army was defeated by the Russian destroyers and on July 2 the German minelayer "Albatross" was driven ashore by the Russian cruisers and the cruiser "Prinz Adalbert" was torpedoed and seriously damaged by the British submarine "E. 9." In August a part of the High Sea Fleet made a serious attempt to force the Gulf of Riga, but on Aug. 19 the battlecruiser "Moltke" was badly damaged by a torpedo from submarine "E. 1." The operations were abandoned and for some time the Baltic was the scene of only minor operations, but, in the closing months of 1915, the German iron trade with Sweden was harassed by British submarines, which sank 14 steamers engaged in the trade and the cruisers "Prinz Adalbert" and "Bremen" and a destroyer.

The **Grand** Fleet. — Improvements in the British intelligence, especially in directional wireless, gave timely warning of any movements of the German Fleet. By the end of the first quarter in 1915, the Allied flank in Flanders was stabilized, supplies to the army were ensured by the grip of the Dover and Harwich forces upon the narrow seas while the northern bases had been made practically submarine proof. These factors led to a general redistribution of the British fleet. The Channel fleet was broken up and most of its ships were sent out to the Dardanelles. The Grand Fleet battle squadrons remained at Scapa Flow and Cromarty and the battlecruisers at Rosyth. During the year the Battle fleet swept down the North Sea to the Heligoland Bight no less than 17 times and many other searches were made of the Danish and Norwegian coasts by the battlecruisers and light forces. During one of these cruises "U. 29" was rammed by the "Dreadnought." The British Navy was short of destroyers until the autumn, when the new vessels began to appear. Until then constant calls were made upon the Grand Fleet for destroyers to assist the auxiliary patrol in hunting submarines. The work of the destroyers was incessant and arduous and due to their efficiency the Germans gained no major success with submarine or mine against the British fleet during the year. The northern blockade was maintained with increasing efficiency by the 10th Cruiser squadron, now composed entirely of armed merchant cruisers. The fleet base at Scapa Flow developed into a great training establishment for new personnel. A system of gunnery and other training was organised which brought the many new ships joining the fleet to a state of fighting efficiency in minimum time and new officers and men were trained for the ancillary services all over the world. This year of strenuous work was marked by no outstanding event after the Dogger Bank action and it closed with the disaster to the armoured cruiser "Natal," lost by internal explosion at Cromarty on New Year's eve. During August and September, Zeebrugge and Ostend were several times bombarded by the monitors and other ships of the Dover Patrol, in support of the Allied offensive. The results were inconclusive owing to the difficulties of fire observation and to the fact that the ships, finding themselves outranged by the heavy German shore guns were forced to keep at extreme range.

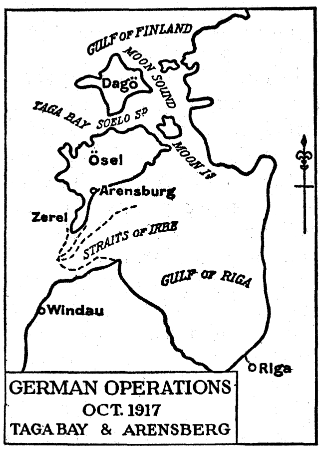

FIG. 2.— MAP SHOWING GERMAN OPERATIONS AT TAGA BAY AND ARENSBERG, OCTOBER, 1917

Submarine Warfare.— By the beginning of 1915 the ocean high-ways had been made safe for commerce, but the narrow seas around the British Isles were becoming unsafe for any traffic. On Feb. 17, 1915, Germany declared these waters to be a "War Zone" and announced her intention of using submarines to sink merchant-ships. Thus commenced the submarine campaign (*q.v.*). In the first quarter of 1915, 38 British ships were sunk by submarines and by Dec. 31 this number was swelled to 259. In the same period 48 ships were sunk by mines and the tonnage loss for the year approached 900,000 tons. For these two forms of warfare against trade Britain was unprepared and the submarine and minelaying tactics of the enemy produced a situation beyond the capacity of the weak and scattered coastal patrol and minesweeping flotillas. Trawlers, drifters, yachts and small steam and motor vessels of all kinds were armed to reinforce the flotillas. By the beginning of 1915, no less than 750 of these craft were in commission and their numbers were rapidly swelled at the opening of submarine warfare. By August 1915 the auxiliary patrol was a complete organization and the coastal waters were divided into twenty-one patrol areas. In each area destroyers and auxiliary craft were employed in submarine hunting, minesweeping, guarding channels, guiding traffic, rescue work and in many other duties. The auxiliary ships were manned by seamen, yachtsmen and fishermen, enrolled in the Royal Naval and Royal Naval Volunteer Reserves. As in days of old, the seafaring population of the country, of all classes, came forward in the hour of need and in its ceaseless watch around the coast until the end of the war, the auxiliary patrol paid a heavy price and rendered to the country service of incalculable value.

THE DARDANELLES CAMPAIGN

Early in 1915 political complications in the Balkans and the Russian wish for an open Dardanelles to ensure munitions supply, made imperative some demonstration of the Allied power in the Eastern Mediterranean. It was decided to attack the Dardanelles, where, since September, Admiral Carden had been keeping a close watch. In the redistribution of the British fleet, after the Falkland Islands battle, Carden was strengthened with a number of the older battleships and cruisers. The French Government offered a squadron and both naval and military aid was promised by Russia in the Black Sea. By the end of February, Carden's force consisted of the battlecruiser "Inflexible," the new battleship "Queen Elizabeth," 16 old battleships (4 French), 20 destroyers (6 French), a flotilla of 35 minesweeping trawlers and a seaplane carrier were on their way, and a varying number of cruisers and submarines were under his orders. Admiral de Robeck was appointed second in command. The Greek Government handed over the Island of Lemnos as an advanced base and Admiral Wemyss was appointed to command it.

From the first the naval view was that any attack upon the Straits by ships could be only a diversion unless it was backed by a strong military expedition. Steps were accordingly taken to send troops to the Aegean, but the situation on the eastern and western fronts caused delay and it was not until Feb. 20, after the first bombardment, that the decision was made to send out five divisions (4 British and 1 French).

The First Bombardment.— Bad weather in January made reconnaissance of the Straits difficult, but enough was done to enable Carden to recommend, on Feb. 15, that a naval bombardment was not a sound operation without a strong military force to consolidate the work of the fleet. But the political situation was critical and Carden was pressed by the War Council to commence operations. Pointing out that no progress could be expected until the minesweepers and seaplanes arrived, Carden decided to bombard the outer forts on the first opportunity. Owing to bad weather this did not occur until the 19th and at 10 A.M. on that day the battleship "Cornwallis" fired the first shot of the campaign at Fort Orkaniye. The forts were hit repeatedly and made no reply, but when the "Vengeance" (flying de Robeck's flag), closed to moderate range she received a hot fire from all guns. Thus early it was proved that long range bombardment of modern earthworks was ineffective unless the

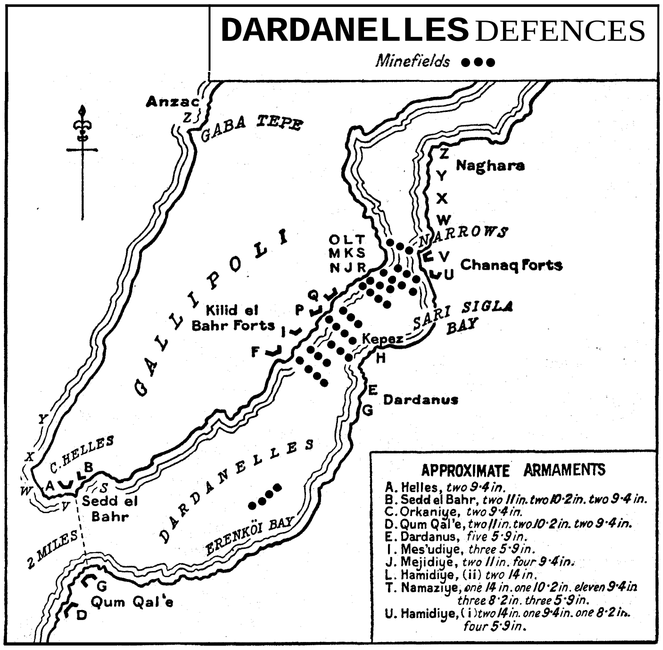

FIG. 3.— MAP OF DARDANELLES DEFENCES. SHOWING APPROXIMATE ARMAMENTS AND POSITION OF MINEFIELDS

ships can close to decisive range and knock out each gun by direct hits.

Carden was now informed that he was expected to force the Straits without military assistance. On February 25, after a four days gale, a bombardment, commencing at moderate range, was intensified by British and French ships closing in towards the shore. The four outer forts were silenced and the minesweepers began clearing the Straits. Next day, demolition parties, supported by marines landed to complete the destruction of the forts, and the fleet, going as far up the Straits as had been swept, bombarded the inner forts at long range. As before the forts made no reply when hit, but the ships were badly worried by mobile howitzers on each shore, which could not be located. Gales delayed operations for two days and on March 1 and 2 the Narrows were again attacked, with similar results, the ships being constantly hit by an increasing number of hidden howitzers. Each night the minesweepers were driven off by gunfire as they attempted to sweep the minefields off Kephez. On March 3 de Robeck reported that the Straits could not be forced unless one shore or the other were occupied and that no progress was possible without military assistance. This was emphasized on March 4 by the repulse of the demolition parties, showing that the time was past for employing small forces onshore.

As yet, no definite decision had been made as to the scope of any military operations. In spite of the Admiralty's reiterated demands for troops and the doubts of General Birdwood on the spot, that the fleet could force a passage unaided, Lord Kitchener, at the War Office, in his instructions to General Sir Ian Hamilton, on the latter's appointment as commander-in-chief, only contemplated "the employment of military force on any large scale . . . at this juncture. . . . in the event of the fleet failing to get through after every effort has been exhausted." *(See* W. S. Churchill, *The World Crisis.)* Mr. Winston Churchill, as First Lord, continued to urge the fleet to new efforts and on March 11, Admiral Carden was told "the results to be gained are . . . great enough to justify loss of ships and men if success cannot be obtained without it."

A naval attack was, therefore, planned for March 18, by which time General Sir Ian Hamilton would have arrived. Meanwhile daily bombardments of the forts produced indefinite results and desperate attempts were made nightly without success to sweep up the Kephez minefields. All experience proved that until the mobile guns were suppressed they could prevent minesweeping operations, and until the minefields were cleared ships could not approach to decisive range at which alone they could destroy modern earthworks. On March 16 Admiral Carden's health broke down and he was forced to hand over his command to Admiral de Robeck, who at once proceeded to carry out the attack planned.

The Naval Attack of March 18.—The plan of attack arranged for the four modern ships ("Inflexible," "Queen Elizabeth," "Lord Nelson" and "Agamemnon") to engage the inner forts at 14,000 yards, whilst a British and French division, of four old ships each, alternately pressed home the attack to 10,000 yards, which was the limit of the swept area. Two old battleships on each side were to attempt to keep down the fire of the small guns onshore. The action commenced at 11.30 A.M. on the 18th. Little reply came from the forts, but unseen guns opened a heavy fire. The "Agamemnon" was frequently hit and the "Inflexible" forced out of the line with her forebridge burning. At noon the French division passed through the British line, closed to 10,000 yards and received a hot fire from the forts. The "Gaulois" was forced out of action and the "Bouvet" was heavily hit, but the squadron gallantly held its place and by 1.45 the fire of the forts was slackening. De Robeck then sent the British division in to relieve the French and ordered the minesweepers up to clear the channel. At 2 0 P.M. as the French squadron was steaming out the "Bouvet," struck a mine, blew up and sank in a few minutes, with nearly all hands. The British division engaged the forts with apparent success until 3 0 P.M. when the "Irresistible" struck a mine and sank, her crew being saved. The fire from the forts now became intermittent, but at 4.5 P.M. the "Inflexible" was mined and ten minutes later a similar fate befell the "Ocean." The "Inflexible" reached Tenedos and was beached, but the "Ocean" was abandoned and sank. The ships withdrew just after 6 P.M. and as they did so the forts opened a heavy but inaccurate fire; the attempt to force the Straits thus ended in failure. The forts had been damaged but were not put out of action and the minefields were still intact. The loss to the Allies had been severe: three battleships sunk, three heavy ships badly damaged and others severely handled.

The First Landings.—For political reasons the campaign had to be continued and the failure of the fleet to force the Straits necessitated the landing of an army upon the Peninsula. For this operation the transports were unprepared and the army was concentrated in Egypt to reorganise, a valuable month thus being lost. *(See* DARDANELLES CAMPAIGN.) Meanwhile the fleet reconnoitred and prepared for the landing and, when the weather permitted, harassed the Turkish reinforcements now crowding on to Gallipoli. Smyrna was strictly blockaded and the Russian fleet was active off the Bosphorus.

By April 23, the transports had reassembled at Mudros and the work of getting into position for the landings commenced. The weather favoured the operation and early on the morning of the 25th, landings were effected on five beaches around Cape Helles and Gaba Tepe (Anzac). At the same time, French troops gained a footing on the Asiatic side and a demonstration was made in the Gulf of Xeros; 18 battleships, 12 cruisers, 29 destroyers, 8 submarines and a host of small craft supported the landing. At each beach, the covering ships went close inshore in support, whilst the attendant ships carried the troops and aided by small craft and boats suited to the particular beach, landed them. Opposition was severe and losses very heavy but by sunset the army was established ashore and the naval parties had the work of organising the beaches well in hand. Thenceforward the campaign became mainly a military one in which the rôle of the Navy was to support the troops by gunfire, to evacuate wounded and to ensure the supply of food, water, stores, munitions and reinforcements to the beaches. This task was an arduous and dangerous one and casualties on the beaches were heavy. The old battleships "Albion" (April 28) and "Prince George" (May 5) were so damaged by gunfire that they had to be docked and on May 13, the "Goliath" was torpedoed by a Turkish destroyer and sank with great loss of life. The appearance of German submarines in the Mediterranean now rendered the position of heavy ships employed off the Peninsula precarious. The "Queen Elizabeth" was ordered home to join the Grand Fleet and the replacement of battleships by monitors and old "bulged" cruisers commenced, but two more battleships were lost: the "Triumph" on May 25 and the "Majestic" on May 27, both torpedoed by "U. 21."

Lord Fisher Resigns.—The War Council decision on May 14 to continue the campaign led to the resignation of Lord Fisher (*q.v.*). This was followed by the reconstruction of the Government and the removal of Mr. Winston Churchill from the office of First Lord of the Admiralty. Throughout the summer months the navy supported and supplied the army on the peninsula, and more troops being sent out, a successful landing was made at Suvla Bay on the night of Aug. 6–7. But neither here nor at the other positions was any appreciable progress made onshore and all idea of forcing the Straits with the fleet was consequently abandoned. Submarines alone could pass the Narrows and of the 12 boats (9 British and 3 French) which made the adventure, 7 were lost. The presence of these vessels in the Marmora, however, produced such alarm as greatly to interfere with the Turkish supplies to the Peninsula.

The Evacuation.—By the end of October the defeat of the Serbian Army and the opening of the Salonika Campaign hastened the decision to withdraw from Gallipoli, and preparations for this difficult operation commenced. Night by night, the vast accumulation of stores were removed and on the night of Dec. 18–19 the troops were withdrawn from Suvla Bay and Anzac under cover of the fleet. So successful was the operation that the Turks knew nothing about it and awoke to find that their enemy had vanished. The more difficult evacuation of the Helles Beaches was accomplished on Jan. 8–9, 1916, without the loss of a man. Little of value was left in the hands of the enemy and with these two wonderful examples of naval and military co-operation the ill-fated campaign was brought to a close.

HOME WATERS 1916

Heavy weather in January hampered the work of the 10th Cruiser squadron on the northern patrol and caused damage to the submarine defences of Scapa Flow and on the 6th the battleship ('King Edward VII.," struck a mine off Cape Wrath and was lost. Scheer succeeded von Pohl in command of the High Sea Fleet in January and he at once adopted more energetic tactics. On Feb. 10 German destroyers appeared on the Dogger Bank and sank the sloop "Arabis," whilst minesweeping. A sweep by the Grand Fleet followed with the usual barren result. During the dark February nights the raider "Moewe" slipped homeward through the blockade after her successful cruise and the "Greif," another raider, in attempting to break out was brought to action by the armed merchant cruiser "Alcantara" on Feb. 29 and both ships were sunk. Cruising constantly during March the Grand Fleet saw nothing of the enemy until March 24–25 when the Harwich Force met a Division of enemy destroyers at night. The German "G. 194" was rammed and sunk by the light cruiser "Cleopatra" and a British destroyer was lost by collision. On April 23 the German fleet put to sea, the battlecruiser "Seydlitz" being forced to return after striking a British mine. Zeppelins raided the East Coast on the night of April 23–4 and at daybreak Yarmouth and Lowestoft were bombarded by the German battle-cruisers. The Harwich Force engaged them and the light cruiser "Conquest" received heavy damage from their fire as they hurriedly retired eastward, reaching their minefields just in time to escape Beatty's battlecruisers. The 3rd Battle squadron (7 King Edward's) was stationed in the mouth of the Thames at the end of April to deal with the coastal raids and on April 26 a heavy mine and net barrage was laid in the Straits by the Dover Patrol. On May 4–5 an aerial attack, supported by the Grand Fleet, was made upon the Zeppelin sheds at Tondern. One Zeppelin was destroyed at sea. Mines were laid off the Horns Reef and Borkum before the fleet returned north.

The Battle of Jutland.— At the end of April, in deference to protests from the United States and other neutrals, the German submarines received orders to cease sinking merchant ships without warning. Scheer thereupon determined to use the submarines thus released in an attempt to trap the British fleet. By May 23, 22 submarines were stationed off the British bases, and the High Sea Fleet was to put to sea on that day in the hope of enticing the Grand Fleet over them. The plan had to be modified as the weather delayed the German fleet until May 30. On that day, following upon reports of unusual activity by the enemy, the Grand Fleet sailed on one of its periodical southerly sweeps. On May 31, after a preliminary action between the rival battle-cruiser forces in which the British suffered heavy losses, the two main fleets met and the battle of Jutland (*q.v.*) was fought. The German fleet after sustaining severe damage and being skilfully extricated from a very dangerous situation, eluded the British fleet at night and retired behind its minefields at daylight on June 1. The Grand Fleet returned to its bases on the 2nd and 3rd of that month.

June 5 was marked by the tragic loss of the "Hampshire," with Lord Kitchener on board, after striking a mine on the Orkney coast.

There were no large fleet movements during June as the High Sea Fleet was repairing its damage after Jutland. All the damaged British ships rejoined the Grand Fleet by the middle of July when a number of exercise cruises took place. In the second week in August, just as before Jutland, an unusual number of submarines were reported in the North Sea. Expecting another move on the part of the High Sea Fleet, Jellicoe swept south in force on August 18. Next morning ten Zeppelins were located stretched across the North Sea. By noon a fleet action appeared imminent, the battle fleets being only 42 miles apart, but warned by the Zeppelins, Scheer turned and made for home, and was soon beyond pursuit. The German battleship "Nassau" was twice torpedoed by a British submarine as the fleet put to sea; the cruisers "Nottingham" and "Falmouth" were torpedoed and sunk; and two submarines were accounted for by the British flotillas during the operation.

During the autumn British squadrcns were constantly at sea on observation cruises, while regular British cruiser patrols were established in the North Sea and a submarine patrol was maintained off the German ports. But the German fleet made no move until the night of Oct. 26, when two German destroyer flotillas, working from Zeebrugge, made their first raid on the Dover Straits, sinking two British destroyers and seven drifters and escaping unscathed. On Nov. 5 a division of the German fleet put to sea to help a stranded submarine. The British submarine "J. 1" was waiting and succeeded in torpedoing and damaging the battleships "Kronprinz" and "Grosser Kurfiirst."

Jellicoe, First Sea Lord.— The long winter nights at the end of November enabled the raiders "Moewe" and "Wolf" to break through the blockade. This was annoying but not serious, for it was the submarine which had now become the menace to shipping and exceptional measures were called for to deal with it. At the end of November, therefore, Admiral Jellicoe was appointed First Sea Lord to take over this great task. Admiral Beatty succeeded him in command of the Grand Fleet.

In September war against merchant ships was renewed with ever increasing vigour. During 1916, 436 British merchant ships were lost, totalling 1,250,000 tons. Of these 322 were sunk by submarines, 88 by mines and 26 by raiders, etc. During the year a further 218 merchant ships had been attacked by submarines and had escaped.

THE MEDITERRANEAN 1915–16

The French fleet based upon Malta blockaded the Straits of Otranto watching for the Austrian "Dreadnought" squadron. The latter made no move but the Austrian submarines were active and the battleship "Jean Bart" (Dec. 1914) and the cruiser "Leon Gambetta" were torpedoed and sank. The French admiral withdrew his heavy ships to Malta and kept watch upon the narrow waters of the Adriatic with cruisers and destroyers. In May 1915, after prolonged negotiations as to the distribution and command of the Allied fleets in the Mediterranean, Italy declared war against Austria. The Italian fleet, reinforced by 4 British battleships and 4 light cruisers and by 12 French destroyers and 7 submarines became responsible for the Adriatic blockade. The French Admiral remained nominally in command of the Mediterranean, controlling the western basin, whilst naval operations in the Levant were under British control. The Italian battle squadron was based upon Taranto, but it was upon the cruisers, working from Brindisi, that the principal burden devolved. The cruisers "Dublin" (June g) and "Giuseppe Garibaldi" (July 18) were torpedoed by Austrian submarines and the latter sank. In September a barrage of British net drifters was placed across the Straits of Otranto, but owing to the depth of water it was not very effective.

The Dardanelles campaign dominated other events in the Mediterranean during 1915 and, with the appearance of German submarines in that sea during the summer, the task of protecting the stream of transports and supply ships became very difficult. In the autumn the almost simultaneous decision to evacuate Gallipoli and to commence the Salonika Campaign (*q.v.*) made demands upon the British transport service which all but stressed its powers to breaking point, and the losses caused by submarines became very serious.

Dedeagatch was bombarded on Oct. 21 and a British squadron was constantly operating at Salonika and on the Bulgarian coast until the end of the war. The collapse of Serbia in November 1915 was followed by an Austrian naval raid upon Durazzo. The raiding force was engaged by the "Dartmouth," "Weymouth" and "Nino Bixio" (Italian), the Austrians escaping with the cruiser "Helgoland" badly damaged and a destroyer sunk. Corfu was occupied as a base for the Serbian army in Jan. 1916 but the subsequent vacillating conduct of Greece did much to hamper the Allies during the Salonika campaign (*q.v.*).

The year 1916 in the Mediterranean was a continual struggle with the German and Austrian submarines, whose use of the

Greek ports and islands called for constant British and French activity around that coast. In December after an Allied force, landed from the fleet, was treacherously fired upon at Athens, a strict blockade of Greece was declared and enforced by the Allies. The British Aegean squadron, which was reinforced at the end of the year by four battleships, kept a close watch upon the Dardanelles and the Syrian coast during 1916.

Overseas Campaigns.--On Feb. 28, 1916, the final surrender of the colony brought the Cameroon Campaign to an end. In East Africa, although the coast was blockaded by the Cape squadron, the coast towns remained in German hands until September 1916. By this time all were occupied and the colony was cut off irom the sea. The command of Lake Tanganyika was established by two British motor boats, carried 2,000 miles overland from Capetown, but fighting in the interior continued until after the Armistice. In Mesopotamia, 1916 was a year of pause and preparation for the next campaign. Kut surrendered on April 29 after a gallant naval attempt to relieve the town had failed five days previously.

UNRESTRICTED SUBMARINE WARFARE 1917

After the refusal of the Allies to consider her proffered peace terms at the end of 1916, Germany saw that her fate was sealed unless she could by some means, break the Allies' sea power (*q.v.*). The German High Naval Command was granted its wish and it was proclaimed that, after Feb. 1 submarines would sink all merchant ships on sight and without warning. The commencement of this ruthless campaign was followed by the severance of diplomatic relations between the United States and Germany and on April 6 the United States entered the nar against the Central Poners The German aim was to strike a fatal blon by bringing the Allied. and more especially the British, seaborne trade to a standstill by sinking so many ships as to reduce seriously available tonnage and to make the merchantmen refuse to face the risk of sailing. To some extent this latter was successful at first, in the case of neutral shipping, but British merchantmen continued to put to sea in spite of the heavy toll taken by the submarines. During February and March a weekly average of 23 British ships were lost and in April. the darkest month for British shipping, 196 vessels of nearly *600.000* tons were sunk. These losses were so serious, that, had they continued, success must have ultimately renarded the German effort.

The Convoy System.—Every known method of protecting shipping at sea was adopted: camouflage (*q.v.*), defensive gun armaments, zig-zag courses in submarine waters and directing traffic along routes patrolled by craft armed with every anti-submarine device were all tried; but still the toll of losses grew. In spite of constant changing of the patrolled routes, by the end of March this system had definitely broken down and the Convoy System (*q.v.*) was adopted. To this there was, at first, much opposition, both from the fleet and from merchant owners and ship masters, and the difficulties appeared insuperable. Chief amongst these was the finding of sufficient escort ships, mainly destroyers, for the convoys. The destroyers from the Grand Fleet and Harwich could not be spared, as the High Sea Fleet was still in being and a menace, and there were but few others. The arrival of an American flotilla at Queenstown and of a Japanese one in the Mediterranean eased the situation: the Admiralty under Jellicoe persevered and by the end of May the Convoy System was in full swing. Its effects were immediate. In the second quarter of 1917 the weekly average losses amounted to over 30 merchant ships: in the third quarter this was reduced to just over 20 and in the last quarter to well below that figure, whilst in 1918 the average weekly loss was under 15. In all, 88,000 ships sailed under convoy during the war with a loss of only one half of 1%. During 1917, 1,134 British ships were sunk by submarines, whilst 841 others were attacked and escaped: 137 were sunk by mines, mostly laid by submarines and 38 by surface craft. The total tonnage loss for the year was over 3,500,000 tons and as a counter to this great loss *75* German submarines were sunk.

VARIOUS OPERATIONS 1917

The Dover Raids.—The German submarine and destroyer bases at Zeebrugge and Ostend were frequently bombarded by the monitors of the Dover Patrol but, although much damage was done, the lock gates and basins were not hit. The mine and net barrage in the Straits was constantly patrolled by destroyers and drifters and German destroyers made several attempts, by night raids on the patrols, to open a way for their submarines into the Channel. On the night of March 17 a German flotilla attacked the patrol, sank the destroyer "Paragon" and damaged the "Llewellyn." On April 20, they were not so successful, for the raiding flotilla was met by the "Swift" and "Broke" and, in the spirited hand-to-hand fight that ensued the German destroyers "G. 42" and "G. 45" were sunk. Thereafter, except for ineffectual sorties on April 26 and May 2, no raid was made upon the Dover Straits for nearly a year. Further north the Harwich Flotilla was constantly on the alert and on Jan. 23, in a night melée with a flotilla off the Dutch coast, the German leader was forced into Ijmuiden badly crippled, another boat was driven back to Zeebrugge and the British destroyer "Simoon" was sunk.

The Scandinavian Convoy.—Although to a great extent covered by the Grand Fleet cruisers and escorted by destroyers, the Scandinavian convoy was open to bold attack by the German surface craft and two such attacks were successful. On Oct. 17 two German light cruisers met this convoy of nine vessels, sank the escorting destroyers "Strongbow" and "Mary Rose" and the ships of the convoy without warning and escaped unscathed. Again on Dec. 12 a German flotilla attacked the convoy and sank the destroyer "Pellew" and four armed trawlers, most of the merchant ships escaping. These two mishaps led to a reorganization of this convoy route and to the strengthening of the escorts.

The Action of November **17.**—Owing to delays in the production of mines, the British policy of intensive mining off the entrances to the German ports was not put in force until October. This was followed by a great increase in the German minesweeping service, some of the flotillas having to work as far as 150 miles from Heligoland. In November the Grand Fleet cruisers constantly raided the Bight and the Cattegat and on Nov. 2 the decoy ship "Kronprinz Wilhelm" was sunk in the latter area. On Nov. 17, two British light cruiser squadrons, supported by battlecruisers, attacked the German minesweepers and their covering force in the Bight. **A** long range action followed, the Germans retiring under smoke-screens to the minefields, when two battleships appeared in support and the British force withdrew. In this indecisive affair the light cruiser "Konigsberg" was heavily hit and one German outpost vessel was sunk and on the British side the light cruiser "Calypso" was hit and her captain killed. On Dec. 23 three destroyers escorting the Dutch convoy steamed into a German minefield off the Maas Lightship and were sunk in quick, succession. The Grand Fleet suffered a heavy loss when the battleship "Vanguard," on July 9, was lost at Scapa Flow with nearly all hands, owing to an internal explosion.

At the end 'of the year Admiral Wemyss relieved Admiral Jellicoe as First Sea Lord and Vice-Admiral Keyes took over the command of the Dover Patrol, in succession to Vice-Admiral Sir Reginald Bacon.

The Baltic in **1917.**—A few British submarines operated in the Baltic throughout the year, being employed mainly on reconnaissance work by the Russian Admiral. In October, after Riga was captured by the German Army, an attempt to open up the Gulf of Riga was made by the High Sea Fleet, and a military force was successfully landed on Osel Island. The Straits of Irben were swept but the battleships "Bayern," "Grosser Kurfiirst" and "Markgraf" all struck mines. The Russian battleship "Slava" was sunk but after three German battleships had been attacked by British submarines the naval force was withdrawn, leaving Osel Island in military occupation.

Mesopotamia, **1917.**—After many months of preparation, General Maude commenced his advance up the Tigris in Feb. 1917. The army was supported by a flotilla of eight new river gunboats and a number of armed river steamers. Kut was retaken on Feb. 24 and in the heavy fighting that followed the naval flotilla played a prominent part. The 6-inch and 4-inch guns of the gunboats did much to convert the Turkish retreat into a rout and the British flag was hoisted over Baghdad on March 11. (See MESOPOTAMIA, OPERATIONS IN.)

The Mediterranean, **1917.**—Allied naval strategy was centred in the Adriatic during the year, for the French and Italian battle squadrons had to keep a watchful eye upon the Austrian dreadnoughts. But the enemy submarines and not the battleships became the dominating factor and, using the Austrian bases, they operated all over the Mediterranean. Their target was a vast one consisting of the great volume of trade to the East, swelled by troop and supply ships feeding the armies at Salonika (*q.v.*), in Egypt, in Syria (*q.v.*) and in Mesopotamia. The 40-mile Otranto Straits were too deep for mining and were patrolled by 50 British North Sea drifters, supported by British and Italian cruisers and destroyers. Stopping the passage of enemy submarine was a difficult task and the patrols were always open to sudden raids. On May 15 Austrian cruisers and destroyers descended upon the patrols and sank 14 drifters before they were chased back to Cattaro by the cruisers "Weymouth" and "Dartmouth." The latter ship was torpedoed during the action but did not sink.

Owing to separate commands in the different areas, difficulties arose in the co-ordination of the methods of protecting merchant ships from submarines and by the middle of the year the losses in the Mediterranean became very serious. In August a British commander-in-chief was appointed to Malta as the single authority responsible for trade protection in that sea. A convoy system was started, under the escort of British and Japanese destroyers and the toll of losses was gradually reduced. A further co-ordination of naval effort followed the meeting of the Allied Naval Council at Malta in November. During the year a British squadron of two battleships and a number of cruisers cruised in the Levant, watching the Dardanelles and co-operating with the Salonika force. On the Palestine coast, a flotilla of monitors, destroyers and gunboats took an active part in the battles of Gaza (*q.v.*), which led to the fall of Jerusalem (Nov. 11).

THE NORTH SEA AND CHANNEL 1918

During 1918 the mine became predominant as a counter to the submarine and a duel developed between the two weapons. The mine barrage in the Dover Straits was strengthened and with the patrol craft armed with every known anti-submarine device nine submarines were accounted for in that area during the early weeks of the year and it became evident to the German naval command that the passage of the Straits was virtually closed to them. They made two attempts to reopen the Straits. On Feb. 15 a destroyer flotilla raided the patrols at night, sank seven drifters and a trawler and escaped without being brought to action. On March 21 a similar raid was not so fortunate, the German flotilla being met by British destroyers. One German destroyer was rammed and cut in half by the "Botha," another was sunk by gunfire and the Germans were chased into Ostend. The "Botha" was torpedoed but reached Dover safely.

Zeebrugge and **Ostend.**—This proved to be the last German attempt upon the Straits, but as long as their bases at Zeebrugge and Ostend remained in being, raids were to be expected. As early as 1914, Jellicoe had proposed an attempt to block these places, but it was not until the last months of his time at the Admiralty that active steps were taken to put the plan into execution. Admiral Keyes was appointed to Dover to carry it out. After weeks of secret preparation, the mixed force selected sailed on the afternoon of April 22 to attempt to block the entrances at Zeebrugge and Ostend. The flotilla returned to Dover next morning, its mission at Zeebrugge accomplished.

At Ostend the blockships failed to find the entrance, but this was remedied a fortnight later, when a volunteer crew took the "Vindictive," of Zeebrugge fame, into Ostend and sank her in the entrance. 'These two brilliant actions did not entirely block the Flanders Coast bases. but their moral influence was great and they acted as an added inducement to the German submarines to shun the waters of the Dover command and to confine their efforts to gain the open sea to surmounting the lesser perils of the northabout route.

