property management and for conveyancing but also as a method of defrauding creditors, depriving feudal landlords of their dues, and permitting religious institutions to derive the benefit of land that they could not own directly.

Originally, carrying out the use depended on the conscience of the person entrusted with the property, because there was no writ by which the common-law courts could enforce it. Toward the end of the 14th century, however, the equity courts began to issue decrees for its enforcement. Whereas common-law courts had considered B to be the full owner, equity courts viewed him as merely the nominal owner and considered C the true, or "equitable," owner and rendered judgments on that basis.

By 1535 the use had become so objectionable because of its frequent employment for improper and illegal objects—particularly for avoiding dues or taxes—that Parliament enacted the Statute of Uses, which abolished many forms of the use. The uses that survived were called trusts, and they constitute the foundation on which the modern law of trusts exists.

use tax, levy on the use or possession of a commodity. Under the principle that the taxpayer should pay according to the benefits received from public services, a use tax is often levied on the user of a service, so that costs of the service are not borne by the general taxpayer. Common examples are motor-vehicle and boat licenses and user fees for airports or harbour-docking privileges. The revenue from the tax is generally used by a government to cover the costs of the maintenance and regulation of the services-in these instances, highways, waterways, and airports. In the United States a use tax is often levied by state or local governments on purchases made outside the jurisdiction and therefore not subject to the jurisdiction's retail sales tax. In this case the use tax is generally equal to the retail sales tax.

In the United States the first federal use tax was levied on telephone and telegraph messages during the Spanish-American War (1898). During World War I all freight and passenger transportation was subject to a use tax. A federal use tax was levied on all motor vehicles during World War II, but this tax was eventually shifted to the states.

The use tax as a vehicle-licensing plan serves a dual purpose as revenue raiser and as a method for identifying all vehicles using the public streets and roads. However, it is a regressive tax, despite numerous attempts to make it more equitable.

Userkaf (fl. 3rd millennium BC), first king of the 5th dynasty of Egypt (c. 2465–c. 2325 BC) who elevated the cult of Re, god of the sun, to unprecedented importance.

Probably descended from Redjedef (third king of the 4th dynasty), Userkaf strengthened his legitimacy by marrying the heiress Khentkaues, who was a descendant of the main branch of the royal family. Thus he ended the dynastic struggles that the rival branches had caused during the 4th dynasty.

His queen occupied a very prominent position and even built her own tomb at Giza, known as the Unfinished Pyramid. Userkaf himself built the first of a series of temples to Re at Abū Ṣīr, somewhat north of modern Cairo, on the west bank of the Nile. His pyramid at Ṣaqqārah was smaller than those of the 4th dynasty, perhaps indicating that the Re cult eclipsed some of the pharaoh's preeminence. Also, the royal control of administration slackened under Userkaf, with a corresponding growth of importance of provincial personalities, particularly in Upper Egypt.

ushabti figure, any of the small statuettes made of wood, stone, or faience that are often

found in large numbers in ancient Egyptian tombs. The figures range in height from 4 to 9 inches (10 to 23 cm) and often held hoes in their arms. Their purpose was to act as a magical substitute for the deceased owner when

the gods requested him to undertake menial tasks in the afterlife. The word *ushabti* is usually translated "answerer"; the earlier form of the word is *shawabti*. During the New Kingdom (1539–1075 BC) the figures were made to resemble the tomb owner by being fashioned in the form of a mummy bearing the owner's name.

Ushak carpet, floor covering handwoven in the city of Uşak (Ushak), Tur. By the 16th century the principal manufacture in Ottoman Turkey of large commercial carpets had been established at Uşak, which produced for palace and mosque use and for export. By the 18th

and early 19th centuries, this manufacture had come increasingly under European control. The carpets became coarser and rougher, with designs calculated to please European tastes, at the close of the 19th century. The quality had probably never been as fine as that of

the court carpets, made nearer to the capital cities.

The best known pattern among the older carpets is a scheme of large, rounded medallions of two types, alternating upon a field of brick red or, occasionally, of dark blue. The medallions are in blues and black-brown, with yellow and white used sparingly. A second common pattern shows diagonal rows of eight-pointed star medallions alternating with diamonds. In the 18th and 19th centuries, a number of carpets with prayer-niche motifs in rows were made for mosque worship. Holbein rugs, Lotto carpets, and bird rugs have been attributed to Uşak, as have several prayer-rug types, including the so-called Tintorettos.

ushpizin (Aramaic: "visitors"), according to the Jewish Kabbalistic book the Sefer ha-zohar ("Book of Splendour"), seven ancient worthies who take turns visiting the homes of all pious Jews to share their dinner on the festival of Sukkot. A custom developed of reciting a fixed formula of invitation to the seven: Abraham, Isaac, Jacob, Joseph, Moses, Aaron, and David. Poor scholars are sometimes invited to join the family dinner as representatives of the ushpizin.

Usküdar, formerly SCUTARI, city constituting the greater part of Uskudar ilçe (district), Istanbul il (province), Turkey, at the foot of Bulgurlu Hills on the Asiatic side of the Bosporus Strait opposite Istanbul, Known as Chrysopolis in ancient times, it was a dependency of the older and better sited colony of Chalcedon (modern Kadıköy), where, according to the historian Polybius, the Athenians set up a toll for ships passing through the Bosporus. The name Scutari came into use toward the end of the Byzantine period. The Ottoman Turks took the city in the 14th century and renamed it Üsküdar (Courier) because of its function as a post station for Asiatic couriers. The Ottomans used it as a base for military operations against the Asiatic parts of the empire and also, until the development of the Anatolian railways, as the terminus of caravan routes from Syria and Asia.

Üsküdar, as seen from the sea, presents a view of painted wooden houses and white minarets backed by the cypress trees of its great cemetery, Büyük Mezaristan, further inland. The cemetery includes the graves of 8,000 British soldiers who died there during the Crimean War (1853–56). Major buildings include the Mihrimah (or Iskele) Cami (mosque), built by the architect Sinan in 1548, the vast barracks of Sultan Selim III, and the military hospital made famous during the Crimean War (1853–56) by the pioneering nursing work of Florence Nightingale.

Usküdar is primarily residential. Large numbers of its residents commute to Istanbul. It is connected by rail and road with major centres of Anatolia and is linked by ferry service with Istanbul. Pop. (1980) city, 261,141; ilçe, 366,186

Usk, Welsh BRYNBUGA, town, Monmouth district, Gwent county, Wales, on the River Usk, 20 mi (32 km) from its Bristol Channel mouth. The town was settled first by Celts and then by Romans (Burrium). A Norman castle was built in the 12th century but was partially destroyed c. 1402 during the rebellion of the Welsh prince Owen Glendower. Usk is now a small market town and tourist centre.

The River Usk, which flows through the town, rises in the Black Mountain range at the Dyfed-Powys boundary, in the Brecon Beacons National Park. Both the river and the town of Usk are noted for good fishing. Pop. (1981 prelim.) 1,907.

Usmān 'Alī Khān, Mīr: see Osman Ali.

Usman dan Fodio, Usman also spelled UTH-MAN, or USUMAN, Arabic 'UTHMĀN IBN FŪDĪ (b. December 1754, Maratta, Gobir, Hausaland—d. 1817, Sokoto, Fulani Empire), Fulani mystic, philosopher, and revolutionary reformer who, in a jihād (holy war) between 1804 and 1808, created a militant new Muslim state, the Fulani Empire, in what is now northern Nigeria.

Early years. Usman was born in the Hausa state of Gobir, in what is now northwestern Nigeria. His father, Muhammad Fodiye, was a scholar from the Toronkawa clan, which had emigrated from Futa-Toro in Senegal in about the 15th century. While still young Usman moved south with his family to Degel, where he studied the Qur'ān with his father. Later he moved on to other scholar relatives, travelling from teacher to teacher in the traditional way and reading widely in the Islāmic sciences. One powerful intellectual and religious influence at this time was his teacher in the southern Saharan city of Agadez, Jibrīl

ibn 'Umar, a radical figure whom Usman both respected and criticized and by whom he was admitted to the Qādirī and other Ṣūfī orders. In about 1774-75 Usman began his active

In about 1774–75 Usman began his active life as a teacher, and for the next 12 years he combined study with peripatetic teaching and preaching in Kebbi and Gobir, followed by a further five years in Zamfara. During this latter period, though committed in principle to avoiding the courts of kings, he visited Bawa, the sultan of Gobir, from whom he won important concessions for the local Muslim community (including his own freedom to propagate Islām); he also appears to have taught the future sultan Yunfa.

Growing leadership. Throughout the 1780s and '90s Usman's reputation increased, as did the size and importance of the community that looked to him for religious and political leadership. Particularly closely associated with him were his younger brother, Abdullahi, one of his first pupils, and his son, Muhammad Bello, both distinguished teachers and writers. But his own scholarly clan was slow to come over to him. Significant support seems to have come from the Hausa peasantry. Their economic and social grievances and experience of oppression under the existing dynasties stimulated millenarian hopes and led them to identify him with the Mahdī (Divinely Guided One), a legendary Muslim redeemer whose appearance was expected at that time. Though he rejected this identification, he did share and encourage their expectations.

During the 1790s, when Usman seems to have lived continuously at Degel, a division developed between his substantial community and the Gobir ruling dynasty. In about 1797–98 Sultan Nafata, who was aware that Usman had permitted his community to be armed and who no doubt feared that it was acquiring the characteristics of a state within the state, reversed the liberal policy he had adopted toward him 10 years earlier and issued his historic proclamation forbidding any but the Shaykh, as Usman had come to be called, to preach, forbidding the conversion of sons from the religion of their fathers, and proscribing the use of turbans and veils.

In 1802 Yunfa succeeded Nafata as sultan, but, whatever his previous ties with the Shaykh may have been, he did not improve the status of Usman's community. The breakdown, when it eventually occurred, turned on a confused incident in which some of the Shaykh's supporters forcibly freed Muslim prisoners taken by a Gobir military expedition. Usman, who seems to have wished to avoid a final breach, nevertheless agreed that Degel was threatened. Like the Prophet Muhammad, whose biography he frequently noted as having close parallels with his own, the Shaykh carried out a hijrah (migration) to Gudu, 30 miles to the northwest, in February 1804. Despite his own apparent reluctance, he was elected imām (leader) of the community, and the new caliphate was formally established.

The jihād. During the next five years the Shaykh's primary interests were necessarily the conduct of the jihād and the organization of the caliphate. He did not himself take part in military expeditions, but appointed commanders, encouraged the army, handled diplomatic questions, and wrote widely on problems relating to the jihād and its theoretical justification. On this his basic position was clear and rigorous: the Sultan of Gobir had attacked the Muslims; therefore he was an unbeliever and as such must be fought; and anyone helping an unbeliever was also an unbeliever. (This last proposition was later used to justify the conflict with Bornu.)

As regards the structure of the caliphate, the Shaykh attempted to establish an essentially

simple, nonexploitative system. His views are stated in his important treatise Bayān wujūb al-hijra (November 1806) and elsewhere: the central bureaucracy should be limited to a loyal and honest vizier, judges, a chief of police, and a collector of taxes; and local administration should be in the hands of governors (emirs) selected from the scholarly class for their learning, piety, integrity, and sense of justice.

Initially the military situation was far from favourable. Food supplies were a continuing problem; the requisitioning of local food antagonized the peasantry; increasing dependence on the great Fulani clan leaders, who alone could put substantial forces into the field, alienated the non-Fulani. At the Battle of Tsuntua in December 1804, the Shaykh's forces suffered a major defeat and were said to have lost 2,000 men, of whom 200 knew the Qur'an by heart. But, after a successful campaign against Kebbi in the spring of 1805, they established a permanent base at Gwandu in the west. By 1805-06 the Shaykh's caliphal authority was recognized by leaders of the Muslim communities in Katsina, Kano, Daura, and Zamfara. When Alkalawa, the Gobir capital, finally fell at the fourth assault on October 1808, the main military objectives of the *jihād* had been achieved.

Later life. Although the jihād had succeeded, Usman believed the original objectives of the reforming movement had been largely forgotten. This no doubt encouraged his withdrawal into private life. In 1809–10 Bello moved to Sokoto, making it his headquarters, and built a home for his father nearby at Sifawa, where he lived in his customary simple style, surrounded by 300 students. In 1812 the administration of the caliphate was reorganized, the Shaykh's two principal viziers, Abdullahi and Bello, taking responsibility for the western and eastern sectors, respectively. The Shaykh, though remaining formally caliph, was thus left free to return to his main preoccupations, teaching and writing.

His five years at Sifawa were a productive period, to judge from the number of dated works that survive, most of them dealing with the practical problems of the community, including the series of books addressed to "the Brethren" (al-Ikhwan), arising out of the dispute with Bornu and its principal administrator and ideologist, Muhammad al-Kanemi. At his weekly meetings on Thursday nights, he criticized aspects of the post-jihād caliphate (as indeed did Abdullahi and Bello), especially the tendency of the new bureaucracy and its hangers-on to become another oppressive ruling class. Around 1815 he moved to Sokoto, when Bello built him a house in the western suburbs, and where he died, aged 62, in 1817. Assessment. Usman was the most impor-

tant reforming leader of the western Sudan region in the early 19th century. His importance lies partly in the new stimulus that he, as a *mujaddid*, or renewer of the faith, gave to Islām throughout the region; and partly in his work as a teacher and intellectual. In the latter roles he was the focus of a network of students and the author of a large corpus of writings in Arabic and Fulani that covered most of the Islāmic sciences and enjoyed—and still enjoy—wide circulation and influence. Lastly, Usman's importance lies in his activities as founder of a jamā'a, or Islāmic community, the Sokoto caliphate, which brought the Hausa states and some neighbouring territories under a single central administration for the first time in history.

Uspensky, Gleb Ivanovich (b. Oct. 25 [Oct. 13, Old Style], 1843, Tula province, Russia—d. April 6 [March 24], 1902, St. Petersburg [now Leningrad]), Russian intellectual and

writer whose realistic portrayals of peasant life did much to correct the prevalent romantic view of the Russian agricultural worker.

Uspensky studied law at the Universities of Moscow and St. Petersburg and for a time worked as a teacher. His first important work,

Nravy Rasteryayevoy ulitsy (1866; "The Customs of Rasteryayevoy Street"), is a series of narrative essays about poverty and drunkenness in the suburbs of the city of Tula. For a time he was a follower of the Narodniki (radical populists), but unlike them he refused to idealize the Russian peasant, whose primitive life became the main subject of his writing, as in Vlast zemli (1882; "The Power of the Soil"). After spending most of his last 10 years as a patient in mental homes, he committed suicide.

Ussachevsky, Vladimir (Alexis) (b. Nov. 3 [Oct. 21, Old Style], 1911, Hailaer, Manchuria [China]—d. Jan. 4, 1990, New York, N.Y., U.S.), Russian-born American composer known for his experiments with music for the tape recorder, often combined with live sound.

The son of Russian parents, Ussachevsky entered the United States in 1931 and thereupon studied at Pomona College, Claremont, Calif., and at the Eastman School of Music of the University of Rochester, Rochester, N.Y. In 1951 he began experimenting with tape composition, and in 1953 he began collaborating with the composer Otto Luening (q.v.). This fruitful partnership resulted in a number of works incorporating tape recorder and conventional instruments. In addition to works written with Luening, his compositions include Sonic Contours (performed 1952) for tape and instruments; a piano concerto; and orchestral, choral, and chamber works. He also wrote tape scores for George Tabori's film version of Sartre's play No Exit (1962) and for a television documentary, An Incredible Voyage (1968). In 1968 he began working in computer music. He taught music at Columbia University from 1947 to 1980, and in 1959 he helped found the Columbia-Princeton Electronic Music Center, New York City.

Ussher, James (b. Jan. 4, 1581, Dublin, Ire.—d. March 21, 1656, Reigate, Surrey, Eng.), Anglo-Irish prelate of the Anglican church who was memorable for his activity in religious politics and for his work on patristic texts, especially the chronology of the Old Testament.

Ordained priest in 1601, Ussher became professor (1607-21) and twice vice-chancellor (1614, 1617) at the university where he had received his B.A., Trinity College, Dublin. He was made bishop of Meath in 1621 and archbishop of Armagh in 1625. Ussher became primate of all Ireland in 1634. He was in England in 1642, when the Civil War broke out, and he never returned to Ireland. Having earned the respect of both Anglicans and Puritans, he proposed in 1641 a method for combining the episcopal and presbyterian forms of church government in the Church of England. A Royalist, he vainly counseled Charles I against assenting to the execution in 1641 of Thomas Wentworth, Earl of Strafford, to appease Parliament. Ussher was briefly bishop of Carlisle in 1642 before moving to Oxford. Declining an invitation to join the Westminster Assembly of Divines (1643–49), he preached against its legality. From 1647 to 1654 he was preacher at Lincoln's Inn, London.

Ussher wrote widely on Christianity in Asia Minor, on episcopacy, and against Roman Catholicism. An expert in Semitic languages, he argued for the reliability of the Hebrew text of the Old Testament and employed an agent in the Middle East to collect biblical and other manuscripts for him. Scholars still respect him for his correct distinction between the genuine and the spurious epistles of the 2nd-century St. Ignatius of Antioch, on which he published works in 1644 and 1647. The general public may find Bibles perpetuating his chronological researches (published in the 1650s), which dated the creation of the universe at 4004 BC. This date was widely accepted in the Western world until the 19th century. Ussher had a

Ussuri River, Wade-Giles romanization wu-SU-LI CHIANG, Pinyin WUSULI JIANG, tributary of the Amur River that for a considerable distance forms the boundary between China and the Soviet Union. It is formed by the confluence of the Ulakhe and Arsenvevka rivers, both of which rise on the southwestern slopes of the Sikhote-Alin mountains. Its length from the source of the Ulakhe is 565 miles (909 km), and its basin is 72,200 square miles (187,000 square km) in area. The Ussuri is navigable from its confluence with the Bolshava ("Great") Ussurka. It joins the Amur River near Khabarovsk. Large sections of the river border have been in dispute between the Soviet Union and China, and in 1969 there was a battle between military forces of the two countries. In 1977 they reached limited agreement on rules of navigation on the Ussuri.

Ussuriysk, also spelled USSURIJSK, city, Primorsky kray (region), far eastern Russian Soviet Federated Socialist Republic. It lies about 50 miles (80 km) north of Vladivostok along the Trans-Siberian Railroad at the junction with a line to Harbin in Heilungkiang province, China. Founded as the village of Nikolskoye in 1866, it became a city in 1897 and was renamed Nikolsk-Ussuriysk in 1926, Voroshilov in 1935, and Ussuriysk in 1957. It has food-processing, footwear, clothing, and other light industries. A medical school and agricultural and teacher-training colleges are also located there. Pop. (1989 prelim.) 162,-

Ust-Ilimsk, city and administrative centre of Ust-Ilimsk *rayon* (sector), Irkutsk *oblast* (province), south-central Russian Soviet Federated Socialist Republic. It became a city in 1973 in connection with the building of the nearby Ust-Ilimsk dam and hydroelectric power station on the Angara River. A huge timber-processing complex was constructed in the early 1980s. Pop. (1989 prelim.) 109,000.

Ust-Kamenogorsk, also spelled UST'-KAMENOGORSK, city and administrative centre of Vostochno-Kazakhstan oblast (province), eastern Kazakh Soviet Socialist Republic. It lies in the foothills of the Rudny Altay mountains and at the junction of the Ulba and Irtysh rivers. Founded as a Russian fort in 1720, it later became a centre of trade with Mongolia and China and the gateway to the mineral wealth of the Rudny Altay. Ust-Kamenogorsk is now a major centre of nonferrous metallurgy (lead, zinc, titanium, and magnesium) in the Soviet Union, with important associated research institutes and laboratories. Other industries include food processing and machine building. Pop. (1989 prelim.) 324,000.

Ust-Ordynsky Buryat autonomous okrug, formerly (until 1977) UST-ORDYNSKY BURYAT

NATIONAL OKRUG, district in Irkutsk oblast (province), east-central Russian Soviet Federated Socialist Republic. It covers an area of 8,600 square miles (22,400 square km) and is situated west of Lake Baikal and across the Angara River. It was created in 1937. Its plateau relief is partly in boreal forest, or taiga, of larch, spruce, fir, pine, and birch and partly in forest-steppe. Coal is mined in the west, where the Trans-Siberian Railroad crosses the okrug. Timber working is well developed, but agriculture, principally swine husbandry and dairying, is confined to the forest-steppe of the west and south. The indigenous Buryats live for the most part in rural areas, and the urban population is mainly Russian. Pop. (1989) prelim.) 136,000

Ustaša, also spelled ustashi, extreme Croatian nationalist movement that ruled the independent state of Croatia (in present-day central and north-central Yugoslavia) during World War II. In 1929, when King Alexander I established a Serbian-dominated dictatorial regime in Yugoslavia, Ante Pavelić, a former delegate to Parliament and an advocate of Croatian separatism, fled to Italy and formed the Ustaša movement, which was directed toward achieving Croatian independence from Yugoslavia. The Ustaša modeled itself on the Italian Fascists and founded terrorist training centres in Italy and Hungary. To foment political crises in Yugoslavia, the Ustaša's members attempted to incite a peasant rebellion in northern Dalmatia in 1932 and participated in the assassination of King Alexander in 1934 at Marseille. They did not achieve their ultimate goal, however, until after the Germans invaded and partitioned Yugoslavia (April 1941), founding the independent state of Croatia

The Ustaša then returned to Croatia and, under the leadership of Pavelić and the sponsorship of the Germans, formed a government. The Ustaša also conscripted an army to join the Axis powers and to fight the resistance movements that were beginning to operate in the Yugoslav lands. To make their state more purely Croatian, the Ustaša created their own militia, which terrorized the Serbian and other non-Croatian populations under their jurisdiction. Less extreme Croatian nationalists as well as German and Italian officials criticized the Ustaša's extraordinarily brutal practices, which included executions of hundreds of thousands of Serbs and Jews. Although many inhabitants of the region reacted to their brutality by joining the resistance movements, the Ustaša remained in control of Croatia until May 1945, when the German power protecting them collapsed and Pavelic and his supporters fled before the Communist Partisans.

Ustí nad Labem, German Aussig, capital, Severočeský kraj (region), Czechoslovakia. It is a port on the west bank of the Elbe (Labe) River at the latter's confluence with the Bilina River. Although dating from the 10th century, the city has developed mainly since the 19th century and has been largely reconstructed since World War II. Its western outskirts mark the limit of the north Bohemian coal basin. The growth of lignite (brown-coal) mining, of Elbe navigation, and of rail transport stimulated the city's industrial expansion and commerce. Ústí nad Labem's varied manufactures include engineering products, glass, ceramics, and textiles. The Střekov Castle, standing on a precipitous basalt crag across the river, is the only notable reminder of the city's medieval origin. Pop. (1988 est.) 105,509.

Ustinov, Dmitry Fedorovich (b. Oct. 30 [Oct. 17, Old Style], 1908, Samara [now Kuybyshev], Russia—d. Dec. 20, 1984, Moscow), Soviet military and political figure who was minister of defense from 1976 to 1984.

Ustinov graduated in 1934 from the Military Institute of Mechanics in Leningrad and

worked first as a construction engineer, then as director of a Leningrad armament factory. In 1941 Stalin appointed Ustinov people's commissar of armaments, a position that he kept under the titles of minister of armaments (1946-53) and minister of defense industries (1953-57). In that post, Ustinov in 1941 initiated the evacuation of many Soviet arms factories to sites east of the Ural Mountains, out of the reach of the advancing German armies, and after the war he set the course by which the Soviet armed forces eventually reached their current level. He was a full member of the Central Committee from 1952, and in 1957 Nikita Khrushchev made him a deputy premier, still with overall responsibility for the armaments industry. In 1963 he became both chairman of the Supreme Council of National Economy and first deputy premier. In 1965 he was elected a secretary of the Central Committee with responsibilities for the military, defense industry, and security organs, and he became a candidate member of the Politburo. As such, he worked closely with Yury Andropov, who in 1967 became head of the KGB. In April 1976, when Defense Minister Marshal Andrey Grechko died, Ustinov was appointed to replace him. At the same time, he was made a full member of the Politburo and marshal of the Soviet Union. During the 1970s Ustinov played an important behindthe-scenes role in Soviet-U.S. arms limitation negotiations.

Ustyurt Plateau, Russian PLATO USTYURT, also spelled PLATO UST'URT, plateau in the Uzbek and Kazakh Soviet Socialist republics. lying between the Aral Sea and the Amu Darya (river) Delta in the east and the Mangyshlak Peninsula and Kara-Bogaz-Gol Bay in the west. It has an area of about 77,000 square miles (about 200,000 square km) and an average elevation of about 500 feet (about 150 m), rising to a maximum of 1,200 feet (365 m) in the southwest. At its edges it drops steeply to the Aral Sea and the surrounding plain. The plateau consists of a gently undulating, monotonous desert, which provides meagre pasture for camels and sheep. Oil and gas deposits lie west of the plateau.

usufruct, in Roman-based legal systems, right to the use and enjoyment of the property of another. This legal concept developed in Roman law and found significant application in the determination of the property interests between a slave held in usus fructus (Latin: "use and enjoyment") and a temporary master. Any property acquired by a slave as a result of his labour legally belonged to his immediate master, and thus any property coming to the slave produced by or in return for his services while under a usus fructus bond rightfully belonged to the person to whom he was bound.

Modern civil-law systems recognize two types of usufructs. The perfect usufruct includes only those things that a usufructuary (one who holds property under right of usufruct) can use without changing their substance, such as land, buildings, or movable objects; the substance of the property, however, may be altered naturally by the effect of time and the elements. The quasi-, or imperfect, usufruct includes property that is consumable or expendable, such as money, agricultural products, and the like, which would be of no advantage to the usufructuary if he could not consume them, expend them, or change their substance.

The term usufruct never found its way into the English common law, although certain general similarities can be found in the common-law concept of estate.

uṣūl al-fiqh, in classical Islāmic theory, the four major sources from which law is derived: the Qur'ān; the sunna, or sunnah (practice of the Prophet as transmitted through his sayings); ijmā' (consensus of scholars); and qiyas (analogical deductions from these three). The uṣūl, systematized under ash-Shāfi'ī (767–820), were the result of an Islāmization of law that began about the 2nd century of the Muslim era (8th century AD).

Law existed apart from religion under the first four caliphs and the Umayyad dynasty and was generally administered through existing pre-Islāmic institutions of foreign (Roman, Byzantine, Jewish, Persian) character. Pious Muslim scholars, who were later grouped into the ancient legal schools of Iraq, Hejaz, and Syria, began to reinterpret the law in an Islāmic light. Ash-Shāfi'i completed this Islāmization process by establishing a norm for interpretation, the uṣūl, but the functions of the individual principles were fixed in legal theory by later scholars.

Usulután, city, southeastern El Salvador. It lies on the Pacific coastal plain at the southern foot of Usulután Volcano. The city's name, which is Indian, means "city of the ocelots." Usulután is a commercial centre dealing in the grain, coffee, sugarcane, fruit, and hardwood lumber produced in the adjacent hinterland. The city has only small industrial developments. Pop. (1985 est.) 32,172.

Usumacinta River, Spanish Río USAMACINTA, river in southeastern Mexico and northwestern Guatemala, formed by the junction of the Pasión River, which arises in the Sierra de Santa Cruz (in Guatemala) and the Salinas River, also known as the Chixoy, or the Negro, which descends from the Sierra Madre de Guatemala.

The Usumacinta River flows northwestward, receiving the Lacantum River and forming the border between Mexico and Guatemala. Below the ruins of Piedras Negras, located in Guatemala, the river begins its meandering course through the swampy lowlands of the southern shores of the Bay of Campeche. It forms the Chiapas-Tabasco border and continues generally northwestward. The main arm joins the Grijalva River and empties into the Bay of Campeche below Frontera; the central

arm, called San Pedro y San Pablo, flows into the bay at the town of San Pedro; and the eastern arm, the Palizada, empties into the Términos Lagoon in Campeche state. The total length of the main channel, including the Chixoy, is approximately 600 miles (1,000 km). Navigable for 300 miles (480 km) inland, the Usumacinta has had great economic significance as a means of communication for the towns on its banks and for exporting logs, chicle, and other lowland products.

usury, in modern law, the practice of charging an illegal rate of interest for the loan of money. In Old English law, the taking of any compensation whatsoever was termed usury. With the expansion of trade in the 13th century, however, the demand for credit increased, necessitating a modification in the definition of the term. Usury then was applied to exorbitant or unconscionable interest rates. In 1545 England fixed a legal maximum interest; any amount in excess of the maximum was usury. The practice of setting a legal maximum on interest rates later was followed by most states of the United States and most other Western nations.

In some Muslim countries the charging of interest is still forbidden, at least in theory. The Quran, the Muslim holy book, prohibits the charging of interest, although various methods have been devised in order to circumvent the prohibition. For instance, a higher price may be charged for goods when payment is deferred than is charged if payment is made in advance or upon delivery.

USWA: see United Steelworkers of America.

USX Corporation, American holding company that was incorporated in 1986 to oversee the operations formerly directed by the United States Steel Corporation. Headquartered in Pittsburgh, Pa., USX oversees four independent operating units: USS, Inc. (formerly United States Steel Corporation), headquartered in Pittsburgh; Marathon Oil Company, headquartered in Findlay, Ohio; Texas Oil & Gas Corp., headquartered in Dallas, Texas; and U.S. Diversified Group, headquartered in Pittsburgh.

At the beginning of the 20th century, a number of businessmen were involved in the formation of United States Steel Corporation, including Andrew Carnegie, Elbert H. Gary, Charles M. Schwab, and J.P. Morgan. Carnegie had founded Carnegie Steel Company, centred in Pittsburgh, and Gary had founded Federal Steel Company, centred in Chicago. In 1900 Schwab became president of the Carnegie company; and, when Carnegie expressed a wish to retire, Schwab approached Gary with the idea of a giant consolidation. With the aid of J.P. Morgan, they bought Carnegie's interests for over \$492,000,000 and put together U.S. Steel, composed of the Carnegie and Federal companies as the nuclei, along with National Steel, National Tube, American Steel and Wire, American Steel Hoop, American Sheet Steel, and American Tinplate. U.S. Steel was capitalized at \$1,400,000,000 and became the first billion-dollar corporation in American history. Schwab was named president (but resigned in 1903 to join Bethlehem Steel), and Gary was made chairman of the board (a post that he held until his death in 1927).

Very soon after, in 1901, two other companies, American Bridge and Lake Superior Consolidated Iron Mines, were brought in; and more companies were absorbed in the years following. The example of U.S. Steel prompted mergers elsewhere in the metal industry.

During its formative period the company was dominated by Gary, who exercised influence throughout the American steel industry

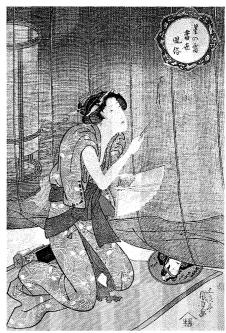

through his famous "Gary dinners," to which he invited the heads of major steel producers; out of the meetings came agreements on cooperative pricing and marketing that stabilized a once wildly fluctuating market. Gary opposed "unreasonable" competitive practices, and he opposed labour organizers. A general steel strike in 1919 was answered by his refusal to negotiate and his use of strikebreaking tactics. In 1920 the U.S. Supreme Court held that U.S. Steel was not a monopoly in restraint of trade under the U.S. antitrust laws.

A successor of Gary, Myron C. Taylor (1874–1959), board chairman from 1932 to 1938, took a different view toward unions and recognized the United Steelworkers of America in 1936. Another major figure in the company's history was Benjamin F. Fairless (1890–1962), president 1938–52 and board chairman 1952–55.

In the late 20th century, though it remained the largest steel producer in the United States, only about one-third of U.S. Steel's business remained in steel. With the acquisition of Marathon Oil Company in 1982 and Texas Oil & Gas Corp. in 1986, U.S. Steel assumed a major role in the oil and gas industry. The company had also become heavily involved in the chemical industry, mining, construction, real estate, and transportation (such as railroads, shipping, and shipbuilding). Thus, in 1986, the holding company USX Corporation was established to oversee the diversified interests divided among four operating units: USS (for steel), Marathon Oil, Texas Oil & Gas, and U.S. Diversified Group (directing the chemical, engineering, real estate, and other businesses).

Uta, genus of New World lizards of the family Iguanidae. The seven species that have been described occur in the southwestern United States and in adjacent regions of Mexico. The side-blotched lizard, or ground uta (Uta stansburiana), is found as far north as Washington state. Uta species range in length from 10 to 27 cm (4 to 11 inches). They are usually dull-coloured; the males of some species have a blue throat and abdomen. These lizards are climbers and are commonly found on bushes and large rocks.

Utagawa Kunisada (b. 1786, Edo [Tokyo]—d. Jan. 13, 1865, Edo), Japanese artist who was

probably the most prolific of all the painters and printmakers of the ukiyo-e ("pictures of the floating world") movement. He was particularly known for his erotically decadent portraits of women, executed with a powerful, free style. Kunisada also excelled at portraits of actors, which were frequently more original than those of his teacher Utagawa Toyokuni. His masterpiece is a series of illustrations for *Nise murasaki inaka genji*, a parody by Ryūtei Tanehiko of *The Tale of Genji (Genji monogatari*).

Utagawa Kuniyoshi, original name IGUSA MAGOSABURŌ (b. Jan. 1, 1798, Kanda, Edo

"Kōsō goichidai ryakuzu," woodblock print by Utagawa Kuniyoshi; in the Sakai Collection, Tokyo By courtesy of the Sakai Collection, Tokyo

[now Tokyo]—d. April 14, 1861, Edo), Japanese painter and printmaker of the ukiyo-e ("pictures of the floating world") movement. Like his rival Utagawa Kunisada, Kuniyoshi was a pupil of Utagawa Toyokuni. He established his fame as the designer of musha-e ("warrior prints") with his series of prints entitled "Tsūzoku Suikoden gōketsu hyakuhachinin" ("One Hundred and Eight Popular Warrior Heroes from Shui-hu ch'uan"), published in about 1827. He also produced landscapes, frequently using Western perspective. Among the most famous of these are the 10-print series "Tōto meisho" ("Famous Sights of Edo") and the five-print series "Tōto Fujimi sanjūrokkei" ("Thirty-six Sites in Edo Overlooking Mount Fuji").

Utagawa Toyokuni, original name Kurahashi Kumakichi, later Kumauemon, also called Toyokuni (b. 1769, Edo [now Tokyo]—d. Feb. 24, 1825, Edo), Japanese artist of the ukiyo-e ("pictures of the floating world") movement who developed the style of his master, Utagawa Toyoharu, making it one of the most popular of its day.

Toyokuni specialized in prints of actors but was also known for his portraits of women. His "Yakusha butai-no-sugatae" ("Portraits of Actors in Their Various Roles"), a series of large nishiki-e, or polychrome prints, created between 1794 and 1796, marked the peak of his creative work. His drawing for woodblock prints was characterized by the use of powerful and vivid lines that achieved an effect of exaggeration reminiscent of the style of his contemporary Sharaku. Toyokuni's later style degenerated frequently into sheer grotesquerie.

Utah, constituent state of the United States of America, located in the western mountain region in the west-central United States. It is bounded on the north by Idaho and Wyoming, on the east by Colorado, on the south by Arizona, and on the west by Nevada. The capital is Salt Lake City.

A brief treatment of Utah follows. For full treatment, see MACROPAEDIA: United States of America: Utah.

Prehistoric habitation of the Utah region occurred as early as 10,000 BC. About AD 400 the

Pueblo (Anasazi) Indian culture, with its communal cliff dwellings, was located throughout Utah. This culture disappeared about 1250 and was followed by Shoshoni Indians, practicing a desert culture. Spain explored the area in the late 18th century. The region passed to Mexico in 1821 and became a part of the United States in 1848, at the conclusion of the Mexican War. U.S. exploration of Utah, however, had preceded its annexation: Jim Bridger reached the Great Salt Lake in 1824. Later explorers included Jedediah Smith and John C. Frémont.

Utah entered its formative stage in U.S. history with the arrival of the Mormons in 1847. The Mormons, members of the Church of Jesus Christ of Latter-day Saints, had fled persecution in Ohio, Missouri, and Illinois. Using the Great Salt Valley as their base, they colonized a huge portion of the surrounding area. They applied for statehood no less than six times between 1849 and 1887 and finally entered the Union in 1896 as the 45th state, only after they had renounced polygamy and their church's political People's Party.

Utah straddles three physiographic regions. In the northeast is the Middle Rockies region, containing the Uinta Mountains, the only major east—west mountain range in the United States. The western third of the state is part of the Basin and Range Province, a broad, flat, desertlike area with occasional mountain peaks. Both the Great Salt Lake and the Great Salt Lake Desert are in this region. The remainder of the state (slightly more than half) lies within the Colorado Plateau. This elevated region is cut by brilliantly coloured canyons.

Utah is basically arid, though the southwestern corner is almost dry subtropical in climate. The state has four distinct seasons. The average July temperature is about 70° F (21° C). Except in the southwestern corner, the average winter temperature is slightly below freezing. Daily temperatures vary widely, relatively low humidity prevails, and average precipitation is 11 inches (280 mm) a year. The average annual snowfall is 4.5 feet (1.4 m).

About 70 percent of the land of Utah is owned by either the federal or the state government. The majority of the state's population is concentrated in a short strip, not more than 100 miles (161 km) long, stretching from Ogden to Provo. Its four counties contain more than three-fourths of the state's population. The birth rate is high and the death rate low. With increasing rates of immigration, the state has grown rapidly. Between 1970 and 1980 its population increased by nearly 38 percent, more than three times the national average. Indians comprise about 1 percent of

the population, and Hispanic people constitute 4 percent.

Agricultural production is highly dependent on irrigation, and more than three-fourths of farm income is from livestock and livestock products. Hay is the most important crop, followed by wheat, barley, and corn (maize). Mineral wealth is particularly important. Copper once accounted for much of the value of the state's mineral production, but its production has been reduced considerably. Utah is the world's foremost producer of beryllium and is a major producer of gold, silver, lead, uranium, and molybdenum. There are large coal and petroleum reserves. The state remains below the national average in the proportion of personal income derived from manufacturing. Printing and publishing; food processing; the manufacture of transporation equipment, computer hardware and software, nonelectrical machinery, rocket engines, and fabricated metals; and petroleum refining, are the major manufacturing activities.

With access to all national markets, Utah is developing into a major distribution centre for the West. Although overall railway mileage has declined, the road network has been expanding rapidly.

More than two-thirds of the population is Mormon, and the church exerts a strong influence on the state's cultural life and traditions. Mormon culture emphasizes closely knit family life, widespread interest in family genealogy, abstention from the use of alcoholic beverages and tobacco, and participation in sports and personal-development programs. Performing arts are highlighted by the Mormon Tabernacle Choir, the Utah Symphony Orchestra, the Salt Lake Oratorio Society, and Ballet West. More than one-half of Utah's governmental expenditure is for education. Utah has the highest proportion of highschool graduates and the highest median level of school years completed of any state in the nation. Area 84,899 square miles (219,889 square km). Pop. (1990 est.) 1,776,000.

Utah Lake, lake in Utah county, northcentral Utah, U.S.; it covers 150 square miles (390 square km) and is 23 miles (37 km) long. A freshwater lake, it drains through the Jordan River into Great Salt Lake to the northwest and is a remnant of prehistoric Lake Bonneville. It is the site of Utah Lake State Park and of waterfowl and bird preserves.

Utamaro, in full kitagawa utamaro, original name kitagawa nebsuyoshi (b. 1753,

Japan—d. Oct. 31, 1806, Edo, Japan—d.), Japanese printmaker and painter who was one of the greatest artists of the Ukiyo-e movement (paintings and wood-block prints of the "floating world"); he is known especially for his masterfully composed portraits of sensuous female beauties.

Probably born in a provincial town, he went to Edo (now Tokyo) with his mother. There, under the name of Toyoaki, he started painting and designing rather unoriginal wood-block prints of women. He also occupied himself with nature studies and published many illustrated books, of which *Gahon chūsen* (1788; "Insects") is best known.

In about 1791 Utamaro gave up designing prints for books and concentrated on making half-length single portraits of women rather than prints of women in groups as favoured by other Ukiyo-e artists. In 1804, at the height of his success, he made some prints depicting the military ruler Toyotomi Hideyoshi's wife and concubines. Consequently, he was accused of insulting Hideyoshi's dignity and was ordered to be handcuffed for 50 days. The experience crushed him emotionally and ended his career as an artist. Among his best known works are the wood-block-print series "Fu ninsõgaku jittai" ("Ten Physiognomies of Women"), "Seirō jūni-toki" ("Twelve Hours at the Gay Quarters"), "Seirō nanakomachi" ("The Seven Beauties of the Gay Quarters"), and "Kasen koi no fu" ("Women in Love").

name was given to the latter state. When the Spanish Father Silvestre Vélez de Escalante traversed their territory in 1776, while seeking a route from Santa Fe (now in New Mexico) to California missions, the Ute had no horses and lived in small family clusters subsisting by food collecting. At that time there was no clear distinction between the Ute and the Southern Paiute, both of whom spoke Ute, which belongs to the Southern Numic branch of the Numic (formerly Plateau Shoshonean) languages. After acquiring horses in the early 19th century, however, the Ute of western Colorado and later of northern Utah became organized in loose bands of hunters. As the area was settled by Europeans, these bands became predators on livestock. In the southern regions of Utah, Nevada, and California,

however, the Ute and Chemehuevi remained afoot, and the Ute came to be called Southern Paiute (see Paiute).

After the Indian wars (1864–70) most of the Colorado Ute were settled on a reservation in southwestern Colorado; those of Utah were placed on the Uintah and Ouray Reservation, where most of them remain. They numbered about 1,700 in Colorado and 2,660 in Utah in the late 20th century.

uterine bleeding, abnormal bleeding from the uterus, which is not related to menstruation. Menstruation is the normal cyclic bleeding that occurs when the egg has been released from the ovary and fertilization has not occurred. Other episodes of bleeding that cannot be considered part of the normal cycle are called dysfunctional uterine bleeding. This occurs most often in women during early adolescence and immediately before menopause begins. Menopause is the period during which egg release and menstrual bleeding slacken and cease. Dysfunctional bleeding is thought to be caused by imperfect ovarian functioning. The ovaries are the source of the eggs and of hormones that act upon the uterus.

The ovaries are controlled by the hypothalamus in the brain and by the pituitary; these structures give the ovaries the stimulus to produce and secrete the reproductive hormones estrogen and progesterone. A reduction in the amount of estrogen causes the walls of the uterus to shed part of their lining and bleed. Alterations in any of the structures controlling the uterus may create unusual bleeding patterns. The ovary itself may be mechanically disrupted by pressure from other organs, displacement, or tumour growths.

Emotional stress or psychological disturbances may affect the hypothalamus and cause suppression of stimulants to the ovary, with resultant uterine bleeding. Dysfunctional bleeding can also be associated with changes in environments, obesity, chronic illness, and with psychologically seated sexual problems and anxieties.

Blood and cardiovascular disorders such as anemia, clotting defects, fragile capillaries, and heart congestion also cause abnormal bleeding. Small blood vessels may spontaneously rupture if, for example, the blood pressure is high. Local injuries can bruise or injure the uterine wall. Intercourse, masturbation, abortion attempts, forceful inserting of tampons, and mechanical contraceptive devices may cause injury and irritation.

Infections in the abdominal cavity, the ovaries, or the uterus may cause some bloody discharge. Such discharge is usually not severe and does not persist. The further away an infection is from the ovaries and uterus, the less likelihood it has of causing dysfunctional bleeding.

Bleeding that is intermittent spotting or that gushes after intercourse or douching may be a sign of tumour growths or polyps. Some tumours produce estrogen that disrupts the normal menstrual cycle. Nearly all tumours in the uterus are richly supplied with blood vessels; when the tumours are moved or rotated, small vessels usually rupture, producing the abnormal bleeding.

Treatment for dysfunctional bleeding is directed toward the underlying cause.

uterine cervix, lowest region of the uterus; it attaches the uterus to the vagina and provides a passage between the vaginal cavity and the uterine cavity. The cervix, only about 4 centimetres (1.6 inches) long, projects about 2 centimetres into the upper vaginal cavity. The cervical opening into the vagina is called the external os; the cavity running the length of the cervix is the endocervical canal; the opening of the endocervical canal into the uterine cavity, the internal os. The endocervical canal transports sperm into the uterine

cavity, allows the escape of blood from the uterus during menstruation, and supplies mucus (a thick lubricating protein) to the female reproductive tract. During childbirth the canal is greatly stretched (see parturition, human).

The endocervical canal is lined with a moist mucous membrane. Cells within this tissue layer secrete fluids and project minute hairlike structures called cilia that help to move sperm through the canal. The fluids given off consist mainly of water, sugars, starches, and proteins. During ovulation (when the ovaries release an egg) the mucous secretions are plentiful and watery; before and after ovulation the secretions are thick and relatively scant. The mucus is arranged in a meshlike pattern of filaments and spaces. During ovulation the openings in the meshwork of filaments become larger so that sperm may freely pass through. Lysozyme, also present in cervical mucus, is an enzyme that helps to destroy certain types of bacteria and acts as a defense against infections.

Covering the mucous membrane is a thick layer of collagen and elastic fibres. There is also some muscle tissue, but the quantity is considerably less than in the rest of the uterus. The cervix is densely fibrous and, consequently, more rigid than the other uterine tissue. During pregnancy the cervix is the only part of the uterus that does not expand to house the developing child; the mucus inside the endocervical canal becomes very thick at this time and acts as a plug that helps to seal off the rest of the uterus from infection. Shortly before childbirth, the mucus thins, and the cervical walls relax to permit delivery.

Afflictions pertaining to the cervix include chronic inflammation, laceration and hemorrhaging during childbirth, malignant and benign tumours, and any of the many infectious venereal diseases.

uterine tube (anatomy): see fallopian tube.

uterus, also called womb, an inverted pear-shaped muscular organ of the female reproductive system, located between the bladder and rectum. It functions to nourish and house the fertilized egg until the unborn child, or offspring, is ready to be delivered.

For a depiction of the uterus in human anatomy, shown in relation to other parts of the body, see the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

The uterus has four major regions: the fundus is the broad, curved upper area in which the fallopian tubes (q.v.) connect to the uterus; the body, the main part of the uterus, starts directly below the level of the fallopian tubes and continues downward until the uterine walls and cavity begin to narrow; the isthmus is the lower, narrow neck region; the lowest section, the cervix, extends downward from the isthmus until it opens into the vagina. The uterus is 6 to 8 centimetres (2.4 to 3.1 inches) long; its wall thickness is approximately 2 to 3 centimetres (0.8 to 1.2 inches). The width of the organ varies; it is generally about six centimetres wide at the fundus and only half this distance at the isthmus. The uterine cavity opens into the vaginal cavity, and the two make up what is commonly known as the birth canal.

Lining the uterine cavity is a moist mucous membrane known as the endometrium. The lining changes in thickness during the menstrual cycle, being thickest during the period of egg release from the ovaries (see ovulation). If the egg is fertilized, it attaches to the thick endometrial wall of the uterus and begins developing. If the egg is unfertilized, the endometrial wall sheds its outer layer of cells; the egg and excess tissue are then passed from the body during menstrual bleeding (see menstruation). The endometrium also produces secretions that help keep both the egg and the sperm cells alive. The components of the endometrial fluid include water, iron,

potassium, sodium, chloride, glucose (a sugar), and proteins. Glucose is a nutrient to the reproductive cells, while proteins aid with implantation (q.v.) of the fertilized egg. The other constituents provide a suitable environment for the egg and sperm cells.

The uterine wall is made up of three layers of muscle tissue. The muscle fibres run longitudinally, circularly, and obliquely, entwined between connective tissue of blood vessels, elastic fibres, and collagen fibres. This strong muscle wall expands and becomes thinner as a child develops inside the uterus. After birth, the expanded uterus returns to its normal size in about six to eight weeks; its dimensions, however, are about one centimetre (0.4 inch) larger in all directions than before childbearing. The uterus is also slightly heavier and the uterine cavity remains larger.

The uterus of a female child is small until puberty, when it rapidly grows to its adult size and shape. After menopause, when the female is no longer capable of having children, the uterus becomes smaller, more fibrous, and paler. Some afflictions that may affect the uterus include infections; benign and malignant tumours; malformations, such as a double uterus; and prolapse, in which part of the uterus becomes displaced and protrudes from the vaginal opening.

Uthagamandalam, formerly ootacamund, town, administrative headquarters of Nīlgiri district, Tamil Nādu state, southeastern India, in the Nīlgiri Hills, at about 7,500 ft (2,300 m) above sea level. It is sheltered by several peaks, including Doda Betta (8,652 ft), the highest point in Tamil Nādu. Founded by the British in 1821, it was used as the official government summer headquarters for the Madras Presidency until Indian independence in 1947. The town is primarily a tourist resort, but it also contains tea-processing and textile industries, schools, and two colleges affiliated with the University of Madras. Pop. (1981) 78,277.

Uthai Thani, town and changwat (province) in the Northern region of Thailand, west of the Mae Nam (river) Chao Phraya. The provincial capital, Uthai Thani, is a market town in the eastern lowland part of the province. The province (area 2,598 sq mi [6,730 sq km]) includes a fertile lowland in the east and the Prathet Thai highlands in the west. Somewhat isolated from the country's main transportation lines and centres of development, it produces fish and rice. There are several ancient town ruins. Pop. (1980) town, 17,126; province, 225,632.

Uthman dan Fodio, Arabic 'UTHMĀN IBN FŪDĪ (Muslim reformer): see Usman dan Fodio.

'Uthmān ibn 'Affān (d. June 17, 656, Medina, Arabian Peninsula), third caliph to rule after the death of the Prophet. He centralized the administration of the caliphate and established an official version of the Qur'ān. 'Uthmān is critically important in Islāmic history because his death marked the beginning of open religious and political conflicts within the Islāmic community (see fitnah).

Uthmān was born into the rich and powerful Umayyad clan of Mecca, and he became a wealthy merchant. When Muhammad began preaching in Mecca c. 615, he soon aroused the hostility of the Umayyads, but about five years later Uthmān accepted Muhammad and thus became the first convert of high social and economic standing. Muhammad valued this contact with the Meccan aristocracy, and he allowed Uthmān to marry one of his daughters. Uthmān rarely displayed energy or initiative, however, and his role in the first years of Islāmic history was passive.

Umar, the second caliph, died in 644, and

'Uthmān was elected successor by a council named by 'Umar before his death. Apparently 'Uthmān was selected as a compromise, when the more powerful candidates cancelled each other out. He also represented the Umayyad clan, which had suffered a partial eclipse during the Prophet's lifetime but was now reasserting its influence.

As caliph 'Uthman promulgated an official version of the Qur'an, which had existed in various versions. Uthman followed the same general policies as had 'Umar, but he had a less forceful personality than his predecessor. He continued the conquests that had steadily increased the size of the Islamic empire, but the victories now came at a greater cost and brought less booty in return. Uthmān tried to create a cohesive central authority to replace the loose tribal alliance that had emerged under Muhammad. He established a system of landed fiefs and distributed many of the provincial governorships to members of his family. Thus much of the treasure received by the central government went to 'Uthman's family and to other provincial governors rather than to the army. As a result of his policies, Uthmān was opposed by the army, and he was often dominated by his relatives, unlike 'Umar, who had been strong enough to impose his authority on the governors, whatever their clan or tribe.

By 650 rebellions had broken out in the provinces of Egypt and Iraq. In 655 a group of Egyptian malcontents marched upon Medina, the seat of caliphal authority. Uthmān, however, was conciliatory, and the rebels headed back to Egypt. Shortly thereafter, however, another group of rebels besieged Uthmān in his home, and, after several days of desultory fighting, he was killed.

Utica, modern UTIQUE, traditionally the oldest Phoenician settlement on the coast of North Africa. It is located near the mouth of the Majardah (French Medjerda, ancient Bagradas) River in modern Tunisia. After its founding in the 8th or 7th century BC, Utica grew rapidly and was second only to Carthage among Phoenician settlements in Africa. In the Third Punic War (149-146 BC), Utica sided with Rome against Carthage; after the destruction of Carthage it was made the administrative centre of the Roman province of Africa. Utica became a municipium (a community that exercised partial rights of Roman citizenship) under Octavian (later the emperor Augustus) in 36 BC and a colonia (a Roman settlement with full rights) under the emperor Hadrian (ruled AD 117–138); but it lost its primacy in Africa when Carthage was refounded as a Roman city in 44 BC. Little is known of its later history. Excavations have uncovered a number of Phoenician graves dating from the 8th century BC onward and a substantial residential section of the Roman city.

Utica, city, seat (1798) of Oneida County, central New York, U.S., on the Mohawk River and Barge Canal, 45 mi (72 km) east of Syracuse. The first settlers were Dutch and Palatinate Germans, and in 1758 the British built Old Ft. Schuyler, near the site of an ancient Indian council stone. Destroyed by the Indian-Tory raid in 1776, the early village was rebuilt and connected by stagecoach to Albany (1793) and by river to Schenectady. Incorporated as the village of Utica (its name was drawn from a hat) in 1798. its growth as a textile-industrial centre dates from the completion of the Erie Canal in 1825. In 1879 F.W. Woolworth opened his first store in Utica, selling only five-cent merchandise. Diversified manufacturing (including metal fabricating and the manufacture of machinery and electronic equipment) developed after World War II. The city is surrounded by dairylands with truck gardens to the west. Mohawk Valley Community College and the Utica College of Syracuse University

were established there in 1946, and the State University of New York College of Technology in 1973. The Munson-Williams-Proctor Institute (incorporated as a school of art in 1919) maintains a museum. Utica is the site of a state psychiatric center and the New York State Masonic Home. The annual Utica Eisteddfod festival is sponsored by the city's Welsh citizens. Inc. city, 1832. Pop. (1980) 75,632; (1982 est.) Utica-Rome metropolitan area (SMSA), 318,100.

Utilitarianism, in normative ethics, a tradition dating from late-18th-century England in which action is held to be right if it tends to promote happiness—not only that of the agent but of everyone affected by his act. Thus, Utilitarians focus upon the consequences of an act rather than upon its intrinsic nature or the motives of the agent. The leading proponents of Utilitarianism were the English philosophers Jeremy Bentham and John Stuart Mill. A brief treatment of Utilitarianism follows. For full treatment, see MACROPAEDIA: Philosophical Schools and Doctrines.

Utilitarianism is among those moral theories, often called teleological (concerning ends or purposes), that derive judgments about right or wrong from judgments about the quality of certain states of affairs—e.g., the quality of people's lives. Its main opposition comes from those moral theories, often called deontological (concerning duty or moral obligation), that maintain that, although some judgments about right can be derived from judgments about desirable states of affairs, others cannot be. Prominent among the latter, according to deontologists, are certain judgments about justice. Mill saw justice as Utilitarianism's largest problem, and that opinion persists.

Many Utilitarians have met such objections by defining new forms of the theory. One range derives from differing attitudes toward the value theory. The classical form is hedonist, but one can employ values other than, or in addition to, pleasure (ideal Utilitarianism), or one can, more neutrally, and in a version popular in economics, regard anything as valuable that appears as an object of (rational or informed) desire (preference Utilitarianism). One can also deny parity to the two sides of the value scale, maintaining that avoidance of disutility is morally more important than promotion of utility (negative Utilitarianism). One can also apply the test of utility maximization directly to single acts (act, or direct, Utilitarianism), or to acts only indirectly through some other suitable object of moral assessment, such as rules of conduct (rule Utilitarianism).

Some of the strands of Utilitarianism, especially hedonism and consequentialism, are traceable to ancient Greek philosophy; but Utilitarianism in its full sense, with its emphasis on impartial utility maximization, is an essentially modern theory. British antecedents of Bentham include Bishop Richard Cumberland in the late 17th century, Francis Hutcheson in the early 18th, and David Hume. There were two important non-British influences on Bentham, in the Frenchman Claude-Adrien Helvétius and the Italian Cesare Beccaria. both of the 18th century. Bentham's own major statement, An Introduction to the Principles of Morals and Legislation, was published in 1789, and John Stuart Mill's essay "Utilitarianism," perhaps the most compact and attractive of the classical statements, appeared in 1861.

By the time of the publication of *The Methods of Ethics* by the British philosopher Henry Sidgwick in 1874, Utilitarianism had become one of the foremost ethical theories of the day.

It continued to be advocated, challenged, and redefined into the 20th century. G.E. Moore, in Principia Ethica (1903) and Ethics (1912), proposed new criteria for the Utilitarian ideal. Economists have developed their own theory largely in Utilitarian terms, and many of the important 20th-century developments in Utilitarianism are to be found in the economic literature. The Utilitarian framework has also been employed by social scientists, mathematicians, and statisticians in formal decision

Utkal Plains, coastal plains in eastern Orissa state, eastern India. Extending over approximately 16,000 sq mi (41,400 sq km) and fronting the Bay of Bengal on the east, the plains are bounded by the Tamilnad Plain on the south, the Lower Ganges Plain on the north, and the Eastern Ghāts on the west. The Utkal Plains are coastal lowlands consisting chiefly of Mahānadi Delta deposits and marine sediments, and they merge with the Eastern Ghāts at an elevation of about 250 ft (76 m). The plains have a nearly straight shoreline. Buddhism flourished in the Utkal Plains in the 3rd century AD under Asoka, and the region is described in the rock edicts of Dhauli as forming part of the ancient Kalinga territory. Successive ancient dynasties including the Sātavāhanas, Karas, and Eastern Gangas ruled the region until, in the latter half of the 16th century, it passed to the Muslims and later to the Marāthās. The British assumed control of the plains in 1804. Comprised of recent and Tertiary alluvium, with patches of Archaeon gneiss and sandstone, the plains are widest in the deltaic regions. Sand dunes of decomposed granites and zircon, created mainly by the action of wind at low tide, and lagoons are found along the Bay of Bengal. Chilka, the largest lake in the region (in the southwest), is salty; Samang and Sur (north and northeast of Puri, respectively) are freshwater lakes. Littoral forests are found along the coast of Cuttack and Balasore districts, and tropical moist deciduous forests are found inland throughout Puri and Cuttack districts. The Mahānadi, Brāhmani, Baitarani, and Subarnarekha rivers are often subject to heavy flooding; the combined outflow of these rivers has formed the Mahānadi Delta in the northern part of the plains. The region has fertile red and black soils. Agriculture is the main occupation, and rice is the principal crop; pulse (legumes) and oilseeds are also grown. Major irrigation projects located in the plains permit double cropping. Industry, centred in urban areas such as Cuttack, Bhubaneswar, and Puri along the Calcutta-Madras railway, includes paper mills, refrigerator plants, and the production of ceramics, glass, refractories, textiles, and galvanized pipe. The plains have a network of roads and railways, inland waterways in Cuttack district, and an airfield at Bhubaneswar.

Uto-Aztecan languages, family of American Indian languages spoken in Mexico, northern Guatemala, and the western United States. The Uto-Aztecan languages are recognized by modern linguists as falling into eight groups, four of which make up the Shoshonean division and three the Sonoran division. The formerly recognized Nahuan division is now generally included in Sonoran.

The languages of the Shoshonean division (all of which are spoken in the United States), are (1) Numic (formerly called Plateau Shoshonean), which includes Mono and Northern Paiute, Panamint and Shoshoni, and Kawaiisu and Ute; (2) Tubatulabal; (3) the Takic (or sothern Californian) branch, including Serrano, Luiseño-co-Juaneño, Gabrieleño-Fernandeñno, Cahuilla, and Cupeño; and (4) Honi

The languages of the Sonoran division comprise (1) the Piman group, or Pimic, including Papago, Pima Bajo (or Lower Pima), Tepecano, and northern and southern Tepehuán; (2) the Yaquian, or Taracahitian, branch, also called Taracahitic, including Tarahumara, Guarijio, Yaqui-Mayo, and the extinct languages Tubar, Eudeve, and Opata; and (3) the Coran group, also called Corachol, including Cora and Huichol.

The former Nahuan division includes the three major dialects Nahuatl, Pipil, and the extinct Pochutec.

The Uto-Aztecan lanugages are more distantly related to the Kiowa-Tanoan language family of the southwestern United States, and the combined group is known as Azteco-Tanoan.

utopia, an ideal commonwealth whose inhabitants exist under seemingly perfect conditions. Hence "utopian" and "utopianism" are words used to denote visionary reform that

tends to be impossibly idealistic.

The word first occurred in Sir Thomas More's Utopia, published in Latin as Libellus . . . de optimo reipublicae statu, deque nova insula Utopia ("Concerning the highest state of the republic and the new island Utopia"; 1516); it was compounded by More from the Greek words for "not" (ou) and "place" (topos) and thus meant "nowhere." During his embassy to Flanders in 1515, More wrote Book II of Utopia, describing a pagan and communist city-state in which the institutions and policies were entirely governed by reason. The order and dignity of such a state was intended to provide a notable contrast with the unreasonable polity of Christian Europe, divided by self-interest and greed for power and riches, which More then described in Book I, written in England in 1516. The description of Utopia is put in the mouth of a mysterious traveller, Raphael Hythloday, in support of his argument that communism is the only cure against egoism in private and public life. More, in the dialogue, speaks in favour of mitigation of evil rather than cure, human nature being fallible. The reader is thus left guessing as to which parts of the brilliant jeu d'esprit are seriously intended and which are mere paradox.

Written utopias may be practical or satirical, as well as speculative. Utopias are far older than their name. Plato's Republic was the model of many, from More to H.G. Wells. A utopian island occurs in the Sacred History of Euhemerus (flourished 300 BC), and Plutarch's life of Lycurgus describes a utopian Sparta. The legend of Atlantis inspired many utopian myths; but explorations in the 15th century permitted more realistic settings, and Sir Thomas More associated Utopia with Amerigo Vespucci. Other utopias that were similar to More's in Humanist themes were the I mondi (1552) of Antonio Francesco Doni and La città felice (1553) of Francesco Patrizi. An early practical utopia was the comprehensive La città del sole (written c. 1602) of Tommaso Campanella (q.v.). Francis Bacon's New Atlantis (published 1627) was practical in its scientific program but speculative concerning philosophy and religion. Christian utopian commonwealths were described in *Antangil* (1616) by "I.D.M.," *Christianopolis* (1619) by Johann Valentin Andreae, and *No*vae Solymae libri sex (1648) by Samuel Gott. Puritanism produced many literary utopias, both religious and secular, notably, The Law

of Freedom . . . (1652), in which Gerrard Winstanley advocated the principles of the Diggers. The Common-Wealth of Oceana (1656) by James Harrington argued for the distribution of land as the condition of popular independence.

In France such works as Gabriel de Foigny's Terre australe connue (1676) preached liberty. François Fénelon's Télémague (1699) contained utopian episodes extolling the simple life. L'An 2440 by Louis-Sébastien Mercier (1770; Eng. trans., 1772) anticipated Revolutionary doctrines. G.A. Ellis' New Britain (1820) and Étienne Cabet's Voyage en Icarie (1840) were related to experimental communities in the United States that revealed the limitations of purely economic planning. Consequently, Bulwer-Lytton, in *The Coming Race* (1871), invented an essence that eliminated economics altogether, and William Morris demonstrated his contempt for economics in News from Nowhere (1890). Two influential utopias, however, had an economic basis: Looking Backward, 2000-1887 (1888) by Edward Bellamy (q.v.) and Freiland (1890; A Visit to Freeland..., 1894) by Theodor Herzka. H.G. Wells, in A Modern Utopia (1905), returned to speculation.

Many utopias are satires that ridicule existent conditions rather than offering practical solutions for them. In this class are Swift's Gulliver's Travels (1726) and Samuel Butler's Erewhon (1872). In the 20th century, when the possibility of a planned society became too imminent, a number of bitterly anti-utopian, or dystopian, novels appeared. Among these are *The Iron Heel* (1907) by Jack London, My (1924; We, 1925) by Yevgeny Zamyatin, Brave New World (1932) by Aldous Huxley, and Nineteen Eighty-four (1949) by George Orwell. The Story of Utopias (1922) by Lewis

Mumford is an excellent survey.

Concurrent with the literature, there have also been many attempts by religious groups and political reformers to establish utopian communities, especially in the Americas. In the two centuries between 1663 (when some Dutch Mennonites established the first such communitarian colony in what is now Lewes, Del.) and 1858, some 138 settlements were begun in North America. The first to outlast the lifetime of its founder was the Ephrata Community (q.v.) established in Pennsylvania in 1732 by some German Pietists. Other German Pietist settlements were founded by George Rapp (Harmony in Pennsylvania, Harmony [or Harmonie] in Indiana, and Economy in Pennsylvania), by the Amana group (in Iowa), and by the Shakers (q.v., 18 villages in eight states). Some of them pursued celibacy. Other communal religious sects still flourish; among the largest are the Hutterites, chiefly in the United States and Canada but having colonies also in Paraguay and England.

One of the first secular communities was New Harmony, founded in 1825 when the British manufacturer Robert Owen purchased Harmony, Ind., from the Rappites. It was a cooperative rather than communist society. Although it foundered, it sponsored the first kindergarten, the first trade school, the first free library, and the first community-supported public school in the United States.

The ideas of the French social reformer Charles Fourier had a strong influence upon American reformers in the 1840s, particularly upon the leaders of Brook Farm in Massachusetts. Between 1841 and 1859, about 28 Fourierist colonies were established in the United States. The Icarians, followers of Cabet, established ill-fated communities in Illinois (Nauvoo, formerly settled by Mormons), Missouri, Iowa, and California.

A unique venture was the Oneida Community founded in Putney, Vt., by John Humphrey Noyes in 1841 and moved to Oneida, N.Y., in 1848. The group practiced "complex marriage," in which all husbands and wives were shared. Noyes said that Oneida was the continuation of Brook Farm without its mistakes. He was convinced that socialism was impossible without religion, and that the "extended" family system would dissolve selfishness and demonstrate the practicality of this way of life. Children remained with their mothers until they could walk but were then placed in a common nursery.

After the American Civil War the enthusiasm for secular utopian experiments waned. There were some new settlements in the 1890s. following the publication of such Utopian tracts as Laurence Gronlund's The Cooperative Commonwealth (1884) and Bellamy's Looking Backward, but the impulse had run its course and these latter movements were soon gathered into the fold of political socialism. The creation of utopian religious communities continued into the 20th century, but they too were usually short-lived. The religious colonies, in almost all instances, were established and maintained by a single powerful personality who was believed by his disciples to have a singular gift of prophecy or wisdom. Most of these colonies flourished during the lifetime of the original leader and then declined slowly after his death.

Utopia Planitia, northern lava plain on the planet Mars. It was the landing site of the U.S. Viking 2 planetary probe (1976). The boulderstrewn plain of Utopia Planitia, at 47°.97 N and 225°.74 W, superficially resembles the Viking 1 landing site in Chryse Planitia (q.v.). Soil samples from the two sites are nearly identical in composition, which is probably the result of a mixing of windblown dust from wide regions of the planet. The Utopia plain differs from the Chryse area in that it has a system of shallow troughs, which may be part of a largescale polygonal patterning possibly associated with ice wedging by permafrost. The vesicular boulders detected at the Utopia site may be either local lavas or rocks ejected from the nearby crater Mie. Photographs transmitted by the Viking 2 lander showed the presence of a thin layer of white ground frost, composed of water, for about 100 days during each of the two Martian winters observed. The frost is probably deposited when carbon dioxide and water condense on airborne dust and precipitate. The carbon dioxide portion is thought to evaporate during exposure to sunlight, leaving only water frost.

Utraquist, also called CALIXTIN, or CALIX-TINE, any of the spiritual descendants of Jan Hus who believed that the laity, like the clergy, should receive the Eucharist under the forms of both bread and wine (Latin utraque, "each of two"; calix, "chalice"). Unlike the militant Taborites (also followers of Hus), the Utraquists were moderates and maintained amicable relations with the Roman Catholic Church. As a consequence, the Council of Basel in 1433 declared them to be true Christians. In 1434 the Utraquists joined Catholic Czech forces to defeat the Taborites at the Battle of Lipany. When, however, the Utraquists developed into an independent church, Rome withheld approval, even though Roman bishops officiated at Utraquist ordinations to the priesthood. The Utraquists, together with all other Protestant sects, were outlawed in Bohemia after the Battle of White Mountain in 1620.

Utrecht, provincie, central Netherlands, the country's smallest, with an area of 514 square miles (1,331 square km). It extends southward from the narrow Lake Eem, which separates Utrecht provincie from the South Flevoland polder of Flevoland provincie. Utrecht provincie lies between the provincies of Noordholand and Zuidholland (west) and Gelderland (east). Its history is closely linked with that of the city of Utrecht, its capital.

The provincie is drained by the Lower Rijn (Rhine), Kromme (Winding, or Crooked) Rijn, Lek, Vecht, and Eem rivers. The sandy soil of its hilly eastern part supports pig and poultry raising and horticulture around Amersfoort and Utrecht. The low-peat areas of the northwest have a few polders and lakes where much peat was cut and where dairy farming is now important. River clay found in the southwest, deposited by the Rijn, IJssel, and other rivers, supports fruit growing and market gardening. Utrecht, the largest city, and Amersfoort are the only sizable industrial communities; but there is light manufacturing in smaller towns such as Zeist, Veenendaal, and Maarssen. The provincie's northern part mostly comprises the resort and residential region known as the Gooi, whereas the region between Utrecht city and Amersfoort is pleasantly wooded.

Utrecht has many fine old castles and manor houses founded by wealthy Amsterdam merchants in the "Golden Age" (1650–1720). Near Baarn in the village of Soestdijk is former queen Juliana's royal residence. Pop. (1986 est.) 944.372.

Utrecht, gemeente (commune) and capital, Utrecht provincie, central Netherlands. It lies along the Kromme Rijn (Winding, or Crooked, Rhine), Oude (Old) Rijn, and Vecht rivers and the Amsterdam-Rijn Canal. Its original Roman name, Trajectum ad Rhenum (Ford on the Rhine), later became Ultrajectum, and then Utrecht.

The site of successive Roman, Frisian, and Frankish fortresses, Utrecht became a bishop's see in 696, when St. Willibrord was permitted by the Frankish king Pepin (Pippin II) to establish his headquarters there. Willibrord became the archbishop of the Frisians and, starting from Utrecht, converted to Christianity most of what is now the northern Netherlands. Utrecht was chartered in 1122 and had a city council as early as 1304. Utrecht's greatest prosperity was in the 11th and 12th centuries, but throughout the Middle Ages it remained the most powerful and important town in the northern Netherlands. Under its bishops, it became the capital of a powerful principality and a cultural, commercial, and industrial (mainly cloth-weaving) centre until it was surpassed by Amsterdam (26 miles [42 km] northwest) in the 15th century. Utrecht's bishops came increasingly under the influence of Holland until the Utrecht bishop Henry of Bavaria sold his temporal rights to Emperor Charles V in 1527, upon which Utrecht became part of the Habsburg dominions. Spanish domination prevailed until 1577, when the women of Utrecht scaled the local Spanish fortress and tried to pull it down. Thenceforth Utrecht supported the cause of the prince of Orange. Partly in reaction to the Spanish occupation, the town became a firm stronghold of Calvinism and remained so for many centuries. The Union of Utrecht (1579) was signed by the seven northern provinces of the Netherlands in league against Spain; the treaty established a military league to resist the Spaniards and served as the foundation of the later Netherlands kingdom. The archbishopric of Utrecht was established in 1559, suppressed in 1580, and revived in 1851. Occupied by the forces of Louis XIV (1672–74), Utrecht was the site of the negotiations culminating in the treaties of Utrecht (1713-14), which ended the War of the Spanish Succession. It was occupied by the French from 1795 to 1813 and was the residence of Napoleon's brother Louis, king of Holland (1806-10).

Utrecht is the seat of Roman Catholic and Old Catholic (Jansenist) archdioceses and of the county court of law. Its university (1636), the largest of the Dutch state universities, has many special schools and a library partly housed in the palace of King Louis Napoleon. Utrecht has numerous museums, including the Central Museum (art, history, archaeological

findings), The Netherlands Railway Museum, The Netherlands Gold and Silver Museum, the Clock and Watchmaking Museum, the Museum of Modern Religious Art, the Old Catholic Museum, and the National Museum "from Music Box to Barrel Organ."

All that remain of Utrecht's cathedral (built 1254-1517) are the transept and tower (1321-82), the latter being the tallest church tower in The Netherlands (about 370 feet [113 m]). The cathedral's nave collapsed in a storm of 1674 and was never rebuilt; the chapter room (1409), which is joined to the church by a Gothic cloister, is now the main assembly hall of the university. Other churches are Jans Church (founded 1040), Sint Pieters Church (1048), Nicolai Church (1131), Jacobi Church (1173), Buur Church (10th century), Geerte Church (1260), and Sint Catharijne Church (1468; now the Roman Catholic cathedral), all in a variety of styles reflecting numerous additions and restorations. The Paushuize (Pope's House) was completed in 1523 for the only Dutch pope, Adrian VI, who was a native of Utrecht. The city's Maliebaan (1636) is one of the finest promenades in The Netherlands. In the 19th century the old city ramparts were made into parks, and modern residential districts arose.

The city is now the headquarters of The Netherlands' railroads. It has a vegetable, fruit, and cattle market and is a financial and insurance centre and a site of the national mint. The Royal Dutch Industries Fair, founded in 1916, is the most important of the famous spring and autumn trade fairs held in the city. Diversified industries include construction, steelworking, printing, and the manufacture of aluminum, clothing, furniture, and chemicals. Pop. (1987 est.) 229,326; metropolitan area, 516,064.

Utrecht, State University of, Dutch RIJKS-UNIVERSITEIT TE UTRECHT, state-supported coeducational institution of higher learning founded in 1636 at Utrecht, Neth. In the 17th and 18th centuries Utrecht attracted many foreign students, especially from England and Scotland. James Boswell, Samuel Johnson's biographer, studied law at Utrecht (1763–64).

The largest Netherland state university, Utrecht has faculties of theology, law, medicine, science, arts, veterinary medicine, and social sciences. It offers interdisciplinary programs in geography and pre-history.

Utrecht, treaties of, also called PEACE OF UTRECHT (April 1713–September 1714), a series of treaties between France and other European powers (April 11, 1713 to Sept. 7, 1714) and another series between Spain and other powers (July 13, 1713 to June 26, 1714), concluding the War of the Spanish Succession (1701–14).

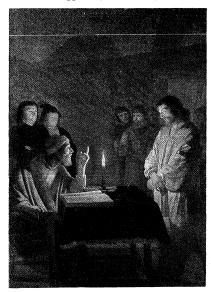

France concluded treaties of peace at Utrecht with Britain, the Dutch republic, Prussia, Portugal, and Savoy. By the treaty with Britain (April 11), France recognized Queen Anne as the British sovereign and undertook to cease supporting James Edward, the son of the deposed king James II. France ceded Newfoundland, Nova Scotia, the Hudson Bay territory, and the island of St. Kitts to Britain and promised to demolish the fortifications at Dunkirk, which had been used as a base for attacks on English and Dutch shipping. In the treaty with the Dutch, France agreed that the United Provinces should annex part of Gelderland and should retain certain barrier fortresses in the Spanish Netherlands. In the treaty with Prussia, France acknowledged Frederick I's royal title (claimed in 1701) and recognized his claim to Neuchâtel (in present Switzerland) and southeast Gelderland. In return France received the principality of Orange from Prussia. In the treaty with Savoy, France recognized Victor Amadeus II, duke of Savoy, as king of Sicily and that he should rule Sicily and Nice. The treaty with Portugal recognized its sovereignty on both banks of the Amazon River. France's Guiana colony in South America was restricted in size.

The peace treaties involving Spain took longer to arrange. Spain's treaty with Britain (July 13) gave Gibraltar and Minorca to England. The treaty was preceded by the asiento agreement, by which Spain gave to England the exclusive right to supply the Spanish colonies with African slaves for the next 30 years. On Aug. 13, 1713, the Spanish treaty with Savoy was concluded, ceding the former Spanish possession of Sicily to Victor Amadeus as his share of the spoils of war. In return he renounced his claims upon the Spanish throne. The peace between Spain and the Dutch was delayed until June 26, 1714, and that between Spain and Portugal until the Treaty of Madrid (February 1715).

The Holy Roman emperor Charles VI, in what is considered the end of the War of the Spanish Succession, concluded peace with France in the Treaties of Rastatt and Baden (March 6, 1714 and Sept. 7, 1714; see Rastatt and Baden, Treaties of). Peace between the Emperor and Spain was not concluded until the Treaty of The Hague (February 1720).

The question of the Spanish Succession was finally settled in favour of the Bourbon Philip V, grandson of France's Louis XIV. Britain received the largest portion of colonial and commercial spoils and took the leading position in world trade. In international politics the settlement at Utrecht established a pattern for the next 20 years.

Utrecht school, principally three Dutch painters—Dirck van Baburen (c. 1590–1624), Gerrit van Honthorst (1590–1656), and Hendrik Terbrugghen (1588–1629)—who went to

Rome and fell fully under the pervasive influence of Caravaggio's art before returning to Utrecht. Although none of them ever actually met Caravaggio (died 1610), each had access to his paintings, knew his former patrons, and was influenced by his follower Bartholomeo Manfredi's (1580–1620/1) half-length figural groups, which were boldly derived from Caravaggio and occasionally passed off as the deceased master's works.

Back in the Netherlands the "Caravaggis-

ti" were eager to demonstrate what they had learned. Their subjects are frequently religious ones, but brothel scenes and pictures in sets, such as five works devoted to the senses, were popular with them also. The numerous candles, lanterns, and other sources of artificial light are characteristic and further underscore the indebtedness to Caravaggio.

Although Honthorst enjoyed the widest reputation, painting at both the Dutch and English courts, Terbrugghen is generally regarded as the most talented and versatile of the group.

Utrera, city, Sevilla province, in the autonomous community (region) of Andalusia, southwestern Spain, southeast of the city of Seville on the Arroyo de la Antigua, a tributary of the Río Guadalquivir. The site has been occupied since prehistoric times and was known as Utricula during the Roman period. The city, an episcopal see before domination by the Moors (who called it Gatrera), was retaken by Alfonso the Wise of Castile in the 13th century; it reverted to a Moorish stronghold until finally reconquered (1340) by Juan Manuel for use as a Christian base. It was a notorious refuge for brigands and outlaws in the Middle Ages and was twice ruined (by Muhammad V in 1368, and in the Peninsular War, 1808-14) and rebuilt. Landmarks such as a 14th-century Moorish castle, the Gothic churches of Santa María and Santiago, and the Sanctuary of Consolation (Consolación)

Economic activities are agriculturally based and include the production of olive oil, poultry, textiles, wines, margarine, cereals, and flour. Horses and fighting bulls are raised in the vicinity. Pop. (1981) 37,877.

Utrillo, Maurice (b. Dec. 25, 1883, Paris—d. Nov. 5, 1955, Le Vésinet, Fr.), French painter, noted especially for his pictures of the houses and streets of the Montmartre district of Paris.

Utrillo was the natural son of Suzanne Valadon, an artist's model who herself became a successful painter. His father was not known, and he was given a name by a Spanish art critic, Miguel Utrillo. When, as an adolescent, Maurice became an alcoholic, his mother encouraged him to take up painting as therapy. Despite frequent relapses into alcoholism, painting became Utrillo's obsession, and he produced thousands of oils. Initially influenced by the Impressionists, he gradually developed a strong, sure style of his own, which

showed no sign of his mental and physical deterioration.

Utrillo's best work is that of his "white period" (c. 1908–14), so called from the lavish use of zinc white. These freshly conceived and freely brushed oils brought him fame and a fortune. In his later years his painting, largely based on picture postcards, declined sharply in originality and vigour.

Utsunomiya, capital, Tochigi Prefecture (ken), Honshu, Japan, on the alluvial plain between the Ta-gawa (Ta River) and the Kinu-gawa. A castle town in the 11th century, it served as a post town on the Nikkōkaidō (Nikkō Highway) during the Tokugawa era (1603–1867). The city became the prefectural administrative centre in 1884. During World War II industries were relocated to Utsunomiya from Tokyo, producing railway cars, aircraft, and machinery. Other manufactures include processed foods, paper, and tobacco. Rice and vegetables are grown in the surrounding area. A university was founded there in 1949.

tury. Tourism is based on several old temples and other places of interest. The Oya-ji (Oya Temple) was founded during the Heian era (794–1185) and contains the oldest Buddhist images in Japan. The Peace Kannon (a manifestation of the goddess of compassion) is an 88-ft (27-m) statue carved on the wall of a quarry between 1948 and 1956. Pop. (1983 est.) 394,442.

Uttar Kannad, also called NORTH KANARA, district, western Karnātaka (formerly Mysore) state, southern India, paralleled by the Western Ghāts (east) and a coastal strip on the Arabian Sea (west). Formerly called Kanara, it was part of Bombay Presidency until 1956. Its area (3,968 sq mi [10,276 sq km]) is drained by the Kālīnada, Gangavāli, Tadri, and Sharavati rivers, the latter forming Jog Falls (q.v.) on the southern border. Rice milling and betel nut and pepper farming are the main occupations. Coir fibre is processed from coconut from the numerous plantations. There are saltworks and deposits of manganese. Teak, bamboo, and blackwood are obtained from the northern forests. The Dandeli Sanctuary (1949) is a refuge for the tiger, panther, sloth bear, and elephant. Fishing ports include Kārwār (the district headquarters), Honāvar, Belekere, Tadri, and Kumta, Sirsi and Halival are the main inland population centres. Pop. (1981) 1,072,034.

Uttar Pradesh, constituent state of the Republic of India, lying for the most part in the

upper valley of the Ganges River in the northern part of the country. It is bounded on the north by Nepal and the Chinese Autonomous Region of Tibet and, in India, in the northwest by Himāchal Pradesh state, in the west by Haryana state and the union territory of Delhi, and by the states of Rajasthan in the southwest, Madhya Pradesh in the south, and Bihar in the east.

The following article summarizes the administrative history, geography, demographic patterns, economy, and culture of modern Uttar Pradesh; for additional treatment of its geography and history, see MACROPAEDIA: India.

Uttar Pradesh, the birthplace of Rāma and Krishna (Kṛṣṇa), has been the seat of Hindu religion and culture from the earliest times. Buddha preached his first sermon at Sarnath and attained parinirvāņa ("freedom of spirit")

at Kuśinagara.

Earlier, in the Vedic period (c. 1500-600 BC), the area formed part of the ancient country known as Madhyadeśa. Later such great Hindu kings as Asoka and Samudragupta ruled the area. During the Muslim period, this part of the great northern Indian plain was known as Hindustan. It remained under the Mughal emperors until the close of the 18th century. The British gradually extended their power west from Bengal in the 19th century, and Uttar Pradesh became the main scene of the Indian Mutiny of 1857 against British rule. The area was in the forefront of the Indian independence movement, and it became a state on Jan. 26, 1950, when India became a republic. It is the birthplace of India's first three prime ministers—Jawaharlal Nehru, Lal Bahadur Shastri, and Indira Gandhi.

Physiographically, Uttar Pradesh can be divided into four regions: (1) the Himalayan region in the north, where some peaks rise to more than 23,000 ft (7,000 m); (2) the submontane region composed of a forested piedmont zone and a damp and marshy tract of thick jungle and tall grass; (3) the Ganges Plain, almost level and featureless, which makes up the largest part of the state; and (4) the hill and plateau region of the south, part of the central Indian plateau. A land of many rivers, Uttar Pradesh is drained by the Ganges (and its tributaries—the Yamuna, the Rāmganga, the Gomti, and the Ghāghara), the Chambal, the Betwa, the Ken (all tributaries of the Yamuna), and the Son.

The entire state, except for the northern region, has a tropical monsoon climate. In the plains, January temperatures range from 54.5° to 63.5° F (12.5° to 17.5° C) and May temperatures from 81.5° to 90.5° F (27.5° to 32.5° C), with a maximum of 113° F (45° C). From 85 to 90 percent of the annual rainfall comes during the rainy season from the Bay of Bengal summer monsoon. Rainfall varies from 40 to 80 in. (1,000 to 2,000 mm) in the east to 24 to 40 in. in the west. In the Himalaya region, rainfall ranges between 40 and 80 in., in some places exceeding that upper

Uttar Pradesh is at once the most populous and the second most densely populated state in India. It has more than 16 percent of the total population of India. Two ethnographic groups inhabit the state-Mongoloid peoples in the far north near the Tibetan border and Aryo-Dravidian people in the plains and the hill and plateau region of the central and southern part of the state. Nearly four-fifths are Hindus, and the balance Muslims and Jainas. Hindī is the mother tongue of most, with about 10 percent speaking Urdū. A large majority of the state's population lives in villages of fewer than 500 inhabitants. The western plain is the most urbanized region.

Agriculture is by far the most important sector of the state's economy, employing about three-fourths of the work force and accounting for nearly that share of the total net income. Much land is under irrigation, and food crops (rice, wheat, corn [maize], and edible oil seeds) are dominant. Sugarcane is the most important commercial crop, and potatoes, cotton, tobacco, and jute are also grown. It is the major opium-growing state in India. The per-acre yield of most crops, however, is low

Uttar Pradesh is rich neither in forest resources nor minerals. It has some phosphate shale, manganese, coal, and perhaps some oil; it is the largest silica-producing, and the second largest limestone-producing state in the country. Uttar Pradesh does, however, have vast hydroelectrical potential in the northern and southern hilly regions. Thermal generation supplies two-thirds of aggregate electrical

power plant capacity.

Uttar Pradesh is one of India's comparatively industrially backward states. Only a tiny fraction of the population is engaged in industry, most in such cottage industries as handloom weaving. Large-scale operations include paper, sugar, and textile mills, leather works, and engineering-equipment factories. There are cement factories in Mirzāpur, a precisioninstrument plant at Lucknow, the capital, a chemical plant at Bareilly, an antibiotics factory at Rishikesh, a diesel-locomotive works at Vārānasi, a nitrogenous-fertilizer factory at Gorakhpur, and an oil refinery at Mathura.

Lack of adequate road transport hinders the exploitation of the rich Himalayan forests. A fifth of the state's roads are unpaved, and the railway system suffers from the presence of two different gauges of track. Air service is provided between several large Uttar Pradesh towns and Delhi, and the state's transportation system also includes the three major inland waterways of the Ganges, the Yamuna, and the Ghāghara.

Uttar Pradesh has contributed much to the composite culture of India. From time immemorial, various arts have flourished in towns and cities as well as in the countryside. Handicrafts were developed at various centres, notably in Lucknow, famous for its chikan (a type of embroidery); in Morādābād, noted for its metal enamelling; in Vārānasi, known for its brocades and brass ware; and in Nagīna, known for its ebony work. The songs and dances of the countryside are significant features of local culture. They include the kajari of Mirzāpur and Vārānasi; the Alha Udal, a folk epic; and various village dances.

Uttar Pradesh has 20 universities and more than 350 colleges, but the literacy rate is far lower than in many other Indian states. The Lucknow College of Arts, the Morris College of Music (in Lucknow), and the College of Indology of the Banaras Hindu University are doing much to encourage the growth of the fine arts in the state. Area 113,673 sq mi (294,413 sq km). Pop. (1981) 110,862,013.

Uttaradit, town and changwat (province) in the Northern region of Thailand. Uttaradit town, the provincial capital, is a farming market centre on the Mae Nam (river) Nan and the Bangkok-Chiengmai railway. The town centre was rebuilt after being destroyed by a fire in 1967. The Pha Then Buddhist shrine is southwest of the town.

The province has an area of 3,027 sq mi (7,839 sq km) and borders Laos along its eastern highlands. It is drained by the Mae Nam Nan and is one of Thailand's foremost fruit-growing provinces, producing rambutans, mangosteens, durians, coconuts, and other fruits. Rice is cultivated and iron ore is mined. Pop. (1980 est.) town, 33,315; (1980) province,

Uttarkāshi, town, administrative headquarters of Uttarkāshi district, Uttar Pradesh state, northern India, on a mountain ridge, northeast of Dehra Dūn, near the Chinese border.

Uttarkāshi district is 3,095 sq mi (8,016 sq km) in area and lies entirely within the Himalaya Range. It is drained by tributaries of the Yamuna River. Pop. (1981) town, 10,043; district, 190,948.

Uttlesford, district, county of Essex, England. It occupies 248 sq mi (642 sq km) in the northwestern corner of the county, where it borders Cambridgeshire and Hertfordshire. A low ridge of chalk hills runs from southwest to northeast through a rolling countryside. The district is largely rural. The main town is Saffron Walden; there are also many smaller old parishes, such as Thaxted, Great Dunmow, and Stansted Mountfitchet. The region has long been a residential area for affluent commuters to London. Proposals to enlarge the Stansted airport to become London's third major field, after Heathrow and Gatwick, have encountered strenuous local opposition. Pop. (1983 est.) 64,000.

Utzon, Jørn (b. April 9, 1918, Copenhagen). Danish architect best known for his dynamic, imaginative, but problematical design for the Sydney Opera House, Australia.

He studied at Copenhagen School of Architecture (1937-42) and then spent three years in Stockholm, where he came under the influence of the Swedish architect Erik Gunnar Asplund. He also studied in the United States, and, for a six-month period in 1946, he worked in the office of the Finnish architect and designer Alvar Aalto. Among his important early works are two houses in Denmark, his own at Hallebæk (1952), and another at Holte (1952-53).

In 1956 Utzon's dramatic design for the new opera house at Sydney placed first in competition and brought him international fame. Construction, however, posed a variety of problems, many resulting from the innovative nature of the design, a series of sail-like shells. He resigned from the project in 1966, but construction continued until September 1973.

Utzon is also noted for two housing estates, one near Helsingør (1956) and another in Fredensborg in northern Sjælland (1957-60). Both made effective use of the surrounding terrain. His Bagsůaerd Church (1976) in suburban Copenhagen has the appearance of clustered farm buildings. He was given numerous awards for his works, including a gold medal by the Royal Institute of British Architects in 1978.

ern Greenland, north of Nuussuaq Peninsula, separated from Karrat Isfjord by Upernivik and Ubekendt islands. About 100 miles (160 km) long and 15–30 miles (24–48 km) wide, Uummannaq divides into several smaller fjords extending eastward to the inland ice cap, where they are fed by extensive glaciers. Qarajaqs Isfjord is its most southerly arm. The town of Uummannaq (founded 1763) is on a small island just north of Nuussuaq Peninsula. A hunting and fishing base, it has a hospital and a weather and radio station. Pop. (1982) Uummannaq town, 1,212.

Uusimaa, in full uudenmaan lääni, Swedish nylands län, lääni (province), southern Finland, on the Gulf of Finland. Its land area is 3,822 square miles (9,899 square km). Helsinki, the national capital and also the provincial administrative capital, is located midway along the Uusimaa coast. Other important towns include Porvoo (Borgå), Kerava, Lovisa (Loviisa), Hyvinkää, Hangö (Hanko), and Ekenäs (Tammisaari). In some areas the population is mainly Swedish-speaking. The area is low and flat in the south, rising gradually to the north.

Economic activity outside of Helsinki includes granite and limestone quarrying; the cultivation of rye, oats, potatoes, and sugar beets; cattle raising; timbering; and the manufacture of wood products. The economy of the Helsinki area, the centre of Finland's business and industrial activity, is highly diversified. Tapiola, a part of the town of Espoo, is a newly planned residential area. Pop. (1985 est.) 1,175,373.

Uvalde, city, Uvalde County, southwestern Texas, U.S., on the Leona River, 84 miles (135 km) west-southwest of San Antonio. Fort Inge was built (1849) on the Leona's east bank, and the site was settled in 1852 by W.W. Arnett, who was joined in 1853 by Reading W. Black and H.L. Stratton. Black opened a trading post (1855), cut the first street, and called the community Encina. Incorporated in 1856 as a city and named county seat, it was renamed for the county (which derived its name, anglicized, from Guan de Ugalde, Mexican governor of Coahuila).

Economic activities in Uvalde and vicinity are basically agricultural and include vegetable processing and the production of animal feed, honey, wool, and mohair. Local deposits of asphalt, basalt, sand, gravel, and lime are also worked. Institutions include Southwest Texas Junior College (1946) and the Garner Museum, the home of Vice President John Nance Garner (1933–41). Pop. (1984 est.) 14,908.

Uvarov, Sergey Semyonovich, Graf (Count) (b. Sept. 5 [Aug. 25, Old Style], 1786, Moscow—d. Sept. 16 [Sept. 4], 1855, Moscow), Russian statesman and administrator, an influential minister of education during the reign of Tsar Nicholas I.

Uvarov served as a diplomat (1806–10), head of the St. Petersburg educational district (1811–22), and deputy minister of education (1832) before being named minister of education in 1833. In an important report to the tsar in 1833 he declared that education must be conducted "with faith in the . . . principles of orthodoxy, autocracy, and nationality." These words were subsequently adopted by various periodicals and associations as articles of faith. The ideology that they came to represent was rooted in loyalty to dynastic rule, traditional religious faith, and romantic glorification of the homeland. Uvarov's sub-

sequent educational policies were reactionary: he restricted the educational opportunities of nonnoble students and tightened government control over university and secondary school curricula. During his tenure the educational system did expand significantly, however, particularly in the fields of technical and vocational instruction.

Uvarov was minister of education from 1833 to 1849 and president of the Academy of Science from 1818 until his death. He was created a count in 1846.

uveitis, inflammation of the uvea, the middle coat of the eyeball, which is pigmented and contains blood vessels. The uvea consists of three parts: the iris, the ciliary body (containing the muscle that controls the curvature of the lens), and the choroid, the layer of the eyeball between the retina and the sclera (the white outer covering of all except the front part of the eyeball). Anterior uveitis affects only the iris or the ciliary body, or both; posterior uveitis, the choroid. Uveitis is also classified by whether or not it is granulomatous—that is, whether or not there is persistent inflammatory tissue with a granular surface.

Granulomatous uveitis causes impairment of vision, pain, watering of the eyes, and sensitivity of the eyes to light; the nongranulomatous type also causes impairment of vision, but there is less pain and less sensitivity to light. Eventual complete recovery occurs far more often in the nongranulomatous type than in the granulomatous.

Causes of uveitis include systemic infections (e.g., measles, syphilis, and tuberculosis), other systemic diseases (e.g., rheumatoid arthritis), and allergic reactions. In many cases no particular cause can be identified.

Anterior uveitis, which is also called iritis if the inflammation is confined to the iris, cyclitis if it affects only the ciliary body, and iridocyclitis if both structures are involved, causes contraction of the pupil and deposition of clumps of cells on the iris and the cornea. The pupillary edges of the iris may adhere to the lens, impeding the flow of the aqueous humour. The resultant increased pressure within the eyeball may injure the optic nerve and cause blindness (see glaucoma). Posterior uveitis usually affects the retina. Blurring of vision results from the retinal involvement and from debris in the vitreous, the jelly-like substance that fills the rear portion of the globe. Complications include bleeding with growth of connective tissue into the vitreous,

the clouding of the lens, and atrophy of the eyeball.

In some rare cases, there may occur a condition called "sympathetic ophthalmia," in which symptoms of irritation occur not only in the injured eye but also, sympathetically as a hypersensitive reaction, in the uninjured eye. Insufficient or delayed therapy can result in blindness in both eyes.

Treatment of uveitis is directed toward elimination of infection, reduction of inflammation, and preservation of vision, including that of the eye that may have escaped the uveitis.

Uwajima, city, Ehime ken (prefecture), Shikoku, Japan, facing the Bungo Channel between the Inland Sea and the Pacific Ocean. Uwajima developed as a castle town in the late 16th century. Connected by rail to major ports on the Inland Sea in 1945, it became the transport hub of southwestern Shikoku. The port is an active fishing centre; associated industries produce ships, processed foods, and fishnets.

Uwajima contains places of historic interest, including the remains of its castle. Atago Park, named for the Shintō god who protects towns from fire, contains the Uwatsuhiko Shrine, well known for its festivals. The city hosts $t\bar{o}$ - $gy\bar{u}$ (contests between bulls) after the harvest season. Pop. (1980) 71,586.

Uxbridge, locality, Hillingdon London Borough, Greater London metropolitan area, Eng., on the Colne River, 16 miles (26 km) west of London. Formerly a market town, it became in the 20th century a busy industrial and commercial centre (mainly electrical equipment and agricultural machinery) and a residential area. It is the site of Treaty House, where agents of Charles I sought unsuccessfully in 1645 to negotiate with the Parliamentarians. Pop. (1971) 11,475.

tural style that flourished in the Late Classic Period (AD 600-900). Quite probably this style and the northern Maya lowland culture continued in full vigour for a century or so after the decline and abandonment of the southern Maya lowland centres such as Tikal, Palenque, and Uaxactún. After about 1000, when the Toltec (or Toltec-inspired) invaders arrived in Yucatán and established their capital at Chichén Itzá, major construction in the city ceased. According to Maya legendary history, however, Uxmal continued to be occupied and was a participant in the political League of Mayapán. When the league ended, Uxmal, like the other great cities of the north, was abandoned (c. 1450). Before abandonment, the ruling family of the city, like the Itzá of Chichén or the Cocom of Mayapán, were the Tutul Xius.

The site of Uxmal is a dry grass savanna area, but the surrounding region is heavily forested.

Water was furnished by wells (cenotes) within the city or by rain-collecting pools to the west, in which breed malarial mosquitos. The ruins cover about 160 acres (60 hectares), but remains of the residential districts of the city cover considerably more ground. Limestone was used in construction, and most surfaces were finished with plaster. Stones were cut and fitted so expertly that in many cases the mortar is not visible. The main buildings are the Temple of the Magician, atop a huge pyramid; the Nunnery Quadrangle, consisting of four rectangular buildings, all facing on a central courtyard and divided into many small rooms, probably the quarters of the priests; the Governor's Palace, erected on a triple terrace; the House of Turtles, a smaller building so called from its frieze of sculptured turtles; and the House of Pigeons, also a quadrangle, one building of which resembles a huge dovecote.

Uyo, town and capital of Akwa Ibom state, southeastern Nigeria, on the road from Oron to Ikot Ekpene. A collecting station for palm oil and kernels, it is also a local trade centre (yams, cassava, palm produce) for an area inhabited mainly by the Ibibio people. The town has a brewery (opened in 1976) and a textile mill. It is the headquarters of the Uyo Local Government Council and the site of an advanced teacher-training college and the Cross River State School of Arts and Science. Pop. (1988 est.) 62,030.

Uyuni, town, southwestern Bolivia. It lies on the cold, windswept Altiplano, a high intermontane plateau, at 12,024 feet (3,665 m) above sea level, just east of the vast Uyuni Salt Flat. Founded in 1890, it prospered, with the assistance of Slav and Syrian colonists, as a railroad junction and mining and market centre. Northeast of the town are the Pulacayo and Huanchaca silver mines. From Uyuni a branch of Bolivia's main north-south railroad line runs westward to the Pacific Ocean, giving the nation access to port facilities at Antofagasta, Chile. Pop. (1976) 8,960.

Uyuni Salt Flat, Spanish salar de uyuni, arid, windswept salt flat, southwestern Bolivia. It lies on the Altiplano, or high plateau, at 11,995 feet (3,656 m) above sea level. It is Bolivia's largest salt-encrusted waste area (about 4,085 square miles [10,582 square km]) and is separated from the Coipasa Salt Flat, a similar but smaller feature to the north, by a range of hills. On its shores are saltworks, principally at Salinas de Garci Mendoza on the north, Llica on the northwest, and Calcha on the south.

Uzbek (Mongol ruler): see Öz Beg.

Uzbek khanate, any of the three states that occupied Transoxania (Mā Warā' an-Nahr), in the present Uzbek Soviet Socialist Republic, before it came under Russian rule in the 19th century. The khanates of Bukhara and Khiva (Khwārezm) were established by two branches of the Shaybānid dynasty, which won control of Transoxania from the Timurids in the late 15th and early 16th centuries. The Shaybānids were replaced at Bukhara successively by the Astrakhanids and the Mangits. A third state, the khanate of Kokand, emerged in the mid-18th century. The whole area came under Russian control in the 1860s and '70s, but the khans remained as figurehead rulers until after the 1917 Revolution.

Uzbek language, member of the Turkic language group (a subfamily of the Altaic languages), spoken in the Uzbek S.S.R., the eastern part of the Turkmen S.S.R., the northern and western parts of the Tadzhik S.S.R., and the southern part of the Kazakh S.S.R. in the U.S.S.R. and also in northern Afghanistan and in China.

In Uzbek roughly two main dialect groups can be distinguished. One includes the southern, or Iranized, dialects (Tashkent, Bukhara, Samarkand) and the semi-Iranized dialects (Fergana, Kokand), which, as a result of the influence of the Tadzhik language, have lost the typical Turkic linguistic feature of vowel harmony. The other group comprises the northern Uzbek dialects in southern Kazakhstan and several dialects in the region of Khiva. These dialects do not show Iranian influence. (Kipchak-Uzbek is practically a dialect of the Kazakh language.) In the creation of a new literary language after the Russian Revolution, a dominant role was first played by the northern dialects and later by the southern dialects. The latter serve as the basis of the current literary language, but the northern dialects are still often considered as "pure Uzbek."

Uzbek is classified with Uighur (New-Uighur) in the southeastern division of the Turkic languages. See also Turkic languages.

Uzbekistan, officially uzbek soviet socialist republic, Russian uzbekistan, of uzbekskaya sovetskaya sotsialisticheskaya respublika, Akademiya Nauk transliteration uzbekistan, of uzbekskaja sovetskaja socialističeskaja respublika, one of the 15 union republics of the U.S.S.R.

A brief treatment of Uzbekistan follows. For full treatment, see MACROPAEDIA: Union of

Soviet Socialist Republics.

The republic of Uzbekistan, a Muslim cultural centre, was founded in 1924, and its area includes the Kara-Kalpak Autonomous S.S.R. The capital of Uzbekistan is Tashkent. The republic lies in the heart of central Asia largely between the Amu Darya (ancient Oxus) and Syr Darya rivers. It is bounded by the steppes of Kazakhistan on the north and northwest; by the mountainous Kirgiziya and Tadzhikistan on the east and southeast; by the predominantly desert Turkmenistan on the southwest; and for a short distance in the south by Afghanistan.

Land. Although Uzbekistan contains fertile oases and high mountain ranges, almost four-fifths of the area consists of flat sun-baked lowlands. This area lies in the west, which is dotted by salt marshes, sinkholes, and caverns. The delta of the Amu Darya spreads over the central portion of the Kara-Kalpak A.S.S.R. In the east in the valley of the Zeravshan is the ancient cultural centre of Uzbekistan, with the cities of Bukhara and Samarkand providing a reminder of historical continuity.

Uzbekistan's fauna is dominated by desert forms such as various snakes, geckos and other lizards, and rodents; desert fox and wolf, and an occasional gazelle and antelope are also found. In the oases there are wild pig, roe deer, and many birds. In the high mountains of the east there are bear, wolf, Siberian goat, and many birds including birds of prey.

Uzbekistan has a climate that is very dry and distinctly continental. The summer is long and warm, and the winter is short with occasional severe frosts; mean temperatures in the winter are as low as 10° F (-12° C).

Uzbekistan's rivers originate in the mountains; their waters are lost to irrigation, filtration, and evaporation as they flow through the dry lowlands, and most rivers disappear in the sands. Many natural tributaries are captured for irrigation before they reach the main riverbed. The desert is slowly receding before irrigation.

The economy. Uzbekistan is the chief source of the Soviet Union's cotton and is one of the largest cotton producers in the world. It is the nation's most important region for the raising of Karakul sheep and of silkworms. Cattle raising, orchards, and fur farming are also important.

The republic has large reserves of natural gas, petroleum, and coal and a variety of metallic ores. In the Kuramin Range there are deposits of copper, zinc, lead, tungsten, and molybdenum. There is potential for the development of an aluminum industry. Gold is found in the Kyzylkum (desert).

Uzbekistan's industry is the main producer of machines and heavy equipment in Central Asia. A chemical industry is closely connected with the Uzbek cotton industry, producing fertilizers for the cotton fields and deriving many other chemical products from the byproducts and waste materials of cotton processing. The republic is also one of the leading centres of the Soviet natural-gas industry.

Administration. The legislative body of the republic is its Supreme Soviet; candidates are selected for a four-year term and are ratified in a general election. The Supreme Soviet appoints a Presidium to act between sessions and a Council of Ministers, or cabinet. Medical and educational facilities are free and paid

for by taxes

Culture. Over the centuries Uzbekistan has been noted as a centre of Muslim culture. Soviet Muslims of the republic have struggled to understand and protect their cultural inheritance. The 'Uthman Qur'an, an original transcription of the Qur'an promulgated as standard by the caliph 'Uthman ibn 'Affan, was taken from Samarkand by the Russians at the beginning of the 20th century. After the Russian Revolution, Soviet Muslims petitioned for its return, and it is now in the Tashkent Museum of the History of the Peoples of Uzbekistan. Outstanding medieval scholars who came from the area now known as Uzbekistan include Mūsā Khwārezmī, a 9th-century mathematician; Abu Reikhan al-Bīrūnī (973-1048), a 10th-century polymath and philosopher; Ulugh Beg, a 15th-century astronomer who built an observatory at Samarkand; and the late 15th-century poet 'Alī Shīr Navā'ī. More recent poets and prose writers of the region have continued the cultural tradition, among them Mahmud Behbudi, Abdullah Qadri, Sharaf R. Rashidov, and Asqad Mukhtar.

History. The Uzbek national name seems to have originated from Khan Uzbek, one of the chiefs of the Golden Horde, who, having embraced Islām himself, was active in its propagation. The name Uzbek, therefore, came to be applied to the Sunnite Muslim section of the Golden Horde, which constituted the ruling class. During the decline of the Golden Horde in the 15th century, the Uzbeks occupied the territory between the lower Volga River and the Aral Sea. During the rule of Abulkhair, an Uzbek federation was formed in what is now western Kazakhstan. Under Shaibani Khan, Abulkhair's grandson, this tribal federation at the beginning of the 16th century invaded and occupied the settled regions of Bukhara and Samarkand and, later, Urgench and Tashkent, ousting the earlier empire founded by the great Timur (Tamerlane).

Even at this period the Uzbeks were far from homogeneous; they were a mixture of the descendants of the ancient Iranian population of Khorezm and Sogdiana and of many nomadic groups that at some earlier era had settled in the oases of the Amu Darya, Syr Darya, and Zeravshan rivers. After occupying what is virtually their present habitat, the Uzbeks became even more intermingled with older tribes, such as the Karlyks and Uighur. By the 19th century they no longer had any political or national existence, and the land was under the nominal control of the Russian Empire. The Uzbek's present political existence began with the creation of the Uzbek Soviet Socialist Republic in 1924, within the U.S.S.R. Area 172,700 square miles (447,400 square km). Pop. (1987 est.) 19,260,000.

Uzhgorod, also spelled užgorop, Hungarian ungvár, city and administrative centre of Zakarpatskaya *oblast* (province), Ukrainian Soviet Socialist Republic, on the Uzh River and south of the Uzhok Pass across

the Carpathians. First mentioned in 903, its position has long given it trading and military significance. Formerly in Austria-Hungary, it passed to Czechoslovakia in 1919, to Hungary in 1938, back to Czechoslovakia in 1945 and to the U.S.S.R. in the same year. Today its industries include the manufacture of machine tools, furniture, veneer, and margarine. It also has a university, founded in 1945. Pop. (1983 est.) 102,000.

Uzi submachine gun, Israeli firearm used in that country's armed forces and widely used elsewhere as a police and special-forces weapon. The Uzi is named for its designer, Maj. Uziel Gal, who developed it after the Arab-Israeli War of 1948, during which the Israeli army had had no reliable submachine gun. Gal based his design on various Czech and Soviet submachine guns that he had studied. The Uzi is 25.6 inches (65 centimetres) long and is equipped with a folding stock. The barrel is about 10 inches long and has a bore of 9 millimetres (0.36 in.). The weapon weighs 7.7 pounds (3.5 kilograms), takes box magazines that hold between 25 and 32 rounds, and fires at a rate of 600 rounds per minute.

Uzlovaya, also spelled uzlovaja, city and centre of a rayon (district), Tula oblast (administrative region), western Russian Soviet Federated Socialist Republic. In Soviet times it has developed as a centre of coal mining on the Moscow-Donets Basin railway; it was incorporated in 1938. Lignite (brown coal) is mined there. The city also has chemical industries and manufactures machinery for the mining industry. Pop. (1983 est.) 64,000.

Uzun Hasan (b. c. 1420—d. Jan. 5/6, 1478), ruler of the Turkmen Ak Koyunlu (White Sheep) dynasty from 1453, who created a short-lived empire in Iran, Iraq, and Armenia.

With the death of Kara Osman, founder of the Ak Koyunlu dynasty, in 1435, a civil war ensued among his descendants. By 1453 Uzun Hasan had emerged victorious and succeeded to the throne. His principality, centred at Diyarbakır (modern Diyarbakır, Tur.), was surrounded by two hostile powers: in the east, the rival Turkmen dynasty of Kara Koyunlus (Black Sheep) led by Jahān Shāh; and in the west, the growing power of the Ottomans. Uzun Hasan entered into a series of alliances to secure his western flank. He made a major move in 1458 by marrying Catherine, the daughter of Kalo-Ioannes, the Christian emperor of Trebizond (in northeastern Anatolia). He also strengthened diplomatic ties with Venice, Muscovy, Burgundy, Poland, and Egypt and with the Karamanid dynasty of south-central Anatolia.

In 1461 Uzun Hasan began his campaigns against the Kara Koyunlus. With the death of Jahān Shāh in 1467, he was able to annex territories in Azerbaijan and Iraq. By 1469

he had occupied all of Iran. Uzun Ḥasan's support of the Karamanids, however, precipitated war (1472) with the Ottomans (August 1473), who decisively defeated the Ak Koyun-lus at the Battle of Terjan and thus emerged supreme in Anatolia.

Uzziah, also spelled ozias, also called AZARIAH, or AZARIAS, in the Old Testament (II Chron. 26), son and successor of Amaziah, was king of Judah for 52 years (c. 791–739 BC). Assyrian records indicate that he reigned for 42 years (c. 783-742). His reign marked the extreme height of Judah's power. He fought successfully against other nations and exacted tribute from the Ammonites. Judah expanded westward with settlements in Philistia.

During his reign the nation prospered, and desert areas were reclaimed by water conservation. Jerusalem's walls were reconstructed, towers were added, and engines of war were mounted at strategic points. A large army was maintained. The nation's prosperity under Uzziah was believed to have been a result

of the King's fidelity to Yahweh.

According to II Chron. 26:16-21, Uzziah's strength caused him to become proud, which led to his destruction. He attempted to burn incense in the Temple, an act restricted to priests. When the priests attempted to send him from the Temple, the King became angry and was immediately stricken with leprosy. His son Jotham ruled for his father until Uzziah died.

V-1 missile, also called FLYING BOMB, BUZZ BOMB, or DOODLEBUG, German pilot-less, pulse-jet engine aircraft of World War II. More than 8,000 were launched against London from June 13, 1944, to March 29, 1945. with about 2,400 hitting the target area. A smaller number were fired against Belgium. The rockets were launched from the Pas-de-Calais on the northern coast of France and subsequently from other sites in German-occupied western Europe.

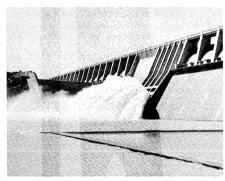

The V-1 was about 25 feet (8 m) long, exclusive of the long tail pipe of its jet engine, and had a wingspan of about 18 feet (5.5 m). It was launched from catapult ramps or sometimes from aircraft. It carried a 2,000-pound (about 900-kilogram) explosive warhead at about 360 miles (580 kilometres) per hour and had an average range of 150 miles (240 km).

V-2 rocket, formally A-4, German ballistic missile of World War II, the first rocket to surpass the speed of sound and the forerunner of modern space rockets and long-range missiles.

Developed in Germany from 1936, it was first fired against Paris on Sept. 6, 1944. Two days later the first of more than 1,300 V-2s was fired against Great Britain (the last on March 27, 1945). Belgium was bombarded almost as heavily. After the war, both the United States and the Soviet Union captured large numbers of V-2s and used them in research that led to the development of their missile and space exploration programs.

The V-2 was 47 feet (14 m) long, weighed 28,000–29,000 pounds (12,700–13,200 kg) at launching, and developed about 60,000 pounds of thrust, burning alcohol and liquid oxygen. The payload was about 2,000 pounds of high explosive, horizontal range was about 220 miles (350 km), and the peak altitude usually reached was about 60 miles (100 km).

Vaal River, northern tributary of the Orange River, South Africa. Rising at Sterkfontein Beacon near Breyten, southeastern Transvaal,

Vaal Dam on the Vaal River, South Africa Authenticated News International

it flows 750 miles (1,210 km) southwest to its confluence with the Orange near Douglas; the Vaal's middle section forms most of the Orange Free State-Transvaal boundary. It is basically a plateau river and occupies a shallow bed. Most of the year its flow is minimal, but the winter months can create the muddy torrent for which the Vaal ("gray-brown") is named. The river's flow is regulated by the Vaal Dam, 23 miles (37 km) upstream of Vereeniging, where water is diverted into the Hartz Valley irrigation scheme. The river's major tributaries—the Klip, Wilge, Vals, Vet, and Riet rivers-enter on its left bank. The Vaal is fully developed economically, its waters used for the domestic and industrial needs of the Witwatersrand.

Vaasa, in full Vaasan Lääni, Swedish Vasa Län, *lääni* (province), western Finland, on the Gulf of Bothnia. Its land area is 10,-211 square miles (26,447 square km). The province's land rises from a level but indented coastline through generally forested country, with large cultivated plains, toward an eastern lake region. The timber industry and agriculture are important. The city of Vaasa is the province's administrative capital, main seaport, and largest city. Other important towns are Kaskö (Kaskinen), Kokkola, Kristinestad (Kristiinankaupunki), Pietarsaari (Jakobstad), Seinäjoki, and Nykarleby (Uusikaarlepyy). Pop. (1987 est.) 444,466.

Vaasa, Swedish VASA, town, capital of Vaasa lääni (province), western Finland, on the Gulf of Bothnia. Founded in 1606 by the Swedish king Charles IX, it was chartered in 1611 and was named for the reigning House of Vasa. Finland's second Court of Appeal was instituted there in 1776. Devastated by fire in 1852, the town was rebuilt a few years later in a more strategic location approximately 5 miles (8 km) closer to the sea, and its name was officially changed to Nikolainkaupunki until 1917 (although its traditional name was always used locally). Vaasa was the provisional capital of Finland during the Finnish War of Independence (1918).

Vaasa is now an important port, exporting timber and importing other raw materials. Its industries include flour and textile mills, a sugar refinery, large bakeries, and machinery and soap factories. It has regular passenger and car ferry service to Sweden as well as air and rail connections to the rest of Finland. Pop. (1986 est.) mun., 54,353.

vacancy, in crystallography, absence of an atom or molecule from a point that it would normally occupy in a crystal. Such an imperfection (crystal defect) in the regular spacing of atoms changes the electrical and optical properties of the crystal. The theory of colour centres holds that vacancies give colour to many solids. Vacancies can be created by mechanical deformation of the crystal, rapid cooling from high temperature, or the impact of radiation on the crystal. In the so-called Schottky defect an atom moves from the inside of the crystal to its surface. In the Frenkel defect an atom moves to a new position between other atoms of the solid. In either case, the empty space created by the migration of the atom is a vacancy. The relative numbers of these two types of defects vary from crystal to crystal. See also colour centre.

Văcărescu FAMILY, Romanian boyars of Phanariote (Greek) origin, a gifted family that gave the first poets to Romanian literature.

lenăchiță (1740–99), after traveling and studying in St. Petersburg and Vienna, wrote poems inspired by Russian folk songs. He wrote the first Romanian grammar book (Gramatica românească, 1787). His chief poems, Amărîtă turturea ("Sad Turtledove") and Testamentul, reveal a high artistic level and a mastery of a rich Romanian language. Ienăchiță's sons, Alecu (1765–99) and Nicolae (1784–1825), also wrote poems inspired by folk songs and modern Greek anacreontics. They composed love poems and satires.

Iancu (1792–1863), son of Alecu, was the most important writer of the Vācārescu family. A poet who had been several times exiled for his anti-Russian activity, he was the first Romanian playwright and was also an able translator into Romanian of plays by Jean Racine, Molière, and August von Kotzebue. His *Colecții de poezii* ("Collected Poems") appeared in 1848.

Elena (also spelled Hélène; 1866–1947), a niece of Iancu, was a poet and novelist who wrote in French. A maid of honour of Queen Elizabeth of Romania, she had a love affair with the Crown Prince (afterward King) Ferdinand; the marriage was opposed by King Carol I, and Elena was exiled to Paris, where she spent the rest of her life. She published

many volumes of lyrical verse (Chants d'aurore, 1886 [for which she was awarded the prize of the Académie Française]; L'Âme sereine, 1896; Lueurs et flammes, 1903; Dans l'or du soir, 1928) and a few novels. In 1925 she was elected an honorary member of the Romanian Academy.

Vacarius (b. c. 1115-20, Lombardy, Italy—d. after 1198, England), scholar of Roman (civil) and canon law, who was, at the nascent University of Oxford and elsewhere, the first known teacher of Roman law in England.

Educated at Bologna, Vacarius went to England to act as counsel to Theobald, archbishop of Canterbury, in his successful struggle (ending in 1146) to have the papal legateship transferred from the bishop of Winchester to himself. By 1149 Vacarius had become a popular lecturer on civil law. For those of his listeners who could not afford legal training, he is said to have prepared a treatise (nine books) on the Digest, or Pandects, and Codex of the Byzantine emperor Justinian I. Known as Liber pauperum, this work became one of the chief legal texts at Oxford, where, at an uncertain date, Vacarius began to teach. Oxford students of law soon were called pauperistae, in reference to his book.

King Stephen (reigned 1135-54) tried ineffectually to suppress Vacarius' teaching and to destroy civil and canon law books in England. After the accession of Henry II to the throne, however, Vacarius served his friend Roger of Pont l'Évêque, archbishop of York, as legal adviser, ecclesiastical judge, and envoy to the papal court. Apparently he shared Roger's antagonism to Thomas Becket, archbishop of Canterbury. Nothing is known of him after 1198 or 1199, when Pope Innocent III wrote to him concerning the Fourth Crusade.

vaccine, suspension of either weakened or killed microorganisms that is capable of causing antibody production against an infectious microorganism when artificially introduced into the body, thereby conferring immunity from a subsequent infection of that microorganism. Once stimulated by a vaccine, the antibody-producing cells of the body remain sensitized to the infectious agent and respond to reinfection by producing more antibodies, thus reinstituting the immune response. Vaccines may be produced from both bacteria and viruses, although they have been most effective in preventing viral diseases. Vaccines of weakened, or attenuated, microorganisms generally produce a mild or subclinical form of the disease. Attenuated vaccines include those for measles, hepatitis, and smallpox. Vaccines of inactivated, or killed, microorganisms also produce the immune response (i.e., antibody production); however, greater quantities of the vaccine are required, and the time period before the appearance of the response is longer. Inactivated vaccines include those for influenza, rabies, and typhoid. Vaccines are given either orally or by injection.

The first vaccine was introduced by the British physician Edward Jenner in 1798 when he noted that the virus of cowpox (vaccinia) could produce lasting protection against smallpox when he inoculated humans with it. In 1881 Louis Pasteur demonstrated immunization against anthrax by means of the injection of a comparatively harmless attenuated culture of the bacillus causing that disease. Four years later he developed a vaccine for rabies. A widespread and intensive search for new vaccines was subsequently conducted. The resulting vaccines have been credited with the control of many former scourges. Smallpox has been eradicated through vaccination, and vaccines against polio, diphtheria, whooping cough, measles, and rubella have largely controlled these diseases in the developed world. Effective vaccines have also been developed for typhoid and paratyphoid fevers, cholera, plague, tuberculosis, undulant fever, tularemia, chronic staphylococcal and streptococcal infections, tetanus, influenza, yellow fever, some types of encephalitis, Rocky Mountain spotted fever, typhus, and hepatitis B, although some of these vaccines are used only in selected population groups at high risk. Interest in bacterial vaccines slackened with the introduction of antibiotics in the mid-20th century, but vaccines remain a mainstay in the fight against many infectious diseases.

In the late 20th century new types of vaccines were developed with the help of advanced laboratory techniques. Medical researchers became able to identify those biochemical components of a pathogen, or disease-causing microorganism, that stimulate the immune response to that organism in the body. Such a biochemical component can then be produced in the laboratory and subsequently administered to humans, upon whom it acts like any other vaccine. An improvement on this approach, using recombinant DNA technology, is to splice the gene which codes for the production of that immunity-causing component into the DNA of an entirely different microorganism, the vaccinia virus, which was formerly used as a smallpox vaccine. The altered virus is then injected into humans and stimulates antibody production both to itself and to the pathogen whose genes have been incorporated into it. This approach potentially enables the vaccinia virus to function as a live vaccine against several different diseases once it has received gene splices from the relevant disease-causing microorganisms. See also immunization.

Vaccinium, genus of about 150 species of shrubs, in the heath family (Ericaceae), found widely throughout the Northern Hemisphere and extending south along tropical mountain ranges. The shrubs are erect or creeping, with alternate, deciduous or evergreen leaves. The small flowers resemble those of the true heaths (Erica), but the ovary is beneath the flower. The flowers are clustered in the leaf axil (the upper angle between the leaf stem and the main stem) or are solitary. The berries are usually edible.

More than 40 species of *Vaccinium* shrubs occur in North America, especially in the northern and mountainous parts. The highbush blueberry (*V. corymbosum*) and other species of blueberries are found in the eastern United States and adjacent Canada. The cowberry (*V. vitis-idaea*), also known as red whortleberry, or mountain cranberry, grows in northern Canada. Several species occur in the Rocky Mountains region. More than 10 species are found in the Pacific states, including the western blueberry (*V. occidentale*), the red bilberry (*V. parvifolium*), and the California blueberry (*V. ovatum*).

Four species occur in Great Britain: the bilberry (*V. myrtillus*), also called blaeberry, or whortleberry; the bog bilberry (*V. uliginosum*); the small-fruited cranberry (*V. oxycoccus*); and the cowberry. All are widely distributed throughout Europe, Asia, and North America. *See also* bilberry; blueberry; cranberry.

Vacoas-Phoenix, town (township) on the island of Mauritius, in the western Indian Ocean. It lies in the western highlands region of the country, about 10 miles (16 km) south of Port Louis, the national capital. Vacoas and Phoenix were separate villages until 1963, when they became a single administrative unit; later (1968) the town became independently administered. Major industries include beer

brewing, vegetable canning, and the manufacture of cosmetics and garments. The town has well-surfaced roads, and a major highway links it with Port Louis. Sugarcane and vegetables grown in the surrounding region are marketed in the town. Pop. (1983 prelim.) 56,011.

vacuole, in biology, a space within a cell that is empty of cytoplasm, lined with a membrane, and filled with fluid. Especially in protozoa, vacuoles are cytoplasmic organs (organelles), performing functions such as storage, ingestion, digestion, excretion, and expulsion of excess water. The large central vacuoles often found in plant cells enable them to attain a large size without accumulating the bulk that would make metabolism difficult.

vacuum flask, also called DEWAR VESSEL, or THERMOS FLASK, vessel with double walls, the space between which is evacuated. It was invented by the British chemist and physicist

Vacuum flask

Sir James Dewar in the 1890s. Thermos is a proprietary name applied to a form protected by a metal casing.

The vacuum flask was devised to preserve liquefied gases by preventing the transfer of heat from the surroundings to the liquid. The evacuated space between the walls (which are ordinarily glass or steel) is practically a nonconductor of heat; radiation is reduced to a minimum by silvering the glass or steel. The chief path by which heat can be communicated to the interior of the inner vessel is at the vessel's neck, the only junction of the walls, which therefore is made as small as possible. This thermal isolation applies equally to heat, a hot liquid remaining at a high temperature in the flask for several hours.

vacuum technology, all processes and physical measurements carried out under conditions of below-normal atmospheric pressure. A process or physical measurement is generally performed in a vacuum for one of the following reasons: (1) to remove the constituents of the atmosphere that could cause a physical or chemical reaction during the process (e.g., vacuum melting of reactive metals such as titanium); (2) to disturb an equilibrium condition that exists at normal room conditions, such as the removal of occluded or dissolved gas or volatile liquid from the bulk of material (e.g., degassing of oils, freeze-drying) or desorption of gas from surfaces (e.g., the cleanup of microwave tubes and linear accelerators during manufacture); (3) to extend the distance that a particle must travel before it collides with another, thereby helping the particles in a process to move without collision between source and target (examples of uses are in vacuum coating, particle accelerators, television picture tubes); (4) to reduce the number of molecular impacts per second, thus reducing chances of contamination of surfaces prepared in vacuum (useful in cleansurface studies).

For any vacuum process a limiting parameter for the maximum permissible pressure can be defined. It can be the number of molecules per unit volume (reasons 1 and 2), the mean free path (reason 3), or the time required to form a monolayer (reason 4).

At room temperature and normal atmospheric pressure, 1 cubic foot (0.03 cubic m) of air contains approximately 7×10^{23} molecules moving in random directions and at speeds of around 1,000 miles per hour (1,600 kilometres per hour). The momentum exchange imparted to the walls is equal to a force of 14.7 pounds for every square inch of wall area. This atmospheric pressure can be expressed in a number of units, but until relatively recently it was commonly expressed in terms of the weight of a column of mercury of unit cross section and 760 mm high. Thus, one standard atmosphere equals 760 mm Hg, but to avoid the anomaly of equating apparently different units, a term, torr, has been postulated; one standard atmosphere = 760 torr (1 torr = 1)mm Hg). This term was replaced in 1971 by an SI unit defined as the newton per square metre (N/m²) and called the pascal (one pascal = 7.5×10^{-3} torr).

The first major use of vacuum technology in industry occurred about 1900 in the manufacture of electric light bulbs. Other devices requiring a vacuum for their operation followed, such as the various types of electron tube. Furthermore, it was discovered that certain processes carried out in a vacuum achieved either superior results or ends actually unattainable under normal atmospheric conditions. Such developments included the "blooming" of lens surfaces to increase the light transmission, the preparation of blood plasma for blood banks, and the production of reactive metals such as titanium. The advent of nuclear energy in the 1950s provided impetus for the development of vacuum equipment on a large scale. Increasing applications for vacuum processes were steadily discovered, as in space simulation and microelectronics.

Various kinds of devices have been developed for producing, maintaining, and measuring a vacuum. Several of the more significant types are described below.

Oil-sealed rotary pump. Capacities are available from ½ to 1,000 cubic feet per minute, operating from atmospheric pressure down to as low as 2×10^{-2} torr for singlestage pumps and less than 5×10^{-3} torr for two-stage pumps. The pumps develop their full speed from atmosphere to about one torr, the speed then decreasing to zero at their ultimate pressures. One device of this type, useful for pumping both liquids and gases, is a twobladed pump in which the rotor is eccentric to the stator, so forming a crescent-shaped volume that is swept by the blades through the outlet valve. Another variety, a rotary piston pump, is similar to a single-bladed pump, but the single blade is part of the sleeve fitting around the rotor. The blade is hollow and acts as an inlet valve, closing off the pump from the system when the rotor is at top centre.

Ultimate pressures attainable are limited by leakage between the high- and low-pressure sides of the pump (due mainly to carryover of gases and vapours dissolved in the sealing oil that flash off when exposed to the low inlet pressure) and decomposition of the oil exposed to hot spots generated by friction.

Typical applications of this pump are in food packaging, high-speed centrifuges, and ultraviolet spectrometers. It is also widely used as a forepump or a roughing pump, or both, for most of the other pumps described.

Mechanical booster. Capacities are available from 100 to 70,000 cu ft per minute,

operating usually in the pressure range of 10 to 10⁻³ torr. The peak speed of the pump is developed in the pressure range of 1 to 10-2 torr, the speed at the lower end of the pressure range depending on the type of forepump used. A typical mechanical booster utilizes two figure-eight-shaped impellers, synchronized by external gears, rotating in opposite directions inside a stator. The gas is trapped between the impellers and the stator wall and transferred from the high vacuum to the fore vacuum side of the pump. The mechanical booster must be backed by another pump in series when working in its normal pressure range. The most frequently used type of forepump is the oil-sealed rotary pump. Typically, the mechanical booster is employed for pumping vacuum-melting furnaces, in an impregnation plant for electrical equipment, and in low-density wind tunnels.

Vapour diffusion pump. This pump is mainly used on equipment for the study of clean surfaces and in radio-frequency sputtering. Capacities are available up to 190,000 cu ft per minute with an operating pressure range of 10^{-2} to less than 10^{-9} torr when water-cooled baffles are used and less than 10^{-11} torr when refrigerated baffles are employed. The pumping speed for a vapour pump remains constant from about 10⁻³ torr to well below the ultimate pressure limitations of the pump fluid—that is, with the best fluids to pressures of better than 10^{-9} torr. The diffusion pump is initially evacuated by an oil-sealed rotary pump to a pressure of about 0.1 torr or less. When the pump fluid in the boiler is heated, it generates a boiler pressure of a few torr within the jet assembly. High-velocity vapour streams emerge from the jet assembly, impinge and condense on the water- or air-cooled pump walls, and return to the boiler. In normal operation a portion of any gas arriving at the inlet jet is entrained, compressed, and transferred to the next stage. This process is repeated until the gas is removed by the mechanical forepump.

Sputter ion pump. Capacities are available up to 14,000 cu ft per minute, with an operating pressure range of 10^{-2} torr to below 10^{-11} torr. The full speed of the pump is developed in the pressure range from about 10^{-6} to 10^{-8} torr, although the characteristic at the lower pressure is dependent on pump design. This pump makes use of the sputtering principle, in which a cathode material such as titanium is vaporized—or sputtered by bombardment with high-velocity ions. The active gases are pumped by chemical combination with the sputtered titanium, the inert gases by ionization and burial in the cathode, and the light gases by diffusion into the cathode.

A typical pump consists of two flat rectangular cathodes with a stainless steel anode between them made up of a large number of open-ended boxes. This assembly, mounted inside a narrow box attached to the vacuum system, is surrounded by a permanent magnet. The anode is operated at a potential of about seven kilovolts (kV), whereas the cathodes are at ground potential.

Sputter ion pumps have a long life and can provide ultrahigh vacuum, free of organic contamination and vibration. They are employed mainly for clean-surface studies and in those applications where any organic contamination will give unsatisfactory results.

Titanium sublimation pump. Capacities are available up to many thousands of cu ft per minute, operating in the pressure range of 10^{-3} to below 10^{-11} torr. The full speed of the pump, which only pumps chemically reactive gases, is developed at pressures below 10^{-5} torr. In this type of pump, titanium is sublimed onto the pump walls from either a resistance or an electron-beam heated source. Active gases are pumped by chemical combination, but inert gases are not pumped. As a consequence, it must always be used in conjunction with a diffusion or sputter ion pump.

At pressures below 10⁻⁵ torr the film will be deposited faster than it is being consumed, allowing deposition to be carried out at intervals rather than on a continuous basis. Sublimation pumps are generally used in conjunction with a sputter ion pump in applications where a high speed is required and freedom from organic contamination is essential, as in the evaporation of materials onto a clean surface.

Sorption pump. Typically, the size of these pumps is about 1,000 grams of sorbent material, which retains gas molecules on its surface. They are capable of pumping from atmosphere to 10-2 torr or can be used in series down to 10⁻⁵ torr. In most cases the sorbent material is a molecular sieve—that is, a material that has been processed so that it is porous, with pore sizes comparable to the size of molecules, although activated charcoal can also be employed. The sorbent is positioned inside a cylindrical container that is connected to the vacuum system and that can be immersed in liquid nitrogen for supercooling to aid the sorption process. The gas is released when the sorbent returns to room temperature. This pump is used mainly for roughing systems in which the sputter ion and titanium sublimation pumps serve to ensure freedom from organic contamination.

This type of pump utilizes ex-Cryonump. tremely low temperatures to condense gases and thus remove them from the system. Pumping speeds of millions of cu ft per minute are possible with the cryopump over the pressure range 10⁻³ torr to well below 10⁻¹⁰ torr. This type of pump can develop its full speed curve over the entire pumping range. Most cryopumps employ helium to cool the lowtemperature surface; the helium can be in the form of gas at about 15 K or liquid helium at 4.2 K. A cryopump, which depends on the condensation of the gas for its pumping speed, will not effectively pump gases, such as helium and hydrogen, that have high vapour pressures at the low-temperature surface. Consequently, complementary diffusion or sputter ion pump capacity is a necessary adjunct to a cryopump vacuum-producing system. Most such pumps are used in high-altitude or space simulation. McLeod gauge. The McLeod gauge takes

advantage of Boyle's law (the product of pressure and volume for a given quantity of gas remains constant if a constant temperature is maintained) to determine gas pressure within a range of 10 to 10⁻⁶ torr. Raising the mercury level in the McLeod gauge seals off the gas from the system to which the gauge is connected. When the level of mercury is raised further, the gas is compressed. The difference in levels of mercury between this trapped volume and the system being evacuated corresponds directly to the pressure in torr in the trapped volume. As the gauge depends only on the known initial volume trapped, the final compressed volume, and the pressure in this final volume—all of which can be directly measured—it is called an absolute gauge and is mainly a standard for calibrating

Thermal conductivity gauges. Two types of thermal conductivity gauges, the Pirani and the thermocouple, determine pressure by the rate at which heat is dissipated from a hot filament. The Pirani gauge basically is a Wheatstone bridge with one arm in the form of a heated filament placed in the vacuum system. The resistance of the filament depends on its temperature, which, in turn, depends on the rate of dissipation of thermal energy through the residual gas. Thermal energy dissipation is affected by the pressure and thermal conductivity characteristics of the residual gas. The bridge is powered from a constant voltage source, and out-of-balance current due to temperature changes is indicated directly in torr. In the thermocouple gauge, the hot junction of the thermocouple is attached to a filament in the vacuum system and powered from a constant voltage source. The mode of operation is the same as that of the Pirani except that the temperature of the filament indicates the pressure. These gauges are rugged and simple to operate and cover a range of from 100 to 10⁻⁴ torr.

Cold-cathode ionization gauge. This gauge makes use of the fact that the rate of ion production by a stream of electrons in a vacuum system is dependent on pressure and the ionization probability of the residual gas. Also called the Penning gauge, it consists of two cathodes opposite one another with an anode centrally spaced between them inside a metal or glass envelope. Outside the envelope a permanent magnet provides a magnetic field to lengthen the path travelled by the electron in going from cathode to anode, thus increasing the amount of ionization occurring within the gauge. Normally the anode is operated at about 2 kV, giving rise to a direct current caused by the positive ions arriving at the cathode. The pressure is indicated directly by the magnitude of the direct current produced. The pressure range covered by this gauge is from as low as 10^{-7} torr. It is widely used in industrial systems because it is rugged and simple to use.

Hot-filament ionization gauge. The operating principles of this gauge are similar to the Penning gauge except that the electrons are produced by a hot filament and accelerated to a grid. The pressure range covered is either 1 to 10^{-5} torr or 10^{-2} to 10^{-7} torr, depending on the electrode structure. Electrons emitted from the filament ionize residual gas molecules in the container being evacuated; the ion current arriving at the collector plates is directly proportional to the pressure and the ionization probability of the residual gas. This is a clean, accurate gauge that can be used down to about 10⁻⁶ torr; below this pressure its accuracy is reduced due to the soft X-rays produced by electrons striking the grid. These X-rays generate a current in the collector circuit independent of pressure.

Bayard-Alpert hot-filament ionization gauge. In this ionization gauge, the cross section of the collector is reduced to minimum to reduce the X-ray effect. This is achieved by inverting the gauge—that is, the collector (a fine wire) is surrounded by the grid. The pressure range covered is 10⁻³ to 10⁻⁹ torr or down to 10⁻¹¹ torr if a modulated instrument is used. Operating principles are the same as for the other ionization gauges described above.

Vadakalai (Tamil), Sanskrit uttara-ķalār-YA, one of two Hindu subsects of the Śrīvaisnava, the other being the Tenkalai. Though the two groups use both Sanskrit and Tamil scriptures, the Vadakalai relies more on Sanskrit texts, such as the Vedas (earliest sacred scriptures of India), the Upanisads (early religiophilosophic texts), and the religious poem the Bhagavadgītā. Their main point of disagreement, however, is on the question of God's grace. The Vadakalai contend that some effort is required on the part of the devotee who seeks deliverance, and they use as an example the baby monkey, which, when carried, holds fast to its mother. Its theory is thus called markata-nyāya (the analogy of the monkey). The performance of religious duties is also expected. The two groups also hold different views about Vishnu's consort, Śrī (Laksmī). The Vadakalai believe that she is indistinguishable from the Lord and can grant the grace necessary for spiritual liberation.

The Vadakalai are referred to as the northern school (as opposed to the southern school, the Tenkalai) because their main centre is in Mysore. Their most important teacher was Vedāntadeśika, also known as Venkaṭanātha,

who lived sometime during the late 14th century. See also Tenkalai.

Vadianus, Joachim, original name JOACHIM VON WATT (b. c. 1484, Sankt Gallen, Switz.—d. April 6, 1551, Sankt Gallen), Swiss religious reformer and one of the most important native Swiss Humanists.

Crowned poet laureate by the Habsburg emperor Maximilian (1514), Vadianus served as rector at the University of Vienna (1516–17) and supervised the publication of the works of various ancient writers, notably Ovid and Pliny the Elder. Later he practiced medicine at Sankt Gallen, where he was mayor in 1526. He used both his political influence and his power as a popular preacher to establish the Reformation in the city. He presided at the second debate at Zürich (1523) over doctrines of the reformer Huldrych Zwingli and at a similar debate at Bern (1528) over the preaching of Berthold Haller. He produced a number of minor historical works.

Vadodara, also called BARODA, city, administrative headquarters of Vadodara district, east central Gujarāt state, west central India, on the Viśvāmitra River, southeast of Ahmadābād. The earliest record of the city is in a grant

The Maharaja Sayajirao University of Baroda at Vadodara, Gujarāt, India

or charter of AD 812 that mentions it as Vadapadraka, a hamlet attached to the town of Ankottaka. In the 10th century Vadapadraka displaced Ankottaka as the urban centre. It seems also to have been known as Chandanavati, after Raja Chandan of the Dor Rājputs, who wrested it from the Jainas. The city underwent periodic renamings, to Varāvati, Vatpatraka, Baroda, and, in 1971, Vadodara.

The history of Vadodara falls into a Hindu period (until 1297); a period under the Muslim Delhi sultanate (1297–c. 1401); an independent Gujarāt sultanate, during which the nucleus of the present city was built (c. 1401–c. 1573); a Mughal Empire period (c. 1573–1734); and a Marāṭhā period, during which it became the capital of the powerful Gaekwar family (1734–1947). In 1802 the British established a residency in the city to conduct relations between the East India Company and the Gaekwars; later it was also responsible for British relations with all the states of Gujarāt and the Kāthiāwār Peninsula.

The long history of Vadodara is reflected in its many palaces, gates, parks, and avenues. It houses the Maharaja Sayajirao University of Baroda (1949) and other educational and cultural institutions, including several museums. Among the city's varied products are cotton textiles and homespun cloth, chemicals, matches, machinery, and furniture. Vadodara is a rail and highway junction and has an airfield.

Vadodara district occupies 3,007 sq mi (7,788 sq km), extending from the Narmada River (south) to the Mahi River (north). It cor-

responds roughly to the capital division, or district, of the former princely state of Baroda (the Gaekwar dominions). Cash crops are cotton, tobacco, and castor beans. Wheat, pulses, corn (maize), rice, and garden crops are grown for local use and export. Pop. (1981) city, 734,473; metropolitan area, 744,881; district, 2,558,092.

vadose zone, region of aeration above the water table. This zone also includes the capillary fringe above the water table, the height of which will vary according to the grain size of the sediments. In coarse-grained mediums the fringe may be flat at the top and thin, whereas in finer grained material it will tend to be higher and may be very irregular along the upper surface. The vadose zone varies widely in thickness, from being absent to many hundreds of feet, depending upon several factors. These include the environment and the type of earth material present. Water within this interval, which is moving downward under the influence of gravity, is called vadose water, or gravitational water.

Vadsø, town and seat of Finnmark fylke (county), northern Norway. Located on the northern shore of Varangerfjorden, the original settlement was on the adjacent island of Vassøya, but in the early 1700s the port was reestablished on the mainland. Vadsø received its town charter in 1833, and the town prospered, principally through trade with Russia. It was almost totally destroyed by the Germans during World War II but has been rebuilt. The inhabitants, almost one-half of whom are Finnish, long have depended primarily on fishing and fish processing. Pop. (1983 est.) mun., 5,995.

Vadstena Bracteate, gold coin-like ornament with runic inscriptions and rich designs, discovered in Östergötland, Swed., probably dating from the 5th century. A 24-character futhark (runic alphabet), arranged in three groups of eight symbols, is engraved on it, followed by eight characters, tuwa tuwa, of unknown, perhaps magical, significance. The bracteate is the oldest and best record of the tripartite division of the futhark. An old replica was found at Motala, Swed., and a variant at Grumpan. The bracteate had obvi-

Vaduz, capital of Liechtenstein, central Europe, in the Rhine Valley. The seat of one of the two former lordships (Schellenberg and Vaduz) that united to form the principality in 1719, Vaduz is a flourishing tourist centre and the residence of the ruling prince, whose castle

overlooks the town. Mentioned in a document of c. 1322, destroyed in the Swabian Wars

(1499), and rebuilt in the following centuries, the castle was restored in 1905–16 in 16th-century style. Although it has belonged to the princes since 1712, Francis Joseph II, who succeeded to the monarchy in 1938, was the first to make it his permanent residence. The town's Fürst Liechtensteinische Gemäldegalerie displays parts of the world-famous art collection of the princes of Liechtenstein. The State Art Collection includes works by 20th-century painters, and the Liechtenstein Postal Museum has a collection of stamps, including all of those issued by the country since 1912. Pop. (1982 est.) 4,980.

Vaganova, Agrippina (Yakovlevna) (b. July 6, [June 24, old style], 1879, St. Petersburg, Russia—d. Nov. 5, 1951, Leningrad), ballerina and teacher who developed a technique and system of instruction based on the classic style of the Imperial Russian Ballet but which also incorporated aspects of the more vigorous, acrobatic Soviet ballet developed after the Revolution. Her pupils included such outstanding dancers as Marina Semenova, Natalia Dudinskaya, and Galina Ulanova.

Vaganova was herself a student of outstanding teachers, and she also learned from observing Enrico Cecchetti and his student the prima ballerina Olga Preobrajenska. Upon graduation in 1897 from the Russian Imperial School of Ballet, St. Petersburg, she joined the Mariinsky (now Kirov) Theatre, where she became known as "queen of variations" for her soaring leaps and brilliant footwork. Although she danced the ballerina roles of Odette-Odile (Swan Lake), the Tsar-Maiden (The Humpbacked Horse), and the Mazurka (Chopiniana), she was not given official ballerina ranking until 1915, two years before her retirement from the stage.

Vaganova began her teaching career after the Revolution and in 1921 joined the Leningrad Khorteknikum (formerly the Imperial Ballet School), becoming its director in 1934. She also trained teachers at the Leningrad Ballet School (1934–41) and the Leningrad Conservatory (1946–51), where she was appointed professor. Her teaching system emphasized harmony and coordination of all parts of the body but particularly developed the back, enabling her students to make soaring leaps and manoeuvre while in the air.

She staged many ballets for the Mariinsky (Kirov) company, notably Swan Lake (1933), with Galina Ulanova as Odette-Odile. In 1936 she was made Peoples' Artist of the Russian Soviet Federated Socialist Republic. Her writings include a collection of memoirs and letters, Agrippina Yakovlevna Vaganova (1958), and the widely used textbook, Fundamentals of the Classic Dance (1934), which has been translated into many languages, including an English version by Anatole Chujoy (1946).

vagina, canal in female mammals and certain invertebrates that serves primarily to receive the male reproductive cells, or sperm. In humans, it also functions as an excretory canal for the products of menstruation and is part of the birth canal during childbirth.

In humans the vagina is about 9 cm (3.5 inches) long; it is located in front of the rectum and behind the bladder. The cervix of the uterus connects to the upper region of the vagina. The vaginal channel is narrowest at the upper and lower ends. In most virgins, the external opening to the vagina is partially closed by a thin fold of tissue known as the hymen. The opening (vaginal orifice) is partially covered by the labia majora.

The lining of the vaginal cavity responds to stimulation from the various ovarian hormones by either building new cell layers or shedding the old ones. The thickness of the lining varies directly with the amount of estrogen liberated from the ovaries; the lining is thickest and most elastic during ovulation (egg release from the ovaries) and during pregnancy. The vaginal lining characteristically has several transverse ridges known as vaginal rugae, which permit expansion of the vaginal cavity. These tend to disappear in older women and in those who have borne children.

There are no glands in the vaginal wall. The mucus that lubricates the vaginal cavity has traditionally been ascribed to the cervix or to the Bartholin's glands in the labia. After extensive clinical observation, however, William H. Masters and Virginia Johnson reported in 1966 that vaginal lubrication during sexual excitement was supplied by the seepage of a mucuslike fluid through the walls of the vagina. The cells in the lining contain large quantities of glycogen (stored animal starch). Bacteria within the vagina ferment the glycogen, so that lactic acid is produced. The lactic acid makes the surface of the lining slightly acidic, thus protecting against disease-causing microorganisms that have gained entry via the vaginal orifice.

The muscle walls of the vagina are thick and elastic in order to accommodate both the movement of the penis during intercourse and the passage of a child during delivery. The muscular wall is composed of two layers of muscle fibres, a weak internal circular layer, and a strong, external longitudinal layer. Covering the muscle tissue is a sheath of connective tissue that consists of blood vessels, lymphatic ducts, and nerve fibres. This layer joins those of the urinary bladder, rectum, and other pelvic structures.

and other pelvic structures.

Maladies that can affect the vagina include bacterial infections (see leukorrhea; vaginitis), ulcerated sores, prolapse, in which the internal portions of the vagina protrude out of the vaginal orifice, and occasionally cancerous tumours.

For a depiction of the vagina in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

vaginismus, muscle spasm that closes the opening to the vagina in the female reproductive tract. The vagina serves as a birth canal for the delivery of babies and as the copulatory organ during sexual intercourse. The spasm may be so intense that the vagina seems pathologically obstructed. Vaginismus is a protective mechanism that sometimes develops when there are tender lesions in the reproductive tract. More commonly, it is an involuntary physiological manifestation of fear or anxiety that is experienced at the prospect of sexual intercourse. Vaginismus can totally prevent coitus or make it extremely difficult, a condition known as dyspareunia.

vaginitis, inflammation of the vagina, usually owing to infection. The chief symptom is leukorrhea, *i.e.*, the abnormal flow of a whitish or yellowish discharge from the vagina. The

treatment of vaginitis depends on the cause of the inflammation. Several different microorganisms can produce vaginitis in women of reproductive age; atrophic vaginitis, caused by reduced estrogen levels, can occur in women after menopause; and certain chemicals can cause an irritant or allergic vaginitis.

Among the microorganisms that commonly cause vaginitis are Candida albicans, a common yeast; Chlamydia or Gardnerella bacteria; and Trichomonas vaginalis, a protozoan. The last two types of vaginal infections are usually transmitted from males to females through sexual contact and help make vaginitis one of the most common sexually transmitted diseases. Candidiasis can also occur during pregnancy and can cause infant thrush in children born to infected mothers. Treatment of these infectious forms of vaginitis is by appropriate antimicrobial drugs.

Atrophic vaginitis occurs in postmenopausal women because the lack of estrogen stimulation causes the surface membrane of the vagina to become thin, dry, and fragile, increasing the likelihood of infection. Regular treatment with an estrogen cream restores the protective surface and eliminates vaginitis.

vagrancy, state or action of one who has no established home and drifts from place to place without visible or lawful means of support. Traditionally a vagrant was thought to be one who was able to work for his maintenance but preferred instead to live idly, often as a beggar. The punishment for this ranged from branding and whipping to conscription into the military services and transportation to penal colonies. In English law, a man who deserted his wife and children was considered a vagrant, as was also any man who gave a false account of himself.

The vagueness of the common-law meanings of vagrancy has been reflected in subsequent statutory law. In the United States and northern Europe, vagrancy must generally be accompanied by the act of begging before it becomes punishable. Usually local authorities merely encourage the vagrant to move on, relieving themselves of the financial burden of maintaining the offender. In some countries the term describes a more serious offense than begging. Often it applies to a person who has a fixed habitation but pursues a calling condemned by the law as immoral, such as prostitution or gambling.

Vagrancy is frequently used by police and prosecutors as a tool for proscribing a wide range of behaviour. Political demonstrations, the obstruction of streets or walks, riotous activities, and loitering have all been variously interpreted as violations of vagrancy laws. This fluid application of a vague statute or ordinance has been heavily criticized by leal scholars and civil libertarians. The United States Supreme Court declared a Florida state statute unconstitutional, in February 1972, on the ground that its terms were not sufficiently explicit to inform those subject to it what conduct would render them liable to its penalties. See also disorderly conduct.

vagus nerve, also called TENTH CRANIAL NERVE, longest and most complex of the cranial nerves. The vagus nerve runs from the brain through the face and thorax to the abdomen. It is a mixed nerve that contains parasympathetic fibres. The vagus nerve has two sensory ganglia (masses of nerve tissue that transmit sensory impulses): the superior and the inferior ganglia. The branches of the superior ganglion innervate skin in the concha of the ear. The inferior ganglion gives off two branches: the pharyngeal branch and the superior laryngeal nerve. The recurrent laryngeal nerve branches from the vagus in the lower neck and upper thorax to innervate the muscles of the larynx (voice box). Farther down the vagus gives off cardiac, esophageal, and pulmonary branches. In the abdomen the vagus innervates the greater part of the digestive tract and other abdominal viscera.

The vagus nerve has the most extensive distribution of the cranial nerves. Its pharyngeal and laryngeal branches transmit motor impulses to the pharynx and larynx; its cardiac branches act to slow the rate of heartbeat; its bronchial branch acts to constrict the bronchi; and its esophageal branches control involuntary muscles in the esophagus, stomach, gall bladder, pancreas, and small intestine, stimulating peristalsis and gastrointestinal secretions

Váh River, tributary of the Danube River in Slovakia, Czechoslovakia. Rising in the Tatra Mountains as the Biely Váh (in the High Tatras) and Čierny Váh (in the Low Tatras), the river describes a long arc to the west and south. It joins the Little Danube to become the Váh Danube (Vážský Dunai), which forms the eastern limit of Great Rye Island, and after several miles enters the Danube River at Komárno after a course of 242 miles (390 km). The Váh has a large number of tributaries, many of which fall steeply off the Tatras and the outer ranges of the Carpathians. The eastwest valley formed by its upper course provides a natural transportation route across Slovakia that is followed by major road and rail arteries; the river's north-south valley between Zilina and Bratislava similarly serves as a corridor. The river flows rapidly—particularly when swollen by seasonal meltwater, since the Tatras have few storage lakes-through a picturesque valley. There are numerous small hydroelectric power stations along the Váh. The area of its drainage basin is 4,109 square miles (10,641 square km).

vāhana (Sanskrit: "mount," or "vehicle"), in Hindu mythology, the creature that serves as the vehicle and as the sign of a particular deity. The *vāhana* accompanies, pulls the chariot of, or serves as the seat or mount of his god. The *vāhana* is also used on banners to identify the god or the cult affiliation of the devotee.

Some scholars understand the concept as a way of incorporating local theriomorphic (animal form) deities into the classical pantheon of Hindu deities. Others suggest the mythological pattern might have been borrowed from Mesopotamian art and mythology.

The *vāhana*s of the major gods, such as Šiva's bull Nandi, and Vishnu's bird Garuda, have a considerable mythology of their own. The *vāhana*s of other gods include the *hannsa* (goose or swan) of Brahmā, the rat of Ganeśa, the peacock of Skanda, the elephant Airāvata of Indra, the parrot of Kāma, the owl of Lakṣmī, the lion of Pārvatī, and the man of Kubera.

Vai, also spelled VEI, also called GALLINAS, people inhabiting the eastern part of Liberia and contiguous parts of Sierra Leone. Early Portuguese writers called them Gallinas ("chickens"), reputedly after a local wildfowl. Speaking a language of the Mande branch of the Niger-Congo family, the Vai have close cultural ties to the Mande peoples.

Vai behaviour in all aspects of life is strongly influenced by secret societies known as *poro* and *sande*—for men and women, respectively. The modern Vai are largely Islāmized. Formerly known as slave traders, the Vai now rely on farming and fishing; many work in government or for foreign companies. Their crafts are well-developed, especially weaving and goldsmithing. A unique syllabic system of writing, invented in the 19th century by a Vai man, Doalu Bukere, is used mostly among older people. Many Vai are literate in Arabic. In the late 20th century the Vai numbered about 50,000.

Vaida-Voevod, Alexandru (b. 1872, Olpret, Transylvania [now in Romania]—d. March 19, 1950, Bucharest), politician who served four times as prime minister of Romania (1919–20, 1932, 1932, 1933) and was a leading spokesman for the union of Transylvania with the lands of the Old Kingdom (Moldavia and Walachia).

A native of Hungarian-ruled Transylvania, Vaida-Voevod joined a small Romanian nationalist group in the Hungarian Parliament after 1906, becoming one of the foremost opponents of the governmental policy of forced Magyarization of national minorities. In October 1918 he presented a resolution to Parliament announcing Transylvania's right to self-determination, and in December 1918, following Hungary's surrender to the Allies in World War I, he won appointment to the Transylvanian directing council, which proclaimed union with Romania. He subsequently joined the Romanian delegation to the post-World War I peace conference at Paris (1919).

Following the successes of his National Party in the elections of November 1919, Vaida-Voevod was named Romanian prime minister in a coalition government. His radical approach to national land reform prompted the intervention of King Ferdinand, who dissolved the administration by fiat (March 1920). From 1928 to 1930 Vaida-Voevod served as minister of the interior; and from August to October 1932 he held simultaneously the prime ministry and the ministry of foreign affairs. His final ministry (January-November 1933) was marked by widespread labour unrest and growing Fascist activity. After his dismissal from office, he formed his own virulently nationalist, semi-Fascist group.

Vaigai River, river in Tamil Nādu state, southern India, flowing 150 miles (240 km) generally southeast. Rising in the Varushanād Hills of western Tamil Nādu, it initially flows northeast through the Kambam and Varushanād valleys. In its central reaches the Vaigai flows eastward into the Vaigai reservoir at Narasingāpuram. Near Sholavandān it bends to the southeast, passing Madurai town on its course to its mouth on Palk Strait, which separates the southeast coast of India from Sri Lanka. The Vaigai River rarely floods; its chief tributaries are the Siruliar, Theniar, Varāha Nadī, and Mangalar.

Vaihinger, Hans (b. Sept. 25, 1852, Nehren, Württemberg [Germany]—d. Dec. 18, 1933, Halle, Ger.), German philosopher who, influenced by Arthur Schopenhauer and F.A. Lange, developed Kantianism in the direction of pragmatism by espousing a theory of "fictions" as the basis of what he called his "as if" philosophy.

Vaihinger taught philosophy at the University of Halle from 1884 to 1906, until near-sightedness forced his retirement. His major work, Die Philosophie des Als Ob (1911; The Philosophy of "As If"), begun in 1876, went through many editions. Vaihinger began writing Kantstudien in 1896 with the assistance of international scholars and eight years later founded the Kant Society. He saw life as a maze of frustrations and searched for a philosophy to make life livable.

Vail, Alfred Lewis (b. Sept. 25, 1807, Morristown, N.J., U.S.—d. Jan. 18, 1859, Morristown), American telegraph pioneer and an associate and financial backer of Samuel F.B. Morse in the experimentation that made the telegraph a commercial reality.

Shortly after Vail graduated from the University of the City of New York in 1836, he met Morse and became interested in Morse's telegraph experiments. In return for a share in the rights, he agreed to construct telegraph

equipment and to bear the cost of obtaining American and foreign patents. Working in Morristown with the financial backing of Vail's father, Vail, Morse, and a third associate. Leonard D. Gale, made the first successful demonstration of the electric telegraph on Jan. 6, 1838. Public demonstrations followed in New York City and Philadelphia, and in March 1843 Congress authorized construction of a telegraph line between Washington, D.C., and Baltimore. On May 24, 1844, Vail, as Morse's assistant, received, over the Washington-Baltimore line, the famous first message, "What hath God wrought!" Though Vail continued to work with Morse for another four years, he gradually lost interest in the telegraph and resigned. His cousin Theodore Newton Vail was later the organizer of telephone service in the United States.

Vail, Theodore Newton (b. July 16, 1845, Minerva, Ohio, U.S.—d. April 16, 1920, Baltimore), American executive who twice headed the Bell Telephone Company at critical times and played a major role in establishing telephone services in the United States.

After a highly successful career in the railway postal service, Vail was persuaded in 1878 to join Bell Telephone as general manager. During his active tenure in this position (until 1887), he developed a long-distance service by merging and interconnecting local exchanges, set up the Western Electric Company to manufacture telephone equipment, and placed the telephone industry on a sound financial basis.

Retiring in 1889, he spent several years in Argentina, developing a waterpower plant in Córdoba and a street railway in Buenos Aires. After the deaths of his wife (1905) and his only child (1906), he returned to the United States.

In 1907 Vail was invited to return as president of the American Telephone & Telegraph Company, the successor to Bell. When the Bell patents had expired in 1893 and 1894, hundreds of independent local firms had begun to compete with the Bell company. Vail chose to cooperate with the new competitors, charging them a fee for connection with his long-distance lines. In 1915 the first transcontinental telephone line was opened, and, in the same year, radio-telephone communications began across the Atlantic Ocean. Vail, who directed U.S. telephone services for the government during World War I, stayed on as AT&T president until his retirement in 1919.

Vaillant, Édouard-Marie (b. Jan. 28, 1840, Vierzon, Fr.—d. Dec. 18, 1915, Paris), French revolutionary publicist and politician who was exiled for his role in the Paris Commune of 1871. After his return he became an important member of the Socialist Party.

Educated as an engineer, Vaillant subsequently studied medicine, first in Paris, and later in Heidelberg, Tübingen, and Vienna. He returned to France, and during the German siege of Paris (1870–71) he wrote revolutionary articles propagating the thought of Auguste Blanqui, French Socialist theoretician, whose friend and disciple he had become.

Vaillant participated in the Paris insurrection of March 18, 1871, and was elected a member of the Commune, the revolutionary government of Paris. With the defeat of the Commune, he fled to England, where he met Karl Marx. He was a member of the General Committee of the First International of Working Men's Associations (September 1871). In 1872, with other Blanquists, Vaillant withdrew from the International, believing it to be insufficiently revolutionary.

Vaillant was condemned *in absentia* to death in July 1872 and returned to France only after the general amnesty of 1880. There he was active in Blanquist groups until 1904.

Vaillant was elected a municipal councillor (1884) and from 1893 until the end of his life represented a Paris district in the National

Assembly. He was an ardent advocate of the eight-hour day and of comprehensive social security. In 1898 he became leader of the Blanquists in the Chamber. In 1905, when the various Socialist factions were united, he began his friendship and collaboration with Jean Jaurès, the leading Socialist politician; together they were able to control all the Socialist congresses until 1914. Though a lifelong pacifist, Vaillant regarded it as the duty of all Socialists to defend France on the outbreak of World War I.

Vaiont Dam, concrete arch dam across the Vaiont River in Italy with a height of 859 feet (262 m) and crest length of 623 feet (190 m). Completed in 1961, it was severely damaged by a massive landslide into the reservoir in 1963 that claimed more than 2,500 lives.

Vair, Guillaume du (b. March 7, 1556, Paris—d. Aug. 31, 1621, Tonneins, Fr.), a highly influential French thinker and writer of the troubled period at the end of the 16th century.

A lawyer by training, du Vair occupied high offices of state under Henry IV, having made his reputation with his eloquent and cogently argued orations. He first came to the fore with a brilliant oration on the death of Mary, Queen of Scots. The elaborate style of his speeches, with all their erudition and ingenuity, was appreciated in an age that had a highly developed taste for rhetoric. As a thinker, du Vair is famed for such treatises as De la constance et consolation ès calamités publiques (1593; "On Constancy and Consolation in Public Calamities," Eng. trans. A Buckler, Against Adversitie, 1622). In this

Du Vair, engraving by François Langlois H. Roger-Viollet

work he put forward an amalgam of Stoicism and Christianity that was well calculated to appeal to readers in a France torn apart by civil war. Philosophers such as Justus Lipsius had already attempted to fuse Christian and Stoic ethics, but du Vair's importance in the dissemination of ideas of this sort is undeniable. Malherbe was the first of the French poets to take up du Vair's doctrines, and the French moraliste tradition of the 17th century owed much to him. A number of his philo-

sophical works were translated into English in the 17th century.

vairāgin, in Hinduism, a religious ascetic who worships principally one or another form of the god Vishnu. *Vairāgins* generally wear white robes, in contrast to the ochre-coloured robes worn by Saiva ascetics, and are also differentiated by their tilak (sect mark on the forehead), which is never made of ash and is always vertical in design.

Most vairāgins, when not wandering or on pilgrimage, reside in monastic communities called sthānas ("spots" or "places"); but the nāgā ("naked") vairāgins, who are also the militants among the Vaiṣnava ascetics, form their own groups, called akhārās. In the past, battles between groups of naked ascetics belonging to different sects centred mainly on bathing and processional rights during pilgrimage assemblies, such as the Kumbha Melā.

Vairocana (Sanskrit: "Illuminator"), also called MAHĀVAIROCANA ("Great Illuminator"), the supreme Buddha, as regarded by many Mahāyāna Buddhists of East Asia and of Tibet, Nepal, and Java.

Some Buddhists regard Vairocana, or Mahāvairocana, as a being separate from the five "self-born" Dhyāni-Buddhas, one of whom is known as Vairocana (see Dhyāni-Buddha). Among the Shingon sect of Japan, he is the chief object of reverence and is regarded as the source of the entire universe. In Japanese he is called Dainichi Nyorai ("Great Sun Buddha"), or Roshana; in Chinese Pi-lu-che-na; in Tibetan Rnam-par-snang-mdzad, or Rnam-snang ("Maker of Brilliant Light").

Asuka-en

When represented as one of the "self-born" Buddhas, as he is in Nepali, Tibetan, and Javanese art, Vairocana occupies the chief position and is often considered to be the progenitor of the other four Dhyāni-Buddhas, or the Ādi-Buddha himself. In paintings, Vairocana is coloured white and his hands are shown in the dharma-chakra-mudra ("teaching gesture"). His consort is Vajradhātvīšvarī or Tārā, his family Moha, his mount the dragon (or lion), his symbol the chakra ("wheel"), his skandha ("personality component") rūpa ("matter"), his syllable a or om, his element space, his sense perception hearing, his sense organ the ear, and his location in the human body the head.

In China and Japan, Vairocana is given reverence by Buddhists of the Yogācāra school (which led to the foundation of the Shingon sect). Legend claims that he transmitted to a supernatural personage, Vajrasattva, the Yoga

doctrine, which was in turn introduced into China in AD 719 by Vajrabodhi and into Japan by Kūkei (Kōbō Daishi; 774–835).

In Japan he is also worshiped in the form of the fierce Fudō Myō-ō (Chinese: Pu-tung-fo; Sanskrit: Acala), whose duty it is to combat evil and to take charge of the soul after death. Vairocana is frequently represented in Japanese painting and sculpture, most notably the 53-foot (16-metre), seated, bronze Roshana in the Tōdai-ji, at Nara, which was installed in AD 752 but restored in later centuries. As the supreme Buddha, his characteristic gesture is the mudra of the six elements, in which the index finger of the left hand is clasped by the five fingers of the right, symbolizing the uniting of the five elements of the material world (earth, water, fire, air, and ether) with the spiritual (consciousness).

Väisälä, Yrjö (b. Sept. 6, 1891, Kontiolahti, Russia—d. July 21, 1971, Rymättylä, Fin.), Finnish meteorologist and astronomer noted for developing meteorological measuring methods and instruments.

Väisälä By courtesy of Turun Yliopisto

After receiving his Ph.D. in 1922, Väisälä joined the faculty of the Geodetic Institute of Turku University (1925) and worked as an astronomer and surveyor, completing a magnetic survey of the Earth and inventing the light-interference system for measuring long paths (on the order of 100 metres) for use as baselines in geodetic surveys (1927). Later in his career, Väisälä turned to meteorology and developed, among other things, a new method of radio direction finding (1951). In 1952 he helped found the Turku University Astronomical Observatory and was its director until his death. Väisälä received the Honorary Award of the Finnish Academy of Sciences and Letters in 1954.

Vaiśālī, Pāli vēsalī, city of ancient India, north of Patna, northwestern Bihar state, on the Gandak River. In antiquity Vaisālī was the capital of the Licchavi republic and was closely associated with the early histories of both Buddhism and Jainism. Roads connected it with Rājagrha to the south and Kapilavastu and Śrāvastī to the north. Mahāvīra, the founder of Jainism, was born in Vaisalī and spent much time there. The Buddha also visited the city on many occasions. Its several important monasteries and shrines were described by the Chinese pilgrim Fa-hsien in the 5th century AD. After the death of the Buddha (c. 483 BC) the second great council of Buddhists was held at Vaisālī to provide rules of conduct.

According to tradition, the city in early times was surrounded by three walls with gates and watchtowers. The site today is marked by two groups of mounds and has been partly excavated by archaeologists. The earliest occupation of the site is associated with black-andred pottery of probably pre-Buddhist age; it was followed by the northern black polished ware of early Buddhist times. Vaiŝālī is on the site of a village now known as Basarh.

Vaisheshika, also spelled VAISESIKA, Sanskrit VAISEŞIKA ("Particular"), one of the six orthodox systems (darshans) of Indian philosophy,

significant for its naturalism, a feature that is not characteristic of most Indian thought. The Sanskrit philosopher Kaṇāda Kāṣyapa (2nd-3rd century Ap?) expounded its theories and is credited with founding the school. Important later commentaries were written by Praṣ́astapāda, Udayana, and Śrīdhara.

After a period of independence, the Vaisheshika school fused entirely with the Nyāya (q.v.) school, a process that was completed in the 11th century. Thereafter the combined school was referred to as Nyāya-Vaisheshika.

The Vaisheshika school attempts to identify, inventory, and classify the entities and their relations that present themselves to human perceptions. It lists six categories of being (padārthas), to which was later added a seventh. These are:

(1) Dravya, or substance, the substratum that exist independently of all other categories, and the material cause of all compound things produced from it. Dravyas are nine in number: earth, water, fire, air, ether, time, space, spirit, and mind.

(2) Guṇa, or quality, which in turn is subdivided into 24 species.

(3) Karman, or action. Both guna and karman inhere within dravya and cannot exist independently of it.

(4) Sāmānya, or genus, which denotes characteristic similarities that allow two or more objects to be classed together.

objects to be classed together. (5) Viseya, or specific difference, which singles out an individual of that class.

(6) Samavāya, or inherence, which indicates things inseparably connected.

To these six was later added *abhāva*, nonexistence or absence. Though negative in content, the impression it makes is positive; one has a perception of an absence where one misses something. Four such absences are recognized: previous absence, as of a new product; later absence, as of a destroyed object; total absence, as of colour in the wind; and reciprocal absence, as of a jar and a cloth, neither of which is the other.

The Vaisheshika system holds that the smallest, indivisible, indestructible part of the world is an atom (anu). All physical things are a combination of the atoms of earth, water, fire, and air. Inactive and motionless in themselves, the atoms are put into motion by God's will, through the unseen forces of moral merit and demerit.

Vaishnavism, also called VISHNUISM, or VIŞNUISM, Sanskrit VAIŞNAVISM, worship of the god Vishnu and of his incarnations, principally as Rāma and as Krishna. It is one of the major forms of modern Hinduism—with Saivism and Shaktism (Sāktism).

A major characteristic of Vaishnavism is the strong part played by bhakti, or religious devotion. The ultimate goal of the devotee is to escape from the cycle of birth and death so as to enjoy the presence of Vishnu. This cannot be achieved without the grace of God. Vishnu is not only the end (upeya) but also the means (upāya). For his part, the devotee must cultivate the auxiliary disciplines of karman, the path of good works, and jñāna, the way of spiritual knowledge.

Sectarian Vaishnavism had its beginnings in the cult of Vāsudeva-Krishna, who may have been a Yādava tribal leader (c. 7th-6th century BC). The Vāsudeva cult coalesced with others worshiping the deified sage Nārāyaṇa so that by about the 2nd century AD Vāsudeva, Krishna, and Nārāyaṇa appeared in the celebrated religious poem the Bhagavadgītā as interchangeable names of Lord Vishnu. The cult of the pastoral Krishna was soon added.

The philosophical schools of Vaishnavism differ in their interpretation of the relationship

between individual souls and God. The doctrines of the most important schools are: (1) viśistādvaita ("qualified monism"), associated with the name of Rāmānuja (11th century) and continued by the Srīvaisnava sect, prominent in South India; (2) dvaita ("dualism"), the principal exponent of which was Madhva (13th century), who taught that although the soul is dependent on God it is not an extension of God, that the soul and God are separate entities; (3) dvaitādvaita ("dualistic monism"), taught by Nimbarka (12th century), according to which the world of souls and matter is both different and not different from God; (4) śuddhādvaita ("pure monism") of Vallabha, which explains the world without the doctrine of maya (illusion); (5) acintyabhedābheda ("inconceivable duality and nonduality"), the doctrine of Caitanya, in which the relation between the world of souls and matter on the one hand and God on the other is not to be grasped by thought but is both different and nondifferent.

In addition to these philosophical schools, each of which has its own sectarian following, Vaishnavism also includes a number of popular expressions of devotionalism, which were furthered in the late medieval period by the vernacular writings of Rāmānanda and his disciples and by Vaishnava poets such as Tulsīdās in the Hindi area, Mīrā Bāī in Gujarāt, and Nāmdev and Tukārām in the Marāthā country.

Vaisnava-Sahajiyā, member of an esoteric Hindu cult centred in Bengal that sought religious experience through the world of the senses, specifically human sexual love. Sahaja (Sanskrit: "easy" or "natural") as a system of worship was prevalent in the Tantric traditions common to both Hinduism and Buddhism in Bengal as early as the 8th-9th centuries. The divine romance of Krishna and Rādhā was celebrated by the poets Jayadeva (12th century), Candīdās, and Vidyāpati (mid-15th century), and parallels between human love and divine love were further explored by Caitanya, the 15th-16th-century mystic, and his followers. The Vaiṣṇava-Sahajiyā cult developed from the 17th century onward as a synthesis of these various traditions.

The Vaiṣṇava-Sahajiyās elevated parakīyārati (literally, "the love of a man for a woman who legally belongs to another") above svakīyā-rati (conjugal love) as the more intense of the two. Parakīyārati, it was said, was felt without consideration for the conventions of society or for personal gain and thus was more analogous to divine love. Rādhā is conceived as the ideal of the parakīyā woman, and the Vaiṣṇava-Sahajiyās never attempted (as did some sects of Vaishnavism) to depict her as the wife of Krishna.

The Vaiṣṇava-Sahajiyās were looked upon with disfavour by other religious groups and operated in secrecy. In their literature they deliberately employed a highly enigmatic style. Because of the extreme privacy of the cult, little is known about its prevalence or its practices today.

Vaiśravana, alternate name for Kubera (q.v.), the popular god of wealth in Hindu, Jaina, and Buddhist mythology. In Tibetan Buddhism he is one of the eight protective deities. See dharmapāla.

Vaisya, also spelled VAISHYA, Sanskrit VAISYA, third highest in ritual status of the four varnas, or social classes, of Hindu India, traditionally described as commoners. Legend states that the varnas (or colours) sprang from Prajapati, a creator god—in order of status, the Brahman (white) from his head, the Kshatriya (red) from his arms, the Vaisya (yellow) from his thighs, and the Sudra (black) from his feet.

The yellow colour associated with the Vaisya, according to one theory, links them with the south point of the compass. The Vaisya were commoners, not servile groups. Their role lay in productive labour, in agricultural and pastoral tasks, and in trading. Their way of life demanded study, sacrifice, and the giving of alms. Early scriptures show that Vaisya could and did rise even to the rank of Brahman, as in the case of the two sons of Nābhāgarishta, mentioned in the sacred work *Harivamsa*.

The Vaisya share with the two higher classes, the priestly Brahman and the authoritative Kshatriya, the distinction of being dvija, or "twice-born," achieving their spiritual rebirth when they assume the sacred wool thread at the upanayana ceremony. The Vaisya are credited in history with favouring the rise of the reformist religious beliefs of Buddhism and Jainism. In modern times, the Vaisya class has become a symbol of middle-class respectability and prestige; it is a stepping-stone used by people to raise their status in the system through modified behaviour and the adoption of more prestigious caste names. Vaitown, also called BOMI HILLS, city, western Liberia, West Africa. Located in the Bomi Hills former iron-mining district, it is associated with the Liberian Mining Company (LMC; a subsidiary of Republic Steel Corporation), which closed down mining operations in the late 1970s. The firm, first in Liberia to export iron ore, completed a 43-mile (69kilometre) narrow-gauge railway to the port at Monrovia in 1951. Iron interests added 49 miles (79 km) to the railroad in 1961 to connect the Bomi Hills to the National Iron Ore Company's mine at Fono on the Mano River. In addition, LMC built a hospital, schools, housing, and an electric generating plant. A swamp cultivation project has increased local rice production. The city is the centre of a government-sponsored agricultural reforestation program and a surveying school. Pop. (1974) 3,421.

Vajirañāṇavarorasa, also spelled WACHI-RAYANWAROROT, or WACHIRAYAN WAROT (b. April 12, 1860, Bangkok—d. Aug. 2, 1921, Bangkok), prince-patriarch of Buddhism in Siam, who institutionalized Thai Buddhism, spread the faith in the countryside, and was his generation's leading intellectual.

Vajirañana was a son of King Mongkut and spent, by his own account, a youth of profligate luxury. Early contact with a scholarly and ascetic Scottish physician, Peter Gowan, and Prince Pavares, then leader of the Buddhist reform sect founded by King Mongkut in the 1830s, finally led him to think seriously of a monastic vocation, and in 1879 he was ordained a monk. He then devoted himself to the study of Pali and the Buddhist scriptures and distinguished himself in ecclesiastical examinations. In 1892 he became abbot of Wat Pavaranivesa, the leading monastery of the reform Thammayut order, and in the following year became patriarch of the order.

Having written numerous textbooks, reorganized the Buddhist hierarchy, and modernized monastic education, he became a close adviser to King Chulalongkorn and assisted in the extension of modern education in the provinces. In 1910 he was appointed Supreme Patriarch of Thai Buddhism. As a classical Pali scholar, he was elected an Honorary Member of the Royal Asiatic Society of Great Britain. His autobiography is the earliest of that genre in Thai literature.

Vajiravudh, also Phramongkutklao, or Rama vi (b. Jan. 1, 1881, Bangkok—d. Nov. 26, 1925, Bangkok), king of Siam from 1910 to 1925, noted for his progressive reforms and prolific writings.

Vajiravudh was educated at Oxford University, where he read history and law; he also

received military training at Sandhurst and served briefly with the British Army. Having been named heir apparent in 1895, he returned to Siam in 1903 and succeeded his father, Chulalongkorn, in 1910. Although not comparable to his father as an administrative and political reformer, he promoted numerous social reforms, including a recodification of Siamese law to make monogamy the only legal form of marriage, adoption of the Gregorian calendar, implementation of universal smallpox vaccination, the establishment of the Thai Red Cross, and enactment of a law that required all subjects to take surnames. In 1917 he founded Chulalongkorn University, the first in Siam, and in 1921 he made universal primary education free and compulsory. His attempts to close gambling houses and opium dens, however, met with popular resistance.

Vajiravudh's long overseas education isolated him from the life of his people; moreover, his uncritical love of English traditions led to such unwise actions as the founding of a royal paramilitary force under his direct command, the Wild Tiger Corps, outside the regular armed forces. Resentment of this corps, coupled with youthful impatience with Siam's slow political development, led to an abortive plot against him led by young army and navy officers in 1912. He frustrated and alienated not only conservatives, who saw his reforms as undermining of traditional society and his personal life as scandalous, but also liberals, who were offended by his refusal to grant a constitution and by his obstinacy in maintaining the primacy of the absolute monarch.

Vajiravudh, however, had considerable success in foreign policy. He entered World War I on the side of the Allies in 1917 and joined the League of Nations. He used the increased willingness of the Western powers to treat Siam as a fully equal state to gain a renegotiation of earlier unequal treaties and the renunciation of Western rights in Siam.

In private life Vajiravudh was a prolific writer and translator. He introduced Western forms into Thai literature, particularly the dialogue drama. Using several dozen pseudonyms, he composed about 50 original plays, adapted more than 100 from English and French dramatists, and translated several of Shakespeare's.

vajra, Tibetan RDO-RJE, five-pronged ritual object extensively employed in Tibetan Buddhist ceremonies. It is the symbol of the Vajrayāna school of Buddhism.

Vajra; in the Newark (New Jersey) Museum By courtesy of the Newark Museum, New

Vajra, in Sanskrit, has both the meanings of "thunderbolt" and "diamond." Like the thunderbolt, the vajra cleaves through ignorance. The thunderbolt was originally the symbol of the Hindu rain god Indra (who became the Buddhist Sakra) and was employed by the 8thcentury Tantric (esoteric) master Padmasambhava to conquer the non-Buddhist deities of Tibet. Like the diamond, the vajra destroys but is itself indestructible and is thus likened to śūnya (the all-inclusive void).

The vajra is fashioned out of brass or bronze, the four prongs at each end curving around the central fifth to form a lotus-bud shape. A nine-pronged vaira is less commonly used.

In ritual use the *vaira* is frequently employed in conjunction with the bell (Sanskrit ghantā; Tibetan dril bu), the various gestures (mudrās), when correctly executed, having considerable metaphysical power. The vajra (symbolizing the male principle, fitness of action) is held in the right hand and the bell (symbolizing the female principle, intelligence) in the left hand, the interaction of the two ultimately leading to enlightenment. In art the vajra is an attribute of many divinities, such as the celestial Buddha Aksobhya and his manifestation as a bodhisattva ("Buddha-to-be"), Vajrapāņi (In Whose Hand Is the Vajra). The viśva-vajra is a double vajra in the shape of a cross with four equal arms.

Vajrapāni, Tibetan PHYAG-NA-RDO-RJE, Chinese KIN-KANG, Japanese KONGŌ, in Mahāyāna Buddhist mythology, one of the celestial bodhisattvas ("Buddhas-to-be"), the manifestation of the self-born Buddha Aksobhya.

Vairapāni, bronze statuette from Nepal. 19th century; in the Rijksmuseum voor Volkenkunde, Leiden, Neth.

Vajrapāni (Sanskrit: Thunderbolt-Bearer) is believed to be the protector of the nagas (halfman, half-serpent deities) and sometimes assumes the shape of a bird in order to deceive their traditional enemy, the hawklike Garuda. Because of his association with the rain-controlling nagas and with the Hindu god of rain, Indra, he is invoked in times of drought.

Like Indra he holds the thunderbolt and is coloured dark blue or white. His statues are often found in a triad with the Buddha Amitāyus (or the bodhisattva of wisdom, Mañjuśrī) and the lotus-bearing bodhisattva of compassion, Padmapāṇi. In Tibet he assumes ferocious forms to combat demons and to guard the mystical teaching of Buddhism, and in Japan he guards the temple doorways (see Ni-ō).

Vairavāna (Sanskrit: Vehicle of the Diamond [or Thunderbolt]), also called TANTRIC BUD-

DHISM, important development within Buddhism in India and neighbouring countries, notably Tibet. Vajrayāna, in the history of Buddhism, marks the transition from Mahāyana speculative thought to the enactment of Buddhist ideas in individual life. The term vajra (Sanskrit: "diamond," or "thunderbolt") is used to signify the absolutely real and indestructible in man, as opposed to the fictions an individual entertains about himself and his nature: vāna is the spiritual pursuit of the ultimately valuable and indestructible

Other names for this form of Buddhism are Mantrayana (Vehicle of the Mantra), which refers to the use of the mantra (a, v_{\cdot}) to prevent the mind from going astray into the world of its fictions and their attendant verbiage and to remain aware of reality as such; and Guhyamantrayāna, in which the word guhya ("hidden") refers not to concealment but to the intangibility of the process of becoming aware of reality.

Philosophically speaking, Vajrayāna embodies ideas of both the Yogācāra discipline, which emphasizes the ultimacy of mind, and the Mādhyamika philosophy, which undermines any attempt to posit a relativistic principle as the ultimate. Dealing with inner experiences, the Vajrayāna texts use a highly symbolic language that aims at helping the followers of its disciplines to evoke within themselves experiences considered to be the most valuable available to man. Vajrayāna thus attempts to recapture the Enlightenment experience of the Gautama Buddha.

In the Tantric view, Enlightenment arises from the realization that seemingly opposite principles are in truth one. The passive concepts Sūnyatā ("voidness") and prajñā ("wisdom"), for example, must be resolved with the active karuṇā ("compassion") and upāya ("means"). This fundamental polarity and its resolution are often expressed through symbols of sexuality (see yab-yum).

The historical origin of Vajrayāna is unclear, except that it coincided with the spread of the mentalistic schools of Buddhism. It flourished from the 6th to the 11th century and exerted a lasting influence on the neighbouring countries of India. The rich visual arts of Vajrayāna reach their culmination in the sacred mandala (q.v.), a representation of the universe used as an aid for meditation.

Vajrayoginī, in Vajrayāna (Tantric Buddhism), female embodiment of the cognitive function leading to Buddhahood. Vajrayāna emphasizes experience over speculation but uses the terms of speculative philosophical Buddhism in an imaginative way. This practice means that images taken from the ordinary life of the individual become the means to further a deeper understanding of man's being, which is both action (upāya) and knowledge (prajñā), each reinforcing the other.

In iconographical representations, Vajrayoginī is usually depicted in a terrifying form, holding in her hands a skull and a dagger, her right leg stretched out, the left one slightly bent (ālīdha). She is surrounded on all sides by cremation grounds, indicating that the ordinary world has become dead in contrast to the rich world of inner life and its vision of reality without distorting fictions. Although she may be visualized alone, she is usually in union (yab-yum) with Heruka, who, when he is united with Vajrayoginī, is known as Hevajra. As such he is very popular in Tibet, particularly with the Bka'-brgyud-pa (a major Buddhist sect), whose tutelary deity he is.

As an expression of the multiplicity of psychic phenomena, Vajrayogini may be accompanied by other aspects of herself, such as Vajravairocanī (She Who Reveals), coloured yellow, like the all-illuminating sun, or Vajravarnanī (She Who Colours), coloured green, symbolizing the widest range of perception and the fact that man's view is "coloured." In

her principal form, Vajrayoginī is also known as Vajradākinī (She Who Roams over the Void)

In spite of her importance in Vajrayāna Buddhism, Vajrayogini does not figure as the main deity of a Tantra (literary work). There are four sādhanas (methods of visualization) describing her various forms.

Vakaga, northernmost préfecture of the Central African Republic, bordering Chad to the northwest and The Sudan to the northeast. Until the mid-1960s it was an autonomous sub-prefecture named for the town of Birao, the prefectural seat. The northern part of Vakaga, around Birao, with an average temperature of 80° F (27° C), has a far drier climate than the rest of the country. Rainfall, averaging 34.5 in. (876 mm) per year, falls almost exclusively in the months from May to September.

The land rises from 1,529 ft (465 m) at Birao to more than 4,000 ft on the Sudanese border, reaching 4,462 ft at Mt. Ngaya and 4,422 ft at Mt. Tinga. Vakaga is sparsely inhabited. Sorghum is the staple grain crop. Ground transport is poor—the road between Birao and Ouanda Djallé, the two main towns, is open only seasonally-but both Birao and Ouanda Djallé have air connections with Bangui. Two major game reserves, André Félix National Park in the east and Saint-Floris National Park in the west, are noted for their antelope, elephants, giraffes, hippopotamuses, lions, panthers, and other large mammals. The area of Vakaga is 17,934 sq mi (46,450 sq km). Pop. (1975) 21,391.

Vākātaka DYNASTY, Indian ruling house originating in the central Deccan in the mid-3rd century AD, the empire of which is believed to have extended from Malwa and Guiarāt in the north to the Tungabhadra in the south and from the Arabian Sea in the west to the Bay of Bengal in the east. The Vakatakas, like many of the contemporary dynasties of the Deccan, claimed Brahmanical origin. Little is known, however, about Vindhyaśakti (c. AD 250-270), the founder of the family. Territorial expansion began in the reign of his son Pravarasena I, who came to the throne c. 270 and reached the Narmada in the north by annexing the kingdom of Purikā.

Pravarasena's kingdom was partitioned after his death. The main line continued with Rudrasena I (c. 330), his son Pṛthvīṣeṇa I (c. 350), and Pṛthvīṣeṇa's son Rudrasena II 400). In the period of Prthvisena the Vākātakas came into contact with the powerful Gupta family of North India, which was making a bid to expand in the west at the expense of the Western Ksatrapas. Because of its territorial position, the Vākāṭaka family was recognized as a useful ally; Prabhāvatī Gupta, the daughter of Candra Gupta II, was married to Rudrasena II. In this period, Gupta impact was significant in Vākātaka polity and culture. Rudrasena's death was followed by a lengthy regency of Prabhāvatī Guptā during the minority of her sons Divākarasena and Dāmodarasena. After the Guptas became involved in a war against the Hūnas, the Vākātaka dynasty was free to expand in central India, and in the period of Narendrasena (c. 450-470), son of Pravarasena II, Vākātaka influence spread to such central Indian states as Kosala, Mekala, and Malava. This power, however, ultimately brought the Vākātakas into conflict with the Nalas and caused a setback to the family. Its power was temporarily revived in the reign of Prthvisena II, the last known king of the line, who acceded to the throne c. 470.

Apart from this senior line was the Vatsagulma (Bāsim, in Akola district) line, which branched off after Pravarasena I and occupied the area between the Indhyādri Range and the Godāvari River. The Vākāṭakas are noted for having encouraged arts and letters.

Vākhān, also called wākhān, or wakhan corridor, a mountainous region and panhandle in the Pamir Mountains of northeast Afghanistan. Since the demarcation of the frontier (1895–96), it has formed a political buffer between Russian Turkistan, British India, and China. In mid-1981 the Soviet army occupied the corridor as part of their military intervention in Afghanistan and most of the Vākhān's residents fled to Pakistan. The Vākhān River flows from west to east for 100 mi (160 km) joining the Pamir River near Qal'ehye Nīāz Beyg, the main village.

Vakhtangov, Yevgeny (b. Feb. 13 [Feb. 1, old style], 1883, Vladikavkaz, Russian Empire—d. May 29, 1922, Moscow), Russian theatrical director of the Moscow Art Theatre. A pupil of Konstantin Stanislavsky, he succeeded by the early 1920s in reconciling the Naturalistic acting techniques of his master with the bold experiments of Vsevolod Y. Meyerhold. His departure from Naturalism in the direction of greater theatricality gave rise to some of the most original productions of the Russian post-Revolutionary theatre. In 1920 he took charge of the Third Workshop, a subsidiary studio of the Moscow Art Theatre, and gradually led that company toward a "fantastic realism." He made use of masks, music, dance, and boldly abstract costume and scenery design in pursuit of a theatre that would offer the popular audience dreams, fantasy, and satire rather than a mirror of itself.

As director, simultaneously, of the Habima Theatre, he found in Jewish folklore a further field for the exercise of whimsy and grotesquerie. The Dybbuk, S. Ansky's tale of demoniac possession, was a particular success (1922). While far less extreme than Meyerhold, Vakhtangov did not hesitate to realize bold new interpretations. In his brilliant production of Carlo Gozzi's Chinese fairy tale Turandot, he introduced commedia dell'arte techniques and had actors dress and make up on the stage and stagehands change sets in view of the audience. The production of *Tu-randot*, begun when Vakhtangov was fatally ill, was nevertheless infused with the gaiety, charm, and optimistic humanity that were characteristic of his work. After the dress rehearsal he was confined to bed and died three months later at 39. The Third Workshop was renamed the Vakhtangov Theatre. Ruben Simonov's Stanislavsky's Protege (1969) is an English translation of a memoir and rehearsal log by a pupil who later headed the Vakhtangov Theatre.

väki, supernatural power believed by the Baltic Finns to reside in those natural sites, objects, and animals that for various reasons attracted popular attention and inspired strong emotional attachments. Väki was often conceived of as an impersonal power, akin to the Polynesian mana, but it also referred to the agents of the power, diffuse spiritual entities that frequent natural sites or man-made places, such as cemeteries or other religious locales that evoked strong emotional reactions. People with special gifts, seers, were able to see the true nature of these powers, more specifically, the individual spiritual entities that constituted what was generally conceived as a vague impersonal power.

Val-de-Marne, département, Île-de-France region, northern France, bordering the southeast limits of Paris. With an area of 94 sq mi (244 sq km), it was created in 1964 as part of the administrative reorganization of Greater Paris. Val-de-Marne comprises the southeast portion of the former Seine département and a few communes of the former Seine-et-Oise département, which themselves were originally created in 1790 out of the old province of Île-de-France (q.v.).

The northeast embraces the residential urban centres in and around the great S bend of the Marne River and the area of the confluence with the Seine, which bisects the département from south to north. The Marne, which is still popular for boating, is also an important commercial waterway. Both banks of the Seine are heavily industrialized. Market (truck) gardens scattered among the built-up areas produce quantities of vegetables. The southeast part of the département consists of woods and agricultural land. A large part of Orly Airport is in Val-de-Marne, though its terminal is in the neighbouring Essonne département. Adjoining the airport at Rungis is the Paris central produce market, moved from Les Halles in the centre of the city. The produce market and the airport are served by a branch of the Autoroute de Sud, the main French motorway, which crosses the *département* north-south.

The north part of Val-de-Marne includes Vincennes, and the southeast embraces the late 16th-century château and park of Gros Bois. The *département* has two *arrondissements*—Créteil, the capital, which occupies a central position, and Nogent-sur-Marne. Val-de-Marne is in the educational division of Paris. Pop. (1982) 1,193,655.

Val-d'Oise, département, Île-de-France region, embracing the northern outer suburbs of Paris. Occupying an oblong area of 482 sq mi (1,249 sq km), the département extends from the northeast of Paris to the border of Normandy. It was created in 1964 from the northern part of the Seine-et-Oise département, which in 1790 was formed from portions of the historic province of Île-de-France.

The Oise River crosses the *département* from northeast to southwest, flowing through Pontoise, the capital, and joining the Seine River just south of the border. The Seine, in its northern meanders, flows three times along the southern departmental border. The short western boundary is bordered by the Epte River. The climate is equable and the rainfall moderate.

In the early 1970s the urban spread of Paris was continuing to encroach upon the eastern half of the *département*, much of which is covered by the hilly forests of Montmorency, L'Isle-Adam, and Carnelle; but agriculture persisted in the western half, being chiefly devoted to cereals. Mushrooms are grown on a large scale in limestone caves between Pontoise and Montmorency. Auvers-sur-Oise, which inspired several artists, including the 19th-century Dutch painter Vincent van Gogh, is an attraction for tourists. Enghien-les-Bains is the nearest spa to Paris.

The southeastern area of the *département*, particularly the area of Argenteuil, made famous by Impressionist artists, is heavily industrialized. The southeast corner includes part of the Paris airport of Le Bourget. The Autoroute du Nord, one of the main French motorways, runs within the eastern departmental border. The *département* is divided into the *arrondissements* of Cergy, Pontoise, Argenteuil, and Montmorency. It is in the educational division of Paris. Pop. (1982) 920,598.

Val-d'Or, town, Nord-Ouest (Northwest) region, western Quebec province, Canada, near Lakes Blouin, de Montigny, and Lemoine. Although the name means "valley of gold," there is no valley in the vicinity. Founded by miners in 1934, its economy depends chiefly on mining (gold, molybdenum, zinc, lead, and copper) and lumbering. Val-d'Or is also a

base for the hunting and fishing of the Abitibi country, and the north entrance to La Vérendrye Provincial Park is about 25 mi (40 km) south. A civil and military airport is located immediately south, at Bourlamaque. Inc. village, 1935; town, 1937. Pop. (1981) 21,371.

Valabhī, city of ancient India, capital of the Maitraka dynasty in the 5th-8th centuries AD, situated on an inlet of the Gulf of Cambay, northwest of the port of Bhavnagar, in Saurāṣtra (later Gujarāt), India. The city is thought to have been established c. AD 470 by the founder of the dynasty, Senāpati Bhaṭārka, following the breakup of the Gupta Empire. It continued as capital until c. 780, when it suddenly and unaccountably disappeared from history. It apparently survived the Arab invasions of Saurāṣtra in c. 725-735.

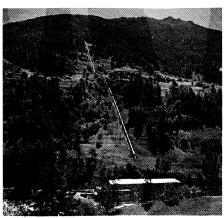

Valabhī was a celebrated centre of learning, with numerous Buddhist monasteries. It was visited by the Chinese pilgrim Hsüan-tsang in the middle of the 7th century and by I-ching at the century's close. The latter described it as equalling the fame of Nālandā in Bihār. According to a Jaina tradition, the second Jaina Council was held in Valabhī in the 5th or 6th century AD; at this council the Jaina scriptures assumed their present form. The city has now vanished, but it is identified with a village, Vala, where numerous copperplate inscriptions and seals of the Maitrakas have been found.

Valachi, Joseph (Michael) (b. Sept. 22, 1904, New York City—d. April 3, 1971, La Tuna Federal Correctional Institution, Texas, U.S.), U.S. gangster, member of Lucky Luciano's mob family, who turned informer in 1962.

Valachi was a low-level "soldier." with interests chiefly in the numbers rackets and other gambling from the 1930s to the 1950s. In 1959 he was convicted of narcotics violations and sentenced to 15 years in prison. In June 1962, in the federal prison at Atlanta, Ga., crime boss Vito Genovese, a fellow inmate, suspecting him (incorrectly) of having become an informer, gave him the kiss of death (a sign that he was to be killed). Valachi panicked, killed a fellow prisoner who he mistakenly thought was his assassin, and, with feelings of revenge, told all to the U.S. Bureau of Narcotics and Dangerous Drugs, the FBI, the Justice Department, and the U.S. Senate Permanent Subcommittee on Investigations, headed by John L. McClellan. Valachi was the first syndicate member ever to describe the history, membership, and inner workings of the national crime cartel popularly called the Mafia what Valachi termed La Cosa Nostra ("Our Thing"). Robert Kennedy called his testimony the "biggest single intelligence breakthrough yet in combatting organized crime and rack-eteering in the United States." Investigations, indictments, and convictions mushroomed in the years to follow.

His memoirs were published as *The Valachi Papers* (1968), by Peter Maas.

Valais (French), German wallis, canton, southern Switzerland, bordering on Italy to the south and France to the west and bounded by the cantons of Vaud and Bern on the north and Uri and Ticino on the east. Its area of 2,018 sq mi (5,226 sq km) includes the valley of the upper Rhône, from its source at the Rhône Glacier to its mouth on Lake Geneva (Lac Léman); the valley runs from east to west, then, in a right angle at Martigny, from southeast to northwest. From just above Saint-Maurice, the Rhône's right bank belongs to Vaud. The mountain chains of the Bernese and the Pennine Alps border the valley, and on each side lateral valleys open; those of the south are spread out and inhabited and those of the north are steep and largely uninhabited, with the exception of the Lötschental (Lötschen Valley) and Leukerbad (Loeche-les-Bains).

Electric power station near Vissoie in the Anniviers Valley, Valais canton, Switzerland

Inhabited in prehistoric times, the region first appeared in the account of Julius Caesar's conquest of the Celts at Octodurum (Martigny) c. 57 BC. It was originally called Vallis Poenina (Upper Rhône Valley). Part of the kingdom of Jurane Burgundy from 888, Valais was granted in 999 by King Rudolf III of Burgundy to the bishop of Sion, who became prefect, count of Valais, and later prince-bishop. Subsequent history was mostly related to the struggles of the patriots against their episcopal overlords and of the bishops against the dukes of Savoy, who coveted their land. Efforts to Protestantize Valais during the Reformation were unsuccessful. The princebishops retained their power until the revolution of 1798, when Valais became part of the Helvetic Republic. For strategic reasons, Napoleon made Valais the independent Rhodanic Republic in 1802 and incorporated it into France as the *département* of Simplon in 1810. In 1815 Valais entered the Swiss Confederation. Although it took part in the conservative Sonderbund (Catholic separatist league) in 1845, it did not fight but submitted to federal forces in 1847.

The canton is thinly populated, with no major cities; Sion (q.v.) is the capital and major town. Of the total territory, only about half is productive, with mountain pasture, glaciers, and forest covering the rest. Valais has a pleasant summer temperature and at least 50 peaks (notably the Matterhorn) exceeding 13,-000 ft (4,000 m), both factors contributing to the economic importance of the resort and tourist industries. Although Valaisan agriculture remains largely traditional, milk is carried by pipelines from high pastures to the central dairies. The formerly marshy plain of the Rhône has been transformed into the finest orchard in Switzerland, one of the few areas in the country in which apricots are grown. Large hydroelectric plants produce a quarter of the nation's power; the largest dam in west-ern Europe (at 7,756 ft above sea level, the highest gravity dam in the world), the Grande Dixence, is in the Val d'Hérens. Metal products and chemicals are manufactured, with plants near Sierre, at Visp, and at Monthey. An oil refinery is located at Collombey-Muraz. The canton is served by an airport and 10 railways and by roads extending through all the valleys, over the plateaus, and through the famous Simplon, Great St. Bernard, and Grimsel passes. Cableways are numerous as a means of transport. The highest cableway in Europe, to the Klein-Matterhorn, 2.4 mi (3.8) km) long and reaching an elevation of 12,533 ft, began operation in 1980. The population is about two-thirds French speaking and onethird German speaking and more than 90 percent Roman Catholic. Pop. (1983 est.) 224,-550.

Valanginian stage, standard, worldwide division of Early Cretaceous rocks and time (the Cretaceous period began about 144,000,000 years ago and lasted about 77,600,000 years). Rocks of the Valanginian stage overlie those of the Berriasian and underlie those of the Hauterivian stage. In Great Britain and elsewhere in northern Europe, the Valanginian is represented by portions of the Wealden Beds; limestones dominate the Valanginian of the Swiss Alps and the Middle East. The Valanginian is characterized by sandstones in India, Australia, Japan, Mongolia, and northern Siberia. Shales occur in New Zealand, parts of Mongolia, and North Africa. The Valanginian has been divided into three zones, characterized by distinctive fossil ammonite cephalopods (mollusks).

Valaorítis, Aristotélis (b. Aug. 2, 1824, Leucas island, Greece—d. July 24, 1879, Leucas island), Greek poet and statesman who was memorable chiefly for the ardent patriotism he displayed both in his poetry and in his political career.

Valaoritis was educated in Leucas and at Geneva, Paris, and Pisa (1842–48) and also travelled widely in England and Germany. He returned to Leucas in 1850 and took a prominent part in the union of the Ionian Islands with Greece (1863). He then entered Greek politics but retired in 1869, after the failure of the Cretan Revolution.

His early collection of *Stichourgemata* ("Versifications") appeared in 1847. In 1857 his Mnemosyna ("Memorials"), was published and was later much expanded. His longer poems, Kyra Phrosini (1859) as well as Athanases Diakos and Astrapoyiannos (1867), deal with recent events in Greek history. His unfinished Phōteinos, set in the 14th century, appeared posthumously (1891). Valaoritis was a fluent and gifted versifier in the spoken language used by the Ionian school; but his romantic fervour, inspired especially by admiration of Victor Hugo and by his own ardent patriotism, put no restraint on his exuberance, and much, though by no means all, of his work suffers from lack of condensation and selfcriticism.

Valdai Hills, Russian VALDAYSKAYA VOZ-VYSHENNOST, upland region running northsouth, about midway between Leningrad and Moscow, Russian Soviet Federated Socialist Republic. The hills are a northward extension of the Central Russian Upland. The ridge is underlain by projections of strata over which have been deposited glacial materials in the form of terminal moraines and other detritus. They reach a height, near Vyshny Volochok, of 1,125 ft (343 m). Toward the west the hills decline steeply toward the Lake Ilmen lowland, but there is no distinct boundary on the east.

The uplands form the watershed between the basins of the Volga and Western Dvina rivers and the Ilmen plain; in the Middle Ages they were an important portage region between the rivers. At Vyshny Volochok the first canal in Russia was built, in 1708.