Last Sortie of the German Fleet.—The Scandinavian convoy remained a bait for the High Sea Fleet and on April 23 it put to sea, for the last time in full strength, to try to intercept it. The date was an unfortunate one for the German enterprise for on that day both outward and homeward bound convoys were in the vicinity of the Forth. The British intelligence system failed to warn Beatty that enemy were at sea and the German battlecruisers reached the Norwegian coast at Lat. 60 N. before they were reported. Here the "Moltke" broke down and had to be taken in tow. The German fleet made for home at its best speed; the "Moltke" was torpedoed by Submarine "E. 42" on her way south, but managed to reach her base.

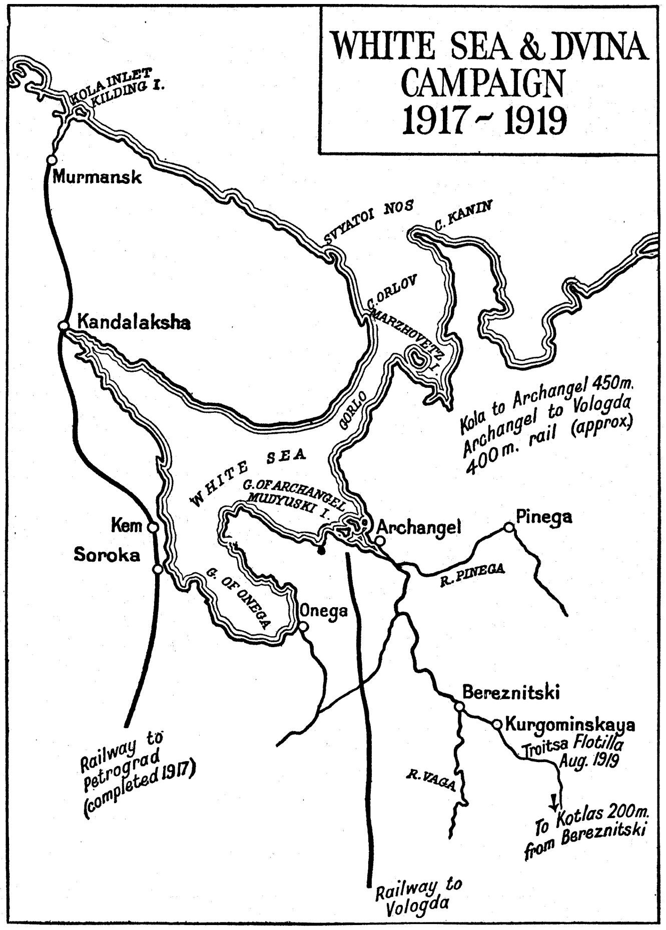
The Northern Barrage.—Frequent raids were made by the British cruisers and destroyers upon the flotillas engaged in clearing ways for the German submarines through the minefields and on April 15, during a raid into the Cattegat, 14 German trawlers were sunk. From the commencement of the British intensive mining policy in the autumn of 1917 until Feb. 1918 over 16.000 mines had been laid in the Heligoland Bight. On Feb. 15 a deep minefield was laid in the Cattegat and the following month saw the beginning of the greatest minelaying operation of the war, the laying of the Northern Barrage. (See MINES [NAVAL] .)

This vast undertaking. the closing by mines of the northern entrance to the North Sea from the Orkneys to the Norwegian coast, involved the laying of over 70,000 mines. The mines were made in the United States and were laid by British and American vessels, escorted by the squadrons of the Grand Fleet, with which for some time an American battle squadron had been working. The Northern Barrage was successful both as a moral deterrent and by the number of submarines destroyed in it.

The End of the Submarine Campaign.—By the middle of 1918 the mastery of the Allies over the submarine was in sight, both from the number destroyed and from the lessening toll they took of merchant ships. In the first nine months of the year over 60 submarines were sunk by the Allied naval forces: the average weekly loss of British merchant ships was over 17 in the first quarter of the year and by the third quarter this figure was reduced to under 11. During 1918, 1,108 submarine attacks were made upon British merchant ships: of these 581 were sunk and 527 escaped, a far higher percentage than hitherto. During 1918 only 8 British ships were lost by mines, a figure that attests the efficiency of the Auxiliary Patrol and Minesweeping services.

On July 19 a naval air raid, supported by the Grand Fleet, was made upon Tondern and a Zeppelin shed was destroyed. In another raid on August 11 made into the Heligoland Bight by cruisers and coastal motor boats, a Zeppelin was brought down and destroyed, but the motor boats suffered heavily from the enemy air craft. These proved to be the last two important operations of the Grand Fleet during the war.

The White Sea, 1918–19.—The closing of the Black Sea and the Baltic brought the northern route to Russia into prominence and vast quantities of munitions and fuel were, in 1917, sent to the ice free port of Murmansk (connected by rail to Petrograd in 1917) and to Archangel, which was open from July to October. When Russia collapsed in 1917 the old battleship "Glory" and the cruisers "Cochrane" and "Amiral Aube" (Fr.) were sent to Murmansk and were followed in May 1918 by the cruiser "Attentive," the seaplane carrier "Narana" and a force of 9,000 troops (2,100 British). The object of the expedition was to prevent Germany using these ports as submarine bases, to keep open supplies and give support to the anti-Bolshevik forces under Kolchak (*q.v.*). Archangel was occupied in August after a spirited duel between the "Attentive" aided by the Narana's seaplanes and the forts, and an advance was made along the railway towards Vologda and up the Dwina river towards Kotlas, the latter being supported by a flotilla, which included a British monitor and a number of local river steamers fitted out as gunboats and motor launches, mostly manned by British crews. Troitsa, 250 miles from Archangel, was occupied in September, when the flotilla had to retire before the river began to freeze. In April 1ǐ9 a British flotilla, which eventually included 6 monitors, 6 river gunboats, minesweepers, and coastal motor boats, 18 seaplanes and a kite balloon, assisted in the attempt to advance to Kotlas, but Kolchak's effort failed and political influences caused the Allied Governments to order a withdrawal from North Russia. The flotilla successfully covered



the re-embarkation with the loss of two small monitors. By the end of Sept. 1919 the evacuation was complete.

The Baltic, 1918.—The British submarine flotilla, working under the orders of the Russian commander-in-chief, was stationed at Helsingfors during the winter of 1917–18. After the break-up of Russia, the Germans advanced upon Helsingfors, and on April 3, 1918, the flotilla of seven boats was taken to sea through the ice and sunk to avoid falling into the hands of the enemy.

The Mediterranean and Black Sea, 1918.—Early on the morning of Jan. 20, the "Goeben" and "Breslau" suddenly reappeared in the Mediterranean. Shadowed down the Dardanelles by two British destroyers, they made for Imbros Island, where they found the monitors "Raglan" and "M. 28" at anchor. The two British ships were soon set on fire and sunk but in rounding the south of the island the Germans met disaster. The "Breslau" struck a mine and sank and the "Goeben" shortly afterwards struck two mines in quick succession. In a sinking condition she crept back into the Straits and was beached in the Narrows. Continuous attacks upon her from the air failed to do material damage and a desperate attempt to torpedo her, made by "E. 14," resulted in the loss of the submarine. Eventually the "Goeben" was towed off and once more made her escape to Constantinople.

The loss of merchant tonnage on the congested traffic lanes of the Mediterranean remained severe and although the unified control of Trade Protection gradually reduced this loss the Mediterranean was one of the chief danger areas on the trade routes until the end of the war. The Otranto barrage, though a deterrent, was unable to close the passage to the German and Austrian submarines and its patrols were always open to sudden raids. On April 22 Austrian destroyers made a descent upon the patrols but were driven off and in June the Austrian dreadnought squadron at last moved out of Pola and sailed for Cattaro with the intention of attacking the barrage. The squadron was attacked by Italian torpedo boats, the dreadnought "Svent Istvan" was sunk, the attack was abandoned and the Austrians returned to Pola. On Oct. 31 the defences of that port were pierced by the Italian mosquito craft and the battleship "Viribus Unitis" was torpedoed and sunk. During the closing months of the war a flotilla of British monitors and small craft were employed on the northern shores of the Adriatic in co-operating with the flanks of the Italian Army in their final struggle with the Austrians.

The Black Sea.—Until the break up of Russia, sporadic fighting took place between the Turko-German naval forces and the Russian Black Sea fleet, in which the Russian dreadnoughts dominated the situation. After the mutiny of the Black Sea fleet, a danger arose that one or more of the battleships might fall into the hands of the Germans as potential fighting units. The Allied Aegean squadron was therefore strengthened in 1918 by 4 French battleships and 2 British dreadnoughts. It was one of the latter ("Superb") that on Nov. 12, 1918 led the Allied fleets up the Dardanelles and subsequently to Constantinople.

THE FINAL PRASE

As the months of 1918 drew on the menace of the submarine waxed less and less and during May, June and July over 600,000 American troops were safely carried across the Atlantic and landed in France. It was the beginning of the end. In August the German Western Front began to crack under the blows of the French and British armies: Austria was breaking up: September saw the Bulgarian front give way and, in October, Germany, racked by internal troubles, was forced to her knees.

Scheer, who had relinquished the command of the High Sea Fleet to von Hipper on being called to Headquarters in August as Chief of the Naval Staff, received orders late in September to be prepared to leave the Flanders Coast. In October the retirement began, hastened from the sea by the ships of the Dover Patrol. Ostend was clear of German troops on Oct. 17 and two days later they were in full retreat from Zeebrugge. Eighteen destroyers and torpedo boats escaped to the Bight but a number of submarines were left behind and blown up.

Mutiny in the German Fleet— After its futile sortie in April the High Sea Fleet made no move and signs were not wanting that its fighting spirit had departed. As early as May 1917 there had been unrest amongst the personnel and outbreaks of mutiny occurred in the battleships "Westfalen," "Kaiser," "Kaiserin" and "König Albert." In the spring and early summer of 1918 further outbreaks called for stern repressive measures. The continued inactivity of the fleet and the withdrawal of the best of its personnel for service in the submarines and in the flotillas, so undermined its morale that when called upon to make a final effort it failed.

Scheer had planned a last raid into the Channel by the whole High Sea Fleet, whilst a concentration of submarines in the North Sea attacked the Grand Fleet on its way south. The submarines were recalled from their war upon commerce at the end of October and were stationed off the Scottish coast, but, when, on Oct. 29, the signal was made to prepare for sea, open mutiny broke out and the fleet refused to sail. From that moment the High Sea Fleet ceased to exist as a fighting machine and the war at sea was over. Most of the crews of the destroyer and submarine flotillas remained loyal until the end and one of the latter inflicted the last casualty of the war upon the British navy when, on Nov. 10, the old battleship "Britannia" was torpedoed off Cape Trafalgar.

The Armistice.— Under the terms of the Armistice, Germany agreed to surrender 10 battleships, 6 battlecruisers, 8 light cruisers, 50 destroyers and all submarines. These terms were enforced without delay and two scenes followed that will be forever memorable in the long sea history of Britain. On Nov. 20, Rear-Admiral Tyrwhitt, with the Harwich flotillas, met the surrendering submarines off the Essex coast and escorted them into Harwich. Slowly, the long line of 129 submarines passed into the harbour, watched, in dead silence, by great crowds on either shore. Thus was the greatest menace to Britain's sea power laid to rest. The next day, Nov. 21, Admiral Beatty with the Grand Fleet, met the German Fleet off the Firth of Forth. Between two long lines of British ships the High Sea Fleet steamed to its anchorage below the Forth Bridge and there, at sunset, the German flag was hauled down and was not hoisted again. Thus the proud fleet of Germany surrendered to its enemy, who for over four years had watched and thwarted its every move.

The Peace Terms.—In June 1919 the naval conditions of the Peace terms were signed. They were drastic and reduced Germany at a blow from the position of a great sea power to that of a minor one. The maximum strength of the German navy was fixed at 6 small battleships, 6 cruisers, 12 destroyers, 12 torpedo boats and no submarines, with a personnel not to exceed 15,000 officers and men.

Within two months of the signature, the remaining 8 dreadnoughts with 8 light cruisers and 92 of the latest destroyers and torpedo boats were surrendered, disarmed but with their guns on board, and, within one month, all submarines, either built or building, were either surrendered or broken up.

The disposal of this great array of ships became the subject of delicate discussion between the Allies. Great Britain wanted to destroy them all but France and others wished to add their share to their fleets. The question was partially settled by the Germans themselves, when on June 21, the fleet interned at Scapa Flow, was scuttled. There were at anchor in the war base of the Grand Fleet, 11 battleships, 5 battlecruisers, 8 light cruisers and a number of destroyers. At 10 A.M., by preconcerted signal, the crews opened the valves and the ships began to sink. Only four, the "Baden" (the latest battleship) and three light cruisers remained afloat. This act cost Germany dear, for she had to surrender in place of the battleships, 300,000 tons of floating docks, her remaining five light cruisers and 42,000 tons of floating cranes, etc., in lieu of the destroyers.

Comparative Naval **Losses.**—The warship losses of the powers engaged are shown in the following table.

	Great Britain	France	Italy	Japan		Russia	Turkey	Austria	Germany	
									Losses	Surrendered
Dreadnoughts	2*	..	1*	1*	..	2*	..	2	..	18
Pre-dreadnoughts	11*	4	3	..	..	2	1	1	1	..
Battlecruisers	3	..	..	1*	..	..	..	..	1	6
Cruisers	13*	5	1	..	1	2	..	..	6	..
Light cruisers	12	..	2	2	..	..	1	3	17*	23
Destroyers	67	12	8	1	2	20	3	6	66	92†
Submarines	54	14	8	..	..	20	..	14**	199	All

*One lost by accidental internal explosion. †Also 50 of the newest torpedo boats.

**By the peace terms Austria was left without coast line and her navy ceased to exist.

In addition to those shown in the table, Great Britain lost 60 minor war vessels (torpedo boats, sloops, gunboats, monitors, coastal motor boats, etc.), her losses in this type being heavier in proportion than that of the other Allies. British losses of auxiliary vessels totalled 17 armed merchant cruisers and 828 other vessels. This latter figure included 288 colliers and oilers, 246 trawlers and 130 drifters. Submarines accounted for 35% of the loss amongst auxiliary vessels, 28% were sunk by mines and 9% were lost by wreck or fire.

Under the urgent stress of war, science brought about the rapid development of certain new weapons and new methods; the submarine and the mine and their countermeasures; the increased range of the great gun and in the power of explosives; the use of poison gas and the birth of aircraft as fighting machines. Reference to all these matters will be found elsewhere; they were common to all belligerents and did not alter the course of the war at sea. For, upon the sea, history was repeated. Like France and Spain in the wars of the 18th century, Germany found herself, at the outset, in the grip of the blockade of the British Fleet. Isolated from the world and cut off from oversea supplies, she attempted by her submerged blockade, like Napoleon with his Continental System (*q.v.*), to strike a vital blow at Britain's seaborne trade. Like the Continental System, the Submerged Blockade came near to success, but, in the end, under the steady pressure of the Allied navies, it failed. With supplies unlimited the wasteful struggles between the great armies might have been prolonged indefinitely, but with the Central Powers denied their wants by the Allied blockade at sea, whilst the Allied armies received their every need from overseas, there could be but one end.

Upon the British Merchant Navy fell by far the greatest burden of carrying the seaborne trade that kept the Allied armies in the field and fed the civilian populations; heavy indeed was the price it paid in the faithful performance of this duty. To the Royal Navy fell the lion's share of the fighting upon the sea: its great traditions were maintained and glorified and when the Armistice called a halt the two navies of Britain had once again carried the country in triumph to the end of a great war.

(S. T. H. W.)

WORLD WAR II. The article which follows is divided into six broad sections which describe the principal political and military events of World War II. The military and air operations have been treated according to three main geographical divisions—Europe, Africa and the near east; China; and the war in the Pacific.' Naval operations are described in a separate section, although it is often impossible to draw a sharp line of demarcation between purely military and purely naval action in World War II, particularly in the Pacific.

Following are the main sections and divisions of the article:

I. The Origins

II. The War in Europe, Africa and the Near East
- A. The German Campaign in Poland
  - 1. Polish Dispositions
  - 2. The German Offensive
  - 3. The Russian Invasion
- B. The Russo-Finnish Winter War
  - 1. Early Finnish Successes
  - 2. Mannerheim Line Crushed
- C. German Campaigns in Denmark, Norway
  - 1. German Invasion
  - 2. Allied Landings in Norway
  - 3. Narvik Episode
- D. The Western Front, First Phase
  - 1. The "Phony War"
  - 2. German Conquest of the Low Countries and France
    - (a) Conquest of the Netherlands
    - (b) Conquest of Belgium, First Phase
    - (c) Thrust into France
    - (d) Conquest oi Belgium, Final Phase
    - (e) Collapse of France
  - 3. The Siege of Britain
  - 4. British Amphibious Raids
  - 5. Air Wariare over Western Europe, Germany, Mediterranean and Italy
    - (a) The Success of the Blitzkrieg
    - (b) The Battle of Britain
    - (c) The Defensive Phase
    - (d) The Offensive Phase
  - 6. The German Occupation of Western Europe
- E. The British Airican Campaigns
  - 1. East Africa
    - (a) Italian Conquest of British Somaliland
    - (b) British Conquest of Somaliland, Eritrea and Ethiopia
  - 2. Egypt and Libya
    - (a) First Italian Offensive (Sept.–Dec. 1940)
    - (b) British Counteroffensive (Dec. 1940–Feb. 1941)
    - (c) Second Axis Offensive (March–April 1941)
    - (d) Second British Counteroffensive (Nov. 1941–Jan. 1942)
    - (e) Third Axis Offensive (Jan.–Aug. 1942)
    - (i) Final British Offensive (Oct. 1942–April 1943)
  - 3. Occupation oi Madagascar
- F. The Near East Campaigns
  - 1. Iraq
  - 2. Syria
  - 3. Iran
- G. The Balkan Campaigns (1940–41)
  - 1. The Greek–Italian War
  - 2. German Occupation of Rumania and Bulgaria
  - 3. German Conquest of Yugoslavia and Greece
  - 4. The Conquest of Crete
- H. The German–Russian War
  - 1. To the Outskirts of Moscow
  - 2. Russian Winter Counteroffensive
  - 3. German Advance to the Caucasus
  - 4. Turning Point at Stalingrad
  - 5. Russian Reconquest of the Ukraine
  - 6. Russians Enter Poland and Rumania
  - 7. The Russians on the Vistula
  - 8. The Hungarian Plain Reached
  - 9. From the Vistula to the Oder
  - 10. Fall of Berlin
- I. The North African Campaign, Nov. 1942–May 1943
  - 1. Plan and Composition of the Forces
    - (a) Western Task Force: French Morocco
    - (b) Central Task Force: Western Algeria
    - (c) Eastern Task Force: Algeria and Tunisia
  - 2. Landings in North Airica
  - 3. Capture of Tunisia
  - 4. Summary
- J. The Sicilian Campaign, May–August 1943
- K. The Italian Campaign, Sept. 1943–May 1945
  - 1. The Italian Surrender
  - 2. The Landings
  - 3. Advance to the Gustav Line, Sept. 20–Dec. 10, 1943
  - 4. Anzio and Cassino, January–May 1944
  - 5. The Summer Offensive, May–September 1944
  - 6. The Winter Pause, Oct. 1944–April 1945
  - 7. The Final Phase, April–May 1945
  - 8. Summary
- L. Balkan Operations (1942–44)
  - 1. Resistance in Yugoslavia and Greece
  - 2. British Reconquest of Greece
- M. Allied Reconquest of Western Europe
  - 1. Plans for "Overlord"
  - 2. Western Europe before Invasion
  - 3. Beginning of the Assault
  - 4. Launching of Operation "Dragoon"
  - 5. The Advance to the German Frontier
  - 6. The Counteroffensive in the Ardennes
  - 7. The Drive ior the Rhine
  - 8. Crossing of the Rhine; the Ruhr Pocket
  - 9. The German Collapse
  - 10. Summary

III. The Chinese-Japanese War (1937–45)
- A. Prior to Pearl Harbor
  - 1. Background of War
  - 2. The Loukouchiao Incident
  - 3. Strategy
  - 4. Fall of Nanking
  - 5. Victory at Taierhchwang; Defeat at Wuhan
  - 6. Situation after Outbreak of European War
  - 7. Japan's Pre-Pearl Harbor Offensives
- B. After Pearl Harbor
  - 1. One World War
  - 2. New Japanese Objectives
  - 3. Shansi Front
  - 4. Increased Air Transport
  - 5. Japan's Last Adventure
  - 6. Surrender

IV. The War in the Pacific
- A. The Period of Japanese Conquests
  - 1. The Japanese Plan of Conquest
  - 2. Pearl Harbor
  - 3. The Philippines
  - 4. Malaya and the Netherlands East Indies
  - 5. Operations to the East
- B. The Allies Strike Back
  - 1. New Japanese Plans
  - 2. Allied Reorganization and Plans
  - 3. Battles of the Coral Sea, Midway and the Aleutians
  - 4. Guadalcanal
  - 5. The Papuan Campaign
  - 6. Reduction of Rabaul
  - 7. Recapture oi the Aleutians
- C. Across the Pacific
  - 1. Allied Offensive Plans
  - 2. The Gilberts and Marshalls
  - 3. Up the New Guinea Coast
  - 4. The Marianas
  - 5. Allied Reorganizations in the Pacific
  - 6. Westward toward the Philippines
- D. The Last Campaigns
  - 1. Revised Allied Plans
  - 2. Leyte
  - 3. The Luzon Campaign
  - 4. The Southern Philippines and Borneo
  - 5. Iwo Jima
  - 6. The Ryukyus; Okinawa
  - 7. Victory in the Pacific

V. The War at Sea
- A. Prior to U.S. Entry into War
  - 1. Two Great Strategic Aims
  - 2. Battle of the River Plate; the "Altmark"
  - 3. Operations off Norway and Denmark
  - 4. Germany on the Atlantic
  - 5. Immobilization of French Navy
  - 6. Operations during Battle of Britain
  - 7. Mediterranean Operations
  - 8. Battle of Cape Matapan
  - 9. Operations off Greece and Yugoslavia

I. THE ORIGINS

The years between World Wars I and II covered another period in history wherein the struggle for world peace resulted in failure. It was a period during which those who had the power to enforce peace failed to act and during which the aggressors. encouraged by such failure and heedless of the destruction and human suffering entailed, again took up war and oppression as a means of accomplishing their objectives.

World War I had been sufficiently vast and destructive to induce mankind to search deeply for the means of avoiding another such convulsion. Many objective and high-principled leaders, who devoted all the energies they could summon to the establishment of a form of society which would bring security and peace, arose after that conflict. If there were also men of partisan approach and background, they did not dominate the scene; and it is safe to say that all were so gripped by the full sense of the destructive power of war as to seek honestly and energetically for security. Then, as at later times, there was divergence of opinion as to method.

Then, as after World War II, acute postwar problems arose which had to be dealt with even while discussion of the form of a world organization was taking place—problems in some instances very much like those which confronted the world after 1945. These problems frequently plagued the general will to set up a form of international organization which would become either a substitute for. or a moderation of. the old methods of achieving security; namely, by alliance. individual action and war.

It was the conflict, probably inevitable, between the concept of individual security and Pres. Woodrow Wilson's doctrine of collective security which compromised the settlement after World War I. It stalked across the entire period between the wars, and finally led to outright defiance of the League of Nations by the axis powers and to virtual abandonment of it by the western democracies. The establishment of the many new small nations had been tied in with the creation of the League as the fundamental basis of fostering European peace. With these new nations and the alterations of boundaries which were necessary to produce them, and without firm adherence to the League on the part of the victors, Germany was left a wide choice of European issues to exploit.

All the great Allied Powers, including the U.S.S.R., appear to have been guilty of the most painful blunders in their vacillation between collective and individual security as the aggressors began their exploitation of Allied disunity, weaknesses and indecision. That vacillation frequently nullified effective action toward peace. It was only in the face of black disaster and in the heat of actual armed conflict that unified action was forged.

Significance of **Versailles.**—It is to this persistent conflict between collective and individual security and the jockeying it produced among the powers, rather than to the harshness or the softness of the treaty of Versailles in respect to Germany, that one must look for the elements most useful to the aggressors during the decade preceding World War II.

The Versailles treaty attempted to put together French and Anglo-U.S. concepts of a stable world order. France, which sought drastic modifications of Germany's political boundaries, finally settled for military guarantees of the type with which for centuries it had been familiar. These it accepted from Great Britain and the United States of America in return for the abandonment of its claim to strategic frontiers and of its plan for the dismemberment of Germany.

The resultant treaty, at least in French eyes, presupposed the continuance of English and U.S. military support. which in the end was not forthcoming. France, as a result. never was induced by a basic sense of security to rest its full faith in the League of Nations.

Practically from the instant of the refusal of the United States to support France by a military alliance and the consequent loss of the British guarantee, the essential elements of the whole theory on which the treaty was drafted were removed. The United States' refusal to ratify the treaty was a body blow of almost fatal character in itself, considering the part which the assumed adherence of the United States had played in the treaty negotiations. Even France's proposal for an international police force was rejected. The representatives of Great Britain and the United States had been rather well satisfied with the geographical and military positions of their respective countries after World War I. They were disposed to be content with the formal creation of an organization to keep the peace without placing any great emphasis on the methods by which such an organization would be made potent and dynamic. The League without U.S. participation was thus doubly undermined. To make matters worse, after U.S. withdrawal, England quickly shifted to its old concepts of the balance of power and of restricted intervention in European affairs which effectively deterred it from supporting France's proposals to curb the first military gestures of the renascent reich. Instead of Anglo-French integration of policy, there ensued a sort of duel between the two countries resulting in the practically unilateral and highly unsuccessful occupation of the Ruhr by France and the consequent encouragement of Germany to flout the treaty.

The Germans, especially Adolf Hitler, made much of the harshness of Versailles; but in retrospect no serious contention can be held that the political burdens of Versailles were too great for it to bear. The boundaries in some cases were awkward. as for example the Polish corridor; but they left Germany a strong national state, with a chance for complete economic recovery. Considering the conglomeration of races in Europe and the acute sense of security need which German aggression had induced, the territorial solutions attempted at Versailles could not be said to have been unreasonable or vindictive. It is true that the reparations clauses of the treaty were unrealistic, and together with other factors—most of them of German origin—they played a part in inducing the distressful inflation which Germany underwent. The reparations clauses were moderated, however, by successive plans of adjustment; and in the end Germany failed to pay by way of reparations as much as was received by it in foreign loans on which it later defaulted. It is true that the inflation under which Germany suffered and the economic collapse of the country did serve to destroy the chief prop the German republic had in the way of political support, for it embittered the middle class against the government, and it enabled Hitler to gain ground with his joint denunciation of the republic's leaders and Germany's former enemies.

While the economic features of the treaty had serious consequences, the true defect of Versailles lay in the failure of the Allied Powers to move together in the enforcement of the settlement. even after their own moderation of its terms. The truth of the matter became apparent too late, but eventually, even to Anglo-U.S. apologists for the alleged harshness of the treaty, it became evident that Hitler was grossly overplaying Versailles as a justification for his depredations.

Primary German **Responsibility.**—Hitler, however, successfully utilized the treaty as a means of gaining power at home and of disseminating publicity abroad as to the sincerity of his purposes. It was only on the verge of war that the realization arose that something deeper than modifications of the treaty of Versailles stood between peace and war in Europe. Hitler's reiteration at each crisis he precipitated that he sought no further concessions in Europe finally lost its force.

Prior to World War II, the German standard of living had substantially improved—it was measurably higher than that of the first victims of Hitler's attacks. If there was discrimination displayed by contiguous states against German residents, none of it approached Hitler's charges nor faintly suggested the brutalities Hitler was himself exerting on minorities within his own borders. Yet these were the elements which his propagandists stressed and which readied the nation for another mar.

With all this, Hitler could not have made Germany march without another factor which underlay the whole German structure. This was a still deeply seated tradition and sense of superiority fostered by Germany's military philosophers and supported generally by the people. It arose from pride in Germany's many and important military successes in the past and a conviction of superiority which was never entirely dissipated by its really thorough defeat in 1918. The unconvincing character of that defeat in German minds, and the humiliations which defeat brought Germany, supplied the chief nourishment on which Hitler's propaganda could and did thrive.

Germany had no justifiable military, political or economic cause for war and it was always within its power to avert it; but the Allied Powers made the way easy for Hitler's ambitions, first, by their failure to enforce collectively the provisions of the treaty and the agreements made subsequent to the treaty, and, second, by their refusal to take united and timely action in the way of economic concessions which would have strengthened the republic. These concessions, which were never forthcoming in unified form, were belatedly urged on Hitler when they were of no further avail as a war preventive.

In condemning the shortsightedness and indecision of the Allied Powers, it must always be borne in mind that these factors did not cause the war. They only failed to prevent it.

The utter wantonness of Hitler and the willingness of the German people to support him and condone his depredations caused the European war, and in the disappointment caused by the weakness and indecision of the Allied leaders and peoples one should not lose sight of the primary and fundamental responsibility of Germany, Japan and Italy for the years of misery they inflicted on the world.

Futility of Disarmament.—Throughout the period between World Wars I and II, the western democracies clung persistently to the concept that disarmament in itself would bring peace. Indeed, this became almost the only continuing element of their policy Even in the face of the most significant acts of aggression on the part of Germany, Japan and Italy, the disarmament conferences went on. No disarmament agreements of any substance were concluded by the axis powers, a fact significant enough in itself; but all the while they went on arming. The democratic governments were informed of this rearmament, but they chose to ignore it. They fastened only the more firmly to the hope that the more convenient policy of disarmament would induce peace. Though no agreements were consummated, the two greatest of the democracies were actually disarming through their failure to maintain their military establishments at any stage which either Germany or the smaller nations, eventually to become Germany's victims, could recognize as a factor measurable in terms of time and effect in enforcing peace.

This tendency arose in large part from the expressions of great bodies of well-meaning people, in both Great Britain and the United States, who firmly believed that no arms meant no violence. It was combined with the ever-present reluctance of political parties in power to take the responsibility of imposing on the electorate the added tax and personal burdens which armament involves.

Whatever the motive, the result was clear. None of the axis powers felt that there was either a will or a capacity to enforce the peace on the part of the great democracies. This belief was transmitted to those countries which might have resisted the aggressions. It thus entered into the calculations of both aggressor and victim—the aggressor being convinced that he could make away with his gains before any retribution could overtake him and the victim being convinced that resistance was useless, since no help could or would arrive before he was overrun.

Locarno and London.—Two occurrences, rather characteristic of the trend of world politics in the interwar period, should be referred to before reciting the sequence of the direct and immediate events which led up to the actual outbreak of World War II. The first was the repudiation of the Locarno pact of 1925, and the second was the failure of the World Economic conference in 1933. During the period between the wars, as indeed in most periods of history, political and economic issues went hand in hand as parallel irritants to friendly relations. In the period referred to, the economic crazy quilt of high tariffs, reparations, foreign loans and strangulation of international trade constantly created international complications and demanded rectification.

A serious effort was made, and for a time seemed successful, to deal with the political issues at Locarno. The conclusion of the pacts ushered in a period of much good feeling. It followed the evacuation of the Ruhr and the acceptance of the Dawes plan as a settlement of the reparations problem and the stabilization of German economy. At Locarno, Franco-German and Belgian-German boundaries were guaranteed; the permanent demilitarization of the Rhineland was provided for; war was renounced and the principle of arbitration of disputes between the countries was established, except for cases in which self-defense, League action or German violation of the demilitarization provisions was involved. Great Britain and Italy joined in to promise assistance to the country which became the victim of another's aggression. Germany was elected to the League. Thus, all but Germany's eastern boundaries were dealt with. The Soviet Union naturally was disturbed, but in spite of Russian suspicions the Locarno pact established a basis upon which much might be built and even more hoped for. Here was an agreement entered into freely by Germany as a coequal. It had none of the aspects of the Diktat which Germany signed in the Hall of Mirrors at Versailles.

Hitler came to power in Jan. 1933; in 1936, not long after he had proclaimed his firm intention to observe the agreements which were made at Locarno, hardly more than ten years after the pacts had been signed, the new German leader marched his troops into the Rhineland in direct violation of the pacts. The great powers did no more than make formal protestations to this action.

The other significant event was the attempt made to solve the major economic problems then plaguing the world. To accomplish this, a great economic conference was called together to meet in London in June 1933. The conference was called by the League in a supreme effort to recognize the integral character of the world's economy. The economic dislocations brought on by World War I, and the continued nationalistic measures and countermeasures which were everywhere in force, were patently interfering with the political stability of the world. The conference was to deal primarily with the removal of trade barriers, the stabilization of currencies and the disposal of other restrictions impeding world trade.

Though having high hopes and possibilities, the conference at the very outset was blocked by the action of the United States in opposing any measure leading to the stabilization of currencies. Other restrictions on the power of the U.S. delegates, together with the force and manner in which their authority respecting currencies was taken from them by their own chief, turned the conference into something of a fiasco.