DENMARK

• Valdemar I, byname VALDEMAR THE GREAT, Danish VALDEMAR DEN STORE (b. Jan. 14, 1131, Denmark—d. May 12, 1182, Denmark), king of Denmark (1157–82) who ended the Wend (Slav) threat to Danish shipping, won independence from the Holy Roman Emperor, and gained church approval for hereditary rule by his dynasty, the Valdemars.

The son of Knud Lavard, duke of South

Jutland, and a great-grandson of the Danish king Sweyn II, Valdemar gained sole possession of the monarchy, concluding more than

25 years of civil wars waged by competing contenders for the throne. He soon began a series of expeditions against the Wends, aided by his foster brother Absalon, whom he made bishop of Roskilde. By 1169 his forces had captured the Wendish stronghold of Rügen (now in Germany), which was incorporated into the diocese of Roskilde, and had stormed the Wend sanctuary at Arcona. A year later, however, he was forced to divide his gains with his ally Henry the Lion, duke of Saxony.

Valdemar acknowledged the overlordship of the Holy Roman emperor Frederick I Barbarossa and accepted his antipope Victor IV (or V), leading Denmark's chief prelate Eskil, archbishop of Lund, to choose exile rather than oppose Pope Alexander III. After Valdemar and Bishop Absalon reneged and acknowledged Alexander in c. 1165, Eskil returned to Denmark, confirmed the canonization of the King's father, and anointed his son Canute IV as joint king (1170), inaugurating the hereditary rule of the Valdemars and vitiating the overlordship of Frederick I.

After sponsoring improvements in Danish fortifications and armed forces to defend against a possible German attack, Valdemar was able to ally with Frederick I in 1181 on virtually an equal footing. The alliance was strengthened by the marriage of Valdemar's daughter to a son of Frederick. Valdemar's strong rule provoked several rebellions that proved unsuccessful; the most serious (1180) was caused by the policies of Absalon, archbishop of Lund after 1177. The uprising was repressed by Valdemar in 1181.

Valdemar II, byname VALDEMAR THE VICTORIOUS, Danish VALDEMAR SEJR (b. 1170, Denmark—d. March 28, 1241, Denmark), king of Denmark (1202–41) who, between 1200 and 1219, extended the Danish Baltic

empire from Schleswig in the west to include lands as far east as Estonia. In his later years he worked to unify Denmark's legal and ad-

ministrative systems.

The son and brother, respectively, of the Danish kings Valdemar I and Canute IV, Valdemar acted as the duke of Schleswig from 1188 and conquered Holstein (North Albingia) and Hamburg (1200–01). Succeeding to the throne in 1202, he initially supported the Welf candidate for the office of Holy Roman emperor, Otto IV, who in turn recognized Valdemar's sovereignty in Holstein. Valdemar later broke with Otto, defeated a Welf coalition (1214), and supported Otto's rival, the future emperor Frederick II, who yielded to Valdemar the Wendish (Slavic) lands and the German territory north of the Elbe and Elde rivers.

Active from 1206 in crusades to Christianize the eastern Baltic region, Valdemar launched a campaign in Estonia in 1219, aided by the Knights of the Sword, Bishop Albert of Riga. and a Wendish navy. After his victory at Reval (Tallinn), Valdemar ruled over all of Estonia, and the country was divided into two bishoprics, Reval and Dorpat (Tartu), Conflicts with his allies led to a reapportionment of the Estonian dominions (1222), after which he retained only Reval and northern Estonia.

Shortly after crowning his son Valdemar as joint king (1218) to perpetuate his dynasty's control over the vast Danish empire, Valdemar was surprised, captured, and imprisoned with his son by Count Heinrich of Schwerin (in northeast Germany) and held until 1225, his Danish and German vassals failing to come to his aid. After prolonged negotiations, he agreed to retain only Rügen and Estonia beyond the Baltic as a condition of release; in addition, he surrendered his sons and many hostages and paid a heavy ransom. In 1227 he launched a counteroffensive but was decisively defeated at Bornhöved, and his North German empire was finished. Danish sovereignty was also challenged in Estonia, but by an agreement with the Knights of the Sword (1238), Valdemar retained his possessions there.

Despite his foreign reverses, Valdemar's rule in Denmark was strong. He carried through domestic reforms, completing the reorganization of the Danish army begun by Valdemar I and granting landed peasants exemption from taxes in return for knight service. He effectively controlled the church and the nobility, reformed the legal code, and changed the legislative system to enlarge monarchical power, as described in his revised Law of Jutland (1241). His division of Denmark into large feudal estates, each controlled by one of his sons, contributed to the destructive competition for power after his death.

Denmark (1340-75) who united his country under his own rule after a brief period of alien domination. His aggressive foreign policy led to conflict with Sweden, North German principalities, and the North German trading centres of the Hanseatic League.

A son of King Christopher II, Valdemar lived after 1328 at the court of Louis IV the Bavarian, Holy Roman emperor. In 1338 he left the imperial court, and, with the aid of the Emperor and of Louis, margrave of Brandenburg, he began a diplomatic offensive to wrest sovereignty in Denmark from Gerhard and John the Mild, counts of Holstein. After the assassination of Gerhard in April 1340, Valdemar reached an agreement with John and was recognized as king of Denmark.

Through his marriage to Helvig, sister of Valdemar, duke of Slesvig (Schleswig), Valdemar Atterdag obtained northern Jutland and extended his control to the remainder of the alienated Danish lands. Using money raised by increasing taxes and by his sale (1346) of Estonia, he had by 1349 established control of Zealand and large areas of Funen and Jutland. Also in 1349 he intervened in North German politics, opposing the attempt of the German king Charles IV (Holy Roman emperor after 1355) to remove Valdemar's ally Louis of Brandenburg and to take Rügen and Rostock from Danish control. After liberating Louis's lands as far as Berlin, Valdemar reconciled Charles with Louis (1350) and reaffirmed Danish sovereignty in Rügen and Rostock.

On returning to Denmark, Valdemar faced a revolt (1350) by leading Jutland magnates, aided by the counts of Holstein; it was the first of a series of uprisings challenging the formidable personal rule that he had established. After all the outbreaks had been quelled, a parliament met at Kalundborg 1360) to consolidate the peace and to define the reciprocal rights and obligations of the ruler and his subjects.

Valdemar completed his reunification of his father's kingdom in 1360 by regaining Skåne from Sweden. The following year he conquered Gotland, including its wealthy town of Visby. He thus gained a strong foothold in the Baltic trade and aroused the opposition of a powerful coalition of the Hanseatic League, Sweden, Mecklenburg, Holstein, and the dissident Jutland nobles. After the coalition's forces severely defeated him in 1368, Valdemar was forced to accept the Treaty of Stralsund (1370), by which the Hanseatic towns were granted commercial privileges but the Danish kingdom remained intact. The marriage of his daughter Margaret to the Norwegian king Haakon VI in 1363 made possible the unification of Denmark and Norway, which lasted from 1380 until 1814.

SWEDEN

• Valdemar Birgersson (b. 1243—d. Dec. 26, 1302), king of Sweden (1250–75) who governed jointly with his father Birger Jarl (q.v.) until the latter's death in 1266 and then reigned alone. Because of an extramarital affair with his wife's sister, a postulant nun, by whom he had a child, Valdemar in 1274 made a pilgrimage to Rome to gain forgiveness. Pope Gregory X exacted concessions, whereby Valdemar acknowledged papal overlordship and the responsibility to send taxes to Rome; and these concessions inspired Valdemar's brothers to rebel. By 1275, Magnus, the next in line, had made himself king (as Magnus I). Valdemar, defeated in battle, fled into exile in Norway, where he continued unsuccessfully for many years to hatch conspiracies to regain the throne.

Valdenses (religious movement): see Waldenses.

Valdepeñas, city, Ciudad Real province, in the autonomous community (region) of Castile-La Mancha, south central Spain. The city lies on the left bank of the Río Jabalón, southeast of the city of Ciudad Real. Situated in a fertile area of La Mancha plain, it is the centre of a grape-growing district, the wines of which are among the most popular in Spain. Related industries are vinegar making, liquor distilling, and barrel making. The city has a large number of wine cellars (bodegas). Its Gothic Church of the Assumption was originally a mosque. Pop. (1981) 24,946.

Valdés, Alfonso de (b. 1490?, Cuenca, Spain—d. Oct. 3?, 1532, Vienna), Humanist satirist, one of the most influential and cultured thinkers in Spain of the early 16th century and twin brother of Juan de Valdés.

Valdes may have studied at the University of Alcalá before joining the court of the emperor Charles V as a secretary and official Latinist. Valdés held important positions at the Diet of Worms, where he worked for reconciliation between Martin Luther and the church, and at the Diet of Regensburg. He was named to the post of archivist in Naples but died of the plague in Vienna before he could assume the position. His principal works are the *Diálogo* de Mercurio y Carón ("Dialogue of Mercury and Charon") and the Diálogo de las cosas ocurridas en Roma (c. 1529; "The Dialogue of What Happened at Rome"), which express his loyalty to the emperor and his devotion to the Humanist ideals of Erasmus, whose disciple and correspondent he was. In both he justified imperial policy and criticized the foes of a purified religion.

Valdés, Juan de (b. 1490?, Cuenca, Spaind. May 1541, Naples), Spanish Humanist. He and his twin brother, Alfonso, were members of an influential intellectual family that played significant roles in the religious, political, and literary life of Spain and its empire.

Juan studied under Spain's leading Humanists and developed religious views that closely followed the ideas of Erasmus of Rotterdam, with whom both he and his brother maintained a correspondence. His work Diálogo de la doctrina cristiana (1529: "Dialogue on Christian Doctrine") was not well received by the Inquisition, and Valdés found it prudent to leave Spain. Accepting a post from the emperor Charles V, he spent the rest of his life in Italy but wrote in Spanish for his Italian public. The *Diálogo de la lengua* (c. 1535; "Dialogue on the Language"), which circulated only in manuscript until the 18th century, treated of Spanish style and language with that blend of wit, grace, learning, and common sense that characterizes Humanism at its best.

Valdés Leal, Juan de Nisa (b. May 4, 1622, Seville-d. Oct. 15, 1690, Seville), painter, president of the Seville Academy, and the maior figure in Sevillian painting for many years, known for his dramatic, inventive, and often

violent paintings.

His father was Portuguese, and he was educated in Córdoba under the guidance of Antonio del Castillo and worked there until 1653. For the next few years he painted both in Córdoba and Seville. Moving to the latter city in 1656, he became in 1660 an original member of the Academy there (founded by Murillo), and later (1663-66) he served as its president. After the death of Murillo he was the principal painter in Seville.

In his early work he was markedly influenced by Francisco de Herrera the Elder and by Castillo. Paintings such as the "St. Andrew" of 1645 (San Francisco, Córdoba) and "La Vírgen de los Plateros" (Museo Provincial de Bellas Artes, Córdoba) are marked by their exotic colours, dramatic lighting, and vigorous brushstrokes. The paintings from Seville show even more clearly elements that prefigure the Spanish Rococo: hectic movement, immaterial forms, and brilliant colouring. Influenced in this period both by Seville painters and by Herrera the Younger and Madrid painters, he produced such works as the "Vanitas" (1660), the "Finis Gloriae Mundi" and the "Triumph of Death" (1660 and 1672), and "Jesus Disputing with the Doctors" (1686), all characterized by their macabre subject matter, dynamic energy, and theatrical violence. The violence of his subjects has often distracted attention from the inventiveness of his execution.

Valdez, city, southeastern Alaska, U.S. It is the northernmost all-year port in North America and lies on Prince William Sound. Formerly known as Copper City, it was named in 1898 for its harbour (explored and named by Spaniards in 1790) when it became a gateway for the Yukon goldfields. It is a port of entry and the southern terminal for the trans-Alaskan pipeline from Prudhoe Bay. The petroleum industry is the main economic activity, supplemented by mining, tourism (hunting and fishing), and fur farming. After it was severely damaged in 1964 by the Alaskan earthquake, the town was rebuilt 5 miles (8 km) west on safer ground. The Columbia Glacier is nearby. Valdez was the principal settlement affected when the oil tanker Exxon Valdez ran aground in Prince William Sound on March 24, 1989, in what was the largest oil spill in U.S. history. Inc. 1901. Pop. (1986 est.) 3,560.

Valdivia, capital of Valdivia provincia, Los Lagos región, southern Chile. It lies at the confluence of the Callecalle and Cruces rivers, which there form the Valdivia River, 11 miles (18 km) from the Pacific Ocean. Although it was founded in 1552 and was a strategically significant outpost during the colonial era, Valdivia did not flourish until after the mid-19th century, when a large influx of German settlers introduced capital and new skills into the local economic life. The city's commercial and administrative heart, on the Valdivia River's south bank, is flanked by residential districts, railroad shops, and factories (foodstuffs, leather, lumber products, metal fabricating), and boatyards. Linked to the city by two bridges are a north-bank industrial neighbourhood, the Southern University of Chile (founded 1954), an airport, and fairgrounds. The preponderance of frame and corrugated metal buildings gives Valdivia a pioneer-city appearance. Almost all of its important maritime trade is by barge to or from the seaport of Corral, at the mouth of the Valdivia River. Both Valdivia and Corral were severely damaged in the 1960 earthquake and tidal wave. Pop. (1987 est.) mun, 117,205.

Valdivia, Pedro de (b. c. 1498, Extremadura, Spain—d. January 1554, Tucapel, Chile), conqueror and governor of Chile for Spain and founder of the cities of Santiago and Concepción.

Valdivia served with the Spanish army in Italy and Flanders before being sent to South America in 1534. During the Peruvian civil

war (1538), he fought with Francisco Pizarro against Diego de Almagro. For the Chilean expedition, Valdivia took charge (1540) of a force of 150 Spaniards (including his mistress, Inés Suárez) and some Indian allies. He marched across the coastal desert of northern Chile, defeated a large force of Indians in the valley of Chile, and, on Feb. 12, 1541, founded Santiago. In 1546 he extended Spanish rule south to the Bío-Bío River. After fighting in Peru for two years, Valdivia returned to Chile as governor. In 1550 he began to conquer Chile south of the Bío-Bío and founded the city of Concepción. He was killed in the course of a campaign directed against the Araucanian Indians.

Valdosta, city, seat (1860) of Lowndes county, southern Georgia, U.S. Troupville, the original town and county seat (1825), was moved 4 miles (6 km) east in 1859 to the present site to be on the right-of-way of the area's first railroad. The new town was named for Georgia governor George M. Troup's plantation, Valle d'Aosta (the name of an Italian region). Valdosta is a rail and commercial centre for tobacco, timber, and cattle with diversified manufacturing. It is an important inland naval stores market, especially for turpentine. Tourism (based on numerous small fishing lakes to the south), and Moody Air Force Base, 12 miles (19 km) north, also contribute to the economy. Valdosta State College was established in 1906. Inc. town, 1860; city, 1901. Pop. (1988 est.) 37,927.

Vale of Glamorgan, district, South Glamorgan county, southern Wales. It was created in 1974, covers an area of 114 square miles (296 square km), and extends along the Bristol Channel the length of the South Wales coastline between Penarth Head and Nash point. The rectangular layout of the town of Cowbridge in the centre of the Vale, together with the discovery of Roman coins nearby, suggests that the Roman military station of Bovium may have been located there. The Normans built substantial fortifications at both Cowbridge and the coastal town of Barry. The region's most significant industrial growth occurred in the 1880s, when massive docks were built at Barry to export coal mined in the Rhondda valley and other valleys to the north.

Modern Barry is both the industrial centre and the administrative seat of the district, and chemical industries have grown to the east of the port. Agriculture is the main economic activity throughout the inland Vale, and Cowbridge serves as the market centre. The emphasis is on the rearing of beef and dairy cattle. Barry Island is a popular tourist resort, and the town of Penarth functions as both a resort and as a residential area for workers who commute to Cardiff. The Turner House Art Gallery in Penarth is part of the National Museum of Wales. The M4 Motorway extends along the district's northern border, and the Rhoose (Cardiff) airport is located just west of Barry. Pop. (1986 est.) 116,100.

Vale of White Horse, district, county of Oxfordshire, England, covering 224 square miles (581 square km) in the southwest of the county. Its principal feature is a rich clay valley that lies north of the chalk downs of Berkshire. The vale stretches 17 miles (27 km) from Shrivenham to Abingdon and is drained by the River Ock, a tributary of the Thames. At Uffington the hills reach an elevation of 856 feet (285 m) in Whitehorse Hill, on which a gigantic figure (374 feet [114 m] long) of a horse is cut, the turf having been removed to reveal the white, chalky subsoil. It is of unknown origin and date but is certainly prehistoric. A number of other prehistoric remains occur in the vicinity, including the megalith (large standing stone) known as Wayland's Smithy. A prehistoric grassy track, the Ridge

Way (one of the best walks in England), follows the crest of the hills. Other ancient tracks follow the foot of the escarpment, which is marked by a series of spring-line villages; in the centre is Wantage, the ancient market town that is said to be the birthplace (849) of Alfred the Great.

In addition to the vale itself, the predominantly rural district takes in the northern slopes of the Berkshire Downs and a considerable frontage on the River Thames. Abingdon, where the Ock flows into the Thames, is the site of the district's main administrative offices and is the largest town. The Atomic Energy Authority and the Agricultural Research Council maintain research establishments in the district, and automobiles and surgical instruments are manufactured. Pop. (1986 est.) 110,400.

Vale Royal, district, county of Cheshire, England, named for a great Cistercian abbey built by Edward I near the present village of Whitegate. The district, with an area of 148 square miles (384 square km), is centred on the Cheshire salt field in the middle of the county. The two main towns, Winsford and Northwich, were both founded on salt production. Northwich was important for salt in Roman times. In the 18th and 19th centuries uncontrolled extraction of salt caused much subsidence both in the countryside and among the buildings of Northwich. The modern chemical industry of Northwich, the main source of employment in the district, is based on brine products. Winsford is famous for its rock-salt mine, the only one still in production in the county, although extraction has declined. The district has abundant agricultural land that is especially important for dairying. In the west, Delamere Forest, the remnant of a great medieval hunting ground, is an important recreational area. Pop. (1986 est.) 113,500.

Valence, town, capital of Drôme département, Rhône-Alpes region, southeastern France, on the left bank of the Rhône River. Built on a succession of terraces bordering the Rhône, it is dominated by the ancient Cathedral of Saint-Apollinaire, which was consecrated by Pope Urban II in 1095 and completed early in the 12th century. Damage done during the Wars of Religion (1569–98) was repaired in the 17th century. The Champ de Mars, a vast esplanade south of the cathedral, offers a fine view of the Rhône valley. Valence probably became a bishopric in the 4th century and was ruled by its bishops until Louis XI in 1450 persuaded them to give up their temporal power in exchange for royal protection and a university (suppressed after the French Revolution).

Valence is a prosperous commercial centre for the fruit and vegetable products of the Rhône valley and has numerous industries, including jewelry, textiles, and metallurgy. Pop. (1982) 64,942.

valence, also spelled VALENCY, in chemistry, the property of an element that determines the number of other atoms with which an atom of the element can combine. Introduced in 1868, the term is used to express both the power of combination of an element in general and the numerical value of the power of combination

The explanation and the systematization of valence was a major challenge to 19th-century chemists. In the absence of any satisfactory theory of its cause, most of the effort centred on devising empirical rules for determining the valencies of the elements. Characteristic valencies for the elements were measured in terms of the number of atoms of hydrogen with which an atom of the element can com-

bine or that it can replace in a compound. It became evident, however, that the valences of many elements vary in different compounds. The first great step in the development of a satisfactory explanation of valence and chemical combination was made by the American chemist G.N. Lewis (1916) with the identification of the chemical bond of organic compounds with a pair of electrons held jointly by two atoms and serving to hold them together. In the same year, the nature of the chemical bond between electrically charged atoms (ions) was discussed by German physicist W. Kossel. After the development of the detailed electronic theory of the periodic system of the elements, the theory of valence was reformulated in terms of electronic structures and interatomic forces. This situation led to the introduction of several new conceptsionic valence, covalence, oxidation number, coordination number, metallic valence-corresponding to different modes of interaction of atoms.

valence electron, any of the fundamental negatively charged particles in the outermost region of atoms that enters into the formation of chemical bonds. Whatever the type of chemical bond (ionic, covalent, metallic) between atoms, changes in the atomic structure are restricted to the outermost, or valence, electrons. They are more weakly attracted to the positive atomic nucleus than are the inner electrons and thus can be shared or transferred in the process of bonding with adjacent atoms. Valence electrons are also involved in the conduction of electric current in metals and semiconductors.

Valencia, medieval kingdom of Spain, alternately Muslim and independent from 1010 to 1238 and thereafter held by the kings of Aragon. Though its territory varied, it generally comprised the modern provinces of Alicante, Castellón, and Valencia.

When Umayyad power in Moorish Spain disintegrated in the reign of Hisham II (1010), Valencia eventually came to be ruled by 'Abd al-Aziz al-Mansūr (reigned 1021-61), grandson of the famous Cordoban caliph of that name. Stabilized by the protection of the caliphs of Córdoba and by friendship with Christian princes, his reign marks a period of peace and prosperity. However, his successor, a minor, 'Abd al-Malik (reigned 1061-65), was attacked by Ferdinand I of Castile and Leon, who missed capturing Valencia but inflicted such a defeat on its defenders that they sought protection from al-Ma'mun, the ruler of Toledo. Al-Ma'mun deposed the minor, and for the next 10 years (1065-75) Valencia formed part of his domains.

The effeminacy of al-Qādir, al-Ma'mun's successor, permitted the Valencians to reassert their independence under the leadership of the Toledan governor, Abū Bakr, who allied himself with Alfonso VI of Leon and Castile. But when the latter took Toledo in 1085, he installed al-Qādir as puppet ruler in Valencia with mercenary support. The following year, when the mercenaries were recalled to stem the Almoravids, al-Qādir was left defenseless before his hostile subjects. Several potentates maneuvered to depose him. The count of Barcelona, allied with the Muslim ruler of Zaragoza (Saragossa), besieged Valencia (1089). To forestall them, Alfonso offered the spoils of the city to the freebooter Rodrigo Díaz de Vivar, called El Cid. On his approach the siege was lifted, but the Cid found it more politic to exact protection money from al-Qadir than to occupy the city. This was forced on him when the Valencians assassinated al-Qādir in 1092 and constituted themselves as a republic under Almoravid protection. The Cid ruled Valencia from 1094 until his death

in 1099. When his widow was forced to relinquish the kingdom to the Almoravids in 1102, the Christians burned the city before evacuating it.

For the next 30 years Valencia was ruled by Almoravid governors; but, in the confused period that preceded the arrival of the Almohads, the city again recovered a measure of independence. The Valencians admitted as their overlords several ephemeral Murcian princelings, until the Valencian Ibn Mardanish seized control of both kingdoms in 1147. This prince, of Spanish origins, aroused popular opposition in Valencia by his alliances with the Christians, and in 1151 the Valencians, with Almohad support, revolted against him. The kingdom remained in the hands of local rulers, vassals of the Almohads, until it fell to James I of Aragon on Sept. 28, 1238. Henceforth, its history fused with that of Aragon.

Valencia, Catalan VALÈNCIA, comunidad autónoma ("autonomous community") of eastern Spain. It encompasses the Spanish levantine provinces of Castellón, Valencia, and Alicante and was established by the statute of autonomy of July 1, 1982.

A brief treatment of Valencia follows. For full treatment, see MACROPAEDIA: Spain.

Valencia (Valentia) was a prosperous area during the Roman Empire and was taken by the Visigoths in the early 5th century AD. In the early 8th century it was captured by the Moors, and in 1021 it became the newly established independent Moorish kingdom of Valencia. The Christian reconquest of the kingdom of Valencia from Muslim rule by the Crown of Aragon was completed by 1245. The kingdom continued to be administered separately under its own parliament and laws; the Furs de Valènica, which were promulgated in 1261, confirmed Valencia's autonomy within the Crown of Aragon. The regional government was formalized as the Generalitat del Regne in 1418 and was nullified in 1707 by the decree of Nueva Planta, which brought the region under the laws and administration prevailing in the rest of Spain.

Various political parties advocating Valencian autonomy came to the fore after World War I. The comunidad autónoma government established in 1982 consists of an executive council, headed by a president, and a unicam-

eral legislative assembly, or cortes.

The Valencia autonomous community is long and narrow and occupies a rough northto-south axis along the Mediterranean Sea, which lies to the east. It is bounded on the north by Catalonia, on the west by Aragon and New Castile, and on the southwest by Murcia. Castellón province occupies the northern part of the Valencia autonomous community, Valencia province is in the centre, and Alicante is the southernmost province. The coastal plains on the Mediterranean side of the autonomous community rise into the Iberian and Baetic mountains on the west. The landscape of the western mountain region is deeply eroded, being subject to violent downpours followed by prolonged droughts; much of the zone has been stripped of a grass cover. Rolling hills predominate in the southernmost province of Alicante, softening the sharp contrast between coastal plain and mountainous hinterlands found elsewhere in Aragon. The most sizable stream in the autonomous community, the Segura River, flows eastward through Alicante province. A Mediterranean climate prevails over the autonomous community, with rainy and mild winters; winters are harsher in the hinterlands. Annual precipitation is low, ranging from 16 to 20 inches (400 to 500 mm), and the agricultural wealth of the coastal plains is based on intensive irrigation. Annual precipitation ranges from 17 inches (430 mm) in the province of Castellón to 11 inches (280 mm) around Elche; the number of months without rain increases from north to south.

The seacoast has been densely populated since the Muslim occupation (714-1245), and the region's rich farmland is subdivided into small farms, or minifundios. The owners of the minifundios form a rural middle class with strong ties to the urban middle class through marriage and social mobility. The population is becoming increasingly concentrated in the coastal cities, making Valencia one of the largest cities in Spain. The development of the urban infrastructure has not kept pace with the growth of the cities, and urban sprawl is reducing the availability of the rich surrounding farmlands.

Intensive irrigation has made the autonomous community one of the richest farmlands in the Mediterranean basin, with individual farms producing from two to four cash crops a year. One-fourth of the land under cultivation is irrigated, with oranges and rice the main crops. The large-scale cultivation of oranges dates from the late 19th century, when rail transport opened up the European market to Valencian produce. Israel, Algeria, and South Africa have subsequently, however, cut into the Valencian share of the world orange market. Rice paddies are widespread, and their exceptionally high yields frequently result in overproduction. One-third of the arable land is dry-farmed, producing traditional Mediterranean crops of grapes and olives.

The structure of the industrial sector closely parallels that of the agricultural sector, with production generally in the hands of small proprietors whose establishments manufacture a wide range of consumer goods, including furniture, candy, shoes, and toys. Factories are widely dispersed, though there is some concentration around the centres of Valencia, Alcoy, Elche, Elda, and Sagunto.

The region's service sector is well-developed, accounting for a large share of the gross domestic product and employing a commensurate portion of the work force. Tourism has expanded considerably, though it is unevenly distributed, favouring Alicante over the other provinces.

There is an unusual degree of marketing cooperation in agriculture and industry, and many cooperatives are found in the region. Catalan has traditionally been the language of the middle class, and a Valencian variant has been discernible since the 15th century. Notable Valencian writers of the early 20th century include Vicente Blasco Ibáñez (d. 1928) and Gabriel Miró (d. 1930); both authors, however, wrote in Castilian.

The traditional middle-class farmstead is the *alqueria*, which is built of stone and features a central passage allowing carts access to an enclosed courtyard behind the living quarters. In the upper story the harvest is stored. The farmstead of the poorer peasant is the *barraca*, which is built of reeds and adobe and roofed with thatch.

There are numerous religious festivals, many of them recalling the Muslim occupation. The gayates, or festivities, of Castellón commemorate the reconquest, while various towns in Valencia and Alicante stage festivals featuring Moors and Christians. The fallas, or festive bonfires, celebrate Valencia's feast day, culminating in the burning of elaborate floats. Pop. (1986 est.) 3,790,164.

Valencia, province, in the comunidad autónoma ("autonomous community") of Valencia, eastern Spain. It is situated along the Mediterranean Sea and has an area of 4,156 square miles (10,763 square km). The province centres on the coastal plain of the Gulf of Valencia; it is limited to the south by

the mountains of northern Alicante and less clearly to the north by the watershed of the Río Turia. Interior plateaus rise westward in a series of faulted steps, representing the edge of the Meseta Central (high tableland), trenched deeply by the gorges of the Río Júcar and its tributary, the Cabriel. Much of the interior is wild, sparsely populated country, opening out onto the lower and richer lands around Requeña and Liria.

The coastal plain (1,244 sq mi [3,222 sq km]) is the largest in eastern Spain, where more than 75 percent of the province's wealth and 80 percent of its population are concentrated. The plain's productivity is the result of extensive irrigation, based upon the rivers and continuously developed and expanded since pre-Roman times. Chief products include oranges on the plain and rice near the coast. Cereals, fruit, and vegetables are also cultivated on the plain, and vines and olives are grown on the hills. Fishing is of some importance on the coast. Industrial development includes construction of a nuclear power plant at Cofrentes, underway in 1980. The capital is Valencia (a, v_{\cdot}) city; other urban centres are Alcira, Sueca, Torrente, Sagunto, and Cullera. Pop. (1982 est.) 2,112,921.

Valencia, capital of Valencia province and the autonomous community (region) of Valencia, and of the former kingdom of Valencia, eastern Spain. Located on the Mediterranean coast at the mouth of the Río Turia (Guadala-

viar), it is surrounded by orchards in a region known as the Huerta de Valencia. The earliest mention (Valentia) is by the Roman historian Livy, who states that the consul Decimus Junius Brutus Callaicus settled the soldier veterans of the Lusitanian leader Viriathus there in 138 Bc. It later became a prosperous Roman colony.

Taken by the Visigoths in AD 413 and in 714 by the Moors, it became in 1021 the seat of the newly established independent Moorish kingdom of Valencia, which extended from Almería to the Ebro estuary. From 1089 until the final capitulation of the city in 1094, the kingdom was fought for by the Spanish soldier-hero El Cid, who eventually secured it from the Moorish Almoravids. It remained in the hands of El Cid, after whom it is sometimes called Valencia del Cid, until his death there in 1099. The Moors recovered the city (and kingdom) in 1102.

In 1238 James I of Aragon added Valencia to his dominions; but the kingdom continued to be administered separately, with its own laws and parliament. In 1479, with the other countries of the Aragonese crown, the kingdom was united with Castile under the monarchs Ferdinand and Isabella, resulting in a long period of peace during which the city developed rapidly and the arts prospered. The first Spanish printing press is said to have been set up there in 1474, and during the next two centuries the city was the seat of the Valencian school of painting. During the Spanish Civil War it was the loyalist capital from 1936 to

Valencia has been called the city of the 100 bell towers, of which the most outstanding are the Gothic Miguelete Tower (1381-1424), adjoining the cathedral, and the hexagonal Tower of Santa Catalina (1688–1705), a fine example of Valencian Baroque style. The most important church is the cathedral (La Seo), situated in the ancient city centre. Begun in the 13th century (completed 1482), it represents several styles (its three doorways are respectively Romanesque, Baroque, and Gothic); and it possesses many works of art, including two large religious paintings by Goya. On Thursdays at noon the doorway opening onto the Plaza de la Constitución is the site of the Tribunal de las Aguas (Water Court), which has been in existence at least since the 10th century. It is composed of farmers, who hear disputes over irrigation waters and dispense justice on the spot, conducting all proceedings orally, in the Valencian dialect of Catalan.

Notable civic buildings include the splendid late-Gothic (15th century) Lonja de la Seda (Silk Exchange); the Palacio de la Diputación, which housed the parliament of the kingdom of Valencia, with a 15th-century courtyard and beautifully panelled rooms; the Town Hall (Ayuntamiento), a modern building with important archives and the city historical museum; and the 18th-century Neoclassical Palacio de Justicia. Valencia was a walled town, but the walls were removed in the 19th century, and only two of its gates survive. Remains of Moorish buildings include the Almudín (the public granary), which houses the Museum of Paleontology, and the Baños del Almirante (13th century).

There are museums of art and ceramics, botanical gardens, and a university (1501) which, in the early 1970s, was being transferred to a newly developed University City.

From Valencia's port, El Grao, are exported agricultural produce (rice, oranges, lemons, onions, wine) and manufactured items, including furniture, glazed tiles and ceramics, fans, textiles, and iron products. Pop. (1982 est.) 770,277.

Valencia, city, capital of Carabobo state, northwestern Venezuela, on the Río Cabriales in the central highlands at 1,600 ft (490 m) above sea level, near the western shore of Lake Valencia. It was founded in 1555, eight years before the founding of Caracas, the national capital, as Nueva Valencia del Rey by Alonso Díaz Moreno, a soldier from the Spanish city of Valencia; it rivalled Caracas as the region's major city until well into the 19th century. In 1814, during the struggle that led to Venezuela's independence, the city was the site of a bloody battle between forces of about 200 under Rafael Urdaneta and opposing Spanish forces of about 4,000. The final, decisive battle of that war (June 1821) was fought at Carabobo, 18 mi (29 km) south of the city, and is commemorated by a monument. During and after that war Valencia was three times capital of the republic, in 1812, 1830, and 1858. Today it is one of Venezuela's two major industrial centres; growth factors both historically and presently include its location on the axis of communications between central and western Venezuela and at a pass connecting the cattle-raising Llanos (plains) with the urban consumers of the northern highlands, and its easy access to Puerto Cabello, 34 mi (55 km) by expressway to the north. Lying in the heart of the nation's most fertile and productive agricultural region, Valencia benefits from the wide variety of crops grown there. Industries include the manufacture of animal feeds (it has long been the principal centre for fattening cattle from the plains), fertilizers, food and dairy products, vegetable oils, soaps and detergents, chemicals and pharmaceuticals, paper, cartons, rubber goods, textiles, garments, shoes, cement, furniture, automobile accessories, and motor vehicle assembly.

It is the site of the Universidad de Carabobo (1852). The city is linked with Caracas, 75 mi (120 km) to the northeast, by railroad and expressway. Pop. (1981 est.) 568,000.

Valencia, Guillermo (b. Oct. 29, 1873, Popayán, Colom.—d. July 8, 1943, Popayán), Colombian poet and statesman, whose technical command of verse and skill at translation are notable.

Valencia, a member of a prominent family, received a humanistic classical education and read widely in several languages, developing the cosmopolitan outlook and balanced temperament that were reflected in both his political and his literary life. His first volume of poetry, Ritos (1898, rev. ed. 1914; "Rites"), containing original poems and free translations from French, Italian, and Portuguese, established his literary reputation at home and abroad as a leader of the experimental Modernist movement with its exotic imagery. Unlike many of the Modernists, however, he was an escapist only in his poetry, not in his own life. He led an active career as a statesman and a diplomat and was twice a candidate for the presidency of Colombia, in 1918 and 1930.

He was never a prolific poet; in later years, he abandoned original poetry almost entirely, concentrating on translations. One of these was Catay (1928; "Cathay"), which he translated from Franz Toussaint's La Flute de jade ("The Jade Flute"), a French translation of an anthology of Chinese poems. He translated La balada de la cárcel de Reading (1932; "The Ballad of Reading Gaol") from the English poem by the 19th-century writer Oscar Wilde. He also turned more frequently to writing essays, many of which are collected in Panegíricos, discursos y artículos (1933; "Panegyrics, Speeches, and Articles").

Valencia, Lake, Spanish LAGO DE VALENCIA, lake in Carabobo and Aragua states, central Venezuela. Lying in a basin in the Cordillera de la Costa (Maritime Andes) of the central highlands at an elevation of 1,362 ft (415 m) above sea level, Lake Valencia measures approximately 18 mi (29 km) from east to west and 10 mi from north to south. Its total area of 141 sq mi (364 sq km) makes it the second largest natural lake of Venezuela, after Lake Maracaibo. On its shores cotton, sugarcane, tobacco, corn (maize), coffee, fruits, and cattle are raised. Formerly known as Tacarigua, the lake is fed by many streams. The lake was formerly ringed with marshlands, but it has become a popular resort area. Valencia city is near the southwestern shore and Maracay is on the northeastern rim

Valenciennes, town, Nord département, Nord-Pas-de-Calais region, northern France, on the Escaut (Scheldt) River. The origin of the name is obscure. Some believe that it stems from one of the three Roman emperors called Valentinian. Others attribute it to a corruption of val des cygnes ("valley of the swans"), swans being featured on the civic coat of arms.

The town flourished under the counts of Hainaut. In 1328 Philippa of Hainaut married Edward III of England there. In 1433 Valenciennes went to Philip the Good and then to Charles the Bold, dukes of Burgundy. Louis XI tried in vain to capture it; the Treaty of Nijmegen, 1678, saw it finally ceded to France. The Germans entered Valenciennes in the first month of World War I, and great destruction was caused by allied raids in the last week of the fighting. The damage was repeated between 1940 and 1944. After the war a new town centre was built. Valenciennes was

once important for its fine lace: the industry had practically died out, but was renovated to some extent. Prosperity was brought to Valenciennes by the exploitation of the first French coalfield and the development of ironworking. But these traditional industries were endangered in the early 1980s by the general crisis of the industrial north. Conversion to a different industrial base may be facilitated by the high quality of existing transportation and service facilities. New industries actively being sought included petroleum refining and automobile construction. The Musée des Beaux-Arts displays works by such masters as Rubens and Van Dyck, as well as some by notable painters born in the vicinity, including Watteau, Pater, and Harpignies. Pop. (1982) 41,976.

Lace produced in Valenciennes itself flourished from about 1705 until 1780. The industry continued on a diminished scale into the 19th century at other centres.

The lace is distinguished by having no cordonnet (the raised outline present in most laces of the period to give definition to the design) and is consequently flat and even in texture. Early Valenciennes had a repertoire of backgrounds including a "snowy" ground of little "partridge eye" circles; from 1715 the laceworkers within the city (as opposed to those around it) started using exclusively a diamond mesh ground, calling this type vrai ("true") Valenciennes and that with the older grounds, still used outside the city, fausse ("false") Valenciennes. Never a formal, "dress" lace, Valenciennes was nevertheless costly; it was used by the rich and by those at court for bedlinen, lingerie, fichus (triangular scarf draped over the shoulders), and the like. Early

patterns were of curving, conventional leaves and flowers; in the late 18th century there was greater naturalism in their treatment. From around 1830 the diamond *vrai* Valenciennes mesh and some of the characteristic patterns were successfully imitated by machine.

Valens (b. c. 328—d. Aug. 9, 378). Eastern Roman emperor from 364 to 378. He was the younger brother of Valentinian I, who assumed the throne upon the death of the emperor Jovian (Feb. 17, 364). On March 28, 364, Valentinian appointed Valens to be co-emperor. Valens was assigned to rule the Eastern part of the empire, while Valentinian took the throne in the West. Soon Valens was challenged by the pagan Procopius, who had himself proclaimed emperor in Constantinople (September 365). When Valens marched from Antioch to confront the usurper, Procopius was deserted by many of his troops; on May 27, 366, he was betrayed and put to death.

Valens next waged war on the Visigoths, who had aided Procopius and were threatening to invade Thrace. In May 367 the Emperor crossed the Danube and devastated the Visigothic territories (in modern Romania). Two years later he invaded the area again and decisively defeated the tribe. After suppressing the conspiracy of Theodorus at Antioch in the winter of 371–372, Valens became involved in war with the Persians. He achieved a victory in Mesopotamia but in 376 was obliged to make peace on unfavourable terms. In that year the Visigoths, defeated and pursued by the Huns, were allowed by Valens' generals to settle in Roman territory south of the Danube. Soon the tribe rebelled against the Romans and engaged the Emperor in the great Battle of Adrianople (modern Edirne, Tur.) on Aug. 9, 378. The poor tactics employed by Valens led to the total defeat of his army, and the Emperor himself was numbered among the

Valens was an Arian Christian who persecuted Catholics while interfering little with the pagans. Bishops who had been restored by the emperor Julian were banished, although near the end of his reign Valens relented somewhat and allowed these exiles to return.

Valentine, Latin VALENTINUS (b. Rome—d. September 827, Rome), pope for about 40 days during August-September 827. He became archdeacon under Pope St. Paschal I. Beloved for his goodness and piety, he was elected pope in August but died a month later. Nothing is known of his pontificate.

valentine, special form of greeting card exchanged in observance of St. Valentine's Day (February 14), a day set aside as a lovers' festival. The custom has no connection with the two St. Valentines or with known incidents in their lives. It is probable that the valentine was the first of all greeting cards. The paper

valentine dates from the 16th century; by 1800 hand-painted copperplates were produced to meet large demands. These were followed by woodcuts and lithographs.

Valentine, SAINT (d. 3rd century, Rome; feast day February 14), name of two legendary martyrs whose lives seem to be historically based. One was a Roman priest and physician who suffered martyrdom during the persecution of Christians by the emperor Claudius II Gothicus and was buried on the Via Flaminia. Pope St. Julius I reportedly built a basilica over his grave. The other, bishop of Terni, Italy, was martyred, apparently also in Rome, and his relics were later taken to Terni. It is possible these are different versions of the same original account and refer to only one person.

St. Valentine's Day as a lovers' festival dates at least from the 14th century. The modern tradition of sending valentine cards has no relation to the saints. E. M. Fusciardi's *Vita di S. Valentino* appeared in 1936.

Valentinian I, Latin in full FLAVIUS VALENTINIANUS (b. 321—d. Nov. 17, 375, Brigetio, Pannonia Inferior), Roman emperor from 364 to 375 who skillfully and successfully defended the frontiers of the Western Empire against Germanic invasions.

Valentinian, the son of an army officer stationed in Pannonia (in central Europe), joined the army and served with his father in Africa. According to some sources, when Valentinian was a tribune in the forces of Julian the Apostate (emperor 360–363), he was disgraced for refusal to renounce Christianity. He did serve, however, in Julian's Persian expedition of 363, and was promoted by Julian's successor, Jovian, who died soon afterward (Feb. 17, 364).

Nine days later the commanders of the army proclaimed Valentinian emperor at Nicaea (modern Iznik, Tur.). On March 28 he appointed his younger brother Valens as co-ruler and assigned him to govern the East, while Valentinian retained the West. Both agreed to allow religious toleration, which, unlike Valens, Valentinian maintained throughout his reign.

Displaying inexhaustible energy, Valentinian set about fortifying and defending the borders. In January 365, his generals in Gaul were defeated by the Germanic Alemanni; by October, Valentinian had set up residence in Paris from which he directed operations against the invaders. His general Jovinus defeated them three times. At Durocatalaunum (modern Châlons-sur-Marne, Fr.), the third engagement, Jovinus inflicted heavy casualties on the Alemanni, securing Gaul for years to come. Meanwhile, in 367, the Emperor moved to Ambiani (modern Amiens, Fr.) to be in closer communication with his general Theodosius (father of the later emperor Theo-

dosius I), who was defending Britain from Saxon, Pictish, and Scottish invaders.

In order to strengthen the line of succession, Valentinian proclaimed (Aug. 24, 367)

his nine-year-old son, Gratian, as co-emperor. Two months later Valentinian took up residence at Trier (now in Germany). He remained there for seven years, devoting his attention to the construction of an elaborate system of fortifications on the Rhine. Then, an invasion of Pannonia by the Quadi in 375 brought Valentinian to Sirmium (modern Sremska Mitrovica, Yugos.), where he soon fell sick and died.

Despite his achievements, Valentinian gained a reputation for irritability and cruelty. He frequently chose ministers of the worst character who ruthlessly oppressed the provincials.

Valentinian II, Latin in full FLAVIUS VALEN-TINIANUS (b. 371, Treveri, Belgica—d. May 15, 392, Vienna [modern Vienne], Viennensis), Roman emperor from 375 to 392

Valentinian was the son of the emperor Valentinian I and his second wife, Justina. On Nov. 22, 375, five days after the death of his father, the four-year-old Valentinian was proclaimed emperor at Aquincum (modern Budapest). The declaration was made without the knowledge or consent of the two reigning emperors, Valens and Gratian, but they later accepted Valentinian and allowed him to rule (through his mother) Italy, Africa, and Illyricum. In 383 Gratian was put to death by the usurper Magnus Maximus, and in 387 Maximus invaded Italy. Valentinian and his mother fled to Thessalonica, Greece, to the dominions of the new Eastern emperor, Theodosius I. After the overthrow of Maximus by Theodosius in 388, Valentinian was restored to his rule. But in 392 the young emperor was found dead in his palace at Vienna, perhaps murdered by agents of Arbogast, whom he had sought to dismiss from the regency of Gaul.

Valentinian III, Latin in full FLAVIUS PLACIDIUS VALENTINIANUS (b. July 2, 419, Ravenna—d. March 16, 455, Rome), Roman emperor from 425 to 455. At no time in his long reign were the affairs of state personally managed by Valentinian. He was the son of the patrician Flavius Constantius (who ruled as Constantius III in 421) and Galla Placidia. When his uncle, the emperor Honorius, died in 423, the usurper John ruled for two years before he was deposed. Then Placidia controlled the West in her young son's name until 437, although the powerful patrician Aetius became the effective ruler toward the end of this regency. The most important political event of these years was the landing of the Vandals in Africa in 429; 10 years later they threw off the overlordship of Valentinian's

On Oct. 29, 437, Valentinian married Licinia Eudoxia, the daughter of Theodosius II (Eastern emperor, 408-450) and Eudocia. Little is known of Valentinian in the years after his marriage. He spent his life in the pursuit of pleasure while Aetius controlled the government. In 444 Valentinian, acting in conjunction with Pope Leo I the Great, issued the famous Novel 17, which assigned to the bishop of Rome supremacy over the provincial churches. The most important political events of the closing years of his reign were the Hun invasions of Gaul (451) and of northern Italy (452), but it is not known whether Valentinian personally played any significant part in meeting these crises.

As a result of false information that made him doubt Aetius' loyalty, Valentinian murdered the great patrician with his own hands in the imperial palace at Rome on Sept. 21, 454. The following year, two barbarians, Optila and Thraustila, who had been retainers of Aetius, avenged their master by murdering the Emperor in the Campus Martius.

Valentino, Rudolph, byname of RODOLFO PIETRO FILIBERTO RAFFAELLO GUGLIELMI (b. May 6, 1895, Castellaneta, Italy—d. Aug. 23, 1926, New York City), Italian-born U.S. motion-picture actor who was idolized as the Great Lover" of the 1920s.

Valentino in The Sheik, with Agnes Ayres, 1921

He immigrated to the United States in 1913 and worked for a time as a gardener, dishwasher, and later as a dancer in vaudeville. In 1918 Valentino went to Hollywood, where he played small parts in films until he was given the role of Julio in The Four Horsemen of the Apocalypse (1921). He immediately became a star, his popularity being managed by skillful Hollywood press agents. His films, which were usually romantic dramas, included *The Sheik* (1921), *Blood and Sand* (1922), *The Eagle* (1925), and The Son of the Sheik (1926).

Valentino's sudden death from a ruptured ulcer at age 31 caused worldwide hysteria, several suicides, and riots at his lying in state, which attracted a crowd that stretched for 11 blocks. Each year after his death a mysterious "Woman in Black," sometimes several

Women in Black," appeared at his tomb.
A biography by Alexander Walker was published in 1976.

Valentinus (fl. 2nd century AD), Egyptian religious philosopher, founder of Roman and Alexandrian schools of Gnosticism, a system of religious dualism (belief in rival deities of good and evil) with a doctrine of salvation by gnōsis, or esoteric knowledge. Valentinian communities, founded by his disciples, provided the major challenge to 2nd- and 3rdcentury Christian theology.

Valentinus studied philosophy at Alexandria. His disciples claimed that he had been educated by Theodas, a purported pupil of St. Paul, and was baptized a Christian. According to documentary fragments of 2nd- and 3rd-century theologians Valentinus moved to Rome c. 136, during the time of Pope St. Hyginus (c. 136–140), and exercised influence there for some 25 years, expounding his synthesis of Christian and oriental Gnostic teaching. Aspiring to be bishop of Rome, he left the Christian community when he was passed over for that office c. 140.

On abandoning Rome for Cyprus c. 160, and possibly Alexandria, Valentinus continued to develop his system of mythically derived religious philosophy. He is the reputed author of the Gospel of Truth, which achieved a fusion of Christian Pauline theology with Gnostic principles. A 4th-century Egyptian papyrus, the Jung Codex (discovered in 1946), containing Coptic translations of Valentinian texts, has helped in the difficult reconstruction of Valentinus' doctrine, which had survived only in short excerpts of his letters and commentaries quoted or paraphrased by his orthodox theological adversaries.

The Valentinian system developed into Eastern and Western forms in greater complexity, although the earlier structure was similar to Pauline mystical theology, with its emphasis on the instrumentality of Christ's death and resurrection in effecting Christian deliverance. Current scholarship tends to increase the importance of Valentinian doctrine in influencing the later rise of anthropocentric modes of Christian spirituality, leaving traces in every era of the church down to the present, with the emergence of a Western prototype, Pelagianism, after the 5th-century monk from Britain, Pelagius.

Valenzuela, Fernando de, MAROUÉS (marquess) DE VILLA SIERRA (b. Jan. 19, 1630, Naples—d. Feb. 7, 1692, Mexico), Spanish royal favourite and minister during the regency of Charles II.

He obtained a footing in the palace by his marriage with Maria de Uceda, lady-in-waiting to Mariana, Philip IV's second wife. When he was appointed introducer of ambassadors (Oct. 12, 1671), it became notorious that whoever had a petition to present must apply to him. He became popularly known as the duende, the fairy or brownie of the palace, and was believed to be the lover of the queen. Dismissed (1675) from court by intrigue, he was made marqués de Villa Sierra by the queen and ambassador to Venice. He exchanged the embassy for the governorship of Granada, organized a counterintrigue, and returned to court. The queen-regent appointed him prime minister and made him a grandee, to the profound indignation of the other grandees. At the palace revolution of January 1678, Valenzuela fled to the Escorial, was captured, degraded from the grandeeship, and exiled to the Philippines (and then to Mexico), and his property was confiscated.

Valera, city, central Trujillo state, northwestern Venezuela, on the Río Motatán, on a northern spur of the Cordillera de Mérida. The state's largest city, Valera overshadows the state capital, Trujillo, 12 mi (19 km) to the east-northeast. It is the leading commercial centre for the agricultural hinterland, in which sugarcane, cacao, coffee, fruit, and grains are cultivated. Flour milling is a principal industry. The area has traditionally supplied about one-fourth of the nation's wheat. The city is just a few miles south of the Pan-American Highway, providing easy access to the growing towns around Lake Maracaibo and in the Cordillera de Mérida. Valera also has an airport. Pop. (1981 est.) 115,000.

Valera y Alcalá Galiano, Juan (b. Oct. 18, 1824, Cabra, Spain-d. April 18, 1905, Madrid), important Spanish 19th-century novelist and stylist, also a diplomat and politician. Valera travelled to Europe and America in the diplomatic corps and served as deputy, senator and under-secretary of state in Madrid.

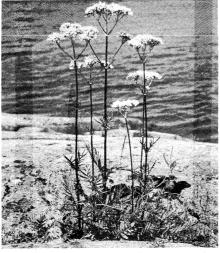

His novels are characterized by deep psychological analysis of the characters, especially women. He was opposed to naturalistic narrative and held that the novel was a form of poetry. His best known works are Pepita Jiménez (1874), notable for its terse, elegant style and masterful character development, Doña Luz (1879) and Juanita la Larga (1895). Other important novels are Las ilusiones del doctor Faustino (1875), Morsamor (1899) and El comendador Mendoza (1877). Valera's prolific literary output includes some very fine translations, including parts of Goethe's Faust and Daphnis and Chloe (1907); literary criticism of Don Quixote, Faust, and other works; short stories, including El pájaro verde (1887; "The Green Bird"); plays (La venganza de Atahualpa); and numerous essays on religion, philosophy, history and politics. His letters to intellectual figures such as Marcelino Menéndez y Pelayo and Leopoldo de Cueto constitute a valuable record of his impressions on many topics of the era.

Valerian, Latin in full PUBLIUS LICINIUS VA-LERIANUS (d. 260), Roman emperor 253–260. He was consul under Severus Alexander (emperor 222-235) and played a leading role in inducing the Senate to risk support for Gordian I's rebellion against the emperor Maximinus (238). Valerian may have been one of the 20 consulars who successfully defended Italy against the Emperor. He is not again mentioned until the reign of Decius (emperor 249-251). Under Gallus (emperor 251-253) Valerian held a command on the Upper Rhine and was summoned to bring the northern armies to aid in the struggle against the rival emperor Aemilian. Valerian arrived too late to save Gallus but managed to avenge and succeed him.

As emperor he vigorously renewed Decius' persecution of the Christians, executing, among others, Bishop Cyprian of Carthage and Bishop Xystus (Sixtus II) of Rome. Recognizing that it was no longer possible for one emperor to control the whole empire, Valerian appointed his son Gallienus to rule the West while he marched east to repel the Persian invasion. But he was captured by the Persian king Shāpūr I in June 260 and died in captivity.

Valerianaceae, the valerian family of the teasel order (Dipsacales), containing about 10 genera and more than 400 species of annual and perennial herbs, a few outstanding as ornamentals, salad or pot herbs, and as sources of medicines and perfumes. Greek valerian refers to Jacob's ladder (Polemonium caeruleum), in the phlox family (Polemoniaceae). The true valerian—native to the temperate zones, the Andes Mountains, and Africahave three- to five-lobed tubular flowers, often spurred at the base and clustered in tight heads. The sepals are either absent or bristle-

like. The leaves may be simple or divided.
The largest genus, *Valeriana*, contains about 200 species and is best known for common valerian, or garden heliotrope (V. officinalis), occasionally as tall as $1^{1/2}$ metres (5 feet). The species is native to Eurasia and is naturalized in North America, where other members of the genus are native. It has divided leaves and sweetly fragrant, pinkish-white heads of small blooms. The scent of the flowers is the source of its popular name, for common valerian is not a true heliotrope (the genus Heliotropium belongs to the family Boraginaceae). A spicy

Two Mediterranean species of the genus Valerianella, grown for their long, undivided leaves that are used in salads and as pot herbs, are corn salad (V. olitoria) and Italian corn salad (V. eriocarpa). The genus has about 80 members, mostly Eurasian; a few are native or naturalized in North America. Red valerian, or Jupiter's-beard (Centranthus ruber), native to the Mediterranean, is widely naturalized in British meadows, roadsides, and on walls. Its billowy masses of tiny, fragrant, pink, white, or red blooms are borne on stems sometimes reaching 90 centimetres (3 feet). Other ornamental species are Fedia cornucopiae, an annual with red flower clusters from the Mediterranean; Plectritis congesta, a rose-pink flowered annual from northwestern Northern America; and members of the Eurasian genus Patrinia, perennials with yellow or white flow-

Valerius Flaccus, Gaius (fl. 1st century AD), epic poet, author of an Argonautica, an epic which, though indebted to other sources, is written with vivid characterizations and descriptions and style unmarred by the excesses of other Latin poetry of the Silver Age.

Very little is known of Valerius Flaccus' life, but he must have died about AD 90, because Quintilian mourns his recent death in his Institutio oratoria, a work written before AD 96.

The Argonautica, his only surviving work, is an epic poem in hexameter verse, dedicated to the Emperor Vespasian. It describes the famous voyage of the ship "Argo" in which Jason and other heroes sailed to Colchis to bring the Golden Fleece back to Thessaly.

Valerius clearly borrowed material from the Argonautica of the Alexandrian poet Apollonius Rhodius (fl. c. 200 BC); and for his style and treatment he was deeply indebted to Virgil, though his Medea is a much gentler and less passionate figure than Dido. His verse technique owes much to Ovid. But he possessed creative gifts of his own; his work is written in simple and direct language and the narrative reveals strong dramatic talent. Valerius' work is also free of some of the vices of contemporary Latin poetry, such as display of erudition and exaggerated rhetoric.

The Argonautica was unknown until the first four and a half books were discovered by the Italian Humanist Poggio at Saint-Gall in 1417. The first edition was published in 1474; later editions include that in the Teubner se-

Valerius Licinianus Licinius: see Licinius.

Valerius Maximus (fl. c. AD 20), Roman historian and moralist who wrote an important book of historical anecdotes for the use of rhetoricians.

Born into a poor family, Valerius Maximus owed everything to Sextus Pompeius (consul AD 14 and proconsul of Asia), his friend and patron, whom he accompanied to the East c. 27. His book, Factorum et dictorum memorabilium libri ix (c. AD 31; "Nine Books of Memorable Deeds and Sayings"), was intended for use in the schools of rhetoric and written to exemplify human virtues and vices. The book's anecdotes, drawn chiefly from Roman history, include extracts from the annals of other peoples, principally the Greeks. The arrangement is loose and irregular, and the style turgid, artificial, and showy, but Valerius sometimes managed an effective and well-placed pointed expression, an ingenious transition, or a clever piece of fancy. Despite its contradictions and errors, his collection proved very popular, especially in the Middle

Ages. Valerius' sources are not easily determined. He made considerable use of Cicero, and he also used Pompeius Trogus, Livy, and probably Varro. Valerius was a champion of the empire, and he voiced the general feeling that the Romans of his day were inferior to their ancestors but greatly superior to the rest of the world.

Valéry, Paul, in full AMBROISE-PAUL-TOUS-SAINT-JULES VALÉRY (b. Oct. 30, 1871, Sète, Fr.—d. July 20, 1945, Paris), French poet, essayist, and critic. His greatest poem is considered La Jeune Parque (1917; "The Young Fate"), which was followed by Album de vers anciens 1890-1900 (1920) and Charmes ou poèmes (1922), containing "Le Cimetière

Valéry

marin" ("The Graveyard by the Sea"). He later wrote a large number of essays and occasional papers on literary topics and took a great interest in scientific discoveries and in political problems.

Valéry was born at a small Mediterranean port where his father was a customs officer. He was educated at Montpellier, where he studied law and cultivated his interest in poetry and architecture. He was a diffident youth, and his few friends at this time were Gustave Fourment, who became a professor of philosophy, and the writers Pierre Louys and André Gide. His early literary idols were Edgar Allan Poe, J.-K. Huysmans, and Stéphane Mallarmé, to whom he was introduced in 1891 and whose artistic circle he came to frequent regularly.

Valéry wrote many poems between 1888 and 1891, a few of which were published in magazines of the Symbolist movement and favourably reviewed, but artistic frustration and despair over an unrequited love affair prompted him in 1892 to renounce all emotional preoccupations and to dedicate himself to the "Idol of the Intellect." He disposed of most of his books, and from 1894 until

the end of his life he would rise at dawn each day, meditate for several hours on scientific method, consciousness, and the nature of language, and record his thoughts and aphorisms in his notebooks, which were later to be published as the famous *Cahiers*. Valéry's new-found ideals were Leonardo da Vinci ("Introduction à la méthode de Léonard de Vinci" [1895]), his paradigm of the Universal Man, and his own creation, "Monsieur Teste" (Mr. Head), an almost disembodied intellect who knows but two values, the possible and the impossible ("La Soirée avec Monsieur Teste" [1896]).

From 1897 to 1900, Valéry worked as a civil servant in the French War Office; from 1900—the year of his marriage to a close friend of Mallarmé's daughter—until 1922, he was private secretary to Edouard Lebey, director of the French press association. Valéry's main daily duty was to read out the chief events from the newspapers and the Paris Stock Exchange to the director, and he thereby became a well-informed commentator on current affairs.

Pressed by Gide in 1912 to revise some of his early writings for publication, Valéry began work on what was intended to be a valedictory poem to the collection La Jeune Parque, centred on the awakening of consciousness in the youngest of the three ancient "Parques, or "Fates," which traditionally symbolized the three stages of human life. He became so engrossed in the technical problems it presented that he took five years to complete the long symbolic work. When finally published in 1917, it brought him immediate fame. His reputation as the most outstanding French poet of his time was quickly consolidated with Album de vers anciens, 1890-1900 and Charmes ou poèmes, a collection that includes his famous meditation on death in the cemetery at Sète (where he now lies buried).

Valéry's most idiosyncratic works are all variations on the theme of the tension within the human consciousness between the desire for contemplation and the will to action: in "Introduction à la méthode de Léonard de Vinci" and repeatedly in his notebooks, he contrasts the infinite potentialities of mind with the inevitable imperfections of action; in La Jeune Parque, he shows a young Fate by the sea at dawn, uncertain whether to remain a serene immortal or to choose the pains and pleasures of human life; in "Le Cimetière marin" he broods by the sea at noon on Being and Not-Being, on the living and the dead; his many letters regularly complain of the conflict in his own life between the dictates of public life and his desire for solitude.

Valéry wrote no more poetry of consequence after 1922, but his place as a major writer was secure. Though his fame was first established, and still largely rests, on his poetic achievements, and though he devoted considerable attention to the problems of writing poetry, he consistently claimed that poetry in itself did not much interest him, and that literary composition, like mathematics and the sciences, served him only as mirrors to the workings of his own mind. His essays and prefaces, more often than not written quickly to order, were the fruits of his regular meditations and reveal his interest in a remarkably wide variety of subjects: writers and writing, philosophers and language, painters, dancing, architecture, and the fine arts are all reexamined with refreshing vigour. He retained an abiding interest in education, politics, and cultural values, and two remarkably prescient youthful essays on the Sino-Japanese conflict ("Le Yalou," written 1895) and the threat of German aggression ("La Conquête allemande," 1897) reveal the same anxious awareness of the forces menacing Western civilization as his very last public lecture on Voltaire (delivered in 1944)

After the death of Lebey in 1922, the formerly retiring Valéry became a prominent public personage. His erudition, courtesy, and dazzling conversational gifts made him a much sought-after society figure, and he was as much at ease in the company of the foremost international writers and scientists of the day as with generals and heads of state. Valéry was greatly interested in the state of modern physics and mathematics, and through extensive reading and, often, personal acquaintances he became well versed in the work of such scientists and mathematicians as Maurice, duc de Broglie, Bernhard Riemann, Michael Faraday, Albert Einstein, and James Clerk Maxwell. He made lecture tours all over Europe and delivered speeches on a number of national occasions. He was elected to the Académie Française in 1925, was made administrative head of the Centre Universitaire Méditerranéen at Nice in 1933, and became professor of poetry, a chair created especially for him, at the Collège de France in 1937. On his death, he was given a full state funeral.

Though he made much of his preoccupation with intellectual problems and incurred the particular displeasure of the Surrealists for his scathing attacks on poetic inspiration, there is ample evidence in Valéry's work that he remained all his life keenly responsive to the pleasures of the senses: the voluptuousness of his female nude studies ("Luxurieuse au bain," "La Dormeuse," and the picture of Eve in "Ebauche d'un serpent"), the warmth with which he writes of the lovers' embrace ("Le Cimetière marin," "Fragments du Narcisse," "La Fausse Morte") or of the sun, sky, and sea, which he had loved since his Mediterranean childhood—all show that he must not be too closely identified with his arid Monsieur Teste. The distinctive feature of his prose and poetry, even when he is dealing with the most abstract of subjects, is sensuousness; his prose is aphoristic and graceful, his poetry rich in natural images and allusions, always classical in form, and, at its best, as sinewy, subtly rhythmical, and melodious as the very best verse of the great dramatist Jean Racine or the Symbolist poet Paul Verlaine.

(R.D.D.G.)

MAJOR WORKS. Poetry. La Jeune Parque (1917); Album de vers anciens, 1890–1900 (1920), including "Hélène," "Narcisse parle," and "César"; Charmes ou poèmes (1922), including "Ébauche d'un serpent," "La Pythie," "Le Cimetière marin" ("The Graveyard by the Sea," trans. by C. Day Lewis, 1946), and "Au Platane."

Play. Mon Faust (unfinished, 1946).

Literary essays. Variété, 5 vol. (1924-44); Tel quel, 2 vol. (1941-43); Écrits divers sur Stéphane Mallarmé (1950).

Other prose writings. "Introduction à la méthode de Léonard de Vinci" (1895; "Introduction to the Method of Leonardo da Vinci," 1929); "La Soirée avec Monsieur Teste" (1896; "An Evening with Monsieur Teste," 1925); L'Ame et la danse (1925, rev. 1945; Dance and the Soul, 1951); Regards sur le monde actuel (1931; Reflections on the World Today, 1948); Pièces sur l'art (1931, 2nd ed. 1934, augmented ed. 1936); Analecta (1926, Analects, 1970); Degas, danse, dessin (1938; Degas, Dance, Drawing, 1960); Les Cahiers (1957–61), meditations on a wide range of topics.

BIBLIOGRAPHY. The most complete bibliography of writings by and about Valéry is in the "Bibliothèque de la Pléiade" edition of his works. Much information about unpublished material was included in the Bibliothèque Nationale's catalog of the 1956 Valéry exhibition.

Editions. There are two major collected editions of Valéry's works: the two-volume Gallimard edition, ed. by J. Hytier (1957-60); and the 12-volume collection (1931-50), volumes A and published by Editions du Sagittaire, remaining volumes by Gallimard. A photographic reproduction of Valéry's 254 Cahiers has been published in a limited edition of 29 volumes (1957-61).

Correspondence. Lettres à quelques-uns (1952); André Gide-Paul Valéry: Correspondance 1890-1942 (1955); Paul Valéry-Gustave Fourment: Correspondance 1887-1933 (1957). Translations. The Collected Works of Paul Valéry, ed. by J. Matthews, 15 vol. (1956—; 13 volumes had appeared by 1975). Selections from Valéry's poetry and prose have been translated into all the major European languages and also into Japanese and Russian.

Biographical and critical studies. The most detailed is by Valéry's daughter, Agathe Rouart Valéry in vol. 1 of the "Pléiade" edition; her Paul Valéry (1966) is rich in iconographical interest. Also particularly informative are H. Mondor's studies Les Premiers temps d'une amitié: André Gide et Paul Valéry (1947), Précocité de Valéry (1957), and Propos familiers de Paul Valéry (1957). Good general introductions to Valéry's life and work include: A. Berne-Joffroy, Valéry (1960); J. Duchesne-Guillemin, Études pour un Paul Valéry (1964); and A.E. Mackay, The Universal Self: A Study of Paul Valéry (1961). Excellent accounts of Valéry's poetic theory and practice are: J. Hytier, La Poétique de Valéry (1953); W.N. Ince, The Poetic Theory of Paul Valéry: Inspiration and Technique, 2nd ed. (1970); J.R. Lawler, Lecture de Valéry, une étude de Charmes (1963); F. Scarfe, The Art of Paul Valéry (1954); and P.O. Walzer, La Poésie de Valéry (1953). The clearest studies of Valéry's thought are: M. Bémol, Paul Valéry (1949) and La Méthode critique de Paul Valéry (1950, reissued 1960); and J. Robinson, L'Analyse de l'esprit dans les Cahiers de Valéry (1963).

Valhalla, Old Norse VALHÖLL, in Norse mythology, the hall of slain warriors, who live there blissfully under the leadership of the god Odin. Valhalla is depicted as a splendid palace, roofed with shields, where the warriors feast on the flesh of a boar slaughtered daily and made whole again each evening. They drink liquor that flows from the udders of a goat, and their sport is to fight one another every day.

Thus they will live until the Ragnarök (Doomsday), when they will march out the 540 doors of the palace to fight at the side of Odin against the giants. When heroes fall in battle it is said that Odin needs them to strengthen his forces for the Ragnarök.

Valignano, Alessandro (b. February 1539, Chieti, Kingdom of Naples—d. Jan. 20, 1606, Macau), Italian Jesuit missionary who helped introduce Christianity to the Far East, especially to Japan.

Born into an influential Italian family and educated for the law, Valignano joined the Society of Jesus in 1566 after undergoing a religious experience. In 1573 the Society appointed him to the Far East to help supervise the growth of its missions there. He arrived in Portuguese India in 1574 and spent most of the rest of his life in the service of missions in Goa, India; Macau, off the China coast; and in Japan. Among the missionaries he helped to prepare for work in China was the Italian Jesuit Matteo Ricci, who was responsible for the tremendous influence of Catholicism at the Chinese court in the 17th century.

It was in Japan, however, that Valignano made his major contribution to the propagation of Christianity. On his first visit he arranged for the Jesuit mission to receive a portion of the highly profitable silk trade between Japan and Macau. In this way, he not only made his mission self-supporting but also was able to convert several of the Japanese daimyos (hereditary feudal lords), who also hoped to share in the trade. Further, Valignano's priests dressed like Zen Buddhist monks to accommodate themselves in every possible way to Japanese culture. So highly esteemed was Valignano that he was received by two successive rulers of Japan and was permitted to establish a centre to train native priests. The four young Japanese Christian samurai he sent to Rome in 1582 comprised the first

Japanese diplomatic mission to Europe. They were feted by the King of Spain, received by the Pope amid much ceremony, and painted by Tintoretto.

Although Christianity was suddenly proscribed in Japan in the early 17th century, Valignano's work had a tremendous influence. By the time of his death, there were an estimated 300,000 Christians and 116 Jesuits in the country.

Valindaba, site of a uranium enrichment pilot plant in south central Transvaal, South Africa, on the western outskirts of Pretoria. Built by the Uranium Enrichment Corporation of South Africa (Ucor), it became operational in 1975. Valindaba uses a new process, developed in the 1960s in the Republic of South Africa, for the enrichment of uranium in the fissionable 235-isotope. The feed material required by the plant is uranium in the form of uranium hexafluoride (UF₆) and the plant is expected to produce 50 tons annually of enriched uranium by the mid-1980s, about the quantity needed annually to feed the two Koeberg nuclear reactors near Cape Town.

valine, an amino acid (q.v.) obtained by hydrolysis of proteins and first isolated by the German chemist Emil Fischer (1901) from casein. It is one of several so-called essential amino acids for fowl and mammals; *i.e.* they cannot synthesize it and require dietary sources. It is synthesized in plants and microorganisms from pyruvic acid (a product of the breakdown of carbohydrates).

Valkeakoski, city, Hämeen *lääni* (Häme province), southwestern Finland, on the western shore of the Mallasvesi (lake), just south-southeast of Tampere. The city is connected to Tampere, Hämeenlinna, and the rest of Finland by railroad, highway, and lakeboat service. Local industry includes pulp and paper milling, machine shops, and textile mills. Factory workers' houses, dating from 1870 to World War I, are part of an open-air museum. The Visavuori Museum is located in the studio of the sculptor Emil Wikström. Pop. (1983 est.) mun., 22,588.

Valkyrie, also spelled WALKYRIE, Old Norse VALKYRJA (Chooser of the Slain), in Norse mythology, any of a group of maidens who served the god Odin and were sent by him to the battlefields to choose the slain who were worthy of a place in Valhalla. These foreboders of war rode to the battlefield on horses, wearing helmets and shields; in some accounts, they flew through the air and sea. Some Valkyries had the power to cause the death of the warriors they did not favour; others, especially heroine Valkyries, guarded the lives and ships of those dear to them. Old Norse literature made references to purely supernatural Valkyries and also to human Valkyries with certain supernatural powers. Both types of beings were associated with fairness, brightness, and gold, as well as bloodshed.

Valla, Lorenzo, Latin LAURENTIUS VALLENsis (b. 1407, Rome—d. Aug. 1, 1457, Rome), Italian humanist, philosopher, and literary critic who attacked medieval traditions and anticipated views of the Protestant reformers. Valla was the son of a lawyer employed at

Valla was the son of a lawyer employed at the papal court. His family was from Piacenza. Until he was 24 Lorenzo spent most of his time in Rome, studying Latin grammar and rhetoric. Unable to obtain a post as papal secretary in 1430, he left Rome and spent the next five years wandering about northern

Italy. He taught rhetoric at the University of Pavia, where he made public his De voluntate (Eng. trans. 1978), a dialogue about the nature of the true good. That work surprised many of its readers by its then unfashionable defense of the Greek philosopher Epicurus, who maintained that, with the attainment of virtue, a wise man may live a life of prudent pleasure, free from pain. Valla then went on to attack Stoicism, the philosophy of the control of the emotions through reason and its advocacy of a simple life. Valla caused a still greater sensation by an attack on the barbarous Latin used by the celebrated 14th-century lawyer Bartolus. The law faculty at Pavia took offense, and Valla found it expedient to leave.

He lived at Milan and Genoa before settling down, in 1435, as royal secretary and historian at the court of Alfonso of Aragon, king of Naples. He remained 13 years in Alfonso's service, and it was during this time that Valla, then in his 30s, wrote most of his important books. His Declamatio (Treatise of Lorenzo Valla on the Donation of Constantine, 1922), written in 1440, attacked the crude Latin of its anonymous author and from that observation argued that the document could not possibly have dated from the time of Constantine. As King Alfonso was at war with Pope Eugenius IV at this time, it was politically convenient to attack the foundation of papal claims to temporal power in Italy. The book was first printed in 1517 in Germany, the same year that Luther posted his Ninety-five Theses on the church at Wittenberg, criticizing papal policies.

Valla wrote other books in his years at Alfonso's court. In his brief dialogue De libero arbitrio ("On Free Will"), Valla attacked the Stoic philosopher Boethius (480-524/525), who had attempted to reconcile man's free will with God's foreknowledge; and in his Dialecticae disputationes ("Dialectical Disputations"), Valla reduced Aristotle's nine "categories" to three (substance, quality, and action, which corresponded to noun, adjective, and verb) and denounced as barbarisms a number of the technical terms of Scholastic philosophy, such as "entity" and "quiddity." Valla preferred the language of ordinary people to the jargon of professional philosophers. His "Disputations" was at once a rhetorician's attack on logic and an attempt to reduce philosophical problems to linguistic ones. The Elegantiae linguae Latinae ("Elegances of the Latin Language"), printed in 1471, was the first textbook of Latin grammar to be written since late antiquity; it became highly popular in grammar schools all over Europe

Valla could make even grammar polemical and shocked contemporaries by his criticisms of the prose of the famous Roman rhetorician Cicero. Similarly, his first book, written when he was 20 and now lost, had apparently argued that Quintilian, another Roman rhetorician, was a better stylist than Cicero. Valla also produced a history of the reign of Ferdinand of Aragon, Alfonso's father. Characteristically, he showed most interest in linguistic problems, such as how to write in classical Latin about things that did not exist in Roman times—e.g., cannons and parliaments. For his offenses against the "dignity of history" he was attacked in an Invective by Bartolomeo Facio, another humanist in Alfonso's service. Valla responded with his "Recriminations Against Facio," written in dialogue form and recalling the debates among the court humanists, to which the King loved to listen. This work also contains Valla's celebrated emendations to the text of the Roman historian Livy.

Meanwhile, Valla had become embroiled in another controversy, theological this time, over his refusal to believe that the Apostles' Creed had been composed by the Twelve Apostles. As a result, he was denounced by the clergy and investigated by the Inquisition, which found him heretical on eight counts, including

his defense of Epicurus and his criticisms of Aristotle's categories. Only Alfonso's personal intervention saved him from the stake.

Valla left Naples in 1448 when Nicholas V successor to Eugenius IV and a supporter of humanists, appointed him papal secretary, a post in which he was confirmed by Nicholas' successor in 1455. Valla also taught rhetoric in Rome, where he remained until his death. In his 40s, he composed his last major work, In Novum Testamentum ex diversorum utriusque linguae codicum collatione adnotationes ("Annotations on the New Testament Collected from Various Codices in Each Language"), with the encouragement and advice of two famous scholars, the cardinals Bessarion and Nicholas of Cusa. The Adnotationes, not printed until 1505, applied the methods of humanist philology to a sacred text. Predictably, Valla was attacked for his disrespect to St. Jerome, the presumed author of the Latin translation of the Bible; during the Counter-Reformation the Adnotationes were to be placed on the *Index*, the Roman Catholic Church's list of condemned books. Valla also translated many works from Greek into Latin. Early in his Naples days he had translated Aesop's fables, and Pope Nicholas commissioned him to translate the historians Thucydides and Herodotus. Despite his heavy literary commitments, he never seemed to lack time or energy to engage in controversies. The Florentine humanist Poggio Bracciolini had criticized the "Elegances," and Valla replied in his Antidoti in Poggium ("Antidotes to Poggio"). Both scholars are seen at their worst here, hurling at one another accusations of ignorance, of barbarism, of plagiarism, and even worse. Benedetto Morandi, a notary from Bologna, assailed Valla for his disrespect in arguing that Livy had made mistakes about Roman history; so Valla rebutted with his Confutatio in Morandum ("Refutation of Morandi"). In a little dialogue De professione religiosorum ("On Monastic Vows"), Valla criticized the vows of poverty, chastity, and obedience on the grounds that what mattered was "not a vow, but devotion."

Valla's last public appearance was characteristic of his provocative, polemical style. In 1457 he was invited to deliver an encomium of St. Thomas Aquinas to an audience of Dominicans in the church of Sta. Maria sopra Minerva at Rome, to celebrate the saint's anniversary. Valla, however, delivered an antiencomium, a critique of St. Thomas' style and his interest in logic that advocated a return to the theology of the Fathers of the church. It is uncertain whether Valla was a priest or not. He certainly held ecclesiastical benefices. He never married but had three children by his Roman mistress.

An aggressive man, even for that age of intellectual gladiators, Valla made enemies easily. A professional heretic, he was well suited for his role as a critic of authority and orthodoxy. As one colleague observed about his notorious comparison of Cicero and Quintilian: Valla wrote simply to disturb people. There is no doubt about his success in this respect. More than 50 years later, in the age of Luther and of the great European humanist Erasmus, his barbs were still felt. Many of his criticisms of established ideas were pedantic and quibbling, but some were penetrating. He was disliked for his "impudence," "presumption," "temerity," and "sacrilege." In an age when many traditions were held sacred, Valla's sacrilege fulfilled an important intellectual and social function.

Vallabha, also called VALLABHĀCĀRYA (b. 1479, Benares, Jaunpur, India-d. 1531, Benares), Hindu philosopher and founder of the important devotional sect the Vallabhācāryas, also known as the puştimārga ("the way of prosperity, or well-being").

Born to a Telegu Brahman family, Vallabha showed precocity in spiritual and intellectual matters from an early age. He initiated his first disciple in 1493 at Mathura, which became the centre of his activities, though he undertook several pilgrimages throughout India, propagating his doctrine of bhakti (devotion) to the god Krishna. It was near Mathura, at the foot of Mount Govardhana, that Vallabha discovered the central cult object of the sect, an image of Krishna called Śrī-Nāthajī.

Vallabhācārya (ācārya, "teacher") himself belonged to the Rudra sect established by Vișnusvāmin, and his philosophical system of pure nondualism (śuddhādvaita)—i.e., the identity of God and the universe—closely follows that of the Visnusvāmin tradition. God is worshiped not by fasting and physical austerities but by love of him and of the universe. Salvation arises only by virtue of the grace of God. In order to receive divine love, the devotee must surrender himself wholly (samarpana) to God's gift of love.

Vallabha was married and had two sons, though he became a sannyāsin (ascetic) shortly before his death. His son Vitthala succeeded him as head of the Vallabhācārya sect.

Vallabhācārya, school of Hinduism prominent among the merchant class of North and West India; its members are worshipers of Lord Krishna (Kṛṣṇa) and followers of the pustimārga ("way of prosperity, or wellbeing"), founded by the 16th-century teacher Vallabha.

The worship of the sect centres around the adventures of the youthful Krishna, whose amorous play with the gopis (wives and daughters of the cowherds) of Vṛndāvana are described in the 10th book of the Sanskrit classic, the *Bhāgavata-Purāṇa*. Daily worship consists of elaborate service to the daily activities god. Special festivals are celebrated according to the seasons of the year, events of Krishna's life, and anniversaries of the sect's founders, Vallabha and his son Vitthala. Participation in the highest form of bhakti (devotion) is attainable only through divine grace (pusti); personal efforts such as good deeds or religious observances are not essential.

The Vallabhācārya sect is renowned for the degree of devotion paid its gurus (spiritual leaders), who are considered earthly embodiments of the divine. Vallabha was succeeded as leader of the sect by his son Vitthala (also known as Gosāinjī), and he in turn by his seven sons, each of whom established his own separate temple. The descendants of the seven sons of Vitthala are the present leaders of the sect and are addressed by the title Mahārāja

or Mahārāja Gosāinjī.

The main temple of the sect is at Nāthdwārā (Rājasthān), in Gujarāt state, which has installed in it a distinctive image of Krishna called Śrī-Nāthajī, which, according to the tradition of the sect, revealed itself to Vallabha when he was visiting Govardhana Hill, a scene of one of the god's exploits.

Valladolid, province, in the comunidad autónoma ("autonomous community") of Castile-León, northwestern Spain. It is bordered by the provinces of León and Palencia (north), by Burgos and Segovia (east), by Segovia, Ávila, and Salamanca (south), and by Zamora (west). It is a great plain with an area of 3,166 square miles (8,201 square km) lying in the basin of the Duero (Portuguese: Douro) River, which crosses it from east to west. Northern Valladolid is part of the so-called Tierra de Campos, known as the "granary of Spain." The most important crops there are wheat, barley, oats, rye, and vegetables; sugar and chicory are grown, and alfalfa and corn (maize) are produced for fodder. The use of irrigation and agricultural mechanization is increasing in the province. Flour milling is important, and there are other industries connected with food, as well as metalworking, textile weaving, chemical manufacture, construction, and tanning, all mainly in the provincial capital, Valladolid (q.v.). Wine production is also significant. Besides Valladolid city, the main population centres are Medina del Campo, Iscar, Medina de Ríoseco, Peñafiel and Tordesillas. Pop. (1986 est.) 485,335.

Valladolid, city, capital of Valladolid province, in the comunidad autónoma ("autonomous community") of Castile-León, northwestern Spain. The city lies along the Pisuerga River at its confluence with the Es-

gueva, southwest of Burgos.

The first recorded mention of Valladolid (Moorish Belad Ulid) appears to be in a letter of 1074 from Alfonso VI to Count Pedro Ansúrez granting him the lordship of the place. Under Ansúrez, Valladolid grew into a city of considerable importance. From the reigns of Alfonso VII to Philip II (and again from 1600 to 1606 under Philip III) it was the seat of the Castilian and then of the Spanish court. The Ansúrez lordship was ended in 1208 when Alfonso VIII incorporated Valladolid with the crown lands. The Catholic monarchs Isabella of Castile and Ferdinand of Aragon were married there in 1469

Valladolid suffered severely during the Peninsular War (1808-14), when many of its ancient buildings were destroyed by the French. Surviving architectural monuments are the collegiate church of Santa Cruz (late 15th century); the university, which has a Baroque facade (1715) by Narciso and Diego Tomé; the house of the counts of Rivadavia (now the Diputación Provincial), in which Philip II was born in 1527; and the Capitanía General palace, a former royal palace with a notable patio. The unfinished cathedral, incorporating parts of a 13th-century structure, was begun in 1585 by Juan de Herrera and was consecrated in 1688.

Other landmarks include the collegiate church of San Gregorio, of the 15th century, with a magnificent late Gothic facade, now housing a famous museum of wood sculpture and carving; and a monument to Christopher Columbus (erected 1905), who died in Valladolid on May 20, 1506.

Valladolid's university (founded 1346) is one of the oldest in Spain. The city has many other educational institutions and is the seat

Industry (food processing, textiles, engineering) and commerce are the most important sources of employment, though there is some work in forestry and agriculture. Pop. (1985) est.) 335,374.

Valladolid, University of, Spanish UNIVER-SIDAD DE VALLADOLID, coeducational state institution of higher learning at Valladolid, in northwestern Spain. Established in the 13th century as an outgrowth of an old episcopal school of Valladolid, the university was recognized by Pope Clement VI in 1346 and was endowed and granted special privileges by the kings of Spain. By the 16th century it drew students from all over Spain, training candidates for posts in the Spanish empire. At first a school of liberal arts and theology, the university soon became known for its courses in canon law. It was reorganized as a state university in the 19th century. The modern university includes faculties of law, science, philosophy and letters, medicine, and economics and political science. There is also a faculty of law at San Sebastián and a faculty of science at Santander.

Vallandigham, Clement L(aird) (b. July 29, 1820, Lisbon, Ohio, U.S.-d. June 17, 1871,

Lebanon, Ohio), politician during the American Civil War (1861-65) whose Southern sympathies and determined vendetta against the Federal government and its war policy resulted in his court-martial and exile to the Confederacy.

Admitted to the Ohio bar in 1842, Vallandigham was elected to the state legislature in 1845. While a member of the U.S. House of Representatives (1857-63), he was adamant

against the principles and policies of the newly formed Republican Party, particularly as they related to the slavery issue. Of Southern ancestry, he idealized the Southern way of life, and he assumed leadership of the faction of Midwest Democrats, called Copperheads, who opposed the prosecution of the war against the South—a war they viewed as beneficial only to Eastern interests.

During the Civil War he bitterly attacked the administration of President Abraham Lincoln, charging that it was destroying not only the Constitution but civil liberty as well. He also became commander of the secret, antiwar Knights of the Golden Circle (later Sons of Liberty). In 1863 he made vigorous speeches in Ohio against the war and the government and consequently grew to be one of the most suspected and hated men in the North. He was arrested in May by military authorities for expressing treasonable sympathy with the enemy; tried and found guilty by a military commission, he was sentenced to imprisonment. Soon afterward Lincoln commuted his sentence to banishment behind Confederate

Bored with exile in the South, Vallandigham made his way to Canada, where he continued his campaign of harassment from across the border. In September 1863 the Ohio Peace Democrats nominated him in absentia for governor, but resounding Union military victories at Gettysburg and Vicksburg in July ensured his decisive defeat at the polls. He returned illegally to Ohio in 1864 and took an active part in that year's election campaign. He also wrote part of the national Democratic platform in which the war was denounced as a failure.

After the war Vallandigham criticized the Radical Reconstruction policy of the Republicans as both unconstitutional and tyrannical, but in 1870 he recognized the uselessness of further opposition and urged his party to emphasize financial issues instead. He died the following year after accidentally shooting himself with a firearm that was an exhibit in a murder trial.

Valle, Pietro della (b. April 11, 1586, Rome—d. April 21, 1652, Rome), Italian traveler to Persia and India whose letters detailing his wanderings are valuable for their full descriptions.

Valle vowed to make a pilgrimage to the Holy Land, and on June 8, 1614, he sailed from Venice for Istanbul, where he remained a year, learning Turkish and Arabic. On Sept. 25, 1615, he left for Jerusalem by way of Alexandria, Cairo, and Mount Sinai. After visiting the holy sites, he proceeded to Damascus and Baghdad, where he married a Syrian Christian woman, and to Eşfahān, Persia (now in Iran), which he reached early in 1617. He attended the court of Shāh 'Abbās I and then resumed his journey with his wife. She died at Persepolis, Persia (1621), and Valle transported her embalmed remains with him on his journey. He reached Surat in northwestern India in 1623 and, for about a year, continued southward along the coast to Calicut (Kozhikode). By way of Basra, in southern Mesopotamia, and the desert route to Aleppo, Syria, Valle finally reached Rome on March 28, 1626.

In Rome he was appointed a gentleman of the bedchamber by Pope Urban VIII. He recorded his travels in a series of letters published in three volumes: *Turkey* (1650), *Persia* (1658), and *India* (1663). An account of his life and travels is in Wilfrid Blunt, *Pietro's Pilgrimage* (1953).

Valle Central, also called MESETA CENTRAL, highland valley in central Costa Rica, containing most of the country's large cities and about 60 percent of the total population. The area of 3,500 square miles (9,000 square km) is actually formed by two basins separated by low volcanic hills, 3,000 to 5,000 feet (900 to 1,500 m) above sea level. The naturally rich soils are a result of the gradual weathering of volcanic material and basaltic lavas from the four volcanoes overlooking the valley from the Cordillera Central to the north. The subtropical forest of precolonial days gave way around 1850 to coffee cultivation, which has leached the soils and reduced their fertility. The higher and smaller basin is drained by the Reventazon River, which flows into the Caribbean. The Inter-American Highway passes through the region, where the capitals of four provinces (Alajuela, Heredia, San Jose, and Cartago) cluster near the convergence of the provincial boundaries.

Valle d'Aosta, region, northwestern Italy, containing the upper basin of the Dora Baltea River, from its source near Mount Blanc to just above Ivrea. The region is enclosed on the north, west, and south by the Alps and has an area of 1,259 square miles (3,262 square km). Originally the territory of the Salassi, a Celtic tribe, the valley was annexed by the Romans; Aosta (q.v.), the capital, was founded in 24 BC. After the fall of the Western Roman Empire in the 5th century, the Valle d'Aosta formed part of the Burgundian and Frankish kingdoms, passing through many hands until it was acquired in the 11th century by the House of Savoy (the future royal house of Italy). Aosta province was formed from part of Torino province in 1927, and the autonomous region of Valle d'Aosta was created in 1945 in recognition of the special French linguistic and cultural orientation of the area. time, the southern portion was returned to Torino province.

The busy highway from the Po Valley to the Great and Little St. Bernard passes runs through the region, which is important for dairy products and tourism and has hydroelectric resources. There is some industry in the area. A nationalist group supporting increased use of French in the region gained political and electoral strength throughout the 1970s. Pop. (1986 est.) 113,714.

Valle de la Pascua, city, northeastern Guárico state, central Venezuela. Lying in the Llanos (plains), it is an important regional centre for a large cattle-raising area. Its main commodities are livestock products; the dairy industry is also prominent. The city lies on the highway that skirts the southern slopes of the Andes from San Cristóbal, near the Colombian border, to El Tigre, 130 miles (210 km) to the east-southeast. Pop. (1987 est.) 67,913.

Valle del Cauca, department, western Colombia, rising from the Pacific lowlands across the Andean Cordillera Occidental to encompass the valley of the upper Cauca River. It covers an area of 8,548 square miles (22,140 square km). The department is a leading producer of sugar, rice, tobacco, and coffee. Buenaventura is the nation's chief Pacific port, through which the major portion of Colombia's coffee is exported. The Pan-American Highway and the Puerto Berrío-Popayán

railroad run along the Cauca Valley, linking Cali with major cities to the northeast. Pop. (1985) 2,847,087.

Valle-Inclán, Ramón María del (b. Oct. 28, 1866, Villanueva de Arosa, Spain—d. Jan. 5, 1936, Santiago de Compostela), Spanish novelist, dramatist, and poet who combined a sensuous use of language with bitter social satire.

Valle-Inclán was raised in rural Galicia, and after attending law school and visiting Mexico City he settled in Madrid, where he became known for his colourful personality. He early came under French Symbolist influence, and his first notable works, the four novelettes known as the Sonatas (1902–05), feature a beautifully evocative prose and a tone of refined and elegant decadence. They narrate the seductions and other doings of a Galician womanizer who is partly an autobiographical figure. In his subsequent works Valle-Inclán developed a style that is rich in both popular and literary appeal, as in several plays featuring the patriarchal Don Juan Manuel de Montenegro and his brood of wild sons.

Some of Valle-Inclán's later plays and novels are in the manner he called *esperpento* ("horrible, nauseating persons, or things"). This intentionally absurd and cruelly satirical style is intended to express the tragic meaning of Spanish life—which he saw as a gross deformation of European civilization—through the systematic distortion of classic heroes. The best of his *esperpento* plays are *Luces de Bohemia* (1920; "Lights of Bohemia") and *Los cuernos de Don Friolera* (1921; "Don Friolera's

Horns"). His major novels of the later period include two works, *La corte de los milagros* (1927) and *Viva mi dueno* (1928), as well as an unfinished one, *Baza de espadas* (1958), that were part of an unfinished nine-volume cycle of historical novels collectively entitled *El ruedo ibérico* (1927–28; "The Iberian Circle"); the completed works deal with the political corruption and social degradation of Spain in the latter 19th century. Valle-Inclán's novel *Tirano Banderas* (1926) is a vivid portrayal of a Latin-American despot.

Valledupar, capital of César department, northern Colombia. It is situated on a plain between two mountain ranges, the Serranía de Perijá and the Sierra Nevada de Santa Marta. Founded in 1550, the settlement prospered during the colonial era but suffered much damage in 19th-century civil wars. It is now a commercial centre for the agricultural and pastoral hinterland. Factories produce ice and bricks, and there is a sawmill. The city lies on the Santa Marta-Bogotá highway; another road leads north to Ríohacha. Valledupar is also served by domestic airlines. Pop. (1985) 142,771.

Vallee, Rudy, byname of HUBERT PRIOR VALLÉE (b. July 28, 1901, Island Pond, Vt., U.S.—d. July 3, 1986, North Hollywood, Calif.), one of the most popular American singers of the 1920s and '30s. His collegiate style as a singing bandleader made him a national figure.

While attending Yale University (Ph.B., 1927), he became a professional musician, playing first drums, then clarinet, then saxo-phone and working with Vincent Lopez and the London Savoy Havana Band (1924-25), among others. In 1928 he formed his own dance band, first called the Yale Collegians and then renamed the Connecticut Yankees, and concentrated on singing, using a hand megaphone, which became one of his trademarks, to amplify his suave, light-toned voice. For a time he was a prolific broadcaster. Later he moved to other aspects of show business, becoming a nightclub owner, a master of ceremonies in theatres, and an actor in Hollywood, where, beginning as a singer in the film Vagabond Lover (1929), he evolved into an accomplished light comedian and a character actor. His last major role was in the stage and film versions (1961-64 and 1967) of the musical How to Succeed in Business Without Really Trying (1967). Vallee's radio and stage theme songs were "My Time Is Your Time" and "The Whiffenpoof Song."

Vallejo, city, Solano County, western California, U.S. It lies along San Pablo Bay at the mouth of the Napa River, just north of Oakland. In 1850 General Mariano G. Vallejo offered land for the new state capital of California. Although his offer was accepted and the new town of Vallejo was laid out, the legislature met there for only seven days in January 1852 and for a month in 1853. The establishment of the Mare Island Naval Shipvard in 1854 permitted the town to survive. An agricultural-trade centre, it has developed flourmilling and meat-packing industries. Military installations in the area, including Travis Air Force Base, are important to the economy. The California Maritime Academy was established there in 1929. Inc. city, 1868. Pop. (1986 est.) city, 93,562; Vallejo-Fairfield-Napa metropolitan area (PMSA), 392,300.

Vallejo, César (Abraham) (b. March 16, 1892, Santiago de Chuco, Peru—d. April 15, 1938, Paris), Peruvian poet who in exile became a major voice of social change in Spanish-American literature.

Born the 11th child to a family of mixed Spanish and Indian origins, Vallejo as a child witnessed at firsthand hunger and poverty and the injustices done to the Indians. He attended the University of Trujillo (1913–17), where he studied literature, wrote a thesis, *El romanticismo en la poesía castellana* ("Romanticism in Castilian Poetry"; published 1954), and studied law

Vallejo's first book of poems, Los heraldos negros (1918; "The Black Heralds"), showed him still under the stylistic influence of Parnassianism and Modernism in his exploration of what were to be his major themes: his loss of security when his mother and older brother died; his resulting sense of the futility and inherent limitations of life; and the inability of human beings to achieve their potential because of social oppression and injustice.

In 1920 Vallejo's involvement in political matters concerning Indians led to his imprisonment for nearly three months. This experience heightened his feeling of loss at the death of his mother and contributed to a state of depression that was to torment him the rest of his life. Escalas melografiadas (1922; "Musical Scales"), a collection of short stories, and many of the more complex poems of Trilce (1922) were conceived during his imprisonment. The major work Trilce signaled a complete break with tradition by incorporating neologisms, colloquialisms, typographic innovations, and startling imagery in Vallejo's attempt to express the disparity that he felt existed between human aspirations and the limitations imposed on people by biological existence and social organization.

After publishing Fabula salvaje (1923; "Savage Story"), a short psychological novel about the decline of a mentally disturbed Indian, Vallejo left for Paris, never to return to his native land. Life in Paris was difficult for him, he barely made a living from translations, language tutoring, and political writing. But while he felt like an outsider because of his Indian heritage, he succeeded in establishing contacts with leading avant-garde artists. He kept in touch with Peru by publishing articles in Amauta, the journal founded by his friend José Carlos Mariátegui, founder of the Peruvian Communist party.

Vallejo came to believe that the language of poetry should be devoid of all traditional devices in its description of the human condition, and that literature should also serve the cause of the masses. Marxism seemed to him to be the only way of rectifying the abuses and injustices he saw in society, and two visits to Russia in 1928 and 1929 served to reinforce his political commitment. He joined the Communist Party in 1931.

Vallejo was expelled from Paris in 1930 as a political militant and went to Madrid. There he wrote the proletarian novel El tungsteno (1931; "Tungsten"), showing the brutal exploitation and degradation of Indian workers at a Peruvian tungsten mine. He returned to Paris in 1932, and he then spent two years in Spain during that nation's civil war (1936–39). The Spanish Civil War inspired most of his last important volume of poetry, Poemas humanos (1939; Human Poems), which presents an apocalyptic vision of an industrial society in crisis and unable to advance beyond a state of mass evil, alienation, and despair.

Most of the poems of the 1930s were published only after Vallejo's death. His fiction is collected in *Novelas y cuentos completos* (1970; "Complete Novels and Stories") and his poetry in *Obra poética completa* (1974; "Complete Poetical Works"). *The Complete Posthumous Poetry* (1978) is an English translation by Clayton Eshleman and José Rubia Barcia.

Books about Vallejo include André Coyné, César Vallejo (1968); James Higgins, Visión del hombre y de la vida en las últimas obras poéticas de Vallejo (1968; "Vision of Man and Life in the Last Poetical Works of Vallejo"); Angel Flores, ed., Aproximaciones a César Vallejo, 2 vol. (1971; "Encounters with César Vallejo"); and Jean Franco, César Vallejo: The Dialectics of Poetry and Silence (1976).

Valles, in full CIUDAD DE VALLES, city, eastern San Luis Potosi state, northeastern Mexico. It lies along the Tampaon (or Valles) River, west-southwest of Tampico. Sugarcane, citrus fruits, avocados, coffee, tobacco, and cattle are processed there, and lumbering (principally pine) is also important. The city is a commercial centre and a transportation hub that is easily accessible by highways and by railroad. Pop. (1980) 65,609.

Vallès, Jules (-Louis-Joseph) (b. June 10, 1832, Le-Puy-en-Velay, Fr.—d. Feb. 14, 1885, Paris), French Socialist journalist and novelist, founder of *Le Cri du Peuple* (1871), which became one of France's leading Socialist newspapers.

The son of a provincial schoolteacher, Vallès moved to Paris to pursue his studies and was soon involved in left-wing political activities. He became a popular and controversial journalist in the 1850s, attracting attention with his sympathetic descriptions of the poor and outcast and his attacks on the French bourgeoisie. He became a member of the Commune of Paris of 1871, serving on its education commission. After the suppression of the Commune, Vallès fled to England, returning to France following the amnesty of 1880. Perhaps his best-regarded work is the trilogy of autobiographical novels entitled *Jacques Vingtras* (1879–86).

Valletta, also spelled VALETTA, seaport and capital of Malta, on the northeast coast of the island. The nucleus of the city is built on the promontory of Mount Sceberras that runs like a tongue into the middle of a bay, which it thus divides into two harbours, Grand Harbour to the east and Marsamxett (Marsamuscetto) Harbour to the west. Built after the Great Siege of Malta in 1565, which checked the advance of Ottoman power in southern Europe, it was named after Jean Parisot de la Valette, grand master of the order of Hos-

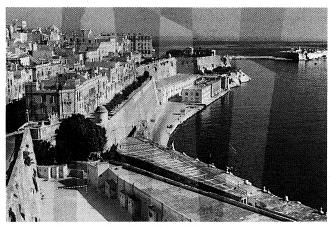

Grand Masters (1574), now the residence of the president of the Republic of Malta and the seat of the House of Representatives and containing the armoury of the Hospitalers; the Aragon Auberge, now the Ministry of Education and Culture; the Provence Auberge, now the National Museum; and the Castile and León Auberge, now the office of the prime minister. Of the other auberges (lodges built for the langues, or nationalities, of the Hospitalers), those of France and Auvergne were destroyed in World War II, and that of Italy was heavily damaged. The National Malta Library was built in the late 18th century; the University of Malta was founded by Pope Clement VIII in 1592; the Manoel Theatre dates from 1731-32; and the National Museum of Fine Arts (opened 1974) is housed in a residence dating from 1571.

Valletta has little industry but is the centre of the large transit trade and the local trade of the islands. Since World War II its naval dockyard has been converted for commercial use. The city's artistic treasures and equable climate sustain a considerable tourist trade. Pop. (1986 est.) 9,263.

valley, elongate depression of the Earth's surface. Valleys are commonly drained by rivers and may be in a relatively flat plain or between ranges of hills or mountains.

A brief treatment of valleys follows. For full treatment, *see* MACROPAEDIA: Continental Landforms.

Valleys formed by the incision of rivers and by slope denudation are typically V-shaped; those formerly occupied by glaciers are characteristically U-shaped. Valley evolution is mainly controlled by climate and rock type; most valleys are in balance with the stream regime flowing through them. Formerly, all valleys were thought to be great chasms in

pitalers (Knights of St. John of Jerusalem), and became the Maltese capital in 1570. The Hospitallers were driven out by the French in 1798, and a Maltese revolt against the French garrison led to Valletta's seizure by the British in 1800. After 1814 the city became a British Mediterranean naval and military base of the first importance; it was subjected to severe bombing raids in World War II and was the place where the Italian fleet surrendered in 1943.

One of the most interesting buildings in Valletta is St. John's Co-Cathedral, which was formerly the conventual church of the Hospitaler order and is now equal in rank with the archbishop's cathedral at Mdina. It was designed by the Maltese architect Gerolamo Cassar and built between 1573 and 1578. Other important buildings by Cassar are the Palace of the

the Earth opened up by cataclysmic tectonic events. Depressions formed in this way are not true valleys, although they are often called such; examples are Death Valley and the Great Valley of California.

Very narrow, deep valleys cut in resistant rock and having steep, almost vertical sides are called canyons. They may reach depths of several thousand feet. Smaller valleys of similar appearance are called gorges. Both types are commonly cut in flat-lying strata but may occur in other geological situations.

Valley City, city, seat (1875) of Barnes County, southeastern North Dakota, U.S., in the Sheyenne River Valley. Settlers went there in 1872 with the coming of the Northern Pacific Railway. Originally called Worthington, the community was renamed and incorporated as a village in 1881. It developed as

an agricultural trade centre. Valley City State College was opened in 1890. Bald Hill Dam, a flood-control project on the Sheyenne River, impounds Lake Ashtabula 11 mi (18 km) northwest. Inc. city, 1883. Pop. (1980) 7,774.

Valley Forge, in U.S. War of Independence, Pennsylvania encampment grounds of the Continental Army under Gen. George Washington from Dec. 19, 1777, to June 19, 1778, a period that marked the triumph of morale and military discipline over severe hardship. Following the American failures at nearby Brandywine and Germantown, Washington led 11,000 regulars to take up winter quarters at Valley Forge on the west bank of the Schuylkill River, 22 miles northwest of Philadelphia, then occupied by the British. The site was considered a defensible one, strategically located on leading trade routes and near farm supplies.

During that unusually harsh winter, the force of Washington's leadership held together the dwindling American Army, which was suffering from the bitter cold, lack of clothes, semistarvation, gross mismanagement in the commissary and transport departments, Congressional neglect, and public criticism. More adequate money and supplies were forthcoming after the Franco-American Alliance became known in late spring 1778. Despite rampant disease and hundreds of deaths, the Continental Army was reorganized, and it emerged the following June as a well-disciplined and efficient fighting force, largely due to the efficient drilling methods introduced by Baron Frederick von Steuben.

The encampment grounds of more than 2,000 acres are maintained by the National Park Service of the Department of the Interior as the Valley Forge National Historic Park.

Valli, Romolo (b. Feb. 7, 1925, Reggio Emilia, Italy—d. Feb. 1, 1980, Rome), Italian actor who appeared in leading stage roles and won many awards for his work in motion pictures. He was also well known as a theatre manager and founded the Compagnia dei Giovani with his friend Giorgio de Lullo in 1954.

Valli's first major success came in the early 1950s at the Piccolo Teatro in Milan, and he went on to play in works by classical and modern dramatists. He toured in London and Paris and managed the Spoleto Festival until 1978. Valli had roles in many films, including Luchino Visconti's Il Gattopardo (1963; The Leopard) and Death in Venice (1971), Vittorio De Sica's Il Giardino dei Finzi-Contini (1970; The Garden of the Finzi-Continis), and Bernardo Bertolucci's 1900 (1975). He was appearing in a new play with his company I Giovani del Teatro Elisio when he was killed in an automobile accident.

site of the hermitage of Sta. Maria d'Acquabella and later that of the Benedictine monastery founded in the 11th century by St. John Gualberto (or Gualbert). Although the monastery was plundered by the troops of the Holy Roman emperor Charles V in 1529 and those of Napoleon in 1808 and finally confiscated in 1866, its buildings (largely 17th century) and rich art works remain. The village is now a summer resort, and the monastery, which served as a school of forestry (1870–1914), is now used for summer schools of the University of Florence.

Valois, historic region of France that gave its name to the second line of the Capetian dynasty; it corresponds to the southeastern quarter of the modern département of Oise, with an adjacent portion of Aisne. Under the Merovingian kings (c. 500-751) and their successors, the first Carolingians, the county of Valois, or pagus Vadensis, with its capital at Vez, was an administrative district; in the post-Carolingian period it became a hereditary countship. Dynastically united with the Vexin (borderland between Île-de-France and Normandy) in the early Capetian period, it passed, with Crépy as capital, in 1077 to the House of Vermandois. In 1214 Philip II Augustus of France annexed Valois to the royal domain. Philip of Valois became king of France in 1328; his descendants ruled until 1589. Under them, Valois was a duchy held by members of the royal family. Louis XIII, a Bourbon king, gave Valois to his brother Gaston, duc d'Orléans, in 1630. Louis XIV gave it in turn to his brother Philippe, likewise duc d'Orléans, in 1661. The latter's descendants held it until the Revolution. In 1790 it was erased in the redivision of France into départements.

Valois DYNASTY, the royal house of France from 1328 to 1589, ruling the nation from the end of the feudal period into the early modern age. The Valois kings continued the work of unifying France and centralizing royal power begun under their predecessors, the Capetian dynasty (q.v.).

The House of Valois was a branch of the Capetian family, for it was descended from Charles of Valois, whose Capetian father, King Philip III, awarded him the county of Valois in 1285. Charles's son and successor, Philip, count of Valois, became king of France as Philip VI in 1328, and thus began the Valois dynasty. The house subsequently had three lines: (1) the direct line, beginning with Philip VI, which reigned from 1328 to 1498; (2) the Valois-Orléans branch, which consisted of one member, Louis XII (reigned 1498–1515), son of Charles, duc d'Orléans, a descen-

dant of King Charles V; and (3) the Valois-Angoulême branch, beginning with Francis I, son of Charles, count of Angoulême, another descendant of Charles V; it reigned from 1515 to 1574 and was succeeded by the Bourbon dynasty, another branch of the Capetians.

The early kings of the Valois dynasty were occupied primarily with fighting the Hundred Years' War (1337–1453), which broke out under Philip VI (reigned 1328–50). During this period the monarchy was threatened both by the English, who at times controlled much of France, and by the revived strength of feudal lords, such as the Armagnac and Burgundian factions, which challenged the supremacy of the kings. Charles VII (reigned 1422–61) met these threats and began the task of restoring royal power.

The Valois kings gradually increased their authority at the expense of the privileges of the feudal lords. The crown's exclusive right to levy taxes and to wage war was established; and many of the basic administrative institutions that had begun to develop under the Capetians continued to evolve under the Valois; for example, the Parlements (courts) were extended throughout France to dispense royal justice. Their strong position in France enabled three of the Valois kings (Charles VIII, reigned 1483-98; Louis XII, reigned 1498-1515; and Francis I, reigned 1515-47) to undertake the ultimately unsuccessful Italian wars of the late 15th and early 16th centuries. These wars marked the start of Valois rivalry with the Habsburgs (ruling house of the Holy Roman Empire), a rivalry which lasted until the end of the French dynasty.

The French Renaissance occurred during the reigns of Francis I and Henry II (reigned 1547-59). The Wars of Religion (1562-98) weakened the power of the last Valois kings, for militant Roman Catholic and Protestant factions dominated politics.

Valparaíso, region, central Chile, bordering the Pacific Ocean on the west, Argentina on the east, and Santiago metropolitan region on the southeast. It was created in 1974 and encompasses Valparaíso, San Antonio, Quillota, Petorca, San Felipe, Los Andes, and Isla de Pascua (Easter Island) provinces. Valparaíso region has an area of 6,193 sq mi (16,040 sq km) and is Chile's third most populous region. In the north the region is mountainous, interrupted by broad valleys, including the northern reaches of the Central Valley of Chile, which lies between the coastal ranges and the piedmont alluvial slopes of the Andes. Climatically, the region lies in a transitional zone between the arid northern part of Chile and the subhumid central part. Major transverse valleys include those of the Aconcagua and Ligua rivers, their tributaries, and the lower Río Maipo basin.

In the fertile northern valleys where irrigation is employed, especially around San Felipe, and in the westward-draining lowlands near Valparaíso city, the regional capital, alfalfa, grapes and other fruits, vegetables, and cereal grains are grown. Cattle and sheep are pastured in the rangeland in the coastal mountains of southwestern Valparaíso region. The region contains rich mineral resources, particularly copper, kaolin, and salt. It is second in the nation to Santiago metropolitan region in industrial development; leading products are textiles, chemicals, cement, clothing, processed foods, and tobacco. The Concón petroleum refinery and the oil storage tanks at Quintero and Viña del Mar are economically important. The port of San Antonio, south of Valparaíso city, exports copper brought by railroad from the large mine at El Teniente, near Rancagua in O'Higgins region. Highways and an electrified railway link the urban centres to Valparaíso city. The Pan-American Highway and the main north-south railroad pass through the northern portion of the region, which was heavily damaged in a 1971 earthquake. A major east-west highway connects the region with Mendoza, Arg., via the Uspallata Pass, site of the famed statue "Christ of the Andes," on the border. Valparaíso also has several popular beach resorts, notably Viña del Mar (q.v.). Portillo, near Mount Aconcagua (22,834 feet [6,960 m]), has become South America's most popular Andean winter resort, particularly for skiing.

Juan Fernández Islands and Easter Island in the Pacific are administered from Valparaíso city. Pop. (1987 est.) 1,336,073.

Valparaíso, capital of Valparaíso provincia and región, central Chile, lying on the south side of a broad, open bay of the Pacific, 115 miles (185 km) northwest of Santiago. The city stands on the slopes of a semicircular spur of the coastal mountain range that ends in the rocky peninsula of Point Angeles. This point affords good shelter to the bay from southerly and westerly winds but leaves it open to those from the north.

Valparaíso city, Chile Walter Aquiar—EB Inc.

Valparaíso was founded in 1536 by a conquistador, Juan de Saavedra, who named it for his birthplace in Spain. Few colonial buildings have survived a succession of pirate raids, severe storms, fires, and earthquakes. After Chilean independence in 1818 and the final breaking of Spanish mercantile monopoly, the port developed with the birth and evolving power of the Chilean navy and the links created by steamship services to Europe. Much of the city was rebuilt after a devastating earthquake in 1906; many buildings were again heavily damaged in a 1971 earthquake. Although Valparaiso has long been one of Chile's largest cities, its population grew relatively slowly during the mid- and late 20th century and even tended to decrease.

The commercial quarter of Valparaiso, with its port works, warehouses, banks, and shopping centre, occupies reclaimed land adjacent to the bay, as do the administrative buildings grouped around the Plaza Sotomayor. The cathedral, parks, boulevards, theatres, cafes, and a few colonial buildings, notably the Church of La Matriz, are also concentrated in this lower part of the city. The Chilean naval academy buildings and residential quarters are located on the steep slopes and valleys of encircling hills, with an agglomeration of poorer dwellings and shacks occupying the highest parts. Funicular railways, elevators, steps, and zigzag roads connect the lower city with the upper. The adjacent tourist resort of Viña del Mar gradually evolved into a residential sub-

Valparaíso is preeminently commercial and industrial; there are foundries as well as factories that produce chemicals, textiles, sugar, paints, clothing, leather goods, and vegetable oils. An oil refinery is at nearby Concón. Most Chilean imports enter through the port; and, although its exports are a small fraction of the value of the Chilean total, its significance in internal maritime communications

is paramount. It is a terminal and major port of call for several international shipping lines.

It is also a cultural centre and is the site of the Federico Santa María Technical University (established 1926), the Catholic University of Valparaíso (1928), and the Natural History and Fine Arts museums.

State railways connect Valparaíso with the national capital of Santiago, 115 miles (185 km) southeast, and with all the important cities and ports of Chile from Pisagua to Puerto Montt. The city is the western terminus of the Transandine Railway and thus has direct overland connection with Buenos Aires. Good highways run to the resort towns north and south and to Santiago. Internal airlines link the city with other parts of Chile. Pop. (1987 est.) 278,762.

Valparaiso, city, seat of Porter county, northwestern Indiana, U.S., just east-southeast of Gary. Laid out in 1836 as the county seat, it was first called Portersville but was renamed for Valparaíso, Chile. It was a point on the old Sauk Trail, a thoroughfare for Sauk Indians traveling to Detroit to collect annuities from the British for services in the War of 1812. Valparaiso is in a dairy and popcorn-seed-growing area. Manufactures include magnets, steel products, automobile accessories, food-processing machinery, and electrical specialties. It is the site of Valparaiso University (1859; Lutheran Church-Missouri Synod), Valparaiso Technical Institute (1874), and Sloan Galleries of American Paintings. Pines Ski Area. Indiana Dunes State Park, and Flint Lake are nearby. Inc. 1865. Pop. (1987) est.) 22,391.

Valsād, also called BULSĀR, town, southeastern Gujarāt state, west-central India, on the Gulf of Cambay, south of the city of Surat. Known for its handloomed cloth, dyes, bricks, and pottery, it also has a castor-oil-extraction industry. Fruit is grown in the vicinity. One of many minor ports of Gujarāt, Valsād exports cotton and silk fabrics, grain, timber, tiles, and molasses. It is served by national and state highways and lies on the main line of the Western Railway.

Except for a barren coastal stretch, the area around Valsād is intensively cultivated; chief crops include cotton, millet, pulses, and rice. Railroads and highways traverse the region, centring upon Valsād. Pop. (1981) town, 54,-017; metropolitan area, 82,697.

Valtellina, German VELTLIN, upper valley of the Adda River from its sources in the Ortles mountains westward to its entry into Lake Como, largely in Sondrio provincia, Lombardia (Lombardy) regione, northern Italy. The valley is enclosed by the Bernina Alps (north), the Ortles mountains (northeast), and the Orobie Alps (south) and traversed by good roads over four well-marked Alpine passes: the Stelvio (9,042 feet [2,756 m]), the Bernina (7,621 feet [2,323 m]), the Aprica (3,858 feet [1,176 m]), and the Umbrail (9,944 feet [3,031 m]).

Historically, the valley was the southern part of ancient Raetia (q.v.). It was then the object of dispute between Milan and the bishops of Como from the 6th to the 13th century and between Milan and the Swiss canton of Graubünden in the 16th and 17th centuries. It belonged to the Graubunden from 1639 until 1797 and, after being dominated by the French during the Napoleonic Wars, passed to Austrian Lombardy; it was joined to the Kingdom of Italy in 1859. The population of the Valtellina within the diocese of Como is Italian-speaking and Roman Catholic. Vigorous measures have been taken to prevent inundations of the Adda, and the fertile valley supports varied agriculture, forestry, and livestock. The Valtellina is known for its wines. and it has also become important for its hydroelectric plants. Tourism is an increasingly significant economic factor. The chief towns are Sondrio, Tirano, Chiavenna, Morbegno, and Bormio.

value-added tax, government levy on the amount that a business firm adds to the price of a commodity during production and distribution of a good. Three major types of value-added tax have been identified, depending on the deductions allowed, but only one—called the "consumption" type—is widely used today.

Calculation of the value-added tax of the consumption type can be made in any of three different ways, but virtually every country imposing the tax uses the "invoice," or "credit," method of computation. Using this method, each seller (the party responsible for collecting the tax and paying it to the government) first calculates the sum of all the taxes that he has collected on goods sold; he then totals the sum of all the taxes that he has paid on goods purchased. His net tax liability is the difference between the tax collected and the tax paid.

tax paid. It is generally assumed that the burden of the value-added tax, like that of other sales taxes, falls upon the final consumer. Although the tax is collected at each stage of the production-distribution chain, the fact that sellers receive a credit for their tax payments causes the tax, in effect, to be passed on to the final

consumer, who receives no credit. The tax can be regressive (*i.e.*, the percentage of income paid in tax rises as income falls), but most countries have at least partly avoided this effect by applying a lower rate to necessities

than to luxury items.

In 1954 France was the first country to adopt the value-added tax on a large scale. It served as an improvement on the earlier turnover tax, by which a product was taxed repeatedly at every stage of production and distribution, without relief for taxes paid at previous stages. Although easier to administer, such a tax discriminated heavily against industries and sectors in which products were bought and sold several times, encouraging an undesirable concentration of economic power.

In 1968 West Germany adopted the value-added tax, and since then most of the other western European nations have followed suit, largely as the result of a desire to harmonize tax systems. All members of the European Communities are required to implement value-added taxes that conform to a model prescribed by the Community. Many countries in South America, Asia, and Africa have also adopted the tax. The U.S. state of Michigan used a value-added tax from 1953 through 1967 and again from 1975.

valve, in anatomy, any of various structures, especially in the heart, veins, and lymph ducts, that function to close temporarily a passage or orifice, permitting movement of a fluid in one direction only. A valve may consist of a sphincter muscle or of two or three membranous folds.

In the heart there are two valves that prevent backflow of blood from the ventricles into the atria. On the right side of the heart is the tricuspid valve, composed of three flaps of tissue; on the left is the two-piece bicuspid valve. Once blood has left the heart and entered the aorta, its return is prevented by the semilunar valves, which are membranous sacs that open away from the heart. If the flow of blood reverses, the sacs fill and expand, blocking the entrance of the aorta. The valves in the venous system are of this same type. A valve unique to birds is the renal portal valve, which closes to shunt blood past the kidneys, increasing its supply elsewhere when necessary. In the digestive system of mammals the ileocecal valve, controlled by a sphincter muscle, prevents the return of the contents of the small intestine after they have passed into the colon.

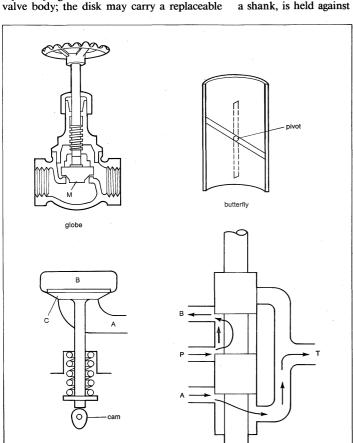

valve, in mechanical engineering, device for controlling the flow of fluids (liquids, gases, slurries) in a pipe or other enclosure. Control is by means of a movable element that opens, shuts, or partially obstructs an opening in a passageway. Valves are of seven main types: globe, gate, needle, plug (cock), butterfly, poppet, and spool.

In the globe valve shown in the Figure (upper left), the movable element M may be a tapered plug or a disk that fits a seat on the valve body; the disk may carry a replaceable

and permit flow in one direction only. They are made in several types. If the movable element in the globe valve in the Figure were kept on its seat by gravity or a spring, it would permit flow from left to right but not from right to left.

Safety valves, which are usually of the poppet type, open at a predetermined pressure. The movable element may be kept on its seat by a weighted lever or a spring strong enough to hold the valve closed until the pressure is reached at which safe operation requires opening.

On gasoline engines, poppet valves are used to control the admission and rejection of the intake and exhaust gases to the cylinders. In the Figure (lower left), the valve, which consists of a disk with a tapered edge attached to a shank, is held against the tapered seat C by

Types of valves

poppet

rubber or leather washer, as in a household water faucet. In a gate valve, the movable element is a wedge-shaped disk that seats against two tapered faces in the valve body. A needle valve has a long tapered needle fitting in a tapered seat.

A plug valve, or cock, is a conical plug with a hole perpendicular to its axis fitting in a conical seat in the valve body at right angles to the pipe. By turning the plug the hole is either lined up with the pipe to permit flow or set at right angles to block the passage.

A butterfly valve is a circular disk pivoted along one diameter; the solid lines in the Figure (upper right) show one in the closed position. In the fully open position, shown dotted, the disk is parallel to the direction of flow. The damper in a stovepipe or a warm-air heating system is of this type, which is also used in the intake passage to carburetors on gasoline engines. On hydraulic turbines such valves may be 20 feet or more in diameter.

Some valves operate automatically; check (or nonreturn) valves, for example, are self-acting a compressed spring. The valve is raised from its seat by the action of a rotating cam that pushes on the bottom of the shank, permitting gas flow between region A, which leads to the intake or exhaust pipes, and region B, which leads to the cylinder.

In hydrostatic fluid-power systems, in which the working medium is usually pressurized oil, spool valves are employed to regulate the oil flow. The valve shown in the Figure (lower right) provides two flow paths for the output from a pump. In the extreme upper position, as shown, active flow is from the pump port P to the working, or load, port B; discarded fluid from the load passes from port A to the tank or sump port T. In the extreme lower position, the functions of ports A and B are reversed. In the mid or neutral position of the spool, ports A and B are blocked. The movement of the spool may be manually or electrically controlled.

valve, in music, a device, first used in 1815 by musicians Heinrich Stölzel and Friedrich Blühmel of Berlin, that alters the length of the vibrating air column in brass wind instruments by allowing air to pass through a small piece of metal tubing, or crook, permanently attached to the instrument. Descending valves switch in extra tubing, lowering the fundamental pitch; the less common ascending valves cut air off from the tubing, raising the pitch. Valves enable players to produce notes lying outside the harmonic series of an air column the length of the original tubing (in relative pitch, C-c-g-c'-e'-g'-bb' [approximately]-c"-d"-e", etc).

Brass instruments normally have three descending valves; used in combination they can lower the pitch of the instrument six semitones. Two principal switching methods are used: piston and rotary mechanisms.

Valverde, province, northwestern Dominican Republic. Created on territory removed in 1959 from Santiago province, the 220-sq-mi (570-sq-km) province lies mainly in the fertile and densely populated Valle del Cibao; it is drained by the Yaque del Norte River. The principal economic activity is agriculture; cacao, coffee, tobacco, corn (maize), sugarcane, rice, and fruits are the leading crops. Lumbering and placer gold mining are also carried on. The province is traversed by secondary and main highways linking Mao (q.v.), the provincial capital, with other communities in the valley. Pop. (1981) 100,319.

Vāmana, fifth of the 10 incarnations (avatāras) of the Hindu god Vishnu. He made his appearance when the demon king Bali ruled the entire universe and the gods had lost their power. One day the dwarf Vāmana visited the court of Bali and begged of him as much land as he could step over in three paces. The King laughingly granted the request. Assuming a gigantic form, Vāmana with one step covered the whole earth, and with the second step the midworld between earth and heaven. As there was nowhere left to go, the demon king lowered his head and suggested Vāmana place

his foot on it for the promised third step. Vāmana was pleased, and with the pressure of his foot sent Bali down below to rule the nether world. Vishnu in this form is often identified as Trivikrama (God of the Three Strides).

The images of Vāmana usually show him already grown to giant size, one foot firmly

planted on earth and the other lifted as if to take a stride. If shown small in stature the sculptures may depict him as a deformed dwarf, or as a brahmachari (monastic student), dressed in the deer skin, loin cloth, and sacred thread, and with the tufted hair of the student.

vampire, in popular legend, a bloodsucking creature, supposedly the restless soul of a heretic, criminal, or suicide, that leaves its burial place at night, often in the form of a bat, to drink the blood of humans. By daybreak it must return to its grave or to a coffin filled with its native earth. Its victims become vampires after death. Although the belief in vampires was widespread over Asia and Europe, it was primarily a Slavic and Hungarian legend, with reports proliferating in Hungary from 1730 to 1735.

Among the various demons of ancient folk tradition, the vampire has enjoyed the most conspicuous and continual literary success in the 20th century, owing largely to the popularity of the Gothic novel *Dracula* (1897) by the British author Bram Stoker. Count Dracula, its "undead" villain from Transylvania, be-

came the representative type of vampire. The novel, a play (1927), and a popular series of films made vampire lore common currency. Tod Browning's classic film Dracula (1931), starring Bela Lugosi, set the pattern for the dozens of vampire movies that followed in the mid- and late 20th century.

Typically the vampire had a pallid face, staring eyes, and protruding incisor teeth and fed by biting and sucking blood from the victim's throat. Methods for recognizing vampires (they cast no shadow and are not reflected in mirrors) and for warding them off (by displaying a crucifix or sleeping with a wreath of garlic around one's neck) are known to every schoolchild. Vampires can be put to final rest by driving a stake through their hearts, by burning them, or by destroying their daytime resting places.

vampire bat, any of three species of bloodeating bats, family Desmodontidae, native to the New World tropics. Named after the bloodsucking human spirits of folklore, vampire bats are shy, tailless, brown bats that run swiftly and can leap with considerable agility. They are about 6-9 cm $(2\frac{1}{3}-3\frac{1}{2}$ inches) long and weigh about 15-50 g ($\frac{1}{2}-1\frac{1}{2}$ ounces). The three species are the common (Desmodus rotundus), white-winged (Diaemus youngi), and hairy-legged (Diphylla ecaudata) vampire bats.

Vampire bats leave their sheltered roosts after dark and forage low over the ground, feeding on practically any quietly resting warmblooded animal. They make a small cut with their sharp incisor teeth, often without disturbing their prey, and lap the blood that flows from the incision. They take the blood of mammals and birds, often attack cattle and other domestic animals, and occasionally bite

Van, city, eastern Turkey. It lies on the eastern shore of Lake Van at an altitude of about 5,750 feet (1,750 m). The city lies in an oasis at the foot of a hill crowned by an ancient ruined citadel. A ruined stone building near the foot of the rocky spur bears cuneiform inscriptions dating from the 8th and 7th centuries BC, when Van was the chief centre of the Urartu Kingdom. After the fall of Nineveh (612 BC) it was occupied in succession by the Medes, Achaemenian Persians, and the kings of Pontus. Rock inscriptions on the citadel hill include one in Old Persian carved on the orders of the Achaemenian king Xerxes I (early 5th century BC). Van was included in the kingdom established by King Tigranes I in the 1st century BC. The Romans and the Sāsānids of Persia fought over it for a time; it became a tributary state to the Arabs in the 7th century; and it prospered under the Armenian Bagratid dynasty in the 8th century. The region fell to the Seljuq Turks after their victory over Byzantium (1071) and was later annexed to the Ottoman Empire in 1543. Russian forces occupied the city from 1915 to 1917 during World War I.

The ruined citadel situated on an isolated ridge of rock above Van, Tur.

The mound of Toprakkale, 3 miles (5 km) north of the modern city, is the site of an excavated ancient Urartian city dating from the 8th century BC. Van's local museum contains numerous specimens of Urartian inscriptions and pottery found in the vicinity. Van's trade is mainly in regional products such as skins, grains, fruits, and vegetables. Lake Van, the largest body of water in Turkey, is the focus of a growing tourist trade, and there are air services from Ankara and Istanbul.

The region in which Van is situated is a stockraising area, specializing in horses; grains, fruits, and vegetables are grown. The region has a large Kurdish population; the Armenian section of the population, which had nationalist aspirations, was deported by government order and was subsequently massacred during World War I. Pop. (1985 prelim.) city, 121,-306.

Van, Lake, Turkish van gölü, lake, largest body of water in Turkey and the second largest in the Middle East. The lake is located in the region of eastern Anatolia near the border of Iran. It covers an area of 1,434 square miles (3,713 square km) and is more than 74 miles (119 km) across at its widest point. Known to the ancient Greek geographers as Thospitis Lacus, or Arsissa Lacus, its modern Turkish name, Van Gölü, is derived from Van, or Chauon, the name of the capital of the Urartian kingdom that flourished on the lake's eastern shore between the 10th and 8th centuries BC. Roughly triangular in shape, the lake lies in an enclosed basin; its brackish waters are unsuitable for either drinking or irrigation. The salt water allows for no animal life save the darekh (related to the European bleak, a small soft-finned river fish of the carp family), a freshwater fish that has adapted to a saline environment.

Lake Van occupies the lowest part of a vast basin bordered by high mountains to the south, by plateaus and mountains to the east, and by a complex of volcanic cones to the west. At some time during the Pleistocene Epoch (10,-000, to about 2,000,000 years ago), a lava flow from the Nemrut volcano extended for nearly 37 miles (60 km) across the southwestern end of the basin, blocking westward drainage to the Murat River and thereby transforming the depression into a lake basin without outlet.

Lake Van is divided into two sections; the main body of water is separated from its much shallower northern extension by a narrow passage. Its shores are generally steep and lined with cliffs; the southern shore is extremely sinuous and eroded. The waters are dotted with islands, including Gadir, the largest, in the north; Çarpanak in the east; and Aktamar and Atrek in the south. The main body of the lake to the south is much deeper than its northern section, with the greatest depths exceeding 330 feet (100 m).

Lake Van's catchment area exceeds 5,790 square miles (15,000 square km); it forms the largest interior basin of Turkey except for that of the central Anatolian region. The lake is fed by rainfall and meltwater as well as by several tributaries, notably the Bendimahi and Zilan rivers, which flow in from the north, and the Karasu and Micinger rivers, which enter the lake from the east. Lake Van experiences a seasonal variation of its water level of about 20 inches (50 cm) per year. It is lowest during the winter months and begins to rise after the spring thaw. With the arrival of additional water from the melted snows of the surrounding mountains, the lake rises to its highest level in

The lake has three distinct temperature zones in summer, consisting of an upper layer of warm water, a lower region of cold water, and an intermediate transitional layer. During the winter the surface cools quickly; occasionally the shallow northern sector freezes over. Freezing of the entire lake is retarded by its high salinity. The most abundant salts in the lake are sodium carbonate and sodium sulfate. A regular passenger boat service plies the lake between the coastal towns; there is a small shipyard at Tuğ on the southwestern shore.

Van Allen, James Alfred (b. Sept. 7, 1914, Mt. Pleasant, Iowa, U.S.), American physicist whose discovery of the Van Allen radiation belts, two zones of radiation encircling the Earth, brought about new understanding of cosmic radiation and its effects upon the Farth

Van Allen was a naval officer during World War II and helped develop the radio proximity fuse for naval artillery shells. In 1946 he was placed in charge of high altitude research at the Applied Physics Laboratory of Johns Hopkins University, Silver Spring, Md. He supervised the testing and use of captured German V-2 rockets for upper atmosphere exploration and assisted in the development of the Aerobee, one of the first rockets built for research purposes.

Van Allen became professor of physics at the University of Iowa in 1951. He was one of the scientists who proposed a program of worldwide cooperation in research, the International Geophysical Year (IGY) of 1957-58. The instrumentation of the early Explorer satellites, part of the United States' IGY program, was built by Van Allen and his associates. The information on cosmic radiation gathered by these satellites led to the discovery of the Van Allen radiation belts. He later participated in the development of numerous space probes built to study planetary and solar physics.

Van Allen wrote numerous papers and journal articles. He also edited Scientific Uses of Earth Satellites (1956) and was an associate editor of the Journal of Geophysical Research (1959-64) and Physics of Fluids (1958-62). He was elected to the National Academy of Sciences in 1959 and became president of the American Geophysical Union in 1982.

Van Allen radiation belt, doughnut-shaped zones of highly energetic charged particles trapped at high altitudes in the magnetic field of the Earth. The zones were named for James A. Van Allen, the American physicist who discovered them in 1958 using data transmitted by the U.S. Explorer satellite.

The Van Allen belts are most intense over the Equator and are effectively absent above the poles. No real gap exists between the two zones; they actually merge gradually, with the flux of charged particles showing two regions of maximum density. The inner region is centred approximately 3,000 km (1,860 miles) above the terrestrial surface. The outer region of maximum density is centred at an altitude of about 15,000 to 20,000 km (9,300 to 12,-400 miles), though some estimates place it as far above the surface as six Earth radii (about 38,000 km [23,700 miles]).

The inner Van Allen belt consists largely of highly energetic protons, with energy exceeding 30,000,000 electron volts. The peak intensity of these protons is approximately 20,000 particles per second crossing a spherical area of one square cm in all directions. It is believed that the protons of the inner belt originate from the decay of neutrons produced when high-energy cosmic rays from outside the solar system collide with atoms and molecules of the Earth's atmosphere. Some of the neutrons are ejected back from the atmosphere; as they travel through the region of the belt, a small percentage of them decay into protons and electrons. These particles move in spiral paths along the lines of force of the Earth's magnetic field. As the particles approach either of the magnetic poles, the increase in the strength of the field causes them to be reflected. Because of this so-called magnetic mirror effect, the particles bounce back and forth between the magnetic poles. Over time, they collide with atoms in the thin atmosphere, resulting in their removal from the belt.

The outer Van Allen belt contains charged particles of both atmospheric and solar origin. the latter consisting largely of helium ions from the solar wind (steady stream of particles emanating from the Sun). The protons of the outer belt have much lower energies than those of the inner belt, and their fluxes are much higher. The most energetic particles of the outer belt are electrons, whose energies reach up to several hundred million electron

Studies show that intense solar activity causes disruptions of the Van Allen belts, which in turn are linked with such phenomena as auroras and magnetic storms. See also aurora; magnetic storm.

Van Buren, city, seat (1839) of Crawford County, western Arkansas, U.S., on the Arkansas River opposite Fort Smith. The site, settled (1818) by Thomas Martin, was later called Phillips Landing (for Thomas Phillips, who bought land rights in 1836). In 1838 it was renamed for U.S. President Martin Van Buren. It developed as a trading post and "fitting-out" point for settlers moving to the West; after 1873 it became a railroad junction point for river traffic. Natural gas, discovered in the 1900s, attracted smelters and glass factories. Parts of the Ozark National Forest lie to the north, and lumbering was once significant. Economic activities now focus mainly on food processing and shipping vegetables, especially spinach. Cyrus Adler, a Jewish educator, was born in Van Buren, which was also the home of the humorist Bob Burns, who invented the musical instrument known as the "bazooka." Inc. 1842. Pop. (1984 est.) 12,834.

Van Buren, Martin (b. Dec. 5, 1782, Kinderhook, N.Y., U.S.—d. July 24, 1862, Kinderhook), eighth president of the United States (1837-41) and one of the founders of the Democratic Party. He was known as the "Little Magician" because of his reputed cunning and skill as a politician.

He studied law and in 1803 began practice in Kinderhook. He served two terms in the New York Senate (1812-20) as a Jeffersonian Republican and during his tenure was appointed

state attorney general. After his election to the U.S. Senate in 1821, he created a group known as the Albany Regency, an informal political organization set up to run New York state during his absence in Washington.

Van Buren regarded himself as a disciple of Thomas Jefferson. In the Senate he supported the doctrine of states' rights, opposed a strong central government, and disapproved of federally sponsored internal improvements. After the election of John Quincy Adams in 1824. Van Buren aided in the formation of a new political amalgam that resulted in the Democratic Party. Made up of factions of the Jeffersonian Republican Party led by Andrew Jackson, William H. Crawford, and John C. Calhoun, it espoused the principles of Jefferson and capitalized on Jackson's popularity.

In 1828 Van Buren resigned his Senate seat and successfully ran for governor of New York. He gave up the governorship within 12 weeks to become President Andrew Jackson's secretary of state. As such, he was criticized for extending the spoils system, but, according to some historians, the criticism was exaggerated. He resigned in 1831 to permit reorganization of the Cabinet and served briefly as minister to Great Britain.

Nominated for the vice presidency in 1832 by the first national convention of the Democratic Party, Van Buren was elected with Jackson on a ticket opposing the established bank system. He became Jackson's choice to succeed him and in 1835 was unanimously nominated for the presidency. Winning the election, he took office in 1837, as a financial panic spread throughout the nation. In 1840 his proposal to remove government funds from state banks and put them in an "independent treasury" passed only after a bitter congressional battle, in which many conservative Democrats deserted to the Whig Party. A costly war with the Seminole Indians in Florida and his failure to support the proposed annexation of Texas also lessened his popularity. The question of the northeast boundary of the United States provoked conflict between the inhabitants of Maine and Canadians bordering the Aroostook River. Armed clashes were halted by Van Buren and a permanent settlement was later negotiated in the Webster-Ashburton Treaty of 1842. One of his last acts in office was to order that no person should work more than 10 hours a day on federal public works.

Unanimously renominated in 1840 by the Democrats, Van Buren was overwhelmingly defeated by the Whig candidate William Henry Harrison. Four years later he failed to win the Democratic nomination. In 1848 he was nominated by the antislavery Democrats ("Barnburners") and then by the Free-Soilers, with whom the Barnburners and "conscience" Whigs united, but he failed to be elected. He retired to his estate, Lindenwald, in Kinderhook.

Van Buren's memoirs, written in 1833, were published in 1920. He also wrote an *Inquiry* into the Origin and Course of Political Parties in the United States (1867). Two biographies are Edward M. Shepard, Martin Van Buren (1892), and Robert V. Remini, Martin Van Buren and the Making of the Democratic Party

Van Cortlandt, Stephanus (b. May 7, 1643, New Amsterdam—d. Nov. 25, 1700, New York City), Dutch-American colonial merchant and public official who was the first native-born mayor of New York City and chief justice of the Supreme Court of New York.

Van Cortlandt attended the New Amsterdam school of the Dutch Reformed Church and began a successful and profitable mercantile career under his father's guidance. After the British conquest of New Netherlands in 1664, he succeeded in ingratiating himself with the new rulers and was able to continue his commercial enterprises.

Van Cortlandt started his public career in 1668 as an ensign in the Kings County militia, and he subsequently rose to the rank of colonel. He was appointed a member of the governor's council in 1674. Three years later, he became the first native-born mayor of New York City. When the Dominion of New England was established, he was selected as one of the provincial councillors to serve under Governor Sir Edmund Andros. After James II had been deposed, Jacob Leisler led a revolt against the provincial government in 1689, forcing Van Cortlandt to flee the colony. William and Mary appointed Colonel Henry Sloughter as the new royal governor of New York to displace Leisler, however, and Van Cortlandt was concurrently appointed to Sloughter's council. Van Cortlandt then returned to the colony and subsequently was among the New York aristocrats advocating the prosecution and execution of Jacob Leisler.

Van Cortlandt also served New York in sev-

eral administrative and judicial positions. He was an adviser to the governors on Indian affairs and in 1698 was made commissioner of customs and collector of revenues for the colony. In judicial affairs, he presided over the New York City mayor's court, became a judge in the Kings County courts, and was an associate justice and chief justice of the Supreme Court of New York. During his career, Van Cortlandt amassed vast landholdings, which were incorporated in 1697 into the Manor of Cortlandt.

Van de Graaff, Robert Jemison (b. Dec. 20, 1901, Tuscaloosa, Ala., U.S.—d. Jan. 16, 1967, Boston, Mass.), American physicist and inventor of the Van de Graaff generator, a type of high-voltage electrostatic generator that serves as a type of particle accelerator. This device has found widespread use not only in atomic research but also in medicine and industry.

After working for a time as an engineer with the Alabama Power Company, Van de Graaff went to Paris in 1924 to study at the Sorbonne. There the lectures of Marie Curie turned his interests to atomic physics, and the following year he went to the University of Oxford to do research in the laboratory of the Irish physicist J.S.E. Townsend. While at Oxford, Van de Graaff was impressed with the need for a source of energetic beams of subatomic particles for the study of atomic behaviour. He conceived the idea for the Van de Graaff generator and, upon returning to the United States in 1929, continued to develop it.

Van de Graaff built his first generator in the early 1930s. The device, which is used for producing a very high electrostatic potential, depends for its operation on deposition of a charge on a moving belt of insulating fabric. This charge is conveyed on the belt into a smooth, spherical, well-insulated metal shell, where it is removed, passing to the metal shell. The shell increases in potential until an electric breakdown occurs or until the load current balances the charging rate. Machines of this kind, properly enclosed, have produced potentials of about 13,000,000 volts (13 megavolts). In a related device called the Pelletron accelerator, the moving belt is replaced by a moving chain of metallic beads separated by insulating material. The Pelletron accelerator at the Oak Ridge National Laboratory, Tenn., produces 25 megavolts and will accelerate protons or heavy ions, which are then injected into an isochronous cyclotron for further acceleration.

Van de Graaff became a research associate in 1931 and an associate professor in 1934 at the Massachusetts Institute of Technology (MIT), Cambridge. In 1946 he cofounded the High Voltage Engineering Corporation (HVEC) to manufacture his accelerator, and in 1960 he left MIT to work full time for HVEC.

Van Deman, Esther Boise (b. Oct. 1, 1862, South Salem, Ohio, U.S.—d. May 3, 1937, Rome, Italy), American archaeologist and the first woman to specialize in Roman field archaeology. She established lasting criteria for the dating of ancient constructions, which advanced the serious study of Roman architecture.

Van Deman earned an A.B. (1891) and A.M. (1892) from the University of Michigan in Ann Arbor. After teaching Latin at Wellesley College (Mass.) and the Bryn Mawr School in Baltimore, she received a Ph.D. from the University of Chicago (1898). She then taught Latin at Mount Holyoke College (1898–1901) and Latin and archaeology at Goucher College (1903–06). From 1906 to 1910 she lived in Rome as a Carnegie Institution fellow, and from 1910 to 1925 she was an associate of the Carnegie Institution in Washington, D.C. Between 1925 and 1930 she taught Roman archaeology at the University of Michigan.

While in Rome, Van Deman developed

methods for dating ancient Roman building materials. In *The Atrium Vestae* (1909), she publicized her discovery that the size and composition of bricks and mortar used in Roman constructions were indicative of their age. She later extended that method of identification to other kinds of concrete and brick constructions. Her major work, written after she retired and settled in Rome, is *The Building of the Roman Aqueducts* (1933).

Van Deman, Ralph H(enry) (b. Sept. 3, 1865, Delaware, Ohio, U.S.—d. 1952, San Diego, Calif.), U.S. intelligence officer, called "the father of American military intelligence." Van Deman followed an eclectic educational course before settling on a military career: he took a degree from Harvard, studied law for a year, and then took a medical degree (1893). He served briefly as an army surgeon and then attended the Infantry and Cavalry School at Fort Leavenworth, Kansas. In 1897 he was assigned to the Military Intelligence Division (MID). In 1901, then a captain, he organized the Philippine MID. It was in the Philippines that he developed his expertise in organizing documents and records. He was given his first covert mission, the mapping of lines of communication around Peking, China, in 1906. A year later he was appointed chief of the map section of the MID in Washington, D.C. General Franklin Bell, then chief of staff, who har-

boured a grudge against intelligence officers in

general and Van Deman in particular, forced

the virtual disbanding of MID by merging it

with the War College.

In 1915 Van Deman returned to Washington from a second tour in the Philippines and found intelligence operations in chaos. In response he created an unofficial group of associates to collect and coordinate intelligence. With the entry of the United States into World War I in 1917, he attempted to reorganize military intelligence. The chief of staff, General Hugh Scott, found the concept of spying so distasteful that he ordered Van Deman to cease all efforts to organize a service. By adroit political maneuvering, however, Van Deman was able to gain sympathetic attention in higher government circles and soon found himself in charge of the reconstituted MID. As organized by Van Deman, military intelligence included the forerunners of the Defense Mapping Service, the Counter-Intelligence Corps (CIC), the Intelligence Command, the Industrial Security organization, the National Security Agency, and the U.S. Army Intelligence Center and School. Among those employed by him were the cryptographer Herbert O. Yardley, John Foster Dulles, later U.S. secretary of state, and Allen Dulles, later director of the

Central Intelligence Agency (CIA).

Later in the war Van Deman served in France, and in 1919 he was the senior American intelligence officer and chief of counterintelligence for the Paris Peace Commission. He retired as a major general in 1929.

Van Deman continued his intelligence work in private life. He created a massive set of files on private citizens whose political affiliations he believed to be potentially subversive. In this enterprise he enjoyed the unofficial cooperation of local police departments, military intelligence organizations, and the Federal Bureau of Investigation (FBI). This loose network survived in many instances after regular intelligence services were severely limited in the 1930s. In 1941 Van Deman was appointed intelligence adviser to the War Department. His work during World War II earned him the Legion of Merit.

After Van Deman's death his files were taken over by a nonprofit research organization called the San Diego Research Library, which made them available not only to gov-

ernment agencies but also to private political groups and candidates, a practice that led to abuses. The files were routinely consulted in the granting of security clearances until 1971, when the practice was halted by executive order

Van Depoele, Charles Joseph (b. April 27, 1846, Lichtervelde, Belg.—d. March 18, 1892, Lynn, Mass., U.S.), Belgian-born American inventor who demonstrated the practicability of electrical traction (1874) and patented an electric railway (1883).

After immigrating to the United States in 1869, Van Depoele became a successful manufacturer of church furniture and then began to pursue his interest in electricity. In addition to his notable patents of 1874 and 1883, Van Depoele received patents on an electric generator (1880), a carbon commutator brush (1888), an alternating-current electric reciprocating engine (1889), a telpher system (for a car running suspended from cables; 1890), a coal-mining machine (1891), and a gearless electric locomotive (1894). Van Depoele sold his electric-railway patents in 1888 to the Thomson-Houston Electric Company of Lynn, Mass., which soon thereafter was absorbed into the General Electric Company.

van der ——: see under substantive word (e.g., Waals, Johannes Diederik van der; Weyden, Rogier van der), except as below.

van der Waals forces, relatively weak electric forces that attract neutral molecules to one another in gases, in liquefied and solidified gases, and in almost all organic liquids and solids. The forces are named for the Dutch physicist Johannes van der Waals, who in 1873 first postulated these intermolecular forces in developing a theory to account for the properties of real gases. Solids that are held together by van der Waals forces characteristically have lower melting points and are softer than those held together by the stronger ionic, covalent, and metallic bonds.

Van der Waals forces may arise from three sources. First, the molecules of some materials, although electrically neutral, may be permanent electric dipoles. Because of fixed distortion in the distribution of electric charge in the very structure of some molecules, one side of a molecule is always somewhat positive and the opposite side somewhat negative. The tendency of such permanent dipoles to align with each other results in a net attractive force. Second, the presence of molecules that are permanent dipoles temporarily distorts the electron charge in other nearby polar or nonpolar molecules, thereby inducing further polarization. An additional attractive force results from the interaction of a permanent dipole with a neighbouring induced dipole. Third, even though no molecules of a material are permanent dipoles (e.g., in the noble gas argon or the organic liquid benzene), a force of attraction exists between the molecules, accounting for condensing to the liquid state at sufficiently low temperatures.

The nature of the attractive force in molecules, which requires quantum mechanics for its correct description, was first recognized (1930) by the Polish-born physicist Fritz London, who traced it to electron motion within molecules. London pointed out that at any instant the centre of negative charge of the electrons and the centre of positive charge of the atomic nuclei would not be likely to coincide. Thus, the fluctuation of electrons makes molecules time-varying dipoles, even though the average of this instantaneous polarization over a brief time interval may be zero. Such time-varying dipoles, or instantaneous dipoles, cannot orient themselves into alignment to account for the actual force of attraction, but

they do induce properly aligned polarization in adjacent molecules, resulting in attractive forces. These specific interactions, or forces, arising from electron fluctuations in molecules (known as London forces, or dispersion forces) are present even between permanently polar molecules and produce, generally, the largest of the three contributions to intermolecular forces.

Van Devanter, Willis (b. April 17, 1859, Marion, Ind., U.S.—d. Feb. 8, 1941, Washington, D.C.), associate justice of the United States Supreme Court (1910–37).

After graduating from Cincinnati Law School in 1879, he initially worked for his father's law firm; but in 1884, he moved to Cheyenne, Wyo., to become a railroad attorney. There he became involved in territorial politics, serving on a commission to codify the Wyoming statutes in 1886, as corporate counsel for the City of Cheyenne, and in the territorial legislature. After two years as chief justice of the territorial Supreme Court, he returned to private practice when Wyoming became a state in 1890. He remained heavily involved in Republican politics.

In 1897 he became an assistant U.S. attorney general, and in 1903 Pres. Theodore Roosevelt named him circuit judge for the eighth circuit. Seven years later, Pres. William Howard Taft appointed him to the U.S. Supreme Court. Van Devanter specialized in the fields in which he had worked in the West: public land, water rights, Indian questions, and admiralty and corporation law. Highly conservative on economic issues, he stayed on after his intended retirement date to become the backbone of the anti-New Deal bloc.

Van Diemen Gulf, inlet of the Timor Sea of the Indian Ocean, indenting Northern Territory, Australia. Measuring 90 mi (145 km) by 50 mi and partially enclosed by Melville Island (northwest) and the Cobourg Peninsula (northeast), it is fronted by the mainland as far west as Cape Hotham (south). Receiving the South and East Alligator and Mary rivers, the gulf has access to the open sea through Clarence Strait to the west and Dundas Strait to the north. Reached in 1644 by the Dutch navigator Abel Tasman and named by him after Anthony van Diemen, then governor general of the Dutch East Indies, it was charted in 1802 by the British navigator Matthew Flinders.

Van Diemen's Land (1642–1855), the southeastern Australian island colony that became

the commonwealth state of Tasmania. Named for Anthony van Diemen, governor general of the Dutch East Indies, the island was discovered and named in 1642 by Abel J. Tasman, a celebrated navigator under Van Diemen's command. The first British settlers in the early 19th century retained the name. After being a part of the colony of New South Wales since 1803, Van Diemen's Land became a separate colony in 1825. It achieved self-governing status in 1850. In the first half of the 19th century the administrators, soldiers, and settlers of Van Diemen's Land brutalized and harassed the island's Aborigines to such an extent that the race was virtually extinct by the second half of the 19th century (see Black War). Vandiemonians initiated the large-scale colonization of the future colony of Victoria in the mid-1830s. The island was renamed Tasmania in 1855

Van Doren, Carl (Clinton) (b. Sept. 10, 1885, Hope, Ill., U.S.—d. July 18, 1950, Torrington, Conn.), U.S. author and teacher whose writings range through surveys of literature to novels, biography, and criticism.

Educated at Columbia University (Ph.D., 1911), Van Doren taught there until 1930. In

that period he was one of a group of academicians who helped to establish American literature and history as an integral part of university programs. He also served as managing editor of the *Cambridge History of American Literature* (1917–21) and literary editor of *The Nation* (1919–22) and *Century Magazine* (1922–25).

For his discerning biography Benjamin Franklin (1939), Van Doren won a Pulitzer Prize. Other works include The American Novel (1921; revised 1940); Contemporary American Novelists (1922); American and British Literature Since 1890 (1925), in col-

Van Doren, Mark (b. June 13, 1894, Hope, Ill., U.S.—d. Dec. 10, 1972, Torrington, Conn.), U.S. poet, writer, and eminent teacher. He upheld the writing of verse in traditional forms throughout a lengthy pe-

riod of experiment in poetry. As a teacher at Columbia University for 39 years (1920–59), he exercised a profound influence on generations of students.

Van Doren was the son of a country doctor, and was reared on the family farm in eastern Illinois and in the town of Urbana. Following in the footsteps of his older brother, Carl, he attended Columbia University and became literary editor of *The Nation*, in New York City (1924–28), and its film critic (1935–38). After receiving his Ph.D. from Columbia, he served as a professor of English there from 1942 to 1959

Van Doren's literary criticism includes *The Poetry of John Dryden* (1920; rev. ed., 1946), the basis of which was his Ph.D. dissertation at Columbia. He also wrote *Shakespeare* (1939), a volume of essays on the plays; *Nathaniel Hawthorne* (1949); and *The Happy Critic* (1961), a book of essays. Two of his finest studies grew out of a course he taught at Columbia. In *The Noble Voice* (1946; reprinted as *Mark Van Doren on Great Poems of Western Literature*, 1962) he considers 10 long poems, from Homer and Virgil through Lucretius, Dante, Chaucer, Milton, Spenser, Wordsworth, and Byron. His *Introduction to Poetry* (1951; new ed., 1966) examines shorter classic poems of English and U.S. literature.

The author of more than 20 volumes of verse, Van Doren published his first, Spring Thunder, in 1924. In 1940 he won the Pulitzer Prize for his Collected Poems, reissued as Collected and New Poems, 1924-1963. His poetry includes the verse play The Last Days of Lincoln (1959) and three book-length narrative poems, Jonathan Gentry (1931), about the settling of the Midwest by three generations of Gentrys, their experience in the Civil War, and the end of a long-held dream of a paradise beyond the Appalachian Mountains; Winter Diary (1935), the poetic record of a winter spent on his Connecticut farm; and The Mayfield Deer (1941), a backwoods tale of murder and revenge. He was the author of three novels—The Transients (1935), Windless Cabins (1940), and Tilda (1943)—and several volumes of short stories; he also edited a number of anthologies. In 1922 he married Dorothy Graffe, author of five novels and the memoir The Professor and I.

Van Dyck, Sir Anthony, Van Dyck also spelled VANDYKE, Flemish ANTHONIE VAN DYCK, Anthonie also spelled ANTONIE, or ANTON (b. March 22, 1599, Antwerp—d. Dec. 9, 1641, London), after Rubens, the most prominent Flemish painter of the 17th century. A prolific painter of portraits of European aristocracy, he also executed many works on

religious and mythological subjects and was a fine draftsman and etcher. Appointed court painter by Charles I of England in 1632, he was knighted the same year.

Background and early years. Van Dyck was the seventh of 12 children of Frans van Dyck, a well-to-do silk merchant. At the age of 10, he was apprenticed to Hendrik van Balen, a successful Antwerp painter, and he must soon have come under the influence of Rubens, who after 1608 assumed undisputed leadership of art in Antwerp.

Van Dyck's first surviving work, the portrait of a man, is dated 1613; a self-portrait could not have been done much later. In the figural compositions of the first eight years of his career, he obviously emulated Rubens' melodramatic style, though, instead of using Rubens' technique of enamel-like glazes, he painted directly and with a rather coarse texture. His colour scale is darker and warmer than Rubens'; his lights and shades are more abrupt; and his figures are more angular in their gestures and less harmoniously proportioned. He exaggerated the expression of his figures, from the fierce fanaticism or feverish ecstasy of saints and the brutality of executioners to the voluptuous smiles of satyrs and the drunken stupor of Silenus, companion to Dionysus, the god of wine.

The Belgian patricians and their wives that he painted during his early years generally are rendered in bust or knee length; their hands hold gloves or other articles or fall idly over the back or armrest of a chair. His earliest portraits had neutral backgrounds, but under Rubens' influence he introduced props such as columns to enrich the setting. With consummate skill he rendered details of costume and decor. His portraits, always convincing as likenesses, show the models as calm and dignified. Their expressions are guarded rather than warm.

Van Dyck was precocious. When only 18, he acted as family representative in a lawsuit; before he was 19, his father declared him legally of age. In February 1618 he was inscribed as master in the Antwerp guild. It is uncertain when he entered the studio of Rubens, but on July 17, 1620, a correspondent of Thomas Howard, earl of Arundel, reported that "Van Dyck is still staying with Rubens and his works begin to be appreciated as much as those of his master." In March 1620 Rubens used the assistance of "Van Dyck and some other disciples." In view of Van Dyck's fully developed personal style in these years, however, it is probably more accurate to call him Rubens' collaborator rather than his pupil.

Although the relationship between Rubens and Van Dyck became strained after 1630,

"Self-Portrait," detail, oil on canvas by Sir Anthony Van Dyck, c. 1621; in the Metropolitan Museum of Art, New York City

there is no evidence that Rubens tried to hamper the career of the young rival. He probably helped him with recommendations on his first trip to England (November 1620 to February 1621), where Rubens' admirer the Earl of Arundel was also Van Dyck's protector.

Career in Antwerp and Italy. Apparently unwilling to remain at the court of King James I, despite an annual salary of £100, Van Dyck returned to Antwerp and in October 1621 set out for Italy. There, too, Rubens' recommendations paved his way. His first goal was Genoa, where he was immediately patronized by the same group of aristocratic families for whom Rubens had been active 14 years earlier.

Genoa remained Van Dyck's headquarters, but he is known to have visited Rome, Venice, Padua, Mantua, Milan, and Turin. In 1624 he visited Palermo, where he painted the Spanish viceroy Emanuel Philibert of Savoy. Although everywhere employed with commissions, Van Dyck used the opportunity of his Italian years to study the works of the great Italian painters. A sketchbook in the British Museum testifies to his attraction to the Venetian masters, above all, Titian. He made many rapid sketches of their compositions, occasionally adding notes about colour and spontaneous words of praise. The few figural compositions of Van Dyck's years in Italy betray a trend toward colouristic and expressive refinement under the influence of the Venetian school. Recollections of Rubens and of Bolognese masters may be seen in his most accomplished religious work done in Italy, the "Madonna of the Rosary." The Italian portraits, many in full length, stress grandeur and aristocratic refinement. There, he also did his first equestrian portraits. While in earlier portraits the sitters generally look at the beholder, now they often are turned away as if concerned with weightier matters. Some of his Genovese ladies, portrayed in glitter and silk, have a condescending look. In July 1627 Van Dyck was again in Antwerp, where he remained until 1632. The frequent absence of Rubens between 1626, when he entered the diplomatic service, and 1630 on foreign missions may have induced many patrons to turn to Van Dyck. He received numerous commissions for altarpieces and for portraits, which forced him to employ assistants. During this period Van Dyck also began to make small monochrome portraits in oil and drawings in chalk of princes, soldiers, scholars, art patrons, and, especially, of fellow artists, with the view of having them engraved and published. At least 15 of these portraits were etched by Van Dyck himself. The others were engraved. The series, popularly known as Van Dyck's Iconography, was first published in 1645-46. The tendencies first manifested in works

done in Italy carry over into the five years Van Dyck now spent in Antwerp. He and his patrons appear to have realized that his talent was suited better to themes involving tender emotion than to themes of violent action. The happiest works of that period show the Virgin as the affectionate mother with the infant Jesus in her arms or as the Mater Dolorosa in lamentation scenes; equally appealing are pictures showing saints in religious transport. In memory of his father, Van Dyck in 1629 painted the crucified Christ with St. Dominic and St. Catherine of Siena, one of his noblest works and a prime example of the spiritual intensity fostered by the Counter-Reformation. Some of Van Dyck's most enchanting stories from mythology or fable were done during these years. His manner of painting was now quite economical. The pigments were put on thinly, in delicate combinations of blue, gray, pink, ochre, and sienna. The emphasis is on mellowness, in colour and tone. Although he continued to give an almost sensuous appeal to textures, such as silk, hair, and human skin, his paintings became increasingly cool and artificial. In this period, bust- and half-length

figures were again in the majority, as they had been during his first years in Antwerp. Among his models were many members of the great princely houses of Europe, but some of the finest pictures are of collectors and art patrons, as well as scholars, churchmen, and a great many Antwerp artists. To this group should be added portraits done during his visit to the Continent in 1634-35, among them one of the Abbé Scaglia, the skillful diplomat, for whom Van Dyck also painted one of his last religious pictures, a lamentation (Antwerp). In these portraits a new predilection for rhetorical poses is noticeable. With agile hands, some figures seem to address an audience, in keeping with a Baroque taste in portraiture.

Last years in England. After a brief trip to Holland in February 1632, Van Dyck again went to England, where he became highly successful. King Charles I appointed him "principalle Paynter in ordinary of their Majesties" and knighted him. He gave him a golden chain and settled upon him an annual salary of £200 sterling. Yet, in March 1634 Van Dyck returned once again to Antwerp, ostensibly to settle matters connected with his family estate but probably also to establish contacts with the new Spanish governor expected in the fall of that year. The Antwerp guild of artists appointed him "honorary dean," a title that had been bestowed before only on Rubens. In 1635 Van Dyck was again in England, after about a year's absence.

He lived in Blackfriars in London, outside the jurisdiction of the local guild, where Charles I liked to visit him. During the summer Van Dyck was given a place in Eltham Castle, Kent. His work now consisted almost exclusively of painting portraits, and they are his most popular.

The visual image of English society prior to the revolution of 1648 has forever been shaped by Van Dyck. Charles I himself was frequently portrayed by the master and nowhere perhaps more revealingly than in a beautiful canvas in Paris in which he appears "as he would have wished to live in history: a figure of matchless elegance, of unquestioned authority and high culture, the patron of the arts, and the upholder of the divine right of kings" (E.H. Gombrich, *The Story of Art*, 1950). A portrait showing three views of the King was made to serve for a bust to be made by Gian Lorenzo Bernini; the sculpture perished, however, in 1697.

As in his Italian portraits, full-length renderings prevail, but his English patrons seem more rigid and, as a rule, more prosaic than their Latin counterparts. An unusual feature, reflecting a literary vogue, is allegorical attributes and mythological disguises. Ladies often are pictured with roses or holding a hand under water running from an urn. Portraying himself with a sunflower, Van Dyck expresses emblematically his devotion to the King.

Van Dyck's gift for combining formality and casualness shows up particularly well in portrait commissions involving groups of people. To his last decade belong a little-known picture of of the family of John, count of Nassau-Siegen, and the largest of all his extant paintings (more than 19 feet [580 centimetres] wide), of the family of Philip Herbert, earl of Pembroke. In his several versions of the children of Charles I, among other pictures, he gives to his models all their youthful innocence no matter how gravely dignified their pose

Van Dyck organized his portrait painting in an efficient manner designed also to increase his prestige. He gave hourly appointments to his sitters, leaving the execution of accessories to his assistants. While the King paid slowly and at times was even forced to reduce the

artist's demands, Van Dyck derived a comfortable income from his many portraits. His life matched in luxury that of his clients. In 1639 he married Mary Ruthven, by whom he had one daughter.

He must have realized, however, that the political fortunes of the Stuart monarchy were declining. He had failed in an ambitious plan to decorate the Banqueting House at Whitehall with a "Procession of the Knights of the Garter" in tapestry, and in September 1640 he again left England, induced possibly by the hope of taking the place of Rubens, who had died in May. In nervous haste he went from Antwerp to Paris, thence back to London, and again to Paris. At the end of November 1641 he returned to London, sick and having failed in his projects. He died shortly thereafter and was buried in St. Paul's.

Van Dyck was a handsome Assessment. man, but his features lacked strength, and he was rather short. Although socially ambitious, he remained devoted to the members of his family and on cordial terms with fellow artists. His manners were suave and ingratiating. According to legend, he inclined to licentiousness and extravagance, but the evidence is inconclusive. Whatever the faults of his character, he certainly was never idle. Only by combining facility of execution with great industry could a man who died at the age of 42 have painted a body of work as large as his. Five hundred of his portraits, apart from many copies from his own hand, are extant.

Van Dyck's influence was pervasive and lasting. Many of the younger Flemish painters owe more to him than to Rubens. Dutch and German portraitists, especially those active in London, among them Sir Peter Lely and Sir Godfrey Kneller, continued his manner, as did several native Englishmen. The style of the great 18th-century English portrait painters, especially that of Thomas Gainsborough, was deeply indebted to Van Dyck, and Spanish painters, who appear to have known Van Dyck's works mainly from engravings, imitated and occasionally even copied the religious compositions of the Flemish artist.

The enduring fame of Van Dyck rests on his portraits. Whether he painted the patricians and artists of Antwerp, the nobles of Genoa, or the court of Charles I, Van Dyck succeeded in idealizing his models without sacrificing any of their individuality. He adopted patterns of portraiture that had been formulated before, chiefly by Hans Holbein, Antonio Moro, Titian, and Rubens, but he invented innumerable variations, never losing sight of the fundamental necessity to retain an impeccable formality no matter how exact the likeness. His reputation was always high, but, whereas formerly the works of his last period were most admired, those of his youth and of his Genovese period have been favoured in the 20th century for their freshness and spontaneity. The interest of scholars and collectors has also turned increasingly toward works neglected before, such as the artist's oil sketches and his many drawings and watercolours, including some of his sensitive studies of landscapes.

Van Dyke, Henry (b. Nov. 10, 1852, Germantown, Pa., U.S.—d. April 10, 1933, Princeton, N.J.), U.S. short-story writer, poet, and essayist popular in the early decades of the 20th century.

Educated at Princeton, Van Dyke graduated from its theological seminary in 1877 and became a Presbyterian minister. His early works, "The Story of the Other Wise Man" (1896) and "The First Christmas Tree" (1897), were first read aloud to his congregation in New York as sermons. These quickly brought him recognition. Other stories and anecdotal tales were gathered at regular intervals into volumes. Among these collections were The Ruling Passion (1901), The Blue Flower (1902), The Unknown Quantity (1912), The Valley of Vision (1919), and The Golden Key (1926).

Van Dyke's popularity also extended to his verse, collected in *Poems* (1920).

Van Hise, Charles Richard (b. May 29, 1857, Fulton, Wis., U.S.—d. Nov. 19, 1918, Milwaukee), U.S. geologist who conducted basic geological studies of the Precambrian (570,000,000 to 4,600,000,000 years ago) formations of the Lake Superior region, particularly the iron ores in these formations. These studies were useful for the economic exploitation of the vast iron-ore fields found in that region.

From 1879 Van Hise taught at the University of Wisconsin at Madison, of which he became president in 1903. During his term (which ended with his death), the university's research and extension programs were greatly

expanded, and enrollment nearly trebled. He was also deeply concerned with broad social problems, as is seen in Conservation of Natural Resources in the United States (1910) and Concentration and Control: A Solution of the Trust Problem in the United States (1912).

Van Horne, Sir William Cornelius (b. Feb. 3, 1843, near Joliet, Ill., U.S.—d. Sept. 11, 1915, Montreal), U.S.-born Canadian railway official who directed the construction of Canada's first transcontinental railroad.

Van Horne worked as a telegraph operator on the Illinois Central Railroad. By 1880 he was general superintendent of the Chicago, Milwaukee and St. Paul Railroad system. In 1881 he became general manager of the Canadian Pacific Railway and oversaw the completion of its construction (1885). He rose to be president of the Canadian Pacific in 1889, then served as chairman of the board from 1899 to 1910. His activities expanded to include the promotion of railways and industry in Cuba. He was knighted in 1898.

"De," "la," and similar components of a name, when followed by a space, are alphabetized as separate words (e.g., De Forest, Lee). When they are joined to the following part of a name, the combination is treated as a single word (e.g., DeForest, John William).

Van Loo, Charles-André, also called CARLE VAN LOO, Van Loo also spelled VANLOO (b. Feb. 15, 1705, Nice, Fr.—d. July 15, 1765, Paris), Rococo painter especially known for his elegant portraits of European royalty and fashionable society in the mid-18th century. He belonged to a noted family of artists of Flemish origin. His elder brother, Jean-Baptiste Van Loo, brought him up, taught him his profession, and took him to Rome. They returned to Paris, where in 1724 they won first prize in the French Royal Academy competition. Van Loo went back to Rome in 1727 and was awarded various distinctions. On his way home to Paris he stopped in Turin and painted works for the king of Sardinia's palaces. After his return to Paris in 1734, he became a professor at the Academy in 1737 and in 1763 was elected director. Van Loo was appointed first painter to the king and shared with François Boucher the favour of Paris society and foreign courts. Mme de Pompadour commissioned him to work for her at her château at Bellevue.

Van Loo was acknowledged to be the leading painter of historical and religious subjects in France during the Rococo period. Though versatile in style and technically facile, he was not particularly original. His precise, detailed genre scenes, somewhat reminiscent of Nicolas Lancret, influenced many painters, notably Johann Heinrich Tischbein.

Van Nu en Straks circle, group of writers associated with an influential Flemish review, Van Nu en Straks ("Today and Tomorrow"; 1893–94 and 1896–1901). Though holding a variety of opinions, they strove for an art that should comprehend all human activity and give universal significance to individual feelings. Led by August Vermeylen, they included Prosper van Langendonck, Emmanuel Karel de Bom, and Alfred Hegenscheidt. Van Nu en Straks gave Flemish literature a European importance.

Van Vechten, Carl (b. June 17, 1880, Cedar Rapids, Iowa, U.S.—d. Dec. 21, 1964, New York City), U.S. novelist and music and drama critic, an influential figure in New York literary circles in the 1920s; he was an early enthusiast for the culture of U.S. blacks.

Van Vechten was graduated from the University of Chicago in 1903 and worked as assistant music critic for The New York Times (1906-08), then as that paper's Paris correspondent. His elegant, sophisticated novels, Peter Whiffle, His Life and Works (1922), The Tattooed Countess (1924), and Nigger Heaven (1926), were very popular. He also wrote extensively on music and published an autobiography, Sacred and Profane Memories (1932), following which he vowed to write no more and to devote his time to photography. His extensive collection of books on U.S. blacks, the James Weldon Johnson Memorial Collection of Negro Arts and Letters, is now at Yale University; he also established the Carl Van Vechten Collection at the New York City Public Library and the George Gershwin Memorial Collection of Music and Musical Literature (music books) at Fisk University, Nashville, Tenn.

Van Vleck, John H(asbrouck) (b. March 13, 1899, Middletown, Conn., U.S.—d. Oct. 27, 1980, Cambridge, Mass.), U.S. physicist and mathematician who shared the Nobel Prize for Physics in 1977 with Philip W. Anderson and Sir Nevill F. Mott. The prize honoured Van Vleck's contributions to the understanding of the behaviour of electrons in magnetic, noncrystalline solid materials.

Educated at the University of Wisconsin, Madison, and at Harvard, where he received his Ph.D. in 1922, Van Vleck joined the faculty of the University of Minnesota, Minneapolis, in 1924. He taught at Wisconsin from 1928 to 1934, and he then went to Harvard, where he eventually served as chairman of the physics department (1945–49), dean of engineering and applied physics (1951–57), and Hollis professor of mathematics and natural philosophy (1951–69).

Van Vleck developed during the early 1930s the first fully articulated quantum mechanical theory of magnetism. Later he was a chief architect of the ligand field theory of molecular bonding. He contributed also to studies of the spectra of free molecules, of paramagnetic relaxation, and other topics. His publications include Quantum Principles and Line Spectra (1926) and The Theory of Electric and Magnetic Susceptibilities (1932).

vanadate mineral, any of the many naturally occurring compounds of vanadium (V), oxygen (O), and various metals; most of these minerals are rare, having crystallized under very restricted conditions. Although vanadinite occasionally is mined as a vanadium ore and carnotite as a uranium ore, most vanadates have no economic importance; they are prized by mineral collectors, however, for their brilliant colours.

The structures of the vanadate minerals are complex. Some vanadate minerals contain vanadate tetrahedra (VO₄), in which four oxygen atoms occupy the corners of a tetrahedron surrounding a central vanadium atom. Each vanadate tetrahedron has a net charge of -3, which is neutralized by large, positively charged metal ions (e.g., calcium, manganese, or ferrous iron) outside the tetrahedron. Unlike the similar silicate tetrahedra, which link to form chains, sheets, rings, or frameworks, vanadate tetrahedra are insular. The vanadates containing these tetrahedra are structurally and chemically similar to the phosphate and arsenate minerals; indeed, some vanadium in many of these vanadates often is replaced by phosphorus or arsenic, forming solidsolution series with both the phosphates and the arsenates. Like the phosphate and sulfate minerals, many vanadates are complexes of transition metals, particularly of ferrous iron, manganese, and copper.

Other vanadates, particularly those that contain uranium, contain $V_2O_8^{\,6-}$ ions, in which two atoms of vanadium are surrounded by eight atoms of oxygen arranged in two square pyramids that share one edge. Very complex clusters also exist but are usually classed with the complex oxide minerals rather than with the vanadate minerals.

vanadic anhydride, vanadium pentoxide, a compound of vanadium and oxygen widely used as an oxidation catalyst, as in the oxidation of unburned hydrocarbons in automobile exhaust (see vanadium).

vanadinite, vanadium mineral in the pyromorphite series of the apatite group of phosphates, lead chloride vanadate, Pb₃(VO₄),Cl, which is a source of vanadium and a minor source of lead. Typical occurrences are as orange, red, or brown hairlike or barrel-shaped crystals in the oxidized zone of lead deposits as in the Urals, U.S.S.R.; Transvaal, S.Af.; Chi-

vanadium (V), chemical element, silverywhite soft metal of Group Vb of the periodic table, alloyed with steel and iron for high-speed tool steel, high-strength structural steel, and wear-resistant cast iron. Discovered (1801) by the Spanish mineralogist Andrés Manuel del Río, who came to believe it was impure chromium, vanadium was rediscovered (1830) and named by the Swedish chemist Nils Gabriel Sefström for the beautiful colours of its compounds in solution.

Found combined in various minerals, coal, and petroleum, vanadium is the 22nd most abundant element in the Earth's crust. Some commercial sources are the minerals carnotite, vanadinite, and roscoelite. (Deposits of the important vanadium-bearing mineral patronite occurring in coal at Mina Ragra, Peru, have been materially depleted.) Other commercial sources are vanadium-bearing magnetite and flue dust from smokestacks and boilers of ships burning certain Venezuelan and Mexican oils. The English chemist Henry Enfield Roscoe first isolated (1867) the metal by hydrogen reduction of vanadium dichloride, VCl2, and the U.S. chemists John Wesley Marden and Malcolm N. Rich obtained it, 99.7 percent pure (1925), by reduction of vanadium pent-

oxide (also called vanadic anhydride), V_2O_5 , with calcium metal.

Vanadium metal, sheet, strip, foil, bar, wire, and tubing have found use in high-temperature service, in the chemical industry, and in bonding other metals. Most of the vanadium produced is used as ferrovanadium (30-80 percent vanadium) in making vanadium steels. Vanadium and iron are mutually soluble in the liquid state in all proportions. Vanadium (added in amounts generally less than 1 percent) has two effects upon steel: it refines the grain of the steel matrix, and with the carbon present it forms carbides. Thus, vanadium steel is especially strong and hard with improved resistance to shock. Vanadium compounds (pentoxide and certain vanadates) are used as catalysts in the contact process for manufacturing sulfuric acid and in the oxidation by oxygen of a large number of such organic substances as naphthalene to phthalic anhydride, benzene to maleic acid, aniline to aniline black, toluene to benzaldehyde and benzoic acid, anthracene to anthraquinone, and methyl alcohol to formaldehyde.

Natural vanadium consists of two isotopes: stable vanadium-51 (99.76 percent) and weakly radioactive vanadium-50 (0.24 percent). More than a half dozen artificial radioactive isotopes have been produced. Sodium hydroxide, hydrochloric acid, and dilute sulfuric acid do not dissolve vanadium. It does not tarnish in air readily but when heated combines with oxygen, nitrogen, carbon, or sulfur. The oxides corresponding to the four oxidation states are VO, V₂O₃, VO₂, and V₂O₅. The hydrogen-oxygen compounds of vanadium in the two lower oxidation states are basic; in the two higher, amphoteric (both acidic and basic). In acid solution the ions exhibit a lavender to blue colour in the +2 to +4 states and a greenish-yellow colour in the +5 state.

Vanbrugh, Sir John (baptized Jan. 24, 1664, London—d. March 26, 1726, London), British architect who brought the English Baroque style to its culmination in Blenheim Palace, Oxfordshire. He was also one of the dramatists of the Restoration comedy of manners.

Vanbrugh, detail of an oil painting by Sir Godfrey Kneller; in the National Portrait Gallery, London

Vanbrugh's grandfather was a Flemish merchant and his father was a sugar baker in Chester, Cheshire, Eng., where the young Vanbrugh (by tradition) went to the King's School. In 1686 he was commissioned in a regiment of foot soldiers and in 1690, while visiting Calais, Fr., was arrested as a suspected English agent. Imprisoned in the Bastille, he wrote the first draft of a comedy. After his release in 1692, he was a soldier again for six years but appears to have seen no active service.

His first comedy, The Relapse: Or Virtue in Danger, was written as a sequel to Colley Cibber's Love's Last Shift. It opened in 1696 and was highly successful. His next important piece, The Provok'd Wife (1697), was also a triumph. In 1698 the churchman Jeremy Collier published an attack on the immorality of the theatre, aimed especially at Vanbrugh, whose plays were more robust than those of such contemporaries as William Congreve. Vanbrugh and others retaliated but to little effect, and he kept silent until 1700. Then came a sequence of free and lively adaptations from the French, more farce than comedy, including The Country House (first performed 1703) and The Confederacy (1705).

In 1702 Vanbrugh entered another field; he designed Castle Howard, Yorkshire, for Lord Carlisle. His first design was far simpler than the richly articulated palace that resulted. Probably he was untrained, but aptly at hand was Nicholas Hawksmoor, the accomplished clerk of the great architect Sir Christopher Wren. Hawksmoor played the assistant to Vanbrugh but was in effect the partner. The Vanbrugh-Hawksmoor Baroque manner is often called "heavy," but the heaviness is in the service of the emphatic. Their manner was a joint creation.

Through Lord Carlisle, who was head of the Treasury, Vanbrugh became in 1702 comptroller of the queen's works. Meanwhile, the theatre languished, for it was under atack and divided. Probably it was Vanbrugh himself who in 1703 proposed to revive it with a grand new building in the Haymarket, designed by himself. Though a magnificent building, it proved a failure, partly because of its poor acoustics and partly because of its suburban location, and he lost considerable money in the venture.

In 1705 Vanbrugh was chosen by John Churchill, duke of Marlborough, to design the palace at Woodstock, Oxfordshire, which was the nation's gift to the hero of many campaigns. Blenheim, so-named after Marlborough's most famous victory, was the architectural prize of Queen Anne's reign. Again Hawksmoor was indispensable to Vanbrugh: Blenheim is their joint masterpiece. Any one of its powerful components may have been of Hawksmoor's shaping, but the planning and broad conception were surely Vanbrugh's, and the massive effect was the result of the hero-worshipping soldier-architect. Though the Duke approved the plans, the Duchess did not; there was trouble over costs and payments, and she caused Vanbrugh's dismissal.

Under George I, Vanbrugh was knighted in 1714 and made comptroller again in 1715. Influenced by the art of fortification and Elizabethan building, Vanbrugh's great last works were Eastbury, Dorset; Seaton Delaval, Northumberland; and Grimsthorpe, Lincolnshire. Without Hawksmoor, he adopted an essentially simple style in these designs, using a few elementary forms with increasing audacity, until in Seaton Delaval (1720) he achieved the height of drama with a comparatively small house.

Vanbrugh married late in life, and his wife was 30 years his junior. He was much liked; in the words of Alexander Pope and Jonathan Swift, "a man of wit and honour." A useful study is Laurence Whistler's Sir John Vanbrugh: Architect and Dramatist (1938).

Vance, Cyrus (Roberts) (b. March 27, 1917, Clarksburg, W.Va., U.S.), U.S. lawyer and public official who was secretary of state from 1977 to 1980 during the administration of Pres. Jimmy Carter.

Vance received his bachelor's degree from Yale University in 1939. Following graduation with honours from the Yale law school in 1942, he enlisted in the Navy and served as a gunnery officer aboard destroyers in the Pacific. A short time after being discharged in 1946, he joined a Wall Street law firm.

Vance's career in government began in 1957, when Sen. Lyndon B. Johnson made him special counsel for the Senate Armed Services Committee's subcommittee on military preparedness. He later served in a similar capacity for the Senate Special Committee on Space and Aeronautics. In 1960 he joined the administration of newly elected Pres. John F. Kennedy as general counsel for the Department of Defense. He worked closely with Defense Secretary Robert McNamara and in 1962 became secretary of the army. Shortly after Kennedy's assassination, President Johnson named Vance deputy secretary of defense.

In addition to his responsibilities at the Pentagon, Vance served as a personal adviser to Johnson. He was a member of the peace team sent to the Panama Canal Zone after Panamanian students had rioted. In 1965 he took part in a mission investigating the rebellion in the Dominican Republic. In March 1966 Vance travelled to Vietnam on an inspection tour. He had initially been a vigorous advocate of U.S. prosecution of the war. After he resigned his Pentagon post for health reasons in mid-1967, however, his views changed; by 1968 he was urging Johnson to stop the bombing of North Vietnam and to declare a cease-fire in the South. In May 1968 Johnson chose Vance as deputy chief delegate to the Vietnam peace talks in Paris. Vance served under Averell Harriman, handling many negotiations himself. He resigned upon the inauguration of Richard Nixon in January 1969 and returned to private law practice (1969-77).

Vance reentered public service when Jimmy Carter selected him to head the State Department. Vance sought to continue the policy of détente with the Soviet Union, and he worked to procure an arms-limitation treaty. He played a crucial role in the so-called Camp David accord between Egypt and Israel in 1978, and he visited China to further the process of normalizing relations between the United States and the People's Republic. Vance worked vigorously during 1979-80 to secure the release of captive U.S. diplomats in Iran but resigned from the Cabinet over opposition to Carter's abortive rescue mission in the spring of 1980. He returned to private law practice.

Vance, Zebulon B(aird) (b. May 13, 1830, Buncombe County, N.C., U.S.—d. April 14, 1894, Washington, D.C.), North Carolina representative, governor, and senator during the American Civil War and Reconstruction eras. Vance studied law at the University of North Carolina and for a time practiced in Asheville. Elected in 1854 as a Whig member of the North Carolina House of Commons, Vance in 1858 won a seat in the U.S. House of Representatives, running on the Know-Nothing ticket. Upon the outbreak of the Civil War, however, he sided with the Confederacy and organized his own company of troops, which elected him captain, and by August 1861 he was colonel of a North Carolina regiment that later distinguished itself at the Seven Days' Battle.

In 1862 Vance ran for governor of North Carolina and won handily despite accusations that, owing to his former pro-Union stance, he was "the Yankee candidate." Opposed for reelection in 1864 by a candidate advocating an immediate end to the war and restoration of the Union, Vance ran on a pro-war platform and won by an even greater majority than in 1862. But in May 1865 he surrendered to federal military authorities and shortly thereafter was imprisoned in Washington, D.C.

He was pardoned in 1867. Soon afterward, Vance plunged back into politics once again. In 1870 he was elected to the U.S. Senate, but the Radical Republicans refused to let him take his seat.

In 1876 Vance was again elected governor of North Carolina, marking the end of the Reconstruction governments in that state. After two years of his four-year term, he was elected to the U.S. Senate and took his seat on March 18, 1879. Reelected twice (for terms beginning in 1885 and 1891), he opposed the protective tariff, the internal-revenue system, civilservice reform, and the repeal of the Sherman Silver Act. His name is not associated with any constructive legislation.

Vancouver, city, southwestern British Columbia, Canada. It lies between Burrard Inlet (an arm of the Strait of Georgia) to the north and the Fraser River delta to the south, and is opposite Vancouver Island. The city is just

north of the U.S. (Washington) boundary. It has a fine natural harbour and occupies a superb site facing the sea and mountains. Originating as a sawmilling settlement called Granville in the 1870s, it was incorporated as a city in 1886 (after it became the terminus of the first trans-Canada railroad, the Canadian Pacific) and was renamed to honour Captain George Vancouver, of the Royal Navy, who had navigated the coast in 1792. The community recovered from a disastrous fire (1886) to become a prosperous port, aided, in part, by the opening of the Panama Canal (1915), which made it economically feasible to export grain and lumber from Vancouver to the American east coast and Europe. By the 1930s Vancouver had become Canada's third largest city (including its metropolitanarea population) and its most important Pacific coast port.

The city is now the industrial, commercial, and financial heart of British Columbia, with trade and transportation as its basic functions. Its ice-free deepwater port, with extensive docks and grain-elevator facilities, handles freighters, a fishing fleet, and ferries (to Vancouver Island) and is connected to mainland Canada and the United States by four major railroads. An international airport serves the city, as do roads to the eastern provinces (Trans-Canada Highway) and Seattle, Wash., which is located 125 miles (200 km) to the south. Wood processing, based on the extensive forest resources of the hinterland, is one

of Vancouver's major industries. Power for sawmilling and plywood and paper manufacturing is provided by hydroelectric developments to the north and by oil and naturalgas pipelines from Alberta. Other significant economic activities include food processing, fishing, shipbuilding, metal fabricating, and printing and publishing.

Vancouver's atmosphere is somewhat British with Oriental overtones and includes a Chinatown overshadowed on the Pacific coast only by San Francisco. Gastown is a restoration (1880s) of the original heart of the city. The business and financial district adjoins the port facilities along Burrard Inlet and False Creek. Large, attractively landscaped residential suburbs included in the metropolitan area extend to the south and east along the mouth of the Fraser River and encompass the cities of New Westminster, Port Moody, and Port Coquitlam. To the north, across Burrard Inlet, are the residential suburbs of North Vancouver and West Vancouver, which are backed by steep mountains up to 5,000 feet (1,500 m) high and are connected to Vancouver by the Lions Gate and Second Narrows bridges. Educational and cultural institutions within the metropolitan area include the University of British Columbia (1908; with a notable Museum of Anthropology on its campus), Simon Fraser University (1963), H.R. MacMillan Planetarium, the Centennial and Maritime museums, the Vancouver Art Gallery (1931), and BC Stadium (1983) for sporting events. Stanley Park (with its arboretum, gardens, aquarium, and zoo) occupies 1,000 acres (405 hectares) of the downtown peninsula at the harbour entrance. Pop. (1986) city, 431,147; metropolitan area, 1,380,729.

Vancouver, city, seat (1854) of Clark county, southwestern Washington, U.S. It lies at the head of deepwater navigation on the Columbia River, there bridged to Portland, Ore. The oldest continuously inhabited white settlement in the state, it was founded in 1824 as a Hudson's Bay Company post, Fort Vancouver (named for Captain George Vancouver), and served as headquarters of the company's Pacific Northwest operations. The first steamboat (USS Beaver) to enter the Pacific (1836) was assembled there after arriving under sail from England with engines and paddle wheels as deck cargo. Fort Vancouver, which is now a national historic site, became a U.S. military reservation (Vancouver Barracks) in 1848. Manufacturing, farming, lumbering, and port operations (including the shipping of grain, lumber, paper, cable, and canned foods) provide a diversified economic base. The city is a distribution centre for hydroelectric power produced in the Columbia Basin. It is the site of Clark College (1933) and state schools for the deaf and the blind. Gifford Pinchot National Forest is headquartered in Vancouver. Inc. 1857. Pop. (1988 est.) 45,621.

Vancouver, George (b. June 22, 1757, King's Lynn, Norfolk, Eng.—d. May 10, 1798, Richmond, Surrey), English navigator who, with great precision, completed one of the most difficult surveys ever undertaken, that of the Pacific coast of North America, from the vicinity of San Francisco northward to present-day British Columbia. At that time he verified that no continuous channel exists between the Pacific Ocean and Hudson Bay, in northeast Canada.

Vancouver entered the Royal Navy at age 13 and accompanied Captain James Cook on his second and third voyages (1772–75 and 1776–80). After nine years' service in the West Indies, he took command of the expedition to the northwest coast of North America for which he is noted. Departing from England on April 1, 1791, he went by way of the Cape of Good Hope to Australia, where he surveyed part of the southwest coast. After stops at Tahiti and the Hawaiian Islands, Vancou-

ver sighted the west coast of North America at 39°27′ N on April 17, 1792. He examined the coast with minute care, surveying the intricate inlets and channels in the region of

Vancouver Island and naming, among others, Puget Sound and the Gulf of Georgia. By August he was negotiating with the Spaniards to take over their concession of coastal claims at Nootka Sound, off Vancouver Island. Continuing his coastal exploration in April 1793, he surveyed north to 56°44′ N and south to below San Luis Obispo, Calif. In 1794 he sailed to Cook's Inlet, off southern Alaska, and, after a fresh survey of much of the coast north of San Francisco, sailed homeward via Cape Horn, reaching England on Oct. 20, 1794. His Voyage of Discovery to the North Pacific Ocean and round the World . . . 1790–95, three volumes with an atlas of maps and plates, was published in 1798.

Vancouver Aquarium, aquarium located in Stanley Park, Vancouver, B.C., Can., that has the largest collection of fishes and marine invertebrates in Canada. The collection includes nearly 3,000 specimens of about 300 fish species and more than 3,500 representatives of approximately 150 different kinds of invertebrates. The aquarium's specialty is marine fish species native to the eastern part of the North Pacific, i.e., off Canada's western coast. The aquarium's marine invertebrate collection is among the most outstanding in the world. One regional exhibit focuses on the giant octopus. Among the other comprehensive displays is one of starfishes from the Canadian coastal region. The aquarium also has an array of reptiles, amphibians, and marine mammals. Some of these mammals—e.g., the dolphins and the beluga and killer whales-have been trained to perform in an arena. The aquarium was established in 1956 and is administered by the Vancouver Aquarium Association. It sponsors various educational programs and encourages research, setting aside laboratory space for visiting investigators.

Vancouver Island, island lying off of southwestern British Columbia, Canada, that is the largest island (area 12,079 square miles [31,285 square km]) on the Pacific coast of North America. It is separated from mainland Canada by the straits of Georgia, Johnstone, and Queen Charlotte and from the United States by Juan de Fuca Strait. The island, averaging 50 miles (80 km) in width and extending for 285 miles (460 km) along a northwest-southeast axis paralleling the mainland, is actually the top of a partially submerged mountain system. It has a deeply dissected, heavily wooded, mountainous interior with several peaks of more than 7,000 feet (2,100 m). Flanked on the east by a coastal plain, its coastline, especially on the west, is deeply indented with fjords. Strathcona Provincial Park occupies 571,-878 acres (231,436 hectares) in the central

part of the island, while the Pacific Rim National Park (96,000 acres [38,850 hectares]) is in three sections along the west coast, and Cape Scott Provincial Park (37,200 acres [15,050 hectares]) is at its northwestern tip.

First discovered by Captain James Cook (1778), the island was surveyed in 1792 by George Vancouver and was held by the Hudson's Bay Company until it was made a British crown colony in 1849. In 1866 it was united with the mainland colony of British Columbia, which entered (in 1871) the Dominion of Canada as a province, with Victoria (q.v.), the island's chief city, as the provincial capital. Important industries include lumbering, fishing, mining (coal, iron ore, and copper), agriculture (dairy products, fruits, and vegetables), and tourism. The major population centres, situated predominantly along the east coast, apart from Victoria, are Duncan, Nanaimo (q.v.), Port Alberni, Courtenay, North Cowichan, Port Hardy, and Campbell River (q.v.). The island is served by air and ferry service to mainland Canada and the United States. Pop. (1986) 509,460.

Vanda (Finland): see Vantaa.

Vanda, genus of colourful orchids, family Orchidaceae, with about 70 species distributed from eastern Asia to Australia. Most species have long, sturdy stems that bear closely spaced, strap-shaped leaves. Many hybrids have been developed by crossing species within the genus and also by crossing Vanda species with those of other orchid genera.

Vanda flowers usually are flat and have a short spur on the lip. One of the most beautiful species, V. sanderiana, is considered to be in a separate genus, Euanthe, by some authorities. This many-coloured Philippine flower is often used in hybridization. The bluish-flowered V. coerulea and the dark-spotted V. tricolor are other well-known species.

Vandal, member of a Germanic people who maintained a kingdom in North Africa from AD 429 to 534 and who sacked Rome in 455. Their name has remained a synonym for willful desecration or destruction.

Fleeing westward from the Huns at the beginning of the 5th/century, the Vandals invaded and devastated parts of Gaul before settling in Spain in 409. There the Asdingi Vandals under King Gunderic became the ascendant group after attacks by allies of the Romans had dissipated the Silingi and Alani Vandals. In 429 Gunderic's brother and successor, Gaiseric (q.v.; reigned 428–477), settled his people in North Africa, where they became federates of Rome in 435. Four years later Gaiseric threw off Roman overlordship, captured Carthage, and established an independent autocracy. With their rule firmly established in what is now northern Tunisia and northeastern Algeria, the Vandals eventually annexed Sardinia, Corsica, and Sicily, and their pirate fleets controlled much of the western Mediterranean. Under Gaiseric, the Vandals even invaded Italy and captured Rome in June 455. For a fortnight they occupied the city and systematically plundered it, carrying off many valuable works of art.

The Vandals were ardent Arian Christians, and their persecutions of the Roman Catholic church in Africa were at times fierce, particularly during the last years of the reign of Gaiseric's successor, Huneric (reigned 477–484). In 533 the Byzantines under Belisarius invaded North Africa following the deposition by the usurper Gelimer of Huneric's son, Hilderich, who was a close friend of the Byzantine emperor Justinian. In one campaigning season the Vandal kingdom was destroyed. Rome again ruled the area and restored the churches to the Roman Catholics. The Vandals played no further role in history.

Vandalia, city, seat (1821) of Fayette county, south-central Illinois, U.S., on the Kaskaskia River. Laid out in 1819, it served as the state capital from 1820 to 1839. The State House (1836), the third built in Vandalia before the capital was removed to Springfield, is preserved as a state historic site. Abraham Lincoln and Stephen A. Douglas served in the legislature there, and in the Supreme Court room Lincoln received his license to practice law. A monument in the State House grounds marks what was for many years the western terminus of the Cumberland (National) Road. A basic agricultural economy prevails, and there are oil developments in the area. A state correctional centre is just north of the city. Inc. 1821. Pop. (1986 est.) 6,640.

Vandamme, Dominique-René, COMTE (count) D'UNEBOURG (b. Nov. 5, 1770, Cassel, near Dunkirk, Fr.—d. July 15, 1830, Cassel), French general in the Revolutionary and Napoleonic wars.

Vandamme enlisted in the army in 1786, served in Martinique in 1788, and on returning to France entered into the Revolutionary movement, raising a company of light infantry. He was promoted and eventually was made general of brigade, serving in the Low Countries (1794), on the Rhine (1795), and in Germany (1796). In 1799 he was promoted general of division and served in Holland, Germany, and Switzerland. He was renowned for his tenacity and fearlessness as a fighting general as well as for his frank, rough manners and plundering and dissolute life, but he was a devoted servant of Napoleon. In

1805, for his leadership at Austerlitz, he was given the Grand Eagle of the Legion of Honour, and in 1806–07 he commanded a small corps of the Grande Armée. In 1808 he was made Count d'Unebourg. In 1809 he served in the Eckmühl campaign, but in 1812, while commanding the Westphalian contingent, he quarreled with King Jérôme Bonaparte and returned to France.

He returned to the army in 1813, but his corps, sent against the line of retreat of the Allies at the battle of Dresden, surrendered at Kulm. At the end of the war he was forbidden to enter Paris. When Napoleon returned from exile in Elba, Vandamme joined him and was made a peer of France and placed at the head of the III Corps in the army of the north. After Waterloo he brought back his corps in good order to Paris and thence to the Loire. The Restoration first imprisoned and then exiled him. He went to the United States but returned in 1820 to his native village.

Vandegrift, Alexander A(rcher) (b. March 13, 1887, Charlottesville, Va., U.S.—d. May 8, 1973, Bethesda, Md.), U.S. Marine Corps officer who led the first large-scale U.S. offensive against the Japanese, on Guadalcanal in the Solomon Islands, during World War II.

Commissioned a second lieutenant in the Marine Corps in 1909, Vandegrift had advanced to the rank of major general by 1942. Having served in Nicaragua, Haiti, and China, he was well prepared for the jungle-warfare techniques that were required in the Pacific area. When the United States launched a marine amphibious assault against the Solomons in August 1942, Vandegrift surprised Guadalcanal's Japanese defenders with his bold use of concentrated, mobilized firepower. He not only made a successful landing but also managed to hold his position against repeated counterattacks despite diminishing supplies until the marines were relieved by army troops in December. In November 1943 he commanded the 1st Marine Amphibious Corps landing on Bougainville. He was the first ma-rine to be awarded both the Navy Cross and the Medal of Honor.

Appointed the 18th commandant of the U.S. Marine Corps (January 1944), he became the first Marine Corps officer to hold the rank of general while still on active duty (March 1945). He retired in 1948.

Vandenberg, Arthur H(endrick) (b. March 22, 1884, Grand Rapids, Mich., U.S.—d. April 18, 1951, Grand Rapids), U.S. Repub-

Vandenberg

lican senator who was largely responsible for bipartisan congressional support of international cooperation and of President Harry S. Truman's anticommunist foreign policy after World War II.

Editor of the *Grand Rapids Herald* from 1906, Vandenberg became active in Republican politics and was appointed U.S. senator in 1928—a post he retained through election until his death. While supporting conservative policies in the domestic field, he grew interested chiefly in foreign relations. During the

1930s, he was a spokesman for isolationist sentiment and a bitter critic of Pres. Franklin D. Roosevelt. After the Japanese attack on Dearl Harbor (Dec. 7, 1941), however, he began to revise his picture of world relations and by the war's end had come around to the view that the United States should participate actively in an effective international organization. He expressed this opinion in a notable Senate speech (January 1945) and thus provided valuable Republican support for the United Nations. In the same year Roosevelt appointed him a delegate to the United Nations Conference on International Organization that met in San Francisco.

As chairman of the Senate Foreign Relations Committee (1946–48), Vandenberg marshalled congressional support for the Truman Doctrine of aid to Greece and Turkey (1947), the Marshall Plan of aid to Europe (1948), and the North Atlantic Treaty Organization (1949), all of which sought to prevent the spread of Communism in Europe. Furthermore, in the spring of 1948 he helped defeat a Republican-sponsored measure to inhibit the Reciprocal Trade Agreements program, substituting instead a provision for independent action on the part of the Tariff Commission.

Vanderbijlpark, town, Transvaal, South Africa, on the Vaal River, southwest of Johannesburg. It was founded in 1942 after it was determined that the South African Iron and Steel Industrial Corporation steelworks at Pretoria could no longer be expanded. Officially declared a town in 1952 when the steelworks were opened, Vanderbijlpark is now the major steel-producing centre of South Africa. Other important metal-processing industries produce castings and equipment for mines and power stations. Educational facilities include an advanced technical institute and a branch campus of the Potchefstroom University for Christian Higher Education. Pop. (1983 est.) mun., 285,974.

Vanderbilt FAMILY, one of the wealthiest and most prominent families in the United States. The third generation of Vanderbiltsfollowing Cornelius and William Henry Vanderbilt (qq.v.)—was led by William Henry's sons: Cornelius (1843–99), William Kissam (1849–1920), and George Washington (1862– 1914). Of the three, Cornelius was by far the most devoted to furthering the family's business and investment interests. Following his father's death in 1885, Cornelius took charge of the various railroads and other corporations and of the philanthropic activities. He served on numerous social and civic boards, and he oversaw the granting of enormous sums to Yale University, Columbia's College of Physicians and Surgeons, the Metropolitan Museum of Art, and many other educational, charitable, and religious organizations.

William Kissam Vanderbilt worked with his brother Cornelius in managing the Vanderbilt investments and enterprises. But he was far less interested in business than were his brother, father, and grandfather. In 1903 William Kissam turned over management of the railroads to an outside firm and thereafter devoted himself to his philanthropic, social, and sporting interests. He was deeply involved in the operation of the Metropolitan Opera, in collecting art, and in racing yachts. In 1895 he retained the America's Cup for the United States at the helm of "Defender."

George Washington Vanderbilt, the youngest son of William Henry, had the least involvement with the family businesses or investments. He created a huge estate, Biltmore, near Asheville, N.C., and there carried on extensive experiments in scientific farming, stock breeding, and forestry. He gave large gifts to the New York Public Library, Columbia University, and the American Fine Arts Society. Of the fourth generation, Cornelius' son Cor-

Of the fourth generation, Cornelius' son Cornelius III (1873–1942) was a financier. Other

sons Alfred Gwynne (1877–1915) and Reginald Claypoole (1880–1925) were noted for their interest in show horses. William Kissam left two sons—William Kissam (1878–1944) and Harold Stirling (1884–1970)—both associated with the New York Central Railroad. Harold Stirling Vanderbilt was also notable as the inventor of the game of contract bridge and as the skilled yachtsman who won the America's Cup three times.

Cornelius, Jr. (1898–1974), the son of Cornelius III, was a writer who founded a chain of newspapers.

Vanderbilt, Amy (b. July 22, 1908, New York City—d. Dec. 27, 1974, New York City), U.S. journalist and author of Amy Vanderbilt's Complete Book of Etiquette (1952), a book that has been called a "guide to gracious living." An acknowledged authority on manners, mores, and etiquette, Vanderbilt took five years to research and write the book, which underwent periodic revisions and sold millions of copies. The book was later retitled Amy Vanderbilt's Etiquette.

Called "the successor to Emily Post," Vanderbilt became a part-time reporter for the Staten Island Advance when she was 16. She studied in Switzerland and at the Packer Collegiate Institute in Brooklyn before attending New York University for two years to study journalism. She held a variety of jobs in the 1930s and 1940s, including one with an advertising agency and another with a public relations firm. From 1954 to 1960 she was the hostess of a television etiquette show, "It's in Good Taste." She had a radio show, "The in Good Taste." She had a radio show, "The Right Thing To Do," from 1960 to 1962. She served as official etiquette consultant for a number of agencies and organizations, including the U.S. Department of State. In addition to her book on etiquette, she also wrote books on "everyday etiquette" and cooking.

Vanderbilt, Cornelius (b. May 27, 1794, Port Richmond, Staten Island, N.Y., U.S.—d. Jan. 4, 1877, New York City), U.S. shipping and railroad magnate who acquired a personal fortune of more than \$100,000,000.

The son of an impoverished farmer and boatman, Vanderbilt quit school at age 11 to work on the waterfront. In 1810, at the age of 16, he purchased his first boat with money borrowed from his parents. He used the boat to ferry passengers between Staten Island and

Cornelius Vanderbilt

New York City; then, during the War of 1812, he enlarged his operation to a small fleet with which he supplied government outposts around the city.

Vanderbilt expanded his ferry operation still further following the war, but in 1818 he sold all his boats and went to work for Thomas Gibbons as steamship captain. While in Gibbons' employ (1818–29), Vanderbilt learned the steamship business and acquired the capital that he used in 1829 to start his own steamship company.

During the next decade, Vanderbilt gained

control of the traffic on the Hudson by cutting fares and offering unprecedented luxury on his ships. His hard-pressed competitors finally paid him handsomely in return for Vanderbilt's agreement to move his operation. He then concentrated on the northeastern seaboard, offering transportation from Long Island to Providence and Boston. By 1846 "the Commodore" was a millionaire.

The following year, he formed a company to transport passengers and goods from New York City and New Orleans to San Francisco via Nicaragua. With the enormous demand for passage to the West Coast brought about by the 1849 gold rush, Vanderbilt's Accessory Transit Company proved a huge success. He quit the business only after his competitors—whom he had nearly ruined—agreed to pay him \$40,000 (later it rose to \$56,000) a month to abandon his operation.

By the 1850s he had turned his attention to railroads, buying up so much stock in the New York and Harlem Railroad that by 1863 he owned the line. He later acquired the Hudson River Railroad and the New York Central Railroad and consolidated them in 1869. When he added the Lake Shore and Michigan Southern Railroad in 1873, Vanderbilt was able to offer the first rail service from New York City to Chicago.

During the last years of his life, Vanderbilt ordered the construction of Grand Central Terminal in New York City, a project that gave jobs to thousands who had become unemployed during the Panic of 1873. Although never interested in philanthropy while acquiring the bulk of his huge fortune, later in his life he did give \$1,000,000 to Central University in Nashville, Tenn. (later Vanderbilt University). In his will he left \$90,000,000 to William's four sons, and—consistent with his lifelong contempt for women—the relatively small remainder to his second wife and his eight daughters.

Vanderbilt, William Henry (b. May 8, 1821, New Brunswick N.J., U.S.—d. Dec. 8, 1885, New York City), U.S. railroad magnate and philanthropist who nearly doubled the Vanderbilt family fortune established and in large part bequeathed to him by his father Cornelius.

A frail and seemingly unambitious youth, William was dismissed by his strong and dynamic father as incompetent to run the family business. The two split on William's decision to marry at age 19, and Cornelius sent his son off to farm on Staten Island. To his father's surprise, William made the farm a profitable operation.

While Cornelius was still concentrating on steamship lines, William became interested in railroads. In 1857 he convinced his father to make him receiver of the bankrupt Staten Island Railroad and a few years later startled his father by putting the line back on a sound financial footing. In 1864 William became vice president of the New York and Harlem Railroad and assumed the same position with the New York and Hudson Railroad in 1865; both lines were owned by his father.

It was not until after the Commodore's death in 1877 that William was fully able to demonstrate his financial and managerial genius. He greatly expanded the New York Central network and acquired the Chicago and North Western; the Nickel Plate (New York, Chicago, & St. Louis); Cleveland, Columbus, Cincinnati, and Indianapolis; and other railroads. He fought regulation of the railroads as he engaged in rate wars and gave special rates to favoured shippers. By the time poor health forced him to resign his railroad presidencies

in 1883, William Henry had nearly doubled the Vanderbilt family fortune.

In addition, he established the Vanderbilt family name in philanthropy. He gave substantial gifts to Vanderbilt University, Columbia's College of Physicians and Surgeons, and other recipients. He built a block-long mansion on Fifth Avenue and filled it with what was claimed to be the finest private collection of paintings and sculpture in the world. In his will he divided his fortune more equitably than had his father, and he left substantial bequests to the Metropolitan Museum of Art, the YMCA, and various churches and hospitals.

Vanderlyn, John (b. Oct. 15, 1776, Kingston, N.Y., U.S.—d. Sept. 23, 1852, Kingston), U.S. painter and one of the first American artists to study in Paris. He was largely responsible for introducing the Neoclassical style to the United States.

As a young man Vanderlyn copied a Gilbert Stuart portrait of Aaron Burr that attracted

the attention of Burr. He sponsored Vanderlyn's artistic training, first with Stuart and then, in 1796, at the École des Beaux-Arts, Paris. Vanderlyn returned to New York in 1801, where he did paintings of Niagara Falls. In 1803 Vanderlyn was able to return to Europe, and his best work was done during this period. Vanderlyn returned to the U.S. when he was 40 years of age, and the treatment accorded him was a bitter contrast to his European successes. He did not receive the federal commissions for which he had been hoping. Expecting to duplicate the European popularity of panoramas, he installed his 3,000foot Palace and Gardens of Versailles (1816-19; Metropolitan Museum of Art, New York City) and other works in a rotunda built at his own expense on land leased from the city of New York. Vanderlyn realized little income from the project, and he was embittered when ten years later the city cancelled his lease. He retired to Kingston, N.Y., and supported himself by painting uninspired portraits that were hardly recognizable as coming from his hand. In 1832 he finally received a commission from the U.S. government: a full-length portrait of George Washington (Capitol, Washington, D.C.). Ten years later he received another: "Landing of Columbus" (1842-44; Capitol Rotunda, Washington, D.C.).

Vandervelde, Émile (b. Jan. 25, 1866, Ixelles, Belg.—d. Dec. 27, 1938, Brussels), Belgian statesman and a prominent figure in European Socialism who served in Belgian coalition governments from 1914 to 1937 and was influential in the peace negotiations following World War I.

Vandervelde joined the Belgian Workers' Party in 1889 and became a party leader. He entered Parliament as a Socialist in 1894

and played a leading role in the international Socialist congresses after 1900. In the years before World War I he was prominent in the Socialist agitation for universal suffrage, granted in Belgium in 1919. He was named minister of state in 1914 and served in the Cabinet throughout the war. In the Paris Peace Conference treaty negotiations (1919–20), he gained inclusion of clauses favouring labour, including one advocating an eight-hour day; as minister of justice, he sponsored major penal reforms (1919).

After the gains of the Workers' Party in the elections of 1925, he was named minister for foreign affairs in a Socialist-Catholic coalition government and helped negotiate the Pact of Locarno (1925) among Germany, Belgium, France, Great Britain, and Italy. He continued as foreign affairs minister in the first two years of Henri Jaspar's ministry but was criticized by opposition parties for advocating limitation of military service to six months and for his antimilitarist stance in foreign policy. He served as minister without portfolio (1935–36) and minister of public health (1936–37) before retiring to become a law professor at the Free University of Brussels.

Vandervelde's works include Le Collectivisme et l'évolution industrielle (1900; Collectivism and Industrial Evolution, 1907); Le Socialisme contre l'état (1918; Socialism Versus the State, 1919); and Le Parti Ouvrier Belge, 1885–1925 (1925; "The Belgian Workers' Party, 1885–1925").

Vane, Sir Henry, THE ELDER (b. Feb. 18, 1589, Hadlow, Kent, Eng.—d. May 1655), English statesman, a prominent royal adviser who played an equivocal role in the events leading to the outbreak of the Civil War between King Charles I and Parliament.

After serving in five Parliaments, he was

appointed secretary of state by Charles I in February 1640. Three months later Vane announced to the House of Commons that Charles I would waive collection of the un-

popular royal levy known as ship money if Parliament would supply the crown with 12 military subsidies. By refusing to accept fewer than 12 subsidies, Vane created a deadlock that led to the dissolution of the Short Parliament by Charles. Vane may have been trying to block a reconciliation between Charles and Parliament, perhaps because he was secretly working against the King

working against the King.

In 1641 Vane helped bring about the impeachment and execution of the King's chief minister, Thomas Wentworth, the earl of Strafford, by testifying that Strafford had proposed using Irish troops to suppress Charles's Parliamentary opponents. As a result, Charles dismissed Vane from office. He worked for the Parliamentary cause during the Civil War but was not placed on the Council of State in 1650 because of opposition from leading radicals. In 1654 he served in Oliver Cromwell's first Parliament.

Vane, Sir Henry, THE YOUNGER (b. 1613—d. June 14, 1662, London), English Puritan, one of the most capable administrators in Parliament during the Civil Wars between the Parliamentarians and Royalists.

His father, Sir Henry Vane the Elder, was an adviser to King Charles I. Henry the Younger was converted to Puritanism in his youth, and in order to practice his beliefs freely he went to New England in 1635. After serving as governor of Massachusetts for a year (1636–37), he returned to England, where his father obtained for him an appointment as joint treasurer of the navy (1639). Joining the opposition to Charles I in the Long Parliament that convened in November 1640, he supported a bill to abolish the episcopacy, and with his father he helped bring about the impeachment of the King's chief minister, Thomas Wentworth, earl of Strafford. Consequently, Charles I dismissed him from his treasurership.

Vane was the chief English negotiator of the Solemn League and Covenant with Scotland in 1643, and he succeeded John Pym as leader of the House of Commons in 1643. Although he disapproved of the purge of the Presbyterian members of Parliament by the army (1648), he served in the resulting Rump Parliament. A committed republican, he was a prominent member of the Commonwealth's Council of State from 1649 to 1653, but, adhering to the principle of parliamentary sovereignty, he led the opposition to Cromwell's dissolution of the Rump Parliament in April 1653. Withdrawing from politics, he wrote several books of theological speculation, including the obscure, somewhat mystical Retired Man's Meditations (1655).

In 1656 Vane was briefly imprisoned for publishing a pamphlet attacking Cromwell's Protectorate. He helped the army overthrow Oliver's son, Richard Cromwell, in 1659 and sat in the restored Rump Parliament. Two years after the Restoration of King Charles II (1660) he was executed for his past Parliamentary activities. J. Willcock's *Life of Sir Henry Vane the Younger* appeared in 1913, and Violet Roe's *Sir Henry Vane the Younger* in 1970.

Vane, John Robert (b. March 29, 1927, Tardebigg, Worcestershire, Eng.), English biochemist, co-recipient with Sune K. Bergström and Bengt Ingemar Samuelsson of Sweden (qq.v.) of the 1982 Nobel Prize for Physiology or Medicine.

Vane was graduated from the University of Birmingham and earned a doctorate at the University of Oxford in 1953. He spent two years on the faculty of Yale University before returning to England to join the Institute of Basic Medical Sciences of the University of London. He became research director of

the Wellcome Research Laboratories, Beckenham, Kent, in 1973.

Vane and his two colleagues received the Nobel Prize for their isolation, identification, and analysis of prostaglandins, biochemical compounds that influence blood pressure, body temperature, allergic reactions, and other physiological phenomena in mammals. In demonstrating that aspirin inhibits the formation of prostaglandins associated with pain, fever, and inflammation, Vane provided a physiological rationale for the effectiveness of the world's most widely used drug.

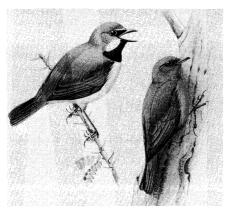

Vane, Sutton, original name VANE SUTTON-VANE (b. Nov. 9, 1888, England—d. June 15, 1963, Hastings, Sussex, Eng.), English playwright, remembered for his unusual and highly successful play Outward Bound (1923), about a group of passengers who find themselves making an ocean voyage on a ship that seems to have no crew. Slowly they realize that they are dead and bound for the other world, which is both heaven and hell.

Vane, who started his career as an actor, was shell-shocked early in World War I. Later in the war he returned to France to perform behind the lines. Back home in England, he began to write plays. Because he could find no one willing to produce his strange *Outward Bound*, he hired a small London suburban house called the Everyman Theatre and mounted the production himself at a total cost of £120. The play was an instant success and was transferred to a leading London theatre. Its success later was duplicated in New York, and it has been twice filmed.

Vänern, largest lake in Sweden, 2,156 sq mi (5,585 sq km) in area, in the southwestern part of the country. It averages 144 ft (44 m) above sea level and is fed by numerous rivers (the largest being Klarälven), draining into the Kattegat via the Göta älv, a major source of hydroelectric power. Vänern is surrounded by rocky, wooded shores except on the south, where the coast is low and conducive to farming. The lake, about 90 mi (145 km) long and as much as 322 ft deep, forms a major link in the Göta Kanal, a waterway that crosses Sweden from the Kattegat to the Baltic Sea. Lake ports dealing in timber and tourists include Karlstad, Lidköping, Vänersborg, Kristinehamn, Åmal, Säffle, and Mariestad. Vänern is the third largest lake in Europe, after Ladoga and Onega (both in the Soviet Union).

vanga-shrike, also called VANGA, any of the 12 species of Madagascan birds constituting the bird family Vangidae (order Passeriformes). The coral-billed nuthatch is sometimes included. They are 13 to 30 centimetres (5 to 12 inches) long, with wings and tails

of moderate length. The hook-tipped bill is stout and of remarkably variable shape and length, much like the variability among Darwin's finches, also isolated. Most species are glossy black or blue above and white below; some have white heads or have reddish-brown or gray markings (sexes similar). They make cup nests in trees or brush. The hook-billed vanga-shrike (Vanga curvirostris) is a big-billed form that catches tree frogs and lizards. Smallest species is the red-tailed vanga, or tit-shrike (Calicalicus madagascariensis).

Vanguard, any of a series of unmanned U.S. experimental test satellites. Vanguard I, launched March 1, 1958, consisted of a tiny 3.25-pound (1.47-kilogram) sphere equipped with two radio transmitters. It was the second artificial satellite placed in orbit around the Earth by the United States, the first being Explorer 1 (Jan 31, 1958). By monitoring Vanguard's flight path, scientists found that the Earth was almost imperceptibly pear-shaped in confirmation of earlier theories. Vanguard II, orbited on Feb. 17, 1959, carried lightsensitive photocells that were designed to provide information about the Earth's cloud cover, but the tumbling motion of the satellite rendered the data unreadable. Vanguard III, the last in the series, was launched several months later. It was used to map the Earth's magnetic field.

Vanguardia Española, La (Spanish: "The Spanish Vanguard"), morning daily newspaper published in Barcelona, one of the largest and most influential newspapers in Spain. It was established in 1881 by Carlos Godó, in whose family it remained, as a political organ favouring the policies of Praxedo Mateo Sagasta, the leader of a liberal political coalition. In its early years the Vanguardia was hampered by press censorship. Ramon Godó Lallana assumed direction of the paper in 1897 and began to build it into a leading national daily. La Vanguardia Española operated with little government interference in the early part of the 20th century but came again under official control following the fall of the Spanish monarchy in 1931. The paper was fined twice in 1933 for publishing matter deemed improper by the Republican government; its political outlook is liberal. The paper is noted for its coverage of international news-it has more foreign correspondents than any other Spanish journal—and for its sports reporting. It was a pioneer in progressive labour policies, early providing such employee benefits as sick pay, paid vacations, and pensions. In the early 1980s its circulation was about 190,000 daily and 250,000 Sunday.

vanilla, genus of tropical climbing orchids, from the pods of which a widely used flavouring agent is extracted. Vanilla had been used to flavour xocoatl, the chocolate beverage of the Aztecs, centuries before Cortés drank it at Montezuma's court, and soon afterward vanilla became popular in Europe. Today it is used in a variety of sweet foods and beverages, particularly chocolate, confections, ice cream, and bakery goods, and in perfumery.

The vanilla beans of commerce are the cured, unripe fruit of *Vanilla planifolia*, Mexican or Bourbon vanilla, which is native to Mexico, Central America, and northern South America, or *Vanilla tahitensis*, Tahiti vanilla, which is native to Oceania. Principal sources are Madagascar, the Comoro Islands, and Réunion, which furnish about 70 to 75 percent of the world's supply; and Mexico, Uganda, and French Polynesia.

The plant has a long, fleshy climbing stem that attaches itself by aerial rootlets to trees; roots also penetrate the soil. Numerous flowers open a few at a time and last but a day during the blooming season, which lasts about two months. Because of their dainty structure, the blossoms can be naturally pollinated only

by a small bee of Mexico; in other countries the flowers are pollinated artificially with a

wooden needle as soon as they open. The fruit, a bean pod, reaches its full length of about 8 inches (20 centimetres) in four to six weeks but may take up to nine months to mature. As soon as they turn golden green at the base, the unripe beans are harvested.

Fresh vanilla beans have no aroma. The characteristic aroma results from enzymatic action during curing. The traditional method begins with subjecting the harvested beans to a process of nightly sweating and daily exposure to the sun for about 10 days, until they become deep chocolate brown in colour. Then the beans are spread on travs in an airy shelter until dry enough for grading and packing. Curing and drying requires from four to five months. The best grade of cured bean pods may be covered with tiny crystals of vanillin, which provide the characteristic aroma, sweet, rich, and delicate. This coating, known as givre, may be used as a criterion of quality. Vanillin is not naturally present in the fleshy exterior of the pod but is secreted by hairlike papillae in its lining and ultimately becomes diffused through the viscid, oily liquid surrounding the seeds. The cured pods contain about 2 percent vanillin; other organic constituents include vanillic acid (odourless), oleoresin, sugar, gum, calcium oxalate, alcohols, aldehydes, and esters contributing to the full fragrance and flavour. Tahiti beans are reddish brown in colour, of less full flavour than the Mexican or Bourbon product, and contain a small amount of heliotropin, or piperonal, which characterizes their flavour.

Vanilla extract is prepared by crushing the cured, dried vanilla beans and extracting with alcohol. Vanilla flavour is made from oleoresin vanilla, a dark, semisolid concentration of vanilla extract, and alcohol and water. Imitation vanilla is made from commercially synthesized vanillin.

"De," "la," and similar components of a name, when followed by a space, are alphabetized as separate words (e.g., De Forest, Lee). When they are joined to the following part of a name, the combination is treated as a single word (e.g., DeForest, John William).

Vanimo, minor port and administrative headquarters of West Sepik province, northwestern Papua New Guinea. Located on a peninsula surrounded by a white sand beach fronting the Pacific Ocean, Vanimo is about 20 mi (30 km) east of the border with Irian Jaya province, Indonesia. It was developed as the headquarters of West Sepik district (now province) after the Sepik district was divided in 1966. On a well-drained alluvial plain covered with lowland rain forest, the town is a lumbering centre with sawmills and a port for overseas shipment of timber. Some copra is produced along the coast. Road building has proceeded slowly; the main project is the construction of a coastal road. The town has an airfield. Pop. (1980 prelim.) 3,051.

Vanir, in Norse mythology, race of gods responsible for wealth, fertility, and commerce and subordinate to the warlike Aesir. As reparation for the torture of their goddess Gullveig, the Vanir demanded from the Aesir monetary satisfaction or equal status. Declaring war instead, the Aesir suffered numerous defeats before granting equality. The Vanir sent their gods Njörd and Freyr to live with the Aesir and received Hoenir and Mimir in exchange. The birth of the poet-god Kvasir resulted from the peace ritual in which the two races mingled their saliva in the same vessel.

vanitas (Latin: "vanity"), in art, an important type of still-life painting that flourished in the Netherlands in the early 17th century, consisting of collections of objects symbolic of the inevitability of death and the transience

and vanity of earthly achievements and pleasures; a vanitas painting exhorts the viewer to consider mortality and to repent. The vanitas evolved from simple pictures of skulls and other symbols of death and transience frequently painted on the reverse sides of portraits during the late Renaissance. It had acquired an independent status by about 1550, and by 1620 had become a very popular genre. Its development until its decline in about 1650 was centred in Leiden, in the United Provinces of the Netherlands, an important seat of Calvinist learning, with its emphasis on man's sinfulness and its rigid moral code.

Although a few vanitas pictures include figures, the vast majority are pure still lifes, containing certain standard elements: symbols of arts and sciences (such as books, maps, and musical instruments), wealth and power (such as purses and jewelry), and earthly pleasures (such as goblets, pipes, and playing cards); symbols of death or transience (such as skulls, clocks, burning candles, soap bubbles, and flowers); and, sometimes, symbols of resurrection and eternal life (usually ears of corn or sprigs of ivy or laurel). The earliest vanitas pictures were sombre, somewhat monochromatic compositions of great power, containing only a few objects, usually books and a skull, executed with elegance and precision. As the century progressed, other elements were included, the mood lightened, and the palette became diversified. Objects were often tumbled together in disarray, suggesting the eventual overthrow of the achievements they represent. In later paintings the standard subject matter of the vanitas theme became largely a pretext for meticulous virtuosity in the rendering of varied textures and surfaces,

but the artistic quality of the genre in no sense declined. Several of the greatest Dutch still-life painters, including David Bailly, Jan Davidsz de Heem, Willem Claesz Heda, Pieter Potter, and Harmen and Pieter van Steenwyck, were masters of the vanitas still life, and the influence of the genre can be seen in the iconography and technique of other contemporary painters, including Rembrandt.

Vannes, town, capital of Morbihan département, Bretagne region, western France, at the confluence of two streams forming the Vanne River, which opens into the virtually land-locked Golfe du Morbihan about one mile below the town. A market centre, it has spread around the old walled town situated on a hill. The 13th–17th-century ramparts, linked by towers and gates, are well preserved on the east side of the old town above the Rohan stream. The Place Henri IV is bordered by 16th-century gabled houses. The cathedral of Saint-Pierre, burned by the Normans in the 10th century, was rebuilt between the 13th and 19th centuries.

Vannes was the centre of the Veneti tribe who led the unsuccessful Armorican rising against Julius Caesar after the Roman conquest. The Celtic ecclesiastic St. Paternus was consecrated first bishop of Vannes in 466. After a period of rule by independent counts, Vannes came under the yoke of the Franks. In 845 Nominoë, the Breton leader in Armorica, defeated the Frankish king Charles the Bald and established the independent duchy (for a time kingdom) of Brittany. Vannes became part of the duchy in 990. The Estates of Brittany, meeting in Vannes in 1532, ratified the union of the duchy with the French crown. The town is an important agricultural centre, with poultry farming and the production of poultry and cattle foodstuffs. Light industries include the manufacture of tires, prefabricated building material, and metalworking. Vannes' magnificent flower gardens are a tourist attraction. Pop. (1982) 39,979.

Vanoise National Park, nature reserve, located in the département of Savoie, southeastern France, and contiguous with the Gran Paradiso National Park in Italy. The park, created in 1963, is the oldest French national park and occupies 130,565 ac (52,839 ha). The park is dominated by the Massif de la Vanoise, which is bounded by the Isère River to the east and the Arc River to the south. The Pointe de la Grande Casse (12,638 ft [3,852 m]) is the highest peak in the park; there are 107 others that rise above 9,800 ft. Conifers predominate and include larches, firs, spruces, Scots pines, mountain pines, and arollas. Zones of quartzite and schist support rock campions, cowberries, wavy hairgrass, blue-spiked rampions, and round-leaved restharrow. Typical birds are nutcrackers, black grouses, ptarmigans, ring ouzels, golden eagles, and buzzards. Ibex, chamois, marmots, foxes, and badgers are common. Sheep are allowed to graze in the park. More than 350,000 ac adjoining the park have been designated as a peripheral, or buffer, zone and are being developed to accommodate tourists. The peripheral zone includes the nature reserves of Tignes and Val-

Vansittart (of Denham), Robert Gilbert Vansittart, Baron (b. June 25, 1881, Farnham, Surrey, Eng.—d. Feb. 14, 1957, Denham, Buckinghamshire), British diplomat, author, and extreme Germanophobe.

Vansittart, 1938

BBC Hulton Picture Library

Vansittart was educated at Eton and then trained for diplomatic service. He was first secretary at the Paris Peace Conference (1919-20) and principal private secretary to Lord Curzon (1920-24) and to successive prime ministers (1928–30). As permanent under secretary at the Foreign Office (1930–38), he warned the British government of the growing military power of Germany and insisted that Great Britain should rearm. Vansittart espoused a Germanophobic doctrine—which became known as vansittartism—that held that the conduct of German war leaders from the time of the Franco-German War (1870-71) had had the wholehearted support of the German people and that Germany had to be permanently demilitarized to ensure against future agression.

Vansitart was regarded by Neville Chamberlain as a hindrance to the British government's efforts to reach a settlement with Hitler. During the Czech crisis of 1938 Vansitart was made chief diplomatic adviser to the government, a post of no importance. He retired in 1941 and was raised to the peerage (which became extinct upon his death).

Vansittart wrote novels, verse, and plays, among them Les Pariahs (1902) and Dead Heat (1939). In his autobiography, The Mist Procession, published posthumously in 1958, he could recall no major issue on which his advice was taken, and he described his life as "a story of failure."

Vantaa, Swedish VANDA, city in Uudenmaan lääni (Uusima province), southern Finland, just north of Helsinki. Located in the estuary of the Vantaa River, it was incorporated as a city in 1972. Notable landmarks are the church of St. Lauri (1492), the parish of Helsinki Museum, and the Finnish Aviation Museum. Vantaa is connected with Helsinki and Lahti by motorways and railways. It is also an important manufacturing and tourist centre. Pop. (1983 est.) mun., 138,018.

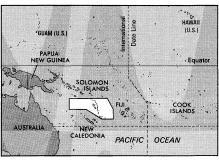

Vanua Lava, volcanic island in the Banks Islands of Vanuatu, southwestern Pacific Ocean, 75 mi (120 km) north-northeast of Espiritu Santo. The island, 15 mi long by 12 mi wide, was first explored in 1859 by Bishop George Selwyn, who located a good harbour (Port Patteson) on the east coast. A second harbour, Vureas (Avareas) Bay, is on the southwest coast. Mt. Suretamati on the island rises to 3,022 ft (921 m) and is an active volcano, the sulfur deposits of which were once worked by a French concern. The island exports copra and cacao. Pop. (1979) 909.

Vanua Levu, second largest island (2,137 sq mi [5,535 sq km]) of Fiji, bordering the Koro Sea in the South Pacific, 40 mi (64 km) northeast of the island of Viti Levu. Sighted by the Dutch navigator Abel Tasman in 1643, the volcanic Vanua Levu (meaning Great Land) was formerly called Sandalwood Island. The central mountain range, culminating at Mt. Nasorolevu (3,386 ft [1,032 m]), divides the island into wet (southeastern) and dry (northwestern) sections. Natewa Bay, on the east coast, cuts deeply into the island to make a

peninsula of its southeastern corner, while the south coast is indented by the broad Savusavu and Wainunu bays.

The Ndreketi (Drekiti) is one of several streams in the northwest with level valleys where sugarcane is cultivated. Lambasa (Labasa) on the north coast is the main population centre and port of the island. Vanua Levu exports sugar and copra. Copper ore was mined at Undu Point in the northeast until the supply was exhausted in the mid-1960s. The population of the island comprises slightly more Indians than Melanesians. Pop. (1986) including adjacent islands, 129,154.

Vanuatu, in full REPUBLIC OF VANUATU, Bislama RIPABLIK BLONG VANUATU, French RÉPUBLIQUE DE VANUATU, formerly NEW HEBRIDES, French NOUVELLES-HÉBRIDES, republic consisting of a chain of 13 principal and many smaller islands in the southwestern Pacific Ocean, 500 miles (800 km) west of Fiji and 1,100 miles (1,800 km) east of Australia. The islands extend from north to south for 400 miles (650 km) in an irregular Y shape and have a total land area of 4,707 square miles (12,190 square km); they include the Banks Islands (Vanua Lava, Gaua [Santa Maria], Mota, and Mota Lava) and Espiritu Santo, Malo, Aoba, Maéwo, Pentecôte (Pentecost), Malakula, Ambrym, Épi, Éfaté, Erromango,

Vanuatu

Tanna, and Anatom. The capital is Vila (also called Port-Vila) on Éfaté, the main island. The population in 1988 was estimated at 149,000. *See also* Pacific Islands.

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. A diverse relief—ranging from rugged mountains and high plateaus to rolling hills and low plateaus, with coastal terraces and offshore coral reefs—characterizes the islands. Sedimentary and coral limestones and volcanic rock predominate; frequent earthquakes indicate structural instability, and there are active volcanoes on several islands, including the Banks group, Tanna, Lopevi, and Ambrym. The highest point is Mount Tabwémasana, 6,165 feet (1,879 m), on Espiritu Santo, the largest island, which has an area of 1,420 square miles (3,680 square km).

The climate is oceanic tropical, moderated by southeast trade winds between May and October. Winds are variable during the rest of the year, and hurricanes may occur. In 1987 Vanuatu was ravaged by the worst cyclone in its history, one that destroyed or damaged much of the nation's housing. The annual rainfall that Vanuatu receives varies from about 80 inches (2,000 mm) in the south to 160 inches (4,000 mm) in the north. Mean temperatures vary between 72° F (22° C) and 81° F (27° C) at Vila, on Éfaté, in the centre of the chain.

All of the islands are well forested; tropical rain forests abound with tall trees, a thick growth of ferns and vines, and orchids at higher elevations. The southern islands, including Erromango and Tanna, have open patches of grassland. On parts of the coasts of Malakula and Éfaté there are stretches of man-

groves. Mammals on the islands prior to the arrival of the Europeans included bats, rats, and wild pigs. There are numerous species of birds, including pigeons, parrots, honeyeaters, thrushes, and swiftlets.

The people. The indigenous population, called ni-Vanuatu, is overwhelmingly Melanesian, but there are also small numbers of Europeans, Chinese, Vietnamese, Polynesians, and Micronesians. Most of the islanders live in rural communities; the two main towns are Vila, the country's largest centre of population, and Luganville (also called Santo) on Espiritu Santo Island. The country has a relatively low population density; the most populated islands are Éfaté, Espiritu Santo, Tanna, and Malakula. Many Melanesian languages and dialects are spoken, and most are related to those of Fiji and New Caledonia. The national language is Bislama, an English-based Melanesian pidgin; it is the country's lingua franca and is used in debate in Vanuatu's Parliament. Bislama, English, and French are the official languages. The population is mainly Christian, including Presbyterians, Anglicans, and Roman Catholics. Some of the inhabitants adhere to traditional religious practices, and the Jon Frum cargo cult has followers, particularly on Tanna. Vanuatu has high birth and death rates. About 45 percent of the population is less than 15 years of age.

The economy. Vanuatu has a developing free-market economy based mainly on agriculture, cattle raising, and fishing. Its gross national product (GNP) per capita, which is growing more rapidly than the population, is about average among the countries of Oceania.

Most of the population practices subsistence agriculture or is employed on plantations. Cultivation is generally restricted to the narrow coastal plains and low plateaus. Subsistence crops include coconuts, bananas, yams, cassava, taro, breadfruit, and vegetables. Copra, cocoa, and coffee are the important cash crops. Large numbers of cattle are raised in expanding operations on coconut plantations or on some large cattle ranches on the islands of Espiritu Santo (site of an abattoir), Éfaté, and Malakula. Raising poultry, pigs, and goats is part of the local economy.

Fishing, an important part of Vanuatu's economy, consists primarily of a Japanese-held company that operates a fleet of fishing vessels; tuna and bonito are frozen for export at a plant on Espiritu Santo. In addition to meat canning and fish freezing, small-scale manufacturing includes the production of soft drinks, building materials, furniture, and aluminum boats. There are manganese deposits on Efaté and Erromango islands.

Tourism is an increasingly important source of foreign exchange, and because Vanuatu has no direct taxation, it is becoming a finance centre as well. The nation's major exports are copra, fish, and beef and veal. The Netherlands, France, and Japan are the main export destinations. Manufactured goods, foodstuffs, and petroleum are the major imports, primarily from Australia, Japan, New Zealand, and France. Budgetary aid from the United Kingdom and France compensates for much of the traditionally unfavourable balance of trade.

There are all-weather roads on Éfaté and Espiritu Santo; the other large islands have mostly unsealed roads. The main deepwater ports are at Vila and Luganville. Regular shipping services are maintained with New Caledonia, Australia, New Zealand, and Europe. Interisland service is provided by small shipping vessels and is mostly unscheduled. Bauerfield near Vila on Éfaté and Pekoa near Luganville on Espiritu Santo are international airports; many of the other islands have airfields.

Government and social conditions. The constitution, which came into effect upon independence in 1980, provides for a president

who is elected for a five-year term by an electoral college comprising the Parliament and the presidents of the Regional Councils. Members of the single-chamber Parliament are elected for four years on the basis of universal franchise through an electoral system that provides for proportional representation of the country's political groups. The prime minister is elected from the Parliament by its members; he heads the Council of Ministers, which he himself appoints from members of the Parliament. The constitution also provides for a National Council of Chiefs, which is concerned with matters relating to custom and tradition. The Supreme Court hears and determines civil and criminal proceedings.

Malaria is the greatest health hazard. The major hospitals are located at Vila and Luganville and are part of a health services network that also includes health centres, clinics, and dispensaries.

Education is principally conducted in English and French. Primary education is available for almost all children, and there are a number of secondary schools. Vanuatu has a technical training institution and a teacher training college. There is one weekly newspaper and a radio station, both out of Vila.

History. Many of the northern islands that now compose Vanuatu have been inhabited by Melanesian peoples for at least 3,000 years; the earliest radio-carbon date for settlement on the southern islands is 420 BC on Tanna. The islands were sighted in 1606 by the Portuguese navigator Pedro Fernández de Quirós; they were rediscovered by the French explorer Louis de Bougainville (1768) and were charted and named (for the Scottish Hebrides Islands) by Captain James Cook (1774). Sandalwood merchants and European missionaries came to the islands in the mid-19th century and were followed by cotton planters, mostly British and French, about 1868. Conflicting British and French interests were resolved by the creation (1887) of a Joint Naval Commission to administer the islands. In 1906 the two nations agreed to the establishment of a condominium government. Anglo-French high commissioners were delegated to exercise their powers through resident commissioners stationed at Vila, the capital of the condominium and now capital of the republic, on Efaté. Joint sovereignty was held over the indigenous Melanesian people, but each nation retained responsibility for its own nationals according to the protocol of 1914 (ratified 1922). The island group escaped Japanese invasion during World War II and became a major Allied base. After World War II, lo-cal political initiatives originated in concern over landownership-more than one-third of the New Hebrides was owned by foreigners. Following the development of local political parties, a short-lived Representative Assembly (1974-77) was elected. Independence was agreed upon at a 1977 conference in Paris attended by British, French, and New Hebrides representatives. Elections were held and a constitution drawn up in 1979. Despite an unsuccessful attempt in mid-1980 by Jimmy Stevens, the Na-Griamel Party leader, to establish Espiritu Santo Island as independent from the rest of the group, the New Hebrides became independent within the Commonwealth under the name of the Republic of Vanuatu ("Our Land Forever") on July 30, 1980.

Vanvitelli, Luigi (b. May 26, 1700, Naples—d. March 1, 1773, Caserta, near Naples), Italian architect whose enormous Royal Palace at Caserta (1752–74) was one of the last triumphs of the Italian Baroque.

Vanvitelli was trained by Niccolò Salvi and worked with him on lengthening the facade of Gian Lorenzo Bernini's Palazzo Chigi (1664–1745, Rome). He completed several other buildings, including the Chiesa del Gésu (1743–45), before he began work on the Royal Palace. The palace, commissioned by

the Spanish king of Naples as the summer residence of the Bourbons of Spain, was modelled after the imperial architecture of the palace of Versailles. The quadrilateral building at Caserta, enclosing four courtyards, has 1,200 rooms, a huge chapel, and a theatre. In addition to its celebrated staircase, which is the largest in Italy, the palace offers many magnificent vistas.

Vanvitelli also built the Lazzaretto and Arco Clementino for Pope Clement XII in Ancona; the Chiesa dell'Annunciata (1756/61–1782) in Naples, and the monastery of S. Agostino. He rebuilt Michelangelo's S. Maria degli Angeli in Rome and contributed to other works in Milan, Siena, Pesaro, Macerato, Perugia, Loreto, and elsewhere. Besides designing secular buildings, he built the aqueduct Carolino (1752–64), 25 miles long, which supplies Naples with water.

solid are held together by cohesive forces, and these forces must be overcome in separating the atoms or molecules to form the vapour; the heat of vaporization is a direct measure of these cohesive forces.

Condensation of a vapour to form a liquid or a solid is the reverse of vaporization, and in the process heat must be transferred from the condensing vapour to the surroundings. The amount of this heat is characteristic of the substance, and it is numerically the same as the heat of vaporization. See also sublimation.

vapour lock, partial or complete interruption of the fuel flow in an internal-combustion engine, caused by the formation of vapour or bubbles of gas in the fuel-feeding system. Vapour forms because of fuel boiling in the fuel lines, usually as a result of excessive heating of the engine in hot weather or operation of the vehicle in areas of high altitude, which lowers the boiling point of the fuel. In some engines the fuel line may be routed too close

vaporization, also called EVAPORATION, conversion of a substance from the liquid or solid phase into the gaseous (vapour) phase. If conditions allow the formation of vapour bubbles within a liquid, the vaporization process is

to the exhaust manifold or other parts of the engine which give off intense heat. Allowing the engine to cool usually enables the vapour to recondense and thereby clears the vapour lock.

vapour pressure, pressure exerted by a vapour when the vapour is in equilibrium with the liquid or solid form, or both, of the same substance—i.e., when conditions are such that the substance can exist in both or in all three phases. Vapour pressure is a measure of the tendency of a material to change into

the gaseous or vapour state, and it increases with temperature. The temperature at which the vapour pressure at the surface of a liquid becomes equal to the pressure exerted by the surroundings is called the boiling point (q.v.) of the liquid.

vapour trail, also called CONDENSATION TRAIL, or CONTRAIL, streamer of cloud sometimes observed behind an airplane flying in clear, cold, humid air. It forms upon condensation of the water vapour produced by the combustion of fuel in the airplane engines. When the ambient relative humidity is high, the resulting ice-crystal plume may last for several hours. The trail may be distorted by the winds, and sometimes it spreads outwards to form a layer of cirrus cloud. On rare occasions, when the air is nearly saturated with water vapour, air circulation at the wing tips of an airplane may cause sufficient pressure and temperature reductions to cause cloud streamers to form.

Var, département, Provence-Alpes-Côte-d'Azur region, southeastern France, fronting the Mediterranean. Created in 1790 from a part of the historic province of Provence (q.v.), it was reduced in 1860 to an area of 2,316 sq mi (5,999 sq km) by the transfer of the Grasse district to the newly created Alpes-Maritimes département in the east. It thus no longer included the Var River, but it retained its name.

The coastline, extending eastward from a point midway between Marseille and Toulon to within 10 miles of Cannes, is rocky, with many bays, bold headlands, and offshore islands (the Îles d'Hyères). Its western end forms the harbour and roadstead of Toulon, the naval port, which is the *département*'s largest town and, since 1974, its capital. Fashionable and picturesque seaside resorts, including Le Lavandou, Saint-Tropez, Sainte-Maxime, and Saint-Raphaël, are dotted along the coast, which abounds with hotels and villas.

Running roughly parallel to the coastline from the Toulon depression, the wooded Monts des Maures, which reach 2,530 ft (771 m) at Notre-Dame-des-Anges, extend northeastward to the estuary of the Argens River at Fréjus. The mountainous chain continues northeast of Cannes with the Massif de l'Estérel. Beyond the depression that girdles the Monts des Maures, most of the département is occupied by the Alpes de Provence, which reach a height of 5,626 ft (1,715 m) in the Lachens mountains in the northeast. The pine-clad highlands have frequently been devastated by fire, and large areas are covered with scrub. The Verdon River, with its grand canyon and gorges, flows along the northern border for many miles. Draguignan, in the east centre, is located on the scenic Route Napoléon, which runs over the Alps from the Mediterranean.

The *département* has a mild Mediterranean climate, but in winter the mistral wind brings with it sharp, cold spells. In summer there is usually no rain for more than six weeks, apart from occasional local storms. Small holdings in the lower parts, using irrigation, are intensively cultivated with early vegetables, fruit, and flowers. Mimosa is cultivated along the sheltered coastal strip of the Maures, once a fastness of Moorish pirates from whom it derives its name. During World War II the coast was the scene of Allied landings in 1944. The *département* has two *arrondissements*, Draguignan and Toulon. It is in the educational division of Nice. Pop. (1982) 708,331.

Varāha (Sanskrit: Boar), third of the 10 incarnations (avatars) of the Hindu god Vishnu. When a demon named Hiraṇyākṣa dragged

the earth to the bottom of the sea, Vishnu took the form of a boar in order to rescue it. They fought for a thousand years. Then Varāha slew the demon and raised the earth out of the water with his tusks. The myth reflects an earlier creation legend of Prajāpati (Brahmā), who assumed the shape of a boar in order to lift the earth up out of the primeval waters.

In painting and sculpture, Varāha is represented either in full animal form or with the head of a boar and the body of a man. Completely zoomorphic sculptures show him as a colossal boar with the earth, personified as the dark-hued goddess Bhūmidevī, clinging to one of his tusks. As half-human, half-animal, he is often shown standing with one leg bent supporting Bhūmidevī, whose expression, according to Indian canons of representation, should express both shyness and joy.

Varāhamihira, also called Varaha, or Mi-HIRA (b. 505, Ujjain, India—d. 587, Ujjain), Indian philosopher, astronomer, and mathematician, author of the *Pañca-siddhāntikā* ("Five Treatises"), a compendium of Greek, Egyptian, Roman, and Indian astronomy.

Varāhamihira's knowledge of Western astronomy was thorough. In five sections, his monumental work progresses through native Indian astronomy and culminates in two treatises on Western astronomy, showing calculations based on Greek and Alexandrian reckoning and even giving complete Ptolemaic mathematical charts and tables.

Although Varāhamihira's writings give a comprehensive picture of 6th-century India, his real interest lay in astronomy and astrology. He repeatedly emphasized the importance of astrology and wrote many treatises on sakuna (augury) as well as the Bṛhaj-Jātaka ("Great Birth") and the Laghu-Jātaka ("Short Birth"), two well-known works on the casting of horoscopes.

Varallo, town, Vercelli province, Piemonte (Piedmont) region, northwestern Italy. It lies along the Sesia River, 31 miles (50 km) northwest of Novara. The town is rich in art and churches, among which are San Gaudenzio (restored 1710), with a polyptych by the 16th-century painter Gaudenzio Ferrari, who left

his most important works to the community, and Santa Maria delle Grazie (1487–1501), with frescoes by Ferrari. On the nearby Monte Sacro is a sanctuary consisting of the Church of the Assunta (1649) and 45 chapels, with about 1,000 statues and 6,000 frescoed figures (mostly by Ferrari). Varallo has an art school, gallery, and local museum. It is a summer resort with textile, paper, and food industries. Pop. (1981) mun., 8,298.

Vārānasi, also called BENARES, BANARAS, or KĀŚĪ, city, southeastern Uttar Pradesh state, northern India. It is located on the left bank of the Ganges River and is one of the seven sacred cities of the Hindus.

Vārānasi is one of the oldest continuously inhabited cities in the world. Its early history is that of the first Aryan settlement in the middle Ganges valley. By the 2nd millennium BC, Vārānasi was a seat of Aryan religion and philosophy and was also a commercial and industrial centre famous for its muslin and silk fabrics, perfumes, ivory works, and sculpture. Vārānasi was the capital of the kingdom of Kāšī during the time of Buddha (6th century BC), who gave his first sermon at

nearby Sārnāth. The city remained a centre of religious, educational, and artistic activities as attested by the celebrated Chinese traveler Hsüan-tsang, who visited it in c. AD 635 and said that the city extended for about 3 miles (5 km) along the western bank of the Ganges. Vārānasi subsequently declined during the three centuries of Muslim occupation, beginning in 1194. Many of the city's Hindu temples were destroyed during the period of Muslim rule, and learned scholars fled to other parts of the country. The Mughal emperor Akbar in the 16th century brought some relief to the city's religious and cultural activities. There was another setback during the reign of the Mughal emperor Aurangzeb in the late 17th century, but later the Marāthās sponsored a new revival. Vārānasi became an independent kingdom in the 18th century, and under subsequent British rule it remained a commercial and religious centre.

In 1910 the British made Vārānasi a new Indian state, with Rāmnagar (on the opposite bank) as headquarters but with no jurisdiction over the city of Vārānasi. In 1949, after Indian independence, the Vārānasi state became part of the state of Uttar Pradesh.

Vārānasi has the finest river frontage in India, with miles of ghats, or steps, for religious bathing; an array of shrines, temples, and palaces rises tier on tier from the water's edge. The inner streets of the city are narrow, winding, and impassable for motor traffic; the

newer, outer suburbs are more spacious and are laid out more systematically. The sacred city is bounded by a road known as Panchakosi; every devout Hindu hopes to walk this road and to visit the city once in a lifetime and, if possible, to die there in old age. More than 1,000,000 pilgrims visit the city each year.

Among the city's numerous temples, the most venerated are those of Viśvanātha, dedicated to Shiva: that of Sankatmochana, dedicated to the monkey-god Hanuman; and that of Durgā. The Durgā Temple is famous for the swarms of monkeys that inhabit the large trees near it. The Great Mosque of Aurangzeb is another prominent religious building. Two of the more important modern temples are those of Tulasi Mānas and the Viśvanātha on the campus of the Banaras Hindu University. The city has hundreds of other temples. At Sārnāth, a few miles north of Vārānasi, there are ruins of ancient Buddhist monasteries and temples as well as temples built by the Maha Bodhi Society and by the Chinese, Burmese, and Tibetan Buddhists.

Vārānasi has been a city of Hindu learning through the ages. There are innumerable schools and countless Brahman pandits, or learned men, responsible for the continuation of traditional learning. There are also three universities, including the large and important Banaras Hindu University (1916), and more than a dozen colleges and high schools.

The city is also a centre of arts and crafts and of music and dance. Vārānasi is famous for its production of silks and brocades with gold and silver threadwork, as well as for wooden toys, bangles made of glass, ivory work, and brass ware. Pop. (1981) 708,647.

Varda, Agnès (b. May 30, 1928, Brussels), French still photographer and one of the few successful female motion-picture directors. Her first film, *Le Pointe courte* (1954), was a precursor of the French New Wave films of the 1960s.

Varda became a student at the Sorbonne and the École du Louvre and became a still photographer. As the official photographer of the Théatre National Populaire from 1951 to 1961, she discovered an interest in both theatre and film. Varda's first film, Le Pointe courte, proved her to be an original artist. Varda's second feature, Cleo de cinq à sept (1961; Cleo from 5 to 7), an introspective and intellectual film, displays the influence of the New Wave. It is an intimate account of a pop singer who sees the world around her with a new vision while she waits for the results of a medical examination that will tell her if she is suffering from a terminal illness.

In 1964, Varda directed Le Bonheur (Happiness), an abstract picture of happiness that was to be her most controversial film. Les Creatures was released in 1966, and her most popular films of the next two decades were L'Une chante l'autre pas (1976; One Sings, the Other Doesn't) and Sans toit ni loi (1985; Without Roof or Law, or Vagabond).

Vardar River, German WARDAR, Greek AX-10s, major river in Macedonia, Yugoslavia, and in Greece. It rises in the Sar Mountains and flows north-northeast past Gostivar and Tetovo (in the Gostivar-Tetovo depression); it then turns sharply to flow southeast past Skopje and Titov Veles into Greece, where it enters the Gulf of Salonika of the Aegean Sea. Of its total length of 260 miles (420 km), 187 miles (300 km) are in Yugoslavia; its drainage basin is 8,643 square miles (22,387 square km). The river's valley is important as a source of agricultural production and as a part of the Morava-Vardar corridor, a major transportation route between central Europe and the Aegean.

Vardon, Harry (b. May 9, 1870, Grouville, Jersey, Channel Islands—d. March 20, 1937, Totteridge, Hertfordshire, Eng.), British professional golfer who pioneered accurate and reliable hitting techniques that are still the ba-

sis of the modern golf swing.

Vardon began playing golf desultorily while working as a manservant for an affluent amateur golfer on the island of Jersey in the English Channel. Realizing both his own talent and the money that could be made in the game, he turned professional golfer at age 20. He subsequently achieved dominance in the sport, winning the British Open in 1896, 1898, 1899, 1903, 1911, and 1914 and the U.S. Open in 1900. The Vardon Trophy, named for him, is awarded annually to the professional with the best scoring average.

Vardon UPI-EB Inc

Vardon owed his success largely to new methods that revolutionized golf's mediumand long-distance hitting techniques. Prior to him, the traditional style was to drive the ball at great speed and at a low angle, or trajectory, thereby achieving great distances but sacrificing any real ability to aim and control where the ball would come to a stop. Vardon, by contrast, hit the ball high in the air so that it would land at a steep angle and come to a stop quickly, without excessive bouncing and rolling. This method, along with adjustments in his stance and swing, enabled him to land the ball within quite short distances of the flagstick. Vardon became such a trendsetter that his name was adopted for the Vardon, or overlapping, grip, which he helped popularize but did not actually invent.

Vare, Glenna Collett, née GLENNA COL-LETT (b. June 20, 1903, New Haven, Conn., U.S.—d. Feb. 3, 1989, Gulfstream, Fla.), sportswoman who dominated American women's golf in the 1920s.

As Glenna Collett she won her first U.S. Women's Amateur championship in 1922; she regained this title five times (1925, 1928-30, 1935) and won the French championship in 1925. In the middle 1920s she won 59 of 60 consecutive matches in tournament play. She was a Curtis Cup choice against Britain (1932,

Varenius, Bernhardus (Latin), German BERNHARD VAREN (b. 1622, Hitzacker, Hannover [Germany]—d. 1650/51, Leiden, Neth.), a major figure in the revival of geographic learning in Europe, whose scholarly general geography remained the accepted standard authority for more than a century.

After studying medicine, Varenius was attracted to geography by his acquaintance with geographers. In 1649 he published Descriptio Regni Japoniae ("Description of the Kingdom of Japan"), which in addition to describing Japan included a Latin translation of an account of Siam (Thailand), possibly by the Dutch navigator Willem Corneliszoon Schouten, and excerpts from the Arab traveler and geographer Leo Africanus on religion in Africa. Geographia generalis (1650), his bestknown work, sought to lay down the general principles of geography on a wide scientific basis according to the knowledge of the day. It not only was a systematic geography on a scale not previously attempted but also contained a scheme for special, now known as regional, geography. This major work was frequently revised, and the edition of 1672 had improvements by Sir Isaac Newton.

Varese, city, capital of Varese provincia, Lombardia (Lombardy) regione, northern Italy. It lies among the Alpine foothills descending to the Lake Varese, north of Milan. The modern Piazza Monte Grappa is a square in the centre of the city. Notable buildings include the basilica of San Vittore (1580–1615), with paintings of the 17th-century Lombard school and a Baroque bell tower; the Municipal Palace (1766-72), a former castle of the dukes of Este with adjacent scenic landscaped public gardens; and the civic museum, displaying prehistoric, Roman, and naturalhistory exhibits. The environs of Varese include Sacro Mountain, with the pilgrimage church of Santa Maria del Monte (1684) symbolizing the Holy Rosary, and Campo dei Fiori Mountain, site of an important observatory. Industries include the manufacture of leather goods, particularly shoes, together with textiles, machinery, and plastics. Pop. (1987 est.) mun., 88,353.

Varèse, Edgard, original name EDGAR VARÈSE (b. Dec. 22, 1883, Paris—d. Nov. 8, 1965, New York City), French-born American composer and innovator in 20th-century techniques of sound production.

Varèse spent his boyhood in Paris, Villars in Burgundy, and Turin, Italy. After composing without formal instruction as a youth, he later studied under Vincent d'Indy, Albert Roussel, and Charles Widor and was strongly encouraged by Romain Rolland and by Claude Debussy. In 1907 he went to Berlin, where he was influenced by Richard Strauss and Ferruccio Busoni. In 1915 he immigrated to the United States.

Varèse's music is dissonant, nonthematic, and rhythmically asymmetric; he conceived of it as bodies of sound in space. After the early 1950s, when he finally gained access to the electronic sound equipment he desired, he concentrated on electronic music.

Varèse actively promoted performances of works by other 20th-century performers and founded the International Composers' Guild in 1921 and the Pan-American Association of Composers in 1926; these organizations were responsible for performances and premieres of works by Béla Bartók, Alban Berg, Carlos Chávez, Henry Cowell, Charles Ives, Maurice Ravel, Wallingford Riegger, Francis Poulenc,

Varèse The Bettmann Archive

Anton von Webern, and others. He also founded the Schola Cantorum of Santa Fe (New Mexico) in 1937 and the New Chorus (later, Greater New York Chorus) in 1941 to perform music of past eras, including works of Pérotin, Heinrich Schütz, Claudio Monteverdi, and Marc-Antoine Charpentier.

Varèse's works include Hyperprism (1923) for wind instruments and percussion; Ionisation (1931) for percussion, piano, and two sirens; and Density 21.5 (1935) for unaccompanied flute. His Déserts (1954) employs taperecorded sound. In the Poème électronique (1958), written for the Philips Pavilion at the Brussels World's Fair, the sound was intended to be distributed by 425 loudspeakers.

Vargas, Getúlio (Dorneles) (b. April 19, 1883, São Borja, Braz.—d. Aug. 24, 1954, Rio de Janeiro), president of Brazil (1930–45, 1951-54), who brought social and economic changes that helped modernize the country. Although denounced by some as an unprincipled dictator, Vargas was revered by his followers as the "Father of the Poor," for his battle against big business and large land-

Vargas was born in the state of Rio Grande do Sul, into a family prominent in state politics. Contemplating a military career, he joined the army when he was 16 but soon decided to study law. In 1908, shortly after graduating from the Pôrto Alegre Law School, he entered politics. By 1922 he had been elected to the National Congress, in which he served for four years. In 1926 Vargas became minister of finance in the Cabinet of President Washington Luís Pereira de Souza, a post he retained until his election as governor of Rio Grande do Sul in 1928. From his position as state governor, Vargas campaigned unsuccessfully as reform candidate for the presidency of Brazil in 1930. While appearing to accept defeat, Vargas in October of that year led the revolution, organized by his friends, that overthrew the republic.

For the next 15 years Vargas was chief of state of Brazil, ruling most of that time with-

out a congress. He held sole power as provisional president from Nov. 3, 1930, until July 17, 1934, when he was elected president by the constituent assembly. On Nov. 10, 1937, Vargas presided over a coup d'état that destroyed the constitutional government and set up the avowedly totalitarian New State (Estado Novo).

Prior to 1930 the federal government had been in effect a federation of autonomous states, dominated by rural landholders and financed largely by the proceeds of agricultural exports. Under Vargas this system was destroyed. The tax structure was revised to make state and local administrations dependent upon the central authority, the electorate was quadrupled and granted the secret ballot, women were enfranchised, extensive educational reforms were introduced, social-security laws were enacted, labour was organized and controlled by the government, and workers were assured a wide range of benefits, including a minimum wage, while business was stimulated by a program of rapid industrialization. Vargas, however, did not change the private-enterprise system, nor did his social reforms extend in practice to the rural poor.

But on Oct. 29, 1945, Vargas was overthrown by a coup d'état in a wave of democratic sentiment sweeping postwar Brazil. He still, however, retained wide popular support. Although elected as senator from Rio Grande do Sul in December 1945, he went into semiretirement until 1950, when he emerged as the successful presidential candidate of the Brazilian Labour Party. He took office on Jan. 31, 1951.

As an elected president restrained by congress, a profusion of political parties, and public opinion, Vargas was unable to satisfy his labour following or to placate mounting middle-class opposition. Thus, he resorted increasingly to ultranationalistic appeals to hold popular support. By mid-1954 criticism of the government was general, and the armed forces, shocked by scandals within the regime, joined in the call for his withdrawal. Rather than accept forced retirement, Vargas took his life on Aug. 24, 1954. (R.E.P.)

Vargas Llosa, (Jorge) Mario (Pedro) (b. March 28, 1936, Arequipa, Peru), Peruvian writer whose commitment to social change is evident in his novels, plays, and essays. In 1990 he was an unsuccessful candidate for president of Peru.

Vargas Llosa received his early education in Cochabamba, Bol., where his grandfather was the Peruvian consul. He later attended a series of schools in Peru before entering a military school, Leoncio Prado, in Lima in 1950.

After his first publication, La huida del Inca (1952; "The Escape of the Inca"), a three-act

play, his stories began to appear in Peruvian literary reviews, and he coedited *Cuadernos de composición* (1956–57; "Composition Book") and *Literatura* (1958–59). He worked as a journalist and broadcaster and attended the University of Madrid. In 1959 he moved to Paris, where he lived until 1966.

Vargas Llosa's first novel, La ciudad y los perros (1963; "The City and the Dogs"; Eng. trans. The Time of the Hero), was widely acclaimed. Translated into more than a dozen languages, this novel, set in the Leoncio Prado Military School, describes adolescents striving for survival in a hostile and violent environment. The corruption of the military school reflects the larger malaise afflicting Peru.

The novel *La casa verde* (1966; *The Green House*), set in the Peruvian jungle, combines mythical, popular, and heroic elements to capture the sordid, tragic, and fragmented reality of its characters.

Los cachorros (1967; The Cubs, and Other Stories) is a psychoanalytical portrayal of an adolescent who has been accidentally castrated. Conversación en La Catedral (1969; Conversation in The Cathedral) deals with Manuel Odría's regime (1948–56). The novel Pantaleón y las visitadoras (1973; "Pantaleón and the Visitors"; Eng. trans. Captain Pantoja and the Special Service) is a satire of the Peruvian military and religious fanaticism.

His semiautobiographical novel La tia Julia y el escribidor (1977; Aunt Julia and the Scriptwriter) combines two distinct narrative points of view to provide a contrapuntal effect

Vargas Llosa also wrote a critical study of the fiction of Gabriel García Márquez in García Márquez: Historia de un deicidio (1971; "García Márquez: Story of a God-Killer"), a study of Gustave Flaubert in La orgía perpetua: Flaubert y "Madame Bovary" (1975; "The Perpetual Orgy: Flaubert and 'Madame Bovary'"), and a study of the works of Jean-Paul Sartre and Albert Camus in Entre Sartre y Camus (1981; "Between Sartre and Camus").

After living three years in London, he was a writer-in-residence at Washington State University in 1969. In 1970 he settled in Barcelona. He returned to Lima in 1974 and lectured and taught widely throughout the world. A collection of his critical essays in English translation was published in 1978. La guerra del fin del mundo (1982; The War of the End of the World), an account of the 19th-century political conflicts in Brazil, became a best-seller in Spanish-speaking countries. In 1983 his play La Señorita de Tacna (1981; "The Lady of Tacna") was performed in English in New York City. Another play, La Chunga (1986; "The Jest"), was also critically acclaimed.

Vargas Llosa in 1990 lost his bid for the presidency of Peru in a runoff against Alberto Fujimori, an agricultural engineer and the son of Japanese immigrants.

vargueno, Spanish BARGUEÑO, wooden cabinet of mixed Spanish and Oriental origin that first appeared in Europe in the late Middle Ages and became a common article of furniture in the Spanish colonial empire from the late 16th century onward. Its major component is a chest with a drop front. The interior is divided into an intricate arrangement of drawers and recesses for holding jewels, documents, and other valuables. The drawers and recesses are inlaid with ivory, silver, or gold and are occasionally stained in bright colours. The exterior is elaborately mounted at the corners and elsewhere in iron or silver, and the front is secured by a heavy padlock or conventional lock.

Originally, the base was another chest divided into two cupboards, but later versions usually stand on a support of baluster legs spanned by intricate arcading after French and Italian Renaissance prototypes. The design of

variable star, any star whose observed light varies notably in intensity. The changes in brightness may be periodic, semiregular, or completely irregular.

A brief treatment of variable stars follows. For full treatment, see MACROPAEDIA: Stars and Star Clusters.

Variable stars may be classified into three broad types according to the origin and nature of their variability: (1) eclipsing, (2) pulsating, and (3) explosive.

In an eclipsing variable, one member of a double, or binary, star system partially blocks the light of its companion as it passes in front of the latter, as observed from Earth. Each time this happens, the brightness of the entire system fluctuates. Such an eclipsing variable is perhaps best exemplified by the binary star Algol, whose name means "blinking demon."

Unlike eclipsing binaries, the other two types of variable stars are intrinsically variable—that is to say, their own output of radiant energy fluctuates with time. The pulsating variables expand and contract cyclically, causing them to pulsate rhythmically in brightness and size. The Cepheids and RR Lyrae stars are typical examples of such variables. The explosive (or eruptive) variables include novas, supernovas, and similar stars that undergo sudden outbursts of radiant energy, which results in rapid brightening. This increase in brightness lasts only for a short period of time, followed by relatively slow dimming.

Besides these three major classes, there are also several miscellaneous variables: R Coronae Borealis stars, T Tauri stars, flare stars, pulsars (neutron stars), spectrum and magnetic variables, X-ray variable stars, and radio variable stars. By the late 20th century, more than 30,000 variable stars had been catalogued.

variables, separation of, one of the oldest and most widely used techniques for solving some types of partial differential equations. A partial differential equation is called linear if the unknown function and its derivatives have no exponent greater than one and there are no cross-terms—*i.e.*, terms such as ff' or f'f'' in which the function or its derivatives appear more than once. An equation is called homogeneous if each term contains the function or one of its derivatives. For example, the equation $f' + f^2 = 0$ is homogeneous but not

linear, $f' + x^2 = 0$ is linear but not homogeneous, and $f_{xx} + f_{yy} = 0$ is both homogeneous and linear

If a homogeneous linear equation in two variables has a solution f(x, y) that consists of a product of factors g(x) and h(y), each involving only a single variable, the solution of the equation can sometimes be found by substituting the product of these unknown factors in place of the unknown composite function, obtaining, in some cases, an ordinary differential equation for each variable. For example, if f(x, y) is to satisfy the equation $f_{xx} + f_{yy} = 0$, then by substituting g(x)h(y) for f(x, y), the equation becomes $g_{xx}h + gh_{yy} = 0$, or $-g_{xx}/g =$ h_{vv}/h . Because the left side of the latter equation depends only on the variable xand the right side only on y, the two sides can be equal only if they are both constant. Therefore, $-g_{xx}/g = c$, or $g_{xx} + cg = 0$, which is an ordinary differential equation in one variable and which has the solutions $g = a \sin (xc^{1/2})$ or $g = a \cos (xc^{1/2})$. In a similar manner, $h_{yy}/h = c$, and $h = \exp(\pm yc^{1/2})$. Therefore, $f = gh = a \exp(\pm yc^{1/2}) \sin(xc^{1/2})$ or $a \exp(\pm yc^{1/2}) \sin(xc^{1/2})$ are solutions of the original equation $f_{xx} + f_{yy} = 0$. The constants a and c are arbitrary and will depend upon other auxiliary conditions (boundary and initial values) in the physical situation that the solution to the equation will have to satisfy. A sum of terms such as $a \exp(\pm yc^{1/2}) \sin(xc^{1/2})$ with different constants a and c will also satisfy the given differential equation, and, if the sum of an infinite number of terms is taken (called a Fourier series), solutions can be found that will satisfy a wider variety of auxiliary conditions, giving rise to the subject known as Fourier analysis.

The method of separation of variables can also be applied to some equations with variable coefficients, such as $f_{xx} + x^2 f_y = 0$, and to higher-order equations and equations involving more variables.

Varian, Russell H(arrison); and Varian, Sigurd F(ergus) (respectively b. April 24, 1898, Washington, D.C., U.S.—d. July 28, 1959, Juneau, Alaska; b. May 4, 1901, Syracuse, N.Y., U.S.—d. Oct. 18, 1961, Puerto Vallarta, Mex.), brothers who, with William W. Hansen, invented the klystron radio tube, a powerful microwave generator.

Russell Varian received his M.A. in 1927 from Stanford University, Stanford, Calif., and worked in a technical capacity with several organizations, including Humble Oil and Refining Company, Farnsworth Television Company, Stanford University, and Varian Associates.

During the period 1935-39, Russell and his brother, Sigurd, a largely self-taught engineer and pilot, worked with William W. Hansen of Stanford to develop the klystron. Russell Varian and Hansen developed the theoretical basis of the klystron, a novel application of the principle of amplitude modulation to a beam of electrons. Sigurd Varian built the mechanism. The klystron tube was first used in radar detection and guidance systems and was later applied to electron accelerator technology. Russell Varian also invented a magnetometer that was used for the measurement of the Earth's magnetic field by the Vanguard satellite. In 1948 the brothers formed Varian Associates, a firm that produced microwave devices useful in the linear electron accelerator and in detectors of nuclear magnetic resonance.

variance, in statistics, the square of the standard deviation of a sample or set of data, used procedurally to analyze the factors that may influence the distribution or spread of the data under consideration. See mean.

variation, in biology, any difference between cells, individual organisms, or groups of organisms of any species caused either by genetic differences (genotypic variation) or by the effect of environmental factors on the expression of the genetic potentials (phenotypic variation). Variation may be shown in physical appearance, metabolism, fertility, mode of reproduction, behaviour, learning and mental ability, and other obvious or measurable characters.

Genotypic variations are caused by differences in number or structure of chromosomes or by differences in the genes carried by the chromosomes. Eye colour, body form, and disease resistance are genotypic variations. Individuals with multiple sets of chromosomes are called polyploid; many common plants have two or more times the normal number of chromosomes, and new species may arise by this type of variation. A variation cannot be identified as genotypic by observation of the organism; breeding experiments must be performed under controlled environmental conditions to determine whether or not the alteration is inheritable.

Environmentally caused variations may result from one factor or the combined effects of several factors, such as climate, food supply, and actions of other organisms. Phenotypic variations also include stages in an organism's life cycle and seasonal variations in an individual. These variations do not involve any hereditary alteration and in general are not transmitted to future generations; consequently, they are not significant in the process of evolution.

Variations are classified either as continuous, or quantitative (smoothly grading between two extremes, with the majority of individuals at the centre, as height in human populations); or as discontinuous, or qualitative (composed of well-defined classes, as blood groups in man). A discontinuous variation with several classes, none of which is very small, is known as a polymorphic variation. The separation of most higher organisms into males and females and the occurrence of several forms of a butterfly of the same species, each coloured to blend with a different vegetation, are examples of polymorphic variation.

varicose vein, also called VARIX, vein that is twisted—tortuous—and distended with blood. The term varix is also used for similar abnormalities in arteries and in lymphatic vessels. Varicose veins occur in a number of areas, including the legs; the esophagus, or gullet; the spermatic veins, which return blood from the testes (varicose veins in this area cause a mass in the scrotum that is called a varicocele); the veins of the broad ligaments, folds of peritoneal membrane that extend from the uterus to the walls of the pelvis; and the veins of the urinary bladder.

Varicose veins in the legs, by far the most common location, result from malfunctioning of the valves in the veins. These valves normally prevent blood from reversing its flow after the movement of the leg muscles has forced the blood upward and from superficial veins to the deep veins. When the valves do not function properly, the blood collects in the superficial veins, distending and twisting them. Weakness of the valves and of the walls of the veins may be inherited. Other possible causes include garments that improperly constrict the legs (e.g., stretch boots that are tight only at the top rather than evenly down the length of the lower leg), enlarged lymph nodes, and tumours of the pelvis. The increase in the number of varices that occurs during pregnancy has awakened the suspicion that abnormalities in endocrine secretion play a role.

Symptoms include a sensation of heaviness and a tendency for the leg muscles to cramp while one is standing. The feet and legs swell at the end of the day. The skin may be inflamed and moist, a condition called weeping eczema. Ulcers may appear around the ankles, and clots may develop in the diseased blood vessels (see thrombophlebitis).

Treatment consists of the use of elastic bandages or strong support hose if the affected person is unable to undergo surgery; injection of a sclerosing solution—a solution that hardens the vein and makes it like a cord—directly into the vein, a method used primarily for dealing with minor varices and for treatment of varices that have persisted after most have been corrected by surgery; and surgical treatment, consisting of tying off the affected veins or removing them, a process called stripping. The most recent treatment has been by electrolyte methods. See also hemorrhoid.

Varig, abbreviation of EMPRESA DE VIAÇÃO AEREA RIO GRANDENSE (Portuguese: Grandense Air Transport Enterprise"), Brazilian airline founded on May 7, 1927, with the assistance of a Berlin trading concern, Kondor Syndicat, which had begun flights in the state of Rio Grande do Sul the previous January. Thereafter, Varig opened several more intrastate routes. Major expansion did not begin until 1953, however, when the Brazilian government guaranteed Varig's service from Rio de Janeiro to New York City (a service inaugurated two years later). In the 1960s the company absorbed a number of smaller Brazilian airlines, including Real (Redes Restaduais Aereas) and Panair do Brasil. Its route network covers the five continents of South America, North America, Europe, Africa, and Asia. Headquarters are in Rio de Janeiro.

variola (disease): see smallpox.

variolation, obsolete method of immunizing patients against smallpox by infecting them with substance from the pustules of patients with a mild form of the disease (variola minor). The disease then usually occurs in a lessdangerous form than when contracted naturally. The method was popularized in England in 1721-22 by Lady Mary Wortley Montagu; it has long been known by the Turks, Chinese, and other peoples. In America, Cotton Mather learned of its use in Africa from his slave, Onesimus, who himself had been inoculated. Its use spread in America after 1721; in 1728 it was introduced into South America. Variolation continued to be opposed by some religious groups and most physicians, who were not convinced of the safety of the method. It was supplanted by vaccination after 1798. In 1842 an act of Parliament in England made the practice of variolation a felony in that country.

variscite, phosphate mineral, hydrated aluminum phosphate (AlPO₄ · 2H₂O), which is valued as a semiprecious gemstone and an ornamental material. Both variscite and strengite, a similar mineral in which iron replaces aluminum in the crystal structure, occur as glassy nodules, veins, or crusts, in near-surface deposits: variscite is produced by the action of phosphate-rich waters on aluminous rocks, and strengite by alteration of iron-containing phosphates. Variscite is usually green; strengite, red. Variscite occurs in Germany, Austria, Czechoslovakia, Zaire, and Australia and in commercially important quantities near Fairfield, Utah, U.S. It also occurs with apatite on islands where phosphatic solutions from guano (seafowl excrement) have altered aluminous igneous rocks. Strengite deposits are

known in Germany, Portugal, Sweden, and the United States. For detailed physical properties, *see* phosphate mineral (table).

Variscite is cut en cabochon (with a round, convex, polished surface) for brooches, earrings, and beads and is frequently substituted for turquoise. It also is carved into bowls or other decorative objects. Because of its porosity, it tends to absorb grease and oil, which discolour it.

working and pulp- and paper-manufacturing centres, and most of Finland's lake ships are built there. Pop. (1988 est.) mun., 24,791.

Värmland, län (county) of west-central Sweden, extending north from Vänern (lake) and northwest to the Norwegian frontier. It takes in most of the traditional *landskap* (province) of Värmland. Much of the 6,789-squaremile (17,584-square-kilometre) area forms a plateau, reaching a height of 2,267 feet (691 m) at Branberget in the north. The well-forested region is deeply cut by several rivers and long, narrow lakes. Farmlands are restricted to the valleys and the southern lake-dotted lowland. Värmland has channeled its timber and ironore resources into industrialization, namely, iron mining, lumbering, and papermaking. One of the most important industrial towns is Karlstad (q.v.), the capital.

Värmland is the setting for the novel Gösta Berlings saga (1891) by Nobel Prize-winner Selma Lagerlöf. At Mårbacka, south of Sunne, is the house (now a museum) where Lagerlöf was born, wrote most of her novels, and died. Pop. (1989 est.) 280,694.

Varmus, Harold (Elliot) (b. Dec. 18, 1939, Oceanside, N.Y., U.S.), American virologist and cowinner (with J. Michael Bishop) of the Nobel Prize for Physiology or Medicine in 1989 for their work in clarifying the origins of cancer

Varmus graduated from Amherst (Mass.) College (B.A.) in 1961, from Harvard University (M.A.) in 1962, and Columbia University, New York City (M.D.), in 1966. He then joined the National Cancer Institute, Bethesda, Md., where he studied bacteria. In 1970 he went to the University of California at San Francisco as a postdoctoral fellow. There he and Bishop began the research that was to win them international recognition. Varmus remained on the faculty of the University of California, where he became a professor of biochemistry and biophysics in 1982.

Varmus and Bishop found that, under certain circumstances, normal genes in healthy cells of the body can cause cancer; these genes are termed oncogenes. Oncogenes ordinarily control cellular growth and division, but, if they are picked up by infecting viruses or affected by chemical carcinogens, they can be rendered capable of causing cancer. This research, carried out with the aid of colleagues Dominique Stehelin and Peter Vogt in the mid-1970s, superseded a theory that cancer is caused by viral genes, distinct from a cell's normal genetic material, that lie dormant in body cells until activated by carcinogens.

varna, Sanskrit VARNA, any one of the four traditional social classes of Hindu India. Although the literal meaning of the word varna (Sanskrit: "colour") has invited speculation that class distinctions were originally based on differences in degree of skin pigmentation, and though this might have been true between the fairer-skinned Aryans and the darker aboriginals of ancient India, the notion of "colour" may be regarded as a device of classification. Colours were frequently used as classifiers; e.g., the Vedic scripture known as the Yajurveda is divided into two groups of texts, White and Black.

Indian society is made up of four different varnas, or classes, known since the late Rigveda hymn 10.90, in which it is declared that the Brahman (priest), the Kshatriya (nobleman), the Vaisya (commoner), and the Sūdra (serf) issued forth at creation from the mouth, arms, thighs, and feet of the primeval person (purusa). The set of four contains several groups of contrasts: the Sūdra, surely the aboriginal non-Aryan population, is in contrast with the first three, who are "twiceborn" (dvija) after undergoing the ceremony of spiritual rebirth (upanayana) that initiates them into Aryan manhood. The Sūdras live in servitude to the other three. The Vaisyas, in turn, contrast as common people, grazers, and cultivators with the governing classesi.e., the secular Kshatriyas, or barons, and the sacerdotal Brahmans. Brahmans and Kshatriyas themselves contrast in that the former are their priests, while the latter have the actual dominion. In the older description, far greater emphasis is placed on the functions of the classes than on hereditary membership, in contradistinction to caste, which emphasizes heredity over function.

The system of the four classes (cāturvarnya) is fundamental to the views the traditional lawgivers held of society. They specified a different set of obligations for each: the task of the Brahman is to study and advise, the baron to protect, the Vaisya to cultivate, and the serf to serve. History shows, however, that the four-class system was more a social model than a reality. The multitudinousness of castes is explained as the result of hypergamous and hypogamous alliances between the four classes and their descendants. Although the Sūdra, in the beginning, clearly comprised the residual class of all non-Aryans, the inclusion of them

in the four-varna system bestowed on them a measure of dignity. A move to accommodate still others not so distinguished led to the rather unofficial acceptance of yet a fifth class, the pañcama (Sanskrit: "fifth"), which include the "untouchable" classes and others, such as tribal groups, who are outside the system and, consequently, avarṇa ("casteless").

In modern times, traditional Hindus, awakened to the inequities of the caste system yet loath to abandon the hierarchy described in the four-varna system as fundamental to the good society, have often advocated a return to this clear-cut varna system by reforming castes. Individual castes, in turn, have sought to raise their social rank by identifying with a particular varna and demanding its privileges of rank and honour. See also jāti.

Varna, also spelled WARNA, seaport and third largest city in Bulgaria. Lying on the north shore of Varna Bay on the Black Sea coast, the town is sheltered by the Dobrudzhansko plateau, which rises to more than 1,000 feet (300 m) above sea level. A narrow canal (1907) links Varna Lake—a drowned valley into which the Provadiyska River flows—to the Black Sea. The city is an important administrative, economic, cultural, and resort centre. It is a modern city, with wide, tree-lined boulevards, a fine park on the waterfront, and spacious beaches. Along the coast north of Varna are several popular resort towns, including Druzhba, Zlatni Pyassŭtsi ("Golden Sands"), Albena, and Balchik, the last once the summer retreat of Romanian royalty and aristocracy.

Varna was founded as Odessus by Milesian Greeks in the 6th century BC; later it was Thracian, Macedonian, and Roman. In AD 681 it became part of the First Bulgarian empire (c. 679–1018) and was named Varna. During the reign (1218) of Ivan Asen II, it became a thriving centre of trade with Genoa, Venice, and Dubrovnik. After falling under Ottoman domination in 1391, it continued to grow in importance. In 1444, in a pitched battle fought nearby, the Turkish armies of Murad II routed the armies of the last Christian Crusade against the Turks in the Balkans.

The Russians captured Varna in 1828 during the war for the liberation of Greece, but, when they left, the city reverted to the Turks. In 1854 Varna became a base for Anglo-French troops operating against Sevastopol during the Crimean War. It was liberated from the Turks in 1878 and ceded to Bulgaria by the Treaty of Berlin. After the building of the Ruse-Varna railway in 1866 and the rail link to Sofia in 1899, the town expanded further. A modern harbour was constructed in 1906.

The city has regular domestic airline services and, in the summer, international flights. Regular boat and bus services connect the Black Sea towns. Nearly half of Bulgaria's maritime and river transport passes through Varna's harbour, which accommodates vessels up to 20,000 tons. Major export items are livestock, grain, and processed foodstuffs. Industries include flour milling, boatbuilding, and manufacturing.

The city has a university, a naval academy, an oceanography and fishery-research institute, a medical school, museums, a theatre, an opera house, and an art gallery. The 4th-century Aladzha Monastery, one of the earliest Bulgarian monasteries, overlooks the city from the north; its cells and chapel are carved out of the rock. A 5th/6th-century basilica is a reminder of an ancient Genoese colony. Between 1949 and 1956 Varna was renamed Stalin. Pop. (1989 est.) 306,300.

Varna, Battle of (Nov. 10, 1444), Turkish victory over a Hungarian force, ending the European powers' efforts to save Constantino-

ple from Turkish conquest and enabling the Ottoman Empire to confirm and expand its control over the Balkans.

In the early 1440s Ulászló I, the king of Hungary (who was also Władysław III of Poland), sponsored a campaign against Sultan Murad II of the Ottoman Empire to reduce the Turkish threat to Constantinople and to restore Serbia to its prince, George Branković. The Hungarian forces, commanded by Hunyadi, were supported by Pope Eugenius IV and allied with Prince George as well as with Prince János Vlad of Walachia. They compelled Murad to conclude a 10-year truce (June 1444), by which he restored a tributary Serbian state and pledged not to cross the Danube River.

Nevertheless, Ulászló, influenced by the Pope's legate Julian Cesarini, soon took advantage of the Sultan's preoccupation in Asia Minor by breaking the truce and renewing his campaign. Hunyadi resumed his command only with reluctance, and Prince George refused to join Ulászló's crusade. Reinforced only by a Walachian contingent, the Hungarian army marched to Varna, where on November 10 it clashed with Murad, who had returned from Asia Minor with a force three times larger than Ulászló's. Although the Hungarians gained an initial advantage, the Turks eventually killed Ulászló, almost annihilating the Christian army, and forced Hunyadi to flee.

Following the battle, Poland remained without a king for three years. Unhindered by further major interference from the central European powers, the Turks extended their control over the Greek rulers in the Peloponnese, who had cooperated with the crusaders; they also conquered Constantinople (1453) and reabsorbed Serbia (by 1459).

Varnhagen von Ense, Karl August (b. Feb. 21, 1785, Düsseldorf, Pfalz-Neuburg-d. Oct. 10, 1858, Berlin), German writer, diplomat, biographer, and, with his wife, Rahel, a leading figure of a Berlin salon that became a centre of intellectual debate. His numerous biographies are smoothly written and well organized but rely heavily on anecdote.

Varnhagen began his literary career (1804) by becoming joint editor of a poetry annual. Enlisting in the Austrian Army (1809), he was wounded at the Battle of Wagram the same year and later accompanied his superior officer, Prince Bentheim, to Paris. He spent a year in the Prussian civil service (1812) but later resumed his military career. His experiences in Hamburg and Paris as an adjutant are recorded in Geschichte der Hamburger Ereignisse (1813; "History of the Hamburg Events"), and his campaigns are described in Geschichte der Kriegzüge des Generals von Tettenborn (1815; "History of the War Platoon of General von Tettenborn").

Entering the Prussian diplomatic service, he was present at the Congress of Vienna (1814-15) and was resident at Karlsruhe until his recall in 1819. In 1814 he married Rahel Levin, whose salon was a gathering place for the writers, diplomats, and intellectuals of the day. Retiring from diplomatic service, Varnhagen became more involved in literature, although he was ocassionally recalled for important political assignments.

Varnhagen's biographies include those of General von Seydlitz (1834), Sophia Charlotte, queen of Prussia (1837), and General Bülow von Dennewitz (1853). A collection of his correspondence with the geographer and explorer Alexander von Humboldt has also been compiled.

Varnhagen von Ense, Rahel, née LEVIN (b. May 19, 1771, Berlin—d. March 7, 1833, Berlin), German literary hostess from early in the 19th century whose soirees were attended by many of the Romantics, notably Heinrich Heine

Rahel was from a wealthy Jewish family of Berlin. Her brother Ludwig Robert was a minor playwright. Literary salons presided over by such women as Henriette Herz and Rahel Levin became the centres of social activity for writers and their followers. A sudden loss of fortune in 1806 interrupted Rahel's salon activity, but she was able to resume it after she met Karl August Varnhagen von Ense, a minor writer and literary personality, in 1808. They were married in 1814. In 1819 he was dismissed from the diplomatic service because of his liberal politics, and the family returned to Berlin, where Rahel's salon regained its prominence. Many of Rahel Varnhagen's letters were published in 1967. Her husband brought out a collection of her writings, Rahel. Ein Buch des Andenkens für ihre Freunde, 3 vol. (1834, reprinted 1971; "Rahel. A Book of Memories for Her Friends").

varnish, liquid coating material containing a resin that dries to a hard transparent film. Most varnishes are clear, but some contain pigments.

A brief treatment of varnish follows. For full treatment, see MACROPAEDIA: Industries, Chemical Process.

The first varnishes were solutions of natural resins, the natural secretions of plants, and were produced by heating the resins, adding natural oils such as linseed, cooking the mixture to the desired viscosity, and then diluting it with turpentine. The resultant coating took three to four days to harden and was not durable. Other drawbacks were variability in properties, supply, and price inherent in nat-

ural products.

Modern varnishes rely largely on synthetic resins that are less variable in availability and quality, and adaptable to many uses. The first synthetic resins used in varnishes, developed by the chemist Leo Baekeland, were phenolic resins similar to Bakelite. Improved through the 1930s and 1940s, phenolics were displaced in many uses by alkyds, which eventually became the single most important resin class in the coatings industry, but phenolics continue to be used in marine and floor varnishes. Alkyds are made with an alcohol such as glycerol, a dibasic acid, such as maleic or phthalic acid, and an oil, such as castor, coconut, linseed, or soybean, or a fatty acid. Other synthetic resins used in varnishes include amino resins, formed by the condensation of urea or melamine with formaldehyde; polyurethanes and epoxy resins; silicones; and vinyl resins.

varnish tree, also called JAPANESE VARNISH TREE, LACQUER TREE, OF WOOD OIL TREE, any of various trees whose milky juice is used to make a varnish or lacquer. The term is applied particularly to an Oriental tree, related to poison ivy, that is highly irritating to the skin. On being tapped, the tree exudes a thick, milky emulsion that was possibly used as the first drying oil; it has the peculiar property of drying only in a moist atmosphere. From this exudate is obtained the lacquer used to produce the highly polished woodenware of China and Japan with the hard and durable coats that are unaffected by water. See also goldenrain tree.

Varnitsa, also spelled VARNICA, new city, a port on the right bank of the Dnestr River, just north of Bendery, Moldavian Soviet Socialist Republic. The city was created to serve as a river outport for Kishinyov, 35 mi (56 km) to the northwest, to which it is connected by rail. Upon its completion it was to be the largest port on the Dnestr River; at its inauguration in 1976 the port had facilities for direct land-to-water transshipment, with an annual capacity of 1,200,000 tons. Other industry includes concrete products and the processing of the agricultural products of the surrounding river valley, especially fruits, vegetables, wine grapes, and dairy products. Pop. (latest census) 3,500.

Varro, Marcus Terentius (b. 116 BC, probably Reate, Italy-d. 27 BC), Rome's greatest scholar and a satirist of stature, best known for his Saturae Menippeae ("Menippean Satires"). He was a man of immense learning and a prolific author. Inspired by a deep patriotism, he intended his work, by its moral and educational quality, to further Roman greatness. Seeking to link Rome's future with its glorious past, his works exerted great influence before and after the founding of the Roman Empire (27 BC).

Varro studied with a prominent Latin scholar and with the philosopher Antiochus of Ascalon at Athens. Though not attracted to a political career, he played some part in public life and rose to the office of praetor. He served with Pompey the Great in Spain (76), became his pro-quaestor there, and also served under him

in the war against the pirates (67).

In 59 Varro wrote a political pamphlet entitled *Trikaranos* ("The Three-Headed") on the coalition of Pompey, Julius Caesar, and Crassus. He sided with Pompey in Spain (49) but was pardoned (47) and appointed librarian by Caesar, to whom he dedicated the second part of his Antiquitates rerum humanarum et divinarum ("Antiquities of Human and Divine Things"). Under the second triumvirate Varro was outlawed by Mark Antony, and his books were burned, but his property was later restored by Augustus. He spent the rest of his life in study and writing.

Varro wrote about 74 works in more than 600 books on a wide range of subjects: jurisprudence, astronomy, geography, education, and literary history, as well as satires, poems, orations, and letters. The only complete work to survive is the De re rustica ("Farm Topics"), a three-section work of practical instruction in general agriculture and animal husbandry, written to foster a love of rural life.

Dedicated to Cicero, Varro's De lingua Latina ("On the Latin Language") is of interest not only as a linguistic work but also as a source of valuable incidental information on a variety of subjects. Of the original 25 books there remain, apart from brief fragments, only books v to x, which contain considerable gaps.

Of Varro's 150 books of the Saturae Menippeae, some 90 titles and nearly 600 fragments remain. The satires are humorous medlevs in mixed prose and verse in the manner of the 3rd-century-вс Cynic philosopher Menippus of Gadara. The subjects range from eating and drinking to literature and philosophy. In these satires, Varro shows himself a man of the old stamp, making fun of the follies and absurdities of modern times. He preaches a simple life of old-fashioned Roman virtue and piety, opposes luxury and philosophic dogmatism, and shows considerable skill in handling several meters and poetic manners.

The De re rustica appears in an edition with an English translation by W.D. Hooper and H.B. Ash in the Loeb Classical Library (1934), which also offers De lingua Latina and an English translation by R.G. Kent (1938). There is an edition (1953) of the Saturae Ménippeae by F. della Corte, who also wrote Varrone—il terzo gran lume romano (1954).

Varthema, Lodovico de, de Varthema also spelled DI BARTHEMA, Latin VARTOMANUS, or vertomannus, (b. c. 1465-70, Bologna, Bologna—d. June 1517, Rome), intrepid Italian traveler and adventurer, whose account of his Middle Eastern and Asiatic wanderings was widely circulated throughout Europe and earned him high fame in his own lifetime. He made significant discoveries (especially in Arabia), and made many valuable observations of the peoples he visited; his ready wit enabled him to handle difficult situations.

He sailed from Venice near the end of 1502,

He next sailed for northwestern India by way of Somaliland but then returned to Arabia. Touching at Zupār and Muscat, he went on to Hormuz in the Persian Gulf and spent much of 1504 in southern Persia. At Shīrāz, Persia, he entered into partnership with a merchant whom he knew from his Mecca pilgrimage and who accompanied him on the rest of his Asian travels. Following an unsuccessful attempt to reach Samarkand, the two men returned to Hormuz and embarked for India. Sailing the length of the western coast, they touched at Cambay and at Goa, from where Varthema visited the inland capital of Bijāpur; at Cannanore he detoured to visit Vijayanagar, a great city enjoying its final days of splendour; at Calicut (now Kozhikode) Varthema observed Hindu customs as well as trade and city government. He visited Ceylon and southeastern India and then made his way to the magnificent Myanmar (Burmese) capital at Pegu. From Malacca, on the southern Malay peninsula, he returned to India in the summer of 1505 and, upon reaching Calicut, posed as a Muslim holy man. Eager to return to Europe, Varthema joined the Portuguese garrison at Cannanore, fought for Portugal, and was knighted for his services. In 1507 he sailed for Europe by way of the Cape of Good Hone.

Varthema's account, Itinerario de Ludouico de Varthema Bolognese...(1510), first appeared in English translation in Richard Eden's History of Travayle (1576–77). The Hakluyt Society of London published an English translation, Travels of Ludovico di Varthema, in 1863.

Varuna, in the Vedic phase of Hindu mythology, the god-sovereign, the personification of divine authority. He is the ruler of the sky realm and the upholder of cosmic and moral law (rta), a duty shared with the group of gods known as the Adityas, of whom he was the chief. He is often jointly invoked with Mitra, who represents the more juridical side of their sovereignty, or the alliance between man and man, while Varuna represents the magical and speculative aspects, or the relationship between god and man. In later Hinduism, Varuna plays a lesser role. He is guardian of the west and is particularly associated with oceans and waters. Thus he is often attended by the river goddesses Gangā and Yamunā. He corresponds closely to the Zoroastrian god Ahura Mazdā.

Varus, Publius Quintilius (d. AD 9), Roman general whose loss of three legions to Germanic tribes in the Battle of the Teuto-

burg Forest caused great shock in Rome and stemmed Roman expansion beyond the Rhine River.

Varus came of an old patrician family; his father, Sextus Quintilius Varus, was one of the murderers of Julius Caesar and committed suicide after the Battle of Philippi (42 BC). Varus himself, however, came to be related by marriage to the emperor Augustus and thus acquired political influence, becoming consul in 13 BC, proconsul of Africa (77-6 BC), and then legate in Syria, where he acquired enormous wealth. When Judea rebelled on the death of Herod I the Great (4 BC), Varus marched an army against the insurgents, crushed them, and reestablished direct Roman government.

Augustus eventually sent Varus to the Roman frontiers east of the Rhine, where he functioned as both a civil administrator and a military commander in an attempt to introduce Roman jurisdiction into the recently conquered region.

The Germans, however, found in Arminius, a prince of the Germanic Cherusci tribe, a leader of extraordinary resource. Arminius formed the design of freeing his people from Roman rule and soon came to a secret understanding with influential German chiefs. In September of the year AD 9, Varus, who had been falsely informed that a distant tribe was in revolt, led his legions into the Teutoburg Forest to put down the uprising. Here the Germans were lying in wait for him; and everything was in their favour, the narrow defiles having caused disorder among the troops and the ground having been made muddy by heavy rains. The battle that ensued lasted three days, during which the Romans were altogether destroyed; and Varus killed himself by falling upon his sword.

The aged Augustus was said to have been overcome with grief upon receiving news of the disaster, crying, "Varus, Varus, give me back my legions!" The defeat of Varus was followed by the loss of all Roman possessions east of the Rhine.

varved deposit, any form of repetitive sedimentary rock stratification, either bed or lamination, that was deposited within a one-year time period. This annual deposit may comprise paired contrasting laminations of alternately finer and coarser silt or clay, reflecting seasonal sedimentation (summer and winter) within the year. Varved deposits are to be distinguished from rhythmites, the latter also being made up of paired laminations or beds but with an annual cyclicity that cannot be proved.

Varved deposits are usually associated with fine-grained sediments, the muds or mudrocks, which include both silt- and clay-grade materials. Laminations in many mudrocks are both thin and laterally persistent over large areas. They may exhibit the right order of thickness, as shown by the rates of sedimentation estimated for times past or observed at present, and have a structure similar to laminations currently being formed. Using this premise, one may deduce that many mudrock laminations are of an annual nature and that the varved deposits depend upon the yearly climatic cycle. This cycle affects temperature, salinity, and silt content of waters as well as the seasonal production of plankton.

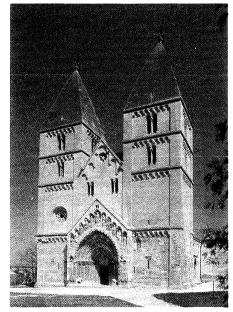

Varved deposits are most commonly associated with sedimentation in lakes, particularly those that are located in glacial or proglacial environments. During the summer months sediment is transported into the lake from the surrounding drainage basin as a result of ice melting and outwash. The central part of the lake receives relatively coarse sediment—silt to very fine-grade sand detritus—distributed by currents. The sediment settles to the bottom, with the coarser particles settling faster. In the wintertime the lake may not receive any new sediment input, probably because the

lake is ice covered. Thus the finest sediments, the clays, flocculate in the water column and settle out of suspension in the lake. The end product is a coarse- and fine-grained sediment couplet, the sediment being light (summer) and dark coloured (winter), respectively. This couplet is the hallmark of varved deposits. The annual cyclicity of the varved deposits in modern lakes can be proven as seasonal by using pollen analysis or by undertaking carbon-14 dating of the succession. Some varved sediments in the glacigenic environment can display an exponential decrease in thickness of the couplet away from the ice front. This may be a result, in part, of the couplet being deposited by density current and autosuspension mechanisms operating within the water body.

Varved deposits in recent and ancient sedimentary sequences, where they are often termed varvite, frequently display disruption of the fine lamination and couplets by outsize clasts. These clasts are called dropstones and were introduced vertically through the water column into the lake area, where only finegrained sediments normally accumulate, by ice rafting and melting. This phenomenon of disrupted varvites constitutes the strongest evidence of past glacial activity in a region.

Varved sediments also can be found in nonglacial lakes and marine settings and as a result of aeolian processes. Varved deposits are commonly associated with evaporite sequences where lake sediments display detrital and chemical cycles. These thicker couplets are the product of a cyclic variation in rainfall imposed upon the deposits of a continuously subsiding lake basin.

Vasa, House of, Swedish (and Polish) dynasty descended from an old family of Uppland, related both to the Sture family and to the Bonde family of Sweden's King Charles VIII (d. 1470). Its founder was Gustav Eriksson Vasa, who became regent of Sweden in 1521 and King Gustav I Vasa in 1523. His descendants reigned until 1818, the last being Charles XIII. It was succeeded by the House of Bernadotte.

A grandson of Gustav I Vasa became king of Poland, as Sigismund III Vasa, in 1587 and was concurrently king of Sweden from 1592. On Sigismund's death in 1604, a son, Władysław IV Vasa, was elected to the Polish throne; and an uncle, Charles IX, already regent, received the Swedish crown. The Vasa dynasty in Poland ended a generation later, in 1668, with the resignation of Sigismund's second son, John II Casimir Vasa.

Vasarely, Victor, Hungarian VIKTOR VÁ-SÁRHELYI (b. April 9, 1908, Pécs, Hung.), Hungarian-born French painter of geometric abstractions who became one of the leading figures of the Op art (q.v.) movement.

He was trained as an artist in Budapest in the Bauhaus tradition. In 1930 he left Hungary and settled in Paris, where he initially supported himself as a commercial artist but continued to do his own work. During the 1930s he was influenced by Constructivism, but by the 1940s his characteristic style of painting animated surfaces of geometric forms and interacting colours had emerged. His style reached maturity in the mid-1950s and 1960s, when he began using brighter, more vibrant colours to further enhance the suggestion of movement through optical illusion. Representative works include "Sirius II" (1954, Galerie Denise René, Paris), "Ondho" (1956–60, Museum of Modern Art, New York City), and "Arny-C" (1967–69, Galerie Denise René). Vasarely became a naturalized French citizen

Vasarely became a naturalized French citizen in 1959. Much of his work is housed in the Musée Vasarely, at the Château de Gourdes, in Vaucluse département, southern France. In 1970 he established the Foundation Vasarely, which in 1976 took up quarters near Aix-en-Provence in a building that he designed.

Vasari, Giorgio (b. July 30, 1511, Arezzo, Florence—d. June 27, 1574, Florence), Italian Mannerist painter, architect, and writer whose fame as an artist has been overshadowed by the importance of his study of the history of Italian Renaissance art.

When still a child, Vasari was the pupil of Guglielmo de Marcillat, but his decisive training was in Florence, where he enjoyed the friendship and patronage of the Medici family, trained within the circle of Andrea del Sarto, and became a lifelong admirer of Michelangelo. As an artist Vasari was both studious and prolific. Apart from his work at Arezzo, he is best represented by the great fresco cycles in the Palazzo Vecchio, Florence, and in scenes from the life of Pope Paul III in the Cancelleria, Rome (the so-called 100-days fresco). Vasari's paintings are in the style of the Tuscan Mannerists and have often been criticized as being facile, superficial, and lacking a sense

of colour. Today, Vasari is more highly regarded as an architect than as a painter. His best known works of architecture are the Uffizi (Florence), begun in 1560 for Cosimo I de' Medici, and the church, monastery, and palace built for the Cavalieri di S. Stefano in Pisa. These designs show the influence of Michelangelo and are outstanding examples of the Tuscan Mannerist style of architecture. Vasari was also among the founders of the Florentine Accademia del Disegno (1562).

His Le Vite de' più eccellenti architetti, pit-tori, et scultori italiani . . . (1550, 2nd ed., 1568; The Lives of the Most Eminent Italian Architects, Painters and Sculptors . . .) was dedicated to Cosimo de' Medici. In it Vasari accepts the Renaissance view of medieval art as the incompetent product of the Dark Ages that separate classical antiquity from the Renaissance and concentrates on the revival of the arts in Tuscany, initiated by Giotto and culminating in the works of Michelangelo, the only living artist mentioned. In a second and much enlarged edition, the painters are mentioned first in the title. This edition, which includes the biographies of a number of artists then living, as well as Vasari's own autobiography, is now much better known than the first edition and has been widely translated.

Vasari's style is eminently readable, and his methods were sometimes analogous to those of the modern art historian. When facts were scarce, however, he did not hesitate to fill in the gaps. The introductions to each of the three main volumes comprise a valuable treatise on the various arts and also give an acute insight into Vasari's theories and prejudices. T.S.R. Boase's Giorgio Vasari: The Man and the Book was published in 1979.

Vasconcelos, José (b. Feb. 28, 1882, Oaxaca, Mex.—d. June 30, 1959, Mexico City), Mexican educator, politician, essayist, and philosopher, whose five-volume autobiography, Ulises Criollo (1935; "Ulysses Creole"), La tormenta (1936; "The Torment"), El desastre (1938; "The Disaster"), El proconsulado (1939; "The Proconsulship"), and La flama (1959; "The Flame"), is one of the finest sociocultural studies of 20th-century Mexico. A

A lawyer, Vasconcelos campaigned for the revolutionary presidential candidates Madero and Villa. After serving as rector of the University of Mexico, he was appointed minister of public education (1920–24), during which time he initiated major reforms in the school system, especially expanding the rural school program. In 1929 he ran unsuccessfully for the presidency of Mexico. Because of his po-

litical activism, he was forced to spend several periods of his life living in exile.

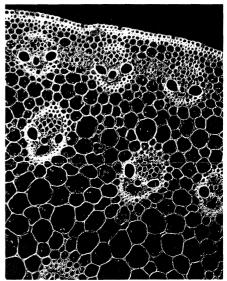

His philosophy, which he called "aesthetic monism," essentially an attempt to deal with the world as a cosmic unity, is set forth in Todología (1952). He carried over his philosophy into his writings on Mexico, calling for a synthesis of Mexican life based upon the indigenous culture of the Indians, which transcended what he saw as the narrow limits of Western culture. He is most famous for his autobiography. Among his other principal works are La raza cósmica (1925; "The Cosmic Race") and Bolivarismo y Monroismo (1934; "Bolivarism and Monroism").

vascular system, in plants, assemblage of conducting tissues and associated supportive fibres. Xylem tissue transports water and dissolved minerals to the leaves, and phloem tissue conducts food from the leaves to all parts of the plant.

The condition of the xylem, the woody elements in the stem, defines several categories. The protostele has a solid xylem core; the siphonostele has an open core or one filled with generalized tissue called pith. The dis-

Vascular bundles in corn stem

continuous vascular system of monocots (e.g., grasses) consists of scattered vascular bundles; the continuous vascular system of dicots (e.g., roses) surrounds the central pith.

Vascular bundles run longitudinally along the stem. Vascular rays extend radially across the stem, assisting in conduction from the vascular bundles to tissues alongside them. The vascular tissues and supporting tissues constitute the stele.

Several kinds of vascular bundles are recognized. In the collateral pattern, the phloem lies only on one side of the xylem, usually toward the stem exterior. This arrangement is typical of the dicots, the majority of flowering plants, such as roses, apples, oaks, pines, etc. If phloem is on the outer and inner faces of the xylem the bundle is bicollateral. A concentric bundle has xylem entirely surrounded by phloem (amphicribal condition) or phloem entirely surrounded by xylem (amphivasal condition). Closed bundles lack cambium and are unable to continue growth laterally. They are typical of monocots, such as grasses, lilies, and palms, in which they are scattered in two or more rings in the stem.

some, combining an elaborate overall repeat pattern of ogival lozenges with a profusion of extravagantly styled blossoms of varied form, in a wide range of rich and harmonious colours. The lozenges are usually produced by three intersecting networks of larger ovals, each created by continuous vine stems, those of each net having a different aspect and colour. The fantastic flowers are placed along the vines in such a way that one is centred in each lozenge. In other examples there is a single lozenge system, each lozenge sometimes having a different ground colour. In most of these carpets there is an ornamental vase form, usually standing on a bracket, in several of the lozenge panels. In the oldest examples the vase has a solid ceramic shape, Chinese in aspect; and it is quite possible that the entire design scheme was developed from a Far Eastern silk pattern, perhaps that of a brocade.

In later carpets the vase shows certain exaggerations and becomes less plausible. The production of carpets in the Vase design seems to have continued into the 18th century. Imitation Vase carpets exist, together with carpets in which the surface has been reknotted in some new design upon an old Kerman double-warped foundation.

vasectomy, severing of the vas deferens in the male reproductive tract to bring about sterility or to prevent infection. The testes in the male produce the sperm cells that fertilize the ovum, or egg, in the process of producing a new organism. Connected to each testis is the epididymis, a structure that serves as a storage sac for sperm. The duct that passes sperm from the testes to the prostate and other reproductive organs is the vas deferens (see ductus deferens). The testes, the epididymis, and the beginning of the vas deferens are enclosed in the scrotal sac.

Vasectomy is a relatively simple procedure that can be performed in the physician's office. The scrotum is locally anesthetized, and the vas deferens is isolated by external examination. A small incision is made over the cord, it is clamped in two spots, and severed between the clamps. The two free ends of the vas deferens are then usually cauterized to coagulate the blood and seal off the tubes. The clamps are removed and the small incision is closed with a single stitch.

As a prophylactic, vasectomies are usually performed to prevent further infections from occurring in the epididymes or testes. It is considered much less injurious to the body to produce sterility than to take the risk of losing the functioning testes altogether. After the vas deferens has been severed, the testes still produce hormones that allow the male to perform in a normal sexual manner, and the hormones that support the secondary sex characteristics such as pubic hair, facial hair, and deep voice. Vasectomies are usually performed for the purpose of contraception. The male still emits small quantities of sperm for up to six weeks after the operation. Once the residual supply in the remaining reproductive tract has been depleted or washed out, he is sterile. Surgical attempts to reconnect the cords have a success rate of at least 40 percent, and there is some evidence that greater success may be achieved with improved microsurgical techniques. Nevertheless, sterilization by means of vasectomy should be considered permanent.

Vasiliki ware, elaborately shaped handmade pottery from Vasiliki, eastern Crete, produced in the second phase of the Early Minoan period (c. 3000-c. 2000 BC). The surface of the wares is covered with a red or brown semi-lustrous paint that appears mottled, an effect achieved by uneven firing. See Greek pottery.

Vasily (Russian personal name): see under Basil, except as below.

Vasily, also spelled VASSILY, English BASIL, name of rulers of Russia, grouped below chronologically and indicated by the symbol •.

• Vasily I, in full VASILY DMITRIYEVICH (b. 1371—d. February 1425, Moscow), grand prince of Moscow from 1389 to 1425.

While still a youth, Vasily, who was the eldest son of Grand Prince Dmitry Donskoy (ruled Moscow 1359-89), travelled to the Tatar khan Tokhtamysh (1383) to obtain the Khan's patent for his father to rule the Russian lands as the grand prince of Vladimir. Diplomatically overcoming the challenge of the prince of Tver (now Kalinin), who also sought the patent, Vasily succeeded in his mission. But he was subsequently kept at Tokhtamysh's court as a hostage until 1386 when, taking advantage of Tokhtamysh's conflict with his suzerain Timur Lenk (Tamerlane), he escaped and returned to Moscow.

Despite the hostility caused by his flight, in 1388 Vasily led a Muscovite military contingent in Tokhtamysh's campaign against Timur Lenk in Central Asia; and after returning home he received Tokhtamysh's patent and succeeded his father as grand prince of Moscow and Vladimir (1389). Embarking on a program of aggrandizement for Moscow, Vasily (with permission from Tokhtamysh) annexed the principalities of Nizhny Novgorod (now Gorky) and Murom, thereby increasing Moscow's control over the central Volga region. His efforts to expand westward, however, brought him into conflict with both Lithuania (with which he had maintained cordial relations, particularly after marrying the Grand Duke's daughter Sophia in 1390) and Novgorod. Although he temporarily settled the Muscovite-Lithuanian territorial disputes by placing the border between the two states along the Ugra River, his clashes with Novgorod continued intermittently from 1397 to 1417.

Vasily also remained involved in Tatar politics. In 1395 he raised an army to fight Timur

Lenk, who had invaded the Russian lands after defeating Tokhtamysh. Timur Lenk retreated before engaging Vasily in battle, and during the next decade the Muscovite Grand Prince was able to make his state effectively independent of Tatar dominance. In 1408, however, Edigü, who had replaced Tokhtamysh and reorganized the Tatar khanate, laid siege to Moscow and compelled Vasily to resume his tribute payments to the Khan and again recognize Tatar suzerainty.

• Vasily II, in full vasily vasilyevich, byname vasily the blind, Russian vasily tyomny (b. 1415—d. March 27, 1462, Moscow), grand prince of Moscow from 1425 to 1462.

Although the 10-year-old Vasily II was named by his father Vasily I (ruled Moscow 1389–1425) to succeed him as the grand prince of Moscow and of Vladimir, Vasily's rule was challenged by his uncle Yury and his cousins Vasily the Squint-Eyed and Dmitry Shemyaka. After a long, chaotic, and bitter struggle, during which Vasily not only temporarily lost his throne both to Yury (1434) and to Dmitry Shemyaka (1446–47) but was also blinded by Dmitry (1446), Vasily recovered his position (1447) and ruled Muscovy for another 15 years.

Despite the prolonged internal discord, which finally ended in 1452, Muscovy made great strides toward becoming a large, politically consolidated, powerful Russian state during Vasily's reign. The Russian Church asserted its independence from the patriarch at Constantinople; and the state of Muscovy, in an effort to enlarge its territories, absorbed most of the neighbouring principalities. It gained suzerainty over the Grand Principality of Ryazan (1447) and the city of Vyatka (1460). To pursue his policy of aggrandizement without foreign interference, Vasily concluded a non-aggression pact with Lithuania in 1449. He could not, however, avoid intermittent conflict with the rival Tatar hordes bordering his lands on the south and east, one of which tried unsuccessfully to storm Moscow in 1451. Nevertheless, he welcomed individual Tatars at his court and, encouraging them to enter his service, established a vassal Tatar horde to defend his state's southeastern frontier (c. 1453). By the end of his reign he had also substantially reduced the domination of the Tatar khan, who formally remained his suzerain, over Muscovy.

• Vasily III, in full VASILY IVANOVICH (b. 1479—d. Dec. 3, 1533, Moscow), grand prince of Moscow from 1505 to 1533. Succeeding his father, Ivan III (ruled Moscow 1462–1505), Vasily completed his father's policy of consolidating the numerous independent Russian principalities into a united Muscovite state by annexing Pskov (1510), Ryazan (1517), and Starodub and Novgorod-Seversk (now Novgorod-Seversky) by 1523. He also strengthened his growing state by capturing Smolensk from

Lithuania in 1514. His forces were defeated by the Lithuanians at Orsha (1514), however, and Muscovy also suffered devastating raids

by Tatars of both the Crimea and Kazan. Nevertheless, Vasily was loyally supported by the metropolitan Daniel, who intrigued in his favour and sanctioned his canonically unjustifiable divorce from his barren first wife (1525). Vasily overcame the opposition of those boyars who objected to his autocratic tendencies and transmitted an enlarged, powerful, centralized state to his son Ivan IV the Terrible.

• Vasily (IV) Shuysky, original name VASILY IVANOVICH, KNYAZ (Prince) SHUYSKY, or SHUISKY (b. 1552—d. Sept. 12, 1612, Gostynin, near Warsaw), boyar who became tsar (1606–10) during Russia's Time of Troubles.

A member of an aristocratic family descended from Rurik, the legendary founder of the dynasty that ruled Russia until 1598, Vasily Shuysky achieved prominence in 1591 when he conducted the investigation of the death of Dmitry Ivanovich, the brother and heir of Tsar Fyodor I (ruled Russia 1584-98) and determined that the nine-year-old child had killed himself with a knife while suffering an epileptic fit. In 1605, however, after Boris Godunov, Fyodor's chief adviser and his brother-in-law, had become tsar and a pretender claiming to be Prince Dmitry had appeared, Shuysky reversed himself and, declaring that Dmitry had escaped death in 1591, supported the pretender's claim to the throne. When Boris died in April 1605, Shuysky instigated a movement to murder Boris' son Fvodor II and swore allegiance to the first False Dmitry

Shortly after Dmitry had been crowned, Shuysky reversed his position again and, accusing the new tsar of being an impostor, engaged in a plot to overthrow him. After a brief

Vasily Shuysky, engraving, 1610 Novosti Press Agency

period of banishment, he organized a group of boyars opposed to the pretender, provoked a popular riot, and assassinated Dmitry. On May 29 (May 19, old style), 1606, Shuysky was named tsar of Russia.

Hoping to avoid challenges from future pretenders, Vasily ordered that the remains of Prince Dmitry be brought to Moscow and had the late tsarevich canonized (June 1606). He also proclaimed his intentions to rule justly and in accord with the boyar Duma (an advisory council). Nevertheless, opposition to his regime mounted. Although he succeeded in suppressing a rebellion of Cossacks, peasants, and gentry (October 1607), he was unable to prevent the second False Dmitry, who had gained support from Poles, anti-Shuysky bovars, and many of the defeated rebels, from establishing a court and government at Tushino that rivalled Vasily's (spring 1608). Only with aid obtained from Sweden was Vasily able to restore his control over northern Russia and force the pretender to withdraw from Tushino (January 1610). But Sweden's intervention provoked a Polish declaration of war against Vasily. When Moscow was threatened by a Polish advance, as well as by a renewed offensive of the second False Dmitry, the Muscovites rioted, and an assembly, consisting of both aristocratic and common elements, deposed Vasily (July 1610), who was forced to take monastic vows.

Vaslui, judeţ (district), eastern Romania, occupying an area of 2,046 sq mi (5,300 sq km), bounded on the east by the Moldavian S.S.R. of the Soviet Union. The terrain consists of rolling hills. The Elan, Bîrlad, and Tutova rivers drain the district. Vaslui (q.v.) city is the district capital. Building materials, timber, wood products, and foodstuffs are manufactured in Vaslui, Huşi, and Fălciu. Bîrlad is a machinery- and textile-production centre that was the residence of the princes of Moldavia during the 14th century. The town is known for its state theatre, museum of history and science, and 17th-century churches. Agricultural activities of Vaslui district include livestock raising and cereal and vineyard cultivation. Negresti, Stefan cel Mare, and Dragomirești are other towns. Highway and railway connections, usually parallelling river courses, extend between the district's major towns. Pop. (1982 est.) 448,430.

Vaslui, town, capital of Vaslui *judet* (district), northeastern Romania, on the Bîrlad River. Near Vaslui, in 1475, Stephen (Ştefan) the Great, with 40,000 troops, defeated a Turkish army three times as large. He also built the St John the Baptist church in 1490 and the prince's residence. The town is a trading centre; tiles and bricks are made from local clay soils, and a factory processes edible oils and stock feed. A railway connection and highways extend through the town. Pop. (1982 est.) 52,187.

vasomotor system, in anatomy, the part of the nervous system that supplies the muscle fibres of the walls of blood vessels. Included are the vasoconstrictor and vasodilator nerves, which function to narrow or widen the particular vessels they supply and thus to regulate the amount of blood passing to a particular body part or organ. These nerves are controlled by the vasomotor centre located in the medulla of the brain.

vassa (Pāli: "rains"), the Buddhist monastic retreat observed primarily in Buddhist communities in Southeast Asia during the three-month monsoon period each year.

The tradition that monks—who ordinarily would be mendicant wanderers—gather in monasteries during the rainy season for a time of study and religious discourse may derive from the ancient custom among South Asian ascetics of retreating to a forest grove, usually

near a village, during the monsoon when travel was difficult. Residing in their retreat during the rains, they continued to pursue their meditative quest and begged alms from local townspeople. The practice was well known in India by the time of the Buddha (6th century BC), who after his enlightenment is said to have spent the rainy season in a sheltered spot in the forest near Benares.

The Buddha's followers assumed the same practice and after his death continued to gather during the monsoon to recite the rules of Buddhist discipline and to reaffirm their commitment to the Buddha's vision of dharma. As the monastic community (the sangha) became wealthier by virtue of larger and more frequent contributions from the laity, more permanent meditation and study centres, or vihāras, were constructed to house the members of the contemplative groups during their annual retreats. With the ascendency of the powerful Mauryan king Asoka (3rd century BC), who admired and followed the Buddha's teachings, these vihāras flourished throughout northeast India. The vihāras are the institutional precursors of both the great Buddhist monastic centres, or Mahāvihāras, of South and Southeast Asia and of the custom of the annual religious retreat still practiced in Theravāda Buddhist countries today. The vassa has been largely forgotten by Mahāyāna Buddhists, especially those in China and Japan.

In Thailand, where all Buddhist males customarily spend some time in a monastery, vassa is a favoured period for temporarily experiencing the life of a monk. Seniority as a monk is commonly measured by the number of vassa seasons spent in a monastery.

Vassa begins on the first day of the waning moon of the eighth lunar month (usually in July) and ends on the full moon of the eleventh month (usually October). Vassa concludes with the pavāranā ceremony, in which every monk, irrespective of rank or seniority, agrees willingly to receive instruction from any other monk in the monastery if he acts improperly. The lively kathina ("cloth") ceremony, in which groups of laymen present gifts to the monks, takes place during the first month following the conclusion of vassa.

vassal, in feudal society, one invested with a fief in return for services to an overlord. Some vassals did not have fiefs and lived at their lord's court as his household knights. Certain vassals who held their fiefs directly from the crown were tenants in chief and formed the most important feudal group, the barons. A fief held by tenants of these tenants in chief was called an arriere-fief, and, when the king summoned the whole feudal host, he was said to summon the ban et arriere-ban. There were female vassals as well; their husbands fulfilled their wives' services.

Under the feudal contract, the lord had the duty to provide the fief for his vassal, to protect him, and to do him justice in his court. In return, the lord had the right to demand the services attached to the fief (military, judicial, administrative) and a right to various "incomes" known as feudal incidents. Examples of incidents are relief, a tax paid when a fief was transferred to an heir or alienated by the vassal, and scutage, a tax paid in lieu of military service. Arbitrary arrangements were gradually replaced by a system of fixed dues on occasions limited by custom.

The vassal owed fealty to his lord. A breach of this duty was a felony, regarded as so heinous an offense that in England all serious crimes, even those that had nothing to do with feudalism proper, came to be called felonies, since, in a way, they were breaches of the fealty owed to the king as guardian of the public peace and order.

The vassals' rights over the fiefs grew larger and larger in course of time, and soon fiefs became hereditary in the sense that investiture could not be withheld from an heir who was willing to do homage. The rules of inheritance tended to safeguard an undivided fief and preferred the eldest among the sons (primogeniture). This principle was far from absolute; under pressure from younger sons, parts of an inheritance might be set apart for them in compensation (appanages; q.v.). Vassals also acquired the right to alienate their fiefs, with the proviso, first, of the lord's consent and, later, on payment of a certain tax. Similarly, they obtained the right to subinfeudate, that is, to become lords themselves by granting parts of their fiefs to vassals of their own. If a vassal died without heir or committed a felony, his fief went back to the lord (see escheat).

Västerås, city and capital of the *län* (county) of Västmanland, east-central Sweden. It lies at the confluence of Svart River and Lake Mälar, west of Stockholm.

Västerås is Sweden's largest inland port and the centre of its electrical industry. Originally known as Aros (River Mouth) and later as Västra (West) Aros, it was already a market centre and a bishopric by the beginning of the European Middle Ages. In medieval times it also served as a major export harbour for iron and copper from the Bergslagen mining region. Several national parliaments were held there, including that of 1527, which formally introduced the Reformation into Sweden, and that of 1544, which established the hereditary rights of the Vasa family to the throne. In the city's Gothic cathedral lie the remains of Eric XIV. Beside Svartån stands a 12th-century castle, now a museum. Pop. (1988 est.) mun., 117,563.

Västerbotten, län (county), northern Sweden, extending from the Gulf of Bothnia west to the Norwegian border. Its land area of 21,390 square miles (55,401 square km) comprises the traditional landskap (province) of Västerbotten and parts of Angermanland and Lappland. The terrain rises from the gulf through a forested upland zone and culminates in Mount Burg (4,678 feet [1,426 m]) near the Norwegian frontier. Farming, lumbering, and mining are important economic activities in the län. In the past much timber was floated down rivers to such coastal milling centres as Umeå (q.v.), the capital and chief port, and Skellefteå. Deposits of copper, lead, gold, silver, and bismuth mined at Boliden, Rävliden, and Kristineberg are refined at Rönnskär. Pop. (1988 est.) 245,703.

Västergötland, landskap (province), southwestern Sweden, composed of the administrative län (county) of Skaraborg and portions of those of Alysborg, Göteborg och Bohus, Halland, and Örebro. Lying between Lakes Vättern and Vänern, its land area of 6,438 square miles (16,675 square km) is bounded by the traditional landskap (provinces) of Östergötland and Närke on the east, Dalsland and Bohuslän on the west, Värmland on the north, and Halland and Småland on the south. Only a small portion of the province's territory fronts on the sea, but this important area includes Göteborg, which is Sweden's second largest city. The scenery in Västergötland varies from wooded uplands in the southern area to ridges in the central and northern parts that rise to heights of more than 1,000 feet (305 m). The name of the province means West Gothland.

Agriculture is predominant in the northern part of the *landskap*, with its fertile plains; rye, wheat, and oats are the chief crops. Industry is important around Göteborg, Borås, and Vänersborg. The province's leading industries include fishing, limestone quarrying, shipbuilding, sugar refining, and the manufacture of textiles, paper, porcelain, and matches. Besides Göteborg, important towns are Mariestad, Vänersborg, Trollhättan, Borås, Skara,

Mölndal, Alingsås, Ulricehamn, Lidköping, Skövde, Hjo, Tidaholm, and Falköping. Pop. (1988 est.) 1,125,461.

Västernorrland, län (county) of northeast Sweden, on the Gulf of Bothnia. Its land area of 8,370 square miles (21,678 square km) takes in most of the two traditional landskap (provinces) of Medelpad and Angermanland. Rising from the low coastal strip is a heavily forested interior plateau that supplies timber for sawmilling and wood-processing industries. Road and rail have largely replaced the old logging routes to the coastal mills provided by the Angerman River and other streams. Härnösand, the capital, Sundsvall, and Örnsköldsvik are major shipping centres for timber and pulp. There are road, rail, and air connections with Stockholm. Pop. (1988 est.) 260,332.

Västmanland, län (county) of central Sweden, extending north of Lake Mälar. Its land area of 2,433 square miles (6,302 square km) includes the southwestern part of the traditional landskap (province) of Uppland and the eastern part of Västmanland. A fertile plain in the southeast rises northward to the edge of hilly Bergslagen district and is drained by the Arboga River, the Kolbäcks River, and several smaller rivers. Dairying and market gardening are pursued on the plain, while mining and metalworking are centred on Fagersta, in Bergslagen district. The proximity of iron ore, with lesser deposits of copper, lead, and zinc, influenced the development of Västerås (q.v.), the capital, and Köping as engineering centres. Pop. (1988 est.) 254,253.

Vasto, town, Chieti provincia, Abruzzi regione, south-central Italy. It is a beach resort, with brickmaking, candlemaking, and agricultural-processing industries. The town, the ancient name of which was Histonium, has an archaeological museum. There is a 13th-century castle, and the town cathedral has a facade and Gothic portal dating from the same period. The palace of the D'Avalo family dates from the 16th century. Pop. (1988 est.) mun., 32,932.

Vasubandhu (fl. 4th century AD), Indian Buddhist philosopher and logician, younger brother of the philosopher Asanga. His conversion from the Sarvāstivāda to the Mahāyāna Buddhist tradition is attributed to Asanga. Vasubandhu refined classical Indian syllogistic logic by distinguishing the procedure for reaching inferences in formal debate (five steps) from the method in personal thought (three steps). He wrote several śāstras ("treatises") holding that all seemingly external objects are only mental representations, and he is also reputed to be the author of the Abhidharmakośa, a systematization of Sarvāstivāda doctrine written before his conversion.

Vāsudeva, the patronymic of Krishna (Kṛṣṇa), son of Vāsudeva of the Sātvata sect of the Yādava clan. He may have lived in the Mathura area of North India in the 6th-7th century Bc. A significant 2nd-century-Bc inscription at Besnagar, near Vidisha (Bhīlsa), Madhya Pradesh, refers to a column topped by a figure of Garuḍa (the emblem or mount of Lord Vishnu), erected in honour of Vāsudeva by the Indo-Greek ambassador Heliodorus, who termed himself a "Bhāgavata." Though, in the earliest parts of the great Indian epic the Mahābhārata, the divinity of Krishna appears to be still open to doubt, by the time of the writing of the Bhagavadgītā (1st-2nd century AD), Vāsudeva-Krishna was clearly identified with the Vedic god Vishnu.

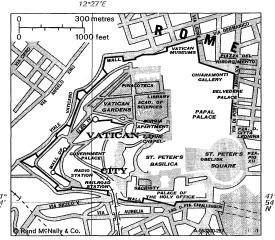

The worshipers of Vāsudeva, or Krishna, formed one of the earliest theistic devotional movements within Hinduism. When they merged with other groups, namely the Bhāgavata, they represented the beginnings of modern Vaiṣṇavism, or worship of Lord Vishnu.

vat dye, any of a large class of water-insoluble dyes, such as indigo and the anthraquinone derivatives, that are used particularly on cellulosic fibres. The dye is applied in a soluble, reduced form to impregnate the fibre and then oxidized in the fibre back to its original insoluble form. Vat dyes are especially fast to light and washing. Brilliant colours can be obtained in most shades. Originated in medieval Europe, vat dyes were so named because of the vats used in the reduction of indigo plants through fermentation.

Vatican Apostolic Library, Italian BIB-LIOTECA APOSTOLICA VATICANA, official library of the Vatican, especially notable as one of the world's richest manuscript depositories. The library is the direct heir of the first library of the Roman pontiffs. Very little is known of this library up to the 13th century, but it appears to have remained only a modest collection of works until Pope Nicholas V (1447-55) greatly enlarged it with his purchase of the remnants of the imperial library of Constantinople (now Istanbul), which had recently been conquered by the Ottoman Turks. Popes Sixtus IV (1471-84) and Julius II (1503-13) further enlarged the library, and under Sixtus V (1585-90) the architect Domenico Fontana erected the library's present building. By the late 20th century the library possessed 65,000 manuscripts (mostly in Latin or Greek) and more than 900,000 printed volumes.

Roman Catholic Church, and an enclave in Rome, situated on the west bank of the Tiber River. Its medieval and Renaissance walls form its boundaries except on the southeast at St. Peter's Square (Piazza San Pietro). Of the six entrances, only three—the Piazza, the Arco delle Campane (Arch of the Bells) in the

eralism, and materialism. Preparations for the council were directed by a central commission and subcommissions, dominated by members of the Curia (papal bureaucracy), and resulted in 51 schemata, or proposed decrees, of which only 6 actually came before the council. Of the approximately 1,050 bishops and others who were eligible to participate, about 700 attended the formal opening on Dec. 8, 1869; a few more eventually appeared. The council,

facade of St. Peter's Basilica, and the entrance to the Vatican Museums in the north wall—are open to the public. Within the walls is a miniature nation. The most imposing building is St. Peter's Basilica, built during the 4th century and rebuilt during the 16th century.

The city has its own telephone system, post office, and radio station, as well as an army of more than 100 Swiss Guards, its own banking system and coinage, stores, and a pharmacy. Almost all supplies—including food, water, electricity, and gas—must be imported. There is no income tax and no restriction on the import or export of funds. Banking organizations and operations and expenditures are veiled in secrecy.

Vatican City's independent sovereignty was recognized by the then Fascist Italian government in the Lateran Treaty of 1929. Sovereignty is exercised by the pope upon his election as the head of the Roman Catholic Church. He has absolute executive, legislative, and judicial powers within the city. The pope appoints the members of the Vatican's governmental organs, which are separate from those of the Holy See. The Papal Commission for Vatican City exercises the papal powers of government; administrative powers are delegated to a governor, who is assisted by a central council.

Cultural life has much declined since the Renaissance, when the popes were among Italy's foremost patrons of the arts. The Vatican Museums, the frescoes by Michelangelo in the Sistine Chapel, the frescoes by Pinturicchio in the Borgia Apartment, and Raphael's Stanze, or rooms, nevertheless attract critics, artists, and flocks of tourists from all over the world. The Vatican Library contains a priceless collection of manuscripts from the pre-Christian and Christian eras. The Vatican publishes its own influential daily newspaper, L'Osservatore Romano, and its press can print books or pamphlets in any language from old Ecclesiastical Georgian to Indian Tamil. Pop. (1978 est.) 729.

Vatican Council, FIRST, 20th ecumenical council of the Roman Catholic Church (1869–70), convoked by Pope Pius IX to deal with contemporary problems. The Pope was referring to the rising influence of rationalism, lib-

which was never formally dissolved, promulgated two doctrinal constitutions: *Dei Filius*, a greatly shortened version of the schema on Catholic faith, which deals with faith, reason, and their interrelations; and *Pastor Aeternus*, which deals with the authority of the pope.

The statement on the pope's authority was approved only after long and heated debate both preceding and during the council. The decree states that the true successor of St. Peter has full and supreme power of jurisdiction over the whole church; that he has the right of free communication with the pastors of the whole church and with their flocks: and that his primacy includes the supreme teaching power to which Jesus Christ added the prerogative of infallibility, whereby the pope is preserved free from error when he teaches definitively that a doctrine concerning faith or morals is to be believed by the whole church. The original schema had not included a statement of papal infallibility, but the majority of the council fathers, urged on by Pius IX, overrode vociferous opposition from those who argued that a formal definition was inopportune and gave their approval to the dogmatic

After the discussion on infallibility, the council fathers were permitted to leave Rome for a few months. Before they could return, the Piedmontese troops occupied Rome. On Oct. 20, 1870, Pius IX suspended the council indefinitely. It had completed only a small fraction of the work planned.

Vatican Council, SECOND, 21st ecumenical council of the Roman Catholic Church (1962-65), announced by Pope John XXIII on Jan. 25, 1959, as a means of spiritual renewal for the church and as an occasion for Christians separated from Rome to join in search for reunion. Preparatory commissions appointed by the Pope prepared an agenda and produced drafts (schemata) of decrees on various topics. In opening the council on Oct. 11, 1962, the Pope advised the council fathers to try to meet the pastoral needs of the church. Those summoned to the council included all Catholic bishops and certain other church dignitaries. Invited to the council sessions, but without the right to vote, were a number of observers from the major Christian churches and communities separated from Rome and a number of Catholics called auditors.

The work of the preparatory commissions had been done by members of the Curia (the papal bureaucracy); once the council had been opened, however, council fathers from diverse parts of the world were added to the commissions. The revised decrees that grew out of the council discussions and the work of the enlarged commissions tended to have a more progressive viewpoint. The work of the council continued under Pope John's successor, Paul VI, and sessions were convened each autumn until the work of the council was completed on Dec. 8, 1965. Sixteen documents were enacted by the council fathers.

The "Dogmatic Constitution on the Church" reflects the attempt of the council fathers to utilize biblical terms rather than juridical categories to describe the church. The treatment of the hierarchical structure of the church counterbalances somewhat the monarchical emphasis of the first Vatican Council's teaching on the papacy by giving weight to the role of the bishops. The teaching of the constitution on the nature of the laity (those not in holy orders) was intended to provide the basis for the call of lay people to holiness and to share in the missionary vocation of the church. By describing the church as the people of God, a pilgrim people, the council fathers provided the theological justification for changing the defensive and inflexible stance that had characterized much of Catholic thought and practice since the Protestant Reformation.

The "Dogmatic Constitution on Divine Revelation" attempts to relate the role of Scripture and tradition (the postbiblical teaching of the church) to their common origin in the Word of God that has been committed to the church. The document affirms the value of Scripture for the salvation of men while maintaining an open attitude toward the scholarly study of the Bible.

study of the Bible.

The "Constitution on the Sacred Liturgy" establishes the principle of greater participation by the laity in the celebration of mass and authorizes significant changes in the texts, forms, and language used in the celebration of mass and the administration of the sacraments.

The "Pastoral Constitution on the Church in the World of Today" acknowledges the profound changes humanity is experiencing and attempts to relate the church's concept of itself and of revelation to the needs and values of contemporary culture.

The council also promulgated decrees (documents on practical questions) on the pastoral duties of bishops, ecumenism, the Eastern-rite churches, the ministry and life of priests, the education for the priesthood, the religious life, the missionary activity of the church, the apostolate of the laity, and the media of social communication. Furthermore, declarations (documents on particular issues) on religious freedom, the church's attitude toward non-Christian religions, and on Christian education were produced. These documents reflected the renewal in various areas of church life begun decades before Pope John-biblical, ecumenical, liturgical, lay apostolate. The impulse of the documents and the council deliberations in general had by the early 1970s been felt in nearly every area of church life and had set in motion many changes that may not have been foreseen by the council fathers.

Vatican Museums and Galleries, art collections of the popes since the beginning of the 15th century, housed in the papal palaces and other buildings in the Vatican. The Pio-Clementino Museum (Museo Pio-Clementino or Musei di Scultura) was founded in the 18th century by Pope Clement XIV and enlarged by Pope Pius VI. This museum exhibits the pontifical collection of ancient sculpture that originated with the col-

lection of Pope Julius II. The Chiaramonti Sculpture Gallery (Museo Chiaramonti), established by Pope Pius VII in the 19th century and designed by the sculptor Antonio Canova, is also devoted to ancient sculpture. It has three parts: the museum, in a gallery designed by Bramante; the New Wing (Braccio Nuovo); and the Gallery of Inscriptions (Lapideria) with its unrivalled collection of ancient epigraphy. The Gregorian Etruscan Museum (Museo Gregoriano Etrusco), founded in 1836 by Pope Gregory XVI (reorganized in 1924), houses a collection of objects from Etruscan excavations and objects from the Regolini-Galassi tomb with its collection of Etruscan jewelry. The Egyptian Museum (Museo Gregoriano Egizio), also founded by Gregory XVI, was opened to the public in 1839. The Pinacoteca, founded by Pope Pius VI in 1797, has been housed in its present gallery (commissioned by Pope Pius XI) since 1932. It has an outstanding collection of Italian religious paintings and also includes Russian and Byzantine painting.

In 1956 a modern art collection was initiated, which exhibits secular works by such 19th- and 20th-century artists as Renoir, Seurat, Van Gogh, Rouault, Matisse, and Picasso. In 1973 the Vatican opened its first museum of contemporary art, including the work of both European and U.S. artists, housed in 65 galleries in the Vatican Palace.

Vatican palace, papal residence in the Vatican north of St. Peter's Basilica. From the 4th century until the Avignonese period (1309–77) the customary residence of the popes was at the Lateran. Pope Symmachus built two episcopal residences in the Vatican, one on either side of the basilica, to be used for brief stays. Charlemagne built the Palatium Caroli on the north of St. Peter's to house his subjects during their visits to Rome. Other buildings added by Leo III and Eugenius III were modernized by Innocent III, who gave them added protection when he built a second fortified wall within that of Leo IV. Nicholas III began the first of the many buildings known today as papal palaces.

In the Renaissance Nicholas V rebuilt the north and west walls of the palace of Nicholas III and founded the Vatican Library (see Biblioteca Apostolica Vaticana), making use of such architects as Leon Battista Alberti and Bernardo Rossellino. He also commissioned Fra Angelico to paint the stories of St. Stephen and St. Lawrence in the Chapel of Nicholas V.

Under commission from Sixtus IV, Giovanni dei Dolci built the Sistine Chapel. He also remodelled and decorated the Vatican Library. The rooms remodelled by Alexander VI are called the Borgia Apartments. Under Julius II, Bramante completed the north facade, two of the so-called *logge* (to which Raphael added a third). Raphael was commissioned to decorate the rooms of the Segnatura and of Heliodorus as well as the loggia overlooking the Courtyard of the Maresciallo.

Among the things built for Paul III were the Sala Regia and the Pauline Chapel, both designed by Antonio da Sangallo the Younger. The painters Giorgio Vasari, Taddeo Zucaro, and Daniele da Volterra decorated the Sala Regia; Michelangelo painted the martyrdom of St. Peter and the conversion of St. Paul in the Pauline Chapel (1542–50). The Casino of Pius IV was the work of Pirro Ligorio and Giovanni Salustio Peruzzi; today this building is the seat of the Pontifical Academy of Sciences. The three chapels of St. Stephen, of St. Peter, and of St. Michael, with paintings by Vasari

and with stuccoes by Guglielmo della Porta. and the chapel of the Swiss Guards, painted by Giulio Mazzoni and Daniele da Volterra, date from the time of Pius V. Gregory XIII (1572-85) was responsible for the wing closing the north side of the present Courtyard of S. Damaso, containing rooms decorated by Antonio Tempestà and Mathys Bril and for the famous Gallery of Maps, designed by Ottaviano Mascherino, with maps of the regions of Italy from designs by Ignazio Danti. The present apartments along the eastern side of the Courtyard of S. Damaso were built in the time of Sixtus V by Domenico Fontana, who also made a new wing for the Vatican Library including the Sala Sistina, thereby cutting the Belvedere Courtyard in half.

In the Baroque period Urban VIII built the Hall of the Countess Matilda, today called the Matilda Chapel, which was decorated by Pietro da Cortona. Under Alexander VII, Bernini built the Scala Regia. In the late 18th and 19th centuries many of the additions and alterations had to do with the development of the Vatican Museum.

Vatnajökull, extensive ice field, southeastern Iceland, covering an area of 3,200 sq mi (8,400 sq km) with an average ice thickness of more than 3,000 ft (900 m). Generally about 5,000 ft above sea level, in the Öræfajökull (Öraefa Glacier) in the south it rises to 6,952 ft (2,119 m) on Hvannadalshnúkur, the highest peak in Iceland. There are numerous active volcanoes throughout the ice field, the meltwaters of which feed hundreds of rivers, the largest of which are the Thjórsá, Skjálfandafljót, Fjöllum, Jökulsá á Dai, and Lagarfljót. Meltwater and moraine deposition at its southern end, aggravated by glacial bursts caused by hot springs under the ice, long prevented road construction on the narrow strip of land between the ice field and the ocean. Thus the coastal road encircling the island was not completed until the mid-1970s.

Periodic eruptions of Grimsvötn, the largest volcano under the ice field, melt the surrounding ice and create a lake that occasionally breaks through its ice walls, causing catastrophic floods called *jökulhlaupav* ("glacier runs"). During the eruptions of 1934 and 1938, the rate of *jökulhlaupa* discharge reached 65,000 cu yd (50,000 cu m) per second. In the 20th century a *jökulhlaupa* has broken out of Vatnajökull roughly every 5 or 10 years.

Vattel, Emmerich de (b. April 25, 1714, Couvet, Neuchâtel, Switz.—d. Dec. 28, 1767, Neuchâtel), Swiss jurist who, in *Le Droit des gens* (1758; "The Law of Nations"), applied a theory of natural law to international relations. His treatise was especially influential in the United States because his principles of liberty and equality coincided with the ideals expressed in the Declaration of Independence. In particular, his defense of neutrality and his rules for commerce between neutral and belligerent states were considered authoritative in the U.S.

Vattel's work was, as he acknowledged, a popularization of *Jus gentium* (1749; "The Law of Nations"), by the German philosopher Christian Wolff. Vattel, however, rejected Wolff's conception of a regulatory world state, substituting national rights and duties proceeding from his own view of the law of nature.

Vättern, English LAKE VÄTTER, lake in south central Sweden, southeast of Vänern between the administrative counties of Skaraborg and Östergötland and north of the traditional province of Småland. With a length of 81 mi (130 km), a breadth of about 19 mi and an area of 738 sq mi (1,912 sq km), it is Sweden's second largest lake, though only one-third the size of Vänern. It has a maximum depth of 420 ft (130 m) and a surface 289 ft above sea level. The lake, known for its dangerous

currents, drains eastward through the Motala Ström into the Baltic Sea.

Vättern is bounded by cliffs to the east and west; there are few harbours and Visingsö (area 9.5 sq mi) is one of the few islands. The region around the lake developed after 1832 with the opening of the Göta Canal, which uses the lake and continues on to Stockholm at Motala, on the northeastern shore. Jönköping, at the southern end, is the largest town on the lake. Tourism is important at Vadstena, on the eastern shore south of Motala, with St. Bridget's Convent (c. 1383); Kloster Kyrkan (Convent Church; 1395–1424), also known as the Blue Church from its bluish-gray limestone; and the 16th-century castle of King Gustav I Vasa. On the western shore, Hjo developed as a spa in the late 18th century and still thrives as a lakeside resort.

Vauban, Sébastien Le Prestre de (b. May 15, 1633, Saint-Léger-de-Foucherest [now Saint-Léger-Vauban], Fr.—d. March 30, 1707, Paris), French military engineer who revolutionized the art of siege craft and defensive

fortifications. He fought in all of France's wars of Louix XIV's reign (1643-1715).

Early career. Vauban was from a family of very modest means that belonged to the petty nobility. In 1651 he became a cadet in the regiment of Louis II de Bourbon, prince de Condé, who was about to rebel against the young Louis XIV.

Vauban's talents were soon revealed. He distinguished himself by defending towns in the Argonne region and in the siege and capture of Sainte-Menehould for Condé. In 1653 he was taken prisoner by the government's forces. Honourably treated, he was soon induced to change sides and to help the royalists to recapture Sainte-Menehould. During a siege in 1654 he was twice wounded. In 1655 he was admitted, as a "king's ordinary engineer," into the corps of officers that was gradually being built up, outside the regular military hierarchy, for specialized work on fortification and siege craft. After taking part in operations against various fortresses and cities between 1655 and 1657, he was engineer in chief at the siege of Gravelines in 1658.

During the interval of peace, from 1659 to 1667, Vauban was employed in demolishing the fortifications of Nancy, in Ducal Lorraine, from 1661 to 1662 and in fortifying Alt-Breisach, a French outpost on the right bank of the Rhine, from 1664 to 1666. In 1663 he was given a company in the King's Picardy regiment. His services in the capture of Tournai, Douai, and Lille in the French invasion of the Spanish Netherlands in 1667 were rewarded with a pension, a lieutenancy

in the Royal Guards, and the governorship of the Lille citadel.

Vauban's growing responsibilities included those as "commissary general of fortifications"—though that title remained with the nominal holder of the office until 1677; he travelled constantly and conducted an immense correspondence with the King and with the war minister, the marquis de Louvois. Vauban's technical memoranda made his systems of fortifications the focus of military studies in Europe for more than a century. In the period of peace from 1668 to 1672 he not only inspected the defenses of Roussillon, the French Low Countries, Picardy, and Lorraine but also was sent to Piedmont (1671) to advise the Duke of Savoy on the defenses of Verrue, Vercelli, and Turin-advice that France later had cause to regret.

Innovations in siege craft. Louis's Dutch war of 1672-79 brought conspicuous glory to Vauban because of the King's presence, in supreme command, at sieges that he was directing. At the siege of Maastricht (1673) he used a complete system of "parallels"i.e., trenches dug parallel or concentric to the perimeter of the defenses and connected by radical zig-zag trenches that made the approach comparatively safe from the defenders' artillery fire. For his success at Maastricht he was promoted and given a grant of money that enabled him to buy the château of Bazoches (near his family's seat of Vauban), and further successes won him the rank of maréchal de camp (equivalent to brigadier general) in 1676. At the siege of Valenciennes, in 1677, he persuaded the King, against the advice of Louvois and five marshals, to authorize a daylight assault, partly because the conventional assault in darkness often resulted in the attackers' shooting at one another by mistake. For the capture of Valenciennes he received another grant of money.

In 1680-81 Vauban undertook another great tour of the French frontiers, inspecting or improving fortifications. For Strasbourg (1681) he designed a splendid fortress of the most advanced kind. Having directed the siege of Luxembourg in 1684, he subsequently also redesigned the defenses of that city. His design for the fortification of Landau in Bavaria is sometimes reckoned as his greatest work (1687).

In September 1688, early in the War of the Grand Alliance, in which Louis was opposed by the combined forces of the Netherlands, England, the Holy Roman Empire, and their lesser allies, Vauban was promoted to lieutenant general; and in October, under the command of the dauphin Louis, he took Philippsburg, on the right bank of the Rhine south of Speyer. At this siege he introduced ricochet gunfire, whereby a cannonball was made to bounce forward over parapets and to hit several objectives before its force was spent. At the same time he was advocating use of the socket bayonet, another invention of his. This bayonet was slipped over the muzzle into a socket and did not have to be removed before firing of the musket. He took Mons in 1691 and Namur, rapidly and with few casualties, in 1692. At the siege of Charleroi, in 1693, he was for the first time in command of an infantry division. Diverted to Brest in 1694 to guard against an English threat to Brittany, he returned to the Low Countries for the defense of Namur in 1695 but could not save the city. In 1697 he participated in the siege and capture of Ath and was wounded again.

During the peace of 1698–1701 Vauban reconstructed the defenses of Neuf-Brisach in Alsace, the last of the 160 fortresses on which he worked. By this time his health was failing him, but he still wanted active employment in the War of the Spanish Succession (1701–14).

In a letter of 1702 to the King, he asked to be created a marshal of France so as to avoid the embarrassment of having to serve under marshals junior to himself. Louis XIV, knowing (as all Europe did) that many of France's victories were due far more to his discerning patronage of the petty gentleman Vauban than to the performances of higher nobles whose birth alone had hastened their appointment as marshals, created Vauban marshal of France in January 1703. Vauban had, however, never commaded an army in the field—as was customary for marshals of France-and was only really capable of "engineering," which was considered beneath a marshal's dignity. After directing operations for the recapture of Alt-Breisach (1703), he was recalled from service. In 1705 and again in 1706 he offered to help an incompetent general in the siege of Turin, whose fortification he had himself planned, but the offer was rejected. Vauban's last effective commission was to organize an entrenched camp at Dunkerque (1706)

Writings. Vauban was indefatigable. He devoted his time between duties and in convalescence to writing assiduously on matters of public concern. Some of these writings concerned his profession, others were external to it; many were assembled by him in manuscript volumes under the collective title of Oisivetés "Leisures"). His treatises De l'attaque et de la défense des places ("On Siege and Forti-fication"), written in 1705-06, were printed in 1737 and reprinted in 1829 (several interpretations of his systems of fortifications had been published in his lifetime). He wrote also on the expediency of recalling the banished Huguenots to France (1689); on routes for canals and inland navigation; on privateering at sea; on the geography of the Vézelay district; on forestry and pig breeding; on overseas colonies; and on international affairs, with regard to the concessions that could be made, strategically and politically, for a satisfactory peace (1706). His most important "leisure, however, was his Projet d'une dixme royale (printed anonymously, 1707; Project for a Royal Tythe, or General Tax), suggesting the abolition of nearly all France's existing taxes and the substitution of a tax of 10 percent on all land and trade from which no one should be exempt. He substantiated his arguments with a mass of statistical documentation practically unprecedented and, in so doing, pioneered the use of statistics in economics. But the French government-too deeply committed to the system of tax farming (i.e., selling the right to collect taxes to groups of financiers for a fixed sum), reluctant and even unable to revoke the exemptions of the privileged classes because of dependence on them, and lacking interest in fundamental reforms—suppressed the publication of his book. Vauban was crushed by this rebuff, but the story that his book made Louis XIV forget his past services is untrue.

Personality. Vauban was of medium height, squarely and solidly built. Although he was unpretentious and straightforward, his martial appearance and unpolished manners disguised his kindness and his truly considerate readiness to help people. On the battlefront, he was always concerned to save soldiers' lives, and he often let other officers take the credit for the fruit of his own courageous efforts. The Duc de Saint-Simon, the outstanding memorialist of the reign of Louis XIV, who never squandered praise, described Vauban as "the most honourable and virtuous man of his age . . . incapable of lending himself to anything false or evil."

BIBLIOGRAPHY. The most comprehensive monograph is P. Lazard, Vauban, 1633–1707 (1934), well illustrated and covering the development of France's corps of military engineers from its origins to Vauban's time. There is also a shorter life, in French, by A. Rebelliau, Vauban (1962). English readers may consult Sir Reginald Theodore Blomfield, Sebastien le Prestre de Vauban, 1633–

Vaucanson, Jacques de (b. Feb. 24, 1709, Grenoble, Fr.—d. Nov. 21, 1782, Paris), prolific inventor of robot devices of significance for modern industry.

Educated at the Jesuit College of Grenoble, Vaucanson developed a liking for machinery at an early age, first in Lyon and later in Paris. In 1738 he constructed an automaton, "The Flute Player," followed the next year by "The Tambourine Player" and "The Duck." The last was especially noteworthy, not only imitating the motions of a live duck, but also the motions of drinking, eating, and "digesting." Appointed inspector of silk manufacture in 1741, Vaucanson's attention was drawn to the problems of mechanization of silk weaving. Several of his improvements were adopted by the industry, but his most important invention was ignored for several decades. Taking into account the inventions of his predecessors, he succeeded in automating the loom by means of perforated cards that guided hooks connected to the warp yarns. Power was to be supplied by falling water or by animals. After Vaucanson's death, his loom was reconstructed and improved by J.-M. Jacquard and became one of the most important inventions of the Industrial Revolution.

To build his machines, Vaucanson invented many machine tools of permanent importance. Toward the end of his life, he collected his own and others' inventions in what became in 1794 the Conservatoire des Arts et Métiers (Conservatory of Arts and Trades) in Paris; it was there that Jacquard found his automatic loom.

Vaucheria, genus of yellow-green algae characterized by oil food reserves and multinucleate tubular branches lacking cross walls except in association with reproductive organs or an injury. Asexual reproduction is by motile zoospores and nonmotile aplanospores; sexual reproduction also occurs. The spherical female sex organ (oogonium) and the slender hook-shaped male sex organ (antheridium) are usually produced on branches close to each other. After the nonmotile egg is fertilized by a biflagellate sperm, the zygote may enter a resting phase for several weeks before germinating into a new plant. Although most species occur in fresh water or are terrestrial, some are marine and others live in ice.

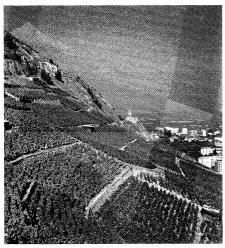

Vaucluse, département in Provence-Alpes-Côte-d'Azur region, southeastern France, created in 1793 from the Comtat Venaissin (a papal possession in Provence), the principality of Orange, and a part of Provence (q.v.). It is bounded west by the Rhône River and south by the Durance River, below which the Bouches-du-Rhône département extends southward to the Mediterranean. The northern boundary runs eastward from a point on the Rhône about 15 mi (25 km) northwest of Orange; just above the border, northwest of Vaison-la-Romaine, the canton of Valréas, a small exclave of Vaucluse, is surrounded by the Drôme département. With its exclave the Vaucluse département has an area of 1,377 sq mi (3,566 sq km).

The western part consists of the lowlands of the Rhône Valley, which are crossed by streams from the Pre-Alpes, including the Aigues, Ouvèze, Nesque, and Sorgue. The west-east blocks of limestone mountains that occupy the eastern part rise steeply from the plain. The northern range to the east of Orange culminates in the majestic Mont Ventoux, (6,263 ft [1,909 m]), the highest point in the département. At the west end of the Plateau de Vaucluse, south of Mont Ventoux, Fontaine-de-Vaucluse, famous for its association with the 14th-century Italian poet Petrarch, the Sorgue River issues from underground in the form of a resurgent spring. The

Lubéron mountain chain, extending west-east above the Durance Valley for 25 mi, culminates at a height of 3,691 ft (1,125 m) in the Grand Lubéron.

The mountains are snowy in winter and parched in summer. In the Rhône plain the climate is mild and sunny although in winter the mistral wind brings sudden cold spells. The plain is extensively watered by irrigation channels, some of which date back to the Middle Ages. Fodder crops, vegetables, and fruit are intensively grown. Melons are a speciality of Cavaillon, and the vineyards of the Côtes-du-Rhône are renowned for such wines as Châteauneuf-du-Pape. The great multipurpose Donzère-Mondragon scheme, harnessing the Rhône for power, irrigation, and navigation, lies partly within the département. Industry includes canning and the production of fertilizers. Avignon and Orange are centres of tourism. Vaison-la-Romaine has considerable Gallo-Roman ruins. The département has three arrondissements: Avignon, Apt, and Carpentras. Vaucluse is in the educational division of Aix-en-Provence. Pop. (1982) 427,-343.

Vaud (French), German WAADT, canton, southwestern Switzerland, bordering France and the Jura Mountains to the west and Lake Geneva (Lac Léman) to the south. It has an area of 1,243 sq mi (3,219 sq km). In the west

it extends a short way along the shores of Lake Neuchâtel, with a long narrow eastern tongue stretching past Payerne. The Avenches region, a few miles beyond, forms an enclave in Fribourg canton, parts of which, in turn, form enclaves in Vaud. The canton's southeastern part, north and east of the Rhône River, is Alpine, containing Les Diablerets (10,531 ft [3,210 m]), its highest summit, and more than 4 sq mi of glaciers. The central area is hilly and morainic with plains along the lakes.

Vaud was first inhabited in prehistoric times by the lake dwellers and then by the Celtic Helvetii, who while attempting to migrate south were defeated by Julius Caesar in 58 BC. The establishment of Viviscus (Vevey), Lausonium or Lausonna (Lausanne), and other Roman towns followed; in 27 BC the state Civitas Helvetiorum was created, with its capital at Aventicum (Avenches), where important Roman remains have been excavated. There were frequent Alemannic incursions in the 2nd-4th century, and the Burgundians occupied the area in the 5th century, followed by the Merovingian Franks. In 888 the Carolingians made the region part of Jurane Burgundy until 1032. The German Zähringen overlords, who had defeated the rebellious Burgundians, were succeeded in 1218 by the counts of Savoy, who gave political unity to

Vaud. The power of Savoy declined in the 15th century and Vaud was overrun by the Bernese, who finally annexed it in 1536 and imposed the Reformation by force. Discontented with Bernese rule, the Vaudois enthusiastically received the French Revolutionary troops in 1798 and proclaimed first the "Lemanic Republic" and, shortly thereafter, the canton of Léman. The present canton of Vaud was set up and joined the Swiss Confederation in 1803; a popular liberal constitution was achieved in 1831 (modified and revised in 1845, 1861, and 1885). In the 19th century, Vaud joined the anti-Jesuit movement, opposed the Sonderbund (separatist league of Catholic cantons), and accepted the new constitution of 1848 for a Swiss federal state.

The population is mainly French speaking and mostly Protestant. Lausanne (q.v.), the capital, is the only major city. Vaud is the greatest wine producer in Switzerland (mainly white wines), with vineyards and wineries primarily along Lake Geneva. Wheat is widely grown. Sugar beets are cultivated at Orbe, tobacco in La Broye Valley, and fruit at the foot of the Jura. Pasture and livestock raising are common in the Alps. Limestone and sandstone are quarried in the Jura and salt is mined at Bex. Although Vaud is not widely industrial, many towns specialize in certain products such as watches, various metal items and instruments, chocolate, cigars, and biscuits. The most important activity, however, is tourism, based on lakeside resorts such as Montreux, Vevey, and Lausanne and numerous mountain resorts. Road and rail communications are highly developed. Pop. (1983 est.) 532,589.

vaudeville, light entertainment popular in the United States from the mid-1890s until the early 1930s that consisted of 10 to 15 individual unrelated acts, featuring magicians, acrobats, comedians, trained animals, jugglers, singers, and dancers. It is the counterpart of the music hall and variety in England. The term is probably a corruption of vaux-de-vire, satirical songs in couplets, sung to popular airs in the 15th century in the Val-de-Vire (Vau-de-Vire), Normandy, France. It passed into theatrical usage in the early 18th century to describe a device employed by professional actors to circumvent the dramatic monopoly held by the Comédie-Française. Forbidden to perform legitimate drama, they presented their plays in pantomime, interpreting the action with lyrics and choruses set to popular tunes. It eventually developed into a form of light musical drama, with spoken dialogue interspersed with songs, that was popular throughout Europe.

In the United States the development of variety entertainment was encouraged in frontier settlements as well as in the widely scattered urban centres. In the 1850s and 1860s straight variety grew in popular favour. Held in beer halls, the coarse and sometimes obscene shows were aimed toward a primarily male audience.

Tony Pastor, a ballad and minstrel singer, is credited both with giving the first performance of what came to be called vaudeville by the late 19th century and with making it respectable. In 1881 he established a theatre in New York City dedicated to the "straight, clean variety show." His unexpected success encouraged other managers to follow his example. By the 1890s vaudeville was family entertainment and exhibited high standards of performance.

Many future stars were developed under the vaudeville system—e.g., W.C. Fields, juggler and comedian; Will Rogers, cowboy and comic; the famous "American Beauty," Lillian Russell; Charlie Case, monologuist; and Joe Jackson, pantomimist. European music hall artists such as Sir Henry Lauder, Albert Chevalier, and Yvette Guilbert also appeared in vaudeville in the United States.

By the end of the 19th century the era of the vaudeville chain, a group of houses controlled by a single manager, was firmly established. The largest chains were United Booking Office, with 400 theatres in the East and Midwest, and Martin Beck's Orpheum Circuit, which controlled houses from Chicago to California. Beck also built the Palace Theatre in New York, which from 1913 to 1932 was the outstanding vaudeville house in the United States. In 1896 motion pictures were introduced into vaudeville shows as added attractions and to clear the house between shows. They gradually preempted more and more performing time until, after the advent of the "talkies" about 1927, the customary bill featured a full-length motion picture with "added acts" of vaudeville. The great financial depression of the 1930s and the growth of ra-dio and later of television contributed to the rapid decline of vaudeville and to its virtual disappearance after World War II.

Vaugelas, Claude Favre, seigneur de (lord of), BARON DE PÉROUGES (b. Jan. 6, 1585, Meximieux, Fr.—d. February 1650, Paris), French grammarian and an original member of the Académie Française who played a major role in standardizing the French language of literature and of polite society. A courtier, he was a habitué of the salon of the Marquise de Rambouillet, where his taste and judgment in questions of speech and writing earned the respect of men of letters.

In his Remarques sur la langue françoise, utiles à ceux qui veulent bien parler et bien escrire (1647; "Remarks on the French Language, Useful for Those Who Wish to Speak Well and Write Well"), Vaugelas recorded what he considered good usage: the speech of the "soundest" elements of the court and the written language of the most intelligent authors. His contemporaries soon accepted his decisions as authoritative in cases of doubtful or conflicting usage; parler Vaugelas meant to speak not merely correctly but elegantly, and the Remarques became la bible de l'usage.

Vaugelas was sensible enough to realize that good usage changed with changes of interest in society. But when Richelieu took over his literary discussion group of nine to form the Académie Française, he instructed them to create firm rules for the language and to render it pure and eloquent. Vaugelas' dicta were then taken too literally. The rigidity imposed by the Académie was resisted by authors in the second half of the 17th century, and, even some of Vaugelas' contemporaries, not content with the formal language of the court, spiced their writing with language of the common people. Ultimately, however, the Académie eliminated the excesses of Renaissance diction and set a standard of literary taste.

Vaughan, Henry (b. April 17, 1622, Llansantffraed, Breconshire, Wales—d. April

23, 1695, Llansantffraed), Anglo-Welsh poet and mystic remarkable for the range and intensity of his spiritual intuitions.

Educated at Oxford and studying law in London, Vaughan was recalled home in 1642 when the first Civil War broke out, and he remained there the rest of his life.

In 1646 his Poems, with the Tenth Satyre of Juvenal Englished was published, followed by a second volume in 1647. Meanwhile he had been "converted" by reading the religious poet George Herbert and gave up "idle verse." His Silex Scintillans (1650; "The Glittering Flint," enlarged 1655) and the prose Mount of Olives: or, Solitary Devotions (1652) show the depth of his religious convictions and the authenticity of his poetic genius. Two more volumes of secular verse were published, ostensibly without his sanction; but it is his religious verse that has lived. He also translated short moral and religious works and two medical works in prose. At some time in the 1650s he began to practice medicine and continued to do so throughout his life.

Though Vaughan borrowed phrases from Herbert and other writers and wrote poems with the same titles as Herbert's, he was one of the most original poets of his day. Chiefly he had a gift of spiritual vision or imagination that enabled him to write freshly and convincingly, as is illustrated in the opening of "The World".

I saw Eternity the other night Like a Great Ring of pure and endless light

He was equally gifted in writing about nature, holding the old view that every flower enjoys the air it breathes and that even sticks and stones share man's expectation of resurrection. The Romantic poet William Wordsworth may have been influenced by Vaughan.

Vaughan's poetry was largely disregarded in his own day and for a century after his death. He shared in the revival of interest in 17th-century metaphysical poets in the 20th century. The standard edition is *Works* (1914; 2nd ed., 1957), edited by L.C. Martin.

Vaughan, Sarah (Lois), byname sassy, or THE DIVINE ONE (b. March 27, 1924, Newark, N.J., U.S.—d. April 3, 1990, Hidden Hills, Calif.), American jazz vocalist and pianist known for her rich voice, with an unusually wide range, and for the inventiveness and virtuosity of her improvisations. Among her bestknown songs were "It's Magic," "Make Yourself Comfortable," "Broken-Hearted Melody," "Misty," and "Send in the Clowns."

Vaughan was born to musical parents, a carpenter father who played guitar and a laundress mother who sang in a local Newark Baptist choir. Vaughan herself sang in the church choir as a child and also took piano

lessons throughout the 1930s and studied the organ. In October 1942 she won a talent contest at the Apollo Theater in New York City, singing "Body and Soul." On the recommendation of singer Billy Eckstine, she joined Earl Hines's big band in 1943 as vocalist and second pianist. When Eckstine formed his own band the following year, Vaughan made her first recordings with the group. Both Hines's and Eckstine's bands included musicians who went on to develop bebop, and from the beginning of her career Vaughan was associated with this new jazz. Beginning in 1945 Vaughan performed as a soloist, often with her own trio but also with other jazz groups and bands as well as with symphony orchestras. She toured throughout the world and recorded extensively, and she came to be regarded as one of the greatest of all jazz singers

Vaughan Williams, Ralph (b. Oct. 12, 1872, Down Ampney, Gloucestershire, Eng.—d. Aug. 26, 1958, London), English composer of the first half of the 20th century, founder of the nationalist movement in English music.

Vaughan Williams studied at Trinity College, Cambridge, and in London at the Royal College of Music under two major figures of the late 19th-century renaissance of English music, Sir Charles Stanford and Sir Hubert Parry. In 1897–98 he studied in Berlin under the noted composer Max Bruch and in 1909 in Paris under Maurice Ravel. About 1903 he began to collect folk songs, and in 1904–06 he was musical editor of *The English Hymal*, for which he wrote his celebrated "Sine Nomine" ("For All the Saints"). After artillery service in World War I, he became professor of composition at the Royal College of Music.

His studies of English folk song and his interest in English music of the Tudor period fertilized his talent, enabling him to incorporate modal elements (i.e., based on folk song and medieval scales) and rhythmic freedom into a musical style at once highly personal and deeply English.

Vaughan Williams' compositions include orchestral, stage, chamber, and vocal works. His three Norfolk Rhapsodies (numbers 2 and 3 later withdrawn), notably the first in E minor (first performed, 1906), were the first works to show his assimilation of folk song contours into a distinctive melodic and harmonic style. His nine symphonies cover a vast expressive range. Especially popular are the second, A London Symphony (1914; rewritten 1915; rev. 1918, 1920, 1934), and the seventh, Sinfonia Antarctica (1953), an adaptation of his music for the film Scott of the Antarctic (1949). Other orchestral works include the Fantasia on a Theme by Thomas Tallis (1910); concerti for piano (later arranged for two pianos and orchestra), oboe, and tuba; and the Romance for harmonica and orchestra (1952).

Of his stage works, The Pilgrim's Progress (1951) and Job (1931), a masque for dancing, reflect his serious, mystical side. Hugh the

Drover (1924), a ballad opera, stems from his folk song interest. Riders to the Sea (1937) is a poignant setting of John Millington Synge's

He wrote many songs of great beauty, including On Wenlock Edge (1909), set to poems of A.E. Housman and consisting of a cycle for tenor, string quartet, and piano (later arranged for tenor and orchestra) and Five Mystical Songs (1911), set to poems of George Herbert. Particularly notable among his choral works are the Mass in G Minor, the cantatas Toward the Unknown Region (1907) and Dona Nobis Pacem (1936; Grant Us Peace), and the oratorio Sancta Civitas (1926; The Holy City). He also wrote many part-songs, as well as hymn and folk-song settings.

Vaughan Williams broke the ties with continental Europe that for two centuries through George Frideric Handel, Felix Mendelssohn, and lesser German composers had made Britain virtually a musical province of Germany. Although his predecessors in the English musical renascence, Sir Edward Elgar, Sir Hubert Parry, and Sir Charles Stanford, remained within the continental tradition, Vaughan Williams, like such nationalist composers as the Russian Modest Mussorgsky, the Czech Bedřich Smetana, and the Spanish Manuel de Falla, turned to folk song as a wellspring of native musical style.

vault, in building construction, a structural member consisting of an arrangement of arches, usually forming a ceiling or roof.

The basic barrel form, which appeared first in ancient Egypt and the Middle East, is in effect a continuous series of arches deep enough to cover a three-dimensional space. It exerts the same kind of thrust as the circular arch and must be buttressed along its entire length by heavy walls with limited openings.

Roman architects discovered that two barrel vaults that intersected at right angles formed a groin vault which, when repeated in series, could span rectangular areas of unlimited

Vault, showing groin construction

length. Because the groin vault's thrusts are concentrated at the four corners, its supporting walls need not be massive and require buttressing only where they support the vault. The groin vault, however, requires great precision in stone cutting, an art that declined in the West with the fall of Rome. Vaulting was continued and improved in the Byzantine Empire and in the Islāmic world.

Medieval European builders developed a modification, the rib vault, a skeleton of arches or ribs on which the masonry could be laid. The medieval mason used pointed arches; unlike round arches, these could be raised as high over a short span as over a long one. To cover rectangular areas, the mason used two intersecting vaults of different widths but of the same height.

Using 19th-century materials, builders could construct large iron skeletons as frameworks for vaults of lightweight materials-for example, the glass-vaulted Crystal Palace of the 1851 Exhibition in London. Because the new materials eliminated weight and thrust problems, the simple barrel vault returned to favour for such structures as railroad terminals and exhibition halls. In many modern frame systems the vault has lost its functional significance and become a thin skin laid over a series of arches. The reinforced-concrete shell vault, a bent or molded slab, is one of the most important innovations. The steel-reinforced shell exerts no lateral thrust and may be supported as if it were a beam.

vaulting, gymnastic exercise in which the athlete leaps over a cylindrical form similar to the side horse (q.v.) except that the pommels are removed. In men's vaulting, also called longhorse vaulting, the horse is placed lengthwise. The height of the horse is raised to 1.35 m (48.7 inches). A Reuther board, a special type of springboard developed in Germany, is placed in front of the near end of the horse. The gymnast takes a run, gathers momentum as he nears the horse, rebounds off the Reuther board, and, supporting his hands on the horse, vaults over it. A variety of tricks may be performed, such as vaulting over with straddled legs, with legs together and bent into a squatting position, or with legs straight and the hips bent, as well as handsprings, cartwheels, and other more difficult movements. The hands may be placed on either the near or the far end of the horse, but the space for the support of the hands is limited, and touching beyond this space incurs a penalty on the scoring of

the vault. Each vault is evaluated according to a table of standards of difficulty.

The women's vaulting horse is the same as the men's except that it is 1.1 m (43 inches) high and is placed sideways instead of lengthwise. Women also use the Reuther board and perform vaults similar to those done by men, except that the vault is much shorter, since it is performed over the width of the horse rather than its length. For both men's and women's champions, see Sporting Record: Gymnastics. See also Olympic Games.

Vaupés, comisaría ("commissariat"), southeastern Colombia, bounded by Guainía comisaría (north), Brazil (east), the Apoporis River (south), and Guaviare comisaría (west). Created in 1963, its area was reduced in 1977 when Guaviare comisaría was established. It now occupies an area of 25,200 square miles (65,268 square km) of mostly tropical, evergreen rain forests. Vaupés is drained by tributaries of both the Amazon and Orinoco river systems, including the Vaupés, Taraira, Apoporis, and Papunava.

The principal economic activities of Vaupés are subsistence agriculture, fishing, forestry, and the collection and preparation of plants for medicinal and traditional purposes. A significant portion of the sparse population of Vaupés lives in and around Mitú, the *cabecera* (county seat). The local population is largely indigenous Indian tribes who reside on *minifundias* (small farms) and speak many different Indian dialects or languages, as well as Spanish. Transportation infrastructure is very poor; access is by river or air. Pop. (1985) 18,935.

Vauquelin, Nicolas-Louis (b. May 16, 1763, Saint-André-d'Hébertot, Fr.—d. Nov. 14, 1829, Saint-André-d'Hébertot), French chemist who discovered the elements chromium (1797) and beryllium (1798).

Vauquelin, lithograph by François-Séraphin Delpech

A peasant's son, Vauquelin went to work in an apothecary shop, where he was befriended by Antoine-François Fourcroy, who made him his laboratory assistant (1783–91). He began publishing on his own authority in 1790 and was associated with 376 scientific papers. His teaching and consultative posts date from 1795. In 1809 he succeeded Fourcroy as chemistry professor to the medical school at Paris.

Vauquelin's other chemical discoveries included quinic acid, asparagine (the first amino acid to be isolated), camphoric acid, and other naturally occurring compounds. In 1827 he was elected to the Chamber of Deputies. Vauquelin is also remembered as the sponsor of Louis-Jacques Thenard, another peasant's son who became a famous chemist.

Vauvenargues, Luc de Clapiers, marquis **de** (marquess of) (b. Aug. 6, 1715, Aix-en-Provence, Fr.—d. May 28, 1747, Paris), French moralist and essayist whose belief in the individual's capacity for goodness played a part in the shift of opinion away from the pessimistic view of human nature elaborated by such 17th-century thinkers as Blaise Pascal and the Duke de La Rochefoucauld. He shared with others of his time a renewed respect for the emotions, thus prefiguring Jean-Jacques Rousseau. He stood out in his day, however, for his exaltation of action, through which he believed man achieved fulfillment and dignity. In this he anticipated the novelist Stendhal. The hero, he believed, is one who is impelled by strong passions to win renown through the performance of great deeds-preferably (but not necessarily) those contributing to the wellbeing of humanity.

Vauvenargues first sought his own fulfillment in military glory, joining the army and serving in the wars of the Polish (1733-39) and Austrian (1740-48) successions. In 1745, disappointed by the army and broken in health, Vauvenargues reluctantly turned to literature as a way to achieve fame. The rest of his life was spent in Paris in poverty. Among his few friends were Jean-François Marmontel, secretary of the French Academy, and Voltaire. He published one moderately successful book, which grew in esteem with time, Introduction à la connaissance de l'esprit humain, suivie de réflexions et de maximes (1746; duction to an Understanding of the Human Mind, Followed by Reflections and Maxims"). It consisted of the title essay and some 700 maxims, aphorisms, and reflections.

He appears to have been a Deist in the Voltairian manner, although he opposed Voltaire in the value that he attributed to the nonrational and emotional experience. Despite their divergent viewpoints, Voltaire proclaimed the *Maximes* as possibly one of the best books in the French language.

Vaux (of Harrowden), Thomas Vaux, 2nd Baron (b. 1510—d. October 1556), one of the early English Tudor poets associated with Sir Thomas Wyat and the Earl of Surrey.

Vaux accompanied the lord chancellor Thomas Cardinal Wolsey, on his embassy to France in 1527 and attended King Henry VIII to Calais and Boulogne in 1532. Created a Knight of the Bath at the coronation of Anne Boleyn (1533), he was captain of the Isle of Jersey until 1536.

Vaux's two best-known poems, included in Tottel's *Miscellany* (1557), are "The aged lover renounceth love" and "The assault of Cupide upon the fort where the lovers hart

lay wounded, and how he was taken." The *Paradyse of daynty devises* (1576) contains 13 poems signed by him.

Vaux-le-Vicomte, château near Melun, Fr., designed in 1656 by Louis Le Vau for Nicolas Fouquet, finance minister to Louis XIV. The château, finished in 1661, is considered to be one of the masterpieces of French Baroque residential architecture.

The garden, designed by André Le Nôtre, was the prototype of the gardens that Le Nôtre later designed for Louis XIV at Versailles. Many critics, however, prefer the ingenuity of Vaux-le-Vicomte to the repetition of Versailles.

Vauxhall, neighbourhood in the borough of Lambeth, Greater London, England, on the south bank of the River Thames near Vauxhall Bridge. Public gardens were laid out about 1661 and were a favourite resort of the metropolis from the 17th century, during the time of the diarists Samuel Pepys and John Evelyn, to the early 19th century, during the time of the Prince Regent, later King George IV. By 1859 the increasing urbanization of London caused the gardens to be closed and the site built over.

coral and the other volcanic. To the east lie uplifted coral islands, including Vava'u Island, the largest (35 sq mi) of the group, rising to 670 ft (200 m). The smaller western volcanic chain is generally wooded and includes Late (6 sq mi), dormant since 1854 and rising to 1,700 ft, the group's highest point. Fonualei, an island 40 mi (64 km) northwest of Vava'u with an active volcano rising to 600 ft, was discovered in 1781 by the Spaniard Francisco Antonio Mourelle, who named it Amargura (Spanish for "bitterness") because of his disappointment at being able to obtain neither food nor fresh water.

Vava'u Island has a fine sheltered harbour and several unique coastal caves. It is the site of Neiafu, the group's administrative head-quarters. Its fertile soil yields corn (maize), breadfruit, yams, and copra, the last for export. An airfield at Lupepau'u serves the island. Pop. (1981 est.) 16,400.

Vavilov, Nikolay Ivanovich (b. Nov. 25 [Nov. 13, old style], 1887, Moscow—d. Jan. 26, 1943, Saratov, Russian S.F.S.R.), Soviet plant geneticist whose research into the origins of cultivated plants incurred the animosity of T.D. Lysenko, official spokesman for Soviet biology in his time.

Vavilov studied under William Bateson, founder of the science of genetics, at the University of Cambridge and the John Innes Hor-

ticultural Institution in London (1913-14). Returning to Russia, he served as professor of botany at the University of Saratov (1917-21) and as director of the Bureau of Applied Botany, Petrograd (now Leningrad). As head of the All-Union V.I. Lenin Academy of Agricultural Sciences, he established 400 research institutes throughout the country. From 1916 to 1933 he made expeditions to many parts of the world, including Iran, Afghanistan, Ethiopia, China, and Central and South America, amassing an immense collection of plants. He brought to the Soviet Union, for further study and breeding, samples of 50,000 varieties of wild plants and 31,000 wheat specimens.

Observations made during Vavilov's worldwide studies led him to postulate that a cultivated plant's centre of origin would be found in the region in which wild relatives of the plant showed maximum adaptiveness. These conclusions were summarized in *The Origin, Variation, Immunity and Breeding of Cultivated Plants* (Eng. trans. by K.S. Chester, 1951). In 1920 he expanded the theory, stating that the region of greatest diversity of a species of plant represents its centre of origin. He eventually proposed 13 world centres of plant origin.

Widely heralded as one of the greatest contributors to the study of botanical populations, Vavilov was publicly denounced by Lysenko at several successive plant-breeding congresses (1934–39) as a purveyor of "Mendelist-Mor-

ganist genetics." His reputation in his own country was destroyed, and he was arrested in 1940 and eventually imprisoned at a concentration camp at Saratov.

Växjö, city and capital of the administrative *län* (county) of Kronoberg, southern Sweden, on Växjösjön (lake). The city was a medieval trading centre; it was burned several times by the Danes, and most of the present buildings were built after 1843. Today Växjö is a railway junction and a manufacturing centre producing matches, furniture, and paper.

Växjö has a cathedral and is the seat of a Lutheran bishopric. In 1716 the botanist Carolus Linnaeus studied at the cathedral school. Near the cathedral is a monument to Esaias Tegnér, the poet, who was bishop of Växjö from 1824 to 1846. The Småland Museum (1867) contains fine displays of glassware and textiles. Pop. (1984 est.) 65,859.

Vazov, Ivan (Minchov) (b. June 27, 1850, Sopot, Bulg.—d. Sept. 22, 1921, Sofia), man of letters whose poems, short stories, novels, and plays are inspired by patriotism and love of the Bulgarian countryside and reflect the main events in his country's history.

Vazov was educated at Sopot and in Plovdiv; he then taught for a time in the provinces. His father sent him to study commerce in Romania, where contact with the émigré leaders of the Bulgarian revolutionary movement led him to resolve to devote his life to the national cause as well as to literature. After the liberation of Bulgaria from the Turks (1878), Vazov was a civil servant and a district judge. In 1880 he settled in Plovdiv, where he edited several newspapers and periodicals. During the anti-Russian regime of Stefan Stambolov, Vazov went into exile in Odessa (1886-89), where he began his greatest novel, Pod igoto (1894; Under the Yoke, 1894), a chronicle of the trials of the Bulgarians under Ottoman rule. After Stambolov's fall (1894), Vazov was elected to the assembly and during 1898-99 served as minister of education.

His other works include the epic cycle of poems Epopeya na zabravenite (pub. 1881–84; "Epic to the Forgotten"); the novella Nemilinedragi (1883; "Unloved and Unwanted"); the novels Nova Zemya (1896; "New Land"), Kazalarskata Tsaritsa (1903), and Svetoslav Terter (1907); and the plays Hashove (1894), Kam propast (1910; "Toward the Abyss"), and Borislav (1910).

veal, meat of calves slaughtered between 3 and 14 weeks, delicate in flavour, pale grayish white in colour, firm and fine-grained, with velvety texture. It has no marbling, and the small amount of fat covering is firm and white. In modern livestock farming, calves bred to yield high-quality veal are raised indoors under controlled temperatures (60°-65° F [16°-18° C]) and intensively fed on milk, high-protein calf meal, or both. Herbaceous foods are excluded, resulting in an iron deficiency producing the desirable light colour in the meat. Although the meat of an animal from 15 weeks to one year is technically called calf, it is frequently marketed as veal.

Wholesale cuts, usually smaller than comparable beef cuts, vary in different countries. Because of its high amount of connective tissue and low fat content, large cuts of veal require long, slow cooking. Fat in the form of lard or salt pork may be added to avoid dryness. Veal is often served rare in European countries but is usually thoroughly cooked in the U.S. Cuts such as the leg, loin, shoulder, and breast are usually roasted, often boned and stuffed, or braised. Schnitzel, pan-fried cutlets coated

with bread crumbs, are a specialty of Germany and Austria. Scallops, small thin slices—called scallopine in Italy and escalopes or médaillons in France—may be cooked in wine or other sauces.

Veblen, Oswald (b. June 24, 1880, Decorah, Iowa, U.S.—d. Aug. 10, 1960, Brooklin, Maine), U.S. mathematician who made important contributions to differential geometry and early topology. Many of his contributions found application to atomic physics and relativity.

Veblen taught mathematics at Princeton University (1905–32) and was appointed professor at the Institute for Advanced Study, Princeton, N.J., in 1932. He became professor emeritus in 1950.

Veblen's work on the axiom systems of projective geometry came about because of his great interest in the foundations of geometry. John Wesley Young collaborated with him on the first volume of *Projective Geometry*, 2 vol. (1910–18; 1965).

The first book to systematically cover the basic ideas of topology was Veblen's *Analysis Situs* (1922), his most influential work and for many years the best available topology text. He also laid the foundations of the Princeton school of topological research.

Soon after the discovery of general relativity. Veblen turned to differential geometry and took a leading part in the development of generalized affine and projective geometry. His work, The Invariants of Quadratic Differential Forms (1927), is distinguished by precise and systematic treatment of the basic properties of Riemann geometry. In collaboration with his brilliant student J.H.C. Whitehead, Veblen extended the knowledge of the Riemann metric for more general cases in The Foundations of Differential Geometry (1932). This work provided a clear definition of a differentiable manifold (in the large) and inspired others to refine the definition, the refined definition being basic to modern geometrical research.

Veblen's belief that "the foundations of geometry must be studied both as a branch of physics and as a branch of mathematics" quite naturally led him to the study of relativity and the search for a geometric structure to form a field theory unifying gravitation and electromagnetism. With respect to the Kaluza-Klein field theory, which involved field equations in five-dimensional space, he provided the first physical interpretation of the fifth coordinate. By regarding the coordinate as a gauge variable, he was able to interpret the theory as one involving four-dimensional space-time.

In connection with this contribution, Veblen provided a new treatment of spinors (expressions used to represent electron spin), which is summarized in *Projektive Relativitätstheorie* (1933; "Projective Relativity Theory").

Veblen played a key role in the formation of the school of mathematics at the Institute for Advanced Study. This role, combined with his tremendous influence in encouraging and developing young mathematicians, represents a contribution equal to that of his mathematical innovations.

Veblen, Thorstein (Bunde) (b. July 30, 1857, Manitowoc County, Wis., U.S.—d. Aug. 3, 1929, near Menlo Park, Calif.), U.S. economist and social scientist who sought to apply an evolutionary, dynamic approach to the study of economic institutions. With *The Theory of the Leisure Class* (1899) he won fame in literary circles, and, in describing the life of the wealthy, he coined phrases—"conspicuous consumption," and "pecuniary emulation"—that are still widely used.

Veblen was of Norwegian stock. He did not learn English until he went to school, and all his life he spoke it with an accent. He was graduated from Carleton College in Minnesota in three years, proving himself a brilliant scholar and a mocking individualist given to railing at

established ideas. He went on to Johns Hopkins and Yale to study philosophy, receiving his Ph.D. from Yale in 1884. Unable to find a teaching position, he returned to his father's farm in Minnesota, where he spent most of the next seven years reading. "For days," writes his biographer, "all that one could see of him was the top of his head at the garret window." In 1888 he married Ellen Rolfe, a member of a wealthy and influential family. Still unable to find a job, he entered Cornell in 1891 as a graduate student. There he impressed J. Laurence Laughlin so highly that, when Laughlin was asked to head the economics department at the new University of Chicago in 1892, he took Veblen with him as a fellow in economics. Not until 1896, when Veblen was 39, did he attain the rank of instructor.

His first book, The Theory of the Leisure Class, subtitled An Economic Study of Institutions, was published in 1899. Still read today. it represents the essence of most of his thinking. Veblen sought to apply Darwin's evolutionism to the study of modern economic life. The industrial system, he wrote, required men to be diligent, efficient, and cooperative, while those who ruled the business world were concerned with making money and displaying their wealth; their outlook was a survival from a predatory barbarian past. Veblen examined with obvious relish the "modern survivals of prowess" in the amusements, fashions, sports, religion, and aesthetic tastes of the ruling class. The book caught the interest of the literary world, most of whom read it as a satire rather than as science, and Veblen soon had a reputation as a social critic extending far beyond his academic horizons.

His reputation did not bring him academic success. He was an indifferent teacher with only contempt for the university ritual of lecture and examination. His most famous course, "Economic Factors in Civilization," ranged over vast fields of history, law, anthropology, and philosophy but paid little attention to orthodox economic theory. In 1904 he published *The Theory of Business Enterprise*, in which he expanded on his evolutionary theme of the incompatibility between the modern industrial process and the irrational ways of business and finance (i.e., on the difference between making goods and making money).

At Chicago Veblen attained only the rank of assistant professor, and he was forced to leave after being charged with marital infidelity. He was appointed to an associate professorship at Stanford in 1906. After three years his personal affairs once more became an issue, and he was forced to resign again. With some difficulty he found a post as a lecturer at the University of Missouri, at a much lower salary, remaining there from 1911 until 1918. He was divorced by Ellen Rolfe and in 1914 married Anne Fessenden Bradley, a divorcee whom he had known for some years. She had

two daughters, whom she brought up according to Veblen's utilitarian ideas as expressed in *The Theory of the Leisure Class*.

At Missouri he enjoyed a productive period. In The Instinct of Workmanship and the State of the Industrial Arts (1914), he elaborated on his idea that business enterprise was in fundamental conflict with the human disposition to useful effort and that a large proportion of men's energies were wasted through inefficient institutions. The outbreak of World War I served to deepen Veblen's pessimism as to the prospects of the human race. In Imperial Germany and the Industrial Revolution (1915), he suggested that Germany had an advantage over democratic states like England and France because its autocracy was able to channel more of the gains of modern technology into the service of the state. He added that the advantage was only temporary because the German economy would eventually develop its own system of conspicuous waste. With An Inquiry into the Nature of Peace and the Terms of Its Perpetuation 1917) he acquired an international following. He maintained that modern wars were caused mainly by the competitive demands of national business interests and that an enduring peace could be had only at the expense of "the rights of ownership, and of the price system in which these rights take effect.

In February 1918 he took a job with the Food Administration in Washington, D.C., but his approach to economic problems was of no use to government administrators, and he remained less than five months. In the fall of 1918 he became a contributor to *The Dial*, a literary and political magazine in New York, for which he wrote a series of articles on "The Modern Point of View and the New Order," later published in book form as *The Vested Interests and the State of the Industrial Arts* (1919; republished as *The Vested Interests and the Common Man: The Modern Point of View and the New Order)*.

While his prestige in the literary world had never been higher, Veblen's own life was going badly. His second wife had suffered a nervous collapse that was followed by her death in 1920. Veblen himself had largely to be looked after by a few devoted friends and appeared to be psychologically incapable of conversing with strangers interested in his ideas. For a while he lectured at the New School for Social Research in New York City, his salary being supported by a subsidy from a former student. His last book, Absentee Ownership and Business Enterprise in Recent Times: The Case of America (1923), was an ill-written and repetitious examination of corporation finance, in which he stressed again the contradiction between the industrial arts and business enterprise.

In 1926 he gave up teaching and returned to California, living with a stepdaughter in a cabin in the mountains overlooking the sea, where he died.

Veblen's reputation reached its high point in the 1930s, when the economic depression appeared to many to be a vindication of his critical ideas about the business system. The reading public saw him as a political radical or a Socialist, although Veblen was a pessimist who never committed himself to any form of political action. Among economists he has had both admirers and critics, the latter more numerous. The scholarly analysis of modern industrial society owes much more to Veblen's German contemporary Max Weber, whose ideas are more complex than his. Even his closest disciples have found his anthropological and historical approach too sweeping to satisfy their scientific requirements, although they have admired his vast learning and his original insights. One of the most eminent of them, Wesley C. Mitchell, called him "a visitor from another world," saying, "No other such emancipator of the mind from the subtle

tyranny of circumstance has been known in social science, and no other such enlarger of the realm of inquiry." (F.S.P.) BIBLIOGRAPHY. Works by Veblen. In addition to the works cited above, Veblen's books include: The Higher Learning in America: A Memorandum on the Conduct of Universities by Business Men (1918); The Place of Science in Modern Civilisation and Other Essays (1919); The Engineers and the Price System (1921); The Laxdaela Saga (trans. from the Icelandic, 1925); and Essays in Our Changing Order (1934), a posthumous collection from periodicals.

Works about Veblen. Much has been written about Veblen. The basic source for students of Veblen will always be Joseph Dorfman's monumental Thorstein Veblen and His America (1934). The best short introduction to Veblen's ideas is Wesley C. Mitchell, "Thorstein Veblen," his introduction to What Veblen Taught (1936), a selection from Veblen's writings. For students of economics a good appraisal is J.M. Clark's obituary in the American Economic Review, 19:742-745 (1929). A general approach is David Riesman, Thorstein Veblen: A Critical Interpretation (1953), which has an extensive bibliography. Veblen's place in intellectual history is depicted in Morton White, Social Thought in America, 2nd ed. (1957), an analysis of the leading ideas of Veblen and some of his contemporaries. Douglas F. Dowd (ed.), Thorstein Veblen: A Critical Reappraisal (1958), is a collection of essays commemorating the 100th anniversary of Veblen's birth. A useful book is Max Lerner (ed.), The Portable Veblen (1948), with a strongly sympathetic introduction by the editor and a bibliography. John P. Diggins, The Bard of Savagery: Thorstein Veblen and Modern Social Theory (1978), is a later reassessment of his thought.

Vecchi, Orazio (baptized Dec. 6, 1550, Modena, Duchy of Modena—d. Feb. 19, 1605, Modena), Italian composer best known for his madrigal-comedy *L'Amfiparnaso* and other entertainment music.

Vecchi served as maestro di cappella at the cathedrals of Salò and Modena and as canon at Correggio cathedral before his appointment as maestro at the Modena ducal court (1598). Vecchi composed masses, motets, canzonets, and madrigals. His most original work, L'Amfiparnaso (1597), which has been called a "madrigal opera," is a set of 15 pieces, dramatic in nature but not intended to be staged. Although this work stands entirely apart from the path opera was to take, Vecchi's sense of drama and contrast made him a pioneer of dramatic music.

Vecchio, Palazzo, also called PALAZZO DELLA SIGNORIA, most important historic government building in Florence, having been the seat of the Signoria of the Florentine Republic in the 14th century and then the government centre of the Medici grand dukes of Tuscany. From 1865 to 1871 it housed the Chamber of Deputies of the Kingdom of Italy, and since 1872 it has been the town hall.

The Tuscan Gothic design of the Palazzo Vecchio has been traditionally attributed to Arnolfo di Cambio. It was constructed between 1298 and 1314 and had additions by Giorgio Vasari and Buontalenti in the late 16th century. The former completely reorganized and redecorated much of the interior. On the terrace facing the Piazza della Signoria are several famous examples of Renaissance sculpture: Donatello's "Judith and Holofernes" (1456–57); a copy of Michelangelo's "David" (1504; the original that once stood there is now in the Accademia); and "Hercules and Cacus" (1534) by Baccio Bandinelli.

Vecchio, Ponte (bridge): see Ponte Vecchio. Vecellinus, Spurius Cassius: see Cassius Vecellinus, Spurius. veche, popular assembly that was a characteristic institution in Russia from the 10th to the 15th century. The veche probably originated as a deliberative body among early Slavic tribes. As the tribes settled in permanent trading centres, which later became cities, the veche remained as an element of democratic rule, sharing power with a prince and an aristocratic council. Although its power varied from city to city, the veche generally could accept or reject the prince who "inherited" the city and, by controlling the town's militia, could veto a prince's plans for a military campaign.

In Novgorod, where the veche acquired its greatest power, it was able to choose the city's prince, to enter into a contract with him that specifically defined and limited his powers, and to dismiss him. It also elected the major military and civil officials subordinate to the prince. In most areas the veche ruled both a city and its dependent villages; the heads of families in the entire region were entitled to participate in its sessions, which could be convoked by the prince, the town officials, or the citizenry. (Usually only the townsmen attended the meetings and the veche thus became a representative of urban interests.) The veche met irregularly; it had no formal procedural rules, and decisions were reached when one side gave up.

During the 11th and 12th centuries the veche acquired its greatest power but gradually lost importance with the decline of the old trading cities in the central Dnepr River region. The political centre of Russia was shifting to the northeastern region, where newer cities lacked the strong urban classes capable of developing their own political organs and of successfully competing with the authority of the princes. After the Mongol invasion of Russia (1240), the veche was further weakened; it was suppressed by the Mongols, who wanted to control the townspeople, considered to be the greatest opponents of Mongol rule. The Russian princes also aided the Mongol suppression in order to curtail the power of the institution.

By the middle of the 14th century the *veche* in most Russian cities no longer functioned as an independent, permanent governing body, although it sporadically reappeared in times of crisis. In Novgorod the *veche* survived until 1478, when the Muscovite grand prince Ivan III conquered that city and abolished it; the Pskov *veche* was similarly dissolved in 1510.

vector analysis, a branch of mathematics that deals with quantities that have both magnitude and direction. Some physical and geometric quantities, called scalars, can be fully defined by specifying their magnitude in suitable units of measure. Thus, mass can be expressed in grams, temperature in degrees on some scale, and time in seconds. Scalars can be represented graphically by points on some numerical scale such as a clock or thermometer. There also are quantities, called vectors, that require the specification of direction as well as magnitude. Velocity, force, and displacement are examples of vectors. A vector quantity can be represented graphically by a directed line segment, symbolized by an arrow pointing in the direction of the vector quantity, with the length of the segment representing the magnitude of the vector.

A brief treatment of vector analysis follows. For full treatment, see MACROPAEDIA: Analysis (in Mathematics): Vector and tensor analysis.

Vector algebra. A prototype of a vector is a directed line segment AB (see Figure 1) that

can be thought to represent the displacement of a particle from its initial position A to a new position B. To distinguish vectors from scalars it is customary to denote vectors by boldface letters. Thus the vector AB in Figure 1 can

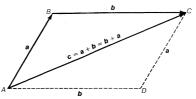

Figure 1: Parallelogram law for addition of vectors

be denoted by a and its length (or magnitude) by |a|. In many problems the location of the initial point of a vector is immaterial, so that two vectors are regarded as equal if they have the same length and the same direction.

The equality of two vectors \mathbf{a} and \mathbf{b} is denoted by the usual symbolic notation a = b, and useful definitions of the elementary algebraic operations on vectors are suggested by geometry. Thus, if AB = a in Figure 1 represents a displacement of a particle from A to B and subsequently the particle is moved to a position C, so that BC = b, it is clear that the displacement from A to C can be accomplished by a single displacement AC = c. Thus, it is logical to write a + b = c. This construction of the sum, c, of a and b yields the same result as the parallelogram law in which the resultant c is given by the diagonal AC of the parallelogram constructed on vectors AB and AD as sides. Since the location of the initial point B of the vector $BC = \mathbf{b}$ is immaterial, it follows that BC = AD. Figure 1 shows that AD + DC = AC, so that the commutative law

$$a+b=b+a \tag{1}$$

holds for vector addition. Also, it is easy to show that the associative law

$$(a+b)+c=a+(b+c)$$
 (2)

is valid, and hence the parentheses in (2) can be omitted without any ambiguities.

If s is a scalar, sa or as is defined to be a vector whose length is |s||a| and whose direction is that of a when s is positive and opposite to that of a if s is negative. Thus, a and -a are vectors equal in magnitude but opposite in direction. The foregoing definitions and the well-known properties of scalar numbers (represented by s and t) show that

$$s(ta) = (st)a$$

$$(s+t)a = sa + ta$$

$$s(a+b) = sa + sb.$$
(3)

Inasmuch as the laws (1), (2), and (3) are identical with those encountered in ordinary algebra, it is quite proper to use familiar algebraic rules to solve systems of linear equations containing vectors. This fact makes it possible to deduce by purely algebraic means many theorems of synthetic Euclidean geometry that require complicated geometric constructions. *Products of vectors.* The multiplication of

Products of vectors. The multiplication of vectors leads to two types of products, the dot product and the cross product.

The dot or scalar product of two vectors a and b, written $a \cdot b$, is a real number $|a||b|\cos(a,b)$, where (a,b) denotes the angle between the directions of a and b. Geometrically,

$$\mathbf{a} \cdot \mathbf{b} = |\mathbf{a}| |\mathbf{b}| \cos(\mathbf{a}, \mathbf{b})$$

$$= |\mathbf{a}| \times \text{projection of } \mathbf{b} \text{ on } \mathbf{a}.$$
(4)

If a and b are at right angles then $a \cdot b = 0$, and if neither a nor b is a zero vector then the vanishing of the dot product shows the vectors to be perpendicular. If a = b then $\cos(a,b) = 1$, and $a \cdot a = |a|^2$ gives the square of the length of a.

The associative, commutative, and distributive laws of elementary algebra are valid for the dot multiplication of vectors.

The cross or vector product of two vectors \boldsymbol{a} and \boldsymbol{b} , written $\boldsymbol{a} \times \boldsymbol{b}$, is the vector

$$\mathbf{a} \times \mathbf{b} = \mathbf{n} |\mathbf{a}| |\mathbf{b}| \sin{(\mathbf{a}, \mathbf{b})}, \tag{5}$$

where n is a vector of unit length perpendicular to the plane of a and b and so directed that a right-handed screw rotated from a toward b will advance in the direction of n (see Figure 2). If a and b are parallel, $a \times b = 0$.

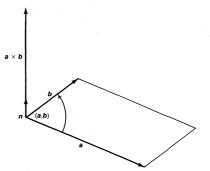

Figure 2: Cross-product formed by multiplication of two vectors

The magnitude of $a \times b$ can be represented by the area of the parallelogram having a and b as adjacent sides. Also, since rotation from b to a is opposite to that from a to b,

$$a \times b = -b \times a$$
.

This shows that the cross product is not commutative, but the associative law $(sa) \times b = s(a \times b)$ and the distributive law

$$\mathbf{a} \times (\mathbf{b} + \mathbf{c}) = \mathbf{a} \times \mathbf{b} + \mathbf{a} \times \mathbf{c} \tag{6}$$

are valid for cross products.

Coordinate systems. Since empirical laws of physics do not depend on special or accidental choices of reference frames selected to represent physical relations and geometric configurations, vector analysis forms an ideal tool for the study of the physical universe. The introduction of a special reference frame or coordinate system establishes a correspondence between vectors and sets of numbers representing the components of vectors in that frame, and it induces definite rules of operation on these sets of numbers that follow from the rules for operations on the line segments.

If some particular set of three noncollinear vectors (termed base vectors) is selected, then any vector A can be expressed uniquely as the diagonal of the parallelepiped whose edges are the components of A in the directions of the base vectors. In common use is a set of three mutually orthogonal unit vectors (i.e., vectors of length 1) i, j, k directed along the axes of the familiar Cartesian reference frame (see

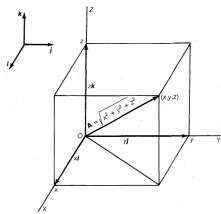

Figure 3: Resolution of a vector into three mutually perpendicular components

Figure 3). In this system the expression takes

$$A = xi + yj + zk,$$

where x, y, and z are the projections of A upon the coordinate axes. When two vectors A_1 and A_2 are represented as

$$A_1 = x_1 i + x_2 j + x_3 k$$

 $A_2 = y_1 i + y_2 j + y_3 k$

then the use of laws (3) yields for their sum

$$A_1 + A_2 = (x_1 + y_1)i + (x_2 + y_2)j + (x_3 + y_3)k.$$
 (7)

and A_2 is the vector determined by $(x_1 + y_1, x_2 + y_2, x_3 + y_3)$. Also, the dot product can be written Thus in a Cartesian frame, the sum of A_1

$$A_1 \cdot A_2 = x_1 y_1 + x_2 y_2 + x_3 y_3, \tag{8}$$

since

$$i \cdot i = j \cdot j = k \cdot k = 1,$$

 $i \cdot j = j \cdot k = k \cdot i = 0.$

The use of law (6) yields for

$$\mathbf{A}_{1} \times \mathbf{A}_{2} = (x_{2}y_{3} - x_{3}y_{2})\mathbf{i} + (x_{3}y_{1} - x_{1}y_{3})\mathbf{j} + (x_{1}y_{2} - x_{2}y_{1})\mathbf{k},$$
 (9)

so that the cross product is the vector determined by the triple of numbers appearing as the coefficients of i, j, and k in (9).

If vectors are represented by 1×3 (or 3×1) matrices consisting of the components $(x_1, x_2,$ x_3) of the vectors, it is possible to rephrase formulas (7) through (9) in the language of matrices. Such rephrasing suggests a generalization of the concept of a vector to spaces of dimensionality higher than three. For example, the state of a gas generally depends on the pressure p, volume v, temperature T, and time t. A quadruple of numbers (p,v,T,t) cannot be represented by a point in a three-dimensional reference frame. But since geometric visualization plays no role in algebraic calculations, the figurative language of geometry can still be used by introducing a four-dimensional reference frame determined by the set of base vectors a_1, a_2, a_3, a_4 with components determined by the rows of the matrix

$$\begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{bmatrix}$$

A vector x is then represented in the form

$$x = x_1 a_1 + x_2 a_2 + x_3 a_3 + x_4 a_4,$$

so that in a four-dimensional space, every vector is determined by the quadruple of the

components (x_1, x_2, x_3, x_4) . Calculus of vectors. A particle moving in three-dimensional space can be located at each instant of time t by a position vector \mathbf{r} drawn from some fixed reference point O. Since the position of the terminal point of r depends on time, r is a vector function of t. Its components in the directions of Cartesian axes, introduced at O, are the coefficients of i, j, and k in the representation

$$\mathbf{r} = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$$

If these components are differentiable functions, the derivative of r with respect to t is defined by the formula

$$\frac{d\mathbf{r}}{dt} = \frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} + \frac{dz}{dt}\mathbf{k} = \mathbf{v},$$
 (10)

which represents the velocity v of the particle. The Cartesian components of v appear as coefficients of i, j, and k in (10). If these components are also differentiable, the acceleration a = dv/dt is obtained by differentiating (10):

$$\frac{d^2\mathbf{r}}{dt^2} = \frac{d^2x}{dt^2}\mathbf{i} + \frac{d^2y}{dt^2}\mathbf{j} + \frac{d^2z}{dt^2}\mathbf{k} = \mathbf{a},$$
 (11)

The rules for differentiating products of scalar functions remain valid for derivatives of the dot and cross products of vector functions, and suitable definitions of integrals of vector functions allow the construction of the calculus of vectors, which has become a basic analytic tool in physical sciences and technology.

Field theory. Problems of continuum mechanics (e.g., fluid mechanics, elasticity, aerodynamics, heat conduction, electrodynamics) call for a consideration of scalar and vector functions specified at each point of some region. A region of space with each point of which a scalar function is associated is called a scalar field, while a region in which a vector function is determined is a vector field. Examples of scalar fields are regions at each point of which the temperature or density of a body can be determined. A region in the vicinity of a charged body in which the electric-intensity vector is determined is an example of a vector field. A scalar function u(P) determined at each point P of a scalar field is called a scalar point-function, while a vector function $\nu(P)$ specified in a vector field is a vector point-function.

Gradient of a scalar field. If there is a scalar point-function u(P) at a point P, and another scalar point-function u(P') at a nearby point P', where the vector directed from P to P' is denoted Δr , then

$$\frac{u(P')-u(P)}{|\Delta r|}$$

represents the average space rate of change of u(P) in the direction of Δr . The limit of this ratio as $|\Delta r| \rightarrow 0$, when this limit exists, represents the space rate of change of u(P) in the direction of Δr . The vector in that direction for which the space rate of change of u(P) is a maximum is called the gradient of u(P) and is denoted by grad u or Δu . It can be shown that in Cartesian coordinates

$$\nabla u = \frac{\partial u}{\partial x} \mathbf{i} + \frac{\partial u}{\partial y} \mathbf{j} + \frac{\partial u}{\partial z} \mathbf{k}.$$

With each point of a scalar field, where ∇u exists, there can be associated a vector field. If u(P) is the temperature, then ∇u gives the direction of the heat-flow vector in the field.