The political value of Locarno was destroyed by the determination of Hitler to prepare his way for outright aggression, whereas the attempt to deal with world economic problems was nullified at a critical time largely by a leader who had just come on the scene and who was to play such a vital part in the final overthrow of Hitler—Pres. Franklin D. Roosevelt. The president felt a compelling domestic need for higher prices and was prepared to place that consideration above the international need for stabilized world economic conditions. This event is stressed as a significant incident of the general trend of nationalistic action which tended to interfere with constructive plans for world peace. The event is the more significant in that President Roosevelt, who was later to become almost the personification of collective action and internationalism, was impelled to pursue this course. Whatever his motives, the failure of the London conference served to encourage the policies of economic nationalism. This encouragement unfortunately played into the hands of the nazi leaders of Germany. Other factors may have obstructed the possibilities of success at London, but the action of the United States made a spectacular contribution to its failure.

These two events stood out as typical of the halting and contradictory character of Allied action as against the unequivocal evidence of axis intention, particularly as such intention became manifest after Hitler's accession to power. They were only typical, however, for it would not be difficult to find similar instances of the operation of British, French and Russian self-interest or to locate as flagrant an example of axis provocation.

Failure to Check Aggression.—Thus, first one country and then another, the western democracies as well as the U.S.S.R. (for the record shows that all were sooner or later involved), took, or failed to take, action, which set the stage for the ever-present and unrelenting determination of Hitler to divide and conquer. This was the pattern which led to war, and one step after another followed, no one of which seemed sufficient at the time to induce the powers to undertake collective action or even courageous individual action. Some of the major incidents can be only briefly summarized, with consequent risk of oversimplification, but it is impossible to misinterpret the trend.

The Japanese aggression in Manchuria in 1931 apparently was the first of the definite steps toward doom. It is necessary at this stage to look at the state of affairs in the far east to judge the part Japan was to play in the drama.

Paralleling the nazi and fascist motives of Germany and Italy, another virulent and demoralizing force was steadily at work and steadily antagonistic to peace. Comparatively late in emerging from a deep tribal isolationism to become a member of the international community, and permeated with a strong militaristic tradition, Japan had persistently expanded its territories and areas of influence through opportunistic conquests before World War I; viz., China (1894), Russia (1904) and the German possessions in the far east (1914).

For a time, after obtaining the concessions for which it contended at Versailles, Japan gave evidence of participating with considerable good will in the international field. It had benefited greatly both territorially and otherwise by its intervention in World War I, at relatively little cost. Encouraged in addition by the spectacle of the weak support given by the great powers to the League and inspired by the opportunities it felt that a feeble China afforded it, Japan's materialist and militarist elements soon impelled the country to discard all inhibitions, seize Manchuria and subjugate Asia to exclusive Japanese interests. When the League rather feebly sought to remonstrate, Japan departed from that organization and from then on matched each self-serving protestation of peaceful intent with an act of the most barefaced aggression.

Its first step was, as has been indicated, in Manchuria. In Sept. 1931 a portion of the track of the South Manchurian railway was blown up with all the marks of a manufactured incident. The Japanese army immediately took possession of important strategic positions in Manchuria. Four months later Japanese forces landed in Shanghai, bombarding the town and engaging the Chinese forces located there. All of Manchuria was occupied. The foresighted warning of Henry L. Stimson, then United States secretary of state, who called for collective action, appealed neither to Great Britain, whose stake in the Pacific areas was, if anything, greater than that of the United States, nor to the United States. In spite of Secretary Stimson's prescience, the United States, as Great Britain well knew, was in no mood to take determined action. In retrospect, the failure to act in Manchuria becomes the first recognized signpost along the road of missed opportunities which led to war.

Ethiopia, the Rhineland, Spain.—The League was bluntly challenged by Japan and promptly collapsed before the challenge. It was only a relatively short time later, in Oct. 1935, that Benito Mussolini defied the League in his conquest of Ethiopia. France this time failed to support Great Britain, and it was not long before the shoe was on the other foot when in March 1936 Hitler marched into the Rhineland. As Pierre Laval had failed to support Great Britain over Ethiopia, so now Stanley Baldwin failed to join with France over the Rhineland, and again there was no firm individual or collective action.

These were portentous incidents, but more ominous than any of them was the outbreak of bitter armed conflict within Europe itself. The Spanish peninsula, so important to British and French interests, became in July 1936 the scene of a violent struggle which ended in a serious deterioration of British and French power in Europe. The Civil War moved from a left-*v.*-right domestic struggle to a sort of international proving match of strength and weapons, in which German and Italian forces became deeply involved; and the position of the democratic powers became increasingly weak as totalitarian forces were strengthened. "Nonintervention" became a watchword of Allied policy, and still the German and Italian reinforcements of men and arms grew. Soviet aid was given to the loyalists (left) but never on the scale of the axis assistance which was made available to Gen. Francisco Franco's rightist forces. Entire divisions were transported to the peninsula, and the fighting was on a fully organized scale. The war in Europe had in reality already started, but it was significantly obscured in western eyes by a fog of ideologies—communism v. the right and a stubborn refusal to face up to political and strategic realities. Refuge was taken in nonintervention pacts entered into after laborious exchanges between foreign offices but only unilaterally observed. When the fog had lifted with a Franco victory, English sea power all over the world was compromised by the weakened position of its fleet in the Mediterranean. France had another hostile European power with which to cope. The Soviet Union was more deeply isolated, and Hitler was better prepared for his impending excursions into middle Europe.

Japan again renewed its aggression by the seizure of Peiping in July 1937. Italy withdrew from the League. Through all this period the greatest potential power for peace had little to offer. The United States at this stage appeared to the world as isolationist, pacifist, neutral and disarmed, and its government had little influence upon the world situation. Others were to call the tune by which the world was to dance, and the attitude of the United States was ignored by the aggressor nations that were in a few years to be destroyed by a combination of powers of which the United States was to be the chief centre of strength.

Austria and Czechoslovakia.—While Hitler was already fighting in Spain, he was preparing at home his more ambitious plans of conquest and forging the means by which they were to be carried out.

By 1936 the paramilitary organizations of Germany were in full strength. The *Sturm Abteilungen* (SA), the *Schutzstaffel* (SS) and the *Reichsarbeitsdienst* (RAD) consisted of more than 1,500,000 men, disciplined as military organizations, yet intimately involved in the social and political life of the country. They were the select exponents of the nazi doctrine. Force was the keystone of their existence. Their intermittent spectacles of massed manpower with Teuton, if not barbaric, display of colour and music gave indication of the dangerous momentum of the country. At their head was the coterie of individuals which had followed Hitler to power. Strange mixtures of zealots and opportunists placed in positions of great and self-perpetuating authority, they came to feel no limit to their ambitions or the destiny of the state they ruled. Though Hitler seems to have had a design for all his conquests, the tremendous concentration of power in the hands of this relatively small group created a psychological impulse as well as a means to act promptly and drastically. With this fearful imperative it was not long before action was forthcoming.

Austria was marked as the first victim. Chancellor Engelbert Dollfuss had made an attempt at strengthening the government in Austria in 1933, but it was not the type of strength which Hitler sought, since it involved exclusion of nazis. After Dollfuss' assassination in 1934 by nazi storm troopers, Kurt von Schuschnigg became chancellor and under heavy external pressure in

July 1936 agreed to a friendship pact with Germany.

Not content with this arrangement and in accordance with plans laid far in advance, Hitler, with a modern modification of Canossa, first humiliated Schuschnigg at his Berchtesgaden hilltop and then forced Schuschnigg's resignation. This time full collaboration with the nazis was exacted, and on the night of March 11, 1938, German troops marched into Austria on the pretense that Arthur Seyss-Inquart, the new nazi chancellor, needed them to restore order.

Next in order was Czechoslovakia; nazi propaganda began its heaviest drumfire on this front in the summer of 1938. The world heard much during this period about Hitler's rages and his "patience." So great was the tendency toward appeasement, so firm the determination not to be embroiled over issues in "remote" countries, that the appeal of Pres. Eduard Benes for assistance brought only a blunt proposal by the French minister at Prague that either Czechoslovakia should agree to the Anglo-French plan for the surrender of the Sudetenland to Germany, with the abandonment of the highly prized border fortifications and the existing military alliance, or look elsewhere for help. It was quite clear that if Czechoslovakia refused, it had to face the rearmed might of Germany alone.

Munich. — Somewhere between Sept. 21 and Oct. 1, 1938, another opportunity for France, Britain and the U.S.S.R. to join and oppose was lost. The famous Munich agreement, from which the Soviet Union was excluded, was entered into on Sept. 30 and incorporated a drastic concession to Germany in the Sudeten issue. It was such an abandonment of Czechoslovakia that it represented a showdown on the one hand too humiliating for the great powers long to endure and on the other too successful for nazi politics not to exploit. Again great pressure was placed on the Czech government to conform to the Munich agreements, and just at this stage even Poland, soon itself to be engulfed, sped an ultimatum to demand the immediate cession to it of the Teschen area. Again came capitulation, and this time President Benes resigned and fled to London. Neville Chamberlain, Edouard Daladier and the Munich capitulation were much criticized. But individuals were condemned for a policy which was largely dictated by the people of the Allied nations themselves. Munich was generally applauded in France and Britain, and the representatives of those countries were met with welcoming crowds on their return. Prime Minister Chamberlain was following the overwhelming desire of the people of Great Britain to avoid a war which they sensed would be desperate if not worse in its consequences to them. Subconsciously, they may have sensed the significance of air power not only as a challenge to their long dominance of the seas but also as a weapon which could be employed perhaps disastrously against the homeland itself. The people of France were in a like mood. Czechoslovakia was not in the sphere of their vital interests. It was probably time, they reasoned, that such a maladjustment as the Sudetenland should be moderated. "If we have to fight it must be on larger issues than that," said Chamberlain, echoing the sentiments of the majority. A "quarrel in a far away country between people of whom we know nothing" was not a sufficient base on which to make a stand. But if Chamberlain was doing all he could to avoid a stand which might mean war, he was merely coping with a dilemma which Stanley Baldwin had had more timely opportunity to avoid. Daladier was but following a course toward which Camille Chautemps and the rationalizing spirit of France had directed him.

The illusion of "peace in our time" which it was hoped that truce had brought was soon to be dispelled. On the night of March 14, 1939, Pres. Emil Hacha of Czechoslovakia was called to Berlin, subjected to another of Hitler's set tirades and threatened with the destruction of Prague by air. In the face of these threats. and in approximately six months after Munich, all Czechoslovakia was overnight made a vassal state of Germany.

Poland and **the Russo-German** Pact. — Great Britain and France were belatedly aroused, if not to collective European action. at least to strong joint and individual action. Poland was so obviously the next victim that this time Great Britain made its position entirely clear in advance. An attack on Polish independence resisted by the Poles would mean active support to Poland from Great Britain, and in this action it was stated that France would join. At this point Mussolini attacked and on April 8, 1939, seized the weakest opponent at hand — Albania.

Events moved quickly. A firm military alliance was concluded between Germany and Italy on May 9, 1939. Maxim Litvinov, soviet commissar for foreign affairs, who had been an outspoken and consistent advocate of collective security, resigned on May 3, 1939, an ominous note if one had the foresight to interpret it; for shortly thereafter, and almost in the midst of protracted Allied-Soviet negotiations for collective action in the event of further German aggression, Moscow announced on Aug. 21, 1939, a ten-year treaty of nonaggression and neutrality with nazi Germany. Left out of the Austrian settlement and the Munich negotiations, suspicious of the western powers and desirous of a free hand in the Baltic states, the U.S.S.R. joined hands with Germany on the verge of battle. Its motives were destined to be debated and its conduct alternately supported and condemned at least until the time, if ever, when history might disclose definitive proof of their true character.

The great hope of the U.S.S.R. from the time of the treaty of Brest-Litovsk had lain in the spread of great revolutionary movements. It was Nicolai Lenin's thought that his action in withdrawing as a participant from World War I would be followed by revolutionary developments in Germany and the German army. Subsequently, it became a tenet of the soviet faith that such movements must occur throughout the world if the full concept of soviet philosophy were to develop. In the interval between World Wars I and II such upheavals were not forthcoming to the degree soviet concepts required. The soviet leaders set about implanting agents and propagating soviet doctrine in the countries and dependencies of the western democracies. This doctrine of revolution, mixed with some rather involved interpretations of its own self-interest, constantly ran counter to the soviet need for collective action to meet the recrudescence of German strength. There was inculcated in its people fear of the "imperialism" of the western democracies which rather outdid in rivalry, as the chief enemy concept, the strength of fascism or the growth of German industrial and military power. If the western European powers had been very slow to recognize the need for a soviet *rapprochement*, their reluctance could be understood when all the while soviet agents fomented destruction of their governments.

If Litvinov, a liberal diplomat of wide experience, did see the need and worked toward collective action, there were others in the Soviet Union who inspired actions which gave the democracies as much cause for suspicion as the exclusion of soviet representatives from important councils gave the Soviet Union.

Another strong element in Allied suspicions was the constantly recurring suggestion of soviet desire for continuing "imperialistic" wars. Indeed, until Hitler made it so unmistakably clear that the object of his chief animosity was the Soviet Union, Joseph Stalin seemed not to fear the nazi development in Germany. With this background it was not surprising that both British and Russian leaders should harbour the unexpressed hope that matters would so fall out that their respective countries could stand aloof while Germany became embroiled in war with the other.

After many unfortunate failures to co-operate in the solution of European problems, this conflict was put to the final test. The Soviet Union held out for guarantees which Britain did not feel it could give. Not receiving the price of its support, it spectacularly stood aside to permit Germany to have its way with Poland. Germany was not long in acting, and the failure of any combined Anglo-French-Russian policy to check the aggressor was to cost the Soviet Union unbelievable destruction and death, France utter defeat and bring England and the whole civilized world to the brink of ruin.

Hitler, with his border problems now in order, struck at Poland on Sept. 1, 1939. Great Britain and France, no longer hesitant, declared war on Germany two days after the attack; but no steps could be taken to save Poland from its fate. (J. J. McC.)

II. THE WAR IN EUROPE, AFRICA AND THE NEAR EAST

A. THE GERMAN CAMPAIGN IN POLAND

The German conquest of Poland in Sept. 1939 was the first demonstration in war of the theory of high-speed armoured warfare which had been conceived by the British tank exponents after World War I and adopted by the Germans when their rearmament began. Its adoption was mainly a result of the initiative of the young Gen. Heinz Guderian, a soldier of vision, who organized and trained the new armoured divisions. Although the senior German generals took a cautious view of the new technique and had developed the means for it in a measure much more limited than the tank exponents visualized, it sufficed to produce a startlingly quick victory. Poland was all too well suited for such a demonstration. Its frontiers mere immensely wide—about 3,500 mi. in all. The stretch of 1,250 mi. adjoining German territory had recently been extended to 1,750 mi. by the occupation of Czechoslovakia. This had also resulted in Poland's southern flank's becoming exposed to invasion as the north flank, facing East Prussia, already was. Western Poland had become a huge salient that projected between Germany's jaws.

1. Polish Dispositions.—It would have been wiser for the Polish army to assemble farther back, behind the broad river lines of the Vistula and the San, but that would have entailed the definite abandonment of some of the most valuable parts of the country. The Silesian coal fields were close to the frontier, while most of the main industrial zone, though farther back, lay west of the river barrier. It was difficult to conceive that the Poles could have maintained their hold on the forward areas even in the most favourable circumstances, but the economic argument for making the attempt, and delaying the German approach to the main industrial zone, was heavily reinforced by national pride and military overconfidence, as well as by an exaggerated idea of what Poland's western allies could do to relieve the pressure.

The Polish army at peace strength was as large as the French and not much smaller than the German. It comprised 30 infantry divisions and 12 cavalry brigades. But Poland's industry was insufficient to make full use of its manpower or even furnish an adequate scale of equipment for its active forces. On mobilization it could increase its number of divisions by only one-third, whereas Germany could more than double its divisions, except for the armoured and motorized ones; but this limitation on Germany's side was offset by Poland's almost complete lack of such modern-type forces. Poland had no armoured or motorized divisions, merely a sprinkling of light tanks, while only one of its cavalry brigades was motorized; and its old-style formations were very short of both anti-tank and anti-aircraft guns. Yet many of its leaders gallantly but absurdly clung to the double belief that their preponderance of horsed cavalry was an important asset and that they could take the offensive against the German mechanized forces. They also tended to discount the effect of Germany's vastly superior air force, which was nearly ten times as powerful as their own.

The unrealism of such an attitude was repeated in the Polish dispositions. Approximately one-third of the forces were concentrated in or near the corridor (Polish Pomorze), where they were perilously exposed to a double envelopment—from East Prussia and the west combined. This indulgence of national pride was inevitably at the expense of the forces available to cover the areas more vital to Poland's defense. For in the south, facing the main avenues of approach, the forces were thinly spread. At the same time nearly another third of Poland's forces mere massed in reserve north of the central axis. between Lodz and Warsaw, under the commander in chief, Marshal Edward Smigly-Rydz. This grouping embodied the offensive spirit; but its aim of intervening with a counterattack did not correspond to the Polish army's limited capacity for manoeuvre, even if this had not been cramped by German air attack on the rail and road routes of movement. The Poles' forward concentration in general forfeited their chance of fighting a series of delaying actions, since their foot-marching army was unable to get back to the positions in the rear, and man them, before being overrun by the invader's mechanized columns. In the wide spaces of Poland the unmechanized state of its forces was a heavier handicap than the fact that it was caught by surprise before all its reserves had been called up. By the same token, the 40-odd infantry divisions of normal pattern which the Germans employed in the invasion counted for much less than their 14 mechanized or partially mechanized divisions. These included six armoured divisions, four light divisions (motorized infantry with two armoured units) and four motorized divisions. It was their deep and rapid thrusts that decided the issue, in conjunction with the overhead pressure of the *Luftwaffe,* which wrecked the Polish railway system besides destroying most of the Polish air force before it could come into action.

2. The German Offensive.—The German forces crossed the frontier shortly before 6 A.M. on Sept. 1, 1939; air attacks had begun an hour earlier. In the north, the invasion was carried out by Gen. (later Field Marshal) Fedor von Bock's army group, which comprised the 3rd army under Gen. (later Field Marshal) Georg von Kuchler and the 4th army under Gen. (later Field Marshal) Giinther von Kluge. The former thrust southward from its flanking position in East Prussia, while the latter pushed eastward across the Polish corridor to join it in enveloping the Poles' right flank. The greater role was given to Gen. (later Field Marshal) Gerd von Rundstedt's army group in the south. This was nearly twice as strong in infantry and more in armour. It comprised the 8th army under Gen. Johannes von Blaskowitz, the 10th under Gen. (later Field Marshal) Walter von Reichenau and the 14th under Gen. (later Field Marshal) Siegmund List. Blaskowitz, on the left wing. was to push toward the great manufacturing centre of Lodz and help to isolate the Polish forces in the Poznan salient, while covering Reichenau's flank. On the right wing. List was to push for Cracow and simultaneously turn the Poles' Carpathian flank, using an armoured corps to drive through the mountain passes. The decisive stroke, however, was to be delivered by Reichenau, in the centre, and for that purpose he was given the bulk of the armoured forces.

The success of the invasion was helped by the way the Polish leaders, despising the defensive, had devoted little effort to the construction of defenses, preferring to rely on counterattacks—which they believed their army, despite its lack of machines, could effectively execute. Thus, the mechanized invaders had little difficulty in finding and penetrating open avenues of advance, while most of the Polish counterattacks broke down under the combined effect of a repulse to their forward movement and a deepening German threat to their own rear. By Sept. 3, when Britain and France entered the war, Kluge's advance had cut the corridor and reached the lower Vistula, while Küchler's pressure from East Prussia toward the Narew was developing. What was more important, Reichenau's armoured forces had penetrated to the Warta and forced the crossings there. Meanwhile, List's army was converging from both flanks on Cracow, forcing Gen. Antoni Szylling's army in that sector to abandon the city and fall back to the line of the Nida and the Dunajec.

By Sept. 4 Reichenau's spearheads had reached and crossed the Pilica, 50 mi. beyond the frontier. Two days later his left wing was well in the rear of Lodz, after capturing Tomaszow, and his right wing had driven into Kielce. Thus, the Polish Gen Juliusz Rommel's army, covering the Lodz sector, was outflanked, while Gen. Stanislaw Kutrzeba's army was still far forward near Poznan and in danger of being isolated. The other German armies had all made progress in fulfilling their parts in the great enveloping manoeuvre planned by Gen. Franz Halder, the chief of the general staff, and directed by Gen. (later Field Marshal) Walther von Brauchitsch, the commander in chief. The Polish armies were splitting up into unco-ordinated fractions; some of which were retreating while others were delivering disjointed attacks on the nearest German columns.

The German advance might have travelled still faster but for a lingering conventional tendency to check the mobile forces from driving far ahead of the infantry masses that were backing them up. But as newly gained experience showed that such a risk was offset by the opponents' confusion, a bolder course was pursued. Exploiting an open gap between Lodz and the Pilica, one of Reichenau's armoured corps raced through to the outskirts of Warsaw on Sept. 8; it had covered 140 mi. in the first week. By the following day the light divisions on his right wing reached the Vistula farther south, between Warsaw and Sandomierz. They then turned northward. Meanwhile, near the Carpathians, List's mobile forces had swept across the Dunajec, Biala, Wisloka and Wislok in turn, to the San on either flank of the famous fortress of Przemysl. In the north, Guderian's armoured corps (the spearhead of Kiichler's army) had pushed across the Narew and was attacking the line of the Bug, in the rear of Warsaw. Thus, a wider pincer movement was strongly developing outside the inner pincers that were closing on the Polish forces in the bend of the Vistula west of Warsaw.

On Sept. 10 Marshal Smigly-Rydz issued orders for a general retreat into southeastern Poland, where Gen. Kazimierz Sosnkowski was placed in charge, with the idea of organizing a defensive position on a relatively narrow front for prolonged resistance. But this was now a vain hope. While the big encirclement west of the Vistula was being tightened, the Germans were now penetrating deeply into the area east of the Vistula. Moreover. they had turned both the line of the Bug in the north and the line of the San in the south. Guderian drove southward in a wide outflanking thrust to Brzesc-nad-Bugiem (Brest-Litovsk). On the southern front Gen. (later Field Marshal) Paul von Kleist's armoured corps reached Lwow on Sept. 12. There the Germans were checked by Sosnkowski, but they spread northward to meet Kiichler's forces. Although the invading columns were feeling the strain of their deep advances and were running short of fuel, the Polish command system was so badly dislocated that it could not profit either by the Germans' temporary slackening or by the stubbornness that many isolated bodies of Polish troops still showed. These dissipated their energy in random efforts while the Germans were completing the encirclement.

3. The Russian Invasion. — On Sept. 17 the soviet armies crossed Poland's eastern frontier. That blow in the back sealed the country's fate, for there were scarcely any troops there to oppose this second invasion. Next day the Polish government and high command crossed the Rumanian frontier, the commander in chief sending back a message to tell his troops to fight on. Perhaps it was as well that it did not reach most of them, but many gallantly fulfilled its intention in the days that followed, although their resistance collapsed bit by bit. The garrison of Warsaw held out until Sept. 28, despite heavy bombardment from the air and the ground; the last considerable Polish fragment did not surrender until Oct. 5, and guerrilla resistance continued into the winter. About 80,000 escaped over neutral frontiers. The German and Russian forces had met and greeted each other, as partners, on a line running south from East Prussia past the Narew-Bug line and Przemysl to the Carpathians. That partnership was sealed, but not cemented, by the mutual partition of Poland.

B. THE RUSSO-FINNISH WINTER WAR

Following the partition of Poland, the soviet government made haste to underwrite its forward security policy by re-establishing strategic control of the U.S.S.R.'s former buffer territories on the Baltic. By Oct. 10, 1939, Estonia, Latvia and Lithuania were induced to allow soviet forces to garrison key points on their soil. On Oct. 14 similar demands were presented to Finland. Considered from the viewpoint of strategic safeguards — against Hitler's possible use of Finnish territory as a springboard for attack on the U.S.S.R.—they were moderate, and the small cessions of territory required of Finland were to be compensated by the U.S.S.R.'s giving up strips elsewhere. But national sentiment made it hard for the Finns to agree to a settlement on these lines. When they continued to argue the points, the soviet forces invaded their country on Nov. 30.

1. Early Finnish Successes. — The original advance ended in a check that astonished the world. A direct push from Leningrad up the Karelian isthmus came to a halt in the forward layers of the Mannerheim line.

An advance near Lake Ladoga did not progress. At the other end of the front the Russians cut off the small port of Petsamo on the Arctic ocean, as a means of blocking the entry of help to Finland by that route. Two more immediately menacing thrusts mere delivered across the waist of Finland. The more northerly thrust penetrated past Salla to Kemijärvi, halfway to the Gulf of Bothnia, before it was driven back by the counterattack of a Finnish division which had been switched up by rail from the south. The southerly thrust. past Suomussalmi, was interrupted in turn by a counterstroke, early in Jan. 1940. Circling round the invaders' flanks, the Finns blocked their line of supply and retreat, waited until their troops were exhausted by cold and hunger, then attacked and broke them up.

Sympathy with Finland as a fresh victim of aggression had rapidly developed into enthusiasm at the apparent success of the weak in repulsing the strong. This impression had far-reaching repercussions. It prompted the French and British governments to consider the dispatch of an expeditionary force to this new theatre of war with the object not only of aiding Finland but also of securing the Swedish iron mines at Gallivare from which Germany drew supplies, while establishing themselves in a position that threatened Germany's Baltic flank. Partly because of the objections raised by Norway and Sweden. this project did not materialize before Finland collapsed. France and Britain were thus spared entanglement in war with the U.S.S.R. as well as uith Germany at a time when their own powers of defense were perilously weak. But the obvious threat of an Allied move into Scandinavia precipitated Hitler's decision to forestall it by occupying Norway. Another effect of Finland's early successes was that it reinforced the tendency in western quarters to underrate the soviet military strength. The general view was epitomized in Winston Churchill's broadcast assertion of Jan. 20, 1940, that Finland "had exposed, for the world to see, the military incapacity of the Red army." His misjudgment was to some extent shared by Hitler—with momentous consequences the following year.

More dispassionate examination of the campaign, however, provided better reasons for the ineffectiveness of the original advance. There was no sign of proper preparation to mount a powerful offensive, furnished with large stocks of munitions and equipment. There were clear signs that the soviet authorities had been misled by their sources of information about the situation in Finland, and that, instead of reckoning on serious resistance, they imagined that they might have to do no more than back up a rising of the Finnish people against an unpopular government. The country cramped an invader at every turn, being full of natural obstacles that narrowed the avenues of approach and helped the defense. Between Lake Ladoga and the Arctic ocean the frontier appeared very wide on the map but in reality was a tangle of lakes and forests, ideal for laying traps as well as for stubborn resistance. Moreover, on the soviet side of the frontier the rail communications consisted of the solitary line from Leningrad to Murmansk, which in its goo-mi. stretch had only one branch leading to the Finnish frontier. This limitation was reflected in the fact that the "waistline" thrusts which sounded so formidable in the highly coloured reports from Finland were made with only one division apiece, while only two were employed in the outflanking manoeuvre north of Ladoga.

2. Mannerheim Line Crushed. — Much the best approach to Finland was through the Karelian isthmus, but this was blocked by the Mannerheim line, while the Finns' six active divisions were concentrated there at the outset. The Russian thrusts farther north, though they fared badly, served the purpose of drawing part of the Finnish reserves thither while thorough preparations were being made, and 14 divisions brought up, for a serious attack on the Mannerheim line. This was launched on Feb. 1, under the direction of Gen. Kiril A. Meretskov. Its weight was concentrated on a 10-mi. sector near Summa, which was pounded by a tremendous artillery bombardment. As the fortifications were pulverized, tanks and sledge-carried infantry advanced to occupy the ground, while the soviet air force broke up attempted countermoves. After little more than a fortnight of this methodical process a breach was made through the whole depth of the Mannerheim line. The attackers then wheeled outward to corner the

Finnish forces on either flank, before pushing on to Viipuri (Viborg). A wider flanking operation was carried out across the frozen Gulf of Finland by troops who advanced from the icebound island of Hogland and landed well in the rear of Viipuri. Although an obstinate defense was still maintained for several weeks in front of Viipuri, Finland's limited forces had been worn down in the effort to hold the Karelian isthmus. Once a passage was forced, and their communications menaced, eventual collapse was certain. Capitulation was the only way in which it could be averted, since the proffered Anglo-French expeditionary force had not arrived, though almost ready to sail.

On March 6, 1940, the Finnish government sent a delegation to negotiate peace. Beyond the earlier soviet conditions, Finland was now asked to cede areas in the communes of Salla and Kunsamo, and also the Finnish part of the Fisher peninsula. They were also asked to build a railroad from Kemijarvi to the frontier (which was not yet established). On March 13 it was announced that the Soviet terms had been accepted. (B. H. L. H.)

C. GERMAN CAMPAIGNS IN DENMARK AND NORWAY

The German conquest of Norway and Denmark was the first of Hitler's aggressions which was not long premeditated. Reluctantly, he was induced to embark upon it. The chief instigator probably was the commander in chief of the navy, Grand Adm. Erich Raeder, who first broached the problem to Hitler on Oct. 10, 1939. Various intelligence reports indicated British designs on Norway and Raeder held that enemy control of that country was synonymous with the loss of the war. Sweden would fall completely under enemy influence; the supply of Swedish ore, on which the German war economy was so dependent, would be cut off. The danger appeared aggravated by the Russo-Finnish war; the British might get a foothold in Norway as a result of giving aid to Finland. Vidkun Quisling visited Germany and conferred with Raeder on Dec. 11. 1939. He advised Raeder that there was imminent danger of Britain's gaining a foothold in Norway and expressed the view that the National party. which he represented, desired to anticipate any possible British step in this direction by placing the necessary bases at the disposal of the German armed forces. The next day Raeder obtained Hitler's approval of the proposal that the armed forces high command be permitted to make plans with Quisling for preparing and executing the occupation either by friendly methods, *i.e.,* the German *Wehrmacht* called in by Nonvay, or force.

Admiral Raeder envisaged certain military advantages accruing to Germany as a result of gaining Norwegian bases but he was quite aware that the occupation would be accompanied with extremely great risk for the navy in view of the heavy superiority of British sea power. Consequently he continued to hold that the maintenance of Norway's neutrality was the best solution but under no circumstances must Nonvay fall into British hands. Hitler was in agreement with this view. But in early 1940 signs and even overt acts appeared to force his hand. On Feb. 16 the British destroyer "Cossack," on orders from the admiralty, pushed up Josing fjord and forced the German tanker "Altmark," which had taken refuge in Norwegian territorial waters, to hand over about 300 prisoners. Since the Norwegian torpedo boats present on that occasion did not intervene, the Germans concluded that Norwegian territorial waters would henceforth not afford sure protection for German shipping and that Norway probably would not contest further overt acts on the part of the British, and they hoped this might also apply in the event of a German occupation. The British attack on the "Altmark" infuriated Hitler and it is likely that he then made the decision to execute the planned undertaking. On Feb. 21 Hitler appointed Gen. Nikolaus von Falkenhorst head of the planning and operations staff for *Weserübung,* the code name for the operation, and the future commander in chief of the army of occupation in Norway. On March 1 Hitler issued his top secret directive for implementing *Weserübung*, but no date of execution was set. Finland's capitulation to the U.S.S.R. on March 13 temporarily eased the situation but not for long. Intelligence reports gave the Germans definite reason to believe that the western powers were contemplating action against Scandinavia and incidents of German shipping being molested by British forces in Norwegian territorial waters multiplied. Yet on March 26 Raeder advised Hitler that in his opinion "the danger of a British landing in Norway is no longer acute" but "sooner or later Germany will be faced with the necessity of carrying out operation *Weserübung*. Therefore it is advisable to do so as soon as possible, by April 15 at the latest, since after that date the nights are too short; there will be a new moon on April 7." Hitler agreed to the operation on X-day, around the period of the new moon. On April 2 D-day was ordered for April 9 with the time for landing at 5:15 A.M.

When the Germans later captured the French archives they found evidence of how narrowly they had forestalled the Allies in the race for Norway. These documents showed that: (1) the Allied supreme council in Paris on Feb. 5 had determined to prepare French-British forces in Great Britain for transport to Norway; (2) on Feb. 6 the British foreign minister had informed the Norwegian minister in London that Great Britain wished to have certain bases on the Norwegian coast "in order to interrupt the German ore transport from Narvik"; (3) the Allied plans had projected aid to Finland, seizure of the Swedish iron-ore mines at Gallivare and occupation of the northern ports. Even though peace had meanwhile been concluded between the U.S.S.R. and Finland, the final decision to undertake Operation "Scandinavia" was made on March 28; the departure date of the first transports was set for April 5. At the last minute the sailing of the transports was postponed to April 8. Therewith the Allies had lost the "race for Norway." German naval forces were then under way for all those places which the Allies had selected for their landings.