Divergence of a vector field. On the other hand, two important fields can be associated with each continuously differentiable vector point-function v(P): one is a scalar field and the other a vector field. Let v(P) be defined in some region τ about the point P and let σ be the surface of τ . The component of $\nu(P)$ (which for the sake of concreteness can be thought to represent velocity v of fluid particles moving in τ) in the direction of the exterior unit normal n to σ is $v \cdot n$. The amount of fluid issuing from σ is given by $[\mathbf{v} \cdot \mathbf{n} d\sigma]$, where the integration symbol represents the summation of $\mathbf{v} \cdot \mathbf{n}$ over the elements $d\sigma$ of the surface σ

The flux of fluid per unit volume τ is thus equal to

$$(1/\tau) \int \sigma(\mathbf{v} \cdot \mathbf{n}) \, d\sigma$$

and the limit of this ratio as $\tau \to 0$, so that σ shrinks toward P, is a scalar called the divergence of v(P). Thus, the divergence of v(P), written $\operatorname{div} \nu(P)$, represents the rate of fluid flow from P. If div $\nu(P)$ is positive at P, then P is a source of fluid; if it is negative, then Pis a sink. If $\operatorname{div} v(P) = 0$, then no fluid issues

In Cartesian coordinates div v(P) turns out to be given by the simple formula

$$\operatorname{div} \mathbf{v} = \frac{\partial v_1}{\partial x} + \frac{\partial v_2}{\partial y} + \frac{\partial v_3}{\partial z},$$

where $\mathbf{v} = v_1 \mathbf{i} + v_2 \mathbf{j} + v_3 \mathbf{k}$. Curl of a vector field. Also associated with $\mathbf{v}(P)$ is an important vector field in which the

vector called curl of v(P) is defined by the

$$\operatorname{curl} \mathbf{v}(P) = \lim_{\tau \to 0} \frac{\int \sigma(\mathbf{n} \times \mathbf{v}) d\sigma}{\tau}.$$

velocity of the fluid at any point P in the field. In Cartesian coordinates curl v is given by the

$$\operatorname{curl} \mathbf{v} = \left(\frac{\partial v_3}{\partial y} - \frac{\partial v_2}{\partial z}\right) \mathbf{i} + \left(\frac{\partial v_1}{\partial z} - \frac{\partial v_3}{\partial x}\right) \mathbf{j} + \left(\frac{\partial v_2}{\partial y} - \frac{\partial v_1}{\partial x}\right) \mathbf{k}.$$

When $\operatorname{curl} v = 0$ at every point of the region, the field is said to be irrotational, and when $\nu(P)$ is such that div $\nu = 0$, the field is solenoidal. The importance of these two special fields stems from the fact that every continuously differentiable vector function v(P)defined in a region τ (subject to mild restrictions) can be expressed as a sum of two vector functions f(P) and g(P) such that f(P) is solenoidal and g(P) is irrotational. The possibility of such decomposition greatly simplifies the study of many velocity and force fields occurring in physics.

Ved-ava, among the Mordvins, the water mother, a spirit believed to rule the waters and their bounty; she is known as Vete-ema among the Estonians and Veen emo among the Finns. The water spirit belongs to a class of nature spirits common to the Finno-Ugric peoples dependent on fishing for much of their livelihood. Fishermen sacrificed to the water spirit as a personification of their concerns, gave her the first of their catch, and observed numerous taboos while fishing. Ved-ava, however, was also responsible for promoting fertility in humans and in livestock. In appearance the water mother reflected general European traditions of the mermaid: long hair that she may be seen combing while seated on a stone, large breasts, the lower part of the body fishlike. She can often be seen or heard playing music to entice people, but seeing Ved-ava generally bodes misfortune, most often drowning. Ved-ava has also been thought of as the spirit of a drowned person. At other times she is simply a personification of the water itself.

Veda, sacred hymn or verse composed in archaic Sanskrit and current among the Indo-European speaking peoples who entered India from the Iranian regions. No definite date can be ascribed to the composition of the Vedas, some of which possess high literary merit, but a period c. 1500-1200 BC would be acceptable to most scholars. The hymns formed a liturgical body that in part grew up around the cult of the soma ritual and the sacrifice. They extolled the hereditary deities, who for the most part personified various natural and cosmic phenomena, such as fire (Agni), sun (Sūrya and Savitr), dawn (Usas), storms (the Rudras), war and rain (Indra), honour (Mitra), divine authority (Varuna), and creation (Indra, with some aid of Vishnu). Hymns were composed to these deities, and many were recited or chanted during rituals.

The foremost collection, or Samhitā, of such hymns, from which the hotr (chief priest) drew the material for his recitations, is the Rigveda. Sacred formulas known as mantras were recited by the priest responsible for the sacrificial fire and the carrying out of the ceremony; these mantras and verses in time were drawn into Samhitās known collectively as Yajurveda. A third group of priests, headed by the udgātṛ ("chanter"), performed melodic recitations linked to verses that, although drawn almost entirely from the Rigveda, came to be arranged as a separate Samhita, the Sāmaveda ("Veda of the Chants"). To these three Vedas—Rg, Yajur, and Sāma, known as the *trayī-vidyā* ("threefold knowledge")—is added a fourth, the Atharvaveda, a collection of hymns, magic spells, and incantations that represents a more folk level of religion and remains partly outside the Vedic sacrifice.

The entire corpus of Vedic literature—the Samhitās and the expositions that came to be attached to them, the Brāhmaṇas, the Āranyakas, and the Upaniṣads—was considered Sruti, the product of divine revelation. The whole of the literature seems to have been preserved orally (although there must early have been manuscripts to assist memory). Even today several of these works, notably the three oldest Vedas, are recited with subtleties of intonation and rhythm that have been handed down from the earliest days.

vedanā (Sanskrit and Pāli), in the Buddhist chain of dependent origination, the sensation that leads to thirst. See pratītya-samutpāda.

Vedānta, one of the six orthodox systems (darśana) of Indian philosophy and the one that forms the basis of most modern schools of Hinduism. The term Vedānta means in Sanskrit the "conclusion" (anta) of the Vedas, the earliest sacred literature of India; it applies to the Upanişads, which were elaborations of the Vedas, and to the school that arose out of the "study" (mīmāṃsā) of the Upanişads. Thus Vedānta is also referred to as Vedānta-Mīmāṃsā ("Reflection on Vedānta"), Uttara-Mīmāṃsā ("Reflection on the Latter Part of the Vedas"), and Brahma-Mīmāṃsā ("Reflection on Brahman").

The three fundamental Vedānta texts are: the *Upaniṣads* (the most favoured being the longer and older ones such as the *Bṛhadāran-yaka*, the *Chāndogya*, the *Taittiriya*, and the *Kaṭha*); the *Brahma-sūtras* (also called *Vedān-ta-sūtras*), which are very brief, even one-word interpretations of the doctrine of the *Upaniṣads*; and the famous poetic dialogue, the *Bhagavadgītā* ("Song of the Lord"), which, because of its immense popularity, was drawn upon for support of the doctrines found in the *Upaniṣads*.

No single interpretation of the texts emerged, and several schools of Vedānta developed, differentiated by their conceptions of the nature of the relationship and the degree of identity between the individual self (ātman) and the absolute (Brahman). These range from the nondualism (Advaita; q.v.) of the 8th-century philosopher Sankara to the theism (Visiṣṭādvaita; q.v.) of the 11th-12th-century thinker Rāmānuja and the dualism (Dvaita; q.v.) of the 13th-century thinker Madhva.

The Vedanta schools do, however, hold in common a number of beliefs; transmigration of the self (samsāra) and the desirability of release from the cycle of rebirths; the authority of the Veda on the means of release; that Brahman is both the material (upādāna) and the instrumental (nimitta) cause of the world; and that the self (atman) is the agent of its own acts (karman) and therefore the recipient of the fruits, or consequences, of action (phala). All the Vedanta schools unanimously reject both the heterodox (nāstika) philosophies of Buddhism and Jainism and the conclusions of the other orthodox (āstika) schools (Nyāya, Vaisesika, Sāmkhya, Yoga, and, to some extent, the Pūrva-Mīmāmsā).

The influence of Vedanta on Indian thought has been profound, so that it may be said that, in one or another of its forms, Hindu philosophy has become Vedanta. Although the preponderance of texts by Advaita scholastics has in the West given rise to the erroneous impression that Vedanta means Advaita, the nondualistic Advaita is but one of many Vedanta schools.

Vedāntadeśika, also called VENKAŢANĀTHA (b. 1268, Tuppule, near Kānchipuram, Vijayanagar, India—d. 1370, Srīrangam), leading theologian of the Viśiṣṭādvaita (Qualified Nondualism) school of philosophy and founder of the Vaḍakalai, a subsect of the Śrīvaiṣṇavas, a religious movement of South India.

Vedāntadeśika was born into a distinguished Śrīvaisnava family that followed the teachings of Rāmānuja, an 11th-12th-century saint. A precocious child, Vedāntadeśika was said to have been taken at the age of five to meet the sect's leader, Vātsya Varadācārya, who blessed him saying he would in time be a great teacher and repudiate all false philosophers. He married and had a family but lived on alms in order to devote himself fully to his philosophic and literary efforts. He was a prolific writer in both Sanskrit and Tamil; his more than 100 works include commentaries on Vaisnava scriptures; Nyāya-pariśuddhi, a comprehensive work on Viśistādvaita logic; Yādavābhyudaya, a poetic work on the life of Krishna; Sankalpa-sūryodaya, an allegorical drama; and devotional hymns.

According to Vedāntadeśika's interpretation of prapatti (surrender to the grace of God), some effort is required on the part of the worshipper to secure God's grace, just as the baby monkey must hold to its mother (the markaṭa-nyāya, or the "analogy of the monkey"). This view—together with ritual and linguistic differences—became the basis for the split between the two subsects, the Vaḍakalai and the Tengalai, who held that God's grace is unconditioned and that the human soul is as unassertive as a kitten carried by its mother.

Vedda, also spelled VEDDAH, primitive people of Sri Lanka (Ceylon) who were the aboriginal inhabitants prior to the 6th century BC. They adopted Sinhala and no longer speak their own language. Physically they are allied to the Dravidian jungle peoples of southern India and to early populations in Southeast Asia. They have now been largely absorbed into the modern Sinhalese population; in 1911 they were reported to number about 5,300, while by 1964 the government estimated their population at about 800. By the 1970s, they had virtually ceased to exist as a separate community.

The aboriginal material culture and subsistence patterns of the Vedda were extremely simple. They lived in caves and rock shelters, wore bark-cloth clothing, hunted game with bow and arrow, and gathered wild plants and honey. Their religion was essentially a cult of the dead; ancestral spirits were believed to enter the bodies of shamans, through whom they communicated with their descendants.

Vedder, Elihu (b. Feb. 26, 1836, New York City—d. Jan. 29, 1923, Rome), Americanborn Romantic painter and illustrator whose reputation is based primarily on paintings derived from dreams and fantasies.

After studying in Paris (1856-61), Vedder returned to the United States at the outbreak of the Civil War. He supported himself by illustrating comic valentines and calisthenics books and by drawing for Vanity Fair. It was during this period of hardship that Vedder conceived such fantastic and melancholic works as "The Lair of the Sea Serpent" (1865; Museum of Fine Arts, Boston) and "The Lost Mind" (1864-65; Metropolitan Museum of Art, New York City). Vedder settled permanently in Rome in 1866 but made frequent trips to the United States. In 1884 he illustrated an edition of *The Rubáiyát of Omar Khayyám*, a work well suited to his imaginative style. He also executed a large lunette mural, "Rome," for the Walker Gallery at Bowdoin College, Brunswick, Maine (1894), and five wall paintings and a mosaic for the Library of Congress (1896-97). His book Doubt and Other Things was published shortly before his death.

Vedel, Anders Sørensen (b. Nov. 9, 1542, Vejle, Den.—d. Feb. 13, 1616, Ribe), Danish historian and ballad collector who translated the Gesta Danorum of the medieval historian Saxo Grammaticus from Latin into Danish (1575). In 1591 he published his Et hundrede udvalde danske viser, a collection of 100 medieval Danish folk songs and ballads. Based on oral and manuscript sources, it was the earliest printed collection and remains a principal source of Danish ballads. It was enlarged and republished in 1695 by Peder Syv. Vedel was a clergyman at the royal court.

Vedic chant, religious chant of India, the expression of hymns from the Vedas, the ancient scriptures of Hinduism. The practice dates back at least 3,000 years and is probably the world's oldest continuous vocal tradition. The earliest collection, or Samhitā, of texts is the Rigveda, containing about 1,000 hymns. These are chanted in syllabic style—a type of heightened speech with one syllable to a tone. Three levels of pitch are employed: a basic reciting tone is embellished by neighbouring tones above and below, which are used to emphasize grammatical accents in the texts. These Rigveda hymns are the basis for a later collection, the Sāmaveda (Veda of the Chants). the hymns of which are sung in a style that is more florid, melodic, and melismatic (one word to two or more notes) rather than syllabic, and the range of tones is extended to six or more.

A simple, numerical system of notation—together with an oral tradition that stresses absolute precision in text, intonation, and bodily gestures—has served to perpetuate this stable tradition and to ensure its uniformity throughout all parts of India. The Vedas (q.v.) are chanted today exactly as they were centuries ago.

Vedic sacrifice, central religious rite of the Vedic period of ancient India, a form of worship introduced by the invaders who entered India from the Iranian region. The rite was performed by offering edibles to a sacred fire. The fire, deified as Agni, carried the oblations to the gods.

to the gods.

Sacrifices performed according to Vedic rites continue to be performed in India occasionally, while the offering of oblations to a sacred fire is an important element of much modern Hindu worship (see yajña).

The rite of the sacrifice, simpler in the earlier period, became increasingly complex and governed by innumerable rules, which were embodied, together with hymns and prayer formulas used, in the oral tradition of the Vedas (sacred scriptures) and the Kalpa-sūtras. During the late Vedic period, the complexities of ritual were emphasized to such an extent that they took on added magical effectiveness, and, if rites were improperly or incorrectly performed, they could, unless rectified, bring about disaster or death.

Vedic ritual required neither temples nor images; the ceremonies took place in an open space that was consecrated afresh for every important occasion. The altar (vedi) was a quadrangle marked out by hollowing or slightly raising the ground. The agnyādhāna ("installation of the fire") was a necessary preliminary to all the large public events, preceded by the patron's fast.

The sacrifices were of two major types—domestic (gṛhya) and public (śṛauta, or vaitānika). The domestic rites were observed by the householder himself or with the help of a single priest, and performed over the domestic hearth fire. Some occurred daily or monthly, and others accompanied a particular event, such as the saṃskāras, sacraments marking each stage of an upper caste Indian's life, from conception to death.

The grand rites performed in public lasted several days or months and could be undertaken only by wealthy men or kings. They required the services of many priests and were usually performed at three fire-altars. Most characteristic of the public ceremonies were the soma sacrifices, which ensured the prosperity and well-being of both men and gods. The celebrated asvamedha (q.v.), or "horse sacrifice," was an elaborate variant of the soma sacrifice. Other ceremonies marked fixed dates of the lunar calendar, such as the full or new moon or the change of seasons. Human sacrifice (purusamedha) is described and alluded to as a former practice but may have been more symbolic than actual. The sacrifice of the mythical giant Purusa, from whose dismembered limbs sprang up the four major castes, probably served as a model for the conjectured human sacrifices.

Vediovis (Roman god): see Vejovis.

Vedism, religion of the ancient Indo-European-speaking peoples who entered India about 1500 BC from the Iranian region; it takes its name from the collections of sacred texts known as the Vedas.

Knowledge of Vedic religion is derived from the surviving texts and also from certain rites that continue to be observed within the framework of modern Hinduism, such as the rite of initiation (see upanayana) and domestic sacrifices (see yajña). The earliest Vedic religious beliefs included some held in common with other Indo-European-speaking peoples, particularly with the early Iranians (e.g., common mythological figures and the cultic use of the juice of the soma plant). Contact with indigenous elements and internal evolution resulted in further development. Though it is impossible to say when Vedism gave way to classical Hinduism, a decrease in literary activity among the Vedic schools from the 5th century BC onward can be observed, and about this time texts of Hindu character began to appear.

Characteristic of Vedism was a belief in the efficacy of ritual and in the correspondences between macrocosm and microcosm. The universe was thought to be in continual danger of being destroyed by chaos; man contributed to the maintenance of the world by performing sacrifice and by offering the gods the invigorating soma drink. Ritual became increasingly complex, and errors required careful propitiation, all of which encouraged the predominance of the priests. The basic stratification of Vedic society into four social classes, or varnas—Brahmans (priests or teachers), Kshatriyas (rulers), Vaisyas (traders), and Sūdras (non-Aryan serfs)—by and large persisted in later Hinduism.

The gods of the Vedic pantheon were not always clearly delineated and tended to merge with one another. Most were conceived as male and were connected with the sky and other natural phenomena, such as Indra, the rain god, and Agni, the fire god. Vishnu and Siva (Rudra), the major deities of classical Hinduism, were relatively unimportant figures in Vedism. The beliefs in transmigration and karma (causal effects that govern rebirth) so typical of later religions in India did not appear to be held by the authors of the Vedic texts. See also Vedic sacrifice.

Vedivs (Roman god): see Vejovis.

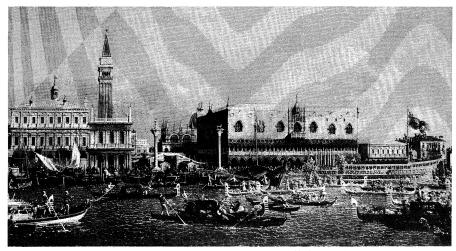

veduta (Italian: "view"), detailed, largely factual painting, drawing, or etching depicting a city, town, or other place. The first vedute probably were painted by northern European artists who worked in Italy, such as Paul Brill (1554–1626), a landscape painter from Flanders who produced a number of marine views and scenes of Rome that were purchased by visitors.

Among the most famous of the *vedutisti* are four Venetians. Canaletto (Antonio Canal, 1697–1768), probably the greatest of the *vedutisti*, painted precise views of Venetian architecture that are found in most of the

world's major art galleries. The Guardi family, Giacomo (1678–1716), Giannantonio (1699–1760), and Francesco (1712–93), produced a great number of views of Venice. The most famous member of the family was Francesco, whose style was based on that of Canaletto, though his treatment is freer. Giovanni Pannini (c. 1691–1765/68) was the first artist to concentrate on painting ruins.

To the engraver the attractions of *vedute* were immense. Canaletto issued his etched *vedute* in 1741; and Giambattista Piranesi (1720–78)—etcher, archaeologist, and architect—completed what is probably the best

Veeck also signed Satchel Paige, a well-known veteran of the black baseball leagues. The Indians won the pennant and the World Series in 1948. In 1949 the club was sold, and Veeck headed another group that bought the American League St. Louis Browns. In 1951, while still owner of the Browns, Veeck staged his most famous promotion when he had 3 ft 7 in. Ed Gaedel pinch hit. Finding it impossible to throw to Gaedel's strike zone, the pitcher walked him. Although the crowd thoroughly

known of all the series of *vedute*, "Le Vedute di Roma." Allowing for variations of scale and minor additions, these scenes of monumental Roman ruins are essentially factual. His etchings of prison interiors, however, are examples of *vedute ideate*, which are realistically drawn though completely imaginary scenes. Guardi and Canaletto produced another form of *veduta*, the *capriccio*, in which architectural elements, though correct, are combined in a rather strange fashion—*e.g.*, Canaletto's drawing in which St. Peter's in Rome is shown rising above the Doge's Palace in Venice, or the etching by William Marlow (1740–1813) of "St. Paul's Cathedral in London with the Grand Canal of Venice."

Veeck, Bill, byname of WILLIAM LOUIS VEECK (b. Feb. 9, 1914, Hinsdale, Ill., U.S.—d. Jan. 2, 1986, Chicago), American professional baseball club executive and owner, who introduced many innovations in promotion.

Veeck grew up with baseball management. His father, a Chicago sportswriter, was president of the National League Chicago Cubs (1919–33), and young Veeck himself sold peanuts and scorecards at Wrigley Field during Cubs home games. He became treasurer for the Cubs in 1940; and in 1941, with Charley Grimm, a former player and manager of the Cubs, he bought the Milwaukee Brewers, then the name of a Cub minor-league property. They helped move the club from last place in 1941 to second place in 1942 and first place in 1943-45, while raising attendance to the highest level then known in the minor leagues. Improvement in team members was accompanied by a number of amusing promotional efforts.

In 1946 Veeck headed a syndicate that bought the franchise of the American League Cleveland Indians, who had not won a pennant since 1920. In the first year, the Indians drew more than 1,000,000 fans for the first time. Veeck then hired Larry Doby, who, as a result, became the first black ever to play in the American League. Shortly afterward

enjoyed the stunt, the league commissioner declared Gaedel's contract invalid the following day. In 1953 Veeck sold his controlling interest in the Browns, and the franchise was transferred to Baltimore.

Veeck returned to baseball in 1959, when he headed a group that acquired control of the American League Chicago White Sox. The team won its first pennant since 1919 that year, and attendance rose to nearly 1,500,000. Veeck's group sold the ball club in 1969. In 1976 Veeck again headed a group that took control of the White Sox. In 1981, however, he sold the team once more, largely because of the financial difficulties stemming from intense bidding among baseball-team owners for the contracts of free-agent players. Veeck, who believed that baseball's primary function should be to entertain, became disillusioned with what he regarded as an increased emphasis on baseball as a business.

Veeck wrote, with Ed Linn, Veeck as in Wreck (1962), The Hustler's Handbook (1965), and Thirty Tons a Day (1972).

Vega, also called ALPHA LYRAE, brightest star in the northern constellation Lyra and fourth brightest in the night sky, with a visual magnitude of 0.04. It is also one of the Sun's closer neighbours, at a distance of about 26 light-years. Vega's spectral type is A (white) and its luminosity class V (main sequence). It will become the Earth's pole star by about AD 14,000 because of the precession of the equinoxes.

Vega, Garcilaso de la, also called EL INCA (b. April 12, 1539, Cuzco, Peru—d. April 24, 1616, Córdoba, Spain), one of the great Spanish chroniclers of the 16th century, noted as the author of distinguished works on the history of the Indians in South America and the expeditions of the Spanish conquistadors.

Vega was the illegitimate son of a Spanish knight and landowner, Sebastian Garcilaso de la Vega, and an Inca Indian princess. Raised in his father's household in Peru, he absorbed both the traditions of the Incas and the stories told by his father's Spanish associates. He learned Spanish and Latin and was an eyewitness of the civil wars then raging in Peru, which he later recorded in his chronicles.

A highly intelligent youth, he was used by his father as a scribe and agent to govern his vast estates in Peru. In the fall of 1560 he arrived in Spain and came under the protection of his father's brother. In the 1560s he served in the Spanish armies, in which he reached the rank of captain. Later he entered the priesthood, becoming a minor ecclesiastic in 1597.

Vega's literary career started with his translation into Spanish of the Italian Neoplatonic dialogue, Dialoghi di amore ("Dialogues of Love"), by the Jewish humanist Léon Hebreo, which was published in 1588. Vega is best known for La Florida del Ynca (an account of Hernando de Soto's expeditions north of Mexico) and his history of Peru, describing the civil wars that broke out among the Spanish conquerors of Peru (Part I, 1608/09; Part II, 1617). Vega's writing places him within the currents of Spanish Renaissance literature, but he should not be confused with the great early 16th-century poet of the same name, to whom he was related.

Vega, Lope de, in full LOPE FÉLIX DE VEGA CARPIO, byname THE PHOENIX OF SPAIN, Spanish EL FÉNIX DE ESPAÑA (b. Nov. 25, 1562, Madrid—d. Aug. 27, 1635, Madrid), outstanding dramatist of the Spanish Golden Age, author of as many as 1,800 plays and several hundred shorter dramatic pieces, of which 431 plays and 50 shorter pieces are extant.

Life. Lope de Vega was the second son and third child of Francisca Fernandez Flores and Félix de Vega, an embroiderer. He was

taught Latin and Castilian in 1572-73 by the poet Vicente Espinel, and the following year he entered the Jesuit Imperial College, where he learned the rudiments of the humanities. Captivated by his talent and grace, the bishop of Avila took him to the Alcalá de Henares (Universidad Complutense) in 1577 to study for the priesthood, but Vega soon left the Alcalá on the heels of a married woman.

On his father's death in 1578, the embroidery shop passed to the husband of one of the poet's sisters, Isabel del Carpio. Vega later adopted the noble name of Carpio in order to give an aristocratic tone to his own. He acquired a humanistic education from his abundant though haphazard readings in erudite anthologies. In 1583 he took part in the Spanish expedition against the Azores.

By this time Vega had established himself as

a playwright in Madrid and was living from his comedias (tragicomic social dramas). He also exercised an undefined role as gentleman attendant or secretary to various nobles, adapting his role as servant or panderer according to the situation. By this time, also, the poet's life was already launched on a course of tempestuous passion. The "remote beauty" who took him from the Alcalá was followed by Elena Osorio, an actress of exceptional beauty and maturity. His romantic involvement with her was intense, violent, and marred by Vega's jealousy over Elena's liaison with the powerful gallant Don Francisco Perrenot de Granvelle. nephew of the cardinal de Granvelle, Finally, when Elena abandoned the poet, he wrote such fierce libels against her and her family that he landed in prison. The libel continued in a court case in 1588, which sent him into exile from Castile for eight years. In the middle of this incredible court scandal, Vega abducted Isabel de Urbina (the "Belisa" of many of his poems), the beautiful 16-year-old sister of Philip II's earl marshal. They were forced to marry, and the new husband immediately departed with the Spanish Armada against England. On his return, he passed the remainder of his exile in Valencia, at that time a centre of considerable dramatic activity, and took to the serious writing of plays. Here, too, he engaged in writing romanceros, or ballad poetry, which had become fashionable. In 1590 he was appointed secretary to the duke of Alba, whom he followed to Toledo and then to the ducal estate at Alba de Tormes, where his wife died in childbirth in 1595. He auctioned off everything he owned and left for Madrid, where his public concubinage with the widow Antonia Trillo de Armenta caused him another lawsuit (1596).

He had left the duke's service in 1595, and in 1598 he went to the home of the marqués de Sarriá, future conde de Lemos, with whom he remained until 1600. Sometime around 1595 he also met the illiterate and singularly beautiful actress Micaela de Luján, who was to be for nearly 20 years the poet's most peaceful love; she was the "Camila Lucinda" of numerous magnificent verses composed for her by Vega. He took a second wife, Juana de Guardo, the daughter of a wealthy pork butcher, by whom he had two children, Carlos Félix and Feliciana. He was mercilessly pilloried by his literary enemies for such an opportunistic union.

Height of literary productivity. From 1605 until his death he remained a confidential secretary and counselor to the duke of Sessa, with whom he maintained a voluminous and revealing correspondence. In 1608 he was also named to a sinecure position as a familiar of the Inquisition and then prosecutor (promotor fiscal) of the Apostolic Chamber. By this time, Vega had become a famous poet and was already regarded as the "phoenix of Spanish wits." In 1609 he published Arte nuevo de hacer comedias en este tiempo ("New Art of Writing Plays in This Time"), a poetic treatise in which he defended his own plays with more wit than effectiveness.

In 1610, in the midst of full literary production—on the road to his 500 comedias—Vega moved his household definitively from Toledo to Madrid. In Madrid, Vega was afflicted by painful circumstances that complicated his life in a period when he was still very creative. Juana became ill, miscarried, and lived in precarious health under Vega's constant care; Carlos Félix, his favourite son, also became ill and died, in 1612. Juana died in childbirth with Feliciana, and Micaela de Luján must also have died during that time, since Vega took into his own home the children remaining from this relationship, Marcela and Lope Félix, or Lopito.

These heartbreaks moved the poet to a deep religious crisis. In 1609 he entered the first of several religious orders. From this time on he wrote almost exclusively religious works. though he also continued his theatrical work, which was financially indispensable. In 1614 he entered the priesthood, but his continued service as secretary and panderer to his patron, the duke of Sessa, hindered him from obtaining the ecclesiastical benefits he sought. The duke, fearful of losing Vega's services, succeeded in having one of the poet's former lovers, the actress Lucia de Salcedo, seduce Vega. The duke thus permanently recovered his secretary. Vega thereafter became involved in new and scandalous romantic relationships. In 1627 his verse epic on the life and execution of Mary, queen of Scots, La corona trágica, which was dedicated to Pope Urban VIII, brought in reward a doctorate in theology of the Collegium Sapientiae and the cross of the Order of Malta, out of which came his proud use of the title *Frey* ("Brother"). His closing years were full of gloom. His last lover, Marta de Nevares, who shared his life from 1619 until her death in 1632, lost first her sight and then her sanity in the 1620s. The death at sea of his son Lope Félix del Carpio y Luján and the abduction and abandonment of his youngest daughter, Antonia Clara, both in 1634, were blows that rent his soul. His own death in Madrid in August 1635 evoked national mourning.

Works. Vega became identified as a playwright with the comedia, a comprehensive term for the new drama of Spain's Golden Age. Vega's productivity for the stage, however exaggerated by report, remains phenomenal. He claimed to have written an average of 20 sheets a day throughout his life and left untouched scarcely a vein of writing then current. Cervantes called him "the prodigy of nature." Juan Pérez de Montalván, his first biographer, in his *Fama póstuma* (1636), attributed to Vega a total of 1,800 plays, as well as more than 400 autos sacramentales (short allegorical plays on sacramental subjects). The dramatist's own first figure of 230 plays in 1603 rises to 1,500 in 1632; more than 100, he boasts, were composed and staged in 24 hours. The titles are known of 723 plays and 44 autos, and the texts survive of 426 and 42, respectively.

The earliest firm date for a play written by Vega is 1593. His 18 months in Valencia in 1589-90, during which he was writing for a living, seem to have been decisive in shaping his vocation and his talent. The influence in particular of the Valencian playwright Cristóbal de Virués (1550-1609) was obviously profound. Toward the end of his life, in *El laurel de Apolo*, Vega credits Virués with having, in his "famous tragedies," laid the very foundations of the comedia. Virués' five tragedies, written between 1579 and 1590, do indeed display a gradual evolution from a set imitation of Greek tragedy as understood by the Romans to the very threshold of romantic comedy. In the process the five acts previously typical of Spanish plays have become three; the classical chorus has given way to comment within the play, including that implicit in the expansion of a servant's role to that of confidant; the unities of time, place, and action have disappeared, leaving instead to each act its own setting in time and space; and hendecasyllabic blank verse has yielded to a metrical variety that, seeking to reflect changing moods and situations, also suggests the notable degree of lyricism soon to permeate the drama. The Spanish drama's confusing of tragic effect with a mere accumulation of tragic happenings has deflected the emphasis from in-depth character portrayal to that of complexity of plot, action, and incident, and the resulting emphasis on intrigues, misunderstandings, and other devices of intricate and complicated dramatic plotting have broken down the old divisions between dramatic genres in favour of an essentially mixed kind, tragicomedy, that would itself soon be

known simply as comedia. Finally, from initially portraying kings and princes of remote ages, Virués began to depict near-contemporary Spain and ordinary men and women.

There can be no claiming that Vega learned his whole art from Virués. Bartolomé de Torres Naharro at the beginning of the 16th century had already adumbrated the cloak and sword (cape y espada) play of middleclass manners. A decade before Virués, Juan de la Cueva had discovered the dramatic interest latent in earlier Spanish history and its potential appeal to a public acutely responsive to national greatness. In the formation of the comedia this proved another decisive factor on which Vega fastened instinctively.

It was at this point that Vega picked up the inheritance and, by sheer force of creative genius and fertility of invention, gave the comedia its basic formula and raised it to a peak of splendour. The comedia's manual was Vega's own poetic treatise, El arte nuevo de hacer comedias en este tiempo, in which he firmly rejected the Classical and Neoclassical "rules, opted for a blend of comedy and tragedy and for metrical variety, and made public opinion

the ultimate arbiter of taste.

The comedia was essentially, therefore, a social drama, ringing a thousand changes on the accepted foundations of society: respect for crown, for church, and for the human personality, the latter being symbolized in the "point of honour" (pundonor) that Vega commended as the best theme of all "since there are none but are strongly moved thereby." This "point of honour" was a matter largely of convention, "honour" being equivalent, in a very limited and brittle sense, to social reputation; men were expected to be brave and proud and not to put up with an insult, while "honour" for women basically meant maintaining their chastity (if unmarried) or their fidelity (if married). It followed that this was a drama less of character than of action and intrigue that rarely, if ever, grasped the true essence of tragedy.

Few of the plays that Vega wrote were perfect, but he had an unerring sense for the theme and detail that could move an audience conscious of being on the crest of its country's greatness to respond to a mirroring on the stage of some of the basic ingredients of that greatness. Because of him the comedia became a vast sounding board for every chord in the Spanish consciousness, a "national" drama in the truest sense.

In theme Vega's plays range over a vast horizon. Traditionally his plays have been grouped as religious, mythological, classical, historical (foreign and national), pastoral, chivalric, fantastic, and of contemporary manners. In essence the categories come down to two, both Spanish in setting: the heroic, historical play based on some national story or legend, and the cloak and sword drama (q.v.) of contem-

porary manners and intrigue.

For his historical plays Vega ransacked the medieval chronicle, the romancero, and popular legend and song for heroic themes, chosen for the most part as throwing into relief some aspect either of the national character or of that social solidarity on which contemporary Spain's greatness rested. The conception of the crown as fount of justice and bulwark of the humble against oppression inspires some of his finest plays. Peribáñez y el comendador de Ocaña (Peribáñez and the Commander of Ocaña), El mejor alcalde, el rey (The King, the Greatest Alcalde), and Fuente Ovejuna (All Citizens Are Soldiers) are still memorable and highly dramatic vindications of the inalienable rights of the individual, as is El caballero de Olmedo (The Knight from Olmedo) on a more exalted social plane. In Fuente Ovejuna the entire village assumes responsibility before the king for the slaying of its overlord and wins his exoneration. This experiment in mass psychology, the best-known outside Spain of all

his plays, evoked a particular response from audiences in tsarist Russia.

Vega's cloak and sword plays are all compounded of the same ingredients and feature the same basic situations: gallants and ladies falling endlessly in and out of love, the "point of honour" being sometimes engaged, but very rarely the heart, while servants imitate or parody the main action and one, the gracioso, exercises his wit and common sense in commenting on the follies of his social superiors. El perro del hortelano (The Gardener's Dog), Por la puente Juana (Across the Bridge, Joan), La dama boba (The Lady Nit-Wit), La moza de cántaro (The Girl with the Jug), and El villano en su rincón (The Peasant's House Is His Castle) are reckoned among the best in this minor if still-entertaining kind of play.

All Vega's plays suffer from haste of composition, partly a consequence of the public's insatiable desire for novelty. His first acts are commonly his best, with the third a hasty cutting of knots or tying up of loose ends that takes scant account both of probability and of psychology. There was, too, a limit to his inventiveness in the recurrence of basic themes and situations, particularly in his cloak and sword plays. But Vega's defects, like his strength, derive from the accuracy with which he projected onto the stage the essence of his country and age. Vega's plays remain true to the great age of Spain into which he had been born and which he had come to know, intuitively rather than by study, as no one had ever known it before.

Vega's nondramatic works in verse and prose filled 21 volumes in 1776-79. Much of this vast output has withered, but its variety remains impressive. Vega wrote pastoral romances, verse histories of recent events, verse biographies of Spanish saints, long epic poems and burlesques upon such works, and prose tales, imitating or adapting works by Ariosto and Cervantes in the process. His lyric compositions-ballads, elegies, epistles, sonnets (there are 1,587 of these)—are myriad. Formally they rely much on the conceit, and in content they provide a running commentary on the poet's whole emotional life.

Among specific nondramatic works that deserve to be mentioned are the 7,000-line Laurel de Apolo (1630), depicting Apollo's crowning of the poets of Spain on Helicon, which remains of interest as a guide to the poets and poetasters of the day; La Dorotea (1632), a thinly veiled chapter of autobiography cast in dialogue form that grows in critical esteem as the most mature and reflective of his writings; and, listed last because it provides a bridge and key to his plays, the Arte nuevo de hacer comedias en este tiempo. This verse apology rested on the sound Aristotelian principle that the dramatist's first duty is to hold and satisfy his audience: the comedia, he says in effect, had developed in response to what the Spanish public demanded of the theatre. The treatise is not close-knit or philosophically argued, but from it can be extracted a clear picture of the principles and conventions of a drama entitled to be called national, both in its close identification with the social values and emotional responses of the age and in its having evolved its own criteria where other nations were content to borrow.

Virtually all of the more important vegetables are known to have been cultivated among the ancient civilizations of either the Old or the New World. Some, such as the cucumber. potato, sweet corn (maize), and onion, have been so changed by cultivation that their wild ancestors can no longer be identified with cer-

Vegetables are usually classified on the basis of the part of the plant that is used for food. The root vegetables include beets, carrots, radishes, and turnips. Stem vegetables include asparagus and kohlrabi. Among the edible tubers, or underground stems, are girasoles (or Jerusalem artichokes), potatoes, and taro. The leaf and leafstalk vegetables include brussels sprouts, cabbage, celery, lettuce, rhubarb, and spinach. Among the bulb vegetables are garlic, leeks, and onions. The head, or flower, vegetables include artichokes, broccoli, and cauliflower. The fruits commonly considered vegetables by virtue of their use include beans, cucumbers, eggplant, okra, sweet corn, squash, peppers, and tomatoes.

Most fresh vegetables have a water content in excess of 70 percent, with only about 3.5 percent protein and less than 1 percent fat. Vegetables, however, are good sources of minerals, especially calcium and iron, and vitamins, principally A and C.

Modern vegetable farming ranges from smallscale, low-technology production and local sale to vast commercial operations utilizing the latest advances in automation and technology. The large majority of vegetables are planted by seeding in the fields where they are to be grown, but occasionally they are germinated in a nursery or greenhouse and transplanted as seedlings to the field. During the growing season herbicides, pesticides, and fungicides are commonly used to inhibit damage by weeds, insects, and diseases, respectively. Harvesting operations are usually mechanized in welldeveloped nations, but the practice of harvesting by hand is still employed in some areas or is used in conjunction with machine operations. Other concerns of the vegetable farmer are post-harvest storage, which may require both large bins and silos as well as refrigerated facilities, and product marketing.

In addition to their primary value as food crops, vegetables are also cultivated for processing into such products as animal feeds, oils, starch, sugar, and food colouring and

other additives.

vegetarianism, theory or practice of living solely upon vegetables, fruits, grains, and nuts, generally for ethical, ascetic, or nutritional reasons. Meat, fowl, and fish are excluded from all vegetarian diets, but some vegetarians use milk and milk products; those in the modern West usually eat eggs also, but most vegetarians in India exclude them, as did those in the classical Mediterranean lands. Vegetarians who exclude animal products altogether have taken the name vegans, and those who use milk products are sometimes called lactovegetarians. Among some agricultural peoples the eating of flesh has been infrequent except among the privileged classes; such people have rather misleadingly been called vegetarians.

rather misleadingly been called vegetarians.

Ancient period. Deliberate avoidance of flesh eating probably first appeared sporadically in ritual connections, either as a temporary purification or as qualification for a priestly function. Advocacy of a fleshless diet for normal use began around the middle of the 1st millennium BC more or less simultaneously, and probably independently, in India and in eastern Mediterranean lands as part of the philosophical awakening of the time. In the Mediterranean lands, avoidance of flesh eating is first recorded as a teaching of Pythagoras of Samos (fl. 530 BC) and his followers. The Pythagoreans generalized certain Orphic ritual restrictions—they rejected not only flesh but beans and mallows-and may have been influenced by Egyptian priestly customs or even by individual thinkers in the Fertile Crescent. The Pythagoreans alleged the kinship of all animals as one basis for human benevolence toward other creatures, which should not be killed for food. From Plato onward many pagan philosophers (e.g., Epicurus, Plutarch) and particularly the Neoplatonists recommended a fleshless diet; the idea carried with it condemnation of bloody sacrifices in worship and was often associated with belief in reincarnation of souls—and, more generally, with a search for principles of cosmic harmony in accord with which human beings could live. In India the Buddhists and Jains refused to kill animals for food, on ethical and ascetic grounds: the human being should not inflict harm on any sentient creature. The idea was soon taken up also in Brahman circles, and was applied especially to the cow; as in Mediterranean thought, the idea carried with it condemnation of bloody sacrifices and was often associated with a sense of cosmic harmonies.

In later centuries vegetarianism had a differing fate in the Indic and the Mediterranean spheres. In India itself, though Buddhism gradually declined, the ideal of harmlessness (ahimsā), with its corollary of a fleshless diet, spread steadily in the 1st millennium AD until many of the upper castes (especially of Vaisnava faith), and even some of the lower, had adopted it. Beyond India it was carried, with Buddhism, widely northward and eastward, as far as China and Japan; but less conscientious Buddhists limited themselves to avoiding the killing of animals and would eat of a carcass if someone else supplied it. In some countries, fish were included in an otherwise fleshless diet.

West of the Indus, the monotheistic traditions that came to power were less favourable to vegetarianism. In the Hebrew Bible, however, is recorded the belief that in Paradise the earliest human beings had not eaten flesh: that it was permitted only after Noah's flood and even then the blood in it, as being the life

of it, was not to be consumed. Ascetic Jewish groups and some early Christian leaders disapproved of flesh eating as a luxury, gluttonous, cruel, and expensive. Some Christian monastic orders ruled out flesh eating, and its avoidance has been a penance even for lay persons. Many Muslims have been hostile to vegetarianism, yet some Muslim Sūfī mystics (who became the chief guides of Muslim spiritual life) recommended a meatless diet for spiritual seekers. Akbar, the 16th-century Muslim emperor in India, recommended a fleshless diet as a Sūfī custom.

Modern period. With the transformation of Western and then world life in modern times, vegetarianism too entered a new phase. As part of the humanitarianism of the 17th and 18th centuries in Europe, with its confidence in moral progress, sensitiveness to animal suffering was revived and with it the Pythagorean disapproval of flesh eating. Certain Protestant groups came to the fleshless diet by way of their perfectionistic reading of the Bible. Persons of diverse philosophic views advocated vegetarianism-for example, Voltaire praised, and Shelley and Thoreau practiced, the diet. Vegetarians of the early 19th century usually condemned the use of alcohol as well as flesh and appealed as much to the nutritional advantages of light fare, in contrast with the rich and heavy meat diet of that day, as they did to ethical sensibilities. Some advocated only what could be eaten without cooking. As always, vegetarianism tended to be combined with other efforts toward a humane and a cosmically harmonious way of life.

During the 19th century the movement began to produce results even among nonvegetarians. By the early 20th century it was contributing substantially to the drive to vary and lighten the nonvegetarian person's dietespecially in English-speaking countries; such foods as peanut butter and cornflakes were invented by vegetarians in the United States. In some places a vegetarian diet was regarded simply as one among many regimens indicated for specific disorders. Elsewhere, in contrast, and notably in Germany, the fleshless diet was regarded as but one element in vegetarianism, which was expected to be a comprehensive reform of life habits in the direction of simplicity and healthfulness-the term being derived (by such vegetarians) not from "vegetable food" but directly from the Latin vegetus, meaning "active, vigorous."

The vegetarian movement as a whole was always carried forward by ethically inclined individuals, such as (in modern times) Leo Tolstoy and George Bernard Shaw, and by certain religious sects, such as the Seventh-Day Adventists and the Theosophists; but special institutions have grown up to express vegetarian concerns as such. The Bible Christian sect of England and the United States (Philadelphia) took the lead in establishing national vegetarian societies, each publishing its own journal; the first such society was formed in England in 1847. An international federation of vegetarian societies was founded tentatively in 1889 and more enduringly in 1908, as the International Vegetarian Union; in later years Westerners were joined in this by some vegetarians of the Indic and Buddhist traditions. Vegetarian restaurants, schools, and rest homes have sprung up, especially in certain European countries (in India, the railroads necessarily developed a double restaurant system, vegetarian and nonvegetarian). In the West a special industry processes high-protein vegetable foods to simulate various meats in form and flavour, so as to ease the transition from the accustomed flesh eating; and "health food" stores offer products conforming to vegetarian tastes. To the same end, vegetarian societies publish recipes which, ever since the importance of protein was recognized, have centred on the tasty use of legumes, nuts, cheeses, and eggs. The Science Council of the

International Vegetarian Union abstracts articles from scientific journals that may bear upon efforts to develop foods and medicines that would be more consistent with vegetarian ethical standards.

Vegetius, in full FLAVIUS VEGETIUS RENATUS (fl. 4th century AD), Roman military expert who wrote what many authorities consider the single most influential military treatise in the Western world. His work exercised great influence on European tactics after the Middle Ages.

A patrician and reformer with little actual military experience, Vegetius lived in an era when cavalry and foreign auxiliary levies had diluted and corrupted the traditional legionary formation, which had been based on a disciplined infantry and cohesive organization. His treatise Rei militaris instituta, also called Epitoma rei militaris, advocated a revival of the old system but had almost no influence on the decaying military forces of the later Roman Empire. His rules on siege craft, however, were studied during the Middle Ages, and, after the crossbow, the longbow, gunpowder, and the pike had deprived cavalry of much of its shock power, Vegetius' work became, and remained for centuries, the military bible of Europe. Vegetius' emphasis on constant drill, severe discipline, the use of reserves, the gathering of intelligence, encirclement, and the use of terrain features helped to transform Western warfare from a capricious game played by aristocrats to the efficient destructive force it became after the Renaissance.

vehicular safety devices, seat belts, harnesses, inflatable cushions, and other devices designed to protect occupants of vehicles from injury in case of accident. A seat belt is a strap that fastens a rider to a moving vehicle and prevents him from being thrown out or against the interior of the vehicle during sudden stops.

The first patent for a restraining belt designed to protect passengers in road vehicles was granted to E.J. Claghorn in 1885. The first lap-type belt resembling the modern seat belt was a leather strap used on a United States Army airplane in 1910, and for the next 25 years seat belts were used primarily on aircraft. In the 1940s tests demonstrated that the severity of head injuries could be substantially reduced by holding the body in place with a seat belt, and some seat belts for automobiles were manufactured in the early 1950s. Common automobile restraint systems developed by the early 1970s were lap belts, anchored to the car underbody, to keep the rider from sliding forward; and shoulder harnesses, anchored to the car underbody and the roof rail, to keep the rider from jackknifing into the instrument panel. These fabric belts were provided with quick attach-and-release buckles and were able to withstand loads of 6,000 pounds (2,700 kilograms). Despite convincing evidence of the value of seat belts, however, motorists in all countries were apathetic, and only the passage of legislation caused seat belts to appear universally in automobiles. Even then, widespread failure by drivers and passengers to make use of the belts led to developmental work on passive-restraint systems.

Passive-restraint devices protect drivers and passengers without any action on their part. Among those tested was the air bag, an inflatable pillow-like cushion stored in the instrument panel and triggered to inflate in a fraction of a second by the force of impact, cushioning and absorbing the energy of the rider and then deflating.

Other important safety devices used on au-

tomobiles and other vehicles include safety glass, the newer types of which deflect without breaking under severe stress; improved door locks that keep doors closed under severe conditions; and collapsible steering columns that telescope under impact, absorbing energy.

Veii, modern VEIO, ancient Etruscan town, located about 10 miles northwest of Rome. Veii was the greatest centre for the fabrication of terra-cotta sculptures in Etruria in the 6th century Bc. The town had hegemony over Rome in the 7th and 6th centuries; a subsequent series of wars ended in the destruction of Veii (396 Bc). Its destruction was not total, however, and the Romans later reconstructed

the city. Under Augustus it was made a *municipium*, and up to the 3rd century AD it continued as a religious centre.

In origin, Veii appears to have been a conglomeration of Villanovan villages during the 9th and 8th centuries BC, the graveyards of which occupied the rocky plains around the city. One of the chambered tombs, the Grotta Campana, contains the oldest known Etruscan frescoes. The ashes of the dead were stored in burial urns surmounted by archaic terracotta portrait heads. Nearby are the remains of the Temple of Apollo, home of the terracotta statue of the "Apollo of Veii" and also a temple shrine dedicated to the neighbouring Cremera River.

vein, in geology, ore body that is disseminated within definite boundaries in unwanted rock or minerals (gangue). The term, as used by geologists, is nearly synonymous with the term lode, as used by miners. There are two distinct types: fissure veins and ladder veins.

Fissure veins, the earliest described bedrock deposits, occupy one or more fissures; they are tabular, with two dimensions much greater than the third. Fissure veins are formed in two stages, sometimes greatly separated in time; first the fissure is formed, and then it is filled with ore. There are several varieties: simple, with relatively straight, parallel walls; chambered, with irregular, fragmented walls; chambered, with irregular, fragmented walls; chambered, with irregular, with fat lenses in a string or roughly parallel in schists; sheeted, with several distinct, closely spaced, parallel fractures; and composite, with several roughly parallel fissures and connecting diagonals in partially replaced rock.

Ladder veins are short, rather regularly spaced, roughly parallel fractures that traverse dikes (tabular bodies of igneous rocks) from wall to wall. Their width is restricted to the width of the dike, but they may extend great

distances along it. Ladder veins are not as numerous or important as fissure veins.

vein, in physiology, any of the vessels that, with four exceptions, carry oxygen-depleted blood to the right upper chamber (atrium) of the heart. The four exceptions—the pulmonary veins—transport oxygenated blood from the lungs to the left upper chamber of the heart. The oxygen-depleted blood transported by most veins is collected from the networks of microscopic vessels called capillaries by thread-sized veins called venules.

For a depiction of many of the veins in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

As in the arteries, the walls of veins have three layers, or coats: an inner layer, or tunica intima; a middle layer, or tunica media; and an outer layer, or tunica adventitia. Each coat has a number of sublayers. The tunica intima differs from the inner layer of an artery: many veins, particularly in the arms and legs, have valves to prevent backflow of blood, and the elastic membrane lining the artery is absent in the vein, which consists primarily of endothelium and scant connective tissue. The tunica media, which in an artery is composed of muscle and elastic fibres, is thinner in a vein and contains less muscle and elastic tissue, and proportionately more collagen fibres (collagen, a fibrous protein, is the main supporting element in connective tissue). The outer layer (tunica adventitia) consists chiefly of connective tissue and is the thickest layer of the vein. As in arteries, there are tiny vessels called vasa vasorum that supply blood to the walls of the veins and other minute vessels that carry blood away. Veins are more numerous than arteries and have thinner walls owing to lower blood pressure. They tend to parallel the course of arteries. See also artery; capillary.

Vejle, city and port, seat of Vejle amtskommune (county), eastern Jutland, Denmark, located on Vejle Fjord, northwest of Fredericia. Chartered in 1327, it is now an agricultural distribution centre with good harbour facilities. Predominantly a textile-producing centre, it also produces foundry iron, hardware, canned goods, and toys. The church of St. Nikolaj dates from the 13th century, and there is a city museum. The amtskommune, on the Little Belt (area 1,155 sq mi [2,991 sq km]), comprises picturesque, hilly country with beech forests. Fertile soil in the east supports vegetable and dairy farming and cattle breeding. Other cities are Fredericia, Horsens, and Kolding (qq.v.).

At Jelling, 9 mi (14 km) northwest of Vejle, are the 10th-century burial mounds of King Gorm and Queen Thyra, with two runic stones in their memory. Pop. (1982 est.) city, 43,534; (1983 est.) mun., 49,709; (1983 est.) amtskommune, 327,102.

Vejovis, also spelled VEDIOVIS, or VEDIVS, in Roman religion, a god of uncertain attributes, worshiped at Rome between the two summits of the Capitoline Hill (the Arx and the Capitol) and on Tiber Island (both temples date from just after 200 BC) and at Bovillae, 12 miles southeast of Rome. His name may be connected with that of Jupiter (Jovis), but there is little agreement as to its meaning: he may be a "little Jupiter" or a "sinister Jupiter" or "the opposite of Jupiter" (i.e., a chthonic, or underworld, god). The last seems most likely, since his offering was a she-goat humano ritu; the term humano ritu has been defined both as on behalf of the dead and as a substitute for a human sacrifice.

Vela, any of a series of 12 unmanned U.S. reconnaissance satellites developed to detect radiation from nuclear explosions in the Earth's atmosphere. Launched from 1963 to 1970, the Vela satellites were supposed to make certain that no countries violated the 1963 international treaty banning the testing of nuclear weapons on the ground or in the atmosphere. Although their primary function was military reconnaissance, the Velas made several significant astronomical discoveries, including the detection of a powerful X-ray source between the constellations Centaurus and Lupus.

Each Vela spacecraft carried radiation detectors sensitive to X-ray and gamma-ray emissions. The satellites were always launched in pairs to an orbit of more than 60,000 miles (96,000 kilometres) above the Earth. The first twin craft were orbited on Oct. 17, 1963. By 1967 an advanced version of the satellite had been developed. The new model was equipped with more sophisticated detection instruments and was designed to continually point toward the Earth, unlike the earlier version, which viewed the heavens as well. The first pair of advanced Vela satellites was orbited on April 28, 1967. The last two pairs in the series were launched in 1969 and 1970.

velarization, in phonetics, secondary articulation in the pronunciation of consonants, in which the tongue is drawn far up and back in the mouth (toward the velum, or soft palate), as if to pronounce a back vowel such as o or u. Velarization is not phonemic in English, although for most English speakers the l in "feel" is velarized, but the l in "leaf" is not. It is distinctive in some languages (e.g., Arabic). Velarized consonants may be distinguished from velar consonants, in which the primary articulation involves the back of the tongue and the velum; in velarized consonants there must always be some other primary articulation.

Velasco Alvarado, Juan (b. June 16, 1910, Piura, Peru—d. Dec. 24, 1977, Lima), president of Peru from 1968 until 1975.

Formerly commander in chief of the Army, Velasco came to power by overthrowing Pres. Fernando Belaúnde Terry. His revolutionary military government was unique among modern Latin-American military regimes for its reformist and populist character and was responsible for sweeping changes in Peruvian society. The government limited U.S. economic influence in Peru, nationalized transportation, communications, and electric power, and converted millions of acres of privately owned farms into worker-managed cooperatives. Velasco successfully defied U.S. interests in 1968 by seizing the La Brea and Pariñas oil fields without compensating the owners (International Petroleum Co., a subsidiary of Standard Oil Company of New Jersey, later Exxon) and again in 1969, when he ordered U.S. boats fishing within the 200-mile coastal limit captured and fined. When the United States retaliated by temporarily suspending arms sales, he re-torted, "Let them send the Marines as they did in Santo Domingo. We will defend ourselves with rocks if necessary." Velasco's government also instituted tax reforms and a new constitution and established diplomatic relations with the major Communist countries. Under Velasco's rule, Peru advocated the removal of the Organization of American States' sanctions against Cuba and sought Latin-American unity against U.S. power and influence. Velasco was deposed by Gen. Francisco Morales Bermúdez, his prime minister and war minister, in August 1975 in response to popular discontent with the regime's reluctance to allow more political participation and because of illnesses that severely limited Velasco's activity as president.

Velasco Ibarra, José María (b. March 19, 1893, Quito, Ecuador—d. March 30,

1979, Quito), lawyer, major political figure in Ecuador from the 1930s to the 1970s, and five times president of Ecuador.

Velasco Ibarra was born into a wealthy family and educated in Quito and Paris. He held various public posts before being elected president as the Conservative Party's candidate in 1933, assuming office in 1934. His economicdevelopment plans, which included the proposed division of large landed estates, failed to win the support of Congress, and he responded by assuming dictatorial powers, imprisoning opposition leaders, and censoring the press. He was deposed in 1935 by Army leaders after 11 months in office and went into exile in Colombia until 1944, when he returned to Ecuador at the head of a multiparty coalition to take over the presidency from Carlos Arroyo, who resigned under popular pressure. Economic difficulties and repressive policies caused his liberal supporters to desert him, and again he was forced into exile in 1947. This time he went to Argentina.

He returned to Ecuador and was elected president in 1952 and served his only full four-year term. During this term he reorganized the diplomatic corps and supported price controls, public works, and aid to agriculture and industry. Elected for a fourth time, in 1960, he promised land reform and higher wages. He was deposed again in 1961, reelected to his last term in 1968, and proclaimed a military-backed dictatorship two years later, but he was deposed by the military in 1972 before his term expired. He spent most of the remainder of his life in exile in Argentina, returning a month before he died.

Velasco Ibarra wrote several books on statecraft and in 1952 described himself as a neoliberal representing a "third position between capitalism and communism."

Velázquez, Diego (Rodríguez de Silva) (baptized June 6, 1599, Seville—d. Aug. 6, 1660, Madrid), major Spanish painter of the 17th century, a giant of Western art. His early works were naturalistic religious or genre scenes. He evolved a rich, expressionistic style. Absorption of Italian influences culminated in the heightened realism of his final masterpieces.

A brief account of the life and works of Diego Velázquez follows; for a full biography, see MACROPAEDIA: Velázquez.

In 1611 Velázquez was apprenticed to the Mannerist painter Francisco Pacheco in Seville and developed a naturalistic style. His early subjects were mostly religious or genre, and he popularized a new type of composition, the bodegón, a kitchen scene with prominent still life (e.g., "Old Woman Frying Eggs," 1618). Appointed court painter in 1623, he portrayed the royal family, including Philip IV, in many major works. In his early court portraits he was influenced by Titian but subsequently adopted something of the elaborate decor and richer colouring of Rubens; "Los Borrachos" (c. 1628-29) appears to have been inspired by both masters. Velázquez' first journey to Italy, in 1629, resulted in a development of his treatment of space, perspective, light, and colour that marked a new phase in his lifelong pursuit of the truthful rendering of visual appearance. Major works of his middle years include "The Coronation of the Virgin" (c. 1641–42) and "Philip IV at Fraga" (1644). During his second visit to Italy, in 1649, he painted the great portrait of Innocent X. Among many paintings of his later years are "The Toilet of Venus" ("The Rokeby Venus," c. 1651) and "The Infanta Margarita in a Pink Dress" (1653-54).

The number of documents relating to his paintings are relatively few, and as he seldom signed or dated his works their identification and chronology has often to be based on stylistic evidence alone. Though many copies of his portraits were evidently made in his studio by assistants, his own production was not large, and his surviving autograph paintings probably number less than 150. He is known to have worked slowly, and during his later years much of his time was occupied by his duties as court official in Madrid.

Velázquez de Cuéllar, Diego (b. c. 1465, Cuéllar, Spain—d. 1524, Santiago de Cuba, Cuba), conquistador and first Spanish governor of Cuba.

Velázquez sailed to the New World in 1493 on the second voyage of Christopher Columbus. Columbus' eldest son, Diego Columbus, later entrusted Velázquez with the conquest of Cuba under the title of adelantado (governor) and, with Hernán Cortés, Velázquez departed for Cuba in 1511. In the next four years he founded the settlements of Baracoa, Bayamo, Santiago de Cuba, and Havana (La Habana). After his conquests were completed about 1514, he encouraged colonization and became governor of Cuba.

Velázquez organized the exploration of the coasts of the Yucatán Peninsula and the Gulf of Mexico led by Hernández de Córdoba (1517) and Juan de Grijalba (1518), and in 1518 he appointed Cortés leader of a new expedition to conquer the mainland of Mexico. Velázquez became suspicious of the independent-minded Cortés and rescinded the order; Cortés sailed without permission in 1519, and Velázquez sent two unsuccessful expeditions against him. One was so badly defeated that its commander, Pánfilo de Narváez, and his army went over to Cortés' side.

Velázquez complained to the Spanish court, but, after Aztec riches started to arrive from Mexico, he was instructed to ignore Cortés.

Velch (ancient city, Italy): see Vulci.

veld (Dutch and Afrikaans: "field"), open country in southern Africa used for pasturage and farmland.

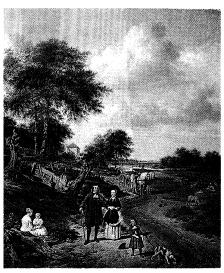

The following article summarizes information about the veld; for full details, see MACROPAEDIA: Africa.

The major regions of the veld may be distinguished on the basis of elevation: the Highveld is mostly composed of land between 4,000 and 6,000 ft (1,200 and 1,800 m); the Middle Veld regions lie between 2,000 and 4,000 ft; the Lowveld lies between 500 and 2,000 ft. The ecological zones comprising the veld may also be distinguished on the basis of their characteristic vegetation, such as bush veld, thorn veld, or grass veld; however, the boundaries between these different varieties are frequently vague. The Highveld comprises most of the high plateau country of South Africa, Botswana, Lesotho, and Zimbabwe. Throughout the Highveld, soils tend to be thin, poor, and powdery and thus easily carried away by both wind and water erosion. The Middle Veld encompasses a vast and geologically complex region in the Cape of Good Hope province and in South West Africa/Namibia. Most of it has a stony or rock surface underlain by Precambrian rocks. There are two areas of Lowveld, one in eastern Transvaal and Swaziland and the other in southeastern Zimbabwe. The soils of the Lowveld are more fertile than those of the other veld regions because they are well supplied with basic minerals and are more retentive of moisture. The characteristic elements of a veld climate are medium or light rainfall, mild or warm winters, hot or very hot summers with moderate or considerable variations in daily temperatures, and abundant sunshine. The grass veld vegetation, dominated by species of red grass, is characteristic of South African Highveld; the Middle Veld favours both red grasses and more droughtresistant species; and the Lowveld supports a parklike plant cover with acacia and maroola

trees and many varieties of grasses dominant. Mass slaughter and poaching have thinned out every major species of mammal and repitle and several species of birds. These survive only in or near protected areas such as Kruger National Park in Transvaal. The veld is among the world's oldest inhabited regions and forms one of the areas most suitable for settlement on the African continent. The Highveld, in particular, has long attracted migrants as well as settlers because of its generally open land, easy gradients, abundant food supply, and available water.

Velde, Adriaen van de (b. Nov. 30, 1636, Amsterdam—d. Jan. 21, 1672, Amsterdam), Dutch painter who specialized in landscapes and animals.

He was the son of a well-known marine painter, Willem van de Velde the Elder, who

was probably his first teacher. He also studied at Haarlem. The southern atmosphere and the classical quality of van de Velde's forms suggest Italian influences, probably the result of contact with Dutch artists who had been to Rome. He was occasionally called upon to paint the figures in landscapes by Jacob van Ruisdael, Meindert Hobbema, and others. He also executed etchings and drawings of landscapes with animals. Among his most original paintings are beach scenes, such as "View of the Seashore" (Mauritshuis, The Hague).

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Velde, Esaias van de (b. 1590/91, Amsterdam—buried Nov. 18, 1630, The Hague), painter, draftsman, and etcher who was one of the founders of the realist school of Dutch landscape painting in the early decades of the 17th century.

He arrived in Haarlem in 1610, when such artists as Willem Buytewech, Frans Hals, and Hercules Seghers were active there. He reduced the number of figures and the strong local colours traditional in 16th-century northern landscape painting, achieving a new unity of atmosphere and tone. After 1618 he settled at The Hague. Such paintings as "View of Zierikzee" (1618; Staatliche Museen Preussischer Kulturbesitz, Berlin-Dahlem) and etchings such as "The Gallows" exemplify van de Velde's importance for the progressive landscape style. His most important pupil was Jan van Goyen, whose tonal landscapes were strongly influenced by the works of his teacher.

His son Esaias van de Velde the Younger was also a painter.

Velde, Henry (Clemens) van de (b. April 3, 1863, Antwerp—d. Oct. 25, 1957, Zürich), Belgian architect and teacher, who ranks with his compatriot Victor Horta as an originator of the Art Nouveau style, characterized by long sinuous lines, usually derived from naturalistic forms.

By designing furniture and interiors for the Paris art galleries of Samuel Bing in 1896, van de Velde was responsible for bringing the Art Nouveau style to Paris. He was not, however, interested in the style as such but rather in the philosophy of William Morris and the Arts and Crafts movement in England. His most vital contributions to modern design were made as a teacher in Germany, where his name became known through the exhibition of furnished interiors at Dresden in 1897.

In 1902 he went to Weimar as artistic adviser to the grand duke of Saxe-Weimar, reorganized the Kunstgewerbeschule (arts-andcrafts school) and the academy of fine art, and thus laid the foundations for Walter Gropius' amalgamation of the two bodies into the Bauhaus in 1919. Like the progressive German designers at the time, van de Velde was connected with the Deutscher Werkbund, designing the theatre for the Werkbund Exposition in Cologne in 1914.

Despite official appointments in Belgium, van de Velde after 1918 made no further contributions to architecture or design. A valuable extract from his *Memoirs* (1891–1901) was published in the *Architectural Review*, 112:143–148 (September 1952).

Velenje, town, northern Slovenia, Yugoslavia, located 12 miles (19 km) northwest of Celje on the Paka River. Velenje was built as a model mining-workers' town with distinct administrative, business, residential, and recreational areas. It is adjacent to an important lignite mine in the Celje coal basin. There is a power plant, a chemical works, an electrical machinery factory, and a mining school. Pop. (1981 prelim.) mun., 38,041.

Vélez de Guevara, Luis (b. July 1579, Ecija, Spain—d. Nov. 10, 1644, Madrid), Spanish poet, playwright, and novelist, who ranks high among the followers of Lope de Vega and displays a gift for creating character. His fantastic satirical novel, El diablo cojuelo (1641;

"The Crippled Devil"), became well-known from its adaptation by the French dramatist Alain Lesage as *Le Diable boiteux* (1707).

After soldiering in Italy, Vélez held various posts in noble and royal households, becoming a favourite of Philip IV of Spain. He was a remarkably successful playwright, composing more than 400 plays, several of which were based on those of Lope. A careless but entertaining playwright, he was called Quitapesares ("Care Dispeller") by Miguel de Cervantes for the gaiety and animation of his work. Unfortunately his productivity brought him little reward; constantly in debt, he eventually died in poverty.

El diablo cojuelo is an extraordinarily difficult book, abounding in complicated wordplay and written in a tense, equivocal style. The more accessible French version eventually brought it a European audience.

Velia (ancient city): see Elea.

veliger, larva typical of certain mollusks such as marine snails and bivalves. The veliger develops from trochophore (q,v) larva and has large, ciliated lobes (velum) that form from the ciliary ring (prototroch) characteristic of the trochophore stage. The velum, used in swimming and feeding, generally disappears in the adult. During the veliger stage, the mollusk begins to develop a foot and shell.

Velika Morava (Yugoslavia): see Morava River.

Velikiye Luki, also spelled Velikie Luki, or Velikije Luki, city, Pskov oblast (province), western Russian Soviet Federated Socialist Republic, situated on the Lovat River. Founded by 1166, the city was sacked by Lithuanians in 1198, by King Stephen Báthory of Poland in 1581, and by the Swedes in 1611. Today an important railway junction, it has industries that include locomotive and rolling-stock repair, engineering, and consumer-goods production. Pop. (1987 est.) 113,000.

Veliko Türnovo, formerly (until 1965) TÜRNOVO, also spelled TURNOVO, TÄRNOVO, TRNOVO,

dour, but most of the relics were destroyed by the Turks or by the earthquake of 1911. Ruins of the medieval town have been excavated on the Trapezitsa and Tsarevets hills; the latter, the home of the Bulgarian tsars, is surrounded by thick walls and defenses and accessible only by a drawbridge. Much of the town has been restored as a national historical and cultural monument, with maximum retention of old architecture and town layout.

Once a prehistoric settlement, Tŭrnovo was later the site of a Roman fortress, probably on Carewec Hill. The Second Bulgarian Empire was proclaimed at Tŭrnovo in 1185, and it remained the imperial capital until 1393, when it was sacked and burned by the Turks. Throughout Ottoman rule it was a cultural and educational centre, a prosperous trading town, and a focus of Bulgarian resistance. Numerous notable personalities in Bulgarian arts, crafts, and sciences lived and worked in Tŭrnovo.

Uprisings against the Turks broke out several times. The first Bulgarian constitution was drafted and passed in Türnovo in 1879, and there the independent Kingdom of Bulgaria was proclaimed in 1908 in the Church of the Forty Martyrs (built in 1230 by the emperor Ivan Asen II). Notable also is the 14th-century Church of St. Peter and St. Paul. Among the 11 monasteries located in the area is Sveta Troitsa ("Holy Trinity"), in which Eftimi, the last Bulgarian patriarch (1374–93), wrote extensively. The town has an archaeological museum.

Present-day Veliko Tŭrnovo ("Great Tŭrnovo") has a light-industrial base, specializing in foodstuffs and beverages, consumer items, furniture, and textiles. It remains a craft centre. To the northeast is Gorna Oryakhovitsa, the rail junction for Sofia and Varna, site of a regional airport for domestic service, and an important market-gardening centre. Pop. (1987 est.) 70,610.

Velikonda Range, range of hills of southeastern Andhra Pradesh state, southern India. They trend north to south and form the eastern flank of the Eastern Ghāts, which at that point are strongly folded and faulted. The Velikondas are assumed to have been elevated during the Cambrian period (570 to 505 million years ago). They are relics of ancient mountains that were eroded and dissected by numerous streams. Rivers find their way through the hills by narrow gaps, usually marked by rapids. The main railway from Madras to Bombay runs along the corridor formed by the Penner River between the Velikondas and the Pālkonda hills to the south. The Velikondas reach an elevation of 2,500 to 3,000 feet (750 to 900 m) but are sparsely wooded and almost devoid of human population except for a few scattered groups of aboriginal Chenchus. The valleys, however, are moderately populated. The narrowness of the corridors through the hills has permitted the streams to be dammed and storage tanks to be built, making a certain amount of cultivation and irrigation possible. Peanuts (groundnuts) and jowar (sorghum) are the main crops.

Velikovsky, Immanuel (b. June 10, 1895, Vitebsk, Russia [now in Belorussian S.S.R.]—d. Nov. 17, 1979, Princeton, N.J., U.S.), American writer, proponent of controversial theories of cosmogony and history.

Educated at the universities in Edinburgh, Kharkov, and Moscow (M.D., 1921), he practiced medicine in Palestine and then studied psychology in Zürich and (from 1933) Vienna. After examining legends of the ancient Jews and other eastern Mediterranean peoples, he concluded that some tales described actual occurrences and were not mere myths or allegories. In the United States from 1939, he

expanded the geographic scope of his study of ancient documents. In his first book, Worlds in Collision (1950), he hypothesized that in historical times an electromagnetic derangement of the solar system caused Venus and Mars to approach the Earth closely, disturbing its rotation, axis inclination, and magnetic field. Later works are Ages in Chaos (1952), revising the chronology of the pre-Christian Middle East; Earth in Upheaval (1955), adducing geological and paleontological evidence supporting his belief that catastrophes have overwhelmed the Earth; Oedipus and Akhnaton (1960), linking Egyptian history with Greek mythology; and Peoples of the Sea (1977), identifying Ramses III with Nectanebo, pharaohs otherwise dated 800 years apart.

The animosity of the American scientific community toward Worlds in Collision caused the original publisher, threatened with a boycott of its scientific-textbook division, to turn Velikovsky's work over to a firm not involved in textbook publishing.

Veliky Ustyug, also spelled VELIKY USTIUG, city, Vologda oblast (province), northwestern Russian Soviet Federated Socialist Republic, a port on the Sukhona River. One of the oldest settlements of European Russia, mentioned in documents from 1218, it was an important trading centre on the Moscow-Arkhangelsk road in the 16th century and later was renowned for painting and silverworking. Still noted for silver handicrafts, it now has numerous industries, especially brush making. Fine examples of 17th-century architecture remain. Pop. (1970) 36,737.

Velleius Paterculus (b. c. 19 BC—d. after AD 30), Roman soldier, political figure, and historian whose work on Rome is an important source for the principates of Augustus and Tiberius.

Velleius Paterculus' father was of equestrian status, and his mother belonged to a distinguished Campanian family. He served as military tribune in Thrace, Macedonia, Greece, and the East and in AD 2 was present at the interview on the Euphrates between Gaius Caesar (later the emperor Caligula) and the Parthian king Phraates V. Later, as prefect of cavalry and legatus, he served for eight years (from AD 4) in Germany and in Pannonia under Tiberius. He was quaestor in AD 7 and praetor in 15 and was still alive in 30, for he dedicated his work to Marcus Vinicius as consul for that year.

Velleius Paterculus wrote a compendium of Roman history from the origins to AD 29. The period from the death of Julius Caesar to that of Augustus is treated most fully, and the achievements of Tiberius are described in eulogistic terms. His style is that of the Silver Age, employing antithesis, epigram, and rhetorical embellishment.

Vellore, town, Tamil Nādu state, southern India, located on the Pālār River, southwest of Madras. A notable feature of the town is its fort (see Vellore Mutiny). The town played an important role during the Marāṭhā, Muslim, and British wars of the 17th and 18th centuries. Although its cigar and bell-metal manufactures have continued, the town has also developed as a Christian medical centre and contains one of the largest and best-equipped hospitals in India. It has medical and nursing colleges and several other colleges, all affiliated with the University of Madras. Pop. (1981) town, 174,247; metropolitan area, 247,041.

Vellore Mutiny (May 10, 1806), outbreak against the British by South Indian troops, who broke into the fort at Vellore, where the sons of Tippu Sultan of Mysore had been lodged since their surrender at Seringapatam in 1799. The outbreak, though it was encouraged by the Mysore princes, was caused basically by resentment at changes in headgear and shaving style and the prohibition of ornaments and caste marks.

Little effort was made by the British to reassure the men or listen to their grievances, and about 130 British troops were killed before the fort was recovered, within hours, by a force under Colonel Robert Gillespie. The affair alarmed the British because of its connection with the Mysore princes, who were thereupon removed to Calcutta. William Bentinck, the governor of Madras, was recalled for what was really the negligence of the commander in chief.

Velnias, also called Velinas, or Vels (Lithuanian), Latvian Velns, in Baltic folklore, the god of the *vėles*, the "phantoms of the dead" (Latvian *velis*, "zombie"). He is a one-eyed, prophetic trickster capable of raising whirlwinds and leading the host of the dead through the skies. Velnias is akin in type to the Germanic Wodan (Scandinavian: Odin) and is identical with the god Patollo, or Pickollos, of early Old Prussian and Lithuanian sources.

velocipede, version of the bicycle reinvented in the 1860s by the Michaux family of Paris. Its iron and wood construction and lack of springs earned it the nickname boneshaker. It was driven by pedaling cranks on the front axle. To increase the distance covered for each turn of the cranks, the front wheel was enlarged until, finally, in the ordinary, or pennyfarthing, bicycle, the wheel would just go under the crotch of the rider. The penny-farthing nickname came from the smallest and largest British coins of the time, in reference to the disparity in the size of the wheels. By the second half of the 20th century, the original meaning was restricted to those knowledgeable in the history of the bicycle, while to others it referred to a children's tricycle, which duplicates the differentiated wheel size. The velocipede was eventually replaced by the more stable safety bicycle, having a chaindriven rear wheel.

velocity, quantity that designates how fast and in what direction a point is moving. Because it has direction as well as magnitude, velocity is known as a vector quantity and cannot be specified completely by a number, as can be done with time or length, which are scalar quantities. Like all vectors, velocity is represented graphically by a directed line segment (arrow) the length of which is proportional to its magnitude.

A point always moves in a direction that is tangent to its path; for a circular path, for example, its direction at any instant is perpendicular to a line from the point to the centre of the circle (a radius). The magnitude of the velocity (i.e., the speed) is the time rate at which the point is moving along its path.

If a point moves a certain distance along its path in a given time interval, its average speed during the interval is equal to the distance moved divided by the time taken. A train that travels 100 km in 2 hours, for example, has an average speed of 50 km per hour.

During the two-hour interval, the speed of the train in the previous example may have varied considerably around the average. The speed of a point at any instant may be approximated by finding the average speed for a short time interval including the instant in question. The differential calculus, which was invented by Isaac Newton for this specific purpose, provides means for determining exact values of the instantaneous velocity.

Velsen, gemeente (commune), Noordholland provincie, western Netherlands, situated on the North Sea Canal, which connects Amsterdam with the North Sea. It embraces IJmuiden (the foreport of Amsterdam), Santpoort, Driehuis, and Velsen-Noord. A major centre of the Dutch steel industry, using raw materials imported by ship, it has blast furnaces and coke ovens, as well as metallurgical, chemical, and paper industries. It was considerably damaged in World War II, and reconstruction includes a new town hall (1965). Pop. (1987 est.) 56,802; Velsen-Beverwijk metropolitan area, 124,105.

velvet, in textiles, fabric having a short, dense pile, used in clothing and upholstery. The term derives from the Middle French velu, "shaggy." Velvet is made in the pile weave, of silk, cotton, or synthetic fibres, characterized by a soft, downy surface formed by clipped yarns. The wrong side of the fabric is smooth and shows the weave employed.

Velvets can be made water-repellent and crush-resistant. They are also occasionally patterned or embossed.

velvet ant, a solitary (nonsocial) wasp of the family Mutillidae, belonging to the order Hymenoptera, so called because the females are covered with dense hairs and, like ants, are wingless. Most species are brightly coloured, with yellow, orange, or red patterns, ranging

Velvet ant (Dasymutilla occidentalis)

in size from about 6 to 20 mm (about 0.25 to 0.80 inch). About 3,000 species are known, and they are most prevalent in the hot, dry regions of the Western Hemisphere.

Only the females have a sting, which is powerful. Both sexes make a squeaking sound by rubbing a special stridulating organ. Although most species are parasites of other bees and wasps, some parasitize flies or beetles. The female lays eggs in the cells in which the host lives—one egg per cell. In cool regions the larvae, which are external parasites on the immature host, pass the winter in the pupal

velvet crab, any of certain species in the swimming crab (q.v.) group.

velvet grass, also called YORKSHIRE FOG (Holcus lanatus), one of eight perennial grasses constituting the genus Holcus (family Poaceae), native to Europe and Africa. It has tufted flower clusters that may be white, green, pink, or purple.

Velvet grass, so called because the entire plant has a velvety feel when touched, was introduced into Australia and North America as a forage species. It now grows as a weed in damp places such as ditches, stream banks, and drainage areas.

velvet water bug, any member of the relatively rare insect family Hebridae (about 120 species) of the order Heteroptera. The small, plump insects are usually less than 3 millimetres (0.1 inch) long. Their body is covered with fine, velvetlike hairs.

Velvet water bugs can be found in freshwater habitats throughout the world and may be seen walking or running on the moist ground at the edge of a body of water or on the water surface

velveteen, in textiles, fabric with a short, dense pile surface and a smooth back, usually made of cotton and resembling velvet. It is made by the filling-pile method, in which the plain or twill weave is used as a base and extra fillings are floated over four or five warps. After weaving, the floats are cut, and their ends are brushed up to form a smooth pile about one-eighth inch long.

The fabric back is smooth and shows the basic weave. Velveteen has more body and is less easily draped than velvet. It imparts warmth and is used for women's and children's garments and also for draperies and bedspreads.

velvetleaf, any of various plants with soft, velvety leaves, particularly *Abutilon theophrasti*

Velvetleaf (Abutilon theophrasti)

Walter Dawn

(sometimes A. avicennae), commonly known as Indian mallow, an annual, hairy plant of the mallow family (Malvaceae). Native to southern Asia, A. theophrasti is cultivated in northern China for its fibre and is widely naturalized in warmer regions of North America, where it is often a weed. It grows 0.6–2.4 metres (2–8 feet) tall and has heart-shaped leaves and beaked seed pods.

velvety shore bug, any insect of the family Ochteridae (order Heteroptera), which numbers about 25 species. These insects resemble tiny toads, are about 4 or 5 millimetres (almost 0.2 inch) long, and live among plants near streams and ponds.

As indicated by their common name, the body surface is smooth and velvetlike. The front legs are slender and are developed for running.

vena cava, in air-breathing vertebrates, including humans, one of two major trunks, the superior and inferior venae cavae, that deliver oxygen-depleted blood to the right side of the heart. The superior vena cava drains the arms, head, and chest area above the diaphragm, with the exception of the heart and lungs (see coronary circulation; pulmonary circulation),

while the inferior vena cava drains the area below the diaphragm.

For a depiction of the vena cava in human anatomy, shown in relation to other parts of the body, see the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

Superior vena cava. Not far below the collarbone and in back of the right side of the breastbone, two large veins, the right and left brachiocephalic, join to form the superior vena cava. The brachiocephalic veins, as their name implies—being formed from the Greek words for "arm" and "head"—carry blood that has been collected from the head and neck and the arms; they also drain blood from much of the upper half of the body, including the upper part of the spine and the upper chest wall. A large vein, the azygos, which receives oxygen-poor blood from the chest wall and the bronchi, opens into the superior vena cava close to the point at which the latter passes through the pericardium, the sac that encloses the heart. The superior vena cava extends down about 7 centimetres (2.7 inches) before it opens into the right upper chamber—the right atrium of the heart. There is no valve at the heart opening.

Inferior vena cava. Just as the superior vena cava begins with the union of the brachiocephalic veins, so the inferior vena cava is formed by the coming together of the two major veins from the legs, the common iliac veins, at the level of the fifth lumbar vertebra, just below the small of the back. Unlike the superior vena cava, it has a substantial number of tributaries between its point of origin and its terminus at the heart. These include the veins that collect blood from the muscles and coverings of the loins and from the walls of the abdomen, from the reproductive organs, from the kidneys, and from the liver. In its course to the heart the inferior vena cava ascends close to the backbone; passes the liver, in the dorsal surface of which it forms a groove; enters the chest through an opening in the diaphragm; and joins the right atrium of the heart at a non-valve opening below the point of entry for the superior vena cava.

venationes (Latin: "animal hunts"), in ancient Rome, type of public spectacle that included animal hunts.

Contests between beasts or between men and beasts were staged in an amphitheatre, usually in connection with gladiator shows. The men used in these exhibitions were either captives, condemned criminals, or professional animal hunters. Originating in the 2nd century BC as part of the games of the circus, such displays were immensely popular with the Roman public. Julius Caesar built the first wooden amphitheatre for the exhibition of this spectacle. The popularity of venationes became such that the world was searched for lions, bears, bulls, hippopotamuses, panthers, and crocodiles to be displayed at public celebrations and slaughtered. As many as 11,000 animals were exhibited and killed on a single occasion. Although it is uncertain how long the venationes were presented, they were still in existence after the shows of gladiators were abolished in the 5th century. Representations of venationes appear on coins, mosaics, and tombs of the period.

Venda, also called BAVENDA, a Bantu-speaking people inhabiting the so-called Republic of Venda created by South Africa. It is situated in the extreme northeastern corner of South Africa, bordering on southern Zimbabwe. The

Venda have been called a "composite people" because they have historically consisted of a multiplicity of culturally different tribal groups. Apparently the Venda have become more culturally uniform since they settled in their present location after migrating through Zimbabwe from an area farther to the northwest, and almost all now speak the Venda language.

Much of the Venda's countryside in the south features mountains and wide valleys that receive abundant rainfall and are both densely populated and agriculturally productive. The northern area has a hot, dry climate and flat grasslands suitable for stock raising. The rugged Venda habitat was largely responsible for protecting them from invading enemies in the 19th century. Zulu warriors led by Mzilikazi, the eventual founder of the Ndebele (Matabele) people, generally met defeat in their attacks on the inaccessible mountain fortresses of the Venda. The Venda were, in fact, the last of the peoples in the area to come under European control.

Since the era of raids more Venda villages have been situated on the plains, and individual villages no longer need to be nearly self-contained. Agriculture dominates the Venda economy. The principal crops are corn (maize), peanuts (groundnuts), beans, peas, sorghum, and vegetables, and the planting season starts around October. The Venda may have been primarily herders at some time in the distant past. During the 20th century their cattle holdings—especially the herds of their chiefs—have increased from a few to an appreciable number; they also keep goats, sheep, pigs, and fowl.

The Venda chiefs are traditionally custodians of the land for their people, while local headmen permit household groups to occupy and work tracts of land. Lineages of kinsmen, with membership based on patrilineal descent, are used to reckon inheritance and succession. Cattle are given as bridewealth by a groom in a custom called *lobola*. Matrilineal descent is also observed by the Venda, especially in the religious practice of the ancestor cult. Ancestral spirits, including those of chiefs, are among those thought to inhabit the Venda countryside. Ralu Vhimba is the deity traditionally recognized.

Venda, republic in southern Africa. Covering an area of 2,393 sq mi (6,198 sq km) in the mid-1980s, it consists of an enclave within the Transvaal, South Africa, just south of Zimbabwe. Its capital, formerly at Sibasa, was moved to Thohoyandou when Venda was declared independent in 1979. Venda shares a boundary to the southeast with the non-independent black state of Gazankulu, South Africa. The Limpopo River flows just to the north of and parallel to the northern border of Venda, and Kruger National Park borders on the northeast.

The Venda people migrated into the region in the early 1700s AD from what is now Zimbabwe and established numerous ruling houses. These came in conflict with the Transvaal republic in the latter half of the 19th century resulting in a campaign against Chief Mphephu by the Transvaal government. The chief was defeated and the Venda area was annexed in 1898. Venda was a distinct administrative unit within South Africa before it became officially independent. In 1962 South Africa designated it a homeland for the Venda-speaking people, and a territorial authority was established. The territory was granted partial self-government in 1973. A legislative assembly was elected, and Patrick Mphephu became chief minister.

On Sept. 13, 1979, South Africa proclaimed Venda an independent republic, with Mphephu as president. It was the third of South Africa's black states to be granted independence in the 1970s, following Transkei (1976) and Bophuthatswana (1977). The United Nations Security Council met the next week and unanimously condemned the creation of the three black republics as an attempt, on the part of South Africa, to legitimize and perpetuate apartheid. Only South Africa, Transkei, and Bophuthatswana recognized Venda's independence.

The republic has few natural resources and no large towns. Grazing of livestock predominates; crops include corn (maize), peanuts (groundnuts), beans, peas, sorghum, wheat, fruits, and vegetables. There are large supplies of stone for construction, and coal deposits have yet to be exploited. Small-scale industries include carpentry, leather working, welding, upholstering, sawmilling, and clothing manufacturing. Sibasa, the former capital, where a motor workshop is located, was selected in the 1970s as a site for further industrial development. Most citizens work outside Venda as migrant contract workers in the Republic of South Africa, Venda's major trade partner. Pop. (1985 est.) 424,000.

Vendée, coastal département, Pays de la Loire region, western France, created in 1790 from the historic province of Poitou (q,v.) and from the généralité (a fiscal subdivision) of Poitiers. Vendée is historically renowned for the Wars of the Vendée—counterrevolutionary peasant uprisings at the end of the 18th and beginning of the 19th century. Vendée borders the Atlantic Ocean for most of the distance between the Loire and the Gironde estuaries.

About two-thirds of the *département*, which has an area of 2,595 sq mi (6,721 sq km) and lies largely in the Armorican Massif, is *bocage* countryside, characterized by numerous trees and by small hedge-bound fields, which are chiefly either under grass or used for growing fodder crops; there are also many cider apple orchards. Farming is devoted primarily to cat-

tle raising and dairying. In the Gâtine country, extending from northwest to southeast, the hills rise to 945 ft (288 m) and are covered with heath or woods. Inland from the coast in the north and south are extensive marshlands. The marshy Marais Poitevin in the south is drained by canals that are used as thoroughfares by farmers and market gardeners. The coastline stretches for about 125 mi (200 km); offshore there are numerous reefs and sandbanks. Much of the coast is lined with woods, including the Forêt d'Olonne located on sand dunes north of Les Sables d'Olonne, a seaside resort with one of the finest stretches of sand in France. On the coast the climate is mild and rainy. The département, which is essentially rural, has three arrondissements, La-Roche-sur-Yon (the capital), Fontenay-le-Comte, and Les Sables d'Olonne. Vendée is in the educational division of Nantes. Pop. (1984 est.) 490,300.

Vendée, Wars of the (1793–96), counterrevolutionary insurrections in the west of France during the French Revolution. The first and most important occurred in 1793 in the area known as the Vendée, which included large sections of the départements of Loire-Inférieure (Loire-Atlantique), Maine-et-Loire, Deux-Sèvres, and the Vendée proper. In this fervently religious and economically backward region, the Revolution of 1789 was received with little enthusiasm and only a few minor disturbances. The first signs of real discontent appeared with the government's enactment of the Civil Constitution of the Clergy (July 1790) instituting strict controls over the Roman Catholic Church.

A general uprising began with the introduction of the conscription acts of February 1793.

On March 4 rioting commenced at Cholet, and by the 13th the Vendée was in open revolt. The uprising coincided with rising disaffection in Lyon, Marseille, and Normandy and seriously threatened the Revolution internally at a time when it had just suffered a military defeat at Neerwinden (March 18). The peasant leaders Jacques Cathelineau, Gaston Bourdic, and Jean-Nicolas Stofflet were joined by royalist nobles such as Charles Bonchamps, marquis de Bonchamps, Maurice Gigost d'Elbée, Francois-Athanase Charette de La Contrie, and Henri du Vergier, comte de La Rochejaquelein. In May the rebels (about 30,000 strong) took the towns of Thouars, Parthenay, and Fontenay, and their army, which had changed its name from "the Catholic Army" to "the Catholic and Royal Army," turned north and on June 9 took Saumur.

Crossing the Loire River, the Vendéans marched east, seizing Angers (June 18), but failed to capture the important centre of Nantes. There followed two months of confused fighting. By autumn the government forces had been reinforced and placed under a unified command. On October 17 the main Vendéan army (about 65,000) was heavily defeated at Cholet and fled north across the Loire, leaving only a few thousand men under Charette to continue resistance in the Vendée. The Vendéans then marched north to raise the Cotentin region and occupy a few towns. They later retreated south and, after failing to capture Angers (December 3), turned east but were overtaken and defeated at Le Mans (December 12). Perhaps 15;000 rebels were killed in this bloody battle and in the butchery of prisoners that occurred afterward. Still trying to cross the Loire to reenter the Vendée, the main army was finally crushed at Savenay by the Republican forces (December 23)

General warfare was now at an end, but the severe reprisals taken by the Republican commander Gen. Louis-Marie Turreau de Garambouville provoked further resistance. With the recall of Turreau (May) and the rise to power of the moderate Thermidorian faction in Paris (July), a more conciliatory policy was adopted. In December the government announced an amnesty, and on Feb. 17, 1795, the Convention of La Jaunaye granted the Vendée freedom from conscription, liberty of worship, and some indemnities for losses.

Charette again took up arms during a British-backed landing of exiled French nobles at Quiberon Bay, in Brittany (June 1795). The nobles' defeat (July) and the capture and execution of Stofflet (February 1796) and of Charette (March) ended the struggle. In July, Gen. Lazare Hoche announced that order had been restored in the west.

Subsequent, though smaller, royalist risings in the Vendée occurred in 1799, in 1815, and, finally, in 1832, in opposition to the constitutional monarchy of Louis-Philippe.

vending machine, coin-actuated machine through which various goods may be retailed. Vending machines should not be confused with coin-operated amusement games or music machines. The first known commercial use of vending machines came early in the 18th century in England, where coin-actuated "honour boxes" were used to sell snuff and tobacco. These devices were also in use in the British-American colonies later in the century.

The first practical, commercial use of vending machines took place in the United States in 1888, when machines were used to expand the sales of chewing gum into places where gum sales otherwise could not be made, specifically the platforms of the New York City elevated railway. The American industry was limited mainly to penny-candy vending until 1926, when the modern era of automatic selling opened with the appearance of cigarette vending machines. The first soft-drink machine followed in 1937.

As the United States began its defense buildup prior to its entry into World War II, plant managements estimated that people could not work efficiently for 10, 12, or more hours without a refreshment break, and vending machines proved the most practical way of providing refreshments. During the 1940s and 1950s the vending machine business was concentrated in plants and factories, and by the end of that period, machines were being used to sell a wide variety of freshly prepared as well as prepackaged foods to replace or supplement traditional in-plant food service facilities. Refrigeration was added to vending machines to sell bottled soft drinks.

The ability of vending machines to sell products at competitive prices around the clock without regard to holidays is now widely recognized. The business has grown beyond plants and factories, and machines are commonly used in schools, colleges and universities, recreation centres, health care facilities, offices, and the like.

Typically, vending service is provided by companies (operators) who own and place machines on premises owned by others. These companies provide complete maintenance and service, as well as products, usually without any cost to the owners of the premises other than perhaps a servicing charge.

Vending machines have been used in Great Britain, continental Europe, and Scandinavia since the 1880s, when they were employed to sell confectionery and tobacco products. In recent years, the vending machine business in those countries has closely paralleled the expansion of vending in the United States. Vending in Japan began in earnest in the 1960s and developed rapidly into a major factor in that country's distribution system.

Vendôme, historic town of north central France, capital of an arrondissement in the département of Loir-et-Cher, southwest of Paris and 20 mi (30 km) northwest of Blois. It stands on the Loir River, which there divides and intersects the town. To the south stands a hill on which are ruins of the 11th-century castle of the counts (later dukes) of Vendôme. The town was extensively damaged during World War II but was thereafter largely restored. The local industry is diversified and includes household appliances, computers, printing, control and measurement apparatus, and food processing.

The Roman Vindocinum was a provincial fortification of Gaul, replaced later by a feudal castle, around which the town arose. Christianity was introduced by St. Bienheuré in the 5th century, and the important Abbey of the Trinity was founded about 1030. When the reign of the Capetian dynasty began, Vendôme was the chief town of a countship belonging to Bouchard, called "the Venerable." The succession passed by various marriages to the houses of Nevers, Preuilly, Montoire, and Bourbon. The countship of Vendôme was raised to the rank of a duchy and peerage of France for Charles de Bourbon (1515); his son Anthony, king of Navarre, was the father of Henry IV who gave the duchy of Vendôme in 1598 to his natural son César (1594-1665), in whose line the dukedom continued for more than a century. The last of the family in the male line 1654–1712) was Louis XIV's famous general, Louis-Joseph, duc de Vendôme. Pop. (1982)

Vendôme, César, duc de (duke of) (b. 1594, Coucy, Fr.—d. Oct. 22, 1665, Paris), leader in several aristocratic revolts during the reign of King Louis XIII of France (ruled 1610–43).

The elder son of King Henry IV by his mistress, Gabrielle d'Estrées, Vendôme was legitimized in 1595 and created duc de Vendôme in 1598. In 1609 he married Françoise, daughter of Philippe-Emmanuel de Lorraine, duc de Mercoeur, to whose governorship he succeeded at that time. His participation in the

aristocratic revolts of 1614, 1616, and 1620 increased the animosity of his half brother Louis XIII. An enemy of Louis's powerful first minister, the Cardinal de Richelieu, Vendôme was implicated in an unsuccessful plot (the Chalais conspiracy) in 1626 to assassinate Richelieu. As a result, he and his brother Alexandre, grand prior of France, were imprisoned at Vincennes. Alexandre died in prison (1626), and César was forced to resign Brittany before his release (1630).

Vendôme lived quietly until 1640, when he fled to England after being accused of plotting to poison Richelieu. Following the accession of King Louis XIV in 1643, Vendôme returned to France. He was reconciled with Louis's chief minister, Cardinal Jules Mazarin, after the first phase (1648-49) of the uprising known as the Fronde, remaining loyal to Mazarin throughout the second phase (1650-53), the revolt of the nobles. He even agreed to the marriage of his elder son, Louis, Duke de Mercoeur, to Mazarin's niece, Laure Mancini. Vendôme led the royal troops against the rebels in Burgundy, of which he was appointed governor in 1650; as admiral he helped to capture the insurgent stronghold of Bordeaux in July 1653. Joining French forces in the ongoing war with Spain, he defeated a Spanish fleet off Barcelona in 1655.

Vendôme, Louis-Joseph, duc de (duke of), also called (until 1669) DUC DE PENTHIÈVRE (b. July 1, 1654, Paris—d. June 15, 1712, Vinaroz, Spain), one of King Louis XIV's leading generals during the War of the Spanish Succession (1701–14).

Vendôme was the son of Louis de Vendôme, Duke de Mercoeur, by his marriage to Cardinal Jules Mazarin's niece, Laure Mancini. Vendôme entered the French Army in 1672 and had risen to the rank of lieutenant general by the outbreak of the War of the Grand Alliance (1689–97) between France and the other major powers. He distinguished himself in the victory over the Allies at Steenkirke (1692) and was made commander in Catalonia in 1695; two years later he captured Barcelona.

The dispute over the succession to the Spanish throne brought France and Spain to war with the British, the Austrians, and the Dutch in 1701. Appointed to the command in northern Italy in 1702, Vendôme fought the Austrian commander, Prince Eugene of Savoy, in the bloody but indecisive Battle of Luzzara on August 15. He took Vercelli in 1704 and defeated Prince Eugene at Cassano in August 1705. In May 1706 Vendôme was transferred to the Flanders front, where the British commander John Churchill, 1st Duke of Marlborough, had just won an overwhelming victory at Ramillies. Vendôme made limited gains until he was severely defeated by Marlborough and Prince Eugene at Oudenaarde on July 11, 1708. Vendôme subsequently failed to relieve besieged Lille (in northern France), which fell to the Allies in October. Recalled by Louis XIV, he was temporarily disgraced.
In the autumn of 1710, Vendôme was made

In the autumn of 1710, Vendôme was made commander of the army of King Philip V of Spain. He recaptured Madrid for Philip and on December 9 forced the British general James Stanhope to surrender at Brihuega. The next day he won a major victory over Guido von Starhemberg's Austrian forces at Villaviciosa. As a result of these triumphs, Philip was assured of his throne, and the Austrians were confined to Catalonia. Vendôme was completing the reconquest of Catalonia when he died.

Vendsyssel-Thy, island at the north end of Jutland, Denmark, known as Vendsyssel in the east and Thy in the west. The Limfjorden separates it from the mainland, to which it was attached until 1825, when water erosion cut a channel through the narrow isthmus at Thyborøn. The island has an area of 1,809 square miles (4,685 square km).

Vendsyssel is an open, windswept region. Frederikshavn, the main port, lies on the east coast facing Göteborg, Sweden, across the Kattegat. The island's west coast, curving around the shallow, treacherous Jammerbugt ("Bay of Woe") of the Skagerrak, is lined with white sand beaches and shifting dunes. In the 20th century many seaside vacation cottages have been built among the older fishing villages along the shore. At Skagen (q.v.) in the extreme north, where the Kattegat and the Skagerrak meet, the dunes move perceptibly from year to year.

The Thy peninsula curves southwest from Vendsyssel to the Thyborøn channel. Dunes and drift sand, blown inland from the North Sea shore, cover a quarter of the land. Plantations of conifers and marram grass have stabilized much of the duneland for use as a wildlife sanctuary and holiday resort. Farming and fishing are limited, especially on and near the North Sea, and Thisted on the Limfjorden is the only sizable town. At Hanstholm on the North Sea, a deepwater port was opened in 1967 to accommodate fishing boats and provide employment, and new town development was projected. Pop. (1981) 309,834.

veneer, extremely thin sheet of rich-coloured wood (such as mahogany, ebony, or rosewood) or precious materials (such as ivory or tortoiseshell) cut in decorative patterns and applied to the surface area of a piece of furniture. It is to be distinguished from two allied processes: inlay, in which cutout pieces of decorative wood or other materials—such as metal, leather, or mother-of-pearl—are inset into cavities cut into the main structure of the piece being decorated; and marquetry, or boulle work, which is a more elaborate kind of complex veneering.

There are two main types of veneering, the simplest being that in which a single sheet, chosen for its interesting grain (yew or purple wood, for example), is applied to a whole surface of inferior wood in one unit. In the more complex variation called crossbanding, small pieces of veneer wood are fitted together

within a surrounding framework in such a way that the grain changes pattern, thus altering the tone according to the light. This process can produce complex fan shapes, sunbursts, and floral patterns.

By courtesy of the Victoria and Albert Museum, London

When the veneers are made up of small pieces cut from the same larger piece of wood and affixed so that their grain runs in opposite directions in accordance with a formal geometric pattern, the process is known as parquetry.

Veneering allows the use of beautiful woods that because of limited availability, small size, or difficulty in working cannot be used in solid form for making furniture. In addition, it significantly increases the strength of the wood by backing it with a sturdier wood and, through the process of laminating veneers at right angles in successive layers, offsets the cross-grain weakness of the wood.

Modern veneering, which uses special glues and drying and testing equipment, produces a strong and beautiful product. Basically, the process involved in making all veneers is the same. First, the decorative wood is sawn, sliced, shaved, or peeled, sometimes by a rotary machine, into pieces between 1/16 and 1/32 inch in thickness. Then the veneer is glued to a prepared, coarser wood and secured by the application of mahogany, zinc, or cardboard presses; for curved and intricately shaped surfaces, molded sandbags are used. Early handcut veneers were thicker than the later machine-sawn product; although they were seldom less than 1/8 inch in thickness, they were cut by hand to 1/10 inch in 16th-century southern Europe.

Although the craft of veneering was practiced in classical antiquity, its use lapsed during the Middle Ages. It was revived in the 17th century, reaching its apogee in France and spreading from there to other European countries. Because of their preference for ebony, the French masters of the craft of veneering were known as ébénistes, although they later combined veneering with technical variations such as marquetry. By the end of the 17th century, woods such as almondwood, boxwood, cherry wood, and pearwood were used.

The considerable craftsmanship involved in the artistic use of veneers is most evident in the 18th and early 19th centuries, when Chippendale, Hepplewhite, and Sheraton used manogany and satinwood veneers. Later, exotic woods, various metals, and animal materials such as tortoiseshell—which was also popular with 17th-century Flemish craftsmen—were in vogue. By the mid-19th century, with the introduction of mechanical saws, the veneering process was sometimes used in mass production to cover defects in cheap pine or poplar furniture.

Venera, any of a series of unmanned Soviet planetary probes that were sent to Venus. Venera 2 (launched in 1965) flew to within 25,000 miles (40,200 km) of Venus in Febru-

ary 1966, and Venera 3 crash-landed on its surface the following month, becoming the first spacecraft to strike another planet. Venera 4 (1967) analyzed the chemical composition of Venus' upper atmosphere and provided the scientific community with the first direct measurements for a model of the planet's atmospheric makeup. Venera 5 and 6 (1969) made similar soft landings on Venus, but ceased transmitting data before reaching the surface because of the extreme heat and pressure of the planet's atmosphere. Venera 7 (1970) and Venera 8 (1972) detected the occurrence of certain long-lived radioactive isotopes (chiefly uranium and thorium) on Venus' surface. Venera 9 and 10 (1975) sent back the first closeup photographs of the planet's surface; these images showed that certain parts of Venus were covered with sizable sharp-edged rocks and others with fine-grain dust. Venera 11 and 12 (1978) measured the chemical components of the planet's lower atmosphere.

venerable, Latin VENERABILIS, title or respectful form of address, used from very early times in Europe, especially for certain clergy or for laymen of marked spiritual merit. St. Augustine in some epistles cited the term in reference to bishops, and Philip I of France was styled *venerabilis* and *venerandus* ("reverential"). The venerable by which Saint Bede is commonly known ("the Venerable Bede," or "Bede the Venerable") survives from a contemporary practice of so addressing bishops and abbots and, posthumously, worthy clerics such as Bede.

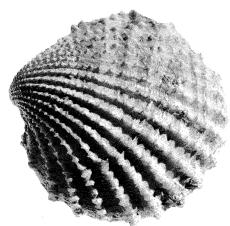

In the Roman Catholic Church, the title "Venerable" is bestowed on a deceased person in the first of three stages leading to beatification (with the title of "Blessed") and canonization (with the title of "Saint"). The candidate to these higher honours becomes "Venerable" when his or her case has been officially accepted by the Sacred Congregation of Rites and when a special papal decree announces the candidacy, asserting that the person had virtues of heroic degree or had suffered martyrdom.

Priests of the Carthusian order (other than the prior-general) are addressed as "Venerable" (rather than "Reverend," as in other orders)

In the Church of England, venerable is the proper title of address for an archdeacon.

and lasted 16,000,000 years). The shell, composed of two halves (valves), is distinctive in form and generally large. Transverse ribs radiate from the apex of the valves and are broken by a series of concentric growth rings. Internally, the valves are marked by distinctive nodes along the edge and thickenings that form raised bars at the apex; these form the surfaces along which the valves articulate.

Venetan, group of dialects of Italian spoken in northeastern Italy. It includes the dialects spoken in Venice (Venetian), Verona (Veronese), Treviso (Trevisan), and Padua (Paduan).

Veneti, ancient people of northeastern Italy, who arrived about 1000 BC and occupied country stretching south to the Po and west to the neighbourhood of Verona. They left more than 400 inscriptions from the last four centuries BC, some in the Latin alphabet, others in a native script (see Venetic language).

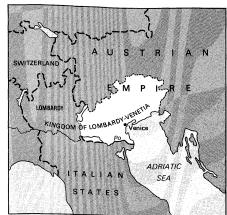

The chief Venetic settlement was Este (later the Roman colony of Ateste), which was also the cult centre of their important divinity Reitia, possibly a goddess of childbirth. The horses bred in Venetia were famous in the Greek world, and there was other commerce both with Greek lands and with the Alps and northern Europe, including some control of the amber route from the Baltic. The Veneti were friendly to Rome throughout and assisted Rome against the Gauls, especially in the war of 225 BC. The colony of Aquileia, founded in 181 BC, protected Venetia from raids by its mountain neighbours, and a century of peace and Romanization followed, though probably much land was bought up by Roman settlers. The towns were given Latin rights in 89 BC and full citizen status in 49 BC.

Veneti, ancient Celtic people who lived in what is now the Morbihan district of modern Brittany. By the time of Julius Caesar they controlled all Atlantic trade to Britain. They submitted to Caesar in 57 Bc; but the next winter, disturbed by his interest in Britain, they seized some Roman commissariat officers and, with the support of several maritime states, attempted to regain independence. Caesar built galleys in the Loire River and in the late summer of 56 met the Venetic fleet of more than 200 ships in Quiberon Bay and destroyed it. After his victory Caesar executed the tribal elders and sold the rest of the people. By some means, however, the tribe as such survived and is attested in imperial times.

Venetia, Italian VENEZIA, territory of northeastern Italy and northwestern Yugoslavia between the Alps and the Po River and opening on the Adriatic Sea. Italians often use the name Veneto for the region around Venice proper (Venezia) and the name Venezia Giulia for the country to the east.

Historically Venetia was the mainland territory under the control of the Republic of Venice from the 14th and 15th centuries, extending from Lake Garda to Dalmatia. After the collapse of the Venetian Republic (1797) and a number of political shifts during the French Revolutionary Wars, Venetia came under Austrian rule and formed the eastern part of the Kingdom of Lombardy-Venetia, set up in 1815. Its boundaries then were, on the west, Lake Garda and the Mincio River and, on the east, Istria (Venetian before 1797) and Gorizia. In 1866 Venetia (in the sense of Veneto) was incorporated into the recently formed Kingdom of Italy.

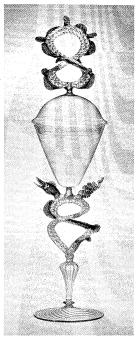

In the 20th century, changes in the northeastern boundary of Italy resulted in new designations for the historic area of Venetia. After World War I, Italy received from Austria Istria and Gorizia (renamed Venezia Giulia) and the southern Tirol (renamed Venezia Tridentina, although it had never been under Venice's control). These areas, together with the previously annexed Venetia (renamed Venezia Eu-

Venetia, 1815-66

ganea), came to be called commonly the Tre Venezie (Three Venices). After World War II, Italy lost most of Venezia Giulia to Yugoslavia, and the areas now remaining to Italy in the northeast have been reorganized into the regions of Friuli-Venezia Giulia, Veneto, and Trentino-Alto Adige (qq.v.).

Venetian glass, variety of glasswares made in Venice from the 13th century, at the latest, to the present. Although a glassblowers' guild existed in Venice from 1224, the earliest extant specimens that can be dated with certainty are from the mid-15th century. The early history of Venetian glass is therefore largely conjectural. It is known that in 1291 the glasshouses moved across the lagoon to the island of Murano (q.v.), where they have remained. The

capture of Constantinople by the crusaders in 1204 and by the Ottomans in 1453 brought an influx of Byzantine glassworkers to Venice. In the 16th century, a period from which a significant number of samples has survived, Venice was no longer a world power; and Venetian glass therefore belongs, along with much of the city's other art, to its period of commercial decline.

In the 15th century efforts were concentrated in the perfection of cristallo—i.e., clear glass

that approximated rock crystal in appearance. By the 16th century techniques of adding colour to clear glass were mastered as well as those of decolourizing glass from the natural smoky tint of all primitive glass produced by metal in the glass material. Gilding and enamelling were also known. These and other secrets were guarded, and severe penalties were meted out to defecting workmen. Examples from the 16th century include vessels done in millefiori technique, an ancient technique in which canes of different coloured glass are bonded together so that a section reveals many small multicoloured flowerlike beads. Other techniques used were calcedonio, a method of simulating marble and other stones; and latticinio, in which rods of opaque, usually white, glass were incorporated in the body of the glass vessel and worked in patterns. Diamond-engraving was made possible in the 16th century by the improvements that had been made in the quality of the glass.

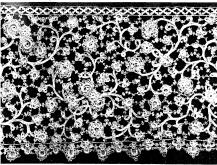

The staple products of Venetian glassblowers in the 16th and 17th centuries were drinking glasses. Their peculiarly Venetian characteristic was the elaborate working of the stem with tools such as pincers while the glass was still malleable. Symmetrical "wings" were drawn outward at each side; these were sometimes further elaborated into animals or masks, and sometimes the stem so bristled with projections that the glass can hardly have been used for drinking at all. This type of drinking glass and some other vessels with elaborately flared bowls are usually called bouquetiers ("flower

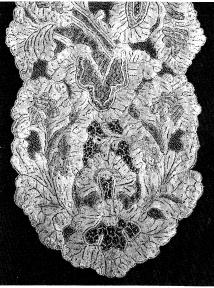

In spite of the restrictions on the migration of workmen, many Venetian glassmakers did in fact defect, notably to Altare near Genoa. The techniques so jealously guarded became common knowledge; and from the 16th century various countries, including France, Germany, England, and the Netherlands, produced their own versions of Venetian glass types, façon de Venise ("Venetian fashion").

In the 18th century competition from other countries, especially Bohemia, caused somewhat of a decline in the prestige of Venetian glass, although 17th-century types continued to be reproduced along with mirrors and beads. In the 19th century little was done that was worthwhile apart from the reproduction of older types. In the 20th century the old techniques such as latticinio were employed with continued skill to produce some tasteless glass, though from c. 1961 some good specimens such as plain obelisks and hourglasses were being made. The reproduction of 17thcentury types continues.

Venetian needle lace, French POINT DE VENISE, Venetian lace made with a needle from the 16th to the 19th century. Early examples were deep, acute-angled points, each worked separately and linked together by a narrow band, or "footing," stitched with but-tonholing. These points were used in ruffs and collars in the 16th and 17th centuries and, from their presence in portraits by Anthony Van Dyck, are known as "vandykes." Geometrical designs began to give way in the late 16th century to more curvilinear patterns. From 1620 Venetian raised lace (in Italian punto a relievo, in French gros point de Venise) developed distinct from flat Venetian (point plat de Venise). The pattern was raised

by outlining the design with a cordonnet, a heavier thread, bundle of threads, or horsehair, worked over with buttonholing, so that the curls, scrolls, and conventionalized leaves stood out like relief carving. Rose point (point de rose) was less grandiose than gros point but even more ornamented with many little loops (picots) and rosettes; lace with more light bars of thread (brides) worked with such motifs as picots and stars like snowflakes was called point de neige ("snow lace"). Point de Venise à réseau ("Venetian lace with a mesh"), imitated c. 1650 from French lace, had a mesh ground instead of bars. Lace making declined in Venice in the early 19th century but was revived in 1872 at nearby Burano.

Venetian school, Renaissance art and artists. especially painters, of the city of Venice. Like rivals Florence and Rome, Venice enjoyed periods of importance and influence in the continuum of western European art, but in each period the outstanding Venetian characteristic has remained constant, a love of light and colour.

The founder of the dynasty of painters that was most important in Venice during the early Renaissance was Jacopo Bellini (c. 1400-70), a pupil of Gentile da Fabriano. Two of his sketchbooks are preserved, and there is reason to suspect that many of the compositions made famous by his sons Gentile (c. 1429–1507) and Giovanni (c. 1430–1516) and his son-in-law Andrea Mantegna (1431-1506) were derived from him. Gentile Bellini has the distinction of having been for a time (1479-81) painter to the court of Mehmed II in Constantinople, and he also visited Rome, where he filled a now-lost album with studies. Giovanni Bellini was the most important teacher of his generation and included among his pupils were Giorgione (1477-1510), Titian (1488/90-1576), Jacopo Vecchio (c. 1480-1528), and Sebastiano del Piombo (c. 1485-1547). In short, he instructed the painters of the High Renaissance in Venice. Giovanni Bellini, as well as being the foremost painter in the Republic, was one of the most inventive and original. He was receptive to the interest in landscape that was so integral a part of the contemporary Flemish works then arriving in Venice, and in his many Madonna paintings he used bits and pieces of the natural world to vary and embroider his theme. Bellini's late style is pure High Renaissance. He managed to make a transition that few masters of his generation achieved. Although the circle around Bellini was the most successful and progressive, there were other painters like Vittore Carpaccio (1460–1525/26) and painter families such as the Vivarini and, later, the Bassano who were not as closely allied to him yet were also part of the Venetian school.

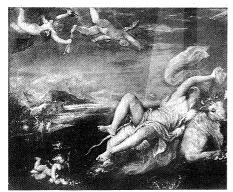

The early death of the mysterious Giorgione deprived the Venetian school of its most promising master. There are few paintings by him, and even some of those are thought to have been finished by Titian or Sebastiano. His remaining works are filled with a hazy, brownish light that serves to enhance the ro-

mance of their moodiness.

Upon Giovanni Bellini's death, Titian became painter to the Republic and the dominant force in Venetian painting for the next half century. His rich colours and painterly technique were widely imitated. Although interested in both religious and classical subjects, Titian was most sought after for his psychologically penetrating portraits. In 1533 he was knighted and made court painter to the emperor Charles V.

The last masters of this phase of the Venetian school—Jacopo Tintoretto (c. 1518-94), Paolo Veronese (1528-88), and El Greco (15411614)—were strongly influenced by Titian. Tintoretto was the leading exponent of Mannerism in Venice; Veronese, a facile and gifted decorator; El Greco, a passionate mystic who found Spain more compatible to his highly personal style.

The last period of significance for the Venetian school occurred in the 18th century, during which time several painters of quality were

produced who enjoyed international reputations: Canaletto (1697–1768), Tiepolo (1696–1770), Bellotto (1720–80), and Francesco Guardi (1712–93).

Venetic language, a language spoken in northeastern Italy before the Christian era. Known to modern scholars from some 200 short inscriptions dating from the 5th through the 1st century BC, it is written either in Latin characters or in a native alphabet derived from Etruscan, the Etruscans having established settlements in the Po Valley in the 6th century BC. Authorities are undecided as to whether Venetic is related to the Italic languages such as Latin or is an independent branch of Indo-European.

Veneto, also called VENEZIA EUGANEA, regione, northern and northeastern Italy, comprising the provincie of Venezia, Padova, Rovigo, Verona, Vicenza, Treviso, and Belluno. Occupying an area of 7,090 square miles (18,364 square km), it is bounded by Trentino-Alto Adige (north), Emilia-Romagna (south), Lombardia (west), Austria (northeast), and Friuli-Venezia Giulia and the Adriatic

Sea (east). The northern limit of Veneto is marked by a mountainous area, including the Dolomites, between Lake Garda (southwest) and the Carnic Alps to the northeast. The southern part consists of a fertile plain extending to the Gulf of Venice and drained chiefly by the Po, Adige, Brenta, Piave, and

Livenza rivers, the mouths of which form an extensive delta area with shore lagoons. The region was subjected to a severe storm and flood in November 1966; rivers overflowed the plain, and, around Belluno in the southern Dolomites, landslides caused by rains destroyed communications and engulfed houses and people.

Veneto is a chief producer of corn (maize), wheat, sugar beets, and hemp. Dairy-cattle fodder and fruit (apples, pears, peaches, cherries), and wine grapes are also grown. There is much irrigation, and considerable land has been reclaimed, especially in the Po delta. After World War II, large estates were expropriated for distribution to smallholders. The region uses methane (marsh) gas from the Po plain and hydroelectric power from the swift streams of the Alpine area. The larger towns of the plain have textile, silk, lace, hemp, paper, founding, and shipbuilding industries, as well as sugar refining and food processing. Port Marghera, the port of Venice, has metallurgical and chemical industries; the only other notable port is Chioggia, south of Venice.

Besides Venice, the capital, the principal cities are Verona, Rovigo, Padua, Vicenza, Treviso, and Valdagno. The regione has a dense road and rail network and is connected by motorway to Milan and Turin. Venice is connected to the mainland by a road bridge and rail bridge. Pop. (1987 est.) 4,372,869.

Venette, Jean de (b. c. 1308, Venette, Fr.—d. c. 1369), French chronicler who left a valuable eyewitness report of events of the central France of his time.

Of peasant origin, Jean joined the Carmelite order and was elected prior of the Carmelite convent at Paris in 1339. In 1342 he was appointed provincial of France for the Carmelite order. He also apparently served as a master of theology at the University of Paris. About 1360 he composed a short history of the Carmelites up to 1240. His Latin chronicle, covering the period of 1340-68, was a continuation of the work by Guillaume de Nangis. Although he was interested in the success of the 14th-century Valois dynasty, he displayed an unusually pronounced sympathy for the peasants and was critical of both the monarchy and the feudal lords. An evewitness of most of the events he recorded, he provided innovative interpretation and lively discussion of the narrative, a characteristic unique among chroniclers at that time. He also wrote an unpublished religious poem, the Roman des trois Maries (c. 1347).

Venezuela, officially REPUBLIC OF VENEZUELA, Spanish REPÜBLICA DE VENEZUELA, Country at the northern extremity of South America, covering an area of 352,144 square miles (912,050 square km). The capital is Caracas. The country's greatest extent is about 650 miles (1,050 km) from north to south and about 800 miles (1,285 km) from east to west. It is bordered on the east by Guyana, on the south by Brazil, and on the west by Colombia. Venezuela fronts the Caribbean Sea on the north and the Atlantic Ocean on the northeast. The population in 1990 was estimated at 19,735,000.

A brief treatment of Venezuela follows. For full treatment, see MACROPAEDIA: Venezuela. For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. Venezuela may be divided into three broad geographical regions: the Llanos

Venezuela

(Plains), a low-lying grassland of central Venezuela occupying about one-third of the country's territory; the Guiana Highlands in the southeast, a sparsely inhabited, often rugged, granite massif comprising more than two-fifths of the country; and the coastal plains and mountains in the north, including (from west to east) ranges of the Andes, a lower transitional mountainous zone, and the Coastal Range. The 5,150-square-mile (13,-300-square-kilometre) Lake Maracaibo in the northwestern part of the country is a shallow, partly freshwater inlet of the sea surrounded by swampy lowlands. Highest elevations range from 16,427 feet (5,007 m) in the Venezuelan Andes to roughly 8,200 feet (2,500 m) in the Guiana Highlands and to 9,069 feet (2,765 m) in the Coastal Range. Venezuela has only one active volcano, Sanare (last erupted 1927).

The Orinoco River (1,700 miles [2,735 km] long) drains most of the Llanos and the Guiana Highlands, emptying into the Atlantic Ocean through a number of distributaries. Tributaries of the Orinoco in the Guiana Highlands descend over gigantic, erosion-resistant mounds known as *tepuis*; Angel Falls, the highest waterfall in the world (3,212 feet [979 m]), descends from one of these *tepuis*. The Orinoco drainage system has great hydroelectric potential, particularly at the Guri Dam on the Caroní River.

The climate in Venezuela, although variable according to elevation, is generally tropical, with the seasons marked more by differences in rainfall than in temperature; at Caracas, for example, the average annual temperature is 72° F (22° C) with an average annual range of about 8° F (4° C). Areas lying behind topographic barriers, such as the northern-coastal plains and Caribbean islands, are arid (11 inches [280 mm] annual rainfall at Guaira), whereas the windward mountain slopes of northern Venezuela are generally well watered. Extensive flooding is common in the Llanos during the May-October rainy season, followed by an equally severe dry season.

Infertile red tropical lateritic soils predominate. Cultivated land is mostly in the coastal and Maracaibo lowlands and in intermonane valleys. Forests cover about two-fifths of Venezuela, and grasslands (in the Llanos, the high tablelands of the Guiana Highlands, and the high alpine meadows of the Andes) about one-half. Where it is humid the forests vary from true rain forest in the low-lying Orinoco basin to semitropical evergreen at higher elevations, often characterized by orchids and tree ferns. Wildlife is profuse, although it has retreated before human presence in the north; in this zone, numerous endangered species have been recognized since the mid-1970s.

Venezuela's principal mineral resources are petroleum, amounting to about 7 percent of world reserves, and natural gas, amounting to about 3 percent. Iron and bauxite reserves,

like petroleum, finance and serve the industrial base of the country; other mineral reserves include gold, diamonds, coal, and salt.

The people. Nearly 70 percent of Venezuela's population is of mulatto-mestizo ancestry, followed by whites (about 20 percent), blacks (9 percent), and American Indians. Spanish is the chief language, though more than 25 Indian languages are still spoken, and English is widely used as a second language. Roman Catholicism is the main religion. Population density is not high overall, and the Guiana Highlands have a low density of only 6 persons per square mile. The population is very young—about 40 percent are younger than 15 years of age. Health standards are good for a developing country, and life expectancy is 68 years for men and 73 for women. Because of the country's low population density and excellent physical-development prospects, the government considers the demographic situation satisfactory despite the high natural growth rate. More than 80 percent of the population is urban, and about one-eighth lives in Caracas and its environs. There is considerable population movement from the rural areas to the cities. Immigration, mostly from Colombia, Spain, Italy, and Portugal, reinforces historic trends.

The economy. Venezuela has a developing market economy supported mainly by the exploitation of petroleum. The gross national product (GNP), which grew rather rapidly in the 1970s, declined during the late 1980s. Nonetheless, Venezuela has the highest GNP per capita of all the countries in South America. The GNP originates primarily in the services sector (about three-fifths of the total), followed by manufacturing, and agriculture.

Agricultural land in Venezuela amounts to only about 4 percent of the total land area, and of this, nearly one-third lies fallow. Although almost 15 percent of the labour force is employed in agriculture, the country is a net importer of foods; grains and animal fodder predominate among these imports. Domestic food-crop production includes bananas, corn (maize), and sorghum; the main cash crops are sugarcane, coffee, and cacao. Cattle are the chief livestock.

Forest reserves are enormous, covering most of the southern half of the country, and, despite the presence of valuable hardwoods like mahogany, are little exploited. Fisheries are likewise little developed, in spite of Venezuela's long coastline; anchovies are the principal species caught. Petroleum and natural gas provide most of Venezuela's foreign income. Relatively large amounts of high-grade iron ore are mined, as well as bauxite, diamonds, and small amounts of gold.

Manufacturing was originally concentrated in Caracas but has been extended by opportunity and policy to the northern coastal centres of Maracaibo (foodstuffs and heavy machinery) and Morón (petrochemicals) and to the eastern Orinoco basin centred on Ciudad Guayana (steel and aluminum complexes).

The transportation sector has road, rail, water, and air services well adapted to current needs. Almost one-third of the road network is paved. The poorly developed railroad network is mostly private and used for industrial purposes such as transporting iron ore from mines in the Guiana Highlands to the steel mills of Ciudad Guayana. La Guaira, the port for Caracas, is the country's main port for imports, and Simón Bolívar Airport, also near Caracas, is Venezuela's busiest international airport.

The national labour force is distributed primarily among public administration and defense, trade, and manufacturing. The booming economy of the 1970s and early 1980s attracted job seekers from surrounding countries, especially Colombia. Venezuela continues to have an active labour-union movement.

Venezuela has enjoyed a positive balance of trade for decades. The major destinations for its exports, largely of crude petroleum and refined petroleum products, are the United States (by far the largest), Japan, and Colombia; the United States is the major import source. Machinery and transport equipment, chemicals, and basic manufactures are the major imports.

Government and social conditions. The country of Venezuela is a rarity in Latin America—a functioning democracy (since 1958) with a stable and representative civilian government comprising a directly elected president and a bicameral legislature. The legislature consists of a Senate and a Chamber of Deputies, both houses elected for a term of five years. The central government maintains direct control of the 20 states, 2 federal territories, and federal dependencies (Caribbean islands), and the president appoints the governors of the states. Venezuela's constitution, the 26th since independence (1821), was promulgated in 1961. The judiciary, headed by the Supreme Court of Justice, is national and there are no autonomous state courts.

The national government is financed primarily by oil revenues (one-third), indirect taxes and direct taxes, and budget expenditures are usually closely matched to revenues. The chief expenditures are primarily for goods and services, capital investments, and transfer payments. Management of the economy through government participation is strong because of the existence of government corporations that dominate oil, steel, aluminum, and other industries.

The public-welfare system is generally well developed. Social security was established in 1944. Compensation is also provided for maternity, illness, and disability. Health services are excellent and compare favourably with those of more developed countries, although the numbers of doctors and of hospital beds are still relatively low.

Literacy is at 89 percent and rising. Preschool

Literacy is at 89 percent and rising. Preschool and nine years of basic education are free and compulsory. Secondary education is less well developed, providing places for less than half of the 13-to-17-year age group. The country has numerous institutions of higher learning.

Privately owned radio, television, and printed news media are free to criticize the government but generally practice self-censorship. Circulation of daily newspapers is among the highest in Latin America. Television broadcasting is available to most Venezuelans.

Cultural life. Venezuela's folk and popular culture is regional in character and is represented by figures such as the llanero, or vaquero, the cowboy of the Llanos; the maracucho, the dynamic businessman of the Maracaibo basin; the guayanés, the hardy frontiersman following a dream; and the rugged andino of the mountains. Early 19th-century literature, exemplified by the political statements of Simón Bolívar and the belles lettres of Andrés Bello, has been succeeded by such outstanding 20th-century novelists as Rómulo Gallegos and Arturo Uslar Pietri.

Traditional music has strong regional expression. Venezuelan artists have particularly made important contributions in the field of plastic arts. Jesús Soto is an outstanding producer of kinetic art, a visual expression utilizing moving parts. Museums dedicated to Venezuelan folklore, colonial art, fine arts, and the life of Simón Bolívar are found in Caracas.

History. The pre-Columbian Indian cultures of Venezuela are not part of the better-known civilizations of the Andes or Central America but arose in a transitional region connecting the so-called marginal cultures of the Andes with those of the Caribbean and Amazon basin. Isolated tribes settled extensively throughout the coastal and Llanos regions from at least 2000 BC until the arrival

of European colonists in the 16th century AD. The Venezuelan coast was sighted by Columbus in 1498 during his third voyage and the next year was named Venezuela ("Little Venice") by Spanish explorers after observing native Indian villages perched on stilts along the shores of swampy Lake Maracaibo.

For three centuries Venezuela was a Spanish colony dominated by priests and bureaucrats from Spain. Creoles (native-born whites) owned the colony's wealth (principally land) and used it to hold other races in bondage. Venezuelan creoles led by Francisco de Miranda and Simón Bolívar spearheaded the South American independence movement of about 1810-25. After the defeat of the Spanish in 1821, Venezuela, together with Colombia and Ecuador, was part of the republic of Gran Colombia, but in 1830 it seceded and became an independent republic. Between 1830 and 1958 Venezuela was generally ruled by a series of military dictators including generals Antonio Guzmán Blanco (1870-88), Cipriano Castro (1899-1908), and Juan Vicente Gómez (1909-35).

A long-standing and continuing border dispute with Guyana (formerly British Guiana) over about two-thirds of Guyana's territory originated in 1844 when Venezuela claimed the south-to-north-flowing Essequibo River of central Guyana as its eastern border on the grounds of prior Spanish possession. The territory (mostly tropical rain forest) is still depicted in Venezuelan maps as territory to be reclaimed, despite rulings in 1899 and in later years that have been generally in favour of the British and Guyanese claims.

Political order and liberal concessions (including the building of roads and schools) under the tyrannical rule of Gómez attracted British, Dutch, and American petroleum interests shortly before and after World War I. By the late 1920s Venezuela had become the world's leading exporter of oil and was second only to the United States in oil production. The oil boom of the 1940s and '50s paid the government huge royalties; some of these funds were used for public works (especially in modernizing Caracas at the expense of ru-ral areas) while intermittent strongman rule continued. The overthrow in 1958 of the military dictator Peréz Jiménez was followed by democratically elected, mostly left-of-centre administrations. Rómulo Betancourt was the first elected president of Venezuela to serve his full term (1959-64). His programs led to social and economic advancement and the beginnings of political and economic stability. In the two decades following Betancourt, Venezuela changed presidents five times by democratic process. In the early 1980s, even with the special pressures of worldwide economic recession, democracy seemed firmly established. Venezuela's economic dependence on petroleum exports made it extremely vulnerable to the dramatic changes in the demand for oil that characterized the late 1970s and the 1980s.

Venezuela, Gulf of, Spanish GOLFO DE VENEZUELA, inlet of the Caribbean Sea in Venezuela and Colombia, extending 75 miles (120 km) north-south and reaching a maximum east-west width of 150 miles (240 km). It is bounded by the Guajira Peninsula on the west and by the Paraguana Peninsula on the east and is connected with Lake Maracaibo to the south through Tablazo Bay and a channel 35 feet (11 m) deep near the city of Maracaibo. The gulf is surrounded by lowlands with little or no cultivation. It is a shipping route for the petroleum-producing Lake Maracaibo region.

Venice, Italian VENEZIA, city, major seaport, and capital of both the *provincia* of Venezia and the *regione* of Veneto, northern Italy. Once the centre of a maritime republic whose influence was felt throughout the Mediterranean world, Venice is now known principally for its canals, art, architecture, and unique romantic atmosphere.

A brief treatment of Venice follows. For full treatment and a city map, see MACROPAEDIA: Venice.

The historic city of Venice lies almost in the centre of a crescent-shaped lagoon that stretches for about 32 miles (51 km) from northeast to southwest. It is built on an archipelago of islets, mud flats, and sandbanks about 2 miles (3 km) long and 1 mile (1.5 km) wide. The limits of the modern city, embracing the whole 90-mile (145-kilometre) perimeter of the lagoon, include 10 principal islands (apart from those of the mother city) and 2 industrial mainland boroughs, Mestre

the Doges' Palace. The entrance to the square was built at the point where the Grand Canal meets the broad San Marco Basin. The ornate chambers of the Doges' Palace were decorated by a number of Venice's great artists, and St. Mark's is filled with objects collected over the years by the Venetians in their various conquests.

There are approximately 450 palaces and old houses of historic and artistic significance in Venice. Typically they are built on pilings or on stone fill. Few of these houses remain in the hands of the original families. Most of the residences have been cut up into office buildings and antique shops, and some of the palaces have been converted into hotels that have, in their turn, gained renown.

Venice's principal art museum, the Accademia on the Grand Canal, occupies the former convent, church, and trade-guild building of Santa Maria della Carità; the works of many famed Venetian artists are displayed there. Some of the Accademia's collection came from the scuòle, confraternity (or trade) guilds, two of which still exist as charitable organizations in their original buildings, completely restored

Tourism and industry related to tourism, such as the production of glass, lace, and textiles, employ a large share of the Venetian work force, although some of the work is seasonal. Port activities occupy additional workers, but the port of Marghera now handles a greater amount of shipping than does the old city. Most recent industrial development has been on the mainland.

Venice's many canals follow the original watercourse among the 118 original islands. The main stream through these isles, the Grand Canal, flows around two wide curves through the city. Ranging in width from 120 to 228 feet (37 to 69 m) and having a mean depth of 9 feet (2.7 m), the Grand Canal is bordered by many palaces, churches, and a maritime gas station. Until the 19th century, the Grand Canal was crossed only by the Rialto Bridge, which was designed by Antonio da Ponte; two additional bridges now span the Grand Canal. The most famous of Venice's approximately 400 bridges is the Bridge of Sighs, a short, covered passageway between the Doges' Palace (Palazzo Ducale) and the Venetian Republic's prison.

The architecture of Venice is varied, with Italian, Arabic, Byzantine, Gothic, Renaissance, Mannerist, and Baroque styles all represented. For centuries the social and political centre of Venice was the Piazza San Marco (St. Mark's Square), one of the most famous squares in the world. Arcades line three of its sides; the eastern end, spiked with the 324-foot (99-metre) Campanile, is closed by the golden San Marco Basilica and the pink facade of

with their original decorations and paintings. The Church of Santi Giovanni e Paolo (called San Zanipolo by Venetians), consecrated by the Dominicans in 1430, features a Giovanni Bellini polyptych and a Paolo Veronese ceiling. The Franciscan Santa Maria Gloriosa dei Frari, built in the 13th century, contains the mausoleum for the artist Titian together with his "Assumption," "Pésaro Madonna," and other works. Other notable churches include the Il Redentore, San Giorgio Maggiore, and Le Zitelle.

Venice is also noted for its music, which became increasingly important as the city's commercial power declined. Claudio Monteverdi, a chief pioneer of the opera form, wrote the first opera ever performed in Venice, *Proserpina rapita*. Many operas by such celebrated artists as Giuseppe Verdi, Gioacchino Rossini, and, more recently, Igor Stravinsky were first performed in Venice at La Fenice Theatre.

Beginning in the 1950s the deterioration of ancient buildings and other art treasures, which had been a long, slow process related to floods, subsidence, and various other natural phenomena, was accelerated by air pollution resulting from internal-combustion engine exhausts and domestic and industrial smoke. In the mid-1960s the United Nations Educational, Scientific and Cultural Organization (UNESCO) began a worldwide campaign to harness scientific and technical procedures aimed at saving historic Venice. In 1988 testing was begun on a prototype for a series of barriers designed to prevent flooding in the city

Transportation within Venice is chiefly by water, and virtually every type of water transport can be seen plying the Venetian canals, including water taxis and buses, red fire boats, police speedboats, and the famous, hand-propelled gondolas. Automobiles are not allowed within the central city. Vehicular traffic can reach the old city by causeway but must be left in parking lots provided on the outskirts. A railroad bridge runs alongside the causeway. Air service is centred at Marco Polo International Airport, and motorboat service is provided to transport passengers to the city. Pop. (1988 est.) mun., 327,700.

Venice, resort city, Sarasota county, southwestern Florida, U.S., located on the Gulf of Mexico, 18 miles (29 km) south of Sarasota. Originally a fishing village founded in the 1880s, it was later planned (1924-25) as a retirement city for members of the Brotherhood of Locomotive Engineers; the project was abandoned after the stock-market crash of 1929, but Venice survived as a small resort noted for tarpon fishing. It revived after 1960, when it replaced Sarasota as the winter headquarters for the Ringling Bros. and Barnum & Bailey Circus. Light manufacturing augments tourism as the economic mainstay. Nearby are Oscar Scherer State Park, Warm Mineral Springs and Cyclorama (an enclosed rotunda with murals depicting the life of Ponce de León), and the National Police Hall of Fame and Museum. Inc. 1925. Pop. (1987 est.) 15,-

Venice, Gulf of, Italian GOLFO DI VENEZIA, northern section of the Adriatic Sea (an arm of the Mediterranean Sea), extending eastward for 60 miles (95 km) from the Po River delta, Italy, to the coast of Istria, Yugoslavia. It receives the Po, Adige, Piave, and Tagliamento rivers. Marshes, lagoons, and sandspits border the gulf's shores as far as Trieste, Italy, where the low plateau of the Istrian Peninsula begins. A northeast wind, called the bora, causes rough seas and creates shipping hazards in the gulf.

The rise of the city of Venice as a maritime power at the northwestern end of the gulf gave special importance to Adriatic shipping routes in the Middle Ages. Modern gulf ports, apart from Venice, include Pula and Rovinj, Yugos., and Trieste, which is located on a northeastern inlet, the Gulf of Trieste.

Venice majolica, majolica also spelled MA-IOLICA, tin-glazed earthenware made at Venice and reaching its zenith in the 16th century. The workshops of Maestro Ludovico (fl. 1540-45), Domenigo da Venezia (fl. 1550-60), and Jacomo da Pesaro (fl. 1543) were outstanding.

Although Venetian artisans also are known to have painted narrative scenes from the antique in the Urbino manner, they excelled in depicting arrangements of decorative tro-

phies, globes, musical instruments, and other apparatus, executed in a brilliant linear style in a blue-tinged enamel on a bluish-white or white ground, highlighted with opaque white. Another typical design was a dense network of intertwining stems and arabesques. In their preference for blue-and-white enamel decoration, the Venetians showed the influence of Chinese porcelain and Turkish ware.

Vening Meinesz, Felix Andries (b. July 30, 1887, The Hague—d. Aug. 10, 1966, Amersfoort, Neth.), Dutch geophysicist and geodesist known for his measurements of gravity.

Participating in a gravimetric survey of The Netherlands soon after he graduated from Delft Technical University in The Netherlands as a civil engineer in 1910, Vening Meinesz devised an apparatus based on pendulums swinging together in opposite phase for use on the unstable subsoil and later modified the apparatus for use on submarines. His submarine device was used from 1923 until the late 1950s, when spring gravimeters on surface ships superseded it. During his early cruises he discovered striking gravity anomalies in the East Indies.

Vening Meinesz was a professor of geodesy at the Delft Technical University from 1938 to 1957. He is also noted for his investigations concerning convection currents within the Earth and for his study of the effect of solar movements on the deformation of the Earth's crust.

Venini, Paolo (b. 1895—d. July 1959, Venice), Italian glassmaker and designer and manufacturer of glassware, whose works are outstanding for their combination of traditional technique and modern form. His glass factory in Murano contributed to a revival of art glass manufacture in the 1930s and '40s and employed some of the finest designers of the period, among them Gio Ponti and Tyra Lundgren.

Although Venini was educated to be a lawyer, his family had been in the glass-making business in Italy since the 18th century. In 1921, after practicing law in Milan for a short time, he bought a partnership in a Murano glass firm, establishing his own Venini and Company four years later. From the beginning Venini's workshop turned out beautiful tableware that was years ahead of the work of other contemporary designers. His own designs were strikingly simple, their purity of outline set off against unusual combinations of colours worked into the glass in bold, stripe-like threads, lattices, grids, and, sometimes, in the traditional Venetian millefiore manner. His boldly striped translucent glass lampshades won critical acclaim. His pieces are displayed in museums and considered prime examples of modern glass artistry.

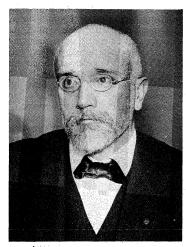

venison, (from Latin *venatus*, "to hunt"), the meat from any kind of deer; originally, the term referred to any kind of edible game.

Venison resembles beef and mutton in texture, colour, and other general characteristics. It has virtually the same chemical composition as beef but is less fatty. Lean venison roast, before cooking, contains by weight approximately 75 percent water, 20 percent protein, and 2 percent fat; this protein content is about the same as that of a lean beef rump.

Like most game, deer after being killed should be drained of blood and allowed to cool. Venison may be eaten fresh, but it is generally hung in a cool place for three to five days, and often for six to ten days or more, for aging, or ripening. Aging enhances the tenderness and the palatability of the meat, particularly in older deer. The legs, saddle, loin, and tenderloin are butchered for steaks, chops, or cutlets, which are best cooked only briefly and can be served with a number of sauces and garnishes; the less desirable parts

of the animal, such as the shoulder, shank, and breast, are usually well marinated and are excellent for use in stews. See also game.

Venizélos, Eleuthérios (Kyriakos) (b. Aug. 23, 1864, Mourniés, Crete—d. March 18, 1936, Paris), prime minister of Greece (1910–15, 1917, 1924, 1928–30), the most prominent Greek politician and statesman of the early

20th century. Through his policy Greece doubled in area and population during the Balkan Wars (1912–13) and also gained territorially and diplomatically after World War I in negotiations with Italy, Bulgaria, and Turkey.

Early career. His father, Kiriakos Venizélos Krivatas, was a Cretan revolutionary who had been deported by Turkey (Crete being then a part of the Ottoman Empire) to the island of Síros for 19 years. At the age of two Eleuthérios left his native village to go to Síros with his family, who had been deported there for a second time after an insurrection against the Sultan in 1866. Eventually he went to Athens, where he was graduated from the Athens University law school.

As leader of the Cretan students in his last year at the university, Venizélos first attracted public attention with his vivid interview of the British statesman Joseph Chamberlain, during his visit to Athens in 1886. On returning to Crete, Venizélos became a lawyer, journalist, and, a year later, a member of the island's National Assembly and leader of the local parliament's newly formed Liberal Party. During the 1897 Greco-Turkish War, with the support of an army under Col. Timóleon Vássos, dispatched from Greece, he led an unsuccessful insurrection in Cape Akrotírion, near Khaniá, to secure the union of Crete with Greece. After the intervention of the European great powers, however, Crete's government became autonomous, under the suzerainty of the Sultan. When Prince George, second son of King George I of Greece, was made high commissioner of the great European powers in autonomous Crete, Venizélos, at the age of 35, was appointed his minister of justice (1899-1901). He was soon in conflict with the absolutist prince George, however, and, four years later, organized an armed insurrection against his rule, forcing him to leave Crete. Under the new high commissioner, Aléxandros Zaímis, a former premier of Greece, he again became a member of the Cretan government.

Prime minister. In Greece, meanwhile, a group known as the Military League had formed a revolutionary movement and invited Venizélos to Athens to lead it. Venizélos persuaded the league and King George to revise the constitution. In the elections held in August 1910 Venizélos won a seat as a deputy from Athens. In October he became prime minister, embarking immediately on a

program of reform. He reorganized the armed forces; created an alliance of the Balkan Christian peoples (Balkan League); and, in the ensuing Balkan Wars of 1912–13, contributed to the final expulsion of the Ottoman Empire from the peninsula. Greece, under his premiership, doubled its territory and population by the acquisition of southern Macedonia (Salonika and the hinterland), south Ipiros (Ioánnina Préveza and Árta), Crete, and the Aegean Islands.

At the outbreak of World War I, Premier Venizélos proposed that the Greek army fight the Turks, who were allies of the German Empire. King Constantine, however, was in sympathy with the Central Powers and opposed him. For two years Venizélos struggled to change the King's mind, but after the invasion of Greek Macedonia by German-Austrian-Bulgarian armies (1916), he assumed the leadership of an anti-Constantine insurrection in Macedonia, Crete, and the islands. He organized a new panhellenic army in the Macedonian allied front and, following Franco-British intervention, forced Constantine into exile (1917). Greece, reunited under King Alexander, second son of Constantine, and Premier Venizélos, declared war against the Central Powers.

As soon as hostilities ended, Venizélos went to Paris to participate in the peace conferences. During his absence from Greece for almost two years, he acquired a reputation as an international statesman of considerable stature. In July 1919 he reached agreement with the Italians on the cession of the Dodecanese and secured an extension of the Greek area of occupation in Anatolia. The Treaty of Neuilly with Bulgaria (November 1919) and the Treaty of Sèvres with Turkey (August 1920) were triumphs both for Venizélos and for Greece.

Venizélos returned to Athens in September 1920; King Alexander suddenly died in October. Despite Venizélos' international triumph, the Greek people, in the November 1920 elections, gave a parliamentary majority to a coalition of monarchist parties, and King Constantine was recalled by a plebiscite. The defeat may perhaps be attributed to Venizélos' loss of popularity during his long absence; the continued maintenance of martial law; and the continuing hostilities with Turkey, the government of which was holding out against the impositions of the Treaty of Sèvres. Venizélos abruptly left Greece and exiled himself in Paris

Following the defeat of the royal army by the Turks (1922) and the subsequent armed insurrection, led by Gen. Nikólaos Plastíras and Gen. Stilianos Gonatas, King Constantine was dethroned (and succeeded by his eldest son, George), and six royalist leaders were executed. Venizélos assumed the leadership of the Greek delegation that negotiated the peace treaty of Lausanne (1923) with the Turks. Within a few months, another insur-rection, led by Gen. Ioannis Metaxas, forced George into exile, and Venizélos returned to Greece to become premier again. He fell into disagreement, however, with some Republican leaders who wished to abolish the monarchy, and he exiled himself again (1924). During the second Hellenic Republic (1924-35) he returned to Greece and reassumed leadership of the Liberal Party. In the general election of 1928, he obtained a huge majority, forming his third, and last, four-year Cabinet. During this period Venizélos succeeded in restoring normal relations with all of Greece's Balkan neighbours. His domestic position was weakened, however, by the effects of the Great Depression in the early 1930s; and in the elections of 1932 he was defeated.

After his defeat he continued to lead the

Liberals, but the end of his political career came in March 1935, when, after the failure of an attempt to prevent the restoration of the monarchy, he went to Paris, where he died in 1936. (D.P.)

Venkataraman, Ramaswamy (b. Dec. 4, 1910, Rajamadam, Madras [now Tamil Nādu], India), Indian politician, government official, and lawyer who became president of India in 1987.

Venkataraman studied law at the University of Madras and began his legal practice in 1935. He became involved in India's independence struggle and was consequently jailed by the British in 1942-44. After his release he continued to practice law, and in 1950 he was elected to independent India's Provisional Parliament as a member of the Congress Party. He subsequently was a member of the Lok Sabha (lower house of Parliament) from 1952 to 1957 and from 1977 onward. He served as minister of industry and labour for the state of Madras from 1957 to 1967. He eventually joined the central government, serving as minister of finance and industry (1980-82) and minister of defence (1982-84). After serving as vice president of India in 1984-87, he was elected to the largely ceremonial post of president in July 1987.

Venlo, gemeente (commune), Limburg provincie, southeastern Netherlands. It lies along the Maas (Meuse) River, near the German border. Chartered in 1343, it joined the Hanseatic League in 1364 and was a medieval fortress and trade centre. Venlo is now the centre of "greenhouse" market gardening; vegetables are exported to the Rhineland. The municipality also manufactures electric bulbs, optical instruments, and wood products. Heavily damaged in World War II, its buildings have since been restored. Notable medieval buildings include St. Martin's Church and the town hall. Pop. (1987 est.) 63.598.

Vennberg, Karl (Gunnar) (b. April 11, 1910, Blädinge, Swed.), poet and critic who was the critical-analytical leader in Swedish poetry of the 1940s.

Vennberg was a teacher of Norwegian in a Stockholm folk high school. His influential reviews and critical essays broke the ground for the radical cause of the 40-talslyrik (1947; "Poetry of the 1940s"), an anthology that he edited together with Erik Lindegren. His two volumes of verse, in which he exposes contemporary deception and self-deception, Halmfackla (1944; "Straw Torch") and Tideräkning (1945; "Reckoning of Time"), together with Lindegren's collections from these years, are considered the central works of the new Swedish poetry of the 1940s. His later volumes of poetry include Gatukorsning (1952; "Intersection"), Synfält (1954; "Points of View"), and Sju ord på tunnelbanan (1971; "Seven Words in the Subway").

venom, the poisonous secretion of an animal, produced by specialized glands that are often associated with spines, teeth, stings, or other piercing devices. The venom apparatus may be primarily for killing or paralyzing prey or may be a purely defensive adaptation. Some venoms also function as digestive fluids. The venom poisoning of humans is primarily a problem of rural tropical regions, though it occurs worldwide. Many thousands of human

deaths due to venom poisoning occur each year.

Most venoms injure humans only when introduced into the skin or deeper tissues, usually through a sting or bite. Venoms are mixtures of toxic enzymes and various other proteins that act on the body in different ways. Neurotoxin venoms act on the brain and nervous system and can cause either nervous excitation (characterized by such symptoms as muscle cramps, twitching, vomiting, and convulsions) or nervous depression (with such symptoms as paralysis and weakening or arrest of respiration and heartbeat). Hemotoxins affect the blood or blood vessels: some destroy the lining of the smaller blood vessels and allow blood to seep into the tissues, producing local or widespread hemorrhages, while others render the blood less coagulable or cause abnormally rapid clotting, leading to circulatory collapse that can be fatal. Still other venoms produce the symptoms of an allergic reaction, resulting in wheals, blisters, and violent inflammation, often followed by death of tissue and muscle

Most major animal phyla contain venomous species, but relatively few come into harmful contact with humans. These few include certain snakes (e.g., cobras, mambas, vipers, pit vipers, coral snakes, and rattlesnakes); certain fishes (e.g., stingrays, weevers, spiny sharks, scorpion fish, ratfish, and certain catfish); a few lizards (Gila monster); some scorpions and several spiders (e.g., the black widow and brown recluse); some social insects (e.g., the bee, wasp, and certain ants); and various marine invertebrates, including some sea anemones, fire corals, jellyfish, cone shells, and sea urchins. Snakes and spiders inject venom into their victims with their fangs; fishes use venomous spines and scorpions and many insects use stings.

Venom attacks can range in severity from a simple localized inflammation of the skin to almost immediate death, depending on the animal involved and the potency and mode of action of its venom. An attack's severity also depends on the victim's age (children are more severely affected than are adults) and the location of the injury (a venom wound on an arm or leg is usually less serious than a similar one on the head or trunk). See also poison.

Venosa, Latin VENUSIA, town and episcopal see, Potenza provincia, Basilicata regione, southern Italy. It is situated on the lower slope of Mount Vulcano, north of Potenza. Originally a settlement of the Lucanians (an ancient Italic tribe), it was taken by the Romans after the Samnite Wars (291 BC); from its position on the Appian Way it became an important Roman garrison town. The poet Horace was born there, and many of his poems mention places in the vicinity. Stones from the local Roman amphitheatre are built into the walls of the abbey church of Santa Trinità (1059). The church contains the tombs of the Norman soldier of fortune Robert Guiscard, his first wife, and his half brothers. The town's massive 15th-century castle and the cathedral (1470) are also notable, and north of the town are Jewish catacombs with inscriptions from the 4th and 5th centuries.

Venosa is an agricultural centre producing olive oil and paper. Pop. (1988 est.) mun., 12,208.

venous sinus, in human anatomy, any of the channels of a branching complex sinus network that lies between layers of the dura mater, the outermost covering of the brain, and functions to collect oxygen-depleted blood. Unlike veins, these sinuses possess no muscular coat. Their lining is endothelium, a layer of cells like that which forms the surface of the innermost coat of the veins. The sinuses receive blood from the veins of the brain and connect directly or ultimately with the internal jugular

vein. Blood from the sinuses, after it leaves the internal jugular vein, flows through the brachiocephalic vein and the superior vena cava to the upper right chamber (atrium) of the heart.

Vent, Îles du, English WINDWARD GROUP, eastern group of islands within the Society Islands, French Polynesia, in the central South Pacific. The group is composed of volcanic islands surrounded by coral reefs. The far larger Tahiti and Moorea (qq.v.) lie at the centre of the group. Maiao, covering about 3 square miles (8 square km) and located some 60 miles (95 km) west of Tahiti, is sparsely populated and is cultivated for copra. Tetiaroa, 25 miles (40 km) north of Tahiti, comprises 13 islets, with a total area of 2.5 square miles (6.5 square km). Mehetia (1 square mile [2.6] square km]), 60 miles (95 km) east of Tahiti, is uninhabited. Makatea (q.v.), a raised coral atoll and geologically part of the Tuamotu Archipelago, is included within the group for

administrative purposes.

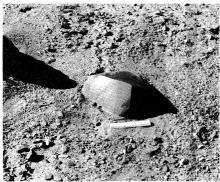

Administratively the Îles du Vent were part of the Society Islands from 1767 until 1946, when they became part of French Polynesia. Coconut plantations are the chief agricultural resource. Tourism is increasingly important to the economy, especially on Tahiti and Moorea. Pop. (1988 est.) 140,341.

Ventidius, Publius (b. before 90 BC, Asculum Picenum, Picenum [now Ascoli Piceno, Italy]—d. soon after 38 BC), Roman general and politician who rose from captivity to military fame, a change of fortune frequently cited by ancient authors.

In his youth, Ventidius was captured by the forces of the Roman general Pompeius Strabo in his native town of Asculum Picenum, which had joined the revolt (90–88) of Rome's Italian allies—peoples in Italy not incorporated into the Roman state. In 89, Ventidius was led in Strabo's triumphal procession at Rome. The prisoner was soon freed, and for years he probably made a living as an army contractor.

Eventually Ventidius' talents were recognized by Julius Caesar, who enlisted his aid during the Civil War (Caesar against Pompey and the Optimates, 49–46) and appointed him practor for 43. In the struggle for power that followed the assassination of Caesar (44), Ventidius sided with the Caesarian leader Mark Antony. Ventidius' forces reinforced those of Antony, and Antony in turn made Ventidius a consul. Sent by Antony to expel the Parthians from Anatolia and Syria, Ventidius defeated the enemy at the Cilician Gates (mountain pass in present-day southern Turkey) and Mount Amanus in 39 and at Mount Gindarus in 38. He died soon after celebrating a triumph at Rome.

ventifact, stone that has received one or more highly polished, flattened facets as a result of erosion by windblown sand. The facets are cut in sequence and correlate with the dominant wind direction. As one surface is cut, the stone may become out of balance and may

turn to expose another surface to the wind. A ventifact that has been eroded to three curved facets is called a dreikanter. Ventifacts are produced under arid conditions and are generally formed from hard, fine-grained rocks such as obsidian, chert, or quartzite.

ventilating, the natural or mechanically induced movement of fresh air into or through an enclosed space. The supply of air to an enclosed space involves the removal of a corresponding volume of expired air which is possibly laden with smells, heat, noxious gases, or dust resulting from industrial processes.

The hazards of poor ventilation were not clearly understood until the early 20th century. Carbon dioxide accumulation, once thought to be the major cause of illness resulting from poor ventilation, has since been revealed to have a minimal effect under most circumstances. A more immediate problem is posed by the increased temperatures and humidity generated by the bodily warmth and exhalations of human occupants.

Natural ventilation results from thermal effects, such as those from a flue, or may be caused by wind, or both. These forces are small and often variable. Their effectiveness is aided by opening or closing windows.

Much greater control can be achieved with mechanical ventilation systems. They typically include a fan (from the standard propeller or disk type to the quieter centrifugal type), a heater, and a filter to remove particulate matter. A mechanically powered inlet of air when combined with a natural exhaust tends to cause a slight positive pressure within an enclosed space, so that the air leakage is outward. A mechanical exhaust with a natural air inlet causes a slight negative pressure, so that air leakages are inward. Both methods are reliable means of ensuring adequate ventilation.

Ventimiglia, town, Imperia provincia, Liguria regione, northwestern Italy. It is situated at the mouth of the Roia River near the French border, just northeast of Nice, Fr. To the east of the modern town is the ruined Roman town Albium Intemelium, or Albintimilium, with the remains of a theatre. Ventimiglia's town hall houses a collection of Roman antiquities. Ventimiglia was the seat of a county from the 10th century and later of a commune that fell under Genoese domination. Its medieval quarter contains the cathedral with an 11th-century octagonal baptistery, the Romanesque Church of San Michele, and 13thcentury towers and fortifications. At Mortola Inferiore are the Hanbury Botanical Gardens; nearby are the Grimaldi Caves. The modern town is a resort and international customs station, with a noted flower market. Pop. (1988 est.) mun., 25,802.

Ventnor, town (parish), South Wight district, county of Isle of Wight, England, on the southeastern coast of the Isle of Wight. From a small fishing hamlet it grew in the 19th century into a fashionable resort, noted for its mild climate and long hours of sunshine. The novelist Charles Dickens lived for a time nearby, and the poet Algernon Swinburne is buried in the churchyard. Pop. (1981) 6,450.

Ventôse Decrees, during the French Revolution, laws providing for the confiscation of the property of enemies of the revolution and its distribution to needy patriots. The Ventôse Decrees are sometimes considered to be the most radical expression of social democracy of the revolution. They were passed by the National Convention (revolutionary assembly) on 8 and 13 Ventôse in the year II (February 26 and March 3, 1794) at the request of the idealistic young revolutionary Louis de Saint-Just, a member of the Committee of Public Safety (the executive ruling body). Although undertaken by the government as a political move to secure the support of the popular classes, the Ventôse Decrees failed in this goal because the most pressing need of the lower classes, the problem of obtaining food, was not met. The Ventôse Decrees were not put into effect and were completely abandoned after the fall of Robespierre on 9 Thermidor (July 27, 1794).

ventricle, muscular chamber that pumps blood out of the heart and into the circulatory system. Ventricles occur among some invertebrates. Among vertebrates, fishes and amphibians generally have a single ventricle, while reptiles, birds, and mammals have two.

In humans, the ventricles are the two lower chambers of the heart. The walls of the chambers, and particularly the walls of the left ventricle, are far more heavily muscled than the walls of the atria, or upper chambers (see atrium), because it is in the ventricles that the major force is exerted in the process of pumping the blood to the bodily tissues and to the lungs. Each opening leading into or away from the ventricles is guarded by a valve (see heart valve). These openings are the following: those from the two upper chambers; the opening from the right ventricle into the pulmonary artery, which transports blood to the lungs; and the opening from the left ventricle into the aorta, the main trunk by which oxygen-rich blood starts its course to the tissues. The interior surfaces of the ventricles are ridged with bundles and bands of muscle, called trabeculae carneae. The papillary muscles project like nipples into the cavities of the ventricles. They are attached by fine strands of tendon to the valves between the atria and ventricles and prevent the valves from opening when the ventricles contract.

For a depiction of the ventricles in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

ventricular fibrillation, irregular and uncoordinated contraction of the muscle fibres of the ventricles, the heart's lower chambers. Since ventricular fibrillation completely prevents the heart's functioning as a pump, it quickly brings death unless emergency measures restore the circulation of oxygenated blood throughout the body. Ventricular fibrillation may result from myocardial infarction-death of a section of heart musclefrom electric shock, deprivation of oxygen, certain serious chemical imbalances in the blood (abnormally high levels of potassium or low levels of calcium), or poisoning with digitalis or epinephrine. Treatment centres on early administration of drugs or, more frequently, of electric shocks to the ventricle. These measures are supplemented by closed chest massage. The massage serves to remove from the heart muscle the accumulated potassium ions and waste products of metabolism. See also atrial fibrillation.

ventricular septal defect, opening in the partition between the two ventricles, or lower chambers, of the heart. Such defects are congenital and may be accompanied by other congenital defects of the heart, most commonly pulmonary stenosis.

The partition between the ventricles is thick

and muscular except for a small fibrous section called the membranous septum. It is in this membranous portion that most septal defects are found. The condition is diagnosed by recognition of the characteristic heart sounds caused by the defect. If the opening is small, there may be no symptoms and no need for treatment. If it is large, with significant flow of blood from the left ventricle to the right, the treatment is surgical closure of the defect. If the blood flow is from the right ventricle to the left, as indicated by elevated pulmonary blood pressure, surgical repair is not indicated.

ventriloquism, the art of "throwing" the voice, i.e., speaking in such a manner that the sound seems to come from a distance or from a source other than the speaker. At the same time, the voice is disguised (partly by its heightened pitch), adding to the effect. The art of ventriloquism was formerly supposed to result from a peculiar use of the stomach during inhalation—hence the name, from Latin venter and loqui, "belly-speaking." In fact, the words are formed in the normal manner, but the breath is allowed to escape slowly, the tones being muffled by narrowing the glottis and the mouth being opened as little as possible, while the tongue is retracted and only its tip moves. This pressure on the vocal cords diffuses the sound; the greater the pressure, the greater the illusion of distance.

A figure, or dummy, is commonly used by the ventriloquist to assist in the deception. The ventriloquist animates the dummy by moving its mouth while his own lips remain still, thereby completing the illusion that the voice is the dummy's, not his. When not using a dummy, the ventriloquist employs pantomime to direct the attention of his listeners to the location or object from which the sound presumably emanates.

Ventriloquism is of ancient origin. Traces of the art are found in Egyptian and Hebrew archaeology. Eurycles of Athens was the most celebrated of Greek ventriloquists, who were called, after him, eurycleides, as well as engastrimanteis ("belly prophets"). Many peoples are adepts in ventriloquism—e.g., Zulus, Maoris, and Eskimo. The first known ventriloquist as such was Louis Brabant, valet to the French king Francis I in the 16th century. Henry King, called the King's Whisperer, had the same function for the English king Charles I in the first half of the 17th century. The technique was perfected in the 18th century. It is also well known in India and China. In Europe and the United States, ventriloquism holds a place in popular entertainment. Notable ventriloquists have included Edgar Bergen in the United States and Robert Lamouret in France.

Ventris, Michael (George Francis) (b. July 12, 1922, Wheathampstead, Hertfordshire, Eng.—d. Sept. 6, 1956, near Hatfield, Hertfordshire), English architect and cryptographer who in 1952 deciphered the Minoan Linear B script and showed it to be Greek in its oldest known form, dating from about 1500 to 1200 BC, roughly the period of the Homeric epics.

As a boy, his fascination with the classics led Ventris to study Greek and Latin. A competent and zealous cryptographer at 14, in 1936 he heard the famed archaeologist Sir Arthur Evans lecture on the pictographic Linear B that he had discovered at Knossós, Crete, in about 1900 and how it still baffled linguists and archaeologists. Ventris' determination to solve the puzzle of this peculiar writing dated from that time.

At 18 Ventris published a paper in the *American Journal of Archaeology* supporting the possibility of a relation between the script and another problematic language, Etruscan.

In 1949, following architectural studies that had been interrupted by service in the Royal Air Force during World War II, he began searching in earnest for the key to Linear B. The method by which he achieved success was essentially that of statistical analysis, aided by stray hints from the analysis of various arrangements of syllabic signs. After the publication (1951) of texts in an almost identical script found on the Greek mainland in 1939, Ventris' progress was rapid. In June 1952 he announced over a British radio program that he had found the Linear B to be a very archaic form of Greek.

Joined shortly thereafter by the Cambridge linguist John Chadwick, they assembled dramatic evidence supporting Ventris' theory. In 1953 they published their historic paper, "Evidence for Greek Dialect in the Mycenaean Archives." Their Documents in Mycenaean Greek (1956; rev. ed., 1973) was published a few weeks after Ventris' death in an auto acident, and Chadwick's The Decipherment of Linear B (1958; 2nd ed., 1968) followed.

Ventspils, German WINDAU, formerly (1721–1918) VINDAVA, city and port, Latvian S.S.R. It lies at the mouth of the Venta River on the Baltic Sea coast. A settlement existed there in the 2nd millennium BC; by the 10th century AD it was inhabited by Wends (a Slavic people). In 1242 the Teutonic Knights built a castle there, and in 1378 town status was conferred. A shipyard was established in 1642, and in 1904 Ventspils was reached by the railway. Its port is ice-free, like other Soviet Baltic ports south of the Gulf of Riga, and is one of the Soviet Union's major ports for the export of oil and chemicals. It has a pipeline from the Volga–Urals oil field, a fishing fleet, and a large fish cannery. Pop. (1987 est.) 52,000.

Ventura, formally SAN BUENAVENTURA, city, seat (1873) of Ventura county, California, U.S. It lies on the Pacific coast overlooking the Santa Barbara Channel. It is the site of the San Buenaventura Mission, the ninth and last mission founded (1782) by Junípero Serra (restored as a historic site). Ventura developed as an agricultural (primarily lemon-growing) centre, later turning to petroleum production, tourism, and diversified manufacturing. Ventura (junior) College was established in 1925. Inc. town, 1866; city, 1906. Pop. (1988 est.) city, 89,726; metropolitan area (PMSA), 647, 300.

Venturi, Robert (Charles) (b. June 25, 1925, Philadelphia, Pa., U.S.), American architect who proposed an alternative to the Functionalist mainstream of 20th-century American architectural design.

Venturi studied at the Princeton University School of Architecture (1947–50). After further study at the American Academy in Rome (1954–56), he worked as a designer in the architectural firms of Oscar Stonorov (Philadelphia), Eero Saarinen (Bloomfield Hills, Mich.), and Louis I. Kahn (Philadelphia). After holding partnerships in several firms, he opened a longer-lasting architectural firm with John Rauch in 1964. Venturi's wife, Denise Scott Brown, became a partner in the firm in 1967. From 1957 to 1965 Venturi was a member of the faculty at the University of Pennsylvania School of Architecture.

Venturi's own architectural philosophy, set forth in *Complexity and Contradiction in Architecture* (1966), called for an eclectic approach to design and an openness to the multiple influences of historical tradition, ordinary commercial architecture, Pop Art, and the broader context of contemporary architecture in general. He championed the ambiguity and paradox, the "messy vitality" of the

great architecture of the past over the simple, unadorned, cleanly functional steel-and-glass boxes of the International Style. Venturi's manifesto had a profound impact on younger architects who were beginning to find similar constraints and limitations in the Modernist architectural aesthetic.

In Learning from Las Vegas (1972; written with Denise Scott Brown and Steven Izenour), Venturi took his critique several steps further and analyzed with wry appreciation the neon-lit urban sprawl and the automobile-oriented commercial architecture of Las Vegas. He questioned the Modernists' rejection of the use of applied ornament and decoration, and ended the book with a discussion of his own buildings.

In his own buildings, which frequently exhibit the ironic humour of his theoretical pronouncements, Venturi uses the vocabulary of commercial building to create structures that attempt to reconcile the realities of mass culture with the ideals and rigour of high art. His buildings incorporate materials and visual references standard to the shopping centre and subdivision but previously shunned by socalled serious architects. During the late 1970s and '80s, as an unofficial dean of the eclectic movement known as Post-Modernism, Venturi turned to historical precedent in much of his work, notably to the 19th-century Shingle style of domestic architecture. Among his outstanding works are the Humanities Classroom Building of the State University of New York at Purchase (1973), the Franklin Court, Independence National Historical Park, Philadelphia (1976), and the Gordon Wu Hall of Princeton University (1983).

venturi tube, short pipe with a constricted inner surface, used to measure fluid flows and as a pump. The 18th-19th-century Italian physicist Giovanni Battista Venturi, observing the effects of constricted channels on fluid flow, designed an instrument with a narrow throat in the middle; fluid passing through the tube speeds up as it enters the throat, and the pressure drops. There are countless applications for the principle—e.g., an automobile carburetor, in which air flows through a venturi channel at whose throat gasoline vapour enters through an opening, drawn in by the low pressure. The pressure differential can also be used to measure fluid flow. See also Bernoulli's theorem.

venue, in law, locality in which a criminal offense has occurred or in which a court has jurisdiction to try the offense. The concept of venue involves important issues of public policy in the adjudication of crimes.

Local and general statutes specify the court in which a criminal offense must be tried. If the case is brought before an improper official, either the accused, the prosecutor, or the court itself may move for a change of court, or a change of venue. Such a change involves primarily the transfer of a case to a different locale or jurisdiction rather than merely to a different court. The transfer of a case to a higher court within the same jurisdiction is not a change of venue.

The grounds for a change of venue are specified in the statutes, although much is left to the discretion of the court. Grounds for a change have included newspaper reporting considered to have biased all potential jurors, the danger of violence, racial prejudice, and the convenience of jurors or witnesses.

Generally, the right to request a change of venue must be exercised by the accused, but the prosecution also may obtain a change. The judge may disqualify himself and request a change to another court in another jurisdiction. A codefendant has the right to request a change even if it requires splitting the trial into two or more separate cases.

Venue statutes usually specify that a trial must take place in the district that has subject-matter jurisdiction over the offense. Often this is the district in which the crime was committed or in which a corpus delicti was discovered. If trial is held in an improper court, the defendant cannot later complain if he has failed to request a change. If he makes such a request and it is wrongfully denied, an appeal court can request a new trial.

Venus, ancient Italian goddess associated with cultivated fields and gardens and later identified by the Romans with the Greek goddess of love, Aphrodite.

Venus had no worship in Rome in early times, as the scholar Marcus Terentius Varro (116-27 BC) shows, attesting that he could

Venus with Cupid and a dolphin, classical sculpture; in the Museo Nazionale Romano, Rome

find no mention of her name in old records. This is corroborated by the absence of any festival for her in the oldest Roman calendar and by her lack of a flamen (special priest). Her cult among the Latins, however, seems to be immemorial, for she had apparently at least two ancient temples, one at Lavinium, the other at Ardea, at which festivals of the Latin cities were held. Hence, it was no long step to bring her to Rome, apparently from Ardea itself. But how she came to be identified with so important a deity as Aphrodite remains a puzzle.

That Venus' identification with Aphrodite took place fairly early is certain. A contributory reason for it is perhaps the date (August 19) of the foundation of one of her Roman temples. August 19 is the Vinalia Rustica, a festival of Jupiter; hence, he and Venus came to be associated, and this facilitated their equation, as father and daughter, with the Greek deities Zeus and Aphrodite. She was, therefore, also a daughter of Dione, was the wife of Vulcan, and was the mother of Cupid. In myth and legend she was famous for her romantic intrigues and affairs with both gods and mortals, and she became associated with many aspects, both positive and negative, of femininity. As Venus Verticordia, she was charged with the protection of chastity in women and girls. But the most important cause of the identification was the reception into Rome of the famous cult of Venus Erucina—i.e., of Aphrodite of Eryx (Erice) in Sicily—this cult itself resulting from the identification of an Oriental mother-goddess with the Greek deity. This reception took place during and shortly after the Second Punic War. A temple was dedicated to Venus Erucina on the Capitol in 215 BC and a second outside the Colline gate in 181 BC. The latter developed in a way reminiscent of the temple at Eryx with its harlots, becoming the place of worship of Roman

courtesans, hence the title of *dies meretricum* ("prostitutes' day") attached to April 23, the day of its foundation.

The importance of the worship of Venus-Aphrodite was increased by the political ambitions of the gens Iulia, the clan of Julius Caesar and, by adoption, of Augustus. They claimed descent from Iulus, the son of Aeneas; Aeneas was the alleged founder of the temple of Eryx and, in some legends, of the city of Rome also. From the time of Homer onward, he was made the son of Aphroditethat is, the Trojan clan of the Aeneadae probably had a hereditary cult of their local mother-goddess-so that his descent gave the Iulii divine origin. Others than the Iulii sought to connect themselves with a deity grown so popular and important, notably Gnaeus Pompeius, the triumvir. He dedicated a temple to Venus as Victrix ("Bringer of Victory") in 55 BC. Caesar's own temple (46 BC), however, was dedicated to Venus Genetrix, and as Genetrix ("Begetting Mother") she was best known until the death of Nero in AD 68. But despite the extinction of the Julio-Claudian line, she remained popular, even with the emperors; Hadrian completed a temple of Venus at Rome in AD 135.

As a native Italian deity, Venus had no myths of her own. She therefore took over those of Aphrodite and, through her, became identified with various foreign goddesses. The most noteworthy result of this development is perhaps the acquisition by the planet Venus of that name. The planet was at first the star of the Babylonian goddess Ishtar and thence of Aphrodite. Because of her association with love and with feminine beauty, Venus has been a favourite subject in art since ancient times; notable representations include the statue known as the "Venus de Milo" (c. 150 BC) and the painting "The Birth of Venus" (c. 1485) by Sandro Botticelli.

Venus, in astronomy, second major planet from the Sun. Named for the Roman goddess of love and beauty, it is, after the Moon, the most brilliant natural object in the night-time sky. Venus comes closer to the Earth than any other planet, approaching to within about 40,000,000 km (24,800,000 miles) at inferior conjunction—i.e., when Venus comes between the Earth and the Sun.

A brief treatment of Venus follows. For full treatment, see MACROPAEDIA: Solar System. Venus revolves around the Sun at a mean distance of 107,500,000 km (66,650,000 miles) in a nearly circular orbit. As it travels around the Sun, Venus undergoes phase changes similar to those of the Moon. It completes one orbital revolution in 225 Earth days but goes

Venus is a near twin of the Earth in size and mass. Its diameter is about 12,103 km as compared to 12,756 km for the Earth; and its mass is approximately 0.81 of the latter.

through one cycle of phases in 584 days.

The two planets, however, bear little resemblance to one another in other respects. Venus is completely enveloped by a 15-kilometre-(9-mile-) thick layer of clouds consisting chiefly of droplets of concentrated sulfuric acid. Below this layer, which occurs at an altitude of more than 50 km (30 miles), are other dense clouds of sulfur dioxide intermixed with sulfur in both liquid and particulate form. Various U.S. and Soviet space probes have detected lightning in this region. The cause of such electrical discharges is unknown, though some investigators speculate that they are produced by chemical activity rather than by thunderstorms or other weather disturbances as on the Earth.

The composition of Venus's atmosphere is quite different from that of the terrestrial atmosphere. Spacecraft measurements indicate that carbon dioxide comprises more than 96 percent of the constituent matter, which accounts for the extreme density of the Venu-

sian atmosphere. Nitrogen makes up another 3.4 percent, and water vapour from 0.01 to 0.5 percent; trace amounts of argon, oxygen, neon, and sulfur dioxide also are present. The dense atmosphere, together with the thick cloud cover, traps incoming solar energy so efficiently that Venus has a surface temperature of about 475° C (887° F)—the highest of any planet in the solar system. This high temperature is accompanied by an equally high surface pressure of about 94 atmospheres.

Closeup photographs transmitted in 1975 by the Soviet Venera 9 and 10 planetary probes at two different sites revealed plains strewn with rocks, some of boulder size. The rocks at the Venera 9 landing site were jagged and angular, whereas those at the Venera 10 site were flat and rounded, indicative of erosion. Moreover, radar mapping of the entire Venusian surface by American scientists has uncovered various types of relief features, such as large circular structures reminiscent of impact craters, long troughs or canyons, shield volcanoes, and mountains. The tallest mountain, called Maxwell in honour of the British physicist, stands 11,000 m (36,000 feet) above the planet's mean surface. It is probably of volcanic origin, and there is indirect evidence that Venus is still experiencing active volcanism. Overall, the Venusian topography does not suggest plate-tectonic activity of the kind thought to have shaped much of the Earth's surface, but no definitive conclusions can be drawn because of insufficient data.

Unlike most of the other planets, Venus rotates in retrograde (from east to west), slowly turning on its axis once every 243 days. The axis itself is tilted only 3° from the plane of the planet's orbit around the Sun. These facts indicate that seasonal changes must be very slight, and no such variations have so far been observed. Solar heating and the slow rotation of Venus result in an atmospheric circulation in which air rises in the tropics, migrates sluggishly to the poles, and descends there. Such a simple pattern would be completely unstable on the rapidly rotating Earth. Even on Venus, remarkable instabilities appear superimposed in the form of intense wave patterns, especially in the polar regions, and modify the simple picture. Also, the rotation rate of the atmosphere increases with height from the surface to the upper atmosphere. Thus, features in the clouds have been observed to travel completely around Venus's equator in about four Earth days. The most prominent of the features observable from the Earth is a combination of planetary-scale waves that resembles a giant "Y" laid on its side. A polarorbiting spacecraft has discovered a very cold collar feature surrounding the north pole at cloud-top level with two hot features rotating inside of it.

Venus de Milo, ancient statue of Aphrodite, now in Paris at the Louvre Museum. Carved by a sculptor of Antioch on the Maeander River in about 150 BC, it was found on the Aegean island of Melos in 1820. The general composition derives from a 4th-century Corinthian statue. The action and modernized drapery give the Venus great nobility. The statue is a conspicuous example of the Hellenistic sculptural tradition's academic traits and close reliance on older masterpieces.

Venus's flower basket, any of several sponges of the genus Euplectella, especially E. aspergillum (class Hyalospongiae, glass sponges). The name Venus's flower basket derives from the delicate, white, latticelike skeletons. In the living animal the skeleton is covered by a thin layer of cells. E. aspergillum is found in a small area of the sea near the Philippine Islands. Similar species occur near

Japan and in other parts of the western Pacific Ocean and the Indian Ocean.

The "basket" is a curved tube about 25 cm (10 inches) long. A tuft of fibres at the narrow

base attaches the animal to the sea bottom. Euplectella species feed on organic debris and microscopic organisms that are drawn into its central cavity through numerous holes in the body wall.

The skeleton of Venus's flower basket is a prized curio. In Japan it is regarded as a symbol of eternal love.

animals. The only member of its genus, the plant is native to a small region of North and South Carolina, U.S., where it is common in damp, mossy areas.

The plant, which grows from a bulblike rootstock, bears a round cluster of small white flowers at the tip of an erect stem 20 to 30 cm (8 to 12 inches) tall. The leaves are 8 to 15 cm (3 to 6 inches) long and are hinged along the midline so that the two nearly circular lobes, with spiny teeth along their margins, can fold together and trap an insect alighting on them. This action is triggered by pressure on six sensitive hairs, three on each lobe. In normal daytime temperatures the lobes, when stimulated by prey, snap shut in about half a second. Glands on the leaf surface secrete a red sap that digests the insect's body and gives the entire leaf a red, flowerlike appearance. About 10 days are required for digestion, after which the leaf reopens. The trap dies after capturing three or four insects.

Venus's girdle, ribbon-shaped comb jelly of the order Cestida (phylum Ctenophora) found in the Mediterranean Sea. It is the common name for *Velamen veneris* (*Cestum veneris*). Its graceful, transparent body, which is a delicate violet in colour, is 1 metre (about 40 inches) or more long and about 5 centimetres (2 inches) wide. It has a well-developed musculature and swims with an undulating motion.

Venus's-hairstone, variety of quartz interspersed with fine crystals of the mineral rutile (q, v).

Venus's looking glass (Legousia speculum-veneris), species of annual herb of the bellflower family (Campanulaceae), native to sandy, sunny

parts of the Mediterranean region. It is grown as a garden ornamental for its blue, violet, or white, wide-open, bell-shaped flowers.

The long calyx (collection of fused sepals) resembles a mirror handle and is the source of the plant's common name. Basal leaves are egg shaped; stem leaves are narrow. The plant reaches a height of about 22 centimetres (9 inches).

Venyukovia, genus of extinct mammal-like reptiles (therapsids) found as fossils in Middle Permian deposits in eastern Europe (the Permian Period began 280,000,000 years ago and lasted 55,000,000 years). Venyukovia was herbivorous, with primitive teeth; it is thought that Venyukovia may well have been the ancestor of an important group of plant-eating therapsids, the Dicynodontia. Venyukovia and the dicynodonts did not give rise to more advanced forms, however.

Veracruz, state, east central Mexico. Long and narrow, it stretches 430 mi (690 km) along the Gulf of Mexico coast, averaging 55 mi in width, bounded north by Tamaulipas, east by the Gulf, southeast by Tabasco and Chiapas, and west by Oaxaca, Puebla, Hidalgo, and San Luis Potosí. Its 27,683-sq-mi (71,699-sq-km) territory consists of low, level, sandy strips along the Gulf, a zone heavily broken by tidewater streams and lagoons, behind which the land rises to the central plateau, cut into rich valleys, often covered by dense tropical rain forest. Orizaba, Mexico's highest peak, at 18,-406 ft (5,610 m), is located in these highlands. More than 40 rivers cross the state, carrying rich silt and providing hydroelectric power but also causing frequent inundations.

Veracruz is rich in archaeological remains of the pre-Columbian Olmec, Totonac, and Huastec cultures. Part of the coast was explored in 1518 by Juan de Grijalva, although the first landing was made by Hernán Cortés

in 1519 at San Juan de Ulúa. Veracruz became a state in 1824.

A massive reclamation project involving drainage, hydroelectric installations, preplanned cities, and a balanced industrial-agricultural economy was inaugurated in 1947 by the national government in the Papaloapan River Basin. Dams to provide hydroelectric power, irrigation, and flood control were built, and modern farm methods were introduced.

The wealth of the state is based on commerce, agriculture (ranging from cotton to coffee to corn [maize], according to altitude), manufacturing, and the production and processing of petroleum at its northern and southern extremities. The state ranks second nationally in mining, having half of Mexico's petroleum reserves and a third of its refinery capacity. Pastoral activities furnish cattle and hides for domestic consumption. Forest industries supply rubber, cabinet woods, chicle, orchids, and medicinal plants. Among the state's numerous and varied industries are sugar refineries, distilleries, chemical plants, metal working, and textile mills. Fisheries in the Gulf of Mexico and processing of the catches is an industry of national importance. Transportation facilities are good, especially in the south. A major highway and railroad link Veracruz city and the state capital of Jalapa to Mexico City. Other roads lead eastward to the Yucatan Peninsula, and there are airports in the state's largest cities. Pop. (1984 est.) 6,171,000.

Veracruz, in full VERACRUZ LLAVE, city and port, on the Gulf of Mexico, east central Veracruz state, east central Mexico.

Veracruz is built on a hot, low, and barren sandy beach on the Gulf of Mexico only about 50 ft (15 m) above sea level. Hernán Cortés founded La Villa Rica de la Veracruz (Rich Town of the True Cross) as the first Mexican municipality in 1519, but the site was twice abandoned because of its rainy, humid, and somewhat unhealthy conditions; the present city dates from about 1599. As the chief link between colonial Mexico and Spain,

Veracruz prospered as a port and became the most "Spanish" of Mexican cities, with an admixture of Caribbean creole influences. It was attacked and captured repeatedly—first by privateers, then by French and U.S. forces, and, after independence in 1821, by numerous revolutionary governments. It was renamed Veracruz Llave in honour of Gen. Ignacio de la Llave, governor of Veracruz state (1857–60). Both the 1857 and 1917 Mexican constitutions were proclaimed there.

Veracruz is now one of Mexico's chief seaports and a communications centre for the Gulf littoral and the tropical and highland hinterlands. It is linked by highway, railroad, and air to both highland and lowland cities. The city also houses the Regional Technical

Institute of Veracruz (1957). Pop. (1980) 333,-000.

Veracruz incident (April 21-Nov. 14, 1914), the occupation of Veracruz, the chief port on the east coast of Mexico, by military forces of the United States during the civil wars of the Mexican Revolution.

On April 9, 1914, the crew of the USS *Dolphin*, anchored in the port of Tampico, was arrested after landing in a forbidden area and detained for one and one-half hours. U.S. president Woodrow Wilson demanded a 21-gun salute to the U.S. flag as an apology. When the Mexican president Victoriano Huerta refused, Wilson sent a fleet to the Gulf of Mexico.

A report that Germany was dispatching arms to Huerta aboard the merchant vessel Ypiranga bound for Veracruz prompted Wilson to order the port seized. The resisting Mexican force failed to stop the invading U.S. Marines and suffered about 200 casualties. Both Huerta and his rival Venustiano Carranza denounced the seizure. The action cut Huerta off from the source of needed munitions (although the arms aboard the Ypiranga did reach Huerta), but the United States permitted his opponents to be supplied. By July 1914, the Constitutionalists under Carranza were able to take over the government, and Huerta was forced into exile. On November 14 the U.S. Marines were withdrawn.

Veraguas, province, western Panama, bounded by the Mosquito Gulf to the north and the Pacific Ocean to the south. Established in 1719, Veraguas originally covered all of western Panama but now contains only 4,280 sq mi (11,086 sq km). It is the only Panamanian province that straddles the isthmus. The Pacific lowlands and the lower southern slopes of the central highlands are important agricultural districts, producing rice, corn (maize), and coffee; pigs, poultry, and cattle are also significant. Santiago (q.v.), the provincial capital, is on the Pan-American Highway. Pop. (1985 est.) 204,100.

Veralden-radien, also called VERALDEN-OLMAI (Lapp: "Ruler of the World"), the deity thought by the Lapps to be closest to the starry heaven. Because the deity associated with mailmen stytto, the pillar supporting the heavens, he is also responsible for the continued maintenance of life and is considered a fertility god. Veralden-radien is believed to support all growth. The goddess of childbirth, Madderakka, receives the souls of unborn children from him, while he takes the souls of the departed down to Yabme-aimo, the Lapp realm of the dead. Veralden-radien was also the object of a phallic cult; each autumn a bull reindeer was traditionally sacrificed to him, then its genitalia were tied around Radien's statue and the blood smeared over the statue.

The worship of Veralden-olmai has many Scandinavian features, which has led scholars to look for the god's origin among the Germanic peoples. He is often mentioned in connection with the Swedish deity Frey, a fertility god, and the Saxon world-supporting pillar Irminsul, which may have influenced some of the mythological concepts of the Lapps.

veranda, in architecture, most frequently, an open-walled, roofed porch attached to the exterior of a domestic structure and usually surrounded by a railing. The word came into English through the Hindi *varandā*, but it is related to the Spanish *baranda*, meaning "railing," and thus most likely entered Hindi via Portuguese explorers of India.

Veranda most often refers to a long porch that extends along more than one outside wall of a house and is used for outdoor activities. In some parts of the United States, however, it is used to mean any kind of porch, and in India it refers to either a long, open porch or an enclosed area in the front of the house where visitors are received.

Veratrum, genus of poisonous herbs of the lily family (Liliaceae). The genus includes about 15 to 45 species, among them the American hellebore and the European hellebore (*see* hellebore) and the false hellebore (*see* skunk cabbage).

The perennials bear flowers that are greenishwhite to brownish-purple and are planted as ornamental borders. Their poisons have commercial value as insecticides and medicine.

Verāval, town, south central Gujarāt state, west central India, on the Arabian Sea coast of the Kāthiāwār Peninsula. It is part of the Pātan urban agglomeration. Its port principally handles timber and agricultural products. Matches, textile bobbins, and bone fertilizer are manufactured, and there is offshore fishing. The ruins of the ancient city and Hindu temple of Somnāth are nearby. Verāval is a railway terminus and lies on a major highway. Pop. (1981) 85,048.

Verbania, commune, Novara province, Piemonte (Piedmont) region, northern Italy, and a summer resort on Lake Maggiore (ancient Verbanus Lacus). Formed in 1939 by the union of the towns of Pallanza and Intra, it has botanical gardens, two 16th-century churches (S. Secondo and Madonna di Campagna), and the 18th-century Palazzo Dugnani, which houses a museum. Industries include the manufacture of textiles and machinery and food processing. Pop. (1984 est.) mun., 32,165.

Verbenaceae, the verbena, or vervain, family of plants, order Lamiales, a worldwide but mainly tropical grouping of about 100 genera and more than 2,600 species, some important for their timber and others for their flowers. The flowers of the Verbenaceae usually consist of a tube flaring into three to five almost

equally cut lobes. An occasional species, such as the shrub lemon verbena (*Aloysia triphylla*), has fragrant oils.

Verbena is a genus of about 250 plants, all but two or three species of which are native to the Western Hemisphere. The garden hybrid V. hortensis, derived from a number of South American species, bears flat heads of phloxlike flowers, sometimes with yellow eyes, on square-stemmed, creeping plants. Vervain, a name sometimes given the genus and also applied to the spike-flowering American species, is best applied to the Eurasian species Vofficinalis, now widely naturalized and once considered a medicinal plant. Blue vervain (V. hastata), of North America, reaching 1.5 m (5 feet) in height, produces terminal spikes of blue to purple flowers. The family also includes teak (Tectona grandis), from Southeast Asia, a tree growing to 60 m (see teak).

Outstanding among the 30 Petrea species,

all tropical American, is a woody evergreen vine called purple wreath, or sandpaper vine (*P. volubilis*). It bears long, hanging clusters of violet-blue pansy-like flowers and has oval leaves so rough as to be likened to sandpaper.

Lippia, with 220 species, bears clusters of white, rose, or purplish flowers. From South America, L. canescens is a matting ground cover with oblong leaves and small heads of yellow-throated, lilac flowers.

Caryopteris, with 15 East Asian species, is exemplified by blue spirea, or bluebeard (C. incana), an oval-leaved shrub up to 1.5 m tall with clusters of bright-blue flowers in the autumn. Other tropical plants such as Chinese hat plant (Holmskioldia sanguinea) and species of pigeon berry, or golden dewdrop (Duranta), beauty berry (Callicarpa), and glory-bower (Clerodendrum) are cultivated as ornamentals.

Verbiest, Ferdinand, Chinese name NAN HUAI-JEN (b. Oct. 9, 1623, Pitthem, Spanish Netherlands [now Pittem, Belg.]—d. Jan. 23, 1688, Peking), Dutch Jesuit missionary and astronomer who became an influential official in the Chinese government.

A trained astronomer at a time when the Chinese were impressed with Western astronomical knowledge, Verbiest took the place of his Jesuit predecessor, Adam Schall von Bell (1591–1666), as director of the Imperial Board of Astronomy and advised the Emperor in many matters, including the construction of more than 300 cannon, each named for a saint, when the Ch'ing dynasty was threatened by a rebellion in South China. In 1678 Verbiest served as a translator in Chinese treaty negotiations with the Russians, obtaining from the Russians knowledge of an overland route through Siberia that could be used by Jesuits coming to China from Europe. Verbiest's correspondence with his European friends describing the achievements of Chinese civilization inspired such European Enlightenment figures as the German philosopher Gottfried Leibniz.

Vercelli, Latin VERCELLAE, capital of Vercelli province, Piemonte (Piedmont) region, northwestern Italy, on the Sesia River, southwest of Novara. The chief city of the Libici (a Ligurian tribe), it later became a Roman municipium (town). The Campi Raudii (Raudian Fields) to the south were the scene of Hannibal's first victory on Roman soil (218 BC) and of the Roman general Marius' defeat of the Cimbri in 101 BC. A powerful independent republic in the Middle Ages, Vercelli fell to the Visconti family of Milan in 1335 and to the House of Savoy in 1427. It was occupied by the Spanish from 1638 to 1659 and by the French from 1704 to 1706 and during the Napoleonic Wars. A bishopric from the 4th century, it has been an archbishopric since 1817. Notable landmarks include the cathedral (reconstructed 1572), with a valuable library that houses the Codex Vercellensis, a late 10th-century Old English manuscript; the Romanesque-Gothic basilica of S. Andrea (1219-24); and the churches of Saints Cristoforo, Paolo, and Francesco, with paintings by Gaudenzio Ferrari and his pupil Bernardo Lanino. Vercelli was the birthplace of the painter Sodoma, who, with Ferrari, headed the city's noted school of painting. It has an art gallery, local museum, and municipal library and archives.

Vercelli is a rail junction and major rice market in an irrigated agricultural region; its industries include flour milling, food processing, and the manufacture of textiles, chemicals, and machinery. Pop. (1984 est.) mun., Vercelli Book, Latin CODEX VERCELLENSIS, Old English manuscript written in the late 10th century. It contains texts of the poem Andreas, two poems by Cynewulf, The Dream of the Rood, an "Address of the Saved Soul to the Body," and a fragment of a homiletic poem, as well as 23 prose homilies and a prose life of St. Guthlac, the Vercelli Guthlac. The book is so named because it was found in the cathedral library at Vercelli, northern Italy, in 1822

Marginalia in the manuscript indicate that the manuscript was in English use in the 11th century. It was probably taken to Italy by one of the numerous Anglo-Saxon pilgrims on the way to Rome.

Vercingetorix (d. 46 BC), chieftain of the Gallic tribe of the Arverni. He led a major rebellion against Roman rule in Gaul (52 BC) and was acclaimed king of the tribe and general of the confederates. After initial successes he was besieged by the Roman general Julius Caesar in the fortress of Alesia and forced to surrender. Taken to Rome, Vercingetorix was exhibited in Caesar's triumph (46) and then executed.

Verde, Cape, French CAP VERT, promontory forming the westernmost part of continental Africa. It is shaped like a triangle (about 9 miles [15 km] per side) with the base of the triangle roughly along the north and its apex on the south, the site of the seaport of Dakar, capital of Senegal. Near Pointe des Almadies, the northwestern tip of the cape, lies Dakar's international airport, famous as a transatlantic ferrying point during World War II. Twin volcanic cones, the Deux Mamelles ("Two Teats"), dominate the landscape along the coast northwest of Dakar. See also Cape Verde Peninsula.

Verde, (José Joaquim) Cesário (b. Feb. 25, 1855, Lisbon—d. July 18, 1886, Lisbon), poet who revived Portuguese poetry by introducing colloquial language and by exploring its capacity for expression at a time when exalted rhetoric was the accepted means. He dealt extensively with themes pertaining to the growth of urban life.

Born into a well-to-do middle-class family, Verde studied at the faculty of arts of the University of Lisbon but left without a degree. Adopting a bohemian life-style, he nevertheless earned a living as a fruit farmer and for a time as a businessman, publishing poetry in newspapers and literary magazines sporadically until his early death from tuberculosis.

After his death, a friend, the literary critic António da Silva Pinto, collected and published his poems as *O Livro de Cesário Verde 1873–1886* (1887; "The Book of Cesário Verde").

Verdi, Giuseppe (Fortunino Francesco) (b. Oct. 10, 1813, Le Roncole, near Busseto, Duchy of Parma [Italy]—d. Jan. 27, 1901, Milan), leading Italian composer of opera in the 19th century, noted for such works as Rigoletto (1851), Il trovatore (1853), La traviata (1853), La forza del destino (1862), Don Carlo (1867), Aida (1871), Otello (1887), and Falstaff (1893).

Early life and career. Verdi's father, Carlo Giuseppe Verdi, keeper of a tavern and grocery, was illiterate and too poor to give his son a thorough education, but the boy showed his musical gift at an early age and attracted the attention of Antonio Barezzi, a merchant and an amateur of music in Busseto, who encouraged and helped him in his education. Besides copying parts and deputizing for the organist,

Verdi began to compose pieces for the local philharmonic society and the church. At the age of 18, he was sent to Milan, at Barezzi's expense, to enter the conservatory but was rejected as being over the age limit for entry. He remained in Milan for three years, however, studying with Vincenzo Lavigna, a musician on the staff of La Scala (Teatro alla Scala). In 1834 he returned to Busseto to claim, with Barezzi's support, the vacant office of musical director. The clerical party, however, secured the post for a candidate of their own, and

a factional dispute followed. This experience fostered Verdi's anticlericalism and his dislike of Busseto. He was, nonetheless, appointed musical director to the commune and played an active part in the life of the town. In 1836 he married Margherita Barezzi, his patron's

An opportunity of composing an opera, Oberto, conte di San Bonifacio, took Verdi back to Milan in 1836. The project fell through, but three years later the opera was produced at La Scala and was sufficiently successful to secure him a commission to compose three more operas for the Milanese theatre. The first of these, Un giorno di regno (King for a Day, first performed 1840), an opera buffa (comic opera), was received so badly that it was withdrawn after one performance. Verdi, who had recently lost his wife and a year previously his infant son (another child had died before he left Busseto), was overcome with despair and vowed he would never write another opera. The director of La Scala released him from his contract but, when he thought the wound had healed, pressed on the young composer a libretto based on the story of Nebuchadrezzar II. Verdi read it reluctantly until, coming on the words of a chorus of Jews in captivity, he was suddenly released from his inhibitions. The production of Nabucco in 1842 established his reputation in Italy.

Among the singers in Nabucco was Giuseppina Strepponi, who had been instrumental in securing the acceptance of Oberto by the La Scala management. She was to become, after a scandal-ridden interlude, Verdi's second wife. Giuseppina had had a successful career as an interpreter of Donizetti's heroines and had been the mistress of Napoleone Moriani, a tenor with whom she sang. By him she had three sons, one of whom survived apparently until 1853. All this gives point to her later reluctance to marry Verdi and to the truthfulness of his portrait of Violetta, the "fallen woman" with the heart of gold, in La traviata

(The Fallen Woman): Strepponi certainly had such a heart.

Verdi had been born in a divided Italy. At birth a French citizen (he had in fact been christened Joseph-Fortunin-François by a French clerk in territory held by Napoleon), he was now a foreigner with a passport in Austrian-dominated Milan. The chorus in Nabucco may have sparked the patriotism that was to make him the spokesman of Italian aspirations and that led to conflicts with the Austrian censorship. The Italian public certainly read into the prayer of the Jews for deliverance from captivity their own hopes of freedom from the Austrian Empire. The succeeding operas—I Lombardi (The Lombards, 1843), a tale of the Crusades; Ernani (1844), based on Victor Hugo's drama; I due Foscari (The Two Foscaris, 1844); and Giovanna d'Arco (Joan of Arc, 1845) all provided opportunities for the expression of patriotic sentiments, in spite of the censor, under the guise of dramatic propriety. Until the Italian patriots succeeded in establishing an independent Italy united under Victor Emmanuel II, king of Sardinia, Verdi-whose very name was taken to spell out Vittorio Emanuele Re D'Italiaremained the unofficial musician laureate of the popular cause, to the detriment for a time of his artistic development.

In Macbeth (1847) Verdi took a definite step forward. Just as the biblical theme had contributed to the grandeur of *Nabucco*, so the tragic theme of Shakespeare's drama called forth the best that was in him. Much that is trite and crude as well as forceful remains in Macbeth, but there are also intimations of the genius that was to produce Don Carlos, Aida, and Otello.

Verdi's popularity in Italy attracted attention abroad. In 1846 he went to Paris for a production of Ernani and in the following year to London, where I masnadieri (The Robbers), based on Schiller's Die Räuber, was performed for the first time. He returned to Paris, where he renewed his friendship with Giuseppina Strepponi, who had retired from the stage to teach singing. An intimate relationship developed, but, though there was no impediment to their marriage, neither was willing to go through the formality. Strepponi, a devout Catholic, seems to have felt herself unworthy to be Verdi's wife. Verdi aggravated the scandal and brought on himself the rebuke of his first wife's father by installing his mistress at Sant'Agata, a property near Busseto that Verdi, now a man of some wealth, had purchased. Sant'Agata became his home for the rest of his life.

Verdi seems to have been unconscious of the social enormity of his conduct. He responded to local censure by refusing to have anything to do with Busseto and its musical activities, having first scrupulously repaid with interest the contribution made by the commune to his musical education. In 1859, seven years after his arrival at Sant'Agata, he and Strepponi stole off to an obscure village in Savoy and legalized their union in the eyes of church and state.

Middle period. In the meantime he had composed the three operas that have done most to familiarize his name: Rigoletto, Il trovatore (The Troubadour), and La traviata. In Rigoletto he made an important advance toward a coherent presentation of the drama in music. There is less distinction between the recitatives (part of the score that carries forward the story in imitation of speech), which tend toward arioso (melodic, lyric quality), and the arias, which have lost their rigid formality and are skillfully dovetailed into what precedes and follows them, and the musical interest is concentrated mainly in a series of duets. These culminate in the famous quartet, in effect a double duet for Gilda and Rigoletto on one side of a wall and the Duke and Maddalena on the other. Il trovatore, with its violent heroic action, evoked a different kind of music, powerful and less subtle in its outpouring of impassioned melody. Even greater is the contrast of style in La traviata, with its intimate mood and lyrical pathos—a vein that Verdi had previously exploited in Luisa Miller (1849), which was based on Schiller's Kabale und Liebe.

These three great successes of Verdi's middle years were not achieved without tribulation. The composer was now strongly suspect to the censors, and the plot of Le roi s'amuse. Hugo's poetic drama from which Rigoletto was derived, contained the attempted murder of a king, which was politically taboo, and a curse, which was blasphemous. Only after the king's reduction in rank to a duke and various other modifications was the text approved. Traviata was a different matter. With La dame aux camélias (The Lady of the Camellias) Alexandre Dumas had just caused a considerable scandal in Paris, and Verdi's operatic version, though at first performed in 17th-century costumes, too obviously broke away from the type of remote subject considered proper for opera. For this reason and also because a particularly stout prima donna was cast as the consumptive heroine, the first performance in Venice was a fiasco. "Is it my fault or the singers"? Time will show," was Verdi's characteristically laconic comment.

Verdi was now an international celebrity, and the change in his status was reflected in his art. From 1855 to 1870 he was mainly occupied in producing works for the Opéra at Paris and other theatres conforming to the Parisian operatic standard, which demanded spectacular dramas in five acts with a ballet. Verdi, always a conscientious craftsman willing to provide what his patrons demanded, set himself to compose "grand" operas on the Meyerbeerian scale, though he groaned under the Opéra's lavish demands. His first essay in the new manner, Les Vêpres siciliennes (The Sicilian Vespers, 1855), represents a sad falling off from the quality of Rigoletto and La traviata. The fault lay partly in the libretto by Eugène Scribe, who refashioned an old piece he had written for Donizetti.

Two operas for Italian theatres, Simon Boccanegra (Venice, 1857) and Un ballo in maschera (A Masked Ball, Rome, 1859), affected in a lesser degree by the impact of the grand operatic style, show the enrichment of Verdi's power as an interpreter of human character and a new mastery of orchestral colour. Boccanegra, despite a gloomy and excessively complex plot, holds the attention by the subtle presentation of character and not, as in most of the early operas, simply by means of melodious music and sensational dramatic strokes (coups de théâtre). Un ballo in maschera, a romantic version of the assassination of Gustav III of Sweden, was potentially a better drama, but again the censorship barred the murder of a king and so made nonsense of the story, which was transported from 18th-century Stockholm to Puritan Boston, a hundred years earlier. This was Verdi's last encounter with a foreign censorship. In 1860, Italy, apart from the papal states, was united as a kingdom. Count Cavour, the political architect of the new state, was anxious to obtain the services in Parliament of distinguished Italians outside the world of politics. Verdi reluctantly agreed to stand for election to the chamber of deputies, which he dutifully attended in Turin, but he took no active part in politics, and after Cayour's death in 1861 he resigned his seat.

In 1862 Verdi represented Italian musicians at the London Exhibition for which he composed a cantata to words by the poet and composer Arrigo Boito. In the same year his next grand opera, La Forza del destino (The Force of Destiny), was produced at St. Petersburg. This was followed in 1867 by Don Carlos (based on Schiller's tragedy) at the Paris Opéra.

Again there is evident an advance in subtlety of characterization and in the orchestration. These qualities were brought to the highest pitch in *Aida*, commissioned by the khedive of Egypt to celebrate the opening of the Suez Canal and produced in Cairo in 1871. For this masterpiece, as for *Macbeth*, Verdi wrote a detailed scenario; Antonio Ghislanzoni was commissioned to turn it into verse, the form of which was often dictated by the composer.

When Rossini died in 1867, Verdi proposed that a requiem mass in his honour be composed by himself and a dozen of his contemporaries for performance at Bologna, Rossini's spiritual home. The project, however, hardly got beyond the committee state, and Angelo Mariani, who was to have conducted the performance, seemed to Verdi less than wholehearted in his support. Verdi, who could not bear being thwarted, visited his wrath on the unfortunate Mariani, the most distinguished Italian conductor of the day and hitherto one of Verdi's closest friends, who further annoyed Verdi by arranging and directing a commemoration of Rossini at Pesaro, his birthplace. The quarrel reflects little credit on Verdi. He could never forgive an injury real or imagined, as attested to by his lifelong hatred of La Scala and its audience, which had rejected Un giorno di regno. The breach with Mariani was widened when the conductor refused to go to Cairo to direct the first performance of Aida. He pleaded illness and was indeed suffering from cancer, of which he died in 1873. Fuel was added to the fire by a scurrilous libel in a Florentine paper that accused Verdi of stealing Mariani's mistress, Teresa Stolz, the soprano who was to be the outstanding Aida in the Italian performances of the opera. There is not a vestige of evidence to support this story, though some years later, after Mariani's death, Verdi does seem to have developed a warmer attachment to the singer, causing his wife some distress. But if infatuation there was, it passed, and the happy relationship between Verdi and his wife was reestablished.

In 1873, while awaiting the production of *Aida* in Naples, Verdi wrote a string quartet, the only instrumental composition of his maturity. In the same year he was moved by the death of Alessandro Manzoni, the Italian patriot and poet, to compose a requiem mass in his honour, into which he incorporated the final movement he had written for the abortive Rossini mass.

Late masterpieces. By the early 1870s Verdi had reached the summit of his career, and, apart from supervising Italian productions of his operas earlier produced abroad, he retired to his estate near Busseto, the cultivation of which he superintended with no less care than he applied to operatic rehearsals. But Tito Ricordi, his publisher, was reluctant to allow his most profitable composer to rest on his laurels. He contrived a reconciliation with Arrigo Boito, who had offended Verdi by some youthful criticism years before. A proposal that Boito should write a libretto based on Shakespeare's Othello attracted Verdi, but the poet was first asked to revise the unsatisfactory libretto of Simon Boccanegra, which he greatly improved. The Othello project then took shape, and the opera was presented at La Scala in 1887. In his 74th year, Verdi, stimulated by a libretto incomparably superior to anything he had previously set, had produced his tragic masterpiece. In Otello the drama is completely absorbed into a continuous and flexible musical score that reflects every aspect of the characters and every movement of the action.

After an enormously successful tour with Otello throughout Europe, Verdi once more retired to Sant' Agata, declaring that he had produced his last work. But one more Shakespearean opera was to come. Boito, with infinite skill, converted The Merry Wives of Windsor, strengthened with passages adapted

from the Henry IV plays, into the perfect comic libretto, Falstaff, which Verdi set to miraculously mercurial music. This, his last dramatic work, produced at La Scala in 1893, avenged the cruel failure of Verdi's only other comedy in the same theatre 55 years before. After Falstaff Verdi turned to choral composition, producing experimental settings of Ave Maria and of Laudi alla Vergine Maria, the words from Dante's Paradiso. These, together with the more substantial Stabat Mater and Te Deum, were published in 1898 under the title Quattro pezzi sacri (Four Sacred Pieces). He wrote nothing more. In 1897 his wife's death had broken their long partnership, and Verdi himself grew gradually weaker in health, dying less than four years later.

Assessment. From the first there appeared in Verdi's music a forceful character and a gift for impassioned melody that at once proclaimed to the public the arrival of a new master. Thereafter he gradually developed into an artist of the first rank and ended in transforming opera into true music drama (dramma per musica), as his contemporary Richard Wagner was doing in Germany. Verdi's development was independent of Wagner's; he was, he said, not a learned composer, only a very experienced one. That experience, entirely practical, was gained in the theatre. (D.Hus.)

MAJOR WORKS. Operas. 27 (not including revisions), among them Nabucodonosor (usually called Nabucoo; first performed, 1842), I Lombardi alla prima crociata (The Lombards on the First Crusade, 1843), Ernani (1844), Macbeth (1847), Luisa Miller (1849), Rigoletto (1851), Il trovatore (1853), La traviata (The Fallen Woman, 1853), Les Vèpres siciliennes (usually called I Vespri siciliani; The Sicilian Vespers, 1855), Simon Boccanegra (1857, extensively revised 1881), Un ballo in maschera (A Masked Ball, 1859), La forza del destino (The Force of Destiny, 1862), Don Carlos (1867), Aida (1871), Otello (1887), Falstaff (1893).

Choral works. Inno delli nazioni (Hymn of the Nations, 1862); Messa da requiem (1874); Quattro pezzi sacri (Four Sacred Pieces): Ave Maria (1889), Stabat Mater (1897), Te Deum (1896), Laudi alla Vergine Maria (1898).

Chamber music. String Quartet in E Minor (1873).

BIBLIOGRAPHY. The Verdi Institute (Istituto di Studi Verdiani) at Parma is devoted to the detailed study of Verdi's life and works and publishes a periodical Bulletin (in Italian, English, and/or German). In 1977 the Italian music publishing firm of Ricordi and the University of Chicago Press announced plans for a complete critical edition of Verdi's work. The principal archives, including the manuscripts of the operas, are in the possession of Messrs. Ricordi, Milan. Verdi's correspondence has been published, in great part, in I copialettere di Giuseppi Verdi, ed. by G. Cesari and A. Luzio (1913); and in Carteggi Verdiani, ed. by A. Luzio, 4 vol. (1935); Verdi, the Man in His Letters (1970) and Letters of Giuseppe Verdi (1971) are in English. Arthur Pougin, Verdi: Histoire anecdotique de sa vie et de ses oeuvres (1886; Verdi: An Anecdotic History of His Life and Works, 1887), contains details (not always accurate) of Verdi's early life derived from the composer himself. Frederick Crowest, Verdi, Man and Musician (1897, reprinted 1978), is a biography with emphasis on his English experiences. John Francis Toye, Giuseppe Verdi (1931; revised 1946, reprinted 1972), though out of date in some respects, is still valuable for its detailed accounts of the librettos. There are flood-control reservoirs near Toronto and Neodesha, Kan., and one near Oologah, Okla. The river's name is probably derived from a French word referring to a greenish-gray sub-

The Verdon rises in Les Trois Évêchés mountain south-southwest of Barcelonnette, in the Alpes-de-Haute Provence *département*, and is 125 mi (200 km) long. It is dammed several times above and below the gorges.

Granted in 1672 to Zacharie Dupuis, a French military pioneer, it was named after his birthplace of Saverdun, Fr. Verdun, a southern suburb of Montreal city, is primarily residential, with few industries. In 1959 it joined the newly established Montreal Metropolitan Corporation. The city has numerous parks and recreation facilities bordering on a riverfront promenade 3 mi (5 km) long. Inc. village, 1875; town, 1907; city, 1912. Pop. (1981) 61,287.

Verdun, town, Meuse *département*, Lorraine region, northeastern France, on the Meuse River. Most of the town is on the left bank, near the Citadel. Practically destroyed in World War I, it was rebuilt with wide streets. A cathedral, dating from the 11th century, rising on the highest point of the town, has been restored.

Verdun was a Gallic fortress before Roman times. It was there in 843 that three grandsons of Charlemagne divided his empire in the Treaty of Verdun. Conquered by German invaders in the 10th century, it was later linked with Metz and Toul to form the Trois-Évêchés (Three Bishoprics) territory. In 1552 Henry II took over the three bishoprics, and France's ownership was confirmed in 1648 by the Peace of Westphalia. In 1792 Verdun was besieged by the Prussians and yielded only a few weeks before the French victory at Valmy. The Prussians captured it again in 1870 and held it until 1873. Verdun's forts were then strengthened. In World War I this 'great advanced citadel of France" became, in Winston Churchill's phrase, "the anvil upon which French manhood was to be hammered to death." The long battle fought in the surrounding countryside is commemorated by numerous monuments, of which the most remarkable are the Ossuaire de Douaumont and the Monument de la Victoire. There are more than 70 cemeteries (Allied and German) in the area, and war museums are in the Citadel and in the restored 17th-century Hôtel de Ville. The Verdun battlefields are still much visited. During World War II in September 1944 it was heavily bombed by the Germans after its liberation by the United States.

The district surrounding Verdun is mainly agricultural. The town has some foundries, factories producing furniture, and food-processing industries. Pop. (1982) 21,170.

Verdun, Battle of (Feb. 21–July, 1916), one of the most devastating engagements of World War I, in which the French repulsed a major German offensive.

German Gen. Erich von Falkenhayn believed in a strategy of attrition and argued that

Germany should bleed France to death by choosing a point of attack "for the retention of which the French would be compelled to throw in every man they have." The fortress of Verdun and its surrounding fortifications along the Meuse River was the point selected. The Germans massed huge amounts of artillery and troops for the attack, which the French knew was impending but believed would occur elsewhere. Thus, Verdun was unprepared when one of the heaviest bombardments of the war rained down on the area. From the offensive's start on February 21, the Germans advanced with little opposition for four days until they reached Fort Douaumont, which they took. French reinforcements arrived just in time and with them General Henri Pétain, who took command and managed to slow the German advance by several French counterattacks. In March and April the hills and ridges west of the Meuse River and north of Verdun were bombarded, attacked, counterattacked, taken, and retaken. The third phase of the battle began in June, when the Germans again assaulted the heights along the Meuse River but were unable to maintain an advantage. By July they realized that their plan to seize Verdun and undermine France's will to resist had failed with a terrible loss of men-about 400,000 French casualties and nearly as many German—and material for both sides. From October until the end of the year, the French took the offensive and regained the forts and territory they had lost earlier.

Verdun, Treaty of (August 843), treaty partitioning the Carolingian empire among the three surviving sons of the emperor Louis I the Pious. The treaty was the first stage in the dissolution of the empire of Charlemagne and foreshadowed the formation of the modern countries of western Europe. Louis I had carefully planned his three elder sons' inheritances; but from 829 onward his attempts to allocate substantial territory to the future Charles II the Bald, his young son by a second wife, led to revolts by Charles's half brothers. After Louis's death (840) open warfare broke out; Louis's third son, Louis the German, allied with Charles in attacking the eldest son, the emperor Lothair I. Defeated at Fontenoy, in present Belgium (June 841), and driven from Aix-la-Chapelle (Aachen, Ger., 842), Lothair sued for peace. At Verdun (in present northeastern France) the following year, Lothair was confirmed in possession of the imperial title and received Francia Media, a long central strip of territory including parts of modern Belgium, The Netherlands, western Germany, eastern France, Switzerland, and much of Italy. Louis the German received Francia Orientalis, the land east of the Rhine River. Charles received Francia Occidentalis, the remainder of modern France.

verdure tapestry, also called GARDEN TAPESTRY, type of tapestry decorated with a design based on plant forms. It is not known exactly when the first verdure tapestries were made, but, by the 16th century, tapestries with formal designs derived from foliage had become immensely popular. In the last half of the 17th century, landscapes were incorporated into their design.

Such famous tapestry factories as Aubusson and Lille in France specialized in the production of verdures, especially those of small dimensions used as upholstery and pillow covers. Verdure tapestry should not be confused with menues verdure, or millefleur tapestry, since the floral decoration of millefleur tapestries serves merely as a backdrop for the figurative elements of the design.

Verdy, Violette, original name NELLY GUIL-LERM (b. Dec. 1, 1933, Pont-l'Abbé, Brittany, Fr.), French ballerina and dance director, who was awarded the French Order of Arts and Letters in 1973 and the Dance Magazine Award in 1968.

Verdy began dancing as a child, most notably with Madame Rousanne and later Victor Gsovsky, both in Paris. She made her debut with Les Ballets de Champs-Elysees in 1945 and danced with Roland Petit's Ballets de Paris in 1950 and in 1953–54. Verdy then performed with the London Festival Ballet (1954–55), La Scala, Milan (1955–56), the American Ballet Theatre (1957–58), and as principal ballerina in the New York City Ballet (1958–77).

Roles in many ballets were created for Verdy, notably in Roland Petit's Le Loup (1953), George Balanchine's Jewels (1967), and Jerome Robbins' Dances at a Gathering (1969). She also appeared in motion pictures, including Ballerina (1949) and The Glass Slipper (1954). Verdy stopped performing in 1976 to become the director of the Paris Opéra Ballet, and in 1980 she became artistic codirector of the Boston Ballet.

Vere FAMILY, noted English family that held the hereditary office of lord great chamberlain from 1133 to 1779 and the earldom of Oxford from 1142 to 1703.

The family derived its name from the village of Ver, near Bayeux, in France. Its founder, Aubrey de Vere (c. 1040-1112), was a Norman who came to England with William the Conqueror and was granted lands by the latter in Essex, Suffolk, Cambridgeshire, and Middlesex. His son Aubrey de Vere II (c. 1090-1141) was made lord great chamberlain of England in 1133. His son Aubrey de Vere III (c. 1110-1194) was created Earl of Oxford in 1142. Robert (1362-92), the 9th Earl of Oxford, was a favourite of King Richard II. John (1442-1513), the 13th Earl of Oxford, was a Lancastrian leader in the Wars of the Roses and crowned King Henry VII in 1485. Two of the grandsons of John, the 15th earl, were notable soldiers known as the "fighting Veres"; Sir Francis (1560-1609) commanded the English troops in the Netherlands that fought against Spain in the service of the United Provinces, while his younger brother Sir Horace (1565-1635) fought in Germany during the Thirty Years' War. Edward (1550-1604), the 17th Earl of Oxford, was a poet and dramatist who squandered much of the family's wealth: he has sometimes been proposed as the real author of William Shakespeare's plays. After the death (1625) of Henry, the 18th earl, the office of lord great chamberlain passed to a distant cousin, Robert de Vere, whose descendants held the office until it passed to coheiresses in 1779. Aubrey de Vere (1627-1703) became the 20th and last Earl of Oxford in the Vere family. He died in 1703 without male issue, and his daughter Diana married Charles Beauclerk, 1st Duke of St. Albans, who was an illegitimate son of King Charles II by the actress Nell Gwyn. Their third son, Vere Beauclerk, was created Baron Vere of Hanworth in 1750, and his fourth son, Aubrey, succeeded as 5th Duke of St. Albans in 1787.

Vereeniging, town, Transvaal, South Africa. It lies along the Vaal River, south of Johannesburg, at the Orange Free State border. Its name, which means "association," refers to the coal-mining association that owned the

town when it was founded in 1892. Peace negotiations to end the South African War took place there in 1902, and the resulting treaty was named after the town. The community was incorporated as a town in 1912. Vereeniging's access to abundant coal and water from the Vaal River has enabled it to become one of South Africa's main heavy industrial centres, with plants manufacturing assorted iron and steel products, glass, and bricks and tiles. Large local thermal power stations transmit electricity through the national grid. Demonstrations in 1960 denouncing pass laws at the nearby township of Sharpeville led to the shooting deaths of 69 blacks. Pop. (1985) 60, 584

Vereeniging, Peace of (May 31, 1902), treaty that ended the South African War (a, v,). or Boer War; it was signed in Pretoria, after initial Boer approval in Vereeniging, between representatives of the British and ex-republican Boer governments. It ended the independence of the South African Republic and Orange Free State, which came under British military administration. A general amnesty was declared, burghers were to be disarmed. and a commission was appointed with a grant of £3,000,000 to reconstruct the Transvaal. Clause VIII left the question of a voting franchise for nonwhites to be settled after the defeated Boers had been granted self-government. Thus, black Africans were left without the vote (except in the Cape Colony) when South Africa was unified in 1910.

Vereshchagin, Vasily Vasilyevich, Vereshchagin also spelled VERESTCHAGIN (b. Oct. 26 [Oct. 14, Old Style], 1842, Cherepovets, Russia [now in Russian S.F.S.R.]—d. April 13 [March 31], 1904, Port Arthur [now Lüshun], China), Russian painter noted for his war scenes.

Vereshchagin attended the St. Petersburg Academy and studied in Paris. Devoting his life to travel, he acquired subjects for paintings from on-the-spot impressions in the Caucasus, in the Crimea, along the Danube River, and in Turkistan with the Russian army. In the Balkans during the Russo-Turkish War (in which he was wounded), Vereshchagin was provided with the themes for some of his famous war pictures. He also painted in Syria and in Palestine and between 1885 and 1903 traveled in Russia, the United States, and Japan. He died during the Russo-Japanese War, aboard the flagship of Admiral Stepan Osipovich Makarov.

Vereshchagin's paintings of scenes during the invasion of Russia by Napoleon in 1812 enjoyed extraordinary popularity; innumerable reproductions of them were made. The pacifist and humanitarian movement of the time made use of his painting of a pyramid of skulls ("Apotheosis of War," 1871; State Tretyakov Gallery, Moscow). His works are to be seen in Moscow at the State Tretyakov Gallery and in Leningrad at the State Museum of Russian Art

Verethraghna, also called BAHRĀN, in Zoroastrianism, the spirit of victory. Together with Mithra, the god of truth, Verethraghna shares martial characteristics that relate him to the Vedic war-god Indra. In Zoroastrian texts, Verethraghna appears as an agent of Mithra and Rashnu, the god of justice, and as the means of vengeance for Mithra in his capacity of god of war.

Verethraghna was an especially popular deity in Sāsānian Iran, where five kings bore

his name. The 14th yasht, or hymn, of the Avesta, the sacred book of Zoroastrianism, is dedicated to Verethraghna, and the 20th day of the month is named for him.

Verga, Giovanni (b. Sept. 2, 1840, Catania, Sicily—d. Jan. 27, 1922, Catania), novelist, short-story writer, and playwright, most important of the Italian verismo (Realist) school of novelists (see verismo). His reputation was slow to develop, but modern critics have assessed him as one of the greatest of all Italian novelists. His influence was particularly marked on the post-World War II generation of Italian authors; a landmark film of the Neorealist cinema movement, Luchino Visconti's Terra trema (1948; The Earth Trembles), was based on Verga's novel I malavoglia.

Born to a family of Sicilian landowners, Verga went to Florence in 1869 and later lived in Milan, where the ideas of other writers much influenced his work. In 1893 he returned to Catania.

Starting with historical and patriotic novels, Verga went on to write novels in which psychological observation was combined with

romantic elements, as in Eva (1873), Tigre reale (1873; "Royal Tigress"), and Eros (1875). These sentimental works were later referred to by Verga as novels "of elegance and adultery." Eventually he developed the powers that made him prominent among the European novelists of the late 19th century, and within a few years he produced his masterpieces: the short stories of Vita dei campi (1880; "Life in the Fields") and Novelle rusticane (1883; Little Novels of Sicily), the great novels I malavoglia (1881) and Mastro-don Gesualdo (1889), and Cavalleria rusticana (1884), a play rewritten from a short story, which became immensely popular as an opera (1890) by Pietro Mascagni.

Verga wrote with terse accuracy and an intensity of human feeling that constitute a distinctively lyrical Realism. His realistic representations of the life of the poor peasants and fishermen of Sicily are particularly notable, and indeed, his strong feeling for locale helped start a movement of regionalist writing in Italy. His stories most commonly treated man's struggle for material betterment, which Verga saw as foredoomed. D.H. Lawrence translated several of his works into English, including Cavalleria rusticana and Mastro-don Gesualdo. Another notable English translation is The House by the Medlar Tree (1953), Eric Mosbacher's version of I malavoglia.

Vergennes, Charles Gravier, comte de (count of) (b. Dec. 28, 1719, Dijon, Fr.—d. Feb. 13, 1787, Versailles), French foreign minister who fashioned the alliance with the North American colonists that helped them throw off British rule in the U.S. War of

Independence; at the same time, he worked, with considerable success, to establish a stable balance of power in Europe.

Vergennes's father was president of the Parlement (high court of justice) of Dijon. He accompanied his uncle, the diplomat Théodore Chevignard de Chavigny, on embassies to Portugal and Germany in the 1740s, and in 1750 he was made ambassador to Trier (now in Germany). After serving on an embassy to Hanover (1752), Vergennes became ambassador to Ottoman Turkey in 1754. Two years later France, in alliance with its traditional enemy, Austria, went to war against Prussia and Great Britain (Seven Years' War, 1756-63). During the conflict, Vergennes ably defended French policies to the Turks, who were bitterly anti-Austrian. After the war, Vergennes, on orders from his government, set about stimulating tensions between Turkey and Russia. He was recalled to Paris at the outbreak of the Russo-Turkish War (1768-74).

Appointed ambassador to Sweden in 1771, Vergennes assisted King Gustav III (ruled 1771–92) in the coup d'état (August 1772) by which Gustav greatly strengthened his authority at the expense of the Swedish nobles. In June 1774 the newly crowned French monarch Louis XVI recalled Vergennes and made him minister of foreign affairs.

As early as December 1775, eight months after the outbreak of the U.S. War of Independence, Vergennes was advocating that France provide secret financial assistance to the insurgent American colonists. In this way, he hoped to strike a blow at Great Britain that would avenge France's defeat in the Seven Years' War. His schemes were vigorously opposed by the comptroller general, Anne-Robert-Jacques Turgot, who claimed that such aid would strain French finances, but by the time Turgot fell from power, in May 1776, Vergennes had won the support of the king. In February 1778 he concluded an alliance with the colonists, and France then declared war on Great Britain. Although French volunteers and a French fleet helped the colonists gain their decisive victory at the Battle of Yorktown in 1781, Vergennes did not try to regain former French territory in North America when he negotiated peace with Great Britain in 1783.

Meanwhile, Vergennes sought to prevent the Holy Roman emperor Joseph II from using the Franco-Austrian alliance as a means of gaining French support for Austrian expansion into Bavaria. When Joseph went to war with Prussia over this issue (War of the Bavarian Succession, 1778–79), Vergennes helped mediate the peace settlement. In addition, he blocked Joseph's attempts (1784–85) to exchange the Austrian Netherlands for Bavaria and to force the Dutch to open the Scheldt River to Austrian shipping. In the months immediately preceding his death, Vergennes concluded commercial treaties with Great Britain and Russia

Vergerio, Pietro Paolo, byname VERGERIO THE ELDER, Italian VERGERIO IL VECCHIO (b.

July 23, 1370, Capodistria, Istria [now Koper, Yugos.]—d. July 8, 1444/45, Budapest), Italian educator whose treatises on Humanistic education greatly influenced educational methods and curriculum in Renaissance Italy.

Vergerio studied at Padua, Florence, and Bologna and obtained degrees in the arts and medicine. From 1390 to 1406 he was professor of logic at Padua. It was during this period (1392?) that he composed *De ingenuis moribus et liberalibus studiis* ("On the Manners of a Gentleman and Liberal Studies"), the most influential of Italian Renaissance educational treatises, which passed through 40 editions before 1600; in it he advocated Latin as the core of liberal education and the revival of the study of Greek, as well as the pursuit of a broad range of academic subjects and physical education.

From 1406 to 1417 Vergerio was papal secretary to popes Innocent VII and Gregory XII and then entered the service of the Holy Roman emperor Sigismund, for whom he translated the *Anabasis* of Arrian into Latin. Among his several other works are *On Restoring Unity in the Church* and a *Life of Petrarch*.

Vergerio, Pietro Paulo, byname VERGERIO THE YOUNGER, Italian VERGERIO IL GIOVANE (b. 1497/98, Capodistria, Rep. of Venice Inow Koper, Yugos.]—d. Oct. 4, 1565, Tübingen, Bohemia [Germany]), Italian reformer and most famous of "Old Catholic" bishops in the 16th century who accepted the principles of the Reformation while retaining a historic Roman Catholic episcopate and not withdrawing from the Church.

Educated in jurisprudence at Padua, Vergerio practiced law in Padua, Verona, and Venice but soon turned to an ecclesiastical career, becoming papal nuncio in Germany in 1533; while on visits to Germany he met Martin Luther. He next was awarded a bishopric in Croatia, then in Capodistria, but returned in 1540 to active papal diplomacy. By this time, however, he was under suspicion for Protestant persuasions, and in 1544 and again in 1549 he was denounced before the Venetian inquisition. In the second trial he was convicted of heresy, but he had fled Italy and settled in the Swiss Grisons (1549-53), where he was consecrated in a bishopric, without communion with Rome. Thereafter, he traveled about Europe, notably Württemberg, Prussia, and Poland, all the while publishing polemics and urging reforms.

Verghina, also spelled VERGINA, archaeological site and ancient capital of Macedonia in Imathía nomós (department), northern Greece. It is situated on a plateau 47 miles (75 km) southwest of Thessaloniki, at the eastern foot of the Vermion Mountains, on the southern edge of the Haliakmon plain. Surrounded by oak and beech forests, it is named after a legendary queen of ancient Beroea (present Véroia, capital of the nomós). Verghina was built on a city site from the Stone Age and was first called Balla. The palace of Palatista, partly destroyed by fire, dates from the reign of Antigonus Gonates III (c. 263-221 BC), who defeated Cleomenes III, king of Sparta (died c. 219 BC). Near the palace there is an Iron Age cemetery that dates from the 10th to 7th centuries BC. Most of the early royal tombs in Macedonia are intricate subterranean structures built of limestone, usually with a vaulted roof. The later temple tomb of the 3rd century is constructed of marble and limestone. A Macedonian necropolis at Verghina contained objects such as silver jewelry, gold and

iron swords, bronze ornaments, brooches in geometric shapes, and various weapons.

Vergil, Polydore, original name POLIDORO VERGILIO (b. c. 1470, Urbino, Urbino and Pesaro—d. April 18, 1555, Urbino), Italian-born Humanist who wrote an English history that became required reading in schools and in-

fluenced the 16th-century English chroniclers Edward Hall and Raphael Holinshed and, through them, Shakespeare.

Vergil was educated in Padua and perhaps in Bologna. After he was ordained priest, he was given various appointments in England by the papal chancery, initially in 1502 as subcollector of Peter's Pence (a contribution to the pope). In 1508 he was made archdeacon of Wells. He became friends with such English Humanists as Sir Thomas More, William Grocyn, and John Colet, and remained in England, with periodic visits to Italy, until 1550, when he returned to Urbino.

Among Vergil's important works were *Proverbiorum libellus* (1498), known as the Adagia, a collection of proverbs and aphorisms with comments and moralistic reflections; De rerum inventoribus (1499), a popular, often reprinted treatise on inventions; and particularly the Anglicae historia libri XXVI ("Twenty-six Books of English History"), which began publication in 1546 and was finally collected in its complete form in 1651 (partial Eng. trans., Three Books of Polydore Vergil's English History Comprising the Reigns of Henry VI, Edward IV, and Richard III, 1844). This history was of great influence, both because an order of the Privy Council in 1582 made it required reading in English schools and because of its effect on the English historians Hall and Holinshed; the last-named in particular was a favourite source of material for Shakespeare.

Verginius Rufus, Lucius (b. AD 15—d. 97), Roman governor of Germania Superior who, in May 68, put down a rebellion against Nero led by the Gallic governor Vindex. When Galba, the governor of Nearer Spain, succeeded Nero as emperor after Nero committed suicide in June, Verginius, favoured by his troops to be Nero's successor, was relieved of his command by the new emperor.

The son of an undistinguished Roman knight, Verginius was three times consul. After the emperor Otho's suicide (April 69), Verginius was again offered the empire by Otho's troops but declined. Under the Flavian emperors he devoted himself to writing. He was a close friend of the younger Pliny, and the historian Tacitus delivered the oration at his funeral.

Vergniaud, Pierre-Victurnien (b. May 31, 1753, Limoges, Fr.—d. Oct. 31, 1793, Paris), eloquent spokesman for the moderate Girondin faction during the French Revolution.

The son of an army contractor, Vergniaud attended college in Paris and in 1781 became an advocate in the Parlement (high court of justice) of Bordeaux. Although he was a capable lawyer, he was so indolent that he refused to take cases unless he was in need of money.

Vergniaud greeted the outbreak of the Revolution with enthusiasm. In 1790 he attracted widespread attention by pleading the case of a soldier who had been involved in a riot against a landlord. Elected to the administration of the Gironde département (1790), he looked on with approval as the revolutionary National Assembly in Paris abolished France's feudal institutions and restricted the hitherto absolute powers of King Louis XVI. Vergniaud took a seat with the other Girondin deputies in the Legislative Assembly, which succeeded the National Assembly on Oct. 1, 1791, and he spoke with eloquence in favour of war with Austria. After war was declared (April 20, 1792), he exposed Louis XVI's counterrevolutionary intrigues and suggested (July 3) that the King should be deposed. Nevertheless, unlike their Jacobin rivals, Vergniaud and the other Girondins were unwilling to form ties with the disenfranchised lower classes. Faced with the threat of popular insurrection in Paris, Vergniaud attempted secretly to come to terms with the King in late July. The popu-

lace of Paris rose against Louis on August 10, and Vergniaud, as president of the Assembly, was forced to propose the suspension of the King and the summoning of a National Convention.

In the Convention, which met on Sept. 20, 1792, Vergniaud avoided attacking the Montagnards (as the Jacobin deputies were called) until they revealed (Jan. 3, 1793) his previous negotiations with the King. During the trial of Louis XVI, Vergniaud at first sought to save the monarch's life, but he finally joined the majority in voting (January 1793) for the death sentence. On June 2, 1793, Parisian insurgents, in alliance with the Montagnards, forced the convention to place Vergniaud and 28 other Girondin leaders under house arrest. Vergniaud continued to defy his opponents but made no attempt to escape from Paris. Imprisoned on July 26, he was condemned by the Revolutionary Tribunal on October 30 and guillotined the following day. Eugène Lintilhac's Vergniaud was published in 1920.

Verhaeren, Émile (b. May 21, 1855, Saint Amand lez-Puers, Belg.—d. Nov. 27, 1916, Rouen, Fr.), foremost among the Belgian poets who wrote in French. His work, by its strength and range, has been compared to that of Victor Hugo and Walt Whitman.

Verhaeren was educated at Brussels and Ghent and during 1875-81 studied law at Louvain, where he became acquainted with

Max Waller, the founder of the influential periodical *La Jeune Belgique* (1881). He became one of the group in Brussels who brought about the literary and artistic renaissance of the 1890s.

His first book, a collection of violently naturalistic poems (Les Flamandes, 1883), created a sensation. Verhaeren was an art critic as well as a poet, and many of the poems in his first collection concerned paintings. It was followed by short stories, but his reputation as a lyric poet was confirmed by a succession of works: Les Moines (1886), Les Soirs (1887; The Evening Hours, 1918), Les Débâcles (1888), Les Flambeaux noirs (1890), Au Bord de la route (1891; later retitled Les Bords de la route), Les Apparus dans mes chemins (1891), and Les Campagnes hallucinées (1893).

In 1895, Verhaeren's growing concern for social problems inspired Les Villages illusoires and Les Villes tentaculaires. Les Heures claires (1896; The Sunlit Hours, 1916), an avowal of his love for his wife, led to the series of his major works, among which the most outstanding are Les Visages de la vie (1899), Les Forces tumultueuses (1902), Les Tendresses premières (1904, the first part of the five-part Toute la Flandre), La Multiple Splendeur (1906), Les Rythmes souverains (1910), and Les Blés mouvants (1912). During that period he also published books on art, two further collections of personal lyrics to his wife, and plays—Les Aubes (1898; The Dawn, 1898), Le Cloître (1900; The Cloister, 1915), Philippe II (1901; Eng. trans., 1916), and Hélène de Sparte (1912; Helen of Sparta, 1916).

The qualities most noted in Verhaeren's considerable poetic output—more than 30 collections—are vigour and breadth of vision. His unusually strong lyrical gifts of vitality and originality are expressed in a fresh, unpolished language of great power and flexibility. His three main themes are Flanders, human energy (expressed in the desire for progress, for the brotherhood of man, and for the emancipation of the working classes), and his tender, understanding love for his wife. It is perhaps in the poems celebrating domestic joys that he is most moving. More generally popular are those glorifying Flanders—the greatness of its painters and the pleasures of its common people—and those that exalt the triumph of human intelligence over matter and praise the epic beauty of the industrial age.

His plays in verse, although often showing dramatic power and poetic inspiration, are criticized for an excessively rhetorical style and are rarely produced. His works on art show sympathy with those painters—Rembrandt, Rubens, and others—who depict life at its boldest, most dramatic, and most colourful.

verifiability principle, a philosophical doctrine fundamental to the school of Logical Positivism holding that a statement is meaningful only if it is either empirically verifiable or else tautological (i.e., such that its truth arises entirely from the meanings of its terms). Thus, the principle discards as meaningless the metaphysical statements of traditional philosophy as well as other kinds of statementssuch as ethical, aesthetic, or religious principles—asserted as true but neither tautological nor known from experience. Such statements may have meaning in the sense of being able to influence feelings, beliefs, or conduct but not in the sense of being true or false and hence of imparting knowledge. According to the principle, then, a nontautological statement has meaning only if some set of observable conditions is relevant to determining its truth or falsity; so stated, it reflects the view that the meaning of a statement is the set of conditions under which it would be true.

Disagreement among Positivists has arisen over the kinds of conditions that qualify as observable for purposes of verification and the exact nature of their relevance to the truth or falsity of statements. While Hans Reichenbach has maintained that verifying observations must be physically possible or compatible with the known laws of science, it has been more widely held that they need only be logically possible or conceivable in a noncontradictory way. Early exponents of the view that observation reports provide an indubitably certain foundation for knowledge held that verifiability requires that a statement be logically entailed by some finite set of observation reports. Later Positivists, having abandoned this view, have required of a verifiable statement only that it be made evident or supported or rendered probable by the relevant set of observations.

The principal criticism of the verifiability principle has been that, because it is not an empirical proposition, it is itself on its own terms either meaningless or else tautologically true as an arbitrary definition of meaningfulness. In response, it has been argued both that the principle is indeed a tautology, though a nonarbitrary one in that it reflects actual usage and that it is strictly meaningless but to be taken as a recommendation for the conduct of scientific inquiry.

verisimilitude, the semblance of reality in dramatic or nondramatic fiction. The concept implies that either the action represented must be acceptable or convincing according to the audience's own experience or knowledge or, as in the presentation of science fiction or tales of the supernatural, the audience must be enticed into willingly suspending disbelief and accepting improbable actions as true within the framework of the narrative.

Aristotle in his Poetics insisted that literature should reflect nature—that even highly idealized characters should possess recognizable human qualities—and that what was probable took precedence over what was merely possible.

Following Aristotle, the 16th-century Italian critic Lodovico Castelvetro pointed out that the nondramatic poet had only words with which to imitate words and things but the dramatic poet could use words to imitate words, things to imitate things, and people to imitate people. His influence on the French neoclassical dramatists of the 17th century is reflected in their preoccupation with vraisemblance and their contribution of many refinements in respect to appropriate diction and gesture to the theory.

The concept of verisimilitude was incorporated most fully by Realist writers of the late 19th century, whose works are dominated by well developed characters who very closely imitate real people in their speech, mannerisms, dress, and material possessions.

verismo (Italian: "realism"), literary realism as it developed in Italy in the late 19th and early 20th centuries. Its primary exponents were the Sicilian novelists Luigi Capuana and Giovanni Verga. The realist movement arose in Europe after the French Revolution and the realist influence reached Capuana and Verga particularly through the writings of Balzac and Zola in France and of the scapigliatura milanese (see scapigliatura, "Milanese bohemianism") group in Italy. Verismo's overriding aim was the objective presentation of life, usually of the lower classes, using direct, unadorned language, explicit descriptive detail, and realistic dialogue.

Capuana initiated the movement with the short stories Profili di donne (1877; "Studies of Women") and the novel Giacinta (1879) and other psychologically oriented, clinically rendered works, which were objective almost to the point of excising human emotion. Works by his friend Verga, of which the best-known are I malavoglia (1881; The House by the Medlar Tree, 1953) and Mastro-don Gesualdo (1889), described with more emotional warmth the dismal conditions in early 19th-

century Sicily.

Like Capuana and Verga, most other veristi described the life they knew best, that of their native towns or regions. Thus the best of the minor writers of the movement were regionalists: the Neapolitan novelist Matilde Serao, the Tuscan Renato Fucini, and Grazia Deledda, the novelist of southern Italy who received the Nobel Prize for Literature in 1926.

Verismo faded from the scene in the 1920s but emerged after World War II in a new and explosively vital form, neorealismo (Neoreal-

verismo (Italian: "realism"), a style of Italian opera writing that flourished in the last decade of the 19th century. It was marked by melodramatic, often violent plots with characters drawn from everyday life. Musical devices included passionate declamation by solo voices and emotionally charged harmonies and melodies. The leading exponents were Pietro Mascagni (Cavalleria rusticana, 1890; Rustic Chivalry) and Ruggero Leoncavallo (Pagliacci, 1892; The Clowns). Another example is Umberto Giordano's Andrea Chénier (1896). Puccini was influenced by verismo, particularly in Tosca (1900), and occasional veristic operas were written in the 20th century, e.g., Ermanno Wolf-Ferrari's I gioielli della Madonna (1911; The Jewels of the Madonna).

Veríssimo, Érico Lopes (b. Dec. 17, 1905, Cruz Alta, Braz.-d. Nov. 28, 1975, Porto Alegre), novelist, literary historian, and critic whose writings in Portuguese and in English on Brazilian literature introduced readers throughout the world both to the literary currents of modern Brazil and to his country's social order and cultural heritage.

Born into an old Portuguese family of the Rio Grandedo, Veríssimo interrupted his schooling because of family financial losses and worked as a clerk in a store and in a bank and as a partner in a pharmacy before becoming assistant editor of a publishing house in Pôrto Alegre in 1930.

Veríssimo's first novel, Clarissa (1933), immediately met with critical and popular acclaim; it was followed by a series of best-selling and widely translated novels, including Caminhos Cruzados (1935; Crossroads, 1943), Olhai os Lírios do Campo (1938; Consider the Lilies of the Field, 1947), and O Resto É Silêncio (1943; The Rest Is Silence, 1946). These novels, experimental in technique and use of language, reveal Veríssimo's deep preoccupation with the individual in a changing social structure.

Fluent in English, Verissimo taught Brazilian literature in the United States for a time. The series of lectures he gave at the University of California (Berkeley), 1943-44, was published in English in Brazilian Literature: An Outline (1945). He returned to the United States to visit, and he served (1953-56) in Washington, D.C., as director of the Department of Cultural Affairs of the Pan-American Union of the Organization of American States.

Verissimo's best known and most ambitious work, the trilogy O Tempo e o Vento (1949-62; partial Eng. trans., *Time and the Wind*, 1951), traces the history of a Brazilian family through several generations to the late 20th century. It is perhaps the most faithful portrayal of the gaucho.

Verkhoyansk, also spelled verchoiansk, or verchojansk, town, Yakut Autonomous Soviet Socialist Republic, far northeastern Russian S.F.S.R., on the Yana River near its confluence with the Sartang. Founded as a fort in 1638 and today a minor centre of tin and gold mining, Verkhoyansk is noted chiefly for its exceptionally low winter temperatures, with a January average of -56° F (-49° C). Its minimum, -89.9° F (-67.5° C), is only equalled by Oymyakon on the Indigirka as the lowest ever recorded outside Antarctica. Pop. (latest census) 1,400.

Verkhoyansk Mountains, also spelled ver-KHOIANSK, Or VERCHOJANSK, Russian VER-KHOYANSKY KHREBET, mountains of the Yakut Autonomous Soviet Socialist Republic, far northeastern Russian S.F.S.R., extending for 700 mi (1,100 km) in a huge arc parallel to, and east of, the lower Lena River to the Laptev Sea. The range represents a major anticlinal structure, created in a period of folding. Its height generally exceeds 3,300 ft (1,000 m), reaching a maximum of 7,838 ft (2,389 m). The mountains are in sparse tundra vegetation of mosses and lichens. No routes cross the range, and the area is virtually uninhabited.

Verlaine, Paul(-Marie) (b. March 30, 1844, Metz, Fr.—d. Jan. 8, 1896, Paris), French lyric poet first associated with the Parnassians and later known as a leader of the Symbolists.

Verlaine, detail from "Un Coin de table," oil painting by Henri Fantin-Latour, 1872; in the Louvre,

With Stéphane Mallarmé and Charles Baudelaire he formed the so-called Decadents.

Life. Verlaine was the only child of an army officer in comfortable circumstances. He was undoubtedly spoiled by his mother. At the Lycée Bonaparte (now Condorcet) in Paris, he showed both ability and indolence and at 14 sent his first extant poem ("La Mort") to the "master" poet Victor Hugo. Obtaining the baccalauréat in 1862, with distinction in translation from Latin, he became a clerk in an insurance company, then in the Paris city hall. All the while he was writing verse and frequenting literary cafes and drawing rooms, where he met the leading poets of the Parnassian group and other talented contemporaries, among them Mallarmé, Villiers de L'Isle-Adam, and Anatole France. His poems began to appear in their literary reviews; the first, "Monsieur Prudhomme," in 1863. Three years later the first series of *Le Parnasse contemporain*, a collection of pieces by contemporary poets (hence the term Parnassian), contained eight contributions by Verlaine.

The same year, his first volume of poetry appeared. Besides virtuoso imitations of Baudelaire and Leconte de Lisle, Poèmes saturniens included poignant expressions of love and melancholy supposedly centred on his cousin Elisa, who married another and died in 1867 (she had paid for this book to be published). In Fêtes galantes personal sentiment is masked by delicately clever evocations of scenes and characters from the Italian commedia dell'arte and from the sophisticated pastorals of 18thcentury painters, such as Watteau and Nicolas Lancret, and perhaps also from the contemporary mood-evoking paintings of Adolphe Monticelli. In June 1869 Verlaine fell in love with Mathilde Mauté, aged 16, and they married in August 1870. In the delicious poems written during their engagement (La Bonne Chanson), he fervently sees her as his long hoped-for saviour from erring ways. When insurrectionists seized power and set up the Paris Commune, Verlaine served as press officer under their council. His fear of resultant reprisals from the Third Republic was one factor in his later bohemianism. Incompatibility in his marriage was soon aggravated by his infatuation for the younger poet Arthur Rimbaud, who came to stay with the Verlaines in September 1871.

Verlaine abandoned his wife and infant son, Georges, in July 1872, to wander with Rimbaud in northern France and Belgium and write "impressionist" sketches for his next collection, Romances sans paroles ("Songs Without Words"). The pair reached London in September and found, besides exiled Communard friends, plenty of interest and amusement and also inspiration: Verlaine completed the Romances, whose opening pages, especially, attain a pure musicality rarely surpassed in French literature and embody some of his most advanced prosodic experiments; the subjects are mostly landscape or regret or vitu-peration of his estranged wife. The collection was published in 1874 by his friend Edmond Lepelletier; the author himself was then serving a two-year sentence at Mons for wounding Rimbaud with a revolver during an emotional storm in Brussels on July 10, 1873.

Contrition, prison abstinence, and pious reading (some in English, along with admiring study of Shakespeare and Dickens) seem to have produced a sincere return to Roman Catholicism in the summer of 1874, after his wife had obtained a separation. Leaving prison in January 1875, he tried a Trappist retreat, then hurried to Stuttgart to meet Rimbaud, who apparently repulsed him with violence. He took refuge in England and, for over a year, taught French and drawing at Stickney and Boston in Lincolnshire, then at Bournemouth, Hampshire, impressing all by his dignity and piety and gaining an appreciation of English authors as diverse as Tennyson, Swinburne, and the Anglican hymn writers. In 1877 he returned to France.

From this period (1873–78) date most of the poems in *Sagesse* ("Wisdom"), which was published in October 1880 at the author's expense (as were his previous books). They include outstanding poetical expressions of simple Catholic Christianity as well as of his emotional odyssey. Literary recognition now began. In 1882 his famous "Art poétique"

(probably composed in prison eight years earlier) was enthusiastically adopted by the young Symbolists. He later disavowed the Symbolists, however, chiefly because they went further than he in abandoning traditional forms: rhyme, for example, seemed to him an unavoidable necessity in French verse.

In 1880 Verlaine made an unsuccessful essay at farming with his favourite pupil, Lucien Létinois, and the boy's parents. Lucien's death in April 1883, as well as that of the poet's mother (to whom he was tenderly attached) in January 1886, and the failure of all attempts at reconciliation with his wife broke down whatever will to "respectability" remained, and he relapsed into drink and debauchery. Now both famous and notorious, he was still writing in an attempt to earn a living but seldom with the old inspiration.

Jadis et naguère ("Yesteryear and Yesterday") consists mostly of pieces like "Art poétique," written years before but not fitting into previous carefully grouped collections. Similarly, Parallèlement comprises bohemian and erotic pieces often contemporary with, and technically equal to, his "respectable" ones. Verlaine frankly acknowledged the parallel nature of both his makeup and his muse. In Amour new poems still show the old magic, notably passages of his lament for Lucien Létinois, no doubt intended to emulate Tennyson's In Memoriam, but lacking its depth. Prose works such as Les Poètes maudits, short biographical studies of six poets, among them Mallarmé and Rimbaud; Les Hommes d'aujourd'hui, brief biographies of contemporary writers, most of which appeared in 1886; Mes Hôpitaux, accounts of Verlaine's stays in hospitals; Mes Prisons, accounts of his incarcerations, including the story of his "conversion" in 1874; and Confessions, notes autobiographiques helped attract notice to ill-recognized contemporaries as well as to himself (he was instrumental in publishing Rimbaud's Illuminations in 1886 and making him famous). There is little of lasting value, however, in the rest of the verse and prose that Verlaine turned out in an unsuccessful effort to keep the wolf from a door shared usually with aging prostitutes such as Philomène Boudin and Eugénie Krantz, prominent among the muses of his decadence. During frequent spells in hospitals, doctors gave him devoted care and friendship. He was feted in London, Oxford, and Manchester by young sympathizers, among them the critic Arthur Symons, who arranged a lecture tour in England in November 1893. Frank Harris and Cranmer Byng published articles and poems by Verlaine in The Fortnightly Review and The Senate. Relief pensions from admirers (1894) and the state (1895) were also recognition, however tardy or insufficient, of the esteem he attracted as a poet and a friend. He died in Eugénie Krantz's lodgings in January 1896.

Assessment. One of the most purely lyrical of French poets, Verlaine was an initiator of modern word-music and marks a transition between the Romantic poets and the Symbolists. His best poetry broke with the sonorous rhetoric of most of his predecessors and showed that the French language, everyday clichés included, could communicate new shades of human feeling by suggestion and tremulous vagueness that capture the reader by disarming his intellect; words could be used merely for their sound to make a subtler music, an incantatory spell more potent than their everyday meaning. Explicit intellectual or philosophical content is absent from his best work. His discovery of the intimate musicality of the French language was doubtless instinctive, but, during his most creative years, he was a conscious artist constantly seeking to develop his unique gift and "reform" his (V.P.U.) nation's poetic expression.

MAJOR WORKS. Poetry. Poèmes saturniens (1866); Fêtes galantes (1869); La Bonne Chanson (1870); Romances sans paroles (1874); Sagesse (1880); Jadis et naguère (1884); Amour (1888); Parallèlement (1889, rev. ed. 1894); Bonheur (1891); Chansons pour elle (1891); Liturgies intimes (1892); Odes en son honneur (1893); Chair, dernières poésies (1896); Invectives (1896). Biography and criticism. The best accounts of Verlaine's life and works are Verlaine by Antoine Adam, new ed. (1966; The Art of Paul Verlaine, 1963); (in English) Verlaine, by Joanna Richardson (1971). Personal but not always accurate accounts were given by the poet's friends and contemporaries: Edmond Lepelletier, Paul Verlaine (1907; Eng. trans. 1909); and Ernest Delahaye, Verlaine (1919). Octave Nadal, Paul Verlaine (1961); and Eleonore Zimmerman, Magies de Verlaine (1967), assess Verlaine's work personally. Claude Cuenot, Le Style de Paul Verlaine, 2 vol. (1963), analyzes his style. Louis Morice, Paul Verlaine, le drame religieux (1946), is a Catholic view. Georges Zaved. La Formation littéraire de Verlaine (1962), lists or suggests the poet's formative reading. Vernon P. Underwood, Verlaine et l'Angleterre (1956), describes his stays in England and possible effects on his work. Mathilde Verlaine gives her view of the ill-fated marriage in *Mémoires de ma vie* (1935).

Vermeer, Jan, Jan also rendered JOHANNES (b. Oct. 31, 1632, Delft, Neth.—buried Dec. 15, 1675, Delft), painter, mainly of interior genre subjects, who was one of the masters

of Dutch art in the 17th century. He had an unerring grasp of pictorial design and a pure and individual colour sense. But the most extraordinary element in his art is the unswerving objectivity with which he recorded the soft play of daylight on varied shapes and surfaces. His masterpieces include the self-portrait "Allegory of Painting" (c. 1665).

Life. Vermeer was born in his family's tavern in the marketplace of Delft, and he lived his entire life in that city. The city archives indicate that he married on April 5, 1653, and was enrolled in the artists' guild in December of that year. That he had some reputation in his lifetime is indicated by the record left by Balthazar de Monconys, a Frenchman, who went to Delft especially to see him in 1663. He served as chairman of the artists' guild in 1662–63 and 1670–71. Further records, however, indicate his financial difficulties. It appears that he looked principally to his activities as an art dealer to support his family, rather than to the sale of his own paintings.

According to the sparse records of this quiet man, Vermeer lived in a small world of bakers and grocers who accepted his paintings as pawns for his debts. It was in a shopkeepers' milieu that he conducted his artistic experiments: these tradesmen of his neighbourhood supplied him the bread, with its hard and shiny crust, the flowing milk, and the other bodily nourishments to which he added a spiritual dimension in his painting, as in his "Kitchen-Maid."

Vermeer also depicted Dutch aristocratic and upper middle-class society, in which refined ladies read their mail, do lacework, receive cavaliers, play music, dabble in philosophy and literature, and entertain in their salons. The theatre in which these characters appear is a lavish one, with precious carpets, fine musical instruments, embroidered dresses and robes, ermine and silk, pearls, and silver cutlery.

Vermeer re-created the figures of Dutch society as wholly devoted to the weighing of pearls, to poetry and astronomy, to music and geography; they are heroes of a closed universe, in which gradations of natural and reflected daylight are rendered with infinite care. His paintings may be said to depict a refined life, if refinement is understood as a sifting of reality designed to make it more easily apprehended.

The mystery of Vermeer's life has produced scores of interpretations, all revealing the same tendency to circumscribe it narrowly. One art historian, Reginald H. Wilenski, presented him as a laboratory researcher attempting to broaden the scope of the eye by means of optical instruments and mirrors. In France, André Malraux saw him enclosed in his family circle and recognized his wife, Catharina Vermeer, in scores of his characters. Notably, however divergent the views are, both represented him as a recluse. A close scrutiny of his paintings also brings to mind the idea of an artist confined to the rooms that he is depicting, attentive to all the objects separating him from his main theme but giving no hint whether he considers them obstacles to his progression or supports in a difficult enterprise. It should be added here that the two known landscapes by Vermeer were both painted from a window; it is uncertain whether it was some physical infirmity or merely the wish to paint with all his supplies at hand that rooted Vermeer to the stool on which he portrayed himself, seen from the back, in his "Allegory of Painting." The question reveals the paucity of knowledge of his surpassingly accomplished and hermetic art. It scarcely influenced either his contemporaries or the painters of later time, however; its tightly knit texture was enough to discourage whole legions of artists, and even a major 20th-century counterfeiter of Vermeer did not dare to imitate his mature works but rather forged works from the Delft master's unknown youth.

In his own time Vermeer's works seem to have been regarded as experimental and therefore not widely appreciated. After he died, at the age of 43, and was buried in the Old Church of Delft, his wife, Catharina, frantically tried to save 29 of his paintings from the bankruptcy that was her lot. Vermeer had

been ruined by the political troubles and the wars of the times.

The art of Vermeer expresses a Work. knowledge of matter that is so sensitive as to be almost scientific. Each painting seems to be the sum of various analytic experiments with light and with the microscopic observation of matter, as well as of a specifically pictorial research that frees his colours from merely rendering forms, that investigates new visual means of suggesting the rapports between the human presence and its environment, and that explores bold perspectives that today suggest the use of wide-angle lenses and telescopic lenses in photography. It is noteworthy that the rediscovery of Vermeer in the late 19th century coincided with the interest in the refinement of perception accompanying the development of photography.

A certain number of paintings attributed to Vermeer are clearly marginal in respect of his sustained and exceptionally high level of production. Although unsigned, they cannot be attributed to any other artist. These works—"Diana at Her Toilette" (c. 1654), "Christ in the House of Martha and Mary" (c. 1654–55), the "Procuress" (1656), and "A Girl Asleep"—are assumed to be works in which Vermeer conducted his earliest investigations.

Elements such as colour treatment, the perspective, the analysis of some objects, although not conclusive in themselves, unmistakably relate them to the Delft master's greatest works, next to which they become unified and attuned. In his next stage, the great painter acceded to the levels at which art is the absolute master of subject matter; he assumed a gradually fuller possession of reality. Neither distance nor shade attenuated the perception of every element in the paintings. Vermeer even went so far as to indicate the time on the clock—7:10 AM—in a celebrated "View of Delft." At this level of perfection, it is difficult to establish a clear progression among the various paintings. There are some works of exceptional power and others that are less accomplished. Some may even reveal a side of the painter not particularly noticed before: "Allegory of the Faith," for example, is of an unexpected symbolical complexity. One composition that seems to surpass all the rest is the "Allegory of Painting," which was long attributed to Pieter de Hooch.

Since the authenticity of the dates on his paintings is generally considered to be doubtful, the chronology of Vermeer's sparse production is almost impossible to determine. Within the assemblage of his greatest paintings, it is impossible to determine that one is an improvement over another. The traditional rule of art historians is that the more complex compositions are created later in the artist's career. Accordingly, the "Allegory of the Faith" and the "Allegory of Painting" should represent the painter's ultimate accomplishments. But Vermeer is just as faithful to himself in such simpler compositions as the "Head of a Young Girl" or "The Girl in a Red Hat," not to mention his landscapes. "Young Woman Reading a Letter," sometimes known as "Woman in Blue," and "The Kitchen-Maid" are simpler and therefore inferably earlier than those compositions in which there is a wealth of symbolic elements, but the simpler works are also bolder in experimentation, which is traditionally an indication of a later work.

Vermeer somehow manages to be unique within a typically Dutch genre. He withstood all of the Italian, the French, and the Flemish influences that are sensed in the work of other Dutch artists of his time. Whereas Frans Hals seems at times to converse with the Spaniard Velázquez, for example, and Rembrandt with the Italian Baroque painter Guercino, Vermeer is preoccupied with a wholly personal direction unlike any other. Vermeer is typically Dutch, however, in his way of "plan-

ning" reality, of analyzing it thoroughly. It is reminiscent of the rigorous methods of the Dutch hydraulic engineers in their conquests over marshland and sea or of the astronomer Huygens discovering the rings girding Saturn.

Despite their unique denseness and clarity, all of Vermeer's works were attributed to others until, in 1866, the art historian Théophile Thoré (pseudonym of W. Bürger), who rediscovered him, attributed 76 paintings to him. Two years later, this number was reduced by another scholar to 56. By 1907, the number was reduced to 34, and it remains between 30 and 35, depending on the authority.

An attempt to create a chronology of his works in 1937 brought the authorities into heated controversy with each other. The matter was greatly complicated when a forger, Hans van Meegeren, in 1945 demonstrated that he had painted works that had been attributed by the greatest connoisseurs to Vermeer's early period. Insofar as Vermeer studies are concerned, the art world has not yet recovered from that hoax. (P.De.)

Vermigli, Peter Martyr, Italian PIETRO MARTIRE VERMIGLI (b. Sept. 8, 1500, Florence—d. Nov. 12, 1562, Zürich, Switz.), leading Italian religious Reformer whose chief concern was eucharistic doctrine.

The son of a prosperous shoemaker, Vermigli had by 1518 entered the Lateran Congregation of the Augustinian Canons Regular at Fiesole. After eight years of study at Padova he served variously as preacher, vicar, and abbot, finally becoming abbot at St. Peter ad Aram, a city monastery in Naples, in 1537. There he joined the select group around Juan de Valdés and read the pseudonymous works of

the Reformers. Vermigli became suspect, and the Theatines procured his suspension from preaching, but sympathetic cardinals at Rome had the ban lifted. In 1541 he became prior of San Frediano at Lucca, where he gathered a teaching staff and introduced both monastery and congregation to Reformed doctrine and worship. Summoned to appear before his order at Genoa, he fled in August 1542 to Zürich. Martin Bucer then called him to Strasbourg (now in France), where he was professor of theology (1542-47, 1553-56). Vermigli in 1547 accepted Archbishop Thomas Cranmer's invitation to England and became regius professor of divinity at the University of Oxford. The major event of his stay was a disputation (1549) on the Eucharist, at which three matters of belief were debated: (1) transubstantiation, (2) carnal or corporeal presence, and (3) whether "the body and blood of Christ is sacramentally joined to the bread and the wine." His influence on the 1552 prayer book and the Forty-two Articles (1553) is problematic. His eucharistic doctrine, in the Oxford Disputation and Treatise and in Defensio adversum Gardinerum (published in 1559), was close to that of John Calvin, Bucer, and Philipp Melanchthon. After Queen Mary's accession, Cranmer named him the archbishop's assistant, but Vermigli went into exile, followed by disciples such as John Jewel, during later persecutions by the crown. He returned to Strasbourg in 1553 but in 1556, after the Lutheran-Reformed dispute over the ubiquity of Christ's body intensified, went to Zürich as professor of Hebrew.

Fort Vermillion, a trading post, was built on the site in 1835, and a permanent settlement was established nearby in 1859. A flood in 1881 completely destroyed the city, which was rebuilt higher on the bluffs. Its name is derived from the river, which in turn comes from the red (vermilion) clay along the river's banks. The University of South Dakota was established by the Territorial Legislature in Vermillion in 1862 but was not opened until 1882. Vermillion is also a marketing and shipping centre for agricultural products (dairy foods, grains, and truck vegetables). Inc. city, 1877. Pop. (1986 est.) 9,270.

Vérmion Mountains, Greek vérmion óros, mountain range, Imathía nomós (department), west-central Macedonia, Greece. The range rises west of the broad plain of Kambania, which extends southward to the Gulf of Salonika. The mountains reach a height of 6,732 feet (2,052 m) west of Náousa. The Vérmion range is formed from limestone. Ski resorts, such as Seli and Káto, are located at higher elevations on the northeast slopes, while farther down on the plateau are larger centres such as Véroia (ancient Beroea), which is a good base for climbing the Vérmion; Náousa; and Edhessa. Pine, beech, and oak grow on the slopes. During the spring and summer the mountains, with their variety of woods and flowers, are a hiking centre for vacationers and provide pastureland for local herds.

Vermont, constituent state of the United States of America, situated in the New England region, northeastern U.S. It is bounded on the north by the Canadian province of Quebec, on the east by New Hampshire, on the south by Massachusetts, and on the west by New York. The capital is Montpelier.

A brief treatment of Vermont follows. For full

A brief treatment of Vermont follows. For full treatment, see MACROPAEDIA: United States of America: Vermont.

Settled originally by Abnaki Indians who

lived by hunting and fishing, the state was visited by the French explorer Samuel de Champlain, who sighted Lake Champlain on Vermont's northwestern border in 1609. The French made the first permanent European settlement in 1666 on Isle La Motte. Both the Dutch and the British established settlements in the 18th century, but the area fell exclusively to the British in 1763. Contested by both New York and New Hampshire, Vermonters created an independent republic in 1777. In 1791 they joined the Union as the 14th state. The state grew quickly, but by the 1830s its residents were departing in large numbers to other parts of the country. Vermont was the site of the only American Civil War action north of Pennsylvania: in 1864, a band of Confederates raided St. Albans from Canada.

The Green Mountains, part of the Appalachian system, trend north-south through the centre of Vermont. The highest point, Mount Mansfield, is 4,393 feet (1,339 m) above sea level. Only 15 percent of the state is level land with fertile soil and high productive capability. Most of the rivers drain into Lake Champlain, which empties northward via the Richelieu River into the St. Lawrence River. Some 400 natural lakes are located entirely within the state.

The climate tends to be cold. Winter temperatures can drop to -34° F (-37° C) and lower, but in the summer they rarely rise above 90° F (32° C). Snowfall usually averages between 70 and 80 inches (1,800 and 2,000 mm) each winter in the valleys and up to 110 inches (2,800 mm) in the mountains. The annual growing season is only about 120 days.

Vermont's culture typified that of the New England Yankee of English and Protestant background, but other ethnic groups have become important. There are French-Canadians in Winooski, Italians in Barre, Spaniards in Barre-Montpelier, Welsh in western Vermont, and Poles in Brattleboro. The population rose 20 percent from 1970 to 1985, one of the highest growth rates in New England, but many new arrivals were building second, or vacation, homes. Vermont's urban population is low-34 percent in 1980; the state had no census-defined Standard Metropolitan Statistical Area until 1980.

Dairying is the dominant agricultural activity, and Vermont has more milk cows per capita than any other state except Wisconsin. Industry has undergone major changes; once-flourishing textile plants are closed, as are railroad shops and related industries, but specialized products are still important. Wood and paper products account for about onetenth of the manufacturing output. Printing is among the major industries. The mining of marble, granite, and slate, is also significant. Tourism continues to grow in importance, with summer visitors attracted by its forests and mountains and winter sports enthusiasts drawn by its numerous ski resorts.

Rail and airline service is limited. Aside from the main north-south routes in the Connecticut River valley, roads are often winding, narrow, and hilly. Transportation remains a

major problem.

Vermont enjoys a vigorous cultural life despite its rural and small-town character. Art galleries are found in a number of cities and there is a state-supported symphony orchestra. A state-operated arts-and-crafts service aids in marketing the work of folk-arts practitioners. Local history is highlighted, and most of the state's more than 100 covered bridges are maintained and protected by the state. The University of Vermont was chartered in 1791, and the school of languages at Middlebury College is internationally known. There are numerous daily and weekly newspapers, several commercial television stations, and many radio stations. Area 9,614 square miles (24,-900 square km). Pop. (1990 est.) 562,000.

vermouth, wine-based fortified drink flavoured with aromatic herbs. The name derives from the German Vermut, or "wormwood, a bitter herb and traditional ingredient of vermouth and absinthe. As many as 40 different herbs and flavourings may be used in vermouth, including juniper, cloves, quinine, orange peel, nutmeg, and coriander; the vermouths of various producers are flavoured according to closely guarded recipes

There are two styles of vermouth: the socalled French, or dry style, which is white, and the Italian, or sweet style, which is darker in colour. Both styles, however, are made in both countries, as well as in the United States. Vermouth is used primarily as an ingredient in mixed drinks or sometimes as an apéritif on its own.

Vermuyden, Sir Cornelius (b. 1595, Tholen, Neth.—d. April 1683?, London), British engineer who introduced Dutch land-reclamation methods in England and drained the Fens, the low marshy lands in the east of England.

An experienced embankment engineer, Vermuyden was employed in 1626 by King Charles I of England to drain Hatfield Chase on the isle of Axholme, Yorkshire. Jointly financed by Dutch and English capitalists, this project was a controversial undertaking, not only for the engineering techniques used but also because it employed Dutch instead of English workmen. The fenmen, local inhabitants who hunted and fished in the fens, attacked the Dutch workers; to complete the project, the engineer had to employ English workers and compensate the fenmen for their loss of hunting and fishing rights.

In 1630 Vermuyden contracted to drain the Great Fens, or Bedford Level, Cambridgeshire; this project, completed in 1637, drew objections from other engineers, who claimed the drainage system was inadequate. During the English Civil War, Parliament ordered the dikes broken and the land flooded (1642) to stop a Royalist army advance. In 1649 Vermuyden was commissioned to reclaim the Bedford Level; 40,000 acres were drained by

In 1653 Vermuyden, who had been knighted in the 1620s and had become a British subject (1633), headed an unsuccessful English mission to the United Provinces of the Netherlands to arrange a political union between the two nations.

Vernadsky, Vladimir Ivanovich (b. March 12 [Feb. 28, Old Style], 1863, St. Petersburg [now Leningrad]—d. Jan. 6, 1945, Moscow), Russian geochemist and mineralogist who is considered to be one of the founders of geochemistry and biogeochemistry.

The son of a professor, Vernadsky graduated from St. Petersburg University in 1885 and became curator of the university's mineralogical collection in 1886. In 1890 he became a lecturer on mineralogy and crystallography at Moscow University, where he earned his Ph.D in 1897. He served as a professor at Moscow University from 1898 to 1911. After the Russian Revolution he was active in scientific and organizational activities; he founded and directed (from 1927) the biogeochemical laboratory of the Academy of Sciences at Leningrad.

Vernadsky's initial work was in mineralogy. He carried out highly detailed studies on aluminosilicates and was the first to correctly describe their chemistry and their structure, which forms the basis of many other minerals. He was also a pioneer in geochemistrythe measurement and study of the distribution and migration of the chemical elements and isotopes in the Earth's crust. In this regard he gathered detailed data on the layers of the crust, described the migration of atoms in such layers, tried to explain the occurrence of chemical elements in those layers, and in general studied the formation of chemical

compounds under the influence of geologic processes

Vernadsky was one of the first scientists to recognize the tremendous potential of radioactivity as a source of thermal energy, and he was also one of the first to postulate the longterm heat buildup from radioactivity as a driving force behind many geochemical processes. His later years were taken up with the study of the contributions that life processes make to the atmosphere, and he correctly attributed to living things the creation of the oxygen. nitrogen, and carbon dioxide present in the atmosphere. He also studied the effects living things have on the chemistry of the Earth's crust (e.g., the subsurface concentrations of certain elements due to biological cycles). Vernadsky is thus regarded as the founder of the theory of the biosphere (i.e., the total mass of living organisms, which process and recycle the energy and nutrients available from the environment).

Vernal, city, seat (1880) of Uintah county, northeastern Utah, U.S. The city lies along Ashley Creek, a small tributary of the Green River, and is located 180 miles (290 km) eastsoutheast of Salt Lake City, at an elevation of 5,322 feet (1,622 m) in an area of geologic and fossil interest. Settled in the 1870s as Ashley Center (for the fur trader William H. Ashlev). it was incorporated in 1879 and was renamed Vernal in 1893, implying a springlike growth (hence, progress).

The settlement developed as a trading and processing centre for a ranching and dairy area and later became a tourist centre for the High Uintas Primitive Area within Ashley National Forest (which lies to the northwest and is headquartered at Vernal), the Dinosaur National Monument (12 miles [19 km] east), and the Flaming Gorge National Recreation Area (40 miles [64 km] north). The hub of Utah's "Dinosaurland," it is the site of the Utah Field House of Natural History and hosts a summer art festival; the Dinosaur Roundup Rodeo (July) and a quarter horse show and race (June) are also held there. The Uintah and Ouray Indian Reservation and its Hill Creek Extension lie just to the west and south of Vernal. Aside from livestock farming, the locality has mining (gilsonite, oil, oil shale, phosphate rock, and natural gas) and lumbering. Pop. (1986 est.) 8,180.

vernalization, the artificial exposure of plants (or seeds) to low temperatures in order to stimulate flowering or to enhance seed production. By satisfying the cold requirement of many temperate-zone plants, flowering can be induced to occur earlier than normal or in warm climates lacking the requisite seasonal chilling. Knowledge of this process has been used to eliminate the normal two-year growth cycle required of winter wheat. By partially germinating the seed and then chilling it to 0° C (32° F) until spring, it is possible to cause winter wheat to produce a crop in the same

Devernalization can be brought about by exposing previously vernalized plants or seeds to high temperatures, causing a reversion to the original nonflowering condition. Onion sets that are commercially stored at near freezing temperatures to retard spoilage are thereby automatically vernalized and ready to flower as soon as they are planted. Exposure to temperatures above 26.7° C (80° F) for two to three weeks before planting, however, shifts the sets to the desired bulb-forming phase.

Verne, Jules (b. Feb. 8, 1828, Nantes, Fr.d. March 24, 1905, Amiens), French author whose writings laid much of the foundation of modern science fiction.

In Paris Verne studied law but afterward chose to follow his interest in literature. In 1850 his play, Les Pailles rompues ("The Broken Straws"), was successfully produced at Alexandre Dumas's Théâtre Historique. He served as secretary at the Théâtre Lyrique (1852–54) and later turned stockbroker but continued writing comedies, librettos, and stories

In 1863 he published in Jules Hetzel's Magasin d'Éducation et de Récréation the first of his Voyages extraordinaires—Cinq Semaines en ballon (1863; Five Weeks in a Balloon, 1869). The great success of the tale encouraged him to produce others in the same vein of romantic adventure, with increasingly deft depictions of fantastic but nonetheless carefully conceived imaginary scientific wonders. The Voyages continued with Le Voyage au centre de la Terre (1864; A Journey to the Centre of the Earth, 1874), De la Terre à la Lune (1865; From the Earth to the Moon, 1873, Vingt Mille Lieues sous les mers (1870; Twenty Thousand Leagues Under the Sea, 1873), and L'Île mystérieuse (1874; The Mysterious Island, 1875), in which he foresaw a number of scientific devices and developments, including the submarine, the aqualung, television, and space travel.

Verne's novels were enormously popular throughout the world; one in particular, the grippingly realistic *Le Tour du monde en quatre-vingt jours* (1873; *Around the World in Eighty Days*, 1873), generated great excitement during its serial publication in *Le Temps* and remained one of his most popular works. From 1872 he lived in Amiens. In 1892 he was made an officer of the Légion d'Honneur.

Verne Boyer—H. Roger-Viollet

A number of successful motion pictures have been made from Verne novels, starting in 1916 with Twenty Thousand Leagues Under the Sea (remade in 1954 by Walt Disney), The Mysterious Island (1929 and 1961), From the Earth to the Moon (1958), Journey to the Center of the Earth (1959), and, perhaps the most popular, Around the World in Eighty Days (1956).

Verné rug, handmade Caucasian pileless floor covering on which the designs are executed in Soumak brocading upon a foundation weave that appears between the motifs. Usually the field design consists of rectangular panels upon which appear attenuated forms of animals and peacocks or angular winged plants. Similar creations fill the wide border, and if guard stripes appear, they are very narrow. In other examples the panels may contain a row of conventionalized leaves or rectilinear split arabesques.

The name Verné is also often applied to a series of Anatolian brocaded rugs the panels of which contain diamonds, delicate latticework, or other varied geometric forms. Caucasian Vernés are normally all wool, except for white cotton accents. Many Anatolian pieces make

Verner's law, linguistic explanation of the apparent exceptions to Grimm's law (q.v.), which first demonstrated the significant role that accent (stress) played in linguistic change in the Germanic languages. It provided further evidence for the important claim of 19thcentury linguists that phonetic laws have no exceptions and proved to be a decisive influence in establishing the direction taken by the Neogrammarian school of historical linguistics (see Neogrammarians). This law, one of the greatest discoveries in historical linguistics, was first presented in an article, "Eine Ausnahme der ersten Lautverschiebung" ("An Exception to the First Sound Shift"), in the Zeitschrift für vergleichende Sprachforschung of July 1875, by the Danish linguist Karl

Grimm's law stated that the Indo-European p, t, and k sounds changed into f, th or d, and h in the Germanic languages. Verner noticed that Grimm's law was valid whenever the accent fell on the root syllable of the Sanskrit cognate, but, when the accent fell on another syllable, the Germanic equivalents became b, d, and g. This was also the case with s and r. Technically, this rule states that in the Germanic branch of Indo-European, all non-initial voiceless fricatives (spirants) became voiced between voiced sounds if they followed an unaccented syllable in Indo-European or Sanskrit. For example, Sanskrit bhrátar, with the accent on the root syllable, corresponds to Gothic brobar, but Sanskrit pitā, accented on the final syllable, corresponds to Gothic fadar.

Vernet, Carle, Carle also called CHARLOT, original name ANTOINE-CHARLES-HORACE VERNET (b. Aug. 14, 1758, Bordeaux, Fr.—d. Nov. 27, 1836, Paris), French painter of battle scenes for Napoleon I and of sporting subjects, notably horses, for King Louis XVIII.

The son of the popular landscapist Joseph Vernet, the younger Vernet early exhibited a gift for painting and came to develop an acute eye for natural detail. Although Napoleon commanded him to paint vast battle scenes, such as "Marengo" (1804), his real talent was for intimate genre and for drawing rather than for painting. His long series of fashionable studies, often satirizing contemporary man-

ners and costume, were reproduced by the best engravers of the time. After the restoration of the monarchy, Vernet became court painter to Louis XVIII.

Vernet, (Émile-Jean-)Horace (b. June 30, 1789, Paris—d. Jan. 17, 1863, Paris), French painter of sporting subjects and vast battle panoramas, notably those in the Gallery of Battles at Versailles.

The son and grandson, respectively, of two well-known painters, Carle Vernet and Joseph Vernet, Horace developed a remarkable facility for working on a grand scale and became one of France's most important military painters. A Bonapartist, he specialized in glorifying the Napoleonic era. During the restoration of the monarchy after 1815, his studio was a centre of political intrigue as well as a meeting place for sportsmen, artists, and writers. A period with the French Army in Algiers (1833) inspired some paintings of the Arab world. He was subsequently commissioned by Louis-Philippe and Napoleon III to produce the battle pieces at Versailles.

Vernet, (Claude-)Joseph (b. Aug. 14, 1714, Avignon, Fr.—d. Dec. 3, 1789, Paris), French landscape and marine painter whose finest works, the series of 15 "Ports of France" (1754–65; Louvre), constitute a remarkable record of 18th-century life.

The son of a decorative painter, Vernet worked at Rome (1734–53), finding inspiration both in the expansive, luminous art of the 17th-century French master Claude Lorrain and in the dramatic and picturesque work of the 17th-century Italian painter Salvator Rosa.

Vernet's shipwrecks, sunsets, and conflagrations reveal an unusually subtle observation of light and atmosphere. With his compatriot Hubert Robert, he catered to a new taste for idealized, somewhat sentimentalized landscapes. After returning to Paris he became a member of the French Royal Academy and was commissioned by King Louis XV to paint the port series. The decline in his later work is attributed to overproduction. The family tradition of painting was maintained by his son Carle Vernet

Verneuil process, also called FLAME-FUSION PROCESS, method for producing synthetic rubies and sapphires. Originally developed (1902) by a French chemist, Auguste Verneuil, the process produces a boule (a mass of alumina with the same physical and chemical characteristics as corundum) from finely ground alumina (Al_2O_3) by means of an inverted oxyhydrogen torch that opens into a ceramic muffle. With slight modifications, this method is used to produce spinel, rutile, and strontium titanate.

Highly purified alumina is placed in a container with a fine sieve at its base. When the container is tapped by a mechanically-activated hammer, the alumina sifts down into the enclosed chamber. Oxygen passes into this chamber and carries the fine alumina particles into the intense heat of the central part of an oxyhydrogen flame, where they fuse and fall on the molten upper surface of the boule as droplets. Flame characteristics and the rate of powder feed and boule lowering are adjusted to produce a boule of uniform diameter. The temperature of the upper surface of the boule is held just above the melting point, which for

Verneuil apparatus

colourless sapphire is 2,030° C (about 3,690° F). When a boule reaches the desired size, normally 150 to 200 carats, the furnace is shut down, and the boule is cooled.

Strain develops during cooling, because the outer surface cools faster than the interior; this phenomenon causes considerable loss from cracking during the manufacturing process. The strain is relieved by splitting the boule longitudinally, which is induced by snapping off its elongated stem. Some residual strain not disadvantageous for gem and most industrial uses is left in the half-boule developed by splitting. Strain-free, whole boules may be produced by annealing at 1,950° C.

Synthetic corundum. Before 1940 all synthetic corundum was made in Switzerland, Germany, and France. For several years after the discovery of the process of manufacture, all of the production was used for gemstones. Synthetic ruby was the chief product and was produced by using an intimate mixture of aluminum and chromium oxides; 5 percent chromium oxide (Cr₂O₃) yields a pale-pink boule and 6 percent a deep-red one. The higher the percentage of chromium oxide, the more difficult it is to control boule growth and the greater the loss from cracking on cooling. Blue sapphire is produced by adding iron and titanium, green by cobalt, and yellow by nickel and magnesium oxides.

Star rubies and sapphires, first developed in 1947 in the United States, are made by adding one percent rutile (titanium oxide, TiO₂) to the starting powder, forming the boules in the usual manner, and then heat treating them at temperatures between 1,100° C and 1,500° C. The rutile forms small needlelike crystals that

are oriented along the hexagonal crystal planes within the boule; these are similar to the same crystals in natural star sapphire. The synthetic gems have sharper and more distinctly developed stars than the natural crystals.

It is very difficult to distinguish between natural and synthetic colourless sapphires. The natural crystals have microscopic irregularly-shaped gas and liquid inclusions, whereas the synthetic gems usually show microscopic cracks along and normal to the intersection of facets. Under the microscope, coloured synthetic stones show curved lines parallel to the upper growth surface of the boule. They represent uneven distribution of pigmentation. Occasionally, especially in blue sapphire, they are visible to the unaided eye.

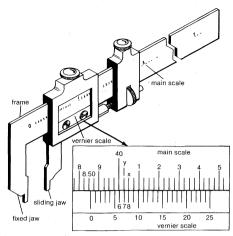

Synthetic spinel. Spinel boules have a square cross section with round corners but otherwise are like corundum boules in manufacture, size, and appearance, although they do not develop internal stresses during cooling. They are made in all colours by adding appropriate pigments.

Synthetic rutile. Synthetic rutile, first produced in 1948 by the Verneuil process, is far superior to the natural material as a gemstone, because natural rutile is dark in colour and the pure synthetic boules may be produced in nearly any shade by the addition of appropriate pigments. Rutile boules have a square cross section similar to spinel boules but rarely exceed 100 carats in weight. When removed from the furnace they are black in colour, because some titanium is still unoxidized; on heating in an oxygen atmosphere, however, the oxygen is slowly absorbed and the colour fades until only a faint yellow tinge remains in unpigmented boules.

Vernier, Pierre (b. c. 1580, Ornans, Fr.—d. Sept. 14, 1637, Ornans), French mathematician and government official who is best remembered for his invention of the vernier caliper, an instrument for making accurate linear measurements. Taught by his scientistfather, Claude Vernier, he early developed an interest in measuring instruments. During his adult years, however, science was for him primarily an avocation. He held various positions with the government of Spain and then became commandant of the Castle of Ornans in France and later director general of the treasury in Bourgogne. In La Construction, l'usage, et les propriétés du quadrant nouveau de mathématiques (1631; "The Construction, Uses, and Properties of a New Mathematical Quadrant"), he described his new measuring instrument. The book also contained a table of trigonometric sines and a method for deriving the angles of a triangle from known measurements of its sides.

vernier caliper, instrument for making very accurate linear measurements introduced in

1631 by Pierre Vernier of France. It utilizes two graduated scales: a main scale similar to

Vernier caliper

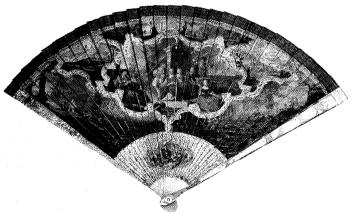

that on a ruler and an especially graduated auxiliary scale, the vernier, that slides parallel to the main scale and enables readings to be made to a fraction of a division on the main scale.

In the figure, the vernier scale has 25 divisions, whereas the main scale has 24 divisions in the same length. This means that the divisions on the vernier scale are shorter than those on the main scale by 1/25 of a division on the main scale. In the figure, line 8 on the vernier coincides with line x on the main scale. To align lines 7 and y the vernier would have to be moved to the left by 1/25 of a main-scale division; to align lines 6 and 40, the movement would be $\frac{2}{25}$, and so on. By similar reasoning, the 0 line on the vernier would have to be moved a distance equal to 8/25 of a main-scale division to align it with the 8.50 line on the main scale. This means that in the position shown in the figure the 0 line is 8/25 of a main-scale division to the right of the 8.50 line. The reading of the vernier is therefore 30 + 8.50 + 0.08 = 38.58

Vernier scales are also made with 10 divisions in the same length as 9 on the main scale; the technique of reading such a scale is similar to that described above. A vernier scale can be used to increase the accuracy of angular as well as linear measurements.

furniture and such personal articles as brisé fans (see fan) and snuffboxes. The process of adding bronze or gold powder to green varnish was perfected by the Martin family (q.v.), hence its name vernis Martin ("Martin varnish"). Highly praised by Voltaire, it was developed to imitate east Asian lacquer ware being imported into France during the Louis XV period. Vernis Martin was made in several colours, green and a golden red being the most characteristic. See also lacquerwork.

Vernon, city and metropolitan area, southern British Columbia, Canada, in Okanagan Lake country, 317 mi (510 km) northeast of Vancouver. Pioneers called the early settlement Priest's Valley because of a missionary outpost maintained there by Paul Durieu. It was also known as Forge Valley (for its blacksmithing business) and, in 1885, as Centreville (the name of the original townsite). It was renamed Vernon in 1887 after Forbes G. Vernon, who was at that time provincial commissioner of lands and works.

Now a service centre for a large lumbering, dairying, and fruit-growing area, its major industries are fruit and vegetable packing and canning, leather tanning, logging, and sawmilling. The city is a popular hunting and fishing base and holds an annual winter carnival at nearby Silver Star Mountain. Architecturally, it is dominated by the Vernon Civic Complex (opened 1966), comprising the City Hall, museum, library, fire and police buildings, and community centre, and the Convention Hall. Inc. 1892. Pop. (1981) city, 19,987; metropolitan area, 21,213.

Véroia, historically BEROEA, commercial centre of Greek Macedonia and capital of the nomós (department) of Imathía. It is situated on a plateau at the western edge of the Thessaloníki (Salonika) plain on the eastern foot of the Vérmion Óros (mountain) north of the Aliákmon Potamós (river). The seat of a metropolitan bishop of the Greek Orthodox Church, the town straddles the Tripótamos (river), an Aliákmon tributary that provides hydroelectric power and irrigation.

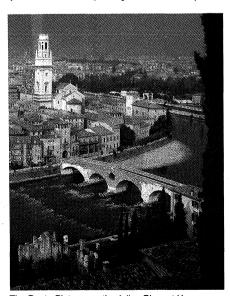

'éroia is on the site of ancient Beroea, a city of Emathia prominent from at least the beginning of the 4th century BC. Part of the kingdom of Macedonia, it surrendered to Rome in 168. The Apostle Paul and Silas preached to the Jewish community there in AD 54 or 55. Under the emperor Diocletian (reigned 284-305) the city was one of the two capitals of the Roman province of Macedonia. At an early date it was the seat of a bishop. Invaded by Serbs and Bulgars, in 1361 it was captured by the Turks, who named it Karaferiye and established a military colony. Only fragments of fortifications and sculpture from the Hellenistic and Roman periods remain, but in 1960 excavations were undertaken on the earliest ramparts.

The modern town has cotton and woollen mills and trades in wheat, fruit, and vegetables. It is linked to Edessa (Édhessa) by the Thessaloníki-Kozáni railway, with connections to Bitola, Yugos. Lignite mines operate in the area. The town has an archaeological museum and many Byzantine churches of wattle and timber. Pop. (1981) 37,087.

Verona, city, episcopal see, and capital of Verona province, Veneto region, northern Italy, at the foot of the Monti Lessini, halfencircled by the Adige River, west of Venice.

Founded by an ancient tribe (possibly the Euganei or Raeti) and later occupied by the Gallic Cenomani, it became a Roman colony in 89 BC and rapidly rose in importance because it was at the junction of main roads between Italy and northern Europe. Occupied by the Ostrogoth king Theodoric (489), who built a castle on the site of the present Castel San Pietro on the Adige, it remained important under the Lombard kings. Captured by Charlemagne in 774, it was the residence of his son Pepin and of Berengar of Tour. An independent commune from the early 12th century, it suffered during the early struggles between the Guelfs (papal party) and Ghibellines (imperial party), choosing the Guelf party. Ruled by the tyrant Ezzelino da Romano (1226–59), the city grew calmer and prospered under the Scaliger (della Scala) family after Mastino I della Scala became podesta (chief magistrate) in 1260. In the reign of Bartolomeo della Scala, Romeo Montague and Juliet Capulet traditionally loved and died; their romance is commemorated by the so-called Tomb of Juliet, Romeo's House, and Juliet's House. Bartolomeo's brother Cangrande I (died 1329), the greatest Scaliger, protected the exiled poet Dante. Verona fell to Gian Galeazzo Visconti in 1387 and to Venice in 1405, which held it, apart from its occupation by Emperor Maximilian I (1509-17), until 1797, when it was ceded to Austria by Napoleon I at the Treaty of Campo Formio. The last congress of the Quadruple Alliance (Russia, Prussia, Austria, Britain) was held at Verona (1822). In 1866 the city was united to the Kingdom of Italy. It suffered heavy damage in World War II but has since been restored.

Verona is one of the richest cities in northern Italy in Roman remains, most notably the Arena, now used for opera. Also from the 1st century AD are the Roman theatre (with adjacent archaeological museum) and two gateways. The Arco dei Gavi (reconstructed in 1932) was erected in the 1st century BC. The Museo Lapidario Maffeiano (1714) contains Greek and Roman antiquities. Remarkable for rich Romanesque and Gothic architecture, often in a distinctive pink brick, Verona also produced two great Renaissance architects, Fra Giocondo and Michele Sanmicheli. Outstanding churches include the Romanesque S. Zeno Maggiore (originally 5th century, rebuilt 1117-1227), with a brick and marble facade, a celebrated marble porch, and a triptych by the 14th-century painter Andrea Montegna, and the Gothic S. Anastasia (foundation 1290; completed 1422-81). The

Romanesque-Gothic cathedral (rebuilt 15th century) contains an "Assumption" by the 16th-century artist Titian and one of Europe's oldest libraries. Also notable are the churches of S. Fermo, comprising two 11th-century edifices, the upper rebuilt after 1313; SS. Nazzaro e Celso (rebuilt 1464-83); and S. Giorgio in Braida, begun in 1477 and consecrated in 1536, partially designed by Sanmicheli. Notable secular landmarks include the Castelyecchio (now the Museo Civici, Verona), built by Cangrande II in 1354; the Loggia del Consiglio (1493), attributed to Fra Giocondo; the Arche Scaligere, comprising the elaborate Scaliger tombs with Gothic canopies surmounted by equestrian statues; the Palazzo della Ragione (1193; much altered); and the Ponte Scaligero (1354), rebuilt after being damaged in World War II.

Verona was also a renowned medieval centre of painting. The work of Antonio Pisanello (Pisano) climaxes the courtly fresco work of the 14th and 15th centuries. The influence of Bartolommeo Montagna of Vicenza and his father-in-law, the Venetian Jacopo Bellini, in the 15th century combined with that of Venice to affect the whole Veronese school. The city's most famous painter was the 15th-century artist Paolo Caliari, (Paolo Veronese), who spent most of his active life in Venice although his "Martyrdom of St. George" remains in S. Giorgio in Braida at Verona.

The city is the centre of rail and road connections from northern Italy to central Europe via the Brenner Pass; and it links Milan and Venice by rail and road and is served by airports at Boscomantico and Villafranca. erona ships fruits and vegetables to central Europe and is noted for its cereal market and its annual International Agricultural and Horse Fair (since 1898). There are engineering, chemical, and paper industries, sugar refining, and diversified manufactures. Artistic furniture making and work in precious metals and marble are flourishing handicraft industries, and Verona's traditional wines (Bardolina, Valpolicella, Soave, and Recioto) are famous. Pop. Verona, Congress of (Oct. 20-Dec. 14, 1822), last meeting of the Holy Alliance powers and Britain, held at Verona, to consider the revolutionary situation in Spain. Convened because the French king Louis XVIII wanted his allies' consent to intervene in Spain to overthrow the constitutional regime established there in 1820, the congress agreed to support France if it should be attacked by Spain and authorized a French expedition into Spain (1823). The British, however, by threatening the use of their sea power, prevented the members of the congress from interfering with the revolts occurring in Spanish America and created enough discord among the allies to cause a breakdown in the congress system.

Veronese, Guarino: see Guarino Veronese.

Veronese, Paolo, pseudonym of PAOLO CALIARI (b. 1528, Verona, Republic of Venice—d. April 9, 1588, Venice), one of the major painters of the 16th-century Venetian school. His characteristic works are huge, vastly peopled canvasses depicting allegorical, biblical, or historical subjects painted in splendid colour and set in a framework of Classical architecture. A master of the use of colour, Veronese also excelled at illusionary compositions that extend the eye beyond the actual confines of the room.

The early years. Caliari became known as Veronese after his birthplace. Though at first apprenticed as a stonecutter, his father's trade, he showed such a marked interest in painting that in his 14th year he was apprenticed to a painter named Antonio Badile, whose daughter Elena he later married. From Badile, Veronese derived a sound basic painting technique as well as a passion for paintings in

which people and architecture were integrated. The style of his first known work, "Bevi-The style of his first known work, lacqua-Lazise Altarpiece," reflects Badile's influence. Veronese was also influenced by a group of painters that included Domenico Brusasorci, Giambattista Zelotti, and Paolo Farinati; attracted by Mannerist art, they studied the works of Giulio Romano, Raphael, Parmigiano, and Michelangelo. Fragments of a fresco decoration executed by Veronese in 1551 for the Villa Soranza in Treville (now in S. Liberale, Castelfranco), with their elegant decorative figures, already suggest a new idiom. The influence of Michelangelo is evident in a splendid canvas, "Temptation of St. Anthony," painted in 1552 for the cathedral of Mantua.

In 1553 Veronese was introduced to Venice and launched on a long collaboration with the Venetian authorities in connection with the decoration of different parts of the Palazzo Ducale. The first of these commissions, the partitioned ceiling of the Sala del Consiglio dei Dieci (Hall of the Council of Ten), reveals characteristics of Veronese's mature style: skillful foreshortenings that make figures appear to be actually floating in space above the viewer, chromatic splendour, and luminous passages that endow even the shadows with colour.

In 1555, probably at the summons of the prior of S. Sebastiano in Venice, Veronese began the decoration of the church that was to become his burial place. Whereas in the Palazzo Ducale he had often worked in collaboration with Zelotti, Veronese worked alone in S. Sebastiano. In the "Story of Esther," depicted on the ceiling, appear the first of his rigorous compositions of foreshortened groups in luminous architectural frameworks and his decorative fancies that juxtapose animated, almost stereometric foregrounds and background figures wrought with a few strokes of light. The skilled fresco painter, who had worked in the villas and palaces of Venetian noblemen, including the beautiful boudoir of the Trevisan family in Murano, recounted the stories of St. Sebastian in elegantly fluent frescoes painted for the church (1558). In his decoration of the two shutters of the organ (1559), he again revealed his mastery of rhythmic composition and illusionistic perspective through extreme foreshortening. Contemporaneously with the decoration of S. Sebastiano, Veronese received numerous commissions for altarpieces, devotional paintings, and some "Suppers." The theme of the latter—depicted in such paintings as "The Pilgrims of Emmaus" and "Feast in the House of the Pharisee"—allowed him to compose large groups of figures in increasingly complex Renaissance architectural settings that attest to his knowledge of the works of the 16th-century Venetian architects Michele Sanmicheli, Andrea Palladio, and Jacopo Sansovino.

The later years. The decoration of the villa at Maser (1561), built by Palladio for Daniele and Marcantonio Barbaro, the latter a scholar and translator of the works of the Roman architect Vitruvius, marked a fundamental stage in the evolution of the art of Veronese and in the development of Venetian painting. Assisted by his brother Benedetto in the execution of the architectural framework, Paolo brilliantly interpreted the villa's Palladian rhythms, breaking through the walls with illusionistic landscapes and opening the ceilings to blue skies with figures from classical mythology. Mannerism had given way to harmonious rhythms and a superb handling of colour that imbued his frescoes with glowing vitality: the mythological scenes exalting human pleasures; the depiction of Barbaro's wife with the children and the wet nurse; and the landscapes, rendered in illusionistic perspective and detailed with classic ruins.

The classic compositions at Maser were succeeded by paintings with a tendency to monumentality and with a love for decorative pomp, as in "The Marriage at Cana," executed in 1562 and 1563 for the refectory of S. Giorgio Maggiore (now in the Louvre, Paris). In this work the planes are multiplied, space is dilated, and an assembly of people is accumulated in complex but ordered movements. In their solemn monumentality "The Family of Darius Before Alexander" and the canvasses executed for the Cuccina family (c. 1572), which contain splendid portraits, are more organic in structure.

The wealth of whimsical and novel narrative details characteristically incorporated in Veronese's paintings and particularly in the "Last Supper," commissioned in 1573 by the convent of SS. Giovanni e Paolo, aroused the suspicion of the Inquisition's tribunal of the Holy Office, which summoned Veronese

to defend the painting. The tribunal objected to the painting on grounds that it included irreverent elements, inappropriate to the holiness of the event, for example, a dog, a jester holding a parrot, and a servant with a bleeding hose. Replying that "we painters take the same liberties as poets and madmen take," Veronese adroitly and staunchly defended the artist's right to freedom of imagination. The tribunal, perhaps influenced by the civil authority, elegantly resolved the question by suggesting that the theme be changed to a "Feast in the House of Levi."

The nocturnal tone in the "Adoration of the Magi" in the church of Sta. Corona (Vicenza) endows the painting with a new intimacy, without renunciation of the characteristic Veronesian richness of colour, laid on with the minute, precious brush strokes also used in small canvases, both sacred and profane, executed during this period. These paintings represent the most authentic expressions of the last 15 years of Veronese's life; for discernible in the large decorations for the Palazzo Ducale begun during this period—including the "Rape of Europa" and the "Apotheosis of Venice"—is a greater participation of his workshop, where his brother Benedetto, his sons Carlo and Gabriele, his nephew Alvise dal Friso, and others were employed. In 1588 Veronese contracted a fever and died after a few days of illness. His brother and sons had him buried in S. Sebastiano, where a bust was placed above his grave.

The sons continued their father's work, signing it haeredes Pauli ("Paul's heirs"). They were able to make use of a quantity of splendid sketches and drawings. Among Veronese's last works were superb allegorical fables, such as a series for Rudolph II that included "The Choice of Hercules" and "Allegory of Wisdom and Strength" (Frick Collection, New York City); and "Mars and Venus United by Love" (Metropolitan Museum of Art, New York City), in which the figures are bound to each other by harmonious rhythms. His final work also included biblical scenes (Kunsthistorisches Museum, Vienna) with agitated, gloomy landscapes. A pathos-filled small altarpiece of "St. Pantaleon Healing a Sick Boy" and versions of the "Pietà" exhibit a dramatic quality and a meditative mood unusual in Veronese's works. It is the other, the serene Veronese, characterized by splendid colour and a luminosity that animates groups of figures and pure architectural structures, who above all was loved in his time and in the following centuries. Various leading artists of the 17th century found him a source of inspiration—as did Sebastiano Ricci and Giovanni Battista Tiepolo, who renewed the vital chromatic idiom of Venetian decorative painting. Nineteenth-century French painters from Eugène Delacroix to Paul Cézanne looked to Veronese, inspired by his use of colour to express exuberance as well as to model form.

Seventeenth-century Venetian sources include Carlo Ridolfi, Le maraviglie dell'arte (1648; ed. by Detlev von Hadeln, 1914-24); Marco Boschini, La carta del navegar pitoresco (1660; ed. by Anna Pallucchini, 1966); and Antonio M. Zanetti, Della pittura veneziana..., 2nd ed., 2 vol. (1792), initiating the critical work on Veronese, which was not sustained and that was only renewed at the beginning of the 20th century in the work of Bernhard Berenson, The North Italian Painters of the Renaissance (1907). Franz H. Meissner, Paolo Veronese (1897), was the first monograph on the artist (in German). The articles by Detlev von Hadeln, "Veronese und Zelotti," in Jahrbuch der preussischen Kunstsammlungen, 35:168–220 (1914) and 36:97–218 (1915); and by Giuseppe Fiocco, "Paolo Veronese und Farinati," *ibid.*, New Series, 1:123–136 (1926), are the early research results presented in the form of a catalog. which Fiocco built upon in his first monograph (in Italian), Paolo Veronese (1928), enlarging it by an examination of the artist's disciples and of his school. Fiocco concentrated more on the personality of Veronese in his successive volume Paolo Veronese (1934). The following article by Anna M. Brizio is also worth noting: "Note per una definizione critica dello stile di Paolo Veronese,' in L'Arte, 29:213-242 (1926); see also the brilliant monograph by Adolfo Venturi, Paulo Veronese, per il IV centenario della nascita (1928); and Rodolfo Pallucchini, Mostra di Paolo Veronese (1939); and Veronese, 2nd ed. (1943), in which he considered the premises of Brizio and the novelty of Veronese's complementary colours and his position with regard to Mannerism. Gino Fogolari, "Il processo dell'Inquisizione a Paolo Veronese," Archivio Veneto, vol. 16 (1935), illuminates an episode that was important for its demonstration of the relationship between the art of the time and the Counter-Reformation. Bernhard Berenson, Italian Pictures of the Renaissance: Venetian School, 2 vol. (1957), offers the first accurate catalog of the works of Veronese.

Veronica (plant): see speedwell.

Veronica, SAINT (fl. 1st century, Jerusalem; feast day July 12), renowned legendary woman who, moved by the sight of Christ carrying his cross to Golgotha, gave him her kerchief to wipe his brow, after which he handed it back imprinted with the image of his face. This account is not the primitive form of the legend derived from *Historia ecclesiastica* by Bishop Eusebius of Caesarea. Eusebius tells that at Caesarea Philippi there lived the woman whom Christ healed of a hemorrhage (Matt. 9:20).

The legend continued to grow. In France, Veronica was reportedly married to the convert Zaccheus (Luke 19:1-10). In the Bordeaux district, she supposedly brought relics of

the Blessed Virgin to Soulac-sur-Mer, where she died and was buried. In the 12th century

the kerchief image began to be identified with one at Rome, the image eventually even being called Veronica.

Verrazano-Narrows Bridge, suspension bridge spanning New York Harbor from Brooklyn to Staten Island, built by Othmar H. Ammann from 1959 to 1964. Succeeding the Golden Gate as the world's longest suspension bridge (until the completion of the Humber Bridge [q.v.] in 1981), it has a main span of 4,260 feet (1,298 metres). The double-decked, six-lane-wide roadway, 228 ft above mean high water at midpoint, is supported by four cables hung from towers 690 ft high. The cables themselves weigh nearly 10,000 tons each; the roadway 60,000 tons. An exceptionally expensive engineering project largely

because of the problem of land acquisition, its total cost was \$325,000,000.

Verrazzano, Giovanni da, Verrazzano also spelled VERRAZANO (b. 1485, Tuscany, Italy—d. 1528, Lesser Antilles), Italian navigator and explorer for France who was the first European to sight New York and Narragansett bays.

After receiving an upper-class education in Florence, Verrazzano moved to Dieppe, Fr., and entered that nation's maritime service. He made several voyages to the Levant, and in 1523 he secured two ships for a voyage backed by the French government to discover a westward passage to Asia. In January 1524 he sailed one of those vessels, "La Dauphine," to the New World and reached Cape Fear about the beginning of March. Verrazzano then sailed northward, exploring the eastern coast of North America. He made several discoveries on the voyage, including the sites of present-day New York Harbor, Block Island, and Narragansett Bay, and was the first European explorer to name newly discovered North American sites after persons and places in the Old World.

Verrazzano wrote interesting, though sometimes inaccurate, accounts of the lands and inhabitants that he encountered. His explorations concluded at the eastern part of Newfoundland. His return to France on July 8, 1524, gave King Francis I his nation's claim to the New World.

Verrazzano undertook two more voyages to the Americas. In 1527 he commanded a fleet of ships on an expedition to Brazil that returned profitable dyewood to France. His final voyage began in the spring of 1528, when he sailed with his brother, Girolamo, from Dieppe with two or three ships. The fleet sailed to Florida, the Bahamas, and finally the Lesser Antilles. He anchored there off one of the islands (apparently Guadaloupe), went ashore, and was captured, killed, and eaten by cannibals.

verre églomisé (French: "Glomyized glass"), glass engraved on the back that has been covered by unfired painting or, usually, gold or silver leaf. The method owes its name to Jean-Baptiste Glomy (d. 1786), a French picture framer who used the process in glass mounts.

The technique derives from late antiquity and was transmitted by the Early Christian tradition. It has been revived at different periods in the history of glass: in Italy during the 14th, 15th, and 16th centuries; in Holland and Spain during the 17th and 18th centuries; and in France, England, and the United States in the 18th century.

Usually executed on a panel of glass (for a picture frame, for example) backed with gold or silver leaf, the technique involves engraving a design through the leaf and applying coloured pigment so that the coloured portions show through the engraved areas. The painting is in turn backed with protective glass or foil. Some late 18th-century examples depicting views of Holland can be assigned to a Dutch engraver signing himself simply "Zeuner." During the same period, verre églomisé was popular in the United States as decoration for such objects as clock cases and the panels of Sheraton style mirrors.

Verres, Gaius (b. c. 115 BC—d. 43), Roman magistrate notorious for his misgovernment of Sicily. His trial pointed up the extent of official corruption in the Roman provinces during the Late Republic. The son of an undistinguished senator, he became quaestor to the consul Gnaeus Carbo, but, when civil

war broke out in 83, Verres embezzled the military funds and joined the forces of Lucius Cornelius Sulla.

In 80 Verres was legate on the staff of Gnaeus Cornelius Dolabella, governor of Cilicia. Together they plundered the provincials until, in 78, Dolabella was tried at Rome and convicted, mainly on Verres' evidence. In 74 Verres used lavish bribery to obtain the city praetorship then abused his authority for personal gain.

He was next sent as governor to Sicily (73–71). Although corrupt governors were by no means rare, Verres was clearly remarkable for the extent to which he extorted bribes, juggled with the requisition of grain, looted works of art, and arbitrarily executed provincials and Roman citizens. He returned to Rome in 70, and, in the same year, at the Sicilians' request, Cicero prosecuted him. So effective was Cicero's first brief speech and the testimony of his witnesses that Verres' lawyer, the leading Roman advocate Quintus Hortensius, refused to reply. Verres left Rome before the verdict and lived in exile until 43, when he was murdered by order of the general Mark Antony, who apparently coveted his works of art.

Verri, Pietro (b. Dec. 12, 1728, Milan—d. June 28, 1797, Milan), political economist, journalist, government official, and man of letters, leader of a Milanese academy and director of its influential periodical, and author of literary, historical, and economic works.

Verri studied in Monzi, Milan, Rome, and Parma, then served as a captain in the Seven Years' War. After his return to Milan he became the moving spirit of the Società dei Pugni, a group of Milanese intellectuals influenced by the French Encyclopedists. From 1764 to 1766 he directed the society's periodical, Il Caffe ("The Coffeehouse"), with the collaboration of his novelist brother, Alessandro (1741-1816). Pietro Verri contributed at least 38 articles on literary subjects to Il Caffè. For much of his life he held important posts in the Milanese government, working for administrative reform and a revitalization of commerce. Among his important economic treatises are Riflessioni sulle leggi vincolanti (1769; "Reflections on the Banking Laws") and Meditazioni sull' economia politica (1771). His correspondence with his brother Alessandro, Carteggio di Pietro e Alessandro Verri, 12 vol. (1910-42), provides a vibrant picture of Milanese life in their time.

Verrill, Addison Emery (b. Feb. 9, 1839, Greenwood, Maine, U.S.—d. Dec. 10, 1926, Santa Barbara, Calif.), zoologist and naturalist who, as curator of zoology at the Peabody Museum of Natural History at Yale University, developed one of the largest, most valuable zoological collections in the United States.

From 1871 to 1887, while he was in charge of scientific explorations by the United States Commission of Fish and Fisheries, Verrill found and described hundreds of new marine

specimens. He specialized in invertebrates, especially worms, mollusks, corals, sponges, and starfishes, and made important technical improvements in the equipment used for collecting specimens. His expeditions took him to the Atlantic and Pacific coasts of North America and to Hawaii and Central America; many of his more than 300 papers became standard references.

Verrill studied at Harvard, where he was an assistant to Louis Agassiz (1860–64). He was professor of zoology at Yale (1864–1907), curator of zoology at the Peabody Museum of Natural History (1865–1910), nonresident professor of comparative anatomy and entomology at the University of Wisconsin, Madison (1868–70), and an instructor in geology at Yale (1870–94).

Verrius Flaccus, Marcus (fl. late 1st century BC), Roman freedman who became a learned scholar and grammarian and the most famous teacher of his day. Verrius Flaccus introduced the principle of competition among his pupils and awarded old books, beautiful or rare, as prizes. Augustus entrusted the education of his two grandsons to him, and thenceforward his school was in the imperial house on the Palatine. He died at an advanced age during the reign of Tiberius.

The works of Verrius Flaccus are lost, but he is known to have written fasti (a type of calendar) that were set up at Praeneste, where, in fact, fasti have been found that have been accepted as his. A work of his that was much used was De significatu verborum ("On the Meaning of Words"), a large lexicon that was the first of its kind and that was, moreover, a storehouse of antiquarian learning, in which Latin authors were quoted extensively. Some idea of its value is obtainable from what remains of the abridgment made by Festus in the 2nd or 3rd century and from the abridgment of that made by Paul the Deacon in the 8th century.

Verrocchio, Andrea del (b. 1435, Florence—d. 1488, Venice), 15th-century Florentine sculptor and painter and the teacher

of Leonardo da Vinci. His equestrian statue of Bartolomeo Colleoni, erected in Venice in 1496, is particularly important.

Early life. Little accurate biographical information is known about Verrocchio. He was the son of Michele di Francesco Cioni, a maker of bricks and tiles who later became a tax collector. Financial security always seemed to be a family problem. Verrocchio had to support several of his brothers and sisters. Never marrying, he later provided for the ed-

ucation and dowries of the daughters of his younger brother Tommaso.

Initially he was trained as a goldsmith. His master has traditionally been recorded as a supposed goldsmith, Giuliano Verrocchi, whose last name Andrea apparently took as his own. Another questionable biographical tradition is that of his apprenticeship under Donatello, the greatest Italian sculptor of the early Renaissance. Since the stylistic affinity of Verrocchio's early sculpture is with the work of Antonio Rossellino rather than Donatello, this liaison seems doubtful.

His first studies in painting date possibly from the mid-1460s. He is said to have been a pupil of the Florentine artist Alesso Baldovinetti. But it is assumed that he and Sandro Botticelli worked together under the early Renaissance master Fra Filippo Lippi at Prato, a city near Florence, where Lippi had been commissioned to execute a series of murals for the cathedral.

Medici patronage. Verrocchio's most important works were executed in the last two decades of his life. His rise to artistic prominence, which he owed chiefly to encouragement by Piero de' Medici and his son Lorenzo, the leading art patrons of Florence, evidently began only after the death, in 1466, of Donatello, who had been the Medici favourite. Besides the paintings and sculptures Verrocchio produced for the Medici, he designed costumes and decorative armour for their festivals, tournaments, and solemn receptions. Made curator of the collection of antiquities in the Medici palace, he restored many pieces of ancient Roman sculpture, especially portrait busts.

It appears that Verrocchio produced few works for patrons outside of Florence. Though he is said to have worked in Rome for Pope Sixtus IV among others, there is no documentary trace that he ever left the area around Florence until the early 1480s, when he moved to Venice, where he died within a few years. Even while he was in Venice his Florentine workshop was maintained and directed by his favourite student, Lorenzo di Credi. Di Credi was also the administrator and principal heir of Verrocchio's estate.

Verrocchio's reputation was widespread in the second half of the 15th century and many well-known artists of the Italian Renaissance studied painting and sculpture at his Florentine studio. The most important of his students were Leonardo da Vinci and Perugino, the latter Raphael's teacher. The mural painter Domenico Ghirlandajo, Michelangelo's master, was temporarily in close contact with Verrocchio. Sandro Botticelli, the major Florentine painter of the late 15th century, and Francesco di Giorgio, the important Sienese artist, clearly oriented themselves toward Verrocchio's art in certain phases of their development, as did the prominent Florentine sculptors Benedetto da Maiano and Andrea Sansovino.

The paintings and sculptures. The only surviving painting that according to documentary proof should be by Verrocchio, an altarpiece of the "Madonna and Child with Saints" in the Donato de' Medici Chapel of the cathedral at Pistoia, was not completed by the master himself. Largely executed by his pupil Lorenzo di Credi, its handling is inconsistent with that of the "Baptism of Christ" (c. 1474/75; Uffizi, Florence), which has been attributed to Verrocchio ever since it was first mentioned in 1550 by the Renaissance biographer Giorgio Vasari (1511-74) in his Vite de' più eccellenti pittori, scultori, ed architettori italiani . . (Lives of the Most Eminent Italian Painters, Sculptors, and Architects...). One of the two angels and part of the distant landscape in the "Baptism," however,

were certainly painted by his apprentice, the young Leonardo da Vinci. Other paintings ascribed to Verrocchio are the Madonna (Inv. No. 104a) in the Staatliche Museen Preussischer Kulturbesitz of Berlin, the "Tobias and the Angel" in the National Gallery in London, and the altarpiece in Argiano, with Christ on the Cross between St. Jerome and St. Anthony. After the mid-1470s Verrocchio dedicated himself principally to sculpture, in which he manifested strong personal convictions and an inventive ability.

The sculptural works either recorded to be by Verrocchio or actually extant are few in number. According to his brother Tommaso, Verrocchio was responsible for an inlaid slab (1467) in the Florentine church of S. Lorenzo recording the burial place of Cosimo de' Medici, who died in 1464. In 1468 Verrocchio is known to have executed a bronze candlestick (Rijksmuseum, Amsterdam) for the Palazzo della Signoria in Florence. This work was followed by his first major commission, the tomb of Piero and Giovanni de' Medici in the Old Sacristy of S. Lorenzo. Completed in 1472, this sarcophagus, set in an archway, is impressive for its originality of composition and its inspired use of coloured marble and porphyry in conjunction with rich bronze ornamentation.

Verrocchio's earliest surviving example of figurative sculpture is a small bronze statue of David (Bargello, Florence), which is generally dated before 1476. A second bronze figure, the "Putto with Dolphin," is important in the development of freestanding Renaissance sculpture for its spiral design, which represents a successful effort to evolve a pose in which all views are of equal significance. It was originally commissioned for a fountain in the Medici villa in Careggi, near Florence. The putto, sometimes called a cupid, is precisely balanced in the projection of its limbs and probably was placed initially on a fountain so that it could be turned by the pressure of streams or jets of water. In the mid-16th century it was reinstalled on top of a fountain designed for the courtvard of the Palazzo Vecchio in Florence (the original is now kept in the Palazzo Vecchio museum; the present fountain figure is a copy).

Verrocchio's reputation as one of the great relief sculptors of the 15th century was clearly established with his cenotaph, or memorial, in the cathedral at Pistoia, to a Tuscan ecclesiastical dignitary, Cardinal Niccolò Forteguerri. Ordered in 1476, the cenotaph was still unfinished when Verrocchio died, and its completion was entrusted first to Lorenzo di Credi, then to Lorenzetti, and finally to a minor Italian Baroque sculptor. Though its effect has been altered by changes and additions foreign to Verrocchio's original design, the Forteguerri cenotaph contains some of the artist's most important relief sculpture. Its scenographic arrangement of the figures into a dramatically unified composition anticipates the theatrical effect of the dynamically composed wall reliefs executed by Baroque sculptors of the 17th century. Another relief dates from 1478/79, when it was decided to extend the silver altar in the baptistery of the cathedral of Florence, and one of the four supplementary scenes was allotted to Verrocchio. Depicting the "Beheading of St. John the Baptist" (Museo dell'Opera del Duomo, Florence), this work was delivered in 1480. Dating from about 1477/78 is a terra-cotta relief of the Madonna (Bargello, Florence) coming from the Florentine hospital of Sta. Maria Nuova.

In the late 1470s Verrocchio produced two portrait sculptures. A penetrating realism distinguishes his terra-cotta bust of Giuliano de' Medici (in the National Gallery of Art, Washington, D.C.) from the idealization of the

individual that characterizes his marble bust known as "Lady with Primroses" (Bargello, Florence). The latter work created a new type of Renaissance bust, in which the arms of the sitter are included in the manner of ancient Roman models. This compositional device allows the hands, as well as the face, to express the character and mood of the sitter.

Perhaps the most important work Verrocchio executed in Florence was a bronze group of "Christ and St. Thomas" commissioned for a niche in the east exterior wall of the Or San Michele in Florence. Executed between 1467 and 1483, the work is remarkable for its technical perfection, highly intellectual sense of compositional design, and understanding of the subtle emotional nature of the subject. In 1483 Verrocchio was commissioned by the Venetian government to undertake a second major work in bronze, a commemorative statue of Bartolomeo Colleoni, a condottiere, or professional soldier, who had been employed by the Venetian republic. At Verrocchio's death the model was not yet cast, and the work of casting and chasing, or polishing, was entrusted to the Venetian sculptor Alessandro Leopardi. It was erected in 1496 in the Piazza SS. Giovanni e Paolo in Venice. The movement of the horse and commanding forward gaze of Colleoni gives the impression that the warrior is riding into battle at the head of his troops, who press behind. This innovative scenographic conception was influential in the development of the equestrian figures executed from the Baroque period of the 17th century to those produced in the 19th century by sculptors of the Romantic style. Besides Donatello's monument to the condottiere Gattamelata (c. 1447-53) at Padua, Verrocchio's Colleoni monument is aesthetically the most important equestrian statue of the Renaissance. Contrived with great technical assurance and modelled with power and sensitivity, it forms a fitting climax to Verrocchio's sculptural career.

MAJOR WORKS. *Paintings*. "Baptism of Christ" (c. 1474–75, partly overpainted and completed by Leonardo; Uffizi, Florence); "Madonna and Child with Saints" (1478–79, completed by Lorenzo di Credi after 1485; cathedral, Pistoia, Italy).

Sculpture. Tombstone for Cosimo de' Medici (marble, serpentine, porphyry, and brass, 1465-67; S. Lorenzo, Florence); "Christ and St. Thomas" (bronze, 1467-83; Or San Michele, Florence); Candelabrum (bronze, 1468; Rijksmuseum, Amsterdam); "Tomb of Piero and Giovanni de' Medici" (marble and porphyry with bronze, 1472; S. Lorenzo); "David" (bronze, before 1476; Bargello, Florence); "Lady with Primroses" (marble, after 1476; Bargello); "Monument of Cardinal Niccolò Forteguerri" (marble, 1476-88; cathedral, Pistoia); 'Madonna and Child" (terra-cotta relief, c. 1477/ 78; Bargello); "Beheading of St. John the Baptist" (silver, relief, 1478/79; Museo dell'Opera del Duomo, Florence); "Giuliano de' Medici" (terracotta, 1478-79; National Gallery of Art, Washington, D.C.); "Putto with Dolphin" (bronze, c. 1479; Palazzo Vecchio Museum, Florence); "Bartolomeo Colleoni" (bronze finished by Alessandro Leopardi, 1483-88; Piazza SS. Verrucaria, genus of lichens of the family Verrucariaceae, often found as a black crust covering seashore rocks. Along with the effects of weathering, *Verrucaria* helps break down limestone rocks by secreting acids that dissolve the cement holding together the rock particles. This produces an environment for the growth of mosses and higher plants.

vers de société (French: "society verse"), light poetry written with particular wit and polish and intended for a limited, sophisticated audience. It has flourished in cultured societies, particularly in court circles and literary salons, from the time of the Greek poet Anacreon (6th century BC). The tone is flippant or mildly ironic. Trivial subjects are treated in an intimate, subjective manner, and even when social conditions form the theme, the light mood prevails.

The Roman poets Catullus, Martial, and Horace produced much witty vers de société and have often been translated or closely paraphrased; but much strikingly original verse has come from poets or other writers known for their serious works. Jean Froissart, the 14th-century historian of feudal chivalry, wrote some of the most charming examples of the late Middle Ages. The English Cavalier poets Robert Herrick, Thomas Carew, and Richard Lovelace wrote much fine vers along with their elegant lyrics.

The 18th century was rich in examples, both in French and in English. Among the best English practitioners were John Gay and Alexander Pope, whose poem *The Rape of the Lock* (1714) is a masterpiece of the genre. Voltaire, in addition to his political and philosophical works, produced exquisite gems of occasional verse, epistles, and light satires for the enjoyment of his royal friends and patrons.

Vers de société bloomed again in 19thcentury literature after the Romantic movement's decline, with the poetry of William Ernest Henley and the scholarly Austin Dobson

Later in the 20th century, the U.S. poet Ogden Nash created a new, sophisticated, and urbane vers de société with a theme of selfironic adult helplessness. In England the tradition was kept alive by the neo-Victorian topical poems of Sir John Betjeman.

vers libre (French: "free verse"), 19th-century poetic innovation that liberated French poetry from its traditional prosodic rules. In vers libre, the basic metrical unit is the phrase rather than a line of a fixed number of syllables, as was traditional in French versification since the Middle Ages. In vers libre, the lengths of lines may vary according to the sense of the poem, the complete sentence replaces the stanza as a unit of meaning, and rhyme is optional.

Vers libre appears to have been the independent invention of several different French poets in the late 1880s. Among its early advocates and theoreticians were Gustave Kahn, Jules Laforgue, Francis Vielé-Griffin, and Édouard Dujardin. The use of a free prosodic structure in French poetry was not entirely new: it had antecedents in the poems of the Symbolists, the prose poems of Rimbaud, and, much earlier, in the metrical experiments of Victor Hugo. But the widespread adoption of vers libre at the end of the 19th century influenced poetic trends in other countries, so that verse patterned on irregular metrical designs has become a tradition in the modern poetry of all Western nations. Versailles, capital city of Yvelines département, Paris region, northern France, 14 mi (22 km) southwest of Paris. The city developed around the 17th-century palace built by Louis XIV, the principal residence of the kings of France and the seat of the government for more than 100 years. The first scenes of the French Revolution were also enacted at the palace, whose gardens, the masterpiece of André Le Nôtre, have become part of the na-

tional heritage of France and one of the most visited historic sites in Europe. Although it was a place of entertainment, the grandiose palace was also well equipped as a centre of government. Of about 20,000 persons attached to the court, some 1,000 courtiers with 4,000 attendants lived in the palace itself. About 14,000 soldiers and servants were quartered in annexes and in the town, which was founded in 1671 and had 30,000 inhabitants when Louis XIV died in 1715.

Louis XV throughout his reign continued the building program begun by his predecessor, and the palace became a symbol of royal extravagance. In 1837 Louis-Philippe restored the palace and turned it into a museum consecrated to "all the glories of France." The German army besieging Paris in 1870 used Versailles as its headquarters, and in 1871 the German emperor was crowned there. For eight years after the peace with Germany, the palace was the seat of the French Parliament, and the constitution of the Third Republic was proclaimed there in 1875. The presidents of the Third and Fourth republics were elected in Versailles. The Treaty of Versailles (1919) between the Allies and Germany was signed in the palace, which was again restored and modernized under President Charles de Gaulle.

The city of Versailles is now a local administrative centre and residential suburb of Paris. The palace serves as a tourist attraction and as a residence for visiting heads of state. The oldest quarter of the city, Satory, contains the cathedral of Saint-Louis, while the new quarter, Le Chesnay, in the north, is the site of the church of Notre-Dame. Versailles is an important garrison town, with a military hospital and a school of military engineering and artillery. Economic activities include distilling, leatherwork, and market gardening. A school of horticulture (1874) is attached to a fine garden. Versailles is also a centre of commerce and education. Pop. (1982) 91,014.

Versailles, Treaty of, peace document signed at the end of World War I by the Allied and Associated Powers and by Germany in the Hall of Mirrors in the Palace of Versailles, France, on June 28, 1919; it took force on Jan. 10, 1920.

When the German government asked U.S. President Woodrow Wilson to arrange a general armistice in October 1918, it declared that it accepted the Fourteen Points (*q.v.*) he had formulated as the basis for a just peace. However, the Allies demanded "compensation by Germany for all damage done to the civilian population of the Allies and their property by the aggression of Germany by land, by sea and from the air." Further, the nine points covering new territorial consignments were complicated by the secret treaties that England, France, and Italy had made with Greece, Romania, and each other during the last years of the war.

The treaty was drafted during the Paris Peace Conference in the spring of 1919, which was dominated by the national leaders known as the "Big Four," David Lloyd George of Britain, Georges Clemenceau of France, Woodrow Wilson of the United States, and Vittorio Orlando of Italy. The first three in particular made the important decisions. None of the defeated nations had any say in shaping the treaty, and even the associated Allied powers played only a minor role. The German delegation was presented with a fait accompli; it was shocked at the severity of the terms and protested the contradictions between the assurances made when the armistice was negotiated and the actual treaty. Accepting the war guilt" clause and the reparation terms were especially odious to them.

The population and territory of Germany was reduced by about 10 percent by the treaty. On the west Alsace and Lorraine were returned

to France, and the Saarland was placed under the supervision of the League of Nations until 1935. In the north three small areas were given to Belgium; and, after a plebiscite in Schleswig, northern Schleswig was returned to Denmark. In the east, Poland was resurrected, given most of formerly German West Prussia and Poznán (Posen), given a "corridor" to the Baltic Sea (which separated East Prussia from the rest of Germany), and given part of Upper Silesia after a plebiscite. Danzig (Gdansk) was declared a free city. All Germany's overseas colonies in China, in the Pacific, and in Africa were taken over by Britain, France, Japan, and other Allied nations (see mandate).

The "war guilt clause" of the treaty deemed Germany the aggressor in the war and consequently made Germany responsible for making reparations to the Allied nations in payment for the losses and damage they had sustained in the war. It was impossible to compute the exact sum to be paid as reparations for the damage caused by the Germans, especially in France and Belgium, at the time the treaty was being drafted, but a commission that assessed the losses incurred by the civilian population set an amount of \$33,000,000,000 in 1921. Although economists at the time declared that such a huge sum could never be collected without upsetting international finances, the Allies insisted that Germany be made to pay, and the treaty permitted them to take punitive actions if Germany fell behind in its payments.

The Big Four, especially Clemenceau, wanted to make sure that Germany would never again pose a military threat to the rest of Europe, and the treaty contained a number of stipulations to guarantee this aim. The German army was restricted to 100,000 men, the general staff was eliminated, the manufacture of armoured cars, tanks, submarines, airplanes, and poison gas was forbidden, and only a small number of specified factories could make weapons or munitions. All of Germany west of the Rhine and up to 30 miles (50 km) east of it was to be a demilitarized zone. The forced disarmament of Germany, it was hoped, would be accompanied by voluntary disarmament in other nations.

The treaty included the Covenant of the League of Nations, in which members guaranteed each other's independence and territorial integrity. Economic sanctions would be applied against any member who resorted to war. The league was to supervise mandated territories, the occupied Saar Basin, and Danzig and to formulate plans for reducing armaments. The treaty also established the Permanent Court of International Justice and the International Labour Organisation.

The Treaty of Versailles was bitterly criticized by the Germans, who complained that it had been "dictated" to them, that it violated the spirit of the Fourteen Points, and that it demanded intolerable sacrifices that would wreck their economy. In the years after it was ratified the Treaty of Versailles was revised and altered, mostly in Germany's favour. Numerous concessions were made to Germany before the rise of Adolf Hitler, and by 1938 only the territorial settlement articles remained.

Many historians claim that the combination of a harsh treaty and subsequent lax enforcement of its provisions paved the way for the upsurge of German militarism in the 1930s. The huge German reparations and the war guilt clause fostered deep resentment of the settlement in Germany, and when Hitler remilitarized the Rhineland in 1936 (a violation of the treaty), the Allies did nothing to stop him, thus encouraging future German aggression.

verse, a single line of metrical composition; more broadly, the metrical composition itself or the poetic technique of a particular poem.

Although verse is sometimes used as a synonym for poetry, it is usually understood to be metrical composition that ranks in artistic quality below the level of poetry. Verse may be technically skillful, or even dazzling, but lacking in depth or imaginative power. Verse also refers to the shortest division of chapters of the Bible.

verset, stanza form modeled after poetic biblical passages such as those found in the Song of Solomon and the Psalms. It is characterized by long lines and powerful, surging rhythms and usually expresses fervent religious or patriotic sentiments. The verset is a flexible form approximating free verse and the prose poem and is open to a wide range of emotional expression. Poetic devices such as repetition, assonance, alliteration, and figures of speech contribute to the overall vigour of the lines. The verset appears mainly in the literature of Christian countries where it was first used in medieval religious and mystical texts.

vertebral column, also called SPINAL COL-UMN, SPINE, or BACKBONE, in vertebrate animals, the flexible column extending from neck to tail, made of a series of bones, the vertebrae. The major function of the vertebral column is protection of the spinal cord; it also provides stiffening for the body and attachment for the pectoral and pelvic girdles and many muscles. In humans an additional function is to transmit body weight in walking and standing.

For a depiction of the vertebral column in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

Each vertebra, in higher vertebrates, consists of a ventral body, or centrum, surmounted by a Y-shaped neural arch. The arch extends a spinous process (projection) downward and backward that may be felt as a series of bumps down the back, and two transverse processes, one to either side, which provide attachment for muscles and ligaments. Together the centrum and neural arch surround an opening, the vertebral foramen, through which the spinal cord passes. The centrums are separated by cartilaginous intervertebral disks, which help cushion shock in locomotion.

Vertebrae in lower vertebrates are more complex, and the relationships of their parts to those of higher animals are often unclear. In primitive chordates (e.g., amphioxus, lampreys) a rodlike structure, the notochord, stiffens the body and helps protect the overlying spinal cord. The notochord appears in the embryos of all vertebrates in the space later occupied by the vertebral bodies-in some fish it remains throughout life, surrounded by spool-shaped centrums; in other vertebrates it is lost in the developed animal. In primitive chordates the spinal cord is protected dorsally by segmented cartilages—these foreshadow the development of the neural arch of true vertebrae.

Fish have trunk and caudal (tail) vertebrae; in land vertebrates with legs, the vertebral column becomes further subdivided into regions in which the vertebrae have different shapes and functions. Crocodilians and lizards, birds, and mammals demonstrate five regions: (1) cervical, in the neck, (2) thoracic, in the chest, which articulates with the ribs, (3) lumbar, in the lower back, more robust than the other vertebrae, (4) sacral, often fused to form a sacrum, which articulates with the pelvic girdle, (5) caudal, in the tail. The atlas and axis vertebrae, the top two cervicals, form a freely movable joint with the skull.

The numbers of vertebrae in each region and in total vary with the species. Snakes have the greatest number, all very similar in type. In turtles some vertebrae may be fused to the shell (carapace); in birds all but the cervical vertebrae are usually fused into a rigid structure, which lends support in flight. Most mammals have seven cervical vertebrae; size rather than number account for the variations in neck length in different species. Whales show several specializations—the cervical vertebrae may be either much reduced or much increased in number, and the sacrum is missing. Humans have 7 cervical, 12 thoracic, 5 lumbar, 5 fused sacral, and 3 to 5 fused caudal vertebrae (together called the coccyx).

The vertebral column is characterized by a variable number of curves. In quadrupeds the column is curved in a single arc (the highest portion occurring at the middle of the back), which functions somewhat like a bow spring in locomotion. In humans this primary curve is modified by three more: (1) a sacral curve, in which the sacrum curves backward and helps support the abdominal organs, (2) an anterior cervical curve, which develops soon after birth as the head is raised, and (3) a lumbar curve, also anterior, which develops as the child sits and walks. The lumbar curve is a permanent characteristic only of humans and their bipedal forebears, though a temporary lumbar curve appears in other primates in the sitting position. The cervical curve disappears in humans when the head is bent forward but appears in other animals as the head is raised.

vertebrate, any animal of the subphylum Vertebrata, having a vertebral column, or backbone. The vertebrates, which include the fishes, amphibians, reptiles, birds, and mammals, are the predominant members of the Chordate phylum. In addition to the backbone from which they derive their name, the vertebrates are characterized by (1) a muscular system consisting primarily of bilaterally paired masses and (2) a central nervous system partly enclosed within the backbone.

A brief treatment of vertebrates follows. For full treatment, see MACROPAEDIA: Chordates. Vertebrates are unique in possessing an internal skeleton formed of either cartilage or bone, or both. By its ability to provide support during growth, this skeleton allows vertebrates to achieve large size, so that most vertebrates are bigger than most invertebrates. Except in the most primitive forms, the skeleton consists of skull, vertebral column, and two pairs of limb elements, although one or both pairs of limbs are absent from a few higher forms (e.e., snakes, whales) that have lost limbs in the course of evolution. The skull, by providing a secure housing for brain, eyes, ears, and olfactory organs, has facilitated the evolution of intelligence and a high degree of responsiveness to the environment.

The vertebral column and limb skeleton provide support for the body as a whole: movement is effected by the action of muscles that are attached to the bones or cartilage. The mass of musculature forms the contours of the body. The outer surface is covered by skin that protects the inner parts not only by providing a general covering but also by forming structures of specific protective value, such as bony or horny scales, feathers, and fur.

Internally the vertebrate trunk is a hollow cavity in which the visceral organs are suspended. The heart and respiratory organs are closely associated. The heart lies just behind the gills or between the lungs; it sends unoxygenated blood directly into these organs for oxygenation and removal of carbon dioxide, The digestive tract includes esophagus, stomach, and intestine and usually terminates in a cloaca, a chamber common to the digestive genital, and urinary systems. In mammals, however, the digestive tract acquires a separate terminal opening.

The central nervous system consists of brain and spinal cord. Although both of these become very thick-walled, they always retain a small central canal; i.e., they are hollow. The brain in lower vertebrates is devoted largely to serving the sense organs of the head. During the course of evolution, however, the brain becomes much larger, relative to body size, through the development of association areas that permit more intensive interchange of information among the parts of the brain. The spinal cord, extending backward from the base of the skull, gives off pairs of nerves at repeated intervals. These nerves run to the skin, muscles, and internal organs. The brain also gives off a series of nerves, not regularly arranged, of which one passes through the neck to innervate the heart, lungs, and other vis-

vertigo, sensation that a person's surroundings are rotating or that he himself is revolving. Usually the state produces dizziness, mental bewilderment, and confusion. If the sensation is intense enough, the person may become nauseated and yomit.

Aircraft pilots and underwater divers are subject to vertigo because the environments in which they work frequently have no reference points by which to orient their direction of movement. The illusions caused by disorientation are perhaps the most dangerous aspect of vertigo; a pilot, for example, may sense that he is gaining altitude when in reality he is losing it, or he may feel that he is steering to the right when he is on a straight course. See also spatial disorientation.

vertisol, soil type differentiated from the nine other major orders on the basis of its high content of swelling clays, which during the dry season cause deep cracks to form. Vertisols are subdivided according to how long the cracks persist. After the cracks form, at the onset of the dry season, loose soil sloughing off from the surface begins accumulating in them until the next wet season, when expansion of the clays causes the cracks to close again. Repeated over long periods of time, this process leads to a gradual inversion of the soil layers. The high content of expanding clays makes vertisols very sticky when wet and very hard when dry. Although tillage of vertisols is difficult in large parts of India and The Sudan where primitive implements are still in use, the soils are very productive where agricultural machinery, fertilizer, and irrigation are

Vertov, Dziga, pseudonym of DENIS ARKADYEVICH KAUFMAN (b. Jan. 2, 1896 [Dec. 21, 1895, Old Style], Belostok, Russia—d. Feb. 12, 1954, Moscow), Soviet motion-picture director whose kino-glaz ("film-eye") theory—that the camera is an instrument, much like the human eye, that is best used to explore the actual happenings of real life—had an international impact on the development of documentaries and cinema realism during the 1920s. He attempted to create a unique language of the cinema, free from theatrical influence and artificial studio staging.

As a newsreel cameraman during the Russian Civil War, Vertov filmed events that were the basis for such factual films as Godovshchina revolyutsii (1919; The Anniversary of the October Revolution) and Boi pod Tsaritsynom (1920; Battle of Tsaritsyn). At age 22 he was the director of a government cinema department. The following year he formed the Kinoki (the Film-Eye Group), which subsequently issued a series of manifestos against theatricalism in films and in support of Vertov's film-eye theory. In 1922 the group, led by Vertov, initiated a weekly newsreel called Kino-pravda ("Film Truth") that creatively

Vertov Novosti Press Agency

integrated newly filmed factual material and older news footage.

The subject matter of Vertov's later feature films is life itself; form and technique are preeminent. Vertov experimented with slow motion, camera angles, enlarged close-ups, and crosscutting for comparisons; he attached the camera to locomotives, motorcycles, and other moving objects; and he held shots on the screen for varying lengths of time, a technique that contributes to the rhythmic flow of his films. Outstanding among Vertov's pictures are Shagay, Sovyet! (1925; Stride, Soviet!), Shestaya chast mira (1926; A Sixth of the World), Odinnadtsatyi (1928; The Eleventh), Chelovek s kinoapparatom (1928; The Man with a Movie Camera), Simfoniya Donbassa (1930; Symphony of the Donbass), and Tri pesni o Lenine (1934; Three Songs of Lenin). rertov later became a director in the Soviet Union's Central Documentary Film Studio. His work and his theories became basic to the rediscovery of cinéma vérité, or documentary realism, in the 1960s.

Verulamium, a Romano-British town in the territory of the Catuvellauni, across the River Ver from St. Albans, Hertfordshire, Eng. Before the Roman conquest, Verulamium was the capital of Tasciovanus, prince of the Catuvellauni; under Roman rule it soon was made a municipium. Destroyed by Boudicca (Boadicca; queen of the Iceni) in AD 60-61, it soon regained its prosperity. Among its ruins are the forum, a theatre associated with a temple of Romano-Celtic type, a market hall, two triumphal arches, fragments of the town wall, and many well-appointed houses with fine mosaics and wall paintings.

Verus, Lucius, in full Lucius Aurelius Verus, also called (AD 136–161) Lucius Ceionius Aelius Aurelius Commodus Antoninus, original name Lucius Ceionius Commodus (b. Dec. 15, 130—d. 169), Roman emperor jointly (161–169) with Marcus Aurelius. Though he enjoyed equal constitutional status and powers, he did not have equal authority, nor did he seem capable of bearing his share of the responsibilities.

He was the son of a senator, Lucius Ceionius Commodus, whom the emperor Hadrian adopted as his successor. After his father's death, Lucius Verus and Marcus Annius Verus, at the insistence of Hadrian, were adopted by the future emperor Antoninus Pius. Lucius Verus' "brother" succeeded as Emperor Marcus Aurelius on the death of Antoninus and made Lucius Verus his colleague in the principate. For the first time Rome had two emperors of technically complete equality. When sent to deal with Parthian advances in Armenia and Mesopotamia (162–166), Verus dallied in Antioch and subordinate generals concluded the war.

In 167 or 168 Verus campaigned with Marcus Aurelius in the vicinity of Pannonia against a German people, the Marcomanni, but he died on the march home.

vervet, ground-dwelling guenon (q.v.) that is widely distributed in the savannas of Africa.

Verwey, Albert (b. May 15, 1865, Amsterdam, Neth.—d. March 8, 1937, Noordwijk aan Zee), Dutch poet, scholar, and literary historian who played an important role in the literary life of The Netherlands in the late 19th and early 20th centuries.

Verwey began to write poetry early in life, and his first book of poems, Persephone, was published in 1883. He was a cofounder in 1885 of the periodical De nieuwe gids ("The New Guide"), which was one of the chief organs of the Dutch literary revival of the 1880s. Verwey contributed sonnets and other poems to this periodical. His own poetry manifested a unique form of mysticism that was influenced by the pantheism of Benedict Spinoza. Verwey's early poetry, such as that in Cor Cordium (1886), was notable for its air of spontaneity and its melodious and evocative qualities. His later poetry is still marked by these qualities but is at the same time highly intellectual, representing Verwey's attempts to

express the mystical ideas that he saw as underlying the world's appearances. The concept of constant renewal of the self, long essential to Verwey, is exquisitely expressed in the freeverse poem *Een dag in April* (1926; "A Day in April"), in which Verwey's mastery of rhythm and "image thinking" is supremely evident.

Verwey was editor of his own periodical, De Beweging (1905–19), in which many influential young Dutch writers made their debut. With De Beweging. Verwey reached a position of eminence in Dutch cultural life. He was professor of Dutch literature at the University of Leiden from 1925 to 1935. As a scholar and literary historian, he wrote in particular on the 17th-century Dutch poets Joost van den Vondel and Henric Laurenszoon Spieghel.

Verwoerd, Hendrik Frensch (b. Sept. 8, 1901, Amsterdam, Neth.—d. Sept. 6, 1966, Cape Town, S.Af.), South African professor, editor, and statesman who as prime minister (1958–66) rigorously applied a policy of apartheid.

When Verwoerd was three months old his family migrated to South Africa. A brilliant scholar at the University of Stellenbosch, he was appointed professor of applied psychology there in 1927. In 1933 he changed to the chair of sociology and social work.

Verwoerd became prominent in politics in 1937, when he was appointed editor of the new Nationalist daily, *Die Transvaler*, in Johannesburg. He held that post until the Nationalists won the 1948 election, when he was appointed a senator. Becoming minister of native affairs in 1950, he was responsible for much of the apartheid legislation. In the election of 1958 he won a seat in the House of Assembly, and, after the death of Prime Minister Johannes Gerhardus Strijdom, the parliamentary caucus of the Nationalists selected Verwoerd as his successor in September 1958.

Once he was in office, Verwoerd's program for apartheid was applied in full, with an intricate system of laws separating whites, Cape

Coloureds, Asians, and Africans (blacks). He pushed through the Promotion of Bantu Self-Government Act in 1959; it provided for the resettlement of blacks in eight separate reservations, or Bantu Homelands (now designated black states). These racial policies provoked demonstrations by blacks, which on one occasion—March 1960 at Sharpeville—led to bloodshed. On Oct. 5, 1960, white voters by a small majority approved his recommendation that South Africa leave the Commonwealth, and Verwoerd's dream of a republic came true on May 31, 1961.

On April 9, 1960, a deranged white farmer shot Verwoerd in an assassination attempt that failed. Six years later Verwoerd was stabbed to death in the parliamentary chamber by a temporary parliamentary messenger, Demetrio Tsafendas, a Mozambique immigrant of mixed racial descent.

Very Large Array (VLA), radio telescope system situated on the plains of San Augustin near Socorro, New Mexico, U.S. The VLA went into operation in 1980 and is the most powerful radio telescope in the world. It is operated by the National Radio Astronomy Observatory.

The VLA consists of 27 parabolic dishes that are each 25 m (82 feet) in diameter. Each of these dishes is mounted on a transporter that can be moved along rails laid out in an enormous Y pattern. (The arms of this pattern extend about 21 km [13 miles] each.) The resolution of the VLA is altered by changing the positions of the dishes. The radio signals recorded by the component dishes are integrated by computer so that the entire array acts as a single radio antenna with a maximum effective aperture of 27 km (17 miles). This large aperture gives the VLA a resolving power equal to that of the best ground-based optical telescopes.

Vesaas, Tarjei (b. Aug. 20, 1897, Vinje, Nor.—d. March 15, 1970, Vinje), Norwegian novelist and short-story writer whose symbolic and allegorical narratives won him much recognition in Norway and other European countries.

A writer since 1923, Vesaas first experienced significant success with his two novels about life on a Norwegian farm, Det store spelet (1934; The Great Cycle) and Kvinner ropar heim (1935; "Women Call Home"). His growing political and social awareness mark his Kimen (1940; The Seed), which shows how hatred is stirred up by mass psychology, and Huset i mørkret (1945; "House in Darkness"), a symbolic vision of the Nazi occupation of Norway. Fuglane (1957; The Birds), considered his greatest work (and later filmed), pleads for tolerance toward the outsider. He also wrote a renowned collection of short stories entitled Vindane (1952; "The Winds").

Vesalius, Andreas (Latin), Flemish Andries VAN WESEL (b. December 1514, Brussels [now in Belgium]—d. June 1564, island of Zacynthus, Republic of Venice [now in Greece], Renaissance Flemish physician who revolutionized the study of biology and the practice of medicine by his careful description of the anatomy of the human body. Basing his observations on dissections he made himself, he wrote and illustrated the first comprehensive textbook of anatomy.

Vesalius was from a family of physicians and pharmacists. He attended the University of Louvain in 1529–33, and in 1533–36 he attended the medical school of the University of Paris, where he learned to dissect animals. He also had the opportunity to dissect human cadavers, and he devoted much of his time to a study of human bones, at that time easily available in the Paris cemeteries.

In 1536 Vesalius returned to his native Brabant to spend another year at the University of Louvain, where the influence of Arab medicine was still dominant. Following the prevailing custom, he prepared, in 1537, a paraphrase of the work of the 10th-century Arab physician, Rhazes, probably in fulfillment of the requirements for the bachelor of medicine degree.

He then attended the University of Padua, a progressive university with a strong tradition of anatomical dissection. On receiving the M.D. degree the same year, he was appointed a lecturer in surgery with the responsibility of giving anatomical demonstrations. Since he knew that a thorough knowledge of human anatomy was essential to surgery, he devoted much of his time to dissections of cadavers and insisted on doing them himself, instead of relying on untrained assistants. At first, Vesalius had no reason to question the theories of Galen, the Greek physician who had served the emperor Marcus Aurelius in Rome and whose books on anatomy were still considered as authoritative in medical education in Vesalius' time. In January 1540, breaking with this tradition of relying on Galen, Vesalius openly demonstrated his own method—doing dissections himself, learning anatomy from cadavers, and critically evaluating ancient texts. He did so while visiting the University of Bologna. Such methods soon convinced him that Galenic anatomy had not been based on the dissection of the human body, which had been strictly forbidden by the Roman religion. Galenic anatomy, he maintained, was an ap-

plication to the human form of conclusions drawn from the dissections of animals, mostly dogs, monkeys, or pigs. It was this conclusion that he had the audacity to declare in his teaching as he hurriedly prepared his complete textbook of human anatomy for publication. Early in 1542 he traveled to Venice to supervise the preparation of drawings to illustrate his text, probably in the studio of the great Renaissance artist Titian. The drawings of his dissections were engraved on wood blocks, which he took, together with his manuscript, to Basel, Switz., where his major work De humani corporis fabrica libri septem ("The Seven Books on the Structure of the Human Body") commonly known as the Fabrica, was printed in 1543.

In this epochal work, Vesalius deployed all his scientific, humanistic, and aesthetic gifts. The Fabrica was a more extensive and accurate description of the human body than any put forward by his predecessors; it gave anatomy a new language, and, in the elegance of its printing and organization, a perfection

hitherto unknown.

Early in 1543, Vesalius left for Mainz, to present his book to the Holy Roman emperor Charles V, who engaged him as regular physician to the household. Thus, when not yet 28 years old, Vesalius had attained his goal. After relinquishing his post in Padua, and returning in the spring of 1544 to his native land to marry Anne van Hamme, he took up new duties in the service of the Emperor on his travels in Europe. From 1553 to 1556 Vesalius spent most of his time in Brussels, where he built an imposing house in keeping with his growing affluence and attended to his flourishing medical practice. His prestige was further enhanced when Charles V, on abdication from the Spanish throne in 1556, provided him with a lifetime pension and made him a count.

Vesalius went to Spain in 1559 with his wife and daughter to take up an appointment, made by Philip II, son of Charles V, as one of the physicians in the Madrid court. In 1564 Vesalius obtained permission to leave Spain to go on pilgrimage to the Holy Sepulchre. He traveled to Jerusalem, with stops at Venice and Cyprus, his wife and daughter having re-

turned to Brussels.

Assessment. Vesalius' work represented the culmination of the humanistic revival of ancient learning, the introduction of human dissections into medical curricula, and the growth of a European anatomical literature. Vesalius performed his dissections with a thoroughness hitherto unknown. After Vesalius, anatomy became a scientific discipline, with far-reaching implications not only for physiology but for all of biology; medicine became a learned profession. Conflicting reports obscure the final days of Vesalius' life. Apparently he became ill aboard ship while returning to Europe from his pilgrimage. He was put ashore on the Greek island of Zacynthus, where he (M.Fl./Ed.) died.

BIBLIOGRAPHY. Andreas Vesalius of Brussels, 1514-1564 (1964), is a complete biography of Vesalius, written by C.D. O'Malley, who had an unequalled knowledge of the life of Vesalius and of his cultural environment. Harvey W. Cushing, A Bio-Bibliography of Andreas Vesalius, 2nd ed. (1962), is still valuable.

Vesco, Robert Lee (b. Dec. 4, 1935, Detroit, Mich., U.S.), American financier, once considered the boy wonder of international finance, who later became a fugitive from U.S. and other legal authorities. He was a key figure in certain American financial and political scandals of the early 1970s.

The son of a Detroit auto worker, he left school at 16 to work as an apprentice in an auto body shop. He was later a draftsman and worked in the Detroit aluminum industry. In 1957 he went to New York City as an administrative assistant in engineering for a chemical company. In 1960 he became an independent manufacturer's representative, selling aluminum products. He gained financial interests in two small New Jersey manufacturing companies, and by the mid-1960s he had merged them to form International Controls Corporation. In October 1967 he added Fairfield (N.J.) Aviation Corporation. He set off on a course of mergers, acquisitions, and accounting legerdemain that appeared to make a record of ever-increasing profits. He came to control many smaller companies, and he took annual sales from \$1,300,000 to more than \$100,000,000 within three years.

In 1971 he acquired control of Investors Overseas Services (IOS), founded by Bernard Cornfeld (q.v.). The U.S. Securities and Exchange Commission accused Vesco and his associates of looting the ISO mutual fund empire of \$224,000,000, defrauding thousands of investors. In 1973 Vesco was indicted for making illegal contributions totaling \$250,000 to the reelection campaign of Pres. Richard M. Nixon. In 1976 he was indicted by a U.S. federal grand jury on charges relating to his

fraudulent schemes in ISO.

He fled from the United States in 1972 and for various periods lived wealthily in Costa Rica, the Bahamas, Nicaragua, and Antigua. In all these countries he allegedly employed political bribery, and none granted occasional extradition requests from the United States and from Switzerland, where ISO had been headquartered. While abroad, Vesco reportedly increased his stolen wealth through further large investments, notably in international arms sales to such countries as Libya. About 1984 Vesco went to live in Cuba, where he allegedly had more than one home and his own private plane and yacht.

Vesey, Denmark (b. c. 1767, probably St. Thomas, Danish West Indies—d. July 2, 1822, Charleston, S.C., U.S.), self-educated black who planned the most extensive slave revolt in U.S. history (Charleston, 1822).

Sold as a boy in 1791 to a Bermuda slaver captain named Joseph Vesey, young Denmark, who assumed his master's surname, accompanied him on numerous voyages and in 1783 settled with his owner in Charleston.

In 1800 Denmark was allowed to purchase his freedom with \$600 he had won in a street lottery. He was already familiar with the great Haitian slave revolt of the 1790s, and while working as a carpenter he read antislavery literature. Dissatisfied with his secondclass status as a freedman and determined to help relieve the far more oppressive conditions of bondsmen he knew, Vesey planned and organized an uprising of city and plantation blacks. The plan reportedly called for the rebels to attack guardhouses and arsenals, seize their arms, kill all whites, burn and destroy the city, and free the slaves. As many as 9,000 blacks may have been involved, though some scholars dispute this figure.

Warned by a house servant, white authorities on the eve of the scheduled outbreak made massive military preparations, which forestalled the insurrection. During the ensuing two months, some 130 blacks were arrested. In the trials that followed, 67 were convicted of trying to raise an insurrection; of these, 35, including Vesey, were hanged, and 32 were condemned to exile. In addition, four white men were fined and imprisoned for encouraging the plot.

vesicular exanthema, viral disease of swine

causing eruption of painful blisters on feet and snout. Blisters emerge 24 to 72 hours after exposure and are accompanied by fever, which lasts 24 to 36 hours and may occur

again after two or three days.

The symptoms resemble those of foot-and-

mouth disease and vesicular stomatitis, thus creating a problem of diagnosis. Control programs include quarantine, elimination of infected animals, cleaning and disinfecting contaminated areas, and cooking garbage used for swine feed.

vesicular stomatitis, viral disease causing blisters in the mouths of cattle, horses, and mules and on the snouts and feet of swine. Horses and cattle with vesicular stomatitis become feverish two to five days after exposure. After the blisters break, the fever subsides, and the animal usually recovers. Differential diagnosis between vesicular stomatitis, vesicular exanthema, and foot-and-mouth disease, all of which display similar symptoms, is based partly on the differing susceptibilities to the three diseases among horses, cattle, and swine.

vesiculitis, inflammation and infection of the seminal vesicles in the male reproductive tract. The seminal vesicles are ductlike glands that add fluid secretions to the seminal fluid as it passes from the body during intercourse. Infections present in the prostate or related organs usually involve the seminal vesicles also. Infections can reach the glands through the urethra or by way of the bloodstream.

The symptoms of vesiculitis are similar to those in cases of prostate infection; they may include a dull aching pain in the abdomen, discomfort in the urethra, pain after sexual intercourse, the presence of blood in the seminal fluid, premature or painful ejaculation, and impotence. Treatment is usually administration of antibiotics. See also prostatic disorder.

Vesoul, town, capital of Haute-Saône département, Franche-Comté region, eastern France. It lies between the isolated conical hill, La Motte (1,263 ft [384 m]), and the Durgeon River. The hill is crowned by a votive chapel and a statue of the Virgin Mary.

Vesoul is of ancient origin, but records go back only to the 9th century. The town was much damaged in the late 16th-century Wars of Religion and the Thirty Years' War of the 17th century. Vesoul, which changed hands a number of times, was incorporated into France in 1678 under Louis XIV by the Treaty of Nijmegen. The centre of an agricultural region, the town is an important market for farm produce and cattle. The chief industry is metallurgy. Pop. (1982) 18,257.

Vespasian. Latin in full CAESAR VESPASIANUS AUGUSTUS, original name TITUS FLAVIUS VES-PASIANUS (b. Nov. 17?, AD 9, Reate [Rieti], Latium—d. June 24, 79), Roman emperor (AD 69-79) who, though of humble birth, became the founder of the Flavian dynasty after the civil wars that followed Nero's death in 68. His fiscal reforms and consolidation of the empire generated political stability and a vast Roman building program.

Early life. Vespasian was the son of Flavius Sabinus, a Roman knight who had been a tax

Vespasian ingratiated himself with the ruling emperor, Caligula (Gaius Caesar); and in the next reign, that of Claudius, he won the favour of the powerful freedman Narcissus. He became commander of the Legio II Augusta, which took part in the invasion of Britain in 43. After distinguished conduct at the crossing of the Medway River, he was given charge of the left wing of the advance; he proceeded to occupy the Isle of Wight and to conquer tribes as far west as Devon, capturing more than 20 "towns." For these achievements he was awarded triumphal honours and appointed to two priesthoods, and in 51 he became consul. But, on Claudius' death in 54, Narcissus, whose power had been waning, was driven to suicide; and for a time Vespasian received no further appointment. About 63 he obtained the proconsulate of Africa, where his extreme financial rigour made him so unpopular that on one occasion the people pelted him with turnips. There was no ground for suspecting personal enrichment, but the reputation for avarice remained with him the rest of his life.

In the autumn of 66 he accompanied Nero to Greece, where he was indiscreet enough to fall asleep at the Emperor's artistic performance. But this did not prevent his appointment, in February 67, to the command against the Jewish rebellion in Judaea, the scene of two disastrous Roman defeats in the previous year. The appointment was exceptional because Judaea had never before been garrisoned by a legionary army, and Vespasian was given three legions with a large force of auxiliary troops. For such an appointment Vespasian was regarded as a safe man-a highly competent general but one whose humble origins made it almost inconceivable that he would challenge Nero's government should he win victories. As long as Nero was alive, this diagnosis was surely right. Vespasian conducted two successful campaigns in 67 and 68, winning almost all Judaea except Jerusalem. But on Nero's death in June 68 he stopped fighting.

Struggle for power. This pause was surprising, and it was accompanied by the fact that at this moment, with his son Titus as intermediary, Vespasian settled certain differences he had had with the neighbouring governor of Syria, Gaius Licinius Mucianus. The matters discussed between the two commanders are unknown, but the circumstances cannot but raise the question whether they were already considering a bid for power. Vespasian seems to have claimed that further operations against the Jews required a directive from the new emperor, Galba. Such a claim may have been formally valid, but there may have also been underlying political considerations. Vespasian did eventually decide to accept Galba, whose noble descent, given the standards of the day, would have been daunting to a man of Vespasian's position in society. He therefore remained quiet and in the following winter sent Titus to congratulate Galba.

The news of Galba's murder (Jan. 15, 69) reached Titus on his way at Corinth, and he returned to participate in more pregnant discussions between Vespasian and Mucianus. A civil war in Italy was now inevitable; but the main contenders, Otho and Vitellius, were both men whom Vespasian could reasonably

hope to challenge. The chronology of Vespasian's actions cannot be precisely determined; what is certain is that at the latest after Otho's defeat and suicide on April 16, he began to collect support. On July 1, probably as a result of a contrived plot, the two Egyptian legions proclaimed him emperor, followed a few days later by the legions of Syria and Judaea. The ubiquitous response in other parts of the empire can hardly have been unplanned, despite Vespasian's claim that his pronunciamento was a response to the misgovernment of Vitellius (who only reached Rome in mid-July).

To ensure his base he had fought a brief campaign against the Jews in midsummer; but he now sent Mucianus with an expeditionary force to Dyrrhachium (Durazzo), where a fleet was instructed to meet him. Vespasian himself went to Alexandria and held up Rome's corn supply. During August the Danubian armies made open their support for him; one of their legionary commanders, Antonius Primus, entered Italy with five legions, destroyed the main Vitellian force near Cremona, and sacked that city. Antonius then proceeded victoriously southward, entering Rome on December 20, when Vitellius was murdered by his own troops. But Antonius arrived too late to prevent the execution of Vespasian's brother Sabinus, who had been persuaded to occupy the capitol, where his small force had been stormed by the Vitellians. It was also alleged that but for Antonius' invasion and its destructive progress Vespasian's victory could have been bloodless, a very doubtful claim. Vespasian gave no thanks to Antonius, whose final misfortune was that Mucianus was able to cross quickly to Rome and take over the reins of power.

On December 21 Vespa-Reign as emperor. sian's position was officially confirmed by the Senate, but he remained quite frank about the military origin of his rule. He dated his powers to July 1, when the troops had acclaimed him, thus flouting constitutional precedent and contradicting even the behaviour of his rival Vitellius, who had awaited confirmation by the Senate. Later Vespasian received by law a number of powers for which his Julio-Claudian predecessors had not sought explicit sanction. Whether similar grants had been made to Galba, Otho, and Vitellius or were to be made to Vespasian's successors is not known; but a fragment of the enabling law survives, and it includes a provision that can be said to confer on him a naked autocracy. More important to him than any legal enactment, however, was the recognition of his extralegal authority (auctoritas) and the prestige of his upstart house. He carefully publicized the divine omens that portended his accession and also built up the titles surrounding his name. He held the consulate, for brief periods on each occasion, every year of his reign except two; and he gave frequent consulates to his two sons, Titus and Domitian. He accumulated "salutations" as imperator from his armies and allowed Titus to share them with him. Throughout his reign he was insistent that his sons would succeed him, one after the other (Titus having no male issue); and it was probably over hereditary succession that he quarrelled with certain doctrinaire senators such as Helvidius Priscus, who was executed about 76. But Helvidius and his friends had already expressed general misgivings about Vespasian's government in the early months of 70.

In about October 70 Vespasian returned to Rome from Alexandria. While in Egypt he had been concerned with raising money; and his exactions, coupled with sales of imperial estates to speculators, caused great discontent among the Egyptians. He now announced that about three times the revenue of the empire was needed to put the state to rights, and both before and after his return he promoted his financial program. He increased,

and sometimes doubled, provincial taxation and revoked immunities granted to various Greek-speaking provinces and cities. He reclaimed public land in Italy from squatters and instituted various new taxes, including the diversion to Rome's treasury of the tax paid by Jews of the Diaspora to the Temple at Jerusalem. Such measures were essential after the deficit incurred by Nero and the devastations of the civil wars, but contemporaries inevitably continued to charge Vespasian with "avarice." Such a charge, however, was irrelevant to any emperor of the year 70.

The sum raised by Vespasian for public funds cannot be determined. But he was able to build his Forum and the Temple of Peace, to begin the Colosseum over the foundations of Nero's "Golden House," and above all to restore the capitol. His biographer Suetonius claims that throughout Vespasian's reign his firm policy was "first to restore stability to the tottering state, and then to adorn it." But, despite his buildings and his generosity to needy friends, he probably bequeathed a substantial surplus of public money to his successors.

It was in the same spirit of stabilization that he turned to military affairs. The first task was to restore discipline to the armies after the events of 68-69. Before Vespasian's return Mucianus reduced the Praetorian Guard, greatly enlarged by Vitellius, to approximately its former size; and the legions on the frontiers were soon regrouped to remove from dangerous positions those that had fought for Vitellius, Important changes were made in the East, where Vespasian replaced the single army (which until Nero's time had only four legions) in Syria with three armies, with a total of six legions, in Cappadocia, Syria, and Judaea. Titus effectively ended the Jewish war with the capture of Jerusalem in August 70, and about the same time an alarming revolt in the Rhineland was broken by Vespasian's cousin Petilius Cerealis. The way was now open for the improvement of certain frontiers. In southern Germany annexation of a territory called Agri Decumates cut off the reentrant angle formed by the Rhine at Basel. In Britain more important advances were made; the kingdom of Brigantia in northern England was incorporated in the province, the pacification of Wales was completed, and in 78 the general Gnaeus Agricola began the seven years' governorship that was to lead Roman arms into the Scottish Highlands.

Vespasian had some difficulty with his sons at the beginning of his reign. Domitian had been overbearing and irresponsible in the months before his father's return and was kept firmly in a junior position during the remaining years. With Titus there was cause for alarm when his troops, after his victory in Judaea, asked him to take them to Italy; but he returned alone. Although Titus was not allowed an independent triumph, he became virtually a partner in Vespasian's rule, not only accumulating consulates and imperatorial salutations with his father but also being given command of the Praetorian Guard.

In 73 Vespasian and Titus became censors. In this office, although little is known about the details, they probably carried out extensive reorganization of the provincial communities, including some of the taxation reforms mentioned earlier. They bestowed Latin rights on all Spain, which meant that all city magistrates obtained Roman citizenship, with consequent profit to the imperial treasury; and no doubt Roman citizenship was granted liberally elsewhere. In addition they recruited many new members, provincial as well as Italian, to the Roman Senate.

With the Senate, despite the discords of the early months, Vespasian succeeded in maintaining friendly relations. To the historian

Tacitus, who was embarking on his senatorial career in Vespasian's last years, he was "the only emperor who had changed for the better." With opponents he considered dangerous or irreconcilable, he could be ruthless: with Helvidius Priscus may be associated a group of "philosophers" who were expelled from Italy; and in 78 he executed Eprius Marcellus, one of his earliest and most efficient supporters, accused of a conspiracy that may have been directed at Titus' association with the Jewish princess Berenice. But he showed good-natured tolerance of offensiveness that could do no harm.

Personal characteristics. Matching the rugged and uncompromising features that are familiar from his portrait busts, Vespasian cultivated a bluff and even coarse manner, characteristic of the humble origins he liked to recall. This was popular, as also were his great capacity for hard work and the simplicity of his daily life, which was taken as a model by the contemporary aristocracy. At the same time he was astute and ambitious; he built up a powerful party quickly at the outset, and many of his initial appointments were dictated by nepotism or the desire to reward past services. The policies of his reign, though sensible, reveal no great imaginativeness, compared with those of such later emperors as Traian or Hadrian. Yet it was justly believed by contemporaries that Vespasian had prevented the dissolution of the empire by putting an end to civil war, and it was fitting that pax ("civil peace") should be a principle motif on his coinage. In his last illness he said, "Vae, puto deus fio" ("Oh dear, I think I'm becoming a god"); and after his death he was immediately accorded deification.

He had married one Flavia Domitilla, who bore his sons Titus and Domitian and a daughter, Flavia Domitilla (later deified). Both his wife and daughter died before he became emperor. He then returned to an earlier mistress, called Caenis, who had been a freedwoman of Antonia, sister-in-law to the emperor Tiberius; she too died before he did. BIBLIOGRAPHY. For Vespasian's rise to power and the subsequent part of the civil wars, the primary source is Tacitus, The Histories (written c. AD 105; Eng. trans. by K. Wellesley, 1964); unfortunately the surviving books take the story no farther than the autumn of 70. On eastern affairs, The Jewish War of Josephus (Eng. trans. by G.A. Williamson, 1959), written a decade after the events, contains differences from Tacitus both in emphasis and in detail. Of Suetonius, Lives of the Caesars (trans. by Robert Graves), his Divus Vespasianus, written about 125, is one of the most fascinating; but it is brief and entirely deserts a chronological framework after Vespasian becomes emperor (the edition by A.W. Braithwaite, 1927, is still valuable). The only modern full-length biography of Vespasian is L.P. Homo, Vespasien, l'empereur du bon sens (69-79 ap. J.-C.) (1949). But an informative sketch is provided in the well-documented study by Michael Grant, Twelve Caesars (1975).

vespers, evening prayer of thanksgiving and praise in Roman Catholic and certain other Christian liturgy. Vespers and lauds (morning prayer) are the oldest and most important of the traditional liturgy of the hours. Many scholars believe vespers is based on Judaic forms of prayer and point to a daily evening celebration observed among Jews in the first century before Christ.

By the 3rd century, the writings of Tertullian show clear evidence of an evening prayer. During the 4th, 5th, and 6th centuries, cathedral choirs and monastic orders developed the vespers service, as it was known for centuries thereafter. Following the second Vatican Council (1962–65) the Roman Catholic service was translated into the vernacular and simplified, but it continues to revolve around the Magnificat canticle, various psalms and antiphons, and readings that vary according to liturgical season.

The Lutheran and the Episcopal churches both include an evening prayer service in their liturgies. In the Episcopal Church, evening prayer traditionally was called evensong, and can be found in the 1549 Book of Common Prayer. Both Protestant churches revised their rite for evening prayer during the 1970s and both rites are patterned closely after the traditional Roman Catholic evening prayer. In the Episcopal Church, the revised prayers offer alternative choices for greater individual choice among congregations.

An early name for vespers is *lucernarium*, literally "lamp-lighting time," referring to the candles lit for this service when it was held in the early evening.

Vespertilionidae, large family of bats, suborder Microchiroptera, including almost 300 species known collectively as common bats. Vespertilionids are found worldwide in tropical and temperate regions. Their habitats are as varied as jungles and deserts.

The vespertilionids are nocturnal bats with small eyes and well-developed tails. Most species have long wings, and some have very large ears. The fur is generally gray, brown, or blackish; but it may be red, as in red bats (*Lasiurus*), grizzled, as in frosted bats (*Vespertilio*), or marked with white, as in spotted bats (*Euderma*). The Philippine bamboo bat, possibly the smallest of bats, is a vespertilionid about 4 centimetres (1½ inches) in head and body length; it weighs about 1.5 grams (½ ounce) and has a wingspan of 15 cm. Other vespertilionids range up to 10 cm in head and body length and 50 g in weight.

Most vespertilionid bats feed on insects, often catching their prey in the membrane between their hindlegs before seizing the insect with their teeth. The fish-eating bat (*Pizonyx*) and a few species of brown, or mouse-eared, bats (*Myotis*) prey on fish.

In general, the vespertilionids live in colonies and roost in caves, hollow trees, and similar shelters. Some have been found in the twigs of birds' nests and in roof thatching; others habitually roost in branches, on tree trunks, or in the hollow core of bamboo stalks. Many vespertilionids inhabiting temperate regions hibernate or migrate in winter.

Vespucci, Amerigo (b. 1454, Florence—d. 1512, Seville), merchant and explorer-navigator, who took part in early voyages to the New World (1499–1500, 1501–02). From his name derived the name of the American continent.

Vespucci was the son of Nasta-Early life. gio, a notary. As a boy Vespucci was given a humanistic education by his uncle Giorgio Antonio. In 1479 he accompanied another relation, sent by the famous Italian family of Medici to be their spokesman to the King of France. On returning, Vespucci entered the "bank" of Lorenzo and Giovanni di Pierfrancesco de' Medici and gained the confidence of his employers. At the end of 1491 they sent him to Seville, where they had a business directed by a man named Giannotto Berardi, who appears to have been engaged chiefly in fitting out ships; and Vespucci was probably present when Columbus returned from his first expedition, which Berardi had assisted. Later, Vespucci was to collaborate, still with Berardi, in the preparation of a ship for Columbus' second expedition and of oth-

ers for his third. On the last occasion Vespucci and Columbus became personally acquainted. When Berardi died, either at the end of 1495 or at the beginning of 1496, Vespucci became manager of the Seville agency.

The period during which Vespucci made his voyages falls between 1497 and 1504. At the beginning of 1505 he was summoned to the court of Spain for a private consultation, and, as a man of experience, was engaged to work for the famous Casa de Contratación de las Indias (Commercial House for the West Indies). which had been founded two years before at Seville. In 1508 the house appointed him chief navigator, a post of great responsibility, which included the examination of the pilots' and ships' masters' licenses for voyages. He also had to prepare the official map of newly discovered lands and of the routes to them (for the royal survey), interpreting and coordinating all data that the captains were obliged to furnish. Vespucci, who had obtained Spanish citizenship, held this position until his death. His widow, Maria Cerezo, was granted a pension in recognition of her husband's great

Vespucci's voyages. Two series of documents on Vespucci's voyages are extant. The first series consists of a letter from Vespucci himself dated from Lisbon, Sept. 4, 1504, written in Italian, perhaps to the gonfalonier (chief magistrate of a medieval Italian republic) Piero Soderini, and printed in Florence in 1505; and of two Latin versions of this letter, printed under the titles of "Quattuor Americi navigationes" and "Mundus Novus," or "Epistola Alberici de Novo Mundo." The second series consists of three private letters addressed to the Medici. In the first series of documents, four voyages by Vespucci are mentioned; in the second, only two. Until the 1930s the documents of the first series were considered from the point of view of the order of the four voyages. According to a theory of Alberto Magnaghi, on the contrary, these documents are to be regarded as the result of skillful manipulations, and the sole authentic papers would be the private letters, so that the verified voyages would be reduced to two. The question is fundamental for the evaluation of Vespucci's work and has given rise to fierce controversy; attempts to reconcile the two series of documents cannot generally be considered successful.

The voyage completed by Vespucci between May 1499 and June 1500 as navigator of an expedition of four ships sent from Spain under the command of Alonso de Ojeda is certainly authentic. (This is the second expedition of the traditional series.) Since Vespucci took part as navigator, he certainly cannot have been inexperienced; but it does not seem possible that he had made a previous voyage (1497–98) in this area (i.e., around the Gulf of Mexico and

the Atlantic coast from Florida to Chesapeake Bay), though this matter remains unresolved.

In the voyage of 1499-1500, Vespucci would seem to have left Ojeda after reaching the coast of what is now Guyana. Turning south, he is believed to have discovered the mouth of the Amazon River and to have gone as far as the Cabo de La Consolación or Santo Agostinho (about 6° S latitude). On the way back, he reached Trinidad, sighted the mouth of the Orinoco River, and then made for Haiti. Vespucci thought he had sailed along the coast of the extreme easterly peninsula of Asia, where Ptolemy, the geographer, believed the market of Cattigara to be; so he looked for the tip of this peninsula, calling it Cape Cattigara. He supposed that the ships, once past this point, emerged into the seas of southern Asia. As soon as he was back in Spain, he equipped a fresh expedition with the aim of reaching the Indian Ocean, the Gulf of the Ganges (modern Bay of Bengal), and the island of Taprobane or Ceylon (now Sri Lanka). But the Spanish government did not welcome his proposals, and at the end of 1500 Vespucci went into the service of Portugal.

Under Portuguese auspices he completed a second expedition, which set off from Lisbon on May 13, 1501. After a halt at the Cape Verde Islands, the expedition travelled southwestward, reached the coast of Brazil toward Cabo de Santo Agostinho, sighted (January 1502) Baía de Guanabara (Rio de Janeiro's bay), and certainly sailed as far as the Río de la Plata, which Vespucci was the first European to discover. In all probability the ships took a quick run still farther south, along the coast of Patagonia to the Gulfo de San Julián or beyond. The return route is unknown. The ships anchored at Lisbon on July 22, 1502.

This voyage is of fundamental importance in the history of geographical discovery in that Vespucci himself, and scholars as well, became convinced that the newly discovered lands were not part of Asia but a "New World." In 1507 a humanist, Martin Waldseemüller, reprinted at Sainte-Dié in Lorraine the "Quattuor Americi navigationes" ("Four American Voyages"), preceded by a pamphlet of his own entitled "Cosmographiae introductio," and he suggested that the newly discovered world be named "ab Americo Inventore . . . quasi Americi terram sive Americam" ("from Amerigo the discoverer . . . as if it were the land of Americus or America"). The proposal is perpetuated in a large planisphere of Waldseemüller's, in which the name America appears for the first time, although applied only to South America. The suggestion caught on; the extension of the name to North America, however, came later. On the upper part of the map, with the hemisphere comprising the Old World, appears the picture of Ptolemy; on the part of the map with the New World hemisphere is the picture of Vespucci.

It is uncertain whether Vespucci took part in yet another expedition (1503–04) for the Portuguese government (it is said that he may have been with one under Gonzalo Coelho). In any case, this expedition contributed no fresh knowledge. Subsequently, Vespucci returned to the service of Spain and certainly, in the capacity of piloto mayor (master navigator), helped to prepare other expeditions, but he never again joined one in person.

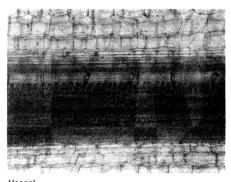

Some scholars have held Vespucci to be an ignorant usurper of the merits of others. The fact that Spain entrusted him, a foreigner, with the office of chief navigator is sufficient to dispose of these accusations. The Spaniards saw that he possessed an outstanding knowledge of nautical science, and that he was a man to whom confidential matters could be entrusted. (Ro.A.)

vessel, also called TRACHEA, in botany, the most specialized and efficient conducting structure of xylem (fluid-conducting tissues). Characteristic of most flowering plants and absent from most gymnosperms and ferns, vessels are thought to have evolved from tracheids (a primitive form of water-conducting cell) by loss of the end walls.

A vessel consists of a vertical series of vessel members that vary from elongated to squat, drum-shaped cells the walls of which are secondarily thickened with rings, spirals, or networks of cellulose, that later become lignified. The length of vessels varies from two cells to rows several metres long. During development, the end walls, already pitted, break

through and eventually disappear. The living protoplast of the cell also breaks down and disappears. See also tracheid.

Vest-Agder, southernmost *fylke* (county) of Norway, extending inland from the North Sea and its arm, the Skagerrak, to the southern fringes of the Setesdal (valley). Its area is 2,811 sq mi (7,280 sq km). A mild marine climate favours horticulture, which is well developed along the level coastal areas, especially east of Lindesnes, the southernmost point on the Norwegian mainland. The northern portion of the fylke is mountainous and sparsely settled, while the central upland moors are used for pasturing of cattle and sheep. Fishing, lumbering (in the north), mixed farming, and dairying are the main economic activities. The seaport and county seat of Kristiansand (q, v), in the extreme southeast, is an important fishing, shipping, and regional industrial centre. Pop. (1981 est.) 136,730.

Vesta, in Roman religion, goddess of the hearth, identified with the Greek Hestia. The lack of an easy source of fire in the early community placed a special premium on the ever-burning hearth fire, both publicly and privately maintained; thus, from the earliest times Vesta was assured of a prominent place in both family and state worship. Her worship was observed in every household along

with that of the Penates and the Lares, and her image was sometimes encountered in the household shrine.

The state worship was elaborate. Her sanctuary was traditionally a circular building, in imitation of the early Italian round hut and symbolic of the public hearth. The shrine of Vesta in the Roman Forum was also of great antiquity. There burned the perpetual fire of the public hearth attended by the Vestal Virgins (q, v) and renewed annually on March 1 (originally the Roman new year). The innermost sanctuary was not open to the public once a year, however, on the Vestalia (June 7–15), it was opened to matrons who visited it barefoot.

The days of the festival were unlucky. On the final day occurred the ceremonial sweeping out of the building, and the period of ill omen did not end until the sweepings were officially disposed of by placing them in a particular spot along the Clivus Capitolinus or by throwing them into the Tiber.

In addition to the shrine itself and between it and the Velia stood the magnificent Atrium Vestae. The name originally was given to the whole sacred area comprising the shrine, a sacred grove, the Regia (headquarters of the pontifex maximus, or chief priest), and the House of the Vestals, but ordinarily it designated the home or palace of the Vestals.

Vesta is represented as a fully draped woman, sometimes accompanied by her favourite animal, an ass. As goddess of the hearth fire, Vesta was the patron deity of bakers, hence her connection with the ass, usually used for turning the millstone, and her association with Fornax, the spirit of the baker's oven. She is also found allied with the primitive fire deities Cacus and Caca.

Vesta, in astronomy, the brightest asteroid, though not the largest, and the only one ever visible with the naked eye. Found on March 29, 1807, by Heinrich Wilhelm Matthäus Olbers, it was the fourth minor planet to be discovered. Its diameter is about 390 kilometres (240 miles).

Vestal Virgin, in Roman religion, any of the six priestesses, representing the daughters of the royal house, who tended the state cult of Vesta, the goddess of the hearth. Chosen between the ages of six and ten by the pontifex maximus ("chief priest"), they served for 30 years, during which time they had to remain virgins. Afterward they could marry, but few did, as it was considered unlucky. The Vestal Virgins tended the perpetual fire in the Temple of Vesta, prepared ritual food, cared for objects in the temple's inner sanctuary, and officiated at the public worship of Vesta (the Vestalia, June 7–15). Failure to attend their

duties was punished by a beating; violation of the vow of chastity, by burial alive. The Vestal Virgins enjoyed many honours and

privileges, including emancipation from their fathers' rule.

Vestdijk, Simon (b. Oct. 17, 1898, Harlingen, Neth.—d. March 23, 1971, Utrecht), prolific Dutch writer whose early novels, with their unrelenting exposure of the barrenness of middle-class provincial life, shocked the bourgeois world of the 1930s.

The cerebral, intellectual approach that characterizes Vestdijk's writing was already apparent in his poetry, with which he started his literary career. In his first published novel, Meneer Vissers hellevaart (1936; "Mr. Visser's Journey Through Hell"), the influence of James Joyce is evident-from the wealth of interior monologue to the author's preoccupation with distasteful everyday details. The bestiality and mental cruelty of Mr. Visser is shown to stem from his militaristic upbringing, but, as in most of Vestdijk's novels, psychoanalytical intentions tend to swamp spiritual and human considerations in the work. His novel Terug tot Ina Damman (1934; "Back to Ina Damman"), a love story, was considered equally shocking when it appeared, but, having a less bitter theme, it probably remains the most popular of his 38 novels.

Vesterålen, island group, in the Norwegian Sea, northern Norway. Forming the northern end of the Lofoten-Vesterålen archipelago, the Vesterålen include, from east to west, Hinn Island (largest Norwegian island but for Spitsbergen), And Island, and Lang Island; important smaller islands are Gryt and Hadsel, and there are hundreds of islets and skerries (small, rocky islets and reefs). The islands are composed of volcanic rock (gneiss and granite). Their climate is similar to that of the Lofoten island group—i.e., temperate, owing to the North Atlantic Current. Administratively, Hinn Island is divided between Troms and Nordland fylker (counties); the rest of the archipelago is in Nordland fylker

A settlement on the islet of Bjark is mentioned in the 11th century. Waters around the islands are among the best in Norway for fishing, yielding vast catches of cod, haddock, and halibut. Fishing and fish processing are virtually the sole economic activity; agriculture is nonexistent. Harstad on Hinn Island is the

main town and port in the islands. The islet of Andørja, actually a submarine mountain, rises, in the peak of Mount Langli, to 4,190 feet (1,277 m), the highest island mountain in Norway.

Vestfjorden, fjord, in the Norwegian Sea off the northwestern coast of Norway. Formed by the Norwegian mainland to the east and the Lofoten islands to the north and west, Vestfjorden is about 100 miles (160 km) long and almost 50 miles (80 km) wide at its mouth, becoming narrower toward its head.

The port of Narvik is located on its northeastern arm, Ofotfjorden, and the port of Bodø on the southeastern side of its mouth, on Saltfjorden. The legendary and treacherous Maelstrøm (q.v.) Moskenstraumen), a channel, is located near the northwestern side of the mouth of Vestfjorden. The fjord is dotted with thousands of islands, and it branches into hundreds of smaller fjords.

Vestfold, fylke (county), southeastern Norway. Lying along the western shore of Oslo Fjord, the county seat is Tønsberg (q.v.), Norway's oldest town. Vestfold is known for its prehistoric Bronze Age mounds and for its Viking ship burials. By the 10th century the local kings had established themselves as the first dynasty to begin the unification of Norway.

Covering 856 square miles (2,216 square km) of rolling countryside, the *fylke* contains some of Norway's best farmland (dairying, grains, and fruits). Formerly a headquarters for whaling fleets, the coastal towns of Vestfold now engage in fishing and shipbuilding. Some lumbering is carried on in the interior. Horten has a fine yacht harbour, with an annual summer regatta. Pop. (1988 est.) 194,619.

vestibulocochlear nerve, also called AUDITORY NERVE, ACOUSTIC NERVE, or EIGHTH CRANIAL NERVE, nerve in the human ear, serving the organs of equilibrium and of hearing. It consists of two anatomically and functionally distinct parts: the cochlear nerve, distributed to the hearing organ, and the vestibular nerve, distributed to the organ of equilibrium.

The cochlear nerve fibres end in terminals around the bases of the inner and outer hair cells of the organ of Corti and begin in groups of nerve cells-dorsal and ventral cochlear nuclei-located at the base of the brain at the juncture of the pons and the medulla oblongata. The vestibular portion of the vestibulocochlear nerve originates in a group of nerve cells called the vestibular ganglion, in the internal acoustic meatus, a channel in the temporal bone through which the facial and auditory nerves and some blood vessels run. The sensory endings of this portion of the nerve are in the semicircular canal and in the utricle and saccule, the structures of the inner ear responsible for the sensation of equilibrium.

Vestini, ancient Sabine tribe, which occupied the eastern and northern bank of the Aternus (modern Aterno) River in central Italy. They entered into the Roman alliance in 302 BC and remained loyal until they joined the Social War (90–88 BC), by which they won Roman citizenship.

The Vestini's local dialect, belonging to the Northern Oscan group, probably survived until this time. The oldest known Latin inscriptions of the district are not earlier than 100 BC, and they indicate that the Latin first spoken by the Vestini was not that of Rome but that of their neighbours, the Marsi and the Aequi (qq.v.).

Vestlandet, geographical region, southwestern Norway. Its 22,592 square-mile (58,512 square-kilometre) area embraces the *fylker* (counties) of Rogaland, Hordaland, Sogn og Fjordane, and Møre og Romsdal. Providing the most spectacular fjord and mountain

scenery in Norway, the region has been a tourist mecca for centuries. Except for the Jæren plain located at the extreme southern end of the region, Vestlandet is mountainous, with Jotunheimen and the Hardanger Plateau being the highest areas. The Jostedals Glacier. the largest glacier in Europe, is located in the north-central part of the region, while Hardanger Icecap and the Folge Glacier are smaller ice fields in the south. Norway's longest fjord, Sogna Fjord (127 miles [204 km]), located in the central part of the region, nearly divides Vestlandet in two; farther south Hardanger Fiord knifes inland for 111 miles (178 km). Many waterfalls flow into the fjords, with the Syv Systre, Toka Gorge, and Vørings Waterfalls among the most beautiful and best known. The rugged coastline is protected by thousands of offshore islands in a nearly continuous line.

Vestlandet contains the second and fourth most populous Norwegian cities, Bergen and Stavanger, respectively; both are historically important port cities and trading centres. Other ports are Kristiansund, Ålesund, Haugesund, and Sandnes. Most of the inhabitants of Vestlandet live in these communities and in the hundreds of fishing villages along the coasts, fjords, and islands. Economically, the region depends on fishing, tourism, lumbering, shipping, and farming (mostly on the Jæren plain). Most industry is located in the larger cities and towns. Development of the region's large hydroelectric potential began in the 1970s. Land transportation routes are few, though both rails and roads connect with the rest of Norway. The main form of intercity transportation is by coastal ferries and ships. In addition, many tour ships ply the fjords, offering tourists unsurpassed vistas. Pop. (1988 est.) 1,078,825

Vestmanna Islands, Vestmanna also spelled VESTMANN, or WESTMAN, Icelandic VESTMANNAEYJAR, group of 14 small Icelandic islands off Iceland's southern shore. They have a total area of about 8 square miles (21 square km). Volcanic in origin, the islands are rocky and barren, with precipitous cliffs up to 1,000 feet (300 m) in height rising straight up from the Atlantic Ocean.

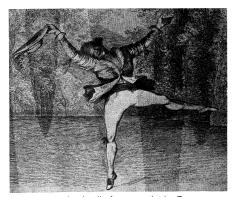

The largest and only inhabited island is Heimaey, 4 miles (6 km) in length, on which the town of Vestmannaeyjar is located. Cod fishing and some limited farming are the chief economic activities. The fiery emergence in 1963–67 of the volcanic isle of Surtsey, 14 miles (23 km) southwest, covered the island group with a layer of ash.

Vestmannaeyjar, town, southern Iceland, on Heima Island, the largest of the Vestmanna Islands. One of the older Icelandic settlements, it grew as a fishing village. It is almost entirely dependent upon cod fishing and processing, having been the site of Iceland's first fish-freezing plant, established in 1908.

A series of disasters has afflicted the town. Often plundered by English ships in the 15th century, in 1627 it was attacked by Algerian pirates, who carried off many of the inhabitants into slavery. In 1963, when the volcanic island of Surtsey emerged from the Atlantic Ocean, the town was covered with a layer of volcanic ash. In January 1973 a 1-mile- (1.6kilometre-) long fissure in the side of the longdormant Helgafell Volcano began to erupt, burying the town under a rain of ash and cinder and forcing the evacuation of most of the inhabitants. When the eruption subsided in June, most of the evacuees returned and removed the thick deposits of ash that covered the town's buildings. Vestmannaeyjar subsequently made a complete recovery from this disaster. Pop. (1984 est.) 4,743.

Vestris, Auguste, also called Vestr' ALLARD, original name MARIE-JEAN-AUGUSTIN VESTRIS (b. March 27, 1760, Paris—d. Dec.

5, 1842, Paris), son of the great ballet dancer Gaetano Vestris and the ballerina Marie Allard, himself a dancer whose unusually brilliant technique and prodigious leaps set a new

style of ballet. He was a star of the Paris Opéra from his debut in 1772 until his retirement in 1816, spending the 1791 season in London.

Vestris's greatest roles were in *Télémaque* and as Amour in Pierre Gardel's *Psyché*. His later years were devoted to teaching, his pupils including August Bournonville, Fanny Elssler, and his son Auguste-Armand, who also became a dancer but is remembered chiefly as the first husband of the English actress and theatrical manager Madame Vestris.

Vestris, Gaetano (Apolline Baldassare), also called GAÉTAN VESTRIS (b. April 18, 1729, Florence—d. Sept. 23, 1808, Paris), the finest French male ballet dancer of his time.

With his parents, brothers, and sisters—almost all of whom had careers in the theatre—he went to Paris in 1747 and about a year later, at age 19, entered the Paris Opéra ballet school, studying under Louis Dupré. Vestris danced briefly in the ensemble, was appointed soloist in 1751, and for the next 30 years enjoyed a succession of triumphs in the ballets of Jean-Barthélemy Lany, Pierre Gardel, and Jean-Georges Noverre. Because of his conceited ways, as well as his undisputed gifts, he was called, half ironically, "the god of the dance."

Vestris, Madame, married name (from 1838) LUCIA ELIZABETH, or ELIZABETTA, MATHEWS, *née* BARTOLOZZI (b. Jan. 3, 1797, London—d. Aug. 8, 1856, London), British actress, opera singer, and manager who inaugurated tasteful and beautiful stage decor and set a standard in stage costumes.

In 1813 she married Auguste-Armand Vestris, a dancer and ballet master who left her four years later. Mme Vestris made her first appearance in Italian opera in 1815 and had an immediate success in London and

in Paris, where she played with F.-J. Talma. Her first hit in English was in 1820. Because of her beautiful figure, she was a particular favourite in such breeches parts as Cherubino in *The Marriage of Figaro* and in *Giovanni in London*. In 1831 she became lessee of the Olympic Theatre and began presenting the burlesques and extravaganzas for which that house became known. She married Charles James Mathews in 1838, accompanying him to the United States and aiding him in his subsequent managerial ventures.

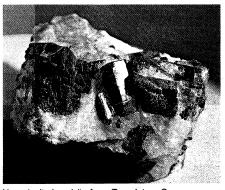

A biography, Madame Vestris and the London Stage, was published in 1974.

Vestsjællands, amtskommune (county), western Sjælland (Zealand), Denmark, created in 1970 from the former counties of Sorø and Holbæk, with an area of 1,155 sq mi (2,991 sq km). The northern coast is characterized by tonguelike peninsulas and islands.

Fertile clay loams support agriculture, dairying, and pig rearing. The principal centres of industrial activity are Slagelse, Kalundborg, Holbæk (qq.v.), Ringsted, and Nykøbing-Sjælland. Sorø (q.v.) is the administrative seat. Pop. (1982 est.) 278,117.

schist. Fine glassy crystals coloured yellow, green, or brown have been found in the Ala Valley in the Piedmont, and on Mte. Somma, Italy; the Vilyuy River, Siberia; Christiansand, Nor.; Litchfield, Quebec; and Auburn, Maine, Amity, N.Y., and Franklin, N.J. For chemical formula and detailed physical properties, *see* silicate mineral (table).

Transparent crystals of a good green or brown colour are sometimes cut as gemstones. Cut stones resemble diopside or epidote but can be distinguished optically. A compact green variety resembling jade, found at several localities in California, is known as californite. A sky-blue variety, cyprine, contains traces of copper.

Vesuvius (Mount), Italian VESUVIO, active volcano that rises above the Bay of Naples on the plain of Campania in southern Italy. Its western base rests almost upon the bay. The height of the cone in 1980 was 4,198 ft (1,280 m), but it varies considerably after each major eruption. At about 1,968 ft a high semicircular ridge, called Mt. Somma, begins, girding the cone on the north and rising to 3,714 ft. Between Mt. Somma and the cone is the Valle del Gigante (Giant's Valley). At the summit of the cone is a large crater about 1,000 ft deep and 2,000 ft across; it was formed in the eruption of 1944. More than 2,000,000 people live in the area of Vesuvius and on its lower slopes. There are industrial towns along

the coast of the Bay of Naples and small agricultural centres on the northern slopes.

Vesuvius originated during the late Pleistocene Epoch, probably somewhat less than 200,000 years ago. Although a relatively young volcano, Vesuvius had been dormant for centuries before the great eruption of AD 79 that buried the cities of Pompeii and Stabiae under ashes and lapilli and the city of Herculaneum under a mud flow. The writer Pliny the Younger, who was staying at a place west of Naples, gave an excellent account of the catastrophe in two letters to the historian Tacitus. Between the years 79 and 1631, several eruptions were reported. Confirmed eruptions occurred in 203, 472, 512, 787, 968, 991, 999, 1007, and 1036. The explosions of 512 were so severe that Theodoric the Goth released the people living on the slopes of Vesuvius from payment of taxes.

After some centuries of quiescence, a series of earthquakes, lasting for six months and gradually increasing in violence, preceded a major eruption that took place on December 16, 1631. Many villages on the slopes of the volcano were destroyed; about 3,000 people were killed; the lava flow reached the sea; and the skies were darkened for days. After 1631 there was a change in the eruptive character of the volcano and activity became continuous. Two stages could be observed: quiescent and eruptive. During the quiescent stage the volcano's mouth would be obstructed, whereas in the eruptive stage it would be almost continually open.

Between 1660 and 1944 some 19 of these cycles were observed. Severe paroxysmal eruptions, concluding an eruptive stage, occurred in the years 1660, 1682, 1694, 1698, 1707, 1737, 1760, 1767, 1779, 1794, 1822, 1834, 1839, 1850, 1855, 1861, 1868, 1872, 1906, and 1944. The eruptive stages varied in length from 6 months to 30³/₄ years. The quiescent stages have varied from 18 months to 7¹/₂ years.

Scientific study of the volcano did not begin until late in the 18th century. An observatory was opened in 1845 at 1,995 ft, and, in the 20th century, numerous stations were set up at various heights for making volcanologic measurements. A large laboratory and a deep tunnel for seismo-gravimetric measurements were also built.

The slopes of Vesuvius are covered with vineyards and orchards, and the wine grown there is known as Lacrima Christi; in ancient Pompeii the wine jars were frequently marked with the name Vesuvinum. Higher up, the mountain is covered with copses of oak and chestnut, and on the northern side along the slopes of Mt. Somma the woods proceed to the very summit. On the western side the chestnut groves give way above 2,000 ft to undulating plateaus covered with broom, where the crater left by the great eruption of the year 79 has been filled in. Still higher, on the slopes of the great cone and on the inner slope of Mt. Somma, the surface is almost barren; during quiescent periods it is covered by tufts of meadow plants.

The soil is very fertile, and in the long period of inactivity before the eruption of 1631 there were forests in the crater and three lakes from which pasturing herds drank. Vegetation on the slope dies off during eruptive periods because of the volcanic gases. After the eruption of 1906, forests were planted on the slopes in order to protect inhabited places from the flows of mud that usually occur after violent eruptions, and in the fertile soil the trees grew rapidly. In 73 BC the gladiator Spartacus was besieged by the praetor Publius Claudius Pulcher on the barren summit of Mt. Somma, which was then a wide, flat depression walled by rugged rocks festooned with wild vines.

He escaped by twisting ropes of vine branches and descending through unguarded fissures in the crater rim. Some paintings excavated in Pompeii and Herculaneum represent the mountain as it looked before the eruption of AD 79, when it had only one peak.

Veszprém, megye (county), western Hungary, extending north from Lake Balaton. It occupies an area of 1,810 square miles (4,689 square km) and consists largely of the forested Bakony Mountains (q.v.). Lowlands in the northwest of the megye are agriculturally poor, but the production of wines is important on the north shore of Lake Balaton, particularly around Balatonfüred. The Bakony Mountains and Lake Balaton form the basis for a substantial tourist industry.

Since 1945 the county has experienced rapid industrial growth based on the mineral wealth of the Bakony Mountains. Lignite, bauxite, and manganese are especially significant. Ajka, formerly a small coal-mining village, has developed a substantial aluminum industry. Chemical plants have been important in the growth of Veszprém town, the county seat; and Várpalota, just northeast, has chemical, aluminum, coal-mining, and mineral-oil industries. At Herend is a well-known porcelain and china factory. Other population centres include Keszthely, Pápa, and Tapolca. At Zirc, high in the Cuha Valley, is a 12th-century abbey, and Nagyvázsony is the site of the ruins of the legendary Kinizsi Castle. Pop. (1986 est.) 388,000.

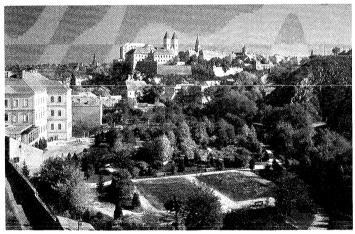

Veszprém, town and seat of Veszprém *megye* (county), western Hungary. It lies along the

Vetch (Vicia cracca)

(Fabaceae). About 150 species are known. The plants are 30–120 cm (1–4 feet) tall, with trailing or climbing stems and compound leaves with several pairs of leaflets. The magenta, bluish white, white, or yellow flowers are borne singly or in clusters. Two to 10 seeds are borne in a pod. A few species of vetch are cultivated as important fodder and cover crops and as green manure. Like other legumes, they add nitrogen to the soil by means of nitrogen-fixing bacteria and thus are particularly valuable as a soil-enriching crop. For the low-growing ground cover *Coronilla varia, see* crown vetch.

Séd River, spanned there by a viaduct, in the Bakony Mountains, southwest of Budapest. The town already had a cathedral and castle in the 9th century; it was named after the Polish prince Bezbriem. The town is built on five hills and contains many historical and architectural monuments: the street of ancient houses; the Cathedral of St. Michael; the Gizella Chapel with valuable 13th-century frescoes; the Baroque bishop's palace (1765–76); the Franciscan cloister (1770–76); and the fortress with its Heroes' Gate. Between 1552 and the end of the 17th century, Veszprém was intermittently occupied by the Turks. The town is a rail and market centre. The Veszprém University of Chemical Engineering was founded in 1949.

Manufactures include textiles, wine, and vegetable oil. Veszprém also has a chemical industry. Pop. (1986 est.) 64,000.

country's wars. The observance originated as Armistice Day, which was set aside by the United States, Great Britain, and France to commemorate the ending of World War I (Nov. 11, 1918). After World War II it was recognized as a day of tribute to the veterans and the dead of that conflict as well. In Canada it came to be known as Remembrance Day, and in Great Britain the Sunday nearest November 11 was proclaimed Remembrance Sunday honouring the dead of both World Wars. In 1954, after the Korean War, the date was officially designated in the United States as Veterans Day to honour servicemen of all U.S. wars.

Veterans Day is usually observed with parades, speeches, and floral tributes placed on servicemen's graves or memorials. In the United States, group naturalization ceremonies have come to be an important part of the day's activities. Special Veterans Day services are held at Arlington National Ceme-

tery, Arlington, Va., and at similar shrines in other countries.

veterinary science, also called VETERINARY MEDICINE, the prevention, diagnosis, and treatment of the diseases of domestic animals and the management of other animal disorders. The field also deals with those diseases that are intercommunicable between animals and humans

Persons serving as doctors to animals have existed since the earliest recorded times, and veterinary practice was already established as a specialty as early as 2000 BC in Babylonia and Egypt. The ancient Greeks had a class of physicians who were literally called "horsedoctors," and the Latin term for the specialty, veterinarius ("pertaining to beasts of burden") came to denote the field in general in modern times. After a period of virtual nonexistence during the Dark and Middle Ages, veterinary science revived in the mid-18th century, when the first veterinary schools in Europe were established. With the field in the hands of educated men, veterinary science rapidly regained its lost status, and its subsequent development largely parallels that of modern medicine.

The preventive and control measures used in veterinary science are of vital economic importance to the livestock industry. Such common animal diseases as mastitis, brucellosis, swine fever, erysipelas, anthrax, and leptospirosis can cause major losses among stock animals and must be controlled or prevented by veterinarians. Vaccination and immunization are important tools against infectious diseases such as anthrax, bovine tuberculosis, brucellosis, canine distemper, and rabies. Sanitation measures and the rigid segregation, or quarantine, of sick animals are other basic control measures to combat their spread. Veterinarians also treat parasitical infections, conditions resulting in impaired fertility (in livestock), and nutritional disorders, and they often set broken limbs and neuter domestic pets.

The education and training of a veterinarian requires him to study the basic preclinical disciplines of anatomy, histology, physiology, pharmacology, microbiology (including bacteriology, virology, and parasitology), and pathology. The clinical subjects of study can be broadly divided into internal medicine. surgery, preventive medicine, and clinical practice. Internal medicine includes the diagnosis and treatment of diseases as they affect animals. Preventive medicine and public health concern the broader aspects of disease prevention and control, especially of those diseases transmissible between animals and humans or affecting human welfare. Surgery includes wound treatment, fracture repair, the excision of body parts, and the related techniques of radiology, anesthesiology, obstretrics, treatment of lameness, and so on. In most veterinary schools, a clinic is operated to enable students to observe and assist with actual cases of disease or other conditions requiring attention. In both medical and surgical treatment, the same techniques are used as in medical practice on humans. Many veterinarians specialize either in the care of small animals, i.e., pets, or in the care of livestock. A few veterinarians specialize in the care of wild animals held in zoos.

To qualify for membership in the veterinary profession in most countries of the world, candidates must complete an educational program of from four to six years of work at the university level, after which they must obtain a license to practice from some duly constituted authority. In many countries the degree of doctor of veterinary medicine (D.V.M.) is awarded after successful completion of such a formalized course of study. Veterinary associations exist in practically all countries, their purpose being to advance the standards and improve the services of the profession.

Veterans of Foreign Wars (vFw), American organization created in 1913–14 by the merger of three national war-veteran societies that were founded in 1899, shortly after the Spanish-American War. The American Veterans of Foreign Service, the Colorado Society of the Army of the Philippines, and another society also known as the American Veterans of Foreign Service merged in a convention in Pittsburgh, Pa., to become the single nationwide association known since then as the Veterans of Foreign Wars of the United States.

Membership in the VFW is restricted to any active or honourably discharged male officer or enlisted man who is a citizen of the United States and who has served in its military service "in any foreign war, insurrection or expedition, which service shall be recognized by the authorization or the issuance of a campaign medal" by the military or naval service. The basic aims of the VFW are: to ensure the national security through maximum military strength; to speed the rehabilitation of the nation's disabled and needy veterans; to assist veterans' widows and orphans and the dependents of needy or disabled veterans; and to promote Americanism by means of education in patriotism and by constructive service to communities.

The VFW maintains both its legislative service and the central office of its national rehabilitation service in Washington, D.C. The latter nationwide program serves all disabled veterans of all wars, members and nonmembers alike, in matters of government compensation and pension claims, hospitalization, civil-service employment preference, and so on. Another important function of the VFW is the thousands of individual community-service projects that it supports annually through its more than 10,000 local units, which are known as "posts." The VFW maintains a national headquarters in Kansas City, Mo.

vetiver, also called KHUS-KHUS (Vetiveria zizanioides), perennial grass of the family Poaceae, native to tropical Asia and also introduced into the tropics of both hemispheres. Its thick, fragrant roots contain an oil used in perfumes. It is planted as hedges in some areas. In others it has escaped cultivation and become a weed.

Veuillot, Louis (b. Oct. 11, 1813, Boynes, Fr.—d. March 7, 1883, Paris), author and leader within France of extreme Ultramontanism, a movement advocating absolute papal supremacy.

The son of poor parents, Veuillot early began writing for periodicals and developed his talents in provincial journalism. He was uninterested in religion until 1838, when he was converted while on a visit to Rome and immediately became involved in polemics. He became editor of L'Univers in 1843, and that newspaper subsequently served as the medium for his Ultramontane campaign. Veuillot quickly became disillusioned with the Second French Republic (1848-52) and was a champion of Emperor Napoleon III and the Second Empire (1852–70) until the emperor threatened Pope Pius IX's temporal sovereignty by his military campaign in Italy (1859). Veuillot's continued opposition to Napoleon's Italian policy eventually led to the suppression of L'Univers (1860-67).

Veuillot lived in Rome during the First Vatican Council (1870), which asserted papal infallibility, thus representing a triumph for the Ultramontanists. He subsequently came to regard the restoration of the Bourbons as the best hope of the Roman Catholic Church in France. His health failed in 1878, but his influence persisted in the French church until his death. Veuillot was an enemy of all

conciliation and compromise, despised industrialism, and hated bourgeois institutions and all that stemmed from the French Revolution. He was a talented writer and was adroit in the manipulation of public opinion, however. Merciless toward opponents, including all he chose to call liberal Catholics, Veuillot finally

drew a rebuke from Pope Pius IX for his "bitter zeal." His *Oeuvres complètes* (1927–38) include novels, biographies, correspondence, poetry, and polemical writings.

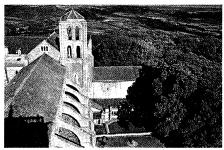

Veurne, French FURNES, municipality, West Flanders province, western Belgium. The municipality lies at the junction of four canals, northeast of Dunkerque. It was founded in about 870 by Baldwin I Iron-Arm (or Ferreus), first count of Flanders. An important town of the Spanish Netherlands, it was often besieged in the 17th century. During World War I, it was the centre of that part of Belgium unoccupied by the Germans.

An agricultural market for the fertile coastal plain of the Veurne-Amblecht Polders (land reclaimed from the sea), Veurne also manufactures bricks and tiles. It is famous for its annual processions of the Holy Cross (in May) and of the Penitents (in July), both dating from medieval times. Historic buildings grouped around the ancient Grote Markt (marketplace) include the 15th-century Gothic-style Spanish Pavilion (until 1586 the town hall), the Meat Market (1615, now a theatre), the 15thcentury St. Nicholas Church with its massive tower, the Spanish Guard House (1636), the town hall (1596-1612 and restored in 1880), the Palace of Justice (1612), the Gothic Belfry (1628, burned 1940 but restored), and St. Walburga's Church (begun 1230-80). At Coxyde (Flemish Koksijde), an often-sacked 12th-century Cistercian abbey has been unearthed. Pop. (1983 est.) mun., 11,256.

dictine abbey, which was founded in the 9th century under the influence of Cluny. After the supposed remains of St. Mary Magdalene were deposited in the abbey for safekeeping from Muslim armies, vast numbers of pilgrims were attracted to the abbey, and a town of about 10,000 inhabitants grew up around it. St. Bernard preached at Vézelay in 1146 before Louis VII in order to inspire the Second Crusade. The influence of the abbey declined from the late 13th century on.