German Invasion.—The landing places for the blitz occupation and the forces assigned to each were as follows: Narvik, battleships "Scharnhorst," "Gneisenau" and 10 destroyers, the latter with 2,000 landing troops; Trondheim, cruiser "Hipper" and 4 destroyers with 1,700 landing troops; Bergen, cruisers "Koln," "Konigsberg," "Bremse," 2 torpedo boats and torpedo motorboat flotilla I with 1,900 landing troops; Kristiansand and Arendal, cruiser "Karlsruhe," 3 torpedo boats and torpedo motorboat flotilla II with 1,100 landing troops; Oslo, cruisers "Blucher," "Liitzow," "Emden" and 3 torpedo boats with 2,000 landing troops; Egersund, 4 mine sweepers with 150 landing troops. Since the loading capacity of the warships was very limited, the heavy weapons, equipment and ammunition had to be loaded in transports scheduled to arrive simultaneously at the ports of destination. They had to be sailed ahead of the warships because of their slower speed. Stavanger was occupied solely by air-borne troops on the morning of April 9. The German air force assisted in the capture of Oslo, Kristiansand and Bergen with parachute and air-borne troops. The invasion of Denmark proceeded apace with Norway; the former had to be occupied to safeguard the lines of supply by sea and by air and to provide air bases for the operations to the north. Little Denmark fell with little resistance being offered; the country was hardly defensible against a powerful attack with modern weapons.

The navy had to carry the fight to capture the Norwegian ports with strong assistance from the air force. At 9:48 A.M., and again at 2:25 P.M., April 7, the combined Narvik-Trondheim task forces were sighted and reported by British air reconnaissance. The royal air force made an unsuccessful attack on the German force before the weather closed in. The British high command recognized that a German naval operation to the northward was in progress and certain important decisions were made. Britain's own landing operation was abandoned, the troops then on board were disembarked and all measures were geared to the interception of the German force. On the evening of April 7 the British home fleet under Adm. Sir Charles Forbes put to sea. At 8:20 A.M., April 8, the first action between German and British naval forces took place north of the Bergen-Shetland Islands line. The British destroyer "Glowworm," which had lost contact with its force in heavy weather, ran into the destroyer "Bernd Von Arnim" and the cruiser "Hipper" and was sunk by gunfire. At 2:20 P.M. the former Polish submarine "Orzel" sank the transport "Rio De Janeiro" loaded with troops for Bergen. It was a disastrous blow, for the landing of the survivors and the dead in German army uniform necessarily revealed the German intentions and gave warning to the Norwegians. Upon arrival off Vest fjord, the ten Narvik destroyers were detached and, by a lucky circumstance, they found the approach to Narvik unguarded by the British. However, the Norwegian armoured coastal ships "Eidsvold" and "Norge" engaged them at short range until both were sunk by torpedo fire. The commander of the landing troops, Maj. Gen. Eduard Dietl, took over the town without resistance from the Norwegian Col. Konrad Sundlo, one of Quisling's friends. The Bergen group was fired on by coastal batteries; the "Konigsberg" took three hits and the "Bremse" one. The debarkation of troops was accomplished without interference. British planes attacked the "Königsberg" at Bergen on April 10 and scored two direct hits; the ship burned out and capsized. Trondheim, Kristiansand, Arendal and Egersund were occupied with little or no resistance. At Oslo, however, the navy was stopped. In attempting to pass the strongly fortified narrows leading to Oslo, the van ship, the heavy cruiser "Blucher," was only from 500 to 600 yd. away when the coastal batteries opened fire. Within a few moments the ship took two 11-in. hits, at least twenty 5.9-in. hits and finally two torpedoes irom a shore torpedo battery. Fires within the ship touched off a magazine explosion; it capsized and sank. The "Liitzow," steaming astern of the "Blücher," also received three hits but the fighting effectiveness of the ship was not seriously impaired. The attempt to iorce the narrows was then abandoned; the troops were landed outside and the capitulation of the fortifications was acconiplished the same day by a combined land, sea and air attack. Meanwhile Oslo itself had been taken by the air iorce; Fornebu airfield had been seized by parachute troops during the morning; at noon six companies oi air-borne troops landed there and occupied important points of the city. The political situation was confused; Quisling got nowhere in getting Piorwegian support to form a new government, while the king and the government leaders fled to the northward with a view to rallying resistance. Meanwhile, the German air force had been busy operating against the British naval forces off the Norwegian west coast. Though the damage inflicted did not come up to German expectations and was in fact much below the claims made by the attacking planes, nevertheless the deterrent effect on British operations was great. Actually, the German planes sank only one ship, the destroyer "Gurkha," scored one hit on the battleship "Rodney," and near misses inflicted light damage to the cruisers "Southampton" and "Glasgow."

In faraway Narvik, beyond the effective reach of the German air force, the British navy reacted speedily. During the early morning of April 10 the Germans were taken completely by surprise when the shells and torpedoes of five British destroyers suddenly rocked the harbour. A mutually damaging action was fought but in the balance the loss was definitely German. What was left of the German naval iorce at Narvik was finished off on April 13, when the British struck again with the battleship "Warspite" and nine destroyers. The loss of ten destroyers was a staggering blow to Germany, but the addition of more than 2,000 men irom their crews was a welcome accretion to General Dietl's defenses.

Allied Landings in Norway.— Speed was particularly important ior the Allied counterattack to retake at least central and northern Norway before the Germans could reinforce and consolidate their positions. The transports and troops for their own landing operations were readily available, but it was not until April 12 that the first convoy sailed from the Clyde. It was decided to retake Trondheim and Narvik but, since their troops were equipped ior only an unopposed landing, a direct attack could not be considered. It was decided to capture Trondheim by a pincer attack commanded by Lt. Gen H. R. S. Massy; north arm irom Namsós with about 6,000 men under Maj. Gen. Sir Adrian Carton de Wiart; south arm from Andalsnes with about 6,000 men under Maj. Gen. Sir Bernard Paget. The prospects looked good since the Germans had landed only 1,700 troops at Trondheim. The German air force had not been able to prevent the Allied landings but it did hit hard and continuously in the subsequent operations. Carton de Wiart's forces moved south slowly, plagued by deep snow, smaii enemy detachments and especially by enemy air attacks, to Steinkjer and then were iorced to retreat. Carton de Wiart suggested evacuation and this was done shortly thereafter. Paget's iorces reached Dombas in the Gudbrand valley on April 19 but, instead of being able to wheel north on Trondheim, they had to iace the German vanguard pushing north irom Oslo, while being threatened in the rear by the Trondheim occupation force. If the *Luftwaffe* could have been checked, the Allies might have held on but their own air support was lacking. Evacuation was directed and in the first days oi May the last Allied troops in the Trondheim area were re-embarked. At this time Allied troops were landed at Mosjoen, Mo and Bodo in order to block the movement of German troops to the relief of Narvik. However, these iorces slowed General Feuerstein less than did the difficult mountainous terrain. On May 11 and 18 he took Mosjoen and Mo respectively; the British withdrew to their principal base at Bodo, where they held on to the end of the month.

Narvik Episode.—To recapture Narvik, the British landed at Harstad and Salangen on Vaags fjord. The operation began on April 14 and the Allied forces were built up until they finally numbered about 24,000. When the attempt to capture Trondheim was abandoned, it was decided to hold iast at Narvik where British sea power was in firm control of the line of supply and where the Germans were cut off irom support. Progress had been slow, for General Dietl with his 2,000 mountain troops plus more than 2,000 sailors skiliully fought a defensive action. On May 24 the Allies decided to liquidate the whole Norwegian undertaking; the Germans had meanwhile driven deep into France and it appeared advisable to draw in their scattered forces. However, the plans ior a concentric attack on Narvik were so far advanced that it appeared desirable to capture that port prior to the evacuation. By the evening of May 28 the Allies had uncontested control; General Dietl withdrew into the mountains east of Narvik. The Allies pressed in pursuit and enveloped the flanks; the situation was becoming more difficult ior the Germans from day to day. In the first week of June, however, the Allies began their evacuation. On June 8 Dietl reported to the German high command that Narvik had again been occupied by his own so recently hard-pressed troops. The next day the Norwegian iorces also ceased hostilities; the king and government left Norway for England. On June 8 the Germans scored a naval victory over the Rritish naval forces off northern Norway. The battleships "Scharnnorst" and "Gneisenau" nad been sent north in an attempt to relieve the situation at Narvik. The Germans took a final thrust at the withdrawing foe, sinking the aircrait carrier "Glorious," the auxiliary cruiser "Orama" and the tanker "Oil Pioneer," while "Scharnhorst" took a torpedo hit from a destroyer.

Evaluation.—The surprise attack on Norway mas the first great combined operation of army, navy and air force. Norway, however, should have been a more difficult operation ior the Germans No order for mobilization was given until the iateiul night of April 8–9, despite the warnings irom the Norwegian minister in Berlin and urgings from the chief of the general staff. The German navy never recovered irom the heavy sacrifices made in the landing operations. It had numerous other losses, but the loss of the ten Narvik destroyers alone represented exactly half of the German strength in this type.

The Franco-British counterblow was ill-starred from the beginning because it was undertaken with inadequate iorces and underestimation of the German potentialities. The counterattack had prospects of success only ii the line of supply from Germany to Norway had been promptly and effectively cut. This was not done. Allied submarines pinpricked the main line of supply on the waters from Germany to Oslo but only large means could avail in this situation; *i.e.,* the extension of British naval supremacy into the Skagerrak and Cattegat. The German air force would have exacted a price and the British high command must have considered the probable price too high. This represented a new development in sea power; with the advent of air power, conditions had developed which made it possible to overcome enemy naval superiority in limited waters without a fleet of equal strength.

Had Germany bided its time and allowed the Allies to move into Norway first, it would have been saved the stigma of an attack on a neutral nation. To deiend their positions in Norway would have cost the Allies dearly; the Germans would have had control of the long arm of the lever since they could have taken immediate counteraction via Denmark and southern Sweden. In view of German air superiority it would have been extremely difficult for the Allies to supply their iorces in Norway. Moreover, had the Allies gone into Norway on their own initiative, it would have been a matter of national prestige to hold their ground there, and more and more blood and treasure would have been expended. (R. E. K.)

D. THE WESTERN FRONT, FIRST PHASE

1. The "Phony War."—When the Germans invaded Poland on Sept. 1, 1939, they left only 23 divisions in the west. The French mobilized nearly five times as many divisions. The German generals themselves felt that their western front was dangerously underinsured, but they could see no way of increasing the insurance without forfeiting their chance of a quick victory over Poland. Their anxiety proved excessive. The French had hardly dented the foremost layers of the defense before the Germans had overrun Poland and returned in force to the nest. The French advance was confined to the 100-mi. stretch of the common Franco-German frontier between the Rhine and the Luxembourg border, and any pressure was limited to narrow sectors of this stretch. At the end of the month. following the collapse of Poland, the French command decided to withdraw its divisions to the shelter of its own Maginot line. Then stagnation settled on the western front for the next seven months.

The German command felt that the French had never seriously tried to attack and had thereby let slip a great opportunity. The first assumption was true; the second more doubtful. The French army was a ponderous machine, with a tactical doctrine to match, and thus had little capacity for rapid action. Even if the French army had been fitted for manoeuvre, room for manoeuvre was lacking as long as Belgium remained neutral. On Sept. 1 Gen. Maurice Gamelin, the French commander in chief, addressed a memorandum to his government which argued that the only way of success would lie in "extending our front of attack" from the Moselle to Maastricht, for an advance through Belgium and Dutch territory to the lower Rhine. If Belgium and the Netherlands would not agree to this. and the French government was unwilling to override their neutrality, the prospect was dim. As this wider alternative was ruled out, Gamelin did not see any point in courting heavy loss and wearing down the French army's morale by pressing the attack on the Rhine-Moselle sector.

While Germany clearly benefited from the neutrality of Belgium and the Netherlands at this stage of the war, it was doubtful whether the alternative that Gamelin desired would have made any important difference to the fate of Poland. For the mobilization of the French army was not completed until Sept. 20, and the leading British army corps arrived at the front only in the first week of October, whereas most of Poland was overrun by the third week of September. But the prospects of subsequent resistance to a German offensive in the west might have been greater if the French armies had been permitted to advance into Belgium in Septeniber. The situation was radically changed with the collapse of Poland. The scales of forces in the west now tilted heavily to the German side, and the primary problem of the French was to assure their own defense. In these different circumstances, however, they still favoured the idea of an advance into Belgium, even if it could be carried out only after a German invasion of Belgium. That was a more questionable decision. Their o n army was not well fitted to execute such a racing manoeuvre and establish itself firmly on a fresh line at short notice.

The widespread view that the French leaders were too defensive minded is a fallacy. During the months that followed the fall of Poland, Gamelin showed a hankering for the offensive and mooted various provocative moves to threaten Germany's flanks, even though he had to admit that the means were lacking. That urge to do something, however unpromising the chances, was stimulated by political criticism of Gamelin's "caution," particularly from Paul Reynaud, whose cry for bold and early action brought him growing political influence, as usually happens in a democracy at war. The pressure of such tendencies could be traced in the development of the French plan to meet a German invasion of Belgium. The first idea was that the two armies on the extreme left, the French 7th army and the British, should advance a short distance across the frontier and occupy a position along the Escaut river as far as Ghent, there linking up with the Belgian army, which was expected to fall back on the line Antwerp-Ghent. This was extended by November into plan D, which embraced a 60-mi. advance to the line of the Dyle, east of Brussels, and a general wheel forward of the French left centre to correspond. In March a third development in the plan gave it a still more venturesome turn. The French 7th army was to dash up the Belgian coast past Antwerp into the Netherlands, so that it could not only buttress the joint between the Belgian and Dutch armies, but strike at the flank of the Germans advancing into Belgium.

The plan and the distribution of forces expressed the twin convictions of the French high command. One was that the Germans would make their main effort in the plain of Belgium, north of Namur, as in 1914. The other was that no serious stroke could be delivered south of Namur, through the Ardennes, because of the difficulties presented by that hilly and wooded belt of country. This proved a fatal delusion. Yet if the German offensive had been launched when Hitler intended, in November, Gamelin's plan might well have succeeded in checking it on the Dyle, while at the worst a decisive defeat of the French would have been unlikely. But Hitler's desire was repeatedly postponed by the weather, coupled with the hesitation of his generals. And when at last the German offensive was delivered. six months late, its plan had been so changed as to profit decisively from the nature of the French plan.

The centre of gravity was shifted from Gen. Fedor von Bock's army group B on the right, facing the main plain of Belgium, to Gen. Gerd von Rundstedt's army group A, facing the wooded hill belt of Belgian Luxembourg. The change was suggested by Gen. (later Field Marshal) Erich von Manstein, Rundstedt's chief of staff, who argued that the tank forces could be effectively used in the Ardennes, contrary to orthodox ideas, and that the risk of a check would be less than if they met the main mass of the Allied forces head-on in the centre of Belgium. Manstein's proposal was regarded as too hazardous by the heads of the German army; but its boldness appealed to Hitler, who, in March, secured its adoption. The French advance into Belgium now played into the hands of the Germans in the same way that the French advance of 1914 into Lorraine and the Ardennes had done. It was, however, the employment of fast-moving armoured vehicles, instead of foot-marching infantry masses, that made the vital difference to the result in 1940 compared with 1914.

The period that popular opinion christened the "phony war" was far from being such in reality. It was a period when the Allies were projecting offensive schemes which they lacked the power to execute, and when Hitler was repeatedly mounting an offensive, only to be compelled to defer it, contrary to his desire, but to his advantage.

2. German Conquest of the Low Countries and France.— Following the dramatic success of his April coup in Norway, Hitler became more eager to attempt the deferred stroke in the west. But it was not until May 7, 1940, that the first warning order since January was actually issued. On May 8 Hitler was "very agitated" by reports that the Dutch were accelerating their precautions and might allow the British to reinforce them. The invasion was launched in the early hours of May 10. Under the remodelled plan, Bock's army group B comprised two armies instead of the former three. The 18th army, under Gen. Georg von Kiichler, invaded the Netherlands with the aid of an armoured division and air-borne forces, while the 6th army (Gen. Walter von Reichenau) advanced along the main avenue into Belgium, with the aid of an armoured corps. These two German armies had to deal with the Dutch and Belgian armies, the British expeditionary force (now grown to 13 divisions, of which 9 were available there) and two of the best-equipped French armies. Lacking superiority of numbers there, the Germans depended on surprise and superior skill. Rundstedt's army group A covered the stretch between the middle Meuse (Maas) and the Moselle. It advanced with 46 divisions, of which 7 were armoured, while a further 27 divisions of the general reserve backed it up. Once it had brushed aside the screen of Belgian troops in the Ardennes it had only to deal with two French armies consisting of 12 infantry divisions—half of them low-grade—and 4 horsed cavalry divisions. Against this weak hinge of the Allied wheel forward into Belgium were massed nearly two-thirds of Germany's forces in the west and nearly three-quarters of its armoured punch. Along the Franco-German frontier, between the Moselle and Switzerland, stood Gen. (later Field Marshal) Wilhelm von Leeb's army group C, comprising two armies. Its task mas merely to threaten an attack on the Maginot line and thus pin down the excessively large proportion of the French forces that were arrayed there. For 41 divisions were posted in and behind that well-fortified sector, compared with 39 on the longer sector between the Maginot line and the channel coast, while the larger part of the French general reserve was also on this flank. The responsibility for those fatal dispositions lay more directly with Gen. Alphonse Joseph Georges, the commander in chief of the armies on the northeast front, than with Gamelin. For the moment that danger was obscured by the dramatic opening of the campaign in the Low Countries.

(a) Conquest of the Netherlands.—The Dutch army comprised ten divisions and the equivalent of a further ten in smaller formations. It should thus on paper have had a very good chance of withstanding the German invasion, since its front was covered by successive rivers, while the attacking army comprised only seven divisions, apart from the air-borne forces. But the Dutch had a wide front, very sensitive and densely crowded rear, poor equipment in modem weapons and no experience of modern war. Apart from air superiority, the German offensive depended for its success primarily on the air-borne forces under Gen. Kurt Student. Contrary to popular imagination after the event, these forces were on a small scale. Four parachute battalions were used, together with a regiment of air-transported infantry. to seize the bridges at Moerdyk, Dordrecht and Rotterdam, on the main road artery from the south into the heart of the Netherlands, with the aim of opening the way for the mobile ground forces. One parachute battalion, followed by two air-transported regiments, descended on the airfields around The Hague with the aim of capturing the main government buildings. The attack on the capital did not succeed, though it caused a lot of confusion and thus aided the invader's purpose. But the bridges were captured with very slight loss, and the defense was too disorganized to dislodge the troops who had dropped out of the sky before they were reinforced by forces arriving overland.

While the invasion could hardly have triumphed without this capture of the back door, the air-borne coup would have mattered little if the Dutch front had not broken down at a specially vulnerable spot.

Gen. Hendrik Gerard Winkelman, the Dutch commander in chief, was mainly concerned to cover the direct approach into the heart of the Netherlands. Out of his four army corps, two were massed on the Geld valley position, between the Maas (Meuse) and the Zuider Zee, while another was in reserve behind them. The remaining corps had held the Peel line south of the Maas; but, just before the invasion came, the Dutch command came to the conclusion that it would be safer to concentrate on holding the central part of the Netherlands, covered by the great rivers. So the army corps in the south was withdrawn, leaving the Peel line to be held by a screen composed of lower-grade troops who lacked anti-tank and anti-aircraft guns. Nothing could have been better designed to suit the German aim of bringing quick reinforcement to the air-borne troops near Rotterdam.

On May 10 the Germans penetrated the Peel line. The next day the defenders retreated due west past Tilburg toward Breda, thus leaving a clear road by which the solitary German armoured division could drive northwestward to the Moerdyk bridge. That same afternoon the leading mobile troops of Gen. Henri Giraud's French 7th army reached Tilburg, after a remarkable 140-mi, dash from the French frontier. Disconcerted by the Dutch retreat and German air attack, they fell back on Breda. By May 12 they had been reinforced but made no serious attempt to advance over the farther 10-mi. strip to the Maas and bar the German armoured division's passage to Moerdyk. This reached the outskirts of Rotterdam soon after midday. Meanwhile, the main German forces had spent t o days in closing up to the Geld valley line. On May 12 they made a narrow breach in it. Lacking reserves on the spot for effective counterattack, the Dutch command decided to abandon this line and fall back on the "fortress of Holland" line, just in front of Amsterdam and Utrecht. Its defense was never tested; for by the time the Germans closed up to it, late on May 14, the campaign had been brought to an end.

The Germans had made no progress at Rotterdam on May 13, and their situation there might have again become precarious since it formed a narrow wedge thrust far forward between the Dutch and French forces. But it was difficult for the Dutch to see the situation in such a light. They were more conscious that most of their country had been swiftly overrun and that the roar of German aircraft filled their ears. The queen and the government sailed for England on May 13, leaving the country in charge of General Winkelman. By the next afternoon he had decided to surrender. That decision was produced not only by the blackness of the outlook but by the threat of bombing the cities of Rotterdam and Utrecht if resistance continued. Such action was in accord with the old laws of warfare governing the bombardment of besieged places, since both cities were now in the fighting zone. But its technical legality did not diminish its inhumanity as a means of moral pressure. Rotterdam was actually bombed, through a fault in signal communications, after the Dutch had yielded to the threat. The horror it produced was shown in the way the statement that this bombing, by a mere 30 planes, had killed 30,000 people was credited, and continued to be believed long after bombings oi ten times such a scale had been found to kill only a fraction of the number.

(b) Conquest *of* Belgium, First Phase.—The direct invasion of Belgium was made with stronger forces than were used against the Netherlands, but with only a handful of air-borne troops. Reichenau's 6th army deployed four army corps abreast on the 30-mi. Roermond-Aachen front and also included Gen. Erich Hoeppner's armoured corps. The air-borne troops consisted of a mere 500. To compensate for the shortage, dummy parachutists were dropped over a wide area, thus accounting for the reports that "thousands of parachutists" were descending on the country. At the start of the invasion of the west, the main weight of the German air force, of the dive bombers in particular, was concentrated on the gateway into Belgium, before being switched south to help in the passage of the upper Meuse around Sedan. That concentration of air bombardment was the invaders' biggest asset in gaining an ascendancy over the Belgian defense. The tiny element of air-borne troops, however, counted for almost as much. For it was they who secured the keys to the gate.

The most delicate point of the Belgian forward position lay north of Liege, where the Maastricht "appendix" of Dutch territory protruded between the Belgian and German frontiers, forming an indefensible strip that could mask an approach to the Albert canal, which there formed the Belgian frontier line. The invaders' chances turned on gaining the bridges at that point before they could be blown up, and preventing the guns of Eben Emael, Belgium's most modern fort, from dominating them subsequently. Early on May 10, before it was light, a platoon in gliders landed at the back of each bridge and captured each intact. Other gliders landed on the top of Eben Emael and dropped explosives into the guns and the exits unobserved by the garrison inside—which was thus helplessly imprisoned in its now useless fort. By the morning of May 11 sufficient German troops had accumulated beyond the canal to burst through the Belgian line. The leading armoured division now drove through to the west, while part of the infantry wheeled south and entered Liege from the rear. That evening the Belgian command (King Leopold III, commander in chief; Gen. F. F. O. Michiels, chief of staff) ordered a general withdrawal to the Antwerp-Namur (or Dyle) line, where the leading Allied divisions had just arrived—the French 1st army (under Gen. Georges Blanchard) occupying the sector from Namur to Wavre, the British (under Viscount Gort) occupying the sector from Wavre to Louvain, while the Belgians wheeled back to hold the sector from Louvain to Antwerp.

In view of the imminent collapse of the Belgians' forward position, the French advance to the Dyle line had been accelerated on May 11, and from there Gen. René Prioux's cavalry corps (of two light mechanized divisions) pushed on eastward to meet the Germans. It was too late to check the break-through on the Albert canal, but it helped to cover the Belgians' retreat from Liege. Falling back by stages, Prioux checked a series of German tank thrusts on May 12–13. During the second night his corps withdrew to an anti-tank obstacle a few miles in front of the main position. On May 14 the Germans made a powerful effort to break through in the direction of Gembloux, and a big tank battle developed. Although Prioux prevented a complete break-through, his corps was so badly mauled by the afternoon that it had to be withdrawn to reorganize behind the main position, which mas now solidly occupied by the rest of the 1st army. When the Germans attacked the next morning, they were checked. Immediately afterward, Hoeppner's armoured corps was sent south to join Rundstedt's army group. Its disappearance appeared to increase the French prospects of holding this end of the Dyle line, while no pressure at all had yet developed on the British sector. But on the evening of May 15 Gamelin ordered its abandonment. For by then Rundstedt's armoured forces, which had crossed the Meuse at Sedan on May 13, were driving deep into France. It had now become a question for the Allies, not whether they could hold out in Belgium, but whether they could escape being cut off there.

(c) Thrust into France.—The break-through from the Ardennes across the Meuse turned more on the approach march than on the battle. The passage of such great forces through such a difficult belt of country as the Ardennes was an amazing feat of staff work. Rundstedt's army group comprised, from right to left, the 4th army (Gen. Gunther von Kluge), the 12th army (Gen. Siegmund List) and the 16th army (Gen., later Field Marshal, Ernst Busch), while the 2nd army (Gen., later Field Marshal, Maximilian von Weichs) was in reserve. But its thrust was provided by two armoured groups: a large one under Gen. Paul von Kleist and a smaller one under Gen. Hermann Hoth. Guderian was put in charge of Kleist's principal spearhead, and delivered the decisive thrust, at Sedan. The solution of the approach march problem was both bold and ingenious. While the armoured divisions used such roads as were available through that hilly and wooded belt, infantry divisions started alongside them by using field paths and marched so fast across country that the leading ones reached the Meuse only a day after the armoured divisions.

Early on May 10 Kleist's leading troops crossed the frontier of Luxembourg, where they met only road obstructions. In three hours they reached the frontier of Belgian Luxembourg, 30 mi. beyond. There they found bridges blown up and met opposition, first from the Belgian *chasseurs ardennais* and then from French horsed cavalry. The French paid forfeit for pushing old-fashioned cavalry divisions deep into the Ardennes in face of armoured divisions. By the next evening they were driven back across the Semois in disorder and had suffered such losses as to ease the Germans' task in forcing the difficult passage of that river. Georges now ordered reinforcements to that sector, but their arrival was too slow to match the German rate of movement.

By the evening of May 12 the Germans were across the French frontier and overlooking the Meuse. The blow was about to fall not only on the hinge of the French advance into Belgium but on the joint between two armies: Gen. Charles Huntziger's and army and Gen. André Corap's 9th. Huntziger's left wing, from Sedan eastward, was composed of two reserve divisions of oldish men. Corap's right wing, west of Sedan, was of similar composition. The defenses were rudimentary; it was the least-fortified stretch of the whole French front. Worse still, they had hardly any anti-tank guns and no anti-aircraft artillery. Such was the measure of the trust placed in the unlikelihood of an armoured thrust through the Ardennes.

On May 13 Kleist's forces achieved a threefold crossing—by Guderian's corps at two points near Sedan, and by Gen. Georg Hans Reinhardt's corps at Monthermé. At Sedan, wave after wave of dive bombers swooped on the defenders of the south bank. These could not stand the nerve-racking strain, and the German troops were able to push across the river in rubber boats and on rafts. The tremendous air bombardment was the decisive factor in the crossings A thousand aircraft supported Kleist's forces while only a few French aircraft intervened in a gallant but hopeless effort to aid their troops on the ground. Next day, after the tanks had been brought across, Guderian widened the Sedan bridgehead and beat off French counterattacks. On May 15 he broke through the defenses into open country, turning westward in the direction of the channel coast. On May 16 he swept on west for nearly 50 mi. His superiors tried to put on the brake, feeling that such rapid progress was hazardous. But the pace of the drive upset the French far more, and their collapse spread as Reinhardt's corps joined in the pressure.

There was no "battle of the bulge," such as was vividly described in the Allied reports at the time. It was a procession in quick time along an almost empty corridor behind the backs of the Allied armies in Belgium. Meanwhile, further crossings had been made to the west, between Givet and Namur—one by Maj. Gen. (later Field Marshal) Erwin Rommel's armoured division. Thus, the breach had widened to 60 mi., and any French positions remaining had become mere islets lapped and left behind by the waves of the armoured torrent that was now sweeping through the corridor between the Sambre and the Aisne. Giraud had been sent to replace Corap and reinforcements followed. But there again the measures were inadequate and taken too late. When he arrived, on May 15, he drew up a plan for a counteroffensive to block the corridor on a line 25 mi. W. of the Meuse. But a day later he found that the forces were not available, while the Germans had advanced in strength far beyond their line. So he now decided to withdraw to the line of the Oise, 30 mi. farther back, and block the Germans there. Once again he was too late, for the German armoured divisions outran his retreating troops and were across that barrier on May 17. Even if the French had been able to mount a counter-offensive. they would not have found it easy to crush the invaders' flank. For Kleist's southern flank was progressively lined by his motorized divisions, which in turn were relieved by the infantry corps that were marching on as fast as possible. This lining of the Aisne had an important indirect effect, by playing on the most instinctive fear of the French. For on May 15 Gamelin received an alarming report that the Germans were crossing the Aisne between Rethel and Laon. He told the government that he had no reserves between that sector and Paris and that he could not guarantee the security of the capital for more than a day. After Gamelin's startling message the French premier. Reynaud. hastily decided to evacuate the government from Paris to Tours. By evening more reassuring reports came from the Aisne, and Reynaud went to the radio to broadcast a denial of "the most absurd rumours that the government is preparing to leave Paris." At the same time he seized the opportunity to replace Gamelin, and for that purpose summoned Gen. Maxime Weygand from Syria. Weygand did not arrive until May 19, and thus for three critical days the supreme command was in a state of mental, though not actual, suspense.

While the Allied statesmen, like their peoples, were still dreaming of an attack that should cut off the "bulge," the German armoured forces raced on to the sea and cut off the Allied forces in Belgium. The remaining obstacles that could have blocked the tanks were not manned in time on an adequate plan. After crossing the Oise on May 17, Guderian's advanced troops reached Amiens two days later. On May 20 they swept on and reached Abbeville, thus blocking all communications between north and south. By the next day the motorized divisions had taken over the line of the Somme from Péronne to Abbeville, forming a defensive flank barricade. Guderian's corps then turned north up the coast in a drive for Calais and Dunkirk on May 22, while Reinhardt's, swinging south of the British rear position at Arras, headed for the same objective—the last escape port that remained open for the British.

(d) Conquest of Belgium, Final Phase.--After abandoning the Dyle line on May 16 the Allied armies in Belgium had wheeled back to the line of the Escaut (or Scheldt). By the time they arrived there, the position had been undermined by the cutting of their communications. On May 19 Gort began to consider the necessity of evacuating the British expeditionary force by sea, and the preparatory steps entailed. Next day, however, orders came from the cabinet that the B.E.F. was to march south on Amiens. Gort argued that such a long-range drive in reverse was not practicable, either tactically or administratively. All he could manage was an attack by two divisions, which had just been rushed south to Arras for the purpose, led by a brigade of infantry tanks, the only armoured troops he had. When this riposte was launched on May 21. it comprised no more than two tank battalions backed by two infantry battalions, while elements of one French light mechanized division covered its flanks. Nevertheless, this small drive into the corridor momentarily shook the nerve of the German higher command. The effect showed that if two or three armoured divisions had been available for a concentrated counterstroke, the German advance might have been dislocated.

After this flash in the pan the Allied armies in the north made no further effort to break out of the trap, while the belated relieving push from the south was so feeble as to be almost farcical. The prevailing confusion was increased by Weygand's arrival to take over supreme command. This veteran of 1914–18 was better in expounding theory than in grasping reality, and even his theory was out of date. His grandiloquent orders had no more chance of being translated into practical terms than those of Reynaud and Churchill. While the governments and commanders got into a tangle of divergent views and orders, the cut-off armies in the north fell back on a slant closer to the coast under increasing pressure from Reichenau's advance through Belgium. More dangerous still was the backdoor approach of Guderian, whose armoured forces were sweeping north past Boulogne and Calais. So three of Gort's divisions were pulled out of the front and sent south to strengthen the line of canals that covered Dunkirk and the Allies' rear. Two more were allotted for Weygand's renewed project of a Franco-British drive down into the German corridor. But then the Belgians' extended right flank, adjoining the British, gave way under Reichenau's pressure; so these two divisions were rushed north again. By the time they arrived, on May 27, the Belgian centre had cracked. and there were no reserves to fill this fresh gap. With their country overrun and their backs to the sea, in a small strip cronded with refugees, the Belgians were driven to sue for an armistice that evening; and the cease-fire was sounded early next morning.

Even before the Belgian capitulation, the British government had decided to evacuate the B.E.F. by sea from Dunkirk, and the admiralty had been collecting every kind of small craft to help in taking away the troops. The retreat to the coast now became a race to re-embark before the German pincers closed. As many of the troops had to be taken off from the beaches, it was a slow and difficult process, extending from May 26 to June 3. In the end 233,039 British troops were taken away, as well as 112,546 Allied troops, mainly French, though most of the equipment had to be left behind. The evacuation could not have been achieved but for the air cover provided by fighter aircraft from the English coast, the indomitable efforts of the seacraft and the good discipline of the troops. It was Hitler, however, who did most to make their escape possible. For the German armoured forces had reached and crossed the canal defense line close to Dunkirk as early as May 23, when the bulk of the B.E.F. was still far distant from the port. But they were halted by Hitler's order on May 24, and actually pulled back to the canal line, just as Guderian was expecting to drive into Dunkirk.

That "miraculous" intervention, which brought salvation to the British, was prompted by several factors. Kleist and Kluge contributed to it by the anxiety they expressed about the British tank counterattack at Arras and by overestimating its scale. Rundstedt contributed by the way he impressed on Hitler the need to conserve the armoured divisions for the next stage of the offensive. Goring contributed by insisting that the Luftwaffe could deliver the coup de *grâce* at Dunkirk and prevent any escape by sea. Hitler himself was greatly influenced by his memories of marshy Flanders in World War I, and thus became needlessly fearful of his tanks' becoming bogged if they drove any further north. But some of his generals who talked with him felt that his halt order was also the result of a belief that Britain would be more willing to make peace if its pride was not wounded by seeing its army surrender.

'Three days passed before Brauchitsch, the army's commander in chief: persuaded Hitler to withdraw his veto and allow the armoured forces to advance. But they now met stronger opposition, and almost immediately Hitler stopped them again, ordering them to move south ready for the attack on the Somme-Aisne line. Reichenau's army followed, leaving Küchler's to clear up things in the north, where more than 1,000,000 prisoners had been taken in the three weeks' campaign, at a cost of 60,000 German casualties.

(e) Collapse of France. — The new French front along the Somme and the Aisne was longer than the original one! while the forces available to hold it were much diminished. The French had lost 30 of their own divisions in the first stage of the campaign, besides the help of their Allies. (Only two British divisions remained in France, though two more that were not fully trained were now sent over.) In all, Weygand had collected 49 divisions to cover the new front, leaving 17 to hold the Maginot line. The Germans, by contrast. had brought their 10 armoured divisions up to strength again with relays of fresh tanks, while their 130 infantry divisions were almost untouched. For the new offensive the forces were redistributed, two fresh armies (2nd and 9th) being inserted to increase the weight along the Aisne sector (between the Oise and the Meuse) ; Guderian was given command of a group of two armoured corps that were moved to lie up in readiness there. Kleist was left with two corps, to strike from the bridgeheads over the Somme at Amiens and Péronne respectively, in a pincer move aimed to converge on the lower reach of the Oise near Creil. The remaining armoured corps was to advance between Amiens and the sea.

The offensive was launched on June 5, initially on the western stretch between Laon and the sea. Resistance was stiff for the first two days, but on June 7 the most westerly armoured corps broke through on the roads to Rouen, with Rommel leading. The defense then collapsed in confusion, and the Germans met no serious resistance in crossing the Seine on June 9. Kleist's pincer stroke did not, however, go according to plan. The left pincer, from Péronne, was hung up by tough opposition north of Compiègne. The German supreme command then decided to pull back Kleist's group and switch it east to back up the break-through that had been made in Champagne. The offensive there did not open until June 9, but then the collapse came quickly. As soon as the infantry had forced the crossings, Guderian's tanks swept through the breach toward Châlons-sur-Marne and then eastward. The drive continued at racing pace, over the Langres plateau to Besançon and the Swiss frontier, cutting off all the French forces in the Maginot line.

On June 10 Italy declared war. An Italian offensive, however, was not launched until ten days later and was then easily held in check by the weak French forces. On June 11 Churchill flew to Tours in a vain effort to encourage the French leaders. Next day Weygand addressed the cabinet, told them the battle was lost, blamed the British for both defeats and then declared: "I am obliged to say clearly that a cessation of hostilities is compulsory." There was little doubt that he was correct in this estimate of the military situation, for the French armies were now splitting up into fragments. The cabinet was divided between capitulation and a continuance of the war from North Africa but decided only to move itself to Bordeaux.

The Germans entered Paris on June 14 and were driving deeper on the flanks. Two days later they reached the Rhône valley. Meanwhile Weygand had continued his pressure for an armistice, backed by all the principal commanders. Reynaud resigned, whereupon a new cabinet mas formed by Marshal Henri Philippe Pétain, and the request for the armistice was transmitted to Hitler on the night of June 16. Hitler's terms were delivered to the French envoys on June 20. The German advance proceeded beyond the Loire while discussion continued, but on June 22 the German terms were accepted. The armistice became effective at 1:35 A M. on June 25, after an accompanying armistice with Italy had been signed the day before.

3. The Siege of Britain. — No plans had been made for the invasion of Britain when the Germans launched their offensive. Nor were any made even when the collapse of France was assured. It is clear that Hitler counted on the British government's agreeing to a compromise peace on the favourable terms he was disposed to offer and had no desire to press the conflict to a decisive conclusion. The German army was given to understand that the war was over, leave was granted and part of the Luftwaffe was shifted to other quarters. Even when Churchill's determination to continue the war was manifest, Hitler still clung to the belief that it was merely a bluff. feeling that Britain must recognize "her militarily hopeless situation." That hope of his was slow to fade. It was not until July 2. 1940, that Hitler even ordered a consideration of the problem of invading England, and he still sounded a note of doubt about its necessity when at last. on July 16. he ordered preparations to begin for such an invasion, christened Operation "Sealion." But he said that the expedition must be ready by mid-Aug. 1940.

The German army was in no way prepared for such an undertaking. The staff had not contemplated it, the troops had been given no training for landing operations and nothing had been done to build landing craft for the purpose. So all that could be attempted was a hurried effort to collect shipping, bring barges from Germany and the Netherlands and give the troops some practice in embarkation and disembarkation. It was only the temporary "nakedness" of the British forces, after losing most of their equipment in France, that offered such an improvisation the possibility of success. The main operation was entrusted to Rundstedt's army group A, which was to use the 9th and 16th armies, comprising 2j divisions. Starting from the various harbours between the Scheldt and the Seine estuaries, they were to converge on the south coast of England between Folkestone and Worthing, while air-borne troops were to capture the cliff-covered Dover area. According to the plan, ten divisions were to be landed in the first four days, to establish a wide bridgehead After about a week the main advance inland would begin, its first objective being to gain the high ground along an arc from the Thames estuary to Portsmouth. In the next stage, London was to be isolated from the west. If opposition were stiff, the 6th army (from army group B) might be landed west of Weymouth for a push northnard to the Severn.

The German generals were very apprehensive of the risks that their forces would run in crossing the sea. They had little confidence in the capacity of either their own navy or the *Luftwaffe* to keep the passage clear. The German admirals were even more frightened about what would happen when the British navy appeared on the scene. They had no confidence in their own power to stop it and insisted that the responsibility must be placed on the Luftwaffe. Goring, however, expressed assurance that the Luftwaffe could check British naval interference as well as drive the British air force out of the sky. So it was agreed that he could try his preliminary air offensive, which did not commit the other services to anything definite, while the time for the invasion attempt was postponed to mid-September.

During July and early August a rising stream of air attacks was delivered against Britain's convoys and ports. Then on Aug. 13 the main offensive was unleashed, initially against air bases. Although targets and tactics were changed in different phases, the underlying object was always to wear down Britain's air defense, and the effort was maintained far into September. Although it severely strained the limited resources of fighter command, under Air Chief Marshal Sir Hugh Dowding, the German losses in both bombers and fighters were disproportionately heavy. Aug. 15 and 18, Sept. 15 and 27 were the *Luftwaffe's* days of greatest loss in the long series of air battles over Britain. As the expensiveness of the daylight attacks came to be impressed on the Luftwaffe, the offensive effort was increasingly diverted into the channel of night raids on Britain's industrial centres. Although the nightly "blitz" imposed a great strain on the civilian population, besides impairing war production and food supply, it contributed little to the main purpose that had prompted the air offensive. (See Battle of Britain, below.)

The evident inability of the Luftwaffe to dominate the sky increased Hitler's hesitation to take a decision on Operation "Sealion." Orders he issued on Aug. 16 hinted at further delay. On Sept. 3 the date of invasion was deferred to Sept. 21, and then on Sept. 19 he ordered the shipping to be dispersed. On Oct. 12 he announced that the operation was off for the winter, though a pretense of preparations was to be kept up. Long before the spring came he had decided to turn eastward against the U.S.S.R., and plans for the invasion of Britain were definitely discarded. Rundstedt and other generals had doubted all through whether his intentions were serious, in view of the apparent lack of interest and impetus on his part compared with the way he had spurred on the preparations for other offensives. The campaign against Britain thenceforth became purely a blockade of its sea approaches, conducted mainly by the German submarines, supplemented by the Luftwaffe.

4. British Amphibious Raids.—The number of operations carried out by the commandos during World War II was small, but they had a tonic effect on British national morale during the depressing period of isolation and siege that followed the enforced evacuation of the continent by the British forces in 1940. They helped to show that the German hold on the continental coast line was not completely secure, and they gained valuable experience for future amphibious operations on a larger scale. While the German command had reason to welcome these occasional raids as a help in keeping its own troops alert, it became uncomfortably impressed by such evidence of the excessive stretch of coast it had to cover as a result of its conquests. The commando operations were also valuable as a school in the application of irregular tactics to regular warfare, correcting the normal tendency of armies to develop formal habits and stereotyped methods.

The earlier raids had as their main target the fish-oil plants in Norway that were used in the making of glycerine for explosives; destruction of shipping was one of the subsidiary aims. The first raid was carried out—by British commandos, light naval forces and Korwegian marines—at the head of the Vest fiord off Narvik, on March 7, 1941. The next was a purely Norwegian raid, at Oksfiord, between Tromso and Hammerfest on the night of April 11. On Dec. 27 a larger raid, mainly by British forces, was delivered against the island of Vaagsoey. In 1942 commando operations were switched to the Atlantic shores of occupied France. The first was on the night of Feb. 27 at Bruneval, near Le Havre, where the secrets of the radar station formed the main objective. Some parachute troops co-operated in this very successful small operation. A more ambitious one was attempted at St. Nazaire on March 28 and did considerable damage to the harbour works, though at a rather high cost. On April 22 there was a small raid near Boulogne.

A much bigger operation was attempted at Dieppe on Aug. 19, 1942. Officially described as a reconnaissance in force, it furnished useful lessons for the future in the problem of invading a well-defended coast. Although the cost was very high, it showed the possibility of achieving a large-scale landing under modem conditions, while bringing out mistakes that were to be avoided. In this operation, the commandos played only the preparatory role, in the form of a dual flanking move. The right-hand thrust was successful in disabling the coastal guns on its sector, but the left-hand thrust miscarried; it unluckily ran into a German flotilla before the landing. The main assault was carried out on the beaches of Dieppe, by a mainly Canadian force of about 7,000 men, and tanks were employed to help it, though their efforts were seriously obstructed by the sea wall. Kearly half the assaulting force was lost, largely as prisoners. Losses in landing craft and aircraft were also heavy, though in the air a compensating toll was taken by the great Allied "umbrella" of about 1,000 fighters.

(B. H L. H.)

5. Air Warfare over Western Europe, Germany, Mediterranean and Italy.—Germany used its air force from 1939 to 1944 mainly as an adjunct to offensive military and naval operations; but by the beginning of 1944 it was forced to switch to the defensive because of the Allied air campaign against its industrial area. Thereafter, German offensive action was largely limited to mechanical weapons, first the flying bomb or V-I and later the big rocket or V-2. Allied air strength in the earlier period had been built up from a condition of numerical inferiority to an overwhelming preponderance. Victory in the long run depended largely on the Allies' success in expanding and deploying their air forces and on the failure by Germany to prevent this. If the German air force could have smashed the British aircraft industry between 1940 and 1942 or the Russian aircraft industry after 1941, or stopped the flow of U.S. aircraft to Britain after 1941 or prevented the movement of air forces to North Africa, the eastern Mediterranean and the Soviet Union, it could have changed the course of the war. It achieved none of these tasks; as a strategical weapon, German air power failed.

Allied air effort, whether its strength warranted it or not, always took account of strategical as well as tactical needs until the two merged into one with the invasion of Germany. By that time it had disorganized German production and transport, safeguarded Allied bases and given vital support to the ground forces in a series of campaigns.

This continuous and mounting attack on the sources of axis power formed the background to the campaigns. It went on in retreat and in advance. It rose at last to an intensity never before imagined. While the armies of Germany and Italy were being forced back, the whole economy of their homelands was being destroyed. High on the program of destruction were the aircraft industry and the oil needed by the axis air forces. When finally the Allied armies crossed the Rhine in the last stages of the war, there was practically no interference from the German air force.

(a) The Success of the Blitzkrieg.—Most of the nations Germany attacked between 1939 and 1941 were in a position similar to that of Germany at the end of the war. The one exception was the U.S.S.R. When Germany invaded Poland in Sept. 1939 it had about 5.000 first-line aircraft. Nearly 2,000 of these were used in the campaign. Poland could muster at most 600 aircraft; the German aim was to put these out of action first. In two weeks this purpose had been achieved, and German air units could concentrate on turning retreat into confusion and on spreading terror among civilians. The entire campaign cost Germany only about 200 aircraft. When the Germans invaded Norway in April 1940 the air defense was equally inadequate, and it was impossible for the British to reinforce the Norwegian army.

Ship-based aircraft, few in numbers, backed up by only two land-based fighter squadrons, could not compete with the German land-based aircraft of superior performance. Thus, a second campaign was decided in the air.

When the main thrusts were delivered into the Netherlands, France and Belgium, the German air operations resembled those of the Polish campaign, with some innovations. Again the resistance was weak. About 3,500 aircraft were used by the Germans. Against these France had a total of 2,500, but never many more than 1,000 aircraft in its first-line strength. The British air strength in France did not exceed 500 aircraft. Heavy air fighting took place, and the Germans suffered serious losses, especially among their dive bombers; but they were too well supplied with aircraft to be checked.

In the Netherlands, parachute troops were used in force for the first time. About 20,000 were dropped, chiefly in the neighbourhood of Rotterdam; this action was preceded by an intense bombing of the dock area of the city. On other parts of the 250-mi. front, German aircraft attacked airfields and communications, broke down resistance in front of their troops, put up a defensive umbrella over their advancing columns, bombed and fired at refugees on the roads and took every opportunity to create chaos in the rear of the opposing armies. By way of breaking the spirit of the French, there were raids on certain towns, including one by 120 bombers on military objectives around Paris. Meanwhile the relatively small force of the royal air force continued to cover the British retreat to Dunkirk and to oppose to the limit of its powers the advance of the Germans. The bombing of towns by the Luftwaffe had released the British from their inhibitions concerning targets where civilians might be involved. During the German advance there were frequent attacks on railway yards, oil supplies and road junctions in western Germany. In the air fighting near Dunkirk, the Germans had a taste of the opposition they were thenceforth to meet. British victories in the air made the evacuation possible but could not impede the collapse of France. The German air force lost 2,000 aircraft in six weeks of fighting, yet after six weeks' refitting it was ready for the next venture, to prepare the way for the invasion of England.

(b) The Battle of Britain.—The Germans had available for this task about 3,000 aircraft. The British could put against them a fighter force about 800 strong; but this force was extremely well armed with eight-gun fighters, its aircraft carried armour over vital parts, its pilots were well trained and, perhaps most important of all, it was equipped with radar which had been brought secretly to a high state of efficiency. This apparatus detected formations at a distance of 50–60 mi. and revealed their strength, height and direction.

The Germans opened the battle of Britain on Aug. 8, 1940, with attacks on shipping and on south coast ports. For ten days they kept up this onslaught. From Aug. 12 they combined their campaign against shipping with raids on airfields, aircraft factories and radar stations in southeast England. On the whole they used about 500 aircraft a day; on some days, the figure reached 1,000. Throughout, losses were heavy. Failing to obtain the success they had expected, the Germans tried out various plans—night attacks on industrial towns in the Midlands, raids on the airfields of the home counties.

Early in September came attacks on London itself. The first was made by more than 400 aircraft; of these, nearly a quarter were brought down. So heavy were the losses of the Germans in their daylight assaults that they turned to night bombing. Daylight raids continued, but they were more a nuisance than a threat; the night raids were to trouble Britain for two years. Meanwhile an invasion fleet of barges had been assembling on the French and Belgian coasts and British bombers had been attacking it. Many barges were destroyed, but the danger of invasion remained an influence in British policy for many months and, together with the German campaign against shipping, curtailed British activity in other theatres of war. (See also Siege of Britain.)

(c) The Defensive Phase.—When Italy entered the war in June 1940 there were fewer than 400 British aircraft in the whole middle east command; these had to look after the defense of Malta, the Suez canal and the Sudan and to undertake offensive operations in Libya, Eritrea, Italian East Africa and Ethiopia. The Italians, on the other hand, had a front-line strength of about 1,500 aircraft. Reinforcements from the air forces of Australia, New Zealand, South Africa and Rhodesia soon arrived in North and East Africa. Under the "cash-and-carry" arrangement a certain number of U.S. aircraft, chiefly fighters and long-range reconnaissance types, were taken in British ships to Britain and thence to Africa. Later, under the lend-lease scheme, the flow was greatly increased.

The Italian air force was roughly handled wherever the British forces came into conflict with it. Axis ports on both sides of the Mediterranean were bombed. The British air units made up in dash what they lacked in numbers and equipment. Ship-borne aircraft had one outstanding success in Nov. 1940, when British planes caught some ships of the Italian navy at anchor in Taranto harbour and torpedoed seven, including three battleships. In the following April they took a major part in the battle of Cape Matapan. But for the most part, the British forces were at a disadvantage, especially in protecting convoys and in preventing the movement of traffic from Italian ports.

These difficulties came to a climax with the advance of the Germans through Yugoslavia to the Greek coast in April 1941 and with the capture of Crete by an air-borne force in May. This was the first example of an entirely air-borne campaign; it was preceded by intense bombing of the three airfields from which the small British fighter force operated. The latter became so reduced in size as to be ineffective against a raiding force about 500 aircraft strong and had to be withdrawn. Then the Germans dropped paratroops and glider troops, so that by the end of a week they had nearly 23,000 men on the island.

This evidence of German skill in air-borne invasion increased the anxiety felt in Britain. Night bombing had meanwhile grown in strength. Sometimes as many as 450 bombers attacked London in a night. A large part of the City had been destroyed by fire at the end of 1940. There had been heavy raids on other towns such as Coventry, Bristol, Birmingham, Liverpool and Birkenhead. Defense against night attacks was having little success mainly because single-seat fighters were being used and there was no room in them for an air-borne radar set and its operator. The possibility of an air-borne invasion by night was acknowledged. Home defense then remained a priority and alongside it stood the need to give more attention to the Atlantic battle.

German submarines were now working in packs, guided by scouting aircraft from advanced bases. Some of these aircraft made bombing attacks on merchant ships approaching Europe. With coastal bases all the way from Norway to the Spanish border in Its hands, the German air force came near to making good the claim that air power could neutralize sea power. In the end, air power from British bases held down the German aircraft and checked the operations of the German submarines as well. Small escort carriers—converted merchant ships—came to be used in addition to naval escorts, and the R.A.F. steadily increased its long-range patrols until they were not only locating but fighting the submarines. By the end of the war, 415 out of the total of 781 submarines accounted for had been destroyed by air action. In this defense of Britain as a base, operations began near the shores of Britain and were gradually extended into the oceans until air cover was provided along all the convoy routes.

In the Mediterranean in 1941 there was a parallel situation in which the Germans held the majority of bases for controlling traffic in that sea, and the British were even less well equipped than they were at home. The Germans failed to knock out Malta and they paid heavily in every attempt they made to do so. Although the British were unable to prevent the transport of German troops from Italy to Africa, they did destroy the ships supplying these forces.

(d) The Offensive Phase.—The process of building up a British striking force in the middle east was slow and laborious. For two years the bulk of the fighting strength was in Britain and had to be used from Britain. Bombers and fighters went out whenever the weather was fit, by day and by night, to hamper German production and communications and to challenge the German air force in France. The daylight raids were intended to tie down units in France which might otherwise have been moved to the

Mediterranean and the U.S.S.R. Most British scruples were removed by the German incendiary attacks and so with the night raids began the campaign of systematic widespread destruction which was afterward to make Germany the most devastated area in Europe.

Strategic bombing, aimed at Germany's power to feed the war machine, was gathering weight by the end of 1941. The first of the four-engined bombers had gone into action. Mounting production in Britain was adding to the numerical strength of the attack building up; new ideas in technique were also being introduced. The raid by 1,000 British bombers on Cologne on the night of May 30–31, 1942, introduced the "saturation" attack; the 1,000 aircraft delivered more than 2,000 tons of bombs within a period of 90 min. There was a repetition at Essen the following night and again at Bremen on June 25. This time the attack was completed in 75 min. It was the last 1.000-bomber raid, but all this was the prelude to the series of heavy night raids which the R.A.F. continued right up to the end of the war. These were based on the "pathfinder" technique, by which radar was used to enable a specially trained advance party to locate the target and mark it with distinctive ground or sky markers, flares so powerful that their light could often be seen through clouds. On those marker flares the main body dropped its bombs.

During this period bigger and bigger bombs were used. At the end of June 1942 the 4,000-lb. bomb was introduced. By September the 8,000-lb. bomb was in use and a year later there was first a 12,000-lb. bomb and then a 22,000-lb. bomb for the uprooting of particularly difficult structures such as viaducts. Another important development in the early part of 1942 was the arrival of heavy bomber units of the United States army air forces and of fighter units to escort them on daylight attacks. The B-17 four-engined bombers specialized in precision bombing, and this was a consideration in deciding that the U.S. heavy bombers should undertake the day bombing while the British Lancasters and Halifaxes should continue their night campaign. From Sept. 1942 the daylight campaign of the Americans, continually growing in volume, was carefully co-ordinated with the mounting night offensive of the R.A.F. It was also supplemented by high-speed, unprotected attacks in daylight and in darkness by R A.F. Mosquito bombers, each capable of carrying one 4,000-lb. bomb or a selection of smaller bombs.

While these developments were taking place in the west, Germans and Russians were both using their air forces to help their armies, much in the way that Germany had applied air power in its earlier campaigns. Air losses on both sides were heavy. The Russians, for instance, admitted the loss of 4,500 aircraft in the first two months of the fighting in 1941. German losses in the same period were nearly 2,000. That winter and in subsequent winters, Germany withdrew some of its best air units from the Soviet Union to the western and Mediterranean fronts to be used against Britain.

On both these fronts, however, by the beginning of 1942 the British were beginning to assert superiority in the air. On the French front, this was shown in a series of provocative sweeps by day bombers and fighters, which were later amplified by the addition of U.S. army air forces and which cleared the way for the Normandy landings of June 1944. In the Mediterranean, the Allied air superiority expressed itself first in a close co-operation with the army and later also in the complete isolation of the axis forces in Tunisia from their sources of supply in Sicily and on the Italian mainland. It also amounted to air supremacy during the Allied crossing from Tunisia to Sicily, a crossing in which paratroops and glider troops were used in large numbers.

The technique of close co-operation with the army had been carefully worked out during the seesaw battles of the desert campaign. Both strategical and tactical operations had been planned by the air force to serve the general military scheme. Soon after the opening of the British offensive at El Alamein, the Anglo-U.S. landings in Morocco and Algeria took place Nov. 1942, and the limited axis air forces in Africa had to serve two fronts. They were already outnumbered in Egypt. and such was the spirit of the Allied air forces that they were outfought as well. As the Allied air forces moved up always within a few miles of the forward troops, their effectiveness against the axis line of supply from Italy was improved until neither reinforcement nor escape was possible for the troops in Tunisia. The process of making the front too hot for the axis air forces was repeated in Sicily, so that within a fortnight of the Allied landings not a single axis aeroplane was based on the island.

In the African campaign, the air operations of the Allies differed from those which the Germans had applied to their offensives in the sense that they stretched out farther beyond the battlefields and that they dealt with air opposition which, on occasions, was strong. In supporting the armies the Allied air forces employed fighter bombers which gave better help than the axis dive bombers and made successful use of rocket projectiles against armour and against shipping. As the Allies advanced northward through Italy, the Germans experimented with radio-controlled bombs in attacks on ships; but the strength of Allied air cover soon made these of little consequence.

British and U.S. air forces were now working together. The performance of the British air forces in the advance from El Alamein and of the united air forces in Sicily and Italy set the standard for subsequent operations in western Europe, where the numbers of aircraft were greater and where powerful forces of heavy bombers could be fitted into the strategic plan. Before the Allied landings were made in Normandy, the German air force had been bombed out of its forward bases, its radar had been disorganized and its sources of supply and reinforcement had been attacked. Railways in the whole of northwest France had been reduced by attacks on junctions and on rolling stock. Coastal fortresses were smothered. A regular patrol of aircraft in the English channel kept submarines out of the course the invasion fleet was to follow. The whole scheme of air protection and preparation was co-ordinated and directed toward the threefold end of pushing back the axis' air defense, of preventing air or sea interference and of isolating the battlefield chosen by the supreme commander.

It succeeded beyond expectations, although Germany had had two years in which to convert its air force from an offensive into a defensive weapon. Its success undoubtedly owed much to its comprehensiveness. It brought Germany's production to a standstill, and it crippled German communications; at the same time, it provided effective cover for Allied strategy and close tactical support for the ground forces. In the Mediterranean, the method had been evolved and tested. In France and on through Belgium to the Rhine and beyond, it was applied with the full weight of the Allied resources and with the skill derived from experience.

The one factor which tended to divert and dissipate part of the Allied air effort was the introduction by the Germans of mechanical air weapons. Launching sites of the flying bombs and the rockets had to be attacked, and fast fighters had to be used to intercept the flying bombs. When the armies advanced far enough to put these weapons out of action, the war was nearly over, and Germany's air power had been largely destroyed by air action. (E. C. SD.)

6. The German Occupation of Western Europe.——Under the terms of the Franco-German armistice, the northern half of France together with the whole of its Atlantic seaboard remained in German occupation. "Unoccupied France" was economically the poorer part, and at the time of the armistice its problems were complicated by the fact that its population had been swollen by several million refugees from the north and from Belgium. The French government under Marshal Pétain, which was established at Vichy, retained a nominal independence but was naturally subject to German control and interference. It was permitted to retain an army similar in size (100,000) to that which Germany had been allowed under the Versailles treaty, and also its navy, as well as its colonial empire. This concession, which proved of great importance for the future, was prompted not only by a desire to secure French co-operation but by the Germans' naval weakness and consequent difficulty, when faced by the royal navy, in extending their tide of conquest to the French territories overseas.

The other conquered countries of western Europe were completely occupied, but the Germans sought, for their own convenience, to get the administration carried on by officials of these countries, subject to German control. A policy of conciliation was at first pursued. It corresponded to the ideas of the German military chiefs, who had learned the drawbacks of repression from the experience of World War I, while it also represented Hitler's desire to get these countries to accept their intended place in his "new European order." At first, that policy made considerable progress — largely because of the way the German troops fulfilled the high command's instructions to behave with restraint and courtesy in the conquered countries. This polite behaviour, combined with the German efforts to restore normal conditions, began to win over a much larger proportion of the peoples than merely the instinctive collaborators. Its prospects, however, were frustrated by the combination of Britain's continued defiance with nazi impatience and intolerance. Overbearing demands provoked resistance in occupied Europe, leading to more drastic measures and thus to more widespread resistance, in a rising spiral. This resistance became increasingly organized, with British support, and caused the occupying forces more and more trouble as the war went on. Besides the more active forms, sabotage and guerrilla (*q.v.*) warfare, there was a much more general passive resistance which had on the whole greater effect, without the legacy of licensed violence that in the former case often complicated the restoration of order after liberation.

In France, where the resistance eventually became strongest, it started with the handicap imposed by the Vichy government's tendency to avoid any such direct opposition to the conquerors as might worsen the plight of the French people. At the same time, prior to June 1941, the leaders of the large Communist party advocated collaboration with the Germans against Britain, as the last European stronghold of "western plutocracy." After the German invasion of the U.S.S.R. its attitude changed, and it started its own resistance movement. Others were also doing so on separate lines — Radical, Socialist or Catholic. The disunity of these movements hampered their effectiveness, and in their discords they often played into the hands of the occupying forces, until a later stage.

Outside France, Gen. Charles de Gaulle had started his "Free French" (later "Fighting French") movement as early as June 18, 1940. But he was able to collect only a few hundred in England, at Morval camp near Aldershot, and support for him elsewhere was at first small. The censure of the Vichy government was a deterrent to many, while confidence was shaken by the fiasco of De Gaulle's July attempt, under the protection of a British fleet, to seize Dakar, on the West African coast. But his prospects gradually improved as German impositions and the Vichy government's subservience brought an increasing flow of converts to his cause. The British entry into Syria in 1941 and Madagascar in 1942 paved the way for extension of his authority. Still more decisive was the U.S.-British occupation of French North Africa. in reply to which the Germans rushed to occupy the whole of France (Nov. 11, 1942) and turned the French people more definitely against them. Although the French fleet at Toulon did not escape to join the Allies, it was scuttled rather than allow it to fall into German hands (Nov. 27). Henceforth, there was a great development of the resistance in France, which was now better coordinated, while being more plentifully equipped with arms dropped by air. All the different bodies were now unified under the C.N R. (Conseil National de la Résistance), while the guerrilla sections were combined in a single organization entitled the F.F.I. (Forces Françaises de l'Intérieur), though the Communist partisans retained a measure of autonomy.

At the same time the regular forces under De Gaulle were growing fast. A brigade under Gen. Joseph Marie Pierre Koenig played a gallant part in the British campaign of 1942 in Libya. Larger forces mere employed in the Tunisian campaign. The following year an army corps under Gen. Alphonse Juin went to Italy and achieved the decisive manoeuvre through the mountains in the Allied offensive of May 1944 that led to the capture of Rome. Meannhile Koenig had taken over command of the F.F.I., which severely harassed the German communications in France before and during the Allied invasion of Normandy. On **Aug.** 18, as the Allied armies approached, the people of Paris rose in arms to liberate their city, and a French armoured division was hurried thither to support their efforts. In the same week a French army under Gen. Jean de Lattre de Tassigny formed part of the Allied landing in the south of France. It later achieved striking successes in the Rhine campaign. (B. H. L. H.)

E. THE BRITISH AFRICAN CAMPAIGNS

1. East Africa. — When Italy declared war on France and Great Britain Gen. Sir Archibald (later Field Marshal Lord) Wavell, commander in chief, British land forces in the middle east, was faced with the problem of disposing pitifully small resources in manpower and material to meet the numerically superior enemy ready, from favourable strategic positions, to launch a concentric offensive against Egypt and the Sudan. The fall of France rendered the position of the British in the Nile valley still more desperate, and success seemed likely for Mussolini in his new African venture. Although the British were particularly vulnerable in this nodal strategic area, the Italians were overcautious; they lacked daring, they lost precious time and they missed an opportunity which never again presented itself.

(a) Italian Conquest of British *Somaliland.*—The campaign in East Africa was opened by three limited Italian offensives: emerging from the Eritrean plateau they took Kassala in the Anglo-Egyptian Sudan and stopped there (270 mi. from Khartoum); they took Moyale in the north of Kenya; finally they occupied British Somaliland. This vast desert country was defended by a force of 5 battalions with one battery of howitzers and limited air support from Aden against the whole Italian eastern army amounting to 24 battalions with four groups of pack artillery, two groups of medium artillery, 30 tanks and adequate air support. The Italians crossed the frontier of British Somaliland on Aug 5, 1940, progressing along the main Jijiga (Giggiga)-Berbera highway. The British — under Maj. Gen. A. R. Godwin-Austen— fought a gallant rear-guard action toward Berbera, where in the night of Aug. 17–18 almost the whole force was embarked.

(b) British Conquest of Somaliland, Eritrea and Ethiopia. — During the autumn of 1940 General Wavell was under constant pressure by Winston Churchill to reduce to the minimum the troops in Kenya and the Sudan and to send all available forces to Egypt. He resisted and was authorized to start small-scale offensive operations against the Italians in East Africa. At a meeting in Cairo on Dec. 2, 1940, on the eve of the offensive against Marshal Rodolfo Graziani's forces in the western desert, General Wavell instructed Lieut. Gen. Sir William Platt, general officer commanding, Sudan, to prepare to recapture Kassala and Lieut. Gen. Sir Alan Cunningham, general officer commanding, East Africa, to conquer Chisimaio (Kismayu). It was also ordered that the rebellion in Ethiopia was to be encouraged by all possible means, and to this end Lieut. Col. O. C. Wingate was appointed staff officer for patriot forces toward the end of November and flown to Ethiopia, where Brig. D. A. Sandford had preceded him. By this time General Platt had at his disposal one Indian division and General Cunningham two African divisions and one South African.

Early in Jan. 1941 the Italians evacuated Kassala, and General Wavell therefore ordered an advance on Asmara and Massawa; in the meantime General Platt's small army was reinforced by another Indian division and moved to Eritrea from the battlefield of Sidi Barrani. General Cunningham was told that if successful in capturing Chisimaio he should advance on Mogadiscio. The emperor Haile Selassie, under the protection of the "Gideon force" of Wingate, crossed the frontier of Ethiopia on Jan. 20, 1941, and the subsequent operations of this small force cleared the Gojjam area of large Italian forces.