The great abbey Church of the Madeleine, which is one of the largest monastic churches in France, was started at the end of the 11th century. It was restored in the 19th century by Emmanuel Viollet-le-Duc. Nearby, the medieval castle of Bazoches was rebuilt by Sébastien Vauban, who is buried in the local church. The village still has most of its medieval ramparts. Pop. (1982) 383.

VHF, in full VERY HIGH FREQUENCY, conventionally defined portion of the electromagnetic spectrum including any radiation with a wavelength between 1 and 10 metres and a frequency between 300 and 30 megahertz. VHF signals are widely employed for television and radio transmissions. In the United States and Canada, television stations that broadcast on channels 2 through 13 use VHF frequencies, as do FM radio stations. Many amateur radio operators also transmit on frequencies within the VHF band.

VHF waves, unlike longer waves, are not strongly reflected from the atmosphere; therefore, they do not bend readily around the Earth's curvature and cannot be transmitted beyond the horizon. Their range is further limited by their inability to pass through hills or large structures. Accordingly, VHF waves are limited to use in short-range, line-of-sight communications, including radio and television broadcasting, and in electronic navigation systems. They are especially suited to such applications because their reception is not impaired by random electromagnetic noise ("static") of longer wavelengths. Because of their limited transmission range, VHF signals of the same frequency can be used by transmitters several hundred miles apart without interfering with one another. See also UHF.

VIA Rail Canada, Inc., Canadian stateowned passenger-railway system. Established in 1978 as a crown corporation independent of the Canadian National Railway Company and Canadian Pacific Ltd., it has gradually assumed full responsibility for managing all the country's rail-passenger services except commuter lines.

Before the formation of VIA, Canada's rail-ways were spending more than \$20,000,000 a year to support the rail-passenger system. After World War II, passenger service fell off, owing to competition from airplanes and automobiles, and much stock became outdated, with service becoming inefficient and costly. VIA, which is responsible to Parliament, permits economies not possible when the two railroads ran independent passenger services.

It has acquired ownership of all CN and CP passenger locomotives but does not own any track. The government compensates the railroads for the cost of operating VIA trains over their tracks.

viaduct, type of long bridge or series of bridges, usually supported by a series of arches or on spans between tall towers. The purpose of a viaduct is to carry a road or railway over water, a valley, or another road. The viaduct is both functionally and etymologically related to the aqueduct, which carries water; both were developed by Roman engineers.

The long spans of Roman viaducts were sup-

ported by semicircular arches resting on piers of stone or masonry. A well-preserved example is the span over the Tagus River at Alcantara, Spain (c. AD 105). The next advance in viaduct construction did not occur until the late 18th-century development of iron bridges and the 19th-century introduction of steel.

In the early 20th century the spread of reinforced-concrete construction led to the building of concrete arch structures such as the Colorado Street viaduct over the Pasadena Freeway in California (1938). A recent method used on long viaducts is segmental construction. The sections are precast and jacked forward from one end of the viaduct to form the extension.

Viana, Carlos de Aragon, príncipe de (prince of), English CHARLES OF ARAGON (b. May 29, 1421, Penafiel, Aragon—d. Sept. 23, 1461, Barcelona), heir apparent to the throne of Navarre (from 1428), who engaged in intrigues for both the Navarrese and the Aragonese crowns.

The son of the future John II of Aragon and Blanche, daughter of Charles III of Navarre, who succeeded her father in 1425, Carlos was accepted as heir apparent by the Navarrese Cortes. On Blanche's death (1441) her testament was found to direct Carlos not to use the royal titles without his father's consent. John regarded his son with jealous animosity, and consent was not forthcoming, but Carlos, for a time, governed Navarre as viceroy; later, however, John sent his second wife, Juana of Castile, to supervise the Navarrese government (1451), and civil war began between beaumonteses, who defended Prince Carlos' rights, and agramonteses-supporters of Juana. Defeated and disinherited, Carlos fled to the Neapolitan court of his uncle, Alfonso V of Aragon (1455), devoting himself to literary studies in Messina.

When Alfonso was succeeded in Aragon by John (1458), Carlos obeyed an order to return home and was enthusiastically received by the Catalans, who demanded his formal recognition as heir to the Aragonese throne. The intrigues of Queen Juana on behalf of her own son Ferdinand prevented this, and Carlos was imprisoned by his father (1460). The Catalans then rebelled (February 1461), forcing John II to proclaim Carlos his heir and governor of Catalonia (June). But the prince died, leaving John to cope with a general uprising of the Catalans, who believed—probably without reason—that Carlos had been murdered.

Viana do Castelo, town, capital, and concelho (township), Viana do Castelo distrito ("district"), northwestern Portugal. It lies at the mouth of the Lima River, north of Porto. Mount Santa Luzia dominates the town, which originated as the Roman Velobriga. An important medieval seaport trading with Genoa and Venice, it subsequently developed as the base for cod-fishing fleets sailing to the Grand Banks of Newfoundland. Notable buildings of Gothic, Renaissance, and Manueline architecture in the town include the Misericórdia church, Medahões House, and the Convent of São Bento. Local manufactures include carpets, rope, clothing, and flour products.

Viana do Castelo district has an area of 871 square miles (2,255 square km). Wine production and fishing are its economic mainstays. Pop. (1981) town, 15,356; concelho, 79,963; (1986 est.) district, 264,900.

Vianney, Saint Jean-Baptiste-Marie, also called CURÉ D'ARS (b. May 8, 1786, Dardilly, Fr.-d. Aug. 4, 1859, Ars; canonized May 31, 1925; feast day August 4 [formerly August 9]), French priest, the patron saint of parish priests, who as a renowned confessor became famous for his supernatural powers.

Because of the French Revolution, Vianney received little education and made his first communion and confession secretly. He was ordained a priest in 1815 and was made assistant priest at Écully, Fr. In 1818 he became priest of Ars, which he made a model parish and from which reports of his holiness and his supernatural powers soon spread. From 1824 he suffered attacks that he believed were caused by the devil, who allegedly on one occasion set fire to Vianney's bed. By 1827 Ars became a pilgrimage, and, every year from 1845 until Vianney's death, about 20,000 persons visited Ars to see Vianney and especially to make their confession to him. The holy curé spent as many as 12 or 15 hours daily in his confessional. He was canonized by Pope Pius XI. L.C. Sheppard's The Curé d'Ars appeared in 1959.

Viardot, (Michelle Ferdinande) Pauline, née GARCÍA (b. July 18, 1821, Paris-d. May 18, 1910, Paris), French mezzo-soprano, bestknown for her outstanding success in highly dramatic operatic roles.

As a child Viardot studied piano with Franz Liszt, composition with Anton Reicha, and voice with her mother. She was the sister of Maria Malibran, the celebrated soprano, and of the great voice teacher Manuel García II. Viardot made her concert debut at the age of 15 in Brussels and her operatic debut two years later as Desdemona in Gioacchino Rossini's Otello in London. She was noted for her wide vocal range and could sing both soprano and contralto roles. Her greatest successes were in highly dramatic roles, such as Fidès in Giacomo Meyerbeer's Le Prophète (1849), which was written for her, and Rachel in Fromental Halévy's La Juive. The climax of her career came in 1859 when she performed the title role in Hector Louis Berlioz' re-creation of Christoph Gluck's Orfeo ed Eurydice at the Théâtre Lyrique in Paris. She sang for several seasons in the opera in St. Petersburg, Russia, and was one of the first artists to promote Russian music in western Europe. Her thoughtful interpretations earned her a place in Parisian intellectual circles, and Johannes Brahms, Camille Saint-Saëns, Robert Schumann, and Gabriel Fauré all wrote pieces for her. In her later years she taught singing and composed. Her compositions include vocal transcriptions of Chopin's mazurkas, songs setting Russian texts, and several operettas, including La Dernière Sorcière, which was performed in German at Weimar in 1869, and Cendrillon ("Cinderella"), which was successfully revived at Newport, R.I., in 1971.

Viareggio, town, Lucca provincia, Toscana (Tuscany) regione, central Italy. It lies along the Ligurian Sea, south of the Apuan Alps, just northwest of Pisa. Sheltered by dense pine woods and possessing a famous 5½-mile (9-kilometre) beach of fine sand, it is one of Italy's most popular seaside resorts and has a small harbour for yachts and a fishing port.

The body of the English poet Percy Bysshe Shelley was cremated on the beach near Viareggio after he drowned offshore in 1822; he is commemorated in the Piazza Shelley by a bust sculptured by Urbano Lucchesi (1894). At nearby Torre del Lago is the villa of the 19th- and 20th-century composer Giacomo Puccini, which is the site of his grave. Pop. (1984 est.) mun., 58,454.

Viau, Théophile de, Viau also spelled VIAUD (b. 1590, Clairac, near Agen, Fr.—d. Sept. 25, 1626, Paris), French poet and dramatist of the pre-Neoclassical period.

Born into a Huguenot family of the minor nobility, Viau went to Paris, where he soon won a reputation as the leader of the freethinkers (libertins). He was briefly house dramatist to the Hôtel de Bourgogne in Paris, writing one important tragedy, Pyrame et Thisbé (1623).

This period of prosperity ended when he was charged with irreligious activities. He fled, was sentenced in absentia to death, was caught, rearrested, and was finally released in 1625 under sentence of banishment. His health broken, he died soon afterward.

Viau wrote odes and other poems on a wide range of topics. His verse is marked by a strong feeling for nature, great musicality, a use of original and ingenious imagery, and an epicurean outlook that is tempered by apocalyptic visions and the thought of death. Viau defended spontaneity and the supremacy of inspiration against the set of literary rules laid down by the influential poet François de Mal-herbe. Viau's reputation consequently went into eclipse during the Neoclassical literary period in France but was rehabilitated by the Romantics of the 19th century.

Vibo Valentia, Latin HIPPONIUM, town, Catanzaro provincia, Calabria regione, southern Italy. It lies near the Gulf of Sant'Eufemia. It originated as the ancient Greek town of Hipponion and was praised in the 1st century BC by the Roman statesman and author Cicero. There is a museum of Greek antiquities, and ruined Greek walls can be seen outside the town. Rebuilt in the 13th century after destruction by the Arabs, Vibo Valentia was damaged by earthquakes in 1783 and 1905.

Historical monuments include various ancient palaces and churches, especially the church of San Michele, the Baroque church Collegiata di San Leone Luca, and a 13thcentury Norman castle used by the Holy Roman emperor Frederick II. An earlier name of the town was Monteleone. Vibo Valentia is now a centre for regional agriculture, with wagon- and tool-making industries and tomato canning. Pop. (1984 est.) mun., 32,-400.

Viborg, city, seat of Viborg amtskommune (county commune), north-central Jutland, Denmark. It lies northwest of Arhus. Originally a centre of pagan worship, Viborg (English: "sacred hill") was a royal town and the early capital of Jutland. According to legend, it was from Viborg that King Canute set out to conquer England. The kings of Denmark were consecrated in Viborg from 1027 onward. The first Danish coins were struck there in the early 11th century, and it became a bishop's see in 1065. After its 12th-century charter was renewed (1440), it was the largest town in Jutland (and was also the starting point of the Reformation in Denmark) until the 17th century. Successive fires accelerated its decline, caused when the political centre of Denmark shifted east. After 1866 reclamation of the surrounding heathland revived the city, which became the seat of the High Court for

Jutland in 1919. It is now a commercial centre manufacturing beer, tobacco, textiles, and machinery. Historic buildings include the 12th-century cathedral (rebuilt 1864–76), with frescoes by Joakim Skovgård; the medieval Sondersogns and Asmild churches; the Baroque Town Hall (1728); and the Bishop's Palace (1728).

Viborg amtskommune (area 1,592 square miles [4,122 square km]), created in 1970 from the former amtskommuner of Viborg and Thisted, lies west of the Djursland peninsula and includes the Salling peninsula, Fur Island, and Mors Island in Lim Fjord, and the Thy peninsula between Lim Fjord and the Skagerrak. The Thy peninsula is a low, wooded region with a smooth dune coast and chalk and limestone quarries. The rest of the county commune is more fertile, supporting mixed farming and dairying. The Dollerup Hills and the Hald Lake National Park lie south of Viborg, and the medieval castle of Spøttrup is on the Salling peninsula. Viborg, Nykøbing Mors, Skive, and Thisted are the principal centres. Pop. (1984 est.) city, 28,944; (1986 est.) mun., 39,502; (1986 est.) amtskommune, 230,948.

vibraphone, also called VIBRAHARP, percussion instrument that has tuned metal bars and is similar in shape to a xylophone. Felt or wool beaters are used to strike the bars, giving a soft, mellow tone quality. Suspended vertically below each aluminum bar is a tubular, tuned resonator that sustains the tone when the bar is struck. The special feature of the vibraphone, and the one that gives the instrument its name, is a set of small, electrically operated fans above the resonators (and below the bars) that cause a vibrato effect by rapidly closing and opening the resonators. A pedalcontrolled damper, consisting of a long strip of felt below each row of bars, can silence the bars, permitting the playing of short notes and unblurred series of chords. Cutting off the fans, changing their speed, or using hard mallets are other ways to alter the normal tone quality of the vibraphone.

Vibraphone

The vibraphone was invented in about 1920 and was soon common in dance bands and became a prominent jazz instrument. Its foremost jazz practitioner was Lionel Hampton. The vibraphone was first used in the orchestra in Alban Berg's opera *Lulu* (1937). The instrument's compass varies; three octaves upward from the F below middle C is common.

vibration, periodic back-and-forth motion of the particles of an elastic body or medium, commonly resulting when almost any physical system is displaced from its equilibrium condition and allowed to respond to the forces that tend to restore equilibrium.

A brief treatment of vibration follows. For full treatment, see MACROPAEDIA: Mechanics: Dynamics.

Vibrations fall into two categories: free and

forced. Free vibrations occur when the system is disturbed momentarily and then allowed to move without restraint. A classic example is provided by a weight suspended from a spring. In equilibrium, the system has minimum energy and the weight is at rest. If the weight is pulled down and released, the system will respond by vibrating vertically.

The vibrations of a spring are of a particularly simple kind known as simple harmonic motion (SHM). This occurs whenever the disturbance to the system is countered by a restoring force that is exactly proportional to the degree of disturbance. In this case, the restoring force is the tension or compression in the spring, which (according to Hooke's law) is proportional to the displacement of the spring. In simple harmonic motion, the periodic oscillations are of the mathematical form called sinusoidal.

Most systems that suffer small disturbances counter them by exerting some form of restoring force. It is frequently a good approximation to suppose that the force is proportional to the disturbance, so that SHM is, in the limiting case of small disturbances, a generic feature of vibrating systems. One characteristic of SHM is that the period of the vibration is independent of its amplitude. Such systems therefore are used in regulating clocks. The oscillation of a pendulum, for instance, approximates SHM if the amplitude is small.

A universal feature of free vibration is damping. All systems are subject to frictional forces, and these steadily sap the energy of the vibrations, causing the amplitude to diminish, usually exponentially. The motion is therefore never precisely sinusoidal. Thus, a swinging pendulum, left undriven, will eventually return to rest at the equilibrium (minimum-

energy) position.

Forced vibrations occur if a system is continuously driven by an external agency. A simple example is a child's swing that is pushed on each downswing. Of special interest are systems undergoing SHM and driven by sinusoidal forcing. This leads to the important phenomenon of resonance. Resonance occurs when the driving frequency approaches the natural frequency of free vibrations. The result is a rapid take-up of energy by the vibrating system, with an attendant growth of the vibration amplitude. Ultimately, the growth in amplitude is limited by the presence of damping, but the response can, in practice, be very great. It is said that soldiers marching across a bridge can set up resonant vibrations sufficient to destroy the structure. Similar folklore exists about opera singers shattering wine glasses.

Electric vibrations play an important role in electronics. A circuit containing both inductance and capacitance can support the electrical equivalent of SHM involving sinusoidal current flow. Resonance occurs if the circuit is driven by alternating current that is matched in frequency to that of the free oscillations of the circuit. This is the principle behind tuning. For example, a radio receiver contains a circuit, the natural frequency of which can be varied. When the frequency matches that of the radio transmitter, resonance occurs and a large alternating current of that frequency develops in the circuit. In this way, resonating circuits can be used to filter out one frequency from a mixture.

In musical instruments, the motion of strings, membranes, and air columns consists of a superposition of SHM's; in engineering structures, vibrations are a common, though usually undesirable, feature. In many cases, complicated periodic motions can be understood as the superposition of SHM at many different frequencies.

Vibrio, genus of comma-shaped bacteria in the family Vibrionaceae. Vibrios are aquatic microorganisms, some species of which cause serious diseases in humans and other animals. The term vibrio is also used in a general sense for any of the species.

Vibrios are microbiologically characterized as gram-negative, highly motile, facultative anaerobes (not requiring oxygen), with one to three whiplike flagella at one end. Their cells are curved rods $0.5~\mu m$ (micrometre; $1~\mu m = 10^{-6}$ metre) across and 1.5 to $3.0~\mu m$ long, single or strung together in S-shapes or spirals.

Two species of vibrio are of significance to humans: *V. cholerae*, which is the cause of cholera (*q.v.*), and *V. parahaemolyticus*, the agent of an acute enteritis, or bacterial diarrhea. *V. anguillarum* is found in diseased eels and other fishes.

species native to Malaysia. Many species are cultivated for their ornamental foliage, fragrant clusters of usually white flowers, and colourful blue-black fruits.

The American wayfaring tree, or hobble-bush (V. alnifolium), native to eastern North America, grows to 3 m (10 feet) tall; it has roundish leaves, with white flower clusters and red berries that turn purple-black at maturity. The wayfaring tree of Europe, V. lantana, grows to 5 m (16 feet). The European cranberry, highbush cranberry, or water elder (V. opulus), a small tree reaching 4 m (13 feet) is native to northern Europe and North Africa. It has three- to five-lobed, maplelike leaves and round heads of white flowers that are followed by hanging clusters of shiny, bright red, translucent berries. The leaves turn red in autumn. V. trilobum, from northern North America, is similar but has short-stalked flowers and three-lobed leaves.

A variety of the European cranberry, *V. opulus* variety *roseum*, is known as snowball, or guelder rose, for its round, roselike heads of sterile florets. Chinese snowball (*V. macrocephalum* variety *sterile*) and Japanese snowball (*V. plicatum*) are common snowball bushes with large balls of white to greenish white flowers. The 4.5-metre- (15-foot-) high black haw (*V. prunifolium*), of eastern North America, has plumlike leaves, small white flower clusters, and blue-black berries.

Other North American species are the southern black haw (V. rufidulum), similar but taller; the sheepberry, or nannyberry (V. lentago), with finely toothed, oval leaves; and the arrowwood (V. dentatum), with roundish to oval, coarsely toothed leaves. Laurustinus (V. tinus), a 3-metre-tall evergreen with oblong leaves, is native to the Mediterranean area.

Sweet viburnum (V. odoratissimum), from India and Japan, bears dark-green, shiny, evergreen leaves and large clusters of fragrant flowers.

vicar (from Latin vicarius, "substitute"), an official acting in some special way for a superior, primarily an ecclesiastical title in the Christian Church. In the Roman Empire as reorganized by Emperor Diocletian (reigned 284–305), the vicarius was an important official, and the title remained in use for secular officials in the Middle Ages. In the Roman Catholic Church, "vicar of Christ" became the special designation of the popes starting in the 8th century, and eventually it replaced the older title of "vicar of St. Peter."

In the early church, the name vicar, or legate, was used for the representative of the pope to the Eastern councils. Beginning in the 4th century, vicar of the apostolic see or vicar apostolic came to mean a residential bishop with certain rights of surveillance over neighbouring bishops. By the 13th century a vicar was an emissary sent from Rome to govern a diocese that was without a bishop or in special difficulties. The Roman Catholic Church in England was governed by vicars apostolic from 1685 until 1850 when Pope Pius IX reestablished the English hierarchy. In modern times vicars apostolic are generally titular bishops appointed to rule territories not yet organized into dioceses.

A vicar general is appointed by the bishop as the highest administrative officer of the diocese, with most of the powers of the bishop. The pope governs his own diocese of Rome through a cardinal vicar and a special vicar general for the Vatican City. Vicar general is also the title for some heads of religious orders.

A vicar forane (or rural dean) is a priest in charge of a subdivision of a diocese called a forane vicariate, or deanery. In canon law a priest working with or in place of the pastor of a parish is called a vicar, or curate.

In the Church of England, a vicar is the priest of a parish the revenues of which belong to another, while he himself receives a stipend. A vicar general is employed by some bishops to assist in special duties.

In the Protestant Episcopal Church and in some Lutheran churches, the vicar is an assistant to the pastor.

Vicente, Gil (b. c. 1465, Portugal—d. 1536/37), chief dramatist of Portugal, sometimes called the Portuguese Plautus. He was also a noted lyric poet, in both Portuguese and Spanish

The record of much of Vicente's life is vague, to the extent that his identity is still uncertain. Some have identified him with a goldsmith of that name at the court of Evora; the goldsmith is mentioned in royal documents from 1509 to 1517 and worked for the widow of King John II, Dona Leonora. Others believe he was the master of rhetoric of the future King Manuel. His first known work was produced June 7, 1502, on the occasion of the birth of the future John III. This was a short play entitled Monológo del Vaquero ("The Herdsman's Monologue"), which was presented in Castilian in the apartment of Queen Maria. Later that year he produced for Christmas a longer but equally simple Auto Pastoril Castelhano ("Castilian Pastoral Play").

For the next 34 years he was a kind of poet laureate, accompanying the court from Lisbon to Almeirim, Thomar, Coimbra, or Evora and staging his plays to celebrate great events and the solemn occasions of Christmas, Easter, and Holy Thursday. The departure of a Portuguese fleet on the expedition against Azamor in 1513 turned his attention to more national themes; and in the *Auto da Exhortação da Guerra* (1513; "Play of Exhortation to War") and *Auto da Fama* (1515; "Play of Fame"), inspired by the victories of Albuquerque in the East, he wrote fervent patriotic verse. In 1514 he produced the charming *Comédia do Viúvo* ("The Widower's Comedy").

After the death of King Manuel in 1521, Vicente frequently complained of poverty, but he received various pensions in the new reign and enjoyed the personal friendship of King John III.

On the occasion of the departure by sea of King Manuel's daughter Beatriz to wed the duke of Savoy in August 1521, Vicente's Cortes de Júpiter ("Jupiter's Courts") was acted in a large room "adorned with tapestry of gold," a fact chronicled by his friend, the poet Garcia de Resende. The Frágua de Amor (1524; "The Forge of Love") was also written for a court occasion, the betrothal of King John III to the sister of the Holy Roman emperor Charles V. In the Auto Pastoril Português (1523; "Portuguese Pastoral Play"), the farce Juiz da Beira (1525; "The Judge of Beira"), the Tragi-comédia Pastoril da Serra da Estrela (1527; "The Pastoral Tragicomedy of Serra da Estrela"), and the satirical *Clérigo* da Beira (1529–30; "The Priest of Beira"), he returned to the peasants and shepherds of the Beira mountain country that he knew so intimately.

He devoted himself more and more to the stage and multiplied his output in answer to the critics of Sá de Miranda's school. In 1526 came the Templo de Apolo ("The Temple of Apollo"), followed in rapid succession by the biblical play Breve sumário da história de Deus ("A Brief Summary of the Story of God"), Nao de amores ("The Ship of Love"), Divisa da Cidade de Coimbra ("The Coat of Arms of the City of Coimbra"), and Farsa dos Almocreves ("The Muleteers' Farce"). These last three plays, with the Serra da Estrella, were all produced before the court in 1527 at Lisbon and Coimbra. On the other hand the Auto da Festa (1525; "The Festival Play") appears to have been acted in a private house at Evora.

Vicente was now over 60, but he retained his vigour and versatility. The brilliant scenes of two of his last plays, Romagem de Agravados (1533) and Floresta de Enganos (1536; "The Forest of Lies"), are loosely put together, and may well be earlier work; but the lyrical power of Triunfo do Inverno (1529; "The Triumph of Summer") and the long, compact Amadis de Gaula (1532) show that he retained his creative powers in his last decade. Auto da Mofina Mendes (1534), partly a religious allegory, shows his old lightness of touch and penetrating charm. Auto da Lusitânia, which was acted in the presence of the court in 1532, may with some plausibility be identified with the Caça de Segredos ("The Hunt for Secrets") at which Vicente tells us he was at work in 1525. It was the last of his plays to be staged at Lisbon in his lifetime; in Lent of 1534, by request of the abbess of the neighbouring convent of Odivelas, he produced there his religious Auto da Cananéia ("The Canaanite Play"), but the remainder of his plays were acted before the king and court at Evora; and it was probably at Evora that Vicente died in the year of his last play (1536).

Vicente's 44 plays admirably reflect the change and upheaval of his era in all its splendour and its squalor. Eleven are written exclusively in Spanish, 14 in Portuguese; the rest are multilingual; scraps of church or medical or law Latin, of French and Italian, of the dialect or slang of peasants, gypsies, sailors, fairies, and devils frequently occur. His drama may be divided into religious plays, foreshadow-

ing the Calderon *autos*, court plays, pastoral plays, popular farces, and romantic comedy. They were often elaborately staged: a ship was rowed on the scene, or a tower opened to display some splendid allegory; here too he anticipated the later Spanish drama.

The various plays of the years 1513–19, composed when he was about 50, show Vicente at the height of his genius. He possessed a genuine comic vein, an incomparable lyric gift, and the power of seizing touches of life or literature and transforming them into something new by the magic of his phrase and his satiric force, under which lay a strong moral and patriotic purpose.

Vicente López, partido (political subdivision) of Gran (Greater) Buenos Aires, Arg., directly north of the city of Buenos Aires, in Buenos Aires province, on the Río de la Plata estuary. Colonization of the area began with the second and permanent founding of Buenos Aires (1580). The region was called Costa de Monte Grande (later becoming the Pago de Monte Grande in 1730) and included the present partido of San Isidro. In 1706, the region became part of the parish of the San Isidro Labrador chapel, which in 1784 became San Isidro partido. In 1905 the partido of Vicente López was created out of San Isidro territory; its name honours the Argentine historian Vicente López, author of the country's national anthem.

The partido covers 15 sq mi (39 sq km) and is bordered by the Río de la Plata (northeast), the national capital (Buenos Aires, southeast), and the partidos of General San Martín (southwest) and San Isidro (northwest). Olivos is the cabecera (principal built-up area). Other localities are Vicente López, Florida, and Munro. Olivos, Vicente López, and Florida are primarily residential communities with some light industry. Munro has many manufacturing and processing establishments producing textiles, chemicals, lumber, metals, and food. Beach resort facilities are located along the coast of the partido in Olivos and Vicente López. The Argentine presidential residence is located in Olivos.

With the growth of the national capital, the partido of Vicente López has been absorbed into the north-northwestern suburban area of Gran Buenos Aires. The partido experienced most population growth in the 1920s through 1950s. Its population density is the second highest among the partidos. Three railway lines cross the partido, and the national highway system connects it with Buenos Aires city and other parts of Argentina. Pop. (1980) 291,072.

Vicenza, Latin VICETIA, city, episcopal see, and capital of Vicenza province, Veneto region, northern Italy, traversed by the Bacchiglione and Retrone rivers, at the eastern end of the valley between the Monti Lessini and the Monti Berici (which connects Lombardy with Veneto), northwest of Padua. Originally a settlement of the Ligurians or Veneti, it became the Roman Vicetia and, after the barbarian invasions, the seat of a Lombard duchy. In 1164 it formed part of the Veronese League against Frederick I Barbarossa and continued through the 13th century to struggle against the imperial power and local tyrant lords. It was ruled by the Scaligers from 1311 until it passed to the Visconti (1387) and in 1404 to Venice, whose fortunes it afterward shared. It suffered widespread destruction in World War II but has been largely restored.

Once surrounded by 13th-century walls, Vicenza is a compact city, famous as the home of the 16th-century architect Andrea Palladio and his successor Vincenzo Scamozzi, who enriched it with numerous buildings. The most notable Palladian structures are the Basilica (1549–1614); the Loggia del Capitanio (1571); the Teatro Olimpico (1580–84), Palladio's last work, finished by Scamozzi; and the Villa Ro-

tonda (1553–89), also completed by Scamozzi (1599). Palladio's Palazzo Chiericati (1551–57) houses the art museum, containing works by northern Italian painters, including the 15th- and 16th-century artist Bartolommeo Montagna, the best known painter of Vicenza. Earlier churches include the Gothic cathedral (13th century, rebuilt since 1944), Sta. Corona (1260, restored), S. Lorenzo (13th century), and SS. Felice e Fortunato (nucleus 4th century, with major restorations of the 10th–12th century). The Basilica of Monte Berico (rebuilt 1687–1702) and the Villa Valmarana (1669) stand outside the city.

The economic and communications centre of its province, Vicenza has engineering, food-processing, chemical, textile, and timber industries. Pop. (1981 prelim.) mun., 118,007.

viceroy, one who rules a country or province as the representative of his sovereign or king and who is empowered to act in the sovereign's name. Viceroy (virrey) was the title given to the principal governors of Spain's American colonies. In the early 16th century the great viceroyalties of New Spain (Mexico) and Peru were instituted; two more-New Granada and Río de la Plata-were created in South America in the 18th century. The viceroys were appointed by the king of Spain and the Council of the Indies from among noble Spanish families. Their official powers and duties were extensive: the collection and augmentation of royal revenues, the nomination of lesser colonial officials (both civil and ecclesiastical), the enforcement of the laws, the protection of the Indians and their conversion to Christianity, and, until the 18th century, the grant of encomiendas (grants of Indians for labour and tribute to certain colonists).

The powers of the viceroys were subject to various limitations: other important colonial officials were also crown appointed and could thwart them by dealing directly with Madrid; the home government's minute regulations on every aspect of colonial administration (though they were often ignored) tended to allow little discretionary power; the audiencia, a court that shared the viceroy's administrative responsibilities, often used its power to obstruct him. The viceroy's princely salary was supposed to prevent corruption. Commercial dealings were forbidden to him. Before laying down his office he was required to report to the king the principal deeds and events of his administration, which was also subjected to a iudicial review (residencia).

In Brazil, the captain general, who occupied a position similar to the Spanish viceroys, was styled viceroy from the mid-17th century. From the 14th century the governors appointed by the English crown to rule in Ireland were called viceroys; and between 1858 and 1935 the title was applied to the British governor general of India.

Vich, city, Barcelona province, in the autonomous community (region) of Catalonia, northeastern Spain, on the Plana (plain) de Vich. The city lies on the Río Meder (an affuent of the Ter). First inhabited by the Ausetanos, an ancient Iberian tribe, it was called Ausa; it was Romanized in the 2nd century and took the name Vicus Ausonensis (Ausona) in the 5th. In 826 it was destroyed by Arab invaders who rebuilt it as Vich in 885. A powerful self-governing city in the Middle Ages, it aided James I of Aragon in his conquest of Valencia (1235–38). The French, under Gen. Joseph Souham, defeated the Spanish at Vich in 1810.

The city has a restored Roman temple and a Neoclassical cathedral. The latter, founded in 1040 and reconstructed in the period 1780–1803, is notable for the wall paintings of José María Sert y Badía, whose earlier series were destroyed in 1936 when the building was sacked during the Spanish Civil War. The Museo Episcopal houses early Catalan paintings and Roman sculpture. Liberal Catholic philosopher and writer Jaime Luciana Balmes y Urpiá was a native of Vich. The city, a meat-processing and dairy centre, also produces cereals, textiles, and dyes. Pop. (1981) 30,057.

Vichada, commissariat, eastern Colombia, in the Orinoco River basin, bounded north and east by Venezuela and south by the Río Guaviare. It occupies an area of 38,704 sq mi (100,242 sq km), and is drained by several navigable tributaries of the Orinoco, including the Meta (along the northern border), Vichada, and Guaviare. As elsewhere in the llanos (plains), cattle raising is a dominant economic activity. There is also some fishing and hunting and gathering. The only major road roughly parallels the Río Meta from Villavicencio, Meta department, to the commissariat capital of Puerto Carreño (q.v.), on the Orinoco, the eastern border of the commissariat. Most travel, however, is by river or by air. Pop. (1981 est.) 14,355.

Vichuga, also spelled vičuga, centre of a rayon (district), Ivanovo oblast (administrative region), western Russian Soviet Federated Socialist Republic. It developed from a number of industrial villages and was incorporated in 1920. It is now an important centre of the textile industry, especially for cotton, and it also has casting and other industries. Pop. (1983 est.) 51,000.

Vichy, town, Allier département, Auvergne region, central France, on the east bank of the Allier River. A spa, it is separated from the river by parks surrounding the extensive bathing establishments.

Known to the Romans as Vicus Calidus, Vichy acquired fame for its alkaline springs in the 17th century. Royal patrons set the pattern of visits kept up by Napoleon III in the 19th century. During the later republics the number of visitors grew to more than 130,-000 a year. Vichy exports its bottled waters the world over. Following the Franco-German Armistice in 1940, it was at Vichy that Marshal Pétain set up his collaborationist government, known thereafter as the Vichy government. The town recently received a new impulse: the creation of a modern sports facility, together with a plan to develop an international water sports centre, including transformation of the existing bathing establishment by the building of an annex containing a commercial centre and deluxe hotels. Extensive development of the neighbourhoods of Bellerive and Cusset was planned. Pop. (1982) 30,522.

Vichy France, formally FRENCH STATE, French ÉTAT FRANÇAIS (July 1940–September 1944), France under the regime of Marshal Philippe Pétain from the Nazi German defeat of France to the Allied liberation in World War II.

The Franco-German Armistice of June 22, 1940, divided France into two zones, one to be under German military occupation, one to be left to the French in full sovereignty, at least nominally. The unoccupied zone comprised the southeastern two-fifths of the country, from the Swiss frontier near Geneva to a point 12 miles east of Tours and thence southwest to the Spanish frontier, 30 miles from the Bay of Biscay.

Although not a member of the government when the Armistice was signed, Pierre Laval joined it the following day and became the main architect of the Vichy regime. It was he who on July 10, 1940, persuaded the National Assembly (summoned at Vichy to ratify the Armistice) to grant Pétain authority to promulgate a new constitution (569 votes in favour, 80 against, 18 abstentions), so that Pétain was able, the next day, to assume in his own name full legislative and executive powers in the "French State." The Vichy governments in fact survived for four years by never promulgating a new constitution. Their policy changed in tune with the fortunes of the war. When close collaboration with the Germans proved impracticable, a plot was formed at Vichy against Laval, who fell from power in December 1940 and was succeeded as premier for a short time by Pierre Etienne Flandin and then by Adm. Jean Darlan. Backed by Charles Maurras's Action française (a paper that found in Vichy a chance to try out its traditionalist, semiroyalist doctrines), Pétain and Darlan embarked on a period of attentisme ("wait and see") in their dealings with Germany. Vichy became, at least superficially, a corporative state. The republican slogan of "Liberty, Equality, Fraternity" was replaced Work, Family, Fatherland." A labour charter was passed, and there was much talk of a Pétainist "national revolution."

In April 1942 Laval returned to power and contrived to convince the Germans that they could get more active collaboration from him. Germany was now engaged in massive war with Russia and with the United States and needed greater security in the West. But six months later the whole basis of Vichy's position was transformed. U.S. and British forces landed in North Africa; the main units of the French fleet were scuttled by their crews at Toulon; and on Nov. 11, 1942, Germany occupied the whole of France and disbanded the "armistice army" of Vichy.

Henceforth, Vichy had no assets with which to bargain, except the cult of loyalty to Pétain (which still kept many Frenchmen, at home and overseas, obedient to the Armistice) and the cleverness of Laval. It became increasingly a tool of German policy and, by January 1944, included extreme collaborators such as the National Socialist Marcel Déat. Darlan was assassinated in December 1942 in Algiers. Meanwhile, the internal resistance movements grew rapidly in strength and significance as large numbers of young men fled to the hills and open country to escape the German forced-labour laws. Living as outlaws in the maquis and aided by the country people and by supplies dropped by aircraft from Great Britain, they harassed German communications and transport in preparation

for Anglo-American landings. The six months

preceding D-day were a period of civil war in

France between the men of the maquis and

the German Gestapo aided by Vichy militias. When the provisional government of Charles de Gaulle moved to France after the Allied invasion of Normandy, it took over from a fascist regime in utter collapse. In September 1944, after the liberation of Paris, the new government declared Pétain's French State abolished, together with all its laws.

Laval fled to Germany and Austria but was captured and returned to France, where he was tried and executed (1945). Pétain, abducted to Germany, voluntarily returned to France for trial and was convicted; his death sentence, however, was commuted by de Gaulle to solitary confinement for life, and he died in prison (1951).

Vickery, Howard Leroy (b. April 20, 1892, Bellevue, Ohio, U.S.—d. March 21, 1946, Palm Springs, Calif.), U.S. naval officer and outstanding merchant shipbuilder of World War II.

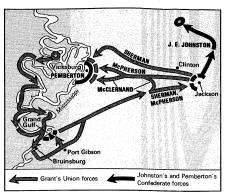

Vickery graduated from the U.S. Naval Academy, Annapolis, Md., in 1915 and became assistant to the chairman of the U.S. Maritime Commission in 1937. He was appointed a commissioner in 1940 and vice chairman of the commission in 1942, the year he became a rear admiral. Under his leadership, more than 5,500 oceangoing ships were built, an unprecedented production record and a contributing factor in winning World War II despite shipping losses inflicted by German submarines. In 1944 he was made a vice admiral.

Vicksburg, city, seat (1817) of Warren County, western Mississippi, U.S., on the Mississippi River, at the mouth of the Yazoo, 44 mi (77 km) west of Jackson. Frenchmen settled there in 1718 and built Fort-Saint-Pierre (1719) on the high bluffs, but the settlement was wiped out by Indians 10 years later. A military outpost established on the site by Spaniards in 1790 was known as Nogales, later called Walnut Hills. A sprawling community developed which was incorporated in 1825 and named for the Rev. Newitt Vick, a Methodist minister. The settlement prospered as a shipping point. Because of its strategic location, Vicksburg was besieged for 47 days during Gen. Ulysses S. Grant's campaign for control of the Mississippi River in the Civil War, before surrendering on July 4, 1863. The Old Courthouse (1858) is now a museum displaying Confederate and antebellum Americana.

Vicksburg is now a major tourist spot and a shipping centre for cotton, livestock, lumber, and paper products. Manufactures include earth-moving equipment, trailers, and light fixtures, and there are boatbuilding yards and U.S. government machine shops. The 1,741-ac (705-ha) Vicksburg National Military Park and Cemetery partially encircle the city. The U.S. Army Engineer Waterways Experiment Station is nearby. Pop. (1980) 25,434.

Vicksburg Campaign (1862–63), in the U.S. Civil War, decisive series of engagements fought at Vicksburg, Miss., halfway between Memphis and New Orleans on the Mississipper River; the campaign successfully divided the Confederacy and proved the military genius of Union Gen. Ulysses S. Grant.

When in the spring of 1862 the Confederates lost Ft. Henry and Ft. Donelson in Tennessee, and then New Orleans, Vicksburg became a key point in the Southern defense. The main Union objective was to clear the river and cut the South in half. Moving immediately to take advantage of the city's natural features, the Confederates constructed batteries and fortified the riverfront. These proved effective and held firm against Union naval bombardment in June; ironclads, which could run the batter-

ies but could not damage the city, withdrew a month later.

Anticipating attack by land, the South impressed or hired slave labour from nearby plantations to build fortifications to the rear and at nearby strategic points. Winter saw a series of Northern movements mostly remote from Vicksburg and none successful in reaching a high-ground approach to the city. About to lose his reputation for effectiveness, Grant established his headquarters on the Louisiana bank of the river above Vicksburg and designed a bold move. On April 16, 1863, a part of the upper fleet ran the batteries at Vicksburg, followed two nights later by four boats towing large barges. Meanwhile, the general had crossed the river and made his way southward to meet the ships at Bruinsburg. The fleet successfully ran the batteries at night on the 29th for a rendezvous with Grant and put the army across 10 miles below. Moving quickly before the enemy could concentrate its forces, Grant took Port Gibson on May 2, reached Grand Gulf on May 3, and prevented the Confederate army of General Joseph E. Johnston near Jackson from linking up with the Vicksburg forces.

At this point, the Southern high command made fateful contradictory decisions. Pres. Jefferson Davis wired Gen. John C. Pemberton to hold Vicksburg at all costs, but General Johnston, who had been driven out of Jackson by Grant on May 14, was in favour of abandoning the city until the armies of the South could be joined. Pemberton came out of Vicksburg on his way to Johnston's aid but met Grant moving westward and was forced to return to the city. Thus on May 18 Grant found himself in the rear of Vicksburg, having brought up men and supplies, and Pemberton was isolated. When assault failed, Grant settled down to siege tactics. By July 3 the besiegers were close to the Confederate lines, and Johnston had been prevented from coming to Pemberton's relief, nor could the latter escape across the river to Louisiana. On July 4, Pemberton surrendered approximately 30,000 men. The Mississippi River had been opened; the Confederacy was divided. Vicksburg proved a turning point in the Civil War, and Lincoln had found a new general.

Vico, Giambattista (b. June 23, 1668, Naples—d. Jan. 23, 1744, Naples), Italian philosopher of cultural history and law, who is recognized today as a forerunner of cultural anthropology, or ethnology. He attempted, especially in his major work, the *Scienza nuova* (1725; "New Science"), to bring about the convergence of history, from the one side, and the more systematic social sciences, from the other, so that their interpenetration could form a single science of humanity.

Early life and career. Vico was the son of a poor bookseller. In his family's home everyone was miserably huddled together in a mud-floored, ground-level room used simultaneously as a bookshop, living room, and kitchen. When he was scarcely seven, Vico injured his head falling from the ladder that led to the small second-floor attic that served as the sleeping room. The injury appeared so serious that the doctor predicted that it would lead to death or imbecility. Although the injury healed, he became stern and melancholy in nature. Vico later acknowledged this in his autobiography and observed: "such a nature do men with profound and active spirits possess."

Vico attended various schools, including a Jesuit college, for short periods but was largely self-taught. He had to study by candlelight in a miserable room crowded with a large family. He often skipped his classes, because his mediocre teachers could offer him nothing more than an arid Scholasticism, the system of Western Christian philosophy that flourished from the 11th to the 15th century but had declined greatly by the time of Vico. Despite his life of poverty, he was able to escape occasionally to the countryside; these excursions opened immense horizons beyond his limited early environment. In fact, personal experience, rather than reading, was the primary source of Vico's unique genius, although his reading was extensive, varied, and always distinguished by a personal interpretation.

Vico, portrait by an unknown artist; in the Biblioteca Angelica, Rome By courtesy of the Biblioteca Angelica, Rome

From early in life, Vico experienced the alternations of enthusiasm and discouragement, of exaltation and depression, that are often the sign of an overflowing imagination. These moods lifted him above his sad, mundane existence into the realm of ideas, where he encountered his first master, the Greek philosopher Plato. A critical spirit quickly intervened, and he turned to Tacitus, a Roman historian, and to Machiavelli, an Italian statesman and political philosopher, who portrayed men not as they should be but as they unfortunately are. Thus, contrasts soon became an important element in his thought: between nature and spirit; between the body, as "this sombre prison," and the soul; between the high aspirations of the imprisoned soul and the fall that awaits it when it yields to the desires of the senses.

Vico's thought became increasingly independent, and he preferred to meditate in solitude; but, at the same time, he frequented the fashionable salons, where he met several scholars of the time, such as Thomas Corneille, a French dramatist, and Giovanni Mario Crescimbeni, a literary historian, with whom he debated. Gradually, this circle of scholars became attracted by the ideas of René Descartes, Benedict de Spinoza, and John Locke, which were penetrating Naples at the end of the 17th century. Although Vico was distantly involved in the controversies, he continued to depend more upon the course of his own self-instruction.

Following an attack of typhus, Vico left

Naples and accepted a tutoring position in the home of the Duca della Rocca at Vatolla, south of Salerno, where he wrote his most authentic, and most despondent, poetry. There, secretly infatuated with his pupil, the young Giulia della Rocca, he discovered the pain of "social barriers"—barriers that were insuperable, because they were the vestige of entrenched ancient structures. Giulia, who admired Vico, died at the age of 22, shortly after her marriage to a young man "of her sphere." Although Vico always had a longing for a peaceful world, he felt that the discord that governs the individual spreads and that history itself only partially obeys the designs of Providence.

After his return to Naples, Vico found the next few years less difficult. He recovered from his ill-fated passion and in December 1699 married a childhood friend, Teresa Destito, who was well intentioned but almost illiterate and incapable of understanding him. In the same year he obtained a chair of rhetoric at the University of Naples. One of the duties of the professor of rhetoric was to open the academic year with a Latin oration, and Vico carried out this responsibility by giving the introductory lectures between 1699 and 1708. The last one, printed in 1709 under the title De Nostri Temporis Studiorum Ratione ("On the Method of the Studies of Our Time"), is rich with his reflections about pedagogical methods. This work was followed almost immediately by the publication of Vico's great metaphysical essay De Antiquissima Italorum Sapientia ("On the Ancient Wisdom of the Italians"), which was a refutation of the Rationalistic system of Descartes.

This tranquil interval, during which he brought his aging father to live with him, did not last. Three of his eight children died at an early age, and another, Ignazio, caused his parents grave anxiety and was even imprisoned for his debts. Vico was also disappointed in his own career, which had initially appeared promising. He failed to obtain the more prestigious and better paid chair of law that he actively sought. When a notice contemptuous of his work appeared in one of the scholarly publications, his fiery temper was sparked, and he wrote his pamphlet "Vici Vindiciae" "The Vindications of Vico") in reply. It was distressing for him to see so many mediocre thinkers favoured and to be unable to ensure publication of his most important work.

The outline Period of the "Scienza Nuova." of the work that he planned to call Scienza nuova first appeared in 1720-21 in a two-volume legal treatise on the "Universal Law." The outline was written in Latin and appeared in a chapter entitled "Nova Scientia Tentatur" ("The New Science Is Attempted"). The ideas outlined here were to be fully developed in a version that the powerful cardinal Corsini, the future pope Clement XII, agreed to sponsor. According to contemporary practice, this meant that he would assume the costs of publication. At the last moment the Cardinal withdrew, pleading financial difficulties. It is probable, however, that the Cardinal was alarmed by certain of Vico's propositions, which were bold for that period, such as the notion that human society went through a "bestial" stage and that it is possible for society to revert to this primitive barbarism in which men possess only an obscure form of

According to his autobiography, since he lacked money to publish the full text of his work, Vico sold the only jewel he possessed—a family ring—and reduced his book by two-thirds. It appeared in 1725 under the title Scienza nuova but was unsuccessful. Vico complained bitterly of the virtually universal indifference that his masterpiece evoked. He quickly regained his confidence, however, and returned to his work with energy. His mind was crowded with ideas, but ordering and sys-

tematizing them was a trying task for him. He thought as a poet, not as a dialectician. Nevertheless, he began a total revision and restructuring of his work.

In his autobiography Vico revealed that a vain hope had been born in him when Jean Leclerc, an encyclopaedist and one of the greatest scholars of the time, had written to him from Amsterdam in 1722 asking for information about him. Vico had sent his two-volume legal treatise to him, and Leclerc had devoted 17 two-column pages in the 1722 edition of his Bibliothèque ancienne et moderne ("Ancient and Modern Library") to Vico. This, however, was a trifle in comparison with the 70 pages devoted to Paola Mattia Doria, a friend of Vico from the salons of Naples. His hope was further betrayed when the Scienza nuova was not mentioned in subsequent volumes of the celebrated Bibliothèque.

Vico's effort to restructure his masterpiece was completed as the second edition of the *Scienza nuova*. It was actually the fourth edition, if the outline contained in the legal treatise and the "fragments" written between 1729 and 1732 are taken into account. The definitive edition that appeared posthumously in 1744, however, was marked *terza impressione* ("third edition") and was conceived according to a very different and greatly revised plan.

Vico's contemporaries portray him, in his old age, awakening intermittently from his exhaustion to dash off prophetic lines or to comment on a text from some classical author for the few pupils remaining to him. He found satisfaction in the fact that his eldest son, Gennaro, succeeded him in his chair at the university. Surrounded by the three survivors of his once numerous family (Ignazio had died shortly after his release from prison), Vico died. Since the stairway of his house was too narrow to permit passage of his coffin, it had to be lowered through a window, and then it was unceremoniously borne to the church of the Oratorian priests, where his remains are still kept

Vico's vision. Vico had his own vision of man and the universe, and, in a time when the deductive method brought into fashion by Descartes was much employed, he posed the modern problem of sense: the sense of life and of history. He discovered the irrational, the small flame that at certain times grows imperceptibly in the heart of reason. His philosophy recognized the aspirations of humanity, its obsessions and dreams, its precarious achievements, and its frustrations and defeats. He described human societies as passing through stages of growth and decay. The first is a "bestial" condition, from which emerges "the age of the gods," in which man is ruled by fear of the supernatural. "The age of heroes" is the consequence of alliances formed by family leaders to protect against internal dissent and external attack; in this stage, society is rigidly divided into patricians and plebeians. "The age of men" follows, as the result of class conflict in which the plebeians achieve equal rights, but this stage encounters the problems of corruption, dissolution, and a possible reversion to primitive barbarism. Vico affirmed that Providence must right the course of history so that humanity is not engulfed in successive cataclysms.

According to Vico, the origin of unequal social classes, which often retain the rigidity of primitive castes, must be attributed to imperfect forms of religion, not to technological progress. All of Vico's anthropology is based on the affirmation of the absolute primacy of religion, which was no doubt suggested to him by the thought of Giovanni Pico della Mirandola, an Italian Renaissance philosopher. Vico observed that three principles are dominant in the birth and regeneration of nations: "All the people have a religion; official marriages are celebrated among them; and the burial of the dead is a properly human and universal cus-

tom." Modesty and piety are the basic moral sentiments, the pillars on which the family is built. When they crumble, the descent toward the bestial state of man accelerates. Without expressly saying so, Vico thought that the degeneration that struck down the idolatrous religions of ancient times could even overtake what for him was the true religion—Christianity, which had established monasteries as refuges from the world and had secured the purity of sentiments and morals.

A second basic notion of Vico is that man has a mixed nature: he remains closer to the beast than to the angel. For Vico the second stage of barbarism, which closes the age of men, arises from an excess of reflection or from the predominance of technology. This stage heralds an imminent new beginning of history. The fundamental perversity of the second stage of barbarism makes it, in fact, more dangerous than the first, which in its excess of strength contains noble impulses that need only to be brought under control. Man becomes a coward, an unbeliever, and an informer, hiding his evil intentions behind "flattery and hypocritical wheedling." Families live huddled together in tentacled cities, veritable "deserts of souls." These degenerate peoples do not hesitate to rush into the worst of slaveries to find shelter and protection. Money becomes the only value. This dissolution from the age of men to the bestial state exposes humanity to a fate far worse than arrests or regressions of civilizations. Vico hoped to serve warning to men of the evils that could overtake them if they became worshippers of a materialist ideology or the servants of a science uninformed by conscience.

Influence. Johann Wolfgang von Goethe, the great German writer, received a copy of the second edition of Scienza nuova from an enthusiastic student of Vico whom he visited in Naples in 1787. In an article published that same year, Goethe spoke of the dead writer "wisdom is now endlessly praised by Italian legal writers." He said that the work had been handed to him "as though it were a sacred thing" and that it contained "prophetic insights on the subject of the good and the just that we shall or must attain in the future, insights based on sober meditation about life and about the future." Convinced by the strength of Vico's demonstration, Goethe henceforth believed that the evolution of humanity should be represented not by a continually ascending line but by a spiral. Nevertheless, it appears that Vico's work was not widely read during the 18th century.

In the 19th century, Jules Michelet, a great nationalist and romantic historian of France, called Vico "his own Prometheus," his intellectual forerunner. Michelet eventually abandoned the idea of recourse to Providence but continued to cite Virgil and Vico as his authorities. Auguste Comte, the French Positivist philosopher, hailed Vico as an influence in the formulation of his law of the three states, or ages, of mankind. Karl Marx, who developed an economic interpretation of history, owed a great deal more to Vico than he himself acknowledged; in fact, there was a close relationship of dependence. They were separated, however, by their major difference over religion. Today, many scholars see in Vico the forerunner of the sciences of anthropology and ethnology. In fact, in recent times, despite the obscurity of his style, Vico has been increasingly recognized as one of the important figures in European intellectual history, and Scienza nuova has been accepted as one of the landmark works in that history.

Victor, name of popes and antipopes, grouped below chronologically and indicated by the symbol •.

• Victor I, SAINT (b. Africa—d. 199, Rome?; feast day July 28), pope from c. 189 to 199. Succeeding St. Eleutherius in 189, Victor is hailed for having asserted Roman authority in the church. Most notably, he imposed the Roman date for Easter over that celebrated by the Quartodecimans, or Asiatic Christians, whom he threatened to excommunicate if they did not follow suit. This threat was reputedly the first papal act to influence ecclesiastical affairs of the Eastern patriarchs.

Under Victor, Latin replaced Greek as the official language of the Roman Church, and Victor himself wrote in Latin. In addition to settling the Easter controversy, he held a number of synods at Rome to deal with the Dynamic Monarchian heresy of the Byzantine merchant Theodotus, whom Victor excommunicated for teaching that Jesus was a normal human being until his Baptism, when the divine power (dynamis) descended upon him. Victor's actions were more characteristic of a pope than those of any of his predecessors.

• Victor II, original name GEBHARD OF DOLLNSTEIN-HIRSCHBERG (b. c. 1018, Swabia—d. July 28, 1057, Arezzo, Tuscany), pope from 1055 to 1057. He was of noble birth and was appointed bishop of Eichstätt in 1042. He eventually became chief adviser to the Holy Roman emperor Henry III, who in 1054 nominated him as Pope St. Leo IX's successor. After his consecration on April 13, 1055, Victor joined Henry at Florence. There, in June, they held a council that condemned clerical marriages and simony. In similar synods at Lyon (1055) and Toulouse (1056), he expanded his clerical reform.

In 1056 he was summoned to the imperial court in Germany to attend Henry's death (October 5). As guardian of the Emperor's infant son, Henry IV, and as adviser to the empress regent Agnes, Victor wielded enormous power, which he employed tactfully to maintain peace throughout the empire and to

strengthen the papacy against baronial aggressions.

• Victor III, BLESSED, original name DAU-FERI, Benedictine name DESIDERIUS (b. 1027, Benevento, Principality of Benevento—d. Sept. 16, 1087, Montecassino, Principality of Capua; beatified July 23, 1887; feast day September 16), pope from 1086 to 1087.

Of noble birth, he entered the Benedictine monastery of Montecassino, where he changed his name to Desiderius and where in 1058 he succeeded Pope Stephen IX (X) as abbot. His rule at Montecassino marks its golden age, for he promoted writing and manuscript illumination, established an important school of mosaic, and radically reconstructed the abbey, considered a major event in the history of Italian architecture. He was made cardinal priest by Pope Nicholas II in 1059 and papal vicar in southern Italy, where he negotiated peace between the Normans and the papacy.

Favoured by the cardinals and his predecessor, St. Gregory VII, Desiderius was chosen pope, but he declined the office, and the year 1085 passed without an election. On May 24, 1086, the cardinals proclaimed him pope against his will, but before his consecration was completed, he was driven from Rome by supporters of the Holy Roman emperor Henry IV, who had set up the antipope Clement III in 1084. Victor retired to Montecassino.

In March 1087 he convened a synod at Capua and resumed his authority. He received belated consecration in St. Peter's, Rome, on May 9, but imperial support for Clement made it impossible for Victor to spend more than a few weeks in the city. He sent an army to Tunis, where it defeated the Saracens and compelled them to pay tribute to Rome. In August 1087 he held, at Benevento, a synod that excommunicated Clement; banned Hugues of Die, archbishop of Lyon, and Abbot Richard of Marseille as schismatics; and condemned lay investiture. Falling ill at the synod, Victor returned to Montecassino, where he died.

• Victor (IV), original name GREGORY CONTI (fl. 12th century), antipope from March to May 29, 1138. He was a cardinal when chosen pope by a faction opposing Pope Innocent II and led by King Roger II of Sicily and the powerful Pierleoni family.

Victor succeeded the antipope Anacletus II (Pietro Pierleoni), but the renowned mystic abbot St. Bernard of Clairvaux influenced him to reconcile with Innocent. He submitted at Rome on May 29.

• Victor (IV), original name OTTAVIANO DE MONTICELLO (d. April 20, 1164, Lucca, Tuscany), antipope from 1159 to 1164, the first of four antipopes established against Pope Alexander III by the Holy Roman emperor Frederick I Barbarossa. (In adopting his papal name, he ignored the antipope Victor of 1138.)

Made cardinal by Pope Innocent II in 1138, he was elected by a minority of cardinals in September 1159, while, concurrently, a majority elected Alexander as Adrian IV's successor. After a scandalous scene between Victor and Alexander, Victor's armed supporters burst into St. Peter's, Rome, and enthroned him, forcing Alexander to withdraw.

Frederick, as protector of the church, attempted to solve the schism both through diplomacy and by convening the Council of Pavia in 1160 to obtain ecclesiastical endorsement for Victor. Europe, however, rejected any revival of imperial control over the papacy. Even in Germany some clergy remained loyal to Alexander. Victor never received much support and anathematized Alexander, who excommunicated Frederick for convoking the council. Victor was succeeded by the antipope Paschal III.

Victor Amadeus, Italian VITTORIO AMEDEO, name of dukes of Savoy and kings of Sardinia, grouped below chronologically and indicated by the symbol •.

• Victor Amadeus I (b. May 8, 1587, Turin, Savoy—d. Oct. 7, 1637), duke of Savoy from 1630 to 1637, son of Charles Emmanuel I.

The French were again occupying Savoy when his father died in 1630, but by an alliance with France-his wife Christine was a daughter of King Henry IV—he managed to recover Savoy and obtain one-third of Montferrat by the Treaty of Cherasco (1631). At the same time, he had to yield the Piedmontese fortress of Pinerolo to the French, who were thereby to hold a threat of domination over Savoy for the next 65 years. He was a wise and popular ruler. His eldest son, Francis Hyacinth (Francesco Giacinto), a minor, died within a year of his own death, and his second son, Charles Emmanuel II, also a minor, remained long under the regency of his mother during a period of civil war.

• Victor Amadeus II (b. May 14, 1666, Turin, Savoy—d. Oct. 31, 1732, Moncalieri, near Turin), duke of Savoy who through his diplomacy became the first king of Sardinia-Piedmont and thus established the foundation for the future Italian national state. He grew up under the protection of a regency headed by his mother, Marie de Savoie-Nemours (died March 15, 1724), who amid the power-politics rivalries of the day pursued a pro-French policy; and he married Anna d'Orléans, a niece

of Louis XIV. But on the renewal of the wars in 1690, he joined the Austrian and Spanish Habsburgs against Louis; when the Spaniards refused to agree to his acquisition of Milan, he made a separate peace distinctly favourable to his interests. In the next war, that of the Spanish Succession, he began on the French side, but in 1703 he changed to the Habsburg and ultimately extracted the title of king of Sicily (1713), later traded for that of Sardinia (1720).

In 1730 Victor Amadeus abdicated in favour of his son, Charles Emmanuel III, but, when he changed his mind and attempted to reassume his throne, Charles Emmanuel had him arrested (1731) and confined for the remainder of his years.

• Victor Amadeus III (b. June 26, 1726, Turin, Piedmont, Kingdom of Sardinia—d. Oct. 16, 1795, Moncalieri, near Turin), Savoyard king of Sardinia (Piedmont–Sardinia) from 1773 to 1796.

Victor Amadeus, the son of Charles Emmanuel III, was incapable and extravagant, and he chose equally incapable ministers. On the outbreak of the French Revolution he sided with the royalists and was eventually brought into conflict with the French Republic. Although his troops had some successes against the French in 1792, 1794, and 1795,

his army became demoralized and the treasury empty; and Napoleon Bonaparte's campaign of 1796 forced Victor Amadeus to accept the Armistice of Cherasco and the Treaty of Paris, whereby he ceded Savoy and Nice to France and granted free passage across Piedmont to the French. He died soon afterward, being succeeded by his timid and ascetic son, Charles Emmanuel IV.

Victor Emanuel Range, section of the central highlands, Papua New Guinea, east of the Star Mountains and forming part of the boundary between West Sepik and Western provinces. The rugged rampart, rising sheer from the south to over 10,000 ft (3,000 m), is composed of coralline limestone, which is so porous that water falling on it quickly percolates into the ground, making surface water scarce.

Victor Emmanuel, Italian VITTORIO EMANUELE, name of kings of Sardinia (Sardinia-Piedmont), grouped below chronologically and indicated by the symbol •.

• Victor Emmanuel I (b. July 24, 1759, Turin, Kingdom of Sardinia—d. Jan. 10, 1824, Moncalieri, near Turin), duke of Aosta, duke of Savoy, and king of Sardinia (1802–21) on his brother Charles Emmanuel IV's abdication.

He participated in the First Coalition against Revolutionary France (1792–97). All his dominions save Sardinia were occupied by the French during 1802–14. His kingdom was later restored, with the addition of Genoa, by the Final Act of the Congress of Vienna (June 9, 1815), but he abdicated (1821) in favour of another brother, Charles Felix.

• Victor Emmanuel II (b. March 14, 1820, Turin, Piedmont, Kingdom of Sardinia—d. Jan. 9, 1878, Rome), king of Sardinia-Piedmont who became the first king of a united Italy.

Brought up in the court of his father, Charles Albert, and given a conventional monarchical education emphasizing religious and military

training, he was married to his cousin Maria Adelaide, daughter of an Austrian archduke. After the Revolution of 1848, when war broke out with Austria, Victor Emmanuel was given command of a division. In the luckless campaign that followed he proved a brave soldier but an indifferent general.

Ascending the throne on his father's abdication, he consolidated his position by suppressing the republican left and paying an indemnity to Austria, which brought him considerable opprobrium in Italy. In November 1852 he made the momentous decision to turn the government over to the able, determined Count Cavour, whose skillful manoeuvres over the next few years made him king of Italy. At the decisive battles of Magenta and Solferino, he commanded the Piedmontese corps in person, and following the armistice of

Villafranca, he exercised a valuable restraint on Cavour, who wanted to continue the war alone. The following year Victor Emmanuel secretly encouraged Garibaldi in the conquest of Sicily and Naples; he then led his Piedmontese army into papal territory to link up with Garibaldi in the face of an excommunication by Pius IX.

Following Cavour's death in 1861, Victor Emmanuel played a more direct role in government and despite setbacks achieved two notable triumphs: the acquisition of Venetia through war on the side of Bismarck's Prussia in 1866, and of Rome after the withdrawal of the French garrison in 1870. The occupation of Rome as the national capital so antagonized Pius IX that he refused all overtures toward reconciliation, and no meeting ever took place between the two sovereigns; nevertheless, on Victor Emmanuel's death in 1878 Pius permitted his burial in the Pantheon.

• Victor Emmanuel III (b. Nov. 11, 1869, Naples—d. Dec. 28, 1947, Alexandria), king of Italy whose reign brought the end of the Italian monarchy.

After a mainly military education, he came suddenly to the throne in 1900 on the as-

sassination of his father, King Umberto I. A tractable constitutional monarch, he accepted a Liberal cabinet and readily acquiesced in Italy's war against Turkey in 1911 and entrance into World War I in 1915.

When the strains put on the parliamentary system by the war brought Mussolini to the fore, Victor Emmanuel failed to prevent the Fascist seizure of power, though it apparently lay in his hands to do so merely by signing the decree of martial law proposed by the cabinet. He was quickly reduced to a figurehead or less by the Mussolini dictatorship, but in 1943, following disastrous Italian military reverses in World War II, capped by the Allied invasion of Sicily, Victor Emmanuel surprised the world by having Mussolini arrested and installing Marshal Pietro Badoglio as premier. The move failed to extricate Italy from the war or the King from his difficult position, and finally, on June 5, 1944, the day after the Allied liberation of Rome, he named his son Crown Prince Umberto lieutenant general of the realm, relinquishing all power for himself but retaining his title of king.

In 1946 public opinion forced a plebiscite to decide between the monarchy and a republican form of government. In an effort to influence the vote in favour of the dynasty, Victor Emmanuel abdicated in favour of Umberto (May 9, 1946), but the plebiscite resulted in a victory for the republic, and both Victor Emmanuel and Umberto went into exile.

Victor Harbour, town and coastal resort, South Australia, situated at the mouth of the Inman River, on the northwest shore of Encounter Bay (so called for the chance meeting of the British explorer Matthew Flinders and the French navigator Nicolas Baudin, in 1802). Founded in 1839, the town was named

for HMS "Victor," a ship that had entered the bay two years earlier. In the 1880s there was a concerted effort to make the harbour (protected from the sea by the small Granite Island) the primary outlet for Murray River Basin traffic, and it did hold some importance as a port until 1912.

Declared a town in 1914, Victor Harbour is a service centre for a region producing beef and dairy cattle, sheep, fruits, and wine. Fine beaches and easy access from Adelaide (52 mi [84 km] north) have helped to make the place the state's leading coastal resort. Pop. (1981) 4,522.

Victor-Perrin, Claude, DUC (duke) DE BELLUNE, byname CLAUDE PERRIN (b. Dec. 7, 1764, La Marche, Fr.—d. March 1, 1841, Paris), a leading French general of the French Revolutionary and Napoleonic wars, who was created marshal of France in 1807.

In 1781 he entered the army as a private soldier and, after 10 years' service, received his discharge and settled at Valence. Soon afterward he joined the local volunteers, rising to the command of a battalion. He served at Toulon (1793), in the Italian campaign of 1796-97, in La Vendée, and then in Italy at Marengo. In 1802 he was governor of the colony of Louisiana for a short time; in 1803 he commanded the Batavian army, and in 1805-06 was French plenipotentiary at Copenhagen. On the outbreak of hostilities with Prussia he joined the V Army Corps as chief of the general staff. He distinguished himself at Saalfeld and Jena; and after Friedland, where he commanded the I Corps, Napoleon gave him the marshalate. After the Peace of Tilsit he became governor of Berlin, and in 1808 he was created duke of Belluno (Bellune). In the same year he was sent to Spain, where he took a prominent part in the Peninsular War (especially at Espinosa, Talavera, Barrosa, and Cádiz), until his appointment in 1812 to a corps command in the invasion of Russia. There his most important service was in protecting the retreating army at the crossing of the Beresina.

He took an active part in the wars of 1813–14, until in February of the latter year he had the misfortune to arrive too late at Montereau-sur-Yonne. The result was a scene of violent recrimination and his supersession by Napoleon, who relieved him of his command.

Victor-Perrin now transferred his allegiance to the Bourbons and in December 1814 received from Louis XVIII the command of the second military division. In 1815 he accompanied the King to Ghent, and on the Second Restoration he was made a peer of France. He was war minister in 1821–23. In 1830 he was major general of the royal guard, and after the revolution of that year he retired altogether into private life.

Victoria, in full ALEXANDRINA VICTORIA (b. May 24, 1819, Kensington Palace, London—d. Jan. 22, 1901, Osborne, near Cowes, Isle of Wight, Eng.), queen of the United Kingdom of Great Britain and Ireland (1837–1901) and empress of India (1876–1901), last of the House of Hanover, who gave her name to an era, the Victorian Age. She and her husband, Prince Consort Albert of Saxe-Coburg-Gotha, had nine children; through their marriages there descended many of the royal families of Europe.

A brief account of the life and works of Queen Victoria follows; for a full biography, see MACROPAEDIA: Victoria and the Victorian

Victoria's long reign restored dignity and popularity to the British crown and may have saved the monarchy from abolition. The only child of Edward, duke of Kent, Victoria acceded to the throne in 1837. Prince Albert,

her cousin, on his first court visit, met her at Windsor on Oct. 10, 1839. Victoria proposed to him five days later, and they were married in the following February. She was devoted to her husband, relied on his advice, and mourned his premature death (1861) for the last 40 years of her reign. In the latter period she favoured the Conservative Party, but her influence on governments was slight, consisting essentially of a long rearguard action against the growth of "democratic monarchy," a development to which she herself had actually contributed by making the monarchy respectable. At her death, in contrast to the situation at her coronation, its continuance was guaranteed.

Victoria, formally EMPRESS FREDERICK, original name VICTORIA ADELAIDE MARY LOUISE, German KAISERIN FRIEDRICH, Or VIKTORIA ADELHEID MARIA LUISE (b. Nov. 21, 1840, London—d. Aug. 5, 1901, Schloss Friedrichshof, Kronberg, Ger.), consort of the German emperor Frederick III and eldest child of Queen Victoria and Prince Albert of Great Britain.

Well-educated and multilingual from child-hood (spent largely at Windsor and Buckingham Palace), she remained all her life strongly devoted to England and, even after her marriage to the Prussian crown prince, Frederick William, in 1858, spoke English habitually in her German household. Her English liberalism came to be shared by her husband (whom she tended to dominate) but was scorned by the conservative Prussians, especially the old emperor, William I, and Otto von Bismarck, with whom a mutual resentment developed. Within the constraints of her position, however, she encouraged philanthropic causes and the arts.

When her husband developed throat cancer and died only 99 days after becoming emperor (as Frederick III) in 1888, she lost all possibility of influencing a change of political climate. She was again subjected to estrangement, for her son, the new emperor William II, was thoroughly Prussianized. Although later somewhat reconciled to him, she semi-retired to Kronberg in the Taunus hills, where she built a palatial country seat, Schloss Friedrichshof. She died there of cancer, outliving her mother by only six months.

Victoria, state of southeastern Australia, occupying a mountainous coastal region of the continent.

The following article summarizes the administrative history, geography, demographic patterns, economy, and culture of Victoria; for additional treatment of its geography and history, see MACROPAEDIA: Australia.

Victoria is separated from New South Wales to the north by the Murray River for a length of 1,065 mi (1,714 km) and by an additional artificial boundary of 110 mi. The western boundary is with South Australia, and the southern coastline on the Tasman Sea and the Indian Ocean stretches for 980 mi and includes the shoreline of Port Phillip Bay. Melbourne, the state capital, is at the head of the bay off Bass Strait.

Victoria has a rich variety of landscapes. The main upland areas are a southern continuation of the Dividing Range of eastern Australia. Plains surround this upland core on the north, west, and south. The southern plains are divided into smaller areas by the Otway Range, the South Gippsland Highlands, and Port Phillip Bay. Victoria can thus be divided into three geographical regions. The central uplands contain the most extensive forest in the state. There is some mixed farming in the sheltered valleys. Most of the northern plains consist of the Mallee, an infertile area

of unreliable rainfall which supports Mallee eucalyptus and little else. There is, however, a narrow fertile strip adjoining the Murray River. There the agriculture consists of wheat growing and the raising of Merino sheep and prime lambs. The southern plains are divided by Port Phillip Bay. These plains are grazed to support the wool, beef, and dairy industries.

Victoria comes second after New South Wales among Australian states in terms of production and population but in the late 20th century it sustained the fastest economic growth, fueled after 1965 by the exploitation of gas and oil fields in Bass Strait and the completion of a new integrated steel plant. In the 1980s Victoria had a broadly based economy with well-developed primary, manufacturing, and service sectors. About a third of the work force was engaged in manufacturing, with lesser numbers in commerce, farming, construction, and transport. Most of the factories are located in Melbourne, which is also the major port and the focus of the rail, air, and road systems of Victoria.

Before 1939 the majority of Victoria's population had been born in Australia, but after 1945 the country in general and Victoria in particular encouraged large-scale immigration from Europe in order to make the country

dustries that extend beyond the state, and by state wages boards for those within. The economy is strong and since 1945 has been able to absorb large numbers of migrants and still have full employment. There has been a 40-hour workweek since 1948 and most employees are covered by long-service awards and compensation schemes.

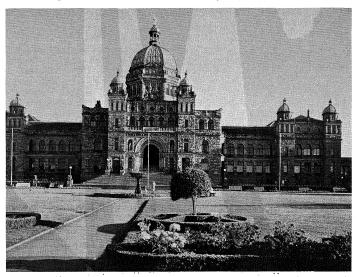

Education is compulsory and free to the age of 15. There are three universities in Victoria.

The most important modern cultural development in Victoria has been the creation of the Victorian Arts Centre near Melbourne. The entire project included art galleries, court-yards for theatrical productions, a convention centre and concert hall, a display centre, and a hall for state receptions. There are several other art galleries at different centres such as Geelong and Bendigo. Melbourne also has an orchestra that has made successful overseas tours.

Area 87,884 sq mi (227,620 sq km). Pop. (1981) 3,832,443.

stronger economically and strategically and to assist European refugees made homeless by World War II.

Victoria was politically separated from New South Wales in 1851; responsible government was conferred in 1855, with power vested in a bicameral legislature consisting of a Legislative Assembly and a Legislative Council. The leader of the party with the greatest plurality in the Legislative Assembly is the premier-designate and forms a government for the proforma approval of the governor-general, the titular representative of the British Crown. This slate of proposed ministers becomes the Executive Council, which advises the governor-general, whose position places him above party politics, and he is regarded as the trustee of the constitution.

Voting is compulsory and universal adult suffrage prevails. Members of the Legislative Assembly are elected in single-member electorates for three-year terms; members of the Legislative Council are elected from two-member districts for six-year terms. In the early 1980s there were four major political parties: the Liberal Party, the Country Party, the Australian Labor Party, and the Democratic Labor Party.

Wages and working conditions in Victoria are supervised by the Commonwealth Conciliation and Arbitration Commission, for inin 1843 as a Hudson's Bay Company fur-trading post known as Ft. Camosun, which was later renamed Ft. Victoria to honour the English queen.

Victoria, which retains a distinct transplanted English atmosphere, served as capital of the colony of Vancouver Island from 1848, before becoming the administrative centre of the united colony of British Columbia in 1868. The city was associated with the gold rush of the 1860s; it is now one of the largest commercial and distribution centres of the province and, because of its equable climate, a popular tourist resort and retirement community. A major Pacific-coast port, with a naval base and dockyard, Victoria is connected to mainland Canada and the U.S. by air and ferry service and to the remainder of the island by rail and highway. Manufacturing is centred on the forest-products industry but also includes shipbuilding and food processing. The city is the site of Victoria University (1963; formerly Victoria College, established in 1902), an armed forces training college (Royal Roads), The British Columbia Provincial Museum (1886), and an astrophysical observatory. The Victorian-style Parliament Buildings (seat of the provincial legislative assembly) overlook the Inner Harbour and yacht basin. Included in Victoria's metropolitan area are the communities of Esquimalt, Oak Bay, and Saanich.

Victoria, city and capital of the British Crown Colony of Hong Kong (q,v), on the north shore of Hong Kong Island, across a strait from Kowloon on the mainland, with which it is connected by ferry and by automobile and mass transit railway tunnels. The city is the chief commercial and cultural centre of Hong Kong and is the headquarters for numerous international banks and corporations. Pop. (1981) 590,771.

Victoria, town and capital of the Republic of Seychelles, located on the northeastern coast of Mahé Island, the largest island in the Seychelles group. Victoria is the only port of the archipelago and the only town of any size in Seychelles. Three-fourths of the people of Mahé Island live in Victoria. The port has

deep water for large ships and is capable of accommodating four ships at one time. An inner harbour provides facilities for smaller craft. An international airport was built near Victoria in 1971, subsidized by British funds in compensation for the temporary removal of certain islands from Seychelles hegemony. As the business and cultural centre for the country, the town has modern facilities including a hospital and a teacher-training college. Victoria is connected by paved roads to major points on Mahé Island. Pop. (1980 est.) 23,-880

Victoria, city, seat (1836) of Victoria County, southern Texas, U.S. It lies along the Guadalupe River, 85 miles (137 km) northeast of Corpus Christi. Founded in 1824 by Spanish settlers under Martín de León, it was named to honour both Nuestra Señora de Guadalupe de Jesus Victoria (Our Lady of Guadalupe) and Guadalupe Victoria, the first Mexican president. Actively involved in the Texas Revolution, it was incorporated (1839) as a city in the Republic of Texas. It developed as a cattle centre and became a rendezvous for trail drivers moving northward.

Since the 1940s Victoria has become a hub for oil, gas, and petrochemical production of the Texas Gulf Coast. The city's industrial growth was stimulated by completion (1963) of the 35-mile- (56-kilometre-) long Victoria Barge Canal to the Gulf Intracoastal Waterway. Institutions in the city include Victoria College (1925), the University of Houston at Victoria (1973), and a museum. Pop. (1985 est.) city, 58,851; metropolitan area (MSA), 76,000

victoria, French carriage, named for Queen Victoria at least by 1844, and renowned for its elegance. It was first imported into England by the Prince of Wales in 1869, where it rapidly gained popularity. It was usually pulled by one or two horses.

The victoria was a low, light, four-wheeled, doorless vehicle with a forward-facing seat for two persons covered with a folding top, or calash, and a removable, elevated coachman's seat above the front axle. The graceful body curved down from the coachman's seat to the floorboards, and up again like a gently sloping chair. Panel-boot victorias were, confusingly,

Victoria, Guadalupe, original name MANUEL FÉLIX FERNÁNDEZ (b. 1786, Tamazuela, Mex.—d. 1843, Perote), Mexican soldier and political leader who was the first president of the Mexican Republic.

Victoria left law school to join the movement for independence from Spain, fighting under José María Morelos in 1812. He changed his name to show his devotion to the cause of Mexican independence (the image of the Virgin of Guadelupe, the patron saint of Mexico, had been adopted as a symbol of the insurgency). After the death of Morelos, Victoria waged guerrilla war against the Spaniards from the mountains around Veracruz and Puebla. When Agustín de Iturbide came to power (1821), Victoria at first supported him, but by 1822, as Iturbide arrested all political opponents and dissolved the legislature, Victoria denounced him and joined Antonio López de Santa Anna's successful revolt in 1823.

Victoria became Mexico's first elected president (1824-29), but, while honest, unassuming, and a courageous general, he was not particularly suited for the presidency. The inexperienced administrator was not able to deal effectively with the constant political bickering and Byzantine machinations of government rivals, often being taken advantage of by those he trusted. It is small wonder that little progress was made domestically and the economy was in a shambles. During Victoria's tenure in office, Iturbide was executed. In foreign affairs, Victoria managed much better and established relations with all the major powers. The bitterest blow of his term came in 1827 when his vice president, Nicolás Bravo, led a revolt against Victoria. It was easily suppressed by his comrades from revolutionary times, Generals Santa Anna and Vicente Guerrero.

Victoria, Lake, also called VICTORIA NYANZA, largest lake in Africa and chief reservoir of the Nile, lying mainly in Tanzania and Uganda but bordering on Kenya. Among the freshwater lakes of the world it is exceeded in size only by Lake Superior in North America, its area being 26,828 square miles (69,485 square km). An irregular quadrilateral in shape, its shores, save on the west, are deeply indented. Its greatest length from north to south is 210 miles (337 km), its greatest breadth 150 miles (240 km). Its coastline exceeds 2,000 miles (3,220 km). Its waters fill a shallow depression in the centre of the great plateau that stretches between the Western

and Eastern Rift Valleys. The lake's surface is 3,720 feet (1,134 m) above sea level, and its greatest ascertained depth is 270 feet (82 m). Many archipelagos are contained within the lake, as are numerous reefs, often just below the surface of the clear waters. Lake Victoria has more than 200 species of fish, of which the *Tilapia* is the most economically important. The lake's basin area covers 92,240 square miles (238,900 square km).

The lake's shores vary in aspect. The lake's southwestern coast is backed by precipices 300 feet (90 m) high, which give way on the western coast to papyrus and ambatch swamps marking the delta of the Kagera River. The lake's deeply indented northern coast is flat and bare. A narrow channel leads into the Kavirondo Gulf, which has an average width of 16 miles (25 km) and extends for 40 miles (64 km) eastward to Kisumu, Kenya. The Ugandan cities of Kampala and Entebbe lie along or near the northern coast. At the lake's southeastern corner is Speke Gulf, and at the

Fishermen on Kavirondo Gulf on the northern shore of Lake Victoria in Kenya

southwestern corner Emin Pasha Gulf. Of the numerous islands in the lake, Ukerewe, north of Speke Gulf, is the largest, with wooded hills rising 650 feet (200 m) above the lake. It is densely populated. At the lake's northwestern corner are the 62 islands of the Sese archipelago, some of them of striking beauty.

The Kagera River, the largest and most important of the lake affluents, enters the western side of Lake Victoria just north of latitude 1° S. The only other river of note entering from the west is the Katonga, north of Kagera. The lake's only outlet is the Victoria Nile, which exits from the northern coast.

The search by Europeans for the source of the Nile led to the sighting of the lake by the British explorer John Hanning Speke in 1858. Formerly known to the Arabs as Ukerewe, the lake was named by Speke in honour of Queen Victoria of England. A detailed survey of the lake was made by Sir William Garstin in 1901. Plans for gradually raising the level of the lake's waters were completed in 1954 with the construction of the Owen Falls Dam on the Victoria Nile at Jinja, Uganda; the dam, which provides hydroelectric power on a large scale, made the lake a vast reservoir.

The Lake Victoria region is one of the most densely populated in Africa; within 50 miles (80 km) of its shores live several million people, nearly all Bantu-speaking. There are local steamer services around the lake.

Victoria, Tomás Luis de (b. c. 1548, near Avila, Spain—d. Aug. 27, 1611, Madrid), Spanish composer who ranks with Palestrina

and Orlando di Lasso among the greatest composers of the 16th century.

He was sent by Philip II in 1565 to prepare for holy orders at the German College in Rome. He probably studied with Giovanni da Palestrina, whom he eventually succeeded as director of music at the Roman Seminary. From 1578 to 1585 he assisted Philip Neri as chaplain of San Girolamo della Carità. In 1578 he met the pious dowager empress Maria, widow of Maximilian II, and later became her chaplain. In 1584 she entered the convent of the Descalzas Reales in Madrid, where Victoria became priest and organist. He settled in Madrid in 1594.

Victoria's works include 21 masses and 44 motets, among the finest of the period. He also wrote psalm settings; hymns; several Magnificats; four offices for the dead; and music for Holy Week services, including two Passions, the *Improperia*, and the Lamentations of Jeremiah. His last work was the Requiem (1605) in memory of the empress Maria.

His music has a depth of purpose that some writers have compared to the mystical fervour of St. Teresa of Avila, who probably knew him as a youth and was patroness of the Descalzas. With the contrapuntal technique of Palestrina he fused an intense dramatic feeling that is uniquely personal and deeply Spanish. He often reused his own and other music through the technique of parody and was a master of canonic devices. His use of plainsong as cantus firmus is surprisingly rare. He also used devices modern in the late 16th century. The pictorial writing that portrays the fury of the wild beasts in "Cum beatus Ignatius" surpasses that of the contemporary madrigalists. His use of repeated notes for emphasis reflects the growing Florentine interest in recitative. In his polychoral works he exploits the contemporary Venetian manner, and his provision of written organ parts looks forward to the age of the continuo. Harmonically, his music shows a remarkable sense of tonal contrast, foreshadowing the majorminor concept of tonality characteristic of the Baroque era.

Victoria and Albert Museum, institution in London that has the major collection of decorative arts in Great Britain. It is generally regarded as the world's greatest decorativearts museum. The foundation of the museum dates to 1852, when the British government established under Sir Henry Cole the Museum of Manufacturers in Marlborough House. This museum largely housed a decorative-arts collection of objects displayed at the Great Exhibition in 1851 and drawn from the Government School of Design. It was renamed the Museum of Ornamental Art in 1851, and it became the Victoria and Albert in 1899, when Oueen Victoria laid the cornerstone for the present building designed by Sir Aston Webb. The new museum in South Kensington was opened by Edward VII in 1909.

The museum has vast collections of European sculpture, ceramics, furniture, metalwork, jewelry, and textiles from the early Middle Ages to the 20th century, as well as many art objects from South and East Asian addition, the museum houses the national collections of British watercolours and miniatures, prints, and drawings, as well as the National Art Library. The collection of Italian Renaissance and Baroque sculpture is one of the best outside of Italy. The museum's subsidiaries include the Bethnal Green Museum the Wellington Museum (Apsley House), Ham House, and Osterley Park.

Victoria Cross, the highest decoration for valour in the British armed forces, awarded for extreme bravery in the face of the enemy. It was instituted in 1856 by Queen Victoria at

the request of her consort, Prince Albert. The first crosses were awarded during the Crimean War. In 1858, new statutes allowed the Victoria Cross to be conferred for gallantry when not in the presence of the enemy; instances of this were extremely rare, and by 1881 the cross was again awarded for conspicuous courage in the face of the enemy. King Edward VII, in 1902, decreed that the honour could be awarded posthumously, which, since then, it frequently is. Anyone in any branch of the British armed forces is eligible, including women, although no woman has as yet received the award.

So great is the prestige of the Victoria Cross that it takes precedence over all other orders and medals in Britain, and recipients are entitled to add V.C. after their name. Only 1,348 crosses have been awarded since the honour was instituted. The medal is bronze (originally cast from Russian guns captured in the Crimean War), depicting a lion on a crown with the inscription "For Valour," while the reverse side has the date of the act for which the decoration is bestowed and the name, rank, and regiment of the recipient.

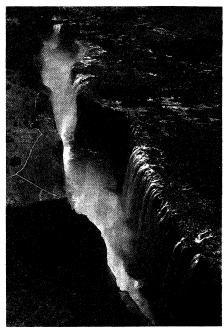

Victoria de las Tunas, city, capital of Las Tunas provincia, eastern Cuba. It is principally a commercial and manufacturing centre for the rich agricultural and pastoral hinterland, whose major yields are sugarcane, bananas, oranges, and cattle; beeswax and honey are also produced. Deposits of both iron ore and marble are located in the vicinity. Victoria de las Tunas is on the central highway and a major railroad, 140 miles (225 km) northwest of Santiago de Cuba. A branch railroad runs 30 miles (50 km) north to Puerto Manatí, on the northern coast, and the city has an airport. Pop. (1988 est.) 115,085.

Victoria Falls, spectacular waterfall located about midway along the course of the Zambezi River, at the border between Zambia to the north and Zimbabwe to the south. More than twice as wide and twice as deep as Niagara Falls, the falls span the entire breadth of the Zambezi River at one of its widest points (more than 5,500 feet [1,700 m]). At the falls, the river plunges over a sheer precipice to a maximum drop of 355 feet (108 m). The falls' mean annual flow is almost 33,000 cubic feet (935 cubic m) per second.

The Zambezi River does not gather speed as it nears the drop, the approach being signaled only by the mighty roar and characteristic veil of mist for which the Kalolo-Lozi people named the falls Mosi-oa-tunya ("The Smoke That Thunders"). The lip of the falls' precipice is split into several parts by various small islands, depressions, and promontories along its edge. The eastern portions of the falls are mostly dry during times of low river flow.

The waters of Victoria Falls do not drop into an open basin but rather into a chasm that varies in width from 80 to 240 feet (25-75 m). This chasm is formed by the precipice of the falls and by an opposite rock wall of equal height. The chasm's only outlet is a narrow channel cut in the barrier wall at a point about three-fifths of the way from the western end of the falls, and through this gorge, which is less than 210 feet (65 m) wide and 390 feet (120 m) long, flows the entire volume of the Zambezi River. At the gorge's end is the Boiling Pot, a deep pool into which the waters churn and foam at flood time. Just below the Boiling Pot, the gorge is spanned by the Falls Bridge, which carries rail, automobile, and pedestrian traffic between Zambia and Zimbabwe. The river's waters then emerge into an enormous zigzag trough that forms the beginning of Batoka Gorge, which has been cut by the river to a depth of 400-800 feet (120-240 m) through a basalt plateau for a distance of 60 miles (100

1855). He named them after Queen Victoria of the United Kingdom. In addition to the falls themselves, which now attract tourists from all parts of the world, adjacent Victoria Falls National Park (Zimbabwe) and Livingstone Game Park (Zambia) abound with large and small game and offer recreational facilities.

Victoria Falls, township, northwestern Zimbabwe. It is located on the south bank of the Zambezi River adjacent to the falls (the greatest in Africa). It faces Maramba, Zambia, across the river. The first storage and rest huts in the original village were built in 1898 by Albert Giese, discoverer of the Hwange (formerly Wankie) coalfields. The township was founded in conjunction with the construction of a railway bridge just below the waterfall in 1905. The Victoria Falls Hotel dates from that year. In 1930 the bridge was expanded to carry automobile traffic as well as trains.

Victoria Falls is the customs and immigration post for travelers to and from Zambia and a major tourist centre. It is surrounded by the Zambezi and Victoria Falls National Park. The township has a domestic airport 3 miles (5 km) away. Pop. (1982) 8,126.

nation Gulf, Dease Strait, and Queen Maud Gulf. It is about 320 miles (515 km) long and 170–370 miles (270–600 km) wide, with an area of 83,896 square miles (217,290 square km). The terrain rises from a deeply indented coast to about 2,150 feet (655 m) in the northwest.

The island's sparse population is concentrated chiefly in the settlements of Holman (which is an Eskimo print-making centre known for silk screening and prints made from stone cuts) and offshore Read Island in the west and Cambridge Bay (the site of a Canadian weather station) in the southeast. Discovered in 1838 by Thomas Simpson, the island was named for Queen Victoria and was first explored by John Rae in 1851.

Victoria Land, physical region in eastern Antarctica, bounded by the Ross Sea (east) and Wilkes Land (west), and lying north of the Ross Ice Shelf. It was discovered in 1841 by a British expedition led by Sir James Clark Ross, and it was named for Queen Victoria. It consists largely of snow-covered mountains, with heights up to 13,200 feet (4,025 m).

The United States and New Zealand operate research stations there. More than 300 meteorites preserved in Antarctic ice were located in 1979 in the Allan Hills and Darwin Glacier areas of Victoria Land. Their discovery was the result of a scientific insight that in less than three years doubled the number of meteorites available worldwide for scientific study.

Victoria Nile, river, the upper section of the Nile, issuing from the northern end of Lake Victoria at Ripon Falls (now submerged), west of Jinja, Uganda. The river flows 260 miles (420 km) northwest over the Owen Falls Dam, through Lake Kyoga, and past Masindi Port and Atura to the northern end of Lake Albert (Lake Mobutu Sese Seko), where it forms a swampy estuary. Victoria River, longest river in Northern Territory, Australia. The river rises in low sand hills at 1,200 feet (370 m) elevation north of Hooker Creek. It flows north and northwest for about 350 miles (560 km) across a region of hills and basins to enter Joseph Bonaparte Gulf of the Timor Sea via a 16-mile-wide mouth at Queens Channel. Fed by its major tributaries—the West Baines, Wickham, Gordon, Armstrong, and Camfield rivers—the Victoria drains a basin of 27,060 square miles (70,090 square km). Its upper course,

seasonally intermittent, flows through some of Australia's largest cattle ranges.

Reached in 1839 by Captain J.C. Wickham of the HMS *Beagle*, the river was named in honour of Victoria, who had been crowned queen of Great Britain in 1837. The river is only 500 feet (150 m) above sea level 300 miles (480 km) from the coast; its last 100 miles (160 km) are tidal, of which the lowest 50 are navigable by boats of up to 10-foot (3-metre) draft.

Victoria Strait, southern arm of the Arctic Ocean, lying between Victoria Island on the west and King William Island on the east, in eastern Kitikmeot region, Northwest Territories, Canada. The strait is about 100 miles (160 km) long and from 50 to 80 miles (80 to 130 km) wide. It connects Queen Maud Gulf (south) with McClintock Channel (northwest) and Franklin Strait (northeast). The Royal Geographical Society and Jenny Lind islands are near the southern entrance of the strait.

In 1845 Sir John Franklin, the English explorer, led an expedition of 129 men in the HMS *Erebus* and HMS *Terror* in search of the Northwest Passage, a route through the Canadian Arctic archipelago connecting the Atlantic and Pacific oceans. The ships became hopelessly icebound in Victoria Strait just northwest of King William Island, and all lives were lost.

Victoriaville, town, Trois-Rivières ("Three Rivers") region, southern Quebec province, Canada, on the Nicolet River. Originally called Demersville, it became a village in 1860 and was renamed for Queen Victoria in 1861.

Victoriaville is located in a mixed farming area and serves as a distributing centre. The town processes food and manufactures hockey sticks, furniture, clothing, farm implements, bricks, and sheet metal and foundry products. The Victoriaville College, a bilingual commercial institution that is operated by the Brothers of the Sacred Heart, is on the eastern outskirts of the town. Inc. town, 1890. Pop. (1986) 21,587.

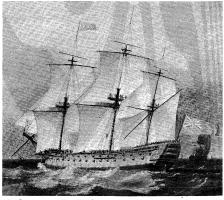

Victorville, city, San Bernardino county, southwestern California, U.S. It lies along the Mojave River in Victor valley at the edge of the Mojave Desert. The settlement was founded in 1885 by the Santa Fe Railroad, and its name was derived (1901) from Jacob N. Victor, a railway official.

Mining (granite and limestone) and cement and lime production are the city's basic economic activities, supplemented by agriculture (irrigated crops, poultry, cattle) construction, tourism, and nearby George Air Force Base. Victorville and its back country have been used as settings for many western movies. It is the seat of Victor Valley College (1961). Inc. 1962. Pop. (1988 est.) 24,641.

Victory, flagship of the victorious British fleet commanded by Admiral Horatio Nelson in the Battle of Trafalgar on Oct. 21, 1805. The ship is preserved today as a historic relic at Portsmouth, Eng.

HMS Victory, launched at Chatham in 1765, was a 100-gun ship of the line with a length of 186 feet (57 metres), a displacement of 2,162 tons, and a crew of more than 800 men. As a flagship of Britain's Channel and Mediterranean fleets during the American Revolution and French Revolutionary wars, the ship saw extensive action against France and its allies. In 1778 under Admiral Augustus Keppel, and again in 1781 under Richard Kempenfelt, it led engagements near the island of Ushant (Ouessant). In 1782 it flew the flag of Admiral Richard Howe in the relief of a besieged garrison at Gibraltar, and in 1793 it served under Admiral Samuel Hood during a brief occupation of Toulon, Fr. In 1797 the Victory was the flagship of Admiral John Jervis in his destruction of a Spanish fleet off Cape Saint Vincent, Port.

At the Battle of Trafalgar the Victory's flags gave Nelson's famous signal "England expects that every man will do his duty." The Victory itself engaged two French ships of the line; from the topmast of one a sniper fired the shot that mortally wounded Nelson, who died in

the ship's cockpit in the midst of battle. After carrying Nelson's body home, *Victory* continued to aid in Britain's continental blockade during the Napoleonic Wars. By the 1830s the ship had been dismasted and moored at Portsmouth, Eng., as a stationary flagship of the naval command. There it remained until 1922, when it was placed in dry dock and restored to its condition under Nelson. The ship and an attached maritime museum have attracted tourists since 1928.

Victory Peak, Russian PIK POBEDY, Chinese SHENG-LI FENG, mountain in the eastern Kokshaal-Tau Mountains, on the frontier of the Kirgiz Soviet Socialist Republic and the People's Republic of China. It was first identified in 1943 as the highest peak (24,406 feet [7,439 m]) in the Tien Shan range and the second highest peak in the U.S.S.R.; its name commemorates victory in World War II. An enormous dome-shaped mountain, heavily glaciated and frequently wreathed in clouds, it was first climbed in 1956 by Soviet alpinists.

vicuña (Lama, or Vicugna, vicugna), South American member of the camel family, Camelidae (order Artiodactyla), closely related to the alpaca, guanaco, and llama, which are known collectively as lamoids. Unlike camels, lamoids do not have the characteristic camel humps; they are slender-bodied animals, and they have long legs and necks, short tails, small heads, and large, pointed ears. Gregarious animals, they graze on grass and other plants. When annoyed, they spit. Lamoids are able to interbreed and to produce fertile offspring. Depending on the authority, the llama, alpaca, and guanaco may be classified as distinct species or as races of llama (Lama glama). Because of certain structural features, the vicuña is sometimes separated from the other lamoids as Vicugna vicugna.

The vicuña inhabits semiarid grasslands in the central Andes, at altitudes of 3,600–4,800 metres (12,000–16,000 feet). A swift, graceful animal, it stands about 80 centimetres (30 inches) at the shoulder. The vicuña has been hunted for centuries with a resulting decline in its numbers and was already the subject of protective regulation in the time of the Incas. It is listed as rare in the *Red Data Book* and is protected in several South American

countries. The Peruvian government began to encourage domestication of the vicuña in the 19th century, but in the first half of the 20th century there were only a few domesticated flocks.

The vicuña is covered with a remarkably long, fine, soft, and lustrous fibre that varies in colour from light cinnamon to a pale white. It is the rarest and finest of the group of textile fibres called specialty hair fibres (q.v.). The annual yield of fleece sheared from domesticated vicuñas shows a wide range of from 85 to 550 g (3 to 20 ounces) per animal. Vicuña fibre is strong and resilient, but it is highly sensitive to chemicals and is generally used in its natural colour. The costly fibre is made into high-priced coats, dressing gowns, and shawls. Vicuña is produced primarily in Bolivia, Peru, and Chile.

Vidal, Gore, original name EUGENE LUTHER VIDAL (b. Oct. 3, 1925, West Point, N.Y., U.S.), prolific American novelist, playwright, and essayist, noted for his irreverent and intellectually adroit novels.

Philips Exeter Vidal graduated from Academy in New Hampshire in 1943 and served in the U.S. Army in World War II. Thereafter he resided in many parts of the world—the east and west coasts of the United States, Europe, North Africa, and Central America. His first novel, Williwaw (1946), which was based on his wartime experiences, was praised by the critics, and his third novel, The City and the Pillar (1948), shocked the public with its direct and unadorned examination of a homosexual main character. Vidal's next five novels, including Messiah (1954), were received coolly by critics and were commercial failures. Abandoning novels, he turned to writing plays for the stage, television, and motion pictures and was successful in all three media. His best-known dramatic works from the next decade were Visit to a Small Planet (produced for television, 1955; on Broadway, 1957; for film, 1960), The Best Man (play, 1960; film, 1964), and the screen scenarios for The Catered Affair (1956), The Scapegoat (1959), and Suddenly Last Summer (1960).

Vidal returned to writing novels with Julian (1964), a sympathetic fictional portrait of Julian the Apostate, the 4th-century pagan Roman emperor who opposed Christianity. Washington, D.C. (1967), an ironic examination of political morality in the U.S. capital, was followed by several popular novels that vividly re-created prominent figures and events in American history—Burr (1974), 1876 (1976), and Lincoln (1984). Another success was the comedy Myra Breckenridge (1968), in which Vidal lampooned both transsexuality and contemporary American culture. In Rocking the Boat (1962), Reflections upon a Sinking Ship (1969), The Second American Revolution (1982), and other essay collections, he incisively analyzed contemporary American politics and government. Vidal was noted for his outspoken political opinions and for the witty and satirical observations he was wont to make as a guest on talk shows.

Vidal de La Blache, Paul (b. Jan. 22, 1845, Pézenas, Fr.—d. April 5, 1918, Tamaris-sur-Mer), French geographer who had a profound influence on the development of modern geography.

He studied history and geography at the École Normale Supérieure, in Paris, and taught there from 1877 until he became professor of geography at the Sorbonne (1898–1918).

Vidal's life study of the interrelations of people's activities and their physical environment made him the founder of French human geography. He held that the role of people is not passive, since within limits they can modify their environment to advance their own ends. Many later French geographers had either studied under him or his students. Vidal was the moving force behind a spate of lu-

cid regional monographs on France and other parts of the world; all form a distinctive part of geographic literature. Tableau de la géographie de la France (1903; "Outline of the Geography of France") is prefixed to Ernest Lavisse's history of France and is considered a notable example of Vidal's approach. La France de l'Est ("Eastern France") appeared in 1917. Many of Vidal's papers were collected in Principes de géographie humaine (1922; Principles of Human Geography, 1950). In 1891 he founded and, until his death, edited the periodical Annales de Géographie ("Annals of Geography").

Vídalín, Arngrímur Jónsson: see Jónsson, Arngrímur.

Vídalín, Jón Thorkelsson, also called MAGISTER JÓN (b. 1666, Gardhur, near Reykjavík, Ice.—d. 1720, Iceland), Lutheran bishop, best-known for his Húss-Postilla (1718–20; "Sermons for the Home"), one of the finest works of Icelandic prose of the 18th century.

The son of a learned physician and a grandson of the scholar Arngrimur Jónsson the Learned, Vídalín was educated at Skálholt in Iceland and at the University of Copenhagen and rose rapidly in the church, becoming bishop of Skálholt in 1697. The extreme poverty of the Icelanders and the misery that had been caused by a series of epidemics aroused his indignation against the negligent secular authorities, and he carried on a lifelong feud against them. His Baroque antithetical style sprinkled with proverbs, his ironic portrayals of prevailing abuses, and his vivid pictures of hell—all of these elements made Vídalín's homilies the most popular devotional work in Iceland down to the 19th century.

Videla, Jorge Rafaél (b. Aug. 2, 1925, Mercedes, Arg.), military officer who was president of Argentina from 1976 to 1981.

After a long and successful military career, Videla became chief of the Army General Staff in 1973, and in 1975 President Isabel Perón, under pressure from the military establishment, appointed him commander in chief. From this position he began a reorganization of the military leadership, removing officers sympathetic to Peronism. In the same year, he led an army campaign against the People's Revolutionary Army (Ejército Revolucionario del Pueblo) in Tucumán province, which resulted in the annihilation of hundreds of Marxist guerrillas. When Isabel Perón was deposed on March 24, 1976, he accepted the presidency as head of a three-man (later a five-man) military junta including General Orlando Ramón Agosti and Admiral Eduardo Emilio Massera. He promised the country an eventual return to civilian government, but only after order had been achieved. Videla then suspended Congress and vested legislative powers in a nine-man military commission, halted the functioning of the courts, political parties, and labour unions, and filled all important posts with military personnel. It was estimated that as many as 4,000 persons suspected of subversion or corruption were arrested in the last week of March 1976 alone, and an unknown number of others "disappeared" over the years, apparently murdered. Videla then took measures to restore economic growth, reversing Peronism in favour of a free-market economy. These measures were moderately successful, but dissatisfaction in the labour sector continued. Videla's continued campaign against the left elicited strong international criticism. Meanwhile he was threatened by extreme right-wing military factions; although he rejected their extreme authoritarianism, he broadened the scope of political arrests and executions to include journalists, educators, and intellectuals.

Videla retired in 1981 and was succeeded by General Roberto Viola. After Argentina returned to civilian rule in December 1983, charges were brought against various former junta leaders. Videla and Massera were both convicted of murder and sentenced to life imprisonment in 1985. The other three junta leaders received lesser terms.

video game: see electronic game.

video tape recorder, also called VIDEO RECORDER, electromechanical device that records and reproduces an electronic signal containing audio and video information onto and from magnetic tape. It is commonly used for recording television productions that are intended for rebroadcasting to mass audiences. There are two types of video tape units: the transverse, or quad, and the helical.

The transverse unit uses four heads rotating on an axis perpendicular to the direction of 2-inch (5-centimetre) tape. The transverse format achieves a 1,500 inch-per-minute head-to-tape speed necessary for high picture quality. For broadcast industry needs, an audio track, control track, and cue track are added longitudinally. These units follow the standards of the North American Television Standards Commission—i.e., the electron beam sweeps 525 horizontal lines at 60 cycles per second.

The helical unit, designed for home and amateur use, uses half- or three-quarter-inch tape traveling around a drum in the form of a heix. There are various forms of these recorders: the playback deck can play back recorded programs but cannot record or erase; the video-record deck can record directly from a camera but cannot record off-the-air programs; the TV-record deck has an antenna and tuner for recording off-the-air programs. Portable reel-to-reel or cassette recorders are also produced. See also magnetic recording.

videocassette recorder, also spelled VIDEO CASSETTE RECORDER (VCR), electromechanical device that records, stores, and plays back television programs on a television set by means of a cassette of magnetic tape. A videocassette recorder is commonly used to record television programs broadcast over the air or by cable and to play back commercially recorded cassettes on a television set.

Prototypes of videocassette recorders were developed in the 1960s, but the first relatively convenient and low-cost VCR was introduced by the Sony Corporation in 1969. With the subsequent development of the Betamax format by Sony and the VHS format by the Matsushita Corporation in the 1970s, videocassette recorders became inexpensive enough to be purchased by millions of families for use in the home. Both the VHS and Betamax systems use videotape that is 0.5 inch (13 mm) wide, but the two systems are mutually incompatible with each other, and a cassette recorded on one system cannot be played back on the other system. A third system using 0.3-

inch- (8-millimetre-) wide tape was introduced in early 1985.

A videocassette recorder can have from two to as many as seven tape heads that read and inscribe video and audio tracks on the magnetic tape. Most VCRs have fast-forward and reverse controls and a timer that enables television programs to be recorded automatically, and they can record a program on one television channel while a viewer watches a program on another channel of the same television set.

Colour home movies can be made with the use of a camcorder system; this consists of a videocassette recorder that is connected to a relatively light and simple video camera. One camcorder system uses 8-millimetre videotape, and other portable video systems are available for filming outside of the home or studio.

videodisc, also spelled VIDEODISK, rigid circular plate of either metal or plastic used to record video and audio signals for playback. It resembles a phonograph record and can be played on a disc machine attached to a conventional television receiver. There are two major classes of videodiscs: magnetic and nonmagnetic.

The magnetic videodisc has an oxide-coated surface onto which input signals are recorded as magnetic patterns in spiral tracks. The video heads of the playback unit pick up these impressions and produce electrical signals that are converted back into pictures and sounds (see also magnetic recording).

Nonmagnetic videodiscs are available in two basic types. One is produced by a mechanical recording system analogous to that used in the manufacture of phonograph records, whereas the other involves laser technology. The mechanically recorded disc is a metallic plate with spiral grooves of V-shaped cross section. The pickup of the recorded information from the disk is accomplished electrically by a stylus. A metallic layer on the rear of the stylus detects capacitance variations as the stylus passes along the valleys and peaks of the grooves.

The laser videodisc is a metal or plastic disc on which input signals are recorded as a sequence of coded holes that were originally written onto a master disc by using a high-power laser. Copies are made by contact printing the master onto discs of the same size. During playback the signals are read out with a low-power helium-neon laser that is focused by a lens to form a tiny spot on a disc. Variations in the amount of light reflected from the disc are sensed by a photodetector. Electronic circuitry translates the light signals into video and audio signals for the television receiver.

videophone, also called VIDEO TELEPHONE, device that simultaneously transmits and receives both audio and video signals over telephone lines. Such a device consists of a telephone; a display unit with a television picture tube, camera tube, and loudspeaker; a control unit with a microphone; and associated circuitry.

The utilization of television as an adjunct to telephone service has been considered since the earliest demonstration of television itself. The first practical television–telephone service was established in 1936 by the German Post Office. Limited public service was provided over coaxial cables between Berlin, Leipzig, Nürnburg, and Hamburg until 1940. The American Telephone and Telegraph Company developed a modern videophone system in the late 1950s and began providing intercity service between Chicago, New York, and Washington, D.C., on a test basis in 1964. During the early 1970s this service, known as Picturephone, was offered to regular subscribers of the Bell System in the same cities. A similar system acquired more widespread use in Japan.

High cost has limited the use of videophones.

One of the main difficulties is the expense of transmitting video signals, which requires a minimum bandwidth of one megahertz. This is equivalent to the demands of more than 300 regular long-distance telephone calls. The development of new techniques of reducing transmission bandwidth and the use of improved fibre-optic telephone cables (assemblies of thin glass rods) may help to make videophone service more economical.

Vidin, also spelled WIDYN, port town, extreme northwestern Bulgaria, on the Danube River. An agricultural and trade centre, Vidin has a fertile hinterland renowned for its wines and is the site of an annual fair. A regular ferry service connects it with Calafat, across the Danube in Romania.

Vidin occupies the site of an old Celtic settlement, Dunonia, founded in the 3rd century BC and fortified by the Romans as Bononia. A Bulgarian fortress dating from the 13th century and called Babini Vidini Kuli ("Granny Vida's Towers") is well-preserved. The churches of St. Panteleimon and St. Petka have fine murals. During the Second Bulgarian Empire (1185–1396), when the town was known as Bdin, a brief revolt occurred there; later, as the empire under Ivan-Aleksandůr was disintegrating, he gave a third of it to his son, with Bdin as the capital. In 1396 the Vidin kingdom fell to the Turks, who ruled it until 1878 except for a period of Austrian occupation from 1683 to 1690. Pop. (1986 est.) 62,689.

Vidisha, also spelled VIDIŚĀ, town, westcentral Madhya Pradesh state, central India. It lies just east of the Betwa River. Formerly called Bhīlsa (or Bhelsa), Vidisha is of great antiquity, being mentioned in the Sanskrit epics Mahābhārata and Rāmāyana. Under the Maurya and Gupta empires the town was a great religious, commercial, and political centre. It fell to the Muslims in 1235. Numerous remains of Buddhist stupas nearby, commonly called Bhīlsa Topes, date from between the 3rd century BC and the 1st century AD and include the Sanchi (q,v) group. To the north lies the site of Besnagar, the older city remains, with a 1st-century-BC monolithic pillar. Nearby, on Udayapur Hill, are remains of cave temples dating from the Gupta period (4th-6th century AD). Renamed Vidisha in 1956, the modern town is an agricultural trade centre and is engaged in flour milling and hand weaving. The town has four colleges, including a technological institute, affiliated with Bhopāl University. Wheat, sorghum, and oilseeds are the chief crops of the surrounding area. Pop. (1981) town, 65,521.

Vidocq, François(-Eugène) (b. July 24, 1775, Arras, Fr.—d. May 11, 1857, Paris), adventurer and detective who helped create the police de sûreté ("security police") in France. A venturesome, sometimes rash youth, Vidocq had bright beginnings in the army, fighting in the Battles of Valmy and Jemappes in 1792. After having spent several periods in prison, mostly for petty offenses, and having tried his hand at a number of trades, he offered his services to the state in 1809 and created a new police department under Napoleon. His experience of life among thieves in Arras, Paris, and the provinces contributed to the effectiveness of the security brigade. He resigned in 1827 to start a paper and cardboard mill, where he employed former convicts. The business was a failure, and in Louis-Philippe's reign he again became chief of the detective department. Dismissed in 1832 for a theft that he allegedly organized, Vidocq created a private police agency, the prototype of modern detective agencies. It was, however, soon suppressed by the authorities.

Known all over France as a remarkably audacious man, Vidocq was a friend of such authors as Victor Hugo, Honoré de Balzac, Eugène Sue, and Alexandre Dumas père. Several works were published under Vidocq's name, but it is doubtful that he wrote any of them. The figure of Vidocq is believed to have inspired Balzac's creation of the criminal genius Vautrin, one of the most vivid characters to appear in his novelistic series La Comédie humaine (The Human Comedy).

Vidolini, also spelled VIDOLINO: *see* Vitale da Bologna.

Vidor, King (Wallis) (b. Feb. 8, 1894, Galveston, Texas, U.S.—d. Nov. 1, 1982, Paso Robles, Calif.), American motion-picture director whose films of the 1920s and '30s in both content and theme were among the most creative of those produced in Hollywood; they deal in relatively uncompromising terms with such themes as idealism and disillusionment in contemporary life.

As a schoolboy, Vidor was an assistant projectionist in a nickelodeon. In 1915 he went to Hollywood, where he was a prop boy, scriptwriter, newsreel cameraman, and assistant director, while his wife, Florence Vidor (divorced 1925), became a well-known silentfilm actress. Within three years (1918) Vidor was directing his first films. The Big Parade (1925), a film about World War I, was a tremendous success and established his reputation. Marked by a flair for characterization and social consciousness, it was followed by The Crowd (1928), considered to be one of the finest of all silent films. With grim and sombre imagery, it deals with the life of a very average American, who starts out with high hopes but is gradually broken by the social ills of modern urban life. Vidor's other films include *Hallelujah!* (1929), the first Hollywood film with an all-black cast; Street Scene (1931), a tragedy of lower-class New York life based on the play by Elmer Rice; Our Daily Bread (1934), dealing with the formation of a farm cooperative; The Wedding Night (1935), containing a sensitive depiction of Polish immigrant customs; and The Citadel (1938), a screen adaptation of the novel by A.J. Cronin about a physician's struggle in a Welsh mining community, which won an Academy Award nomination for best director. He also directed the black-and-white (Kansas) scenes of The Wizard of Oz (1939).

Some of Vidor's well-known films of the 1940s and '50s were *The Fountainhead* (1949), *Duel in the Sun* (1946), and *War and Peace* (1956). Vidor's autobiography, *A Tree Is a Tree* (1953), contains valuable information on the development of the motion picture.

Vidyāraņya (Hindu philosopher): see Mādhavācārya.

Vidyasagar, Isvar Chandra, also spelled isvarcandra bidyasagar (b. Sept. 26, 1820, Birsingha, Midnapore district, India—d. July 29, 1891), Indian educator and social reformer, considered the father of Bengali prose. He was a brilliant student at Sanskrit Col-

lege, Calcutta, where he received the title Vidyasagar ("Ocean of Learning"), and in 1850 he was appointed head pandit (scholarteacher) of Fort William College, Calcutta. A year later he became principal of Sanskrit College, where he promoted the study of English and admitted students of lower castes.

Vidyasagar was well-read in English literature and was influenced by Western ideas. Although an orthodox high-caste Brahmin, he took a leading part in social reform movements, notably a successful campaign to legalize remarriage of widows, many of whom had

been married for the first time in childhood. He also opposed child marriage and polygamy and did much to promote the education of girls, but his reforming zeal met with much opposition from orthodox Hindus.

Vidyasagar was a prolific and vigorous writer. Among his works are *Vetāl Pañcavimsati* (1847; "Twenty-five Tales of a Goblin"); *Shakuntalā* (1854), which was based on a famous play by the Sanskrit poet and dramatist Kālidāsa; and *Sitār Vanavās* (1860; "The Exile of Sita").

Vidzeme, also called LIVONIAN HIGHLAND, plateau region of central Latvian Soviet Socialist Republic, roughly corresponding to the historic state of Livonia (q.v.). It is a hilly, irregular, partially terraced morainic area, dotted with many small morainal lakes. It reaches an elevation of 1,024 feet (312 m) at Mount Gaizin and is drained to the west by the Gauja River, which flows into the Gulf of Riga about 12 miles (20 km) north of Riga after a course of 286 miles (460 km).

Viedma, city, capital of Río Negro provincia. south-central Argentina. It lies along the western bank of the Negro River, 20 miles (32 km) from the river's mouth at the Atlantic Ocean and opposite Carmen de Patagones in Buenos Aires province. A fort called Mercedes de Patagones, built there in 1779 by the explorer Francisco de Viedma, was the capital of the Patagonian Territory until the Río Negro national territory was set up in 1884. In 1955, with the creation of Río Negro province, Viedma became the provincial capital. The agricultural potential of the city's environs, long-stymied by occasional inunda-tion from the Negro River, was enhanced after 1970 with the assistance of international funds. Viedma received its present name in 1878. Pop. (1980) 24,338.

Vieille, Paul(-Marie-Eugène) (b. Sept 2, 1854, Paris—d. Jan. 14, 1934, Paris), French scientist, known for his invention of smokeless powder.

After studying with the chemist Marcellin Berthelot, Vieille collaborated with him in researches that led to important discoveries of the physics of shock waves (1881). He then undertook to solve the problem of harnessing the powerful but unstable substance nitrocellulose as a propellant charge to replace black powder. Utilizing the colloiding action of certain solvents, he molded the resulting gelatinous mass into shapes of controlled dimensions, resulting in the formation of an explosive that came to be known as Powder B, its French army designation (c. 1885); this was the first of the series of modern smokeless high explosives. Vieille made further contributions in the study of shock waves and pressures and on the stability of nitrocellulose.

Vieira, António (b. Feb. 6, 1608, Lisbon—d. July 18, 1697, Salvador, Braz.), Jesuit missionary, orator, diplomat, and master of classical Portuguese prose who played an active role in both Portuguese and Brazilian history. His sermons, letters, and state papers provide a valuable index to the climate of opinion of the 17th-century world, both in Brazil and in Portugal

Vieira went to Brazil with his parents as a child of six. Educated at the Jesuits' college in Bahia, he joined the Society of Jesus in 1623 and was ordained in 1635. He soon became the most popular and influential preacher in the colony, and his sermons exhorting the various races to join the Portuguese in arms against the Dutch invaders of Brazil (1630–54) are considered the first expression of the Brazilian national mystique of forming a new race of mixed bloods. In addition to the Tupí-Guaraní tongue, the lingua franca of the

Brazilian littoral, Vieira learned a number of local Amazon dialects and the Kimbundu language of the black slaves who had been brought to Brazil from Angola.

Vieira worked among the Indians and black slaves until 1641, when he went with a mission to Portugal to congratulate King John IV on his accession. The king soon fell under the spell of Vieira's self-assured and magnetic personality and came to regard the tall, lean, dynamic Jesuit as "the greatest man in the world." The king made him tutor to the infante, court preacher, and a member of the royal council. Vieira's devotion to the king was such that after John's death (1656) he formed a fixed idea that the king would return to inaugurate a prophesied golden age of peace and prosperity.

Between 1646 and 1650 Vieira was engaged in diplomatic missions to Holland, France, and Italy. But by his outspoken advocacy for toleration for Jewish converts to Christianity in Portugal and because of his willingness to cede Pernambuco to the Dutch as the price of peace, he made enemies in Portugal. By 1652 it had become prudent for him to leave the country for Brazil. His denunciation of slaveowning there resulted in his return to Lisbon in 1654. During his stay in Portugal, he secured decrees protecting the Brazilian Indians from enslavement and creating a monopoly for the Jesuits in the government of the Indians, and he returned triumphantly in 1655. He resumed his apostolic mission in Maranhão and on the Amazon delta, where for six years he traveled widely and laboured energetically before being forced back to Lisbon in 1661. For prophesying the return of John he was condemned by the Inquisition and imprisoned (1665-67).

On his release (1668) he went to Rome, where he succeeded in securing at least temporary toleration for the converted Jews. He remained there for six years, becoming confessor to Queen Christina of Sweden and a member of her literary academy. In 1681 he returned to Bahia, where he remained, a fighter for the freedom of the Indians, until his death at 89.

Vieira is claimed as a literary master by both the Portuguese and the Brazilians. Though his prose style, in its ornateness, Latinisms, and elaborate conceits, is a product of the Old World, his works nevertheless are of the New World in their emotional freedom, boldness of thought, and advanced attitude of racial tolerance

Vieira, Luandino, pseudonym of José VIEIRA MATEUS DA GRAÇA (b. May 4, 1935, Lagoa de Furadouro, Port.), Angolan writer of short fiction and novels.

Vieira immigrated with his parents to Angola in 1938, living in and around the *musseques* (African quarters) of Luanda. His writings reflect the fusion of Kimbundu (the language of the Mbundu people) and Portuguese that is the unique language of the *musseque*. Vieira, a white Angolan, committed himself early to the overthrow of the Portuguese colonial government and was arrested in 1961 for disclosing, during a BBC interview, secret lists of deserters from the Portuguese armies fighting in Africa. He spent 11 years in prison, mostly at Tarrafal, Cape Verde Islands.

Vieira is best-known for his early collection of short stories, Luuanda (1963). The book, which received a Portuguese writers' literary award in 1965, was banned until the overthrow of the colonial government in 1974. Although the stories are not overtly political, their realism makes clear the oppressiveness of Portuguese occupation. Many of Vieira's stories follow the traditional structure of African oral narrative. His political novella A Vida Verdadeira de Domingos Xavier (1974; The Real Life of Domingos Xavier) portrays the cruelty of white "justice" and the courage

of African men and women in preindependent Angola. His other works—among them Velhas Estórias (1974; "Old Stories"), Nós Os do Makulusu (1974; "Our Gang from Makulusu"), Vidas Novas (1975; "New Lives"), and João Vêncio: Os Sues Amores (1979; "João Vêncio: Regarding His Loves")—include both novels and collections of stories.

As secretary-general of the Union of Angolan Writers, Vieira directed the publication of a number of works by other Angolan authors and poets.

Vieira, Mario: see Craveirinha, José.

Vieira da Silva, Maria Elena (b. June 13, 1908, Lisbon), Portuguese-born French painter of intricate, semiabstract architectural compositions.

Vieira da Silva studied sculpture first with Antoine Bourdelle at Paris in 1928 and later with Charles Despiau. Her interest in painting flowered under the tutelage of Fernand Léger and Stanley William Hayter. Although the abstract patterning of her early paintings tended to the decorative, her mastery of spatial manipulation became apparent. The luminous spots and intersecting lines in her paintings assumed an explicit architectural organization, culminating in the dreamlike cityscapes of such mature works as "Golden City" (1956). She lived in Brazil during World War II, returned to Paris in 1947, and became a French citizen in 1956.

Viélé-Griffin, Francis, pseudonym of EGBERT LUDOVICUS VIELE (b. May 26, 1864, Norfolk, Va., U.S.—d. Nov. 12, 1937, Bergerac, Fr.), American-born French poet who became an important figure in the French Symbolist movement.

Viélé-Griffin, son of a military governor for the Union in the American Civil War, was sent to France at the age of eight to attend school and remained there for the rest of his life. His first collection of verse, Cueille d'avril (1886; "April's Harvest"), showed the influence of the Decadent movement, and the next two, Les Cygnes (1887; "The Swans") and Les Joies (1889; "The Joys"), established his reputation as a preeminent Symbolist.

In 1890 Viélé-Griffin cofounded the review Les Entretiens politiques et littéraires ("Political and Literary Conversations"), in which appeared many of his essays calling for the liberation of verse from the strictures of traditional poetic form. He accomplished such liberation in his own poems through his pioneering use of vers libre (free verse). Viélé-Griffin's work is marked by a fundamental optimism that is grounded in his delight in nature and his belief in the spiritual dimension of human life. He lived much of the time in Touraine, and many of his works-such as La Clarté de vie (1897; "The Brightness of Life") and Le Domaine royale (1923; "The Royal Domain")-celebrate the countryside. Otherssuch as La Chevauchée d'Yeldis (1893; "The Ride of Yeldis"), *Phocas le jardinier* (1898; "Phocas the Gardener"), and *La Légende ailée* de Wieland le forgeron (1900; "The Winged Legend of Wieland the Blacksmith")-draw on Christian themes and Greek and medieval legends for their inspiration.

Vienna, German WIEN, Czech VIDEŇ, Hungarian BÉCS, city and Bundesland ("federal state"), the capital of Austria. It is located along the Danube (Donau) River and serves as a gateway between western and eastern Europe. Vienna was the seat of the Holy Roman Empire from 1558 to 1806 and then of the Austro-Hungarian Empire until 1918. It is a city of nobility and vast cultural achievement, renowned for its architecture and music.

A brief treatment of Vienna follows. For full treatment, see MACROPAEDIA: Vienna.

Vienna borders the Danube where the Pan-

nonian Basin begins to rise toward the Alpine regions to the west. The highest area within the city is called the Wiener Wald ("Vienna Woods"); it descends rapidly toward the Danube in four roughly semicircular terraces. The climate is typically midcontinental, with a January average of 31° F $(-0.5^{\circ}$ C) and a July average of 67° F $(19.5^{\circ}$ C); rainfall amounts to about 26 inches (660 mm).

Trade and industry are the basis of Vienna's economy; principal manufactures include electrical appliances, paper, clothing, and machine tools. The city government plays a large role in the economy, including the manage-

ment of many enterprises.

Much evidence of Vienna's rich history remains. One of its most famous buildings, St. Stephen's Cathedral, was built during the middle of the 12th century, destroyed by fire, and rebuilt two centuries later. Other notable medieval buildings include the Hofburg, the late 13th-century palace of the Habsburg rulers; and the 14th-century churches of the Friars Minor (Minoritenkirche) and of Maria am Gestade.

Toward the end of the 17th century, Baroque architecture began to appear, notably in the building of the Plague Column. The Viennese style of Baroque remained popular for more than 70 years, giving way eventually to an architectural style called Ring architecture, for the buildings lining the Ringstrasse. Buildings constructed in this style include the neo-French Renaissance State Opera house, the pseudo-Gothic Votive Church, the neo-Italian Renaissance University of Vienna, and the neo-Flemish Gothic Rathaus (City Hall).

In addition to possessing remarkable architecture, Vienna was for centuries the music capital of the world. Franz Joseph Haydn, Wolfgang Amadeus Mozart, Ludwig van Beethoven, Franz Schubert, Johannes Brahms, Johann Strauss, Gustav Mahler, Arnold Schoenberg, and many other great figures in Western music made it their home. The waltz, derived from Tirolean folk dances, was established in Vienna by 1820, and the great age of the Viennaes operetta began shortly thereafter. Vienna is the home of one of the world's great symphony orchestras, the Vienna Philharmonic.

There are more than 30 museums in Vienna. One of the city's most striking collections, lodged in the treasure room of the Hofburg Palace, is the regalia of the Habsburgs and the Holy Roman emperors. The palace also houses the world's largest collection of graphic arts, including works by Rembrandt and Albrecht Dürer among its more than 1 million pieces. The Fine Arts Museum contains the Habsburg collection of old masters. The former residences of Sigmund Freud and of Haydn, Mozart, Beethoven, and Schubert have also been established as museums.

Subways encircle the central city and extend to the suburbs. Railways run to the north, east, and south, and major road arteries radiate in all directions. Vienna's international airport is located 11 miles (18 km) to the southeast, at Schwechat. Area city, 160 square miles (415 square km); metropolitan area, 1,491 square miles (3,862 square km). Pop. (1981) city, 1,515,666; metropolitan area, 1,973,758.

Vienna, Congress of, assembly in 1814–15 that reorganized Europe after the Napoleonic Wars. Having begun in September 1814, five months after Napoleon's first abdication, it completed its "Final Act" in June 1815, shortly before the Waterloo campaign and the end of the Hundred Days of Napoleon's return to power. The settlement was the most

comprehensive treaty that Europe had ever seen.

Austria, Prussia, Russia, and Great Britain, the four powers chiefly instrumental in the overthrow of Napoleon, had concluded a special alliance among themselves with the Treaty of Chaumont, on March 9, 1814, a month before Napoleon's first abdication. The subsequent treaties of peace with France, signed on May 30 not only by the "four" but also by Sweden and Portugal and on July 20 by Spain, stipulated that all former belligerents should send plenipotentiaries to a congress in Vienna. Nevertheless, the "four" still intended to reserve the real making of decisions to themselves. Two months after the sessions began, however, Bourbon France was admitted to the "four." The "four" thus became the "five," and it was the committee of the "five" that was the real Congress of Vienna.

Representatives began to arrive in Vienna toward the end of September 1814. Klemens, prince von Metternich, principal minister of Austria, represented his emperor, Francis II. Tsar Alexander I of Russia directed his own diplomacy. King Frederick William III of Prussia had Karl, prince von Hardenberg, as his principal minister. Great Britain was represented by its foreign minister, Viscount Castlereagh. When Castlereagh had to return to his parliamentary duties, the Duke of Wellington replaced him, and Lord Clancarty was principal representative after the duke's departure. The restored Louis XVIII of France sent Talleyrand. Spain, Portugal, and Sweden had only men of moderate ability to represent them. Many of the rulers of the minor states of Europe put in an appearance. With them came a host of courtiers, secretaries, and ladies to enjoy the magnificent social life of the Austrian court.

The major points of friction occurred over the disposition of Poland and Saxony, the conflicting claims of Sweden, Denmark, and Russia, and the adjustment of the borders of the German states. In general, Russia and Prussia were opposed by Austria, France, and England, which at one point (Jan. 3, 1815) went so far as to conclude a secret treaty of defensive alliance. The major final agreements were as follows.

For Poland, Alexander gave back Galicia to Austria and gave Thorn and a region around it to Prussia; Kraków was made a free town. The rest of the duchy of Warsaw was incorporated as a separate kingdom under the Russian emperor's sovereignty. Prussia got two-fifths of Saxony and was compensated by extensive additions in Westphalia and on the left bank of the Rhine. It was Castlereagh who insisted on Prussian acceptance of this latter territory, with which it had been suggested the king of Saxony should be compensated; Castlereagh wanted Prussia to guard the Rhine against France and act as a buttress to the new Kingdom of The Netherlands, which comprised both the former United Provinces and Belgium. Austria was compensated by Lombardy and Venice and also got back most of Tirol. Bavaria, Württemberg, and Baden on the whole did well. Hanover was also enlarged. The outline of a constitution, a loose confederation, was drawn up for Germany-a triumph for Metternich. Denmark lost Norway to Sweden but got Lauenburg, while Swedish Pomerania went to Prussia. Switzerland was given a new constitution.

In Italy, Piedmont absorbed Genoa; Tuscany and Modena went to an Austrian archduke; Parma was given to Marie-Louise, consort of the deposed Napoleon. The Papal States were restored to the pope, Naples to the Sicilian Bourbons.

Valuable articles were agreed to on the free navigation of international rivers and diplomatic precedence. Castlereagh's great efforts for the abolition of the slave trade were rewarded only by a pious declaration.

The Final Act of the Congress of Vienna comprised all these agreements in one great instrument. It was signed on June 9, 1815, by the "eight" (except Spain, who refused as a protest against the Italian settlement). All the other powers subsequently acceded to it.

As a result, the lines laid down by the Congress of Vienna lasted, except for one or two changes, for more than 40 years.

Vienna, Siege of (July 17-Sept. 12, 1683), expedition by the Turks against the Habsburg Holy Roman emperor Leopold I that resulted in their defeat by a combined force led by John III Sobieski of Poland. The siege marked the beginning of the end of Turkish domination in eastern Europe.

The leader of the Hungarian Calvinists. Imre Thököly, appealed to the Turkish grand vizier, Kara Mustafa, to attack the Habsburg capital. With the tacit support of the Hungarian army, 150,000 Turks laid siege to Vienna, succeeded in capturing the outer fortifications, and began to tunnel to the inner walls. The emperor fled the city. Pope Innocent XI tried unsuccessfully to induce Louis XIV of France to aid Leopold against the Turks and then appealed to Poland with a large subsidy. Although Sobieski and the emperor had made a pact of alliance earlier that year, Sobieski was reluctant to come until Innocent persuaded Charles of Lorraine to join a combined army with the electors of Saxony and Bavaria as well as 30 German princes. The 80,000 troops of this relieving army formed along the top of the Vienna hills, and, on the morning of September 12, Lorraine's and Sobieski's forces attacked the Turks. The battle raged for 15 hours before the Turkish invaders were driven from their trenches. The red tent of the grand vizier was blown up, but he escaped while thousands of members of his routed army were slaughtered or taken prisoner. Reports stated that it took the armies and the Viennese a week to collect the booty that was left behind in the Turkish

Vienna, University of, German UNIVERSITÄT WIEN, state-financed coeducational institution for higher learning at Vienna. Founded in 1365, it is the oldest university in the German-speaking world.

The university was first chartered, following the model of the University of Paris, by the Habsburg duke Rudolf IV of Austria, as an expression of his rivalry with German king Charles IV, who had founded the University of Prague in 1348. After Rudolf's brother and successor, Albert III, reorganized the foundering university in 1384, endowing it generously, broadening the curriculum, and making enrollment more geographically comprehensive, Vienna achieved first rank among universities in the German-speaking east, with special distinction in medicine, law, and theology.

The university was a centre of revolution in 1848 and in 1850 won important reforms, including greater freedom for teachers and students, the seminar method of instruction, and a wider selection of subjects. In 1878 women were admitted to study in the philosophy (liberal arts) faculty on a limited basis, broadened 11 years later; in 1900 the medical school became coeducational, in 1919 the law school. The modern university includes faculties of Roman Catholic and of Protestant theology, social sciences and economics, medicine, basic and general sciences, human sciences, and mathematics and natural sciences.

Vienna Circle, German WIENER KREIS, a group of philosophers, scientists, and mathematicians formed in the 1920s that met regularly in Vienna to investigate scientific language and scientific methodology. The philosophical movement associated with the

Circle has been called variously logical positivism, logical empiricism, scientific empiricism, neopositivism, and the unity of science movement. The work of its members, although not unanimous in the treatment of many issues, was distinguished, first, by its attention to the form of scientific theories, in the belief that the logical structure of any particular scientific theory could be specified quite apart from its content. Second, they formulated a verifiability principle or criterion of meaning, a claim that the meaningfulness of a proposition is grounded in experience and observation. For this reason, the statements of ethics, metaphysics, religion, and aesthetics were held to be assertorically meaningless. Third, and as a result of the two other points, a doctrine of unified science was espoused. Thus, no fundamental differences were seen to exist between the physical and the biological sciences or between the natural and the social sciences.

The founder and leader of the group was Moritz Schlick, who was an epistemologist and philosopher of science. Among its members were Gustav Bergmann, Rudolf Carnap, Herbert Feigl, Philipp Frank, Kurt Gödel, Otto Neurath, and Friedrich Waismann; and among the members of a cognate group, the Gesellschaft für empirische Philosophie ("Society for Empirical Philosophy"), which met in Berlin, were Carl Hempel and Hans Reichenbach. A formal declaration of the group's intentions was issued in 1929 with the publication of the manifesto Wissenschaftliche Weltauffassung: Der Wiener Kreis ("Scientific Conception of the World: The Vienna Circle"), and in that year the first in a series of congresses organized by the group took place in Prague. In 1938, with the onset of World War II, political pressure was brought to bear against the group, and it disbanded, many of its members fleeing to the United States and a few to Great Britain.

Vienna porcelain, ceramic ware made at the Vienna factory in Austria between 1719 and 1864. Claudius Innocentius du Paquier (d. 1751), a Dutchman, began making porcelain there with the help of two workmen from Meissen in Germany. In 1744 he sold the enterprise to the Austrian state. After a

succession of different directors, Konrad von Sorgenthal took over the direction in 1784. After Sorgenthal's death in 1805, the factory produced little that was original.

Vienna porcelain achieved fame early for its rich decoration, which took many forms as one period of taste gave way to another. During the du Paquier period, the range included formal, orientalizing flowers (indianische Blumen), succeeded by more naturalistic flowers (deutsche Blumen) based on contem-

porary European illustrations; leaf and strapwork patterns; black monochrome painting (Schwarzlot), often of animals and hunting scenes; and little figures in the "Chinese" taste drawn with more than usual vivacity and assurance. The colour range, which included mauve, green, blue, gray, brownish gray, and pink, was dominated by a colour graduating from orange to rust. Of the many artists employed at Vienna, Jakobus Helchis (fl. 1740) was distinguished for cupids drawn delicately but strongly in a range of pink, mauve, and orange. The State period, until 1784, had Johann Josef Niedermayer, who produced porcelain figures of distinction from 1747 to 1784 as Modellmeister. In the period from Sorgenthal's direction onward, the Neoclassical taste was paramount, and the artistry was that of the miniaturist. The use of gilding gave a jewellike appearance to the tableware, and new background colours were developed, such as dark blue, dark brown, and bright yellow; they tended to cover the whole outer area of the vessel except for small reserves (spaces) in which minute landscapes, figures, and the like were brilliantly executed. The repertoire of classical and Renaissance motifs was augmented by antique designs collected by Anton Grassi (who had succeeded Niedermayer as Modellmeister in 1778). The factory began to decline in 1805 and closed in 1864.

Vienna State Opera, German STAATSOPER, theatre in Vienna, Austria, that is one of the world's leading opera houses, known especially for performances of works by Richard Wagner, Wolfgang Amadeus Mozart, and Richard Strauss. The original theatre was built in 1869 to house the expanded operations of the Vienna Court Opera (Hofoper), by which name it was originally known. Particularly famed during the conductorship of Hans Richter (artistic director 1880-96) were productions of Wagner's cycle Der Ring des Nibelungen. The directorship of the composer Gustav Mahler (1897–1907) was one of the artistic high points of the opera's history. Among directors from 1908 until the annexation of Austria by Germany in 1938 were Richard Strauss and the conductors Clemens Krauss and Felix Weingartner.

Wartime bombing destroyed the building in 1945. Its reconstruction, completed in 1955, was financed by taxes, contributions, and U.S. Marshall Plan aid. In the interim, performances of the State Opera were held at the Vienna Volksoper (Folk Opera) and the Theater an der Wien. The outstanding musical director of the period after World War II was the conductor Herbert von Karajan. Performances are financed in part by a state subsidy.

Vienne, *département*, Poitou-Charentes *région*, west-central France. It was created mainly from the historic province of Poitou (*q.v.*), and from neighbouring parts of the provinces of Touraine, Berry, and Anjou.

Most of the département, which has an area of 2,699 square miles (6,990 square km), occupies the lowland Poitou threshold of the Paris Basin, between the Massif Central and the highlands south of the Loire River. As the natural approach from the southwest to the Paris region, it has been the scene of many battles. Among the most memorable were the defeat of the Saracens (Arabs) in 732 by the Frankish leader Charles Martel and the English victory over the French in 1356 at the Battle of Poitiers.

The *département* is crossed south-north by the Vienne River and by its tributary, the Clain, which joins it near Châtellerault. The climate is mild, with warm summers; rain is abundant, especially in winter. The region is essentially rural. Cereals, fruit, vegetables, and fodder crops are extensively cultivated. Tobacco is also grown, and mushrooms are exported from Châtellerault and Loudun. Forests and woodlands abound.

Poitiers is the capital of the département and its largest town. Châtellerault, where there is some industry, is the only other town of considerable size. The département's other towns are small agricultural market centres, and some have Romanesque churches. Chauvigny, on a promontory above the Vienne River, has the ruins of several feudal castles. Charroux, in the south, has extensive remains of a great abbey, half of which was demolished in the 19th century. The département is also rich in megalithic remains. It has three arrondissements, Poitiers, Châtellerault, and Montmorillon; Vienne is in the educational division of Poitiers. Pop. (1987 est.) 381,700.

Vienne, town, Isère département, Rhône-Alpes région, southeastern France. It lies along the Rhône River where the latter is joined by the Gère River. In ancient times Vienne was the capital of the Celtic tribe known as the Allobroges. It was conquered by the Romans in 121 BC and was subsequently one of the most important towns of Gaul until Roman rule of the area ended in AD 275. Late in the 9th century the town became part of the Holy Roman Empire, and it was transferred to French sovereignty in 1450.

The old town lies in a depression that is surrounded by steep hills. Vienne is among the richest French repositories of Roman and medieval buildings. The town's Roman temple dates from the early 1st century AD. It became a Christian church in the 5th century, was used as a club for the Jacobins during the French Revolution, and was restored to its original aspect in 1860. The ruined Roman theatre on the slopes of nearby Mount Pipet could seat more than 13,000 spectators and is still used for theatrical performances. In the centre of the town, excavations in the 1960s and '70s uncovered the walls of a 1st-century theatre and temple consecrated to the Eastern divinity Cybele. On the right bank of the Rhône, excavations have uncovered Roman residential and industrial quarters extending over 10 acres (4 hectares).

Vienne has three important medieval churches. Near the Rhône Bridge is the 9th-century Church of Saint-André-le-Bas, which was rebuilt in the 12th-13th century. The former Abbey Church of Saint-Pierre was begun in the 4th century and is one of the oldest Christian churches in France. It now houses a museum of Roman sculptures and other antiquities. The largest church in the town is Saint-Maurice Cathedral, which was built in the 12th-15th century.

Present-day Vienne is a marketing centre for the agricultural produce of the Rhône River valley. Its industries include textiles, metallurgy, and footwear. Pop. (1982) 25,414.

Vienne, Council of, 15th ecumenical council of the Roman Catholic church (1311–12), convoked by Pope Clement V at the insistence of Philip IV of France, who demanded the posthumous trial of Pope Boniface VIII and the suppression of the Knights Templars, one of the great military religious orders founded during the Crusades. Vienne, near Lyon, was chosen because it was easily accessible and because it was in a practically independent state that was not acquired by France until 1349. Philip invited all Western bishops to attend;

Philip invited all Western bishops to attend; though he personally ordered 230 to be present, only about 120 came. No trial was held, but the Templars were suppressed by a papal order issued independently of the council. Besides voting money for a crusade and issuing reform decrees, the council heard complaints of opposing factions among the Franciscans—the Spirituals and the Conventuals—concerning the practice of poverty and sided with the more moderate Conventuals; Clement sanctioned their decision.

Vienne River, river, western France, 217 mi (350 km) in length, a left-bank tributary of

the Loire. Rising on the Plateau de Millevaches, the Vienne flows through agricultural regions, taking a winding course through five départements. It flows west-northwest into the Haute-Vienne département, receiving the Maulde and Taurion tributaries, which are dammed in several places, before it flows past the city of Limoges. Beyond Saint-Junien it turns sharply north and broadens. After passing through Châtellerault, it meets the Creuse River and bends westward past Chinon before joining the Loire.

Vientiane, largest city and capital of Laos, situated on a plain just northeast of the Mekong River. The city's central river port location in a country relying heavily on its rivers for transportation and its surrounding hinterland of intensive rice cultivation have made Vientiane the major economic centre of Laos. The city has a tropical monsoon climate, every month having an average daytime temperature above 80° F (27° C) and more than 80 percent of Vientiane's annual precipitation on the average falling in the five months May-September.

The town was founded during the late 13th century, and in the mid-16th century the capital of the Lao kingdom (a state known as Lan

That Luang temple, Vientiane, Laos Picturepoint, London

Xang) was moved to Vientiane from its previous traditional location at Luang Prabang (now Louangphrabang). In 1778 Vientiane came under Siamese control; in 1828 it was sacked and destroyed when the subject Laotian king revolted against Siamese hegemony. From 1899 to 1953, with the exception of the Japanese occupation (1945), Vientiane was in succession the seat of the French governor and the French administrative capital.

Vientiane still has some of its older wooden structures, despite its government offices, foreign embassies, schools, and radio station. Its modern industries include brewing, lumber processing, and the manufacture of brick, tile, textiles, cigarettes, matches, detergents, plastic bags, rubber sandals, and iron and steel. The Lao farmers of the surrounding area tend rice, corn (maize), and livestock in some of the best alluvial lowlands of Laos. Before 1975 the city was the principal stock shipping and slaughtering centre of the country. Since the shift in the country's import trade from Vietnam to Thailand, Vientiane has replaced Pakxé to the southeast as Laos's principal port of entry.

The Sisavangvong University in Vientiane has faculties of agriculture, art, education, forestry and irrigation, and medicine. Affiliated bodies include Fa-Ngum College, Lycée Vientiane, Polytechnic, and Pali and Sanskrit institutes. Ho Phakeo, the national museum, is located in the city, as are the Dongsaphangmeuk Library and the Bibliothèque Nationale.

At Vientiane the Mekong River is navigable only by small craft; passage to the right bank and the Thai railhead of Nong Khai is by ferry. Vientiane has an international airport, and highways link the city with Louangphrabang and Savannakhet in Laos and with Ho Chi Minh City. The Nam Ngum Dam north of Vientiane provides enough hydroelectric power for the surrounding areas and for export to Thailand as well. Vientiane's outstanding building is the That Luang, a stupa (temple), dating from c. 1566 and restored by Lao civil servants under Prince Phetsarath during the French colonial period. Pop. (1981 est.) city, 210,000.

Vieques Island, Spanish ISLA DE VIEQUES, island, Puerto Rico, second in size only to the main island. It lies 13 miles (21 km) east of the main island, fronting south on the Caribbean Sea and north on the Vieques Sound, which connects the Caribbean with the Atlantic Ocean. Composed mostly of volcanic and granite intrusives, the generally hilly island is 21 miles (34 km) long and 3 miles (5 km) wide, and it is 52 square miles (135 square km) in area. It was annexed to Puerto Rico in 1854.

Vieques (also called Isabel Segunda), the chief town, is located on an inlet of the northern coast. Since 1941 about 70 percent of Vieques has been under the jurisdiction of the U.S. Navy. Sugarcane is the principal crop in the civilian areas of the island; coconuts, grains, sweet potatoes, avocados, bananas, and papayas are grown, and poultry and cattle are also raised. Vieques municipio, which is coterminous with the island, has four barrios (wards), three of them rural. Pop. (1984 est.) 7.800.

Vierordt, Karl von (b. July 1, 1818, Lahr, Baden—d. Nov. 22, 1884, Tübingen, Ger.), German physician and professor of medicine who developed techniques and instruments for the measurement of various aspects of blood and its circulation.

Vierordt received his education at the universities of Berlin, Göttingen, Vienna, and Heidelberg and started a practice at Karlsruhe in 1842. His first papers, on respiration and strabismus (a visual disorder), were well received. In 1849 he became associate professor of theoretical medicine at Tübingen and four years later was made professor of physiology there.

One of Vierordt's early discoveries was an exact method of making an erythrocyte (red blood cell) count. His inventions included the sphygmograph, the first instrument that could produce a graphic representation of the pulse, and the hemotachometer, an instrument that monitored the velocity of blood flow. Other research included spectrographic analyses of hemoglobin solutions, bile, and urine and studies of respiration and sound conduction.

Vierzon, city, Cher département, Centre region, central France. It lies along the Canal du Berry, at the confluence of the Cher and Yèvre rivers, northwest of Bourges. The city grew from a rail and industrial complex formed in 1938 from several small communes (Vierzon-Ville, Vierzon-Village, Vierzon-Forges, and Vierzon-Bourgneuf). Metals, glass, and agricultural machinery dominate local industry. Pop. (1982) 33,093.

Viet Cong (vc), in full VIET NAM CONG SAN, English VIETNAMESE COMMUNISTS, the guerrilla force that, with the support of the North Vietnamese Army, fought against South Vietnam (late 1950s–1975) and the United States (early 1960s–1973).

Though beginning in the mid-1950s as a collection of various groups opposed to the South Vietnamese government of President Ngo Dinh Diem, the Viet Cong became in 1960 the military arm of the National Lib-

eration Front (q.v., NLF). In 1969 the NLF joined other groups in the areas of South Vietnam that were controlled by the Viet Cong to form the Provisional Revolutionary Government (PRG). The movement's principal objectives were the overthrow of the South Vietnamese government and the reunification of South Vietnam and North Vietnam.

The early insurgent activity in South Vietnam against Diem's government was initially conducted by elements of the Hoa Hao and Cao Dai religious sects. After 1954 they were joined by former elements of the southern Viet Minh (q.v.), a Communist-oriented nationalist group. The overwhelming majority of the Viet Cong were subsequently recruited in the south, but they received weapons, guidance, and reinforcements from North Vietnamese Army soldiers who had infiltrated into South Vietnam. For the most part, the Viet Cong fought essentially a guerrilla war of ambush, terrorism, and sabotage; they used small units to maintain a hold on the countryside, leaving the main population centres to government authorities.

When peace negotiations were held in Paris in 1971-73, a delegation from the PRG was present. Under terms of the agreement reached there, the PRG won acknowledgment of its authority in areas under its control, pending general elections to determine the future of South Vietnam. The peace agreement soon broke down, however, as both the South Vietnamese government and the PRG began trying to improve their military and territorial positions at each other's expense. Following the full-scale North Vietnamese invasion of South Vietnam and the subsequent rapid collapse of the government of South Vietnamese president Nguyen Van Thieu in the spring of 1975, the PRG assumed power as the government of South Vietnam; the following year, when reunification of the country was accomplished, the PRG joined other political groups in forming a National United Front. Real governmental power in what had been South Vietnam was subsequently exercised by the Vietnamese Communist Party and its North Vietnamese leadership.

Viet Minh, in full VIET NAM DOC LAP DONG MINH HOI, English LEAGUE FOR THE INDEPENDENCE OF VIETNAM, organization that led the struggle for Vietnamese independence from French rule. The Viet Minh was formed in China in May 1941 by Ho Chi Minh. Although led primarily by Communists, the Viet Minh operated as a national front organization open to persons of various political persuasions.

In late 1943 members of the Viet Minh, led by General Vo Nguyen Giap, began to infiltrate Vietnam to launch guerrilla operations against the Japanese, who occupied the country during World War II. The Viet Minh forces liberated considerable portions of northern Vietnam, and after the Japanese surrender to the Allies, Viet Minh units seized control of Hanoi and proclaimed the independent Democratic Republic of Vietnam.

The French at first promised to recognize the new government as a free state but failed to do so. On Nov. 23, 1946, at least 6,000 Vietnamese civilians were killed in a French naval bombardment of the port city of Haiphong, and the first Indochina War began. The Viet Minh had popular support and was able to dominate the countryside, while the French strength lay in urban areas. As the war neared an end, the Viet Minh was succeeded by a new organization, the Lien Viet, or Vietnamese National Popular Front. In 1951 the majority of the Viet Minh leadership was absorbed into the Lao Dong, or Vietnamese Workers' Party (later Vietnamese Communist) Party, which

remained the dominant force in North Vietnam.

Elements of the Viet Minh joined with the Viet Cong (q.v.) against the U.S.-supported government of South Vietnam and the United States in the Vietnam War (or second Indochina War) of the late 1950s, '60s, and early '70s. After the reunification of the country (1976), Viet Minh leaders continued to take an active role in Vietnamese politics.

Viet-Muong languages, branch of the Mon-Khmer group of the Austro-Asiatic family of languages, spoken in Vietnam and neighbouring states. The most important language of the group is Vietnamese, including Northern, called Tonkinese and spoken in and around Hanoi; Central, called High Annamese and spoken in Hue; and Southern, called Cochinchinese, the language of the Mekong River delta.

Vietnamese is also spoken in parts of Kampuchea (Cambodia), Laos, and Thailand; it has borrowed many words from Chinese. The second language of the group, Muong, is spoken primarily in northern Vietnam.

Viet Nam Doc Lap Dong Minh Hoi (political organization): see Viet Minh.

Viet Nam Quoc Dan Dang (VNQDD), English VIETNAMESE NATIONALIST PARTY, the first large-scale revolutionary nationalist organization in Vietnam. Founded officially in 1927, the VNQDD was modeled after the revolutionary Nationalist Party (Kuomintang) of Sun Yat-sen, later led by Chiang Kai-shek, in China. Its aim, like that of the Nationalist Party, was the establishment of a republican democratic government free from foreign interference; structurally it remained an open though tightly organized party. Gaining the allegiance of many military officers, as well as of the young intelligentsia, the VNQDD turned to terrorist activities in the late 1920s after the French repeatedly denied it a chance to participate in the electoral process.

Its most ambitious action—an event known as the Yen Bai uprising—occurred on the night of Feb. 9, 1930, when the military garrison at Yen Bai, a small town along the Chinese border, mutinied. Before the remainder of the country could follow suit, however, the French, who had been alerted, crushed the revolt with such severity that the VNQDD was destroyed. Many former members joined the newly formed Indochinese Communist Party.

Viet Tri, town, northern Vietnam. It lies along the Red River, about 35 miles (55 km) northwest of Hanoi. It is an industrial centre with a paper mill and a chemical factory and is on the Haiphong railway.

Rice, tea, lacquer trees, and sugarcane are among the principal crops in the region. The town's former college of light industry has been used since 1976 for general higher education. Pop. (latest census) 21,501.

Viète, François, SEIGNEUR (lord) DE LA BIGOTIERE, Latin FRANCISCUS VIETA (b. 1540, Fontenay-le-Comte, Fr.—d. Dec. 13, 1603, Paris), French mathematician who introduced the first systematic algebraic notation and contributed to the theory of equations.

Viète, a Huguenot sympathizer, solved a complex cipher of more than 500 characters used by King Philip II of Spain in his war to defend Roman Catholicism from the Huguenots. When Philip, assuming that the cipher could not be broken, discovered that the French were aware of his military plans, he complained to the pope that black magic was being employed against his country.

Viète's Canon mathematicus seu ad triangula (1579; "Mathematical Laws Applied to Triangles") is probably the first western European work dealing with a systematic development of methods—utilizing all six trigonometric functions—for computing plane and spherical triangles. Viète has been called "the father of modern algebraic notation," and his *In artem analyticem isagoge* (1591; "Introduction to the Analytical Arts") closely resembles a modern elementary algebra text. His contribution to the theory of equations is *De aequationum* recognitione et emendatione (1615; "Concerning the Recognition and Emendation of Equations"), in which he presented methods for solving equations of second, third, and fourth degree. He knew the connection between the positive roots of an equation (which, in his time, were thought of as the only roots) and the coefficients of the different powers of the unknown quantity.

eastern coast of the Indochinese Peninsula in Southeast Asia, covering an area of 128,052 square miles (331,653 square km). The capital is Hanoi. The country's maximum length from northwest to southeast is about 850 miles (1,370 km) and maximum width from east to west is about 340 miles (550 km) in the north and about 210 miles (340 km) in the south. Vietnam is bordered on the north by China; on the west by Laos, Kampuchea (Cambodia), and the Gulf of Thailand; and on the south and east by the South China Sea and the Gulf of Tonkin. The population in 1990 was estimated at 66,743,000.

A brief treatment of Vietnam follows. For full treatment, see MACROPAEDIA: Southeast Asia, Mainland.

For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. Vietnam can be divided into four physiographic regions: the Annamitique Chain of mountains extending from north to south through west-central Vietnam, the Red River delta in the north, the Mekong River delta in the south, and the coastal plain in the east. The extremely rugged and densely forested Annamitique Chain, a southward extension of the Yunnan Plateau, covers about two-thirds of the total land area. Parallel northwestsoutheast ranges with several peaks rising to more than 6,000 feet (1,830 m) above sea level dominate the northern half of Vietnam, and a series of heavily eroded longitudinal plateaus (average elevation 2,500 to 5,000 feet [760 to 1,500 m]) extend into the southern half. Extensive rubber and tea estates occur on the mountains' slopes.

In the north the densely populated Red River delta, roughly triangular in shape, is intensively cultivated (wet rice is the chief crop). The Red River and its tributaries are subject to severe and frequent flooding and are important for irrigation and local freight transporta-

tion. The fertile Mekong River delta is almost four times larger than the Red River delta and is one of the richest rice-growing areas in the world. The annual floods in the Mekong River, unlike the Red, are regular and increase the fertile land each year by depositing new sediments on the floodplains. There are extensive rice paddies and plantations of sugarcane, bananas, and coconuts in the Mekong delta. A low-lying, narrow coastal plain about 620 miles (1,000 km) long connects these two major river deltas.

Vietnam has a tropical monsoonal climate with hot winters in the south and cool winters in the north. Temperatures above 100° F (38° C) are frequent throughout the country. The mean annual precipitation (mainly occurring from May to October) is 60 to 80 inches (1,500 to 2,000 mm). Typhoons are frequent in the northern and southwestern parts of the country.

About two-fifths of the total land area is under tropical evergreen and subtropical deciduous forests of oak, beech, chestnut, pine, teak, and ebony. Bamboo is widespread both in the undergrowth of forests and in pure stands, primarily along rivers. Mangrove forests are prevalent in the tidal coastal plains, and savanna-type grasses and shrubs cover the highlands and plateaus of the southwest. A great amount of forestland has been degraded by slash-and-burn cultivation and by bombing and herbicides used by U.S. armed forces during the Vietnam War in the late 1960s, although war-ravaged areas subsequently underwent some renewal. About one-fourth of the country's total land area is cultivated.

Northern Vietnam is rich in various mineral resources, the most important of which are the large reserves of anthracite and lignite coal. Other minerals found in the north include iron ore, lead, zinc, bauxite, copper, chromium ore, tungsten, and tin. Some petroleum deposits exist off the southern coast.

posits exist off the southern coast.

The people. Vietnamese are the predom-

inant ethnic group, accounting for almost 90 percent of the total population. Minorities in the north include Chinese, Hmong, Tai-speaking peoples, Nung, and Tay (Tho). Southern minorities include highland ethnic groups, Khmer, and Chan. Vietnamese is the official language; French, Chinese, English, and Khmer are also spoken. Buddhism and Taoism are the major religions, and Confucianism is a predominant philosophy. Roman Catholics, Muslims, Hoa Hao, Cao Dai, and Protestants are other religious groups.

Vietnam's birth and death rates are estimated to be relatively high by world standards but are comparable with those of other countries in Southeast Asia. The country's annual average population growth rate of 2.0 percent is also relatively high. Consequently, about two-fifths of the population is younger than 15 years. Life expectancy in Vietnam is about 60 years.

During the Vietnam War (1955–75) there was a sizable shift of the population from rural to urban areas, especially in the south. By the late 20th century, one-fifth of the total population lived in urban areas. When the government of South Vietnam collapsed in 1975, about 1,000,000 refugees fled the country. Refugees who managed to flee Vietnam since that time are estimated at another 1,000,000, including Vietnamese and many ethnic Chinese. In 1976 the government began a plan to redistribute 10,000,000 people of the urban population into rural "new economic zones," particularly in the south, by 1996. Between 1976 and 1986 it was reported that more than 4,000,000 people had been settled in the new economic zones.

The economy. Vietnam has a centrally planned, developing economy that is largely based on agriculture. Unyielding policies of collectivization and nationalization implemented by an often inefficient and sometimes

corrupt bureaucracy have hampered Vietnam's economic reconstruction since the end of the Vietnam War in 1975. The nation's economy stagnated while its population grew at a rapid pace, thus lowering the general standard of living. Vietnam's gross national product (GNP) per capita consequently remains one of the lowest in the world.

Agriculture employs approximately threefifths of Vietnam's work force and accounts for a comparable proportion of the net material product (which consists of agriculture, mining, manufacturing, construction, public utilities, transportation, and trade). Parts of the country were facing food shortages by the time the government began allowing the sale of surplus grain on the open market in the late 1980s. By far the greatest part of arable land is used for rice cultivation, with two crops harvested per year in many areas. Other significant food crops include cassava, sweet potatoes, sorghum, and corn (maize). State collective farms produce some coffee, tea, and rubber for export as well as sugarcane, soybeans, and coconuts. Pigs and cattle are the main livestock raised.

Fish and shellfish harvested from inland waters and the South China Sea are the second most important food staple after rice, as well as important export commodities. The industry has suffered, however, from a loss of boats (used by escaping refugees) and fuel shortages. The Ministry of Forestry supervises the timber industry, and though there has been little modernization, production is slowly expanding. Vietnam extracts economically significant amounts of coal, apatite (phosphate rock), tin, and chromite.

Mining and manufacturing account for about one-fourth of the net material product but employ only a small percentage of the labour force. Most of the country's industries are concentrated in the north. Shortages of raw materials and skilled labour persist in the industrial sector. The government has urged all state-run production to expand piecework and incentive pay systems to increase output. Reconstruction efforts after 1976 centred on cement, steel, textile, and electric-power production facilities. Transport and distribution of goods, however, remains a problem because of an inadequately developed infrastructure. Coal-burning plants were the primary source of electricity, but the amount produced is insufficient to meet the country's needs.

Vietnam is heavily dependent on foreign aid, supplied mainly by the Soviet Union. Imports exceed the value of exports. The Soviet Union is Vietnam's main trading partner, although Japan is also a major source of imports and Hong Kong a major destination for exports. Imports include fuel and raw materials, machinery, and foodstuffs; exports are dominated by manufactured goods and handicrafts.

Government and social conditions. Vietnam is a socialist republic whose 1980 constitution vests the executive power in the chairman of the Council of State (president), who appoints the Council of Ministers and its chairman. The National Assembly is the legislative organ, whose members serve a five-year term. It elects the chairman of the Council of State and gives formal approval to proposals of executive organs. The Supreme People's Court is the highest court of appeal and supervises lower People's courts. The most important political institution in the country is, however, the Vietnamese Communist Party, most of whose members hold high positions in the government. Major policy decisions are formulated by its all-powerful Politburo. The party selects the members of the National Assembly, who are then ratified by voters from a single unopposed candidate list. Vietnam's large armed forces consist of the army, navy air force, paramilitary regional and provincial forces, the militia, and the reserves.

Vietnam provides health services and facili-

ties that reach into the villages and rural areas, and the incidence of diseases such as poliomyelitis, typhoid, diphtheria, and tuberculosis has been reduced. Education is officially compulsory and free for 10 years of schooling. The government claims to have eradicated illiteracy in the late 1970s. Higher education is provided for by the University of Hanoi and other colleges. The press and all broadcasting facilities are operated and controlled by the government and the Communist Party. A number of daily, biweekly, and weekly newspapers are published including the Nhan Dan, the official party newspaper.

History. A distinct Vietnamese ethnolinguistic group began to emerge about 200 BC in the independent kingdom of Nam Viet, which was later annexed to China. In the 1st century AD the kingdom of Funan, which was greatly influenced by contact with India, occupied much of the Mekong delta area, but it disappeared in the 6th century. By 939 the north was finally freed of Chinese rule. The Vietnamese repulsed three Mongol invasions in the 13th century but were reconquered by the Chinese in 1407, after which a national resistance movement finally drove the Chinese out in 1428. Under the Le dynasty a bureaucratic government was established in the Chinese style, and the borders of Vietnam were gradually pushed southward. By 1757, however, the country had been divided into two parts, and it was not reunited until 1802. by the general Nguyen Anh, who became the

emperor Gia Long.
In the latter half of the 19th century, Vietnam was gradually conquered by the French, who controlled it as a colony (1883-1939) and then as a possession (1939-45). In 1945 communist and other nationalists under Ho Chi Minh declared Vietnam's independence. For seven years the French opposed independence, and Ho Chi Minh led guerrilla warfare against the French in the First Indochina War, which ended in a Vietnamese victory at Dien Bien Phu on May 7, 1954. An agreement was signed at Geneva on July 21, 1954, providing for a temporary division of the country, at latitude 17° N, between a communist-led and Sovietsupported northern half and a U.S.-supported southern half. The activities of North Vietnamese guerrillas and pro-communist rebels in South Vietnam led to U.S. intervention and the Second Indochina War, or Vietnam War (1955-75), which caused great destruction and loss of life. A cease-fire agreement was signed in 1973, and U.S. troops were withdrawn. The civil war soon resumed, however, and in 1975 North Vietnam launched a full-scale invasion of South Vietnam that resulted in the collapse of the South Vietnamese government and its replacement by a regime dominated by the communists. On July 2, 1976, the two Vietnams were united as the Socialist Republic of Vietnam.

In 1978 relations with Kampuchea (formerly Cambodia) and China worsened as border fighting between Vietnamese and Kampuchean forces occurred and thousands of ethnic Chinese fled Vietnam because of government policies directed against them. In 1979 Vietnam invaded Kampuchea, toppling its Khmer Rouge government under Pol Pot and installing a Vietnamese-backed regime. In response, Chinese troops briefly invaded Vietnam along the latter's northern border. Although Vietnam stopped the Chinese advance, it suffered severe economic effects from the nine-day war. In the 1980s Vietnam controlled most of Indochina through its many troops in Laos and Kampuchea. Followers of the Khmer Rouge continued to fight Viet-namese troops in Kampuchea, however, and in 1989 Vietnam completed a phased withdrawal of all its troops from Kampuchea

Vietnam War (1955-75), a protracted and unsuccessful effort by South Vietnam and the United States to prevent the communists of North Vietnam from uniting South Vietnam with North Vietnam under their leadership.

The Vietnam Independence League, generally known as the Viet Minh, was organized in 1941 as a nationalistic party seeking Vietnamese independence from France. It did not become openly communist until the mid-1950s. On Sept. 2, 1945, less than a month after the Japanese surrendered in World War II. Ho Chi Minh, the leader of the Viet Minh, formally declared Vietnam's independence from France. The Viet Minh had a strong base of popular support in the northern portion of ietnam.

The French wanted to reassert their control in Indochina, however, and would recognize Vietnam only as a free state within the French Union. Fighting between the French and the Viet Minh broke out in 1946 and continued until 1954, when the French were badly defeated in the Battle of Dien Bien Phu. An international conference in Geneva in 1954 negotiated a cease-fire between the French and the Viet Minh. To separate the warring forces, the conferees decided that the French and the Vietnamese fighting under French command would move south of the 17th parallel and the Viet Minh would go north of the 17th parallel, which was established as a military demarcation line surrounded by a demilitarized zone (DMZ). Thousands of people accordingly moved north or south away from their homes, and the French began their final departure from Vietnam. The agreement left the communist-led Viet Minh in control of the northern half of Vietnam, which came to be known as North Vietnam, while the noncommunist southern half of Vietnam became South Vietnam. Ngo Dinh Diem became South Vietnam's prime minister during the armistice negotiations.

The Geneva Accords (q.v.) stipulated that free elections be held throughout Vietnam in 1956 under the supervision of an International Control Committee with the aim of reunifying North and South Vietnam under a single popularly elected government. North Vietnam expected to win this election thanks to the broad political organization that it had built up in both parts of Vietnam. But Diem, who had solidified his control over South Vietnam, refused in 1956 to hold the scheduled elections. The United States supported his position. In response, the North Vietnamese henceforth decided to unify South with North Vietnam through military force rather than by political means.

U.S. Secretary of State John Foster Dulles, fearing the spread of communism in Asia, persuaded the U.S. government to provide economic and military assistance to the Diem regime, which became increasingly unpopular with the people. Diem replaced the traditionally elected village councils with Saigonappointed administrators. He also aroused the ire of the Buddhists by selecting his fellow Roman Catholics (most of whom had moved to South Vietnam from the North) to top government positions.

Guerrilla warfare spread as Viet Minh soldiers who were trained and armed in the Norththe Viet Cong-returned to their homes in the South to assassinate, ambush, sabotage, and proselytize. The Diem government asked for and received more American military advisers and matériel to build up the Army of the Republic of Vietnam (ARVN) and the police force, but it could not halt the growing presence of the South Vietnamese communist forces, or Viet Cong. U.S. President John F. Kennedy sent more noncombat military personnel after the North Vietnamese unified the South Vietnamese communist insurgents in an organization called the National Front for the Liberation of Vietnam (NLF) in December 1960. By the end of 1962 the number of U.S. military advisers in South Vietnam had increased from 900 (in 1960) to 11,000, and Kennedy authorized them to fight if they were fired upon.

Popular dissatisfaction with Diem continued to grow, even within his army, and Diem was assassinated during a military coup on Nov. 1, 1963. The U.S. government had despaired of him and knew about the coup beforehand. A series of unstable administrations followed in quick succession after Diem's death, and the Viet Cong increased their activities while the South Vietnamese were thus politically preoccupied.

In August, North Vietnamese patrol boats reportedly fired on the U.S. destroyer *Maddox* in the Gulf of Tonkin, and President Lyndon B. Johnson retaliated by ordering naval planes to bomb North Vietnam. The U.S. Congress almost unanimously endorsed the Tonkin Gulf Resolution authorizing the president to take "all necessary measures to repel attacks ... and prevent further aggression." The Tonkin Gulf Resolution in effect gave the president the formal authority for full-scale U.S. intervention in the Vietnam War.

After 1965 U.S. involvement in the war escalated rapidly in response both to the growing strength of the Viet Cong (who had 35,000 troops in South Vietnam by 1964) and to the incapacity of the ARVN to suppress the Viet Cong on its own, even with a total force of 400,000 men. The United States became more involved in the war not only to maintain the independence of South Vietnam but also to retain the United States' credibility with other allied nations who depended or might depend on its help to resist communist aggression or subversion.

On the night of Feb. 7, 1965, the Viet Cong attacked the U.S. base at Pleiku, killing 8 soldiers and wounding 126 more. Johnson in response ordered another reprisal bombing of North Vietnam. Three days later the Viet Cong raided another U.S. military installation at Qui Nhon, and Johnson ordered more aerial attacks against Hanoi and the NLF-controlled areas in the South. On March 6, two battalions of Marines landed on the beaches near Da Nang to relieve that beleaguered city. By June 50,000 U.S. troops had arrived to fight with the ARVN. Small contingents of the North Vietnamese army began fighting with the Viet Cong in South Vietnam, which they reached via the Ho Chi Minh Trail (q.v.) west of the Cambodian border.

The government in Saigon was now headed by Air Vice-Marshal Nguyen Cao Ky, but he was unable to check the rapidly deteriorating military situation. NLF forces were gaining control of more and more areas of the countryside, and a communist victory seemed imminent. President Johnson's response was to pledge the United States to defend South Vietnam and to send more troops. By the end of 1965, 180,000 Americans were serving in South Vietnam under the command of General William C. Westmoreland.

After mid-1966 the United States and the ARVN initiated a series of new tactics in their intensifying counterinsurgency effort, but their efforts to drive the Viet Cong from the countryside and separate them from their civilian supporters were only partly successful. The U.S. troops depended heavily on superior frepower and on helicopters for rapid deployment into targeted rural areas. The Viet Cong depended on stealth, concealment, and surprise attacks and ambushes.

U.S. troop strength in South Vietnam rose to 389,000 men in 1967, but, despite their sophis-

ticated weapons and equipment, the Americans could not eradicate the skillful and determined insurgents. More North Vietnamese troops arrived to bolster the NLF forces in the South. A presidential election, in which all candidates who favoured negotiating with the NLF were banned, was held in South Vietnam in September, and General Nguyen Van Thieu became president, with Ky as vice president.

On Jan. 30, 1968, the North Vietnamese and Viet Cong launched a massive surprise offensive during the Tet (lunar new year) Vietnamese festival. They attacked 36 South Vietnamese provincial capitals and 5 major cities. The fighting at this time was especially fierce in Saigon and in the city of Hue, which the NLF held for several weeks. The NLF suffered heavy losses (33,000 troops killed) in the Tet Offensive, and the ranks of the Viet Cong were so decimated by the fighting that, from 1968 on, the majority of the insurgents in South Vietnam were actually North Vietnamese soldiers who had infiltrated into the South. Although the general uprising that the NLF had expected in support had not materialized, the offensive had an important strategic effect, because it convinced a number of Americans that, contrary to their government's claims, the insurgency in South Vietnam could not be crushed and the war would continue for years to come.

In the United States, sentiment against U.S. participation in the war mounted steadily from 1967 on and expressed itself in peace marches, demonstrations, and acts of civil disobedience. Growing numbers of politicians and ordinary citizens began to question whether the U.S. war effort could succeed and even whether it was morally justifiable in a conflict that some interpreted as a Vietnamese civil war.

General Westmoreland requested troops to widen the war after the Tet Offensive, but the shifting balance of American public opinion now favoured "de-escalation" of the conflict. On March 31, 1968, President Johnson announced in a television address that bombing north of the 20th parallel would be stopped and that he would not seek reelection to the presidency in the fall. Hanoi responded to the decreased bombing by de-escalating its insurgency efforts, and in October Johnson ordered a total bombing halt. During the interim the United States and Hanoi had agreed to begin preliminary peace talks in Paris, and General Creighton Abrams became the new commander of U.S. forces in South Vietnam.

During 1969, action in South Vietnam tended to be scattered and limited, and the infiltration of North Vietnamese decreased markedly until late fall. In June U.S. President Richard M. Nixon and President Thieu announced the first withdrawal of 25,000 U.S. troops from South Vietnam. At that time there were more than 540,000 U.S. military personnel in Vietnam. The United States instituted a program of "Vietnamization," whereby the South Vietnamese would gradually assume all military responsibilities for their defense while being copiously supplied with U.S. arms, equipment, air support, and economic aid. U.S. commanders in the field were instructed to keep casualties to "an absolute minimum," and losses decreased appreciably. In Paris the peace talks dragged on, but South Vietnam did eventually agree to negotiate directly with the NLF and the North Vietnamese

The war in Southeast Asia expanded during the spring of 1970 when U.S. and ARVN troops invaded border sectors of Cambodia in order to destroy North Vietnamese sanctuaries and staging areas. U.S. planes bombed northern Laos, where sizable North Vietnamese forces were fighting with the pro-communist Pathet Lao ("Lao Country") against the U.S.-supported Vientiane government troops. The Ho Chi Minh Trail was the constant target of B-52 bombers. The expansion of the fighting

into Cambodia sparked a new wave of antiwar demonstrations and protests in the United States. By late 1970 the number of U.S. military personnel in South Vietnam had been reduced to 335,000.

The gradual withdrawal of U.S. troops from Vietnam proceeded as announced, but the peace talks remained stalemated. By the end of 1971 the South Vietnamese had accepted responsibility for all fighting on the ground, although they still depended on U.S. air support. The number of U.S. military personnel in South Vietnam had dropped to about 160,000.

In March 1972 the North Vietnamese invaded the DMZ and captured Quang Tri province. President Nixon responded by ordering the mining of Haiphong and other North Vietnamese ports and an intense bombing of the North. Peace talks resumed in July, but the talks broke down in mid-December with each side accusing the other of bargaining in bad faith. Hanoi and other North Vietnamese cities were then subjected to 11 days of intensive U.S. bombing.

The talks started again in Paris and resulted on Jan. 27, 1973, in an agreement between the South Vietnamese communist forces, North Vietnam, South Vietnam, and the United States. A cease-fire would go into effect the following morning throughout North and South Vietnam, all U.S. forces would be withdrawn and all its bases dismantled, all prisoners of war would be released, an international force would keep the peace, the South Vietnamese had the right to determine their own future, and North Vietnamese troops could remain in the South but not be reinforced. The 17th parallel would remain the dividing line until the country could be reunited by "peaceful means." This pact was augmented by a second 14-point accord signed in June. In August the U.S. Congress proscribed any further U.S. military activity in Indochina. By the end of 1973 there were few U.S. military personnel left in South Vietnam.

But the fighting continued in spite of the cease-fire agreements, and North and South Vietnam each denounced the other for numerous violations of the truce. Casualties, both military and civilian, were as high as they had ever been.

In 1974 South Vietnam began abandoning distant outposts that it could no longer defend, and the Viet Cong captured several provincial capitals. A new communist offensive began in January 1975. The North Vietnamese seized Phuoc Long province, and the ARVN withdrew. The ARVN's unexpected abandonment of the province convinced the North Vietnamese that a full-scale invasion of the South was now practicable. Accordingly, North Vietnam began a large-scale offensive in the Central Highlands, which the ARVN abandoned in March. When President Thieu next decided to evacuate the cities of Quang Tri and Hue, panic ensued, and the South Vietnamese military machine began to come apart. One by one the coastal cities were abandoned, and by early April the ARVN had abandoned the northern half of their country to the North Vietnamese forces. The troops of the ARVN began to melt away, and the remaining Americans escaped by air- and sealifts with Vietnamese friends and coworkers. On April 21, President Thieu resigned and flew to Taiwan. On April 30 what remained of the South Vietnamese government surrendered unconditionally, and North Vietnamese tank columns occupied Saigon without a struggle. A military government was instituted, and on July 2, 1976, the country was officially united as the Socialist Republic of Vietnam with its capital in Hanoi. Saigon was renamed Ho Chi Minh City.

The effects of the long conflict were harsh for all involved. About 47,000 Americans were killed in action and another 305,000 were

wounded in the war. About 250,000 ARVN troops were killed and almost 600,000 were wounded. The North Vietnamese and Viet Cong suffered about 900,000 troops killed and another 2,000,000 wounded. Additional hundreds of thousands of North and South Vietnamese civilians had been killed, many by U.S. bombing campaigns. The countryside was scarred by bombs and defoliation, and cities were heavily damaged. By the war's end much of the population of South Vietnam had become refugees seeking an escape from the fighting. Agriculture, business, and industry had come to a standstill. In the United States, Lyndon Johnson's economic program for a "Great Society" had been largely halted by the economic and military demands of an unpopular war. The cost of the war has been estimated to have totaled about \$200,-000,000,000. With the communist victory in South Vietnam and communist takeovers in neighbouring Cambodia (now Kampuchea) and Laos, the new Vietnam emerged as an important South Asian power.

Vietnamese language, official language of Vietnam, spoken in the late 20th century by about 54,650,000 people. It belongs to the Viet-Muong branch of the Mon-Khmer sub-family of the Austro-Asiatic family of languages. Except for a group of divergent rural dialects spoken between Hue and Vinh, most of the dialects of Vietnamese differ from each other to about the same degree as do the dialects of English in the United States. The standard language is based on the speech of educated people living in and around Hanoi. A large proportion of the vocabulary of Vietnamese has been borrowed from Chinese, and the language has been influenced by Tai.

Characteristics of Vietnamese include the use of tones to distinguish words with identical consonant and vowel sequences, the use of word order to express the syntactic relations of words to each other, and the use of modifiers rather than affixes to express the tense and voice of verb forms.

Vieux-Colombier, Theatre of the, French theatre founded in Paris in 1913 by the writer and critic Jacques Copeau to present alternatives to both the realistic "well-made" plays of the time and the star system of actor-celebrities. Copeau sought to renovate French theatre by focusing attention on the actor, whom he viewed as the essential element in translating the dramatic text into the "poetry of the theatre." He assembled a group of young actors that included Charles Dullin, Suzanne Bing, and Louis Jouvet, who was also his principal stage manager. Copeau and Jouvet designed a small (400-seat) theatre with a permanent stage setting and without the proscenium that separated actors and audience.

The Vieux-Colombier opened in October 1913. By May 1914 Copeau had produced 15 plays, including works by Molière, Shakespeare, and several modern writers. From 1917 to 1919 Copeau moved his company to New York City. Returning to Paris after World War I, he founded a drama school in association with the theatre. In 1924 he left the Vieux-Colombier, and thereafter the theatre was used by various acting companies and for showings of avant-garde cinema. In 1961 it was renamed the Theatre of the Vieux-Colombier-Jacques Copeau.

Vieux Fort, town and former capital of St. Lucia island in the eastern Caribbean Sea. It lies 19 miles (30 km) south of the harbour of Castries and is situated near the island's extreme southeastern tip on fertile, flat ground overlooking Vieux Fort Bay. Named after a 17th-century fort (Old Fort), it was the site of St. Lucia's first sugar works (1765) and is still the centre of a sugar- and coconut-growing

district. Hewanorra International Airport, one of the island's two airports, is nearby. Pop. (1984 est.) 12.951.

Vieuxtemps, Henry (b. Feb. 17, 1820, Verviers, Belg.—d. June 6, 1881, Mustapha, Alg.), Belgian violinist and composer who was one of the most influential figures in the development of violin playing.

As a prodigy, he was taken by his father on a number of European tours, during which he studied violin with Charles de Bériot in Brussels (1829-31), harmony with Simon Sechter in Vienna (1833-34), and composition with Antonín Reicha in Paris (1835-36). He subsequently toured several times in Europe and made three tours of America (in 1843-44, 1857-58, and 1870-71). He held two conservatory positions: one in St. Petersburg (1846-51), where he exerted considerable influence on Russian violin playing, and the other in Brussels (1871-73), where he was forced to resign because of a paralytic stroke. His playing style, which combined extraordinarily precise virtuoso technique and full-bodied tone, was widely imitated. He was one of the earliest bravura 19th-century virtuosos. His compositions, too, were pathbreaking; his concerti especially contributed much to the development of that form.

viewfinder, camera component that shows the area of the subject to be included in a photograph. In modern cameras it usually is part of a direct visual or range finder focusing system and may also be used to display exposure settings or meter information.

Modern viewfinders are variations on two types: reflex and direct optical. In the single-lens reflex camera, the camera lens itself serves as the finder in conjunction with a ground-glass focusing screen to which the image is reflected by a mirror. The image is viewed on the screen through a pentaprism that corrects the lateral reversal of the image as it appears on the screen. At the moment of exposure, the mirror moves out of the way, leaving a clear path to the film.

In a twin-lens reflex camera, the finder has a lens of its own, essentially a duplicate of the aperture lens, placed above it and reflecting the image by a mirror to a ground-glass screen. The image is not inverted but is laterally reversed. The focusing mechanism of the viewfinder regulates the main lens as well.

The direct-optical viewfinder most commonly used, the bright-line viewfinder, is essentially an inverted Galilean telescope system, with an optically projected rectangle outlining the frame area. The viewed image is neither inverted nor reversed.

With direct-optical and twin-lens reflex viewfinder systems, a slight error known as parallax is introduced by the slightly different viewpoints of finder and camera lenses. The error can be reduced by positioning the finder as close to the camera lens as possible or by making the finder field smaller so that the camera field includes it.

Viganò, Salvatore (b. March 25, 1769, Naples—d. Aug. 10, 1821, Milan), Italian dancer and choreographer whose innovations include the synthesis of dance and pantomime, which he called "coreodramma," in highly dramatic ballets based on historical and mythological themes and Shakespearean plays.

Born of a family of dancers and nephew of the composer Luigi Boccherini, Viganò studied literature and music as well as dance. While performing in Madrid he married the Austrian dancer Maria Medina and met the choreographer Jean Dauberval (a pupil and protégé of Jean-Georges Noverre), whom he joined in France and England. Viganò then danced and choreographed in Italy and central Europe, principally Vienna (1793–95 and 1799–1803). In 1811 he went to Milan to

become ballet master at La Scala, Italy's principal opera and ballet theatre. Under his influence, ballet in Italy flourished.

In contrast to many earlier choreographers, Viganò tried to select music for his ballets that was appropriate to their themes and dance movements. In Gli strelizzi (1809) and subsequent ballets, he further developed Noverre's dance-drama approach by combining conventional dance patterns with pantomime, whereas Noverre had stopped at the alternation of such sequences. Among Viganò's more than 40 ballets were Die Geschöpfe des Prometheus (1801; The Creatures of Prometheus), composed especially for him by Beethoven; Gli strelizzi, based on an insurrection in the late 17th century among the guards (streltsy) of the Russian tsar Peter the Great; Otello (1818); and I titani (1819), which explored man's greed for gold.

Vigée-Lebrun, (Marie-Louise-) Élisabeth (b. April 16, 1755, Paris—d. March 30, 1842, Paris), French painter, one of the most successful of all women artists, particularly noted for her portraits of women.

Her father was Louis Vigée, a pastel portraitist and her first teacher. She studied later with a number of well-known painters, among them J.-B. Greuze and Joseph Vernet. In 1776 she married a picture dealer, J.-B.-P. Lebrun. Her great opportunity came in 1779 when she was summoned to Versailles to paint a portrait of Queen Marie-Antoinette. The two women became friends, and in subsequent years Vigée-Lebrun painted at least 25 portraits of Marie-Antoinette in a great variety of poses and costumes; a number of these may be seen in the museum at Versailles. Vigée-Lebrun became a member of the Royal Academy in 1783.

On the outbreak of the Revolution in 1789, she left France and for 12 years traveled abroad, to Rome, Naples, Vienna, Berlin, St. Petersburg (now Leningrad), and Moscow, painting portraits (in Naples, that of Emma, Lady Hamilton) and playing a leading role in society. In 1801 she returned to Paris but, disliking Parisian social life under Napoleon, soon left for London, where she painted portraits of the court and of Lord Byron. Later she went to Switzerland (and painted a portrait of Mme de Staël) and then again (c. 1810) to Paris, where she ceased painting.

Vigée-Lebrun was a woman of much wit and charm, and her memoirs, Souvenirs de ma vie (1835-37; "Souvenirs of My Life"), provide a lively account of her times as well as of her own work. She was one of the most technically fluent portraitists of her era, and her pictures are notable for the freshness, charm, and sensitivity of their presentation. During her career, and according to her own account, she painted 877 pictures, including 622 portraits and about 200 landscapes.

Vigeland, (Adolf) Gustav (b. April 11, 1869, Mandal, Nor.—d. March 12, 1943, Oslo), Norwegian sculptor, best-known for his major work, Fountain Square, an outdoor sculpture complex, in Frogner Park, Oslo. He is said to have been the most prolific sculptor of all time.

Vigeland's parents were farmers, and he was apprenticed to a wood-carver when he was 14 years old. His first work was shown in 1889, and, though early influenced by Auguste Rodin, he soon developed his own realistic style. His works were often controversial, and he remained poor all of his life.

The early sculptures, mostly portrait busts and reliefs, are now in the Vigeland Museum in Oslo. The later, monumental works are concentrated in Oslo's largest park, for which he designed more than 200 individual sculptural projects, including an entrance, bridge, fountain, circular staircase, mosaic labyrinth, and, literally, a stone forest of people. A central monolith, carved from a single block of solid granite 57 feet high, weighed 270 tons before sculpting began. It consists of 121 figures and is surrounded by 36 major groupings, all dealing with the various periods in the cycle of life—birth, childhood, adolescence, maturity, old age, and death.

Vigevano, town, Pavia province, Lombardia (Lombardy) region, northern Italy, on the right bank of the Ticino River, southwest of Milan. An old silk-manufacturing town, it was the site during the Renaissance of a hunting villa of the Sforza family, who built the arcaded Piazza Ducale (1494) and enlarged the former Castello Visconti (1492). A bishopric, it has a notable cathedral (1532–1606).

Industry has grown steadily in Vigevano during the 20th century, and the town is widely known as a shoe-manufacturing centre with an annual International Shoe Fair and Market. It also has textile and leather industries. Pop. (1981 prelim.) mun., 65,355.

Vigfússon, Gudbrandur (b. March 13, 1827, Dalasýsla, Ice.—d. Jan. 31, 1889, Oxford), one of the 19th century's foremost scholars of Old Norse, who completed the Richard Cleasby *Icelandic-English Dictionary* (1874; 2nd ed., 1957) and published editions of a number of Icelandic sagas as well as the collection *Corpus poeticum boreale* (1883; "Body of Northern Poetry").

Vigfússon studied in Iceland and at the University of Copenhagen but took no degree. As a research fellow at Copenhagen (1854-64). Vigfússon published his first work, the Timatel (1855), a brilliant attempt at establishing the chronologies of the Icelandic family sagas, followed by editions of Icelandic works, the first volume of the *Biskupa sögur* (1858; "Bishops' Sagas") and the Eyrbyggja saga (1864). Persuaded to move to Oxford to supervise completion of the Cleasby Icelandic-English lexicographical enterprise (1864), he collaborated on the Flateyjarbók (1860-68; The Flatey Book, 1893) and published his edition of the Badar saga (1869). In 1871 he was granted an honorary M.A. degree by Christ Church, Oxford, became a member of the college, and from 1884 was a reader in Old Icelandic. In the works of his later years, including editions of the Sturlunga saga (1878), the Hákonar saga (1887), and the Corpus poeticum boreale, he wrote prefaces and notes showing insight into literary and historical problems far ahead of his contemporaries.

Vigilius (b. before 500, Rome—d. June 7, 555, Syracuse, Sicily), pope from 537 to 555, known for his major role in what later was called the "Three Chapters Controversy," a complex theological dispute between the Eastern and Western churches.

Vigilius, of noble birth, became a Roman deacon and was with Pope St. Agapetus I during the latter's unsuccessful mission in March 536 to Constantinople to deter the Byzantine emperor Justinian I the Great from reconquering Italy. At Constantinople, Agapetus died on the following April 22, and Vigilius ingratiated himself with Justinian's wife, the empress Theodora. With her, Vigilius schemed the deposition of Pope St. Silverius, who had been elected in June 536 as Agapetus' successor.

Silverius was deposed by the Byzantine general Belisarius, who, on Theodora's orders, entered Rome on Dec. 9, 536, and replaced

him with Vigilius. Silverius was exiled and appealed to Justinian, but upon his return to Rome from Constantinople Silverius was forcefully banished by Vigilius and subsequently died, probably late in 537. Vigilius thus succeeded him as pope.

Meanwhile, Rome had been devastated by the Ostrogoths, and the Eastern Church was torn between orthodoxy and Monophysitism. While faced with a restoration of Rome, Vigilius turned to the ecclesiastical dilemma pressing Justinian. The Eastern conflict was between the orthodox view accepted at the Council of Chalcedon (451) that Christ's divine and human natures coexist and the Monophysite teaching that emphasized his divine nature. The conflict was further complicated by a political problem: if Justinian condemned Monophysitism, he would lose the Monophysite provinces of Syria and Egypt.

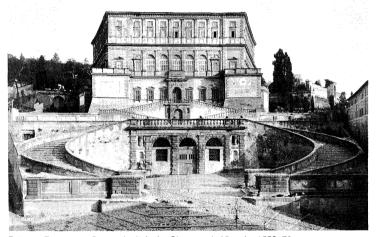

The Emperor attempted a compromise by issuing an edict in 544 condemning three writings (chapters) that were opposed by the Monophysites. His edict roused an outcry in the West, thus causing the "Three Chapters Controversy." In November 545 Justinian forced Vigilius to go to Constantinople, where, despite brutal imperial pressure to condemn the writings, Vigilius long vacillated. Finally, he censured with reservations the Three Chap-

Vignola, Giacomo da, also called GIACOMO BAROZZI Or GIACOMO BAROZIO (b. Oct. 1, 1507, Vignola, Bologna—d. July 7, 1573, Rome), architect who, with Andrea Palladio and Giulio Romano, dominated Italian Mannerist architectural design and stylistically anticipated the Baroque.

After studying in Bologna, Vignola went to Rome in the 1530s and made drawings of the antiquities for a projected edition of Vitruvius' treatise on architecture. In 1541-43 he spent 18 months at the court of Francis I at Fontainebleau and in Paris, where he probably met his fellow Bolognese, the architect Sebastiano Serlio and the painter Primaticcio. On his return to Italy he built the Palazzo Bocchi at Bologna and then went to Rome (c. 1550), where he was appointed architect to Pope Julius III, for whom he built the Villa Giulia in collaboration with Giorgio Vasari and Bartolommeo Ammannati, in 1551-55. This was a summer villa, based on ancient villa types as described by Pliny the Younger, with a small house and an elaborate garden.

In 1554 he built the church of S. Andrea in the nearby Via Flaminia, the first church to have an oval dome, although the ground plan is rectangular. In his church of Sta. Anna dei

ters in his Judicatum ("Verdict") in April 548, causing such adverse reaction in the West that Justinian decided to convoke a general council. Without waiting for the council to convene, however, Justinian repeated his own condemnation, whereupon Vigilius severed relations with him. For his personal safety, Vigilius took refuge first in a sanctuary at Constantinople and then at Chalcedon, from where he issued censures against certain high ecclesiastics who supported Justinian. The council opened in 553 without the Pope and confirmed the sentence passed against the Three Chapters.

Vigilius' Constitutum ("Resolution") of May 24, 553, withheld ratification of the council's decision. Succumbing to lassitude, to the appeals of the Romans for his return, and to the ill treatment to which Justinian was subjecting him, however, Vigilius decided to revoke his first Constitutum and sign a second on Feb. 23, 554, which gave pontifical approbation to the council's verdict. At this point, he lost the support of his nuncio Pelagius I (later his successor), who had been with him throughout the ordeal at Constantinople but who now deserted him. Vigilius then excommunicated Pelagius, who was subsequently imprisoned.

The Pope died on the trip home and was buried at Rome. The Western schism resulting from his Eastern policies raged on for 150 years.

Palafrenieri (begun c. 1572), Vignola extended this idea to include an oval in the ground plan, and this oval theme became a favourite of 17th-century Baroque architects. Vignola's most important church was, however, Il Gesù in Rome, headquarters of the Society of Jesus, which he began in 1568. Vignola died before the structure was completed, but the basic plan is his: aisles subsumed in side chapels so as to produce an illusion of vast interior space. The broad nave thus created was an effective instrument for dramatizing the Mass, and as such was widely copied throughout Europe in the service of the Counter-Reformation.

After the death of his patron Julius III in 1555, Vignola worked mainly for the Farnese family, for whom he completed the huge Palazzo Farnese at Caprarola, near Viterbo, the plan of which had been established earlier by Antonio da Sangallo and Baldassarre Peruzzi.

The academic tendency of Vignola's mind is epitomized in his *Regola delli cinque ordini d'architettura* of 1562, which remained a standard textbook on the architectural orders for three centuries. He also wrote on perspective in *Le due regole della prospettiva pratica*, which was published posthumously (1583) and had a short life.

Vigny, Alfred-Victor, comte de (count of) (b. March 27, 1797, Loches, Fr.—d. Sept.

17, 1863, Paris), poet, dramatist, and novelist, one of the foremost French Romantic writers, who introduced into France the poem in the style of Lord Byron and Thomas Moore and the novel in the style of Sir Walter Scott.

Youth and Romantic works. Vigny was born into an aristocratic and military family that had been reduced to modest circumstances by the rigours of the French Revolu-

tion. His father, a 60-year-old retired soldier at the time of his birth, was a veteran of the Seven Years' War; and his maternal grandfather, the Marquis de Baraudin, had served as commodore in the royal navy. Vigny grew up in Paris and took preparatory studies—somewhat less than wholeheartedly—for the École Polytechnique at the Lycée Bonaparte, where he conceived an "inordinate love for the glory of bearing arms," a passion common to the young men of his generation. Attached to the monarchy by family tradition, he became a second lieutenant in the king's guard when the Bourbons returned to power in 1814 and when he was only 17 years old.

Though he was promoted to first lieutenant in 1822 and to captain the following year, the military profession, limited to garrison duty rather than pursued on the battlefield, bored the young officer, who preferred the adventures of a literary career. After several leaves of absence, he abandoned military life in 1827. In the meantime, he had found in literature a refuge from the pettiness of the military and had published his first poem, "Le Bal," in 1820. Two years later his first collection of verse followed, along with contributions to Victor Hugo's politically conservative literary periodical La Muse Française. Salons and reviews in Paris hailed the birth of a poet who combined grace with a strength and depth that was totally Romantic. Poémes antiques et modernes (1826) was a success.

Vigny, however, was not content to excel merely in poetry, a genre he considered the 'staging," epic or dramatic, of a "philosophical thought." He revealed his narrative talent in Cinq-Mars (1826), a historical novel centred around the conspiracy of the King's favourite, the Marquis de Cinq-Mars, against the Cardinal de Richelieu. Vigny departed from fact only to project a personality and a thesis. Though Sir Walter Scott (whose novels then enjoyed enormous vogue) admired the work, criticism by reviewers prompted Vigny to preface the fourth edition (1829) with an explanation of how art and history could further a philosophical purpose, a thesis he later abandoned. He also showed a typically Romantic interest in Shakespeare, freely adapting Othello (Le More de Venise, first performed 1829) as well as The Merchant of Venice (Shylock, 1829). During these years of his youth he had the appearance of a writer and was even a happy man. The Romantic poet Alphonse de Lamartine recognized his talents; Hugo and Charles Sainte-Beuve treated him as a friend,

though Vigny kept somewhat aloof from the Romantic Cénacle, a literary group centred around leaders of the movement. He and the writer Delphine Gay, the "muse of the country" as she was called—for her beauty as well as her literary talents—formed a striking couple before his marriage in February 1825 to Lydia Bunbury, daughter of a wealthy Englishman whom he had met while stationed at Oloron.

Maturity and disillusion. By 1830 his temperament had become more sombre. The July Revolution engendered in his conscience a political pessimism activated by the repeated faults of the monarchy, an issue that had become evident already in Cinq-Mars. As a point of honour he, like Chateaubriand, sought to remain faithful to the monarchy. But he did not conceal the fact that the cause of the Bourbon king Charles X was worth no more than that of Louis-Philippe, who had been placed on the throne by the moneyed bourgeoisie. He searched unsuccessfully for a political creed, becoming reconciled with the socialistic philosophy of Henri de Saint-Simon and with the progressist Christians whose chief was Lamennais.

He acknowledged his disillusion as early as 1831 in "Paris," a poem of a new genre, which he called "Elévation." He felt all the more tormented, for he felt he could no longer count on the help of the faith of his childhood. He had well been the brother of those "amants de Montmorency," about whom he told in another "Élévation," in which he contemplated suicide (1832): "And God? Such were the times, they no longer thought about Him.' The only thing left for him to doubt was love itself, a trauma he painfully experienced in the course of his liaison (1831-38) with the actress Marie Dorval, for whom he was to create the role of Kitty Bell in Chatterton in 1835. He accused Dorval of deceiving him and of having maintained an overaffectionate friendship with the writer George Sand.

Vigny gave up writing other historical novels, and in Stello (1832) he put together three narrations that represent, under the most ominous pretenses, the isolation of the poet: the levity of Louis XV condemns Nicolas Gilbert to die in privation; the fanaticism of the republican tyrant Robespierre leads André Chénier to the scaffold; the egoism of William Beckford, lord mayor of London, provokes the suicide of the poet Thomas Chatterton; all political regimes inflict on the poet the harshness of "perpetual ostracism." What then is this evil malaise? Vigny, along with all the other Romantics-though less seriously than most of them—questions himself on the nature of it. He submits Stello to a sort of psychoanalytic examination, confided to Doctor Noir (the Black Doctor). After having listened to Stello, the doctor prescribed a remedy of "separating poetic life from political life" and of observing society face-to-face with an "armed neutrali-Vigny adapted the part of Stello dealing with the suicide of Chatterton into a prose drama in three acts, Chatterton. In presenting the last moments of Chatterton's life, he called the public to witness the misfortune of the poet in a materialist and pitiless society. The triumph of Vigny's career as a playwright, Chatterton remains one of the best Romantic dramas. Far superior to La Maréchale d'Ancre (first performed 1831), it expresses the melancholy genius of Vigny more seasonably than does his spiritual comedy Quitte pour la peur (first performed 1833).

The severe and lofty pessimism of *Chatterton* and of *Stello* was only manifest again in *Servitude et grandeur militaires* (1835). It was appropriate that Vigny should derive a lesson from his military disappointments as he had from his poetic disillusions. He again chose the form of a triple narrative and took the argument of the dignity and suffering of the soldier from his own memories. He made his

soldier a brother of the poet, and the soldier was also treated as a "pariah," obliged by his profession to kill and condemned by it to passive obedience. In narrating the story of his "outcast," however, he was meticulous in associating the declaration of his servitude with the disclosure of his greatness. In his hero, Captain Renaud, Vigny dared to give his skeptical contemporaries a prophet and martyr of the religion they so desperately needed.

Thus, while the dramatist and the novelist manifested a vitality unaltered by disillusion, the poet withdrew into a curious silence. Vigny was content to reedit his poems in 1837, a year before his final break with Marie Dorval. Along with his illusions about love, he seems to have lost his lyrical gifts and thereafter lived a totally interior life. He retired, according to the malevolent expression of Sainte-Beuve, to an "ivory tower." He rarely went out, preferring the calm of his manor in Charente at Maine-Giraud to the empty excitement of Paris

In 1841, along with the novelist Honoré de Balzac and Lamartine, he led a campaign in favour of literary copyrights. The article he published in the Revue des Deux Mondes on Ĵan. 15, 1841, "De Mademoiselle Sédaine et de la propriété littéraire," roused opinion and, in fact, inspired the drafting of a bill, which was voted down in the Chamber of Deputies on March 29. Shortly thereafter, Vigny thought it his duty, before asserting himself further in his self-appointed role as defender of the man of letters, to stand as a candidate to the Académie Française. He was elected only on May 8, 1845, after five checks, and he was received under the cupola with a perfidious speech by Comte Molé. He had definitely not been born for great social success, and he realized it all the more when under the Second Republic he did not obtain either the French embassy post in London—which would have suited his culture and tastes—or even a seat in the Chamber representing Charente. Napoleon III, whom he had met earlier (1839) in exile in London, ignored his approaches. The repetitive lack of success confirmed Vigny's judgment on the state of the poet, which he had expressed in Stello.

Before leaving this world, which he willingly compared to a prison, the hermit of Maine-Giraud had the solace of a last love. At the age of 60 he was caring devotedly for his dying wife and was himself suffering the first attacks of cancer. In the midst of this grief he was able to count on the affectionate solicitude of Augusta Bouvard, a young teacher. He died less than a year after Lydia, with whom he had had no children. On October 28, Bouvard bore a son, to whom the last strophe of "L'Esprit pur," written on March 10, seems to have been dedicated:

Jeune postérité d'un vivant qui vous aime! Mes traits dans vos regards ne sont pas effacés; Je peux en ce miroir me connaître moi-même. Young posterity of a man who loves you! In your gaze my features are not erased; In this mirror I can know myself.

Significance and influence. Vigny left numerous unedited works of exceptional interest. Their publication (Les Destinées, 1864; Le Journal d'un poète, 1867; Daphné, 1912; Mémoires inédits, 1958) somewhat pierces the secret silence he had observed beginning in 1837, a silence interrupted only by the appearance of six poems in the Revue des Deux Mondes: "La Sauvage," "La Mort du loup," "La Flûte" (1843), "Le Mont des Oliviers," "La Maison du Berger" (1844), "La Bouteille à la mer" (1854). The evolution of his religious thought—from a tormented skepticism to an advocacy of strictly human values such as honour and pity—can be reconstituted

from the last prayer he uttered in 1837 at the death of his mother to his prophecy of the imminent reign of "L'Esprit pur" (written 1863), a holy spirit, which is essentially human and takes over the place of God. The unedited poems on this thought—"Les Destinées," "Les Oracles," "La Colère de Samson," "Wanda," "L'Esprit pur"—combined (in the posthumous collection of Les Destinées) with poems already published from 1843 to 1854, enriched the substance of the thought and confirmed its orientation.