In Eritrea the Italians made a seven-meek stand on the naturally strong position of Keren (Cheren), which, honever was taken by storm on March 27. Asmara was occupied on April 1 and seven days later General Platt's army was in Massawa. In the south, General Cunningham started his offensive against Italian Somaliland on Feb. 11, three days later was in Chisimaio. and on

Feb. 24 entered Mogadiscio. Instructed by General Wavell to advance on Harrar to cut communications between Addis Ababa and Jibuti (Djibouti), General Cunningham pressed forward and on March 17 was in Jijiga, 744 mi. N. of Mogadiscio. The previous day Berbera had been recaptured by a combined operation from Aden under Air Vice-Marshal G. R. M. Reid. Harrar fell on March 25, Diredawa four days later and on April 6 the 1st South African division entered Addis Ababa. Emperor Haile Selassie, coming from the west, made his formal entry into the capital on May 5, five years to the day after its occupation by the Italians.

After his rapid advance General Cunningham wished to deploy his forces to the west in order to reduce the enemy centre of resistance in the Jimma (Gimma) area; General Wavell, however, anxious to get the South African division and the large quantity of transport as quickly as possible to Egypt, ordered a northward advance along the new Italian-built highway from Addis Ababa to Asmara. At the same time General Platt was ordered to advance south with the 5th Indian division (the 4th returned to Egypt after the fall of Keren). The two British divisions met the Italians at Amba Alaji, 235 mi. S. of Asmara and 424 mi. N. of Addis Ababa. The combined attack resulted in the surrender on May 17, 1941, of a large Italian army under Prince Amedeo di Savoia, duke d'Aosta, its commander in chief. This decisive victory was not the end of the campaign; the Italians continued to resist in two other redoubts until the surrender of Gen. Pietro Gàzzera in the Jimma area on July 8 and of Gen. Guglielmo Nasi at Gondar on Nov. 27, 1941.

The conquest of Italian East Africa had been accomplished by five British divisions and the small guerrilla force of Lieutenant Colonel Wingate (50 British officers, 800 Sudanese and 300 Ethiopians), helped by irregular patriot forces. The Italians had a numerical superiority of four to one over the British and their armies totalled 220,000 men. Discouraged by their defeat in the western desert, they exhibited a low morale throughout and felt uneasy in a country which they had occupied five years earlier but of which the population had remained unconquered.

When General Wavell began operations against Italian East Africa he did not expect such an easy and quick and so complete a victory. The ultimate pattern of the British offensive was a pincer movement on the largest scale through Eritrea in the north and Somaliland in the south converging on Amba Alaji, combined with a direct thrust through western Ethiopia by the patriot forces. "It looks Teutonic in conception and execution, but the result was not foreseen in the original plan," wrote Lord Wavell in his dispatch on "Operations in East Africa" (supplement to the London Gazette of July 9, 1946). It came about gradually through the development of events. "It was in fact an improvisation after the British fashion of war rather than a set piece in the German manner." (K. SM.)

2. Egypt **and** Libya.—These campaigns were dominated by three gifted commanders whose careers overlapped but whose ascendancy fell into three periods: Gen. Sir Archibald Wavell (until Feb. 1941), Field Marshal Erwin Rommel (March 1941–Aug. 1942) and Gen. Sir Bernard (later Field Marshal Viscount) Montgomery (from Sept. 1942).

Between El Agheila, near the Tripolitanian frontier, and El Alamein, about 60 mi. W. of Alexandria, there was no naturally defensive position which could not be readily turned. There was only one road, along the coast. There were several small, but, with the exception of Benghazi, only two large ports, Tripoli and Alexandria (each at the end of the respective lines of communication), by which to maintain major forces. Water supplies were, in parts, sparse. Apart from the Jebel Akhdar, the "bulge" of Cyrenaica which the Italians had attempted to colonize and which was outflanked regularly throughout the campaigns, the terrain was, in the main, flat and arid desert. Between El Agheila and El Alamein there was ample room for manoeuvre, particularly for mechanized forces; airfields were readily confected; moreover, save a small number of Arabs and, at first, a few Italian settlers, there were no civilians. The nature of the country with its solitary coastal road and the dispersion of its small ports gave the campaigns their pattern: a series of mechanized turning movements, outflanking "hooks" from inland while infantry hugged the coast, to secure a port which would nourish a further advance. "North Africa," said Gen. von Ravenstein, the commander of the 21st pnnzer division, "is a tactician's paradise and a quartermaster's hell."

(a) First Italian Offensive *(Sept.–Dec. 1940)*.—When Italy declared war on June 10, 1940, it had more than 200,000 troops in Libya and a considerable numerical superiority in aircraft. Thenceforward, British reinforcements had to reach Egypt via the Cape of Good Hope. With a detachment of the 7th armoured division on the Cyrenaican frontier, the main British positions were at Mersa Matruh, 120 mi. farther east. From June 11, small British columns established an early dominance by harassing raids over the frontier. but on Sept. 13 after a heavy artillery program against the deserted escarpment above Sollum, the Italians invaded Egypt on a narrow front along the coast with two divisions up, two in rear and a further division and the Maletti group in reserve. Sidi Barrani was reached by Sept. 16. These forces, subsequently increased by two additional divisions to a strength of 80,000 men, then distributed themselves, to remain for more than two months with ill-assured supply, in a series of fortified camps from Maktila, on the coast east of Sidi Barrani, to the escarpment about Sofafi, about 50 mi. away, in echelon from the left flank. Their defenses lacked both depth and mutual support. A gap of more than 20 mi. lay between Sofafi on the right and the next camp at Nibeiwa.

(b) British Counteroffensive *(Dec. 1940–Feb. 1941)*.—After an approach march by night over open desert, two highly mobile British divisions (7th armoured and 4th Indian) advanced on the gap. Complete surprise resulted in the rapid capture of Nibeiwa early on Dec. g, and by nightfall the Tummar camps, immediately north, had almost entirely fallen. Next day Sidi Barrani was retaken, and the ragged road to the west had been cut. In quick pursuit, the 7th armoured division intercepted a long Italian column between Buq Buq and Sollum, making its way back to the frontier. "Something is wrong with our Army," wrote Count Galeazzo Ciano on Dec. 11, "if five divisions allow themselves to be pulverized in two days." By Dec. 15 all Italian troops had been driven from Egypt, leaving nearly 40.000 prisoners in British hands, and the majority of the Italian army remaining in Cyrenaica had withdrawn within the invested 17-mi. perimeter of Bardia. There was a pause for maintenance and reliefs and to utilize the port of Sollum, before Bardia fell, after a naval bombardment and a heavy attack from the west, to the 6th Australian division (which had relieved the 4th Indian division) on Jan. 5. About 45,000 prisoners and 460 guns were captured.

By the next day, the 7th armoured division had cut the road Tobruk-Derna and the track Tobruk-Mechili while the Italians were abandoning their airfields at Gazala, Tmimi and Bomba. The southern face of the 28-mi. perimeter of Tobruk was attacked by the Australians on Jan. 21, with effective air and naval support, to capture the road junction Sidi Mahmud 8,000 yd. inside the perimeter. The town capitulated next day with 38,000 more prisoners.

The remaining Italian forces in Cyrenaica fell into two main elements: the majority of the infantry east of Derna and a mechanized group about Mechili. the nodal point of the tracks south from the Jebel Akhdar and the direct westward route to Benghazi. While the Australians pushed into the Jebel, the 7th armoured division moved on Mechili. By Feb. 3 it was evident that the Italians were abandoning the "bulge," and great risks offered complete victory. The 7th armoured division was therefore swiftly directed on Msus with a tight maintenance margin, to cut off the Italians south of Benghazi by moving northwest on Soluch or southwest on Agedabia as required. By Feb. 5, after a gruelling approach across unreconnoitred desert, detachments were astride the main routes southwest of Beda Fomm, blocking escape into Tripolitania. Eighty-four Italian tanks were put out of action next day by the British pincers closing from Soluch and Beda Fomm. After an abortive attempt by 30 Italian tanks to break through at dawn on Feb. 7, Gen. Annibale Bergonzoli surrendered unconditionally. The Italian 10th army had thus been wiped out, and Cyrenaica was in British hands. During the two months following Dec. 7 the army of the Nile advanced about 500 mi. It had destroyed an Italian army comprising nine divisions and part of a tenth and had taken 130,000 prisoners, 400 tanks and 1,300 guns. In these operations Gen. Sir Richard O'Connor, Wavell's tactical commander, had never employed more than two divisions at a time, the 7th armoured division, "the Desert Rats," being engaged throughout. British casualties totalled 1,928 men. The bombardment and supply work of the royal navy had been outstanding, while the royal air force, though most inferior in numbers, had gained complete superiority over the Italian air force.

(c) Second Axis Offensive (March–April *1941*).—Wavell was compelled to gamble on a strategic shoestring. Uncertain when German ground forces would reach Africa (where their aircraft were already operating) and pledged, although Keren and Chisimaio had still to be taken, to send to Greece what he could scramble together, he risked leaving the newly gained Cyrenaica with an understrength armoured brigade covering its western approaches and a new Australian division forming in the Jebel. British and German armoured cars first met on Feb. 20 and, before the month was out, German aircraft had made the port of Benghazi unusable. The maintenance of the slender British forces had therefore been thrown back on the long line to Tobruk when Rommel recaptured El Agheila on March 24 and advanced in force through Marsa Brega on March 31 with the 5th light division (an experimental German formation subsequently converted into the 21st panzer division) and two mobile Italian divisions.

The British attempts to delay, first around Agedabia, to cover Benghazi, then on the line Derna-Mechili to cover Tobruk, were foiled by the faster and more powerful German tanks on the open flank. The Germans thrust in two main groups, one forcing its way through the Jebel on Derna, the other dashing via Msus across the open desert on Tobruk. Having captured a British divisional headquarters at Mechili on April 8 and driven a small delaying force back from El Adem to the Egyptian frontier, Rommel launched an ill-prepared attack on Tobruk on April 10–11, which was worsted after three tense days by the British gunners and Australian infantry who had withdrawn within the perimeter.

Their tanks requiring overhaul, the Germans, with Italians in attendance, settled down to prepare a less impetuous assault while the 15th panzer division moved up from Tripoli. The renewed attack went in on the night of April go—May 1, but the Germans narrowly failed in their purpose, and Tobruk settled down to the rhythm of its long siege.

The escarpment running southeast from Sollum was generally impassable to vehicles for about 50 mi. inland save at Sollum itself and at Halfaya. While Tobruk remained besieged, operations on the Egyptian frontier developed into battles for possession of the two passes. Sollum and Capuzzo were captured by the British on May 1j, only to be regained by the Germans next day. On May 27 the Germans took Halfaya in an operation ("Scorpion") beginning as a diversion for the battle of Crete. As a result of political pressure to relieve Tobruk, Wavell ordered an attack ("Battleaxe") over the frontier on June 15 designed to defeat the German armour in detail before advancing on El Adem. Capuzzo fell, but Halfaya and Sollum remained in German hands, and by the evening of June 16 additional German armour had arrived from outside Tobruk. Following an armoured battle south of Sidi Omar that night, the British began to withdraw after heavy tank losses, particularly from the German 88-mm. gun.

Rommel had already revealed the qualities which were to stamp his desert career: a forceful and inspiring personal leadership, disdaining either risk or advice, the requirements of maintenance and of his allies alike; a roughshod capacity to take advantage of his opponents' mistakes as rapidly as he recovered from his own; a tendency to improvise and to repeat his tactics; a liability to obsession.

Preoccupation with Tobruk conditioned the reorganization and accumulation of strength to which both sides devoted the long hot summer: one to capture, the other to relieve, the fortress. While eight Allied battalions in the front line dominated the four Italian divisions and three German battalions besieging the perimeter, the Allied naval and air forces tackled with redoubtable success the double task of keeping Tobruk alive and hamstringing the build-up and maintenance of the axis forces preparing to assault its mettlesome garrison. The Italian navy was not risking another Matapan; and between May and November no single axis convoy reached Tripoli or Benghazi unscathed; no single axis formation arrived in Africa complete. Meanwhile, Gen. (later Field Marshal) Sir Claude Auchinleck succeeded the sagacious Wavell (who had been involved in six campaigns between February and July) and steadily built up his striking force (which became the 8th army), undisturbed in the desert itself save by an abortive raid to investigate his preparedness by the 21st panzer division over the frontier as far as Rabia on Sept. 14, and by the urgent and political need to change the personnel holding Tobruk.

The Italian forces under Gen. Ettore Bastico's supreme command (for the North African littoral as an Italian domain was perforce also in name an Italian theatre) totalled eight divisions, of which three (Ariete, Trieste and Trento) were formed into a mobile corps. The axis frontier defenses were strengthened by the fortification of Halfaya and Sidi Omar to increase the difficulty of frontal assault and to extend any turning attempt. To release the 1jth and 21st panzer divisions for their proper role, the 90th light division was created from positional battalions about Tobruk. Rommel proposed to hold off the British at the frontier while he attacked Tobruk on Nov. 23.

(d) Second British Counteroffensive (Nov. 1941–Jan. *1942*).—The British attack ("Crusader") at dawn on Nov. 18, 1941, achieved complete surprise. Swinging an armoured corps wide across the frontier from Maddalena, the British sought to bring the German armour to battle, while on the inner flank another corps, having masked the frontier defenses, attacked northward to isolate Sollum and Bardia. The Tobruk garrison was to break out approximately southeast to join the relieving armoured corps. By Nov. 19 the British had seized the vital area of Sidi Rezegh southeast of Tobruk. Rommel replied by ordering the junction of the 21st panzer and Ariete divisions west of Bir el Gobi for attack eastward, while the 15th panzer division moved west from Sidi Omar.

By Nov. 23 the British plan had gone agley. Sidi Rezegh had been retaken, the sortie from Tobruk was stuck and the spearhead of the corps which had attacked north over the frontier was held at Gambut. While uncertainty existed in the British command, a mood relieved by Auchinleck's decision to take over personally, Rommel threw away his opportunity in a characteristic gamble to finish the battle quickly. Collecting all the armour he could muster on Nov. 24, he led a "dash to the wire," a raid over the frontier through the British lines, then swept north on a wide, incoherent front. His disruptive columns, having failed to unseat the British from their essential purpose, swung back on Nov. 26 against the rear of the New Zealanders, who had by then pushed beyond Gambut to retake Sidi Rezegh. Next day the Tobruk garrison captured El Duda, making junction with the relieving forces on Nov. 27. The 21st panzer and Ariete divisions were therefore east and the 1jth panzer division west of the corridor, the reverse of their dispositions when Sidi Rezegh had first been captured and some measure at once of the disruption which Rommel had created for himself and of the whirligig of desert warfare.

By Dec. 1, however, the 15th panzer and the 90th light divisions managed to break through the corridor to join the 21st panzer division at Zaafran. Rommel then again overreached himself and had to pull in his horns by abandoning the area east of the general line Bir el Gobi-El Adem. He began to withdraw from Tobruk on Dec. 7–8 and by Dec. 12, after expensive rear-guard actions, the Germans had reached a line running southwest from Gazala with an open right flank. A heavy battle for disengagement ensued, but by Dec. 15 it was evident that Rommel's lines were both pierced and turned. He retreated to Agedabia, picking up a delivery of tanks from Benghazi en route. The British failed to cut him off and, after another enveloping attempt about Agedabia on Dec. 28–30, tried to contain the main axis forces in western Cyrenaica while they proceeded methodically to eliminate the isolated axis positions masked in the rear: Bardia, Sollum and Halfaya. Refreshed by the arrival of a convoy at Tripoli and by two

Italian divisions, Rommel then withdrew into the strong El Agheila position to refit: back where he had started.

(e) Third Axis *Offensive* (Jan.–Aug. *1942).*—Nearer to his base, Rommel was ready first. Having probed British strength astride the coastal road on Jan. 21, he seized his advantage next day and rapidly captured Saunnu and Antelat. By Feb. 4 he had retaken Benghazi and driven the Allied forces back to their chosen line of resistance south from Gazala. He did not press home his attack on Feb. 14–15, and both sides settled down to prepare again for further advances while the race for supply was run, a phase demonstrating yet again the immense significance of Malta, the "unsinkable aircraft carrier."

The Allied defenses were a straggle of irregularly spaced strong points, "boxes" linked by mine fields. Most important was that at "Knightsbridge," a track junction where the Trigh Capuzzo running west from El Adem crossed the north-south track between two other "boxes," Acroma and Bir Hacheim. South and east of Bir Hacheim the left flank lay open. Rommel planned a swift drive round this flank to capture Bir Hacheim and roll up the Allied positions from south and rear. Tobruk was to fall on May 30.

The attack began on May 25, the German armour swinging round Bir Hacheim, one division making for Acroma, another for El Adem. By May 28 it was obvious that rapid success had escaped Rommel, and the slim margin of supply which he had allowed himself might be turned to Allied advantage. To ensure his continued maintenance, or if necessary his retreat, he had to cut a corridor back westuard through the British mine fields. A fierce four-day armoured battle about Knightsbridge resulted. Within an ace of victory, the 8th army failed to prevent Rommel from keeping open, indeed widening, his feed pipe to the "cauldron." Instead of his enforced withdrawal, Rommel regained the initiative with a modification of his original plan by regrouping his main strength in a salient east of his corridor while he proceeded to eliminate Bir Hacheim, which extended and hobbled his southern supply line, While the Free French hung on tenaciously against repeated attacks on Bir Hacheim from June 2 to 10, farther north the British nere trying unsuccessfully to pinch out the axis salient. The evacuation of Bir Hacheim on the night of June 10–11 offered Rommel the opportunity to destroy the remaining positions piecemeal. A series of heavy armoured battles, in which once again the inferiority of British tanks was revealed, covered the fighting withdrawal of the exposed Allied infantry. The British then attempted to repeat 1941 by holding Tobruk and delaying on the Egyptian frontier. But Tobruk, so long the symbol of British resistance to Rommel, fell with unexpected suddenness on June 21. With the forces thus released and the booty thus secured, Rommel could be stopped at the frontier neither by Allied arms nor by Italian advice. Once again Auchinleck rose to the crisis and assumed personal command. He decided to pause at Mersa Matruh while the last ditch was manned, the El Alamein line which Wavell had reconnoitred and Auchinleck himself had made ready.

By June 26 Rommel had reached Matruh, where he attempted to repeat the enveloping manoeuvre which had just gained him Tobruk. He was foiled by the remarkable rear-guard action of the New Zealanders at Minqar Qu'aim and because the British, who had retreated hundreds of miles under the magnificently offensive protection of the desert air force, despite the loss of 80,000 men, were still full of fight. Although Matruh and Daba fell before the end of June, by the time the Germans reached El Alamein their drive was almost spent. The first few days of July saw desperate fighting, but by July 5 the Germans had begun to establish a defensive screen. Both sides set about developing their defensive layout, and the heavy fighting which continued throughout July centred upon possession of the key ridges of Tel el Aisa in the north and Ruweisat, the backbone of the British defenses in the central sector.

The El Alamein line was the organization of a naturally defensive position about 60 mi. W. of Alexandria between the sea coast and the Qattara depression 35 mi. S. Like the Gazala position, it had been originally laid out as a series of mutually supporting boxes, but with the significant difference that the southern flank was closed by a sand sea generally impassable to large forces. Astride the coastal road lay Rommel's obsession, the El Alamein box itself, upon which the remaining defenses pivoted.

Once again the battle of supply bulked foremost. Rommel was now at the end of a long and frequently punctured pipe line (although an Allied combined operation to take Tobruk failed in September), whereas the Allies were defending their very base. While the toll of axis shipping mounted rapidly, the Allied build-up was for the first time swifter. Nevertheless, Rommel attacked first.

The 8th army, now under Montgomery's command, knew how the battle was to proceed. When Rommel advanced in strength on Aug. 31 to complete the "final annihilation," he was met on the strongly held Alam Halfa ridge, which dominated the southern sector, by massed artillery and tanks which refused to react to his design but fought a model defensive battle on ground of Montgomery's choosing. Close air support was employed as never before. As in May, Rommel had impulsively disregarded his maintenance in the rapid hope of a glittering prize: this time Egypt itself. Far in the rear, the coup de *grâce* was delivered by Air Bfarshal Sir Arthur (later Lord) Tedder's Wellingtons, which sank the fuel convoy in Tobruk which was Rommel's last hope of effective resupply. On Sept. 3 he began to withdraw. Montgomery had become a power in the sand, and the 8th army had acquired the morale and the master it needed for the battle of El Alamein.

(f) *Final* British Offensive (Oct. *1942–April 1943).*—To ensure the safe passage of the last convoy which could renew Malta's almost exhausted aviation spirit, the Allies needed possession of the Martuba group of airfields in the Jebel Akhdar by mid-November. Moreover, the North African landings ("Torch") were to take place early in the month. These requirements and the state of the moon and of Allied readiness set the date for Oct. 23.

By then the axis defenses were deeper and stronger. In the northern sector any Allied attack was intended to lose both force and direction within the system itself; in the south, where the defenses were less intricate, they were sited to canalize Allied penetration. Five Italian divisions were held in position by thick mine fields and a corset of German infantry. In the rear were four armoured divisions and the 90th light division. A further Italian infantry division stood on the frontier. Montgomery's design ("Lightfoot") was to feint in the south while he cut two corridors through the northern axis positions in a moonlit break-in operation with massed artillery support; to hold off the German armour during the "crumbling" operations which would ensue; and, in this dogfight, lasting perhaps ten days, to destroy the axis infantry and thus leave Rommel's armour without firm bases from which to manoeuvre or within which to refurbish. Then only did Montgomery purpose to release his own armour.

Before Oct. 23 the desert air force had conclusively won the air battle and thereafter devoted its full and successful attention to the close support of the land forces shown so effective at Alam Halfa. By Oct. 25 Montgomery had established a bridgehead in the northern axis positions and the dogfight was going well. He then developed his northern thrust by a series of fierce attacks, mainly by the 9th Australian division, the veterans of Tobruk, into a salient which menaced the coastal road and railway. Misled about his ultimate line of advance, the German Africa corps steadily congregated, not without severe losses, in the northern sector about Sidi Abd ur Rahman. Switching his thrust line swiftly, Montgomery, who by shrewd regrouping since Oct. 26 had been accumulating reserves as steadily as Rommel had been committing his. early on Nov. 2 (Operation "Supercharge") cut south of the German strength into the Italian positions. A quickly improvised axis anti-tank screen prevented the immediate break-through, but by Nov. 4 the 51st highland and the 4th Indian divisions had forced back the screen, and the Sherman tanks with which the United States had equipped the British armoured divisions (even at the expense of their own divisions in training) swept with the motorized New Zealanders out into open country. Heavy rain on Nov. 6 and 7 saved the axis forces from annihilation; but four German and eight Italian divisions had been drastically defeated, and 30,000 prisoners were taken.

The pursuit was rapid. The Martuba group of airfields was in Allied hands by Nov. 15, in time to support the convoy which left Alexandria next day. Benghazi fell on Nov. 20 and by Nov. 23 Rommel was back once more at El Agheila. The capture of El Agheila was psychologically important to the 8th army, with its memories of the annual retreat of the past. and as the gateway to Tripoli, its perennial target. In the event, Rommel partially false-fronted the British attack, and the remarkable December outflanking march of the New Zealanders over inland desert never before traversed by large forces failed to entrap many of the Germans who retreated to the Buerat position covering Tripoli. The main Allied difficulty was now administrative, and the size of the force which could be maintained as far as Tripoli was small. By the morning of Jan. 16, however, the "left hook" was beyond the Wadi Zem Zem, the main natural obstacle, and on Jan. 23, exactly three months after the El Alamein battle had begun, the 8th army entered Tripoli.

The next objective was the Mareth line, but first Tripoli had to be "uncorked." Only light forces advanced therefore into southern Tunisia. Between Feb. 28 and March 4, the 8th army was accordingly not well disposed for axis counterattack, yet it was increasingly evident that Rommel, having broken off his Tebessa attack against the 1st army, was turning south to deal the 8th army a blow before the united weight of Gen. Dwight D. Eisenhower's command could be brought against him. He was too late, for when he attacked on March 6 at Medenine with the 10th. 15th and 21st panzer divisions, Montgomery had made ready. In Rommel's last attack in Africa, he was decisively defeated in a single day in an engagement which again demonstrated Montgomery's mastery of the defensive battle.

The Long Range Desert group, a remarkable body of military explorers, had already found a way through the uncharted desert west of the Matmata hills which closed the western end of the Mareth line which the French had originally prepared. Behind the screen provided at Kasr Rhilane by Gen. Jacques Leclerc's Free French (who had joined Montgomery after their astounding march from Lake Chad), a large outflanking force was built up with Gen. Sir Bernard Freyberg's New Zealanders as a nucleus. A heavy frontal attack on the Mareth line proper was launched across the water-filled Wadi Zigzaou on March 20, but the German reaction was heavy. Montgomery straightway reinforced his left hook and by March 26, with the most effective close support by aircraft ever till then employed, he was able to force the axis switch line west of the hills before El Hamma and release an armoured division by moonlight through the disorganized axis forces. German reinforcements were too late; the 52 tanks they had lost at Medenine on March 6 were badly missed at El Hamma. The Mareth line had been turned, and only the axis forces holding the Wadi Akarit position (the "Gabès gap" between the Shott el Fejaj and the sea) stood between the 8th army and its U.S. comrades. The position was stormed in the dark early morning of April 6. The Germans held on throughout the day, but on April 7 British armoured cars made contact with tanks of the U.S. 2nd corps on the Gabès-Gafsa road. (For the rest of the Tunisian campaign, see *The North African Campaign, Nov. 1942–May 1943,* below. (E. T. Ws.)

3. Occupation **of** Madagascar. — The British had reason to believe that the Japanese, after the capture of the Andaman Islands, would seize the island of Madagascar either by force or through Vichy collaboration and thus cut off the last supply route to the middle east. In order to forestall a Japanese invasion, a British naval and military force under the command of Adm. Sir James F. Somerville attacked Diégo Suarez on May 6, 1942. The next day Diégo Suarez surrendered. After the occupation of this important naval base in the Indian ocean it was hoped that some degree of collaboration with the French administration would supervene which would enable the British to secure certain military objectives while still maintaining the machinery of French government in the island. By July it became obvious that the governor general, Armand Annet, although toying with the idea of collaboration, was really playing for time until the rains began in October, and that no sincere *rapprochement* could be expected from him. Lieut. Gen. Sir William Platt, who since July 1, 1942, had been in command of all British troops in Madagascar, therefore advised the chiefs of staff that further operations were essential. The plan proposed by General Platt, Admiral Somerville and Air Commodore M. L. Taylor was accepted. The offensive began on Sept. 10, and the same day the port of Majunga was conquered after slight resistance. Eight days later Tamatave surrendered; on Sept. 23 the British entered Antananarivo, the capital, where they were enthusiastically received by the population. Annet, however, and the pro-Vichy French forces withdrew southward, blocking all roads heavily as they went. At the end of September the British advance from Antananarivo was resumed. Antsirabe was occupied on Oct. 2 and Fianarantsoa on Oct. 29. On Nov. 4 Annet sent a plenipotentiary to obtain terms for an armistice. The British terms were accepted and hostilities ceased on Nov. 5. Annet was interned at Durban, and on Jan. 8, 1943, General Platt handed over the responsibility for the administration of Madagascar to Gen. Paul Legentilhomme, a representative of Fighting France under Gen. Charles de Gaulle. (K. SM.)

F. THE NEAR EAST CAMPAIGNS

1. Iraq. — Influenced by axis successes during 1940, the Iraqi government continued to maintain diplomatic relations with Italy, whose legation became the centre of axis intrigue and propaganda. Early in 1941, Rashid Ali el Gailani became prime minister; backed by four Iraqi generals, known as the Golden Square, he began to collaborate openly with the axis.

On March 31, 1941, the regent of Iraq took refuge on a British warship at Basra to evade arrest by his government. The British government, in accordance with its treaty rights, ordered an Indian brigade to Basra which arrived on April 18. Rashid Ali, on hearing that additional troops were coming from India, ordered the Iraqi army to attack the British air base at Habbaniya, 40 mi. W. of Baghdad. The Iraqi forces consisted of more than 9,000 troops with 50 guns while the garrison of Habbaniya numbered 300 British infantry (flown up from Basra), 1,000 royal air force personnel, 1,000 levees (mainly Assyrians) and no artillery.

On April 30 the Iraqi forces occupied a ridge overlooking Habbaniya and commenced bombardment by air and artillery. Until May 7 the position was critical; then the garrison, supported by British air forces from Egypt, drove the Iraqi forces, which had been reinforced by the German air force, back to Al Falluja on the Euphrates. Meanwhile, the Indian brigade advancing from Basra was delayed by floods and demolitions.

On May 18 a mechanized column consisting of British cavalry and the Arab legion of the emir of Trans-Jordan reached Habbaniya after marching about 560 mi. from Haifa, mostly across desert. This force secured Falluja bridge on May 19 and continued its advance, reaching the outskirts of Baghdad on May 30. The government of Rashid Ali, disheartened by the lack of adequate support from the Germans, thereupon fled the country. Resistance ceased and the regent was able to return and form a new government.

2. Syria. — During May 1941 Gen. Henri Dentz, the French (Vichy) commander in chief, had assisted the passage of German air forces to support Rashid Ali in Iraq. After the evacuation of Crete, the strategical importance of Syria increased; if occupied by the axis, it would constitute a threat against Turkey or Egypt. The Allies decided therefore that the country could not be left open to German infiltration and should be occupied. The degree of resistance to be expected from the French (Vichy) could not be assessed, but the presence of Free French forces with the Allies was expected to have a stiffening effect. The garrison of Syria consisted of about 30 battalions with 90 tanks. The Allies had available for this operation about 15 battalions made up of British cavalry, the 7th Australian division, 5th Indian infantry brigade and Free French forces, but no tanks. On June 8 the Allies crossed the frontier in three columns. The right column (Indian and Free French brigade), moving via Deraa on Damascus, was checked on June 10 ten miles short of that city. The centre (Australian) column captured Merjayoun on June 9, while the left column (Australian), moving up the coast, captured Tyre and forced the passage of the Litani river. Resistance to the advance stiffened thereafter, and Merjayoun was recaptured by a French counterattack. Only along the coast was slow progress maintained.

On June 21 a bold night attack by the 5th Indian brigade reached the outskirts of Damascus and captured the airfield, causing the French (Vichy) to evacuate the city. By the end of June the coastal column, supported by fire from a cruiser squadron of the royal navy, had taken Sidon and faced a strong position covering Beirut. The Allied force in the meantime had been augmented by a British infantry brigade from Egypt and farther east by forces released from the Iraq operations. The British mechanized column from Baghdad turned back across the desert and took Palmyra after hard fighting, while an Indian column moved unopposed up the Euphrates valley to capture Deir ez Zor.

On June 7 the 7th Australian division on the coast launched an attack to secure Beirut and was closely supported by effective fire from the cruisers. in the face of which resistance began to crumble, causing the French (Vichy) to ask for an armistice on July 11. This armistice was signed at Acre on July 14, and Syria passed into Allied occupation.

3. Iran. — During June and July 1941, reports began to reach the Allies of axis activity in Iran and of the infiltration of Germans described as "tourists." By the end of July. German activities had increased to an extent that compromised the neutrality of the Iranian government. After previous warning, on Aug. 16 the British and Soviet governments asked the government to expel all Germans. This request mas answered on Aug. 16 by an assertion on the part of the Iranian government of strict neutrality together with a denial of German subversive activities.

As a result of this unsatisfactory reply, British and Soviet troops moved into Iran on Aug. 25. British columns starting from Iraq were directed in the south on Abadan and Ahwaz and farther north on Kermanshah and Hamadan, while soviet columns advanced south on Tabriz and Pahlevi. After slight initial resistance, the Iranian army ceased fighting. A new government was formed in Tehran, and by Sept. 2 the basis of a settlement with the Allies had been reached.

On Sept. 16 the shah abdicated in favour of his son and on the same day British and soviet troops arrived at Tehran. All axis nationals. with the exception of 80 Germans who had disappeared into the mountains, were evacuated.

G. THE BALKAN CAMPAIGNS (1940–41)

1. The Greek-Italian War. — The occupation of Albania by Italian forces on April 7, 1939, caused a reorientation of the defense plans of the Greek government, which hitherto in accordance with previous Balkan agreements had been implemented for facing Bulgaria as a possible adversary. The distribution of troops was altered to deploy, for defensive purposes on the Albanian front, eight infantry divisions and two infantry brigades. The timing for concentration on this front was 22 days. The Greek air force comprised about 156 planes for all purposes, many of them of an obsolescent type.

In early Aug. 1940 Mussolini discussed in Rome the possibilities of an attack on Greece. The Greek light cruiser "Helle" was torpedoed by an unknown, "alleged Italian," submarine on Aug. 15, the day of the Feast of the Assumption. The Greek government, on advice from Berlin, acted with caution over this incident, but the event had an important psychological effect on the Greek people and added a religious zeal to the prosecution of the coming war against Italy.

On Oct. 12, 1940, and subsequent days Mussolini held conferences in Rome planning the attack on Greece. The date was fixed for Oct. 28. The Italian forces taking part were on a war footing, while the Greek army had not mobilized. The main Italian thrust, consisting of two infantry divisions and an armoured division, was directed through Epirus and was successful in forcing back Greek forces of one infantry division and one infantry brigade to the river Kalamas. In the centre on the Pindus mountains, an Italian mountain division drove in initially through two Greek battalions and almost reached the Metsovo pass but was unable to hold the ground gained in face of counterattacks. In the northeast, in the vicinity of the Prespa lakes, two Italian divisions attacked a Greek force consisting of one infantry division and one infantry brigade with similar results.

After two weeks of fighting, the Italian invasion had been checked and held by the Greek forces, whose divisions had concentrated on their respective battle fronts and gone straight into action. The mountainous nature of the terrain, with its lack of communications, made their supply difficulties acute. Greek peasants, men, women and children from the villages adjacent to the lines, carried up ammunition and rations to the forward troops. The Greek air force, which by this time was reduced to low numbers, was reinforced by five British squadrons from the middle east.

After Nov. 14, 1940, the initiative passed to the Greek forces. On the northeast front, in a hard battle in which five divisions were engaged on each side, the Greek forces captured the town of Koritsa (Korce, Kortcha); on the Epirus and central fronts, the Greeks forced back the Italians toward the frontier and by Nov. 16 had retaken Konitsa. At this juncture Gen. Alexandros Papagos, the Greek commander in chief, was faced with having to decide whether to continue the defensive in the northeast, where the greater successes had been achieved but where they were faced with very mountainous terrain and no definite objective, or to concentrate on the Epirus front for a thrust against the port of Valona. The maintenance of communications for such an operation could be assisted by using sea transport. The latter course was decided upon and resulted in the capture of the port Santi Quaranta (Aghioi Saranta) and the town of Gjinokaster (Argyrocastro) by Dec. 8, while on the rest of the front parallel advances were made in the course of heavy fighting through mountains. In the centre progress had been made in the Aoos valley and Premeti was captured. Additional attempts to reach Valona secured the port of Chimara on Dec. 28, but further offensive was brought to a standstill by heavy snow conditions. The strength of the forces engaged at the end of the year was as follows: Italians, 16 divisions; Greeks, 11 divisions, 2 infantry brigades and 1 cavalry division.

In Jan. 1941 the Greek command transferred the axis of attack to the centre sector. The offensive, initially successful, came to a halt by the end of the month after the capture of Boubessi but short of Tepelini, where it encountered many divisions freshly arrived from Italy. During February the Italians were still further reinforced and between March g and 25 launched a counteroffensive on a narrow front between Trebesina mountain, east of Tepelini and Boubessi, employing 12 divisions. This attack was stopped with heavy losses and no appreciable gain by six Greek divisions, while spasmodic fighting flared up all along the front. The forces engaged at the end of March were: Italian, 26 divisions; Greek, 14 divisions, 2 infantry brigades and 1 cavalry division.

The hard fighting, combined with bitter conditions prevailing in the Pindus mountains during the winter, had taken its toll of Greek manpower in casualties from battle and frostbite. Throughout the campaign, because of the lack of communications in the mountainous country, the maintenance of front-line troops imposed a great strain on all transport resources as well as on the troops themselves, who frequently had to resort to manhandling supplies.

The Italians were better situated in this respect, as the port of Valona and the communications radiating from it were not seriously disrupted. It was this background of conditions that the Greek command had to face when, at the end of March, the Germans were ready to strike from Bulgaria and the action of Yugoslavia was uncertain.

2. German Occupation of Rumania and **Bulgaria.**—During 1940 the occupation by the U.S.S.R. of the two Rumanian provinces of Bessarabia and Bukovina in June and the Italian attack on Greece on Oct. 28 disposed of any German intention of avoiding a commitment in the Balkans.

The joining of the axis by Rumania on Nov. 23, 1940, followed shortly by the infiltration into 'that country of German troops, secured the oil supply from the Ploesti fields and was a preliminary to the occupation of Bulgaria.

On March 1, 1941, Bulgaria joined the axis and the following day German troops commenced to cross the river Danube. In the occupation of Bulgaria the German forces found themselves in contact with two states, Yugoslavia on the west and Turkey to the southeast, whose attitude was so far undetermined. Forces therefore had to be detailed to cover these frontiers and had to be in sufficient strength to overawe the respective governments and prevent their taking action.

The German forces which entered Bulgaria consisted of 17 divisions (including 5 panzer), of which 8 were intended for the operations in Greek Thrace. Their deployment was completed within approximately a week of crossing the Danube, but the build-up of air forces and supplies necessitated a pause; the stage was thus set for carrying out the occupation of the northern Aegean coast line at the end of March.

3. German Conquest of Yugoslavia and Greece.—The attitude of the Bulgarian government to the German infiltration into Rumania, which was nearly completed by the end of Jan. 1941, left no doubt that the German armies would be granted a free passage through that country for an attack on either Turkey or Greece. The Greek armies at that time were heavily engaged in Albania, where 300,000 troops were deployed on the front between Lake Ohrid and the Adriatic.

To replace heavy casualties in the Albanian fighting, the Greek garrisons of the fortified line in eastern Macedonia, covering Salonika against an attack from Bulgaria, had been heavily drawn upon. Faced with the possibility of a German attack from this direction, the Greek government on Feb. 8, 1941, asked the British government what help could be afforded to it in case of such a development. As a result it was agreed that a British force would be sent to Greece to hold a position west of Salonika, which included the Aliakmon river and the Vermion range. This force mas to be augmented by the Greek garrison from Thrace and eastern Macedonia, considered strategically indefensible in view of the forces available. This plan envisaged Yugoslavia, whose attitude was in doubt, either acting as an ally or a strict neutral, to cover the northern flank. In face of the menace of a German attack from Bulgaria, the soundest strategical course would have been to withdraw the Greek armies on the Albanian front to a shorter line and thereby produce reserves which could be used as required for operations in northeast Greece. The Greek commander in chief, however, had to discard this plan in view of the disastrous effect it might have on the morale of the Greek soldiers.

The force for holding the Aliakmon-Vermion line was altered subsequently to three Greek divisions and seven independent battalions. The eastern Macedonia defenses were held by three divisions. On March 7 the first British contingent (1st armoured brigade group) began to arrive in Athens and moved to an area west of the river Vardar, where it completed its concentration by March 21.

Meanwhile, heavy pressure was being brought to bear by the Germans on the Yugoslav government to join the Tripartite pact which, after much vacillation, was signed in Berlin on March 25. The Yugoslavs considered this agreement an infringement of their sovereignty. On March 27 a coup d'état organized by Gen. Dushan Simovich expelled the regent and overthrew the government. A new government was formed in Belgrade, but a paralysis of indecision descended on it, and several days were lost while a state of uncertainty existed as to what courses should be adopted politically or strategically. Meanwhile, the German high command had ordered an attack on Yugoslavia to be ready in eight days. The Yugoslav armies were in a state of semimobilization, ill equipped and lacking in modern weapons, tanks, anti-tank and anti-aircraft guns.

On April 6 the axis attack started with heavy bombing attacks on Belgrade, while land operations took the form of thrusts inward from all round the perimeter. These thrusts were successful in dividing the Yugoslav army and eliminating it in detail. The German columns which moved through Stip were directed on Skoplje and Bitolj with the object of getting in touch with the left flank of the Italian armies in Albania and isolating the Yugoslav forces from Greece. The head of these columns reached Bitolj on April 8 and by April 9 had completed its task of cutting off the Yugoslav forces, which, by this time, were no longer capable of organized resistance. The inevitable result was that Yugoslavia passed under German domination on April 17, within 11 days of being attacked.

The German column moving via Strumica bypassed the Greek defenses in eastern Macedonia and erupted down the Vardar valley into the Salonika plain, where it came into contact with British troops on April g.

The collapse of Yugoslav resistance and the occupation of Bitolj by German forces threatened the Anglo-Greek army in process of occupying the Aliakmon-Vermion position, as any advance down the valley running from Bitolj to Kozani would take that position in flank and reverse, the terrain offering easy movement for armoured fighting vehicles except for a gap with poor facilities for defense near Florina.

The imperial forces had meanwhile been augmented by the arrival of the New Zealand division and two-thirds of the 6th Australian division, which enabled a hastily improvised flank guard to be collected and established to watch the Florina gap. This detachment was in position by April g and in touch with the 20th Greek division on the Vermion range on the right, and a Greek cavalry division with one Greek infantry brigade under command detached from the Albanian front on the left, about Nymphaion.

A heavy bombing attack by the German air force on Piraeus harbour on April 7 caused considerable dislocation to the working of the port, which never regained its former capacity. From April 8 to 11, air operations were on a small scale because of bad weather.

The collapse of resistance in Yugoslavia placed the Anglo-Greek army in a difficult situation. Its flank was threatened by a force of one armoured and one infantry division from the direction of Bitolj, while on its front a German corps was west of the river Vardar and in contact. The Aliakmon-Vermion position was held too lightly for its length of front to offer protracted defense, and it was doubtful how long the detachment guarding the Florina gap could hold on in face of the superior forces opposed to it. It was decided therefore to fall back to a line running from Mt. Olympus through Servia and then northward along the mountain ridge east of and parallel to the upper section of the Aliakmon river.

The German advance from Bitolj crossed the frontier on April 10 and became heavily engaged with the flank guard. A two-day battle was fought in a snowstorm in which the Germans were able to make some slight progress. While this fighting was taking place, the withdrawal from the Aliakmon-Vermion position started on the night of April 11–12 and was completed by the morning of April 13; the flank guard covered by the 1st British armoured brigade thereupon fell back on Kozani.

During these three days' operations, the forecast of General Papagos as to the effect a withdrawal would have on the morale of the Greek army became manifest. His divisions had not been trained to carry out such a complicated manoeuvre as a retreat, and signs of disintegration were beginning to appear. In consequence it was decided to withdraw all forces east of the upper Aliakmon river to its western bank.

Up to April 14, except for the heavy bombing of Kozani, the activity of the German air force was limited while the small British air force engaged German columns. With the improvement of weather conditions, the German air force came into operation again; and its attacks became continuous, widespread and intense, directed mainly on road and rail communications.

Though the Anglo-Greek army in central Macedonia still presented an intact front, the general situation was far from satisfactory. The weakness of the left of the Greek forces in the upper Aliakmon valley and the gap between the left of the Greek cavalry division and the armies in Albania were being exploited by the Germans and would shortly become a menace. To meet this situation it became necessary to withdraw all Allied armies to a shorter line in order to retain an intact front.

On April 14, General Papagos approved the further withdrawal of the Anglo-Greek army to a line through Thermopylae to which the armies in Albania would conform. He suggested at the same time that the British forces should withdraw from Greece to save the country from devastation.

On April 15, fighting developed in the Mt. Olympus area, in which Australian and New Zealand troops were engaged. The withdrawal commenced on April 17 and was largely carried out by night to avoid German air attacks. By April 20 the occupation of the new position was complete, with the New Zealanders holding the famous Thermopylae pass and the 6th Australian division the Brailos pass farther inland.

On April 18 Alexandros Korizis, who had succeeded Ioannis (John) Metaxas as prime minister, committed suicide, and King George II became acting head of the government. As a result of conferences following this crisis it was decided with the full approval of the Greek king and government that the evacuation of the imperial forces was essential, and the first night for embarkation was fixed for April 28. Events in Epirus, however, caused the evacuation to be advanced four days; on April 21 the German Adolf Hitler division had reached Ioannina (Janina) and the local commander, without reference to the high command in Athens, had ordered the capitulation of the whole of the Greek army in Epirus. The embarkation was set therefore to commence on the night of April 24–25 and to be completed in three nights. The port of Piraeus was unusable but still remained a target for German bombing. Nine embarkation points, consisting of small ports and open beaches, were selected on the coast line between Marathon to the north, east of Athens, and Kalamati in the south of the Peloponnesus.

The rearward movement to the beaches began on the night of April 22–23 and was carried out without interference until April 24, when a German attack in force with tanks along the coast on Thermopylae was repulsed by the 6th New Zealand infantry brigade.

The royal navy with the light forces of the Mediterranean fleet carried out the embarkation and transport of troops by sea. By using fast warships for the journey to and from Crete, rigidity in the plan could be avoided and embarkation points altered to suit the tactical situation on land. The movement by sea was subjected to continuous attacks by the German air force by day and cost the loss of some warships and transports. The destruction of the remaining British fighters on an airfield at Argos gave the Germans complete superiority at this time.

The evacuation was completed by April 28–29, but at Nauplion and Kalamati the Germans were successful in cutting off certain detachments which could not be embarked.

The number of British Commonwealth troops sent to Greece was approximately 57,660. Of these, 43,000 were taken off, but all equipment had to be jettisoned. Of those embarked, 27,000 were landed in Crete and the remainder transported to Egypt.

The inability of the Italian forces in Albania to achieve success over the Greeks, the Yugoslav coup d'état and the presence of British forces in central Macedonia forced the German high command to a commitment considerably in excess of its original concept. In all, 27 German field divisions (including 7 panzer divisions) became involved in the campaign against Greece and Yugoslavia, in terrain which precluded rapidity of movement, thereby causing difficulties when it came to extrication.

By April 21, information had reached Athens through Balkan railway sources that a comprehensive and carefully worked out railway movement of troops from southeast Bulgaria to Galicia had been dislocated by the diversion of these troops to the Greek and Yugoslav fronts. That such a concentration was contemplated could portend only that a German attack on the U.S.S.R. was imminent. It could be assessed that in the extrication of their divisions from the Balkans the German high command lost from four to five weeks before completing its preparations for the attack on Russia, which took place on June 22. This delay, if studied in conjunction with the German attempt to take Moscow before the end of 1941 and the advent of an early winter, played no inconsiderable part in the final outcome of World War II.

4. The Conquest of Crete.—The capture of Crete became necessary to the German high command after the occupation of Greece in order to secure sea communications in the Aegean and to provide fields for air action against the middle east and Mediterranean shipping routes. Crete, a mountainous island 160 mi. long by 40 mi. broad, offered poor facilities for defense against an attack from Greece since its one lateral road, harbours and airfields were all located along its northern shore. All Allied shipping therefore had to pass through the narrow waters between either Greece or Rhodes, held by axis forces.

The imperial garrison consisted of 28,000 troops, most of whom, having been evacuated from Greece, were short of equipment and supporting weapons. The defense was disposed along the northern coast to cover the airfields of Malemi and Rethymnon (Retimo), the port and harbour of Heraklion and the naval base at Suda bay. The German air force was in such superiority in attacking shipping and airfields that all British aircraft were withdrawn before the main operation. The main attack started with the heavy bombing of Malemi aerodrome in the northwest corner of the island at dawn on May 20 and was followed by parachutists and gliders. In the afternoon similar tactics were employed against Rethymnon and Heraklion. In all about 7,000 troops were landed during the day. Casualties were extremely heavy, and only at Malemi had the attack established itself. At night counterattacks by New Zealand troops were at first successful, but at dawn they were compelled to abandon ground because of heavy bombing.

During May 21–22, heavy fighting took place around Malemi aerodrome, while German forces were continually landing from troop carriers. This enabled a sufficient force to be built up at Malemi to advance toward the town of Canea (Khania).

During the nights May 21–22 and 22–23, German attempts to reinforce by sea, using a large number of small craft, were frustrated by the royal navy, which caused considerable casualties but at the same time suffered losses itself from bombing after daylight.

Heavy fighting continued through May 24–25, the German attacks on Canea continuing to make progress; at Heraklion two British battalions landed on the south coast, marched overland and eased the pressure. German detachments, however, isolated the Rethymnon garrison by cutting the road east and west of the airfield.

On May 27 the Germans succeeded in breaking through the Allied defenses covering Canea and thereby rendered Suda bay untenable. The continuous fighting and uninterrupted air bombing were beginning to exhaust the power of the defense with the result that on that day the decision was made to evacuate. The losses suffered by the royal navy from axis bombing made it imperative that the evacuation should take place in the shortest possible time, and it was decided that all should be completed by the night of May 31–June 1. The imperial forces in the Canea area, consisting of Australian and New Zealand brigades, British marines and commandos with tank and artillery units, withdrew over the mountains to the small port of Sphakia on the south coast, where embarkation started on the night of May 28–29 and was carried out without undue interference. At Heraklion the evacuation was completed on the night of May 28–29 from that port in warships, thereby avoiding a German attack which was in preparation. The isolated Australian and Greek garrison at Rethymnon, having received no orders to withdraw, continued fighting until May 31, when it was overwhelmed.

There were 27,550 imperial troops in action at the commencement of the attack; of these, 14,580 were evacuated. The German losses were estimated at between 12,000 and 15,000, which included a very high percentage of killed.

The German success was attributable to the manner in which a completely superior air force was handled in conjunction with air-borne troops. The defenders had many difficulties to contend with as most of the troops had been evacuated from Greece, having left behind their supporting arms, while communications on the island were limited to one road parallel to the north coast, connecting the two harbours. The German air-borne troops suffered such casualties that they could not be reconstituted before the autumn. It also had the effect that an operation on such a scale was never again attempted. (H. M. Wn.)

H. THE GERMAN-RUSSIAN WAR

The course of history was changed when Hitler invaded the U.S.S.R. on June 22, 1941, a day ahead of the anniversary of Napoleon's invasion. That move ultimately proved as fatal for him as it had for Napoleon. The effect was most immediate on Britain's situation. Until then its prospects had appeared hopeless in the eyes of most people except its own, for its situation was far worse under modern conditions of war than it had been in Napoleon's time. Its government's decision to continue the struggle after the fall of France and reject Hitler's peace offers could spell only slow suicide unless relief came from one or other of the two remaining great powers. Otherwise, even if a German sea-borne invasion failed, the concentrated development of submarine and air pressure on Britain's sea communications was bound to produce eventual collapse.

Hitler brought Britain relief by turning east, just as the strain was becoming severe. That eastward turn was influenced by Britain's stubborn resistance but had deeper promptings. He had always contemplated the overthrow of the Soviet Union. Though he had brought himself to make the 1939 pact as a matter of expediency, antibolshevism was his most profound emotional conviction. arising from fear even more than from ambition. It had been stirred up afresh before he even considered the question of invading Britain. For early in June 1940, while he was still engaged in the French campaign, Stalin had seized the opportunity to occupy the three Baltic states. Then on June 26, again without notice to Hitler, Russia addressed a 24-hr. ultimatum to Rumania demanding the restoration of Bessarabia, together with the surrender of northern Bukovina. The Russian forces poured in immediately, as Rumania yielded. That placed them ominously close to the oilfields on which Germany depended. Hitler became acutely suspicious of Stalin's intentions and began to feel that he could not afford to wait to complete the subjugation of the west before dealing with Russia.

A provisional plan for a stroke against Russia was worked out in the late summer of 1940 and elaborated in the autumn. The doubts of his generals merely served to give the new turn of his mind a more definite bent. Their doubts suggested that they still distrusted his military judgment; he must prove them wrong once again, and more strikingly. When they argued that it meant war on two fronts, he retorted that to overcome Britain would require an expansion of the air force and navy at the expense of the army, and that this could not be risked while Russia remained a menace. In that mood he did not share his diplomatists' moderate satisfaction over the result of the November discussions with Vyacheslav Molotov in Berlin, but only noted the Russians' hesitation to join the axis. On Dec. 18 he issued "Directive No. 21, Case Barbarossa." which opened with the statement: "The German armed forces must be prepared to crush soviet Russia in a quick campaign before the end of the war against England."

On Feb. 3, 1941, Hitler approved the final draft of the plan and had it presented to a conference of his chief soldiers. Their anxieties were not diminished by the balance sheet, which showed that the invasion would have to be made with an inferiority of numbers, in tanks as well as men, and must trust to an offsetting superiority of quality. That deficiency of strength became a handicap even before the offensive was launched. For Hitler was anxious to safeguard his Balkan flanks before striking at the U.S.S.R. and had hoped to secure this by power diplomacy alone, without fighting. That hope was impaired, to his annoyance, by Mussolini's independent aggression against Greece, which opened up the prospect of a British army's being landed there. This threat led Hitler to decide that he must overcome Greece and clear out the British before he could proceed with his eastern plan. But the effort entailed was much increased when Yugoslavia's adhesion to the axis was upset by a military coup d'etat in that country on March 27. Larger forces had now to be sent south to crush Yugoslavia simultaneously with Greece. Both nations were quickly overrun while the British were hustled back into their ships. But Hitler's decision, on April 1, to mount this double offensive had entailed the postponement of the Barbarossa plan from the middle of May to late June. By the swiftness of his Balkan victories he was able to keep to this revised timetable, but the five weeks' delay shortened the time for carrying out his attempt to conquer the U.S.S.R., and that delay proved the more serious because in 1941 the Russian winter arrived earlier than usual. But spring was late that year, so that the rivers were still in flood and the ground soft until nearly the middle of June. It would thus have been practically impossible for Hitler to have launched his invasion of the U.S.S.R. more than a week or so earlier than he did. A greater hindrance to his chances of victory was that the German intelligence service underestimated the reserves that Stalin could bring up from the depths of the U.S.S.R. It correctly estimated that there were about 150 divisions in western U.S.S.R. and reckoned that a further 50 might be produced. But the Russians actually brought up more than 200 fresh divisions by the middle of August, making a total of 360. The consequence was that although the Germans (who launched their invasion with 120 divisions only) succeeded in shattering the original Russian armies by superior technique, they then found their path blocked by fresh armies. The effects of the miscalculations were increased because much of August was wasted while Hitler and his chief advisers were having long arguments as to what course they should follow after the initial victories.

1. To the Outskirts of Moscow.—The German offensive was delivered on June 22, 1941, by three army groups under the same commanders as in the 1940 invasion of the west. Field Marshal Gerd von Rundstedt was on the right, in southern Poland. Field Marshal Fedor von Bock was in the centre, north of the Pripet marshes. Field Marshal Wilhelm von Leeb was on the left and drove through the Baltic states. But this time the main weight, and the decisive role, was committed to Bock's army group. Two armoured groups (later rechristened "armies"), under Gen. Heinz Guderian and Gen. Hermann Hoth, were allotted to Bock's front, compared with only one, under Kleist, to Rundstedt's front. Once again the issue turned, not on the infantry masses, but on the armoured forces. These had now been increased from 10 divisions to 20, but only by halving the number of tanks in each division.

The invasion profited at the start from the way the Russian position in Poland formed two salients, which lent themselves to pincer strokes. The German command hoped, by these means, to wipe out the Russian armies before reaching the Dnieper, and then have a clear path. The northern salient was quickly pinched off by Guderian and Hoth. Piercing its Brest-Litovsk (Brzesc) flank, Guderian drove 50 mi. deep on the first day, and on June 27 reached Minsk (200 mi. inside the frontier), where he joined hands with Hoth. But Bock's infantry armies, following on, were not quick enough to complete the encirclement. About 300.000 prisoners were taken, but a large part of the enveloped Russian armies forced their way out of the trap. Although these were clumsily handled and frittered their tank strength away in piecemeal action like that of the French in 1940, the isolated troops fought with a stubbornness that the French had not shown, and their resistance imposed a brake by the way it continued to block road centres long after the German tide had swept on.

The German armoured groups now drove on eastward. Guderian crossed the Dnieper on July 10 and reached Smolensk on July 16. There another big encirclement was achieved, in conjunction with Hoth. But the ring was not completely closed, as the foot-marching infantry was still far behind. Although a further 200,000 Russians were captured, a sufficient number escaped to help the newly arriving reserves from the east in building up a fresh resistance along the Desna.

In this latest German hound a series of rainstorms also came to the aid of the Russians, turning the sandy roads into clogging mud. Even when the tanks could have pushed on they were held back because their transport—composed of heavy, wheeled vehicles—was bogged. The Germans had owed their success to the measure in which they were mechanized, but from now on they paid forfeit for not being fully mechanized. If their striking force had been equipped entirely with tracked vehicles they would have suffered fewer checks from the combination of bad weather and the Soviet Union's primitive roads.

Nevertheless the Germans had advanced more than 400 mi., and come within 200 mi. of Moscow, by mid-July. They still had ample time to gain a decisive result before the winter, but lost it primarily because Hitler wasted several weeks in making up his mind about the direction of the next move. He hesitated whether to swing north for Leningrad, south for Kiev or to drive on to Moscow, as Bock and Guderian wished. Brauchitsch was not strong enough to impose a clear-cut decision on Hitler.

Meanwhile, Rundstedt's army group had been driving forward through southern Poland with little difficulty despite the greater strength of the Russian armies there. These mere thrown off their balance by the invasion and fell back eastward in confusion. In the next phase, Rundstedt's advance was delayed by flank counter-attacks from the Pripet marshes. But at the end of July, Kleist's tanks broke through Gen. (later Marshal) S. M. Budenny's front south of Kiev and made a scythelike sweep down through the Ukraine toward the Black sea. The mouths of the Bug and the Dnieper were reached by mid-August, trapping a large part of the southern Russian armies which were opposing the advance from Rumania. Hitler now decided to shift his centre of gravity and carry out another great encircling manoeuvre near the junction of Bock's and Rundstedt's army groups. Kleist was ordered to wheel northward again, and Guderian southward, to close the pincers behind the Russian armies assembled around Kiev. This trap succeeded, and 600,000 prisoners were taken. But it was late in September before the victory was completed, and winter was approaching.

Elated by this great success, Hitler decided to resume the advance on Moscow, while Kleist was again sent south, to form the spearhead of a continued advance southeastward by Rundstedt, from the Dnieper to the Don, on the road to the Caucasus. Leeb's advance through the Baltic states had reached the outskirts of Leningrad, but Hitler cancelled the intended assault, fearing to become entangled in city fighting. Rightly, he deemed it wiser to rely on the German superiority of manoeuvre in the open, but he had lost the best two months of the summer, when the open country was good going. He also handicapped his chances by splitting his effort in divergent directions.

The renewed advance on Moscow began on Oct. 2. Its prospects looked bright when Bock's armies brought off a great encirclement round Vyazma, where an additional 600.000 Russians mere captured. That left the Germans momentarily with an almost clear path to Moscow. But the Vyazma battle had not been completed until the end of October; the German troops were tired, the country became a morass as the weather got worse, and fresh Russian forces appeared in the path as they plodded slowly forward. Some of the German generals wanted to break off the offensive and take up a suitable winter line. But Bock wanted to press on, believing that the Russians were on the verge of collapse, while Brauchitsch and Halder tended to agree with his view. As that also accorded with Hitler's desire, he made no objection. The temptation of Moscow, now so close in front of their eyes, was greater than any of the topmost leaders could resist. On Dec. 2 a further effort was launched, and some detachments penetrated into the suburbs of Moscow; but the advance as a whole was held up in the forests covering the capital.

2. Russian Winter Counteroffensive.—This was the signal for a Russian counteroffensive of large scale, prepared and directed by Gen. (later Marshal) G. K. Zhukov. It tumbled back the exhausted Germans, lapped round their flanks and produced a critical situation. From generals downward. the invaders mere filled with ghastly thoughts of Napoleon's retreat from Moscow. In that emergency Hitler forbade any retreat beyond the shortest possible local withdrawals. His decision exposed his trcops to awful sufferings in their advanced positions facing Moscow, for they had neither the clothing nor equipment for a Russian winter campaign; but if they had once started a general retreat it might easily have degenerated into a panic-stricken rout.

In the south, Kleist's drive had reached Rostov. near the mouth of the Don, on Nov. 23; but it had exhausted its fuel in plowing through the mud. The glamour of attaining this "gateway to the Caucasus" impelled Hitler to insist on staying there, although Rundstedt tendered his resignation rather than commit such a folly. Within a week the Germans were thrown back by a Russian counterstroke there. For a moment their situation looked grave, but they managed to hold on to the defensive line of the Mius river, which Rundstedt had chosen before his removal.

The soviet army's winter counteroffensive continued for more than three months after its December launching, though with diminishing progress. By March 1942 it had advanced more than 150 mi. in some sectors. But the Germans maintained their hold on the main bastions of their winter front—such towns as Schlüsselburg, Novgorod, Rzhev, Vyazma, Briansk, Orel. Kursk, Kharkov and Taganrog—despite the fact that the Russians were often many miles in the rear. In retrospect, it became clear that Hitler's veto on any extensive withdrawal worked out in such a way as to restore the confidence of the German troops and probably saved them from a widespread collapse. Nevertheless, they paid a heavy price indirectly for that rigid defense. Its success encouraged the belief that it could be as successfully repeated in the more adverse conditions of the following winters. A more immediate handicap was that the strength of the *Luftwaffe* was drained in the prolonged effort to maintain supplies by air, under winter conditions, to the garrisons of these more or less isolated bastion towns. The tremendous strain of that winter campaign, on an army that had not been prepared for it, had also a serious delayed effect in other ways. Before the winter ended, many divisions were reduced to barely a third of their original strength. They were never fully built up again. The unfavourable aspects of the situation were realized by the German general staff, but its heads now had less power to influence Hitler's decision. Hitler's pressure was too strong for them to resist, and the pressure of events was too strong for Hitler. He was compelled to go on and on. The weight of military opposition was weakened by the changes in the higher commands which followed the miscarriage of the 1941 campaign. When the failure of the whole campaign was plain to the world. the removal of Brauchitsch was announced. That act served the dual purpose of furnishing Hitler with a scapegoat and opening the way for him to take over direct command of the army.

3. German Advance to the Caucasus.—The plan to launch another great offensive crystallized in the early months of 1942. Hitler's decision was influenced by pressure from his economists. They told him that Germany could not continue the war unless it obtained oil supplies from the Caucasus, a view that was proved mistaken by the fact that Germany failed to secure the Caucasus oil yet managed to continue the war for three more years. But Hitler was the more responsive to such economic arguments because they coincided with his urge to do something positive and offensive. He was led, however, to recognize the limitation of Germany's resources to the extent of admitting the necessity of limiting the scope of his new offensive. The main effort was to be made on the southern flank near the Black sea.

The most effective factor in clearing the path for the German advance mas a Russian offensive toward Kharkov. which began on May 12. This was a premature effort, beyond the powers of the soviet army at this stage in face of the Germans' defensive skill. The prolongation of this Kharkov offensive played into the Germans' hands, absorbing too large a part of the Russians' reserves. Moreover, although the Russians succeeded in parrying the immediate counterstroke which the Germans launched against the southern flank, this gained a valuable leverage for the future by reaching the Donetz river near Izyum. On June 3, preliminary to the main offensive, a siege assault was launched against the fortress of Sevastopol though it was not until July 3 that the fortress, and with it the whole Crimea, was completely in German hands. On June 10 the Germans exploited their Izyum wedge by forcing the passage of the Donetz and gaining a bridgehead on the north bank. This created an invaluable flanking leverage to assist the easterly thrust of their main offensive, which was launched on Tune 28.

The 4th panzer army broke through in the sector between Rursk and Byelgorod and swept rapidly across the 100-mi. stretch of plain to the Don near Voronezh. It then wheeled southeastward into the corridor between the Don and the Donetz, followed by the 6th army, which had the mission of taking Stalingrad. These operations tended to cloak the menace that was developing on the right wing. For a more dangerous thrust was being delivered'by Kleist's 1st panzer army from the Kharkov sector. After achieving a quick break-through, it drove toward the lower Don at and above Rostov. There it gained a crossing, with little opposition, on July 22, after an advance of about 250 mi. from the starting line. The German armies now forked on divergent courses: part for the Caucasus oil fields, and part for the Volga at Stalingrad. After crossing the lower Don, Kleist's right column drove southward through Armavir to the great oil centre of Maikop, zoo mi. beyond Rostov, which it reached on Aug. 9. On the same day the van of his centre column swept into Pyatigorsk, 150 mi. to the east of Maikop, on the outskirts of the Caucasus mountains.

The pace of this early August onrush beyond the Don was terrific. But it slowed down almost as suddenly as it had developed. The prime causes were a shortage of fuel and an abundance of mountains. That dual brake was subsequently reinforced by the distant effect of the struggle for Stalingrad, which drained off a large part of the forces that might have been used to give a decisive impetus to the Caucasus advance. The first serious check occurred on reaching the Terek river, which covered the approaches to the mountain road over to Tiflis. Kleist then tried a manoeuvre to the east, downstream, and succeeded in forcing a passage near Mozdok in the first week of September. But his forces were held up again in the densely wooded hills beyond the Terek. Throughout September and October, Kleist went on trying to push south from Mozdok, by surprise attacks at different points. At each attempt he was blocked. The front was then stabilized, with the Germans still facing the mountain barrier which they had vainly tried to pierce. This final repulse in the central Caucasus coincided with the opening of the great Russian counteroffensive at Stalingrad.

4. Turning Point at **Stalingrad.**—The German command might have captured Stalingrad with little difficulty at the end of July if it had not overestimated the capacity of the Russians to hold Rostov and the lower Don. For the 4th panzer army was temporarily diverted southward to help the 1st, which, in fact, needed no such help. When the postponed thrust to Stalingrad developed a fortnight later, the Russians had gathered just sufficient forces to check the advance. Another fortnight passed before their resistance was loosened by the advance of the German 6th army, under Gen. (later Field Marshal) Friedrich Paulus, eastward across the Don bend. The last week of August had thus arrived before the Germans were ready to begin the final stage. The tenseness of the situation was manifested in the tone of the call to the Russian troops to hold on at all costs to the last man. They responded to the call with wonderful endurance. Attack followed attack in seemingly endless succession, with frequent changes of site and method, but with only slight progress to compensate for the attackers' cost. The more closely the Germans converged on the city, the more their own power of manoeuvre became cramped, whereas the narrowing of the frontage helped the defender in moving his reserves more quickly to a threatened point on the diminished arc. At the same time, the Germans' concentration at Stalingrad increasingly drained reserves from their flank cover, which itself was already strained by having to stretch so far, nearly 400 mi. from Voronezh along the Don to the Stalingrad "isthmus," and as far again from there to the Terek.