Though Alfred de Vigny did not receive the recognition and glory of Lamartine or of Hugo during his lifetime, he did not address posterity in vain. In each succeeding generation his followers—among them Charles Baudelaire, Henri de Régnier, Charles Péguy, André Breton, and Jules Roy—have revered his memory and thoroughly studied his message. With his legacy of "L'Esprit pur" and his other prophetic poetical works, it can no longer be denied that Vigny was one of the first heralds of the metaphysical revolt that continued to torment the West more than a century after his death. Vigo, port town and naval station, Pontevedra province, in the autonomous community (region) of Galicia, northwestern Spain, on

the southeastern shore of the Ría (inlet) de Vigo (an inlet of the Atlantic Ocean), southwest of Pontevedra city. It was attacked by the English admiral Sir Francis Drake in 1585 and 1589; in 1702 a British–Dutch fleet under Sir George Rooke and James Butler, duke of Ormonde, destroyed a Franco-Spanish fleet in the bay.

The town's architecture gives a modern impression, though a few old buildings still remain. These include the medieval chapel of the Casa de Caridad; the neoclassical Collegiate Church of Santo Cristo de la Victoria, built to commemorate the defeat of the French in the Peninsular War (1808–14); and the 17th-century Castillo del Castro.

Vigo, Jean (b. April 26, 1905, Paris—d. Oct. 5, 1934, Paris), French film director whose blending of lyricism with realism and Surrealism, the whole underlined with a cynical, anarchic approach to life, distinguished him as an original talent. Although he completed only three feature films and one short, Taris (1931), before his early death, his films produced great public reaction. A Jean Vigo Prize is awarded each year in France in memory of the filmmaker whose work is characterized by "independence of spirit and quality of directing."

Vigo's father, Miguel Almereyda, a famous militant French anarchist, died in a prison cell in 1917. Vigo spent an unhappy and sickly childhood being shuffled about between relatives and boarding schools. He suffered from tuberculosis and finally settled in the warm climate of Nice, where he directed his first film, A propos de Nice, a satiric social documentary, in 1930. Vigo moved to Paris shortly thereafter and directed Zéro de conduite (1933; Zero for Conduct), which was branded as "anti-French" by the censors, removed from the theatres after only a few months, and was not shown again in France until 1945. The moving story, set in a boy's boarding school, explores the question of freedom versus authority and probably contains elements of Vigo's own unhappy childhood. L'Atalante (1934), a masterpiece, directed a slashing attack on the essence of the French bourgeoisie and had to be drastically edited by its producers who feared criticism from the public. Vigo's death of leukemia at the age of 29 took from the French cinema one of its most promising talents.

vihāra, early type of Buddhist monastery consisting of an open court surrounded by open cells accessible through an entrance porch. The vihāras in India were originally constructed to shelter the monks during the rainy season, when it became difficult for them to lead the wanderer's life. They took on a sacred character when small stūpas (housing sacred relics) and images of the Buddha were installed in the central court.

A clear idea of their plan can be obtained from examples in western India, where the *vi-hāras* were often excavated into the rock cliffs. This tradition of rock-cut structures spread along the trade routes of Central Asia (as at Bāmiān), leaving many splendid monuments rich in sculpture and painting.

As the communities of monks grew, great monastic establishments (mahāvihāras, "great vihāras") developed that consisted of clusters of vihāras and associated stūpas and temples. Renowned centres of learning, or universities, grew up at Nālandā, in present-day Bihār state, during the 5th-12th century and at Nāgārjunakoṇḍa, Andhra Pradesh, in the 3rd-4th century.

Vihāri, also spelled VEHARI, town, administrative headquarters of Vihāri district, Multān

division, Punjab province, Pakistan. The town is a market and processing centre for cotton and oilseeds, and wheat is grown nearby. It lies on the main road between Multān and Lahore.

Vihāri district was created in 1976 from northeastern Multān and southwestern Sāhiwāl districts. It consists of a flat alluvial plain bordered by the Sutlej River on the southeast. Wheat, rice, sugarcane, cotton, and vegetables are grown; there are cotton, rice, and flour mills. Pop. (1981 prelim.) town, 53,000; district, 1,320,000.

vihuela, in full VIHUELA DE MANO, stringed musical instrument that in Spanish Renaissance art music held the popularity accorded the lute elsewhere in Europe. Built like a large guitar, it had six, sometimes seven, double courses of strings tuned like the lute: G-c-f-a-d'-g'. (The guitar then had four double courses.)

The *vihuela* was played by the aristocracy, the guitar by commoners. By the 18th century both instruments had given rise to the six-stringed guitar. The *vihuela de arco* was a viola da gamba, or viol.

Vijayanagar (Sanskrit: City of Victory), great ruined city in southern India and also the empire ruled first from that city and later from Penukonda (in Anantapur district, Andhra Pradesh) between 1336 and c. 1614. The site of the city, on the Tungabhadra River, is now partly occupied by the village of Hampi (Bellary district, Karnataka state).

The city and its first dynasty were founded in 1336 by five sons of Sangama, of whom Harihara and Bukka became the city's first kings. In time Vijayanagar became the greatest empire of southern India. By serving as a barrier against invasion by the Muslim sultanates of the north, it fostered the reconstruction of Hindu life and administration after the disorders and disunities of the 12th and 13th centuries. Contact with the Muslims (who were not personally disliked) stimulated new thought and creative productivity. Sanskrit was encouraged as a unifying force, and regional literatures thrived. Behind its frontiers the country flourished in unexampled peace and prosperity.

The first dynasty (the Sangama) lasted until c. 1485, when—at a time of pressure from the Bahmanī Sultan and the Raja of Orissa—Narasimha of the Sāluva family usurped power. By 1503 the Sāluva dynasty was supplanted by the Tuluva dynasty. The outstanding Tuluva king was Kṛṣṇa Deva Rāya. During his reign (1509-29) the land between the Tungabhadra and Krishna rivers (the Raichūr doab) was acquired (1512), the Orissa Hindus were subdued by the capture of Udayagiri (1514) and of other towns, and severe defeats were inflicted on the Bijāpur sultan (1520). Krsna Deva's successors, however, allowed their enemies to combine against them. In 1565 Rama Rāva, the chief minister of the Vijavanagar Empire, led the empire into the fatal battle at Rakasa-Tangadi (also known as Tālikota) in which the empire's army was routed by the combined forces of the Muslim states of Bijāpur, Ahmadnagar, and Golconda and the city of Vijayanagar was destroyed. Tirumala, brother of Rāma Rāya, then seized control of the empire and founded the Āravīdu dynasty, which established a new capital at Penukonda and kept the empire intact for a time. Internal dissensions and the intrigues of the sultans of Bijāpur and Golconda, however, led to the final collapse of the empire c. 1614.

Vijayawāda, also called BEZWĀDA, town, Krishna district, Andhra Pradesh state, southern India, on the Krishna River. The town is a centre for Hindu pilgrimages. It is also known for its toys, many of them miniatures. Of note is the Victoria Jubilee Museum, which has a

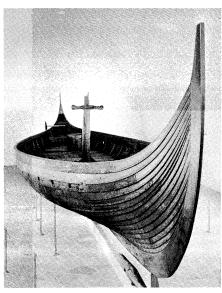

magnificent black granite Buddha. A college of Oriental studies and a medical college are located in the town. Pop. (1981) town, 454,-577; metropolitan area, 543,008.

vijñapti-karman (Sanskrit: "manifest activity"), in Buddhist philosophy, a kind of action that manifests itself outside of the actor and is capable of being recognized by others. Among three kinds of action (i.e., those produced by the body, mouth, and mind) usually admitted in Buddhism, bodily ones and verbal ones are classified as vijñapti-karman. But mind activity (i.e., will or thought) is considered as unmanifest action (avijñapti-karman). These actions, when they are finished, exert some effects on the agent according to the moral natures of the actions.

England. In England desultory raiding occurred in the late 8th century but began more earnestly in 865, when a force led by the sons of Ragnar Lodbrok-Healfdene, Inwaer, and perhaps Hubba-conquered the ancient kingdoms of East Anglia and Northumbria and reduced Mercia to a fraction of its former size. Yet it was unable to subdue the Wessex of Alfred the Great, with whom in 878 a truce was made, which became the basis of a treaty in or soon after 886. This recognized that much of England was in Danish hands. Although hard pressed by fresh armies of Vikings from 892 to 899, Alfred was finally victorious over them, and the spirit of Wessex was so little broken that his son Edward the Elder was able to commence the reconquest of Danish England. Before his death in 924 the small Danish states on old Mercian and East Anglian territory had fallen before

him. The more remote Northumbria resisted longer, largely under Viking leaders from Ireland, but the Scandinavian power there was finally liquidated by Edred in 954. Viking raids on England began again in 980, and the country ultimately became part of the empire of Canute. Nevertheless, the native house was peacefully restored in 1042, and the Viking threat ended with the ineffective passes made by Canute II in the reign of William I.

The Western Seas and Ireland. In the western seas, Scandinavian expansion touched practically every possible point. Settlers poured into Iceland from at least about 900, and from Iceland colonies were founded in Greenland and attempted in North America. The same period saw settlements arise in the Orkneys, the Faeroes, the Shetlands, the Hebrides, and the Isle of Man.

Scandinavian invasions of Ireland are recorded from 795, when Rechru, an island not identified, was ravaged. Thenceforth fighting was incessant, and although the natives often more than held their own, Scandinavian kingdoms arose at Dublin, Limerick, and Waterford. The kings of Dublin for a time felt strong enough for foreign adventure, and in the early 10th century several of them ruled in both Dublin and Northumberland. The likelihood that Ireland would be unified under Scandinavian leadership passed with the Battle of Clontarf in 1014, when the Irish Scandinavians, supported by the Earl of Orkney and some native Irish, suffered disastrous defeat. Yet in the 12th century the English invaders of Ireland found the Scandinavians still dominant (though Christianized) at Dublin, Waterford, Limerick, Wexford and Cork.

The Carolingian Empire and Viking settlement was never achieved in the well-defended empire on the scale evidenced in the British Isles, and Scandinavian influence on continental languages and institutions is, outside Normandy, very slight. Sporadic raiding did occur, however, until the end of the Viking period; and, in the 10th century, settlements on the Seine River became the germ of the duchy of Normandy, the only permanent Viking achievement in what had been the empire of Charlemagne (see Norman).

Farther south than France—in the Iberian peninsula and the Mediterranean coasts-the Vikings raided from time to time but accomplished little of permanence.

Eastern Europe. The eastern Viking expansion was probably a less violent process than that on the Atlantic coasts. Although there was, no doubt, plenty of sporadic raiding in the Baltic and although to go on the "east-Viking" was an expression meaning to indulge in such activity, no Viking kingdom was founded with the sword in that area.

The greatest eastern movement of the Scandinavians was that which carried them into the heart of Russia. The extent of this penetration is difficult to assess; for, although the Scandinavians were at one time dominant at Novgorod, Kiev, and other centres, they were rapidly absorbed by the Slavonic population, to which, however, they gave their name of Rus, "Russians." The Rus were clearly in the main traders, and two of their commercial treaties with the Greeks are preserved in the Primary Chronicle under 912 and 945; the Rus signatories have indubitably Scandinavian names. Occasionally, however, the Rus attempted voyages of plunder like their kinsmen in the West. Their existence as a separate people did not continue past 1050 at the lat-

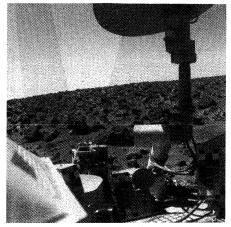

The first half of the 11th century appears to have seen a new Viking movement toward the East. A number of Swedish runic stones record the names of men who went with Yngvarr on his journeys. These journeys were to the East, but only legendary accounts of their precise direction and intention survive.

A further activity of the Scandinavians in

the East was service as mercenaries in Constantinople, where they formed the Varangian Guard of the Byzantine emperor.

landers that touched down at sites (designated Chryse and Utopia, respectively) 6,500 kilometres (about 4,000 miles) apart on July 20 and Sept. 3, 1976. The landers relayed measurements of properties of the atmosphere and soil of Mars and colour photographs of the rocky surface. Experiments designed to detect evidence of living organisms provided no convincing evidence of life on the surface of the planet. The orbiters transmitted photographs of large expanses of the Martian surface.

harbour and shipbuilding industry were important in the 15th and 16th centuries.

Vila do Conde is basically a fishing port, and there is a fish farm nearby. Local manufactures include rope, textiles, confectionery, and lace. Two dominant landmarks are the huge Santa Clara monastery (14th century) built on a hill overlooking the Ave Valley, and an 18th-century, 999-arch aqueduct. The Celtic ruins of Bagunte are nearby at the junction of the Ave and Este rivers. Pop. (1981) town, 20,245; concelho, 63,912.

Vila Luso (Angola): see Luena.

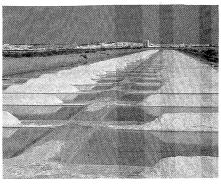

Vila Nova de Gaia, town and concelho (municipality), Porto district, northwestern Portugal, on the south bank of the Rio Douro directly across from the city of Porto. In its many armazéns (great wine lodges), port is matured and blended. Other economic pursuits include pottery, footwear, and textiles; there are also cork-processing factories and distilleries. Pop. (1981) town, 63,177; concelho, 226,386.

Vila Nova de Portimão (Portugal): see Portimão.

Vila Pery (Mozambique): see Chimoio.

Vila Real, town, capital, and concelho (municipality), Vila Real district, northern Portugal, at the confluence of the Corgo and Cabril rivers, east of Porto. The town, which was founded in the 13th century, has notable landmarks, including a cathedral built in the Romanesque and Gothic styles, the former conventual church of São Domingos, and 17th-century houses near the main square. Vila Real is the principal centre of the port-wine-producing area; its other manufactures include textiles and ceramics. The town is connected to Porto and Bragança by rail and paved road.

Vila Real district, bounded by Spain and the Rio Douro, has an area of 1,671 sq mi (4,328 sq km). In addition to viticulture and cereal crops, some livestock raising is carried on in the northern mountainous part of the

district. Tin is also mined there. Besides Vila Real town, Peso da Régua and Chaves are the chief urban centres. Pop. (1981) town, 13,876; concelho, 47,536; district, 263,972.

Vila Velha, also called ESPÍRITO SANTO, coastal city, east central Espírito Santo state, eastern Brazil, on Baía (bay) do Espírito Santo at 10 ft (3 m) above sea level, just southeast of Vitória, the state capital. It was settled in 1535 and was given city status in 1896. Chocolate and candy making are the principal economic activities. Nearby is the 16th-century convent of Our Lady of Penha. Pop. (1980) 74,154.

Vilakazi, Benedict Wallet (b. Jan. 6, 1906, near Stanger, Natal—d. Oct. 26, 1947, Johannesburg), Zulu poet, novelist, and educator who devoted his academic career to the teaching of Zulu and to the study of Bantu languages (for which he received an honorary B.A. while on the staff at Witwatersrand University at Johannesburg). He was also awarded an M.A. for his work on the development of Zulu poetry and a Doctor of Literature degree for a study of "The Oral and Written Literature in Nguni." In addition, he helped to compile a Zulu-English dictionary and sought to give continual encouragement to other southern African writers.

Vilakazi's literary output was large. He is best known for his poetry, which critics praise for the beauty and vitality resulting from his astute powers of observation and for his full use of the resources of the Zulu language. The first volume, *Inkondlo KaZulu* (1935; "Zulu National Songs"), was selected by Witwatersrand University in 1935 to be the lead volume of its Bantu Treasury Series, and *Amal' Ezulu* (1945; "Zulu Treasures") became the eighth volume of the same series.

Vilakazi also published a biography and three novels. He is remembered as a man with a great desire for the intellectual improvement of the Zulu people.

Vilar, Jean (b. March 25, 1912, Sète, Fr.—d. May 28, 1971, Sète), French actor and director who revitalized the Théâtre National Populaire as a forceful educational and creative influence in French life.

Vilar trained as an actor and stage manager.

Vilar, 1961 Lipnitzki—H. Roger Viollet

then toured with an acting company throughout France. In 1943 he began his career as a director with a season in a small Parisian theatre. Invited to direct the first annual drama festival at Avignon in 1947, Vilar effectively used bold movements and simplified settings on the large platform stage of the outdoor theatre. The success of the Avignon festival, followed by productions for more conventional Parisian stages, led to his appointment as director (1951-63) of the Théâtre National Populaire. During his tenure, he endeavoured to bring drama to residents of outlying areas and to those who could not afford tickets to commercial theatrical productions. He continued to stage the Avignon festivals and from 1963 independently produced plays and operas throughout Europe.

Vilas, William F(reeman) (b. July 9, 1840, Chelsea, Vt., U.S.—d. August 27, 1908, Madison, Wis.), a leader of the U.S. Democratic Party in the late 19th century and a member of President Grover Cleveland's Cabinet.

Born in Vermont, Vilas grew up in Wisconsin. He was graduated from the University of Wisconsin (Madison) in 1858 and then studied at the law school of the University of Albany (Albany, N.Y.). Before he could begin a legal career, however, the Civil War erupted. Vilas joined a volunteer regiment in which he eventually rose to the rank of lieutenant colonel.

At the end of his military service, Vilas returned to Madison, where he became a law professor and a leader in the state Democratic Party. In 1884 he served as chairman of the convention that nominated Grover Cleveland for president. Following Cleveland's election, Vilas joined the Cabinet as postmaster general. He soon became a close adviser and friend to the President.

In 1888 Vilas was named to head the Department of the Interior. When Cleveland lost his reelection bid that year, Vilas returned to Madison and to his teaching position at the law school. In 1891 he resumed his political career, elected by the state legislature to a seat in the U.S. Senate. A conservative "Gold" Democrat, Vilas supported the Cleveland administration's economic policies and tried to block the nomination of William Jennings Bryan in 1896.

Vilas retired from politics in 1897 and devoted most of his remaining years to the University of Wisconsin, to which he left a substantial portion of his large estate.

Vilcabamba, Cordillera de, small range of the Andes Mountains in south central Peru, extending about 160 mi (260 km) northwestward from the city of Cuzco. The range, marked by the erosive action of rivers that have cut deep canyons, rises to 20,574 ft (6,271 m) at Nevado Sarkantay (or Cerro Salcantay). The most atypical of the range's peaks is Pumasillo ("puma's claw"), at 20,492 ft, which is not an isolated peak but the culmination of a large massif. Pumasillo is not visible from surrounding villages, and, although its existence was known, not until 1956 was it accurately mapped.

Vîlcea, judeţ (district), south central Romania, occupying an area of 2,202 sq mi (5,705 sq km). The Transylvanian Alps (Southern Carpathians) and the sub-Carpathians rise above settlement areas in the valleys. The Olt and Cerna rivers drain southward through the area of the district. Rîmnicu Vîlcea (q.v.; the district capital), Băbeni, and Berzoi are timber production centres. Chemical factories operate in Govora, and building materials are produced in Călimăneşti. A mica mine is located in Voineasa, and salt mines have been worked in Ocnele Mari since Roman times. Drăgăşani is a wine-making centre. Livestock raising and cereal growing are the district's major agricultural activities. There are sev-

eral 16th- and 17th-century monasteries in the district, including the Hurez Monastery, the largest example of religious architecture built by the Brâncoveanu family. The fortified manors of Măldărești, dating from the 18th and 19th centuries, include a small museum. Muierii Cave is a natural monument containing a cemetery of cave bears and remains from the Middle Paleolithic period (about 150,000 to 100,000 years ago). Resorts with mineral springs include Băile Olănești and Călmănești. Highway and railway connections extend through Rîmnicu Vîlcea, Drăgășani, and Brezoi. Pop. (1982 est.) 419,398.

Vildrac, Charles, pseudonym of CHARLES MESSAGER (b. Nov. 22, 1882, Paris—d. June 25, 1971, Saint-Tropez, Fr.), French poet, playwright, and essayist whose idealistic commitment to humanitarianism characterized his artistic and personal life.

Vildrac, along with writer Georges Duhamel (later his brother-in-law) and others, founded the Abbaye, a community of young artists and writers who, from 1906 to 1907, lived together in the Paris suburb of Créteil. During World War II he was active in the French Resistance. His verse—including *Poèmes* (1905), *Images* et mirages (1907), and Chants du désespéré (1914-20) (1920; "Songs of a Desperate Man")-celebrates brotherhood and proclaims a belief in the basic goodness of man; the latter expresses anguish at the horrors of war. Vildrac's best known play, Le Paque-bot Tenacity (produced, 1920; S.S. Tenacity, 1921), is a character study of two former soldiers about to immigrate to Canada. Michel Auclair (1921) revolves around the loyalty of a man to a woman who has rejected him. La Brouille (1930; "The Misunderstanding") traces the quarrel of an idealist and a pragmatist. Other plays include Madame Béliard (1925), Les Pères ennemis (1946; "The Enemy Fathers"), and Les Jouets du Père Noël (1952;

"The Toys of Father Christmas"). Vildrac also wrote travel memoirs and essays, such as *Notes sur la technique poétique* (1910; "Notes on Poetic Technique"), co-authored with Duhamel. His children's works, including *L'Île rose* (1924; "The Pink Island"), have been praised as excellent examples of the genre. He won the French Academy's Grand Prix for literature in 1963.

Vile, William (b. c. 1700—d. September 1767), outstanding English cabinetmaker of the 18th century. He was long overshadowed by his business neighbour Thomas Chippendale. Vile set up a partnership in London with John Cobb about 1750. He became royal cabinetmaker the following year. The partners were not great innovators, but their standard of craftsmanship was seldom equalled. One outstanding piece was the jewel cabinet of mahogany, inlaid with ivory and various woods and exquisitely carved, made for Queen Charlotte in 1761.

Viljoen, Marais (b. Dec. 2, 1915, Robertson, S.Af.), South African politician who on June 19, 1979, became the fifth state president of the Republic of South Africa.

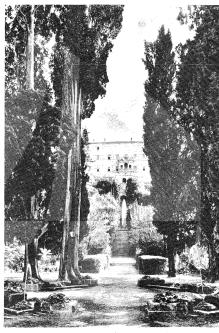

He was born on a farm in the Cape and orphaned at the age of four. Forced to leave school before matriculation (which he obtained later by private study), he joined the Post Office as a learner telegraphist at the age of 18. In 1937 he moved on to journalism as a reporter on a newly founded Afrikaans newspaper edited by the future prime minister H.F. Verwoerd, who in time would give him his first Cabinet post.

Years of service as an efficient party organizer led to his election as a member of the Transvaal provincial council in 1949 and to a seat in Parliament four years later (1953). Following a term as deputy minister of labour

and of mines (1958-61), Viljoen served, either as deputy minister or as minister, in the departments of labour, mines, Coloured affairs, immigration, education, the interior, and posts and telecommunications. In these positions he firmly supported the National Party's policy of apartheid, or separate development, for South Africa's racial groups. Viljoen was president of the Senate from 1976 until he was elected to replace B.J. Vorster as state president.

He served until September 1984, when a new constitution dramatically increasing the president's powers came into effect. Pieter Willem Botha became the first state president under this new constitution.

villa, country estate, complete with house, grounds, and subsidiary buildings. In Great Britain the word has come to mean a small detached or semidetached suburban home. In the United States it generally refers to a sumptuous suburban or country residence.

Villa d'Este at Tivoli, Italy; Renaissance villa designed in 1550 by Pirro Ligorio for Cardinal Ippolito II d'Este Alinari—Eb Inc.

Many villas existed throughout the Roman Empire, and references to them are common in the works of Roman writers, especially Cicero, who had seven villas, and Pliny, who described at great length in his letters his villas in Tuscany and near Laurentum. The Italian countryside is dotted with ruins of innumerable villas. The most famous of these is Hadrian's Villa at Tivoli (c. AD 120–130), which was a sumptuous imperial residence with parks and gardens on a grand scale. The uneven terrain made necessary large flights of steps and terraces. The buildings, which covered an area about two miles in length, were reproductions of celebrated structures the Emperor had seen in his travels.

Roman villas frequently were asymmetrical in plan and were built with elaborate terracing on hillsides; they had long colonnades, towers, fine water gardens with reflecting pools and fountains, and extensive reservoirs for water supply. According to Pliny there were two kinds of villas, the villa urbana, which was a countryseat with city comforts, and the villa rustica, the farmhouse in which the principal room was the kitchen, with the bakery and stables beyond, and room for winepresses, oil presses, hand mills, etc.

During the Middle Ages villas were aban-

doned, and in some places castles and monasteries were built in and on top of them. The great Renaissance villas were also occasionally built on their ruins and frequently used some of the better preserved remains as models. This influence is evident in the Villa Madama (c. 1520) just outside Rome, designed by Raphael, and in Pirro Ligorio's Casino of Pius IV (c. 1558-62) in the Vatican gardens. The Renaissance villa sought, however, greater symmetry than those of antiquity, and the houses were less rambling (frequently being remodelled castles, especially in Tuscany), though the gardens were often even more elaborate. In fact, the garden often became the principal element in the 16th- and 17thcentury villa, as in the Villa d'Este in Tivoli (1550), also designed by Ligorio. By the 18th and 19th centuries, villas in Italy were less extensive, though fine ones continued to be built, especially in the Piedmont, Lombardy, the Venetia, and around Rome and Naples.

In the mid-19th century eclectic Romantic architects often adopted a modified Italian villa style as a model for country and town houses in Germany, England, and the U.S. These were usually characterized by flat roofs, broadly projecting eaves supported on brackets, square towers, and arcaded or colonnaded piazzas.

Villa, Pancho, byname of Francisco VILLA, original name DOROTEO ARANGO (b. June 5, 1878, Hacienda de Río Grande, San Juan del Río, Mex.—d. June 20, 1923, Parral), Mexican revolutionary and guerrilla leader who fought against the regimes of both Porfirio Díaz and Victoriano Huerta and after 1914 engaged in civil war and banditry.

Villa, the son of a field labourer, was orphaned at an early age. After killing, in revenge for an assault on his sister, one of the owners of the estate on which he worked, he was forced to flee to the mountains, where he spent his adolescence as a fugitive.

In 1909 Villa joined Francisco Madero's uprising against the dictator of Mexico, Porfirio Díaz. During the rebellion, Villa, who lacked a formal education but had learned to read and write, displayed his talents as soldier and organizer. Combined with his intimate knowledge of the land and the people of northern Mexico, these gifts enabled him to place at Madero's disposal a division of trained sol-

diers under his command. After the success of the revolution, Villa remained in the irregular army.

In 1912, during the rebellion of Pascual Orozco, Villa aroused the suspicion of Gen. Victoriano Huerta, who condemned him to death, but Madero ordered a stay of execution and sent Villa to prison instead. Villa escaped from prison in November and fled to the United States. After Madero's assassination in 1913, Villa returned to Mexico and formed a military band of several thousand men that became known as the famous División del Norte (Division of the North). Combining his force with that of Venustiano Carranza, Villa revolted against the increasingly repressive and inefficient dictatorship of Huerta, once again revealing his military talents by winning several victories. In December 1913 Villa became governor of the state of Chihuahua and with Carranza won a decisive victory over Huerta in June 1914. Together they entered Mexico City as the victorious leaders of a revolution.

Rivalry between Villa and Carranza, however, soon led to a break between the two, and Villa was forced to flee Mexico City with the revolutionary leader Emiliano Zapata in December 1914. Badly defeated by Carranza in a series of battles, he and Zapata fled to the mountains of the north. But in order to demonstrate that Carranza did not control northern Mexico, Villa executed 16 U.S. citizens at Santa Isabel in early 1916 and soon thereafter attacked Columbus, N.M. Pres. Woodrow Wilson then sent an expedition under General Pershing to that area, but, because of Villa's popularity and intimate acquaintance with the terrain of northern Mexico and because of the Mexican government's dislike of Pershing's presence on Mexican soil, it proved impossible to capture Villa.

Villa continued his guerrilla activities as long as Carranza remained in power. After the overthrow of Carranza's government in 1920, Villa was granted a pardon and a ranch near Parral, Chihuahua, in return for agreeing to retire from politics. Three years later he was assassinated on his ranch.

Villa Clara, province, north central Cuba, bounded on the north by Nicholas Channel, and by the provinces of Cienfuegos on the southwest, Matanzas on the west, and Sancti Spiritus on the east. Part of former Las Villas province until 1976, the territory of 3,117 sq mi (8,073 sq km) consists in the north of coastal marshes backed by plains that become hills in the south. Off the northern coast lies a chain of cays, the Archipiélago de Sabana, rising from a wide insular platform bordered by coral reefs and administered as part of the province. Sugarcane is grown throughout the province; tobacco growing is centred near Remedios, a major tobacco-producing region in Cuba; and rice is cultivated around Santo Domingo. Fruit, black beans, and cattle are also produced; industries include sugar refineries, foundries, tanned-leather factories, distilleries, and sawmills. Gold, asphalt, and barite are found in southeast Villa Clara near Placetas. Caibarién and La Isabela are the chief export and fishing ports. The central highway and major railway of Cuba run through Santa Clara (q.v.), the provincial capital. Pop. (1983 est.) 773,565.

Villa d'Este, estate in Tivoli near Rome with buildings, fountains, and terraced gardens designed (1550) by the Mannerist architect Pirro Ligorio for the governor Cardinal Ippolito II d'Este. Before being confiscated as his residence, the property had been a Benedictine convent.

Franz Liszt occupied the top floor from 1865 until his death in 1886. Today the villa itself is less noteworthy than the spacious park and the magnificent fountains, which are supplied

with water by two canals dug especially for the purpose.

Villa Giulia, Museo Nazionale di (Italian: National Museum of Villa Giulia), museum in Rome principally devoted to antiquities of the pre-Roman period from ancient Umbria, Latium, and southern Etruria. It is housed in the Villa Giulia, or Villa di Papa Giulio (Pope Julius), which was built in the mid-16th century for Pope Julius III. The museum has been housed in the villa since 1889. Celebrated sculptures include the painted terracotta Apollo and Hercules from Formello (Veii), excavated in 1916 and 1939, considered to be among the best examples of late 6thor early 5th-century BC Etruscan sculptures. There is a fine terracotta sarcophagus showing male and female figures feasting, a rare example from the necropolis at Caere. Many artifacts such as vases, bronzes, armour, mirrors, and votive statuettes are among the treasures of the collection. The fine collection of Greek vases includes the famous Chigi vase, found at Veii, a fine example of Proto-Corinthian vase painting dating from the first half of the 6th century BC. The Castellani Collection comprises Greek vases.

Villa-Lobos, Heitor (b. March 5, 1887, Rio de Janeiro—d. Nov. 17, 1959, Rio de Janeiro), Brazilian musician and one of the foremost Latin-American composers of the 20th century, whose music combines indigenous melodic and rhythmic elements with Western classical music from Bach to Puccini.

Villa-Lobos, 1952

A cellist in his youth, he began to investigate Brazilian folk and popular music in 1905. Leaving home because his widowed mother opposed a musical career, he became a musical vagabond at the age of 18. He played popular music engagements on the cello and guitar, all the while absorbing Brazilian folk music and incorporating it into his own compositions.

On his return to Rio he enrolled at the Instituto Nacional de Música but soon was off on another journey, this time to North Brazil (Bahia), where he remained for three years, travelling on musical pilgrimages in the region.

Back in Rio with a large group of manuscripts and an intimate knowledge of Afro-Brazilian music of the districts, he studied Bach, Wagner, Puccini, and other composers whose influence his music was to absorb. A vital boost to his career occurred in 1915, when his music began to be published by the firm of Artur Napoleão. Music poured out of him ceaselessly (about 2,000 works are credited to him in all), and by the time of his first trip to Europe in 1923, he had compiled a long list of compositions in every form.

In 1919, when he was 32, he met the pianist Artur Rubinstein, whose playing of his music throughout the world brought Villa-Lobos increasing recognition.

Villa-Lobos was appointed director of musical education at São Paulo in 1930 and in 1932 took charge of musical education throughout Brazil. He established a conservatory for popular singing (1942) and founded the Brazilian Academy of Music (1945). Between 1944 and 1949 he travelled widely in the U.S. and Europe, where he received many honours and was much in demand as a conductor.

Villa-Lobos wrote operas, ballets, phonies, concerti, symphonic suites, and solo pieces, in a style that was influenced by Bach, French composers, and Wagner. His style was also suffused with an original use of Brazilian percussion instruments and Brazilian rhythms. One of his most characteristic works is Bachianas brasileiras (1930-44), a set of nine pieces for various instrumental and vocal groups, in which a contrapuntal technique in the manner of Bach is applied to themes of Brazilian origin. A similar series of 14 works, composed between 1920 and 1929, bears the generic title Chôros (a Brazilian country dance). His 12 symphonies (1920-58) are mostly associated with historic events or places. Other works include the symphonic poems *Uirapurú* (1917), Amazonas (1929), and Dawn in a Tropical Forest (1954); two cello concerti (1915, 1955); Momoprecoce for piano and orchestra, a harp concerto, a concerto for harmonica and orchestra, a concerto for guitar and orchestra (1952); 16 string quartets (1915-55); and Rudepoema for piano solo (1926; orchestrated 1942).

Villa María, city, east central Córdoba province, north central Argentina, on the Río Tercero at the northwestern limits of the Pampa. Founded in 1867, it was nominated but rejected as the site for the national capital in 1871. It is a rail junction and commercial and manufacturing centre for the hinterland, in which livestock are raised and various grains are grown. Dairies, cement factories, canneries, and textile and flour mills are located in the city, and a military gunpowder and explosives factory is nearby. Villa María is linked by railroad and highway to Córdoba, the provincial capital, and to Buenos Aires. Pop. (1980) Greater Villa María, 67,490.

Villa Mercedes (Argentina): see Mercedes.

Villa Nueva, also called GUAYMALLÉN, suburb east of the city of Mendoza, in north Mendoza province, western Argentina, in the intensively irrigated Río Mendoza valley, at the base of the Andes fronting on the west. It is both an agricultural centre, producing wine grapes, peaches, apples, plums, and olives, and a built-up area with wineries, sawmills, and barrel factories. Villa Nueva is one of the six localities that constitute Greater Mendoza. Pop. (1980) 157,334.

Villa Obregón, delegation (administrative subdivision), north central Federal District, central Mexico, in the Valley of Mexico. Formerly known as San Angel and San Jacinto Tenanitla, the original settlement dates from the colonial era. The cool climate and attractive landscape attracted wealthy families from Mexico City, whose large estates still remain. The church and monastery of El Carmen date from 1615; a monument to Gen. Alvaro Obregón stands at the site of his assassination in 1928. Situated in a fruit-growing district, Villa Obregón also has light industries, including a paper mill and a chemical plant. Various avenues lead to central Mexico City, 9 mi (14 km) to the north-northeast, and the city is on the peripheral expressway. Pop. (1970) 3,904.

Villa Sierra, Fernando de Valenzuela, marqués de (marquess of): see Valenzuela, Fernando de.

Villach, city, Bundesland Kärnten (federal province of Carinthia), southern Austria, on the Drava (Drau) River at the eastern foot of the Villacher Alps, west of Klagenfurt. It

originated as the Roman town of Bilachinium and formed part of the bishopric of Bamberg from 1007 to 1759. An important trade centre in the Middle Ages, it declined after new trade routes were opened up. Commerce revived in the 19th century. Notable landmarks in the city are the parish church of St. Jakob (reconstructed 14th-15th centuries) with a detached tower (311 ft [95 m]), the Heiligenkreuzkirche (1726–38), and the town hall (c. 1570), which was rebuilt after its destruction in World War II. Villach is the commercial centre of Kärnten and its main railway junction and second largest city. Manufactures include cellulose, wood products, machinery, and chemicals; there are also breweries and food-processing plants. Warmbad Villach, noted for its mineral baths, is nearby, and Villach itself is a tourist centre for the Kärnten lake district. Pop. (1981) 52,744.

Villafranca, Conference of, meeting between French emperor Napoleon III and Emperor Francis Joseph I of Austria, resulted in a preliminary peace (July 11, 1859) ending the Franco-Piedmontese war against Austria (1859); it marked the beginning of Italy's unification under Piedmontese leadership. Napoleon made peace without consulting the Piedmontese, not wishing them to become too powerful by acquiring all of northern Italy from Austria. He also feared that France would be open to a Prussian attack along the Rhine if he remained engaged in a long war with the Austrians in Italy. Sixteen days after the bloody Battle of Solferino, the preliminary peace was signed at Villafranca 10 miles (16 kilometres) southwest of Verona in northeastern Italy. Austria gave up Lombardy, excluding Mantua and Peschiera, to France; an Italian Confederation was to be formed under the presidency of the Pope; Austria would be a member of the confederation by virtue of its Italian territories; and the dukes of Parma, Modena, and Tuscany were to be restored peacefully to their thrones after having been deposed by nationalist forces. It was understood that Lombardy would be ceded by France to its ally Piedmont. Piedmontese king Victor Emmanuel II accepted these terms, but his prime minister, Count Cavour, resigned over the compromise with Italian nationalist aims. The terms of Villafranca were confirmed in a formal treaty at Zurich (Nov. 10, 1859). Italian nationalists reacted very strongly against its terms, and by January 1860 Cavour could return to office without feeling bound in any way by them.

Villafranchian Stage, major division of early Pleistocene deposits and time (the Pleistocene Epoch began about 2,000,000 years ago and ended about 10,000 years ago). The Villafranchian Stage was named for a sequence of terrestrial sediments studied in the region of Villafranca d'Asti, an Italian town near Turin. Deposits assigned to the Villafranchian have a widespread distribution; the name Villafranchian is also applied to a land-mammal faunal assemblage that is distinctive. Some dispute exists as to the actual time span included within the Villafranchian. The Villafranchian may include sediments that are partly Pliocene in age and partly Pleistocene or it may be entirely Pleistocene. It is likely that the Villafranchian includes within it the Pliocene-Pleistocene boundary. This boundary is determined by Villafranchian mammals, which include the first appearances of such distinctive forms as zebrine horses and true elephants, as well as distinctive associated forms. The Villafranchian is in part contemporaneous with the Blancan Stage of North America. The Blancan, however, is clearly Pliocene in part and apparently begins earlier than the Villafranchian. Further study is necessary to determine the most precise placement of the Pliocene-Pleistocene boundary and its relationship to the Villafranchian.

The Villafranchian also is significant because within it the earliest hominids that clearly evolved into modern man (the australopithecines) appeared, although australopithecine history may well be shown to extend into the Pliocene Epoch. The australopithecines were small, erect, efficiently bipedal creatures with brain capacities scarcely exceeding that of the modern apes but with distinctly human dentitions and other skeletal features. In Mediterranean Europe, Villafranchian deposits grade into marine sediments, allowing marine and terrestrial correlations to be made.

Villahermosa, city, capital of Tabasco state, southeastern Mexico. It is in the Gulf low-lands at 33 ft (10 m) above sea level, on the Río Grijalva. Founded in 1596 as Villa Felipe II, the settlement has also been known as San Juan de Villa Hermosa and as San Juan Bautista; it was given its present name, meaning "beautiful city," in 1915. The city's cathedral was built in 1614; its archaeological museum is one of the best in Mexico.

As well as a political centre, Villahermosa is the state's chief distributing, processing, and agricultural city. Its industries, which use the regional tropical products, include sugar refineries, distilleries, rice and lumber mills, and factories manufacturing cigars, soap, and clothing. The city is situated on the highway linking Mexico City, to the west-northwest, with the Yucatán Peninsula. A road leads south to Teapa, through which the main Veracruz–Yucatán railroad passes. Villahermosa is also served by domestic airlines. The Benito Juárez Autonomous University of Tabasco was established in Villahermosa in 1959. Pop. (1980) 158,216.

villancico, genre of Spanish song, most prevalent in the Renaissance but found also in earlier and later periods. It is a poetic and musical form and was sung with or without accompanying instruments. Originally a folk song, frequently with a devotional song or love poem as text, it developed into an art music genre.

The villancico consisted of two parts, beginning with the refrain, or estribillo, which alternates with the stanza, or copla. The copla has two parts, the mudanza and the vuelta. The vuelta rhymes with the last line of the mudanza but is sung to the melody of the estribillo. This overlap of poetic and musical form is characteristic of the villancico.

The villancico repertory of the late 15th-early 16th centuries is found in several cancioneros, or song collections. The pieces were in three or four voice parts, the musical texture being either homophonic (chordal) or contrapuntal. An important composer was Juan del Encina. Around 1500, settings of villancicos as solo songs accompanied by vihuela, a guitar-shaped lute, appeared, some in Portuguese as well as Spanish. Composers included some of the great masters of the vihuela, such as Luis Milán and Miguel de Fuenllana.

The *villancico* of the 17th century has a sacred text, often for Christmas. The *estribillo*, elaborately written in four-part polyphony, alternates with *coplas*, short, simple, four-line songs with organ accompaniment. Other instruments are frequently included. In the 18th century this form expanded into a dramatic cantata with arias and choruses. In the 20th century the use of the term is restricted to the Spanish Christmas carol.

villanella, secular Italian composition of the Renaissance, usually for three voices, with no characteristic stanzaic design or poetic form other than a refrain. The villanella was most often written in chordal style with clear, simple rhythm. Traditional rules of composition were sometimes broken; for instance, the normally forbidden movement of voices in parallel fifths was common in the villanella. The villanella was not a folk form but a reaction

against the more refined madrigal, often parodying well-known madrigal texts and music.

The villanella originated in Naples and hence was also called villanella alla napoletana. Although some villanelle appeared earlier, the form was most important during the second half of the 16th century, maintaining its popularity until c. 1700. The earliest master of the villanella was Giovan Tommaso di Maio (d. c. 1550); its most important composer was Gian Domenico da Nola (d. 1592). Villanelle in more artistic style were written by such major composers of madrigals as Adriaan Willaert, Orlando di Lasso, and Luca Marenzio. The villanella was closely related to several other light vocal forms, including the mascherata, moresca, greghesca, and giustiniana.

villanelle, rustic song in Italy, where the term originated (Italian villanella from villano: "peasant"); the term was used in France to designate a short poem of popular character favoured by poets in the late 16th century. Du Bellay's "Vanneur de Blé" and Philippe Desportes' "Rozette" are examples of this early type, unrestricted in form. Jean Passerat (died 1602) left several villanelles, one so popular that it set the pattern for later poets and, accidentally, imposed a rigorous and somewhat monotonous form: seven-syllable lines using two rhymes, distributed in (normally) five tercets and a final quatrain with line repetitions.

The villanelle was revived in the 19th century by Philoxène Boyer and J. Boulmier. Leconte de Lisle and, later, Maurice Rollinat also wrote villanelles. In England, the villanelle was cultivated by W.E. Henley, Austin Dobson, Andrew Lang, and Edmund Gosse. Villanelles in English include Henley's "A Dainty Thing's the Villanelle," which itself describes the form, and Dylan Thomas' "Do Not Go Gentle into That Good Night."

Villani, Giovanni (b. c. 1275, Florence—d. 1348, Florence), Italian chronicler whose European attitude to history foreshadowed Humanism.

In 1300 Villani became a partner in the banking firm of Peruzzi, for which he travelled to Rome (1300–01), where he negotiated with the pope, and (1302–07) to France, Switzerland, and Flanders. In 1308, back in Italy, he left the Peruzzi company. He took an active part in Florentine life and three times (1316, 1317, and 1321) was appointed head of a guild. He was prosecuted for embezzlement but was found innocent. In 1345 he was involved in the bankruptcy of the Bardi and other companies and was imprisoned, but released on bail. He died during the plague of 1348.

His Cronica, or Storia fiorentina, is a vast and ambitious universal history in 12 books. It was planned as a history of events from the fall of the Tower of Babel to Villani's own time, seen from and focussed on Florence. Villani began the work in about 1308. The most interesting part covers the period 1266–1346.

On Florentine history Villani achieved considerable impartiality; although a supporter of the Guelfs, he was not partisan in his views and reflected the outlook of the wealthy borghesi ("bourgeoisie") of the time. His work is of particular value for its inclusion of detailed statistical information on the administration and finance of the Florence of his own time; it is the first introduction of statistics as a positive element in history. For the purity of its Florentine vocabulary, the *Cronica* is considered a classic of the Italian language.

After Giovanni's death, his brother Matteo added 10 books to the *Cronica*, covering the years 1348–63. Matteo's son, Filippo, added another book for the year 1364.

Villanovan culture, Early Iron Age culture in Italy, named after the village of Villanova, near Bologna, where in 1853 the first of the characteristic cemeteries was found. The Villanovan people branched from the cremating Urnfield cultures of eastern Europe and appeared in Italy in the 10th or 9th century BC. The earliest burial rites were usually with cremation; the ashes of the dead were placed in a decorated pottery ossuary of a biconical, or two-storied, form and covered with a bowl. The lid of the urn was sometimes a pottery imitation of a helmet, either the knobbed bell helmet of eastern central Europe or the crested helmet of northern Europe, the Villanovan helmet par excellence.

The Villanovans living in Tuscany also used the terra-cotta hut urn, which imitated a hut of wattle and daub on a frame of poles. The hut urn is characteristic of northern European urn fields, whereas the two-storied urn may be related to similar urns from Hungary and

The Villanovans controlled the rich copper and iron mines of Tuscany and were accomplished metalworkers. In the second half of the 8th century the Villanovans of Tuscany were influenced artistically by Greece; also, inhumation became the predominant burial rite, as it did during the same period in Greece.

During the first quarter of the 7th century an Orientalizing civilization, presumably introduced by Etruscans, was superimposed on the Villanovan in Tuscany. The northern Vil-

lanovans of the Po Valley, however, continued to produce a geometric art as late as the last quarter of the 6th century, when Etruscan expansion obliterated their culture.

Villanueva, Carlos Raúl (b. May 30, 1900, Croydon, Surrey, Eng.-d. Aug. 16, 1975, Caracas), Venezuelan architect often credited with being the father of modern architecture in his country.

Villanueva's best known works were buildings for the Ciudad Universitaria, Caracas;

the Olympic Stadium (1951); the Auditorium (Aula Magna) and covered plaza (Plaza Cubierta), both 1952-53; and the School of Architecture (1957). The Auditorium was particularly notable for its ceiling, from which are suspended floating panels of various sizes and colours, designed by the sculptor Alexander Calder in association with the acoustical specialist Robert Newman.

Villanueva, in association with others, designed a number of large housing developments in Caracas, including one of the world's largest—the Cerro Piloto development (1955-57). For Expo 67, Montreal, Villanueva designed the Venezuelan pavilion. Consisting of three cubes, it was considered an outstanding example of the application of minimal art to

architectural design.

Villanueva y Geltrú, city, Barcelona province, in the autonomous community (region) of Catalonia, northeastern Spain, southwest of Barcelona. The city was chartered by James I of Aragon in 1274. It has a museum founded by the Catalan writer-politician Victor Balaguer containing an "Annunciation" of El Greco. The restored castle of La Geltrú dates from the 12th century. A seaside resort and manufacturing centre, Villanueva produces textiles, electric cables, metal pipes, brandy, and rub-ber products. Wine and hazelnuts come from the surrounding area. Pop. (1981) 43,560.

Villard DE HONNECOURT (b. c. 1225, Picardy, Fr.-d. c. 1250), French architect remembered primarily for the sketchbook compiled while he travelled in search of work as a master mason. The book is made up of sketches and writings concerning architectural practices current during the 13th century.

Honnecourt spent most of his life travelling to such places as Rheims, Chartres, Laon, Meaux, and Lausanne. He visited Hungary in 1245, possibly to work there as an architect. His sketches indicate that he was well acquainted with the great churches that were built during his lifetime. Little mention is made of Honnecourt's own architectural contributions, although he may have been active in the building of Saint-Quentin. In his notes Honnecourt described the work he did on the rose window of Lausanne cathedral.

The architect's sketchbook was originally devoted entirely to sketches marked by sinuous figures in draped robes. Eventually, Honnecourt compiled a manual that gave precise instructions for executing specific objects with explanatory drawings. In his writings he fused principles passed on from ancient geometry, medieval studio techniques, and contemporary practices. The author includes sections on technical procedures, mechanical devices, suggestions for making human and animal figures, and notes on the buildings and monuments he had seen. He also offers insights into the variety of interests and work of the 13thcentury master mason in addition to providing an explanation for the spread of Gothic architecture in Europe.

Villard, Henry, original name FERDINAND HEINRICH GUSTAV HILGARD (b. April 10, 1835, Speyer, Bavaria—d. Nov. 12, 1900, Dobbs Ferry, N.Y., U.S.), U.S. journalist and financier, who became one of the major United States railroad and electric utility promoters.

Villard emigrated to the U.S. in 1853 and was employed by German-American newspapers and later by leading American dailies. He reported (1858) the Lincoln-Douglas debates for eastern newspapers and the Pikes Peak gold rush (1859) for the Cincinnati Daily Commercial. During the Civil War he was a war correspondent, first for The New York Herald and then for the New York Tribune. In 1881 he purchased The Nation and the New

York Evening Post. As an agent for German bondholders, Villard became involved in railway organization. In 1875 he helped reorganize the Oregon and California Railroad and the Oregon Steamship Company and the following year became president of both companies. He organized the Oregon Railway and Navigation Company in 1879 and built a railroad along the Columbia River from Portland, Ore., to Wallula, Wash. In 1881 he secured control of the Northern Pacific, of which he became president. Its transcontinental line was completed under his management, but the costs so far exceeded the estimate that financial pressures forced him to resign from the presidency in 1884. He later recouped his losses, and from 1888 to 1893 he served as chairman of the board of directors of the same company. He bought the Edison Lamp Company, Newark, N.J., and the Edison Machine Works, Schenectady, N.Y., and formed them into the Edison General Electric Company in 1889, serving as president until its reorganization in 1893 as the General Electric Company.

Villarreal de los Infantes, city, Castellón province, in the autonomous community (region) of Valencia, eastern Spain. The city is northeast of Valencia city on the Río Mijares, just southwest of Castellón de la Plana. It was founded in 1274 by King James I of Aragon, who reconquered the kingdom of Valencia from the Moors. A flourishing trade centre during the Middle Ages, it subsequently occupied a prominent place in the affairs of Valencia. In 1904 King Alfonso XIII raised it to city and municipal status. An agricultural centre specializing in citrus fruits and vegetables, Villarreal also produces mosaics, motors, explosives, pumps, refrigerators, paper, woollens, and chemical fertilizers. The shrine of San Pascual contains the tomb of the city's patron, the Franciscan San Pascual Bailón (died 1592). Pop. (1981) 38,385.

Villarrica, capital, Guairá department, southern Paraguay. Founded in 1576 on the Paraná River, the settlement was moved in 1682 to its present site at the edge of the westward extension of the Brazilian Highlands, including the Ybytyruzú mountains at 820 ft (250 m) above sea level. Now Paraguay's third largest city, Villarrica is a commercial, manufacturing, and religious centre. Industrial establishments in the city include sawmills, textile and flour mills, sugar refineries, liquor distilleries, wineries, tanneries, plants processing maté (tea), and shoe factories. The principal exports are maté, tobacco, cotton, sugarcane, oranges, wine, cattle, and hides. Its cathedral and shrine make Villarrica a pilgrimage centre. The city has various schools, a hospital, and a theatre. It is accessible by highway or railroad from Asunción and Encarnación. Pop. (1982 prelim.) 21,203.

Villars, Claude-Louis-Hector, duc de (duke of) (b. May 8, 1653, Moulins, Fr.—d. June 17, 1734, Turin, Italy), French soldier, King Louis XIV's most successful commander in the War of the Spanish Succession (1701The son of an army officer turned diplomat, Villars distinguished himself as a colonel of a cavalry regiment in Louis XIV's war against the Dutch (1672–78). He was made a commissary general of the cavalry upon the outbreak of the War of the Grand Alliance (1689–97)

between France and the other major European powers. In 1698 he became ambassador to Vienna.

Three years later the dispute over the succession to the Spanish throne brought France and Spain to war with the British, the Austrians, and the Dutch. Assigned to protect Upper Alsace from invasion, Villars crossed the Rhine and severely defeated the forces of Louis of Baden at Friedlingen (October 1702). His troops then hailed him as a marshal of France, and Louis XIV granted the appointment and gave him the command of the French army in Germany. Although Villars defeated an Austrian army at Höchstädt an der Donau in September 1703, he asked to be recalled after quarrelling bitterly with his ally Maximilian II Emanuel, elector of Bavaria, who had rejected his plan for a march on Vienna.

Villars was fighting Huguenot rebels (Camisards) in the Cévennes in southern France when the British general John Churchill, 1st duke of Marlborough, and the Austrian commander Prince Eugene of Savoy inflicted a catastrophic defeat on Franco-Bavarian forces at Blenheim in August 1704. The following year he was made a duc and sent back to the Rhine to prevent Marlborough from invading France. He crossed the Rhine in 1707 and advanced deep into Swabia before being forced to retreat.

Appointed commander of the severely demoralized French forces in Flanders in 1709, Villars inflicted extremely heavy casualties on the armies of Marlborough and Prince Eugene at the Battle of Malplaquet on September 11. Because Marlborough would not risk another such encounter, France was saved from invasion. After Marlborough lost his command, Villars defeated Prince Eugene at Denain (July 24, 1712), thereby ending the struggle in Flanders. Returning to the Rhine, Villars captured Landau and Freiburg in 1713 and then concluded with Prince Eugene the Treaty of Rastatt (March 1714), which became part of the final peace settlement of Utrecht.

Villars was a member of the Council of Regency in the opening years of the reign of young Louis XV (ruled 1715–74). At the beginning of the War of the Polish Succession (1733–38) he was given the exceptional title of marshal general of France and sent to attack Austrian possessions in northern Italy. He died less than a year later. Claude Sturgills' Marshal Villars and the War of the Spanish Succession was published in 1965.

Villavicencio, capital of Meta department, eastern Colombia, on the eastern slopes of the Andean Cordillera (mountains) Oriental. Founded in 1840, the city was named after Antonio Villavicencio, an early advocate of the struggle for independence from Spain. It is an important manufacturing and commercial centre for the llanos (plains) and rain forests of eastern Colombia. Industries include a distillery, a brewery, soap factories, coffee-roasting plants, rice mills, and saddleries. The city is accessible by highway from Bogotá, 65 mi (100 km) northwest, and is a hub for roads from northeastern and southern Meta department. It is served by domestic airlines. Pop. (1973) 87,690.

Villaviciosa, port town, Oviedo province, in the autonomous community (region) of Asturias, northwestern Spain, in the Costa Verde (Green Coast) resort area. The town is a fishing port northeast of Oviedo city, where the Ría (inlet) de Villaviciosa enters the Bay of Biscay. Used by the ancient Romans as a landing place, it was first called Tierra de Maliayo or Maleayo (Corrupt Land), which evolved to Villaviciosa (Town of Vices). Alfonso X gave it a charter in 1308. Charles I of Spain (Holy Roman Emperor Charles V) landed in 1517 at nearby Tazones when he arrived from Flanders to take possession of Castile; the Casa de Hevia, where he stayed, is still preserved. The area is famous for its ecclesiastical architecture, notably the church of Santa María de Villaviciosa (13th century) and the convent of Valdediós (8th century).

Economic activities, apart from fishing and tourism, include the production of sparkling cider and apple by-products, dairy foods, and chocolate. Pop. (1981) 15,703.

Ville de Bretagne (France): see Morlaix.

Ville-de-Paris, département, Île-de-France region, France, established in 1964 as part of the administrative reorganization of the Paris metropolitan area. It is coextensive with the municipality of Paris. With the exception of the Bois de Boulogne, the Bois de Vincennes, and some streets formerly in peripheral suburbs, the département is contained within the last line of fortifications built around Paris in 1841-45 and demolished after World War I. Like other départements, it has a préfet as representative of the central government, but the Conseil de Paris resembles a municipal council rather than a departmental assembly. The 20 arrondissements have been maintained, each of which comprises a canton. Area: 41 sq mi (105 sq km). Pop. (1982) 2,176,243.

Villefranche-sur-Mer, harbour town and Mediterranean resort, Alpes-Maritimes département, Provence-Alpes-Côte-d'Azur region, southeastern France. Situated on the wooded slopes surrounding the magnificent roadsteads immediately east of Nice, the town is dominated by Mont Boron. It is connected by a corniche (cliffside) road with Beaulieu to the east and with Saint-Jean-Cap-Ferrat to the southeast on the scenic Cap (cape) Ferrat peninsula, where notable properties include the former Riviera residence of Leopold II, king of the Belgians (reigned 1865–1909).

Villefranche, a picturesque old town, was founded early in the 14th century. Its ancient Saint-Pierre chapel was entirely decorated by the French 20th-century writer and artist Jean Cocteau. The citadel was built in 1560, under the rule of the Duke of Savoy. The town overlooks a beautiful roadstead, well sheltered and often utilized by the French navy for warships. There is a little fishing along the coast. Pop. (1982) 6,627.

Villefranche-sur-Saône, town, Rhône département, Rhône-Alpes region, east central France, located 1 mi (1.6 km) west of the Saône River. Founded in the 12th century,

the town became the capital of the Beaujolais district. After enduring three sieges in the 15th and 16th centuries, the town walls were finally dismantled early in the 19th century. An important wine-trading centre, Villefranche-sur-Saône has metallurgical, textile, and chemical industries. The Autoroute du Sud, running along the right bank of the Saône, skirts the town to the east. Pop. (1982) 28,858.

Villegagnon Island, Portuguese ILHA DE VILLEGAGNON, island in Baía (bay) de Guanabara, southeastern Brazil, connected by a causeway to Rio de Janeiro's Santos Dumont Airport on the mainland. In 1555 French Huguenots from nearby Ilha da Laje under Nicolas Durand de Villegaignon established the colony of La France Antarctique and Ft. Coligny. In 1560 the fort was destroyed by Portuguese troops, and the Huguenots were forced to abandon the island. Villegagnon is the site of Brazil's National Naval Academy.

Villegas, Esteban Manuel de (b. 1589, Matute, near Nájera, Spain—d. Sept. 3, 1669, Matute), Spanish lyric poet who achieved great popularity with an early book of poems, *Poesías eróticas y amatorias* (1617–18).

He first studied classics at the University of Madrid, translating works of the 6th-century-BC Greek poet Anacreon at the age of 14, and later obtained a law degree from the University of Salamanca. Intending to devote his life to literature, he was forced to practice law to support his family. In 1659 he was jailed by the Inquisition because of satires he had published. Returning to Nájera, he spent his remaining years on a translation of the 5th-century-AD Roman scholar Boethius' De Consolatio philosophiae (Consolation of Philosophy, 1963).

Villegas was a poet who largely exhausted his art in his early youth. The *Poesías eróticas*, most of which were written in his teens, are a mixture of translations and imitations of Horace and Anacreon, satires, and idylls. Some critics regard these poems as having a grace and delicacy unequalled in Spanish literature.

Villehardouin, Geoffrey of, French GEOFFROI DE VILLEHARDOUIN (b. c. 1150, near Barsur-Aube, Burgundy—d. c. 1213, Greece?), French soldier, chronicler, marshal of Champagne, and one of the leaders of the Fourth Crusade (1199–1207), which he described in his unfinished Histoire de l'empire de Constantinople. He was the first serious writer of an original prose history in French.

Although only one of the lesser nobility, he was from the start accepted as one of the leaders of the Fourth Crusade. In 1205 his consummate generalship saved the Frankish army from destruction at the hands of the Bulgars outside Adrianople (present Edirne, Tur.) and led them without loss through hostile country to safety in Constantinople.

Villehardouin's Histoire, usually known as the Conquête de Constantinople ("Conquest of Constantinople"), initiated the great series of histories that so distinguishes medieval French literature. His achievement is remarkable because neither in style nor form did he have any models on which to base his work; his Latin predecessors were probably unknown to him at first hand. He probably started writing his chronicle about 1209. In it, he describes the "crusade," a war in which French knights and their Venetian allies invaded the Byzantine Empire and captured its capital Constantinople (1204). It was after the city's fall that Villehardouin distinguished himself in the conflict with the Bulgars.

Villejuif, town, Val-de-Marne département, Paris region, southern suburb of Paris, France. It has a psychiatric hospital and a cancer research institute and manufactures glass, sheet metal, and aircraft parts. Pop. (1982) 42,852.

Villèle, (Jean-Baptiste-Guillaume-)Joseph, comte de (count of) (b. April 14, 1773, Toulouse, Fr.—d. March 13, 1854, Toulouse), French conservative politician and prime minister during the reign of Charles X.

Villèle was educated for the navy, made his first voyage in July 1789, and served in the West and East Indies. In 1807 he returned to France after having amassed a considerable fortune during his travels. He was elected mayor of his commune near Toulouse (1808) and mayor of Toulouse (1815) as well as a deputy in the intransigently royalist chamber of 1815-16. From 1813 he was a member of the royalist secret society Les Chevaliers de la Foi (The Knights of the Faith), and he sat on the extreme right with the ultra-royalists. In 1820 he was made a minister without portfolio. He resigned in July 1821, but in the following December, after the fall of the government of the Duc de Richelieu, Villèle returned as minister of finance and soon became the real head of the Cabinet. He was backed at court by intimates of King Louis XVIII, who in 1822 created him comte and made him premier.

Villèle muzzled the opposition by imposing stringent censorship on the press (1822). In 1825, after the stubbornly reactionary Charles X had succeeded to the throne, Villèle's government provided a long-sought indemnity for the émigrés who had lost their estates in the Revolution, financing it by lowering the rate of interest paid on government bonds. Though the measure was unfair to the bondholders, by satisfying the claims of the émigrés it had the salutary effect of ending the uncertainty over the legal ownership of the lands confiscated during the Revolution. During Villèle's administration the more conservative Catholic elements had great influence, especially in the universities, from which they purged professors with liberal views. All these policies were highly controversial and divisive, but particularly damaging to Villèle was his disregard, perhaps at the insistence of Charles X, of the widespread sentiment in favour of some sort of constitution. When in the elections of 1827 he failed to obtain a rightist majority, he resigned (January 1828), and Charles replaced him with the vicomte de Martignac, a centrist, in a futile effort to appease public discontent. Villèle took no further part in politics.

Villella, Edward (b. Oct. 1, 1936, New York City), American ballet dancer, one of the principal performers of the New York City Ballet, noted for his powerful technique, particularly his soaring leaps and jumps.

He began dance training at 10 years of age and soon won a scholarship to the School of

Villella in The Prodigal Son Martha Swope

American Ballet. Later he entered New York City's School of Performing Arts. After a fouryear hiatus he joined the New York City Ballet in 1957 and became a soloist within a year. A notable interpreter of the dramatic title role of George Balanchine's Prodigal Son, Villella also appeared as the Faun in Jerome Robbins' Afternoon of a Faun and created the roles of Oberon in A Midsummer Night's Dream (1962) and Harlequin in Harlequinade (1965), both by Balanchine. He also excelled in the nonvirtuosic but deeply dynamic Watermill (1972), created for him by Robbins. He performed in a number of pas de deux with Patricia McBride on television. From 1979 he served as artistic coordinator and choreographer of the Eglevsky Ballet Company (until 1984) and as director of the Miami City Ballet (from 1987).

Villemin, Jean Antoine (b. Jan. 28, 1827, Prey, Vosges, Fr.—d. Oct. 6, 1892, Paris), French physician who proved tuberculosis to be an infectious disease, transmitted by contact from humans to animals and from one animal to another.

Villemin studied at Bruyères and at the military medical school at Strasbourg, qualifying as an army doctor in 1853. He was sent for further study to the Val-de-Grâce, the military medical school in Paris. As an army doctor he observed that healthy young men from the country often developed tuberculosis while living in the close quarters of the barracks. Aware that glanders in horses, a similar disease, is transmitted by inoculation, Villemin began his experiments by inoculating a rabbit with tuberculous material from a deceased human patient. Tuberculous lesions were found in the rabbit three months later. He also found that rabbits inoculated with tuberculous material from cows developed the disease.

His results, presented in 1867, were at first ignored. The French believed tuberculosis was hereditary, and German scientists knew that introducing a foreign body into a tissue would produce something like a tubercule. Villemin tried valiantly to spread the doctrine of contagion, but it was some time before his position was vindicated by the experiments of other scientists. He later proved by injection that sputum and blood from tubercular patients can transmit the disease to animals.

Villena, city, Alicante provincia, in the comunidad autónoma ("autonomous community") of Valencia, southeastern Spain. It lies about 45 miles (70 km) northeast of Murcia. Dating from Roman times, Villena was later part of the Moorish kingdom of Valencia and was taken by the Christians in the 13th century. The locality was devastated by an earthquake in 1829. The city is on the right bank of the Vinalopó River and is the centre of a grapegrowing area. The city's industries produce wine, soap, and salt. Architectural features include the Gothic churches of Santiago and Santa María and the medieval castle of the marquéses de Villena, on San Cristóbal Hill. Pop. (1981) 28,279.

Villeneuve, Pierre-Charles-Jean-Baptiste-Silvestre de (b. Dec. 31, 1763, Valensole, Fr.—d. April 22, 1806, Rennes), French admiral who commanded the French fleet at the Battle of Trafalgar (1805).

Belonging to a noble family, he entered the French Royal Navy and received rapid promotion, being named post captain in 1793 and rear admiral in 1796. He commanded a section of the French fleet in Napoleon's expedition to Egypt. His flagship, the *Guillaume Tell*, along with the *Généreux*, were the only warships to escape the French fleet's general destruction during the ensuing Battle of the Nile (Aug. 1, 1798).

Villeneuve played a key role in the failed execution of Napoleon's scheme for the invasion of England in 1805. In the autumn of 1804

Napoleon had named Villeneuve commander of the fleet at Toulon. The duty of Villeneuve's fleet was to draw the British admiral Horatio Nelson's fleet to the West Indies, return rapidly in secret, and, in combination with other French and Spanish ships, enter the English Channel with an overwhelming naval force for the invasion of England. Villeneuve apparently had little confidence in the success of this operation, but nevertheless he took the command in November. In March 1805 he sailed out of Toulon and succeeded in drawing Nelson after him in a cruise out to the West Indies. Villeneuve's fleet then returned to Europe in June-July, during which time it fought an indecisive encounter off El Ferrol. Spain, with an English squadron led by Sir Robert Calder.

Villeneuve then turned south to the port of Cádiz, disregarding Napoleon's standing orders to proceed immediately to the Channel and rendezvous with the other French and Spanish naval forces gathered there. This act of timidity on Villeneuve's part effectively ended Napoleon's hopes for an invasion of England while Nelson's fleet was somewhere else. In Cádiz Villeneuve then received orders to sail his fleet into the Mediterranean for an attack upon Naples, but, while making his preparations, he learned that another officer had been sent to replace him in his command. In a spasm of wounded vanity, he embarked his fleet out of Cádiz to face the waiting fleet of Nelson, and the result was the Battle of Trafalgar (q.v.) of October 1805. Villeneuve's impulsive decision to leave Cádiz and give battle to Nelson's better-prepared fleet has been severely criticized.

At Trafalgar Villeneuve showed personal courage, but the incapacity of the Franco-Spanish fleet to maneuver gave him no opportunity to influence the course of the battle, which ended for the French in complete defeat. Villeneuve himself was captured and was taken as a prisoner to England, but he was soon released. Shortly after returning to France he committed suicide at an inn in Rennes, where he had been waiting to learn the extent of the emperor's displeasure with him.

Villiers de L'Isle-Adam, (Jean-Marie-Mathias-Philippe-) Auguste, comte de (count of) (b. Nov. 7, 1838, Saint-Brieuc, Fr.—d. Aug. 19, 1889, Paris), French poet, dramatist, and short-story writer whose work reflects a revolt against Naturalism and a combination of Romantic idealism and cruel sensuality. His hatred of the mediocrity of a materialistic age and his compelling personality made a considerable impression on later writers.

Villiers, the descendant of an aristocratic family, lived most of his life in considerable poverty and spent some time planning to marry a rich heiress; when he did finally marry, on his deathbed, it was to his mistress, a former chambermaid. He was a friend of the leading writers of his time but was not more

widely known until about five years before he died.

His most enduring works are the drama Axël (1885-86) and the short stories in Contes cruels (1883; Cruel Tales, 1963). The latter, inspired by the works of Edgar Allan Poe, satirize bourgeois morality. Splendidly written, they often have an element of horror or even sadism that reveals both the desire to shock and some of Villiers's private obsessions.

Axël combines symbolism and occult themes in the story of the lord of a German castle, in the cellars of which a mysterious treasure is hidden, and his doomed love for an escaped nun who has discovered the secret. Axël is unperformable in its full version; it was revived, in 1962, in a version lasting four hours. Villiers's Correspondance was published in 1962.

life of criminal excess, spending much time in prison or in banishment from medieval Paris. His chief works include Le Lais, or Le Petit Testament, Le Grand Testament, and various

ballades, chansons, and rondeaux.

Life. Villon's father died while he was still a child, and he was brought up by the canon Guillaume de Villon, chaplain of Saint-Benoît-le-Bétourné. The register of the faculty of arts of the University of Paris records that in March 1449 Villon received the degree of bachelor, and in May-August 1452, that of master. On June 5, 1455, a violent quarrel broke out in the cloisters of Saint-Benoît among himself, some drinking companions, and a priest, Philippe Sermoise, whom Villon killed with a sword thrust. He was banished from the city but, in January 1456, won a royal pardon. Just before Christmas of the same year, however, he was implicated in a theft from the Collège de Navarre and was again obliged to leave Paris.

At about this time he composed the poem his editors have called Le Petit Testament, which he himself entitled Le Lais (The Legacy). It takes the form of a list of "bequests," ironically conceived, made to friends and acquaintances before leaving them and the city. To his barber he leaves the clippings from his hair; to three well-known local usurers, some small change; to the clerk of criminal justice, his sword (which was in pawn).

After leaving Paris, he probably went for a

while to Angers. He certainly went to Blois and stayed on the estates of Charles, duc d'Orléans, who was himself a poet. Here, further excesses brought him another prison sentence, this time remitted because of a general amnesty declared at the birth of Charles's daughter, Marie d'Orléans, on Dec. 19, 1457. Villon entered his ballade "Je meurs de soif auprès de la fontaine" ("I die of thirst beside the fountain") in a poetry contest organized by the Prince, who is said to have had some of Villon's poems (including the "letter" dedicated to the young child, "Épître à Marie d'Orléans") transcribed into a manuscript of his own work.

At some later time, Villon is known to have been in Bourges and in the Bourbonnais, where he possibly stayed at Moulins. But throughout the summer of 1461 he was once more in prison. He was not released until October 2, when the prisons were emptied because King Louis XI was passing through.

Free once more, Villon wrote his longest work. Le Testament (or Le Grand Testament. as it has since been known). It contains 2,023 octosyllabic lines in 185 huitains (eight-line stanzas). These huitains are interspersed with a number of fixed-form poems, chiefly ballades (usually poems of three 10-line stanzas, plus an envoi of between 4 and 7 lines) and chansons (songs written in a variety of metres and with varied verse patterns), some of which he had composed earlier.

In Le Testament Villon reviews his life and expresses his horror of sickness, prison, old age, and his fear of death. It is from this work especially that his poignant regret for his wasted youth and squandered talent is known. He re-creates the taverns and brothels of the Paris underworld, recalling many of his old friends in drunkenness and dissipation, to whom he had made various "bequests" in Le Lais. But Villon's tone is here much more scathing than in his earlier work, and he writes with greater ironic detachment.

Shortly after his release from the prison at Meung-sur-Loire he was arrested, in 1462, for robbery and detained at the Châtelet in Paris. He was freed on November 7 but was in prison the following year for his part in a brawl in the rue de la Parcheminerie. This time he was condemned to be *pendu et etran-glé* ("hanged and strangled"). While under the sentence of death he wrote his superb "Ballade des pendus," or "L'Épitaphe Villon," in

which he imagines himself hanging on the scaffold, his body rotting, and he makes a plea to God against the "justice" of men. At this time, too, he wrote his famous wry quatrain "Je suis Françoys, dont il me poise," "I am François, they have caught me." He also made an appeal to the Parlement, however, and on Jan. 5, 1463, his sentence was commuted to banishment from Paris for 10 years. He was never heard from again.

Poetry. The criminal history of Villon's life can all too easily obscure the scholar, trained in the rigorous intellectual disciplines of the medieval schools. While it is true that his poetry makes a direct unsentimental appeal to our emotions, it is also true that it displays a remarkable control of rhyme and reveals a disciplined composition that suggests a deep concern with form, and not just random inspira-tion. For example, the ballade "Fausse beauté, qui tant me couste chier" ("False beauty, for which I pay so dear a price"), addressed to his friend, a harlot, not only supports a double rhyme pattern but is also an acrostic, with the first letter of each line of the first two stanzas spelling out the names Françoys and Marthe. Even the arrangement of stanzas in the poem seems to follow a determined order, difficult to determine, but certainly not the result of happy accident. An even higher estimate of Villon's technical ability would probably be reached if more were known about the manner and rules of composition of the time.

A romantic notion of Villon's life as some sort of medieval vie de bohème-a conception reinforced by the 19th-century Symbolist poet Arthur Rimbaud, who saw him as the "accursed poet"-has been challenged by modern critical studies. David Kuhn has examined the way most texts were made to yield literal, allegorical, moral, and spiritual meanings, following a type of biblical exegesis prevalent in that theocentric age. He has discovered in Le Testament a numerical pattern according to which Villon distributed the stanzas. If his analysis is correct, then it would seem Le Testament is a poem of cosmic significance, to be interpreted on many levels. For example, stanza 33—the number of years in Christ's age—Kuhn believes refers directly to Jesus, and this would certainly be impossible to regard as the random inspiration of a "lost child." The critic Pierre Guiraud sees the poems as codes that, when broken, reveal the satire of a Burgundian cleric against a corps of judges and attorneys in Paris.

That Villon was a man of culture familiar with the traditional forms of poetry and possessing an acute sense of the past is evident from the poems themselves. There is the ballade composed in Old French, parodying the language of the 13th century; Le Testament, which stands directly in the tradition of Jehan Bodel's Congés ("Leave-takings"), poetry that poets such as Adam de la Halle and Bodel before him had composed when setting out on a journey; best of all, perhaps, there is his "Ballade des dames du temps jadis" ("Ballade of the Ladies of Bygone Times," included in Le Testament), with its famous, incantatory refrain "Mais où sont les neiges d'antan? ("But where are the snows of yesteryear?").

However farfetched some of these insights into Villon may appear to be, it is not surprising that the poet-given the historical context of learning-should inform his own work with depth of thought, meaning, and significance. But an "intellectual" approach to Villon's work should not distract from its burning sincerity nor contradict the accepted belief that fidelity to genuine, often painful, personal experience was the source of the harsh inspiration whereby he illuminated his largely traditional subject matter—the cortège of shattered illusions, the regrets for a lost past,

the bitterness of love betrayed, and, above all, the hideous fear of death so often found in literature and art at that time of pestilence and plague, massacre and war.

The little knowledge of Villon's life that has come down to the present is chiefly the result of the patient research of the 19th-century French scholar Auguste Longnon, who brought to light a number of historical documents-most of them judicial recordsrelating to the poet. But after his banishment by the Parlement in 1463 all trace of Villon is lost. Still, it is a wonder that any of his poetry should have survived, and there exist about 3,000 lines, the greater part published as early as 1489 by the Parisian bookseller Pierre Levet, whose edition served as the basis for some 20 more in the next century. Apart from the works mentioned, there are also 12 single ballades and rondeaux (basically 13-line poems with a sophisticated double rhyme pattern), another 4 of doubtful authenticity, and 7 ballades in jargon and jobelin—the slang of the day. Two stories about the poet were later recounted by Rabelais: one told of his being in England, the other of his seeking refuge at the monastery of Saint-Maixent in Poitou. Neither is credible, nor is it known when or where François Villon died.

Assessment. Perhaps the most deeply moving of French lyric poets, Villon ranges in his verse from themes of drunkenness and prostitution to the unsentimental humility of a ballade-prayer to "Our Lady," "Pour prier Nostre-Dame," written at the request of his mother. He speaks, with marvelous directness, of love and death, reveals a deep compassion for all suffering humanity, and tells unforgettably of regret for the wasted past.

His work marks the end of an epoch, the waning of the Middle Ages, and it has commonly been read as the inspiration of a "lost child." But as more becomes known about the poetic traditions and disciplines of his day, this interpretation seems inadequate. It is probably either too early or too late fully to understand Villon's work, as one critic has suggested; but although the scholar must still face a variety of critical problems, enough is known about Villon's life and times to mark him as a poet of genius, whose work is charged with meaning and great emotional force.

Villon, Jacques, pseudonym of GASTON ÉMILE DUCHAMP (b. July 31, 1875, Damville, Normandy, Fr.—d. June 9, 1963, Puteaux, near Paris), noted French painter and printmaker who helped bridge the gap between the purely abstract and the realistic schools of modern art.

Villon was the brother of the artists Suzanne Duchamp (Crotti), Raymond Duchamp-Villon, and Marcel Duchamp. He prepared for a law career as a young man but in 1894 went to Paris, where he spent the next 12 years contributing illustrations and cartoons to newspapers. After 1906 he was able to devote himself primarily to painting. Villon's mature style of painting combined a Cubist use of flat, geometric shapes with a palette of luminous colours. He exhibited at early Cubist shows in Paris in 1911 and 1912 and in the New York City Armory Show in 1913. His compositions eventually brought him international acclaim after World War II. Called a "master of the Paris school" because of his influence on a generation of younger painters, Villon won the Grand Prix at the Venice Biennale in

Villon's portraits and landscapes done after World War II marked a partial return to realistic treatment and were acclaimed for their synthesis of Impressionist colours and Cubist analysis of form. He was also a prolific printmaker. He completed more than 600 colour lithographs, drypoints, engravings, and etchings, among which were many illustrations of literary works by Racine, Hesoid, and Virgil. Two retrospective shows of his paintings and prints were held in New York City in 1953.

villota, plural VILLOTE, type of 16th-century Italian secular song similar to the villenella but having its origins in folk music. The villota has no structural uniformity and usually weaves a popular or street song into its poetic-musical fabric. Clearly, it was meant to be entertaining, with nonsense syllables in the text (which might also be of a bawdy nature) and a dancelike rhythm. Frequently, the longer and more complex villote will conclude with a separate section, called a *nio*, which acts as a refrain and is set off from the main part (or verse) by its faster tempo and occasionally, contrasting metre. Villote often reveal their local origin, either by means of a dialect employed or by regional identifications, as in villote alla paduana (Padua), alla veneziana (Venice), or alla mantovana (Mantua).

villus, plural VILLI, in anatomy, any of the small, slender, vascular projections that increase the surface area of a membrane. Important villous membranes include the sac that encloses unborn (fetal) mammals and the

mucous-membrane coating of the small intestine. In humans the villi project into the intestinal cavity, greatly increasing the area for food absorption and adding digestive secretions. The villi number about 6,000 to 25,000 per square inch (10 to 40 per square millimetre) of tissue. They are most prevalent at the beginning of the small intestine and diminish in number toward the end of the tract.

The large number of villi give the internal intestinal wall a velvety appearance. Each villus has a central core composed of one artery and one vein, a strand of muscle, a centrally located lymphatic capillary (lacteal), and connective tissue that adds support to the structures. The blood vessels are thought to transport proteins and carbohydrates absorbed by the villi's cells, while the lymphatic capillary removes droplets of emulsified fat (chyle). The muscle strand allows the villi to contract and expand; it is believed that these contractions empty the contents of the lacteal into larger lymphatic vessels.

Covering the core of a villus is the surface mucous-membrane layer. This is mainly composed of two cell types: tall, narrow, columnar cells that absorb the substances passed into the blood and lymphatic vessels; and goblet cells, rounded at the end, that secrete mucus into the intestinal cavity. On the surface of each columnar cell there are about 600 very fine projections called microvilli that further increase the absorptive area of each villus.

Villi of the intestine move in swaying, contracting motions. These movements are believed to increase the flow of blood and lymph and to enhance absorption. The villi of the small intestine absorb about 2 gallons (7½ litres) of fluid per day, and absorption seems to be indiscriminate.

Vilnius, Russian VILNYUS, Polish WILNO, Russian (formerly) VILNA, city, capital of the Lithuanian Soviet Socialist Republic, at the confluence of the Neris (Russian Viliya) and Vilnia rivers. A settlement existed on the site

Lenin Square, Vilnius, Lithuanian S.S.R. Novosti Press Agency

in the 10th century, and the first documentary reference to it dates from 1128. In 1323 the town became capital of Lithuania under Grand Duke Gediminas; it was destroyed in 1377 by the Teutonic Knights. Subsequently rebuilt, Vilnius received its charter of self-government in 1387, and a Roman Catholic bishopric was established there. The town and its trade flourished and grew; in 1525 a printing press was set up, and in 1579 a Jesuit academy was opened. The city underwent many calami--Russian occupation in 1655-60, Swedish capture in 1702 and 1706, French occupation in 1812, and recurrent fires and plagues. In 1795 Vilnius passed to Russia in the Third Partition of Poland. It was occupied by the Germans in World Wars I and II and suffered

heavy damage. From 1920 to 1939 it was included in Poland (see Vilnius dispute); it was taken by Soviet troops in 1939 and attached to Lithuania in June 1940, in conjunction with the Soviet annexation of Lithuania. Soviet rule brought mass deportations (1940–41, 1946–50) of ethnic Lithuanians from Vilnius, and many Russians moved into the city. In 1970 the population of Vilnius was 43 percent ethnically Lithuanian (up from 34 percent in 1959) and 18 percent Polish.

A prominent feature of the city before World War II was its Jewish community, for nearly 150 years the centre of eastern European Jewish cultural life. Traceable as far back as 1568, this community comprised 20 percent of the city's population by the middle of the 17th century. In the 18th century, under the influence of Rabbi Elijah ben Solomon (q.v.), it underwent a decisive religious and spiritual growth, becoming renowned for rabbinical studies that between 1799 and 1938 produced texts of the Mishna, Jerusalem Talmud, and other works that are still standard. In the 19th century the community became a centre for the Haskala (Enlightenment) and was the home also of the first Jewish socialists in Russia; by the beginning of the 20th century it had become the focus of the Zionist movement in Russia as well. A flourishing source of Hebrew and Yiddish literature, with numerous newspapers and literary, scientific, and cultural periodicals, it was the birthplace of the YIVO Institute for Jewish Research (founded 1924). The German occupation during World War II destroyed the community, reducing the city's Jewish population from 80,000 in 1941 to 6,000 by 1945.

Many historic buildings survive, representing the Gothic, Renaissance, Baroque, and classical styles of architecture. The ruins of the Castle of Gediminas on Castle Hill dominate the old town, with its narrow, winding streets that climb the wooded slopes surrounding the confluence of the rivers. There are a 16th-century Gothic Church of St. Anne and a dozen 17th-century Baroque churches, notably the Church of SS. Peter and Paul. The cathedral dates originally from 1387, but in its present form from 1801. Around the old town are the newer sectors of the city, with a rectangular street plan, large apartment blocks, administrative buildings, and modern factories.

Present-day Vilnius is an important industrial centre, producing machine tools, agricultural machinery, electronic calculators and other electrical and electronic apparatus, textiles, clothing, and foodstuffs. The city is the cultural centre of Lithuania. The V. Kapsukas State University is the successor to the Jesuit academy of 1579, and the Vilnius Civil Engineering Institute was founded in 1969. There are institutes of fine arts and teacher-training schools and several theatres and museums. The art gallery occupies the former town hall, built in the 18th century. Pop. (1983 est.) 525,000.

Vilnius dispute, Vilnius also spelled WILNO, post-World War I conflict between Poland and Lithuania over possession of the city of Vilnius (Wilno) and its surrounding region.

Although the new Lithuanian government established itself at Vilnius in late 1918, it evacuated the city when Soviet forces moved in on Jan. 5, 1919. A few months later Polish forces drove the Red Army out of Vilnius and occupied it themselves (April 20, 1919). The Lithuanians rejected the demands of the Polish chief of state, Józef Piłsudski, for union with Poland, and hostilities were avoided only by the Allies' creation of a demarcation line (the Foch Line) to separate the armies of the two countries; Vilnius was left on the Polish side of the line. In the summer of 1920, however, the Red Army reoccupied Vilnius, and on July 12 Soviet Russia ceded the city to Lithuania. Subsequently, violence broke out

between Lithuania and Poland. The League of Nations arranged a partial armistice (Oct. 7, 1920) that put Vilnius under Lithuanian control and called for negotiations to settle all the border disputes. Two days later the Polish general Lucjan Żeligowski drove the Lithuanian troops out, proclaimed the independence of central Lithuania, and established its government at Vilnius. For the next year and half, negotiations continued under the aegis of the League of Nations, which finally abandoned its role as mediator on Jan. 13, 1922.

Five days earlier, however, General Zeligowski, again prompted by Piłsudski, called for elections for a regional Diet, which on February 20 voted to incorporate central Lithua-nia into Poland. That arrangement was later accepted by the League's council, which set the border almost along the Foch Line (Feb. 3, 1923)—a decision that was confirmed on March 15 by the conference of ambassadors of the Allied Powers. Lithuania, however, rejected the settlement and, on the basis of the continuing Vilnius dispute, refused to arrange regular diplomatic relations with Poland. Only in 1938, under the pressure of a Polish ultimatum (issued March 17), did Lithuania agree to receive a Polish representative. Vilnius was restored to Lithuania on Oct. 10, 1939.

Vilyuy River, also spelled VILIUI, river in central Siberia, flowing mainly through the Yakut Autonomous Soviet Socialist Republic of the Russian S.F.S.R. The longest tributary of the Lena, it has a length of 1,647 mi (2,650 km) and a drainage basin of about 190,000 sq mi (491,000 sq km). Rising on the Central Siberian Plateau in the Evenky autonomous okrug, it flows in a winding course, first east (soon entering the Yakut A.S.S.R.), then south and southeast, then generally east again, until it joins the Lena about 200 mi northwest of Yakutsk.

The Vilyuy Valley is sparsely populated; small riparian settlements are Vilyuysk (founded 1634), Verkhnevilyuysk, and Suntar (the traditional head of navigation, about 500 mi from the river mouth).

In 1954 rich diamond deposits were discovered at Mirny, near the river 450 mi from its mouth. Access roads and an airport were built and the Vilyuy Dam complex was begun, near the mine site, on the Vilyuy at Chernyshevsky. Power is used for the diamond concentrators at Mirny, and a power line extends 250 mi north to diamond deposits at Aykhal (1964) and Udachny (1968). The dam project has radically altered both the natural fluvial regime of the Vilyuy and the economy of its valley.

tury. The classical vina of northern Indian, or Hindustani, music, a difficult solo instrument, has a large resonating gourd under each end of the body and high, movable frets. On the vina of southern Indian, or Carnatic, music, the lower gourd is replaced by a pear-shaped body, making the instrument a lute rather than a zither. Like the northern vina it has four melody strings and three drones. Its frets are small metal bars. It occupies in Carnatic music the dominant position held by the sitar, which is a form of vina, in Hindustani music. A special group in southern India holds the secret to making the wire strings for this fine solo instrument.

"Vina" may also refer generically to stringed instruments. Prior to about 1000, it usually referred to an arched harp.

vinaigrette, small metal perfume container usually made of gold or silver and containing a pierced metal tray beneath which was placed a piece of sponge soaked in an aromatic substance such as vinegar combined with lavender. Vinaigrettes were made as boxes and many more novel forms from the late 18th to the late 19th century. Most English examples were made in Birmingham.

Vinaya Piţaka (Pāli and Sanskrit: "Basket of Discipline"), the oldest and smallest of the three sections of the Buddhist canonical Tipiţaka ("Triple Basket") and the one that regulates monastic life and the daily affairs of monks and nuns according to rules attributed to the Buddha. It varies less from school to school than does either the Sutta (discourses of the Buddha and his disciples) or Abhidhamma (scholastic) sections of the canon, and the rules themselves are basically the same

even for Mahāyāna schools, although some of the latter greatly extended the accompanying narrative and commentarial material. Three works comprise the Pāli *Vinaya*:

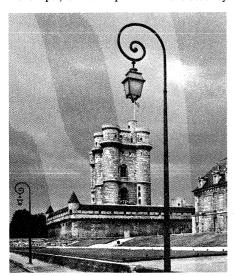

1. Sutta-vibhanga ("Classification of the Suttas"; corresponds to Vinaya-vibhanga in Sanskrit), an exposition of the monastic rules (pātimokkha, q.v.) and the disciplinary actions prescribed for each offense, arranged according to severity—from transgressions requiring expulsion from the order to those needing only to be confessed—plus minor rules of conduct. Each rule is accompanied by (a) the story of the incident that first prompted the Buddha's ruling, (b) an early word-for-word commentary on the rules, and (c), in some instances, a later discussion of exceptions.

2. Khandhaka ("Divisions"; Sanskrit Vinaya-vastu, "Vinaya Subjects"), a series of 22 pieces (at least in the Pāli version) dealing with such matters as admission to the order; monastic ceremonies; rules governing food, clothing, lodging, and the like; and procedures for handling offenses and disputes. As in the Sutta-vibhanga, an account is given of the occasion when each regulation was formulated by the Buddha. The arrangement is chronological, and stories of major events are included, thus providing a picture of the evolving life of the early monastic community.

3. *Parivāra* ("Appendix"), a classified digest of the rules in the other *Vinaya* texts, apparently confined to the Theravāda school.

Vincennes, city, Val-de-Marne *département*, Paris region, eastern residential suburb of Paris, France, immediately outside the city limits. It is connected to Paris by the Métro (subway).

The château of Vincennes, which succeeded an earlier fortified hunting lodge on the site, consists of four principal buildings—the keep, the chapel, and two pavilions—enclosed by

an enceinte with nine towers. The magnificent and well-preserved keep, the finest surviving in France, 170 ft (52 m) in height, was begun under Philip VI, completed under Charles V (reigned 1364–80), and used thereafter as a royal residence until Versailles was built. The chapel, not completed until 1552 but in Gothic style, has a Flamboyant facade and a great rose window. The two pavilions—the Pavillon du Roi and the Pavillon de la Reine—were built by Louis Le Vau, under the direction of Cardinal Mazarin, during the third quarter of the 17th century.

After the court deserted the château, it had

a checkered history, being used as a porcelain factory, a cadet school, and a small-arms factory. In 1791, during the Revolution, the Marquis de Lafayette saved it from destruction. Napoleon converted it into an arsenal, and in 1840 it was turned into a fortress. The army was removed in 1930 and restoration started, to be interrupted during World War II when the Germans had a supply depot there; in 1944 part of the Pavillon de la Reine was destroyed by an explosion.

The château has many associations with French history. Four kings of France died there—Louis X, Philip V, Charles IV, and Charles IX—as did Henry V of England and Mazarin. During the reign of Louis XIII it was used as a state prison, and its prisoners included the Great Condé, the Cardinal de Retz, Denis Diderot, and the Comte de Mirabeau; the Duc d'Enghien was shot there in 1804.

The Bois de Vincennes was enclosed in the 12th century and, as a royal hunting preserve, was the reason for the château being built there. The surviving forest is a park, with a zoo, a racecourse, and a sports stadium. Pop. (1982) 42,852.

Vincennes, city, seat (1790) of Knox County, southwestern Indiana, U.S., on the Wabash River, 51 mi (82 km) north of Evansville. Indiana's oldest city, from the time of its settlement (1702) by French traders on the site of an Indian village, it figured prominently in early national American history. A fort, one of a chain from Quebec to New Orleans, was erected by the French in 1732; and in 1736 the settlement around it was named for François-Marie Bissot, sieur de Vincennes, its commandant. Ceded to the British at the end of the French and Indian War (1763), the settlement was virtually self-governing until the outbreak of the Revolution and remained predominantly French in population and tradition for almost 100 years after that. A British force occupied the fort for a brief period, but briefly in 1778 and finally in 1779 it was taken by American forces under George Rogers Clark. Clark's victory at Vincennes, followed by the passage of the Northwest Ordinance (1787), brought an influx of settlers from Kentucky, Virginia, and Pennsylvania. From 1800 to 1813 Vincennes was the capital of Indiana Territory (commemorated by a state memorial). The Indiana Gazette, the first territorial newspaper, was published there in 1804 by Elihu Stout. At Vincennes, also, Gov. (later Pres.) William Henry Harrison negotiated several treaties with the Indians and launched the campaign that culminated in the Battle of Tippecanoe (November 1811). The George Rogers Clark National Historical Park (1966), Grouseland (1803-04; the Harrison mansion), and Vincennes University, a junior college founded in 1806, are among the 42 historic sites in the city. Indiana University-Southwest Campus opened there in 1971.

The city is a commercial centre for an agricultural and coal-mining region and has some light industries including auto seat assembling and the manufacture of batteries, paper products, and glass. Inc. 1856. Pop. (1980) 20,857.

Vincennes ware, pottery made at Vincennes, near Paris, from c. 1738, when the factory was probably founded by Robert and Gilles Dubois, until 1756 (three years after it had become the royal manufactory), when the concern moved to Sèvres, near Versailles. After 1756 pottery continued to be made at Vincennes, under Pierre-Antoine Hannong; both tin-glazed earthenware (officially) and soft-paste porcelain (clandestinely, in defiance of a Sèvres monopoly) were made until royal intervention forced Hannong's dismissal in 1770. The factory continued until c. 1788. Histories of the royal porcelain manufactory of France usually discuss products before 1756 under the name Vincennes and those after 1756 under the name Sèvres, though when

it comes to questions of patronage and style, pottery authorities refer freely to the Vincennes-Sèvres administration.

Some of the innovations for which Sèvres became famous actually began during the Vincennes period. Soft paste (a porcellaneous material but not true porcelain) was made from 1745 by François Gravant and a company formed with a monopoly of the production of "porcelain in the style of the Saxon." Typical of Vincennes were biscuit figures (white mat, unglazed figures in soft paste) introduced c. 1751–53 by J.-J. Bachelier, and flowers (c. 1748), also modelled in soft paste, on wire stems or applied to vases.

Vincent DE PAUL, SAINT (b. April 24, 1581, Pouy, now Saint-Vincent-de-Paul, Fr.—d. Sept. 27, 1660, Paris; canonized 1737; feast day September 27), French saint, founder of the Congregation of the Mission (Lazarists, or Vincentians) for preaching missions to the peasantry and for educating and training a pastoral clergy.

Educated by the Franciscans at Dax, Fr., he was ordained in 1600 and graduated from the University of Toulouse in 1604. He was allegedly captured at sea by Barbary pirates but escaped. He spent a year in Rome, then went to Paris, where he remained permanently. He placed himself under the spiritual guidance of the celebrated Cardinal Pierre de Bérulle, who entrusted him with the parish of Clichy, Fr.

After founding the Congregation of the Mission in 1625, Vincent de Paul established in and around Paris the Confraternities of Charity—associations of laywomen who visited, fed, and nursed the sick poor. The wealth of these women, many of noble family, aided him in establishing the foundling and other hospitals. With St. Louise de Marillac he cofounded the Daughters of Charity (Sisters of Charity of St. Vincent de Paul), an association patterned after the Confraternities of Charity.

Vincent Ferrer, Saint (b. c. 1350, Valencia, Aragon—d. April 5, 1419, Vannes, Fr.; canonized 1455; feast day April 5), Aragonese friar and renowned preacher who helped to end the Great Western Schism.

In 1367 he entered the Dominican Order at Valencia, where he became professor of theology. In 1394 the antipope Benedict XIII made him his confessor and theologian to his court at Avignon, but five years later Vincent resigned to undertake missions. Travelling through Burgundy, southern France, Switzerland, northern Italy, and Spain, he attracted crowds everywhere and had notable success in winning Jewish converts.

In an effort to end the schism, he had tried twice to persuade Benedict to relinquish his papal claim. In 1412 he was one of nine judges who elected Ferdinand I king of Aragon, and he persuaded Ferdinand to cease supporting Benedict, thus helping to end the schism. The last two years of his life were devoted to preaching in northern France.

Vincent OF BEAUVAIS (b. c. 1190, Beauvais?, Fr.—d. 1264, Paris), French scholar and encyclopaedist whose *Speculum majus* ("Great Mirror") was probably the greatest European encyclopaedia up to the 18th century.

After he had entered the Dominican order in Paris (c. 1220) and become a priest and theologian, Vincent conceived the idea of creating a systematized compilation of universal knowledge and spent the years up to 1244 on that project. About 1250 he was appointed lector and chaplain to the French royal court of Louis IX, where he wrote an influential pedagogical treatise, *De eruditione filiorum nobilium* (1260–61; "On the Education of Noble Sons").

The original Speculum majus consisted of three parts, historical, natural, and doctrinal. A fourth part, the Speculum morale ("Mirror of Morals"), was added in the 14th century by an unknown author. An immense undertaking, the work covered all of Western human history from the Creation to the time of Louis IX, summarized all natural history and science known to the West, and provided a thorough compendium on European literature, law, politics, and economics. Perhaps the most notable aspect of Vincent's encyclopaedia is his familiarity with Greco-Roman classical scholarship and his obvious respect for the classics, particularly the Greek philosopher Aristotle, the Roman statesmanphilosopher Cicero, and the Greek physician Hippocrates. This was an indication of the disappearing hostility to antiquity after the 12thcentury renaissance of learning.

The final synthesis of the three sections included 80 books, an enormous project for a single scholar. Vincent denied his own originality (although his own chronicle of 1223 50 on the reigns of Louis VIII and Louis IX was used by many later chroniclers); he gave full credit to the ancient and medieval writers from whom he had drawn his excerpts. His completed project remains one of vast erudition and serves as an excellent gauge of the state of knowledge in the 13th century. It was extremely influential in its own day, particularly on the English poet Geoffrey Chaucer. It was translated into French in 1328 and printed in Paris in 1495-96, and it was well known to humanist scholars of the Italian Renaissance.

Vincent OF LÉRINS, SAINT, pseudonym PEREGRINUS (b. possibly Toul, Belgica [now in France]—d. c. 450; feast day May 24), Gallo-Roman saint, the chief theologian of the Abbey of Lérins, known especially for his heresiography Commonitoria ("Memoranda").

Supposedly the brother of Lupus of Troyes, Vincent may possibly have been a soldier before joining, before about 425, the Abbey of Lérins, on the Mediterranean island of Lérins, near Cannes, Fr. Vincent was later ordained priest and spent his monastic life at Lérins, where he acquired a preeminent reputation in scriptural learning and dogma.

About four years after the Council of Ephesus (431), Vincent, under the pseudonym of Peregrinus "Pilgrim"), wrote Commonitoria, which attempted to reply to current heresies. It is unclear whether the work once consisted of two books, the second of which was lost and replaced by a résumé made by Vincent, or whether it is complete in its present form.

For the Semi-Pelagians of whom Vincent was a leading spokesman, St. Augustine of Hippo was a dangerous innovator teaching contrary to tradition. The *Commonitoria* is now generally admitted to be an indirect attack on Augustine, who is not named but to whom the work alludes. In the *Commonitoria* Vincent tries to provide a valid criterion for orthodoxy and, in doing so, enunciates the classic formula for traditional doctrine: "What is believed everywhere, at all times, and by all." Most of Vincent's other works are lost.

Vincent's surviving works are in J.-P. Migne's *Patrologia Latina*, vol. 50. Critical editions of the *Commonitoria* include those of R.S. Moxon (1915) and A. Jülicher (1925). R. Morris' English translation, *Vincent of Lérins*, the *Commonitories*, is in *The Fathers of the Church*, vol. 7 (1949).

Vincentian, also called LAZARIST, member of CONGREGATION OF THE MISSION (C.M.), a Roman Catholic society of priests and brothers founded at Paris in 1625 by St. Vincent de Paul for the purpose of preaching missions to the poor country people and training young men in seminaries for the priesthood. Following the congregation's approval by Pope Urban VIII in 1632, Vincent took possession of the former priory of Saint-Lazare at Paris, whence the name Lazarists. From this headquarters, 550 missions to the rural poor were organized before Vincent's death in 1660. The Vincentians also became involved in the work of clerical training very early. They started giving retreats at Saint-Lazare in 1631 for men about to be ordained, and soon five or six retreats were given each year. The Vincentians opened a permanent house in Rome in 1642, and shortly thereafter the pope directed that all those to be ordained in Rome were obliged to make a retreat with the Vincentians. The French Revolution inflicted great suffering on the Vincentians, but growth began again in the early 19th century. The Vincentians arrived in the United States in 1816, making their first foundation in St. Louis, Mo. To its original work, the congregation has added extensive foreign missions, educational work, and chaplaincies to hospitals, prisons, and the armed forces.

Vincent's gingivitis, also called VINCENT's INFECTION, VINCENT'S ANGINA, OF TRENCH MOUTH, acute and painful infection of the tooth margins and gums that is caused by the symbiotic microorganisms Bacillus fusiformis and Borrellia vincentii. The chief symptoms are painful, swollen, bleeding gums; small, painful ulcers covering the gums and tooth margins; and fetid breath. The ulcers may spread to the throat and tonsils. Fever and malaise may also be present. Vincent's gingivitis can occur after a prolonged failure to brush one's teeth, though there are many other predisposing factors, such as vitamin deficiencies, emotional stress, and so on. The infection is readily treated by bed rest, the administration of penicillin or other antibiotics, and the use of antiseptic mouth rinses. Regular tooth brushing is the chief preventive measure.

Vinci, Leonardo (b. 1690, Strongoli, Kingdom of Naples [Italy]—d. May 27, 1730, Naples), Italian composer who was prominent among the Neapolitan school of opera composers that included G.B. Pergolesi and Leonardo Leo.

Vinci's first known work was a comic opera in the Neapolitan dialect, *Lo cecato fauzo* (1719; "The False Blind Man"). He served as chapelmaster to the prince of Sansevero and in 1725 received a conductorship of the royal chapel at Naples, a post he held until his death. His earliest extant serious opera, *Silla dittatore* (1723; "Silla the Dictator"), inaugurated a series of about 40 operas, of which 25 were written for Naples and 11 for Rome. Arias from his operas were published in London in 1758 under the title *Collection of Songs*. In addition to his operas, Vinci also composed oratorios, masses, and motets.

Vindex, Gaius Julius (d. May AD 68, Vesontio, Germania Superior [now Besançon, Fr.]), governor of the Roman province of Lugdunensis (east-central and northern Gaul) who led a revolt in Gaul against the emperor Nero. His rebellion, begun in March 68, was

followed by other revolts in Spain, Africa, and Egypt and set in motion a series of events that led to Nero's suicide the following June.

Born to a royal family among one of the Gallic peoples of Aquitania, Vindex was a Roman citizen, senator, and possibly praetor before becoming governor. Coins minted during his rule confirm his allegiance to the traditional ideals of the Roman ruling class.

According to the historian Dio Cassius, Vindex inveighed against Nero and swore to act in the interest of the Roman Senate and people and to foster a return to the Augustan model of empire. Some modern scholars, however, have regarded Vindex' rebellion as a move toward Gallic independence. In any event, discontent was rife in the empire and he won the support of Galba, a governor in Spain. Vindex committed suicide after vainly trying to resist the Roman armies of the Rhine under the command of Verginius Rufus.

Vindhya Range, broken range of hills forming the southern escarpment of the central upland of India. From Gujarāt state on the west, it extends about 675 miles (1,086 km) across Madhya Pradesh state to abut on the Ganges River valley near Vārānasi (Benares). The mountains form the southern edge of the Mālwa Plateau and then divide into two branches: the Kaimur Range, running north of the Son River into western Bihār state, and the southern branch, running between the upper reaches of the Son and Narmada rivers to join the Sātpura Range in the Amarkantak Plateau.

The Vindhya Range, at an elevation of 1,500–3,500 feet (450–1,100 m), gives rise to the main southern tributaries of the Ganges-Yamuna system, including the Chambal, Betwa, Ken, and Tons rivers. Because of their horizontal sandstone structure, the mountains tend to be flat-topped and plateaulike. The Vindius of the 2nd-century-AD Greek geographer Ptolemy, the range is regarded as marking the border between northern and peninsular India

Vineberg, Arthur Martin (b. May 24, 1903, Montreal—d. March 26, 1988, Montreal), Canadian heart surgeon, noted chiefly for his development, in 1950, of a surgical procedure for correction of impaired coronary circulation.

The "Vineberg procedure" involved implanting the left internal mammary artery into the heart wall. Later he combined this procedure with transferring fatty tissue from around the intestines to around the heart. The transferred

tissue then developed new vascular connections with the heart muscle.

Vineberg received his M.S. degree (1928) and his Ph.D. (1933) in physiology from McGill University, Montreal. He studied in Paris and New York City before joining the staff of the Royal Victoria Hospital, Montreal, where in 1957 he was named head of the department of cardiac surgery. He wrote How to Live with Your Heart: The Family Guide to Heart Health (1975) and, with Lorene Freeman, Myocardial Revascularization by Arterial/Ventricular Implants (1982).

vinegar, sour liquid that is made by the fermentation of any of numerous dilute alcoholic liquids into a liquid containing acetic acid. Vinegar may be produced from a variety of materials: apples or grapes (wine or cider vinegar); malted barley or oats (malt vinegar); and industrial alcohol (distilled white vinegar). There are also vinegars made from beer, sugars, rice, and other substances. As a commercial product, however, vinegar was probably first made from wine (French vin, "wine"; aigre, "sour").

Vinegar can be made from any liquid that is capable of being converted into alcohol in a two-step process. The fruit juice or other liquid contains sugar, which is converted into alcohol and carbon dioxide gas by the actions of yeast enzymes. The alcohol thus formed combines with atmospheric oxygen by the action of Acetobacter bacteria, forming acetic acid and water. Organic acids and esters derived from the fruit or other source material are also present and are responsible for the flavour and aroma variations of vinegar. Table vinegar contains approximately 4 percent acetic acid.

In 1864 the French physicist Louis Pasteur showed that it is *Acetobacter* bacteria that cause the conversion of alcohol to acetic acid. These bacteria work together symbiotically, producing enough acetic acid to prevent invasion by other organisms.

Despite its ancient origin, the technology of vinegar production advanced slowly, improvements consisting principally of better methods of aeration. The Orleans process, best-known of the old methods, used a barrel of about 50 gallons (200 l) capacity. A mash consisting of wine or other alcoholic liquid was poured into the barrel, and a small amount of vinegar containing a mass of vinegar bacteria, called mother of vinegar, was added to start the reaction. One or two small air holes drilled above the liquid level exposed the surface to aeration. The finished vinegar was drawn off through a wooden spigot near the bottom. Care was taken in refilling the barrel with the new charge of raw ingredients to avoid breaking up the surface film of bacteria.

Early in the 18th century, a Dutch technologist, Hermann Boerhaave, found that the rate of acid production in the vinegar process was directly proportional to the amount of surface exposed to air. Thus, subsequent methods attempted to introduce more air into the casks. In the 20th century, continuous aeration—air bubbles pumped through the mash—was developed.

Vinegar's principal uses are the flavouring of foods and the preservation, or pickling, of meat products, fish, fruit, and vegetables. For use as a condiment, vinegar is often flavoured with garlic, onions, tarragon, or other herbs and spices. Mixed with oil and seasonings it becomes a classic cold sauce—vinaigrette—used as a dressing on vegetable salads and served as a sauce with cold cooked vegetables, meats, and fish. Vinegar is also a common ingredient in marinades and is widely used in the pickling of cucumbers and other vegetables.

vinegar fly, also called POMACE FLY, insect of the genus *Drosophila* of the family Drosophilidae (order Diptera). *Drosophila* species number about 1,000. Some species, particularly *D. melanogaster*, are used extensively in laboratory and field experiments on genetics and evolution because they are easy to raise and

have a short life cycle (less than two weeks at room temperature). More data have been collected concerning the genetics of the vinegar fly than have been obtained for any other animal. *Drosophila* chromosomes, especially the giant ones in the salivary glands of mature larvae, are used in studies involving heritable characteristics and the basis for gene action.

The biology of *Drosophila* in its natural habitats is not well known. The larvae of some species live in rotting or damaged fruits, the adults being strongly attracted to, and feeding on, fermenting plant juices. Other larvae develop in fungi or in fleshy flowers.

Vineland, city, Cumberland county, southern New Jersey, U.S. It lies along the Maurice River (there dammed for flood control and drainage). The community was established in 1861 when Charles K. Landis purchased a 20,000-acre (8,097-hectare) tract of land and brought in settlers from New England and Italy. It was incorporated in 1880 as a borough and became a city in 1952 after its consolidation with Landis Township.

Vineland is a market centre for a truck-farming and poultry region and has diversified manufactures, notably glass and clothing. Institutions include a training school of the American Institute for Mental Studies, the Vineland State School (1888), the American Institute for Mental Studies (1888), the New Jersey Memorial Home for Disabled Veterans, their Wives and Widows (1900), and Cumberland County College (1963). Viner, Jacob (b. May 3, 1892, Montreal—d. Sept. 12, 1970, Princeton, N.J., U.S.), Canadian-born American economist who made major contributions to the theory of cost and production, international economics, and the history of economics.

Viner graduated from McGill University (1914) and then immigrated to the United States, obtaining his Ph.D. from Harvard University in 1922. He was a professor at the University of Chicago (1925–46)—with which his name is particularly associated—and Princeton University (1946–60), where he was emeritus after 1960. Early in his career he became associated with the economist Frank Taussig, who greatly influenced Viner's theories on international trade.

These theories are embodied in three works in particular: Canada's Balance of International Indebtedness (1924), a study of balance of payments adjustment; Studies in the Theory of International Trade (1937), a major work in the history of economic thought; and The Customs Union Issue (1950), containing the now-familiar trade-creation/trade-diversion distinction. These works are regarded as classics in

their field. Viner's work on international trade covered the entire field from pure theory to policy. He was one of the greatest writers in economic history, combining erudition and critical acuteness to an extraordinary degree. But he was a highly competent theorist over a much wider field than international economics, and in *The Long View and the Short* (1931) he made what many regard as a fundamental contribution to the theory of costs by clarifying the relationship between long- and short-run costs. This work presented his now-famous envelope cost curve.

Vinet, Alexandre-Rodolphe (b. June 17, 1797, Ouchy, Switz.—d. May 4, 1847, Clarens), French-Swiss theologian, moralist, and literary critic who was instrumental in establishing the Reformation in French-speaking Switzerland.

After studying theology at the University of Lausanne, he taught French at the University of Basel (1817–37) before returning to Lausanne as professor of practical theology (1837–45) and French literature (1845–46) at the Académie.

Ordained in 1819, he advocated freedom of religious practice (Mémoire en faveur de la liberté des cultes, 1826; "A Report Favouring the Freedom of Sects") and defended the separation of church and state (Essai sur la manifestation des convictions religieuses et sur la séparation de l'Église et de l'État, 1842; "Essay on the Manifestation of Religious Convictions and on the Separation of Church and State"). He held that conscience, not theological dogma, is man's true moral guide. In 1845-47, because of civil interference with the

Swiss national church's autonomy, he led a secession that took the name of Free Church. His emphasis on personal religious observance and his pragmatic approach to church dogma proved influential in France and England as well as in Switzerland.

Vinet was also a noteworthy critic, as is evident in his *Études sur Blaise Pascal* (1848; *Studies of Blaise Pascal*). Most of his purely literary work, such as *Études sur la littérature française au dix-neuvième siècle*, 3 vol. (1849–51; "Studies of French Literature in the Nineteenth Century"), was published posthumously.

Vingt, Les, also called société des vingt, English the twenty, or the society of the twenty, group of artists who exhibited together in Belgium during the years 1891–93, having been brought together by a common interest in Symbolist painting. Like their French and German contemporaries, these painters, who were centred on Brussels, had shifted the emphasis in their works from the world of daily life outside the artist, which the Impressionists had caught, to the inner life, a world that celebrated mystery, allusion, and symbol.

Belgian symbolist painting employed simplified forms, heavy outlines, a subjective use

of colour, and a heightened spiritual content inspired by religious, exotic, and primitive cultures. These techniques were demonstrated in the paintings and graphics of James Ensor, Jan Toorop, and Henry van de Velde, all members of Les Vingt. The Société des Vingt members, and in particular Henry van de Velde, eventually transformed their own Symbolist styles into the designs of the Art Nouveau movement.

Vinh, city, north-central Vietnam, located on the Ca River delta, 160 miles (260 km) south of Hanoi. The Ca River enters the Gulf of Tonkin just northeast of Vinh. An important trade centre for the surrounding region, the city is the focus of a densely populated agricultural area. It is also the site of an electric power plant and has chemical and textile industries. Manganese and phosphates are mined nearby. Pop. (1979) 154,040.

Vinh Long, town, Mekong delta region, southern Vietnam. It is a river port on the right bank of the Tien River; it has a hospital and commercial airport. It also has served as the focal point of the Roman Catholic Church in the Mekong delta; a large Catholic cathedral is located in the town. Vinh Long's cultural attractions include a late 18th-century governor's palace and a Cantonese pagoda. Pop. (1971 est.) 35,304.

Vinita, city, seat (1907) of Craig County, northeastern Oklahoma, U.S. It lies northeast of Tulsa along the old Osage Trace (later Texas Road), a route used by fur trappers and pioneers in the 1880s. Founded in 1871 when the railroads arrived, it was named for Vinnie Ream, who sculpted the statue of Lincoln in the Capitol in Washington, D.C. Vinita is an agricultural community where livestock raising and shipping and meat-packing are important. There are oil wells in the vicinity. The city is the seat of the Eastern State Hospital (for the mentally ill). The humorist Will Rogers went to school in Vinita, and the Will Rogers Memorial Rodeo is held each August. Grand Lake (Lake O' the Cherokees), impounded by Grand River Dam to the east, furnishes electric power and recreation. Inc. 1898. Pop. (1984 est.) 6,724.

Vinje, Aasmund Olafson (b. April 6, 1818, Vinje, Nor.—d. July 30, 1870, Gran), poet and journalist who wrote some of the finest lyric poems in Norwegian literature.

The son of a poor tenant farmer, Vinje took a law degree but then struggled to support himself by teaching, writing, and doing clerical work for the government. In 1851 he began writing for an Oslo newspaper, and in 1858 he started a newspaper of his own, Dølen ("The Dalesman"), in which he used the newly standardized rural variant of the Norwegian language known as New Norwegian, or Nynorsk. In his own newspaper Vinje wrote about everything from philosophy and literature to politics. It was not until he was 40 that Vinje started writing poetry, mostly lyrics about mountain scenes and other aspects of nature. His best-known work is his Ferdaminni fraa sumaren 1860 ("Travel Memoirs from the Summer of 1860"); this book combines essays and poems in a witty and amusing account of Vinje's journey on foot from Oslo to Trondheim to report on the coronation of the new Swedish-Norwegian king. His other more widely known works are the poetic cycle Storegut (1866) and his account of his tour of England in A Norseman's View of Britain and the British (1863). Vinje's lyric poems are notable for their simplicity and directness and their deep appreciation of nature. His prose writings are marked by their abundant common sense and an amusing, and sometimes caustic, wit.

Vinland, the wooded land in North America that was visited and named by Leif Eriksson in about the year AD 1000. Its exact location is not known, but it was probably somewhere along the Atlantic coastline of what is now eastern or northeastern Canada.

The most detailed information about the Vikings' visits to Vinland is contained in two Norse sagas, the Saga of the Greenlanders and the Saga of Erik the Red. These two works' accounts differ somewhat. According to the Greenlanders' Saga, Bjarni Herjulfsson became the original European discoverer of mainland America when his Greenland-bound ship was blown westward off course in about 986. He apparently sailed along the Atlantic coastline of eastern Canada and then returned to Greenland. He was followed in about 1000 by a crew of 35 men led by Leif Eriksson, who set out to try to find the land accidentally sighted by Bjarni. (The Saga of Erik the Red presents Leif himself as the first discoverer of Vinland.) Leif's expedition came first to an icy, barren land which they called Helluland ("Flat-Stone Land"); sailing southward, they encountered a flat, wooded land which they named Markland ("Wood Land"). Again they set sail southward, and the warmer, wooded area that they found they named Vinland. There they built some houses and explored the region before returning to Greenland. In 1003 Leif's brother Thorvald led an expedition to Vinland and spent two years there. In 1004 (or 1010, according to other historians) Thorfinn Karlsefni, encouraged by Thorvald's reports of grapes growing wild in Vinland, led a colonizing expedition of about 130 people (or 65, according to one saga) to Vinland. By the time they had stayed there three years, the colonists' trade with the local Indians had turned to mutual warfare, and so the colonists gave up and returned to Greenland. In about 1013 Erik the Red's daughter Freydis led an unsuccessful expedition to Vinland and soon afterward returned to Greenland. So ended the Norse visits to the Americas as far as the historical record is concerned.

The Norsemen's name for the land they discovered, Vinland, means "Wine Land." Thorfinn reported that he found "wine berries" growing there, and these were later interpreted to mean grapes, though the Norsemen referred to any berry as a "wine berry," and it is probable that they had actually come upon cranberries. This fruit evidently proved disappointing to Thorfinn's colonists, for when they became disgruntled during the third year of the colonizing expedition, they made a grievance out of not having seen much of the wine banquets that had been promised them.

Nevertheless, the Vinland name was retained by the Scandinavians, and it was as a wine land that the North American continent entered the literature of continental Europe, almost certainly first in 1075 through the History of the Archbishops of Hamburg-Bremen written by Adam, head of the cathedral school of Bremen (see Adam of Bremen). Adam mentioned Vinland on the authority of King Sweyn II Estrithson of Denmark, who told of Iceland, Greenland, and other lands of the northern Atlantic known to the Scandinavians. Adam says of King Sweyn: "He spoke also of yet another island of the many found in that ocean. It is called Vinland because vines producing excellent wines grow there."

In the 1960s Helge Ingstad adopted the view of the Swedish philologist Sven Söderberg that Vinland did not mean "wine land" but rather "grassland" or "grazing land." Ingstad discovered in 1963 the remains of house sites and other artifacts of a Norse settlement at L'Anse au Meadow, at the northernmost tip of Newfoundland. Dating techniques have conclusively proved that the remains date from about 1000 AD—*i.e.*, the time of the Norsemens' reputed visits. Further evidence of Viking exploration came in 1965, when the

Yale University Press published a medieval map showing the outlines of continental Europe, Iceland, Greenland, and Vinland, the latter being described in a notation on the map as "Island of Vinland, discovered by Bjarni and Leif in company." The authenticity of this map, however, has been sharply debated.

Vinnitsa, also spelled VINNICA, oblast (province), Ukrainian Soviet Socialist Republic, occupying an area of 10,250 square miles (26,500 square km) on the Volyn-Podolsk Upland and in the basins of the Yuzhny Bug and Dnestr rivers. Its gently rolling hills are greatly dissected by river valleys and widespread erosion gullies. The north consists of forest-steppe and the south of true steppe, but more than seven-tenths of the surface has been plowed. Agriculture is intensively developed, and about one-half of the population is rural. The oblast lies in the heart of the chief sugar-beet zone of the Soviet Union. Other important industrial crops are sunflowers and tobacco; grains are dominated by wheat and corn (maize); orchards are extensive. Dairying and the keeping of beef cattle, pigs, and poultry are well developed. The oblast's communities, apart from Vinnitsa, the administrative centre, are small and are engaged in processing farm produce, especially sugar refining. Pop. (1986 est.) 1,953,000.

Vinnitsa, also spelled VINNICA, city and administrative centre of Vinnitsa oblast (province), Ukrainian Soviet Socialist Republic. It lies along the Yuzhny Bug River. Founded in 1363 as a fortress by Prince Algirdas of Lithuania, it was often sacked by the Tatars and passed later to Poland and finally, in 1793, to Russia. Town status was conferred in 1795, although the settlement's growth accelerated only after the building of the Kiev-Odessa railway through the town in 1870. Modern Vinnitsa, as the centre of a major agricultural region, produces fertilizers and has food-processing industries in addition to electronics, agricultural equipment, light engineering, clothing, and footwear industries. The city has teacher-training and medical institutes, several theatres, and a philharmonic society. Pop. (1986 est.) 375,000.

Vinogradoff, Sir Paul Gavrilovitch, Russian PAVEL GAVRILOVICH VINOGRADOV (b. Nov. 30 [Nov. 18, Old Style], 1854, Kostroma, near Moscow—d. Dec. 19, 1925, Paris), Anglo-Russian legal scholar and medievalist who was perhaps the greatest authority in his time on the feudal laws and customs of England.

Educated at the University of Moscow (Ph.D., 1884), he was appointed professor there and became active in Russian educational reform. When university authorities curtailed the students' freedom of expression, he resigned his professorship (1902) and left Russia for England, where in 1903 he became professor of jurisprudence at Oxford. He was knighted in 1917, one year before he became a British subject.

Vinogradoff's most important work is Villeinage in England (1892; originally published in Russian, 1887), in which he advanced the theory that the Anglo-Norman manor developed not from a society based on serfdom but from a free village community. His most ambitious work, Outlines of Historical Jurisprudence (1920–22), was incomplete at his death.

Vinogradov, Ivan Matveyevich (b. Sept. 14 [Sept. 2, Old Style], 1891, Milolyub, Russia—d. March 20, 1983, Moscow), Soviet mathematician known chiefly for his contributions

to the analytical theory of numbers, including a partial solution of the Goldbach conjecture concerning the possibility of expressing integers as the sums of a few primes.

Vinogradov was graduated from the University of St. Petersburg in 1914. He taught at the University of Perm from 1918 to 1920 and was then appointed professor of mathematics at the Leningrad Polytechnic Institute. From 1925 he also served as head of the department of numbers theory at the Leningrad State University. He became director of the V.A. Steklov Institute of Mathematics of the Academy of Sciences of the U.S.S.R. in 1932 and, in 1934, professor of mathematics at the Moscow State University.

Among his published works are The Method of Trigonometrical Sums in the Theory of Numbers (1954; originally published in Russian, 2nd Russian ed., 1980) and An Introduction to the Theory of Numbers (1955; originally published in Russian, 7th Russian ed., 1965). His collected works were published in Russian in 1953. Vinogradov also edited a work on Carl Friedrich Gauss and a mathematics encyclopaedia.

Vinson, Fred(erick) M(oore) (b. Jan. 22, 1890, Louisa, Ky., U.S.—d. Sept. 8, 1953, Washington, D.C.), American lawyer and 13th chief justice of the United States, who was a vigorous supporter of a broad interpretation of federal governmental powers.

Following completion of his legal studies at Centre College in Danville, Ky., in 1911, Vinson entered private practice of the law in Louisa and quickly assumed an active role

in local political affairs. In 1923 he was appointed to fill a vacancy in the U.S. House of Representatives. The following year he was elected to the seat as a Democrat and, except for one two-year period, served as a member of Congress until 1938.

As a congressman Vinson was recognized as an outstanding expert in tax and fiscal policy. From 1938 to 1943 he served as associate justice of the U.S. Court of Appeals for the District of Columbia. Between 1943 and 1945 he held a succession of high executive posts in emergency agencies of World War II and in 1945 he became secretary of the treasury in the cabinet of Pres. Harry S. Truman. In this office he helped establish he International Bank for Reconstruction and Development and the International Monetary fund.

Upon appointment by President Truman, Vinson became chief justice of the U.S. Supreme Court on June 24, 1946. It is generally believed that his tact reduced personal animosities that had arisen on the court. As a judge his interpretation of the powers of the federal government often led him to reject claims of individual right asserted in opposition to the exercise of governmental authority. Perhaps his best known opinions, however, are those upholding the rights of members of

racial minorities under the equal protection clause of the Fourteenth Amendment to the Constitution. He spoke for the court in refusing to permit a state court to enforce a private agreement ("restrictive covenant") to sell real property to white persons only (Shelley v. Kraemer, 1948). His opinion for the court in 1947 upheld the power of the federal courts to enjoin a strike in coal mines then under control of the federal government. He strongly dissented from the court's opinion holding unconstitutional the President's seizure of the strike-threatened steel industry during the Korean War (Youngstown Sheet & Tube Co. v. Sawyer, 1952).

Vinson Massif, peak in the Ellsworth Mountains of western Antarctica, between the Sentinel and Heritage ranges, overlooking Ronne Ice Shelf. Discovered in 1935 by the American explorer Lincoln Ellsworth, it is, at 16,864 ft (5,140 m) above sea level, the highest mountain on the continent. The massif slopes gently to the northwest. A number of species of fossil mollusks, including trilobites and brachiopods, has been discovered in the massif, indicating that during the Cambrian Period a mild climate prevailed there.

Vint, also called RUSSIAN WHIST, card game resembling both Whist and Bridge. It is sometimes called Russian Whist because of its popularity in that country toward the end of the 19th century, when Bridge was becoming popular in the Western world. Vint is similar to Bridge in the auction to determine the bid and the trump, and to Whist in the play of the cards. Like both games, it is a four-handed game with partnerships of two.

In bidding, the suits rank, from low to high, spades, clubs, diamonds, hearts, and no-trump. Contract is established after eight consecutive passes. Regardless of the trump situation, each contracted odd trick (those beyond the book of six tricks) scores (below the line) 10 times the value of the contract (10 if the bid was one trick, 20 if it was two, etc.). The first side to make 500 below the line wins. Above-line bonuses are 1,000 for winning a game, 2,000 for winning the rubber (two games); for taking 13 tricks, the bonus is 2,000 + 5,000 if six was bid, 10,000 if seven was bid. A player who defeats a contract gets 100 times the trick value per undertrick.

vinyl acetate, colourless, liquid organic compound, the polymer of which is polyvinyl acetate (a, v).

vinyl chloride, also called CHLOROETHYLENE, a colourless, flammable, toxic gas belonging to the family of organic halogen compounds, used principally in making polyvinyl chloride (q.v.), an important synthetic resin.

Vinyl chloride was first prepared in 1835 by the reaction of ethylene chloride with caustic potash; its slow transformation into a flaky solid when exposed to sunlight also was noted but not recognized as polymerization until many years later. An industrial process for making vinyl chloride from acetylene and hydrogen chloride in the presence of mercury-(II) chloride was discovered early in the 20th century, but commercial production was not begun until World War II, when substitutes for natural rubber were required. The process based on acetylene has remained important in Europe, but in the United States vinyl chloride is commonly manufactured from ethylene chloride, either by heating it to temperatures of 480°-510° C (900°-950° F) or by treating it with a dilute solution of caustic soda. Its chemical properties are similar to those of olefins, but, apart from its conversion to polymers, its only important reaction is that with hypochlorous acid, forming chloroacetaldehyde, used in making pharmaceuticals such as sulfathiazole. Prolonged exposure of humans and laboratory animals to vinyl chloride vapour has been linked to several forms of cancer.

vinyl compound, any of various organic chemical compounds, including acrylic compounds and styrene and its derivatives, useful in making plastic film; sheeting; upholstery; floor tile; inflatable and solid toys; buttons; molded and extruded articles; fibres for weaving into fabric; insulation for wire; screening; tubing, especially for chemicals; substitutes and replacements for rubber; and components of water-base paints and textile finishes.

Vinyl compounds contain the hydrocarbon vinyl group (CH₂=CH-). The molecules of a single vinyl compound can be made to polymerize; that is, to join end to end, forming a polyvinyl compound such as polyvinyl chloride. The molecules of two different compounds can also be made to link up, forming a copolymer, such as the plastic Vinylite and the textile fibre vinyon. See also polyvinyl acetate; polyvinyl alcohol; polyvinyl chloride; vinyl chloride; vinylidene chloride.

vinyl fluoride, also called FLUOROETHYLENE, a colourless, flammable, nontoxic, chemically stable gas belonging to the family of organic halogen compounds and used as the starting material in making polyvinyl fluoride (q, v), a plastic used in films for coating structural materials. Vinyl fluoride, first prepared in 1901, is manufactured by the reaction between acetylene and hydrogen fluoride.

vinylidene chloride, also called 1,1-DI-CHLOROETHYLENE, a colourless, dense, toxic, volatile, flammable liquid belonging to the family of organic halogen compounds, used principally in combination with vinyl chloride, acrylonitrile, or methyl methacrylate for the manufacture of a class of plastics called saran. Vinylidene chloride is also used as a starting material for making methylchloroform, or 1,1,1-trichloroethane, a solvent useful in cleaning electrical machinery.

Vinylidene chloride is produced by the reaction of 1,1,2-trichloroethane (itself derived from acetylene or ethylene) with lime or with caustic soda; it usually is prepared only as it is needed because it is rapidly attacked by oxygen to form peroxides that catalyze the formation of undesired polymers.

viol, also called VIOLA DA GAMBA, bowed, stringed musical instrument used principally in chamber music of the 16th to the 18th century. The viol shares with the Renaissance lute the tuning of its six strings (two fourths,

a major third, two fourths) and the gut frets on its neck. It was made in three sizes: treble, tenor, and bass, with the bottom string tuned, respectively, to d, G (or A), and D. To these sizes was later added the violone, a double bass viol often tuned an octave below the bass.

Viols are characterized by sloping shoulders; deep ribs; thin, flat backs; and, above all, vertical playing position, with the bottom of the instrument resting on the knee or held between the legs—hence viola da gamba (Italian: "leg viol"). The breadth of the bridge, which was arched to give the bow separate access to each string, made forceful playing impossible, and the supine position of the bow hand, palm uppermost, encouraged a smooth playing style. The frets gave to each note the clarity of an open string—a clear, ringing, penetrating tone for which the viols were much prized.

By the second half of the 16th century, the viol acquired a significant repertory of music for ensemble, for solo bass, and for the lyra viol, a small bass viol (also called viola bastarda). A quasi-polyphonic style of viol playing had also developed, in which two- to six-part chords were stopped with the player's left hand. As the style of instrumental composition changed during the 17th century, an expressive, vocal sound in the soprano register was emphasized, and the tenor and treble viols declined in favour of the violin, with which they were unable to compete because their deep bodies created a hollow, nasal timbre.

The bass viol, however, had by the mid-16th century developed a repertory of complex solo divisions, or ornate variations on a melody, often played on a small bass called a division viol. When that fashion died out in the late 1600s, the normal-sized solo bass viol, or viola da gamba (the name became synonymous with the bass viol as the other viols fell into disuse), was used in the instrumental forms of the Baroque period. Solo bass-viol playing continued in Germany and France into the 18th century, and—in France especially—the instrument even acquired a low seventh string, tuned to A'. Elsewhere the bass viol survived chiefly because its sustained tone lent a pleasing support to the harpsichord. This combination, using the basso continuo, or thorough bass technique, provided harmonic support for the Baroque instrumental ensemble. When composers in the newer classical style began to write complete harmonies in the upper instrumental parts, the viol, deprived of its last useful function, dropped out of use altogether. In the 20th century, viols were successfully revived for the performance of Renaissance and Baroque music.

viola, stringed musical instrument, the tenor of the violin family. It is built in proportions similar to the violin but has a body length of 14½ to 17 inches (37 to 43 centimetres), about two inches longer than a violin. Its four strings are tuned c-g-d'-a', beginning with

the C below middle C. The modern symphony orchestra contains from 6 to 10 violas.

In the 18th-century orchestra the viola usually doubled cello parts. Gluck, Mozart, and Haydn gave it distinctive treatment, and it gradually assumed an independent orchestral role. Berlioz included a long viola solo in his Harold in Italy; in Richard Strauss's Don Quixote the viola carries the theme of Sancho. The viola also gained in prominence through the viola sonatas of Paul Hindemith (himself a violist), Béla Bartók's viola concerto, and violists such as William Primrose and Walter Trampler. It was frequently used in 20th-century chamber-music ensembles; e.g., by Arnold Schoenberg and Pierre Boulez.

The viola d'amore is a viol-violin hybrid played like a violin. It is of 18th-century origin, has six or seven melody strings and several sympathetic strings, and is unfretted. A 17th-century violin with five wire strings was also called viola d'amore. The viola da braccio, or viola da brazzo (Italian: "arm viol"), was the original name for violin-family instruments, in contrast to the viola da gamba ("leg viol"), or viol, family.

Violales, the violet order of flowering plants, belonging to the class called dicotyledon (q.v.; characterized by two seed leaves). The Violales include about 117 genera, and some 1,975 species in nine families. The order consists chiefly of shrubs and trees, but it also contains herbaceous (nonwoody) plants, including the large family of violets.

A brief treatment of Violales follows. For full treatment, see MACROPAEDIA: Angiosperms. Except for the violet family (Violaceae) and the rockrose family (Cistaceae), the order Violales is confined to tropical regions. Its members are typically small trees and shrubs that grow as low vegetation beneath the taller trees of forests. They rarely, if ever, form the dominant plant life of an area. Plants of the Violales order are limited in their economic

importance, but some provide sources of ornamentation, food, and dye.

The family with the longest history of use by humans is the Violaceae, members of which are found on all continents. Violets, both wild and cultivated varieties, are favourite ornamental garden plants. Members of the genus *Viola* include pansies, bird's foot violets, sweet white violets, and numerous other familiar species with variously coloured blossoms. The flowers of wild species are small, but horticulturalists have developed large-flowered hybrids. Wild violets sometimes serve as food, as an ingredient of wine and candy, and as the base of French perfume.

The Cistaceae family, which is distributed worldwide, also contains many small ornamental plants. At least 20 species of the rockrose genus, *Cistus*, have been introduced into North America from their native Mediterranean region and are widely used in rock gardens. The sunrose (*Helianthemum*) also belongs to this family.

A few of the many species in the large Flacourtiaceae family produce small fruits used in the tropics for jams and preserves. Another member of this family, the Ceylon gooseberry (Dovyalis hebecarpa), is cultivated in south Florida and California for its edible fruit. The sole species in the Bixaceae family, Bixa orellana, is widely planted in the tropics, and the pulp around its seeds is processed to make a red dye.

Most members of the Violales order are woody perennial plants. Flowers generally consist of five sepals and five petals, with either radial or bilateral symmetry; most have the male and female reproductive structures in the same flower. All but one genus in the order are characterized by parietal placentation—that is, the seeds are attached to the inner wall

of the fruit. The fruit is usually a dry capsule with a number of openings for release of the seeds. Leaves are simple, grow alternately and spirally on the plant stems, and have paired stipules (leaflike appendages) at the bases of the leaf stalks. The Violales are closely related to the Theales order of flowering plants.

violet, common name for plants of the genus *Viola*, of the family Violaceae, comprising about 500 species of herbs or low shrubs. The distribution is worldwide. Among the most popular garden varieties is the pansy (q, v),

Downy violet (Viola sproria)

a hybrid that has been grown in gardens for centuries. (The so-called African violet (q, v,) belongs not to the order Violales but to Scrophulariales, the figwort order.)

In some regions violets are eaten raw or cooked. They have also been used in the manufacture of sweet syrups, candy, wine, and perfumes. In former times medicines were made from violets.

Wild violets may be annuals or perennials. Because violets freely hybridize, however, it is often difficult to identify their species. The flower grows singly on a stalk. The leaves may grow on the same stalk as the flower (stemmed violets) or on separate stalks (stemless violets). The flower has five petals, four arranged in unlike pairs, the fifth with a spur. The colour is usually blue, violet, lilac, reddish purple, yellow, or white.

Typically, violets grow in meadows or damp woods. All wild species bloom early in the spring, but some cultivated varieties bloom later. Many violets have two types of flowers, fertile and infertile. The infertile flower is showy and appears in the spring. The fertile, less conspicuous flower appears in the summer and is completely closed and self-fertilizing.

Among the most common North American species are the common blue, or meadow, violet (*V. papilionacea*) and the bird's-foot violet (*V. pedata*). The common blue violet grows up to 20 centimetres (8 inches) tall and has heart-shaped leaves with finely toothed margins. The flowers range in colour from light to deep violet, or they may be white. The bird's-foot violet, a perennial named for its deeply cleft leaves, has variably coloured flowers, with lilac and purple combinations.

The sweet, or florist's, violet (*V. odorata*) is fragrant and the source of perfume.

violin, bowed, stringed musical instrument that evolved during the Renaissance from earlier bowed instruments: the medieval fiddle; its 16th-century Italian offshoot, the *lira da braccio*; and the rebec. Like its predecessors but unlike its cousin the viol, the violin has a fretless fingerboard, which is made of ebony. Its strings are hitched to tuning pegs and to a tailpiece passing over a bridge held in place by the pressure of the strings. The bridge

transmits the strings' vibrations to the violin belly, or soundboard, which is made of pine and amplifies the sound. Inside the instru-

Interior of violin, showing corner and end blocks and linings; underside of table with bass bar and internal modelling, or curvature

ment, beneath the treble foot of the bridge and wedged between the violin belly and back, which is made of maple, is the sound post, a thin stick of pine that transmits the string vibrations to the instrument's back, contributing to the characteristic violin tone. The belly is supported from beneath by the bass bar, a narrow wood bar running lengthwise and tapering into the belly. It also contributes to the resonance of the instrument. The sidewalls, or ribs, are constructed of pine-lined maple.

The violin was early recognized for its singing tone, especially in Italy, its birthplace, where the earliest makers—Gasparo da Salò, Andrea Amati, and Giovanni Paolo Magginihad settled its average proportions before the end of the 16th century. During its history the violin has been subject to modifications that have progressively adapted it to its evolving musical functions. In general, the earlier violins are more deeply arched in the belly and back; the more modern, following the innovations of Antonio Stradivari (1644-1737), are shallower, yielding a more virile tone. In the 19th century, with the advent of large auditoriums and the violin virtuoso, the violin underwent its last changes in design. The bridge was heightened, the sound post and bass bar were thickened, and the body became flatter. The neck was angled back, giving greater pressure of the strings on the bridge. The result was a stronger, more brilliant tone in place of the delicate, intimate tone of the violin of the 18th century.

The earliest violins were used for popular and dance music. During the 17th century it replaced the viol as the primary stringed instrument in chamber music. The Italian composer Monteverdi included violins in the orchestra of his opera Orfeo (first performed in 1607). In France the king's orchestra, les 24 violons du roi, was organized in 1626. Arcangelo Corelli, a virtuoso violinist, was among the earliest composers to contribute to the new music for the violin, as did Vivaldi, J.S. Bach, and the violinist Giuseppe Tartini. Most major composers from the 18th century on wrote solo music for the violin, among them Mozart, Beethoven, Schumann, Brahms, Edvard Grieg, Paul Hindemith, Arnold Schoenberg, and Alban Berg. Such virtuosos as Francesco Geminiani, Niccolò Paganini, Joseph Joachim, Fritz Kreisler, David Oistrakh, Yehudi Menuhin, and Isaac Stern stimulated the composition of fine violin music. The violin was assimilated into the art music of the Middle East and South India and, as the fiddle, is played in the folk music of many countries. The tenor violin, known

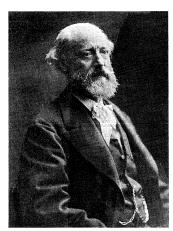

in the 16th-18th century, was midway in size between the viola and cello. It was tuned F-c-g-d'. "Tenor violin" also occasionally referred to the viola.

Violle, Jules(-Louis-Gabriel) (b. Nov. 16, 1841, Langres, Fr.—d. Sept. 12, 1923, Fixin), French physicist who at Mont Blanc in the French-Swiss Alps made the first high-altitude determination of the solar constant (1875). A graduate of the École Normale Supérieure at Paris, he taught at the University of Lyon (1883), then at the École and, from 1891, at the Conservatoire des Arts et Métiers, Paris.

Violle also determined the fusion points of palladium, platinum, and gold. His interest in high-temperature radiation led to his proposing the photometric unit, violle, or Violle's standard. He was also interested in the theory of geysers, the origin of hail, and atmospheric exploration through balloon soundings.

Viollet-le-Duc, Eugène-Emmanuel (b. Jan. 27, 1814, Paris—d. Sept. 17, 1879, Lausanne, Switz.), French Gothic Revival architect, restorer of French medieval buildings, and writer whose theories of rational architectural design linked the revivalism of the Romantic period to 20th-century Functionalism.

Viollet-le-Duc was a pupil of Achille Leclère but was inspired in his career by the architect Henri Labrouste. In 1836 he travelled to Italy, where he spent 16 months studying architecture. Back in France he was drawn irrevocably to Gothic art. J.-B. Lassus first trained Viollet-le-Duc as a medieval archaeologist on the restoration of Saint-Germain-l'Auxerrois (1838). In 1839 his friend, the writer Prosper Mérimée, placed him in charge of the restoration of the abbey church of La Madeleine at Vézelay (1840), the first edifice to be restored by a modern state commission. Mérimée, a medievalist of note, was inspector of the recently formed Commission des Monuments Historiques, an organization in which Viollet-le-Duc soon became a focal figure. In 1840 he worked with F.-L.-J. Duban on restoring the Sainte-Chapelle in Paris, and in 1845 he and Lassus were appointed to restore Notre-Dame de Paris and to build a new sacristy in the Gothic style; this commission was

regarded as an official sanction for the Gothic Revival movement in France. Another important early restoration was the work done in 1846 on the abbey church of Saint-Denis. After 1848 he was associated with the Service des Edifices Diocésains, supervising the restoration of numerous medieval buildings, the most important being the cathedral of Amiens (1849), the synodal hall at Sens (1849), the fortifications of Carcassonne (1852), and the church of Saint-Sernin at Toulouse (1862).

Viollet-le-Duc can be said to have dominated 19th-century theories of architectural restoration; his initial aim was to restore in the style

of the original, but his later restorations show that he often added entirely new elements of his own design. Twentieth-century archaeologists and restorers have severely criticized these fanciful reconstructions and added structures posing as restorations, for they often destroy or render obscure the original form of the edifice.

Of his original works, all his designs for ecclesiastical buildings were in a weak Gothic style, notably the churches of Saint-Gimer (1853-59) at Carcassonne, and Nouvelle Aude (1855) at Carcassonne, and Saint-Denis-de-l'Estrée at Saint-Denis. In his own work, however, he was not a confirmed medieval revivalist, for all but one of his secular buildings are in an uneasy Renaissance mode.

His numerous written works, all finely illustrated, provide the foundation on which Viollet-le-Duc's distinction rests. He wrote two great encyclopaedic works containing exact structural information and extensive design analysis: Dictionnaire raisonné de l'architecture française du XIe au XVIe siècle (1854-68; "Reasoned Dictionary of French Architecture from the XIth to the XVIth Century' and the Dictionnaire raisonné du mobilier française de l'époque carlovingienne à la Rénaissance (1858-75; "Reasoned Dictionary of the French Bank from the Carlovingians to the Renaissance"). Running to 16 volumes, these two works provided the vital visual and intellectual inspiration required to sustain the Gothic Revival movement. He determined, however, to think his way beyond the Romantic attractions of the Gothic style. Pursuing the inquiries of 18th-century French architectural theorists, he envisaged a rational architecture for the 19th century based on the coherent system of construction and composition that he had observed in Gothic architecture, but which would in no way imitate its forms and details. Architecture, he thought, should be a direct expression of current materials, technology, and functional needs. Ironically he was unable to accept the challenge of his own ideas, for both he and his French disciples continued to design buildings in eclectic styles.

Viollet-le-Duc's general theory of architecture, which affected the development of modern organic and functional concepts of design, was set forth in his book Entretiens sur l'architecture (1858-72). Translated into English as Discourses on Architecture (1875), this work, containing information on the construction of iron skeletons enclosed by nonbearing masonry walls, especially influenced the late 19th-century architects of the Chicago school, particularly John W. Root. Other important writings by Viollet-le-Duc include L'Art russe (1877 "Russian Art") and De la décoration appliquée aux édifices (1879 "On Decoration Applied to Buildings").

Viotti, Giovanni Battista (b. May 12, 1755, Fontanetto da Po, Piedmont—d. March 3, 1824, London), Italian violinist and composer, principal founder of the 19th-century school of violin playing.

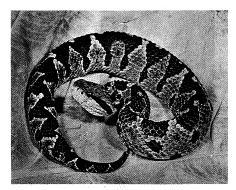

In 1768 he went to Turin, where he studied with the virtuoso Gaetano Pugnani. He travelled with Pugnani in Germany, Poland, and Russia and made his debut in Paris as a violinist in 1782. He became court musician to Marie-Antoinette and established himself as a teacher and opera impresario. In 1792 he went to London, where he conducted Italian operas and appeared as soloist in his own violin concerti at the Salomon Concerts. In 1798 he went to Germany but returned to London in 1801 to enter the wine business. He was director of the Italian opera in Paris from 1819 to 1822.

Viotti greatly developed the violin concerto, using the sonata form and a skilled orchestration. He wrote 29 violin concerti, of which

No. 22 in A Minor is especially well known; 10 piano concerti, some of them transcriptions of the violin concerti; and string quartets and other chamber works.

viper, any of about 200 species of venomous snakes of the family Viperidae. Vipers form two groups, or subfamilies, the Viperinae (Old World vipers) and the Crotalinae (pit vipers), considered separate families by some author-

ities. Vipers are characterized by a pair of long, hollow, venom-injecting fangs attached to movable bones of the upper jaw (the maxillaries) that can be folded back in the mouth when not in use. The pit vipers (copperheads, rattlesnakes, and others) are further distinguished by a heat-sensitive pit organ located midway between each nostril and eye. The pit organs help the snake accurately aim its strike at warm-blooded prey. Vipers range in length from less than 30 centimetres (12 inches) in Orsini's viper (Vipera ursini) to more than 3 metres (10 feet) in the bushmaster (Lachesis muta). They eat small animals and hunt by striking then trailing their prey

striking, then trailing, their prey.

Old World vipers are found in Europe, Asia, and Africa. They are typically slow, stocky, and broad-headed. Many are terrestrial, but tree vipers (Atheris) are slender, prehensile-tailed, and arboreal, while mole vipers (Atractaspis) are small-eyed burrowers. Most species bear live young.

Pit vipers are found from deserts to rain forests, primarily in the New World. A genus found in Central and South America is *Bothrops*. They may be terrestrial or arboreal. Some, such as the moccasins (*Agkistrodon* species), are aquatic. Some species lay eggs; others produce live young.

viperfish (Chauliodus), any of a genus of marine fishes in the family Chauliodontidae (order Salmoniformes). Representatives of the six species are found in tropical regions of the major oceans. The viperfishes are deep-sea dwellers and have luminescent organs along the sides; some forms have light organs on the tips of their fins and inside of their mouths. The lights sometimes function in the attraction of other fishes on which they feed. The name viperfish comes from the enlarged teeth that protrude from the upper and lower jaws. All of the species are small, the largest being the Pacific viperfish (C. macouni), which attains a length of 30 centimetres (1 foot).

Viphya Mountains, highlands in Mzimba District, north central Malaŵi. They comprise two main blocks, divided by a 15-mi-(24-km-) wide saddle (pass), and extend 130 mi from Mt. Champhila (5,971 ft [1,820 m]) in the south to Mt. Uzumara (6,375 ft) in the north-northeast. They overlook the Mzimba plain (west) and form a sheer wall of the Lake Nyasa rift valley (east). The altitude of 5,000–6,000 ft is interrupted by the saddle (4,000 ft), parallel rift faults to the west and

rugged dissected terrain to the east. The undulating plateau surface is covered with grassland, patches of primary forest, and residual hills. The montane streams are sources of the Luweya and Limphasa rivers (flowing to Lake Nyasa) and the Kasitu River (flowing to the South Rukuru River). As a result of afforestation with softwood trees, a pulpwood industry has developed. Northern Viphya is used for military training and southern Viphya supports tung and tea plantations. The town of Mzuzu (pop. [1977] 16,119), located in the saddle on the road from Nkhata Bay to the inland plateau, is the administrative and service centre for the Northern Region of Malaŵi.

Vir Singh, Bhai (b. 1872, Punjab, India—d. 1957, Punjab), Sikh writer and theologian who was chiefly responsible for raising the Punjabi language to a literary level never before attained.

He wrote at a time when Sikh religion and politics and the Punjabi language were under such strong attack by the English and Hindus that the Sikhs had begun to doubt the value of their way of life. With his versatile pen, he extolled Sikh courage, philosophy, and ideals, gathering respect for the Punjabi language as a literary vehicle. The core of his philosophy is that man must overcome his pride or ego before he can realize God. Once the battle of self is won, man can then know God in all of his manifestations.

Bhai Vir Singh founded the weekly paper Khālsā Samācār ("News of the Khalsa") in Amritsar (1899), where it is still published. Among his novels are Kalgīdlur Camathār (1935), a novel on the life of the 17th-century gurū Gobind Singh, and Gurū Nānak Camathār, 2 vol. (1936; "Stories of Guru Nanak"), a biography of the originator of the Sikh religion. Other novels on Sikh philosophy and martial excellence include Sundarī (1943), Bijai Singh (1899), and Bābā Noudh Singh (1946). He used poetical and literary forms never before known to Punjabi, such as short metre and blank verse. His poem "The Vigil" was published posthumously. The Punjab University recognized his contribution by awarding him an honorary doctorate.

Viracocha, also spelled HUIRACOCHA, or WIRAQOCA, creator deity originally worshipped by the pre-Inca inhabitants of Peru and later assimilated into the Inca pantheon. A god of rain, he was believed to have created the

sun and moon on Lake Titicaca. After forming the rest of the heavens and the earth, Viracocha traditionally wandered through the world teaching men the arts of civilization. At Manta (Ecuador) he walked westward across the Pacific, promising to return one day. He was sometimes represented as an old man wearing a beard (a symbol of water gods) and a long robe and carrying a staff.

The cult of Viracocha was extremely ancient, and it is likely that he is the weeping god sculptured in the megalithic ruins at Tiahuanaco, near Lake Titicaca. He probably entered the Inca pantheon at a relatively late date, possibly under the emperor Viracocha (died

c. 1438), who took the god's name. The Incas believed that Viracocha was a remote being who left the daily working of the world to the surveillance of the other deities that he had created. He was actively worshipped by the nobility, primarily in times of crisis.

Virchow, Rudolf (Carl) (b. Oct. 13, 1821, Schivelbein, Pomerania, Prussia—d. Sept. 5, 1902, Berlin), German pathologist and statesman, one of the most prominent physicians of the 19th century. He pioneered the mod-

ern concept of pathological processes by his application of the cell theory to explain the effects of disease in the organs and tissues of the body. He emphasized that diseases arose, not in organs or tissues in general, but primarily in their individual cells. Moreover, he campaigned vigorously for social reforms and contributed to the development of anthropology as a modern science.

Early career. In 1839 Virchow began the study of medicine at the Friedrich Wilhelm Institute of the University of Berlin and was graduated as a doctor of medicine in 1843. As an intern at the Charité Hospital, he studied pathological histology and in 1845 published a paper in which he described one of the two earliest reported cases of leukemia. This paper became a classic. Virchow was appointed prosector at the Charité, and in 1847 he began, with his friend Benno Reinhardt, a new journal, Archiv für pathologische Anatomie und Physiologie, und für klinische Medizin ("Archives for Pathological Anatomy and Physiology, and for Clinical Medicine"). After Reinhardt's death in 1852, Virchow continued as sole editor of the journal, now known as Virchows Archiv, until his own death 50 years

Early in 1848 Virchow was appointed by the Prussian government to investigate an outbreak of typhus fever in Upper Silesia; his subsequent report laid the blame for the outbreak on social conditions and on the government. The government was annoyed, but it had to deal with the revolution of 1848 in Berlin. Eight days after his return from Silesia, Virchow was fighting at the barricades. After the revolution Virchow embraced the cause of such medical reforms as abolition of the various grades of physicians and surgeons, and from July 1848 to June 1849 he published a weekly paper, Die Medizinische Reform, much of which he wrote himself. His liberal views led the government, on March 31, 1849, to suspend him from his post at the Charité, but a fortnight later he was reinstated, with the loss of certain privileges.

In 1849 Virchow was appointed to the newly established chair of pathological anatomy at the University of Würzburg—the first chair of that subject in Germany. During his seven

fruitful years in that post, the number of medical students in the university increased from 98 to 388. He trained there many men who later became famous. In 1850 he married Rose Mayer, with whom he had three sons and three daughters. At Würzburg Virchow published many papers on pathological anatomy. He began there the publication of his six-volume Handbuch der speziellen Pathologie und Therapie ("Handbook of Special Pathology and Therapeutics"), most of the first volume of which he wrote himself. At Würzburg he also began to formulate his theories on cellular pathology and started his anthropological work with studies of the skulls of cretins (dwarfed, mentally deficient individuals) and investigations into the development of the base of the skull.

In 1856 a chair of pathological anatomy was established for Virchow at Berlin; he accepted the call subject to certain conditions, one of which was the erection of a new pathological institute, which served him for the rest of his life. During much of this second Berlin period, Virchow actively engaged in politics. In 1859 he was elected to the Berlin City Council, on which, for the rest of his life, he dealt mainly with public health matters, such as sewage disposal, the design of hospitals, meat inspection, and school hygiene. He supervised the design of two large new Berlin hospitals, the Friedrichshain and the Moabit, opened a nursing school in the Friedrichshain Hospital, and designed the new Berlin sewer system.

In 1861 Virchow was elected to the Prussian Diet. He was a founder of the Fortschrittspartei (Progressive Party) and a determined and untiring opponent of Otto von Bismarck, who in 1865 challenged him to a duel, which he wisely declined. In the wars of 1866 and 1870 Virchow confined his political activities to the erection of military hospitals and the equipping of hospital trains. In the Franco-German War he personally led the first hospital train to the front. He was a member of the Reichstag from 1880 to 1893.

Medical investigations. By 1848 Virchow had shown the falsity of the then current view that phlebitis (inflammation of a vein) causes most diseases. He had demonstrated that masses in the blood vessels resulted from "thrombosis" (his term) and that portions of a thrombus could become detached to form an "embolus" (also his term). An embolus set free in the circulation might eventually be trapped in a narrower vessel and lead to a serious lesion in the neighbouring parts.

Virchow's concept of cellular pathology was initiated while he was at Würzburg. Until the later 18th century, diseases were supposed to be due to an imbalance of the four fluid humours of the body (blood, phlegm, yellow bile, and black bile). This was the "humoral pathology" which dated back to the Greeks. In 1761 an Italian anatomist, Giovanni Battista Morgagni, showed that diseases were due not to an imbalance of the humours but to lesions in organs. Around 1800 a French anatomist, Xavier Bichat, demonstrated that the body was made up of 21 different kinds of tissues, and he conceived that in a diseased organ only some of its tissues might be affected. The later events in the complex history of the cell theory were taking place while Virchow was a youth, and at Würzburg he began to realize that one form of the cell theory, which postulated the origin of every cell from a preexisting cell and not from amorphous material, could give new insight into pathological processes. In this he was influenced by the work of many others, notably by the views of John Goodsir of Edinburgh on the cell as a centre of nutrition and by the researches of Robert Remak, a German neuroanatomist and embryologist, who in 1852 was one of the first to point out

that the multiplication of cells to form tissues was accompanied by cell division. By that year Remak had concluded that in pathological tissues also new cells arose from existing cells. But Remak's writings had little influence on pathologists and medical practitioners. Thus the idea expressed by Virchow's omnis cellula e cellula ("every cell is derived from a [preexisting] cell") is not completely original. Even this aphorism is not Virchow's; it was coined by François Vincent Raspail in 1825. But Virchow made cellular pathology into a system of over-whelming importance. His main statement of the theory was given in a series of 20 lectures in 1858. The lectures, published in 1858 as his book Die Cellularpathologie in ihrer Begründung auf physiologische und pathologische Gewebenlehre (Cellular Pathology as Based upon Physiological and Pathological Histology), at once transformed scientific thought in the whole field of biology.

Virchow shed new light on the process of inflammation, though he erroneously rejected the possibility of migration of the leucocytes (white blood cells). He distinguished between fatty infiltration and fatty degeneration, and he introduced the modern conception of amyloid (starchy) degeneration. He devoted great attention to the pathology of tumours, but the importance of his papers on malignant tumours and of his three-volume work on that subject (Die krankhaften Geschwülste, 1863-67) was somewhat marred by his erroneous conception that malignancy results from a conversion (metaplasia) of connective tissue. His work on the role of animal parasites, especially trichina, in causing disease in man was fundamental and led to his own public interest in meat inspection. In 1874 he introduced a standardized technique for performing autopsies, by the use of which the whole body was examined in detail, often revealing unsuspected lesions.

Virchow's attitude to the new science of bacteriology was complex. He was on the whole antagonistic to the role of bacteria in causing disease, and he rightly argued that the discovery of the presence of a certain organism in a certain disease did not always mean that that organism was the cause of the disease. He suggested, long before toxins were actually discovered, that some bacteria might produce these substances. Though it is sometimes said that Virchow was antagonistic to Darwin's theory of the origin of species by natural selection, the fact is that he accepted the theory as a hypothesis but during much of his later life continued to assert that so far there was not sufficient scientific evidence to justify its full acceptance.

Work in anthropology. In 1865 Virchow discovered pile dwellings in northern Germany, and in 1870 he started to excavate hill forts. Meanwhile he had been using his enormous influence in the cause of anthropology. In 1869 he was part founder of the German Anthropological Society, and in the same year he himself founded the Berlin Society for Anthropology, Ethnology, and Prehistory, of which he was president from 1869 until his death. During the whole of that period, he edited its Zeitschrift für Ethnologie.

In 1874 Virchow met Heinrich Schliemann, the discoverer of the site of Troy, and he accompanied Schliemann to Troy in 1879 and to Egypt in 1888. It was due largely to Virchow that Schliemann gave his magnificent collection to Berlin. In 1881 and in 1894 Virchow made personal expeditions to the Caucasus. Virchow was the organizer of German anthropology.

In 1873 Virchow was elected to the Prussian Academy of Sciences. He declined to be ennobled as "von Virchow," but in 1894 he was created *Geheimrat* (privy councillor).

Virden, town, southwestern Manitoba, Canada, near the Assiniboine River, 47 mi (76 km) west of Brandon. A farming and grainshipping centre, the community proposed after the discovery of oil in 1951 and has become the operational headquarters of the province's oil industry. Some wells have been drilled within the town limits. There are also extensive local potash deposits. Manufacturing activities include flour milling, feed and dairy production, metalworking, and printing. Originally called Gopher Creek, it was renamed Manchester by Canadian Pacific Railway officials in 1882. Later it was called Virden for the Scottish home of Lord Mountstephen, a railway financier, when some of his kinsmen settled in the locality. Inc. village, 1890; town, 1904. Pop. (1981) 2,940.

Virden, city, Macoupin County, southwest central Illinois, U.S. Laid out in 1852 along the Chicago and Mississippi Railroad, it was named for John Virden, a local innkeeper. Once a coal-mining town, Virden was the scene of a mine riot on Oct. 12, 1898, in which at least 10 people were killed. The city was under martial law for several days, and the union movement credited the incident as an important milestone, especially in the winning of the eight-hour day. The mines have since ceased operation. Virden is now an agricultural community with corn (maize) and soybeans as the chief crops. Livestock raising is also important. Inc. 1873. Pop. (1980) 3,899.

virelai, one of several formes fixes ("fixed forms") in French lyric poetry and song of the 14th and 15th centuries (compare ballade; rondeau). It probably did not originate in France, and it takes on several different forms even within the French tradition. Similar forms can be found in most of the literatures of medieval and early Renaissance Europe: in the Galician cantiga, the Arabic zajal and muwashshaḥ, the Italian lauda, ballata, and frottola, the Spanish villancico, and the English carol (qq.v.).

The standard virelai form has three stanzas, each preceded and followed by a refrain. Each stanza is in three sections, the first two having the same rhyme scheme and the last having the rhyme scheme of the refrain. In a musical setting the third section of each stanza therefore takes the same music as the refrain, while the first two sections have different music. In the following diagram uppercase letters represent a repeat of the same music with the same text, lowercase the same music with different text; R means refrain and Roman numerals refer to stanzas:

R I R II R III R A bba A bba A bba A

The musical history of the virelai in France has three distinct stages. First came the monophonic (single-part) settings of simply rhythmized and syllabic melodies. Guillaume de Machaut (c. 1300–77), who is more famous as the earliest known composer systematically to write polyphonic songs, wrote most of his virelais in this monophonic style. He preferred to call them *chansons balladées*, though he allowed that they could also be called virelais.

The next stage, in the second half of the 14th century, was one of large polyphonic settings. Their tremendous length was made acceptable by the often lighthearted nature of virelai texts. Jean Vaillant, Solage, Jacob de Senleches, and other composers included imitations of bird calls and the sounds of nature in their virelais; and to judge from the number of surviving sources, the songs achieved exceptional popularity.

The virelai fell out of favour in the first half

of the 15th century but then returned in a curtailed form with just one stanza, thereby providing the form for some of the most attractive songs of the later 15th century. This revived virelai had taken on an entirely different set of characteristics: in the 14th century the virelai, like each of the other formes fixes, had a musical and a poetic style associated specifically with it, but none of this is apparent in its 15th-century revival. For the later composers, especially Antoine Busnois and Jean d'Ockeghem, the main attraction of the virelai seems to have been that the music written for the first two sections of the stanza could be entirely different from that for the refrain; and it was usually even written in a different metre. The form thus allowed more musical variety than did the rondeau. These later virelais with only one stanza are often called bergerettes.

Virén, Lasse (b. July 22, 1949, Myrskalä, Finland), Finnish distance runner and the first athlete to win gold medals for both the 5.000- and 10.000-metre races in consecutive Olympic Games: at Munich in 1972 and at Montreal in 1976.

Virén began running as a youth. At the age of 19 he dropped out of school to train under Rolf Haikkola, a follower of the New Zealand coach Arthur Lydiard, who stressed building up endurance by running very long distances. While winning the gold medals in the Olympic Games at Munich, Virén set a world record for the 10,000-metre race of 27 min 38.4 sec (broken in 1973). He had also set a world record for the 5,000-metre race in 1972 of 13 min 16.4 sec (broken in 1972).

vireo, any of 42 species of New World birds constituting the family Vireonidae (order Passeriformes). This includes pepper-shrikes and shrike-vireos—about five tropical species sometimes separated as the families Cyclarhidae and Vireolaniidae, respectively. About 15 tropical forms are called greenlets-formerly the usual name for all vireos.

White-eyed vireo (Vireo griseus) Thase Daniel-Bruce Coleman Inc./EB Inc.

Vireos are the most primitive of the New World songbirds. The slightly notched and hook-tipped bill is stout but narrow, with fine bristles at the base. Vireos are 10 to 18 cm (4 to 7 inches) long and are plain gray or greenish in colour, with white or yellow touches (sexes alike). They occur in woodlands and thickets, where they glean insects from foliage, and repeat loud short phrases over and over. The vireo's nest is a cuplike structure suspended from a small fork of a branch, and the bird's eggs are white and sparsely speckled with reddish brown. The best-known and most widely distributed species of vireo is the red-eyed vireo (Vireo olivaceus), which breeds from southern Canada to Argentina. It is 15 cm (6 inches) long, with a black-outlined, white eye-stripe that contrasts with the bird's gray crown. Similar in general appearance is the white-eyed vireo (V. griseus).

Viret, Pierre (b. 1511, Orbe, Switz.—d. May 4, 1571, Orthez, Fr.), champion of the Reformation in the Swiss canton of the Vaud and the most important native religious Reformer of French-speaking Switzerland.

In 1531 Viret came under the influence of the fugitive French religious Reformer Guillaume Farel and began preaching in the Vaud soon after. As pastor at Neuchâtel (1533), he won the favour of the Bernese, who, following their annexation of the Vaud (1536), supported his reforming efforts in the Vaudois capital of Lausanne. Viret led the disputation of Lausanne (October 1536) and subsequently organized the Reformed Church throughout the Vaud. His lengthy pastorate at Lausanne was disrupted by disagreements with the Bernese, however, and in 1559 he was forced to leave the city. Viret died in the service of Jeanne d'Albret (the mother of the future French king Henry IV) as a professor at the academy in

Virgil, Virgil also spelled VERGIL, Latin in full publius vergilius maro (b. Oct. 15, 70 BC, Andes, near Mantua [Italy]—d. Sept. 21, 19 BC, Brundisium), the greatest Roman poet, best known for his epic, the *Aeneid* (from c. 30 BC; unfinished at his death).

A brief treatment of Virgil follows. For full

treatment, see MACROPAEDIA: Virgil.

The son of a prosperous farmer in the Roman province of Cisalpine Gaul, Virgil received a thorough education. Although his life was quiet, his poetry reflects the general turbulence in Italy during an extended period of civil war and then the trend toward stability that followed the rise of Octavian (afterward the emperor Augustus) to undisputed power in 31-30 BC. Virgil became a member of Augustus' court circle and was aided by the imperial minister Maecenas, one of the most famous patrons of the arts. He died of a fever contracted on a visit to Greece.

Virgil's first major work, the collection of 10 pastoral poems, called the Eclogues (42-37 Bc), may be read as a visionary prophecy of local tranquillity and world peace-conditions that, in his last years, he saw imposed to a considerable degree by Augustus. His Georgics (37-30 BC) points toward a Golden Age in the form of immediate practical goals: the repopulation of rural Italy and the rehabilitation of agriculture by the government as soon as the civil wars shall have ended. Finally, the 12 completed books of the Aeneid celebrate the dual birth of Rome. The legendary founding of Rome by Aeneas of Troy and the Roman unification of the world by Augustus are viewed as extraordinary tasks, glorious achievements, and divinely ordained

Virgilian series, major division of Late Carboniferous rocks and time in the United States (the Late Carboniferous epoch, approximately equivalent to the Pennsylvanian period, began about 320 million years ago and ended about 286 million years ago). Named for exposures studied in the region of Virgil, Kan., it is the uppermost series of the Late Carboniferous and overlies rocks of the Missourian series. In the midcontinental region of the United States, the Virgilian consists of sandstones, shales that are often variegated, thin limestones, and some coal deposits. Cyclothems,

which are rhythmically repetitive stratigraphic sequences, are often evident in Virgilian strata. Three important subdivisions of the Virgilian are recognized; the lowermost Douglas group is followed by the Shawnee and Wabaunsee groups, each of which is further divided into formations.

Virgin Birth, fundamental doctrine of orthodox Christianity that Jesus Christ had no natural father but was conceived by Mary through the power of the Holy Spirit. The doctrine that Mary was the sole natural parent of Jesus is based on the infancy narratives contained in the Gospel accounts of Matthew and Luke. It was universally accepted in the Christian church by the 2nd century, was enshrined in the Apostles' Creed, and, except for several minor sects, was not seriously challenged until the rise of Protestant theological liberalism in the 19th century. It remains a basic article of belief in the Roman Catholic, Orthodox. and most Protestant churches. Muslims also accept the Virgin Birth of Jesus.

A corollary that has been deduced from the doctrine of Mary's virginity in the conception of Jesus is the doctrine of her perpetual virginity, not only in conception but in the birth of the child (i.e., she was exempt from the pain of childbirth) and after the birth throughout her life. This doctrine, which poses problems of biblical interpretation, was found in the writings of the Church Fathers and was accepted by the Council of Chalcedon (451). It is part of the teaching of the Orthodox and Roman Catholic churches and is also maintained by some Anglican and Lutheran theologians.

but only a few tropical plants have become established, the most prominent of which are figs, mahogany, cinnamon-bay, mango, guava, breadfruit, mangrove, hibiscus, frangipani, and bougainvillea. Most of the 100 species of birds are land birds, but some herons, egrets, and pelicans can be found. The only native land mammal is the bat; the mongoose was introduced from Europe to control rodents and snakes. The original inhabitants, the peaceful, agricultural Arawak Indians, have left remains of villages and some rock carvings.

Virgin Islands of the United States, organized unincorporated island territory of the United States, at the eastern end of the Greater Antilles, about 40 miles (64 km) east of Puerto Rico, in the northeastern Caribbean Sea. Composed of three large islands, St. Croix, St. John, and St. Thomas, and about 50 small islets and cays, the islands cover 136 square miles (352 square km). The population in 1990 was estimated at 108,000, and the capital is Charlotte Amalie on St. Thomas.

The land. Geologically, together with the British Virgin Islands, the islands are an extension of the central fault-block mountain ranges of Puerto Rico and part of the Greater Antilles. Composed of metamorphosed igneous and sedimentary rocks overlain in parts by limestone and alluvium, they rise off the continental shelf to maximum heights of 1,556 feet (474 m) at Crown Mountain on St. Thomas, 1,277 feet (389 m) at Bordeaux Mountain on St. John, and 1,165 feet (355 m) at Mount Eagle on St. Croix (the largest of the islands, with an area of 84 square miles [218 square km]). St. Thomas and St. John are very rugged, but St. Croix's mountains are confined to the north, with a large rollingto-level plain opening to the south. All the islands are surrounded by fringing coral reefs, and ancient elevated reefs ring the main islands. Between St. Croix and the northern islands, the Anegada Passage plunges to 15,000 feet (4,570 m) below sea level. The climate is pleasant, with temperatures at St. Thomas averaging a maximum of 82° F (28° C) during the day in January and 88° F (31° C) in July and being tempered throughout the year by northeasterly trade winds. Nighttime minimum temperatures are about 11° F (6' C) cooler, and the relative humidity is low for the tropics. Rainfall averages 45 inches (1,100 mm) annually, with a marked rainy season from September to December. Droughts occur periodically, and hurricanes may strike the islands on rare occasions. Early plantation clearance destroyed the islands' tropical forest, which is now found only in a few places on St. Thomas and has elsewhere been replaced by secondary woodland and scrub. Island fauna is sparse, save for birds, but the surrounding seas abound in commercial and game species. There are no important mineral deposits.

The people. About 80 percent of the population is black or mulatto, and most of the remainder are Hispanic (mainly Puerto Rican) or recent white immigrants. Less than half of the population is native-born. English is the official language, but some French is spoken on St. Thomas, and Spanish on St. Croix among Puerto Ricans. The population is predominantly Christian, mainly Roman Catholic, Episcopalian, Pentecostal, Lutheran, Methodist, Moravian, and Seventh Day Adventist. There is also an Orthodox Jewish community. The population increased rapidly from the early 1960s to the mid-1970s primarily because of substantial immigration from the U.S. mainland, the eastern Caribbean, and Puerto Rico. Since the mid-1970s population growth has been slower than average for the West Indies, largely because of the territory's comparatively low birth rate. The infant mortality rate and overall death rate are also comparatively low, while life expectancy, at 69 years, is among the highest in the region. Charlotte Amalie, the capital, is also the only town with a population of more than 10,000.

The economy. The U.S. Virgin Islands have a developing free-enterprise economy based on tourism and manufacturing. The gross national product (GNP) is growing faster than the population; the GNP per capita is the highest in the Caribbean region. About onefifth of the total land area is farmland, most of it on St. Croix. Agricultural production in the 1970s through the '80s underwent transition from the traditional reliance on sugarcane to more diversified crops. Citrus fruits, tamarinds, mangoes, bananas, sorghum (for animal feed), and vegetables, all for internal consumption, were the main crops grown. Cattle (ranched on St. Croix), goats, sheep, and pigs are the main livestock. St. Croix produces milk, sufficient for island needs. The Agriculture Department operates experimental farms on St. Thomas and St. Croix to grow and test new types of crops. The government has also built dams on St. Croix and St. Thomas to improve farmers' water supply.

Only 6 percent of the land is forest, but the government has planted large areas of St. Croix with mahogany and also has reforested parts of St. Thomas. A bay-tree forest on St. John supplies leaves for the bay-rum industry.

Fishing is restricted to supplying local needs and to sportfishing. A marine-biology laboratory has been established on St. John.

Manufacturing has diversified beyond the traditional rum-distilling industry to include petroleum refining, watch assembly, and the manufacture of chemicals, pharmaceuticals, and clothing. Electrical energy is produced by thermal-power plants. The U.S. government has encouraged industry by allowing certain manufactures to enter the United States duty-free, and the local government has offered tax incentives.

Tourism, based on the pleasant tropical climate, attractive scenery, good fishing, proximity to the U.S. mainland, and free-port status, has rapidly expanded and dominates the economy. The Virgin Islands National Park, covering two-thirds of St. John, and the Buck Island National Monument, set on the islet's coral reef, are other major attractions. Souvenir and handicraft industries have developed for the tourist market.

The leading sectors in employment are government service; retail trade, including personal, business, and domestic services; manufacturing; agriculture and self-employment; and hotels.

The islands' extensive road network is mostly paved. St. Croix and St. Thomas have sched-

uled bus service. Charlotte Amalie, on St. Thomas, and Frederiksted and Limetree Bay, on St. Croix, are deep-water ports. A new container port on the southern coast of St. Croix handles the bulk of the islands' cargo traffic. There is ferry service between the three main islands and also to the British Virgin Islands. There are two international airports, Harry S. Truman on St. Thomas and Alexander Hamilton on St. Croix. Interisland seaplanes serve the islands and also Puerto Rico, the British Virgin Islands, and Saint-Martin.

Exports total more than four-fifths of imports in value annually. Refined petroleum, clothing, watches, and rum are the main exports, shipped mainly to the United States, Puerto Rico, and the British Virgin Islands. The main imports are crude petroleum, food products, and semimanufactures and components.

Government and social conditions. The government is organized under the Organic Act of the Virgin Islands, passed by the U.S. Congress in 1936, amended in 1954 and subsequently. The governor, elected by universal suffrage to a four-year term, appoints heads of the executive branches and administrative assistants for St. Croix and St. John with approval of the unicameral legislature, or Senate; its 15 members are elected by universal suffrage to four-year terms. The people are U.S. citizens and elect a nonvoting representative to the U.S. House of Representatives but do not vote in U.S. national elections. The U.S. Department of the Interior appoints a federal comptroller who supervises revenue and expenditure. There are three political parties, the Democratic and the Republican, affiliated to the U.S. parties, and the Independent Citizens Movement. The District Court of the Virgin Islands operates under federal law, and the judges and district attorney are appointed by the U.S. president with the advice and approval of the U.S. Senate. There is also a territorial court.

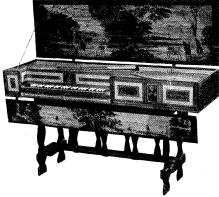

St. Thomas and St. Croix have hospitals, and the Public Health Service operates mobile medical units for outlying areas, as well as a program for immunization, clinical services, home-care services, and special programs. Health conditions are excellent, as improved housing and sanitation have eradicated tropical diseases.

Education is compulsory and free for children between ages 5½ and 16 in public primary, secondary, and vocational schools. Higher education and teacher training are available at the University of the Virgin Islands, a U.S. land-grant institution with campuses on St. Thomas and St. Croix. The main public library is on St. Thomas and has branches in St. Croix and St. John. There is mobile library service to outlying areas. The Department of Conservation and Cultural Affairs administers museum and library services.

The islands probably were originally settled by Arawak Indians, but they were inhabited by the warlike Caribs when Columbus landed on St. Croix in 1493. They had extensive farms and settlements on the island. Columbus named the islands Santa Ursula y las Once Mil Virgenes, in honour of the legendary St. Ursula and the 11,000 martyred virgins. In 1555 a Spanish expedition defeated the Caribs and claimed the islands for Spain, but by 1625 English and French settlers were farming on St. Croix, and it had become a haven for pirates. In 1650 the Spaniards evicted the remaining English settlers, but the French took the islands later that same year. St. Croix was willed to the Knights of Malta in 1653, but they sold it to the French West India Company. Dutch buccaneers had established themselves on Tortola, but the English evicted them in 1666, while Denmark claimed St. Thomas and St. John. Dividing the islands into plantations, the Danes began growing sugarcane, first using convicted criminals and, after 1673, African slaves for labour. Commerce developed from the triangular trade in slaves brought from Africa, rum and molasses sent to Europe, and European goods shipped back to the islands. St. Thomas became a major slave market for the Caribbean. Denmark purchased St. Croix in 1733, and it became a major centre of sugarcane production. Alexander Hamilton, the U.S. statesman, was born on Nevis Island in 1755, brought to St. Croix in 1765, and worked there as a countinghouse clerk. By the early 19th century the sugar industry began to decline and two slave revolts had shaken the plantation economy. Slavery was abolished in 1848, and the United States began negotiations to purchase the islands from Denmark. The sale was made in 1917 for U.S. \$25,000,000. Administered by the U.S. Navy, they were transferred to the Department of the Interior in 1931, and civilian governors appointed by the president ruled the islands. Tourism began to develop in 1945. In 1954 the Organic Act of the Virgin Islands was revised and created the current governmental structure. In 1970 the first popularly elected governor took office, and in 1976 the islands were given the right to draft a constitution, subject to approval by the U.S. Congress and president. Completed in 1978, the islands' constitution was rejected in a referendum (1979) and again rejected after amendment (1981). Substantial immigration from the mainland United States, the eastern Caribbean, and Puerto Rico (1960-75) produced social tension between islanders and the new settlers.

Virgin Mary, Presentation of the, feast celebrated in the Roman Catholic and Eastern churches on November 21. Based on a legend contained in the Protevangelium of James, a 2nd-century work not included in the Bible, the feast commemorates a visit by the threeyear-old Mary to the Temple in Jerusalem, where she was consecrated to the service of God. It was celebrated in the Eastern church in the 6th century but did not become widely accepted in the West until the 15th century. Pope Pius V (1566-72) suppressed it, but in 1585 Pope Sixtus V reestablished the feast.

virginal, also called VIRGINALS, or PAIR OF VIRGINALS, musical instrument of the harpsichord family, of which it may be the oldest member. The virginal may take its name from Latin virga ("rod"), referring to the jacks, or wooden shafts that rest on the ends of the keys and hold the plucking mechanism. Unlike the harpsichord and spinet, the virginal's single set of strings runs nearly parallel to the keyboard. By building the instrument with its keyboard at one side or the other of the front of the

rectangular case, different tone colours can be obtained because of the change in plucking point of the string.

Italian virginals, often polygonal in shape, differed from the rectangular Flemish and English virginals in having the keyboard centrally placed, thus producing a characteristic mellow tone. Sometimes two virginals were built together, a small one fitting like a drawer into the case of the larger. The smaller played at a higher pitch and could sometimes be mounted over the keys of the larger virginal so that one player could control both. Virginals were particularly popular in 16th- and 17thcentury England, where the name was also used generically to mean any harpsichord. The 17th-century Fitzwilliam Virginal Book contains pieces that are characteristic of the English repertory. The cases of virginals were frequently decorated with paintings, inlays, and carvings.

Virginia, town and gold-mining centre, northcentral Orange Free State, South Africa, in one of the world's richest goldfields. Virginia was a former whistle stop (named, 1892) on the line between Johannesburg and Cape Town. A modern, well-planned town, it was founded in 1954, after gold was discovered in the vicinity. Mining, gold-extraction plants, and processing plants recovering uranium and sulfuric acid as a by-product from gold ore form the basis of the economy. Pop. (1985) 17,624.

Virginia, city, St. Louis county, northeastern Minnesota, U.S., in the Mesabi Range region. First a lumbering town, it developed as a mining centre after 1890, when Leonidas Merritt and his five brothers discovered rich iron-ore deposits. It was laid out in 1892 and named

for the home state of the development company's president. Although hematite iron-ore reserves diminished, taconite remains in great quantities and since World War II the production of taconite pellets has become significant. Mesabi Community College was founded in 1918. Lookout Mountain Ski Area and the southern fringe of Superior National Forest are immediately north, making tourism an economic asset. Inc. 1894. Pop. (1986 est.) 9.150.

Virginia, constituent state of the United States of America, on the central Atlantic seaboard. It is bounded on the northwest by West Virginia, on the northeast by Maryland, on the east by the Atlantic Ocean, on the south by North Carolina and Tennessee, and on the west by Kentucky. The capital is Rich-

A brief treatment of Virginia follows. For full treatment, see MACROPAEDIA: United States of America: Virginia.

Virginia was Great Britain's first American colony, founded in 1607 at Jamestown. The colony faltered at first, but by 1619 it had its own representative assembly and a growing tobacco industry. Virginia grew rapidly during the 18th century and on the eve of the American Revolution was the largest of the 13 Colonies. Its citizens were among the leaders of the American Revolutionary period and contributed four of the country's first five presidents, but they hesitated to ratify the Constitution (June 1788) and were early exponents of states' rights and nullification. Virginia was the scene of Nat Turner's slave insurrection of 1831, and, as agriculture declined, it became known for slave breeding. It wavered on secession until President Abraham Lincoln issued the call for volunteers, but the western part of the state refused to secede and split off to become West Virginia in 1863. Virginia, whose own capital of Richmond was also the capital of the Confederacy, bore the brunt of military action during the war. Already in economic difficulty before the American Civil War, the state was plagued by the war's devastation for decades. Only after World War I was Virginia able to achieve basic financial reforms and begin agricultural diversification and industrial development.

Virginia is divided into three physiographic regions. The Coastal Plain, also known as the Tidewater, lies east of the fall line; major rivers separate the Northern Neck Peninsula, the Middle Peninsula, and The Peninsula, all west of Chesapeake Bay, and across the bay lies the Eastern Shore area on the Delmarva Peninsula. The Piedmont of middle Virginia is a region of rolling hills extending westward to the Blue Ridge. The mountain region of the west is made up of the Appalachian Plateau, the Ridge and Valley Province, and the Blue Ridge.

The state's climate is generally mild and equable but varies according to elevation and proximity to Chesapeake Bay and the Atlantic. In the southeast, winter temperatures rarely go below 15° F (-9° C), or in summer above 100° F (38° C). In the mountains, winter temperatures of 0° F (-18° C) may occur, but cool nights in summer follow daytime highs that usually stay below 90° F (32° C). Rainfall averages from about 32 to 48 inches

(810 to 1,200 mm) yearly.

Most of eastern Virginia was first settled by the English. During the 1700s, the Welsh, together with French Huguenots, were the prominent immigrants, and a large number of people of Scots-Irish and German descent moved into the Shenandoah Valley from Pennsylvania. Black slaves were the foundation of the state's plantation agriculture and at the start of the Civil War comprised about half of the state's population, but the proportion of blacks thereafter declined steadily to about one-fifth of the population in the late 20th century. More than two-thirds of Virginia's population is in urban areas, mostly in suburban Washington, D.C., and in a corridor connecting Washington to Richmond and Norfolk. The population was growing faster than the national average in the late 20th century, largely because of substantial net inmigration, most of it to the metropolitan ar-

The federal government is Virginia's largest employer. Income derived from military installations alone is considerable. Manufacturing is the second largest employer, with chemicals and allied products the major items of manufacture followed by food processing, tobacco products, textiles, and apparel. Agriculture is no longer dominated by tobacco. Truck farms, whose products include milk, cheese, and vegetables, dot the eastern shore. Apple and peach orchards are found in the northwest. Pine timber is the main forest product. Extracted nonmetals include coal, stone, clay, sand, and gravel.

Virginia's port of Hampton Roads is one of the nation's leading ports in foreign-tradetonnage handled. Primary and secondary roads of more than 65,000 miles (105,000 km) comprise the nation's third largest state-maintained system. Most traffic is north-south, adding to Virginia's status as a "bridge" state. There is a dense network of railway track that includes

Amtrak passenger service. Washington's two major airports are located in Virginia.

There is a state Commission of the Arts and Humanities, and the Museum of Fine Arts in Richmond was established in 1934. Historical sites abound and include Colonial Williamsburg, George Washington's Mount Vernon, Thomas Jefferson's Monticello, the Civil War battlefields of Bull Run and Appomattox, and General Robert E. Lee's house, now in Arlington National Cemetery. The College of William and Mary (founded in 1693) is the country's second oldest college. The University of Virginia in Charlottesville was largely the creation of Thomas Jefferson. Area 40,767 square miles (105,586 square km). Pop. (1990 est.) 6,157,000.

Virginia, University of, American institution of higher education in Charlottesville, Va., on a campus of 1,000 acres (405 hectares) near the foothills of the Blue Ridge Mountains. Founded by Thomas Jefferson, it was chartered in 1819. Jefferson was aided by Joseph C. Cabell (1778–1856), a member of the Virginia Senate and the chief fund-raiser. The school elected Jefferson its first rector of the board of visitors (the governing body). James Madison and James Monroe were other U.S. presidents who served on the university's board.

Jefferson laid out the campus of his "academical village," designed its buildings, supervised the construction of the Rotunda (designed by him after the Pantheon in Rome), planned the curriculum, and selected the faculty. The school opened in 1825 with a faculty of eight. Jefferson introduced an elective system of study and opposed the granting of degrees as "artificial embellishments." By the time of the American Civil War, the university was second only to Harvard in size of faculty and student body. The bachelor of science degree was offered from 1868, and in 1899 the bachelor's degree became the primary degree offered. (The university had approved a master of arts degree in 1831, the primary degree in the 19th century; the M.D. was first awarded in 1829 and a degree in law in 1840.)

In 1904 Edwin A. Alderman was elected the first president. The chief administrative officer had been previously the chairman of the faculty. Under Alderman (1904–31), the university established its basic modern structure. The McIntire School of Commerce was established in 1952 and the Center for Advanced Studies in 1965. Special programs include Asian, Afro-American, Latin-American, and Russian studies and environmental and computer sciences.

Enrollment is largest in the College of Arts and Sciences. Other schools teach architecture, education, engineering and applied sciences, and nursing. Graduate professional schools are the Colgate Darden School of Business Administration, the Graduate School of Arts and Sciences, and schools of law and of medicine.

Mary Washington College for Women (chartered in 1908) was consolidated with the university from 1944 to 1972. By the 1970s women were enrolled in all units of the university; previously, they could attend only selected programs and the graduate schools. Clinch Valley College at Wise, Va., is an affiliated school

Virginia and Kentucky Resolutions (1798 and 1799), in U.S. history, measures passed by the legislatures of Virginia and Kentucky as a protest against the Federalist Alien and Sedition Acts. The resolutions were written by James Madison and Thomas Jefferson (then vice president in the administration of John Adams), but the role of those statesmen remained unknown to the public for almost 25 years. Generally, the resolutions argued that

because the federal government was the outcome of a compact between the states, all powers not specifically granted to the central authority were retained by the individual states or by the people. For this reason, they maintained that the states had the power to pass upon the constitutionality of federal legislation.

The Virginia and Kentucky Resolutions were primarily protests against the limitations on civil liberties contained in the Alien and Sedition Acts rather than expressions of full-blown constitutional theory. Later references to the resolutions as authority for the theories of nullification and secession were inconsistent with the limited goals sought by Jefferson and Madison in drafting their protests.

Virginia Beach, independent city, southeastern Virginia, U.S., on the Atlantic coast and Chesapeake Bay; adjacent to the cities of Norfolk and Chesapeake. The city extends southward to the North Carolina border, covering 259 square miles (671 square km) of land and water, with 38 miles (61 km) of ocean front. Back Bay is a brackish lagoon and a national wildlife refuge, paralleling the ocean in the south of the city. Founded in 1887, Virginia Beach developed as a resort following construction of a hotel and a railroad linking it with Norfolk. After World War I it became an important base in the national coastal-defense system. In 1963 Virginia Beach and the former Princess Anne county merged as the City of Virginia Beach.

The city's economy is based on tourism, military installations (Little Creek Naval Amphibious Base, Oceana Naval Air Station, the Fleet Combat Direction Systems Warfare Training Center at Dam Neck, and Fort Story), agriculture (grains, vegetables, and dairy products), and diversified manufactures.

Virginia Wesleyan College (1966), which is headquartered in Norfolk, straddles the city boundary. Cape Henry Memorial, situated at the entrance to Chesapeake Bay, marks the first landing (1607) of the Jamestown colonists. Nearby is the Cape Henry Lighthouse (1791). The Alan B. Shepard Civic Center (1957) was one of the first geodesicdomed structures in the U.S. Facilities for water recreation and fishing are available from the city's boardwalks, bays, and beaches. Virginia Beach is known for seafood, especially the Lynnhaven oyster. Inc. town, 1906; city, 1952. Pop. (1987 est.) city, 340,158; Norfolk-Virginia Beach-Newport News metropolitan area (MSA), 1,346,100.

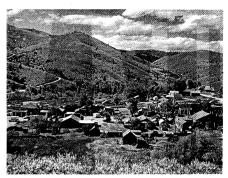

Virginia Capes, Battle of (Sept. 5, 1781), in the U.S. War of Independence, French naval victory over a British fleet that took place outside Chesapeake Bay. The outcome of the battle was indispensable to the successful Franco-American Siege of Yorktown from August to October.

In late summer 1781 Lord Cornwallis led the main British army of the South onto the Yorktown Peninsula, Virginia, where he confidently awaited rescue by reinforcements from the British fleet. In the meantime the French admiral Count de Grasse proceeded with his entire fleet of 24 ships from the West Indies to Chesapeake Bay.

Sailing from New York, a British fleet of 19 ships under the command of Admiral Thomas Graves confronted the French at Virginia Capes on September 5. Only the leading squadrons of the two fleets engaged in moderate fighting in the late afternoon. Although British losses were heavier, the contest was by and large undecided, and the two partly becalmed fleets drifted along parallel courses for the next three days without incident. Then, reinforced by additional vessels and siege guns from Newport, R.I., the French sailed back into Chesapeake Bay to take final control of the harbour, while the British fleet returned to New York. British naval historian Sir William

M. James labeled this the "decisive battle of the war," one that sealed the fate of Cornwallis and of the British cause in America. *See* also Siege of Yorktown.

first town to be incorporated (1864) in Montana and was the territorial capital (1865–75). The mines are no longer productive but the town has been reconstructed in the style of gold-rush days. Restored buildings include the offices of the *Post*, Montana's first newspaper (issued Aug. 27, 1864). The vigilantes organized there in the 1860s exterminated the notorious Plummer outlaw gang. Tourism, supplemented by livestock raising, is the economic mainstay. In the summer, 19th-century drama and vaudeville shows can be seen in the Old Opera House. Nevada City, just west, is also a reconstructed gold camp. Pop. (1986 est.) 190.

named for a prospector, "Old Virginia" Fennimore, it became a booming mining camp after the discovery of the Comstock Lode (chiefly silver) on nearby Mount Davidson. When the Nevada Territory was created by Congress in 1861, Virginia City had more than three-fourths of the new territory's population. In the 1870s its population reached 30,000, and there were 6 churches and more than 100 saloons. In 1875 the town was devastated by a

The "bonanza barons" such as George Hearst and John MacKay who made millions in the mines built Victorian-style mansions, and even public buildings were elaborately decorated. A reporter on the city's newspaper, the Territorial Enterprise, during its boom period was Samuel Clemens, who first signed his pen name, Mark Twain, to one of his newspaper stories.

After 25 years of frantic mining activity, Virginia City's population dwindled as the ore was worked out in the 1880s. It soon became a ghost town. The remaining business houses—mainly saloons and popular museums and some old mansions—are maintained for the tourist trade. The Virginia and Truckee Railroad (1869), which tapped the Comstock, has been partially restored. Incorporated as a city in 1864, it was later disincorporated and reincorporated in 1877; final disincorporation came, however, in 1881. The area has been designated a national historic district. Pop. (1988 est.) 600.

Virginia creeper (Parthenocissus quinquefolia)
Louise K. Broman—Root Resources

It is commonly found in eastern North America and is often grown as a covering vine for walls, fences, and trunks of large trees. Its fall colour ranges from yellow to red-purple. Several cultivated varieties, with smaller leaves and shorter tendrils, have been developed to provide denser coverage. A related woody vine, Boston ivy, is similarly used. *Compare* Boston ivy.

Virginia Declaration of Rights, in U.S. constitutional history, declaration of rights of the citizen adopted June 12, 1776, by the constitutional convention of the colony of Virginia. It was a model for the Bill of Rights added to the U.S. Constitution 15 years later. The Virginia declaration, largely the work of George Mason, was widely read by political leaders on both sides of the Atlantic. It declared that "all men are by nature equally free and independent and have certain inherent rights" of which they cannot deprive themselves or their posterity. These rights were "the enjoyment of life and liberty, with the means of acquiring and possessing property, and pursuing and obtaining happiness and safety." Specific civil liberties enumerated included freedom of the press, the free exercise of religion, and the injunction that no man be deprived of his liberty except by the law of the land or by the judgment of his peers.

Virginia Falls, cataract on the South Nahanni River, a tributary of the Liard, in Nahanni National Park (1,840 square miles [4,765 square km]), Northwest Territories, Canada, 76 miles (120 km) east of the Yukon Border. Highest in the region, the spectacular falls have a drop of 316 feet (96 m) and are shrouded in mist. They are divided near the centre by a pillar of limestone, with sheer cliffs rising to heights of 2,000 feet (610 m) at some points on either side of the canyon.

Virginia reel, spirited American country dance for couples. It stems from the rinnce fadha, a pre-Christian Irish dance that evolved into the English dance called the Sir Roger de Coverley. Brought to Virginia by English colonists, the Sir Roger de Coverley in time became the Virginia reel, the several versions of which range from the polished form danced in the ballrooms of 18th-century Virginia to the livelier present-day version.

The Virginia reel is a progressive dance for couples in longways formation—i.e., a double line, partners facing. To violin accompaniment and the calls of the fiddler, the dancers execute several figures. In the characteristic "reel" figure, the partners at the head of the set alternately swing each other and the other dancers as they move to the bottom of the set. The dance concludes after each couple has progressed to the head of the set.

Virginius affair (1873), seizure of the Cuban ship Virginius (fraudulently flying the U.S. flag and carrying U.S. registration) by Spanish authorities and the summary execution of 53 of its passengers and crew, among them U.S. and British citizens. Hostilities between the United States and Spain were averted when Spain returned the ship and paid an indemnity of \$80,000 to the families of the executed Americans. Spain also paid an indemnity to Great Britain for the executed British subjects. A promise to punish the Spanish officers responsible for the incident was never fulfilled.

Virgo, in astronomy, zodiacal constellation lying between Leo and Libra, at about 13 hours right ascension (the coordinate on the celestial sphere analogous to longitude on the Earth) and 2° south declination (angular distance south of the celestial equator). The brightest star, Spica (Alpha Virginis), is of the first magnitude.

In astrology, Virgo is the sixth sign of the zodiac, considered as governing the period from about August 23 to about September 22. It is represented as a young maiden carrying a sheaf of wheat. She is variously identified as a fertility goddess (the Babylonian and Assyrian Ishtar, among others) or the harvest maiden (the Greek Persephone and others).

Virgo A, catalog numbers M87 and NGC4486, giant elliptical galaxy in the constellation Virgo. It is the strongest known source of radio energy among the thousands of galactic systems comprising the so-called Virgo Cluster. Virgo A is also a powerful X-ray source, which suggests that very hot gas pervades the entire galaxy. A luminous gaseous jet projects outward from the galactic nucleus. Both the jet and the nucleus appear to emit synchrotron radiation, a form of nonthermal radiation released by charged particles that are accelerated in magnetic fields and travel at speeds near that of light. Virgo A is located approximately 20,000,000 parsecs from the Earth.

virion, an entire virus particle, consisting of an outer protein shell called a capsid and an inner core of nucleic acid (either ribonucleic or deoxyribonucleic acid-RNA or DNA). The core confers infectivity, and the capsid provides specificity to the virus. In some virions the capsid is further enveloped by a fatty membrane, in which case the virion can be inactivated by exposure to fat solvents such as ether and chloroform. Many virions are spheroidal—actually icosahedral—the capsid having 20 triangular faces, with regularly arranged units called capsomeres, two to five or more along each side; and the nucleic acid is densely coiled within. Other virions have a capsid consisting of an irregular number of surface spikes and the nucleic acid loosely coiled within. Virions of most plant viruses are rod-shaped; the capsid is a naked cylinder (lacking a fatty membrane) within which lies a straight or helical rod of nucleic acid. A few plant viruses exhibit variations of that model.

viroid, an infectious particle smaller than any of the known viruses, an agent of certain plant diseases. The particle consists only of an extremely small circular RNA (ribonucleic acid) molecule, lacking the protein coat of a virus. Viroids appear to be transmitted mechanically from one cell to another through cellular debris. Viroids are of much interest because of their subviral nature and their obscure mode of action. Potato spindle tuber disease is viroid-induced. Whether viroids occur in animal cells is still uncertain.

virology, branch of microbiology that deals with the study of viruses.

Although diseases caused by viruses have been known since the 1700s and cures for many viral diseases were (somewhat later) effected, the causative agent was not closely examined until 1892, when a Russian bacteriologist, D. Ivanovski, observed that the causative agent (later proved to be a virus) of tobacco mosaic disease could pass through a porcelain filter that was impermeable to bacteria.

Direct visualization of viruses became possible after the electron microscope was introduced about 1940. In 1935 tobacco mosaic virus became the first virus to be crystallized; in 1955 the poliomyelitis virus was crystallized. (A virus "crystal" consists of several thousand viruses and, because of its purity, is well suited for chemical studies.) Virology is a discipline of immediate interest because many human diseases, including smallpox, influenza, and the common cold, as well as a host of economically important plant and animal diseases, are caused by viruses.

Virtanen, Artturi Ilmari (b. Jan. 15, 1895, Helsinki—d. Nov. 11, 1973, Helsinki), Finnish biochemist whose investigations directed to-

ward improving the production and storage of protein-rich green fodder, vitally important to regions characterized by long, severe winters, brought him the Nobel Prize for Chemistry in 1945.

As a chemistry instructor at the University of Helsinki (1924–39), where he became professor of biochemistry (1939–48), Virtanen studied the fermentation processes that spoil stores of silage. Knowing that the fermentation product, lactic acid, increases the acidity of the silage to a point at which destructive fermentation ceases, he developed a procedure (known by his initials, AIV) for adding dilute hydrochloric or sulfuric acid to newly stored silage, thereby increasing the acidity of the fodder beyond that point. In a series of experiments (1928–29), he showed that acid treatment has no adverse effect on the nutritive value and edibility of the fodder and of products derived from animals fed the fodder.

A professor of biochemistry at the Helsinki University of Technology (1931–39), and director of Finland's Biochemical Research Institute, Helsinki, from 1931, Virtanen also conducted valuable research on the nitrogenfixing bacteria found in the root nodules of leguminous plants, on improved methods of butter preservation, and on economical, partially synthetic cattle feeds. His AIV System as the Basis of Cattle Feeding appeared in 1943.

virtue, in Christianity, any of the seven virtues selected as being fundamental to Christian ethics. They consist of the four "natural" virtues, those inculcated in the old pagan world that spring from the common endowment of humanity, and the three "theological" virtues, those specifically prescribed in Christianity and arising as special gifts from God.

Virtue has been defined as "conformity of life and conduct with the principles of morality." The virtues are thus the practical attitudes and habits adopted in obedience to those principles. They have been conventionally enumerated as seven because that number is supposed, when combined with its opposite number of seven deadly sins, to cover the whole range of human conduct.

The natural virtues are sometimes known as the four cardinal virtues (from Latin cardo, "hinge") because on them all lesser attitudes hinge. They are prudence, temperance, fortitude, and justice. This enumeration is said to go back to Socrates and is certainly to be found in Plato and Aristotle. Late Roman and medieval Christian moralists—such as Ambrose, Augustine, and Thomas Aquinas—took over the list as a convenient summary of the teaching of the ancient philosophers and of the highest excellence at which they aimed.

To these four, Christianity added the three theological virtues of faith, hope, and love. This classification was taken over directly from the Apostle Paul, who not only distinguished these three as the specifically Christian virtues but singled out love as the chief of the three: "So faith, hope, love abide, these three; but the greatest of these is love." According to Christian teaching, the theological virtues do not originate from the natural man. They are imparted by God through Christ and are then practiced by the believer.

In the Christian ethic, love, or charity, which is omitted from the list of the pagan philosophers, becomes the ruling standard by which all else is to be judged and to which, in the case of a conflict of duties, the prior claim must be yielded.

Exponents of situation ethics have argued against the recourse to a priori rules of conduct, asserting that every question of conduct must be decided in the light of its own particular circumstances and that the only principle

is that of love. On this showing it would appear that love remains the only virtue.

Virunga Mountains, Virunga also spelled BIRUNGA, also called M'FUMBIRO MOUNTAINS. volcanic range in east-central Africa, extending for about 50 miles (80 km) along the borders of Zaire, Rwanda, and Uganda. Of its eight major volcanic peaks, the highest is Karisimbi, at 14,787 feet (4,507 m). The name Virunga Volcanoes"), probably of Swahili derivation, has prevailed over the earlier M'fumbiro 'That Which Cooks"), which is still used in Ùganda. Individual volcanoes bear Rwandan descriptive names, such as Sabinyo (Sabinio; "Old Man with Large Teeth") and Muhavura "Landmark," or "Guide"). Snow and hail are frequent on Karisimbi, giving the mountain its white cap and its name, which means "Place of Cowrie Shells."

The six volcanoes of the centre and east are extinct. Mikeno and Sabinio are the oldest of these, dating from the early part of the Pleistocene Epoch (the Pleistocene began about 2,000,000 years ago and lasted until about 10,000 years ago); their craters have disappeared and erosion has imposed a jagged relief. In the middle of the Pleistocene Epoch, Karisimbi, Visoke, Mgahinga, and Muhavura appeared, all but Karisimbi possessing a crater summit. The crater of Muhavura contains a small lake. Not more than 20,000 years ago, Nyiragongo and Nyamulagira emerged at the western end of the chain, both with extensive craters. The main crater of Nyiragongo is about three-quarters of a mile (1.2 km) across and contains a liquid lava pool. The lava field of these two volcanoes has remained active, and some of the flows have reached as far as Lake Kivu, notable eruptions occurring in 1912, 1938, and 1948. Many lesser cones flank the major volcanoes.

In 1861 the British explorer John Hanning Speke saw the Virunga Mountains from a distance; in 1876 the British explorer Sir Henry Morton Stanley obtained a clear though distant view of the three eastern volcanoes; and Count Adolf von Götzen, a German, explored the two western volcanoes in 1894. The first maps resulted from the major expedition of Adolf Friedrich, duke of Mecklenburg, which was undertaken in 1907–08. Modern access to the western volcanoes is from Goma (Zaire) and Gisenyi (Rwanda); the remaining mountains are located within the circuit of roads connecting Goma and Rutshuru (Zaire), Kisoro (Uganda), and Ruhengeri and Gisenyi (Rwanda).