On the surface, the defenders' position came to appear increasingly perilous, or even desperate, as the circle contracted and the Germans came closer to the heart of the city. The most critical moment was on Oct. 14. The defenders now had their backs so close to the Volga that they had little room left in which to practice shock-absorbing tactics. But beneath the surface fundamental factors were working in their favour. The attackers' morale was being sapped by heavy losses, a growing sense of frustration, and the coming of winter, while their reserves were so fully absorbed as to leave the overstretched flanks without resiliency. They were thus becoming ripe for the counterstroke which the Russian command was preparing. It was launched on Nov. 19 and was well timed. It started in the interval between the first strong frosts, which hardened the ground for rapid movement, and the heavy snows, which clogged manoeuvre. A pair of pincers, each composed of several prongs, was inserted in the flanks of the Stalingrad attack, so as to isolate the 6th army and 4th panzer army. The pincers were driven in at places where the flank cover was largely provided by Rumanian troops. The plan was devised by a brilliant triumvirate of the Russian general staff, Zhukov, Gen. (later Marshal) Alexander M. Vasilevsky and Gen. (later Marshal) Nikolai N. Voronov. By Nov. 23 the encirclement was completed. It was welded more firmly in the days that followed, enclosing about 250,000 Germans.

Meanwhile, another powerful Russian force had burst out of the Serafimovichi bridgehead and spread over the country west of the Don bend. This outer-circle movement was of vital importance, for it dropped an iron curtain across the more direct routes by which the relieving forces might have come to the aid of Paulus. Thus, the German reply, in mid-December, was delivered from the southwest, beyond the Don, up the line from Kotelnikovo to Stalingrad. But this hastily improvised advance was checked a long way short of the beleaguered army and then gradually forced back by Russian pressure on its own flank. With the frustration of this attempt any hope of relieving Paulus passed, for the German command had no reserves for another attempt.

Hitler was at last brought to realize the inevitability of a disaster greater even than the Stalingrad encirclement if he persisted in his dream of conquering the Caucasus and compelled the armies there to cling on while their flank was exposed for 600 mi. back. So, early in Jan. 1943, the order was sent that they were to retreat. The decision was taken just in time for them to escape being cut off. Their successful extrication prolonged the war, but it preceded the actual surrender of the Stalingrad armies in making clear to the world that the German tide was on the ebb. Paulus' army at Stalingrad surrendered on Feb. 2, 1943, at the same time as Kleist's army from the Caucasus recrossed the Don at Rostov. The latter could hardly have escaped if Paulus' army had yielded any time during the first seven weeks after its encirclement. Its sacrifice detained Russian forces that could otherwise have poured down upon Kleist's line of retreat and swamped the improvised army group under Field Marshal Erich von Manstein which was covering Kleist's rear. Even as it was, those two held off the Russians' outflanking pressure by the narrowest of margins. In terms of time, space, force and weather conditions that Xenophonlike retreat was an amazing performance.

5. Russian Reconquest of the Ukraine.— After Kleist's army had passed safely through the Rostov bottleneck, it had still to ward off dangers that were developing farther back on its line of retreat. In the last half of Jan. 1943 Gen. Nikolai F. Vatutin's armies had struck southward from the middle Don to the Donetz. At the same time Gen. Filip I. Golikov's armies, farther west, broke through the front of the Hungarian 2nd army, and within a week drove forward 100 mi., halfway from the Don to Kharkov. Before the end of the month the Russians struck westward from Voronezh, across the upper Don, and advanced on Kursk, the starting point of the last German summer offensive, which they captured on Feb. 7. Two days earlier Vatutin's troops had crossed the Donetz southward at Izyum and then spread westward to capture Lozovaya junction on Feb. 11. Besides undercutting the German position at Kharkov, which fell into the Russians' hands on Feb. 16, these advances came near to intercepting the armies of Manstein and Kleist. Their retreat became a race, with the odds against them.

But a dramatic change came over the scene in the last half of February. An early thaw intervened to hamper the Russians in bringing up supplies and reinforcements to maintain their momentum. Thus, the retreating armies gained time to get back to the Dnieper, with the help of the better communications in the coastal strip, and mount a counteroffensive just as the Russian advance had lost its impetus. This counteroffensive, directed by Manstein, snapped off the Russian wedges southwest of Kharkov and recovered the line of the Donetz. If the Germans could have crossed the river quickly and cut astride the rear of the soviet armies that were pushing westward, they might have produced a Russian disaster comparable to their own at Stalingrad. But they were baulked in the attempt, lacking the strength to storm such a barrier. Although they squeezed the Russians out of Kharkov, their own drive petered out in the slush of the spring thaw.

Further evidence of their shrinking strength was seen in the withdrawal they were now compelled to carry out in the north. Gen. Kurt Zeitzler, who had succeeded Gen. Franz Halder as chief of the general staff, persuaded Hitler that it was no longer possible to maintain their advanced position facing Moscow. So in March the Germans abandoned their salients there and fell back to a straighter line close to Smolensk. What the Germans gained by this shortening of their front was, however, more than offset by the fresh extension caused by the success of their counteroffensive in the south. Although its results had been limited, it had secured a promising set of offensive springboards that looked all too tempting to a leader who clung to the hope that an of-. fensive success in summer might still turn the war in his favour. By recapturing Byelgorod and retaining Orel the Germans had suitable flank positions for a pincer stroke against the big salient in which the Russians were left around Kursk.

Following this line of thought, Hitler concentrated all efforts on that offensive without regard to the risk that the cost of an unsuccessful attack would leave him without reserves to maintain any subsequent defense of his long front. He would not agree to Manstein's suggestion of letting the Russians advance first and then delivering a riposte from the flank. At the same time, Zeitzler tended to encourage Hitler's hopes of another brilliant success. But the increasing difficulty in building up the forces, with fresh drafts of men and equipment, was reflected in the increased delay that year in opening the summer offensive. Three months' pause followed the close of the winter campaign.

By contrast, the soviet army had improved much since 1942, both in quality and quantity. The flow of new equipment had greatly increased as well as the number of new divisions, and its numerical superiority was now about four to one. Better still, its leadership had improved with experience. Generals and junior commanders alike had become more skilled tacticians. That was foreshadowed in the way the Russians, in the summer of 1943, waited to let the Germans lead off and commit themselves deeply, while they themselves kept well poised to exploit the Germans' loss of balance in lunging.

The German offensive was at last launched on July 5, and into it Hitler threw 17 armoured divisions, almost all he had. The pincers got entangled in the deep mine fields which the Russians had laid, forewarned by the long preparation of the offensive, and failed to secure any large bag of prisoners since the Russians had withdrawn their main forces out of reach. After a week of effort the German armoured divisions were seriously reduced.

On July 12, as the Germans began to pull out, the Russians launched their own offensive, which thus had the recoil-spring effect of a counterstroke. The Germans just managed to check the northern thrust from cutting their communications behind Orel, and they were not squeezed out of that city until Aug. 5. The southern thrust began more gradually but then quickened into a deep drive past Byelgorod. The danger of a general collapse was narrowly averted by the arrival from the south of the Germans' one remaining armoured corps, though Kharkov had to be abandoned. In the second half of August the Russian offensive was more widely extended; and though it did not make headway very fast, its alternating strokes kept the scanty German reserves scurrying from sector to sector.

In September the shrinkage of German reserves was reflected in an acceleration of the Russians' advance. Skilful commanders like Vatutin, Gen. (later Marshal) Ivan S. Koniev and Gen. (later Marshal) Konstantin K. Rokossovski were quick to exploit thin stretches of the broad front. Before the end of the month they had reached the Dnieper and established a wide range of bridgeheads beyond it. While attention was focussed by Vatutin's threat to the famous city of Kiev, Koniev burst out of his bridgehead at Kremenchug and went halfway to severing the great bulge formed by the Dnieper bend. Although Manstein rushed reserves there in time to stem the advance and extricate the imperilled garrisons, it was at the price of a breakdown between the Dnieper bend and the sea. The Russians' fresh stroke there reached the mouth of the Dnieper early in November, closing the exits from the Crimea and isolating the German forces there.

At the same moment Vatutin advanced from his bridgeheads near Kiev, broke into the city from the rear and drove 100 mi. westward in a week to capture the junctions of Zhitomir and Korosten, not far from the Polish frontier. Manstein was left without reserves to meet this crisis, but ordered one of his best young generals, Hasso von Manteuffel, to scrape together such armoured fragments as he could find for a flank counterattack. This light stroke profited by the Russians' overstretch and tumbled them out of both junctions. Manstein tried to develop the opportunity by organizing a larger counteroffensive when reinforcements arrived from the west; but although it pushed the Russians back toward Kiev it was never so dangerous as it appeared on the surface, and early in December it petered out in the mud.

Hitler's chief consolation that autumn was that his northern armies, after falling back from Smolensk in September to a line covering the upper Dnieper, succeeded in repelling five successive Russian offensives between October and December. The assaults there were mainly delivered astride the Moscow-Minsk highway. As they came along an obvious line and on a narrow front, the well-knit defense proved superior despite a numerical inferiority of about one to six. It showed how Hitler might have spun out the war if his strategy had been wiser and less self-exhausting.

6. Russians Enter Poland and Rumania. — The dominant factor in the campaign of 1944 was that the German front remained as wide as ever, while the German forces were shrinking. As a natural result the Russian advance continued with little check except from its own supply problem; and, because of the Russians' simpler requirements, that problem was less of a handicap than in any other great national army. On Dec. 24, 1943, Vatutin's armies, now reinforced, burst out of the Kiev salient and within a week had regained Zhitomir and Korosten. On Jan. 4 they crossed the prewar Polish frontier. Scraping up reserves, Manstein produced another inner flank counterstroke that checked Vatutin's progress, but only at the price of thinning the line both north and south. The Russians soon profited by the opportunity. On the north, they drove forward and captured Luck, 100 mi. beyond the frontier, by Feb. 5. On the south, Vatutin's left wing converged with Koniev's right wing to pinch off a force of ten weak German divisions that was still clinging, by Hitler's order, to the Dnieper line near Korsun. This produced a miniature Stalingrad. The effort to bring help to this trapped force entailed, in turn, the abandonment of Nikopol, in the Dnieper bend, and its valuable manganese ore.

Early in March 1944 the Russians started a new combined manoeuvre of still wider scope. It began with a thrust toward Tarnopol that outflanked the defensive line of the upper Bug. This was delivered by Zhukov, who had taken charge of Vatutin's armies when the latter was stricken with a fatal illness. Meanwhile, at the southern end of the front, Gen. (later Marshal) Rodion Y. Malinovski's armies pushed forward across the mouths of the Dnieper and the Bug. Between these two horns, Koniev drove suddenly forward to the central stretch of the Bug, crossed it, drove on to the Dniester 70 mi. beyond and crossed this difficult river by seizing pontoon bridges intact in the confusion caused by his swift onrush.

Before the end of March, Koniev's spearheads had penetrated to the line of the Pruth near Jassy, in Rumania, while Zhukov had crossed the upper reaches of that river. This advance brought them close to the foothills of the Carpathians, the ramparts of Hungary. Hitler promptly reacted to the danger by occupying Hungary. The preservation of this mountain barrier was essential, not only to check a Russian surge into the plains of central Europe but also to ensure any continued hold on the Balkans.

On April 1 Zhukov's advance reached the entrance to the Tartar pass, and it looked as if he might repeat Sabutai's exploit of 1241, when the Mongols swept through the Hungarian plain to the Danube in a few days. But his spearhead failed to penetrate the pass, and there was not sufficient weight behind it to renew the impetus. His forces were feeling the effects of their prolonged advance, while the Germans benefited by falling back on their supply lines. The following week they succeeded in mounting a flank counterstroke from the Lwow area that broke off the tip of Zhukov's spearhead and enabled them to extricate a part of their forces which had been trapped by the Russians' rapid advance. After this the front in southern Poland was stabilized from April to July. Koniev, also, was halted in his effort to penetrate the northern stretch of the Rumanian frontier. But his left wing wheeled south down the Dniester, toward the Black sea, thus threatening the rear of the German forces that were facing Malinovski's advance toward Odessa. This leverage squeezed the Germans out of that great port, which was regained by the Russians on April 10.

April also saw the liberation of the Crimea, to which Hitler had insisted on clinging. Gen. (later Marshal) F. I. Tolbukhin attacked southward, from the mainland, and unhinged the defenses of the Perekop isthmus by a crossing of the Siwash lagoon. Then Gen. A. I. Yeremenko struck westward from his foothold on the Kerch peninsula. The Germans were thrown into confusion, and most of the Crimea forces were quickly overrun, up to the outskirts of Sevastopol. Hitler still believed that the fortress itself could be maintained, though he let the Rumanians be evacuated by sea and relied on the stubbornness of the German garrison. But when the Russians breached the southeast approaches, between Inkerman and Balaklava, the garrison abandoned Sevastopol on April 10 and fell back into the Khersonese peninsula. The Germans' resistance there, with their backs to the sea, was as brief as on the Cape Bon peninsula in Tunisia the year before.

On the other flank of the eastern front, a January offensive broke the Germans' encircling grip on Leningrad. There, however, they achieved an orderly withdrawal, at the end of which they stood fast on the line of lakes from the Gulf of Finland to Pskov. This straightening and shortening of their front much improved their situation for the moment. But it left the Finns in isolation and prompted them to approach the Russians for an armistice in February. Although the Finns baulked at accepting the Russian conditions and did so again after the renewed negotiations that followed a Russian advance to Viipuri in June, it was only a postponed capitulation. Moreover, Finland's attempted breakaway set an example that Germany's other satellites soon followed. The general stabilization of the eastern front that the Germans apparently achieved in May 1944 was unstable, both politically and militarily, under the surface.

7. The Russians on the Vistula.—The Russians' main summer offensive was launched two and a half weeks after the Anglo-U.S. invasion of Normandy. Contrary to general expectation, the offensive began, not from the Russians' great wedge in southern Poland, but from their relatively backward line north of the Pripet marshes, in White Russia. This was the best-fortified sector of the German front and had withstood repeated assaults in 1943; but for that very reason it was less likely to be reinforced, now that the German reserves were so scanty. Moreover, the German communications there were long stretched and suffered much interference from the Russian partisans, whereas the Russian communications were shorter there than in the south, so that their offensive could have greater momentum. Four groups of armies were massed there for the Russian offensive. Realizing the danger, the German commanders wanted to carry out a withdrawal before the blow fell, to the line of the Berezina, which would have thrown the Russian advance out of gear; but Hitler forbade it.

The offensive opened on June 23, 1944. Exploiting wedges driven in the previous autumn, the right wing began by pinching out the famous bastion town of Vitebsk and then swung south across the highway from Moscow to Minsk. On the other flank Rokossovski's armies broke through just north of the Pripet marshes and then drove 150 mi. deep. in a week, to cut the highway farther back on the stretch from Minsk to Warsaw. Minsk itself fell on July 3. Although a large part of the enveloped armies managed to find a way back by secondary routes, the Russian mechanized spearheads raced ahead, bypassing any attempted blocks. By mid-July they had overrun half of northeast Poland and pressed deep into Lithuania.

On July 14 the Russian armies south of the Pripet marshes joined in the offensive, and within a fortnight were across the San, besides capturing Lwow. This multiple pressure at so many points gave Rokossovski's mobile columns an opening to slip through the centre, past the end of the marshes, and reach the Vistula. On July 31 one of them penetrated to the suburbs of Warsaw, and the Polish underground leaders there were encouraged to give the signal for a rising.

It was a moment of general crisis for the Germans. In the west their front in Normandy was collapsing, while their rear was shaken by the repercussions of the plot to kill Hitler and the purge that followed. But an astonishing rally came in August, beginning at Warsaw. Three SS armoured divisions arrived at the crucial moment and delivered a counterstroke which threw back the Russian advanced forces. This gave the Germans a breathing space in which to suppress the Polish rising. But the change was not confined to that sector, for by the end of the first week of August the Russians were held up almost everywhere. They had advanced up to 450 mi. in five weeks—the longest and fastest advance they had yet achieved. They were now suffering the natural effect of overstretching their communications and had to bow to that strategic law. Six months were to pass on the Vistula before they were ready to mount a fresh drive.

8. The Hungarian Plain Reached.—The reprieve which Hitler obtained on the main front, however, was offset by the advent of a fresh menace on his Balkan flank. On Aug. 20, 1944, Malinovski and Tolbukhin launched a converging attack on the German salient that still projected into Bessarabia. Aug. 23 saw a change of government in Rumania, which thereupon made peace and simultaneously changed sides as a sequel to negotiations that had been proceeding for some time. With their passage thus cleared, the Russians pushed through the mountain barrier into Transylvania and, more quickly, up the Danube valley to the Yugoslav frontier. At the same time they occupied Bulgaria, where they met no resistance.

The autumn of 1944 saw the gradual development of a great wheel, by the Russian left wing, through the vast spaces of southeastern and central Europe. All that the Germans could do was to put a brake on it, by holding the successive communication centres as long as possible, and gain time to extricate their forces from Greece and Yugoslavia. Belgrade was liberated on Oct. 20. Meanwhile, the inner flank of the wheel had reached the edge of the Hungarian plain. From there the Russians made a strong spurt, which reached the suburbs of Budapest on Nov. 4. But, like other cities that had been stubbornly defended, Budapest proved a hard nut to crack. It was still unconquered at the end of the year, though by then deeply enveloped, and did not fall until Feb. 13, 1945.

The autumn of 1944 also saw a similar flank-sweeping process at the northern end of the eastern front. Finland capitulated early in September, and the Russians then concentrated on clearing the Baltic states and, if possible, cutting off the German army group which still clung there. Although it managed to evade several dangerous scythe strokes, the remains of it were cornered, by mid-October, in the Courland peninsula. The Russians then tried to break into East Prussia, but their attacks there were repelled and deadlock ensued.

The year 1944 had seen a tremendous shrinkage in Germany's Lebensraum. Yet it had avoided the total collapse that seemed almost certain at the end of the summer. Its subsequent rally—in the east and in the west and the centre of Europe—was proof of the combined effect of its contracted defensive front and the attackers' extended communications. It also showed how the Allies' demand for unconditional surrender had helped Hitler to stiffen the Germans' resistance. That might have continued longer, gaining time for the development of his new weapons, if he had planned a strategy of elastic defense instead of insisting on the rigid defense of untenable positions.

9. From the Vistula to the **Oder.**—The year 1945 opened

with a German counteroffensive to relieve Budapest. This did not succeed in its local aim, and it was made with armoured divisions that had formed the main reserve available to meet a renewed Russian offensive in Poland. Yet Hitler, while dictating this abortive effort in Hungary, would not permit any withdrawal from the Vistula line, to forestall the expected Russian offensive there. He thus, in a double way, played into the hands of Stalin.

After nearly six months' interval for preparation, the Russians had built up their communications in Poland and assembled abundant resources for a long drive. Besides a numerical superiority of nearly five to one, they had greatly increased the output of their new heavy Stalin tanks, while the inflowing stream of U.S. trucks enabled them to motorize many more of their infantry brigades. to back up the armoured thrust.

The offensive was initiated on Jan. 12, 1945, by Koniev's three armies, from the Baranow bridgehead. A breach was soon made, and armoured corps poured through it, some driving westward, while others threatened the rear of the Germans who were facing Zhukov. On Jan. 14 both Zhukov and Rokossovski joined in the offensive, and the breach became zoo mi. wide. Warsaw was isolated and fell on Jan. 17, by which time Zhukov's spearheads were close to Lodz. Two days later Koniev's spearheads crossed Germany's Silesian frontier besides driving into Cracow, while Rokossovski reached the southern frontier of East Prussia. Too late, Hitler allowed German divisions to be rushed north from Slovakia; they were too few to fill such an immense gap.

Rokossovski entered East Prussia by the same route, toward Tannenberg, that Gen. Alexander Samsonov had taken with fatal results in 1914, but Tannenberg was to be reversed this time, for Rokossovski swept on past that battlefield and reached the Baltic on Jan. 26, thus isolating all the German forces east of Danzig. Meanwhile, Koniev had already reached the Oder, isolating the industrial area of Upper Silesia.

Between these two far-stretched wings, Zhukov's armoured columns drove through the corridor between the Vistula and the Warta, bypassed the great fortified communication centres of Torun and Poznan, which were thus surrounded by the motorized forces following on, and on Jan. 30 crossed the Brandenburg frontier, 220 mi. from Warsaw and barely 100 from Berlin. Next day one of his spearheads reached the lower Oder near Kiistrin, only 40 mi. from Berlin.

10. Fall of Berlin.—But the advance had gone so far and so fast that it no longer had the momentum needed to overcome the defense of this great river, which was aided by a sudden thaw. Although Zhukov gained footholds near Kiistrin and Frankfurt in the following week, his advanced forces lacked sufficient weight to burst out. Koniev then sought to develop a flanking leverage by a push down the west bank of the Oder from Breslau, but his forces in turn were held up on the Neisse, which there provided the Germans with a convenient switch line. The Germans were much helped at this stage by the fact that their front had been forcibly contracted to only a fraction of its former extent. That contraction went far to balance their losses for the moment, giving their defense a better proportion of force to space than it had enjoyed since the tide of the war had turned and thrown them on the defensive. Although the Russians were baulked, it was the menace of their imminent approach to Berlin that led Hitler to decide that most of his fresh drafts must be sent to reinforce the Oder, whatever the risk to the defense of the Rhine. The way was thus eased for the passage of the Rhine by the U.S. and British armies.

Early in March 1945 Zhukov enlarged his bridgehead over the Oder but did not succeed in breaking out. Russian progress on the far flanks continued, and Vienna was entered early in April. Meanwhile, the German front in the west had collapsed, and the Allied armies there were driving eastward from the Rhine with little opposition. They reached the Elbe, 60 mi. from Berlin, on April 11. There they halted. On April 16 Zhukov resumed the offensive, in conjunction with Koniev, who forced the crossings of the Neisse. This time the Russians burst out of their bridgeheads and within a week were driving into the suburbs of Berlin, where Hitler chose to remain for the final battle. By April 25 the city had been completely isolated by the encircling armies of Zhukov and Koniev, and Koniev's forces joined hands with the American forces on the Elbe river. But in Berlin itself desperate street-by-street resistance was put up by the Germans and mas not completely overcome until the war itself ended, after Hitler's suicide, with Germany's unconditional surrender.

(B. H. L. H.)

I. THE NORTH AFRICAN CAMPAIGN, NOV. 1942–MAY 1943

From the summer of 1941 to June 1942 the tide of war set most strongly against the Allies. Japan's rapid expansion of its initial successes had brought it to the shores of Australia and to the eastern frontier of India. Sinkings of Allied shipping were mounting alarmingly in number. The U.S.S.R., having borne the full brunt of terrific German onslaughts during the summer and autumn of 1941, was showing signs of exhaustion and insistently demanding Allied action to ease the pressure. Finally, in June 1942, the British forces in Libya suffered a major defeat, being driven back to El Alamein, on the edge of the Nile delta.

Faced with the possibility of a complete Russian collapse, Great Britain and the United States were forced to come to its aid. Both had previously agreed that the European theatre was decisive and that any relieving action must be taken there. In April 1942 an American project for an invasion of continental Europe in the spring of 1943 was discussed but was rejected as being too tardy and incapable of achievement in the time available. Thus, in July, it was decided, as an alternative, to launch the North African campaign, under the code name of "Torch," not later than Oct. 30; this left little more than three months for the preparation of this vast expedition.

The object of the operation was to clear the northern coast of Africa (thereby opening the short sea route through the Mediterranean to the far eastern theatre of operations) and to secure a base from which a subsequent attack on Italy could be launched.

This necessitated the occupation of French Morocco, Algeria and Tunisia, the last being strategically the most important, since its proximity to Italy and the facilities provided by the modem ports of Tunis and Bizerta made it eminently suitable as a base for the subsequent operations. Its very proximity, however, made it easy for the axis to reinforce it rapidly.

The plan, in outline, was to occupy French Morocco and Algeria, to guard against any possible reaction from Spanish Morocco by neutral Spain and then to advance with all possible speed into Tunisia and to occupy at least the important northeastern corner, before the axis could reinforce it in sufficient strength. This phase of the operations was, therefore, likely to develop into a race between the Allies and the axis.

The French political situation further complicated the plan, as the Vichy government, which still controlled French North Africa, would most probably oppose any attempt to occupy it. It was known, however, that there existed throughout the area a strong element of opinion bitterly opposed to Vichy and ready to welcome the Allied landings; but, despite searching diplomatic investigations by the United States, its strength was unpredictable. One thing was certain: the Vichy government was bitterly antagonistic to Great Britain; so that, if the operation was to stand any chance of winning support from those in authority in French North Africa, it would have to be American in character.

Accordingly, in July 1942 Lieut. Gen. Dwight D. Eisenhower, then in command of the U.S. forces in Great Britain, was appointed supreme commander of Operation "Torch." With a combined Anglo-U.S. staff, he began the preparation of this venture, which was to require the use of no fewer than 650 ships.

1. Plan and Composition of the Forces.—General Eisenhower was to establish his headquarters at .Gibraltar, and the operation was to consist of three groups of landings, each group being allocated to a separate task force.

(a) Western Task Force: French Morocco.—This force, of a total strength of about 34,000, was to capture Casablanca, linking up with the central task force at Oran. and to be prepared to deal with any interference from Spanish Morocco. It was to be an entirely U.S. force, prepared and trained in and dispatched directly

NORTH AFRICAN CAMPAIGN. 1942

from the United States, 3,000 mi. distant.

(b) Central Task Force: Western Algeria.—This force was to capture Oran, linking up with the task forces on its flanks, and to be ready also to deal with any interference from Spanish Morocco. The army component (about 31,000) was to be entirely American, but the naval and air components were predominantly British, and this force was to be trained and dispatched from the United Kingdom.

(c) Eastern Task Force: Algeria and Tunisia.—This force was to capture Algiers and then to advance into Tunisia with all possible speed, to secure the vital northeastern region. The army component was to be a joint Anglo-U.S. force of about 32,000, the naval and air components being provided by Great Britain; and this force was also to be trained and dispatched from the United Kingdom. To allay French susceptibilities, an American general was to command during the landing operations, but subsequently a British commander, Lieut. Gen. K. A. N. Anderson, was to carry out the advance into Tunisia.

2. Landings **in North** Africa.—By the end of October, everything was ready for the launching of "Torch"; and in Egypt, though few then appreciated it, the door to final victory had already been pushed ajar by the British 8th army's attack at El Alamein on Oct. 23. From now onward the tide of battle was to set ever more strongly in favour of the Allies.

By Oct. 26 the leading elements of "Torch" were en route for North Africa. Eisenhower established his headquarters at Gibraltar on Nov. 5, and the landings were to commence on Nov. 8.

At this point two Frenchmen who were to become deeply involved in the subsequent course of events entered the scene. Adm. Jean Darlan, whose authority as successor to Marshal Pétain, head of the Vichy government, was paramount in North Africa, arrived unexpectedly in Algiers. To Eisenhower's headquarters came Gen. Henri Giraud, a bitter enemy of Vichy, upon whose influence over the French forces in North Africa great faith had been placed. He had been smuggled out of France by submarine, as a potential commander of those French forces, after the landings had been effected.

At 1 A.M. on Nov. 8 President Roosevelt broadcasted an assurance to the French people that the Allies sought no territory, and the Spanish government was informed that no operations were contemplated against Spanish Morocco.

Simultaneously British and U.S. landings began east and west of Algiers. Initially surprise was complete, though opposition stiffened as the leading troops approached the city, and an American raid, transported in two British destroyers to capture the dock area, was very severely handled, one destroyer being sunk. By 5 P.M., however, a firm lodgment was held in the city.

Immediately before the landings Admiral Darlan was informed of their imminence, and many hours of indecisive negotiation and telegraphing to Pétain in Vichy followed. Finally, at 7 P.M., realizing that further resistance was hopeless, he authorized the French commander to negotiate a surrender and to resume control of the French garrison under Allied direction.

Likewise at 1 A.M. on Nov. 8 the main landing began in the Bay of Arzieu, east of Oran, with two subsidiary landings to the westward. Moderate opposition was encountered, but the troops were soon firmly established ashore. An air-borne expedition, flown directly from England to capture the airfields outside Oran, miscarried because of bad weather, and a sea-borne attempt to seize Oran harbour before the port installations could be sabotaged also met with disaster. French naval vessels from Oran put out to sea, but were overpowered by the British naval supporting ships. The coastal batteries remained active, though under heavy bombardment, throughout; and fighting continued in and around Oran till Nov. 11, when the French capitulated

When the western task force landed at 4 A.M. on Nov. 8, it found the French troops on the alert. This had arisen from a mishandling of the political situation as between the French resident-general and the army commander, whose loyalties differed. Eventually the resident-general was placed under arrest. The main landing was made at Fedala, near Casablanca, and subsidiary ones at Port Lyautey in the north and at Safi to the south. At sea, a fierce naval action took place in which the French lost seven ships and three submarines and suffered heavy casualties. Except at Port Lyautey, initial opposition was light; but as the U.S. troops fought their way inland it gradually stiffened. Fighting continued throughout Nov. 8 and g. Finally, on the morning of Nov. 10 the resident-general, now released from arrest, informed Admiral Darlan in Algiers that further resistance was useless; then, on the latter's orders, he surrendered.

On Nov. g Giraud, with Gen. Mark W. Clark (acting as Eisenhower's personal deputy), arrived in Algiers, where the situation among the French high authorities was naturally tense. From his icy reception, it was obvious that Giraud's authority would not be accepted by anyone of importance, yet the early issue of a general cease-fire order to all the French troops was of vital importance, so that the Tunisian advance could be begun without delay. Darlan was the one man who could issue such an order with a reasonable hope of its being obeyed, and with him Eisenhower decided to deal. Knowing that its issue would probably result in the occupation of the remainder of metropolitan France by the Germans, Darlan vacillated; but finally, on Nov. 11, after being given half an hour to make up his mind by General Clark, he issued the cease-fire order "in the name of the Marshal." He himself assumed complete authority in French North Africa—which he maintained till his assassination on Dec. 24. Giraud was to assume command of all French troops, under Eisenhower's orders.

The Allies had gained Morocco and Algeria, but in Tunisia the axis, reacting immediately to the Allied landings, began on Nov. g to bring in reinforcements with all speed, by sea and by air. The French authorities took no action to oppose this move; finally the army commander withdrew his garrisons westward, surrendering valuable territory to axis occupation, and placed himself at General Giraud's disposal. The Allies' chances of success in the race to occupy the northeastern corner of Tunisia had already been jeopardized.

3. Capture **of Tunisia.**—Once Algiers was secured, Anderson assumed command, and the 1st army began the advance to Tunisia. Bougie was captured on Nov. 11 and Bône (Bona) the next day; and by Nov. 16 the advance had reached Béja, where axis forces were encountered. U.S. air-borne forces, after capturing Youks les Bains airfield, reached Gafsa on Nov. 15.

By their advance, the Allies had gained airfields in eastern Algeria from which air support for further operations could be provided; but, though reinforced with every available U.S. unit and joined by the considerable yet poorly equipped Tunisian French forces, the 1st army could not achieve its object. By the end of November the axis forces numbered 15,000 men, supported by tanks and artillery and backed by an ever-increasing air force. The supply problem was also being aggravated by axis air attacks on Algiers, by the lack of road transport and shipping and by the fact that no more than one single-line railway and two roads, all poor, existed throughout the 650-mi. line of communication.

On Nov. 25 General Eisenhower moved his headquarters to Algiers; and on Nov. 28 a combined Anglo-U.S. force reached Djedeida, only 12 mi. from Tunis. This was the climax of the advance, for now heavy winter rains set in, turning the improvised Allied airstrips into quagmires and grounding their aircraft, while axis aviation, operating from all-weather strips in Tunisia, went unhindered. Sections of the supply routes through the mountainous country became impassable, and only the barest necessities could reach the forward area.

On Dec. 1 the Germans attacked at Djedeida, driving the Allies back to Medjez-el-Bab. After a further period of three days' continuous rain, Eisenhower decided to halt on the line then reached. This ran generally along the eastern edge of the mountainous country of western Tunisia from Medjez-el-Bab in the north, through Ousseltia and Faid, to Gafsa.

These adverse factors, together with the initial indecision of the French in Tunisia, served for the time to hold the Allies from their goal—Tunis and Bizerta. But the pause in operations was used for reorganization and for preparing a renewal of the offensive to take place when ground and weather should permit. In this offensive the sea and air forces were to protect the Allies' lines of supply and disrupt those of the axis.

By Dec. 28, meanwhile, the British 8th army had reached Buerat, about 700 mi. from its starting point in Egypt, and the Allied net was beginning to encircle the axis forces. On Jan. 18 a sharp axis attack up the Bou Arada valley, at the junction point of the British and French forces, caused both to fall back several miles, with the loss of Ousseltia. The weaknesses shown by this setback caused Eisenhower to vest complete operational control of all forces in the forward area in Anderson. These forces were regrouped into three corps, the British 5th in the north, the French 19th in the centre and the U.S. 2nd to the south.