The Virunga Mountains rise out of densely populated plateaus that are inhabited mostly by Rwandan cultivators and, in certain areas, by cattle herders. Within the mountains a few pygmoid Twa cling to their earlier habitat. The southern sector of Zaire's Virunga National Park (q, v) includes those portions of the mountains that are within Zaire: the southern flanks of the central and eastern mountains comprise Kagera National Park (Parc National de la Kagera) in northwestern Rwanda; and there is a small game reserve on the Uganda slopes of Muhavura and Mgahinga. Conservation protects an inexhaustible field of scientific research and controls an incomparable assemblage of tourist assets, outstanding among which are contemporary volcanoes, alpine vegetation, and wildlife that includes the golden monkey and the mountain gorilla.

Virunga National Park, formerly ALBERT NATIONAL PARK, park in northeastern Zaire, central Africa. It was created in 1925 and has an area of 3,120 square miles (8,090 square km). Its southern tip touches the northern shore of Lake Kivu, bypassing the town of Goma to the east. The Virunga Mountains lie between Lakes Kivu and Edward and extend from Zaire to Rwanda and Uganda. The great volcanoes of this range, clothed with cloud forests, include the dormant Mikeno,

Karisimbi, Visoke, and Sabinyo (Sabinio) and the active Nyiragongo and Nyamulagira. Farther north are the Rutshuru Falls and the Mai ya Moto sulfur springs. Much of the park's central region is occupied by Lake Edward. To the northeast the Ruwenzori Range (q.v.) soars to more than 16,000 feet (4,880 m). The park has abundant wildlife, including elephants, hippopotamuses, rare mountain gorillas, and okapis.

virus, an infectious agent of small size and simple composition which can multiply only in living cells of animals, plants, or bacteria. A brief treatment of viruses follows. For full treatment, see MACROPAEDIA: Viruses.

Viruses are microscopic; they range in size from about 20 to 250 nanometres in diameter (1 nanometre = 10^{-9} metre). By contrast, the smallest bacteria are about 400 nanometres in size. A virus consists of a single- or doublestranded nucleic acid core surrounded by a protein capsid; some viruses also have an outer envelope composed of fatty materials (lipids) and proteins. The nucleic acid core carries the virus's genome—its collection of genesand may consist of either deoxyribonucleic acid (DNA) or ribonucleic acid (RNA). The protein capsid provides protection for the nucleic acid and may contain molecules that enable the virus to enter its appropriate host cell. Some viruses are rod-shaped, others are roughly spherical, and still others have complex shapes consisting of a multisided "head" and a cylindrical "tail."

Viruses are classified on the basis of their nucleic acid content, their size, the shape of the capsid, and the presence of a lipoprotein envelope. Thus, the primary division is into two classes: RNA viruses and DNA viruses.

Outside of a living cell, a virus is a dormant particle; but within an appropriate host cell, it becomes an active entity capable of subverting the cell's metabolic machinery for the production of new virus particles.

The virus's developmental cycle begins with the entrance of the particle's nucleic acid, and in some cases its proteins, into a susceptible host cell. Bacterial viruses adsorb and firmly attach to the surface of the bacterium and then penetrate the rigid cell wall, transmitting the viral nucleic acid into the host. Animal viruses enter host cells by a process called endocytosis. Plant viruses, by contrast, enter through wounds in the cell's outer coverings—e.g., through abrasions made by wind or through punctures made by insects.

Once inside the host cell, the viral genome usually directs the production of new viral components—new viral protein is synthesized and new viral nucleic acid is produced. These components are then assembled into complete virions (entire virus particles containing nucleic acid enclosed within a protein capsule), which are discharged from the host cell.

Among bacterial viruses, or bacteriophages. the release of the new virions is accomplished by lysing (bursting) the host cell. This pattern is called a lytic type of infection. Bacteriophages sometimes, however, show a different pattern of infection, called the lysogenic, or temperate, type. In a lysogenic infection, the viral genome forms a stable association with the chromosome of the host cell and replicates in concert with that chromosome prior to cell division. In such cases, no progeny virions are produced and the infecting virus seems to disappear. Its genome, however, is being passed on to each new generation of cells that stem from the original host. Occasionally, something will induce the latent viral genome to direct viral replication, with the subsequent bursting of the host cell and the release of new virions.

Closely related to the lysogenic pattern of infection is the phenomenon of transduction. Transduction is the process whereby a virus carries bacterial genes from one host to an-

other. This occurs when genes from the original host become incorporated into a virion that subsequently infects another bacterium. If this infection is of the lysogenic type, the genes from the original host may become part of the new host.

Viral infections of plant and animal cells resemble those of bacterial cells in many ways. The release of new virions from plant and animal cells does not, however, always involve the lysing of the host cell as it does in bacteria. Particularly among animal viruses, the new virions may be released by budding off from the cell membrane, a process that is not necessarily lethal to the host cell.

In general, a viral infection produces one of four effects in a plant or animal cell: inapparent effect, in which the virus lives dormantly in the host cell; cytopathic effect, in which the cell dies; hyperplastic effect, in which the cell is stimulated to divide prior to its death; and cell transformation, in which the cell is stimulated to divide, take on abnormal growth patterns, and become cancerous.

Viral infections in animals can be either localized or disseminated to many distant locations in the body. Some animal viruses produce latent infections; in these the virus persists in a quiescent state, becoming periodically active in acute episodes, as in the case of the hernes simplex viruses.

There are a number of different ways an animal can respond to a viral infection. Fever is a general response; many viruses are inactivated at temperatures just slightly above the host's normal body temperature. The secretion of interferon by infected animal cells is another general response. Interferon inhibits the multiplication of viruses in noninfected cells.

In addition to countering with fever and interferon production, which are general responses to infection by any viruses, humans and other vertebrates also can mount an immunological attack against a specific virus. The immune system produces antibodies and sensitized cells that are tailor-made to neutralize the infecting virus. These immune defenders circulate through the body long after the virus has been neutralized, thereby providing long-term protection against reinfection by this virus. This long-term immunity is the basis for active immunization against viral diseases. A weakened or inactivated strain of an infectious virus is introduced into the body. This virus does not provoke an active disease state, but it does stimulate the production of immune cells and antibodies, which then protect against subsequent infection by the virulent form of the virus. Active immunizations are now routine for such viral diseases as measles, mumps, poliomyelitis, and rubella.

In contrast, passive immunization is the injection of antibodies from the serum of an individual who has already been exposed to the virus. Passive immunization is used to give short-term protection to individuals who have been exposed to such viral diseases as measles and hepatitis. It is useful only if provided soon after exposure, before the virus has become widely disseminated in the body.

The treatment of an established viral infection usually is restricted to palliation of the specific symptoms; for example, fluid therapy may be used to control dehydration, or aspirin may be given to relieve aches and reduce fever. There are few drugs that can be used to directly combat an infecting virus. This is because viruses use the machinery of living cells for replication; drugs that inhibit viral development also inhibit the functions of the host cell. Nonetheless, a small number of antiviral drugs are available for specific infections.

The most successful controls over viral diseases are epidemiological. Large-scale active immunization programs, for example, can break the chain of transmission of a viral disease. Worldwide immunization is credited with the eradication of smallpox, once one of the most feared viral diseases. Because many viruses are carried from host to host by insects or contaminated food, insect control, and hygienic food handling can help eliminate a

virus from specific populations.

Historic descriptions of viral diseases date as far back as the 10th century BC. The concept of the virus, however, was not established until the last decade of the 19th century, when several researchers obtained evidence that agents far smaller than bacteria were capable of causing infectious diseases. The existence of viruses was proved when bacteriophages were independently discovered by researchers in 1915 and 1917. The question of whether viruses are actually microorganisms (similar to very tiny bacteria) was resolved in 1935, when the virus responsible for causing mosaic disease in tobacco was isolated and crystallized; the fact that it could be crystallized proved that the virus was not a cellular organism.

Because their genomes are small and because large quantities can be prepared in the laboratory, bacteriophages are a favourite research tool of molecular biologists. Studies of bacteriophages have helped to illuminate such basic biological processes as genetic recombination, nucleic acid replication, and protein synthesis.

Vis, Italian LISSA, Yugoslav island in the Adriatic Sea, the outermost major island of the Dalmatian archipelago. Its area is 35 sq mi (90 sq km), and its highest point is Mt. Hum, at 1,926 ft (587 m). Climate and vegetation are Mediterranean and subtropical, with palms, Mediterranean pines, citrus, eucalyptus, cacti, and early vegetables. Fishing and canning are important economic activities. Wine making is also important, and Vis has a long history of fine wines.

The town of Vis itself contains the ruins of the Greek colony of Issa, founded in 390 BC. The people were allied with Rome during several of its wars and became part of the empire in 47 BC. Slav settlers began arriving in the 8th century AD, and during the Middle Ages, Byzantium held sway over the island. Thereafter, it was ruled by Venice, Austria, Napoleon's short-lived Illyrian Provinces, and the Austro-Hungarian Empire; it became part of the new Yugoslav state in 1918.

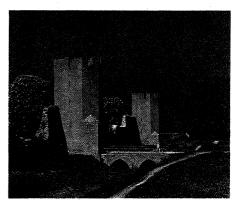

Major naval engagements were fought in nearby waters: in 1811 between Franco-Venetian and British fleets, the latter being victorious; and in 1866 between Austrian and Italian navies, the first clash of modern ironclad steam fleets, in which the Austrians won the day. During World War II the island was liberated from the Germans by Yugoslav Partisan forces and became a centre for joint Allied operations. Pop. (1981 prelim.) 4,134.

Visalia, city, seat (1853) of Tulare County, south central California, U.S., on the Kaweah River delta in the San Joaquin Valley, 42 mi (68 km) southeast of Fresno. Founded in 1852 by Nathaniel Vise, it developed as an agricultural (olives, grapes, cotton) and livestock-shipping centre, now supplemented by light manufacturing. It is the seat of the College of the Sequoias (1926). Sequoia and Kings Canyon National parks and the Mineral King Winter Sports Center are east. Inc. town, 1874; city, 1923. Pop. (1980) city, 49,729; (1982 est.) Visalia-Tulare-Porterville metropolitan area (smsa), 258,300.

Visayan, also spelled BISAYAN, any of three cultural-linguistic groups of the Philippines-Cebuano, Hiligaynon, and Samaran (qq.v.).

Visayas, also called BISAYAS, island group, central Philippines, between the Philippine (east) and Sulu (west) seas. The densely populated group of seven large and several hundred small islands constitutes an ethnolinguistic region of 23,582 sq mi (61,077 sq km), defined by the dominance of the four major Visayan dialects: Waray-Waray, Cebuano, Hiligaynon, and Aklanon. Bohol, Cebu, Leyte, Masbate, Negros, Panay, and Samar (qq.v.) are the main islands. Pop. (1980) 11,112,523

Visby, city and capital of the administrative län (county) of Gotland, southeastern Sweden, on the northwest coast of the island of Gotland, in the Baltic Sea. A Stone Age settlement of seal hunters and fishermen existed on the site c. 2000 BC. By the 12th century AD Visby's profitable trade with Europe had begun to attract foreign merchants, chiefly Germans, and the town became closely associated with Lübeck and other Hanseatic towns. It reached its zenith in the 13th century as a leading commercial centre of Europe, coining its own money and developing an international mar-

itime code. After the conquest of Gotland by the Danish king Valdemar IV Atterdag in 1361, however, Visby lost its importance in international trade.

Modern Visby still displays traces of its medieval heritage. Surrounding the medieval section is a 13th-century wall with 40 towers, 2.1 mi (3.4 km) long and reaching heights of more than 30 ft (9 m). A few lofty merchants' houses of limestone from the 13th and 14th centuries still line the narrow streets, while some houses span them on arches. Many relics of Visby's past are contained in Gotlands Fornsal, a museum devoted to history and medieval art.

Visby is the seat of a Lutheran bishop as well as the secular capital of Gotland. Residents are employed in administrative service, industry, trade, and handicrafts. There are steamer services to Nynäshamn, Oskarshamn, and Västervik; air connections with Stockholm, Malmö, and Norrköping; and bus services to various parts of Gotland. Pop. (1984) est.) 20,442.

Viscaceae, one of the mistletoe families of flowering plants of the sandalwood order (Santalales), including about 11 genera and more than 450 species of semiparasitic shrubs. This family is sometimes considered a subfamily of the mistletoe family (Loranthaceae).

Members of the Viscaceae are primarily tropical in distribution and are parasites on the branches of many tree species. The leaves are usually attached in pairs, one leaf opposite the other on the branch; they have parallel veins. Many species have scalelike leaves. The unisexual flowers are tiny, and the fruit is a one-seeded berry, the seed being covered with a sticky substance. The European mistletoe (Viscum album) and North American mistletoes of the genera Phoradendron and Arceuthobium are well-known members of the family.

viscacha, South American rodent belonging to the family Chinchillidae (order Rodentia), found in rocky, mountainous country (mountain viscacha) or on the Argentine pampas (plains viscacha).

Mountain viscachas, or mountain chinchillas

(*Lagidium*), are large eared, rabbitlike, and about 35 centimetres (13½ inches) long excluding the black, 25-cm tail. The soft fur, which is mixed with wool and used for yarn, is tan or grayish, often with a black middorsal

stripe. These viscachas are diurnal and gregarious and shelter in burrows or crevices. They are agile and feed on plants. Litters, usually of one young, are born two or three times a year; gestation is about three months.

Plains viscachas (Lagostomus maximus) are colonial and live in extensive burrow systems (vizcacheras) characterized by refuse, stones, and other objects piled by the animals around the entrances. Plains viscachas are coarse haired, blunt headed, and gray with black and white stripes across the face. They are about 50 cm long, excluding the 10-cm tail. There are usually two young per litter; gestation takes about four months. Agile and fast, plains viscachas are considered pests because of their burrowing and because they feed on grasses needed for domestic animals.

16th centuries. Hermann the Elder (died Jan. 13, 1488) established the foundry. His son Peter the Elder (b. 1460–d. 1529) was the most celebrated member of the family, producing monumental brasswork and bronzework that attracted patrons from as far off as Poland and Hungary. Works by Peter, who was assisted by his five sons, include the tomb of Archbishop Ernst von Sachsen in Magdeburg cathedral (1494–95); the colossal bronze figures of Theodoric and King Arthur (1513) for the tomb planned by the emperor Maximilian I; and the Shrine of St. Sebaldus in St. Sebalduskirche in Nürnberg, executed 1516, in which Peter incorporated his own portrait, complete with leather apron and tools.

Vischer, Friedrich Theodor von (b. June 30, 1807, Ludwigsburg, Württemberg—d. Sept. 14, 1887, Gmunden, Austria), German literary critic and aesthetician known for his efforts to create a theoretical basis for literary Realism.

Vischer's theories of aesthetics, based on ideas of Hegel, began to develop while he was teaching at Tübingen, where he had studied. He became a professor at Tübingen in 1844 but was suspended for two years because of an outspokenly liberal inaugural address. His work was finally published in six volumes as *Āsthetik*, oder Wissenschaft des Schönen (1846–57; "Aesthetics, or Fine Arts"). In 1855 he became professor at Zürich, but he returned to Tübingen in 1866.

Vischer's other works include Kritische Gänge, 2 vol., (1844; "Critical Path"), a collection of essays; and Altes und Neues (1881; "Old and New"). He also wrote a whimsical popular novel, Auch Einer, 2 vol. (1879; The Humour of Germany, 1892), and a collection of poems, Lyrische Gänge (1882; "Lyrical Pathways").

viscometer, instrument for measuring the viscosity (resistance to internal flow) of a fluid. In one version, the time taken for a given volume of fluid to flow through an opening is recorded. In the capillary tube viscometer, the pressure needed to force the fluid to flow at a specified rate through a narrow tube is measured. Other types depend on measurements of the time taken for a sphere to fall through the fluid, or of the force needed to rotate the inner cylinder of a coaxial pair (the space between the two cylinders being filled with the fluid under test), or of the rate at which oscillations of a disk vibrating in the fluid die out.

Visconti FAMILY, Milanese family that dominated the history of northern Italy in the 14th and 15th centuries.

Originating in the minor nobility, the family probably obtained the hereditary office of viscount of Milan early in the 11th century, transforming the title into a surname. The Visconti gained ascendancy in Milan through Pope Urban IV, who appointed Ottone Visconti (1207–95) archbishop of Milan in 1262 to counterbalance the power of the ruling Della Torre family. Ottone defeated the Della Torre at the Battle of Desio (1277), claimed the old temporal powers of the archbishops of Milan, and gradually transferred authority to his grandnephew Matteo I (see Visconti, Matteo I).

Acquiring the titles of imperial vicar (representative of the empire) and *signore* (lord) of Milan, the Visconti extended their sovereignty over many north Italian cities, arousing the opposition of Pope John XXII, who placed Milan under interdict and went so far as to preach a crusade against the Visconti.

After Matteo's abdication (1322) in favour of his son Galeazzo I (c. 1277–1328), the dynasty consolidated its power, continuing its territorial expansion and concluding marriage alliances with the rulers of other Italian cities and with princely families of France, Germany, and Savoy. When Galeazzo I was

succeeded by his son Azzo (1302-39), peace was concluded with the Pope (1329). A crisis created by Azzo's death without heirs in 1339 was solved with the election of his uncles Luchino (1292-1349) and Giovanni (1290-1354), younger sons of Matteo I, as joint lords. Under their rule, territory lost during the struggle against the pope was regained, and the boundaries of the state were further extended. After Luchino's death in 1349, the title of signore became hereditary. Giovanni Visconti, who also had become archbishop of Milan in 1342, continued as lord of Milan, while its territory was increased by the temporary annexation of Bologna and Genoa in the 1350s.

After Giovanni's death, the Visconti dominions were shared among his three nephews. When Matteo II (c. 1319–55) died, Bernabò (1323–85) and Galeazzo II (c. 1321–78) divided Milan and its territory, Bernabò taking the eastern area and Galeazzo II the western. Established at Pavia (south of Milan), Galeazzo II became a patron of artists and poets, including Petrarch, and founded the University of Pavia. Ruling independently, the brothers pursued a coordinated policy, their territorial interests involving them in all the Italian wars of the time, mainly against Florence and the popes.

After Galeazzo II died in 1378, Bernabò contracted a military alliance with the French prince Louis of Anjou and made plans to marry his daughter Lucia to Louis's son. In 1385 Galeazzo II's son Gian Galeazzo seized Bernabò, who died in prison a few months later

Under Gian Galeazzo the Visconti reached their greatest power. At his death in 1402, the Visconti were dukes of Milan and counts of Pavia, and the family controlled most of northern Italy (see Visconti, Gian Galeazzo). His rule was followed by the catastrophic reign of his elder son, Giovanni Maria (1388–1412), under whom Gian Galeazzo's conquests were lost and many Lombard cities reverted to local lords. Described by contemporaries as incompetent and morbidly cruel, perhaps insane, Giovanni Maria was assassinated by conspirators in 1412.

His brother Filippo Maria (1392-1447), succeeding to the dukedom, managed by marriage to the widow of the condottiere (mercenary captain) Facino Cane to gain control of Cane's troops and territories and gradually reconstructed the Visconti dominions. A neurotic recluse beset by bad health, Filippo Maria nevertheless succeeded in dominating Italian affairs. In Milan he reorganized the government finances and introduced the silk industry. In 1447, when a Venetian army advanced on Milan, Filippo Maria appealed for help to his son-in-law the condottiere Francesco Sforza, husband of his only daughter Bianca Maria. Filippo Maria died suddenly, however, leaving the duchy to be contested between Sforza and King Alfonso V of Aragon, whom Filippo Maria had designated his heir. Sforza won and soon restored the Visconti state under his own dynasty. Visconti governmental institutions survived into the 18th century, and, although the Visconti name disappeared with Bianca Maria, Visconti blood was transmitted through the female line to the great dynasties of Europe: the Valois of France, the Habsburgs of Austria and Spain, and the Tudors of England.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume.

Visconti, Gian Galeazzo, byname count of valour, Italian conte di virtò (b. 1351, Milan—d. Sept. 3, 1402, Melegnano, near Milan), Milanese leader who brought the Visconti dynasty to the height of its power and

almost succeeded in becoming the ruler of all northern Italy.

The son of Galeazzo II Visconti, who shared the rule of Milan with his brother Bernabò. Gian Galeazzo was married in 1360 to Isabella of Valois, daughter of the king of France. After his father's death in 1378, Gian Galeazzo succeeded him as ruler of the western half of Milan and its territory, with headquarters at Pavia, south of Milan. In 1382, when Bernabò contracted a military alliance with the French prince Louis of Anjou and planned to marry his daughter Lucia to Louis's son, Gian Galeazzo took alarm, viewing the marriage as an enhancement of Bernabo's position and a threat to his own. In 1385 he ambushed and captured Bernabò. Two months later, when Bernabò's granddaughter Isabella of Bavaria married Charles VI and became queen of France, the feud between uncle and nephew became an element in French politics. Bernabò died in prison the same year, possibly from poisoning. In 1387 Gian Galeazzo's daughter Valentina was married to the French king's brother Louis, duc d'Orléans, a union that later resulted in the claims of Louis XII and Francis I to the duchy of Milan.

Gian Galeazzo united all the Visconti dominions in his own hands and further amplified them by his military power and his clever manipulation of rival cities. An able administrator, he aimed at transforming his territories into a united state, and encouraged the training of government officials at the University of Pavia. During the second year of his reign, the building of the cathedral of Milan was begun, and in 1396 he founded the celebrated Carthusian monastery, the Certosa di Pavia. He was strongly influenced by the poet Petrarch, who had lived at Galeazzo II's court and had directed the collection of the Visconti library.

Overthrowing the della Scala dynasty of Verona in 1387, Gian Galeazzo gained control of the greater part of the March of Treviso (north of Venice). In return for a large bribe, the German king Wenceslas made him a hereditary prince of the Holy Roman Empire, with titles of duke of Milan (1395) and count of Pavia (1396). Pisa and Siena accepted Gian Galeazzo's lordship in 1399, Perugia and other Umbrian towns in 1400. In 1402 he annexed Bologna. Only Florence stood between him and the lordship of all northern Italy. Three months after the seizure of Bologna, his armies had been mustered for an attack on Florence when he died of the plague.

Visconti, Louis-Tullius-Joachim (b. Feb. 11, 1791, Rome—d. Dec. 23, 1853, Paris), Italian-born French designer of the tomb of Napoleon I and one of the architects of the French Bibliothèque Nationale.

Visconti's father, a celebrated Italian archaeologist, fled Rome with the boy in 1798. Visconti studied architecture with Charles Percier at the École des Beaux-Arts in Paris. He was awarded a second grand prix d'architecture and the prix départemental by the Academy and in 1825 was appointed architect of the Bibliothèque Nationale, where his chief responsibility was the restoration of the public reading room.

Visconti made his early reputation as a domestic architect, although he built a number of public fountains in Paris, including the Fontaine Gaillon (1824–28), the Fontaine Louvois (1835–39), and the Fontaine Molière (1841–43). He participated in the Picturesque and Gothic revivals, his works reflecting those fashions including the Château de Lussy (1844), which is modelled after an English cottage.

In 1842 Louis-Philippe ordered the ashes of Napoleon brought back to the Hôtel des Invalides, and Visconti was commissioned to design an appropriate tomb; the result was a sumptuous structure in variously coloured

marbles. After the accession of Napoleon III, Visconti was given the task of designing a connecting structure between the old Louvre and the Tuileries. Visconti's design was eventually carried out but with extensive decorative modifications by H.-M. Lefuel.

Visconti, Luchino, in full DON LUCHINO VISCONTI, CONTE (count) DI MODRONE (b. Nov. 2, 1906, Milan—d. March 17, 1976, Rome), Italian motion-picture director whose realistic treatment of individuals caught in the conflicts of modern society contributed significantly to the post-World War II revolution in Italian filmmaking and earned him the title of father of Neorealism. He also established himself as an innovative theatrical and opera director in the years immediately after World War II.

Born into an aristocratic family, Visconti was well acquainted with the arts: his mother was a talented musician, and throughout his childhood his father engaged performers to appear at their private theatre. He studied cello for 10 years and spent a short time as a theatrical set designer. He also had a solid classical education. In 1935 Visconti was hired as an assistant to the French motion-picture director Jean Renoir, who developed his sensitivity

to social and political issues.

Ossessione (1942; "Obsession"), an adaptation of James M. Cain's novel The Postman Always Rings Twice, established his reputation as a director. In it he used natural settings, combined professional actors with local residents, experimented with long-travelling camera shots, and incorporated sequences taken with hidden cameras to enhance authenticity. A masterpiece of realism, this film foreshadowed the postwar Neorealist work of such internationally important filmmakers as Roberto Rossellini and Vittorio De Sica. Six years later La terra trema (1948; The Earth Trembles), a documentary-style study of Sicilian fishermen filmed entirely on location and without actors, won the Grand Prize at the Venice Film Festival. Visconti's other widely acclaimed films include Bellissima (1951; The Most Beautiful) and Siamo donne (1953; We the Women), both starring Anna Magnani; Rocco e i suoi fratelli (1960; Rocco and His Brothers); and Il gattopardo (1963; The Leopard), based on the novel by Giuseppe di Lampedusa about a traditional aristocrat with liberal convictions, a character with whom Visconti strongly identified; Lo straniero (1967; The Stranger); La caduta degli dei (1969; The Damned); and Morte a Venezia (1971; Death in Venice). At the time of his death he had nearly finished editing his last film, L'innocente (The Innocent), based on the novel by Gabriele D'An-

As a theatrical director Visconti introduced to Italy the work of such French and U.S. playwrights as Jean Cocteau, Jean-Paul Sartre, Arthur Miller, Tennessee Williams, and Erskine Caldwell. He built up a repertory company that supplied actors for later films.

During the 1950s Visconti produced internationally recognized operas starring the soprano Maria Callas. Combining realism and spectacle, he scored artistic successes with productions of *La traviata* (1955), *La sonnambula* (1955), and *Don Carlos* (1958, Covent Garden, London).

Visconti, Matteo I, byname MATTEO THE GREAT, Italian MATTEO IL GRANDE (b. Aug. 15, 1250, Invorio, Lombardy—d. June 24, 1322, Milan), early head of the powerful dynasty of the Visconti, who for almost two centuries ruled Milan.

Installed as captain of the people in 1287 with the help of his great-uncle Ottone Visconti, archbishop of Milan, Matteo succeeded in extending his six-month term to five years and in being several times reelected. In 1294 the German king Adolf of Nassau made him imperial vicar in Milan. Exiled in 1302, when

the Della Torre family, rulers of the city in the first half of the 13th century, returned to power, he recovered Milan in 1310 with the aid of the Holy Roman emperor Henry VII. His position was strengthened by the Emperor's sojourn in Italy, and by 1315 he ruled through his own military efforts and those of his sons the important north Italian cities of Piacenza, Bergamo, Lodi, Como, Cremona, Alessandria, Tortona, Pavia, Vercelli, and Novara. Opposed in his drive for power by Pope John XXII, Matteo in 1317 renounced the title of imperial vicar to placate the Pope, assuming that of lord of Milan. The Pope, nevertheless, excommunicated him in 1320, accusing the Visconti of heresy and witchcraft, and declared an interdict against the city. In May 1322 Matteo abdicated in favour of his son Galeazzo I and died a month later.

Visconti-Venosta, Emilio, Marchese (Marquess) (b. Jan. 22, 1829, Milan—d. Nov. 24, 1914, Rome), Italian statesman whose political-diplomatic career of more than 50 years spanned Italian history from the Risorgimento to the power politics of World War I.

A youthful participant in the revolutionary movement against Austrian rule that began in 1848, Visconti-Venosta was forced in 1859 to flee to Piedmont; he served the government there in a diplomatic capacity during the War of Italian Independence (1859-60) that unified most of Italy under the Piedmont-Savoy dynasty. By 1863 he had become minister of foreign affairs of the new Italy. Falling from power because of his part in concluding the Convention of 1864 (in which France agreed to withdraw its troops from Rome in return for moving the Italian capital from Turin to Florence), he briefly became ambassador to Turkey before returning to the Foreign Ministry for the Six Weeks' War of 1866—a portfolio he briefly lost but resumed from 1869 to 1876, during which period Rome was the national capital

For the next 20 years he was out of the government as a man of the right; the disastrous Battle of Adowa (1896) in Ethiopia, which compromised the foreign policy of the left ministry, brought a new government in which Visconti-Venosta was again foreign minister. In the altered diplomatic world to which he returned, he undertook to improve Italy's relations with France in order to reduce dependence on Germany and Austria-Hungary, Italy's partners in the Triple Alliance. He negotiated an agreement in 1896 by which Italy recognized the French protectorate over Tunisia in return for a guarantee of the rights of Italians in Tunisia. After a year out of office he returned in May 1899 and continued the policy of rapprochement with France, paving the way for the agreement of 1902 by which Italy and France conceded each other a free hand in Morocco and Libya, respectively. He was the Italian delegate to the Algeciras Conference of 1906.

By the time of his death, Visconti-Venosta had seen his pro-French policy produce two gains, first the Italian occupation of Libya after the war with Turkey in 1911–12 and, more significantly, Italy's neutral posture on the outbreak of World War I.

viscosity, resistance of a fluid (liquid or gas) to a change in shape, or movement of neighbouring portions relative to one another. Viscosity denotes opposition to flow. The reciprocal of the viscosity is called the fluidity, a measure of the ease of flow. Molasses, for example, has a greater viscosity than water. Because part of a fluid that is forced to move carries along to some extent adjacent parts,

viscosity may be thought of as internal friction between the molecules; such friction opposes the development of velocity differences within a fluid. Viscosity is a major factor in determining the forces that must be overcome when fluids are used in lubrication and transported in pipelines. It controls the liquid flow in such processes as spraying, injection molding, and surface coating.

For many fluids the tangential, or shearing, stress that causes flow is directly proportional to the rate of shear strain, or rate of deformation, that results. In other words, the shear stress divided by the rate of shear strain is constant for a given fluid at a fixed temperature. This constant is called the dynamic, or absolute, viscosity and often simply the viscosity. Fluids that behave in this way are called Newtonian fluids in honour of Sir Isaac Newton, who first formulated this mathematical description of viscosity.

The viscosity of liquids decreases rapidly with an increase in temperature; the viscosity of gases increases with an increase in temperature. Thus, upon heating, liquids flow more easily, whereas gases flow more sluggishly.

The dimensions of dynamic viscosity are force times time divided by area. The unit of viscosity, accordingly, is newton-second per square metre.

For some applications the kinematic viscosity is more useful than the absolute, or dynamic, viscosity. Kinematic viscosity is the absolute viscosity of a fluid divided by its mass density. (Mass density is the mass of a substance divided by its volume.) The dimensions of kinematic viscosity are area divided by time; the appropriate units are metre squared per second.

viscount, feminine viscountess, a European title of nobility, ranking immediately below a count, or earl.

In the Carolingian period of European history of the vicecomites, or missi comitis, were deputies, vicars, or lieutenants of the counts, whose official powers they exercised by delegation. As the countships eventually became hereditary, the lieutenancies did so too: for instance, the viscounts in Narbonne, in Nîmes, and in Albi appear to have made their office hereditary by the beginning of the 10th century. Even so, viscounts remained for some time with no other status than that of the count's officers, either styling themselves simply vicecomites or qualifying their title with the name of the countship whence they derived their powers.

France. By the end of the 11th century, the universal tendency of feudalism to associate status with the possession of land caused the French viscounts to qualify their title with the name of their own most important fief. In Aquitaine, of which the counts of Poitiers were dukes, and in the county of Toulouse the viscounts were great barons often able to assert themselves against their suzerain (e.g., those of Limoges, of Turenne, of Béziers, and of Carcassonne). In the Île-de-France, in Champagne, and in part of Burgundy, on the other hand, the viscounts by the end of the 12th century were surviving only as minor feudatories, having lost their special administrative functions to the prévôts.

In Normandy, however, the judicial functions of the viscounts as deputies of the duke remained important; by the middle of the 11th century most of the country was administratively divided into vicontés (this explains the Norman use of the name viscounte or vicecomes for the sheriff in England); and under Henry I of England the hereditary holders of the vicontés in his Norman possessions were to a large extent replaced by ducal officials.

England. In England the viscountcy was not introduced into the peerage until nearly 400 years after the Norman conquest: John, Lord Beaumont, who had been created count of Boulogne in 1436, was in 1440 created Viscount Beaumont in the peerage of England, with precedence over all barons. The oldest English viscountcy surviving in the second half of the 20th century was that of Hereford, created in 1550; the oldest Irish one, however, that of Gormanston, was considerably senior, having been created in 1478.

Viscounts had been set up in Cat-Spain. alonia by Charlemagne in the 8th century, whence the title had spread, with diminishing functions and increasing nobility, to Aragon and to Castile. Philip IV of Spain introduced the system of vizcondados previos (regulations of 1631 and of 1664); under this, no one could proceed to the rank of conde (count) or marqués (marquess) unless he had previously been vizconde: a fee of 750 ducats had to be paid for this habilitating title (except in the case of counts' sons); and a further fee of 750 ducats was required for the obligatory cancellation of the vizcondado when the time came for conferring the higher rank. The removal of the obligation to cancel, in 1846, led only to confusion, as numerous families began petitioning to have their already cancelled titles revived; and in 1858 it was declared that the vizcondado previo was no longer necessary for accession to the higher titles.

Viscount Melville Sound, formerly MEL-VILLE SOUND, arm of the Arctic Ocean, District of Franklin, Northwest Territories, northern Canada. It is 250 mi (400 km) long and 100 mi wide. The discovery of this body of water,

reached from the east by Sir William Edward Parry (1819–20) and from the west (1850–54) by Sir Robert McClure, proved the existence of the Northwest Passage and provided passage through the Arctic archipelago. A crossroads of Arctic waterways, it lies between Banks, Victoria, and Prince of Wales islands on the south and Melville and Bathurst islands on the north. This section of the Northwest Passage is navigable only under favourable weather conditions.

vise, also spelled VICE, device consisting of two parallel jaws for holding a workpiece; one of the jaws is fixed and the other movable by a screw, a lever, or a cam. When used for holding a workpiece during hand operations, such as filing, hammering, or sawing, the vise

Bench and pipe vise

may be permanently bolted to a bench. In vises designed to hold metallic workpieces, the active faces of the jaws are hardened steel plates, often removable, with serrations that grip the workpiece; to prevent damage to soft parts, the permanent jaws can be covered with temporary jaws made from sheet copper or leather. Pipe vises have double V-shaped jaws that grip in four places instead of only two. Woodworking vises have smooth jaws, often of wood, and rely on friction alone rather than on serrations.

For holding workpieces on the tables of machine tools, vises with smooth hardened-steel jaws and flat bases are used. These machine vises are portable but may be clamped to the machine table when in use; means may also be provided for swivelling the active part of the vise so that the workpiece can be held in a variety of positions relative to the base. For holding parts that cannot be clamped with flat jaws, special jaws can be provided.

Viseu, town, capital, and concelho (municipality), Viseu district, northern Portugal, southeast of Porto. Notable landmarks include the Romanesque and Gothic cathedral (12th and 16th centuries) and the Museu de Grão-Vasco, a museum dedicated to the works of a 16th-century school of painting headquartered in Viseu. Nearby are the ancient city of Vaca and the Cava de Viriato, a Roman military colony founded in the 2nd century Bc. The locality is famous for its wine (called Dão) and annual agricultural fair. Local handicrafts include black pottery, bobbin lace, embroidery, and copper and wrought iron articles.

Viseu district has an area of 1,933 sq mi (5,007 sq km). Framed by the Caramulo, Arada, and Montemuro mountains in the west, the district is drained by the upper basin of the Mondego and Vouga rivers. It is densely populated in the more humid western plateaus, with impressive flights of cultivated terraces on the deep valley slopes, which produce chiefly corn (maize), cabbage, grapes, and sheep. There are uranium and tin deposits in the area. Pop. (1981) town, 21,454; concelho, 84,576; district, 421,752.

Vishākhapatnam, city, administrative headquarters of Vishākhapatnam district, northeastern Andhra Pradesh state, southern India. Located on the Bay of Bengal, Vishākhapatnam is an important shipbuilding centre. Improvements to the harbour have made it capable of accommodating ships with a draft of 33.5 ft (10.2 m). The first steamer to be built in India was launched in Vishākhapatnam's protected harbour in 1948. The city is a suburb of Waltair, where Andhra University is located. Vishākhapatnam exports manganese and oilseeds and has an oil refinery. A medical college and medical museums are located there.

Vishākhapatnam district, with an area of

about 4,325 sq mi (11,200 sq km), was once part of Srikākulam district but was divided from it in the 1940s. The west is dominated by the well-forested Eastern Ghāts, and the east is drained by numerous rivers, among them the Godāvari and Indrāvati. Agriculture is the mainstay of the economy. Pop. (1981) city, 565,321; metropolitan area, 603,630; district, 2,576,474.

Vishnu, Sanskrit VIṢNU, one of the principal Hindu deities, worshipped as the protector and preserver of the world and restorer of dharma (moral order). Vishnu, like Siva (the other major god of Hinduism), is a syncretic

personality who combines many lesser cult figures and local heroes. He is known chiefly through his *avatāras* (incarnations), particularly Rāma and Krishna.

Vishnu was not a major deity in the Vedic period. A few Rigvedic hymns (c. 1400–1000 BC) associate him with the sun and relate the always popular legend of his three strides across the universe (which later formed the basis of the mythology of his avatar Vāmana, the dwarf). Legends of other avatars are found in the early literature and by the time of the epic the Mahābhārata begin to be identified with Vishnu. In theory, Vishnu manifests a portion of himself anytime he is needed to fight evil, and his appearances are innumerable; but in practice, 10 are most commonly recognized (see avatar)

recognized (see avatar).

Temple images of Vishnu depict him either sitting, often in the company of his consorts Lakşmi (also called Śri) and Bhūmidevi (Earth); standing holding various weapons; or reclining on the coils of the serpent Śesa, asleep on the cosmic ocean during the period between the periodic annihilation and renewal of the world. The standing Vishnu is dressed in royal garments and holds in his four (sometimes two) hands the śańkha (conch), cakra (discus), gadā (club), or padma (lotus). On his chest is the curl of hair known as the śrivatsa mark, a sign of his immortality, and around his neck he wears the auspicious jewel Kaustubha. In painting, Vishnu is usually shown as dark complexioned, a distinguishing feature also of his incarnations.

Vishnu's mount is the bird Garuḍa; his heavenly abode is called Vaikuṇṭha. Among the 1,000 names of Vishnu (repeated as an act of devotion by his worshippers) are Vāsudeva, Nārāyaṇa, and Hari.

visible trade, in economics, exchange of physically tangible goods between countries, involving the export, import, and re-export of goods at various stages of production. It is distinguished from invisible trade, which involves the export and import of physically intangible items such as services.

Countries lacking various raw materials will import needed substances such as coal or crude oil from nations able to export such materials. Sometimes raw materials will be partially processed or converted into producer goods within the country from which they originate. Goods may also be processed into consumer goods prior to export or import and prior to the ultimate purchase by the buyer. These consumer goods may be durable (consumed over a period of time), as are appliances or automobiles, or nondurable (consumed almost immediately), as is food. Visible trade also includes the export and import of goods used directly in the production of other goods and services (capital goods) such as industrial machinery and equipment.

The relationship of visible trade exports to imports is reflected in a country's balance of trade or visible balance. A surplus in the balance of trade occurs when exports exceed imports and a deficit occurs when imports are greater than exports. The balance of trade is the major component of a country's balance of payments, which includes debits and credits resulting from invisible trade.

Visigoth, member of a division of the Goths (see Goth). One of the most important of the Germanic peoples, the Visigoths separated from the Ostrogoths in the 4th century AD, raided Roman territories repeatedly, and established great kingdoms in Gaul and Spain.

The Visigoths were settled agriculturists in Dacia when they were attacked by the Huns in 376 and driven across the Danube into the Roman Empire. They were allowed to enter the empire but the exactions of Roman officials soon drove them to revolt and plunder the Balkan provinces, assisted by some Ostrogoths. On Aug. 9, 378, they utterly defeated the army of the emperor Valens on the plains outside Adrianople, killing the Emperor himself. For four more years they continued to wander in search of somewhere to settle. In October 382 Valens' successor, Theodosius I, settled them in Moesia as federates, giving them land there and imposing on them the duty of defending the frontier. They remained in Moesia until 395, when, under the leadership of Alaric, they left Moesia and moved first southward into Greece and then to Italy, which they invaded repeatedly from 401 onward. Their depredations culminated in the sack of Rome in 410. In the same year Alaric died and was succeeded by Ataulphus, who led the Visigoths to settle first in southern Gaul, then in Spain (415).

In 418 they were recalled from Spain by the patrician Constantius, who later became emperor as Constantius III, and were settled by him as federates in the province of Aquitania Secunda between the lower reaches of the Garonne and Loire rivers. Their chieftain Wallia died soon after the settlement in Aquitaine was carried out, and he was succeeded by Theodoric I, who ruled them until he was killed in 451 fighting against Attila in the Battle of the Catalaunian Plains. Theodoric I is the first Visigothic leader who can properly be described as a monarch.

While persistently trying to extend their territory, often at the empire's expense, the Visigoths continued to be federates until 475, when Theodoric's son Euric declared himself an independent king. Euric also codified the laws issued by himself and his predecessors and fragments of his code, written in

Latin, have survived. It was under him, too, that the Gallic kingdom, of which the capital was at Toulouse, reached its widest extent. It stretched from the Loire to the Pyrenees and to the lower reaches of the Rhône and included the greater portion of Spain. Euric, a fervent Arian, was succeeded by his tolerant son Alaric II, who in 507 was defeated and killed by Clovis and the Franks at the decisive battle of Vouillé near Poitiers.

As a result of Vouillé the Visigoths lost all their possessions in Gaul apart from Septimania, a strip of land stretching along the coast from the Pyrenees to the Rhône with Narbonne as its capital, which the Franks were never able to wrest from them, although they often tried to do so. Henceforth, until they were finally destroyed by the Muslims in 711, the Visigoths ruled Septimania and much of Spain, with Toledo as their capital.

Visigothic art, artistic style produced in southern France and Spain under the Visigoths, who ruled the region between the 5th and the 8th century AD. The style is largely the result of local Roman traditions combined

with Byzantine influences. The effect of Germanic metalworking techniques is also seen in the decorative arts, but the ornamentation of these pieces, most notably a collection of jewelled crowns and crosses known as the treasure of Guarrazar (Museo Arqueológico Nacional, Madrid, and Musée de Cluny, Paris) owes nothing to the Germanic artistic traditions. Instead, plant and animal motifs from the Mediterranean and Eastern traditions are used.

The architecture of the Visigoths, although small in scale, was not unambitious: their masonry work was excellent, stone vaulting was often employed, and horseshoe arches were characteristic. Buildings of the 7th century, such as San Juan Bautista, Baños de Cerrato (661), were most often basilican (see basilica) in plan and short and wide in elevation. Interior and exterior ornamental sculpture was a distinctive feature of these churches.

vision quest, among the American Indian hunters of the eastern woodlands and the Great Plains, an essential part of a young boy's (or, more rarely, a girl's) initiation into adulthood. The youth was sent out from the camp on a solitary vigil involving fasting and prayer in order to gain some sign of the presence and nature of his guardian spirit (q, v). The specific techniques varied from tribe to tribe, as did the age at which the quest was to be undertaken, its length and intensity, and the nature of the sign.

In some traditions the youth would watch for an animal who behaved in a significant way; in others he discovered an object (usually a stone), which resembled some animal. In the predominant form, he had a dream in which his guardian appeared (usually in animal form), instructed him, took him on a visionary journey, and taught him songs. Upon receiving these signs and visions he returned to his home, indicated his success, and sought out a religious specialist for help in interpreting his visions.

The techniques of the vision quest are not confined only to those at puberty. They underlie every visionary experience of the Indian, from those of the ordinary man who seeks to gain contact with and advice from his guardian to the visions of the great prophets and shamans (religious personages with healing and psychic transformation powers). Among the South American Indians, the vision quest, like the guardian spirit, is confined exclusively to the shaman.

Viśiṣṭādvaita (Sanskrit: Nonduality of the Qualified), one of the principal schools of Vedānta, an orthodox philosophy of India. This school grew out of the Vaiṣṇava (worship of the god Vishnu [Viṣṇu]) devotional movement prominent in South India from the 7th century on. One of the early Brahmans (class of priests) who began to guide the movement was Nāthamuni (10th century), head priest of the temple at Śrīraṅgam (in modern Tamil Nadu state). He was succeeded by Yāmuna (11th century), who wrote some philosophic treatises but no commentaries.

The most towering figure is his successor, Rāmānuja, or Rāmānujācārya (master Rāmānuja, c. 1050-1137), who wrote commentaries on the Brahma-sūtras (the Śrībhāṣya, "Beautiful Commentary") and on the Bhagavadgītā; and a treatise on the Upanişads, the Vedārthasamgraha ("Summary of the Meaning of the Veda"). Rāmānuja was the first of the Vedanta thinkers who made the identifi-cation of a personal God with the Brahman of the *Upanişad*s and the *Vedānta-sūtra*s the cornerstone of his system. As a personal God, Brahman possesses all the good qualities in a perfect degree, and Rāmānuja does not tire of mentioning them. He interprets the relationship between the unitary and infinite Brahman and the plural and finite world in a novel way, which, however, has some support in the Upanisads. For him the relation between the infinite and the finite is like that between the soul and the body. Hence nonduality is maintained, while differences can still be stated. Soul and matter are totally dependent on God for their existence, as is the body on the soul.

God has two modes of being, as cause and as product. As cause, he is in his essence qualified only by his perfections; as product, he has as his body the souls and the phenomenal world. There is a pulsating rhythm in these periods of creation and absorption. For Rāmānuja, release is not a negative separation from transmigration, or series of rebirths, but, rather, the joy of the contemplation of God. This joy is attained by a life of exclusive

devotion (bhakti) to God, singing his praise, performing adulatory acts in temple and private worship, and constantly dwelling on his perfections. God will return his grace, which will assist the devotee in gaining release.

Visistādvaita flourished after Rāmānuja, but a schism developed over the importance of God's grace. For the southern, Sanskrit-using school, the Vaḍakalai, God's grace in gaining release is important, but man himself should make his best efforts. This school is represented by the thinker Venkaṭanātha, who was known by the honorific name of Vedāntadeśika (Teacher of Vedānta). The northern, Tamil-using school, the Tenkalai, holds that God's grace alone is necessary.

The influence of Visisṭādvaita spread far to the north, where it played a role in the devotional renaissance of Vaiṣṇavism, particularly under the Bengal devotee Caitanya (1485–1533). In southern India the philosophy itself is still an important intellectual influence.

visit and search, procedure adopted by a belligerent warship to ascertain whether a merchant vessel is liable to seizure. If an inspection of the papers shows the ship to be an enemy vessel or to be carrying contraband, breaking blockade, or engaging in unneutral service, it is immediately captured. More often there is merely suspicion of such activities, in which case the vessel may be searched. If the searchers are satisfied the vessel is innocent, it is allowed to proceed. If suspicion remains, it may be brought into port for a more thorough search. If it is finally declared innocent and a prize court considers there was no probable cause for capture, the court may order damages to be paid.

As the size of modern ships makes it impossible to search them thoroughly on the high seas, the practice of taking them automatically into port for search was adopted by British warships in World War I. The United States, however, protested on the ground that international law did not permit diversion of the vessel unless search at sea showed probable cause for capture. As a result, the British adopted the navicert system in 1916. The navicert issued by the belligerent's representative in a neutral country was tantamount to a ship's passport, possession of which ensured, in the absence of suspicious circumstances, that the vessel would be allowed to proceed on its way

While the principle of freedom of the seas normally forbids visit and search of foreign merchant vessels on the high seas in time of peace, the practice has occasionally been extended to "pacific blockades" instituted as measures of reprisal, usually by a large state against a small one. On Oct. 23, 1962, for example, U.S. Pres. John F. Kennedy proclaimed a "quarantine" of Cuba, under which any vessel suspected of carrying prohibited materials, especially missiles, to Cuba would be intercepted within a designated zone around Cuba, stopped, visited, searched, and, if found to be carrying such materials, diverted. If it attempted to escape or resist, it would be shot at and perhaps sunk. A few Soviet vessels were diverted, but none were sunk, and the crisis was soon terminated. This procedure, which resembled pacific blockade, was criticized as contrary to the UN Charter, which prohibited the use or threat of force except in defense against armed attack.

visitador (Spanish: "inspector"), plural VISITADORES, royally appointed official sent periodically in the late Middle Ages to investigate the administration of justice in the towns of the Spanish Kingdom of Castile. In the late 15th century, the visitadores were also enjoined to inspect the other aspects of civic administration, including finances and the state of repair of roads and bridges.

The institution of the *visita* ("inspection") was applied also to the Spanish colonies in the

Americas. The visitador reported to the Council of the Indies (colonial office) in Madrid. Visitas were to be initiated without warning; they might concern only one official or province or an entire principal colonial jurisdiction (a viceroyalty or captaincy general), in which case the inspector was called a visitador general. Nonroyal appointees were investigated by inspectors appointed by the viceroy or president (chief colonial officials) with the collaboration of the audiencia (the administrative and judicial tribunal within their jurisdictions).

King Philip II of Spain (1556-98) made the visita a regular feature of colonial government. Visitas were usually initiated when complaints against specific colonial officials were lodged with the government in Madrid. The Council of the Indies might order a further investigation if one of the involved parties challenged the original report of the visitador. The visita (1765-71) of José Gálvez, appointed by Charles III, in New Spain resulted in widespread reforms throughout the Spanish-American colonies. Unlike many visitadores, Gálvez forcefully and honestly executed his royal commission even in the face of strong opposition by colonial officials with vested interests, including the viceroy, who was replaced at Gálvez' suggestion.

Visitandine, member of visitation order. formally congregation of the visitation OF HOLY MARY (V.H.M.), a Roman Catholic order of nuns founded by St. Francis de Sales and St. Jane Frances de Chantal at Annecy, Fr., in 1610. The order was originally destined for charitable work, visiting and caring for the sick and poor in their homes, as well as for prayer. But, after five years of this work, the founders were obliged to accept a rule of strict enclosure, or cloistered life, which at the time was considered an indispensable adjunct of the religious life for women. Although Francis de Sales did not intend for the Visitation nuns to embrace the teaching apostolate, they nevertheless were conducting private academies before 1641. In modern times many Visitandines are devoted to education. The unifying apostolate of the order is the spread of devotion to the Sacred Heart of Jesus. When Francis de Sales died in 1622, there were 13 monasteries; in 1641, the year of Jane de Chantal's death, the number was 85; on the eve of the French Revolution, the order numbered nearly 200 monasteries, with about 7,000 religious. In the late 20th century there were about 190 monasteries.

Visitation, the visit, described in the Gospel According to Luke (1:39–56), made by the Virgin Mary, pregnant with the infant Jesus, to her cousin Elizabeth. At the sound of Mary's greeting, the pregnant Elizabeth felt the infant St. John the Baptist leap in her womb, which, according to later doctrine, signified that he had become sanctified and cleansed of original sin. Mary then said the Magnificat (q.v.). The Feast of the Visitation of the Blessed Virgin Mary is celebrated in the Roman Catholic Church on May 31 (or, until 1969, on July 2)

Until the 12th century, representations of the visitation showed the two women greeting each other either with formality and reserve (in the severe tradition of Hellenistic art) or with a tender embrace (of Syrian origin). The more emotional version, in accordance with a later medieval taste for realism, became predominant from the 12th century on. The growing importance of the Virgin as an object of devotion brought about another change at the beginning of the 15th century: Elizabeth was shown kneeling before her cousin. Also in the 15th century, a peculiar version of Byzantine origin began to gain popularity in the west and was widely adopted for a time; it showed the child John the Baptist, visible in the womb of Elizabeth, saluting the Child Jesus,

visible in Mary's womb. This representation was outlawed by the Counter-Reformation Council of Trent, which considered it undignified, and the more sedate version showing Elizabeth kneeling was later imposed.

Visscher, Anna (Roemersdochter) (b. Feb. 2?, 1583, Amsterdam, Neth.—d. Dec. 6, 1651, Alkmaar), Dutch poet and daughter of the Renaissance man of letters Roemer Visscher. She was admired and praised in verse by such poets as Constantijn Huygens and Pieter Corneliszoon Hooft.

Anna Visscher's poetry is rather stiff and impersonal; she wrote for the most part sonnets and lofliederen, cleverly devised odes to important personages. She spent 12 years (1602–14) translating Cent emblèmes Christiens ("A Hundred Christian Emblems") by Georgette Montenay (first published 1854), but her main contribution to Dutch literature was her publication of a revised and improved version of Roemer Visscher's Sinnepoppen ("Emblems") in 1640.

Visscher, Roemer (Pieterszoon) (b. 1547, Amsterdam, Spanish Habsburg domain [now in The Netherlands]—d. Feb. 19, 1620, Amsterdam), poet and moralist of the early Dutch Renaissance who was at the centre of the cultural circle that included the young poets Pieter C. Hooft, Joost van den Vondel, and Gerbrand Bredero. A friend of Henric L. Spieghel and Dirck Coornhert, he was foremost in the movement for the purification and standardization of the Dutch language and the extension of its use in education.

Like most versatile Renaissance men of letters, Visscher did not take himself seriously as a poet. He called his only poetry volume *Brabbeling* ("Jabbering"), and it was first published in 1612 without his knowledge. For the most part love poems, the work as a whole contains many allusions to Dutch social, political, and domestic life, presenting an authoritative picture of Visscher's Amsterdam.

The style of the poems varies from fashionable wordplay to a simple, individual use of language that occasionally produces a poignancy rarely found in poetry of the time.

Visscher's other main work, Sinnepoppen (1614; "Emblems"), is a collection of short moral pieces, again showing the writer's preference for essentially Dutch themes and objects.

Visser 't Hooft, Willem Adolph (b. Sept. 20, 1900, Haarlem, Neth.—d. July 4, 1985, Geneva, Switz.), Dutch clergyman and theologian who led the World Council of Churches as its secretary-general from 1948 to 1966.

Visser 't Hooft was educated at the Haarlem Gymnasium and prepared for the ministry of the Netherlands Reformed Church at the University of Leiden. His long career as a leader of Christian organizations began with the post of secretary of the World Committee of the Young Men's Christian Association in 1924, which he left in 1931 to become general secretary of the World Student Christian Federation. He was ordained a minister of the Reformed Church of Geneva in 1936.

The movement for cooperation and fellowship between the various Christian churches had resulted in the provisional formation in 1937 in Utrecht, Neth., of the World Council of Churches, and Visser 't Hooft was chosen to be its secretary-general in 1938. After the interruption of this work during World War II, Visser 't Hooft emerged in the postwar decades as a pivotal figure in the ecumenical movement. Under his leadership the World Council of Churches was officially constituted in 1948 by 147 Protestant and Orthodox Catholic denominations, and the organization grew to include nearly 300 denominations in the following decades. Visser 't Hooft played a major role in the inclusion of churches from communist countries in the World Council, and he also sought to enlarge the role played by African, Asian, and Orthodox churches in the organization. His efforts to include the Roman Catholic church as a member proved unsuccessful, however.

Visser 't Hooft served as editor of the *Ecu*menical Review from 1948 to 1966. He was also the author of numerous books on the ecumenical movement and the nature and functions of the church.

Vistula Lagoon, German frisches haff, Polish zalew wiślany, Russian vislinsky zaliv, shallow, marsh-fringed lagoon on the Baltic coast, bisected by the Polish-Soviet border and considered part of the Gulf of Gdańsk. Covering 330 square miles (855 square km), it is 56 miles (90 km) long, 6 to 15 miles (10 to 19 km) wide, and up to 17 feet (5 m) deep. The Nogat, the eastern distributary of the Vistula River delta, is the principal river entering the lagoon. The long, narrow Vistula Spit protects the lagoon from the main body of the Gulf of Gdańsk (northwest); and a narrow, dredged channel offers access to the gulf and the Baltic for the important port of Kaliningrad (U.S.S.R.). Other ports include Elblag (Poland) and Baltisk (U.S.S.R.). The lagoon has important fisheries.

Vistula River, Polish WISŁA, largest river of Poland and of the Baltic Sea's drainage basin, rising in the Beskid mountains of southern Poland.

The following article summarizes information about the Vistula River. For full treatment, see MACROPAEDIA: Europe.

The Vistula flows east and then north through Poland, entering the Baltic Sea through an extensive delta region east of the city of Gdańsk. Its length is 651 miles (1,047 km), and it drains an area of 75,067 square miles (194,-424 square km), of which more than four-fifths lies in Polish territory.

The course of the Vistula may be said to consist of three principal sections. Its upper

reaches extend from its source generally eastward through Kraków to where it receives the San River near Sandomierz. Along its middle reaches, the Vistula flows northward in a great curve from the mouth of the San to that of the Narew River, near Warsaw. Passing Warsaw, it flows northwestward past Toruń, until, near Bydgoszcz, it turns sharply northeastward to enter the Baltic Sea; in the past there were two main branching channels to the Baltic—the Nogat to the Vistula Lagoon and the Leniwka (now called the Martwa Vistula) to the Gulf of Gdańsk—but the main branch is now a channel running directly to the sea from Świbino. The main right-bank tributaries of the Vistula include the Bug, Wieprz, San, Wisłoka, and Dunajec rivers; the Nida, Pilica, Brda, and Wierzvca enter from the left bank.

Climatic variations in the Vistula River basin cause a diversity in runoff and hence marked oscillations in the water level of the river. The Vistula is only navigable by small vessels upstream from the San River; below this point it is accessible to steamers (carrying coal, lumber, and industrial products) between the heavy-industrial centres of Poland in Silesia and the Baltic ports. Eastward the Bug and Narew rivers and the Dnepr-Bug Canal link the Vistula with the vast inland-waterway system of the Soviet Union.

visual-field defect, a blind spot (scotoma) or blind area within the normal bounds of vision. In most cases the blind spots or areas are persistent, but in some instances they may be temporary and shifting, as in the scotomata of migraine headache. Narrowing of the fields of vision may be due to syphilitic inflammation of the optic nerves or to glaucoma. In this type of defect the field of vision widens as the distance from the observed object increases. In hysteria another type of narrowed vision sometimes occurs, called tunnel vision, or shaft vision, in which the field does not widen with distance.

Constriction of the visual field with enlargement of the natural blind spot at the centre of the field comes from papilledema, the abnormal collection of fluid in the optic disk. The optic disk is the point at which the optic nerve enters the eye; the small blind spot normally present in the centre of the visual field results from the absence of retinal visual cells—rods and cones—in the optic disk.

Blind spots in the interior of the visual fields can result from a number of other causes, including poisoning with wood alcohol or with quinine, diseases that attack the nerve sheaths, deficiency diseases, and atherosclerosis, a form of blood vessel disease in which fatty plaques form in the innermost layer of the vessels.

Blindness in one-half of each of the visual fields is also encountered. This may be in corresponding halves of the fields (homonymous hemianopia) or in the inner or the outer halves (nasal or temporal hemianopia). Similarly, a quarter of each field may be involved. The extent and the location of the blind areas in the visual fields may be clues concerning the location of the lesion responsible. Bitemporal hemianopia—blindness in the two outer halves of the visual fields-suggests, for example, a lesion in the optic chiasma, the point at which the optic nerves from the two eyes meet and at which some of the nerve fibres from one retina cross over to the opposite side of the brain. A tumour of the pituitary may press upon the chiasma and have this effect.

visual pigment, any of a number of related substances that function in light reception by animals by transforming light energy into electrical (nerve) potentials.

It is believed that all animals employ the same basic pigment structure, consisting of a coloured molecule, or chromophore (the carotenoid retinal, sometimes called retinene), and a protein, or opsin, of moderate size. Retinal, is derived from vitamin A₁; retinal, is derived from vitamin A2.

Many vertebrate animals have two or more visual pigments. Scotopsin pigments are associated with vision in dim light and, in vertebrates, are found in the rod cells of the retina; the retinal, forms are called rhodopsins, and the retinal, forms porphyropsins. Photopsin pigments operate in brighter light than scotopsins and occur in the vertebrate cone cells; they differ from the scotopsins only in the characteristics of the opsin fraction. The retinal, forms are called iodopsins; the retinal, forms cyanopsins.

Viśvakarman (Sanskrit: "All Accomplishing"), in Hindu mythology, the architect of the gods. The name was originally used as an epithet of any powerful god but later came to personify creative power. Viśvakarman is the divine carpenter and master craftsman who fashioned the weapons of the gods and built their cities and chariots. He is the architect of the mythical city, Lanka, and is also said to have made the great image of Jagannātha at Puri (Orissa). He revealed the sciences of architecture and mechanics to men and is the patron deity of workmen, artisans, and artists.

Vitaceae, the grape family of flowering plants, in the buckthorn order (Rhamnales), comprising 12 genera of woody plants, most of them tendril-bearing vines. The largest genus, which is pantropic in distribution, is Cissus, containing about 350 species. Vitis, with about 60 to 70 species, is the one genus in the family of great economic importance; it includes the European wine grape (V. vinifera) and the North American fox grape (V. labrusca), the parent species of most of the cultivated slipskin American grapes. The Boston ivy (q.v.; Parthenocissus tricuspidata) and the Virginia creeper (q.v., P. quinquefolia) are well-known woody vines common in the eastern United

Vital, Ḥayyim ben Joseph (b. 1543, Safed, Palestine [now Zefat, Israel]—d. May 6, 1620, Damascus [now in Syria]), one of Judaism's outstanding Kabbalists (expounder of Jewish esoteric or occult doctrine).

In Safed, Palestine, in about 1570, Vital became the disciple of Isaac ben Solomon Luria, the leading Kabbalist of his time, and after Luria's death (1572) Vital professed to be the sole interpreter of the Lurian school. He became the leader of Palestinian Jewish Kabbalism and served as rabbi and head of a yeshiva (school of advanced Jewish learning) in Jerusalem (1577-85). His major work was the 'Etz hayyim ("Tree of Life"), a detailed exposition of Lurian Kabbala, which also appeared in altered editions by rivals that he repudiated. His son Samuel published accounts of Vital's dreams and visions posthumously under the title Shivhe R. Hayyim Vital

vital rates, relative frequencies of vital occurrences that affect changes in the size and composition of a population. When calculated per 1,000 inhabitants—as is conventional in vital-statistics publications—they are referred to as crude rates. More refined rates often must be used in the more meaningful analysis of population change.

Principal among vital rates are the crude birth rate and the crude death rate; i.e., annual numbers of births or of deaths per 1,000 population, based on the midyear population estimate. The difference between these two rates is the rate of natural increase (or decrease, if deaths exceed births). Rates of natural increase are a net result of fertility trends,

health conditions, and variations in the age composition of the population. They approximate rates of population growth, a result of natural increase and the balance of migration (immigrants minus emigrants), when the latter is comparatively small.

The marriage rate records the annual number of marriages per 1,000 inhabitants. It is a crude measure, since, aside from the effects of age composition and preferred ages at marriage, it also is influenced by remarriages of previously widowed or divorced persons. More importantly, it does not include marriage unions that are not legally formalized, and there are differences in the definition of legal marriage. Some countries, for example, recognize common-law marriages as legal, while others do not; and in some Latin-American countries, marriages performed under indigenous tribal rites are not recorded as legal. Divorce rates and the infant mortality rate complete the set of most widely published vital rates. The infant mortality rate is calculated as the number of infant deaths (deaths of children under 12 months of age) occurring in a given year per 1,000 live births occurring in the same year.

These vital rates are widely used and facilitate much useful comparison of time trends and of local variations within or among countries. Being summary measures, they do not reveal many factors that may have a distorting effect for purposes of more specialized comparison. Chief among these factors is the variable age composition of the population. Thus, the crude birth rates are somewhat distorted measures of reproductivity, because the percentage of total population at reproductive ages is not taken into account. The crude death rates distort the comparison of mortality conditions to an even greater extent. Even under the best health conditions, mortality is at least relatively high at advanced ages; therefore, the proportion of aged persons in the population—e.g., those aged 65 and overhas a large effect. See also mortality.

For international statistical data on the principal vital rates, see the Britannica World Data section in the BRITANNICA WORLD DATA ANNUAL.

Vitale DA BOLOGNA, Vitale also spelled D'AIMO DE' CAVALLI, OF VITALE DELLE MADONNE (b. c. 1309, Bologna, Emilia [Italy]—d. 1361), Italian painter of the Bolognese school whose early 14th-century paintings in the International Gothic style show a marked Sienese influence.

The first official record of Vitale was in Bologna, where he painted the Odofredi Chapel in the Church of San Francesco. During this period he is credited with painting the "Last Supper" (1340; Pinacoteca, Bologna) for a room of the Monastery of San Francesco, as well as lyrical frescoes for the Chapel of San Lorenzo and the guesthouse of San Francesco.

In 1348 he went to Udine, where he painted the Chapel of San Nicolo in the cathedral there. The frescoes of the life of St. Nicholas in this church have a Giottoesque monumentality of form. The "Madonna dei Battuti" (Vatican Museum) and "Madonna dei Denti" (1345; Galleria Davia-Bargellini, Bologna) are among the only signed works of the artist. The influence of Giovanni Pisano as well as of the Sienese can be seen in the "Madonna dei Denti." The frescoes in the Church of Santa Maria dei Servi in Bologna and in the apse of the Santa Maria in Pomposa (1351) have also been attributed to Vitale. The fresco of the story of St. Eustase, in Pomposa, shows Vitale's use of more violent movement in his compositions.

Vitale's defined work generally displays a play of masses defined by a restless Gothic line. He returned to the serene elegance of his earlier work, however, in the frescoes of the Church of Santa Maria dei Servi in Bologna (c. 1355). Other works attributed to Vitale are a Nativity fresco (Pinacoteca Nazionale. Bologna), believed to have been painted in 1350; the "Adoration of the Magi" (National Gallery, Edinburgh); a "St. Anthony" (Pinacoteca Nazionale), and a "St. George and the Dragon" (Pinacoteca, Bologna).

Vitalian, SAINT, Latin VITALIANUS (b. Segni, Duchy of Rome—d. c. Jan. 27, 672, Rome; feast day January 27), pope from 657 to 672. Consecrated as St. Eugenius I's successor on July 30, 657, Vitalian soon dealt peacefully with monothelitism, a heresy maintaining that Christ had only one will. In 648 the Byzantine emperor Constans II had issued his Typos, an edict forbidding discussion of the monothelite question and attempting to impose unity on the church. Instead, the Typos caused a schism between the Eastern and Western churches. Vitalian avoided condemnation of the Typos, whereupon Constans confirmed his election to the papacy. In 663 Constans visited Rome, where he was royally received by the pope.

the bronze ornaments of Rome. In 668 Vitalian consecrated St. Theodore of Tarsus as the first archbishop of Canterbury to rule the whole English church.

Constans, in return, however, confiscated all

vitalism, school of scientific thought—the germ of which dates from Aristotle-that attempts (in opposition to mechanism and organicism) to explain the nature of life as resulting from a vital force peculiar to living organisms and different from all other forces found outside living things. This force is held to control form and development and to direct the activities of the organism. Vitalism has lost prestige as the chemical and physical nature of more and more vital phenomena have been shown.

vitamin, any of various organic compounds that are required in minute quantities in the diet of most animals for the maintenance of normal metabolic functions. Vitamins act especially as coenzymes and precursors of coenzymes in the regulation of metabolic processes. Unlike the macronutrients (proteins, carbohydrates, and fats), they do not provide energy or serve as building units.

A brief treatment of vitamins follows. For full treatment, see MACROPAEDIA: Biochemi-

cal Components of Organisms.

The value of certain foods in maintaining health was recognized long before the first vitamins were actually identified. In the 18th century, for example, it had been demonstrated that the addition of citrus fruits to the diet would prevent the development of scurvy. In the 19th century it was shown that substituting unpolished for polished rice in a ricebased diet would prevent the development of beriberi. Despite these observations, however, it was not until the early 20th century that the existence of vitamins was actually established. In 1906 the British biochemist Sir Frederick Hopkins demonstrated that foods contained necessary "accessory factors" in addition to proteins, carbohydrates, fats, minerals, and water. Then, in 1912, the chemist Casimir Funk identified that the antiberiberi substance in unpolished rice was an amine (a type of nitrogen-containing compound), so Funk proposed that it be named vitamine—i.e., vital amine. This term soon came to be applied to the "accessory factors" in general, all of which were originally thought to be closely related. It was later discovered that different vitamins have different chemical properties and different functions and that many of them do not contain amines at all. Because of its wide currency, Funk's term continued to be used, but the final e was dropped.

In 1912 Hopkins and Funk advanced the vitamin hypothesis of deficiency, a theory that postulates that the absence of sufficient amounts of a particular vitamin in a system may lead to certain diseases, such as scurvy or beriberi. The letters which were assigned to vitamins in the early days of vitamin research categorize them according to their function. As further research revealed the chemical structure of these substances, they received scientific names, although they are still popularly known by their letter classifications (e.g., vitamin B_2 for riboflavin).

Although the need for vitamins has been demonstrated in a wide range of animals—and even in heterotrophic bacteria and yeasts—a substance that is a vitamin for one species is not necessarily a vitamin for another. Moreover, a substance that can be manufactured by an organism may still be considered a vitamin for that organism if the synthesis of the substance is not always sufficient to meet the organism's metabolic needs. The human nutrient vitamin D, which is essential for bone growth, is an example of such a substance. A form of vitamin D is synthesized in the skin when that tissue is exposed to sunlight. If this tissue synthesis of vitamin D is not sufficient to meet a person's metabolic needs (as is often the case in children, whose rapid skeletal growth requires relatively large amounts of vitamin D), the substance must be provided from the diet. A somewhat similar situation exists with the human nutrient vitamin K. This substance cannot be made by the human body, but it is readily synthesized by the bacteria that normally flourish in the human colon. This bacterial product is absorbed through the colon wall, thereby providing the metabolic needs of the human. It is only when the normal bacterial flora of the colon has been destroyed—for example, by large doses of antibiotics—that vitamin K must be provided in the diet.

In regard to human nutrition, the vitamins can be divided into two categories: water-soluble vitamins (the B vitamins and vitamin C) and fat-soluble vitamins (A, D, E, and K).

Water-soluble vitamins are absorbed by the intestine and carried by the circulatory system to the specific tissues in which they will be put into use. They are distinguished from each other by the degree to which they are soluble in water, a factor that influences their route inside the body. When intake of water-soluble vitamins exceeds a person's need for them, they are stored to a limited extent in body tissue, but most of the excess is excreted in urine.

In their free state, B vitamins are inactive. They must go through several chemical processes to perform their function within the body. Only with the addition of other substances or parts of other molecules do they reach their functional, or coenzyme, form. The coenzyme is a compound that unites with a protein component called an apoenzyme to form an active enzyme. The enzyme then acts as a catalyst in various metabolic and regulatory processes.

The physiological functions of vitamin C are well known, but its precise metabolic mechanisms are less certain. It is not known whether vitamin C acts as a coenzyme. Vitamin C is essential for the growth of bones and teeth, for the maintenance of the subcutaneous tissues and the walls of the blood vessels, and for the healing of wounds. A highly debated medical hypothesis which suggests that the intake of high quantities of vitamin C can help prevent or cure some diseases (such as the common cold and some infectious and malignant diseases) continues to be investigated but with no clear scientific data to support the claims.

The intestine absorbs fat-soluble vitamins with the help of bile salts. The lymph system carries these vitamins to the different parts of the body. The body can store larger amounts of fat-soluble vitamins than of water-soluble ones. The liver provides the chief storage tis-

sue for vitamins A and D, while vitamin E is stored in body fat and to a lesser extent in reproductive organs. Relatively little vitamin K is stored.

The fat-soluble vitamins perform different functions. Vitamin A combines with proteins in the retina of the eye to aid in night vision. It may have other functions that are as yet uncertain. Vitamin D is essential to the growth of the organism, especially in calcium metabolism for bone growth. Vitamin E also facilitates animal growth: deficiencies in the substance cause infertility in some species. Vitamin K is necessary in the enzymatic processes in blood clotting.

vitamin A, a fat-soluble alcohol, most abundant in fish and especially in fish-liver oils. Vitamin A is also found in butter and in the liver fat of various animals. Vitamin A is not present in plants, but many vegetables and fruits contain one or more of a class of pigments that can be converted to vitamin A in the body; of these pigments, β -carotene (provitamin A) is an excellent source of the vitamin. The colour of carrots largely results from their β -carotene content.

Vitamin A is readily destroyed upon exposure to heat, light, or air. The vitamin, which functions directly in vision, is a component of a pigment, called visual purple, present in the retina of the eye.

Several closely related compounds with the effects of vitamin A are found in animal fats. Freshwater-fish oils, for example, contain, in addition to vitamin A, vitamin A_2 , which differs from the former by having two fewer hydrogen atoms. Vitamin A_2 can also form a visual pigment.

Vitamin A is required by humans in very small amounts; the recommended dietary allowance for adults is 1.0 mg. This can be provided by 6 mg of β -carotene.

The existence of vitamin A was first clearly recognized in 1913; its chemical nature was established in 1933; and it was first synthesized in 1947.

vitamin A deficiency, dietary lack of vitamin A resulting in various disorders that most commonly involve the eye and the epithelial tissues (the skin and the mucous membranes lining the internal body surfaces).

In humans, one of the earliest signs of vitamin A deficiency is night blindness (nyctalopia), the visual failure to adapt promptly from light to darkness and to see in the dark. This aspect of vision is normally dependent on visual purple, or rhodopsin, a protein found in the eye that maintains its photosensitivity only in the presence of vitamin A.

If the deficiency is severe and persists, especially in malnourished infants and children, a condition known as xerophthalmia may develop. In xerophthalmia, the eyes are sensitive to light, the secretion of lubricating tears is stopped, and the eyelids become swollen and sticky with pus. The mucous surfaces of the eye may become eroded in spots, allowing infection to set in, thus leading to ulceration and other destructive changes of the cornea (the transparent outer covering of the eye) and other eye structures. This condition will eventually result in blindness.

Early signs of vitamin A deficiency may also be reflected in changes in the mucous membranes of the mouth, throat, and respiratory and genito-urinary passages. These lining membranes become atrophied and dry and lose their cilia, the tiny hairlike projections that normally help in clearing away foreign particles. The defective mucous surfaces have weakened resistance to bacterial invasion, and their susceptibility to various infections increases. If insufficient intake of vitamin A is prolonged, the skin may become dry and rough, with the appearance of plugs of horny material about the hair follicles (follicular hyperkeratosis).

Vitamin A deficiency may also result in defective bone and teeth formation and in poor general growth. In experimental rats and in cattle, reproduction may either fail totally or result in few live births.

Vitamin A is found in all animal livers (where it is normally stored) and in milk products containing milk fat. In addition, many yellow and green leafy vegetables contain carotenes, chemically related substances that are converted to vitamin A in the body.

Except in the later stages, when cellular damage in the cornea and associated deeper structures is too extensive, xerophthalmia can be effectively treated with vitamin A. It is usually most effective when supported by a well-balanced diet rich in protein. Although xerophthalmia is seldom encountered in countries where dairy products are readily available, it has been a serious problem in certain parts of the world. Xerophthalmia is common among poor preschool children in Indonesia, Bangladesh, India, and the Philippines. It also occurs in some parts of Africa. The global incidence has been estimated at some 500,000 new cases per year, half of which lead to blindness.

vitamin A excess, also called HYPERVITA-MINOSIS A, toxic condition most frequently produced by a high intake of vitamin A, generally 150 mg daily over a period of several months. Unlike the water-soluble vitamins (e.g., ascorbic acid, thiamine, riboflavin), vitamin A is soluble in fat, and a surplus in the body is not eliminated in the urine but rather is stored in the liver, where it may eventually reach toxic levels.

General signs of toxicity include nausea, coarsening and loss of hair, drying and scaling of the skin, bone pain, fatigue, and drowsiness. There may also be blurred vision and headache in adults and growth failure, enlargement of the liver, and nervous irritability in infants. Prognosis is good when vitamin A intake is reduced.

Although hypervitaminosis A is most often caused by an excessive, regular intake of vitamin A concentrate, it has also been known to occur among explorers and inhabitants of the Arctic, following large meals of the vitamin A-rich polar bear liver.

Carotene, the yellowish pigment (found in such foods as carrots, sweet potatoes, and egg yolks) that is converted to vitamin A in the body, is not toxic per se, but the blood plasma may contain a high enough concentration of the pigment to impart a yellowish colour to the skin, a condition known as carotenemia.

vitamin B complex, several vitamins that traditionally have been grouped together because of loose similarities in their properties, their distribution in natural sources, and their physiological functions, which overlap considerably. All the B vitamins, like vitamin C, are soluble in water, in contrast to the fat-soluble vitamins A, D, E, and K.

Most of the B vitamins have been recognized as coenzymes (substances that participate with enzymes in accelerating the interconversion of chemical compounds), and they all appear to be essential in facilitating the metabolic processes of all forms of animal life. The complex includes pantothenic acid, nicotinic acid, biotin, folic acid (qq.v.), riboflavin (see vitamin B₂), thiamine (see vitamin B₁), pyridoxine (see vitamin B₆), and cyanocobalamin (see vitamin B₁₂). The compounds carnitine, choline

(qq.v.), and lipoic acid, myoinositol (see inositol), and para-aminobenzoic acid (q.v.) perform analogous functions in the animal body and have been included among the B vitamins by certain authorities.

Two growth-promoting substances, tentatively named vitamins B_{13} and B_{15} , also may belong to the complex.

vitamin B_1 , also called THIAMINE, or THIAMIN, a water-soluble, nitrogen-containing alcohol that is necessary in the diet of all animals except ruminants (e.g., cows) to prevent beriberi (q.v.), a disease characterized by multiple neuritis (lesions of nerves), general debility, and painful rigidity.

Vitamin B, (thiamine), chloride hydrochloride

Thiamine was the first vitamin to be isolated in pure form (1926). Its structure was fully elucidated and the vitamin synthesized in 1936.

Thiamine has been found to function in some of the enzyme systems by means of which the body converts carbohydrates into energy. In these functions it is a component of a compound called thiamine pyrophosphate.

Thiamine is found most abundantly in cereal grains and in certain other seeds. Pork is one of the richest animal sources. The recommended daily intake of thiamine is 1.0 to 1.1 mg for adult women and 1.2 to 1.4 mg for adult men.

vitamin B₁ deficiency: see beriberi.

vitamin B₂, also called RIBOFLAVIN, a yellow nitrogen-containing alcohol that occurs abundantly in whey (the watery part of milk) and in egg white. An essential nutrient for animals, it can be synthesized by green plants and by

Vitamin B₂ (riboflavin)

most bacteria and fungi. The greenish yellow fluorescence of whey and egg white is caused by the presence of vitamin B_2 . Riboflavin, recognized as a vitamin in 1933, was first synthesized in 1935.

Vitamin B₂ is known to function as part of metabolic systems concerned with the oxidation of carbohydrates and amino acids, the constituents of proteins. Like vitamin B₁ (thiamine), it functions not in the free form but in more complex compounds formed by the organism from the vitamin, such as flavin mononucleotide (FMN) and flavin adenine dinucleotide (FAD), or flavoprotein. Vitamin B₂ is widely distributed in both plants and animals, but its abundance varies considerably. Milk, eggs, kidney, and liver are good dietary sources. An adult human needs 1.2 to 1.7 mg of the vitamin per day.

vitamin B₂ deficiency, also called RIBOFLA-VIN DEFICIENCY, a condition caused by a dietary lack of riboflavin (vitamin B₂), an organic compound of the vitamin B complex. Deficiency is characterized by variable symptoms that may include reddening of the lips with cracks at the corners of the mouth (cheilosis); inflammation of the tongue (glossitis); ocular disturbances, such as vascularization of the eyeball with eyestrain and abnormal intolerance of light; and a greasy, scaly inflammation of the skin. Some disagreement persists as to the characteristic syndrome of riboflavin deficiency in humans because it tends to be associated with a deficiency of other vitamins, notably niacin (see pellagra).

vitamin B_6 , a nutrient essential to microorganisms and animals. It prevents erosion of the skin in higher animals. It occurs in three forms: pyridoxine (or pyridoxol), pyridoxal, and pyridoxamine. Pyridoxine was first isolated in 1938 and synthesized in 1939. Pyridoxal and pyridoxamine, which were discovered in the 1940s, are more widely distributed than pyridoxine and are responsible for most of the vitamin B_6 activity of natural materials.

Vitamin B₆ functions in the formation and breakdown of amino acids, and hence indirectly of protein, in living tissues. It is also involved in the synthesis of serotonin and norepinephrine (two neurotransmitters) and of heme (a molecular constituent of hemoglobin).

No human disease has been found to be caused by a deficiency of vitamin B₆ in the diet, although certain human ailments of obscure origin respond to its administration. In

Vitamin B_{6} (pyridoxine), the pyridoxine family of vitamins

experimental animals, vitamin B_6 deficiency produces symptoms that depend to some extent on the other constituents of the diet—e.g., the skin lesions in rats may not appear if certain fats are present in the food. The intensity of the deficiency symptoms and the amount of vitamin B_6 required to prevent them are increased by feeding diets unusually rich in protein or certain amino acids, such as methionine.

About 1950 vitamin B_6 deficiency was produced experimentally in human infants. In infants the deficiency first manifests itself in a convulsion that is readily controlled by administration of the vitamin. Many cases of such convulsions have been reported in infants fed a substitute for human milk that contained insufficient amounts of vitamin B_6 . Because heat treatment of cows' milk destroys the vitamin, the deficiency can be corrected by altering the processing of the milk. An adult human needs 2.0 to 2.2 mg of vitamin B_6 daily.

Pyridoxal, pyridoxamine, and pyridoxine are equally effective in the nutrition of animals, though not always in the nutrition of microorganisms. Vitamin B₆ is widely distributed in foodstuffs and is particularly abundant in cereal grains, meats, nuts, and some fruits and vegetables.

vitamin \mathbf{B}_{12} , also called CYANOCOBALAMIN, a crystalline compound essential to a number of microorganisms and animals, including humans. Vitamin \mathbf{B}_{12} , known as the antipernicious-anemia factor, is also known as the extrinsic factor—a substance from outside the body—that aids in the development of red

blood cells in higher animals. The vitamin, which is unique in that it contains a metallic ion, cobalt, has a complex chemical structure. Vitamin B_{12} occurs in several forms, called cobalamins; cyanocobalamin is the principal one used for medical purposes.

Vitamin B₁₂

In the 1930s the American physician W.B. Castle isolated an "intrinsic factor" in normal gastric secretion that was absent in the stomachs of persons suffering from pernicious anemia, an acute and sometimes fatal disorder of the red blood cells. Castle postulated that an "extrinsic factor" that alleviated or prevented pernicious anemia was to be found in animal liver, because improvement had been noted when diets of these patients included large amounts of liver. In 1948-49 simultaneous studies by the chemists Karl Folkers in the United States and Alexander Todd (later created Baron Todd) in England isolated and identified vitamin B₁₂ as the pure antianemia factor present in liver. The human daily requirement for vitamin B_{12} is 3 micrograms; good dietary sources are eggs, meat, and dairy products.

So far as is known, vitamin B₁₂ is not present in higher plants. It is required in the diet of all higher animals that have been studied. It is synthesized by several molds and bacteria, and the ultimate source of the vitamin in liver and other animal materials generally appears to be microorganisms of various kinds. Microorganisms that synthesize vitamin B₁₂ occur in the rumen (the first stomach chamber) of cows and sheep. From the rumen it is transferred to the muscle and other tissues, which humans eat. Several kinds of bacteria unable to make the substance require minute amounts for growth. Vitamin B_{12} cooperates with folate in the synthesis of DNA. A deficiency of either compound leads to disordered production of DNA and, hence, to the impaired division of red blood cells that is the cause of pernicious anemia (q.v.). Vitamin B_{12} also has a separate biochemical role, unrelated to folate, in the synthesis of fatty acids in the myelin sheath that surrounds nerve cells.

vitamin B₁₂ deficiency, a condition in which an organism fails to receive a sufficient quantity of vitamin B₁₂ (cyanocobalamin), a red-pigmented crystalline concentrate that is essential to human and animal digestion and nutritional absorption and which is known to prevent pernicious anemia (q.v.). Lack of vitamin B₁₂ occasions defective formation of the papillae (small projections) of the tongue, giving an appearance of abnormal smoothness. A deficiency of vitamin B_{12} often causes defective function of the intestine, resulting in indigestion and sometimes constipation or diarrhea. A very serious effect is degeneration of certain motor and sensory tracts of the spinal cord: if the degeneration continues for some time, treatment with vitamin B₁₂ may not correct it. Initial numbness and tingling of fingers or toes may, without treatment, progress to great instability of gait or virtual paralysis.

Because vitamin B₁₂ is found in animal but not vegetable foods, complete vegetarianism may lead to deficiency. Deficiency may also result from competition for vitamin B₁₂ by the broad tapeworm or by intestinal bacteria growing in cul-de-sacs or above partial obstructions in the digestive tract. Additional nutritional deficiencies, such as those of folic acid or iron, are likely to develop in such cases, as in primary intestinal diseases such as chronic celiac disease, tropical sprue, or regional ileitis, all of which affect the absorptive capacity of the small bowel.

vitamin C, also called ASCORBIC ACID, water-soluble, carbohydrate-like substance that is involved in certain of the metabolic processes of animals. Although most animals can synthesize vitamin C, it is necessary in the diet of some, including humans and other primates and guinea pigs, in order to prevent scurvy (q, v.), a disease characterized by debility, blood changes, spongy gums, and hemorrhages in the tissues of the body. First isolated in 1928, vitamin C was identified as the curative agent for scurvy in 1932. It has since been the object of continued active laboratory research.

Definitive knowledge of the details of its action is surprisingly scant, even though the vitamin is known to be essential in a variety of metabolic functions, including synthesis of collagen (a protein important in the formation of healthy skin, tendons, bones, and supportive tissues and in wound healing); maintenance of the structural strength of the blood vessels; metabolism of certain amino acids; and the synthesis or release of hormones in the adrenal glands. It has also been suggested that vitamin C plays a part in protecting the body against infection, though scientific data do not clearly support this claim.

Relatively large amounts of vitamin C are required—e.g., an adult man is said to need about 70 mg per day. Citrus fruits and fresh vegetables are the best dietary sources of the vitamin. Because vitamin C is easily destroyed by reactions with oxygen, especially in neutral or alkaline solution or at elevated temperatures, it is difficult to preserve in foods. The vitamin is added to certain fruits to prevent browning.

vitamin C deficiency: see scurvy.

vitamin D, any of a group of fat-soluble alcohols important in calcium metabolism in animals. They are formed by ultraviolet ir-

radiation (sunlight) of sterols present in the skin. The most important of these sterols are 7-dehydrocholesterol, formed by metabolic processes in animals, and ergosterol (q.v.), present in vegetable oils. The action of sunlight converts these two compounds, respectively, to cholecalciferol, or vitamin D_3 , and calciferol, also called ergocalciferol, or vitamin D_2 . Vitamins D_2 and D_3 are equivalent in human metabolism, but in birds vitamin D_2 is much less effective than D_3 , which therefore is preferred in the formulation of poultry-feed supplements.

After the vitamins are formed from the sterols, further chemical reaction, which occurs in the liver, changes them into compounds that participate in absorption of calcium into the bloodstream and formation of bone. It is not usually essential that vitamin D be taken in food, but winter sunshine in northern regions and sunlight that has passed through certain kinds of glass or through clouds or the contaminated air of cities may lack sufficient amounts of ultraviolet rays to bring about adequate production of the vitamin. Under these conditions, supplementary vitamin D must be ingested. In the United States and Canada it is customarily added to milk. Vitamin D is one of the most active vitamins in terms of the amount required per day. About 10 micrograms (400 International Units) is considered adequate for a growing child.

Lack of vitamin D causes rickets (q.v.). A prolonged high intake of the vitamin can cause a toxic reaction (see vitamin D excess).

vitamin D deficiency: see rickets.

vitamin D excess, also called HYPERVITA-MINOSIS D, toxic symptoms resulting from a prolonged high intake of vitamin D, a fatsoluble nutrient. Unlike the water-soluble vitamins, a surplus of vitamin D in the body is not eliminated in the urine but remains in the body, sometimes reaching toxic levels.

A vitamin D-poisoned individual may complain of weakness, fatigue, loss of appetite, nausea, and vomiting. Examination may reveal small yellowish deposits beneath the fingernails, in the eyes, and scattered over the skin. In infants and children there may be growth failure. Because vitamin D is involved in the intestinal absorption of calcium, this mineral may reach abnormally high concentration in the blood (hypercalcemia), and autopsies have revealed widespread deposition of calcium phosphate throughout the body, particularly in the kidneys. Toxic manifestations have been observed in adults receiving 50,000 to 100,000 International Units daily and in infants on relatively low daily intakes of 2,000 to 4,000 International Units

vitamin E, a fat-soluble compound (tocopherol) found principally in certain plant oils and the leaves of green vegetables. Wheatgerm oil is a particularly rich source. Vitamin E, first recognized in 1922, was first obtained in a pure form in 1936; it was identified chemically in 1938. A number of similar compounds having vitamin E activity and called tocopherols have been isolated.

Vitamin E acts as an inhibitor of oxidation processes in body tissues. It protects unsaturated fats in the body from oxidation by peroxides and other free radicals. The possibility that vitamin E may help prolong an active life-span by slowing the rate of oxidative destruction of biological membranes is under study. The tocopherols are used commercially as antioxidants to retard the rancidification of fats, especially vegetable oils.

For the effects of depriving animals of this vitamin, see vitamin E deficiency.

vitamin E deficiency, dietary lack of vitamin E (a collective term referring to a family of compounds known as tocopherols), which plays an active role as an inhibitor of oxidation processes in body tissues.

The richest sources of vitamin E are vegetable oils and foods that are high in vegetable fats, such as nuts and wheat germ. Lettuce and other leafy green vegetables are also good sources. A naturally occurring dietary deficiency of the vitamin is unlikely.

In experimental animals, the characteristic signs of induced vitamin E deficiency vary with the species. In the mature female rat, reproduction fails because of absorption of the fetus; in the mature male rat, sterility results from degeneration of the germinal tissues. The vitamin deficiency in rabbits and guineapigs is characterized mainly by acute muscular dystrophy, or wasting away of the muscles. In the chick, vitamin E deficiency leads to abnormalities in the vascular system and muscular weakness. In monkeys experiencing the vitamin deficiency, an anemia usually accompanies muscular weakness.

Humans with a deficiency of vitamin E display, among other symptoms, a mild anemia and a low concentration of tocopherols in the blood plasma. Patients with a chronic deficiency exhibit prolonged malabsorption of fats, as well as mild anemia, unsteadiness (ataxia) and pigmentary changes in the retina. These symptoms respond to prolonged vitamin E treatment.

vitamin K, any of several fat-soluble naphthoquinone compounds present in the leaves of plants. Vitamin K is required for the bodily synthesis of four of the blood's coagulation factors: prothrombin and factors VII, IX, and X. A deficiency of vitamin K in the body leads to an increase in clotting time of the blood (see vitamin K deficiency).

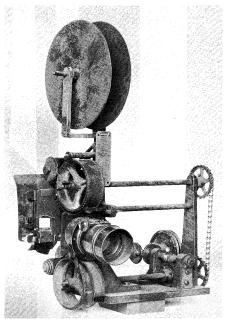

In 1929 a previously unrecognized fat-soluble substance present in green leafy vegetables was found to be required for coagulation of the blood to take place. The substance was called vitamin K for Koagulation vitamin. A pure form of the vitamin was isolated and analyzed structurally in 1939; several related compounds having vitamin K activity have also been isolated and synthesized. Vitamin K₁, the compound recognized in 1939, is synthesized by plants, whereas vitamin K₂ is of microbial origin and is the important form in mammalian tissue. All other forms of vitamin K are converted to vitamin K_2 in the body. There are a number of closely related compounds of the vitamin K2 series.

Besides the natural compounds, many synthetic compounds having vitamin K activity are used to decrease blood-clotting time.

vitamin K deficiency, lack of vitamin K in the body, resulting in impaired clotting of the blood and internal bleeding. Blood clotting is delayed or prevented because vitamin K is unavailable to act as a cofactor in the synthesis of the four required coagulation factors (especially prothrombin).

Vitamin K deficiency is seldom naturally encountered in higher animals because the vitamin is usually adequately supplied in the diet, besides being synthesized by intestinal bacteria. In humans, deficiency may occur following the administration of certain drugs that inhibit the growth of the vitamin-synthesizing bacteria or as a result of constitutional disorders affecting the production or flow of bile, which itself is necessary for the intestinal absorption of vitamin K. In newborn infants, the absence of large intestinal bacteria coupled with the absence of body stores of vitamin K may result in a condition known as hemorrhagic disease of the newborn, which can be prevented by the administration of vitamin K to the infant shortly after birth, or to the mother during labour.

Vitascope, motion-picture projector patented by Thomas Armat in 1895; its principal features are retained in the modern projector: sprocketed film operated with a mechanism (the "Maltese cross") to stop each frame briefly before the lens, and a loop in the film to ease the strain. The Vitascope was adopted by Thomas A. Edison to project his Kinetoscope

oblast (province), Belorussia, U.S.S.R. It has an area of 15,500 square miles (40,100 square km) and lies mostly in the broad, shallow basin of the Western Dvina River. To the east and south the land rises in a series of gently undulating uplands. Swamps are extensive in the Western Dvina basin, but most of the oblast is in mixed forest of pine, spruce, oak, birch, and alder; the uplands have been largely cleared for agriculture, bringing about serious soil erosion. Flax and rye are the main crops, and the raising of dairy and beef cattle and pigs is important. In the south are many orchards. Apart from Vitebsk city, Orsha, and the oil-refining centre at Novopolotsk, the towns are small and engaged in timber working and in processing farm produce. Much peat is cut for fueling electric-power stations. Pop. (1989 prelim.)

Vitebsk, city and administrative centre of Vitebsk oblast (province), Belorussia, U.S.S.R. It lies along the Western Dvina River at the latter's confluence with the Luchesa River. Vitebsk, first mentioned in 1021, was a major fortress and trading centre and had a stormy history. It passed to Lithuania in 1320, later to Poland, and then to Russia in 1772. It was destroyed by the Poles in the 16th century, by the Swedes in the Great Northern War, by Napoleon I in 1812, and by the Germans in World War II. Modern Vitebsk is a major industrial centre, producing machine tools, electrical instruments, and a range of consumer goods, including textiles, meat and dairy products, and other foodstuffs. The city has medical, veterinary, teacher-training, and polytechnic institutes. Pop. (1989 prelim.) 350,000.

Vitellius, Aulus (b. AD 15—d. 69, Rome), Roman emperor, the last of Nero's three short-lived successors.

Aulus was the son of the emperor Claudius' colleague as censor, Lucius Vitellius, who was also consul three times. Aulus himself became consul in AD 48 and proconsul in Africa (c. 61). He was appointed commander of the Lower German army in 68. In the midst of the disturbances following Nero's death, he was proclaimed emperor by his troops (Jan. 2, 69).

He marched on Italy, and on April 16 the rival emperor Otho committed suicide. Vitellius entered Rome in July, but on July 1 a commander of the eastern legions, Vespasian, had also been proclaimed emperor. After Vespasian's troops defeated Vitellius' forces, Vitellius considered abdication; but his Praetorian Guard forbade such a move, and, when

troops loyal to Vespasian entered Rome on December 20, Vitellius was murdered with great barbarity by his own soldiers.

Viterbo, city, capital of Viterbo province, Lazio (Latium) region, central Italy. It is situated at the foot of the Cimini Mountains, northwest of Rome. Of Etruscan origin, the town was taken by the Romans about 310 Bc. In 774 Viterbo was included among the Lombard towns of Tuscany, and it was given by Matilda of Tuscany to the pope in the 11th century. An independent commune and an episcopal see from 1193, Viterbo occasioned three centuries of disputes between the papacy and the Holy Roman Empire before it became a papal possession in 1396. Viterbo rivaled Rome as the papal residence after 1257, but it again declined in importance after the removal of the papacy to Avignon, Fr., in 1309.

Though almost 70 percent of the town was destroyed in World War II, it was one of the first towns in Italy to complete postwar reconstruction. Viterbo's medieval quarter, enclosed by 11th- to 13th-century walls and towers, remains practically unchanged, with its Romanesque arcades and 13th- and 14th-century houses and palaces. Notable landmarks, besides the famous papal palace, include the 12th-century Cathedral of San Lorenzo and the 13th-century Church of San Francesco (each containing the tombs of two popes), the Renaissance town hall, and the 12th-century Church of Santa Maria della Verità, housing the Civic Museum. The body of St. Rose of Viterbo is preserved in the church named in her honour.

The city's industries are primarily agricultural. Pop. (1988 est.) mun., 59,474.

Viti Levu, largest island (4,011 square miles [10,388 square km]) of Fiji, west of the Koro Sea in the South Pacific. Its name means "great Fiji." Sighted (1789) by Captain William Bligh of the British navy, the island is split by a central mountain range with many inactive volcanoes. Tomanivi (Mount Victoria), the highest point in Fiji, rises to 4,341 feet (1,323 m). The mountain range divides the island climatically into a wet southeastern

section (120 inches [3,050 mm] of rain annually) and a dry northwestern section (70-90 inches (1,800-2,300 mm).

Suva (q, v), the Fijian capital, is situated on the island's southeastern coast and has an excellent harbour. Lautoka, on the northwestern coast, is a port for a sugarcane-growing region. Sugar, pineapples, cotton, rice, and tobacco are cultivated in the fertile valleys and deltas of Navua Creek and the Rewa and Singatoka (Sigatoka) rivers. There is a goldfield, first developed in the 1930s, in the north-central part of the island at Vatukoula, a community that is privately owned by associated mining companies. Nadi, in the west, has an international airport, and an oil-fuel installation is at nearby Vunda Point. The population of the island comprises Indians and Melanesians. Pop. Vitier, Cintio, Cintio also spelled CYNTHIO (b. 1921, Key West, Fla., U.S.), Cuban poet, anthologist, critic, and scholar of Cuban poetry.

Vitier began as a writer of extremely difficult, hermetic poetry. His poetry until Canto Llano (1954; "Clear Song") was primarily concerned with the nature of poetry, the function of memory, and the intricate role of language in the creative process. The essay "Poética" (1961) is a lucid exposition of his artistic credo. With the advent of the Castro revolution, Vitier radically changed his poetic style. His poems became direct, clear, and accessible to most readers. Some critics assert that he captured the spirit of the revolution without resorting to propaganda. His poetic work was collected in Visperas (1953; "Vespers") and Testimonios (1968).

He compiled three anthologies of Cuban poetry, and his study *Lo cubano en la poesía* (1958; "The Cuban in Poetry") reveals the depth of his critical intuition. His literary essays, especially those on the works of José Martí, contributed to his reputation as one of the most important and influential scholars of Latin-American literature.

vitiligo, also called LEUKODERMA, hereditary patchy loss of melanin pigment from the skin. Though the pigment-making cells of the skin, or melanocytes, are structurally intact, they have lost the ability to synthesize the pigment. The reason for this condition is unclear. Vitiligo appears clinically as milk-white, irregularly oval patches of skin, which are small at the beginning but enlarge gradually. These patches are roughly symmetrical and are seen most commonly on the hands, wrists, face, neck, and upper trunk. The hair growing in the depigmented area is also white. Individuals with vitiligo (about 1 percent of the adult population) are usually in good general health, but vitiligo presents a cosmetic problem that can be serious in dark-skinned individuals. The normal skin colour rarely returns and there is no known cure.

Vitim Plateau, Russian VITIMSKOYE PLOSKOGORYE, gently rolling plateau area, in Eastern Siberia in the Buryat Autonomous Soviet Socialist Republic and Chita oblast (administrative region), Russian S.F.S.R. The plateau is drained by the Vitim River and varies in height between 4,000 and 5,250 ft (1,200 and 1,600 m). It consists of a series of granites, granite-gneisses and gneiss-granites, while in the centre and southwest are basalts and basalt lavas extruded by numerous small and now extinct local volcanoes. The rivers have eroded canyon-like courses.

Vitim River, river and tributary of the Lena River in Eastern Siberia, Russian Soviet Federated Socialist Republic. It rises on the eastern slopes of the Ikat Mountains near the town of Bagdarin in the Buryat Autonomous Soviet Socialist Republic and flows in a generally northerly direction to join the Lena in a delta at the town of Vitim. It has a length of 1,229 mi (1,978 km), and the area of its basin is 87,650 sq mi (227,000 sq km). The Vitim is navigable to the town of Bodaybo, the centre of the Bodaybo goldfields, located 185 mi from its mouth.

The battle was fought between a combined English, Spanish. and Portuguese army numbering 72,000 troops and 90 guns under Arthur Wellesley, 1st duke of Wellington, and a French army numbering 57,000 troops and 150 guns commanded by King Joseph Bonaparte. The French occupied a defensive position in the basin of Vitoria, an area about 12 mi (19 km) long and 7 mi deep, surrounded by mountains and protected to the north and west by the Zadorra River, which was spanned by several lightly held bridges. inal captaincy of Espírito Santo by the Portuguese crown, Vitória attained city status and was made a provincial capital in 1823. It is the seat of Universidade Federal do Espírito Santo (1961). In and near the city are textile factories, sugar refineries, and other small manufacturing plants. After World War II Vitória became Brazil's leading iron-ore port, but after 1962 the volume of exports greatly exceeded the old port's capacity. New facilities, which can accommodate the largest ore carriers, were built at Tubarão, just to the north. Vitória exports small amounts of coffee, cocoa, cereals, meats, molasses, alcohol, monazite sands, and lumber. Minerals exported include iron ore, steel, monazite, and coal. There has been oil exploration in the bay. The city has rail connections with Rio de Janeiro (260 mi [418 km] southwest) and Belo Horizonte and is accessible by highway and air as well as by sea. Pop. (1980) 165,090.

Vitoria, capital of Álava province, in the autonomous Basque Country, northeastern Spain, lying north of the Montes de Vitoria on the Río Zadorra and southwest of San Sebastián. Founded as Victoriacum by the Visigothic king Leovigild to celebrate his victory over the Basques in 581, it was granted a charter by Sancho VI the Wise of Navarre

finally gave way. By 7 PM the French were in full retreat toward Pamplona, leaving behind vast quantities of plunder, baggage, and all their artillery. The French losses (killed, wounded, and captured) were about 8,000 and those of the allies about 5,000. By their victory the British and their allies gained control of the Basque provinces, and compelled the French forces to retreat over the Pyrenees and back into France.

Vitoria, Francisco de (b. probably 1486, Vitoria, Álava, Castile—d. Aug. 12, 1546), Spanish theologian best remembered for his defense of the rights of the Indians of the New World against Spanish colonists and for his ideas of the limitations of justifiable warfare.

Early life and education. Vitoria was born in the Basque province of Álava. He entered the Dominican order and was sent to the University of Paris, where he was to remain as student and then lecturer for nearly 16 years. He returned to Spain in 1523 to lecture in Valladolid, and he had already begun his investigation of the morality of colonization when he was elected in 1526, by an enthusiastic majority of students, to the prime chair of theology at Salamanca.

The aim of Salamanca University was to present the then new Renaissance scholarship in

a framework of scholastic reasoning in the medieval style. At Salamanca Vitoria addressed himself to most of the critical debates of his time. In lecturing on the wars between France and Spain, he did not adopt the common Spanish view that the French king must be guilty because he refused to take either heresy or the Turkish menace seriously. Instead, he saw faults on both sides and warned that the Franco-Spanish feud would be the ruin of Christendom. He strongly condemned the behaviour of councillors, courtiers, and governors; he also criticized the clergy for failure to take up residence in their parishes, for holding more than one office at a time, and for their indifference to the poor.

Vitoria's anticolonial views. Vitoria was doubtful of the justice of the Spanish conquest of the New World. As a friar, he refused to agree that war might be made on people simply because they were pagans or because they refused conversion-for belief was an act of the will and could not be forced. Nor could pagans be punished for offenses against God, because Christians committed just as many such offenses as pagans. The pope had no right to give European rulers dominion over primitive peoples; the most he could do was to allocate spheres for missionary work. Pagans had a right to their property and to their own rulers; they were not irrational. One could not speak of discovery as if the lands had been previously uninhabited; thus the only possible justification for conquest might be the protection of the innocent from cannibalism and human sacrifice. If a Christian ruler presumed to rule over a colony, it was his duty to give it benefits equal to those of the home country and to send efficient ministers to see just laws observed. The Indians were as much subjects of the king of Spain "as any man in Seville."

At Salamanca, Vitoria revived the study of the works of St. Thomas Aquinas. None of his lectures survives except in students' notes, but his recapitulations—mandatory summaries of the year's course—survive in unusual numbers. He rewrote his lectures annually, even after 26 years of lecturing, telling his students that lecture notes from the previous year would not be useful. He answered questions both during and after class, and his style is said to have been lively and witty.

Vitoria's writings on war were addressed to the possibility of limiting the horrors of contemporary warfare. In principle, war was not justified except as defense against aggression or to right a very great wrong. In any case, the declaration of war should be preceded by efforts at conciliation and arbitration. A ruler should also consider whether the war might not do more harm than good. Innocent persons might be killed only if it was absolutely impossible to distinguish them from participants. Finally, if a subject's conscience told him a war was wrong, he must not take part in it.

Vitoria's arguments, involving the application of moral principles, led to his being often consulted by the emperor Charles V. In 1530 the Empress wrote to ask him about the divorce of King Henry VIII of England, and this led him to give a course of lectures on matrimony. In 1539 the Emperor himself wrote to inquire about the possibility of sending 12 "learned and pious friars" to Mexico to found a university, and a second time to ask for some of Vitoria's pupils. Vitoria's open criticism did not affect Charles' friendly attitude; in 1541 he wrote to Vitoria twice on the subject of the Indians. In 1545 Prince Philip (later Philip II of Spain) wrote in his father's behalf to invite Vitoria to the Council of Trent. Vitoria declined, saying he was "more likely to go to the other world." He died in the following year at the age of 60.

Influence. Vitoria's influence was widespread; it swept the universities and even affected the royal councils. About 5,000 students passed through his classrooms; 24 of his pupils held chairs of arts or theology at Salamanca; and in 1548 two also held chairs of St. Thomas Aquinas at Alcalá, the rival university.

Vitoria and some of his contemporaries are sometimes credited with being the founders of international law. But, while it is true that their sense of living in an expanding world made them more aware than their predecessors of the unity of mankind and more anxious to assert it, their theory contained no pacts or covenants, only good and useful universal custom, which might be expected to change as nations developed. This position is much closer to the traditional law of nations, or jus gentium, than to modern international law.

Vitruvius, in full MARCUS VITRUVIUS POLLIO (fl. 1st century BC), Roman architect, engineer, and author of the celebrated treatise De architectura (On Architecture), a handbook for Roman architects.

Little is known of Vitruvius' life, except what can be gathered from his writings, which are somewhat obscure on the subject. Although he nowhere identifies the emperor to whom his work is dedicated, it is likely that the first Augustus is meant and that the treatise was conceived after 27 BC. Since Vitruvius describes himself as an old man, it may be inferred that he was also active during the time of Julius Caesar. Vitruvius himself tells of a basilica he built at Fanum (now Fano).

De architectura was based on his own experience, as well as on theoretical works by famous Greek architects such as Hermogenes. The treatise covers almost every aspect of architecture, but it is limited, since it is based primarily on Greek models, from which Roman architecture was soon decisively to depart in order to serve the new needs of proclaiming a world empire. De architectura is divided into 10 books dealing with city planning and architecture in general; building materials; temple construction and the use of the Greek orders; public buildings (theatres, baths); private buildings; floors and stucco decoration; hydraulics; clocks, mensuration, and astronomy;

and civil and military engines. Vitruvius' outlook is essentially Hellenistic. His wish was to preserve the classical tradition in the design of temples and public buildings, and his prefaces to the separate books of his treatise contain many pessimistic remarks about the contemporary architecture. Most of what Pliny says in his Natural History about Roman construction methods and wall painting was taken from Vitruvius, though unacknowledged. Vitruvius' expressed desire that his name be honoured by posterity was realized. Throughout the antique revival of the Renaissance, the classical phase of the Baroque, and in the Neoclassical period, his work was the chief authority on ancient classical architecture.

The text of *De architectura* with an English translation is published in the Loeb Classical Library in two volumes.

Vitry, Philippe de, also called PHILIPPUS DE VITRIACO (b. Oct. 31, 1291, Paris, Fr.—d. June 9, 1361, Meaux), French prelate, music theorist, poet, and composer.

Vitry studied at the Sorbonne and was ordained a deacon at an early age. His earliest-known employment was as secretary to Charles IV. Later he became adviser to Charles and to his successors at the royal court at Paris, Philip VI and John II. Vitry served in many diplomatic and political missions in this capacity, several of them to the papal court in Avignon. During one such visit in 1351, Pope Clement VI appointed him bishop of Meaux.

Vitry was known as a poet and composer and was considered one of the leading intellectuals of his time. His scholarship and dedication were warmly praised by Petrarch, who regarded him as "the unparalleled poet of France." Vitry's historical eminence, however, is mainly derived from his contributions as a musician. He was the author of the famous and authoritative treatise of music Ars nova (c. 1320; "New Art"), which dealt with the theoretical aspects of French music in the first half of the 14th century. It included an explanation of new theories of mensural notation, a detailed account of the various uses and meanings of the coloured notes, and the introduction of additional durational symbols in the new notational system. (Modern scholars believe that, of the 24 chapters of the Ars nova, only the last 10 [dealing with mensural rhythm and notation are original.)

Most of Vitry's musical output was lost, judging from the many references to his motets that appear in the treatise. The extant pieces were published by Leo Schrade in *Polyphonic Music of the 14th Century*, vol. 1 (1956).

Vittone, Bernardo Antonio (b. 1702, Turin, Piedmont [Italy]—d. Oct. 19, 1770, Turin), one of the most original and creative of late Baroque church architects in all Europe and a primary figure in the brief flowering of Piedmontese architecture.

Vittone studied painting in Rome. Returning to Turin in 1733, he observed the late works of Filippo Juvarra under construction and, in 1737, edited the papers of Guarino Guarini, the Architettura civile.

Vittone obtained spectacular visual and structural effects in a number of small, centralplan churches that he designed in Turin and elsewhere in the Piedmont from 1737 to 1770. These churches had multiple-level interiors and used innovative vaulting techniques for their complex domes. A central dome might have two or even three successive vaults, the lower ones being pierced to allow the viewer to see through them to the ones above. This placing of structures within structures might also be illusionistically achieved or enhanced by skillful painting or by the manipulation of lighting through cleverly placed windows. A prime example is the Church of Santa Chiara at Bra (1742); it has a low vault pierced by windows through which one sees a second shell, painted with heavenly scenes and lit by windows not visible from the interior.

Vittone would frequently place smaller, subsidiary domes around a larger, lower, central dome and would open up the space for viewing by using relatively slim piers whose curving forms contribute to an impression of light, airy soaring movement in the elegantly decorated interior. Among his other masterpieces are the Chapel of the Visitation at Valinotto (1738), and the churches of San Bernardino in Chieri (1740) and Santa Chiara in Turin (1742). His later churches, such as the Assunta at Grignasco (1750) and that of San Michele at Rivarolo Canavese, are larger, simpler, and more monumental but feature the same kinds of diminishing successions of curving, converging vaults and piers.

Vittorini, Elio (b. July 23, 1908, Syracuse, Sicily, Italy—d. Feb. 13, 1966, Milan), novelist, translator, and literary critic, the author of outstanding novels of Italian Neorealism mirroring his country's experience of fascism and the social, political, and spiritual agonies of 20th-century man. With Cesare Pavese he was also a pioneer in the translation into Italian of English and American writers.

The son of a railroad employee, Vittorini left school when he was 17, and six months later he became a road-construction worker in northern Italy. He then moved to Florence, learned English while working as a proof-reader, and began to publish short stories in the journal *Solaria*. He made his living until 1941 by translating the works of such American and English writers as William Saroyan, D.H. Lawrence, Edgar Allan Poe, William Faulkner, Daniel Defoe, and Ernest Hemingway, in addition to the British poets T.S. Eliot, W.H. Auden, and Louis MacNeice.

Vittorini's first major novel, *Il garofano rosso* (written 1933-35, published 1948; *The Red Carnation*), while overtly portraying the personal, scholastic, and sexual problems of an adolescent boy, also conveys the poisonous political atmosphere of fascism. In 1936 Vittorini began writing his most important novel, *Conversazione in Sicilia* (1941, rev. ed. 1965; Eng. trans., *Conversation in Sicily*; U.S. title *In Sicily*), the clearest expression of his antifascist feelings. The action of the book is less

important than the emotional agony of its hero, brought on by his constant consciousness of fascism, war, and the plight of his brothers.

Recognizing the novel's power, the fascist government censored its serialization in Letteratura in 1936-38 and even withdrew an entire issue of that periodical from circulation. In 1942, after publication of the book, Vittorini was called in for questioning and finally was imprisoned in 1943. Released after the German occupation, he continued to fight fascism through the Resistance movement.

After the war Vittorini published the influential politico-cultural periodical *Il Politecnico* (1945-47) and later edited the Milan literary quarterly Il Menabò with Italo Calvino. He then became head of the foreign-literature section of a major Italian publishing house.

Among Vittorini's other important works are Uomini e no (1945; "Men and Non-Men"), an account of his Resistance experiences; the allegorical Marxist novel Il sempione strizza l'occhio al frejus (1947; The Twilight of the Elephant); and another allegory, Le donne di Messina (1949; Women on the Road). Vittorini's critical writings are collected in Diario in pubblico (1957; "Public Diary") and the posthumously published Le due tensione: appunti per una ideologia della letteratura (1967; The Two Tensions: Notes for an Ideology of

Vittorino DA FELTRE, original name vit-TORE DEI RAMBOLDINI (b. 1378, Feltre [Italy]-d. Feb. 2, 1446, Mantua), Italian educator who is frequently considered the greatest humanist schoolmaster of the Renaissance.

After 20 years as a student and teacher at the University of Padua, Vittorino was asked, in 1423, to become tutor to the children of the Gonzaga family, the rulers of Mantua. He agreed to do so if he could set up a school away from the court and, hence, from political influence. Enrolled in his school, La Giocosa ("The House of Joy"), besides his royal charges, were about 60 children, including boys of other noble families and poor boys chosen for their ability.

The central features of the curriculum were the languages and literature of Rome and Greece. Other subjects included arithmetic, geometry, and music, as well as games and physical exercises, for the school followed the Greek ideal of development of the body as well as of the mind. Vittorino saw education, however, as a pathway to the Christian life. His pupils pictured him as a successful teacher who loved them, cared for their health and character, and adapted his methods to their abilities. Further, he used no corporal punishment. La Giocosa was possibly Europe's first boarding school.

Vittorino not only educated future Italian rulers and professional men but also taught Latin to Greek scholars who came to him from the East, thus enabling them to translate the Greek manuscripts that were to inspire the great minds of the Renaissance.

Vittorio Veneto, formerly (until 1923) vit-TORIO, town, Treviso provincia, Veneto regione, northeastern Italy, located north of Treviso. Formed in 1866 by the union of Serravalle, now the town's residential northern section, and Ceneda, the industrial southern part, it was named for Victor Emmanuel II. It was the scene in 1918 of the Italians' decisive defeat of the Austro-Hungarian army. Serravalle is an old, walled district with 16thcentury houses; the cathedral (1755), with an altarpiece by Titian; and the Loggia Serravallese (1462), housing a museum with a Madonna by Andrea Sansovino, who also executed the facade of the Loggia Cenedese. Vittoriosa, town, eastern Malta, one of the Three Cities (the others being Cospicua and Senglea). It is situated on a small peninsula, just south of Valletta across Grand Harbour. One of the most important towns in medieval Malta, in 1530 it became the first residence on the island of the Hospitalers (Knights of St. John of Jerusalem). It was strongly for-tified and served as the Hospitalers' defense bastion against the Turks in the Great Siege of Malta in 1565. Its name, formerly Birgu, was changed to Vittoriosa to commemorate that victory. It served as the Hospitalers' capital until replaced by Valletta in 1570. The town continued to develop in the 17th century with commercial facilities and shipyards. Although severely damaged in World War II, some of its old fortifications remain, including Fort St. Angelo (870; renovated and extended 1530). The Palace of the Inquisitors and most of the 16th-century auberges (lodges of the Hospitalers) also survive. Pop. (1983 est.) 4,134.

Vivaldi, Antonio (Lucio) (b. March 4, 1678, Venice, Republic of Venice [Italy]—d. July 28, 1741, Vienna, Austria), Italian composer and violinist who left a decisive mark on the form of the concerto and the style of late Baroque instrumental music.

Life. His main teacher was probably his father, Giovanni Battista, who in 1685 was admitted as a violinist to the orchestra of the San Marco Basilica in Venice. Antonio, the eldest child, trained for the priesthood and was ordained in 1703. His distinctive reddish hair

colour would later earn him the soubriquet Il Prete Rosso ("The Red Priest"). He made his first known public appearance playing alongside his father in the basilica as a "supernumerary" violinist in 1696. He became an excellent violinist, and in 1703 he was appointed violin master at the Ospedale della Pietà, a home for foundlings. The Pietà specialized in the musical training of its female wards, and those with musical aptitude were assigned to its excellent choir and orchestra, whose muchpraised performances assisted the institution's quest for donations and legacies. Vivaldi had dealings with the Pietà for most of his career: as violin master (1703-09; 1711-15), director of instrumental music (1716-17; 1735-38), and paid external supplier of compositions (1723-29; 1739-40).

Soon after his ordination as a priest, Vivaldi gave up celebrating mass on account of a chronic ailment that is believed to have been bronchial asthma. Despite this, he took his status as a secular priest seriously, and even earned the reputation of a religious bigot.

Vivaldi's earliest musical compositions date from his first years at the Pietà. Printed collections of his trio sonatas and violin sonatas respectively appeared in 1705 and 1709, and in 1711 his first and most influential set of concerti for violin and string orchestra (Opus 3. L'estro armonico) was published by the Amsterdam music-publishing firm of Estienne Roger. In the years up to 1717, Roger published three more collections of his concerti (Opuses 4, 6, and 7) and one collection of

sonatas (Opus 5).

Vivaldi made his debut as a composer of sacred vocal music in 1713, when the Pietà's choirmaster left his post and the institution had to turn to Vivaldi and other composers for new compositions. He achieved great success with his sacred vocal music, for which he later received commissions from other institutions. Another new field of endeavour for him opened in 1713 when his first opera, Ottone in villa, was produced in Vicenza. Returning to Venice, Vivaldi immediately plunged into operatic activity in the twin roles of composer and impresario. From 1718 to 1720 he worked in Mantua as director of music for that city's governor, Prince Philip of Hesse-Darmstadt. This was the only full-time post Vivaldi ever held; he seems to have preferred life as a freelance composer on account of the flexibility and entrepreneurial opportunities it offered. Vivaldi's major compositions in Mantua were operas, though he also composed cantatas and instrumental works.

The 1720s were the zenith of Vivaldi's career. Based once more in Venice, but frequently traveling elsewhere, he supplied instrumental music to patrons and customers all over Europe. Between 1725 and 1729 he entrusted five new collections of concerti (Opuses 8-12) to Roger's publisher successor, Michel-Charles Le Cène. After 1729 Vivaldi stopped having his works published, since he found it more profitable to sell them in manuscript to individual purchasers. During this decade he also received numerous commissions for operas and resumed his activity as an impresario in Venice and other Italian cities.

In 1726 the contralto Anna Girò sang for the first time in a Vivaldi opera. Born in Mantua about 1711, she had come to Venice to further her career as a singer. Her voice was not strong, but she was attractive and acted well. She became part of Vivaldi's entourage and the indispensable prima donna of his subsequent operas, causing gossip to circulate that she was Vivaldi's mistress. After Vivaldi's death she continued to perform successfully in opera until quitting the stage in 1748 to marry a nobleman.

In the 1730s Vivaldi's career gradually declined. The French traveler Charles de Brosses reported in 1739 with regret that his music was no longer fashionable. His impresarial forays became increasingly marked by failure. In 1740 Vivaldi traveled to Vienna, but he fell ill and did not live to attend the production there of his opera L'oracolo in Messenia in 1742. The simplicity of his funeral on July 28, 1741, suggests that he died in considerable poverty.

After Vivaldi's death, his huge collection of musical manuscripts, consisting mainly of autograph scores of his own works, was bound into 27 large volumes. These were acquired first by the Venetian bibliophile Jacopo Soranzo and later by Count Giacomo Durazzo, Christoph Willibald Gluck's patron. Rediscovered in the 1920s, these manuscripts today form part of the Foà and Giordano collections of the National Library in Turin.

Instrumental music. Almost 500 concerti by Vivaldi survive. More than 300 are concerti for a solo instrument with string orchestra and continuo. Of these, approximately 230 are written for solo violin, 40 for bassoon, 25 for cello, 15 for oboe, and 10 for flute. There are also concerti for viola d'amore, recorder, mandolin, and other instruments. Vivaldi's remaining concerti are either double concerti (including about 25 written for two violins), concerti grossi using three or more soloists, concerti ripieni (string concerti without a soloist), or chamber concerti for a group of instruments without orchestra.

Vivaldi perfected the form of what would become the classical three-movement concerto. Indeed, he helped establish the fast-slow-fast plan of the concerto's three movements. Perhaps more importantly, Vivaldi was the first to regularly employ in his concerti the ritornello form, in which recurrent restatements of a refrain alternate with more episodic passages featuring a solo instrument. Vivaldi's bold juxtapositions of the refrains (ritornelli) and the solo passages opened new possibilities for virtuosic display by solo instrumentalists. The fast movements in his concerti are notable for their rhythmic drive and the boldness of their themes, while the slow movements often present the character of arias written for the solo instrument.

The energy, passion, and lyricism of Vivaldi's concerti and their instrumental colour and simple dramatic effects (which are obtained without recourse to contrapuntal article) rapidly passed into the general language of music. His concerti were taken as models of form by many late Baroque composers, including Johann Sebastian Bach, who transcribed 10 of them for keyboard instruments. The highly virtuosic style of Vivaldi's writing for the solo violin in his concerti reflects his own renowned technical command of that instrument.

Several of Vivaldi's concerti have picturesque or allusive titles. Four of them, the cycle of violin concerti entitled *The Four Seasons* (Opus 8, no. 1-4), are programmatic in a thoroughgoing fashion, with each concerto depicting a different season of the year, starting with spring. Vivaldi's effective representation of the sounds of nature inaugurated a tradition to which works such as Ludwig van Beethoven's *Pastoral Symphony* belong. Vivaldi also left more than 90 sonatas, mainly for stringed instruments. Their form and style are conventional by comparison with the concerti, but they contain many fluent, attractive works.

Vocal music. More than 50 authentic sacred vocal compositions by Vivaldi are extant. They range from short hymns for solo voices to oratorios and elaborate psalm settings in several movements for double choir and orchestra. Many of them exhibit a spiritual depth and a command of counterpoint equal to the best of their time. The mutual independence of voices and instruments often anticipates the later symphonic masses of Joseph Haydn and Wolfgang Amadeus Mozart. As more of this repertory becomes available in modern editions, its reputation seems likely to rise.

The reception of Vivaldi's secular vocal works is more problematic. Nearly 50 operas by him have been identified, and 16 survive complete. In their time they were influential works with appealing melodies and inventive orchestral accompaniments. Nevertheless, the unfamiliarity of modern audiences with

Baroque poetry and dramaturgy, which often appear stilted and artificial, is bound to inhibit their appreciation among nonspecialists. Vivaldi's cantatas, numbering nearly 40 works, are more suitable candidates for general revival, though their quality is variable.

Vivarais, ancient mountainous province of France, centred on the town of Viviers (Viviers-sur-Rhône) and corresponding approximately to the modern departement of Ardèche. The ancient Roman site, Vivarium, later became the episcopate seat of Viviers; and the bishop of Viviers was virtual master of Vivarais, even though, from the 9th century, it belonged to the counts of Toulouse. In the 13th century it was united to the French crown. Part Catholic, part Protestant, it suffered severely in the Wars of Religion of the 16th century.

Vivarini, Alvise, also called LUIGI VIVARINI (b. c. 1446, Murano?, Republic of Venice [Italy]—d. c. 1505), painter in the late Gothic style whose father, Antonio, was the founder of the influential Vivarini family of Venetian artists.

Vivarini's earliest work is an altarpiece at Monte Fiorentino (c. 1475). Between 1483 and 1485 he was at work in southern Italy, producing altarpieces at Barletta (1483) and Naples (1485). In 1488, with Giovanni Bellini, he was employed on paintings (now lost) for the Doges' Palace in Venice. His last work,

an altarpiece begun in 1503 for Santa Maria dei Frari in Venice, was completed by Marco Basaiti.

Alvise was somewhat traditional and conventional in his approach, ignoring, for the most part, the trend away from the forms of Gothic painting. His few late works, however, have a stamp of individuality that distinguishes them from the mainstream of the Venetian style at the time—e.g., his psychologically complex portrait of an unknown Venetian gentleman, signed and dated 1497, now in the National Gallery, London.

Vivarini, Antonio (b. c. 1415, Murano?, Republic of Venice [Italy]—d. c. 1480), painter, one of the most important and prolific Venetian artists of the first half of the 15th century, founder of the studio of the influential Vivarini family of painters.

varini family of painters.
From 1444 Vivarini collaborated with his brother-in-law Giovanni d'Alemagna (d. 1450); later he worked with his younger brother, Bartolomeo. Surviving altarpieces executed by Antonio and Giovanni d'Alemagna are in the churches of San Zaccaria (1443-44) and San Pantalon (1444) and in the Accademia (1446), all in Venice; and a polypych is in the Brera, Milan (1448). Between 1447 and 1450 the two artists lived in Padua, where, together with Andrea Mantegna and Niccolò Pizzolo, they executed a cycle of frescoes in the Ovetari Chapel of the Church of the Eremitani (destroyed in World War II).

The styles of Antonio and Giovanni are not easily distinguished, but Antonio was certainly the dominant partner. The soft, rounded figures in his heavily ornamented polyptychs are influenced by Gentile da Fabriano and, more superficially, by Masolino. The earliest work signed by Antonio and Bartolomeo Vivarini is a polyptych, now in the Bologna gallery, commissioned by Pope Nicholas V in 1450. It is couched in the same idiom as the paintings of Antonio's first period, but, in later works, the intervention of his more progressive younger brother resulted in the introduction of Renaissance elements into Antonio's style.

Vivarini, Bartolomeo (b. c. 1432, Murano?, Republic of Venice [Italy]—d. c. 1499), painter and member of the influential Vivarini family of Venetian artists.

Vivarini was probably a pupil of his brother Antonio, with whom he collaborated after 1450; but, unlike him, Bartolomeo was profoundly influenced by Paduan painting of the circle of Francesco Squarcione. From his first dated work (1448) onward, he reveals a stronger feeling for plasticity and greater formal resource. A painting of St. John of Capistrano (Louvre, Paris) of 1459 is typical of Bartolomeo's austere and individual style. Contact with the paintings of Andrea Mantegna seems to have marked a turning point in Bartolomeo's career, first apparent in an altarpiece of 1464 in the Accademia, Venice. All his most distinguished works date from after that time; among these are altarpieces in Venice in the churches of SS. Giovanni e Paolo (1473), Santa Maria dei Frari (1474), and San Giovanni in Bragora (1478) and in the Accademia (1477). His last dated work is a triptych of 1491 at Bergamo, in Lombardy, where he apparently was active in his last

own higher self; to labour for the benefit of mankind was the noblest endeavour.

Born into an upper-middle-class Kāyastha family in Bengal, he was educated at a Western-style university where he was exposed to Western philosophy, Christianity, and science. Social reform was given a prominent place in Vivekananda's thought, and he joined the Brahmo Samaj (Society of Brahma), dedicated to eliminating child marriage and illiteracy and determined to spread education among women and the lower castes. He later became the most notable disciple of Ramakrishna, who demonstrated the essential unity of all religions. Always stressing the universal and humanistic side of the Vedas as well as belief in service rather than dogma, Vivekananda attempted to infuse vigour into Hindu thought, placing less emphasis on the prevailing pacifism and presenting Hindu spirituality to the West. He was an activating force behind the Vedanta (interpretation of the Upanisads) movement in the United States and England. In 1893 he appeared in Chicago as a spokesman for Hinduism at the World's Parliament of Religions and so captivated the assembly that a newspaper account described him as "an orator by divine right and undoubtedly the greatest figure at the Parliament." Thereafter he lectured throughout the United States and England, making converts to the Vedanta movement.

On his return to India with a small group of Western disciples in 1897, Vivekananda founded the Ramakrishna Mission (q.v.) at the monastery of Belur Math on the Ganges River near Calcutta. Self-perfection and service were his ideals, and the order continued to stress them. He adapted and made relevant to the 20th century the very highest ideals of the Vedāntic religion, and although he lived only two years into that century he left the mark of his personality on East and West alike.

viverrid, any member of the family Viverridae, small mammals, order Carnivora, including the civets and mongooses. All are native to the Old World; they evolved from Eurasian forms in the Eocene or Oligocene epochs and later spread throughout Africa. Most have slender bodies with long tails and short legs terminating in four- or five-toed feet. Their necks and heads are typically elongated, their muzzles tapering, their ears small, and their dentition varied (32-40 teeth). Most species have anal scent glands. Some viverrids are nocturnal, some diurnal; they feed principally on small animals and vegetable matter. Many species bear two annual litters, each containing two to four young. Life expectancy ranges from 5 to 15 years.

Vives, Amadeo (b. Nov. 18, 1871, Collbató, Spain—d. Dec. 1, 1932, Madrid), Spanish composer noted for his nearly 100 light operas.

After study in Barcelona, Vives founded (1891), with Luis Millet, the choral society Orfeó Catalá. His first opera, Artus, produced in Barcelona in 1895, made use of Catalan folk songs, and Euda d'Uriach (Barcelona, 1900) originally had a Catalan libretto. His most popular opera probably was Maruxa (Madrid, 1914). Other well-known operas include Balada de carnaval (Madrid, 1919) and Doña Francis-quita (Madrid, 1923), the latter inspired by Lope de Vega's play La discreta enamorata. Vives also composed more serious music, including Canciones epigramáticas, a series of songs with texts from some of the great Spanish poets. He published a book of essays, Sofia, in 1923.

Vives, Juan Luis (b. March 6, 1492, Valencia, Aragon—d. May 6, 1540, Bruges), Spanish Humanist and student of Erasmus, eminent in education, philosophy, and psychology, who strongly opposed Scholasticism and emphasized induction as a method of inquiry.

Vives left Spain at the age of 17 to avoid the Inquisition. After studies at Paris (1509–12), he was appointed professor of the humanities at Louvain (1519). Having dedicated his commentary (1522) on St. Augustine's *De civitate Dei* to Henry VIII of England, he went

in 1523 to England, where he was appointed preceptor to Mary, princess of Wales, and lectured on philosophy at Oxford. In 1527 he forfeited Henry's favour by opposing the royal divorce from Catherine of Aragon and was imprisoned for six weeks, after which he left England for The Netherlands to devote himself to writing.

In education Vives achieved renown through such works as *De ratione studii puerilis* (completed 1523; "On the Right Method of Instruction for Children") and *De disciplinis libri* xx (1531; "Twenty Books on Disciplines"), in which he advocated the use of the vernacular in schools, argued for the building of academies, and supported the education of women. Perhaps his greatest innovation was to recommend the study of nature for boys, applying the principle of induction from personal inquiry and experience that Erasmus had advocated for the study of Scripture and languages.

Vives' claim to eminence in psychology and philosophical method rests on his *De anima et vita libri tres* (1538; "Three Books on the Soul and on Life"), in which he discusses the association of ideas, the nature of memory, and even animal psychology. The work somewhat anticipates the ideas of the great thinkers of the century following his death by its emphasis on induction as a method of psychological and philosophical discovery.

Viviani, René (b. Nov. 8, 1863, Sidi bel Abbès, Alg.—d. Sept. 7, 1925, Le Plessis-

Robinson, Fr.), Socialist politician and premier of France during the first year of World War I.

A member of an Italian family that had settled in Algeria, Viviani began his career as a lawyer, first in Algiers, then in Paris; he pleaded in many political actions in behalf of workers and Socialists and acquired a reputation as a brilliant and effective speaker. A Socialist deputy for Paris from 1893 to 1902, he collaborated with Jean Jaurès, the great Socialist politician, in launching L'Humanité (1904), an influential Socialist newspaper, and in helping to found a unified Socialist party, the Section Française de l'Internationale Ouvrière (1905). After reelection to the Chamber of Deputies, he joined the government of Premier Georges Clemenceau in October 1906 as France's first minister of labour, leaving the new party and becoming an "Independent" Socialist. During his three years in Clemenceau's Cabinet, no effective reforms were enacted to ameliorate the condition of labour or the poor. Remaining minister of labour under Aristide Briand until November 1910, he was responsible for codifying all social legislation passed since 1900. After serving as minister of education (December 1913-June 1914), he became premier and minister of foreign affairs on June 16, 1914.

When Germany declared war on France (Aug. 3, 1914), Viviani resigned as minister of foreign affairs; at the end of August he formed a government of national union, with representatives of all parties. Criticized for a munitions shortage, he resigned as premier in October 1915 but served as minister of justice until March 1917.

Viviani represented France at the League of Nations at Geneva in 1920 and again in 1921 and at the Washington Naval Conference of that year. He entered the Senate in 1922 but took no further part in politics.

vivianite, phosphate mineral, hydrated iron phosphate [Fe₃(PO₄)₂ · 8H₂O], that occurs as colourless (when freshly exposed) or dark-blue (after long exposure), glassy crystals in the weathered zones of phosphate deposits and as concretions in clays (widespread). It also occurs in recent sediments, in lignite and peat, in forest soils, and as the colouring agent in odontolite. Localities of occurrence include England, Germany, Bolivia, Japan, and the Soviet Union. It is abundant in New Jersey and Colorado. For detailed physical properties, see phosphate mineral (table).

Vivien, Renée, pseudonym of PAULINE M. TARN (b. 1877, London—d. 1909, Paris), French poet whose poetry encloses ardent passion within rigid verse forms. She was an exacting writer, known for her mastery of the sonnet and of the rarely found 11-syllable line (hendecasyllable).

Of mixed Scottish and American ancestry, she was educated in England, but she lived nearly all her life in Paris and wrote in French. Her poetry was influenced by Keats and Swinburne; by Baudelaire; by Hellenic culture; by her extensive travels in Norway, Turkey, and Spain; and by her lesbianism, all of which imparted a certain exoticism to her writings. Like her contemporary Anna de Noailles, she was gifted with beauty, fortune, talent, and fame. Nevertheless, Vivien was deeply unhappy, being unable to adjust to the realities of life. She hated the crassness of her age; her dark, candlelit apartment was decorated with objets d'art from past civilizations. Her major works are Cendres et poussières (1902; "Ashes and Dust"); Les Kitharèdes (1904; "The Women of Kithara"); translations from Sappho, the Greek poetess of Lesbos; and Sillages (1908; "Sea Wakes"). Vivien seems to have found peace shortly before her death with her conversion to Roman Catholicism, intimated in the new austerity of her last works, *Dans un coin de violettes* (1908; "In a Violet Garden") and *Le Vent des vaisseaux* (1909; "Ship Wind"). Her *Poésies complètes* were published in 12 volumes in 1901–10 and in two volumes in 1934.

viviparity, retention and growth of the fertilized egg within the maternal body until the young animal, as a larva or newborn, is capable of independent existence. The growing embryo derives continuous nourishment from the mother, usually through a placenta or similar structure. This is the case in most mammals, many reptiles, and a few lower organisms. A more primitive condition, known as ovoviviparity and found in certain snakes, is the simple retention of the egg until it hatches. In this case the embryo derives food from the yolk present in the egg and is not dependent on the mother except for physical protection. Compare oviparity.

Vizcaya, English BISCAY, Basque BIZKAIA, provincia, in the autonomous Basque Country (País Vasco), northern Spain; it has an area of 856 square miles (2,217 square km). Originally a tribal territory of the Vascones (4th century AD), it was vested in the crown of Castile and Leon in 1379, but the central government has always had difficulties in ruling the fiercely independent Basques. Charters of rights and privileges (fueros) toward some form of regional autonomy were granted to the Basque provinces (Basque: Euskal-Herria; Spanish: Vascongadas), notably in the Economic Accord (Concierto Económico) of 1925 signed with the national exchequer. This agreement was canceled, however, after the Nationalist victory of 1937. In 1980, with Alava and Guipúzcoa, it became one of the three component provinces of the autonomous region of the Basque Country.

The Cantabrian coastal area, in the north, where fishing and tourism represent the economic mainstays, has many high cliffs and inlets (rias); Bermeo and Ondarroa are its most important fishing ports. Bilbao (q.v.), the provincial capital and seaport, and its environs comprise the industrial (iron, steel, chemicals) and commercial centre of Vizcaya, which has the greatest mineral wealth of any Spanish province. Guernica (now Guernica y Luno), near Bilbao, is the symbol of Basque glory and the subject of a painting by Pablo Picasso inspired by the massacre there during the Spanish Civil War.

The inland Nervión River valley, bordered by the coastal mountain range (Mount Oiz; 3,363 feet [1,025 m]) and by the inland arc of mountains that connects near the Aitzgorri (5,066 feet [1,544 m]) with the Navarrese mountains of Aralar, is an agricultural region where corn (maize) and apples are cultivated and livestock is raised; its cider is famous throughout Spain. The eastern iron district of Vizcaya, between Santander and Burgos, is also important because of its pasturage for livestock. Farms are scattered throughout the province in isolated caserios (settlements), although, in the western valleys of Carranza and Lanestosa, the Castilian influence of hamlets is clear. Pop. Vizetelly FAMILY, originally spelled VIZZE-TELLI, family of Italian descent active in journalism and publishing from the late 18th century in England and later in France (briefly) and the United States.

James Henry Vizetelly (d. 1838) published Cruikshank's Comic Almanack and other British annuals. His son Henry Richard (1820–94) was a correspondent (chiefly in Paris)

for The Illustrated London News and the founder of two brief competitors. In 1852 he published a best-selling cheap reprint of Uncle Tom's Cabin, by the American novelist Harriet Beecher Stowe. Forming his own company in 1882, he published inexpensive editions (later called the "Mermaid Series") of early English dramatists and translations of Gustave Flaubert, Fyodor Dostoyevsky, Leo Tolstoy, and other continental European authors. For publishing the novels of Émile Zola, Vizetelly was fined and then (1889) was jailed on charges of obscenity, the imprisonment permanently damaging his health. In his final years he was nevertheless able to publish a cheerful, anecdotal account of literary life in London and Paris from 1840 to 1870, entitled Glances Back Through Seventy Years: Autobiographical and Other Reminiscences (1893). His younger brother Frank (1830-83?) helped to establish (1857) the Paris periodical Le Monde illustré, which he edited for two years. He later served for 24 years (1859-83) as a war correspondent for The Illustrated London News in Giuseppi Garibaldi's Italy, in Spain, in the American Civil War, and in Egypt. He disappeared (either slain or enslaved) during a British military disaster in the Sudan.

Edward Henry Vizetelly (1847-1903), son of Henry Richard by his first marriage, also was a war correspondent, for the London Daily News and The New York Times. His brother Ernest Alfred (1853-1922) was a translator and biographer (1904) of Zola and the author of several books on French history from 1852. Francis Horace (afterward Frank) Vizetelly (1864-1938), Henry Richard's only son by a second marriage, emigrated to the United States (1891), where he formed a lifetime association with the publishing house of Funk and Wagnalls. Beginning as assistant on the Standard Dictionary of the English Language (1894), he was from 1912 the chief editor of the abridgments and succeeding works, notably the New Standard Dictionary (1913). He was a prolific contributor to newspapers and magazines; "The Lexicographer's Easy Chair," his correspondence column in the journal Literary Digest, was the most successful American feature-column of its kind. In 1930 he established a school for announcers of the Columbia Broadcasting System; rejecting British pronunciation, he insisted on American standards. Though not fully conversant with modern linguistics, he was a force for linguistic realism. On his death in New York City in 1938, The New York Times appraised him as "philologist, instructor, and entertainer in ordinary to the American people.'

Vizianagaram, also spelled VIZIANAGRAM, town, northeastern Andhra Pradesh state, southern India. Situated in the heart of the Eastern Ghäts, Vizianagaram is a rail junction and shipping centre for sunn hemp (jute substitute) and jute products. Manganese is mined nearby. The town has several colleges.

Vizianagaram derives its name from the Vijayanagar empire, a powerful Hindu realm that successfully resisted Muslim expansion in southern India in the 14th and 15th centuries. The town, founded in 1712, was the headquarters of the rajas of Vizianagaram, who played a notable role in the history of Andhra Pradesh in the 18th century and were patrons of education and the fine arts. Their fort (1714) lies about 1 mile (1.6 km) east of the railway station. The area is well-served by roads and by branches of the South Eastern Railway. Pop. (1981) 114,806.

vizier, Arabic and Modern Persian WAZIR, Turkish VEZIR (from old Iranian Pahlavi vçir, "judge"), originally the chief minister or representative of the 'Abbāsid caliphs and later a high administrative officer in various Muslim countries, among Arabs, Persians, Turks, Mongols, and other eastern peoples. The office took shape during its tenure by the Barmakid

(Barmecide) family in the 8th century. The 'Abbāsid vizier stood between sovereign and subjects, representing the former in all matters touching the latter. This withdrawal of the head of state from direct contact with his people was unknown to the previous Umayyad caliphate and was certainly an imitation of Persian usage. Under the early Ottoman sultans, the office was called *pervane* ("advice"), a usage inherited from the Seljuqs of Anatolia. The Ottoman title vizier was first conferred on a military commander about 1380. Thenceforth until the conquest of Istanbul (1453), it denoted the highest rank in the ruling institution and could be held simultaneously by several persons, including the ministers of state. In this period members of the powerful Candarli family served periodically as ministers and held the rank of vizier.

Under the sultan Mehmed II (reigned 1444-46, 1451-81), the Ottomans assumed the old Islāmic practice of giving the title vizier to the office of the chief minister, but they had to use the distinguishing epithet "grand." A number of viziers, known as the "dome viziers," were appointed to assist the grand vizier, to replace him when he was absent on campaign, and to command armies when required. Later the title vizier was granted to provincial governors and to high officials such as the defterdar (fi-

nance officer).

The grand vizier was the absolute representative of the sultan, whose signet ring he kept as an insignia of office. His actual power, however, varied with the vigour of the sultans. In 1654 the grand vizier acquired an official residence known as the Babiali (Sublime Porte), which replaced the palace as the effective centre of Ottoman government. Beginning in the 19th century the grand viziers presided over the council of ministers, appointed by the sultan; and after 1908 they acquired the right to appoint the Cabinet ministers. The title disappeared with the collapse of the empire.

The term vizier is also customarily applied to a pair of civil officers in ancient Egypt having viceregal powers. The office dates from at least the 4th Dynasty (c. 2575-c. 2465 BC) and achieved great importance from the reign of Sesostris III (1836-18 BC), when the vizier acquired jurisdiction over the entire bureaucracy of ancient Egypt.

Vlaardingen, gemeente (municipality), Zuidholland *provincie* (province), southwestern Netherlands, on the Nieuwe Waterweg, just west of Rotterdam. An early Dutch naval victory was won nearby when Dirk IV defeated Emperor Henry III in 1037; the victories of Count William V (1351) near the town established the Bavarian line of Holland. Vlaardingen has developed in the 20th century from a small fishing village into one of the largest seaports of The Netherlands. The completion of the largest shipyard in The Netherlands, on nearby Rozenburg Island in 1958, greatly increased the town's industrial importance. Economic facilities include herring fisheries, dairies, and metallurgical and chemical (phosphates) works. Historic landmarks include the Weighbridge (1156), the Grote Kerk (Great Church; 1643), the town hall (1650), and the fish market (1779). The Benelux Tunnel (completed 1967) begins in Vlaardingen. Pop. (1983 est.) 77,072.

Vlach, one of a European people constituting the major element in the populations of Romania and the Moldavian Soviet Socialist Republic as well as smaller groups located throughout the Balkan Peninsula, south and west of the Danube River. Although their Slav neighbours gave them the name Volokh, from which the term Vlach is derived, the Vlachs call themselves Romani, Romeni, Rumeni, or Aromani; they are also referred to as Romanians or Rumans.

The Vlachs emerged into history in the Middle Ages, primarily in the region south of the Danube. They traditionally claim to be descendants of the ancient Romans who in the 2nd and 3rd centuries AD occupied Dacia, a Roman province located in the regions of Transylvania and the Carpathian Mountains of modern Romania. A more generally accepted version of this theory suggests that their ancestors were a Thracian tribe, native to the Roman province of Dacia, which intermarried with the Roman colonists and assimilated their language and culture.

After the Romans evacuated Dacia (AD 271), the area was subjected to a series of barbarian invasions. According to some scholars, the Romanized Dacians remained in the area, probably taking refuge in the Carpathian Mountains. They remained there for several centuries as shepherds and primitive farmers, until conditions settled and they returned to the plains.

Another theory suggests that the Romanized Dacian population moved south of the Danube when the Romans left Dacia. After the invasions subsided, the Vlachs, seen in this theory as a later group of immigrants, moved into the area from their Romanized homelands south of the Danube or elsewhere in the Balkans. This theory cites the major role the Vlachs played in the formation and development of the Second Bulgarian Empire (also known as the Empire of Vlachs and Bulgars; founded 1184) as evidence that the centre of the Vlach population had shifted south of the Danube.

By the 13th century the Vlachs were reestablished in the lands north of the Danube, including Transylvania, where they comprised the bulk of the peasant population. From Transylvania they migrated to Walachia (Land of the Vlachs) and Moldavia, which became independent principalities in the 13th and 14th centuries and combined to form Romania at the end of the 19th century.

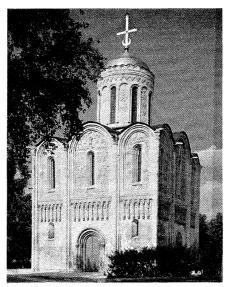

Other groups of Vlachs migrated to other

regions of the Balkan Peninsula. The Macedo-Vlachs, or Tzintzars, settled on the mountains of Thessaly. According to the 12th-century Byzantine historian Anna Comnena, they founded the independent state of Great Walachia, which covered the southern and central Pindus Mountain ranges and part of Macedonia. (After the establishment of the Latin Empire at Constantinople in 1204, Great Walachia was absorbed by the Greek Despotate of Epirus; later it was annexed by the Serbs, and in 1393 it fell to the Turks.) Another Vlach settlement, called Little Walachia, was located in Aetolia and Acarnania. In addition, Vlachs known as Morlachs, or Mavrovlachi, inhabited areas in the mountains of Montenegro, Hercegovina, and northern Albania as well as on the southern coast of Dalmatia, where they founded Ragusa (modern Dubrovnik). In the 14th century some Morlachs moved northward into Croatia, causing much of northern Dalmatia to acquire the name Morlacchia. In the 15th century others, later called Cici, settled in the Istrian Peninsula.

Vladimir, oblast (administrative region), western Russian Soviet Federated Socialist Republic, centred on Vladimir city; it has an area of 11,200 sq mi (29,000 sq km) and lies east of Moscow in the basin of the Oka River. The greater part is a low plain, with extensive swamps in the south. The oblast has a natural vegetation of spruce, pine, and oak, but much of the forest has been cleared. Industries in the oblast produce textiles, engineering goods, timber goods, and glassware. Agriculture is concentrated chiefly in the northwest, where there is considerable market gardening, Much land reclamation has taken place in the swamps. Pop. (1982 est.) 1,603,000.

the Klyazma River. Vladimir was founded in 1108 by Vladimir II Monomakh. It became the centre of a princedom, deriving importance from trade along the Klyazma. In 1157 Prince Andrew Bogolyubsky moved his capital there from Kiev. In 1238 the city was devastated by the first Mongol invasion, and in 1293 it was again sacked by the Mongols; on each occasion it rapidly recovered. In 1300 the Orthodox metropolitan was established there, but in 1326 the church authority and in 1328 temporal authority were transferred to

Moscow. Thereafter the city, suffering several further Tatar attacks in the 15th century, became a minor local centre, although in 1796 it was made a seat of provincial government.

Post-revolutionary Vladimir has grown chiefly on the basis of its textile, machine-building, and chemical industries. The city has many surviving buildings of its long history, including some superb examples of early Russian architecture. Especially noteworthy are the kremlin; the Cathedral of the Assumption, built in 1158 and several times rebuilt or restored; the triumphal Golden Gate of 1158, restored under Catherine II the Great; and the Cathedral of St. Dmitry (1197, restored 1835). Pop. (1983 est.) 320,000.

Vladimir I, in full VLADIMIR SVYATOSLA-VICH, byname SAINT VLADIMIR, or VLADIMIR THE GREAT, Russian SVYATOY VLADIMIR, or VLADIMIR VELIKY (b. c. 956, Kiev—d. July 15, 1015, Berestova, near Kiev; feast day July 15), grand prince of Kiev and first Christian ruler in Kievan Rus, through whose military conquests the provinces of Kiev and Novgorod were consolidated into a single state, and whose Byzantine baptism determined the direction of Christianity in what became Rus-

Son of the Norman-Rus prince Svyatoslav of Kiev by one of his courtesans, in the Rurik lineage dominant from the 10th to the 13th centuries, Vladimir was made prince of Novgorod in 970. On the death of his father in 972, he was forced to flee to Scandinavia, where he enlisted help from an uncle and overcame Yaropolk, another son of Svyatoslav, who attempted to seize the duchy of Novgorod as well as Kiev. By 980 Vladimir had consolidated the Kievan realm from the Ukraine to the Baltic Sea and had solidified the frontiers against incursions of Bulgarian, Baltic, and Eastern nomads.

Although Christianity in Kiev existed be-fore Vladimir's time, he had remained a pagan, accumulated about seven wives, established temples, and, it is said, taken part in idolatrous rites involving human sacrifice. With insurrections troubling Byzantium, the emperor Basil II (976-1025) sought military aid from Vladimir, who agreed, in exchange for Basil's sister Anne in marriage. A pact was reached c. 987, when Vladimir also consented to the condition that he become a Christian. Having undergone baptism, assuming the Christian patronal name Basil, he stormed the Byzantine area of Chersonesus (Korsun, now part of Sevastopol) to eliminate Constantinople's final reluctance. Vladimir then ordered the Christian conversion of Kiev and Novgorod, where idols were cast into the Dnepr River after local resistance had been suppressed. The new Rus Christian worship adopted the Byzantine rite in the Old Church Slavonic language. The story (deriving from the 11th-century monk Jacob) that Vladimir chose the Byzantine rite over the liturgies of German Christendom, Judaism, and Islam because of its transcendent beauty is apparently mythically symbolic of his determination to remain independent of external political control, particularly of the Germans. The Byzantines, however, maintained ecclesiastical control over the new Rus Church, appointing a Greek metropolitan, or archbishop, for Kiev, who functioned both as legate of the patriarch of Constantinople and of the emperor. The Rus-Byzantine religio-political integration checked the influence of the Roman Latin Church in the Slavic East and determined the course of Russian Christianity, although Kiev exchanged legates with the papacy. Among the churches erected by Vladimir was the Desyatinnaya in Kiev (designed by Byzantine architects and dedicated c. 996) that became the symbol of the Rus conversion. The expansion of education, judicial institutions, and aid to the poor were other legacies of the Christian Vladimir.

Another marriage, following the death of Anne (1011), affiliated Vladimir with the Holy Roman emperors of the German Ottonian dynasty and produced a daughter, who became the consort of Casimir I the Restorer of Poland (1016–58). Vladimir's memory was kept alive by innumerable folk ballads and legends.

Vladimir II Monomakh, in full VLADIMIR VSEVOLODOVICH MONOMAKH (b. 1053—d. May 19, 1125, near Kiev), grand prince of Kiev from 1113 to 1125.

The son of Grand Prince Vsevolod I Yaroslavich (ruled Kiev 1078-93) and Irina, the daughter of the Byzantine emperor Constantine IX Monomachus, Vladimir became actively engaged in the politics of Kievan Rus, helping his father and uncle Izyaslav (ruled at Kiev intermittently 1054-78) defeat his cousins Oleg Svyatoslavich and Boris Vyacheslavich at Chernigov (1078) and succeeding his father as prince of Chernigov when Vsevolod became grand prince of Kiev. Vladimir ruled Chernigov from 1078 to 1094, restoring order among his cousins in Volhynia (1084-86) and assuming a leading role among princes of Rus at the conferences held to avert perpetual warfare among themselves (1097 and 1100). In 1113, when his cousin Grand Prince Svyatopolk II (ruled Kiev 1093–1113) died, the veche (city council) of Kiev named him the successor to the throne of Kiev.

During his reign, as prior to it, Vladimir was almost constantly involved in wars, fighting a variety of enemies but primarily the Polovtsy, who had settled in the steppe region southeast of the Kievan state and had been raiding the lands of Rus since 1061. In his "Testament," which he wrote for his sons and which constitutes the earliest known example of Old Russian literature written by a layman, Vladimir recounted participating in 83 noteworthy military campaigns and recorded killing 200 Polovtsy princes. In addition to his martial qualities, Vladimir Monomakh was known as an adept administrator, whose ability to curtail the internecine warfare among his princely relatives revived, if only temporarily, the declining strength of Kievan Rus. He was also noted as a builder; he founded the city of Vladimir on the Klyazma River in northeastern Russia, which by the end of the 12th century replaced Kiev as the seat of the grand prince.

Vladimir-Suzdal school, school of Russian medieval mural and icon painting that flourished in the 12th and 13th centuries around the neighbouring cities of Vladimir and Suzdal in the Suzdal region of northeastern Russia. Vladimir-Suzdal, along with the city of Novgorod in northwestern Russia, was one of the two areas that inherited the Byzantine artistic traditions of Kiev, Russia's first capital, which lost preeminence to Vladimir in 1157. Like Kiev a centre of princely authority, Vladimir-Suzdal maintained great continuity with the monumental and aristocratic spirit of Kievan Byzantine art, producing works of an exceptionally high quality.

Stylistic similarities and a scarcity of documentation complicate the attribution of particular works to the Kievan or Vladimir-Suzdal schools. Impossible to dispute are frescoes that decorate the Suzdalian churches; fragments of 12th- and 13th-century works appear at the Cathedrals of St. Dmitry and the Assumption in Vladimir, the church of SS. Boris and Gleb in Kideksha, and Suzdal Cathedral. These fragments, the remains of work by Greek artists, depict aristocratic, dignified, classically

featured figures painted with a confident impressionist technique. They maintain the delicate balance between the real and the ideal that characterizes the height of Byzantine art, and at the same time they betray Russian intensity of emotion.

Works of the Vladimir-Suzdal school, while preserving Byzantine illusionistic modelling and solid proportions that lack the elongation characterizing all later Russian art, move toward a more Russian expression: their emotion is intensely ascetic, the anatomy of the figures is uncertain and the hands typically small, and there is an increasingly conscious use of expressive colour, which prefigures the colouristic achievements of later Russian art. In addition, there is the use of facial expression to portray a variety of specific emotions that is the peculiar achievement of the Vladimir-Suzdal school, equalled neither by contemporary nor by later schools.

The brilliant artistic development of Vladimir-Suzdal was brought to a sudden end by the mid-13th-century invasions of the Tartars, who conquered all but northwestern Russiand destroyed countless treasures. The grand tradition of Kiev and Vladimir-Suzdal was thus lost, and the development of Russian art continued for the next 200 years along different lines, in the middle-class environment of Novgorod and its satellite city, Pskov. See also Novgorod school and Pskov school.

Vladimir-Volynsky, also spelled VLADIMIR-VOLYNSKIJ, city, Volyn *oblast* (administrative region), Ukrainian Soviet Socialist Republic, situated on the Bug River, where it is crossed by the Kovel-Lvov railway. It was founded by Vladimir I, grand prince of Kiev, in the 10th century and became the capital of one of the chief princedoms of Kievan Russia. Among architectural relics is the Cathedral of the Assumption, built in 1160. The town passed to Poland in 1347, back to Russia in 1795, and to Poland again in 1919; in 1939 the area was annexed by the Soviet Union, which formalized the annexation in 1945. Its

industries process agricultural products. Pop. (1970) 28,412.

Vladimirescu, Tudor (b. c. 1780, Vladimiri, Walachia—d. June 7, 1821, Tîrgovişte), national revolutionary hero, leader of the popular uprising of 1821 in Walachia.

A former officer in the Russian Army, Vladimirescu was influenced by the autonomist movement in Serbia. He initially allied himself with the Greek revolutionary societythe Philikí Etairía—that sought to overturn Turkish rule throughout the Balkans. With the Etairist rising in Moldavia under Prince Alexander Ypsilantis (March 1821), however, he disavowed the Greek leadership of the revolution in the Romanian principalities. He organized a popular rising in Walachia to evict the predominantly Greek administration of the Turkish government and end the spoliations of the native Romanian aristocracy (boieri). His movement at first enjoyed considerable popularity, but his eventual accommodation to the provisional aristocratic government at Bucharest eroded his support. When Ypsilantis suspected Vladimirescu of conspiring with the Turks to cut off the retreat of the Greek revolutionary forces from the Bucharest region, he ordered the arrest of the Romanian leader, who was court-martialled and executed.

• Vladislas II (b. 1456—d. March 13, 1516, Buda, Hung.), king of Bohemia from 1471 and of Hungary from 1490 who achieved the personal union of his two realms.

The eldest son of Casimir IV Jagiełło, king of Poland, Vladislas was elected king of Bohemia in 1471. The early part of his reign was spent in conflict with the Hungarian king Matthias Corvinus, who in 1478 (Treaty of Olomouc) won title to the previously Bohemian crownlands of Moravia, Silesia, and Lusatia. After Matthias died, however, Vladislas was elected king of Hungary as Ulászló II in 1490. During his compliant and vacillating reign, in both Bohemia and Hungary, the nobility widely extended their powers and strengthened their hold over an already oppressed peasantry. Vladislas was also faced with the rivalry of the emperor Maximilian I for the Hungarian crown and was obliged to concede the Habsburg succession to his territories should his own line be extinguished (Peace of Pressburg, 1491; Treaty of Vienna, 1515); that agreement greatly contributed to the eventual formation of a Habsburg Danubian empire.

Vladivostok, seaport and administrative centre of Primorsky Kray (Maritime Territory), Russian S.F.S.R., in the Soviet Far East. It is located around Zolotoy Rog (Golden Horn Bay) on the western side of a peninsula that separates Amur and Ussuri bays on the Sea of Japan. The town was founded in 1860 as a Russian military outpost and was named Vladivostok (Rule the East). Its forward position in the extreme south of the Russian Far East inevitably led to a major role as a port and naval base. In 1872 the main Russian naval base on the Pacific was transferred there, and

thereafter Vladivostok began to grow. In 1880 city status was conferred. The city also grew in importance after the construction of the Chinese Eastern Railway across Manchuria to Chita (completed in 1903), which gave Vladivostok a more direct rail connection to the

rest of the Russian Empire.

During World War I Vladivostok was the chief Pacific entry port for military supplies and railway equipment from the United States. With the outbreak of the Revolution in 1917 various groups of revolutionaries were active in the town, but in 1918 Vladivostok was occupied by foreign, mostly Japanese, troops. American, British, French, Italian, and Czech forces left in 1920, but the last Japanese troops were not withdrawn until Oct. 25. 1922. The antirevolutionary forces in Vladivostok promptly collapsed, and Soviet power was established.

Vladivostok's first role is as a port. Merchant shipping, both passenger and cargo, is principally to other Soviet ports of the Far East. The port is the eastern terminus of the Northern Sea Route along the Soviet Union's Arctic seaboard from Murmansk and is the principal supply base for the Arctic ports east of Cape Chelyuskin. With the closure of Vladivostok to foreign vessels beginning in the 1950s, the major part of international maritime trade now goes by way of Nakhodka, to the east.

The principal exports of Vladivostok are petroleum, coal, and grain, while petroleum products and fish are the main imports. Into the port also comes much of the catch or processed fish from other Far Eastern ports for onward transmission to the rest of the country. It is also the home port of one of the Soviet Union's Antarctic whaling fleets.

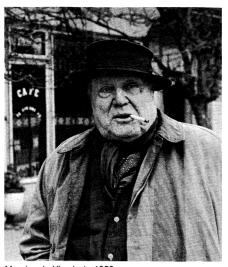

The industrial base of Vladivostok has been much diversified during the Soviet period. In addition to the large ship-repair yards, there are railway workshops and the Metallist plant making mining equipment. Light industry includes instrument and radio factories, timberworking enterprises (notably those producing furniture and veneer), a chinaware works, and manufacturers of pharmaceutical products. Food industries—principally the processing of fish and meat and flour milling-and the building industry (prefabricated building panels) are important. A railroad town, Vladivostok is the eastern terminus of the Trans-Siberian railroad. The city airport provides domestic services.

The city is the chief educational and cultural centre of the Soviet Far East. It is the site of the Far Eastern Scientific Centre, the Far Eastern State University (founded 1920), and several other higher-educational foundations, including medical, art education, polytechnic, trade, and marine-engineering institutes. Vladivostok has amateur and professional theatres as well as a philharmonic society and symphony orchestra. There are also museums of local history and of the history of the Pacific Fleet and a number of libraries. Pop. (1987 est.)

Vlaminck, Maurice de (b. April 4, 1876, Paris-d. Oct. 11, 1958, Rueil-la-Gadelière, Fr.), French painter whose rebellious temperament led him to experiment with raw, blazing colour, applied in thick daubs, and earned him a charter association with the Fauves (see Fauvism).

Vlaminck lived in or near country places most of his life, which may account for his rugged personality as well as his flair for painting nature. His interest in art dated from 1895, with lessons in drawing and study of the Impressionists, and in 1899 he began sharing a studio with André Derain, who had been a friend from boyhood. Vlaminck was also at various times a musician, actor, cyclist, and

whose works became a new influence; he also met Henri Matisse and first exhibited at the Salon des Indépendants, Paris. Though his work remained representational, its freer use of colour was moving in the explosive direction of Fauvism. In 1905 he participated in the controversial group show at the Salon d'Automne, when the term Fauve was first applied to the dynamic canvases of bold colour, applied in a spontaneous, even violent, manner. By 1908, however, he turned to landscapes of thickly applied grays, whites, and deep blues. His style moved closer to that of the final development of Paul Cézanne, and he gained a more solidly based sense of composition. Around 1915 he began to achieve a personal, strongly stated, and thoroughly French Expressionist style.

Vlasov, Andrey Andreyevich (b. Sept. 14 [Sept. 1, Old Style], 1900, Vladimir province, Russia [now in Russian S.F.S.R.]-d. Aug. 1?, 1946), anti-Stalinist military commander who, captured by the Germans early in World War II, became a turncoat and fought with the Germans against the Soviet Union.

The son of a kulak, Vlasov was drafted into the Red Army in 1919 and fought in the Russian Civil War. He joined the Communist Party in 1930 and, in 1938, went to China to serve as a military adviser to Chiang Kaishek. He returned to Russia in 1939 and, after playing major roles in the defense of Kiev and Moscow against the Germans in 1941, was captured with his army the following year (July 1942).

In 1944 Nazi leaders allowed Vlasov to form the Committee for the Liberation of the Peoples of Russia with the aim of overthrowing the Stalin regime. The Russian Liberation Army, which he also headed, was composed of former Russian soldiers captured by the Germans. Near the end of the war, Vlasov's 50,000 troops were allowed by their distrustful German sponsors to go into battle against the advancing Red Army. Most of them soon afterward surrendered to American forces advancing on Czechoslovakia and were forcibly repatriated to Soviet authorities. Vlasov was handed over to the Russians on June 3, 1946, and was tried and hanged.

Vlissingen, English Flushing, gemeente (commune), Zeeland provincie, southwestern Netherlands, situated on the southern coast of Walcheren Island, at the mouth of the Western Scheldt (Schelde) estuary. A medieval trading town with emphasis on herring fishing, its importance lay in its position controlling the approach to Antwerp. Fortified by Charles V, it was the first town to rebel against Spanish rule in 1572 and became the headquarters of the insurgents' navy (the Sea Beggars). It was held by England from 1585 to 1616 as a "security town" under an agreement to assist the Dutch. It was turned into a naval base by Napoleon during the French occupation (1795–1814). A period of prosperity after the independence of The Netherlands was followed in the 19th century by a decline from which Vlissingen did not recover until the establishment of a shipbuilding yard in 1875. The town was heavily damaged when Walcheren and other islands were flooded by the British army in World War II to clear the way to Antwerp in 1944 and by natural floods in 1953. Since rebuilt, it is now an important commercial port, fishing harbour, and seaside resort and is also a naval base. Industries include shipbuilding, engineering, oil refining, and the manufacture of machin-

Historic landmarks include the Church of St. James (1308; rebuilt after a fire in 1911), the Prisoners' Tower (1563), the old exchange (1672), the town hall (1733), and part of an old city gate. The municipal museum has a collection relating to Admiral Michiel Adriaanzoon de Ruyter, a native of Vlissingen. Pop. (1987 est.) 44,863.

Vlorë, also called VLORA, Gheg dialect VLONË, Italian VALONA, town, second seaport of Albania. It lies at the head of the Vlores Bay, which is protected by the mountainous Karaburun (peninsula) and the island of Sazan (Italian Saseno, ancient Saso). Of ancient origin, it was founded as Aulon, one of three Greek colonies on the Illyrian coast. It was strategically important during Roman times and in the 11th-12th-century wars between Normans and Byzantines. Later it was contested by Venetians, Serbs, and Turks. On Nov. 28, 1912, Ismail Qemal Vlora proclaimed there the independence of Albania. Vlorë was occupied by the Italians in 1915-20 and again in 1939. With the rest of the country it reverted to the Albanians after the departure of the Germans in 1944. The harbour was improved following World War II and served as a naval base for the Soviet Union until 1961, when conflict between the two states resulted in a Soviet departure. The city's population includes Muslims, Greek Orthodox, and a few Roman Catholics.

The town of Vlorë is surrounded by hilly olive groves and is situated just inland from its port, which is linked by pipeline to the Stalin oil fields and the Cërrik refinery. Vlorë has a fishing and canning industry, a distillery, and an olive-oil refinery. Natural bitumen from nearby Selenicë is exported. Pop. (1983 est.)

Vlorë proclamation (Nov. 28, 1912), declaration of Albanian independence from Ottoman rule. After the Turkish government adopted a policy of administrative centralization with the Ottoman Empire (1908), Albanian nationalist leaders led a series of revolts (1909-12), demanding the unification of the empire's Albanian districts and political and cultural autonomy within them. While the Albanians, after a successful uprising in 1912, were negotiating with the Turks, however, a coalition of Balkan states declared war on the Ottoman Empire (October 1912).

Because one of the Balkan states' goals was to divide the Albanian districts of the empire among themselves and because their armies swiftly overcame the Turkish forces, the Albanian leaders abandoned their goal of creating an autonomous province within the empire. Instead, on Nov. 28, 1912, while their lands were being occupied by Serbian, Montenegrin, and Greek troops, 83 delegates from all parts of Albania met at Vlorë (Valona), where their leader, Ismail Qemal Vlora, proclaimed Albania an independent state.

Although the Balkan allies continued to seize Albanian territory, the major European powers, influenced primarily by Austria-Hungary and Italy, approved the formation of a sovereign Albanian state (December 1912). Confirming their position in the Treaty of London (May 30, 1913), which ended the 1912 Balkan War, the powers next determined Albania's borders with Serbia, Montenegro, and Greece; obtained the withdrawal of foreign troops from Albania; and on July 29, 1913, formally recognized Albania as an independent principality, guaranteed its status, and named William of Wied its prince.

Vltava River, German MOLDAU, river, the longest in Czechoslovakia, flowing 270 mi (435 km). The drainage basin is 10,847 sq mi 28,093 sq km). The river rises in southwestern Bohemia from two head-streams in the Bohemian Forest (Šumava), the Teplá Vltava on Černá hora (mountain) and the Studená VItava. It flows first southeast, then north across Bohemia, and empties into the Elbe (Czech Labe) River at Mělník, 18 mi north of Prague. Prague and České Budějovice are on the Vltava. At České Budějovice, in the middle basin, is an extensive lake region. The middle and lower course of the Vltava is gorgelike, with rapids and incised meanders. Large hydrodams with associated lakes provide recreational facilities. The principal tributaries are the Lužnice and Sázava (east) and the Otava and Berounka (west). The river is celebrated as the second subject in a cycle of six symphonic poems under the general title of Má vlast ("My Country") by the Czech patriot and composer Bedřich Smetana.

Vo Chi Cong (b. 1912, Quang Nam province, southern Vietnam), strongly anti-French Communist revolutionary who was among the earliest fighters for Vietnam's independence; he held key positions in South Vietnam's National Liberation Front (NLF) and the Provisional Revolutionary Government—both political arms of the Viet Cong guerrillas—during the second Indochina War.

Cong began an activist career in 1930 under Phan Boi Chau and Phan Chau Trinh, early nationalist rebels against the French colonial regime. During World War II he participated in the underground resistance against Japan and the Vichy French, who arrested him and kept him under surveillance in 1942.

It was not until 1961 that he emerged into political significance as a founding member of the NLF. Vo Chi Cong was the chief organizer of the People's Revolutionary Party, South Vietnam's Communist party, and became a strong opponent of Saigon's U.S.-backed regime. After the reunification of Vietnam in 1976, he joined the new national government, serving as the minister of fisheries (1976–77) and of agriculture (1977–78) and as a deputy prime minister (1976–82). He also became a full member of the Politburo of the Vietnamese Communist Party in 1976.

Vo Nguyen Giap (b. 1912, An Xa, Vietnam), Vietnamese military and political leader whose perfection of guerrilla as well as conventional strategy and tactics led to the Viet Minh victory over the French (and to the end of French colonialism in Southeast Asia) and later to the North Vietnamese victory over the Americans

The son of an ardent anticolonialist scholar, Giap as a youth began to work for Vietnamese autonomy. He attended the same high school as Ho Chi Minh, the Communist leader, and while still a student in 1926 he joined the Tan Viet Cach Menh Dang, the Revolutionary Party of Young Vietnam. In 1930, as a supporter of student strikes, he was arrested by the French Sûreté and sentenced to three

years in prison, but he was paroled after serving only a few months. He studied at the Lycée Albert-Sarraut in Hanoi, where in 1937 he received a law degree. Giap then became a professor of history at the Lycée Thanh Long in Hanoi, where he converted many of his fellow teachers and students to his political views. In 1938 he married Minh Thai, and together they worked for the Indochinese Communist Party. When in 1939 the party was prohibited, Giap escaped to China, but his wife and sister-in-law were captured by the French police. His sister-in-law was guillotined; his wife received a life sentence, later commuted to 15 years, but she died in prison after three years.

In 1941 Giap formed an alliance with Chu Van Tan, guerrilla leader of the Tho, a minority tribal group of northeastern Vietnam. Giap hoped to build an army that would drive out the French and support the goals of the Viet Minh, Ho Chi Minh's independent Vietnamese government. With Ho Chi Minh, Giap marched his forces into Hanoi in August 1945, and in September Ho announced the independence of Vietnam, with Giap in command of all police and internal security forces and commander in chief of the armed forces. Giap sanctioned the execution of many non-Communist nationalists, and he censored nationalist newspapers to conform with Communist Party directives. Giap's brilliance as a military strategist and tactician led to his winning the decisive battle at Dien Bien Phu on May 7, 1954, bringing the colonialist regime to an end.

On the division of the country in July, Giap became deputy prime minister, minister of defense, and commander in chief of the armed forces of North Vietnam and led the military forces of the north to victory in the second Indochina war, driving the Americans from the country in 1973 and bringing about the fall of the south in 1975. From 1976, when the two Vietnams were reunited, to 1980 Giap served as Vietnam's minister of national defense: he also became a deputy prime minister in 1976. He was a full member of the Politburo of the Vietnamese Communist Party until 1982. Giap was the author of People's War, People's Army (1961), a manual on guerrilla warfare based on his own experience.

vocal cord, Latin PLICA VOCALIS, either of two folds of mucous membrane that extend across the interior cavity of the larynx and are primarily responsible for voice production. Sound is produced by a rapid opening and closing of the folds at a frequency appropriate to the pitch. The vocal cords are shorter and thinner in women and children, accounting in part for their higher pitched voices.

The ventricular folds, located just above the vocal cords, are sometimes termed false vocal cords because they are not involved in voice production.

vocal fry, also called MURMUR, or BREATHY VOICE, in phonetics, a speech sound or quality used in some languages, produced by vibrating vocal cords that are less tense than in normal speech, which produces local turbulence in the airstream resulting in a compromise between full voice and whisper. English speakers produce a vocal fry when suggesting ghost wails with an oo-sound. See also voice; whisper.

vocal-instrumental concerto, musical composition of the early Baroque era (late 16th and early 17th centuries) in which choirs, solo voices, and instruments are contrasted with one another. Although sometimes employing secular texts, the genre is particularly associated with sacred music and is sometimes referred to as the sacred concerto. Its principle of contrast is rooted in late Renaissance developments such as the multiple choirs of Venice and the change in musical aesthetic toward greater emotional expressiveness.

The genre falls into two loose categoriesconcerti for many voices and for few. The many-voiced type is performed by multiple choirs, accompanied by organ and/or orchestra; it includes such examples as the Vespers (songs at certain hours) of the celebrated Italian composer Claudio Monteverdi. In contrast, the few-voiced type was usually set for one or more solo voices and continuo (low melody instrument, such as cello or bassoon, and harmony instrument, such as an organ or harpsichord). Leading composers of the few-voiced type include Monteverdi and Alessandro Grandi. By the end of the 17th century the two types merged, large-scale concerti frequently including vocal solos with continuo accompaniment.

The Italian vocal-instrumental concerto was adopted by German composers for Lutheran religious music. Such works, often based on the melody of a chorale, or German hymn, became the ancestors of the German church cantata. Notable German composers of the vocal-instrumental concerto include Michael Praetorius and Heinrich Schütz.

vocal pouch, in frogs and toads (amphibians of the order Anura), a sac that serves as a resonating chamber. Its opening into the floor of the mouth is partially closed by vocal cords; air forced past the cords into the pouch produces sound by vibrating the cords.

Vocal pouches vary greatly in size and shape among species. They may be single or double. Darwin's frog has a distensible vocal pouch in which the male harbours eggs about to hatch until they have hatched and the young can survive outside.

vocalization, any sound produced through the action of an animal's respiratory system and used in communication. Vocal sound, virtually limited to frogs, crocodilians and geckos, birds, and mammals, is sometimes the dominant form of communication. In many birds and nonhuman primates the adult repertoire comprises a number of different calls, used to indicate territoriality, aggression, alarm, fright, contentment, hunger, the presence of food, or the need for companionship. Bird song (q.v.), the most intensively studied of animal vocalizations, consists primarily of territorial and mating calls.

vocational education, instruction intended to equip persons for industrial or commercial occupations. It may be obtained either formally in trade schools, technical secondary schools, or in on-the-job training programs, or, more informally, by picking up the necessary skills on the job without actual supervision

Vocational education in schools is a relatively modern development. Until the 19th century such education, except for the professions, was provided only by apprenticeship. This situation was partly due to the low social status associated with such instruction as opposed to a classical curriculum, considered "necessary for a gentleman." With the growth of industrialization during the 19th century, however, several European countries, notably Germany, began introducing vocational education in elementary and secondary schools. In Great Britain, however, opposition to vocational education persisted into the 20th century, although a few trade and junior technical schools were established by local authorities before World War II. By the late 19th century public (common) school vocational education in the United States consisted of manual training and practical arts. These programs were gradually expanded until in 1917 federal aid was provided to public schools for trade and industrial, agricultural, and homemaking courses.

After World War II the demand for trained paraprofessionals in the relatively new fields

of computer science, electronics, and medical services led to an increased interest in short-term postsecondary specialized training programs in these areas as an alternative to a traditional college education.

Vöcklabruck, town, Bundesland Oberösterreich (federal province of Upper Austria), north central Austria, on the Vöckla River southwest of Wels. The fine town square has two old gate towers and a Baroque facade, and there are two 15th-century churches and the Church of St. Ägidius (1688). Vöcklabruck is a busy industrial town with a large asbestos-cement plant and textile, metal, and paper mills. Pop. (1981) 11,039.

Vocontii, a Celtic tribe of the Gallic province of Narbonensis; its members probably lived in the western foothills of the Alps. Subjugated by the Romans (125–124 BC), they were a civitas foederata ("allied state") with two capitals—Vasio (Vaison-la-Romaine) and Lucus Augusti (Luc-en-Diois). Excavations at Vaison have shown that the Roman town was built north of an earlier hill fort; uncovered among the Roman ruins were a theatre, portico, and two groups of houses.

vodka, distilled liquor, clear in colour and without definite aroma or taste, ranging in alcoholic content from about 40 to 55 percent. Because it is highly neutral, with flavouring substances mainly eliminated during processing, it can be made from a mash of the cheapest and most readily available raw materials suitable for fermentation. Potatoes were traditionally employed in Russia and Poland but have largely been supplanted there and in other vodka-producing countries by cereal grains.

Vodka originated in Russia during the 14th century, and the name is a diminutive of the Russian *voda* ("water"). The beverage was mainly popular in Russia, Poland, and the Balkan states until soon after World War II, when consumption began to increase rapidly in the United States and then in Europe. Most producers purchase previously distilled and purified neutral spirits that are extremely high in alcohol content, with almost no flavouring substances remaining. Such spirits are then additionally purified by a filtration process, usually employing charcoal, and are then reduced in strength with distilled water and bottled without aging.

In Russia, where fairly low alcohol content of 40 percent by volume (80 U.S. proof) is preferred, and in Poland, where 45 percent is more common, vodka is usually consumed unmixed and chilled, in small glasses, and accompanied by appetizers. In other countries it is popular for use in mixed drinks because of its neutral character. It may be combined with other beverages without imparting flavour of its own and substituted for other spirits in cocktails not requiring the specific flavour of the original spirit. Popular vodka drinks include the screwdriver, made with orange juice; the bloody Mary, with tomato juice; vodka and tonic, a tall drink; and the vodka martini, with vodka substituted for gin.

Vodkas are sometimes flavoured. Zubrówka, yellowish in colour, highly aromatic, and with a somewhat bitter undertone, is produced by steeping several stalks of Zubrówka, or buffalo grass, in vodka. Other flavoured vodkas are made with such ingredients as lemon peel, berries, peppercorns, and caraway.

vodyanoy, in Slavic mythology, the water spirit. The vodyanoy is essentially an evil and vindictive spirit whose favourite sport is drowning humans. Anyone bathing after sunset, on a holy day, or without having first made the sign of the cross risks being sucked into the water by the vodyanoy. He can assume many different forms that enable him to deceive and trap his victims. The vodyanoy lives alone in his particular body of water and

is known to favour rivers with strong currents and swamps.

Voegelin, Eric (Herman Wilhelm) (b. Jan. 3, 1901, Cologne—d. Jan. 19, 1985, Stanford, Calif., U.S.), German-American political scientist and interdisciplinary scholar known for his studies of modern political thought and for his efforts to create a comprehensive philosophy of man, society, and history.

Voegelin earned a Ph.D. from the University of Vienna in 1922, where he taught law from 1929 to 1938. He escaped to Switzerland when the Nazis annexed Austria, and he subsequently went to the United States, where he was naturalized in 1944. He taught at Harvard University, Bennington College in Vermont, the University of Alabama, and Louisiana State University. From 1958 to 1969 he taught political science at the University of Munich, returning to the United States thereafter as a senior research fellow at the Hoover Institution on War, Revolution, and Peace in Stanford, Calif.

Voegelin is best known for his work on the philosophy of history. He examined not only political institutions but also language symbols and the nature of civilization in current and ancient texts. His work centred on the interpretation of the governing symbols and myths of political society, the understanding of which he viewed as basic to the success of political theory.

Among the principal works of Voegelin are Der Autoritäre Staat (1936), The New Science of Politics (1952), Order and History, 4 vol. (1956–74), Science, Politics and Gnosticism (1959), and From Enlightenment to Revolution (1975).

Voetius, Gisbertus (b. 1589, Heusden, Holland—d. 1676), Dutch Reformed theologian, scholar in Semitic languages, and educator who upheld uncompromising Calvinist views on predestination and condemned as atheistic the rationalist thought of the 17th-century French philosopher René Descartes.

Voetius studied in Leiden and in 1611 became pastor of Blymen, after which he returned to Heusden in 1617. In 1619 he played an influential part in the Synod of Dort, and 1634 he became professor of theology at Utrecht. Three years later he became pastor of the Utrecht congregation. His writings, Politica Ecclesiastica (4 vol., 1663–76) and Diatriba de Theologia (1668; "Discourse on Theology") strongly censured any concession to Roman Catholic doctrine.

Vogel, Hermann Karl (b. April 3, 1842, Leipzig—d. Aug. 13, 1907, Potsdam, Ger.), German astronomer who discovered spectroscopic binaries—double-star systems that are too close for the individual stars to be discerned by any telescope but, through the analysis of their light, have been found to be two individual stars rapidly revolving around one another.

An assistant at the Leipzig Observatory from 1867, Vogel became director of a private observatory at Bothkamp, Ger., in 1870. His early work centred on the study of planetary spectra (the characteristic wavelengths of the light from the planets) to obtain data on the planetary atmospheres; it was published in his Spectra der Planeten (1874; "Spectra of the Planets"). In 1874 he joined the staff of the new Astrophysical Observatory at Potsdam and in 1882 became its director.

In 1887 Vogel began a program of spectroscopic measurement of the radial motions of the stars and introduced the use of photography in stellar spectroscopy. In the course of his work he found that the star Algol is accompanied by a dark companion (about the

size of the Sun) that periodically eclipses it, thus accounting for Algol's periodic and regular variations in brightness. Vogel is also noted for his work in stellar classification. First proposed in 1874 and revised in 1895, the Vogel system is based on the previous work of an Italian astronomer, Angelo Secchi.

Vogel, Sir Julius (b. Feb. 24, 1835, London—d. March 12, 1899, East Molesey, Surrey, Eng.), New Zealand statesman, journalist, and businessman known for his bold project to regenerate New Zealand's economy in the 1870s through large-scale public works financed by British loans.

Attracted by gold discoveries in Victoria, Vogel emigrated to Australia in 1852 and became successful in business and journalism. He moved to Otago, N.Z., in 1861 after being badly defeated for public office and soon guided the Otago Daily Times to a leading position in the colony. Elected to Parliament in 1863, he led the opposition (1865-68) and became colonial treasurer in 1869 in the ministry of William Fox. This was the beginning of a "continuous ministry" during which Vogel, whatever office he held, was the real holder of power in the government of New Zealand. Where it suited his purpose, Vogel implemented policies that had been planned by others, such as the abolition of provincial governments. He also picked the men who formed ministries and headed the government for more than a decade.

Vogel's financial skills, particularly in negotiating loans from the British government, enabled him to develop his own policies. His development scheme, which he implemented as colonial treasurer (1869–72) and prime minister (1873–75, 1876), entailed the building of transportation and communication facilities and other public works. He was knighted in 1875.

A staunch advocate of the extension of British power in the Pacific, Vogel's agitation helped persuade Britain to annex Fiji in 1874. From 1876 to 1880 he served as agent-general in London and reentered New Zealand politics in 1884 as the real power in the ministry of Sir Robert Stout (1884–87). Vogel was unable to stave off economic depression in New Zealand, however, and he resigned his parliamentary seat in 1889, the year of publication of his novel *Anno Domini 2000: Or Woman's Destiny*, which projected his ideas on empire and finance to the year 2000.

Voghera, town, Pavia province, Lombardia (Lombardy) region, northern Italy. Voghera is located on the Staffora River, just southwest of Pavia. Probably the site of Iria, a Roman colony, it was fortified by the Visconti family, whose castle there dates from 1372. The 17th-century church of S. Lorenzo and the unused Romanesque church of S. Ilario (Chiesa Rossa, or Red Church, from its red-brick construction) are also notable. Voghera is an important agricultural market, with an agricultural training school, and has textile, mechanical, and food industries and a hydroelectric plant. Pop. (1981 prelim.) mun., 42,592.

Vogt, Johan Herman Lie (b. Oct. 14, 1858, Tvedestrand, Nor.—d. Jan. 3, 1932, Trondheim), Norwegian geologist and petrologist who pioneered in the use of physical-chemical methods in the study of the origin of igneous rocks and ores.

Vogt was appointed professor of metallurgy at the University of Christiania in 1886. His first important work, *Studier over slagger* (1884; "Studies on Slags"), began a series of studies on molten slags, in which he examined the crystallization of furnace slags and pointed out the close resemblance in mineral composition and texture between slags and certain

igneous rocks. His principal work on slags, Die Silikatschmelzlösungen ("The Molten Silicate Solutions"), appeared in 1903-04. Vogt's

studies served as a starting point in applying the known laws of solutions to the crystallization of igneous-rock magmas, and his pioneer work did much to stimulate the quantitative research that followed. In 1912 he took the chair of mineralogy and geology at the technical high school at Trondheim, retiring 16 years later.

Vogt, Nils Collett (b. Sept. 24, 1864, Christiania [now Oslo], Nor.—d. Dec. 23, 1937, Oslo), Norwegian novelist and poet who dealt primarily with the conflict between the generations and the struggle for intellectual freedom.

Vogt was a rebel in a conservative family, and his first novel, Familiens sorg (1889; "A Grief to His Family"), is about youth in rebellion against a social order dominated by old men. He was greatly in sympathy with the workers' cause and wrote songs for them. He wrote novels, plays, and short stories, but he is remembered mainly for his lyric poetry, published in many volumes, including Det dyre brød (1900; "The Precious Bread"), Septemberbrand (1907; "September Fire"), and his last poems, Et liv i digt (1937; "A Life in Poetry").

Vogtland, physical and cultural region of southeastern Germany, lying between Bavaria Land (state) and Czechoslovakia. A wooded, hilly plateau drained northward by the upper Weisse Elster River, Vogtland is cradled by the higher ranges of the Ore Mountains to the east, the Fichtelg Hills to the south, and the Thüringian Forest and Franconian Forest to the west.

Under the Hohenstaufen dynasty of Holy Roman emperors (1138–1254), the region came to be ruled by an imperial official called a Vogt. The Vogt,s castle in Plauen, the main city, dates from 1250. After Hohenstaufen rule ended, Vogtland fragmented into many petty states. By 1466 the Wettin family controlled most of the region, and its political fortunes thereafter followed those of Saxony.

The economy of the comparatively infertile region developed around household industries. Textiles and clothing have long been major products. Musical-instrument making has been important in southeastern Vogtland since the 17th century, when Protestant refugees from Roman Catholic Bavaria brought their craft with them. Klingenthal and Markneukirchen, specializing in the manufacture of reed and stringed instruments respectively, hold annual music festivals, and a museum at Markneukirchen displays some 2,000 instruments. Vogtland has also become a recreational centre, particularly for winter sports. Spas at Bad Elster and Radiumbad Brambach serve vacationers and convalescents and sell bottled mineral water.

Vohu Manah (Avestan: "Good Mind"), in Zoroastrianism, one of the six amesha spentas ("beneficent immortals") created by Ahura Mazdā, the Wise Lord, to assist him in furthering good and destroying evil. According to Zoroastrian doctrine, because the prophet Zoroaster was, in a vision, conducted into the presence of Ahura Mazdā by Vohu Manah, any individual who seeks to know the Wise Lord must approach him through this immortal.

Since Vohu Manah is the closest of the amesha spentas to Ahura Mazdā, the second month of the Zoroastrian calendar is dedicated to him. His sacred animal is the cow, symbol of the goodness that nourishes.

voice, in grammar, form of a verb indicating the relation between the participants in a narrated event (subject, object) and the event itself. Common distinctions of voice found in languages are those of active, passive, and middle voice. These distinctions may be made by inflection, as in Latin, or by syntactic variation, as in English. The active-passive opposition can be illustrated by the following sentences:

active: The hunter killed the bear. passive: The bear was killed by the

hunter.

The action remains the same, but the focus is different. The subject of an active verb governs the process as an actor, or agent, and the action may take an object as its goal. The passive voice indicates that the subject is being acted upon. The topicalized goal of the action ("the bear") is the grammatical subject of the passive sentence and is acted upon by the agent ("the hunter"), which is the logical, but not the grammatical, subject of the passive sentence. Passive constructions do not always require the agent to be expressed:

passive: The bear was killed.

Although many transitive verbs in English can take either active or passive voice, there are exceptions. Some transitive verbs do not occur in the passive.

sentence: This hotel room sleeps six people.

Six people are slept by this hotel

It is believed that proto-Indo-European distinguished between an active and a middle voice, and it is from the latter that the passive voice in later Indo-European languages developed. The middle voice signifies either an action or a state in which the principal interest is the subject of the verb, as is seen in the following examples from Russian:

active: Ivan bril Pyotra. Ivan was shaving Peter. middle: Ivan brilsya.

Ivan was getting shaved (by himself or by someone else).

In the middle voice the subject may or may not be the agent; the focus is on the action affecting him, whereas the passive voice focuses on the recipient of the action.

The category of voice is not found in all languages. Languages that can preserve meaning while changing focus by means of different forms of the verb can be analyzed as having the category of voice.

voice, also called FULL VOICE, in phonetics, the sound that is produced by the vibration of the vocal cords. All vowels are normally voiced, but consonants may be either voiced or voiceless (*i.e.*, uttered without vibration of the vocal cords). The liquid consonant l and the nasal m, n, ng (as in "sing") are normally voiced in English, and the stops, fricatives, and affricates characteristically possess both voiced and voiceless forms. In English, for example, b is a voiced bilabial stop, whereas p

is a voiceless bilabial stop. Of the other stops, fricatives, and affricates, v, d, th (as in "this"), z, zh (the sound of the s in "pleasure"), j (as in "jam"), and g are normally all voiced sounds; while f, t, th (as in "thin"), s, sh, ch, and k are all voiceless sounds. See also vocal fry; whisper.

voice identification, police technique for identifying individuals by the time, frequency, and intensity of their speech-sound waves. A sound spectrograph is employed to record these waves in the form of a graph that may be compared to graphs of other individuals and differentiated. Though voice graphs (or voiceprints) have been used in courtroom proceedings, the accuracy of this technique in identifying individuals is a subject of controversy among speech scientists.

void (mysticism and religion): see emptiness.

Voinjama, town, northwestern Liberia. Voinjama is located about 170 miles (275 km) inland from the Atlantic Ocean, close to the Guinea border, at an elevation of about 1,500 feet (460 m). It is surrounded by granite domes, or inselbergs, and is generally one of the coolest places in the country. Ethnically, it is dominated by the Mandingo people. Voinjama is connected by road to Zorzor and Kolahun and has an airport. Industries include sundried mud bricks, processed foods and oils, and smelted iron. There is considerable trade in kola nuts and palm kernels. There is an agricultural school and a Roman Catholic mission. Pop. (1974) 6,343.

voir dire, in law, process of questioning by which members of a jury are selected from a large panel, or venire, of prospective jurors. The veniremen are questioned by the judge or, more likely, by the attorneys for the respective parties. The attorneys try to detect bias or preconceived notions of guilt or innocence on the part of the veniremen. They may dismiss a juror for cause and have an unlimited number of challenges of this type. They also have a limited number of peremptory challenges that they can use to dismiss a juror for any reason. See also death-qualified jury; grand jury; petit jury.

Voit, Carl von (b. Oct. 31, 1831, Amberg, Bavaria [Germany]—d. Jan. 31, 1908, Munich), German physiologist whose definitive measurements of gross metabolism in mammals, including humans, helped establish the study of the physiology of metabolism and laid much of the foundation for modern nutritional science.

A pupil of the German chemists Justus von Liebig and Friedrich Wöhler at the University of Munich, where he later served as professor of physiology (1863–1908), Voit became involved in experiments designed to determine the utilization and disposition of proteins, fats, and carbohydrates in animals under varying conditions.

In 1862 he began a collaboration with the German chemist Max von Pettenkofer that led to his most productive investigations. After building a "respiration chamber" capable of supporting human subjects, they proceeded to study animal metabolism during states of activity, rest, and fasting (and in cases of diabetes and leukemia) by measuring accurately the ingestion and excretion of foodstuffs, the consumption of oxygen, and the production of carbon dioxide and heat.

Through 11 years of intensive experimentation, they made the first accurate determination of human energy requirements (in terms of caloric intake), demonstrated the validity of the laws of conservation of energy in living animals, and did much to establish the concept that the basis of metabolism lies in

the cells rather than in the blood. Voit also showed that an animal's oxygen requirement is the result, not the cause, of metabolism; that carbon dioxide production is proportional to the rate of muscular activity; and that the body's protein requirement is determined by the organized mass of the tissues, whereas its fat and carbohydrate requirements are determined by the amount of mechanical work performed.

Voiture, Vincent (b. Feb. 24, 1597, Amiens, Fr.—d. May 26, 1648, Paris), French poet, letter writer, and animating spirit of the group that gathered at the salon of the Marquise de Rambouillet.

Voiture completed his education in Paris and early made the acquaintance of the aged poet François de Malherbe and of Jean-Louis Guez de Balzac, whose zeal for reforming the French language he shared. Having attached himself to Gaston de France, duc d'Orléans, he followed him into exile in 1632 and was sent to Spain to negotiate on Orléans' behalf. On his return to France in 1634, Voiture was elected to the Académie Française.

Voiture excelled at writing occasional pieces of light verse, and his *Lettres* (published 1649) are full of witty and subtle allusions that were enjoyed by his narrow circle. His skillful use of stylistic conceits also appealed to the members of the Rambouillet salon. He was one of the two central figures in the "sonnets controversy," which briefly divided the Parisian literary world between the admirers of Isaac de Benserade's poem "Sonnet sur Job" and the admirers of Voiture's sonnet "L'Amour d'Uranie avec Philis." Voiture's admirers eventually won the argument, but the acrimony that developed, together with the outbreak of the civil wars of the Fronde, put an end to the Rambouillet society.

Voiture concealed a serious intellect beneath his guise as a pleasant purveyor of literary whimsy and badinage. His mastery of literary style and his counseling of writers to use pure diction did much to improve the prose of his period.

Vojvodina, autonomous pokrajina (province) of Yugoslavia within the republic of Serbia, with an area of 8,304 square miles (21,506 square km). Its population is more than one-half Serb, with a large minority of Hungarians and smaller numbers of Croats, Slovaks, and other ethnic groups. The province includes the regions known as Bačka, between the Danube and Tisa rivers and the Hungarian border; Banat to the east of Bačka; and Srem, to the south. For the most part, the province is an extensive plain that is part of the Pannonian Basin, or Plain. The climate is near continental, with approximately 24 inches (610 mm) of rainfall a year.

Fine chernozem soils make Vojvodina the agricultural heart of Yugoslavia. Cerealswheat and corn (maize) in particular-and industrial crops are grown, and there are sugar refineries, breweries, fruit and vegetable canneries, and large milling centres in the province. Poultry and cattle are raised, the latter for several large industrial slaughtering operations. The province has a welldeveloped transportation network, with road and rail connections to Belgrade and Zagreb and to Budapest, Romania, and the southern Balkans, as well as an extensive network of canals and navigable waterways. Principal towns are Novi Sad, the administrative centre, Subotica, Zrenjanin, Vršac, and Sombor. The Banat petroleum and natural gas field is near Vršac and Kikinda. In Pančevo a heavy industrial complex includes an oil refinery, fertilizer plant, and glassworks.

The Slavs first settled in Vojvodina during the 6th century; Hungarian nomad tribes arrived in the 9th and 10th centuries, and the Turks came in the early 16th century. In the late 17th and 18th centuries many Serbs em-

igrated to Vojvodina from Turkish-ruled Serbia proper, while large numbers of Germans and Hungarians also came into the area. In 1918 Vojvodina was incorporated into Serbia as a part of Yugoslavia. Pop. (1986 est.) 2.049.000.

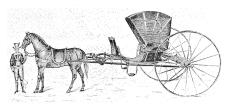

voladores, juego de los (Spanish: "game of the fliers"), pre-Columbian ritual dance of Mexico, possibly originating among the Totonac and Huastec Indians of present-day Veracruz and Puebla states, where it is still danced. Although the costumes and music show Spanish influence, the dance itself survives almost exactly in its original form. Four or six men (the voladores, or "flyers") dance

on a platform atop a pole 60 to 90 feet (18 to 27 m) high; at the end of the dance, they circle downward around the pole as the ropes that fasten them to it unwind. The ancient agricultural fertility significance of the dance has disappeared, but there remains in the number of dancers—four or six—the pre-Christian ritual orientation to the four points of the compass plus the zenith and the nadir.

volante, Spanish one- or two-passenger carriage, having two wheels and an open, hooded

body. The body was set in front of the wheels and attached to the long shafts. The carriage was usually pulled by one horse, which was ridden by the coachman, although two or three horses were also used. Volantes were popular in Spain, Cuba, Mexico, and Louisiana. From about 1830 to 1870, great numbers were manufactured in New York City.

Volapük, artificial language constructed in 1880 by Johann Martin Schleyer, a German cleric, and intended for use as an international second language. Although its vocabulary is

based on English and the Romance languages. the word roots in Volapük have been modified to such a degree that they are virtually unrecognizable; for example, *lol* from English "rose," *nim* from "animal," and *Melop* from "America." It is difficult to learn because of the unfamiliar appearance of the words and because it has a grammar nearly as complex as that of Latin. There are four cases for nouns, six pronouns with plural forms, and six persons and six tenses for the verb, as well as indicative, passive, infinitive, aorist, conditional-conjunctive, imperative, and participial forms, each with full or nearly full conjugation. Although the complexity of Volapük grammar made it difficult, regularity of spelling and grammar eased this somewhat, and in the 1880s, until Esperanto appeared as a competitor, hundreds of thousands of enthusiasts studied Volapük, held conventions, and published books and periodicals in the language.

volcanic dome, also called LAVA DOME, any steep-sided mound that is formed when lava reaching the Earth's surface is so viscous that it cannot flow away readily and accumulates around the vent. Sometimes domes are produced by repeated outpourings of short flows from a summit vent, and, occasionally, extremely viscous lava is pushed up from the vent like a short protrusion of toothpaste from a slightly squeezed tube. More commonly, however, the initial small extruded mass is gradually expanded by new lava being forced up into its interior. Fractures forming in the solidified shell of the expanding dome may allow small flows to escape onto its flanks or around its base, but, for the most part, the growth is simply a slow swelling. As the dome grows, the expanding crust breaks up, and pieces of it roll down to form a heap of angular rock fragments (breccia) around its base. Continued crumbling of the shell of the dome may result in a heap of debris that nearly buries the solid portion of the dome.

Volcanic domes may develop in the summit craters of composite volcanoes (i.e., those consisting of alternations of lava flows with layers of cinder, lapilli, ash, and other pyroclastic ejecta) or completely away from any crater. They may attain heights of several hundred metres and measure thousands of metres across. One of the largest known volcanic domes is that comprising the upper part of Lassen Peak in northern California. The Lassen dome rises more than 600 m (2,000 feet) and has a diameter of approximately 3.2 km (2 miles). The Chaos Crags, located just north of Lassen Peak, constitute a row of spectacular domes.

volcanic glass, any glassy rock formed from lava or magma that has a chemical composition close to that of granite (quartz plus alkali feldspar). Such molten material may reach very low temperatures without crystallizing, but its viscosity may become very high. Because high viscosity inhibits crystallization, forced solidification at this stage by sudden cooling and loss of volatiles, as when extruded from a volcanic vent, tends to chill the material to a glass rather than to crystallize it.

Volcanic glass is unstable and tends to change spontaneously (devitrify) from the glassy to the crystalline state in periods of time that are relatively short by geological standards; the material takes on a stony appearance due to the presence of minutely crystalline aggregates. Geologically ancient glasses are therefore very rare, and most glassy rocks are of Tertiary age or younger (less than 65,000,000 years old). There is good reason to believe that glassy rocks were abundant in ancient geological time, but nearly all of these have since devitrified. Devitrification commonly begins along

cracks in the glass or around large crystals and may spread outward until eventually the entire mass has been converted to fine crystals of quartz, tridymite, and alkali feldspar.

Characteristic of many natural glasses is a streaked or swirly structure that consists of bands or trains of crystals and crystalline bodies. This structure is believed to have been formed by the flowage of viscous lava. Some flow structures consist of alternating bands of different-coloured material; in others, layers of bubble-free glass alternate with highly vesicular glass. See also obsidian; tachylyte.
